Continuity of Learning Through TBM:
Technology-Based Modalities During and After Pandemic

Paulo B. Mangubos, DepED Santa Rosa City, Philippines

Abstract

The COVID-19 pandemic is definitely a health issue that has affected much of the sectors in the community. As a city, Santa Rosa has never been hindered by the present challenges brought by the COVID-19 pandemic, different calamities, and problems that need to be addressed appropriately. This investigated the learners' perspectives on their current capacity and its implications for learning continuity through technology-based modalities. These were investigated based on the availability of gadgets, internet connectivity, and their classroom learning experiences. As per select schools, out of the 28 public schools, select nearby senior high schools was the research locale. This study employed the convergent parallel design, which entails that the researcher concurrently conducted the quantitative and qualitative elements in the same phase of the research process, weighed the methods equally, analyzed the two components independently, and interpreted the results together. This study concluded that respondents favor modular distant learning. Most respondents who have difficulties in meeting the requirements were because of ICT limitations. Even though the majority of them have benefited from the assistance of their families and the local government, some of them are still having issues on their online capacity based on the indicated parameters. The emerging themes from the experiences and difficulties of learning amidst the pandemic were: Technology in Education; The Role and Function of Technology; Technology-based Learning Environment and Assessment; and Safety and Security. This study resulted with a proposed strategic plan - PAU, that can ensure the effective implementation of different learning modalities.

Keywords: Continuity of Learning, Technology-Based Modalities, Strategic Plan

Introduction

The COVID-19 pandemic is unquestionably a health issue that has impacted many community sectors, particularly the school sector. The epidemic has impacted Santa Rosa as a city. All families have experienced the significant disruption, which has had a negative impact on the city's educational system as a whole. The problem highlights the conflict between keeping schools open during their regularly scheduled hours as required by law while both decreasing interaction and saving lives.

Thus, the educational system was forced to act quickly to adapt to the evolving nature of learning, and schools must respond to the massive disruption caused by COVID-19. In Santa Rosa City, different schools and institutions are being urged to create a resilient learning system utilizing data that is both evidence- and need-based so that proactive and responsive measures may be put in place.

As a continuing commitment, SDO Santa Rosa City has never been hindered by the present challenges brought by the COVID-19 pandemic, different calamities, and problems that need to be addressed appropriately. As mentioned by Martin Luther King, "The function of education is to teach one to think intensively and to think critically. Intelligence plus character – that is the goal of true education," which necessitates the division to work more productively and make everyone responsible for quality education that every learner deserves. Hence, education has never stopped during and after the pandemic.

The manner in which instruction and learning take place changes in crisis situations. When crises and calamities occur (man-made and natural) occur, educational institutions must be adaptable and discover new approaches to carry on the learning and teaching processes (Chang-Richards et al., 2019). One new reality brought upon by the world is the move to online learning platforms which is a response to the health problem to reduce the danger of in-person communication.

The new realities of our world, which place a strong emphasis on social isolation for health and safety, eventually call for changes to the ways that schools educate and learn. In order to support and equip schools and learning centers in creating a conducive learning environment and in complying with the quality criteria set in this new normal time, the Division of Santa Rosa City pledges to strengthening our mandate in this regard.

In this regard, the researcher aimed to investigate the issues and challenges in technology-based learning modality in the select schools of Santa Rosa City during and after the pandemic for the development of strategic actions for learning continuity.

Aim of the Study

This study aimed to investigate the issues and challenges in teaching and learning amid the pandemic through the eyes of faculty members and students as the foundation for the development of strategic actions for teaching and learning continuity.

This study specifically sought to answer the following questions:

1. What is the profile of the learners/students in terms of:
   1.1 Preferred flexible learning modalities;
   1.2 Problems in the completion of requirements due to ICT Limitation;
   1.3 Provision of additional/alternative requirements;
   1.4 Receiving of learning feedback; and
   1.5 Learning atmosphere/environment?

2. What is the profile of faculty and students in terms of online capacity as categorized into:
   2.1 Access to e-gadgets;
   2.2 Access to Internet connectivity/Wi-fi connection; and
   2.3 Stability of Wifi/internet connection?

3. What emerging themes from the experiences and challenges of teaching and learning amidst the pandemic can be developed?

4. From the salient findings of this research, what Strategic Plan for teaching and learning can be proposed?

Method

Context, Participants, and Procedures

This study used a convergent parallel design, which required the researcher to conduct both the quantitative and qualitative components at the same time, weigh the approaches equally, separately analyze the two components, then combine their interpretations of the findings (Creswell & Clark, 2011). A thorough study of the research problem was also offered by the convergent parallel design by merging or combining quantitative and qualitative data.

The use of both quantitative and qualitative methods was simultaneous. To determine the difficulties in teaching and learning, a structured online survey utilizing Google forms was conducted. Respondents had options to pick from in the Google form.

Quantitative Population/Sampling Procedure
In the quantitative section of the investigation, simple random sampling was used. A total of 288 students from the listed senior high schools were chosen at random to make up the study's population. The number of respondents per school division is shown in the Table 1.

Distribution of Respondents Per School

School	Learners
School A	95
School B	95
School C	98
Total	**288**

Qualitative Population/Sampling Procedure
In order to respond to study question number three, which examined learners' challenges and experiences, the qualitative method was adopted. The researcher was able to record the experiences and difficulties of the respondents by reading the narratives they provided in

response to the open-ended questions they were asked online. Themes that gave a clear description of the experiences and difficulties were used to examine the narratives.

Data Analysis

The validated and reliable-tested final instrument was converted to online Google Form. The converted instrument was sent through E-mail and Messenger of Social Networking Sites (SNS).

Since the survey was conducted online, retrieval of the data was through cloud computing using the researcher's Google Drive account, wherein it was automatically stored. Data Privacy form and Informed Consent form were given to both respondents for the signature, acknowledging their participation in the whole research process. Lastly, data analysis, interpretation, and thematic analysis were performed accordingly.

Quantitative Part
Data were analyzed to provide a clear picture of the setting and experiences of learners after obtaining the quantitative and qualitative findings. The information was utilized to create a scenario, analyze it, and then use the findings to decide on the strategic activities for teaching and learning continuity. Scenario analysis is a method for predicting outcomes under the premise that a phenomenon would continue in the future (Kishita et al., 2016).

This strategy is helpful for investigating likely future events that might or might not occur (Bekessy and Selinske, 2017). With the help of this method, which creates a theoretical scenario of the best-case (optimistic) or worst-case (pessimistic) scenario for behavior in response to an unexpected event like the pandemic, the researcher was able to develop a comprehensive strategic plan for the continuity of teaching and learning (Balaman, 2019).

Qualitative Part
In order to respond to study question three, which examines the difficulties and experiences of the learners, the qualitative method was adopted. Online open-ended questions were utilized to gather the respondents' narrative responses so they could talk about their struggles and experiences. It provided a detailed account of the experiences and challenges; the tales were then assessed thematically. The researcher then created hypothetical scenarios that served as the foundation for adaptable strategic actions that the schools could take depending on the community quarantine classification and the local health situation where the schools are located. This was done after the researcher analyzed quantitative and qualitative data.

Results

This study was conducted in select nearby senior high schools. These were used by the researcher to compare the continuity of teaching and learning in the Division of Santa Rosa City during and after the pandemic. The conduct of this study in these research locales were pursued since it will greatly help the SDO Santa Rosa City track the status and adherence of schools to the relevant policies of the said department. Moreover, it helped them determine the continuity of learning can be adapted by other divisions or nearby schools to ensure the effective continuity of education during and after the pandemic situation.

The researcher made use of both descriptive and inferential statistics in analyzing the data collected from the respondents.

1. The Profile of the Learners in Terms of:
      1.1. Preferred flexible learning modalities;
      1.2. Problems in the completion of requirements due to ICT Limitation;
      1.3. Provision of additional/alternative requirements;
      1.4. Receiving of learning feedback; and
      1.5. Learning atmosphere/environment.

Table 1: Profile of learners in terms of Preferred flexible learning modalities

Learning Modalities	Frequency	Percentage
Modular Distance Learning	111	35.54
Online Distance Learning	86	29.86
TV/Radio-Based Instruction	0	0
Blended Learning	71	24.65
Homeschooling	20	6.94
Total	288	100

Table 1 shows that most of the respondents prefer Modular Distance Learning (35.54%) which can be inferred that most of them have been exposed to this modality since they had undergone modular distance modality for the past two (2) years due to the pandemic. This is also true since they have been provided with the modules that they use as their learning materials, both printed and digitized modules. They were fortunately provided by the Local Government as a way of continuing education in the city. The digitized modules were stored in the On-The-Go (OTG) flash drives and then transferred to their mobile devices. Consequently, it was followed by Online Distance Learning with 29.86% of the total responses; Blended Learning with 24.65%; and 6.94% for Homeschooling. It can also be seen that none of the participants chose TV/Radio-Based Instruction because it is not available in their communities.

**Table 2: Profile of learners in terms of completion of requirements
due to ICT Limitation**

Statements	WM	VI
E-gadgets are too costly or expensive	3.54	Strongly Agree
Demands too much time be spent on technical problems	3.25	Agree
Effective only when extensive computer resources are available	3.57	Strongly Agree
Limits my choices of instructional materials	2.63	Agree
Requires software-skills training that is too time consuming	2.51	Disagree
Composite Mean	**3.10**	**Agree**

4 - 3.25-4.00 (Strongly Agree); 3 - 2.5-3.24 (Agree); 2 - 1.75-2.49 (Disagree); 1 - 1-1.74 (Strongly Disagree)

In Table 2, Profile of the learners in terms of completion of requirements due to ICT Limitation, it is observed that most of the respondents or 3.57 strongly agree that it can only be effective when extensive computer resources are available. It was followed by the indicator that e-gadgets are too expensive with 3.54 as weighted mean, wherein most of them strongly agree that they are being limited with the completion of their requirements due to expensive gadgets that they need. It is also observed that they agreed on the two other

indicators that it demands too much time be spent on technical problems, and limits their choices of instructional materials. On the other hand, they disagreed that it requires software-skills training that is too time consuming, which means that they can easily adapt to the ICT environment. The composite weighted mean of 3.10 shows that they agreed on the ICT limitations that they encounter in completing their requirements.

Table 3: Profile of learners in terms of additional/alternative requirements

Statements	WM	VI
Requires extra time to complete the learning activities	3.51	Strongly Agree
Makes classroom interaction becomes easier	3.37	Strongly Agree
Helps accommodate students' personal learning styles	3.16	Agree
Motivates students to get more involved in learning activities	3.29	Agree
Results in students neglecting important traditional learning resources (e.g., library books).	3.42	Strongly Agree
Composite Mean	**3.35**	**Strongly Agree**

4 - 3.25-4.00 (Strongly Agree); 3 - 2.5-3.24 (Agree); 2 - 1.75-2.49 (Disagree); 1 - 1-1.74 (Strongly Disagree)

In this table, it can be gleaned that most of them strongly agreed in the stated indicators. Among them, Indicator 1 with 3.51 weighted mean showed that they are required to spend extra time to complete learning activities. It was followed by the idea that students neglect important traditional learning resources with 3.42 weighted mean; and classroom interaction becomes easier (3.37). These indicators manifest that the respondents are aware of the pros and cons that they encounter when they are given additional or alternative requirements using the technology. Additionally, they concurred with the claims that ICT supports students' individual learning styles (3.16) and motivates them to participate more actively in educational activities (3.29). The composite mean of 3.35 means that they strongly agreed that the experiences they have with the additional/alternative requirements using ICT are taken into consideration.

Table 4: Profile of learners in terms of receiving of learning feedback

Statements	WM	VI
Improves student learning of critical concepts and ideas	3.54	Strongly Agree
Eases the pressure on the learners	3.28	Agree
Is successful only if technical staff regularly maintains computers	3.43	Strongly Agree
Is successful only if there is the support of parents	2.76	Agree
Will increase the amount of stress and anxiety students experience	2.91	Agree
Composite Mean	**3.18**	**Agree**

4 - 3.25-4.00 (Strongly Agree); 3 - 2.5-3.24 (Agree); 2 - 1.75-2.49 (Disagree); 1 - 1-1.74 (Strongly Disagree)

The indicator for improving student understanding of important concepts and ideas received the highest weighted mean (3.54), as shown in Table 4, while the belief that learning

feedback can only be successful if the technical staff regularly maintains the computers or e-gadgets that they use received a weighted mean of 3.43. This demonstrates that the respondents concur that learning feedback must be properly given with the assistance of specialists. As a result, the majority of them agreed on the following three additional indicators: Reduces pressure on students (3.28); Will raise the amount of stress and anxiety students suffer (2.91); and Is only successful with parental support (2.76). It manifests that feedback mechanism in the technology-based learning modality is crucial for them and must be done with proper guidance and technical skills. Its composite mean of 3.18 also shows that most of them agree in all the indicated parameters when receiving of learning feedback is concerned.

Table 5: Profile of learners in terms of learning atmosphere/environment

Statements	WM	VI
Is only successful if computer technology is part of the students' home environment.	3.36	Strongly Agree
Is a valuable instructional tool	3.31	Agree
Is successful only if there is the support of parents	3.37	Strongly Agree
Is difficult because some students know more about computers than many parents do	3.42	Strongly Agree
Is only successful if traditional approaches are part of the students' environment.	3.25	Agree
Composite Mean	**3.34**	**Strongly Agree**

4 - 3.25-4.00 (Strongly Agree); 3 - 2.5-3.24 (Agree); 2 - 1.75-2.49 (Disagree); 1 - 1-1.74 (Strongly Disagree)

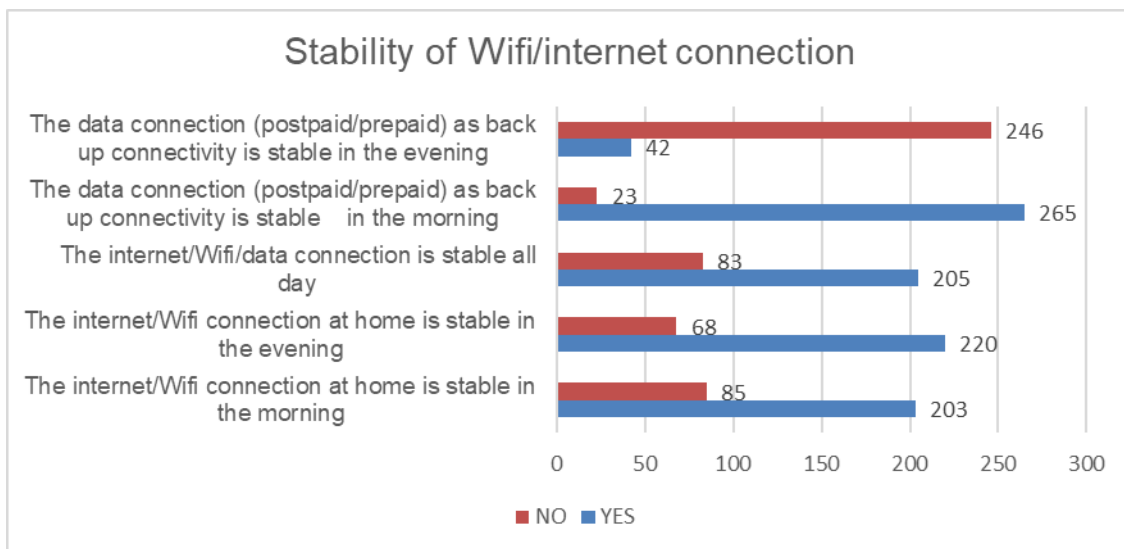
The majority of respondents, as shown in the table, strongly concur with the following statements: is difficult because some students are more computer literate than many parents (3.42); is only successful with parental support (3.37); and is only successful if computer technology is available in the students' homes (3.36). This determines their stance on the ICT learning environment for technology-based modality for the continuity of education during and after the pandemic. They believe that the enumerated considerations must be taken into account when ICT is applied in the learning atmosphere. If the e-gadgets and equipment are not available at home, it will not be successful, especially during online classes. Technical divide can also hinder their learning when parents do not seem to understand their needs in ICT gadgets and learning materials. Their parents must give the full support to the demands of technology. However, some parents do not have the capacity and the skills to support the learners and provide for all its demands.

Technovation has been identified by the Division to be its foremost goal through its banner program B2B-SRC (Be Efficient, Be Empowered, Be Excellent in Santa Rosa) by ensuring the provision of e-learning gadgets and equipment to the learners. Technological innovation has been the trend in this new normal learning environment to which LGUs and external stakeholders give their utmost support to all the needs and demands of the educational system (Mangubos, 2021). This makes the City becomes a good venue in providing technology-based learning environment for its learners.

2. The Profile of Learners in Terms of Online Capacity as Categorized Into:
2.1 Access to e-gadgets;
2.2 Access to Internet connectivity/Wi-fi connection; and
2.3 Stability of Wifi/internet connection?

**Figure 1: Profile of the learners in terms of online capacity
as categorized into access to e-gadgets**
Figure 1 shows that most of the learners (228 or 79.17%) of the learners have access to computer/laptop at home; while only 88 or 30.56% of the total respondents said that they can use the computer/laptop every day. This means that most of them do not own the computer/laptops available at home and share it with the other members of the household. However, 231 or 80.21% of them said that they have an e-tablet that they can use. This is because of the provided e-tablets for the Rosenian learners from the Local Government. It is under the goal of Technovation in the city. Likewise, 258 of the total respondents or 89.58% of them also said that they have mobile phones as an alternate gadget for technology-based learning modality. Thus, 260 or 90.28% of them answered that they use more than one (1) e-gadget in their preferred learning modality.

**Figure 2: Profile of learners in terms of online capacity
as categorized into access to Internet connectivity/Wi-Fi connection**
In the figure above, it shows the online capacity of the respondents based on their access to Internet connectivity/Wi-fi connection. It shows that most of them (262 or 90.97%) utilize prepaid connectivity as back up for their online classes. Only a few, 28 respondents or 9.72%, have postpaid connection that they use when Wifi connection is not available. When it comes to their Wifi/data connection usage, only 32.99% or 95 respondents said that they can use their connection all day long. With regard to sharing Wifi connection from their neighbors, only 40 or 13.89% have that situation, while 95 respondents or 32.99% have their own Wifi/data connection at home.

Figure 3: Profile of the learners in terms of online capacity as categorized into Stability of Wifi/internet connection


For Figure 3 on the Profile of the learners in terms of online capacity as categorized into Stability of Wifi/internet connection, 93.01% or a total of 265 respondents said that data connection (postpaid/prepaid) as back up connectivity is stable in the morning, while 14.58% or 42 respondents have poor data connection at evening. On the other hand, there are 203 respondents or 70.49% with stable internet/Wifi connection at home is stable in the morning, close enough with the 220 of them or 76.39% experience strong internet/Wifi connection at home in the evening. While 205 or 71.18% of the total respondents said that they have stable internet/Wifi connection at home for the entire day.

The results of the survey proved that Santa Rosa City can take advantage of the good internet/Wifi connection of the learners. It is also one of the reasons why technology-based learning modality became possible in the city. Fabella (2021) mentioned in his narratives SDO BE-LCP that the Schools Division of Santa Rosa City boosts its effort to expand the role and importance of ICT in improving the quality and delivery of education and support the teachers in the integration of ICT in the teaching-learning process. Guided by different programs and projects implemented in central and regional level, the ICT Unit implemented different programs and projects that support technology-based learning modalities.

3. What Emerging Themes From the Scenarios Based on the Experiences and Challenges of Learners Amidst the Pandemic Can Be Developed?

Theme 1: Technology in Education

Theme 1, based on the narratives and best scenarios of the learners imply that there is a strong need for the development of technology in education. Learning with technology is only possible if students are technologically literate, which implies a two-step process in which students first learn about the technologies before they can really utilize them to study. However, there have been initiatives to combine the two strategies. Learning about computers and the Internet is combined in this method. It entails teaching the technology skills "just-in-time," or when the student needs to learn them while participating in an activity.

Theme 2: The Role and Function of Technology

The learners have repeatedly brought up the importance of technology, particularly an internet connection, in the overarching narratives about how learning is delivered and assessed, it implies that if everyone was aware of this issue in the crisis situation, learners may eventually return to the regular learning activities outside of the classrooms. According to survey findings, the majority of students and some faculty members live within the city and have internet access.

The technology required for students to interact with each other effectively is another important component to take into account in addition to the internet. In the absence of these, it is necessary to assess the strategy employed during the learner interaction. The problem would be how to create an inclusive IT infrastructure to deliver top-notch instruction to all students given the current health crisis and the change in how education is delivered.

Theme 3: Technology-Based Learning Environment and Assessment

In the gathered narratives, this theme focused on the learning environment and the assessment of learning. When schools instantly turn to online learning as the most practical method of delivery of learning and to alleviate the disruption of classrooms and support continuity of learning. Under this new educational structure, students must stay at home and relocate their classrooms to the same location. However, it is somewhat disregarded that students have various home environments and living circumstances that may affect their learning environment and assessment process through submission of their outputs.

Most of the time, families regularly involved their kids in educational activities. However diverse patterns were seen across various social categories. Low socioeconomic position families and residents of underprivileged areas offered fewer learning opportunities. The reason for this may be in part due to the fact that it can be challenging for families that are economically and socially disadvantaged to obtain the financial and social resources necessary to create an engaging technologically-based learning environment at home.

Theme 4: Security and Safety

Concern for their safety and security is a typical emotion among the parents of the learners in the situations that have been identified based on the provided narratives. According to

Maslow's Hierarchy of Needs, the administration and personnel at the school give priority to students' fundamental needs. Students and professionals have stated that safety and the psychological signs of infection worry are their top concerns (Smith, 2020). It was found in another study that due to job loss, family member loss, and the uncertainty of traveling to the school, the concerns on focused on security and the prospect of continuing education.

The schools must give students access to significant support in order to deal with the hardships, obstacles, and even trauma caused by the pandemic in light of the issues mentioned by the study's respondents. Programs for mental health must be available in formal educational contexts. The tremendous difficulties that students and teachers faced during the epidemic made it less likely that they would be able to successfully complete formal education if their general well-being was weakened.

4. Proposed Strategic Plan for Students' Learning

Proposed Strategic Plan	Technology in Education	The Role and Function of Technology	Technology-based Learning Environment and Assessment	Security and Safety
Prime	Innovative programs in learning modality through technology	Alternative e-services delivery of learning resources	Online and technology-based sites for students' activities and engagement	The arrangement of the classroom with physical distance by student desks for blended learning
Amplify	Upskilling in new normal learning methodologies	Online system for services with some physical transactions when needed	Flexible and adaptive online learning outcome-based assessment	Virtual classrooms for all learning modalities
Utilize	Learning management system to address issues during and after the pandemic	Fully operational learning management system for classes in different modalities	Alternative home-based activities with modified assessment policy"	Support from the LGU, stakeholders, and the community for safety and security

From the generated themes on the salient findings of this study, this Strategic Plan P.A.U. (Plan, Amplify, and Utilize) was designed. This plan can be used as a guide to make school plans in technology-based learning modality for the continuity of education.

Conclusion

1. Respondents favor modular distant learning, according to the learner profile in terms of preferred flexible learning modes. Most respondents who have difficulties in meeting the requirements were because of ICT limitations. While, they firmly agree in the indicators based on their experiences in the supply of additional/alternative criteria. They also strongly agree with the stated indicators based on their personal experiences obtaining feedback on their learning and the learning environment.

2. It was concluded that there are learners who still struggle with using technology when their online capability was categorized into access to e-gadgets, access to Internet connectivity/Wi-fi connection, and stability of Wi-Fi/internet connection. Even though the majority of them have benefited from the assistance of their families and the local government, some of them are still having issues on their online capacity for their studies based on the indicated parameters.

3. The following were identified as the emerging themes from the experiences and difficulties of learning amidst the pandemic: Theme 1: Technology in Education – Students can only learn about technology if they are technologically literate; Theme 2: The Role and Function of Technology – The use of technology is essential when creating materials for online or remote learning in order to maximize their class participation; Theme 3: Technology-based Learning Environment and Environment - necessitates a platform that involves cooperation among educational institutions, parents, and other stakeholders that gives students a quality technologically- based learning environment; and Theme 4: Technology-based Learning Environment – a place where school staff and administration prioritize the basic needs of the learners in safety and security.

4. A strategic plan is needed in order for a technology-based learning modality to become possible. This study resulted with a proposed strategic plan - P.A.U. (Prime, Amplify, and Utilize), that can ensure the effective implementation of different learning modalities.

Practice of Knowledge Presentation in Tunnel Engineering Teaching

Jianqin Ma, Chang'an University, China

Abstract

High education situation is increasingly challengeable. The courses in traditional fields would surfer more squeeze from the changing environment. The teaching style should accordingly be robust and more favorable to student knowledge acquisition. Here is the practice of knowledge presentation in Tunnel Engineering teaching at Chang'an University in China. The presentation style is part of the course design, with the considerations of the features of the course content and experiences. The contents consist of the knowledge sections related to both the foundations to Tunnel Engineering and major professional knowledge, including the planning, design, construction, operation and management of tunnels and underground structures, respectively. To be favorable to the student-centered procedure, the course presentation is systematically designed in terms of specified knowledge points, such as, concept, information or facts, experiences, theory and principle. Each of the knowledge points is presented in a progressive and flexible mode in terms of learning content and complexity. The efficiency and robust of the knowledge presentation are checked by student learning result evaluation, with the indexes of the student's knowledge learning levels. The practice results indicate that: (1) students are skillful to obtain course information, but most of them are frequently confused in information sampling, concept and knowledge system developments; (2) course instructors should focus on the presentation of key concepts, the connections of the knowledge points, student's learning skill and capacity development; (3) adequate evaluation and active motivation are necessary and favorable to student self-enhancement and knowledge building metacognitively.

Keywords: Knowledge Presentation, Teaching, Learning Evaluation, Tunnel Engineering

Introduction

Education quality is vital to a nation and society in this new era. As information is accumulating in an unprecedented manner, we are in a changing world. Information, especially digital issues, plays an increasing role in personal lives and social activities. At the same time, education is highly challenged. High education would play an active role (Ma, 2023). The results of learning and teaching is always one of the key points in education. As a teacher, one of the tasks is to make a teaching effective in terms of knowledge presentation.

In modern society, to make a nation truly dynamic, engineering education should play a fundamental, global, and leading strategic role in social development (Li, 2020). This means that engineering education needs to face the social developing challenges (NASEM, 2018). Educators need knowing how to take advantage of the development and application of contemporary technology in the social development. This trend will be increasingly significant in the future (OECD, 2015). Some emerging engineering education models (Graham, 2018; Stanford2025) or New Engineering Education Plan (Li, 2020) have been in practice to meet the requirements. The well-recognized innovations, in terms of learning and teaching styles, include Massive Open Online Course (MOOC), Small Private Online Course (SPOC), Flipped Classroom, as well as the innovation program in new engineering education, such as the Open-loop University in the Stanford2025, the education styles at the Olin College of Engineering. All of these well-accepted learning and teaching styles prefigure changing in the conventional course presentation.

To adapt to the explosive growth of the knowledge, there are new courses being added to meet the requirements of the new industries and some courses are even cancelled in the curriculum at a university. As a result, a course for a specialty in civil engineering, such as Tunnel Engineering will share less time period. On the other hand, the contents of the existing course are also increasing with time. Therefore, the presentation of a traditional course is challengeable in this changing situation. In terms of student-centered principle, the teaching style should accordingly be robust and more favorable to student knowledge acquisition. Here is the practice of knowledge presentation in Tunnel Engineering teaching at Chang'an University in China.

Situation of the Course

The new information presentation and communication modes are generally beneficial to our living, studying and working. However, it is challengeable for an individual to take advantage of the information available. In brief, we seem enjoy an informational society, however, it is increasingly challengeable for a learner or presenter to cope effectively with the information around us. Course presentation would be helpful to the students' incorporating the sampled information into their knowledge system. The situation of an engineering professional course is of the following features. (1) The information related to a traditional professional course is easily available to students. The quantity of the information is increasingly accumulated with time. This means the information presentation of a teacher should shift from conventional mode to a new style to adapt to the new situation of course information. (2) The modes and forms of the course information are increasing with time. (3) It is challengeable to present the information with conventional way. (4) What is important to students is of personal features. (5) A proper quantity and style (way) to present a specified content is of dynamic feature.

1. Society Requirements

Social hot points or the requirements for a specified knowledge is generally shifting with a time interval. For students being adaptable, education activity should skillfully manage the focus on general knowledge and specified one, respectively. A professional engineer is generally much fit to a specified engineering position. However, a prospective institution needs not only adaptable personnel, but also creating or leading a new engineering field. Practice has given well indications that a super large company would have a super-conventional development stage, which has been founded on the innovation or creation of a new field. Therefore education should be timely tuned, with the knowledge building and capacity development of the students underlined and keeping her key features.

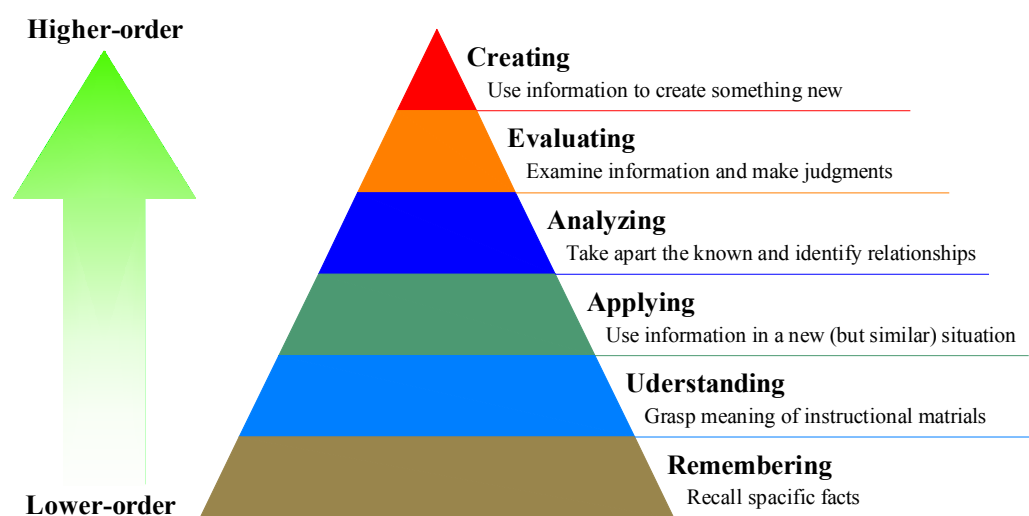
The social requirements are met in fulfilling personal needs. Student-centered course design and plan implementation would focus on student's capability development. Course presentation would contribute to the education objectives. Although various factors will have influence on the results of the learning and teaching achievements, it is one of the key points of course presentation to help students' knowledge building and capacity development. In practice, the course presentation will be with college characteristics, such as in terms of knowledge-level, personal abilities, and objectives. There are well-accepted parameters of personal capacity in social evaluation field, such as the Bloom's taxonomy (Anderson & Krathwohl, 2001) in thinking skills and cognitive domains (Figure 1). Of the parameters, creative thinking is the in the top-level or higher-order.


Figure 1: Sketch showing Bloom's taxonomy (2001) in thinking skills and cognitive domains

2. Techniques Applied in Learning and Teaching

Many information presentation styles are emerging in digital forms. Education is in a constantly changing era. Course would be presented in a traditional way, such as speaking, writing on a blackboard, body language, projector showing, as well as in a digital mode of PPT, video, flash, etc. On the other hand, knowledge presentation could be face to screen through online. It is not an easy job to effectively use the techniques available in practice (Ma, 2023). Teachers should skillfully manage the techniques, especially how to effectively to apply available technology at a specific learning and teaching issue or knowledge point.

This also include guiding professional information sampling, such as through database available.

3. Design of Course Presentation

Learning is a process of the interaction among the students, teachers and knowledge and would take place under certain context (Kozulin et al., 2003). As shown in Figure 2, the results of a course teaching depends on various factors, such as the competence of the instructors and students, learning environment, facilities available in teaching and learning procedure, features of the interaction between instructors and students. The course presentation should be well designed in terms of improving teaching quality and the students' knowledge building and capacity development.

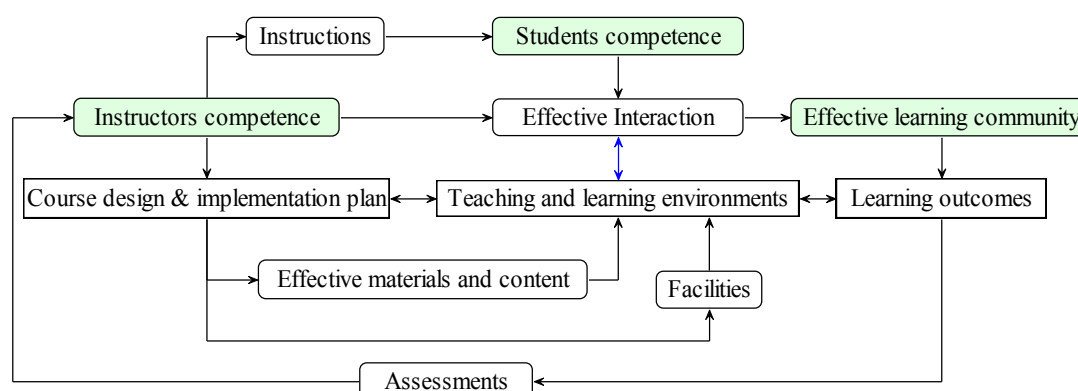
In practice, course presentation is performed in a dynamic situation. The content and difficulty of the course points is changing. The students' learning capability is various and changing. The design of the course presentation should be dynamically tuned, in terms of course content choosing, presentation styles, interaction between students and staffs, as well as effect evaluation. For each presentation, the design should consider the learning objectives, instructional strategies and assessments, such as in terms of the content to be taught, the intentions and performances of both the students and staffs involved, evaluation measures. In the design, learning objectives, teaching strategies and assessments should be closely aligned so that they reinforce one another. The assessment should focus on the level of student achievement indicating the learners' knowledge building and capacity development, especially the potential progress in the future (Daneshfar & Moharami, 2018).


Figure 2: Sketch showing the factors relating to learning results

4. Implementation in a Dynamic Mode

A well-designed course presentation should include content choosing, implementation and delivery plan in details. To be favorable to the student's knowledge building and capacity development, the implementation would be actionable, such as with specific content and presentation styles (Ma, 2023). The learning outcomes should be timely assessed with the assumed criteria. Based on the feedback and evaluation results, the course design and implementation plan will be tuned in a dynamic way (Ma, 2022, 2023). The evaluation results of the students' learning outcomes are reference level of the presentation adjustment.

Practice of the Course Presentation

To be favorable to the students' knowledge building and capacity development, the presentation of the course Tunnel Engineering at Chang'an University is designed and tuned accordingly, in terms of content choosing, interaction between students and staffs, as well as effect evaluation.

1. Course Features and Content Sampling

The Tunnel Engineering should include planning and design, construction, operation and management in a system mode (Ma, 2022). In the course information sampling and presentation design, the content should be specified to each step and stage in the learning and teaching procedure, respectively. For example, considering the students' knowledge building procedure and the course features in terms of the relationship between information, concept, structure and their components, activating points are designed to increase student engagement and systems thinking application (Ma, 2022), with evaluation measures and scales under consideration. Considering the development and usage of underground space are increasing, such as in terms of types and complexity, the information and knowledge system related to the subject Tunnel Engineering are accordingly accumulated with time. To make the course teaching in the pace of the engineering practice, there are new points in course presentation.

In the learning and teaching procedure, we start from concept, which is presented in terms of information. With more information and concepts are learned, students would develop professional knowledge to think in terms of engineering issues. In this process, personal capacity development is vital to the learning and teaching results. It is noted that we can only partially present the complex concept or meaning at a time or stage. How to make the related information being effectively presented and also to be favorable to students accepting, a proper presentation style and implementation plan would be well designed, as well as checking measures, such as testing with informative and summative modes, respectively.

Although we start presenting a course from simple concept with specified information, we need design the presentation in a system mode. The meaning of a concept should be presented with comprehensive considerations. For example, the concept tunnel structure is first presented in a narrow meaning, which means that tunnel structure is same as lining-style supporting system, applied around the tunnel excavation profiles. However, the supporting systems in tunnel engineering have developed into multiple-style modes. A primary supporting system applied in a modern mined tunnel could be partially installed into surrounding rocks, such as rockbolts or dowels, while other items, such as steel sets and shotcrete lining, are built inside of the excavation profile. On the other hand, the structures of a mined/bored tunnel should include both supporting system and surrounding rocks in terms of general meaning. The features of the tunnel structures would strongly depend on the nature of the interaction between the tunnel supporting system and the surrounding rocks. It is important understanding the dynamic feature of tunneling in terms of the tunnel surrounding rock properties and the interaction between the tunnel supporting system and the surrounding rocks. This is mainly because the properties of involved factors, such as the supporting system and surrounding rocks, vary during the tunneling process and after the supporting system being built. The key points of a presentation would be changing and a proper presenting mode should be well designed and prepared in the content sampling, with the subject features under consideration.

2. Modes of Presentation

Teaching is to help students realize the transform from information accepting, such as a receiver, into an information assimilating one in terms of knowledge building and capacity developing. As we present a course starting from information, concept, we need to help students transferring specified information, concepts into subject principles, rules, theories, as well as thinking ability. It is vital to make the information separated being assembled into a student's knowledge system. The results of this dynamic process would depend upon the followings: (a) features of personal capacity building in a professional field; (b) nature of the knowledge as a subject, such as the empirical or custom features, analogical method and working way in the professional field.

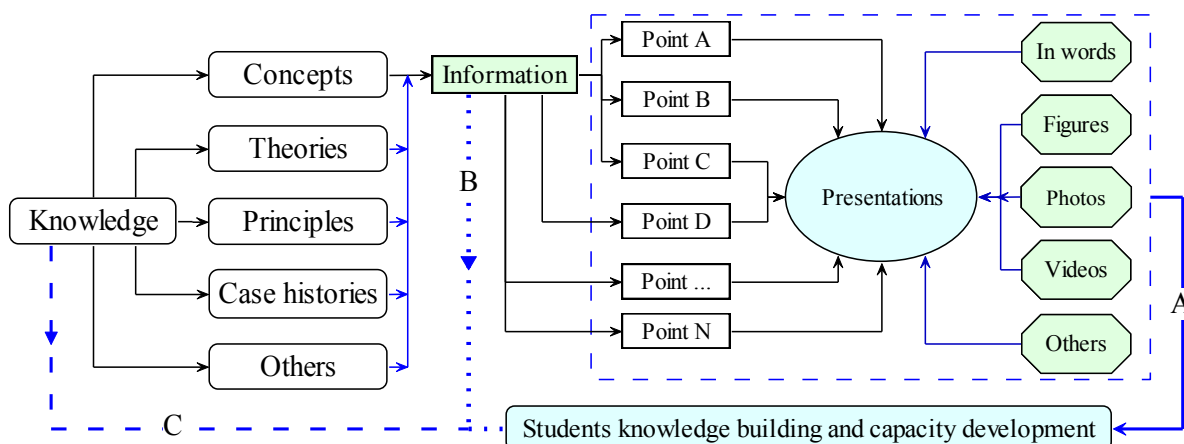
We divided the subject into learning and teaching points, as shown in Figure 3. Each point is presented with specified information and the presentation styles or modes would be specified in terms of words, figures, photos, videos, etc. With the presented information, we can demonstrate the meaning of a concept. Both information and concepts are components of personal knowledge. So, it is vital to make use of the accumulated information and concepts to build personal knowledge. The more effective of the transferring process of assembling the information and concepts into one's knowledge system, the more favorable of the course presentation to students' learning process. The checking of the knowledge building and capacity building results would use the indexes of the thinking skills, as shown in Figure 1. For example, assigning a task to analysis a case with the learnt theory and principles, and to make a decision on the specified problem. There are analogical methods to follow, such as through learning on case histories, rules from design codes, guidelines.


Figure 3: Sketch showing the course presentation tactics with student's knowledge building and capacity development under consideration

It should be noted that teaching is not just to present information, concept, theory, principle, and experience from case histories. It is important to help students to realize transferring the information into thinking skills, esp., critical thinking to use the knowledge to analysis, as following the route A in Figure 3.

3. Post Evaluation

In practice, the presentation types could include measures in class and out of class, being related to where and how to teach and learn. The results of the learning and teaching procedure should be timely checked through both informative and summative modes. There

are a variety of evaluation methods, including process evaluation, diagnostic evaluation and summative evaluation. A well-designed mode is in corresponding to the specified learning and teaching points. Effective reflection to the goal achievement or the students learning outcomes (Figure 2) is helpful to the next learning and teaching procedure, especially for the improvement of the presentation design and its implementation plan.

In general, the results should be positively evaluated in time, such as to meet the student's various intentions of capacity development. The applied approach should be supported by the viability of the specified goals, the enthusiasm of the participants, the applicability and timeliness of the course information and resources. As students' learning outcomes are evaluated, the presentation design and its practical effects are therefore checked in time, such as through discussion with students in a partnership way, quiz, test and assignment on the related learning contents. The experience shows that it is favorable to the student's capacity development that the students' performances are evaluated in an excitation (Ma, 2023).

Discussion

As the above-mentioned that the time for a course is limited. To do right things is vital to make the learning and teaching procedure effective. However, what is favorable measures at a specified time or stage, is a problem in course presentation design and plan execution.

1. Course Presentation Situation

We are in a digital age. Most of the information related to a course could be presented in a digital mode and is readily available to a learner. However, most of the students are not skillful enough in information sampling, especially in taking advantages of the database in digital literary at university. There needs additional information to guide students how to skillfully use the database, with special reference to a professional course learning.

Traditional mode is necessary but not total. Online learning or face to screen mode is of high flexibility and there are less restriction in students learning modality via the Web (Paul & Jefferson 2019). Online technologies would be favorable to students' creative thinking development provided there is a useful interactive e-learning strategies and techniques, tools and activities for developing teaching methods (Wen, 2023), but there is a huge gap between information available and personal knowledge building and capacity developing. A qualified college student would be of skillfully thinking, since modern intelligent would be able to solve problem, such as taking responsibility and making decision in practical situations.

Digital information should be skillfully managed. Online interaction is favorable to guiding, discussion, question and responding, but is would be not as effective as traditional face to face mode, esp., for new knowledge teaching and learning. In presentation design and plan execution, there are underling key points at a specified learning and teaching phase, with students capacity development checking and evaluation under consideration. The evaluation parameters would not only follow a textbook, but also be of college features, as well as with additional skills, such as information sampling in this digital situation.

In the recent years, it is often said that novice graduated from a college could not work with their knowledge in practice. Students know enough but not well qualified. We need consider the features of information and knowledge accumulated in the course learning procedure. If there is no effective connection between the information in brain and the practical problems,

there are not enough skills and capacity to present the practical problem with their own knowledge system in a logical mode. For example, of the factors related, which will determine the features of the procedure? What are the influence factors in the process? How will the results be developed? These information related to a practical problem could not effectively presented and analyzed in corresponding to personal knowledge system.

In a system mode, we need focus not only theories and principles, but also the skills or levels of thinking. Theory is not the full of a practical professional work. There need personal thinking to cope with a practical problem. For example, where we make use of theories and principles in practical problem, we need consider the specified pre-conditions, practical parameters of the project, which are often not fully available or limited. This means we need consider a practical problem in terms of a professional thinking or in the application of an analogical method. In this procedure, personal engineering judgement or empirical method would play a key role in a decision making. All of these require professional thinking or capacity development. It is favorable and also college characteristics to train students professional thinking in the course procedure, such as in face to face lecturing.

On the other hand, what are students believe in are more important than the others. If students have an active starting and believe in themselves, they would have a good chance of being well and effectively involved in the learning and teaching procedure, such as in terms of deep thinking and learning, with critical thinking in learning, reflection involvement. Positive emotion would contribute to learning outcomes (Goetz et al., 2014). In general, what is important to the course presentation is not equally considered by the learners and teachers, esp., at the beginning of the course procedure. There are choices for personal interests or capacity development, considering the difference in learner's competence. Ability, interest and personality are important factors in shaping success (McCabe et al., 2020).

Course presentation design and plan execution should be a dynamic procedure, with interactions among students, teachers, environments and facilities etc. Considering students' performances are more decisive to the level of the learning outcomes, course presentation should be well-designed and the implementation plan be well-known, especially making it known to students before course presentation time. And then students would actively engage in learning and teaching procedure. It is also vital to activate students' subjective initiative, such as through process based assessment. There are always adaptation and adjusting in the learning and teaching procedure, with the learners' situation under consideration.

2. Validity of the Presentation Modes

No presentation manner or style will be always effective for all course points. For example, to present the structure of a tunnel, we need consider it in terms of design, construction, operation and management. It is favorable to present the general features of a tunnel with a video. However, the structure of a planned tunnel will be more vivid with a 3D form. A tunnel building procedure in BIM or practical case recording video would be helpful to student's concept building, since their cognitive processes are inherently visual, and they often interact with knowledge primarily through images.

It is noted that an effective mode is not absolute in terms of knowledge presentation and students' learning procedure. For example, as a phenomena, we can present rockburst a dynamic breaking or failing process, in companion with noise and fragment shooting. In this term, video or a practical case recording is effective way to illustrate a rockburst procedure.

However, the reason and conditions of the rockburst could be complex. Additional information, as well as theory and principle are need to know the mechanism of a practical case. This means knowledge building and capacity development are required in a real and deep learning. And therefore, a concept is often be presented with terms in simple or brief mode at starting. Later, it will be presented with comprehensive terms. Under this situation, it is difficult to present the full meaning with simple words, single picture or photo, even a video of phenomena or procedure recording. There need logical process or thinking in understanding, which is indeed knowledge building and capacity developing. Similarly, same cases, such as tunnel portal structures, it is a description in terms of shapes. Sketch and pictures are more effective than totally in words. However, why different types portal structures are in practical application, we need consider other factors, such as building, operation conditions, regional custom.

In terms of knowledge building, presentation is only the starting point. Teacher could make a high starting level or the knowledge building smooth, but the presentation would not take the place of student's knowledge building by themselves. An effective or favorable situation would be that there are additional routes, such as the routes B and C, as shown in Figure 3, in student's knowledge building and capacity developing. This means student's competence is well qualified or in a higher level in terms of thinking skills and cognitive domains (Figure 1). The more competent of the student's thinking skills, the more effective of the capacity developing in a professional course learning (Figure 2) will be.

It is favorable to apply modern techniques in course presentation. However, we need recognize that new technology could not fully take the place of the traditional form or style of knowledge presentation and knowledge transmission in learning and teaching procedure. Practice in the course presentation indicates the following features.

(1) There is enough information available for course learning at university. However, more than half the students are not skillful in information sampling, especially at the course starting stage. The presentation design would consider this situation.

(2) Of the effectiveness of the various presentation modes, a description concept could be well presented in words plus picture, sketches or videos, such as structure shape or feature showing. A video, such as a case history recording is favorable to show a tunnel building procedure, process phenomena. Where there are various information and learner's thinking involved, such as principles and theories presentation, we need dividing the whole or comprehensive points into a few sub-points to present. In this procedure, it is difficult to present the total meaning with a step. This need students being involved, such as in terms of learners' knowledge building and logical thinking. Under this situation, traditional face to face mode, such as lecturing with the help of blackboard usage, PPT, video showing, as well teacher's body language, would be much effective in the course point presentation and favorable to student's logical thinking being involved.

Conclusion

Conclusions drawn from this study are: (1) students are skillful to obtain course information, but most of them are frequently confused in information sampling, concept and knowledge system developments; (2) course instructors should focus on the presentation of key concepts, the connections of the knowledge points, student's learning skill and capacity development;

(3) adequate evaluation and active motivation are necessary and favorable to student self-enhancement and knowledge building metacognitively.

Trauma-Informed Leadership: A Case Study of Educational Leadership and Crisis Management of Secondary Schools

Grace R. Campos, Bicol University Graduate School, Philippines
Hennie Pama – Lomibao, Bicol University Graduate School, Philippines

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This qualitative research utilized a case study research design that investigated the school head's leadership and crisis management. It enlisted the participation of five school heads using convenient sampling based on inclusion criteria. To collect data, a semi-structured written interview based on Lawson (2021) was used. To display the narratives, the data were transcribed, examined, compared, and carefully categorized into several themes by using nVivo software. The findings reveal that school principals employed:1. Varied leadership practices; 2. Modeling leadership behavior; 3. Decision-making and communication; and 4. External support. The findings of this study highlighted the need of applying situational leadership practices to strengthen school heads' instructional and administrative duties, particularly during times of global crises.

iafor

The International Academic Forum
www.iafor.org

Introduction

The rising vulnerability of nations to both natural and man-made hazards endanger people's lives as well as efforts at sustainable development. According to the United Nations Office for Disaster Risk Reduction, 302 hazards caused disasters in 2011 alone that affected 206 million people, claimed about 30,000 lives, and caused damages of an estimated US$366 billion. Children are the most impacted by disasters because schooling systems are disrupted, which affects one of their fundamental rights—the right to education. So far, the Philippines have experienced typhoons, drought, volcanic eruptions, earthquakes, and the pandemic, COVID-19. During the pandemic, there is evidence emerging across the globe of the critical role that leadership plays in steering communities through the challenges we are all facing.

Although crucial, the COVID-19 pandemic is not likely to be the last catastrophe we will see in our lifetime, and school leaders have been asked to guide their communities through uncertain times before. The difficulties faced by school administrators have included anything from aiding communities through economic, social, and emotional ruin to rebuilding after environmental catastrophes. Throughout these challenging times, school administrators have maintained their focus on achieving the best results for their students and school communities while providing clarity and direction, fostering resilience, and instilling optimism.

It might be intimidating to lead in an uncertain world because there are rarely simple answers or well-defined pathways to take. Leaders must quickly adjust to a scenario that is changing drastically in an uncertain environment. They must also use a variety of leadership styles and skills. To provide the best possible teaching and learning environment and outcomes for students, school administrators must manage the urgent while keeping an eye on the long term. When faced with difficulty, some behaviors set effective leaders apart from the rest of the pack. A proactive, inclusive, and open strategy that doesn't minimize information or postpone action is necessary (Kerrissey & Edmonson 2020).

In addition to assisting students and the community in getting back to normal life, education may play a significant role in developing the knowledge, abilities, and attitudes needed to prepare for and cope with catastrophes. The secondary schools that have integrated disaster risk reduction into their curriculum are mapped out in this paper. While capturing major difficulties when disaster risk reduction is less explicitly addressed or where specialized teacher training is lacking, it also covers national experiences. Trauma is embedded into the fabric of a crisis and must be carefully considered as part of a leadership response. The Philippines had a string of super typhoons, earthquakes, and other calamities before and even during the COVID-19 crisis, which had a severe impact on the Bicol region and damaged schools, forced school closures, and put officials in difficult situations as they managed the crisis response.

In accordance with the DepEd Order on School-Based Disaster Preparedness and Response Measures for Tropical Cyclones, Flooding, and Other Weather-Related Disturbances and Calamities, the current study aims to sketch the leadership practices and crisis management of school leaders in a trauma-informed school.

Research Questions

The purpose of this study is to explore the leadership and crisis management practices of secondary school heads. The present study sought to relate the implications of the findings to

the leadership and management practices in trauma-informed schools. achieve the purpose of this study, more specifically, intends to answer the following key questions:

1. How do school leaders describe the process of becoming trauma-informed school leaders?
2. What leadership practices and/or principles do trauma-informed school leaders employ?
3. How did the school leaders' leadership experience in managing the crisis induced by the natural calamities impact their response to other current crises?

Methodology

A.   Methods

The current study is qualitative in nature and adopted the case study research design. School leaders were purposefully selected as the study's primary data sources. A semi-structured interview was utilized to gather data. Study codes were generated, and emerging themes were analyzed using Nvivo software for qualitative data analysis.

B.   Literature Search

To find trustworthy papers and publications for the research, the researcher searched several databases, including Google Scholar, EBSCO Information Services, Science Direct, and websites. Trauma-informed leadership, leadership skills, leadership practices, crisis management, lived experiences, covid – 19, and disaster risk management were the keywords utilized. The databases were restricted to 10 years, from the years 2012 to 2022, however, there were no geographical restrictions. The researcher wanted to discover information regarding the study, thus manual research was done to reduce the number of sources available.

C.   Eligibility Criteria

The researcher searched trustworthy databases including Google Scholar, EBSCO Information Services, and Science Direct to find the publications of interest using the titles and abstracts as a guide. It was promised that from the year 2012 onward, resources would be published in English. The researcher restricts the inclusion of peer-reviewed papers and topic references to achieve that goal.

In terms of exclusions, the researcher specifically omitted studies conducted in languages other than English and unreliable websites like Wikipedia, social media, and unpublished studies and blogs. Additionally, non-peer-reviewed, out-of-date research that was published in 2012 or earlier is not included.

D.   Selections Strategy

The researcher was able to determine the inclusions for the chosen study, as well as its eligibility and discrepancies, and review them. Regarding the full-text evaluation of the eligible research articles, the author skimmed the title and abstract of the chosen articles.

E.   Data Extraction

Using a standardized form, the researcher retrieved the following study characteristics from the eligible articles which include: (i) study characteristics (title, first author's name, journal, year of publication, country of origin, and objective); (ii) methods (research design, sample size, and duration of the study); (iii) subject characteristics (inclusion and exclusion criteria); (iv) results: the key or major findings of the study.

Results and Discussion

A.   Study Selection

The researcher discovered a total of ten relevant research articles and journals on championing trauma-informed leadership, crisis management, and leadership practices from 2012 to the recent year through screening of titles and abstracts from thirty-nine (39) articles collected from the initial search on EBSCO Information Services.

B.   Data Interpretation

Four themes emerged from this study's findings of school leaders' leadership practices during a crisis. It's based on their organization's 1. Varied leadership practices; 2. Modeling leadership behavior; 3. Decision-making and communication; and 4. External support.

Research Question 1: How do school leaders describe the process of becoming trauma-informed school leaders?

The safety of schools is important and every school's disaster risk management team aims at reducing the vulnerability to, and impact of disasters on schools. It prepares both teachers and students for potential disasters, thereby reducing the impact of said disaster. The Philippines is constantly plagued by different natural calamities and has been known to become resilient regardless of the adversities faced by each family. As a major part of the community, schools are strongly affected by each disaster faced by the country, and school leaders serve as front liners in facing issues and challenges brought by the crisis.

School leaders have faced a variety of challenges, ranging from rebuilding after natural catastrophes to assisting communities in the aftermath of economic, social, and emotional turmoil. School leaders have provided clarity and direction, created resilience, and inspired hope while remaining focused on the greatest possible outcomes for their children and school communities during difficult times (Australian Institute for Teaching and School Leadership Limited, 2020). School head 1 highlighted the process of becoming a trauma-informed leader, she tells:

> *"I must move forward. I must be the character during the time of a calamity that people expect to be present during hard times. I must be the leader that people need answers from, and people see as vulnerable too."*

School Head 2 spoke of the importance of positivity and courage:

> *"You know, you must stay positive and courageous. People will look at you as a pillar of courage during tough times. A crisis is an opportunity that let a school leader exhibit courage and boost other people's morale just by setting an example of having a positive and courageous mindset."*

Similarly, School Head 3 described the importance of continuing to move forward through the crisis, and moving forward with empathy and caring for others during that time:

> *"I can always move forward no matter what. You move forward with empathy. You must put people's emotional health before anything else."*

When describing the process of being a trauma-informed leader, School Head 3 stated:

> *"I've been around enough and gone through enough and face different challenges brought by calamities, natural or man-made. But as a leader, you know the crisis will be resolved. You just must hang in there long enough to see it resolve."*

School Head 5 described positivity as the most important skill that a school head must possess to successfully lead through a crisis:

> *"You just got to stay positive and optimistic. I tried to be brutally realistic and positive at the same time. I'm going to call it as I see it, but I'm always looking at the upside of things, and I think that's critical."*

Leaders that are trauma-informed understand that everyone, including themselves, will struggle because of traumatic events, and they react with kindness and empathy. The leaders described the process of becoming trauma-informed leaders by respecting and honoring the values they possess and of the people surrounding them.

Research Question 2: What leadership practices and/or principles do trauma-informed school leaders employ?

School head 2 described a combination of relational and servant leadership that was remembered and continues to be acknowledged by her school,

> *"servant leadership- it was relational, it was participatory, it was empowering. So that's kind of my style and that was appreciated by people during volcanic eruptions or typhoons and even during the pandemic."*

Further, she described the frailty of positional power,

> *"You know how thin positional power is during the best of times and how it just disappears when the pressure is on, and so you know building relationships is the most important thing."*

School head 3 described the way in which she went to each barangay shelter and evacuation center impacted by typhoons or volcanic eruptions. She and her team connected with every child amidst the chaos of the calamities. She further described how she ensured that when school resumed, that student was able to stay with their teachers even though there were initial

recommendations to have students attend alternative schools throughout their district to resume their education.

All 5 school heads created a leadership, or crisis response team, to support the management of the crisis, this is following the DepEd Order 21, s. 2015 (updated DepEd Order 33s.2021) for the school-based disaster risk reduction management team. Teachers form part as members of the team and school heads established roles for different members of the crisis response team. Their practices include meeting monthly to discuss issues and concerns and determine the next steps in the crisis response. There were two specific themes related to the development of leadership that emerged from coding: distributive leadership and traumatization.

Democratic structures are important during a crisis (Smith & Riley, 2012). All five school heads in the study demonstrated distributive leadership to varying degrees, some more apparent than others.

Though School head 1 created a team to support the crisis management process, he described that he would get the support of his team, but he made all the decisions, which isn't something he recommended doing. He believed, *"it's unique to whatever situation you were in and what kind of school you have."* He further explained that *"it helps if you're in that type of situation to be that kind of leader because you get to plan and you don't have as many checkpoints to go."*

School head 2 acknowledged the ways in which members of her team stepped up, assuming more leadership responsibility and they were instrumental in the crisis management response. She stated:

> *"We were able to come in and commit to the team strategically. And so really my leadership style is very participative. I want to surround myself with people more intelligent than me. I want to empower them. I feel my job is to get out in front of them and clear the way and turn them loose. Having like-minded people press in was important. That was the core that really got us through."*

Similarly, school head 3 explained how members of her team meet each other and conduct consultation with the Local Government Unit and other partner agencies such as Bureau of Fire Protection and the Philippine Red Cross. Having clarity was very important for her team. She shared, *"You really couldn't take a day off or things might start to get confusing. You might ask, 'where is he?' And so, we had a lot of collaboration and talked a ton."* She also worked closely with her students, assembling her student council representatives to learn from them. She would, *"bring it back to the team and say, okay, here's what I'm hearing. Here's what they want. How do we make this happen?"* In describing her leadership style, school head 3 explained:

> *"So that was a lot of my leadership is don't put people into a win, lose situation, give people choices, choices that you can live with. So, I always gave students choices and staff choices that I could live with."*

School head 5 described that one of the most important things a leader can do is encourage problems to come forward and be open to the problems and be open to people:

"You want to be available. You want to know the good and bad things to come your way, but then we want to empower people by asking them what's your recommendation. I try to say that all the time- what's the recommendation? What would you do? What should we do? What do you think so that all the time that trains people who work with the leadership team."

She uses this leadership practice as a way of building capacity and empowering his team to develop problem-solving skills. In fact, she used the analogy of weightlifting to explain the importance of doing this as a leader:

"I can go into a weight room and lift all the weights while everyone watches. But it's not helping them get stronger right? Okay, so you want people to be, you know, lifting as much weight around you and building up their capacity as much as possible. And you can do that in subtle and kind of encouraging ways, but what's your recommendation then of course you can empower them by saying, "That's a great idea! Let's do it" Then they're like wow. Then they feel really empowered."

Moreover, the school leaders also mentioned that another practice they do in school is to have the teachers and selected students attend training sponsored by other agencies. The trainings sponsored by different agencies were especially for disaster preparedness and prevention.

Research Question 3: How did the school leaders' leadership experience in managing the crisis induced by the natural calamities impact their response to other current crises?

Once the school heads began to make sense of the situation, they began to engage in prioritizing the issues and responses needed. School head 4 described how her leadership experience in managing crises induced by natural calamities impacted her response to another current crisis:

"The COVID-19 pandemic was more challenging than another crisis we faced. We were put in a serious dilemma how to figure out how to further serve our students. However, like our practice when we face natural calamities, we nailed down all the variables that you have control over so that you know for sure you identify the variables that are out there that you don't know. You get input and you know to make your best guess. This is one of the beautiful parts I think when we experience a crisis, we start brainstorming priorities, disasters really focus you down on what matters. You know we talk in education all the time about the importance of goal setting. And this is like where the rubber hits the road. It's no longer academic or theoretical. There's no way we can address all those priorities, so let's put them in order and start at the top and see how many of them we can address."

School head 2 routinely used a whiteboard and mapped out the pros and cons for each situation. Her barometer for prioritizing was considering what was best for students. After making sense of a critical situation and prioritizing the needs, the skill of decision-making involves the implementation of necessary responses. The decision-making process involves economic, political, ethical, and safety considerations. These decisions often need to be made under stressful conditions with limited information and time to make them. School head 2 indicated that decisions were made by her. She recalled:

> *"The board said you don't have to come to us for any decisions, so literally, I carried the school on my shoulders. That's what I did. And to be honest with you, it helps if you're in that situation to be that kind of leader, because you can plan, and you don't have as many checkpoints to go to."*

School head 3 emphasized:

> *"You make your decision on what you feel is at times going to do the least amount of harm. And then it's at other times on what's best for everybody. Sometimes you just must make decisions and go with them. Moving forward with empathy and being part of the community. Even when you make the hard decisions, they can hear those hard decisions and have faith in you."*

School head 5 acknowledged the need to engage in repeated questioning to help facilitate the decision-making process:

> *"You're not going to find a perfect situation like you just must make the best decisions now. And you must keep saying to yourself what next? What do we need to do next?"*

Further, school head 5 described the challenges inherent in the decision-making process because *"You don't have all the information you want. You don't have all the time you want. Typically, in schools, we have plenty of time."*

Communication is a critical aspect of crisis management with a specific need for information to flow smoothly within an organization as well as between organizations involved in the coordinated response. As part of their crisis management response, each of the five school heads within this study spoke of the importance and challenges of communication.

School head 2 described the surreal scene when the volcano erupted when the sky turned black and ashes filled the air, barely allowing her to breathe. Since their school is near the vicinity of the volcano, communication became a challenge especially during this disaster because power lines are out, and mobile connection is out too.

Similarly, school head 4 described how rescues were coming narrowly escaping harm and arriving safely at the evacuation center. Parents were unable to contact their children and rushed to school or the evacuation centers.

School head 1 described the need to set up messaging protocols to communicate with staff and families. He emailed staff each day to inform them what was happening for the day. As part of this, he routinely sent pictures to teachers so that they could see first-hand what things looked like. This helped him make sure that "everybody was in the loop of communication about what was going on." Subsequently, he provided families with FAQs each day.

School head 2 described the challenges with communicating when information was changing:

> *"Communication was probably the toughest part because people want to know, and you want to give them information, but the information is changing constantly. It's very frustrating. It's hard enough to reach people. You try every form you have. And again, you don't know where people are so communication is tough."*

Both School heads 1, 2, and 3 described town hall meetings that they held for their communities and/or staff. School heads use their gymnasium to hold the conference and use it as a platform to communicate with the staff and the parents. Other stakeholders are invited too, this serves as an avenue to relay important details on crisis management and/or to orient people on their roles in crisis management.

Another theme that emerged through the analysis of the data was the theme of external systems of support. External networks of support are part of crisis management efforts and responses, providing opportunities for consultation, negotiation, and coordination. In fact, "Crisis operations are multi-organizational, trans-jurisdictional, polycentric response networks. They demand lateral coordination, not top-down command, and control" (Boin & t' Hart, 2003, p. 547). All five school heads described coordinated efforts with public and private organizations as part of their crisis response with varying experiences both positive and negative.

School head 5 emphasized that relationships were instrumental in helping them navigate the crisis. The LGU offered their support to her school, sharing resources and information, including email lists of important resources in the community. Training for staff was also provided for crisis response and management.

School head 1 acknowledged the challenges with coordinating multiple agencies:

> *"You have different state agencies and you're trying to put them all together with questions and answers because they don't talk to each other and how the food chain goes up and the food chain comes back down to you. It was an immense situation that took a while to get through the process."*

She also described how she communicated directly with the Department of Education when she became frustrated with agencies that she felt were not getting things done in a timely manner, so "she just jumped on that and things happened at the provincial level because like I mentioned going up the food chain, then coming back." School head 3 recalled objecting to local officials and asking them to refrain from communicating messages to her families and undermining her response plan:

> *"I talked to all the other school heads in the area, and they said what do you need? I said I need classrooms with my teachers. I don't need kids spread out. They need to be with their teachers and their friends. Other schools provided classrooms so we can continue our classes."*

Conclusions and Recommendations

Utilizing the potential and skills of stakeholders to turn crisis roadblocks into development opportunities is the organizational duty of the school head. They oversee raising production and efficiency of the organization, especially responses in crisis management. They owe it to their stakeholders and the rest of society to set an example of moral behavior and inspire others to do the same. They must encourage virtues and moral conduct despite the health and education challenges to maintain organizational integrity. Finally, it is the professional and operational accountability of school leaders to shape the learning environment for everyone's safety while allowing teachers to perform their duties. When a crisis strikes, they oversee planning support services to help with problem-solving as well as facilitating access to different resources, linkages, and technology.

Based on the findings of the study, it is recommended that future researchers identify factors that impact the coordination of external networks and their ability to collaborate and develop a cohesive crisis management response within a school system. It is also recommended to investigate the characteristics of effective crisis management teams within school settings. Since the researcher conveniently chose the school heads for the current study, it is advised to perform additional case studies and increase the diversity of the participants. Because the conclusions reached from a multiple case study may be more important than those from a single case study and because the findings may support theoretical representation, doing a multiple case study can also have analytical advantages (Yin, 2017).

APPENDIX A
TRAUMA-INFORMED LEADERSHIP QUESTIONNAIRE
Adopted from Lawson (2021)

Part I. Open – ended questions.

1.   Please tell me why being trauma-informed is important as a leader?

2.   Can you describe any personal and/or professional experiences you feel influenced your commitment or preparedness as a trauma-informed leader?

3.   What is your definition of trauma-informed school approach? Has it changed? And if so, how?

4.   Tell me about the knowledge, skills, dispositions you have found important to creating a trauma-informed environment.

5.   Have you deal with resistance with trauma-informed practices and if so, how have you chosen to deal with those?

6.   To what degree have trauma-informed approach supported the needs of your staff and students?

7.   Tell me about the process you and your staff went through to become a trauma-informed school?

8.   Can you describe any challenges you may have encountered in becoming a trauma-informed school?

9.   What evidence of change have you seen since becoming a trauma-informed school?

10.   Based on your experience, how might other school leaders be better prepared to lead and develop a trauma-informed school environment.

PART II. Please consider your knowledge, experiences, and practices related to your role as school principal in a trauma-informed school as you complete the following survey questions.

Questions	Minimal Knowledge	Below Average Knowledge	Average Knowledge	Above Average Knowledge	Extensive Knowledge
What is your level of knowledge related to trauma-informed practices?					
What level of professional development have you received to support teachers and stakeholders in trauma-informed best practices?					
Statements	Strongly Disagree	Disagree	Neither Agree or Disagree	Agree	Strongly agree
I am prepared to be an instructional leader for trauma-informed best practices in school.					
Faculty and staff participate in on-going professional development and collaboration related to a trauma-informed school.					
The COVID – 19 pandemic, natural calamities such as typhoons, volcanic eruptions, earthquakes and others influence my understanding of creating and sustaining					

a trauma-informed environment.					
The COVID – 19 pandemic, natural calamities such as typhoons, volcanic eruptions, earthquakes, and others has influenced my commitment to creating and sustaining a trauma-informed school environment.					

Part III. Open – ended questions

1.   What type of professional development do you receive to support teachers and stakeholders in trauma-informed best practices?

2.   How do you ensure staff members are held accountable for implementation of trauma-informed best practices within school?

3.   How has the natural calamities and the COVID – 19 pandemic affected your vision for a trauma-informed school environment?

Abstract
In the context of business and entrepreneurship, attitudes, digital skills, and the teaching of entrepreneurial values by preschool teachers are very important in engaging children. The purpose of this study is to analyse the needs in developing a model for Digital Entrepreneurship Education for B40 group kindergarten children based on teachers' perceptions. The respondents of this study consisted of 367 kindergarten teachers across Malaysia. This research method was conducted quantitatively using a questionnaire. The collected data were analysed using Statistical Package Social Science (SPSS) version 21 software, considering the mean. The findings of the study revealed that teachers' perceptions of building the Digital Entrepreneurship Education Model for B40 Group Kindergarten Children under the aspect of "Children understand the benefits of saving money" had the highest mean of 3.93. While teachers' perception of "Digital skills should be introduced to children (21st century learning)" recorded the second highest mean with a mean of 3.86, followed by the statement "Children understand the concept of the value of money" with a mean of 3.83.

Keywords: Digital Entrepreneurship, Children Education, Model Entrepreneur

Introduction

Entrepreneurship education must be taken seriously today and is an important component in creating a creative and innovative Malaysian society. Businesses and entrepreneurship are the backbone of the country's economy. In the technological age of the 21st century, the National Entrepreneurship Policy (DKN 2030) should adapt the elements of digital entrepreneurship education to the needs of B40 children through the comprehensive National Preschool Standard-Based Curriculum. Various plans and policies implemented before the Covid 19 pandemic, including the National Financial Literacy Strategy (2019-2023) and the Shared Prosperity Vision 2030 agenda, which aims to balance living standards and community development (Financial Education Network, 2019; Ministry of Economic Affairs, 2019), had to be refined for the educational requirements of the new norm. However, the adequacy of educational development based on children's survival needs (life survival) in the form of entrepreneurial education is less emphasized. To ensure sustainable economic and technological development, as embodied in the National Transformation 2050, individuals' knowledge of financial management must be digitally applied at an early stage, through knowledge related to financial literacy, basic entrepreneurial skills, and a high-trust attitude as a person.

What the future holds for children is difficult to predict if the Covid-19 pandemic continues to plague our country. Therefore, a specific action plan for the development of children's cognitive, affective, and psychomotor development must be observed by all stakeholders to balance the educational needs in this new norm. The National Strategy for Financial Literacy (2019-2023), which was implemented before the pandemic, has provided educators, parents, and stakeholders with some useful guidance on how to intensify financial literacy among Malaysians. This programmed is a comprehensive action plan to raise individuals' awareness of financial literacy (Financial Education Network, 2019). For children who are money literate, they will be provided with the knowledge, skills, attitudes, and habits needed to make smarter financial decisions.

Literature Review

In the National Preschool Standard-Based Curriculum, there is one of the 6 main pillars, namely the Science and Technology Pillar which aims to teach financial literacy (Ministry of Education Malaysia, 2017). This pillar also complements one of the science disciplines, namely Early Mathematics, and the Standard Content on the value of money is also emphasized in children's learning. One of the activities is to teach financial basics to children to familiarize and educate them on how to handle money and daily expenses. However, today's education must be geared towards promoting future careers. Education related to the fundamentals of early childhood entrepreneurship is particularly responsive to these needs, as it targets social engagement and focuses more on children's specific skills (Sarikaya & Coskun, 2015).

Appropriate teaching methods for financial literacy should be integrated into the education system so that children are more skilled and efficient in financial management matters in the future (Mohamad Fazli & Nurhayatul, 2018). Basic elements of entrepreneurship that can be emphasised should include, at the child level, financial literacy, saving and budgeting, willingness to face unexpected events, introduction to money, the need and desire for shared savings (Financial Capability and Inclusion Demand Side Survey, 2018). The study by Batty, Collins, and Odders-White (2015) shows that the financial education programmed for poor families, targeting the primary school level, has a positive effect of helping children improve

their knowledge. Respondents are exposed to instructions and educational programmed on finance that enable them to make prudent and better financial decisions.

According to Abdul Halim and April Ann (2016), the birth of a small entrepreneur should be a useful activity based on real experiences. In the government's efforts through the Education Development Plan (Ministry of Education Malaysia, 2018) and the Shared Prosperity Vision 2030 (Ministry of Economic Affairs, 2019), which emphasises the aspect of further preparing for a prosperous life in the future, the early generation of children are among the most important practitioners who will be prepared for the increasingly challenging world of work. Competence in managing finances is one of the most important components for children to ensure they become smart financial managers when they grow up (Inanna et al. 2020; Nurul 'Alyaa Adilla, 2015).

A study on the appropriate model for early childhood financial education in Malaysia found that the focus is less on preschool education than on secondary education. According to Cheng, et al. (2020), basic entrepreneurship education initiatives should be introduced to all individuals from an early age. The fundamental importance of entrepreneurship should begin and develop in children between the ages of four and seven (Cheng, et al. 2020). At this age, they should already know the basics of managing money and how to manage finances through business. If an individual understands the risks associated with managing finances at a young age, they should be able to make better financial decisions in the future (Inanna et al. 2020). Jufri and Wirawan (2018) noted that what kindergarten children learn about the fundamentals of entrepreneurship will have an impact on their knowledge, values, behaviors, and practices when they are adults. However, according to them, children lack knowledge and practice about basic entrepreneurial programmed that are individualized and have a playful element.

Therefore, a new medium in forming a basic model of entrepreneurship in digital form for kindergarten children is very important for the purpose of devising best practices and implementing appropriate improvements. The objective of this study is to analysing the Need for the Development of a Digital Entrepreneurship Education Model for B40 Group Kindergarten Children based on the teacher's perception.

Research Method and Data Analysis

This research method was carried out quantitatively. This study was conducted to analyse the Need for the Development of a Digital Entrepreneurship Education Model for B40 Group Kindergarten Children based on teachers' perceptions. This questionnaire was distributed to 367 kindergarten teachers.

A total of 367 questionnaires were distributed to kindergarten teachers. The data obtained were analysed using the Statistical Package for Social Sciences (SPSS) version 21. Assessment for frequency (f), percent (%), and mean for the analysis of each item.

1.   The Need for the Development of a Digital Entrepreneurship Education for B40 Kindergarten Children

The data analysis in Figure 1 shows the analysis of the need for the development of a digital entrepreneurship education model for B40 kindergarten children. The data analysis shows that for the statement "Children understand the benefits of saving", many teachers agree 227

(61.9%), strongly agree 69 (18.8%), not sure 49 (13.4%), followed by disagree 19 (5.2%) and strongly disagree 3 (0.8%) by recording the highest mean of 3.93.
Figure 1: The Need for the Development of a Digital Entrepreneurship Education Model for B40 Kindergarten Children (N=367)

"Digital skills should be introduced to children (21st century learning)" recorded the second highest mean with a mean of 3.86. It was found that 211 (57.5%) of teachers agree, 69 (18.8%) strongly agree, 59 (16.1%) not sure, 23 (6.3%) disagree, and 5 (1.4%) strongly disagree. For the statement "Children understand the concept of the value of money", 224 (61%) of teachers agree, 59 (16.1%) not sure, 55 (15.0%) strongly agree, 27 (7.4%) disagree, and only 2 (0.5%) strongly disagree with the mean 3.83.

For the statement "Children should communicate with digital games based on entrepreneurship (example: Bread Barber Shop), it was found that many teachers agree 218 (59.4%), 73 (19.9%) unsure, 48 (13.1%) strongly agree, 22 (6.0%) disagree, and 6 (1.6%) strongly disagree with a mean of 3.76 "Children can use digital application features" recorded a mean of 3.67. It was found that 219 (57.2%) agree, 82 (22.3%) not sure, 39 (10.6%) strongly agree, 31 (8.4%) disagree, and only 5 (1.4%) strongly disagree.

2. Content Requirements of the Digital Entrepreneurship Education Model for B40 Kindergarten Children

Figure 2 content requirements of the digital entrepreneurship education model for B40 kindergarten children. The foundation of honesty in digital entrepreneurship recorded the highest mean of 3.81, with teacher responses of 224 (61%) agree, 48 (13.1%) strongly agree, 77 (21%) not sure, followed by 13 (3.5%) disagree, and the rest 5 (1.4%) strongly disagree "Using various resources to produce digital entrepreneurial products" recorded the second highest mean of 3.78 as many as 218 (59.4%) of teachers agree, 48 (13.1%) strongly agree, 78 (21.3%) not sure, 18 (4.9%) disagree and the rest 5 (1.4%) strongly disagree.
Figure 2: Content Requirements of the Digital Entrepreneurship Education Model for B40 Kindergarten Children (N=367)

Respecting local cultural sensitivity in digital entrepreneurial products yielded a mean score of 3.78, with 211 (57.5%) agree, 81 (22.1%) not sure, 52 (14.2%) strongly agree and the remainder 18 (5.2%) disagree and 54(1.1%) strongly disagree. Next, generating income creatively and innovatively recorded a mean score of 3.77, with 225 (61.3%) agree, followed by 75 (20.4%) not sure, 44 (12.0%) strongly agree, 17 (4.6%) disagree and 6 (1.6%) strongly disagree. Creating new opportunities for digital entrepreneurship through collaborations and business partners also received a mean score of 3.77, with 220 (59.9%) agree, 81 (22.1%) not sure, 45 (12.3%) strongly agree, only 16 (4.4%) disagree and 5 (1.4%) strongly disagree.

The findings of the study as a whole show that the analysis of the need for the development of a digital entrepreneurship education model for B40 kindergarten children under the aspect of "Children understand the benefits of saving money" many teachers agree (61.9%), strongly agree (18.8%) with the highest mean of 3.93. This result is like that of Abdul Halim and April Ann (2016), who found that parents talk to their children about how to save money by saving part of their daily allowance and associate saving with things they want to buy this will encourage them to save.

This study is also like the study by Nurul 'Alyaa Adillah (2015) that teaching children prudent financial management from childhood can reduce financial problems, including bankruptcies, in the future. Competence in managing finances is one of the most important components for children to ensure they become wise financial managers when they grow up.

The response "Digital skills should be introduced to children (21st century learning)" recorded the second highest mean with a mean of 3.79, which is in line with Dayang Tiawa (2006) study showing that using multimedia with children can make them communicate or interact more effectively. Moreover, teaching methods that incorporate multimedia elements such as these will further increase children's interest in learning and, more importantly, ensure that these

children can more easily absorb and understand everything they are taught. In relation to digital games, research has found that a student learns a concept using digital games without being aware of it. Similarly, research by Smaldino et al. (2005) and this digital game stimulates players' thinking to apply the learned skills. According to the study of Abdul Halim (2007), 72.4% of children have a computer at home. 41.4% of children who have a computer at home were introduced to computers by their parents when they were four years old. So, this study is suitable for today's children who already know a little bit about how to use today's technology.

For the teacher feedback "Children can communicate with digital games based on entrepreneurship (example: Bread Barber Shop), it was found that the majority of teachers agree (59.4%) and recorded a mean of 3.76. This is consistent with the study on Digital Game Based Learning (PBPD), a dynamic learning process that combines game elements and student motivation (Chung & Chang, 2017; Putra & Iqbal, 2016). Previous studies have shown that PBPD can effectively increase student motivation and achievement (Alsawaier, 2019; Lizawati et al., 2017; Tangkui & Tan, 2020). The use of PBPD in learning is appropriate for all levels, whether primary school, secondary, or higher. How PBPD is integrated into learning is important (Muhamad et al., 2015). Students' active participation in games in addition to interacting with friends can help them build their own ideas and knowledge.

Conclusions

This study makes a significant contribution to the elements of entrepreneurship, especially the need to develop of a Digital Entrepreneurship Education Model for Kindergarten Children of the B40 group based on teachers' perceptions. This is because the study of entrepreneurship in kindergarten is still not carried out much. This study also provides evidence and explanation for the need to develop a model of digital entrepreneurship education for B40 children in kindergarten. It also helps to increase the importance of entrepreneurial knowledge for students' readiness to apply entrepreneurial elements.

Therefore, a new medium in forming a basic model of entrepreneurship in digital form for kindergarten children is very important for the purpose of devising best practices and implementing appropriate improvements. Disclosure of the B40 group's entrepreneurial fundamentals is closely related to financial information and can have a positive impact on long-term practices (Syahrin et al. 2020). This national-level strategy also supports research collaboration and guides policy-making initiatives in the future to increase public awareness of the importance of financial literacy (Financial Education Network, 2019). In addition, this programme can help parents, the community, and related parties by receiving benefits based on the idea of National Transformation 2050 in shaping the well-being of children through a balanced Malaysian economy.

Proposing a Trauma-Informed Curriculum Framework for Basic Science in Medical Education – A Comprehensive Exploration

Amitabha Basu, St. Matthew's University, Cayman Islands
Aurianna Acloque, St. Matthew's University, Cayman Islands

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This study addresses the impact of psychological trauma on medical students and investigates interventions to support academic success. Observations at a Caribbean medical school revealed students facing trauma-related difficulties, prompting an inquiry into the inadequacies of current educational strategies and the need for trauma-informed medical education. The study hypothesizes that a dedicated and inclusive curriculum can empower students with traumatic experiences to excel in medical education. The overarching question probes the ways past trauma affects education, while secondary questions delve into defining psychological trauma, its impact on academic achievement, and strategies for trauma-informed learning environments. The literature review identifies gaps in curricular frameworks and outcome measurement, highlighting disparities in disease representation, the impact of cultural biases in medical education materials, and the importance of fostering self-regulation skills in students. The research employs an interdisciplinary approach, combining a systematic literature review with qualitative analysis through interviews with traumatized students. Six key findings emerge, emphasizing the significance of creating safe environments, informing educators about trauma, avoiding cultural biases in examinations, and developing self-regulation skills. The proposed Trauma-Informed Curriculum Framework aims to address gaps in medical education by integrating evidence-based interventions. Ethical considerations prioritize participant confidentiality and informed consent. The envisioned framework seeks to contribute globally to trauma-informed medical education, fostering inclusivity and support for students with psychological trauma histories. This research lays the foundation for a transformative curricular framework in medical education.

Introduction

Since 2000, the researchers of this study taught pathology at a US medical school in the Caribbean. During this period, it has been observed that students often fail classes, depart from school, or exhibit "unprofessional" behavior due to personal or family concerns or trauma. As a professor and administrator, the researcher has learned that the difficulties are related to personal psychological trauma, such as childhood abuse, war memories, early pregnancies, diseases or racial prejudice, and the burden of caring for disabled family members or parents with chronic illnesses. At enrollment, these students often don't mention these past traumatic events or family issues. Unfortunately, the demanding curriculum of a medical school often reveals these students' hidden sensitivity and they become stressed. When dealing with these students, universities usually provide counseling, contact emergency medical services if appropriate, or suggest they withdraw from the program for further counseling before continuing. These approaches rarely solved their education challenges. As educators, we regularly encounter students facing academic challenges, but do we understand the reasons behind their struggles, particularly when linked to past adversities or post-traumatic stress syndrome, and are our interventions, infrastructure, and the recognition of these concerns by teachers and admins adequately addressing the diverse needs of these students, and how should we tailor our teaching approaches to effectively support them? These youngsters should not drop out of school despite what has occurred to them. These traumatic experiences have emotional, psychological, neurological, and bodily consequences (Gabor, 2021).

According to data, there is often at least one traumatized youngster in every classroom (K-12). Nearly 40% of American students have experienced some kind of traumatic stressor in their lives, with sexual assault, physical assault, and witnessing domestic violence being the three most common. This information is based on data from the National Child Traumatic Stress Network (Copeland et. al., 2007). Evidence implies that these past traumatic experiences have significant emotional, psychological, neurological, and physical ramifications (Gabor, 2021). While trauma-informed class policy exists and is being practiced in several K-12 schools, trauma-informed curriculum is essentially non-existent in higher education or professional institutions. According to the literature, trauma-informed medical education, or TIME (Brown et al., 2021; Chokshi et al., 2020; Ghazala, 2022; Thomas et al., 2019) is a relatively new educational strategy that focuses on teaching methods, school environments, and teacher training that promotes awareness of students and trainees who experience psychological trauma due to various determinants. The trauma-informed approach, or TIME, is driven by four tenets referred to as the "4 R's." Understanding trauma and how it can affect individuals and groups, recognizing the signs of trauma, having a system that can respond to trauma, and resisting re-traumatization are all components of trauma awareness. A modification of the trauma-informed medical education strategy offers a framework to address and mitigate these consequences and promote the safety and health of patients and medical students in clinical settings. Six principles guide trauma-informed care (TIC). TIC makes decisions that establish trust and provide mutual support to aid healing and rehabilitation. TIC seeks to eliminate power inequities and recognize everyone's participation in rehabilitation and care. TIC promotes recognizing and treating historical trauma, overt prejudice, and latent biases. Norah Sweetman (2022) examines the components of the term "trauma-informed classroom", another analogous approach that promotes a similar concept. This 'trauma-informed classroom' aims to help teachers understand their students' daily lives and recognize trauma-based emotions and behaviors. Classroom activities and teaching approaches can be changed to meet their requirements in conversation with students and via continual feedback. A team must support the teacher and acquire needed services. Therefore, educators advocate for establishing policies and practices that support

learners to prevent further re-traumatization of traumatic experiences (McClinton, 2020; Cohen et al., 2017). When viewed from a different perspective, psychological trauma is also a public health concern that could negatively impact society. The detrimental impacts of living in extreme poverty, neglect, abuse, and addiction on children and their families have been the subject of numerous studies, with prominent institutions reaching a consensus (Radford et al., 2013). Nadine Burke (Burke, 2014) examines the transition from categorizing problem issues as requiring a "social service" or "medical" response to recognizing the chronic levels of trauma experienced by highly neglected groups. Even though there are multiple nomenclatures for the trauma-informed educational approach, the fact remains that these approaches do not highlight specific essential components of this educational strategy. All these approaches do not elaborate on how to assess the academic needs of these students, what kind of pedagogy should be used, the requirements for the infrastructure, how to deliver specific training to teachers, and how the outcome of these interventions should be measured in non-clinical settings in medical education.

The primary hypothesis of the study postulates that individuals facing unfavorable psychological events may encounter disruptions in their pursuit of education, leading to potential discontinuation. It further suggests that these students, when provided with a dedicated and inclusive curriculum, have the potential for academic excellence. The overarching research question centers on understanding how past psychological trauma influences students' education and performance. Additionally, the inquiry seeks to identify effective strategies for addressing the impact of psychological trauma on education.

The secondary research questions are as follows:

Definition of "Psychological Trauma": This question aims to investigate and establish a clear definition of psychological trauma, providing a foundational understanding for the subsequent exploration of its effects on education.

Negative Effects of Psychological Trauma on Academic Achievement and Professionalism: This question delves into the exploration of how psychological trauma negatively affects students' academic achievement and professionalism, shedding light on the multifaceted impact of trauma on various aspects of a student's educational journey.

Development of Strategies for Trauma-Informed Learning Environments: The focus here is on identifying evidence-based strategies that can be implemented to create trauma-informed learning environments. This question addresses the proactive measures that can be taken to support students with psychological trauma in an educational setting.

Roles of Medical Educators and Academic Leaders: This question investigates the roles played by medical educators and academic leaders in the context of addressing the impact of psychological trauma on students. Understanding their roles is crucial for the effective implementation of strategies and the creation of supportive educational environments.

By addressing these research questions, the study aims to contribute valuable insights into the intricate relationship between psychological trauma and education, paving the way for the development of informed and targeted interventions within medical education settings.

Methodology

The researchers attempted to find answers to these research questions and finally to the aims of this study by conducting, a) An interdisciplinary systematic literature review and a follow-up and b) a qualitative investigation of the academic requirements perceived by students who reported having experienced such trauma in their lives. This second part of the research will be qualitative in nature and is scheduled for the next year.

Literature Search

A systematic literature review for the evidence of the definition of trauma was conducted. The review explored why a trauma-informed approach (Thomas et al., 2019) is necessary for medical education in the current geopolitical context. Key search terms were defined using the PICOS approach (Methley, et al., 2014) (Table 1).

Domain	Search term
P – Population (Descriptions of the group of the population of interest)	Medical students who reported experiences phycological trauma.
I – Intervention (What are the main interventions to consider?)	Available effective policies or guidelines on the trauma-informed education or care.
C – Comparison (Is there an alternative policy to compare)?	Comparison of existing protocols and policies across different educational systems, public health and general care system in various countries.
O – Outcomes measures	If these existing protocols and policies are effective in improving outcome of the students' academic performance or attitude toward self-care.
S - Study design	Any study design, excluding case studies and personal communications.

Table 1: Key search terms were defined using the PICOS approach.

Appropriate articles were collected after searching various databases that included Business Sources Complete (EBSCO), Medline/CINAHL-health topics, PsycInfo, ProQuest Cochrane Library, PubMed, Google Scholar, and Discover Aid. were searched with the keywords. Search results were imported into Mendeley Desktop software and duplicates will be removed. Titles and abstracts were assessed against the inclusion and exclusion criteria. Full texts of all eligible studies will be reviewed against the criteria, with reasons for exclusion reported. We searched for evidence specifically about trauma-informed school instructors, the definition of psychological trauma, established classroom policies, and materials relating to their skills, roles, or training. A flow chart of the search strategy is shown in Appendix A.b).

Conclusions

Key Findings

The study's Key findings underscore the significant impact of various diversities, encompassing historical, racial, and disease-related factors, on students' pursuit of academic and professional goals. Recognizing the multifaceted nature of these challenges, the following key recommendations emerge to address and overcome barriers within educational settings.

These recommendations not only aim to create an inclusive learning environment but also advocate for a holistic approach that considers students' psychological well-being, cultural awareness, and collaborative capacities. The six key findings and corresponding strategies are outlined below:

1.   Creating a Safe School and Classroom Environment

Results of the literature review showed that a safe classroom environment is paramount for fostering optimal learning experiences. It serves as the bedrock for students' emotional well-being, creating a space where they feel secure, supported, and free to express themselves. In a safe setting, educators are attuned to signs of distress, allowing them to proactively connect with students facing challenges (Todd, 2021). By redirecting behavior through private discussions and offering reasonable choices, educators empower students to regain control in a supportive manner. Post-crisis, calm discussions about the incident help strengthen relationships, fostering understanding and trust. This comprehensive approach not only enhances academic performance but also cultivates a positive culture of learning, promoting holistic development beyond mere achievement.

In a classroom, fostering a positive and inclusive environment is crucial, and teachers should be mindful of their language to create a supportive atmosphere (Peterson, 2023). Here are some inappropriate words and phrases to be avoided:

i.   Yelling or Overly Stern Voice: Using a loud or stern voice can trigger trauma responses and create a negative emotional impact on students.
ii.   Triggering Language: Avoid using words that may trigger negative emotions or distress in students, as this can hinder their ability to engage and learn.
iii.   Judgmental Phrases: Refrain from using judgmental phrases such as "Really?" "Are you sure?," or "Are you serious? " as they may make students feel invalidated or defensive.
iv.   Negative Labels: Steer clear of using labels like manipulative, lazy, resistant, or unmotivated, as these can contribute to a negative perception and hinder positive behavior.
v.   Time-Frame Accusations: Avoid making statements like "You've been acting like this for a while now," as it may not address the root cause and can be counterproductive.
vi.   Disrespectful Labels: Refrain from labeling students as disrespectful or attention-seeking, as this can perpetuate negative stereotypes and hinder a supportive teacher-student relationship.

Promoting positive communication involves choosing words that uplift and encourage, fostering an environment where students feel respected, valued, and understood. Using constructive language helps create a conducive learning space where students are motivated and eager to engage in the educational process.

2.   Inform Teachers About Psychological Trauma and How It Can Affect Students

Several educators inquire about identifying signs of trauma in students and understanding its manifestations in the classroom. It is crucial to acknowledge that trauma varies significantly from person to person, encompassing diverse experiences, emotional consequences, manifestations, and requirements for recovery (Garay *et al.*, 2022). Due to the inherent need for survival, when a student encounters a traumatic incident that poses a perceived threat to their existence, their brain, and body promptly and forcefully respond to prevent injury by

focusing their energies on self-preservation. This induces a condition of anxiety and stress in the student. Their brain exhibits hyper-focus on the danger, rendering it incapable of diverting attention to any other matter until the threat has subsided. Training programs should focus on identifying signs of trauma. The results showed that recognizing signs of trauma in the classroom includes observing extreme shyness, disproportionate reactions to setbacks, difficulty managing strong emotions, clinginess, challenges in transitioning between activities, forgetfulness, frequent complaints of feeling sick, difficulty focusing, lack of safety awareness, missed deadlines, poor academic performance, apathy, perfectionist tendencies, and physical or verbal aggression among students.

3. *Avoid Cultural Stereotypes and Biases in the Examination Questions*

Text of multiple-choice questions: The results showed that in most MCQs, there is no relevance to why race/ethnicity is used- particularly White/Caucasian. The result of my research shows that in most commercially available question banks (MCQ), descriptive mentions provide additional context but are not key to answering the question, while central mentions contain information crucial for answering the question. For example, in the cases (question texts) where the White/Caucasian patients are mentioned, 92.6% of these mentions are descriptive, offering supplementary information, while 7.4% are central, and directly relevant to the case's question. This distinction is consistent across racial/ethnic categories, emphasizing the importance of recognizing when race/ethnicity information is supplementary versus essential in medical cases. The combined dataset reflects the nuanced utilization of race/ethnicity information, where the majority of mentions are descriptive, contributing context but not integral to answering the posed questions. It is therefore important to address the imbalance in mentioning White/Caucasian populations, which make up about 90% of questions, which may contribute to normative biases and overlook the diverse demographic landscape of the United States.

The research reveals noteworthy trends in disease mentions across diverse racial/ethnic groups, highlighting disparities in disease representation. For White/Caucasian individuals, coronary artery disease (CAD), cystic fibrosis, and hypertension are the most common diseases mentioned in the question stem in MCQ banks. In contrast, African American individuals exhibit a higher prevalence of sickle cell disease, sarcoidosis, and G6PD deficiency, with hypertension as a notable mention. Asian individuals commonly face hypertension and inflammatory bowel disease, with gallstones as a notable mention. Hispanic individuals frequently encounter inflammatory bowel disease, and osteoporosis is a notable mention. Native American individuals are notable for osteoporosis and vasculitis. These statistics underscore the disparities in disease representation, with some diseases appearing more frequently in certain racial/ethnic groups. The challenge lies in avoiding the perpetuation of stereotypes and recognizing the multifactorial nature of disease prevalence. Incorporating this nuanced understanding into medical education is crucial for cultivating culturally competent healthcare professionals.

4. *Avoiding Cultural Stereotypes and Biases in the Medical Textbooks*

Medical textbooks: It has been shown that dermatology texts significantly overrepresent light skin tones and underrepresent dark skin tones (brown and black)- Appendix B. Even though advances in technology have lessened the difficulties associated with shooting people with dark skin tones, discrepancies still exist. According to a 2020 study, up to 18% of the photographs in dermatology textbooks feature people with dark skin tones, mirroring the percentages observed in 2006 (Bandyopadhyay, et. al., 2022; Kaundinya, 2021). Whites' focus and

definition of white as normal when describing skin conditions is the fundamental cause of the underrepresentation of people with brown and black skin. Dark skin tones are more commonly employed to depict STDs than common diagnoses like acne, making the stratification of skin tone portrayal based on disease more worrisome. We immediately associate a diagnosis with a one-dimensional presentation when the majority of diseases that students see are presented in one skin tone. This limits our capacity to identify the ailment in other skin tones or to include it in our differential diagnosis. Until this narrow-minded diagnostic vision is substantially remedied with culturally competent in-person education—a difficult process that is currently not accomplished by all resident training programs—it will follow us into the wards, throughout residency, and into clinical practice. Updating textbooks and materials to incorporate newer evidence and moving beyond cultural stereotypes and biases is crucial for fostering an inclusive learning experience. Diverse perspectives, contributions, and histories should be accurately represented in educational materials to help students develop a more nuanced understanding of different cultures, promoting empathy and reducing stereotypes.

Therefore, updating textbooks and materials to incorporate newer evidence and moving beyond cultural stereotypes and biases is crucial for fostering an inclusive learning experience. Diverse perspectives, contributions, and histories should be accurately represented in educational materials to help students develop a more nuanced understanding of different cultures, promoting empathy and reducing stereotypes.

5.   *Developing Self-Regulation Skills in Students*

The literature search revealed 6 key self-regulatory mechanisms:

   i.   Cue Identification: Recognize individualized cues signaling powerful emotions or reactions.
  ii.   Teaching students how an adolescent Brain Develops: Introducing young individuals to their physiological stress responses, commonly known as "fight, flight, freeze, or fawn," can prove highly beneficial. This knowledge empowers individuals to consciously intercept and evaluate their reactions by recognizing and understanding these innate responses. Once learners can identify their initial instinctual response, they gain the ability to compare it with a more deliberate and thoughtful reaction.
 iii.   Conscious Interception and Regulation: Encourage learners to compare innate responses with deliberate reactions. Facilitate rational thinking during intense emotional states. Contribute to the gradual development of improved emotional regulation (Grotan, et.al., 2019).
  iv.   Individualized Coping Strategies: Adopt diverse coping strategies tailored to unique responses to stressors. Consider preferences for activities like physical exercise, journaling, or meditation.
   v.   Timing of Coping Strategy Planning: Plan coping strategies during calm periods or specialized advisory sessions. Recognize challenges in self-reflection during heightened emotional states.
  vi.   Personalized Approach: Acknowledge diversity in coping mechanisms. Foster a supportive environment for developing and applying effective self-regulation strategies.

Integrating strategies to develop self-regulation skills in students is essential for their academic success. This includes teaching methods for managing stress, building resilience, and promoting emotional intelligence. Providing resources and activities that help students

recognize and regulate their emotions can contribute to a positive learning environment and better academic outcomes.

6. *Promoting Collaboration and Student-Teacher Partnerships*

Creating opportunities for collaboration and establishing student-peer-teacher partnerships can enhance the overall learning experience. This involves encouraging teamwork, group projects, and interactive learning activities. Such collaborative approaches foster a sense of community within the classroom, promote diverse perspectives, and provide additional support networks for students facing academic and personal challenges (Somers & Wheeler,2022: Sweetman 2022).

Implications

The implications of the study extend to educators, educational institutions, and policymakers in the field of medical education.

Curriculum Development
The proposed Trauma-Informed Curriculum Framework provides a foundation for restructuring medical education to accommodate students with traumatic experiences. Incorporating evidence-based interventions, creating safe environments, and avoiding biases in educational materials is crucial to fostering an inclusive and supportive learning environment.

Educator Training
Educator awareness and training programs should be implemented to equip teachers with the skills needed to identify signs of trauma, understand diverse responses, and create trauma-informed learning environments. Professional development initiatives can contribute to a more empathetic and supportive educational culture.

Diversity and Inclusion
Efforts should be made to address cultural biases in medical education materials, ensuring accurate representation of diverse perspectives. Incorporating diverse case studies and avoiding stereotypes in examination questions contribute to fostering cultural competence among medical students.

Student Support Services
Institutions should consider integrating self-regulation skills development programs into their support services. Providing resources and activities that help students recognize and regulate their emotions can contribute to a positive learning environment and better academic outcomes.

Limitations

Despite the valuable insights provided by the study, several limitations should be acknowledged:

Generalizability
The study's findings may have limitations in generalizability due to the focus on a specific Caribbean medical school. Variations in institutional culture, student demographics, and educational systems may affect the applicability of the proposed framework to other settings.

Evolution of Trauma-Informed Education

The field of trauma-informed medical education is evolving, and the proposed framework may require adjustments as new research emerges. Ongoing updates and adaptations to accommodate advancements in the field are essential.

Resource Constraints

Implementing the proposed framework may need help in resource availability, including financial and personnel resources. Institutions may need to assess feasibility and allocate resources effectively to ensure successful integration.

In the not-too-distant future, it will not be unusual for prospective medical students to look into enrolling in medical schools that provide adequate academic support to students who have a history of traumatic psychological experiences. While trauma-informed care is being practiced in many K-12 organizations, trauma-informed pedagogy needs attention during the formative periods of medical education to avoid dropouts, failures, and unprofessionalism. Hopefully, this research on trauma-informed medical education will lead to the development of a feasible curricular framework for medical schools to follow. An early trauma-informed medical education would lead to greater equality by explicitly stating what changes are necessary for the pedagogy and infrastructure to support these students academically.

Effectiveness of Video-Based Flipped Classroom on Students' English Achievements: A Meta-Analysis

Shofie Nurul Azizah, Yogyakarta State University, Indonesia
Jamilah, Yogyakarta State University, Indonesia
Umi Farisiyah, Yogyakarta State University, Indonesia

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Today, flipped classrooms (FC) effectively blend traditional education with social networks, encompassing both in-class and out-of-class environments. The popularity of FC increased its research numbers in many particular contexts and medium. The study specifically focusses on video usage as FC' medium of learning. Therefore, the present study aims to evaluate the impact of using the video-based flipped classroom on EFL students' outcome of their English Language learning. Through a meta-analysis, the selected 41 research papers from 2019 to 2023, involving 988 students were analyzed. Employing a quantitative approach, the analysis examines various moderators, including subject, object, duration, context, tools, and interaction. Findings reveal that a medium-sized sample (21-40 students), two teaching models, and multiple tools enhance the impact of video-based flipped classrooms on English learning outcomes. The video-based flipped classrooms significantly improve English learning achievement (effect size = 0.552) in both productive and receptive skills. The duration of the video has no significant effect. Furthermore, FC with video proves suitable for secondary, high school, and university-level students. The study suggests further exploration of theoretical and practical implications for supporting students' English achievement in video-based flipped classrooms.

Keywords: Flipped Classroom, Flipped Learning, Video-Based Learning, ELT

Introduction

Flip Classroom (FC) pedagogy leads the growing educational shift through technology due to its contribution to suiting 21st-century education needs. FC concept, which characterizes learner autonomy, allows students to study new material through watching online videos, reading passages, and fulfilling online quizzes using technological aids (computer, mobile phone, tab, etc.) outside the classroom (Han, 2022; Lee & Wallace, 2018). In this concept, the classroom form encourages the teacher to design hands-on activities to activate the student's knowledge gained from online teaching. The records from previous studies mentioned that the new paradigm Flipped Classroom (FC) Model is slightly different from conventional education.

The process of FC directs the two-design learning process. Teachers transfer material, theory, and knowledge from home online through various media. Following the process, the students receive the material online. In the classroom section, they were invited to confirm their knowledge with peers and teachers and forced to do some exercises to get an optimal understanding of the material. FC has recognized its valuable benefits, such as letting students study materials whenever and wherever they want (Bishop & Verleger, 2013), helping students learn more about the course material (Gaughan, 2014), improving students' critical thinking and problem-solving skills (Fautch, 2015), making sure students are ready for class (McCallum et al., 2015), and using class time for active learning and getting students more involved in the class.

In the context of FC, studies claimed that the use of flipped classes in the educational process implementation has a beneficial effect on the learning process, such as enhancing a lively learning environment and raising student achievement levels in the classroom (Hew et al., et al. 2021; Hew et al., et al. 2021; Shahnama, 2021). However, numerous studies have documented the FC shortcomings. Discovered that the students' lack of preparation affected their efficacy. They are quickly irritated when watching videos or other content (Nguyen et al., 2019). Additionally, the student's motivation is more important in creating an exciting environment for FC (Wang, 2017). Monitoring students' understanding and comprehension while they engage in learning activities outside the classroom and providing feedback that meets their needs is another factor contributing to FC's reduced efficacy (Milman, 2012). Nonetheless, numerous types of research have documented the FC's shortcomings.

One of the suggested learning materials to make online learning more effective, especially in the flipped classroom, is integrating video lectures or video-based material before in-class activities (Naffi et al., 2020). According to Hwang et al. (2015), the video can help students engage in self-learning. For example, these videos can be created independently or accessed through social media by the teacher. Further, video-based learning serves as a medium that activates both students' auditory and visual senses (Amer, 2022). The essential aspect of implementing flipped classrooms lies in developing video-based learning materials intended for students' engagement outside the traditional classroom or in a class setting. Thus, video-based learning entails capturing live visuals to effectively deliver educational content, enabling students to attain their learning objectives, especially in fostering students' achievement.

In the k12 education context, FC has encouraged many researchers to examine its practice effectiveness. Prior meta-analysis studies are addressed (Hew et al., et al. 2021; Hew et al., 2021; Njie-Carr et al., 2017; Santhanasamy & Yunus, 2022), but there are two key findings

from those studies. First, few studies have compared the effectiveness of FC, specifically that video was used in the outside classroom to traditional classes in learning new languages, particularly English. It becomes significant because giving students plenty of exposure and practice time while they are learning English is crucial. This approach can help students receive more in class.

Moreover, video use has been proven to give students more exposure and motivation to learn. Second, some moderator variables in the application of FC should have been addressed in previous studies. It results in a need for more thoroughness. More variables will be used in the current meta-analysis, including all studies conducted from 2019 to 2023.

According to Sung, Yang, & Lee (2017), student achievement usually utilizes standardized tests to assess how well students have learned or applied their knowledge, typically used to gauge learning achievement. In English language teaching, the student's language achievements focus on language proficiency and mastery of receptive and productive language skills. The standardized examination can be in several forms: performance evaluations, oral interviews, writing assignments, and classroom observations can assess language achievement, including students' listening, speaking, reading, writing, grammar, vocabulary, and pronunciation skills.

This meta-analysis study aims to synthesize the impacts of video-based flipped classes in an ELT context. The study seeks to address the following research questions: (a) In the context of English Language Teaching, what is the overall impact of the video-based flipped classroom approach? (b) What outcome variables most impact the size of the measurable flipped classroom effect? Moreover, (c) Are there any effects of the flipped classroom technique influenced by the characteristics or factors of the research? The current research is significant in discovering the capability and areas of video-based flipped learning in ELT, which draws theoretical significance for lecturers, higher education stakeholders, and other educators.

Literature Review

The Trend of Video-Based Flipped Classroom (FC)

To gain the meaning of literature of video-based FC, the term of Flipped Classroom (FC) approach should be discussed first. FC is a model of learning inverts the traditional classroom by including pre-class time, then followed by in-class section that promote students' active, innovative, practical learning activities. Abeysekera & Dawson (2015) pointed out that FC is a "set of instructional methods that (1) shift most information-transmission teaching outside of class; (2) use class time for learning activities that are active and social; and (3) demand students to finish pre- and/or post-class activities for maximum benefit from in-class work".

In the outside class activities, many teachers preferred to utilize video or other media (Han 2022; Lee and Wallace 2018; Öztürk and Çakıroğlu 2021). Their decision is in line with several favor of FC model, such as improving student academic performance and other beneficial elements of education. Despite its advantages, several weaknesses on using FC in pedagogical context are found, such as lack of access to recourses, technological issue, self-regulation and motivation, students' workload.

Videos used in outside-class FC are proven effective tools for learners, providing a comprehensive understanding and the ability to apply acquired knowledge in various contexts. To promote interactive learning, teachers can supplement traditional resources with video materials, enabling students to engage at their own pace and enhance face-to-face interactions (Onojah et al., 2019). Therefore, incorporating self-learning video lectures in the FC setting, have shown positive learning outcomes, in which allowing students autonomy and a solid foundation for in-class activities (DeLozier & Rhodes, 2017). Moreover, videos also contribute to student engagement, especially when combined with in-person teaching (Brame, 2016; Noetel et al., 2021). Active learning through videos encourages critical thinking and problem-solving (Niemi, 2002), optimizing class time for interactive discussions (Sams & Bergmann, 2013).

English Language Achievement

The term "English Language Achievement" describes a person's level of achievement or skill in using the English language. It includes a variety of abilities such English speaking, writing, listening, and reading. English language proficiency is usually assessed by tests, evaluations, or assessments that gauge a person's language proficiency and mastery of English grammar, vocabulary, comprehension, and communication skills. It is frequently used to assess someone's proficiency in English as a second language or as a foreign language and may be crucial in a variety of contexts, including social, professional, and educational ones (Kintan, 2022). In this study, the language skills are delivered in the form of flipped learning where students can could enhance the skill both inside or out class activities with various mode that utilized by their English teachers, especially video.

Meta-Analysis

Meta-analysis refers to a statistical technique used to combine and analyze the results of multiple independent studies on a particular research query or topic. In ber book, Retnawati et al. (2018) cited that meta-analysis involves meticulously reviewing and synthesizing data from multiple studies in order to draw broader conclusions and more precise and reliable estimates of the investigated effects or relationships. The primary purpose of meta-analysis is to provide a comprehensive and objective summary of previously conducted research. It allows researchers to increase the sample size, which enables the identification of consistent patterns and trends across studies. It also aids in revealing the extent, direction, and consistency of effects. The last, meta-analysis can resolve controversies and inconsistencies: when individual studies produce contradictory or inconsistent results. Thus, since numerous studies existed in the context flipped classroom, the researcher intended to find the precise and reliable finding the effectiveness video-based on English Language Achievement.

Methods

This study utilizes a quantitative research approach with a meta-analysis design to achieve its objectives. The main goal is to determine the significance of the average impact of the Video-based flipped classroom (FC) on English learning achievements. Meta-analysis allows for an overall examination of the effect size of FC on English learning achievements by analyzing the results of previous studies using statistical methods.

The research data for this study was obtained from Publish or Perish, a software that provides relevant references. This application aids researchers in retrieving and analyzing relevant

studies in a comprehensive and concise manner, offering a systematic approach to literature review. In Publish or Perish, the researcher selected Google Scholar, and Scopus as filtering sources due to their accessibility. These two platforms were chosen because the researcher could open and access them.

Inclusion and Exclusion Criteria

In this meta-analysis, a thorough set of inclusion and exclusion criteria was created. According to Table 1, each publication in this study focused on using flipped classroom approaches to teach English in any skills. All of the articles were authored in English and published between 2019 and 2023. The studies also compared the flipped classroom with traditional teaching strategies using quasi-experimental and experimental study designs. Both between- and within-subject comparisons were used to quantify the student learning outcomes. Articles that provided thorough data (mean, standard deviations (SD), sample size, and associated inferential statistical test values like t-value) to compute effect sizes were also taken into account. Studies were considered as valid if the learning or behavioral outcomes for the experimental or observational groups were quantified and precisely described.

Table 1: Studies Criteria

Criteria	
Learning content	Flipped Classroom (FC) for English Language Teaching
Language	English
Timeframe	Published between 2019-2023
Literature type	Peer-reviewed articles & conferences and proceedings
Research design	Experimental, quasi-experimental
Implementation	Flipped classroom
Accessibility	Both open access articles and library repositories offer full texts.
Research outcomes/results	Clearly stated educational results

Identification and Selection of Articles

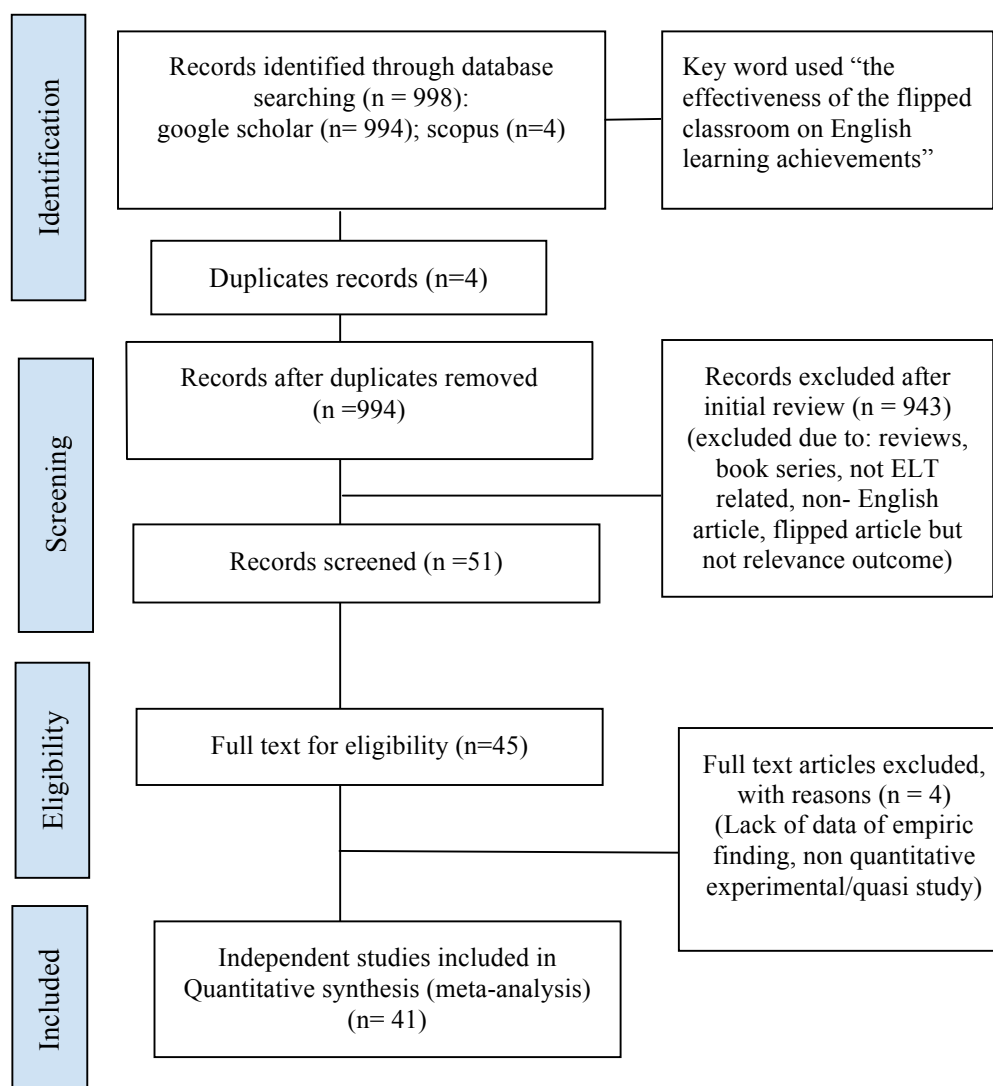
There are three phases in the stage of identification and selections of the articles. Firstly, to make sure they were pertinent to flipped classroom in English Language Teaching (ELT) context, the titles and abstracts were screened by the researcher. Secondly, review articles, thesis/dissertation, and the articles that reported other discipline beside ELT were excluded. Therefore, all selected studies move in to Microsoft Excel spreadsheet. Thirdly, duplicates studies were also excluded (See Figure 1).


Figure 1: Prisma Data Selection

The keyword used in the search was "the effectiveness of the flipped classroom on English learning achievements". In the initial search, a total of 994 articles were downloaded from Google Scholar, and 4 articles were obtained from Scopus, within a limit of 1000 articles. After excluding irrelevant articles, duplicates, papers lacking conceptual similarity, and studies that did not report English language achievement, subject, objectives, rules and context, interactions, and tools, as well as those without sufficient statistical information, a final selection of 41 studies were made for this meta-analysis research. These articles specifically addressed English learning achievements in the flipped classroom setting and implemented experimental methodologies.

Statistical Analysis: Meta-Analysis

A meta-analysis study must follow certain procedures in order to produce the evidence needed to respond to the study's research questions. The impact of flipped classrooms (FC) in enhancing students' English learning achievement is examined in this meta-analysis. In order to establish the explanation for the significance, the support of variable moderators in each study included in this analysis is important.

The procedures of conducting a meta-analysis are clearly discussed by When conducting a meta-analysis that employs study parameters in the form of means, researchers must consider whether each study measures variables on the same scale. The standard error of the effect size for the same size across studies and different formulas. The application utilized in this stage is software. This study's meta-analysis utilizes artifacts or studies on variables with the same scale. The effect size—the average score of certain variables that are the focus of each study—is taken as the mean in this meta-analysis. In this study, the effect size calculation that will be used is Hedges'g because it has an inbuilt correction for bias when the sample size is small.

Results and Discussion

In this section, the findings of the study including effect size & standard error, overall effect size, forest plot, heterogeneity test, and variable moderators are presented.

Effect Size and Standard Error

The first result analysis in the openMEE analysis is the result display standard error (SE) and effect size (ES) calculation. The two calculations are presented below:

Table 2: Study Identity, Effect Size and Standard Error

	Study Identity	ES	SE		Study Identity	ES	SE
1	(Al-Jarrah et al. 2021)	1.405	0.100	22	(Vaezi 2019)	0.014	0.051

20	(D Umutlu and Akpinar 2020)	0.415	0.114	41	(Öztürk and Çakıroğlu 2021)	0.976	0.091
21	(Vaezi 2019)	0.019	0.051				

Mean Effect Size

In this present study, a random test of effect model was utilized to calculate the mean effect size of the forty-one studies.

Table 3: Coefficients or Mean Effect Size

Coefficients

	Estimate	Standard Error	z	p	95% Confidence Interval	
					Lower	Upper
intercept	0.552	0.169	3.265	0.001	0.221	0.884

Note. Wald test.

*r=0.1 (low); r=0.3 (medium); r=0.5 (high) (Cohen, 1988)

The outcome of the video-based FC paradigm on English learning achievement may be evaluated from Table 3. 0.552 is the estimated coefficient. For a learning process to be successful, a score of 75 is required (Candra & Retnawati, 2020; Retnawati, 2014). We can infer that the estimate coefficient has not gotten to the required level. It is not 75 or more. This indicates that the flipped classroom approach is not having a significant influence on the English model (Candra & Retnawati, 2020; Retnawati, 2014).

Forest Plot

Study	Effect [95% CI]
Study 1	1.40 [1.27, 1.54]
Study 2	0.06 [-0.09, 0.22]
Study 3	2.88 [2.74, 3.02]

Study 18	0.20 [0.04, 0.36]
Study 19	0.33 [0.18, 0.47]
Study 20	0.29 [0.13, 0.44]
Study 21	0.02 [-0.08, 0.12]
Study 22	0.01 [-0.09, 0.11]
Study 23	0.03 [-0.13, 0.18]
Study 24	-1.35 [-1.52, -1.18]
Study 25	1.17 [1.03, 1.32]
Study 26	2.16 [2.01, 2.30]
Study 27	0.01 [-0.20, 0.22]
Study 28	1.58 [1.43, 1.74]
Study 29	0.00 [-0.18, 0.19]
Study 30	-4.15 [-4.44, -3.87]
Study 31	1.29 [1.17, 1.40]
Study 32	1.75 [1.61, 1.88]
Study 33	0.45 [0.30, 0.59]
Study 34	1.31 [1.10, 1.53]
Study 35	1.14 [0.91, 1.38]
Study 36	0.03 [-0.14, 0.20]
Study 37	0.31 [0.15, 0.48]
Study 38	1.01 [0.83, 1.20]
Study 39	0.43 [0.27, 0.60]
Study 40	0.51 [0.34, 0.68]
Study 41	0.68 [0.50, 0.86]
RE Model	0.55 [0.22, 0.88]

Figure 2: Forest Plot

The size of the effect size aggregation is shown by the location of the diamond at the bottom, whose area represents the whole area of the total weight of each study (Retnawati, H.; Apino, E.; Kartianom; Djidu, H.; Anazifa, 2018). From the forest plot of the present study, the study no 2 is the largest confidence, it is the study from Al-Jarrah et al. (2021). The study no 2 analyzed secondary students' grammar using FC setting. Furthermore, the smallest confident interval is the study number 30 from Nhac (2022)' experiment which utilized 15 minutes video to teach students vocabulary using video-based FC.

Heterogeneity Test

Table 4: Heterogenity Test

Fixed and Random Effects			
	Q	**df**	**p**
Omnibus test of Model Coefficients	10.657	1	0.001
Test of Residual Heterogeneity	5291.055	40	< .001

Note. p -values are approximate.
Note. The model was estimated using Hedges method.

The Q statistics value obtained for the Residual Heterogeneity test from Table 3 is 5291.055 with df (k - 1) = 40 and p-value < 0.001. This outcome invalidates the H0 hypothesis that the data is homogeneous. Retnawati, H.; Apino, E.; Kartianom; Djidu, H.; Anazifa (2018) based it on the crucial criteria for the rejection area; H0 is rejected if the p-value 0.05 with a significance level of 95% (=0.05). The data is heterogeneous because H0 is discarded.

Variable Moderators

The results of the data analysis in the heterogeneity test are caused by variable moderators. There five variables in this study: subject, objectives, rules, context, sources. The research gathered are categorized using the variable moderators. The variable moderators and their inclusion in the current meta-analysis are detailed in greater detail in Table 4. The heterogeneous studies included in this meta-analysis are due to several sub-dimensions typically included in video-based FC, which the variable moderators cause. These are the potential moderator variables that could be utilized to distinguish between each finding of FD on the video-based flipped classroom investigation. Additionally, that data is necessary to investigate the precise impact of FC in a meta-analysis study.

Table 5: Variables Moderator

Dimension	Sub dimension	Coding Scheme	n/Percentage
Subject	Sample size	Small 1-20	46.3
		Medium 21-40	53.7
		Big 41-60	0
	Level	Primary	4.9%
		Secondary	9.8%
		Varsity	85.4%
Objectives	Result of Learning domain	Integrated	13.9%
		Per-skill/component	86.1%
	Skills Type	Recitative skill	40.5%
		Productive skill	42.9%
		Recitative & Productive skills	16.7%
Rules	Video duration	Short (1'-10')	7.3%
		Medium (10'-30')	48.8%
		Long (30'-50')	2.4%
		Unidentified	41.5%
	Video play tool	Social Media	19.5%
		CD/FD	7.3%
		LMS/ Web-based	43.9%
		Unidentified	29.3%
	Video sources	YouTube	48.4%
		Self-Produced	16.1%
		Other Sources	19.3%
		Self-Produce &YouTube	9.7%
Context	Country	Asian	97.6%
		Europe	2.4%
Sources	Publication Type	Scopus	7,14%

The high confidence interval was a medium sample size to deal with the subject variable. Studies with a smaller sample size demonstrate a stronger effect than those with a larger sample size. This may be because relatively few studies have used small sample sizes. This study also discovered that the biggest impact size was associated with a medium sample size. The fundamental explanation is that fewer sources of variation are present in a small sample size, which results in a greater effect size (Slavin et al., 2009). Then the varsity subject also got the strongest effect.

This table presents the distribution of data across different dimensions and sub-dimensions, along with the corresponding coding schemes and percentages. The discussion for each dimension and sub-dimension:

In term of subject, the sub-dimension namely sample size found that the majority of the sample size falls within the medium range (21-40), accounting for 53.7% of the total, while a smaller portion falls within the small range (1-20) at 46.3%. There are no cases in the big range (41-60).

For the level dimension, its data indicates that the Varsity level dominates with 85.4%, followed by Secondary with 9.8% and Primary with 4.9%.

In addition, the objectives dimension, particularly result of learning domain: the distribution shows that 86.1% of the data is related to per-skill/component, while the rest (13.9%) is

integrated learning domain. In the same dimension, the skills type data is divided into recitative skill (40.5%), productive skill (42.9%), and a combination of both recitative and productive skills (16.7%). Regarding objective variables, teaching English per skill, not integrated skills, was determined as the largest effect size. This result may be caused by the fact that the appropriate implementation of the flipped classroom will be effective in each domain of learning outcomes, whether viewed as a whole or by skill/competency.

Next is about the rules used in the studies. First sub-dimension is the video duration in FC classroom data, which indicates that the majority of the video duration falls within the medium range (10'-30') at 48.8%, followed by short (1'-10') at 7.3%. A significant portion is unidentified (41.5%). In sub-dimension video play tool, the LMS/Web-based is the most commonly used video play tool, accounting for 43.9%, followed by Social Media (19.5%), and CD/FD (7.3%). A considerable portion is unidentified (29.3%). Further the video Sources data found that YouTube is the predominant video source at 48.4%, followed by self-produced sources at 16%. Therefore, the medium-length video duration that utilizes a web-based Learning Management System (LMS) as the media and YouTube as a video resource statistically got their highest interval confidence in each category.

The findings also indicate that the video-based FC method for teaching English has the greatest effect size in Asia. This is because Asian countries must adopt student-centred learning for teaching English as a foreign language. In line with the findings of Zheng, Bhagat, Zhen, and Zhang's meta-analysis (Zheng et al., 2020), the meta-analysis is more significant in some developing countries because it can facilitate learning in these nations.

This breakdown provides a detailed insight into the distribution and percentages within each dimension and sub-dimension, offering valuable information for analysis and decision-making.

Bias Publication

This test is carried out to determine whether the data that has been collected can be used as a representative sample of its population or not by looking at representative sample of the population or not by looking at whether the funnel plot shows a symmetrical or asymmetrical shape, whether the funnel plot shows a symmetrical or asymmetrical shape. The test publication bias test is carried out with the funnel plot in the following figure.
Figure 3: Effect Size

From figure 2, it can be seen that the distribution of the data was even. Therefore, it may be said that this publication is impartial. In other word, funnel plot result shows that the 41 studies are not biased, or in other words, that they are valid, based on the results of several tests designed to detect biased publications. Providing English learning inclusion strengthens the conclusion of the meta-analysis that the flipped classroom is demonstrably effective for enhancing students' English learning achievement.

Conclusion and Suggestion

The present meta-analysis study provides evidence of substantial gain in the effectiveness of video-based flipped classrooms on English learning achievement. The achievement found comes from the positive effect of the video-based flipped classrooms and several moderator variables. This study found that 41 studies included argued that the video-based flipped classroom model has a high effect size on English learning achievement for g = 0.552, in terms of all English skills, both productive and receipted skills. The data also show that the success of flipped classrooms is affected by seven moderator variables from activity theories. The moderators found that Video FC is effective when the class have a medium sample size and teaches productive and component skill. It is also argued that using videos formed in medium length, utilising web-based or social media in playing and taking from YouTube as a resource to learn are factors with moderated effect sizes.

The results of this study provide insight that can be implemented in the following English-learning flipped classroom, especially regarding video material. The findings also strengthen and validate the learning activities during online or hybrid forms, which halted all academic pursuits. This model can be used as a learning method for English lessons. This opportunity can be used to instruct students to master material before the actual class, in-class, or online applications due to students' greater access to technology and information at home. Implementing a reversed classroom will inevitably result in more efficient time spent learning material. This model aids in the process of learning. In addition, English is a subject that requires extensive practice. The benefits of flexible classrooms encourage English language acquisition.

Recommendations are made for the next researcher to increase the years covered to obtain more complex findings and analyses. The moderator variables may differ according to the requirements of each researcher. Further, for future studies, it is suggested to explore more theoretical and practical implications of video-based flipped classrooms supporting students' English achievement. Additionally, the study recommends testing other variables' influence on the success of the flipped classroom and addressing the shortcomings of the flipped classroom, such as students' lack of preparation, motivation, and understanding while engaging in learning activities outside the classroom. Furthermore, future research could compare the effectiveness of the flipped classroom with traditional classes in learning new languages, particularly English, and address the need for more thoroughness in addressing moderator variables in the application of the flipped classroom. The study's findings provide valuable insights for educators, researchers, and policymakers, and future research in this area could contribute to the ongoing development of effective teaching methods in English language education.

Practices and Challenges of Learner Autonomy in English Learning: Voices From High and Low Achievers

Sri Novianti, Universitas Pendidikan Indonesia, Indonesia
Fazri Nur Yusuf, Universitas Pendidikan Indonesia, Indonesia

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Autonomy of English language learners in EFL contexts has long interested scholars to investigate how autonomy is practiced and ways to promote it. However, there seems less research investigating how learner autonomy is practiced among students from different academic competence levels. Therefore, this qualitative study aims to investigate students' practices and challenges of autonomy in learning English. This study involved two high school students (high and low achievers) in an EFL classroom. Both students' English proficiency was categorized based on academic achievement judgment. The data were collected through online questionnaires designed to gauge students' frequency in carrying out activities supporting learner autonomy and semi-structured interviews asked to ascertain those activities and identify challenges students face in doing the practices. The study's findings reveal contrastive practices in terms of learning quality and material access among the high and low achievers. Likewise, different considerable challenges are found. The high achiever perceives limited time of learning as the most affecting constraint whereas another participant lacks learning motivation since he feels no relevance between English and his real world. Interestingly, the willingness of both low and high achievers to practice autonomy in learning is similar; notwithstanding, they expect the teacher to always provide them with related materials to be learned inside and outside the classroom. The study's results suggest teachers fully encourage and facilitate students to engage them with activities supporting their autonomy.

Keywords*: Learner Autonomy, Autonomy Practices, Autonomy Challenges, High Achiever, Low Achiever*

Introduction

Over the years, there have been growing interests in the promotion of learner autonomy in English language teaching and learning. Many researchers have proven that learner autonomy contributes to the success of English as Foreign Language learning (Hsieh & Hsieh, 2019; Rahman & Suharmoko, 2018; Tran, 2020). The studies are in line with the theory of the learner autonomy emergence which tries to specify the roles of teachers and learners in the teaching and learning process. Cotteral (1999) defined the theory of learner autonomy in that it is the movement of teachers and students' roles which used to focus on teachers as presenter, explainer, encourager, and determiner of students' learning and how to assess its result, meanwhile, students are meant to be controlled by those roles of teachers. This issue is a serious challenge regarding the relationships between teachers and learners. Thus, learner autonomy is the result of the challenge and aims to help students to take charge of their own learning (Holec, 1981 and Little, 1991).

In the traditional view of teaching and learning, learners tend to be passive since they are not persons in charge to determine what and how to learn. Instead, all information is provided by teachers, and learners absorb the information with no evaluation and reflection. This traditional view has been gradually replaced and changed by the new shift called learner autonomy. Holec (1981) coined the term learner autonomy in the context of language learning in Europe. Holec mentioned that autonomous learners can define their own goals and strategies for understanding and evaluating their own development in language learning.

Similar issues and challenges exist in English language instruction in Indonesia. Having a look at the *Kurikulum Merdeka* as the new curriculum implemented in Indonesian education, it is strongly suggested that learning is conducted by having a learner-centered approach. (Lengkanawati, 2019). This is due to the fact that skills needed in the era of 4.0 require learners to have soft skills, good characters, and literacy-numeration skills. Regarding these crucial, student-centered learning is one way to develop those skills since it involves criteria such as depth cognitive and social skills, personal growth, and social maturity.

However, English language learning in Indonesia is dominated by teachers. This issue has become a problem since the learning process tends to be teacher-centered. Lengkanawati (2019) revealed that teachers have not well promoted learner autonomy as one of the key objectives in language teaching and learning. Furthermore, it cannot be neglected that learner autonomy still faces a challenge in Indonesian context since the standard norms set in the culture of education emphasize center to teachers. The norms include the principles of total obedience, the unquestioning mind, the concept of elders-know-all, and the beliefs that teachers are always right as well as do no wrong (Dardjowidjojo, 2001).

Promoting learner autonomy has become a challenge since Indonesia's educational setting involves a big classroom of more than 25 students. This results in teachers' difficulty in supporting students to have a learner autonomy attitude. In other words, self-directed learning does not normally happen in most schools in Indonesia. Ramadhiyah (2018) described that the culture of students just being recipients is very popular in Indonesia. Students tend to rely on teachers' explanations and decisions in learning without voicing their own and asking 'why'. Padmadewi (2016) is also in agreement in this situation in that the traditional cultures of students and teachers' role in teaching and learning process leads students to not perceive needs for studying English causing them to be unenthusiastic to take chances in learning.

The fact that learner autonomy is rarely promoted in language teaching and learning in Indonesia has encouraged researchers to investigate the promotion of learner autonomy with different strategies. However, in the Indonesian English language setting, studies on learner autonomy are limited to how teachers perceive learner autonomy, how technology is used in promoting learner autonomy, and how learner autonomy is practiced in university and public high school. However, the practices investigated are generalized among all learners, whereas in reality students vary. This issue has interested the researcher to conduct study on learner autonomy to two different students: high and low achiever. Thus, the present study aims to answer:

1. How is learner autonomy practiced by the high and low achiever?
2. What are challenges encountered by the two different learners to be autonomous in learning?

Method

Research Design

The study employed a qualitative descriptive design to describe the phenomenon in the field and provide a rich description of the experience. The qualitative descriptive design seems to be suitable for this study since it attempts to provide detailed information on practices students are likely to undertake to encourage themselves to become autonomous learners in learning English, and challenges students encounter regarding learner autonomy implementation. Moreover, the study is considered as a qualitative descriptive since it will focus on the exploration of learner autonomy at two different levels of students.

Research Participants

The study involved two students with different academic levels, a high achiever and a low one. They were selected based on the teacher's judgment on their academic competence, especially in English learning. There are some reasons underlying the selection of the two participants. To begin with, previous research on learner autonomy was found to generalize students and treat them as the same levels, thus this issue has interested me to conduct a study on learner autonomy to different levels of students. Secondly, there was research I previously conducted to these two participants aiming at revealing their motivation in learning English. The bond has been developed between us and it encourages certain openness in the participants' responses to the researcher's questions in this study. To avoid biases in inappropriate portions, I undertook this study by collaborating with my academic advisor who is an experienced researcher and expertise in the topic of learner autonomy. The participants were distributed questionnaires. In addition, selected students based on the questionnaire results will be interviewed to explore their responses.

Research Instruments

In the study, qualitative data were collected beginning with revealing the participants' tendency in undertaking activities encouraging them to be autonomous through a 5 point *Likert-scale questionnaire*. The questionnaire also aims at answering the first research question regarding practices of learner autonomy the students are likely to undertake. The questionnaire begins with asking students about their perception of their own and the teacher's role in learning and followed by autonomous activities they carry out by using the framework of Joshi (2011). Since this is a qualitative study, a more exploration of students'

responses to the questionnaire was conducted through an open-ended interview to enrich research question 1 and answers research questions 2 (challenging students encounter in carrying out autonomous activities). The interview was also conducted by following the aspects of learner autonomy proposed by Joshi (2011). The selection of this framework was based on the fact that Joshi's is really appropriate to answer both research questions being studies, despite its widely used by previous researchers in the field.

Data Collection and Analysis

The questionnaires were distributed through a google form. After collecting data from the questionnaires, follow up interviews were conducted as well as recorded to selected students based on responses obtained from the questionnaire results. Results from students' questionnaires were analyzed by looking at the items students answer both similarly and differently. After the tendency of activities students undertake is obtained, they were explored more through interviews. Results from the interviews were focused, categorized, and transcribed. The data then were displayed based on Joshi"s (2011) framework: perceptions of their own roles and teachers" roles and autonomous activities students are likely to undertake. Lastly, conclusion drawing will be done by referring to research questions 1 and 2.

Findings and Discussion

This section discusses results obtained from both online questionnaires and interviews conducted to the high and low achieving students regarding their practices of autonomy and challenges they encountered in learning English.

Practices of Learner Autonomy

Categories specified by Joshi (2011) were used to describe practices of learner autonomy both high and low achievers have. The description consists of the learner's perception of their own and teacher's roles and autonomous activities they carry out. In relation to students' role in learning English, results obtained from the questionnaires show that both participants have quite similar perceptions about their roles as English learners in that students should be all responsible for finding their own ways of practicing English and should build a clear vision of reasons why they learn English. However, completely different voices, if not opposite, were revealed when they were confirmed and explored more through interview, as indicated in the following excerpts:

> *"I have to be serious in studying because I want to pursue my education abroad. I keep my goals, but I also have to focus on the teacher's goals because they are related. Since I have my personal goals and what is taught at school is also important, I just balance it."* (Excerpt from high achiever)

> *"My goal in learning English is to gain knowledge related to things I initially did not know. I do not have anything more serious such as to prepare myself or work later. I also follow the teacher's way more than my own way in studying English."* (Excerpt from low achiever)

The high achiever stated that having clear vision and purpose of learning English is crucial in addition to learning goals specified by teachers, so her purpose does not merely come from herself nor the teacher. She has her own learning goal, to be able to master English since she

wants to later continue her study abroad, but she is also eager to first reach the learning goals set by the teacher. Moreover, she believes that the teacher's learning goal does not contradict her own goal; instead, it helps her to become more fluent in using English. Dissimilar with the voices from the high achiever, the low one has completely different perception on vision of learning English, if not opposite. To him, learning English is simply to gain knowledge on materials he was previously not familiar with. As a result, since he also does not have long-term ambition, learning goals specified by teachers are extremely favored. How both participants perceived their roles in learning English appears to influence their practices of autonomy. While the high achiever tends to combine her own and teacher's way, the low one depends merely on the teacher.

In relation to students' perception of teacher roles, and in line with students' responses above, the questionnaire results show that the high achiever agrees that a lot of learning can be done without the teacher while the low one strongly disagrees with the statement. Notwithstanding, their voices seem to be quite similar after more explored in the interview, as exemplified below:

> *"In learning, I follow the teacher's way, but I also look for material from other sources, usually via Youtube by listening to songs and then I can find out the meaning of the song. Whenever I face difficulty, I will ask the teacher to explain. The way the teacher teaches really influences me. I agree that if the teacher's way of teaching does not suit me, I will not understand. However, I can study on my own without a teacher if learning resources are provided."* (Excerpt from high achiever)

> *"I can't study without the teacher. I find it more difficult to understand the material because I am not guided, and I become lazy. I hope that the teacher always provides materials and notes for us. If no examples are given, I prefer to copy because I don't understand and I'm afraid of being wrong. If there are things I don't understand, I also need to ask the teacher."* (Excerpt from low achiever)

Surprisingly, the high achiever is also dependent on the teacher's way of teaching, if not a hundred percent, despite her previous answer that students should have their own clear vision in learning. Her desire to learn English from resources other than just those provided by the teacher show that she is actually able to learn without the teacher as long as the guidance exists to help her deal with difficulty in learning. The practices actually confirm how scholars have conceptualized learner autonomy, in which it is a quite well-established concept. Holec (1981), as the originator of the concept, stated that learner autonomy is not learning without a teacher. Some previous studies also voice that learner autonomy is strongly connected to teacher's guidance and facilitation, and teachers should employ various supporting strategies (Bozack, A. R, et al, 2008; Yuzulia, 2020; Wiraningsih and Dewi, 2020).

More strong dependence is perceived by the low achiever who relies everything in learning on the teacher's decision. Unlike the high achiever who is able to learn independently in the absence of the teacher, the low one has to struggle with bad habits such as being lazy and cheating. The low achiever is not able to decide whether he should use much self-study materials to learn English, while the high achiever agrees she should do so. The responses from the two participants do suggest the teacher positions herself as a party with multiple roles and has significant influences on students' learning. As stated by Alonazi (2017) that language teachers should be facilitators, counselors, and resources. Being a facilitator means that teachers help learning to make it easier to happen, being a counselor means that teachers

help in identifying and solving students' difficulties in learning, and being a resource means that teachers help learners with knowledge and skills they need. Similarly, Tran and Duong (2018) found that the benefits of learner autonomy can only be felt by students if teachers provide them supportive factors, such as the teacher's autonomy-oriented role. Thus, it is not surprising that both participants agree if the failure of students is directly related to teachers' classroom employment.

Corresponding to autonomous activities students carry out, the participants' practices are totally different in terms of their learning awareness, self-efforts, self-esteem, and motivation. The high achiever's voices reflect that she involves in many autonomous activities, as can be seen in the following excerpt:

> *"My English ability is still lacking. I find a lot of difficult words in reading. To overcome this I use Google Translate to search for new words. In my free time, I also like to watch movies to enrich my vocabulary and see how people talk. I also take the initiative to speak in class, take notes, read English content on social media, and give myself rewards like going to a salon."* (Excerpt from high achievers)

Regarding their learning awareness, the high achiever is aware of her English ability and eager to cope with her English limitations. This awareness results in her high degree of self-effort such as using every opportunity to participate in activities where she can speak English, making notes and summary of lessons learned, using audio-visual materials to develop her speech, and taking risks in learning English. Her self-esteem also increases since she involves herself in various activities to improve her English, so she is able to note her strengths and weaknesses in learning. It is also found that she builds her own motivation such as buying new things due to her success or celebrating it in her own way. When interviewed, her response shows that she terribly involved herself in numerous autonomous activities. Contrary to the optimistic sound by the high achiever, the low one seems to be down beat, as indicated in the following excerpts:

> *"I can't speak English because it's difficult. I also rarely study and look for other sources. I find a lot of English content on social media, but I only read it. I don't delve into it because I feel lazy. Maybe it's my character. When it comes to assignments, I always do them because I feel sorry for my parents who are often called to school. I often cheat, especially in exams, since I find no relevance between English and my real and future life."* (Excerpt from high achiever)

It is very noticeable from the low achiever's statements that he has low motivation in English, and it influences his self-effort and self-esteem which lead to his laziness in doing autonomous activities. He is also trapped in the culture of cheating which really blocks the ability to be autonomous. Cheating culture has been a serious concern in Indonesian students' learning and exams, and it is connected with students' self-control (Ednadita et al, 2020). This issue suggests two important things: (a) self-control development should be focused more by teachers through supporting activities, and (b) attention to low achieving students and their academic dishonesty should be paid more. The neglect of the two aspects can result in students' inability in being autonomous in learning and in their real life after finishing their studies.

Another finding is that the low achiever's judgment on his own English ability, which is very low, causes him to have no intention to cover the weakness. Instead, English serves as an

enemy he avoids. As a result, he puts no effort in learning English and is not interested in learning English. From the two participants' contradictory practices, it can be seen that learners vary in terms of many aspects including motivation which will be discussed below as the challenge students encounter to be autonomous in learning.

Challenges Students Encountered

In relation to challenges students encounter in carrying out activities which support learner autonomy, the findings show different constraints faced by the two participants. As discussed previously, the low achiever expresses pessimism in learning English due to lack of motivation. Continuous bad habits including laziness and cheating have been practiced a lot during learning. Traced back, which he feels no urge to learn English, it leads to his ignorance in studying. The low achiever's excerpts above also show that he believes in the constant character he owns, indolent, causing him to not be eager in making improvement. Ekiz and Kulmetov (2016) argued that socio-functional validity is an important factor in motivation. Learning English as a foreign language may or may not be worthwhile from the student's point of view, depending on its social reality. When students perceive that they need English outside the classroom, they may be eager to learn it. However, students may find it not worth learning when they have no urge to use English outside the classroom or in their daily lives. In other words, if there is no out-of-class validity, language learning misses its functional consequences, and lack of motivation happens among students (Jafari 2013).

This issue implies that students' motivation needs to be paid great attention in addition to language knowledge. Dornyei (1997) stated that helping students to be motivated in the EFL classroom is not an easy task; it is often a difficult and complex task involving a multiplicity of psycho-sociological and linguistic factors. Despite its complexity, teachers, as one of the cores in education, cannot leave this issue from attention due to the fact that motivation contributes much to successful learning, and demotivation happens not merely due to students' internal factor, but also the learning environment (Harmer, 2007; Haynes, 1996).

One of the aspects was explained by Harmer (2007) in that poorly lit and overcrowded classrooms can be excessively demotivating because students may not study as well in uncomfortable situations as they do in more comfortable ones. Haynes (1996) added that positive school climate perceptions are important predictors that can provide students with a favorable learning environment. Students are more likely to participate in the learning process when they are in a compassionate, relaxed, and helpful learning environment. On the other hand, if the learning environment is not designed to ease students in learning such as poor lighting, unsuitable atmosphere, unpreferred order of desks, and disturbing visuals, students are easily unmotivated since those factors demotivate them.

Unlike the low achiever, motivation is not the affecting factor for the high achiever; instead, lack of learning time is the most constraints, as indicated in the following excerpts:

> *"When there are many tasks, I don't have the opportunity to learn more because it makes me very tired."* (Excerpt from high achiever)

This challenge has something to do with time-management and quantity of tasks and homework given to the students. There is no exact number of task quantities specified by curriculum, but teacher's adjustment with the students' needs is needed and the quality, other than quantity, of the assignments should be more emphasized.

Conclusion and Recommendations

In conclusion, findings of this study reflect that some different practices of learner autonomy exist among high and low achieving students. The challenges they encounter in carrying out autonomous activities are also not similar; however, both of their results point out that they expect teacher existence and existence in learning. The results disconfirm the misconceptions of learner autonomy which emphasize learning without teachers. Instead, teachers' roles are centered in developing and assisting learner autonomy. Learners should be involved in making decisions for their own learning. All activities done both in the classroom and beyond the classroom including planning and doing actions that the learners do by themselves plays a role in promoting their autonomy. It is the student who is the agent to develop, taking responsibility, and having control over their own learning.

Notwithstanding, it is important to note down that being autonomous in the classroom does not mean that teachers' role in the classroom is banned. Instead, teachers should be able to initiate and stimulate students to be autonomous, especially if the students lack autonomy. Regarding this, some activities and practices should be implemented by teachers so that teachers" roles to encourage students to be autonomous can be enhanced. Stefanou et al (2004) mentioned that there are three practices teachers can do to develop students" autonomy: organizational autonomy support, procedural autonomy support, and cognitive autonomy support. Organizational autonomy support allows students to choose the organization of the classroom. Procedural autonomy support relates to students" right to select among available resources including media and materials of learning. Cognitive support is giving students a chance to evaluate their learning including both during and after the learning process.

K K Soman, Central University of Tamil Nadu, India

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Massive Open Online Courses (MOOCs) have gained immense popularity in re-cent years, with the emergence of various platforms such as Coursera, Udacity, edX, etc. These platforms offer courses in various fields, ranging from computer science to humanities. The objective of the present study is to examine the association between student-instructor rapport and student interest while pursuing MOOCs. The sample comprised 383 college students pursuing undergraduate and postgraduate courses in Karnataka, and employed two measures, namely the Instructor-Student Rapport Scale and the Student Interest Scale. The findings of the study suggested a significant positive relationship between instructor-student rapport and student interest. Personal connection, one dimension of instructor-student rapport was found to be a significant predictor of emotional interest in students; whereas enjoyable interaction, another dimension of instructor-student rapport, was demonstrated as a significant predictor of cognitive interest. The study throws light into the scope of utilizing instructor-student rapport in enhancing student interest, thereby enhancing the efficacy of MOOCs across the country.

Introduction

Massive Open Online Courses (MOOCs) are online courses that offer free or affordable access to educational resources to anyone with an internet connection. MOOCs have revolutionized the way we learn and have become an essential tool for individuals, organizations, and institutions around the world. The importance and uses of MOOCs are numerous and have impacted the way we approach education and professional development. One of the most significant advantages of MOOCs is their accessibility. Anyone with an internet connection can enroll in a MOOC, regard-less of their location or financial situation (Al-Rahmi et al., 2019). MOOCs are a great way for people who cannot afford traditional education or are located in remote areas with limited access to educational resources to learn new skills and acquire knowledge (Liyanagunawardena et al., 2013). MOOCs also offer a wide range of courses on various topics, from computer science and business to language learning and creative writing. The diversity of courses available on MOOC platforms means that learners can tailor their learning to their interests and needs (Pomerol et al., 2015). This flexibility also allows individuals to learn at their own pace and on their schedule. In addition to individual learners, MOOCs have also become a valuable tool for organizations and institutions. Companies can use MOOCs to provide training and development opportunities for their employees (Park et al., 2018). MOOCs can help organizations upskill their employees and prepare them for new roles or responsibilities. Institutions such as universities and colleges can also use MOOCs to supplement their traditional classroom teaching and provide their students with additional re-sources and learning opportunities. Furthermore, MOOCs have become an essential tool for individuals looking to switch careers or acquire new skills. MOOCs can help learners develop new skills and knowledge that are in high demand in today's job market. Learners can earn certificates or credentials from MOOCs to demonstrate their skills and knowledge to employers. MOOCs also provide a platform for learners to connect with experts in their field of study. Learners can participate in online forums and discussions, ask questions, and receive feedback from peers and instructors. This collaboration and interaction with others can enhance the learning experience and provide learners with a sense of community and support (Galán et al., 2022).

Massive Open Online Courses (MOOCs) have gained immense popularity in recent years, with the emergence of various platforms such as Coursera, Udacity, edX, etc. These platforms offer courses in various fields, ranging from computer science to humanities. In India, MOOCs have also gained traction and have been used by many to enhance their skills and knowledge. A study by Venkatesh et al. investigated the perception of students toward MOOCs in India. The authors found that the majority of students found MOOCs to be beneficial for improving their knowledge and skills. However, they also noted that the completion rates of MOOCs were relatively low, which could be attributed to various factors such as lack of motivation, time constraints, and inadequate guidance (Venkatesh et al., 2003). Sahoo et al. examined the effectiveness of MOOCs in promoting lifelong learning among working professionals in India. The authors found that MOOCs were effective in enhancing the skills and knowledge of professionals, especially in the fields of computer science and engineering; MOOCs could serve as a cost-effective alternative to traditional forms of education (Sahoo et al., 2018). The availability of high-speed internet and the credibility of the platform were significant factors that influenced the adoption of MOOCs and the lack of interaction with instructors and peers, and the absence of formal recognition were some of the factors that hindered the adoption of MOOCs (Muti Altalhi, 2021).

MOOCs have been effective in enhancing the employability of graduates in India, especially in the fields of data science, artificial intelligence, and machine learning (Mohan et al., 2020). The quality of content, the credibility of the platform, and the level of interaction with instructors and peers were significant factors that influenced the satisfaction of students with MOOCs, and the lack of guidance and feedback, and the absence of formal recognition, were some of the factors that hindered the satisfaction of students with MOOCs (Nilashi et al., 2022). The Government of India has launched several initiatives to promote the use of MOOCs in the country, including SWAYAM (Study Webs of Active-Learning for Young Aspiring Minds), which is a platform for online courses offered by Indian universities and approved by the University Grants Commission (UGC). Several colleges and universities in Karnataka have also adopted MOOCs as part of their curricula, with some offering credit for the completion of these courses. The objective of the present study is to examine the association between student-instructor rapport and student interest while pursuing MOOCs.

Methodology

The study employed two measures, namely the Instructor-Student Rapport Scale & Student Interest Scale. The Instructor-Student Rapport Scale (ISRS) was developed by Brandi N. Frisby and S.A. Myers in 2008, and it consists of two dimensions, personal connection (5 items) and enjoyable interaction (6 items) (Tatum, 2019). ISRS measures the extent of the rapport between the instructor and the student in the instructional communication context. The Student Interest Scale (SIS) was developed by Joseph P. Mazer in 2012, and it consists of two dimensions, emotional interest (9 items) and cognitive interest (7 items). SIS assesses student experiences of emotional and cognitive forms of interest in instructional communication (Mazer, 2012). Both scales are measured on a 5-point rating scale. The sample comprised 383 college students pursuing undergraduate and postgraduate courses in Karnataka. More than half of the participants are females (53.5%), around three-fourths of them below 20 years of age (72.8%) and hailing from urban localities (73.6%). The majority of them study in aided colleges (52.5%) and pursue commerce and management studies (40.7%), followed by social sciences and humanities (31.6%), science (20.1 %), and other (7.6%) courses. Informed consent was taken from the participants and the measures were distributed among them for self-reporting. The obtained data was checked, edited, and coded in Microsoft Excel. Descriptive, correlation, and regression analysis (Version 23) was carried out to obtain the study results, using Statistical Package for Social Sciences (SPSS), Version 23.

Results and Discussion

Table 1: The Pearson correlation coefficient indicates a significant positive relationship between instructor-student rapport and student interest

Variable	Mean	SD	(1)	(2)	(3)	(4)
Personal Connection (1)	17.81	3.90	1	.333**	.946**	.337**
Enjoyable Interaction (2)	13.97	4.26		1	.234**	.975**
Emotional Interest (3)	26.46	6.03			1	.242**
Cognitive Interest (4)	20.10	5.57				1

**p<0.01

As demonstrated in Table 1, the Pearson correlation coefficient indicates a significant positive relationship between instructor-student rapport and student interest. The analysis

suggests that personal connection has a fairly strong correlation with emotional interest (r= .946, p <.01) whereas enjoyable interaction is strongly correlated with cognitive interest (r= .975, p <.01). To confirm this trend, a linear regression analysis was carried out, enquiring the extent to which personal connection and enjoyable interaction can predict the emotional interest and cognitive interest respectively. The findings are illustrated in Table 2 and Table 3.

Table 2: Linear regression predicting emotional interest from personal connection

Predictor	β	t	R^2	Adj. R^2	F	Sig.
Personal Connection	.946	57.02	.895	.895	3251.51	<0.001

Linear regression analysis revealed that personal connection is a significant predictor of emotional interest (β = .946, t = 57.02, p<0.00). The rise of online education has dramatically changed the way people learn and acquire knowledge. With the convenience and flexibility of online learning, more people are now turning to this alternative form of education. However, the success of online education depends not only on its convenience and accessibility but also on the emotional interest of students. Emotional interest, or the degree to which students are engaged and invested in their learning, is crucial for learning outcomes and retention. In recent years, research has shown that personal connection is a significant predictor of emotional interest in online education. Research has shown that personal connection is a significant predictor of emotional interest in online education. A study conducted by the Online Learning Consortium found that students who felt connected to their instructors and classmates had higher levels of motivation and engagement in their courses. The study also found that personal connection was a stronger predictor of emotional interest than the quality of the course content or the technology used (Gray, 2016). In conclusion, personal connection is a significant predictor of emotional interest in online education. When students feel connected to their instructors, they are more likely to be engaged, motivated, and invested in their learning. Therefore, instructors and course designers need to prioritize creating opportunities for personal connection in online education to ensure the success of their courses. By doing so, they can create a sense of community and belonging that is crucial for human motivation and well-being.

Table 3: Linear regression predicting cognitive interest from enjoyable interaction

Predictor	β	t	R^2	Adj. R^2	F	Sig.
Enjoyable Interaction	.975	86.41	.951	.951	7467.34	<0.001

Linear regression analysis also suggested that enjoyable interaction is a significant predictor of cognitive interest (β = .975, t = 86.41, p<0.00). When individuals find the learning experience enjoyable, they are more likely to become engaged and motivated to continue learning. This is particularly important in online education, where many distractions and challenges can cause learners to disengage. By focusing on creating engaging and enjoyable learning experiences, educators can increase learners' cognitive interest and ultimately improve their learning outcomes. Therefore, educators need to prioritize creating engaging and enjoyable online learning experiences that foster enjoyable interaction, as this will lead to a greater level of cognitive interest and success in online education.

Conclusion

Online education has become increasingly popular in recent years, with the number of students enrolled in online courses growing steadily. This trend has only accelerated during the pandemic, with many universities and colleges forced to shift their courses online. According to a survey conducted by BestColleges.com, 87% of students said they were interested in taking online courses. One reason for the popularity of online education is its convenience. Online courses offer students the ability to study from anywhere, at any time, as long as they have a computer and an internet connection. This flexibility is particularly appealing to students who have work or family obligations that make it difficult to attend traditional classes. Another factor contributing to the growing interest in online education is the perceived cost savings. Many online courses are less expensive than traditional courses, and students can avoid additional expenses such as commuting and housing costs. Additionally, online courses offer students the ability to complete their degrees at their own pace, allowing them to save money by taking fewer courses per semester. One of the main reasons for the growing popularity of MOOCs in India is their accessibility. MOOCs are free or low-cost, and students can access them from anywhere, at any time. This makes them particularly appealing to students who are unable to attend traditional courses due to financial or geographic constraints. Another reason for the popularity of MOOCs in India is the quality of education they offer. Many MOOCs are designed and delivered by leading universities and experts from around the world, and they offer students the opportunity to learn from the best. This is particularly important in a country like India, where access to high-quality education is often limited. MOOCs also offer students the opportunity to acquire new skills and knowledge that can help them in their careers. This is particularly important in a country like India, where there is a growing demand for skilled workers in areas such as technology, data science, and management. However, there are also challenges associated with MOOCs in India. One of the main challenges is the lack of accreditation for MOOC courses. While some universities in India are now offering credit for MOOC courses, this is still not widespread. As a result, many students may be hesitant to invest their time and money in MOOC courses that may not be recognized by employers. MOOCs have become an essential tool for individuals, organizations, and institutions looking to learn, grow and adapt in today's rapidly changing world. The accessibility, flexibility, and diversity of courses available on MOOC platforms have revolutionized the way we approach education and professional development. The importance and uses of MOOCs will only continue to grow as technology advances and the demand for life-long learning increases.

Development of Interaction Simulation Video for Enhancing Digital Empathy Skills

Sirikanya Maneenil, Sukhothai Thammathirat Open University, Thailand
Pattaraporn Jamsai, Kasetsart University, Thailand
Suebwong Chuensombat, Sukhothai Thammathirat Open University, Thailand

Abstract
This study applies research and development design aimed creates an interactive simulation video that enhances digital empathy skills. There are two groups of participants. First, six experts in educational technology and digital empathy content were purposively selected. Second, 48 high school students were multi-stage sampling. The research instruments were (1) the evaluation form to check the quality of the interactive simulation video and (2) the digital empathy skill test to measure students of knowledge, practical, and attitudes. The data were analyzed using a mean, standard deviation, and percentage. There are three episodes of interactive simulation video. Episode 1, "I'm not afraid true...I'm really afraid it is not," is about spreading accurate information. Episode 2, "My Areas vs. Your Areas," is about respect for rights and emotional control. Episode 3, "Fun Post…Miserable," is about posting information creatively and politely. Each episode consists of three types of interactions; overlay elements, embedded questions, and hotspots. Based on the expert's evaluation, all episodes of interactive simulation videos are quality at the highest level in all aspects (content, video media, and interaction). Episode 1 had an average of quality 4.66 (S.D. = 0.52). Episode 2 had an average of quality 4.67 (S.D. = 0.52). Episode 3 had an average of quality 4.74 (S.D. = 0.44). The score of the digital empathy skills that students took after study on the interactive simulation video was 93.11% (knowledge 90.00%, practice 96.67%, attitude 92.67%). Thus, interactive simulation videos are effective in enhancing students' digital empathy skills.

Keywords: Interaction Video, Simulation Video, Digital Empathy Skills

The International Academic Forum
www.iafor.org

Introduction

According to prior research, experiential learning is one of the best teaching methods for developing students' digital empathy skills. However, learning from real-world experience has some drawbacks. To support students in learning about digital empathy abilities and practicing how to apply those skills, the researchers embraced the concept of interactive simulation video as opposed to teaching through real-world experience. An interactive simulation video is an approach that encourages students to participate in the learning process independently while watching the video. Students are encouraged to comprehend, analyze, and reflect on circumstances that they may encounter in real life by using interactive simulation videos. Khammanee (2014) stated that adopting the simulation strategy when teaching encourages students to take on the defined learning objectives. The goal of the simulation technique is to encourage students to participate in a chosen narrative. The vignettes were based on actual circumstances that students can encounter in their daily lives online. Students made decision while watching the interactive simulation video will determine the results they experience.

The interactive simulation video is created to simulate real-world events using interactive video. The interactive simulation video's major goal is to give students a close-up experience in which they can either learn or practice new information and abilities. Using the interactive simulation video has many benefits, including motivating students to participate in their education, making it simple to monitor students' progress, and continuously assessing students' learning. The interactive simulation video also gives students rapid feedback. As a result, after each lesson, students can assess their performance and growth. Nonthaman (2018) stated that an interactive simulation video is a teaching tool that supports students' learning across all subject areas (cognitive, affective, and psychomotor abilities). The interactive simulation video will promote student motivation and deeper topic comprehension. Based on the aforementioned ideas, the research's aim was to develop an interactive simulation video for improving students' digital empathy skills.

Purpose

To develop an interactive simulation video that enhances digital empathy skills.

Methodology

Participants

There are two groups of participants. First, six experts in the field of educational technology and digital empathy content were purposively selected. All experts graduated with a doctoral degree and have experience related to designing teaching materials, interactive videos, digital intelligence, or digital empathy. Second, 48 high school students were multi-stage sampling. They are 11-grade students, both male and female.

Research Instruments

(1) An evaluation form uses to check the quality of the interactive simulation video. There are five levels of evaluation (Likert scale). The evaluation criteria are as follows (Leekitwattana, 2015):

5	means	"the most"
4	means	"a lot"
3	means	"moderate"
2	means	"few"
1	means	"minimal"

The score would be interpret as following:

The average score of 5.00 - 4.51	means	"highest quality"
The average score of 4.50 - 3.51	means	"high quality"
The average score of 3.50 - 2.51	means	"medium quality"
The average score of 2.50 - 1.51	means	"low quality"
The average score of 1.50 - 1.00	means	"least quality"

(2) The digital empathy skills test measures students of knowledge, practical skills, and attitudes. There are 24 questions. The digital empathy skills test examined the Item-Objective Congruence (IOC) by three content experts to check the validity. The experts' evaluation showed that the digital empathy skills test has content validity as the IOC comes up between 0.66 and 1.00. The difficulty of the items (p) was between 0.43 - 0.80. The discrimination power (r) was between $0.27 – 0.53$. The reliability of the whole test (KR-21) was 0.78.

Research Design

This study applies research and development design to create an interactive simulation video to enhance digital empathy skills. The researcher has the following research procedures.

Phase 1: Create an Interactive Simulation Video

1.1 Create a simulation video according to the self-learning media design plan. The self-learning media design plan has already been verified by an expert. The researcher creating a simulation video of "Thinking Before Clicking ... Digital Citizen Ethics", which consist of three episodes.

1.2 Take the finished simulation scenario video to develop it as an interaction, based on self-learning media design plan.

1.3 Bring interactive simulation video to experts to evaluate. In this regard, six experts in the field of educational technology and digital empathy evaluated the quality of the video. The evaluation form uses a five-level quality measure (Likert scales).

Phase 2: Find out the Effectiveness of the Interactive Simulation Video With 5th Grade Students Using the Achievement Assessment

2.1 Experiment with a small target group of three students by having students' study from interactive simulation video to find application problems in various areas. The researcher observes the students during the lesson and ask questions (R1).

2.2 Using the information obtained to improve the interactive simulation video (D1).

2.3 Experiment with a medium-sized target group of 15 students by allowing students to study from the interactive simulation video that adjust from experiment with small target groups (R2).

2.4 Using the information obtained to improve the interactive simulation video (D2).

2.5 Experiment with a large target group of 30 students by allowing students to study from the adjusted interactive simulation video to determine the effectiveness of the video (R3).

2.6 Using the information obtained to improve the interactive simulation video (D3).

Result

Phase 1: Create an Interactive Simulation Video

1.1 The researcher created a simulation video of "Thinking Before Clicking...Digital Citizen Ethics", which consists of three episodes:

Episode 1: "I'm not afraid true...I'm really afraid it is not" about spreading accurate and accurate information, 05.24 minutes in duration.

Episode 2: "My areas Vs your areas" about respect for rights without violating other people's privacy and emotional control when conflicting, 06.16 minutes in duration.

Episode 3: "Fun post…Miserable" about posting information creatively and using words in polite way to communicate, 07.54 minutes in duration.

1.2 Take the finished simulation scenario video to develop it as an interaction based on a self-learning media design plan. Each episode consists of three types of interactions:

1.2.1 Overlay elements interaction: To insert a summary of the essence and conclusion of the content. The overlay elements help enhance knowledge which leads to strengthening skills and attitudes.

1.2.2 Embedded questions interaction: To insert a participatory question. Embedded question increases participation and reviews the students' knowledge and understanding. The students make decisions in a situation to strengthen their skills and attitudes.

1.2.3 Hotspots interaction: To direct students to external links by having the students (a) summarize their knowledge and understanding of principles and concepts, (b) apply the situations in the video to real life, and (c) express their feeling towards the simulation events in the video.

1.3 Six experts evaluated the quality of the video, which the evaluation results are follows.

Table 1: The result of interactive simulation video on episode 1:
"I'm not afraid true...I'm really afraid it is not"

Items	Mean	S.D.	Interpret
Content	**4.70**	**0.46**	**The most**
1. The content is appropriate for the learner level	5.00	0.00	The most
2. Content accuracy	4.83	0.41	The most
3. Order of content presentation	4.50	0.84	A lot
4. Interesting content	4.50	0.55	The most
5. Appropriate of the language used in the video	4.67	0.52	The most
Video Media	**4.60**	**0.56**	**The most**
1. The sequencing is appropriate	4.33	0.82	A lot
2. The color tones are beautiful and consistent with video media	4.50	0.55	A lot
3. Voices and narrations are accurate and appropriate	4.67	0.52	The most
4. Background music sound effects are appropriate	4.83	0.41	The most
5. Media clarity	4.67	0.52	The most
Interaction	**4.67**	**0.48**	**The most**
1. The interaction style is suitable for learning style.	4.83	0.41	The most
2. Sequence and timing of each interaction is appropriate to the content	4.67	0.52	The most
3. Placement of text elements and interactive presentation graphics are appropriate	4.67	0.52	The most
4. Interesting interaction on video	4.67	0.52	The most
5. The narration and sound effects are appropriate	4.50	0.55	A lot
Overall	**4.66**	**0.51**	**The most**

Summarizes the quality of an interactive simulation video on episode 1: "I'm not afraid true...I'm really afraid it is not" by experts showing that there is a quality at the highest level in all aspects (x = 4.66). When considered individually in terms of content, video media, and interaction aspects, found to have the highest level of quality in all aspects as well.

Table 2: The result of interactive simulation video on episode 2: "My areas Vs your areas"

Items	Mean	S.D.	Interpret
Content	**4.70**	**0.48**	**The most**
1. The content is appropriate for the learner level	5.00	0.00	The most
2. Content accuracy	4.67	0.52	The most
3. Order of content presentation	4.50	0.84	A lot
4. Interesting content	4.67	0.52	The most
5. Appropriate of the language used in the video	4.67	0.52	The most
Video Media	**4.60**	**0.53**	**The most**
1. The sequencing is appropriate	4.33	0.82	A lot
2. The color tones are beautiful and consistent with video media	4.83	0.41	The most
3. Voices and narrations are accurate and appropriate	4.33	0.52	A lot
4. Background music sound effects are appropriate	4.67	0.52	The most
5. Media clarity	4.83	0.41	The most

Items	Mean	S.D.	Interpret
Interaction	**4.70**	**0.49**	**The most**
1. The interaction style is suitable for learning style.	4.67	0.52	The most
2. Sequence and timing of each interaction is appropriate to the content	4.67	0.52	The most
3. Placement of text elements and interactive presentation graphics are appropriate	4.67	0.52	The most
4. Interesting interaction on video	4.67	0.52	The most
5. The narration and sound effects are appropriate	4.83	0.41	The most
Overall	**4.67**	**0.50**	**The most**

The quality of an interactive simulation video on episode 2: "My areas vs. your areas" by experts showed that, there is quality at the highest level in all aspects (x = 4.67). When considering each side of content, video media, and interaction, it found that, there is the highest quality on all sides.

Table 3: The result of interactive simulation video on episode 3: "Fun post…Miserable"

Items	Mean	S.D.	Interpret
Content	**4.80**	**0.37**	**The most**
1. The content is appropriate for the learner level	5.00	0.00	The most
2. Content accuracy	4.67	0.52	The most
3. Order of content presentation	4.83	0.41	The most
4. Interesting content	4.67	0.52	The most
5. Appropriate of the language used in the video	4.83	0.41	The most
Video Media	**4.67**	**0.50**	**The most**
1. The sequencing is appropriate	4.67	0.52	The most
2. The color tones are beautiful and consistent with video media	4.83	0.41	The most
3. Voices and narrations are accurate and appropriate	4.50	0.55	A lot
4. Background music sound effects are appropriate	4.67	0.52	The most
5. Media clarity	4.67	0.52	The most
Interaction	**4.77**	**0.45**	**The most**
1. The interaction style is suitable for learning style.	4.83	0.41	The most
2. Sequence and timing of each interaction is appropriate to the content	4.83	0.41	The most
3. Placement of text elements and interactive presentation graphics are appropriate	4.67	0.52	The most
4. Interesting interaction on video	4.67	0.52	The most
5. The narration and sound effects are appropriate	4.83	0.41	The most
Overall	**4.75**	**0.44**	**The most**

Table 3 summarizes the quality of an interactive simulation video on episode 3: "Fun post … Miserable" by experts showing that there is quality at the highest level in all aspects (x = 4.74). When considering each side of content, video media, and interaction, there are the highest quality on all sides.

Phase 2: Find Out the Effectiveness of the Interactive Simulation Video With Students Using the Achievement Assessment.

2.1 Experiment with a small target group of three students by having students' study from interactive simulation videos to find application problems in various areas. The researcher observes the students during the lesson and interviews students about the video (R1).

2.2 Using the information obtained to improve the interactive simulation video (D1). Data analysis from observing the use of interactive simulation video and interviewing three students for various application problems. The results showed no problems.

2.3 Experiment with a medium-sized target group of 15 students by allowing students to study from the interactive simulation video that adjusts from the experiment with small target groups (R2). In order to determine the effectiveness of the interactive simulation video, students will be required to study the content through an interactive simulation video and take a digital empathy skills test after watching the video.

2.4 Using the information obtained to improve the interactive simulation video (D2). The researcher's analysis of performance values relative to the standard criteria is determined in Table 4.

Table 4: The results of the experiment were used with a medium-sized target group of 15 to determine the performance trend of interactive video scenarios.

	Knowledge	Practice	Attitude	Total
Mean	4.53	4.80	4.53	4.62
Percent	90.67	96.00	90.67	92.44

The score of the digital empathy skills test after studying the interactive simulation video was found to be 92.44%, indicating that the interactive simulation video is based on criteria compared to standard criteria.

2.5 Experiment with a large target group of 30 students by allowing students to study from the adjusted interactive simulation video to determine the effectiveness of the video (R3). In order to determine the effectiveness of interactive simulation video, students will be required to study the content through interactive simulation video and take a digital empathy skills test after studying.

2.6 Using the information obtained to improve the interactive simulation video (D3). The researcher analysis of performance values relative to the standard criteria determined as in Table 5.

Table 5: The results of the experiment were used with a large target group of 30 to determine the performance trend of interactive video scenarios.

	Knowledge	Practice	Attitude	Total
Mean	4.50	4.83	4.63	4.66
Percent	90.00	96.67	92.67	93.11

The score of the digital empathy skills test after studying the interactive simulation video was found to be 93.11%, indicating that the interactive simulation video is based on criteria

compared to standard criteria. The Office of the Basic Education Commission (2010) stated that 80% of scores interpret as a student with excellent academic performance.

Discussion and Conclusion

The results reviewed the process involved in synthesizing documents and relevant research to establish the framework for designing interactive simulation video scenarios. Subsequently, the framework was used to develop a series of three episodes of interactive simulation videos. Each episode encompassed evaluations of content, video quality, and interaction. Expert assessments indicated that every component of each episode exhibited the highest quality. Furthermore, the digital literacy skills assessment scores showed a significant improvement in digital empathy skills, reaching an average score of 93.11%. The researchers would like to discuss the following points:

1. In terms of content, the researchers have studied the problems associated with the use of social media among teenagers (Supamangmee, 2021; Puwinchana, n.d.). The most common issue identified is cyberbullying, which involves infringements on personal data, emotional control, and the spread of fake news. These findings have influenced the thematic direction, treatment, and screenplay development for each episode of the video. This process includes organizing the presentation of content in a way that captures and enhances the learners' interest and understanding. Additionally, appropriate language usage aligned with the learners' level is considered, following the principles of scriptwriting. This process involves various steps, such as providing necessary information about scenes and characters, improving the script for better comprehension, and refining the storytelling to make it concise and engaging. These efforts contribute to making the content more interesting (Sargent & Rising, 2022).

2. In terms of video quality, the assessment results indicate the highest level of quality. This outcome is a result of designing interactive simulation video scenarios that encompassed the following elements: 1) Issues, 2) Concepts, 3) Learning Outcomes, 4) Evaluation Methods, 5) Themes, 6) Treatment, 7) Interactive Flowchart Activities, and 8) Screenplay. All of these components were developed during the pre-production phase and evaluated by experts in media and educational technology, and content expertise before creating the media. After completion, the videos were further assessed by both experts and student viewers who were similar to the target audience (try-out) for further refinement. This aligns with the rational approach to the media effectiveness evaluation process, which involves conducting evaluations in stages, using a panel of experts for evaluation based on judgment, and following the production process for each medium (Wattananarong, 2014). Additionally, the videos were used with try-out groups consistent with the evaluation principles mentioned by Chaijaroen (2008), which involve comparing the media against predetermined criteria. Furthermore, the digital literacy skills assessment scores showed a significant improvement in digital empathy skills, reaching an average score of 93.11%, compared to the criteria and evaluation results set by the Basic Education Commission, Ministry of Education, which are set at 80%, indicating excellent learning outcomes (Office of Academic Affairs and Education Standards, 2010).

3. In terms of interaction, the researchers employed various interactive formats, such as overlay elements, embedded questions, and hotspots, to make them suitable for the learning style and enhance the engagement of interactive responses in the simulation videos. This corresponds to the work of Palaigeorgiou, Papadopoulou, and Kazanidis

(2018), who define interactive videos as presentations that offer response options in various formats within the video. The purpose is to promote learner participation and engagement with the presented learning content.

The research findings demonstrate that the development of interactive simulation videos is an integration of the various concepts mentioned above, blended and applied to create interactive simulation videos. Overall, each episode of the videos exhibited the highest level of quality. Additionally, the results from using the interactive simulation videos showed their effectiveness in enhancing knowledge, skills, and attitudes related to ethical digital technology usage among learners.

Analysis of Gender Difference of Factors Affecting Academic Performance of Mathematics Doctoral Students

Xiaonan Han, University of Macau, China

Abstract

This study aimed to investigate the gender differences in the factors affecting the academic performance of mathematics doctoral students. A total of 147 participants were surveyed using a questionnaire that included items such as fear of delay, doctoral student engagement, support from parents and teachers, facilitating conditions, stress levels, and well-being. this study aimed to investigate the impact of various factors on the academic performance of mathematics doctoral students and whether there were any gender differences in these factors. Structural equation modeling (SEM) and Multiple group analysis approach were adopted to analyze the questionnaire data. The results showed that the fear of being delayed did not have a significant impact on the academic performance of doctoral students in mathematics, but it did heighten their stress levels. The level of engagement of students had a positive impact on their academic performance, and teacher support had a significant impact on academic performance, particularly for male students. However, there were no significant gender differences in the factors affecting academic performance. These findings suggest the importance of creating a supportive environment and promoting student engagement to enhance academic performance. The study's findings also have practical implications for institutions, supervisors, and parents seeking to enhance the academic performance of different-gender doctoral students.

Introduction: Analysis of Gender Difference of Factors Affecting Academic Performance of Mathematics Doctoral Students

The OECD reported in 2015 that women made up almost half of all doctoral students in their jurisdiction. While the number of female doctorate recipients has been increasing, the field of mathematics remains an exception to this trend (Su & Rounds, 2015). It has been historically believed that gender differences in math Ph.D. participation and achievement were due to differences in ability or interest (Charles, 2011). However, research in the US and Sweden has shown no differences in math performance between boys and girls in primary, middle, and high school (Brandell et al., 2007). This conclusion was also supported by a meta-analysis of international assessments in math. Despite this parity in performance, there is still a significant gender gap in female participation in Ph.D. studies and beyond, leading to the so-called "leaky pipeline" phenomenon (Else-Quest et al., 2010; Moss-Racusin et al., 2012).

It is extremely difficult to attain academic achievement in doctoral studies, resulting in a significant number of dropouts and low satisfaction levels among students pursuing a doctorate degree (Zhang et al., 2022). So, there is many research focusing on digging deeper on doctoral students' academic performance. Most previous studies measured students' academic performance in terms of the number of high-quality publications and the time to complete the Ph.D. program (Ceci et al., 2009). Few studies have used process evaluation to assess student academic performance. Comparative studies have shown an increase in doctoral education in East Asia, as reported by Shin and his colleagues (2018). However, these studies have mainly focused on developed countries and have not given much attention to developing countries. So, It is important to identify gender-based differences in factors that affect the performance of mathematics Ph.D. students in order to offer improved assistance or aid for postgraduate students in other East Asian settings.

Literature Review

There are many research explained gender-based performance differences in Ph.D. students (Brandell et al., 2007; Heffron et al., 2021; Wan Chik et al., 2012). Most previous studies measured students' academic performance in terms of the number of high-quality publications and the time to complete the Ph.D. program. Fisher and his team found that the women included in their study finished their Ph.D. training approximately six months later than their male peers and published about one paper less during their doctoral studies. It also has been observed that males have a higher probability of completing their studies compared to females (Strayhorn, 2005; Wao & Onwuegbuzie, 2011).

However, Previous studies have not fully considered the intricacies of attaining a postgraduate degree when examining the factors that facilitate the success of doctoral students. Bagaka and colleagues (2015) have argued that the "All But Dissertation" approach undermines the true objectives of successful doctoral programs, which should prioritize factors such as mastery of material, commitment to excellence, writing and communication skills, study skills, knowledge of professional literature, and critical thinking abilities.

Other research has also suggested that women's academic performance can differ significantly depending on the field of research (Ceci et al., 2009; Su & Rounds, 2015). While previous reports have focused on doctoral students from different fields, such as kinesiology (Young et al., 2019), STEM (Fisher et al., 2020), communication (Carpenter et

al., 2015), and education (Spaulding & Rockinson-Szapkiw, 2012). There is still limited literature on mathematics postgraduates.

In conclusion, the objective of this research is to investigate and identify whether there is gender difference that impact the academic progress of doctoral students in mathematics. A survey was conducted on 147 postgraduate students from Indonesia, and a range of quantitative analysis methods were utilized, including structural equation modeling.

Theoretical Background

Doctoral Academic Performance Indicators

Researchers in the field of higher education have made numerous efforts to examine the academic performance of doctoral students. Recent studies have focused on different indicators of success, such as attrition rates (Castelló et al., 2017; Leijen et al., 2016), retention rates (Ames et al., 2018), completion rates (Bekova, 2021), and on-time graduation (Ndayambaje, 2018). Although these indicators are reasonable, some scholars (Bagaka et al., 2015) have argued that success in doctoral education should also focus on the competencies of postgraduates as scholars, their knowledge of specific areas, and their personal abilities. The definition of academic success at the doctoral level varies across different subjects, and a comprehensive definition of doctoral success is highlighted as a combination of internal and external factors.

To provide a comprehensive assessment of doctoral students' academic performance, multiple indicators are prioritized instead of solely relying on degree completion rates. According to Olehnovice's (2015) theories, academic competence can be divided into three categories:

F1: Informative competencies: determine structure, content, and strategy of experiments or research.

F2: Communicative competencies: the ability to collaborate and participate in the academic environment, both locally and globally.

F3: Instrumental competencies: determine the appropriate procedures and patterns of interpretation for data.

Factors Affect Ph.D. Student Academic Performance

Numerous prior reports have investigated various factors that influence academic success of postgraduate students, highlighting the complex core of doctoral studies (Leijen et al., 2016) Wollast et al., 2018). Leijen and colleagues (2016) identified three categories of factors that contribute to doctoral students' progress, including personal characteristics, supervisory arrangements, and the broader learning community. Castelló et al. (2017) also examined institutional and personal variables that affect doctoral students' dropout rates. Despite the importance of institutional support, family support was found to be a significant source of social support, particularly in East Asian countries where students have high levels of family support and comfort (Choi & Nieminen, 2013). In this study, the model focuses on various predictors that have been derived from previous theories, such as fear of delay, doctoral student engagement, support from parents and teachers, facilitating conditions, stress levels, and well-being. It is anticipated that these factors will have an effect on the academic achievement of mathematics doctoral students, and they are discussed in detail in the following paragraphs.

Student Engagement

Student engagement refers to the level of investment a student makes in their education, including time, energy, and cognitive efforts. The concept is broken down into: behavioral, cognitive, and emotional three perspectives. It is a crucial aspect that impacts a student's learning outcomes, grades, and accomplishments. At the K-12 level, student engagement is closely tied to academic success and educational abilities (Shuck & Reio Jr, 2014). In this study focused on mathematics doctoral students, engagement is defined as their ability to read literature, seek opportunities, collaborate with peers, create learning tools, discuss with mentors, conduct research, and publish results. Higher levels of engagement in these activities are believed to reduce stress and directly impact academic performance.

Parental Support

Previous studies (Mata et al., 2018) have consistently shown that parental support is strongly linked to student academic achievement and is a crucial factor in shaping their learning success. This type of support can impact a student's motivation to learn, attendance, and overall behavioral attitudes. It can be divided into two categories: academic and emotional support. Dityawati's meta-analysis (2019), revealed that receiving support from parents had a notable and favorable impact on the academic accomplishment of students. However, another study suggested that helping with homework and assisting with learning did not have a significant impact on educational abilities (Wu, 2001). Therefore, it appears that parental support does not always have a significant influence on a student's learning progress. The present research, which centers on mathematics doctoral students, hypothesizes that parental support will effectively decrease stress levels and enhance academic achievement.

Facilitating Conditions

Facilitating conditions are the circumstances that enable students to pursue a graduate degree and have access to individuals who can assist them in resolving academic issues. To improve the academic skills of these students, educational institutions should provide a variety of amenities, such as workshops and training sessions. Previous research (Wijaya et al., 2022) has indicated that facilitating conditions can indirectly impact student academic achievement during a pandemic by influencing their behavior. For this study, it is predicted that facilitating conditions will have a positive effect on well-being and improve their academic performance.

Teacher Support

Parental and teacher support are critical factors in determining students' abilities. Prior research conducted by Mata's team (2018) explored the correlation between teacher support and academic success among students in elementary and secondary schools. In this particular study, teacher support refers to the suitable guidance given by mentors and professors to all postgraduate mathematics students. Since collaboration skills are essential in the 21st century, teacher support can also motivate doctoral students to work with professionals or peers, leading to significant improvements in their academic performance through mutual learning. Our hypothesis suggests that teacher support will have a constructive and noteworthy effect on the academic accomplishment and overall welfare of mathematics doctoral students.

Student Well-Being

Student well-being is a critical factor that affects various aspects of the academic world, including learning abilities, engagement, achievement, and teamwork capability (Ansong et al., 2020). It is important for educators to understand that student well-being significantly influences academic achievement (Mehta, 2011). In addition to preventing students from exhibiting problems such as stress and frustration, well-being also helps them grow and learn from educational challenges. The term "well-being" in this context is defined as the ability and resources to regulate emotions effectively and maintain a constructive and optimistic attitude while engaging in the learning process. Some institutional policymakers place a strong emphasis on student well-being during classroom learning, believing that students can only achieve maximum academic performance when they are educationally satisfied and supported (Pietarinen et al., 2014). This study predicts that facilitating conditions and teacher support on campus will influence student well-being and that it will be significantly and positively associated with the academic performance of mathematics doctoral students.

Stress Level

Stress has a great impact on a person's psychology (Salanova et al., 2010). Studies (Wang et al., 2021; Westphal et al., 2022) have explored the relationship between stress and academic performance due to its effect on students' health. Surprisingly, this study found that stress is rarely beneficial for individuals, which is consistent with existing literature (Abdullah et al., 2022; S. Liu & Onwuegbuzie, 2012). While stress can sometimes motivate people to learn more and improve their abilities, it can also have negative consequences on their overall well-being.

However, stress can also improve coping strategies that may be useful in solving other problems in the future. Despite this, the present study predicts that stress levels will significantly reduce the academic performance of mathematics postgraduates. Parent support and student engagement are predicted to reduce stress levels for doctoral students.

Based on the literature review, 14 initial hypotheses containing 5 independent, 2 intermediate, and 1 dependent variable are shown in Figure 1. Based on analysis above, this research tends to explore how do these factors impact the academic performance of male and female Ph.D. students and gender difference of factors affecting academic performance of mathematics doctoral students.

Figure 1: A Proposed Framework for Factors Affecting Mathematics
Doctoral Student's Academic Performance
Methodology

Participants

There are 147 Indonesian mathematic doctoral students engaged in this study. The study informed consent from study participants. All the participants were provided with complete information regarding the study's objectives, methodologies, potential advantages, and risks, and they were given the chance to ask any questions and opt-out of the study at any given time. Table 1 provides detailed data of the participants.

Table 1: Demographic Respondents' Data

Demographics		N	Percentage
Gender	Male	59	40.14%
	Female	88	59.86%
Age	20–24 years old	41	27.89%
	25–29 years old	86	58.50%
	30 years old and above	20	13.61%
Academic year	First	23	15.65%
	Second	41	27.89%
	Third	52	35.37%
	Fourth year above	31	21.08%
Marital status	Married	91	61.90%
	Not yet Married	56	38.10%
Job status	Not Yet Working	119	80.95%
	Already Working	28	19.05%

Data Collection Tool and Procedure

Using Google Docs, a set of online questionnaires was created. The questionnaires was designed based on the literature review, which had a 5-point Likert scale ranging from strongly disagree (1) to strongly agree (5). All of the questionnaire items were taken from previous reports and were modified to fit the context of this study, ensuring that the questionnaire had good validity and reliability.

The questionnaire was reviewed by three professors before it was distributed to participants from August to September 2022. The questionnaire was randomly distributed through email, WhatsApp groups, and university professors. Participants were not compelled to fill out the questionnaire and were not required to provide their names, which ensured the anonymity of the data. The information obtained from the questionnaire was kept for study purposes only and was not disseminated. It took an average of 9 minutes to fill out the questionnaire.

The questionnaire used in this study had two parts. The first part collected basic information about the doctoral students, such as their gender, age, and academic year. The second part consisted of 27 measurement items that were taken from previous reports and focused on various factors including fear of delay, engagement, parental and teacher support, facilitating conditions, stress level, well-being, and academic performances.

Data Analysis

The data obtained were processed and analyzed using SPSS 23 and AMOS 26, Firstly, the data were initially assessed and sorted, with the descriptions of the participants carried out through SPSS 23. The subsequent phase of the study focused on analyzing the measurement model to verify its reliability and validity, with a particular emphasis on the Composite Reliability (CR), as well as the factor loading and AVE estimations. Furthermore, AMOS was used to apply structural equation modelling (SEM) which was more suitable for explaining the difference between gender difference of factors affecting academic performance. This study also examined the measurement invariance of the scale in male and female groups. The measurement invariance includes four aspects of invariance: configural invariance, metric invariance, scalar invariance, and strict invariance. When evaluating the measurement invariance, if the change in the RMSEA index is less than 0.01, it is considered as passing the measurement invariance test. So, we can say that the results (Table 2) of the measurement invariance test showed an acceptable result.

Table 2: Measurement Invariance Result

Model	χ^2	df	CFI	RMSEA	Model Compare	$\Delta\chi^2$	Δdf	p	ΔRMSEA
M1: Configural invariance	2487.42	866	0.63	0.16					
M2: Metric invariance	2635.76	928	0.61	0.16	M2−M1	147.94	62	< .001	−0.001
M3: Scalar invariance	2686.96	951	0.60	0.16	M3−M2	51.60	23	< .001	-0.001
M4: Strict invariance	2787.71	985	0.59	0.16	M4−M3	100.75	34	< .001	-0.001

Validity

The CMIN/DF value is 2.82 < 3, which indicates an acceptable fit (Kline, 1998). Comparative Fit Index also shows a very good fit (close to 1), (Hu & Bentler, 1999). (See Table 3 and Table 4).

Table 3: CMIN

Model	NPAR	CMIN	DF	P	CMIN/DF
Default model	121	1145.89	406	0	2.82
Saturated model	527	0	0		
Independent model	62	280	465	0	6.88

Table 4: Comparative Fit Index

Model	NFI	RFI	IFI	TLI	CFI
Default model	0.642	0.59	0.74	0.69	0.73
Saturated model	1.00		1.00		1.00
Independent model	0.00	0.00	0.00	0.00	0.00

Analysis Measurement Model

Validity was tested by observing the value of factor loadings This was accompanied by the values of AVE and CR, which should be greater than 0.50 and 0.70 respectively. We can see that except for facilitating condition (0.434) and engagement (0.456), other factors have acceptable AVE value. Besides, the Composite Reliability exceeded the 0.70 limitation. Detailed results of analysis are provided in Table 5.

Table 5: Standardized Regression Weights

Indicator			Std. Estimate	AVE	CR

Result

Multiple group analysis in AMOS is a powerful tool for comparing models across different groups and identifying any differences that may exist (Byrne, 2016). So multiple group analysis was used to identify the differences between different genders. From Table 5, we can see that $P > .05$, indicating that the model is not significantly different on different gender groups.

Table 6: Multiple group analysis

Model	DF	CMIN	P	NFI	IFI	RFI	TLI
Structural weights	12	2.636	0.056	-0.004	-0.005	-0.004	-0.005

Figure 2 and 3 show the result of structural model of male and female. Table 7 and 8 show the results of regression weights of male and female, $p<.05$ means that the path is significant, and in the case of a significant path, a positive coefficient means that the independent variable has a significant positive effect on the dependent variable, and a negative coefficient means that the independent variable has a significant negative effect on the dependent variable.

Table 7: Result of male

Academic performance	<---	Facilitating conditions	-1.974	0.629	-2.872	0.004

| Academic performance | <--- | Wellbeing | 1.259 | 0.349 | 2.736 | 0.006 |
| Academic performance | <--- | Stress | -0.022 | 0.036 | -0.305 | 0.761 |

Through the comparison of the two results, for the factor stress, only fear of postpone had a significant effect on stress (p < .001), and the effect of fear of postpone on women's perceived stress was greater than the effect on men's (0.542 > 0.467), student engagement and parental support had no significant influence on stress. It seems like men's stress is more likely to be influenced by parental support. In terms of well-being, only facilitating conditions had a significant effect ($p < .001$). There was almost no difference between male and female in terms of the effect of teacher support on well-being.

In terms of the dependent variable of academic performance, student engagement, teacher support, facilitating conditions, and well-being have a significant impact on academic performance. Among them, facilitating conditions have a negative impact on academic performance, while the others have a positive impact. Student engagement, facilitating conditions, and well-being have a greater impact on female academic performance than on male academic performance, while teacher support has a greater impact on male academic performance.

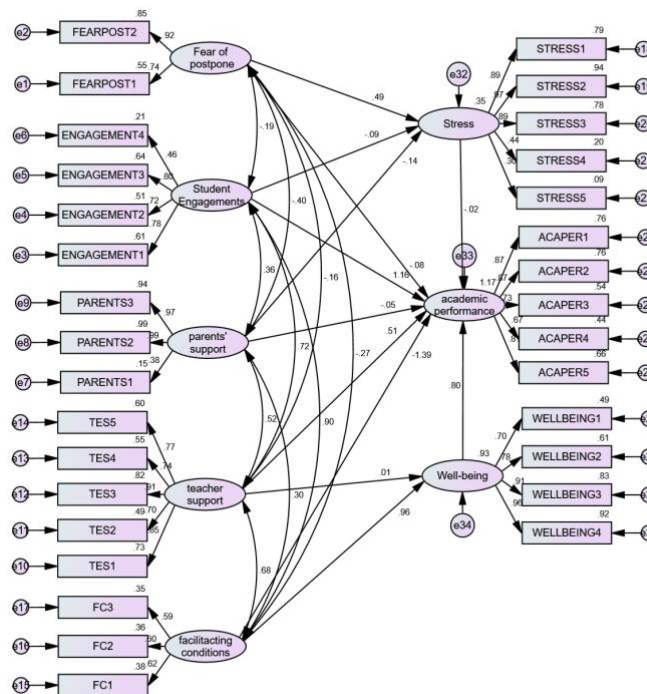
Figure 2: Structural Model Evaluation Result for Male


Figure 3: Structural Model Evaluation Result for Female
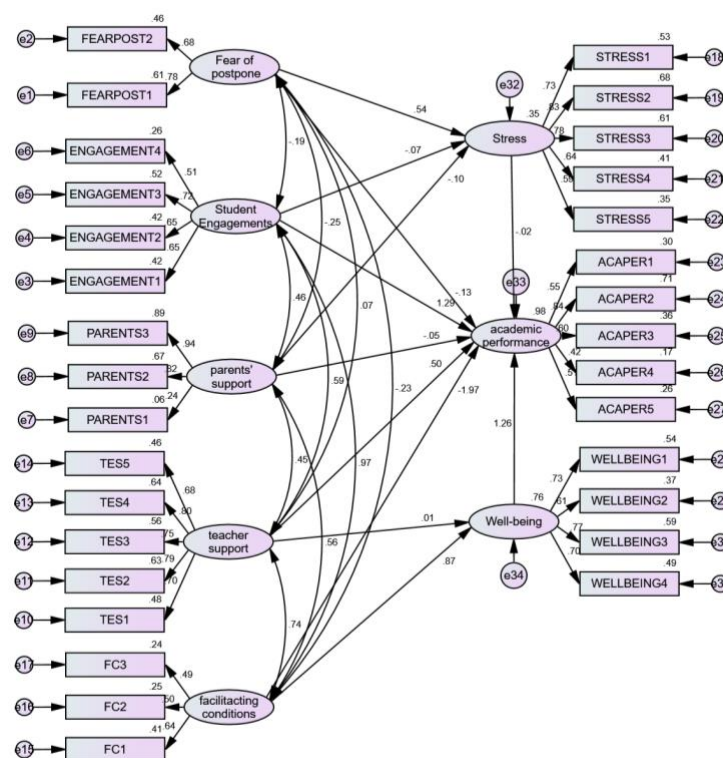

Discussion

Our research indicated that the fear of being delayed could heighten the stress levels of doctoral students in mathematics, but it did not have a significant impact on their academic performance. This finding contradicts previous studies that demonstrated how fear of failure and stress can motivate individuals to achieve their goals effectively (Liu et al., 2022; Putwain & Symes, 2011). Daniel (2020) suggested that anxiety levels increase when individuals experience fear, and this often drives them to perform better.

The result emphasizes that the academic performance of doctoral students in mathematics was positively impacted by their level of engagement. Those who were highly engaged had a better perception of their academic achievements. This finding is consistent with previous research that suggests students who are more passionate about their education tend to perform better academically (Gopal et al., 2018; Kossen & Ooi, 2021).

The significant impact of teacher support on academic performance has been found in this study which is consistent with previous studies (Davidson et al., 2021). Furthermore, the conclusion of teacher support has a greater impact on males is also consistent with previous research (Fisher et al., 2020), which surveyed 227 alumni of STEM Ph.D. programs in 17 African countries and found that supervision had a stronger impact on men than women.

Our study found no significant difference between factors affecting males and females, which is consistent with previous research results (Seagram et al., 1998; Sheridan & Pyke, 1994; Wilson & Reschly, 1995). The academic environment and expectations for both genders are relatively similar at the doctoral level. However, some studies have found that female academic performance is worse than that of males, as evidenced by the fact that women take

longer to complete their doctoral-level requirements. If this is the case, it may be due, in part, to the accumulated microinequities that women experience as graduate students. Many authors have pointed out that the nature and quality of graduate education is not equivalent for men and women (Ceci et al., 2009; Feldon et al., 2017).

Conclusions

About the first research question, how do these factors impact the academic performance of male and female Ph.D. students. Our research found that the fear of being delayed did not have a significant impact on the academic performance of doctoral students in mathematics, but it did heighten their stress levels. The level of engagement of students had a positive impact on their academic performance, and teacher support had a significant impact on academic performance, particularly for male students. These findings suggest that universities and educators should prioritize creating a supportive environment for students and promoting student engagement to enhance academic performance.

About second research question, gender difference of factors affecting academic performance of mathematics doctoral students. our research found no significant difference between factors affecting males and females in doctoral-level mathematics. These findings suggest the importance of creating a supportive environment and promoting student engagement to enhance academic performance, regardless of gender.

Implication

The study's findings have practical implications for institutions, supervisors, and parents seeking to enhance the academic performance of doctoral students. The results indicate that the success of these students is closely linked to the involvement of parents, lecturers, and the students themselves. Therefore, these stakeholders must collaborate to reduce stress levels, promote well-being, and support doctoral students' academic progress. Institutions should develop programs that prioritize the well-being of doctoral students, encouraging them to view earning a doctoral degree as a worthwhile pursuit. Faculty members and supervisors should consider implementing strategies to improve students' engagement and well-being.

Limitation

First, our sample size was not large enough. Furthermore, it is probable that any disparities between genders are not connected to the elements we investigated in our study, but rather to external factors like societal and cultural influences. Our findings suggest that gender may not be a significant predictor of academic achievement in doctoral-level mathematics, but more research is necessary to comprehend the intricate interplay of factors that contribute to gender disparities in graduate education. Potential future studies could delve into other factors, such as mentoring, career goals, and work-life balance, and explore how they interact with gender and other demographic variables. This research could inform policies and practices that promote gender equality and diversity in mathematics doctoral education and beyond.

Implementation of 5S Lean Methodology in Reviewing Competencies in a Higher Education Institution

Jasim Al Dairi, Military Technological College, Oman
Yousuf Al Khamisi, Sultan Qaboos University, Oman

Abstract

The potential of applying Lean Management in Higher Education Institutions has increased significantly in last few years leading to tremendous savings. Reviewing and updating competencies' curriculum matrix is one of the critical and complicated processes that consume time and effort. Consequently, there has been a quest for a scientific and sustainable approach to effectively manage this review. This paper presents a novel approach of implementing Lean (5S) methodology in reviewing technical competencies required for the graduates of the Military Technological College in the Sultanate of Oman. The 5S framework has been imbedded into an action plan using the PDCA (Plan, Do, Check, and Act) Deming's cycle. As a result, the method applied has helped in sorting out the actual required competencies, the team has identified the required (new, amended, and deleted) competencies in all of the targeted Engineering Departments, in addition, the major wastes within the overall process were identified and the future review process was standardised and documented.

Keywords: Kaizen, SDCA, PDCA, 5S, Lean, MTC, Competencies, Curriculum Matrix, Higher Education

Introduction

The sophistication of equipment and machine learning technology has accelerated the global economic race competition. In forthcoming era, leading edge organisations will be forced to give the preference in recruitment to the specialised hands-on skills personnel. Therefore, vocational competencies based on updated required skills and knowledge are going to play major role in achieving the required students' attributes of Higher Education (HE) institutions.

Military Technological College (MTC) – Oman has taken a step further as a leading organisation in this field. It delivers academical technical and vocational competencies needed by graduates using three integrated approaches (i.e., academic programmes, Training Needs Analysis (TNA) programmes, and integration of the TNA programmes with the academic programmes) [1]. This has led to have a very complicated competencies' curriculum matrix mapping for MTC engineering departments, that obviously triggered searching for a scientific and sustainable approach to manage such a review process.

Overview and Review Scope

MTC has been established to become a Centre of excellence through its substantial provision of education and training for Ministry of Defense (MoD) and civilian technicians and engineers in the Sultanate of Oman. The College aims to become amongst the best in the filed of military and applied non-military technical education and training. This has driven its mission as the place of delivering vocational trade, specialists, undergraduate and postgraduate engineering programs in a high quality learning and training environment [1].

The college comprises of five engineering departments, namely Systems, Aeronautical, Marine, Civil and Quantity Survey, and Geomatics. The Geomatics department is a recent addition that has not been considered during the implementation stage of this study. In the course of the review process, the number of competencies taken into account is as follows: 371 for Systems Engineering, 54 for Aeronautical Engineering, 111 for Marine Engineering, and 78 for Civil and Quantity Survey Engineering [4].

The plan was to develop a review process aimed at a comprehensive review of competency descriptors' documents, focusing specifically on the following sections: elements and performance criteria, required skills and knowledge, resources required to demonstrate the competencies, and the assessment strategies. However, the process was intentionally designed to be flexible, allowing for the removal of existing competencies or the addition of new ones in response to changes in technology and stakeholder requirements.

Methodology

Lean is a management philosophy and methodology that originated in manufacturing sector but has since been applied across various industries. It is centered on the concept of maximising customer value while minimising waste [5]. In essence, lean thinking seeks to optimise processes by eliminating unnecessary steps and increasing processes efficiencies [3]. Research indicates that the initial implementation of Lean management in higher education occurred in 2003 [2].

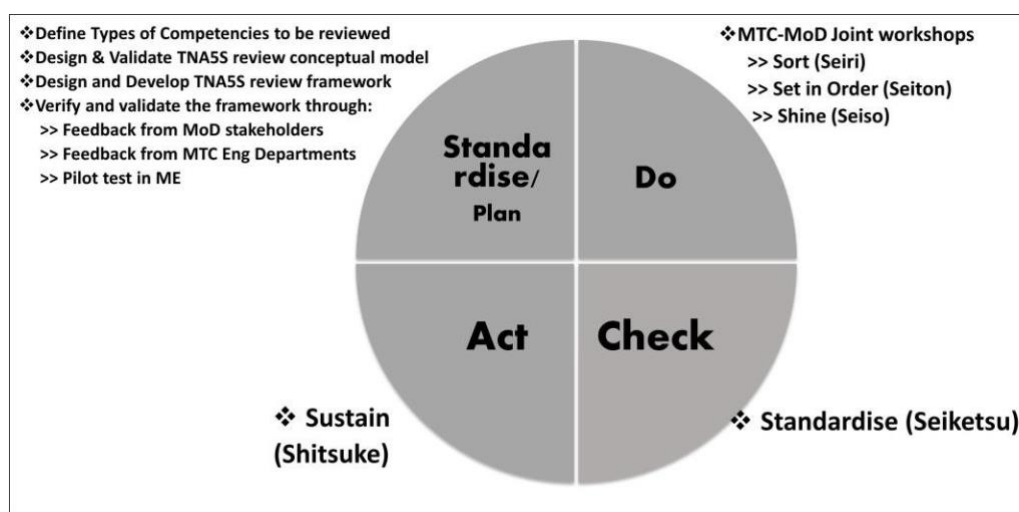
Numerous tools and techniques are available within the realm of Lean methodology (e.g., value stream mapping, value engineering, kanban, etc.). In the context of this study, a strategic choice has been made to incorporate the 5S housekeeping Lean tool. This Japanese tool utilize five keywords, all beginning with the letter S, as its basis. Sort (Seiri), Set in order (Seiton), Shine (Seiso), Standardise (Seiketsu), and Sustain (Shitsuke), and it has been seamlessly integrated into a PDCA (Plan-Do-Check-Act) Deming cycle using Kaizen mode (i.e., starting the first cycle with Standardise instead of Plan); Figure 1 shows Cycle-1 TNA5S review conceptual model. This deliberate integration aims to enhance the efficiency and effectiveness of the review process mechanism by systematically addressing and improving the competencies descriptors elements described earlier through clear documentation and well-established accessibility of the required information from different stakeholders.


Figure 1: Cycle-1 TNA5S review conceptual model.

During *Standardise* step of Cycle-1 of the TNA5S review conceptual model, types of competencies to be reviewed were defined. The designed model underwent validation by a Lean practitioner, ensuring its conformity to Lean principles. The TNA5S review framework was then meticulously developed and successfully underwent a verification and validation process, necessitating only minor adjustments. A pilot test was conducted in coordination with Marine Engineering department.

In the subsequent *Do* phase, a comprehensive plan was developed and executed in a collaborative workshops forum involving all stakeholders (i.e., MoD specialists, MTC engineering departments' concern lecturers and instructors, and random selected participants from MTC graduates). The primary objective was to delineate vocational competencies from other types (*Sort*). The *Set in Order* aspect was employed to categories mandatory competencies separately from complementary ones which will systematically impact the proficiency levels students must attain before graduation. The process concluded with removing unnecessary elements, conducting proofreading, and updating the documents (*Shine*).

Following the *Do* phase, efforts were directed towards ensuring the planned implementations were executed as intended. This included confirming that competency descriptors for all Engineering departments adhered to a unified format and complied with established policies

and regulations (*Standerdise*). The final task involved obtaining Check/evaluation approval, as a prerequisite to progress to the subsequent step.

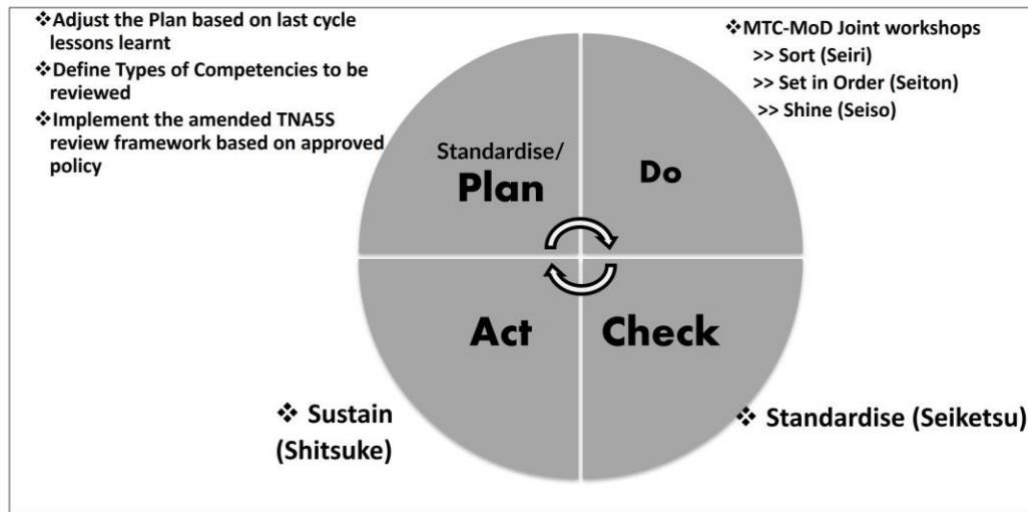
In the *Act* phase, insights and lessons gleaned from the process were comprehensively discussed and documented. These insights are instrumental in refining the Plan step for the next cycle of the review (*Sustain*), as illustrated in Figure 2.


Figure 2 Cycle-2 TNA5S review conceptual model.

Findings

Despite the fact that the implementation of the new review mechanism has resulted in enhanced efficiency and effectiveness of the overall process and significant reduction in review lead time, Figure 3 highlighted the comprehensive review findings pertaining to incorporated new (22 competencies), modified (173 competencies), and deleted (2 competencies) descriptors.
Figure 3: TNA5S Competencies Review Findings.

During the review process, three primary forms of waste were identified. Firstly, overproduction manifested as departments repeatedly generating amendments to competency descriptors, leading to the creation of multiple versions. Secondly, overprocessing was evident in the unnecessary inclusion of elements in competency descriptors documents. Lastly, waiting times were notable, primarily stemming from extended periods required for peer review and consultation with stakeholders.

Conclusion

In conclusion, the effective implementation of the TNA5S review conceptual model and framework demonstrates its success in streamlining competency review process. This achievement proves the adaptability of Lean principles in higher education, showcasing their potential to eliminate waste and enhance efficiency. The key takeaway lies in the commitment to sustain Lean practices, emphasising ongoing dedication as a critical factor for success. This accomplishment marks a significant step toward reshaping educational processes and promoting continuous improvement in higher education.

EFL Students' Perceptions of the Use of Higher Order Thinking Skills in English Language Writing: Indonesian Students' Contexts

Faza Lutfiyana, Universitas Pendidikan Indonesia, Indonesia
Fazri Nur Yusuf, Universitas Pendidikan Indonesia, Indonesia

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Higher Order Thinking Skills (HOTS) is inevitably important to develop students' critical and creative thinking skills in 21st century era. HOT skills are the cognitive ability to analyze, evaluate, and create some topic inside or outside the classroom. This case study was conducted to explore the impact of using HOT skills and investigate student's perception towards its use in EFL writing classrooms. This study involved three students in the third grade in junior high school. They were asked to independently write recount texts with similar theme. Students' worksheet and interviews are conducted and then analyzed by using Bloom's taxonomy. The findings eventually show that that stage "analyze" mostly appears in written form and the students felt actively involved in learning activities, developed their writing skills, and experienced learner autonomy and problem-solving abilities. The study recommends that HOT skills have a positive result for EFL students and be explicitly infused in the teaching and learning of writing activities in EFL classrooms.

Introduction

Inevitable prompt growth in the 21st century influences almost every aspect of human life (Assare, Mohammadi, Forutan, & Salehizadeh, 2016) and there is no exception for the education aspect. Much improved competencies and skills are needed to equip students of any level of education in today's globalization and disruption era (Huang et al., 2010). The fundamental aspect is Higher-order thinking skills. As they are known, they needed education to meet the demands of the twenty-first century. many specialists have noted the connection between students' academic success and higher-order thinking capabilities (HOTS). This is why students who learn with critical thinking abilities frequently achieve academic success. In the current decades, Higher-Order Thinking Skills (HOTS) has become the center of attention of some countries in the world to build their generation to be critical thinkers who are ready to face real-life situation in this era. Many countries applied HOTS as an aspect that should include in the curriculum at every stage of education including Indonesia.

The utilization of HOTS in the educational process, particularly in teaching and learning, is important. The effectiveness of learning itself may be impacted by learners' capacity for critical thought. The abilities include all varieties of abstract talents, such as problem-solving and critical thinking abilities (Nourdad, Masoudi, & Rahimali, 2018). Reid (2014) argues that students need to develop their critical thinking abilities urgently so that they can become aware of their own thoughts as they consider different approaches to an issue. Students who are self-conscious are aware of what they are learning, and those who are self-monitoring consider their strengths and weaknesses as problem-solvers. One of the thinking skills that people now require is the capacity to solve problems. The theory of human thinking skills was classified by Benjamin Bloom at the beginning of his publication entitled Educational Objectives: The Classroom of the Educational Goals. It was the original version explaining the learning objectives and thinking ability.

Since many years ago, the significance of those thinking abilities has been recognized. It follows that using HOTS in the classroom shouldn't have been a challenge for educators of all generations. Nowadays, there are essentially three generations of teachers. First, those who were born between Baby Boomers are those born between 1945 and 1964. The smallest generation, those born between 1965 and 1979, are referred to as Gen X or digital immigrants. Gen Y refers to those who were born between 1980 and 1999. According to Gibson, Greenwood, and Murphy (2009), this generation is also known as the Millennial, Echo-Boomers, and Net Generation. Teachers should be able to create and implement HOTS that is connected with the subject matter during the teaching and learning process (Sutarto, 2017).

Literature Review

Concepts of Higher-Order Thinking Skills (HOTS)

The 2013 Curriculum, developed by Indonesia's Ministry of Education and Culture (Kemendikbud), strongly emphasizes a strong emphasis on 21st-century abilities. Teachers are supposed to help students develop the 4Cs (critical thinking and problem-solving, communication, collaboration, and creativity), which are the pillars of 21st-century learning. (P21, 2011). Therefore, the teacher should employ instructional strategies that can help students develop their higher-order thinking skills (HOTS). According to Brookhart (2010), the idea of HOTS is the act of taking the knowledge that has been stored in memory,

restructuring it, and using it to serve a function in unexpected contexts. Additionally, HOTS is divided into three fundamental categories: transfer, critical thinking, and problem-solving. As a higher level of cognitive activity, HOTS includes the following skills: (a) the ability to apply knowledge and skills in new contexts; (b) the ability to describe the problem logically and solve it creatively; and (c) the ability to critically evaluate arguments and reach a conclusion.

Additionally, according to Brookhart (2010:5), the highest level of Bloom's cognitive taxonomy is higher-order thinking. Any cognitive taxonomy's educational objective is to enable transfer among students, according to the author. Higher Order Thinking (HOT) is the phrase used to describe "thinking at a level higher than memorization of facts or telling something back to someone." Additionally, "HOT requires students to act and takes thinking to higher levels than simply restating the facts." Additionally, the old paradigm frequently ran into the awareness of the necessity of creating a learning process that places a focus on HOTs in the twenty-first century. Under the Regulation of Education and Culture Minister of Indonesia Number 22 the Year 2016 concerning the Standard Process of Elementary and High Education, knowledge is acquired through actions such asanalyzing, evaluating, and creating. This statement is in line with the Bloom Taxonomy called HOTS.

The application of HOTS in the educational process, particularly in teaching and learning, is important. The efficiency of learning itself may be impacted by learners' capacity for critical thought. The abilities include all varieties of abstract talents, such as problem-solving and critical thinking abilities (Nourdad, Masoudi, & Rahimali, 2018). Weay, Masood, and Abdullah (2016) claim that Bloom categorizes educational goals into three categories: cognitive, affective, and psychomotor domain. The six stages of Bloom's taxonomy's cognitive domain are knowledge, comprehension, application, analysis, synthesis, and evaluation. The five levels of the affective domain are receiving, responding, valuing, organizing, and characterizing. Meanwhile, the psychomotor domain is classified into seven levels, namely perception, set, guided response, mechanism, complex over response, adaptation, and origination. Those three educational objectives are then popularly known as Bloom's Taxonomy.

In contrast, Harris et al. (2014) quote Anderson and Krathwohl (2001) who define a new cognitive domain that includes remembering, understanding, applying, analyzing, evaluating, and producing. The analyzing, evaluating, and creating tasks—which were previously handled by analyzing, synthesizing, and evaluating—are where the original and amended versions diverge. According to the revised version, producing is the highest level of mental capacity, while remembering is the lowest. On the other hand, As stated by Rajendran and Idris (2008) in Chidozie (2014), higher-order thinking skills involve the need of analysis, evaluation, and creation or production as thinking skills. As components of HOTS, analyzing is the capacity to dissect information into its component pieces and organize the pertinent information; evaluating is the capacity to consider something and develop an opinion; and generating is the highest capacity to produce novel ideas or concepts.

Higher-Order Thinking Skills in EFL Classroom

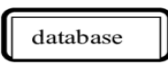
Higher Order Thinking Skills (HOTS) are divided into three categories by Brookhart (2010) based on the learning goals that students must attain. Transfer, critical thinking, and problem-solving are the first three. If a student is able to think critically, which means that they can make good decisions or offer valid criticism, they are considered to have HOTS. As a result,

they are able to offer justifications, reflect, and choose wisely. The student's capacity for evaluation is important to mention in this case. Students are required to be able to judge a source's reliability in the present era, where there is a variety of information, and determine if the material is reliable or not. In project-based learning, all of the HOTS components are present. Based on the aforementioned explanation, it can be concluded that project-based learning is unable to accommodate the achievement of three Basic Competencies, namely attitudes, knowledge, and, skills in the Indonesian 2013 Curriculum. Therefore, project-based learning can be used as an alternative in implementing the Curriculum 2013.

The National Research Council (1987) initiative, which covered a number of American schools, offered several major recommendations on different techniques to synthesize theories relating to HOT skills. The main study showed that HOT abilities had a significant influence on students' successful learning outcomes. It was discovered that kids compared to knowledge acquired by lower-order abilities, notably rote memorization, knowledge acquired through HOT learning processes is better retained in the long term.

Teaching English is commonly conducted by different teachers who bring various experiences and knowledge into the classroom. What the teacher brings into the teaching brings into the teaching-learning process will influence the students' outcomes. By exploring their perceptions, the result will become one of many references that may evaluate their behaviors toward the classroom, (Borg, 1999). Evaluating what the teachers do in the classroom, it may result in improving students' achievement, especially in the EFL Classroom. Istiqomah (2018) argued in her research, developing HOTS for junior high schools mainly in EFL Classrooms is not easy and challenging for them. Teachers and students face many difficulties in delivering English subject materials that employ HOTS in it. Students' different characteristics, levels of intelligence, and motivation become the factors that may influence their teaching-learning process (Juhansar et al., 2018).

HOTS Strategies in Pedagogical Practices

Frangenheim's model (2006) grounded on Bloom's taxonomy promotes strategies for pedagogical practices by integrating HOT skills which has the Thinking Skills Framework (TSF hereafter) for students (Table 1) and is complemented with the Teacher's TSF. This model helps teachers in understanding the importance of using HOT skills and empowers teachers with creative and innovative strategies in their pedagogical practices. Students become engaged in their learning through the TSF and they are able to practice HOT skills effectively through various activities. Results from various studies contend that students' interest and engagement in the classroom impact positive learning outcomes which even motivates them to pursue challenging tasks in the classroom environment (Ames, 1992; Kaplan et al., 2002).


Bloom Level	Verbs	Starters	Tools

Table 1: Thinking Skills Framework (TSF hereafter) for students

This study adopted Frangenheim's (2006) model. In this model, the students' TSF advocates engaging and individualized lessons where it paves the way for students to take ownership of their learning. In this TSF (Table 1), students will be able to understand the intended learning outcomes that the teacher designs through various questions and activities which educate students in the six cognitive levels of Bloom's taxonomy. When students learn about these levels, they are also exposed to the appropriate thinking tools for each of the six levels of thinking. Frangenheim's HOT model (2006) encourages 21st-century skills of critical and creative thinking skills to be acquired through questioning at the appropriate level and scaffolding of tasks by incorporating a range of collaborative and cooperative strategies. The learning outcomes are achieved through a combination of strong content knowledge and the effects on student engagement can be dramatic.

Methodology

Research Questions

The study was guided by the following research questions:

- What are ESL students' perceptions of learning writing using Higher Order Thinking Skills?

Research Design

The study aimed to explore students' perspectives on the use of Higher—Order Thinking Skills in their writing ability. To answer the research question, this research employed a qualitative case study method. This process (Cresswell, 2014) is what this study intends to. Therefore, this study employed a qualitative case study since it aimed to see the natural phenomenon of the teachers understanding and their teaching approach which were elaborated descriptively.

Research Sample

The sample is the three students who were selected. The participant had sought the cooperation of the researchers not to name the school, Students, as a measure of safeguarding the privacy of the EFL students involved in this study. Hence, the school will be named 'School A' and the location of this school was in a remote setting in Temanggung Regency, central Java Indonesia. The students were identified based on purposive sampling as the form one class was the target group that is currently experiencing the national based-assessment system. The case study was selected based on the criteria that the five students were selected as the sample for this study.

Research Instruments

A semi-structured interview and document analysis were conducted to collect information about the students' HOTS perception. To collect deeper detailed information, the document analysis is processed through a student's worksheet while the interview guideline was developed based on theories of HOTS by Anderson et al. (2001) and then analyze using TSF. Regarding HOTS theory the method was developed based on the Retnawati et al. (2017). The procedures permit the researcher to explore the data from the participants related to their understanding of HOTS in the writing context. For the Interview guideline were developed based on the knowledge. The interview was conducted at the beginning in which the results were used as the guideline for developing the observation checklist. The interview was conducted in a one-on-one mode which was recorded and transcribed for accurate recording. The interview sessions, which were held in a classroom immediately after school hours, aimed to elicit students' perceptions concerning the impact of using HOT skills in their EFL writing classroom.

Interview sessions were held after the completion of the teaching of writing using HOTS (four weeks). An interview schedule, based on Frangenheim's (2006) HOT model, was constructed to formulate appropriate questions that will facilitate the collection of the required data to answer the research questions. The construction of interview questions for the EFL students was given due consideration regards to the research questions, objectives and HOT skills' framework of this study. This procedure involved segregating themes and

issues in relation to the area of study which is closely aligned to the teaching and learning of writing using HOT skills. The responses provided by the EFL students were then analyzed deductively. The analysis looked into various aspects that encompassed the manner in which the students perceived the effectiveness of learning writing using the TSF.

Procedure

The participants are students in the ninth grade of junior high school who has learned to recount text. The teacher guided them to write the characteristics feature of the text and then the researcher analyzed using the Thinking Skills Framework (TSF). There were six choices in TSF cognitive domain. During the analysis of data, the researcher was briefed on the features of incorporating HOTS in the designing of the rubrics which is in relation to the TSF. They included the following tasks: asking students to write down their text, asking for semi-structured interviews, and providing specific feedback. These features of HOTS integrated the writing lessons were part of the journey in ensuring that students mastered the art of recount text and that processes experienced by students were engaging while creativity was promoted.

The TSF poster (Table 1) was guided and used by the researcher to analyze HOTS by taking into consideration Bloom's levels of remembering, Understanding, Applying, Analyzing, Evaluating, and Designing. The six elements in the TSF played an important role in ensuring HOTS. In the first lesson, the teacher highlighted the TSF to the students and Bloom's six levels of cognitive domains, the use of appropriate verbs, sentence starters, and the ways to employ the appropriate thinking tools. At the end of task 6, focus group interviews were conducted among 48 students who volunteered from the three intact EFL classes, with the aim of determining the extent to which HOT skills affect EFL students' learning of writing and their perceptions of learning writing using HOT skills. There were 2 focus group interviews that were conducted for each class: Group A and Group B from Class 1; Group C and D from Class 2 and Group E and F from Class 3. In analyzing student responses in the focus group sessions, pseudonyms were used to reflect actual student views.

Result

Students' Perception of Bloom's Taxonomy Level 1 (Remembering)

To analyze the students' perception of this stage, there were asked to write and talk about recount texts specifically their experience. They act as a source to recall information. The result indicated that all of the students use cognitive "Remember" in their writing product and in the interview but use different words. Student "A" stated TSF helped them to know the characteristic words that he would apply in their writing. The other students concurred with student A. Majority of students were excited to use "To be" and "Modality" to express the cognitive "Remember" while implementing HOTS both in their text or oral skills. They stated:

> "Last school holiday, I was happy because I could meet my grand parent again after a long time. The atmosphere there was very pleasant. I could play with my brothers and sisters".

The result indicated that TSF helped the students to be "aware of what was expected" from them in the lessons. They "felt that they performed better". All of the participants really

understand well in this cognition. The students were of the opinion the cause-effect map was helpful in understanding the ways in which elaborated their activity during their vacation.

Students' Perception of Bloom's Taxonomy Level 2 (Understanding)

Students conveyed their experience, acting like an expert in understanding the reasons why they can talk that their holiday is fantastic. Student B stated that the 'Wh' questions asked by the teacher had made them think "very deeply" to mention how fun they were on their holiday. He said:

> "What did you think about my trip? The vacation was fun. My cousins and I stayed for few days. It was great when every day joking around with my cousins, visiting the relatives' house, going to fields, and eating snack every without end".

Most students realized that the TSF helped them to be "More critical" of themselves in the lessons. They "felt that they do perfectly". They believe that this stage pushes them to explore and elaborate on the reason behind their fascinating holiday.

Students' Perception of Bloom's Taxonomy Level 3 (Applying)

Most students had collectively voiced out that they enjoyed themselves dramatizing their experiences during the holiday. Each of them has a different idea to share their argument. Student C stated,

> "At that time, when my cousins and I were walking through stairs and telling stories, then I suddenly fell and all eyes were looking at me. How embarrassed I am. Then I immediately stood up and continued on my way even though my legs were really sore".

Many other students felt the same way as student C and the idea in the form of storytelling was performed in class. When students were asked about their experience writing the recount essay, there were quite a number of responses that basically highlighted on students usually have a 'mental block' during writing but after experiencing the TSF lessons, students had "no problem and phobia" about writing essays.

Students' Perception of Bloom's Taxonomy Level 4 (Analyzing)

Almost all the students conveyed their "enthusiasm" acting like a magnifying glass to share their interesting and uninteresting stories. Student A said:

> "Last semester break was really fun. I can meet again with my family and enjoy a lots of food in Bantengan Art. This holiday will always be missed".

Many students communicated similar opinions as student A. The Fishbone diagram was a tool that "fascinated" students and they enjoyed the experience of applying their information to related writing activities in the classroom.

Students' Perception of Bloom's Taxonomy Level 5 (Evaluating)

From all the participants, it was clear that the majority of students stated that they gained "confidence" in having the opportunity to share and conclude the extent of their holiday experience. The students who considered themselves "shy", stated that they felt "grand" at being able to assume the role of judge-jury. Most students also communicated that they were able to critically evaluate situations, and discuss and recommend ways to control the knowledge. Student B stated, "I am not usually confident of my evaluation ability but not anymore though. I have realized my ability to evaluate well". Students C concurred with him and said "Oh yes! I feel the same too and am proud of myself for doing a good job. I was amazed at myself for being able to share my activity and conclude their impression of their holiday". Similar responses were stated by student A.

Students' Perceptions of Bloom's Taxonomy Level 6 (Designing)

All students communicated to the researchers that they felt like an "inventor" designing the brochure containing the activity about their holiday session. Student C said, "I felt cool and creative designing the brochure, especially the graphics. My friend edited it and other friends suggested colors and ideas for designing it. We worked so well together and never got this chance before". Several other students shared similar viewpoints and said that they imagined themselves being "future inventors".

Conclusion

The findings from the interviews indicate that students perceived their roles in the writing classroom as follows: they felt engaged in active learning, they experienced learner autonomy, they developed their writing, researching and personal skills as well. The HOT lessons promoted students' involvement and discussions in the classroom in which students believed that their ideas matter in the classroom. The HOT lessons tapped into students' prior knowledge by providing context-rich language resources and this concurs with Cummins, (1994) and Dong's, (2004) findings that language teachers play an important role to promote HOT skills aligned to language skills.

The students in this case study felt that HOT skills are nurtured by giving them a platform to compare, question, discuss, validate and reflect on their own and others' ideas. Research findings advocate that students from diverse ethnic and socio-economic environments in junior high should be given the platform to develop their HOT skills in real classroom teachings (Newman, Bryk & Nagaoka, 2001). In this study, students' ability to question their peers and likewise, answer their teacher's questions, provided a new dimension in their thinking and this in turn helped to develop their writing skills. The TSF fostered HOT skills among students when they learned to use the critical and creative thinking tools in a practical way and engaged in co-operative learning.

The findings of this study suggest that HOT writing lessons facilitate students' writing ability and interest and should be explicitly infused in the teaching and learning of writing activities in EFL writing classrooms. The TSF which was used as a conceptual framework of this study confirms the extensive effect of HOT skills in promoting students learning outcomes in writing where it has the potential to enhance students' minds, leading to the production of a variety of alternatives, ideas, actions, solutions and design. To some extent, the findings of this study confirm the significant value of HOT skills in generating ideas so students have the

potential in acquiring creative and critical thinking. While the findings of this case study cannot be generalized to all EFL classrooms in Malaysia, there is a possibility that the use of the TSF can be viewed as a viable option in the teaching of writing among other secondary school students, especially in regards to examining the potential of this framework in other EFL contexts.

Attitudes of Students Towards Lessons Using Video Materials

Khishigdelger Batjantsan, National University of Mongolia, Mongolia

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This paper examines the attitudes of students toward lessons using video materials in the context of teaching the Japanese language to foreign students. Previous teaching methods in the field have shifted from grammar lectures to communication-based student-centered learning approaches. Consequently, the use of video content has gained popularity due to its effectiveness in enhancing learning outcomes and providing real-life examples difficult to express in a foreign language. In this research study, a survey was conducted on 56 Mongolian university students learning Japanese to assess the importance of video lessons in Japanese language classes and gather students' feedback on their experiences with video-based teaching. 96.4% of students believed that video lessons were necessary, indicating a strong interest and enthusiasm for incorporating video content into their learning experience. To find the motivational factors that motivate students, a factor search was conducted on 20 questions of motivation to learn Japanese and based on these questions: Factor I-identified regulation, Factor II-intrinsic motivation, and Factor III- external regulation. The survey results suggest that the use of video materials in Japanese language lessons can be highly effective. Students expressed a preference for video-based teaching, highlighting its potential to enhance motivation and create a real learning experience. Additionally, students who attended lessons using video materials reported higher satisfaction levels. Therefore, incorporating video materials into the classroom can be an effective approach to improving students' attitudes and learning outcomes in foreign language education.

Introduction

In Japanese, hardware training is defined as "... demonstration and listening training ..." which refers to a course that uses film or programming. Researchers and many real-life examples show that the use of images and sounds for the human senses of sight and hearing enhances learning outcomes. This training plays a particularly significant role, especially in understanding difficult content to express in a foreign language. In recent years, content such as Japanese movies, plays, and anime has become popular all over the world through social media and the Internet, providing an incentive for Japanese language learners. In many countries around the world, there is a tendency to use video as a valuable learning tool for foreign language and cultural education. On the other hand, lessons that are only based on textbooks and chalkboards lack a comprehensive all-around learning environment for learning a new language. Audio-video training allows students to overcome some of the temporal and spatial constraints of any phenomenon, and to that extent helps to deepen students' understanding and knowledge. Some studies have shown that learners use these videos effectively for independent learning or extracurricular learning. Using such substance in classroom settings can strengthen the "relationship between classroom and extracurricular learning," and conducting video lessons that combine listening activities can improve the quality of teaching.

Based on the history of the development of teaching the Japanese language to foreign students, there have been three prevalent methods in the past.[1] In the beginning period, lectures on grammar structure and translation methodologies were predominant in the learning process. Such lectures were correlated to the social and political environment of that time. Consequently, from the 1980s, various practices for pronunciation and speaking skills, such as repetition and memorization became more popular. During both times, the learning processes were mainly instructor-centered. However, as a consequence of major developments and social research on the theory of learning a second language and the theory of language transformation, there have been many changes and shifts in improving communication-based student-centered learning methods and processes.

In Japanese, lessons aided by technological devices, which include movies and shows, are expressed as "demonstration and listening training." Practical real-life examples and science-based research studies show that the use of images and sounds for the human senses of sight and hearing enhances learning outcomes. More specifically, this method is important in conveying meanings and contexts that are difficult to express in a foreign language. In recent years, video content such as Japanese movies, plays, and anime has become popular all over the world through social media and the Internet, providing an incentive for Japanese language learners. There is a tendency to use video content as a valuable learning tool for foreign language and cultural education. On the other hand, lessons that are only based on textbooks and chalkboards lack a comprehensive all-around learning environment for learning a new language. Audio-video training allows students to overcome some of the temporal and spatial constraints of any phenomenon, and to that extent helps to deepen students' understanding and knowledge. Some studies have shown that learners use these video content effectively for independent learning or extracurricular learning. Using such substance in classroom settings can strengthen the "relationship between classroom and extracurricular learning," and conducting video lessons that combine listening activities can improve the quality of teaching.

Research on Increased Video Materials During Japanese Lessons for Mongolian Students

There are many Japanese classes in many schools in Ulaanbaatar. It can be seen that in any bookstore, there are various Japanese textbooks, dictionaries, and video materials for Japanese learners in Mongolia. The schools that are teaching Japanese in their curriculums all have Japanese grammar, speaking, reading, creative writing, and translation lessons despite their differences in the number of learners in each school, demographics, lesson hours, and lesson content.

What Level of Importance Do Video Lessons Have in Such Classes?

To answer the above question, we conducted a survey on November 15th, 2017 on students learning Japanese. All around, 56 students with levels 1 and 2 from Mongolian universities participated in the survey. The results show 62.5% or 35 students have answered "yes" when asked if they have participated in classes with video lessons. However, 85.7% of 30 students answered "unsatisfied" when asked about the outcome of the lessons, which brings up speculation of whether the classes merely showed videos and did not follow up with thorough lesson materials.

When asked about whether having lessons that use video materials is necessary, 96.4% of 54 students answered yes, which shows the enthusiasm and interest of the students in video lessons in such a way that showing video content in class is highly effective.

Based on the survey results, it can be seen that using video content in lessons may even be more effective than many other ways of learning. The experimental lesson was designed and conducted in a way that lessons can increase learners' enthusiasm and motivate them as video content comprises visual aids, movements, and audio to create a real learning experience and environment.

Experimental Lessons and Analysis Using Video Materials in Japanese Language Teaching

Trial period of the experimental lessons: March 12, 2018 - April 12, 2018.

Twenty-four teachers of the Academy for the Promotion of Intellectual Development participated in this experimental course. The teachers do not have prior Japanese language knowledge as the center provides soroban counting tray training; therefore, they will be the learners in our study.

Course Description: Video technology has the advantage of being able to pause, restart, scroll, re-show, and show with or without sound. The order of the lessons has been decided in a way that it is possible to rewatch the videos as this type of lesson needs to be shown for the first time, for the second time, and the final stage.

Course Materials: A series of daily video lessons on learning Japanese through the everyday adventures and activities of Erin, a girl studying in Japan.

One of the main criteria for choosing a video is to know how the language elements are used and incorporated into the video conversation (grammar, usage, vocabulary, etc.). It is also important to observe the frequency with which the use occurs and select a video that matches

the topic of the lesson being taught. It is possible to find specific rules, grammar, and examples of usage in real life or films; however, it is time-consuming. Therefore, we chose a video material, which was made by a professional organization, to make the Japanese language training video easier to use and understandable to the students. Additionally, materials made by the researchers, such as vocabulary words, visual aids, and exercise sheets were used alongside the textbooks.

Student Satisfaction Survey

Satisfaction survey questions about experimental lessons were taken examples from the "classification assessment question" developed by Hoshino and Muta [2003]3 and the dissatisfaction scale of Ando (2000) "English language-related dissatisfaction". The lesson evaluation was divided into 4 sections: 7 questions for the lesson approach, 7 questions for the student's level of understanding, 2 questions from the communication matters, and 4 questions from the teacher's efforts. A total of 16 questions were selected and revised, which include:
- The question "I wanted to learn more" was changed to "3. I became interested in relearning Japanese through videos."
- The question "I understood the meaning of the Japanese-speaking content" was changed to "9. I was able to understand the meaning of the Japanese-speaking video in a conversation lesson."

For each evaluation question there are five levels to the answers: 1- don't think so at all, 2- don't think so much, 3- don't agree at all, 4- think so, and 5- absolutely think so. In addition, five questions were asked to freely write down their impressions of the lessons aided by video materials. The table below shows the survey questions for the satisfaction level of the Japanese language lessons.

Table 1: Student Satisfaction Survey Questions

№	Questions	Factors
1	I used to wait for the next conversation lesson	1
2	I was satisfied with the conversation lessons	1
3	I became interested in relearning Japanese through videos	1
4	I enjoyed watching videos and talking in conversation classes	1
5	The atmosphere in the conversation classes was good	1
6	The instructor taught me interesting things to learn in the conversation classes	1
7	The content of the conversation lessons was interesting	1
8	I was able to understand the meaning of Japanese words in the conversation classes	2
9	I was able to understand the meaning of the video in Japanese in the conversation classes	2
10	I understood the content of the conversation lessons well	2
11	I tried to speak Japanese	2
12	I tried to focus in the conversation classes	2
13	I tried to memorize Japanese vocabulary words	2
14	I was happy to be able to communicate in Japanese in the conversation classes	2
15	The voice of the teacher was clear in the conversation classes	3
16	The conversation material was appropriate	3
17	The teacher was effective in teaching the conversation class	3
18	There were relevant exercises in the conversation classes	3
19	The teacher was trying to make the students speak in the conversation classes	4
20	The conversation lesson was easy to read as the teacher wrote it on the board	4

Analysis of the Satisfaction Factor of the Experimental Lessons (Factor Analysis)

After the trial session, factor analysis was conducted on 20 questions about student satisfaction with the video lessons. Factor analysis (D. Chimgee, 2018, p. 164) reduces the number of variables in a model or examines the relationship between variables. It was explained that the main purpose of this analysis was to replace the multi-attribute or variable factor with a few attribute variables. The Promax rotation of the Maximum Likelihood method was chosen for factor analysis. As a result, three factors emerged. This model is shown in Table 2.

Table 2: Results of the satisfaction factor analysis of Japanese language lessons

Factor number	Questions
Factor I Student effort/level of understanding ($\alpha = .751$)	14 I was happy to be able to communicate in Japanese in the conversation classes. 8 I was able to understand the meaning of Japanese words in the conversation classes. 9 I was able to understand the meaning of the video in Japanese in the conversation classes. 12 I tried to focus on the conversation classes.
Factor II Course Satisfaction ($\alpha = .709$)	6 The instructor taught me interesting things to learn in the conversation classes. 7 The content of the conversation lessons was interesting. 3 I became interested in relearning Japanese through videos.
Factor III Teacher's effort ($\alpha = .733$)	15 The voice of the teacher was clear in the conversation classes 17 The teacher was effective in teaching the conversation class 18 There were relevant exercises in the conversation classes

Factor I can be regarded as a question related to the level of understanding of students as it comprises questions such as, "14. I was happy to be able to communicate in Japanese in the conversation classes," "8. I was able to understand the meaning of Japanese words in the conversation classes," "9. I was able to understand the meaning of the video in Japanese in the conversation classes," "12. I tried to focus in the conversation classes."

Factor II can be related to the approach to the lesson, as it includes questions such as, "6. The instructor taught me interesting things to learn in the conversation classes" and "7. The content of the conversation lessons was interesting."

Factor III is a question related to the teacher's diligence as it consists of questions such as, "15. The voice of the teacher was clear in the conversation classes," "17. The teacher was effective in teaching the conversation class," and "18. There were relevant exercises in the conversation classes."

The structure of the four factors was considered in the distribution of the satisfaction question; however, depending on the results of the research factor analysis, it was decided that establishing three variables is necessary. Cronbach alpha was used to test the reliability of the three-factor construction variable. Its results are shown in Table 3.

Table 3: Reliability of the variable's alpha

	Factors	Alpha (Cronbach)
1	Level of understanding of students	0.75
2	Attitude to the lesson	0.78
3	Teacher's effort	0.71

Course satisfaction factor I ($\alpha = 0.75$), factor II ($\alpha = 0.78$), and factor III ($\alpha = 0.71$) were the results, and the compatibility of the variable was considered sufficient.

The generated variable is the subscale score of the corresponding questions. The average score for each of the 24 students' variables was 4.19 (SD = 0.71), the attitudes variable was 4.21 (SD = 0.78), and the teacher's effort variable was 4.54 (SD = 0.66). Figure 1 below shows the distribution of satisfaction variables in Japanese language lessons.

Figure 1: Distribution of Japanese language lesson satisfaction variables (%)

In total, 71.61% of students answered 5-absolutely think so and 4-think so. Additionally, 72.53% of the students answered 5-absolutely think so and 4-think so to the distribution of responses to the lesson approach variables and the structure. It was observed that the students who attended the lesson using the video material were satisfied.

Conclusion

The analysis of the student satisfaction (distribution correlation) shows that students' attitudes toward lessons using video improved. Additionally, an analysis of student motivation factors was conducted, which resulted in three factors. To find the motivational factors that motivate students, a factor search was conducted on 20 questions of motivation to learn Japanese, and based on these questions: Factor I-identified regulation, Factor II-intrinsic motivation, and Factor III- external regulation. This is in line with the three factors identified in the Ando [2000] study: regulation, internal motivation, and external regulation. There was a coefficient ($r > 0.4$) for all variables between student motivation and class satisfaction. Therefore, it is concluded that the use of video materials had a positive effect on students.

Youth and Adult Education in the Municipal Network of Barreiros in the Paths of Inclusion and Development: A Qualitative Approach in the Context of Popular Education in Latin America

Natália Antônia da Silva Ramos, Municipal Department of Education, Brazil
Carlos Arthur Soares de Avelar Júnior, Government of Barreiros Pernambuco, Brazil
Onilda Patricia de Sousa Bello, Government of the State of Pernambuco, Brazil

Abstract

This article aims to explain Youth and Adult Education in the Municipal Network of Barreiros in the paths of Inclusion and Development, in a qualitative approach in the context of Popular Education in Latin America based on the actions promoted by the Municipal Network, the social subjects, the curriculum and the role of municipal management in promoting public educational policies in contemporary times. The general objective is to understand Latin American Popular Education in a historical and cultural context based on public educational policies linked to Youth and Adult Education in the municipality of Barreiros – PE. Among the specific objectives we have: understanding the municipality's actions to reduce functional illiteracy: implementing literacy and basic education programs for young people and adults; promoting social inclusion and promoting education in flexible teaching modalities that allow students to combine their studies with work and other responsibilities and investigating how public educational policies aimed at continuous teacher training in the Barreiros Municipal Network develop appropriate teaching materials and adopt innovative pedagogical approaches. Literature analyzes indicated that, in the theoretical field, Youth and Adult Education in Latin America dialogues with the public educational policies promoted by the Rede Municipal dos Barreiros, Pernambuco, Brazil, as they strive for a reflective, critical, civic education, innovative, technological, professional and that promotes the student's comprehensive training.

Introduction

This study aims to explain Popular Education in a Latin American educational conception, focusing on Youth and Adult Education in the Barreiros Municipal Network, investigating paths to inclusion and development, based on government public policies, historical landmarks and academic publications. , we aim to make a connection between the history of Popular Education in Latin America, in the context of Youth and Adult Education, and the actions developed by the Barreiros Municipal Network in a qualitative sampling of education in this modality.

The general objective is to understand Latin American Popular Education in a historical and cultural context based on public educational policies linked to Youth and Adult Education in the municipality of Barreiros – PE. Among the specific objectives we have: understanding the municipality's actions to reduce functional illiteracy: implementing literacy and basic education programs for young people and adults; promoting social inclusion and promoting education in flexible teaching modalities that allow students to combine their studies with work and other responsibilities and investigating how public educational policies aimed at continuous teacher training in the Barreiros Municipal Network develop appropriate teaching materials and adopt innovative pedagogical approaches.

The methodological procedure used in this research was a bibliographic review and literary refinement, which was based on concepts from the works of Jara (2020), Pontual and Ireland (2006), Gadotti and Torres (2003), Freire (1987), Narita and Kata (2020), Carvalho, Ramalho and Santos (2019), Brutscher (2021), among others that address Popular Education in the historical-social context and its importance for social transformation to break heterogeneity. This work is a qualitative study, using bibliographic research, document analysis and constant data mining in articles and books.

We also use the case study, a scientific research resource that uses qualitative data, investigated and received from concrete events, in order to justify, explore or describe current situations within a specific context, without following a specific direction. investigation but mining data, which are collected from the reality investigated, in our case public educational policies for Education in the Municipal Network of Barreiros – Pernambuco – Brazil.

We also aim to understand Youth and Adult Education in Latin America based on a qualitative sampling of the Barreiros Municipal Network and its integration with the National Common Curricular Base and its relationship with the student's comprehensive training in the educational and social context based on the profile of the educator linked to 21st century Education, aware of the challenges that still exist such as infrastructure, training processes and teaching resources.

Justification

Popular Education in the Latin American context is an object of study and educational practice that plays a primary role in promoting social justice, equality and citizen participation throughout Latin America. This educational approach is based on concrete foundations and was developed in response to the needs of social subjects, within their specificities. Among the types of Popular Education we have Indigenous Education, Quilombola Education, Prison Education, Rural Education and Youth and Adult Education.

According to Pontual and Ireland :

> Popular Education, in a Freirean sense , wanted to be a specific contribution to revolutionary social change, one that could enhance a new type of education that formed individual and collective subjects and that focused on the protagonism of these subjects as a condition for the development of their historicity itself. (Pontual and Ireland, 2006, p.88)

When referencing the work of Paulo Freire (1987), we have the reflection of an education that needs to participate in the development of the student in its multiple dimensions, this education being in the context of Popular Education, a liberating education that breaks the historical hegemony that exists in Latino society. American. As one of the specificities of Popular Education, we have Youth and Adult Education which is made up of students outside the appropriate age range for regular schooling and needs special attention, as they are social individuals whose right to education has been denied to them either by social difficulties and/or people, or even the State's shortcomings in guaranteeing this modality for everyone in a given historical space.

In this context, we have public policies that are developed by the State with the aim of providing Popular Education, in the context of Youth and Adult Education (EJA) that enables the development of a liberating education, which encourages students to take center stage, their critical sense and their active participation in society.

Pontual and Ireland state that:

> What is today called "public policies" is not a matter that is purely the responsibility of the State, but also of society. If society and social movements are not involved in the constitution of the public, according to liberal logic, public policies will inevitably lead to technocratic, instrumental or clientelist practices. (Pontual and Ireland, 2006, p.89)

In this vein, we will approach Latin American Popular Education, having as a qualitative investigation point the Education of Youth and Adults in the Municipal Network of Barreiros, which has been developing successful public government policies regarding this educational modality. Actions such as the incorporation of educational technology can help make learning more dynamic and accessible, allowing EJA students to develop digital skills and have access to hybrid educational resources.

As for pedagogical actions, we have Popular Education in the Barreiros Municipal Network that adopts a student-centered pedagogical approach, in which students are active participants in the learning process. This contrasts with traditional authoritarian, decontextualized and passive methodological approaches, which do not motivate critical thinking, citizen participation and autonomy of students.

Another point of action is social empowerment where social subjects of education acquire knowledge, skills and confidence to face everyday challenges, in multiple dimensions such as social, economic and political. This process promotes the empowerment of social communities, enabling them to become agents of change in their own lives and in their societies.

Sustainability and development are also aspects that play an important role in the development of sustainability, environmental preservation and social development. Promote learning about environmental, economic and social issues, helping to build more conscious and responsible societies in relation to the environment, environmental preservation and the well-being of all.

In this sense, Latin American Popular Education promotes a holistic, dynamic and participatory educational approach that respects cultural diversity and empowers communities, through their students, to become agents of change in their own lives and in their societies. Therefore, the promotion of Youth and Adult Education in this governmental path is a fundamental instrument for building a more inclusive, qualitative and equitable future throughout Latin America.

In the normative context, according to Brazil (1988) and LDB (1996), we have EJA as an educational modality aimed at those who did not have access to or completed Basic Education (Primary Education, Early and Final Years and High School) at the regular standard age. Also according to the references, EJA must be offered free of charge and with the same quality and equity as regular education, adapting to the needs and characteristics of students outside the age group, young people, adults and the elderly.

Education of Young People and Adults

Youth and Adult Education (EJA) in the Latin American context is a fundamental action to correct the educational distortion in the countries that make up the bloc, thus acting as a fundamental pillar for promoting inclusion, accessibility and reducing educational inequalities. Thus, EJA is a type of education aimed at citizens who did not finish their studies at the correct age and its offer guarantees the right to an education that aims to fill this gap. Thus, EJA provides learning opportunities for young people, adults and elderly people in Basic Education, in the modalities of Elementary School, initial and final years and High School.

However, according to Machado (2008), it is common knowledge that we have challenges in EJA classes such as the quality of the teaching and learning processes, training of teachers prepared for these educational modality, accessibility and dropout rates. Along this path, we believe that improving Youth and Adult Education (EJA) will require investment in human resources, school infrastructure and the incorporation of new practices and pedagogical supports. In this north, all of Latin America will be able to reap the benefits of a population that is more educated and prepared for the job market, the promotion of citizenship and a society strengthened by justice and social equity. EJA is a strong mechanism for promoting the right to education for students' comprehensive training.

Along this path, EJA's challenges include school dropout, which is the abandonment or even lack of participation of students in classes due to multiple aspects, such as work, family issues and personal situations. Another challenge is the quality of teaching, which can vary, and the lack of inputs, such as infrastructure, transport, textbooks and personal motivation, in addition to the need for qualified teachers for this stage of work and accessibility.

History of Education in Barreiros – Pernambuco – Brazil

The history of education in Barreiros, Pernambuco, is marked by challenges and advances that reflect the educational context of the state and Brazil as a whole. To understand this trajectory, it is important to observe the main milestones and developments over the years. During the colonial period, education in Barreiros, as in much of Brazil, was restricted to religious institutions, mainly the Catholic Church.

The Jesuits played a significant role in education, but access was limited to the white elite and the children of wealthy settlers. With Brazil's independence in 1822, there was a gradual increase in interest in education. The Empire promoted the creation of public schools, but education continued to be the privilege of the wealthier classes.

With the Proclamation of the Republic in 1889, significant changes occurred in the educational system of Barreiros and Brazil. Laws were enacted that established the secularization of education, making it more accessible to a greater number of people. However, illiteracy was still high, and public education faced structural challenges.

In the 1950s and 1960s, there were advances in Brazilian education, including the actions that took place in the municipality of Barreiros – PE, with the creation of the National Education Plan (PNE) in 1962, establishing guidelines for the expansion of education and the reduction of illiteracy. There was an effort to build public schools and promote basic education throughout the country.

During the Military Dictatorship (1964-1985), education suffered political interventions and ideological censorship. However, during this period, the government also invested in expanding the educational system, including Youth and Adult Education (EJA), although there was strong repression of freedom of expression and civilian indoctrination to military precepts.

With the return to democracy in the 1980s, there was a renewed focus on the democratization of education in Barreiros and throughout Brazil. Laws and policies were enacted that guaranteed access to education for all, regardless of age, race or social class.

Today, Barreiros, like the rest of Brazil, continues to face challenges in the educational area. Improving school infrastructure, teacher training, promoting inclusion and combating illiteracy are some of the current concerns. In addition to regular schools, Barreiros also has technical and vocational education institutions, with the Escola Técnica Estadual Central Barreiros and the Instituto Federal de Educação Polo Barreiros – PE, which aim to prepare young people for the job market. These institutions offer courses focused on different areas, such as agriculture, industry, hospitality and commerce.

Youth and Adult Education (EJA) plays an important role in the city, providing learning opportunities for those who did not complete their studies at the appropriate age.

Furthermore, educational technology and the search for partnerships with governmental and non-governmental institutions are ongoing strategies to improve the quality of education in Barreiros and meet the demands of today's society.

In short, the history of education in Barreiros, Pernambuco, is a narrative of evolution and overcoming challenges over the years, reflecting efforts to provide quality and inclusive education for all its citizens.

Methodology

The methodological procedure used in this research was a bibliographic review and literary refinement, which was based on concepts from the works of Jara (2020), Pontual and Ireland (2006), Gadotti and Torres (2003), Freire (1987), Narita and Kata (2020), Carvalho, Ramalho and Santos (2019), Brutscher (2021), among others that address Popular Education in the historical-social context and its importance for social transformation to break heterogeneity.

This work is a qualitative study, using bibliographic research, document analysis and constant data mining in articles and books. We also aim to understand Youth and Adult Education in Latin America based on a qualitative sampling of the Barreiros Municipal Network and its integration with the National Common Curricular Base and its relationship with the student's comprehensive training in the educational and social context based on the profile of the educator linked to 21st century Education, aware of the challenges that still exist such as infrastructure, training processes and teaching resources.

As an object of investigative study, in a qualitative approach, we have the Barreiros Municipal Network in serving Youth and Adult Education students, through documentary research, interviews with participants and analysis of educational indicators such as SAEPE (State of Education Assessment System). Pernambuco), IDEB (Basic Education Development Index) and PISA (International Student Assessment Program).

The documentary analysis, in notes, reports and results of the municipality's internal and external evaluations led us to understand that the work carried out by the Barreiros Municipal Network regarding public educational policies directs us towards an evolutionary path of education, with priorities for accessibility, professional education, use of innovative pedagogical support, constant ongoing training linked to educational practices, provision of quality school meals and teaching material associated with the students' reality of life.

Main Research Aspects

Scientific research is implemented in different aspects of investigation:
- **Literary refinement**: deepening the theme in different authors with the aim of understanding different arguments about the investigation
- **Needs Identification**: Monitor surveys and research to identify the demand for EJA programs in the Barreiros community
- **Structuring Courses and Programs**: Monitor the implementation of personalized curricula and study programs to meet the specific needs of EJA students
- **Teacher Training**: Supervise regular training and qualification for EJA teachers, addressing best pedagogical practices and teaching strategies
- **Infrastructure and Resources**: Identify actions to improve the infrastructure of schools that offer EJA, ensuring adequate facilities and access to modern educational resources
- **Monitoring and Evaluation**: Strengthen the continuous monitoring and evaluation system to measure student progress and identify areas for improvement

- **Partnerships and Resources**: enhance actions that promote partnerships with civil society organizations, higher education institutions, local companies and government agencies

Expected Results

The main results expected from the actions analyzed include:
- Significant reduction in functional illiteracy in Barreiros
- Increase in the EJA completion rate
- Improvement in students' reading, writing and mathematics skills
- Greater inclusion of marginalized groups in education
- Development of a more educated and egalitarian community
- Inclusion of students in the job market

Conclusion

This study approached Popular Education in a Latin American educational conception, focusing on Youth and Adult Education in the Municipal Network of Barreiros, investigating paths to inclusion and development, based on government public policies, historical landmarks and academic publications, we aim to make a connection between the history of Popular Education in Latin America, in the context of Youth and Adult Education, and the actions developed by the Barreiros Municipal Network in a qualitative sample.

In this direction, we realize that public educational policies on Youth and Adult Education in the Barreiros Municipal Network are initiatives that aim to transform the lives of young people and adults through education. By offering new dynamic, flexible and inclusive learning opportunities, the educational actions of the Barreiros Municipal Network contribute to the educational, economic and social development of the Municipality, enabling its citizens to build a better future for themselves and the community.

EJA plays a crucial role in the development of inclusive education and the reduction of social inequalities. Youth and Adult Education provides training for young people, adults and the elderly who seek to acquire basic educational skills in order to improve their quality of life, professional development and participate more effectively in society. In this way, EJA makes it possible to reduce illiteracy and create more informed and engaged citizens.

In the Latin American context, EJA challenges educators, managers and politicians to develop effective public policies to meet the specific needs of this population. This research addressed the challenges and opportunities associated with EJA in a Municipal Education Network, highlighting the importance of an education that promotes: access and retention, literacy and literacy, motivation and self-esteem, financial and material resources, preparation for the job market and improvement specific pedagogical approach for educators using innovative methodologies.

Preparing E-Tutors for Success:
A Qualitative Analysis of a Community Management Training Module for Students

Lisa-Marie Langesee, Technische Universität Dresden, Germany

Official Conference Proceedings

Abstract

The role of corporate community managers, who facilitate digital and cross-location collaboration within corporate communities, is comparable to that of e-tutors, who moderate and assist virtual group work in the university context. E-tutors have a variety of tasks that go beyond merely monitoring their supervised groups. They need to be equipped with numerous competencies to ensure successful e-tutoring. However, current literature only partly addresses how e-tutors build the required understanding and competencies. This study investigates the gap of how a qualification module for e-tutors should be designed to prepare them best. For this purpose, seven participants in an e-tutor qualification module were interviewed. It became apparent that the qualification module had gaps, especially in the training of intercultural competencies, which in turn influenced the interviewees' readiness to become e-tutors. Additionally, beneficial formats for competence development were identified. The study found that Virtual Collaborative Learning (VCL) is a helpful format for developing several competencies, particularly media competencies. In addition, certain framework conditions must be given to attract students to the module, e.g., practical relevance. Based on the findings, the study provides recommendations for designing a qualification module for e-tutors, including the importance of addressing intercultural competencies, incorporating e-tutor tandems, and providing VCL opportunities. Additionally, the study analyzes the consequences arising from its findings, explicitly focusing on their direct impact on succeeding cohorts of e-tutors. This study provides significant insights into developing competencies for e-tutors while offering practical recommendations to enrich their e-tutoring experience.

Introduction

As digital education continues to expand and adapt to our interconnected world, the role of e-tutors is more important than ever (Martin-Cuadrado et al., 2021; Raviolo et al., 2023; Schneider & Preckel, 2017). Like corporate community managers navigate the world of virtual collaboration in companies, e-tutors moderate and support virtual group work, but within the context of higher education (HE). Their broad range of responsibilities (Langesee, 2022) is central to the quality of digital learning experiences, highlighting the need for adequately trained e-tutors (Kopp et al., 2012).

However, little study has been done on the qualification process for e-tutors with this understanding. Even though Heuel & Feldmann (2013) discussed a standardized European e-tutor qualification, they focus on the e-learning competence of traditional teachers and professional tutors. To the best of our knowledge, there are no standards for how e-tutors acquire the competencies and expertise they need to support virtual group work. In addition to analyzing the basic qualification of e-tutors, the focus will also include the subsequent development and reinforcement of competencies. This extended approach can address competence deficits in a more long-term manner.

This presents us with the critical question of how the qualification of e-tutors should be designed to prepare them for practical application (RQ1). This question spotlights a gap in current research and suggests a need for a practical exploration of an effective structure and content for an e-tutor qualification module.

In addition to RQ1, this study proposes two additional research questions. First, "How does the e-tutor qualification module affect the development of e-tutoring competencies?" (RQ2). This question aims to assess the strengths and weaknesses of the existing module from students' perspectives.

The third research question probes into the possibility of tandem e-tutoring: "What are the participants' anticipations and perceptions regarding the potential implementation of e-tutor tandems, and what aspects do they foresee as potentially positive or negative?" (RQ3). This question aims to understand the participants' expectations and perceptions about introducing e-tutor tandems in the supervision phase, as the tandem approach was already successfully tested for e-tutors (Langesee & Ukhova, 2023).

This study aims to analyze the readiness of e-tutors for their roles regarding key competencies. Furthermore, it investigates the potential of different formats in further developing competencies for e-tutors. This study's contribution lies in critically examining the e-tutor qualification module by interviewing the participating students post-module. After a qualitative content analysis, the paper provides practical recommendations and identify areas for improvement to enhance the overall quality and effectiveness of e-tutoring, potentially impacting the next generation of e-tutors.

Theoretical and Conceptual Background

This chapter delves into the theoretical and conceptual background supporting the paper, setting a baseline for a more nuanced understanding of the subject matter.

E-Tutors

Central to this paper are e-tutors and the qualification process to become one. However, clearly defining "e-tutor" can be challenging due to its various interpretations and synonymous terms. E-tutors may also be identified as e-moderators, e-coaches, distance learning instructors, or online tutors. According to de Metz & Bezuidenhout (2018), e-tutors are primarily involved in offering support to distance learners. However, Jödicke & Teich (2015) offer a more fitting definition for this research as they identify e-tutors as facilitators whose role is to aid students in achieving their learning objectives in current virtual learning frameworks. Unlike traditional tutors, e-tutors supervise, support, and direct the learning journey rather than deliver knowledge directly.

In addition, e-tutors act as students' first contact and help with diverse aspects of the learning experience. The support activities range from technological to organizational, from content-related to interpersonal challenges (Jödicke & Teich, 2015). To summarize, e-tutors can be viewed as facilitators of learning who fortify virtual learning processes within today's HE landscapes.

Qualification Module

To be able to support students in such a setting, the e-tutors need to qualify first. There is a broad range of scenarios where e-tutors can be deployed. However, only a few publications shed light on the concrete qualification of e-tutors in HE (e.g., Adamus et al., 2009; Doukakis et al., 2013; Heuel & Feldmann, 2013). In the context we investigated, e-tutors are supportive moderators in VCL modules (Clauss et al., 2019).

The VCL concept is a student-centered approach in higher education where students work in groups to solve realistic case studies using collaborative technology, e.g., MS Teams. It involves synchronous and asynchronous activities and requires a case study, learning platform, pedagogical support by e-tutors, and learning analytics (Clauss et al., 2019; Schoop et al., 2010).

In this paper's context, the e-tutors' training occurs in a semester-long master's module utilizing a flipped classroom approach. Employing the flipped classroom approach, the module incorporates e-lectures for content delivery, in-person seminars for reinforcing the content, and a four-week VCL phase on MS Teams.

The VCL allows students to experience a collaborative virtual learning environment first-hand. During this period, students are grouped into teams of four to six, working on weekly tasks drawn from a realistic case study. Students must assume various roles, such as project manager, reporter, and expert for Business Administration, technology or human resources. Qualified e-tutors accompany the VCL phase.

The module comprises six main themes, specifically tailored to cater to the roles and responsibilities of e-tutors while also addressing the basics of community management. It incorporates lessons and tasks on organizational support, technical support, group-related support, subject-related support, feedback, and assessment. They learn to manage learning activities, handle and solve conflicts proactively, develop intercultural skills, and provide effective feedback. Adding to this, students gain a glimpse into the day-to-day operations of

an e-tutor, facilitated by real-life experiences shared by active e-tutors. Upon successful module completion, students are qualified to become e-tutors.

The module's thematic focus areas are illustrated in Figure 1.

Figure 1: Content of the E-Tutor Qualification Module

Competencies

To match the multifaceted role of an e-tutor, specific competencies are necessary. During a qualification tailored to the tasks of e-tutors, exactly these should be addressed.

Fulfilling the diverse roles of an e-tutor requires distinct competencies that differ significantly from those needed for traditional face-to-face tutoring (Langesee et al., 2022). Despite numerous discussions, a universal definition of competence remains elusive. Generally, competence combines knowledge, skills, and attitudes (Baartman & de Bruijn, 2011; Le Deist & Winterton, 2005). These competencies, while identifiable and measurable through behavior (Rowe, 1995), are not static attributes but can be developed.

Another established definition by North (2021) explains competencies as personal abilities that can be cultivated to act suitably in given situations. It is a well-rehearsed process to stimulate, direct, and utilize personal resources, ensuring effective handling of intricate scenarios, tasks, and actions. These elements are intrinsically tied to performance and can be enhanced through educational interventions (Parry, 1998). This perception of competencies provides a basis for the discourse in this paper.

A comprehensive exploration of the specific competencies required by e-tutors to effectively supervise student groups was carried out in Langesee (2022; 2023). This study identified the following key areas of competence: pedagogical, professional, social, intercultural, media, communication, organizational, individual, and evaluative. Notably, these nine competence areas overlap considerably with 21st-century skills.

A competence-oriented qualification is an important approach in HE that aims to develop students' knowledge, skills and attitudes that are relevant to their personal and professional development in the 21st-century. This qualification focuses on the learning outcomes and the ability to apply them in different contexts rather than on the input or content of the curriculum. It can enhance graduates' employability, mobility and lifelong learning, as well as their social responsibility and civic engagement (Brauer, 2021).

Therefore, adequately addressing the underlying competencies is essential to succeed in the modern work environment (Bourn, 2018). A recent work by Pérez-Sanagustin et al. (2022) also states that HE institutions must address the reality of post-Covid-19 more than ever, including competence-oriented teaching (Dlouhá et al., 2019).

Methodology

This chapter offers an in-depth look into the research methods utilized in the study, namely semi-structured interviews and qualitative content analysis, clarifying the systematic approach taken for data collection and interpretation.

Semi-Structured Interviews

The qualitative data collection in this study was anchored in semi-structured interviews, a method widely recognized in social science research (Magaldi & Berler, 2020). The interview guide was meticulously crafted to frame the questions and systematically structure the research process, allowing a beneficial balance between comparability and the capacity to glean additional, valuable insights (Kallio et al., 2016).

This guide comprised four thematic blocks. The initial block communicated the interview's objectives within the introduction (Helfferich, 2010), while the second aimed to foster a pleasant atmosphere for the interviewee, promoting openness for the duration of the interview (Edwards & Holland, 2013). The main part of the interview was occupied by the third and fourth thematic blocks, focusing on assessing nine specified competencies (Langesee, 2022) and the effectiveness of seminars, e-lectures, and the VCL as teaching formats.

The final block also provided opportunities for suggestions for module improvement, with open-ended questions allowing interviewees to offer detailed insights and suggestions (Kallio et al., 2016). The interview guide was pre-tested and refined based on feedback (Weichbold, 2022).

Seven students, who were active participants in the course, were involved in the interviews (Table 1). This selection criterion ensured the interviewees had firsthand experiences and knowledge of the module. To maintain a diversified view, interviews were conducted by two researchers (Graneheim & Lundman, 2004).

The interviews were recorded using MS Teams, which also facilitated automatic transcription. The final transcription adhered to Dresing and Pehl's (2018) guidelines, ensuring anonymity in line with Elo and Kyngäs' method (2008) for the coding process.[1]

	9	2	28,6
	11	1	14,3

Table 1: Overview - Demographics of Interviewees

Qualitative Content Analysis

According to Elo & Kyngäs (2008), a qualitative content analysis was conducted to extract the relevant information from the interviews to answer the research questions. It consists of three phases: preparation, organization, and reporting. The preparation phase focuses on defining the study object - in this case, the interviews. The qualitative data is analyzed using the selected method during the organization phase. This study used a combined deductive-inductive approach (Ravindran, 2019) to code interviews, leading to twelve main categories from the interview guide. Post-deduction, interview-based coding began, and independent subcategories were inductively formed.

After initial coding, the subcategories underwent discussion for quality validation, resulting in 41 subcategories (Graneheim & Lundman, 2004). Subsequently, the distribution of the subcategories was discussed. Afterward, the researchers reviewed each other's work to ensure quality. The detailed category assignment can be found in the online appendix.[2]

Seven main categories are of main interest for answering the research questions and are therefore presented in detail. The remaining five main categories are integrated into the analysis as they foster the understanding of certain results and help to put them into context. An overview of the main categories can be found in Figure 2. The green-colored main categories are discussed in more detail in the upcoming section.

Learning Analytics, Gamification, Chatbots	Expectations and Challenges	E-Tutoring and Community Management	E-Tutor Tandem

Figure 2: Overview of Main Categories

Results

This chapter presents the results of thematically relevant thematic blocks three and four from the interview guide and its deductive-inductive categories, according to the final phase of qualitative content analysis by Elo & Kyngäs (2008).

Pre-module Competencies

To evaluate and document the competence level before the module, participants were initially queried about their pre-module competencies in the opening segment of the interview.

Four participants (I2, 3, 5, 7) specified they had notable social competence prior to participating in the module, enhanced through previous group work instances. Pedagogical competence was found exclusively in students with business education or those who attended modules specifically focusing on pedagogy (I1, 4, 7). One participant (I2) explained that their first exposure to feedback was only through schooling.

Three participants (I1, 3, 5) affirmed pre-existing professional competence, particularly in the realm of virtual collaboration, prior to the module. The majority (I1, 3, 5, 6, 7), because of their experience as working students, exhibited varying levels of organizational competence involving methodologies such as SCRUM (I1).

Similar to their organizational competence, most of them (I1, 3, 4, 5, 7) also showed a well-developed media competence, especially in using Microsoft 365, including MS Teams, which are commonly used in business settings. Three participants (I2, 5, 7) reported having distinct communication competence before the module.

Intercultural competence was reported by only one participant (I1), although it was somewhat subdued, primarily due to language constraints. Individual competence was generally well-developed among some participants (I1, 2, 7). One interviewee (I1) named their creative work environment a contributing factor. However, only one participant (I3) claimed to have evaluation competence, which they attributed to their prior education.

Post-module Competencies

Participants particularly highlighted the development of pedagogical competence (I1, 2, 4, 5, 7). Although it was not the module's direct focus, it was refined during the intense virtual collaboration phase, with the reflection on individual and group methods emerging as a significant contributing factor (I5).

The participants described a positive development of their media competence (I1-7), primarily attributed to compulsory involvement with the collaboration platform and various MS Teams tools, such as the "Praise" function and the Planner (I5). However, data analysis abilities remained underdeveloped or non-existent (I2).

The interviewees experienced a development of their communication competence (I1, 2, 3, 4, 6, 7), although unevenly across participants. The rationale for this development lies in intense group work and the unique demands posed by virtual communication (I1, 6). A participant's role within the team also played a key role, with project managers developing this competence more than regular project members (I3).

The interviewees mentioned that they positively developed evaluation competence by giving each other feedback and (jointly) reflecting on the feedback received (I1, 2, 3, 4, 6, 7). The interviewees reported being frequently encouraged to engage in self- and group reflection.

Participants described that multiple factors facilitated the development of social competence (I1, 2, 3, 5, 6, 7), including accommodating diverse personalities and work styles within group work (I1). Essential collaborative tasks also fostered intensive teamwork, positively impacting social competence. The creation of the group contract emerged as another contributing factor (I6).

Additional information on the collaboration platform helped some participants to develop professional competence (I1, 3, 5, 6, 7). The module, described as a "protected area" by one participant (I6), offered a safe space for experimenting with MS Teams, a common collaboration platform in many companies. Autonomously handling tasks and researching group work topics also enriched professional competence (I1).

However, growth in organizational competence was described less (I1, 2, 7), with the role of the project manager lauded for making group-based organizational decisions (I6, 7). The structuring of learning activities also contributed to its development (I2).

The interviewees reported that they did not develop individual competence independently but that it was encompassed within other competencies, such as virtual communication improvement (I1, 3, 4, 6, 7). Nevertheless, creativity, an attribute of individual competence, was not addressed.

Regarding intercultural competence, participants reported no significant development (I1, 2, 3, 4, 6, 7). Only one noted having a non-native speaker in the team (I5), which presented opportunities to enhance intercultural competence to a certain extent, for instance, by rephrasing tasks for unified comprehension.

Influence of Formats on Competence Development

The study found that participants identified VCL as the most conducive teaching-learning format for competence development. However, it was noted that it was not a single format but a mix that often contributed to competence development. For instance, a blend of e-lecture, seminar, and VCL was instrumental in fostering pedagogical competence (I1, 2, 4, 5, 7), with the e-lecture for initial knowledge transfer, the seminar for consolidation, and VCL for application.

Media competence was initially addressed through e-lecture and subsequently enhanced through practical usage in the VCL (I1-6). For communication competence, participants highlighted intensive seminar discussions and VCL experiences as catalysts for development (I1, 2, 3, 5, 7).

The merging of the three teaching-learning formats helped to enhance professional, individual, and evaluation competencies (I1-7). Like communication competence, social competence primarily advanced through the seminar and VCL activities (I1-6).

Organizational competence was primarily developed via VCL (I1, 2, 4, 5, 6), with two respondents noting that the degree of improvement varied based on roles (I1, 5).

Regarding intercultural competence, VCL played a significant role for participants who directly interacted with non-native speakers (I2, 4, 5). One respondent added that e-lectures also provided valuable support in advancing their intercultural competence (I1).

Perceptions on E-Tutor Tandems: Benefits and Challenges

Interview outcomes on the e-tutors tandem concept presented diverse perspectives regarding group formation and task delegation (I1), underlining the significance of diversity and heterogeneity in tandem pairs (I1). To bypass redundancy, a respondent emphasized the necessity for clear roles within groups and at least one point of contact per topic (I3). Furthermore, pairing an experienced e-tutor with a novice was suggested (I5), allowing two new e-tutors to collaborate and navigate their roles together (I5).

In summarizing the interviews concerning the benefits of the e-tutor tandem model, it emerged that collaborative work and the advantage of having a second opinion were positively regarded (I1). Some interviewees also recognized the potential value of an e-tutor network, while others suggested they might prefer working independently (I2). Participants noted the supportive role and sense of security provided by e-tutors as beneficial (I3, 5). This dual supervision also opens opportunities for new methodologies, insights, and techniques (I7).

A sizable pool of qualified individuals is required to successfully deploy the tandem model to meet the learners' needs (I1). The availability of financial resources could also impact the feasibility of task distribution (I2). Some participants expressed that task sharing may only sometimes be essential and could potentially lead to resource wastage (I3, 4).

Preparing for Dual Roles in E-Tutoring and Community Management

The interviews underscored the significance of an emotional component and human touch within the e-tutor role (I1). One Interviewee differentiated the e-tutor's role as a learning process supervisor from the actual learning process itself (I2). Contrarily, some participants mentioned needing more preparation for assuming the e-tutor role (I4-7). Nonetheless, e-tutor experience could prove beneficial in undertaking the community manager position (I3).

Different views were expressed regarding the preparation for the job as a community manager. Two interviewees stated that previous work as an e-tutor could facilitate their work as a community manager (I1, I3, I6). However, some expressed a desire for more concrete insights into group assessment and a need for behind-the-scenes insight (I1, 5, 7).

Bridging the Gap Between Expectations and Challenges in the Module

Participants stressed some challenges associated with the course. One respondent struggled with language nuances, which hindered their active participation and expressed a desire for enhanced engagement opportunities in certain situations (I1). Difficulties emerged in the effort to immerse oneself in the tasks which mention diverse locations without being physically present. Another respondent highlighted issues of role distribution and encountered limitations in understanding the project manager's role (I5). The issue of unclear role assignments and specific task allocations was also a contention.

Practical relevance within the course emerged as a significant theme in the interviews. One participant expressed a desire for increased real-world applicability (I1). Another participant revealed that the course lessons significantly influenced their personal life (I4). A further wish for the inclusion of practical, situational exercises was expressed by another interviewee (I7).

Participants voiced diverse suggestions concerning the course. One respondent hoped for a more explicit definition of e-tutors and that e-tutors assume roles similar to traditional tutors (I1). A request for more tangible e-tutoring preparation emerged from another respondent (I5), while the proposal to include the course in undergraduate studies was put forth by another to engage potential e-tutors earlier in their academic journeys (I6).

Concerning roles in e-tutoring, respondents relayed a handful of criticisms. A participant pointed out varying competence requirements and attributes depending on the assumed role (I2). Another participant gave constructive feedback on project management, proposing improvements to competence identification and application (I3). Critiques of role labeling, allocation, and group hierarchy were voiced by a fourth participant (I4) and echoed by another, who further observed differences in competence promotion based on roles (I7).

The Role of Learning Analytics, Chatbots, and Gamification

Three interviewees wished to use learning analytics (I1, 2, 4). One wish is the provision of user data in a meaningful form (I1). One interviewee mentioned the implementation of gamification in this context (I7). Another described utilizing reactive and proactive chatbots for providing and showing information (I4).

Discussion and Recommendations of Action

This chapter addresses the implications of the findings and offers suggestions for improving the design of e-tutor qualification modules and competence development.

This paper presents an intriguing exploration of an e-tutor training module. One of the key takeaways from the paper is how the flipped classroom concept has proven beneficial in enhancing several competencies. The paper argues for a blended approach, where a mix of formats would enhance competence development.

However, the paper also acknowledges that not all competencies can be addressed and thus developed equally. For instance, the training module falls short of enhancing intercultural competence. One approach for improvement is integrating international students into the module, which could broaden the intercultural perspective and enhance the relevant competencies. Generally, a heterogenous group composition during the VCL phase is highly recommended.

The qualitative analysis shows that the initial qualification module lays a strong foundation for e-tutors. The paper further argues for enhancement via e-tutor tandems, which can facilitate a more profound competence development for e-tutors. The results make a compelling argument for adopting e-tutor tandems in the training module, suggesting they can provide a beneficial balance of peer interaction and work-sharing. Working in tandem facilitates a shared responsibility approach, thus alleviating the workload pressure on novice e-tutors. This distribution of tasks paves the way for more strategic planning and problem-solving, potentially improving the tutoring quality and enriching the supervised students' learning experience. The tandem arrangement fosters a supportive and secure environment, promoting competence development and building confidence.

Furthermore, innovative approaches such as learning analytics, chatbots, and gamification were called for. In addition to providing user data through learning analytics, gamification approaches can be used for appropriate representations to overview the behaviors of the student group. Additionally, they should be presented in a motivating way for the student groups to foster their engagement with them. In addition, using proactive and reactive chatbots is considered helpful for early identification of missing digital literacy and answering questions. Implementing such approaches supports e-tutors in the operational tasks and enables them to focus on the pedagogical work assignment and their competence development.

In addition, it must be noted that the examined e-tutor qualification is embedded in a formal learning setting. As discussed in Langesee & Ukhova (2023), competence development can be enhanced by informal settings, such as self-directed e-tutor tandems. Subsequent employment as an e-tutor and participation in (informal) competence-enhancing activities can promote more intensive engagement with an e-tutor's competencies.

Finally, the paper identifies tandems as particularly valuable for first-time e-tutors. They provide an additional contact person, which gives a sense of security and motivates students to become active e-tutors. It emphasizes the importance of applying theoretical knowledge from the training module in practice, enhancing the learning experience, and further addressing the key competencies.

Conclusion

This research explores an e-tutor qualification module and the potential of e-tutor tandems to enhance their competence development. Our findings yield robust answers to the proposed research questions.

Responding to RQ1 and RQ2, we observed that participation in an e-tutor module enhances vital competencies for e-tutoring, primarily through a blend of teaching-learning formats. These include a VCL phase, e-lectures, and seminars, each contributing uniquely to competence development. VCL emerged as the most beneficial format, which suggests the need to incorporate more such interactive and collaborative learning experiences into e-tutor qualification modules.

Especially regarding RQ1, our study indicates that the e-tutor qualification module positively impacts several key competencies. Participants describe a significant development in pedagogical, media, communication, evaluation, and social competencies in the post-module interviews. However, a development in organizational and individual competence was less pronounced, suggesting that these areas might benefit from additional focus in the module design. Intercultural competence did not significantly advance, indicating the necessity for future research to incorporate intercultural sensitivity in e-tutor qualification programs.

Concerning RQ3, our study reveals positive opinions about the e-tutor tandem approach. Most participants viewed it as a potentially beneficial method, allowing for collaboration, shared feedback, and security, which can lead to more confidence in e-tutoring and enhanced competence development. However, resource constraints and the risk of redundancy were cited as potential challenges. Thus, deploying e-tutor tandems requires careful planning, clear role definitions, and sufficient resources to ensure successful implementation. Additionally, personal competence development is crucial but challenging. Further addressing the individual competencies of e-tutors can be a first step in this direction while also fulfilling the objective of competence-oriented learning in HE.

As in every research, some limitations must be acknowledged in this study. One constraint is the five-month duration of the module, which may not sufficiently allow for e-tutors' competence development. A follow-up approach for competence development, like e-tutor tandems, can be used to counter this. Also, the small number of interviewees is limiting but gives exciting insights and adds to the knowledge base of e-tutoring in HE.

Inherent subjectivity in qualitative research, stemming from personal perspectives and experiences during data interpretation and analysis, can potentially introduce bias (Noble & Smith, 2015). To counteract subjective and biased evaluation and analysis, coding, analysis, and interpretation were conducted in close consultation between two researchers. Another way to mitigate this could be to apply mixed-method research using multiple perspectives and data sources (Taherdoost, 2022). The constraints mentioned might affect the generalization of results across diverse individuals and populations.

Future research should focus on several key areas. First, a follow-up quantitative evaluation should be pursued to validate the presented findings and identify broader and underlining trends. Second, examining the efficacy of the proposed recommendations in practice would solidify our understanding of competence development. Furthermore, the use of gamification and chatbots could support the positive development process of competencies.

Additionally, piloting the e-tutor tandem concept during the VCL could provide prospective e-tutors with a practical understanding of this approach. Ultimately, iterative research is essential for optimizing the e-tutor qualification process for the HE landscapes.

Overall, this research paper presents a robust analysis and contributes valuable insights to the literature on e-tutor qualification and competence development.

Abstract

The study discusses the transition of schools in the Emirate of Sharjah from a five-day workweek to a four-day workweek at the start of January 2022, and explores results of surveys conducted to assess satisfaction of stakeholders and challenges that educational institutions and communities faced with this transition. The survey sought to understand the impact of this change on critical variables such as productivity, family financial impact, student learning, work-life balance, wellbeing, health, and school operations. The results released in May 2023 showed high level of parent satisfaction and financial savings, high motivation and satisfaction among school employees, and improved physical and emotional wellbeing of student skills and their ability to be more self-directed; to engage in socialization leisurely activities after school. The results also revealed certain challenges that teachers and professional staff reported in finding sufficient time to cover the required school curriculum, prepare lesson plans and attend professional development during the reduced school week. With global interest across all sectors in reducing the work week from five days to four, it is imperative that educational researchers and regulators understand how the Western literature can have either positive or negative impact on policy borrowing across Western, Middle Eastern, South Asian, and Eastern cultures. This paper provides early guidance to policymakers, practitioners, and scholars on these matters.

Keywords: Sharjah, Schools, Reduced Workweek, School Hours, Work Life Balance, Welllbeing, Productivity

Introduction

Reduced workweek in Sharjah evolved for different reasons than those in other parts of the world. It emerged in Sharjah to accommodate the long-standing tradition of maintaining Fridays as non-working days and to conform to the United Arab Emirates declaration in January 2022 that made Saturdays and Sundays as the official weekend days. Unlike Sharjah, the reduced workweek in other parts of the world evolved for purely economic reasons or to respond to demands for less working hours in the interest of providing greater family time. For example, moderate body of literature in the United States on reduced working hours in schools were due to two factors: first, limited transportation options in rural areas requiring school systems to find alternate solutions, such as reducing the week from five days to four; second, readiness for change because of COVID online learning schemes, particularly prompted by other social or economic necessities, such as limited transportation.

The literature on reduced working hours in schools is sparce outside Western contexts. Sharjah, with a diverse student population, is an ideal location to expand the global knowledge base on time reduction in school. While countries, as well as multilaterals, such as the OECD, have set minimum expected days of school per year as policy or benchmark, online/distance learning has increasingly allowed for new methods of accounting for learning time. Yet days in school, or even hours in school, have been subject to country comparison assuming no difference in quality of learning. Time in school has various productivity implications by culture, including expectations of guided practice, independent learning, teacher-centered instruction, as well as other educational constructs.

The Emirate of Sharjah transitioned to a four-day workweek in January 2022. All private and government schools have therefore implemented a four-day week, Mondays through Thursdays. To support schools, educators, students, and families in this transition, the Sharjah Private Education Authority (SPEA) conducted various stakeholder surveys during January and February 2023. The results of these surveys have provided SPEA with a clear set of indicators on satisfaction and challenges, related to such aspects as productivity, learning, work-life balance, wellbeing, health, family financial impact and school operations. The results, summarized in this report, provide insight into the ways in which schools, families, and educators have responded, both positively and negatively, to the changes. The results are being utilized by SPEA, as a regulatory body, to suggest new initiatives that aim to support the wellbeing and productivity of schools, students, educators, and families. The results are also a catalyst for SPEA's sister organization, the Sharjah Education Academy (SEA), to improve the professional development courses provided to teachers and school leaders.

The Educational Landscape in Sharjah

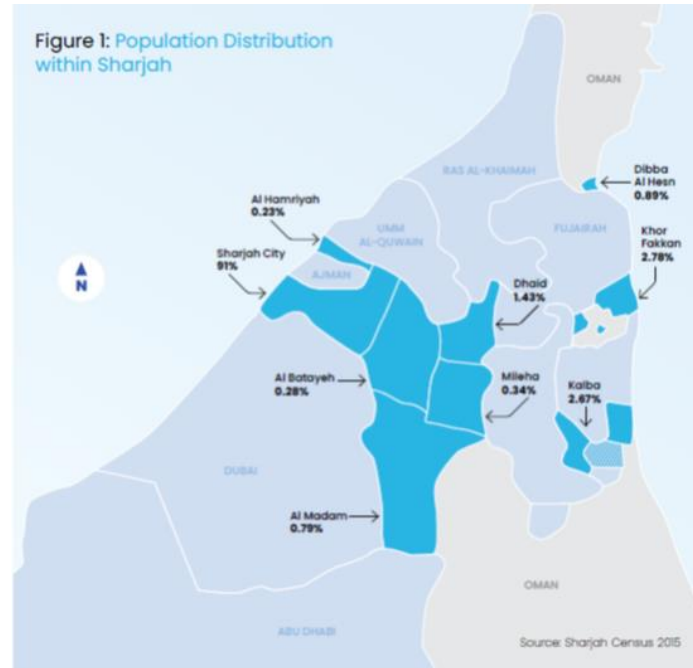
Sharjah is the third largest Emirate in the UAE by size, with its population comprising 22.4% of the total UAE population. The population is made up of 88% expatriates, with the majority originating from South Asian and Arab countries. Sharjah has succeeded in attracting a large talent pool due to a leadership focus on education, government's various policies to attract and retain talent within the Emirate, and the Emirate's relatively low cost of living compared to neighboring Emirates. Figure 1 shows the distribution of Sharjah's population across the major municipalities.


Figure 1: Distribution of Sharjah's population

Over the last decade, Sharjah has witnessed a steady growth in the number of private schools, from 94 schools in 2013/2014 to 130 schools in 2022/2023. Currently enrolled in the 130 schools are approximately 185,000 students.

The number of private schools in the UAE has increased at a higher rate than public schools. The percentage of public schools in Sharjah has decreased from 92% in 2009/2010 to 49% in 2018/2019. As illustrated in figure 2, Private schools in Sharjah follow ten different curricula, with the highest school numbers utilizing British/IB, American, Indian, and UAE Ministry of Education curricula. Between 2017 and 2022, the number of American and British/IB curriculum schools increased at a compound annual growth rate of 4.5%.
Figure 2: The distribution of curricula in Sharah (2017-2022)

More than one third of total enrollment is in schools utilizing the Indian curriculum. Schools offering the British curriculum are the second most popular, with 21% of total enrollments. Enrollment in private schools is centralized to a large degree in the city of Sharjah (97%), with more than a quarter of enrollments in the district of Muwailah. Enrollment distribution by curriculum is illustrated in Figure 3.
Figure 3: Student enrollment by curriculum (2021-2022)

The overall student-to-teacher ratio across Sharjah's private schools is less than 18 to 1. In 2021/2022, 11,902 teachers were employed by 122 private schools in Sharjah, with an expatriate teaching workforce of 98%. Student-to-teacher ratios are as low as 6 to 1 in premium-priced schools, whose tuition fees are above AED 50,000 per year. As shown in figures 4 and 5, the highest student-to-teacher ratio is in Indian curriculum schools, followed closely by schools that offer the UAE Ministry of Education curriculum.
Figure 4: Student to teacher ratio by tuition fees (2021-2022)

Figure 5: Student to teacher ratio by curriculum (2021-2022)

The student-teacher ratio (STR) is the number of students divided by the number of teachers in a school. It is a measure of the workload for teachers and the level of individual attention that students receive. A lower STR is generally considered to be better, as it allows for more individualized instruction and support. However, there is no single ideal STR, as the optimal ratio will vary depending on the specific needs of the students and teachers.

In the United States, the average STR for public schools is 16:1. However, there is a wide range of STRs across the country, with some schools having ratios as high as 30:1 and others as low as 8:1. The STR is also affected by the grade level, with elementary schools typically having lower ratios than middle and high schools.

Sharjah private schools have approximately 32,000 vacant seats, which translates into a capacity utilization rate of 84%. The capacity utilization rate, which represents the percentage of filled seats in schools, is calculated by dividing enrollments over maximum capacity. The current capacity utilization level, which is within the optimal utilization levels of 80-90% for primary and secondary education, enables schools to meet additional demand in the short term and maintain the flexibility needed for rearranging student schedules. While Indian curriculum schools have a high utilization rate, they have 30% of the free seats. A quarter of the free seats are in the American curriculum schools, followed by British and UAE Ministry of Education curriculum schools (17% and 15%, respectively). Accordingly, Sharjah Private Education Authority developed a forecast model illustrated in figure 6, to forecast the estimated number of needed school till 2026.
Figure 6: School Demand Forecast (2021-2022)

The key growth drivers for primary and secondary private educational institutional growth include expatriate population growth, government support for quality education, and parental high spending on education in the UAE. The UAE's school-going population is estimated to grow from 1.3 million in 2021 to 1.5 million in 2028, according to the United Nations population forecast (Insights, 2023). Sharjah's existing large expatriate population, estimated at 88%, underlies the preference for international curricula. SPEA's 2022-2024 strategy with its focus on four strategic priorities of: enhancing the quality of life and wellbeing of the educational community; promoting trust in the quality of education; fostering a culture of innovation, creativity, and continuous learning, as well as encouraging Sharjah's competitiveness in the education sector, are strengthening Sharjah schools' ability to attract more students.

The Four-Day Work Week in Sharjah

The four-day workweek was implemented in the Emirate of Sharjah in January 2022. This step occurred following the decline of COVID-19 and the new ways/practices of applying efficiency at the workplace. Globally, COVID-19 strained supply chains, accelerated governmental deficit spending, and produced high rates of inflation. COVID-19 nevertheless enhanced governmental and private sector focus on strategic priorities associated with risk mediation, competitive advantage, innovation, and quality of life.

During the 2020-2022 period throughout the globe, organizations in both the public and private sectors implemented and continually adapted work-from-home plans. Habits regarding work, learning, and recreation shifted, creating new knowledge for post-COVID productivity, work-life balance, and remote learning. This was true around the world, and particularly so in Sharjah—and, like schools and educational systems throughout the world, these adaptations and learnings occurred in Sharjah's schools. In particular, as the Sharjah Education Academy (SEA) had been developed in the midst of the pandemic, it became clear that teacher knowledge and skill needed rapid updating to address the hybrid learning approaches that were adopted across schools.

The shift to the four-day workweek in Sharjah occurred as a result of the lessons learned in the years of COVID-19, as well as a desire to innovate in work-life balance and human capital development, while also finding new ways to utilize technology to increase productivity. Upon implementation of the four-day workweek across the education sector in Sharjah, other reform initiatives began to take shape, led through the expert support of the Sharjah Private Education Authority (SPEA), including quality improvement for early childhood education, PK-12 school improvement, and identification and support for students of Special Needs. The four-day workweek implementation occurred alongside various other strategic priorities and reforms that aim to increase human capital development, organizational productivity, wellbeing and work-life balance.

Global Trend

Time magazine recently reported that 2023 will be the year of the four-day work week (Abend, 2023). This expectation was driven by various pilot programs that found positive aspects in reduced workweeks across the globe. For example, results of a recent study published in the UK showed there was no productivity loss among 61 private firms that participated in the reduced workweek (Lewis, Stronge, Kellam, & Kikuchi, 2023). While most focus on the changes in the length of the workweek has been on private sector work in

knowledge-focused jobs, education employs a large share of educated workforces in most developed countries, and therefore, must be considered in changing attitudes about the workweek. Furthermore, education cannot be disentangled from the overall workforce due to family constraints with regard to childcare and transportation.

The four-day week is a trend that will continue globally as more institutions and countries achieve tangible returns that support continued implementation. With the trend expanding, the impact will also be significant on school systems that will switch to either reduced working hours or a four-day school week. Some school districts in the United States, as well as some school systems in South Pacific countries, are among the few places this has been attempted before. For example, in the 1970s, with high fuel costs, some school districts in the United States reduced the week to four days temporarily (Armitage, 2022). Some rural school districts also moved to a four-day week during the 2008 economic recession, in order to save on resources (Sawchuk, 2021). Additionally, there are 662 school districts across the United States that made the same transition since COVID-19 (Thompson & Morton, 2021).

The transformation in the United Sates has been encouraged by positive results. Using data from the Colorado Department of Education in the United States, Anderson and Walker (2015) argued that the four-day week has positively affected the percentage of students scoring at the proficient or advanced levels on mathematics and reading achievement tests. Further studies in the United States suggest that the four-day week gave students opportunities to spend more time on homework and extracurricular activities. It also had an impact through decreased per-pupil bullying incidents by approximately 31% and per-pupil fighting incidents by approximately 27% (Morton, 2021). In one study in the United States, 85% percent of parents and 95% of students said they would choose to stay on a four-day school week, after experiencing it (Kilburn et al., 2021).

Methodology and Participants

SPEA conducted the study with a clear focus of measuring the impact of applying the 4-day workweek on productivity, learning, work-life balance, wellbeing, health, family financial impact and school operations. SEA has collaborated with SPEA in producing this report. The formal study was conducted between January and February 2023. Parents and school employees (teachers and administrative staff) were surveyed. Both surveys comprised closed-ended items (the parent survey had 33 questions; the employee survey had 24), as well as some open-ended items. Both surveys had three questions about positive experiences, challenges, and recommendations. The parent survey was administered electronically in Arabic and English to all parents of children in the private schools in Sharjah targeting approximately 185,000 students. The employee survey was electronically administered to 17,663 employees among 130 private preK-12 schools. Both surveys were administered during a short timeline from the 27th of January to the 3rd of February 2023, to determine the perceptions and ratings about the four-day workweek.

Over the course of seven days that the survey was open, a total of 31,198 surveys were completed by parents. Of parent survey-takers, 66.4% were female and 33.6% were male. In terms of age, 49.2% of parents reported that they were from "30 to 39" in age and 39.2% reported that they were "40 to 49" years old. 83% of parents reported that they lived in Sharjah, with 11% living in Ajman. 97% of the parents were married.

School employees were also surveyed. Of 17,663 total employees in Sharjah private schools, 6,988 completed the survey (approximately 40%). Of these, 5,421 were teachers out of a total of 12,464 teachers (43%). Of non-teachers, survey takers included specialists, librarians, nurses, counselors, secretaries, school leaders, and other positions. Employee survey takers from Indian curriculum schools constituted the highest proportion (45%), with British and American following (24% and 18% respectively). Of employee survey-takers 83% were female and 17% were male. In terms of age, 42.4% were from the "30 to 39" age category, and 31% were "40 to 49" years old. 71% of employees lived in Sharjah and 18% lived in Ajman. 85.4% of employees were married. In terms of annual school tuition, 36% of employees completing the survey worked at schools with less than 10,000 AED annual tuition, 32% were in schools with annual tuition from "10,000 AED up to 20,000 AED;" and 32% worked in schools with annual tuition from "20,000 AED to 56,000 AED". For school size (e.g., number of students enrolled), 28.2% of employees worked in schools with less than 2,000 students, 33.1% were in schools with from "2,000 up to 3,000" students, and 38.7% were in schools with at or above 3,000 students. For a total number of classes taught per week, 34.4% taught "16 to 23" classes, 54.4% taught "24 to 28" classes, and 11.2% taught "29 to 38" classes per week.

Parent Survey Results

Parents reported a high level of satisfaction with the four-day workweek, with Emirati parents reporting a higher level of satisfaction than all parents together on most measures. Work-life balance, level of happiness, and social-emotional health are all reported to be increased as a result, with again Emirati parents expressing a higher level of satisfaction than all parents together.
Figure 7: Impact of 4-day workweek on wellbeing
Figure 8: Impact of 4-day workweek on wellbeing

In terms of financial saving, parents clearly reported a benefit in financial savings due to the four-day day work week. 79% of Emirati parents noted that they have benefited by saving on transportation while also 48% of all parents noted a benefit. In addition 80% of Emirati parents reported that they saved on fuel costs due to commuting one day less per week. The results also show that parents reported additional saving in utilities and health care (78%).
Figure 9: Impact of 4-day workweek on financial saving

Parents recognize that the four-day week has improved: school attendance (81% of all parents), participation in extracurricular activities (75% of all parents), and improvement in completing school assignments (80% of all parents). Parents largely have indicated that their children feel more productive (78%) and happy (81%).
Figure 10: Impact of 4-day workweek on children improvement
Figure 11: Impact of 4-day workweek on children improvement

Parents reported that the transition to a four-day week has positively impacted the participation in students' participation in extracurricular activities, their motivation to learn and had a generally positive impact on their children's socialization (79% of all parents, 92% of Emirati parents) and relaxation (81% of all parents, 93% of Emirati parents).
Figure 12: Impact of 4-day workweek on children improvement

In the survey, parents were asked to provide open-ended written comments on positive experiences and challenges. Out of 76,212 words of text provided, and through the below word cloud, which helps to visualize the most common/repeated words within the open-end questions. the majority of most frequent words relate to aspects of family, rest, and happiness. There is a general sense that the four-day week has allowed students to be more self-directed in their leisure time, and that their overall physical and emotional health has seemed to improve.

Figure 13: Parent's positive experience

In terms of challenges noted, out of 74,508 total words in the dataset, the majority relate to aspects of time management, whereby students struggle to figure out how to adapt to a lengthened or more intensive day, or that they lose touch with school during the long weekend and do not manage their time well.

Figure 14: Parent's challenges

Overall, the four-day week has been perceived positively by parents, despite the concerns over time management and exhaustion from the lengthened school day. SPEA attaches great importance to working side by side with schools in adapting school hours with the requirements of the different curricula. Parents reported strong levels of agreement for the 4-day workweek / 3-day weekend, providing very positive, impactful and transformational benefits with respect to enhancing the quality of life and wellbeing of the family.

School Employee Survey Results

Key findings among school employees indicate high satisfaction of the 4-day workweek, citing such qualities as work-life balance, wellbeing, and happiness. For example, 91% reported improved work-life balance and improved happiness. 87% indicated that the four-day week has a positive impact on their ability to exercise or go to the gym.

Figure 15: Impact of 4-day workweek on teacher

Employees also indicated readiness and adaptiveness of students, rating highly such aspects as the "student daily attendance in school." Slightly lower, but still reported at 81%, is impact on student homework load and projects.
Figure 16: Impact of 4-day workweek on teacher

Among work-related factors, school employees rated their level of motivation for work highly (88%), along with management of work priorities, level of work productivity, and ability to achieve objectives (all at 86%). Rated lower are aspects of time pressure: educators reflected less confidence in their ability to complete professional development (83%), time to prepare lessons (80%), and reduced pressure on teaching (64%).
Figure 17: Impact of 4-day workweek on teacher

Nearly 5% of surveys indicated, within the open-ended written responses, that they struggle to teach all the curriculum or complete tasks. Over 5% reported that extra work is assigned to them over the weekends, and that long working hours or lack of time within the day can be a challenge (7%). Some teachers report that they do not benefit from the three-day weekend, as

they are required to go to school for additional work over the weekends. This is a crucial indicator for SPEA, showing the not all the curricula are agile enough to adapt to the 4-day workweek and awareness and transformation is needed to align with the new direction.

It is clear that with all the increased pressures, employees are highly aware of the value trade-off and therefore report a positive impact overall. The response from school employees gives us very clear recommendations. Schools will need to continue working to identify ways to increase productivity among employees within the working days, as the data show that not allowing teachers to benefit from the three-day weekend may impact wellbeing, stress, and possibly teacher turnover. Key aspects of professional development for managerial aspects of school organization may assist in this regard.

Implications

The four-day work week implemented in Sharjah's private schools has yielded positive results related to the wellbeing of individuals. Eighty-five percent of students and 79.9 % of teachers reported improved level of wellbeing. The recognition of this impact on their wellbeing reflected increased level of happiness and higher degree of engagement within the educational system. On the other hand, the increased level of wellbeing was countered by another adverse measure that some schools have adopted which required school employees to report to school on some weekends to carryout planning, professional development and other non-instructional chores.

The results extend beyond wellbeing to the development of profound trust in the Sharjah Private Education Authority by 90.2% of parents and 96.1% of teachers, thus suggesting an enhanced sense of community collaboration and support. The positive impact on schools is not merely anecdotal. For example, the formal ITQAN school performance reviews during the 2022-2023 school year showed an improvement of 68% of reviewed schools. Improved wellbeing and school's ability to effectively adapt to the new reduced workweek cannot be taken outside of the context of all other variables that contributed to the overall school improvement and students' achievement of learning outcomes. These results paint a compelling portrait of success, where such data undeniably indicates the significant potential of the four-day workweek in the educational landscape of Sharjah as well as in redefining work-life balance while optimizing educational outcomes.

Conclusions and Recommendations

The surveys conducted by the Sharjah Private Education Authority on the transition to the four-day week have provided valuable insight into the needs that schools, parents, students, and teachers have, as well as the positive impacts they have experienced. The following broad conclusions are drawn from the study:

1. Parents and teachers alike report that they, and their students, have an improved quality of life as a result of the shift to the four-day week. It has permitted more leisure time, reduced household expenses, and had positive effects on physical and mental health.
2. Parents and teachers alike recognize that new time management skills are needed among students, both in school and at home.
3. The transition to the four-day week has put new pressures on teachers and students that did not exist before, at the same level of intensity. While these new pressures

have caused some concerns among teachers and parents, there is a comparable level of recognition that these challenges are balanced by the positive effects.

The conclusions of this study have shaped recommendations for schools, parents and teachers, as well as for the Sharjah Private Education Authority and the Sharjah Education Academy. They are as follows:

1. Promoting extra-curricular activities and partnerships: raising awareness of the importance of extra-curricular activities and building partnerships with the private sector to explore, develop and sponsor, creative and talented people. Additionally, encourage activities in different forms, to meet the needs of students according to their interest.

2. Planning and modern teaching methods: in partnership with international partners and with Sharjah Education Academy, SPEA can raise awareness on the importance of planning the school day, so that it does not affect the increase of working hours during the week.

3. Policies and enablers: spreading awareness among educational institutions, parents, and students, regarding SPEA's wellbeing framework, and how to empower the community to employ weekly vacation days to achieve effective and fruitful outputs.

4. Adopt smart and flexible teaching methods that allow the student to apply knowledge in an effective way, without affecting wellbeing or increasing school burdens.

5. Schools should emphasize time management skills among students. This starts with a recognition that quality learning will not occur when content is spread thin and addressed quickly. Valuable skills acquisition occurs through quality learning, not quantity. As such, schools must re-evaluate their goals if they feel they are unable to meet all their needs within the time they are given. This should not be seen as a reduction in school output, but rather an improvement in the overall quality and satisfaction of learning.

6. Schools must develop better procedures for management of staff time, so that all staff have an improved experience of the four-day week transition. When teachers do not have a chance to benefit from the three-day weekend, schools may lose out on the opportunity to retain a higher percentage of their excellent staff. This can be resolved through careful and collaborative planning.

7. Parents can take an active role in helping their children manage their personal time and promoting healthy behaviors, both during the four-day week and the three-day weekend. Trying new sports or participating in new out-of-class learning activities will have a positive effect on overall student performance, satisfaction, and development.

8. The Sharjah Private Education Authority will continue to monitor the perceptions of staff and parents, as well as the implementations of schools. From this monitoring, SPEA will be able to fine-tune any regulations to increase overall performance and the satisfaction of parents, students, and school staff.

9. The Sharjah Education Academy will offer training to teachers on promotion of time management skills among students, as well as evidence-based strategies for increasing learning quality within available teaching hours.

Scaffolding to Support Self-Regulated Online Learning

Siew Lee TENG, Academy of Singapore Teachers, Singapore

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
Recognising that equipping students with digital literacy is crucial for them to navigate online materials and increasing student agency are both important educational goals in the future of learning, this study explored the use of scaffolding to design online learning experiences to support student self-regulated learning through an online course on solving Chemistry data-analysis questions that was developed for student self-study. The learning packages that were designed incorporated different types of scaffolding and strategies to support self-regulated learning, leveraging features in the online learning portal developed by the Ministry of Education, Singapore. The study was conducted in four secondary schools in Singapore. Data were collected from analysis of students' work responses on the SLS portal, pre- and post-test results, and a survey. Findings showed that students were highly responsive to the online learning experiences, which led to enhanced performance on data-analysis items. In addition, findings provided insights into the implications for supporting self-regulated learning when engaging secondary school students in an online learning environment.

Keywords: Scaffolding, Self-Regulated Learning, Online Learning

iafor

The International Academic Forum
www.iafor.org

Introduction

Information technology has become an integral part of our lives, with the use of education technology expanding so quickly in the current education landscape that the traditional mode of teaching and learning with solely paper and pen is no longer the norm. With this, equipping students with digital literacy skills is becoming increasingly important in schools. In Singapore, one of the desired outcomes of education is to nurture independent students with a sense of ownership of their learning (MOE, 2018) and schools can leverage the affordances of EdTech tools available in the Student Learning Space (SLS), an online learning portal developed by the Ministry of Education (MOE) to nurture self-regulated learning in an online learning environment.

Recognising that students at a younger age may not fully appreciate the learning intentions in online learning environments and may require more adult guidance, this study explored the teaching and learning of data analysis skills in the Secondary Chemistry curriculum through online self-regulated learning. The purpose is to gain insights into: (i) online learning of Chemistry data-analysis skills; (ii) leveraging on technology to scaffold student learning in an online environment and (iii) ways to better support students in online self-regulated learning.

Literature Review

Scaffolding and Zone of Proximal Development (ZPD)

Wood, Bruner and Ross (1976) first discussed the importance of scaffolding on the learners' capability in solving problems with the help of adults. Scaffolding is closely related to the learning theory of the Zone of Proximal Development by Vygotsky (1978) which explains that student, with the help of a more knowledgeable other, can perform more complex tasks than they would otherwise be capable of performing on their own. It is about what the learner cannot do, what the learner can do with assistance and what the learner can do unaided.

Greater use of education technology in recent years has added another dimension to how we understand scaffolding in the 21st century education. With technology, the child's interaction with a more knowledgeable adult and/or peer would now include interaction with the content in an online environment.

Scaffolding in Online Learning

In terms of types of scaffolding that are provide effective instructional support for learning in an online environment, Hanaffi, Land and Oliver (1999), and Jumaat and Tasir (2014) presented four types of scaffolding, namely the conceptual, metacognitive, procedural, and strategic scaffolding.

Conceptual scaffolding supports students cognitively to acquire knowledge and perform complex tasks independently that are within the zone of proximal development. This includes concept development, sequence of thought processes and breaking down of complex tasks.

Metacognitive scaffolding guides students to review and assess what they already know or what have learnt. It brings out awareness in learning, to reflect, review and assess how well they have learned, and take a moment to evaluate their progress in the course. Metacognition

is an important aspect in self-regulated learning, and metacognitive scaffolding provides opportunities for review, feedback and to support growth.

Procedural scaffolding guides students to utilise available resources, materials and tools to complete a task. Procedural scaffolding can play a critical role in ensuring that students can use the tools in the learning management system. This includes the instructions and navigating the Edtech tools in the online portal.

Strategic scaffolding provides guidance and structure about alternative solutions, strategies or options to complete a task, such as offering choices. It often refers to deploying the principles of differentiated instructions when guiding students in working on the task.

Self-Regulated Learning (SRL) and Motivation

Zimmerman (2015) noted how students become masters of their own learning processes. He defines self-regulated students as "metacognitively, motivationally, and behaviourally active participants in their own learning" (Zimmerman, 1990, p. 4). In the 21st century education, it is beneficial to ensure that students are equipped with self-regulated capabilities to empower them to learn for life.

Additionally, Lavi, Shwartz and Dori (2019) found a significant relationship between cognition, metacognition and motivation and self-regulated learning.
Lavi, Shwartz and Dori (2019)

Self-regulated learning occurs in the context of a task the learner is pursuing. Scaffolding is found to play a critical role in enhancing student efficacy and student motivation in learning (e.g., Darasawang and Wiriyakaru, 2013). This is because scaffolding increases the likelihood of student success, and challenges students through deep learning and discovery. Self-regulated learners view themselves as autonomous, competent and confident in their ability to perform. Competence can be supported in well-structured environments that allow for opportunities for growth, positive feedback, and challenges (Ryan and Deci, 2020).

Design of Self-Regulated Online Learning Experiences

The data-analysis in Chemistry online course was developed to enable students to acquire knowledge and skills to solve problems that require handling of information and interpretation in the Upper Secondary Chemistry curriculum. Consideration was given to the following essential elements to promote self-regulated online learning when designing this online course:
   (1) Cognition, using conceptual and procedural scaffolding to develop understanding and thinking processes in solving data analysis questions. For example, big ideas of each lesson, simple notes on each skills set, guiding questions, use of *interactive thinking*

      tools for crowdsourcing answers as well as the use of practices that mapped to the examples.

(2) Metacognition, tapping on EdTech features such as *tooltips, hints, automated feedback* that promote metacognition. Metacognitive scaffolding such as *reflection*, *think again* and *prompts* to check against success criteria to guide students in learning as the support opportunities for learning and growth.

(3) Motivation, sustaining student motivation and engagement so that they can fully benefit from the online learning. Principles of Differentiated Instruction and Self-Determining Theory were applied, such as setting respective tasks with multi-modal scaffolding (*videos, diagrams*) offering choices for different learning preferences (*audio or text*, *try first or go through example*), embedding checking in prompters on *challenges*, *encouragement* and *try again* messages.

The Chemistry data-analysis online course includes three lesson packages that are presented in the form of a learning guide. Each lesson covers specific skillsets and success criteria that were worked out from the key skills required in handling data and problem-solving:

      Lesson 1: Describing Trend and Relationship, and the Underlying Issues
      Lesson 2: Extracting Data for Calculations
      Lesson 3: Making Inferences and Deductions

Data Collection and Implementation

The target sample was Secondary Three students from Government secondary schools taking the Chemistry syllabus. The study was implemented in two cycles (i.e., with two batches of students) in four schools with a total of 263 students completed the pre- and post- tests that were administered.

Prior to attending the online course, the students completed a pre-test which covered the data-analysis skills they would learn in the online course. Following that, they were given a duration of about one school term (10 weeks) to complete the online course as part of their Chemistry learning process. Schools could decide if they would like to administer the online course as a fully student self-study module, or with handholding and monitoring by the teacher.

The objectives and timeline of the online course were shared with the students by their teachers. Students in School A were assigned the online course as a fully student self-study while students in schools B, C and D completed the online course with teacher check-ins every two to three weeks to address issues related to navigating the online materials or using the Edtech tools, without actual teaching of the content covered in the online course. Students could raise any challenges faced in the learning tasks while teachers provide self-regulated feedback to all via the learning portal. In-class lessons in class went on as per normal as the teaching and learning of other topics continued and students were given the ownership to decide on how they would plan to complete the assignment, with a recommended timeline given in the online course instructions. At the end of the online course, students had to complete the post- test that was administered.

A student perception survey was also administered separately to gather deeper insights on student engagement and motivation in self-regulated learning, including additional questions to seek students' input on ways to improve the learning experiences of the online course.

Result Analysis

Pre- and Post- Tests

The overall results of the pre- and post- tests are shown in Table 1:

Table 1: Overall Results for Pre- and post- test

Year	2021	2022
N	128	112
p-value	7.50×10^{-21}	1.99×10^{-15}
Cohen's d	0.88	0.89

The paired t-test p-value ≤ 0.05 shows that the intervention is statistically significant and the Cohen's d value > 0.8 indicates a large effect size. The results are consistent for the sample size of 263 students in the two cycles. This result shows that the online course is effectively supports the students' learning.

Individual school's pre- and post- test results were also analysed to gain deeper insights into the study and the details are in Table 2:

Table 2: Results for Individual School's Pre- and Post- test

2021				
School (N)	A* (36)	B (17)	C (41)	D (34)
p-value	2.48×10^{-4} (significant)	7.73×10^{-5} (significant)	9.49×10^{-10} (significant)	2.94×10^{-6} (significant)
Cohen's d	0.545 (medium effect)	0.869 (large effect)	1.08 (large effect)	0.933 (large effect)
2022				
School (N)	A* (28)	B (15)	C (28)	D (41)
p-value	6.25×10^{-4} (significant)	0.128 (non-significant)	6.17×10^{-9} (significant)	3.26×10^{-6} (significant)
Cohen's d	0.302 (small effect)	0.382 (small effect)	1.31 (large effect)	0.907 (large effect)

While students in School A completed the online course on their own with little teacher's guidance, the paired t-test result of School A still reflected a significant p value, with a medium effect in 2021 and a small effect in 2022. This means that the online course has a positive impact on students' acquisition of data-analysis skills despite minimal teacher's guidance. A non-significant effect and a small effect size were obtained for School B in 2022 due to a higher baseline in the pre- test, i.e., students were at a higher starting position and had some data-analysis skills before they started the online course.

The findings from additional data submitted by two other schools (School E and School F), which repeated the data collection process, showed consistent results as shown in Table 3.

Table 3: Results for Two Other Schools' Pre- and Post- test

2023		
School (N)	E* (36)	F (36)
p-value	4.20×10^{-4} (significant)	0.0823 (non-significant)
Cohen's d	0.573 (medium effect)	0.355 (small effect)

The results showed a consistency when students were given the online course to complete on their own with little to no teacher's guidance, the intervention is significant with small to medium effect size (School A in 2021 and 2022, and School E in 2023). While the consistency in the non-significant impact to students with a higher baseline in the pre-test was also clearly reflected in the results (School B in 2022 and School F in 2023).

Student Survey

The student survey that was administered focused on engagement and motivation in terms of students perceived value (V) and ownership (O) in completing the online assignment as well as the clarity (C), access (A) and rigour (R) of the online course in their learning. The results from student survey are collated in Table 4.

Table 4: Results for Students Perception Survey

No.	Question stem	% of students agree and strongly agree	
		2021 (N = 107)	2022 (N = 122)
1 (V)	I understand why I have to do the lesson packages.	98.1	94.3
2 (C)	The instructions in the lesson packages are easy to understand.	93.4	91.0
3 (C)	The success criteria are helpful for me to focus on what is required when answering the type of the questions.	91.6	94.3
4 (A)	The examples help me to understand how to answer the type of questions.	94.4	95.1
5 (R)	The number of practice questions are sufficient to help me learn the skills.	84.2	88.5
6 (R)	The practice questions are good challenges for me.	96.3	94.3
7 (A/C)	The automated feedback is helpful for me to think about how I can better answer the questions.	90.7	92.6
8 (V/O)	I am willing to spend time and effort to do similar lesson packages to learn and practice the skills in problem solving.	93.5	89.3

Results from the student survey showed that in general, the students understood the rationale of the online learning guide for self-study. They felt that the online course was pitched at the right level, was easy to understand and accessible. As such, the online course sustained student engagement, built student competence and confidence, and enhanced their motivation to learn.

Qualitative feedback showed students responded positively to the online course:

> *"It was simple and straight to the point where I can read and understand, then proceed to do on myself."*

> *"The examples on how to do the questions and then giving us the practice questions, which are similar."*

> *"... provided sufficient explanations…"; "videos with clear explanations."*

"Videos and guiding questions are very useful…"; "I liked the hints and examples…"

"I can do it at my own time and own target."; "At my own pace."

"[Can have] more examples on the different type of questions…"

Some examples of students' responses on self-regulated learning process (forethought, monitoring and evaluation) are as follows:

"Try to recall the methods shown [in the examples]."

"I would cross [reference] from the examples given or read the passage again."

"I struggled a lot, but I referred to the practice questions."

"I used the [suggested] answers to check what I may have omitted in my answer."

"I used the PEEL (point elaboration example link) method."

Overall, the online course was well-received by the students, and they were motivated to learn as they saw the value and purpose of the self-regulated learning online course. Regardless of their readiness (including those with higher pre-test baseline), students appreciated the online course in supporting them in acquiring knowledge and/or developing better understanding of answering data-analysis questions. All the data points provided good insights into effective instructional scaffolding to support online learning, which has a significant positive impact on student ability to answer data analysis questions.

Implications for Teaching and Learning

Some insights on good practices in supporting online self-regulated learning are distilled from this study:

(1) There must be clarity in terms of the role of the teacher.
In teaching and learning with technology, student-content interaction needs to be supported by student-teacher interaction to enhance students' learning. Even when setting an online course for students to learn independently, teachers still play an important role in supporting learning, especially for students at the secondary school level. This includes helping students to navigate the online learning materials, use of EdTech tools, helping students to review their learning process, and even sending reminders to complete the work may still be necessary. In addition, teachers need to be mindful of the affective domain of learning, especially to spend time to have conversation with the students on the purpose and learning goals, and checking in how with them on how they feel about the online learning and finding out any issues or challenges they are facing. By doing so, teachers can better guide students to close their learning gaps and increase their motivation by making the task more accessible and achievable.

(2) Student readiness must be considered.
An important consideration for developing students to be self-regulated learners for online learning is student readiness. From the feedback gathered, low readiness students require

additional help, more regular check-ins and teachers' guidance, such as pointing out concept development more explicitly to students and directing them to relevant examples for the practice questions. In addition, some students need more practice to be more confident in mastering the skills. Hence, if the online course is intended for students to acquire skills, teachers can supplement the course by providing more questions for students to check their understanding, while encouraging them to focus on growth and making progress in learning.

(3) Student agency as an outcome must be deliberately planned for self-regulation to take place.

Fostering greater student agency in learning can better sustain student engagement and cultivate good learning habits for students to fully benefit from the online learning. First, through scaffolding that providing successful experiences of mastering in an online environment, students gain confidence and competence, which helps sustain their motivation and engagement in the online tasks assigned. Second, providing opportunities to give students a voice in their learning preferences, such as allowing them to give input to improve the online learning materials, increases student ownership of learning. Teachers could gather feedback from students and make the necessary adjustment as students go through the online learning, instead of making modifications only at the end of the course. Third, student ownership towards self-regulated learning can be developed by guiding them to set goals to complete their assignments, monitor their own learning against the success criteria and self-evaluation of performance focusing on growth. Finally, a collaborative learning environment, where students can support each other and contribute to the discussion of a question or a part of the content from the online course, can be built in both the online learning environment or face-to-face setting.

(4) Technology can promote skills and content acquisition.

This study showed that students were able to develop data-analysis and problem-solving skills beyond the learning of chemistry content via online learning. The use of multimodal instructions such as *text*, *video* and *audio* provide a variation of scaffolding that caters for different learning preferences. Features of Edtech tools such as *interactive thinking tools*, *hints,* and *tooltip* provide metacognitive scaffolding to guide students in checking and monitoring their thinking process, thus helping to facilitate and deepen learning in the SRL process. All these expanded the possibilities to leverage the technology for the teaching and learning of Chemistry via online learning.

Conclusion

The findings from this study showed that providing effective instructional scaffolding supported students in self-regulated online learning. These findings concurred with the study by Baars, Khare and Ridderstap (2022) that effective instructional support is crucial in the SRL process, which include cognitive and metacognitive engagement as well as the importance of enhancing student self-efficacy supported by scaffolding in mastery of the learning.

Code Switching Analysis: English Memes Reaction Video as the Supplemental Resources for Indonesian EFL Learners

Amelia Kartikawati, Ganesha University of Education, Indonesia

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

In Indonesia, most English communication still happens only in classroom settings. It leads to ineffective English language learning for students. In order to be proficient in English, students need to have supplemental resources without depending only on the teachers in school. The utilization of social media can be very helpful in English language learning. In Indonesia, Mr. D is a well-known English teaching influencer with Instagram account and Youtube channel of gurukumrd. One of his Youtube contents is an English meme reaction. The use of memes is quite new for English teaching in Indonesia. His videos teach English grammar clarity, word choices, and cultural opinion in a humorous way. This study analyzed code switching types used by Mr. D on the meme reaction video. The use of code switching in educational settings is a common thing. Wardhaugh's theory was used to analyze the code switching types in the video. The types are divided into 2 (two), namely situational and metaphorical. The researcher used qualitative study based on content analysis. The results of the study showed that Mr. D used both types of code switching. The metaphorical (65%) is the dominant code switching type used by Mr. D, compared with the situation type (35%). The viewers showed positive attitudes (99%) towards the content through the comment box, making them more motivated to learn English. 1% showed a neutral attitude. In addition, the meme reaction could be a reference for English teachers in Indonesia to implement fun teaching in classroom settings.

Introduction

Indonesia has English as a foreign language which is very different from the neighboring countries like Singapore, Hong Kong, and Malaysia. Those countries are using English as their second language (Sulistyo, 2015). In Indonesia, English learning happens mostly in the classrooms. The government inserts English in the national curriculum to be learned in formal education. English has become a compulsory subject in the elementary level. It proves that the government is very supportive towards English learning in Indonesia.

In fact, although many Indonesian students have been taught English even since kindergarten, they still find it difficult to master the language. Indonesian students face many difficulties in learning English, such as lack of language exposure (Farhani et al., 2020). They have no maximal exposure to the target language and minimal opportunities to interact with native speakers. Most Indonesian students only depend on teachers in schools in terms of English learning, whereas language learning should not only happen in a classroom setting. It will work more effectively if the students also add more resources outside the school. Social media can be very helpful in English language learning in Indonesia. It creates a sustainable and independent learning process (Lutfi, 2020).

Recently, more students are realizing the importance of English mastery in their social life. Many English learning resources are easily found on the internet. It is considered to complete the learning needs of students that cannot be obtained from the school. There are many influencers who are Indonesian or foreigners who focus on English language learning. They promote English learning through social media freely such as Instagram and Youtube. The social media account of gurukumrd is one of the influencers that is quite well known in Indonesia. It is managed by Mr. Danish or Mr. D. He comes from the United States and is currently living in Indonesia. Mr. D teaches English in a humorous way which makes him already has 1.4 million followers on Instagram and more than half million subscribers on Youtube. One of his content on Youtube is the English meme reaction. Memes in language learning are not new for English learners. Some studies showed positive results for the students' vocabulary memorization (Kayali & Altuntas, 2021) and creating happiness for students in classroom teaching (Reddy et al., 2020). Mr. D's meme reaction video is mostly delivering knowledge about English grammar clarity, word choices, and culture opinion. His reaction video can be defined as the innovative video teaching which can be an additional source for Indonesian students in English learning. Mr. D's contents are considered very communicative and engaging to his viewers, that is why this study wants to dig deeper into Mr. D video in terms of code switching use between Indonesian and English.

The linguistic phenomenon in bilingual and multilingual often called code switching. The use of code switching can be found in the forms of monologue or dialogue. Situational code switching and metaphorical code switching are the types of code switching (Wardhaugh, 2006). In the education setting, code switching used by the teachers is not new. Many studies have shown good results on impacting students' language learning. Code switching is frequently used in the educational process to aid in the students' comprehension (Mukti and Muljani, 2016) and to manage the classroom by showing solidarity or empathy (Gultom & Naibaho, 2021).

The researcher put the objectives of this study to understand the types of code switching employed by Mr. D on his video and how are the viewers/learners' perspectives towards the video based on the comments box section. To answer the objectives of the study, the

researcher conducted a study entitled "Code Switching Analysis: English Memes Reaction Video as The Supplemental Resources for Indonesian EFL Learners".

Theory

Wardhaugh's Code Switching Theory

The code switching theory used in this study is Wardhaugh's theory. The theory divided code switching into 2 (two) types which are situational and metaphorical (Wardhaugh, 2006).

The Situational Code Switching
It happens where the speakers change their language use depending on the certain situation. The speakers speak one language in one situation and deliberately change the language in different situations at the same time. Sometimes, even the code switching happens subconsciously by the speakers where they are not aware of the switching language activity.

Metaphorical Code Switching
It happens where the speakers do not only change the situation but require it to change the topic (Yosi & Sadia, 2019). Wardhaugh (2006) added the language changing from formal to informal, official to personal, serious to humorous, and politeness to solidarity.

Popularity of Memes and Reaction Video in Language Learning
Nowadays, the popularity of social networking sites is not only for entertainment purposes but also for communication (Garg, 2021). The popularity of memes on the internet is part of the communication among internet users. According to Oxford Learner's Dictionary (2022), meme can be defined as an image, video, or a piece of text containing humorous material which spread rapidly among internet users. In language learning, memes can be an enjoyable and beneficial material provided by the teacher to the students during the class. Kayali & Altuntas (2021) conducted a study in the College of Foreign Languages, Gazi University Turkey. According to the study, students' language memory was positively impacted by the use of memes. In addition, applying memes for language students emerges the creativity and engagement in their language learning. Teaching language with memes is not something new, various studies conducted in the classrooms related to the effect of memes. It concluded that memes are a useful supportive tool for the teaching process (Reddy et al., 2020).

The popularity of memes has created a new content category on Youtube namely meme reaction video. The studies about the use of Youtube videos in teaching EFL learners are very often to be conducted. The implementation of Youtube showed positive effects on the EFL learners' English acquisition (Cahyana, 2020) and the utilization of memes will boost EFL learners' motivation in language learning activity (Purnama et al., 2017). Thus, the researcher expects that the evolution of meme reaction video is considered to be useful to learners both in formal classroom settings or independent learning through the internet.

Methodology

This study was presented in qualitative research with descriptive content analysis. For analyzing qualitative data, a study often applies qualitative content analysis (Elo et al., 2014). Content analysis is conducted to identify the specific characteristics of materials such as video. This study used English memes reaction video of Guruku Mr. D's Youtube channel as the source of data. The video entitled "gurukuMrD Reacts: Meme Bahasa Inggris" that

published on May 2nd 2021. The researcher chose the video because Mr. D taught English in a humorous way through English memes reaction videos, which is rare to find on English learning in the formal classroom settings. Furthermore, the researcher expects that the code switching analysis of this video will give broader references to English teachers in Indonesia in terms of pedagogical skill. In addition, this video contains many switching languages that will support the data of this study.

The researcher collected the data through document technique. The document in this study is the transcript of Mr. D's Youtube video. The researcher applied some steps to collect the data, which are searching, downloading, watching, listening, and taking notes. The researcher used observational methods and media as the research instruments. The techniques of data analysis used by the researcher are familiarizing and organizing, coding and reducing, and interpreting and representing.

Finding

After analyzing the data, the researcher found that there are 2 (two) types of code switching used by Mr. D on the meme reaction video. The metaphorical type was used more dominantly than the situation type ones. The percentage of situational was 35% and metaphorical gained 65%. The details of findings are as follows:

No.	Type of Code Switching	Total	Percentage
1	Situational	6	35%
2	Metaphorical	11	65%

Table 1: Frequency of Code Switching Type Used

The meme reaction video of Mr. D drew the viewers/learners' attention. It could be identified by reading on his Youtube's comment box. The result showed 99% of viewers/learners have positive attitudes towards the video. 0% who showed a negative attitude and 1% showed neutral attitude towards the video. The details are as follows:

No.	Type of Code Switching	Total	Percentage
1	Positive	80	99%
2	Negative	0	0%
3	Neutral	1	1%

Table 2: Viewers'/Learners' Attitudes

Discussion

The Code Switching Types Used by Mr. D

The target audience of Mr. D is Indonesian learners where English is still a foreign language. That is why the code switching found in this study mostly was used to emphasize the meaning of topics and to show solidarity. The researcher discovered that Mr. D employed

both situational and metaphorical code-switching on his English memes reaction video. Based on the findings, the dominant code-switching type used was metaphorical type. This type of code switching allows the viewers'/learners to get a certain communicative effect that can be easier to be understood (Mukti & Muljani, 2016). One of metaphorical code switching used by Mr. D is shown below:

> *This is real life, ini bukan meme … Apa pentingnya nilai kalau banyak orang yang nilai bahasa Inggris passing … maybe not A … tapi passing, tapi nggak bisa bahasa Inggris, so apa pentingnya nilai? Yang penting bisa diajak ngobrol ya ….*

The utterance above showed the use of code switching in terms of persuading viewers/learners to have clear motivation for learning English. To achieve language learning goals, motivation is needed. Nerghes (2011) stated that the use of code switching enhances learners' motivation in digging more information related to the topic. The use of metaphorical code switching on the video focuses on engaging viewers/learners.

The researcher discovered many changing situations from serious to humorous on the video. In line with Wardhaugh's theory (2006), this language changing situation used by Mr. D was identified as a metaphorical code switching. The dialogue was taken from the video between Mr. D and a cameraman:

> *Mr. D : "WTF adalah singkatan!" (showing serious facial expression)*
> *A man : "Ya?"*
> *Mr. D : "WTF adalah singkatan!" (still showing serious facial expression)*
> *(No response)*
> *Mr. D : "You got it or it's not funny? Oke, gak lucu." (laugh together)*

The dialogue above allowed the cameramen and audience to start thinking together about the content at first. But, suddenly Mr. D changed his language into Indonesian to emphasize that his utterance is not funny at all. The code switching used here created a special communication between speaker and audience (Mukti & Muljani, 2016). In the teaching-learning process, the communication could enhance teacher and learners' chemistry which lead to motivation enhancement of learners.

The use of situational code switching was also found on the video. Mr. D talked with a man behind the camera during the video. The interaction became entertaining because of their mixed conversation of English and Bahasa Indonesia. One of situational code switching used is shown below:

> *Mr. D : What is bekas? Bekas is like a remake … left over?*
> *A man : Yes, secondhand.*
> *Mr. D : Oh, secondhand. Because mantan dalam bahasa Indonesia itu sifat … kata sifat …*

Based on the dialogue above, Mr. D switched from Bahasa Indonesia to English when communicating with a man behind the camera. After that, Mr. D switched again into Indonesian language when explaining to the viewers/learners.

In code switching, there are at least two languages that are involved. In this study, the code switching allows Indonesian and English used in the utterance. According to Mugo &

Ongo'nda (2017), code switching can be formulated by the presence of matrix language and embedded language. The matrix language may be recognized as the speaker's native tongue or as the language in which certain morphemes or phrases are used more frequently in speech. On the other hand, embedded language aids in finishing the formula's code switching example. In this study, the researcher discovered that the matrix language of Mr. D is Indonesian and the embedded language is English. Apart from the fact that Mr. D is an American who speaks English as a first language, but the communication style in his video stated differently.

In comparing independent learning through Mr. D's video and experiences of English learning in classroom settings, the researcher discovered similarity in terms of code switching implementation purposes. It is also firmly believed that teachers' code-switching is a successful teaching method when dealing with students who have little English proficiency (Ahmad & Jusoff, 2009). In conclusion, mostly the main purpose of code switching used on the video is for viewers'/learners' comprehension. The material comprehension creates a good English learning output for learners.

The Viewers'/Learners' Attitudes Toward the English Memes Reaction Video

In the twenty-first learning century, English material resources can be obtained anywhere and anytime in the world through technology. The use of English internet memes in language learning created humor and decreased learners' anxiety (Harshavardhan et al., 2019). The statement is in line with this study result where English memes are used by Mr. D to teach Indonesian EFL learners through his Youtube. Most of the Youtube's viewers showed a positive attitude toward the content. The indication of a positive attitude can be explored more on his Youtube's comment box. Most of the viewers/learners expressed their feelings after watching the video, such as happy and craving more English meme reaction in their English language learning journey. The researcher discovered viewers also provided answers on questions asked by Mr. D on the video. It showed that the learning process was very engaging with the viewers.

The researcher found a viewer/learner's comment left on the common box which indicated the neutral attitude. It was written in Javanese language as follows:

Figure 1: Neutral attitude found on Mr. D's YouTube

The meaning of the comment above was "not understand, but I am laughing" and it was categorized as neutral. It was because the viewer did not show a positive advantage towards the video in terms of English learning comprehension. In addition, he also did not mention any negative words after watching the content. It proves the use of memes gives a broader perspective in drawing Indonesian viewers'/learners' attention. The comment indicated that even he did not understand the material, but he enjoyed the meme reaction video. In education settings, memes can be a tool to provide extensive materials for teacher and student

communication (Dongqiang et al., 2020). In conclusion, memes stimulate students' enthusiasm and initiative to participate more in the English language learning process.

Conclusion

The use of code switching is often found in the EFL classroom and it gives a positive effect to the learners. English video meme reaction is something new for English language learning in Indonesia. The content contains many code switching utterances between Indonesian and English. The findings revealed 2 (two) types of code switching used which are metaphorical and situation. The metaphorical type (65%) was used more dominantly than the situation type (35%). The result of the study also revealed 99% of Mr. D's viewers showed positive attitudes towards the content and 1% of them had a neutral attitude. There is no negative attitude found during the study. The data can be identified from the comment box on his Youtube channel. Most viewers/learners showed excitement and craved for more video content like this. The researcher concluded the English meme reaction video enhances EFL learners' motivation to learn more into English. The motivation emerges from the learners' curiosity in participating more to learn. In addition, the method can be a reference for English teachers to implement fun teaching in classrooms through memes.

Future study should explore further on the teachers' code switching implementation on other social media, such as TikTok. The reason is because of the popularity of TikTok recently, particularly among Indonesian youngsters. The use of memes in English learning topics also needs further exploration to various levels of learners, from young learners until adult learners. This study did not dig more on how code switching used by the educator could facilitate the learners in terms of material comprehension. Therefore, future studies should explore more the effects of code switching used on other supplemental resources for Indonesian EFL learners.

Determinants of Career Adaptability of Undergraduates in Malaysia

Choon-Wei Low, Universiti Tunku Abdul Rahman, Malaysia
Ming-Yu Cheng, Universiti Tunku Abdul Rahman, Malaysia
Kar-Yee Ng, Universiti Tunku Abdul Rahman, Malaysia

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
Career adaptability refers to adapting to changing tasks and engaging in continued self-learning. It is crucial to respond to the changing demands of employers. Undergraduates are the future talents of a country. Their readiness to join the dynamic labour market is essential to be examined. Thus, this study examines the factors affecting career adaptability among undergraduates in Malaysia. This study uses an online questionnaire for data collection purposes. The questionnaire includes career adaptability, decision-making self-efficacy, proactive personality, and academic performance. After filtering the responses received, the regression analysis consists of 171 responses from undergraduates. Results show that career decision-making self-efficacy, proactive personality, and academic performance positively relate to career adaptability. This study found that career decision-making self-efficacy and proactive personality significantly influence career adaptability. The findings in this study recommend universities encourage undergraduates to participate in extracurricular activities to have the opportunities to enhance their decision-making skills and develop their ability to take initiative.

Keywords: Career Adaptability, Career Decision-Making Self-Efficacy, Proactive Personality, Academic Performance

iafor

The International Academic Forum
www.iafor.org

1. Introduction

The evolution of technology has brought about rapid shifts in employment structures, impacting the present generation. Technology is one of the critical components in various economic activities in today's modern world, especially in the digital world. The industry is transforming technologically, altering our living and working styles. With technology, the Fourth Industrial Revolution (IR 4.0) is reshaping how we live, work, and communicate. Its rapid change is unprecedented. IR 4.0 radically changes traditional industries, which rely on centralized factories, vast workforces, and huge organizations (Economic Planning Unit, 2021).

While technology has the potential to generate new job opportunities, it also can eliminate large numbers of jobs (Mashelkar, 2018). According to a survey by the McKinsey Global Institute, the demand for specific advanced IT and programming skills is projected to surge by as much as 90% between 2016 and 2030. These skills are integral to IR 4.0, requiring workforces to significantly enhance their technical proficiency to remain competitive in an increasingly automated and digitalized economy. Furthermore, acquiring basic digital skills is imperative in navigating the landscape of IR 4.0 (McKinsey & Company, 2018). As the technological landscape evolves, workers must adapt to change and proactively cultivate the skills necessary to thrive in a highly dynamic and technologically driven economy.

Over the past few years, Malaysia has witnessed robust economic growth, but a shift in the economic structure has contributed to a notable increase in unemployment. The transformations in economic structures and industrial activities have not only reshaped the composition of occupations in the labour market but have also left a discernible impact on the education sector. In 2021, Malaysia observed a significant rise of 4.7% in graduates, with a total of 5.61 million individuals graduating compared to 5.36 million in 2020. The number of graduates in the labour force also experienced a 4.6% increase, reaching 4.77 million in 2021, compared to 4.56 million in the preceding year. Despite these shifts, the graduates' labour force participation rate (GLFPR) remained at 85.0%, as reported in the previous year (Department of Statistics Malaysia, 2022a).

New graduates often encounter challenges securing suitable employment, particularly during economic crises, and are more susceptible to job mismatches and underemployment. Job mismatch arises when individuals are compelled to accept positions that do not align with the skill level corresponding to their educational qualifications. In Malaysia, the skill-related underemployment rate witnessed a 6.3% increase, equivalent to 114.6 thousand persons, reaching 1.9 million persons in 2021, up from 1.8 million in 2020. Consequently, the rate of skill-related underemployment for employed individuals with tertiary education rose from 38.0% in 2020 to 38.7% in 2021 (Department of Statistics Malaysia, 2022b). This surge is primarily attributed to the lack of experience in career planning and job exploration among new graduates and an overreliance on academic performance. Additionally, they may lack the soft skills and adaptability required to navigate the job market during economic downturns.

The cultivation of high career adaptability among university students in Malaysia is paramount, as it equips them to navigate the dynamic and ever-changing job market. In a rapidly evolving global economy, individuals must possess the skills and adaptability to navigate new environments and situations, ensuring continued relevance in the workforce. Numerous studies underscore the significance of career adaptability in augmenting employability and fostering career success among undergraduates. However, there is a

growing concern that many university students in Malaysia lack the requisite career adaptability skills to confront these changes and thrive in the labour market effectively.

Despite the critical importance of career adaptability, research indicates that Malaysian university students exhibit low levels of this crucial skill, resulting in adverse career outcomes such as unemployment, underemployment, and job dissatisfaction. Notably, Malaysian university students demonstrate a moderate level of career adaptability, characterized by higher levels of career concern, confidence, and control (Guan et al., 2013).

Numerous factors influence career adaptability, encompassing personality traits, decision-making self-efficacy, and the impact of career guidance (Savickas & Porfeli, 2012). A comprehensive understanding of these factors is pivotal for universities and policymakers in developing effective career development programs. By addressing these aspects, educational institutions can enhance students' career adaptability, better preparing them for the dynamic and evolving labour market. Hence, the central research question driving this study is: What factors significantly affect the career adaptability of undergraduates?

The outcomes of this study offer valuable insights for policymakers and educators, guiding how to effectively equip undergraduates to confront the challenges of a rapidly evolving labour market. This information is a foundation for universities to craft targeted career guidance programs and formulate policies to enhance students' career adaptability. Such initiatives have the potential to diminish instances of underemployment and contribute to overall improvements in Malaysia's labour market outcomes.

By fostering high levels of career adaptability among graduates, universities play a pivotal role in nurturing individuals who can significantly impact the country's economic growth. Graduates with solid career adaptability are well-positioned to drive innovation, enhance productivity, and create new job opportunities. As a result, these proactive measures benefit individual graduates in navigating their careers and contribute to Malaysia's broader economic landscape. The collaborative efforts of policymakers, educators, and institutions can thus pave the way for a more resilient and thriving workforce better prepared to meet the demands of an ever-changing employment landscape.

2. Literature Review

Career development is an important aspect to investigate in an individual's life. It involves the process of exploring various career opportunities and making informed choices. Two theories that explain how individuals make career choices are Career Construction Theory (CCT) and Social Cognitive Career Theory (SCCT). According to CCT, individuals have varying capacities and willingness to adapt to change. Career adaptability is the ability of an individual to deal with current and future challenges in their work roles. Career adaptability consists of four self-regulatory strengths: concern, control, curiosity, and confidence (Savickas, 1997; Savickas & Porfeli, 2012).

SCCT explains how an individual makes career choices based on self-efficacy, goal selection, outcome expectations, and environmental factors. Self-efficacy is an individual's belief about their ability to achieve certain performance levels in specific tasks. A person with a high level of self-efficacy towards a particular task is more likely to exhibit interest in performing the task, demonstrate persistence in the face of obstacles, and potentially achieve success. The Career Decision-making Self-Efficacy Scale developed by Taylor and Betz (1983) is the most

used instrument to evaluate individuals' levels of self-efficacy. It comprises 25 items that measure five dimensions, including self-appraisal, occupational occupation, goal selection, planning, and problem-solving. Given its relevance to evaluating university students' career adaptability, this scale has gained significant popularity among researchers and practitioners alike (Taylor & Betz, 1983).

Previous studies on career decision-making self-efficacy show a positive relationship between self-efficacy and career adaptability among higher education students (Duffy, Douglass, & Autin, 2015; Ebenehi, Rashid, & Rahim, 2016; Rudolph, Lavigne, & Zacher, 2017; Shin, Lee, & Seo, 2019).

Besides career decision-making self-efficacy, individuals must also be ready to take action to improve their career circumstances (Savickas, 2013). This aspect can be understood through the concept of proactive personality. A proactive personality refers to an individual's tendency to take the initiative to influence their environment. Proactive persons are more likely to effectively navigate career-related changes by identifying opportunities for improvement and creating an environment that aligns with their goals (Bateman & Crant, 1993; Seibert, Crant, & Kraimer, 1999).

3. Methodology

This study used a survey method in a quantitative research design to gather data from undergraduates in Malaysia. The questionnaire was distributed using Microsoft Forms and consisted of four sections. The sections in the questionnaire include the first section – demographic information; the second section – career adaptability (CA); the third section – career decision-making self-efficacy (CDMSE); and the fourth section – proactive personalities (PAP). The analyses conducted in this study included a reliability test, a Pearson correlation test, and multiple linear regression.

The CA scale used the 24 items from Savickas and Porfeli (2012), CDMSE refers to the 25-item scale by Betz, Klein, and Taylor (1996), and PAP used the 17-item scale from Bateman and Crant (1993). This study used a 5-point Likert scale to measure CA, CDMSE, and PAP. The academic performance refers to Cumulative Grade Point Average (CGPA). The scale scores of all variables were summed up and converted to 100%.

Figure 1 shows the research framework of this study. CA is the dependent variable, while CDMSE, PAP, and CGPA are independent variables in this study.
Figure 1: Research Framework

4. Data Analysis

The demographic composition of the participants revealed that 45% of respondents were in their first or second year of undergraduate studies, while 55% were in their third or fourth year. This distribution across academic years provides a balanced representation, capturing insights from students at different stages of their undergraduate journey.

As depicted in Table 1, the results revealed exceptionally high Cronbach's Alpha values. Specifically, the CA, CDMSE, and PAP measures demonstrated strong internal consistency, with Cronbach's Alpha values of 0.945, 0.931, and 0.962, respectively. These high values underscore the reliability and stability of the instruments, affirming the consistency in measuring the targeted constructs. The analysis unveiled a mean score of 78.47 for undergraduate CA. Notably, the standard deviation for PAP was 15.66. This variation indicates the degree of dispersion in responses, offering insights into the diversity of perceptions among participants, particularly regarding PAP.

Examining the correlation patterns among the variables, the findings presented in Table 2 elucidated significant relationships. A positive correlation between CA and PAP implies that individuals with higher career decision-making self-efficacy and proactive personality tend to exhibit greater career adaptability. A positive correlation emerged between CA and CGPA, indicating that those with higher career adaptability scores tend to perform better academically.

Table 1: Reliability Test

Variables	Cronbach's Alpha
CA	0.945
CDMSE	0.931
PAP	0.962

Table 2: Mean, Standard Deviation, and Correlation

Variables	Mean	Standard Deviation	CA	CDMSE	PAP
CA	78.465	11.509	1		
CDMSE	71.620	11.161	0.585***	1	
PAP	70.812	15.664	0.365***	0.423***	1
CGPA	78.708	10.868	0.146	0.099	0.180**

Note: ***$p < 0.01$, **$p < 0.05$

The study's primary objective was to unravel the factors that significantly influence the career adaptability of undergraduates. This study achieved the objective through multiple regression analysis, briefly summarizing the outcomes in Table 3. The examination of different model configurations provided nuanced insights into the relative impact of CDMSE and PAP on CA.

In Model 1, both CDMSE ($\beta = 0.522$, $p < 0.01$) and PAP ($\beta = 0.132$, $p < 0.1$) demonstrated a positive association with Career Adaptability (CA). The beta coefficients signify the strength and direction of the relationships, indicating that higher levels of CDMSE and PAP are associated with increased levels of CA. The significance levels (p-values) below 0.05 suggest that these associations are statistically robust.

Model 2, which excluded CGPA due to its insignificance in Model 1, revealed a strengthening of the impact of both CDMSE (β = 0.524, p < 0.01) and PAP (β = 0.144, p < 0.05) on CA. This model refinement allowed for a more focused examination of the core variables, emphasizing their robust contributions to predicting CA.

Models 3 and 4 delved into the individual effects of CDMSE and PAP, respectively. These models revealed that both factors exerted even stronger influences on Career Adaptability, with a beta coefficient of 0.585 (p < 0.1) for CDMSE and 0.365 (p < 0.1) for PAP. The elevated beta coefficients suggest that when considered in isolation, both CDMSE and PAP play substantial roles in shaping the levels of Career Adaptability among undergraduates. The results affirm the importance of CDMSE and PAP in contributing to the nuanced construct of CA among the study participants.

The regression models employed in this study underscored that CDMSE and PAP emerged as the predominant factors significantly influencing the career adaptability of undergraduates. Notably, the beta coefficients provided a quantitative measure of the strength and direction of these influences, with CDMSE exerting a more significant impact (β = 0.585) compared to PAP (β = 0.365).

The substantial influence of CDMSE is highlighted by the higher beta coefficient (β = 0.585), indicating a more pronounced contribution to the variation in CA. It suggests that as undergraduates perceive themselves as more productive in making career decisions, their levels of career adaptability are likely to be elevated. The finding aligns with the notion that a heightened sense of self-efficacy in career decision-making empowers individuals to navigate the complexities of their professional journeys with increased adaptability and resilience.

Simultaneously, the positive association between PAP and CA, as indicated by the beta coefficient of 0.365, emphasizes the relevance of taking initiative and being proactive in shaping one's career trajectory. Undergraduates with higher scores in proactive personality traits demonstrated a heightened level of career adaptability, underlining the importance of a proactive mindset in fostering adaptive behaviours in the face of evolving career landscapes.

These results resonate with previous research studies (Duffy, Douglass, & Autin, 2015; Ebenehi, Rashid, & Rahim, 2016; Guan et al., 2016; Rudolph, Lavigne, & Zacher, 2017; Shin, Lee, & Seo, 2019; Ebenehi et al., 2016; Karacanozdemir & Yerin Guneri, 2017). The consistency across these findings validates and reinforces the robustness of the outcomes of the current study. The alignment with prior research enhances the study's credibility and contributes to the broader understanding of the pivotal role played by CDMSE and PAP in shaping CA among university undergraduates.

<div align="center">Table 3: Regression Results</div>

	Model 1	Model 2	Model 3	Model 4
CDMSE	0.522	0.524	0.585	
	(7.663)***	(7.689)***	(9.374)***	
PAP	0.132	0.144		0.365
	(1.912)*	(2.105)**		(5.101)***
CGPA	0.070			
	(1.117)			
R-square	0.364	0.359	0.342	0.133
R	0.603	0.599	0.585	0.365
F value	31.828	47.047	87.877	26.018

Note: Standard errors are in parentheses. *** $p<0.01$, ** $p<0.05$, * $p<0.1$

5. Conclusion

This study concluded that career decision-making self-efficacy and proactive personality significantly influence undergraduates' career adaptability. They are positively related to career adaptability. The analysis in this study found that undergraduates with higher confidence in career decision-making are better prepared to face the challenges in labour after completing their undergraduate studies. Regression results also show that undergraduates possessing a proactive personality have a higher chance of attaining job positions. This study recommends that universities encourage undergraduates to join more extracurricular activities such as organizing activities. Joining extracurricular activities provides opportunities for undergraduates to take on leadership roles and develop confidence, decision-making skills, and the ability to take initiative.

From Kente Cloth to Tapestry Art: Exploring the Intricacies of Cultural Hybridity

Francis Ankyiah, University of Education, Ghana

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
This study explores the concept of cultural hybridity through an examination of the similarities and differences between Kente cloth and medieval tapestries. Drawing on examples from Ghanaian and European cultural heritage, the study investigates the ways in which traditional art forms can adapt and evolve through cross-cultural exchange. The study highlights the intricate designs and patterns found in both Kente cloth and medieval tapestries, and suggests that these similarities reflect a process of cultural exchange and adaptation. Through an analysis of the historical and cultural contexts in which these art forms emerged, the study demonstrates the unique complexities of cultural hybridity and the potential for cross-cultural dialogue. Overall, the study emphasizes the importance of exploring the intricacies of cultural hybridity in understanding the exchange of traditional art forms. It suggests that a deeper understanding of the similarities and differences between cultural artifacts can lead to new forms of artistic expression and cultural understanding, and can promote a more inclusive and diverse cultural heritage for future generations.

Keywords: Kente Cloth, Tapestry Art, Cultural Hybridity, Cross-Cultural Exchange, Artistic Innovation

1. Introduction

The study focuses on the concept of cultural hybridity in the exchange of traditional art forms, with a specific focus on Kente cloth from Ghana (Figure 1) and medieval tapestries from Europe (Figure 2) Cultural hybridity refers to the process of cultural exchange and adaptation that occurs when different cultures come into contact with one another (Bhabha, 1994). This concept has become increasingly relevant in the context of globalization and the growing interconnectedness of cultures around the world.

According to Appiah (1991), cultural hybridity has long been a feature of human history, as different cultures have interacted and borrowed from one another throughout time. The exchange of traditional art forms is one example of this process, as artists and communities have adapted and innovated upon traditional techniques and designs in response to new cultural and historical contexts.

According to Bhabha (1994), cultural hybridity is a complex process that occurs when different cultures intersect and interact with one another. It involves the negotiation of cultural differences and the creation of new forms of cultural expression that reflect the unique histories and traditions of each culture. Cultural hybridity can occur in a variety of contexts, including the exchange of traditional art forms, the adaptation of cultural practices and beliefs, and the formation of new cultural identities.

The study of cultural hybridity in the exchange of traditional art forms is significant for several reasons. First, it highlights the importance of cross-cultural dialogue and understanding in the preservation and promotion of cultural heritage. By exploring the similarities and differences between traditional art forms from different cultures, we can gain a deeper appreciation for the diversity and richness of cultural expression around the world.

Second, the study of cultural hybridity can lead to new forms of artistic expression and innovation. When artists and communities adapt and innovate upon traditional techniques and designs in response to new cultural and historical contexts, they create new forms of cultural expression that reflect the unique histories and traditions of each culture.

Finally, the study of cultural hybridity has important implications for the promotion of cultural diversity and inclusivity. By recognizing the value and significance of traditional art forms from different cultures, we can promote a more inclusive and diverse cultural heritage for future generations.

2. History of Kente Cloth and Medieval Tapestries

Kente Cloth and Its Historical Significance

Kente cloth is a traditional Ghanaian fabric that is woven using brightly coloured threads in intricate patterns. According to oral tradition, Kente cloth was first woven by the Ashanti people of Ghana in the 17th century (Ross, 2014). The fabric was originally made from silk and reserved for use by royalty and other members of the elite. Over time, Kente cloth became more widely available and was used in a variety of contexts, including religious and cultural ceremonies, as well as everyday wear (Padilioni, 2017).

Kente cloth is known for its intricate designs and patterns, which often feature symbolic motifs that represent concepts such as wisdom, bravery, and unity. The colours used in Kente cloth also have symbolic meaning, with each colour representing a different concept or emotion (Padilioni, 2017).

Today, Kente cloth is an important symbol of Ghanaian cultural identity and is recognized around the world as a powerful expression of African heritage. It is often worn during special occasions, such as weddings and funerals, and is considered a valuable cultural artifact.

Medieval Tapestries and Their Historical Significance

Medieval tapestries are large, woven textiles that were produced in Europe during the Middle Ages. Tapestries were often commissioned by wealthy individuals or institutions and were used to decorate important buildings and spaces (Campbell, 2013). They were also used as a form of political propaganda, with many tapestries depicting scenes from mythology, religion, and history that conveyed specific messages about power and authority.

Medieval tapestries are known for their intricate designs and patterns, which often feature realistic depictions of people and animals, as well as detailed landscapes and architectural elements (Rex, 2013). They were woven using a variety of techniques, including wool and silk, and were often embellished with gold and silver thread.

Today, medieval tapestries are considered valuable cultural artifacts and are housed in museums and galleries around the world. They provide a window into the artistic and cultural practices of medieval Europe and offer insights into the political and social structures of the time.

Comparison of the Two Art Forms

While Kente cloth and medieval tapestries originated in very different cultural contexts, there are some interesting similarities and differences between the two art forms. On the one hand, both Kente cloth and medieval tapestries are known for their intricate designs and patterns. Kente cloth is characterized by bold, geometric patterns and bright colours, while medieval tapestries often feature realistic depictions of people and animals, as well as detailed landscapes and architectural elements (Rex, 2013). Both art forms often convey symbolic meaning through their designs, with Kente cloth using motifs to represent concepts such as wisdom and unity, and medieval tapestries using scenes from mythology and history to convey messages about power and authority (Campbell, 2013).

On the other hand, there are also some significant differences between Kente cloth and medieval tapestries. Kente cloth is a relatively lightweight fabric that is often used for clothing and accessories, while medieval tapestries are large, heavy textiles that were used primarily for decoration (Rex, 2013). Additionally, while Kente cloth is made using a handloom, medieval tapestries were often produced using a more complex form of weaving that involved multiple weavers working together on a single piece (Campbell, 2013).

3. Cultural Significance of Kente Cloth and Medieval Tapestries

Symbolism and Meaning in Kente Cloth

Kente cloth is known for its rich symbolism and the intricate meanings woven into its patterns and designs. The patterns and colours used in Kente cloth often represent specific concepts or emotions, and are deeply rooted in Ghanaian cultural traditions (Padilioni, 2017). For example, the Adwinasa pattern (Figure 3), which features a diamond shape with a cross inside, is associated with the concept of "greatness" and is often worn by chiefs and other

important figures. The Fathia Fata Nkrumah pattern (Figure 4), which features a stylized image of a sword, is associated with the concept of "freedom" and was created to commemorate Ghana's independence from colonial rule in 1957 (Padilioni, 2017). The colours used in Kente cloth also hold symbolic significance. For example, blue is often associated with "peace" and "harmony," while green represents "growth" and "renewal". Red is associated with "blood" and "sacrifice," while yellow represents "wealth" and "royalty" (Padilioni, 2017).

In all, the symbolism and meaning woven into Kente cloth reflect the values and beliefs of Ghanaian culture, and provide insights into the history and traditions of the Ashanti people.
Figure 3: Fathia Fata Nkrumah pattern

Figure 4: Adwinasa cloth

Symbolism and Meaning in Medieval Tapestries

Medieval tapestries often feature intricate designs and scenes that are rich in symbolism and meaning. Many tapestries are commissioned by wealthy individuals or institutions and are used to convey political and social messages (Campbell, 2013). For example, the famous Lady and the Unicorn tapestries (Figure 5), created in the late 15th century, feature a series of six tapestries that depict a lady and a unicorn in various settings (Campbell, 2013). The tapestries are rich in symbolism, with each tapestry representing one of the senses, and the final tapestry representing "A Mon Seul Desir," or "to my only desire" (Campbell, 2013). The tapestries are often interpreted as a representation of courtly love, with the lady and the unicorn representing the lovers and the various scenes representing their journey together.

Other tapestries, such as the famous Bayeux Tapestry (Figure 6), depict historical events and convey specific messages about power and authority (Rex, 2013). The Bayeux Tapestry, created in the 11th century, depicts the events leading up to the Norman Conquest of England in 1066 (Rex, 2013). The tapestry is rich in symbolism, with each scene conveying a specific message about the events and the people involved. For example, the scene depicting the Battle of Hastings shows King Harold being struck by an arrow in the eye, a symbolic representation of his defeat and the triumph of the Norman army (Rex, 2013).

Figure 5: Lady and the Unicorn tapestries

Figure 6: Bayeux Tapestry

Overall, the symbolism and meaning in medieval tapestries provide insights into the historical and cultural context of the time, and offer a glimpse into the artistic and political practices of medieval Europe.

Comparison of Cultural Significance

Kente cloth and medieval tapestries are both highly valued for their cultural and historical significance. However, they hold different cultural meanings and are valued in different ways. Kente cloth is an important symbol of Ghanaian cultural identity and heritage. It is often worn during special occasions, such as weddings, funerals, and other important ceremonies, and is considered a valuable cultural artifact (Padilioni, 2017). Kente cloth is also regarded as a symbol of African cultural heritage and is recognized around the world as a powerful expression of African identity and creativity.

Medieval tapestries, on the other hand, are highly valued as historical artifacts that provide insights into the artistic and cultural practices of medieval Europe. They are often displayed in museums and galleries as examples of the artistic achievements of the time, and are regarded as symbols of wealth and status (Rex, 2013; Campbell, 2013).

To conclude, while both Kente cloth and medieval tapestries hold significant cultural and historical value, they are valued in different ways and reflect the unique cultural traditions and practices of their respective societies.

4. Cross-Cultural Exchange and Adaptation

Cultural Exchange Between Ghana and Europe

The cultural exchange between Ghana and Europe has a long and complex history that spans several centuries. European contact with Ghana dates back to the 15th century, when Portuguese explorers first arrived on the coast of West Africa (Owusu-Ansah, 2013). Over time, European powers established trade relationships with Ghanaian kingdoms, leading to the exchange of goods, ideas, and cultural practices.

During the colonial period, Ghana became a British colony and was subjected to a variety of cultural and political influences from Europe. European missionaries played an important role in spreading Christianity in Ghana and introducing Western education and cultural practices (Owusu-Ansah, 2013). At the same time, Ghanaian culture continued to evolve and adapt in response to these new influences, leading to the emergence of new forms of cultural expression.

In recent years, there has been a growing interest in the exchange of cultural practices between Ghana and Europe. Many Ghanaian artists and musicians have gained international recognition for their work, and there has been a renewed interest in traditional Ghanaian art forms such as Kente cloth (Padilioni, 2017). At the same time, Ghanaian cultural practices have also influenced European culture, with elements of Ghanaian music, fashion, and art appearing in European popular culture.

The cultural exchange between Ghana and Europe has been complex and multifaceted, with both positive and negative aspects. While European influence has had a significant impact on Ghanaian culture, Ghanaian cultural practices have also influenced European culture in important ways.

Incorporation of Kente Cloth Designs in Medieval Tapestries

We make a valid point that Kente cloth, which emerged in Ghana centuries after the medieval period, could not have directly influenced medieval European tapestries due to timing (Edusei, 2006). As Kemp (2012) notes, tapestry production flourished in Europe between the 12th-16th centuries CE. However, broader African textile influences on Europe are plausible over the longue durée of cultural contacts. As Goody (2010) discusses, trans-Saharan trade networks existed from antiquity, opening channels for the diffusion of sub-Saharan craft traditions northward. While evidence is limited, subtle stylistic adaptions are possible (Monson 2012).

From the 15th century onwards, the surge of European exploration and colonialism in Africa "brought about profound transformations in cultural exchanges" (Mudimbe 1988, p.127). Travelers, missionaries and colonists encountering diverse African weaving techniques may have transmitted some influences (Glassman 1995). The colonial era, when European powers controlled much of West Africa, involved intensive social and economic interactions conducive to creolized cultural forms emerging on both sides of the colonial divide (Gilroy 1993). Textile artisans experimenting with hybrid styles offer one plausible pathway for African influences on European production during this period of heightened contact (Ferguson 2003).

In contemporary globalization, renewed interest in cultural heritages has supported revivals fusing historical African and European influences (Crowley 2005). While direct borrowing of Kente motifs seems unlikely for medieval tapestries, Africa's broader role in the gradual evolution of European textile traditions remains a possibility given multi-directional diffusion over centuries of interconnectivity (Chilver 2013).

Adaptation and Innovation in the Exchange of Traditional Art Forms

The exchange of traditional art forms between cultures has often led to adaptation and innovation, as artists and artisans incorporate new ideas and techniques into their work. This

has been true in the exchange of traditional art forms between Ghana and Europe, as well as in other cultural contexts.

For example, the exchange of ideas and techniques between Ghanaian weavers and European textile producers has led to the emergence of new forms of textile production that incorporate elements of both Ghanaian and European traditions (Padilioni, 2017). Similarly, the exchange of musical ideas between African and European musicians has led to the emergence of new forms of music that combine elements of both traditions.

This process of adaptation and innovation is often driven by the desire to create new and exciting forms of expression that reflect the unique cultural traditions and practices of different societies. It is also driven by the desire to learn from and be inspired by other cultures, and to create new forms of cultural exchange that promote mutual understanding and respect.

The adaptation and innovation that occurs in the exchange of traditional art forms is a reflection of the dynamic and evolving nature of culture, and highlights the importance of cultural exchange in promoting creativity and innovation.

5. Similarities and Differences in Design and Technique

Analysis of Design and Technique in Kente Cloth

Kente cloth is known for its intricate designs and bold colours, which are created using a complex weaving technique that involves multiple steps and the use of specialized looms (Padilioni, 2017). The designs woven into Kente cloth are rich in symbolism and meaning, and often reflect important cultural concepts and values.

One of the key features of Kente cloth is the use of geometric patterns and shapes, such as squares, diamonds, and triangles. These shapes are often combined in intricate and complex ways, creating designs that are both visually striking and deeply meaningful. The use of bright colours is also an important aspect of Kente cloth, with each colour holding symbolic significance. For example, red is often associated with blood and sacrifice, while yellow represents wealth and royalty.

The weaving technique used to create Kente cloth is highly specialized and requires a great deal of skill and precision. The cloth is woven on a narrow strip loom, with each strip measuring between four and six inches wide. The strips are then joined together to create a larger piece of cloth, with the designs and patterns aligning perfectly across the seams.

In all, the design and technique used in Kente cloth reflect the unique cultural traditions and practices of the Ashanti people, and demonstrate the level of skill and artistry involved in traditional African textile production.

Analysis of Design and Technique in Medieval Tapestries

Medieval tapestries are known for their intricate designs and rich colours, which were created using a variety of weaving techniques and materials. Many tapestries were made using wool, silk, or a combination of both, and were decorated with intricate designs and scenes that conveyed specific messages (Campbell, 2013).

One of the key features of medieval tapestries is the use of perspective and depth, which was achieved by using a variety of weaving techniques, such as shading and hatching (Campbell, 2013). This allowed tapestry makers to create realistic and dynamic scenes that conveyed a sense of movement and action.

The designs woven into medieval tapestries were often highly symbolic, conveying messages about power, authority, and social hierarchy. Many tapestries depicted scenes from mythology, religion, or history, and were used to decorate important buildings and spaces, such as churches and castles (Campbell, 2013). The designs often included intricate details and imagery, such as animals, plants, and architectural elements, which added to the richness and complexity of the tapestries.

The weaving technique used to create medieval tapestries was highly specialized and required a great deal of skill and precision. Tapestry makers often worked in teams, with each person responsible for a different aspect of the weaving process (Campbell, 2013). The designs were often created using a cartoon, or full-scale drawing, which was then transferred onto the loom, where the weavers would work from the bottom up, creating the design row by row.

Overall, the design and technique used in medieval tapestries reflect the unique artistic traditions and practices of medieval Europe, and demonstrate the level of skill and artistry involved in tapestry production during this time period.

Comparison of Similarities and Differences

Kente cloth and medieval tapestries are both highly valued for their intricate designs and rich symbolism. However, there are also important differences between the two forms of textile art.

One similarity between Kente cloth and medieval tapestries is the use of intricate designs and patterns. Both forms of textile art often depict complex scenes and imagery that convey specific messages and meanings. Additionally, both Kente cloth and medieval tapestries are created using highly specialized weaving techniques that require a great deal of skill and precision.

However, there are also important differences between the two forms of textile art. Kente cloth is made using a narrow strip loom and is often created using bright colours and geometric patterns, while medieval tapestries are often larger in size and were created using a variety of materials, such as wool and silk (Campbell, 2013). Additionally, while both forms of textile art hold significant cultural and historical value, they are valued in different ways and reflect the unique cultural traditions and practices of their respective societies.

In summary, while Kente cloth and medieval tapestries share similarities in their intricate designs and weaving techniques, they also reflect important differences in their materials, size, and cultural significance.

6. Implications of Cultural Hybridity in Traditional Art Forms

Importance of Cultural Hybridity in Preserving Traditional Art Forms

Cultural hybridity, or the blending of different cultural practices and traditions, can play an important role in preserving traditional art forms. By incorporating new ideas and techniques

into traditional art forms, artists and artisans can create new and innovative works that reflect the changing cultural landscape.

One example of the importance of cultural hybridity can be seen in the evolution of Kente cloth. While Kente cloth has a long and rich history in Ghanaian culture, it has also evolved over time to incorporate new patterns, colours, and weaving techniques (Padilioni, 2017). This has allowed Kente cloth to remain relevant and vibrant, even as cultural practices and traditions change.

Similarly, the exchange of cultural practices between different societies can also provide new opportunities for the preservation of traditional art forms. By sharing their artistic traditions and practices with other cultures, artists and artisans can gain new insights and perspectives that can help them to adapt and innovate in new and exciting ways.

The importance of cultural hybridity in preserving traditional art forms highlights the dynamic and evolving nature of culture, and the role that creativity and innovation play in ensuring that traditional art forms continue to thrive and evolve over time.

Potential for Cross-Cultural Dialogue and Understanding

The exchange of cultural practices between different societies can also provide opportunities for cross-cultural dialogue and understanding. By sharing their artistic traditions and practices with other cultures, artists and artisans can foster greater appreciation and understanding of different cultural perspectives and practices.

For example, the exchange of cultural practices between Ghana and Europe has led to a greater appreciation of traditional Ghanaian art forms, such as Kente cloth, in European art circles (Padilioni, 2017). This has helped to promote greater understanding and appreciation of Ghanaian culture and heritage, while also encouraging dialogue and exchange between different cultural communities.

Similarly, the exchange of musical ideas between African and European musicians has led to the emergence of new forms of music that combine elements of both traditions, promoting greater understanding and appreciation of different cultural practices.

It is obvious to understand that, the potential for cross-cultural dialogue and understanding that arises from the exchange of cultural practices highlights the important role that cultural exchange plays in promoting mutual respect, understanding, and appreciation between different cultural communities.

Implications for Future Generations

The exchange of cultural practices and the preservation of traditional art forms has important implications for future generations. By promoting greater understanding and appreciation of different cultural practices, future generations can learn to value and respect diverse cultural perspectives and traditions. For example, by preserving traditional art forms such as Kente cloth, future generations can gain a greater understanding of the cultural heritage and history of the Ashanti people of Ghana (Padilioni, 2017). This can help to instill a sense of pride and appreciation for one's cultural heritage, while also fostering greater understanding and respect for the cultural traditions of others.

Similarly, by promoting cross-cultural dialogue and exchange, future generations can learn to value and respect the perspectives and traditions of different cultural communities. This can help to promote greater social cohesion and understanding, while also fostering a sense of global citizenship and responsibility.

In all, the implications for future generations highlight the important role that cultural exchange and the preservation of traditional art forms play in promoting mutual respect, understanding, and appreciation between different cultural communities.

7. Conclusion

In conclusion, this study explores cultural hybridity by comparing Kente cloth and medieval tapestries. It shows how these traditional art forms adapt through cross-cultural interactions, highlighting their shared designs and patterns as evidence of cultural exchange. By analysing historical and cultural contexts, the study reveals the complexities of cultural hybridity and its potential for cross-cultural dialogue. Understanding the nuances of cultural hybridity can lead to new artistic expressions, cultural comprehension, and a more inclusive cultural heritage for future generations.

Challenges and Recommendations to Champion Breastfeeding Teachers in Albay

Christine Grace M. Azul, University of Santo Tomas-Legazpi, Philippines

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

In today's modern world, it is equally significant for the mothers to nurse their babies and pursue their jobs. However, working mothers specifically teachers face initial challenges when they chose to breastfeed and return to work. In the Philippines, Republic Act No. 10028 (2009) otherwise known as Expanded Breastfeeding Promotion was implemented to support breastfeeding employees through establishment of lactation area and the practice of 40-minute lactation period at work. However, not all workplace is implementing the law. This research was a mixed qualitative and quantitative type of study. A quantitative approach through a survey questionnaire using a five-point Likert scale assessed the challenges faced by the 15 mothers who continued breastfeeding their babies after their maternity leave in Albay. A qualitative approach deepened the understanding of these challenges to come up with proposed recommendations through open-response questions in the survey. Descriptive statistics and qualitative content analysis were utilized to analyze the data. Two main challenges were identified in the workplace: lack of time (2.67) and lack of lactation area (2.93). Most breastfeeding teachers experienced inflexible working schedule and inaccessible lactation area in schools. Despite the challenges, they were supported by their co-teachers (4.33) and supervisors (3.67) by covering their duties and giving them constant moral support. The Department of Education (DepEd) with the help of school supervisors/principals must monitor the implementation of flexible work schedule, improvised lactation area, and inclusive guidelines in schools throughout Albay to fully create a supportive working environment for the breastfeeding teachers.

Introduction

Decades of research prove that breastfeeding is best for babies up to two years of age. Breastfeeding for six months or longer create indisputable benefits both for the infant and mother (Lawrence, 2022). Thus, it is important for the mother to give the best source of food to her baby through breastfeeding. It is equally significant for the mothers though to nurse their babies and pursue their jobs. According to Whipps & Honoroff (2019), maternal return to employment outside the home shortly after birth is inevitable for some families. Although the benefits of breastfeeding are strong, most mothers are unable to continue breastfeeding upon returning from maternity leave due to different challenges at work (Harrington, et al., 2022).

Benefits of Breastfeeding

There are long-term benefits of breastfeeding both for the mother and the child. Primarily, it is the first preventive health measure that can be given to a child at birth because breastmilk contains all the essential nutrients suitable for the infant's needs (Department of Education [DepEd], 2010). It also has nutrients and enzymes that could fight infection at an early age so researchers have repeatedly demonstrated the recommendation of breastfeeding over formula feeding in most cases (Lena, 2018). Its health benefits to the infant such as lower risk of gastroenteritis, diarrheal illnesses, urinary tract infections (UTIs), sepsis, and respiratory infections are always underscored (Al-Katufi et al., 2020). Hence, it is an important public health strategy for improving infant and child morbidity and mortality (Al-Binali, 2012). Furthermore, UNICEF Philippines (2017) stated that breastfeeding mothers have lower rates of breast and ovarian cancer, two leading causes of death among women.

Breastfeeding has been widely researched to bring forth more advantages beyond the health benefits. The skin-to-skin closeness that occurs during breastfeeding promotes bonding and attachment between mother and infant as well which led to increased efficiency of breastfeeding and enhanced neurological and psychosocial development of the infant (Bettinelli, 2012). It also boosts the morale of mothers because breast-fed babies are inclined to be more healthy or immune from sickness (Department of Labor and Employment [DOLE], 2014). Lastly, it alleviates poverty, promotes economic growth, and ends inequalities globally (UNICEF Philippines, 2017). Despite the notable benefits of breastfeeding, it continues to be a tough challenge for working mothers.

Breastfeeding Challenges at Work

A working mother face initial challenges when she chose to breastfeed and work full-time. Bettinelli (2012) stated that return to work is a well-known recognized factor that has been associated with diminished breastfeeding frequency and duration. Given the increasing number of women in the workforce, the workplace is a fundamental setting of intervention to support women who face challenges such as early cessation of breastfeeding once they return to work (Vilar-Compte et., al. 2021).

Indeed, some of the mothers are conflicted with their roles as a mother and as a member of the labor force. Lawrence (2022) stated that it is undeniably difficult to give up equally significant roles at home and at work. However, working creates difficulties and presents challenges in continuing breastfeeding. One of these challenges is that they mistakenly think they cannot breastfeed if they plan to return to work, and thus they may not talk with their

employers about their intention to breastfeed or how breastfeeding might be supported at their workplace (Bettinelli, 2012). In addition, few workplace environments are supportive of breastfeeding employees and employer perspectives toward breastfeeding remain discouraging (Stewart-Glenn, 2012). Even with the presence of lactation rooms, there were reported problems of their availability and accessibility to teachers and poor quality (Hentges & Pilot, 2021). Harrington, et al., (2022) added that lack of time, lack of space, and unsupportive work culture remain as challenges at work of breastfeeding employees.

In a study conducted by Al-Binali (2012), adverse work-related issues were one of the main reasons for a very low rate of exclusive breastfeeding among female school teachers in Saudi Arabia. Seeing that teachers can be found in the classroom most of the time at work and may have additional duties beyond the class hours, a breastfeeding teacher may find it more challenging to schedule pumping/nursing breaks. Based on Hentges & Pilot (2021) study, many teachers reported difficulties in creating time for breastfeeding where fixed schedules overlapped with lactation breaks. Thus, Philipps (2020) added that workplace climate in schools can be unfavorable for the demands of breastfeeding.

Breastfeeding Support for Teachers

Breastfeeding mothers in the academic field specifically teachers face various challenges at work. For mothers who choose to return to work postpartum, there are alternative options to breastfeeding such as pumping/expressing milk or breastfeeding the infant during breaks (Phillips, 2020). Way back 2009, this was highly supported by the passing of the Republic Act No. 10028 (2009) otherwise known as Expanded Breastfeeding Promotion Act. It stated that one way to support the exclusive breastfeeding movement in the workplace is to have a lactation room for breast pumping and milk storage. Establishment of lactation stations equipped with facilities for hand-washing and refrigeration and with electrical outlet and comfortable seat is required in non-health institutions (Department of Education [DepEd], 2010). With this initiative, literature shows that working mothers who have access to lactation facilities tend to be more productive as they feel less guilty of working full-time while providing one of the essential needs of their babies (Department of Labor and Employment [DOLE], 2014). This kind of intervention in the workplace is important in protecting, promoting, and supporting breastfeeding among working mothers (Vilar-Compte et., al. 2021).

A lactation period not less than 40 minutes in addition to the regular time-off for meals to breastfeed or express milk is also practiced in the Philippines (Department of Education [DepEd], 2010). Being the first law to provide paid breastfeeding breaks, its implementation should be closely monitored in the workplace throughout the country (World Health Organization, [WHO], 2015). This measure gives the breastfeeding mothers ample time to express milk in the workplace without worrying about their work schedule. An initiative like this which prioritizes the practical merging of breastfeeding and work is essential in optimizing the benefits of breastfeeding and supporting the employee (Lawrence, 2022). In addition, providing time for expressing milk in the workplace improved job satisfaction of employees (Jantzer et., al. 2018). Through these adequate policies, the right of women to combine motherhood and professional development would be fulfilled (Vilar-Compte et., al. 2021).

In combination with the implementation of sound policies, the sincere support of the co-workers could also impact the breastfeeding success of working mothers. According to Vilar-

Compte et., al. (2021), feeling comfortable and supported in breastfeeding or breast pumping in the workplace is essential in achieving successful breastfeeding goals at work. Indeed, the presence of a lactation room, implementation of lactation breaks, co-workers' support, and adoption of policies in the workplace all play a vital role to champion breastfeeding teachers.

Being a breastfeeding teacher myself, this research has a special place in my heart. The outcome of this study will be significantly beneficial to champion the essential role of women especially mothers as the primary source of nutrition of their babies. It will also empower mothers to do their best amidst balancing roles as a parent and a professional. Lastly, it will encourage the government and private sectors to support the advocacy of breastfeeding and/or breast pumping in the workplace. Therefore, the objectives of this study were to discuss the breastfeeding challenges and find possible recommendations to support teachers in Albay achieve their breastfeeding goals. Specifically, it aimed to:
   a. Identify the breastfeeding challenges of teachers
   b. Determine ways to support breastfeeding teachers
   c. Propose possible recommendations to address the challenges and support breastfeeding teachers

Methodology

This research was a mixed qualitative and quantitative type of study. The same research methodology was done in Stewart-Glenn (2012) and Phillips (2020) studies. A quantitative approach through a survey questionnaire using a five-point Likert scale assessed the challenges faced by the participants. A qualitative approach deepened the understanding of these challenges to come up with proposed recommendations through open-response questions in the survey. Descriptive statistics and qualitative content analysis were utilized to analyze the data.

Research Participants

The target participants were 15 mothers (Phillips, 2020; Hentges & Pilot, 2021) who continued breastfeeding their babies after their maternity leave. Given that the field of education is predominantly dominated by women, mothers who were working as full-time teachers with one child below the age of two (2) years were the chosen participants of this study.

Research Locale

The participants came from private and public schools in Albay. Given its strategic location in the Bicol Region as the gateway and urban province, most mothers here are expected to be involved in the workforce such as the academic field.

Research Instrument

Building upon the literature, the survey questionnaire was divided into two parts: a five-point Likert scale consisted of 10 questions and an open-ended section composed of three (3) questions. The questions in the first part were categorized into four themes: a) employee's perception as a breastfeeding mother b) employee's experiences in the workplace specifically work schedule and pumping area station c) employee's experiences with co-teachers' support; and d) employee's experiences with school head's support. In the second part, the questions

required a deeper explanation on the challenges and support that the participants had experienced in the workplace. The questions were adapted yet modified from Phillips (2020) study. Thus, a letter was sent to the author about the adaptation of the research instrument.

Data Gathering Procedure

The search for 15 target participants took a month last March 2023. They were selected through purposive sampling given that they were a unique sample as mothers who were in the minority of having experienced breastfeeding while working full time. A snowballing technique was also implemented as other eligible participants who might be interested in the study were recommended by initial participants. A consent form and initial conversation to build rapport with the participants was done first before the survey was distributed using email and/or Facebook. A short orientation about the objectives of the research and the data gathering procedure was also accomplished. The accomplished self-administered survey was collected and compiled in a span of one month.

Data Analysis

In the first part of the survey, descriptive statistics were used to analyze the quantitative data from the Likert scale (see interpretations below). On the second part of the survey, content analysis was used to analyze the open-ended responses (Hentges & Pilot, 2021).

Mean	Verbal Interpretation
4.20-5.00	Fully Agree
3.40-4.19	Agree
2.60-3.39	Neutral
1.80-2.59	Disagree
1.00-1.79	Fully Disagree

Results and Discussion

Fifteen breastfeeding teachers with diverse teaching experiences from two (2) cities (Legazpi and Tabaco) and one (1) town (Daraga) of Albay province participated in the study. On average, mothers were 32 years old and most of them were Junior High School teachers.

Breastfeeding Perceptions

Theme	Indicator	Mean	Verbal Interpretation
Perceptions as a mother and teacher	I am certain there is a place I could go to breastfeed or express breastmilk at work.	3.06	Neutral
	I am comfortable asking for help while breastfeeding or expressing breastmilk at work.	3.67	Agree
	I can talk about breastfeeding or expressing breastmilk at work.	4.2	Fully Agree

Table 1: Perceptions of Breastfeeding Teachers

Table 1 shows that the participants perceive their workplace as a secure and welcoming space for breastfeeding. They can openly share their thoughts and experiences in their breastfeeding journey at work with a mean rating of 4.2 and verbal interpretation of "Fully Agree."

However, they are not that certain if there is a proper place for breastfeeding or breast pumping at work. This finding concurred with the study of Harrington, et al. (2022) that lack of specific space for breastfeeding employees remains as one of the tough challenges at work.

Breastfeeding at Work

Theme	Indicator	Mean	Verbal Interpretation
Work Schedule and Pumping Area	My breaks are long and frequent enough to breastfeed or express breastmilk.	2.67	Neutral
	My breastfeeding or pumping area includes everything I need.	2.73	Neutral
	My breastfeeding or pumping area is in a private location and free of interruptions.	2.93	Neutral

Table 2: Breastfeeding Schedule and Area

In Table 2, most of the participants view their breaks at work as neither enough or insufficient to breastfeed or pump breastmilk with a mean rating of 2.67. Despite the demands of work, alternative options to breastfeeding such as pumping/expressing milk or breastfeeding the infant during breaks (Phillips, 2020) is still possible. Then again, many teachers in the study reported difficulties in creating time for breastfeeding where fixed schedules overlapped with lactation breaks (Hentges & Pilot, 2021).

Even with the initiative of Department of Education (DepEd) to release a memorandum in 2010 concerning the establishment of lactation rooms in the workplace, this stays as a major concern in schools throughout Albay. Many of the participants considered this as a major challenge at work with mean ratings of 2.73 and 2.93. Thus, all indicators regarding work schedule and lactation area in the workplace got a "Neutral" response which proves that this is one of the toughest challenges in their breastfeeding goals.

Breastfeeding Support

Theme	Indicator	Mean	Verbal Interpretation
Support from Co-teachers	My co-teachers support my breastfeeding goals.	4.33	Fully Agree
	My co-teachers cover my job duties if I need time to breastfeed or express breastmilk.	3.47	Agree

Table 3: Breastfeeding Support from Co-teachers

In terms of support from co-teachers in Table 3, the study garnered the highest mean rating of 4.33 with a verbal interpretation of "Fully Agree." Indeed, feeling comfortable and supported in breastfeeding or breast pumping in the workplace is essential in achieving successful breastfeeding goals at work (Vilar-Compte et., al., 2021). When it comes to their co-teachers covering their duties when they needed to breastfeed or pump, the mean rating was 3.47 which was a bit lower than the previous indicator mentioned above. It is noteworthy that workplace climate in schools can be unfavorable for the demands of breastfeeding (Philipps, 2020) even with the support of your colleagues.

Theme	Indicator	Mean	Verbal Interpretation
Support from Supervisors	My supervisor supports my breastfeeding goals.	3.67	Agree
	My supervisor helps me manage my workload so I could breastfeed or express breastmilk.	3.27	Neutral

Table 4: Breastfeeding Support from Supervisor

In addition, the participants received adequate support from their supervisors with a mean rating of 3.67 as shown in Table 4. But the help they get to manage their workloads was a bit lower at 3.27 mean rating. With manageable and/or flexible workload, they will have ample time for expressing milk in the workplace which will lead to improved job satisfaction (Jantzer et., al. 2018).

Indicator	Main Theme	Subtheme
What was the toughest challenge that you have experienced as a breastfeeding mom in your school?	Work Challenges	• Schedule • Lactation Area
What was the biggest support that you have received while breastfeeding or expressing breast milk in school?	Work Support	• Moral Support • Covering Duties
Can you name and describe polices related to breastfeeding or breast pumping that have been adopted by your school?	Work Policies	• Accessibility to Lactation Area • Lack of Policies

Table 5: Summary of Themes

The findings of the study identified themes and subthemes as illustrated in Table 5: (1) Work Challenges (2) Social Support (3) School Policies. These themes were applied to structure the findings and deepen the understanding on the challenges experienced by the participants and the support and policies they needed to help them succeed in their breastfeeding goals.

Work Challenges

Schedule

As teachers, these mothers faced unpleasant work-related issues such as a demanding work schedule which is one of the main reasons for a very low rate of exclusive breastfeeding (Al-Binali, 2012). Six (6) participants revealed their difficulty to breastfeed or pump milk during working hours. They cannot schedule breast pumping in between classes due to a lot of reasons such as handling preschoolers which require close attention, limited time during breaks, and doing paper works even after teaching in classrooms. One of them explained: "The toughest challenge I have experienced so far was my work time and schedule. There are times when I really need to breastfeed or express breast milk but I was not able to do it because I am still at work and should be with my pupils." This is also in consonance with Hentges and Pilot (2021) study wherein participants reduced the frequency, postponed, and skipped pumping sessions due to time issues. Clearly, a lactation period not less than 40 minutes in addition to the regular time-off for meals to breastfeed or express milk which

should be practiced in the Philippines (Department of Education [DepEd], 2010) was not properly exercised by the participants.

Lactation Area

Lactation facilities such as a designated area at work impact the mothers' ability to continue breastfeeding (Hentges & Pilot, 2021). Five (5) participants shared that there was no breastfeeding/pumping area in the workplace. According to them, finding a private and comfortable place to breastfeed was a huge challenge because there was no specific place for breastfeeding moms. The rooms available were inappropriate and have no privacy from students who usually needed consistent attention. One of the participants highlighted: "One of the challenges that I experienced as a breastfeeding mom is finding a private and comfortable place to breastfeed." This only demonstrates that the memorandum from DepEd, which mandates the establishment of lactation stations equipped with facilities for hand-washing and refrigeration and with electrical outlet and comfortable seat was not fully realized in most schools in Albay (Department of Education [DepEd], 2010). This challenge should be seriously addressed because this is also considered as the top intervention to support breastfeeding women in the workplace based on Vilar-Compte et., al. (2021) study.

Work Support

Moral Support

Most of the participants felt supported and secure in their workplace. Thus, a school can be considered as one of the few workplace environments that are supportive of breastfeeding employees (Stewart-Glenn, 2012). Six (6) mothers disclosed that their co-teachers are encouraging them to continue breastfeeding which made them felt good about themselves emotionally and mentally. In the words of one of the participants: "The biggest support I have received was moral support from my other colleagues who can fully understand my situation as a breastfeeding mom and that means a lot." This is similar with the results found in Philipps (2020) study where the participants responded favorably regarding overall co-worker support. They also received tips on how to increase their milk supply and reminders to pump on time and remain positive about being a breastfeeding mother. Hence, a workplace is certainly a fundamental setting of intervention to support women who face challenges such as early cessation of breastfeeding once they return to work (Vilar-Compte et., al. 2021).

Covering Duties

Apart from moral support, five (5) participants discussed positively how their co-teachers cover their duties whenever they are breastfeeding or breast pumping. One of them stated: "The biggest support that I have received while breastfeeding is the support from my co-teachers and principal. They attend to my class while I am breastfeeding." Their colleagues and even the principal is willing to attend to their class and give them consideration when they needed more time to complete their work while they are breastfeeding. One of the mothers also appreciated the gesture of letting her extend her breaks while she pumps milk and they attend to her class. This finding contradicts the study of Al-Katufi et al., (2020) which demonstrated deficient work support from colleagues as one of the top barriers in pursuing breastfeeding in the workplace. This might be a case of differences between two work cultures in the Middle East and Southeast Asia.

Work Policies

Accessibility to Lactation Area

Despite the lack of appropriate lactation area in the school, three (3) of the participants noted the initiative of their workplace to allow them to breast pump in the Faculty Room privately and in a designated small room. One of them added that she also had a flexible schedule and can go home early to breastfeed her child: "As to policies, there are none. The school pays consideration, however, to breastfeeding moms since they allow their employees to pump at faculty rooms and go home earlier (if work is done) to breastfeed their babies at home." This shows that some schools make use of the limited and available facilities to support the breastfeeding teachers. This initiative which prioritizes the practical merging of breastfeeding and work is essential in optimizing the benefits of breastfeeding and supporting the employee (Lawrence, 2022).

Lack of Policies

However, 11 out of 15 participants noted the lack of any policy in school supporting breastfeeding teachers. One of them narrated: "I guess there is no policy related to breastfeeding or breast pumping that has been adopted by our school. This kind of situation should be addressed and I guess everyone should be aware of the struggles of some breastfeeding moms that are working as public school teachers and weren't able to breastfeed and do milk pumping due to our work." Indeed, without the appropriate policies in place, the right of women to combine motherhood and professional development would not be fulfilled (Vilar-Compte et., al. 2021).

Conclusion

This research identified the practices that hinder breastfeeding of teachers after returning to work. The participants have had trouble breastfeeding/breast pumping at work due to two (2) major challenges: a) lack of time and b) lack of lactation area. In the middle of these challenges, they also received enough support in the workplace from their co-teachers and supervisors. With this, the following are the recommendations to overcome these challenges and support breastfeeding teachers in Albay:

A.　Flexible Work Schedule

Looking at the challenges of the participants, their work schedule remains as the top barrier to achieve their breastfeeding goals. It is recommended that the teachers should be well-informed about the Republic Act No. 10028 (2009) otherwise known as Expanded Breastfeeding Promotion Act which grants nursing employees paid break intervals not less than 40 minutes for every (8)-hour working period. Being mindful of this act would allow them to properly plan their work schedule and breastfeeding sessions. Though this is the first law to provide paid breastfeeding breaks, not all workplaces are implementing this law (World Health Organization, [WHO], 2015). Thus, it is important both for the teacher and supervisor/principal to be aware of this so proper guideline will be practiced in the workplace regarding breastfeeding employees.

One of the participants cited a flexible schedule granted to her as a breastfeeding mother. While this might be challenging for the supervisor, it is still feasible. For instance, a lunch

break can be extended to practice the 40-minute paid break or early out (after accomplishing the duties at work) can be implemented. Through this intervention in work schedule, protecting, promoting, and supporting breastfeeding among working mothers will be achievable (Vilar-Compte et., al. 2021).

B. Improvised Lactation Area

Another notable challenge is the establishment of proper lactation area in schools. Even with the presence of lactation rooms, there were reported problems of their availability and accessibility to teachers and poor quality (Hentges & Pilot, 2021).

Looking at the reality of education facilities in the Philippines, it is recommended to establish makeshift lactation area in schools. It is important to observe safety, cleanliness, and privacy in the designated area to ensure the good quality if not the ideal characteristic of a lactation area. With this initiative, literature shows that working mothers who have access to lactation facilities tend to be more productive as they feel less guilty of working full-time while providing one of the essential needs of their babies (Department of Labor and Employment [DOLE], 2014).

C. Inclusive School Guideline

As breastfeeding teachers, these mothers have the right to be provided with support and resources to perform their utmost duty as a mother and an educator. Given their responsibilities, it is unquestionably difficult to give up equally significant roles at home and at work (Lawrence, 2022). Through an inclusive school guideline, the co-teachers and supervisor/principal will work hand in hand to cater to the unique needs (such as lactation break and lactation area) of the breastfeeding teacher/s. As a result, the mother would feel included and valued at work and would see the school as a supportive working environment in her breastfeeding journey.

These critical needs of the mothers must be met and normalized so that the breastfeeding support for teachers will be institutionalized at the physical and organizational level (Hentges & Pilot, 2021). Amidst the difficulties, the Bicolano participants were supported by their colleagues which made things a lot easier for them to continue their breastfeeding goals. With this solid support and love, it is possible to establish proper guidelines in schools (both public and private) in Albay to champion breastfeeding teachers.

Official Conference Proceedings

Abstract

This study aims to explain Education in a Latin American educational conception, focusing on Paths for the Promotion of a Culture of Peace in Latin America, investigating Education in the 21st century in the Gameleira Municipal Network, based on public policies governmental frameworks, historical landmarks and academic publications, we aim to make a connection between 21st Century Education in Latin America and the actions developed by the Gameleira Municipal Network, in Basic Education in the Initial and Final Years of Elementary School, in a qualitative sampling of education in this modality. The general objective of this study is to understand Latin American Education in a historical and cultural context based on public educational policies linked to 21st Century Education in promoting the Culture of Peace in the municipality of Gameleira - PE; Among the specific objectives we have: relating Educational Public Policies through 21st Century Education and the role of schools in promoting a culture of peace using the Gameleira Municipal Network as a qualitative analysis, within the scope of Elementary Education in Final Years and Initial Years; Verify the extent to which the pedagogical actions of a Latin American Municipal Network have promoted a culture of peace and the reduction of school violence; Relate experiences of Education for the 21st Century in promoting the culture of peace, in the context of Basic Education, the Gameleira Municipal Network, Elementary Education, Final and Initial Years, with pedagogical results and actions that seek the quality of the teaching process and learning.

Keywords: Culture of Peace, School Education, Ways to Peace, School Guitar Education, 21st Century Education

Introduction

Delors (2012) and Debarbieux (2006) clarify that education must be attentive to contemporary social changes and adapt to such changes that generate transformations in society. From this perspective, the school needs to act on different fronts of action in search of promoting education with equity and quality, with democratic work being fundamental, open to collective participation and social well-being.

In the view of Tognetta and Vinha (2012), these transformations are driven by the cultures of young people as they expect from school, albeit unconsciously, something more than curricular content. They call for a comprehensive, meaningful education, where human values and interactions are constantly strengthened. The school of the 21st century radically changes its stance, as teachers push knowledge towards the student and no longer in their direction, with their objectives being: protagonism, motivation, autonomy and critical positioning of the student, in the face of the reality that surrounds him.

We also aim to understand Youth and Adult Education in Latin America based on a qualitative sampling of the Gameleira Municipal Network and its integration with the National Common Curricular Base and its relationship with the student's comprehensive training in the educational and social context based on the profile of the educator linked to 21st century Education, aware of the challenges that still exist such as infrastructure, training processes and teaching resources.

The methodological proposal of this research is content analysis and case study, with a qualitative evaluation of actions promoted by the Gameleira Municipal Network, in Basic Education in the Initial and Final Years of Elementary School, with a focus on deepening public educational policies aimed at the promotion of a culture of peace at school, whose qualitative approach, action research, becomes the best way when we aim to analyze specificities of locations or social groups.

Justification

The culture of peace in society, based on the universal goals of coexistence, established and proclaimed by resolution 217 A (III) of the UN General Assembly of 1948 (UN, 1948), It also needs to be followed by educational institutions, in our focus schools, which need to balance strategies to combat violence and promote peace, along with actions that seek the quality of the teaching and learning process, in consensus with Law 13,663, of 14 of May 2018, which amends Article 12 of Law No. 9,394, of December 20, 1996, to include the promotion of awareness, prevention and combat measures against all types of violence and the promotion of a culture of peace among the responsibilities of educational establishments.

Along this path, the Municipal Education Network of the Municipality of Gameleira – PE, in the Initial and Final Years of Elementary Education, has developed a list of actions that aim to guide pacification in its activities, with the premise of strengthening the school, implementing resources technological technologies and innovative actions, which enhance the teaching and learning process in a qualitative context with National and International emphasis.

Thus, this study investigated the performance of municipal public management and its actions and support to promote Education for the 19th Century, with a focus on promoting

culture and promoting education with equitable quality for all. Investigate education in a Latin American context and how this has promoted a culture of peace in the school environment, valuing social, economic and cultural aspects to strengthen student belonging to school and how this impacts the school routine. Along this path, this work contributed to guiding the promotion of a culture of peace and, consequently, the fight against violence in educational environments.

In this vein, we will approach 21st Century Education, in the Latin American context, having as a qualitative research point the Gameleira Municipal Education Network, which has been developing successful government public policies regarding this educational modality. Actions such as innovative practices, such as the use of technology, actions to strengthen learning and the incorporation of educational technology can help make learning more dynamic and accessible, allowing students to develop digital skills and have access to hybrid educational resources.

Regarding pedagogical actions, we have in the Gameleira Municipal Network, State of Pernambuco, in Brazil, a Popular Education that adopts a student-centered pedagogical approach, in which students are active participants in the learning process. This contrasts with traditional authoritarian, decontextualized and passive methodological approaches, which do not motivate critical thinking, citizen participation and autonomy of students.

History of Gameleira Education

 Gameleira, a municipality located in the state of Pernambuco, is known for its rich history and culture. Education played a fundamental role in the evolution of this community, shaping the present and future of its generations. This article will examine the trajectory of education in Gameleira, highlighting the historical milestones, the challenges faced and the impact on the lives of local inhabitants.

The history of education in Gameleira dates back to the beginning of the 20th century, when the first local educators came together to offer learning opportunities. The first schools were modest, often located in community buildings, but they reflected the community's commitment to education. Dedicated teachers worked tirelessly to provide children with access to knowledge.

In the following decades, Gameleira saw growth in educational infrastructure, with the construction of new schools and the expansion of the education system. However, progress has not been without challenges. The lack of financial resources, the lack of teaching materials and limited infrastructure were frequent obstacles. Still, the determination of educators and the local community continued to drive education forward.

Education was not just a means of acquiring knowledge in Gameleira; it was a transformative force. Schools have become centers of cultural and social activities, promoting community cohesion and the preservation of local traditions. Young people were trained to face personal challenges and contribute to the city's growth.

Over time, Gameleira overcame many of the challenges faced in the educational field. Government investments and local initiatives led to improved school conditions, teacher training and expanded access to education. Literacy rates have increased and the quality of education has improved significantly.

Currently, Gameleira has a network of public schools that offer quality education. Teachers, many of whom are children of the city, continue to play a crucial role in training future generations. The city proudly celebrates its achievements and its commitment to educational excellence.

The future of education in Gameleira is promising. Expansion plans, modernization of school infrastructure and the introduction of educational technologies are on the horizon. The city is determined to equip its young people to face the challenges of the 21st century and to continue contributing to the development of society.

Main Goal

- Understand Latin American Education in a historical and cultural context based on public educational policies linked to 21st Century Education in promoting the Culture of Peace, using the municipality of Gameleira – Pernambuco, Brazil as a point of investigation.

Specific Objectives

- Relate Educational Public Policies through 21st Century Education and the role of schools in promoting a culture of peace using the Gameleira Municipal Network as a qualitative analysis, within the scope of Elementary Education in the Final Years and Initial Years.

- Verify the extent to which the pedagogical actions of a Latin American Municipal Network have promoted a culture of peace and reduced school violence.

- Relate experiences of Education for the 21st Century in promoting the culture of peace, in the context of Basic Education, the Gameleira Municipal Network, Elementary Education, Final and Initial Years, with pedagogical results and actions that seek the quality of the teaching process and learning.

Methodology

The methodological procedure used in this research was a bibliographic review and literary refinement, which was based on concepts from the works of Silvia (2010), Heidrich (2009), Delors (2012), among others that address 21st Century Education in the context of Culture of Peace through innovative government public policies.

This work is a qualitative study, using bibliographic research, document analysis and constant data mining in articles and books. We also aim to understand 21st Century Education in the context of the Culture of Peace in Latin America based on a qualitative sampling of the Gameleira Municipal Network - PE and its integration with the National Common Curricular Base and its relationship with the student's comprehensive training in the context educational and social based on the profile of the educator linked to 21st century Education, aware of the challenges that still exist such as infrastructure, training processes and teaching resources.

As an object of qualitative study we have the Gameleira Municipal Education Network serving students from the Municipal Public Network in Basic Education, in the Initial and Final Years of Elementary School, through documentary research, interviews with participants and analysis of government public policies.

1. Initial Diagnosis:
Before starting the project, it is essential to carry out a diagnosis of the current situation in schools in the municipality. This may include collecting data on school violence, student, parent, and teacher perceptions of school safety, and identifying problem areas.

2. School Community Engagement:
Involving all members of the school community, including principals, teachers, students, parents and staff, is essential. Hold meetings to present the project and obtain the support and involvement of all interested parties.

3. Formation of the Coordination Team:
Appoint a coordination team that will be responsible for leading and implementing the culture of peace project. This team must include representatives from all interested parties, and must be responsible for planning, monitoring and evaluating activities.

4. Definition of Objectives and Goals:
Establish clear, measurable goals for the project, such as reducing rates of school violence, improving school climate, and increasing community participation in promoting peace.

5. Development of the Action Plan:
Create an action plan that describes the specific activities to be carried out to achieve the project objectives. This may include workshops, lectures, awareness campaigns, conflict mediation classes and peace-related extracurricular activities.

6. Implementation of Activities:
Put the action plan into practice, ensuring that all activities are carried out as planned. Monitor progress regularly and make adjustments as needed.

7. Awareness Campaigns:
Conduct school-wide awareness campaigns to promote a culture of peace. This may include spreading messages of peace, events and activities that involve students and the community.

8. Conflict Mediation Programs:
Develop conflict mediation programs, training students and teachers to act as mediators in conflict situations.

9. Assessment and Monitoring:
Regularly evaluate project results against established goals. Collect feedback from the school community and adjust the action plan as necessary.

10. Celebration and Recognition:
Recognize and celebrate the project's achievements, whether through awards, special events or ceremonies that value efforts towards a culture of peace in schools.

11. Expansion and Sustainability:
After obtaining positive results, consider expanding the project to other schools in the municipality and work on long-term sustainability, ensuring that the culture of peace continues to be promoted in schools.

12. Partnerships and Resources:
Seek partnerships with local organizations, government agencies and civil society groups to support the project and secure financial, human and material resources.

13. Final Assessment and Reports:
After project implementation, prepare a final report that highlights results, lessons learned, and recommendations for future culture of peace initiatives.

This methodology provides a general framework for implementing a culture of peace project in schools in a municipality. Adapting to the specific needs of the community and schools is essential to the success of the project.

Main Research Aspects

Scientific research is implemented in different aspects of investigation:
- **Literary refinement:** deepening the theme in different authors with the aim of understanding different arguments about the investigation.
- **Teacher Training:** Supervise regular training and qualification for EJA teachers, addressing best pedagogical practices and teaching strategies.
- **Infrastructure and Resources:** Identify actions to improve school infrastructure, ensuring adequate facilities and access to modern educational resources.
- **Monitoring and Evaluation:** Strengthen the continuous monitoring and evaluation system to measure student progress and identify areas for improvement.
- **Partnerships and Resources:** enhance actions that promote partnerships with civil society organizations, higher education institutions, local companies and government agencies.

Expected Results

The main results expected from the actions analyzed include:
- Promotion of a Culture of Peace in Schools with a focus on pacification in Social Environments through innovative pedagogical practices in Basic Education Schools, Municipal Network.
- Significant reduction in functional illiteracy.
- Increase in the completion rate of Elementary Education in the Initial and Final Years.
- Improvement in students' reading, writing and mathematics skills.
- Development of a more educated and egalitarian community.
- Strengthening bonds.
- Creating partnerships and articulations between different institutions.
- Evolution of educational indicators in large-scale assessments.
- Valuing students and education professionals.

Conclusion

This study investigated 21st century education in Latin America, in the context of promoting a culture of peace in the school environment, in a qualitative approach with the objective of the Municipal Education Network of Gameleira – PE, through the promotion of public policies linked to Basic Education, Elementary Education in the Initial and Final Years.

Education in the 21st century, in the context of a culture of peace, needs to seek strategies to combat violence and promote peace, together with contemporary actions that focus on the quality of the teaching and learning process, in consensus with Law 13,663, of 14 December May 2018, which amends Article 12 of Law No. 9,394, of December 20, 1996, which includes the promotion of awareness, prevention and combat measures against all types of violence and the promotion of the Culture of Peace as one of the responsibilities of educational establishments.

The story of education in Gameleira, Pernambuco, Brazil is a narrative of perseverance, commitment and progress. Over the decades, education has been a driving force in the community, empowering its inhabitants to seek a better life and contribute to the city's growth. Gameleira's educational legacy is a testament to the transformative power of education and its vital role in building a brighter future.

The results of the investigative processes revealed the evolution of educational indicators based on the promotion of a culture of peace in schools. These results were based on dynamic, democratic and cooperative teaching moments, with the participation of students who reflected, discussed and understood the importance of promoting a culture of peace in the school environment.

Finally, this work could contribute to guiding the promotion of a culture of peace and, consequently, in confronting school violence in Public Networks in Latin America and the World, through the promotion of public educational policies that have a social impact. Aware that there is no ready, complete, ideal formula for this problem, but paths that are clues for actions that we can follow in a pacification process proposed to consolidate education in the 21st century.

Developmental Stages of L2 Syntactic Acquisition:
An Empirical Study in Thai EFL Context

Phisutsiam Nguangkhamnam, iFuture Institution, Thailand

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This research aimed to identify the predominant developmental stages in which the majority of Thai EFL university students were currently operating. The empirical study of L2 syntactic acquisition was conducted within the framework of English question formation developmental stages, designed to address challenges in EFL learning. In this qualitative investigation, a purposive selection process was employed, enlisting a group of 120 intermediate to high proficiency university students as research participants. The evaluation of students' proficiency levels utilized the Standardized 300D Test of Nelson English Tests, while a picture-cued written task served as the research instrument to assess their competence in wh-question formation. The analysis encompassed 120 writing samples produced by non-English major students at Kasetsart University, Kamphaeng Saen Campus, employing Interlanguage Analysis. The outcomes, guided by the research hypothesis, revealed a discrepancy, indicating falsification, as 51 participants were currently operating at developmental stage 2: Aux^{2nd}, Do^{2nd} (42.50%), with statistical significance at the 0.01 level. Moreover, it was noticed that prerequisite knowledge from earlier developmental stages might not have been fully acquired in advance. From a pedagogical standpoint, the study recommended the implementation of a classroom model specifically tailored to address EFL learning challenges, particularly in the realm of syntactic acquisition.

Keywords: Developmental Stages, Syntactic Acquisition, Second Language Acquisition (SLA), English Writing, English as a Foreign Language (EFL)

iafor

The International Academic Forum
www.iafor.org

Background of Study

In the contemporary interconnected and globalized era, English plays a pivotal role as a global lingua franca. Its significance transcends mere communication, encompassing diverse domains such as business, education, and international relations. Proficiency in English writing skills holds particular importance, serving as a crucial tool for expressing ideas, conducting business transactions, and participating in academic endeavors. The ascendancy of English as a dominant language on the global stage has heightened the demand for effective English language learning strategies, especially in nations where English is taught as a Foreign Language (EFL) (Smith, 2023). Thailand exemplifies such a context, where the importance of English, especially in the domain of writing, is underscored by its relevance in both business and educational contexts.

In the Thai context, English assumes the designation of an EFL, and proficiency in the language is deemed essential for individuals aspiring to achieve success in both local and international arenas. The economic and academic advantages associated with a proficient command of English, particularly in writing, have led to an increased emphasis on English language education in Thailand (Nguyen, 2023). This emphasis is evident in various educational policies and programs aimed at enhancing English language skills. In addition, the business sector places a premium on effective English communication, with proficient writing skills being recognized as a key asset. However, despite concerted efforts, traditional methods of English language teaching in Thailand, particularly those centered on grammar instruction, have exhibited limitations in fostering practical language skills.

Historically, English education in Thailand has been characterized by a predominant emphasis on grammar rules and rote memorization, reflecting a conventional and rigid approach. While grammar undeniably plays a crucial role, an excessive focus on this aspect may hinder the development of practical language skills, especially in writing. Research suggests that an overly narrow focus on grammar might impede learners from acquiring a natural and intuitive grasp of sentence structure, consequently limiting their ability to communicate effectively (Smith, 2018). The imperative for a paradigm shift in English language teaching in Thailand becomes apparent, necessitating innovative and effective strategies that transcend the traditional confines of grammar-focused instruction.

The shortcomings of traditional English language teaching methods underscore the need for a more nuanced approach, particularly in the realm of writing. The exploration of the Developmental Stages of English Language sentence formation presents an intriguing avenue. Understanding how learners progress through distinct stages in acquiring syntactic structures can offer valuable insights into effective pedagogical strategies (Brown, 2019). Research in this domain has the potential to reshape the landscape of EFL education in Thailand, providing a fresh perspective on the development of English writing skills. By directing attention to the developmental stages of sentence formation, educators can tailor their approaches to align with learners' evolving linguistic abilities, fostering a more organic and comprehensive understanding of English syntax.

The applicability of the Developmental Stages of English Language sentence formation becomes even more pertinent in environments where opportunities for authentic language use are constrained. In numerous EFL contexts, including Thailand, learners may encounter challenges in immersing themselves in English-speaking environments, limiting their exposure to real-world language use. However, the developmental approach offers a

structured framework capable of guiding learners through various stages of syntactic acquisition, thereby providing a roadmap for language development even in linguistically constrained environments (Brown, 2019). This adaptive approach aligns with the needs of EFL learners who may lack the daily exposure to English outside the classroom.

In conclusion, the global significance of English, coupled with its specific relevance in the Thai EFL context, underscores the necessity for a departure from traditional teaching methodologies, particularly in the domain of writing. The Developmental Stages of English Language sentence formation emerges as a promising avenue for exploration, offering a fresh perspective on syntactic acquisition. By assimilating and understanding these developmental stages into pedagogical practices, educators in Thailand can augment the effectiveness of English language instruction, equipping learners with the essential tools needed to navigate the globalized world through proficient writing skills.

Developmental Stages in English Question Formation

The systematic process of language acquisition, whether within the realms of primary or secondary language acquisition, unfolded through developmental stages that progressed in a sequence beyond conscious control (Larsen-Freeman & Long, 1991; Heinsch, 1994; Willis & Willis, 2001). These stages, characterized as "developmental stages" by Johnston (1985), were integral to the comprehension of learnability, necessitating learners to encounter foundational knowledge in preceding stages for the acquisition of a new language. Pienemann's Processability Theory (PT) posited that learners navigated through distinct stages, emphasizing the impossibility of skipping stages (Pienemann, 2007). These stages played a pivotal role in understanding syntactic structures, particularly in the context of forming questions in English.

Dyson's (2008) elucidation of Pienemann's (2007) Developmental Stages of English Word Order delineated six sequential stages in syntactic acquisition, providing a structured framework for comprehending the stepwise progression of syntactic acquisition in English. The stages were outlined as follows:

Stage 1 involves learners lacking syntactic categories such as nouns or verbs, leading to communication limitations relying on non-verbal cues.

Stage 2 entails the production of flat strings as learners map words from their conceptual structure, resulting in the formation of basic SVO structures.

Stage 3 allows learners to acquire operations involving sentence beginnings and ends, facilitating positional exchanges, such as moving auxiliaries to the beginning.

Stage 4 introduces sentence-internal operations like subject-auxiliary inversion, constrained by working memory limitations.

Stage 5 sees the emergence of linguistic processing proficiency, enabling the movement of second auxiliaries after wh-words or wh-phrases.

Stage 6 focuses on operations within subordinate clauses, presenting challenges due to the cancellation of a prior developmental stage, where learners at this stage can cancel the inversion of subject-auxiliary in statements, marking a complex phase in syntactic development.

Previous research on developmental stages in English question formation highlighted their significance in language learning. Studies by Foster, Harris, and Joo (2010), Yumiko (2010), Mackey (1999), and Johnston (1985) emphasized positive sequences of acquisition, affirming that learners did not bypass stages. Doman (2012) examined Japanese ESL learners and

reported positive sequences in the highest stage of wh-question formation development. However, critiques by Hudson (1993) and Bachman (1990) contended that developmental stages offered a limited perspective, primarily focusing on syntax and morphology.

Foster, Harris, and Joo (2010) scrutinized English question formation in ESL university students, revealing diverse developmental patterns. Similarly, Yumiko (2010) conducted a longitudinal study on a Japanese learner, indicating independent development of developmental sequences in English questions. Mackey (1999) and Johnston (1985) identified positive sequences in grammatical development, reinforcing the necessity of prerequisite knowledge before advancing to the subsequent stage. Doman (2012) reiterated positive sequences in the highest stage, suggesting its utility in guiding language instructors.

Despite the positive viewpoints, critiques by Hudson (1993) and Purpura (2004) emphasized limitations. Hudson questioned the narrow focus on grammar in developmental stages, while Purpura pointed out empirical issues, such as limited fixed patterns and the absence of tests in classrooms. However, Doman (2007) argued against overlooking these drawbacks, emphasizing that developmental stages offered valuable insights into language acquisition, even if they provided only a partial view of language.

The study, specifically exploring English wh-question formation, omitted certain stages to align with its objectives. Stages 1 and 2, involving words and rising-intonation SVO structures, were excluded as participants were instructed to formulate wh-questions with given wh-words. Stages 3 and 4, encompassing do-fronting and yes-no inversion, copula inversion, were also excluded, as the study focused on subject and object wh-questions. Consequently, the framework for the study was presented in Table 1 below.

Table 1: The Modified Developmental Stages in L2 English *Wh*-Question Formation

Stage	*Wh*-Question types	Examples	Description
1	*Wh*-fronting	*What you write?*	Learners formulate inquiries by positioning a constituent antecedent to the subject, verb, and complement, thereby constructing wh-questions that initiate with an initial wh-word.
2	Aux 2nd	*Who will you see?*	Learners place the auxiliary, be it "do" or an alternative variant, in the second position during the construction of direct queries, and they extrapolate this pattern to indirect interrogatives through the process of overgeneralization.
2	Do 2nd	*What does she do?*	
3	Cancel Inversion	*I wonder who he is.*	Learners comprehend the syntactic structure employed in the construction of indirect inquiries.

Source: Adapted from Dyson (2008)

In summary, despite criticisms previously directed towards developmental stages within the realm of English interrogative structure, empirical research confirmed their pivotal role in guiding language acquisition. The manifestation of positive sequences of acquisition, as elucidated in diverse scholarly investigations, underscored the integral contribution of these stages to the developmental trajectory of learners, thereby providing invaluable insights for language educators. Despite the critical discourse surrounding them, developmental stages persisted as an invaluable instrument in illuminating the intricate processes underlying language acquisition.

Research Methodology

The study aimed to identify the predominant developmental stages among Thai EFL university students. This qualitative research involved 120 non-English major learners at Kasetsart University, Kamphaeng Saen Campus, with an average age of 19.38, ranging from 18 to 22. Only intermediate-high English proficiency participants were chosen to ensure a more comprehensive analysis of syntactic errors related to English wh-question formation. This selection criterion was based on the understanding that lower proficiency learners might lack the necessary skills for this particular aspect of English (Condelli and Wrigley, 2003; Graham and Macaro, 2007).

After carefully selecting participants based on their proficiency levels, all 120 intermediate - high English proficiency learners, who had studied English as a foreign language for over 12

years, were included. Additionally, these learners had formal instruction in English wh-question formation as part of their regular program, establishing a common academic background among the participants.

The sole research instrument employed in this study was a picture-cued written task, adapted from Lightbown and Spada's (1999) work. This task prompted learners to envision appropriate questions based on provided pictures. The test, comprising 30 images, was slightly modified by altering graphics and incorporating an underlined answer, along with a wh-word (who, what, or which) in parentheses as a cue for each expected question. The inclusion of answers aimed not only to aid participants in creating precise questions but also to prevent confusion and the use of unintended wh-words such as where, when, why, or how.

The task required participants to generate 30 wh-questions, including 10 subject and 10 object wh-questions, along with 5 embedded subject and 5 embedded object wh-clauses. These specific wh-clauses served to assess knowledge at developmental stage 3: Cancel Inversion. Each image was displayed for one minute, allowing participants to move to the next item, ensuring a timed response for each question. An item of a picture-cued written task was shown in Figure 1 below.

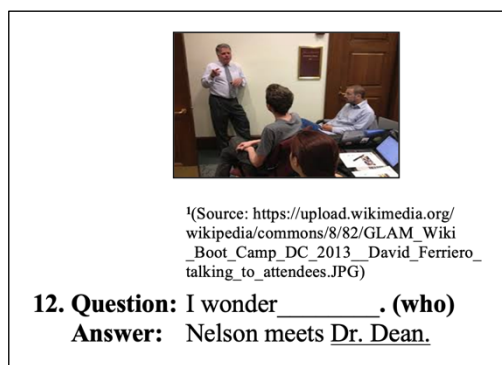
12. Question: I wonder_____. (who)
Answer: Nelson meets <u>Dr. Dean.</u>


Figure 1: Example of the picture-cued written task

During the written task, participants were required to employ the provided wh-word (in this instance, "who"), ensuring its logical relevance to the image and the underlined word in the response. For the specific item in Figure 1, the anticipated answer was "I wonder who Nelson meets."

The purpose of the test was to identify the general developmental stages of Thai EFL learners in acquiring subject and object wh-questions. The sample was chosen using purposive sampling, considering specific criteria aligned with the study's objectives, as wh-question formation had been formally instructed in their classes with explicit syntactic rules. All students, regardless of their major, were required to enroll in compulsory English courses during the first semester as part of their academic obligations.

In this research, data collection procedures occurred in two primary phases: (1) assessing the overall English proficiency level of participants and (2) administering a writing task utilizing the Standardized 300 D Test of Nelson English Tests. This test, adapted from Zahra and Farahani (2012), has been endorsed by various researchers for its reliability in evaluating learners' proficiency level, as indicated by studies by Yasser (2012), Zahra and Farahani (2012), Kolaei et al. (2013), Behnaz et al. (2014), and Gholam-Reza et al. (2014). The test's suitability for this study stems from its convenience, established standardization, and

accuracy in measuring proficiency. Comprising fifty multiple-choice items, the test evaluates participants' lexical, grammatical, and phonological knowledge (Fowler and Coe, 1976). The test format has been modified into a table for enhanced readability and comprehension. It includes two sheets: Sheet I, a question paper with three parts assessing lexical and grammatical knowledge, and Sheet II, an answer sheet capturing participants' personal details and responses to the fifty items. Participants required approximately 40 minutes to complete the entire test.

Based on the pilot test, data were gathered from 30 EFL learners who had a comparable academic background to the study participants. The standard deviation (SD) was 4.804, and the mean was 20.1. Participants scoring between 0 and 15.673 (<SD - mean) were categorized as having lower English proficiency, those between 15.674 and 25.207 (SD ± mean) were considered intermediate, and those between 25.208 and 50.000 (>SD + mean) were classified as having high proficiency (Gholam-Reza et al., 2014; Zahra and Farahani, 2012). In summary, participants scoring between 15.674 and 50.000 were selected for the study. Before administering the Standardized 300 D Test of Nelson English Tests to assess overall English proficiency, all participants were required to sign a consent form for ethical considerations.

The utilization of a writing task for data collection provided the advantage of securing authentic data, as participants were assigned the task of formulating wh-questions within a controlled environment. To prevent potential influences from external sources, participants were situated individually in the English language laboratory, each having private partitions, and were allocated a restricted timeframe. However, drawbacks associated with this data collection method included the susceptibility to biases and varied interpretations. To mitigate these issues, two experts with proficiency in teaching English writing were enlisted to validate the collected data and address any potential biased judgments.

The researcher conducted data analysis in alignment with the study's objective: identifying the overall developmental stages of Thai EFL university learners in the acquisition of subject and object wh-question formation. Initially, each written work, comprising 30 items (10 subject wh-questions, 10 object wh-questions, 5 subject embedded wh-clauses, and 5 object embedded wh-clauses), was individually examined. Every item was categorized into specific developmental stages based on the Modified Developmental Stages in L2 English Wh-Question Formation. The quantities of items within each stage were aggregated, and percentages were computed to ascertain the prevalence of developmental stages. The participant's current stage was determined by the highest percentage among the three developmental stages (stages 1, 2, and 3). Subsequently, after analyzing all written works, the overall developmental stages of wh-question formation for all participants were identified. Finally, statistical analysis, specifically Proportion Testing (z-test), was applied to establish the significance level for hypothesis testing. Approximately 10% of the analyzed data underwent validation by two experts to address any disparities in response checking. Discussions with the experts were conducted, and any discrepancies were resolved to ensure accuracy.

Results

In scrutinizing the research hypothesis, a written task was employed to evaluate the developmental stage of each participant. The hypothesis postulated that the majority of Thai EFL university learners were operating at developmental stage 1: Wh-fronting. The

subsequent task focused on the syntactic structure of wh-questions, reflecting the participants' syntactic knowledge. The analysis entailed categorizing all 30 items in each written work to determine the corresponding developmental stage for each item. Following the completion of the categorization process, the items were tallied, and percentages were computed to discern the prevailing developmental stage for each participant.

The outcomes revealed a refutation of the hypothesis, with 51 participants (42.50%) presently functioning at developmental stage 2: Aux^{2nd}, Do^{2nd}. Moreover, 16 participants (13.33%) were currently at developmental stage 3: Cancel Inversion. However, data from 53 participants (44.17%) indicated that they were presently operating at developmental stage 1: Wh-fronting, corroborating the initial research hypothesis. In summary, the statistical analysis illustrated a higher percentage of participants not currently operating at developmental stage 1: Wh-fronting (55.83%), with a significance level of 0.01 ($Z = 1.10$, $Z_{0.01} = 2.367$). Consequently, the results contradicted the research hypothesis.

Contrary to the research hypothesis, which posited that the majority of Thai EFL university learners operate at developmental stage 1: Wh-fronting, this hypothesis has been contradicted. The data indicates that 51 participants (42.50%) crafted wh-questions by positioning an auxiliary ('do' or another type) at the second position of the sentence, aligning with the knowledge required for developmental stage 2: Aux^{2nd}, Do^{2nd}. However, there is supporting data in favor of the research hypothesis. This is evident in 53 participants (44.17%) who formulated English wh-questions by placing a wh-word at the initial position of the sentence (without an aux-insertion), and 16 participants (13.33%) who constructed indirect clauses by canceling inversion. Despite the supportive data from the 53 participants, the statistical analysis reveals a significance level of 0.01, which contradicts the research hypothesis.

Discussion

Developmental Stage 1: Wh-fronting
In the identification of the developmental stages involved in the formation of English wh-questions, participants were involved in a modified picture-cued written task. This task entailed the analysis of 30 wh-question items, encompassing subjects, objects, and embedded clauses. The findings unveiled that 53 participants (44.17%) demonstrated proficiency in constructing English wh-questions, particularly by fronting wh-words, indicative of mastery at developmental stage 1, surpassing stages 2 and 3. This observation aligned with the initially posited research hypothesis. Notably, among Thai speakers, the formation of object wh-questions without auxiliary insertion was commonplace, as the auxiliary was perceived as optional. Consequently, the majority of these participants formulated object wh-questions resembling subject wh-questions, potentially influenced by L1-transfer. Comparable patterns were observed in prior studies, illustrating a prevalent inclination among learners to predominantly operate at developmental stage 1, providing further insight into consistent findings within this language acquisition context.

Developmental Stage 2: Aux^{2nd}, Do^{2nd}
The outcomes demonstrated that 51 participants (42.50%) proficiently generated English wh-questions by incorporating an auxiliary in the second sentence position, indicating competence in the requisite knowledge at stage 2. Two plausible interpretations could be derived from these findings. Initially, participants successfully acquired aux-insertion during wh-question formation, having traversed developmental stage 1: Wh-fronting, as evidenced

by their elicited wh-questions. However, subsequent to aux-insertion learning, they encountered challenges in distinguishing between subject and object wh-question structures due to insufficient L2 syntactic knowledge. As a result, they generalized this aspect to both wh-question types, encompassing wh-clauses. In this context, their current operation was construed as developmental stage 2: Aux[2nd], Do[2nd], influenced by overgeneralization arising from limited familiarity with the target language (Brown, 1994). Furthermore, in contrast to the proposition by Pienemann (2007) and Doman (2012) asserting that L2 learners must sequentially process structures for acquisition, the study's findings challenged Pienemann's (2007) assertion that learners cannot skip developmental stages. The analysis of written works revealed that learners could correctly formulate wh-questions in later stages while making wh-syntactic errors in preceding stages, suggesting that not all learners necessarily required full mastery of prerequisite knowledge in earlier stages before progressing. Various studies aligned with the notion that the acquisition of English wh-question formation did not consistently adhere to a positive sequential pattern and varied among individuals (Foster et al., 2010 and Yumiko, 2010).

Developmental Stage 3: *Cancel Inversion*

Dyson's (2008) developmental stage necessitated extensive prerequisite knowledge, encompassing operations on subordinate clauses formed using wh-words and lacking auxiliary inversion due to the "cancelling" of knowledge acquired in stage 2. This presented a challenge for learners. Only 16 participants (13.33%) formulated embedded wh-clauses, with a restricted number displaying accurate ones, indicating canceled auxiliary inversion. The results imply that these participants had not fully comprehended the essential knowledge for wh-question formation, as evidenced by syntactic errors such as aux-omission, aux-insertion, aux-inversion, and inverted auxiliary in wh-clauses, reflecting inadequate familiarity with the target language. Previous studies have highlighted similar occurrences, attributing incomplete wh-question knowledge to influences such as insufficient L2 syntactic understanding, L1-transfer, overgeneralization, and learning difficulties in L2 contexts with differing L1 and L2 properties (Pienemann, 2007; Robert, 1998; Kumagami, 2006; Sheen, 2000; Jansen, 2005; Gao, 2009).

Conclusion - Pedagogical Implications

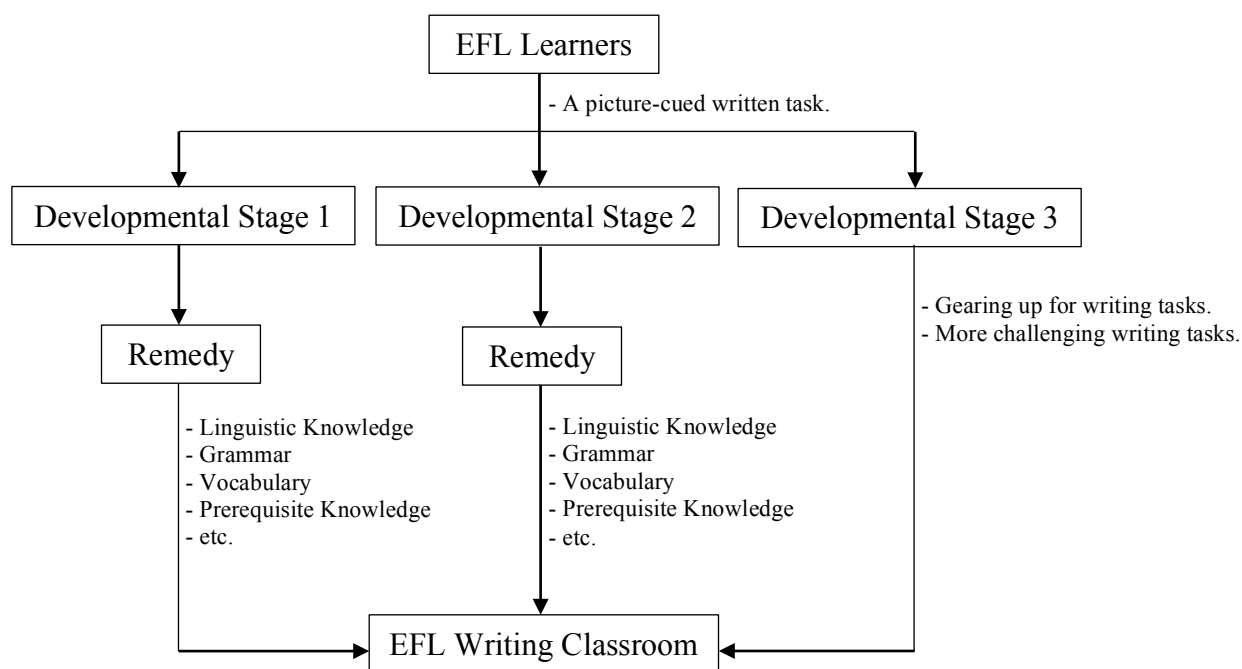
Discerning the developmental stages of L2 learners, particularly in intricate language structures such as wh-question formation, provided advantages. This investigation illuminated the diverse developmental stages experienced by Thai EFL learners, offering assistance to both learners and educators in monitoring advancement. Educators, through the classification of learners based on their respective stages, could concentrate on crucial elements in each, ensuring a methodical learning trajectory. This method empowered learners to comprehend the target language progressively. Furthermore, educators gained insights into prerequisite knowledge, providing guidance on when to strategically introduce specific stages in the learning process. This knowledge proved invaluable for enhancing the learning experience for both learners and instructors. A classroom model designed to address EFL learning challenges, particularly related to syntactic acquisition, was delineated in Figure 2.


Figure 2: A Model of Teaching and Learning Process for EFL Writing

Exploring the Teachers' Perceptions Towards the Development of National Curriculum: A Phenomenological Study

Mohammad Rizky Satria, Yogyakarta State University, Indonesia
Heri Retnawati, Yogyakarta State University, Indonesia

Abstract

The Indonesian national curriculum has undergone several changes in the last two decades. This phenomenon has various implications for teachers with different backgrounds. Through a phenomenological study, this research examines teachers' experiences in dealing with curriculum changes over the years. The informants in this study were eight teachers from various levels and types of schools and regions. Data were collected through in-depth interviews and analyzed by formulating textural and structural descriptions to define the construction of meaning. The results of this study indicate that: First, all informants faced the same phenomenon, but had different experiences due to differences in the level and type of their school; second, diverse experiences produce different meanings, where school conditions and needs, external support, and perspectives on challenges influence the teacher's adaptation process in dealing with the change.

Keywords: Curriculum Change, Teacher's Perception, Phenomenology

Introduction

The curriculum is defined with a diverse scope, from interpreting the curriculum as lesson plans to official state documents (Gufron, 2017). In Indonesia, the curriculum definition refers to Law No. 20 of 2003 concerning the National Education System which states that a "Curriculum is a set of plans and arrangements regarding objectives, content, and learning materials as well as the methods used as guidelines for organizing learning activities to achieve certain educational goals." Hence, the curriculum has an important role in determining the direction and form of an educational process. Moreover, Westbrook et. al. (2013: 12), represent that "The curriculum is the key reference point for teachers, particularly in developing countries, where it is encoded in the official textbook and teacher guides, often the sole resource used by teachers."

The curriculum designed by the government based on the National Education Standards and applied nationally is known as the national curriculum. Until 2022, the national curriculum in Indonesia has gone through a series of developments. It was recorded that the development of the national curriculum occurred in 1947, 1952, 1964, 1968, 1975, 1984, 1994, 2004, 2006, 2013, and 2022 (BSKAP, 2022; Hasan, 2019; Ritonga, 2018). It can be concluded that in the last 2 decades (2002-2022), the national curriculum in Indonesia has changed 4 times. However, the implementation of curriculum changes does not always run smoothly in the field and often becomes something complex to do thoroughly (BSKAP, 2022; Fullan, 2007; Tribuzzi, 2017; Westbrook et. al., 2013).

Various studies have been conducted in other countries to examine how teachers respond to the transformation of the national curriculum. A study conducted by Clasquin-Johnson (2016) in South Africa concluded that teachers' reactions to curriculum changes varied, where the effective follow-up to adaptation to change was influenced by the extent to which teachers had a community of practitioners where they shared teaching practices. Another research was conducted by Mellegård & Pettersen (2016) in Norway which examined the differences in perspectives between policymakers and teachers in the field. Curriculum changes that provide an expansion of independence are interpreted by teachers as an expansion of demands, thus showing discrepancies between the perceptions of teachers and the government. Other research conducted by Jenkins (2020) in Australia concluded that the effectiveness of teachers in implementing curriculum changes proved to be highly dependent on school leadership, teacher relationships with leaders and co-workers, school operational practices, school culture, and personal motivation.

In Indonesia, there are also several studies regarding the existence of teachers amid curriculum changes and how they perceive them. A literature study was conducted by Mahmud (2013), with the title "Teachers in the Middle of Curriculum Changes" concluded that any curriculum changes would be meaningless if teachers did not make changes in their classrooms. Meanwhile Setiawati (2022), in her research "Impact of Curriculum Change Policy on Learning in Schools" concluded that the effectiveness of curriculum changes is determined by the teacher's attitude towards these changes, where changes will run optimally if teachers can see challenges as motivation. Then, research conducted by Lubis (2016), entitled "Readiness of Teachers as Curriculum Developers in Responding to Curriculum Changes" concluded that curriculum changes will run optimally if teachers can design and develop curricula at the level of class or school. These articles summarize valuable conclusions, yet they are not field research so it cannot reveal the authentic perceptions of the teachers. Among the few relevant field research, there are studies held by Hidayah et. al.

(2022), who tried to explore the perceptions of elementary school teachers towards curriculum changes through a descriptive survey in Yogyakarta, and Efferi (2017) who explored high school teacher's responses to curriculum changes through a case study at Madrasah Aliyah Negeri 1 Kudus (Public Madrasa). The two studies concluded that the teacher responses to curriculum changes were still not optimal due to various constraints and the teacher has not voluntarily been able to actively understand the changes. However, the topic of research requires further exploration to dig into teacher perceptions more broadly and in-depth, across different types of schools with intensive interviews. Therefore, this research was conducted to explore teachers' perceptions of the development of a national curriculum through a phenomenological approach to fill this research gap.

This study looks at the issue of curriculum change in Indonesia as a phenomenon and makes the teacher experience a research study. Referring to this, the research questions posed are: How is the teacher's experience related to the development of the national curriculum and how do teachers give meaning to their experiences towards the development of the national curriculum. It is hoped that this research can become the input for all stakeholders to narrow the gap between the perceptions of policymakers and policy implementers in the field. As stated by Soto (2015), curriculum development is an ongoing process that requires lots of analysis from curriculum developers.

Methods

This research is a qualitative study. According to Denzin & Lincoln (2018), qualitative research involves an interpretive and naturalistic approach to the world. Qualitative researchers study things in natural settings, where they seek to make sense of or interpret phenomena as meanings by people. Hence, this research was carried out naturally through direct communication between researchers and informants. The method developed in this research is phenomenology. According to Creswell & Potch (2018), phenomenological studies describe the general meaning for some individuals regarding their life experiences related to a concept or phenomenon. Phenomenology looks closely at a person's interpretation of his life experience and tries to understand the objective meanings behind it. Therefore, phenomenological researchers focus on uncovering the essence of human experience in order to truly understand it (Lodico et al., 2010).

The phenomenological analysis follows the step originated from Stevick, Colaizzi, and Keen, which was reformulated by Moustakas and then simplified by Creswell & Potch (2018). Contains 6 steps, which are: 1) Describe the phenomenon under study, 2) Identify the significant statements from the participant, 3) Define the meaning units, 4) Develop textural description, 5) Develop structural description, and 6) Formulate the essence of the experience.

This study was conducted from December 2022 to March 2023. The research informants consisted of 8 teachers from various levels, school types, and locations to provide rich perspectives. The selection of respondents used a purposive sampling technique with the criteria of having taught in the school at least for 10 years.

Informant	Length of Teaching (Year)	School Level	School Type	Location (City)
1	13	Kindergarten	Private	Semarang, East Java
2	19	Primary	Private, Madrasa	Wonosobo, East Java
3	19	Primary	Public, Special School	Yogyakarta, Yogyakarta Special Region
4	12	Middle	Private	Jakarta, Jakarta Capital Region
5	18	Middle	Public	Pesisir Selatan, West Sumatra
6	12	Middle	Public	Hulu Sungai Tengah, South Kalimantan
7	13	High	Public	Garut, West Java
8	18	High	Public, Vocational	Makassar, South Sulawesi

Table 1: Participant profile

Data collection was carried out through semi-structured in-depth interviews using a variety of different modes for each informant, including face-to-face, online virtual meetings, telephone, and text messages. The data credibility test was conducted through a process of increasing persistence and triangulation and the dependability test was conducted through the process of auditing all stages and results of research by colleagues (experts).

Result

The results of this study are divided into two parts which were developed from the research focus; *first*, is the textural description related to how the teacher's experience relates to the development of national curriculum; *second*, is a structural description related to how teachers give meaning to their experiences towards the development of national curriculum.

Textural Description: Teachers' Factual Experience on the Development of the National Curriculum

Informants in this study have become teachers in the past 12 to 19 years (by 2022). Therefore, their experience is at least related to the development of national curriculum in 2004. In that year there was a significant development by the national curriculum in terms of shifting curriculum content from previously content-based to competency-based. Therefore, the 2004 Curriculum is referred to as the Competency-Based Curriculum (Kurikulum Berbasis Kompetensi/KBK). Furthermore, in 2006, significant developments in the curriculum occurred in terms of increasing the authority of schools in developing a curriculum that is in accordance with the characteristics of the region, so that the 2006 Curriculum is referred to as the Education Unit Level Curriculum (Kurikulum Tingkat Satuan Pendidikan/KTSP). 7 years later, the 2013 Curriculum emerged which encouraged innovation in learning design by reformulating Competency Standards that were more comprehensive targeting aspects of knowledge, attitudes, and skills. Significant developments then occurred during the pandemic of Covid-19 (2019-2022) when the government provided three curriculum options that could be chosen by the school: The 2013 Curriculum, the Simplified 2013 Curriculum (Emergency Curriculum), and the Prototype Curriculum which was later renamed become the Kurikulum Merdeka.

During the national curriculum development, the background of the informants who came from various levels and types of schools made their experience under various conditions. The conclusions from the interviews conducted with all informants indicate that there are specific conditions in dealing with changes between teachers in Early Childhood Education and elementary-secondary schools, teachers in public and private schools, and teachers in public schools, madrasa, and special schools. The specificity of these conditions is related to how far the national curriculum has an impact on the process of teaching and learning in school (school flexibility to adjust curriculum) and how dynamic the school is in dealing with change. Hence, the participant faced the same phenomena but sometimes had a different assumption according to different teaching contexts. Therefore, there are different meanings which we can see in the structural description.

Structural Description: Teachers' Construct of Meaning Toward the Development of the National Curriculum

The results of interviews with all informants led to 6 units of meaning which could be categorized by the informants' meaning of their experiences. The units of meaning are acceptance, significance, adaptation, challenge, support, and expectation.

Acceptance

The acceptance aspect is related to the teacher's initial response to the issue of curriculum development. In this aspect, the teacher interprets the presence of the new curriculum in various ways (positively, negatively, or both). Positive responses see change as natural, while negative responses see it as something that is too soon to be done. However, overall the portion of positive (optimistic) statements far outweighs the negative (pessimistic) statements. Here are some expressions on this subject:

Positive phrases	Negative phrases
The curriculum must change, indeed, in the sense of development. (Informant 4)	*This is my experience and I have seen it from a number of friends, especially those who are seniors, because the changes are really fast, then there aren't many changes. So I thought, ah let the curriculum change as well, later the leaders will change the policies again. (Informant 7)*
It seems that is true if a minister replacement leads to curriculum replacement, but each minister must have an argument about why the curriculum was changed. (Informant 6)	
I see there is an effort for, what is it, to make the national curriculum more adaptive to what is called the needs of the 21st century (Informant 1)	*It's just that not everyone wants to accept the change easily. Depending on the individual teacher, not all of them easily accept the changes, especially the senior teachers. Minister change, curriculum change, is really a hassle. (Informant 2)*

Table 2: Informant statement about "Acceptance"

What is noted in the reception response to the issue of curriculum development is the appearance of the statement "Ministers change, curriculum change" whose intensity appears quite often from all informants, both when conveying positive (optimistic) and negative (pessimistic) things. It indicates that this statement is very popular among teachers and has

become the "Top of Mind" when discussing curriculum change policies. However, when explored further, all informants realized that these statements were actually not always accurate considering that the curriculum was not always changed when there was a change of ministers. This statement tends to be used as a justification for teachers who are not always ready to face changes when a change in curriculum occurs.

Significance

The aspect of significance is related to the extent to which the national curriculum has an impact on the implementation of learning in every classroom. Some informants indicated that the national curriculum greatly determines the teaching-learning process in the classroom, while others did not see it that way. Here is an overview of the mapping:

High significance	Low significance
It's quite an impact, sir, like when we teach, we want to explore anything, we have to refer to the curriculum, right? (Informant 2)	*It doesn't have much effect in my school - the replacement of curriculum from 2006 to 2013 or to a new curriculum. That is because we usually make some readjustments. (Informant 1)*
The national curriculum is important as a reference for schools to conduct appropriate learning in the school. (Informant 6)	*When 2013 curriculum appeared, I was not exposed to this curriculum. (Informant 4)*

Table 3: Informant statement about "Significance"

Informant	Length of Teaching (Year)	School Type	Level of significance based on the conclusion of the interview.
1	13	Private	Low
2	19	Private, Madrasa	High
3	19	Public, Special School	Low
4	12	Private	Low
5	18	Public	High
6	12	Public	High
7	13	Public	High
8	18	Public, Vocational	High

Table 4: The significance level of the national curriculum to the informants

This study found a pattern between the background of the informants and the significance level of the national curriculum for their schools. The first category is informants at the kindergarten level, private schools, and special schools who tend to show a low level of significance for the national curriculum because they are used to developing the national curriculum independently according to the characteristics of their schools. While the second category is informants at the primary-secondary, state schools, and madrasa levels tend to show a high level of significance because so far they are used to fully following curriculum directions practically. As a result, informants in the second category felt more serious impacts from changing the curriculum than informants in the first category.

Challenge

The aspect of the challenge is related to the teacher's main obstacle in facing national curriculum development. This study found two obstacles from the informant's experience, that is the mindset and administrative problems.

Mindset	Administrative
Soon the curriculum will change again so there's no need to change it first. This view still exists because maybe there are too many replacements in the curriculum. So we don't think we need to rush into following the changes because we're afraid that soon they'll be replaced again. (Informant 7)	*My time in the class was drained a lot to complete such administration. Especially with, for example, various administrations, it has to be this version, right? Anyway, now it has to be like this. So in Sundanese, we say ngagugulung administrasi (too busy with administration), so the children are neglected. (Informant 7)*
There are teachers who see administrative changes as a challenge, there are also teachers who see it as a threat. (Informant 5)	*The only difficulty was that earlier, which was about administration, about books, and about report cards. Usually, it's like that, yesterday still used the report card but now digital, right? So you have to make changes again. How do you want this? Not to mention there are several subjects that are merged or omitted. (Informant 2)*

Table 5: Informant statement about "Challenge"

When conveying a statement regarding the obstacles to facing change, the informant's focus shifted from himself to fellow teachers in general (other people and including himself). Shows that is a general observation that they get in the field. All informants understood the mindset and administrative constraints as a real problem. Mindset and administration issues are two different challenges but mindsets influence teachers' perceptions of administration. In this case, some informants viewed the change in administration as a logical implication of curriculum changes, while other informants only viewed it as a complication.

Support

The support aspect is related to what things can help teachers deal with the national curriculum development. This study found there are three parties that the informants hope to provide support in dealing with change: Colleagues (including the community or teacher professional organizations), school principals, and the government (referring to the ministry of education and regional education offices).

Colleagues	School principals	Government (Ministry & Regional education offices)
During this time I gained a lot of knowledge and learned many new things from the community. ... Those teachers who take the initiative to develop themselves will definitely receive training in certain activities. But if the teachers are passive and just stay at school, they won't get anything. (5) *Yes, it's quite good. Because I have several friends to discuss it with, so I can understand quite a bit. (Informant 2)*	*Within the school scope, the curriculum changes more quickly if the principal is adaptive to change. But if it's just the teacher and not the principal, it will take longer, sir. (Informant 5)* *Structural influence is still very much attached, both from the education department and the school principal. The executive function plays an important role in encouraging changes that often take time to process. (Informant 3)*	*Yes, for me, government support is very helpful. Facilitating with training, technical guidance, and seminars and something like that. (Informant 6)* *So if the government wants to make a new curriculum, they have not only introduced the concept, but also ongoing support by accompanying the teacher through the process. (Informant 7)*

Table 6: Informant statement about "Support"

All informants agreed that the school principal has a crucial role in implementing changes in the field. The principal acts as a locomotive that can make teachers move. Meanwhile, the government plays a role in providing adequate training and assistance. In general, differences were found in informants who had community networks or teacher organizations. The more active the teacher is in the community, the more it will help them understand change. However, the more disconnected from the community, the more challenging the efforts to build a comprehensive understanding of change because they only rely on assistance from school principals and the government without carrying out independent initiatives.

Adaptation

The adaptation aspect is related to what extent teachers in the field can adapt curriculum developments. This aspect is directly related to the aspects of acceptance, significance, challenge, and support. Teachers who are used to developing curricula flexibly, who get support from colleagues and school leaders, and who have an open mindset tend to be more optimistic about adaptation. An example of optimism is illustrated by the following statement:

> *Any curriculum from the government, once it reaches the school, is directly adapted to the conditions and needs in the field. At school, we have implemented the principles of flexibility and student-centeredness in accordance with the current curriculum directives. (Informant 3)*

> *Conceptually understanding the curriculum does not take more than a month. (Informant 8)*

The informants' optimism about the adaptation process was built from their experience of dealing with curriculum changes in their schools. A dynamic school environment tends to form a more adaptive awareness of change because it positions the teacher as a curriculum developer, while a less dynamic school environment tends to form a pessimistic awareness of change because it only sees the teacher as a curriculum implementer.

Discussion

Construction of Meaning From Perceptions of Curriculum Development

Informants representing teachers from various backgrounds indicated that they basically agreed with developments. They understand that education is always developing and therefore the national curriculum must also be updated. Controversy arises according to the subjective ideal period. Some teachers believe that changing the curriculum in 10 years is too fast, while others see it as quite ideal. Another thing that forms the teacher's negative perception of curriculum development is a change from a technical-administrative perspective. Changing the curriculum is the same as changing all forms of teaching documents which is quite complicated, accordance to research by Mellegård & Pettersen (2016) who found discrepancies in perceptions between fellow teachers as policy implementers and teachers with the government as policymakers. Amid these conditions, curriculum changes are often closely related to increasing administrative demands.

In the school context, informants have two assumptions: That the national curriculum has a direct impact on the teaching process in schools (high significance) and that the national curriculum does not have a direct impact on the teaching process (low significance). This level of significance is influenced by the condition of the school environment. The higher school's ability to develop its curriculum independently, the lower significance of changes to the national curriculum for teachers. In this case, the mindset of informants is formed by the experience in adapting and socializing with the culture in their respective school environments. However, these findings strengthen the results of literature studies from Setiawati (2022), Lubis (2016), and Mahmud (2013) which indicate that teachers often face all administrative problems and that a positive mindset can help them deal with changes.

Related to the external factors, all informants stated that the school principal has a very crucial role in how teachers begin to respond the development of curriculum, the government has an important role in facilitating and accompanying the teacher's adaptation process to new policies, while colleagues and the community have an important role in providing reinforcement from sharing good practices. Therefore, school principals, government, and colleagues have complementary roles in supporting teachers in dealing with change. This fact is aligned with the relevant research that school principals and co-workers have a significant influence on assistance in adjusting to change (Jenkins, 2020); that adequate teacher training is an important thing that needs to be really considered in the framework of educational change (Fullan, 2007; Soto, 2015; Westbrook et al., 2013), and; that a community of practitioners can help teachers face challenges better (Clasquin-Johnson, 2016).

Acceptance, significance, challenge, and support aspects then influence the adaptation process in dealing with changes. Teachers who perceive themselves as curriculum implementers tend to be pessimistic about the adaptation process while teachers who perceive themselves as curriculum developers have an optimistic view. This is in line with the findings of Soto (2015) that in the midst of curriculum development, an important ability that teachers

must have is the awareness that they are curriculum developers at the classroom and school levels. In this case, the way teachers perceive their role is influenced by their mindset and school environment which are summarized in the aspect of acceptance, significance, challenge, and support that we have discussed.

Conclusion

This study yields two conclusions that refer to the answers of the research questions: *First*, the informants who came from various school and regional backgrounds experienced the same phenomenon of the national curriculum development which took place 2 times in the last 10 year period (2012-2022) and 4 times in the last 20 year period (2002-2022). In that period they faced the same issues but with varied experiences due to differences in background levels and types of schools; *Second*, different experiences in dealing with the phenomenon affect the various meanings for them. Informants perceive the influence of curriculum changes on daily teaching based on their school system, they expected comprehensive support from school principals, the government, and the peer or community, and they agreed that the mindset and administrative issues were the main obstacles but they interpreted it differently as a challenge or a pure problem. Therefore, informants who have a growth mindset and positive environment tend to be more optimistic and ready to adapt compared to other informants. It can be concluded that diverse experiences produce different meanings, where school conditions and needs, external support, and perspectives on challenges influence the teacher's adaptation process in dealing with the change. However, the findings in this study can enrich the field studies that have been conducted by Setiawati (2022) and Efferi (2017) in providing a richer picture of teachers' perceptions of Indonesian curriculum changes in multiple contexts.

Project Management Education for Value Creation

Masahiro Inoue, Keio University, Japan
Tomoko Maruyama, Ehime University, Japan

Abstract

Project management is a fundamental knowledge and skill in the field of engineering. Conventional project management has been based on a waterfall process to achieve deliverables while balancing the scope, schedule, and cost. Today, project management aims to not only obtain deliverables but achieve outcomes for value creation with sustainability. Furthermore, the project management process has become more diverse, including waterfall, agile, and a combination of them. The Project Management Body of Knowledge and the Standards have shifted from the methodologies defining detailed processes to the general principles. Project management education in universities should respond to value creation in diverse project models. However, the general principles are difficult to learn for students with limited practical project experience. Careful consideration should be given to designing project management educational programs. We researched the requirements for project management education for value creation in diverse processes and analyzed the gaps between recent demands and current project management education in universities. We propose a framework for project management education to achieve the learning outcomes for the program and allocate learning outcomes to projects, exercises, and lectures of project management education programs for value creation.

Keywords: Project Management, Education, Value Creation, Framework

iafor

The International Academic Forum

1. Introduction

1.1 Systems Engineering and Project Management

Engineering, particularly systems engineering, is closely related to project management (PM). Systems engineering and PM provide information that spans the entire engineering process. Systems engineering serves as the basis for comprehensive problem-solving. It is a systematic methodology for defining, analyzing, modeling, designing, and implementing solutions to real-world problems. In contrast, PM is a framework for problem-solving projects that includes planning, organizing, teamwork, communication, and management.

1.2 Project Management Education

Conventional PM uses the waterfall process to obtain desired deliverables while balancing scope, schedule, and cost. Currently, projects aim for deliverables and outcomes for value creation and solving social issues. In addition to the waterfall process with well-defined specifications at the beginning of the project, followed by design, implementation, testing, and operation, PM uses the agile process and a combination of both processes. The agile process repeats the development processes of planning, design, implementation, and testing in short cycles, considering changes in requirements as a precondition to achieving high-value results.

As a result, the PM body of knowledge and standards are shifting from process-defined methodologies to principle-centered contents, such as action guidelines.

PM education in many universities has been process-based, focusing on the waterfall process. Currently, there is a need for PM education that responds to value creation and rapid change. However, project experiences can provide insight into the essence of PM principles, such as action guidelines. Understanding such ideas is challenging for undergraduate and master's degree students who lack practical experience in project execution. In addition, it is difficult for students to take adequate actions if they only have knowledge of the principles.

Based on the demand for PM for value creation, herein we review and analyze the effectiveness and weaknesses of PM education integrated into engineering education. Furthermore, we emphasize engineering education and value-generating projects. Finally, we present the learning outcomes of PM education for value creation and discuss how educational programs should be designed in terms of projects, exercises, and lectures.

2 Project Management Education Initiatives Integrated Into Engineering Education

2.1 Systems Engineering and Project Management Education

This section presents the benefits and challenges of integrating PM education into engineering education. Systems engineering and PM are common frameworks that serve as the basis for the real-world activities of engineers. They share many similarities, as education in both knowledge and practical experience is required in both disciplines. Fig. 1 shows the relationship between systems engineering and PM. Both disciplines share an interdisciplinary approach to achieving quality, cost, and delivery (QCD), and they share concepts such as scope, time, cost, quality, and risk management.

However, each discipline comprises many unique areas. Systems engineering provides a technical framework for constructing system components, and its unique areas include design, modeling, and optimization. However, PM is a management framework for the successful implementation of projects, and its unique areas include human resources and communication management.

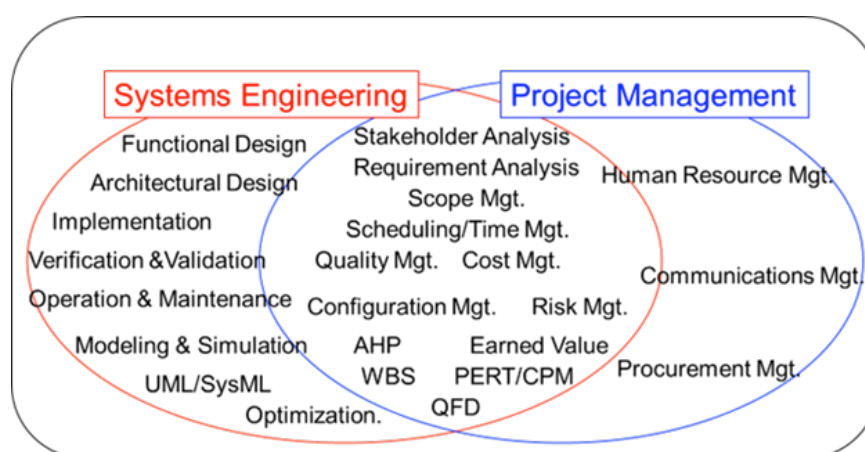
These two disciplines share some techniques and tools, such as brainstorming, work breakdown structure, the critical path method, earned value management, the analytic hierarchy process, and quality function deployment. The knowledge and skills of both disciplines are effective for engineers who promote systems development, and coordinated education is effective.


Figure 1: Relationship Between Systems Engineering and Project Management

2.2 Project Management Education Integrated Into Engineering Education

Educating students who have little practical experience in subjects that depend on empirical knowledge, such as systems engineering and PM, is a major challenge. It is essential to provide students with experience, both real and simulated, and careful coordination of the sequence of lectures, exercises, and projects is essential to their understanding. To address this issue, Inoue and Hasegawa (2010) (2013) have implemented an educational program in which projects, exercises, and lectures are programmed in an evolutionary manner, as shown in Fig. 2. In undergraduate and master's degree programs, project-based learning courses and lectures are scheduled alternately to foster awareness of problems through exercises, understand theories and techniques as a means of problem-solving, and repeat projects in problem-solving by applying such theories and techniques.

As shown in Fig. 2, Systems Engineering A (problem discovery and solving) is scheduled for the second semester of the second year. The content includes systems engineering and system life cycles, problem-solving processes, system requirements definition, system functional design, system evaluation methods, and special lectures from the industry. Simultaneously, System Engineering Exercise A, an exercise course, and a project are organized.

Systems Engineering B (quantitative decision-making methods) is offered in the first semester of the second year. The content includes decision-making methods, stochastic and statistical analysis methods, simulation, and scheduling methods, as well as special lectures from the industry. Simultaneously, the exercise of quantitative decision-making methods, Systems Engineering Exercise B, is arranged and the project is implemented.

PM courses are offered in the first semester of the third year. The course contents include management processes, project initiation, scope management, time management, cost management, exercises in PM tools, risk management, quality management, human resource management, communication management, special lectures on industry, and PM planning exercises. System Engineering Exercise C, which is an exercise course, also runs simultaneously with projects that address real issues in the industry and local communities.

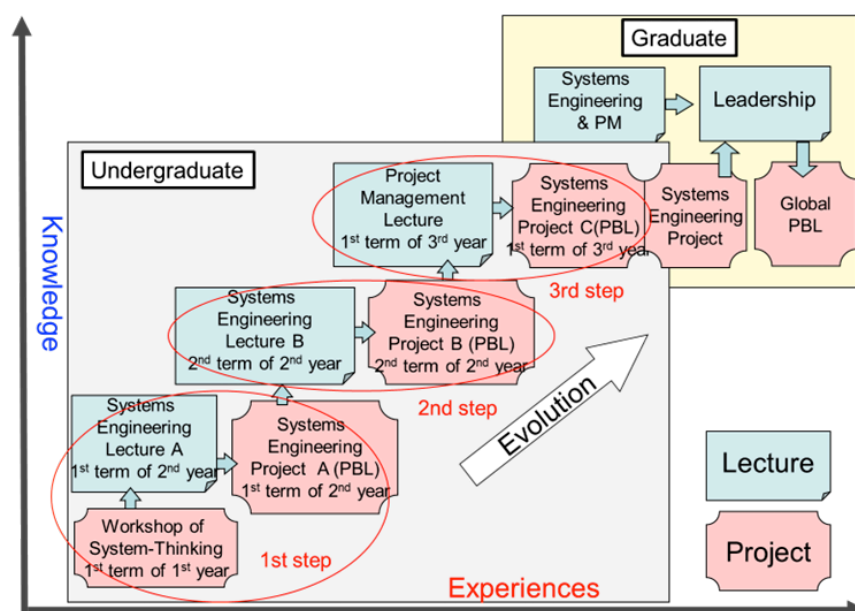
In master's degree programs, a short-term abroad program for global project-based learning (Inoue, 2016) (Inoue, 2020) in collaboration with the industry and local communities is offered, during which students execute projects that solve sustainable development goals (SDG) and industrial issues in cross-cultural environments with students from oversea universities. In addition, as education for soft skills, such as leadership, students acquire leadership skills and gain diverse experiences through repeated simulated exercises using meeting simulators (Inoue & Maruyama, 2014), which they can apply to projects, capstone projects, and global project-based learning.


Figure 2: Project Management Education Integrated into Engineering Education

3   Engineering Education and Projects for Value Creation

3.1   Value Creation

It is necessary to clarify the project stakeholders and envision the value for each stakeholder. Value can be diverse, including economic value and social value and it changes over time. It also changes with social changes, technological changes, and changing needs. The value of a project may not be clear at its conception stage. It is unclear how stakeholders will find value; therefore, a prototype may be required to verify value.

3.2   Projects for Value Creation

Challenge-based learning (CBL) is project-based learning for value creation and is being introduced mainly in engineering universities (Rådberg, 2020). CBL is based on the identification, analysis, and design of a solution to a sociotechnical problem. The learning

experience is typically multidisciplinary, involves different stakeholder perspectives, and aims at finding a collaboratively developed solution that is environmentally, socially, and economically sustainable. It is necessary to define the knowledge and skills required to implement CBL. It is necessary to consider how such knowledge and skills can be taught in the lectures.

3.3 Project Canvas for Value Creation

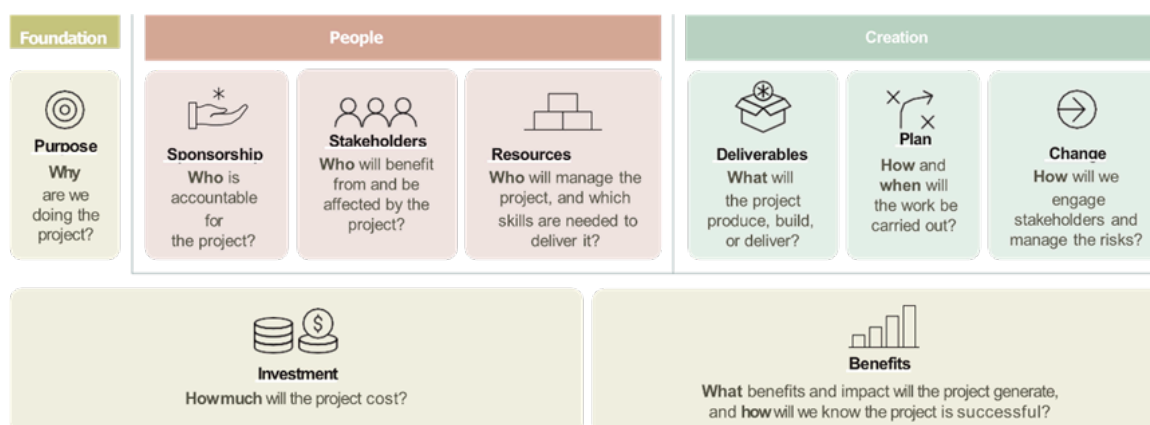
A project framework for value creation has been proposed. Nieto-Rodriguez (2021) proposed a project economy, in which the Project Canvas is employed as a framework for value creation. As shown in Fig. 3, the framework comprises foundation, people, creation, investment, and benefit.


Figure 3: Project Canvas

3.4 Framework for Project Management Education

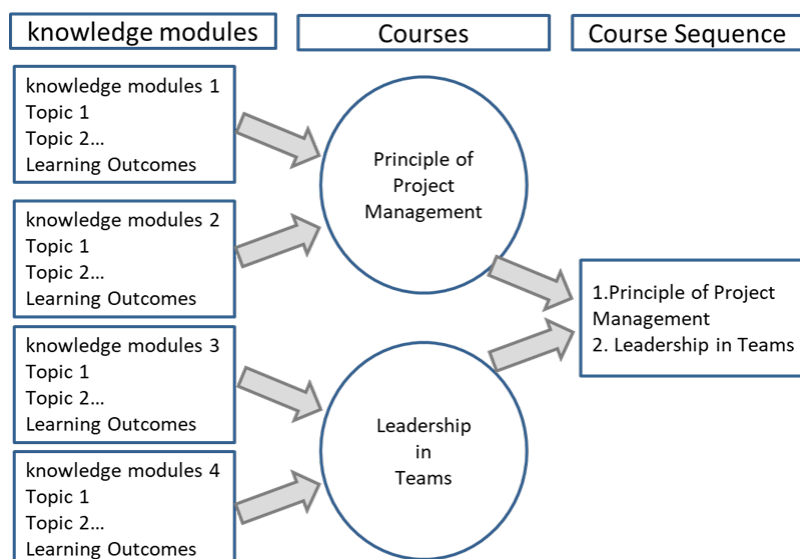
The Project Management Institute (PMI), a professional association for PM, has developed a framework for PM education (PMI, 2025) by academics for academics. It is designed with a module structure that considers various engineering disciplines. The curriculum framework defines knowledge modules (KMs) and sets learning and educational objectives for each KM, as shown in Fig. 4. Multiple KMs are collected to form courses, and educational programs are designed by sequencing multiple courses.


Figure 4: Mapping Knowledge Modules to Design a Sequence of PM Courses

Each KM has a distinct set of learning outcomes, and the PM curriculum should be flexible so that the KM framework can be easily adopted in many disciplines and industrial domains. The guidelines should offer flexibility in collating topics into courses to create relevant curricula in different academic situations and countries. KMs have three categories: (1) technical knowledge; (2) behavioral skills, capabilities, and competencies; and (3) strategic awareness.

(1) Technical KMs include the basic theory and practice of PM. They provide students with a comprehensive technical understanding of the common themes and principles of PM. Technical KMs explain how one can apply one's knowledge to meet project requirements.

(2) Behavioral KMs consider the personal, behavioral, and organizational aspects of PM and provide students the opportunity to develop both personally and professionally. They integrate the well-rounded PM knowledge of an individual with communication, management, and organizational competence.

(3) Strategic KMs consider the business, commercial, and organizational aspects of PM, including strategic issues, program and portfolio management, and governance. They also include emerging topics in PM, such as agile approaches to PM, international issues, and global projects.

3.5 Project Management Body of Knowledge and Standards

PMI (2021) published the Project Management Body of Knowledge (PMBOK) Guide. Until its sixth edition, the PMBOK Guide focused on PM processes, knowledge areas, and techniques, but several changes have been made since its seventh edition, with the PM processes and principles being replaced by knowledge and performance areas, respectively. Project principles are guidelines for behavior during project execution, and they represent the principles of responsibility, respect, fairness, and integrity. The project performance areas are activities that aid in the effective delivery of project outcomes.

Here, we examined the learning outcomes of eight performance areas based on our perspective, assuming PM education in universities, including stakeholder performance, team performance, development approaches and life cycle performance, the performance area of planning, project work performance, delivery performance, measurement performance, and uncertainty performance.

The learning outcomes of stakeholder performance include the ability to effectively identify, analyze, and engage stakeholders. The learning outcomes of team performance include the ability to develop critical thinking and human relations skills and tailor multiple leadership styles. Development approaches and life cycle performance include an understanding of waterfall and agile development approaches and the ability to select and execute a development approach that matches the project deliverables. For the performance area of planning, the learning outcomes include understanding schedule and cost-estimation methods and being able to develop a plan, and those of project work performance include being able to focus on what the project team should work on, balance competing constraints, and implement a continuous learning process. The learning outcomes of delivery performance include the ability to define scope based on requirements and understand quality and change costs. Measurement performance includes the ability to evaluate performance and establish effective measures, and uncertainty performance includes being able to manage risk.

4   Results and Conclusion

4.1   Target Projects for Value Creation

(1) The target project is more than just a project to create deliverables satisfying QCD against predetermined goals. It is a cross-disciplinary engineering project that analyzes the value of diverse stakeholders, discovers goals, and creates valuable outcomes.

(2) It is difficult to determine the detailed goals of a project at the beginning of the project. In addition, the goals of a project can change with time. The agile process, the waterfall process, or a hybrid of both can be employed in a project.

(3) Engineers must be able to make comprehensive judgments to realize a sustainable society, considering technological as well as political, economic, historical, and cultural backgrounds and constraints.

4.2   Scope of Project Management Education

(1) PM education should be integrated into engineering education, and the correlation between systems engineering and PM is particularly important.

(2) It is important to introduce education that provides knowledge and experience for value creation, problem-finding and problem-solving processes with diverse stakeholders, and cross-cultural and interdisciplinary mixed teams.

(3) Engineering education targets not a single technology but cross-disciplinary technologies. It also provides knowledge and skills for solving social issues, such as the SDGs.

4.3 Curriculum Framework and Pedagogy

(1) For PM and systems engineering, which require practical experience, an effective curriculum should repeat lectures, exercises, and projects in stages.

(2) The design method of structuring courses with a combination of KMs with clearly defined learning outcomes is highly versatile and can respond to changes in societal demands.

(3) PM principles are KMs, but it is difficult for students to correlate their superficial understanding of PM principles with their actions. Students must have the opportunity to apply such principles in practice and have a chance to reflect on them. It is vital to incorporate such principles as a perspective for evaluation and reflection in project-based learning courses. Case studies are also effective, as students can reflect on PM principles through simulated case studies.

(4) Only PM principles are not enough for planning and designing a project. Knowledge acquisition and exercises on problem-solving and tools, along with the PM process, are necessary.

(5) KMs change in response to changes in time and project concepts and emphasis. Educational programs can be made flexible by incorporating or substituting KMs in courses, and KMs can be shared across universities.

The Effectiveness of Online Teaching Activities: A Case at UFLS – UD, Vietnam

Tran Thi Thuy Oanh, University of Foreign Language Studies - The University of Da Nang, Viet Nam

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
Universities have been very interested in implementing online teaching activities, which is the optimal choice in a modern society. University of Foreign Language Studies (UFLS) belonging to the University of Danang (UD), Viet Nam have focused on implementing this activity in many recent years through a variety of work such as investing in information technology infrastructure and software, organizing training courses for teachers to use them, encouraging teachers in being conscious of implementing online teaching, spending time to invest in drafting lectures, applying teaching methods suitable to the online teaching model in order to integrate maximize the learning activities of learners. However, all these things have not really met the demand at all for bringing the effectiveness of online teaching due to a lot of reasons. There were still cases where teachers have not mastered online teaching equipment, especially supporting software as well as responding to students' questions about lessons in the teaching process. The paper used qualitative and quantitative as well surveying methods with 373 students of UFLS-UD to find out the current situations and proposed appropriate and feasible solutions to improve the activities of online teaching to ensure the quality of high education at UFLS–UD, Viet Nam in personal and universities in general.

Keywords: E-Teaching, Effectiveness, E-Learning, UFLS, High Education

Introduction

Online teaching and learning activities have become popular for all educational levels in general and at the university level in particular, especially for universities in the context of the Covid 19 epidemic out worldwide. In particular, during the complicated Covid 19 epidemic in Vietnam, it was the interactive teaching activities that helped the training process of universities take place without interruption, thereby not affecting the training process training the country's human resources. However, like any other teaching activities, interactive teaching activities also have certain limitations such as: interactive teaching activities are deployed on the Internet platform, so they greatly affect the ability to interact between teachers and students, between students and students; The quality of the internet connection is a major issue that needs attention when implementing interactive teaching because the quality of interactive teaching activities is seriously affected by the quality of the internet connection, especially for classes with a large number of students or for students in remote areas; Teachers' online teaching methods and skills as well as online learning methods and skills are issues affecting the quality of interactive teaching. Therefore, to achieve quality in interactive teaching requires the attention and investment of universities, teachers and students. In recent times, universities in Vietnam have paid great attention to implementing interactive teaching activities, especially in the context of epidemics like Covid 19, interactive teaching is the optimal choice. For the University of Danang (UD) and its member universities, including the University of Foreign Languages Studies - University of Danang (UFLS-UD), they have focused on implementing interactive teaching, especially during the epidemic Covid 19 disease to ensure the implementation of the training program according to the school year plan while ensuring health safety issues against the epidemic for teachers and students.

Aims of the Study

Based on the theoretical basis of interactive teaching activities at universities and the results of evaluating the effectiveness of interactive teaching activities at UFLS - UD, this study aims to propose solutions to improve the effectiveness of interactive teaching activities at UFLS - UD, contributing part of improving the training quality of the School.

Main Concepts in Online Teaching Activities at University

At universities, teaching activities are the most typical and main activities of the school. Teaching activities are the organization and optimal control of the process of students acquiring knowledge, forming and developing their personality. Learning activities are the process by which students optimally control their mastery of scientific concepts, thereby forming a new psychological structure and developing a comprehensive personality. The two activities of teaching and learning have a close relationship with each other, exist in parallel and develop in the same unified and complementary process. The results of students' learning activities cannot be separated from the results of teachers' teaching activities and vice versa. With the approach to the teaching process, the author Nguyen Duc Chinh defined: "Teaching is an active process in which the teacher shares information with learners, in order to provide and help them process information to achieve the goal of changing their behavior" and "Learning is the process of assimilating information to change behavior in a comprehensive way" (Nguyen Duc Chinh, 2009). Teaching activities at universities are understood as a common and unified process of activities between teachers and students, in which teachers organize, control, guide, test and evaluate the learning process; Students are self-aware and

actively self-organize and self-control their cognitive activities to perform well on learning tasks.

Methodology

Access to Teaching Activities

Using the teaching activities approach to the research topic, we consider the interactive relationship between teachers' teaching activities and students' learning activities to achieve teaching goals. Specifically, based on the requirements of teaching activities in general and interactive teaching activities in particular, we survey the interaction of teachers and students through teachers' teaching activities and students' learning activities in the interactive teaching process. and achieving the goals of interactive teaching activities. On that basis, we propose solutions to improve the efficiency of interactive teaching activities.

Access to the System

Using a systematic approach to the research topic, we consider the factors affecting the effectiveness of interactive teaching activities as well as the relationship between factors affecting the effectiveness of interactive teaching activities. From there, we propose the solutions to improve the effectiveness of interactive teaching activities, in which the solutions to improve the effectiveness of interactive teaching activities are considered in the relationship between interactions and establish the priority of each solution to ensure the feasibility of the solution in the current period to propose recommendations for the School to have a basis for application.

Approach to Assessment and Measurement in Education

Using the assessment and measurement approach in education for the research topic, we establish the contents to evaluate the effectiveness of interactive teaching activities, on that basis, we survey the current status of the effectiveness of interactive teaching activities in the study area. In addition, using the assessment and measurement approach in education for the research topic, we test the urgency and feasibility of solutions to improve the effectiveness of interactive teaching activities and then propose recommendations for schools with priority basis for application.

Questionnaire Survey Method

Using the questionnaire survey method to collect information on a wide spectrum, with a large number of subjects, can allow researchers to draw highly reliable conclusions. Using this method, we surveyed the opinions of 373 full-time students (2nd to 4th year of the 2022-2023 school year) of the Faculty of English (FA), Faculty of English for Specific Purposes (FESP), and Faculty of International Studies (FIS) of UFLS - UD on the effectiveness of interactive teaching activities.

Product Research Methods Work

Conduct research on documents governing interactive teaching activities and interactive teaching plans at UFLS - UD to explain the current state of effectiveness of the school's interactive teaching activities.

Interview Method

Discuss with students information about the advantages and disadvantages of the interactive teaching process at UFLS - UD, especially in the context of the Covid 19 epidemic to have

more basis to explain the current state of effectiveness of the school's interactive teaching activities.

Observation Method

Observe interactive teaching activities at UFLS - UD to have an overview of the current status of interactive teaching activities and from there have more assessments on the current state of effectiveness of interactive teaching activities at UFLS - UD.

Research Methods

The following methods used in the study: descriptive method for describing the data collected, analytic and synthetic methods.

Findings

1. Current Status of Students' Awareness of the Necessity of Interactive Teaching Activities at UFLS – UD

In order to analyze and evaluate the current state of students' awareness of the necessity of interactive teaching activities at universities, we polled the opinions of 373 full-time students (2nd to 4th year of the 2022-2023 school year) of FA, FESP and FIS of UFLS - UD. The survey results show that most of the students surveyed at UFLS -UD highly appreciated the necessity of interactive teaching activities at the university, with survey results showing that up to 89% of surveyed students evaluated this. level of necessity or higher (42.4% of surveyed student opinions rated it as very necessary, 46.6% of surveyed student opinions rated it as necessary). This has important significance, contributing to the effective implementation of interactive teaching activities at UFLS - UD. However, the survey results show that there are still some students who are not really aware of the necessity of interactive teaching activities at universities, of which 9.9% of surveyed students think that these activities are Interactive teaching at university is relatively necessary. In addition, 0.8% of surveyed students thought that interactive teaching activities at university were not necessary and 0.3% of surveyed students thought that interactive teaching activities at university were completely unnecessary.

2. Current Status of Students' Assessment of the Advantages of Online Teaching Activities at UFLS – UD

To have an overall view of students' assessments of the advantages of interactive teaching activities at universities, we surveyed students' opinions on choosing the advantages of interactive teaching activities at universities with the following contents: Training for all students. anytime, anywhere; Save on study costs; Save study time; Teachers and students are proactive and flexible in teaching; Optimize teaching content; Use a variety of images, sounds and videos in the teaching process. Survey results of 373 full-time students (2nd to 4th year of the 2022-2023 school year) of FA, FESP and FIS of UFLS - UD. The scores of interactive teaching activities at universities show the advantages of interactive teaching activities at universities ranked by students in order from high to low as: Training anytime, anywhere (60.9% of opinions rated price); Teachers and students are proactive and flexible in teaching (59.8% of reviews); Use a variety of images, sounds and videos in the teaching process (49.6% of reviews); Save study time (39.1% of reviews); Save learning costs (37.9% of reviews); Optimize teaching content (24.9% of reviews).

3. Current Status of Students' Assessment of Limitations of Online Teaching Activities at UFLS – UD

In order to summarize the current situation of students' assessment of the limitations of interactive teaching activities at universities, we surveyed students' opinions on choosing limitations of interactive teaching activities at universities with the following contents: Difficulties in communication information between students; Requires teachers and students to proficiently use interactive teaching tools; The learning environment does not stimulate students' initiative and creativity; Requires students to be self-aware and active in learning; The quality of interactive teaching depends heavily on physical facilities (machinery, software, Internet system).

Results of the opinion survey of 373 full-time students (2nd to 4th year of the 2022-2023 school year) of FA, FESP and FIS of UFLS - UD. The quality of interactive teaching depends heavily on physical facilities (machinery, software, Internet system) (85.5% of reviews); Requires students to be self-aware and active in learning (49.3% of reviews); Difficulty in exchanging information between students (46.4% of reviews); Requires teachers and students to proficiently use interactive teaching tools (46.1% of reviews); The learning environment does not stimulate students' initiative and creativity (31.6% of reviews).

The assessment results of the surveyed students show that students identify the limitations of interactive teaching activities at universities. This is an advantage for applying solutions to improve the effectiveness of interactive teaching activities at UFLS - UD because when students clearly understand the limitations of interactive teaching activities at universities, they will actively participate in solutions. The school's solutions to improve the effectiveness of e-teaching activities, in which students are the main beneficiaries.

4. Current Status of Students' Assessment of the Difficulties of Interactive Teaching Activities at University

In order to find out the assessment of students of UFLS - UD about the difficulties of interactive teaching activities at the university, we surveyed the opinions of 373 full-time students (2nd to 4th year of the 2022-2023 school year) of FA, FESP and FIS of UFLS - UD.. The survey results after processing the data show that surveyed students' opinions focus on difficulties in IT infrastructure "Limitations in technology infrastructure (equipment, network speed...)" with the score is 4.17%; "Limitations in appropriate interactive teaching support platform" with the score of 3.55% and difficulties in interactive teaching skills "Limitations in interactive teaching skills (concentration, time management...)" with the score of 4.01%.

Difficulties at other educational levels often arise from learning habits or mastery of information system equipment. Surveyed students' opinions rated the difficulties as only at an average level, specifically: "Because "Familiar with learning using traditional methods" with the score of 3.25% and "Limited skills in using technology for information systems" with the score of 3.17%.

Discussing with students about the most common difficulties students encounter when using the information system, we received comments focusing on difficulties due to unstable network connections and internet connections, especially for students in remote areas. Being far from difficult areas, the quality and efficiency of students' information system activities are affected or even interrupted. Through direct exchange and listening to the opinions

presented by students, currently for students in mountainous areas, in the afternoons when there is often thunderstorms, students cannot participate in the information system due to the electricity and internet systems not working. dynamic. Besides, the information system environment is a difficult factor for students. Most students study at home but are affected by family activities or going to shops outside. Although the internet connection is better, it is affected by the noise of the surrounding environment. In addition, due to the lack of information system skills along with the large amount of knowledge that must be received, students cannot absorb the teacher's lectures smoothly. Especially, in cases where knowledge is not understood, it is very difficult for the teacher to guide and explain carefully when interactive teaching is impossible, so it is very difficult for students with interactive learning. This makes students bored or participate in information systems with the main purpose of taking attendance.

5. Current Status of Students' Assessment of Factors Affecting the Effectiveness of Interactive Teaching Activities at UFLS – UD

In order to find out the assessment of students of UFLS - UD on factors affecting the effectiveness of interactive teaching activities at the university, we surveyed the opinions of 373 full-time students (2nd to 4th year of the 2021-2022 school year) of FA, FESP and FIS, UFLS-UD.

The survey results after processing the data show that surveyed students' opinions focused on evaluating factors affecting the effectiveness of interactive teaching activities at universities ranked in order of priority including: "Skills of teachers (technological capabilities, pedagogical methods in interactive teaching)" with score the of 4.47%; "Student learning culture (level of learner cooperation, habits of using technology in learning,...)" with the score of 4.38%; "Facilities (machinery, software, Internet system)" with the score of 4.28%; "Class size" with the score of 4.05%; "Policy on interactive teaching (support and encouragement of the University and UD)" with an average score of 3.95%; "Training management activities of the School" with the score of 3.76%.

6. Student Evaluation of Activities That University of Foreign Language Studies - UD Needs to Organize to Improve the Effectiveness of Interactive Teaching Activities

In order to find out the assessment of students of UD-UD on the activities that UD-UD needs In order to find out the assessment of students of UFLS-UD on the activities that UFLS -UD needs to organize to improve the effectiveness of the University's interactive teaching activities in the coming time, we surveyed the opinions of 373 full-time students (2nd to 4th year of the 2022-2023 school year) of FA, FESP and FIS of UFLS - UD. The results of the survey of students' opinions on the activities that the UFLS - UD needs to organize to improve the effectiveness of the University's interactive teaching activities in the coming time.

The survey results after processing the data show that surveyed students' opinions focused on evaluating the activities the school needs to organize to improve the effectiveness of interactive teaching activities in the coming time, ranked in order of priority. Priorities include: "Organizing training on information system methods" with a score of 4.07%; "Implement support information channels and answer questions during the information system process" with the score of 4.03%; "Organize training courses on using IT tools/applications in information systems" with the score of 3.99%; "Organize training

courses on how to use the information system" with a score of 3.94%; "Compilation of Information System Handbook" with score of 3.92%; "Organizing information system forum" with score of 3.86%.

Surveyed students' opinions on the activities that UFLS - UD needs to organize to improve the effectiveness of the University's interactive teaching activities in the coming time are the basis for considering and proposing solutions to solve the problem. students' wishes, thereby improving the effectiveness of the School's interactive teaching activities.

Conclusion

Describing the survey process, especially surveying, analyzing, and evaluating the current state of effectiveness of interactive teaching activities at UFLS - UD through Surveying the opinions of 373 full-time students (2nd to 4th year of the 2022-2023 school year) of FA, FESP and FIS of UFLS – UD. Based on the survey results, the strengths and limitations of interactive teaching activities at UFLS - UD were evaluated as well as the opportunities and challenges of online teaching activities at the university in the coming time.

The school is interested in investing in physical facilities and IT infrastructure to serve interactive teaching activities and organizes training courses for teachers and students on using interactive teaching software:

- The school's interactive teaching activities have been implemented for all students right during the Covid 19 epidemic to ensure uninterrupted training activities.
- Faculties have made efforts to implement interactive teaching activities and overcome initial difficulties due to the occurrence and complicated developments of the Covid 19 epidemic.

However:

- There is still a group of students who are not fully aware of the necessity of interactive teaching activities at university.
- The skills and methods of interactive teaching of some teachers are not suitable for the form of interactive teaching.
- Many students are not proficient in information system skills and methods, so they encounter difficulties in the information system process.
- Documents managing the school's interactive teaching activities were issued late in the early stages of the Covid 19 epidemic, so teachers and students were confused in implementation.
- The school's IT infrastructure system is not synchronized and the internet connection is clogged at some times, affecting the effectiveness of interactive teaching activities.
- The school has not implemented many support services, guidance, and timely answers to students' difficulties and problems in information system activities, especially in online assessment and evaluation.

A Contrastive Study Between Aboriginal Languages & Chinese: From the Writing System to the Second Language Teaching in the Framework of Australian Curriculum

Diana Po Lan Sham, Hong Kong Chinese Institute of Engineers, Hong Kong SAR

Abstract

In Australia, both Aboriginal languages and Chinese are the oldest but still alive languages taught as first and second languages in the Australian Curriculum. Although the Aboriginal and Torres Strait Islander people are supposed to be the "First Nation" in Australia, in fact, their languages are spoken dialects and languages without their own writing system. In the late 1830s, when the Bible was first translated into Aboriginal language through Latin symbols, the Aboriginal writing system was established. Basically, the existing Aboriginal writing system is only the English orthography based upon 26 alphabets and 3 vowels transcribing the sound of the Aboriginal languages without meaning. The major concerns of learning Aboriginal languages as a second language are to better understand local Aboriginal language and culture as well as why it plays such a big part in their lives in the country. In contrast, Chinese is a system of complete logographs consisting of a huge number of pictograms. Most of the non-English speaking students from kindergarten to L12 prefer to study Chinese mainly due to the fact that China is supposed to be the second largest economy in the world aiming at economic exploration and the huge market owing the population of 14 billion. However, when they learn Chinese-as-second-language, they find out that it is "too foreign" and "too difficult" as the hardest language to learn in the world. This paper investigates the writing systems and as-a second-language education of Aboriginal Languages and Chinese in Australian Curriculum from a contrastive approach.

Keywords: Aboriginal languages, Torre Strait Islander languages, Chinese, Australian Curriculum, Communicative Strand, Understanding Strand

iafor

Introduction: Aboriginal Languages & Chinese in Australia

In Australia, both Aboriginal languages (including Torres Strait Islander languages) and Chinese are the oldest but still alive languages, and taught as first (L1) & second (L2) languages in Australian Curriculum. Although the Aboriginal and Torres Strait Islander people are supposed to be the "First Nations" in Australia, in fact, their languages are spoken dialects and languages without their own writing system.

In the 1830s, when the Bible was first translated into Aboriginal language through Latin symbols, the Aboriginal writing system was established. The major concerns of learning Aboriginal languages as a L2 are to better understand local Aboriginal language & culture as well as why it plays such a big part in their lives in the country.

In contrast, Chinese is a system of complete logographs consisting of a huge number of pictograms and phonetic compounds. Most of the English-speaking students for kindergarten to G12 prefer to study Chinese mainly due to the fact that China is supposed to be the 2nd largest economy in the world aiming at economic exploration & the huge market of more than 12 million. However, when they learn Chinese as L2, they find out that it is "too foreign", "too difficult" and "too suspicious" (Neilson, 2021) as the hardest language for English (L1) speakers to learn (Perry, 2022), though is one of the most spoken languages in the world.

1. The Introduction and Contrast Between Aboriginal and Chinese Writing Systems

In this section, the writing system including alphabets and vowels of Aboriginal languages and the writing system consisting of different types of characters in Chinese are first introduced and analyzed. Secondly, there is a contrast between the Aboriginal and the Chinese writing systems.

1.1. The Aboriginal Writing System

Basically, the existing Aboriginal writing system is only English orthography based upon 26 alphabets and 3 long & 3 short vowels transcribing the sound of the word of the Aboriginal languages without meaning.

Aa	Bb	Cc	Dd	Ee	Ff
Gg	Hh	Ii	Jj	Kk	Ll
Mm	Nn	Oo	Pp	Qq	Rr
Ss	Tt	Uu	Vv	Ww	Xx
Yy	Zz				

Table 1: Table of Alphabets in Aboriginal Languages

The Vowels in Aboriginal Languages

Generally speaking, most Aboriginal languages gave three short vowel: a, i, u & three long vowels aa [a:], ii [i:], uu [u:]. Whereas, there is an exception in Barunga variety of Kriol in Northern Territory having five monophthongs - i, e, a, o, u & five diphthongs - ai, ei, oi, au, ou.

1.2. The Chinese Writing System

Modern Chinese characters are based upon & modified from the classical characters in Han Dynasty 2,000 years ago, are categorized into six types: (1) pictographs (2) indicatives (3) phonetic compounds (4) ideographs (5) borrowed words (6) transmissives, according to Sham's review in Chapter 3 (Sham, 2002).

Types of Chinese Characters

(1) Pictographs are the iconic symbols which has the etymological origins of pictures of concrete objects. eg. 鸟 "bird" & 马 "horse".
(2) Indicatives represent those abstract notions, such as position & numerals, etc. eg. 上 "above" & 下 "below".
(3) Phonetic compounds, which dominate more than 90% Chinese characters, are formed by a semantic and a phonetic. While the semantic contains the meaning of a word, a phonetic indicates the sound of the word. eg. 河 "river" is a phonetic compound formed by 水 "water " the semantic & 可 /he/ the phonetic.
(4) Ideograph consists of two or more semantics and forms a new idea by combining the meanings of the two. eg. 好 "to love" or "good" is formed by 女 "woman" & 子 " child".
(5) Borrowed words representing a large number of concrete-object words with association with the abstract concepts are borrowed. eg. 高 "tower" has become a borrowed word with the same pronunciation but means "high".
(6) Transmissives are regarded as a type of borrowed words, both involving a semantic and a phonetic. eg. 老 "old" & 考 "old man" can be transmitted mutually because they have the same radical 老 and their meanings are closely related.

1.3. The Contrast Between Aboriginal and Chinese Writing Systems

The relationships among the script, sound and meaning of A. Aboriginal languages & B. Chinese as follows:
Figure 1: Relationship among script, sound & meaning in
A. Aboriginal languages B. Chinese

Aboriginal writing system are formed by English alphabets and 3 long & 3 short vowels and most of the words are disyllabic containing more than one morpheme. An Aboriginal script directs to sound first and then to meaning. Whereas, a Chinese character is a syllabic, a morpheme, which can stand alone as a word or serve as a morpheme in a compound, two-character or multi-character word. As more than 90% of Chinese characters are phonetic compounds, the scripts connect to sound and meaning simultaneously.

2. Aboriginal & Torres Strait Islander Languages vs Chinese as L2 in Communicating Strand in the Framework of Australian Curriculum

Concerning development and design of languages in Australian curriculum, Scarino (2014) suggests, "Find ways of capturing the nature, scope and level of language learning" that meets the diverse needs and aspirations of contemporary language learners. Although both languages under the Framework of L2 Pathway in Australian curriculum, the nature, scope and level of Aboriginal and Torres Strait Islander languages for meeting the needs of L2 learners are basically different from Chinese.

In Australian Curriculum, L2 teaching of Aboriginal & Torres Strait Islander Languages with Communicating strand (CS) Understanding Strand (US) is through three stages: Foundation to Year 2; (2) Year 3 to 6; (3) Year 7 to 10, and CS is divided into six sub-strands. The major purposes are using the languages in interpreting, creating and exchanging thoughts, feelings and opinions.

Chinese L2 teaching in Australian Curriculum has both Communicating Strand (CS) & Understanding Strand (US) in five stages: (1) F-Year 2; (2) Year 3 & 4; (3) Year 5 & 6; (4) Year 7 & 8 ;(5) Year 9 & 10, as well as there are five Sub-strands in CS. Based upon the following CS tables (Aboriginal L2 in normal print & Chinese L2 in italics), we deal with the contrasts and differences between Aboriginal languages and Chinese L2 Pathways in the Framework of Australian Curriculum.

2.1 Contrasts Between Aboriginal Languages & Chinese L2 Pathways in Australian Curriculum

Socialising/ Interacting	Taking action/Collaborating	Developing language for classroom interaction
Oral – Interacting, participating & taking action	*Written -- Interacting, participating & taking action*	
1. Socialising		
Obtaining & using information	Conveying information	
Oral – Obtaining, processing & using information	*Written -- Obtaining, processing & using information*	
2. Informing		
Participating in & responding to stories, songs, dance & visual design	Creating & performing	
Oral – Participating in, responding to, creating imaginative experience	*Written -- Participating in, responding to, creating imaginative experience*	
3. Creating		
Translating Interpreting & Explaining	Creating bilingual texts	
Translating Interpreting	*Creating own Chinese translation*	
4. Translating		
Express identity		
5. Identity		
Reflecting in intercultural experience		
Reflecting		
6. Reflecting		

Table 2: Table of Sub-strands & threads in Communicating Strand (CS) of Aboriginal Languages and Chinese L2 Pathways in Australian curriculum

In Communicating Strand, there are six sub-strands containing Socialising, Informing, Creating, Translating, Identity & Reflecting in Aboriginal L2 Pathway whereas only five sub-strands in Chinese L2 Pathway ignoring 5. Identity in the previous one. This indicates that Expressing Identity of being Aboriginal people with particular speech communities & culture is significant in Aboriginal L2 teaching, but not for Chinese L2.

There are only three stages including F-Y2. Y3-6, Y7-10 in Aboriginal L2 Pathway, but five stages including (1) F-Y2; (2) Y3 & 4; (3) Y5 & 6; (4) Y7 & 8; (5) Y 9 & 10 in Chinese L2. Due to fact that the uniqueness and complexity of the Chinese orthography, Pinyin, writing by strokes, emphasis on reading texts and translation, as well as intercultural exchange with the adults & communities in the later stages, songs, music and art are not the major activities in the Chinese L2 pathway. Therefore, each stage containing around two years makes the threads become more specific.

Although the description of all the sub-strands are the same wordings, the threads for each of the sub-strand in Aboriginal L2 are completely different from those in Chinese L2 pathway. As the Chinese L2 divides Socialising, Informing & Creating into two parts: 1. Oral, & 2. Written equally which indicates both oral and written texts are significant in Chinese L2 teaching. Chinese is a visible language which consists of complete logography and the scripts correspond to meaning and sound directly, therefore, written texts plays an important roles in L2 teaching. In contrast, Aboriginal & Torres Strait Islander languages L2 are mainly spoken languages with the phonetic transcriptions of English alphabets in their writing system.

In Socialising, interacting with elderlies & visiting their communities are emphasised through all the stages in Aboriginal L2 pathway, but meeting with familiar or unfamiliar adults are encouraged in the later stages in Chinese L2 pathway. The major difference lies on the inherence of manner and culture from the elderlies in the Aboriginal communities through spoken Aboriginal languages but not from written text. Comparatively speaking, written texts are less emphasised whereas participating & responding to stories, songs, dance and visual design, and then creating & performing are the thread of Creating in Aboriginal L2 teaching.

In Translating, from using contextual cues to identify Chinese characters & words through Pinyin, the Romanization phonetic transcriptions of Chinese besides the writing system, in F-Y2 to creating bilingual texts, identifying similarities of Chinese & English syntax & vocabulary and explaining them for transferring cultural & context-specific concepts between Chinese & English in Y9&10. On the other hand, translating & interpreting a range of words & texts into English-Aboriginal L2 version and creating bilingual texts with others in the community are the tread of Translating.

Reflecting on the diversity between young Australians & the youngsters in Chinese-speaking community affecting individuals, identity and beliefs helps intercultural exchanges in Reflecting. Whereas reflecting on their own languages & cultures happens during interacting with Aboriginal peoples through songs, stories, games & art in intercultural exchanges.

2.2. Differences of the Understanding Strand of Aboriginal & Chinese l2 Pathways

According to Australian Curriculum, Understanding Strand (US) means analysing and understanding language & culture in intercultural exchange. The stages divided in US is the same as in CS, and the contrast of different stages in Aboriginal languages and Chinese L2 has been discussed in CS section already. In US, there are five sub-strands in Aboriginal

languages, thus three sub-strands in Chinese L2 pathway. In the following US table (Table 3), the sub-strands and the threads of Aboriginal L2 are in normal print, and those of Chinese are in italic.

Firstly, the sub-strands in Aboriginal and Torre Islander Peoples languages include 1) System of Language, 2) Language variation & change, 3) Language awareness, 4) Role of language & culture, 5) Role of language building. Whereas only the first two & the 4th sub-strands are found in Chinese L2 pathway.

Sound & writing system	Grammar & vocabulary knowledge
Ways of communicating & creating text	Links between language, kin & land
Phonology	*Orthography*
Syntax	*Text*

1.   Systems of Languages

Variability in language use according to social & cultural context	The dynamic nature of language
Variations in language	*Changes in languages*

2.   Language variation & change

Linguistic landscape & ecology	Protocols for working with Aboriginal & Torres Strait Islander languages

3.   Language awareness

The relationship of language & culture
Language choice

4.   Role of language & culture

Maintaining & strengthening language

5.   Role of language building

Table 3: Table of Sub-strands & threads in Understanding Strand (US) of Aboriginal Languages and Chinese L2 Pathways in Australian curriculum

Secondly, the thread in "Systems of Languages" in Aboriginal L2 pathway is divided into four:
1) Sound & writing systems: Producing sounds, stress, intonation pattern of Aboriginal L2, and developing phonemic awareness linked to the writing system;
2) Grammar & vocabulary knowledge: Understanding & using a range of grammar patterns with expansion of vocabulary including inflections & derivations in Aboriginal L2;
3) Ways of communicating & creating text: Analyzing the use, function & relationship of social processes and forms & structures of different types of texts;
4) Links between language, kin & land: Investigate the connections between stories, ceremony, people & land as evident in community.

Thirdly, the thread of Systems of language in Chinese L2 is also divided into four:
1) Phonology: Recognizing & reproducing the four tones with difference for the meanings of words, intonations & rhythms in different age & social groups;
2) Orthography: Recognizing characters as the form of Chinese writing system for reproduction by using strokes & Pinyin as the form of sound system, and infer the meaning & sound to unfamiliar Chinese words;

3) Syntax: Understanding & producing Chinese L2 sentences with nouns, verbs & adjectives in particular grammatical order, and distinguishing the sentences controls by effective Chinese authors;
4) 4)Text: Familiar to text types for meaning prediction, compare the purposes, sentence & text structure of Classical & contemporary texts.

Fourthly, for Language variation & change in Aboriginal L2, the thread is separated into two:
1) Variability in language use according to social & cultural context: Recognizing & Analyzing different words & language pattern reflecting relationships, social & cultural contexts;
2) The dynamic nature of language: Understanding borrowed words, languages & cultures change as a result of contact of new ideas, popular culture, media & new technologies.

Fifthly, Language variation & change in Chinese L2 is similar to that of Aboriginal L2, & divided into:
1) Variation in language: Recognizing Chinese is a major community language in Australia & many countries unlike Aboriginal languages & how the dynamic language influenced by local & global cultures;
2) Changes in language: Identifying the formal language at school & explaining how Chinese language dynamic changes due to social & technological changes.

Sixthly, the third sub-strand in Aboriginal L2 is Language awareness, which is missing in Chinese L2. The thread is separated into two:
1) Linguistic landscape & ecology: Identifying, investigating & comparing the target languages with Indigenous language in other countries for issues of language policy & rights, reform & multiculturalism;
2) Protocols for working with Aboriginal languages & Torres Strait Islander languages: Learning & researching the target languages with respects and understanding of the norms & protocols.

Seventhly, Role of language & culture in Aboriginal L2 is the relationship of language culture exploring connections between identity & cultures of Aboriginal peoples shaping their ways of thinking, behaving & worldview as the role of language. Role of language & culture in Chinese L2 is Language choice reflecting cultural contexts, values & familiarity between participants within or across communities.

Lastly, the fifth sub-strand, Maintaining & Strengthening language, in Aboriginal L2 is missing in Chinese L2 pathway as Chinese is popular in Australia & many countries. It means recognizing the target languages are passed for generations, and should be kept alive & strong. As Indigenous languages, Aboriginal languages is necessary to be maintained & strengthened in Australia.

Conclusion

In conclusion, Framework of Aboriginal language & Torres Strait Islander languages L2 Pathway is similar to that of Chinese language L2 Pathway in Australian Curriculum basically. The contrasts between them are mainly due to the differences between the two writing systems & phonetics, pedagogical approaches, values, cultures, popularity of the target languages in Australia and the world.

Comparatively speaking, the goal of teaching and learning Aboriginal languages L2 is for the maintenance of the Indigenous languages, whereas the design of Chinese L2 is more knowledge-based approach. In other words, Aboriginal L2 teaching is more vivid, creative and interesting through songs, stories, games & art, but Chinese L2 emphasizes more on written characters & texts in understanding context in addition to Pinyin.

Aboriginal L2 learners just learn the different sounds of Aboriginal language only as the Aboriginal English writing system without much difference from their English L1. However, Chinese L2 learners not only study the orthography of logographic Chinese characters in the writing system, which they must reproduce characters by strokes, and read the boring lengthy texts in addition to Pinyin as the form of Chinese phonetics and then guess the unfamiliar words. Therefore, English L1 learners learn Chinese L2 as a completely new foreign visual writing system consisting of logography with higher complexity, higher difficulty and higher cognitive levels creating heavier cognitive load (Sweller, 2011) consisting of logographs, strokes, pinyin and guess in Communicative Strand. This is based upon the psychological and educational psychological analysis as one of the major reasons why English L1 learners' complaint that Chinese is "too foreign, difficult and suspicious" (Neilson, 2021) as the hardest language in the world (Perry, 2022). In Australia, many English L1 learners drop Chinese L2 course after Y6 if they have started learning Chinese L2 in primary schools.

Furthermore, Systems of language in Chinese L2 pathway consisting of four parts different from that of Aboriginal L2 with some similarities except that Orthography in Chinese focuses on recognizing characters as the form of Chinese writing system for reproduction by using strokes & Pinyin as the form of sound system, and infer the meaning & sound to unfamiliar Chinese words. In other words, English L1 learners are expected to be able to read the logographic characters, write the Chinese characters by strokes as well as pronounce the Chinese words by Pinyin, and then guess the unfamiliar words as a visible language. In fact, most of the Chinese L2 learners could speak fluent Chinese through Pinyin but unable to memorize a large number of isolating Chinese logographs without any cues. That means they perform well in oral practice only because English L1 is a phonetic language containing 26 alphabets, but poor in recognizing Chinese orthography or reading and writing texts due to the distinctiveness of Chinese (Scrimgeour et. Al., 2014) which is far beyond their scope. This is the from the linguistics point of view to analyze the second reason why it is "too foreign, difficult and suspicious" to learn Chinese L2 (Neilson, 2021) as the hardest language for English L1 speaker to learn in the world.

Unlike Chinese is world-widely used as popular community language, Aboriginal L2, the Indigenous languages, has to be learned through interactions with the elderlies in the communities for maintenance and strengthening the languages with cultural identity, language awareness and respects as they have been transmitted from generation to generation. Meanwhile, the ecology of comparing the target languages with other Indigenous languages in the world concerns about issues of language policy & rights, social reform & multiculturalism.

Abstract

The production and consumption of glutinous rice has been a vital part of the local culture and daily lives of the farmers in the Greater Mekong sub-region. The production of glutinous rice provides food security to rural farmers and consumers even in the face of economic, social, and environmental changes. This paper presents the process we used to develop farmer performance and community enterprise towards food security, family and community security, and preservation of biological and cultural assets. The researchers used Participatory Action Research Methodology in Organic Glutinous Rice Seed Community Enterprises and Na Yor Community Enterprise. The research approach involved the principal participation of the stakeholders, including observation, community preparation, lesson learning, knowledge transfer, experimentation, follow-up, and appraisal. The researchers used production standards are mechanisms for development toward SDGs. The study found that a deliberate process eventually brought about an increase in revenue of 19% per month for selling rice seed and processing products. The community enterprises got the certification of organic rice production standards and food safety standards for local wisdom rice production. The researchers discovered more than 30 indigenous glutinous rice varieties in the community and isolated them for future use. We still have the project impact on environmentally friendly production that can reduce the carbon-free more than 10 kg.CO2e, highlighted the importance of inherited wisdom for learning, and strong networks among government and private sectors. Now the community enterprise is the learning center for other communities and change to be SDGs Localization learning area of Thailand.

Introduction

The Mekong region is where most glutinous rice is grown. The biodiversity of glutinous rice varieties in both the Mekong sub-region and Thailand are uniquely important to the communities that exist along the Mekong River. Both sticky and non-sticky rice varieties are widely consumed in Thailand, with the northern and northeastern regions of the country producing and consuming the most glutinous rice (Falvey, 2010). The farmers, the majority of whom are elderly, have been planting glutinous rice for more than 30 years, and typically utilize terrain that primarily relies on rainfall for harvest. While there are many other types of glutinous rice, the most popular cultivar among these farmers is RD6, which they cultivate from seed. However, the farmers don't have a sufficient supply of certified glutinous rice seeds or high-quality seeds, which requires they purchase seed from the government.

Glutinous rice is utilized in the northeast as a regional product for consumption (Suebpongsang, Ekasingh, & Cramb, 2020), as well as in traditional ceremonies, including the 'Boon Khao Jee, Boon Jak Khao' ceremony and various other religious and auspicious rituals. However, the majority of glutinous rice products in the community, such as grains, brown rice, Hang Rice, Khao Mao (pounded unripe rice), snacks, and various other rice-based products (Figure 1), do not meet safety standards (Sattaka, 2019).

The aim of this project is to enhance food security, family well-being, and preserve biological and cultural assets. These goals align with the Sustainable Development Goals (SDGs) associated with social, economic, and environmental conservation. This project also seeks to improve seed production and conservation by ensuring that glutinous rice seed meets established standards, that production processes meet Thai FDA standards, and by driving marketing and tourism initiatives in Sakon Nakhon province. This paper will in turn present both the results and lessons learned stemming from this project.

Figure 1: Glutinous rice products

Glutinous Rice in Thailand

Currently, Thailand, Vietnam, and Laos are the top glutinous rice producing countries in the world, producing a total of around 12 million tons. Approximately 6.0 million tons of glutinous rice are produced in Thailand, followed by 3.5 million tons in Vietnam and 3.2 million tons in Laos. The Department of Internal Trade, pursuant to Ministry of Commerce policies, has project the demand for rice in 2023 to be 27.6 million tons. Therefore, the Rice Department has set the rice production target for 2022/23 at 30 million tons of unmilled rice, divided into 9.1 million tons of jasmine rice, 1.8 million tons of Pathumthani fragrant rice (Thai fragrant rice), 12.9 million tons of white rice (non-waxy rice), 6 million tons of glutinous rice, and 0.2 million tons of niche market rice. Production of Pathum Thani fragrant rice, white rice, sticky rice, and niche market rice is expected to hit 2022/23 targets, except

for jasmine rice, which at 2.3 million tons of rice is expected to exceed its production target (Office of Agricultural Economics, 2022).

Thailand's sticky rice export volume in 2022 was 170,000 tons of milled rice, accounting for 2.2% of the total export volume for that year. The main export market for Thai sticky rice in 2022 was China (42.9%) followed by Laos (11.8%), the United States (10.8%), and Vietnam (6.4%). In 2023, the export volume of Thai sticky rice in the first four months was 0.05 million tons with a value of 32.4 million USD, decreasing -19.8% year over year (YoY) for 2022 and -7.3% (YoY) for 2023. The average export price is 724.5 USD per ton (+15.1% YoY). The main export market for Thai sticky rice in the first four months of 2023 was China (47.1%), followed by the United States (13.1%), Laos (7.6%), Vietnam (5.5%) and Hong Kong (3.3 %) (Sowcharoensuk, 2023).

Glutinous Rice Utilization

For Thai people, glutinous rice is not only a matter of food security but is also a crucial aspect of local culture and daily life (Singanusong & Mingyai, 2019). In rural areas, particularly in the northeastern region of Thailand, the per-person consumption of glutinous rice is approximately 120 kilograms per year, while in Bangkok, it averages just under 80 kilograms per person per year. This difference is notable, especially among those in Bangkok who have migrated for work from the northeastern and northern regions. Glutinous rice is rich in nutrients, approximately 80% of which is starch. Additionally, it contains various beneficial micronutrients, including minerals such as phosphorus, iron, calcium, and vitamins B and E. Moreover, it features active biological ingredients such as phenolic compounds and flavonoids, which possess antioxidant properties (Phanthurat & Thatsanasuwan, 2023). Thus, consuming glutinous rice not only provides energy but also offers high nutritional value.

Glutinous rice has been utilized not just for edible products but for non-edible products as well. Glutinous rice is occasionally used on an industrial scale for products such as rice flour, beverages, and cosmetics. Most local community processing involves primary processing, focusing on the creation of various desserts for household consumption and sale to the public. Farmers, ranging from the household level to the enterprise level, leverage their expert knowledge of glutinous rice cultivation to diversify into other products, such as brown rice, Hang rice, Khaotan (rice cracker), Khao Mao, Khao Tom Mad (bananas with glutinous rice), Khaomak (sweet fermented rice), rice wine, and rice toffee (Sattaka, Muengpak, Xuan, & Mueangkhot, 2020). While some of these products adhere to food safety standards, others do not. Therefore, supporting and encouraging the adoption of glutinous rice production standards, such as GAP (Good Agricultural Practice), Organic, and Food Safety Standards of the Food and Drug Administration, provides an opportunity to expand marketing channels and reduce environmental impacts.

Dao Laum Deuan (DLD) Community Enterprise

DLD, an organic glutinous rice seed community enterprise consisting of 8 communities, is located around the Chalermphrakiat Sakon Nakhon campus of Kasetsart University. Although cultivating rice from certified organic rice seeds is necessary to produce organic rice, for more than 10 years these communities have been producing rice from seed from their own harvests. Because this seed often fails to meet certified health and quality standards, the quality of the rice grown from that seed inevitably suffers, which in turn lowers rice production and results in insufficient rice for local consumption. This situation has

prompted the authorities in Sakon Nakhon province to launch policies to support the local organic rice production in the area. The ultimate goal is to increase production capacity and production yields in order to ensure local food security, encourage job security, and boost the community's income.

Na Yor Community Enterprise

At Na Yor community enterprise, Khao Mao is produced by over 200 households, making it the largest Khao Mao producing community in Sakon Nakhon province. Production involves cultivation of various varieties of glutinous rice. However, the farmers have not conducted soil quality analyses nor have they implemented soil improvement practices for rice cultivation quality. Additionally, the presence of mixed seeds in the paddy fields has negatively impacted production yields. Thus, the researchers initiated a project aimed at enhancing the safety standards of Pounded Unripe Rice in order to boost farmers' income and ensure the sustainability of the quality of life. The research goal is to obtain Thai FDA food safety standard certification for Khao Mao or Pounded Unripe Rice. Thus, the project employs production standards in order to achieve Sustainable Development Goals (SDGs) and to reduce negative environmental impacts. For glutinous rice seed, we adhere to the seed standard of the Ministry of Rice, implement the Good Agricultural Practices (GAP) standard for production management, and follow food safety standards for Kaow Mao production.

Methodology

The participatory action research methodology implemented by the 93 members of the organic rice community enterprises in DLD and Na Yor is in shown in Figure 2. The process is comprised of:

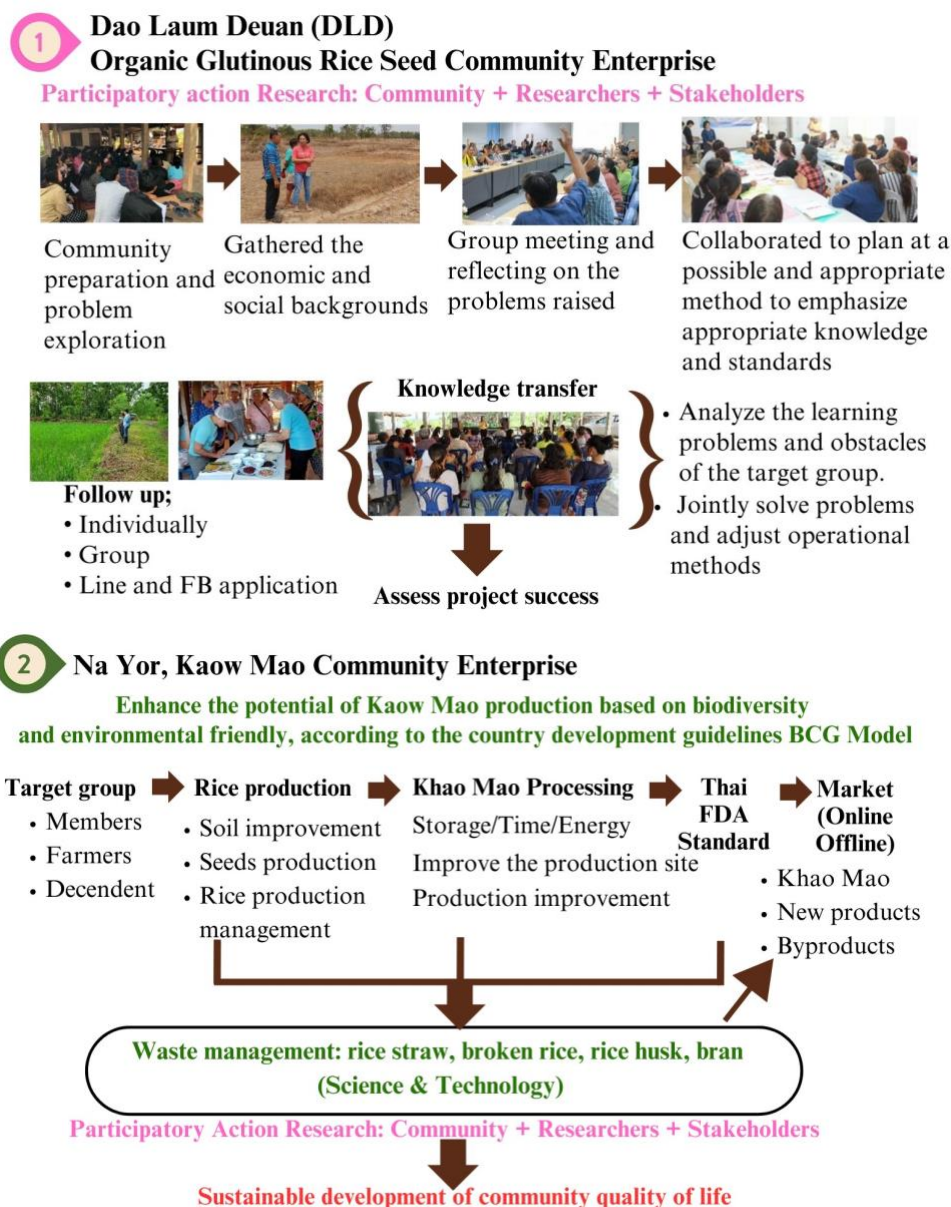
1. Prepare the community to explore the problem and to document relevant economic and social factors.
2. Reflecting on the problems raised in the discussions. This enabled the researchers to discover the actual needs of the community, and to provide the appropriate training.
3. Knowledge transfer to farmers and their descendants related to soil improvement, seed production, rice production management, and glutinous rice processing. This enabled the famers to successfully achieve certifications in seed standards, production standards and Thai FDA standards.
4. Follow-up.


Figure 2: Research methodology of DLD and Na Yor Community Enterprise

Data Collection

The data were collected through a combination of group meetings, lessons learned sessions, observations, and scheduled interviews. The interviews were designed to include baseline socio-economic information and detailed insights into the existing glutinous rice production processes. It also covered knowledge about Rice Department, adherence to organic rice standards and Good Agricultural Practices (GAP) for rice production management, and compliance with glutinous rice food safety standards.

Data Analysis

Descriptive analysis was employed, drawing insights from group meetings, lessons learned sessions, observations, and interviews. The knowledge gathered from the research, combined with community input, was subsequently synthesized. Descriptive statistics, including percentages, averages, standard deviations, and statistical references such as social and

economic background, encouragement in glutinous rice production, and knowledge of glutinous rice production and organic rice production/GAP, were utilized. This comprehensive analysis aimed to assess the glutinous rice community learned with regards to achieving sustainable development goals.

Result

1. DLD, Organic Glutinous Rice Seed Community Enterprise

In the process of producing organic glutinous rice seeds that meet both seed and organic standards, participants not only acquire knowledge through expert training but also benefit from the experience and success of seed producers. This learning approach instills motivation among members of the glutinous rice production community to meet production standards. This is particularly crucial in group production, where the formulation of clear goals and agreements is essential for the collective strength and stability of the group. The organic rice field has been identified as a complex and challenging system, evolving over time under the ongoing influence of technology and environment. Its performance is contingent upon the intricate interplay of numerous interacting elements (Orlando et al., 2020). Drawing insights from the lessons learned by the DLD Organic Rice Seed Community Enterprise Group (Figure 3), the project aims to:

- Establish shared goals and communicate operational procedures to all members.
- Evaluate operational outcomes, and identify challenges and obstacles.
- Facilitate the exchange of information and knowledge to devise effective solutions for overcoming obstacles and ensuring success in seed production.
- Strategically plan and coordinate overall production operations.

Figure 3: Meeting of DLD Organic Rice Seed Community Enterprise

The DLD members share a common goal of producing organic glutinous rice seeds to enhance sustainability in agriculture. The production process for agricultural glutinous rice relies on a rainfed system, emphasizing the dependence on natural rainfall rather than irrigation for cultivation. Most farmers, with an average age of over 50, have a basic level of education. Most agricultural areas consist of small land plots, approximately 2 hectares in size, with glutinous rice production falling below the national average for rice production. By promoting the production of organic glutinous rice seeds through participatory learning and training methods, every farmer involved in the project gains a deeper understanding. Most farmers understand the necessity of avoiding the mixing of seeds with chemicals, and that the cultivation of off-season rice should be conducted in areas with ample water sources. Farmers have acquired increased knowledge, particularly with regards to rice seeds, soil preparation, weed prevention, and disease and pest prevention. Additionally, there is an emphasis on proper storage practices. This enables them to plan their production in accordance with both

non-organic and organic rice seed standards. The study revealed that farmers effectively applied their knowledge by adhering to the principles of producing organic rice seeds. This aligns with the findings of the study by Issahaku *et al.*, which reported that the training resulted in benefits leading to changes in participants' socio-economic statuses and cognitive improvements (Issahaku, Obeng, Akudugu, & Yeboah, 2022). Over 95% of farmers placed significant emphasis on crucial practices, including the use of seeds free from chemical mixtures, avoiding growth promoters and chemical fertilizers, ensuring thorough drying of rice before storage, and selecting storage locations with proper ventilation. However, 28% of farmers did not follow the recommended practice of cutting mixed rice during the tillering and flowering stages. Additionally, 23% of farmers showed a tendency to neglect the use of green manure for soil improvement and the regular weed removal.

By participating in the project, farmers acquired enhanced knowledge and skills, specifically in regards to adhering to both organic and non-organic rice seed standards. Despite this progress, members found it necessary to fine-tune their practices further to achieve optimal production results for food security and job security. Glutinous rice seeds that do not meet seed standards, and sticky rice produced in excess of farmers' needs, are offered for sale, which creates jobs and additional income for farmers. This led to an increase in revenue (Figure 4) and reinforced food safety standards set by the Thai FDA. As a result, the DLD has become a learning center for glutinous rice product development, and a model for other communities.

Figure 4: Glutinous rice seeds of DLD Organic Rice Seed Community Enterprise

2. Na Yor Community Enterprise

The aim is to enhance the potential of Khao Mao production in Figure 5 to meet safety standards, thereby fostering sustainable increases in income and the quality of life. This is achieved through participatory research processes that involve preparing communities and collaborating with network partners. The approach includes problem analysis, the establishment of action plans, the transfer of operational knowledge, and the exchange of information in the area. The process is closely monitored, and collaborative efforts are directed accordingly. The operations are structured into three crucial components, each adhering to specific standards: the quality of native glutinous rice seeds used in Khao Mao production with seed standard of Thai Ministry of Rice, the management of the rice production system with GAP standards, and the production of Khao Mao per Thai FDA standards, ensuring environmental friendliness.

Figure 5: Khao Mao or Pounded Unripe Rice

The operational results revealed that the Nar Yor Community has over 30 varieties of native glutinous rice (Figure 6). After the seed production knowledge transfer gained from training and hands-on field experience, farmers were able to produce seed with a remarkable purity range of 97-100%. Contamination from other rice varieties was minimal, accounting for less than 3%, while the germination percentage ranged between 97-100%. Additionally, the humidity level was maintained at 10-14%.

In the rice production management, soil quality is analyzed before applying the appropriate amount of fertilizer. In addition, the emphasis is on not burning stubble, which produces pollutants dangerous to both humans and the environment and destroys soil fertility, but rather on plowing it down and utilizing it as fertilizer to mitigate environmental impact. Therefore, properly managed crop stubbles have the potential to offer significant economic benefits to farmers while also serving as a means to protect the environment from severe pollution (Abdurrahman, Chaki, & Saini, 2020).

Figure 6: Biodiversity of native glutinous rice for Khao Mao production

In the effort to enhance the production efficiency of Khao Mao to meet safety standards, it was discovered that farmers engaged in Khao Mao production lacked knowledge about food safety standards and did not know how to apply Thai FDA standards. Subsequently, the research conducted an assessment of farmers' knowledge before transferring information on rice production to meet safety standards, yielding an average pre-test score of 19. Following the knowledge transfer, the farmers' average knowledge score significantly increased to 19.24 out of a possible full score of 25. The most common misunderstanding among farmers pertains to the cleaning of machine tools in rice production, emphasizing the necessity to clean them both before and after each use. Additionally, it's crucial to ensure that livestock

pens or animal-raising areas are not located near the rice production site. During work, it is mandatory to wear a hair covering, and the use of jewelry is prohibited while making Khao Mao.

Developing the production of Khao Mao to Thai FDA standards has led to significant improvements in the area and production process in Figure 7. The main points include refraining from activities that create dust and smoke, installing a wastewater treatment tank, and adjusting the production process to align with environmental standards. By shifting from firewood to liquid propane gas for energy in Khao Mao production, the quality of the rice has been maintained, and dust and smoke reduced. This has resulted in a notable reduction of about 19% in production costs while meeting the stringent standards set by the Thai FDA. Additionally, the carbon footprint associated with Khao Mao production has substantially decreased, dropping from 10 kg of CO_2 per 1 kg of Khao Mao to just 0.12 kg CO_2 after the improvements.

Figure 7: Developing the production of Khao Mao to Thai FDA standards

Conclusions: Learning of Community Achieves SDGs

In the pursuit of achieving the SDGs, we employ the Bio, Circular, and Green Economy Model (BCG Model). Our focus is on preserving the biodiversity of rice species, enhancing the production process to meet established standards, and utilizing waste efficiently. Glutinous rice community development aims to establish career stability and generate incomes to achieve SDGs. For the lessons learned from the project, we must:

- Develop primarily based on the needs of the community.
- Encourage participation at every stage of development with farmers in the community.
- Develop production from upstream, middle stream, downstream to meet production standards and environmental criteria.
- Select and adapt technology to the local context, considering available resources and biodiversity.
- Transfer relevant knowledge into practical application in the area.
- Transfer appropriate knowledge to upskill and reskill the community.
- Continue development with people of all ages to achieve sustainable development in the community.
- Elevate production to meet safety and environmentally friendly standards.
- Implement strong community enterprise management practices.
- Establish a robust network of partners to support ongoing development.
- Share, develop a network, and expand results to create a learning society.

Furthermore, the acquisition of agricultural knowledge and information, crucial for achieving the SDGs, is positively correlated with farmers' perceptions. Researchers recommend enhancing farmers' access to education, training, and information, as well as fostering collaboration with stakeholders. These measures are proposed to have a positive impact and increase the utilization of agricultural knowledge and information (Maldayo, Senapathy, & Bojago, 2024). Additionally, positive impacts on socioeconomic factors were found to be significantly associated with the learning methods employed by extension agents and the participatory monitoring and evaluation of smallholder farmer extension activities (Odongo, Opio, Mwesigye, & Bariyo, 2023).

Komkrit Chomsuwan, King Mongkut's University of Technology Thonburi, Thailand
Wisitsree Wiyaratn, King Mongkut's University of Technology Thonburi, Thailand

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Before Covid-19 crisis, the results of undergraduate admission were reported using paper-base with raw data. As a result, the administrators were unable to apply the unclear information for decision in a timely manner. This case study was performed by the academic affair of the Faculty of Industrial Education and Technology, King Mongkut's University of Technology Thonburi (KMUTT), Thailand. The undergraduate admission process was analyzed in group discussion according to the SIPOC model, found that administrators as suppliers wanted to get the dashboards of informative reports which must be accurate and up to date. The online informative reports were then developed using Looker Studio program to make the big data easier to determine for student admission management. The dashboards could display various information such as number of applicants in each academic year, round, academic programs, and category. The system could show grade point average and school of applicants, and which programs or categories were the most interested. There are usually 4 rounds of admission by Thai University Central Admission System (TCAS) for 8 undergraduate programs in an academic year with >10 categories, resulting in big data analysis. After applying the Looker Studio program to present the online informative reports for 5 academic years since 2019, the satisfaction of administrators and related staffs as the target group was evaluated using online questionnaire with 5-point Likert scale. The opinion of 22 respondents showed that they were strongly agree with the online informative reports which are very appropriate to understand and analyze.

Introduction

King Mongkut's University of Technology Thonburi can trace its origin to the Thonburi Technical College (TTC) which was established on 4 February 1960, by the Department of Vocational Education, Ministry of Education. TTC had the mission of training technicians, technical instructors, and technologists. By the Technology Act, enacted on 21 April 1971, three technical institutes are under the Department of Vocational Education: Thonburi Technical Institute (TTI), North Bangkok Technical Institute, and Nonthaburi Telecommunication Institute. They were combined to form one degree-granting institution under the name King Mongkut's Institute of Technology (KMIT) spread across three campuses. TTC thus became KMIT Thonburi campus. In 1974, KMIT was transferred from the Ministry of Education to the Ministry of University Affairs. A new technology act was enacted on 19 February 1986: the three campuses of KMIT became three autonomous institutes, each having university status. KMIT Thonburi campus became King Mongkut's Institute of Technology Thonburi (KMITT). Now KMUTT KMUTT has the following Faculties and Schools Faculty of Engineering (FoE), Faculty of Science (FSci), Faculty of Industrial Education and Technology (FIET), School of Liberal Arts (SoLA), School of Information Technology (SIT), School of Architecture and Design (SoA+D), School of Energy Environment and Materials (SEEM), School of Bioresources and Technology (SBT), Join Graduate School of Energy and Environment (JGSEE), Institute of Field Robotics (FIBO), Graduate School of Management and Innovation (GMI) and College of Multidisciplinary Sciences [1].

The Faculty of Industrial Education and Technology (FIET) has 3 degrees Bachelor's Degree, Master's Degree, and Doctoral Degree is total of 18 programs. The Bachelor's Degree has 8 programs Civil Engineering, Mechanical Engineering, Electrical Engineering, Production Engineering, Packaging and Printing Technology, Applied Computer Science-Multimedia, Industrial Technology and Education, Technology, and Mass Communication. The Master's Degree has 7 programs composed of a Master of Science in Industrial Education Program in Mechanical Engineering, Electrical Engineering, Production Engineering, Civil Engineering, Learning Technology and Mass Communication, Computer and Information Technology, and a Program in Packaging Technology and Printing Innovation. Also, the Doctoral Degree has 1 program such as the Doctor of Philosophy Program in Learning Innovation and Technology.

Application channels for students to bachelor's degree programs of the Faculty of Industrial Education and Technology depend on the Thai University Central Admission System (TCAS). It has 4 rounds to apply, and another round has many projects such as:

    Round 1: Portfolio has 3 projects to apply such as Active Recruitment 1st, Direct Admission for Academic Excellency and Direct Admission for Gifted Student and Pra Jom Klao Scholarship

    Round 2: Quota has 7 projects to apply such as Active Recruitment 2nd, Direct Admission for Vocational Certificate Students, Quota for Printing and Packaging Business Successor, Direct Admission for Development of Teachers' Descendants, Direct Admission with TGAT/TPAT for good students with morals, Direct Admission with TGAT/TPAT for Expanding Educational Opportunity and Direct Admission for producing the personnel in Science Technology and Innovation

    Round 3: Admission has 1 project by the Thai University Central Admission System

Round 4: Direct Admission has 2 projects such as Active Recruitment 3rd and Direct Admission for producing the personnel in Science, Technology, and Innovation

The reporting of past student admissions results has traditionally been conducted using paper methods, relying on big data and raw data that may lead to unclear and unanalyzable information. This applies to various aspects such as school data, GPAX (Grade Point Average), field applications, and round and project applications, among others. The use of paper-based methods hinders the effective and prompt utilization of the data. As a result, there is a recognized need to develop a more efficient student admission reporting process. This development involves the creation of informative reports designed for the analysis of student admissions. The goal is to ensure that the reported data is accurate and up to date, with clear references to data sources and survey times. The reporting process aims to be comprehensive, covering a wide range of topics and subjects. It also prioritizes speed and timeliness to facilitate immediate utilization of the data. Additionally, this research initiative extends beyond reporting to address the design and development of the curriculum within the Faculty of Information Technology and Electrical Engineering (FIET). The purpose is to inform the executives of FIET, enabling them to strategically plan the faculty's curriculum design to better meet the needs of the students. This comprehensive approach aims to enhance the overall effectiveness and responsiveness of the student admission reporting process and curriculum development within IFET.

Objective

This research had3 objectives for Development of Informative Reports for Analysis of Student Admission, Case studies for the Faculty of Industrial Education and Technology, KMUTT.

1. To develop the undergraduate student admissions reporting system into an information format.
2. To assess the effectiveness the undergraduate student admissions reporting system into an information format.
3. To evaluate the satisfaction the undergraduate student admissions reporting system into an information format.

Methodology

Step 1: Study the Current Data Situation Through SIPOC Model

Utilize the SIPOC (Supplier, Input, Process, Output, Customer) By the result Executive of FIET, they want to information report not data report.

SIPOC = Model as a tool for analyzing and understanding the current data processes. This model helps define the relationships between suppliers, inputs, processes, outputs, and customers, providing insights into the workflow.

Step 2: Study Standardized Information Reporting Systems

Investigate information reporting systems that adhere to standards. This can involve exploring methods such as Business Intelligence tools, dashboards, and Key Performance Indicators (KPIs) to ensure reliable and decision-worthy data. I choose the Looker studio because Looker Studio is update information real time.

Step 3: Design and Plan Existing Data for Reporting System Integration

Designing and planning existing data involves considering user requirements and organizing data systems to efficiently support reporting. This includes structuring data to enhance its usability within the reporting framework by Google Sheet.

Step 4: Implement a Reporting System, Develop Quality Assessment Models and Satisfaction Surveys (Seeking Quality)

Create a reporting system with defined Key Performance Indicators (KPIs) and develop assessment models to measure the efficiency of the system. Additionally, design satisfaction surveys to gauge user contentment and quality by Looker Studio.

Step 5: Evaluate System Quality by Experts and Assess User Satisfaction With the System

5.1 Evaluate System Quality by Experts
The Purposive Sampling by experts who can employ various methods such as system testing, code reviews, and peer assessments to identify areas for improvement and refinement.

Main Topics	Main Topis
Satisfaction of Informative Report	- Suitable Data - User-Friendly - Appropriate Reporting of Results

Table 1: The contents for satisfaction evaluation in Questionnaire

5.2 Assess User Satisfaction with the System
Reporting the results of undergraduate student admissions in the past has been done using paper, and the reports consist of raw data. This has led to unclear information for the recipients, making it challenging for them to quickly and effectively utilize the data for further purposes.

Main Topics	Sub-topics
Suitable Data	- Data Accuracy - Data Completeness - Usability of Data for Beneficial Purposes
Report System	- User Friendly - Appropriate Reporting of Results

Table 2: The contents for satisfaction evaluation in Questionnaire

Step 6: Evaluate Satisfaction with the System

6.1   Statistical Measures Used for Evaluation:
6.2   Data Analysis Procedures:
6.2.1   Analysis of Survey Data:
         Calculating the mean ($\bar{x}$) and standard deviation (SD) for quantitative analysis.
6.2.2   Scoring Based on Boonchom's Concept (2013):

Evaluating responses according to Boonchom's framework, where scores are assigned on a scale of 1 to 5, representing the levels of excellence, high satisfaction, moderate satisfaction, low satisfaction, and the lowest satisfaction, respectively.

6.2.3   Interpretation of Satisfaction Levels:
Interpreting the analysis results based on user satisfaction criteria:
Mean scores of 4.51–5.00 indicate the highest satisfaction.
Mean scores of 3.51–4.50 indicate high satisfaction.
Mean scores of 2.51–3.50 indicate moderate satisfaction.
Mean scores of 1.51–2.50 indicate low satisfaction.
Mean scores of 1.00–1.50 indicate the lowest satisfaction.

Results

From the comparison of the traditional undergraduate student admission reporting method is shown in Figure 1, it can be observed that the data presentation consists solely of tables indicating the number of candidates who passed the selection process for each project within each academic program. However, with the development of the new format for reporting undergraduate student admission outcomes (Figures 2 and 3), it provides detailed information. This includes applicant data, interviewee information, system-verified data, Teacher's Council data, King Mongkut's University data, and applicant data for all academic disciplines and projects. The data is categorized according to application types, applicant's school names, chosen academic programs, and applied projects. This enables users to effectively utilize the data for strategic planning, defining admission strategies for undergraduate students, and future curriculum development.

Figure 1: Undergraduate Student Admission Outcome Reporting (Traditional Format)
Figure 2: Undergraduate Student Admission Outcome Reporting (New Format)
Figure 3: Undergraduate Student Admission Outcome Reporting for the Years 2018-2023
(New Format)

Based on the satisfaction survey study regarding the student admission reporting within the
Faculty of Education (Information Report), the findings are as follows:

1. Evaluate System Quality by Experts

Evaluate the system's quality by engaging experts who can employ various methods such as system testing, code reviews, and peer assessments to identify areas for improvement and refinement.

Title for evaluation	$\bar{x}$	S.D.	Level of Satisfaction
1. Suitable Data	4.67	0.58	The Highest
2. User-Friendly	4.00	1.00	High
3. Appropriate Reporting of Results	4.67	0.58	The Highest
Overall Average Evaluation Result	**4.44**	**0.72**	**High**

Table 3: The Result Evaluate System Quality by Experts (N=3)

Table 3 showed the result of Evaluate system by Experts ,focuses on assessing various aspects, including Suitable Data, User-Friendliness, and the Appropriate Reporting of Results. The experts provided ratings on a scale of 1 to 5, and the results were analyzed to derive an overall assessment.

Suitable Data : The system received an impressive average rating ($\bar{x}$) of 4.67 with a standard deviation (S.D.) of 0.58. This indicates a high level of agreement among experts regarding the system's capability to handle suitable data. The consensus was that the system excelled in this aspect, earning it the designation of "The Highest" level of satisfaction.

User-Friendly: With an average rating of 4.00 and a standard deviation of 1.00, the system demonstrated a high level of user-friendliness. While there was a slightly greater variability in expert opinions compared to other criteria, the overall assessment remained at a "High" level of satisfaction.

Appropriate Reporting of Results: Similar to the Suitable Data criterion, the system received an impressive average rating of 4.67 with a standard deviation of 0.58. The unanimous agreement among experts on the excellence of the system's reporting capabilities warranted the designation of "The Highest" level of satisfaction Overall Average Evaluation Result : Combining the evaluations across all criteria, the system achieved an impressive overall average rating ($\bar{x}$) of 4.44, with a standard deviation of 0.72. This reflects a high level of consistency in expert opinions, resulting in an overall assessment at the "High" level of satisfaction.

The findings of this evaluation underscore the exceptional quality of the data for beneficial purposes, particularly in terms of accuracy, completeness, and usability. The consistently high ratings across all dimensions highlight the reliability and effectiveness of the data, providing valuable insights for stakeholders and decision-makers.

2. Assess User Satisfaction With the System

Evaluate user satisfaction by the sample group consists of individuals directly involved in the Executives of Faculty Industrial Education and Technology. And who responsible for admissions, and staff members assigned to carry out tasks.

Title for evaluation	$\bar{x}$	S.D.	Level of Satisfaction
1. Suitable Data			
1. Data Accuracy	4.68	0.57	The Highest
2. Data Completeness	4.32	0.72	High
3. Usability of Data for Beneficial Purposes	4.73	0.63	The Highest
Overall Average Evaluation Result	**4.58**	**0.64**	**The Highest**

Table 4: The Result Assess User Satisfaction with the System of Suitable Data (N=22)

Table 4 showed the result of Assess User Satisfaction with the System of Suitable Data, this research delves into a comprehensive evaluation of data quality with a specific focus on its suitability for beneficial purposes. The assessment encompasses three critical dimensions: Data Accuracy, Data Completeness, and Usability of Data. Ratings, represented by $\bar{x}$ (average), S.D. (standard deviation), and the Level of Satisfaction, were assigned on a scale from 1 to 5. The study culminates in an overall assessment that provides valuable insights into the quality and usability of the data for various purposes.

Data Accuracy: The research reveals an outstanding average rating ($\bar{x}$) of 4.68 for Data. Accuracy, coupled with a low standard deviation (S.D.) of 0.57. This indicates a remarkable consensus among evaluators, signifying that the data is exceptionally accurate, resulting in a "The Highest" level of satisfaction.

Data Completeness: In terms of Data Completeness, the data achieved a commendable average rating of 4.32, with a standard deviation of 0.72. While slightly lower than other criteria, the overall assessment still categorizes the data as "High" in terms of satisfaction.

Usability of Data for Beneficial Purposes: The research highlights the superior usability of the data, with an impressive average rating of 4.73 and a standard deviation of 0.63. Evaluator consensus designates this aspect as achieving "The Highest" level of satisfaction, emphasizing its effectiveness for various beneficial purposes.

Overall Average Evaluation Result: Combining evaluations across all criteria, the data obtained an impressive overall average rating ($\bar{x}$) of 4.58, with a standard deviation of 0.64. This indicates a high level of consistency in evaluator opinions, resulting in an overall assessment at "The Highest" level of satisfaction.

This research provided a comprehensive understanding of the quality and usability of data for beneficial purposes. The consistently high ratings in accuracy, completeness, and usability underscore the reliability and effectiveness of the data, offering valuable insights for stakeholders seeking to leverage data for informed decision-making and strategic planning.

Title for evaluation	$\bar{x}$	S.D.	Level of Satisfaction
2. Report System			
1. User Friendly	4.41	0.67	High
2. Appropriate Reporting of Results	4.50	0.67	The Highest
Overall Average Evaluation Result	**4.45**	**0.67**	**High**

Table 5: The Result Assess User Satisfaction with the System of Report System (N=22)

Table 5 show the result of Assess User Satisfaction with the System of Report System, this research investigates user satisfaction with a Report System through a meticulous evaluation involving a sample group of 22 participants. The study focuses on two critical dimensions: User-Friendliness and the Appropriate Reporting of Results. Ratings, represented by $\bar{x}$ (average), S.D. (standard deviation), and the Level of Satisfaction, were assigned on a scale from 1 to 5. The findings provide insights into the perceived usability and effectiveness of the system.

User-Friendly: The participants' average rating ($\bar{x}$) for User-Friendliness was 4.41, with a standard deviation (S.D.) of 0.67. This indicates a high level of satisfaction, categorizing the system as "High" in terms of user-friendliness.

Appropriate Reporting of Results: For the Appropriate Reporting of Results, the average rating was 4.50, with a standard deviation of 0.67. Evaluator consensus designates this aspect as achieving "The Highest" level of satisfaction, emphasizing the system's excellence in reporting results.

Overall Average Evaluation Result: Combining evaluations across both criteria, the system obtained an overall average rating ($\bar{x}$) of 4.45, with a standard deviation of 0.67. This indicates a consistent level of satisfaction among users, resulting in an overall assessment at the "High" level.

This research provides a comprehensive understanding of user satisfaction with the Report System, emphasizing its high level of user-friendliness and excellence in reporting results. The consistently positive ratings from the sample group underscore the system's effectiveness and usability, offering valuable insights for system developers and stakeholders. These findings contribute to informed decision-making for further system enhancements and improvements.

Conclusion

In summary, the study examined the possible advantages and consequences of putting the suggested information system into practice within the framework of the Faculty of Industrial Education and Technology (FIET). According to the results, the implementation of this information system has the potential to displace conventional report formats and bring about a more simplified and effective method of data administration.

The technology was ready to give FIET executives the power to strategically create courses that exactly match the changing demands of students. Decision-makers can obtain important insights into the curriculum design process by utilizing the information system's capabilities, which promotes flexibility and responsiveness to new developments in education.

Additionally, the information system proved to be very helpful for data-driven planning related to student applications for bachelor's degree programmed in the upcoming academic year. Its capacity to harness and analyze data provides a strategic advantage in tailoring application channels to align with the evolving preferences and requirements of prospective students.

The information system's incorporation of cloud computing technologies guarantees simple accessibility, improving stakeholders' overall user experience. This feature makes it easier to

obtain important information, which boosts productivity and creates an atmosphere that is easy to utilize.

In conclusion, the suggested information system offers a complete solution that, in addition to taking the place of conventional reporting techniques, empowers decision-makers, makes strategic curriculum creation easier, helps with student application preparation, and guarantees accessibility via cloud computing. The present study established the foundation for the implementation of the information system in FIET by providing a proactive method for managing data and making strategic choices in the academic setting.

Suggestions

It became clear from the creation of Informative Reports for the Analysis of Student Admission that the information provided by the present data reporting was insufficient to analyze students' growth during the course. As a result, data collecting will be improved in the future, beginning before students are admitted and continuing until their studies are finished. The goal of this thorough data gathering is to make analysis easier to plan and create future course enhancements.

Literature Review of Teachers' Perspective of Blended Learning Model in Secondary and Higher Institutions

Vesna Lavrič, DOBA Business School, Slovenia

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

The objective of this paper is to provide an extensive literature review of academic papers written in English about teachers' perspective of Blended learning model in secondary and higher-level educational institutions. The research shows us, that there are many factors that influence how the implementation of the Blended learning model is accepted by different educational institutions and in many cases, it comes right down to culture. This is also the reason why, the implementation tactics and acceptance can't just be copied from one country to another, or from one culture to another, so the approach changes each time. There are differences between implementing the model into different levels of education, for example secondary education or higher education and there are also differences between the perceived perspective of Blended learning model on each educational level. The results show us that a lot of the research done in this area has been connected with students' satisfaction, These results imply that more research needs to be done from teachers' perspective. Blended learning is definitely staying here for good and is has brought a lot of success to education but we can also see that more work and research needs to be done to achieve a quality education and satisfaction on all sides.

Keywords: Blended Learning, Teachers' Perspective, Review, Secondary and Higher Institutions

iafor

The International Academic Forum
www.iafor.org

Introduction

Blended learning has been around for decades, the term was first used in 1999, when the American Interactive Learning Center began to launch software programs designed for teaching over the Internet. Unlike many other pedagogical technologies, Blended learning has no specific authorship and has evolved in many ways spontaneously, as a result of numerous attempts to change existing teaching methods and principles. The spontaneous and multifaceted evolution of Blended learning presents challenges when attempting to analyze this technology, beginning with the formulation of a clear definition. Blended learning is a learning system based on a combination of face-to-face learning and computer aided learning (Fedorova, 2020). But even though the Blended learning has quite a rich history, there are still many challenges affiliated with it and are affecting the adoption of this model fully. Some challenges are connected to teachers' and students' attitudes, some challenges are cultural, some challenges arise from technology issues. This literature review research will focus on Teachers' perspectives using Blended learning model in higher and secondary education.

Terminology

The term Blended learning is, as Hrastinski (2019) points out, identified as a broad term, encompassing a range of combinations that involve merging different instructional methods, pedagogical approaches, and technologies. These blends, however, may not align with established definitions of Blended Learning. Online learning, on the other hand, refers to electronically delivered instruction through various multimedia, Internet platforms, and applications. This term is often used interchangeably with others such as web-based learning, e-learning, computer-assisted instruction, and Internet-based learning (Maddison et al., 2017). There are also authors that believe Blended learning needs a wider definition, to better describe its purpose, including Cronje C Johannes (2020) who proposed Blended learning could be defined as appropriate use of a mix of theories, methods and technologies to optimize learning in a given context. Blended learning can also be characterized as the creation of learning experiences that utilize a blend of face-to-face, remote, or online delivery methods, learning technologies, multimedia for delivery, and pedagogical methodologies. This approach aims to achieve a diverse set of learning outcomes within educational or training settings (Leal Filho Editor, n.d.).

Blended Learning in Higher and Secondary Education

There are different reasons for growing varieties of education, one of them, as Bates (2022) points out, is students' diversity, from full-time campus-based learners to lifelong learners already and to address the educational needs of individuals who haven't succeeded in the conventional school system and are seeking second-chance opportunities, especially those with advanced post-secondary education, the use of new information technologies is essential. This demand for flexibility has led to the adoption of a wider range of delivery modes, including campus-based teaching, Blended or hybrid learning, and fully online courses and programs. These varied approaches are applicable in both formal and non-formal educational settings, offering the flexibility for learning to occur at any time and any place. Tonbuloğlu & Tonbuloğlu (2023) have observed Blended learning practices have experienced increased traction in recent years, particularly during the pandemic. Despite the challenging circumstances, these practices have not only retained their prevalence but have also underscored their significance in education by leveraging technological capabilities. Studies

like this led us to believe that there are many obstacles while adopting new learning approaches, from teachers, to students, to technology, culture but nonetheless new education trends seem to be going in the direction of combined face-to-face and online learning. Blended learning has slowly found its way into all levels of education and is becoming a part of everyday learning. The gradual increase in the number of higher education students opting for the Blended option is an indicator that the preference of one learning model of learning over the other might be determined by multiple factors, including level and lifestyle. Educational institutions have responded to Blended learning differently. It has become the most revolutionary trend in higher learning institutions. Researchers have found that motivation, course design, and communication are the key determinants of the success of Blended education in higher learning institutions (Baquero & Escortell, 2022). Blended learning emerges as a precursor to substantial changes in higher education and is expected to wield a similar impact in K-12 schooling and industrial training. The flexibility inherent in Blended learning allows for the optimization of various positive educational functions (Dziuban et al., 2018). The prevalence of Blended learning models in K–12 classrooms is swiftly growing, marking a significant cultural shift in the realms of teaching and learning (Schechter et al., 2017). There are of course challenges that come with online education, like teacher's skills, competencies and attitude. This has been approached in many studies, Ye et al. (2022) studied Chinese English teachers and found that teacher's attitude toward Blended learning, can directly influence teachers' use of Blended learning. In 2017 Schechter et al. (2017) did a study that showed significant improvements in reading skills during the analyzed period for the students of the engaged teachers. The utilization of distance and online learning in the K-12 education sector is experiencing significant and rapid growth. However, the literature – and, in particular, the research – to support the effective design, delivery and support of K-12 distance and online learning has not kept pace (Barbour, 2019). An examination and analysis were conducted on the application effectiveness of both traditional teaching methods and Blended teaching methods, considering student learning behavior and outcomes. The findings revealed that, in comparison to the traditional teaching mode, the Blended teaching mode enhances students' engagement in learning, leading to improved teaching effectiveness. This approach proves beneficial for students in enhancing their knowledge and overall competency (Liu, 2021).

Teachers' Perspective

Blended learning is a fairly new concept to the educational world, where a number of institutes are now implementing it. Understanding the way, in which teachers and students view the concept of Blended learning (BL) is the first step towards attaining success. Particularly, assessing the attitudes of learners toward Blended Learning (BL) allows for the identification of current opportunities and potential obstacles. Simultaneously, understanding the teachers' perspectives on the strategy aids in designing a Blended Learning-based approach. (*Blended Learning: Teachers and Students Perspectives | Free Essay Sample*, n.d.). In a study performed by Sorbie (n.d.), teachers' perceptions of Blended learning varied and included the value of such for individualization of student learning, enhancement of organization, increased engagement, communication, and collaboration. In addition, teachers thought Blended learning allowed students to self-regulate in a student-centered environment while offering real-world relevance. Saeed (2020) has also found a positive response to Blended learning environment from teachers', describing the results of his study by saying that, if teachers are provided with the right type of trainings and peer coaching from experts, they will be able to meet the needs of students and will be encouraged to create a Blended learning classroom. With the right type of support and time, knowledge and understanding of

Blended learning will become an asset for schools throughout the world. Different secondary education researchers, like Arokia Maria Josephine Marie S. & Sreekala Edannur (n.d.), Raymond (n.d.) and Yarborough, 2021 (n.d.) point out, there is a lack of knowledge as to what extent a high school teacher's perspective of Blended learning influences his or her implementation decisions and how teacher perspective and lack of training are critical factors contributing to teachers' reluctance in terms of technology-integrated Blended learning. The findings are similar in higher education, where one of the researchers found that extensive research has identified barriers to the adoption of technology, covering various aspects. These obstacles include issues like the information technology (IT) proficiency of faculty members, organizational climate, resistance to change, limited institutional and financial support, and time constraints. These barriers are typically categorized as first-order and second-order. First-order barriers are linked to external factors such as time, resources, and organizational culture, while second-order barriers are connected to teachers' pedagogical beliefs. Furthermore, a third-order barrier exists, which relates to teachers' ability to design learning experiences that consider the context and needs of the learners (Rizvi et al., 2017). Another author discovered that because, all of the prospective teachers find the undergraduate education they have received is insufficient in terms of gaining knowledge, skills and practices related to Blended learning. The insufficient knowledge, skills and practices related to Blended learning in undergraduate education cause prospective teachers to have difficulty in establishing a connection between social studies education and Blended learning (Bursa, n.d.). In a study on online learning during pandemic, the authors suggested Many teachers who took part in the study initially held a negative perception of online learning and felt apprehensive about adopting it due to their limited ICT skills and pedagogical knowledge. However, the transformative impact of the pandemic on education compelled them to shift their teaching approach to include online learning. Despite the considerable challenges, participants acknowledged that online learning offered advantages to both teachers and students, particularly in terms of time management, resource utilization, and opportunities for lifelong learning (Tsegay et al., 2022). The future of Blended learning primarily relies on how much the challenges teachers have faced over the years are addressed.

Cultural Influence on Blended Learning

Culture is a critical component of any learning environment. Recognizing the impact of culture within a specific learning context is crucial. Efforts should be made to shape that culture towards supporting the desired learning environment believed to be most effective. However, changing a pre-existing, dominant culture is very difficult. Nevertheless, new technologies enable new learning environments to be developed, and thus provide an opportunity to develop the kind of culture within that learning environment that will best serve your learners (Bates, 2022). The cultural values of a country play a significant role in shaping its national psychology and identity (L. Zhang, 2013). Parents often, based on their own believes, influence and decide their children's educational platform. In many cases, parents choose schools for their children based on shared values and beliefs. Consequently, the characteristics of learners within a school are often shaped by both the cultural influence of their parents and the prevailing culture within the educational institution. This is one of the many ways that culture can be self-reinforcing (Bates, 2022). Despite the challenges, certain educators are firm in their belief that the adoption of Blended education should not be overlooked, especially in the face of societal changes and other influencing factors. Its adoption should not over-emphasize the challenges but also the opportunities for learners, educators, and all stakeholders (Baquero & Escortell, 2022). Alsaif Mohammed (2021) noted that certainly, cultural attributes play a crucial role in shaping online presence and influencing

learners' perceptions of computer-based learning. Understanding how individuals from diverse cultural backgrounds respond to online learning necessitates careful consideration of their cultural contexts. The impact of culture on learner behavior and their acceptance of the learning environment becomes particularly pronounced in the educational context, especially when integrating tools and functions tailored to varied learning levels and aligned with cultural preferences. When teachers assume the role of implementing externally initiated educational innovations or new pedagogical approaches, they may either resist or adapt to the innovation, considering the prevailing norms of practice or their perceived preferred practices (Lee, 2019). Culture is strong force and has the power to influence the acceptance of change, it takes time to overcome challenges and adapt to changes, while implementing innovation.

Summary of the Literature and Key Findings by Relevant Authors

A review of previous research relevant to this study can provide a base for comprehension how teachers perspectives may affect the quality and outcomes of a Blended language learning environment. There are many ways to look and compare the Blended learning model implementation into the educational system. We can compare pre and post pandemic implementation and we will see that during pandemic and post pandemic era has increased the implementation because there simply was no other way to educate people, so the educational institutions were in way forced to do so. We can also compare secondary and higher education implementation and see if there were any differences. And last but not least we can also compare the implementation success between teachers' and students' perspective. This paper will focus on higher and secondary education institution and teachers' perspectives of Blended learning model. The below literature summarization includes some of what has been researched in this area so far and the results of the studies. The reason for including students' perspective is to show how much research has been done from students' perspective especially compared to teachers' perspective.

Author	Research focus	Educational stage	Key findings
(Almaiah et al., 2020)	Students	Higher education	The findings revealed three primary challenges hindering the utilization of the e-learning system, specifically, (1) issues related to change management, (2) technical challenges associated with the e-learning system, and (3) difficulties related to financial support.
(Basar et al., 2021)	Students	Secondary education	Even though online learning has demonstrated its ability to support students' well-being during the pandemic, it is deemed less effective compared to traditional in-person learning. Moreover, the absence of a resilient online infrastructure can hinder the efficacy of online learning. To enhance students' online learning experiences, teachers need to employ effective pedagogical methods.
(Bhadri & Patil, 2022)	Students	Higher education	Feedback results indicate that the Blended learning approach is characterized by greater flexibility and offers independent learning opportunities for students.

(Chakraborty, 2017)	Students	Higher education	The study's conclusion was that the majority of lecturers responded positively by adjusting to the transition from offline to online learning, and the implementation of online learning has been successful. Three crucial areas identified as significant in the online learning environment are learners' attitude, motivation, and learning. Teachers can acquire knowledge about various aspects of Blended learning by participating in sessions and networking. This, in turn, will offer a broader range of options for student learning within Blended learning models.
(Danchikov et al., 2021)	Students	Higher education	In managing the online learning process, additional skills such as experience in virtual classrooms, patience, empathy, a caring attitude toward students, exceptional presentation skills tailored to specific topics, adept handling of learning tools, accessibility, and proficiency in using convenient functions were deemed essential.
(Evans et al., 2020)	Teachers	Higher education	Professional development, teachers remain critical to learning.
(Han & Luo, 2021)	Teachers and students General	Higher education	The anticipated result of constructing the hybrid teaching model, encompassing both online and offline components, is not only to fulfill the learning requirements of on-campus students but also to offer high-quality teaching resources and conditions for a broader audience of social learners.
(Hussein Sami et al., 2021)	Students	Higher education	The results suggested that a substantial majority of the participants hold a negative stance toward online education. Similarly, respondents expressed a preference for and deemed on-campus education more effective.
(Jacob et al., n.d.)	Teachers and students	Higher education	Students also expressed a positive inclination towards learning in the Blended Learning (BL) environment, indicating a preference for it over more traditional classes. Notably, teacher practice and behavior were found to have minimal impact on student perceptions of the BL environment, although certain findings suggested that teacher experience might serve as a predictor of student satisfaction with their instructors. The study's results offer valuable and detailed insights into the varied experiences of teachers and students in the context of teaching and learning within a Blended learning model.

(Jiang et al., 2023)	General		Stakeholder perspectives on online education have evolved alongside the widespread adoption of the "technical revolution" and the concept of "lifelong learning" in China. The understanding of online education continues to deepen, fostering a collective appreciation of its value and practical application. This study identifies the inception of China's online education policy, categorizes its development into four stages, and comprehensively compares significant projects in both K–12 and higher education. In China, the integration of individual online learning into large-scale education initiatives reflects a commitment to realizing the vision of lifelong learning.
(Kavitha & Jaisingh, 2018)	Students	Higher education	The success of Blended learning hinges on several factors, including the quality of course materials, the mindset and learning ability of students in interactive environments, and the user-friendliness of tools and the learning environment. Additionally, Blended learning is significantly influenced by a student's attitude towards a given task. The results suggest that the Blended learning approach tends to be more advantageous for students who possess skills in utilizing specific computer programs and applications.
(Kintu et al., 2017)	Students	Higher education	The findings suggest that certain student characteristics and backgrounds, as well as design features, serve as significant predictors for student learning outcomes in Blended learning.
(Koneru, 2019)	Teachers	Higher education	Blended learning instructors found that designing and delivering Blended courses benefitted them in several ways, including: (i) planning and integrating both offline and online assessments and activities, (ii) enriching students' learning experiences with multimedia resources, such as open educational resources (OER); (iii) adopting flexible and innovative instructional practices; (iv) improving communication and interaction with students; and (v) enhancing digital literacy.
(Le & Pham, 2021)	Teachers	Higher education	In summary, Vietnamese pre-service teachers responded positively to and expressed a preference for the utilization of Blended learning in their training programs.
(Liu, 2021)	Students	Higher education	The implementation of the Blended teaching mode has been observed to enhance students' engagement in learning and contribute to an improvement in the overall teaching effectiveness.

(Lubis et al., 2022)	Students	Secondary education	With the establishment of the structural model to gauge user satisfaction in using Blended Learning Systems (BLS), several considerations should be taken into account for model enhancement. These include evaluating the indicators used, refining the sampling technique, enhancing the reflective model, and understanding respondents' willingness to answer. In conclusion, the study indicates that Information Timeliness has a negative impact on Overall Satisfaction. In contrast, variables like User Support, Perceived Utility, Software Adequacy, Computer Self-Efficacy, and Expectation of Quality have a positive influence on Overall Satisfaction.
(Meitreya et al., 2021)	Students	Higher education	Even all the research articles studied did not indicate that online education was better than offline learning. Neither study demonstrated that online learning was less effective than offline, irrespective of the statistical techniques used. We cannot yet imagine whether online learning works better than offline
(Minhas et al., 2021)	Teachers	Higher education	Positive perspectives among teachers also appear to enhance teacher efficacy, subsequently contributing to improvements in student confidence and the overall success of the Blended Learning (BL) initiative. This study reaffirms previous empirical findings emphasizing the significance of professional development in augmenting teacher efficacy.
(Muhammad et al., 2020)	Students	Secondary education	The overall expression of students was positive and perceived that teacher were consistent with good practices in the BL environment.
(Muxtorjonovna, 2020)	General Blended		Blended learning stands out as an effective teaching approach that offers flexibility and ease of access.
(Selim Shawky El-Sayed Tealib & Prof. Dr. Awatef Ali sheir, 2021)	Students	Secondary education	The findings of this research lead to the conclusion that the Blended learning model has a more substantial impact on students' achievements. There was a notable increase in student learning outcomes in information and communication technology subjects after the implementation of Blended learning.
(Sorbie, n.d.)	Teachers	Secondary education	Many of the teachers felt students could easily become disengaged from their learning due to things that do not pertain to the class like using their device to engage in gaming and social media.
(Suri, 2021)	General		Two-way communication is essential and that it is difficult to implement it in online classroom. The pandemic has presented the most significant disruption to education systems in history.

(Tayag, 2020)	Teachers and students	Higher education	While students recognize the advantages of utilizing Blended learning in their lessons, addressing the associated challenges is equally crucial for them to meet the teachers' requirements. On the other hand, teachers are seeking the provision of technical skills, training on new pedagogies, and sufficient preparation time to effectively develop lessons using a Blended learning approach model.
(Tealib Selim Shawky El-Sayed & Sheir Awatef Ali, 2021)	Students	Secondary education	In light of the research results, it can be deduced that the Blended learning model had a more significant contribution to students' achievements. As a recommendation, the study suggests the utilization of Blended learning to enhance students' academic performance.
(Tsegay et al., 2022)	Teachers	Higher education	This study brought attention to teachers' concerns, their perspectives on online learning, and the absence of adequate training in online teaching. Consistent with previous research, the study emphasized that a lack of technological knowledge among teachers constitutes a significant hurdle in the effective implementation of online learning. Many participants underscored their deficiencies in understanding and training related to online teaching and its delivery methods. These challenges seemed to impact teachers' perceptions of their competence and confidence in delivering high-quality online classes.
(W. Zhang & Han, 2012)	Students	Higher education	Upon analyzing and discussing the obtained statistics, the author concluded that, in comparison to the traditional teaching approach, participants exhibited more positive attitudes towards the Blended learning model. Additionally, participants expressed a preference for this new Blended learning model, noting that it could better stimulate their interest, promote autonomous learning and collaborative learning, and enhance their confidence.
(Yarborough, 2021)	Teachers		The findings indicate that teachers view Blended learning as both user-friendly and valuable. Additionally, teachers predominantly employ either the flipped classroom model or the face-to-face driver model for the implementation of Blended learning.
(Zhan et al., 2021)	General review		The quantity of online courses is substantial, though the quality varies; students are expected to possess increased learning autonomy and self-discipline.

The literature review shows that quite a lot of research has focused on students' perspective and experiences of Blende learning, with the biggest issues that students have being connected to their attitude towards learning, technological abilities, teaching methods used by

their teachers during Blended learning and self-discipline. Only a few works in literature demonstrate teachers' perspective towards Blended learning in secondary and higher education. And the research that has been done in this area suggests difficulties are connected to professional development, received training, technological training, preparation time given for the classes and attitude towards teaching in Blended learning environment. The previous studies reveal that the attitude and experiences that teachers have are often negative due the above-mentioned reason. Previous research can only be considered a first step towards a more profound understanding of teachers in general and their needs that will have to be understood and met in order to change the attitude and coincidentally the quality of Blended learning classes.

Conclusions

Above literature review has shown us that a lot of the research done in this area has been connected with students' satisfaction, I do see a lack of research done from teachers' perspective. Teachers play a pivotal role in interpreting innovative designs and translating them into educational practice. (Könings et al., 2007). The collaboration between teachers and learning designers is crucial to successfully implement a robust system using the Blended Learning approach for the future. Simultaneously, educational designers can enhance and create learning-friendly Blended Approaches, facilitating their practical application by students and teachers in the learning process. Bhadri & Patil (2022) say that The adoption of the Blended teaching mode represents an unavoidable trend in educational reform. Baquero & Escortell (2022) believe that the future of Blended learning primarily relies on how much the challenges teachers have faced over the years are addressed. Notwithstanding the challenges, certain teachers firmly believe that the adoption of Blended education should not be disregarded, especially as societal dynamics and other factors undergo change. Its adoption should not over-emphasize the challenges but also the opportunities for learners, educators, and all stakeholders. I do believe that more comprehensive research is needed in this area, as mentioned especially from teachers' perspective. The most formidable challenges associated with 'Blended' learning center around providing professional development opportunities for university teachers. This is particularly crucial as the role of the teacher remains critical to the learning process, whether influenced by or in conjunction with technology (Evans et al., 2020). Some teachers have failed to adapt their teaching ability to the needs of online education and have little motivation to continue engaging in online education (Jiang et al., 2023). It seems that teachers' perspective towards Blended learning really depends on their environment, organization, provided training, culture and consequently attitude. There are a few challenges along the way but with better organization of Blended learning this can be overcome. Further research on teachers' perspective on Blended learning is needed to better understand their experiences and support their needs in order to improve the attitude and perception towards Blended learning.

Pedagogical Strategies for Reflection That Promote Student Growth

Tomoko Maruyama, Ehime University, Japan
Masahiro Inoue, Keio University, Japan

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Institutions of higher education are the starting point for students in pursuing lifelong autonomous careers. To become autonomous learners, they must make independent choices and decisions about the content of and strategy for learning. In this regard, reflection is an essential component of quality learning and the expression of such learning. In addition, it forms part of learning in which learners seek to understand new knowledge and relate it to previous knowledge. Intentional reflection in learning influences one's involvement in the learning process, the interpretation of a task at hand, and strategies selected and adopted. This study analyzed a learning portfolio that continuously recorded the results of the reflection of students on their experiences, which was conducted in a leadership education program for first-year master's students in the Graduate School of Engineering and Science. Based on the results of this analysis, the study conducted interviews with students who demonstrated positive behavior changes. To elucidate the mechanism of behavior, change through reflection, the study focused on the type of semantic environment and factors involved in each other to produce behavior change. On the basis of the results of the quantitative and qualitative analyses and of the literature review on reflection, we propose educational strategies for reflection that promote student growth.

Introduction

Society is rapidly changing with the advent of a volatile, uncertain, complex, and ambiguous world, the use of artificial intelligence (AI) due to the coronavirus pandemic, and the acceleration of digitalization. Students can look forward to a future in which they will continually adapt to new situations, inspire themselves, and carve out unique careers under uncertain and unpredictable circumstances. Universities must be places for the development of autonomous learners in which students are aware of their goals, proactively engage in learning, appropriately evaluate achievements, and move forward to further necessary learning.

Leadership, which is the core of this research, is a highly interdisciplinary theme examined in multiple fields such as engineering education, business administration, educational technology and psychology. At present, leadership research is being transformed from exploring the nature to developing leadership. Learning from experience is gaining attention as an excellent method for leaders to grow, and empirical research on leadership development through experience learning is progressing. Previous studies demonstrate the importance of reflection on experience (McCauley, 2013). Thus, the process of reflection is important for promoting effective reflection from experience.

The current study analyzed a learning portfolio that continuously recorded the results of the reflection of students on their experiences, which was conducted in a leadership education program for first-year master's students in the Graduate School of Engineering and Science. Based on the results of the analysis, we conducted interviews with students who demonstrated positive behavior change. To elucidate the mechanism of behavior change through reflection, we focused on which type of semantic environment and the factors involved in each other to produce behavior change. Using the results of quantitative and qualitative analyses and of a literature review on reflection, we propose educational strategies for reflection that promotes student growth.

1   Reflection and Metacognition

In the modern age, the social system of graduating from college, getting a job, and working at that company until retirement has come to an end. People are expected to develop their careers by utilizing their strengths and areas of expertise and updating their skills. Determining the skills you need requires the ability to reflect on and evaluate your own learning. Continuous self-improvement is based on the desire to grow and is accompanied by the feeling that one is making progress. Visualizing learning outcomes with the support of digital technology will encourage innovation in individual learning.

Metacognition is the perception of cognition from a bird's eye view, and the intentional reflection that learners engage in after an activity enhances metacognition (Moon, 2005). Metacognitive activity is also about thinking about one's own thinking, which is considered essential for effective learning and problem solving (Smith, 2004).

Opportunities to look at the self through others' perspective are important to enable learners to work at higher levels of metacognitive functioning. Mechanisms to enhance learners' metacognition can be intentionally incorporated into lesson design. Working with others is one such mechanism. Learners recognize differences in their own and others' thought

processes, cultural backgrounds, and working approaches. A new objective perspective is fostered by discussing how to collaborate successfully with others.

Advice from faculty members on the results of learners' learning is also an indispensable element. Visualization of learning results accumulated in the learning management system enables learners to analyze the data from an objective viewpoint and select their own learning strategies. However, in order to be able to do this independently, the scaffolding of the faculty members is necessary. The key is how faculty members can support the development of individual learners. This also requires the improvement of metacognitive functions that allow faculty members to objectively see how they themselves relate to learners.

2   Leadership Education Programme

2.1 Definition of Leadership

In this education, leadership is defined as a relational process of people attempting to accomplish change or make a difference to benefit the common good (Komives, 2013). In addition, leadership is not an ability bestowed upon a special person; instead, it is for everyone to exhibit and develop.

2.2 Leadership Education Model

The leadership education model (Fig. 1) presents five modules, namely, knowledge, training by simulation, real action, reflection, and assessment (Maruyama & Inoue, 2018). At the start of a program, a diagnostic evaluation is conducted. Next, a student enters a cycle of skill acquisition. The first step is for students to gain knowledge in the leadership arena through lectures. Then, they utilize simulation to experience leadership actions repeatedly. Simulation provides a safe environment in which they can attempt many approaches to leadership in various situations. A simulation exercise increases awareness of daily improvement and the necessity for new action as a result of self-reflection, all of which stem from various virtual experiences.

In the next step, students as a team utilize project-based learning (PBL), such that the abovementioned simulated experiences can help them exhibit leadership. Students can apply this leadership training to actual projects, which can increase their leadership skills. The application of conscious leadership to a project aimed at a specific goal in limited circumstances is highly effective.

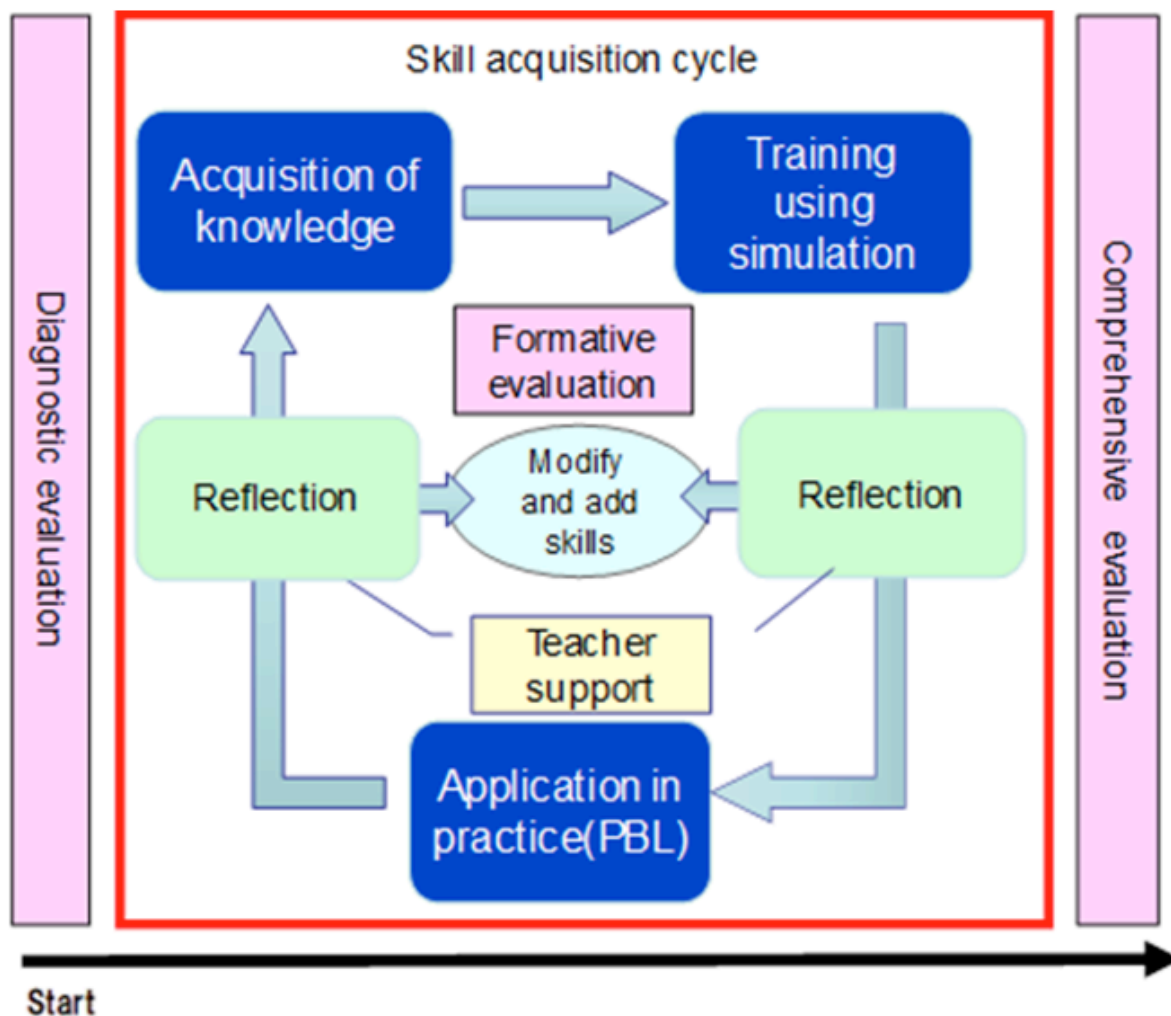
The program repeats the above two steps in an upward spiral of leadership skills. Furthermore, learners reflect on the simulated experiences and action in practice and identify the skill correction component and the skill that requires training. In the end, students complete a comprehensive evaluation. This study focuses on the reflection component, specifically, individual reflection. An e-portfolio was used as a tool to promote reflection. Over a period of seven weeks, the students recorded and reflected on their leadership experiences in the e-portfolio on a weekly basis.


Figure 1: Leadership education model.

2.3 Education Using Simulation

Students who lack experience exhibit large gaps between knowledge and action, which makes immediately transforming knowledge into action impossible for them. Therefore, we utilize simulation as a means of bridging these gaps. The study developed a simulator with the goal of strengthening interpersonal skills and acquiring leadership skills to involve the members around them in achieving goals. Training using the simulator aims to ensure that repeated thoughts and actions are ingrained in the mind, such that they eventually and naturally surface without students being conscious of them as actual actions. The simulated experiences that students acquire through repetitive practice can provide a smooth bridge to reality.

2.4 E-portfolio Design

Table 1 presents the design of the e-portfolio. Students record and review their leadership experiences in the e-portfolio once per week for 7 weeks. For the reflection on leadership in PBL activities, the study uses five levels of prompts to promote deeper reflection.

#	Item	Questions that encourage reflection
1	Reflection of simulated experience	What did you learn from the simulated experience of the simulator? How do you use it in your PBL activities?
	Simulation score	What were the highest and lowest scores in the simulation practice?
2	Reflection of leadership in project-based learning (PBL) activities	1) What happened? (What needs improvement?)
		2) What were your feelings and thoughts at the time?
		3) Where do you think the cause of the failure was?
		4) What are the lessons learned from the experience?
		5) What action do you want to try next time for better results?
3	Evaluation of the frequency of leadership behavior by rubric	Choose your frequency of leadership behavior and enter the applicable number (1 = *always*, 2 = *often*, 3 = occasionally, and 4 less)

Table 1: E-portfolio design.

3   Methods

3.1   Survey Target

This study analyzed a learning portfolio in which the results of the reflection of students on their experiences were continuously recorded. The experiences were provided in a leadership education program for first-year master's students in the Graduate School of Engineering and Science. Afterward, interviews were conducted with five students who demonstrated positive behavior change. To elucidate the mechanism of behavior change through reflection, we focused on which type of semantic environment and factors were involved with one another to produce behavior change.

3.2   Survey Method and Contents

The survey was conducted in the form of semi-structured interviews that lasted for approximately 60 min per person. The survey was conducted in the following order: (1) explanation of the objective of the training and ethical considerations and signing of a research consent form and (2) the semi-structured interview. The main 10 questions of the interview were as follows:

- When were you conducting reflection?
- Where were you conducting the reflection?
- With whom were you reflecting?
- What did you reflect on?
- For what reason did you reflect?
- How did you reflect?
- Have you ever changed internally through reflection?
- Are there any behaviors that changed as a result of reflection?
- How did you use the results of peer reflection?
- What kind of support did you wish to receive from faculty?

Utterances during the interviews were recorded using a digital voice recorder with the approval of the research collaborators. Data analysis was conducted using the KJ method.

4   Results

The results of the analysis identified the following characteristics in the reflections of students with significant positive behavior change.

(1) They view the learning environment as a special opportunity instead of a norm, and they understand which aspect they need to focus on.

(2) They are objective about how reflection can lead to their behavior change.

(3) If they are going to spend time learning, then they want it to be meaningful. If they are going to reflect, then they want it to lead to my personal growth.

(4) They are evaluating their abilities and discovering the characteristics of their learning methods. They analyze which aspects are lacking and recognize the need for change.

(5) They are working on integrating the trajectory of their learning by revisiting the past and checking for changes in their learning.

(6) They recognize that learning outcomes are an individual responsibility.

5   Conclusion

The Graduate School of Engineering and Science has conducted leadership education for first-year students of its master's program. The simulator is used to improve the experience of students in a safe environment, because students have limited opportunities to learn leadership from hands-on experience. The program has five modules, namely, knowledge, training by simulation, real action, reflection, and assessment. The e-portfolio was introduced to invite students to review their behavior.

Thus far, through qualitative and quantitative research results (Inoue & Maruyama, 2016) (Maruyama & Inoue, 2019) (Maruyama & Inoue, 2020), we have identified positive changes in behavior through reflection. Furthermore, we conducted interviews with students with significant positive behavior change to determine the type of reflection they are implementing. By integrating the results of the analyses with those of previous qualitative and quantitative research, we propose some teaching strategies for reflection that promote positive behavior change.

(1) Understand the concepts and terminology of reflection. In other words, reflection literacy should be fostered.

(2) Continually record the results of reflection and visualize changes using e-portfolio and other tools.
(3) Recognize the transformation toward growth through personal reflection.

(4) Discover and utilize one's strengths from the record of reflection results.

(5) Identify events of one's growth.

(6) Discover the relationship of one's actions to the growth of others.

(7) Set life goals and reflect in light of these goals.

In the future, we intend to design a curriculum that introduces reflection that incorporates the abovementioned perspectives. To adjust one's learning, effectively conducting reflection is necessary. This ability is essential for becoming an autonomous learner throughout life.

Using a Corpus-Based Approach to Explore Writing Variation in Engineering Subdisciplines: Pedagogical Implications

Li Lian Khaw, Monash University, Australia

Abstract

In the contemporary academic culture where publications are highly valued, engineering graduate research students are generally expected to publish their research outcomes during their doctoral candidature. Writing for publication can be challenging if one is not aware of the writing conventions in a subdiscipline. Furthermore, technical textbooks have been found to give contrasting and fragmentary advice regarding the use of passive voice to novice writers who intend to write in engineering subdisciplines. In response, some scholars have suggested engaging students with authentic language data relevant to the field, thus helping them better understand language conventions in their discipline. This study used *AntConc*, a corpus analysis tool, to explore writing variation on the use of the first-person pronoun with an active verb and the use of passive voice, as well as their rhetorical functions in journal abstracts, across eight engineering subdisciplines. A main corpus of 480 most-cited paper abstracts from 8 engineering subdisciplines was compiled and divided into 8 sub-corpora. Each sub-corpus consists of 60 abstracts from the top 5 journals in the field. *AntConc* was used to explore and analyse all the sub-corpora. The findings reveal significant variations across these engineering sub-disciplines in terms of usage frequency and rhetorical functions. To train engineering graduate research students in research writing, awareness in sub-disciplinary writing variation should be enhanced, and language analysis tools can be introduced for the students to further train themselves to be well-informed writers in their respective sub-disciplines.

Introduction

In addition to faculty members, graduate research students are the main driving force of research at a university. Graduate research students work on innovative ideas under the guidance of their supervisors and further develop these ideas into research outcomes or industrial solutions. In the contemporary academic culture where publications are highly valued, graduate research students are generally expected to write for publication to communicate the outcomes of their research during their doctoral candidature. However, writing for publication can be challenging if the writer is not aware of the disciplinary writing conventions. One of the questions on writing convention that engineering graduate research students frequently ask is the use of active or passive voice in research writing. However, writing advice provided by technical communication text books to this question can be inconsistent and fragmentary (Conrad, 2018).

One way to deal with this issue is to provide students with more discipline-specific writing assistance (Boettger & Wulff, 2016). With this approach, understanding disciplinary writing variation has become increasingly important and relevant in instructional design and pedagogy (Boettger & Wulff, 2016; Cargill & Adams, n.d.). Moreover, engaging students with authentic language data is deemed a more practical means to help students understand the linguistic patterns used in their respective disciplines. In this regard, corpus-linguistic approaches have been seen as valuable tools to understand variation in technical and scientific writing for pedagogical purposes (Boettger & Wulff, 2016; Cargill & Adams, n.d.).

Many studies have been conducted to investigate various aspects of language use in a number of disciplines, such as reporting words in medical journals (Thomas & Hawes, 1994), personal pronouns in scientific journals (Kuo, 1999), the passive voice and reporting verbs in engineering (Boettger & Wulff, 2016), the use of the first-person pronouns in electrical engineering (Wang et al., 2021) and personal pronouns across soft and hard disciplines (Harwood, 2005; Hyland, 2003; Khedri, 2016). Most of the literature in this area has focused either on the analysis of linguistic features in one single discipline or on cross-disciplinary linguistic variations. Few studies have focused on variation of linguistic patterns across sub-disciplines within the engineering discipline.

This study aims to investigate language use in the abstract of eight engineering sub-disciplines, focusing on the use of active and passive voice, which has been an object of debate in engineering research writing for decades, and the use of first-person pronouns, particularly 'we', which has gained increasing attention in engineering research writing. The investigation aims to answer the following research questions:
- What is the extent and distribution of the use of passive voice in the abstract of engineering research articles across subdisciplines?
- What is the extent and distribution of the use of pronoun 'we' in the abstract of engineering research articles across subdisciplines?
- Does the extent and distribution of the passive voice vary across sub-disciplines in engineering?
- Does the extent and distribution of the pronoun 'we' vary across sub-disciplines in engineering?
- Is there any correlation between the use of passive verbs and that of the pronoun 'we' in general?
- What are the rhetorical functions of the 'we' pronoun in the abstract?

Such a study can further inform our understanding of sub-disciplinary variation. Its findings may be useful to graduate research students who would like to understand style and linguistic patterns in their respective fields for publication purposes.

Active Voice, Passive Voice and the First-Person Pronouns

The passive voice has been one of the most researched and debated clarity markers in scientific writing (Leong, 2020). For example, research writing style in the 17th century was characterised by the use of active voice; however, the style gradually shifted to being object-oriented after the industrial revolution (Ding, 2002; Leong, 2020). According to Ding (2002), "the passive voice in scientific discourse embodies the professional practices and rhetorical contexts of science…Scientists through employing passive voice in their writing tell scientific communities that what they present can be replicated and verified by the communities" (p.152). Passive construction has been deemed to have a place in engineering writing (Stewart, 1984), and its use has been thought to encourage precision and probity (Leather, 1996).

However, in recent years, there seems to be a paradigm shift which favours the use of active voice to improve clarity and conciseness (Foster, 2017). It has been found that many technical guides encourage users to avoid using the passive voice as it is deemed to be top-heavy, cumbersome and confusing (Banks, 2017; Wolfe, 2009). The use of passive voice is criticised for generating ambiguous sentences (Day, 2011). In addition, world leading publishers such as Nature and IEEE also encourage prospective writers to avoid using the passive voice. They advocate using the first-person pronoun 'we' as the subject in active construction. The influence of these journals could be far-reaching and have great impact on the various science and engineering communities. In fact, some diachronic studies on scientific writing has shown increasing use of the active voice at the expense of passive forms (Banks, 2017; Leong, 2020), and the use of active voice has been found to be related to the use of the first-person pronoun subjects.

> *The study found that the extent of passive use was stable from 1880 to 1980 (occurring in about 29–36% of all clauses) but declined in 2017 (averaging below 25%). The study also found a decline in the use of finite passives to describe methodological actions and a corresponding increase in the use of first-person pronouns in the 2017 articles.* (Leong, 2020, p.467)

In addition to addressing clarity issue, the use of first-person pronoun subjects together with active verbs is also associated with authorial stance (Hyland, 2003; Tarone et al., 1981). The use of 'we' as a subject in active construction is a rhetorical strategy (Harwood, 2005; Hyland, 2003; Tarone et al., 1981). Hyland (2003) has identified 4 rhetorical functions with self-mention through first person pronouns, some of which have also been identified by other researchers (Harwood, 2005; Tarone et al., 1998). The four rhetorical functions of self-mentions in research articles proposed by Hyland (2003) include: 1) stating a goal or outlining the structure of a paper, 2) explaining a procedure, 3) stating results or making a claim, and 4) elaborating an argument (p. 257). Harwood (2005) stresses that 'we' is used for self-promoting, with which the authors present unique or innovative methodological procedure, clarify their stance, and report or summarize findings. In a much earlier study, Tarone et al. (1981) also highlight that the first-person plural active is used by authors to contrast their work with those of other contemporary researchers. With reference to the above-mentioned, the rhetorical functions of the 'we' pronoun can be summarised as follows.

1. Stating the purpose or goal
2. Outlining the structure of a paper
3. Presenting one's stance or contrasting one's stance with others'
4. Elaborating an argument
5. Presenting unique research procedure or design
6. Presenting findings or contributions, or making a claim

However, not all publishers or authors of technical guides advocate active construction and the use of the first-person pronouns. The American Society of Civil Engineers, for example, stresses the importance of passive voice: "The passive voice is not intrinsically poor, despite what many writing textbooks and grammar-checkers tell us. We need the passive voice; it stops us from repeatedly having to use 'I' and 'we' or some other agent" (Silyn-Roberts Heather, 2004, p.198). Some researchers also argue that using the passive voice does not always lead to problems and its use is essential in some cases (Krisch & Houdek, 2015).

Because of the historical background and preferences of some journals, it is not hard to see why engineering researchers or technical communication scholars have very different or even contrasting views about the use of active and passive voice, and the use of first-person pronouns in research writing. In fact, some scholars have found advice and views on the use of passive voice in technical and scientific writing inconsistent and fragmentary (Boettger & Wulff, 2016; Conrad, 2018). This may have to do with the propositions of specific journals or sub-disciplines within engineering.

Unfortunately, this means that graduate research students can get conflicting information from engineering and technical communication text books (Wolfe, 2009) and blanket advocates of either the active or passive voice in research writing in different sub-disciplines. More empirical explorations about the use of active and passive voices especially in the engineering subdisciplines could inform the ongoing discussion. This paper contributes to the topic by investigating the use of passive construction, active construction with the 'we' pronoun, and the rhetorical functions of the 'we' pronoun in several sub-disciplines of engineering.

Description of the Self-Compiled Corpora and Analysis

Four hundred and eighty abstracts from the journals of 8 engineering sub-disciplines were collected and compiled to build a corpus. The corpus was divided into 8 sub-corpora, each with 60 most-cited or most popular abstracts from the top 5 journals in the field (Table 1).

The abstract is chosen for analysis in this study because it has been viewed as the most important part of a research article (Stojmenovic, 2010). In addition, Omidian et al. (2018) highlight that fundamental distinctions, in terms of linguistic features and rhetorical functions, among disciplines can be noticed through the analysis of abstracts.

Journal selection was based on the ranking of top journals in the respective sub-disciplines, according to *Google Scholar Metrics*. The papers were randomly selected from the most cited or popular categories in the last 1 to 3 years as listed by each journal.

Sub-corpus	Number of abstracts per sub-corpus	Number of words
1. Environmental and Geological Engineering	60	13956
2. Transportation	60	12529
3. Robotics	60	12038
4. Materials Engineering	60	11920
5. Fluid Mechanics	60	12695
6. Structural Engineering	60	12638
7. Electromagnetism	60	11036
8. Chemical Kinetics and Catalysis	60	11518

Table 1: Data description

Two linguistic features, i.e., the first-person pronoun 'we' and passive verbs, were investigated in all the sub-corpora. The 'we' pronoun was first searched in each sub-corpus and the number of hits was recorded. The number of sentences were also manually calculated to facilitate a comparison on the use of 'we' pronoun on per sentence basis.

To retrieve all instances of passives, any form of the verb BE (e.g., am, is, are, was, were, has been, have been, had been, will have been) was searched in *AntConc* (Anthony, 2005) and the resulting concordance was copied into a spreadsheet. The concordance lines were manually inspected to identify true hits of finite passive verbs, as shown below:
- Basic (be + past participle)
- Progressive (be + being + past participle)
- Perfective (have/has/had + been + past participle)
- Modal (modal + be + pp)
- Modal perfective (modal +have been+ past participle)

The number of passive verbs was calculated against the number of sentences.

Chi-square tests were conducted to investigate statistical significance of variation in terms of the use of the 'we' pronoun and passive voice across the 8 sub-disciplines, and Pearson correlation tests were conducted to see if there was any correlation between the use of the 'we' pronoun and passive verbs.

The most frequent verbs associated with the 'we' pronoun were also explored and analysed to discover their rhetorical functions.

Results and Discussion

Frequency of the 'We' Pronoun

Table 2 provides information on the use of the 'we' pronoun across all sub-disciplines.

Sub-discipline	Hits (occurrences)	Number of sentences	Number of 'we' at the sentence level (60 abstracts per sub-corpus)
Robotics	128	424	3.3
Fluid Mechanics	93	450	4.8
Transportation	77	485	6.3
Chemical Kinetics and Catalysis	40	306	7.7
Materials Engineering	29	419	14.4
Structural Engineering	31	475	15.3
Environmental and Geological Engineering	25	502	20.1
Electromagnetism	16	400	25

Table 2: The use of the first-person pronoun 'we'

Among all the abstracts, the 'we' pronoun appears the most frequently in Robotics (1 in every 3.3 sentences) and the least frequently in Electromagnetism (1 in every 25 sentences).

A chi-square test of independence was conducted to test the following hypotheses:
    H0: Abstracts in different sub-corpora do not differ in the use of the 'we' pronoun.
    H1: H0 is false.

The result – χ^2 (7, N=98330) = 205, $p < 0.00001$ – shows that there are statistically differences in the use of the 'we' pronoun in the abstracts of different fields.

To further verify the above results, the number of abstracts which contain the 'we' pronoun was also tabulated, as presented in Table 3.

Sub-discipline	Number of abstracts which contain at least one occurrence of 'we'	Number of abstracts which do not contain any 'we'	Number of abstracts in each sub-corpus
Robotics	49	11	60
Fluid Mechanics	35	25	60
Transportation	26	34	60
Chemical Kinetics and Catalysis	24	36	60
Materials Engineering	15	45	60
Environmental and Geological Engineering	13	47	60
Structural Engineering	9	51	60
Electromagnetism	8	52	60
Total	179	301	480

Table 3: The number of abstracts containing the 'we' pronoun

As shown in Table 3, the majority of the abstracts (301/480, 63%) do not contain any 'we' pronoun. The 'we' pronoun appears the most frequently in Robotics and the least frequently

in Electromagnetism. Forty-nine out of 60 abstracts (82%) contain the 'we' pronoun in Robotics but only 8 out of 60 (13%) in Electromagnetism do.

A chi-square test of independence – χ^2 (7, N=480) = 101, p < 0.00001 – confirmed that there are statistical differences in the use of the 'we' pronoun in the abstracts of different fields.

Frequency of the Use of Passive Verbs

The use of passive verbs was also explored across all sub-disciplines, and Table 4 details the results.

Sub-discipline	Hits (occurrences)	Number of sentences	Number of passive verbs at the sentence level (60 abstracts per sub-corpus)
Structural Engineering	350	475	1.4
Electromagnetism	226	400	1.8
Environmental and Geological Engineering	231	502	2.2
Chemical Kinetics and Catalysis	142	306	2.2
Materials Engineering	180	419	2.3
Robotics	150	424	2.8
Fluid Mechanics	157	450	2.9
Transportation	133	485	3.6

Table 4: The use of passive verbs across sub-disciplines

Passive verbs appear the most frequently in the abstracts of Structural Engineering (1 in every 1.4 sentences) while the least frequently in those of Transportation (1 in every 3.6 sentences).

A chi-square test of independence on a slightly modified form of the data shown in Table 4 (based on a coarse assumption of the number of sentences per hit) was conducted to test the following hypotheses:

   H0: Abstracts in different fields do not differ in the use of passive voice
   H1: H0 is false

The results – χ^2 (7, N=3461) = 232, p < 0.00001 – showed that there are statistically significant differences in the use of passive voice in the abstracts of different fields.

Correlation Between the Use of the 'We' Pronoun and Passive Verbs

A Pearson correlation test was conducted to explore if there was any correlation between the use of the 'we' pronoun and passive verbs. The results showed that there is a high negative correlation (-0.69) between the number of 'we' per sentence and the number of passive verbs per sentence. This shows that the sub-disciplines which use more 'we' also tend to use fewer passive verbs. This finding adds to the discussion that the use of 'we' may affect the use of passive voice in research writing (Banks, 2017; Leong, 2020).

Overall, the 'we' pronoun appears more frequently in the abstracts of subdisciplines such as Robotics, Fluid Mechanics and Transportation while less in those of Environmental and Geological Engineering, Structural Engineering, and Electromagnetism. It should be noted that most abstracts of the Robotics sub-corpus and of the Electromagnetism sub-corpus were extracted from IEEE journals (4 out of 5), respectively. In general, IEEE journals encourage the use of 'we' and active construction in research writing, and the findings for Electromagnetism seem at odd with this guideline.

Such variations could be due to the nature of the studies or sub-disciplinary conventions, which needs further investigation. For example, Bank (2017) mentions that authors tend to use the 'we' pronoun and active construction when expressing/demonstrating a mental process such as mathematical calculation. This study did not consider the research nature of the abstracts, which should be further investigated in future studies.

Linguistic Patterns in Writing the Research Aim

An analysis was also conducted to discover the linguistic patterns of the purpose/goal statements in the abstracts. Table 5 shows the results.

In terms of presenting the purpose/aim, 'This paper/article/study/work + active construction' is found to be the most frequently used across subdisciplines (35%), followed by the use of passive construction (31%) and 'We + active construction' (30.4%). This implies that the three patterns have their respective places in writing the research aim/purpose of engineering research articles. Compared with the other two, 'This paper/article/study/work + active construction', indicating a more neutral formulation (Foster, 2017), seems to be preferred by most engineering research writers across a few sub-disciplines in this study, particularly in Transportation and Environmental and Geological Engineering. The findings show that despite the encouragement to use active construction, passive construction is often used in writing the research aim, with about 1/3 of the abstracts across subdisciplines using passive construction to present the research aim/purpose. In Materials Engineering and Electromagnetism in particular, about half of the papers present the research aim/purpose in passive construction. As for 'We + active construction', it happens the most frequently in Robotics.

Subject of the sentence	Robotics	Structural Engineering	Chemical Kinetics and Catalysis	Fluid Mechanics	Electro-magnetism	Materials Engineering	Transportation	Environmental and Geological Engineering	Total occurrences (percentages)
We +active construction	42	10	21	27	7	13	19	7	146 (30.4%)
This paper/article/work/ study + active construction	15	25	11	13	22	16	35	31	168 (35.0%)
The aim/objective/purpose of this study		1		1			1	4	7 (1.5%)

'We' Collocation and Rhetorical Functions

An analysis was also conducted to explore what verbs collocated with the 'we' pronoun and what rhetorical functions they served. Frequently seen clusters (i.e., 3 occurrences and above) of the 'we' pronoun and corresponding verb, and their rhetorical functions are listed in Table 6.

We-verb collocation	Frequency	Rhetorical functions
1. We present	36	Purpose; contribution
2. We propose	35	Purpose; procedure; claim
3. We show	25	Purpose; contribution; claim; stance
4. We demonstrate	20	Purpose; procedure; claim
5. We review	14	Purpose; procedure
6. We discuss	13	Procedure; stance
7. We highlight	10	Purpose; stance; claim
8. We study	10	Purpose; procedure
9. We provide	10	Purpose; contribution; procedure
10. We use	10	Procedure
11. We report	9	Purpose; procedure; contribution
12. We identify	9	Procedure; stance; claim
13. We introduce	8	Purpose; procedure; contribution
14. We address	8	Procedure; claim
15. We find	7	Stance; procedure; contribution;
16. We perform	6	Procedure
17. We investigate	6	Purpose; Procedure
18. We examine	5	Purpose; Procedure
19. We hope	4	Stance; claim
20. We observe	4	Procedure
21. We conclude	4	Claim; stance
22. We derive	4	Procedure
23. We conduct	3	Purpose; procedure
24. We leverage	3	Procedure
25. We refer to	3	Procedure
26. We implement	3	Procedure

Table 6: We-verb collocation and rhetorical functions

The clusters in the table above show the various rhetorical functions of the 'we' pronoun collocating with different active verbs. Frequently seen rhetorical functions are presenting the

research procedure, stating the research purpose, presenting one's stance, and highlighting one's claim or contribution, which align with the findings of previous studies.

Conclusion

This paper seeks to explore whether there is any variation in terms of the use of the 'we' pronoun and passive construction in the abstracts across eight engineering subdisciplines, and it was found that the variation is statistically significant. Writers in certain subdisciplines, such as Robotics and Fluid Mechanics, tend to use the 'we' pronoun more often in their sentences as compared to writers in subdisciplines such as Electromagnetism and Environmental and Geological Engineering.

On the other hand, passive verbs appear more frequently in subdisciplines such as Structural Engineering and Electromagnetism, showing that the passive voice does have a place in engineering research writing. It may not be too practical to advise engineering researchers, especially graduate researchers, to avoid the passive voice in their writing as such blanket advice may not suit engineering research writers of different sub-disciplines.

Overall, there is also a negative correlation between the use of 'we' as the subject of active construction and the use of the passive voice, which means that if 'we + active construction' is more frequently used, there will be less passive construction in the abstracts.

In addition, the rhetorical functions of the 'we' pronoun with the corresponding verbs found in this study also align with those of previous studies whereby the use of the 'we' pronoun serves as a promoting strategy to state the research purpose, present authorial stance, describe the research procedure, make a claim or highlight contributions.

One pedagogical approach to equip engineering graduate researchers with knowledge about the writing conventions in their respective research fields is to introduce the concordance tool so that they can explore linguistic patterns in their specific discipline while writing for publication.

As the corpus size in this study is small, the findings should be seen with this caveat in mind. Nevertheless, they do provide a glimpse of language variations in engineering subdisciplines, perhaps showing that academic writing instructors should avoid giving blanket advice when it comes to writing for publication across sub-disciplines. For future studies, the relation between the nature of the study and the use of the 'we' pronoun should also be considered and further researched.

Abstract
This research aims to study of factors influencing trimming skill in pineapples productivity which will lead to an increase in productivity in operations. The results showed that employees' skill is low with an average of 3 - 4 pieces per minute and the average waste was 2.5%. The group population is selected sampling group of employees 41 people with a duration of 5 months period, using the technique of providing feedforward feedback and peer learning techniques (Peer-Assisted Learning). The study found that male employees were more productive than female employees with an average productivity of 10.33 pieces per minute. Part-time employees were more productive than Permanent employees with an average productivity of 9.29 pieces per minute. The age range suitable for work was in the range of 21 - 30 years with an average productivity of 8.28 pieces per minute. In addition, it was found that the employee that has work experience period in between 1 - 5 years is the most effective. They have the highest productivity with an average of 8.27 pieces per minute. The training by using the technique giving information before practice and feedback (Feedforward and Feedback) with peer learning techniques (Peer-Assisted Learning) found that the pineapple trimming skill increased by 39% compared to the pre-training data collection, and reduce the defects caused by the pineapple processing process by 60%.

Introduction

The food industry is an industry that is very important to the country's economic system. In terms of production value, employment, and exports, Thailand's food industry is an industry. There is a high potential for production for domestic consumption and export. Because Thailand has a stable and prosperous agricultural production basis, quality produce is an important key. In addition, employee motivation also affects production efficiency and organizational development to improve in a way. A processed fruit production company is a company that engages in the production and export of canned fruits and fruit juices. It uses relatively high levels of labor. The company therefore wants to improve work methods in some areas to increase productivity and operational skills. From the training of employees' skills Must focus on work processes and operators. Similarly, Kritsada Chianwattanasuk [1] studied the motivation that affects employee performance, a case study of Ajinomoto Company. Betagro Specialty Foods Co., Ltd., found that personal factors in terms of gender, education, age, and different experiences will have different effects on work performance in terms of time, quality, and quantity of work. including relationships with supervisors will affect work to increase employee skills and lead to better productivity. The researcher conducted a research study for example Akaradet Maichan [2] studied the factors that affect the work efficiency of employees in the production line machinery installation industry in Songkhla Province. It was found that the work progress and stability in old age, including the environment in workplace. In additional Mubashar Farooq [3] has conducted a study on the impact of training and providing information before practice and feedback to the performance of employees. It was found that providing information before practice and providing feedback resulted in improved employee performance, like Chotima Nooprik [4]. Providing information before practice and feedback to further student learning was found which students were more efficient. Saisuda Pantrakul [5] analyzed the concept of peer-to-peer learning with hearing-impaired learners and normal learners and found that students improved. The research indicates that investments in training employees in quality control, safety, material requirements planning, and soft skills are worthwhile. As a result, organizations benefit from knowledge-driven revenue cycles, innovation, and creativity. Therefore, the technique of giving information before practice and feedback (Feedforward and Feedback) and the technique of peer-to-peer learning were chosen. (Peer-Assisted Learning) to be applied to employees in the production line and develop employee skills for better performance and for employees to help each other. In addition, it is a guideline for solving problems and improving the factory for use in developing production lines in the future. The feed forward and feedback training was able to helps in reducing the number of people in operations and increasing skills in operations. This leads to a reduction in waste and helps to increase quality output, low cost, and creates additional income.[6] It gives confidence to customers and creates stability for the company. It also directly affects the increase in productivity.

Methodology

The researcher observed and followed up on the evaluation of a specific sample group. The sample group must be willing to test and ready to develop themselves. They are selected as follows: 10 people worked on the production line in the pineapple eye cutting section, which consisted of one rack, Size 70, 80, 83. They have passed the preliminary test that there is an understanding of eye pecking and are ready to cooperate in collecting results to find trimming skill training for employees to increase productivity (Figure 1 and 2).
Figure 1: Example of defective pineapple

Figure 2: Example of processed pineapple

The feed forward is the provision of context for what one wants to communicate prior to that communication. In activity, feedforward creates expectations for the sample group. When an expected experience occurs, this provides confirmatory feedback. People with a peer supporter can share knowledge and experiences during training by being deployed to teach and staying close to people who work in the pineapple trimming process.

Collecting the Data of Staff's Performance

Collect the variable data that impacts on the staff's capacity as followed: Julalak Paka et. al. [6].

"Capacity" means the amount of product that can produce by using measurement unit as piece per hour and transform to piece per minute for plotting the graphs.

"Defect" means the waste of pineapple flesh (pineapple shreds) from peel and tweak the eyes process which is calculated in percentage from the formula as shown below and the result is in percentage of raw material defect.

Equations

Equations to Find the Defect Result in the workpiece that the sample recorded (1).

$$D = \frac{x - \left(x \times \frac{w}{t}\right)}{f} \qquad (1)$$

Explanation

D = Defect value (Percentage)
x = Weight of pineapple shreds from peel and tweak the eyes process (Kilograms)
w = Count of pineapple that is defected (piece)
t = Total pineapple that comes in the process (piece)
f = Count of good pineapple after process (piece)

Training Station Layout

The pineapple peel slides down the conveyor belt. The crew will then cut the pineapple afterwards. The staff will remove the remaining of the pineapple's green skin, prick out the eye, clean it, and then release it onto the belt as shown in the Figure 3.
Figure 3: Schematic diagram of the process of chain pecking pineapple eye

Results

Productivity of pineapple trimming production line size 70, Employees of the 70-production line gave a very good response. It was found that employees competed within the production line to develop better. In addition, employees also help fellow employees who are not able to meet their goals and help develop their friends to have expertise until they reach the goal of becoming Grade A employees. On a production line size of 70, there is information given before practice and feedback, for a total of 7 It was found that there was an improvement in productivity and a reduction in defects. Round 1 is the employee's normal operation. Without having yet provided information before practice (feed forward) and feedback each employee has production that has not yet met the specified criteria of 8 balls per minute because the employee performed the job without having seen the communication media. Learn (work instruction) with video media on new methods of working. But it was operating in the same way as before. But when developing skills and extending time for employees to practice and provide information before practice and feedback, and have employees watch learning media (work instruction) and media that are videos of model employees (best practices). It will be seen that in rounds 2–8, it was found that most employees were able to work with increased productivity continuously for about a round. At 4–5, the productivity began to increase until it reached 8 balls per minute. In addition, it was found that employee number 2 had the specified productivity of 8 balls per minute in round 3, while the other employees still did not meet the criteria because employee number 2 had high competition. And it was found that the employees were in the age range of 20–30 years, with working periods of 1–5 years, male gender, but other employees' numbers were in the elderly. Their ages ranged from 40 to 45 years old. In addition, it was found that employee number 8 had the specified output of 8 balls per minute in the 3rd round and was not in the process of using the size 70 rail all the time. He was taken out to work on the line. Other production, but the employee can do this because employee number 8 was close to employee number 2. Employee number 8 was in the age range of 20–30 years, with a working period of 1–5 years and gender were male.

It can also be explained that workers on a production line with a capacity of 70 were responsible for the flaws resulting from the eye-trimming of pineapples. Due to the employees' adherence to their own level of familiarity during the first round, the eye-pecking flaws were high—roughly 1.40% or higher. Following the guidelines, flaws were found to have decreased to about 0.48%, or less than 1%. When information was given prior to practice and feedback (Feedforward and Feedback) in the second round. Employee number 1 was discovered to be ill, making data collection impossible. Employee number 2 discovered in the first round that losses or defects were roughly 1.40%, but when information was provided before practice and feedback (feedforward and feedback), it was found that defects

or losses gradually decreased, with an average of 0.2–0.3%. and employee number 8 for the first time found Defects or losses were approximately 0.80%, but when information was provided before practice and feedback (feedforward and feedback), it was found that defects in the 3rd round decreased to approximately 0.40%, consistent with other employees. In the third round, the other rounds were not collected because employee number 8 was removed to work on another production line. But the employee was able to perform well because employee number 8 has a position standing close to employee number 2. It will be found that employee number 8 has high skills and can learn quickly. Therefore, working with employees with low skills in proximity to skilled employees contributes to employee motivation and learning from each other.

The productivity of the pineapple trimming production line was 80. It can be explained that Round 1 was the employee's normal work. which has not yet provided information before practice and feedback (Feedforward and Feedback). From the first round of information provided before practice and feedback (Feedforward and Feedback), it was found that each employee has production that has not yet been met. The specified threshold is 8 balls per minute because most of the employees were elderly. They are in the age range of 41–50 years; most are female, making them learn quite slowly. But when the time is extended for employees to have training and provide information before practice and feedback (feedforward and feedback). Learning media (work instruction) and video media of model employees (best practices) It could be seen that in each round where information is provided before practice and feedback (feedforward and feedback), most employees was able to work and increase productivity. Continuously increasing gradually Everyone will be at the same level. Overall, in the 8th round, the productivity began to trend up until it reached 8 balls per minute. Everyone met the target set in the 8th round. In addition, employee number 2 got the specified productivity of 8. goals per minute in the 5th round, while other employees got 6 goals per minute, which still hasn't met the criteria. It was found that employee number 2 was in the age range of 31–40 years, with a working period of 1–5 years, and was female. But other employees are elderly, with an average age of 41–50 years.

Development of reduced defects on production line size 80. It can be explained that defects or losses from trimming pineapple buds are caused by the performance of the employees of the 80-year production line. In the first round, the employees performed their duties according to their own familiarity, so the defects due to eye-scrubbing were quite high. is approximately 2.2% or more. When information is provided before practice and feedback (feedforward and feedback) in the 2nd round, it will be found that defects have decreased by approximately 1.40%, still not meeting the specified criteria, which was not more than 1%. In addition, it will be found that employee number 8 in the first round found that defects were approximately 1.40%, but when information was provided before practice and feedback (feedback and feedback), it was found that defects gradually decreased, with an average of 0.30–0.40%, due to a service life of more than 10 years and that he was a factory trainer. While employee number 2 in the first round found defects were approximately 1.50%, when information was provided before practice and feedback (feedforward and feedback) in rounds 8–9, it was found that defects decreased. has an average of 0.20–0.30%, while other employee numbers have an average of 0.30–0.30% fewer defects.

Productivity of pineapple trimming production line size 83. It can be explained that Round 1 is the employee's normal operation. without having yet Providing information before acting and giving feedback (Feedforward and Feedback), which was from giving information first Practice and feedback (forwarding and feedback) Round 1 found that each employee has

production that has not yet met the specified criteria of 8 children/minute because the employees performed their work without having seen the learning media (work instruction) and video media. But it was operating in the same way as before. When extending the time for employees to practice with information before practice and feedback (Feedforward and Feedback) and allowing employees to watch learning media (Work Instruction) and media that are videos of model employees (Best Practice), it will be found that the employees of the production line size 83 have developed quite quickly. It could be seen that with each round of information given before action and feedback (forward and feedback), there has been an improvement. It was also found that most of the employees of production line size 83 were in the age range of 20–30 years, with a working period of 1–5 years. Overall, by providing information before the seventh round of practice, productivity began to tend to increase. until reaching 8 balls per minute, exceeding the set target. In addition, it was found that employee number 5 achieved the specified productivity of 8 balls per minute in the 3rd round, but while other employee numbers had not yet met the criteria, it was found that employee number 5 was still old. Between 20 and 30 years, the working period was 1–5 years, and the gender was male. In addition, it was found that employee number 6 had a specified productivity of 8 balls per minute in the 4th time, with employee number 6 having a standing position next to employee number 5, making it more than that. competition, but the age of employee number 6 was in the age range of 41–50 years, the working period was 1–5 years, and the gender was female, while other employees will receive the output as specified in the 6th–7th round.

With improved defect reduction on production line size 83, it could be explained that the defects from pineapple eye-cutting were caused by the work of employees on production line size 83. In the first round, the employees performed the work according to their own familiarity, causing the eye-pecking defects to be rather high. It was approximately 1.65% or more. In the second round, it was found that the defects of some employees were higher because they were not yet accustomed to working in a new way and wanted to meet the set goals. Therefore, there were more defects. When employees become accustomed to the new way of working, this makes the average defect of every employee approximately 1.70%. It was found that employee number 6 in round 3 had defects at 0.80%, while for employees' numbers 1, 2, 3, 4, 5, 7, 8, 9, and 10, the average defect rate was 1.3%. Therefore, it could be seen that employee number 6 was an employee who had skills in performing work that reduced defects better than other employee numbers. And in rounds 4–8, it was found that all employees' defects decreased equally, with an average of 0.60%. The specified criteria were not more than 1%.

Productivity and Defection

After training employees by means of providing information before practice and feedback (feedback and feedback), it was found that during operation, the average productivity increased by 39% compared to the first and last time while operating. It was also found that productivity increased and defects in the process from operations were reduced on average by 60%, as shown in Table 1, 2.

Production line	Before improvement	After improvement	% Increasing
70	7.53	9.36	19.55
80	4.61	8.73	47.16
83	4.69	9.66	51.45

Table 1: Comparison the % productivity from employee pineapple-trimming before and after training of each size

Product line	Before improvement	After improvement	% Decrease
70	0.38	0.3	21.05
80	1.59.	0.34	78.62
83	1.62	0.28	82.72

Table 2: Comparison of % defect before and after training by using feed forward & feedback (Std. %defect 0.80%)

Conclusion

The 70-size production line in collecting the first round before starting to develop skills for employees. There was a product that has not yet been made by the standard criteria specified 8 balls/minute. The average of 5.2 balls/minute and the defects from the chopped eye chopper up to 1.4 %, which was more than the specifications set at 1 % after the operation. Providing information before operation and feedback by developing skills through the working manual. The best work sample video in the 2nd - 8th round of employees has been developed to meet the target. All employees can reduce the defects from pineapple eyes lower than the average requirements at approximately 0.48.

The 80 -size production line found that in the first round of data collection before starting to develop skills for employees. The average productivity was 3.4 balls/minute, which had not yet been by the standard criteria of 8 balls/minute and defects from pineapples up to 3.5 %, which was more than the specifications set at 1 % after providing information. Before the feedforward and feedback and learning through the working manual and the best work sample video in the 2nd - 9th round. It can be observed that employees have improved continuously until they can pass the 8 -8-minute standards per minute. Pineapple eyes were lower than the 4th round of 0.62 %.

The 83-size production line found that in the first round of data collection before the development of skills for employees. The average productivity was 3.8/minute, which had not yet been by the standard criteria for 8 balls/minute and defects from pineapples up to 2.6 %, which is more than the specifications set at 1 % after providing information first. Feedforward and feedback by developing skills through the work guide and videos, samples of the best work from the prototype staff, in the 2nd round of the staff, the employee has developed in a better way. Continuously until the 7th round, most employees can pass the standard criteria, and in the 4th round, can reduce the defects from pineapple eyes by everyone's requirements. In addition, found that an average of 39 % increased productivity compared to the first round of data collection that had not been developed. The defects caused by the production process decreased by 60 % and when the production line was analyzed, it was found that factors that influence employees' skills training for increased productivity. Point out that male employees were effective in operating better than female

employees, with an average productivity of 10.33 per minute. Daily employees were more effective than monthly employees, with an average productivity of 9.29 per minute. Suitable for operations will be in 21 - 30 years, with an average productivity of 8.28 per minute. In addition, it was found that the age of 1 - 5 years had the most performance, with an average productivity of 8.27 minutes per minute.

The finally, the feedforward and feedback technique has proven to be the best way to train and develop the staff's skills. After the staff has been trained about the "peel and tweak the eyes" procedure, it increases the staff's performance. The result shows that they understand better, grow in their performance, and work more efficiently. Furthermore, productivity increased whether employees work the same amount of time or less. Thus, the key factor for success was the peer-assisted learning strategy, including feed-forward and feedback training techniques as well.

Suggestion

From the study of factors that influence the skills of staff skills for production, Human resource will use to plan for people to work.

Learning of Successors in Long-Lived Family Firms: Knowledge Construction for Entrepreneurial Mindsets

Koichi Chujo, Japan Advanced Institute of Science and Technology, Japan
Rihyei Kang, Hosei University, Japan

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This study explores how successors in long-lived family firms learn entrepreneurial mindsets that orient the reconfiguration of unique resources of family firms. Learning to shape business values and beliefs is important for successors because values and beliefs are the firms' core related to organizational identity and culture. Entrepreneurial mindsets are values and beliefs that pursue opportunities. Our previous research about long-lived family firms showed that entrepreneurial mindsets are one of the elements learned from transgenerational family knowledge and that successors have complex learning of explicit and tacit knowledge. This research to deepen entrepreneurial mindsets is a case study of semi-structured interviews with family managers of 15 family firms — nine firms of several sectors in Hokuriku district and six traditional food sector firms — over 100 years since their establishment in Japan. The results show three types of learning for entrepreneurial mindsets.

· Learning entrepreneurial mindsets from transgenerational family knowledge.
· Recognizing the constrictive resource value of the family business and forming entrepreneurial mindsets from self-learning or external experience forward retrieve of the family business.
· Recognizing VRIN (Valuable, Rare, In-imitable, and Non-substitutable) resources of the family business and learning conservative mindsets to maintain current resources.

The transgenerational transfer of family values is a key factor in the persistence of a family business. In addition, forming an entrepreneurial mindset of the successor derived from concern for the decline of the family business provides resilience to the longevity of a family business.

Keywords: Family Business, Successor, Familiness, House Percepts, Entrepreneurial Mindsets

Introduction

Most small and medium-sized enterprises (SMEs) in Japan are family businesses, and their business succession is recognized as a social issue due to the aging of family business managers. A large number of long-lived firms characterizes family business in Japan. Long-lived family firms that have been in business for more than 100 years have a high rate of family succession, and a low rate of not having a predetermined successor (Teikoku-Databank, 2022). The data suggest that family succession in long-lived family firms is more stable and that their longevity is not merely a consequence.

Cabrera-Suárez et al. (2001) emphasized the importance of transferring tacit knowledge to the process of family business succession. Tacit knowledge is personal, contains subjective insights, and is rooted in individual actions and experiences, together with the ideals, values, and feelings that individuals hold (Nonaka & Takeuchi, 1995). Transfer of tacit knowledge is not as easy as that of explicit knowledge. In Japan, there is a history of transgenerational transfer of values and beliefs for family business as house precepts (Adachi, 1970). The practice partly remains. Though traditional house precepts are written or oral, Taomoto (2012) identified tacit house precepts in family businesses. In this study, house precepts refer to transgenerational values and beliefs in a family business learned explicitly and tacitly by successors.

The resources unique to a family firm provide it with advantages, so it's necessary to manage the resources' value (Habbershon & Williams, 1999). Chujo et al. (2021) identified values for innovation in house precepts across generations in long-lived family firms. In this study, values for innovation are substituted by entrepreneurial mindsets, which refer to values and beliefs that orient a person to entrepreneurship (Habbershon et al., 2010). This study explores how successors in long-lived family firms learn entrepreneurial mindsets and enhance unique resources of family firms through successors' activities.

Literature Review

Knowledge Construction of Successors

Le Breton-Miller et al. (2004) posit that the transmission of knowledge during succession in family businesses begins cleverly and imperceptibly in the home. Based on a case study of a family business in Europe, Lambrecht (2005) found succession to the next generation to be a time-consuming and ongoing process. Martínez et al. (2016) argue for knowledge acquisition from outside sources and the transgenerational knowledge transfer inside a family. Woodfield and Husted (2017) assumed that the knowledge held differs between generations of a family, and that there is bi-directional knowledge sharing between predecessor and successor. Cabrera-Suárez et al. (2018) found that not only transgenerational knowledge transfer, but also family members, employees of the family, external stakeholders, work experience outside the family business, and education received outside the firm, affect the knowledge construction of the successor, which in turn affects their entrepreneurship.

Familiness

In the approach to study the advantages of family firms, Habbershon and Williams (1999) focused on Valuable, Rare, Inimitable, Non-substitutable (VRIN) resources unique to historical family firms from Resource Based View (RBV) concept of Barney (1991),

Familiness refers to the unique bundle of resources derived from the interaction between the family and the family business, and has both, positive and negative aspects, and is classified into either "distinctive familiness," when it possesses resources that produce advantage, or "constrictive familiness," when it does not (Habbershon & Williams, 1999). Familiness contains shared values/vision of a family (Pearson et al., 2008), a family brand with long history Zellweger et al. (2010), management philosophy and corporate culture (Zellweger et al., 2010), and relationship with stakeholders (Habbershon & Williams, 1999). From the identity dimension of familiness, a successor has overlapping family, organizational, and individual identities, and the overlapping influences the forming of the successor's values (Zellweger et al., 2010). Making distinctive familiness sustainable needs appropriate resource management (Habbershon & Williams, 1999). It is important for the longevity of family firms how the entrepreneurship of successors manages the unique resources of a family business.

Knowledge and Intellectual Capital

Marr et al. (2004) present two streams of research on knowledge in business management. One views knowledge as an entity related to an interpretation of information sets and experience (Albino et al., 2001). Nonaka and Takeuchi (1995) argue that knowledge is related to beliefs in a particular position and to purposeful action. The argument shows that house precepts are knowledge because they are values and beliefs for the family business. The other stream views "knowledge assets as a major part of an organization's value" (Marr et al., 2004, p. 553). The concept of intellectual capital can be presented from this perspective. Intellectual capital refers to knowledge, information, intellectual property, and experience that can be utilized to create wealth (Stewart, 1997). Intellectual capital comprises structural, human, and relational capital. Structural capital includes intellectual property, business processes (including explicit and implicit procedures and rules), corporate philosophy, and corporate culture; while human capital includes skills, know-how, and abilities; and relational capital includes customers, customer loyalty, sales channels, and brands (Guthrie & Petty, 2000). Intellectual capital mostly fulfills VRIN criteria (Teece, 2014), so the perspective is suitable for familiness research.

Research Model and Research Questions

Our research model is as follows:

The entrepreneurship of successors in long-lived family firms relates to learning the entrepreneurial mindsets from the house precepts (Chujo et al., 2021). The knowledge construction in the process of successor learning involves not only family members, but also employees of the family firm, external stakeholders, and work experience and education received outside the family firm in question (Cabrera-Suárez et al., 2018).

The knowledge construction of a successor shapes his/her own values and beliefs, and entrepreneurial activity based on them integrates resources toward distinctive familiness.

The reason is that sustaining distinctive familiness requires proper resource management (Habbershon & Williams, 1999).

The research model conducts the following research question:

- – How do successors in long-lived family firms learn entrepreneurial mindsets and integrate familiness as unique resources of family firms?

Methodology

This study adopts an inductive approach, using qualitative case studies. Case studies examine a phenomenon in context, where the boundaries with the context are unclear (Yin, 2018). This study explores learning by the successors of long-lived family firms, with family businesses as the context. Defining a research question provides clues (Yin, 2018), and focus (Eisenhardt, 1989), for the research. We have already defined the research question of this study above.

The unit of analysis for the cases in this paper is the successor. We distinguish successors from predecessors, considering their pre- and post-succession situation as successors. This study examines multiple case studies, which are more robust and offer greater explanatory power than single ones (Herriott & Firestone, 1983; Yin, 2018). Qualitative studies use theoretical sampling. Theory sampling selects cases likely to replicate the emergent theory (Eisenhardt, 1989). Sampling was conducted according to the purpose of this study and the research question. Long-lived family firms refer to having a history of over 100 years from its establishment, managed by family members, at least partially owned by a family, and succeeded by a family member. Firms are to be small and medium-sized enterprises. Interviewees are management members of the family businesses, who are party to the succession process. From the successor's corporate website, the company history, house precepts, as well as values and principles manifest, in part, in the management philosophy and corporate brand. By selecting firms for which information is, at least, partially available, it becomes possible to check for consistency with the interview data.

This study assigned two survey groups to find the difference between the same sector and different sectors. Survey 1 considers a wide range of sectors in Hokuriku region. Survey 2 examines the traditional Japanese food industry in a wide area of Japan (see Table 1).

	Area	Firm	Sector	Outline
Survey1	Hokuriku	A	services	hotel and restaurant
		B	industry	Japanese sake
		C	retailing	foods
		D	industry	printing
		E	industry	construction
		F	industry	Japanese sake
		G	industry	material
		H	industry	fermented foods
		J	retailing	Japanese lacquer ware
Survey2	Don't care	P	industry	fish processing
		Q	industry	vinegar
		R	industry	fermented foods
		S	industry	vinegar
		T	industry	fish processing
		U	industry	Japanese sake

Table 1: Overview of Interviewed Firms

Following the interview guide created by the research model, semi-structured interviews with successors collected data from 15 family firms. Semi-structured interviews feature more general questions and offer greater freedom in the order and content of questions than structured interviews do (Bryman, 2016). The interviews accorded priority to situations in which the interviewee was comfortable talking. Interviews were conducted either in person or via videoconferencing. There were no differences in the content due to the interview method.

Interviews were recorded and transcribed. Transcribed text was coded using Verbi's MAXQDA data analysis software, in order to perform in-case analysis, from which code relationships were identified. In-case analysis widely covered historical value, house precepts, succession process, and business activity of a successor to identify hidden factors related to entrepreneurial mindsets. A cross-case analysis identified concepts in Table 2.

concept	definition
Learning entrepreneurial mindsets	Learning entrepreneurial mindsets from house precepts and family business history orients a successor to entrepreneurship in a family business.
Learning conservative mindsets	Learning conservative mindsets from house precepts and family business history orients a successor to maintaining VRIN resources of a family business.
Recognizing constrictive familiness	A successor recognizes constrictive familiness that means decline of valuable resources in a family business.
classification of integrating resources	Sirmon et al. (2007)
Stabilizing	Making minor incremental improvements
Enriching	Adding a complementary resource from the resource portfolio to the current bundle
Pioneering	Integrating completely new resources

Table 2: Focused concepts in cross-case analysis

Results

Overview of Results

Table 3 presents the results of the cross-case analysis regarding entrepreneurial mindsets, recognizing constrictive familiness, and integrating resources. Integrating resources indicates strength and content manipulated in human, structural, and relational capital.

Learning entrepreneurial mindsets and recognizing constrictive familiness are not mutually exclusive concepts, and their coexistence is possible. However, this study did not find the combination. The conceivable situation is that, despite some entrepreneurial activities or resource integration efforts, the value of familiness has declined. In this scenario, it might be more difficult to recognize opportunities for new resource integration, or greater risk-taking might be required.

They are classified into the following three categories by sorting based on learning entrepreneurial mindsets and recognizing constrictive familiness:
      Type1: Firm A, B, D, F, G, H, P, Q, R, S
      Type2: Firm C, E, J, T
      Type3: Firm U

	Firm	Learning entrepreneurial mindsets	Learning conservative mindsets	Recognizing Constrictive familiness	Bundling Rsources			
					strength	human capital	structual capital	relational capital
Type1	A	O			Enriching			O
	B	O			Enriching		O	O
	D	O			Enriching		O	O
	F	O			Enriching		O	O
	G	O			Pioneering	O	O	O
	H	O			Enriching		O	O
	P	O			Enriching			O
	Q	O			Enriching		O	O
	R	O			Enriching		O	O
	S	O			Enriching		O	O
Type2	C			O	Pioneering	O	O	O
	E			O	Enriching		O	O
	J			O	Enriching		O	O
	T			O	Enriching			O
Type3	U		O		Stabilizing			

Table 3: The results of the cross-case analysis

Result of Type 1

Successors learn entrepreneurial mindsets in various ways from house precepts. Explicit house precepts show values and beliefs simply, so successors understand the essential meanings during their management.

> *One of our house precepts is "Tradition is a continuation of innovation." …For the first time, I thought the house precept was overstated…I understood the meaning through my management of the family business.* (Firm F)

The history and legacy of family business give tacit house precepts to successors.

> *The founder was a trader...The second generation president became a manufacturer of soy sauce brewers… My father was the third generation, and he expanded into soybean paste brewing.* (Firm H)

> *I found a cool storage place in an old warehouse. My grandfather must have constructed it for improving products… I believe that I inherited his values.* (Firm B)

The successor undertakes enriching or pioneering for integrating resources, so revises familiness to adapt to environmental change. Figure 1 shows the model of Type 1.

House Precepts

Entrepreneurial Mindset	→	Learning of Successor	→	Entrepreneurship	→	Enriching/pioneering for Integrating Resources

↓

Revised Familiness
Figure 1: The model of Type 1

Result of Type 2

In this type, the entrepreneurial mindsets of house precepts do not appear.

The successor recognizes constrictive familiness. Inadequate management of familiness, or environmental changes may render familiness constrictive.

> *At that time, the plastering business was in decline; I felt succession would give me a tough job.* (Firm E)

> *Lacquer shop was not hopeful for the future, so my father never told me to continue the business.* (Firm J)

> *While working for a family firm, I realized the limits of the business.* (Firm C)

The successor thus forms entrepreneurial mindsets his/herself and adopts enriching or pioneering for integrating resources.

> *I thought about establishing a lacquerware shop, and then joined a famous lacquerware shop for training.* (Firm J)

I thought of transformation from delivering to having customers come to buy… I learned my new business through self-study, excluding participation in seminars and advice from the businesspeople concerned. (Firm C)

A successor's commitment to contribute to the family business as an extension of the family derived from the overlap between the family and organizational identity may orient him/her to entrepreneurship (Zellweger et al., 2010). Figure 2 shows the model of Type 2.
Figure 2: The model of Type 2

Result of Type 3

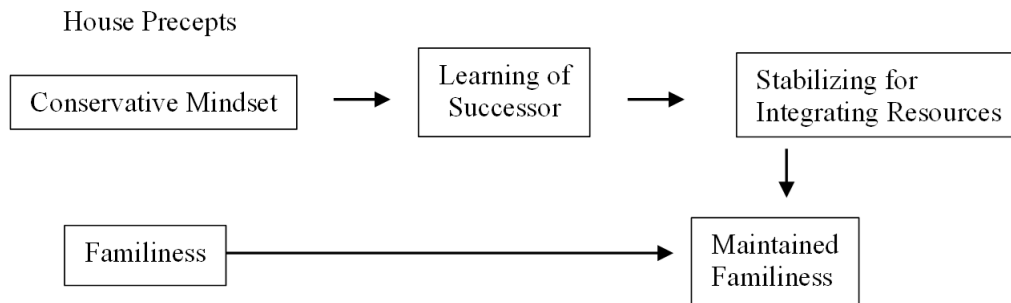
Company U's products have historically been highly popular and have maintained their methods and taste. Its process differs from the commonly employed methods today; it is the only company that maintains both, traditional processes and taste, and has high VRIN resources. The successor takes over historical values and maintains familiness, with minor alterations. Figure 3 shows the model of Type 3.


Figure 3: The model of Type 3

Discussion

Successors to family businesses often begin to learn about the family business from an early age because they can communicate with a predecessor in the family house daily. This environment inspires natural learning about the family business and supports absorbing entrepreneurial mindsets.

Such an environment for successors facilitates the learning of the values of the entrepreneurial mindsets in Type 1. Type 1 offers the highest family business sustainability of the three types, because the entrepreneurial mindsets are transferred across generations and the entrepreneurship derived from the mindsets integrates resources to adapt to environmental change. Enriching of integrating resources retains the company's core values and expands into the periphery with fewer risks. Transgenerational pioneering is most likely limited

because pioneering is more aggressive than enriching and entails more risks (Asaba & Yamanoi, 2022).

Type 2 shows that the successor recognizes the constrictive familiness and forms entrepreneurial mindsets of their own. Constrictive familiness means constrictive resource value because of inadequate adaptation to environmental change. The reason for forming entrepreneurial mindsets is most likely the successor's attempt to contribute to the family business as an extension of the family (Zellweger et al., 2010). Previous research on family firms in Japan shows that the combination of tradition and innovation, referred to as "Enrichment" in Type 1, is one of the factors in their longevity (Asaba & Yamanoi, 2022; Yamada, 2013). This research also identified that forming entrepreneurial mindsets from recognizing the constrictive resource value is valid to retrieve unique resources of a family business. Type 2 demonstrates the resilience of family businesses in recovering from a state of decline.

Type 3 has the characteristics that the family business contains sustainable VRIN resources, and that a successor learns conservative mindsets of house precepts. The sustainability of Type 3 depends on the sustainability of the value of the VRIN resources. The sustainability of Type 3 may be uncertain. A part of Japanese traditional culture has most likely the persistence on business of Type 3.

Conclusion

This study explored the construction of knowledge regarding the entrepreneurial mindsets of family business successors in a dynamic environment. We found the following three types of successor entrepreneurial mindsets in long-lived family firms:

- Learning entrepreneurial mindsets from transgenerational family knowledge.
  - It provides transgenerational entrepreneurship to adapt to environmental change, so a family business is stable for persistence.

- Recognizing the constrictive resource value of the family business and forming entrepreneurial mindsets from self-learning or external experience forward retrieve of the family business.
  - The learning of a successor different from the above gives resilience to the longevity of the family business.

- Recognizing VRIN (Valuable, Rare, In-imitable, and Non-substitutable) resources of the family business and learning conservative mindsets to maintain current resources.
  - The values and beliefs of a family are to inherit Japanese traditional culture.

The transgenerational transfer of family values is a key factor in the persistence of a family business. In addition, forming an entrepreneurial mindset of the successor derived from concern for the decline of the family business provides resilience to the longevity of a family business.

Use of Contextualized Activity Sheets in Improving Students' Knowledge on Climate Change

Pauline L. Cueno, De La Salle Medical and Health Sciences Institute, Philippines
Voltaire M. Mistades, De La Salle University, Philippines

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

As a major global issue, climate change is one of the topics in the senior high school curriculum, specifically in the Earth Science subject. Designing instructional materials in which the learners can relate their personal experiences to climate change plays an important role in enriching their knowledge about climate change. This paper aims to develop and evaluate the use of contextualized activity sheets to improve grade 11 students' knowledge on climate change using the PDSA framework. The researcher-made contextualized activity sheets are composed of six activities anchored to the Department of Education (DepEd) learning competencies. Experts in the field of science education and environmental science validated the contextualized activity sheets, where an overall mean rating of 4.51 is interpreted as Very Acceptable. In addition, pre-test and post-test on the climate change concept test were administered to 157 students to measure the students' knowledge. The results showed that the use of the contextualized activity sheets has a significant difference on the students' knowledge on climate change from the pre-test and post-test, while the Cohen's d result indicated that it has a medium effect on students' knowledge. These results suggest that the contextualized activity sheets can enrich the students' knowledge on climate change and can still be enhanced to suit the needs of other learners from different localities.

Introduction

Climate change is defined as a long-term change in the state of Earth's climate, or a region caused by changes in the greenhouse gas concentrations in the atmosphere either due to natural phenomena or anthropogenic causes (Cruz et al., 2017). To address this global issue, several scientists have proposed two main strategies, namely: mitigation and adaptation. As an effort to mitigate climate change, the United Nations Framework Convention on Climate Change (UNFCCC) issued a protocol which encourages the developed countries to make the first move to reduce their greenhouse gas emissions and help the developing countries to the same. However, for these efforts to be deemed successful, all levels of society should act and to make it happen, transfer of appropriate knowledge must be done (Anderson, 2010; Ledley et al., 2017). To reach such a wide community, a powerful tool such as formal education in schools is needed.

Although most people claim that experience is the best teacher, in the case of climate change, learning from experience will require decades and even millennia. In a span of months, formal education in schools can excellently convey appropriate knowledge and promote learning that leads to action of the young generation of students (Garcia, 2015; Harun et al., 2011). In the Philippines, the study of Nuñez & Clores (2017) found out that K-10 completer have a moderate level of environmental literacy and environmental knowledge. They have argued that environmental education among Filipinos is a necessity so that students can participate in conserving and protecting the environment. Thus, the DepEd developed the Climate Change Education for Sustainable Development modules to use visual materials in stimulating impactful discussion on climate change.

Thus, this paper aims to fill the gap between the need to connect the students to local climatic conditions and the effort of DepEd in developing modules for climate change through contextualization. Contextualization is defined as the process of developing new skills and knowledge among students through presenting subject matter and using authentic materials which are meaningful and relevant to them (Ballesteros, 2015; Garin et al., 2017). It is the assumption of this study that after the implementation of the contextualized climate change activity sheets, there will be an increase in the students' knowledge on climate change.

The need to contextualize learning materials used in teaching was presented in several research in the Philippines. In other disciplines such as Mathematics and Languages, it was argued that teachers need to localize examples, exercises, and illustrations to improve students' performance (Egcas et al., 2017). Hence, this approach can also be used in Science not only to enhance the performance but to promote lifelong learning as well.

Conclusion

Materials and Methods

The study employed an action research design using a quasi-experimental approach. All the participants were subjected to the intervention, the use of the contextualized activity sheets. The quantitative data were collected from pre-test and post-test of the Climate Change Concept Test and were analyzed using the Statistical Package for Social Science (SPSS) software to determine the mean and standard deviation, as well as if there is a significant difference between the pre-test and post- test scores. 154 students from the four sections of Grade 11 students of De La Salle Medical and Health Sciences Institute Special Health

Sciences Senior High School (DLSMHSI-SHSSHS). The module implementers on the other hand were two Earth Science teachers in the school.

Prior to the implementation of the activity sheets, the student participants took the Climate Change Concept test to determine their initial knowledge about climate change. The activity sheets were implemented in October 2020 of the school year 2019-2020 for two weeks. At the end of the implementation, the students took the Climate Change Concept test again to determine the level of their knowledge about climate change.

Results and Discussion

The average pre-test mean scores (Table 1) of the students show that they have a moderate level of knowledge about climate change before using the contextualized activity sheets. It can also be observed that most of the students are somehow familiar with the topics under climate change.

Table 1: Students' pre-test scores on the climate change concept test

	Mean Score	SD	Verbal interpretation
Factors affecting climate	8	1.92	High level
Global climate phenomenon	7	2.15	Moderate level
Overall	15	3.36	Moderate level

Table 2 shows the pre-test and post-test results the students. It can be observed that the use of the contextualized activity sheets helped the students understand the topic better. As a result, their performance yielded high post-test results.

Table 2: Changes on students' knowledge about climate change

Pre-test mean	SD	Post-test mean	SD	t	Cohen's d	p-value
15.29	3.36	17.54	3.18	-9.45	0.69	0.0000…

Moreover, the p-value is less than 0.05 which indicates that there is a significant difference between the mean score of the pre-test and the post- test. It can be inferred that the students' knowledge about climate change improved after using the activity sheets. The Cohen's d value, on the other hand, is 0.69 which shows that the contextualized activity sheets have a medium effect on students' knowledge test. This implies that the materials have average impact on the improvement of the scores in the given concept test about climate change.

These results further proved that contextualizing the activities plays an important role in enriching the students' knowledge. The students were able to understand the relationship between what is being learned in the classroom and what is being seen in the real-world. In a similar study about contextualization, Giamellaro (2014) observed that there was an increase in the students' conceptual understanding in science when an authentic context was given (Giamellar, 2014). A study of Rivet & Krajcik (2008) also implied that contextualization in a science classroom is a way to facilitate the improvement of students' understanding of

difficult science concepts. These are because in contextualization, students have a personalized and first-hand perspective in what they are learning.

The use of contextualized activity sheets can be included in the teachers' strategy for teaching climate change to provide an authentic way for the students to understand the topic better. This can also open a room for discussion among stakeholders to consider the local conditions which can also be included in the materials.

Recommendations

Through the use of the activity sheets, the students who don't have access to the online resources which can help the understand climate change better can be given opportunities to use these kinds of materials. As a result, they are more involved in the learning process since their experiences are taken into consideration in designing the instructional materials. As seen from the results of this study, the use of such materials improved the students' knowledge on climate change.

From the implications of the results, the following suggestions can be done in the future studies, (1) teachers can work with other stakeholders such as school administrators and government agencies to modify these materials with a locality-specific context in mind, (2) the discussion of the concepts can be provided to develop a module which students can use at their own pacing., (3) The contents of the contextualized activity sheets can be modified by other educators to suit the needs of the learners in the lower grade levels, and (4) the activity sheets can be made available in different platforms to make it more accessible to the teachers and the learners who are currently adapting to the changes brought about by the pandemic.

Teacher's Perception of Independent Learning Curriculum in Pancasila Education Learning in Grades I and IV Bandung City Public Elementary School

Faisal Alam, Universitas Pendidikan Indonesia, Indonesia
Sapriya, Universitas Pendidikan Indonesia, Indonesia
Agus Muharam, Universitas Pendidikan Indonesia, Indonesia

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This research aims to describe teachers' perceptions of the independent learning curriculum policy in grades I and IV at state elementary schools in Bandung. This research uses qualitative research, and this research uses a phenomenological research design. Phenomenological analysis examines elementary school teachers' opinions regarding the independent learning curriculum policy in Pancasila education learning. The respondents in this study were elementary school teachers. The reason for choosing classes I and 4 is because those classes were the first to implement the independent curriculum. In this research, the data collection used was interviews. All interview data is collected so that it can be studied descriptively to obtain reliable and trustworthy findings. The research results are as follows: (1) Teachers appreciate the independent learning curriculum policy implemented in elementary schools, (2) The importance of the teacher's role in implementing independent learning curriculum learning in Pancasila education learning, depends on each teacher. , (3) Teachers have the opportunity to develop and implement the curriculum and plan learning to improve the quality of the teaching and learning process, (4) there are many platforms that discuss independent learning curricula that enable independent learning teachers to develop their skills, (5) but not all teachers has implemented an independent learning curriculum in his class. (6) for older teachers who have limited information and technology capabilities, (7) the obstacles to implementing the independent learning curriculum, especially in learning Pancasila education, also depend on the stability of internet conditions, especially for those who teach in remote schools, this is the main obstacle.

Introduction

Education is an effort to develop human potential so that they are able to adapt to life that continues to develop, in line with the demands of changing times. Every individual needs to get an effective education because high quality education will have a real impact on demographic success, in accordance with Law number 20 of 2003. In Indonesia this often happens curriculum innovation that is adapted to the needs of society and the country. The curriculum in Indonesia starts from the 1947 Curriculum to the Merdeka Curriculum continue to innovate (Alam, Sapriya, et al. 2023).

Education aims to optimize the potential of students so that they become individuals who have strong faith and devotion to God Almighty, have superior skills, are creative, independent, have noble character, are healthy, knowledgeable, and act as members of a democratic and responsible society. . To achieve effective educational goals, it is important to have a curriculum that can support the achievement of these goals (Maulida 2022).

The legal basis for implementing the MBKM (Free Learning Campus) curriculum is contained in several regulations, namely Minister of Education and Culture Regulation Number 3 of 2020 which sets Higher Education standards; Minister of Education and Culture Regulation Number 4 of 2020 concerning the Transformation of State Universities into Legal Entity Universities; Minister of Education and Culture Regulation Number 5 of 2020 concerning Evaluation and Accreditation of Study Programs and Higher Education; Minister of Education and Culture Regulation Number 6 of 2020 concerning Procedures for Accepting New Students for Study Programs at State Universities; and Minister of Education and Culture Regulation Number 7 of 2020 which regulates the Establishment, Changes, and Dissolution of State Universities, as well as the Establishment, Changes, and Revocation of Private Higher Education Licenses (Sopiansyah et al. 2022).

Formally, the Pancasila Education subject will replace PPKn in June 2022, in line with the implementation of the new Merdeka Curriculum in the 2022/2023 academic year. There are no substantial differences in characteristics or content between Pancasila Education and PPKn. Both of them still focus on four main consensuses: Pancasila, the 1945 Constitution, Bhinneka Tunggal Ika, and the Republic of Indonesia. However, what differentiates the two.

Currently, the Merdeka Curriculum is being implemented at all levels of education to overcome challenges in the teaching and learning process which has been disrupted by the pandemic. The government has given three options to schools in implementing the Independent Curriculum: (1) Freedom to Learn, (2) Freedom to Change, and (3) Freedom to Share. The implementation of the Independent Curriculum resulted in significant changes felt by teachers and all components involved in education. Learning administration, teaching strategies, and evaluations carried out by teachers will experience a transformation as a result of implementing the Independent Curriculum (Rahimah 2022).

The aim of this research is to find out how teachers perceive the independent learning curriculum implemented in Indonesia, especially in learning Pancasila education.

This research applies qualitative methods, which is a research approach that produces descriptive data, such as verbal reports in the form of speech or writing, as well as behavior that can be observed directly from individuals who are research subjects.

Qualitative research methods developed because there was a paradigm shift in the way we understand reality, phenomena or certain symptoms. This paradigm interprets social reality as something holistic, complex, dynamic and full of meaning (Sugiyono 2021).

Qualitative research is carried out to explore phenomena experienced by research subjects, such as behavior, perceptions, motivations, actions and other aspects in depth and descriptively using language and narrative. This research was carried out in a specific natural context and adopted more organic or natural methods (Moelong 2006).

Qualitative methods used include observation, interviews, and document review. There are several reasons why qualitative techniques are chosen. First, qualitative techniques allow adaptation to actual situations. Second, this technique directly reveals the dynamics of the relationship between researchers and respondents.

Qualitative research emphasizes quality over quantity, gathering information not through questionnaires but by using interviews, direct observation, and relevant official documents. A qualitative approach also prioritizes process over results. This is because the relationships between the elements under investigation become more detailed when observed in the process.

Through this qualitative approach, researchers will conduct observations, interviews and document analysis to provide respondents with a direct picture of teacher perceptions in the context of Independent Curriculum learning in grades I and IV at SDN Bandung City.

Method

This study applies phenomenological research methods. Researchers used a phenomenological (Nuryana, Pawito, & Utari 2019) approach to explore understanding of elementary school teachers' perceptions regarding learning Pancasila Education in the context of the Independent Learning Curriculum.

Phenomenology focuses on subjective experiences in a study. This approach is related to a person's personal outlook and perspective on the world and their interpretation of the various events they experience. This approach aims to understand extraordinary events experienced by individuals without any previous assumptions (Nuryana, Pawito, & Utari 2019).

Phenomenology is the study of what appears (phenomena). Thus, the focus of phenomenology is studying what arises from a phenomenon, so that any research or work that discusses how something appears is included in the domain of phenomenology. In the context of qualitative research that uses a phenomenological approach, we can actually apply phenomenology in everyday life. We naturally observe phenomena, then analyze them so that we can understand how they arise within us. Then, the next stage is to understand the phenomenon itself from its perspective, including how it appears and affects us.

This phenomenological research has an exploratory aim, where the focus is to reveal and explore a phenomenon that has not been previously explored or to enrich information that has been found in previous exploration. Exploratory research using the phenomenological method aims to present detailed and in-depth data and descriptions. The focus of this research is to explore, explore, identify and evaluate elementary school teachers' conceptions of

listening learning, taking into account various different perspectives and experiences (Khan 2014).

The selection of research subjects used the purpose sampling method because the samples were selected based on specific considerations. This consideration is a key factor in determining the sample for research because it is in accordance with the aims and objectives of the research (Sugiyono 2021).

The main consideration is that the informants are class I and IV standard school teachers who have experience developing the independent learning curriculum. The second consideration is that there is no element of coercion on the subjects who become informants. so that the informants who will be interviewed are based primarily on their needs and have met the standards as capable informants in the area under study. The third consideration is that the topics chosen are those who have experience in the field of basic education, especially teachers who are experienced in developing Pancasila education lessons.

To support phenomenological research, research subjects who are also informants must have a deep level of experience in their field. This allows the information obtained to become a source of innovation that is relevant to the research objectives. The selection of informants must pay careful attention to individuals who have significant experience and knowledge regarding the reality to be investigated in depth.

This research will be carried out on class I and IV teachers in the city of Bandung (SDN 053 Cisitu, SDN 208 Luginasari, and SDN 139 Sukarasa Bandung City), which is located in Bandung City, West Java Province. This research was carried out in the even semester of the 2022-2023 academic year.

This research was carried out by me, Faisal Alam, who is a postgraduate student at the Universitas Pendidikan Indonesia and also my lecturers named Professor Sapriya, he is a lecturer at the Universitas Pendidikan Indonesia, and also Dr. Agus Muharam is also a lecturer at the Universitas Pendidikan Indonesia.

Conclusion

SD Negeri 053 Cisitu is located at Jalan Sangkuriang no. 87, Dago, Coblong sub-district, Bandung city, West Java province. This school was founded in 2017 with the establishment decree 420/Kep.674-DisDik/2017 by the Bandung city national education office in collaboration with the Bandung city government based on a proposal from the local community on a land area of 2,916,749 M². According to the principal, the vision for establishing the school is to create students who are devout, accomplished, independent and have an environmental culture.

SD Negeri 208 Luginasari is located at Jalan Sukagalih No.11, Cipedes, Kec. Sukajadi, Bandung City, West Java Province. This school was founded in 1978 with the Decree on the Establishment of Presidential Instruction No. 6 of 1978 by the Bandung City National Education Service in collaboration with the Bandung City Government at the suggestion of the local community. The vision for establishing the school according to the head is to create students who have noble character, are intelligent, skilled, care about the environment and love national culture.

SD Negeri 139 Sukarasa Bandung City is located at Jl. Gegerkalong Hilir No. 82, Gegerkalong, Kec. Sukasari, Bandung City, West Java Province 40153. This school was founded in 1937 with establishment decree 420/Kep.674-Disdik/2017 by the Bandung City National Education Service in collaboration with the Bandung City Government at the suggestion of the local community. According to the head, the vision for establishing the school was "To create students who excel in science and technology and mathematics, think critically and creatively and are polite and cultured".

From the research results, several main findings can be presented as follows:

1. Appreciation of the Independent Learning Curriculum Policy: Teachers appreciate the independent learning curriculum policy implemented in elementary schools.
2. The Central Role of Teachers in Implementing the Learning Independence Curriculum: The importance of the teacher's role in carrying out learning based on the criteria of learning independence, especially in the context of Pancasila education learning, really depends on the individual role of each teacher.
3. Opportunities for Curriculum Development and Learning Planning: Teachers have the opportunity to develop, implement and plan learning to improve the quality of the teaching and learning process.
4. Availability of Platforms for Self-Study: There are many platforms that cover self-study curricula, providing opportunities for teachers to enhance their skills. However, not all teachers implement this curriculum in their classes.
5. Challenges for Teachers with Technological Limitations: Teachers who are older and have limited technological abilities face challenges in implementing a self-paced learning curriculum.
6. Main Obstacle: Internet Conditions in Remote Schools: The main challenge in implementing the independent learning curriculum, especially in Pancasila education learning, is dependence on internet stability, especially for teachers who teach in remote areas.

These findings provide a fairly comprehensive picture of how the Merdeka Belajar curriculum is perceived and implemented in the elementary school environment. The existence of challenges related to the role of teachers, availability of platforms, as well as technological barriers and internet access provide a basis for improving policies to better deal with these obstacles.

The Influence of Self-Concept on Interest in Becoming a Teacher in Indonesian Students of Mathematics Education

Tanti Listiani, Universitas Pelita Harapan, Indonesia
Melda Jaya Saragih, Universitas Pelita Harapan, Indonesia

Abstract

This study aims to determine the influence of self-concept on interest in becoming a student teacher in the Mathematics Education study program at a private university in Indonesia. The method used in this study is a survey method with a descriptive-quantitative approach. The sample used in this study was made up of students of the Mathematics Education study program Class of 2021, with 16 students. Data collection techniques using questionnaires. The total number of respondents used was 16 students. The prerequisite test of analysis consists of a normality test. Test the hypothesis of this study using simple linear regression. The results showed that self-concept had a moderate influence on interest in becoming a teacher with results of 48.1% and 51.9% influenced by other factors, consisting of internal factors such as individual personality factors and external factors such as parental factors, peer factors, gender factors, cost factors, and employment factors. Student self-concept affects students' interest in becoming teachers, for that students need to be given direction and understanding of the importance of good self-concept, especially as holistic educators.

Introduction

Education become an important role in human life (Aspi & Syahrani, 2022; Illu & Gea, 2021; Subakti & Prasetya, 2022). Indonesian Law Number 20 of 2003 says that education is a conscious effort and is designed to create an atmosphere of learning and learning together (Aspi & Syahrani, 2022; Kurniawati, 2022; Mawati et al., 2023). Students can experience changes in understanding, behavior, and reason to survive and relate to others. Teachers have an important task in the world of education. Because the teacher has the main authority in the classroom to guide students through the learning process. Teachers need to have skills to support their work, including producing quality graduates. The quality of existing education will affect human resources and progress for the Nation. To obtain a quality education, it takes good ability from teachers. Teachers are required to have 4 main competencies in educating and guiding their students (Kirana, 2011). To achieve these 4 potentials, of course, prospective teachers need to be well prepared.

UPH Faculty of Education is a faculty that provides teacher graduates with the study program taken. FIP UPH has a mandatory program that must be taken by students. The program is a Field Experience Program (PPL) taken 2 times in 4 years of study. PPL 1 is given so that students can learn and observe teachers at school. Here students can learn directly at school and observe the learning process carried out by the teacher. Next is PPL 2 which is taken before students compile the Final Project. In PPL 2 students will teach directly at school. Students will practice the knowledge learned during lectures and are invited to learn with students in schools according to their fields. There are many things that students can certainly learn while taking this practical program.

Based on interviews with students, students admitted that the job of being a teacher is not easy. Teachers not only teach in class, but teachers have the responsibility to guide students, show examples for students, and guide students' character to be good. In addition, teachers also need to complete quite a lot of school administration, starting from preparing the RPP / Unit Plan, making teaching materials, making power points, and being active in activities at school outside of class hours. This quite heavy task makes some students begin to think about whether the job of being a teacher is a suitable job for them.

Students of the Mathematics Education Study Program experienced this struggle. When he made observations, he saw that the mathematics teacher he observed made more effort to try to make his students understand the material taught. As it is known that mathematics is a subject that students fear and even avoid (Hidayah & Maemonah, 2022). Students experience anxiety when learning mathematics. This fear makes students reluctant to pay attention to mathematics and results in less-than-optimal grades obtained by students. Mathematics teachers have a tough task because they must give confidence to students and introduce mathematics into a fun lesson. Mathematics teachers need to be creative in providing teaching so that students can easily understand the material taught. Mathematics teachers also need to study the content of mathematics content well to avoid misconceptions of the material. In addition, mathematics teachers must also upgrade their abilities, attend training, and update technological developments.

The challenges of mathematics teachers in conducting mathematics learning have made some UPH FIP students worry about their ability to practice teaching. This can have an impact on their interest in becoming teachers. Interest makes a person have encouragement and pleasure

for the job he wants (Yulianto & Khafid, 2016). Internship is the estuary of all educational programs that are lived throughout their learning years (Wicaksono & Darmawan, 2015).

All activities, both held in the form of lectures, practices, and independent activities, are directed to the formation of teaching skills, which are scheduled, and systematically fostered in this PPL. Then in the implementation of teaching practices in PPL activities, students are expected to gain sufficient teaching experience to support students' readiness to become educators. According to Mardiyono in (Yulianto & Khafid, 2016) For every teacher candidate education, it is necessary to hold teacher practices packaged in Field Experience Practice (PPL)". An internship is expected to prepare prospective teachers to be successful in teacher competency tests. Field Experience Practice is a series of activities programmed for prospective teacher students which include teaching exercises and non-teaching exercises as a place to form and foster professional competencies required by teacher work or other education (Hapsari & Widhianningrum, 2016).

Seeing that PPL is an activity that provides many benefits, PPL is a mandatory program given to students of the UPH FIP Mathematics Education study program. The experience gained by students can provide insight and encouragement for students, especially in students' interest in becoming teachers. Interest is a sense of preference and a sense of interest in something or activity without anyone telling you to (Djaali, 2013). With interest, students will be serious in learning teacher theory and in the end, will be ready to carry out their duties as teachers. Students who have more interest in becoming teachers will be better prepared to become teachers compared to other students whose interest is low or even have no interest in becoming teachers (Kholifah & Hadi, 2017; Ulin & Oktarina, 2014). The results showed that the practice of field experience, interest in becoming a teacher, and learning achievement had an effect both partially and simultaneously on readiness to become a professional teacher (Yulianto & Khafid, 2016). The results of other studies also showed that PPL influenced the interest in becoming a teacher at a university in Tanjungpura Pontianak (Simamora et al., 2018).

With a different learning context, the purpose of this study is to see the influence of PPL on students' interest in becoming teachers for UPH FIP Mathematics Education students. Whether the PPL that has been done by students shows good interest or even vice versa. FIP UPH students are students who received scholarships from the foundation during their studies. In addition, students who graduate will receive official ties by working in foundation schools or even outside foundations that collaborate with Faculties/Foundations. Thus, the results of this research can be useful as a reference for Study Programs to obtain their work placement locations after studying. So that the benefits for the study program and students can be felt. Faculty can also provide briefing with various seminars to further strengthen students' vocation or interest in becoming teachers.

Research Methodology

This type of research is quantitative research while data analysis uses statistical procedures with the help of SPSS. The population in this study is students of the Mathematics Education study program class of 2021 who have gained PPL experience at the Faculty of Education, Universitas Pelita Harapan with a total of 16 students. While the sampling technique used in this study is *purposive* sampling (Lenaini, 2021) where students of the Mathematics Education Study Program class of 2021 were used in this study. This is intended because it is specifically for students of the UPH FIP Mathematics Education study program. Data

collection method using questionnaires. Questionnaires are used to measure variables of self-concept and interest in becoming a teacher. The data analysis method uses validity tests, reliability tests, normality tests, descriptive statistical analysis, linear regression analysis, and determining the coefficient of determination.

The following is Table 1 about questionnaire grids to measure students' self-concept. The questionnaire used was adopted from a study conducted by (Nurlatifah, 2014).

Table 1. *Student Self-Concept Questionnaire Grid*

Variable	Indicator	Sub Indicator	Question Item Number	Total
Self-concept	Identity self	- Understanding yourself - Understand your abilities and talents	1,2,3,4,5	5
	Behavioral self	- Designing self-schematics - Decision	6,7,8,9	4
	Judging self	- Conduct a self-evaluation. - Make a change	10,11,12,13	4
	Physical self	- Understand his physical state	14,15	2
	Moral-Ethical self	- Have good ethics and morals	16,17	2
	Personal self	- Understand yourself physically or in a personal attitude. - Have confidence	18,19,20	3
	Family self	- Always have parental support and encouragement	21,22,23	3
	Social self	- Able to interact and adapt. - Favorable environmental conditions	24,25,26,27	4
Total				27

Meanwhile, the following is Table 2, which contains a grid of student questionnaires regarding interest in becoming a teacher. The questionnaire used is a modification of the results of the research conducted by (Nurlatifah, 2014).

Table 2. *Student Learning Interest Grid*

Indicator	Sub Indicator	Question Item Number	Number of Questions
Feeling Happy	- Feeling good when teaching - Enthusiasm for obtaining educational knowledge	9,12 10,13,15,16,17	7
Attention	- Information about education - Views on teachers	1, 2 7,8	4
Interest	- Interest in becoming a teacher	3,4,5,6,11	5
Motivation	- Reasons to want to be a teacher	14,18,19,20	4

The following are the categories used to see the level of self-concept and interest in becoming a teacher based on the scores obtained after filling out the questionnaire (Simamora et al., 2018).

Table 3. *Categories Self-Concept and Interest in becoming a teacher*

Category	Criteria	Score Interval	Self-concept		Interest in becoming a teacher	
			Freq	%	Frequency	%
High	$X \geq (M + SD)$	$X \geq 94,04$	3	18,75		
Middle	$(M - SD) \leq X < (M + SD)$	$75,34 \leq X < 94,04$	11	68,75	7	44
Low	$X < (M - SD)$	$X < 75,34$	2	12.5	11	56
Total			16	100		100

Results and Discussion

Results

The research was conducted in the Mathematics Education Study Program at a private university in Tangerang, Indonesia. One of the courses that must be studied by students is an internship program where students make observations at school by looking at teachers while teaching. This can provide an overview for students of how conditions are in the classroom, the procedures given even in arranging administration at school. The variable studied here is the self-concept of students with student interest in becoming teachers. Because students of the Mathematics Education study program are expected to produce graduates who become teachers. The subjects of the research conducted were 16 students where the internship places were spread across several different schools with different characteristics.

The following table shows the value of descriptive statistics of students regarding variables of self-concept and student interest in becoming teachers.

Table 4. *Descriptive Statistics*

	N	Minimum	Maximum	Sum	Mean	Std. Deviation	Variance
Self-concept	16	66	100	1355	84.69	9.350	87.429
Interest become a teacher	16	60.00	93.75	1188.75	74.2969	8.58740	73.743
Valid N (listwise)	16						

The average self-concept of students is 84.69 which means that the student's self-concept is included in the medium category. While the interest in becoming a teacher shows the average generated is 74.3 which means that the interest in becoming a teacher is included in the low category. The resulting standard deviation on students' self-concept is 9.35 while the standard deviation on interest in becoming a teacher is 8.59 which means the data is quite varied.

Self-Concept and Interest in Being a Teacher

Self-concept data is obtained from the scores of questionnaire data processing that have been filled in by students. The following is the total score obtained by each student and their categories.

Table 5. *Student Self-Concept*

Student	Student Self-Concept		Interest in becoming a teacher	
	Score	Category	Score	Category
1	82	Middle	71.25	Low
2	89	Middle	72.5	Low
3	72	Low	60	Low
4	98	High	86.25	Middle
5	85	Middle	77.5	Middle
6	94	Middle	77.5	Middle
7	83	Middle	68.75	Low
8	83	Middle	70	Low
9	100	High	93.75	Middle
10	88	Middle	66.25	Low
11	87	Middle	78.75	Middle
12	66	Low	77.5	Middle
13	95	High	83.75	Middle
14	78	Middle	70	Low
15	78	Middle	68.75	Low
16	77	Middle	66.25	Low

Figure 1. *Percentage of Self Concept and Interest become Teachers*
In Figure 1. There are 69% of students or 11 students have a medium self-concept, 19% of students or 3 students have a high self-concept and 12% of students or 2 students have a low self-concept.

Data on interest in becoming a teacher were also obtained using questionnaires. From the diagram, the circle shows that 56% of students or 11 students have low interest while 44% or 7 students have moderate interest. At least in this class, none of them have high interest.

Table 6. *Percentage of Self-Concept and Interest in Becoming a Teacher Based on Each Indicator*

Variable	Indicator	Average Per Indicator
Self-concept	Identity self	73,63
	Behavioral self	67,97
	Judging self	80,86
	Physical self	75,56
	Moral-Ethical self	81,67
	Personal self	83,33
	Family self	85
	Social self	80,86
Interest in becoming a teacher	Feeling happy	73,66
	Attention	85,55
	Interest	75,63
	Motivation and drive	62,5

The results of the self-concept questionnaire show that the highest indicator here is personal self while the lowest is the behavioral self-indicator. While in the variable of interest in becoming a teacher, the highest indicator is attention and the lowest is motivation and drive.

Normality Test

This test is conducted to determine whether self-concept variables affect students' interest in becoming normally distributed teachers or not. Normality test using Kolmogorov-Smirnov with the help of SPSS (Pratama &; Permatasari, 2021). The stipulation in the calculation is that if the significance level is more than 0.05 then the data is normal (Mariana & Zubaidah, 2015). The following are the results.

Table 7. *Tests of Normality*

	Kolmogorov-Smirnov[a]			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	df	Sig.
Self-concept	.090	16	.200[*]	.980	16	.967
Interest become Teacher	.145	16	.200[*]	.954	16	.555

[*]. This is a lower bound of the true significance.
a. Lilliefors Significance Correction

Figure 2. *Boxplot of Self Concept and Interest Become Teachers*
Table 7 and Figure 2 show that the data on students' self-concept and interest in becoming a teacher show normal data. This is indicated in the significance that the value is more than 0.05. In the boxplot, the data also tends to be normal, although there are outliers in the variable of interest in becoming a teacher, but it can still be said to be normal.

Linearity Test

The linearity test was conducted in this study to determine whether the two variables, namely the field experience practice variable (variable x) and the variable of interest in becoming a teacher (variable y) have a linear relationship or not by looking at the significance value if it is more than 0.05 then the two data are linearly bound and vice versa (Simamora et al., 2018). With SPSS the linearity test uses the Test for Linearity at a significance level of 0.05.

Table 8. *ANOVA*[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	531.948	1	531.948	12.970	.003[b]
	Residual	574.204	14	41.015		
	Total	1106.152	15			

a. Dependent Variable: Interest in becoming a teacher
b. Predictors: (Constant), Self-concept

In Table 8. F count obtained is 12.970 and significance obtained is 0.003 so it can be said that there is an influence between self-concept and interest in becoming a teacher.

Simple Linear Regression Test

A simple linear regression test is performed to determine the extent of the causal relationship between the dependent and independent variables. Based on the results obtained, it is known that the value of coefficients obtained is 20.361, this means that it can be interpreted that if self-concept is zero, then interest in becoming a teacher is positive 20.361. While the positive regression value of 0.637 can be interpreted as every increase of 1% in self-concept variables, it will be followed by an increase in the average variable of interest in becoming a teacher of 0.637. So, the regression equation is Y = 20.361 + 0.637X.

Table 9. *Simple Linear Regression Calculation Results*

Coefficients[a]

Model		Unstandardized Coefficients B	Std. Error	Standardized Coefficients Beta	t	Sig.
1	(Constant)	20.361	15.062		1.352	.198
	Self-Concept	.637	.177	.693	3.601	.003

a. Dependent Variable: Interest Become Teachers

To calculate how much the correlation value or relationship between the practice of field experience and interest in becoming a teacher can be seen in Table 10. The magnitude of the correlation value or relationship (R) is 0.693. Based on the stipulated conditions, this figure lies between 0.60 – 0.799 which is included in the strong category.

Table 10. *Model Summary*[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.693[a]	.481	.444	6.40426

a. Predictors: (Constant), Self-concept
b. Dependent Variable: Interest become Teacher

The R value obtained is 0.693 which means there is a correlation or relationship (R) of 0.693. In addition, the R square obtained a value of 0.481 which means 48.1% or there is an influence between self-concept variables and interest in becoming a teacher.

Figure 3 shows the influence between self-concept and interest in becoming a teacher. The curve formed shows a positive influence.

Figure 3. *Histogram and Normal Q-Q Plot of Regression Standardized Residual
(Dependent Variable of Interest become Teachers)*
Hypothesis Test

The basis for decision making in this hypothesis test is that if the significance of $t_{counts} \leq t_{table}$ then H1 is rejected, and Ho is accepted and if the significance $t_{counts} \geq t_{table}$ then Ho is rejected and H1 is accepted. The t table value for significance 0.05/2 with degrees of freedom df = n − k or 16-2 = 14 is 2.145. While the calculated t value that can be seen in Table 9 obtained a value of 3.601. Based on existing hypothesis decision making, H1 is accepted, and Ho is rejected because $t_{counts} > t_{table}$ (3.601 > 2.145), so it can be concluded that there is a significant positive influence between self-concept on interest in becoming a teacher in mathematics education students in Indonesia.

Next to find out how much influence between the independent variable and the dependent. See Table 10. The number of R square will be converted into percent which means to find out how much the percentage of influence of the independent variable on the dependent variable. The R square value is 0.481. The magnitude of the influence of self-concept on interest in becoming a teacher in students is 0.481, meaning that the percentage of student self-concept affects interest in becoming a teacher by 48.1%, while the remaining 51.9% is influenced by other factors that were not studied in this study.

Discussion

Self-Concept

Self-concept has a significant role in determining individual behavior in viewing themselves. The benefit of knowing self-concept is that individuals are optimistic, confident, always think and behave and behave positively. The results showed that the average self-concept of students was 84.69, which means that the students' self-concept is included in the medium category. The resulting standard deviation in students' self-concept is 9.35 which means the data is quite varied. In addition, 69% of students or 11 students have a medium self-concept, 19% of students or 3 students have a high self-concept and 12% of students or 2 students have a low self-concept. The results of the self-concept questionnaire show that the highest indicator is personal self, while the lowest is the behavioral self-indicator.

Self-concept is the overall view of oneself, that is, how one sees, assesses, and responds to oneself. When someone has a wrong self-concept, the person will find it difficult to conduct the life process to achieve success. This is because the problems that arise often come from

us, the longer the problems that come from within us are not realized then it will create a series of problems that may have a fatal impact on ourselves.

Self-concept in a person is the result of the learning process that occurs from childhood to adulthood, things that affect self-concept can come from environmental factors, parenting or experiences during the life process. These factors impact the formation of a person's self-concept. The attitude of parents and the environment will be a source of information for them to know who "themselves" are. Self-concept is the basis of a person interacting or behaving with his environment (Melguizo-Ibáñez et al., 2022; Piccirllo et al., 2021; Rohmalimna et al., 2022).

In general, self-concept has two forms, namely positive self-concept and negative self-concept, here is the explanation (Widiarti, 2017):
  a. Positive self-concept
  Individuals who have a positive self-concept will tend to be more optimistic, show confidence, and always be positive about everything, even the failures experienced during the process of life. Individuals who have a positive self-concept will always respect themselves and see everything from the positive side to achieve success in every process of life. Positive self-concept is the key to success in life.
  b. Negative self-concept
  Individuals who have a negative self-concept will always look at and believe that they are weak, helpless, unable to do anything, incompetent, failed, unattractive, disliked, and other negative thoughts in looking at themselves. This individual will tend to be pessimistic or easily discouraged about life and the opportunities he faces, seeing challenges as obstacles or obstacles not as opportunities that must be faced and conquered.

Individuals who have a negative self-concept will easily give up and despair when they find a little obstacle in each process, will always be overshadowed by the fear of failure, and usually, if they experience failure will blame themselves excessively on others.

In forming a self-concept, several components must be owned to form a complete self-concept, these 3 components (Basiroh & Suyato, 2020) It consist of self-ideal, self-image, and self-esteem. 1. Ideal Self: the figure of a person who is judged perfectly and admired and coveted and who wants to be imitated to become an ideal self-model for the individual. 2. Self-image: Self-image is a way of seeing ourselves and judging ourselves in that moment. Always think positively then we will always be positive in every aspect of life.3. Self-esteem: The higher one's self-esteem, self-acceptance, and respect for oneself as someone valuable and meaningful, the higher one's self-esteem.

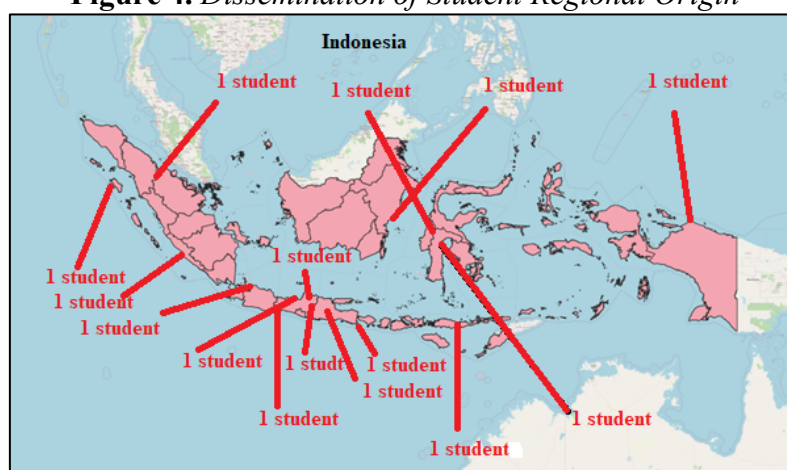
As for the factors that can affect a person's self-concept (Asri & Sunarto, 2020), These include parenting, failure, depression, and internal criticism.

Here are steps that need to be taken to have a positive self-concept: 1) Be objective in recognizing yourself, 2) Respect yourself, 3) Do not be hostile to yourself, 4) Think positive and rational. So, how important is self-concept in increasing learning motivation? The answer must be particularly important, talking about self-concept is never separated from a confident and optimistic attitude.

Interest in Becoming a Teacher

The results of research on the variable of interest in becoming a teacher were conducted in the medium and low categories with the average produced being 74.3 which means that interest in becoming a teacher is included in the low category. The resulting standard deviation of interest in becoming a teacher is 8.59 which means the data is quite varied. Data on interest in becoming a teacher were also obtained using questionnaires. From the pie chart, it shows that 56% of students or 11 students have low interest while 44% or 7 students have moderate interest. While in class no one has a high interest. The variable of interest in becoming a teacher indicator is highest is attention and the lowest is motivation and drive. This means that students are less interested in becoming teachers because of lack of motivation and encouragement in themselves. It can be said that after students make observations in class, it turns out that students are less interested in becoming teachers.

The students studied have diverse backgrounds spread from various regions in Indonesia.

Figure 4. *Dissemination of Student Regional Origin*


Students who study have different ethnicities and divergent backgrounds. Some backgrounds because parents become teachers so that they recommend and provide full support for their children to become teachers. In addition, there are also those who have a background of pastor children, farmer children and various kinds of jobs. So, this can also be a factor that influences students' interest in becoming teachers. In addition, students have also seen for themselves how difficult it is to be a teacher. The task of the teacher is not only to teach but also to complete administration and educate students to have good character. This resulted in the influence of self-concept by 48.1%, the rest was from other factors.

Conclusion

Based on the results of the research that has been done, it can be concluded as follows: Student self-concept is categorized as medium, with a percentage of 84.69%. This figure is in the medium category (80.1%-100%). The interest in becoming a teacher in mathematics education students in this study can be categorized as low, with a percentage of 74.29%. This can be seen from the results of the questionnaire consisting of 4 indicators, namely feelings of pleasure, interest, attention, and motivation. Students are less interested in becoming teachers because of the moderate self-concept factor of 48.1% and 51.9% due to other factors.

Based on the results of the research and conclusions, the researcher provides several suggestions, namely: (1) For mathematics education study programs, should be able to improve students' self-concept by providing support and enthusiasm to fulfill their vocation as prospective teachers. So that the self-concept of moderate students can be high. (2) Students should be serious and maximal in implementing PPL so that useful experience is obtained for students. For students who want to enter the Faculty of Education, Mathematics Education needs to have an interest as a teacher because graduates are expected to become teachers. (3) Further researchers should examine other variables that can influence such as environmental factors, parents, information about the world of work and oneself (willpower).

Perspectives and Practices of Middle Managers of Their Competencies:
Basis for a Sustainable Competency Building Program

Joseph T. Moraca, Eulogio "Amang" Rodriguez Institute of Science and Technology,
Philippines

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
The recurring theme of higher educational institutions in the Philippines is to compete in a competitive global and international market of higher education. To accord with the challenges and demands in higher educational institutions, the role of middle managers is deemed important. This study aimed to determine the relationship between the perspectives and practices of middle managers' competencies. The total population sampling and stratified sampling methods were employed in the selection of middle managers and subordinates as respondents and participants in this study. In this study integration of Quan-Qual results was made through the use of the joint display method, a researcher made questionnaire was developed and a Convergent Parallel model was utilized. The results provided insights to develop a sustainable competency-building program for middle managers in higher educational institutions.

Keywords: Middle Managers, Perspectives, Practices, Competencies, Higher Education

www.iafor.org

1. Introduction

Management is about ideas, people and resources. It is about making the best of the resources one has and maximizing staff potential, equipment, time, money and space. The organization in the academe consists of three levels of managers; these are top managers, middle managers, and first line managers and non-management who work together aimed towards the achievement of a goal.

Middle management is a vital position with a distinctive role. They are entrusted with important work that no one else can do. They think about the bigger picture and work in accordance to achieve optimal productivity. However, not all middle managers possess all the aforementioned capabilities, perspectives and practices to effectively carry out their responsibilities in the organizations they belong to because of lack of experience in decision-making as well as in planning and organization. In view of the aforementioned, many of the said ideas about the problems of academic middle managers' that is highly emphasized on the significance of middle managers' managerial competencies, abilities, leadership, management role and responsibilities and leadership training programs which are meant to help middle managers' address their professional shortcomings and concerns.

This study is premised on Management Competency Theory of Silva (2016) about competencies in management. According to Silva (2016) one must look ahead on the impact it may take on the organization while various aspects of management and leadership behaviour termed competencies in organization are contemporarily needed to bring optimum work performance. Guided by the theory, the researcher sensed the necessity to look into the competencies and relation practices of the middle managers in the academe. It explains that to make a standard work, it is important to possess the right skills and performance of middle managers that align with the organization's strategic direction, provide an impact and affect everyone in the organization. It helps the organization achieve good results and maintain its desired culture. The executive or top managers must understand how they will contribute to the organization's strategic positions and goals of what is expected from the middle managers, and how they are doing as it focuses on the growth and development of both organization and their subordinate.

The Independent Variable-Dependent Variable model was used as the conceptual framework of this study. The IV-DV model was deemed suitable for the purpose of the study since it aims to determine the relationship between the perspectives and practices of middle managers' competencies. The study considered also the Intervening Variables which consists the demographic criteria of the respondents such as age, sex, academic rank, designation/appointed position, number of years of teaching experience and highest educational attainment. The results would be the basis to undertake a development process which requires an analysis of the organization's needs as well as the design and development of a sustainable competency-building program to address the identified needs.

Independent Variable   **Dependent Variable**

Perspectives of Middle Managers' Competencies
• Advocacy • Communication skills • Financial skills • Self-leadership • Problem management and resolution

Practices of Middle Managers' Competencies Communication
• Communication • Decision making • Negotiations • Task management

Intervening Variable

Profile of Respondents
• Age • Sex • Academic rank • Designation/Appointed position • Number of years of teaching experience • Highest educational attainment

Figure 1: The Conceptual Model of the Study

The main concern of the study was to determine the relationship between the perspectives and practices of middle manager's competencies. In particular, the first statement of the problem is (1) What is the profile of the middle managers' based on the following criteria: Age; Sex; Academic Rank; Designated position; Number of years of teaching experience; and Educational qualification? (2) How may the perspectives of middle managers' and their subordinate on their competencies be determined in terms of the following domains such as: 1) advocacy; 2) communication skills; 3) financial skills; 4) self-leadership; and 5) problem management and resolution? (3) What are the practices of the middle managers' competencies in terms of the following indicators: 1) communication; 2) decision making; 3) negotiations; 4) task management; and 5) empowerment? (4) Is there a significant difference between the perspectives and practices of the middle managers' competencies? and (5) What are the perspectives of the middle managers' and subordinates on their competencies as extracted from focus group discussions in terms of the following domain: 1) advocacy; 2) communication skills; 3) financial skills; 4) self-leadership; and 5) problem management and resolution?

2. Method

The Convergent Parallel model, a mixed method in triangulation design was utilized for this study. A convergent parallel design entails that the researcher concurrently conducts the quantitative and qualitative in the same phase of the research process. This design includes quantitative and qualitative research design in order to expand and strengthen the findings and conclusion of the researcher about middle manager's perspective and practices of their competencies. Furthermore, this convergence mixed method research involves collecting and

analyzing quantitative and qualitative data separately on the same phenomenon and then the different results are converged by means of comparing and contrasting during the interpretation. The researcher of this study want to validate and confirm quantitative results with qualitative findings on perspectives and practices of middle managers' of their managerial competencies of state universities and colleges because the researcher will rely on the quality of data gathered in preparing a sustainable competency-building program for middle managers' that will be used by the different HEIs to mentor and guide middle managers in preparation to become leader in the academe or be part of the executive officials of their respective institution.

Because of the nature of the study involved, total population sampling and stratified sampling methods were employed in the selection of middle managers and subordinates as respondents and participants in this study. Respondents will be identified during the pre-survey conducted by the researcher. Pre-survey was conducted in order to determine the number of middle managers' and subordinates as target participants/respondents of this study. The basis of selection criteria for respondents and participants has been identified by the researcher through the survey of the different CHED Memorandum Order for Policies, Standards and Guidelines of the program/ unit.

Table 1: Respondents of the Study

State Universities and Colleges	Middle Managers'		Subordinate	
	Total Population	Sample	Total Population	Sample
SUCs A.	42	42	210	81
SUCs B.	10	9	51	10
SUCs C.	10	10	49	10
SUCs D.	33	31	165	66
Total	**95**	**92**	**475**	**167**

The data-gathering procedure of this study will be conducted with utmost consideration to the privacy of the respondents. Permission to conduct the study in the SUCs will be sought through written correspondence with the university administrators. As for the respondents/participants, their participation will be oriented about the study and their consent sought before they take part in it. They will be asked to sign a written consent before they participate in the survey, interview and focus group discussion. In order to ensure the confidentiality and liabilities of the participants and respondents to this study, the following steps will be observed: (1) any information collected from you during your participation in this survey will be anonymous. You will not be identified as no name/s are required for participation in this study, and all identifying information will be de-identified in the recording and interpretation process. The data and information collected will only be accessed by the researcher. (2) Participation in this study is on a voluntary basis, even if you decided to participate in the survey, you may withdraw anytime. No adverse action will be taken against you for withdrawing your participation as respondents. Any information that you may not wish to reveal will be highly observed by the researcher. If you wish to terminate your participation in this study, please inform the researcher immediately, so that your responses can be separated and destroyed right at that point. During the data gathering, the respondents/participants are given the prerogative to refrain from answering questions

and their request for this will be granted and respected. All the data that will be gathered from the informants will be treated with the utmost confidentiality. Furthermore, the researcher will ensure the protection of the participants' identities and rights in accordance with the Data Privacy Act of 2012.

3. Results and Discussion

3.1. Statement of the Problem 1

More than half of the respondents were 40 – 49 years old; almost two-thirds are male respondents. And the academics ranks of the respondents were almost equally distributed from instructors, assistant professor to Associate Professor. Almost all of the respondents handling the position of department/program chair. Furthermore, more than half of the respondents have been teaching for more than ten (10) years.

3.2. Statement of the Problem 2

On the perspectives of the middle managers and their subordinates on the competencies of the former have the highest level of agreement in each of the domains:

- In terms of ADVOCACY – The middle managers advocate on behalf of individuals and support networks to address their needs, expectations and priorities.
- In terms of COMMUNICATION SKILLS – In giving feedback, the middle managers foster self-improvement and constructive criticism rather than defensiveness or anger.
- In terms of FINANCIAL SKILLS – The middle managers listen openly and attentively to others when they share ideas about financial parameters.
- In terms of SELF-LEADERSHIP – The middle manager fulfills his/her responsibilities and commitments and demonstrates professionalism and responsibility, and
- In terms of PROBLEM MANAGEMENT AND RESOLUTION – The middle manager practices proactiveness in both opportunities and problems.

3.3. Statement of the Problem 3

The following competencies of the middle managers have the highest level of practice in the following indicators:

- In terms of COMMUNICATION – the middle managers communicate effectively at all levels of university/college management.
- In terms of DECISION MAKING, the middle managers exercise flexibility.
- In terms of NEGOTIATIONS, the middle managers design programs with stakeholders to address the need of the institution.
- In terms of TASK MANAGEMENT, the middle managers have values and respect the contribution of all members to meeting the needs of the individual in the department/unit.
- In terms of EMPOWERMENT, the middle managers disseminate regular updates on different in-service training programs available for members of the academic community.

3.4. Statement of the Problem 4

The post analyses on the test of the relationship between the middle managers' perspectives and practices, the study found out that there is a significant relationship between advocacy and the communication practices of middle managers. Also between communication skills and each of the managerial practices such as communication, decision making, negotiations,

task management, and empowerment. Also between financial skills and communication practices.

On the other hand, there is no significant relationship between self-leadership and each of the managerial practices such as communication, decision making, negotiations, task management, and empowerment among the middle managers.

3.5. Statement of the Problem 5

During the focus group discussions, the following were observed: From the responses of the participants of focus group discussion, quality accomplishment and activities of empowerment was the theme developed for advocacy. For communication skills openness and fairness and activities of giving periodic feedback as theme developed from the responses of the participants. It can be also deduced from the data that only the middle manager has a direct involvement on financial skills domain and the subordinates have no participation. Likewise, the data construe that middle manager prepares the annual budget plan to meet the department/unit objectives and targets. Also, professionalism and authority with respect are the theme developed from the responses of participants. The middle manager demonstrates good leadership to his/her subordinates. Additionally, the middle manager addresses complaints especially on faculty loading as commonly faced by his/her unit.

4. Conclusion

Based on the significant findings of the study, the following were concluded:
1. Majority or most of the middle manager respondents were 40 – 49 years old, male, with the academic rank of Instructor handling the position of Department/Program Chair, and have been teaching for more than ten years.
2. The respondents agree on the middle managers' competencies in terms of communication skills and self-leadership, but they slightly agree in terms of advocacy, financial skills, and problem management and resolution competencies.
3. The middle managers assessed themselves that they moderately practiced the following competencies such as communication, decision-making, negotiation, task management, and empowerment.
4. It was found that the middle managers had the same views and assessments on their perspectives and practices when grouped according to the number of years in teaching experience, while the rest of the profile had shown significantly different.
5. It was found that the advocacy, communications skills, and financial skills of the middle managers were related with their managerial practices.
6. From the focus group discussion of middle managers and subordinates, the participants developed themes about on the perspectives of middle managers of their competencies. Middle managers produce quality accomplishment and exhibit good leadership through openness and fairness. It also enumerates the activities of middle managers in terms of empowerment and giving feedback of their performance. Furthermore, the focus group discussion also mentioned the common problems in the department are frequent complaint against the subordinates and uneven distribution of faculty loading.
7. The developed sustainable competency-building program for middle managers serve as a guide and template to conduct seminar and training for the middle managers and faculty to enhance their competencies on school governance and management.
8. This study is anchored on Management Competency Theory of Silva (2014) about competencies in management. The Management Competency Theory of Silva (2014)

states that in order "to provide standard work, it is necessary to possess the right skills and knowledge of the ground rules of the task at hand. Likewise, integrity and commitment and a sense of responsibility are essential for managers that this might help improve employee's performance in attaining all the outstanding goals" Based from the findings of the study middle managers' perspectives of their competencies agree in terms of communication skills and self-leadership, but they slightly agree in terms of advocacy, financial skills, and problem management and resolution competencies. Furthermore, the middle managers assessed themselves that they moderately practiced the following competencies such as communication, decision-making, negotiation, task management, and empowerment, these assessment is further supported by the findings of the focus group discussion. The theory of Management Competency Theory of Silva (2014) is proven by this present study that the communication skills, self-leadership, advocacy, financial skills, problem management and resolution, communication, decision-making, negotiation, task management, and empowerment are the right skills of the middle managers to attain the target goals of the institution.

The Impact of Student-Versus Teacher Led Error Correction in the EFL Classroom: Validity and Reliability Considerations

Aric Denfield, Nihon University Sakuragaoka High School, Japan

Abstract

Corrective Feedback (CF), defined by Lightbown and Spada (1999) as, 'Any indication to the learners that their use of the target language was incorrect', can be classified as being either teacher- or student-led. Empirical evidence suggests that student-led correction is more effective (Lyster and Ranta, 1997); however, it has been found that teacher-led correction is the most commonly used (Pawlack, 2014). The objective of these interventions is to establish the comparable efficacy and perceived effectiveness of the two forms of error correction with students in a Japanese senior high school and to ascertain their views on appropriate error correction (EC) methods. To do this, a series of tests were designed to gauge students' emerging grammatical accuracy in both oral and written communication. In order to guage students' perceptions of the efficacy of the error correction methods, a short survey was administered at the end of the testing stage. Before beginning the large-scale main trial, an external pilot study was conducted to validate the feasibility of the planned research. The current paper notes the considerations involved in the study, as well as its limitations. It then moves on to detail the modifications that were made to the instruments, the testing procedures and other data collection instruments which increased the validity and reliability of the proposed quasi-experimental study. At the conclusion of the pilot, it was found that the full study could proceed.

Keywords: Error Correction, Pilot, Validity, Reliability, Instrument, Procedure

Introduction

The importance of error correction (E.C.) was described by Lee (2017: 582), who asserts that it can, 'play a critical role in eliminating [learner] errors.' Lyster and Saito state that E.C. has 'significant and durable effects on target language development' (2010: 266). The significance of grammatical accuracy was highlighted by Edge (1997), who writes that successful communication can depend on it.

The value of EC can also be located in student expectations. Fukuda (2004) found that students wanted more error correction than their teachers believed was necessary. Dornyei and Ryan (cited in Kartchava, 2016: 19) describe learner beliefs as, 'significant learner characteristics to take into account when explaining learning outcomes'.

In his work on E.C., Hendrickson (1978) posed the question of who should be responsible for error correction. Support for student-led approaches has come from a number of researchers (see, for example, Harmer, 1991; Bartram and Walton, 1991 and Edge, 1997). However, this conclusion is not universally accepted (see for example, Miao, Badger and Zhen, 2006; Conor and Asenavage, 1994; and Paulus, 1999).

In order to explore the impact of the different error correction methods, a study among senior high school students shall be conducted. Prior to the full-scale main trial, a pilot study was undertaken. This paper presents the results of the pilot and it discusses the importance of pilot studies in the research process in general.

Significance of the Study

Pilot studies allow researchers to assess the validity and reliability of the instrumentation and to make any necessary alterations to the procedures. Doody and Doody (2015) assert that a good pilot study will ensure methodological rigour and can lead to higher quality research and scientifically valid work. Malmqvist et al state that they are a crucial part of the research process.

In spite of their importance, however, Fraser et al (2018) note that there is a lack of published studies on the conduct of pilot studies. The authors state that it would be beneficial if more attention were given to them. This paper, therefore, will help to remedy this deficit.

Structure of the Study

First, there shall be an overview of the proposed study, which will include a literature review, the research questions, and details of the site, sample and intervention. This will be followed by a brief discussion of pilot studies and their role in the research process. The paper will move on to describe the pilot conducted prior to the proposed full-scale main trial. This section shall include details on the sample, the instrumentation and procedures, the results of the item analysis and some initial findings on the impact of the different correction methods. To conclude, the conditions under which the full-scale main trial can proceed shall be presented.

Literature Review

Error correction is, according to Ellis (2006), a form of negative feedback. It was defined by Lightbown and Spada (2017: 216) as, 'Any indication to the learners that their use of the target language was incorrect'. Russell (2009), writes that although E.C. remains a contentious issue in second language learning, it is now generally accepted to play an important role in improving learner outcomes (see also, for example, Li, 2010 and Russell and Spada, 2006).

In his review on the theory and practice of error correction, Hendrickson (1978) questioned the dominant assumption among teachers that it was their responsibility to correct learner errors, writing that peer correction might be more effective in developing the grammatical accuracy of learners. However, it should be noted that the author posited this in relation to written work. With regards to spoken errors, the he felt that the impact of peer correction would be limited to lexical errors.

Edge advocates a student-led approach to error correction. He writes that the advantage of self-correction is that it is easier to remember because, 'someone has put something right in his or her own head' (1997: 24). According to the author, the advantages of peer correction are: it involves learners in listening to and thinking about language; students become less dependent on teachers; and finally, students will be better able to assist each other during pair and group work.

Bartram and Walton (1991) also call for a student-led approach to error correction. The authors state it has four advantages, which can be located within more general discussions on the value of active learning (AL). The authors state that learners will feel more involved; they will learn to be more independent; there will be a greater feeling of cooperation; and finally, it will reduce the amount of time that the teacher spends talking.

The value of active learning is supported by Michael (2006), who asserts that available research supports the effectiveness of a student-centered active pedagogy. The author ascribes this to the positive effect of learners explaining their reasoning to themselves, their peers or to their teachers. In terms of how this should be applied, Michael writes that teachers should, 'reform [their] teaching, employing those particular approaches to fostering active learning that match the needs of [their] students, [their] particular courses, and [their] own teaching styles' (2006: 165).

Thinking of the impact of active learning in EFL and ESL, Caine (2020) states that it has been 'standard fare' for many years. The author notes that in the context of Japan, the Ministry of Culture, Sports, Science and Technology (MEXT) has been explicitly using the term in relation to educational reform at both high school and university level since 2014.

With regards to error correction methods, empirical evidence suggests that a more active approach leads to better results. Lyster and Ranta (1997) looked at the uptake rates of different error correction methods. The methods associated with a student-led approach (elicitation, clarification request and repetition) led to higher rates of uptake than teacher-led approaches: recasts and explicit correction. In response to their research question, 'What combinations of corrective feedback and learner uptake constitute the negotiation of form?' (1997:56), Lyster and Ranta concluded it was student-generated repair that was the most effective. Further, the authors assert that, 'elicitation and metalinguistic feedback proved to

be particularly powerful ways of encouraging repairs that involve more than a student's repetition of the teacher's utterance' (1997: 56).

The value of student-led correction is not, however, universally accepted. Miao, Badger and Zhen (2006) conducted a comparative study on the impact of peer and teacher correction on students' writing. The authors found that, while peer correction did have a positive role to play, teacher correction was more likely to be taken up by students and it would also lead to greater improvement. Similar results were obtained by Paulus (1999) and Conor and Asenavage (1994). Conor and Asenavage found that only 5% of peer feedback resulted in change. It is, of course, important to point out that these findings pertain to the impact of feedback for written as opposed to oral errors.

As noted in the introduction, students' beliefs are an important determinant of the success of a given approach and a number of studies support the adoption of a student-centered approach to E.C. In her study of Japanese as a foreign language class in Sydney, Yoshida, (2008) found that, in general, learners preferred to have the opportunity to think about their own errors before being given the correct form by recast. A study by Katayama (2007), which looked at learners' perceptions of oral error correction, found that the most favoured method was for teachers to indicate that a mistake had been made which would enable the student to self-correct.

A more nuanced picture of error correction emerges from a study conducted by Zembytska et al (2022). The authors assert that the choice of error correction method and corrector will depend on the proficiency level of the students. When investigating students' opinions on which E.C. method would be most likely to have the strongest preventive effect, subjects were required to indicate their proficiency level. The results, which are presented in the table opposite, suggest that more proficient students have a preference for teacher-led techniques, while student-led techniques are favoured by less proficient learners.
Figure 1: An analysis of students' preferences regarding the choice of corrector

Proposed Study – Outline

Objective

The objective of this study is to test whether a more active approach to error correction will lead to better short and medium-term outcomes in terms of Japanese high school students' grammatical accuracy, specifically with regards to their use of modals. Additionally, students' attitudes to teacher and student-led error correction will also be investigated.

Research Questions

The four research questions that the paper shall answer are:
1. Does error correction have a significant impact on students' grammatical accuracy?
2. Is there a significant difference between the effects of student and teacher led correction?
3. Do students want to have their errors corrected?
4. Which form of error correction do they prefer?

Site and Sample

The site where the study will be conducted is a private senior high school in Tokyo. The school is part of an escalator system. According to NIER (undated), in the escalator system 'a school corporation' will provide education from pre-school all the way through to university.

In terms of the sample, participants will be grade 2 students. They are between 16 and 17 years old, and their level – using the CEFR as a frame of reference – tends to be around A2 or B1. The sample size will be 90, divided into six groups. Groups of students will be randomly assigned to the different treatment methods: two each for the student and teacher-led correction groups and two groups acting as the control. Intact classes will be used. Burden (2011: 80) writes that, although the results might be less generalizable they provide 'authentic learning environments'. The author also asserts that fully randomized experimental designs often suffer from a lack of 'ecological validity' because of the inauthentic environments in which such studies are conducted.

Intervention

The language focus will be on students' use – both oral and written – of the following modals: must / must not, have to / don't have to, and can / cannot. Allowed to and not allowed to have also been included. While these are not modals, they are in the students' textbook in the unit covering this grammar point.

The techniques that shall be used are student and teacher-led correction. Techniques commonly associated with teacher-led correction are recasts, explicit correction and metalinguistic feedback. Those associated with student-led correction are repetition, clarification requests and elicitation. Error correction for oral mistakes will be either immediate or delayed depending on the activity with which students are engaged. Pawlack (2014) writes that the timing of the corrective move will depend on whether the activity is fluency orientated or accuracy based.

The intervention is planned to last for four weeks. A brief outline of the lessons is as follows.

Week 1 ~ must / must not
Input: Reading and listening activities from the students' textbook
      (*Time Zones, 3rd Ed. Level 3*)
Output: Writing rules for a school club using must and must not.
      Presenting rules to other groups of students.
      Discussion of the rules for the different clubs
Conclusion: Error correction, either peer or teacher led

Week 2 ~ can / cannot and allowed to / not allowed to
Input: Listening 'Life in an American school'
Output: Discuss the differences between a Japanese school and an American school
      In groups, write rules for a school
      Vote on which school they would want to attend
Conclusion: Error correction, either peer or teacher led

Week 3 ~ have to / don't have to
Input: Jigsaw reading 'Rules at home in different countries'
Output: Write a survey and question partner
      Create graphs from data and describe the results
Conclusion: Error correction, either peer or teacher led

Week 4 ~ practice and immediate post test
Output: games using modals learnt during the intervention
      Immediate post test

Instrumentation

The intervention materials consist of oral production, reading, listening and writing activities. The materials must elicit the target structure, and they have to be appropriate for the students' proficiency level and of interest to them. The materials cover all four language domains, in order to cater to both visual and auditory learners. The majority of the tasks are two-way oral interactional tasks.

The instruments for data collection are:
1. A level check to assess the homogeneity of the students
2. A record sheet to monitor the number of corrective moves made and the frequency with which this led to uptake
3. An oral picture description task
4. A gap-fill task
5. A timed grammaticality test
6. An exit survey

Methodology

The paper uses a quantitative approach. Creswell (2014) defines this as, 'an approach for testing objective theories by examining the relationship among variables. These variables, in turn, can be measured, typically on instruments, so that numbered data can be analyzed using statistical procedures.' (Creswell and Creswell, 2018: 41).

The analyses that shall be conducted are: determining the measures of central tendency to show the degree of variability in the data; a repeated measures ANOVA to determine whether there are statistically significant differences among the means of multiple groups; an independent sample t-test to assess if there is a statistically significant difference between groups; and finally, descriptive statistics to summarize the key findings of the survey.

Error Correction Pilot Study

Introduction

The Dictionary of Epidemiology (2018) describes pilot studies as, 'a small-scale test of the methods and procedures to be used on a larger scale'. A good pilot study, according to Doody and Doody (2015) will ensure methodological rigour and it can lead to higher quality research that can be published. Cohen et al (2015) assert, moreover, that where researchers are using 'a home-grown test' conducting a pilot is 'unavoidable' as it will provide the researcher with essential information on item difficulty and discriminability. In spite of the importance of pilot studies, Fraser et al (2018) write that there is a lack of published works.

The limitations of pilot studies must also, however, be borne in mind. In (2017) states that pilot studies are not suitable for testing hypotheses and the data generated in a pilot study should be treated with caution. As Dzwigol (2020) states, the information obtained from a pilot study is necessarily incomplete.

Pilot Study – Implementation

The pilot study was conducted over a period of roughly 8 months. The stages of the pilot were: planning and preparation, the intervention and data collection, data analysis, the refinement and modification of instruments and procedures, and finally report writing.

The intervention was conducted in line with the lesson outline given above. It ran for four weeks. In that time, students had four lessons, each lasting 50 minutes. The objective of the lessons was to enable students to talk and write about rules in different situations and to use appropriate language to make rules for different contexts. The error correction methods used were: elicitation, repetition and clarification requests for the student-led group, and explicit correction, recasts and meta-linguistic explanation for the teacher-led group.

In terms of the sample, a non-probability convenience sample was used. The participants were 30 grade 3 students, divided into three classes. Group 1 was the control group, group 2 the student-led group and group 3 the teacher-led group. Although the sample consisted of 3rd grade students, their level of English is sufficiently similar for them to be representative. Furthermore, they are familiar with the type of communicative activities that will be used in the intervention. Intact classes were used in order to replicate the conditions of the full-scale main trial.

Instructional Materials

The intervention materials consisted of oral production, reading, listening and writing activities. The parameters set out for judging their suitability were that the materials elicited the target structure, that they were appropriate for the students' proficiency level and that they were of interest to the students. On piloting the materials, it could be seen that these objectives were met and the materials can, therefore, be used in the main trial. Examples of the materials are presented in Appendix A.

Data Collection Instruments

Ellis (2006) writes that it is important to have a range of tests so that both the implicit and explicit knowledge of learners can be accessed. Four home-grown tests were, therefore, devised: a level check to assess the degree of homogeneity among the students, a gap fill-test, a timed grammaticality judgement test and a modals speaking task. The tests were distributed using Loilonote. The students are familiar with this application and this did not cause any problems. Additionally, measures were taken to prevent students from copying each other's work and these appear to have been generally effective.

Level Check

Students were given 15 minutes to complete the test. In the full-scale main trial, however, it is anticipated that the test will take between 8 and 10 minutes. The pilot test was a little longer so that items could be easily removed if they were found to be either too easy or too difficult.

Part 1	
1. I often (park play to the go to) football.	87%
2. I have a (allows that job work me to) with animals.	50%
3. Bill (easy-going is is the who one)	23%
4. What's (in smallest the country world the)?	46%
5. You (home at rest stay should and) tomorrow	37%

Table 1: A sample of the data from the item analysis conducted on the level check test

The results presented opposite are for part 1 of the test. The difficulty of each item was calculated using the formula $\frac{A}{N} \times 100$. 'A' refers to the number of students who answered the question correctly, while 'B' is the total number of students who attempted the item. Following Cohen et al (2015), items falling below 33% or above 67% were deemed as being either too easy or too difficult and so were discarded.

	Class -	XXXXX			
Test No.	Grammar	Vocabula	T. Marks	Total	Rounded
1	3	0	12	3	25
2	1	0	12	1	8
3	4	2	12	6	50
4	5	2	12	7	58
5	4	0	12	4	33
6	4	2	12	6	50
7	7	3	12	10	83
8	8	2	12	10	83
9	3	1	12	4	33
10	7	2	12	9	75

Table 2: Data on the division of students into high and low scoring groups

The level check allowed for the division of students into high and low scoring groups – a prerequisite to establish item discriminability – using the formula $\frac{A-B}{1/2(N)}$. The table presents data for one of the groups. As can be seen, the number of students in the high and low scoring groups is roughly equal.

Gap Fill Test

Feedback from the pilot highlighted a number of issues with the test, which would negatively impact on its validity and reliability. First, the instructions were only in English, which led to the test taking longer than it should have. Next, it was not immediately apparent what the answers should be and for some of the items more than one answer was grammatically possible. Finally, some of the students also found the title of the test to be confusing.

In the second version, instructions are in both English and Japanese. Translations were generated by DeepL Translate and were then checked by a native Japanese speaker. Additionally, in the second version, pictures were included in the left-hand column in order to more clearly show what the answer should be and to make the test more visually appealing and less intimidating. Finally, the title was changed to further reduce any confusion on the nature of the task. The tasks are presented in Appendix B.

Both discriminability and difficulty were calculated. The maximum index of discriminability is 1.00. Cohen et al (2015) assert that any items whose index of discriminability is less than 0.67 should be reviewed as the item is not sufficiently discriminating. Whether that item should still be included, however, is for the researcher to decide. A sample of the results for the item analyses is presented opposite. The questions that are marked in red did not test the target language and so results for these items did not have to be calculated.

Questions	Group 1	Group 2	Group 3	Totals	All St. Total	Disc.	Difficulty
1							
2	H = 2 M = 1 L = 0	H = 4 M = 0 L = 0	H = 2 M = 0 L = 0	H = 8 M = 0 L = 0	9	0.76%	0.30%
3	H = 2 M = 0 L = 1	H = 1 M = 0 L = 0	H = 0 M = 1 L = 0	H = 3 M = 1 L = 1	5	0.19%	0.16%
4	H = 2 M = 1 L = 0	H = 3 M = 0 L = 1	H = 3 M = 1 L = 0	H = 8 M = 2 L = 1	11	0.67%	0.37%
5	H = 4 M = 2 L = 2	H = 3 M = 1 L = 1	H = 3 M = 2 L = 0	H = 10 M = 5 L = 3	18	0.67%	0.60%
6							
7							
8	H = 2 M = 1 L = 0	H = 3 M = 1 L = 1	H = 1 M = 1 L = 0	H = 6 M = 3 L = 1	10	0.48%	0.33%

Table 3: A sample of the data obtained from the item analysis for the gap-fill test

Looking at the results, question 3 had to be discarded as both discriminability and difficulty are quite far outside of the acceptable range. The results for question 2 indicated an acceptable level of discriminability; however, it had a difficulty level of 0.30%. Because, however, this is just outside of the recommended range and because it tests language items that will be included in the intervention, this item was retained.

Timed Grammaticality Judgment Test

The same piloting process was completed for the grammaticality judgment test as for the gap-fill test. The layout of the test was changed following feedback from the students, to include instructions in Japanese as students were initially unclear of what was required of them. Furthermore, the test was shortened quite considerably, as it took far longer to complete than had been anticipated. The final version of the test contains 13 items, 10 of which test for knowledge of the target language. A sample of the test is presented opposite.

Q.	Sentence	Right	Wrong	Don't Know	Correction
1	When students start at a new school, they can be join a club activity.				
2	Students are allowed to use not their mobile phones in class.				
3	Because he trains so hard, he can plays soccer very well.				
4	The longer river in the world is, of course, The Nile.				
5	People are allowed to can walk their dogs in the park.				
6	Many high school students can't getting a part-time job.				
7	To be honest, I hardly never help with the housework.				
8	Passengers have to buy a ticket before they get on the train.				
9	High school students are not allowed to dying their hair.				

Table 4: A sample of the layout and questions in the timed grammaticality judgement test

The table shows a sample of the results of the item analysis. When calculating the results, for each item students could score a total of 2 points. When a student could correctly identify if a mistake had been made, he/she would score 1 point. If the student was further able to provide the correction, the student was awarded 2 points, if the correction was appropriate. Where 'don't know' was marked, this was treated as being incorrect and was given 0.

B	C	D	E	F	G	H	I
Q. No.	Group 1	Group 2	Group 3	Group Totals	Total Correct Answers	Disc.	Difficulty
1	H= 5 M= 0 L= 0	H= 6 M= 1 L= 1	H=0 M= 1 L= 1	H= 11 M= 2 L= 2	15	0.43%	0.25%
2	H= 9 M= 4 L= 1	H= 5 M= 3 L= 2	H= 4 M= 1 L= 0	H= 18 M= 8 L= 3	29	0.71%	0.48%
3	H= 3 M =2 L= 0	H= 2 M= 1 L= 1	H= 3 M= 1 L= 1	H= 8 M =4 L= 2	14	0.29%	0.23%

Table 5: A sample of the data obtained from the item analysis
for the timed grammaticality judgement test

Modals Speaking Tasks

The objective of this task was to have students use the target language to make rules in different situations. Prompts were given at the bottom of the task that students could follow. On piloting the task it became apparent that it suffered from a number of defects. First, the instructions were initially only in English, and this caused students some difficulty as they were not familiar with this type of exercise. Second, many students found the prompts in the box to be confusing and multiple answers were possible. Finally, while students were told orally that they needed to record 8 sentences, many stopped after only 1 or 2. In the second version of the task, instructions are given in both English and Japanese, and symbols were added to the prompts in the box, more clearly directing the students to produce the target language. The tasks are presented in Appendix C.

In spite of these modifications, a number of problems, related to the procedures, persisted. First, some of the audio files were useable others were not. Students used the audio recording function on their iPads to record themselves. IC recorders would have been preferable; however, these are not available at the school. Moreover, it was also clear that some of the

students had copied each other. This could have been overcome by having students record themselves individually; however, this was not practical because of the disruption that would have been caused. In light of these problems, the modals speaking task can not be included in the full-scale main trial.

Survey

The survey was initially pre-piloted, with both Japanese and non-Japanese colleagues, to check that the questions were clear and the translations accurate and to ask for suggestions on whether there were any items that should have been included. Cohen et al (2015) write that structured surveys can prevent respondents from adding further important information. By piloting the questionnaire researchers can see if there are any significant gaps in the instrument.

The instrument was then tested with one of the grade 3 groups to make sure that students understood how to complete a Likert-style survey and to confirm that the items were easily understood. The time taken to complete the survey also had to be confirmed. Porter et al (2004), warn of the danger of survey fatigue. The authors note that research on respondent burden – defined as the time and effort required to complete a survey – has generally found that longer surveys will often result in a lower response rate. A number of modifications were made to the instrument at this point. The surveys are presented in Appendix D.

Having obtained positive feedback from the pilot, the survey was tested again, this time using 2 groups (*n*=20). Using Excel, the value for Cronbach alpha was calculated, producing a value of 0.72 which indicates that it is a reliable and valid instrument and so it can be used in the full-scale main trial.

Statistical Analyses

As noted above, pilot studies cannot be used to test hypotheses as the data is, necessarily, incomplete. The sample is not sufficiently large and modifications that are made to the data collection instruments will affect results that are subsequently collected. The data presented should, therefore, be regarded as preliminary.

Statistical Analysis Gap Fill Test

An ANOVA was conducted to see if there was a statistically significant difference within the groups in terms of their test scores before and after the intervention. 3 tests were conducted: the pre-test, an immediate post-test and a delayed post-test, which was conducted one month after the intervention. As the analysis was conducted using Excel, it's the columns bar that shows the data for the repeated measures.

Looking first at the control group, the calculated f of 0.762 is less than the critical f of 3.55, which suggests that there was not a significant difference in the grammatical accuracy of these students. Moving on to the results of the teacher-led and student-led groups, in both there was a significant difference between their pre- and post-test scores, which suggests that error correction is effective in developing the grammatical accuracy of learners.

An independent samples t-test on the results of the immediate post-tests was then conducted. Between the control and the teacher-led group the results were statistically significant, as can

be seen from the p value. However, the t-test comparing the teacher-led and student -led groups failed to produce a statistically significant result.

The data are presented in Appendix E.

Statistical Analysis Timed Grammaticality Judgement Test

Looking at the values for the calculated f and the critical f the results of the ANOVA indicate that there was a significant difference in the results of all of the groups. As can be seen, however, the results for the teacher and student-led groups suggest that for these groups the intervention had a far greater impact.

An independent samples t-test on the results of the immediate post-tests was undertaken to look at the differences between the different groups. Between the control and the teacher-led group the results were statistically significant, as can be seen from the p value. However, once again the t-test comparing the teacher-led and student-led groups failed to produce a statistically significant result.

The data are presented in Appendix F.

Conclusion

Pilot studies are an essential part of the research process. They allow researchers to test the feasibility of a proposed study and to test the instrumentation and procedures that will be used. This paper has looked at the implementation of a pilot study prior to a full-scale main trial, which will investigate the efficacy of student- versus teacher-led correction, as well as students' attitudes to error correction.

Regarding the instructional materials, benchmarks were defined against which their suitability could be measured. The materials successfully elicited the target structures and they were both appropriate for the students' proficiency level and of interest. It was, therefore, concluded that they could be used.

Moving on to the data collection instruments, in terms of the gap fill and timed grammaticality judgement tasks, as a result of the feedback obtained from the students, a number of important modifications were made, which greatly increased their clarity. Furthermore, the results of the item analyses show that with the modifications that were made both instruments can be used in the full-scale main trial. The procedures that were used were suitable and did not have to be altered.

In terms of the modals speaking task, in spite of the changes that were made, the data that was obtained was often neither valid nor reliable. Copying continued to be a problem and a number of the audio files could not be transcribed because of the poor sound quality. The tasks will not, therefore, be used in the full-scale main trial.

With regards to the survey, feedback from the students led to a number of the items being changed. The result of the Cronbach analysis confirms its internal consistency and shows that it can be used in the full- scale trial.

Looking at the data that was obtained, while this is only preliminary, a number of tentative conclusions can be drawn. Error correction does appear to have a positive impact on students' grammatical accuracy with regards to their use of modals expressing permission. This impact could be seen in both immediate and delayed post-tests. The data was not clear, however, as to whether student or teacher-led correction was more effective. The results of the survey indicated, though, that a small majority favoured student-led techniques.

Appendix A– Intervention Instructional Materials

Cooking Club

You are the leaders of the cooking club. You want the students to have fun, to make a lot of delicious food and, most importantly to be safe. Kitchens can be a dangerous place and rules are important. So what rules do you think are important?

Task

In your group, use **must** and **must not** to write 5 rules for cooking club members. *(You can use these ideas to help)*

1. _____
2. _____
3. _____
4. _____
5. _____

Rules at Home ~ Reading (A)

Sarah is sixteen and she lives with her mother and father in a small home in Brighton in England.

Part 1
Read the text about the different rules that Sarah has and then answer the questions.

Some of my friends have very strict parents. But my parents are pretty easy-going. Of course, there are some rules though.

I have to clean my room every day. I have to do the vacuuming and put all my clothes into the washing machine. I also have to take the trash out. I don't have to clean the other rooms. My parents do that.

During the week I have to go to bed by 11:30 p.m. It's important to sleep a lot. At the weekend, I don't have to go to bed early, because on Saturday and Sunday I don't have to go to school, so I can stay in bed until late.

One strange rule that we have is that I have to cook once a week. Luckily, I don't have to do the washing up. I hate washing up!

Sarah		Dave	
1. How often does she have to clean her room?		1. How often does he have to clean her room?	
2. What time does she have to go to bed?		2. What time does he have to go to bed?	
3. Does she have to go to school at the weekend?		3. Does he have to go to school at the weekend?	
4. What is a strange rule that she has?		4. What is a strange rule that he has?	

Part 2
Now, talk to your partner and answer the questions for Dave.

Glossary
Strict = 厳しい
Easy-going = 気楽な
Washing up = 洗い物

Life at Home – Survey

Every home has different rules.
Write questions with have to to find out the rules at your partner's house.
Remember, we can start questions with 'do' or a question word, who, what, when etc.

Questions	Student 1	Student 2
1. How much homework do you have to do every day?		
2. Do you have to take your shoes off at home?		
3.		
4.		
5.		
6.		
7. What rule is the hardest to do?		

Appendix B – Modals Gap-fill Task

Gap Fill - Modals

Instructions

- Look at the sentences below.
- Write the missing word or words in the spaces.
- Try to answer all of the questions.
- This is a review exercise. Don't worry about the grades!

1. How many times have you _____ to Disneyland?
2. In Japan, people under 18 are _____ to buy alcohol.
3. The doctor says I _____ stay at home and take some medicine.
4. People are _____ to play ball games in the park.
5. You _____ ride your bicycle here.
6. Eating a lot of fruit and vegetables is very _____
7. I started to _____ tennis three years ago.
8. You _____ wear a tie if you don't want to.
9. You are _____ to use your hands in soccer if you are not the goalkeeper.
10. You are _____ to touch the animals.
11. In soccer, you are _____ to use your feet and your head.

What are the missing words?

- Write the missing word or words in the spaces.
  空欄に足りない単語を記入してください
- Try to answer all of the questions.
  すべての質問に答えよう
- You have 4 minutes to complete the questions
  4 分間で質問に答えてください。

1.		How many times have you _____ t Disneyland?
2.		In Japan, people under 18 are _____ to bu alcohol.
3.		You _____ ride your bicycle here.
4.		You _____ wear a tie if you don't want to.
5.		Eating a lot of fruit and vegetables is very _____

Appendix C – Modals Speaking Task

Talking about School Rules

- Make sentences about the pictures below.
- Record your speech on Loilonote.
- Use the words and ideas from the boxes to help.
- Try to speak for about one and half minutes.

Picture 1

Schools often have many rules. What rules do students have to follow so that they will not get into trouble?

- **Use the words and ideas from the boxes to help.**

School uniform
Homework
Part-time job
Fighting
On time
School club
Mobile phone / cell phone
Bento

A Quantitative and Qualitative Evaluation of a Growth Group Program for Empathy Training

Yi-Hsing Hsieh, National Changhua University of Education, Taiwan

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Empathy can be conceptualized as three components: cognitive capacity, emotional capacity, and expressive and communicative motive. A growth group program is designed to comprise these three components of empathy. Mu wave (8-13 Hz band) in human electroencephalography (EEG) is a signature of mirror neurons which involve in social functions such as empathy and theory of mind. This study aims to investigate whether a growth group can improve the performance and change the activity of the mirror neuron system. Among twenty-seven undergraduate students selected from a class of taking a general education course, fifteen students are randomly assigned to the experimental group to attend a growth group. Twelve students are randomly assigned to the control group to attend a regular psychology class. After ten times of meetings, both control and experimental groups receive the measures of an empathy scale and then EEG. Participants' feeling and thoughts after the meeting were recorded for a qualitative analysis. The results show that the experimental group performs better than the control group on the testing scores of empathy scale. Mu wave suppression measured from Cz electrode site is significantly larger in the experimental group compared to the control group, indicating that mirror neurons are more active under the condition of self-movement in the experimental group. The qualitative data show that participants feel more confident with using empathic skills in their daily life. The conclusion is that a growth group for empathy training can change the behavior and the brain to some extent.

Introduction

The mirror neuron system (MNS) was first found to be firing in the monkey's premotor cortex when the monkey performed action or observed others' action (Rizzolatti and Fadiga, 1998). The study further showed that the MNS was responsible for understanding the feelings and intentions underlying the observed action (Iacoboni et al., 2005). The human EEG mu wave (8-13 Hz band) suppression was a validated index of the MNS activity and modulated by the degrees of social interaction (Oberman et al., 2007). Some individuals with autism spectrum disorder showed not only the deficit of social interaction, but also the dysfunction of the mu save suppression when they were observing the others' hand movements (Oberman et al., 2005). Cheng et al. (2009) also found that the degree of mu wave suppression was positively related with the empathic scores of interpersonal reactivity index. Moore et al. (2012) found that the mu wave suppression was related to the recognition of human facial emotions (including both positive and negative emotions). Braadbaart et al. (2014) found that the degree of the mu wave suppression was positively related to the degree of correctly imitating the others' facial expressions. Overall, the evidence mentioned above suggests that the MNS played an essential role for many social skills, such as facial emotion recognition and empathy.

Rogers (1957) defined empathy as: the ability to sense the client's private world as if it were your own, but without ever losing the 'as if' quality. According to Hoffman (1977, 1984) and Smith (2006), empathy can be conceptualized as three components: cognitive capacity, emotional capacity, and expressive and communicative motive. Cognitive capacity means that one can understand the other's inner (maybe hidden) thoughts from a perspective of the other. Emotional capacity means that one can sense the other's emotions and feelings from his/her words and body language, yet without one's own emotions getting bound up in it. The expressive and communicative motive means that one can sincerely respond to what one has understood and sensed and communicate with the other. Therefore, empathy can be cultivated by training and experiences for empathic practices. For example, Higgins (1990) and Long (1999) have shown that no matter college students or married adults can improve not only their empathic abilities but also interpersonal relationships after they participate in a growth group for ten hours. Overall, literature reviewed above indicate that empathy training can enhance the empathic abilities and seem to have a positive effect on the interpersonal behaviors. However, whether the empathy training can change the brain seem to remain unclear. This study aims to investigate whether empathy training can not only improve the knowledge and behavioral performance but also change the activity of the MNS.

Methods

Participants

Among twenty-seven NCUE undergraduate students selected from a class of taking a general education course, fifteen students are randomly assigned to the experimental group to attend empathy training group for practicing emotional, cognitive and expressive empathy. Twelve students are randomly assigned to the control group to attend a regular class for learning the knowledge of general psychology.

EEG Measurement

Participants put on an electrode cap with 32 electrode channels connected to Neuroscan Synamps system. EEG (and EOG) data collection is performed in the following four conditions: (1) moving own hand, (2) watching a video of a moving hand, (3) watch a video of two bouncing balls, and (4) watch a video of visual white noise. In condition 2 and 3, the moving hand or ball is sometimes paused for about 2 seconds, and participants are asked to count the number of times when the hand or ball stops moving and report the number of stops to the experimenter at the end of the block. Each condition is performed for about 90 seconds. The reference electrodes are located on the earlobes of both ears. Vertical eye movements were recorded above and below the left eye. The recording position of horizontal eye movement is about 1 cm outside the corner of the eye. Electrodes and skin contact resistance are below 5k Ohm. Filter settings were high pass (0.01 Hz) and low pass (50 Hz). The sampling rate is 500 Hz.

Empathy Measurement

A Chinese version of the Interpersonal Reactivity Index (Andrew and Shek, 2002) is adopted to measure the behavioral performance of empathy. The empathy score is calculated from two subscales: perspective taking and empathic concern, made up of 11 items, each of which is answered on a 5-point Likert scale ranging from "Does not describe me well" (0 point) to "Describes me very well" (4 point). The higher score indicates a better performance, except for three items scored in reverse fashion.

Procedure

The experiment group participated once a week in a growth group described as the following: In week 1, the activity was called "who is who". Every two group members introduced to each other and then introduced his/her partner to all. After this warm-up activity, each member chose two characteristic terms to describe self and the partner, then shared the difference between self-perception and what the partner has perceived. The purpose of week 1 meeting was to make each group member learn how to observe and give feedback to the other member.

In week 2, the activity was called "nonverbal perception". Every two group members talk about a personal story to each other and then write down what had been talked about and what had been perceived in addition to words when the partner was talking. The purpose of week 2 meeting was to learn how to concentrate on verbal and nonverbal information when listening to the other.

In week 3, the activity was called "listening without looking". Every two group members with eyes closed described one apple in a basket of apples to each other and then found out the special apple just described by the partner. The purpose of week 3 meeting was to learn about the difference in perspective of how people perceived a thing.

In week 4, the activity was called "a touching picture". Every two group members together looked at a scenery picture and write down which part had touched the self while taking a guess what part had touched the partner. The purpose of week 4 meeting was to learn how to express own feelings and to sense the other's feeling.

In week 5, the activity was called "sentence completion". Each member finished a homework of sentence completion by using at least an emotional word, and then picked up a sentence and read out it with a tone matched to the emotional words. The purpose of week 5 meeting was to be aware of what kind of feeling was expressed in the words and sentence and give a genuine feedback.

In week 6, the activity was called "listening to body talking". Each member kept his/her mind on the body and shared what had been felt about his/her body after the leader told each member to stretch out his/her hands and legs to a limit. The purpose of week 6 meeting was to be aware of information emitted from the body and learn how to express own feelings and sense the other's feelings.

In week 7, the activity was called "what happened". Every two group members talked to each other with the first words "what happened" and then the listener helped to clarify what was really happened by using the questions of who, how, when, where and what. The purpose of week 7 meeting was to learn how to clarify what had not been told yet during the conversation.

In week 8, the activity was called "role-playing". The leader invited one member to share his/her negative interpersonal experience and then direct a drama about that experience. The other members played one role in the drama. The purpose of week 8 meeting was to learn how to sense the inner world of a role in the drama and communicate with the other actor.

In week 9, the activity was called "compassion meditation". Each member breathed with mindfulness for three minutes and then meditated on someone who ever gave him/her unconditional love. Each member perceived self being loved and felt happiness and peacefulness that love brought. Finally, each member meditated on the partner and wished him/her happiness and peacefulness. The purpose of week 9 meeting was to feel compassion on self and the partner.

In week 10, the leader reviewed all activities and the special moments that each member had experienced. Each member shared thoughts and feelings of the group and made a wish that he/she would perform empathy in everyday life.

After ten times of meetings, both control and experimental groups received the measures of the Interpersonal Reactivity Index (Chinese version) and then EEG.

EEG Analysis

EEG was analyzed using a Neuroscan Synamps system (Scan 4.3). At first, EOG signals were deleted in each experimental condition. The fragments about 15 seconds from the beginning and to the end were also deleted to avoid alpha wave interference from the visual area. Data for each experimental case was combined, so there was approximately 2 minutes of data for each experimental condition. For every 2-second segment, fast Fourier transformation was used to calculate the power of the 8–13Hz bandwidth (mu wave). Considering the individual differences in the absolute value of mu wave power, the mu power obtained in experimental condition 4 was used as the baseline. The ratio value was obtained from dividing the mu power of each experimental situation by the baseline, and then did log conversion for final analysis. A negative value indicates mu suppression. Larger negative values indicate greater suppression.

Results

A Quantitative Analysis

The results of Student's t test show that the experimental group performs (M = 30.4, SD = 4.2) better than the control group (M = 26.2, SD = 4.6) on the testing scores of empathy scale in the Interpersonal Reactivity Index, t(25) = 2.49, p < 0.05. Mu wave suppression (shown in Table 1 and Figure 1) in experimental condition 1 measured from Cz electrode site is significantly larger in the experimental group compared to the control group, t(25) = 2.07, p < 0.05, indicating that mirror neurons are more active under the condition of self-movement in the experimental group. However, mu wave suppression measured from C3 and C4 electrode sites is not significantly different between two groups, t(25) = 0.84, p = 0.41, t(25) = 1.57, p = 0.13, respectively. The qualitative data show that participants feel more confident with using empathic skills in their daily life.
Figure 1. Mu suppression in control and experimental group. A negative value indicates mu suppression. Larger negative values indicate greater suppression.
A symbol (*) means a significant difference.

Table 1. Mu suppression in control and experimental group measured from three experimental conditions(moving own hand, watching a video of a moving hand, and watch a video of two bouncing balls) and three electrode sites (C4, Cz, and C3).

	Control group			Experimental group		
	Self	Hand	Ball	Self	Hand	Ball
C4	0.049	-0.084	0.026	-0.059	-0.075	-0.058
Cz	0.090	-0.066	0.029	-0.052	-0.076	-0.069
C3	0.052	-0.093	0.019	-0.018	-0.045	-0.048

A Qualitative Analysis

According to data collected from the feedback of each participant during the growth group activity of each week, participants (coded as A through O) showed their cognitive and emotional empathy. For example, when D said that he was an introvert and liked reading and being alone, G responded, "I feel that D is a thinker, full of ideas, but may be just not good at showing them." When E observed that G kept her head down and silent for a long time, E said to G, "You look unhappy, do you want to talk about what happened?" When O talked about her story that she hated her younger brother because she felt that her brother stole my mother's love from me, F responded, "If I were you, I may feel the same as you.", and N responded, "it is just a feeling, neither your fault nor anybody else." In the last meeting, participants felt more confident with using empathic skills in their daily life. For example, participant D talked about his change:

> *Before joining the growth group, I always feel that my interpersonal relationships are very poor and I have few friends. At the beginning of the group, I feel a little nervous and don't dare to express my opinion. About the second time, I hear C say to me: He can understand my uneasiness because he is also an introvert and is not good at expressing his inner thoughts and feelings. I suddenly felt a sense of acceptance and understanding. I gradually learn to be more attentive to the thoughts and feelings of other members when they shared. I also hope to bring that feeling of being understood to others.*

Conclusion

After participating in ten meetings of a growth group designed for empathy training, the empathic performance in the experimental group on the Interpersonal Reactivity Index is significantly increased. At the same time, the MNS has become more activated in the experimental group. Therefore, the empathy training can change the behavior and the brain to some extent.

Gender Differences in Perceptions of Digital Device Use and Reading Literacy: Insights From PISA 2018

Safari, National Research and Innovation Agency, Indonesia
Bagus Hary Prakoso, National Research and Innovation Agency, Indonesia
Evi Supandi, National Research and Innovation Agency, Indonesia

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
Gender gaps in literacy arise from ingrained perceptions of masculinity and femininity dictating gender-specific activities in children. While digital literacy enhances classroom engagement, its impact on higher education learning outcomes remains inconclusive. The purpose of this study was to investigate whether there are differences in the perceptions of male and female students regarding the use of digital devices in reading literacy, based on the PISA 2018 test. A quantitative method, using T-test analysis, was employed for the research. The population of this study consisted of 15-year-old students in 2018, with a sample of 15-year-old students who participated in the PISA test across 80 countries. Data for this study were gathered through questionnaires answered by 612,004 students from 80 countries. The research found significant differences between male and female students in the use of digital devices for reading literacy. Female students tend to be less digitally active, influenced by financial constraints, educational disparities, and social norms. The increasing use of information and communication technology (ICT) indicates the complexity of its relationship with reading literacy. The importance of specific online activities and motivational strategies in enhancing reading skills and students' confidence highlights the key role of a holistic approach. The gender gap in technology utilization underscores the need for improving female literacy to address disparities in technology adoption.

Introduction

The research findings of Kong et al. (2022) reveal that students' attitudes towards the use of digital devices are positively correlated with digital reading achievement. This is linked to the need for proficient readers in the digital world with a strong foundation in reading, as well as the critical thinking abilities of students (Suarez-Alvarez et al., 2022). Additionally, a disciplinary climate is required to facilitate the formation of students' reading self-concept, impacting the improvement of their reading performance at the school level (Ma et al., 2022).

Nevertheless, several studies (Delgado et al., 2018; Kong et al., 2018; Clinton, 2019; Singh & Alexander, 2022) indicate that paper media supports better comprehension than screen media, especially when reading longer and more complex texts. Meanwhile, according to the results of the 2018 PISA survey, reading performance has declined in many countries. At the adolescent level, there is a reported significant decline in leisure reading, combining readings, and digital technology skills (Weel and Mangen, 2022).

Concerning gender issues, Ritonga and Sutapa (2021) state that during the preschool period, gender roles influence children in choosing daily activities, including the selection of reading materials. Furthermore, based on the World Economic Forum's report (2021), gender inequality in the future is associated with employment, with the factor of lower wage inequality for women compared to men.

In responding to various findings, there is a need for research with more universal data. One option is to utilize data from the PISA survey. In line with the issues raised, this research aims to investigate whether there are any differences in the perceptions of male and female students regarding the use of digital devices in reading literacy based on the PISA 2018 test. The significance of this research lies in providing valuable insights that can be used by teachers and students as a reference for school policies.

Research Method

It used a quantitative research methodology. This strategy was chosen because it aligns with the study's primary objectives, which are to gather data from observed symptoms and utilize the study's data. The study employed PISA 2018 data, which is freely accessible and can be used for research and development (source: https://www.oecd.org/pisa/data/).

The sample consisted of pupils who had completed the PISA exams at the age of 15 in 80 different countries, representing the group of 15-year-olds who attended school in 2018. These pupils participated in the study by responding to a five-option survey. The optional answers included categories such as "I spend 1 to 30 minutes a week," "31 to 60 minutes a week," and "more than 60 minutes a week" (alternatively, "I don't study this subject" or "I don't have time"). These questions pertained to "Time spent using digital devices during classroom courses in a typical school week (test language classes)" in the 2018 PISA assessment.

This pertains to the literacy exam for reading. According to the analysis conducted using Mplus, the Chi-Square Test of model fit yielded a P-value of 0.000, and the Root Mean Square Error of Approximation (RMSEA) estimate in this study was 0.000. The 90% confidence interval for this result ranged from 0.000 to 0.000. These results suggest that, even if the study's instruments were well-fitted to the model, they had very low explanatory value.

The results from the standard model are presented in Table 1 and Figure 1, further supporting this conclusion.

Variable	Estimate	Est./S.E.	P-Value	Decision
Digital	0,885	579,121	0.000	Valid
Gender	0,428	316,274	0.000	Valid

Table 1: Results from a Standardized Model Using Mplus

As shown in Figure 1, the individual dependability for the instrument used in this study was 0.09, while the instrument's perfect reliability value was 1.00. This demonstrates that an object possesses a higher reliability value than a human being. It also reveals that the majority of survey respondents in this study provided low and medium scores, reflecting the realities of everyday school life.

Figure 1: Analysis outcomes for Winsteps version 5.2.2.0:
Individual and Equipment Dependability

T-test analysis was the chosen method of analysis for this investigation. The primary objective of this study is to examine potential disparities in how male and female students perceive the use of digital devices for reading literacy in the 2018 PISA test.

To ensure the accuracy of the research analyst's conclusions and to analyze all of the study's data, we utilized the SPSS 22.00 application. Winsteps, Mplus, and SPSS 22.00 were employed to assess instrument and person reliability tests, instrument fit models, and the t-test (Safari, 2022a; Safari, 2022b).

Result

The data below pertains to 612,004 students from 80 different countries, based on the percentage of students who responded to the survey.

Gender	Time spent using digital					Total
	No time	1 - 30 minutes a week	31 - 60 minutes a week	More than 60 minutes a week	I do not study this subject	
Female	**93429** **(27,5%)**	40619 (11,9%)	**17869** **(5,3%)**	19179 (5,6%)	1150 (0,3%)	172246 (50,6%)
Male	**89997** **(26,4%)**	36915 (10,8%)	**18762** **(5,5%)**	20280 (6,0%)	2084 (0,6%)	168038 (49,4%)
Total	183426 (53,9%)	77534 (22,8%)	36631 (10,8%)	39459 (11,6%)	3234 (1,0%)	340284 (100,0%)

Table 2: The Proportion of Students Who Use Digital Devices in Class During a Typical School Week for Test Language Lessons

According to Table 2, the majority of male students who answered "31-60 minutes a week" were 5.3% female and 5.5% male, whereas the majority of female students who responded with "No time" were 27.5% and 26.4% for male.

Gender	N	Mean	Std. Deviation	Std. Error Mean
Female	172246	1,80	1,055	0,003
Male	168038	1,85	1,105	0,003

Table 3: The gender-specific average and standard deviation for the pupils

Male students used digital devices for a longer duration of time than female students, according to Table 3; (mean 1.85, standard deviation 1.105) and (standard deviation 1.055, mean 1.80).

t	df	Sig. (2-tailed)
-13,668	340282	0,000

Table 4: Results of a two-tailed T-test

According to Table 4, male and female students held different opinions about using digital devices to improve their reading skills on the 2018 PISA test (P < 0.000).

Discussion

The findings of this study indicate differences in perceptions between male and female students regarding the use of digital devices for reading literacy in PISA 2018. Female students tend to use digital devices less regularly compared to male students.

Referring to the results of PISA 2018, differences were also found in the assessment of male and female students regarding the use of digital devices for reading literacy. According to the analysis of this study, male students are more inclined to use digital devices than female students (mean 1.85, standard deviation 1.105).

The results of the data analysis need to be reinforced by qualitative data that can explain why such differences occur. Unfortunately, obtaining direct answers as to why these differences exist is not easy. One way to address this is for researchers to utilize several research findings that can support the results of the analysis.

The findings of this study align with the OECD ABC analysis (2015) in the Gender Equality in Education Report, which found that some female students participating in formal education seem to lack confidence in using ICT. Various variables, such as financial constraints, educational gaps, lack of technical understanding, and social norms, impact gender-based digital exclusion (Borgonovi et al., 2018; OECD, 2018; OECD, 2015; Hilbert, 2011; Cooper, 2006; Krupp, 2005). These are some of the main causes of gender gaps in the digital industry.

The use of information and communication technology (ICT) among students is becoming increasingly common, both at home and in school. This study modifies the intensity of ICT use and mediates metacognition to explain the ambiguous relationship between students' ICT use and reading literacy, revealing inconsistent results. The relationship between all forms of ICT use and reading literacy, as well as the growth of ICT use, follows a dynamic pattern starting with a positive effect, then declining to less positive, becoming negative and fluctuating, and ultimately ending with a persistent decline (Li and Wang, 2022).

The research findings from Alharbi (2022) suggest that reading emails, participating in online conversations (such as WhatsApp), reading online news, searching for material online to investigate specific subjects, and seeking practical information (such as schedules) online are significant predictors of improved reading skills and grades. According to the findings of Navarro-Martinez and Pena-Acuna published in 2022, there is a relationship between students' use of technology and social media with their academic progress.

Results from the study by Du et al. (2022) reveal that the confidence level of successful students increases after reading one story about a role model and further improves after reading five stories. According to research conducted in 2022 by Martin et al., reading aloud to others can provide benefits in relationships and socioemotional aspects.

Regarding the design of large-scale assessments and data interpretation, it can have an impact if these findings are confirmed in other countries. According to these findings, students' responses to PISA test items indicate broad abilities rather than specific domain talents (Pokropek et al., 2022). Additionally, motivation and socioeconomic levels are crucial indicators of students' success in reading. Economic inequality may be a factor in the variation of students' reading abilities (Yeung et al., 2022).

According to the investigation by Cai and Yang in 2022, reading strategies—such as comprehension techniques and memorization—are related to the ability to understand mathematics through reading. The findings of the study by Hu and Wang in 2022 indicate positive effects from students' perceptions of instructional adaptation, stimulation of reading engagement, disciplinary atmosphere, teacher involvement, and teacher support.

A student's reading ability is influenced by other students and their schools (Qian and Lau, 2022). This is reinforced by the research results by Tan et al. (2022) based on a questionnaire from 11,364 15-year-old students distributed among 332 schools (5,455 females and 5,909 males) participating in PISA 2018. The results show that students' feelings about school have a direct and beneficial impact on their reading literacy.

According to the study by Marcq and Braeken in 2022, the cognitive aspect of reading in PISA 2018 shows significant differences related to variations in students, schools, and items. The findings of the research by Kaya et al. (2022) indicate that motivational and metacognitive reading characteristics have an impact on PISA reading performance.

According to the research findings of Clavel and Flannery in 2022, there are significant differences between the scores of male and female students in mathematics, reading, and science in single-sex schools and coeducational schools. However, after considering various personal, family, and institutional variables, both male and female students attending single-sex schools generally do not perform worse than their peers attending coeducational schools.

The ideal learning time at the school level has a significant impact, where the time spent on learning and discipline in the classroom is the most crucial factor (Liu, 2012). Additionally, support for teacher autonomy has a positive relationship with the motivation and emotional factors of adolescents. This has important practical implications for educators who want to use various teaching techniques to enhance the confidence, self-esteem, and happiness of teenagers (Wang and Hu, 2022).

There is also a weak positive correlation between reading ability and growth mindset, according to hierarchical analysis by Berardo et al. (2022). Furthermore, Gerstner and Tsyawo (2022) show that there is a spatial dependence in student performance between countries related to the proximity between countries.

With the increasing use of smart mobile devices, our daily internet usage has significantly increased. Prawesti's research (2018), which examines the use of digital reading apps and digital reading activities in elementary schools, is one study related to the use of digital reading apps.

According to the research, a noticeable improvement occurs when students participate in digital reading activities using digital reading media. Students who participate in digital reading programs show greater reading motivation than their peers. Long and Szabo (2016) also suggest the idea that students using digital reading are more motivated than those who do not. Students who read using digital reading programs claim that it enhances their motivation to read.

Digital reading applications have the potential to have either positive or negative effects on a person's reading habits, especially in terms of their interest in reading. Compared to teachers in countries below the average PISA score, teachers in countries with above-average PISA scores often provide feedback to their students and give them access to better reading materials (Safari, 2020).

According to Borgonovi et al. (2018), another reason why women use digital technology at a lower rate than men is because they are not aware of its potential benefits. Dalberg (2012) found that 25% of women who rarely use the internet have no desire to do so, and almost all of them believe that it will not help them.

According to UNESCO, only 83% of women worldwide are literate, compared to 90% of men. Because they are more familiar with this technology or because it is easier to use and access, literate women often use internet platform services such as Skype and YouTube.

Examining the social-cultural aspects of gender gaps in technology is also crucial. About one-fifth of women in India and Egypt believe that the internet is not suitable for them due to many cultural considerations (Borgonovi et al., 2018). In India, 12% of women say they avoid using the internet because of unfavorable social perceptions, while 8% claim their families do not approve of internet use (Dalberg, 2012b).

In general, research findings indicate variations in reading achievement as well as metacognitive strategies and reading attitudes between boys and girls. To reduce gender gaps in reading achievement, it is suggested that teachers help students develop reading-related attitudes and metacognitive skills. This research also provides limitations, practical implications, and suggestions for further research (Acar-Erdol and Akin-Arikan, 2022).

Conclusion

This study reveals significant differences between male and female students in the use of digital devices for reading literacy based on PISA 2018. Female students tend to be less digitally active, and this is found to be associated with factors such as financial constraints, educational gaps, and social norms. The increasing use of information and communication

technology (ICT) indicates the complexity of its relationship with reading literacy, emphasizing the need for understanding the evolution of ICT usage in the educational context.

The study highlights specific online activities that can predict improvements in reading skills and student grades. Additionally, motivational strategies, such as reading inspirational stories, prove effective in boosting students' confidence in reading literacy. The connection between reading ability and achievement in mathematics and science underscores the necessity of a holistic approach to enhance student outcomes.

Gender gaps in the utilization of digital technology, particularly digital reading applications, reflect the socio-cultural challenges faced by women. Therefore, improving literacy levels among women is identified as key to addressing gender disparities in technology adoption. In conclusion, this research provides in-depth insights into the complex interaction between gender, technology, and reading literacy, emphasizing the importance of a holistic approach and the need for further detailed research to understand the dynamics of this phenomenon.

The Development of a Motor Control Experimental Set Through a Virtual Reality Program by Using Active Learning

Tanapon Tamrongkunanan, King Mongkut's University of Technology Thonburi, Thailand
Tanes Tanitteerapan, King Mongkut's University of Technology Thonburi, Thailand
Chayanit Pichitronnachai, King Mongkut's University of Technology Thonburi, Thailand

Abstract

The development of a motor control experimental set through a virtual reality program by using active learning. The objectives of this research for 1) Develop a motor control experimental set of operating the motor control circuit 2) Develop an active learning management through a virtual reality program 3) To evaluate the achievement of an active learning management to develop a practical skill 4) To assess the ability of operating the motor control circuit. The statistics for analyzing tool quality are accuracy and the statistics for analyzing the data were mean, standard deviation and percentage. The results showed that 1) The development of the motor control experiment set that was created had a validity or accuracy (IOC) score that passed the criteria, with the average IOC being 0.67-1.00. 2) an active learning management through a virtual reality program 3) The overall quality of activities was at a good level (mean = 4.50, S.D. = 0.81). When considering each aspect, it was found that it was at a very high level, with the highest mean being "learning media (mean = 4.75, S.D. = 0.38) 4) The students' practical skills for motor control circuit passed the criteria, representing 82.60 percent and for the target, 80% of the people are pass the criteria.

Introduction

The direction of national development in the National Strategy (2018 - 2037) has set important development goals to develop people in every dimension and at every age to be good people smart and quality. Thai people are physically, mentally, intellectually, prepared and have good all-round development, be responsible to society and others, have discipline, maintain morality and be a good citizen of the nation, have the correct principles. Gain essential skills in the 21st century, such as the ability to practice problem solving, adapt, communicate, and work with others more effectively, have a habit of continually learning throughout life. The national strategy (2018) The National Education Plan (2017 - 2036) has specified human resource development as a very important mechanism for bringing the country into the 21st century global society and is a main issue specified in the national strategy and the Thailand 4.0 strategy. Preparing manpower in terms of knowledge and skills Essential competencies such as analytical thinking Ability to solve problems, communicate and work as a team, etc. in order to be aware of the changing trends of the dynamic world. National Education Plan (2017) determine characteristics or indicators of practical ability and learners have self-confidence [6] Praphasara Kotakhun (2012) Learners gain knowledge and understanding from direct experiences, resulting in clarity clearly from the learning experience, bring coping skills, finding ways to solve problems and make decisions will be useful in applying them to life [4] Tisana Khammanee (2007). It can be seen that practical ability is an important skill that should be developed for students along with learning outcomes in various subjects. From the study of methods for developing practical ability, it was found that there is a demonstration learning method. There is an idea according to the concept of [5] Tisana Khammanee (2008) said that the teaching method using demonstration is a process that teachers use to help students learn according to the objectives specified by showing or doing things that the students want to learn, let the learners observe and then have the learners ask questions, discuss and summarize the learning gained from observing the demonstration teaching and the demonstration was divided into teaching steps as follows: 1. Demonstration preparation step 2. Demonstration step 3. Learning activity organizing step. 4. Summary and evaluation stage [1] Jaruwan Toontham (2016) has organized learning with a demonstration model to increase learning achievement and practical skills in using an oscilloscope in Bachelor's degree in Computer Engineering class. The research results found that higher than the 80% threshold with statistical significance at the 0.01 level [1] Jaruwan Toontham (2016) and there is also research by [7] Worawat Promden (2018) that develops basic scientific process skills by teaching a demonstration of operations of the physical changes and chemical changes of Grade 5 students, the results found that organizing learning through hands-on demonstration teaching can develop necessary skills for students. Including making students have important skills that learners in the 21st century need to have practical skills [7] Worawat Promden (2018) Therefore, it can be seen that the demonstration learning method is another one method that can promote practical ability.

From the importance of practical ability and how to solve problems by teaching the above demonstrations. Therefore, the researcher is interested in researching the development of a motor control experiment kit through a virtual reality program by using Active Learning to develop hands-on motor control circuit skills in the electric motor control subject. The advantage of demonstrating through the program is to simulate experiments compared with practice. It is expected that after receiving the learning management, the students will have learning behavior as targeted in the curriculum and in addition [2]. Chusak Plianpu (2002) Using experimental sets for teaching will make the teacher and students interact more by giving advice from the teacher. Students will also practice solving problems on their own and

have the discipline to work and be a team. This will help the learners to have the qualifications that the establishment needs and apply this knowledge to their next career.

Research Objective

1. Develop a motor control experimental set of operating the motor control circuit
2. Develop an active learning management through a virtual reality program
3. To evaluate the achievement of an active learning management to develop a practical skill
4. To assess the ability of operating the motor control circuit

Research Hypotheses

H1: The accuracy or precision of the motor control experiment worksheet for developing a motor control experiment set for operating the motor control circuit passes the criteria.

H2: Active learning activities through a virtual reality program (Simurelay) to develop skills in operating electric motor control circuits by hand in the subject of electric motor control in very good level.

H3: After learning with Active Learning activities through a virtual reality program (Simurelay) to develop skills in operating motor control circuits by hands at least 80 percent.

Research Method

Participants

The population and samples in this research are 20 students from 2nd year undergraduate students in the Bachelor of Technology program. Electrical Technology Major: Faculty of Industrial Education and Technology King Mongkut's University of Technology Thonburi Academic year 1/2022 by sampling by purposive method.

Research Instrument and Procedure

In the research study on the development of motor control circuit construction using Active Learning through a virtual reality program (Simurelay) to develop motor control circuit operation skills by hand in the subject of electric motor control is a research/experimental type by using a preliminary experimental research design with a single experimental group to measure results only after the experiment (The One-Shot Case Study Design, posttest-design) according to the concept of [6] Pariwat Khueankaew (2008) with the following steps: Method Build and quantify each tool. The aim/topic of the experiment worksheet is specified consisting of a total of 5 worksheets, study theories, concepts, documents and various research studies in order to understand the principles of creating experimental worksheets and create a motor control experiment worksheet to develop skills in operating electric motor control circuits by hand. From the desired indicators according to the objectives, which are based on the main idea, choose to develop learner indicators and present the created experimental work sheets to experts. The content validity assessment form (IOC) allows experts to consider validity (Validity) according to the content or consider the consistency between the questions and the objectives (Item-Objective Congruence: IOC).

1. Motor control worksheet: To develop skills in operating electric motor control circuits by hand.

2. Model to evaluate the quality of Active Learning activities through a virtual reality program (Simurelay) to develop skills in operating electric motor control circuits by hand in the subject of 5 aspects of electric motor control.

3. Measurement of practical ability using a motor control experiment worksheet. To develop skills in operating electric motor control circuits by hand with a total of 5 manual motor starting experiment worksheets, with 3 indicators.

Experimental Design

Organizing demonstration learning to develop skills in operating electric motor control circuits by hand, subject of electric motor control. The researcher conducted an experiment with a convenience random sample of 20 people using a single-group experimental research design, measuring only the results after the experiment (The One-Shot Case Study Design, posttest-design) according to the concept of [6]. Pariwat Khueankaew (2008) as follows:

ผังการทดลอง E-Group | X   O |

Figure 1: The experimental design

In writing the experimental diagram, various symbols are used to convey the following meanings.

E-Group = Experimental group of 20 people.
X = Experimental variable of Active Learning through a virtual reality program (Simurelay).
O = Variable based on skills in operating electric motor control circuits by hand.

Data Analysis

1. Analysis of the quality of research tools

Analyze the validity or precision. By calculating the consistency between the questions and the objectives (Item Objective Congruence: IOC), the validity evaluation form of all 5 experimental worksheets from content experts by having quality assessment experts calculate the IOC values.

2. Objective data analysis and hypothesis testing

2.1 Analyze the quality of demonstration learning activities to develop operating skills in manual motor control circuits to check the research hypothesis that the quality is at a better level." Analyze the quality data of the activities obtained from the evaluation of experts by finding the average and calculating the standard deviation. The average is then compared with the average range to determine the quality level. Acceptable values are better level which has an average range of 3.50 - 4.49 with good quality.

2.2 Analyze the scores of the experimental worksheet to develop operating skills in manual electric motor control circuits in the subject of electric motor control to examine the research hypothesis stated. "After learning with Active Learning activities through a virtual reality

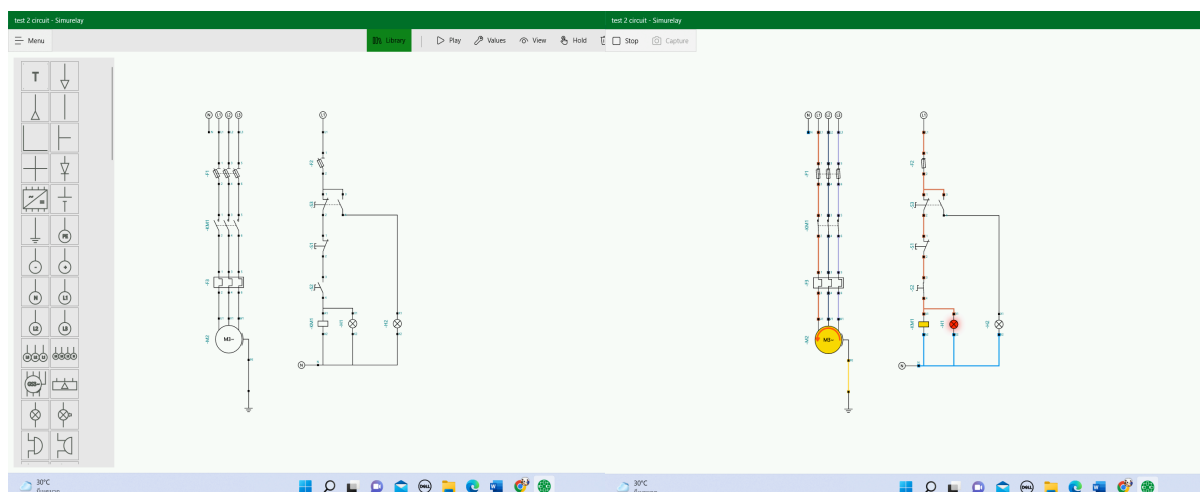
program (Simurelay) to develop skills in operating manual motor control circuits in the subject Electric Motor Control. Not less than 80 percent or more according to the assumption.
Figure 2: Manual operation of electric motor control circuit


Figure 3: Active Learning through virtual reality programs (Simurelay)

Statistics Used Data Analysis

Precision values using the formula for finding consistency values: IOC (Index of Item Objective Congruence), mean, standard deviation (SD), percentage.

Conclusion

1. Developing motor control worksheets to develop skills in operating hand-on motor control electrical circuits. The accuracy or precision (IOC) scores of the motor control worksheets passed the criteria for all 5 experimental worksheets by the average IOC will be 0.67-1.00. It is considered that the stated assumption is "the validity or reliability of the motor control experiment worksheet to develop skills in operating electrical circuits to control motors by hand, passing the criteria (score 0.50 and above)."

2. Development of a motor control experiment set through a virtual reality program using Active Learning in the subject of electric motor control. The sequence of steps in training is as follows.
    Step 1:   Creating Interest
    Step 2:   Provide knowledge to students on each of the 5 experimental worksheets. Divided into 1 worksheet per week.

Step 3: Practice readiness for practice. The instructor will distribute experimental worksheets each time for students to study the working principles of various types of motor connections.

Step 4: Train your ability to practice. The instructor divides the students into groups of 2-3 people, totaling 7 groups. Then the students complete an experimental worksheet and the instructor demonstrates through a virtual reality program. (Simurelay) where students conduct experiments by using circuits from worksheets to experiment through a virtual reality program (Simurelay) and compare with the results of manual training.

Step 5: Summary of the lesson: The teacher works to summarize the content by summarizing each worksheet separately and having the students explain the principles of their work.

Step 6: Measure students' ability to practice connecting circuits from all 5 experimental worksheets.

3. The overall quality of learning management activities is at a good level (mean = 4.50, S.D. = 0.81). When considering each aspect, it was found that the level was excellent level in every aspect, with the aspect having the highest average. From highest to lowest, the top 3 are: "Learning media (mean = 4.75, S.D. =0.38), followed by the learning activities aspect (mean = 4.73, S.D. =0.46) and the overall structure of the plan (mean = 4.53, S.D. =0.81) were considered consistent with the set assumptions.

4. Results of the study of the ability to operate the electric motor control circuit by hand. Shows the percentage of ability to operate the manual motor control circuit, each group, totaling 7 groups, as shown in Table 1.

Group	Target score (total 155)	Result		Percentage
		Pass	Not pass	
1	123	√		80.35
2	133	√		85.80
3	123	√		89.35
4	126	√		81.29
5	129	√		81.22
6	140	√		80.32
7	140	√		80.32
Groups that pass the criteria		7		82.60

Table 1: the percentage of ability to operate the manual motor control circuit by hand

The target group's score was calculated from the results of the evaluation of 5 worksheets and from the experiment of students with skills in operating electrical circuits to control motors by hand, passing the criteria, accounting for 82.60 percent. As for the target, there were 80 percent who passed the criteria, considered consistent with the assumptions specified. That is, after learning with Active Learning activities through a virtual reality program (Simurelay) to develop and develop skills in operating electrical circuits to control motors with hands, subject of electric motor control.

Advantages and Disadvantages of AI in the EFL Classroom

Lidija Eliott, Kwansei Gakuin University, Japan

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Undoubtedly, the conversation around artificial intelligence (AI) has recently intensified, fostered by the rapid development of technology. Learning institutions have joined in the debate, with teachers and learners on the frontline of this conversation. This study particularly explores the direct impact of AI applications such as chatbots (ChatGPT), personalized learning experiences, and predictive analytics on EFL classroom learning, outlining AI's advantages and disadvantages on foreign language learners and their teachers. It employs a qualitative approach to data collection and screening, utilizing surveys on a sample of students at the university level. Evidently, from the study findings, AI can potentially improve learning, especially among students in EFL classrooms. However, there is concern about AI inhibiting the development of learners' research and critical thinking skills. Largely, the findings recognize AI's value in EFL classrooms but appeal for caution from teachers in its application. This study offers valuable insights into AI's impact on EFL classrooms and offers possible changes that could help in its successful integration into EFL teaching practice.

Keywords: Artificial Intelligence, Teachers, Learners, EFL Learning

iafor

The International Academic Forum
www.iafor.org

Introduction

The use of artificial intelligence (AI) technology in the educational sector has significantly increased over the last few years, and this trend is also present in EFL classrooms. Applications of AI that might improve language learning include chatbots, adaptive assessment, personalized learning environments, and predictive analytics (Sumakul et al., 2022). This article will investigate the effects of AI in EFL courses by weighing its benefits and drawbacks. It will examine how AI may boost language practice and feedback for learners of foreign languages and enhance learning results for these students. It will also highlight the possible disadvantages of AI, such as doubts about how it will affect research and critical thinking abilities, ethical issues with data protection, and the potential decline in human contact throughout the learning process. This article aims to provide helpful insights and suggestions for educators on successfully incorporating AI technologies into foreign language training by examining the efficacy of AI in the EFL classroom and outlining future developments in AI for language teaching.

Methods

Participants were Japanese L1 speakers, and they ranged between 20–22 years of age. All questions and explanations were in English. An anonymous and voluntary questionnaire was prepared and distributed among these students to determine their outlook on artificial intelligence (AI) technology. It was written in English, consisted of twenty-two items, and was developed as the instrument for data collection. The study was conducted mid-semester, during the spring of 2023.

Research Questions

The research was conducted to answer the following research questions:
      RQ1: What are the advantages of AI in EFL Classrooms?
      RQ2: What are the disadvantages of AI in EFL Classrooms?

Impact of AI in the EFL Classroom

Overview of AI Applications in EFL Classrooms

Artificial intelligence (AI) has been integrated into EFL classrooms via a variety of cutting-edge technologies that have the potential to transform language instruction completely. One such technology is AI-powered chatbots, like ChatGPT, that let language learners connect and get immediate feedback. These chatbots replicate actual conversation situations, giving students highly accessible practice opportunities and personalized language support (Jeon, 2021).

Adaptive testing is a different AI application popular in EFL courses. Using AI algorithms, adaptive testing systems may evaluate learners' competence levels and customize the testing process to meet their unique requirements. These systems provide a more accurate assessment of learners' language skills by dynamically modifying content and the difficulty of test questions depending on learners' replies. By examining learner data like performance, interests, and learning preferences, AI also makes it possible to personalize learning experiences. AI systems may provide specialized information, exercises, and suggestions by

identifying individual strengths and weaknesses. This promotes a customized language learning method that meets each student's requirements.

Additionally, learner data is used by AI-powered predictive analytics to estimate future performance and pinpoint possible improvement areas. By examining patterns and trends in students' learning behaviors, AI can provide insightful recommendations that help instructors modify their support and teaching methods, ultimately accelerating student development (Rudolph et al., 2023). There are exciting possibilities for language learning with these AI technologies in EFL classrooms. Immersive conversational practice, individualized learning opportunities, and more precise evaluations of language competency benefit language learners. However, since they have repercussions for students and instructors, it is crucial to consider the possible drawbacks of integrating AI into EFL courses alongside the potential benefits.

Advantages of AI in the EFL Classroom

Personalized Learning Experiences

The capacity to provide each student with a personalized learning experience is one of the significant benefits of using AI in EFL classrooms. AI algorithms, which analyze student data such as performance, interests, and learning preferences, can help to tailor material and activities to individual students (Vera, 2023). Due to this personalized approach, students may interact with resources relevant to their needs, interests, and learning preferences. Learners are more likely to remain motivated and advance in their language learning journey by getting information and activities that are relevant and appropriate for their level of skill. Additionally, AI-powered systems may provide students with tailored feedback, indicating areas for improvement and offering them specific coaching (De la Vall & Araya, 2023). This instant and detailed feedback encourages more effective learning and helps students quickly correct their weaknesses.

Enhanced Language Practice and Feedback

Chatbots and other AI tools in EFL classrooms promise to improve language practice and feedback. These AI-powered chatbots allow students to participate in engaging, realistic language discussions, allowing them to hone their speaking and listening abilities in a safe setting (Jeon, 2021). AI-powered chatbots provide students with genuine language usage experiences by imitating real-world communication situations, enhancing their capacity for comprehension and effective communication in various settings (Kim et al., 2021). Additionally, AI systems can provide learners with immediate, focused feedback while immediately detecting their mistakes and making recommendations for development. In addition to assisting students in real-time error correction, rapid feedback encourages students' language acquisition. EFL learners may benefit from opportunities to strengthen their language skills with individualized help by using AI for language practice and feedback, improving both competence and confidence in their language abilities.

Adaptive Testing

Due to its ability to customize tests for individual students, AI-driven adaptive testing offers significant benefits in EFL classrooms. These methods ensure that the assessment appropriately reflects the students' competence level by dynamically adjusting the test

questions' difficulty and substance depending on their replies. Instructors may use a personalized approach to ensure students are suitably challenged, preventing learners from becoming demotivated by overly challenging material or disinterested in simple assignments. Through adaptive testing, instructors may gather knowledge about their student's strengths and shortcomings to modify their teaching tactics, provide help where required, and enhance the learning process (Rudolph et al., 2023). The adaptive nature of AI-driven testing improves assessment accuracy and empowers instructors to provide more efficient and customized training to support language learning in the EFL classroom.

Availability of Language Resources

Students who take EFL classes with AI have access to a wealth of linguistic materials. Digital resources such as interactive exercises, authentic texts, multimedia resources, and language learning applications may all be found on platforms with AI capacity. These materials are accessible at any time and from any location, enabling students to pursue autonomous study outside the traditional classroom's boundaries (Voskoglou & Salem, 2020). AI technology makes it possible for students to study different language materials at their own speed, allowing self-directed learning and encouraging autonomy in the language learning process. Furthermore, the enormous variety of language materials enhances the learning process and allows students to investigate various subjects and situations, promoting a deeper comprehension of the language and culture.

Disadvantages of AI in the EFL Classroom

Limited Human Interaction

Despite the advantages of AI apps for language learning and assessment, it's critical to recognize that they may reduce face-to-face contact in EFL classrooms. For students to participate in genuine and meaningful dialogues, direct connection with instructors and peers is essential. AI chatbots can replicate discussions but cannot fully capture the subtleties and dynamics of interpersonal dialogue (Jeon, 2021). The capacity of learners to completely grasp the nuances of language, such as tone, body language, and contextual knowledge, might be hampered by the lack of face-to-face contact and nonverbal clues. Human connection offers a rich learning environment where students may practice active listening, meaning negotiation, and social interactions, improving communication abilities (Kim et al., 2021). Therefore, to provide thorough language learning experiences in the EFL classroom, it is crucial to establish a balance between AI applications and human engagement.

Risk of Overdependence

Although AI applications offer automatic aid and convenience, relying on them too much in the EFL classroom might lead to passive learning experiences. Learning takes on a more passive quality when AI often gives pre-generated information and automated feedback (De la Vall & Araya, 2023). Developing higher-order cognitive abilities requires active involvement, critical thinking, and problem-solving, all limited by this passive learning technique. The capacity of learners to undertake independent research, think critically, and analyze material outside of the predetermined algorithms and replies offered by AI might be hindered by an overreliance on AI systems (Vera, 2023). AI-based tools and activities that promote active engagement, independent thought, and student-driven inquiry must be balanced to provide a well-rounded education.

Ethical Concerns

AI in the EFL classroom raises significant ethical questions about data security and privacy. AI systems gather and examine learner data, including performance and personal data. To preserve the privacy and rights of students, it is crucial to secure this data against unauthorized access or breaches. Algorithmic biases are another issue wherein AI systems could unwittingly uphold injustices or favor certain groups over others (Wang et al., 2023). To solve this, it is crucial to ensure that AI applications are fair and inclusive, actively minimizing biases and encouraging equal opportunity for all learners. Maintaining trust, protecting student privacy, and upholding ethical norms are crucial when integrating AI into EFL classrooms. These qualities must be continually worked towards.

Technological Limitations and Accessibility

Technology restrictions and accessibility issues may arise when using AI in EFL classrooms. AI systems often depend on specialized infrastructure, such as steady internet connections and suitable hardware, which may not be accessible everywhere in educational settings. A lack of technological access may lead to inequities, preventing some students from using AI-powered tools and experiences. Additionally, using AI technology necessitates a learning curve for instructors and students, requiring time and effort to become used to new resources and modify teaching strategies (Vera, 2023). The learning process may be interfered with, and the smooth integration of AI in the EFL classroom might be hampered by technical issues or dissatisfaction with AI technologies. To successfully integrate AI into the EFL learning environment, it is vital to provide equal access to technology, to offer instructors and students the required assistance and training, and to resolve any technical concerns quickly.

Effectiveness of AI in the EFL Classroom

Empirical research has been undertaken to determine how well AI applications work in EFL classrooms. These studies examine how AI affects language acquisition abilities, including speaking, listening, reading, and writing. Personalized learning platforms, adaptive testing environments, and other technologies have all been studied by researchers. This research gathers information on learners' performance, engagement, and contentment and uses it to draw meaningful conclusions about the efficiency of AI in promoting language learning and enhancing learning outcomes. Empirical studies help us learn how AI may be best used in EFL classrooms via careful study and assessment.

The primary goal of assessing AI's effects on language learning outcomes is to assess the extent to which AI applications improve learners' competence and linguistic growth. Researchers assess learners' language proficiency before and after participating in AI-based treatments, comparing their development to that of students who received conventional classroom instruction (Wang et al., 2023). Language learners' performance, fluency, accuracy, and general language competency are assessed through summative and formative language tests. Additionally, the assessment considers variables like learner satisfaction, engagement, and motivation. Researchers learn more about the efficacy of AI in boosting language learning outcomes and its possible benefits over traditional teaching methods by analyzing the data gathered (Rudolph et al., 2023).

Comparative research has been done to determine how well AI compares to conventional EFL teaching techniques. These studies examine how students who use AI apps and those

who get conventional classroom teaching differ in their learning processes and results. Students' motivation, engagement, retention of information, and overall language ability are compared by researchers. These studies highlight AI's distinctive benefits, such as personalized learning experiences, adaptive evaluations, and fast feedback, by evaluating the strengths and disadvantages of both methodologies (Rudolph et al., 2023). They also emphasize the advantages of conventional teaching techniques, such as one-on-one instruction, instructor direction, and group projects. Comparative studies help to clarify the potential of AI as a supplemental tool in the EFL classroom and provide information on how it may be successfully incorporated alongside conventional teaching techniques.

We comprehend AI's efficacy in EFL classrooms by analyzing empirical data, assessing language learning results, and comparing it with conventional teaching approaches. These conclusions assist educators in making well-informed choices about incorporating AI technologies by pointing them toward pedagogically sound procedures that enhance language learning encounters and foster student success.

Future Trends in AI for EFL Teaching

As it continues to develop, AI technology has significant potential to offer new opportunities in the field of EFL education. AI systems will be able to comprehend and produce language more like that of humans due to developments in natural language processing and creation. As a result, AI chatbots will have better skills, allowing more complex and engaging dialogues with students (Sumakul et al., 2022). Additionally, it is anticipated that adaptive and personalized learning platforms will develop further. These platforms will use AI algorithms to provide customized exercises, assessments, and information depending on the requirements of particular learners. This tailored method will raise interest and improve language learning results. A further development in AI-driven EFL instruction is the integration of apps for virtual reality (VR) and augmented reality (AR) (Sumakul et al., 2022). With the help of VR and AR, language learners may practice in simulated real-life settings and discover cultural backgrounds in immersive learning environments. Given these developments in AI technology, the potential for improving language learning experiences and encouraging student autonomy and engagement is enormous.

Future advancements in AI-based EFL instruction will substantially impact instructors and students. Students will gain more access to personalized and adaptive learning opportunities tailored to their unique requirements, preferences, and learning preferences. Immersive VR and AR environments that enable real-world language practice and cultural discovery may benefit learners (De la Vall & Araya, 2023). Language learning may be made more successful and efficient using AI technology that can continuously give feedback, monitor progress, and make tailored suggestions. AI-powered solutions for instructors may help with lesson preparation, give insights into student performance, and make tailored suggestions for differentiated education.

However, future AI breakthroughs in the EFL classroom also have difficulties and issues to consider. Teachers must acquire the essential skills and expertise to incorporate AI technology into their teaching practices successfully (Vogt & Flindt, 2023). They must also address moral concerns like data privacy, algorithmic biases, and AI-human balance. Access to AI technology and infrastructure must be equitable to avoid learning disparities.

Recommendations for Educators

Strategies for Integrating AI in EFL Classrooms

AI technology should be used in EFL courses using the following methods. First, balance AI and traditional teaching methods. AI has numerous benefits, but human interaction still offers the best ways to learn (Voskoglou & Salem, 2020). To ensure students have adequate chances for direct interaction and collaboration, classroom activities may be augmented by AI technology. Second, professors should advise students about AI usage. This involves offering AI platform users precise instructions, assistance on effective usage, and supporting learner autonomy and responsibility. Finally, educators should stress study and analysis (Pokrivcakova, 2019). While AI may provide quick solutions and feedback, students must have the capacity for independent study, critical thought, and information evaluation. This may be accomplished by giving learners research-based assignments, fostering critical thinking, and providing instruction on how to use AI resources effectively.

Professional Development for Teachers in AI Implementation

Teachers should obtain sufficient professional development in AI implementation to properly integrate AI technology in EFL classrooms. First, instructors need to get training on AI tools and technology. Workshops, webinars, and courses that introduce instructors to the capabilities and uses of AI systems in language learning may be included in this training. Teachers must acquire the technical know-how required to traverse AI platforms with ease and effortlessly incorporate them into their pedagogical practices (Vogt & Flindt, 2023). Second, educators should be trained on ethical issues and data privacy. They must be aware of the effects of using AI technology, such as how crucial it is to safeguard learner data and deal with algorithmic biases. The best practices for protecting data protection, gaining permission, and upholding equity and inclusion in AI-based activities should be made known to teachers (Pokrivcakova, 2019). Last but not least, professional learning groups, conferences, and online forums may promote educator cooperation and the exchange of best practices. This enables educators to exchange successful practices, gain insight from one another's experiences, and collaboratively investigate the useful application of AI technology in the EFL classroom. By following these suggestions, teachers may successfully incorporate AI technologies into the EFL classroom, making the most of their advantages while ameliorating their drawbacks and ensuring students have a balanced and educational experience.

Limitations of the Study

There are several limitations to the present study. First, data were only collected from four classes therefore, the size of the research is limited. Second, the data were collected in the mid-semester. Regular reflections throughout the year may reveal other information. Third, all questions and reflections were written by students in English. If they were allowed to write in Japanese, they might be better able to articulate their feelings.

Conclusion

AI offers both benefits and drawbacks in EFL lessons. AI tools that provide personalized learning, improved language practice, focused feedback, and accurate assessments include chatbots, adaptive testing, and personalized learning experiences. However, there are issues

with the lack of human contact, the danger of dependency, moral issues, and technology constraints. Continuous research and development are essential if AI is to be used to its greatest potential in EFL classrooms. To ensure that AI tools are pedagogically sound and in line with best practices in language education, more research should be done to examine the efficacy and influence of AI on language learning outcomes. AI can improve language learning by providing individualized assistance, adaptive learning opportunities, and immersive language practice. In the EFL classroom, teachers may use AI technology to empower students and support their language growth by finding a balance between AI and human engagement.

Virtual vs. Conventional Internship:
Its Impact on University Students and Fresh Graduate's Employability Level

Lavenda Geshica, Universitas Gadjah Mada, Indonesia
Ananda Zhafia, Universitas Indonesia, Indonesia

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

The COVID-19 pandemic impacted various aspects of people's life. In the education aspect, the COVID-19 pandemic has changed learning methods from face-to-face to online via Zoom or similar platforms (Feldman, 2021). At the same time, there is a need for students and recent university graduates to develop skills to enter the workforce despite the pandemic challenges. This study aimed to explore students' employability in different internship programs. Through a quantitative approach, this research had two groups of participants who had joined virtual internships and conventional internship programs. The characteristics of virtual apprentice participants are university students or fresh graduates who have attended a virtual internship program at least once. Meanwhile, conventional internships are students who have participated in a conventional internship program at least once in any company or institution. Employability in this study consisted of four aspects: independent study, problem-solving, creativity, and communication. These four aspects are taken based on the employability aspects developed by Orji (2013). The situational Judgment Test (SJT) format minimizes social desirability. This study recruited 67 participants data from two groups with virtual and conventional internships. Results showed no significant employability score difference between participants who joined virtual and conventional internship programs. This result implied that virtual internship programs might be as effective as conventional ones in developing employability.

Introduction

The COVID-19 pandemic impacted various aspects of people's life. In the education aspect, the COVID-19 pandemic has changed learning methods from face-to-face to online via Zoom or similar platforms (Feldman, 2021). Employees have also experienced this change in various circumstances; before the pandemic, employees generally worked from the office face to face. However, after the pandemic, many companies have implemented policies to work remotely or what is known as remote working.

At the same time, there is a need for students and recent university graduates to develop skills to enter the workforce. Students commonly use various ways recent graduates of tertiary institutions to improve their skills, including attending training, short courses, and apprenticeship programs. In Indonesia, the government has implemented *Magang Merdeka,* an internship program that college students should take as one of the requirements to graduate from college (Ministry of Education Culture Research and Technology, Republic of Indonesia, 2022). In addition, many universities in Indonesia have also implemented internships as a requirement to earn a bachelor's degree. Therefore, the demand for internship experience has increased as policies are implemented in most local universities.

On the other hand, many challenges are also faced by students and new graduates to gain internship experience. Many companies cannot survive after the COVID-19 outbreak, so the number of available internships is limited. Besides, job opportunities at companies are limited in big cities such as Jakarta. Students in other cities must compete and do more to attain internship experience relevant to their career aspirations.

However, the Adult Education and Human Resource Development (AEHRD) field sees the prospect of changing apprenticeship activities from conventional apprenticeships to virtual internships online and remotely. The exciting thing is that the virtual internship program was implemented before the COVID-19 pandemic. On the other hand, the implementation of virtual internships before the COVID-19 pandemic was not because of physical workplace closures and mobility restrictions (Feldman, 2021).

Research from Mihali (2006) found that internship programs can help students who are still in college to develop essential skills needed in the world of work, such as communication, time management, self-confidence, and self-motivation, which are very important for getting and keeping a job–employability. One of the literature's most widely used definitions of employability (Bridgstock 2009; Jackson 2013) focuses on identifying the "right" combination of skills, attitudes, and individual characteristics that may improve graduate employment opportunities.

This initiative is crucial because virtual internships can help apprentices gain work experience with employees as desired, regardless of location, people with disabilities, or other responsibilities such as family (Jeske & Axtell, 2014). On the other hand, the effectiveness of the virtual internship program in developing the skills needed in the world of work has yet to be widely studied, especially in Indonesia. AlGhamdi (2022) found that virtual apprenticeship programs that are carried out effectively with the right program and adequate infrastructure can provide the same benefits as traditional apprenticeships. On the other hand, the apprentice's desire to learn and the supervisor's role become important during the internship. If this is done, virtual apprentices can obtain similar benefits to their career development from the experience gained during virtual apprenticeships (Jeske, 2022).

With various types of internships, exploring how effective internship programs are on employability in Indonesia's student population has become more crucial for today and the future. Therefore, this research aims to answer whether internship programs can provide effective output in improving the skills of prospective workers.

Participants

This study had two participant groups: virtual apprentices and convention apprentices. The characteristics of virtual apprentice participants are university students or fresh graduates who have attended a virtual internship program at least once. Meanwhile, conventional apprentices are students who have participated in a conventional internship program at least once in any company or institution.

The controlled variables are age (minimum age 18 years old) and working experience (should not have prior working experience). The recruitment of apprentices was carried out using the accidental sampling method. Meanwhile, virtual apprentices were recruited using a purposive sampling method of apprentices at various institutions providing virtual internships.

Instruments

The employability instrument used in this study was developed by Geshica and Zhafira (2023). This scale consists of four aspects: independent study, problem-solving, creativity, and communication. These four aspects are taken based on the employability aspects developed by Orji (2013). Researchers only used four of the ten aspects of employability due to these four aspects being the most relevant to conventional apprenticeship conditions and virtual internships. The situational Judgment Test (SJT) format minimizes social desirability.

SJT is a test that describes a problem or critical situation to identify whether the individual concerned can overcome it (Patterson et al., 2012). Developing the SJT consists of three stages: item creation, response options, format creation, and answer key selection. This instrument consists of 20 items with a score range of 20-100, where the higher the score represents, the higher the level of employability a person has.

Data Collection and Analysis

Data was collected online due to its effectiveness and reachability. All data were obtained in approximately one month. This process collected 67 participants' data from two groups (virtual and conventional internships). Moreover this study used several analysis techniques, such as descriptive analysis, reliability using internal consistency, and item-rest correlation. Moreover, multivariate statistics were performed to answer the research question: t-tests, ANOVA, and descriptive analysis. These analyses were performed using JAMOVI software version 2.3.21.

Descriptive Analysis

This study involved 67 participants with various backgrounds in terms of university and major. The description of the participants' characteristics can be seen in Table 1.

Table 1: *The Result of Descriptive Analysis*

Characteristics	F	Percentage	Characteristics	F	Percentage
Age			Student status		
18-22	43	64%	University student	31	46%
23-27	22	33%	Fresh graduate	36	54%
>27	2	3%			
GPA			Field of internship		
3.00-3.50	20	30%	Digital	32	48%
3.51-4.00	47	70%	Non-digital	35	52%
Age			Student status		
18-22	43	64%	University student	31	46%
23-27	22	33%	Fresh graduate	36	54%
>27	2	3%			
GPA			Field of internship		
3.00-3.50	20	30%	Digital	32	48%
3.51-4.00	47	70%	Non-digital	35	52%
Frequency of internship			Total duration		
			1-3 months	55	82%
Once	47	70%	4-6 months	10	15%
Twice	18	27%	7-12 months	2	3%
Three times	2	3%			

From the table above, the majority of participants' age range was 18-22 years old, had GPA more than 3.50, and currently pursuing a bachelor's degree. A score categorization was also computed to get a holistic view of participants' employability levels. The score categorization used was hypothetic categorization from Azwar (2012). Hypothetical categorization was chosen due to the relatively small number of participants. The computation can be seen in Table 2.

Table 2: *The Score Interpretation and Categorization*

Categorization Reference	Score Categorization	Interpretation	F (%)
$\mu \leq -1.5\sigma$	>64	Very low	5 (7%)
$-1.5\sigma < \mu \leq -0.5\sigma$	64-70	Low	6 (9%)
$-0.5\sigma < \mu \leq +0.5\sigma$	71-76	Average	31 (46%)
$+0.5\sigma < \mu \leq +1.5\sigma$	77-85	High	25 (37%)
$+1.5\sigma < \mu$	>85	Very high	0 (0%)

To calculate the score categorization, firstly the computation of mean and standard deviation were performed. According to these analyses, the mean employability score was 74, and the standard deviation of 7. After obtaining these scores, the calculation of score categorization

showed that most participants had average employability levels. However, none of the participants had a very high score in employability.

Inferential Analysis

Inferential analysis using ANOVA was performed to explore the factors contributing to employability. The result of the t-test can be seen in Table 3.

Table 3: *The Result of the t-test*

		Statistic	df	p
TOTAL	Student's t	-1.50[a]	65.0	0.139

Note. $H_a \mu_1 \neq \mu_2$

[a] Levene's test is significant (p < .05), suggesting a violation of the assumption of equal variances

However, the mean group comparation can be seen in Table 4.

Table 4: *Mean Group Comparation*

	Group	N	Mean	Median	SD	SE
TOTAL	1	32	72.4	75.0	8.32	1.47
	2	35	74.8	75.0	4.33	0.731

Results showed no significant employability score difference between participants who joined virtual (M = 72.4, SD = 8.32) and conventional internship programs (M = 74.8, SD = 4.33), t(65) = -1.50, *p* = 0.139. This result implied that virtual internship programs might be as effective as conventional ones in developing employability.

Discussion

Previous research has proven how internship experiences helped students and graduates obtain the necessary skills to enter the workplace. On the other hand, the government encourages college students to earn internship experience before graduation. Therefore, internship experience becomes more necessary. However, internships are limited in bigger cities and not enough compared to the number of college students who want to become interns.

Therefore, there is a need to fill the gap between available internship opportunities and college students who need to gain internship experience. Before the COVID-19 pandemic, many companies implemented remote working options for employees to enable employees from other cities, even countries, to work. Moreover, remote working has become more popular even after the endemic pandemic. Hence, more companies have engaged with interns and entry-level employees virtually. As virtual work becomes more common, virtual internships could be considered an option to fill the gap in internship opportunities for students and fresh graduates.

This research also proved that there is no significant employability score difference between participants who joined virtual and conventional internship programs. This implied that virtual internship programs might be as effective as conventional ones in developing

employability. Hence, students, fresh graduates, and universities might consider virtual internships an option to enhance employability and become more work-ready.

Although the result is quite important for enriching the knowledge about both types of internships, this current study has several limitations. Firstly, the sample size was relatively small, so it might not be adequate to generalize the results. Secondly, it is crucial to randomly select participants to ensure that the employability score before the internship is comparable.

Conclusion

Internship experience is a necessary experience for college students and graduates before entering the workplace. There are also many ways to sharpen skills and enhance employability to become well-rounded individuals. Virtual internships could be seen as an opportunity to develop employability to increase students' and fresh graduates' work readiness.

The Information of Workplaces From Opinions of Graduated Students Attended the Cooperative Education in the Program of Printing and Packaging Technology, King Mongkut's University of Technology Thonburi

Somsri Binraman, King Mongkut's University of Technology Thonburi, Thailand
Suchapa Netpradit, King Mongkut's University of Technology Thonburi, Thailand
Phichit Kajondecha, King Mongkut's University of Technology Thonburi, Thailand

Abstract

The objectives of the routine-to research (R2R) were to survey the information and opinions from the graduated students who had experiences from attending the cooperative education program, and to provide the database of the workplaces for the undergraduate students in next generations after determining the qualifications for selection. The online questionnaire was created using google form and the link was sent to 150 graduated students of this program by using the line group connection. The satisfaction was evaluated in 5 rating scale from 1, very poor, to 5, very good in three main topics: Readiness and Collaboration, Research Project Support, and Mentor or Advisor Providing. The feedback data with Microsoft Excel program were analyzed using descriptive statistics at the univariate level. The feedback responses of 50% of samples were obtained from 3 generations from 2020, 2021 and 2022, getting the information of total 40 workplaces categorized into 4 types, Design or Graphic Houses, Offset Printing Houses, Packaging Manufacturers, and Suppliers and Services. The results showed that a high number of the design or graphic houses, the suppliers and services, and the packaging manufacturers were very good in mentor and advisor providing. The satisfaction of graduated students in the readiness and collaboration, and research project support of the design or graphic houses and the suppliers and services were high. The workplaces type of design or graphic houses were the most appropriate for internship, and the suppliers and services were more appropriate than the offset printing houses and packaging manufacturers, respectively.

Introduction

The higher education institutions around the world use cooperative education to provide a broader range of degree studies in almost every field of study, making cooperative education graduates "know themselves, know people, and know their work" [1]. Cooperative Education is an education model that systematically switch classroom learning between practical work experience with a partnership of both public and private industrial enterprises and all involved sectors [2].

King Mongkut's University of Technology Thonburi saw the importance of internship as an educational tool for undergraduate students by providing the opportunity to practice and apply the knowledge gained in the classroom in the actual operation at the workplace. Therefore, the university has included the student's internship is part of the required subjects in the student's course [3]. In the program of B.Sc. Printing and Packaging Technology, the cooperative education was set for the 4th year students to have operation practice course in the workplaces in a period of one semester (16 weeks). The aims of this learning activity are to promote students to have more experience and professional skills, understand the behavior of workers and organization culture, able to work with other persons, and have a good attitude before graduating for further career.

As the responsible of the educational service support work, the routine-to research (R2R) was performed to develop the database of workplaces for our undergraduate students in the cooperative education. The questionnaire was then created to survey information and opinions from previous generations of undergraduate students who had experiences from attending their cooperative education program. Our purpose in this study was to get the information of workplace profiles to help the next generation of undergraduate students in choosing their suitable workplace for their internship.

Methodology

The quantitative research method used in this study was surveyed from three generations of graduate students who have experiences from attending the cooperative education practice of B.Sc. program in Printing and Packaging Technology, during the academic year 2020-2022. The online questionnaire as a tool of data collection was created with the google forms with open-end questions on the name of workplace, occupation after graduation and other suggestions, and closed-ended questions for the satisfaction evaluation in 5 rating scale from 1, very poor, to 5, very good. The opinion and satisfaction of the respondents on the workplaces in printing or packaging industries were evaluated as 5 rating scales in three main topics including sub-topics, as shown in Table 1.

Table 1: The contents for satisfaction evaluation in Questionnaire

Main Topics	Sub-topics
Readiness and Collaboration	- Facilities for operations - Welfare support - Advisors preparation - Work safety - Contact and Coordination - Training Plan
Research Project Support	- Correspondence to subject area - Scope of training work - Support by administrators
Mentor or Advisor Providing	- Professional in knowledge and experience - Available for advice - Pay attention in teaching and assignment - Assistance for work problems - Communication and knowledge transfer

The link of google form was sent to 150 graduated students of this program by using the line group connection. The feedback data with Microsoft Excel program were analyzed using descriptive statistics at the univariate level. The average rating scales (1-5) of any workplaces were classified in the range as follows.

4.51–5.00	Very good
3.51–4.50	Good
2.51–3.50	Fair
1.51–2.50	Poor
1.00 –1.50	Very poor

Results

The feedback responses of 75 graduated students (50% of samples) were obtained from 3 generations, those were 8 persons from 2020, 12 persons from 2021, and 55 persons from 2022. The information was summarized for total 40 workplaces relating to printing or packaging industries, which are categorized into 4 types, as follows.
1) Design or Graphic Houses: 3 workplaces from 9 graduated students.
2) Offset Printing Houses: 14 workplaces from 27 graduated students.
3) Packaging Manufacturers: 14 workplaces from 22 graduated students.
4) Suppliers and Services: 9 workplaces from 17 graduated students.

The data shows that the popular workplaces were offset printing houses and packaging manufacturers. The evaluation rating scales of each workplace type were analyzed in average scores to inform the quality level at each main topic and the number of workplaces was counted in percentage, as shown in Table 2.

Table 2: The number (%) of workplaces in each quality level for
4 workplace types in different 3 main topics

Workplace Types	Quality level	Readiness & Collaboration	Research Project Support	Mentor/Advisor Providing
1. Design or Graphic House	Very good	-	-	**66.66%**
	Good	**100%**	**100%**	33.33%
2. Offset Printing House	Very good	14.28%	21.42%	28.57%
	Good	**71.43%**	**42.86%**	**71.43%**
	Fair	14.28%	28.57%	-
	Poor	-	7.14%	-
3. Packaging Manufacturer	Very good	28.57%	21.42%	**50%**
	Good	**35.71%**	**42.86%**	21.42%
	Fair	28.57%	21.42%	21.42%
	Poor	-	7.14%	-
	Very poor	7.14%	7.14%	7.14%
4. Suppliers and Services	Very good	11.11%	33.33%	**66.66%**
	Good	**55.55%**	**44.44%**	33.33%
	Fair	33.33%	11.11%	-
	Poor	-	11.11%	-

For consideration in quantitative results, it was indicated that the high number of design or graphic houses, packaging manufacturers, and suppliers and services were very good in mentor and advisor providing. The offset printing houses were good in readiness and collaboration, and mentor/advisor providing. The poor level was observed in the topic of research project support for the offset printing houses, the packaging manufacturers, and the suppliers and services. After analysis, the very poor packaging manufacturer in all topics was then concerned to be delete from the list. In addition, the workplaces due to the poor quality in the topic of research project support should be revised to solve this problem for the undergraduate students in the next generation.

For consideration in qualitative results, the satisfaction evaluation of graduated students in scale from 1-5 was shown in Figure 1, which shows that the readiness and collaboration, including research project support of 1) design or graphic houses and 2) suppliers and services were slightly higher than those of 3) offset printing houses and 4) packaging manufacturers. For mentor or advisor providing, the suppliers and services were the best due to the staffs have knowledge in techniques and were available to transfer their knowledge of work to the students who practice as the technicians for customer services. The packaging manufacturers had the lowest score in terms of research project support and mentor/advisor providing due to the very tight of work.
Figure 1: The satisfaction level of the graduated students to the workplaces

Table 3 shows that high number of the graduated students prefer to have internship at the design or graphic house and supplier and services. From the questions due to the occupation of graduated students after graduation, there were some persons are working in the same workplace after their internship, as shown in Table 3. For the open-end questions, there were some suggestions from the graduated students as shown in Table 4.

Table 3: Other information of the workplaces

Workplace Types	Number of workplaces satisfied for internship	Number of workplaces admit staffs after internship
Design or Graphic House	87.5%	87.5%
Offset Printing House	76%	48%
Packaging Manufacturer	51%	61.90%
Suppliers and Services	80%	60%

From Table 3, it was shown that the workplaces type of design or graphic houses were the most appropriate for internship and the suppliers and services are more appropriate than the offset printing houses and packaging manufacturers, respectively. However, the graduated students prefer to work as the designer and producer of packaging, due to the present trend, packaging industry requirement and the students' competencies in this program.

Table 4: The suggestions of the graduated students for some workplaces

Workplace Types	Advantages	Disadvantages	Area for Improvement
Design or Graphic House	The workplace type of design or graphic house is suitable for students who have competence in design, are creative and are up to date with current trends.	Travelling is inconvenient, and students going for internships should have their cars because most workplaces are far from the university.	The internship administrators should provide students with information about the travel to the workplace and inform the staff in that workplace about the design course that the student took in the curriculum.
Offset Printing House	It is more suitable for male students as it is easier to take safety precautions and management.	The tools and equipment used for practical training frequently malfunction and become inoperable. There is hard work and poor environmental management.	The internship administrators should survey the needs of both female and male students before allowing them to practice in an internship. The students should have their own equipment such as a laptop or computer notebook.
Packaging Manufacturer	Students gained knowledge from actual practice because there was a good working system.	When going to work, there always be heavy traffic. The students should have their vehicle. They should prepare to adapt to a new society and look for opportunities to learn new tasks.	The internship administrators should inform students to study the route for traveling to work and adapting to working society. When in doubt, always ask their mentor.
Suppliers and Services	Students who are interested in printing technology will gain a lot of knowledge because the staffs are very knowledgeable.	There is no variety in the internship, the work was the same repeatedly. During the rainy season, there was heavy flooding, and the travel was long. The students should stay in dormitories with a roommate to share the expenses.	The internship administrators should provide guidelines for practicing in the area of repair, and presentation of materials and equipment.

Other Information From Graduated Students

From the open-ended questions, the suggestions can be summarized as follows. Two workplace types; the design or graphic houses, and the suppliers and services were excellent in the topic of readiness and collaboration, due to good compensation, allowances, and the equipment or tools for students practice to ensuring the work efficiency.

In topic of research project support, the entrepreneurs of design or graphic houses were ready and willing to collaborate with students to have research and develop for their companies. In term of mentor or advisor providing, the staffs of suppliers and services were expert to effectively provide guidance, suggestion, and knowledge transfer. The success key of internship is to apply the knowledge gained from the workplace for future occupation, income, living, and continue to benefit society.

Conclusion

This study was a routine to research (R2R) to develop the information for undergraduate students to determine the suitable workplace before application for internship in the cooperative education practice course of the B.Sc. Program in Printing and Packaging Technology at the Faculty of Industrial Education and Technology, King Mongkut's University of Technology Thonburi. The qualitative and quantitative results of the workplace was analyzed by survey on the opinion and satisfaction of the graduated students to the workplace that they had ever have a cooperative education practice. In this study, there were 40 workplaces, with a total of 75 respondents from 150 graduated students attending the cooperative education practice during 2020 to 2022.

For consideration in quantitative results, it was indicated that a high number of the design or graphic houses, the suppliers and services, and the packaging manufacturers were very good in mentor and advisor providing. For consideration in qualitative results, the satisfaction of graduated students in the readiness and collaboration, including research project support of the design or graphic houses and the suppliers and services, were also high. The workplaces type of design or graphic houses were the most appropriate for internship, and the suppliers and services were more appropriate than the offset printing houses and packaging manufacturers, respectively.

Design of Challenge Based Learning Module for Developing Social and Digital Skills of Vocational Education Students in Thailand

Tanes Tanitteerapan, King Mongkut's University of Technology Thonburi, Thailand
Sorakrich Maneewan, King Mongkut's University of Technology Thonburi, Thailand
Sakesun Yampinij, King Mongkut's University of Technology Thonburi, Thailand

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

The design of a learning module to achieve social and digital skills for students in the vocational education system in Thailand has been introduced. The module included online lessons for self-learning and onsite activities following the process of Challenge-based Learning (CBL) classified as 3 processes: engage process, investigate process, and act process. The online lessons were designed as the Definition of community, Digital wellness, Digital content creation with smartphones, Online marketing, Challenge-based Learning Details, and Project Accomplishment. Students learned these lessons before access to activities in the CBL process. The students were grouped and assigned to get the project theme from the community and investigate how to apply knowledge and vocational skills to assist the community. The CBL process was utilized as a project framework that students would get the project theme from the engage process, get the project procedures from the investigate process, and get project accomplishment from the act process. To ensure the effectiveness and efficiency of the learning process, an on-site mechanism has been developed to meet, support, and monitor CBL learning activities for 533 students from vocational colleges in Thailand. The students were grouped as A, B, C, D, E, and F to create the projects and all projects were designed to present the results through 3 minutes of digital clips. The results indicate that the students have received enhanced experiences including skills in critical thinking, emotional intelligence, social skills, social responsibility, readiness for change, and various preparedness and adaptability to changes.

Introduction

Vocational education usually is set to prepare young Thai people to have the readiness to work as manpower in the workforce or labor market. This is an educational system that is different from fundamental education (high school level education) which focuses on preparing people with academic skills for continuing to get access to higher education. In Thailand, vocational education is divided into 2 levels (1) vocational certificates which have 3 study years for basic professional skills in many kinds of occupations for those who graduate from secondary schools, and (2) vocational diploma certificates which have 2 study years for advanced professional skills in many kinds of occupations for those who graduate from the vocational certificate level or high school. The goal of developing students in the vocational education system in the country at technical colleges is the professional skills that fit for needs of many kinds of occupations in the labor market. In the past, this focused only on how to develop students having enough professional skills with the necessary technical disciplines for working after graduated study in college. The learning activities are almost handled in the college and have only a short duration for work practicing in the real workplace. However, presently, expectations of vocational education have been changed. Due to it being related to many kinds of innovation both in development and application, then, it is not adequate for holding only professional skills, but 21st-century skills also must be developed for vocational students to be good and smart manpower in the era of everything around us is smart.

Digital skills are one of the best added-on skills for this era for technicians who are experts in professional skills. The filming skills are the best example of digital skills that students may apply to expand their professional skills to other opportunities in the works. Meanwhile, social skills such as global thinking or thinking for other skills are also necessary for vocational students due to, they have competencies in professional that are very good if they have the mind to do something for others with their professional.

Figure 1: Challenge Based Learning Framework [1]

To develop students to have both digital skills and social skills, the challenge-based learning (CBL) concept is a good way to be considered. This has been developed from the project-based learning (PjBL) concept that is designed to relate to real issues from the society of the community around students. The CBL will be applied as the learning base to develop the potential of students who must find and take the challenge to solve problem issues from the social or communities under the facilitation and coaching of teachers. The learning process for CBL can be divided into 3 steps as shown in Fig.1. The first step is "Engage" which is to

find out the problem issue from the society or communities around students covering house, school, or workplace. The second step is "Investigate" which is to find out what knowledge, skills, and materials are needed and what plans are needed to solve the defined problems. The third step is "Act" which is to find out how to implement the defined plan and what the conclusion of the solution is.

Therefore, this paper aims to design a learning module to develop the digital skills and social skills of vocational students in the vocational education system in Thailand based on the framework of challenge-based learning (CBL).

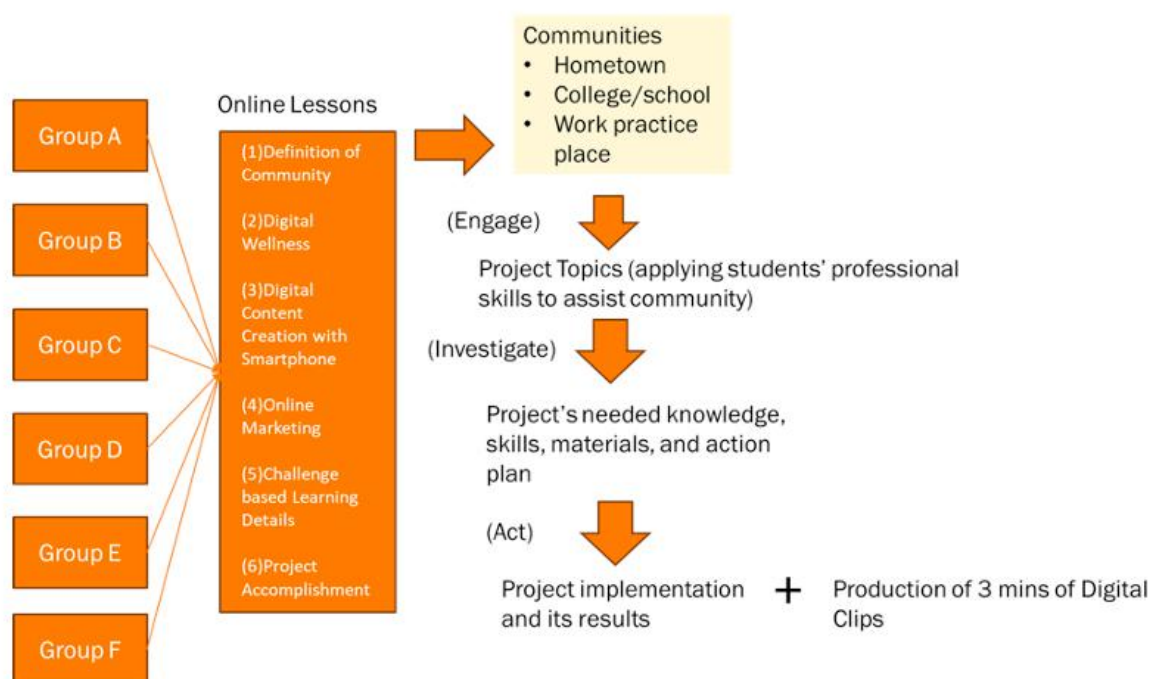
Design of the Proposed CBL Module


Figure 2: Proposed CBL Module

To design the learning module, the module learning outcome must be defined first. After learning the proposed module, students will be able to have (1) Awareness of social issues and the ability to apply their knowledge and skills to help society, (2) Empathy towards society and community, (3) Leadership and teamwork abilities, (4) Readiness for change due to changing social contexts, (5) Self-value recognition, and (6) Work opportunity. All these are the module learning outcomes. To achieve these outcomes, learning activities were designed by using learning technology and learning design as shown in Fig.2. To prepare students before access to the CBL processes, 6 necessary online lessons as (1) **Definition of Community** to understand what community is and how to understand others who are around us, (2) **Digital Wellness** to understand what useful and prohibition of social media are, (3) **Digital Content Creation with Smartphone** to understand how to create digital contents with a smartphone because it is the most convenient for students, (4) **Online Marketing** to know how to promote and sell products on online platforms, (5) **Challenge-based Learning Details** to understand each step of learning in the CBL, and (6) **Project Accomplishment** to know how to complete the project from initiation to the end were designed. Students will be grouped and all be assigned to learn designed online lessons that have a pretest and posttest

for each lesson so students can do self-evaluation. After self-online learning, each group of students will go to a community that here widely defined as a hometown, college/school, or work practice place to find out the social issue/problem. In the **Engage** process, students will discuss what issue they faced and what professional knowledge and skills they have for assisting the community as a group project topic. Next, in the **Investigate** process, students will find out what needed knowledge, skills, and materials are and define the action plan for implementing to accomplish the project. Finally, in the **Act** process, students will implement the action plan until they accomplish the project. To present the results of the project and to show how achievement for all module learning outcomes occurred, the production of 3 minutes of digital clips will be required. All these steps shown in Fig.2 are the proposed learning module and all learning evidence should be kept in the learning management system (LMS). Moreover, in developing students with the CBL processes, the teacher should act by facilitating or coaching skills.

Proposed Module Implementation

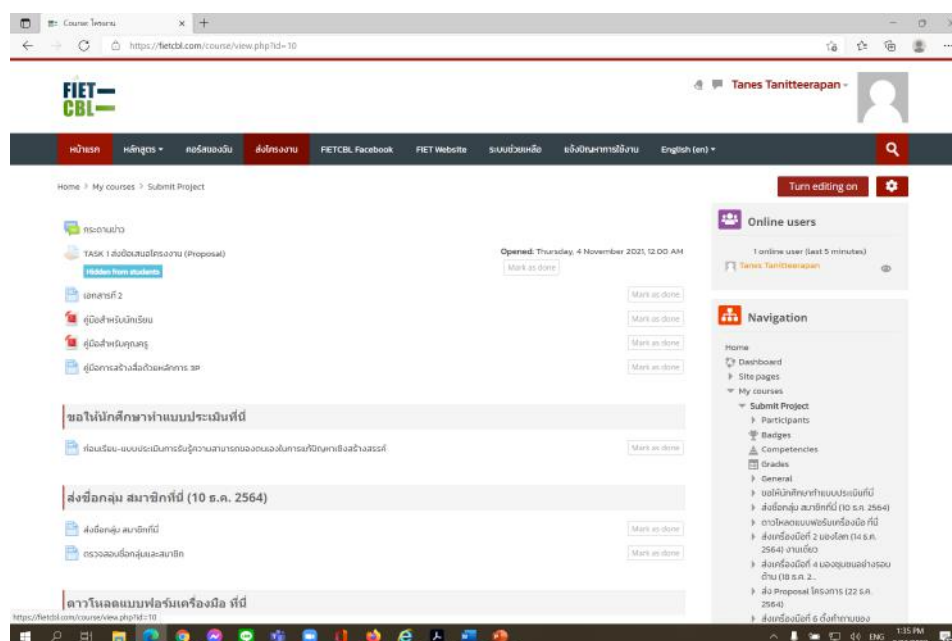
Figure 3: Proposed CBL Module during tryout


Figure 4: Designed LMS for keeping all learning evidence on the CBL processes

The module as shown in Fig.2 was implemented and to verify the idea, it was applied to the project population of 533 students from 15 vocational colleges around central Thailand.

Students were grouped across disciplines and institutions as A, B, C, D, E, and F total of 78 groups. In this, 70 teachers from 15 participated vocational colleges and 16 researchers from King Mongkut's University Thonburi were involved as facilitators or coaches in each process of the CBL. During the running process of the CBL module, online and onsite activities as shown in Fig.3 were applied. All assignments from each process of Engage, Investigate, and Act will be kept in LMS as shown in Fig.4. Here, students can access the online lessons and get teacher assignments for each step of learning in the CBL processes.

By applying the proposed module to develop the digital and social skills of 533 students, 78 projects were created and can be divided into 5 categories (1) 7 projects for agriculture works, (2) 13 projects for medical and health works, (3) 18 projects for waste energy and environment management, (4) 26 projects for life improvement, and (5) 14 projects for production and online marketing. All projects must present with 3 minutes of digital clip as shown in Fig.5.

Figure 5: Some digital clips from the proposed module

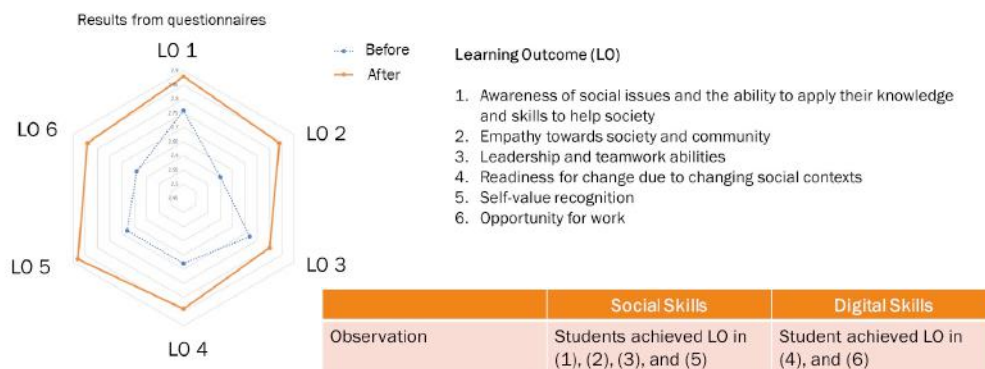
Module Achievement Evaluation


Figure 6: Results of Module Evaluation

To evaluate the achievement of the proposed module, students' behavior while running the module was applied by the researchers. As a result, students can achieve social skills with the learning outcomes on awareness of social issues and the ability to apply their knowledge and skills to help society, empathy toward society and community, leadership and teamwork abilities, and self-value recognition and can achieve digital skills with the learning outcomes on readiness for change due to changing social contexts, and work opportunity as shown in the table in Fig.6. Moreover, the questionnaires for evaluation of the student's learning achievement were applied to the teachers. These were applied to observe before and after learning with the proposed module as shown in Fig.6. From the figure, all learning outcomes achievements after learning were higher than before learning significantly.

Conclusion

A prototype of the design of a learning module for developing social skills and digital skills based on Challenge Based Learning (CBL) was introduced for the Vocational Education System. The module included online lessons for self-learning and onsite activities following the process of Challenge-based Learning (CBL) classified as 3 processes: engage process, investigate process, and act process. The online lessons were designed as the Definition of community, Digital wellness, Digital content creation with smartphones, Online marketing, Challenge-based Learning Details, and Project Accomplishment. Students learned these lessons before access to activities in the CBL process. The students were grouped and assigned to get the project theme from the community and investigate how to apply knowledge and vocational skills to assist the community. The designed module was run both online and onsite as a hybrid learning system. Teachers acted as facilitators or coaches in CBL process and students were developed to have achievement on social skills and digital skills with real issues from communities. Almost 80 projects were developed and created as 3 minutes of digital clips. The results indicate that the students have received enhanced experiences including skills in critical thinking, emotional intelligence, social skills, social responsibility, readiness for change, and various preparedness and adaptability to changes. This designed module might be useful for inspiring an idea to research on development of digital and social skills for Vocational students or others by using various digital education tools as based of development.

Motivation in English Learning: A Case Study of an ESP Course in a Thai University

Watcharee Paisart, King Mongkut's University of Technology North Bangkok, Thailand

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Running an ESP course which requires students to participate actively in the course, the students' ability to interact with topics a teacher raises in class is important. As a teacher, the researcher had noticed that some students enjoyed the class while some did not. This brought to an investigation to see what caused this phenomenon to happen so as to understand the condition and factors that affect students' motivation in learning English. Then, more appropriate lessons may likely be focused for further courses. The investigation was done by an open-ended questionnaire with 103 participants who studied an ESP course in a Thai university. Three main questions were studied: (1) Do you like learning English? (Why or why not); (2) How much motivation do you have in learning English? (What are factors encouraging you to learn English); and (3) How much confidence do you have in speaking English? (What are problems affecting your confidence in speaking English?) The results showed that 76.70% of the students like to study English; while 18.45% do not, and 4.85% neither like nor dislike. Most students love learning English because they want to go abroad and use English to communicate. For their motivation scale ranking from 0-10, the average is at 7.15 with the reason on the ability to communicate with foreigners at 31.08%. For problems affecting confidence in speaking English, the low self-esteem in speaking English is highly stated at 34.16%. The average of confidence in speaking English is at 4.85 (out of 10).

Introduction

In a university which there are a lot of mixed levels of students, to use English as a medium language is in consideration of each specific case. Teachers should be able to cover the content, language structures, vocabulary, and functions as planned in the teaching schedule; while English is encouraged to be used in an English class to make students get familiar of listening and speaking English. However, in some classes, where there are a lot of low to average English proficient students, to use English may cause some difficulties for some students in case their understanding may need more struggling than other students. This may lessen their learning motivation.

Students' motivation is one of important factors which support students' learning (Gardner and Lambert, 1959, 1972; Coleman, James, Galaczi, and Astruc, 2007; Lier, 1996). As Gardner (1982) mentioned that motivation consists of three components: effort (which is about the time the students spend in learning the language and their drive to learn English); desire (relevant to the students' need to be proficient in English); and affect (that is linked to their feeling to study English). So, to be successful in learning a language, students' motivation is important and necessary. In addition, motivation is categorized into two main types, namely integrative motivation and instrumental motivation. The integrative motivation aims to be able to integrate into the language; while the instrumental motivation tends to be able to use the language as functions to communicate. The teachers who teach English should make sure if the use of English does not destroy the students' learning motivation. As Deci and Ryan (1985) mentioned about the supportive learning situation can affect learning motivation.

This study, then, focuses on investigating students' preference in learning English to see if they like English or not. It is likely that students who love learning English tend to have high motivation in learning English than those who do not like to learn English. Liar (1996) mentioned that students who have motivation could achieve their goals in learning more than those who do not have. After that, motivation in learning English was investigated. This study focuses on students who study an ESP course. Most students were in low to average English proficiency. English was used a medium language in class. Moreover, their confidence in speaking English was also studied.

There are three main questions to be investigated:
1. Do you like learning English? (Why or why not)
2. How much motivation do you have in learning English? (What are factors encouraging you to learn English)
3. How much confidence do you have in speaking English? (What are problems affecting your confidence in speaking English?)

The data analysis was done by coding. This is to group similar ideas of answers together and count for frequency and calculate into percentage. Then, intra-coder or intra-rater technique was also employed in order to check for the reliability coefficient. The researcher took about 9 months to re-analyze the data again, then, compare the first and the second times of the data analysis.

The results of the study are presented according to the research questions respectively. The first part shows the findings from the coding, frequency, and percentage. The second part reveals the intra-coder reliability coefficient.

Part 1: Coding, Frequency, and Percentage

The below table is to answer **Question 1** "Do you like learning English?" Most of the students answered that they preferred learning English for 76.70%. About 18.45% said they did not like it and only 4.85% neither liked nor disliked learning English.

Items	Like	Dislike	Neither like nor dislike	Total
Numbers of Students	79	19	5	103
Percentage	76.70%	18.45%	4.85%	100%

Table 1: Students' preference in English learning

This part is linked from the above part about their preference in English learning. Here are supporting reasons why they liked or disliked learning English. It could be seen that most of the students who preferred to learn English answered that they wanted to go abroad and be able to communicate for about 23.08%. Another two reasons with equal numbers of percentage were because English was fun and they were aware of the importance of English, which were 13.84% both.

Items	Reasons	Frequency	%
1	Want to go abroad and be able to communicate	30	23.08%
2	Fun learning	18	13.84%
3	Be aware of importance of English	18	13.84%
4	Use for working	15	11.54%
5	Communicate with foreigners	11	8.46%
6	Use in daily life	11	8.46%
7	Use for practicing singing English songs	7	5.38%
8	Use to watch movies	6	4.62%
9	Value people who can use English	6	4.62%
10	Be attractive in learning English	6	4.62%
11	Effect from affective teacher	2	1.54%
	Total	**130**	**100%**

Table 2: Supporting reasons of their preference in English learning (Like)

Next part shows the supporting reasons of those students who disliked learning English. Most of them (38.70%) mentioned that English had too many points to remember (such as grammar points). The second top supporting reason was because of their self-indulgence for about 29.03%. They thought that they were not competent enough to learn English so they did not have strong drive to push themselves to learn English with their utmost effort.

Items	Reasons	Frequency	%
1	Too many points to remember e.g. grammar	12	38.70%
2	Self-indulgence	9	29.03%
3	Teacher's inappropriate style of teaching	3	9.68%
4	Low-self confidence	3	9.68%
5	Lack of lexical knowledge to be used leading to low intention in studying English	2	6.45%
6	No interest in English learning	1	3.23%
7	Dislike the under-pressure environment in studying	1	3.23%
	Total	**31**	**100%**

Table 3: Supporting reasons of their preference in English learning (Dislike)

The next table shows reasons of a number of students who neither liked nor disliked learning English. The top reason (40%) focused on the teacher's teaching style. So, this shows that teaching style could have an effect on students' preference in learning English in some aspect.

Items	Reasons	Frequency	%
1	Depend on the teacher and teaching style	2	40%
2	Realize that their English knowledge is ok (no problem in life)	1	20%
3	Just learn it because it's a must	1	20%
4	Just be able to learn it but feel so so	1	20%
	Total	**5**	**100%**

Table 4: Supporting reasons of their preference in English learning (Neither like nor dislike)

Next, the results from **Question 2** show how much motivation the students have in learning English. This was to let students rank their score from 0 to 10. The average scores were 7.15.

Score Rank (0 – 10)	Frequency	%
Score at **10**	10	9.71%
Score at **9**	11	10.68%
Score at **8**	25	24.27%
Score at **7**	22	21.36%
Score at **6**	15	14.56%
Score at **5**	13	12.62%
Score at **4**	7	6.80%
Score at **3**	0	0
Score at **2**	0	0
Score at **1**	0	0
Score at **0**	0	0
Total	**103**	**100%**

Table 5: Average score rank in learning English motivation

This part is to show lists of factors that encourage students to learn English. There were 11 lists of factors that the students mentioned. The top two factors were because English could help in communicating with foreigners for 31.08% while another factor focused on its use in working (28.38%).

Items	Factors	Frequency	%
1	It helps in communicating with foreigners.	46	31.08%
2	It helps in working.	42	28.38%
3	It helps in having good profiles.	16	10.81%
4	It helps in travelling.	14	9.46%
5	It helps in entertaining.	9	6.08%
6	It helps in everyday use.	7	4.73%
7	It helps in exploring new things.	5	3.38%
8	English is compulsory. I must learn it.	3	2.03%
9	Teachers and their teaching styles influence motivation.	3	2.03%
10	Students are motivated to learn English because they want to be like their idols.	2	1.35%
11	Students are motivated to learn English because of the environment they live in.	1	0.67%
	Total	**148**	**100%**

Table 6: Factors encouraging students to learn English

The next part focuses on **Question 3** which is about students' confidence in speaking English. The same as the previous part, the students had to rank their scores from 0 to 10 to give themselves scores in their confidence to speak English. The average score of all students was only 4.85 out of 10 which was very low, not even pass half of the full score. This shows that most students had low self confidence in speaking English regardless of their competency.

Score Rank (0 – 10)	Frequency	%
Score at **10**	1	0.97%
Score at **9**	1	0.97%
Score at **8**	3	2.91%
Score at **7**	11	10.68%
Score at **6**	15	14.56%
Score at **5**	33	32.04%
Score at **4**	23	22.33%
Score at **3**	8	7.78%
Score at **2**	3	2.91%
Score at **1**	3	2.91%
Score at **0**	2	1.94%
Total	**103**	**100%**

Table 7: Average score rank in speaking English

This part links to the above part about the confidence in English speaking of students. There were lists of problems that blocked the students from being able to speak English. The top three problems were their low self-image in their English proficiency (34.16%), limitation of vocabulary (22.28%), and their worry about accent (9.90%).

Items	Problems	Frequency	%
1	Low self-image in their English proficiency	69	34.16%
2	Limitation of vocabulary	45	22.28%
3	Worry about accent	20	9.90%
4	Lack of practice in English speaking	18	8.91%
5	Limitation of knowledge in sentence structure	14	6.93%
6	Lack of listening skill	14	6.93%
7	Worry about grammar	14	6.93%
8	Worry about pronunciation	7	3.47%
9	No interest in English	1	0.49%
Total		**202**	**100%**

Table 8: Problems affecting confidence in speaking English

After the presentation of the coding, frequency, and percentage in the above section, then, the next section shows the research findings with another method, which is the analysis of reliability coefficient. This method helps to double check about the reliability coefficient of the findings to see if the data analysis employed was reliable and acceptable in academic aspect or not.

Part 2: Intra-Coder Reliability Coefficient

> The **intra-coder reliability** test is displayed below:
>
> $$\frac{\textbf{Number of items coded the same in the first and second coding}}{\textbf{Number of items coded in the first coding}}$$

To answer **Question 1** about the students' preference in English learning, the students also gave reasons to support why they liked learning it. The first time, the researcher indicated 11 reasons; whereas, the second time of the data analysis, 9 reasons were found. Therefore, the reasons supporting student's preference in English learning were 9 reasons with the reliability coefficient of 0.82. Neuendorf, 2002 (p. 145) mentioned that "coefficients of .90 or more would be acceptable to all, for **.80 or more would be acceptable for most cases** and if it was below this point, there might be some inacceptable points to be discussed." So, in this part it means the finding is acceptable.

First time analysis: 11 reasons

Items	Reasons	Frequency	%
1	**Want to go abroad and be able to communicate**	**30**	**23.08%**
2	*Fun learning*	*18*	*13.84%*
3	Be aware of importance of English	18	13.84%
4	Use for working	15	11.54%
5	**Communicate with foreigners**	**11**	**8.46%**
6	Use in daily life	11	8.46%
7	Use for practicing singing English songs	7	5.38%
8	Use to watch movies	6	4.62%
9	Value people who can use English	6	4.62%
10	*Be attractive in learning English*	*6*	*4.62%*
11	Effect from affective teacher	2	1.54%
	Total	**130**	**100%**

Table 9: 1st time analysis (Question 1: Reasons why they liked learning English)

Second time analysis: 9 reasons

Items	Reasons	Frequency	%
1	**Want to go abroad and be able to communicate with foreigners**	**41**	**31.54%**
2	*Fun learning and be attractive in learning English*	*24*	*18.46%*
3	Be aware of importance of English	18	13.84%
4	Use for working	15	11.54%
5	Use in daily life	11	8.46%
6	Use for practicing singing English songs	7	5.38%
7	Use to watch movies	6	4.62%
8	Value people who can use English	6	4.62%
9	Effect from affective teacher	2	1.54%
	Total	**130**	**100%**

Table 10: 2nd time analysis (Question 1: Reasons why they liked learning English)

Intra-coder Reliability =

Analysis	1st time analysis	2nd time analysis
No. of Reasons	11	9

= 9/11 $\rightarrow$ **R = 0.82**

The next part is to answer **Question 2** about what factors encouraging the students to learn English. The first time of the analysis covered 11 factors; while the second time consisted of only 9 factors. The reliable coefficient of this part was 0.82 which is acceptable (Neuendorf, 2002).

First time analysis: 11 factors

Items	Factors	Frequency	%
1	**It helps in communicating with foreigners.**	**46**	**31.08%**
2	*It helps in working.*	*42*	*28.38%*
3	*It helps in having good profiles.*	*16*	*10.81%*

Analysis	1st time analysis	2nd time analysis
No. of problems	9	9

= 9/9 → **R = 1.00**

Conclusion

From the results of the study, it could be seen that most students, regardless of their English proficiency, preferred to study English because they would like to be able to communicate with other people. This is similar to Carrió-Pastor and Mestre Mestre (2014) which mention that generally most students have motivation to learn a language because they want to be able to use it (instrumental motivation) not to understand it (integrative motivation). So, from this finding, it can be implied that activities and practices in class should also focus more on language application, not just only language point to be memorized. An interesting point which was found in the study was that among students who neither liked nor disliked learning English mentioned that they would wait to decide if they like learning or not by considering the teachers' teaching style. This links to Phan (2010) that the teacher's support in English learning could have an effect on their learning motivation.

The reason most students mentioned for motivating them to learn English was about communication and for work purposes. This shows that they concern about English use as

functional instrument to help them in the future. English which was used as a medium language in class even if the majority of students were in low to average proficiency but from the finding, it showed that most of them preferred that the teacher used English. This might be because they could have a chance to practice their listening skills which could be useful in their work or personal purposes.

Referring to the above paragraph of the conclusion and discussion about the use of English in class; however, most students have low self-esteem in speaking English. They had low self perception on speaking skill. This could be seen from their average speaking score they chose to represent their speaking ability. Then, this could lead to the activity preparation in class that the teachers should find or create some kinds of activity which can help them increase their confidence and self esteem in speaking English with other people.

Improvement of Data Management to Support Educational Quality Assurance of
a Faculty in University Using Digital Platform of Microsoft Teams

Official Conference Proceedings

Abstract
The educational quality assurance (QA) is the management and operation of universities to continuously improve the quality of students and graduate students. The purpose of this study is to improve the data management process for QA of the Faculty of Industrial Education and Technology, King Mongkut's University of Technology Thonburi, Thailand by using the Microsoft Teams. The principle of SIPOC model had been applied for brainstorming and gap analysis, showing that the main problem was an inefficiency in data management including data collecting, organizing, and accessing. The conventional process of information preparation was performed by requesting cooperation from relevant parties which was complicated and delayed, causing lately report submission as requirement. The process for data management of QA was then improved by analysis of data source, type, sequence, period, and connection before redesign using the Microsoft Teams platform. The channel of data collection was communicated with involved administrators to understand and access easily. There was also notification system for staffs to store information at the appropriate time by setting in the google calendar. The results have been follow-up by evaluating the satisfaction of users to the improved system using online questionnaire with 5-scale, showing that the system was good with the mean score of 4.1. The results of this study could enhance the systematic management of data collection, quickly and easily to find the information, reducing the process of QA report preparation. In addition, this procedure could be a good guideline for other practices of the faculty.

Keywords: Microsoft Teams Platform, Quality Assurance, SIPOC

Introduction

IQA stands for Internal Quality Assurance (IQA). IQA is the process of ensuring that the learning and qualifications in an educational environment, meet agreed quality standards. The aim of Internal Quality Assurance is to ensure that assessment practices are consistent, fair, and reliable. They need to result in valid and accurate assessments of learners' knowledge, skills, and understanding. IQA is an important component of the overall quality management system in the education and training sector. The job of the IQA is to oversee the quality assurance process of an organizations training program. The IQA is responsible for making sure that all the training delivered meets the necessary standards. These standards are set by both the training provider and awarding body. The IQA is also responsible for making sure that the assessors and trainers within the organization are trained to the required standards. This would be the organizations 'Lead IQA'. This role is also known as a Centre Lead or Quality manager. The specific job duties of an IQA may vary depending on the organization, but generally, an IQA's job may include the following: 1. developing and implementing quality assurance systems and processes. 2. ensuring that assessors and trainers are using valid and reliable assessment methods and techniques. 3. Monitoring the assessment practices of assessors and trainers to ensure they are consistent and fair. 4. Providing feedback and support to assessors and trainers to improve their assessment practices. 5. Reviewing assessment decisions to ensure they are accurate and valid. 6. Ensuring that all assessment practices are compliant with relevant policies, procedures, and regulations and 7. Maintaining accurate records and documentation of all quality assurance activities [1].

The Ministry of Higher Education, Science, Research, and Innovation (MHESI) has decided to endorse a guide for the examination of educational curricula and the inspection of educational operations to ensure the accreditation standards of higher education programs. This approval applies to both higher education institutions and the Office of the Permanent Secretary, Ministry of Higher Education, Science, Research, and Innovation. The Higher Education Quality Improvement Division (HEC) has developed an inspection manual for educational curricula and the assessment of educational operations to certify higher education standards. This curriculum is intended for higher education institutions in Thailand and is meant to serve as a guide for preparation in designing an educational curriculum that emphasizes learning outcomes and effectively meets the needs of stakeholders [2].

King Mongkut's University of Technology Thonburi (KMUTT), which operates under the jurisdiction of the Ministry of Higher Education, Science, Research, and Innovation (MHESI), is mandated to utilize a manual for the examination of academic programs and the inspection of management operations in studies. This manual serves as a guide for curriculum development and implementation at KMUTT. KMUTT has adopted a comprehensive policy with a primary focus on assessing the quality of its academic programs. The internal quality assurance for these programs involves two distinct criteria. The first criterion addresses a standardized approach to curriculum control, while the second criterion emphasizes standardized guidelines for curriculum development. Both of these criteria are overseen by the Ministry of Higher Education in Thailand.

The Faculty of Industrial Education and Technology at KMUTT offers a total of 16 programs, comprising 8 bachelor's degrees, 7 master's degrees, and 1 Doctor of Philosophy. Each program undergoes a rigorous quality assurance process to ensure adherence to standards and consistent quality. Programs are required to prepare a self-assessment report known as the 'Course Tracking Report' to report on course performance. These reports are

then submitted to the Educational Development and Services Office (EDS) at KMUTT—a central unit that supports the university's educational development. This unit collaborates with other departments, namely the Faculty Development Department, Teaching and Learning Development Department, and Organizational Development Department, to coordinate and manage educational development activities. In the course of quality assurance, there is a need for effective information exchange among various departments within and outside the faculty. A communication channel is established to facilitate the request for various documents necessary for compiling a comprehensive course follow-up report.

Based on the findings from previous operations, it was identified that the process of collecting documents and evidence for preparing the Course Monitoring and Review (CMR) report lacked systematic organization, and there was insufficient planning for data collection over time. This resulted in incomplete information. Additionally, the coordination in requesting information from various departments within the Faculty was slow, leading to delays in submitting CMR reports. These challenges have posed difficulties in meeting the quality assurance standards set by the authorities. The primary issue lies in the inefficiency of data management, encompassing both the collection and organization of data, as well as accessing information. The traditional data preparation process relies on complex and delayed cooperation from relevant parties. In the realm of higher education institution quality assurance operations, a more effective system is needed to facilitate document storage, prevent data loss, and eliminate delays in document retrieval or searching [3].

Consequently, this research aims to achieve two objectives to enhance educational quality assurance: to improve educational quality assurance, such as using digital platforms to improve educational quality assurance. And to increase the efficiency of educational quality assurance by planning data collection and data analysis of the Faculty of Industrial Education and Technology King Mongkut's University of Technology Thonburi.

Methodology

The methodology for this research involves a systematic approach to enhance the curriculum monitoring reports process within the Faculty of Industrial Education and Technology at King Mongkut's University of Technology Thonburi. The methodology consists of several key steps:

Step 1: Study of Operational Issues using the SIPOC Model

In this initial step, the SIPOC (Suppliers, Inputs, Process, Outputs, Customers) Model is employed to examine operational challenges and identify key elements and stakeholders in the curriculum monitoring reports process. For this research, Suppliers were Faculty Staff, Lecturers and Administrators.
1. Inputs were the correct and complete data such as the number of Lecturer's research, the number of students, Satisfactions of stakeholder, and more.
2. Process, Output was the center of quality assurance system.
3. Customers get the benefit of the quality assurance system.

Step 2: Study and Analysis of Main Document Data for Curriculum Monitoring Reports

This step involved a thorough study and analysis of the main document data required for the Curriculum Monitoring Reports. The focus was on understanding the necessary information based on the curriculum criteria set by the Ministry of Higher Education, Science, Research, and Innovation.

Step 3: Planning for Data Collection for Curriculum Monitoring Reports

A detailed planed for the data collection process is developed, ensuring connectivity with all departments within the Faculty of Industrial Education and Technology. Timeframes are defined to facilitate timely and comprehensive information gathering.

Step 4: Creating the System for Data Storage in Folders using Microsoft Teams Platform

This step involved the design of folders and structures for a dedicated data storage system for educational quality assurance. The Microsoft Teams platform is chosen for its accessibility and user-friendly features, aligning with quality assurance requirements.

Step 5: Conducting the Meeting for Information Dissemination

A meeting is organized to disseminate information to academic and supporting staff. Clear instructions are provided on the utilization of the new system.

Step 6: Implementing the Data Collection in Microsoft Teams

The data collection process is initiated within the Microsoft Teams platform according to the designed plan. Relevant personnel are guided and encouraged to actively participate in the data collection process.

Step 7: Evaluation of Satisfactions from Users

In this step, we will assess user satisfaction with the improvements made in data management to support educational quality assurance within a university faculty. The digital platform chosen for this purpose is Microsoft Teams.

Table 1: The contents for satisfaction evaluation in Questionnaire

Main Topics	Sub-topics
Data Access in System	- Information Dissemination for System - Understanding of System Operating - Easy and Convenience in Data Access
Usage of the Data Storage System in MS Teams	- Folder Setting and Providing for CMR - User-Friendliness of Platform - Systematic and Useful of Data - Efficiency Enhancement in Work Operations - Step Reduction for Information Request - Overall Satisfaction on Data Storage System

7.1 Statistical Measures Used for Evaluation:

7.2 Data Analysis Procedures:

7.2.1 Analysis of Survey Data:

Calculating the mean ($\bar{x}$) and standard deviation (SD) for quantitative analysis.

7.2.2 Scoring Based on Boonchom's Concept (2013):

Evaluating responses according to Boonchom's framework, where scores are assigned on a scale of 1 to 5, representing the levels of excellence, high satisfaction, moderate satisfaction, low satisfaction, and the lowest satisfaction, respectively.

7.2.3 Interpretation of Satisfaction Levels:

Interpreting the analysis results based on user satisfaction criteria:

Mean scores of 4.51–5.00 indicate the highest satisfaction.

Mean scores of 3.51–4.50 indicate high satisfaction.

Mean scores of 2.51–3.50 indicate moderate satisfaction.

Mean scores of 1.51–2.50 indicate low satisfaction.

Mean scores of 1.00–1.50 indicate the lowest satisfaction.

Results

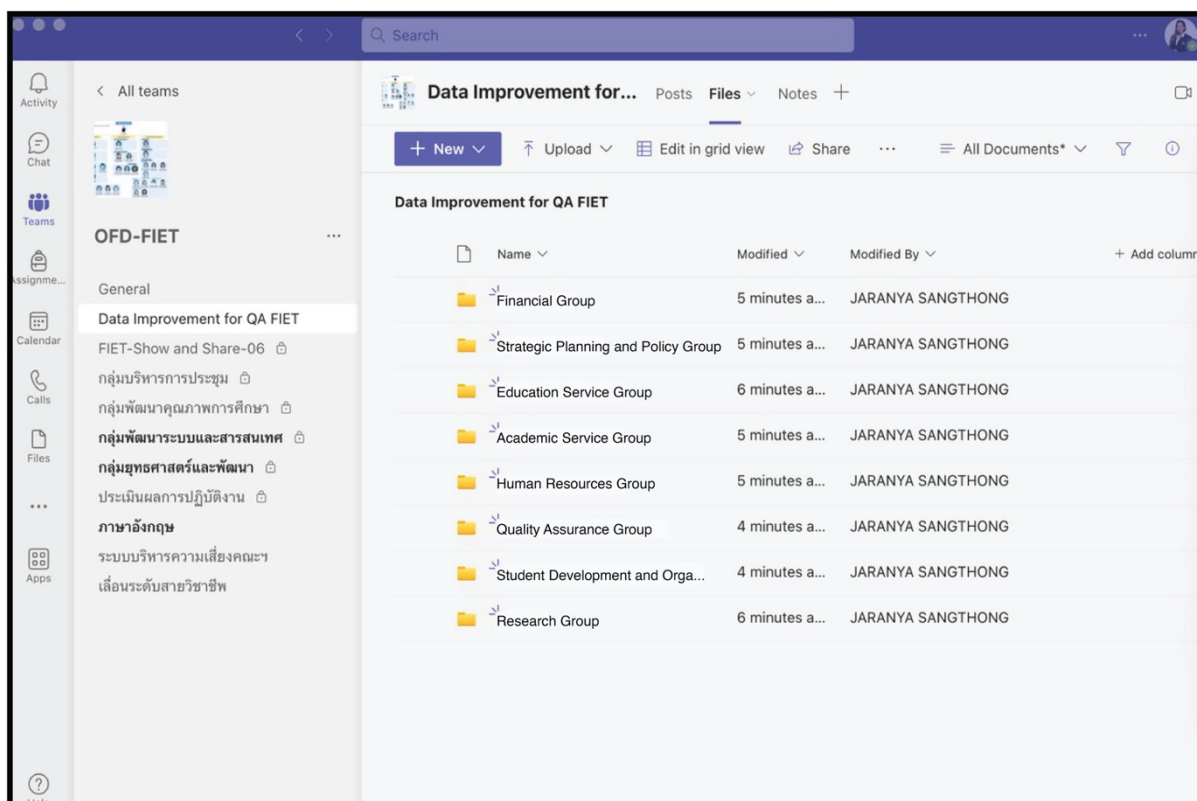
Following this, Microsoft Teams was a tool for monitoring and follow-up for essential information encompassing financial data, policies, both current and graduated student information, research outputs from faculty members and students, and stakeholder satisfaction. Data from these aspects is collected from eight distinct groups, ensuring that it remains current and prepared for thorough analysis. The eight groups contributing to this comprehensive dataset are shown in Figure 1: Financial Group, Strategic Planning and Policy Group, Education Service Group, Academic Service Group, Human Resources Group, Quality Assurance Group, Student Development and Organizational Communication Group, and Research Group. This utilization of Microsoft Teams served to streamline communication, facilitate collaboration, and ensure that all relevant information was readily available for efficient decision-making and strategic planning within the research framework , as shown in Figure 1.


Figure 1: The Data Collection in Microsoft Teams from 8 Groups

Based on the satisfaction survey study on the improvement of Data Access in System to support educational quality assurance within a faculty at the university, utilizing the digital platform of Microsoft Teams, the research findings are summarized in Table 2.

Table 2: The Result Evaluate System Quality by Users for Data Access in System (N=20)

Data Access in System			
Title for evaluation	$\bar{x}$	**S.D.**	**Level of Satisfaction**
1. Information Dissemination for System	3.95	0.59	High
2. Understanding of System Operating	4.24	0.44	High
3. Easy and Convenience in Data Access	4.43	0.68	High
Overall Average Evaluation Result	**4.21**	**–**	**High**

The results revealed a heightened level of satisfaction across multiple dimensions, encompassing information dissemination, understanding of system operation, and ease of data access. The cumulative average evaluation result of 4.21 substantiates the conclusion that the implemented enhancements in data management through Microsoft Teams had significantly and positively influenced user satisfaction within the educational quality assurance framework. This indicated a successful integration of the digital platform in meeting user expectations and improving overall system quality in the academic setting.

Based on the satisfaction survey study on the improvement for Usage of the Data Storage System in MS Teams to support educational quality assurance within a faculty at the

university, utilizing the digital platform of Microsoft Teams, the research findings are summarized in Table 3.

Table 3: The Result Evaluate System Quality by User for Usage of
the Data Storage System in MS Teams (N=20)

Usage of the Data Storage System in MS Teams			
Title for evaluation	$\bar{x}$	**S.D.**	**Level of Satisfaction**
1. Folder Setting and Providing for CMR	4.22	0.62	High
2. User-Friendliness of Platform	4.86	0.36	Highest
3. Systematic and Useful of Data	4.57	0.6	Highest
4. Efficiency Enhancement in Work Operations	4.38	0.5	High
5. Step Reduction for Information Request	4.52	0.51	Highest
6. Overall Satisfaction on Data Storage System	4.33	0.48	High
Overall Average Evaluation Result	**4.44**	**-**	**High**

The results for the evaluation of the data storage system in Microsoft Teams demonstrate a high level of satisfaction among users across various dimensions. Users expressed satisfaction with folder settings for CMR, the user-friendliness of the platform, the systematic and useful nature of the data, efficiency enhancement in work operations, step reduction for information requests, and overall satisfaction with the data storage system. The cumulative average evaluation result of 4.44 further affirms the high satisfaction level, indicating the successful utilization of the data storage system in Microsoft Teams to meet user needs and enhance overall system quality in the academic context.

Conclusion

In conclusion, the implementation of digital platform-based data management, specifically utilizing Microsoft Teams, has proven to be instrumental in enhancing the quality assurance (QA) processes within a university faculty. The transition to a digital approach has facilitated the centralization of essential information, offering an efficient and easily accessible repository for Curriculum Monitoring Reports (CMR) preparation. This centralized approach ensured compliance with QA standards set by the faculty.

The success of this digital platform is underscored by its effectiveness in data analysis, aligning seamlessly with the requirements stipulated by the Ministry of Higher Education. By leveraging Microsoft Teams, the faculty had not only streamlined data management but had also demonstrated a commitment to meeting and exceeding educational quality assurance standards. This digital transformation stands as a testament to the adaptability and efficacy of modern technology in advancing educational administration and ensuring the continuous improvement of academic processes.

Suggestion

From this research, there were additional suggestions for developing a data management system to support educational quality assurance at the curriculum level according to the AUN-QA criteria as follows:

1. 1.Increase Publicity and Awareness: There should be an effort to increase awareness and publicity to attract more users to the system.
2. Continuous System Development: Continuous development and updates to the system were essential to ensure it remains current and aligned with evolving needs.
3. User Manual Development: The creation of a comprehensive user manual is crucial to guide users on how to effectively utilize the system.
4. Retrospective Data Enhancement: There should be a focus on adding retrospective data about students, providing a more comprehensive historical perspective.

These recommendations are designed to contribute to the ongoing improvement and evolution of the data management system, ensuring that it not only meets the current needs of users but also adapts to future requirements. By addressing these suggestions, the system could become more user-friendly, informative, and aligned with the quality assurance standards outlined by IQA.

Education Inequality Within the European Union: A Spatial Statistics Approach

Andrea Furková, University of Economics in Bratislava, Slovakia

Abstract

This study aims to investigate the spatial distribution of educational inequality within the European Union (EU) using a spatial statistics approach. Educational inequality remains a significant challenge for policymakers seeking to ensure equal opportunities for all EU citizens. By examining the spatial dimension of this issue, the study contributes to a deeper understanding of the geographical patterns of educational disparities across EU member states. The research employs spatial statistical techniques, including Exploratory Spatial Data Analysis (ESDA) to analyse data on educational indicators such as educational attainment levels and other relevant factors. These indicators are obtained from Eurostat for the most recent years available. The analysis will be carried out in the context of EU regions and we will focus on tertiary education. The findings reveal significant spatial variations in higher educational inequality across EU member states. ESDA techniques help identify clusters of regions with pronounced disparities in access to higher education, providing valuable insights for targeted policy interventions. Spatial autocorrelation analysis quantifies the extent of spatial dependence, highlighting areas where similar levels of higher educational inequality are clustered. Despite efforts to promote equal opportunities, disparities in access to higher education persist across member states. By analysing the spatial dimension of this issue, the study contributes to a comprehensive understanding of the geographical patterns of higher educational inequality in the EU.

Keywords: Tertiary Educational Attainment Level, Educational Inequality Within the European Union, Spatial Autocorrelation

Introduction

Education is a fundamental right and a crucial driver of economic growth and social well-being. Within the European Union (EU), the pursuit of equal educational opportunities for all citizens has been a central tenet of regional policy. The European Union has made significant strides in promoting education as a means of fostering social cohesion and economic development. In the context of the EU, The European Education Area strategic framework (Council of the European Union, 2021) was put in place to structure collaboration between EU Member States and key stakeholders to achieve their collective vision. As part of this collaboration, several goals related to education were set. For example, by 2030 at least 45% of 25-34-year-olds should have a higher education qualification. Despite the attention paid to the issue of education in the EU, educational inequality remains a persistent challenge, with disparities in educational attainment posing barriers to social mobility and economic development. Numerous studies have explored educational inequality within the EU, with a particular emphasis on gender disparities, socioeconomic factors, and policy interventions (e.g. Muszynska & Wedrowska, 2023; Palmisano et al., 2022). However, the spatial dimension of these disparities, along with their localized geographical patterns, has received comparatively less attention. Exploratory Spatial Data Analysis (ESDA) techniques offer valuable insights into the localized nature of educational inequality. This paper addresses the issue of gender-based disparities in tertiary educational attainment within the EU by employing Local Moran and Local Geary statistics. By focusing on local spatial patterns, we aim to gain a deeper understanding of the geographical distribution of educational disparities across EU member states.

Figure 1 (two box maps – Male and Female) illustrates spatial distribution of population by tertiary educational attainment level across the European regions separately for Male and Female. In addition, to point out the gender-based disparities in tertiary educational attainment, two boxplots were constructed (Male and Female). Local spatial patterns evident from Figure 1 indicate gender-based educational disparities. Significant differences in tertiary education between men and women are also confirmed by the comparison of boxplots presented in Figure 2.

2. Research Methods

In this section, we will briefly introduce the primary methodological framework underpinning our empirical analysis. Our empirical analysis relies on selected tools from Exploratory Spatial Data Analysis (ESDA). ESDA tools facilitate the assessment of spatial connections among observations, or spatial units (such as regions or countries). Spatial association, also known as spatial autocorrelation or spatial dependence, occurs when spatial units are not independent across the geographic area. This implies that neighbouring spatial

units are linked in some way. For a more in-depth exploration of this concept, we can refer to works like Getis (2010) or Anselin & Rey (2014).

ESDA encompasses various techniques that help us describe and visualize spatial distributions, identify unusual locations or spatial outliers, and uncover patterns of spatial association, clusters, or hotspots. To detect spatial autocorrelation, we can employ global and local indicators of spatial association, including well-known statistics like Moran's *I*, Getis-Ord statistics, and Geary's *C* statistic. These statistics are employed to examine the overall spatial autocorrelation of the variable of interest, essentially testing for general spatial trends across the entire area. Conversely, the local versions of these statistics allow for a more detailed analysis of local spatial patterns. In this paper, we specifically consider local versions of Moran's *I* and Geary's *C* statistics to measure spatial associations.

A local version of Moran's *I* statistic has been proposed by Anselin (1995) to further analyse local spatial patterns. In this case, particular location *i* is fixed. The local Moran's I_i statistic for the location *i* is defined as (Feldkircher, 2006):

$$I_i = \frac{\left(x_i - \bar{x}\right)}{\frac{1}{N}\sum_{k=1}^{N}\left(x_k - \bar{x}\right)^2}\sum_{j=1}^{N} w_{ij}\left(x_j - \bar{x}\right) \tag{1}$$

where x_i represents the underlying variable for region *i*, $\bar{x}$ represents the mean of the variable, *N* is the number of regions in the data set and w_{ij} are the elements of spatial weight matrix **W** of dimension $N \times N$ (for more details see, e.g., Getis, 2010 or Anselin & Rey, 2014). Each location (region) has an associated test statistic and spatial pattern can be visualised by cluster map. This graphical tool enables to detect which of the spatial unit has a statistically significant relationship with its neighbours, and show the type of relationship (*high-high* and *low-low* – positive spatial associations or *high-low*, *low-high* – negative spatial associations).

Next, we briefly discuss a local Geary statistic. As in its global counterpart (for more details see Anselin, 2019b), the focus is on squared differences, or, rather dissimilarity than similarity. Small values of the statistic suggest positive spatial autocorrelation (see Getis, 2010), whereas large values suggest negative spatial autocorrelation. The local Geary statistic takes on the following form:

$$G_i = \sum_{j} w_{ij}\left(x_i - x_j\right)^2 \tag{2}$$

where all variables were defined before.

Statistical inference can be based on a conditional permutation procedure and is interpreted in the same way as for, e.g., local Moran statistic or Getis Ord statistic. However, the interpretation of significant locations in terms of the type of association is not as straightforward for the local Geary as it is for the local Moran statistic. Closer examination (see formula (2)) reveals that this statistic consists of a weighted sum of the squared distance in attribute space for the geographical neighbours of observation *i*. The attribute similarity is not a cross-product, and thus has no direct correspondence with the slope in a scatter plot (Anselin, 2019a; Anselin, 2019b).

3. Empirical Results

The paper uses a set of data from the Eurostat regional statistical database (Eurostat, 2023) to perform spatial education inequality analysis. Database contains 221 European regions at NUTS 2 level (NUTS - Nomenclature of territorial units for statistics). Figures 3 and 4 provide an overview of the study area. These figures (left sides) show real spatial distributions for population by tertiary educational attainment level (male and female) across the EU regions.

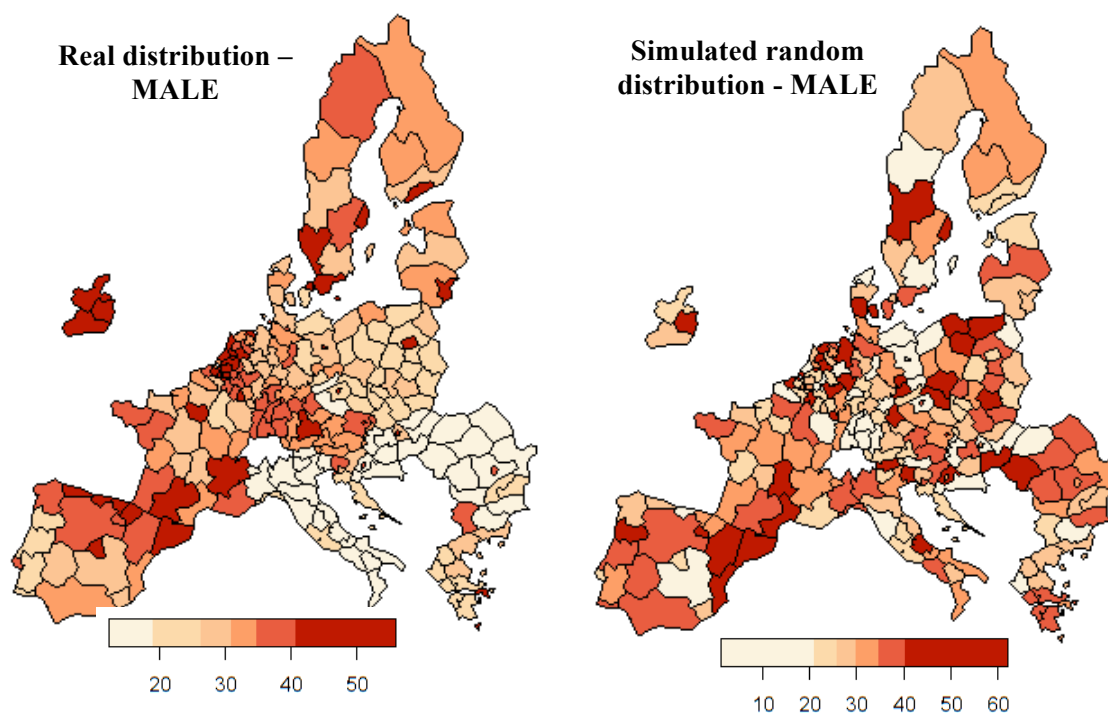
It is clear that the levels of tertiary education attainment among men and women are not evenly distributed, but the level of education probably tends to be spatially correlated. Figures 3 and 4 illustrate the difference between the true – likely spatially autocorrelated distribution (left) and the simulated random distribution (right) for the population by levels of tertiary education attainment. The well-known Moran's I[1] test can be considered a quick check for spatial autocorrelation. If the observations are randomly distributed in space, there should be no particular relationship between the indicator population by level of tertiary education attainment and its spatial lag. This is the case of a simulated random distribution (see Figures 3 and 4 - right sides). The corresponding values of the Moran I statistic are shown in Table 1. Conversely, the observations have a particular spatial structure if the corresponding values of the Moran I statistic are statistically significant. It is therefore clear that the geographical location of the region and the characteristics of the neighborhood play a significant role in the analysis of educational inequalities within the EU.


Figure 3: Illustration of the gap between real - spatially autocorrelated distribution (left) and simulated random distribution (right) for population
by tertiary educational attainment level (in %) - Male
Source: author's elaboration in RStudio

---

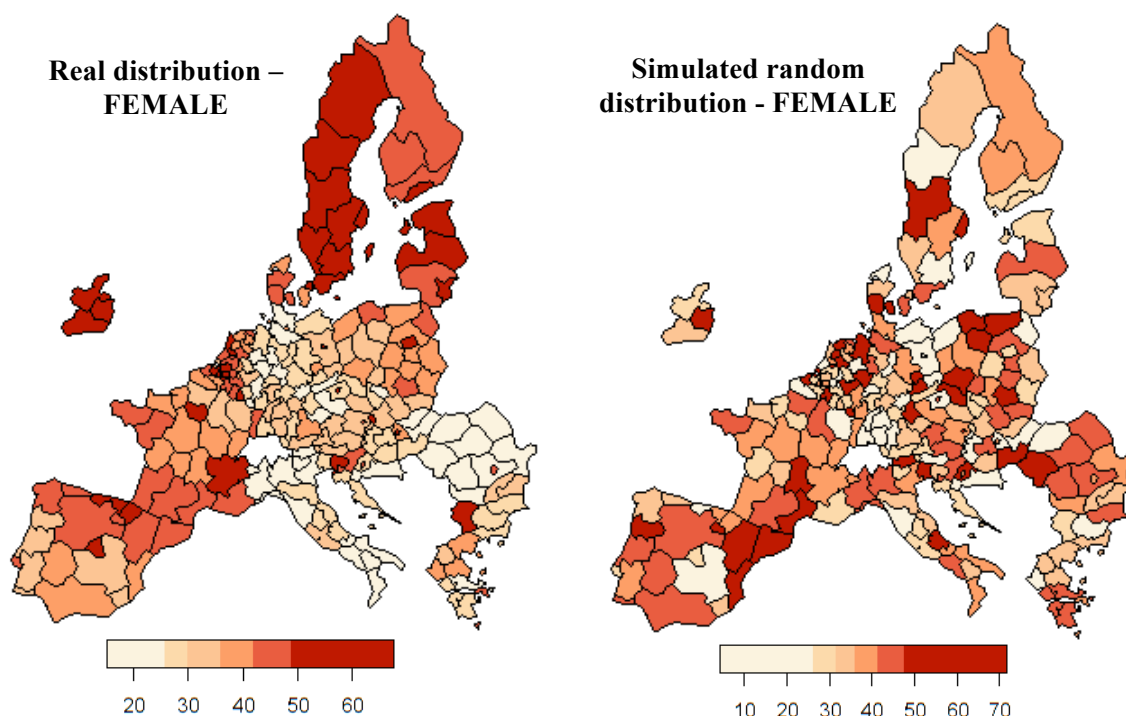
[1] For calculation of Moran´I statistics, spatial weighting matrix of queen contiguity scheme was used. This form of matrix is used in all parts of our spatial analysis (for more details see, e.g., Anselin & Rey 2014).


Figure 4: Illustration of the gap between real - spatially autocorrelated distribution (left) and simulated random distribution (right) for population by tertiary educational attainment level (in %) - Female

Source: author's elaboration in RStudio

	Population by tertiary educational attainment level (in %) - MALE		Population by tertiary educational attainment level (in %) - FEMALE		Population by tertiary educational attainment level (in %) - TOTAL	
	Real distribution	Simulated random distribution	Real distribution	Simulated random distribution	Real distribution	Simulated random distribution
Moran´s Index	0.4843***	-0.0003	0.4280***	-0.0003	0.4965***	-0.0374
Pseudo *p*-value	0.0010	0.4650	0.0010	0.4540	0.0010	0.2510

Table 1: Moran's *I* index of population by tertiary educational attainment level (in %) – Male, Female and Total

Note: Symbol *** indicates statistical significance at 1% level of significance

Geary cluster maps (constructed based on the local Geary statistic defined by formula [2]) provide more evidence about indicated unequal distribution and spatial clustering of tertiary education levels within the EU. Based on the Figure 5 we identify significant locations – regions with positive spatial autocorrelation. A significant local Geary statistic that is less than its expected value under the null hypothesis of spatial randomness suggests a clustering of similar values (small differences imply similarity). For those observations, the association high-high or low-low can be detected. Based on the indicator population by tertiary educational attainment level - Male, 36 high-high and 53 low-low local Geary clusters were identified (see Figure 5[a]). Similar spatial pattern can be seen from Figure 5 (b) where the results for the indicator population by tertiary educational attainment level – Female are depicted (42 high-high and 61 low-low local Geary clusters). The high-high locations (so-called hot spots) are mainly regions of Finland, Sweden, France, Ireland and Spain. These

regions are regions where high values of tertiary education levels are clustered. Low-low values (so-called cold spots locations) are mainly concentrated in regions of Italy and most of the Eastern European regions.

As the calculation of local Geary statistic is based on the squared difference (see formula [2]), there may be observations for which a classification to high-high or low-low clusters is not possible. This is because the squared difference can cross the mean (expected value). These locations are referred as other positive spatial autocorrelation (see Figure 5). As for negative spatial autocorrelation (large values imply dissimilarity), it is not possible to assess whether the association is between high-low or low-high outliers, since the squaring of the differences removes the sign (Anselin, 2019b). In this analysis, there is one region with this type of association for Male and Female.

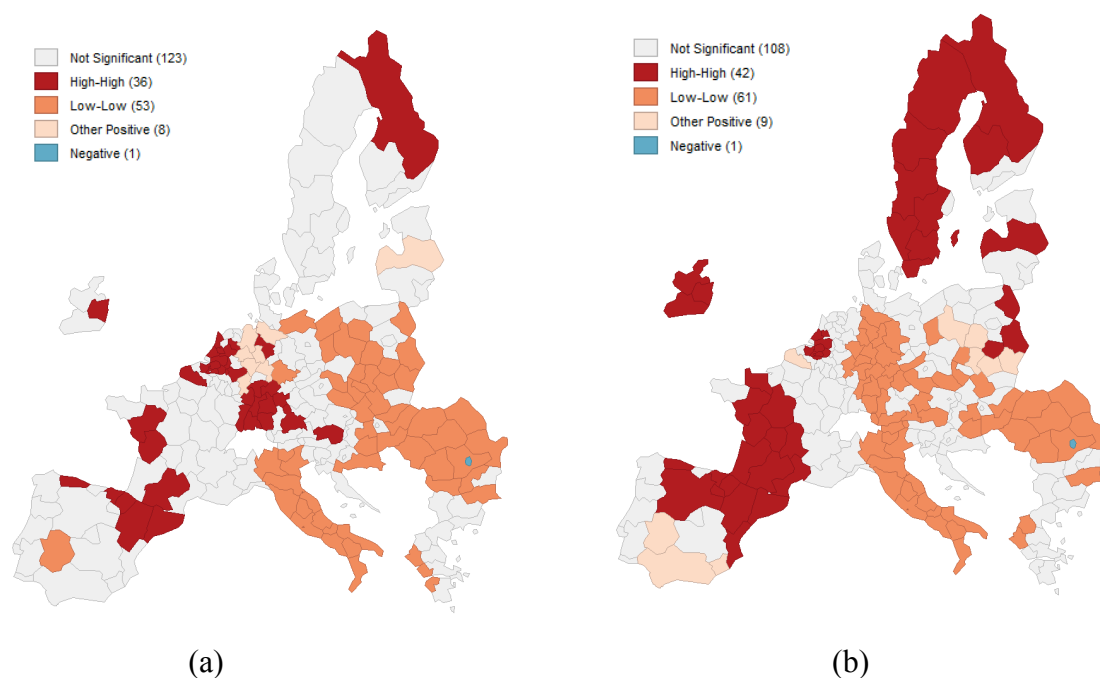
(a)   (b)


Figure 5: Local Geary clusters: population by tertiary educational attainment level (in %): Male (a) and Female (b)
Source: author's elaboration in GeoDa

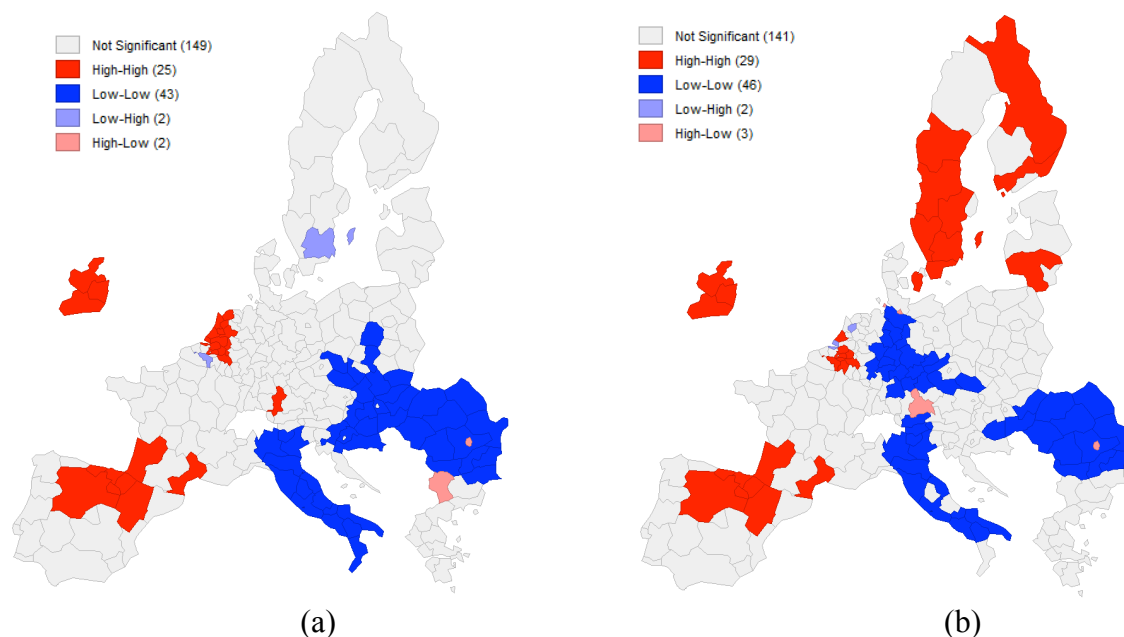
In contrast to the local Geary statistic presented so far, the local Moran *I* statistic allows to assess whether the association is high-low or low-high in the case of negative spatial autocorrelation. We can see these associations on the Figure 6 (Lisa cluster maps) and they are calculated based on the formula given in (1) . Hot spot as well as cold spot localities detected on the basis of Moran's *I* statistics are in significant agreement with the results from Geary's statistics. The results thus indicate that inequalities in tertiary education within the EU regions are influenced by the spatial distribution of the regions, both with regard to the education of men and women.


Figure 6: Lisa cluster maps: population by tertiary educational attainment level (in %):
Male (a) and Female (b)
Source: author's elaboration in GeoDa

Conclusion

The aim of this study was to examine the spatial distribution of educational inequality within the EU using a spatial statistics approach. The research uses spatial statistical techniques such as Geary and Moran statistics belonging to Exploratory spatial data analysis. The analysis was carried out in the context of the EU regions and focused on tertiary education for men and women. The findings reveal significant spatial differences in higher education inequality in the EU member states. By analyzing the spatial dimension of this issue, the study contributes to a comprehensive understanding of the geographic patterns of higher education inequality in the EU, and the results can be used in the creation of regional policies.

Official Conference Proceedings

Abstract
In increasingly polarized political contexts, exacerbated by concerns over student safety, mental health, and media hysteria over "safe spaces" and "cancel culture", teaching contentious political science topics has become more challenging than ever before. At the same time, students do not enter as blank slates on these topics and are likely to bring their own ideas – sometimes vociferously – into the classroom. Political science topics can be inherently binary, they can carry a high risk of pre-existing biases among participants, and they can be tense and uncomfortable to discuss. Under such circumstances, how can course tutors ensure that all perspectives on a given topic are adequately addressed while ensuring that discussions are held in a respectful and collegiate manner? In this paper, we offer reflective accounts of our own experiences of political science teaching in two particularly contentious areas in the UK higher education context – nuclear weapons and Brexit – where all of these risks are high. The paper offers three techniques for overcoming tension and ensuring that the topics are covered in a balanced manner to foster good faith discussion and debate. We emphasize the use of counter-balancing case studies which challenge existing biases, the "weaponization" of expected pre-existing biases to provoke critique, and the use of humor to create a positive, open and free learning environment. We conclude that the use of these techniques can be helpful in teaching contentious topics – helping practitioners to navigate the "stormy seas" of today's challenging political science teaching context.

1. Introduction

Political polarization has increasingly pervaded societies around the world. For those teaching in political science classrooms, this presents unique challenges – ensuring that debate remains balanced and respectful, ensuring that all perspectives are adequately covered, and ensuring that existing biases do not preclude students from exploring a given topic in its entirety. In this paper, we reflect on our experience teaching Nuclear Weapons and Global Politics in one case, and British Politics in the other. These topics at first appear to have little in common. Nonetheless, both faced the same polarization issue. It goes without saying that political science classrooms, where student interest in current affairs is high and some students may have even selected specific modules out of interest in activism around that topic, that these issues would be politically fraught. For the authors, the challenge of such polarization was to prevent classrooms from becoming "one-sided". As the so-called "Culture Wars" have become more problematic for classroom teaching, we sought means by which to ensure that these problems were mitigated against in our respective classrooms.

2. Literature Review and Methodology

The literature is abundant when it comes to advice for would-be educators and current educators struggling with the issue. Bielby (2003, pp. 377–379) provides three critical advice on how to teach contentious topics; to be well-prepared, to have appropriate facilitation, and to provide support. Hess (2004, pp. 259–260) identifies four ways of dealing with contentious topics in a classroom; to deny, to privilege, to avoid, and to provide balance in opinion. This paper builds on these works by presenting practical advice for other educators in teaching contentious topics in politics modules. There are some clear limitations to this research in that the evaluation of student responses are subjective and thus the authors cannot be certain that all students were able to learn in the way the classes were designed. The relatively small sample size also means that there is limitation in terms of generalizability of findings. Nevertheless, the aim of this paper is to share the practices of the authors in the hope that this will present a useful tool for other educators in their own journey in teaching politics in higher education.

A total of 236 students enrolled in British Politics in the academic year 2022/23, and 140 students enrolled in Nuclear Weapons and Global Politics in the same period. Of these numbers, we were each responsible for 40 students in the most recent semester at the time of writing this paper, in addition to 60 more from the previous year for Nuclear Weapons and Global Politics. Thus, the total number of students between us was 140.

The paper is structured based on the key lessons drawn out of the authors' teaching practice in these two modules. These are counter-balancing case studies, the use of pre-existing biases, and use of humor. Following Bielby's (2003) advice on how we need to be prepared, consider how to facilitate the delivery of the class content, and what support to offer, each section will discuss how the authors prepared for, facilitated, and provided support for the students. In addition, each section will specify which of the approaches to a contentious topic they adopted following Hess' (2004) four options (denial, privilege, avoidance, and balance). As stated previously, the primary aim of this paper is to share the authors' approaches to teaching contentious political topics so that it can provide a practical toolset for other educators to tackle the problem.

3. Counter-Balancing Case Studies

We define the use of counter-balancing case studies as case studies which run counter to expectations in the existing public and academic discourses. These were intended to challenge existing biases and open up debate by pushing back against stereotypes and previously acquired knowledge. The examples we focus on in this section are the examples of global leaders, particularly Prime Ministers Theresa May and Margaret Thatcher in relation to Nuclear Weapons and Global Politics, and the role of the £350m per week claim during the UK's referendum on membership of the European Union in relation to British Politics. In the prior case, this was intended to show the limitations in the feminist discourse in relation to nuclear weapons; in the latter case, it was intended to overcome the conception that people had been duped by a false claim in order to underscore why the claim was effective. In both cases, it was expected that pre-existing biases would play a strong role in shaping student responses, and so it was important to be aware of the political context in which the classroom was operating to ensure that planning could be made around such biases. This is the first component of the humorous contrarianism toolkit; we were "contrarian" to the popular academic and public discourses on these topics.

3.1 Counterbalancing in Nuclear Politics and Gender: Theresa May and Margaret Thatcher

In Nuclear Weapons and Global Politics, the specific class for the week was titled Gender and Nuclear Violence. Students had been expected to read Sex and Death in the Rational World of Defense Intellectuals by Carol Cohn (Cohn, 1987), a critically important text in the study of gender and nuclear weapons. The paper argues that the technostrategic language choices of experts in the fields of security and defense, particularly pertaining to nuclear weapons, are inherently heterosexual male-dominant and sexualised, and she argues that antinuclear and feminist activists should seek to challenge the claims to objectivity and rationality inherent in the security and defense fields. With this, however, came the danger that students would take views on deterrence as a simple male/female binary. In the wider context, there is a cultural tendency to conflate femininity with anti-nuclear views and with pro-disarmament stances, perhaps because feminist groups were at the forefront of anti-nuclear movements (Gwartney-Gibbs & Lach, 1991, pp. 161–162). Considering the significant danger of essentialising "women" as a single category lacking in diversity and only reinforcing what can be considered hegemonic views of femininity and masculinity (Brown & Considine, 2022, pp. 1261–1265), it was thought important to provide counterbalancing case studies to contextualise the theoretical discussions. The counter-balancing case studies were presented as a warm-up activity. This is showcased in Figure 1.

Warm-up Activity: Who said the following?

1: "We will retaliate if attacked first with a pre-emptive strike... We will leave _____'s military little short of total destruction and ruin".

2: "The whole point of a deterrent is that our enemies need to know that we would be prepared to use it."

3: "I call upon the scientific community... to give us the means of rendering these nuclear weapons impotent and obsolete".

4: "The weapons of war must be abolished before they abolish us".

Figure 1: A warmup matching activity used in Nuclear Weapons and Global Politics. The quotes were meant to run counter to the expectations and pre-existing biases which students were expected to have.

While students were asked to quote-match all of the figures, the major focus was on May. This was followed by an ad-hoc showing of the video clip in which May, in response to a parliamentary question, states in no uncertain terms that she would be willing to authorize a nuclear strike and that such a willingness was key to the UK's deterrent capability (BBC News, 2016b). This had a further beneficial reinforcement effect in that it honed in on the concept of deterrence – a core theme of the module – and showcased how it was deployed in real terms by world leaders. Under Hess' (2004, pp.259–260) four options, this most closely fit with "denial"; since the presentation was such that any of the four could have said any of the quotes, it fundamentally presented the issue as a noncontroversial one.

This produced the desired effect; by using "contrarianism", students questioned the discursive male/female binary in the following seminar activities, one of which was an activity where students applied a gender-based analysis to a quote (selected by themselves) from Prime Minister Thatcher, a figure with a considerably more divisive reputation in the UK political context, with young people (adults aged 18-24) holding more negative views than other age groups (YouGov, 2019). While it was thought important to begin with May as a "blank slate" to prove that the ostensible binary at play is in fact considerably more nuanced, the prior use allowed for the full exploration of the motivations of Prime Minister Thatcher's views on deterrence and nuclear weapons. This was backed by a small amount of background information and a further video clip of PM Thatcher's address to the Conservative Party Conference in 1989 ('Margaret Thatcher on Strong Defence', 2013). Students were able to apply a broad variety of motivating factors bringing considerable nuance to the discussion, and achieved the objective of giving students a deeper, more comprehensive level of understanding of the role of gender in nuclear politics; the risk of having a binary discussion based around male/female stereotypes was avoided through the use of these two counterbalancing case studies.

3.2 Counterbalancing in British Politics: The NHS and the £350m Per Week Claim

In British Politics, Brexit was proven to be a highly contentious topic. In Week 7 of British Politics, which covered the development of British politics from 1979 to the present, the 2016 EU referendum in which the majority of the public voted in support of Brexit was the main topic. The author adopted the option of privileging (Hess, 2004) the side of the Leave argument. This is why the Leave side's claim that £350m per week being sent to the EU would be put to better use if it was used to fund the National Health Service (NHS) in the UK was chosen as a key topic for the class. This claim acted as a counter-balance of the narrative that students would have been accustomed to, that the Leave side had won the referendum through the use of lies (Belam, 2016). This topic was relatively well-known among the British public and thus helped students formulate their own opinion on the topic as well as shortening the time of explaining it to students. Since the majority of young people supported Remain (BBC News, 2016a), it is not a stretch to believe that most of the students also would have also been inclined towards Remain arguments. In such a context, it was essential to familiarize students with the arguments from the opposite side as a counterbalance.

In terms of how the class was facilitated (Bielby, 2003), the seminar began with a brief explanation of the rebate system using official data from the Office for National Statistics (Keep, 2021). According to Bloom's taxonomy, this consists of knowledge and comprehension, ensuring that the students understand the mechanism behind the claim (Bloom, 1956). This was followed by a quote from Full Fact, an independent fact checking organization which verifies claims being made by "politicians, public institutions and journalists, as well as viral content online" (Full Fact, 2023). The quote from the Full Fact website can be seen in Figure 2.

Figure 2: A screenshot from the Full Fact website showing the claim from theLeave campaign and the response from the fact checking team (Full Fact, 2017).

By introducing the quote first, students were given the opportunity to think how they would interpret this information. This provided one level above what was presented previously according to Bloom's taxonomy (Bloom, 1956); it showed how the knowledge students gained on the rebate was being applied. By introducing the data as well as the rebuttal from Full Fact allowed students time to consider how the data was being communicated to the general public, including potential Leave voters. The purpose of the author's lecture, as well

as the essay question for the module, was to have students argue as to why the Leave side won.

In terms of support (Bielby, 2003), the author shared the PowerPoint slides with links to the primary sources so that students were able to check the sources themselves, which also helped some to use the example in their own essays. Thus, the use of this counterfactual, counterbalancing case study allowed for a higher-level of learning under Bloom's taxonomy (Bloom, 1956), and provided key training on conducting research on contentious topics.

4. Weaponizing Pre-existing Biases

With awareness of the teaching context core to the use of counter-balancing case studies, we also made use of the pre-existing biases themselves to create provocative discussion questions. This might be dubbed the "picking a fight" technique, and this was very much influenced by Hess' (2004, pp.259–260) second option of taking a side in a partisan manner. In Nuclear Weapons and Global Politics, the examples shown here are from a seminar titled Nuclear Weapons and Multipolarity, with two activities using this technique focused around the critique of pervading anti-US and anti-NPT arguments in the academic discourse with young people in Europe tending to be largely critical of US foreign policy and viewing it with cynicism (Greenwood, 2023). In British Politics, the polarization between leave and remain voters inherently led to a large risk of pre-existing biases. With large majorities of young people having supported remain (Eichengreen et al., 2021, p. 1131) and with a pervading discourse in some quarters that leave voters were "stupid" (Grant, 2017), this bias was addressed through an activity where students critically evaluated the arguments of both sides in a debate held by the BBC.

Students do not come to class as clean slates. Their previous experiences, their backgrounds, and their half-developed thoughts are brought into the classroom with them. There is pedagogical value in acknowledging this fact and using it effectively for pedagogical purposes. As Philip (2003, p. 371) notes, "a desirable pedagogic approach should recognise the importance of previous knowledge and beliefs in the learning context and express, wherever possible, non-judgmental respect towards these pre-existing values". Seminars are ideal places to try and test out these ideas and thoughts, helping hone their arguments. Similar to the contentious topics covered in the previous section, this could create problems as these unstructured thoughts and ideas could fossilise as pre-existing biases which limit the perspectives of students. In being contrarian to some of these ideas, we attempted to use partisanship as a means to deepen learning.

4.1 Nuclear Weapons and Global Politics: Anti-US and Pro-disarmament Norms

In Nuclear Weapons and Global Politics, the expected anti-US sentiment was first utilised in a warm-up activity with a counterfactual question: "If only one of the current nuclear-armed powers could have nuclear weapons, which would you want it to be and why?" Students were given a short period of time to discuss the question among themselves and then asked to volunteer answers – there are nine nuclear weapons states (Davenport & Kimball, 2023) (or ten if one counts Iran, which does not possess nuclear weapons but is generally considered a key nuclear threat), and therefore nine potential answers. The idea was to directly confront the students with the limitations of their own pre-existing bias; while they may not have been in favour of western countries possessing nuclear weapons, they were even less in favour of other countries possessing nuclear weapons. In the activity, most students answered Britain,

France or the United States with China coming a distant fourth. Student discussions centred around the issue of trust, linking to key debates in the wider module. The warm-up successfully achieved the goal of challenging discursive anti-American sentiment, which was a key objective in leading to the following activity.

The main seminar discussion was focused around the statement "It is fundamentally unfair that the United States should stop other countries developing nuclear weapons when it maintains an enormous nuclear arsenal". It was expected that most students would gravitate to being in favour of this statement, and indeed the initial reaction largely confirmed this. Nonetheless, students began to question it as the discussion continued; students incorporated the talking points of the previous discussion, and directly began to mirror some of the both real-world and theoretical discussions around arms control frameworks such as the Non-Proliferation Treaty (Tannenwald, 2013, p. 300). These talking points were successful in creating a nuanced, balanced discussion. Eventually the question was reformulated and students were asked to reflect on the issue in the aftermath; what was more desirable outcome for them, non-proliferation or fairness? This was done to encourage deeper thinking later, as leaving students in what was essentially a simulation of a real arms control debate with a lack of closure encourages reflection later even as it frustrates (Asal & Blake, 2006, p. 9).

Some students changed their minds on which was a preferable outcome when faced with the question directly after having it reframed via the activity; the weaponization of the pre-existing bias in pointing out the contradiction that fairness was necessarily the most desirable outcome in the study of nuclear weapons provoked visible shock and later rumination from some students when it was pointed out that they might actually be arguing for more, not less nuclear weapons in the world. This was also an effective utilisation of the students' inherent anti-nuclear weapons viewpoint; on the one hand, they believed strongly in the values of fairness and equality, on the other, they largely believed in non-proliferation. This seminar activity allowed both to be played off against one another and thus forced students to reflect on which value they thought preferable in the context of Nuclear Weapons and Global Politics. This deepened student learning; students were forced in very stark terms to come to grips with which "bias" was preferable, with the expectation that students would ultimately conclude that neither was ideal, but forcing them to confront the decisions which preceded major global agreements on nuclear weapons.

4.2 British Politics: Brexit Rematch

Once again, the example used here comes from Week 7 of British Politics. Similar to how the use of a familiar case study allowed for the class to focus on the discussion rather than introducing the case study itself, pre-existing biases can help the educator cover more topics in a short time. The module leader had also encouraged the use of students' instincts rather than their knowledge, cognisant of the diversity of the student cohort. Considering this level of diversity, the use of pre-existing biases was actively adopted as an ice-breaker activity at the start of the seminar. In the case of Brexit, students who were taking the course in 2022 would have been around 12 years old (assuming they were 18 years old at the time of enrolment in the course program) when the referendum was called and spent most of their GSCEs and A-level education following the news of the country's negotiation process for a Brexit deal. Brexit was thus a familiar topic for students. Thus, the background of students including their age and social network (Bielby, 2003) allowed for the effective use of pre-existing biases.

The class discussion was designed to first ask students to share how their family members, friends, and constituencies discussed Brexit. This enabled the discussion to naturally include both Leave and Remain perspectives. By encouraging students to share what kind of discussions they had with people who supported Leave and Remain, it personalized the different views and reduced the pre-existing biases to take control of the narrative.

This was followed by a group activity in which students became strategists for either the Leave or Remain campaign. The task was for them to think of three things as listed in Figure 3. First, they had to decide who they wanted as key spokespeople (high-profile politicians or public figures) who could best deliver the strongest arguments of their campaign. Second, they were asked to identify the key arguments which they believed would make their side appealing for both their base supporters as well as the people they believed could be swayed to support their side. Finally, they were asked to identify key voters - both those who were most likely to vote on their side, as well as the target group of potential voters they wanted to convince to vote on their side. This activity was only 15 minutes in duration, so it relied heavily on pre-existing biases as to what kind of arguments were most associated with either side as well as who they imagined supporting Leave or Remain. This encouraged students to consider both sides of the argument, which provided a balanced use of different opinions (Hess, 2004).

Brematch: Brexit rematch

Leave Campaign
- Key spokesperson(s)
- Key arguments*
- Key voters (those likely to vote & those you need to convince)

Remain Campaign
- Key spokesperson(s)
- Key arguments*
- Key voters (those likely to vote & those you need to convince)

Figure 3: The "Brematch" activity slide giving directions to students on how to conduct the task.

In short, rather than pre-empting pre-existing biases, the author decided to actively use it to humanize the different sides. Pre-existing biases can thus help students focus on the analysis, as well as help students consider different perspectives in a given argument.

5. The Use of Humor

Both authors made extensive use of in-class humor for the purposes of ice-breaking and to efficiently relay information. In Nuclear Weapons and Global Politics, a key approach to this across all classes was the use of internet memes, many of which were themed around the Star Wars franchise. Internet memes are increasingly used in modern classrooms across numerous disciplines; they promote critical thinking and creative activities based around them are a form of active learning (Kyrpa et al., 2022, p. 50; Wells, 2018, pp. 243–244), and they are

effective in catching and retaining student attention and relieving tension (Kyrpa et al., 2022, pp. 50–51). Star Wars was selected due to not only the author's personal interest in the franchise but also because of the broad space it occupies in popular culture; 63% of people in Britain aged 18-24 profess to have seen at least the original six Star Wars films (albeit with a slight imbalance between male and female demographics with 73% of males and 58% of females having watched them) (Nelson, 2012). Even those who had not seen the franchise can also be assumed to have at least some degree of knowledge of it considering it has been widely referenced or parodied in other media, and the humor-softening effect is still present regardless as long as students can tell that a joke is being told. The specific example is from the class Nuclear Weapons and Domestic Politics, in which the "For the Better, Right?" or "Anakin-Padme" meme template was used.

In British Politics, on the seminar about the 2010-2015 UK Coalition Government, a party-political broadcast which parodied the four highest-polling political parties (the Conservative Party, the Labour Party, the Liberal Democrat Party, and the UK Independence Party) was utilised. The task was for students to watch this 3 minute 40 second broadcast from the 2015 general election and discuss in pairs what it told us about the political parties in question. Since the video was a caricature of the four political most significant parties, the task was to identify the characteristics of them which were being made fun of. This is a key component of the humorous contrarianism strategy; in addition to serving its own purposes, humor signals to students that taboo and difficult topics need not be tense.

5.1 Nuclear Weapons, Global Politics, and a Galaxy Far, Far Away

The "For the Better, Right?" meme template focuses on the two characters Anakin Skywalker and Padme Amidala in a romance scene. The meme template refers to subverted expectations from an initially reasonable position with an undesirable outcome. This meme reached peak prominence in 2021 and remained popular for some time after (Google Trends, 2023; Know Your Meme, 2021). In the specific context of the class, the meme concluded a discussion on how views on security, deterrence, and nuclear weapons have shifted in Japan, which was given as a case study essentially arguing that changed circumstances have made issues such as nuclear weapons sharing more politically saleable in Japan than they were previously. The meme in question is presented in Figure 4, which was generated using a free online meme generator.
Figure 4: The "For the Better, Right" meme template as it appeared in a class activity. The meme communicates the idea that, contrary to pre-existing biases, deterrence is growing in prominence as a topic in the Japanese security discourse and nuclear weapons no longer hold the taboo they once did.

The meme was intended to convey a complex message in a simple format, encapsulating issues surrounding the security debate in Japan. The meme alludes to the possibility that while increasing deterrence options (a position which would widely be regarded as reasonable), that this could eventually lead to nuclear proliferation (an unexpected and less desirable outcome in the context of Japan and nuclear politics). This meme drew amusement from students, which was followed by further discussion and questions about the likelihood of Japan adopting nuclear weapons. This example, using Japan, also acted as a counter-balancing case study and it allowed the weaponization of students' pre-existing biases to subvert expectations. In the context of the class, this tied to a wider question about whether domestic politics were likely to cause or prevent nuclear proliferation. The humorous nature of the example created a positive atmosphere, and a robust discussion was held on the subject with a diversity of viewpoints. This worked as part of the broader strategy to combat in-classroom tension and to showcase that nuance was present even in seemingly clear-cut examples. Again, the goal was not to proselytize; only to encourage openness and diversity of viewpoints.

This strategy was successful, mirroring previous academic works (Garner, 2006, p. 180; Jeder, 2015, p. 829). Humor was used to soften the tension around difficult topics or topics where one-sidedness was expected. This was effective both because the references were immediately recognizable, and also because humor allowed for a higher degree of openness among students. Classroom climate is widely discussed in the existing literature; there is a wide consensus that perceived openness increases knowledge and engagement and even real-world political participation (Campbell, 2008; Castillo et al., 2015, pp. 31–32; Persson, 2015, p. 595). Humor was a useful means by which to improve classroom openness and to signal to students that even difficult topics could be discussed freely. In the teaching of topics where

strong preexisting biases were present or where classroom acrimony was expected, the experience of Nuclear Weapons and Global Politics demonstrated that it was vital.

5.2 British Politics: Parody and Political Satire in Education

The use of humor was attempted in most of the seminars, but there are many reasons why humor may be important in a politics class. For one, students tend to associate humor with enthusiasm towards the subject (Bakar, 2020, p. 143). Educators can use it to lighten tension, and if done sporadically it can help maintain a good balance between the seriousness of university education with an inclusive atmosphere (Bakar, 2020, p. 142; Martin, 2022). It helps distil complex topics into something people can understand (Becker & Bode, 2018), similar to the use of memes in the previous section.

A prime example of this was in Week 10 of British Politics in which the students were introduced to the UK's Conservative-Liberal Democrat coalition government (2010-2015). This time period presented a challenge as to how to best discuss the major topics of the time period in the span of a single seminar. The author decided to use a 4-minute party political broadcast from 2015 by the Green Party of England and Wales titled Change The Tune (♫ Change The Tune - Green Party Election Broadcast [2015], 2015). The broadcast was a parody of the four highest-polling political parties of the UK (the Conservative, Labour, Liberal Democrat, and UK Independence parties), and it encapsulated some of the main controversies of the coalition government (♫ Change The Tune - Green Party Election Broadcast [2015], 2015). The jokes were useful for a politics class as they were not only accurate, but captured the commonly held public discourse well - in other words, it "flew close to the truth" (Buonanno, 2018, p. 71).

The aim of this activity was a form of reverse learning with the students required to figure out the issues which were being parodied. In the 4-minute video clip, a parody of Deputy Prime Minister Nick Clegg, then-leader of the Liberal Democrats, winks suggestively as he sings along with the other politicians "and we all agree on tuition fees", as can be seen in Figure 5. The Liberal Democrats were at the height of their popularity in the lead up to the 2010 general election, leading some to describe the phenomenon as "Cleggmania". The key group energised by the Liberal Democrats was young people as the party promised an end to tuition fees. The Liberal Democrats formed a coalition government with the Conservative Party and raised tuition fees from £3,000 to £9,000, a move that was never quite forgiven by the public and contributed to their defeat in the general election five years later (BBC News, 2015). Thus, from just a second of footage, students needed to identify that the man was Nick Clegg, the promise that tuition fees would be eliminated, and that the Liberal Democrats reneged on this when they formed a government with the Conservative Party.

Figure 5: A screenshot from the Change the Tune broadcast showing the "wink" on the topic of tuition fees by the actor portraying Nick Clegg
(♫ Change The Tune - Green Party Election Broadcast [2015], 2015).

Consequently, the use of humour offers much potential and scope for creative teaching and can be used to serve as an important teaching tool. There are some limitations in this approach such as the need to avoid certain parodies (Hess, 2004) to maintain an inclusive environment. In short, humor, if used appropriately, has the potential of elevating the student learning experience.

6. Conclusions

Both authors found the strategy of humorous contrarianism effective in maintaining open classroom environments and promoting discussion of difficult or one-sided topics. In particular, our collective experience has reinforced the findings of previous academics on the efficacy of using humor (Garner, 2006, p. 180; Jeder, 2015, p. 829), and on the criticality of preparation and knowing the material (Bielby, 2003, p. 377). We would emphasise in addition to the criticality of the knowing the material that knowing the context on key political debates is key. We also made conscientious efforts where possible to ensure that the materials we used were accessible and well-known. In doing so, we were able to immediately and positively signal to students that these topics were "open for discussion" and could be enjoyed despite the sometimes difficult and uncomfortable nature of the discussions. The counterbalancing case studies and weaponization of pre-existing biases worked in conjunction to enable this. We hope that these techniques will provide grounds for further experimentation in teaching difficult topics in an increasingly polarized university environment.

Using Technology to Teach English Communication for Repeaters

Gota Hayashi, Tokyo Keizai University, Japan

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Eight students (n=8) attending a required course called English Communication at one university in Japan were taught during fall AY2020 (i.e., from September 2020) after the instructor reviewed literature from January 2017 to August 2020 on teaching EFL learners who are repeating their courses. When class began in September, the instructor started teaching 15 sessions on zoom with each session consisting of two 90-minute sessions on zoom, and took notes after class based on class observation after each session. Based on a synthesis of literature review and notes based on observation, it became evident that (1) a semester-long twice a week 90-minute course based on having students make answers based on open-ended questions can elicit increasingly complex responses from students whose TOEIC scores range from 295 to 345 points in the target language; and (2) having students submit reflections at the end of each class can enable teachers to understand difficulties students are facing with developing their linguistic skills and encourage students to reflect on themselves for personal development. Details of literature review, open-ended questions, and notes based on observation will be presented to help the audience think about ideas that can be applied to their own classes.

Keywords: English Communication, Japanese University Students, Retaking Required Courses

Introduction

A review of literature between 2017 and 2020 suggests eight key points EFL instructors should keep in mind to support remedial EFL students at the university level. First, instructors should keep in mind how their actions can affect students' levels of motivation (Han, Takkaç-Tulgar, & Aybirdi, 2019; Jodaei, Zareian, Amirian, & Seyyed, 2018; Khouya, 2018; Quadir, 2017). Second, instructors should aim for low-stakes, high-interest instruction (Quint Oga-Baldwin & Fryer, 2018). Third, instructors should allow students to use visuals when presenting (Iida, 2020). Fourth, instructors should allow students to become used to performing assigned tasks and teachers should be persistent to get students to complete tasks instead of adjusting them immediately (Yamaoka, 2019). Fifth, instructors should consider students' interests and classroom dynamics for tasks (Ghonsooly, Hassanzadeh, Samavarchi, & Seyyedeh, 2017; Yamaoka, 2019). Sixth, instructors should consider various ways to provide feedback and consider cognitive-load on students when providing feedback (Ghosn-Chelala and Al-Chibani, 2018). Seventh, instructors should provide updated content and materials (Custorne & Beh, 2018; Ghonsooly, Hassanzadeh, Samavarchi, & Seyyedeh, 2017). Eighth and finally, instructors should provide successful experiences for students (Ghonsooly, Hassanzadeh, Samavarchi, & Seyyedeh, 2017; Quadir, 2017).

The author reviewed the aforementioned literature, written between 2017 and 2020, from August 2020 to September 2020, to prepare to teach a course on English Communication for eight university students in Japan. Although the author has been teaching the course since 2018, preparation for the fall of academic year 2020 was felt to be particularly important. Specifically, while instruction during 2018 and 2019 were in the classroom, instruction during 2020 was completely online due to COVID-19. The course was designed for students whose TOEIC Bridge scores were between 115 and 130 points, equivalent to between 295 and 345 points on the TOEIC test (ETS, 2006). The ensuing sections will cover: (1) course design, (2) reflections on teaching that consider both the literature review and the instructor's weekly field notes, and (3) implications for instructors teaching EFL.

Course Design

After a review of literature, the course syllabus was reexamined. This was done for the instructor to teach his students as effectively as possible throughout the course. The course consisted of 15 sessions from September 23rd, 2020 to January 13th, 2021. Each session consisted of two parts: a 90-minute session from 1pm to 2:30pm (i.e., third period), and another 90-minute session from 2:40pm to 4:10pm (i.e., fourth period). There were three components to grades: (1) Class Activities, (2) Midterm Quizzes, and (3) Final Quizzes. Each activity consists of one or two open-ended questions. For each question, students were required to write at least seven sentences for their answers. Forty minutes were allocated to introduce two open-ended questions and for students to work on the questions while on zoom (zoom Video Communications, Inc., 2023). The instructor stays on zoom to support students when they have questions. The purpose of setting aside 40 minutes and providing feedback as necessary within that timeframe was so that the instructor can consider students' cognitive load, or more specifically, the intensity of tasks they can manage within a given time-frame (Ghosn-Chelala and Al-Chibani, 2018). The students are required to submit their work in approximately 40 minutes for the tasks they worked on before the midterm. This was followed by a five-minute break, in which the instructor compiled work submitted online by the students into one Microsoft Word document. After work from students were collected, the instructor allocated 45 minutes to provide feedback to the entire class commenting on points

the students did well on and points they could improve on. Students took a ten-minute break before the next period (i.e., fourth period).

During the fourth period, the instructor had students enter another zoom session through another zoom invitation for internet security, and had students prepare for oral presentations during the second-half of fourth period. During the first half, students were asked to: (1) practice for fluency, intonation, pronunciation, pauses between sentences, and emphasis of words, and (2) were encouraged to present without looking at the scripts that they wrote, so the tasks do not become perfunctory. In the second half of the period, eight students who registered for the course were asked to present in the order they were assigned, and were given a maximum of three minutes to present. Feedback on good points and points to improve on were provided. For their assignments, they were asked to submit a reflection by 10 pm on the day the class was conducted in Japanese, their first language, in at least seven sentences, focusing on two points: (1) the contents of their classmates' presentations, and (2) what they learned from feedback from their instructor after their presentations. They were also asked to include the edited version of their scripts based on feedback from third period.

After the first six sessions, session 7 and session 8 were midterm quizzes to assess students' ability to communicate in English. For session 7, the students were required to present on: (1) one question they prepared and presented on before, and (2) one answer to an original question they made themselves. For session 8, the students were required to present on: (3) another question they have prepared and presented on before that they did not present on during session 7, and (4) one answer to another original question. The students were asked to think of an original question themselves after they became familiar with a variety of open-ended questions. This was done so that students could reflect on questions that they felt were personally relevant in the target language after they have become familiar with different types of open-ended questions in the target language (Quint Oga-Baldwin & Fryer, 2018).

After the first eight sessions, there were four more sessions, followed by two final quizzes. From sessions nine to twelve, they continued to work on open-ended questions like before the midterm quizzes but this time by using reading materials to support their answers. Following the midterm quizzes, from reading the students' weekly reflections, the instructor felt that students were ready to be introduced to the concept and the practice of not only providing answers to open-ended questions but also providing answers with evidence. For final quiz part 1, for review, students were required to: (1) present on one question that they have presented on before the midterm, and (2) make and answer one original open-ended question. After that, for the final session for this course, the students were required to: (1) present on one question that they have presented on after the midterm, and (2) make and answer one original open-ended question using at least one source to support their answer.

Reflections on Teaching: Adjustments Throughout the Course

The first session was held on September 23rd, 2020, and out of eight registered students, six attended the class. The lesson unfolded as designed. However, out of six students, only one student was able to write full answers (i.e., at least seven sentences) to the two open ended questions. With previous literature suggesting that teachers should be persistent with the tasks and allow time for students to get used to tasks (Yamaoka, 2019), while providing successful experiences for students (Ghonsooly, Hassanzadeh, Samavarchi, & Seyyedeh, 2017; Quadir, 2017), the teacher provided full credit for all students attempting to complete tasks by turning in what they could write within the allotted time. One student mentioned that she was not

used to computers and typing. However, the student also mentioned that she will try to stay with the class, and it was good to know the flow of the entire course during the first session. She has mentioned that she will stay with the other students as much as she can.

During session 2, seven out of eight students attended. Most students found it difficult to submit responses to two open ended questions. However, most were able to finish writing detailed responses to one question. A student requested that the instructor provide questions before the beginning of each class, so students who wish to work on the questions beforehand could work on them before the session starts. Since literature on EFL has suggested that instructors keep in mind how their actions can affect students' levels of motivation (Han, Takkaç-Tulgar, & Aybirdi, 2019; Jodaei, Zareian, Amirian, & Seyyed, 2018; Khouya, 2018; Quadir, 2017), the instructor accommodated for that student's request by allowing students who wish to get a head start on the open-ended questions 15 minutes prior to the start of each session after session 2.

During session 3, six out of eight students attended. The student who requested the instructor to have students start to work on their two questions 15 minutes before the start of class seemed to have started early and was able to submit 10 to 15 minutes before the deadline. That student requested that he stay with the instructor voluntarily after class and discussed what he is currently working on related to his English studies and how that is connected to his future vision. Upon reflection, accommodating the student's wants may have successfully contributed to building rapport with the student. The instructor ended the class with a certain level of concern for those who were absent during the session, in terms of developing a routine for working on their English.

During session 4, several students entered their zoom sessions late but six out of eight students attended. The questions were more complex this time than previous ones. Only a few students could answer both questions within time allotted. During the presentation portion of the work, several key words and phrases that they can pronounce or enunciate better were pointed out. Students seemed to not be able to pronounce words that they were not familiar with. For example, many could not pronounce the word *specifically*. They also had trouble enunciating words particularly words that are plural (e.g., countries). After the feedback phase, it was difficult for many students to read smoothly from the scripts that were edited. They had difficulties pausing at appropriate places for information that they presented for their presentations to be processed and clearly understood by the instructor. Words of encouragement were provided to start practicing for the midterm, in which one component of it was to ask students to present their answers to one open-ended question that they have presented on before. Their jobs were to prepare to present so they could present smoothly without looking at their scripts during their midterms. A reminder was given ahead of time so that students can have successful experiences during the midterm (Ghonsooly, Hassanzadeh, Samavarchi, & Seyyedeh, 2017; Quadir, 2017).

During Session 5, seven out of eight students who were registered attended class. It was the first time for one of the students to attend. The class went smoothly. One student asked to leave early because he had things to do. In his open-ended response to one of the open-ended questions on how he would change once he graduates from university, he said he will be busier, and he wanted to get many things done while at university. Another student expressed how lonely he felt as a result of not being able to meet faculty members and other students face to face. Upon reflection, providing opportunities for reflection after class as part of their course assignment after every session was effective in providing the instructor an

understanding as to factors outside of the classroom that could affect the quality of students' levels of class participation (Quint Oga-Baldwin & Fryer, 2018).

For session 6, class went smoothly. Students seemed to have gotten into the habit of writing class reflections, and many students have started to derive intrinsic motivation from answering the questions. This is aligned with Yamaoka's (2019) suggestion that instructors should allow students to become used to performing assigned tasks and that instructors should be persistent to get students to complete tasks instead of adjusting them immediately. On the other hand, one student was absent two times in a row.

However, during Session 7 and 8, there was a midterm, and all students attended the class. Although each of the four midterm quizzes was only 5 percent of their grades and were low-stakes (Quint Oga-Baldwin & Fryer, 2018), the word *midterm* might have encouraged attendance particularly during a difficult time with COVID19 in which many students were taking classes online which was a mode that they were unfamiliar with instead of on campus. During third period, students presented on their answers to one of the twelve questions we had already covered. Students scored from 3 to 4.5 points out of 5 points on the quality of their presentations. During fourth period, students presented their answers to an original question they came up with themselves. What students talked about included: (1) lessons and experiences from the time they were university students, (2) future goals, (3) hobbies, and (4) dreams of going abroad. It seemed that students with students' dreams of going abroad, learning English was relevant, and what students needed was successful experiences to build their confidence and ability to utilize English abroad (Ghonsooly, Hassanzadeh, Samavarchi, & Seyyedeh, 2017; Quadir, 2017). Students scored from 3 to 5 points. Five areas that they can improve on were addressed: (1) eye contact, (2) avoid long pauses, (3) pronunciation, (4) intonation, and (5) avoid long pauses if possible. With session 8, there was another midterm, and all students showed up for the test. Students did not have problems with intonation. For the future goals of the course, it was recommended that students present without their scripts as much as possible while trying to avoid long pauses, practice pronunciation of difficult and unfamiliar words for accuracy, and avoid long pauses.

Session 9 was the first session after the midterm. The initial plan was to have students do the same routine of having them write out scripts during the first 40 minutes. However, that task turned out to be 60 minutes, because after the midterm, the instructor planned to have students read an article and provide open ended answers noting the similarities and the differences between the opinion of the author of the article and their own. One student has said after the first 30 minutes that he cannot finish writing in 40 minutes. So, time was extended to 60 minutes. Before the 60-minute time limit, students were asked to turn in their scripts and the instructor started providing feedback after 60 minutes was over. The feedback extended to fourth period, and after that, the instructor explained in detail about the contents of the reading for students to rework on their scripts as their assignment due by 10pm on the same day. Students were expected to rehearse for their presentations next time, and the instructor told the students that he would provide feedback on their speaking during the next class.

For session 10, one student did not show up, and because there were three students absent last time, the instructor had them present towards the end and provided feedback first on the assignments that those who attended class turned in. Seven students did their presentations during the last half of the third period and the instructor gave students feedback on parts that they can further improve on. During the fourth period, the instructor provided feedback on

scripts that those who were absent submitted before the start of fourth period. The instructor also went over speaking tips so that they could recite their presentations in front of the whole class for the second time during the second half of fourth period. This time, students were asked to write reflections that is at least seven sentences in length in English due by 10pm on the same day focusing on what they learned from their feedback and their classmates' presentations. Three students submitted their assignments on time, and one student e-mailed the assignment at midnight stating that the student forgot to press send. This felt inevitable due to COVID-19 and online courses. The fatigue from numerous assignments as well as the increase in the level of this new assignment in which students are asked to write in English as well as due to the number of absences last session, it was reasonable that four out of seven students who attended this session submitted their assignment.

Sessions 11, 12, and 13 were challenging for students, and striking the balance between persistence (Yamaoka, 2019) and success (Ghonsooly, Hassanzadeh, Samavarchi, & Seyyedeh, 2017; Quadir, 2017) was difficult for the instructor. For session 11, students read an article on diversity and prepared their scripts for two questions related to the topic. Two students wrote that they felt their lack of competence. Some reasons noted were a lack of knowledge about society in general from not being able to answer in detail to the two questions on diversity and the quality of their work compared to their classmates. It made sense for the instructor to address those two points during the next session. Specifically, some students enrolled in the course have taken several courses with the instructor and they have an advantage over those who have not taken any, so it is better for the students to mentally reframe and think that with effort, they can achieve the level of proficiency that their classmates have achieved. For session 12, the students presented on their articles and the instructor provided feedback, and for session 13, the instructor had students write about the similarities and differences of challenges college students abroad and college students in Japan are facing and possible solutions to alleviate the situation using one source.

While the task of providing answers to open-ended questions using a source was difficult, the students during the final assessment (Session 14 and Session 15) showed growth because of overcoming the challenge. During Session 14, students took final assessment quiz 1 parts 1 and 2, and one student was absent. Overall, students' presentations were clear. They projected and they could get their message across clearly. Students still could improve on their fluency by avoiding long pauses, speaking without looking at the script and making more eye contact, and refine their pronunciation and intonation. During the second half, feedback was provided, and students did not ask specific questions afterwards. For Session 15, students took final assessment quiz 2 parts 1 and 2, and all students showed up to class. Everyone who showed up to class passed, and there was an improvement of overall fluency and accuracy in students' output.

Conclusion: Implications for Instructors Teaching EFL

This paper examined eight university students who are repeating a required English Communication course at a university during COVID-19, when all class sessions normally conducted in the classroom turned into online instruction via zoom. Aligned with the literature on EFL in the tertiary setting, instructor's actions seemed to have influenced students' level of motivation to participate in class (Han, Takkaç-Tulgar, & Aybirdi, 2019; Jodaei, Zareian, Amirian, & Seyyed, 2018; Khouya, 2018; Quadir, 2017). In reality, however, because the course was conducted on zoom and some were attending class from smartphones and some from their personal computers, it was difficult to have students use visual aid as

suggested by literature when presenting (Iida, 2020). As literature suggests, it is important for instructors to anticipate technical difficulties (Alizadeh, Mehran, Koguchi, and Takemura, 2019). Having students write reflections after each class session can clarify students' technical issues as well as other responsibilities students are facing. Furthermore, having students write answers to open-ended questions can help the instructor understand students as individuals including their interests and that can be conducive to a positive classroom atmosphere in which the instructor not only can understand about the linguistic skills of the individual students but also become involved in facilitating their development of becoming responsible citizens. Each instructor at university can possibly formulate their own open-ended questions (Custorne & Beh, 2018; Ghonsooly, Hassanzadeh, Samavarchi, & Seyyedeh, 2017) and make the questions more challenging (Yamaoka, 2019) as their courses progress, to help his or her students for their linguistic, cultural, and social development while considering cognitive load, classroom dynamics (Ghonsooly, Hassanzadeh, Samavarchi, & Seyyedeh, 2017; Yamaoka, 2019), and the balance between students' success and the degree of challenge for each task that is provided in and outside of class.

Contribution of Ergonomics in Designing Accessible Classrooms for Deaf and Hard of Hearing Students in Indonesia: A Proposed Guideline

Fiodesy Gemilang Putri, Independent Scholar, Indonesia
Made Sania Saraswati, Independent Scholar, Indonesia

Abstract
For the past decade, several studies have been conducted in order to assess and confirm the impact of the physical classroom environment towards students' learning effectiveness, including deaf and hard of hearing (DHH) students. Several principles of ergonomics have been gathered aiming to provide guidelines in building a classroom that serves DHH students' needs. However, there is limited research on what needs to be considered when designing classrooms for DHH students in Indonesia. Looking at the fact that there are 2,270 special schools in Indonesia (Center for Data and Information Technology, Indonesian MoEC, 2020) with more than four classrooms used for DHH students in each school, a guideline which provides minimum requirement on designing classroom for DHH students is needed in order to ensure that the classroom would present positive impacts to the students' academic progress, not hindering the process of learning. This research aims to support academic progress of DHH high school students in Indonesia by providing inclusive classrooms using our proposed guideline synthesized from a systematic review of 12 academic papers. In the guideline, the first principle is to prioritize the comfort of the students, which is crucial for their psychological safety leading to engagement in class. The second principle is to enable them to function optimally as students. This proposed guideline places emphasis on resource availability, enabling teachers to implement it in accordance with the specific requirements of DHH students within the classroom setting.

Keywords: Ergonomic Design, Inclusive Design, Classroom Design, Hearing Disability

Introduction: Background and Objective

Indonesia, committed to providing quality education without discrimination, established this principle in the Law on the National Education System (No. 20 of 2003). The law places the responsibility on both national and local governments to create a conducive learning environment where students can actively develop their potential. It is further detailed in Government Regulation No. 32/2013, specifying aspects like school buildings and classrooms. Ministerial Regulation No. 22/2023 of the Ministry of Education, Culture, Research and Technology (MoECRT) provided specific definitions regarding these facilities.

Based on the Ministerial Regulation No. 14/2017 issued by the Ministry of Public Works and Public Housing, focusing on building access requirements, including accessibility features. Despite rooting in Universal Design, the Ministerial Regulation primarily addresses physically visible disabilities. This overlooks non-physically apparent disabilities like deafness. This regulation, while a positive step, only provides examples of accessibility features like ramps for wheelchair users and tactile paving for students with vision impairments (Norman et al., 2020). Currently, DHH students are usually put in special schools because the public schools are yet to implement an inclusive learning method and environment, despite their ability to follow the curriculum in regular public schools.

Deafness poses a unique challenge as it is not immediately visually discernible, which might lead to its oversight in architectural design. This oversight is crucial as deaf and hard of hearing (DHH) students heavily rely on visual cues for communication and navigation, inadvertently leading modern architectural designs to prioritize aesthetics, inadvertently isolating them (Oliviera et al., 2020). Addressing this gap, the DeafSpace Guidelines advocate inclusivity in architectural design by delineating key design concepts for a deaf-friendly environment. These encompass sensory reach, space and proximity, mobility, light and color, as well as acoustic and electromagnetic considerations.

In examining the current state of classrooms at the oldest special school in Southeast Asia, located in Bandung, West Java, Indonesia, it becomes evident that they fall short in providing adequate sensory range. As of 2020, the vice principal revealed that one classroom, with unspecified dimensions, accommodates three to four groups of students (Alhamidi, 2022). Each group consists of at least five primary schoolers or eight middle and high schoolers. However, it is important to note that the classroom is not specifically tailored for DHH students. According to the Center for Data and Information Technology, Indonesian MoEC (2020) there are 2,270 special schools in Indonesia with more than four classrooms used for DHH students in each school. These classrooms are not specifically designed for DHH students since other students are using the class simultaneously.

A study conducted in one of the oldest universities in Bandung assessed a lecture room using DeafSpace Guidelines. Beyond the structural aspects, the study emphasized the pivotal role of interior manipulation in enhancing comfort, consequently boosting learning effectiveness for DHH students (Harahap et al., 2020).

This paper aims to synthesize a comprehensive guideline for crafting inclusive public high school classrooms for DHH students in Indonesia. Derived from a systematic review of 12 academic papers, the review is designed to offer a detailed overview of recent findings concerning the interplay between ergonomic principles and classroom design for this demographic. It outlines minimum requirements, focusing on ergonomics to enhance learning

productivity by establishing a comfortable environment that mitigates physical fatigue, consequently fostering heightened student motivation. The focus on high school classrooms is predicated on the available body of literature pertaining to this age group, comprising students typically aged between 16 and 18 years old. This scope encompasses classrooms in public special schools, considering the distinctive processes that govern the provision of facilities in public educational institutions. Clusterization is based on the level of accessibility based on resources available as well.

Methods

The Process of Systematic Literature Review

The systematic literature review aims to address the following research questions, with the objective of formulating a proposed guideline for inclusive high school classrooms that facilitate the academic progress of DHH students in Indonesia:
1. What are the prominent factors proven to be effective in improving learning productivity for DHH students in classroom design?
2. What are the prominent factors for designing a DHH classroom that can be implemented in Indonesia?

The literature search was conducted from July to August 2023, utilizing the Scopus (Elsevier) database, which provides results across various fields of interest, including ergonomic design, deaf and hard of hearing, inclusive design, psychology, and education. The selection process involved the use of Scopus search and filter engine, employing specific keyword combinations as follows:
1. '*ergonomics in classroom design in Indonesia*' followed by a 'worldwide' search using the keywords combination '*ergonomics in classroom design*'
2. '*classroom for deaf student in Indonesia*', followed by a 'worldwide' search using the keywords combination '*classroom for deaf student*'

The search also implemented inclusion and exclusion criteria. Articles were included if they were published between 2013 and 2023, mentioned tangible characteristics of classroom design (such as size, layout, arrangement, furniture, etc.) for all age groups, and utilized all methods of data collection. Articles were excluded if they were published before 2013, mentioned disabilities other than deaf and hard of hearing, or if they highlighted aspects that need to be considered in the classroom but were intangible, such as pedagogical aspects, curriculum models, teaching methods, etc., without explicit reference to the physical attributes of the classroom environment.

The authors systematically integrated all discernible and measurable attributes derived from the selected literature. This approach was adopted to provide a clear explanation of the indicators prevalent in the design of classrooms tailored for deaf and hard of hearing students. The deliberate exclusion of intangible factors stemmed from a strategic intent to ensure that the ensuing guidelines would be both comprehensive and pragmatically applicable to teachers in Indonesia. By affording exclusive attention to tangible aspects, this study aspires to offer actionable guidelines for enhancing the learning efficacy of deaf and hard of hearing students within classroom settings.

Identification

Total records found through Scopus (Elsevier)
database, using two keywords combination:
'ergonomics in classroom design' and
'classroom for deaf students' ;
using 'Indonesia' as the first filter on the first
search, then
using 'worldwide / all countries' on the second
search
(n = 443)

Screening with eligibility assessment

Records did not match the include and
exclude criterias
(n = 427 not included)

Screened

Total records screened
(n = 16)

Screening from duplication

Records found due to citation duplication
was removed
(n = 4)

Included

Total records passed the eligibility assessment
and duplication
(n = 5 for **'ergonomics in classroom design'**
and
 n = 7 for **'classroom for deaf students'**)

Figure 1: Summary of the literature search process

In the initial phase, a total of 443 papers were identified. Subsequently, 427 articles were
excluded based on the pre-defined eligibility criteria, as previously outlined. Out of these, 16
papers were gathered, and an additional four were eliminated due to redundancy.
Consequently, this search process yielded 12 articles, encompassing elements pertinent to the
formulation of effective classroom design (n = 5 papers) and features conducive to the
learning experiences of deaf and hard of hearing students (n = 7 papers).

During the screening process, the authors collaborated to look at the connection between the
paper to the objectives by reading the abstract. For those papers that initially demonstrated
the capacity to address the research questions, a comprehensive analysis was conducted,
involving the systematic listing of methodologies and outcomes. Due to the limitation of
personnel, the screening process was conducted qualitatively with expert supervision. without
utilizing any inter-rater reliability assessment.

The systematic literature review conducted in Table 1 (Appendix) reveals several factors that
have the potential to serve as foundational principles when designing classrooms for students
with hearing impairments (DHH). However, the specific implementation of these factors is
contingent on the unique characteristics of the students who will be utilizing the classroom on
a daily basis. For example, the selection of classroom colors presents a notable consideration.
Barrett et al. (2015) suggest that employing balanced and saturated colors on the walls is

appropriate for providing an intermediate level of stimulation. Nonetheless, the applicability of this recommendation hinges on the age group of the students. While this color scheme may remain suitable for children, it could potentially overwhelm adolescents, potentially overloading their visual cognition. Consequently, high school students might derive greater benefit from lighter and pastel colors on the walls.

A similar situation arises with seating arrangements. Both Manca et al. (2020) and Taylor (2020) advocate for classroom designs that afford seating flexibility, enabling students to readily adjust their seating and allowing them room for movement if required. However, this level of adaptability may not be imperative for high school students, who typically exhibit a preference for a more static approach to learning. Instead, emphasis should be placed on determining the appropriate seating layout, such as a U-shape or semi-circle arrangement. Given the potential existence of other pertinent aspects necessitating consideration, albeit with varying interpretations of implementation, a synthesis process is imperative to formulate a more comprehensive proposed guideline that can be directly applied in the design of classrooms for DHH students.

The Process of Synthesizing the Proposed Guideline

The systematic literature review has identified various aspects that must be measured and assessed when designing classrooms for students with hearing impairments (DHH). However, these findings have not been synthesized into a practical guideline that can be directly utilized by classroom designers before construction or by teachers after the classroom is built. The process and results of this synthesis will be explained in this section.

The authors believed that a proposed guideline should be specific and comprehensive to facilitate easier implementation. Due to the lack of specificity found in the literature, the authors decided to create a guideline tailored for DHH students in Indonesian high schools, specifically for those aged 16-18 years. The intention was not to focus solely on maintaining students' attention spans (assuming high school students have already outgrown this issue) but to enhance the effectiveness of the learning process.

The proposed guideline comes from synthesizing recommended aspects cited in the literature, choosing the ones that are prominent to be mentioned and necessary to be put into practice. The authors used thematic content analysis which was performed under the supervision of an expert who continuously challenged and gave feedback on how the author clustered the relevant. findings. However, the authors try to put some aspects that could be not a priority, considering the unpredictable power outages due to improper distribution of power supply and the difficulty to have maintenance budget in schools in Indonesia to fully implement it.

The aspects mentioned in the proposed guidelines are divided into two big clusters: 1) hard to change by teachers, and 2) easier to adjust by teachers. This clustering was based on High School Building Development Guidelines published by Directorate General of Early Childhood Education, Elementary Education, Middle and High Education (2020) where it talks about the process of revamping the classroom and school building. It says that to renovate the building needs several steps that have to comply with the checklist of identification of the fulfillment of space functions, the budget would be rocketing, and the request to renovate would not directly be approved by the government as well. Therefore, assuming that there are lots of classrooms and schools in Indonesia that have not yet met the

indicators to promote comfort for DHH students, the authors propose to categorize the aspects in 'hard to change' and 'easier to adjust' clusters, for easier implementation.

Conclusion: Results and Discussion

In the preceding section, the authors attempted to categorize the guideline into two primary groups: 'hard to change by teachers' and 'easier to adjust by teachers'. The former refers to aspects that are already in place and would require significant classroom renovations for improvements, making changes time-consuming. Although these aspects are crucial, the authors do not want to restrict teachers from making necessary improvements to enhance the learning experience. Therefore, the authors introduced the 'easier to adjust by teachers' cluster, encompassing aspects inside the classroom not integrated into the existing structure. This allows teachers to customize these elements, aiming to provide additional benefits for students with hearing impairments in terms of learning effectiveness.

The aspects mentioned in the 'hard to change' category also happen to provide comfort, which is essential for the psychological safety of the students and could lead to increased engagement in the class. These are the prerequisite to exist if the teachers want the students to be ready and focused to learn in the class. Citing the ergonomics principle of Built Environment, factors that are relevant to provide comfort, include: visual field (lighting, natural and electrical), acoustic, and other configurations (temperature, air flow, and the size of the classroom).

On the other hand, the 'easier to adjust' category promotes function, meaning that these aspects support the students to function and learn optimally in the class by being able to tailor the elements to the students' specific needs and cultural behavior. Based on the Stimulation-Individualization-Naturalness principle, factors that contribute to provide function are those referenced in the stimulation and individualization groups, such as: classroom color, seating arrangement, and the furniture. Stimulation and individualization lead to personalized classrooms that could further cater DHH students needs, as DHH types varied from one student to another. Other than budget considerations, these personalizations can only be performed by the teachers.

Table 2: The proposed guideline for designing classrooms for
DHH high-school students in Indonesia

Category	Aspects need to be considered	Indicators and parameters
Hard to change by teachers, the ones that provide comfort	Classroom size	• The ideal size of the classroom needs to measure the users who will use the classroom daily (the age, the body scale), and what kind of activities they will perform daily in the classroom (Gaudiot et al, 2019; Harahap et al, 2020) • Minimum ratio of 3 m^2/students (Rahmat, 2016) • Ideal capacity of 8-10 people per classroom, assuming this is an ideal case to have effective 1-on-1 guidance from the teacher (Xue et al, 2020)
	Classroom structure	• The structure of the classroom needs to be strong and firm, not cracked, and the ceiling needs to have no leak (Widiastuti et al, 2020)

		• The building needs to comply with the disaster resistant regulations in the country, especially the natural disaster that often occurs (Lassa et al, 2022) • The classroom and the school needs to have standard operational procedures of what to do if disaster happens, including a color sign system to alert danger and a comprehensive evaluation process (Gaudiot et al, 2019; Lassa et al, 2022)
	Lighting	• Natural lighting could be improved by providing more windows with a certain size. This could be a method to save electrical spending and to utilize daylight (Barrett et al, 2015; Gaudiot et al, 2019; Manca et al, 2020; Oliviera et al, 2020; Harahap et al, 2020) • Electrical lighting needs to have a minimum 100 lux per class (Rachmat, 2016) *However*, considering there are differences in electrical capacity and classroom size in every DHH classroom in Indonesia, this aspect could be put as not a priority
	Air flow	• The existence of bigger windows mentioned above to support lighting, could also be considered to support airflow by providing the window with ventilation flow with a particular size and design (Barrett et al, 2015; Gaudiot et al, 2019; Manca et al,2 020; Widiastuti et al, 2020) • Ventilation holes need to be at least 15% of the floor surface area, and it needs to ensure the flow of >= 0.15 m/s (Rachmat, 2016)
	Temperature and humidity	• The windows (for promoting natural righting and air flow) need to be located on certain spots that minimize sun exposure aiming to reduce direct heat from the sun glare (Barrett et al, 2015) • To avoid sun exposure, the classroom could also be provided with some shades outside the room (Barrett et al, 2015) • Air humidity needs to be within the range of 40%-60% in order to avoid fatigue (Rachmat, 2016) • Overall temperature of the classroom needs to be within the range of 18C-28C, and will be better if there is a fan or an air conditioner so the people inside can control the temperature (Rahmat, 2016) *However*, considering there are differences in electrical capacity and supply stability in every DHH classroom in Indonesia, this aspect could be put as not a priority
	Acoustic	• For an unoccupied classroom, the sound level needs to be <= 30 dB, and for an occupied classroom it should be within the range of 50 dB - 85 dB in order to maintain effective communication and learning process inside the classroom and to avoid fatigue (Gremp et al, 2018; Manca et al, 2020; Taylor, 2020)

		• If possible, the wall materials, the floor materials, the ceiling tile, and the furniture materials need to not reflect the noise in order to maintain students' focus, and the materials could also be a good sound absorbing to avoid echoes (Gaudiot et al, 2019; Harahap et al, 2020; Manca et al, 2020; Oliviera et al, 2020)
Easier to adjust by teachers, the ones that provide function	Furniture	• The chairs and desk need to follow ergonomic principles, which accommodate natural resting positions, and with the height and the width following the body scale of the students. The top of the desk needs to be large enough to provide ample room for smooth sign language communication while also accommodating items on its surface (Barrett et al, 2016; Gaudiot et al, 2019; Manca et al, 2020) • The blackboard needs to be big enough to allow better view, and needs to be placed at the appropriate spot to avoid sun glare. It is better to use blackboard rather than whiteboard since the whiteboard tends to reflect the sunlight (Gaudiot et al, 2019) • Provide the classroom with cabinets that can store books and students' files as part of the standard operational procedure for mitigating natural disasters (Lassa et al, 2022)
	Classroom color	• Light or pastel colors on the walls (Barrett et al, 2015; Gaudiot et al, 2019; Harahap et al, 2020; Widiastuti et al, 2020) • It is better to not utilize lots of bright color and striking decoration since it would overstimulate high-school students visually (Barrett et al, 2015; Harahap et al, 2020)
	Seating arrangement	• Recommendation for seating layout: U-shape, semi-circle, or circular. It depends on the shape of the class whether it is a square or a rectangle, and depends on the number of students (Barrett et al, 2015; Gaudiot et al, 2019; Kushalnagar, 2019; Harahap et al, 2020; Manca et al, 2020; Taylor, 2020; Widiastuti et al, 2020; Xue et al, 2020) • The arrangement needs to provide enough range of visibility for each student. It is recommended that the students are put in a 45 degree shape so they can see the blackboard/the slides, the teachers, and their peers on their right and left sides (Gaudiot et al, 2019; Harahap et al, 2020)
	Additional learning tools and accessories	• It is better for the classroom to have visual signs and other visual information as cues to support accessibility, and to be included in the standard operational procedures for mitigating natural disasters (Barrett et al, 2015; Harahap et al, 2020)

The authors have made sure to incorporate DeafSpace principles in the aspects mentioned above to enhance accessibility and inclusivity for students who are deaf or hard of hearing. For example, selecting a U-shape or semi-circle seating arrangement aligns with the

principles of space and proximity, which would maintain the students' focus on visual communication. The inclusion of windows to maximize natural light, complemented by artificial lighting, demonstrates the application of light and color principles.

Limitations

In the course of reviewing relevant papers for the systematic literature review, the authors engaged in rigorous discussions to challenge each other's perspectives on specific studies. However, due to time constraints and a shortage of personnel, the authors did not conduct an inter-rater reliability assessment. It is advisable for future reviews to incorporate this assessment before beginning the systematic literature review process.

When synthesizing the results of the systematic literature review to create a comprehensive guideline, the authors employed thematic content analysis under expert supervision. However, the authors did not utilize a supporting methodology or conduct a readability test beforehand, again due to time constraints and limited personnel. To enhance future research, it would be beneficial to employ primary research methods such as interviews, focus group discussions, or surveys to evaluate the readability and usability of the guideline intended for implementation.

Acknowledgements

Appendix

Table 1: Result of systematic literature review

No.	Author	Title	Research Objective	Research Design	Participants: Number of Schools (n), Sample (pp), Age (yr), Country (c)	Relevant Results and Outcomes
1	Barrett et al	(2015) The impact of classroom design on pupils' learning: Final results of a holistic, multilevel analysis	To report the final results of HEAD (Holistic Evidence and Design) project To present different approach on examining good classroom design: SIN framework	Experimental design, quantitative and qualitative	n = 153 classroom of 27 schools pp = 3766 students yr = 5-11 years old c = England	● On Naturalness: classroom orientation towards more natural lighting alongside large windows for better air quality as well, but in Indonesia's equatorial position, glare and heat effects need careful consideration; improve electrical lighting, however, it is in lower priority for regions with limited electricity accessibility in Indonesia. ● On Ownerships or Individualisation: ergonomic furniture with flexible classroom arrangements, but flexibility could be a lesser priority for high school; distinctive design features to enhance learning engagement with consideration towards DHH students' visual reliance. ● On Stimulation: add decorations and balanced colors to create moderate room stimulation and not overwhelming for DHH students' heightened visual acuity.
2	Rachmat	(2016) Prevalence and Determinants of Fatigue among Private High School Students in Bogor Tengah Sub-district, Indonesia	To find the relationship between classroom's physical environmental conditions towards fatigue among high school students	Quantitative	n = 10 private high schools pp = 288 students yr = 15-17 years old c = Indonesia	● Various factors for designing a comfortable classroom to reduce physical fatigue and enhance motivation, including: classroom size with minimum ratio of 3 m2 per learner, and room capacity no more than 30 people; light intensity with minimum 100 lux; noise level with maximum of 85dB, with also considering school location not too close to the main road of the city; provide mechanical ventilation holes equivalent to at least 15% of the floor surface area; maintain a temperature range of 18-28°C, air humidity between 40-60%, and airflow exceeding 0.15m/s. Consider the availability of air conditioners. However, given budget

					limitations in building schools in Indonesia, we view this as a lower priority. ● The study quantitatively identified key factors impacting student physical fatigue: humidity, temperature, airflow, and air conditioner availability.
3	Gremp et al	(2018) A Descriptive Analysis of Noise in Classrooms across the US and Canada for Children who are Deaf and Hard of Hearing	To obtain sound levels and acoustic characteristics in classrooms that serve DHH children	Experimental design, quantitative	n = 19 schools/42 classrooms pp = 300++ K-2 students yr = 5-7 y.o c = USA and Canada	● The study suggests assessing various aspects related to sounds in DHH classrooms: provide separate classrooms (instruction or inclusive) based on the sound level connected with its location, the sound level of an unoccupied classroom is <= 30 dB (with an overall sound level of around 70 dB to maintain a signal-to-noise ratio of +15 dB), limit the reverberation time of a 10,000 cubic feet classroom to no greater than 0.6 seconds. ● The proposals above would affect wall, floor, ceiling tile, and furniture materials.
4	Kushal nagar	(2019) A Classroom Accessibility Analysis App for Deaf Students	To make an assessment of the architectural visuals effect on the DHH students by using simple accessibility app	Experimental design, quantitative	pp = 15 students yr = >16 y.o c = USA	Besides that there was a strong correlation between participant ratings (on the classroom layout/classroom architecture visuals) and the Classroom Analysis App for accessibility, the study proposed that circular layout is recommended to be used by DHH students in classrooms since it promotes accessibility the most.
5	Gaudiot et al	(2019) The Classroom Built Environment as An Inclusive Learning Process for the Deaf Students: Contribution of Ergonomics in Design	To make an assessment of classroom design for DHH students to support their learning process, based on Built Environment evaluation	Literature review	n paper = 15 papers c = worldwide	● Based on the ergonomics principle of Built Environment, the study highlighted several aspects in the classroom, such as: its size using the student scale, arrangement promoting comfort for the students, promoting natural lighting that minimize direct sun's influence, and room dimensions determined primarily by the students and the various activities. ● Applying Human-Task-Environment principles, the study suggests focusing on several aspects, including: walls and flooring materials need to allow reverberation (helps the acoustics of the classroom), wall coloured in light or pastel colors (provide stimulation), seating arrangement allow participation

					of all DHH students by increasing visual control (e.g. in circular layout, or put them the students in a 45 degrees of shape), big blackboard for better view and spacious desks allowing seamless sign language communication yet keeping the objects on the top, furniture placed to provide comfort and safety.
6	Widiast uti et al	(2020) How classroom design impacts for student learning comfort: Architect perspective on designing classrooms	To determine the factors that affect student learning comfort in the classroom and its distribution	Qualitative and Quantitative (descriptive statistical analysis of survey)	n = several elementary schools (SD), junior high schools (SMP), and senior high schools (SMA) in Yogyakarta, under the same institution of Muhammadiy ah pp = 772 students (245 SD students, 265 SMP students, 262 SMA students) yr = 10-17 years old c = Indonesia	The study proposed several aspects emerged from students opinions, which could be considered in school and classroom, including: ● School building/outdoor theme: importance of a connection with nature, though it may not be a top priority since it is associated with the predetermined school location; emphasis on building strength and durability for classroom safety; prioritize quietness by managing noise levels; considering lighting (both natural and electrical); provide air circulation/ ventilation; maintain the appropriate proportion of indoor space per learner. ● Classroom/indoor theme: adequate facilities is important, however, due to the various budgets on improving facilities, this might not be a priority to be put in the proposed guideline; cleanliness; study atmosphere (i.e. low noise level)' visual quality (e.g. decoration, wall color providing stimulation); space planning (i.e. classroom seating arrangement); lighting (both natural and electrical); air circulation or having air conditioners, however, we consider this as not a priority knowing budget limitations.

7	Manca et al	(2020) The Effect of School Design on Users' Responses: A Systematic Review (2008-	To find the impact of the educational environment design towards students' and teachers' performance	Systematic literature review	n paper = 68 papers yr = 7-12 years old c = worldwide	● Talking about the association between the indoor environmental features and users' psychological responses, the study proposed several aspects to consider, such as:
						  ○ The school needs to be not close to the road.
						  ○ Furniture materials need to not reflect the sound

		2017)			(Lombard effect). ○ Ventilation needs to be increased. ○ Lighting needs to use more natural light. ● Talking about the effect of classroom design and furniture on users, the study proposed some aspects to be assessed, including: ○ Classroom layout needs to have a flexible space (example: U-layout). ○ Chair and desk need to be ergonomic and accommodate a natural resting position. ○ The furniture needs to be in attractive colors. *However*, if this principle is implemented, we need to measure whether the 'attractive colors' would not be noise for the students.
8	Oliviera et al	(2020) The Application of Ergonomics of Built Environment Architectural Projects as a benefit for the Hearing Impaired	To assess building inclusivity and accessibility for DHH students based on DeafSpace principle	Literature review	n paper = 9 papers c = worldwide	The study proposed several principles that can be used in designing classrooms for DHH students. ● In terms of Accessibility of the Built Environment, aspects to be considered: ○ Understanding the environment for navigation. ○ Moving freely within both vertical and horizontal circulation areas. ○ Engaging in activities and using equipment and furniture. ○ Facilitating easy interaction between users and the environment. ● Talking about assessing Ergonomic design of the Built Environment, the classroom design needs to consider: ○ Comfort related to the surroundings. ○ The user's perspective towards the function. ○ The mental aspects of the users. ○ The factors related to completing tasks and the required sizes. ● In terms of taking DeafSpace principle, the classroom design needs to consider: ○ Sensory range ○ Space and proximity

					○ Mobility ○ Light and color ○ Acoustic and EMI
9	Harahap et al	(2020) Study of interiority application in deaf space based lecture space	To assess the accessibility of the lecture space in CADL-ITB (Institut Teknologi Bandung) building using DeafSpace principle	Experimental design, qualitative	pp = 72 participants yr = >16 y.o c = Indonesia	● The study proposed several aspects based on DeafSpace principle that needs to be existed in a classroom for DHH students, such as: ○ Consider U-shape or semi-circle seating positions ○ Provide large amount of wiggle space ○ Use fresh colors and natural lighting ○ Use soundproof material
10	Taylor	(2020) One-Stop Lesson Planning: How Universal Design for Learning Can Help Students Who Are Deaf or Hard of Hearing	To promote Universal Design for Learning (DHH) principles in designing lesson plan and activities inside the classroom	Literature review	n paper = 5 papers c = USA	The study proposed that in order to increase engagement and motivation of students in the classroom, it needs to be designed by considering several aspects, such as: ○ Classroom layout or arrangement needs to utilize flexible seating ○ Allow access to quiet spots when it comes to small groups discussion
11	Xue et al	(2020) Study on the classroom attention mechanism of deaf students based on three-in-one education model	To improve deaf students' learning attention by promoting three-in-one educational model	Experimental design, qualitative	pp = 292 DHH students yr = >16 y.o c = China	The study resulted in mapping influencing factors for deaf people's attention: unintentional, intentional, and external. Talking about how the external environment might influence deaf students' attention, the classroom design needs to consider several aspects, including: ○ Classroom size needs to accommodate 8-10 people so it can cater 1on1 guidance of teachers ○ Classroom layout needs to be in semi-circular ○ Wall and furniture materials need to be sound-absorbing
12	Lassa et al	(2022) Understanding the impacts of floods on learning quality, school facilities, and educational recovery in Indonesia	To assess the effect of floods on quality learning and educational infrastructure by utilizing comprehensive school safety framework	Qualitative	n = 100 schools pp = 80 headmasters and 21 students yr = - c = Indonesia	The study proposed that given Indonesia's susceptibility to disasters, school buildings should be designed with resilience in mind. Additionally, schools should establish standard operational procedures, encompassing immediate response protocols in the event of a disaster, as well as designated safe locations to ensure the safety of students.

An Action Research on the Integration of Pinyin Instruction in Chinese Language Teaching Through the Use of Object-Based Teaching Material

Yeh Ting-Yu, Chung Yuan Christian University, Taiwan

Abstract

This research focuses on action research in the field of Mandarin Chinese teaching. It emphasizes the process and outcomes of converting unidirectional Mandarin pinyin materials into bidirectional interactive materials suitable for Interactive Whiteboards. Considering the equipment conditions of the research site, the researcher repurposed the Chinese Pinyin materials and practically applied them in the classroom for learners of Mandarin as a second language. The participants were 14 adult learners of Mandarin with a starting point of zero proficiency, all aged over 20, and were all enrolled in a visa program affiliated with a university's Mandarin Learning Center. To delve deeply into the teaching situation, this study utilized classroom recordings, teaching notes, converted materials, and classroom observations as research tools. Additionally, after class, learners were asked to fill out a feedback questionnaire designed using a Likert 5-point scale. Through descriptive statistical analysis of teaching recordings and questionnaire results, the study will offer suggestions and areas of improvement regarding learners' performance, teacher-student interaction, and the operation of the Interactive Whiteboard. This research seeks to answer three main questions: (1) What are the principles for converting unidirectional lecture-based materials into bidirectional Interactive Whiteboard materials? (2) What are the teaching strategies for using Interactive Whiteboard materials in Mandarin teaching classrooms? And (3) What are the operational suggestions and areas of improvement for Interactive Whiteboard materials in Mandarin teaching classrooms? The results of the study will provide empirical recommendations for the digital Mandarin teaching field, hoping to make a modest contribution to this area.

Keywords: Interactive Whiteboard, Teaching Chinese as a Second Language, Object-Based Digital Materials, Digital Teaching, Chinese Pinyin

1. Introduction: Interactive Whiteboards in Mandarin Chinese Teaching Classrooms

With the advancement of Information and Communication Technology (ICT), the educational environment has evolved from the early configurations of chalkboards or whiteboards and the use of traditional teaching resources such as paper materials, physical teaching aids, and videotapes, to the widespread use of digital devices and multimedia materials such as projectors, computers, and Interactive Whiteboards today, significantly enhancing teaching efficiency and diversity (Purdue Online & Purdue, 2023). In the context of the new normal, equipment such as Interactive Whiteboards, auto-focus cameras, and wireless microphones have become an indispensable part of Mandarin teaching. Moreover, the ability to proficiently utilize digital teaching platforms and tools has become a fundamental requirement for Mandarin teachers (Lian, 2021a). The use of emerging technologies like Interactive Whiteboards to effectively stimulate learning motivation and interactivity is a focal point of current educational concern.

2. Research Purpose

This research focuses on the Interactive Whiteboards as its main research tool, leveraging its software features such as material extraction, storage, IRS instant feedback, annotation, dragging, and browsing functionalities in Mandarin language classrooms. The study aims to convert traditional unidirectional Chinese Pinyin teaching materials into bidirectional, interactive digital materials. After the development of these materials, they will be practically applied in Mandarin classrooms through action research. The goal is to summarize the principles of transitioning from unidirectional to bidirectional interactive teaching materials and to thoroughly investigate the strategies for using Interactive Whiteboards in Mandarin teaching, as well as operational recommendations and potential directions for improvement. This endeavor seeks to contribute to the integration of educational technology in Mandarin teaching.

3. Literature Review

3.1 Interactive Whiteboards

With the development of information technology, Interactive Whiteboards have been widely used in various teaching fields. Research indicates that the interactive and visual benefits of Interactive Whiteboards can significantly enhance the quality of teaching, which is highly affirmed by educators (Hennessy & London, 2013). They not only replace traditional physical teaching methods but also, in conjunction with the SAMR model, facilitate the digital transformation of education. Interactive Whiteboards are powerful tools that can import, store, drag, annotate, etc., providing teachers with more flexible teaching operations and attracting students' attention with diverse presentations (Fawzi & Zuhrieh, 2011). The use of Interactive Whiteboards can promote students' memory and writing abilities, inject new vitality into the classroom, and enhance teacher-student interaction (Barbarić Pardanjac et al., 2018). Compared to traditional teaching methods, they make learning more intuitive and proactive, which is beneficial for the development of cognitive, affective, and psychomotor skills. In summary, Interactive Whiteboards have become an indispensable and important auxiliary tool in contemporary classrooms.

3.2 Object-Based Digital Teaching Materials

3.2.1 Teaching Methods for Interactive Whiteboards

Participatory teaching methods emphasize the active involvement of students in the learning process, placing them at the core of instruction and breaking away from the traditional unidirectional mode of delivery (Xie, 2008). By employing questioning, discussion, and case studies, these methods foster student engagement, which can enhance learning interest, initiative, and creative thinking (Ciobanu, 2018). Appropriate instructional design is also key to its success (Inguva et al., 2018). Object-based teaching focuses on the interaction between students and physical objects to deepen understanding and application of knowledge (Chatterjee & Hannan, 2015; Lin, 2023). Applying participatory teaching methods to Interactive Whiteboards instruction not only enhances classroom interaction but also improves learning outcomes, keeping students highly interested and focused (BECTA, 2007; Wang, 2016). In summary, integrating participatory strategies with Interactive -Whiteboards teaching is an effective instructional method adopted in contemporary classrooms.

3.2.2 Object-Based Digital Teaching Materials

According to the research by Netolicka and Simonova (2017), educators can effectively create visual teaching resources using the SMART Notebook. Moreover, these virtual teaching materials are not only durable but can also be modified and manipulated according to needs, providing convenience for future teaching. Owens (2012) further suggests that designing course materials with SMART Notebook and incorporating its diverse functions to create various teaching activities, such as competitions, games, and assessments, can shift the teaching focus to a student-centered approach. This not only increases student participation but also stimulates their curiosity, thereby enhancing their motivation to learn. SMART Notebook, in instructional design, not only increases students' interest and motivation but also immerses them in learning through the novel experience of touch interaction, achieving a state of flow and thus enhancing learning effectiveness. Owens also believes that this tool should be used to support student collaboration in small groups to help them achieve specific learning objectives. Xu (2012) also mentions in his research that SMART Notebook has a variety of powerful features, such as adjusting image transparency, combining and splitting images, as well as copying and locking objects; it also includes functions like hyperlinks, flipping, spotlight, and screen masking, making the creation of Interactive Whiteboards multimedia materials much easier. In summary, these studies indicate the SMART Notebook provides educators with a set of strategies to accommodate different learning styles and needs in the classroom.

In the field of Mandarin teaching, using Interactive Whiteboards in conjunction with object-based digital materials has become an important teaching strategy to promote classroom interactivity. Lin (2023) points out in her research that the use of object-based digital materials on Interactive Whiteboards significantly aids cognitive development and skill practice for students through actions such as "dragging," "writing," and "touching the screen," effectively stimulating learners' perceptual potential. According to the nine stages of learning proposed by Gagnè (1985), it is confirmed that using object-based digital materials in Interactive Whiteboards teaching can strengthen learners' intrinsic motivation. Using Interactive Whiteboards as a teaching tool and integrating digital objects into teaching materials has not only become a popular strategy in teaching but also highlights the

feasibility and advantages of combining object-based materials with Interactive Whiteboards in Mandarin teaching.

3.3 Digital Chinese Pinyin Teaching

In the field of Mandarin teaching, integrating multimedia objects has become a preferred strategy. In the digital teaching of Chinese Pinyin, educators can utilize various multimedia resources such as videos, audio, animations, and interactive games to enrich the content of instruction. Huang (2010) discusses the benefits of multimedia teaching, noting that it can stimulate multiple senses of learners simultaneously, thereby enhancing memory retention. Multimedia objects not only facilitate the execution of the teaching process but also bring a variety of stimuli to learners, further improving learning effectiveness. Ren (2010) in his research on the design of Chinese Pinyin teaching materials using multimedia, also mentions that the use of hyperlinks can integrate reading and practice more systematically. Citing the dual-coding theory (Mayer, 2002), he explains that presenting Pinyin symbols in specific colors through animation effects, which provide both visual and auditory stimuli, aids learners in recognition and absorption.

Huang and Ren further suggest that corresponding oral diagrams or animations should be added to multimedia Chinese Pinyin teaching materials or classrooms to simulate the pronunciation parts and their operations, helping learners to understand the mechanism of Chinese Pinyin pronunciation in depth. Additionally, using recording functions to document learners' vocal practice is an effective strategy; educators can provide immediate corrections to learners' pronunciation through these recordings.

In the realm of Chinese Pinyin instruction, we have witnessed the evolution from traditional paper-based materials to digital teaching resources. With the introduction of digital technology, contemporary teaching strategies have integrated visual, auditory, and interactive elements, not only creating a more efficient and engaging teaching model for educators but also presenting a more attractive and effective learning experience for learners. However, to fully realize the advantages of digital Chinese Pinyin teaching, depends on educators possessing a profound literacy in digital education and combining appropriate instructional design and execution strategies.

3.4 The Utilization of Bloom's Cognitive Taxonomy in Teaching Strategies

3.4.1 Bloom's Taxonomy 2.0

Bloom's Taxonomy of Educational Objectives is a systematic classification of educational goals. This framework was originally developed by Benjamin Bloom in 1956, with the intention of enhancing the quality of instruction and improving teaching outcomes. The taxonomy has profound implications for curriculum design, teaching assessment, and the evaluation of learning outcomes. The original classification focused primarily on the cognitive domain of educational objectives; however, in 2001, Anderson and Krathwohl revised it, expanding it to include the affective domain and the psychomotor domain, thus making it more relevant to contemporary educational needs. According to the research by Lin (2023), Bloom's taxonomy aims to encourage educators to delve deeply into the cognitive, skill, and attitudinal domains of teaching. Within the cognitive domain, the taxonomy categorizes learning objectives into six levels, ranging from basic to higher-order: Remembering: the ability to recall learned knowledge, Understanding: the ability to grasp the

meaning of learned material, Applying: the ability to use learned material in new situations, Analyzing: the ability to explain the underlying meanings or principles of learned knowledge so that others can understand the conveyed content, Evaluating: the ability to organize learned knowledge into a systematic structure of one's own, and Creating: the ability to critique objects or information encountered based on previously learned knowledge or methods. The hierarchy is illustrated as follows:
Figure 1: Bloom Taxonomy Level 2.0 (Huitt, 2011)

Bloom's Taxonomy emphasizes the transformation of educational expectations into tiered instructional objectives, which are then used to systematically formulate curricula to enhance learning outcomes (Lin, 2023). Based on this classification, Anderson and Krathwohl (2001) proposed a series of instructional verbs (Huitt, 2011), providing educators with clear guidance that aligns with student learning needs. Through these verbs, educators can clearly grasp teaching objectives, and students can more precisely understand their learning purposes, thereby optimizing the quality of teaching and learning. In summary, the instructional verbs within Bloom's Taxonomy enable educators to effectively translate teaching expectations into tiered objectives, systematically design curricula, and improve learning motivation and outcomes.

3.4.2 Teaching Strategies

As educational technology advances, teaching strategies continue to evolve from a singular model of knowledge transmission to one that emphasizes diversity, interactivity, and student-centeredness. For instance, the Direct Method emphasizes intuitive knowledge conveyance, while game-based learning uses game interactions to deepen understanding, prompting encourages autonomous exploration, demonstration teaching showcases skills, and cooperative learning emphasizes teamwork (ViewSonic Library, 2020). These strategies aim to stimulate learning potential and promote student development. In the context of interactive materials, educators should develop appropriate strategies to guide students in acquiring knowledge and correctly operating the materials (Lin, 2023; Merrill et al., 1991). Borsook and Higginbotham (1991) propose seven elements for the design of interactive materials: immediacy of response, non-linear access to information, adaptability, feedback, options, bi-directional communication, and information granularity. In summary, contemporary

teaching strategies emphasize diversity, interactivity, and a student-centered approach, and educators should formulate appropriate strategies in conjunction with the characteristics of the materials to maximize teaching effectiveness.

4. Research Methods

This study employed action research methodology, following Lewin's (1946) four steps of planning, action, observation, and reflection, to apply Pinyin teaching materials on an Interactive Whiteboard for Mandarin language instruction, observing its impact and feasibility in the teaching environment. The subjects were 14 Mandarin language learners over the age of twenty with no prior knowledge of the language, including 2 from Indonesia, 1 from South Korea, 8 from Thailand, 1 from Honduras, and 2 from Vietnam. The instructional experiment was conducted over approximately 9 sessions, each lasting 50 minutes. The research setting was a Mandarin Language Teaching Center at a university in Taiwan, equipped with Interactive Whiteboards and other devices to meet the needs of a blended teaching approach. The teaching process involved video recording, observational note-taking, and after-class feedback questionnaires and interviews with learners to understand their perceptions of using the Interactive Whiteboard. This study utilized the myViewBoard software to adapt the teaching materials for the Interactive Whiteboards, conducting an instructional experiment to observe the impact and feasibility of Interactive Whiteboards in Mandarin language teaching.

5. Result

5.1 The Principles for Converting One-Way Lecture-Based Materials Into Two-Way Interactive Whiteboard Materials

In the realm of pedagogical methodologies, Bloom's Taxonomy stands as a foundational framework enabling educators to systematically fulfill predefined educational objectives. The present study seeks to innovate the realm of Pinyin instruction by transforming static PowerPoint resources into dynamic, two-way interactive materials, facilitated by the specialized capabilities of Interactive Whiteboard software. This conversion process is characterized by the strategic employment of the software's unique design functionalities to construct progressive exercise activities that address and rectify the limitations inherent in the original one-directional materials.

The research strategy involves a structured division of Pinyin instructional content into four principal segments, organized in alignment with their pedagogical sequence: Finals, Initials, Tones, and Rules. The investigative thrust will revolve around devising a set of detailed guidelines and standards for the conversion of linear instructional materials into reciprocal, interactive resources optimized for use with Interactive Whiteboards. This framework will be informed by the instructional verbs outlined in Bloom's Taxonomy.

At the Remembering level, educators are poised to employ interactive objects and strategic organization within the material to facilitate memory and description. Provision for written output will be incorporated within the material's layout, enabling notation, while Pinyin symbols sharing phonetic characteristics will be grouped and linked for easy listing. Progressing to the Understanding level, space for annotation will again be allocated, with imagery integrated via the whiteboard's multimedia functionalities to enhance associative learning, while touch control mechanisms will be harnessed for instructional follow-through.

As the curriculum escalates to the Applying stage, educators will be encouraged to mark Pinyin symbols unobtrusively on page corners, easing the cognitive load of learners and supporting demonstration. Integration of auditory elements with Pinyin symbols will enhance whiteboard writing exercises, aiding in selection, while hyperlinked audio within questions will bolster teaching efficacy and self-assessment through examination. The Analyzing level mandates a simplification of Pinyin learning through strategic symbol placement, the design of interactive Pinyin objects for comparative learning, and the creation of sorting activities to aid in distinguishing phonetic nuances.

Evaluating level strategies encompass the design of engaging games like Sticky ball or Scratch-off to randomize Pinyin symbol practice for sound selection, alongside the creation of dictation exercises and audio playback for assessment purposes. Lastly, at the pinnacle of Bloom's Taxonomy—the Creating level—educators will facilitate the separation and recombination of initials, finals, and tones, guiding learners through interactive practice for Pinyin recognition, and utilizing Instant Response Systems to prompt impromptu Pinyin spelling by learners, thus fostering real-time correction and heightened engagement for reorganization.

5.2 Teaching Strategies for Applying Interactive Whiteboards to Chinese Pinyin Teaching

In the classroom, a concept may be suitably introduced through more than a teaching strategy to guide learners in absorbing and applying the knowledge, while simultaneously employing multiple teaching strategies. The researcher will summarize and organize the teaching strategies applicable to the use of Interactive Whiteboards in Chinese Pinyin instruction based on the teaching strategies proposed by the ViewSonic Library (2020) through a literature review. The Direct Instruction method, as a traditional and proven effective model, emphasizes the teacher's leading role and intuitive teaching. With the aid of Interactive Whiteboards, teachers can instantly display multimedia materials and use annotation functions to enhance students' understanding. Play-based learning, especially gamified learning, provides an environment where education is integrated with fun, allowing students to develop social interaction and critical thinking within the game. Interactive tools on Interactive Whiteboards, such as dice and spinners, empower students to control the learning process, thereby enhancing motivation. Digital game-based learning further combines instructional content with game elements, using board games and computer games to promote a deeper understanding of basic concepts. Educational software for Interactive Whiteboards can design various interactive games, such as snakes and ladders and scratch cards, to alleviate learning pressure. The Prompting method guides students to explore answers through questions and suggestions, aiming to motivate students to exceed learning objectives. The magnifying glass or masking functions of Interactive Whiteboards can provide timely assistance during the teaching process, especially in learning spelling rules, where phased exercises help students consolidate knowledge. The demonstration teaching method guides students step by step through the teacher's demonstration, which is particularly common in problem-solving or step-by-step instruction. Interactive Whiteboards can display tongue position diagrams and audio files to help students learn correct pronunciation. Cooperative learning encourages students to work in teams to achieve learning objectives. The grouping function of Interactive Whiteboards and educational software can design cooperative activities to promote mutual learning among students. The Think/Pair/Share strategy focuses on a student-led learning process, where students exchange thoughts within small groups. The drag-and-drop function of Interactive Whiteboards can be used to design pairing

exercises to facilitate discussion among students. Peer-Assisted Learning Strategies give students the lead in the learning environment, with the teacher playing a supporting role. The game design function of Interactive Whiteboards allows students to think, discuss, and correct each other in group activities, thus deepening the understanding and application of knowledge. The application of these teaching methods not only improves teaching efficiency but also enhances the learning experience of students.

5.3 Classroom Feedback Questionnaire

Following the implementation of the action research cycle, the researcher asked the study participants to fill out a classroom feedback questionnaire created using the Likert Scale. Each question had five options, ranging from 1 to 5, representing "strongly disagree," "disagree," "neutral," "agree," and "strongly agree," respectively. The questionnaire was translated into the participants' native languages before being distributed for completion. A total of 14 participants filled out the questionnaire, with nationalities including 2 from Indonesia, 1 from South Korea, 8 from Thailand, 1 from Honduras, and 2 from Vietnam. The researcher calculated the number of respondents per question, the average score, and the standard deviation (SD), with the average and standard deviation reported to two decimal places.

The questionnaire was divided into three parts: 11 questions on the course itself (C1-C11), 4 questions on unidirectional lecture-style materials (P1-P4), and 12 questions on bidirectional interactive materials (M1-M12), each numbered accordingly and analyzed for internal consistency using the SPSS system. For the course section C1-C11, the alpha value was 0.785, with a standardized item alpha of 0.848; for the unidirectional lecture-style material section P1-P4, the alpha value was 0.745, with a standardized item alpha of 0.778; for the bidirectional interactive material section M1-M12, the alpha value was 0.911, with a standardized item alpha of 0.923, all indicating a high degree of correlation.

In evaluating the effectiveness of the Pinyin course, students gave high ratings to the course's interest, teaching methods, interactivity of the materials, and the teacher's teaching attitude. Feedback from the course section indicated that the majority of students (10) strongly agreed that the course was interesting (C1) and believed that the course provided clear guidance on pronunciation (C3), with an average score of 4.57 and a standard deviation of around 0.78, showing consistency in student opinions. Furthermore, students generally believed that the teacher's guidance (C5) and patient teaching (C6) were crucial to learning Pinyin, with average scores of 4.79 and 4.71, respectively, and standard deviations of 0.6 and 0.63, indicating a high consensus on the positive evaluation of the teacher.

Regarding the materials, whether it was the unidirectional lecture-style Microsoft PowerPoint materials (P1-P4) or the bidirectional interactive myViewBoard materials (M1-M12), students provided very positive feedback. In particular, the fun (M9-M11) and convenience (M7) of the myViewBoard materials received the highest average scores of 4.86, with a standard deviation of 0.55, showing a high level of satisfaction and agreement among students. Students felt that these materials not only enriched the classroom content but also increased their interest and efficiency in learning Pinyin.

Overall, this feedback indicates that students have a positive attitude towards the design and implementation of the Pinyin course and believe that the teaching methods and material

design effectively facilitated Pinyin learning. These results provide positive guidance for further improving course design and teaching methods.

5.4 Semi-structured Interview

After the study participants completed the post-class feedback questionnaire, the researcher inquired about their willingness to participate in interviews and conducted semi-structured interviews with those who agreed. A total of 7 participants were interviewed, including 5 from Thailand and 2 from Vietnam. There were 8 interview questions, which were translated into the native languages of the interviewees according to their nationalities. The questions were divided into four categories: one on the course aspect, three on the material aspect, two on the operational aspect, and two on other aspects. Based on the responses from the interviewees, the following conclusions can be drawn:

Learners generally had a positive experience with the Pinyin course, the materials used, and the use of the interactive whiteboard. Interviewees from Vietnam and Thailand unanimously agreed that the Pinyin course was substantially helpful in their study of Mandarin, finding the course easy to understand and engaging. Particularly, the Interactive Whiteboard as a teaching tool was highly praised by the learners; they found it not only convenient and user-friendly but also effective in enhancing learning interest and efficiency through gamified teaching. Learners gave positive feedback on the interactivity of the Interactive Whiteboard materials and the technological approach to teaching, believing that these features helped them quickly absorb new knowledge and vocabulary.

In terms of material content, learners generally felt that the current materials were already very comprehensive and did not suggest any need for improvement or additional features. They indicated that the existing material design met their learning needs and that visual teaching through the Interactive Whiteboard made the learning process more intuitive and efficient. Moreover, students also believed that the Interactive Whiteboards were not only suitable for Pinyin learning but could also be effectively used for other areas of Mandarin learning, such as vocabulary and sentence teaching.

Overall, learners affirmed the application of Interactive Whiteboards in Mandarin teaching and expressed gratitude and satisfaction with the teacher's teaching methods. They felt that the teacher's instruction was already very effective, with no additional suggestions or comments. This indicates that the Interactive Whiteboard, as a teaching tool, plays a significant role in enhancing the effectiveness of Mandarin teaching and the learning experience of students.

6. Conclusion and Suggestions

Regarding the conversion of unidirectional expository materials into bidirectional interactive materials, teachers should be able to successfully complete the conversion if they follow the principles set forth in Section 5 and pair them with appropriate teaching strategies. The study subjects all gave high evaluations for the conversion of unidirectional expository materials into bidirectional interactive materials. As for the Pinyin course, according to the results of questionnaires and interviews, the Pinyin course received high praise from students, especially in terms of the course's interest, clarity of pronunciation, and the teacher's teaching methods, all of which received enthusiastic feedback from students. Regarding the converted materials, whether using Microsoft PowerPoint or myViewBoard as a teaching tool, students

gave positive evaluations. Among them, myViewBoard, due to its high interactivity and diversity, was considered an effective tool for helping students learn Pinyin. Concerning the benefits of teaching tools, the tools used by teachers in the classroom, such as myViewBoard, not only increased students' interest in learning but also helped them better grasp Pinyin. Students also believed that the teacher's proficient operation and problem-solving abilities were key to the success of the course. Regarding the aspect of learning attitude, although some students felt nervous during class, overall, students had a positive attitude towards the Pinyin course, finding it interesting and helpful for learning. However, during the operation or conversion process, some difficulties might be encountered, causing disruptions or limitations in the conversion process or teaching. The researcher will now provide operational and teaching suggestions based on the observations recorded during the conversion process, the teaching process, and the opinions of the study subjects.

1. Continued Use of myViewBoard: Given the high praise for myViewBoard from students, it is recommended that teachers continue to use this tool in subsequent courses. To further stimulate students' interest in learning, teachers can explore the various interactive features within myViewBoard.

2. Strengthen Game-Based Teaching: Considering that students found the games in the Interactive Whiteboard materials to be significantly helpful for learning, it is recommended that teachers incorporate more game elements when designing courses to enhance students' motivation and learning outcomes.

3. Expand Teaching Content: The Interactive Whiteboard is not only suitable for Pinyin teaching but can also be applied to other Mandarin courses, such as vocabulary and sentence learning. Teachers are encouraged to consider integrating the Interactive Whiteboard into more courses to provide a more diverse learning experience for students.

4. Attention to Students' Emotional Needs: Given that some students may feel nervous during class, it is recommended that teachers include more relaxation and interactive sessions in the course design to reduce students' anxiety.

5. Optimize Material Operation: Considering system limitations, it is recommended that teachers control the number of pages to less than 50 when creating materials to avoid crashes on standard Windows system computers. If using a large screen, the number of pages should be controlled to less than 100. Regarding the limitations of fade-in and fade-out animations, teachers are advised to plan the sequence of object appearances in advance when designing materials to ensure smooth teaching. When using the Interactive Whiteboards, since only one link can be selected at a time, it is recommended that teachers plan the links in advance to ensure that teaching is not disrupted.

In summary, despite some operational limitations of myViewBoard, its benefits in teaching cannot be overlooked. Teachers are advised to consider the above suggestions when operating or converting materials to ensure smooth teaching and effective student learning.

The Development of Assessment Process for Undergraduate Students' Learning Outcomes According to OBE Model

Kesini Khemangkun, King Mongkut's University of Technology Thonburi, Thailand
Suchapa Netpradit, King Mongkut's University of Technology Thonburi, Thailand

Abstract

The outcome-based education (OBE) focuses on an articulated idea of what skills and knowledge the students need to have after learning in course, especially used for occupation. The academic programs in university were designed and continuously improved for up to date according to the stakeholders' requirement before offering to students. Examination or post-test generally is a method for student assessment by evaluating abilities and achievements in every classroom to analyze the effective teaching. This case study showed the development process of learning outcomes assessment for 45 and 55 undergraduate students of 1st year and 2nd year by setting an activity as exhibition model for creative work called "Yearly Micro-Project" in the program of Packaging and Printing Technology, King Mongkut's University of Technology Thonburi, Thailand. For the 4-year curriculum, the year learning outcomes (YLO) of undergraduate students were set to assess KSA (Knowledge + Skills + Attitude) after the end of each academic year. The students gathered all knowledge to create works according to the problems specified by the instructors for presentation of their design and production process for printing and packaging materials. An assessment with Microsoft Forms of rating criteria (Rubric score) on 5-level was created for assessors who attend the exhibition activity could easily give the scores to each student. The advisors followed up on the progress of their work, collecting assessment results and summarizing student learning outcomes. The satisfaction of students and teachers for this project were evaluated, indicating that this learning outcome assessment method was very appropriate.

Keywords: Outcome-Based Education, Year Learning Outcome, Rubic Score

iafor

The International Academic Forum
www.iafor.org

Introduction

The traditional education system for higher education which focuses on scoring good marks rather than learning actual skills or gaining practical knowledge, is outdated. Presently, to avoid the problem of unemployment for the graduated students, the university needs to switch to an outcome-based education (OBE) system that focuses on the actual outcome of the course and not just grades [1]. The King Mongkut's University of Technology Thonburi (KMUTT) has been working to meet the standards set by the Ministry of Higher Education, Science, Research, and Innovation, Thailand to enhance the quality of education, research, and innovation by improving teaching and learning processes by implementing OBE principles. The academic staff then develop their courses by applying technology, innovation, and new teaching methods to develop students' learning outcomes and assessment tools. The OBE focuses on an articulated idea of what skills and knowledge the students need to have after learning in course, especially used for occupation. The traditional student assessment methods had been generally examination or post-test to evaluate the achievements of teaching and learning.

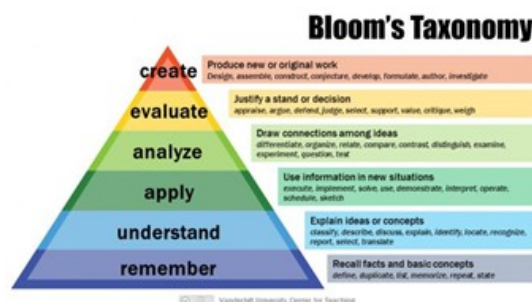
The curriculums of all academic programs in university had to be continuously designed and improved for up to date according to the stakeholder requirement every 4 years. Since the curriculum of Bachelor of Science program in Packaging and Printing Technology at KMUTT was improved in the academic year 2022, a new assessment process of undergraduate students learning outcomes has been applied. After the Program Learning Outcomes (PLO) were established, the Year Learning Outcomes (YLO) according to the PLO was issued for assessment in terms of knowledge, skills, and attitudes (KSA) based on the principles of OBE and followed the Backward Design. The constructive alignment approach was applied to ensure the achievement of learning outcomes as expected which were assessed using a 5-level score based on holistic rubrics following Bloom's Taxonomy [2] for a comprehensive evaluation, as Figure 1.


Figure 1: Bloom's Taxonomy Learning Theory

To test the effectiveness of the OBE assessment system, the first year and the second-year undergraduate students were individual evaluated with a 5-level score rubric using Microsoft Forms by the instructors of the program through the student's work as assignment. This activity of work presentation to evaluate as YLO was organized as an exhibition namely "Yearly Micro-Projects" where the students applied their knowledge in an academic year (2 semesters). The advisors of the students who explained the assignments, had to follow the work progress, summarize their learning outcomes from the assessment results, and gave feedback to help students improve their learning experience. After completing the activities, the information of opinions and satisfaction of the students and instructors to the Yearly Micro-Project activities were collected using Microsoft Forms for further improvement.

Methodology

Designation of Learning Outcome Assessment

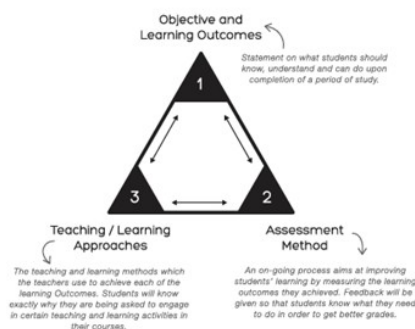
The research methodology for the development of a learning outcome assessment for 45 first-year undergraduate students and 55 second-year undergraduate students in the Packaging and Printing Technology program. The "Constructive Alignment" concept was used as a technique to develop the students and learning activities to achieve the goal, which refers to the "triangle of learning"[3], as Figure 2.


Figure 2: Constructive Alignment Concept

In this program specification, the learning outcome (LO) is carried out according to the principle of backward design and distributed to each subject by providing the course learning outcome (CLO) in alignment with the OBE concept, which contain 1-2 topics and begin with a verb, as shown in Table 1 and 2. The student learning outcomes stated what students are expected to know or be able to do upon completion of a course or a program, which should be clear, observable and measurable, and reflect what will be included in the course requirements (assignments, exams, projects, etc.). In addition to assessment for each subject, the yearly student learning outcomes as the requirement are shown in Figure 3, which could be assessed from the project results that they applied the integrated KSA of all subjects in an academic year of 2022.

Semester/ Academic Year	Course	Instructor	Course Learning Outcome (CLO)
1/2022	Basic Packaging and Printing	A, B	1. Identify the printing systems suitable for print and packaging production. 2. Identify the packaging types and select appropriate packaging for the products.
1/2022	Drawing and Photo for Packaging and Printing	C	1. Create the proper three-dimensional model of packaging. 2. Select appropriate graphics for the project concept.
1/2022	Layout design	C	1. Choose a proper software for printed product design. 2. Use a proper layout for graphic composition.
2/2022	Basic science for Packaging and Printing	D	1. Identify the types of solvents and polymers used in packaging and printing. 2. Identify the types of microorganisms.
2/2022	Prepress process	C, E	1. Prepare files compatible with the printing system.

Table 1: Examples of Course Learning Outcomes (CLO) for
the first-year undergraduate students

Semester/ Academic Year	Subjects	Instructor	Course Learning Outcome (CLO)
1/2022	Printing ink	D	1. Choose the proper printing ink type for the printed products. 2. Test the basic properties of the printing ink.
1/2022	Glass and Metal	F	1. Compare and choose proper glass and metal substrates for application. 2. Test the basic properties of glass and metal substrates.
1/2022	Paper and Wood	A	1. Select the appropriate paper types for packaging use. 2. Make the paper packaging and test the basic properties.
1/2022	Offset printing	B	1. Choose the proper substrates for offset printing. 2. Produce printed products with the offset printing system.
2/2022	Packaging Design	C, G	1. Design the proper packaging correctly.
2/2022	Color Management System	F	1. Create a color profile for the printing. 2. Set the color management system.
2/2022	Post press process	H	1. Choose the proper technique for post-press.
2/2022	Digital printing	D	1. Choose the proper digital printing system. 2. Inspect the print quality of digital printing.
2/2022	Screen printing	E	1. Produce the printed products with screen printing system.

Table 2: Examples of Course Learning Outcomes (CLO) for
the second-year undergraduate students

Figure 3: Year Learning Outcomes (YLO) of the Printing and Packaging Technology
Program for the first, second, third, and fourth academic year

To effectively evaluate the YLO of the students, the activity process for the project
presentation was designed to be carried out in a short time. The assessment tools were then

created by applying the learning theory of Bloom's Taxonomy to measure the learners' level of learning. Before the simulated exhibition for the students' project was organized to show the evidence of learning outcome, the students had to submit their works to the program administrators, as the list in Table 3.

1st Year Student	2nd Year Student
- work file in pdf	- project report (A4)
- sample of packaging selected	- poster (A3)
- project report (A4)	
- poster (A3)	

Table 3: The evidence for submission to present the students learning outcomes

Creation of Assessment Form

The assessment tools were conducted using a Holistic Rubric format [4], which means that the assessment criteria are not separated for each subject but are evaluated as a whole work results. The assessment tools using the Microsoft Forms with 5-level rating score system (level 1: very poor to level 5: very good) with a total weighted score of 100%, which would impact the student's grades. The assessment topics were based on the completion of individual student projects that were assigned to them. In this process, the instructors evaluated all students in knowledge, skills, and attitudes (KSA) because they had to apply their knowledge acquired from all subjects for one academic year to create and present their projects as required. The CLO of each subject was assessed by the subject instructor, while all instructors in this program had to assess the overall qualities from the project work as assignment, as shown in Table 4 and 5.

Subjects	Course Learning Outcome (CLO)	Weight	Assessment Criteria (Rubric Score)				
			1	**2**	**3**	**4**	**5**
Printing ink 1/2022	1. Choose the proper printing ink type for the printed products.	60%	Choose the wrong printing ink types.	Unable to explain the properties and usage of the printing ink.	Able to choose and explain the usage.	Able to choose and explain the printing ink components.	Suggest the printing ink development.
	2. Test the basic properties of the printing ink.	40%	Unable to know tools and methods for printing ink test.	Using the wrong tools and test methods to meet the requirement.	Using the right tools and test methods to meet the requirement.	Explain the results of property test.	Suggest the printing ink property development.
Digital printing 2/2022	1. Choose the proper digital printing system.	50%	Choose the wrong digital printing systems.	Choose the right digital printing systems.	Able to explain the digital printer and digital printing production.	Able to solve the printing problems appropriately.	Suggest the digital printing improvement.
	2. Inspect the print quality of digital printing.	50%	Unable to know the digital printing quality inspection.	Choose the wrong method of printing quality inspection.	Choose the right method of printing quality inspection.	Able to explain the printing quality inspection.	Suggest the solutions of printing problems.

Table 4: Examples of CLO assessment for each subject using a Holistic Rubric

1	2	3	4	5
The work was not beneficial and tends to impact the community, society, environment, etc.	The work was not suitable for use or is incorrect.	The work was created with the appropriate knowledge of packaging and printing.	The knowledge of packaging and printing was correctly applied with the creative thinking.	The work was commercially benefit for community, society, environment, etc.

Table 5: The criteria for overall qualities of work assessment
with the Holistic Rubric of 5-level scoring scale

Organizing of Activity for Learning Outcome Assessment

The activity for learning outcome assessment was organized to enhance the process of OBE. The students should incorporate knowledge (K), skills (S), and attitudes (A) as fundamental of learning to create the project assigned by the instructors. The students had to create their projects aligned with the expected Year Learning Outcomes (YLO) and presented in the event as an exhibition called 'Yearly Micro-Project', and the process was carried out sequentially, as shown in Figure 4.

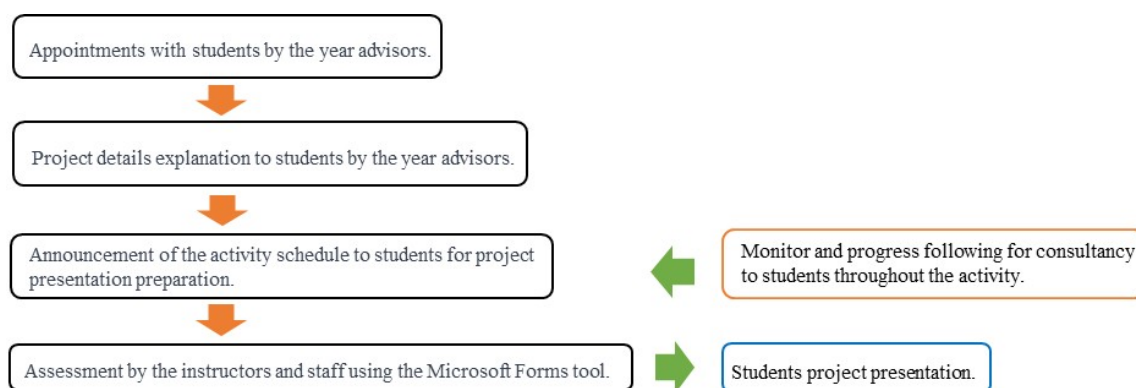
The qualities of student's project work, presentation, and answering ability that indicate their learning outcomes were assessed personally by the instructors, academic staffs, and supporting staffs. Before the event occurs, the year advisors of students must meet with the students to explain the project requirement details. The students should present their projects to the assessors by applying their knowledge acquired for one academic year (2 semesters), as shown in Figure 5.


Figure 4: A diagram illustrating the process steps of Yearly Micro-Project activity

Figure 5: The event of Yearly Micro-Project Activity

Assessment of Student Learning Outcomes

In the assessment process of the learning outcomes of the first-year students and the second-year students, the project work was individually shown and presented to the assessors. After that, the assessors gave the score in the Microsoft Form, determined from the qualities of presentation and the work results, according to various aspects as follows:
1. Creativity of the work
2. Skills and abilities in different subjects
   (ex. packaging and printing, science, English language proficiency, etc.)
3. Intellectual aspects (ex. thinking, planning, problem-solving)
4. Responsibility and ethics in the work

The assessors were divided into two groups for two parts of the assessment process through the Microsoft Forms tool. The subject instructors should assess the learning outcome of the students in their course after completing the classes. In addition, the instructors and supporting staff in the program of Packaging and Printing Technology assessed the overall qualities of the students' work. The average total scores calculated from assessment and weighted scores from all parts from all assessors were interpreted to grade level, as Table 6.

Score Range	Interpretation	Grade
3.75 – 4.00	Excellent	A
3.25 – 3.74	Very good	B+
2.75 – 3.24	Good	B
2.25 – 2.74	Fair	C+
2.00 – 2.24	Poor	C
< 2.00	Very poor	I (incomplete)

Table 6: Interpretation of score range into grade

The administrators of this program set out the criteria for the expected score assessed from the students learning outcome as follows:
1. The score range for the excellent and very good is above the criteria as expected.
2. The score range for the good level is the criteria as expected.
3. The score range under the criteria as expected are the fair and poor level which should be concerned for improvement.

More than 80% of the total undergraduate students should be at the level of good, very good and excellent. However, the students with an average score of more than 2 will be considered to have passed the course with the lower grades while the students with an average score less than 2 will not pass and must present again by improving their works within one year later.

Evaluation of Satisfaction

The evaluation of satisfaction towards the activity of Yearly Micro-Project through the Microsoft Forms tool was also performed by all involved students, instructors and supporting staff. The online questionnaire for satisfaction evaluation in 5-level rating scale [5] on the topics in Table 8 was sent to the activity participants after completing the activity. The obtained scores from the respondents were classified and interpreted in the range as shown in Table 7. The opinion expression was also included in the open-ended questionnaire for further consideration of activity process improvement.

Range of Satisfaction	Interpretation
4.51 – 5.00	Very satisfied
3.51 – 4.50	Somewhat satisfied
2.51 – 3.50	Neutral
1.51 – 2.50	Somewhat unsatisfied
1.00 – 1.50	Very unsatisfied

Table 7: The interpretation for satisfaction evaluation results from 5-level rating scale

Evaluation Topics	Sub-topics
Activity Management	- Activity announcement - Notification of information - Duration of the event - Schedule of the event
Activity Format	- Presentation style - Evaluation method
Activity Venue	- Suitability of venue
Obtained Benefit from the Activity (students only)	- Knowledge, ideas, skills, and experiences from this activity - Application to your studies or practical work. - Accordant to your expectations
Overview of Activities	-

Table 8: The contents in questionnaire for satisfaction evaluation

Research Results

The Learning Outcome Assessment of the Students

After the students' learning outcomes of each subject were assessed by the instructors, the number of students in each grade was identified to determine the teaching and learning achievement, as shown in Table 9.

Subjects	Number of students in each grade from CLO								Mean	S.D.
	A	B+	B	C+	C	I	Level as Expected	Pass		
Basic Packaging and Printing	0	11	25	4	3	2	80.00%	95.55%	2.88	0.73
Drawing and Photo for Packaging and Printing	10	11	13	1	1	9	75.55%	80.00%	3.35	0.99
Layout Design	17	7	12	1	0	5	80.00%	82.22%	2.71	1.44
Basic Science for Packaging and Printing	2	0	2	7	8	26	8.88%	42.22%	1.85	0.88
Prepress Process	32	0	2	0	1	10	75.50%	77.78%	3.71	2.05

Table 9: The assessment of year learning outcomes of 45 first year students

Table 9 shows that the subject of Prepress Process had the greatest number of excellent students (71.11%) who got grade A, mean value = 3.71, S.D. = 2.05. The subject of Basic Packaging and Printing had none of excellent students, mean = 2.88, S.D. = 0.73, indicating that the subject instructor should find the tools to improve the learning activity and outcomes. Two subjects were achieving the criteria of student number getting the expected level (80%) and other two subjects almost met the criteria (around 75.5%), while only one subject was not achieved. The subject of Basic Science for Packaging and Printing had the greatest number of students not pass (grade I), indicating that the subject instructors should improve their teaching methods to enhance the learning outcome of many students.

Subjects	Number of students in each grade from CLO								Mean	S.D.
	A	B+	B	C+	C	I	Level as Expected	Pass		
Printing ink	12	0	20	0	13	10	58.18%	81.81%	2.94	1.32
Glass and Metal	12	22	4	0	14	3	69.09%	94.54%	3.22	0.79
Paper and Wood	14	15	16	2	4	4	81.81%	92.73%	3.36	0.61
Offset printing	2	7	41	1	0	4	90.91%	92.73%	3.05	0.51
Packaging Design	14	26	10	1	0	4	90.91%	92.73%	3.48	0.65
Color Management System	9	0	33	0	10	3	76.36%	94.54%	3.02	0.70
Post press process	10	0	22	0	18	5	58.18%	90.91%	2.80	0.78
Digital printing	8	0	8	0	34	5	29.09%	90.91%	2.42	0.80
Screen printing	0	0	41	0	10	4	74.55%	92.73%	2.75	0.56

Table 10: The assessment of year learning outcomes of 55 second year students

Table 10 shows that the subject of Screen Printing had none of excellent students getting grade A, mean = 2.75, S.D. = 0.56. Four subjects had the highest number of excellent

students (22-25%) who got grade A. There were three subjects meeting the criteria of student number getting the expected level (>80%) and two subjects almost meet the criteria (around 74-76%), while 4 subjects were not achieved, which should be found the tools to improve the learning outcomes.

Score Range	Interpretation	Student Number	Ratio (%)
3.75 – 4.00	Excellent	16	35.55
3.25 – 3.74	Very good	15	33.33
2.75 – 3.24	Good	3	6.67
2.25 – 2.74	Fair	4	8.88
2.00 – 2.24	Poor	2	4.44
< 2.00	Very poor	2	4.44
Total		45	

Remark: Mean score = 3.45, S.D. = 0.72

Table 11: The interpretation of the Year Learning Outcomes for
the first-year undergraduate students

Table 11 shows that the overall scores for 68.88% of total students, more than half, were higher than the mean score, indicating that the learning outcome level was higher than the expected level, while 31.11% of total students got a score below the mean value.

Score Range	Interpretation	Student Number	Ratio (%)
3.75 – 4.00	Excellent	19	34.54
3.25 – 3.74	Very good	31	56.36
2.75 – 3.24	Good	1	1.81
2.25 – 2.74	Fair	0	0
2.00 – 2.24	Poor	0	0
< 2.00	Very poor	4	7.27
Total		55	

Remark: Mean score = 3.42, S.D. = 1.00

Table 12: The interpretation of the Year Learning Outcomes
for the second-year undergraduate students

Table 12 shows that the overall scores for 90.9% of total students almost all students were higher than the mean score, indicating that the learning outcome level was very higher than the expected level, while only 7.27% of total students got a score below the mean value. The results indicate that the second-year undergraduate students with more learning experience and KSA increase had more learning outcomes with higher competency than the first-year undergraduate students.

Evaluation of the Participants' Satisfaction on the Activity

The results of the satisfaction opinions for the activities in this session, evaluated by the participated students, instructors, and staffs are shown as Table 13.

Evaluation Topics	Evaluators		
	Students	Instructors	Staffs
Activity Management	4.22	4.67	4.06
Activity Format	4.24	4.67	4.13
Activity Venue	4.36	4.33	4.50
Obtained Benefit from the Activity (students only)	4.44	-	-
Overview of Activities	4.14	4.33	4.25
Mean	4.28	4.50	4.23
S.D.	0.12	0.19	0.19
Level Interpretation	**Good**	**Good**	**Good**

Table 13: The Evaluation of Satisfaction

From Table 13, the satisfaction survey regarding the organizing of this event, the results indicate that all participants, instructors, and supporting staff were satisfied at the good level. The amount of 72% of the total participants agree to set the activity as this event in the next year, while the other participants of 28% disagree to set this activity.

Conclusions

For the learning outcomes assessment of 45 first-year students from 5 subjects, it was found that one subject (Prepress Process) had the greatest number of excellent students while another one subject (Basic Packaging and Printing) had none of excellent students which should be improved by the subject instructor. Almost four subjects were achieved as the criteria of student number getting the expected level (75-80%) of total students) while only one subject was not achieved. One subject (Basic Science for Packaging and Printing) had a high number of students not pass (grade I), indicating that the subject instructors should find the tools for this problem solving.

For the learning outcomes assessment of 55 second-year students from 9 subjects, one subject (Screen Printing) had none of excellent students getting grade A while four subjects had the highest number of excellent students (22-25%). There were three subjects that achieved the expected number of students getting accepted level and two subjects almost met the criteria while four subjects were not acquired, which should be further improved.

For the overall assessment, more than half (69%) of the first-year undergraduate students got higher average scores than the mean score, and almost all the second-year undergraduate students (91%) got higher average scores than the mean score.

From the evaluation of satisfaction on the activity, the participants, instructors, and staff, were satisfied with this activity with the rating scale range at the level of good.

From the opinion expression, 72% of total participants agree to set the activity continuously in the next year while the others of 28% disagree to set this activity.

Issues Encountered

Students should improve their readiness in preparing content for presentation. They should have more self-learning about the topics they have learned and ask for the information from

the instructors. Additionally, the project work should be continuously updated on the progress by prior present to their year advisors.

ChatGPT Technology and Its Role in Promoting Creativity in Education

Mariam Alkalbani, Mohamed Bin Zayed University for Humanities, United Arab Emirates

Abstract

This study aims to achieve several main objectives. First, it aims to analyze the role of ChatGPT technology in promoting creative interaction between teachers and students in the context of education. Second, seeks to study the impact of ChatGPT technology on the development of students' creative skills, such as critical thinking, creative design, and innovation. Third, aims to explore the possibility of expanding the boundaries of creativity in education using ChatGPT technology. Finally, aims to identify potential future applications of ChatGPT technology in promoting creativity in education. The descriptive analytical approach was used, and the study tool was a questionnaire to identify the technology and its role in promoting creativity in education, and the research sample consisted of (92) university professors in the United Arab Emirates, and they were randomly selected. The results proved that there are statistically significant differences between university professors in the United Arab Emirates towards ChatGPT technology and its role in promoting creativity in education, which indicates its great role in promoting creativity in education.

Introduction

In December 2022, the field of artificial intelligence, particularly the area of chatbot development and utilization, experienced a surge in growth with the launch of the ChatGPT chatbot. However, ChatGPT is not a new concept, as they have been in existence for almost six decades. The first chatbot, called ELIZA, developed by Weizenbaum in 1966, utilized pattern matching to simulate psychotherapist conversation with human patients. While ELIZA may be unfamiliar to the general public, many individuals are familiar with more modern virtual chatbot assistants, such as Amazon's Alexa and Apple's Siri, which operate on logical and virtual chatbot systems. The fundamental goal and premise of so-called chat-bots is that a computer converses with human clients in natural language in a manner that is as human-like as feasible (Bradeško & Mladenić, 2012). They are computer programs that mimic and process human communication, allowing people to interact with digital devices as if they were speaking with another person (Ciechanowski et al., 2019).

With the rapid advancement of technology, education is undergoing a remarkable shift in terms of tools and techniques used in the classroom. Among these innovative technologies, ChatGPT stands out as one of the most promising tools that contribute to enhancing creativity in the learning process.

ChatGPT technology is an AI-based system that can be used to create intelligent and advanced conversations between students and teachers. This technology is based on text analysis and automatic response, providing exciting opportunities for innovation and interactive learning. One of the notable features of ChatGPT technology is its ability to foster creative interaction between teachers and students. Through the ability to communicate and discuss in a direct and effective way, students can interact with educational content, ask questions, and express their ideas freely. This allows teachers to provide appropriate guidance and assistance and promote active learning and innovation.

In addition, ChatGPT technology contributes to the development of students' creative skills. Encourages conversational discussions and collaborative problem solving and promotes critical thinking and creative design. These skills allow students to tap into their creative potential and develop their abilities to find new and innovative solutions to complex problems. It is also important to note that creativity in education can be expanded using ChatGPT technology. In addition to creative interaction within the classroom, this technology can enhance communication and shared learning between students and teachers across time and space. Students can participate in online collaborative discussions and projects, allowing them to benefit from multiple experiences and opinions and foster the exchange of creative ideas.

ChatGPT are increasingly being used in education. Clarizia et al. (2018) introduced it as a useful technology for supporting education, as they enable one of the most important ways to promote and enable personalized learning, not only increasing support and inclusion of students but also significantly reducing the administrative workload of teachers and enabling them to focus more on curriculum development and research (Cunningham-Nelson et al., 2019). Their advantage is that they are an interactive mechanism compared to traditional e-learning systems (Kowalski et at., 2011), and their users are only limited by the creativity and imagination of the user (Roos, 2018). In 2021, Okonkwo and Ade-Ibijola presented a study in which they analyzed 53 articles from reputable digital databases, with the aim of understanding the use of ChatGPT in education, including basic information, benefits,

challenges, and suggestions for future research on the use of ChatGPT in education. Their study found that chatbot technology is used in various areas of education, including teaching and learning (66 %), administration (5 %), assessment (6 %), advisory (4 %), and research and development (19%). They highlight that the introduction of chatbot systems in education can bring personalized online learning and greater accessibility to learning materials, which students can access from anywhere and at any time. Lin and Chang (2020) and Murad et al. (2019) added that ChatGPT are good technological innovations that improve students' interest in learning, cognitive skills acquisition, and academic achievements. They also have a successful impact on students' motivation.

Recently, there has been increasing global interest in the importance and contribution of creativity in the learning process; to form the student's personality, form his identity, build his independence, direct his attention through experimentation, ask questions, identify, and solve the problem using mental imagination and creative self-expression, and find innovative alternatives by generating new ideas.

The use of ChatGPT in educational environments requires special skills from teachers. Most existing research on the use of ChatGPT focuses on the opportunities they offer teachers and other educators to assess curriculum goals. However, it is difficult to find research that explores ChatGPT Technology and its Role in Promoting Creativity in Education.

The number of studies exploring the use of chatbots in education is increasing (e.g., Kuhail et al., 2023; Yildiz Durak, 2023; Hew et al., 2023), The main objective of the current research is to identify the ChatGPT technology and its role in promoting creativity in education through: Building a questionnaire on ChatGPT technology and its role in promoting creativity in education and calculating its honesty and stability, Revealing the reality of the application of ChatGPT technology and its role in promoting creativity in education, Reaching recommendations and suggestions on ChatGPT technology and its role in promoting creativity in education.

Large language models are a form of generative AI that pro-dux human-like language (OpenAI, 2023a). OpenAI trains its text-generating models using machine learning algorithms on large amounts of text, including books, news articles, websites, and Wikipedia (Scharth, 2022). By processing terabytes of data, models acquire the patterns and structure of language, enabling them to provide users with relevant and meaningful content in response to their requests. When I asked ChatGPT to describe itself (prompt-Describe ChatGPT), it generated the following italicised text: ChatGPT is a language model developed by OpenAI. It is a variant of the ChatGPT (Generative Pre-training Transformer) model, which is trained on a massive amount of text data to generate human-like text. It can be used for a variety of natural language processing tasks, such as language translation, text summarization, question answering, and for chatbot applications. It can understand and respond to human inputs in a conversational way, making it well suited for interactive applications. ChatGPT can be fne-tuned on specific data sets and task, which means it can be customized to perform specific task and generate outputs that are more accurate and useful. ChatGPT can... "write stories, give life advice, even compose poems and code computer programs" (Scharth,2022, para. 2). There have been reports however that it... "produces fake citations and reproduces biases that exist in the literature" (Gleason, 2022, para. 7). According to cited ChatGPT output, "AI systems can perpetuate biases that are present in the data they are trained on. This can lead to unequal and unfair outcomes for students, particularly if the bias is related to factors such as race, gender, or socio-economic status" (Zhai, 2022, p. 7). OpenAI (2023) acknowledge in

their advice to educators that... "ChatGPT may produce content that perpetuates harmful biases and stereotypes, sometimes in subtle ways... the model is generally skewed towards content that reflects Western perspectives and people" (para. 18). ChatGPT has gone viral on social media, and anecdotal- tal evidence suggests that students are already familiar with it. It is safe to assume that undergraduate students are using ChatGPT or a similar software. Given ChatGPT's apparent usage and stakeholder concerns, it is crucial to evaluate its output about Promoting Creativity in Education. As far as I am aware, there has been no prior research that has examined the text generated by ChatGPT in relation to its Role in Promoting Creativity in Education. Also, there is little written about its utilisation as a research tool, Promoting Creativity in Education.

Chat GPT, a recent AI innovation by Open AI that quickly gained million users (Haque, et al, 2022) holds the potential for improving self-directed learning. Examining Chat GPT's ability to aid autodidactic. Learning is important for understanding how to best utilize chatbots and AI in education, and for guiding the future of education and technology-assisted learning. By understanding how ChatGPT can support independent study, educators and students can use these technologies to enhance their own learning and development. Additionally, this research can inform policy decisions on incorporating these technologies into educational settings.

The researcher sees Creativity and innovation are necessities, important elements, and basic features that should be available in the teacher, in the modern school principal and in the learner, as a result of the increasing ambitions, the multiplicity of needs, and their diversity, and the phenomenon of the knowledge age and the challenges it imposes in all aspects and fields of life are an essential point in the need to adopt creativity and innovation in the management of the educational process, and the leadership of the school of the era.

The researcher sees ChatGPT It is a powerful language model that relies on artificial intelligence to answer user questions creatively and write articles without quoting from another source. It can be used in different ways to enhance the learning experience and improve education Some of its benefits are providing a rich source of knowledge, reducing the cost of educational resources, access to knowledge to any student from anywhere and at any time, developing new teaching mechanisms that are more interactive, Contribute to the development of curricula and office tasks, Motivate students to think critically and creatively.

Research Focus

The aim of this study was to explore the ChatGPT Technology and its Role in Promoting Creativity in Education.

Research Tools, Procedures, and Results

This part describes the method and procedures of the field side of the current research, including the research methodology, the research community and its sample, the research tool, its validity and stability, the procedures followed by the researcher in the application process, in addition to the statistical methods and treatments used in data analysis.

First: Research Tools and Procedures

Research Methodology

The research used the descriptive analytical approach, due to its suitability for the purposes of the study, and the researcher prepared a questionnaire to identify the ChatGPT technology and its role in promoting creativity in education.

Research Community

The research community consisted of all university professors in the United Arab Emirates, whose number is (108).

Exploratory Research Sample

Where the survey sample consisted of (50) university professors in the United Arab Emirates.

Basic Research Sample

The current research sample consisted of (92) university professors in the United Arab Emirates, and they were selected randomly, and Table No. (1) shows the distribution of the study sample according to its variables.

Table 1: Distribution of Study Sample by Type

Variable	Groups	as	%
gender	males	46	50%
	females	46	50%
Chronological age	Less than 50 years old	46	50%
	More than 50 years	46	50%
Degree	Lecturer	15	15%
	Assistant Professor	17	35%
	Professor doctor	60	50%
Total		92	100%

It is clear from Table (1) that the study sample (46) of male professors by (50%) while females recorded (46) by (50%) and that the percentage of females is less than the percentage of males.

Research Objectives

The main objective of the current research is to identify ChatGPT technology and its role in promoting creativity in education through:
1. Building a questionnaire on ChatGPT technology and its role in promoting creativity in education and calculating its honesty and stability.
2. Revealing the reality of the application of ChatGPT technology and its role in promoting creativity in education.
3. Reaching recommendations and suggestions on ChatGPT technology and its role in promoting creativity in education.

Research Tool: Identify the Technology of Chat ChatGPT and Its Role in Promoting Creativity in Education

To achieve the goal of the research, the researcher prepared a questionnaire after reviewing the theoretical literature on the field of research and previous studies, because the questionnaire is one of the common tools in educational research, where researchers use it to obtain the reality of the already existing situation and conduct research related to trends and opinions.

The justifications for choosing the questionnaire tool are as follows:
- Suitability for the nature of the current research
- The possibility of distributing it to large numbers of examined people who live in distant geographical areas
- Easy to distribute, manage and analyze results
- Saving a lot of expenses and effort on the researcher

The researcher has developed the research tool, which is a questionnaire covering fifteen phrases (Appendix No. 1), about the technology of chat ChatGPT and its role in promoting creativity in education, where he developed it to collect information, according to the following steps:
1- Access to educational literature and previous studies related to the subject of study.
2- Using some previous questionnaire models.
3- Choose appropriate items and exclude others to avoid prolongation or repetition.
4- Modifying some items to suit ChatGPT technology and its role in promoting creativity in education.

The Tool Consisted of Two Parts

The first section: It consists of three variables, including gender, function, and the dependent variable is ChatGPT technology and its role in promoting creativity in education.

The second section: included (15) phrases that include ChatGPT technology and its role in promoting creativity in education.

The research relied on a quintuple gradient according to the Likert method as follows: the degree of "strongly agree" and represents (5) agree and represents (4) two degrees, neutral (3), disagree (2), strongly disagree (1).

First: The Authenticity of the ChatGPT Technology Questionnaire and Its Role in Promoting Creativity in Education

Apparent Honesty

Where the questionnaire was designed in a way that ensures apparent honesty through clarification of the questionnaire instructions and the formulation of questionnaire questions in an easy manner and clear words that do not bear more than one meaning, and one phrase includes one idea, and the answer to the questionnaire phrases does not take a long time and great effort, and the sincerity of the questionnaire was verified by presenting it to a group of specialized arbitrators with experience in the field and their number (7) specialists from the faculty members in the faculties of education, In order to verify the clarity of the phrases and

the affiliation of each of them to the axis that followed and the extent to which the axes of the questionnaire cover the goal of it, the researcher has committed to making amendments and observations made by the arbitrators.

Sincerity of Internal Consistency

The sincerity of internal consistency means "the extent to which the scores of each of the phrases correlate with the total score of the questionnaire (Salah El-Din Mahmoud Allam, 1993, p. 215).

The researcher calculated the correlation coefficient between the degree of each statement and the total degree of the resolution, and the following tables (2) show the validity of the axes of the resolution.

Table 2: Correlation coefficients between the score of each statement and the total degree of the resolution

M	Correlation coefficient	M	Correlation coefficient	M	Correlation coefficient
1	0.805**	6	0.936**	11	0.795**
2	0.917**	7	0.833**	12	0.844**
3	0.879**	8	0.950**	13	0.869**
4	0.858**	9	0.928**	14	0.783**
5	0.869**	10	0.812**	15	0.812**

**Function at 0.01 level

It is clear from Table (2) that all correlation coefficients between each phrase with the total degree of the resolution are a function at the level of 0.01, which means that the resolution has a high degree of internal consistency, which means that the phrases share the measurement of ChatGPT technology and its role in promoting creativity in education.

Resolution Stability

The stability was calculated using the Alpha Cronbach method of resolution and Getman of half segmentation, and the following table shows the stability coefficients of the resolution.

Table 3: Showing the stability coefficients of the resolution

N	Questionnaire	Number of ferries	Alpha stability coefficient	Getman stability coefficient
1	ChatGPT technology and its role in promoting creativity in education	15	0.957	0.969

From the previous table, it is clear that the stability coefficients (0.957 – 0.969) are high for the resolution as a whole, which indicates confidence in the results of the questionnaire.

In light of the above various mechanisms for legalizing the research tool and reassuring its suitability for use, a codified picture of the questionnaire was finally reached, which was presented to the research sample.

Second: Procedures for Applying the Research Tool

After ensuring the sincerity and stability of the research tool, the researcher took several procedures so that he could apply the questionnaire, which were:
- Preparing the study tool in its final form after ensuring its truthfulness and stability.
- Identify the members of the study sample.
- Distributing the questionnaire to the target group, then collecting it.
- Conduct appropriate statistical analysis and come up with and comment on the results.
- Prepare appropriate recommendations and proposals in light of these results.

Third: Statistical Methods Used

The computer was used to enter the study data by the statistical program known as (SPSS-V.17) any (Statistical Package for Social Science), and in order to analyze the study data, a set of statistical methods were used that are consistent with the objectives of the study, and its methodology, namely:

1- Frequencies, and percentages for each of the questionnaire phrases, in order to identify the opinions (responses) of the study sample members towards the degree of approval of the ChatGPT technology and its role in promoting creativity in education, and to identify the various reasons that justify the respondents' answers and provide a more detailed description of these criteria.

2- **The relative** weight of the responses of the sample members to the questionnaire statements, which is given by the following equation:

$$\text{Relative weight} = \frac{5 \times \text{strongly agree repetition} + 4 \times \text{repeat ok} + 3 \times \text{neutral repetition} + 2 \times \text{repeat disagree} + 1 \times \text{iterations strongly disagree}}{\text{Total duplicates}}$$

3- Calculation (Ka2) to find out the statistical significance of the questionnaire statements for all members of the study sample, i.e., to verify the existence of significant differences in the responses of the study sample members on the degree of approval for each of the questionnaire statements, and the extent of the essence of these differences.

4- Correlation coefficients (Pearson's correlation coefficient) to verify the validity of internal consistency for the resolution.

5- Alpha Cronbach α coefficient to determine the degree of stability of the resolution.

Table 4: For the purposes of statistical analysis of the results,
the following criterion has been adopted

description	Range of averages	Relative weight
Strongly agree	From 4.2- 5	84 – 100%
agree	From 3.40- 4.19	68 – 83.8%
neutral	From 2.60- 3.39	52 -67.8%
Disagree	From 1.80- 2.59	36- 51.8%
Strongly disagree	From 1- 1.79	20- 35.8%

Fourth: The Results of the Study

The study aimed to study the identification of " ChatGPT technology and its role in promoting creativity in education". To achieve the objective of the study, a questionnaire was prepared and verified its truthfulness, and its stability coefficient, and after the data collection process, it was coded and entered into the computer and processed statistically using the statistical package program (SPSS) for the social sciences, and the following are the results of the study according to the sequence of his questions and hypotheses.

The results related to (the reality of the application of ChatGPT technology and its role in promoting creativity in education): Which relates to the following question:

> **"What is the reality of the application of** ChatGPT **technology and its role in promoting creativity in education?"**

To answer the previous question, the arithmetic averages, standard deviations, and percentages of the phrases of the ChatGPT technology questionnaire and its role in enhancing creativity in education were extracted, and the study adopted the five-point Likert scale to estimate the degree of achievement of the reality of the application of ChatGPT technology and its role in promoting creativity in education, and the results table (5) shows as follows:

Table 5: Mean, relative weight, and the value of Ka2 and its level of significance for the reality statements of ChatGPT technology and its role in promoting creativity in education

N	Phrases		Strongly agree	Agree	Neutral	Reject	Strongly reject	Average	Relative Weight %	Standard deviation	Order	Ka2

		%	35.9	60.9	2.2	1.1	0					

**Function at 0.01, *Function at 0.05

By extrapolating the results of the previous table, it was found that:

By reviewing the table (5) on "**The reality** of the application of ChatGPT technology and its role in promoting creativity in education", it is clear that:

* The average relative importance of the questionnaire phrases "the reality of ChatGPT technology and its role in promoting creativity in education" = 4.36 with a relative weight (87.2%), which represents a degree of strong approval, meaning that ChatGPT technology has a major role in promoting creativity in education.

* Approval rate for all questionnaire statements strongly agreed: It received strong approval and percentages ranging between (86.2-88 %), the highest of which was statement No. (5) "**I noticed an expansion in the limits of creativity in learning thanks to the use of ChatGPT technology**." by 88%.

* As for the relative importance of the **questionnaire** phrases "The reality of ChatGPT technology and its role in promoting creativity in education", which is reflected in the relative weight of each phrase, by reviewing the previous table No. (5) it is clear that:

Statement No. (5) "I noticed an expansion in the limits of creativity in learning thanks to the use of ChatGPT technology" came in the first place, followed by statement No. (9) **"ChatGPT technology enhances social interaction and communication between students, teachers and parents"** in second place, and statement No. (11) "You see that **ChatGPT** technology Improves students' reading, writing and critical thinking skills" in third place, and in the last place came statement No. (15) "ChatGPT technology provides a more effective and easy way to talk in all areas, in addition to providing resources to improve language performance in general", preceded by phrase number (14) which states "ChatGPT technology is a powerful tool to help users solve problems and provide ideal solutions quickly and accurately".

* With regard to statistical significance, it is noted that:

By reviewing Table No. (5) it is clear from the value of Ka2that all the statements of the questionnaire are statistically significant at the level of (**0.01) and in favor of approval,** that is, there are statistically significant differences between university professors in the United

Arab Emirates towards ChatGPT technology and its role in promoting creativity in education, which indicates its great role in promoting creativity in education , which is consistent with the theoretical framework of the study as well as the results of previous studies in emphasizing the importance of ChatGPT technology and its role in promoting creativity in education.

Discussion

By Discussing the findings, it becomes clear that:
- ChatGPT technology has a major role in promoting creativity in education.
- ChatGPT technology has expanded the development of creativity in education.
- ChatGPT technology enhances social interaction and communication between students, teachers, and parents.
- ChatGPT technology Improves students' reading, writing and critical thinking skills.
- ChatGPT technology promotes creative design and innovation in the context of education.
- ChatGPT technology provides a comprehensive and integrated learning experience that suits the needs of each individual student.
- ChatGPT technology can be used as an interactive source of e-learning by interacting and adapting to educational content.
- ChatGPT technology contributes to creative interaction between teachers and students**.**

These results are consistent with a study (off the school, 2023) on the importance of artificial intelligence in promoting creativity in education. Where the previous study confirmed that the technology has the potential to both limit and augment our creative capabilities. It is up to us, as teachers and educators, to guide the future of this relationship and ensure that it supports the continued growth and development of human creativity. By approaching AI as a tool to be used in the service of human creativity, rather than a threat to it, we can help to ensure a bright future for both the technology and the humans who use it.

Conclusion and Recommendations

From the results of the current research, it is necessary to develop ChatGPT so that it is able to provide unique educational experiences for each student based on their personal needs and interests, create new and innovative educational content, such as explanatory texts and questions to test concepts, and in order to support students in developing creative solutions to problems by providing suggestions and guidance, to encourage students to think critically and devise alternative and non-traditional solutions to educational challenges. , to help enhance interaction between students and increase their engagement by chatting with technology to ask questions and discuss, Provide support to students during distance learning and motivate them to explore topics autonomously, In creating interactive conversations, Create exciting dialogues and conversations with fictional or historical figures to enhance students' understanding of educational materials, Help teachers and students develop interesting and engaging educational stories and scenarios , Supporting classroom discussions by providing multiple perspectives and adding new ideas to stimulate thinking and discussion, creating innovative interactive experiences such as educational games and educational simulations that help stimulate thinking and learning to illustrate difficult concepts in a simple way, Providing customized support for students with special needs, helping them access educational content in ways that suit their needs, using it. To facilitate collaborative learning

and teamwork by fostering interaction and exchange of ideas among students, you must turn into AI mentors who guide students through their learning stages and provide them with personalized advice. Use them to develop innovative interactive lessons that allow students to interact with educational content and conduct effective experiences, so that they can provide practice and training in learning foreign languages through conversations and language exchanges with the model.

Appendix No. (1)

ChatGPT technology and its role in promoting creativity in education.

Strengthening Characteristics of Outstanding Community Business in Sakon Nakhon Province, Northeastern Thailand – A Case Study on Ban Don Koi Weaving Group in Sakon Nakhon Province

Sukontip Vianmana, Kasetsart University Chalermphrakiat Sakon Nakhon Province Campus, Thailand

Patcha Sattaka, Kasetsart University Chalermphrakiat Sakon Nakhon Province Campus, Thailand

Abstract

Over decades, Thai government has been supporting and empowering people in local areas to organize community business groups and creating unique local-based products. However, many groups have been still unsuccessful. To encourage those unsuccessful business groups to become more strength, study on operations of successful business groups is vital. An indigo dyed fabric is a traditional wisdom passed on from ancestors and spread widely especially in Northeastern part of Thailand. Therefore, this study aims to indicate strengthening characteristics of outstanding community business. This study employed both quantitative and qualitative research techniques to collect the data on Ban Don Koi Weaving Group. The group leader was purposively interviewed as recommended by the community development officer as an excellent community business group in Sakhon Nakhon Province which was Ban Don Koi Weaving Group. Descriptive statistics was used to explain general information and strengthening characteristics of the group. The results displayed that the indigo dyed fabric group had established since 2003. There were 63 members in the group. There were totally 7 types of group products. The group earned 5 stars of OTOP award. The strengthening characteristics of the group in terms of producing, marketing, administrating, and financing were clear clarified. The government had been supporting the group some budgets, materials and knowledge since establishment. The results indicated that well planning process before producing, marketing, administrating, and financing activities were crucial and the group personnel working with systematic tasks and their discipline continuously were clearly strengthening characteristics of the group.

Introduction

Over decades, Thai government has been supporting and empowering people in local areas to organize community business groups and creating unique local-based products (Khanson, Sreshthaputra, Limnirunkul & Na, 2015). As they will obtain the first supportive priority from government or other sectors. Although the government has attempted to promote the community business groups for several years, there are many groups have been still unsuccessful and failed in the end (Vianmana, Yasunobu & Elias 2016). As the study of Sakolnakorn & Naipinit (2013), they presented that the main problems caused unsuccessful condition in community businesses are composed of marketing, finance and accounting, production, management information systems, product design, and the cost of production. Likewise, Khanson, Sreshthaputra, Limnirunkul, & Na, (2015) revealed about strategies and actions related to develop community business group (silk weaving activity), which are standard production, marketing support and new information, a clear accounting system, product design, social networks, traditional weaving knowledge transfer, and practical and skillful training for members. As the previous studies, the problems related to community businesses' operations have still problematics. Furthermore, Vianmana & Makoto (2021) mentioned that the number of group members, amount of receipts, the number of group product types, and production or non–production of several group product types, influenced the number and percentage of committee members in charge of several types of functions. This issue relates to the process to operate the community business group. Thus, to encourage those unsuccessful community business groups to become more strength and study on operation in terms of successfulness in the kind of the group are necessary.

Objective

1) To indicate strengthening characteristics of outstanding community business.

Methodology

Selected Study Area

The area is located in Sakon Nakhon province, northeastern part of Thailand. Sakon Nakhon is one of Thailand's seventy-six provinces lies in upper northeastern Thailand also called Isan. Neighboring provinces are (from north clockwise) Nong Khai, Bueng Kan, Nakhon Phanom, Mukdahan, Kalasin, and Udon Thani. The capital is Sakon Nakhon. The total area is 9,580 km^2 (3,700 sq mi) with 1,153,390 inhabitants. The province is divided into 18 districts. The districts are further divided into 125 subdistricts and 1,323 villages (Wikipedia, 2023).

The statistic information from community development department (2022), in Sakon Nakhon, indigo-dyed fabric is the 3rd ranking, out of five GI products (GI stands for Geographical Indication). Indigo-dyed fabric products generated approximately 19,946,534.80 USD;1 USD = 32.15 THB in 2021 (Bank of Thailand, 2021).

Sakon Nakhon province

Figure 1: Sakon Nakhon province, Thailand

Table 1: Sales of OTOP products during 4 years (2018-2021)

No.	OTOP products	2018	2019	2020	2021
1	Fattening beef (Pon Yang Karm)	770,244,780	713,489,800	539,226,133	761,323,000
2	UHT/Pasteurized milk	570,551,689	1,089,209,756	1,022,271,215	1,165,957,994
3	Indigo-dyed fabric	342,331,013	667,266,012	613,034,902	641,281,095

5	Hang rice	40,110,337	63,918,768	63,374,500	78,152,720

Source: Community development department (2022)

General information of Ban Don Koi Weaving Group

Ban Don Koi Weaving Group is a community business which produces indigo dyed fabric products. The group has been started by Mrs. Pim Srikulkij. There has improved local wisdom about textile weaving and passed on to descendants. Then the group was formed to support each other since September 3rd, 2003 and received knowledge support and budget support from local government organization and governor.

The location of this group is house no. 58, moo. 2, Sawang sub-district, Pan Na Ni Khom district, Sakon Nakhon province 47130, Thailand. The group leader is Mrs. Ta-win Oop-pree

(being the group leader since group establishment in 2003). Telephone number is +66 (0) 87-091-2190. The group sell products at the group shop and only platform such as Facebook and LINE applications. The group has registered OTOP in 2004.

About the group products are unique with shiny and beautiful indigo-dyeing fabric colors. The fabric has long-lasting dye color, unique fragrance, also outstanding with beautiful antique and applied patterns. As the group's products which is called "mudmee" is tied/dyed process", has obtained a 5-star OTOP product in 2019 until the present which is the highest ranking of the awards.

Figure 2: The place of Ban Don Koi Weaving Group

Group Structure

As Vianmana and Nohmi (2020), they revealed that the groups are composed of group committee members and general group members. Group committee members consist of executive and general committee members. The group structure consists of a leader, vice-leader(s), secretary(ies), treasurer(s), consultant(s), and general committee member(s) who have specific duties. The majority of the groups have fewer than 15 group committee members.

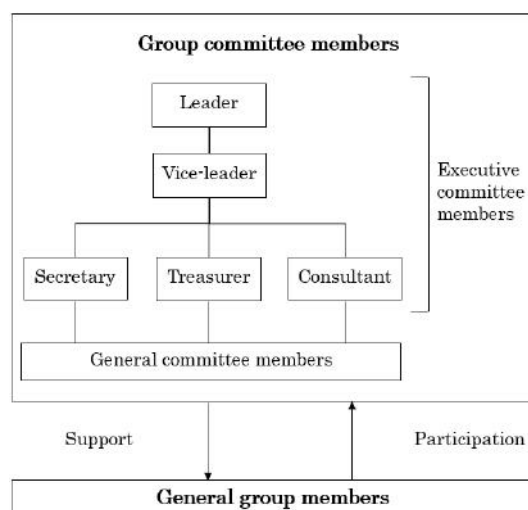
The group leader is responsible for the overall group activities, and he/she directs and supports the group members. He/she also facilitates coordination between the external players (government organizations, other supporters, or customers) and group members. The vice-leader assists the group leader in managing the group operations and is the key person that contacts government organizations or other supporters. The secretary records the information collected from group meetings or other events. The treasurer manages the group's finances.


Figure 3: Group structure of community business (Vianmana and Nohmi, 2020)

This study employed both quantitative and qualitative research techniques to collect the data on Ban Don Koi Weaving Group. The group leader was purposively interviewed as recommended by the community development officer as an outstanding community business group in Sakhon Nakhon province which was Ban Don Koi Weaving Group. Descriptive statistics was used to explain general information and strengthening characteristics of the group. Thus, we study about indigo dyed business group which is a traditional wisdom passed on from ancestors and spread widely especially in Northeastern part of Thailand. Furthermore, this group is an outstanding group in Sakon Nakhon Province suggested by the community development department.

Results

General Information

The results displayed that there were 63 group members in 2023. The group had established since 2003 with 9 group members. The group composted of 17 committee members. There were totally 7 types of group products which were handkerchief, scarf, shawl, a set of fabrics, multi-purpose fabric, ready to wear clothes, and bags (pre- order). The group earned 5 stars of OTOP award which is the highest ranking of the awards and rewarded an industry production standard to guarantee that the product has high quality.

Figure 4: Group structure of Ban Don Koi Weaving Group

Production Planning

Inside the group building, there are 34 handlooms to weave fabrics. Based on seven types of the group's products, a set of fabrics was the bestseller. This set is included by two fabrics in order to make cloth and skirt or trousers. The price per set is around 1,800 -2,600 THB; 1USD = 34.96 THB in 2023, (Bank of Thailand, 2023). The group also produce the products regarding to orders from customers.

About production capacity and its value, the group could produce a set of fabrics about 2,200 sets per month and its value was 840,400 THB, which were the highest number of production capacity and its value compared to other product types. Therefore, the capability to produce high quality products and production capacity are important.
Figure 5: Amount of each product type a month
Figure 6: Value of each product a month

Figure 7: Handlooms

Marketing Planning

The group ordered cotton threads from Bangkok 300-400 Kg. per month (200 THB/ kg.) to produce all group product types. Threads were tied/dyed in indigo colors and dried.

First stage was started by supplying thread from shop in order to produce primary stage by the group members. After that, middleman inside Sakon Nakhon province will come to take the group products at the group place or the group deliver the products to customers using online and transportation service in the country and overseas. Thus, pre-order, market channels, and a credit to finish work intime are important things to strengthen the group.

Figure 8: Indigo color

❖ The group
(members)
❖ Thread shop in
Bangkok

❖ Middleman in the
province
❖ Online
❖ Delivery

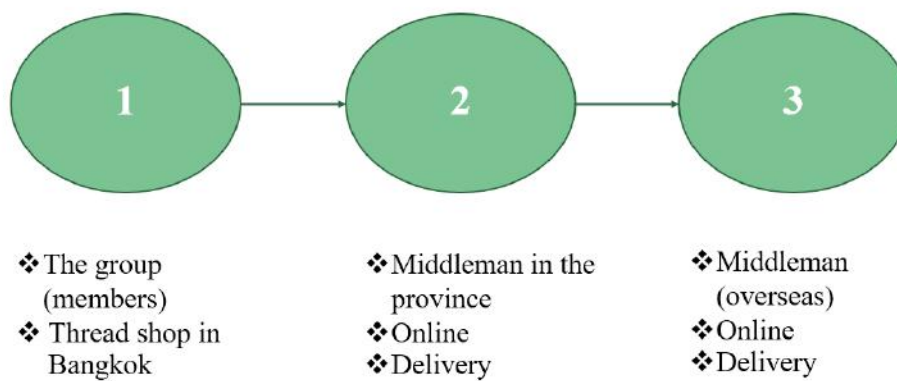
❖ Middleman
(overseas)
❖ Online
❖ Delivery


Figure 10: Marketing stages

Administrating Planning

The group distributed responsibilities to all group members. The group members understood their duties very well. They could finish the work intime following orders from customers. There also had a record for working hours of all group members in order to earn income every month based on the group profit. The group had a group meeting every month to update the group information, orders, responsibilities, and planning, these activities are well strengthening the group operation.
Figure 11: Record for working hours

Financing Planning

The group committee member will calculate earning for group members every month based on the number of record working hours of each and the group profit. The group will have a meeting to plan for working capital every 3 months.

About subsidies that the group have obtained since 2004. From 2004 to 2006, the groups received 27,500 THB a year. After that, from 2007 to 2022, the group obtained 7,500 THB from subdistrict Administrative Organization (SAO). In addition, in 2023, the Ministry of Interior provided new building, equipment and tools for the group, about 12,000,000 THB. Therefore, the subsidies are important to strengthen for the group's operation in early stage until present. In summary, financial support from government is precious. Likewise, the group financing process such as the group has provided earnings to group members every month based on its profit.

Conclusion

The results of descriptive statistics; firstly, displayed that the Ban Don Koi Weaving Group has longevity which been operating about 20 years. As for the planning process, it showed

that the group has pre-order, market channels, and a credit to finish work intime are important things to strengthen the group, high product quality, these could be well representing the outstanding and strengthening of the group background.

Secondly, the strengthening characteristics of the group in terms of producing, marketing, administrating, and financing were clear clarified. The government had been supporting the group with some budgets, materials and knowledge since establishment. These subsidies are important to strengthen for the group's operation in early stage until present.

Finally, the results indicated that well planning process before producing, marketing, administrating, and financing activities were crucial and the group personnel working with systematic tasks and their discipline continuously were clearly strengthening characteristics of the group. Especially, working hour record activity and earning income of group members every month, these activities are major keys to keep the strengthened group operation.

As the study, a group of outstanding community business was selected to clarify the strengthening characteristics of community business in Sakon Nakhon province, Northeastern Thailand. The characteristics might occur only inside this selected group. Therefore, this study remains a limitation. In the future, it will be great to enhance studying in other outstanding community businesses.

Development of Student Status Reports of a Faculty in University Using Interactive Microsoft Power BI for Effective Academic Administration

Pattavee Kittaratip, King Mongkut's University of Technology Thonburi, Thailand
Wisitsree Wiyaratn, King Mongkut's University of Technology Thonburi, Thailand

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

The student status report is generally designed for academic administration to get information to analyze the learning progress. For the case study at the Faculty of Industrial Education and Technology (FIET), King Mongkut's University of Technology Thonburi, there are 8 undergraduate programs, 7 master's programs, and 1 doctoral program. There are average number of 755 students per academic year for all undergraduate students, graduate students, and PhD students. The big data of FIET students could be retrieved from the Academic Information System (New ACIS) which shows the information of student admission, students' history, enrollment, request, study timetable, grades, etc. To support the student admission and academic administration, the data of student status was summarized to be an interactive report using Microsoft Power BI. The system has been continuously improvement from the academic year of 2012 to 2021. The online report included of 3 items: (i) current students registered in the system, (ii) graduated students, and (iii) students who dropped out. In addition, it also showed the grades before admission, current grades, category of application, education history, etc. This developed system could be conveniently reported via online to the administrators for planning and decision-making. The satisfaction of 10 users was evaluated with online questionnaire of 5-scale on 4 topics: ease of viewing, sufficient of data, benefits and outcomes, suitability of report, showing that the average score was >4. Moreover, there was suggestion to develop the system linkage between the faculty and programs to follow-up and analyze the progress of student learning.

Keywords: Information System, Student Status Report, Microsoft Power BI

iafor

The International Academic Forum
www.iafor.org

Introduction

Currently, the Faculty of Industrial Education and Technology at King Mongkut's University of Technology Thonburi manages its teaching and learning activities through 8 units, comprising 7 departments and 1 central unit, offering a total of 16 programs. These programs are divided into 8 undergraduate, 7 master's, and 1 doctoral degree programs. The faculty has established a vision for development: "Developing innovators and creators at the global level." The primary clients of the faculty are students, each with different qualifications based on the program level.

Student status is crucial information that the faculty needs for planning and operations in various aspects, such as student recruitment and selection, curriculum development, student tracking, and assistance. Currently, the information is collected from various university information systems to compile student status reports. However, the existing reporting methods have limitations, such as using paper-based or traditional information systems, which are not versatile in reporting student status data in various formats. The data may be outdated and not suitable for efficient decision-making and planning by the faculty management [1].

Previously, reporting the performance of the educational service unit involved document-based reports with extensive textual information, lacking interactivity and responsiveness to the needs of meeting participants and faculty administrators. During regular faculty committee meetings at the end of each semester and academic year, the "Student Status" report was presented by extracting data from the Educational Management Information System (NewAcis) in the form of Excel files. This report aimed to provide the faculty committee with an overview of student status in each department, such as academic probation for undergraduate students with a GPA below 2.00 and for graduate students with a GPA below 3.00, as well as dropout and dismissal status for students with a GPA below 1.50 or voluntary withdrawal.

The manual reporting process consumed significant committee time in evaluating student status during each reporting period, prompting the researcher to identify the causes and problems in the reporting process. To address these issues, the researcher developed an information system to generate easily interpretable and convenient student status reports for the faculty committee. This system utilized an interactive presentation format under Microsoft Power BI, covering various aspects of student information, such as recruitment channels, year levels, program levels, and academic performance. The developed information system aims to provide a comprehensive and user-friendly overview of student status for efficient analysis and decision-making by faculty administrators [2].

Objectives

This research has 2 for objectives Development of Student Status Reports of a Faculty in University Using Interactive Microsoft Power BI for Effective Academic Administration.
1. To develop database to interactive report
2. To analyst big data base on student status

Methodology

Step 1: Study the Requirements of Executives or Customers and Current Information Through the SIPOC System

Utilize the SIPOC model (Supplier, Input, Process, Output, Customer) to analyze and understand the current data processes. The desired outcome is to generate information reports requested by the executives of the Faculty Industry of Education and Technology (FIET). The SIPOC model serves as a tool for analysis, aiding in the identification of relationships between the producer, input data, process, output, and customers. This helps in obtaining insights into the functioning of the system. The executives aim to receive information that is informative and aligned with the system's operational requirements [3].

Step 2: Study Standardized Information Reporting Systems

The researchers investigated information reporting systems that adhere to standards and are efficient in presenting flexible reports. Systems capable of analyzing large-scale data were explored, and Microsoft Power BI emerged as the supported software within the organization.

Step 3: Design and Plan Existing Data for Reporting System Integration

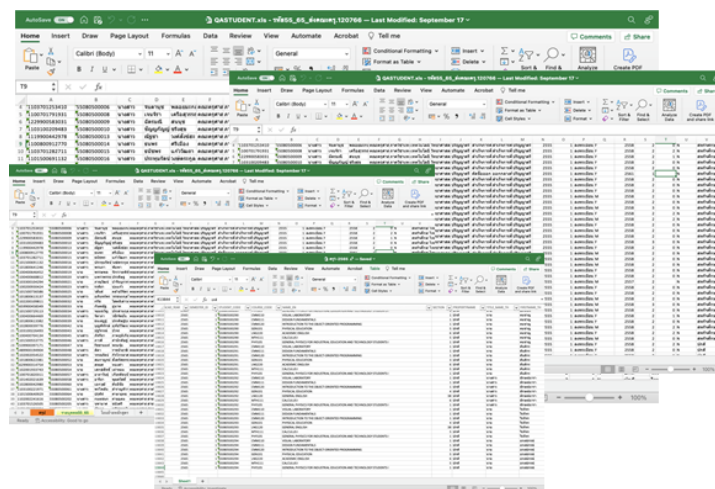
Designing and planning existing data involves considering user requirements and organizing data systems to efficiently support reporting. This includes structuring data to enhance its usability within the reporting framework, utilizing the university's information system database (NewAcis) [4].


Figure 1: Database before Management with Microsoft Power BI
Figure 2: Data Management with Microsoft Power BI

Step 4: Database Management and Data Integration With Microsoft Power BI

Initiate database cleaning, administer database management as shown in Figure1, and design report presentations categorized by student status, such as status, completion status, and dropout status. Ensure clarity and ease of understanding in report design. Integrate the database with Microsoft Power BI for efficient and responsive reporting that effectively meets user requirements was shown in Figure 2.

Step 5: Evaluate User Satisfaction With the System

Present the new reporting system and products to users to assess their satisfaction and gather their feedback. This evaluation can be conducted through surveys or feedback activities to facilitate continuous improvement of the system and future reporting. Listening to user suggestions is crucial in developing and enhancing the system to meet the organization's needs.

The key aspects to consider are as follows:
1. Ease of data selection
2. Adequate data quantity to meet needs
3. Benefits and insights gained from system usage
4. Analyzability for planning student development
5. Suitability for reporting purposes

Results

The research revealed that the Student Status Information System developed using Power BI had the capability to present student status data comprehensively and understandably. User satisfaction with the system was at a high level of 5 (Very Satisfied), with an average rating of 4.71 and a standard deviation of 0.47 (N=14), indicating a considerable level of satisfaction with the system.

Users of the Student Status Information System express satisfaction in various aspects:

Convenience in Data Selection (4.44):
Users report that the system allows for convenient data selection, demonstrating progress and ease of use.

Adequate Data Quantity for Needs (4.22):
The system provides enough data that meets users' needs without exceeding or falling short.

Benefits and Gains from Usage (4.55):
Users feel that the system is beneficial and provides what they need adequately.

Capability for Further Analysis and Student Development Planning (4.44):
The system can be used for analysis, contributing to effective student development planning.

Suitability for Reporting (4.33):
The system is considered suitable for reporting data in line with user requirements.

Conclusion

The research findings demonstrate that the Student Status Information System utilizing Power BI was effective in providing timely information and receives high user satisfaction. The system's user-friendliness and progress in data selection contribute to a sense of convenience for users. Additionally, the system proved beneficial and suitable for analysis, supporting student development planning. This signifies a significant success in developing a system that meets the needs of the current educational environment.

Suggestions

1. Enhance the Feature for Comparing Data Between Academic Years:
Adding the capability to compare data between academic years will make it easier for users to examine trends and changes in data. This is beneficial for academic planning and decision-making.

2. Display Individual-Level Analysis Based on OBEM:
Importing a feature that displays individual-level analysis based on the Outcome-Based Education Model (OBEM) will assist in immediate improvements in areas that require development. Additionally, students and staff can gain an overview of the system's success in teaching and learning.

3. Link Analysis Results to Competency Levels in the Curriculum:
Linking analysis results to competency levels in the curriculum being studied or completed would be highly beneficial for generating reports summarizing students' development in a semester-wise format.

4. Establish Connections With Student Admission Information:
Developing connections with student admission data will aid in tracking and analyzing the effectiveness of students throughout their academic journey.

5. Increase Connectivity With Soft Skill Data:
Adding information about non-professional skills (Soft Skills) will contribute to creating a comprehensive overview of students' overall skill development. This is advantageous for preparing students for the workforce.

6. *Establishing Policies for Student Care and Reducing Future Student Dropout Rates:*
Develop and implement policies aimed at student care with the objective of reducing the likelihood of future student dropouts. These policies should encompass proactive measures to support students in both academic and non-academic aspects, fostering a positive and inclusive learning environment. Regular assessment and adjustments to these policies are essential to effectively care for students and minimize the potential for future dropout incidents.

Anxiety of Primary Students' Teacher in Learning Statistics and Its Relationship to Statistical Learning Outcomes

Melda Jaya Saragih, Pelita Harapan University, Indonesia

Abstract

Learning statistics are useful for primary students' teachers, although they are prepared to be primary school teachers. Statistics can develop student's critical thinking, logic, and necessary in completing their final project, but some student's teachers do not notice and also have learning anxiety which affects their learning outcomes achievement. Learning anxiety is caused by many factors and must be reduced to achieve maximum learning outcomes. This study explores the relationship between statistical learning anxiety and learning outcomes and describes what factors make students anxious in learning statistics. This study used a quantitative approach that explored the relationship between statistical learning anxiety and statistical learning outcomes using the non-parametric test by Spearman Rank correlation test. Data was collected through tests, questionnaires, and student reflections. Test and anxiety questionnaire results analyzed quantitatively, while the results of interviews and reflections will be analyzed qualitatively. Statistics questions tests are arranged based on statistical learning objectives; questionnaires are arranged based on learning anxiety indicators. The subjects of this study were 72 students of the primary student's teacher. The results showed that there was a relationship between statistical learning anxiety and statistical learning outcomes in primary student's teachers. Students' statistical learning anxiety has impact to encourage students to achieve their learning outcomes goals. Based on interviews and reflection data, some of the factors that influence student anxiety include information from seniors who say statistics subject so difficult, mathematics prior knowledge students still relatively low, and their fear of the risk of failing in statistics subject.

Keywords: Learning Outcomes, Statistic Anxiety, Students Teacher

Introduction

Statistics is a science that discusses data collection, data presentation, data processing and data generalization (Riyanto, 2018). All study programs at universities in Indonesia are equipped with Statistics courses, including for prospective elementary school teachers (González, Rodríguez, Faílde, &; Carrera, 2016; Rangkuti, AN, &; Fitriani, F, 2019); Subekti, FE, & Akhsani, L, 2020. Tishkovskaya, S., & Lancaster, G. A., 2012). Elementary school teachers in general are teachers who can teach various subjects because their learning is based on themes known as thematic learning. So, prospective elementary teachers also need to learn statistics because they are also prepared to teach elementary mathematics. In addition, statistics can also help train someone in solving problems, thinking critically, and making the right decisions based on data (Kesici, Baloğlu, & Deniz, 2011). Statistics help students develop their thinking skills in solving various problems. Statistics focuses on concepts, data, and inference, how to describe inferences about phenomena based on existing data. Statistics is also very applicable and is indispensable in everyday life and various fields (Chasanah, AN, Wicaksono, AB, 2020). Statistics are open to interpretation and have no absolute certainty value because generalizations depend on sample data, so no one can determine their truth. So, statistics are needed for prospective teachers both in work as teachers and as significant members of society.

Prospective elementary school students need to understand what statistics are and why statistics are important. If students can understand problems, design experiments, and collect data, conduct surveys, and ask important questions, students will feel a significant impact from statistics so that students can feel the great contribution that students can make when they master statistics courses. However, students often focus more on the difficulty of learning statistics and their final learning results, so students do not enjoy the process developed in themselves while studying statistics. Their difficulties and obstacles in learning and focusing on the result, this is what triggers their learning anxiety to appear. Anxiety about learning statistics is common in social science students, including Primary student's teachers. This is due to the lack of school mathematics knowledge and the unpleasant previous mathematics learning experience (Malik, S., 2015; Paechter et al., 2017).

Learning anxiety can cause students to lose confidence in learning mathematics (Panitz, T. 2023). Learning anxiety can hinder learners in achieving their designed learning goals (Aryani and Hasyim, 2018; Wulandari & Agustika, 2020). Statistical anxiety is slightly different from mathematical anxiety because statistics deal with procedures, using more than mathematical symbols; The cognitive process of statistical anxiety is different from mathematical anxiety. In addition to the manipulation of mathematical symbols, statistical anxiety is more associated with linguistic understanding of data processing. Statistical anxiety creates significant inconsistencies with respect to cognitive processing compared to mathematical anxiety (González et al, 2016). But these two anxieties are interrelated. Statistical anxiety is strongly associated with math anxiety as well as learning anxiety in other related areas (Yang, S. 2021). Learners with high math anxiety tend to be more anxious about statistics as well.

Anxiety will usually arise if the student faces a situation that he considers threatening. This condition will make students think negatively of themselves. Math anxiety often results from unpleasant experiences in learning mathematics (Panitz, T, 2023). Students who feel excessive anxiety often make mathematics a subject to avoid (Priyani, 2013). Anxiety is a psychological condition full of anxiety due to certain things that can affect including: (1)

physiological conditions such as heartbeats, heart palpitations, paleness, nausea, (2) cognitive conditions such as difficulty concentrating and (3) psychological conditions such as feelings of pressure or fear (Nazliati, N, Sari, R, & Fitriani, F. 2019). Math anxiety is a feeling that involves fear when faced with the possibility of handling Math problems (Febryliani, 2021; Soewardini, H.M.D, 2019). All Primary student's student teachers from Pelita Harapan are students who get scholarships and are bound by various regulations. One of them is the GPA standard that they must achieve every semester and are expected to be completed in 8 semesters during their education. In addition, there are several conditions that must be met, for example, being able to take the first field Experience course on the condition that the course fails a maximum of two courses. Students are also required to live in dormitories, so they have an incredibly open connection with information from their seniors. So that this becomes the situation behind their condition, anxiety, and achievement.

Although failure to learn statistics is entirely influenced by learning anxiety, it is necessary to measure how much anxiety will affect their math ability and what factors affect their math anxiety. This is to be able to help what actions need to be improved to provide a better learning experience for students so that the goals of education can be achieved. This study's purpose is to determine the relationship between statistical learning anxiety and learning outcomes and describe the factors that cause student statistical learning anxiety. By knowing student anxiety, helping to provide information on student learning needs so that learning goals and objectives can be achieved properly because intervention on student mindset will be effective in improving student academic achievement (Bostwick K. C. P., Becker-Blease K. A. 2018).

Methods

This study used a quantitative method approach by looking at the relationship between statistical learning anxiety and statistical learning outcomes using the Spearman Rank non-parametric correlation test with the help of SPSS. Data was collected through learning outcomes, questionnaires, closed student interviews. Learning outcome data obtained from test results and questionnaire results are processed quantitatively, while closed interviews will be analyzed qualitatively. The subjects of this study were 72 primary prospective teachers, Teacher Education department.

Result and Discussion

From the data from the questionnaire of 72 Primary prospective teachers, it was obtained that there was a relationship between statistical learning anxiety and student learning outcomes. From the results of SPSS calculations using the non-parametric Spearman Rank correlation test, the following data were obtained:

			Learning_Outcomes	Anxiety
Spearman's rho	Learning_Outcomes	Correlation Coefficient	1.000	.294[*]
		Sig. (2-tailed)	.	.020
		N	72	72
	Anxiety	Correlation Coefficient	.294[*]	1.000
		Sig. (2-tailed)	.020	.
		N	72	72

Table 1: Correlation between Student's Anxiety and Learning Outcomes

From table 1: significance value of 0.02 indicates Ho is rejected, meaning that there is a correlation between statistical learning anxiety and the value of statistical learning outcomes. By comparing the values of Z count and Z of the table obtained the calculation as follows: $Z = rs\sqrt{(n-1)} = 0{,}294 \sqrt{(71)} = 2{,}48$ and $Z_{table\,(0{,}05)} = 1{,}64$. So, Ho was rejected, meaning that there is a correlation between learning anxiety and student statistics learning outcomes. The correlation value is 0.375 when viewed $R^2 = 0{,}086$ This means that learning outcomes are only affected by 8.6% of their learning anxiety. The positive correlation value shows the learning anxiety experienced by students encouraging students to learn better. College students' anxiety is not high anxiety but low and moderate anxiety. Where students can still control their anxiety into learning motivation, they are learning more statistics with various support systems provided such as tutorials and peer tutors.

When viewed from the results of the questionnaire, most students experience anxiety about learning statistics. The results of the questionnaire showed that 15% of students did not experience anxiety in learning statistics, but 85% experienced anxiety in learning statistics. Students stated that they were afraid of getting a failing grade in the statistics course. The following are the results of student questionnaires that state that students are afraid of failing in the educational research statistics course:
Fig. 1: Student Afraid About Failing in Statistics Course

From fig.1, only 10% of students are not afraid of failure while 90% have a fear of failing in statistics courses. From the results of closed interviews, students are afraid to fail the statistics course because of their poor mathematical skills and material that is still not mastered, the results of quiz and midterm test scores are low, the results of their achievements in that semester will be decisive in participating in the field experience program. If any course fails, it will have a significant impact on the subsequent course contract. However, students do the

tasks given and learn as well as possible. Even so, there are students who are not afraid to fail in statistics courses because students assume that if they have the intention to learn and want to try, students believe that it is important to practice a lot and they want to prove that statistics is not as difficult as what many people say. There are also students who make their worries a motivation to learn this course and try to always encourage themselves to continue learning and mastering the subject matter.

Students experience anxiety before taking tests, both quizzes and written exams such as midterm and final test. Students are anxious when they are approaching the exam because they have not studied optimally in preparing for the exam, unable to complete the questions given correctly, the form of exam questions that are different from the sample questions given in class, the number of assignments they have to collect during the exam week and will interfere with their exam preparation. After exams, students are anxious about their test scores because they have not been as expected and there is no chance of remedial. Students feel that they have prepared for the exam seriously, but the results are not as expected. But even so, when viewed from the results of the questionnaire, students prepare themselves before there is a test. Here is the data from the questionnaire:
Fig. 2: Student Prepare Their Self for Each Statistical Test

When viewed from the results of the questionnaire in fig. 2 data, although there is anxiety in students, 91.67% of students prepare themselves before the test. Only a small percentage did not prepare well before they took the statistical test, which was 8.33%. Even though they have prepared themselves for the exam, there is still a feeling of fear in students in facing the exam, because the ability to analyze questions is still low, sometimes lack focus and forget what stages to do to do the questions, lack confidence in the answers, and consider the test difficult. But students feel they must learn more than usual. Students who do not prepare well are also very worried because of lack of preparation. Unlike students who do not experience the anxiety of studying statistics, they can manage their emotions well. During exams, students have a unique way of preparing themselves, so they do not tend to panic during exams. In addition to these reasons, there are students who are not so focused on the results; the important thing is that they have done their best in learning. They do not feel anxious and afraid when learning something new and realize that their worries will hinder them from following the learning.

In addition to feeling anxiety before and after the exam, there are also students who experience anxiety during learning when students are appointed to come forward but cannot explain. Yep, (2023) found that students are worried about getting negative ratings from peers if they cannot do the assigned tasks well. In addition, students also experience anxiety about their ability to understand the material explained by the lecturer and consider statistical material to be difficult in nature. There are students who feel anxious when comparing themselves with their friends who have mastered the learning material during class, but they cannot understand learning. Students immediately judge themselves as not being able to master the lesson because their other friends have mastered it. In addition, students' low understanding of mathematics affects students' statistical learning anxiety (Smith, Brumskill, Johnson, & Zimmer, 2018). Students are not yet confident in their mathematical skills in solving statistical problems. The following are the results of the student questionnaire regarding his confidence in solving statistical problems:
Fig. 3: Student Confident With Their Ability to Solve Statistical Problem

From fig.3, as many as 54.17% of students admitted that they did not have confidence about their ability to solve statistical problems while 45.83% had confidence that they were able to solve statistical problems. In addition, doubts about students' ability to solve and capture statistics lecture material due to lack of initial knowledge of mathematics. Students admit that they are weak in mathematics, have difficulty understanding material concepts, analyzing problems, and applying what formulas will be used. Although many students consider statistics difficult, some students can see the difficulty in learning statistics with different sides. Some students consider statistics not so difficult because the calculations are accompanied by tables that can make it easier to do problems, after attending statistics classes students will be able to master if they focus on listening to the lecturer's explanation in class well, doing exercises seriously and learning more. Some of the things that students do in statistics lectures include always asking friends to study together and asking friends and tutors about material that is not understood, trying to motivate themselves that statistics can still be mastered if they want to practice.

When viewed from the results of closed interviews, things that cause student learning anxiety in learning statistics include: Information obtained from previous seniors that many students who have finished taking this course say that statistics courses are difficult and many students do not graduate in statistics courses. The fear of students if they fail and repeat the statistics course is the main cause of their anxiety. The weight of statistics courses as much as 3 credits

will have a major effect on students' GPA and can affect the courses they can teach in the next semester. Students consider statistics a difficult subject because many formulas and concepts are quite difficult for students to understand (Nurhusain, M, & Hadi, A, 2021). Many students admit that they find it difficult to compile hypotheses and other concepts in inference statistical materials, especially some lecture materials in English. The limited mathematical ability of previous students also makes it difficult for students to understand the material, analyze problems, and apply what formulas will be used (Gurat, M.G., 2018). College students need more practice. In addition, interrelated material factors also affect the mastery of student material because when there is material that students do not understand, it will affect the mastery of the next material.

Conclusion

The results showed a correlation between statistical anxiety and the achievement of mathematics learning outcomes. Student anxiety in learning statistics can still be controlled so that it has an impact in encouraging student enthusiasm in achieving good learning outcomes. The main cause of student anxiety is their fear of failing the course because they see their seniors who repeat by seeing their low math skills and students trying to learn so as not to fail in statistics courses. However, educators need to make students feel comfortable in learning statistics first (Condron, D.J, 2018). Students also experience anxiety when facing exams because students have concluded that statistics courses are difficult, and students' statistical skills are low and their fear of not passing statistics. This condition is a consideration in assessment that does not focus on the form of written assessment and does not focus on the assessment of the form of written tests but the growth of students in learning and can experience the benefits of learning statistics in their daily lives and the benefits they feel in learning. It is necessary to shape the mindset of students by seeing the good impact if they master statistics because they can feel statistics in various aspects of their lives. In line with the results of Nasution's research, S.H. (2019) that interactive tasks with stages of analysis, design and development can reduce student anxiety in doing mathematical tasks. In addition, the results of research by Smith, T.F. (2019) found that by approaching how the mindset of students, how statistics affect their lives, their growth-oriented mindset will reduce anxiety about learning statistics.

Empower Girls Creativity Through Use of Digital Technologies:
A Learning Programme for Girls (SparkDigiGirls)

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
Research shows that girls choose their professional future based on stereotypes, often under the family influence. The area of technology is the one where we find fewer girls, due to the lack of role models or examples of successful women. In response to this need, a group of partners involving universities and associations from Lithuania, Slovenia, Greece, and Portugal developed a project over two years. It started with a compilation of good practices and round table discussions with people who are relevant in the subject area in each country. With the data collected, it was possible to identify subjects and technologies to develop a learning programme for girls. A programme of 16 challenges was developed based on girls' interests that could be solved using technology. The Moodle platform was used to set up the whole structure. Each challenge includes theoretical information about the technology through video. Followed by tutorials where girls can learn how to use the tools. In the end, they must submit evidence of the challenge and fill in a quiz that tests their knowledge. A pilot test was then conducted with 279 girls from the four countries, aged between 14 and 18, for 2 months. The results were very positive, with the girls showing a change of view towards technology. All this experience made it possible to create a guidebook for mentors and organizations that work with girls, which will allow them to attract more girls to the area of technology.

Introduction

Persistent gender stereotypes and misconceptions about careers in technology and engineering contribute to disparity between male and female in ICT. In this context teachers and educators can play a crucial role in reshaping this perspective by providing guidance and opportunities for girls to experience a different narrative (Marques, Manso, Grinevičiūtė, Danielien, 2022; Marques, Araújo, Grinevičiūtė, Danielien, 2023).

From younger age, even in primary school, both boys and girls exhibit a similar inclination toward pursuing careers in science-related fields (Noonan, & Laffarge, 2017). Nevertheless, as they progress through subsequent school years, girls tend to shift their attitudes and preferences, showing a greater inclination towards careers in social, environmental, and medical domains rather than in science, technology, engineering, and mathematics (STEM) and ICT studies (OCDE, 2018). This shift can be attributed to biases, a lack of role models, and other factors that hinder girls from fully capitalizing on the opportunities presented by digital transformation (Lambrecht, & Tucker, 2019; Neerukonda, & Chaudhuri, 2018). Eurostat's 2021 data reveals that girls and women remain underrepresented, comprising only 19.1% of all ICT students in the EU. Among the focus countries of the SparkDigiGirls Project, Lithuania displays the highest percentage of women in ICT at 23.7%. Greece and Portugal follow with 21.3% and 20.7%, while Slovenia exhibits the lowest percentage at 16.6% (Eurostat, 2022).

Recognizing this need, partners from Lithuania, Portugal, Slovenia, and Greece initiated the two-year international project SparkDigiGirls, funded by the Erasmus+ strategic partnership in the field of youth, with the titled "Empower Girls Creativity Through the Use of Digital Technologies" (SparkDigiGirls)[1]. The aim of the project was to inspire girls to explore digital technologies such as Augmented Reality (AR), Artificial Intelligence (AI), and other technologies, generating new and innovative ideas, leveraging their newly acquired digital knowledge to contribute creatively to the STEM industry, traditionally dominated by men (Marques, et. al., 2023).

It is recognized that increasing female participation in the IT sector is important for promoting diversity, economic growth, gender equality, and social impact (SparkDigiGirls, 2021). The project therefore emerged as a way of addressing these perceived needs. To this end, we will present the different phases of the project, identify the main results achieved and present all the outputs resulting from them.

SparkDigiGirls Project

The SparkDigiGirls project ran from 2021 to 2023 in a sequence of three main phases: 1) Diagnostic and curriculum definition; 2) Content development for the online programme and 3) Pilot study and dissemination.

Phase 1 - Diagnostic and Curriculum Definition

Through the diagnostic and curriculum definition phase, the first task was to identify the factors that prevent young girls from pursuing careers in computing and technology, and to

---

[1] For more information visit: http://www.digigirls.eu/

provide practical examples and initiatives aimed at increasing girls' and women's interest in digital technologies. By conducting focus groups in the different countries, it was possible to gather insights, best practices, and perspectives from experts in the ICT-related sector on how to address these challenges and inspire and support girls to explore their creative potential in the field of digital technologies.

During the Focus Group, women were identified as being important to get involved in IT for the following reasons (Grinevičiūtė, et. al. 2021):

- Diversity: Women bring different perspectives, experiences, and skills to the IT sector, which can lead to more innovative and creative solutions. A diverse workforce can also help companies better understand and meet the diverse needs of their customers.
- Economic growth: The IT sector is a fast-growing industry and increasing women's participation can help address the skills gap and talent shortage in the sector. This can lead to increased economic growth and job creation.
- Gender equality: Increasing female participation in the IT sector can help address gender inequality and promote equal opportunities for women in the workforce.
- Social impact: The IT sector has a significant impact on society, and increasing women's participation can help ensure that technology is developed and used in ways that benefit all members of society.

From the analysis of the results obtained during the focus group (Marques, et. al. 2022), it can be concluded that there are several effective ways to increase girls' interest in technology, such as:

- Hands-on experience with ICT, products, and tools: Providing opportunities for practical application of new IT, products and tools can increase girls' interest in ICT. The more hands-on experience a girl has during her education, the greater her interest in ICT. Creativity in the classroom could also increase girls' interest in ICT and should be an integral part of the use of ICT.
- Female role models: Having visible female role models stimulates girls' interest in ICT careers and helps them to imagine themselves in these fields. Female IT students could be mentors and good role models, especially in their schools. This would be the kind of real action that would encourage other girls to choose IT. Girls and women need to see inspiration and role models.
- Teachers as mentors and non-formal education: If educators talk to girls about ICT subjects and actively encourage them, girls will be more attracted to these disciplines. Non-formal education, academies and educational projects encourage girls to think about studying ICT. Participants also emphasized the creation of mentoring programmes to foster girls' interest in ICT.
- Real life applications: Girls become more interested in ICT when they can imagine what they can do with these subjects, how they can be applied in real life situations and how they can be relevant to their future. Therefore, it is important to teach girls not only to play, but also to use technology in a meaningful way, whether exploring or creating.

Phase 2 - Content Development for the Online Programme

In the second phase of the project, the curriculum for the learning programme was developed: "Unleash Your CreativITy with Technology" programme. A MOODLE-based platform (figure 1) was used to create a sequence of sixteen challenges that the girls could complete

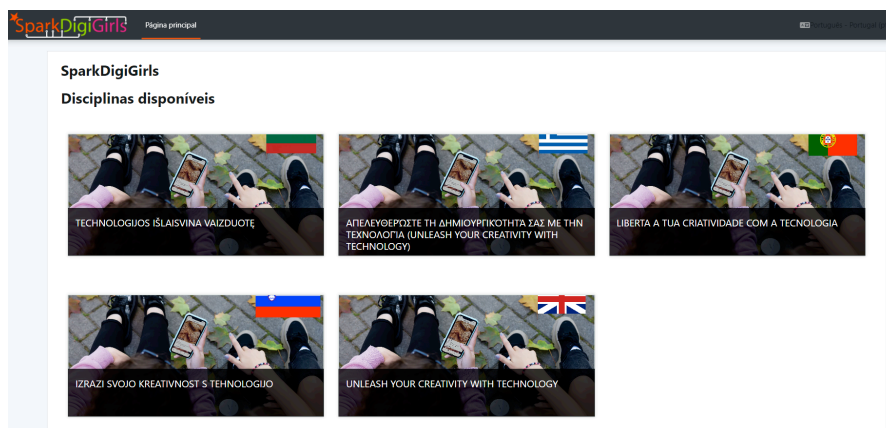
asynchronously and to be used in non-formal education context. This consists of sixteen separate learning modules covering specific topics or areas of interest for young girls age 14+ using several technologies. The learning programme was initially developed in English and then translated and adapted into the languages of each of the partner countries.


Figure 1 - Online training programme in five languages (https://moodle.digigirls.eu/)

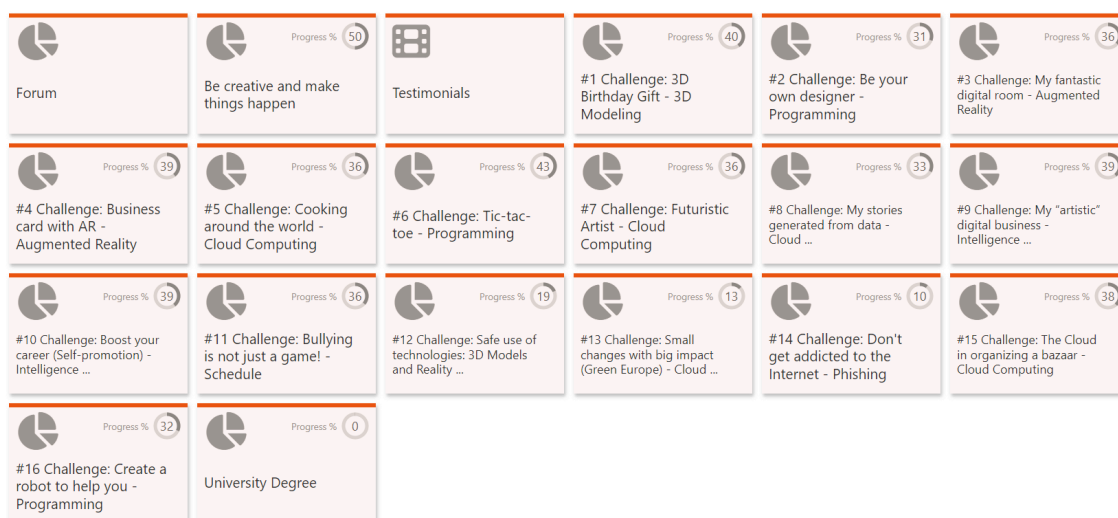
A total of sixteen challenges (figure 2) have been created and organized with
- A learning guide with an introduction and instructions.
- Videos from YouTube to introduce different digital technologies that will be used in the challenge. Each video aims to explain how these technologies work and what they are used for. In some of the videos, an interactive layer has been added using the H5P tool to point out important information in the video or to answer questions.
- Presentations in pdf or ppt files are used to present concrete tutorial tools or step-by-step activities in a clear and summarized way.
- At the end of the challenge, the girls must take a quiz, which is a way to test their knowledge in each challenge.
- It is also necessary to submit evidence of having completed the proposed challenge, it can be an image, link, video, audio, etc.
- After completing each challenge, a certificate is automatically issued by the platform.


Figure 2 - Module organization of 16 challenges
- Unleash Your CreativITy with Technology

The challenges were designed to develop girls' digital skills and critical thinking skills, covering specific topics or areas of interest to the young girls using different technologies, such as:

- Artificial Intelligence (AI): AI was used in several challenges, such as the 'Futurist Artist' challenge, where the girls created an online gallery and put all their art in NFTs format.
- Augmented Reality (AR): AR was used in the 'Be your own designer' challenge, where girls created a fashion game using Scratch and drawing using SketchAR.
- Internet of Things (IoT): IoT was used in the "Small changes with big impact" challenge, where girls developed their own carbon footprint.
- Programming: Programming was used in several challenges, such as the "Pinch of food creations" challenge, where the girls created a website using Wix, and the "Tic-tac-toe" challenge, where they created a fun tic-tac-toe game.
- 3D modelling and printing: 3D modelling and printing was used in the "Birthday present in 3D" challenge, where girls learned how to make a birthday present in 3D.
- Cloud computing: Cloud computing was used in several challenges, such as the "Tic-tac-toe" challenge and the "Pinch of food creations" challenge.
- Blockchain: Blockchain was used in the "Small changes with big impact" challenge and the "Futurist artist" challenge.

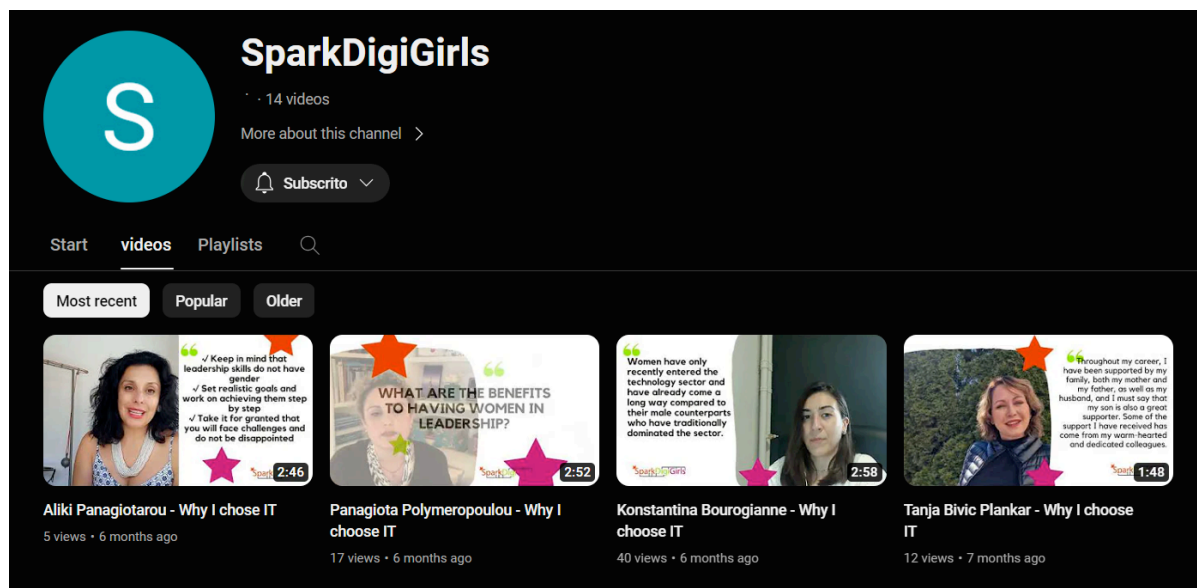
To promote female role models, interviews were conducted with IT professionals or women in leadership positions. This resulted in the production of several videos, which are available on the project's YouTube channel (figure 3). These are also available as the testimonial module to the learning programme (figure 2).


Figure 3 - Youtube channel with female testimonials
(https://www.youtube.com/@SparkDigiGirls1)

The project created two levels of certificates: one for each learning mode (Challenge) and a Grand Certificate (it depends on the number of Challenges completed by the learner).

To obtain a Grand Certificate, it is necessary to complete a challenge from six different technologies (artificial intelligence, augmented reality, Programming, etc.). After completing each challenge, the learner receives the challenge certificate, which has a specific key. When

the learner has collected six keys (one for each technology), he can unlock the Grand Certificate of the Programme.

The certificates are designed to recognize learners' achievements and provide them with tangible evidence of their skills and knowledge. They can be shared on social media or printed as a symbol of the learner's achievement.

Phase 3 – Pilot Study and Dissemination

During the final phase of the project, a pilot test was developed and implemented in the different partner countries. From January to March 2023, a group of 279 girls between the ages of 14 and 18 wanted to develop their creativity using digital technologies.

The pilot test of the SparkDigiGirls programme produced interesting results. It took place over two months and each partner had the autonomy to organize the way they worked with the girls. The initial work was proposed to be entirely online, with the girls able to ask for support from youth workers or partner experts. However, only the Portuguese partner maintained this methodology, while the others opted to organize face-to-face sessions with the girls to motivate them to complete the challenges (Marques, et. al, 2023).

The results of the pilot test showed that the average number of challenges submitted per active girl was similar between Portugal and Lithuania, indicating that the girls found the challenges stimulating, even if they completed them autonomously. The use of the challenges varied between partners, with some partners choosing to set up regular face-to-face sessions with the girls, while others integrated the challenges into activities already planned with groups of girls (Marques, et. al, 2023; SparkDigiGirls, 2023). This enabled more girls to complete the challenges in groups in countries with regular sessions.

The pilot also showed that some challenges had low submission rates and that some materials needed to be revised for language details and to replace a digital tool that did not work as originally intended. In addition, the youth workers agreed that the challenges created could be integrated into girls' non-formal education and run as a club, and they suggested that a mixed format of online and face-to-face training would be most appropriate for the programme.

In summary, the pilot allowed each partner to test the appropriate conditions for the local context and to validate the materials provided for each of the languages. The results showed that the programme has the potential to engage and empower girls to use technology, solve real-life problems, develop creativity, and enhance personal development.

In order to disseminate the learning programme to those interested in working with girls, an e-guidebook (SparkDigiGirls, 2023) has been published that aims to empower youth workers to act as mentors and support girls' creativity in digital technologies.

The e-guidebook is divided into five units, each covering a specific aspect of the project (SparkDigiGirls, 2023):
- Unit 1 introduces the project and the Unleash Your CreativITy with Technology learning programme. It also discusses the lack of female participation in IT and the factors and stereotypes that influence girls' low involvement and interest in digital technologies.

- Unit 2 focuses on youth workers as mentors and provides guidelines for supporting and activating girls' creativity in digital technologies. It discusses the results of the SparkDigiGirls pilot training.
- Unit 3 discusses empowerment and communication practices for blended learning in ICT. It suggests a blended learning approach for the learning programme after the results are achieved and discusses ways to sustain the learning process and maintain attention.
- Unit 4 presents best practices and success stories from the SparkDigiGirls pilot and ways to engage girls in digital technologies. It also includes reflections and feedback from the pilot training.
- Unit 5 provides additional resources, including toolkits and case studies, to enhance teaching and learning activities. The e-guide concludes with a summary of key points and references.

The e-Guidebook is expected to provide valuable information and best practices for youth workers to support girls' creativity in digital technologies. It highlights the importance of mentorship and empowerment in the development of opportunities for young girls in the IT world.

Conclusion

This paper presents the Erasmus+ SparkDigiGirls project, which ran from May 2011 to July 2023. The inspiration behind the project was to address the low participation and interest of girls in digital technologies and to empower them to explore their creative potential in the IT sector. The project aimed to identify the factors that prevent young girls from pursuing careers in computing and technology, and to provide practical examples and initiatives focused on increasing girls' and women's interest in digital technologies. The project sought to gather insights, best practices and perspectives from experts in the ICT-related sector to address these challenges and to inspire and support girls to explore their creative potential in digital technologies.

The findings from the different phases of the project allow us to conclude that providing hands-on experiences, female role models, mentoring programmes and real-life applications can be effective ways to increase girls' interest in technology (SparkDigiGirls, 2022).

The learning programme developed aimed to empower young girls in the digital world, give them the skills, knowledge and confidence to pursue careers in technology and encourage them to become creators and innovators, not just consumers of technology. The project involved a pilot training programme that provided an exciting opportunity for girls to learn about digital technologies and develop their skills (Marques, et al., 2023).

The results of the pilot training were positive, with the girls showing enthusiasm and interest in learning about digital technologies (Marques, et. al, 2023; SparkDigiGirls, 2023). The project partners reported that the girls had the opportunity to be trained and to share their experiences (Marques, et al., 2023). The supportive environment, the role of the mentors and the engaging activities played a positive role. The blended delivery of the programme together with effective communication tools, supportive mentors and peer and collaborative learning were some of the key factors in improving girls' participation in technology projects (SparkDigiGirls, 2023).

At the end of the project, several resources were made available for students and teachers that can be used to enhance their teaching and learning activities. These resources include toolkits, case studies and good practices that can be used to support and activate girls' creativity in digital technologies.

Finally, the SparkDigiGirls project can be considered successful in empowering young girls in the digital world and increasing their interest in IT (Marques, et. al, 2023; SparkDigiGirls, 2023). The project provided valuable resources and best practices for youth workers to support and activate girls' creativity in digital technologies and demonstrated the importance of mentoring and empowerment in increasing opportunities for young girls in the IT world.

Learning the Principles of Narrative Frames: A Pilot Study

Reginald Gentry, University of Fukui, Japan

Abstract

This study explored the strengths and weaknesses of using narrative frames when conducting qualitative research. The focus was on eliciting information regarding participants' (N = 11) beliefs as they entered a postgraduate program at a major university in Japan. The theoretical underpinnings of narrative frames are discussed, the specific narrative frame employed is introduced, lessons learned regarding the analytic approach are shared, and perceived strengths and weaknesses of using narrative frames are offered. As this was a pilot study, the focus was on the narrative frame itself. While the use of this narrative frame was useful for gathering data, it was found to be limiting in scope, and needs supplementation with other qualitative and quantitative data sources to reach its full potential as an investigative resource.

Keywords: Narrative Frame, Autonomy, Thematic Assessment

iafor

The International Academic Forum
www.iafor.org

Introduction

Narrative frames can succinctly be described as "a qualitative method of data collection using prompts to stimulate written expressions of ideas" (Barkhuizen, 2014). Interviewing participants to gather information and elicit detail is a highly involved and time-consuming activity, particularly when working with large groups. Narrative frames offer a more parsimonious method that can create instant physical data that is easy to input into an electronic format.

Orientation and Implementation

Because it is a type of knowledge that is created, Narrative Frames Analysis (NFA) falls under the constructivist paradigm of qualitative research. Under this view, the ontological orientation allows for multiple realities, and the epistemological orientation is focused on a co-construction of understanding between researchers and participants (Hatch, 2002). This allows a greater triangulation of data through prompts tailored to the research focus. By offering multiple opportunities for participants to expand upon their responses, researchers are able to perform a more informed analysis.

Although there is no spoken interview that is taking place in real time, the open-ended items can be seen as a dialogue between the researcher and the participant. Narrative inquirers control the creation of the narration, the audience it is directed towards, as well as the discourse of the society it is created within (Bochner, 2007). Bochner further describes the created narration as knowledge brought forward from the past as opposed to being knowledge related to the past (2007). Simply put, looking back at created narrations allows the reader a glimpse into the mind of the creators at that time, as opposed to a reflection back upon that time. The researcher guides the participant to answer openly without the type of constraints a multiple choice or Likert scale would create. Although the narrative is directed, the responses are completely open, revealing an immense amount of information about the writers and their intentions within their message (Chase, 2005).

During the analysis of these narrations, it is important for the researcher to maintain the correct perspective; while the causation of past actions may seem completely clear in retrospect, that cause might have been clouded at the time the narration was created. Another potential situation of concern is when current information might create a type of bias that did not exist during the time the narration was formed.

Narratives can be used to gather information regarding the activities and intentions of participants or, as with the current study, beliefs. A strong point of the narrative is its ability to capture the voice of participant, unfiltered or restrained with a series of pre-created answers to choose from, or having to choose upon a continuum where their perceptions lie in relation to a statement they may or may not agree with to begin with. With unrestrained freedom to use their own words, participants are able to convey themselves naturally through a written medium.

Current Study

The focus of the research was to use NFA to deconstruct the identities of postgraduate education students. This study was conducted using graduate students (n = 11) enrolled at university in Japan. The main focus was to gather information and decipher their

motivational constructs for joining, and to look for any commonalities or patterns. Also of interest was the efficacy of the implementation of narrations as a medium of gathering data for use in a qualitative study.

The purpose of the study was explained to the participants at the beginning of their program. The participants provided verbal and written consent for the use of their data in the study. Participants were given roughly 15 minutes to complete the narration, but in practice there was no time limit in place. Because the narration was not a test of ability, there would have been no purpose in limiting response time.

Of interest was not just the information gathered, but also the utility of the device itself; NFA is not as commonly employed as either an open-ended or a non-open-ended questionnaire The narration was created with the aid of an outside qualitative researcher who very generously oversaw the creation of the narration. Prompts such as *First, I believe language education…* and *I decided to study in a graduate program because…* were used to elicit personal information that could be coalesced into a broader picture; of interest were any similarities or trends between items and participants.

Analytic Approach

After retrieving the data, all information was entered into a spreadsheet using Microsoft Excel with each frame separated sequentially into columns and participants into rows then separately analyzed to triangulate the responses (Creswell, 2008). The reason for the initial individual analysis was an attempt to prevent any influence from one researcher to another at the interim stage (Clough, 2002).

Afterwards, the researcher engaged in confirmation checks with the participants. This was to ensure the accuracy of the reported data, to ask follow-up questions, and make revisions as needed.

Learner identity in the program showed that all of the participants considered themselves to be professional educators. All participants responded in a manner that demonstrated a self-representation as an educator. This identity was most commonly found to occur through noticing student needs, indicating a high degree of empathy on the part of the participants. For the purpose of anonymity, all participants have been given pseudo names. One participant, Arnold, stated "although competence in English is important for the growth of international business and relations particularly in Japan, English education is not taken very seriously here". Arnold was very empathetic in his responses to his students' need for English, and his perceived lack of competence in language education in Japan. This was unique, since Arnold was working in a private language school at the time, an industry that benefits the most from the lack of a comprehensive English language program in general education.

Tammy[1] described starting her career with the desire to know what language items students needed. Over time, the desire to know what was required for the curriculum became more pedagogically oriented, as she then wanted to know why the items were required. This ultimately led her to want to know how to assess which items were the most necessary. Another participant, Dave[2], explicitly stated a desire to "work hard towards filling the gaps

---

[1],[2] Pseudonyms were used to anonymize the identities of the participants. should be used sparingly.

that current research does not report." There was no mention of career advancement as one of the motivations for entering a postgraduate program. Overall, there was a very altruistic sense in the way identity and motivation were oriented in the participants.

Motivation for entering the degree program followed a similar thread among all participants: the motivation to improve research pedagogy and research acumen. These motivations were given in connection to the desire to perform better as an educator and to add knowledge to the field of second language acquisition to benefit other educators. In all participants, a similar linear trend was observed.

Participants entered the beginning of their career as a novice educator, then broadened their sense of the field, their contributions, and their functions as an second language acquisition teacher. Going through the process of completing a master's degree helped them initiate a perpetuating process that created introspection, metacognitive pedagogical awareness, research interests, and a broader awareness of the field of language education. While these findings are not surprising, they are confirmatory of the expectation that postgraduate students in education would be motivated towards self-improvement. It would be incorrect to generalize these findings to all language teachers; however, the NFA retrieved exploratory and detailed information from which more specific research could be conducted.

The information and conclusions in the pilot study were insightful, but not unexpected. There is very little assistance from the government or places of employment for postgraduate education in Japan. Applicants willing to commit to a five to seven year terminal degree program and incur expenses which might not guarantee future career advancement are most likely highly intrinsically motivated. On the other hand, the origin and drive within each individual can only be fleshed out through qualitative research. NFA was highly efficacious in this domain.

Limitations

The narrative in the study was meant to cover a very wide topic among an extremely diverse crowd of only 11 people. Had the participant numbers been higher, it is possible that more pronounced and definite patterns would have emerged, just as in any other study.

Narrative Frames Analysis

The greatest strength of NFA is its ability to collect a large amount of data from many participants in a short time and with considerably less necessary resources than in-person interviews. The open-ended nature of the stems within the narration allowed participants to respond with a wider range of answers than would be possible in a multiple-choice style questionnaire. The narration itself prompted answers related to the theme of the research, allowing for a smooth stream of information related to all areas of interest.

However, some weaknesses of the narration were observed while analyzing the data. One area of concern in this study was the lack of theoretical premise, which made it unclear where conceptual categories come from and how they related to each other. This was a flaw that is attributable to the design of the study more than it is to any idiosyncratic feature of the NFA. Looking back through responses showed some gaps between concepts, or sections that demanded more depth than there actually was to the participant response. Career is not acknowledged; rather, only answers relevant to research interest are relevant.

One solution could be for participants to write down that they simply do not have an answer. It would be easy to write I am interested most in researching… nothing as a response to one of the prompts. Students in a graduate program might avoid acknowledging in writing a lack of interest in scholarly work. Regardless of the setting, situation, or context of the narration, participants might feel pressed to give more information than what might actually be pertinent to them. This could lead to erroneous answers written just to satisfy the perceived requirement of filling in all information. During the analysis, the researcher noted that many first responses garnered detailed responses, but a request for second responses such as *also, I... often* received much less output, and sometimes gave the appearance of a forced response.

In the creation and analysis of narrative frames for qualitative research, there is a lack of established procedure. Working without a framework or accepted form of standard measurement is difficult and time consuming during the creation process, but particularly troublesome while analyzing data. During the final stages of analysis, the researcher often attempted to parse out meaning through interpretation, particularly when interpreting intentions. This led to a process of attempting to understand how the narratives were interpreted by the writer. Absent any other data (such as a follow-up interview), the NFA results can be difficult to interpret.

Related to the previous point of a lack of framework for analysis, there was a tendency to over- rely on repeated instances. Although the same type of narration might be given multiple times, it does not make it important, only ubiquitous. Without being able to ask the participants follow-up questions to explicate upon the message, it would be very easy to miss important information that was related less often.

One critical point that was raised during the analysis process was the focus on in the text, when what was omitted might have been equally or more important. While the format of the narrative was less rigid than other standardized testing practices, it was rigid in its own way nonetheless. Without the interaction of an interview, the opportunity to redirect the questions based on the answers received was removed, and participants were forced to fit their answers to the prompts given.

Further Studies

Below are some suggestions for improvement in any future studies using NFA to research the same topic.

As this study illustrates, conducting a pilot study of the narrative tool after creation is necessary. Any gaps that appear trying to analyze the data may be addressed, and the instrument can be changed. Passages that produce ambiguous or off-topic answers can be re-written or removed.

Narrowing the theoretical focus of the narration to more specific themes might yield greater results. A narration that covers all aspects of one area will reveal richer data and provide deeper insights by having more diverse items that relate to the same topic.

In addition, a future study should expand the number of participants (e.g., 30). This would permit generalizability to apply in other contexts. Also, larger number of responses should provide unambiguous patterns and trends, if they exist.

Finally, conducting more follow-up interviews with participants after the narrative has been administered and analyzed would be beneficial to the study. This is perhaps the most difficult of all the suggestions, because it implies a prompt turn-around time between administration, classification, and analysis. However, this is a critical addition, as it removes the largest weakness from the NFA in its present form: a lack of clarification with the participants. This does not mean that a full interview necessarily needs to be conducted. The interview could focus on just particular points with a few select people, or in the form of a response group using key sections that need greater elaboration. It could also be an excellent time for participants to respond to and give feedback on researcher findings from the study.

Conclusion

The participants in the study offered key information related to the topic of interest, but also on the efficacy and implementation of NFA. The participants involved were found to be highly motivated educators that saw a postgraduate program as a chance for self-improvement, ultimately increasing their skills as instructors in the real world. Most were observed to have been highly affected during the completion of their graduate degree and by their experience working in the classroom.

Although narratives offer an alternative means to retrieve open information related to a particular topic from participants, there are weaknesses that need to be addressed if a more comprehensive picture is to be offered. The utility of such a device though, is in its ability to be administered to large numbers of participants in very little time. Including a narrative component with quantitative data could be viewed as a highly practical means of doing mixed-methods research in the future.

Challenges in Practicing Intimacy and Maintaining Close Friendships Across Geographical Boundaries: A Study of International Students at Universiti Sains Malaysia

Nur Hafeeza Ahmad Pazil, Universiti Sains Malaysia, Malaysia
Intan Hashimah Mohd Hashim, Universiti Sains Malaysia, Malaysia
Julia Abyana Aziya, Universiti Sains Malaysia, Malaysia

Abstract

As friendship is a significant aspect of human nature, international students who study abroad are bound to experience a different social setting and might encounter changes in their friendship practices, especially with their close ones. Hence, the characteristics or qualities for maintaining close friendships despite being geographically separated and having limitations on practising intimacy were explored in this study. By using semi-structured in-depth interviews with 14 postgraduate international students from various countries studying at Universiti Sains Malaysia, the findings revealed several key elements that contribute to the formation of close friendships. These include trust, similarity, dependability, and support. Through a sociological lens, the study delved deeper into how these characteristics emerge from the participants' friendship experiences. This study also highlights the challenges of intimacy practices among international students in their long-distance close friendships. By examining how intimacy is understood and cultivated in these relationships across different cultures, the research provides valuable insights into the dynamics of maintaining close friendships during temporary periods of mobility abroad, as well as throughout one's lifetime.

Keywords: International Students, Characteristics, Intimacy Practices, Close Friendships, Geographically Separated

Introduction

International students are defined as those who have crossed the borders and are not citizens of the country in which they are studying or who have received prior education in another country (Organization for Economic Co-Operation and Development [OECD], 2013). Over the last decade, the influx of international mobility students has shaped the agendas of numerous higher education institutions, reflecting the global expansion of tertiary education systems (OCED, 2013). According to Padlee et al. (2010), the number of foreign students choosing Malaysia as their educational destination grows year after year. Moreover, in recent years, Malaysia has been chosen as the top study destination choice for international students furthering their studies based on several factors, such as a safe and secure environment, perceived cultural compatibility, a low cost of living, and low fees within the higher education system (Singh et al., 2014). Also, studying abroad enriches both students' academic and personal lives. Since the students come from different countries, they will have difficulties and struggle with many things, such as their studies, cross-cultural adaptation and adjustment, and maintaining their close friendship that has existed despite being geographically separated.

Moreover, the importance of having close friends, especially close co-national contact, become more influential over time as co-nationals are important for promoting cultural adjustment and managing stress (Geeraert et al., 2014), as well as providing emotional and practical assistance from people who have gone through similar transitions (Brown, 2009). This study will provide significant insights into friendship development among international students living overseas with their long-distance close friends and highlight the main characteristics of what makes the best friendship, hence making this study imperative. In addition, the purpose of this research is to investigate the importance of maintaining close friendships while temporarily residing in a foreign country, given that friendship depth and levels of commitment fluctuate over time (Becker et al., 2009). Thus, this study has highlighted some significant characteristics that lead to these complex friendships, which also help in retaining a good, close friendship while being far away from each other. Furthermore, Canary and Yum (2015) stated that friendships are typically thought of as 'weak ties,' which means that to maintain and preserve closeness, people engage in maintenance behaviours to keep their relationships stable. Thus, based on the previous statement, if people are unable to maintain friendship through communication, they will be at risk of losing that friendship, especially when they are geographically separated. Thus, this study also explores how international students perceive and practise intimacy, especially in their long-distance close friendships.

Method

Study Area

This qualitative study utilises semi-structured, in-depth interviews to collect crucial data. 14 postgraduate international students, including both master's and Ph.D. students from Universiti Sains Malaysia (USM), have participated in the study. According to Fernandez (2010), the reasons why students choose to attend USM are due to USM's strong business connections, good reputation, adequate facilities, and the availability of courses that meet the needs of its students. The researchers examine each participant's experiences, perspectives, values, and way of life to gain a deeper understanding of the study and its sociological implications.

Participants

This study included 14 international sojourners, seven males and seven females, all of whom were students at Universiti Sains Malaysia (USM). Participants must be between the ages of 20 and 33, as this is the average age for international students enrolling in universities. This study requires participants to study at USM for at least six months due to their experience adjusting to an unfamiliar environment, which would provide the researchers with a comprehensive understanding of the study. Table 1 provides a breakdown of the participants' demographic characteristics. To maintain the participants' anonymity, they were also assigned pseudonyms.

Table 1: Demographic Background of Participants

Name	Age	Sex	School	Home Country
Freya	25	Female	Pharmacy	Bangladesh
Bella	25	Female	Engineering	Iran
Lidya	32	Female	Accounting	Saudi Arabia
Maria	26	Female	Sustainability	Iran
Ursula	33	Female	Social Science	Pakistan
Maya	31	Female	Social Science	Indonesia
Rose	23	Female	Language	Indonesia
Ali	24	Male	Engineering	Saudi Arabia
Adam	24	Male	Accounting	Jordan
Jabbar	29	Male	Humanities	Iran
Tahar	32	Male	Physics	Yemen
Rizqi	27	Male	Social Science	Indonesia
Haamid	32	Male	Translation	Algeria
Arif	26	Male	Computer Science	Egypt

Sampling Method

Purposive sampling and snowball sampling are two sampling techniques used in this research study. Purposive sampling is based on the researcher's discretion in selecting the units to be studied (Rai & Thapa, 2015), while snowball sampling is used to generate a pool of participants by referring individuals who share a specific research interest characteristic with the target population (Crouse & Lowe, 2018). These methods have assisted researchers in identifying the required sample size for this study.

Research Instrument

This qualitative study used two research instruments to investigate the experiences of international students living temporarily abroad: friendship maps and semi-structured in-depth interviews. The friendship maps by Spencer and Pahl (2006) are used to gain a better understanding of the strength of close co-national friendship and the different types of interaction that occur between friends. Students will be asked to prepare a list of up to twenty names of co-national friends whom they consider to be close and important in their lives. The resulting maps serve as the foundation for the interviews. Furthermore, according to Holmes et al. (2015), interviews may provide more insights into emotional reflexivity because a researcher will gain a better understanding of emotions than through textual or document analysis. Several questions related to the topic and objectives of this study will be prepared in advance, and the students will be asked these questions in an unstructured semi-formal

interview. Open questions allow for the greatest amount of flexibility in acquiring new information and topics raised by students. The goals of the study are to identify close friendships, focus on the details of the close friends, and explore the meaning of close friendships based on the student's experiences.

Data Collection

This study used a friendship map and semi-structured in-depth interviews to collect data. 14 people were recruited via direct message and filled out an ethical consent form before the interview. Data collection took an hour and a half to ensure participants' comfort and confidentiality. Questions were developed to address the research objectives and additional inquiries were made during the interviews.

Data Analysis

Thematic analysis is a technique for organizing data based on shared properties or characteristics by identifying, analyzing, and reporting patterns within the data. This study utilized Braun and Clarke's (2006) six-step thematic analysis guide, which provides a straightforward and practical structure for conducting this type of analysis. Following data collection, all recorded interviews were manually transcribed and analyzed to identify and emphasis the initial themes. The recurring themes were identified and reviewed to ensure that the data had not been misinterpreted or that vital information had not been omitted. The findings are then presented and described in detail using direct quotes from interviews so that the researchers can relate them to sociological concepts and perspectives.

Results and Discussion

a) Characteristics or Qualities for Maintaining Close and Best Friendships

The major qualities that were crucial in maintaining close friendships include trust, dependability, and support as well as similarity which we will discuss further:

Trust

Nearly all of the major theories of interpersonal relationships are built on the concept of trust. Moreover, the concepts of trust and friendship are intertwined as developing a positive and well-maintained friendship requires trust. According to Simpson (2007), trust can be interpreted in several ways, and its relevance may change depending on the stage of relationship growth. As trust evolves as the result of disclosure (Fehr 2000), one must be comfortable with the person to disclose personal things. For example, one of the participants, Maria mentioned that trust is what makes her bond with her close friend:

> *The most personal things, I will always tell him. Even when I fight with my boyfriend, I will tell him. He will say whatever he wants to say because he knows the real me. (MARIA)*

Friendships appeared to become more intimate as the people involved became more open and comfortable with one another. Individuals discussed showing their 'true' selves to one another and engaging in more self-disclosure as time passed. This correlates with the study made by Wieselquist (2007) as the individual's perception of the friend's commitment would

mediate the relationship between a friend's report of commitment and an individual's trust in the friend. Thus, as trust develops and by sharing things reciprocally, they make their friendship intimate. Other participants, like Adam, classified all of his close friends based on their level of trust in him; that is, the more he trusted the person, the closer they were:

> *Actually, it is just about trust. The one that I feel comfortable with. The difference in the friendship circles is that I classified them based on trust. Like I do trust F1 more than the others. (ADAM)*

A study by Waris and Rafiq (2009) found that male same-sex friendships have less trust than women which is also supported by Faturochman et al. (2020) study on gender that revealed females were more trustworthy than males. However, in this study, it has been found that there is a positive correlation between friendship and trust for both genders. Prior to the study by Waris and Rafiq (2009), when it comes to same-sex friendships, male students learn to trust that they can rely on them for catharsis, emotional support, and relationship satisfaction during the most demanding developmental and career-building stages of their lives. Additionally, although Adam stated that he has only a small circle of close friends, for him the quality of friendship over its quantity matters, as Akin et al. (2016) stated a positive and significant relationship was found between friendship quality and subjective happiness. Another participant, Ali, also shed light on how trust is the main foundation that determined his current close friendships:

> *The first thing would be how trusting you are, how much you are trusting the person. Like some other friends when they are considered close, I had surgery one and half a year ago, two surgeries due to football injuries, and some people disappeared. Literally disappeared. So why we are thinking we are close? So, this situation shows you how you can trust people. Everyone on this list, I know that anytime or no matter what I go through even if we are not in contact, nothing is happening, you can trust him, depend on him, ask something so yeah. So, the first thing is trust. (ALI)*

All of Ali's close friends are someone that he puts his whole trust on as his friendships evolve. Furthermore, the persons' shared experiences provide accumulated proof that the other may be relied on, resulting in a sense of trust (Allan, 2011). Rebughini's (2011) astute understanding of the importance of friends being 'witnesses' to each other's emotions indicates a new dynamic in the creation of trust. Trust contributes to the emotional state of feeling valued and loved which in turn gives this particular relationship depth and significance. Hence, we believe that trust acts as the basis of friendship and plays a huge role in building close relationships with each other.

Dependability and Support

Having a close friend during tough times would undoubtedly help people cope because of the many roles that friends play as well as the support and well-being they provide. According to Sherbourne and Stewart (1991), social support can be classified into five categories: emotional (positive affect, empathic understanding); affectionate (display of love); informational (advice, guidance, feedback); tangible (practical aid); and good social contact (availability of others to do fun things together). Moreover, in a past study by Bakalım and Karçkay (2016), there is a positive correlation in the relationship between friendship quality and well-being through perceived social support as it contributes to psychological well-being as well as acts as a protective effect on mental health. This is clarified by the participants:

> *He is my support, he is everything so whatever it comes to me like difficulties or everything, I will contact him. (HAAMID)*

Haamid has emphasised that one of his close friendships is reliable enough that he can depend on him through the thick and thin of life. According to Almaatouq et al. (2016), reciprocated friendships are significantly more intimate and distinct from those that are not. Moreover, being able to physically comfort each other subtly through a remote but shared experience whenever a problem or feeling occurs (Octavia et al., 2007) has also been mentioned by some participants as how their close friends are dependable:

> *When you go to different countries, you will feel so many things, sometimes you feel disappointed and lifeless, and he was there. We always talk to each other, and we can talk from 10 pm to 3 am about what has happened in previous semesters, etc. (ALI)*

> *F2 is a good listener. He always gives good solutions for me when I tell my problems to him. (RIZQI)*

> *Well to have a close friend means you have shared interest, shared values, and yeah showing up when he/she needs helps. I guess that's how it is for me. It's like when you form friendships, that is your support system. So yeah, it's like, sometimes you need to depend on those people to get things through. (ARIF)*

Dependability can come in various ways, such as one can be dependable by giving help and support physically and emotionally. Hence, whenever problems arise or they need someone to listen to Rizqi and Ali will turn to their close friends as they will attentively listen and come up with good solutions. Meanwhile, Arif has disclosed that his friendships are his support system, and he can depend on them when things get rough. Eker, Arkar, and Yaldz (2001) mentioned that social support networks may provide emotional comfort, assist with problem-solving by offering advice, provide vital feedback that improves performance, encourage personal growth, and shield individuals from the adverse consequences of stress. Additionally, throughout this study, it is found that when dealing with stress, the majority of research participants seek help from their social network or their close ones. This shows that social connection is associated with the support that people give and receive from one another, which also has a positive impact on one's health, mood, and sense of belonging (Doroszuk et al., 2019). Ali has also further enlightened the researchers about how his friendship arose with another good friend:

> *He is the guy who has lost his father in a very long time so most of the time he depends on himself so when he needs something, I will be there for him back then. For example, when he is involved in a car accident, I will be the one he calls and if I am facing some financial issues back there, he will be the one I call. If he was facing something at one time back then, he was not with his identification card and the police took him so I was the first one that he would call and go get him, settle the things so yeah. So, when he was in trouble, finding something I would be there for him, and when I was in trouble he would be there. (ALI)*

Close friends continue to be important companions and sources of support for older adults, despite the fact that friendships vary in terms of quality and stability. (Carstensen, 2006). This was demonstrated by Ali's friendship with his close ones, on which they could rely and

provide instrumental as well as emotional support for one another, as providing and receiving support strengthens and extends relationships (Doroszuk et al., 2019).

Similarity

A notable study on homophily and friendship by Kandel (1978) indicates that homogenous behaviors and attitudes influence interpersonal attraction that sustains friendship ties. Moreover, the increasing social isolation in which independent adults with high levels of homophily are unlikely to form an intimate relationship (McPherson et. al. 2006). One of the excerpts taken from the recording demonstrated how sharing sameness for each other bonds them to be closer:

> *We go out, we are so similar to each other like you know, we would like to do activities together. I share the same interest, same character, with her as we are born in the same month too. (MARIA)*

Maria elaborated that this close friend of hers is similar to her as they share the same interests and often do activities together. This is supported by Lawrence and Shah (2020), as their individual preferences explanation of homophilous behavior suggests that, given options, individuals will choose people who are similar to them. Moreover, as mentioned above, individual characteristics also play a role in the frequency with whom they form friendships by facilitating subsequent interactions and the development of the friendship. Hence, homophily in friend selection is said to reinforce an individual's personal identity through a shared "sameness" (Allan, 2010). Both participants, Haamid and Tahar, mentioned how their similarity has grown their friendship to be more intimate:

> *Actually, for F1 he is someone who understands me, and I understand him. It is like we are the same. We have the same perspectives, the same personality, and the same thinking. Although of course, it is not the same 100% but similar. (HAAMID)*

> *I think because we have the same interest, and I don't know but I think I have this interest towards these IT people because he also does IT like F1. Also, we have so many things in common like he likes to think he is a thinker. He is a smart guy although people don't like the way he thinks but I think he has logic, and it makes sense to me. So, I like to discuss things I love people who discuss things with me and do negotiations until we reach a conclusion. I love stuff like that. Critical thinkers. (TAHAR)*

According to Haamid, his close friend (F1) is like a nearly perfect reflection of him. Meanwhile, according to Tahar, the same interest connects him with his close friend. This is intricately related to the concept of Kandel's (1978) study of homophily and friendship, which indicates that the interpersonal attraction that sustains the friendship tie influences homophilous behavior and attitudes. Other participants, like Rose and Jabbar, also share the same highly participative interest with their close friends.

> *We came across with the same interest and we also kind of bonded through our school days. Back in the day, there were group projects and those kinds of things so at first, we kind of bonded through that and later both of us found out that we share the same interest, particularly in music. We shared the same idols and also played the same game. I am very comfortable with her. (ROSE)*

Additionally, homophily also occurs more in similar people who share the same interests rather than dissimilar people. As such, according to Mcpherson (2001), the patterns of homophily tend to get stronger as more types of relationships exist between two people, indicating that homophily in each type of relationship cumulates to generate greater homophily for multiplex than simplex ties. International students thus encounter a variety of difficulties in maintaining their co-national friends while temporarily residing abroad. However, by contacting each other and having the main qualities that make the friendship close, long-distance close friendships can be maintained. Based on the result above, some of the reasons that can be highlighted on why some people are considered special and close to a particular person is due to the trust gained, dependability, and similarity as well as the memories that they have shared with these people have which make them close.

b) Practicing Close Friendship

Throughout the interview, all of the participants, still seek and connect with their close established friends who are not in Malaysia. The established close friends of theirs are majorly co-national and live in their country. People's interaction patterns have shifted as a result of modern (communication) technologies as they have made it easier to maintain relationships across long distances (Utz, 2007). Moreover, the frequency of them keeping in touch depends on how they practice their intimacy. Since they are geographically distant, their ways of contacting each other are mostly through the use of media, including calls, video calls, texting, and a variety of social media platforms (Instagram, Snapchat, etc.). Research by Huq (2020) has unrevealed that the most popular digital technology used to keep connected to long-distance childhood friends was social media such as Facebook, and instant messaging such as WhatsApp. For instance, we can see that one of the participants, Haamid mentioned that he frequently contacts his close friend through texting, and it has been a daily habit for them:

> *When it comes to me and him, it is just us. We do not care. Like now in Malaysia, we are talking daily. 1 hour ago, he was texting me and whenever he woke up, he would text me first. Like it is a daily thing. (HAAMID)*

According to Carbonaro and Workman (2013), the amount of shared social interaction between friends determines the closeness of friendship since the more time friends spend interacting with one another, the more information is received and maintained in the 'relationship system'. Also, sharing problems and feelings between friends who live far away from each other is crucial in maintaining the relationship (Octavia et al., 2007). Furthermore, when being asked about the things they talk about, Lidya mentioned that she usually talks about normal things, being concerned about each other:

> *When I use social media to contact them, it is just to ask about each other because I am living alone here so they always like you know, think about me like if I need anything or if I am sick. Most of the time, to be honest, we just share some famous videos, TikTok videos and yeah sometimes we just share it between us and talk about that. Not really to have like something to talk about but just sharing and like "Have you seen this" and just like that. More like remembering them when I saw the video. (LIDYA)*

Additionally, with the rise in usage of social media such as TikTok, Lidya and her close friends customarily share videos. For Lidya, sharing those videos is how she conveys her

remembrance of them. Although some might view it as a simple act those simple acts are considered as little things that help the relationship (which in this case, friendship) grow fonder for each other. LifeWork (2020) stated that sharing photos or videos with friends and others on sites and committing to having regular phone chats with the people who care about them can help maintain long-distance friendships. Furthermore, Haamid also mentioned that social media helps him enrich his communication when he is far away:

> *In social media, recently we have been talking about the pandemic situation and the work. They will be asking "When you will come back?" or "When you will get married?". For my brother (F2) he will want to gossip and what am I doing in Malaysia like do I have a girlfriend or do I meet with girls, these things. He is just crazy (laughs). If I meet face to face with my close friends, we will share a lot of experiences like the struggle. For example, when I sit with F3, he will start sharing the problems and we will find the solution. It is like random topics, that suddenly happen. Just go with the flow. (HAAMID)*

Haamid also stated that his communication with his close friends started with random topics and flowed into something deeper where he would listen and find solutions to the problems and the things that have shared. Additionally, although it has been reported by Strikwerda and May (2012) that due to the social construct, most males have less complex emotional responses to situations than females, this study however found that males can also be emotionally open to finding comfort which has been expressed by Haamid and his close friend. On the other hand, some participants like Rose and Maria do feel relieved with the existence of social media but they do not feel fully satisfied and feel the full presence when contacting with each other:

> *When I contact them using social media, it feels a bit sad because I cannot do physical interaction but at the same time, I also feel relieved that I live in a generation that has social media as it is kind of like a platform to stay connected to those who are far away from you. So, I would say that I rely on social media to contact them a lot especially the ones who are not studying in Malaysia, long-distance friends. But I do not think social media is enough for me, I like being face to face, and enjoying each other presence, I like that kind of interaction. I would choose face-to-face more. (ROSE)*

> *For social media, sometimes I feel that they should be closer to me and not in social media. Like come, be here. When face-to-face with them I feel very happy. Very, very satisfied. (MARIA)*

Rose and Maria have highlighted the inability to perceive the other person's 'true' presence as one of the major drawbacks of online interactions. Online communication has a negative impact on the perceived quality of life due to the lack of nonverbal cues, a lack of warmth, and a lower demand for engagement (Lee et al., 2011). Due to insufficient nonverbal cues, a lack of physical interaction, and insufficient time spent together, their friendship is not as fulfilling as it once was. Face-to-face communication has been cited by each participant as the most effective method for maintaining intimacy and fostering connection. Most of them are geographically separated, so they acknowledge that social media helps them strengthen their social connections with their closest co-national friends. Therefore, we can conclude that social media plays a significant role in connecting long-distance friendships, but nothing beats face-to-face interaction. This study provides insight into the intimacy practises between

co-national friendships, which assist individuals in feeling at home and connected, as well as in adjusting to their new surroundings.

Conclusion

This study examines the importance of friendship and life satisfaction for international students living temporarily abroad. It conducted online in-depth case interviews with fourteen international students (seven males and seven females) to examine the significance of instrumental and emotional support required, particularly the support from their close co-national friends when living abroad. The study highlighted the overall and main qualities that make up a good friendship, which include trust, similarity, and dependability, as well as support. The study also found that there are some other characteristics and qualities that make up a good friendship, such as trust, similarity, and dependability, as well as support. This study found that there are no significant differences between males' and females' main characteristics in what makes a good and close friendship.

Support is also necessary for the lives of international students to maintain close friendships with their co-national friends back home. This study also highlights that communication technologies have been demonstrated to be the primary means by which long-distance friends maintain relationships with one another. The participants emphasised that they were grateful to be able to connect through mediated communication, but they preferred face-to-face communication the most as they felt a sense of 'presence.' The study was able to identify the important characteristics that play important roles in overcoming friendship distance. It can be useful for international students to improve their lives while studying temporarily abroad by preventing friendships from dissolving in education as it encompasses shifts in both physical and mental health. As with every study, this one also has several limitations. The study was carried out only in the context of Universiti Sains Malaysia. In the future, this research must be replicated with a different and larger sample area that encompasses the whole of Malaysia. More research is recommended and needed to determine whether there are differences in the major qualities of friendship—trust, dependability, and support as well as similarities between both sexes.

Official Conference Proceedings

Abstract

According to the Organization for Economic Co-operation and Development (OECD), professional collaboration is an essential support tool for teachers working in challenging environments. It has been identified as one of the five pillars of teacher professionalism. Scholars have indicated that professional collaboration among teachers is one of the essential directions of current educational reform. This study conducted a multi-level analysis using Hierarchical Linear Modeling (HLM) to examine the factors influencing teachers' professional collaboration. The findings indicate the following. (1) Teachers' self-efficacy did not have a significant effect on professional collaboration; (2) The higher teachers' awareness of teaching beliefs, the more willing they were to collaborate professionally; (3) Teachers' job satisfaction did not have a significant effect on professional collaboration; (4) Teachers' difficulty in collaborating professionally was due to busy work schedules, family responsibilities, and a lack of incentives; (5) The higher the teachers' innovative teaching climate, the more willing they were to collaborate professionally; (6) Teachers prioritize teacher-student relationships, which have a significant positive impact on professional collaboration among teachers; (7) Professional development activities negatively impacted professional collaboration, as teachers were more likely to participate in their own independent qualification programs (degree programs). The study concludes with recommendations to facilitate and promote professional collaboration among teachers.

Keywords: Job Satisfaction, Teacher Self-Efficacy, Teacher Professional Collaboration, Teaching Belief, Teaching and Learning International Survey (Talis)

Introduction

Educational reform relies on teacher interaction and cooperation to achieve educational tasks and goals (Brownell et al., 1997). Professional collaboration among teachers has recently been regarded as an essential direction of educational reform (Morse, 2000). According to the Organization for Economic Co-operation and Development (OECD) (2020), professional collaboration is essential to support teachers to work in challenging environments. It has been identified as one of the five pillars of teacher professionalism. This is because a teacher's work is holistic and dynamic, and teachers often teach students with varying abilities and learning styles. Therefore, teachers require feedback and support, and the relationships and interactions between teachers and colleagues are significant. Teachers can also learn from each other through professional collaboration, including sharing their professional knowledge and learning from each other's teaching experiences via professional learning communities; this ultimately improves the quality of teaching and enhances student learning effectiveness (OECD, 2020). Therefore, professional collaboration provides teachers with more learning opportunities and supports teachers in coping with the challenges and complexity of teaching (Darling-Hammond, 2010).

The Teaching and Learning International Survey

In the Teaching and Learning International Survey (TALIS) 2013, countries such as Finland, Canada, and Singapore were identified as the top performers. Their common feature is a high degree of professional collaboration among teachers (Schleicher, 2016). Teaching is a multifaceted profession. If teachers are encouraged to engage in professional practice inquiry in addition to their teaching role, they can take ownership of their work holistically (Ainley & Carstens, 2018). Therefore, the TALIS focuses on collaboration as a teacher's professional practice; it also examines the role of collaboration in teacher professional development and innovative teaching (Ainley & Carstens, 2018). In a collaborative professional work environment, teachers create a collective force that initiates and sustains continual improvement in their professional practice so that each student they teach receives the highest quality of education possible (Pugach & Johnson, 2002). Empirical studies indicate a positive impact of teachers' professional collaboration on student achievement (Chen et al., 2018), linkages with teachers' beliefs about teaching (Sannen et al., 2021), and the promotion of school success (Garcia-Martinez et al., 2021). Such findings suggest the positive impact of teacher professional collaboration. However, there is a lack of research exploring what factors facilitate teachers' professional collaboration. A clear understanding of the factors affecting teachers' professional collaboration will help to encourage and promote it to ensure teaching quality and student learning.

Based on the above, the importance of professional collaboration among teachers is evident. However, it is often challenging for teachers to collaborate professionally because, under the educational sector's current system, teachers are likely to run their classrooms in a kingly manner. Teachers are accustomed to a culture of independent teaching and learning and a preference for personal autonomy, making collaborative activities among teachers less desirable (Somech, 2008). Although teachers are aware of the positive impact of professional collaboration on teaching quality and student learning outcomes, they still rarely engage in professional collaboration. For instance, Schaffhauser (2018) found that 44% of teachers did not go to another classroom to obtain ideas for teaching or observe feedback. Furthermore, the findings indicate that only 38% of teachers were willing to engage in a collaborative activity; the rest of the teachers never shared their teaching experiences or classroom

innovative content with other teachers. Johnson (2003) suggests that teachers are negative and reluctant to collaborate because they perceive that it leads to increased workload and a loss of pedagogical autonomy. Yet, teacher professional collaboration is an essential component of educators' professional development. However, teachers primarily tend to work in isolation and autonomously (Schaffhauser, 2018). Therefore, the present study conducted an in-depth discussion on the factors that may affect teacher professional collaboration.

Professional collaboration includes a wide range of school activities (Goddard et al., 2007). It can be presented in various forms, including peer sharing, professional learning communities, teacher teams, and professional networks (Vangrieken et al., 2015). Question 33 in the TALIS 2018 survey comprised the Professional Collaboration Questionnaire, including four questions on "Collaborative Teaching," "Observational Learning," "Cross-Classroom Teaching," and "Participating in the Community." According to the TALIS 2018 results, the percentages of Taiwan's junior high school teachers who answered 'never' and 'once a year or less' for the four questions on professional collaboration activities were 79.8%, 52.8%, 70.2%, and 30.1%, respectively. This reflects that more than half of the teachers seldom participated in professional collaboration activities. Hence, the influencing factors behind this phenomenon should be further explored. The present study used the results of the Teaching and Learning International Survey (TALIS 2018) conducted by OECD in 2018 for secondary database analysis. We conducted a multilevel analysis through Hierarchical Linear Modeling (HLM) to identify the factors affecting teachers' professional collaboration. This study's results can help provide a reference for promoting teachers' professional collaboration in Taiwan.

Conclusion

1. Conclusion

The present study focused on Taiwan junior high school teachers in the TALIS 2018 survey to explore potential factors influencing professional collaboration. After conducting analysis and discussion, the following conclusions can be put forward.

(1)   Teacher self-efficacy does not significantly impact professional collaboration.

This finding suggests that self-efficacy alone cannot influence teachers' performance in professional collaboration. Furthermore, the descriptive analysis of the self-efficacy items indicates that Taiwan junior high school teachers tend to be overly focused on classroom discipline and rules, which can decrease their willingness to engage in professional collaboration. Teachers paying more attention to "instructional practices" and "student engagement" may promote professional collaboration.

(2)   Teacher teaching beliefs significantly positively impact professional collaboration.

The results of the present study indicate that when teachers perceive a higher degree of teaching beliefs, their willingness to engage in professional collaboration also increases. Furthermore, the descriptive analysis of the teaching beliefs items shows that when teachers predominantly hold "constructivist teaching" as their teaching belief, their willingness to engage in professional collaboration is greater. Thus, teachers with student-centered teaching beliefs are more likely to recognize that professional collaboration positively impacts

teaching and are more inclined to actively engage in professional collaboration with other teachers. Conversely, if teachers hold a teacher-centered "direct instruction" belief, it may decrease their willingness to engage in professional collaboration.

(3) Teacher job satisfaction does not significantly impact professional collaboration.

This finding suggests that teacher job satisfaction cannot independently influence teacher performance in professional collaboration. Furthermore, the descriptive analysis of the job satisfaction items shows that "all in all, I am satisfied with my job" and "I enjoy working at this school" received the highest scores among the four job satisfaction items. Furthermore, "I would like to change to another school if possible" received the lowest score, indicating that most junior high school teachers in Taiwan are satisfied with their current school jobs. However, the fact that teacher job satisfaction cannot influence teacher performance in professional collaboration may be due to the tendency for teachers in Taiwan to work independently, which could explain the higher job satisfaction levels.

(4) The barriers to participating in professional development activities significantly negatively impact professional collaboration.

This study's findings suggest that the greater the barriers to participation, the lower the willingness to engage in professional collaboration. Moreover, teachers' challenges engaging in professional collaboration activities are directly related to barriers to participating in professional development activities, such as high work stress, heavy family responsibilities, and a lack of incentives and school support.

(5) Teaching innovation has a significant positive impact on teacher professional collaboration.

This finding indicates that when teachers perceive a higher innovative teaching climate, their willingness to engage in professional collaboration increases. Furthermore, if a school fosters an innovative teaching environment, it can enhance the impact of teachers' perceived professional collaboration on teaching. Therefore, creating an innovative and open teaching environment allows teachers to be in a trusting atmosphere of mutual learning; they can become advisors to each other, thereby promoting professional collaboration among teachers.

(6) Teacher-student relationships significantly positively impact teacher professional collaboration.

The findings of this study indicate that when teachers perceive a better teacher-student relationship, their level of professional collaboration is also higher. Furthermore, the descriptive analysis of the teacher-student relationship items shows that the average scores for "most teachers believe that the students' well-being is important" and "teachers and students usually get on well with each other" were the highest among the four teacher-student relationships items. This result indicates that most junior high school teachers in Taiwan emphasize student well-being and maintaining positive relationships with their students. Therefore, when teachers prioritize student well-being, their willingness to engage in professional collaboration is higher because collaboration can lead to better student learning outcomes.

(7) Professional development activities significantly negatively impact teachers' professional collaboration.

This study's findings indicate that the more teachers participate in professional development activities, the lower their willingness to engage in professional collaboration. The study results suggest that most junior high school teachers in Taiwan participate in activities related to qualification and certification courses, graduate degree programs, and visiting school organizations. These types of professional development activities are typically pursued independently by individual teachers. However, participation in face-to-face physical courses that require professional collaboration among teachers is comparatively minimal.

2. Recommendations

(1) Encouraging teachers to collaborate on teaching is a method to enhance "instructional practices" and "student engagement".

This study's research findings indicate that teachers' excessive focus on classroom discipline and rules makes them less willing to collaborate professionally. Therefore, we recommend that teachers should incorporate diverse teaching and assessment strategies in their classrooms to help students prioritize learning and facilitate critical thinking. Additionally, they should avoid investing excessive effort in controlling disruptive behaviors in the classroom and enforcing classroom rules.

(2) Encouraging teachers to engage in critical thinking and group instruction can help establish a professional collaborative belief in constructivist teaching.

The research findings indicate that teachers engaged in professional collaboration predominantly hold constructivist teaching beliefs. Therefore, we recommend that teachers assign tasks in the classroom that require students to engage in critical thinking and encourage them to work together in groups to find solutions to problems. Additionally, allowing students to independently determine the steps to solve complex tasks can help establish a professional collaborative belief in constructivist teaching.

(3) Guiding teachers in balancing their family and work responsibilities can reduce barriers to participating in professional development activities.

The research findings suggest that teachers' reluctance to engage in professional collaboration is influenced by factors such as heavy workloads, excessive family responsibilities, and a lack of incentives for participating in professional development. Therefore, we recommend that schools reduce teacher workload stress and provide support and encouragement to teachers, making them more willing to engage in professional collaboration. Additionally, schools should emphasize the value of participating in professional development to enhance both intrinsic and extrinsic motivations for teachers.

(4) Creating an atmosphere conducive to teaching innovation within schools can positively impact instruction.

Schools should encourage teachers to continually innovate in their teaching environments and provide opportunities for instructional innovation activities. Teachers who are part of an

innovative teaching culture are more inclined to collaborate professionally and collaborate with peers to create innovative teaching content, thereby enhancing instructional quality.

(5)   Establishing professional development communities for teachers and promoting collaborative professional collaboration training can be beneficial.

The research findings indicate that teachers are more inclined to participate in individual activities such as certification courses, degree programs, school visits, and online courses, which may reduce their willingness to engage in professional collaboration. Therefore, we recommend that schools organize in-person courses, seminars, and teacher professional communities that require teachers to collaborate professionally.

Investment in Social Science Education and Its Worthwhile Wage

Thoedsak Chomtohsuwan, Rangsit University, Thailand
Narissara Charoenphandhu, Rangsit University, Thailand
Kitsana Lerdkasetwittaya, Rangsit University, Thailand

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
Investing in education is a type of capital accumulation in humans. The value of money spent or accumulated in humans from birth to graduation is called human capital. Therefore, being a company employee is like investing in capital equal to the amount of human capital accumulated in that company. Wage or salary earned by a company is also like a return on investment. This research aims to find out what wages we earn each month after graduation and whether it is worth the human capital in us or not. What should be the wage rate worth investing in? This research uses secondary data from the National Statistical Office of Thailand and other related data sources. This research focuses on the study of social sciences in 5 majors of bachelor degrees including Communication arts major, Account major, Law major, Economics major, and Business management major. The findings showed that, in the year 2022, the initial wage rate of new graduates in the five fields of social sciences in Thailand is not worth their human capital invested from birth to graduation. Preliminary suggestions from this research are as follows: The government should implement a policy to improve the quality of education to increase graduate productivity. The higher graduate competencies and skills will result in employers willing to pay wages at a higher rate. The government should implement a policy to encourage new graduates to conduct their own business to raise their income higher than being an employee.

Introduction

Globalization and borderless competition under today's capitalist system have important influences on management in every sector, whether it be businesses, state enterprises, or even government agencies. Human resource management is more important than in the past because it is generally accepted that organizations can survive in today's changing environment. This is because those organizations have qualified personnel who can drive the various missions of the organization to achieve its goals (Kitti Meelamian, 2016:149) Human resources are the most important management resource because they are the resource that can create value and add value. It can learn and enhance skills in thought and action. It can drive the organization's mission to achieve its objectives. People are similar to human capital from the aforementioned perspective. Therefore, education is an important factor in developing human resources to have better quality or increase the value of human capital. Studying the ideas of economist Adam Smith (1976), he opined that education is an investment. He stated in his book The Wealth of Nations that investing in education is a matter of human resource development and causes each person to have different abilities.

Investing in education is like investing in any other project where the returns and costs of the project must be considered. Calculating the economic rate of return on investment in education involves both the economic rate of return that benefits society and the rate of economic return that benefits individuals. The personal rate of return is the return that accrues to the learner based on the cost that the learner must pay for the course and upon completion of the course. Graduates will receive a salary, wages, or other benefits including fame, honor, and respect from society.

Investing in education is an important issue that the research team is interested in studying whether investing in education in the social sciences at the higher level with a bachelor's degree and receiving a salary is currently worth the investment in education. If it's not worth it, we'll offer guidelines on how much salary you'll need to earn to make it worth it or have other options to adapt to survive in the current economic situation.

Literature Review

Becker (1964) researched the measurement of economic returns or increased income (monetary terms). This increase in income reflects increased labor productivity. Investing in education can result in people having more knowledge and skills to earn higher incomes.

George Psacharopoulos (1981) researched Returns to Education: An Updated International Comparison. He found that higher levels of education were due to higher investment in education. Therefore, it had a greater effect on increased income. It revealed that investment in education affected the value creation of human capital. However, human capital is one factor that plays an important role in economic development and has an effect on increasing national income. In studying the role of human capital, related theories such as Endogenous Growth Theory are developed from Neoclassical Growth Theory. Robert Solow and Trevor Swan once said that investing in people through investing in education creates value in people with knowledge, abilities, and skills.

Harry Anthony Patrinos and George Psacharopoulos (2004) researched Returns to Investment in Education: A Further Update They found that the personal rate of return for bachelor's degree graduates was higher than that of high school graduates by 10.48 percent for males

and 9.50 percent for females. The rate of return for tertiary graduates ranged from 8.0% to 12.8% per year for males. Females had a rate of return between 4.5 and 7.9 percent per year. Higher education also had an impact on long-term economic growth.

Sasiwimon Warunsiri and Robert McNown (2010) researched The Returns to Education in Thailand: A Pseudo-Panel Approach They developed an econometric equation whereby income varies with years of education and age or work experience. The study found that the rate of return on investment in education was approximately 14-16% per year, female workers earned higher than male workers, urban workers earned higher than rural workers, and single workers earned higher incomes than married workers.

Panadda Bunchad (2001) researched the rate of return on investment in education from the perception of Chulalongkorn University graduates and their decision to pursue graduate studies. When comparing the rate of return from realization with the rate of return from other financial investments, graduates have a realized rate of return that is higher than the interest rate from all forms of financial investment, including short-term, medium-term, and long-term government bond investments including depositing money with commercial banks, both savings and fixed deposits. It revealed that graduates perceive education as a high-return investment that is more worthwhile than other financial investments.

Thoedsak Chomtohsuwan (2016) researched a study of the relationship between human capital returns and education: a case study of Thailand. He found that if workers invest in higher education, they will accumulate more total human capital and receive a higher rate of return on human capital. In addition, research studies have found that investing in different fields of study yields different rates of return. Choosing to invest in different subjects comes from many factors such as family, capital, physical condition, intellectual abilities, distance from educational institutions, and access to educational and work information, etc. However, an individual's decision to choose a field of labor may not depend solely on monetary rewards but may also depend on personal tastes and preferences that derive pleasure from passionate work.

Objectives

This research paper aims to study the cost of education in the social sciences of the Thai population and the rate of return that is worth investing in social science education in Thailand.

Methodology

Hypothesis

To estimate the value of human capital, employment earnings, and rates of return on investment, this research makes the following necessary research hypothesis:
- ✓ To determine the consumption patterns of each generation of the population are not significantly different.
- ✓ To determine that each citizen in the same age group has the same basic daily expenses.
- ✓ To determine the population continuing to study from kindergarten until the highest level of education is completed at the bachelor's degree level at the age of 22 years old.

✓ To determine the population that starts working after graduation at the age of 23 years old.
✓ To define each population working in accordance with their level of education and field of study.
✓ To determine those citizens with the same educational qualifications receive the same rewards from work during the first year of work.
✓ To determine the year 2022 as the base year for calculation.

Sources

This research collects secondary data from the following sources:
✓ Information on the daily spending of the Thai population from the Household Socio-Economic Survey (SES) of the National Statistical Office.
✓ Information on work compensation for new graduates from universities, Thai government, and private agencies.
✓ Information on tuition fees and expenses related to education from Thai public and private educational institutions.
✓ Information from various related research studies.

Analysis

This research divided the sample group into graduates from 5 groups of social science subjects as follows:
✓ Communication arts major
✓ Law major
✓ Economics major
✓ Account major
✓ Business management major

This research analyzed the value of money from investing in education based on the rate of return on human capital which is calculated by comparing the net return value that graduates from each field of study receive from their first year of work compared to the value of the human capital of graduates from that field of study. According to the following equation:

$$\Omega_k = \left(\frac{\lambda_k}{HC_k} \right) \; x \; 100\%$$

$$\lambda_k = Rsl_k + Rad_k - \delta_i$$

$$HC_k = \sum_{i=0}^{22} \left[\delta_i + \varepsilon_i + \gamma_i \right]$$

$$\delta_i = \theta_i \, \mu_i$$

Whereas Ω is the rate of return on human capital (percentage per year), λ is the net return from work (baht), Rsl is salary (baht), Rad is a bonus (baht), HC is human capital (baht), δ is basic living expenses (baht), θ is the proportion of basic consumption expenses, μ is the total

expenses (baht), ε is the cost of education (baht), γ is the opportunity cost (baht), k is the bachelor degree field, i is the age range (years).

However, the net compensation value is the income after deducting basic living expenses during the working year. The income that graduates from each field of study receive from their first year of work is estimated from two main methods: salary and bonuses.

Human Capital is estimated from a person's various expenses for 22 years, accumulated from the time he was in the womb until he graduated with a bachelor's degree. Expenses consist of 3 main parts: basic living expenses, education expenses, and opportunity costs from choosing to continue education at the high school and bachelor's level without working for 15-22 years.

Results

Results of research on the worthiness of investing in social science education in 5 fields of study for Thai people born in the year 2000. The researcher began studying the sample at the age of 4 years old in a kindergarten for 3 years, continued with a primary school for 6 years, continued with a secondary school for 6 years, and continued with a bachelor degree for 4 years and graduated with a bachelor degree in the year 2021 at the age of 22 years old and began working in the year 2022 at the age of 23 years old. The results of calculating the financial value in each age period use a value equivalent to the value in the year 2022 (Constant price 2022) at the exchange rate of the baht to the United States dollar equal to 35.0316 Baht per USD.

This research found that basic living expenses in each age group are different. It tends to increase continuously with increasing age, from 1,004.43 USD per year to 2,590.90 USD per year at constant prices in the year 2022 and the value is adjusted according to the annual inflation rate in Thailand, which fluctuates between -0.9% and -6.08%, as shown in Figure 1.
Figure 1: Inflation rates and basic living expenses of the Thai population
from 1999 – 2022 (at constant prices in 2022)

The value of investing in education from birth until graduation in 5 social science fields is approximately the same, on average approximately 100,284.57 USD. The field of study with

the highest investment value is Communication arts major with an investment value of 101,066.10 USD, followed by Account major with an investment value of 100,265.31 USD, Law major with an investment value of 100,258.68 USD, Economics major with an investment value of 100,019.93 USD, respectively. Business management major has the lowest investment value: 99,812.85 USD. The average basic living expenses of each occupation is approximately 37.18% of annual income, as shown in Figure 2.
Figure 2: Value of investment in social science education and
percentage of basic living expenses to annual income

In summary, during the first year of work, all 5 majors had an average salary of approximately 540.95 USD per month. Account major graduates earn the highest salary at 615.85 USD per month, followed by Communication arts major at 559.45 USD per month, Economics major at 551.74 USD per month, and Business management major at 515.32 USD per month. The Law major has the lowest salary of 462.40 USD per month. Social science careers have extra income and/or bonuses averaging approximately 1 time of the salary per year. The annual income of each occupation is slightly higher than the income from a regular salary. But when subtracting the basic living expenses, the net return from working during the first year decreases significantly.

Investing in social science education has an average first-year financial return of approximately 4.43% per year. The field of study with the highest financial rate of return was Account major at 5.40% per year, followed by Communication arts major at 4.63% per year, Economics major at 4.58% per year, and Business management major at 4.12% per year, respectively. The lowest financial rate of return is Law major at 3.41% per year, as shown in Figure 3. The financial returns from investing in the five social sciences studies above are still low when compared to the returns from better investment options.
Figure 3: Net compensation and rate of return from the first year of work
Figure 4: Current salary rates in 2022 with salary rates worth the investment

This research found that investing in S&P500 stocks has an average Minimum Acceptable Rate of Returns (MARR) of approximately 11% per year. If the said rate of return of 11% per year is used as a criterion for the rate of return that is worth investing in social science studies or the appropriate rate of investment, it is found that the appropriate salary for the fields of Communication arts major, Account major, Law major, Economics major, and Business management major are: 1,054.47 USD, 1,047.70 USD, 1,047.64 USD, 1,045.62 USD, and 1,043.87 USD, respectively and averages approximately at 1,047.86 USD. The actual salary rates in 2022 for Communication arts major, Account major, Law major, Economics major, and Business management major occupations in Thailand compared to the appropriate salary rates are still only 46.95%, 55.86%, 47.23%, 41.22%, 50.63% or approximately 48.38%.

Conclusion: Summary and Discussion

This research found that social science careers in 5 majors in Thailand in the year 2022, including Communication arts major, Account major, Law major, Economics major, and Business management major receive an average salary in the first year of employment of approximately 540.95 USD per month, or approximately 4.43% per year. It is still not worth investing in each major with an average investment value of approximately 100,284.57 USD.

When comparing the average salary rate of new graduates in the first year of work in the year 2022 in other countries in Asia, it was found that of Japan is approximately 1,030.13 USD per month and that of Singapore is approximately 2,122.38 USD per month. It can be seen that both countries have higher average salaries than Thailand. The Thai government must have a policy to help graduates receive a higher average salary than the present and a good return on investment in education.

Comparing the investment return rate of 11% per year, the salary worth investing in social science studies in the 5 majors should average approximately 1,047.86 USD per month, which is 48.38% higher than the current average salary.

Consequently, the government should apply policies to improve the quality of education so that graduates graduate with quality and can work with higher salaries. Employers should also be willing to pay employees a higher salary. In cases where graduates are already working as employees, but their salaries are still low, the government should implement policies that encourage new graduates to do start-up businesses.

Human Capital Investment in Science and Technology Education and Quality of Life in Thailand

Narissara Charoenphandhu, Rangsit University, Thailand
Thoedsak Chomtohsuwan, Rangsit University, Thailand
Shanisara Chamwong, Rangsit University, Thailand

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Investment in education is a vital factor for the development of both individuals and the whole country. In Thailand, people have attempted to increase their human capital in terms of academic knowledge by studying in university as well as entering higher education with the expectation for higher wages and salaries, and a better quality of life. The Thai government has implemented policies to improve equitable quality education and the opportunity to access it. Moreover, the national education plan 2017-2036 is the ultimate goal to be achieved. In the digital economy era, science and technology majors have been important aspects of driving the country. Many students decided to study science and technology. This research uses secondary data from the National Statistical Office of Thailand and other related data sources to investigate the first-year income and the rate of return on studying in science and technology majors. The results showed that, in 2022, new graduates from science and technology fields earned wages and salaries higher than the poverty line and the minimum wage of Thailand. Most of them have a high quality of life. However, the high return comes with high responsibility as well. As analyzed, this research suggests that the government should focus on education improvement for people to enhance their labor productivity and quality of life.

Introduction

In an era of ever-advancing science and technology, where the demand for skilled professionals in these fields is rising, the investment in science and technology education has become an exceptionally crucial investment in human capital. Governments, educational institutions, and private entities across the globe are aware of the necessity of promoting education that provides individuals with the skills, knowledge, and specialized abilities required in this area. The goal is to change how individuals lead their lives, conduct business, engage in societal development, drive economic growth, and tackle a range of challenges, spanning both the individual and society.

Education in science and technology provides individuals with knowledge and abilities that are in line with current labor market demands, particularly in specialized fields such as information technology and engineering. According to "The Future of Jobs Report 2023" released by the World Economic Forum, surveys assessing job requirements in the coming years reveal that over 85% of organizations intend to integrate new and innovative technologies into their operations. This includes expanding their digital footprint and embracing technologies such as Big Data, Cloud Computing, and Artificial Intelligence (AI). There is an anticipation of significant growth in technology-related employment over the next five years, with expertise in technology rapidly emerging as one of the top three critical skills in demand. It is expected that roles in sectors such as Big Data analytics, climate change and environmental management technologies, and encryption and cybersecurity will be the primary drivers of job expansion (WEF, 2023). Therefore, persons who seek education in these areas are more likely to have attractive career prospects, the possibility for large future income, and employment security.

According to the most recent data from Thailand's Ministry of Higher Education, Science, Research, and Innovation, there were 111,553 graduates from various educational institutions in the fields of science, technology, and engineering in 2020. There were 15,729 graduates in natural sciences, mathematics, and statistics, 10,248 graduates in agriculture, forestry, fisheries, and veterinary, 24,913 graduates in health, 15,537 graduates in information and communication technologies (ICTs), and 45,126 graduates in engineering, manufacturing, and construction. Furthermore, the number of students currently enrolled in science, technology, and engineering programs at all levels of education and in all academic years in higher education institutions totaled 497,855 in 2023.

Education is positively correlated with an individual's workforce efficiency. Those who achieve higher levels of education generally experience greater employment opportunities, and a lower probability of facing unemployment, and tend to earn higher incomes on average. Tuition fees, additional educational expenses, and opportunity costs during the study period are all costs of pursuing education beyond the mandatory and college levels. However, it provides benefits in the form of improved skills and certifications, resulting in higher salaries, more work opportunities, and an overall improvement in their quality of life (OECD, 1998).

The quality of life can be measured in a variety of ways, including health, well-being, and economic stability. Investing in human capital through education is a critical aspect in the creation of a high quality of life in this regard. This research aims to investigate the intriguing relationship between investing in human capital in science and technology education and the quality of life in Thailand.

Objectives

This research aims 1) to investigate human capital investment among undergraduate students in three significant majors of science and technology: information technology, engineering, and medicine. 2) to assess the quality of life that results from the returns on investment in science and technology education at the undergraduate level.

Literature Review

Human Capital

Chomtohsuwan T. (2016) defines human capital as the worth of each individual, similar to financial capital, which can generate monetary returns. Individuals with better human capital are more likely to benefit from higher returns. Human capital is classified into two types: (1) Implicit human capital, which includes unobservable elements of an individual that have been present since birth, such as IQ, abilities, attractiveness, genetics, and predecessors' values. Though it is not expressed in monetary terms, it can provide monetary returns. (2) Explicit human capital is the concrete component of human capital. Each person starts with nothing and can build it up through numerous investments such as physical development, healthcare, basic consumption, knowledge and skill acquisition, and formal education.

Gary S. Becker, an American economist who was awarded the Nobel Prize in Economics in 1992, discusses human capital as a characteristic that cannot be separated from the individual. This includes knowledge, skills, health, or inherent values within a person that affect productivity and economic potential. These aspects are inseparable from the individual, much like the movement of financial assets or physical assets (Becker, G. S., 1993). Similarly, Simon Burgess defines human capital as the skills, characteristics, and knowledge that individuals accumulate. It encompasses a wide range of valuable skills and is not limited to just IQ. It is not possible to clearly specify which type of human capital is the most important. Human capital is the result of investments in education, and this investment is not limited to educational institutions alone. Families also play a significant role in this investment process (Burgess, S., 2016).

Human capital, according to Claudia Goldin (2016), is the skills, abilities, health, and expertise gathered through human work that may be used in production, like physical capital, which includes factories, equipment, machinery, and numerous instruments. Human capital and physical capital are both the result of investment decisions that have considerable direct investment costs. Investing in human capital incurs opportunity costs in terms of individuals' time.

Human capital focuses on the individual, in contrast to social capital, which emphasizes relationships. Human capital is the foundation of economic growth, assessable primarily through educational attainment and direct returns in terms of income and productivity. Additionally, it provides indirect returns in terms of health and civic activities. However, measuring the returns on human capital remains a significant challenge, especially those that are 'non-economic,' impacting quality of life and social cohesion (Helliwell, J. F., 2001).

The analysis of human capital is related to the abilities developed through both formal and informal education, both in educational institutions and at home, training, experiences, and development from labor market mobility (Mincer, J., 1981). Mincer also refers to the concept

of 'capital' put forth by Irving Fisher, a renowned American economist. Fisher posited that capital includes any asset that generates income, and he argued that human capital should be considered a part of this asset. Human capital cannot be traded, it exists in the form of skills and abilities that can be leased, and the process of investing in human capital often involves activities that go beyond trading.

The World Bank has defined the term "human capital" as comprising knowledge, skills, and health that individuals invest in and develop throughout their lives. These elements make them aware of their potential as productive members of society. Investing in people through nutrition, healthcare, quality education, careers, and various skills leads to the development of human capital. This is a crucial factor in achieving equality and fostering improved economic growth. The World Bank collaborates with governments in 90 countries through the Human Capital Project (HCP), using human capital investment as one of its primary approaches to achieve the goal of alleviating extreme poverty by 2030 and promoting shared prosperity globally (World Bank, 2019).

Human Capital Investment

Human capital reflects the concept that humans are valuable resources. Investment in human capital can yield significant economic and social returns. Investing in human capital is a process that involves utilizing various resources such as time, money, and effort to enhance individuals' skills, knowledge, abilities, and other attributes. As a result, it influences the overall productivity and economic capacity of individuals. Individuals can improve their chances of future employment and income generation by investing in education, training, and personal development in a variety of areas. This emphasizes the idea that humans are not merely labor factors but valuable assets that can increase their worth through investments. Education and training are the most important components of human capital (Becker, G. S., 1993). There is research that shows that education at the high school and college levels in the United States significantly increases individual income even after accounting for both direct and indirect educational expenses. Furthermore, there is similar evidence from various countries with diverse cultures and economic systems, indicating that the income of individuals with higher education is often higher on average, and generally, post-expense income is much higher in less developed countries.

Theodore William Schultz, an influential economist in the study of human capital theory, proposed the idea that investing in oneself enables individuals to expand their life choices and is one way to elevate their well-being. He argued that humans are assets of value similar to physical capital or machinery. Developing skills, knowledge, and health in individuals can increase their economic value and contribute to economic growth. Education, training, and geographical mobility for job opportunities are forms of crucial investments in human capital that yield returns in the form of higher income, improved job prospects, and overall economic and social progress. Individuals' varying incomes may reflect differences in health and education as fundamental factors (Schultz, T. W., 1961).

Mincer, J. (1981), a human capital analyst, showed interest in the subject of educational investment within educational institutions. He argued that the expenses associated with education, borne by students or their parents, encompass not only tuition and other learning-related costs but also the foregone earnings that could have been earned had the time spent in education been used for income-generating work instead. This potential income is considered the most valuable cost, accounting for more than half of the total educational costs.

Quality of Life

The World Health Organization (WHO) defines "quality of life" as an individual's view of their place in life concerning their goals, aspirations, standards, and concerns in the context of the culture and value systems in which they live. "Quality of life" is a broad and complicated notion that includes physical health, mental well-being, independence, social interactions, personal views, and the individual's relationship with the particular characteristics of the environment. This definition expresses the viewpoint that "quality of life" entails an evaluative assessment within the context of culture, society, and the environment.

Referring to the quality of life model by Felce and Perry (1995) explains that "quality of life" refers to overall general well-being, which encompasses idealized indicators and assessments related to physical, social, material, and emotional aspects. This comprehensive evaluation of well-being comprises three groups of factors: objective life conditions, personal values and aspirations, and the subjective feeling of well-being.

John Kenneth Galbraith presented an essay titled "Economics and the Quality of Life", which explored the relationship between economics and the overall well-being or quality of life of individuals and society. He put forth the idea that a broad set of indicators is necessary to assess the quality of life, including access to education, healthcare, a clean environment, and social services. The measurement of quality of life must consider the holistic aspects of these various aspects. Considering economic growth measures such as GDP alone is insufficient for assessing the well-being and happiness of individuals and society as a whole.

Income: An Indicator of Quality of Life

The Organization for Economic Co-operation and Development (OECD) conducted a study on the quality of life of people in its member countries, totaling 447. This research considered well-being across 11 areas, including income, jobs, health, access to services, environment, education, safety, civic engagement, housing, social support network, and life satisfaction (OECD, 2022). Income is a key component in determining quality of life.

According to the salary report for the year 2023 in Thailand, conducted by Adecco, it was found that the spread of COVID-19 during the years 2021-2022 had an impact on the uncertainty in the labor market. This led to a downward shift in the starting salaries of recent graduates, decreasing from $428 to $343, and even touching the minimum wage level of $285. However, in the year 2023, the starting salaries for recent graduates have once again reached $428. Currently, incomes in the technology sector are increasing. In order to earn a higher salary, job applicants or workers must have additional skills, such as language and communication skills, as well as the ability to work collaboratively with others. These complementary skills help enhance their abilities and make employers more willing to offer higher salaries.

Methodology

This research collected secondary data from various sources, as follows: Data on the daily expenses of the Thai population from the Household Socio-Economic Survey (SES) conducted by the National Statistical Office of Thailand. Data on the salary of new graduates in the year 2022 was obtained from universities, government agencies, and private

organizations. Data on tuition fees and various education-related expenses were obtained from both public and private educational institutions. Other data from relevant studies.

This research divides the sample into three groups based on the major of study in science and technology at the undergraduate level. The details are as follows:
- Engineering major (22 years of study, starting work at the age of 23)
- Information technology major (22 years of study, starting work at the age of 23)
- Medicine major (24 years of study, starting work at the age of 25)

The estimated human capital is derived from the various expenses incurred by individuals from the time they are in the womb of their mother until they complete their undergraduate degree. These expenses consist of three main components: basic living expenses, education-related expenses, and the opportunity cost of choosing to pursue education beyond high school and undergraduate levels without gaining income from working.

The rate of return on human capital investment is calculated based on the net return that graduates in each field receive in their first year of employment, in comparison to the human capital cost of those graduates. The net return is the income earned after deducting basic living expenses during the working years. This research estimates the income in the first year of employment, which primarily comes from two main sources: salary and bonuses.

This research assesses the quality of life of those who have completed education in science and technology majors. This research utilizes income from employment as a factor. In this research, the quality of life is segmented into six levels, categorized by the average monthly income level, which is estimated from the average monthly income per person, classified by population group according to the level of income throughout the nation (Quintile by income) for 2021, using data from the Office of the National Economic and Social Development Council.

Table 1: Quality of life level divided by average monthly income

Average monthly income ($)	Quality of life level
≤ 85.93	Poor
> 85.93 – 151.48	Low
> 151.48 – 221.44	Low-medium
> 221.44 – 333.93	Medium
> 333.93 – 768.74	High-medium
> 768.74	Hight

Results

Human Capital Investment

This research calculates the value of "Human Capital" based on the investments covering educational expenses, basic living costs, and opportunity costs. The results indicate that the highest investment is in the field of medicine, totaling $192,034.16, followed by engineering at $103,891.66 and information technology at $102,620.09, as shown in Figure 1. The average human capital investment across all three majors is $132,848.64.
Figure 1: Human Capital Investment

Human capital investment in medical education is 84.84 percent higher than in engineering and 87.13 percent higher than in information technology. Meanwhile, investment in engineering major is 1.24 percent higher than in information technology major.

Returns on Human Capital Investment

A study of returns from human capital investment in education considers the average monthly monetary returns from working during the first year of employment after graduation. These returns consist of income from salaries and bonuses. The study found that graduates from the medical major received the highest average monthly returns, at \$2,107.92, followed by engineering at \$746.67, and information technology at \$719.42, as shown in Figure 2. On average, the average monthly returns from working during the first year across all three academic majors amounted to \$1,191.34.

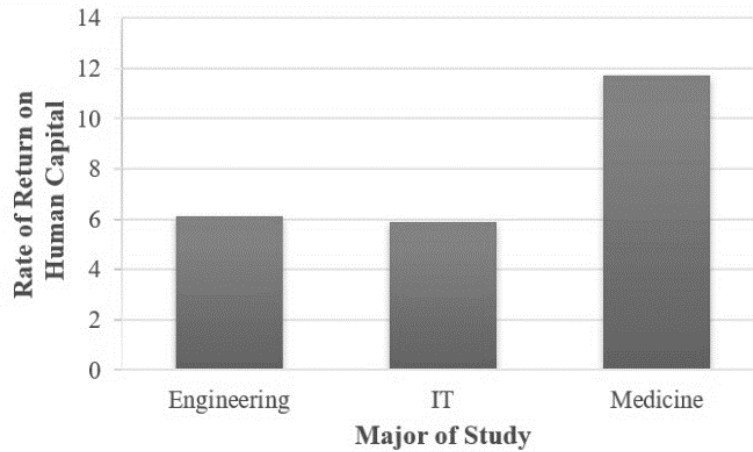
Investing in a medical major provides a 182.31 percent higher return than investing in an engineering major and a 193 percent higher return than investing in an information technology major. In the meantime, investment in engineering provides a 3.79 percent higher return than investing in information technology.
Figure 2: Average monthly returning during the initial year of employment


Figure 3: Rate of return on human capital

The rate of return for the first year is 11.74 percent in the major of medicine, 6.13 percent in engineering, and 5.89 percent in information technology, as shown in Figure 3. The average rate of return across all three majors is 7.92 percent.

Assuming consistent monthly monetary returns for graduates from all three majors, the break-even period for educational investment is approximately 9 years for medical education, 16 years for engineering, and 17 years for information technology.

Quality of Life Assessment

The study found that investments in all three academic majors yield monetary returns that can result in a good quality of life. Investment in engineering and information technology education leads to graduates having a high-medium quality of life level, while investment in medical education leads to graduates having a high quality of life level.

In engineering and information technology majors, graduates receive an average yearly return of $746.67 and $719.42, respectively. These returns fall within the income range of $333.93 to $768.74, indicating that individuals who complete their education in these areas have a high-medium quality of life. For graduates in medicine, the average yearly return is $2,107.92, which falls within the income range of $769 and above, indicating that individuals who complete their education in this field have a high quality of life.
Figure 4: Assessing the quality of life (QOL) of engineering, information technology, and medicine graduates.

According to the study's findings, graduates with a major in engineering, information technology, and medicine had a higher quality of life than those with income at or below the poverty and minimum wage levels. In 2021, Thailand's national average minimum wage was approximately $221.65 per month, falling within an income range of $221.44 to $333.93, indicative of a medium-level quality of life. Those with a monthly income at or below the current poverty line, set at $80.01, experience a poor quality of life.

Conclusions and Recommendations

Investment in human capital in science and technology education is crucial for stimulating economic growth and improving the quality of life. The study results show that individuals who complete their education in science and technology majors: engineering, information technology, and medicine enjoy a good quality of life. Therefore, promoting and supporting education in these areas is essential for the development of the country and the enhancement of people's quality of life.

Promoting Human Capital Investment in Education

Promoting investment in human capital in science and technology education requires cooperation from multiple sectors, including the government, educational institutions, and the private sector.

1. Government
The government can support and create opportunities for access to education in science and technology through various policies. For example, allocating funding for scholarships or financial assistance to students who are interested in or pursuing undergraduate degrees in science and technology fields, especially students from disadvantaged backgrounds. Such initiatives will help reduce financial barriers to education and address educational inequality, particularly in fields with shortages that require significant educational investment, such as medical studies.

The government can still allocate an additional budget for education to support educational institutions in acquiring sufficient resources for the development of graduates in this field. With this budget, educational institutions can improve their facilities and procure educational equipment, especially in fields that require high-value educational equipment, such as medical and engineering. The government should encourage educational institutions to incorporate technology and innovation into the learning processes, for example, supporting the use of teaching technology and online learning development.

These roles of the government sector align with the national education plan 2017-2036, which aims to provide access to educational opportunities, ensure educational equality, improve educational quality, and enhance efficiency in response to the challenges of the contemporary world.

In addition to promoting education, the government also plays a key role in promoting a high-quality life for graduates, such as creating opportunities for employment by encouraging investment in science and technology to increase job opportunities in these professions. Moreover, the government should regulate and enforce the fair regulation of labor laws and regulations to protect workers' rights, guarantee workplace safety, promote access to

affordable and high-quality healthcare services, and foster work-life balance through appropriate working hour policies.

2. Educational institutions

Education institutions ought to enhance their science and technology curricula to remain up-to-date and ensure a high standard, thus enabling the production of graduates equipped with knowledge and skills that align with present and future labor market requirements.

Moreover, these institutions should actively endorse research initiatives, fostering the generation of fresh knowledge and offering students opportunities to engage in research projects. One of the primary objectives of educational establishments is to augment the workforce in these domains, thereby addressing the shortage of professionals. They should also prepare their facilities and teaching equipment to be fully equipped for creating an optimal learning environment, as certain scientific and technological disciplines necessitate the utilization of cutting-edge technology.

3. Private sector

The private sector can promote human capital investment for science and technology education through financial support. Examples, providing scholarships to capable but financially disadvantaged students, research grants for researchers, and funding for various creative and innovative projects, which encourage the discovery and development of new technologies.

Furthermore, the private sector can collaborate with educational institutions to develop curricula that better align with the industry's needs and the job market. Providing internship opportunities for students helps enhance their knowledge and skills by allowing them to learn from real-world experiences.

Studying Quality of Life Factors

Quality of life is a complex topic that requires consideration of various elements. To develop quality of life, the following key factors must be studied:

1. Health and well-being

Caring for both physical and mental health, including engaging in regular exercise, maintaining a balanced diet, getting adequate rest, and preserving mental well-being, are all essential factors that enhance the quality of life. Moreover, residing in a home and working in an environment that provides clean, suitable living conditions, while ensuring safety for both life and property, also plays a significant role in promoting a high quality of life.

2. Work-life balance

Despite the high salaries and employment security available to those who complete their education in engineering, computer technology, and medicine, most people in these fields frequently work hard, are under a lot of stress, and struggle with health problems. These factors, in turn, significantly reduce their quality of life. Maintaining a balance between work, relaxation, family time, and leisure improves quality of life.

3. Financial security

This research divides the quality of life according to income levels, which is a factor reflecting economic well-being. However, having a good quality of life should also prioritize

financial stability. Good financial planning is a way to create financial stability in both the present and the future, especially during the post-retirement phase. This helps reduce stress and increase life satisfaction.

4. Happiness and life satisfaction
Happiness and satisfaction are also factors in assessing the quality of life. Happiness stemming from strong relationships within the family and with friends, as well as satisfaction with life and work resulting from doing a job one enjoys and is skilled at, all play a significant role in determining a person's quality of life.

5. Contribute to society
Participating in society and collaborating with others are crucial in shaping the quality of life. These actions foster happiness, stability, and purpose in one's life.

Utilizing education and skills to positively contribute to society, addressing issues, mentoring others, and undertaking impactful projects, as doctors do, fosters a sense of involvement in resolving challenges. These actions enhance one's joy, self-fulfillment, and satisfaction in personal achievements, all of which profoundly influence the overall quality of life.

Flexible Teaching in Rural Philippine Higher Education:
Attitude and Anxiety of Educators as Predictors of Readiness

Ma. Xerxa Doan Billones-Franco, Northern Iloilo State University, Philippines

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This study investigates the level of readiness of educators towards shifting to flexible teaching in terms of attitude and levels of anxiety. The respondents were 179 educators from the seven campuses of Northern Iloilo State University, Philippines selected through proportional random sampling. This study employed the descriptive cross-sectional study using a survey research design. Data were gathered using a validated and reliability-tested researcher-made questionnaire. Results were analyzed using statistical tools such as Means, Standard Deviation, and T-test for Independent Samples, Analysis of Variance (ANOVA), and Pearson-r. The results of the study revealed that the educators' level of readiness towards flexible teaching in terms of attitude was neither positive nor negative as an entire group, however, as to academic rank, instructors have positive attitudes while college professors have negative attitudes toward flexible teaching. In terms of anxiety, educators have mild levels of anxiety. No significant differences were observed in terms of attitude when classified as to age, sex, civil status, length of teaching experience, and workload, however, a significant difference was observed in terms of anxiety when educators were classified as to sex. Furthermore, the educators' attitudes have a negative significant relationship to anxiety.

Keywords: Flexible Teaching, Higher Education, Attitude, Anxiety, Readiness

Introduction

The COVID-19 pandemic has created the largest disruption of education systems in history, affecting nearly 1.6 billion learners in more than 190 countries and all continents. Closures of schools and other learning spaces have impacted 94 percent of the world's student population, up to 99 percent in low and lower-middle income countries (UNESCO, 2020). Since the education of learners cannot be further delayed, schools have decided to reopen through online delivery (Brooks & Grahek, 2020). However, not all are equipped with the necessary tools for online education. This posed a problem for certain nations which already had an existing predicament in education even before the pandemic.

In the Philippines, aside from professional dilemmas such as coping with the demands of shifting to a new mode of instruction, educators must also deal with constant worrying for themselves and their family's safety which burden their mental well-being. A study by Talidong and Toquero (2020), revealed that Filipino educators experienced anxiety throughout the pandemic and have coping practices to deal with it. In Higher Educational Institutions, where learners came from different parts of the country and with different levels of economic status, remote learning delivery became an option, especially in rural areas where most of the learners lived in provinces and islands. In these circumstances, purely online learning is not applicable; hence, institutions turn to flexible teaching.

Flexible Teaching or flexible delivery is a mode of education more adaptable to time/geographical constraints than face-to-face classrooms. It often appeals to mature, rural/remote students or others with competing life demands (Ragusa, 2009). In much simpler terms, flexible teaching is a means of implementing flexible learning, which is a combination of digital and non-digital technology that ensures the continuity of inclusive and accessible education in the form of online, offline, or blended modes of teaching and learning processes (Ulanday, Centeno, Bayla, & Callanta, 2021). Flexible learning and teaching have gained significant attention for decades (Yuan, Wu, Xiong, Li, Xei & Liu, 2021). Flexible delivery is an approach to education that is student-centered, in respect to teaching and learning methods and resources, which caters to individual differences of learners and is free from the limitations of the time, content, access/entry requirements, instructional approaches/design and place and pace of study (Lundin, 2012; Huang, Liu & Zhan, 2020). It can be full-online, blended learning, flipped classroom, and distance learning (Abisado, Unico, Umoso, Manuel, & Barroso, 2020).

Flexible Teaching was applied in the Northern Iloilo State University and its campuses in the 5th district of the province of Iloilo, Western Visayas, Philippines where students, educators, and the school itself, are located mostly in coastal and agricultural areas in the province. As a precautionary measure against the spread of the virus, the institution transitioned to flexible teaching to continue its service of educating the learners in any way possible. The sudden shift in teaching style caused struggles and an array of challenges that college instructors must overcome to deliver the education that their students need. With these demands in the workplace and the personal dilemma the educators were experiencing, the question of how ready were the educators for this sudden pedagogical shift arises. Given the case of educators in Northern Iloilo State University, where flexible teaching was implemented and both educators and learners lacked resources to implement the necessary means of a smooth transition from the traditional method of learning, this study was conducted to assess the attitude, and level of anxiety of educators as predictors of their readiness during the shift to flexible teaching.

Methodology

This study used the cross-sectional descriptive method to determine the level of readiness of educators in Northern Iloilo State University during the shift towards flexible teaching. The respondents of the study, which was determined through proportionate sampling, were the 179 permanent teaching faculty from the seven campuses of Northern Iloilo State University.

All the respondents were actively teaching in higher education and have shifted to flexible teaching during the pandemic. They were classified according to age, sex, civil status, academic rank, length of teaching experience, and workload.

Categories	f	%
Entire Group	179	100
A. Age		
Young (≤40 years old)	80	44.69
Old (>40 years old)	99	55.31
B. Sex		
Male	68	37.99
Female	111	62.01
C. Civil Status		
Single	44	24.58
Married	135	75.42
D. Academic Rank		
Instructor	68	37.99
Assistant Professor	59	32.96
Associate Professor	50	27.93
College Professor	2	1.12
E. Teaching Experience		
Short (≤15 years)	105	58.66
Long (>15 years)	74	41.34
F. Workload		
5 and below	140	78.21
Higher than 5	39	21.79

Table 1: Distribution of the Respondents by Category

The research instrument used in the study was a survey questionnaire on educators' readiness towards flexible teaching made up of validated and reliability-tested, researcher-made questions that explored the respondents' profiles and assessed their attitudes towards flexible teaching. The last section adopted the General Anxiety Disorder 7-item (GAD-7) scale developed by Spitzer and colleagues (2006) which was used to measure general anxiety symptoms across various settings and populations (Johnson, Sverre & Ulvenes, Pål & Oktedalen, Tuva & Hoffart, Asle, 2019).

Results and Discussion

Attitude. Results of the mean analysis revealed that the level of readiness of educators towards flexible teaching in terms of attitude was "Neither Positive nor Negative" when the respondents were taken as an entire group. When grouped as to age, sex, civil status, length of teaching experience, and workload, results further revealed that the educators' level of readiness as to attitude is "Neither Positive nor Negative" (m= 3.11-3.38; SD= .72 -.86).

However, when grouped as to academic rank, Instructors' level of readiness towards flexible teaching in terms of attitude was "Positive" (m= 3.41; SD= .82), Assistant Professors and Associate Professors both were "Neither Positive nor Negative", whereas College Professors results were "Negative" (m= 2.4; SD= .42). This means that the knowledge of teachers on computers and related technology influences their attitude toward any form of learning involving these tools. The same applies to instructors, who are mostly younger and technology-savvy, and college professors mostly of retirement age.

This supports the study of Krishnakumar & Rajesh (2011) wherein results revealed that teachers who possess knowledge about computers and technology have a more favorable attitude towards e-learning. In the said study, a significant difference was observed in the attitudes of teachers who have blogs and teachers who do not. Another by Badia, Garcia, & Meneses (2018), concluded that teachers' relationship with technology plays a key role in them feeling relaxed or stressed, a common occurrence in an online teaching and learning environment.

Category	N	Mean	S.D.	Description
A. Entire Group	179	3.26	.79	Neither Positive nor Negative
B. Age				
Young (>40 years old)	80	3.34	.78	Neither Positive nor Negative
Old (≤40 years old)	99	3.21	.80	Neither Positive nor Negative
C. Sex				
Male	68	3.30	.84	Neither Positive nor Negative
Female	111	3.24	.76	Neither Positive nor Negative
D. Civil Status				
Single	44	3.38	.86	Neither Positive nor Negative
Married	134	3.23	.77	Neither Positive nor Negative
E. Academic Rank				
Instructor	68	3.41	.82	Positive
Asst. Professor	59	3.18	.75	Neither Positive nor Negative
Asso. Professor	50	3.21	.79	Neither Positive nor Negative
Professor	2	2.3	.42	Negative
F. Teaching Experience				
Short (≤15 yrs)	105	3.34	.79	Neither Positive nor Negative
Long (>15 yrs)	74	3.15	.79	Neither Positive nor Negative
G. Workload				
5 and below	140	3.30	.81	Neither Positive nor Negative
Higher than 5	39	3.11	.72	Neither Positive nor Negative

Scale: *4.21–5.00, Highly Positive; 3.41–4.20, Positive; 2.61–3.40, Neither Positive nor Negative; 1.81–2.60, Negative; 1.00–1.80, Highly Negative*

Table 2: Level of Readiness of Educators towards Flexible Teaching in terms of Attitude

Anxiety. When taken as entire group, the level of anxiety of the educators towards flexible teaching was "Mild" (m= 1.82; SD= .71). Moreover, when categorized as to age, civil status, teaching experience, and workload, the level of readiness of the respondents in terms of anxiety was "Mild" (m= 1.77-2.00; SD= .66-.75). However, when categorized as to sex, males have "Normal" (m=1.62; SD= .75) anxiety level, while females have "Mild" (m= 1.94; SD= .66) anxiety level. When categorized as to academic rank, associate professors have a "Normal" (m= 1.73; SD= .68) level of readiness towards flexible teaching in terms of anxiety, while instructors, assistant professors, and college professors have "Mild" (m= 1.80-1.91; SD= .68-1.21) level of readiness towards flexible teaching in terms of anxiety. It must be noted, however, that although associate professors have a "Normal" level of anxiety, the mean score was along the borderline with only a .03 difference of having "Mild" anxiety. This implies that educators exhibited symptoms that are attributed to a mild level of anxiety due to the current situation brought about by the pandemic. Educators felt the said symptoms during the shift to flexible teaching as they were working at home and the number of positive coronavirus cases was adding up globally and locally.

Several research studies have been made concerning educators' anxiety levels during the pandemic with results ranging from mild to severe levels of anxiety among educators. A study with similar results was conducted in Mexico by Delgado-Gallegos, et. al. (2021) with 63.6% of the 220 respondents exhibiting mild levels of anxiety. A study done in different universities in Latin America by Urcos, et al (2020) showed that 92.3% of 207 educators exhibit a severe level of anxiety with only 6.8% showing a moderate level and 1% mild level of anxiety, and mostly reflected in the female sex. The large percentage of severe anxiety was believed to be a result of the social isolation measures that have been put in place to counter the spread of COVID-19.

	Category	N	Mean	S.D.	Description
A.	Entire Group	179	1.82	.71	Mild Anxiety
B.	Age				
	Young (>40 years old)	80	1.86	.75	Mild Anxiety
	Old (≤40 years old)	99	1.78	.68	Mild Anxiety
C.	Sex				
	Male	68	1.62	.75	Normal Anxiety
	Female	111	1.94	.66	Mild Anxiety
D.	Civil Status				
	Single	44	1.83	.72	Mild Anxiety
	Married	134	1.82	.71	Mild Anxiety
E.	Academic Rank				
	Instructor	68	1.80	.76	Mild Anxiety
	Asst. Professor	59	1.91	.68	Mild Anxiety
	Asso. Professor	50	1.73	.68	Normal Anxiety
	Professor	2	1.86	1.21	Mild Anxiety
F.	Teaching Experience				
	Short (≤15 years)	105	1.79	.69	Mild Anxiety
	Long (>15 years)	74	1.86	.74	Mild Anxiety
G.	Workload				
	5 and below	140	1.77	.70	Mild Anxiety
	Higher than 5	39	2.00	.72	Mild Anxiety

Scale: 4.00-3.22, Severe Anxiety; 2.52-3.21, Moderate Anxiety; 1.77-2.51, Mild Anxiety; 1.0-1.76, Normal

Table 3: Level of Readiness of Educators towards Flexible Teaching in terms of Anxiety

Differences in the level of readiness of educators towards flexible teaching in terms of attitude when classified as to certain categories. Employing T-test for independent samples, the following results were revealed as to the level of readiness of educators in terms of attitude when they are classified as to certain categories. The results revealed that when classified as to age, $t(177)= 1.086$, $p= .279$, sex, $t(177)= .445$, $p= .657$, civil status, $t(177)= 1.115$, $p= .266$, length of teaching experience, $t(177)= 1.597$, $p= .112$, and workload, $t(177)= 1.358$, $p= .176$, the level of readiness of educators towards flexible teaching in terms of attitude have no significant differences. These results failed to reject the null hypothesis which states that: "There is no significant difference in the level of readiness of educators towards flexible teaching in terms of attitude".

This implies that regardless of the educators' age, sex, civil status, length of teaching experience, and workload, their attitude on the readiness towards flexible teaching are basically the same. The said result disagreed with that of the study of Moralista & Oducado (2020) which revealed that there was a significant difference in the favorability of educators toward online education in terms of sex, age, college, educational attainment, years in teaching, academic rank, level taught, and employment status. According to the study, this may be due to the availability or unavailability of technological equipment and stable internet connection to every faculty, which is a necessity for online education.

Table 4: Differences in the level of readiness of educators towards flexible teaching in terms of attitude when classified as to certain categories

Differences in the level of readiness of educators towards flexible teaching in terms of anxiety when classified as to certain categories. Using t-test, the differences on the level of readiness of educators towards flexible teaching in terms of anxiety was determined. T-tests results revealed, that there is no significant differences in the level of readiness of educators towards flexible teaching in terms of anxiety when grouped as to age, $t(177)= .721$, $p= .472$, civil status, $t(177)= .092$, $p= .927$, length of teaching experience, $t(177)= -.678$, $p= .499$, and workload, $t(177)= -1.857$, $p= .065$. However, a significant difference is present when they are grouped as to sex, $t(177)= -2.953$, $p= .004$.

The null hypothesis which states that: "There is no significant difference in the level of readiness of educators towards flexible teaching in terms of anxiety" was failed to be rejected

if the educators were grouped according to age, civil status, length of teaching experience, and workload but was rejected when educators were grouped as to sex. This implies that anxiety towards flexible teaching differs between males and females. The mean value of females was found to be higher than that of the males.

This result supports the findings in the study of Li, Miao, Zeng, Tarimo, Wu, & Wu (2020), wherein an overall anxiety prevalence was recorded through an online survey assessing anxiety in teachers during the epidemic of COVID-19. Eighty-eight thousand six hundred eleven (88, 611) responses from educators all over China were analyzed and results showed that the prevalence of anxiety was higher for women than men. Furthermore, another study by Ozamiz-Etxebarria, Dosil-Santamaria, Picaza-Gorrochategui, & Idoiaga-Mondragon, (2020) yielded the same results where the female sex manifests more numbers in all anxiety levels compared to the male sex.

	Category	d.f.	Mean	S.D	t-ratio	p. value
A.	Age					
	Young(>40 years old)	177	1.86	.75	.721	.472
	Old (≤40 years old)		1.78	.68		
B.	Sex					
	Male	177	1.62	.75	2.953	.004
	Female		1.94	.66		
C.	Civil Status					
	Single	177	1.83	.72	.092	.927
	Married		1.82	.71		
D.	Teaching Experience					
	Short (≤15 years)	177	1.79	.69	.678	.499
	Long (>15 years)		1.86	.73		
E.	Workload					
	5 and below	177	1.77	.70	1.857	.065
	Higher than 5		2.00	.72		

Note: p < 0.05 significant at 0.05 alpha

Table 5: Differences in the Level of Readiness of Educators towards Flexible Teaching in terms of Anxiety when classified according to certain categories

Differences in the level of readiness of educators towards flexible teaching in terms of attitude and anxiety when classified according to academic rank. ANOVA results revealed that there are no significant differences existing in the level of readiness of educators towards flexible teaching when classified as to academic rank in terms of attitude, F(3, 175)= .538, p= .657, and in terms of anxiety F(3, 175)= .538, p= .657. This implies that the level of readiness of educators towards flexible teaching in terms of attitude and anxiety of instructors, assistant professors, associate professors, and college professors are the same.

Category	Sum of squares	d.f.	Mean Square	F	p. value

Table 6: Differences in the level of readiness of educators towards flexible teaching in terms of attitude and anxiety when classified according to academic rank

Relationship between attitude and anxiety. Pearson's-r computation revealed that the educators' attitude was negatively related to anxiety, (r= -.259, p=.000). This implies that the attitude of educators towards flexible teaching is highly dependent on their level of anxiety. Most likely, when educators feel anxious, their attitude towards instruction is affected. Moreover, this result is very much similar to that of Alqabbani, et. al. (2020), wherein a significant moderate negative correlation was obtained between anxiety and attitudes of university instructors who were the respondents of his study.

Note: Significant at 0.01 level (2-tailed)

Table 7: Correlation matrix between attitude and anxiety

Conclusion, Implications, and Recommendations

Based on the result of the study, among the dependent variables which determine the readiness of educators towards flexible teaching, their readiness in terms of anxiety should be given attention as findings showed a mild level of anxiety present among the educators. The study concludes that educators are still in the process of adjusting to the transition from traditional face-to-face instruction to flexible teaching, as findings of this study revealed that although their attitude remains in neutral level, a mild level of anxiety is present among the educators.

When flexible teaching was mandated by the Commission on Higher Education (CHED) to be the mode of instruction in HEIs in the Philippines, educators immediately complied and adapted themselves to the sudden transition from the traditional mode of instruction and coping with the new mode of instruction has been difficult for educators as it requires ample

time for preparation of modules and advance knowledge in ICT. Although technical support from the administration was given, the current situation caused mild anxiety to develop among educators. The presence of mild anxiety is due to factors related to work demands and personal concerns during the onset of the pandemic. Having one of the most important and diverse roles in society, educators were anxious about their personal and family safety, in addition to the demands of their profession including constant concern for the future of instruction and the learners.

The findings of this research further implied that the psychological well-being of educators affects their performance and should be given utmost importance as it negatively affects their attitude towards flexible teaching. The mild level of anxiety of educators should be addressed to prevent it from developing to a severe level, further affecting their work performance. A growing number of studies related to anxiety and stress in the workplace revealed that the efficiency and productivity of workers are highly associated with their psychological state. Educators are no exception. Having one of the most stressful and demanding professions, it is therefore of utmost importance that any feeling of stress and anxiety must be addressed, and educators must be given time to relieve themselves of these negative feelings, which are one of the causes of ineffectiveness.

Since recurring mild anxiety symptoms can have a long-term effect on their productivity and performance, both personally and professionally, a productivity enhancement program through stress and anxiety reduction is recommended to be proposed as part of the wellness program of the university. School administration should support educators with anxiety especially during these challenging times to ensure efficiency and prevent burnout.

The Implication of Subconscious Approach in Stimulating the English Language Knowledge for Interpreting-Majored Students

Nhi Yen Ho, Nha Trang University, Vietnam

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This study investigated the implication of the subconscious teaching approach in stimulating the English language knowledge for Interpreting-majored students. The researcher analyzed some relevant theories: Universal Grammar of Noam Chomsky and Stephen Krashen's Second Language Acquisition. After examining these theories, a proposed subconscious teaching approach was developed to improve the situation of lacking English knowledge by some students in the Interpretation major. This study's method mostly follows the qualitative and quantitative approaches with 80 participants who are seniors from the Faculty of Foreign Languages, Nha Trang University, Vietnam. The study results revealed the whole picture of utilizing the subconscious approach. In stimulating English language knowledge for students. This could also contribute to further improvements in language skills in teaching.

Keywords: Second Language Acquisition (SLA), Universal Grammar, Subconscious

Introduction

The typical challenges in interpretation crucially focus on the lack of competency in listening and speaking skills. From the observation of the researcher, however, Interpreting-majored students tend to be trained in the approaches mostly concentrating on developing interpreting skills. Practice, as a result, obviously works on the aspect of brain plasticity, and the learners can certainly feel the familiarization of repetition, but some of them hardly possess a solid foundation of language knowledge. Admittedly, the constitution of fluency and accuracy in language performance necessarily requires a language base. To consolidate language knowledge playing an irreplaceable role in the language performance of interpreters, the writer examined the subconscious mind by researching its features combined with the Universal Grammar theories and some second language acquisition hypotheses of Stephen Krashen. The specific implication of this article concentrates on students in English interpreting classes in Vietnam.

Literature Review

Subconscious Mind

Pierre Janet – a famous neurologist and psychologist – introduced the concept of the subconscious mind in one of his works in the late 1880s with the definition concerning this term as a "powerful awareness" located underneath the conscious mind (Ellenberger, 1970). In 1893, Sigmund Freud also mentioned the subconscious mind in his writing as a layer, which could not link to the consciousness. However, in 1990, Freud described the human mind by using the topographical model of three levels, which were "conscious mind", "preconscious mind" and "unconscious mind", and he refused the term subconscious mind. Since then, the subconscious mind and preconscious mind have been confused and they are often overlapped. After Sigmund Freud's work, Latham, Stajkovic and Locke (2010) repeated the subconscious mind in their article, and they believed that it could operate "without intention, awareness and conscious guidance". According to Yogachara – a philosophy of Mahayana Buddhism, the subconscious mind is called Ālayavijñāna whose function is a "storehouse – consciousness" (Berzin, 2013). In conclusion, from the mentioned concepts, the subconscious mind can save all types of information received from the senses.

The Universal Grammar

Universal Grammar was mentioned as the "system of categories, mechanisms and constraints shared by all human languages and considered to be innate" (Chomsky, 1986). White (2020) also noted in her book that UG theories mostly focused on the acquisition process of language and the language constituency. Baker (1979) referred to UG as a theory consisting of the content regarding the natural device of language learning in the human mind. The sense of realizing the incorrectness existed in the sentence production was considered an obvious capability.

Following this, it can be inferred that the real essence of UG is the existence of an innate device in the human mind. Throughout the development of UG, lots of scholars have been also carrying out numerous studies regarding the relationship between UG and Second Language Acquisition (SLA). Chomsky (1980) asserted that "language faculty" might be a "mental organ", proving that language itself can be acquired naturally in every human. Language acquisition can be considered the development of the mental organ of language

through language experiences. Universal Grammar certainly follows the natural approach of language forming, leading to a perfect combination of second language acquisition and the innate elements existing in the human mind.

Second Language Acquisition (SLA)

In the history of linguistics, language acquisition was first explained by Skinner (1957); however, it was criticized by Noam Chomsky. Particularly, he assured that language could not be learnt through "reinforcement" since the "innate" elements always existed in human development. Chomsky continued this study by inventing the theory of *Universal Grammar* (1965). In 1967 and 1972, Pit Corder and Larry Selinker continued this trend of research by proposing theories concerning "learners' errors" and "interlanguage". The history continued with some hypotheses of Stephen Krashen – a key scholar in the field of SLA. He gave a concept of SLA as a similar process to the stages of acquiring language of children (1981), and he mentioned the importance existence of "input" in establishing the core language knowledge deleting the feeling of imperfection in language performance. Krashen (1982) determined that language acquisition and language learning were two separate stages, which possessed the features of "consciousness" and "subconsciousness" in each process. However, Krashen received lots of criticism from other scholars, who did not approve of the necessity of language acquisition, and they mostly did not concentrate on the intrinsic power of the learners' minds but the language teaching. Since then, the two concepts of "consciousness" and "unconsciousness" have become one of the most controversial issues in second language learning.

The Comprehensible Input and the Natural Order Hypotheses

In 1985, Stephen Krashen proposed a Monitor Model consisting of five hypotheses (*The acquisition-learning–learning hypothesis, The Natural Order hypothesis, The Monitor hypothesis, The Input hypothesis, and The Affective Filter hypothesis).* In this section, the Comprehensible Input and the Natural Order hypotheses are analyzed.

The comprehensible input of Stephen Krashen is a theory of second language acquisition that states that learners acquire a language when they understand messages or texts that are slightly above their current level of competence. According to Krashen, comprehensible input is the necessary and sufficient condition for language learning, and it occurs when learners are focused on the meaning rather than the form of the language. Krashen also proposes that there is a natural order of acquisition that is independent of the order of teaching and that learners have an internal monitor that can correct their errors based on their learned knowledge of the language. The Comprehensible Input is one of the most successful hypotheses of Stephen Krashen in the research approach of SLA. In a study by Krashen in 1982, he inferred the process of SLA with the necessity of "comprehensible input". This has the power as a potential lever in helping one person acquire a language with a well–founded approach. He assured that language was only acquired through the understanding process (Krashen, 1985), proving the role of comprehensible input was inevitable. In his hypothesis, he mentioned "i" as the current level of the learners and "i + 1" as the level that the learners aimed to achieve. This explained the reason for creating an "i + 1" input to build the learners' language acquisition processes.

The natural order hypothesis is a theory of second language acquisition proposed by Stephen Krashen in 1977. It states that learners acquire grammatical structures in a predictable and

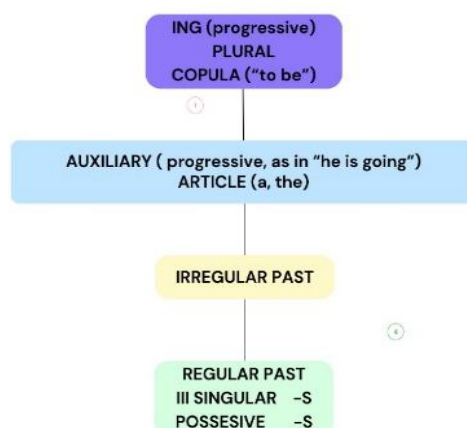
fixed order, regardless of their native language, the age of acquisition, or the amount of exposure. The hypothesis is based on evidence from studies of learners' errors and developmental stages in various languages. According to Krashen, the natural order hypothesis reflects the innate and universal principles of language learning that are independent of external factors. Schmidt (1990) explained in their writing that the Natural Order hypothesis emphasized on the order of acquiring linguistic patterns of the language learners. Krashen (1987) proposed a table of illustrating the order of language acquisition of language learners as follows:


Figure 1: Natural order of language acquisition

Interpretation and Second Language Acquisition

Interpretation or Interpreting implies the most common way of deciphering correspondence between hearing people, who convey in communicated in language, and people who impart in gesture-based communication.

The process of interpretation consists of the specific stages existing in language production. Kormos (2014) clarified these as *conceptualization*, *formulation*, *articulation* and *self–monitoring*. Students, therefore, cannot have good skills in interpreting if they do not possess a solid foundation in language. Nhi (2017) presented diagrams concerning the processes of interpreting from English to Vietnamese and vice versa. She mentioned the stages of *conceptualization* and *formulation* after "transferring" language. This means that the interpreters should reach the level of fluency when they want to achieve perfect language understanding and speaking skills while interpreting. It is evident that before students start their major as interpreters, they have to be trained carefully in four basic language skills (listening, speaking, writing, and reading). Most teachers tend to focus on "how to teach to help the learners perform the language well" rather than "how to teach to help the learners acquire the language well". The researcher concluded that the lack of acquisition leads to a lack of foundation. Therefore, it will be impossible for interpreting students, who still haven't possessed enough language knowledge during the basic skills training, to achieve their perfect language performances.

The Subconscious Approach Model

The Equilateral Triangle of LRD

LRD stands for *listening, reading* and *discussing*. These kinds of activities establish a solid foundation for language development. From the writer's perspective, the equilateral triangle of LRD can help instructors be flexible in designing activities. The instructors in Interpreting classes, therefore, can conduct discussion activities inside the classrooms, while reading & listening activities will become the learners' homework.

LRD equilateral triangle possesses the power of the preconscious. In fact, in this writing, the researcher wants to emphasize the status in the middle of the "unconscious" and "conscious" mind when acquiring language. With LRD, the learners can have opportunities to develop their language mysteriously without awareness. Regarding *Listening*, students can absorb the "tunes" of language, which includes the pronunciation and the familiarization of sounds. At the same pace of language acquisition, *Reading* can establish the "bone" of language consisting of a vast number of vocabularies and grammatical patterns. *Reading* and listening activities, therefore, can help promote the neuroplasticity. With *discussion*, this factor is the connection of *Reading* and *Listening*. It means that when receiving the "input", the learners should have the opportunity to practise with the "output" because, without the appearance of this practice, language performance hardly occurs.

Designing Reading & Listening Activities

While the success of an English–Vietnamese interpreting process crucially focuses on language understanding, the process of interpreting from Vietnamese to English requires a solid background of general language knowledge. The instructors should design activities for students to practice at home, and check their results.

Reading activities should concentrate on solving the problem of how to read rather than the desire to understand. By concentrating on this feature, the instructors can think of an approach, which emphasizes two steps of reading including *"general reading"* and *"close reading"* (Peter Newmark, 1988). In the aspect of *Listening*, interpreting requires flexibility in understanding. This element needs the familiarization of sounds and the realization of words. When examining these two skills, the writer concluded that it is extremely necessary to connect *Listening* and *Reading* activities. The instructors can design these activities by following the topics that were prepared at the beginning of the courses. In the listening activities, the instructors have to focus on developing "note–taking" skills because it can promote some sub–skills in practising interpreting, and the number of times that students can listen is also an aspect of research that the instructors should consider.

However, the analysis above may lead to one question: should all the listening and reading materials be only in English to help Vietnamese students acquire the English language perfectly or should they be in both two languages (English and Vietnamese language)? From the researcher's study, because of the particular features of interpreting students, which require the learners to be fluent in both the source language and target language, the appearance of English and Vietnamese materials in the process of forming the language foundation is necessary. Nevertheless, Vietnamese materials should only exist in *Reading* because listening to the Vietnamese language is quite superabundant in language acquisition. Although the students are Vietnamese, reading in the Vietnamese language is also a

supporting activity for being flexible in using vocabulary when interpreting English to Vietnamese.

Discussion – The Bridge to Success

The bridge that can connect the two hemispheres of *Listening* and *Reading* is the role of discussion, and this activity is in the classrooms. The discussion is considered language immersion because it can reflect the language performance of one person. The most crucial points that an instructor should remember are the type of discussion and how a discussion goes appropriately. In the writer's opinion, to have an effective discussion, which can promote the ability of language performance of interpreting students, the discussion should be in a formal style. There is a fact that working as an interpreter will be like acting on a stage, and an interpreter will be a speaker in using both source language and target language. It is, therefore, necessary to improve public speaking skills for the learners. Furthermore, the activities of speaking in the discussion can help the learners recall their memories concerning the "input" and also apply the "input" to specific contexts of language performance. Without discussion activity, the instructors and the learners cannot evaluate any success in the process of establishing language core. From the experience of the researcher, the small form of panel discussion may be effective because the learners can improve their public speaking skills and also their abilities to be flexible in using language. Discussion, therefore, is likely a tool whose function is bridging the language's bone and language's soul together, and it also creates a lever promoting the ability of language performance.

What students perform in a discussion can be seen as the data from the area of the preconscious mind. However, different people are going to have a different view on this aspect because they believe that students learn everything from *Listening* and *Reading,* so they will store the knowledge in the area of the "conscious mind" not in the area of nearly "unconscious", and this perspective of ideology mind leads to a controversial pattern. Admittedly, it is extremely hard to give evidence of "consciousness" or "preconsciousness", but the writer can give her points of view on that, focusing on the memories of the learners. When the instructors require students to read or to listen at home, they do not concentrate on obligating the students to remember everything. If the learners do not remember anything, which process has happened in their brains? "Consciousness" means that you consciously try to remember and apply everything in the discussion process; however, students just naturally absorb the language. Therefore, the "preconscious" approach is relevant to the discussion process.

Research Methodology

Research Questions

This study aimed to investigate the effects of implementing the subconscious approach in stimulating language knowledge for English-interpreting major students, so the following research questions were proposed:

- How is the subconscious approach applied in the Interpreting teaching process?
- Can the subconscious approach be applied in the Interpreting teaching procedure?
- Is the subconscious approach effective in stimulating language knowledge for Interpreting-major students?

Participants

This study focused on one main group of 80 juniors coming from two Interpreting classes at Nha Trang University. These learners passed Interpreting 1 (according to the program of English-language major at Nha Trang University, the students have to complete 03 compulsory Interpreting subjects namely Interpreting 1, Interpreting 2 and Interpreting 3), so they certainly possess intermediate English language level. However, once teaching in the current circumstance, the researcher realized that their English language foundation encountered a large number of issues. This led to the decision to implement the new teaching approach to improving their language levels.

Instrumentation

The study followed the qualitative approach in collecting the research data. In detail, two research instruments were utilized.

Pre-test & Final Test

Before applying the subconscious approach in the teaching process, the researcher designed a pre-test to evaluate the level of the participants to get the most practical results regarding their features. The test required the students to get involved in solving some relevant interpreting tasks, and these tasks also reflected the language levels of the learners.

After being taught by using the subconscious approach, the participants were then tested by a similar test with quite different content to evaluate the effects of the approach.

Semi-structured Interview

The researcher designed two sets of semi-structured interviews to get the participants' perspectives concerning the effects of the subconscious approach in helping them consolidate their language knowledge.

The first set of interviews was conducted before using the subconscious approach. The questions were as follows:
  - What is your English language level?
  - Do you think you have enough language knowledge to perform well in the interpreting process?

The second set of interviews was used after implementing the subconscious approach in the teaching process. The questions include:
  - Can you feel the improvement of your English language knowledge?
  - Can you feel the improvement in your language performance in the Interpreting process?
  - Did you encounter any difficulties in being taught by implementing some subconscious-approach activities?
  - Do you think that the new approach in Interpreting the teaching process is useful for your Interpreting learning?

Findings and Results

Findings

The Pre-test Results
Figure 2: Pre-test Results

The pie chart given indicates the percentage of the participants' pre-test results. From the chart, it can be seen that most of the learners achieved scores from 60 to 70 (accounting for 40%), and the second position belonged to the group of results ranging from 40 to 50 (35%). The smallest percentage of the results was the group of 80 to 100 (10%), and 15% of the learners received scores below 30.

The Final Test Results
Figure 3: Final Test Results

The pie chart illustrates the percentage of scores received by the participants in the final test. In general, the largest percentage of results was the group of 60 to 70 (50%), followed by the group of 80 to 100 (35%). 10% of the learners got from 40 to 50, and 5% of them possessed scores below 30.

Results of the First Set of the Semi-structured Interview

Being asked about the level of their English language, most of the participants responded that they were at the B2 level, and only 10 students admitted their levels as C1. In the second question, 60 learners confessed that they had encountered a large number of difficulties in dealing with the interpreting process due to the lack of English language foundation. The other 20 participants expressed their ideas regarding their English language level confidently, and they clarified that what they needed to practice was all about the interpreting skills, not the language itself.

Results of the Second Set of the Semi-structured Interview

In the first question concerning the effects or improvement after being instructed by the subconscious approach, 60 participants could feel the changes in their language foundation, but the other 20 of them said that they could not find anything. The second question investigated the language knowledge in the participants' interpreting processes. In detail, 65 students could consolidate their language knowledge, while 15 of them could not reach their targets. Additionally, the participants were also required to indicate information regarding the difficulties they encountered during the whole stage of getting involved with the subconscious approach, and 46% of them responded that the new teaching approach was quite challenging. The last question motivated students to provide their general comments on the effectiveness of the subconscious approach in learning Interpreting, and 60% of the participants agreed that their interpreting skills were improved significantly.

Discussion

The Results of the Pre-test

The results in findings showed that most of the participants were at an intermediate level of interpreting skills when participating in the pre-test because precisely 40% of them achieved scores from 60 to 70. Honestly, the results were beyond the researcher's expectations due to the fact of her observation of her students' language performances during their learning processes. In another aspect of the data collection, the circumstance seems to be reflected in the group of students receiving scores from 40 to 50. It revealed the fact that the students could not perform their language level clearly due to some reasons. The first assumption is that the students are not familiar with the knowledge in the test since they are at the beginning of the course. The researcher then re-examined the test content, and she found out that its content was not the problem. The test content mostly focused on language knowledge rather than interpreting skills, proving that the students could perform without the background knowledge regarding the interpreting course. As a result, the researcher concluded that the participants were at the intermediate language level. In terms of the group of scores below 30, 15% of them received the mentioned results, proving that some students encountered various issues in their learning. In general, although most of the participants achieved intermediate results in their tests, this can also reflect that the learners have still experienced some language problems due to the results' subjective features.

The First Set of the Semi-structured Interview

The students were required to clarify their English language level in the first question, and their responses were quite similar compared to the pre-test results. This revealed that the

students were precisely positioned at the intermediate language level. Additionally, the number of participants who chose C1 as their level was only 10, accounting for a small percentage of the high-skilled language performance, proving that there was a gap in language level among the participants.

These 10 learners could also become good samples of experiencing the subconscious approach in the teaching process, although the main aim of this teaching method mostly concentrated on language learners with a low language knowledge background. Following this, the participants continued to admit the difficulties in learning Interpreting, which was influenced by the lack of language knowledge. Thanks to the participants' features, the researcher could implement the approach to improve the learners' foundation. One of the most typical participants' responses was that they could feel the lack of language knowledge, and they even tried to practice interpreting skills to change their level, but nothing was improved. Others also confessed that if they had carefully learned language skills, they would have changed their English levels. The students realized their weaknesses; however, they did not know the best solutions for their improvements. Hence, it shows that if the learners lack their language knowledge, they hardly improve or learn interpreting perfectly. Additionally, it can also be concluded that interpreting practice cannot change their language performance if they do not know their appropriate training or practice solutions. Fortunately, the participants tended to have the awareness to realize their weaknesses. As a result, their awareness of learning could help them achieve better results in learning with the subconscious approach. Once they know that they need to build their language foundation, they certainly can control the most precise track to follow. In the first part of the interview, the researcher also received a typical response, and the answer was beyond the researcher's expectation since she had not thought of a situation in which the learners could know what they needed to improve. From the response, the researcher can conclude that these students possessed some significant language achievements, proving that they could easily improve their language levels but were not trained appropriately.

The Second Set of the Semi-structured Interview

Regarding the improvement of general language knowledge, although 60 students could feel the changes, this feature could not reflect the positive outcomes of the subconscious approach. The finding, therefore, is quite neutral, which means that it cannot help the researcher conclude the influence on affecting language knowledge. In the improvement of language performance in the learners' interpreting process, 65 of them received good outcomes of the new teaching method, proving the absurd features in the results. Some of them could feel positive differences in their interpreting processes, but they could not feel the changes in their basic language skills. Did they indicate precise results or did they understand themselves clearly? The assumption can be inferred that they could not control or they could not manage their language improvement. They received some changes in their language levels, but they could not realize their real features. In some responses, they assured that their speaking skill improved dramatically, proving that the most influential language skill in this case could be the oral communication aspect. In the next question, the difficulties concerning the new teaching approach were investigated. 46% of the participants asserted that they met some difficulties. In the response, the students mentioned the teaching requirements inferring that the researcher should consider the issues of instructions. From the response, the researcher could "feel" that the learners certainly encountered various problems in their language foundation since they could not complete the basic requirements relating to some simple reading and listening activities. The researcher also examined the features of the

activities that she designed in her classes, and she found out that only 10% of them should have been reconsidered. As a result, the research could clarify the levels of the learners and also intended to adjust the difficulties in the lessons to reduce the gaps in their learning processes. The subsequent question focused on their interpreting skills. More than half of them agreed that they could be more successful in conducting their interpreting processes.

From the analysis, some conclusions can be made. The first glance at the interview revealed that they were quite similar, and they tended to investigate some similar aspects at the same time. The purpose of creating some relevant issues in the questions could activate the real features of the learners. If the participants possessed some similar points in their responses, this indicated the consistency of their thoughts. In contrast, if they had different ideas concerning the issues, they certainly created fake results. In this case, the results' features seem quite unreliable. This implies that the learners themselves may hide something, or they do not manage and understand their English language level in their interpreting learning process.

The Results of the Final Test

The results of the final test reflected that the learners received better scores compared to the ones in the pre-test. The percentage of the group from 60 – 70 and 80 – 100 increased significantly, proving the changes in their skill and language levels. However, this feature was not objective because, during the whole semester, the participants also had to get involved in special interpreting skill training. Hence, it might have influenced their improvement. To get a more precise outcome, the researcher compared the results of the tests and she realized that the participants could receive some good impacts from the new teaching approach through the appearances of their feelings.

Conclusion

Through the findings, the researcher could conclude that the subconscious approach itself is powerful since it already touches and changes the root of the problems in the language performance of the students. In particular, speaking skills can be considered one of the most affected and improved language skills that the participants could gain during the implementation of the teaching approach. The equilateral triangle LRD creating neuroplasticity existing in the approach can be considered a "lever" in smoothing the process of language acquisition. When analyzing and applying this approach to the real circumstances of each class, the instructors need to have a good evaluation of their student's language abilities. In detail, they should base their teaching on these features to design appropriate useful and meaningful activities to help the learners reach the expected targets. More importantly, it is also necessary to examine the activities before instructing the students to get involved due to the fact that each learner will experience the knowledge and abilities differently, leading to the influence on their learning outcomes. In addition, although the subconscious approach mostly affected the speaking skills of the learners, it did not mean that other language skills were not improved. From the features, the researcher has to be more flexible in discovering various aspects of the learners and start to design the teaching approach appropriately. This approach will be examined and developed to erase the gaps in the language knowledge of the learners in Interpreting classes and also in other language classes.

Do Prior Knowledge of Advanced Mathematics Influence Academic Confidence of Students Taking Pre-university Chemistry Courses

Raymond Hee Kok Keong, University of Nottingham, United Kingdom

Abstract
The relationship between Chemistry and Mathematics are directly proportional in the perspective of science, technology, engineering, and mathematics (STEM) education. This study investigates the relationship between prior advanced mathematical knowledge attained in high school could predict the outcome of student's overall confidence in studying Pre-University Chemistry courses. Mathematics is often perceived as a subject that bridges and connects scientific concepts including Chemistry. Most students, however, struggle with the transition from mathematics to chemistry due to wide disparities between the two theoretically but a very slim margin in terms of using mathematical applications into learning STEM subjects, particularly chemistry. This paper uses a mixed-method approach that involved quantitative surveys using questionnaires and selected qualitative interviews using Pre-University students as research samplings. Preliminary findings found positive significant correlation between students' mathematics background played indicative confidence levels in Pre-University Chemistry. Most participants agreed that good mathematical skills in high school play major role in shaping their confidence in Pre-University Chemistry including the integration of mathematical equations, algebra and certain calculus application would support their understanding within the chemical concepts and crucial for their overall understanding in the subject. This research findings also suggest that there is a need of a more integrated approach by educators in teaching mathematics and chemistry at high school level with primary emphasizing the interconnections between the two disciplines by providing sufficient support in order to enhance greater confidence and competence level.

Keywords: Chemistry, Confidence, Educational Assessment, Mathematics, Science Education

Introduction

This dissertation explores the importance of prior mathematic units taken by Pre-University students taking Chemistry as their core subject and how advanced mathematical skills can shape academic confidence and build learners' motivation in the build-up of challenging Chemistry program at different type of Pre-University courses offered around the world.

In my capacity as a Chemistry teacher in few International Schools that I have taught at both Upper Secondary and High School levels specialising in the British A-levels and also tutoring chemistry students from different Pre-University programmes background like the International Baccalaureate (IB), American Advance Placement (AP) and the Australian Year 11 and Year 12 High schoolers , I had witnessed many students regardless of curricula struggling to cope with the vast intensity of the subject's requirements; both theoretical and practical. One of it, is the demanding mathematical skills application in Chemistry.

Chemistry involves significant number of mathematical calculations which are important in daily practice of life (Tapia, 1996) particularly in areas such as stoichiometry, thermodynamics, and kinetics. Students having strong foundation in mathematical skills such as algebra, calculus and statistics would have an upper hand in applying such skills into chemistry. While prior mathematical knowledge is essential in doing well in STEM subjects in university, particularly Chemistry, but whether it is a mandatory knowledge remains to be seen in a larger scale.

The focus of this dissertation is to find out do prior advanced mathematical skills have any effect on the academic confidence and motivation of Pre-University students taking Chemistry particularly focusing on their subject strength and to address difficulties students would face during the entire duration of their pre-University programme. At the same time, I would also research on different Pre-University Chemistry curricula with the emphasis on its connection with prior mathematical skills requirements which could indirectly influenced one's confidence in studying Chemistry at Pre-University level. The impact of different Chemistry curricula on student's confidence and motivation has not been widely studied so my aim is to divulge more on this subject. My conceptual framework in this study is to connect the existing knowledge done and examine further on using my research question in this dissertation to explore additional possibilities. Few research findings have found that many students could still proceed to study Chemistry at higher tier without the needs of mathematics while some disagree with the ideology. Several researchers agreed that mathematics is just a tool but not primarily needed in doing great science subjects (Jogalekar, 2013). I aimed to challenge this statement and my research will explore how reliable are these scientific inquiries.

This dissertation also talks about how the evolution of mathematical chemistry and their relationships changed the landscape on how learners cope with the intensity of both subjects. The literature review also studies the vast differences of some popular Pre-University courses offered globally and their roles in preparing students especially on their readiness and confidence when comes to the topic on how the subject mathematics can be blended into learning Chemistry effectively and vice-versa. This is extremely important as one's academic success in the subject relies heavily on how one single subject could overlaps onto another and their jointly progression into one's learning journey. The synchronisations of both mathematics and chemistry are well documented in many research findings and this study is to acknowledge the theory but at the same time, I would challenge some concrete well-

documented inquiry and try to explore other contradictions between the two subjects. This research findings also involved the introduction and how different Pre-University curricula offered globally could differ from each other especially focusing on the research question on how advanced mathematical modules can be blended into students taking Chemistry as their core subject at Pre-University level, with the primary focus on learner's academic confidence.

Research Framework

This project explores the advantages of the utilisation of mixed methods principles by using both quantitative and qualitative techniques. The introduction of triangulation approach were made connection with the current research framework.

Two major Pre-University Chemistry courses were selected out of a few surveyed and a thorough analysis between the two and investigation from the data obtained conduct an overall conclusion from the study.

Academic confidence is one of few major factors needed to be addressed and placed emphasis by academic authorities to ensure students display their maximum potential in their chosen course or modules either at Pre-University or undergraduate level. A thorough connections between some Pre-University Chemistry courses would have a small leverage over some in terms of its teaching syllabus that could predict the outcome of academic confidence faced by learners.

The different Pre-University Chemistry courses taken by majority of students vary in breath, depth, and difficulty levels. Some are more demanding than others while some required sufficient coursework, laboratory work, internal assessments and active presentation hours before students can complete the course and proceed to undergraduate level. Despite the differences between all the curricula, apparently all Pre-University Chemistry courses have one major similarity: the paramount understanding of substantial mathematical knowledge as a pre-requisite to fully comprehend the scientific concepts in higher level Chemistry. The results generated from this study was made to show whether the need of advanced mathematics is required or could benefit wholesomely for students undertaking Pre-University Chemistry courses.

Lastly, this paper summarises and explains how this research can support and contrast research done by others as well as some recommendations that could add more quality for further study. The research question which investigates the relationships between both mathematics and chemistry provide many insights on the factors and major elements that curriculum designers can take considerations and find ways to improve students' overall confidence in studying and learning chemistry at a higher level. The main theoretical framework of this study explores how my research in this dissertation is intrinsically linked and supported by existing literature and my research methodology on the relevance between advanced mathematics and Pre-University chemistry courses on various learners.

In short, my direction of this study is clear. I want to explore the significant impact on students' confidence levels when they study Chemistry as a Pre-University subject with the emphasis on which course provides a higher confidence threshold for high school learners. I have witnessed many students struggle to cope with the intensity and demand of the syllabus due to the requirements of mathematical skills and I aim to delve into this analogy, as well

finding ways to overcome this fear. As a high school Chemistry teacher, I hope I could find ways to provide adequate opportunities for my learners to maximise their potential by strengthening their mathematics skills to enhance their ability in succeeding learning Chemistry eventually.

Methodology

This study involves the experimentation of using questionnaire as my primary research findings. The main objectives mainly involved the research question on how or can prior advance mathematics skills could enhance academic confidence in high school students using different Pre-U Chemistry syllabi as responding variables. I will measure the data and aim to understand the responses from the pre-selected focus group which represents a subset of the general population of high school learners. The experimental methods used in this dissertation involved a random combined sampling method where questionnaire is designed to target a certain age-group population irrespective of genders. The sampling techniques are made to be a mixture of stratified and cluster whereby the ensuring of a particular category is represented in the sampling process (Voxco Insights, 2021) and clustering allowing only individuals in selected geographical locations namely in the Oceanic continent (Australia & New Zealand), North Americas, Asia, and Europe. In this case, this cluster sample are mainly targeting only students pursuing Pre-University Chemistry studies from the listed countries. Data collected in this survey is considered as non-experimental as my observation in the data obtained were merely based on *in-situ* information without an independent variable. As for the focus group of participants, students were selected in the age-group range of between 16-19 years old, and they represent a large majority of students undertaking Pre-University Chemistry courses before embarking in their respective undergraduate courses, mainly STEM modules in university upon graduating from high school. The selected participants came from different ethnic backgrounds at different geographical locations at different continents around the world. The racial profiling issue are strictly excluded in this study and individuals who take part in this questionnaire were not asked to reveal their racial identity to ensure maximum anonymity.

A questionnaire was carefully designed with a series of specific questions to evaluate students' responses over their thoughts and academic confidence in taking prior advance mathematics in high school and the connectivity with their ability in tackling Pre-University chemistry at the same time. My questionnaire has a research question title that was designed to be short but comprehensive. Questions mainly constituted of a series of four-fold Likert Scale modelling so that I could easily gather large amounts of data (Nemoto & Beglar, 2014) which comprised like *strongly agree*, *agree*, *somewhat*, and *do not agree,* ticking boxes and few numerical number choices of design using Semantic differential scales system of *1-5* numbering (The NIHR RDS for East Midlands/Yorkshire & the Humber, 2009) to collect respondents' responses on the specific question asked. There were also few *yes*, *true,* or *false* patterns which represent dichotomous questions type. In all, I kept the questionnaire's questions simple and easy to understand and avoiding ambiguous words are my priority. The use of complicated jargons and acronyms are eliminated (Sauro, 2021), and the questions are made to suit my respondents' vocabulary. Participants do not have to reveal their name to maintain confidentiality but providing an email address was made an option.

Questionnaire was made and distributed via google form application and were sent to participants in three (3) different channels:

a) *Students I am currently tutoring which constitute different Pre-University Chemistry curricula namely, the A-Level, IB, AP, and the Australian ATAR programme.*
b) *Students undertaking Pre-University Chemistry in selected registered member-only certain social media platform like Facebook.*
c) *Through my personal LinkedIn account that has a specific category which only involves individuals with certain engagement in tertiary Chemistry studies that made up of student-researchers as well as passionate Chemistry educators globally.*

Students in the first channel where I am currently tutoring were reminded to take part in the survey by clicking a link provided by the google form application. Meanwhile, for the two other channels which are the Facebook group and LinkedIn Chemistry group, I sent few reminders after asking the post administrator's permission with the intention of getting regular and consistent responses after dissemination and brief explanation of my research objectives in the group forum.

At the same time, few students were also randomly selected from the group for a face-to-face interview via online innovative communication technologies. I have chosen the videoconferencing platform, Zoom, to evaluate, select and provide a coherent data analysis (Archibald, Ambagtsheer, et al., 2019) from the questionnaire and see its correlation with the research question with the emphasis on the respondents' overall academic confidence and educational progress. This interview would be my secondary data source where I get to listen and do calculative observations on my respondents. After that, interpretation will take place from current existing studies. As for the quantitative analysis, my survey questionnaires are mostly made up of fixed and close-ended questions, thereby, using another alternative tool like videoconferencing would be beneficial to some respondents who prefers to reply at certain length. Zoom videoconferencing tool was selected due to its popularity and students' familiarity. The students were carefully chosen with the priority of their identities being made unknown and anonymity labelled. I chose interview as another platform of generation of qualitative research data because it provides rich source of information from a small group of interviewees point of view. Data collection using Interview methodology comprised of both structured and unstructured (Dovetail, 2023) where there is significant difference. The first-hand collection of data directly from primary source is as important as secondary data which relies from previously gathered resources (Clements, 2021). The current research trends have also demonstrated the reliability and convenience of collecting qualitative data using videoconferencing methodology (Archibald et al., 2019b). At the same time, interview provides my respondents their own viewpoint which has an open-ended question style whereby questionnaires are merely strictly closed questions which could inhibit the choices of respondents due to its limited choices (Mather, Fox & Hunn, 2009).

The first method where questionnaire was produced and distributed to the public were selected on random basis. As mentioned in the research design methodology, respondents came from different background and ethnic races. Students currently pursuing a course in Pre-University studies are targeted. The focus of attention here are the 4 major Pre-University courses researched in this study. This *sampling frame* from the earmarked population were adopted (NIHR Research Design for East Midlands, 2007) and carried out systematically. The students are also expected to take Chemistry as one of their core modules and have already finished high school in their respective countries, preferably taken advanced mathematics modules prior studying Chemistry at Pre-University level.

The Australian High School participants are expected to have completed their Year 10 prior to this survey. The IGCSE (International General Certificate of Secondary School Education) is the British Key Stage 3 equivalent and the MYP (Middle Year Programme) are some of the other completed courses from the British GCE A-Level and IB participants respectively. Meanwhile, the AP students taking part in the questionnaire are expected to have either completed their Grade 9 or lower secondary at school prior taking part in this study.

Participants are mainly drawn from the target population which corresponds to their interest in partaking this survey. Their identity will be kept anonymous and confidential with only their email addresses visible to the researcher. I strictly followed the 2018 General Data Protection Regulation (GDPR) where researchers conducting studies involving human participants will have responsibility of protecting the privacy of their respondents (Ryerson University, 2015). In an event where certain qualitative data are needed in my studies, I conducted a Zoom videoconferencing interview with my participants, therefore a letter of consent was generated for the students for their approval so that my respondents are aware of their anonymity rights are preserved in this paper investigation. I also aimed to maintain a researcher's bias-neutrality in my face-to-face interview by eliminating my own preferences and the data generated from the Zoom interview were compiled together with my questionnaire to summarise a final evaluation and conclusion at the end of this study. The main objective of this mixed-method study is to obtain a richer and hopefully, more comprehensive conclusion in this research study. My initial methodology of obtaining a rather larger sampling size is to reduce margin of error as I have expected not all my respondents that take part in my questionnaire will respond sensibly or there will be some form of existence of bias respondents which may provide inaccurate responses.

However, after some brain storming, I have decided to cap my respondent's quotas to a maximum of around 60-70, if desirable. I felt that response rates are a crucial factor that needed to be addressed by researchers. This is to ensure the quality and the outcome of the survey can be analysed accordingly at the end of this dissertation. Several studies have also conducted on the correlation between the number of questionnaires and the number of participants, including the length of the questionnaires. There were studies that found that respondents are more likely to respond to a shorter version of questionnaire compared to a longer one (Koitsalu et al., 2018). Inversely, Bolt (2014) on the other hand found that the length of a long questionnaire played no significant role in improving response rate. And since designing a questionnaire requires time and valid purpose, my studies focused on only 9 major questions with the aim of not making my respondents losing interest during the answering process. Sample sizes are kept at an acceptable region and the topic of interest are maintained throughout the duration of the survey. Faryadi (2019) explores the quality of data and sample size is not directly correlates. A huge sample size need not be necessary to produce good data as less is more. In responding to the researchers who found that the length of the questionnaire plays significant role to the quality of answers provided by respondents, I found that the quality of the questions is more justifiable rather than the quantity of questions. Therefore, my study was designed to ask my respondents only what is related to my dissertation's research question to ensure a straightforward and explicit response from my participants.

Results

	Overall Percentile	Advance Placement (AP)	Australian High School	British A-Levels	International Baccalaureate (IB)
Total number of students/respondents, (N=58)		3	14	36	5
Found Mathematics are essential before taking Pre-U Chemistry	84.5%	66.7%	71.4%	88.9%	100%
Found good grades in Mathematics modules would boost academic confidence in Pre-U Chemistry	48.2%	66.7%	57.1%	66.7%	80%
Found Pre-U Chemistry course rather challenging	41.4%	66.7%	50.0%	41.7%	40%

Table 1: Result findings for four major Pre-University Chemistry courses

	British A- Level	Australian High School ATAR
Total Representation of students, N=50	36	14
High Mathematics Competency	27.8%	50%
High Chemistry Competency	13.9%	7.1%
Overall High Confidence Level for Mathematics but not Chemistry	27.8%	35.7%
Overall High Confidence Level for Chemistry but not Mathematics	5.6%	28.6%
Overall High Confidence Level for both Mathematics & Chemistry	52.8%	42.9%

Table 2: Two main Pre-University Chemistry courses were compared

	British A-Level	Australian High School ATAR
Number of Participants, N= 50	36	14
Number of students have intention of dropping Pre-U Chemistry	8	5
Overall Percentage Value	22.2%	35.7%

Data Analysis

There is a total of 58 respondents took part in this study which comprises 4 major Pre-University Chemistry courses. Random sampling found that from most of the Pre-University courses, the British A-level appeared to be the most popular amongst all Pre-University students that took part in this survey and Advanced Placement (AP) the least, with both registering a total of 36 and 3 respectively.

The result from this questionnaire found that all International Baccalaureate (IB) students found mathematics modules are important at high school prior taking higher level Chemistry at Pre-University level. Overall, the result found that a whopping 84.5% of the respondents agreed that mathematics is essential but only 48.2% found that obtaining good grades in mathematics do not necessarily guarantee a good academic performance or overall academic confidence in Chemistry at Pre-University level. At the same time, most A-Level students surprisingly do not find Chemistry as daunting as it seems with only 41.7% of participants found their courses challenging. AP Chemistry students registered highest percentage for finding its syllabus rather difficult.

Pie charts were generated from the questionnaire and demonstrated extremely diversified data giving researcher different dimensions and angles and opportunity of more intensive analysis. Each category was analysed and reflection of the overall idea of each question asked in the questionnaire were summarised accordingly.

Most students agreed that the mathematical components are important where 55.2% concurred that prior advanced mathematical knowledge is necessary and another 29.3% agreed taking mathematics modules at high school is a preferable option before taking Pre-University Chemistry. However, there were slight disagreements between some respondents who felt that prior mathematical knowledge may or may not contribute to overall confidence whatsoever. The 3.4% representation might be insignificant but this also showed that some respondents do not fully agree that the correlation of mathematics and chemistry must be parallel to each other.

Most Chemistry students somewhat agreed that advanced mathematics plays significant role in fully understanding the in-depth theoretical concepts of Chemistry. A combined proportion of 62.1% of the population felt strongly on the importance of advanced mathematical skills prior to fully understand Chemistry. This is worthy of attention as for students to do well academically in STEM, chemistry in particular, the ability of one in mathematics does play a convincing role. On the other hand, there were also a rather large number of respondents in this study (36.2%), that felt that only 'somewhat' important for mathematics in relation to fully understand any chemical concepts.

Conclusion & Future Recommendations

After thorough analysis of this study, there is an indeed some common connections between mathematics and chemistry and its outcome of student's academic performances. We cannot disagree that the integration of advanced mathematics into the academic curriculum of chemistry students has a profound impact on their overall academic confidence. Advanced mathematics equips chemistry learners with the tools to approach complex chemical phenomena with precision and rigor. Both questionnaire and interview results shown students would develop better understanding in theoretical Pre-University Chemistry if they have prior advanced mathematics knowledge in high school. However, there are also conflicting responses from respondents from various Pre-University Chemistry courses studied in this research that do not agree with the original hypothesis. Nevertheless, students studying the British A-level programme yielded the highest confidence level in this study compared with 3 other courses, which indirectly answered the hypothesis of my research question in this study. Regardless of these circumstances, I still felt that both educators and relevant school management policy administrators should play crucial role in introducing effective bridging programs for students at secondary and high school level to minimise academic deficiencies between both mathematics and chemistry. Teachers must be able to disseminate key skills like confidence and resilience to students for our learners to develop greater motivation in both well-being as well as academic proficiency. The incorporation of advanced mathematics into the education of chemistry students is not merely a means to an end; it is actually a transformative experience that empowers students to explore the intricate realms of chemistry with more confidence and enthusiasm.

Further and more elaborate research methodology is needed to draw a more accurate conclusion judging from the data obtained from the respondents. Perhaps, a narrowed down Pre-University Chemistry course could be used rather than 4 other courses which are simply

different in their curricula and course expectations on students. At the same time, the sample size could be increased to a larger pool to minimise percentage error. A targeted demographic can be used as well rather than a random selection which may cause confusion at some point. A more detailed, specific, and more inclusive questions can be created in the questionnaire for easier interpreting of results. At the same time, I felt a more accurate triangulation research survey should also include researchers' methods of gathering information at the same time (concurrent design methodology) rather than sequential design (Molina-Azorin, 2016) where time lapse occurs. In addition, the objective of a research study also depends on how the interviews and surveys are done where one can precedes another. This has implications for curriculum development and educational strategies, emphasising the importance of mathematics education in chemistry programs to foster a positive collaboration and competence among future chemistry researchers.

Further research should explore the mechanisms underlying this relationship and investigate potential interventions to improve advance mathematical skills among Pre-University chemistry students.

Diversity and Interesting: International Students' Perception of Chinese Video Programs to Supplement Cultural Teaching

Mengru Huang, Tianjin University, China
Tiewa Cao, Tianjin University, China

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
The growth of Chinese language education on a global scale has significantly aided the dissemination of Chinese culture. The primary venue for introducing Chinese culture to international students is the classroom. Therefore, when practicing classroom teaching of the Chinese language abroad, it is important to consider and plan how to introduce Chinese culture in a way that will make the recipients happy, simple, and quick to accept it. As media teaching tools, Chinese Video Programs benefit from having a large audience, a significant impact, and a long history of promoting Chinese culture. Through a questionnaire survey and semi-structured follow-up interviews with 140 international students at a university in Tianjin and statistical analysis of the data using SPSS software, it was found that diversity and fun are the greatest expectations of international students for the content of Chinese Video Programs. This study also found that rationalizing the length of supplemental instructional videos in the classroom and providing more incentives for learning are very helpful in promoting international students' Chinese culture learning.

Keywords: Teaching Chinese as a Foreign Language in the Classroom, Cultural Teaching, Chinese Video Programs, Learning Motivation, Teaching Effectiveness

iafor

The International Academic Forum
www.iafor.org

Introduction

Since 2020, Chinese language education has been flourishing all over the world (Lou et al., 2022), and multimedia technology has been rapidly applied in the cultural teaching page of foreign Chinese classrooms (Nie, 2023; Singh and Kaur, 2023). Chinese Video Programs as media teaching resources are very helpful to international students' Chinese learning, and with the increase of international students' learning demand (Chen and Yuan, 2023), it is necessary to find the real demand and future expectation of international students for Chinese Video Programs.

In this paper, we conducted a questionnaire survey and follow-up interviews with 140 international students at a University in Tianjin. 73% of the international students were supportive of the application of Chinese Video Programs into classroom teaching, and they preferred to watch such programs in speaking classes and general classes. In terms of program content preference, international students prefer topics such as daily life and sports, prefer vocabulary and cultural knowledge, and hope to practice listening and speaking skills through Chinese Video Programs. This paper provides feasible suggestions on how to apply Chinese Video Programs into foreign Chinese classroom teaching in terms of topic preference, content selection, teaching principles and format expression.

1   Literature Review

1.1 Studies About Chinese Video Programs

Chinese Video Programs are local TV programs developed in China, mainly for foreigners, with Chinese language and Chinese culture as the main teaching content. In terms of research perspectives, scholars have gradually chosen to study a wide range of perspectives, including various aspects of communication content, communication forms and audiences (Zhang and Tsung, 2021; Han et al.,2023); in terms of research objects, including studies on Chinese language teaching borrowed from domestic Chinese TV variety, entertainment, history and culture programs(Repnikova, 2022), as well as comparative studies on Chinese language teaching in selected foreign and domestic TV programs (Hu, 2022), which all of them greatly promote the progress of Chinese Video Programs production in China and provide many inspirations for teaching Chinese as a foreign language in the classroom.

1.2 The Necessity and Feasibility of Chinese Video Programs to Assist Cultural Teaching in Foreign Chinese Classrooms

There is a two-way borrowing relationship between TV programs and teaching Chinese as a foreign language, and TV programs borrow from classroom teaching to maintain the "classroom feel" of the programs (Lin, 2020). According to the theory of audiovisual teaching, classroom teaching should focus on the overall perception and the combination of language and situation (Nicolaou et al., 2019). The cultural adaptation hypothesis emphasizes the importance of providing learners with a linguistic and cultural environment to help them reduce the "psychological distance" and "social distance" in the process of second language acquisition (Bierwiaczonek and Kunst, 2021). The above theories have laid the theoretical foundation and provided practical guidelines for the introduction of Chinese Video Programs into foreign Chinese classrooms.

2   Method

The present study combined quantitative and qualitative research methods by using both a questionnaire survey and interviews, in the hopes that triangulation of the data would be achieved and fascinating insights into the statistical patterns would be gained (Foster, 2023; Lin et al., 2023).

2.1 Participants

140 questionnaires were collected, 132 of them were valid (8 were invalid), with a recovery rate of 100% and an effective rate of 94%. International students from 44 countries participated in the survey, including 24 countries in Asia, 11 countries in Africa, 3 countries in Europe, 3 countries in America and 3 countries in Oceania (Table 1).

Among Asian countries, Cambodia has the most international students with 17, followed by Malaysian international students with 13, and the third largest international student country in Asia is Pakistan with 11, which is closely related to Chinese big geopolitical and Belt and Road strategic layout. In terms of gender ratio, the data from this questionnaire shows that there are 91 males (68.94%) and 41 females (31.06%), with a male to female ratio of about 7:3. In terms of the native language background of international students, the largest number of students are from Indo-European, South Asian and Sino-Tibetan languages, accounting for 47.73%, 14.39% and 12.12% respectively. The number of students from Semitic and Altaic languages is almost the same, with 15 and 14 students respectively, and the least number of students from Bantu and South Island languages, with 3 and 2 students respectively.

Table 1: International students' native language background

Language System	Number	Percentage
Indo-European Languages	63	47.73%
South Asian languages	19	14.39%
Sino-Tibetan Languages	16	12.12%
Semitic languages	15	11.36%
Altaic languages	14	10.61%
Bantu languages	3	2.27%
South Island Languages	2	1.52%
Total	132	100%

2.2 Design

The design of this study consisted of two parts: a questionnaire and a semi-structured follow-up interview. The questionnaire consisted of two parts. The first is the basic information of the respondents. The second is the main part of the questionnaire, which consists of multiple-choice and question-and-answer questions about the application of Chinese Video Programs. Semi-structured interviews were conducted after the questionnaire to compensate for any neglect of the open-ended questions at the end of the questionnaire by the participants or to add any incomplete description of their experiences.

2.3 Data Analysis

SPSS and statistical scales were used to obtain the real needs and future expectations of international students at Tianjin University for Chinese Video Programs to supplement classroom cultural teaching.

3   Results

In general, international students have a positive attitude toward the application of Chinese Video Programs into the teaching of culture in Chinese as a foreign language classroom. They want to see 6-10 minutes of Chinese Video Programs in speaking and general classes, and in terms of program topics, they prefer topics such as daily life and sports. The following is an analysis of the specific details of the introduction of Chinese Video Programs into the teaching of culture in the foreign language classroom.

3.1 International Students' Motivation to Learn Chinese

Motivation is an intrinsic drive that motivates an individual to engage in a certain behavior, often expressed as a desire to exert effort to achieve a certain goal (Turkpenova, 2023). In this survey, the corresponding options of integrative motivation, instrumental motivation and achievement motivation were set (Atkinson, 1981; Gardner, 1985). The main motivation for international students to learn Chinese is mainly integration motivation (Table 2), among which 72 students want to learn Chinese culture (54.55%), while life communication is also the main purpose for international students to learn Chinese (50%). In contrast to integration motivation, instrumental motivation is an important trigger for second language learners to improve their language proficiency in the short term, with 73 students (55.3%) and 44 students (33.33%) having a need to learn and work. This reveals that Chinese language teachers should guide students to maintain an appropriate level of motivation for learning in their daily teaching and provide timely encouragement and rewards.

Table 2: International Students' Motivation to Learn Chinese

Purpose of learning Chinese		Number	Percentage
Convergent Motivation	Cultural Interests	72	54.55%
	Life Interaction	66	50%
Tool-based motivation	Learning Needs	73	55.3%
	Work Needs	44	33.33%
Achievement Motivation	Improve language skills	74	56.06%
Others	/	12	9.09%
Total	/	341	/

In terms of the duration of Chinese learning (Table 3), the chi-square test was used to study the difference between the duration of Chinese learning and Chinese proficiency, and it was found that the duration of Chinese learning was closely related to Chinese proficiency. The percentage of international students who have studied Chinese for one to two years is 21.62%, which is significantly higher than the average of 12.88%. The percentage of international students who have been studying Chinese for one to two years who have obtained HSK level 4 is 21.62%, which is significantly higher than the average of 14.39%. The proportion who has studied Chinese for one to two years to get HSK5 is 40.54%, which is s higher than the

average level of 31.06%. The proportion who has studied Chinese for more than two years taking HSK5 is 36.92%, which is significantly higher than the average of 31.06%. The percentage of international students who have studied for more than two years and have taken HSK6 is 40%, which is significantly higher than the average of 21.97%.

Table 3: Chi-square test between Chinese learning duration and proficiency

| Title | Level | Learning duration | | | Total | χ^2 | p |
		Less than one year	One-two year	More than two years			
	HSK1	12(40.00)	1(2.70)	0(0.00)	13(9.85)		
	HSK2	9(30.00)	2(5.41)	2(3.08)	13(9.85)		
Chinese	HSK3	3(10.00)	8(21.62)	6(9.23)	17(12.88)		
proficiency	HSK4	4(13.33)	8(21.62)	7(10.77)	19(14.39)	84.153	0.000**
	HSK5	2(6.67)	15(40.54)	24(36.92)	41(31.06)		
	HSK6	0(0.00)	3(8.11)	26(40.00)	29(21.97)		
Total		30	37	65	132		

*$p<0.05$ ** $p<0.01$*

It was founded that native language background, age, learning environment and other factors all affect the effectiveness of Chinese language learning for international students, but the length of Chinese language learning is one of the more significant factors. Therefore, if international students want to improve their Chinese language proficiency and pass HSK level 3 or above, they can only do so by learning Chinese for a long time.

3.2 International Students' Preferences for Topics and Content of Chinese Video Programs

In terms of topic preference, topics about daily life were the most popular among international students, with 97 people (73.48%), and topics about work and study were the second most popular choice, with 63 people (47.73%). Topics on hobbies and interests were also popular among students, with 61 people (46.21%), while traditional culture programs were of interest to 58 people (43.94%).
Figure 1: Theme preferences for Chinese Video Programs

When asked what help you would like the Chinese program to bring to you (Figure 1), 97 people wanted to practice listening through watching the Chinese program (73.48%).

Understanding traditional Chinese culture and learning more practical conversations through the program were 86 and 85 respectively, indicating that the cultural needs for watching the program and the practical life application needs are equally important (Figure 2). Language is a tool for human communication, and the goal of language learning is to use the language learned. Therefore, the practice of listening and speaking is a unique advantage of Chinese Video Programs. 17.42% of them hoped that the viewing of Chinese Video Programs would give them more flexibility in their learning time. The large volume and wide coverage of short videos are ideal for expanding students' horizons.
Figure 2: Content Preference of Chinese Video Programs

3.3 International Students' Suggestions on the Use of Chinese Video Programs in Teaching

The use of multimedia and other assistive technologies in the teaching of Chinese as a foreign language and culture not only integrates pictures, texts, sounds and images, but also makes the teaching and learning activities more colorful, and can combine knowledge learning and skill training with vivid and lively images, thus stimulating students' enthusiasm and learning efficiency in Chinese language learning（Figure 3）. When asked whether the use of Chinese Video Programs in classroom teaching could improve classroom learning efficiency, 98.48% of the international students chose yes, while two chose no and gave reasons: one person could not understand the meaning of the program because the current Chinese learning time was too short, and the other thought the speed of the program was too fast.
Figure 3: Applicable class types of Chinese Video Programs

In the survey on the pedagogical role of Chinese Video Programs (Figure 4), 74.24% of the international students thought they had an outstanding pedagogical role in teaching culture, and 67.42% thought they had a significant pedagogical role in teaching vocabulary. The number of international students who thought Chinese Video Programs had a pedagogical role in Chinese characters and grammar was 67 and 63. Chinese character learning and grammar learning are inherently difficult for international students, and the teaching aspect should introduce appropriate teaching aids to enhance the teaching of Chinese characters and grammar. Through the survey results, only 37.12% of international students think that Chinese Video Programs are useful in teaching Pinyin, and 12 others chose other options.

When asked how long they thought it was appropriate to watch Chinese Video Programs in class each time, 47 chose 6 to 10 minutes, accounting for 36%, 45 chose 11 to 15 minutes, accounting for 34%, 20% of international students chose to watch Chinese Video Programs of more than 16 minutes, and 13 thought it was appropriate to watch programs of 0 to 5 minutes, accounting for 10%. According to the guidelines for teaching Chinese as a foreign language, classroom teaching can use videos under 10 minutes (Figure 5).
Figure 4: Teaching Expectations for Chinese Video Programs
Figure 5: Duration of Chinese Video Programs

4   Discussion

Chinese Video Programs, as traditional TV media, have the characteristics of long development time and good mass base. It has formed a stable and good development model with strong content productivity, very high quality, and special professionalism, a standard production process, and a more obvious one-way and linear trend in communication, but the disadvantage is that the interactivity is relatively low. When asked about the advantages of Chinese Video Programs (Table 4), 65.91% of them think that Chinese Video Programs are more systematic in their knowledge introduction, while 44 feel that compared to short video Chinese introduction, Chinese Video Programs have more stable broadcasting platform and broadcasting time, 31 think that large TV programs and Chinese events have corresponding reward and incentive mechanism, which that short-form video programs cannot do.

Table 4: Comparison of Chinese Video Programs and short video programs

Comparison of Chinese Video Programs and short video programs					
Advantages	Number	Percentage	Disadvantages	Number	Percentage
More systematic knowledge introduction	87	65.91%	Lack of entertainment	53	40.15%
Better program settings	72	54.55%	Too much study time	52	39.39%
More stable broadcast platform and time	44	33.33%	Lack of instant interaction	49	37.12%
Rewards and incentives are available	31	23.48%	Slow update	44	33.33%
Others	1	0.76%	Others	3	2.27%

To obtain more in-depth data, this survey conducted follow-up interviews based on the analysis of the preliminary results of the questionnaire, to facilitate the organization of the results, the five interviewees are indicated by A1 to A5.

> Question: Which part of the Chinese program setting interests you the most?
> Answer:
> > A1: Life and entertainment. Prefer videos that introduce the details of Chinese people's daily life.
> > A2: Videos that introduce cultural differences, introduce culture, and are the most updated.
> > A3: Introducing daily life.
> > A4: Prefer life videos, especially about life in modern China, to help understand the popular culture and trends in China, and to make it easier for international students to adapt to or understand life in China in advance.
> > A5: Prefer travel and scenery, prefer daily life, which can be closer to daily life and will help us understand the latest Chinese terms and trends.

According to the interview transcripts of the five interviewees, they tend to prefer video programs on daily life and entertainment topics and are more interested in the contemporary development and introduction of China, including Chinese culture and lifestyle. In terms of video programs, they prefer videos that are updated quickly and have popular elements that

meet the aesthetics and tastes of the public. At the same time, if Chinese Video Programs want to develop better and become more popular, they need to keep up with the contemporary development and changes in China, keep up with the popular trends in time, and meet the learning and aesthetic needs of the younger generation.

5   Conclusions

At the end of the survey, 79 people gave specific suggestions for the introduction of Chinese Video Programs into the cultural teaching of foreign Chinese classes. Twenty-eight of them thought the Chinese Video Programs were helpful to their Chinese learning and encouraged the programs. 14 of them wanted the Chinese Video Programs to be more interesting and to include more laughs to enhance the entertainment of the programs. 7 of them wanted the programs to include more topics about daily life and sports, 6 of them thought the frequency of the Chinese Video Programs should be accelerated and hoped they would be updated continuously. 6 of them suggested 3 people want to learn more Chinese vocabulary and grammar from the program to help their daily Chinese learning. 2 people want the program to be shorter to make it easier to watch in their leisure time. 2 people suggest adding Pinyin and or English to make the program more. They suggested adding pinyin and or English to make the program easier for beginners to understand. Two people wanted to introduce more foreign guests to tell their own stories about learning Chinese, and to show more local cities and people's lives. Two people wanted to introduce Chinese Video Programs as a supplement to classroom teaching, and two people wanted the program to be broadcast on more platforms so that more international students could watch it. One international student from Slovakia said he wanted the program to be more popular in his country. One international student from Slovakia suggested that he would like the program to be more popularized in his country.

From this research, international students' suggestions for Chinese Video Programs include: in terms of content, more daily life and sports themes should be included to enhance the fun of the programs; in terms of promotion, the programs should follow the pace of the times and use more channels to promote the programs to enhance the popularity of the programs; in terms of format, stories and Chinese learning should be told through the perspective of foreigners themselves to enhance the interactivity of the programs. Chinese Video Programs are a good helper for international students to learn Chinese. If we make good use of Chinese Video Programs, Chinese learning will become easier and more accessible.

Abstract

Introduction: Available evidence demonstrates that Team-Based Learning (TBL) enhances teacher-learner interactions, solves cognitive gaps, connects concepts, and builds critical thinking. Nowadays, TBL become a popular approach in undergraduate training (UGT). Surprisingly, only a few institutions implemented TBL into their post-graduate training (PGT) programs. UGT and PGT differ in their educational ecosystem, learning goals, and learner characteristics. Attempting to use TBL in PGT (TBL-PGT) requires adaptations to these differences. There are few conducted studies on TBL-PGT. Most discuss the possibility of using TBL in specific courses and do not discuss technical issues. We also experience challenges during our experiential TBL-PGT course. This paper aims to clarify TBL-PGT characteristics, identify potential challenges and discuss suitable solutions.

Methods: We search papers on TBL-PGT, identify technical issues and discuss potential solutions.

Results: To date, no systematic use of TBL in any post-graduate programs. All TBL-PGT attempts were experiential. The authors agreed that TBL could be part of the PGT program and that implementing TBL-PGT requires suitable adaptations. Experiences from experiential TBL-PGT affirm the crucial role of adapting course design to the particular PGT educational ecosystem, the complexity of knowledge, and the ability to link new concepts to real-life activities. We identify factors that might influence the TBL-PGT program outcomes, which include involving experts, enhancing learner accountability, building teams, determining educational goals, configuring assessments, preparing learning material, formulating authentic applications, training facilitators, and organizing in-class activities.

Conclusions: TBL is suitable for PGT. It promotes certain advantages. However, curriculum developers should consider adaptations while implementing TBL-PGT.

Introduction

In the early 1980s, Larry Michaelsen developed a new approach to teaching-learning that allowed profit the benefits of small-group learning within large classes. This educational approach was very close to the structure that Team-Based Learning (TBL) classrooms use today. Decades later, several US institutions implemented TBL as part of their core curriculums. In the early 2010s, TBL became a popular educational approach. Several educational settings worldwide, including high schools and universities, introduced TBL into their training programs.

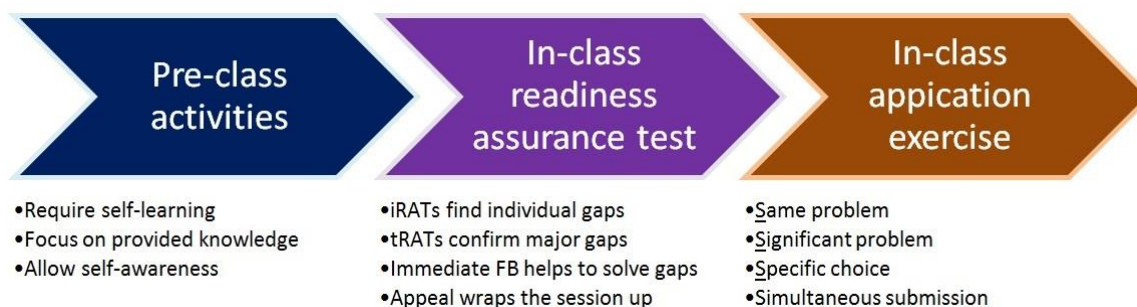
Nowadays, the Team-Based Learning TM Collaborative (TBLC) defines TBL as "an evidence-based collaborative learning teaching strategy designed around units of instruction, known as "modules," that are taught in a three-step cycle: preparation, in-class readiness assurance testing (RAT), and application-focused exercise (APP). A class typically includes one module" [8].


Figure 1: The three steps of Team-Based Learning

By flipping the classrooms, TBL allows beneficiaries to avoid wasting time on in-class speech, so it promotes gaining time. This precious time gained is crucial for ensuring active learning. According to available evidence, TBL effectively enhances teacher-learner interactions. Published works also demonstrate that TBL helps learners effectively solve cognitive gaps, connect learned concepts, and think critically [6, 7].

Unlike the case of undergraduate training (UGT), only a few institutions implemented TBL into their post-graduate training (PGT) programs. The number of publications concerning the use of TBL in post-graduate training (PGT) is quite limited. There are few conducted studies on the use of TBL in PGT (TBL-PGT). Those papers mainly discuss the possibility of using TBL in specific courses rather than its potential technical issues.

Therefore, this paper clarifies findings that concern the use of TBL in PGT, identifies potential challenges, and discusses suitable strategies for solving them.

Methods

We searched affiliated journals of the BEME, the IAMSE and the AMEE for published works on using TBL in PGT, using "team-based learning" and "post-graduate training" as keywords. Found papers were retrieved and reviewed. The revision focused on the type of implementation, potential challenges, and the author's suggestions. These potential challenges and propositions were retrieved and used as subjects of discussion.

Because of the limited number of published works, we could not apply any statistical methodology for analyzing data. Consequently, we decided to perform direct analysis and comparison instead of quantitative or qualitative analysis. Retrieved issues were also compared with UMP's current practices.

Results

We found only five papers which directly discuss issues related to the implementation of TBL in PGT. These five are published by McMullen (Medical Teacher, 2014) [4]; Travis (Teaching of Psychology, 2016) [9]; Graham (Medical Science Educator, 2020) [1]; Xue (Nurse Education Today, 2021) [10]; Nandamudi (Journal of Interprofessional Education & Practice, 2022) [5].

Table 1: Brief description of published papers on PGT-TBL				
Author	**Year**	**Disciplines**	**Implementing type**	
McMullen	2014	Psychiatric	Experiential use	[4]
Travis	2016	Introductory Psychology	Experiential use	[9]
Graham	2020	Transfusion medicine	Experiential use	[1]
Xue	2021	Nursing	Comparative study	[10]
Nandamudi	2023	Dysphagia interprofessional collaborative	Pilot study	[5]

Papers Revision

The revision of these papers found that, to date, only a few institutions implemented TBL in their PGT curriculums. All of these uses of TBL in PGT were experiential and partial. There was no systematic use of TBL in any post-graduate programmes. Preliminary works on the experiential use of TBL in PGT have shown controversial opinions.

Graham ran three transfusion medicine sessions adhering to TBL principles. She demonstrated that TBL is effective and enjoyable. She also mentioned that preparation should be adequate, and team continuity is poor despite 'compulsory' education sessions [1].

McMullen converted a didactic module of lectures into a TBL module for psychiatric residency training. She concluded that her attempt to introduce TBL into her residency training programme was successful. She considered involving TBL experts, reinforcing pre-class preparation and avoiding excessive pre-session assignments as keys to making TBL more relevant [4].

Travis studied the influence of team-based learning (TBL) methods on exam performance and student satisfaction in her PGT class on introductory psychology. She demonstrated that students in the TBL sections performed significantly better on items that tested the content covered in the TBL modules. She concluded that TBL is more effective than lecture in contributing to learning among introductory psychology students without negatively impacting course satisfaction [9].

Xue compared the effect of TBL on post-graduate nursing students with lecture-based teaching with small group discussion (LBTWSGD) and aimed to clarify potential factors that promote the effectiveness of TBL. Xue concluded that TBL effectively improved self-

learning ability and classroom engagement. Xue also mentioned the importance of clear and definite reading assignments in TBL. Quality RAT helped students obtain effective teacher feedback and ensured the effectiveness of discussion and communication [10].

Nandamudi studied the impact of the effectiveness on teaching collaborative practice (in dysphagia intervention) by conducting a TBL-based training in interprofessional education (IPE). She concluded that there was a strong positive influence on achieving the four core competencies [5].

In brief, these five authors agreed that TBL could be part of a residency/post-graduate training programme. On the other hand, McMullen, Graham and Xue shared that appropriate adaptations are the key to implementing TBL in PGT [4, 1, 10].

Experiential Use of TBL for PGT at UMP

In 2017 we built up and started a PGT course based on TBL. It was a course on reproductive medicine. This integrated course included biology, physiology, biochemistry, embryology, endocrinology and gynaecology. At the end of this course, we invited learners to give us feedback. Learners presented positive feedback that concerns the teaching-learning approach. They also showed positive individual perspectives. In the two following academic years, we ran the same PGT credit but applied some modifications to the RAT.

To date, we experienced the impacts of the PGT educational ecosystem on TBL course outcomes. We also found that involving experts, preparing learning materials, defining RAT goals, composing authentic application situations and selecting facilitators should be considered for applying TBL for PGT.

Discussions

PGT is different from undergraduate training (UGT) in several particularities. The three main differences are the educational ecosystem, outcomes of learning and characteristics of learners.

In PGT, simulation-based activities become less important. Various workplace activities replace simulation and then feature PGT. Graduates learn by practising in real-life conditions. Several factors might impact learners' activities and efficacity of learning, such as facing real-life beings, interprofessional relationships and social responsibilities.

PGT focuses on Entrustable Professional Activities (EPA) and targets professional competencies. This approach aims to help learners reach the top three levels of the educational pyramid (shows, does, trusts). Through PGT, learners follow a process of metamorphosis from novice to competent via milestones. Bringing theory into daily practice, practising in real life, facing real issues, moving from knowledge-centred to human-centred feature PGT.

In general, PGT courses involve learners who come from different backgrounds. It makes the PGT learner population heterogeneous. This heterogeneity includes learner competencies and practical experiences. Learner characteristic also concerns their social status, learning accountability and learning dynamics.

Table 2: Characteristics of undergraduate training and post-graduate training		
	Undergraduate training (UGT)	**Post-graduate training (PGT)**
Targets	Knows; knows how; shows	Shows; does; trusts
Educational environment	Simulation-based training	Workplace-based training
Learning materials	Tailored applications	Real life events
	Standardized subjects	Real-life beings
Knowledge complexity	Simple, separate	Complex, linked
Outcome measurement	Pre-defined end-points	Milestone complex system
Validating criterion	Pass-fail criterion	Judgement and decision

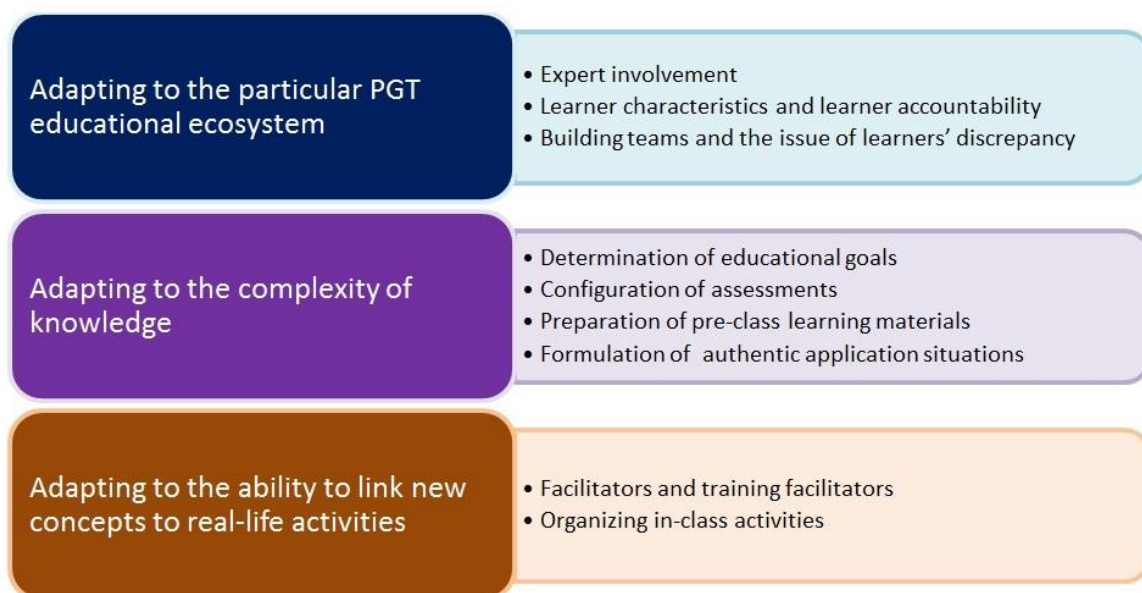
The above particularities of PGT require suitable teaching-learning configurations. In TBL-PGT, the technical issue to be solved is "how to adapt the practice of TBL to PGT while still keeping the TBL principles?" Therefore, measures for implementing TBL-PGT should adapt to the PGT educational ecosystem, the complexity of knowledge and the ability to link new concepts to real-life practices.


Figure 2: The three measures for implementing TBL-PGT

Adapting to the Particular PGT Educational Ecosystem

Three issues may relate to this subject. Those issues are expert involvement, learner accountability and building teams.

Expert Involvement

McMullen emphasized the importance of expert involvement in TBL course success [4]. UMP's practices reaffirmed this statement. In UGT, the participation of experts in the whole teaching process is not mandatory. Their primary roles are curriculum developers, course managers and learning material editors [2, 6]. Inversely, involving experts is a primary prerequisite for implementing TBL-PGT. Experienced experts make the core of human

resources for implementing the TBL curriculum in PGT. Practising in a real-life environment requires learners' competencies.

Therefore, PGT trainers should be experienced practitioners. Recruiting experienced trainers from all related domains becomes the top issue in preparing a TBL course for PGT. In TBL-PGT, experienced trainers should work together in the expert committee. This committee takes responsibility for designing course syllabi, ensuring assessments, preparing course agenda, composing learning materials, approving these materials and facilitating the TBL classrooms.

Learner Characteristics and Learner Accountability

McMullen emphasized that learner accountability should be reinforced [4]. The UMP also experienced the impacts of the lack of learner accountability on course outcomes and therefore made efforts to improve it. Learner accountability is a prerequisite learner characteristic. It conventionally includes a learning attitude and taking responsibility. In PGT, each learner differs from another in their social status, learning accountability and learning dynamics. This particularity might badly impact the TBL-PGT programme outcomes.

TBL-PGT course organizers must pay attention to the issue of learner accountability and seriously discuss this issue during the pre-course talk. Lack of accountability violates TBL classrooms. TBL practitioners should recognize the importance of this issue and perform strategies for accurately assessing learner accountability. Inversely the TBL process holds students accountable for coming to class prepared and working together as a team [1, 3].

Building Teams and the Issue of Learners' Discrepancy

Entrustable Professional Activities (EPA) and Interprofessional Education (IPE) feature PGT. Varieties of workplace activities dominate EPA's teaching-learning processes. In the workplace milieu, learners should perform their tasks in teams rather than individually. Their ability to work in teams becomes a mandatory requirement. Nandamudi considered that TBL-based training enhanced learners' ability to work together in IPE [5]. Travis confirmed this statement and showed empirical evidence, which suggests that TBL is a suitable pedagogical approach that enhances learners' ability to work in teams.[9] Unfortunately, these papers did not discuss learners' discrepancies in their backgrounds. Graham found that the team after-class continuity was poor, but she did not adequately explain potential hidden causes [1]. Learners' discrepancies include discipline, performance and experience. The UMP had faced the same discrepancy issue and had to solve it. The equality between teams in learner characteristics is one of the four principles of TBL. Different learner backgrounds lead to team heterogeneity that may influence the accuracy and effectiveness of team performance.

Consequently, course organizers should build identical teams. Deploying learners who have different learning experiences in equal groups should be respected. Once it meets the above requirement, TBL allows learners to improve their ability to work effectively together.

Adapting to the Complexity of Knowledge

Four issues may relate to this subject. Those are educational goal determination, assessment configuration, pre-class learning material preparation and formulation of authentic application situations.

Determination of Educational Goals

Conventionally, TBL is an approach which aims to teach theory basis in a single-disciplinary/multidisciplinary course. Undergraduates learn through understanding concepts and connecting them. In PGT, the teaching theory basis targets wide-ranging knowledge. In recent decades PGT began shifting its pedagogical approach, leaving multidisciplinary strategies and redirecting toward the universal implementation of interdisciplinary/transdisciplinary courses. The pre-existed boundary between subjects in multidisciplinary approaches becomes less indistinct in the interdisciplinary/transdisciplinary course. The learning contents usually have higher complexity and should be practice-oriented. Graduates often feel challenged while connecting wide-ranging concepts relating to various disciplines. For those reasons, conventional TBL might lose the ability to ensure its effectiveness in PGT. Changing the TBL course syllabi becomes crucial.

TBL course ELOs should target the ability to link ideas rather than focus on the ability to understand separate concepts or the ideas themselves. The above-discussed adaptations were subjects to explore in experiential uses of TBL interdisciplinary courses. It suggested that TBL-PGT allows for gaining advantages, and this approach contributes to putting learners at ease while simultaneously working on several topics. Nandamudi demonstrated that her TBL-based integrated module positively influenced helping learners achieve the four core competencies.[5] The UMP's experiential TBL-integrated course confirmed this statement.

Configuration of Assessments

The TBLC considers the RATs as double-purpose activities targeting assessment-of-learning and assessment-for-learning [1]. PGT-RAT is different from UGT-RAT in its aims. UGT-RAT aims to identify cognitive gaps, while PGT-RAT focuses on more complex competencies (connecting, applying, synthesizing, summarizing). As a formative assessment, PGT-RAT requires adapted changes to help graduates reach their learning goals. Bringing concepts together is one of the primary assessment goals in PGT. Moreover, graduates should be able to link ideas concerning different disciplines (integrating). Low-order thinking MCQs seem likely unable to meet PGT test blueprint requirements. Changing learner assessments is mandatory. PGT-RAT should target a higher level of knowledge, such as the ability to analyze/synthesize complex issues. Therefore, PGT-RATs require the replacement of low-order thinking MCQs with high-order thinking MCQs. Crafting high-order thinking MCQs needs writing experiences, both educational and professional. On the other hand, irrelevant PGT-RAT might "kill" in-class activities without helping learners find the right way to connect separate issues. Technically, composing relevant PGT-RAT is challenging.

Ideally, TBL trainers should work in an expert committee. To ensure the relevance of the PGT-RAT, this committee should identify the most common misunderstood reasonings, professional mistakes, and potential cognitive gaps and put it all into the PGT-RAT. Xue emphasized the need for relevant MCQs for teaching and assessing purposes in TBL-based PGT.[10] The UMP also recognizes this challenge. We experienced several difficulties when composing MCQs for PGT-integrated courses.

Preparation of Pre-class Learning Materials

Implementing TBL-PGT requires adapted learning materials. Provided documents should cover all key ideas which help learners build interdisciplinary connections. Those materials

should consistently develop ideas throughout several disciplines, directly target idea linkings, and constructively align (both vertically and horizontally) with designed ELOs. On the other hand, in the workplace milieu, even though learners are graduates, textbooks are not the first choice as practicable materials. Simplified, structured, oriented and learner-centred documents feature TBL materials. Avoiding potential learners' overload is also an important issue. Even though learners are graduates, the amount of the pre-class workload should not exceed the minimum required. Quality materials support learners to think critically throughout the learning process. McMullen [4], Travis [9] and Graham [1] shared the same idea on the importance of targeted learning materials. They emphasized that ensuring the constructive alignment between ELOs, assessments, and learning materials is a prerequisite to success in TBL-based PGT. UMP experienced the same consideration.

Formulation of Authentic Application Situations

The 4S is the icon of TBL. It includes four principles: working in teams, solving the Same assignment on Significant problems, selecting Specific solutions, and Simultaneous reporting (of team solution) [1, 3]. Application exercises for undergraduate training (UGT-APP) differ from application situations for post-graduate training (PGT-APP) in their learning goals. Most UGT-APPs are simulated exercises. The 4S-based application exercises help students connect separate learned elements and apply knowledge in simulated situations [3]. In PGT, the weighting of practical activities is high. Graduates learn through specialized, oriented training courses.

Consequently, PGT-APPs should focus on more complex and authentic subjects while still respect for the 4S principles. Replacement of solving simulated exercises with managing real-life situations features those courses. Application situations should not include invalid details. Removing them from the original issue is crucial, which ensures reaching ELOs. Graham demonstrated that PGT-APPs did not reach the same degrees of effectiveness throughout different abilities [1]. UMP's experiential TBL-PGT suggested that the PGT-APP should focus on initial acquisitions rather than advanced competencies.

Adapting to the Ability to Link New Concepts to Real-Life Activities

Two issues may relate to this subject. Those issues are the facilitators and the organization of in-class activities.

Facilitators and Training Facilitators

As conventionally described, there is neither a lecturer nor a lecture in TBL classrooms. In UGT, TBL facilitators are in charge of facilitating in-class discussions. They are not being responsible for delivering a course. Consequently, the in-class presence of experts is not a mandatory requirement [10]. Unlike UGT, the PGT in-class activities concern the highest degree of thinking also the ability to link concepts to real-life practices. McMullen suggested that the in-class presence of a proficient practitioner seems likely a primary requirement [4]. To date, the UMP has constantly followed this strategy. Besides, skilled facilitators are a prerequisite in all TBL classrooms.

Facilitators should be familiarized with TBL's philosophy, regardless of UGT-TBL or PGT-TBL. Unskilled facilitators might shoot the in-class discussion down [10]. Future trainers (even experts) should equip themselves with skills for preparing and conducting TBL. They

should regularly attend specific ToT on the ability to facilitate. Through that, they can improve the trainer-trainee interactions and enhance the effectiveness of discussion in PGT. McMullen considered training facilitators as a crucial part of preparation [4]. The UMP has constantly supported this consideration. To date, we conducted several ToT (training of trainers) workshops. This activity allowed us to make our facilitator team stronger.

Organizing In-Class Activities

Even though TBL is one of the various kinds of flipped classrooms, the TBL approach is very different from the other flipped classrooms. A typical TBL flow includes three consecutive steps: preparation before class, in-class RAT and in-class APP [1, 3]. The preparation phase includes all learner must-do activities before a class which mainly focus on self-studying provided materials. This phase aims to provide essential knowledge to learners and does not aim to find or solve their cognitive gaps. Even though the fact that graduates have an advanced background, self-learning is still a matter in PGT-TBL. McMullen and Graham experienced the impact of inadequate learner preparation on TBL-course outcomes [4, 1]. Graham emphasized the significance of the preparation phase in the TBL-based training and suggested conducting an opening talk for each course [1]. The UMP also faced and experienced this issue. For that, UMP constantly respected these recommendations.

The in-class RAT is the icon of TBL. PGT-RAT focuses on high-order thinking. On-target focused discussions and experienced trainers are the two factors that ensure the effectiveness of PGT-RAT. Discussions should treat interdisciplinary/transdisciplinary issues. Discussion should not focus on separate subjects. Even though the in-class presence of experts is mandatory, experts should keep being TBL-facilitator. Delivering speeches shot discussion down. Technically, we consider that facilitating is the most challenging TBL-PGT issue.

The in-class Application Exercise (APP) is also the icon of TBL. PGT-APP concerns transdisciplinary linked concepts. Experienced trainers are crucial to ensure the relevance of PGT-RAT. On the other hand, evidence-based solutions support graduates in enhancing critical thinking. Voting via coloured clickers, as classically described, becomes far to allow graduates to express complex solutions. Using various ways for reporting encourages learners to discuss more complex options. A poster gallery walk seems likely helpful for expressing complex solutions [1].

Conclusion

Available evidence confirms the effectiveness of TBL. Evidence also supports the use of TBL in PGT. Experiential works demonstrate that it is possible to introduce TBL into PGT. However, implementing TBL in PGT requires several adaptations to more complex educational goals. The difference in the educational ecosystem also requires appropriate changes. Paying attention to the impact of an educational ecosystem, involving experts in professional committees, carefully designing course syllabi, preparing appropriate learning materials, changing the way of writing RAT and applications, and involving trainers in ToT workshops are the most common issues which relate to the success of implementation TBL in PGT.

Abstract

Library management systems in digital libraries can bring about innovation in digital inclusion. Digital library users will find it easier to access reading materials anywhere and anytime, so the purpose of this study is to identify the effect of using a library management system in digital libraries on digital inclusion innovation. This research is the result of a synthesis of the findings of previous research articles that are relevant in the 2018-2022 period. This study adapted the Systematic Literature Review method with Publish or Perish software, then filtered and extracted the data according to the criteria for the research objectives so as to produce 54 relevant articles and compiled using the Prisma Protocol. From the results of several research syntheses, it was found that the use of library management systems in digital libraries is able to provide digital inclusion innovations. The topics in the articles obtained mostly explain the development of inclusive digital library management systems. Most of the systems used are user interface applications. In addition, the use of the library management system has a positive impact in the form of increasing inclusive services for users. Future research is expected to be able to present in detail the influence of the library management system on digital libraries to develop digital inclusion that is more friendly for persons with disabilities.

Keywords: Digital Inclusion, Library Management System, Digital Library

Introduction

ICT's development impacts various aspects of life, but not all individuals and groups can fully utilize it due to the digital divide.(W. Wan Abdullah, F. Ahmad, 2018).The International Telecommunication Union reports that only around half the world's population has internet access (ITU, 2020). The digital divide affects access to libraries, essential institutions for community information, knowledge, and education (Edmund T Cabellon, 2016). Libraries and information are two things that are interconnected and cannot be separated (Hasugian, 2009). The library has a very important role and contribution to the experience of students because the library is something that continues to connect with students in terms of meeting student needs (Kezar A, 2006). Libraries have adapted to the digital age, expanding online services, resources, and operating hours to better connect with students and ensure accessibility. (Kezar A, 2006; Snavely, 2012). Indonesia has a remarkably low interest in reading, as indicated by UNESCO's research, with only 0.001% engagement, but libraries can play a crucial role in improving this situation. (Perpusnas., 2021). Libraries, when utilized effectively, can serve as hubs for scientific development, discussions, and knowledge acquisition (Setiawan & Nuryana, 2020). Digital libraries aim to provide broader access to books and reading materials, but limited skills hinder some individuals, highlighting concerns about the digital divide and inequality. (F. Riggins, 2005; Parsons & Hick, 2008; Robinson et al., 2015). Digital inclusion is crucial for supporting individuals and communities in the digital age, addressing the pressing issue of the digital divide, and fostering societal development (Nguyen, 2020). Digital inclusion is also a determining factor for social inclusion (Alam & Imran, 2015; Helsper, 2012; Ragnedda, 2017; Warschauer, 2002). Digital inclusion refers to policies that address the digital divide, promote digital literacy, and reach out to underserved populations (Jaeger et al., 2012).

Library Management Systems (LMS) facilitate digital inclusion by transforming traditional libraries into digital ones through innovative management systems. (Shanmugam Ap Palanigounder, Ramalakshmi Arunachalam, 2020). Library management systems are vital for equitable access to libraries, supporting collection management, borrowing, inventory, and administrative tasks. Adopting these systems enhances operational efficiency, record accuracy, and overall patron service. Subramanian and Muthuraja (Subramanian, S., & Muthuraja, 2019) emphasized the importance of digital library management systems for organizing and accessing knowledge efficiently. Automated library management systems enhance service efficiency, underscoring their importance in library operations (El Naggar, H., & Elsayed, 2020; Rai, S., & Singh, 2020). Digital inclusion in library management involves leveraging technology to enhance accessibility, dissemination, and management of information resources. Innovative library management systems enable more efficient and effective services through software, mobile apps, online platforms, and other technologies for information access, digital borrowing, and various library activities (Das, A., Dey, S., & Maiti, 2018). Innovative library management systems promote digital inclusion and expand student and community engagement by providing easier access, benefiting previously excluded individuals, including those in remote areas, with disabilities, or facing physical accessibility limitations.

Method

This research uses the Systematic Literature Review method to identify research topics related to digital inclusion through innovative library management systems and the impact of library management systems on digital inclusion. In Systematic Literature Review research, it

is necessary to identify as many previous studies that have been conducted in the field to be researched and which are most relevant to the research topic area, which is very important for its direction and methodology, so systematic screening is necessary.

Search Strategy

The screening of journal articles in this SLR research uses the help of PoP (Publish or Perish) software with data sources on Google Scholar. The filtered articles have a range of 2018-2022 (the last five years) with the selection of keywords digital library, digital library management system, and digital inclusion.

Publication Selection & Data Extraction

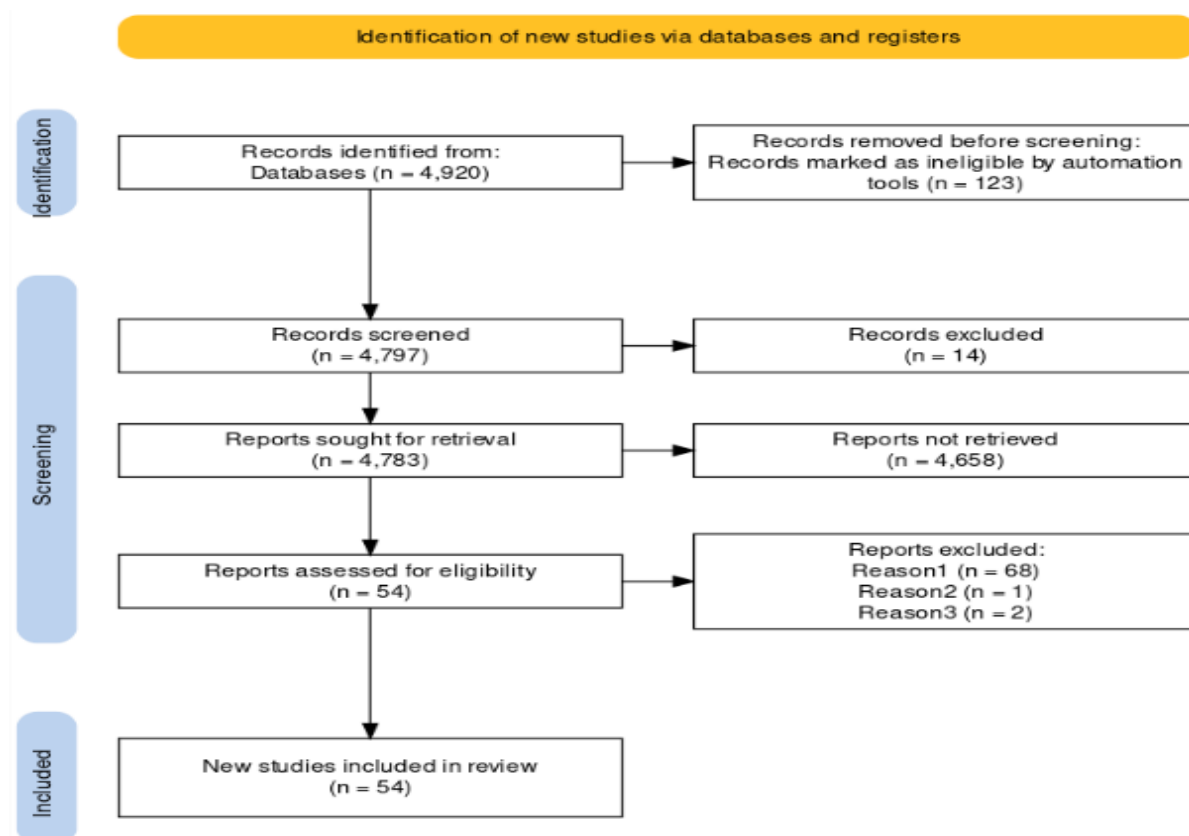
Based on the Prisma Protocol chart in Figure 1, the presentation of articles through the Publish or Perish search identified as many as 4920 articles. In the identification process, screening was carried out by eliminating articles that had never been cited so that 4797 articles were reduced. In the screening process, screening is carried out with criteria taken specifically for journal articles so as to exclude 4783 articles that are not included in the journal. Then, entering the eligibility assessment stage, there are two reasons; the first reason is to filter articles by determining the title of the library so that articles are filtered specifically for digital inclusion in articles with the word library only so that it is reduced to 125 articles. This was done because, in the database obtained by Publish or Perish, digital inclusion was found other than through the library. For the second reason, filtering was carried out with special criteria on journals that were cited more than ten times so as to better ensure the credibility of the article so that there were 54 articles that were reduced.


Figure: 1 PRISMA Diagram

Based on the entire screening series, as shown in the Prisma Protocol Chart, the final number of 54 articles related to the topic of digital inclusion through innovative library management systems was obtained. Thus, this research is directed to provide research results where the existing technology in the library management system can provide digital inclusion innovations to students in particular and the community in general in accessing the library and, in the future, can further develop technology in the library management system.

Result

Article Characteristics

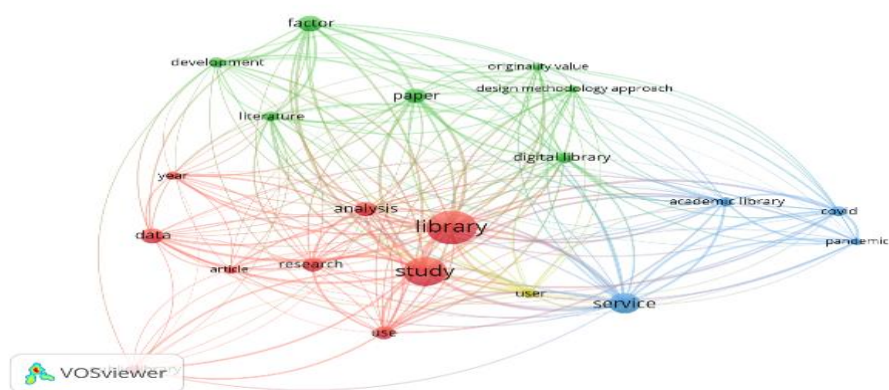
In this SLR research, the final screening results were obtained from as many as 54 articles on the topic of digital inclusion through library management system innovation. The research articles were analyzed using VoSviewer software to find out the article keywords that often appear and other keyword associations. Analysis using VoSviewer can be seen through the keyword mapping shown in Figure 2.


Figure 2: Obtained Article Keyword Mapping

Figure 2 it can be seen that the keyword about. In the research article, the distribution of each year can be shown through the graph in Figure 3.
Figure 3: Distribution of Articles by Year

Based on Figure 3, it can be seen that most of the research articles obtained were published in 2020 and the least in 2022. The number of article citations obtained can be shown using the diagram in Figure 4.
Figure 4: Number of citations of articles obtained

Based on Figure 4, it can be seen that the most cited article has 157 citations with a frequency of 1 article, while there are seven articles that have 12 citations. The distribution of journal publication sources and research articles obtained can be seen in the diagram below in Figure 5.
Figure 5: Distribution of Article Sources Obtained

Based on Figure 5, it can be seen that the distribution of the most sources of articles obtained from the Journal of Library Administration. Series as many as 4 articles. The distribution of article publications obtained can be illustrated with the diagram shown in Figure 6.
Figure 6: Distribution of Article Publications Obtained

Based on Figure 6, the distribution of the most article publications obtained is from Emerald.com, with as many as 14 articles.

Thus, it can be concluded that the characteristics of the articles obtained in the playback mostly carry the words Library, Service, and Digital Library most dominant in the articles obtained because they have a large circle, so it can be said that Library, Service, Digital Library, and Development with the most distribution of article years in 2020. The highest number of citations is 157 citations, and most articles have 12 article citations. From the acquisition of these articles, most journal sources come from the Journal of Library Administration with the most publications, namely Emerald.com.

Use of Library Management System

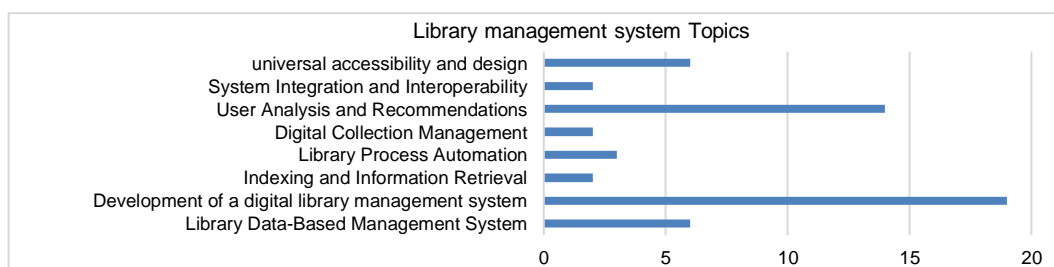
The use of library management systems in digital libraries is an innovation that can facilitate students and the community in accessing reading resources. With digitization, eating libraries today can also be accessed inclusively by anyone at any time. Based on the articles that have been obtained, the use of library management systems is often related to several topics shown in Figure 7.


Figure 7: Library Management System Topics

Based on Figure 7, it can be seen that the most frequently implemented topics in library management systems are the topics of digital library management system development and user analysis and recommendations. The use of library management systems can support the needs of students and the community to access reading materials or books more easily and inclusively. Based on the articles that have been obtained, the form of presentation of the library management system can be shown through the diagram in Figure 8.
Figure 8: Form of Library Management System Presentation

Based on Figure 8, the presentation form of the library management system is often used in the form of a user interface and electronic access to materials.

The form of presentation of the library management system is adjusted to the needs and objectives of digital libraries to facilitate access to reading materials or books as a whole. The library management system in digital libraries is basically developed to further facilitate access to reading materials and books as a whole. The use of library management systems in digital libraries can provide an increase or impact on development and services to be more inclusive. Based on the articles that have been obtained, the library management system that can have a positive impact on digital inclusion can be shown through the diagram in Figure 9.
Figure 9: Positive Impact of Using the System Library Management System
in the Library Digital

Figure 9 shows that the use of library management systems in frequent digital libraries provides a positive impact on the provision of inclusive services and increased accessibility.

Therefore, it can be concluded that the use of library management systems in the digital library shows the topics that are often implemented in the system library management system development digital as well as user analysis and recommendations, with most forms of presentation done in the form of a user interface and electronic access to materials. System usage library management at the library Digital has several positive impacts that can be felt by various parties. The most positive feeling is inclusive service provision, and accessibility increased (A., 2013; Adamou et al., 2019; AlAwadhi & Al-Daihani, 2019; Beyene, 2018).

Discussion

Use of Management Systems Library in Digital Library

Library Management Systems act as a tool for changing traditional libraries to digital libraries (SHANMUGAM AP PALANIGOUNDER, RAMALAKSHMI ARUNACHALAM, 2020).[18] A library management system is important to ensure that all members of society can feel the same benefits from the library. This system plays a crucial role in collection

management, lending, inventory, and administrative activities in the library. By adopting a Library Management System, Libraries can increase operational efficiency, improve the accuracy of recording, and provide services better to visitors.

Subramanian and Muthuraja (Subramanian, S., & Muthuraja, 2019) emphasize the importance of management systems digital library to organize and access knowledge efficiently. An automated library management system helps improve internal efficiency and provides library services; this shows that this system is so important in the context of service library (El Naggar, H., & Elsayed, 2020; Rai, S., & Singh, 2020). The inclusion of digital in library management includes the use of technology to improve accessibility, dissemination, and management of information resources in the library.

Based on that article obtained, the use of management systems library in digital library covers several topics, namely systems library data-based management (Ahlfeld, 2020; Ashiq et al., 2021; Deja et al., 2021; Gahagan & Calvert, 2020; Ma & Lund, 2021; Velasquez & Evans, 2018), Management system development digital library (A., 2013; Adamou et al., 2019; AlexanElizarovder & Novikov, 2019; Ångqvist et al., 2019; Beyene, 2018; Bohmann et al., 2022; Desmarais & Louderback, 2020; Do et al., 2019; Dresel et al., 2020; Elizarov & Lipachev, 2020; Harlow & Hill, 2020; Morinière et al., 2019; Murphy et al., 2022; Peacock et al., 2020; Rafi et al., 2019; Rosman et al., 2020; Singeh et al., 2020; Wang & An, 2019; Waterman et al., 2020; Zheng et al., 2022), Library Process Automation (Desmarais & Louderback, 2020; Leorke et al., 2018; Mbambo-Thata, 2021). Analysis Users and Recommendations (A., 2013; Afthanorhan et al., 2020; AlAwadhi & Al-Daihani, 2019; Ali et al., 2021; Cox et al., 2019; Do et al., 2019; Isibika & Kavishe, 2018; Lediga & Fombad, 2018; Marineo & Shi, 2019; Ocran et al., 2020; Pionke, 2020; Rahimi et al., 2019; Rutherford et al., 2018; Samsuddin et al., 2020), System Integration and Interoperability (Darch et al., 2020; Potnis et al., 2020), accessibility and design universal (Chisita & Chizoma, 2021; Cleave & Geijsman, 2020; Glusker et al., 2022; Rysavy & Michalak, 2020; Sanchez-Rodriguez & LoGiudice, 2018).

Based on the article that obtained, it can be seen that the topic is most often implemented in library management systems is topic Management system development digital library; this is because Libraries, especially in schools or universities, are obliged to develop information technology to achieve learning objectives with developing a digital library technology based According to Deasy Lisa Damayant's study, Library management is very important. Digital library management begins with digital library planning, digital library budget funding, management of digital collections, management of human resources, monitoring and performance evaluation, analysis of obstacles, digital library management, and efforts to create a library management system that serves its aims to overcome them. Obstacle: Utilize digital libraries and build mutual relationships between librarians and students and teachers, with possible students and teachers accessing digital libraries more frequently (Damayanti et al., 2023).

The Form of Presentation of the Management System Digital Library

The form of presentation of the management system library is tailored to your needs and digital library purposes for easy access to reading materials or books as a whole. System library management at the library digital is basically developed for easier access to reading and books overall.

Based on that article obtained, the existing form of presentation in the library management system in a digital library is the interface users (Elizarov & Lipachev, 2020; Leorke et al., 2018; Mbambo-Thata, 2021; Nneji, 2018; Singeh et al., 2020; Wan Zahari Wan Yusoff and Maziah Ismail, 2008; Zheng et al., 2022), electronic access to matter (Desmarais & Louderback, 2020; Dresel et al., 2020; Lediga & Fombad, 2018; Mbambo-Thata, 2021; Rahimi et al., 2019; Velasquez & Evans, 2018), database listening experience (Adamou et al., 2019; Waterman et al., 2020), online catalog (AlexanElizarovder & Novikov, 2019; Rafi et al., 2019; Velasquez & Evans, 2018), games(Cleave & Geijsman, 2020), providing recommendations (Beyene, 2018; Bohmann et al., 2022; Murphy et al., 2022).

Based on the articles obtained, it can be seen that the form of presentation of the library management system that is often used is in the form of a user interface. Many user interface applications have been created, according to research conducted by Maulana Y. & Dian P.S., which makes the user interface of the CIRLIB Application (Cirebon Library) in accordance with the fulfillment of user requirements. The application is designed in the form of use case diagrams, action diagrams, and user interfaces. User interface design services include essential library information, book lending services, on-site reading services, e-books, and education (Yusuf & Sari, 2023).

The Positive Impact of Using the System Library Management for Digital Inclusion

Subramanian and Muthuraja (Subramanian, S., & Muthuraja, 2019) emphasize the importance of management systems digital library to organize and access knowledge efficiently. Automated library management system helps improve internal efficiency and provides library services; this shows that this system is so important in the context of service library (El Naggar, H., & Elsayed, 2020; Rai, S., & Singh, 2020). The inclusion of digital in library management includes the use of technology to improve accessibility, dissemination, and management of information resources in the library.

By implementing an innovative system of library management, libraries can provide more services efficiently and effectively to members of the public. Management system innovative library can involve the use of software, mobile applications, or online platforms for easy access and search information, borrowing and returning digital books, as well as usage of other technology to facilitate library activities (Das, A., Dey, S., & Maiti, 2018).

Based on that article obtained indicates that the use library management system on frequent digital library have a positive impact on inclusion digital is increasing accessibility (A., 2013; Ångqvist et al., 2019; Bohmann et al., 2022; Do et al., 2019; Kazuye Kimura, 2018; Leorke et al., 2018; Rutherford et al., 2018; Rysavy & Michalak, 2020; Singeh et al., 2020; Velasquez & Evans, 2018; Wan Zahari Wan Yusoff and Maziah Ismail, 2008; Wang & An, 2019), Material Diversity (Ahmad et al., 2018; Elizarov & Lipachev, 2020; Morinière et al., 2019; Nneji, 2018; Rafi et al., 2019; Wan Zahari Wan Yusoff and Maziah Ismail, 2008; Wittmann et al., 2019), inclusive service provision (A., 2013; Adamou et al., 2019; Afthanorhan et al., 2020; Ali et al., 2021; Anyim, 2019; Ashiq et al., 2021; Beyene, 2018; Chisita & Chizoma, 2021; Cox et al., 2019; Deja et al., 2021; Desmarais & Louderback, 2020; Glusker et al., 2022; Isibika & Kavishe, 2018; Ma & Lund, 2021; Mbambo-Thata, 2021; Peacock et al., 2020; Potnis et al., 2020; Rahimi et al., 2019; Rahmat & Saqlain Raza, Hasan Zahid, Jaffar Abbas, Fatimah Azzahraa Mohd Sobri, 2022; Rosman et al., 2020; Sanchez-Rodriguez & LoGiudice, 2018; Zheng et al., 2022), achievement and interest read increases (Cleave & Geijsman, 2020; Marineo & Shi, 2019).

Based on the article obtained, it can be seen that the management system used library in digital libraries often has a positive effect on the provision of inclusive services. Basic library services must continue to grow in inclusion to form a society that has access to complete reading materials easily, anywhere and anytime.

This is what Sudarmin et al (Damayanti et al., 2023) said. According to research, change-based library social inclusion is an effort to create an educated society in library and archival services. Enrekang Regency, through various strategies, involves librarians in active roles, politics publishing one. Order and the formation of synergistic teams, meeting stakeholders, launching Enrekang library, and organizing co-learning meetings. However, the Library and Archives Service Enrekang Regency also met some problems in developing a library based on social inclusion. Source limited budget resources and network Internet. The goal is to overcome obstacles by collaborating with various actors (Cleave & Geijsman, 2020; Marineo & Shi, 2019) at the state level, district, and private and to optimize the existing budget as well as possible.

Conclusion

From the presented information, it can be concluded that digital library management systems play a crucial role in transforming traditional libraries into digital entities, advancing service delivery, and resource management. The primary focus of this research is the development of digital library management systems, particularly in educational settings, utilizing information technology to achieve learning objectives and foster digital libraries. These systems come in various presentation forms, with user interfaces being the most commonly used. The implementation of these systems has a positive impact on digital inclusion by enhancing accessibility, diversifying materials, and providing inclusive services. Despite challenges such as resource limitations and internet connectivity issues, collaborative efforts with stakeholders can offer solutions. This research provides an in-depth understanding of how innovation in digital library management systems can enhance digital inclusion, broaden access, and advance learning and reading interests.

Development of TPCK Creativity-Based Learning Model for Improving Grade 7 Students' Academic Achievement and Creative Thinking

Sawitree Inprom, Thungsong School, Thailand
Khajornsak Buaraphan, Mahidol University, Thailand

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Creativity-based Learning (CBL) is useful in developing several important skills for mathematics students. This research aimed to: a) develop the CBL integrated with Technological Pedagogical Content Knowledge (TPCK) or TPCK-CBL Model to teach mathematics for Grade 7 students; and 2) examine students' development of academic achievement and creative thinking in the Ordered Pairs topic after learning with the TPCK-CBL Model. The mixed-methods research design was employed in this study. The researchers collected both quantitative and qualitative data from 70 Grade 7 students, who enrolled in the first semester of the 2022 academic year at Thungsong School, Nakhonsithammarat province, Thailand. The TPCK-CBL Model and its associated lesson plans, the Learning Achievement Test and the Creative Thinking Test was validated by five experts. The results yielded that the TPCK-CBL Model could foster Grade 7 students' academic achievement and creative thinking. Through the engagement in open-ended tasks, students were encouraged to think critically, generate innovative solutions for mathematical problems from multiple perspectives. The use of technology in TPCK further supported the development of students' digital literacy and enabled them to utilize digital tools and software to further explore mathematical conceptions in fruitful ways. This study highlighted the significance in incorporating TPCK with CBL for teaching mathematics for Grade 7 students in Thailand. Through TPACK-CBL Model, mathematics educators can create learning environment that truly nurtures students' academic achievement and creative thinking. Implementing TPCK-CBL not only enhances students' mathematical knowledge but also equips them with the essential skills needed for success in the current digital age.

Keywords: Creativity-Based Learning, TPCK, Mathematics Education, Academic Achievement, Creative Thinking, Grade 7 Students

Introduction

Education stands as an indispensable facet of human existence, a fundamental right that every individual should embrace. Its significance resonates through the tapestry of daily life, serving as a catalyst for holistic development. Education is a transformative force, shaping not only one's cognitive prowess but also fostering skills, nurturing mental well-being, and influencing various dimensions of personal growth. In the contemporary landscape, the 21st century, education plays a pivotal role in equipping individuals with the tools to navigate a world marked by rapid, intense, and unpredictable changes. In this era, the ability to learn and adapt swiftly has become a cornerstone of success. Both educators and learners are called upon to cultivate not only subject-specific knowledge but also high-order learning skills, essential for thriving in the dynamic challenges of the modern age. Teachers, as facilitators of knowledge, bear the responsibility of not only imparting information but also honing their own learning skills. The evolving nature of the 21st century demands educators to be dynamic and adept at integrating contemporary teaching methodologies. A symbiotic relationship exists between the proficiency of teachers in acquiring new knowledge and their effectiveness in fulfilling their roles in this ever-changing educational landscape.

Educational institutions, as crucibles of knowledge, must align their curricula with the dual objectives of imparting core subjects and cultivating 21st-century skills. These skills encompass learning and innovation, life and career proficiency, and information, media, and technology literacy. Among these, learning and innovation skills stand out as linchpin competencies, given the perpetual evolution and increasing complexity of our global milieu. In a world where change is constant, individuals devoid of proficient learning and innovation skills find themselves struggling to keep pace with the ever-shifting paradigm. The absence of these critical skills not only hinders personal growth but also poses formidable challenges to navigating the complexities of contemporary life. Thus, education emerges as an imperative force, not merely confined to the transmission of knowledge but as a dynamic process that empowers individuals to confront and conquer the challenges of the 21st century. It is the cornerstone upon which a resilient, adaptable, and enlightened society is built, fostering a continuum of progress and well-being for all.

The methodology for developing learning experiences that authentically instill skills requires the seamless integration of collaborative learning, knowledge creation, and team-based learning. An educational management strategy that harmoniously aligns with these objectives is Creativity-based Learning (CBL). CBL is regarded as a noteworthy form of active learning extensively researched with Thai learners. The primary objective is to devise teaching methods that seamlessly integrate both subject content and essential 21st-century skills. Specifically, this approach naturally cultivates learners' proficiency in creative thinking. The implementation of CBL has yielded positive outcomes, fostering not only analytical but also creative thinking among learners, marking a significant departure from traditional teaching methods.

CBL is a foundational approach in the management of teaching and learning, where learners take a central role. The core structure of this creative learning and teaching method is designed based on the theory of measuring creative thinking by Professor E. Paul Torrance. The development approach of creative thinking, known as lateral thinking by Edward de Bono, has evolved from the Problem-based Learning (PBL). PBL emphasizes learner-centered teaching and has yielded positive results in various countries. The theory of creative thinking has led to the creation of a new model of active learning, where teaching is centered

around learners and utilizes the use of thinking tools in managing teaching and learning. Teaching through creative thinking involves prioritizing learners, similar to the use of representational thinking in instructional management. This process facilitates changing problem situations and enables the development of learning experiences through hands-on activities (Hall, 1996: 235). The use of representational thinking serves as a beneficial tool for learners in creating understanding, communicating information, and demonstrating reasoning (Greeno & Hall, 1997: 361-367). This enables learners to convey and link understanding about thinking processes, problem-solving method choices, and pathways for problem resolution. Communication may be facilitated through the use of graphs, tables, diagrams, maps, models, or symbols to convey the intended meaning.

To enhance the effectiveness of instruction, educators must possess a critical proficiency known as Technological Pedagogical Content Knowledge (TPCK). TPCK encompasses the understanding and skill of teachers to strategically and diversely incorporate technology into learning processes and instructional methods within their specific content domains. This knowledge empowers the creation of conducive learning environments, enabling students not only to absorb information but also to cultivate fresh insights in the subject matter through the adept use of appropriate technology. Educators proficient in managing these interrelationships can demonstrate this expertise in various ways, depending on their specific skills. The deliberate integration of technology across diverse subject matters has been shown to have a substantial impact, as elucidated by Mishra and Koehler in 2006.

This study seeks to outline guidelines for the creation of a novel instructional model, termed the TPCK-CBL Model, which integrates Creativity-Based Learning (CBL) with Technological Pedagogical Content Knowledge (TPCK). The focus is on applying this innovative model in the context of teaching Grade 7 mathematics.

The authors began by reviewing the literature related to CBL. Then, the authors summarized the common characteristics of CBL, resulting in six steps as shown in Table 1.

Source					Common characteristics of CBL
Riangnarong & Silanoi (2015)	Ruachaiphanich (2015)	Numna (2017)	Srisutham (2019)	Nureak (2021)	
Stimulate creative thinking	Stimulate interest	Stimulate interest	Stimulate interest	Stimulate interest	Stimulate students' interest to be creative
Set individual problems	Pose problems and group according to interests	Pose problems and group according to interests	Pose problems and group according to interests	Pose problems and group according to interests	Pose problems and group students based on common interests
Group activities	Research and think	Research and think	Research and think	Research and think	Collaboratively investigate and think
Present	Present	Present	Present	Present	Present results
Evaluate outcomes	Evaluate outcomes	Evaluate outcomes	Evaluate outcomes	Evaluate outcomes	Evaluate learning

Table 1: Summary of common characteristics of CBL

The foundation of creative learning management with the integration of technology consists of 6 steps.

Step 1: Stimulate Interest to Create
In this stage, the teacher explores the learners' prior knowledge. Then, they stimulate the learners' interest to generate creative thinking by presenting issues, problems, situations, or events encountered in daily life using diverse and contemporary media and technology.

Step 2: Identify the Creative Problem
In this stage, learners identify creative problems related to the presented issues, problems, situations, or events. The teacher, in the role of a coach, guides and advises learners in specifying problems within the scope of the presented issues or situations and the content of the lesson.

Step 3: Investigate to Construct Conceptual Representation and Create Product
In this stage, learners in each group collaborate to investigate and find answers from chosen learning sources related to their groups problem-solving. Subsequently, they collectively analyze the obtained answers and create a conceptual representation to summarize the knowledge. They then use technology appropriately. The teacher's role is to provide guidance, encourage learners to choose information accurately, monitor group work, offer suggestions, ask questions, and provide opportunities for learners to think independently.

Step 4: Present the Conceptual Representation and Product
In this stage, each group of learners presents the conceptual representation used to find answers to the set problem or the creative product of the group. This presentation is done using suitable media and technology. The teacher stimulates questions and comments to prompt learners to express thoughts on the subject and complements the knowledge.

Step 5: Apply
This stage involves the teacher encouraging learners to apply the knowledge gained from the search for answers. The teacher verifies the correctness to ensure learners develop accurate ideas and can apply them effectively.

Step 6: Summarize and Evaluate
In the final stage, learners collectively summarize all the knowledge acquired during the lesson. The teacher stimulates, checks, and supplements the parts where learners may have missed summarizing.

The authors then applied the 6 steps of the TPCK-CBL learning model to design the TPCK-CBL lesson plans for teaching the content of Graphs and Linear relations. The details of the lesson plan are as follows.

Step 1: Stimulate Interest to Create (Duration: 50 Minutes)

A teacher explores students' prior knowledge to ensure they have an adequate foundation for learning about pairs by having students take a pre-learning quiz on pairs, consisting of 10 questions. The quiz is conducted using the Kahoot application.

The teacher stimulates students' interest and encourages creative thinking by requiring them to watch the YouTube video titled "10 Tourist Attractions in Nakhonsithammarat: Travel Thailand." The video is 8.46 minutes long and can be accessed through the link https://www.youtube.com/watch?v=uwsWV2QlLPA.

After students have watched the video, the teacher randomly asks 4-5 students about the relationships they observed in various aspects from the video, using the following questions (10 minutes).

Teacher: From the video, what relationships did you observe?

Expected answer: relationships between various tourist attractions and their locations in Nakhonsithammarat province, such as the natural beauty of Kiriwong Village in Lansaka District, Nui Nok Nok Island in Khanom District, the sluice gate of Utakawipat and Lalum Phuk in Pakphanang District, the ancient city wall, Wat Mahathat Wora Maha Viharn, the main city shrine, Tha Nakasuksa Ratthawut Wichian Shrine, Nang Talung Suchart, and the halls of Phra Issawar and Phra Naryan in Mueang District.

Teacher: Which districts in Nakhonsithammarat have you visited, and what are they known for?

Expected answer: Student previous experiences, mentioning various districts in Nakhonsithammarat, such as Lansaka District with the best climate in Thailand, Mueang District with the Royal Park 84 (Thung Tha Lat), Pak Phanang District with the Klong Katun reservoir, Phrom Khiri Kiri District with the City Residency, and Sichon District with the Chedi Temple (Ai Khai), among others.

Teacher: What renowned local products or OTOP items do you know, have used, tasted from Nakhonsithammarat? Can you mention some products and specify which district they are from?

Expected answer: students' previous experiences, mentioning products like Lala sweets and Taptim Siam pomelos from Pak Phanang District, Taling Plao leather products from Mueang District, and natural dyed fabric and herbal products from Lansaka District.

The teacher commends the students for presenting their thoughts on the relationships observed in various aspects from the mentioned video. The teacher then provides an opportunity for students with additional questions or uncertainties regarding the video to ask further questions (5 minutes).

Step 2: Identify the Creative Problem (15 Minutes)

The teacher distributes Worksheet 1.1 on "The Relationships between Various Aspects and Locations in Nakhonsithammarat Province" (as attached in the learning plan). Each student individually specifies a creative problem found in the video clip "10 Tourist Attractions in Nakhonsithammarat: Travel Thailand." The teacher may provide an example of a problem for students to understand. Students can identify problems such as (15 minutes):

1. Is the coffee shop "Bus Cafe" located in the district of Sichon?
2. Is "Khanom La" from the Pak Phanang district the most famous in Nakhonsithammarat province?
3. Which districts in Nakhonsithammarat province are not coastal?
4. What are the renowned OTOP (One Tambon One Product) items in each district of Nakhon Si Thammarat, and in which district are they located?
5. Which seaside tourist destinations in Nakhonsithammarat province are popular among both local and international tourists, and in which district are they located?
6. What are the historical sites in Nakhonsithammarat province, and in which district are they located?
7. Does the Phrom Khiri District have the most waterfalls in Nakhonsithammarat province?

The teacher instructs all students to write down creative problems identified in the video following the guidelines provided in worksheet 1.1 on the relationships between various elements and the locations in Nakhon Si Thammarat. Each student records their problems on the classroom board. Afterward, the teacher and students collaborate to group the problems related to the relationships between the issues students wish to address and the locations in Nakhonsithammarat (20 minutes).

Students form groups of 4-6 members, grouping themselves based on the problems outlined in worksheet 1.1 regarding the relationships between various elements and the locations in Nakhon Si Thammarat. The number of groups depends on how many problem categories were summarized during the classroom presentations (10 minutes).

The teacher distributes Activity Sheet 1.1 regarding the guidelines for designing solutions to relationship-based problems between various elements and the locations in Nakhonsithammarat (as attached in the lesson plan). Each group of students is tasked with designing solutions for the relationship problems between their identified issues and the locations in Nakhon Si Thammarat. During this activity, the teacher acts as a coach, providing guidance on designing solutions that align with the identified problems related to various elements and the locations in Nakhonsithammarat (30 minutes).

Step 3: Investigate to Construct Conceptual Representation and Create Product (60 Minutes)

Each group of students collaborates to investigate and find answers to the problems assigned to them by studying information from various learning sources. They use the gathered information to construct conceptual representations and create products related to the assigned problems, utilizing suitable learning resources or databases. This may involve online research, library resources, textbooks, or Knowledge Sheet 1.1 on "Pairs" (as attached in the lesson plan). While students are engaged in research, the teacher observes their interests, curiosity, and questions, and provides suggestions and guidance to ensure that students effectively find solutions to the problems in a suitable and efficient manner (30 minutes).

Students use the information obtained from their research to complete Activity Sheet 1.2 on Creating Representations of Various Places in Nakhonsithammarat (as attached in the lesson plan). Group members work together to analyze the information or answers they have gathered and use them to create the most appropriate conceptual representation. This representation may take various forms such as tables, diagrams, maps, models, etc., aiming for a clear and concrete understanding of the solutions to the assigned problems. The teacher observes students' responsibility for their decision-making process, their efforts to ensure accuracy and precision, and their dedication to the task. Additionally, the teacher provides guidance on analyzing data or answers, ensuring correctness, and addressing any questions that arise during the data analysis and representation creation process (30 minutes).

Step 4: Present the Conceptual Representation and Product (60 Minutes)

The teacher randomly selects groups of students for presentation using a spinning wheel. The link shorturl. asia/KFLCI or the QR code is utilized for this purpose.

Representatives from each group present their conceptual representation or creative product using various media and technologies to explain their solutions to the assigned problems. Presentations follow the sequence determined by the randomly selected order. Each group is given a presentation time not exceeding 5 minutes. After each group completes their presentation, the teacher encourages the audience to ask questions, share thoughts, and analyze the accuracy and coverage of the solutions presented by their peers. The teacher provides guidance, stimulates questions, shares comments, and analyzes answers or conceptual representations and creative products from other classmates (30 minutes).

Each group of students verifies the accuracy of their answers to ensure comprehensive coverage. They also make improvements and corrections based on questions, comments, and suggestions from peers and the teacher. Throughout this process, the teacher may ask questions to guide students in refining their answers and ensuring they address the problems comprehensively.

Question: Is tie-dye fabric an OTOP product of only Lankasuka District, or is it available in other districts in Nakhonsithammarat Province?

Expected answer: Tie-dye fabric is an OTOP product in Lankasuka District, Chawang, and Nopphitam in Nakhonsithammarat Province. However, tie-dye fabric from Lankasuka District is the most renowned OTOP product.

The teacher comments the students' works focusing on researching solutions, creating conceptual representations, and presenting their works excellently. Subsequently, each group of students is to submit Activity Sheet 1.1 and Activity Sheet 1.2 to the teacher (15 minutes). The teacher and students collectively discuss and summarize the knowledge gained from the research, which should be summarized as follows (5 minutes).

Guidelines for summarizing knowledge gained from research:

The problem and the answers obtained revolve around the relationship of pairing between two things. In mathematical terms, the relationship of pairing between members of two groups is referred to as an "ordered pair."

The teacher presents additional knowledge about "Ordered pairs" as follows (takes 5 minutes).

If 'a' is a member of the first group and 'b' is a member of the second group, expressed in symbols as (a, b), it is read as "ordered pair A, B." 'a' is referred to as the first element, and 'b' is referred to as the second element.

The teacher presents an additional example regarding "Ordered pairs" as follows:

Example: Write all the ordered pairs from the table showing the relationship between the number of days and the number of hours that your teacher dedicates to teaching at school. Let the first member represent the number of days, and the second member represents the number of hours your teacher dedicates to teaching.

Number of days	1	2	3	4	5	6
Number of hours	6	12	18	24	30	36

Expected answer: You can write all the ordered pairs with the first member as the number of days and the second member as the number of hours as follows: (1, 6), (2, 12), (3, 18), (4, 24), (5, 30), (6, 36).

The teacher presents an additional example regarding "Ordered pairs" as follows:

Example: Write all the ordered pairs from the table showing the relationship between the number of days and the number of hours that your teacher dedicates to teaching at school. Let the first member represent the number of days, and the second member represent the number of hours your teacher dedicates to teaching.

The teacher gives students the opportunity to ask additional questions or express doubts about ordered pairs and examples of ordered pairs (5 minutes).

Step 5: Apply (35 minutes)

The teacher encourages students to apply the knowledge gained from the search for answers by randomly assigning students to write ordered pairs of solutions to problems with the locations in Nakhon Si Thammarat. Students should read and explain the meaning of each ordered pair (5 minutes).

The teacher asks questions for students to compete in answering, aiming to check their understanding and create enthusiasm. The first student to answer correctly will receive a reward from the teacher (5 minutes).

Question: Create three different and diverse ordered pairs. The first member can be any number, and the second member is one of three times that number.

Expected answer: The answer can vary, such as three different and diverse ordered pairs. The first member can be any number, and the second member is one of three times that number, for example $(3,1), \left(-\frac{1}{2}, -\frac{1}{6}\right), (1.23, 0.41)$ etc.

Teacher Instructions: The teacher instructs the students to complete the skills exercise 1.1 on ordered pairs (as provided in the attached document) to assess their understanding. The teacher emphasizes applying the knowledge gained from the activity (20 minutes).

After completing Skills Exercise 1.1 on Ordered Pairs (as attached in the learning plan document), the teacher randomly selects individual students to present their solutions. Each student is required to honestly record their scores in the score sheet. The teacher then collects the exercises for further evaluation. If any student scores below the specified standard, the teacher schedules remedial sessions for those students after school or assigns simpler exercises to reinforce their foundational knowledge (5 minutes).

Step 6: Summarize and Evaluate (25 Minutes)

In collaboration, students summarize the knowledge gained from the lesson on "Ordered Pairs" as follows (5 minutes).

Guidelines for summarizing the knowledge gained from the lesson on "Ordered Pairs."

"Ordered Pairs" refer to the relationship of pairing elements between two groups.

If 'a' is a member of the first group and 'b' is a member of the second group, it is represented by the symbol (a, b). Read as 'Ordered Pair AB,' where 'a' is referred to as the first member, and 'b' is referred to as the second member.

The teacher prompts, checks, and fills in gaps in the parts where students may have incomplete summaries. The teacher raises questions related to "Ordered Pairs" by randomly selecting students to answer. Students are asked to match the ordered pairs of the problem's answers with the locations in Nakhonsithammarat that they researched and write them in the form of ordered pairs (a, b) and (b, a). The teacher then discusses the meaning of these ordered pairs (5 minutes).

Question: Do (a, b) and (b, a) have the same meaning? Explain.

Expected answer: (a, b) and (b, a) do not have the same meaning. For example, (Namtok Phrom Lok, Amphoe Phrom Khiri) means Namtok Phrom Lok is located in Amphoe Phrom Khiri. On the other hand, (Amphoe Phrom Khiri, Namtok Phrom Lok) means Amphoe Phrom Khiri is within Namtok Phrom Lok. Therefore, (Namtok Phrom Lok, Amphoe Phrom Khiri) and (Amphoe Phrom Khiri, Namtok Phrom Lok) have different meanings.

Teachers evaluate learning outcomes by having students complete a post-test on the topic of matching pairs, consisting of 10 questions (10 minutes).

Teachers assess students' learning outcomes through the evaluation of Assignment 1.1 on the topic of the relationships between various elements and the locations in Nakhonsithammarat province. This includes Activity Sheet 1.1 on designing relational problem-solving approaches between different elements and their locations in Nakhonsithammarat province, as well as Activity Sheet 1.2 on creating representations of various ideas in different locations within the province, using appropriate assessment criteria (5 minutes).

Conclusion: Implications

This article showcases the integration of technology into Creativity-Based Learning (CBL) to formulate the TPCK-CBL model, aiming to augment students' creative thinking and conceptual representation. The authors implement six teaching steps within the TPCK-CBL model while crafting lesson plans tailored for teaching mathematics to Grade 7 students. Demonstrated as beneficial for both educators and learners, the TPCK-CBL model strives to nurture students' analytical and creative thinking alongside fostering knowledge creation.

Facilitating the communication of understanding, the model incorporates the use of graphs, tables, diagrams, maps, models, or symbols. Moreover, active student participation in the learning process promotes effective teamwork and collaboration. These attributes are paramount in the 21st century, and fostering such qualities among the children and youth of Thailand holds the promise of cultivating a high-quality population, ensuring the nation's sustainable future.

Acknowledgments

Integration of STEAM With Local Context for Enhancing Early Childhood Students' Creativity

Sri Insura, Anubanphusing School, Thailand
Jirutthitikan Pimvichai, Mahidol University, Thailand

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This article aims to: a) review, analyze and synthesize the literature related to Science, Technology, Engineering, Art and Mathematics (STEAM) education and Context-based Learning (CBL); and b) developing the Context-based STEAM instructional model for enhancing creative skills in early childhood. The authors analyzed the STEAM instruction from the national and international contexts by using content analysis. Then, the researchers synthesized the teaching steps of STEAM Integrated with Local Context (L-STEAM) for enhancing early childhood students' creative thinking. The teaching steps from these literatures were analyzed. From the analysis, the authors synthesized the L-STEAM teaching model consisted of six teaching steps: a) Introduce STEAM problem, b) Investigate, c) Act, d) Share, e) Apply and Extend and f) Self-assessment. At final, the authors raised one example of L-STEAM lesson plan for teaching the Toys and Accessories topic for early childhood students. This example may guide other early childhood teachers in applying local context in teaching with STEAM in any subject they assigned to teach.

Keywords: STEAM Education, Local Context, Creative Thinking, Early Childhood

Introduction

Thailand places importance on delivering education with quality and equity for all Thai citizens. As evident in the 2017 Constitution of the Kingdom of Thailand, Section 5 Article 54, "The state shall ensure that every child receives twelve years of education, from pre-school to the end of compulsory education, with quality and without charge" (Office of the Secretary-General of the House of Representatives, 2540, p. 14). Additionally, the 1999 National Education Act, as amended in 2002 (2nd edition), Article 10: Rights and Responsibilities in Education, specifies that "Education management must provide individuals with equal rights and opportunities for basic education without charge, not less than 12 years" (Office of the National Education Commission, 2545, p. 7).

Quality education is crucial for the development of the country, as emphasized in the National education plan B.E. 2560-2579 (A.D. 2017-2036) (Office of the Education Council, 2017):

> Education is a fundamental right of all Thai citizens that the state must provide to foster the holistic development of individuals at every stage of life. It aims to cultivate intellectual capital crucial for developing skills, qualities, and competencies necessary for professions and leading a fulfilling life in harmony with others in society. (p. 10)

In the Early Childhood Curriculum B.E. 2560 (A.D. 2017), early childhood education concentrates primarily on fostering the holistic development of children from birth to the age of six. The overarching goal of early childhood education is to provide a comprehensive and nurturing learning environment that supports the physical, emotional, social, and cognitive growth of young learners (Ministry of Education Thailand, 2017). Early childhood education encompasses the deliberate cultivation of caregiving skills and the facilitation of learning processes that seamlessly correspond with the natural and age-appropriate development of every child. This approach is designed to unlock each child's fullest potential within the unique framework of their social and cultural environment.

Early childhood education plays a pivotal role in shaping children into well-rounded adults, particularly in the context of the substantial societal and economic shifts witnessed in the 21st century. With rapid advancements in science and technology defining this era, fostering early learning in science, technology, and mathematics becomes imperative. By emphasizing these foundational skills during the formative years, we equip children with the essential tools needed for both current learning and future life challenges. This approach empowers them to lead a high-quality life that aligns seamlessly with the dynamics of both the contemporary world and upcoming transformations (Ministry of Education Thailand, 2017).

Early childhood is crucial for the development of cognitive abilities and the nurturing of creativity. Introducing STEAM concepts during this period sets a solid foundation for a lifelong love of learning and exploration. Hands-on, experiential activities delivered through STEAM education can engage children minds, making learning a joyful and memorable experience. STEAM education embodies an integrated teaching approach that seamlessly combines Science, Technology, Engineering, Arts, and Mathematics into a cohesive and unified pedagogical framework. STEAM education goes beyond the conventional boundaries of subjects, encouraging a holistic approach to learning. By seamlessly integrating science, technology, engineering, arts, and mathematics, educators aim to cultivate a multidimensional

skill set that empowers students to solve complex problems, think creatively, and adapt to an ever-changing global landscape (Loapideht, 2013; Ministry of Education, Thailand, 2017).

Context-based Learning (CBL) is recognized as a constructivist teaching method that places strong emphasis on and leverages the local context surrounding children throughout the learning process. Integrating local context with STEAM education elevates the significance of cultural and contextual relevance in early childhood learning, adding an extra layer of importance to the educational process. By infusing lessons with elements from students' cultural backgrounds, educators not only boost engagement but also nurture a sense of identity and pride. This approach acknowledges the diversity among learners, ensuring that education remains relatable and meaningful for each student (Crawford, 2001; Bennett, Grasel, Parchmann and Waddington, 2005; Gilbert, 2006; Potter and Overton, 2006; Boonmaton, Supap and Wiriyapong, 2018; Tungkawasakul 2017; Tippang, 2019; Gudhom, 2017).

Integrating the local context can significantly enhance student engagement in learning. Students are more likely to be engaged and motivated when learning experiences resonate with their daily lives and cultural backgrounds. The fusion of STEAM with the local context not only encourages students to think creatively but also facilitates the connection of theoretical concepts with real-world applications within their own cultural framework. However, upon a thorough examination of the literature pertaining to education in the Thai context, it becomes evident that there is a gap in research regarding the current situation, problems, and needs regarding the integration of local context in STEAM education for teaching early childhood.

Research Questions

The research questions were: a) What are the current situation, problems, and needs related to STEAM education and CBL in the context of early childhood education; and b) What are the desirable characteristics of a new learning model integrated STEAM education and CBL.

Research Objectives

The research objectives were two folds: a) to investigate the current situation, problems, and needs of STEAM education and CBL in early childhood education; and b) to develop a new learning model integrated STEAM education and CBL for early childhood education.

Literature Review

This section presents the literature review about CBL and STEAM education as follows.

Context-Based Learning (CBL)

The transformations in the learning landscape of the 21st century have given rise to teaching approaches that underscore the significance of context, notably termed as Context-based Learning (CBL). Within CBL, learners engage in educational experiences intertwined with real-life situations encountered in their daily lives. The integration of context in teaching proves advantageous in cultivating students' skills and fostering a profound comprehension of knowledge. CBL serves as a pedagogical strategy that prioritizes delivering learning content within a context closely tied to students' everyday realities. This principle is dedicated to

advancing learning experiences that resonate with various situations in learners' daily lives, facilitating the connection of acquired knowledge with real-life experiences.

CBL underscores the importance of integrating contexts aligned with real-life situations, fostering engaging and meaningful learning experiences for students. The successful implementation of CBL in educational settings necessitates support from educational organizations and teachers alike. Schools should actively create an environment conducive to the incorporation of context in teaching, while teachers should undergo training to enhance their skills in crafting and delivering contextually rich lessons.

Hence, CBL emerges as a teaching strategy that accentuates the creation of meaningful learning experiences closely aligned with real-life situations in learners' day-to-day existence. By employing context as the foundation for learning, this approach involves linking the learning content to the experiences and situations in the actual lives of students. This connection ensures that the learning is not only meaningful within its immediate context but also applicable and transferable to diverse situations, enriching the overall educational experience (Crawford, 2001; Bennett, 2005; Gilbert, 2006; Potter and Overton, 2006; Boonmatan, 2016; Tungkawasakul 2017; Tippang, 2019; Kuadhom, 2017).

STEAM Education

STEAM Education, an innovative educational approach seamlessly integrating Science, Technology, Engineering, Arts, and Mathematics into the learning process. Martinez and Stager (2013) underscored the significance of providing students with opportunities to creatively produce their own work through engaging science and engineering activities through STEAM education. Mae Jemison (2019), a renowned astronaut and physician, advocates for the fusion of science and art, actively supporting STEAM Education as a means to cultivate creativity in students. Mitch Resnick (2018), is an executive and researcher, who leads the Scratch project, which is a creative programming learning platform used to promote collaboration with technology in creative production. Andrea Beaty (2013) is the author of the book "Rosie Revere, Engineer" and other works that focus on encouraging children's interest in experimentation and creative work in various STEAM fields. The scholars emphasize the importance of STEAM Education in developing essential skills for the future e.g., fostering creativity, and collaborating with technology and innovation in a rapidly changing society (Martinez and Stager, 2013; Beaty, 2013).

Research Methodology

This research employs a mixed-method research design. Specifically, the quantitative research utilizes survey research, while the qualitative research involves Focus Group Discussions (FGD).

Quantitative Research

The quantitative research was a survey of teachers' and parents' perspectives on the current situation, problems and needs regarding STEAM education and CBL.

Data Collection

The research instrument was a questionnaire incorporating a five-scale rating (5 = Very high, 4 = High, 3 = Moderate, 2 = Low, and 1 = Very low). For collecting data from teachers, the researchers utilized an instrument called "Problems and Needs in Teaching with STEAM and CBL Questionnaire," which was structured into three distinct parts: Part 1: Background of respondents (5 items); Part 2: Problems and needs in in teaching with STEAM and CBL (20 items); and Part 3: Suggestions for further developing STEAM and CBL (1 open-ended item).

For collecting data from parents, the researchers utilized an instrument called "Problems and Needs in Teaching with STEAM and CBL Questionnaire," which was structured into three parts: Part 1 background information. Part 2 problems and needs of teaching with STEAM and CBL (16 items) and Part 3 suggestions.

Data Analysis

The background data from Part 1 was analyzed for frequencies and percentages. The data from Part 2 was analyzed by calculating for mean and standard deviation (SD). The interpretation of mean ranges of each item in Part 2 (Wongratana, 2007) was as: mean 4.50 - 5.00 was interpreted as a Very High level of problems and needs; while mean 3.50 - 4.49, 2.50 – 3.49, 1.50 – 2.49, and 1.00 – 1.49 were interpreted as the problems and needs were at a High, Moderate, Low and Very Low levelsm respectively. Furthermore, the qualitative data from Part 3 was analyzed by content analysis.

Qualitative Research

Focus group discussion (FGD) were conducted with 35 early childhood teachers (all females), who had experience in teaching with STEAM education and CBL more than five years.

Data Collection

The FGD with teachers about current situation, problems, and needs in STEAM education and CBL was a semi-structured interview: three, one and three questions focusing on the current situation, problems and needs of STEAM education and CBL, respectively.

Data Analysis

The researchers using five steps in analyzing qualitative data from FGDs Preparing, Segmenting, Coding, Categorizing and Thematizing (Buaraphan, 2017).

Results and Discussion

The results and discussion will be presented according to the research questions as follows.

Teachers' Perspectives on Current Situation, Problems and Needs in Teaching With STEAM Education and CBL

All responding teachers were female. Most of them aged 41-45 years old (34.30%), followed by 46-50 years old (31.40%), and 51-55 years old (11.40%). A majority of respondents was fallen in a Professional Level (K2) (68.60%), followed by Practitioner Level (K1) (14.30%) and Others (14.30%). A majority of respondents have teaching experience ranging from 21 to 25 years (37.10%), followed by 16 to 20 years (20.00%) and less than 6 years (14.30%).

Of 35 respondents, the teachers' perspectives on the problems and needs in implementing STEAM education and CBL can be presented as Table 1.

Statement		Mean	SD	Interpretation
Problems				
	School			
1.	STEAM education is not suitable for the local community context.	3.17	1.12	Moderate
2.	STEAM education is not suitable for the school context.	3.14	1.12	Moderate
3.	School administrator does not support STEAM education.	3.26	1.07	Moderate
4.	Teachers do not support STEAM education.	3.09	1.17	Moderate
	Curriculum			
1.	School lacks a STEAM education curriculum.	3.31	1.03	Moderate
2.	School lacks the STEAM education lesson plans.	3.43	1.04	Moderate
3.	Implementation of STEAM education is not widespread in the school.	3.51	0.98	High
	Teacher			
1.	Teachers are not yet ready for STEAM education.	3.43	0.98	Moderate
2.	Teachers lack knowledge and understanding of STEAM education.	3.03	0.89	Moderate
3.	Teachers lack awareness of the importance of STEAM education.	3.26	1.01	Moderate
4.	Teachers lack skills in teaching with STEAM education.	3.14	0.97	Moderate
5.	Teachers have not sufficiently utilized local contexts in teaching with STEAM education.	3.29	1.07	Moderate
	Student			
1.	Kindergarten students are not yet ready for STEAM education.	3.34	1.11	Moderate
2.	Kindergarten students are not yet ready in learning with context-based learning.	2.94	0.94	Moderate
3.	Students have not yet developed problem-solving skills to a satisfactory level.	3.09	1.01	Moderate
4.	Students have not yet developed creative thinking skills to a satisfactory level.	3.23	0.94	Moderate

5.	Students have not yet developed sufficient awareness of local context conservation.	3.26	0.78	Moderate
	Overall problems	**3.23**	**1.02**	**Moderate**
Needs				
	School			
1.	The local community needs STEAM education.	3.23	0.84	Moderate
2.	Schools need STEAM education.	3.83	0.89	High
3.	School administrators should support the implementation of STEAM education.	3.86	0.88	High
4.	School administrators should support the use of local context into teachers' teaching.	3.91	0.92	High
	Curriculum			
1.	Schools should develop a STEAM education-based curriculum.	4.03	0.89	High
2.	Schools should promote teachers to design STEAM education-based lesson plans.	3.83	0.71	High
3.	Schools should encourage the implementation of STEAM education across all levels within schools.	3.94	0.64	High
	Teacher			
1.	Teachers should be ready prepared for implementation of STEAM education.	3.94	0.68	High
2.	Teachers should improve their knowledge and understanding of STEAM education.	4.17	0.75	High
3.	Teachers should raise their awareness of the importance of STEAM education.	4.26	0.78	High
4.	Teachers should develop skills in teaching with STEAM education.	4.23	0.77	High
5.	Teachers should utilize local contexts in teaching STEAM education.	4.23	0.81	High
	Students			
1.	Kindergarten students should be ready prepared for learning with STEAM education.	4.31	0.76	High
2.	Kindergarten students should be ready for context-based learning.	3.97	0.75	High
3.	Students should be developed problem-solving skills to a satisfactory level.	3.89	0.76	High
4.	Students should be developed creative thinking skills to a satisfactory level.	3.94	0.80	High
5.	Students should be developed awareness of local context conservation.	4.06	0.80	High
	Overall needs	**3.98**	**0.79**	**High**

Table 1: Teachers' perspectives on the problems and needs in implementing STEAM education and CBL

In overall, the responding teachers perceived a moderate level (mean = 3.2, SD = 1.02) of problems in implementation of STEAM education and CBL. The top three problems were:

Implementation of STEAM education is not widespread in the school (mean = 3.51, SD = 0.98), followed by the school lacks the STEAM education lesson plans (mean = 3.43, SD = 1.04) and Teachers are not yet ready for STEAM education (mean = 3.43, SD = 0.98).

The responding teachers reflected a high level (Mena = 3.98, SD = 0.79) of needs in teaching with STEAM education and CBL. The top three needs were: Kindergarten students should be ready prepared for learning with STEAM education (mean = 4.31, SD = 0.76), followed by Teachers should raise their awareness of the importance of STEAM education (mean = 4.26, SD = 0.78), Teachers should develop skills in teaching with STEAM education (mean = 4.23, SD = 0.77), and Teachers should utilize local contexts in teaching STEAM education (mean = 4.23, SD = 0.81).

Parents' Perspectives on Current Situation, Problems and Needs in Teaching With STEAM Education and CBL

From the survey of 21 parents regarding the current situation, problems and need in learning with STEAM education and CBL, a majority of respondents were female (66.70%) with their age range between 56 to 60 years old (81.00%).

Statement		Mean	SD	Interpretation
Problems				
1.	School are not ready yet for implementing STEAM education.	1.81	0.93	Low
2.	Teachers are not yet ready for STEAM education.	1.62	0.74	Low
3.	Teachers lack skills in teaching with STEAM education.	2.05	0.92	Low
4.	Teachers have not sufficiently utilized local contexts in teaching with STEAM education.	2.14	0.72	Low
5.	Kindergarten students are not yet ready for STEAM education.	1.86	0.65	Low
6.	Students have not yet developed problem-solving skills to a satisfactory level.	1.67	0.73	Low
7.	Students have not yet developed creative thinking skills to a satisfactory level.	1.48	0.75	Low
8.	Students have not yet developed sufficient awareness of local context conservation.	1.86	0.65	Low
	Overall problems	**1.81**	**0.76**	**Low**
Needs				
1.	The school needs to be developed to be ready to implement STEAM education.	2.81	1.12	Moderate
2.	Teachers should be ready prepared for implementation of STEAM education.	3.43	0.98	Moderate
3.	Teachers should raise their awareness of the importance of STEAM education.	3.48	0.51	Moderate
4.	Teachers should utilize more local contexts when teaching with STEAM education.	3.90	1.04	High

5.	Kindergarten students should be ready prepared for learning with STEAM education.	3.81	0.75	High
6.	Students should be developed problem-solving skills to a satisfactory level.	4.00	0.84	High
7.	Students should be developed creative thinking skills to a satisfactory level.	4.38	0.81	High
8.	Students should be developed awareness of local context conservation.	4.28	0.78	High
	Overall needs	**3.76**	**0.85**	**High**

Table 2: Parents' perspectives on the problems, and needs in implementing STEAM education and CBL

In overall, the responding parents perceived a low level (mean = 1.81, SD = 0.76) of problems in teaching with STEAM education and CBL. Three top problems were: Teachers have not sufficiently utilized local contexts in teaching with STEAM education (mean = 2.14, SD = 0.72), followed by Teachers lack skills in teaching with STEAM education (mean = 2.05, SD = 0.92), and Students have not yet developed sufficient awareness of local context conservation (mean = 1.81, SD = 0.86).

In addition, the parents reflected a high level of needs in STEAM education and CBL (mean = 3.76, SD = 0.85). The top three needs were: Students should be developed their creative thinking skills to a satisfactory level (mean = 4.38, SD = 0.81), followed by Students should be developed their awareness of local context conservation (mean = 4.28, SD = 0.78), and Students should be developed their problem-solving skills to a satisfactory level (mean = 4.00, SD = 0.84).

From FGD, the participating teachers reflected their perspectives on the current situation in teaching with STEAM education and CBL in three main points.

Current situation 1: Teachers were not yet ready prepared for integrating local contexts with STEAM education

The teachers stated that though they implemented STEAM with their students, they still lacked an ability to apply local contexts in STEAM teaching. They reflected the issues like: Integrating local contexts with STEAM education was a novel idea; They tried to emphasize integration of STEAM in various contexts; they tried to integrate STEAM disciplines; STEAM education provided students with the opportunity for developing problem-solving skills.

> In STEAM education, children were tasked with collecting leaves to craft into boats. Before embarking on the actual creation, the children were encouraged to plan and draw pictures, and then they floated their boats to observe whether they sank or floated. The children were joyful, and there was significant collaboration in organizing the activity. (Teacher 01*, FGD)
> *Note: T01 representing Teacher no. 1 in FGD

Current situation 2: Teachers reflected positive attitudes towards STEAM education

The participating teachers reflected their positive attitudes towards STEAM education as: STEAM education was a new pedagogy for kindergarten level; Students learned with STEAM could apply knowledge in real situations and develop creativity; Students enjoy STEAM education through practice and design; STEAM education could facilitate the holistic development in children. However, teachers mentioned obstacles like: Teaching with STEAM education took too much time and Some children need more encouragement to work collaboratively in team.

Current situation 3: Appropriateness in integrating local contexts with STEAM education

The participating teachers stated that integrating various local contexts with STEAM education was suitable for kindergarten students and school contexts. In addition, the teachers mentioned their problems in teaching with STEAM education. The teachers stated the difficulty in managing student learning in STEAM education. Many parents and children did not understand the multiple steps of STEAM education.

The participating teachers agreed that teaching with STEAM education was an innovative idea and they stated their needs in teaching with STEAM education: more learning resources, more support from schools, more trainings on knowledge and skills being essential for successful implementation of STEAM education in kindergarten level. In overall, STEAM education could promote continuous development in children.

Development of a New Learning Model Integrated Local Contexts in STEAM Education for Teaching Early Childhood Education

The authors reviewed the literature related to STEAM education and CBL (CORD, 1999; Bennett, 2005; Gilbert, 2006; De Jong and den Hartog, 2008; University of Southern California, 2009; Thanakwong, 2016; Sa-nguansak, 2019; Plodpluang, 2020) Subsequently, they synthesized the steps of Local Context-based STEAM Education (L-STEAM) into six steps, as outlined in Table 3.

Key Characteristics of CBL	Key Characteristics of STEAM Education	Summary of key characteristics of Context-based STEAM Education
Learning emphasizing contexts being relevant to learners' diverse real-life experiences	Learning is organized in an integrative manner of STEAM	Engaging learners by introducing a STEAM problem integrated diverse and appropriate local contexts being relevant to students' real-life experiences
	A teacher presents problem situations that exist in the real-life context of the learners	A teacher presents problem situations that exist in students' real-life contexts.
	Students gather information and ideas related to the problem	Students gather information and ideas related to the problem
	Students choose an appropriate problem-solving method and create art-embedded product	Students choose an appropriate problem-solving method and create art-embedded product

Learning through hands-on and problem-solving activities	Students test and evaluate the created product and seek ways to improve it	Students work collaboratively to test and evaluate the created product and seek ways to improve it
Learning collaboratively		
Presentation of learned knowledge	Students present products and process and get feedbacks from a teacher and peers	Students present products and process and receive feedbacks from a teacher and peers for further improvement
Applying learned knowledge meaningfully to other contexts		Students apply and transfer learned knowledge and experience meaningfully to other contexts
Transferring learned knowledge to different situations		
Self-assessment of learning	Students gain positive attitudes towards learning process and outcome	Students conduct self-assessment and cultivate positive attitudes towards learning with STEAM education

Table 3: Summary of key characteristics of Context-based STEAM Education

STEAM stands for Science (S), Technology (T), Engineering (E), Arts (A), and Mathematics (M). STEAM education is rooted in STEM education emphasizing learner-centered pedagogy that begins with problem-solving in the context of students' real lives.

The teaching steps of components Context-based STEAM Education can be described as: **Step 1: Introduce STEAM problem:** The teacher presents real-life problem situations in the context of students' lives, connecting Science (S), Technology (T), Engineering (E), Arts (A), and Mathematics (M); **Step 2: Investigate:** Students gather information about the problem, choose problem-solving methods, and design integrated artistic works: **Step 3: Act** Students collaboratively engage in hands-on testing and evaluate their works; **Step 4: Presentation:** Students present their problem-solving methods and integrated artistic works; **Step 5: Apply and Extend:** Application and extension of knowledge, where students apply what they have learned to different situations; and **Step 6: Self-assessment:** Students assess their own learning, review their work, and identify areas for improvement after each session.

Conclusion

The teachers in this study reflected a moderate level of problems in implementing STEAM education and CBL in kindergarten level. They also mention that the school lacks STEAM education lesson plans and kindergarten teachers are not yet ready for STEAM education. The teachers reflected a high level of needs in teaching with STEAM education and CBL. The teachers state that the kindergarten students should be ready prepared for learning with STEAM education. In addition, kindergarten teachers should raise an awareness of STEAM education and further develop skills in integrating local contexts with STEAM education.

The parents in this study perceived a low level of problems in teaching with STEAM education and CBL. They mention that teachers lack STEAM teaching skills and have not sufficiently utilized local contexts in teaching. Students have not yet developed sufficient awareness of local context conservation. Also, the parents reflected a high level of needs in teaching with STEAM education and CBL. They need their child to further develop problem-solving skills, creative thinking skills and awareness of local context conservation.

Early childhood teadhers can effectively utilize the L-STEAM model outlined in this study. Additionally, they have the option to employ the guidelines provided in this research to craft a new learning model tailored to their specific classroom and school settings. Successful integration of the L-STEAM model hinges on increased support from both school administrators and local communities. Administrators play a pivotal role in fostering an environment conducive to the implementation of the L-STEAM model, urging educators to adopt it and facilitating the exchange of insights acquired from real-world applications in kindergarten classrooms through Professional Learning Communities (PLCs). To further enhance the competence of teachers interested in implementing the L-STEAM model, comprehensive training is essential, encompassing a deep understanding, enhanced abilities, and heightened awareness of the model's effective implementation.

Ustaz Hanafi: A Transformative Figure in Malay Silat Through the Education of the Persatuan Seni Silat Cekak Malaysia (PSSCM)

Mohd Azuwan Maoinser, Universiti Teknologi PETRONAS, Malaysia
Anis Suria Mohd Zainudin, Universiti Sultan Azlan Shah, Malaysia
Abdul Hazim Abdullah, Universiti Teknologi PETRONAS, Malaysia

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Ustaz Hanafi, the late Founder, President, and Guru Utama of the Persatuan Seni Silat Cekak Malaysia (PSSCM), was a well-known figure among the members of the organization and the Malay martial arts community. This study aims to examine Ustaz Hanafi's character as a Silat master in PSSCM. Interviews were conducted with 15 active members who had studied under Ustaz Hanafi during the early days of PSSCM. The findings revealed that Ustaz Hanafi possessed a firm and serious demeanour as a Silat master, which was crucial for effectively transmitting and preserving the knowledge of the martial art. Despite the organization being in its infancy in Kuala Lumpur, Ustaz Hanafi's compassionate nature as a teacher fostered a strong bond with his students, ensuring their continued dedication and participation in PSSCM. The philosophy of Ustaz Hanafi's Silat education aimed to cultivate individuals who would contribute to their religion, nation, and country. His distinctive character set him apart from other contemporary Silat masters and allowed him to transform many troubled individuals within PSSCM into better versions of themselves. This paper explores in detail how Ustaz Hanafi's character contributed to the growth and development of PSSCM as a prominent martial arts organization. His leadership, combined with his strict yet caring approach, propelled the organization forward and established its reputation as it stands today. Ustaz Hanafi's legacy as a Silat master continues to inspire and shape the values of PSSCM, fostering a community of dedicated practitioners who strive to make a positive impact.

Keywords: Malay Silat, Martial Art, Transformative Figure, Education

Introduction

Ustaz Hanafi is a transformative figure in the world of Malay Silat, particularly through his role as the founder and 1st Guru of the Persatuan Seni Silat Cekak Malaysia (PSSCM). His influence extends beyond just the physical aspects of Silat, as he emphasized the importance of upholding moral values and respecting one's cultural heritage. Ustaz Hanafi sought to instil a sense of national pride and a strong moral compass in the youth practicing Silat through education within the PSSCM. His teachings encompassed not only the physical discipline of martial arts but also emphasized the significance of moral education and the preservation of cultural traditions. Ustaz Hanafi's dedication to nurturing individuals into well-rounded citizens echoes a sentiment shared by other educators, conveying a holistic approach to personal and national development. According to (Jayanti & Kumalasari, 2022), culture, education, and religion are interrelated. Ustaz Hanafi recognized the importance of integrating religion, culture, and patriotism in shaping the character of individuals and promoting unity within society.

Historically, Silat Cekak was reborn in 1965 with the involvement of 20 students, including Ustaz Hanafi. It was initially introduced as a Silat organization in 1964 under the name Perkumpolan Seni Sari Budaya Sri Kedah and later as Persatuan Seni Silat Chekak Kedah Malaysia in 1971. Subsequently, Ustaz Hanafi strengthened Seni Silat Cekak Malaysia by establishing the legally recognized association PSSCM in 1975 under the Registrar of Societies in Malaysia. Ustaz Hanafi founded PSSCM with the aim of extending the teaching of Seni Silat Cekak Malaysia to communities across Peninsular Malaysia, with a particular focus on students in higher education institutions. This expansion is evident in the initiation of classes in Universiti Malaya (UM), Universiti Kebangsaan Malaysia (UKM), Institut Teknologi MARA (ITM), Universiti Sains Malaysia (USM) and Universiti Pertanian Malaysia (UPM) from 1974 to 1976 (Ahmad & Janudin, 2023). Presently, the number of classes continues to grow in higher education institutions, extending to include education institutions at the middle and elementary school levels. Through the years, his philosophy in teaching students is still relevant and aligns with the national education philosophy. Ustaz Hanafi's approach aligns with Malaysia's national education philosophy, emphasizing holistic development to create well-balanced individuals with intellectual, spiritual, emotional, and physical harmony. The philosophy aims to produce knowledgeable, competent citizens with high moral standards, fostering personal well-being and contributing to family, society, and the nation at large (Malaysia, 2013).

Researchers have undertaken numerous studies to explore the cultivation of positive values contributing to the development of commendable character traits within PSSCM members. One of the earliest studies was conducted by (Ismail, 2002) that discussed the role of Seni Silat Cekak Malaysia in cultivating the self-identity of its members. He asserted that PSSCM, as a non-governmental organization active in safeguarding positive native culture, plays a crucial role in addressing the fading identity of the Malay nation. As a curriculum subject in higher education institutions, Seni Silat Cekak Malaysia has effectively honed the soft skills of university students through their involvement in diverse events that extend beyond the exclusive focus on martial arts (Aizat & Nurazreena, 2013; Maoinser, M. Zaid, & W. Mohar, 2017). The spectrum of soft skills developed by PSSCM includes communication skills, critical thinking and problem-solving skills, teamwork skills, continuous learning and information management, entrepreneurial skills, professional ethics and morality, and leadership skills. In addition to these skills, Seni Silat Cekak Malaysia is proficient at nurturing the Islamic spiritual aspect of its Muslim members, aligning its practices with

Islamic teachings and Malay culture (Ahmad, Ab Majid, Aziz, & Ahmad, 2019; Ezani & Salleh, 2021). Furthermore, PSSCM fosters a sense of volunteerism among its members, contributing to community development and empowerment in Malaysia (Janudin & Samah, 2020).

Despite the existing studies, there is a noticeable gap in research focusing on the character of Ustaz Hanafi and its impact on fostering positive values among PSSCM members. Hence, this manuscript seeks to undertake a qualitative investigation into the characters of Ustaz Hanafi. Through interviews with a cohort of 15 individuals who shared a close relationship with Ustaz Hanafi between 1975 and 1986, this study aims to uncover the fundamental aspects of his character as Guru Silat Cekak. The ultimate goal is for these findings to present Ustaz Hanafi as a role model, influencing both present and future PSSCM members.

Methodology

The study is undertaken in several stages, beginning with a preliminary meeting involving the 3rd President and Guru Utama of PSSCM, Datuk Haji Maideen Kadir Shah, and several prominent figures from PSSCM. This initial phase is followed by scheduling interview appointments with these figures, conducting the actual interviews, transcribing the recorded sessions, and subsequently analyzing the interview content through transcription. Figure 1 illustrates the flow chart of this interview process.

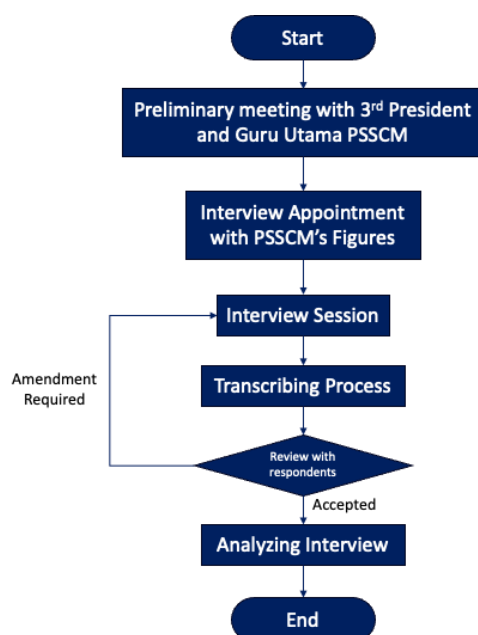
Approximately 15 respondents, who have learned Seni Silat Cekak Malaysia from Ustaz Hanafi and are currently active members of PSSCM, were interviewed for the study. These respondents hail from diverse backgrounds and various states in peninsular Malaysia, collectively amassing over 40 years of experience in PSSCM.


Figure 1: Flowchart of the research

Result and Discussion

Affectionate Teacher and Assimilation of Islamic Teaching Through PSSCM

The initial thematic analysis, derived from interviews with 15 esteemed figures in PSSCM, depicts Ustaz Hanafi as a compassionate instructor who simultaneously imparts Islamic teachings through PSSCM. Safaran notes that although Ustaz Hanafi is a stringent teacher, he shows genuine concern for his students without any discrimination. Abdul Karim echoes this sentiment, affirming that Ustaz Hanafi, while strict, employs an accessible teaching approach, emphasizing his warm-hearted nature. Supporting this viewpoint, Izham & Roziah emphasize in their interviews that Ustaz Hanafi underscores the importance of a strong teacher-student relationship, having close connections with his own students. Zainol adds that Ustaz Hanafi consistently urges all instructors to be warm and approachable to attract new students to learn Silat Cekak.

Ustaz Hanafi's character as a teacher was very outstanding by giving the father-figure vibes towards all his students. Almost all the interviewees responded that Ustaz Hanafi was a strict teacher but at the same time he was approachable and cared for each and every one of his students. This kind of teaching approach was very effective according to (Bhavna Barmi et al, 2023) because by showing affection, only then the teacher will be able to connect with his student on emotional level and build trust. Developed in the 1950s by psychologist and educator Benjamin Bloom, Bloom's Taxonomy stands as a widely embraced pedagogical instrument, playing a pivotal role in shaping the planning and assessment of the teaching and learning process. This methodology categorizes learning objectives into three distinct domains—cognitive, affective, and psychomotor—and establishes a hierarchy that delineates a progressive cycle of learning (Santos et al, 2024). This underscores the importance of emphasizing the emotional connection between teachers and students to ensure the optimal delivery of education.

The second thematic analysis focuses on the integration of Islamic Teaching through PSSCM. According to Rosman, Ustaz Hanafi is adept at guiding individuals who have deviated from Islamic teachings through Silat. Roziah also noted that Ustaz Hanafi consistently underscores the concept of "tawakkal", where individuals entrust the course and outcome of a task to Allah after demonstrating their determination (Alan & Isi, 2023). To further support this perspective, Sabariah highlighted Ustaz Hanafi's extensive knowledge of Islamic teachings, particularly the concept of tawhid, which signifies belief and the testimony that there is no God other than Allah (Tetelepta et al., 2023).

Ustaz Hanafi successfully integrated Islamic teachings into PSSCM as he had previously obtained religious education from an Islamic boarding school (pondok) before teaching Silat. Additionally, he received valuable religious instruction from outstanding teachers of that time, as documented by Halimah in 1978. Consequently, when Ustaz Hanafi later instructed Silat, he effectively incorporated his religious knowledge by blending Islamic teachings with Silat. This approach served as one of his methods for promoting and imparting Islamic principles to the Muslim community.

Martial Art Expert and Professionalism Element in Managing PSSCM as a Leader

Ustaz Hanafi is renowned as a martial arts expert. Not only is he proficient in Silat Cekak, but he is also recognized for his expertise in Silat Sendeng. This acknowledgment comes not only from his students but is explicitly confirmed by four individuals who were interviewed. In his interview, Datuk Haji Maideen remarked, "Ustaz Hanafi has also delved into other martial arts, such as Silat Sendeng." Zafri Miar echoed Datuk Haji Maideen's sentiment, affirming that Ustaz Hanafi possesses substantial experience in Silat Sendeng.

As a distinguished leader and founding father of PSSCM, Ustaz Hanafi is regarded as a visionary figure. Abdul Majid affirmed this assertion by highlighting that Ustaz Hanafi employed the strategy of showcasing practical demonstrations to promote Silat Cekak, aiming to engage and encourage audiences to become members of PSSCM. This is evident in his introduction of Silat Cekak to established universities such as Universiti Sains Malaysia (USM) and Universiti Teknologi MARA (UiTM), formerly known as Institute Teknologi MARA (ITM). The vision of integrating silat cekak into these universities has materialized, with the establishment of seni silat cekak Malaysia as an academic subject at Universiti Sains Malaysia.

This integration is reflected in Figure 1, depicting the demographic of students who have learned silat with Ustaz Hanafi and are still active in Persatuan Seni Silat Cekak Malaysia. The figure illustrates Ustaz Hanafi's strategic focus on both public and university settings. His influence extends beyond traditional boundaries, and the acceptance of silat modernization is evident among the residents of Kuala Lumpur. This sentiment is supported by Mohd Shafie, who expressed in his interview that, "Modernizing the development of silat is crucial for broader public acceptance."

Universiti Sains Malaysia (USM), Pulau Pinang

7. Mdm. Sabariah binti Safar

Universiti Teknologi Mara (UiTM), Shah Alam
1. Mr. Ghazali bin Abdul Rahman
2. Mdm. Faridah binti Abu Bakar

Figure 2: The demographic of respondents

Ustaz Hanafi demonstrates professionalism in teaching silat by maintaining strictness in his Silat Cekak classes while treating all students equally. This characteristic was highlighted by Safaran Haji Ahmad during his interview, as he stated, "Ustaz Hanafi was a strict teacher but deeply concerned about his students, showing no discrimination among them." This

exemplifies Ustaz Hanafi's professionalism in imparting the art of Seni Silat Cekak Malaysia. Abdul Karim Mohd Saied, in his interview, further emphasized this point, noting that Ustaz Hanafi is strict yet employs an easy-to-understand teaching approach, coupled with a warm-hearted demeanor.

Charismatic and Positive Personality

The thematic analysis of the interviews revealed consistent keywords describing Ustaz Hanafi's positive personality. According to Norida, Ustaz Hanafi was characterized as strict, warm-hearted, loving and always emphasizing the importance of honesty in both heart and speech. Sabariah echoed this sentiment by highlighting Ustaz Hanafi's loving and responsible traits while maintaining a soft-spoken demeanor. Additionally, Faridah portrayed Ustaz Hanafi as a casual and easy-going individual that making him approachable across all age levels. Ghazali further remarked that anyone acquainted with him would undoubtedly be awed and captivated by his extraordinary qualities. The positive traits mentioned such as being warm-hearted, patient, wise, morally upright, honest, responsible, soft-spoken, casual, and easy-going, collectively demonstrated Ustaz Hanafi's ability to create a nurturing and supportive environment for his students.

Ustaz Hanafi's warmth and patience contributed to the creation of a safe space for learning, fostering an atmosphere where students feel comfortable expressing themselves. His wisdom and moral integrity served as guiding principles, instilling the importance of making responsible and ethical choices. Furthermore, his honesty fosters a culture of trust and openness, enabling effective communication and constructive feedback. Ustaz Hanafi's loving and caring character enhances personal development and strengthens the bond between teacher and student, promoting a sense of belonging. Moreover, Ustaz Hanafi's soft-spoken and casual demeanor contributes to a relaxed learning atmosphere, encouraging students to perform their Silat Cekak training with comfort and enjoyment. The impact of these positive traits extends beyond technical skills in Silat movement and emphasizing the transformative influence he has on PSSCM members.

The analysis suggests that Ustaz Hanafi possessed charismatic leadership qualities in spearheading PSSCM. His positive personality aligned with characteristics of charismatic leaders, described as magnetic, persuasive, and likable (Murray, 2020). According to charismatic leadership theory, such leaders have the ability to transform the needs, values, and aspirations of followers from self-interests to collective interests and led to a high level of commitment towards achieving the organization's vision and mission (House & Howell, 1992). Additionally, the work of (Nikezić, Doljanica, & Bataveljić, 2013) suggested that charismatic leaders are often regarded in theory as transformational leaders, possessing unique skills that afford them greater influence and personal charisma. Furthermore, a statistical analysis conducted by (Supratman, Entang, & Tukiran, 2021) supported the notion that a charismatic leader's personality significantly influenced the performance of subordinates within an organization. The charismatic and positive personality attributed to Ustaz Hanafi by the respondents unmistakably positions him as a transformative figure in Malay Silat, particularly within the PSSCM members. His leadership style aligns with established theories, emphasizing the profound impact of charisma on organizational commitment and performance.

Conclusions

Drawing from the findings and discussions, it is evident that Ustaz Hanafi possesses extensive knowledge in Islamic teachings, expertise in martial arts, effective leadership skills, a nurturing teaching approach, and a positive personality. The esteemed Ustaz Hanafi played a transformative role in Malay Silat through his contributions to PSSCM education. His notable attributes included firmness, a harmonious rapport with students, articulate communication, genuine warmth, wisdom, and a loving disposition.

The Effect of e-Learning System on Academic Performance in Higher Learning Institutions in Tanzania: Moderating Effect of Behavioral Intention

Deus N. Shatta, National Institute of Transport, Tanzania
Bahati K. Mabina, National Institute of Transport, Tanzania

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This research evaluated the direct impact of an e-learning system on academic performance at higher education institutions in Tanzania. The research was guided by the modified Unified Theory of Acceptance and Use of Technology (UTAUT) and used descriptive and explanatory cross-sectional survey research designs. Likewise, the study used the positivism paradigm and a simple random sampling technique to get a sample size of 322 respondents. The data were obtained through administration of questionnaires and the review of relevant documents. The acquired data underwent inferential statistical analysis using Partial Squares Structural Equation Modeling with the assistance of SmartPLS 4. Additionally, descriptive statistical analysis was performed using IBM SPSS Statistics Version 26 to examine the data collected on respondents' profiles. The results indicate that the e-learning system and behavioral intention have a direct impact on academic performance. Nevertheless, the moderation effect of behavioral intention on the link between the e-learning system and academic performance is negligible. The research confirms that both the e-learning system and behavioral intention have a significant impact on academic performance. Thus, it is essential for higher education institutions in Tanzania and other developing nations to take into account the behavioral intentions of students while deploying e-learning systems in order to optimize the academic performance.

1. Introduction

Learning is a cognitive process that enables individuals to acquire information, skills, and competencies, which in turn influence their decision-making and behavioral patterns (Suresh et al., 2018; Shatta, 2023; Kuliya & Usman, 2021; Chahal & Rani, 2022; Mailizar et al., 2021; Tawafak et al., 2021; Al-Adwan & Al-Debei, 2023). The primary advantage of e-learning is its effective delivery of educational content (Suresh et al., 2018). This includes improved access to information, easy content updates, personalized instruction, convenient distribution, standardized content, and increased accountability (Suresh et al., 2018; Mailizar et al., 2021; Bhalalusesa et al., 2023; Abramson et al., 2015; Abhirami & Devi, 2022; Kuliya & Usman, 2021; Ramadiani et al., 2017; Revythi & Tselios, 2019; Abramson et al., 2015; Kuliya & Usman, 2021).

Electronic content can be updated more easily compared to printed material, and e-learning technologies enable educators to swiftly and effortlessly alter their content (Chahal & Rani, 2022; Mailizar et al., 2021; Tawafak et al., 2021; Al-Adwan & Al-Debei, 2023). Similarly, in e-learning, learners have the ability to manipulate the content, learning order, speed of learning, timing, and frequently, the media used, enabling them to customize their experience to fulfill their individual learning goals (Suresh et al., 2018; Shatta, 2023; Kuliya & Usman, 2021; Chahal & Rani, 2022; Mailizar et al., 2021; Tawafak et al., 2021; Al-Adwan & Al-Debei, 2023).

The advent of internet technology enables the extensive dissemination of digital material to many consumers concurrently, regardless of time and location (Shatta, 2023; Mailizar et al., 2021). E-learning provides a faster, more cost-effective, and potentially superior alternative to traditional education (Suresh et al., 2018). It should be readily accessible to all individuals due to its transformative impact on the college experience for students worldwide (Shatta, 2023; Bhalalusesa et al., 2023; Abramson et al., 2015; Abhirami & Devi, 2022; Kuliya & Usman, 2021; Ramadiani et al., 2017; Revythi & Tselios, 2019). However, there is an ongoing debate in the current research literature on the use or not use of moderators and mediators in studies related to the adoption of technologies, including the implementation of e-learning (Ogundega, 2019; Nassar et al., 2019; Shatta, 2023; Chen et al., 2011; Dwivedi et al., 2017; Venkatesh et al., 2003; Venkatesh et al., 2012; Venkatesh et al., 2016; Alaba et al., 2020; Abubakar & Ahmad, 2015; Mtebe & Raisamo, 2014; Suresh et al., 2018).

Previous studies have examined the influence of both mediators and moderators on the adoption of technologies, as well as the impact of mediators alone on technology use and academic performance. For instance, Ogundega (2019), Venkatesh et al. (2003) and Nassar et al. (2019) explored the effects of both mediators and moderators on use behavior of technologies. On the other hand, Dwivedi et al. (2017) and Shatta (2023) focused solely on the effects of mediators on technology use and academic performance respectively. Nevertheless, the impact of moderators alone on technology use behavior or academic performance has received little attention (Abubakar & Ahmad, 2015). Thus, the objective of this research was to demonstrate how behavioral intention of students acts as a moderator in strengthening the effect of e-learning system on academic performance in higher learning institutions.

1.1 Constructs Development and Hypotheses Formulation

This study used one construct (behavioral intention) from the modified UTAUT by Dwivedi et al. (2017) and other two constructs (e-learning system and academic performance) from the empirical literature review to develop the research model and formulate the hypotheses (Venkatesh et al., 2003; Venkatesh et al., 2016; Venkatesh et al., 2012; Shatta, 2023; Suresh et al., 2018).

1.1.1 Constructs Development

This study adopted the modified Unified Theory of Acceptance and Use of Technology (UTAUT) by Dwivedi et al. (2017) because of its arguments on moderators and additional of other construct in explaining the variance in users' intention to use Information Technologies (IT). Dwivedi et al. (2017) argues that moderators of gender, age, experience and voluntariness have no impact on linkages of constructs (performance expectancy, effort expectancy, social influence and behavioral intention) and use behavior. This argument was supported by the number of existing prior empirical studies (Shatta, 2023), which dropped the four moderators suggested by the origin UTAUT by Venkatesh et al. (2003) and added the academic performance and e-learning as constructs to explain the variance in user's intention to use IT (Dwivedi et al., 2017; Shatta, 2023; Venkatesh et al., 2016; Venkatesh et al., 2012). Figure 1 shows the direct and indirect elements of the modified UTAUT by Dwivedi et al. (2017).

1.1.2 Hypotheses Formulation

Unlikely the criticisms of prior studies by Shatta (2023) and by Dwivedi et al. (2017), on moderation effect, this study argued that behavioral intention would positively moderate the effect of e-learning system on academic performance in higher learning institutions. The direct moderation of behavioral intention on the effect of e-learning system on academic performance was predicted as new theoretical contribution because the existing theories and models had not comprehended this phenomenon (Chen et al., 2011; Dwivedi et al., 2017; Venkatesh et al., 2003; Venkatesh et al., 2012; Venkatesh et al., 2016). In addition, several studies had predicted the effects of e-learning system and behavioral intention on academic performance (Suresh et al., 2018; Abramson et al., 2015; Kuliya & Usman, 2021; Ramadiani et al., 2017; Revythi & Tselios, 2019) and the findings revealed positive and significant

effects. For the purposes of validating and advancing the findings of the existing theorical and empirical literature, this study thought behavioral intention to use e-learning system would positively moderate the effect of e-learning system on academic performance a substance that had not been tested by prior empirical studies and theories (Dwivedi et al., 2017; Venkatesh et al., 2012; Venkatesh et al., 2016; Chahal & Rani, 2022; Mailizar et al., 2021; Tawafak et al., 2021).

H₁: *Behavioral Intention (BI) would positively and directly effect the Academic Performance (AP)*
H₂: *e-Learning System (eLS) would positively and directly effect the Academic Performance (AP)*
H₃: *Behavioral Intention (BI) would positively moderate the direct effect of e-Learning System on Academic Performance (AP)*

1.1.3 Conceptual Model of the Study

The conceptual model of this study was prepared after getting the concepts from the theoretical and empirical literature. The conceptual model of the study is presented in Figure 2.

1.1.4 The Mathematical Model for Latent Variable and Its Observed Indicators

This study adopted the mathematical model $x=lY+e$, to display the association between a latent variable and its observed indicators as revealed in Figure 2. x represents the observed indicator variable, Y represents the latent variable, l is the loading which represents a regression coefficient quantifying the strength of the relationship between x and Y, and e represents the random measurement error (Shatta, 2023; Sarstedt et al., 2022).

2. Methodology

2.1 Research Philosophy, Design, Methods and Tools for Data Collection and Analysis

The study used positivism philosophy and an explanatory cross-sectional survey research methodology, which included collecting data once from a specific group by analyzing a sample of that population (Creswell & Plano, 2018). Furthermore, this research used a survey methodology to collect data from two institutions of higher education (National Institute of Transport and Procurement and Supplies Professionals and Technicians Board). This approach was chosen because it enables the collection and quantitative analysis of data using descriptive and inferential statistics.
