To fulfill the assumptions of this study, we used the tenth rule guideline offered by Hair et al. (2019) for using PLS-SEM and SmartPLS software in data analysis. This guideline was utilized to validate the minimum number of participants needed to examine the proposed research model. According to Hair et al. (2019), the tenth rule states that the minimum sample size needed to test the hypotheses of the research model is equal to ten times the number of indicators of the exogenous construct. In this study, there were six indicators of behavioral intention and e-learning system, which are considered as exogenous constructs. According to the tenth rule of thumb suggested by Hair et al. (2019), the minimum sample size for this study was 60. However, a sample size of 322 respondents used was enough to test the hypotheses of this research, as it exceeded the minimal requirement of 60 respondents. Furthermore, closed-ended surveys were given numerical values to streamline and enhance the accuracy of quantitative data analysis.

The quantitative data acquired for respondents' profile were evaluated using descriptive statistics, using IBM SPSS Statistics Software Version 26. The inferential statistical analysis for evaluating the hypotheses was conducted using Partial Least Squares Structural Equation Modeling (PLS-SEM) with the assistance of SmartPLS 4 software. The extra answer approach was used to address missing data using the SmartPLS 4 software. This research used the value of 99 as a substitute for seventeen (17) missing values that were included in the questionnaires. Conversely, this approach facilitated the establishment of a consistent distinction between data that was seen and data that was not observed (Hair et al., 2019). The identification of outliers was conducted using IBM SPSS Statistics version 26. This included estimating the frequencies of all variables and assessing their degree of agreement. No anomalies were detected in this study.

2.2 Evaluation of Measurement Model and Structural Model

This study used the criteria set forth by Hair et al. (2019) to assess the measurement model and structural model of the proposed research model. There were four processes involved in examining the reflective measuring models: When evaluating the reliability of indicators, the value should be greater than 0.708. Similarly, when assessing the internal consistency of composite reliability of constructs, the value should also be greater than 0.708. For evaluating the convergent validity of constructs, the Average Variance Extracted (AVE) value should be greater than 0.5. On the other hand, for assessing discriminant validity, the Heterotrait-Monotrait Ratio of Correlations (HTMT) criterion value should be less than 0.9. Similarly, the presence of collinearity among the components of the structural model was investigated. As to Hair et al. (2019), VIF values over 5 suggest the presence of likely collinearity across

the predictor constructs difficulties. However, collinearity issues may also arise with VIF values ranging from 3 to 5. Optimally, the VIF values should be in proximity to 3 or below.

Once collinearity was accounted for, the primary factors used to evaluate the structural model in PLS-SEM were as follows: the path coefficients needed to be statistically significant, with t-statistics above 1.96 at a significance threshold of 0.05 for all pathways. Additionally, p-values of 0.05 or below were considered to indicate significance. The R2 values of 0.75, 0.50, and 0.25 may be categorized as significant, moderate, and weak correspondingly (Hair et al., 2019). Similarly, f^2 effect sizes greater than 0.02, 0.15, and 0.35 indicate small, medium, and large impact sizes respectively (Hair et al., 2019). The predictive relevance, as measured by the Q^2 effect size, should have a value greater than zero (Hair et al., 2019; Becker et al., 2018). In general, the assessment findings for both the measurement and structural models were satisfactory and satisfied all the criteria set by Hair et al. (2019).

3. Results

3.1 Respondents' Profile

The female student participants were around 70 percent of the total, while the male participants constituted approximately 30 percent. The results align with the research findings of Shatta (2023), but contradict the study findings of Bhalalusesa et al. (2023), which reported that 71.4 percent of the participants were men and 28.6 percent were girls. Additionally, it is noteworthy that almost 53 percent of the participants were actively pursuing bachelor's and master's degrees. The results of this research suggest that the data gathered from the participants may be regarded as genuine. Table 1 displays the demographic characteristics of the participants in this study.

Table 1: *Type of Respondent * Education Level Crosstabulation*

	Education level				
	Certificate Level	Diploma Level	Bachelor Degree	Master' Degree	Total
Female Students	80	44	85	15	224
Male Students	10	18	45	25	98
Total	**90**	**62**	**130**	**40**	**322**

3.2 R^2 Values, Relevance of the Path Coefficients and Indicators' Loadings Values

Hair et al. (2019) propose that R^2 values of 0.75, 0.50, and 0.25 might be categorized as considerable, moderate, and weak, respectively. The findings of this research showed that the R^2 values for the endogenous construct was 0.516 without moderator and 0.656 with moderator, suggesting an increase of power after introducing the moderator. According to the established criteria outlined by Hair et al. (2019), the values of 0.516 and 0.656 exceeded the minimal level recommended. These findings suggest that the moderator behavioral intention together with e-learning system accounts for 65.6 percent of the variability in academic performance. Additionally, e-learning system alone explains 51.6 percent of the variability in academic performance. Furthermore, it is noteworthy that all path coefficients had positive relationships, indicating that when one standard deviation rises in behavioral intention and in e-learning system corresponds to an improvement in academic performance. Figure 3 and

Figure 4 display the values of R², the outcomes of path coefficients, and the values of indicators' loadings without and with moderator respectively.
Figure 3: *Values of R² without moderator*
Figure 4: *Values of R² with a moderator*

3.3 Reliability and Convergent Validity

The loadings values of the indicators in Figures 3 and 4 were all greater than 0.708, except eLS1, eLS4 and eLS5 of which were less than 0.708. Based on the findings of Hair et al. (2019), indicators with a reliability value below 0.708 may be considered for removal, but only if their exclusion would result in an improvement in both composite reliability (CR) and Average Variance Extracted (AVE). Based on this evidence, eLS1, eLS4 and eLS5 were not deleted because they did not affect the internal consistent reliability and the convergent validity of all constructs. All Average Variance Extracted (AVE) values, were greater than 0.5 and all composite reliability (CR) values were above 0.708 as shown in Table 2. The findings of this study indicate that there were favourable response patterns observed, and each construct demonstrated convergence in explaining the variability of its respective item (Hair et al., 2019).

Table 2: *Internal Reliability and Convergent Validity Results*

Construct	Composite Reliability (CR)	Average Variance Extracted (AVE)
Academic Performance (AP)	0.929	0.685
Behavioral Intention (BI)	0.937	0.712
e-Learning System (eLS)	0.866	0.520

3.4 Discriminant Validity

This is the extent of how indicators actually represent a construct and how they are different from other construct (Hair et al., 2019). The discriminant validity was assessed based on criteria suggested by Hair et al. (2019) in which the discriminant validity Heterotrait-Monotrait Ratio of Correlations (HTMT) criterion value should be < 0.9. The results for Heterotrait-Monotrait Ratio of Correlations (HTMT) criterion values of this study are presented in Table 3.

Table 3: *Heterotrait-Monotrait Ratio of Correlations (HTMT) Criterion Value Results*

Construct	Academic Performance (AP)	Behavioral Intention (BI)	e-Learning System (eLS)
Behavioral Intention (BI)	0.876		
e-Learning System (eLS)	0.831	0.954	
Behavioral Intention (BI) x e-Learning System (eLS)	0.473	0.581	0.605

3.5 Assessment of Coefficient of Determination (R^2)

Coefficient of determination (R^2) is the variance explained in the endogenous latent variable by exogenous latent variables (Hair et al., 2019). However, Hair et al. (2019) recommended three levels of structural model quality as; substantial (75%), moderate (50%) and weak (25%) respectively. During the assessment of measurement model for this study, the standard PLS algorism was calculated for the main effect model and R^2 value was 0.656, which implied satisfactory because it was above moderate and below substantial (Hair et al., 2019). Table 4 presents the coefficient of determination (R^2) value for this study.

Table 4: *Coefficient of Determination (R^2)*

Endogenous Latent	R-square	R-square adjusted
Academic Performance (AP)	0.656	0.653

3.6 Collinearity Statistics (VIF)

The current research evaluated collinearity statistics by using the variance inflation factor (VIF). The VIF values obtained for all items were below 5, suggesting the lack of collinearity concerns among the predictor constructs in the proposed study model (Hair et al., 2019). The collinearity statistical data for the inner model of the proposed research model, as determined by the VIF metric, are shown in Table 5.

Table 5: *Collinearity Statistics (VIF)*

	Academic Performance (AP)
Behavioral Intention (BI)	3.446
e-Learning System (eLS)	3.435
Behavioral Intention (BI) x e-Learning System (eLS)	1.497

3.7 Significance of the Path Coefficients

After doing bootstrapping analysis, the results indicated significant support for two expected hypotheses, whereas one hypothesis was not supported. The results of this study demonstrate the presence of the two predicted relationships in real-world situations. However, one hypothetical prediction does not manifest in reality. The significance of the path coefficients results are shown in Figure 5.
Figure 5: *Significance of the Path Coefficients Results*

3.8 Direct and Moderation Effects of the Hypotheses

Figure 3 presents the results that prove the significant influence of the e-learning system and behavioral intention on academic performance in this study. After opening the report of bootstrapping analysis, Table 6 displays the direct and moderation effects of the hypotheses that were predicted in the research.

Table 6: *Direct and Moderation Effects of the Hypotheses Tested Results*

Hypothesis	Original sample (O)	Sample mean (M)	Standard deviation (STDEV)	T statistics (|O/STDEV|)	P values
BI-> AP	0.683	0.670	0.075	9.168	0.000
eLS -> AP	0.153	0.166	0.070	2.184	0.029
BI x eLS -> AP	0.005	0.003	0.016	0.306	0.760

3.9 Importance-Performance Map Analysis Results

The construct of behavioral intention, as depicted in Figure 6, is situated above the average of the importance and performance of the target construct, namely academic performance. This positioning is logical as it suggests the need to prioritize the behavioral intention of students during implementation of the e-learning systems, with the aim of improving overall academic performance in higher learning institutions. On the other hand, the construct e-learning system is seen below the average of importance but it is above the average of performance. This implies that e-learning system has a restricted impact on the target construct (academic

performance). Therefore, it should be considered of lesser relevance in order to improve the academic performance.
Figure 6: *Importance-Performance Map Analysis Results*

4. Discussion of Results

4.1 The Hypotheses Tested for the Theorized Research Model

This research proposed that behavioral intention would have a direct positive impact on academic performance. The findings revealed positive path coefficient and that there is a direct relationship was statistically significant (p value < 0.05). These findings imply that an increase of one standard deviation of behavioral intention leads to an improvement of academic performance and the correlation exists in real life. The findings align with the current empirical study conducted by Shatta (2023) which revealed that behavioral intention had a significant effect on academic performance (p value < 0.05).

Nevertheless, this research predicted that e-learning system would have a direct impact on academic performance. The findings revealed that there is positive path coefficient, suggesting that an increase of one standard deviation of e-learning system would result in an improvement of academic performance in higher learning institutions. The results of this study align with recent research by Suresh et al. (2018) which found that e-learning had a significant effect on academic performance (p value < 0.05).

Moreover, this research postulated that behavioral intention would moderate the effect of e-learning system on academic performance. The result indicates positive path coefficient, suggesting that when one standard deviation of e-learning system rises would result in a corresponding increase in strengthening the link of academic performance and e-learning system. However, the relationship was found not statistically significant (p value > 0.05) which implies that the correlation does not exist in real life. These results are considered as theoretical contribution since they had not been documented previously by the original and modified UTAUTs (Chen et al., 2011; Dwivedi et al., 2017; Venkatesh et al., 2003; Venkatesh et al., 2012; Venkatesh et al., 2016).

5. Conclusion

5.1 Theoretical Implications

Theoretical contribution has been made to existing modified theories and models as a result of filling the identified theoretical gap, as presented in Figure 7. The moderating effect of behavioral intention on the relationship between e-learning system and academic performance, has been thoroughly understood contrary to the modified UTAUT proposed by Dwivedi et al. (2017). This understanding fills a gap in the existing theoretical literature (Chen et al., 2011; Dwivedi et al., 2017; Venkatesh et al., 2003; Venkatesh et al., 2012; Venkatesh et al., 2016).

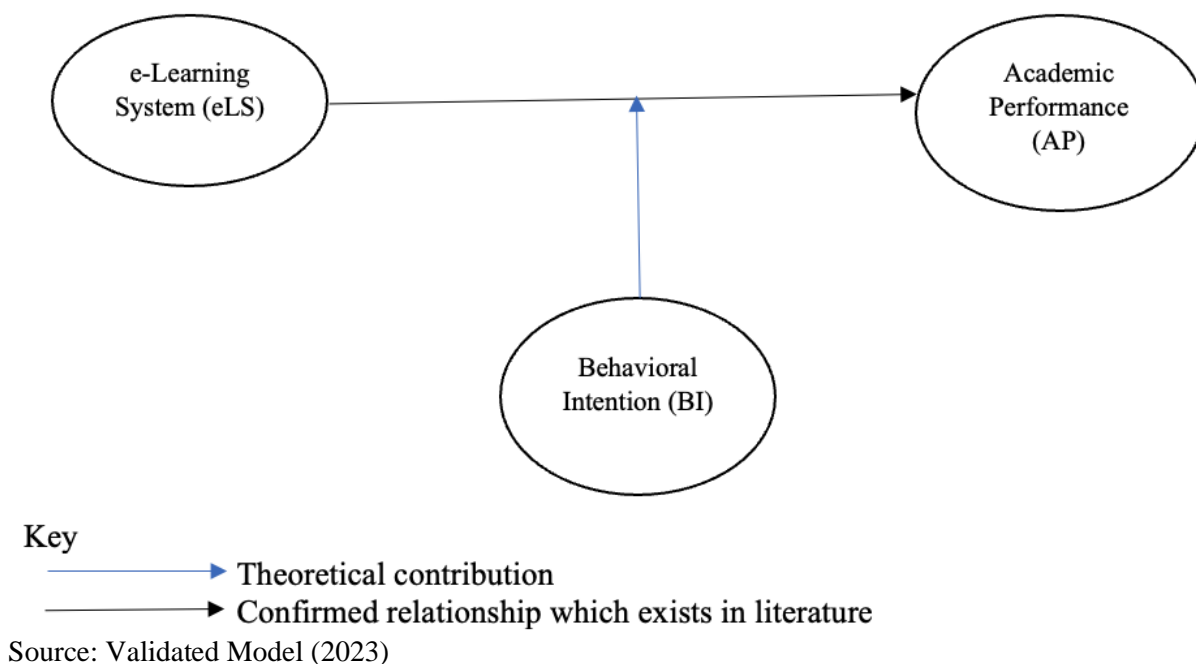
Source: Validated Model (2023)


Figure 7: *The conclusive model that has been verified*

5.2 Practical Implications

The statistical significance of behavioral intention and e-learning system on academic performance implies that the improvement of academic performance of students in higher learning institutions will always depend on their behavioral intention to adopt e-learning. This suggests that students will not only rely directly on academic performance when making

decisions about using e-learning systems. However, the behavioral intention can indirectly influence the mindset of students and lead them to implement the e-learning system.

5.3 Limitation and Recommendation for Future Research

This research used one component, namely "behavioral intention," derived from the modified UTAUT framework developed by Dwivedi et al. (2017) and other two elements (e-learning system and academic performance) derived from prior empirical studies by Shatta (2023) and by Suresh et al. (2018). These factors accounted for only 65.6 percent of the variability in academic performance. The study suggests that future research should include more elements from the modified UTAUT by Dwivedi et al. (2017) in order to increase the variance in academic performance from moderate to substantial. Similarly, this research used students only from Tanzania. Given this observation, this study suggests that future research should include students and academic staff from many countries in order to generalize the proposed model.

Problems and Needs in Experiential Learning in Mathematics: Teachers' and Students' Perspectives From Thailand

Sopapun Thongkum, Narathiwat School, Thailand
Khajornsak Buaraphan, Mahidol University, Thailand

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
This study aimed to explore the teachers' and students' perspectives of problems and needs in Experiential Learning (EL) in Mathematics at secondary education. 31 teachers and 35 grade 11 students from Narathiwat province, Thailand, responded to the questionnaire, which was analyzed for mean and standard deviation (SD). Overall, mathematics teachers had moderate level of problems in EL (mean = 3.21, SD = 0.49). The three major EL problems were: students have not yet developed satisfied metacognitive thinking (mean = 3.65, SD = 0.61), academic achievement (mean = 3.48, SD = 0.77) and mathematical process skills (mean = 3.42, SD = 0.72). Overall, teachers had a high level of needs in EL (mean = 3.98, SD = 0.69). Three major needs were: developing technology skills in EL (mean = 4.16, SD = 0.638), awareness of EL (mean = 4.13, SD = 0.89), and readiness for implementing EL (mean = 4.10, SD = 0.79). The students, overall, had moderate problems of EL (mean = 3.33, SD = 0.58). Three major problems were: 1) students have not yet developed satisfied metacognition (mean = 3.80, SD = 0.83), mathematical process skills (mean = 3.80, SD = 0.99), and academic achievement (mean = 3.77, SD = 1.03). Students had the highest level of needs in EL (mean = 4.24, SD = 0.68). Three major needs were: developing mathematical process skills (mean = 4.49, SD = 0.74), academic achievement (mean = 4.43, SD = 0.70), and readiness for EL (mean = 4.29, SD = 0.67).

Introduction

Thailand emphasizes high-quality and equitable education for all Thai citizens for driving the success of development of the country. As evident in the Article 54 of Section 5 of Constitution of the Kingdom of Thailand B.E. 2560 (2017) specifies that the Thailand government must ensure that every child receives quality education for 12 years for K-12 (Kindergarten to Grade 12) with free of charge. Furthermore, the Second Amendment of National Education Act of B.E. 2545 (2002), in Article 10 Section 2, states that "… Thai children have equal rights and opportunities to receive quality basic education for at least 12 years without any charge" (Office of the National Education Commission, 2002b). In addition, the National Scheme of Education B.E. 2560-2579 (2017-2036) states about education as:

> Education is a fundamental right for every Thai citizen, and the state is obliged to provide quality education to promote the holistic development of all Thai people. This encompasses fostering intellectual assets that are crucial for developing skills, qualities, and competencies needed for pursuing professions and leading a harmonious life within society. (Office of the National Education Commission, 2002a)

The 2008 Core Curriculum for Basic Education stipulates eight learning subject areas including mathematics as one key learning subject area. Mathematics plays a pivotal role in ensuring students' success in the 21st century learning. Mathematics enables individuals to think creatively, logically, systematically, and analytically. In addition, it allows students to comprehend and solve problems comprehensively and accurately. Students with mathematics skills are capable in forecasting, planning, decision-making, and solving everyday-life problems effectively and appropriately. Moreover, mathematics serves as a tool for students in studying science and technology, as well as other discipline. In sum, mathematics is essential in developing human resource to serve the national capability in competing with other countries (Ministry of Education, 2017).

Learning in the 21st century should stimulate students' interest and active engagement and participation. Students should gain maximum experience to practice various skills and competencies through hands-on learning activities. This approach is aligned with Experiential Learning (EL), which emphasizes real-world learning experiences through active and practical training in real-life situations with cooperative work in order to develop students to possess competencies required by professions and development of the country (Rakthai, Cheeprasop, Singhasaem, Suwanwela, & Leartwanawattana, 2021).

EL is rooted in active learning and stemmed from the concept of "Learning by Doing." It emphasizes ultimate experiences that learners should acquire from their ultimate opportunity to actively engage in practical works and learning. EL also influences learners' new ways of thinking and doing (Sreesukong, 2019). In EL atmosphere, a teacher takes a major role in stimulating students' interest and supporting them to learn through practical skills and processes. EL encourages students' analytical thinking, critical thinking and application of knowledge in daily lives. Students learned with EL will be able to use information technology and communication as tools for research, data collection, and construction of new knowledge. The El process inspires students to produce creative works and innovations. In sum, EL helps develop human resources with the competencies demanded by development of the country in this 21st century world (Daosri et al., 2021).

EL is a learning approach that focuses on students learning from various experiences and actions rather than just receiving information through traditional teaching methods that emphasize memorization. This approach effectively promotes students' knowledge and metacognition in mathematics subject. In mathematics classroom, EL utilizes real-world mathematical problems occurred in student everyday life or real-life situations and requires students to solve such problems effectively. So that, EL helps students think critically and practically in applying their mathematical knowledge in real-world situations.

In addition, mathematics teachers should select and appropriately apply technology and computer programs to support more effective mathematics learning. Students should be given opportunities to solve problems, experiment, and test their mathematical knowledge that will lead them to learn mathematics with more effective, engagement and enjoyment. Collaborative activities are also needed in EL. Students should be encouraged to work cooperatively in groups to solve mathematical problems. The EL activities can help foster knowledge creation and idea sharing among students when learning mathematics. Using EL in mathematics can promote students' problem-solving and inquiry skills, critical thinking, and deep understanding of mathematics. However, from the review of relevant literature in the mathematics education context of Thailand, it is evident that there is a lack of research studying the current situation and needs of EL in teaching and learning mathematics. Therefore, the authors are interested in studying the current situation, problems and needs regarding EL from the teachers' and students' perspectives. In addition, the application of Technological Pedagogical Content Knowledge (TPCK) in EL to be a new learning model of EL is proposed.

Research Questions

The research questions for this study are as follows:
a) What are the current practice, problems and needs in teaching mathematics with EL from the teachers' perspectives?
b) What are the current practice, problems and needs in learning mathematics with EL from students' perspectives?

Research Objectives

The research objectives for this study are:
a) to explore the teachers' perspectives on current practice, problems, and needs in teaching with EL in mathematics;
b) to explore the students' perspectives on current practice, problems, and needs in learning with EL in mathematics.

Literature Review

This section presents the literature review about EL, metacognition, and TPCK. The details are as follows.

Experiential Learning (EL)

EL is an educational approach that focuses on the development of knowledge and skills in learners through numerous experiences and real-world practice. It emphasizes active learning, enabling learners to gain deep understanding and effectively apply their knowledge in real-

life situations. EL involves several teaching steps such as stimulating reflection on prior experiences, presenting meaningful content, emphasizing understanding, training learners to analyze and summarize acquired concepts, practical application in real situations, and transferring knowledge to various contexts. Several educators presented teaching steps of EL as follows.

Tittley (1994) outlines six steps of EL as a) Stimulating learners to reflect on past experiences and connect them with new learning experiences while fostering motivation; b) Presenting meaningful content for learners to grasp; c) Analyzing and summarizing experiences using the information provided by the instructor; d) Summarizing concepts after data collection and analysis, leading to the creation of new experiences; e) Practical application of newly acquired concepts and knowledge to verify and confirm learning; and f) Applying gained knowledge to relevant real-life situations. In addition, Burnard (1996) proposed a four-step process of EL as: a) Accepting learning from prior experiences; b) Learning activities focusing on practice and mutual listening; c) Joint reflection; and d) Constructing new knowledge from practical understanding. Furthermore, Chaiyong (2002) developed a seven-step model for EL as: a) Pre-assessment before encountering new experiences, including an exploration of learners' prior experiences; b) Preparing for new experience by specifying learning objectives, tasks, duties and resources; c) Encountering new experience; d) Reporting progress during experiential phase to reveal students' learning progress as well as encountered problems or obstacles; e) Reporting results to summarize what students gained from each experience; f) Summarizing experience by learners and instructors jointly summarizing the results; and g) Post-assessment after the experience. Petch (2019) mentions a five-step process for EL as: a) Collaborating among students and ae teacher to establish objectives, plan activities, teaching methods, and practice; b) Providing advice, guidance, and directions; c) Reflecting on learners' thoughts and experiences; d) Collaborative summarization for future reference; and e) Evaluating progress based on learners' achievements and the joint outcome. The aforementioned teaching steps are crucial in employing EL for effectively teaching mathematics subject. These steps aid mathematics teachers in designing, planning and presenting mathematics content efficiently in order to enhance students' understanding and the application of mathematical knowledge in their daily lives. Furthermore, teaching tools, information and communication technologies, can be used to help deliver mathematical content effectively. Thus, the use of EL approach is essential to foster students' creativity and the 21st century skills to meet the needs of the country.

EL is an effective learning approach to promote students' development of metacognition and mathematical skills. It is a key to help learners gain deeper understanding and improve their ability to apply their mathematics knowledge in real-world situations. The key teaching steps of El include: a) Stimulating learners to reflect on previous experiences and stimulating motivation; b) Presenting content significantly to encourage learners' perception of challenge; c) Analyzing and summarizing concepts after obtaining data and analyzing gained experiences; d) Practically applying acquired knowledge to verify and confirm new learned knowledge; and e) Applying knowledge in various real-life situations to create new experiences. In common, educators support the review of students' prior knowledge and experiences and the practical application of new knowledge both in the classroom and in real-world situations. EL includes summarization and assessment of students' learning progress. It enhances the value of EL education in promoting students' critical and analytical thinking skills, particularly in the field of mathematics at various educational levels (Tittley, 1994; Burnard, 1996; Chaiyong, 2002; Petch, 2019).

Metacognition

In the field of mathematics, metacognition is essential for students in learning and applying mathematics in their daily lives. Students with metacognition will be able to develop analytical thinking skills, problem-solving abilities, and rational analysis in mathematics. Metacognition can help learners acquire an understanding of fundamental mathematical principles and theories, such as addition, subtraction, multiplication, and division, which lead to a deeper comprehension and application of mathematical knowledge in real-life situations. Metacognition in mathematics enables learners to establish a connection between everyday life situations and knowledge in mathematics. It empowers learners to efficiently apply their mathematical knowledge to solve real-life problems. With metacognition, learners can think critically and appropriately in mathematics and develop strong mathematical skills and the ability to effectively tackle mathematical problems. Metacognition can advance students' abilities in learning mathematics or other related disciplines.

However, developing metacognition in mathematics requires continuous effort and practice from learners. The development of metacognition requires proper and suitable steps. Metacognition in mathematics involves logical, analytic and synthetic thinking of knowledge to address mathematical problems. Learners must be able to recognize the fundamental concepts of mathematics and effectively utilize mathematical knowledge in problem-solving and creating mathematical models. Teaching metacognition in mathematics also involves instructing learners to learn how to present and explain mathematical concepts clearly. Learners should be able to communicate and express their thoughts about mathematical problems in an organized manner, which helps them understand and follow the problem-solving process correctly and appropriately. Therefore, metacognition in mathematics is crucial for developing mathematical skills and solving mathematical problems effectively. Learners should value and invest time in practicing metacognition in mathematics continuously for efficient application of mathematics in daily life (Nirand & Somchat, 2022; Santawan, 2010; Kru With, 2014; Wipada, 2014).

Technological Pedagogical Content Knowledge (TPCK)

In 2008, Koehler and Mishra proposed the conception of Technological Pedagogical Content Knowledge (TPCK), which originally rooted in the conception of Pedagogical Content Knowledge (PCK) being introduced by Shulman in 1986. What is new in is the incorporation of knowledge related to technology, known as Technological Knowledge (TK) in existing PCK. TPCK is originated from the increasing development of technology in the 21st century that significantly impacts teaching and learning in all subjects including mathematics. Subsequently, Thomson and Mishra (2008) named this new construct as Technological Pedagogical Content Knowledge or TPCK. TPCK represents the holistic alignment and integration of three knowledge components i.e., Content Knowledge (CK), Pedagogical Knowledge (PK) and Technological Knowledge (TK) (Srisukong & Buaraphan, 2021).

TPCK, then, is the understanding of how these three forms of knowledge intersect and interact. In practice, TPCK does not mean that educators possess three kinds of understanding i.e., technology, teaching methods, and subject matter, individually. It refers to a teacher's understanding how to blend three knowledge components effectively. In sum, TPCK refers to teachers' ability to apply specific technology appropriately and effectively in teaching specific subject content with specific teaching method.

TPCK highly influences teacher education and professional development. It helps educators make informed decisions about how and when to use technology in the classroom. It emphasizes the importance of balancing three different types of knowledge to ensure that technology serves as a tool for enhancing teaching and learning, rather than just being used for its own sake. TPCK integrates a teacher's knowledge of content, pedagogy, and technology in an integrative manner. Teachers with CK will have strong understanding of the subject matter content that align with the curriculum of the educational institution. Teachers with PK will have strong understanding of the principles of instructional design and be able to employ diverse teaching methods within their subject area. Teachers with TK will understand several technologies (including both hardware e.g., iPads, smart TVs, projectors, and telephones; and software e.g., Microsoft, Google Classroom, and various applications) and be able to select, design and create technology to suit the chosen teaching method, learning process. Then, teachers with TPCK must be able to integrate the mentioned three knowledge components into a single knowledge construct as Figure 1.
Figure 1: TPCK Framework (Koehler & Mishra, 2008)

In conclusion, a profound understanding of TPCK is paramount in today's educational landscape. TPCK represents the intricate interplay of technological knowledge, pedagogical skills, and content expertise. Educators who master this dynamic framework are better equipped to design and deliver effective, technology-enhanced lessons. They can seamlessly integrate digital tools into the curriculum, enhancing the learning experience and preparing students for the digital age. TPCK empowers teachers to apply technology to tailor their instruction to the unique needs of their students. It bridges the gap between teachers' subject matter expertise and pedagogical strategies, resulting in more engaging, interactive, and impactful teaching.

Research Methodology

This research employs a mixed-method approach, which combines quantitative research and qualitative research methodologies. The quantitative research utilizes survey research, while the qualitative research involves focus group discussions (FGD). This mixed-method

approach will provide more comprehensive understanding to answer research questions. The details of mixed-method research design and data collection are as follows:

Quantitative Research: Survey Research

The population for this research can be divided into two groups: teachers and students. There were 31 teachers participated in the survey research. They all were teachers under the Narathiwat Secondary Education Service Area Office, who experienced in teaching by EL. Data was collected from the entire population. In addition, there were 35 grade 12 students, who already learned in grade 11 and experienced learning with EL with the first author. They all were students in one school under the Narathiwat Secondary Education Service Area Office and data was collected from the entire population.

Data Collection

For collecting quantitative data, the researchers employed two questionnaires: The Problems and Needs in Teaching with EL in Mathematics Questionnaire and The Problems and Needs in Learning with EL in Mathematics Questionnaire. The former was for teachers and the latter was for students. Both questionnaires aimed to explore the respondents' perspectives on problems and needs in teaching or learning with EL in mathematics.

The Problems and Needs in Teaching with EL in Mathematics Questionnaire (for teachers) employed a 5-level rating scale (5 = Very high, 4 = High, 3 = Moderate, 2 = Low and 1 = Very low) and consisted of three parts:
- Part 1: Basic information of respondents (5 items);
- Part 2: Problems and needs in EL, that was divided into two aspects: Problems related to EL (10 items) and Needs related to EL (10 items); and
- Part 3: Suggestions for developing EL (1 item).

The Problems and Needs in Learning with EL in Mathematics Questionnaire (for students) employed a 5-level rating scale and consisted of three parts:
- Part 1: Basic information of respondents (2 items);
- Part 2: Problems and needs in EL, that was divided into two aspects: Problems related to EL (10 items) and Needs related to EL (10 items); and
- Part 3: Suggestions for developing EL (1 item).

Data Analysis

The researchers analyzed data collected from Part 1 of the questionnaire (basic information of the respondents) by counting frequency and calculating for percentage. The researchers calculated the Mean and Standard Deviation (SD) of the data obtained from Part 2 of the questionnaires. The interpretation of the average values was as: 4.21 - 5.00 being interpreted as Very High level and 3.41 - 4.20, 2.61 - 3.40, 1.81 - 2.60, and 1.00 - 1.80 being interpreted as High, Moderate, Low, Very Low levels, respectively. Then, the researcher analyzed data from Part 3 of the questionnaire by content analysis.

Results and Discussion

The results and discussion will be presented according to the research questions and the details are as follows.

Teachers' Perspectives on Problems and Needs in EL

The majority of respondents were female (74.20%). In terms of age, the majority falls within the 31-35 age group (25.80%) followed by the 25-30 age group (22.60%) and the 36-40 age group (19.40%). Regarding their positions, the majority are Senior Professional Level (K3) and others (29.00%) followed by Professional Level (K2) (25.80%) and Practitioner Level (K1) (16.10%). In terms of teaching experience, the majority have less than 6 years of teaching experience (32.30%) followed by 11-15 years of teaching experience (22.60%) and 6-10 years of experience (19.40%). The teachers' perspectives on problems and needs in EL can be presented as Table 1.

	Statement	Mean	SD	Interpretation
Problems in EL				
1.	A school is not yet ready for EL	2.81	0.75	Moderate
2.	Teachers are not yet ready for EL	2.97	0.80	Moderate
3.	Teachers lack knowledge and understanding of EL	3.29	0.82	Moderate
4.	Teachers lack awareness of the importance of EL	3.00	0.82	Moderate
5.	Teachers lack skills in teaching with EL	3.35	0.88	Moderate
6.	Teachers have not yet used technology in EL	3.10	0.98	Moderate
7.	Students are not yet ready for EL	3.06	0.73	Moderate
8.	Students have not yet achieved academic performance at a satisfactory level	3.48	0.77	High
9.	Students have not yet developed mathematics skills and processes at a satisfactory level	3.42	0.72	High
10.	Students have not yet developed metacognition at a satisfactory level	3.65	0.61	High
	Overall Problems	**3.21**	**0.49**	**Moderate**
Needs in EL				
11.	A school needs to be developed the readiness for EL	3.74	0.93	High
12.	Teachers need to be developed their readiness in teaching with EL	4.10	0.79	High
13.	Teachers need to be developed their knowledge and understanding of EL	4.06	0.85	High
14.	Teachers need to be developed their awareness of the importance of EL	4.13	0.89	High
15.	Teachers need to be developed their skills in teaching with EL	4.06	0.89	High
16.	Teachers need to be developed their skills in using technology in EL	4.16	0.64	High
17.	Students need to be developed their readiness for EL	3.81	0.83	High
18.	Students need to be developed their academic performance to a satisfactory level	4.03	0.75	High
19.	Students need to be developed their mathematics skills and processes to a satisfactory level	3.90	0.83	High
20.	Students need to be developed their metacognition to a satisfactory level	3.84	0.93	High
	Overall Needs	**3.98**	**0.69**	**High**

Table 1: Teachers' perspectives on problems and needs in EL

The responding teachers reflected the problems in EL at a Moderate level (mean = 3.21, SD = 0.49). The top three problems in teaching with EL were: Students have not yet developed metacognition at a satisfactory level (mean = 3.65, SD = 0.61); students have not yet developed academic performance at a satisfactory level (mean = 3.48, SD = 0.77); and Students have not yet developed mathematics skills and processes at a satisfactory level (mean = 3.42, SD = 0.72).

The responding teachers reflected a High level of needs in EL (mean = 3.98, SD = 0.69). The top three needs in EL were: Teachers need to be developed their skills in teaching with EL (mean = 4.16, SD = 0.64); Teachers need to be developed their awareness of the importance of EL (mean = 4.13, SD = 0.89); and Teachers need to be developed their readiness in teaching with EL (mean = 4.10, SD = 0.79).

Students' Perspectives on Problems and Needs in EL

There were 35 students responded to the questionnaire. A majority of them were female (60.00%) with 18 years old (77.10%) followed by 17 years old (22.90%). The students reflected their problems and needs in EL as Table 2.

	Statement	Mean	SD	Interpretation
Problems in EL				
1.	A school is not yet ready for EL	3.09	0.89	Moderate
2.	Teachers are not yet ready for EL	3.09	0.74	Moderate
3.	Teachers lack knowledge and understanding of EL	3.09	0.91	Moderate
4.	Teachers lack awareness of the importance of EL	3.63	0.94	Moderate
5.	Teachers lack skills in teaching with EL	3.31	0.99	Moderate
6.	Teachers have not yet used technology in EL	3.14	1.06	Moderate
7.	Students are not yet ready for EL	2.63	1.03	Moderate
8.	Students have not yet achieved academic performance at a satisfactory level	3.77	1.03	High
9.	Students have not yet developed mathematics skills and processes at a satisfactory level	3.80	0.99	High
10.	Students have not yet developed metacognition at a satisfactory level	3.80	0.83	High
	Overall Problems	**3.33**	**0.58**	**Moderate**
Needs in EL				
11.	A school needs to be developed the readiness for EL	3.94	0.94	High
12.	Teachers need to be developed their readiness in teaching with EL	4.17	0.92	High
13.	Teachers need to be developed their knowledge and understanding of EL	4.26	0.85	Very High
14.	Teachers need to be developed their awareness of the importance of EL	4.20	0.96	High
15.	Teachers need to be developed their skills in teaching with EL	4.17	0.92	High
16.	Teachers need to be developed their skills in using technology in EL	4.20	0.87	High

17.	Students need to be developed their readiness for EL	4.29	0.67	Very High
18.	Students need to be developed their academic performance to a satisfactory level	4.43	0.70	Very High
19.	Students need to be developed their mathematics skills and processes to a satisfactory level	4.49	0.74	Very High
20.	Students need to be developed their metacognition to a satisfactory level	4.26	0.74	Very High
	Overall Needs	**4.24**	**0.68**	**Very High**

Table 2: Students perspectives on problems and needs in EL

In overall, students expressed their perspectives on problems in EL at a Moderate level (mean = 3.33, SD = 0.58). The top three problems in learning with EL were: Students have not yet developed metacognition at a satisfactory level (mean = 3.80, SD = 0.83)), followed by Students have not yet developed mathematics skills and processes at a satisfactory level (mean = 3.80, SD = 0.99); and Students have not yet achieved academic performance at a satisfactory level (mean = 3.77, SD = 1.03).

Regarding needs in EL, in overall, students expressed a Very High needs in (mean = 4.24, SD = 0.68). The top three needs were: Students need to be developed their mathematics skills and processes to a satisfactory level (mean = 4.49, SD = 0.74), followed by Students need to be developed their academic performance to a satisfactory level (mean = 4.43, SD = 0.70); and Students need to be developed their readiness for EL (mean = 4.29, SD = 0.67).

The teachers in this study express a moderate level of problems and a high level of needs to teach mathematics with EL; while the students expressed a moderate level of problems and a very high level of needs to learn mathematics with EL. In addition, this study urges for the integration of TPCK and metacognition into existing EL model in order to improve for more effective EL.

Implications

EL is needed in teaching mathematics for students in the 21st century because it yields several benefits for students. However, there are some problems in teaching and learning with EL arisen from this study that mathematics educators need to pay more attention to and be concern about. Such problems need to be solved or released in order to gain better performance in implementing EL in mathematics subjects. In addition, teachers' and students' voices on needs in teaching and learning with EL should be taken into consideration before adjusting the existing EL model or creating a new EL model that better suits the teaching and learning situations. Other additional components such as metacognition and/or TPCK may be needed to be added into an existing EL model in order to enhance students' metacognition and apply technologies to enhance teaching and learning in mathematics. In future research, a larger sample may be needed for more complete picture of the EL teaching and learning situation in Thailand.

Using Incentive Autonomous Learning Strategies to Enhance EFL Chinese Undergraduate Learning Motivation and Speaking Performances: A Proposal

Yi Yang, Universiti Malaysia Sabah, Malaysia
Asmaa AlSaqqaf, Universiti Malaysia Sabah, Malaysia

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
It is well known that Chinese EFL learners face considerable challenges in speaking English. Affective factors such as learning motivation could be a reason for this issue as motivation plays a vital role in language acquisition. Regrettably, Chinese EFL students lack the motivation to prioritize and improve their speaking as speaking is often neglected at the national examination level. On the other hand, autonomous learning emerges as a highly officious way to address the issue of oral English instruction. However, research that incorporates learning motivation, autonomous learning, speaking performance, and incentive strategies is very limited. Thus, this paper attempts to narrow this research gap by proposing incorporating autonomous learning through incentive strategies to improve EFL learners' learning motivation and speaking performance at a public university in China. Adopting an explanatory mixed-methods research approach, the current study will use a quasi-experimental design with purposive sampling where two classes will serve as the experimental and control groups. The 14-week intervention will be implemented in the experimental group, while an in-situ approach will be implemented in the control group. A pretest and post-test data will be collected to check the participants' changes in speaking performance, while a longitudinal survey will be demonstrated to the students to examine their motivation levels before and after the intervention. It is hoped that the study would provide insights into the role of learning motivation and effective teaching strategies to enhance EFL learners' speaking skills.

Keywords: EFL Chinese Undergraduate, Incentive Autonomous Learning Strategies, Learning Motivation, Speaking Performance

Introduction

Enhancing students' oral English competence marks a significant, persistent, and intricate challenge within the context of foreign language teaching in China. A prevalent issue colloquially referred to as "mute English" is observed in tertiary institutions, which proves to be a difficult predicament to fully rectify (Peng, 2016). Nunan (2007) suggests that a potent strategy to bolster oral English competence is through autonomous learning. Krashen (1982) asserts that affective components such as active motivation can profoundly influence language acquisition. However, it appears that EFL (English as a Foreign Language) students in China lack the necessary motivation for oral English learning (Tang, 2016), raising the critical question of how to adequately stimulate learner motivation. Scholars from the fields of linguistics and psychology have also highlighted the tight connection between learning motivation and learner autonomy (Gao, 2010; Li, 2010; Qin, 2017; Reinders, 2020). According to Jia (2018), a positive correlation exists between an individual's autonomy and learning motivation. Additionally, Ustunlouglu (2017) posits that autonomous learning can cater to students with different learning abilities and meet various learning demands. Therefore, based on the above views, investigating the influence of speaking learning motivation in autonomous learning to enhance the effectiveness of target language instruction and learning is deemed urgent and imperative. However, research focusing on the role of motivation in spoken English concerning the autonomous learning model with incentive strategies, especially among non-English majors in China, remains somewhat limited, lacking systematic and targeted approaches.

Drawing on the second language (L2) motivation theory (Dörnyei, 1994, 2001a) and psychological motivation theory (Dörnyei, 2005), this study seeks to propose a conceptual framework to examine the crucial role of speaking learning motivation in the relationship between an incentive-autonomous-learning-strategies module and EFL learners' oral English competence. Accordingly, this study attempts to achieve the following research objectives.

Research Objectives

Based on the above scholars' theoretical foundation and the analysis of research gap in this research, the following research objectives are put forward as follows:

1. To identify the level of speaking learning motivation among EFL non-English major learners at a public university in China before implementing the incentive-autonomous-learning-strategies based intervention.
2. To identify the level of speaking learning motivation among EFL non-English major learners at a public university in China after implementing the incentive-autonomous-learning-strategies based intervention.
3. To identify whether the incentive-autonomous-learning-strategies based intervention help improve the speaking performance among EFL non-English major learners at a public university in China.

Literature Review

This section sheds light on the EFL research in China and discusses the theoretical foundation for the current research proposal.

EFL Speaking in China

Speaking, an essential language skill involves forming structured verbal expressions to transmit ideas. It's central to English education and manifests a learner's overall proficiency in English (Kahng, 2020). In 2018, China's Ministry of Education issued College English Course Teaching Requirements (trial), emphasizing that the objective of college English education should be more targeted on nurturing students' holistic command of English, with a particular focus on listening and speaking.

Many experts believe that in EFL (English as a Foreign Language) contexts, speaking is more challenging and complex than reading, listening, and writing (Ockey, 2009; Pekarek, 2015; Peng, 2016). Articulating thoughts in a new language isn't straightforward. Speaking is often seen as the primary language skill, evidenced by the term "speakers" for those proficient in a language. Furthermore, learners frequently gauge their language acquisition success by their advancements in spoken communication (Jeon, In'nami, & Koizumi, 2022). This proficiency directly impacts learner's social interactions and individual development (Young, 2011; Van, 2018).

Researchers from China and other areas consistently stress the significance of prioritizing speaking instruction in studies (Qureshi, 2007; Fauzan, 2016; Lin, 2022). In China, speaking teaching is not attached to great importance due to the exclusion of speaking tests in the formal English examination (Gao, 2010). Without external pressure, students themselves often don't feel an intrinsic need to speak English, additionally, students lack effective learning models and instructive guidance from teachers. These issues result in both neglect of speaking teaching and low speaking performance among EFL learners (Deng & Dell, 2023).

According to researchers from psychology and education, there are many factors, such as language learning motivation (Dörnyei, 2001a), autonomous learning (Holec & Little, 2007) and incentive strategies (Zhang, 2022; Gan, 2020; Wang, 2022) may influence learners' speaking skills and competence. The following sections highlight these factors in detail.

Language Learning Motivation

The development from motivation, learning motivation to language learning motivation has experienced a long period, in which the important theories contain self-determination motivation theory, L2 Motivational self-system, and others. In this research, learning motivation is closely related to intrinsic and extrinsic motivation proposed by Gardner and Lambert (1979). The instructor intends to play the role of extrinsic motivation by some inspiring ways to stimulate learners' intrinsic motivation to carry on effective and independent learning.

Some empirical studies have been implemented around language learning motivation, mainly from the perspective of the relationship between learning results and learning motivation. Schmidt (2017) surveyed language learning motivation, and she found that learners with positive and intrinsic language learning motivation are inclined to have much better performance than those with little intrinsic motivation in one aspect of language skill.

Speaking motivation as an important factor in propelling speaking acquisition and teaching (Sukmayasa, 2023) is employed in this study aiming to enhance learner's speaking skills and speaking performance.

Autonomous Learning

Autonomous learning refers to the competence to take control of one's learning (Holec & Little, 2007). This research holds the opinion that autonomous learning is one kind of learning mode, under which, students carry on independent learning with teachers' guidance, methods, and strategies they prefer, learn, explore, and inquire to realize the preset learning goal through their effort.

According to Nunan (2007) and Jia (2018), autonomous learning is an effective way to stimulate and cultivate learners' learning motivation as well as their learning enthusiasm. Unlike other branches under the subject of English, speaking is a comparatively complex skill that needs to be addressed to the individual's differences and needs (Jia, 2018). Thus, autonomous learning carried on by learners themselves may satisfy their different speaking needs and speaking levels.

Besides, the incentive strategies proposed by (Xu, 2020), are adopted to integrate with autonomous learning to help learners stir their speaking motivation and speaking performance.

Incentive Strategies

In China, the specific contents of incentive strategies are proposed by Xu (2020), which incorporate five aspects: interest, participation, goal, confidence, and emotion. The researcher will utilize these strategies during the entire process of oral English teaching. In the pre-learning part, the research will prepare the video relative to each unit theme for students to enjoy, to motivate learners by interest and participation incentive strategies. In class activities, the researcher will invite students to engage in different activities and accomplish corresponding tasks through autonomous learning by applying participation, goal-based, confidence-based, and emotion incentive strategies. In the assessment part, participation, goal-based, confidence-based, and emotion incentive strategies are also applied to motivate them. In this study, the researcher uses the incentive strategies to stimulate students' learning motivation under the autonomous learning model. The cultivation of learning motivation will lay a foundation for further effective learning.

The researcher has discussed the variables associated with speaking motivation, autonomous learning, and the incentive strategies above, which may guide the establishment of the conceptual framework.

The Relationship Among Variables Involved in This Research Proposal: A Conceptual Framework

The current study incorporates and integrates incentive strategies and the autonomous learning model as the theoretical foundation of the speaking module, to improve speaking motivation and speaking performance among Chinese EFL non-English major learners. The speaking motivation served as the crucial role connecting the variable Incentive Autonomous Learning Strategies module and the other variable speaking performance.

After identifying the research objectives above, the conceptual framework is proposed in the following figure, which attempts to investigate the impact of oral English intervention on

EFL Chinese learner speaking learning motivation as well as their oral English performance after the 14-week quasi-experimental teaching.

```
Research Methodology

Utilizing a mixed-methods approach, data will be collected through a quasi-experiment teaching conducted at a public university in China. Concurrently, longitudinal research will be performed by administering a questionnaire to participants to gauge their changes in speaking motivation before and after the intervention.

Participants

The research will adopt a purposive sampling to get two classes involved, representing the control and experimental groups respectively. The quasi-experiment will be undertaken at a public university in China. Non-English major undergraduates in the faculty of Economics and Management at the Chinese university will be selected as the subjects of the experimental process. While the control group consisting of 38 students will receive traditional teaching methods, the experimental group with 40 students will undergo an oral English intervention utilizing incentive autonomous learning strategies (IALS) as shown in Table 1 below.

Research Group		Male	Female	Students' Age
Experimental Group (n=40)		26 65%	14 35%	18-23 100%
Control Group (n=38)		24 63.2%	14 36.8%	18-23 100%

Table 1: Sample of the Study (EFL Learners)

Intervention

This study will adopt the ADDIE Model to develop the incentive-autonomous-learning-strategies based. The ADDIE Model mainly covers five stages: the Analysis Stage is to locate learners' problems and targets they expect to achieve; the Design Stage is to design teaching materials and teaching strategies to use; the Development Stage is to work out a lesson plan; the Implementation Stage is to conduct the intervention; the Evaluation Stage is to evaluate the effectiveness of the intervention.

The module with incentive autonomous learning strategies incorporates the autonomous learning model with the incentive strategies aiming to stimulate and cultivate participants' speaking learning motivation.

After completing the development of the module, the designated intervention will be scheduled to be conducted within 14 weeks during the first semester of the academic year 2023-2024 at the public university in China. The 14-week intervention includes the pretest in Week 1, 12-week teaching activities, and the posttest in Week 14. During the process of intervention, the teaching module will be used in each class with different forms to get learners motivated and activated, thus, enhancing their oral English performance.

Research Instruments and Data Collection

To check the effectiveness of the intervention, different instruments of data collection and analysis will be applied in this research. According to the research objectives, the experimental group will receive the pretest, posttest, intervention, and questionnaires including the motivation questionnaire put forward by Glynn in 2009, the incentive strategies questionnaire developed by Pintrich (2007) and She and Fisher (2000), and the speaking test served as both the pretest and posttest, taken from the 2019-2020 semester one's Speaking Test for non-English major students at the Chinese university, to achieve the corresponding objectives. Among the questionnaires, the motivation questionnaire is longitudinal as the same motivation questionnaire will be assigned and collected twice for participants in the experimental group before and after the intervention. Speaking scores obtained from pre-test and post-test will be collated and analyzed to determine the impact of the intervention on learning motivation and oral English performance; while the control group will accept traditional teaching instruction, only involving the first 2 parts: pretest and posttest.

Research Validity

Validity is termed as the extent to which a concept is accurately measured in a quantitative study (Korb, 2012), which is divided into two main categories as follows, content validity and face validity.

Face Validity

Face validity is the appropriateness, sensibility, or relevance of the test and its items as they appear to the persons answering the test (Holden, 2010). In order to establish face validity of the research instruments, five non-English major students who will not be participating in the real study will be chosen randomly and asked to check the questionnaire items and provide their feedback in terms of its clarity, layout and the language used. Amendments will be made according to the comments obtained from the students.

Content Validity

Content validity refers to the extent to which a research instrument accurately measures all aspects of a construct (Korb, 2012). In order to check the content validity of the Learning Motivation Questionnaire, Incentive Strategies Questionnaire, test, and Oral English Intervention, a panel of three experts with Ph.D. certificates from different fields will be invited to do the evaluation and judgement. One expert from the linguistic field will be invited to verify the suitability, consistency, and coherence of the questionnaires, and the other expert with rich teaching experience will check the rationality and feasibility of the test and the intervention. After their evaluation and analysis, the researcher will do the same as the face validity. Improvements and modification of the questionnaires, tests, and the module will be done based on the responses and feedback from the experts.

Conclusion

This paper establishes a conceptual basis for subsequent implementation of the incentive-autonomous-learning-strategies based module. This study seeks to propose a conceptual framework to examine the crucial role of speaking learning motivation in the relationship between an incentive-autonomous-learning strategies module and EFL learners' oral English competence.

It is hoped that this research could provide theoretical insights through shedding light on the role of motivation in improving the EFL speaking proficiency and enhancing autonomous learning among Chinese EFL learners.

Feasibility and Acceptance of Micro-Video as an Innovative Teaching Method in Engineering Education

Cynthia Hou, The Hong Kong Polytechnic University, Hong Kong SAR
Jiaqi Wang, The Hong Kong Polytechnic University, Hong Kong SAR

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
The growing interest in innovative teaching methods within higher education has prompted an exploration of micro-videos as a valuable intervention tool. Grounded in the Technology Acceptance Model (TAM) theory, this study investigates the effectiveness and acceptance of micro-videos as a teaching method in sustainable engineering education, while also identifying the factors that influence students' acceptance of this approach. The study was conducted in three stages. Firstly, semi-structured interviews were conducted with 30 engineering students to gather insights and formulate a TAM-based model for measuring student acceptance. Secondly, an experiment involving 425 year-2 engineering students from a university in China was conducted. The experiment incorporated a preview-test, micro-video viewing, post-view survey, and a post-test. Results indicated a significant 20% increase in post-test scores, indicating improved knowledge acquisition and confirming the effectiveness of micro-video pedagogy. Furthermore, the study found that the "quality of the framework" and "quality of the content" of the micro-videos had a significant impact on students' attitudes towards using this teaching method via structural equation modelling (SEM). This study provides important implications for the future development of innovative teaching methods. By understanding the feasibility and factors affecting acceptance, educators can harness the potential of micro-videos to enhance engineering education.

Keywords: Sustainable Engineering Education, Micro-Videom, Technology Acceptance Model (TAM), Experiment Intervention, Structural Equation Modelling (SEM)

Introduction

The 1987 Brundtland Report by the United Nations spotlighted sustainability as essential for current development without compromising future generations (United Nations General Assembly, 1987). This concept has since permeated global educational strategies, with an emphasis on integrating sustainability in engineering practices and education. As institutions shape future leaders, sustainability education becomes vital. With evolving societal needs, traditional educational methods often lag. Thus, modern pedagogies in sustainable engineering education, such as project-based learning (PBL) and service learning (SL), have emerged as solutions to instill sustainability principles effectively in students (Lozano et al., 2013; Tang, Law, Gary, Tsui and Lo, 2016; Mesa, Esparragoza, and Maury, 2017; Hou and Wu, 2020; Gutierrez-Bucheli et al. 2022).

With technological advancements, micro-video pedagogy, characterized by its brevity and efficiency, has gained prominence in the educational sector (Liu et al., 2022, Hou et al., 2023a). Its versatility spans various disciplines, proving useful on platforms like TikTok and YouTube. Despite its widespread application, the potential of micro-videos in engineering sustainability education remains untapped, and the student reception towards this teaching method is yet to be thoroughly examined. Hence, it is imperative to explore the integration of micro-video in sustainable engineering curricula and understand its impact on student engagement.

This research aims to address the knowledge gap surrounding the practicality of micro-videos as an instructional tool in engineering education, focusing on sustainable development within the built environment. The study will involve engineering students to assess the impact of micro-videos on their understanding of sustainability concepts. Using pre and post-engagement performance metrics and a Technology Acceptance Model framework, the research seeks to evaluate the pedagogical value of micro-videos and understand students' acceptance levels and influencing factors in the academic context.

This study aims to examine the effectiveness of micro-videos in facilitating engineering students' learning of the sustainable built environment knowledge and investigate the factors that affect students' acceptance of using micro-videos in their learning processes. Specific objectives are as follows:
  (1) To investigate the effectiveness of the micro-video in enhancing students' learning outcome
  (2) To identify the factors that influence students' acceptance and perceptions of the micro-video
  (3) To verify the proposed theoretical model using questionnaire survey data

1. Literature Review

1.1 The Importance of Sustainable Engineering Education

Education for Sustainable Development (ESD) emerged in 1987 with the publication of the Brundtland report, establishing it as a significant field (Zaccai, 2012). ESD is defined as an educational approach that fosters the advancement of knowledge, skills, values, and attitudes to enable individuals to thrive in a more sustainable and just society (United Nations Educational, Scientific, and Cultural Organization, 2005). Nowadays, sustainable education can be synergistically integrated with various concepts such as "Sustainability in

Management Education (SME)" (Figueiró and Raufflet, 2015), "Environmental Sustainability Education (ESE)" (Kónya et al., 2021), and "Engineering Education for Sustainable Development (EESD)" (Gutierrez-Bucheli, Kidman, and Reid, 2022) to cultivate sustainability awareness among higher education students and incorporate sustainability principles into their learning experiences.

Among of these concepts, sustainable engineering education plays a vital role in addressing the challenges of sustainable development and securing a more sustainable future. Engineering is key to finding solutions for sustainable development problems (Davidson et al., 2010; Karatzoglou, 2013). The recognition by UNESCO of the influence of engineering on society, ethics, and individual values further underscores the significance of incorporating sustainability into engineering education (UNESCO, 2010).

One of the emerging issues in "engineering unsustainability" is the environmental impact of engineering activities. Depletion of natural resources, greenhouse gas emissions, and environmental contamination are just a few examples of the negative consequences resulting from engineering projects. Promoting sustainability awareness among engineering students and incorporating sustainable engineering education methods are vital steps in addressing these challenges. Universities and educational institutions have recognized this need and have implemented various approaches to advance engineering sustainability education (Juárez-Nájera et al., 2006; Pérez-Foguet et al., 2018). These approaches aim to cultivate a deep understanding of sustainable development principles and equip future engineers with the knowledge, skills, and values necessary to design and implement sustainable solutions.

1.2 Sustainable Engineering Education Approaches

Applying innovative teaching methods in engineering sustainability education is necessary for ensuring that students are equipped with the knowledge and skills to address current and future sustainability challenges (Hou et al., 2023a; b). Various teaching strategies have been developed and tested to enhance the effectiveness of sustainability education. Research shows that more than 22 distinct teaching strategies effectively strengthen sustainability education in various ways (Jeronen et al., 2017). However, as this field constantly evolves, new methods are emerging and being reformed.

Common and effective teaching methods in engineering sustainability education include project-based, service, experiential, interdisciplinary, and active learning, which fall into categories like project-based learning (PBL), service learning (SL), and general engineering sustainability education methods. These approaches enhance critical thinking, problem-solving skills, and sustainability comprehension in students. While pedagogical methods like flipped classrooms and problem-based learning can boost engagement, they may pose challenges such as time intensity, group dynamics, and resource demands (Gutierrez-Bucheli et al. 2022).

In light of these considerations, the incorporation of micro-video into engineering education programmes is appropriate, as micro-video can stimulate students' learning enthusiasm and initiative. (Wang, 2022; Liu et al., 2022; Tian and Tsai, 2021; Wang et al., 2019). Furthermore, with the development of video platforms, video resources are simple to locate, edit, and generate, while internet-based education has become commonplace for students due to its popularity. The subsequent section will therefore introduce the micro-video teaching procedure.

1.3 Micro-Video Learning and Its Feasibility for Engineering Sustainability Education

Micro-video, as a vehicle for micro-learning, is widely used in university teaching (Liu et al., 2022). There is no agreed-upon definition of micro-video, but a variety of explanations exist. Micro-video, which includes micro-films and micro-documentaries, can be recorded and viewed on multi-channel video terminals. Micro-videos can be as short as 30 seconds or as long as 20 minutes. Micro-videos range between 30 seconds and 20 minutes in length. Wistia, a video hosting and analytics company, has provided a definition of micro-videos - micro-videos are typically less than 60 seconds long and are distinguished by their brevity, simplicity, and singular concentration on a single topic or idea. The micro-potential of videos for education derives from their clear visual presentation and concise transmission of information.

Several disciplines have attested to the effectiveness of micro-videos as a teaching aid, including tertiary-level English (Wang, 2022), chemistry (Wang et al., 2019), and physical education (Huang and Yu, 2022). Micro-videos have been shown to substantially improve both student achievement and motivation, as demonstrated, for instance, by the work of Wu et al. (2022) in the field of pharmacology education. Furthermore, Li et al. (2021) demonstrated that the use of micro-videos in biochemistry education helped students develop problem-solving skills and innovate better. In addition, Gong (2021) found that the use of micro-videos in physical education studies increased students' interest in the subject and broadened their perspectives. Moreover, Wang et al., (2018) discovered that embedded real-time operating systems (RTOS) can benefit from micro-video. Micro-videos, in contrast to traditional teaching resources, leverage vibrant and visually engaging content to enhance classroom efficiency, encourage student participation, and make abstract concepts appealing in engineering sustainable development education (Wang, 2022; Liu, 2022).

According to research conducted by Huang and Yu (2022), students' propensity to utilize micro-videos for educational purposes is significantly influenced by the video's production value, the content's applicability to the course, and the platform's user-friendliness. Students' perception of micro-videos' usefulness for learning and their motivation to learn were also significant factors influencing their openness to using micro-videos in the classroom, according to research by Al-Rahmi et al. (2021). Other factors such as the length of the micro-video, the level of interactivity, and the availability of captions or subtitles may also affect students' willingness to use micro-videos for learning (Brame, 2016).

2. Research Methodology

2.1 Design of the Research Activities

To achieve the above objectives, a mixed-methods approach was utilised, combining both quantitative and qualitative research methods. The study is divided into two stages: experiment preparation (*Stage 1*) and experiment implementation (*Stage 2*).

In *Stage 1*, a micro-video was first developed for teaching "street canyon effect" using an animation development software. After that, the video was distributed among 30 students of various academic backgrounds. Students were encouraged to watch the video during the off-classroom time. In-depth interviews were then conducted with the 30 students to collect feedback. After the analysing the interview data, the micro-video was further verified based on the student feedbacks. At the same time, the interview results were examined to identify

the factors that affect students' acceptance to use micro-video and proposed a TAM-based theoretical model.

In the *Stage 2*, an experiment, including a pre-view test and a post-view test, was implemented to test the effectiveness of the micro-video in facilitating students' learning. The pre-view and post-view tests results were analysed to examine the effectiveness of the micro-videos. A questionnaire survey designed based on the TAM-based model was distributed to the experiment participants for verifying the proposed theoretical model.

2.2 Micro-Video Development

An eight-minute micro-video introducing the "street canyon effect" in sustainable urban built environments was created with vibrant animation and sound effects to enhance student engagement. The video underwent feedback collection from 30 students through in-depth interviews, focusing on aspects such as video quality and the effectiveness of the micro-video pedagogical strategy, with the results categorized for data analysis. Table 1 provides the context of the respondents and their main concerns over the micro-video pedagogy.

Table 1: Respondents' background and concerns over the pedagogy

Academic background	Frequencies (%)
Undergraduate	50%(n=15)
Postgraduate	49%(n=14)
PhD	1%(n=1)
Students' concern over the micro-video pedagogy	**Frequencies (%)**
Quality of the micro-video content	83%(n=25)
Quality of the micro-video operation	60%(n=18)
Quality of the micro-video framework	33%(n=10)

2.3 Pre-view and Post-view Tests

The experiment focused on assessing students' comprehension of the "street canyon effects," involving pre-view and post-view tests. The tests, comprising seven questions each, were intentionally set at a slightly more difficult level post-viewing to highlight the micro-video's effectiveness. Students completed test-1 independently before viewing the video, followed by the experiment, and then completed test-2, all administered online with a 10-minute time limit. Figures 1a and 1b depict two examples of questions disseminated to students via an online platform.
Figure 1a: A question designed in pre-view test

Figure 1b: A question designed in post-view test

Figure 1: Two example questions distributed among students through the online platform

2.4 TAM-Based Model Development

The Technology Acceptance Model (TAM) serves as a primary framework for assessing factors driving students' embrace of micro-video learning. TAM, introduced by Davis in 1989 (Davis, 1989), underscores two pivotal elements influencing technology adoption: perceived usefulness (PU) and perceived ease of use (PEU). PU gauges the potential benefits users anticipate from a technology, while PEU evaluates the anticipated ease of its operation. External elements, like technology characteristics, also impact adoption rates, as highlighted by Liu and Ye (2021). Research by Yang and Su (2017) showed that video production quality, rather than utilitarian factors, significantly influenced student engagement in MOOCs. Further, Brame (2016) emphasized the importance of aligning videos with learning objectives and ensuring technical quality to bolster student engagement. These theoretical insights align with feedback from 30 student interviews.

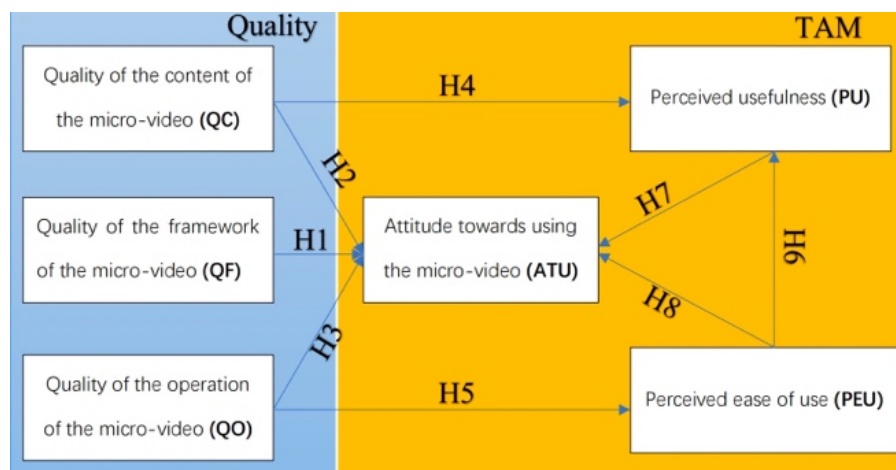
Therefore, based on previous literature and in-depth interviews, the quality of micro-video as an important factor that affect students' acceptance of the micro-video pedagogy was proposed to be added in the new model. The quality of micro-video is categorised into three components: quality of the micro-video contents (OC), quality of the micro-video framework (QF), and quality of the operation of the micro-video (QO). Figure 2 shows the major constructs of the TAM-based model, in which, QC relates to the micro-module content: the topic/knowledge selection in each video, QF refers to the structure and presentation of the knowledge, and lastly QO refers to students' experience with the online platforms.


Figure 2: Proposed TAM-based model

The multiple lines shown in the proposed TAM-based model (Figure 2), are possible impact paths identified based on the literature review, in-depth interview, and the classic TAM model.

> H1: The attitude toward using a micro-video is positively affected by the framework of the micro-video.
>
> H2: The attitude toward using a micro-video is positively affected by the contents of the micro-video.
>
> H3: The attitude toward using a micro-video is positively affected by the operation of the micro-video.
>
> H4: The perceived usefulness is positively affected by the micro-video quality of content.
>
> H5: The perceived ease of use is positively affected by the micro-video quality of operation.
>
> H6: Perceived usefulness is positively affected by the perceived ease of use.
>
> H7: The attitude towards using the micro-video is positively affected by the perceived usefulness.
>
> H8: The attitude towards using the micro-video is positively affected by the perceived ease of use.

2.5 Questionnaire Survey Design and Data Collection

A TAM-based questionnaire with 36 seven-point scale questions was utilized to investigate eight hypotheses concerning the perceived quality of micro-videos in sustainable engineering education. The study, involving 425 engineering students, received ethical approval, and data analysis using SPSS 26 and SEM via SPSS and AMOS software provided insights into the relationships between variables, contributing to a comprehensive understanding of the factors influencing students' acceptance of micro-video pedagogy. . The survey obtained human subject ethics application review approval (No. HSEARS20221217003) from the first author's university.

3. Results

3.1 Effectiveness of the Micro-Video Pedagogy

The two online tests received 425 legitimate responses. Table 2 shows the background information of engineering student participants. The two tests received 425 valid questionnaires (>1 minute response time). The online platform automatically recorded the responses of the students and automatically calculated their scores.

Table 2: Background information of engineering student participants

Attributes	Distribution	Respondent% (n=425)
Major	Built Environment	27% (n=113)
	Engineering Management	32% (n=134)
	Civil Engineering	21% (n=91)
	Town & Country Planning	20% (n=87)
Grade	Undergraduate Grade 2	425 (100%)

The study analyzed the results of two tests, revealing a significant improvement in the correct response rate of students after viewing the micro-video. Test-2 showed a notable increase in the average score (22.8) compared to Test-1 (15.7), with a 7% higher rate of faultless scores, indicating the effectiveness of the micro-video pedagogical method in facilitating student learning and knowledge acquisition. Figure 3 displays the results and comparative analysis of the two tests.

	0-5	6-10	11-15	16-20	21-25	26-30	31-35
Test 1	47	42	102	117	27	12	18
Test 2	17	35	60	86	87	84	56
Ratio(test-1)	11%	10%	24%	28%	6%	3%	4%
Ratio(test-2)	4%	8%	14%	20%	20%	20%	13%
Figure 3: Graphical representation of the test results and their comparisons

3.2 Model Testing and Analytic Results

3.2.1 Reliability and Validity Tests

Cronbach's Alpha was used to determine the questionnaire's internal consistency in this study.

Cronbach's Alpha coefficients for the scale are all greater than 0.7 (PU:0.903; PEU:0.891; QC:0.921; QO:0.856; QF:0.912; ATU: 0.898), suggesting that the questionnaire has adequate internal consistency for use in the present study.

This study used the Kaiser–Meyer–Olkin sampling adequacy measure (KMO) and Bartlett's sphericity test to determine whether the data were suitable for factor analysis. KMO and Bartlett's test analysis results show that the KMO value of the questionnaire is 0.926, which is greater than the standard 0.70, Bartlett's Test of Sphericity is 6789.603, and the P value is 0.00, so it is suitable for factor analysis (Table 3).

Table 3: Test results of KMO and Bartlett's Test

KMO and Bartlett Test		
KMO		0.926
Bartlett test	Approx. Chi-Square	6789.603
	df	406
	P value	0.00

Regarding the factor loadings, as suggested by Hair (2019), items with factor loadings below 0.70 were removed from the model to improve the model and path strength, given that the averages and standard deviations were within the acceptable range. Table 4 shows that, except QO4, all variables had factor loading larger than 0.7. They can all be retained in the model. For QO4, its value is 0.694 and it can also be retained in the model.

Table 4: Results of Confirmatory Factor Analysis

Dimension	Observed variable	Factor loading	S.E.	C.R.	P	CR	AVE
PU	PU1	0.821					
	PU2	0.860	0.058	18.693	***		
	PU3	0.817	0.062	17.391	***	0.655	0.904
	PU4	0.808	0.062	17.114	***

According to the theoretical assumptions, the path relationship of this model was constructed, as shown in the following Figure 4. In the present research, a TAM-based model incorporated six distinct variables, with each adopting a reflective measurement approach. It was imperative to validate that these indicators precisely represented the intended constructs. To determine the robustness and consistency of these indicators, various benchmarks were assessed. The results were promising, with the obtained Cronbach's alpha values surpassing the 0.70 threshold. Additionally, the composite reliability (CR) exceeded 0.60, and the average variance extracted (AVE) from the model surpassed the 0.50 benchmark (shown in Table 4). This implies that the model's indicators are both valid and reliable, meeting the established criteria for effective measurement. Additionally, for adequate discriminant validity, the bold numbers in Table 5 were greater than the corresponding non-bold numbers, indicating that the data achieved good discriminant validity.

Table 5: Correlation analysis and discriminant validity of the dimensions result

Dimension	1	2	3	4	5	6
PU	0. 809					
PEU	0.488	0. 820				
QC	0.358	0.413	0. 817			
QO	0.643	0.493	0.397	0. 779		
QF	0.276	0.302	0.431	0.298	0. 822	
ATU	0.516	0.497	0.458	0.477	0.442	0. 801

3.2.2 Analysis of the Measurement Model

The variables QC, QO, and QF served as independent variables, while PU and PEU served as intermediaries, and ATU served as the dependent variable in the structural equation model developed for this study. The overall model fitting was checked to make sure it was a good fit for the formal survey data. As indicated in Table 6, most indicators were satisfactory following model correction, and GFI and AGFI scores were just below the 0.9 threshold needed to pass evaluation. GFI and AGFI values were above 0.8, which is considered to be

fine by Hair (2019). The proposed model can thus be leveraged for future similar data analyses.

Table 6: Structural equation model fit test results

Reference indicator	x²/df	AGFI	GFI	TLI	NFI	CFI	RMSEA
Evaluation standard	1-3	>0.8	>0.8	>0.9	>0.9	>0.9	<0.08
Statistics	1.892	0. 855	0. 878	0.945	0.901	0.950	0.051
Model fit	yes	yes	yes	yes	yes	yes	yes

To estimate the regression coefficients, this study employs the maximum likelihood technique. The standard errors (SE) of the path coefficients are all positive and there is no outlying phenomenon, as shown in the Table 7. As the absolute value of the corresponding critical value C.R. is greater than 1.96, the regression coefficient value is statistically different from 0.05. When the critical ratio is greater than 1.96, the path coefficient is considered statistically significant at the $p<0.05$ level, and when it is greater than 2.58, at the $p<0.01$ level.

Table 7: Path coefficients and hypothesis test result

	Path		Estimate	S.E.	C.R.	P
QO	←	QF	0.324	0.050	5.407	***
PEU	←	QO	0.526	0.060	8.529	***
QC	←	QF	0.440	0.049	7.548	***
PU	←	QC	0.200	0.048	3.716	***
PU	←	PEU	0.453	0.055	7.726	***
ATU	←	QC	0.167	0.054	2.908	**
ATU	←	QF	0.228	0.048	3.844	***
ATU	←	QO	0.104	0.063	1.607	0.108
ATU	←	PU	0.244	0.064	4.027	***
ATU	←	PEU	0.209	0.069	3.037	**

Note: *** means significant at the 0.001 level; ** means significant at the $p<0.05$ level

Based on the results of the fitting index test shown in the table above, the model fitting index is sufficient for path analysis and hypothesis testing between variables. The model fitting method used in this study is the maximum-likeness method, the non-parametric percentage Bootstrap is used to correct the bias, and the Bias-corrected test method is used to repeat the sampling 2000 times under the condition of a 95% confidence interval (Preacher and Hayes, 2004). In this study, the mediation effect of the structural equation model was analysed, and the specific results are shown in the following Table 8.

Table 8: Mediating effect test result

Parameter	Estimate	Lower	Upper	P
QF-QC-ATU (standardized)	0.073	0.016	0.147	0.011
QF-QO-ATU (standardized)	0.034	-0.017	0.105	0.196
QC-PU-ATU (standardized)	0.049	0.014	0.111	0.002
QO-PEU-ATU (standardized)	0.110	0.035	0.204	0.005

It can be seen from the Table 8 that the indirect influence coefficient of QF-QC-ATU (standardized) is 0.073, the confidence interval of the indirect effect does not include 0, and the p-value is less than 0.05. QC plays an intermediary role between QF and ATU.

4. Discussion - Leveraging Micro-Videos: A Modern Approach to Enhancing Sustainability Education

Micro-videos, with their concise and visually appealing format, have been recognized as a revolutionary tool in the realm of education. As evidenced by a plethora of studies, their rise in the academic domain isn't just a fleeting trend but a testament to their efficacy (Liu et al., 2022; Wang et al., 2019; Wang, 2022;). Particularly, in the context of facilitating sustainable education studies, students' acceptance of micro-video pedagogy is pivotal.

Drawing upon the findings from this empirical study, it is evident that the production quality, content relevancy, and platform's user interface play a significant role in students' inclination towards micro-videos (Huang and Yu, 2022). The findings suggest that when these elements are optimized, micro-videos can offer a richer, more engaging learning experience. This resonates with the broader implications of Al-Rahmi et al. (2021), where students' perception of the usefulness of micro-videos and their intrinsic motivation to learn emerge as critical drivers for their acceptance. It is not just about the video's contents; the surrounding elements, including its duration, interactivity, and the accessibility features like captions, also contribute to its acceptance (Brame, 2016).

Also, the dynamic nature of micro-videos caters to the modern student's learning preferences. Unlike traditional resources, micro-videos, with their vibrant visuals, encapsulate complex, abstract content in a manner that's both engaging and comprehensible. Their mobile-friendly design further amplifies their reach, catering to the on-the-go learning preferences of today's digital-native students (Wang, 2022; Liu, 2022). Furthermore, the inherent structure of micro-videos aligns seamlessly with sustainable education, which often grapples with intricate concepts that need real-world context. The flexibility of micro-videos allows educators to embed real-life instances, making the abstract notions of sustainability tangible.

5. Conclusion

This research explores the effectiveness of micro-video teaching in sustainable engineering education through the lens of the Technology Acceptance Model (TAM). Emphasizing the importance of video quality, the study suggests integrating micro-videos with traditional teaching methods for optimal educational outcomes. Micro-videos, offering real-time insights and engaging storytelling, bridge the gap in sustainable knowledge, democratizing education and transforming abstract concepts into tangible narratives. While the study focused on sustainable built environment, future research could enhance comprehensiveness by comparing micro-video teaching with other methods and exploring a broader range of topics within sustainable engineering. Longitudinal assessments and diverse domain studies could further enrich our understanding of the impact of micro-video pedagogy.

Constructing the Scale of Transcendent Leadership for Junior High School Principals

Wei-Cheng Chien, National Academy for Educational Research, Taiwan
Chuan-Chung Hsieh, National Tsing Hua University, Taiwan

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

In the rapidly changing global organizational environment of today's world, the theory of transcendent leadership has been highly inspiring. Although it has emerged for over a decade, there is currently no related scale available for academic use. Especially in recent years, junior high school principals have faced changing educational environments both within and outside the school, requiring them to possess transcendent leadership thinking and actions. Constructing the scale of transcendent leadership for junior high school principals would be beneficial for the academic research and development of principal leadership studies. Based on this premise, the present study constructs the scale of transcendent leadership by exploring junior high school principals' role positioning and actual practices in school leadership, drawing from the theory of transcendent leadership. The scale has revised through 5 expert reviews and used in a formal questionnaire survey with Taiwanese junior high school teachers as the research participants. A total of 1,580 valid questionnaires were collected. The results of this study establish a questionnaire consisting of 36 items for the junior high school principals' transcendent leadership scale, which can be categorized into four major dimensions and 12 sub-dimensions: 1. "Leadership of Self": character manifestation, self-awareness and regulation, self-spiritual growth. 2. "Leadership of Others ": service orientation, motivating care, fostering spiritual growth. 3. "Leadership of Organization": shared school governance, shaping organizational vision and culture, transcending limitations. 4. "Leadership of Community": establishing community network relations, managing social responsibility, inclusive development.

Keywords: Junior High School Principal, Transcendent Leadership, Scale

Introduction

In regard to emerging leadership theories such as transcendent leadership, most studies remain confined to theoretical discussions (Cardona, 2000; Crossan & Mazutis, 2008; Crossan, Vera, & Nanjad, 2008; Gardiner & Walker, 2009; Gardiner, 2006). There is a significant dearth of empirical research, necessitating a concerted effort to strengthen the empirical research in this area. Currently, only a few empirical studies exist. For instance, Esmailpour and Nikookar (2017) posit that transcendent leadership can inspire employees to achieve the highest level of work quality, thereby enhancing productivity. Their research, involving a questionnaire survey of 189 employees, reveals that transcendent leadership significantly and positively affects employees' well-being and organizational productivity. Tehubijuluw (2014) examines how transcendent leaders contribute to employees' job satisfaction and utilize it as a mediating variable to assist organizations in achieving business objectives and fostering employee development within the organization. The findings indicate that transcendent leadership enhances organizational performance through the intermediary of increased employee job satisfaction. In the realm of education, Lavery (2012) explores the applicability of the transcendent leadership model to Catholic school principals. The study approaches transcendent leadership from a dual perspective of service and spirituality, infusing the notion of service into all actions of transcendent leaders, particularly their unwavering attention to the needs of partners. Given the limited attention and research dedicated to this emerging leadership concept within the education sector, this study aims to investigate the patterns and applications of transcendent leadership within an educational environment, driven by the primary motivation to fill this research gap.

One of the roles of a principal is to foster a positive working atmosphere within the school and establish educational interactive relationships with school personnel, including teachers. The interplay between teacher behavior and principal behavior serves to establish a conducive school climate for educational activities, thereby facilitating effective educational interactions. Conversely, during unfavorable atmospheres within the school, efforts are directed towards improving the motivation of school staff in order to earnestly pursue the achievement of educational objectives (Bredeson & Johansson, 2000). Consequently, individuals assuming leadership roles within the school shape the organizational climate and cultivate members' commitment to the organization, thereby enhancing the comprehensive competitiveness of human resources. This stands as a crucial issue in advancing school administration in the new century.

Transcendent Leadership

Transcendent leadership differs from traditional leadership in that traditional leadership analysis primarily focuses on individuals and dyadic relationships. Traditional leadership theories predominantly regard leadership within the domain of organizational behavior and adopt a micro-level orientation, while transcendent leadership takes a macro-level approach (Waldman, Javidan, & Varella, 2004). Consequently, transcendent leaders perceive the organization as a closely interconnected whole, capable of translating the vision of organizational development initiatives into benefits for all members of the organization (Kishore & Nair, 2013). Transcendent leadership integrates past definitions of relevant leadership concepts, combining experiential evidence with spiritual dimensions, to become a personalized developmental style for leaders (Drucker, 2005; Snook, Nohria, & Khurana, 2012; Doh, 2011; Campbell, 2007). Specifically, it entails the following facets: 1. Leadership as an Ability: Leadership is a capacity to influence and skillfully guide professional team

members towards specific directions, such as making proactive decisions that enable them to feel capable and accomplished. The transcendent leadership concept provides a holistic perspective and motivation, understanding members' talents and styles, allowing everyone to collectively strive towards a common goal and mutually inspire each other to enhance team success. 2. Genuine Leadership Adaptation: Authentic leaders can adapt the transcendent leadership framework in alignment with their own leadership style, thereby encouraging others to leverage their experiences and ideas and contribute to the work or organization. 3. Key Aspects of Transcendent Leadership: Transcendent leadership involves three critical aspects: (1) Cultivating a transcendent mindset that involves listening to members' voices and empowering and enhancing one's own abilities to set standards beyond personal limits, i.e., transcending status quo; (2) Knowing when to lead and guide the team, and when to step back and allow others to take the lead, granting them opportunities for innovative performance and brilliance; (3) Enhancing social relationship skills in transcendent leadership to harmoniously influence other organizational members, elevating collective efforts towards a shared mission.

Within the three dimensions of leadership of self, leadership of others, and leadership of organization, leaders who excel in just one dimension cannot bring about sustained performance benefits to the organization. For instance, even if adept at leading teams and instilling motivation, commitment, and loyalty in members, leaders still need to exhibit organizational leadership. In the current dynamic environment, effective leadership necessitates aligning leadership actions with the organization's overall strategy and possessing robust self-leadership capabilities to navigate challenging trade-offs in complex decision-making. Leaders lacking self-leadership abilities, lacking strong self-awareness, and lacking moral or character advantages would struggle to confront inevitable tough choices (Crossan & Mazutis, 2008). Therefore, the true essence of transcendent leadership lies in fully harnessing leadership effectiveness across all these dimensions. In addition to the aforementioned three leadership dimensions, Boney (2008), when discussing innovative leadership in modern times, also endorses the transcendent leadership concept put forth by Crossan and colleagues. Boney believes that besides leadership of self, leadership of others, and leadership of organizatio, leadership of community should also be incorporated. This theory suggests that contemporary leaders must transcend the balance between these dimensional demands to achieve long-term sustainable performance. This approach, leveraging findings from the social sciences, aptly addresses the gap in leadership of community.

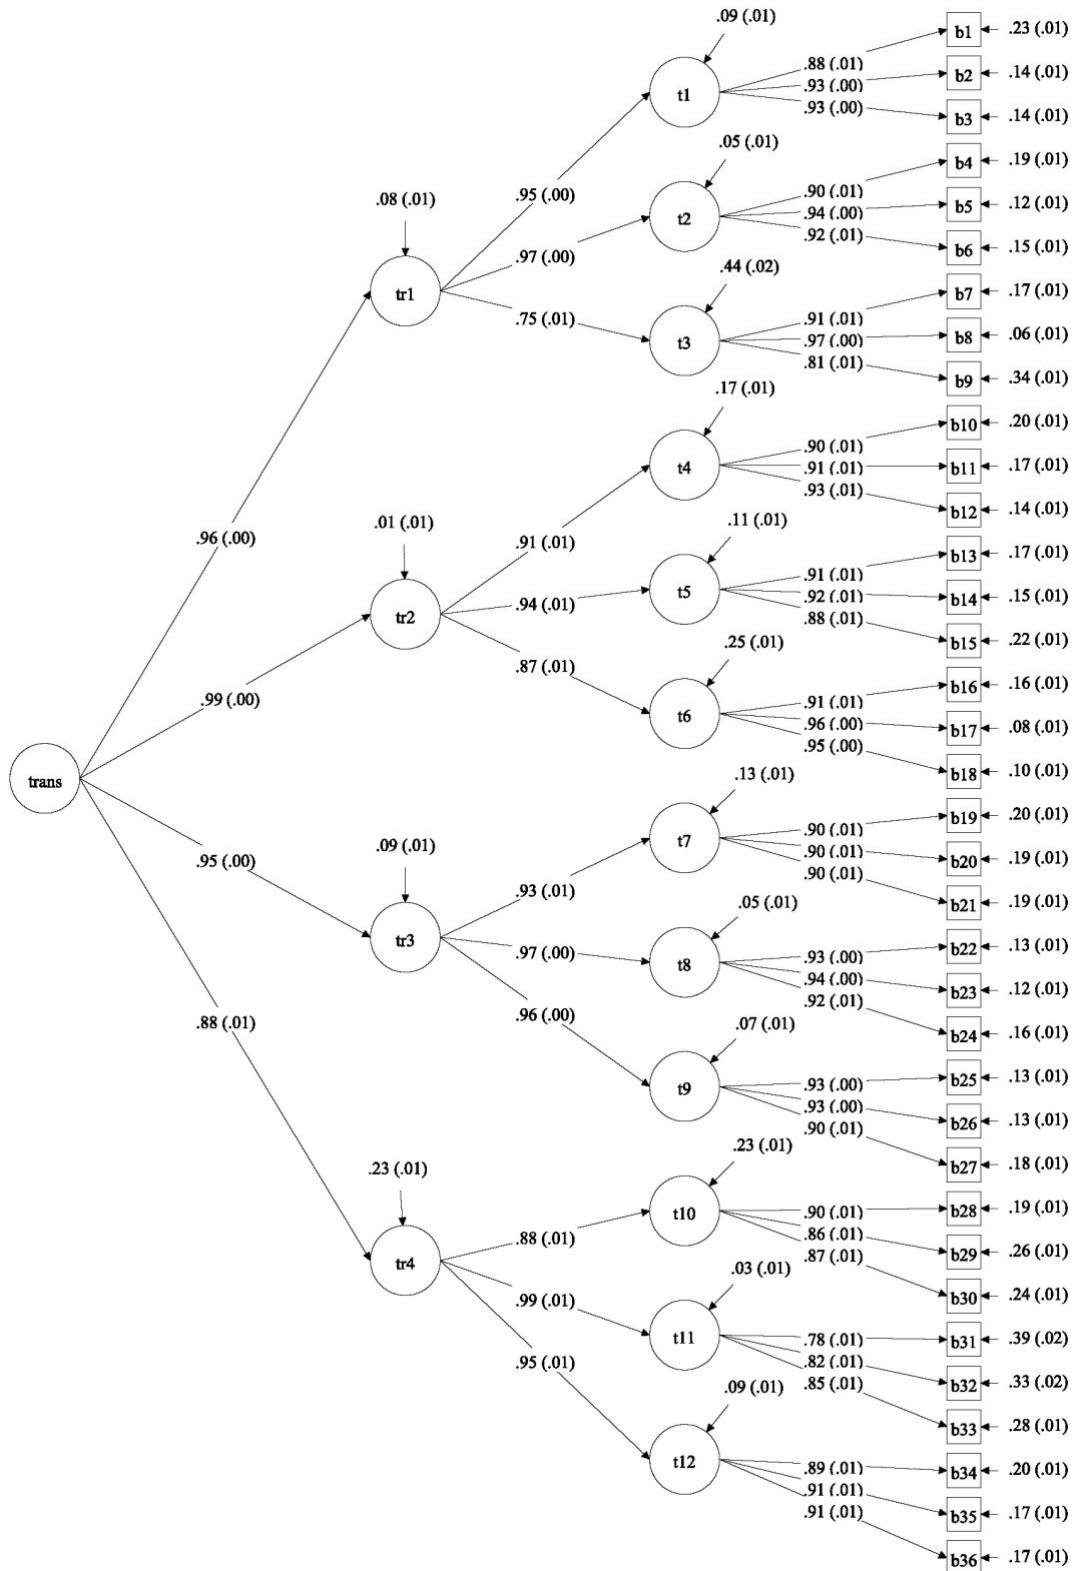
Method

The measurement scale for principal transcendent leadership employed in this study was developed through a synthesis of relevant literature. The scale encompasses four major dimensions and twelve sub-dimensions: "Leadership of Self" (character manifestation, self-awareness and regulation, self-spiritual growth), "Leadership of Others" (service orientation, motivating care, fostering spiritual growth), "Leadership of Organization" (shared school governance, shaping organizational vision and culture, transcending limitations), and "Leadership of Community" (establishing community network relations, managing social responsibility, inclusive development). Following the development of the self-constructed scale, a panel of five experts reviewed and revised it, resulting in a final set of 36 formal questionnaire items, as provided in Appendix 1. Subsequently, a survey was conducted targeting Taiwanese junior high school teachers in 2020, yielding a total of 1,580 valid responses.

Results

The measurement scale for principal transcendent leadership in this study is divided into four major dimensions and twelve sub-dimensions. It employs a 6-point Likert scoring system, where higher scores indicate a higher level of alignment. The α coefficients after questionnaire analysis ranged from .85 to .96, with an overall scale coefficient of .99, indicating good reliability. To confirm the appropriateness of the scale items, confirmatory factor analysis (CFA) was employed to establish the construct validity of the scale. The CFA results yielded χ^2/df = 8.31, CFI = .94, TLI = .93, RMSEA = .06, SRMR = .05, demonstrating a good fit between the data and the model.

Regarding the latent variable model, principal transcendent leadership falls under a three-order CFA model. To test the normality assumption of the data for each observed indicator, skewness and kurtosis of each observed indicator were examined in this study. The results indicated that all observed indicators met the criteria for skewness values less than 3.0 and kurtosis values less than 10.0 (Kline, 2011), suggesting that the data adhered to the assumption of normal distribution. Subsequently, the intercorrelations among the observed indicators were examined. The results revealed that the correlation coefficients between observed indicators ranged from .20 to .92 and all reached a significant level of .001. This signifies that there exists a certain degree of correlation among the observed indicators, warranting further examination of the model fit.

The CFA was conducted using the maximum likelihood (ML) method, and the standardized parameter estimates are presented in Figure 1. The analysis results indicated that the measurement errors for the observed indicators were all positive values, with no negative error variances observed. Furthermore, all error variances were significant at the .001 level. The standardized parameter estimates for all factor loadings ranged from .66 to .99, predominantly meeting the standard criteria. The standard errors for the estimated parameters ranged from .00 to .02, aligning with the criterion of "no large standard errors" (Byrne, 2001; Hair et al., 2010). The analysis outcomes demonstrated a satisfactory overall fit for the higher-order CFA model.


Note: "trans": principal transcendent leadership, "tr1": leadership of self, "tr2": leadership of others, "tr3": leadership of organization, "tr4": leadership of community, "t1": character manifestation, "t2": self-awareness and regulation, "t3": self-spiritual growth, "t4": service orientation, "t5": motivating care, "t6": fostering spiritual growth, "t7": shared school governance, "t8": shaping organizational vision and culture, "t9": transcending limitations, "t10": establishing community network relations, "t11": managing social responsibility, "t12": inclusive development.

Figure 1: The standardized parameter estimates for the three-order CFA of principal transcendent leadership

The questionnaire survey employed a 6-point scale, categorized into five intervals for analysis: high score ranging from 5.01 to 6.00, upper-middle score ranging from 4.01 to 5.00, middle score ranging from 3.01 to 4.00, lower-middle score ranging from 2.01 to 3.00, and low score ranging from 1.00 to 2.00. The analysis results of the descriptive statistics and difference testing for junior high and elementary school principals' transcendent leadership are presented in Table 1. Overall mean analysis from Table 1 reveals that the average score for principal transcendent leadership (M = 4.81) is at the upper-middle level. To ascertain whether there are differences in the current status performances among the dimensions under the research variables, a repeated measured ANOVA was conducted for difference testing. The results indicated a significant mean difference (F = 150.49, p < .001); post hoc comparisons showed that the highest scores were observed in "motivating care" (M = 4.97), "establishing community network relations" (M = 4.96), "service orientation" (M = 4.95), and "character manifestation" (M = 4.93), with "motivating care" significantly higher than "character manifestation." The second-highest group included "self-awareness and regulation" (M = 4.85), "shared school governance" (M = 4.84), and "shaping organizational vision and culture" (M = 4.82), with "self-awareness and regulation" significantly higher than "shaping organizational vision and culture." The third-highest group consisted of "transcending limitations" (M = 4.79) and "self-spiritual growth" (M = 4.77). The fourth-highest group comprised "inclusive development" (M = 4.67) and "managing social responsibility" (M = 4.66). The lowest score was attributed to "fostering spiritual growth" (M = 4.53).

Table 1: Descriptive Statistics and Difference Testing of Principal Transcendent Leadership

	Variable	M	SD
	overall average	4.81	0.77
Leadership of Self	1. character manifestation	4.93	0.84
	2. self-awareness and regulation	4.85	0.87
	3. self-spiritual growth	4.77	0.83
Leadership of Others	4. service orientation	4.95	0.90
	5. motivating care	4.97	0.87
	6. fostering spiritual growth	4.53	0.98
	7. shared school governance	4.84	0.87
Leadership of Organization	8. shaping organizational vision and culture	4.82	0.92
	9. transcending limitations	4.79	0.93

Conclusion

The junior high school principals are able to exhibit transcendent leadership, with the aspect of setting a personal example in "leadership of self" showing the most pronounced performance. The research findings reveal that the average score for principal transcendent

leadership is at an upper-middle level. This indicates that current junior high school principals are largely capable of demonstrating the expected roles of transcendent leadership. They are able to effectively exhibit self-leadership efficacy through introspective reflection, lead school members through positive leadership activities and charisma, and achieve satisfactory leadership outcomes in interactions with community stakeholders. Moreover, among the four major dimensions of transcendent leadership, principals excel the most in the aspect of "leadership of self," while among the sub-dimensions, "motivating care," "establishing community network relations," "service orientation," and "character manifestation" exhibit the most commendable performances.

This study summarizes the relevant behaviors of junior high school principals in terms of transcendent leadership. In the aspect of leadership of self, they exhibit moral virtues such as compassion, selflessness, loyalty, humility, courtesy, humanitarianism, gratitude, courage, love, and faith. These virtues are transformed into tangible leadership practices to exert leadership effectiveness. Regarding leading others, principals emphasize the establishment of school partnerships, considering the well-being of faculty and staff. Through motivation, empowerment, and humane care, they encourage these individuals to strive for personal growth in order to achieve school development goals.

In terms of organizational leadership, principals foster a collective decision-making mindset and integrate entrepreneurial spirit into the school's vision and culture to inspire the entire faculty. Simultaneously, they possess a forward-looking perspective, adjusting the school's strategies and structures in response to changing external environments. Concerning community leadership, principals involve stakeholders such as parents and community members in the school's developmental environment, establishing strong relationships that collectively enhance educational quality. They also shoulder social responsibilities by guiding community growth and integrating local engagement to achieve sustainable development ideals. They balance school and community management strategies to foster harmonious development between the two.

Appendix

Appendix 1.

The Scale of Transcendent Leadership for Junior High School Principals

Dimension	Sub	Item
Leadership of Self	character manifestation	1. Principals demonstrate strong moral integrity, gaining widespread recognition and emulation from faculty and staff.
		2. Principals translate virtues such as compassion, selflessness, humility, and courage into concrete leadership actions that influence school development.
		3. Principals maintain consistency between words and actions throughout the school's developmental process, earning their reputation as trustworthy leaders.
	self-awareness and regulation	4. Principals engage in self-reflection and self-correction, recognizing and rectifying mistakes in their speech and behavior.
		5. Principals engage in frequent self-reflection and introspection, clarifying the core values of school development to make informed decisions.
		6. Principals possess the ability to adjust their leadership actions in alignment with school development goals.
	self-spiritual growth	7. Principals prioritize their own spiritual well-being.
		8. Principals strive to enhance their own spiritual well-being.
		9. Principals possess a rich spiritual life and are willing to sacrifice personal interests for higher school development goals.
Leadership of Others	service orientation	10. Principals are friendly and considerate towards faculty and staff, offering assistance during times of difficulty.
		11. Principals exhibit humility in serving faculty, staff, and students.
		12. Principals listen to faculty opinions and communicate with respect during interactions.
	motivating care	13. Principals encourage faculty to approach school development with hope and enthusiasm.
		14. Principals inspire faculty's identification with the school, motivating them to contribute beyond personal interests.
		15. Principals take pleasure in motivating and commending exemplary performance among faculty and staff.
	fostering spiritual growth	16. Principals show concern for the spiritual well-being of faculty and staff.
		17. Principals utilize various resources to support the spiritual growth of faculty and staff.
		18. Principals strive to improve the spiritual well-being of faculty and staff, fostering continuous self-improvement.
Leadership of Organization	shared school governance	19. Principals establish diverse communication channels, facilitating the sharing of school development information across the entire school community.
		20. Principals employ various meetings to enable faculty to collectively discuss and decide on the school's developmental direction.
		21. Principals respect the professional opinions of various school organizations and parent associations, incorporating these perspectives into collective school decisions.

	shaping organizational vision and culture	22. Principals shape the school's long-term vision and commit to achieving higher school development goals.
		23. Principals instill a belief in the school's vision among faculty and staff, driving their commitment to realizing school objectives.
		24. Principals create a culture of innovative development, leading the school community to challenge and achieve ambitious goals.
	transcending limitations	25. Principals adjust the school's organizational development strategies and goals based on external environmental changes and needs.
		26. Principals possess foresight, strong ambition, and perseverance, leading the school to continuous breakthroughs in development.
		27. Principals keenly detect potential challenges and crises within the school, respond with appropriate strategies, and guide the school through smoothly.
Leadership of Community	establishing community network relations	28. Principals establish positive relationships with parents and community members, fostering harmonious interaction between the school and its stakeholders.
		29. Principals regularly organize campus events to connect with parents and community members emotionally.
		30. Principals proactively promote school objectives through various means, seeking understanding and endorsement from parents and the community.
	managing social responsibility	31. Principals recognize the close relationship between the school and the community, considering the sentiments of parents and community members in decisions that affect community interests.
		32. Principals organize relevant lifelong learning courses, activities, or workshops to contribute to community development and progress.
		33. Principals share school hardware, software, and resources with the community as needed.
	inclusive development	34. Principals value opinions and suggestions from parents and community members, fostering community consensus and adjusting school objectives as necessary for harmonious development.
		35. Principals integrate community industries or characteristics to develop the school's educational features, enhancing education quality while promoting community development.
		36. Principals understand the developmental needs of the community and encourage parents and community members to participate in school management through various channels, achieving mutual development of the school and the community.

Experiences of Teachers Handling Students With Twice-Exceptionality

Mary Nholl T. Flores, University of Southeastern Philippines, Philippines

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

The study was conducted to investigate experiences of teachers handling students with twice-exceptionality. The identified students with twice-exceptionality fit in the operational definition of Gallagher (2006) as all three were diagnosed with Asperger's Syndrome but showed giftedness in the areas of languages and Science. A qualitative single case study was employed which used the transcribed interviews from the respondents for thematic analysis. The researcher looked into their successes along the process and sought to identify the issues and challenges that the teachers encountered along the journey. The findings included: (a) teachers handling students with twice-exceptionality had positive and challenging experiences; (b) teachers handling students with twice-exceptionality found effective strategies based on their experiences; (c) teachers handling students with twice-exceptionality encountered challenges and issues which were recorded in this study. The positive experiences of teachers handling students with twice-exceptionality included: teacher improvement and inspiring experience. The negative experiences included: required effort and no prior experience. The recorded successes of the teachers included: identification of the child's strength and constant communication; encouragement; follow-up works; communication with parents and use of Montessori method. Moreover, the challenges and issues and problems by the teachers included: social or peer relationship, accepting defeats and teachers' lack of experience. The recommendations of this study are: for teachers to have training programs or courses related to twice-exceptionality, an available recommended checklist on the characteristics of students with twice-exceptionality, specific policy/cies and other laws intended for students with twice-exceptionality, and for strengthened parent-teacher partnership to be continued.

Keywords: Twice-Exceptionality, Giftedness, Montessori Method

Introduction

The noble profession of teaching becomes more meaningful when educators effectively impart knowledge to all students - students with disabilities, students who are differently abled, and even to the gifted ones. The nobility of this work does not exempt it from challenges especially in the area of handling different learners. Among these learners are students identified with giftedness. Gifted learners are students who give evidence of high achievement capability in the areas of intellectual, creative, artistic, leadership capacity, or specific academic fields. With the frequent school- related problems that they face include difficulty enduring boredom, negative attitudes of peers, difficulty to understand others, introversion, perfection, impatience, and intolerance (David, 2018). However, when the student is not only gifted but also exhibit one or more specific learning difficulties such as forgetfulness, poor organizational skills, poor peer relationships, low self- esteem, and demonstration of school failure, the teachers' problem becomes more complicated.

Teachers handling students with twice-exceptionality are expected to meet their needs the same way regular students and those with disabilities are catered in the classrooms. This is the ideal situation. However, this task becomes more arduous if the teachers lack prior knowledge or experience in teaching this type of student. Add to this the challenge in misidentification or late identification of the students' needs which hinders the teachers' work. Pawilen (2018) stated that there is a current movement in the Philippines through the Department of Education (DepEd) in developing its first national gifted education curriculum standard to be used in the country.

Additionally, the department has long ago recognized the urgency to address the problem of the implementation of inclusive education for students with disabilities in the country through the DepEd Order 72 series 2009. Students with twice-exceptionality unfortunately don't have specific category to belong in the above-mentioned priorities of the Department of Education making it more difficult on the part of the teachers to address their presence in the classrooms. At present, the entire Philippine education system continues to be challenged with the proper implementation of high-quality inclusion (Muega, 2016). Teachers have the responsibility to meet the needs of all students including students with twice-exceptionality.

There is more than enough international representation of twice- exceptionality even in the neighboring Asian countries. Yet in the Philippine set-up; the country still lacks empirical data about this phenomenon. While twice-exceptional studies are highly emerging in the west, its context locally needs more study.

For the purpose of this single case study, the researcher used the identified categories and characteristics by Gallagher (2006). Who are students with twice-exceptionality? The National Education Association published a journal entitled "The Twice Exceptional Dilemma" which gave a summary of the three categories where students with twice-exceptionality may be found. The first category are those formally students identified as gifted. The giftedness clouds the disability. The second category are those student formally identified a having disability. This time, it's the disability that masks the giftedness. The third category is those students not formally identified as gifted or disabled. The giftedness and disability components mask one another. It is quite complicated to identify students with twice-exceptionality. No wonder teachers, even the trained ones, are required both awareness and knowledge to employ assessment and identification methods.

Students with twice-exceptionality can be specifically identified according to the following types:
- Gifted with Physical Disabilities
- Gifted with Sensory Disabilities
- Gifted with Asperger's Syndrome
- Gifted with Emotional and/Behavioral Disorders
- Gifted with ADHD
- Gifted with Learning Disabilities

According to a journal entitled "Inclusive Education in the Philippines: Through the Eyes of Teachers, Administrators, and Parents of Children with Special Needs", teacher participants in inclusive education have expressed concern over the lack of training among teachers accommodating students who are differently abled and those with special needs (Muega, 2016). Clearly, teachers implementing inclusive education require proper information and skills through trainings so that high-level inclusive education is attained.

This qualitative research used a single-case design to examine the experiences of teachers handling students with twice-exceptionality. Starman (2013) quoted Sturman (1997) in defining a case study as a general term for exploring an individual, group or phenomenon. It is therefore the complete description of an individual's case and its analysis. This includes the description of the case and thorough explanation of the discovery process of research on its own. In the same journal of Contemporary Educational Studies (2013), a supporting definition of a case study by Sagadin (1991) stated that a case study is used to analyse and describe each person individually, or a group of people, process, phenomenon, or an institution in detail. There is an emphasis on the idea that cases are generated and evolve over time and that events occur in "that particular time and particular place".

Additionally, this research interviewed 8 teachers and the three parents of students with twice-exceptionality. Creswell (2013) explained that as an investigation of one or more cases over time through a detailed data gathering collection, the sources of information comes in multiple forms. This results in triangulation, which strengthens the validity of this study.

Participants

This research used purposeful sampling using a selection criterion based on the following: teachers handling students with twice-exceptionality and parents of students with twice-exceptionality. The process of finding the participants was as follow: the researcher looked for three students with twice- exceptionality from three different schools. Afterwards, the researcher selected eight teachers who handled the selected students with twice-exceptionality. These teachers were identified through homogenous purposive sampling. The homogenous sample was created on the basis that the teachers who participated in this research all handled students with twice- exceptionality. The students with twice-exceptionality were diagnosed with Asperger's syndrome and at the same time showed giftedness in the areas of languages and science. Moving on, the researcher gathered data through interviews from the identified teachers who handled students with twice-exceptionality. Additionally, the researcher also interviewed the three parents of students with twice-exceptionality as an important element of this case study. This is to strengthen the validity of this research.

From the 8 teachers interviewed for this study, the first three taught in a private Montessori school. The next three teachers work in a private school affiliated with the British International School with many branches in the Philippines. Lastly, the two remaining teachers worked in a Special Education Center Davao City. They were identified through a criterion sample technique wherein they shared the same school activities as teachers of students with twice-exceptionality, performed the same tasks in their respective schools, and engaged with the same group of people such as their student with twice- exceptionality as well as their parents. The criteria used for the selection of other participants apart from the teachers were the following: (a) teachers handling students with twice-exceptionality diagnosed with Asperger's syndrome and gifted in languages and sciences, and (b) parents of the students with twice-exceptionality. Presented in Table 1 are profiles of the teacher participants of this research.

Table 1: Profile of the Teachers handling Students with Twice-Exceptionality

Pseudonym	Age	No. of years teaching	Type of School
Teacher 1/T1	45	23 years	Private-Montessori
Teacher 2/T2	25	5 years	Private-Montessori
Teacher 3/T3	36	13 years	Private-Montessori
Teacher 4/T4	26	5 years	Private-British Int'l
Teacher 5/T5	23	3 years	Private- British Int'l
Teacher 6/T6	25	4 years	Private- British Int'l
Teacher 7/T7	41	15 years	Public-SPED Center
Teacher 8/T8	37	13 years	Public- SPED Center

Sampling Design

The researcher used a purposeful sampling technique. This is the use of homogenous sampling that is specifically purposive. The participants were teachers handling students with twice-exceptionality diagnosed with Asperger's syndrome and showed giftedness in languages and sciences. They all handled students with twice-exceptionality in a regular class. Aside from that, these teachers also performed common activities related to students with twice exceptionality. The researcher decided on the bases of the above-mentioned commonalities of the respondents whether they share significant and meaningful experiences concerning twice-exceptionality (Yüksel & Yıldırım, 2015). Parents were also interviewed for triangulation purposes.

Research Instruments

The researcher secured the records made available by the school where these teachers work as guide tools to know the status of the students with twice-exceptionality. These served as a guide during the whole duration of the data gathering procedures.

The researcher also prepared the following research instruments to obtain the necessary information for this study. The first instrument was the semi-structured questionnaires for the series of interviews focusing on the experiences of teachers handling students with twice-exceptionality. Another set of semi-structured questionnaire for parents was also used for this study. The researcher prepared a set of questions that lead the participants to share and describe their experiences as teachers handling twice-exceptionality as well as the parents (See Appendix B). Moreover, the research questionnaires underwent validation (See Appendix C). Furthermore, the researcher also gathered observational and anecdotal reports from the teachers that gave description of the performance of the students with twice-exceptionality while under their classes. These are present in the Students' Portfolios.

Data Gathering Procedure

The data gathering procedure ensured the permission letter from the office of the Dean of the College of Education, University of Southeastern Philippines, Davao City to the Head of School of a private school where the participants of the study work. This same process was also done for the teachers working in a public school. The letter contained the request for the study to be approved for the conduct of the institution. It also declared the purpose, statement of the problem, instruments to be used, and the participants.

Data Analysis

Thematic analysis was selected as the research approach for this investigation. It is the process of identifying patterns or themes within the qualitative data (Maguire & Delahunt, 2017). Additionally, the goal of a thematic analysis is to recognize themes or patterns in the data that are significant or noteworthy. Moreover, these themes or patterns are then used to address the research or its issues. To put it simply, it's not just summarizing the data but rather making sense out of the summarized data that makes a good thematic analysis. Braun and Clark (2006) as cited by Maguire & Delahunt (2017) described the two levels of themes, advising researchers to practice identifying the latent level wherein the ultimate goal of the study is to investigate the underlying ideas, assumptions, and conceptualizations, and ideologies that were theorized in shaping the sematic content of the data.

To ensure the objectivity of this study, the researcher gathered another set of data for triangulation to validate the outcome of this research. Creswell (2013) mentioned that the use of triangulation gives validity to the findings of the study.

Ethical Considerations

For this research, the researcher sent approval letters as part of the preliminary procedures before starting the research and conducting the interviews with the participants. This was to ensure that they understood the purpose and methods of the research. The participants will be kept completely anonymous or assigned with aliases in the research and were fully aware that the observation records from this research will remain confidential so that readers may not know their identities.

The participants were also thoroughly informed of the rationale of the study before the onset of the data gathering procedures. This includes discussion of the activities that they will participate and the general questions that were asked from them which will be part of the consent letter.

Research Questions

This study was designed to examine the personal accounts of these teachers, which includes their perceptions towards students with twice exceptionality.

Furthermore, this study would like to answer the following questions:
1. What are the experiences of teachers who are handling students with twice-exceptionality?
2. What are the successes of teachers who are handling students with twice exceptionality?
3. What are the challenges and issues encountered by teachers who are handling students with twice-exceptionality?
4. What recommendations could be offered for teachers handling students with twice-exceptionality?

Research Methods

The participants of this study were also briefed that they were to answer a series of questions prepared by the researcher, which was validated by experts in the field of study. These were recorded upon the agreement of the participants. Confidentiality was of high value for this study. That's why, aliases will be used instead of their real names and information about the school where they are working might be traced, therefore the researcher will not include the mention of this.

The participants were made aware through the consent letter that they will sign that their participation to this study is completely voluntary. This means that they have the right to discontinue their participation if they feel stressed or unable to continue study completion.

The researcher conducted a briefing to the participants explaining to them that their participation of this study will benefit the improvement of programs related to students with twice-exceptionality. Thus, there will be very minimal risks in their participation of the study.

Results and Discussion

The following are the experiences of teachers handling students with twice-exceptionality.

Positive Experiences :Improve as Teachers

When the respondents were asked to describe their experiences in handling students with twice-exceptionality, the responses varied. Four out of the eight teachers described their journey positively. Teacher 1, 3, 6 and 7 generally described their experiences in a positive way. Subsequently, they reflected that the experience helped them improve as teacher. Altogether, the four participants remember the experience as something that helped them improve as teachers.

The parents learned that the teachers handling their child with twice-exceptionality didn't' have any experience of doing so.

Inspiring

Another positive experience shared by the participants was how they felt inspired while handling students with twice-exceptionality. Three out of eight participants felt inspired because of the experience.

To support this, a parent also shared observable experiences with the teacher handling her child. The parent commented that she was impressed and at the same time inspired at how the teacher was able to follow her child and continue being motivated despite the many challenges called for in handling students with twice-exceptionality.

It is quite surprising to discover that there is a very limited number of studies on the intrinsic motivation of teachers in special education. There is one entitled "Teacher career motivation in special education in China" that discussed about the intrinsic motivation being the reason why teachers decided to teach in special education. Consequently, the teachers who participated in that study emphasized that it was their personal decision to teach students with special needs and that they're driven by their passion to influence their students (Yan, 2011). This is aligned to what the participants in this research shared that their positive experience of handling students with twice-exceptionality is factored by them being inspired along the process.

Challenging Experiences: Requires Effort

Seven out of eight teachers on the other hand described their experience as challenging because it required effort on the part of the teachers. Teachers 1, 2, 4, 5, 6, and 8 shared the different ways in which they had to exert extra effort to be able to meet the needs od students with twice- exceptionality.

The parent affirmed that the participants' job of handling their child with twice-exceptionality required effort. They recognized the adjustments that the teacher had to go through to be able to meet the child's needs.

Lack of Experience

Teachers 5, 6, and 7 admitted that it was really challenging for them to handle this type of learner. Aside from the fact that they did not have a background in Special Education, it was also their first time to handle this type of student as a beginning teacher. Teacher 5 confessed that didn't have any experience handling students with special needs. Teacher 6 also confessed that since she didn't have a background in Special Education, she considered the experience as personally challenging. For Teacher 7 who also considered the experience as a challenge due to lack of experience and specifically highlighted the behavioral concern that she had with the child.

Among these Successes, the first on the list is:

Identify the Strengths

Majority of the teachers in this study found it a success that they identified the strengths of students with twice-exceptionality as they experienced handling this type of learner. Six out of the eight teachers emphasized the efficient use of this. Teachers 1, 2, 3, 5, 7, and 8 shared

that found banking in the child's strengths as effective. Identifying the student's strengths included the student likes, interests, potentials, and current level.

The parent also confirmed that the teacher was successful in handling her child by using the child's strengths. The parent shared that her child felt secure with the teacher because the teacher knew strengths and knew how to manage her.

Constant Communication: Regular Meetings

Maintaining constant and open communication with students with twice-exceptionality is a tedious yet fulfilling task as this leads to successful treatment of their behavior in class. The teacher participants found it really important to communicate to their students that they care, therefore, they never hesitate to talk to them when necessary. Six out of the eight teachers emphasized the importance of constantly talking to students with twice- exceptionality.

Consistently meeting the child helps their overall performance. Additionally, the parents also observed the importance of communication through regular meetings. She shared that the meetings help their child be properly guided. And she acknowledged that it was effective.

Encouragement: Choice and Feedback

The next common theme found in the interviews with the teachers was giving of encouragement. Three out of the eight teacher participants mentioned that they found it effective and helpful based on their experiences to encourage the student with twice-exceptionality. These teachers were successful in dealing with the needs of students with twice-exceptionality because of the use of encouragement.

The parent's interview above affirmed the ways the teacher participant encouraged the student with twice-exceptionality. This proved to be an effective strategy for the child. The parent confirmed that her child felt loved because of the encouragements of the teachers.

Follow-Work: Extra Activities

Another theme that emerged and found to be a success by teachers handling students with twice-exceptionality was providing follow-up work. Four out of the eight teacher participants signified that they give and prepare extra- materials for follow-up works for students with twice-exceptionality and it was effective. In order to keep this type of learner focused and productive in school, the teachers were successful by giving them extra work.

Problems in Social/Peer Relationships

Peer Conflicts

Upon summarizing the interview results of this research, another theme emerged which delved on the social challenges of students with twice- exceptionality. Six out of the eight teachers recognized the social struggle experienced by this type of learner as they mingled with their classmates. The social challenges that these students experienced burdens the teacher in class.

Coming from the parents' statements, she admitted that her daughter found it difficult to understand people. Her child found it difficult to interact and communicate with her peers. In the end, her child often would end up working on her own and not socializing with others. This was one problem that the teacher had to solve constantly while managing the class.

Parent Communication

Communication is not only limited to talking to the child as this also involves processing the emotions of the child. Additionally, the teacher participants also highlighted the importance of communicating to the parents and Occupational therapists, as there should exist a partnership among these people who are working together for the benefit of students with twice- exceptionality. Four out of the eight participants suggested this strategy to be applied by other teachers as they found it effective from their own experiences.

Use of Montessori: Lesson Connectivity

Two out of the eight participants mentioned the use of the Montessori method as an experience that was successful as they handled students with twice-exceptionality. The researcher included this in the list, as it is among those answer that is something new and unique.

Additionally, the parent also affirmed the use of Montessori method as an effective strategy to help handle students with twice-exceptionality. The parent explained that because the method allowed students to be self-paced, it gave her daughter the opportunity to be taught lessons at her current level. Moreover, the same parent emphasized that the method allowed the school to give chances to support her daughter's learning development effectively.

Teacher' s Lack of Experience

There were three participants who shared in their responses that the challenges that they had in handling students with twice-exceptionality was mainly because they didn't have prior experience on it. Additionally, their major or background knowledge during their undergraduate is limited or has never included discussions about students with twice-exceptionality.

The statement of the parents supports this when they realize that the teacher struggled in handling their child due to lack of experience. Add to it the fact that their child is really physically active.

Conclusions

Summary of Findings

1. Teachers handling students twice-exceptionality had positive and challenging experiences along the process. The positive experiences documented that the experience of handling students with twice-exceptionality lead to their improvement as teachers. Another positive experience that the teachers shared was the realization that they discovered inspiration in teaching because they handled students with twice-exceptionality.

2. From the same group of participants, they shared that they also felt challenged when they were handling students with twice-exceptionality. The challenges that they experienced spring up from the lack of prior experience or enough knowledge about students with twice-exceptionality. There were participants who had no prior experience in handling students with twice- exceptionality and so they were challenged. Some confessed that it was a challenge because the experience requires effort on the part of the teacher.

3. Teachers handling students with twice-exceptionality shared successes from their experiences. They considered the following as successful experiences: identifying the strengths of the student, communication with the student, encouragement, giving of follow-up works, initiating communication with the parents and other specialists, and using Montessori method.

4. Moreover, teachers handling students with twice-exceptionality encountered issues and problems along their journey. These issues include social or peer relations challenge and the teacher's lack of experience in handling students with twice-exceptionality.

Conclusions

The following conclusions were made based on the findings:
1. Teachers handling students with twice-exceptionality described their experience as positive and challenging experience.
2. Teachers handling students with twice-exceptionality experienced successes as they addressed the giftedness and disabilities of their students.
3. Teachers handling students with twice-exceptionality experienced dealing with issues, and challenges to address the giftedness and disabilities of their students.
4. Teachers handling students with twice-exceptionality need training, proper assessment in handling students with twice-exceptionality, and administrative support to effectively meet the needs of these children.

Implications

1. Policies on meeting the needs of learners with special educational needs such as the Philippine Senate Bill No. 1331 have been approved and mandated. However, the literature of this study reveals that there is no particular policy intended to address the needs specifically of students with twice- exceptionality.

2. The outcome of this research also implies that the knowledge about students with twice-exceptionality is limited for those with background in Special Education. All the more this is true for teachers without any background or experience about students with twice-exceptionality. Additionally, there are very few if not no empirical studies about students with twice-exceptionality in the Philippines.

3. Teachers who handled students with twice-exceptionality weren't equipped but still they found effective strategies in meeting the needs of this type of learner from their own experiences.

Recommendations

In light of the findings and conclusions of this study, the following are recommended to the teachers who participated in this study:

1. The teachers of this study should have the proper knowledge and understanding about students with twice-exceptionality to create affirmative educational environments for this type of learner. Conducting relevant training programs or courses are strongly recommended.
2. Appropriate assessment tools like such as checklist of the characteristics that can help identify students with twice-exceptionality should be used during the diagnostic phase of instruction. Earlier identification leads to earlier and proper intervention.
3. Existing policies and laws should be revisited or enhanced to capture the needs of students with twice-exceptionality.
4. The teacher-parent partnership in handling students with twice- exceptionality did positive results in this study. Therefore, this study recommends this to be continued.
5. Future research on students with twice-exceptionality in the Philippines should be conducted to enrich the empirical data about this type of learners.

Acknowledgment

Stakeholders' Assessment of Basic Science Programme Objectives in Southwestern-Nigeria

Yekinni Olufunmilola Taiwo, Lagos State University of Education, Nigeria

Abstract

Helping to gain better understanding of the world puts science in a better position to influence positively, conditions for life on planet. Therefore, having the necessary science background and knowledge goes a long way to affect people's life positively. Hence, children are taught science early so as to develop the critical thinking skills necessary to sort through all the information that they will be bombarded with in their lives, and make intelligent decision about what to believe and how to value their world and environment. Basic science that is taught in schools has evolved as a process of gradual curriculum reform in science. This study carried out an assessment of the Stakeholders' rating of Basic Science Programme Objectives. Participants were ministry officials (33), principals of schools (89), year tutor/heads of department (166) and classroom teachers (269) selected by stratified random sampling techniques from Southwestern-Nigeria. The instrument engaged was Science Programme Objectives Rating Scale with reliability coefficient (r = 0.72). Findings shows that Stakeholders rated the objectives to be very good ($\bar{x}$ = 3.76). However, the dynamic nature of Science necessitates continual assessment of the programme objectives from time to time.

Introduction

Science has been described as one of the greatest weapons human has ever invented for leaping into the unknown phenomenon. It has also been described as the language of nature, without which communicating with the world, within or outside becomes impossible. A good background in Science enables people to quickly learn and understand how things around them work. Hall-Rose (2004) asserts that people need to master a minimum amount of scientific and technological knowledge to understand the world around them. Having the necessary science background and knowledge goes a long way to affect people's life positively. It is therefore pertinent, that every individual, young, old, male or female be scientifically literate in order to have a better survival. This has made the study of science and technology (which grows out of scientific discovery) indispensable to the survival of every individual on the one hand, and on the other hand an integral part of the culture of a nation, which has to be sustained, developed and passed on to incoming generations. Basic science that is taught in Nigerian schools has developed as a process of gradual curriculum reform.

The introduction of science into the Nigerian school system dated back to the time of the Christian missionaries who brought western type of education to Nigeria. The teaching of science was, however, delayed by the missionaries and the colonial administrators for obvious reasons. One of which was because the motive for colonization was essentially trade, the issue of science education could not have arisen. Another reason for non-introduction of science was the erroneous belief that Africans were inferior human beings and as such not capable of understanding science. Hence, what existed between 1895 and 1920 was the teaching of only Biology-related subjects like Physiology, Nature study and Botany in a few mission schools [Science Teachers Association of Nigeria Newsletter, 1970]. Later, General Science was taught at the Post- Primary Institutions.

According to Taiwo (1975), General Science later disintegrated to the three basic science disciplines, but General Science as a course was retained and taught to lower class as a science course for less able, the least science oriented and those who do not wish to pursue science beyond the secondary school level. Attempt was also made to teach it to higher classes but the point against it was that it was the joining of subjects that are naturally different. It was in the midst of this confusion that the euphoria of integration globally caught up with the Science Teachers Association of Nigeria (STAN), thus leading to the dramatic birth of Nigerian Integrated Science Project (NISP). This inherited confusion, along with other factors such as lack of enlightenment and trial testing, led to the erroneous belief in some quarters that Integrated Science was the old General science 'rechristened'. Nigeria then had to move with the global curriculum changes from the old Nature study and Hygiene through General Science to Integrated Science. Integrated Science then was supposed to lay foundation for subsequent science in the future.

Nigeria as part of the global deliberations on Education for All (EFA) reflected her response in the national education policies and programmes of attaining the Millennium Development Goals (MDGs) by 2015 and the critical target of the National Economic Empowerment and Development Strategies (NEEDS) decided to introduce the 9-year Basic Education programme. Basic Science and Basic Technology as teaching subjects have therefore been introduced as the science subjects to be offered at the Middle Basic and Upper Basic levels.

Federal Ministry of Education (2000) stated the specific objectives of the UBE programme to include ensuring the acquisition of the appropriate levels of literacy, numeracy, manipulative,

communicative and life skills as well as the ethical, moral and civic values needed for laying a solid foundation for lifelong learning. The National Policy on Education (FGN, 2013) entrenches the teaching of science at all levels of education. It is Ibole (2000) belief that science rules the universe. It serves and ensures human survival. Jegede (1983) also asserts that, the development in science and technology has so greatly affected the lives of every human being so much that, to be ignorant of the basic knowledge of this development is to live an empty, meaningless, and probably unrealistic life. Valley and Withier (2009) strongly believe that, a solid foundation in basic sciences is essential to free-thinking participation in the world. It is also clear that, this basic scientific preparation is essential to unlocking doors to a wide variety of professional opportunities.

Therefore, Basic Science has been chosen as one of the core subjects offered at the junior secondary school. It is taught in order to expose students to the basic workings of the scientific enterprise and also provides the learners with the necessary foundation upon which to build subsequent science learning in the senior secondary school. Basically, core curriculum is intended to provide all students with an education that will serve them well regardless of their choices after leaving school. It reinforces the teaching of basic skills and introduces an expanded range of new knowledge and skills to the curriculum. Moreso, Rutherford (2000) enunciates four properties that science course content should have: First, it should be significant; second, it should be accurate; third, it should be aligned with desired or declared learning goals and finally, it should be coherent. The science core curriculum places emphasis on understanding and using skills. Hence, the Basic Science curriculum has been designed to build into the present generation, the skills to meet present and future challenges.

Stakeholders' assessment of the objectives of the Science programme becomes inevitable, because team effort increases the chances of success in reaching educational goals. All stakeholders play important roles as part of a team working for the success of educational goals (Study.com, 2022). Therefore this study assesses Stakeholders' rating of the objectives of Basic Science Curriculum by providing answers to the following research questions:

(1) What are the profiles of the following stakeholders as indicated by the following socio-demographic variables?
   a. Ministry officials: age, gender, qualifications, area of specialization and years of service.
   b. School Principals: age, gender, qualifications, area of specialization and years of service.
   c. Year Tutors/Heads of Department: age, gender, qualifications, area of specialization and years of service.
   d. Classroom teachers: age, gender, qualifications, area of specialization and years of service.
(2) What is the extent of Stakeholders' rating of the Basic Science programme objectives?
(3) Is there significant difference in Stakeholders' Observed and Expected ratings of the Basic Science programme objectives?

Research Design

The study adopted survey research design of the ex-post facto type because the independent variables involved were not manipulated. The assessment was conducted by placing value on the programme objective.

Population

The population for the study comprises all ministry officials, Principals of schools, Year tutors/Heads of departments and teachers teaching Basic science at the Upper Basic class from the six states that comprise Southwestern Nigeria.

Sample and Sampling Procedure

A sample of Five Hundred and Fifty-seven (557) respondents was drawn using purposive and stratified sampling techniques. The procedure was by selecting ten local governments from each state comprising Southwestern Nigeria. The ten Local governments were spread among the three senatorial districts in each of the states.

Instrument

The only instrument employed in this study was Science Programme Objectives Rating Scale (SPORS). This is in two sections: Section A is on the profile of the stakeholders in terms of their age, gender, qualifications, area of specialization and years of service. Section B is a 10-item statement of objectives of Science taught at the Junior Secondary School level. This is based on the objectives of Science of the UBE programme. Stakeholders indicated their rating of the objective of science at the Junior Secondary educational level. The ratings are: 5= Excellent, 4= Very Good, 3= Good, 2= Fair, 1= Poor. The reliability coefficient for the SPORS was determined to be 0.72 (i.e., r =0.72) using Cronbach alpha.

Procedure for Data Collection

The researcher employed the services of trained research assistants from the six states that made up Southwestern geopolitical zone of Nigeria. They assisted in the administration and retrieval of the instruments lasting between two weeks.

Data Analysis

The data collected were analyzed by using descriptive statistics of frequency counts, percentage, mean and standard deviation, as well as t-test statistical analysis.

Results

The Profile of the Stakeholders in simple frequency count and percentages are discussed and followed by pie charts graphical illustrations below:

(i) Demographic distributions of the respondents by State showed Ekiti State having the highest number of respondents (100 representing 17.95%); followed by Lagos and Osun States (95 representing 17.06%); Ondo State (93 representing 16.70%); Ogun State (89 representing 15.98%) and Oyo State having the lowest number of respondents (85 representing 15.26%).
Figure 1: Profile of stakeholders by State

(ii) Demographic distributions of the respondents by Age showed 53 respondents representing 9.51% were in the age bracket 20 – 25years; 265 respondents representing 47.58% were in the age bracket 26 – 40years and 239 respondents representing 42.91% were in the age bracket 41 years and above.
Figure 2: Profile of stakeholders by Age

(iii) Demographic distributions of the respondents by Gender showed that 269 respondents representing 48.29% were Male and 288 respondents representing 51.71% were Female.

Profile of Stakeholders by Gender
Figure 3: Profile of stakeholders by Gender

(iv) Demographic distributions of the respondents by Qualification showed 18 respondents representing 3.23% were OND/HND holders; 128 respondents representing 22.98% were NCE holders; 312 respondents representing 56.01% were First Degree holders and 99 respondents representing 17.77% were Second Degree holders.

Profile of Stakeholders by Qualification
Figure 4: Profile of stakeholders by Qualification

(v) Demographic distributions of the respondents by Area of Specialization showed 278 respondents representing 49.91% specializes in Pure Sciences; 182 respondents representing 32.68% specializes in Applied Sciences and 97 respondents representing 17.41% specialize in Humanities.

Profile of Stakeholders by their Area of Specialization

- Pure Sciences
- Applied Sciences
- Humanities
Figure 5: Profile of stakeholders by Area of Specialization

(vi) Demographic distributions of the respondents by their Years of Service showed 111 respondents representing 19.93% have put 0 – 5years in service; 115 respondents representing 20.65% have put 6 – 10years in service; 159 respondents representing 28.54% have put 11 – 20years in service and 172 respondents representing 30.88% have put 21years and above in service.

Profile of Stakeholders by their Years of Service

- 0-5years
- 6-10years
- 11-20years
- 21years & above
Figure 6: Profile of stakeholders by Year of Service

Research Question Two: What is the extent of Stakeholders' rating of the Basic Science programme objectives?

Table 1 below reveals the mean ratings and standard deviation of the ten statements of objectives of Basic Science by the implementers of the programme. Developing interest in Science and Technology is rated to be very good ($\bar{x}$ = 4.15). Acquiring Basic knowledge in Science and Technology is rated to be very good ($\bar{x}$ = 3.91). Acquiring Basic skills in Science and Technology is rated to be very good ($\bar{x}$ = 3.82). Applying Scientific and Technological knowledge to meet societal needs is rated to be very good ($\bar{x}$ = 3.69). Applying Scientific and Technological skills to meet societal needs is rated to be very good ($\bar{x}$ = 3.68). Taking advantage of numerous career opportunities offered by Science and Technology is rated to be very good ($\bar{x}$ = 3.71). Endowing individual with tools for learning, problem solving, analytical thinking and rational decision is rated to be very good ($\bar{x}$ = 3.54). Becoming prepared for further studies in Science and Technology is rated to be very good ($\bar{x}$ = 3.71). Recognising stages of development is rated to be very good ($\bar{x}$ = 3.61). Also, applying Basic intelligent skills is rated to be very good ($\bar{x}$ = 3.76). In all, the respondents rated the objective of Basic Science to be very good (Weighted average = 3.76), which represents the Observed Stakeholders' rating of the Basic Science programme objectives.

Furthermore, the Expected ratings of the Basic Science programme objectives revealed that for the ten items statements, 138 respondents (representing 24.78%) rated the objectives to be Excellent; 211 respondents (representing 37.88%) rated the objectives to be Very Good: 154 respondents (representing 27.65%) rated the objectives to be Good; 43 respondents (representing 7.72%) rated the objectives to be Fair and 11 respondents (representing 1.97%) rated the objectives to be Poor. In all, the objective of Basic Science was expected to be very good (Weighted average = 3.78), which represents the Expected Stakeholders' rating of the Basic Science programme objectives.

Table 1: Frequency Counts, Percentages, Mean and Standard deviation of extent of Stakeholders' Rating of the Objectives of Basic Science

ITEM	STATEMENT OF OBJECTIVES	EXCELLENT (5)	VERY GOOD (4)	GOOD (3)	FAIR (2)	POOR (1)	MEAN (X)	SD
1	Acquire basic knowledge in science and technology.	149 (26.75)	243 (43.63)	134 (24.06)	28 (5.03)	03 (0.54)	3.91	0.87
2	Acquire basic skills in science and technology.	128 (22.98)	243 (43.63)	150 (26.93)	31 (5.57)	05 (0.90)	3.82	0.88
3	Apply scientific and technological knowledge to meet societal needs.	125 (22.44)	200 (35.91)	178 (31.96)	44 (7.90)	10 (1.80)	3.69	0.97
4	Apply scientific and technological skills to meet societal needs.	125 (22.44)	205 (36.80)	164 (29.44)	48 (8.62)	15 (2.69)	3.68	1.00
5	Apply basic intelligent skills.	140 (25.13)	216 (38.78)	146 (26.21)	40 (7.18)	15 (2.69)	3.76	1.00
6	Endow individuals with tools for learning, problem solving, analytical thinking and rational decision.	111 (19.93)	187 (35.57)	166 (29.80)	75 (13.47)	18 (3.23)	3.54	1.05
7	Take advantage of numerous career opportunities offered by science and technology	130 (23.34)	203 (36.45)	165 (29.62)	49 (8.80)	10 (1.80)	3.71	0.98
8	Recognize stages of development.	92 (16.52)	227 (40.75)	178 (31.96)	46 (8.26)	14 (2.51)	3.61	0.94

9	Develop interest in science and technology	240 (43.09)	190 (34.11)	99 (17.77)	26 (4.67)	02 (0.36)	4.15	0.90
10	Become prepared for further studies in science and technology.	139 (24.96)	195 (35.01)	162 (29.08)	46 (8.26)	15 (2.69)	3.71	1.01
	Weighted average	**3.76**						

*Figures in parentheses are in percentages

Research Question Three: Is there significant difference in Stakeholders' Observed and Expected ratings of the Basic Science programme objectives?

Table 2: Summary of Paired T-test of Observed and Expected ratings of the Basic Science programme objectives

	Basic Science Objectives	N	Mean	Standard Deviation	T	Df	Sig.	Remark
Ratings	Observed	10	3.7580	0.1717	-.405	9	.695	Not significant
	Expected	10	3.7800	0.0000				

Table 2 revealed that there is no significant difference in Stakeholders' Observed and Expected ratings of the Basic Science programme objectives (t = -.405; df = 9; p > 0.05). The mean values show that Observed rating mean score (3.7580) is not significantly different from the Expected rating mean score (3.7800).

Discussion

Stakeholders in education include both those who are directly involved (such as parents, teachers, and students) and those indirectly impacted (such as government officials and local business leaders) by the success or failure of an educational system. All members of a community are stakeholders in education. Local education districts officials, Principals, Year Tutor/HOD and Classroom teachers were handsomely engaged in this study and have rated the objectives of the Basic Science to be very good.

Ivowi & Odunsi (1982) agreed that evaluation studies should focus on three important groups involved in the implementation of school curriculum. These are: teachers, who are the final executors of the programme; learners, whose mental and physical behaviours the programme intends to change; and the society, including policy maker, school administrators and parents, whose support is essential for the achievement of the programme objectives. According to Study.com (2022) team effort increases the chances of success in reaching educational goals, hence, this signals appropriateness of the objectives of the Basic Science curriculum.

Conclusion

This study focused on Ministry officials, Principals, Year Tutor/H.O.D. and Teachers rating of the Basic Science objectives. These personnels could be adjudged to have in depth knowledge and better understanding of the programme. The finding of the study shows that all stakeholders agreed that the objectives are ideal and relevant. With this rating, it can be said that government and policy makers have done their part as it relates to setting standard objective for the Basic Science curriculum of the UBE programme.

Recommendations

The following recommendations are made:
1. Government and relevant stakeholders should provide necessary infrastructures, laboratories and facilities that will motivate teaching and learning of science.
2. Government and relevant stakeholders should motivate science teachers and reward hardworking students with adequate incentives.
3. Government agencies and stakeholders should provide monitoring and evaluation in teachers impacting and students learning system to achieve the desired outcome.
4. Science teachers training and development should be continuous to keep teachers abreast of the global trend.
5. Implementers of the Universal Basic Education programme to ensure that opportunities to engage in science, both in and out of school are varied and stimulating.

The Experience of Empathy in 10th Grade Students With the LGBTQ+ Community Through Narrative Transportation: A Qualitative Investigation

Shawnee McPhail, Gunma Kokusai Academy, Japan

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This research explores secondary school students' expreriences of empathy while engaging with a TV series featuring LGBTQ+ characters. The study, conducted with grade 10 students aged 15-16 in Japan, aimed to uncover perspectives through a generic qualitative inquiry. Thirty-one participants completed a reflection survey, leading to the identification of ten emergent themes related to 1) Enjoyment and Relatability, 2) Positive Impact and Learning, 3) Emotional Connection, 4) Respect for LGBTQ+ Struggles, 5) Inclusion of LGBTQ+ texts in Classroom, 6) Combatting Homophobia, 7) Applicability to Real Life, 8) Discussion Importance, 9) Changing Opinions, 10) Impact on Assumption. The investigation underscores the importance of LGBTQ+ media in education, specifically examining the impact of narrative transportation and empathy on social and cognitive aspects.

1. Introduction

1.1 Background of the Study

The LGBTQ+ community confronts ongoing challenges globally, with discrimination, violence, and mental health issues prevalent (Parks, 2014; Nadal, 2019). Samantha Allen (2018) highlights concerning trends in the United States, suggesting a potential stalling of LGBTQ+ acceptance. The role of educators, role models, and non-LGBTQ+ allies is crucial in fostering inclusivity and combating discrimination (Day et al., 2020; Dhupa, 2016; Tiburcio & Baker, 2023). However, despite imperatives, LGBTQ+ themes often face neglect in classrooms (Batchelor et al., 2018; Bryan, 2017; Page, 2017). McPhail's (2022) research emphasizes the positive impact of LGBTQ+ literature on empathy, prompting an extension of this investigation to secondary students.

1.2 Need for the Study

This study is rooted in the significance of theory of mind and empathy in child development (Białecka-Pikul & Białek, 2021; Wellman, 2018). The relationship between narrative transportation, empathy, and theory of mind within the context of LGBTQ+ media is explored, aiming for a comprehensive understanding of these psychological constructs.

1.3 Purpose of the Study

The study explores secondary students' experiences with a LGBTQ+ TV series, particularly the show "Heartstopper," through the lens of narrative transportation theory. Building on McPhail's (2022) research on empathy while reading LGBTQ+ texts, this investigation aims to contribute insights into the empathetic experiences of secondary students.

1.4 Research Question

- What is the experience of empathy in secondary students when watching a TV series focused on LGBTQ+ characters and themes?
- How can LGBTQ+ texts be effectively implemented in secondary classrooms?

2. Literature Review

2.1 Narrative Transportation

Narrative transportation theory (Gerrig, 1993) conceptualizes the detachment from the reader's world into the narrative world, focusing on narratives, vicarious experiences, emotions, enjoyment, and potential persuasion (Green, 2021; Van Laer et al., 2019). This study explores the empathetic experiences of participants by qualitatively examining the connection and identification with characters during the viewing of "Heartstopper."

2.2 Empathy

Empathy, defined as the ability to understand others' thoughts and feelings, plays a vital role in this study (Flournoy et al., 2016). The investigation adopts a broad definition of empathy, encompassing the understanding and sharing of others' emotions (Baron-Cohen, 2011; Flournoy et al., 2016).

2.3 LGBTQ+ TV Shows in the Classroom

Mainstream media's integration of LGBTQ+ themes, including shows like "Glee," "Modern Family," and "Heartstopper," is noted (Kies, 2016). "Heartstopper" is particularly recognized for its portrayal of diverse queer identities and challenges within the LGBTQ+ spectrum, justifying its selection as the study's focus (Trivette, 2022).

The study addresses the use of TV series, as authentic materials, in English as a Foreign Language classrooms (Rivas, 2021). While existing research acknowledges the positive impact of LGBTQ+ media, a research gap remains concerning the empathic experiences of secondary students engaging with such content.

3. Research Design

This generic qualitative study employed surveys to collect data from 31 grade 10 participants after watching "Heartstopper." The research aligns with generic qualitative inquiry principles (Percy et al., 2015). The data analysis utilized inductive and thematic analysis, grouping anonymous survey responses into ten identified themes.

4. Target Population and Sample

The target population comprised grade 10 students in an English Language Acquisition classroom, aged 15-16 in Japan. Participants self-reported gender and sexuality, and there were heterosexual, cisgender, bisexual, and transgender students. Inclusion criteria specified enrollment in the English Language Acquisition class, while exclusion criteria excluded students from other classes or schools.

5. Procedures

Participants were recruited from the grade 10 classes taught by Shawnee McPhail and Alison Ozawa, with the option to participate provided to all students. Informed consent, voluntary participation, and anonymity were emphasized. Demographic questions were optional, and participants were assured of no rewards, punishments, benefits, or hindrances tied to their responses.

6. Protection of Participants

Participants were informed about the voluntary nature of their involvement through consent forms in Japanese and English. Anonymity was maintained through alphanumeric codes, and data confidentiality was assured. The principal's consent was obtained, and data will be kept confidentially for seven years before destruction.

7. Data Collection

Surveys were administered via Google Form, collecting reflections from participants after watching the TV series. The reflection was unrelated to grades or the unit, ensuring an authentic expression of experiences. Data anonymization followed participant consent.

8. Data Analysis

Thematic analysis was employed to categorize survey responses into emergent themes. A qualitative approach allowed for rich insights into participants' perspectives. The analysis combined inductive methods, capturing recurring words and themes to form a comprehensive interpretation.

9. Presentation of Data and Results

Ten themes emerged from the survey responses, categorizing participants' experiences: 1) Enjoyment and Relatability, 2) Positive Impact and Learning, 3) Emotional Connection, 4) Respect for LGBTQ+ Struggles, 5) Inclusion of LGBTQ+ texts in Classroom, 6) Combatting Homophobia, 7) Applicability to Real Life, 8) Discussion Importance, 9) Changing Opinions, 10) Impact on Assumption.

Enjoyment and Relatability

Participants consistently expressed enjoyment, attributing it to the relatability of LGBTQ+ experiences portrayed in the show. Participant 7 highlighted, "I had fun watching the show because it was easy for me to understand how they feel about themselves and what they are struggling with." Similarly, Participant 15 noted, "I enjoyed watching a show with LGBTQ+ characters and themes because I was in a similar situation with characters who appear in the show."

Positive Impact and Learning

The positive influence of the show on participants was evident, leading to increased awareness and understanding of LGBTQ+ issues. Participant 31 emphasized, "I knew about LGBTQ but watching this was a huge influence on me, and I was able to learn many things." Learning about the struggles faced by the LGBTQ+ community prompted a shift in perspectives, as articulated by Participant 21: "It felt like watching a normal school drama without feeling strange. I thought I might be annoyed, but I didn't feel anything and rather it was really good relationship and I need to emulate."

Emotional Connection

Emotional connection emerged as a recurring theme, with participants expressing strong feelings toward the characters. Participant 12 stated, "I think watching LGBTQ+ has a big impact on us. I was moved by the way the characters live their lives while valuing relationships with other people despite being LGBTQ." Key scenes evoked strong emotions, fostering a deeper connection. Participant 18 shared, "When there were flashbacks to how Ben treated Charlie, I felt strong things and wanted to help him. I understood his pain."

Respect for LGBTQ+ Struggles

Participants underscored the importance of respecting the struggles faced by the LGBTQ+ community. Participant 8 expressed, "It is hard to come out because some people will not feel good, and I think it is okay to have those feelings, but people need to understand LGBTQ+ even if they do not agree." Participant 28 echoed this sentiment, stating, "I think there are many people like Ben and Harry who think negative things about LGBTQ+ people. I think

they can have those opinions, but they should not say it because it hurts people." The show played a pivotal role in fostering empathy and respect for diverse identities.

Inclusion of LGBTQ+ Texts in Education

A significant theme revolved around the incorporation of LGBTQ+ texts in the classroom. Participant 10 emphasized, "I thought learning about LGBTQ+ as a unit is good for education." Participant 11 elaborated, stating, "I enjoyed watching the Heartstopper because every year we learn some SDGs and we search about gender, but I didn't watch real drama so I was interested and want to learn and understand real life." Participants advocated for LGBTQ+ education to promote understanding, support, and diverse perspectives.

Combatting Homophobia

The show was perceived as a tool to combat homophobia, especially in regions less familiar with LGBTQ+ topics. Participant 1 shared their cultural experience in Japan, stating, "In Japan, we don't have these kinds of shows much because LGBTQ+ is not that familiar than western countries. I genuinely felt it was a really good show, and people in Japan should watch this show and notice the problems in LGBTQ+ communities." Participants highlighted the show's potential to challenge discriminatory attitudes and promote societal tolerance.

Applicability to Real Life

Participants found the show applicable to their lives, either through personal experiences or gaining insights into the lives of others. Participant 29 said, "I have a friend who is transgender, and I learned more about them from this show." The perceived realism of the show contributed to a sense of connection and relevance, even for students who did not identify with the characters or themes directly.

Discussion Important

Discussions surrounding the show were deemed essential by participants. Engaging in conversations about characters' feelings and different situations allowed for diverse perspectives and enriched the viewing experience. Participant 29 highlighted, "I enjoyed the discussion, thinking of emotions in each character's various situations. This time, I had a discussion with 3 people and I knew that people each have their own value for love, so I got some new different ideas from those people. It was a very significant discussion."

Changing Opinions

The show played a role in altering participants' opinions about the LGBTQ+ community. Participant 9 shared that their preconceived notions were challenged: "I had an image that transgender people were people who had been abused and would abuse other people. By watching this show, I realized that my understanding of trans people was not correct." Preconceived notions and biases were challenged, leading to a more informed and empathetic understanding of diverse sexual orientations and gender identities.

Impact on Assumptions

Participants acknowledged that the show influenced their assumptions about LGBTQ+ individuals. Participant 21 shared, "I learned coming out is very scary and that you cannot tell by looking at someone if they are LGBTQ+." Participant 12 echoed this sentiment, saying, "I learned we have to change the assumptions we make about other people." Learning not to make assumptions and understanding the complexity of coming out were highlighted as key takeaways from the viewing experience.

The identified themes underscore the multifaceted impact of the show on viewers, promoting understanding, empathy, and positive societal change. The participants' diverse experiences collectively contributed to a positive and rich empathetic engagement with the LGBTQ+ TV series.

10. Conclusion

This study contributes valuable insights into the empathetic experiences of secondary students engaging with LGBTQ+ literature and TV series, shedding light on the potential positive impact of such content in educational settings. The findings offer implications for the effective incorporation of LGBTQ+ texts in classrooms, emphasizing the significance of narrative transportation and empathy in the educational context.

Official Conference Proceeding

Abstract

The purpose of this research is to study the mathematical anxiety and mathematical resilience of 45th class Phra Dabos students and design the network diagram for the revision of the subject of mathematics for industrial technicians by using the data obtained from the stakeholders' requirement to improve the teaching process, time management and learners' potential in knowledge application. The population of this research is 78 students and 2 volunteers of Phra Dabos. The experiment began with collecting the opinions of the students which is divided into 2 phases, phase 1: data collection through mathematical anxiety and mathematical resilience questionnaire, phase 2: data collection through the interview of the students from 8 majors, 2 per major, 16 in total. The questions involved the learning management in the past year and suggestions for the improvements of the learning activities of the volunteers. Followed by the design of a network diagram compiled from the obtained data. The diagram was then thoroughly discussed among the volunteers. The data from the questionnaires was analyzed using descriptive statistics, including mean, standard deviation, percentage, and data analysis. It was found that the overall mathematical anxiety of the 45th class Phra Dabos students was moderate. Likewise, the overall mathematical resilience was also medium. Lastly, the guidelines for improving learning management in the next academic year were obtained and presented in the network diagram. Furthermore, the substance linkage between mathematical anxiety and mathematical resilience was found.

Keywords: Mathematical Anxiety, Mathematical Resilience, Stakeholders' Requirement

Introduction

1. Theoretical Background

One of the main purposes of education is to prepare students to be lifelong learners and could adapt to their ever-changing surroundings. This is also true in Thailand, where its education system still has been struggling for several decades to achieve what we mentioned. As it focuses only on contents and memorization without proper integration of questioning techniques or thought processes, Thai adolescents and the workforce's vast potential remains to lie in wait for improvement. Some Thai students might be able to improve themselves past the point where their education system is at and attain the necessary competencies for thriving in modern society, while many students are left out of the usual formal education due to the lack of opportunities. This would greatly increase the number of vulnerable groups that are prone to drugs, violence, and misconduct instead of capable workforces that would drive the economy.

Non–formal education is sought after by many students who have limited resources and access to formal education as it provides a variety of competencies for those who aim to directly apply for jobs rather than higher education or college certificatese (Shabaya, 2022). This is aligned with the principle of Phra Dabos school, "Thrive and strive without certificate," which aims to provide the needed vocational competencies for those who are left out of formal education and in need of opportunities. Regardless of the students' background, the school indiscriminately offers a one – year vocational course that consisted of eight majors namely, carpenter, welder, electrician, electrotechnician, constructionist, repairman, mechanic and machine tool technician. The curriculum includes two aspects that would be sufficient for their designated occupations: basic theory for a career that involves technician skills and real–world practice where the classes are organized by the institute and volunteered teacher.

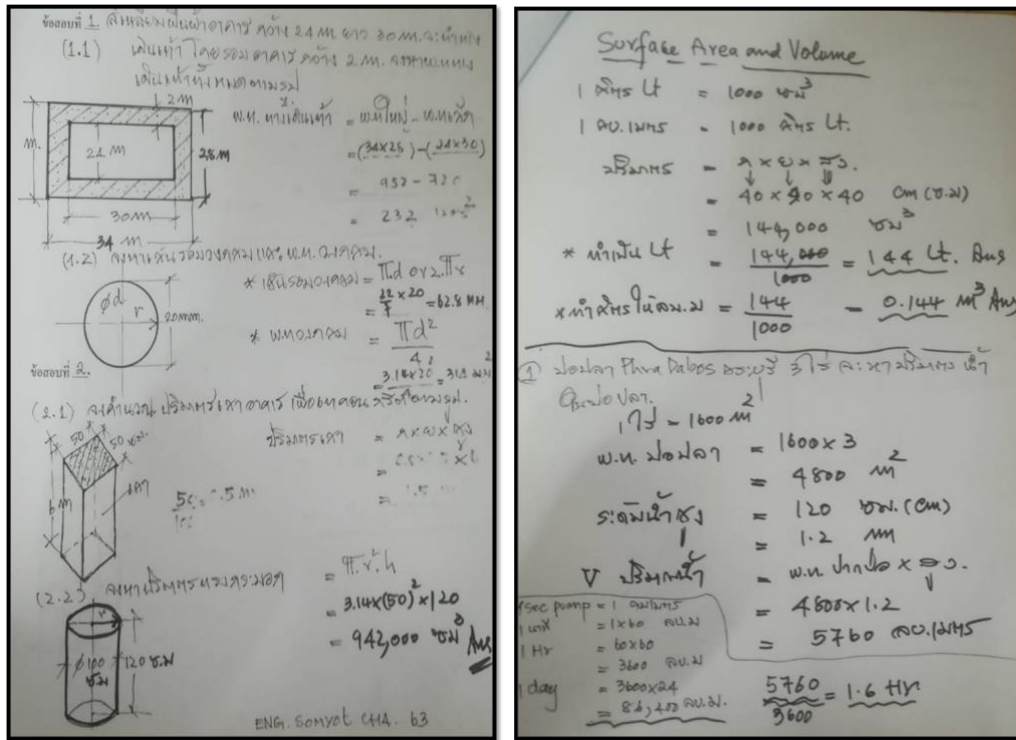
The good intentions to provide the necessary competencies from the institute could not be more apparent, but as the students usually detest the theory part, the content would often be crammed and taught in the manner of brief but aggressive lecture without proper approach as shown in Figure 1 below.


Figure 1: Phra Dabos lectures

And to those who are left behind by the current education system, this would not be ideal. It also proved to be not effective in tackling with the students' mathematical anxiety which was clearly shown during the period of our observation in the subject of mathematic for industrial technician.

Mathematical anxiety is defined as the feeling and anxiety that hinder the mathematical process to solve mathematical problems whether in the context of real world or education (Centre for Neuroscience in Education, 2023). As we interacted with the students, many had shown several indicators of mathematical anxiety, ranging from not being able to explain the answer to the questions that they recently solved to feigning ignorance during the class because there is a chance of being humiliated from the feeling of answering the questions wrong. The problematic situations did not elevate, but it tended to impede the thought process needed for their future professions.

The key to reduce their mathematical anxiety might be lying dormant with the aspects of mathematical resilience as it was stated that teaching the students to be resilient in real life is crucial as they would bounce back from the devastating situation in their life (Casinillo, 2022). Likewise, mathematical resilience is the right dose to the poisonous mathematical anxiety since it would teach the students how to handle the anxious feeling that hinder the mathematical process.

The term mathematical resilience is understood as the confidence, effort and perseverance which support an individual to go through the mathematical process and arrive at the desired outcome (Lee and Ward – Penny, 2022). As we can see, if it is implemented into the curriculum, the students would greatly benefit from it, and it would also be a great help to the school if the process of revising the subject is compiled into a diagram for further autonomous practice of the curriculum.

Hence, the purpose of this research is to study the mathematical anxiety and mathematical resilience of the 45th class Phra Dabos students and design the network diagram for the revision of the subject of mathematics for industrial technicians.

2. Implementation and Results

The experiment is conducted at Phra Dabos school, Samut Prakan with the population of 78 students of class 45 at the institute and 2 volunteer teachers. The experiment was in the manner of data collection through questionnaires and interviews, and divided into three sections namely, the students' opinions, network diagram design and volunteer teachers' opinions. The first section consisted of two phases, phase 1: data collection through 10 – item mathematical anxiety questionnaire and mathematical resilience scale of 23 items, phase 2: data collection through the interview of the students from 8 majors, 2 per major, 16 in total. The questions involved the learning management in the past year and suggestions for the improvements of the learning activities of the volunteers. The second section would focus on constructing the method from the obtained data from the first section to revise the subject and present it as a diagram. The last section would focus on discussion with the volunteer teacher with the results obtained from the prior sections to make an agreement upon the revised teaching approach.

The Students' Opinions

Phase 1: The Results of the Questionnaires

As the mathematical resilience and anxiety of the class 45 Phra Dabos students are within our concern, we had deployed the questionnaires (Johnston-Wilder, 2014) of both variables for data collection.

Table 1: The results of mathematical resilience and mathematical anxiety questionnaires

	Mean ($\bar{X}$)	S.D.	Interpretation
Mathematical Resilience	76.79	7.92	Medium
- Value	28.79	4.40	High
- Struggle	27.95	3.35	High
- Growth	20.05	3.25	Medium
Mathematical Anxiety	26.10	4.20	Medium

The data obtained showed that students' mathematical resilience was on the medium level while its aspects, namely, value, struggle, and growth, were on a high, high, and medium levels, respectively. It was shown that while mathematical resilience was of substance, mathematical anxiety was also on the level that might impact the development of positive attitude and achievement toward mathematics. The level of both variables also sparked the question whether there is any significant relation between them. Though concluding that there is any relation between the variables would require further investigation and study, we would like to see if there is any lead toward what we suspect. Thus, linear-regression where both variables were used as independent and dependent variable was conducted, and the results are shown in the figures below.
Figure 2: The linear-regression of mathematical anxiety
using mathematical resilience as the independent variable
Figure 3: The linear-regression of mathematical resilience using
mathematical anxiety as the independent variable

Table 2: The significance level of the linear regression between
mathematical anxiety and mathematical resilience

	Mean	S.D.	Multiple R	R Square	Sig.
Mathematical anxiety Score	26.1	4.20			
Mathematical Resilience Score	76.79	7.92	0.87	0.76	$5.404e^{-25}$

The results from the regression had shown that both variables could, in a sense, explain each other to a certain degree since the R^2 of the regression is equal to 0.76 and the significance level is less than 0.05. This proved that there might be a worthy lead for further investigation

of the relation between the two variables. Hence, we would subject this as one of the main objectives of our next study.

Phase 2: The Interview

According to the interview, many students had told us that they understand that mathematics is important and would be used in many parts of their lives, but as they proceed in the class regardless of any context or formality, they are usually faced with unknown symbols, rushed lectures and very hard problems. And along the way, they might get humiliated for doing something wrong in the class, hence, they would avoid interacting with teachers during the class and remain silent when vital questions emerge. Some even believed that they would not get any better at mathematics and only the chosen few would excel at learning it.

The content should be consistent with what they were practicing, but it should not be crammed and thought aggressively. They would prefer an organized and comprehensive class if possible. Moreover, teaching mathematics in theory seemed to not intrigue them very well as they demand mathematics in the sense of application as they view it as a more necessary skill.

Thus, presenting them with real – world mathematic problems would be ideal in teaching them the basic theory. Some excerpts from the interview are shown below:

> "Learning mathematics is not for me, I mean it is only who has innate talent."

> "I don't really like the theory part as I want to be a technician. I think practice and application are more important."

> "We would not usually use the content to its fullest, hands – on activity may suit us more."

> "Answering mathematical questions make me really nervous. I usually forget what is on my mind when I am about to answer them."

According to the interview and the results in Table 1, we would say that the students rather had fixed mindset and anxiety in studying mathematics and solving this problem should be of haste by using the approach that would encourage them to see the value of learning process and foster mathematical resilience (Johnston-Wilder et al, 2021).

Network Diagram Design

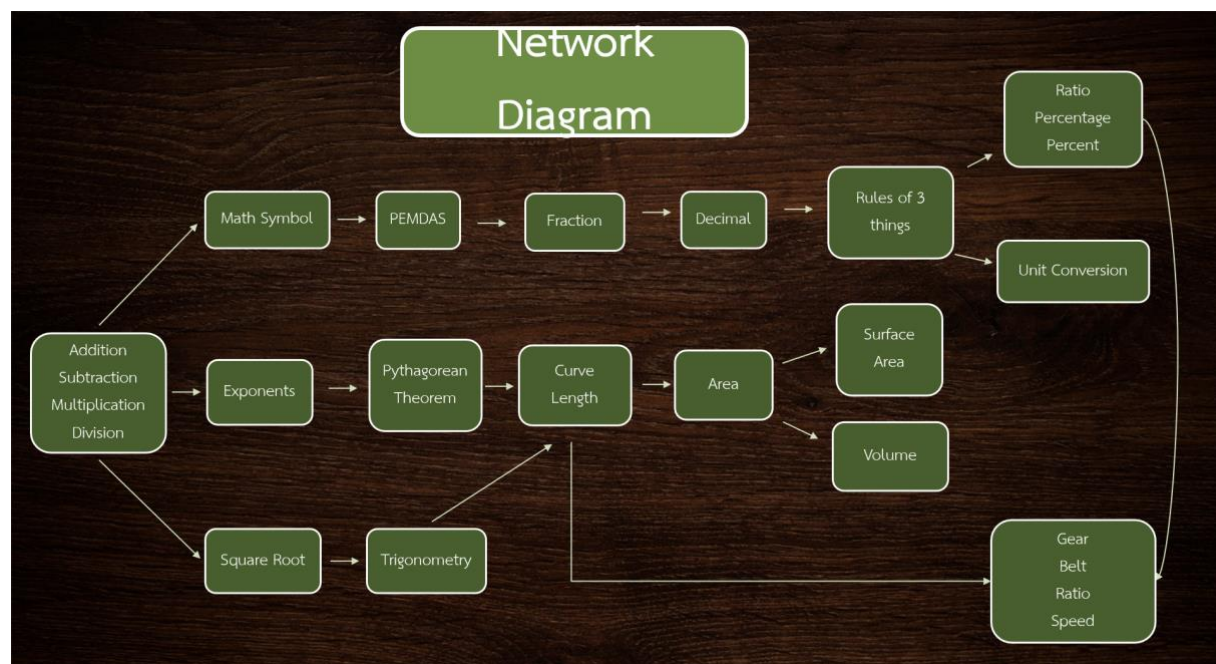
As we collect the data from the students and curriculum, we present the new outline of the subject as a network diagram below.


Figure 4: The network diagram of the revised subject

The network diagram presents on how we would redesign the subject to be more consistent with their practice. Furthermore, we decided to compose the necessary linkage and connection between each topic for seamless implementation and recollection as shown in the above figure.

The Volunteer Teachers' Opinions

As we presented and discussed the revised subject and students' opinions with the other volunteer teachers, we had arrived at the three crucial points to enhance the teaching approach, which are presented below:

1. Interactive learning: Implementing interactive learning methodologies would keep students engaged and foster a deep understanding of mathematical concepts.
2. Practical application: Integrating real-world examples and practical applications of mathematics would help students see the relevance of the subject in their future careers.
3. Collaborative learning: Promoting group projects and collaborative learning environments would develop teamwork skills and encourage peer-to-peer knowledge sharing.

We also agreed upon the use of problem – based learning to cover the three key points above and as the main approach in teaching the course in the next academic year since presenting the students with the approach that focuses more on real – world problems, self – learning and the process of learning would help quell the mathematical anxiety and promote mathematical resilience (Ariyanto et al., 2019; Johnston-Wilder et al, 2021).

Conclusions

In conclusion, this research on mathematical anxiety and resilience among Phra Dabos students offers valuable insights into enhancing the teaching process for the subject of mathematics for industrial technicians. By implementing problem–based learning, students

will have the opportunity to overcome anxiety, develop resilience, and apply their knowledge effectively. The next academic year will witness an even more engaging and impactful mathematics learning experience.

The study also suggests that there might be a linkage between mathematical anxiety and mathematical resilience, which will be explored in our next study. We also aim to promote the students to have a growth mindset for the better development of mathematical resilience, create engaging material to improve learning motivation and focus on mathematical connection to promote the application of mathematics in the real world.

India's Digital Divide and Kerala's 'First Bell':
A Radical & Alternative Form of Digital Education During COVID-19

Mukulika Radhakrishnan, University of Sussex, United Kingdom

Abstract

Education suffered one of the biggest blows due to Covid-19 in 2020-22. As educational institutes moved to digital-online teaching and learning, 'digital divide' or the unequal access of the internet and other digital tools among students, turned out to be a major impediment in its proper conduct & success. In India, caste, class and gender barriers are major contributors to the digital divide, and with the pandemic, this also caused an increased chasm between those who could afford to learn despite difficulties and those who couldn't. This led to widespread discontent and protests by students of various ages across India, raising demands to reopen educational institutes, to provide students with free internet and other digital requirements etc. However, a small state in India's southern end called Kerala came up with an innovative and reformative form of pedagogy in the same period, that stressed on egalitarianism and justice. For a state with high television penetration, the Left-wing state government's well-structured 'First Bell' programme proved useful for students from all backgrounds, and when compared to other Indian states, was able to bridge the digital gap to a great extent. It democratised digital education by making the lessons not only available via the internet but on the government's TV channel too, and secondly, it provided and campaigned to provide students with free laptops, TVs and other gadgets required for e-learning. This paper is on 'First Bell' as a radical and alternative form of digital-online education, with an investigation of its methods and results.

Introduction

This article delves into Kerala's distinctive approach amidst the landscape of Indian states in democratising e-learning and online education, particularly focusing on its initiative, the state government-run 'First Bell' lessons. It examines how Kerala pioneered efforts to ensure accessibility, especially for marginalised students through this initiative, which, unlike in any other Indian states, utilised government-led online classes to address the 'digital divide' exacerbated by the pandemic. It emphasises Kerala's historical commitment to education and literacy, showcasing 'First Bell' as a significant milestone in the society's pursuit of egalitarian principles. Furthermore, it examines how the central government failed in ensuring adequate infrastructure for education across the nation, contrasting this with Kerala's pioneering efforts to bridge the digital gap. This exploration is thus framed within two broader contexts: (1) the onset of the pandemic in India, magnifying the digital divide across states, and (2) Kerala's unique response to Covid-19, diverging from approaches adopted by other states.

The study draws upon various sources, including reports, surveys from international and national agencies, social media posts by Kerala's government representatives, newspaper articles, and secondary literature. Remarkably, despite its significant implications, there remains a dearth of academic research on Kerala's strategies in addressing the digital divide.

The key arguments that this essay aims to present are: (1) First Bell stands as a singular experiment unparalleled in other Indian states; (2) its tangible outcomes significantly mitigated Kerala's digital divide, setting it apart from struggling states; and (3) these efforts should not be viewed in isolation but rather as a continuum of Kerala's long-standing commitment to literacy, post-literacy, and education since the 1990s, emphasising democratic and egalitarian principles.

The first section delves into the multifaceted impact of Covid-19 on India, examining not only its epidemiological ramifications but also the socio-economic and political reverberations experienced across the nation. The second section scrutinises the stark disparities exacerbated by the pandemic, drawing on comprehensive surveys by international and national organisations. Section 3 discusses the spread of the pandemic in Kerala and how the state dealt with it in the context of previous calamities that hit the state, as well as provides a brief introduction to the state Department of General Education's use of digital tools. Section 4 delves deeper into 'First Bell' and the participation and support offered by Kerala's civil society for it, underscoring its commitment to inclusive education and adaptive crisis management. Section 5 explores the challenges encountered by 'First Bell' and Section 6 investigates the results of 'First Bell'.

Ultimately, it calls for a comprehensive study of Kerala's digital initiatives, recognising their transformative potential in revolutionising access to education and narrowing educational disparities on a larger scale.

Covid-19 in India

India, positioned in the Global South, faced devastating repercussions from the SARS-CoV-2 outbreak, witnessing the spread of successive variants—Omicron and its sub-variant, Eris, in 2023. The nation endured three waves of the pandemic, recording 45,001,384 confirmed cases and 533,294 fatalities, amounting to a 1.19 per cent fatality rate (WHO website, 2023).

The initial case emerged on January 30, 2020, triggering the first wave from March to October 2020, followed by subsequent waves from April 2021 to July 2021 and December 2021 to January 2022 (MyGov website, 2023). India initiated its vaccination program on January 16, 2021, administering approximately 1.7 billion doses, including first, second, and booster doses, to over 720 million individuals. Covishield, Covaxin, Sputnik V, and Moderna constituted the approved vaccines in India (Mukim, et.al., 2022).

The central government faced severe public scrutiny concerning its pandemic response and policies. The ruling Bhartiya Janata Party (BJP henceforth) drew criticism (Al Jazeera, 2021) for neglecting the welfare of marginalised communities (Ebrahim, 2022), especially the mishandling the displacement of migrant labourers (Koppikkar, 2020; Sirimane & Thapliyal, 2020), propagating unscientific and religious measures (Indian Express, 2021; Padma 2021), sluggish response (Frayer, 2021), curbing freedom of expression, etc (Imran & Javed, 2023; Radhakrishnan & Thaliyil, 2021). The pandemic's impact reverberated across economic sectors, plummeting India's Gross Domestic Product (or GDP) to 3.1 per cent in the 2020 fiscal year's fourth quarter. Business sectors witnessed a 53 per cent impact, unemployment surged by 19 per cent, and the tourism industry incurred a staggering loss of around Rs. 15,000 crores. Multiple sectors, including service, oil & gas, pharmaceuticals, telecom, automobiles (Nayak, et.al., 2022), real estate & construction (India Today, 2021), transport (Gomathi, et.al., 2021), food & agriculture (Rathore, 2023), suffered severe setbacks, as documented in various studies and news reports.

Reports from various organisations shed light on the dire educational situation during lockdowns. Diverse approaches to the pandemic emerged among Indian states despite centralised regulations on lockdowns and restrictions. Instances of protests surfaced across regions and sectors. For instance, in Karnataka, frontline workers rallied for a fixed monthly wage (Chhabra, 2020), while in states like Chhattisgarh (Tiwari, 2021), and New Delhi (Jha, 2021), both school and university students and teachers protested the blended and online education modes (Kaushal, 2021). Concerns over the digital divide were echoed by students' and teachers' organisations, condemning the shift to online examinations, emphasising the risks of excluding those lacking internet access. The gendered aspect of the digital gap, shedding light on the additional responsibilities faced by girl students, including household chores and potential exposure to abusive environments within their homes, has also been underscored by studies and protests (Mathrani, et.al., 2020).

Digital Divide

India stands as the world's most populous nation with 1.43 billion inhabitants and boasts one of the largest education systems globally, comprising 250 million students across 1.5 million schools and 37.4 million enrolled in 50,000 Higher Educational Institutions (India Today, 2020). However, the abrupt shift to online education amid the pandemic overlooked the nation's vast digital disparity. This oversight disproportionately affected marginalised groups such as the Scheduled Castes, Scheduled Tribes, Other Backward Castes (OBCs) which includes Muslims, girls, and rural students, resulting in their exclusion from continued education (Oxfam India, 2022). Multiple surveys conducted by international and national agencies, including Oxfam India, UNESCO, UNICEF, Azim Premji Foundation, the National Council of Educational Research and Training (NCERT henceforth), the People's Archive of Rural India (PARI henceforth) ICRIER & LIRNEAsia, and the central government's Economic Survey 2021-22, corroborate these findings.

Oxfam India highlighted that over 80 per cent of students in government schools across Eastern and Northern Indian states like Odisha, Bihar, Jharkhand, Chhattisgarh, and Uttar Pradesh did not receive educational materials. UNICEF's study revealed that approximately 67 per cent of parents felt their children's overall skill development lagged due to limited access to digital devices and e-learning tools.

Surveys documented by organisations like PARI indicated the absence of support from government schools and local authorities, resulting in students' discontinuation of studies in Northeastern, Eastern and North Indian states such as Assam, Bihar, Jharkhand, and Uttar Pradesh. The UNESCO report following the pandemic emphasised the widespread perception among respondents that students were falling behind, not just academically but also in social skills, fitness, and future job prospects.

The NCERT survey in 2020 unveiled significant challenges: 27 per cent of Indian school students lacked smartphones or laptops, 2.28 per cent faced hindrances due to frequent power outages, and 3.33 per cent struggled to concentrate during online classes. Moreover, these classes could not effectively address issues in subjects like Mathematics and Science, while 50 per cent of students lacked essential school textbooks. Another survey by the Azim Premji Foundation in 2021 revealed that nearly 60 per cent of Indian school children were unable to access online learning.

Data from the survey conducted by ICRIER & LIRNEAsia in 2021 indicated that only 20 per cent of Indian school children had access to remote education during the pandemic. Alarmingly, 38 per cent of households reported at least one child dropping out due to these challenges. Additionally, the Economic Survey 2021-22 noted a decline in rural children's enrolment (ages 6-14) in schools, highlighting the profound impact of the pandemic on education accessibility.

Covid-19 in Kerala

Kerala was where the first Covid-19 positive case was detected in India – a student of medicine who had just returned home to Kerala's Thrissur district from Wuhan, China – on January 30th, 2020 (Andrews, et.al., 2020). Importantly, the pandemic had arrived in a state which was still recovering from calamities like the Ockhi cyclone (KSDMA website) in 2017 which caused massive infrastructural damage, killed 75 people, and left 208 missing, an outbreak of the Nipah virus in 2018 which led to 17 deaths and 18 confirmed cases (WHO website), and two devastating state-wide floods in 2018 (NIDM, 2020) and 2019 (NRSC, 2019). As far as Covid-19 is concerned, Kerala recorded 65,34,352 cases and 68,197 deaths in total as of April 2022 (Govt of Kerala Dashboard website). The state government received a lot of praise for their handling of the spread of the virus at various stages (Roy & Babu, 2020; Vora, 2020) and was also criticised when it went wrong. However, Kerala's proactive crisis management – testing, contract tracing and communication -- has been considered by experts, policymakers, and surveys as the best when taken in consideration along with the condition in other states (WHO website; Menon, et.al., 2020). Democracy and rationalism have been the axes around which Kerala's response to the pandemic was formulated (Chathukulam & Tharamangalam, 2021). Kerala's robust primary healthcare system was lauded for having laid the foundation for the state's ability to deal with such unprecedented crises – visible in both Nipah and Covid outbreaks (Covid-19 Management, 2022). Along with this, decentralisation and public participation, the use of media by government

representatives for regular communication etc have also been considered exemplary contributors (Ajayakumar, 2020).

Kerala's tryst with literacy and education has been one of the most successful and long-standing models in the country. As per India's Ministry of Education in 2023, Kerala is the most literate state in India, with a literacy rate of 94 per cent, often rounded off as 'total' or '100 per cent literacy', followed by Lakshadweep at 91.85 per cent and Mizoram at 91.33 per cent (India Today, 2023). This is not a new development. Kerala began its literacy campaigns in the form of a coordinated, state-wide mass movement post the Indian independence, which was then followed by post literacy campaigns (Raju, 2023). Public participation was again key in these campaigns, for though initiated by the then Left-wing governments, they were soon taken up by non-governmental agencies, community organisations, etc. Most of Kerala's efforts towards literacy was achieved within a year, between the years 1990 and 1991, when it was declared the most literate state in India (Kumar, 1993).

Attempts towards social development in Kerala is not restricted to education. Kerala tops the country in terms of many other key human development indices like sex ratio, life expectancy, etc, despite low income rates – collectively called the 'Kerala Model' of development (Parayil, 2010).

To cite more recent examples, in 2020, Kerala became the first Indian state to have ICT-enabled hi-tech classrooms in all public schools, according to Chief Minister Pinarayi Vijayan (Krishnakumar, 2020). The state stands first in the School Education Quality Index published by Indian government's think tank NITI Aayog in 2019. As per UNESCO's 'Global Education Monitoring Report' of 2023, Kerala's successful use of technology in education deserves praise. The report specially mentions the state General Education Department's 'SchoolWiki' project, which connects schools to facilitate collaborative content creation and learning. It adds that at least 2 million computers in the state are equipped latest open-source software, due to the state's free software policy (UNESCO, 2023). Further back in 2019, the Kerala High Court had declared access to internet a basic right (LiveLaw, 2019). Kerala is now said to be on the move towards complete digital literacy, as per the state Ministry of General Education (The Hindu, 2023).

'First Bell': A Radical Alternative

Kerala's innovative 'First Bell' initiative for the academic year 2020-21 was orchestrated by a collaboration among several key agencies owned by the state Ministry of General Education: the Kerala Infrastructure and Technology for Education (KITE), the State Council of Educational Research and Training (SCERT), Samagra Shiksha Kerala (SSK), and the State Institute of Educational Technology (SIET). Together, they executed a virtual school education program that aimed to address the challenges posed by the pandemic and ensure continued learning for students across the state (First Bell website).

The program's cornerstone was the telecast of classes on the KITE-run 'Victers' channel, following a daily timetable publicised statewide. These classes, ranging from Grades I to X and XII, were aired on weekdays from 9:30 am to 5:30 pm. The sessions varied in duration, some lasting thirty minutes while others extended up to two hours (First Bell website). To enhance accessibility, the classes were not only broadcast on the Victers channel but also uploaded on YouTube (@itsvicters) and the program's dedicated website (First Bell website). Moreover, they were made available for download, allowing students to view them later. In a

bid to reach even remote areas, the videos were accessible at Akshaya Centres, state government-run resource hubs established across various localities (Akshaya Centre website).

Before the trial lessons commenced, Samagra Shiksha Kerala conducted an extensive survey to gauge the number of students in government/aided schools without internet connections or access to television. Shockingly, the survey estimated that over 2,61,754 families, roughly 6 per cent of the total, lacked these essential resources (The Hindu, 2020). Tragically, one of the individuals on this list, a 14-year-old, succumbed to suicide. This revelation prompted an urgent need for action (PTI, 2020). Consequently, teachers underwent rigorous training, with around 82,000 teachers passing the preparatory program. Through necessary interventions and modifications, the number of households without access to virtual lessons reduced significantly, dropping from 2.6 lakhs to 1.15 lakhs by May 31st (Radhakrishnan, 2020).

Expressing the government's commitment, Kerala's Education Minister, C. Raveendranath, highlighted the initiative's importance in mitigating the disruption caused by the pandemic on one of his Facebook Live sessions. He called for public involvement during the initial trial week, encouraging feedback on the program's efficacy and identifying individuals unable to access these classes (Raveendranath, 2020).

As the trial period neared completion, the number of households without access further decreased to 17,774 by June 11th, prompting the announcement of the second phase of the 'First Bell' initiative, set to commence by June 15th (IANS, 2020).

As of Jan 30, 2021, the subscriber count of the YouTube channel of VICTERS has crossed over 2.4 million. Apart from India, the classes were viewed by people from Middle East, USA and Europe too (IANS, 2021). Approximately 27 terabyte data was downloaded in a single day through the website (IANS, 2020). The success of the 'First Bell' program led to an overwhelming demand for the re-telecast of these virtual lessons, despite the Victers channel airing content round the clock. To meet this demand, the authorities launched another channel, called 'Kite Victers PLUS', in September 2021, with similar educational objectives (Ibid). In fact, Victers is an acronym for 'Versatile ICT Enabled Resource for Students'.

The suicide highlighted the urgency and necessity of inclusive measures. In response, various progressive organisations stepped up their efforts to distribute television sets and other essential devices to facilitate virtual education. Youth and student organisations like the Democratic Youth Federation of India (DYFI), the Students' Federation of India (SFI), and tech groups in Kerala were at the forefront of this movement (John, 2020). Soon, governmental, and non-governmental agencies, irrespective of political affiliations, actively joined in (Mathruhumi News Live, 2020). Common study rooms were established even in remote areas, utilising libraries (ANI, 2020), and Akshaya Centres as hubs for students lacking electronic devices.

Dr. T. M. Thomas Isaac, the then Finance Minister, emphasised the critical role of widespread public support in Kerala's educational progress. He urged collective action to ensure that students, especially from marginalised backgrounds, did not fall behind in academics. The local government took proactive steps by offering financial support for the procurement of television sets and laptops (Isaac, 2020). The Kerala State Financial Enterprises, in collaboration with local self-governing bodies, undertook the responsibility of addressing this issue at the grassroots level. MLA funds were directed toward purchasing

TVs and laptops, while various governmental and non-governmental bodies collaborated to set up study centres in communities.

The engagement with local communities and civil society underscored the decentralised nature of Kerala's approach to addressing the digital divide. Efforts were directed towards determining the families without TVs or devices, setting up study centres, and providing necessary infrastructure. This collective action extended to the opening of 'Ayalpakka Padhanakendrangal' (neighbourhood study centres), where students could gather for shared learning experiences using a single television. Kudumbashree, a statewide women's community network, was also mobilised to aid in this initiative. Additionally, schools received support in the form of laptops, projectors, and TVs to assist students in need. The Industries Department launched a 'TV Challenge' on June 4th, inviting public contributions of new television sets to be later distributed to students lacking access. The 'TV Challenge' gained momentum rapidly, with local businesses and individuals enthusiastically contributing television sets to their nearest District Centre. E. P. Jayarajan, the then Minister for Industries, used social media, specifically Facebook, to rally support for the cause (Jayarajan, 2020). Moreover, the participation extended beyond party lines – the Indian National Congress's Ernakulam MP Hibi Eden extended their support by contributing tablets to the 'Tablet Challenge' in their constituencies (Eden, 2020). This groundswell of support and widespread public participation contrasted with protests in other parts of the country against the exclusivity of online education and examinations, as mentioned in a previous section.

Notably, Wayanad, a district in northern Kerala, faced significant challenges, with an estimated 21,653 families lacking access to TVs or devices, accounting for 15 per cent of the district's student population (The Hindu, 2020). To address this, around 9,200 common study centres were established under the guidance of the local MLA, C. K. Saseendran (Saseendran, 2020). Wayanad also houses the highest number of tribal families in the state. Efforts were directed towards ensuring power connections and availability of TVs in these homes. Similar initiatives were undertaken in coastal areas by Matsyafed, the state-run cooperative federation for fisheries development. This initiative began with a count of families lacking adequate facilities along the coast, which was then forwarded to KSFE for action (Isaac, 2020).

Kerala's unique experiment combined the shift to virtual education with concerted efforts to ensure inclusivity through a decentralised process. Class teachers and school headteachers were tasked with identifying students lacking electronic devices (PTI, 2020). Additionally, the government opted against conducting exams online due to the requisite preparation involved (DNA, 2021).

Soon there were approximately 43-45 lakh students relying on KITE Victers for their daily lessons in Kerala (Philip, 2020). However, it is important to note that virtual or remote education cannot fully replicate the comprehensive learning environment provided by physical classrooms. Though the initiative has made substantial strides, it was also faced with the challenge of reaching all the students in the state. Progressive student organisations stressed that governments should prioritise building more schools, classrooms, and enhancing educational infrastructure, considering the deep-rooted digital divide prevalent in the country.

Challenges

While several parts of the country experience a complete standstill in academic activities, with the central government advocating a digital education approach without ensuring sufficient infrastructure, Kerala stands out. What the state witnessed was a historic mass movement, serving as a significant lesson in both preserving public education and democratising virtual learning.

This phase in Kerala's educational transition showcases not just the challenges but also the complexities associated with the shift to online education, underlining the importance of addressing accessibility issues and social concerns within the digital space.

The 'First Bell' initiative faced its own set of challenges, notably marked by the tragic incident in Malappuram, where a 14-year-old girl took her life allegedly due to the lack of resources required for attending the state government's virtual classes. Her father, a daily wage earner from a Scheduled Caste background, revealed the family's struggles with a malfunctioning television and their inability to afford a smartphone (Prashanth, 2020).

In response to this incident, Chief Minister Pinarayi Vijayan reiterated that the initial online classes were trial sessions and would be re-telecast entirely in the following week. Emphasising that the shift towards online education was a temporary measure, he expressed the government's desire to reopen schools at the earliest possible opportunity (Philip, 2020).

However, alongside issues of accessibility, the transition to online learning brought forth socio-political challenges within the digital space. Shortly after the trial classes aired, reports emerged of cyber harassment against some female teachers. Screenshots of these teachers were circulated through newly created "fan pages," prompting the intervention of the Social Justice Department, which initiated legal action in response to these incidents (Indian Express, 2020; NewsMinute, 2020).

Results

In the state's post-pandemic school exams of the academic year 2020-21, Kerala achieved an extraordinary pass percentage of 99.47 per cent, a record even by the state's high standards. Notably, these exams were conducted amidst the pandemic, whereas many other educational boards had opted against holding exams during that time (TNN, 2021). The results were striking, with over 1.2 lakh students securing the highest grade, 'A plus.' This achievement represented a noteworthy increase from the previous academic year, showcasing a rise in the pass percentage from 98.82 percent to 99.47 percent (Ibid).

UNESCO's *India Case Study: Situation Analysis on the Effects of and Responses to Covid-19 on the Education Sector in Asia* of 2021 reports the situation in Kerala as thus:

> Kerala is an exception: about 70 per cent of parents of both younger and adolescent students believe that overall learning progress is the same or better than it would be in school. Kerala has the greatest technology access, and it has also been among the most proactive states in supporting students: it is the only state where nearly everyone who used remote learning reports that the government has provided remote learning resources, more than 90 per cent report that students are speaking with their teachers. (UNESCO, 2021)

Conclusion

In the wake of a global pandemic that disrupted educational landscapes worldwide, Kerala, nestled in the southern reaches of India, embarked on an unprecedented journey in democratising e-learning and online education. This exploration delves into Kerala's pioneering 'First Bell' initiative, an endeavour unparalleled in other Indian states, which sought to democratise access to education, especially for marginalised students. Situated within the larger context of the pandemic's outbreak and the digital divide pervasive in various states, Kerala's distinctive response to COVID-19 stands as a beacon of innovation. Utilising government-run 'First Bell' lessons and a meticulously devised system for accessibility, Kerala not only stands apart in its approach but also underscores a historical commitment to literacy, education, and egalitarian principles. This essay navigates through Kerala's unique initiatives, shedding light on its remarkable efforts to bridge the digital gap and revolutionise learning opportunities, inviting a deeper exploration of its transformative impact amidst a landscape grappling with educational disparities. Upon examining available statistics and online resources, it becomes evident that Kerala distinguishes itself in terms of technology accessibility. The concerted efforts of the government and civil society have notably extended access, particularly to those residing on the fringes of society. While acknowledging its imperfections, Kerala's exceptional approach stands out in stark contrast to the scenario prevalent across various parts of the nation. Kerala's noteworthy initiatives in preserving public education and democratising virtual learning demand a comprehensive exploration. My essay merely skims the surface, leaving numerous unanswered questions and unexplored avenues, which I aim to thoroughly investigate in the future.

Studying Teachers' Ability to Learner-Centered Pedagogy

Anna Toom, Touro University, United States

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

In modern education, under the influence of humanistic psychology originated by A. Maslow and C. Rogers, learner-centered pedagogy is widely developing. This approach imposes certain requirements on the competence of educators. One such competency is the ability to see the learning task through the child's eyes, which contributes to a productive dialogue and the disclosure of the learner's full potential. In our study, this ability was examined in 270 graduate students who are currently schoolteachers. They observed children in their classrooms while the children were solving various problems in reading, writing, math, and drawing. Then, the teachers answered the following question in writing: "What sequence of actions would the child you were observing have to perform in order to solve his/her problem correctly?" Their answers can be divided into four categories: (a) sociocentric, if they correctly identified the necessary sequence of the child's actions; (b) egocentric, if they rather determined the sequence of their own actions at the time of observing the child; (c) mixed, i.e., including both of the above categories; and (d) others, in which their answers were replaced by irrelevant reasoning. Results showed that 36.6% of the schoolteachers failed the experimental task (categories (b) and (d)). The study author will direct her farther efforts toward improving her *Child Development and Learning* course's curriculum, implementing various assignments into it based on the ability to see the learning tasks through children's eyes. This training will develop the teachers' skills for learner-centered pedagogy.

Introduction

The idea of progressive education arose long before its appearance in modern society. In fact, all outstanding pedagogues of the past developed pedagogical science in the direction of greater democratization. Improvement of the forms of interaction between the teacher and the students in the educational process has always been and remains a priority.

Industrial society was characterized by traditional education based on an authoritarian leadership style, classical training of students, and reliance on direct instructions. Lectures and demonstrations of visual aids were the main teaching methods. The transition to the post-industrial era required a restructuring in many areas of science and human practice, not least in education. The term "progressive education" came into widespread use, distinguishing progressive educational methodologies from traditional 19th-century educational programs.

But not every progressive technique that worked fruitfully in one or several experimental educational institutions became successful on a national scale. The adaptability of unique learning models depended on many factors, the role of which could not always be foreseen. Only in the middle of the 20th century did the most striking discoveries of the world's philosophical and psychological thought naturally combine within a new educational paradigm. It received the name of humanistic education or learner-centered pedagogy.

Unlike the old traditional schools, in the new humanistic educational environment, the student is active and involved in the learning process, not just consuming information but also generating knowledge and ideas. The learner-centered approach to education puts students' interests first. Schoolchildren participate in choosing their curriculum and managing the pace of their intellectual growth. They bear greater responsibility for their own education. It is precisely such members of society that a democratic society needs. And in today's education, learning-centered pedagogy is widely developing.

However, the learner-centered approach imposes certain requirements on the competence of teachers. One such competence is the teacher's ability to see learning situations through the students' eyes. Without this, neither full-fledged dialogue in the classroom nor effective teaching and successful comprehension of knowledge are possible. Training young teachers in this skill should be recognized as one of today's most important pedagogical tasks.

This study's purpose was to determine how many university students enrolled in an educational program and simultaneously working in the school system had the ability to implement learner-centered teaching. The subjects of the study were Touro graduate students majoring in education who were currently working in preschools and elementary schools in New York City.

Theoretical Frame

Before the spread of learner-centered pedagogy, the idea of progressive education was developed in the works of J. Dewey, M. Montessori, J. Piaget, and L. Vygotsky. They belonged to different areas of professional activity and were interested in different aspects of education, from the adaptation of educational outcomes to the requirements of everyday life and the organization of the learning environment to the nature of children's acquisition of knowledge. But together, these theories gave a very powerful impetus to the emergence of a humanistic doctrine in education in the second half of the 20th century.

An American philosopher and educational reformer, John Dewey (1859–1952), founded an experimental school modeled after a democratic society. He stood up for the children who considered schooling in those years to be suppressive and routine, and the educational school model he created helped his students become independent and capable of self-realization. At his school, students acquired knowledge not by memorizing facts and repeatedly listening to lectures but by solving problems that might arise in real life (Mooney, 2013, p. 17).

An Italian doctor, Maria Montessori (1870–1952), a specialist in the field of early childhood development, was convinced that education is successful only when children are also given an opportunity to lead their learning. According to her methodology, children are able to teach themselves if they are provided with the right conditions. "Soon she determined that problems existed not in the children but in the adults, in their approaches, and in the environments they provided" (Mooney, 2013, p. 36). M. Montessori was the first to reorganize the preschool learning environment, making it learner-centered mentally and physically. In Montessori's classrooms, the size of furnishings and materials strictly corresponded to the age and physical build of children, which was an unconditioned innovation in those years.

A Swiss scientist, Jean Piaget (1896–1956), the founder of child cognitive psychology, described the features of the development of children; this is his invaluable merit (McLeod, 2023a). He rejected the 19th- and early 20th-century view of learning as a passive reflection of reality and proposed the concept of active learning. His approach was named "cognitive constructivism" ("Constructivism in teaching," 2021; "Learning theory," n.d.). According to Piaget, learning is a process of transformation of knowledge, not just accumulation of it. Unlike a traditional teacher, who fills children with ready-made ideas and facts, a constructivist teacher creates conditions in which the students themselves seek answers to their questions ("Application of Jean Piaget's Theory," n.d.).

A Soviet psychologist, Leo Vygotsky (1892–1939), the founder of the socio-cultural direction in the development of world psychological science, emphasized the social nature of learning. He pointed out the importance for children, when learning, to interact with more knowledgeable people; that's why his approach was named "social constructivism" (Learning Theory, n.d.). According to Vygotsky, dialogue is a necessary condition for learning and comprehending new information about the world. "Vygotsky's primary contribution to our understanding of young children's development is his understanding of the importance of interaction with teachers and peers in advancing children's knowledge" (Mooney, 2013, p. 101).

These progressive educators of modern times were characterized by the unacceptability of an authoritarian style of interaction with students. Despite all the differences in their theories, they shared the following ideas: "[…] education should be child-centered; education must be both active and interactive; and education must involve the social world of the child and the community" (Mooney, 2013, p. 16).

In the second half of the last century, the learner-centered approach to education became widespread, embodying the best features of the progressive theories of the recent past. And at the same time, it was an independent approach that was developed under the influence of humanistic psychology, initiated by American psychologists Abraham Maslow (1908–1970) and Carl Rogers (1902–1987).

C. Rogers, a psychotherapist, and clinical and educational psychologist, known for his person-centered research, proposed the concept of "client-centered therapy" (McLeod, 2023b). The concept was universal, and the relationship between teacher and student could be seen as the relationship between psychotherapist and client.

Just as in psychotherapy, where there are two opposite approaches—therapist-centered psychotherapy vs. client-centered psychotherapy—in education, there are two kinds of learning environments—teacher-centered vs. learner-centered ones. In the old traditional educational environment, students listened to lectures, completed written assignments, and worked primarily individually. In a new humanistic educational environment, they are active and more involved in the learning process; they do not just consume information but generate ideas and take greater responsibility for their own learning.

According to C. Rogers, one of the most important conditions for this new type of teaching is that the teacher has an "empathic understanding" of the student. Empathy, from the Greek *empatheia,* is "the ability to imagine oneself in another's place and understand the other's feelings, desires, ideas, and actions" (Britannica, n.d.). C. Rogers defined such an ability in teachers as follows:

> This attitude of standing in the other's shoes, of viewing the world through the student's eyes, is almost unheard of in the classroom. One could listen to thousands of ordinary classroom interactions without coming across one instance of clearly communicated, sensitively accurate empathic understanding. But it has a tremendously releasing effect when it occurs. (Rogers & Freiberg, 1994, p. 158)

With the entry of society into the Information Age and the development of new technologies, multiple scientific attempts have been made to apply the student-centered approach in e-learning and other information environments. Here's what experts say about it:

> In this respect, person-centered principles already have proven to be most effective. [...] the present is optimally suited to bring together student-centered teaching and new media in order to ensure effectiveness while equipping teaching and learning with more and life-long personal meaning. (Motschnig-Pitrik & Holzinger, 2002, p. 170)

Methodology

The study was based on the following two hypotheses:
1. One of the most important psychological characteristics underlining the teacher's ability to implement learner-centered pedagogy is the ability to see the learning situation and learning task through the eyes of a student.
2. Among the indicators of this competency is the teacher's capability to deeply focus attention on the student and understand how s/he thinks while solving the learning problem.

The task of the study was to determine how common the ability for learner-centered pedagogy is among university students currently working in schools.

Two hundred and seventy teachers participated in the experiment. They all attended the author's online course *Child Development and Learning in Cultural Context* at the Touro

Graduate School of Education in 2022-2023. (They were taking all their other GSE courses online as well.) The majority of participants were female (75%).

The procedure was as follows: the participants observed children in their classrooms while children were solving various problems in reading, writing, math, drawing, and social sciences. For our study, they answered the following question: "What sequence of actions did the student that you were observing perform to solve his or her problem?"

A computerized survey served as the study instrument, so data collection was done online. The participants submitted their answers electronically as one of their homework assignments for the course. Two experts certified as elementary and middle school educators helped the study's author analyze experimental data.

Results

Analysis of Data

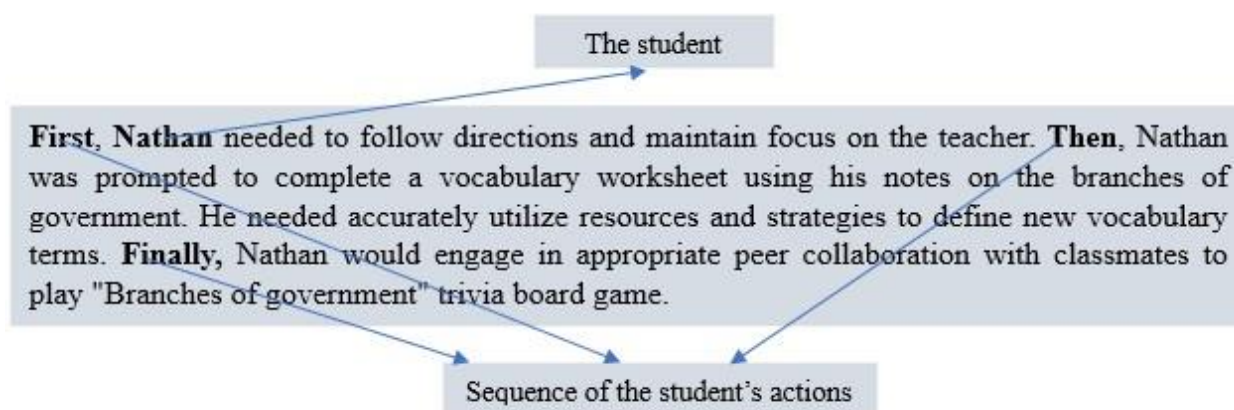
The analysis of the collected data was carried out manually. Each answer was analyzed from the point of view of its compliance with the experimental instructions, or more precisely, with the two main requirements contained in them. Firstly, in a learning situation, attention should be focused on the student, and secondly, the teacher should describe the sequence of the student's intellectual actions necessary to solve the problem. Thus, the two main criteria for analyzing the study participants' responses were "the presence of a student" and "the presence of a sequence of his/her actions." Fig. 1 provides an example of a response that satisfies both criteria.


Figure. 1: A study participant's answer and the analysis of its content

"The student" and "the sequence of the student's actions" were the two key concepts, and teachers' answers were expected to address these aspects of the experimental situation. The first concept allows us to discover the schoolteacher's tendency to focus on a student's activity in a learning situation, and the second one reflects the schoolteacher's ability to specifically and in detail describe the student's physical as well as intellectual actions in a learning situation.

Categorization of Data

Direction of centration. The study participants' answers could be divided into four categories: sociocentric, egocentric, mixed, and others. Answers were *sociocentric* if the study participants primarily described the students in learning situations. An example is presented in both the paragraph below and Fig. 2, where the teacher's attention is focused exclusively on the student:

> The main task that Jake should be accomplishing while being observed is how to solve one variable by using elimination. After he eliminates the variable, he can solve for the other using substitution. He solved for *x*. The positive *4y* and negative *4y* gives us a sum of 0, that is called elimination. In doing so, he is able to solve for *x* first and then substitute for *x* to find *y*-value. (U.T.V., math lesson, fall of 2023)

Figure 2: Illustration of the math problem's solution in the sociocentric answer

Answers were *egocentric* if they told mostly about the teacher and rather determined her or his own actions and reasonings at the time of observing the student. Such an answer is presented in the next example. There, the focus is on the teacher. The volume of text related to the description of the teacher's activities is even three times larger than the statements related to the student. Little is said about the student, only generally and indirectly. An example is presented below:

> I gave Robert a word problem to work on that involved counting, grouping, and division. I provided a hint: multiple methods can be used to solve the problem. I was watching Robert to make sure that he could choose appropriate strategies. When it was necessary, I explained how to correct his errors. (R.R., math lesson, spring of 2023)

It should be noted, however, that the mere fact that the teacher is mentioned in the response does not yet mean that this response should be classified as egocentric. It was possible to mention the teacher in the description, but the main object of observation should still remain the student and his activity.

Answers were considered *mixed* if they included both of the above categories. That is, the study participant's attention was directed to both the teacher and the student; descriptions of their activities were equivalent in their semantic load, and one was incomprehensible without the other. An example of such an answer is:

> I read a book aloud in the classroom and asked questions about its characters in order to comprehend if the story's plot was understandable for the students. Paul answered most of the inferential questions. (M.A., reading lesson, fall of 2022)

Answers were categorized as "*others*" when the explanations of the student's activity were replaced by irrelevant reasoning. For example, "Alisa benefited greatly from visual representations when learning new concepts."

According to the results, **42.7%** of schoolteachers tended to focus their attention on students in experimental learning situations, which represented the *sociocentric* category. Meanwhile, 30.2% of the investigated population of schoolteachers failed to do so, and they fell into the category of *egocentric*. The two remaining categories—*mixed* and *others*—did not show any definite and stable trends. In Fig. 3, the percentage of categories named above is shown.
Figure 3: Distribution of the teachers' answers by categories

Specificity of the description. In the study participants' answers, general formulations prevailed about what the student observed or the observer himself or herself should have done in the learning situation. In the example of the egocentric answer illustrated above, one of the study participants, a math teacher, failed to describe her student Robert's intellectual actions consistently and in detail. She only briefly informed us about how he solved his problem—only that he had to perform three different operations. Of course, this is not enough to consider the experimental condition fulfilled.

In the example of the mixed answer, another study participant, a reading teacher, gave a very vague description of what was going on in her classroom. She identified neither the title of the book that she was reading to her students, nor what characters of the book they were supposed to discuss, nor what questions about the book's content they were answering. Even Paul's activity while she was observing him is not described in detail, although specifics were considered necessary according to the study conditions.

However, **38.7%** of the investigated population still followed the second experimental requirement and specified the students' sequence of actions when solving the problems. This is an example of how an answer looks that unconditionally satisfies the requirement:

> To create a pumpkin patch drawing, Jasper was using the "seagull technique," which I, his art instructor, demonstrated to the class at the beginning of the lesson. First, following the explanations given, he drew a seagull. Second, he drew a line towards the grass on each side of the seagull's wing. Third, he looked at how I and other

students made a round bottom and easily followed this step as well. Fourth, he created a few vertical lines on the pumpkin to make it volumetric figure. (E.K., visual art lesson, spring of 2022)

In her answer, this study participant, an art teacher, presented a complete sequence of actions performed by her student Jasper, who drew a pumpkin using a given model technique. In the sociocentric answer's example illustrated above, the other study participant, a mathematics teacher, reproduced the entire logical chain of operations used by his student Jake and needed to solve a system of linear equations.

A distinctive feature of these and similar answers is the teacher's ability to "unfold" the intellectual activity process of the student solving the problem, that is, to present it in a step-by-step form and analyze it. It is noteworthy that the majority of the schoolteachers surveyed in our study—**61.3%**—did not cope with this task in full.

Learner-centered ability. A little more than one-third of the investigated population—**36%**—completed the experimental task, having satisfied both instructional requirements. These study participants were deeply concentrated on the student under observation, primarily reflecting his/her intellectual activity, and identified and described in detail the sequence of his or her actions while solving the problem given.

Discussion

Causes of Teachers' Egocentrism

Only a little more than one-third of the investigated population coped with the experimental task. Every third study participant demonstrated qualities that suggest s/he had the ability to implement learner-centered pedagogy. Every third is a small number. However, Rogers also discovered that the student-centered technique is not for everyone, and that "empathic understanding" is a rare personality quality. If we look at the result obtained from this angle, it is not at all hopeless.

It is alarming that another third of the population studied did not cope with the experimental task at all. These study participants focused their attention on themselves and talked exclusively or mostly about their own activities in a learning situation. This psychological feature is called "egocentrism." It should be noted that we are not talking about egocentrism as a pathological phenomenon. The subject of this discussion is the egocentrism of healthy individuals.

Egocentrism is a childish trait; it is observed in preschool-age children when thinking is just developing. "Egocentrism refers to the child's inability to see a situation from another person's point of view. The egocentric child assumes that other people see, hear, and feel exactly the same as he does" (McLeod, 2023a). Egocentrism reappears in adolescence and is associated with the process of identity development, which does not always proceed without conflicts (Erikson, 1968, pp. 135–138). Finally, egocentrism manifests itself in old age, where it is associated with cognitive decline. Egocentrism in young and healthy adults is a sign of infantility, personal immaturity, and problems with identity. With a favorable passage of the teenage crisis, egocentrism disappears. Adults who still exhibit egocentrism were probably unable to adequately go through the stage of developing their identity in adolescence (Zheldochenko & Nikolenko, 2020, p. 7).

Apparently, these study participants poorly knew the psychology and peculiarities of children's development. They just did not understand what it means "to put themselves in the student's shoes." They were probably not teachers by vocation, but they came to this profession guided by other considerations. It is known that it is not the best high school graduates who enter our pedagogical colleges; after completing their bachelor's and master's programs, they come to work in schools, but their motivation, intuition, and interactive skills can still be underdeveloped.

It should be noted that this is different from the schools whose education is considered exemplary, for example, in Finland, Singapore, or Japan, where teaching positions are given to the most capable and highly motivated individuals ("How Teachers Are Trained in Finland," n.d.; "Singapore Mathematical School," n.d.). "In Singapore, teaching is a respectable profession. Teachers are selected from the top one-third of their age cohort... Teachers are a top priority in Singapore, as they should be in every education system" (Lee, 2020, pp. 90–91).

Causes of Teachers' Inability to Analyze Students' Thinking

Even if the study participants were able to see the tasks from children's perspectives, they were not always able to "unfold" the process of solving them into a step-by-step intellectual activity. This fact can be partially explained by their lack of responsibility or motivation when doing their homework (the experimental assignment). However, the more probable reason seems to be that these teachers were not properly trained in their school years themselves; probably, their instructors did not require them to present solutions to problems in detail. Such study participants had not developed a culture of mental work.

In the same years when American psychologists were developing the theory of humanistic education, a Soviet educational psychologist, Petr Galperin (1902–1988), created his theory of step-by-step formation of mental actions (Galperin, 2017, pp. 3–20). Its essence was that, when learning a mental or physical action, the child forms it step by step, consolidating the result of learning at the end of each step. When the entire action is fully formed, it goes into the mental plan and becomes automated. Subsequently, if necessary, the individual can "unfold" his solution to check the steps and make sure that he performs his task or a similar one correctly. Solving a problem is developing a skill, and the method of step-by-step formation of mental actions is more appropriate and useful in the case of studying how to solve problems than, say, the trial-and-error method.

Our study participants needed this skill to perform an experimental task in order to compare their solutions with the ones that the learners under their observation created. Without this, it was impossible to adequately understand whether the child correctly saw the goal of his activity, the available means of achieving the goal, and whether she or he could independently find a strategy for solving the problem. Only by mastering this pedagogical technique can one teach children effectively and successfully.

Teachers Can be Trained to Become Learner-Centered

Of undoubted interest in connection with the prospect of training is the relatively small group of study participants—one-fifth of the surveyed population of schoolteachers—whose answers were *mixed*. Their answers contained some descriptions of the intellectual activity of learners solving problems but were unsystematized and disorganized, did not set out the sequence of

actions taken by the child, and generalized what was happening rather than meeting the requirement of specificity. However, in these answers, there was some seed from which useful shoots could sprout with the proper instructional approach. These representatives of the schoolteachers' population should be taught to think in a disciplined manner, that is, to analyze when necessary and to generalize if the task requires it. As the author's previous studies have shown, the skills for analytical-synthetic thinking are a serious problem for today's university students, going beyond the boundaries of one culture (Toom & Inshakova, 2019, pp. 56–57).

From the point of view of the subsequent training, the most perspective subjects of our study seemed to be those whose answers have simultaneously fallen into the categories of *non-specific* and *mixed*. They did not fully cope with the task assigned to them in the study, but they have the preconditions for the possible development of the necessary skills.

The study author's further efforts will be directed towards improving her *Child Development and Learning* course's curriculum and implementing various assignments into it based on the ability to see the learning tasks through other people's eyes, that is, children, adults, and even theorists who have offered their unique approaches to human development and learning. Such training will help the teachers develop skills for learner-centered pedagogy.

That's how the idea of a complex training program for the schoolteachers in the framework of the course curriculum appeared. The teacher's ability to see the learning situation through the student's eyes and understand how the student thinks when solving a learning problem is based on both the teacher's "empathic understanding" and the general culture of his or her thinking. Apparently, one does not exist without the other.

Limitations

The study was conducted at an average American university, in a typical school of education, and likely reflects some of the trends that have developed in the field of education in the country today. However, generalization to a larger teacher population should be done with caution.

The results of this study are limited by the sampling methodology employed. All study participants belonged to one New York university, one educational school, whose students were mostly drawn from the state where it is located. 75% of the participants were female and taught in pre- and elementary schools. These characteristics do not fully coincide with the characteristics of the entire Touro University population of graduate students who are current schoolteachers. In addition, the results are limited by the study instrument used because written self-reports may somewhat simplistically reflect actual classroom situations and own cognitive activities.

The reliability of the findings needs to be tested in a full-scale study that includes experimental and control groups and examines the influence of various factors, including pre-training, on teachers' performance in the study.

Conclusion

Both study hypotheses were confirmed. Learner-centered teachers could deeply focus on a student who solves a problem to monitor his or her intellectual activity and present it in the

form of a sequence of actions. The study task was completed. More than one-third of the study participants (36.0%) showed abilities for learner-centered pedagogy.

The direction of centration and *the specificity of descriptions* are two characteristics or criteria that indicate the teacher's competency. According to the first criterion, the answers of the study participants can be divided into four categories: sociocentric, egocentric, mixed, and others. According to the second criterion, their answers can be divided into specific and non-specific ones.

Some results obtained seem to be alarming:
1. Almost one-third of the surveyed population, whose answers were egocentric (30.2%), lacked "empathic understanding" of children. Perhaps these schoolteachers' career choice in education was a mistake.
2. About two-thirds of the study participants, whose answers were non-specific (61.3%), had difficulties understanding the logic of how their students were thinking when solving problems. Perhaps they lacked a culture of intellectual work.

However, other results obtained are encouraging. One-fifth of the study population (20.7%) showed preconditions for the possible development of the skills for learner-centered pedagogy.

The results allowed us to outline a possible direction for the training. In the framework of the course curriculum, a training program will be organized that will help schoolteachers develop skills contributing to their cognitive culture and mastery of a learner-centered approach to education.

Students' Perceptions of Virtual Laboratories in University Physics Classes

Rim Gharbi, Mediterranean Institute of Technology, Tunisia
Rim Gouia-Zarrad, Mediterranean Institute of Technology, Tunisia

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

The integration of virtual laboratories (VLs) in education has gained significant attention, especially post-Covid-19, due to their potential to augment learning experiences and facilitate distance education in higher institutions. This study evaluates students' perceptions of VLs effectiveness in undergraduate physics courses, addressing two key questions: How do students perceive VLs' effectiveness in understanding theoretical concepts? What are the reported advantages and disadvantages of using VLs compared to traditional on-site laboratories? A questionnaire-based approach was used, involving 80 undergraduate students enrolled in physics courses. The findings indicate a positive impact, with 57.5% of students favoring VLs over on-site laboratories. Students perceive them as valuable tools enhancing the learning experience. While acknowledging these positive outcomes, some students highlight disadvantages of VLs, emphasizing the importance of physical experiments. Consequently, adopting a blended laboratory approach emerges as a promising strategy for educational transformation. By sharing this experience, the authors aim to inspire other educators to explore the potential of integrating VLs to enhance their own courses.

Keyword: Learning Experience, Physics Courses, Virtual Laboratories

Introduction

Virtual laboratories (VLs) are free online educational tools that revolutionize science learning through the integration of visualization techniques, such as animations, simulations, and recorded videos (Diwakar et al., 2015; Nair et al., 2012; Radhamani et al., 2014; Scanlon et al., 2002; Tüysüz, 2010). These labs are designed as content-rich interactive materials, providing users with a real impression of the laboratory experience through click gestures that emulate experimental protocols (Diwakar et al., 2019; Salmerón-Manzano & Manzano-Agugliaro, 2018).

The initiation of the VL traces its roots to the late 20th century. Initially these laboratories have found utility among both teachers and students as complements to traditional on-site labs (Vasiliadou, 2020). With advancements in technology and improved internet connectivity, VLs have evolved to become more sophisticated and accessible. However, within the research community, varying perspectives emerge. Some studies disagree with the efficacy of this new educational tool, positing that students gain more information when using real equipment (Schubert et al., 2001; Schuemie et al., 2001), while others argue that virtual or remote labs contribute significantly to education (Dewhurst et al., 2000; Sicker et al., 2005).

In a traditional laboratory, students typically engage in lectures to grasp theoretical concepts, followed by hands-on sessions to apply these theories in practical scenarios (Nedic et al., 2008). However, if students struggle to comprehend the theoretical information conveyed during a laboratory experiment, they may resort to memorization, leading to a risk of course failure. Such setbacks can foster negative attitudes towards the course among students who have experienced academic challenges (Trundle & Bell, 2010). Achieving a deep understanding of scientific theories poses challenges with traditional teaching methods (Achuthan et al., 2018).

To address these challenges, VLs have emerged as solutions to the limitations encountered in on-site laboratories, functioning as supplements to classroom teaching. By providing an artificial working environment, VLs aim to enhance the learning experience more effectively (Bijlani, 2012; Trundle & Bell, 2010). Numerous studies have demonstrated that students' conceptual understanding in VLs is comparable to or even surpasses that achieved in traditional laboratory settings (Brinson, 2015; Nair et al., 2012; Raman et al., 2014). Moreover, these studies suggest that VLs not only contribute to improved learning but also prove more effective than traditional methods (Achuthan et al., 2017; Magin & Kanapathipillai, 2000; Raineri, 2001). Another body of research even indicates that VLs can adequately substitute traditional labs (Corter et al., 2011; Lang, 2012; Zacharia & Olympiou, 2011), achieving comparable learning outcomes to hands-on laboratories across various science education domains (Ma & Nickerson, 2006; Moosvi et al., 2019; Stahre Wästberg et al., 2019).

Additionally, the growing demands of using VLs became evident when educational activities were affected by the COVID-19 pandemic (Ekarattanawong et al., 2023; Gamage et al., 2020). While theoretical courses transitioned to online delivery, educational institutions had difficulty in fulfilling the program requirements related to laboratory experiments due to the closure of universities and their laboratories.

So, due to the rapid spread of COVID-19 and the delay in finding a vaccine, numerous universities have incorporated VLs as a resource to complement and reinforce the teaching and learning process before and during pandemic closures (García-Vela et al., 2020; Joshi et al., 2021; Radhamani et al., 2021). Various publications offer guidance to institutions on effectively integrating VLs into the education process and encourage their adoption by learners (Çivril & Özkul, 2021).

The use of VLs within the context of distance education has gained substantial popularity in learning (Dhawan, S. 2020) since they have many educational advantages (Fiscarelli et al., 2013; Rotimi et al., 2012; Rutten et al., 2012; Smetana & Bell, 2012; Tatli & Ayas, 2011; Trundle & Bell, 2010; Zabunov, 2013):
- Carry out experiments in a shorter time.
- Carrying out dangerous experiments in a safe environment.
- Low-cost solution: no equipment is needed for performing the experimentations, all the development work and the implementation are done by the computer.
- Enabling students to progress at their own pace, so improve the self-driven learning (Radhamani et al., 2015).
- Providing students with immediate feedback so that they can check their learning.
- Increasing the learners' motivation and their ability to self-study.
- Accessing the virtual laboratory by learners is allowed at all times and places that multiple learners can do the same experiment at the same time (El Kharki et al., 2021).
- Recreating events that would be difficult or impossible to observed in traditional laboratory (Mishra et al., 2020).
- Improve students' conceptual understanding (Gunawan et al., 2018).

Methodology

The study focused on the usage of VLs by undergraduate engineering students at the Mediterranean Institute of Technology (MedTech). As a private co-educational university, MedTech has a diverse student population, comprising approximately 2,000 undergraduates and graduates from over 10 different nationalities. MedTech's engineering school is part of the South Mediterranean University, an English-speaking educational institution in Tunisia, established in 2002.

This study is based on data collected from two distinct cohorts:
- First-year pre-engineering students enrolled in the classical mechanics course, a foundational component of the engineering curriculum. This course is essential for establishing a solid understanding of principles such as motion, moment of forces and conservation of energy in mechanical systems.
- Second-year pre-engineering students participating in the optics and waves course, a fundamental second-year course that delves into the principles of optics and wave phenomena in engineering.

Both physics courses have a biweekly laboratory component aimed at applying the theoretical concepts learned in lectures. As part of our approach, we chose to implement one of the laboratories in a virtual format. Following this virtual session, we conducted a survey to investigate the factors influencing students' acceptance of VLs.

The survey was administered in Spring 2023, involving 80 undergraduate students enrolled in physics courses, including two first-year groups and one second-year group. Before completing the web-based survey, students participated in one session of VLs. The survey respondents comprised 34 female students and 46 male students. The survey encompassed a combination of twenty 5-point Likert scale questions, ranging from 1 = strongly disagree to 5 = strongly agree, allowing students to express the extent of their agreement, along with one open-ended question.

To address the research questions, students gave their feedback anonymously relating to their laboratory experiences at the end of the virtual lab session.

For the first-year students, based on previous research (Radhamani et al., 2021), we decided to use the free platform Amrita (https://vlab.amrita.edu/index.php), which contains a lot of VLs in different fields including chemistry, physics, mechanics, and more. The learning objective of the virtual laboratory is to study the two types of collision: elastic and inelastic. Building on prior research (Abdjul & Ntobuo, 2018; Zulkifli et al., 2022), we opted to utilize the free PHET platform (PHET https://phet.colorado.edu/) for the second-year group to facilitate exploration of standing waves. This choice allowed for the observation and study of phenomena impractical in a traditional laboratory setting. Additionally, it fostered discussions on various resonant modes of vibrations and enabled the calculation of the fundamental resonant frequency.

Data Analysis

Quantitative Study

Derived from the survey outcomes, we present charts illustrating responses to selected questions below:
Figure 1: VLs are helpful and useful.

Observing figure 1, it's apparent that over 65% of students confirm the utility of VLs in understanding theoretical concepts. Additionally, a significant 80% affirm the effectiveness of VLs for data analysis and visualization. These findings strongly support the assertion that VLs serve as beneficial and valuable tools in the learning process.
Figure 2: VLs are self-learning tools.

Here, over 50% of students express the ability to advance at their own pace when utilizing VLs. Furthermore, 70% of students affirm that VLs boast a user-friendly interface. These observations indicate that VLs contribute to enhancing learners' motivation and their capacity for self-study, thereby fostering a more self-driven learning experience.
Figure 3: VLs are easy.

The data reveals that over 70% of students affirm the ease of use of VLs, expressing comfort in their utilization. This underlines that VLs are easy-to-use tools for both learning and practical application.
Figure 4: VLs are flexible.

A significant 80% of students acknowledge that access to the virtual laboratory is permitted at all times and locations, with 49% expressing complete agreement. This facilitation of

flexible learning schedules is evident, providing students with the convenience of accessing resources according to their individual preferences and needs.
Figure 5: Continuity of use

75% of students confirm their intent to continue using VLs in the future and 66% express agreement with the use of other Virtual Learning Systems (VLS). These findings strongly indicate the remarkable effectiveness and appeal of VLs as valuable educational tools.
Figure 6: The preferred laboratory

Most students express satisfaction with the use of virtual labs, with 58% expressing a preference for VLs over on-site laboratories. This preference indicates a positive impact of VLs on students' perceptions and experiences.

However, when questioned about their preferred mode of learning, 49% of students lean towards online learning, while 30% favor traditional learning. To comprehend their choices, we conducted a qualitative study.

Qualitative Study

In the qualitative study, we deepened our understanding of the factors influencing students' preferences for learning modes. Through an open-ended question, "*do you Prefer virtual labs instead of on-site labs? Why? Please explain.*"

We explored the effect of their experiences and perceptions with the aim of uncovering qualitative information that complements and enriches the quantitative results.

We resume below in Table1 and table2 the students' responses to the open-ended question in favor and against the use of VLs.

It is easier to plug in values and get accurate results with no human error
It's very practical, useful, Easier, accurate and more efficient
Designed with the latest technology, virtual labs protect students from the dangers they face while conducting some dangerous laboratory experiments.
It is better
You can get more benefits since you are filly focused
It is more fun XD
Avoid the uncertainty of values
They are easier on the eyes for complicated labs, my eyes hurt trying to read big distances or setting small tolerances. And the simulations give much more accurate results anyways. On top of many other benefits like being very easy to access anywhere
Learning through gaming makes it easier, faster, and funnier
Because the values are more precise and exact
More flexible
It takes less time.
I like digital software
It's easier and we have to use technology to understand more.
I can practice more

Table 1: students' response in favor of VLs use.

Students are totally supportive of the use of virtual labs (VL), as indicated by their positive responses in Table 1 and their preferences for this educational tool. They think that VLs are useful, helpful, practical, flexible, easier…tools to learn. The high level of agreement and approval on the part of students suggests a strong tendency to embrace virtual labs as effective and beneficial elements of their learning experiences. Which confirm the positive students' perception of the effectiveness of VLs.

Nevertheless, it is important to recognize that some responses indicate reservations or opposition to the use of VLs. A summary of these contrasting viewpoints is presented in Table 2 below. This comprehensive analysis allows us to understand the various perspectives and considerations surrounding the adoption of virtual labs in the educational context.

We love the reality and touching stuff
Because some experiments need face to face explain
I love the traditional learning more
It is better to see the experience in front of you
VLs does not make you understand everything and doesn't feel like actually experimenting
On site labs are more efficient and realistic
The experiment gives you the opportunity to try things physically
It's better to manipulate the materials
Sometimes VLs are not as concrete as the on-sites labs we prefer sometimes using the material, however if it is well explained virtual labs can be good too.
in face-to-face labs I can ask the professor a lot of questions and understand more
I love to do things by my hands
Traditional LAB shows us how the formula does work, and it make the subject more understandable.
While VLs are useful, I still prefer to experience the real-world experience to effectively prepare myself for professional life.
It is better to manipulate the material and do the experiments
Having a real experience is better
I prefer physical since we take more time and put in more effort working on it
I like seeing concrete evidence of an experiment
Physically we may ask the professor and understand more
I like hands on practice
Just a preference
Onsite labs are better in reality
Both are good but real-life labs are better seen
VLs likt Einstein
In traditional labs you can interact with the materials and understand the real physical phenomena
It always far better to learn with something that is tangible, you get to understand better the component itself
Because nothing can replace handling equipment with own hands
No when you are on site You are able to understand the lab better and actually get to manipulate stuff

Table 2: students' response against the use of VLs.

Some Comments in the table above affirm the preference of some students for traditional labs over VLs, for them it's more efficient to understand.

Some comments gathered from student responses show that in addition to preferring traditional labs, a significant group of students prefer a combination of virtual labs (VL) and traditional physical experiences. This indicates that students recognize that integrating the two approaches can provide a well-rounded and complete learning experience that combines the benefits of virtual tools with the practical and tangible aspects of traditional labs. The preference for this hybrid approach suggests an openness to exploiting the strengths of both virtual and physical experiences in teaching.

Therefore, the adoption of a blended lab approach, which combines both virtual labs and traditional physical experiences, appears to align with the preferences and needs expressed by students. This blended approach integrates the benefits of virtual tools and hands-on experiences, offering a more versatile and comprehensive learning environment.

Conclusion

In contemporary STEM education, VLs play a pivotal role, offering students a useful, helpful, flexible, easy, and self-directed means to explore and experiment across various scientific disciplines.

Overall, VLs play a crucial role in STEM education by offering students a useful, helpful, flexible, easy, and self-directed means to explore and experiment across various scientific disciplines. As students increasingly embrace VLs (Estriegana et al., 2019), traditional laboratories persist in their importance, providing a tangible and immersive learning experience. Traditional labs create a distinctive environment for students to explore, experiment, and gain practical insights into scientific concepts. Consequently, a blended laboratory approach, integrating face-to-face and online instruction (Graham, C. R., 2006), emerges as a promising strategy for educational transformation (Means, B., et al., 2009). This approach delivers a comprehensive and flexible learning experience, combining the benefits of hands-on experimentation with the accessibility and innovation offered by digital tools. Virtual labs act as complements to on-site teaching (Gregory & Di Trapani, 2012).

Recent research further underscores the advantages of blended learning for students including flexibility, student engagement, and motivation (Antonelli et al., 2023; Sasidharakurup et al., 2015; Setiawan & Rosli, 2023; Yu & Wang, 2023). This compelling evidence positions blended learning as a contemporary educational approach poised to enhance the overall learning experience for students in STEM disciplines.

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This paper outlines the results of the study that surveyed whether incorporating media literacy into English as a second language teaching promotes Kazakh students' critical communication. We reflect on media literacy practices in language classrooms as modes of teaching that foster students' awareness of media content to recognise and resist fake news and disinformation. The present study investigates how the ability to access, understand, analyse, adjust, create, and communicate messages in various forms can best enhance Kazakh students' language awareness and critical communication. The results indicate that suggested pedagogical frameworks take students through all necessary stages, ideas, and assumptions about media content and structure, contributing to Kazakh students' critical communication development. Students demonstrate significant improvements in critical reading and listening, productive speaking and writing, and responding to the onslaught of media messages. They also acknowledge that media-oriented English language instruction created an environment to envisage real-life context and authentic language use.

Introduction

One of the most significant goals of Kazakh Higher Education is to train specialists with a critical eye on ongoing global trends and challenges who can communicate effectively with compassion, mutual respect, responsibility, and equality in a diverse global society (Kuanysheva et al., 2019; Rydchenko et al., 2023; Akhmetova et al., 2023). Needs for effective communication include critical listening, creative cooperating, collaborative problem-solving, and responsible decision-making upon a massive flow of information (Yelubayeva & Mustafina, 2020; Berkinbayeva et al., 2023). Partnership for 21st-century Skills (2003) has declared media literacy (ML) as one of the vital skills present-day students need to live and work successfully. This declaration identified valued outcomes of ML in modern society and the need to incorporate it into education to foster students' awareness of media content in recognising and resisting fake news and disinformation. Critical scholars (Buckingham, 2003, 2015; Hobbs & McGee, 2014; Kellner & Share, 2019) counter that schooling is the first factor to undertake this problem of disparity in media use. Likewise, ML promotes the critical thinking skills necessary to understand and communicate complex issues facing modern society (Worsnop, 2004; Mihailidis, 2014). Other approaches consider that ML skills enable individuals to use media materials intelligently, scrutinise and evaluate their content, critically dissect media forms, investigate effects, and create alternative media messages (MM) in various forms (Kellner & Share, 2005; Potter, 2013). Using social media, Facebook, particularly, supports peer learning, student engagement, and collaborative and contextualised learning (Kelly, 2018). Media literate specialists become intelligent consumers of products and information by comprehending and identifying the influence and meaning behind MM (Jenkins et al., 2009; Cheung & Chau, 2017).

By viewing the media as a tool for teaching critical communication purposes, it is significant to enable students to delineate 'reliable' from 'unreliable' content (Jenkins et al., 2009), create ways to maintain identities and construct discourse and community (Thorne, 2009) as well as inoculate participants against the harmful effects of media and explore the fluid nature of meaning in media texts (Hobbs & McGee, 2014; Potter, 2010). Thus, teachers need to be able to design adequate media-oriented classroom instructions that encourage students to think critically about MM before they comprehend, manipulate, or create their content in a target language.

ML is in its infancy in the Kazakh education system, so it needs pedagogical solutions to equip teachers with the relevant teaching tools to address this gap. The increasing role of media in consuming and producing new knowledge urges not only the introduction of media education in schools but also the designing of a 'critical' pedagogy to implement it.

This paper describes our attempts to incorporate ML into language learning and teaching (LLT). These attempts aim to understand better how the abilities to access, understand, analyse, evaluate, create, and communicate messages in various formats enhance students' language awareness and meaningful communication. Language instructions designed within the proposed framework create an environment to envisage real-life context and media resources to complete tasks aligned with their goals. This idea is proposed to ensure educators can access up-to-date teaching resources that keep pace with global trends (Kung, 2016; Fedorov & Mikhaleva, 2020). Many teachers use social media but typically do not create or share messages or incorporate media content into their lessons. This is due to their attitudes towards media, not because they lack technical skills.

We design media-oriented language classroom activities that teach students to decode MM, identify facts versus opinions, assess the influence of those messages on thoughts, feelings, and behaviours, create their messages thoughtfully, and communicate them accurately within their content. The paper outlines the results of a study that surveyed whether incorporating ML into LLT may promote Kazakh students' communication skills. Results lend themselves to exploring some critical questions for ML in language education:

1. What pedagogical framework takes students through the necessary stages, ideas, and assumptions about media content and structure in LLT?
2. What are students' perceptions of mastering ML for promoting activities to improve language skills?

Literature Review

Media Literacy has been defined variously at different times. However, it is commonly understood as a set of skills that enable people to browse, access, analyse, and evaluate images, sounds, and messages and create new ones in spoken and written communications. The ability to use the media content critically, responsibly, creatively, and in a socialised way is crucial to becoming informed and educated adults. ML seeks to offer media consumers the ability to understand the role of media in society and develop significant skills of inquiry and self-expression necessary for all citizens (Hobbs, 2018; Thoman, 1999; Jenkins, 2006). Buckingham (2003) defines ML as the knowledge, skills, and competencies essential to use and interpret media content. Potter (2013) interprets ML as a set of perspectives individuals use to interpret the meaning of MM. He believes individuals need mindful and critical media consumption to participate adequately in public life and contribute to the public discourse. The US National Association of Media Literacy Education defines ML as a capacity to access, analyse, evaluate, create, and act as a critical thinker, effective communicator, and active citizen using all forms of communication. It does not mean that all media consumers are already 'incredibly' capable and critical (Reyna et al., 2018). It can be accepted that audiences can be active and indeed 'critical' until they realise that there are things that they generally do not know about media but want to learn (Buckingham, 2015). All scholars and documents accept that deepening people's critical abilities broadens their understanding and awareness of what is happening around them and probably what will happen soon. We, therefore, contend that ML encourages students to be informed, engaged, and empowered to think critically while making decisions about message consumption and/or content production.

The need to enhance Kazakh students' critical awareness within LLT is urged because current National Education Standards are based on the designers' separate learning theories and goals without incorporating the socio-cultural content (Fedorov & Levitskaya, 2019; Yelubayeva et al., 2023). Now more than ever, there is a vital need for mechanisms to help students navigate high rates of media space and facilitate their own 'sense of self' along the way. There have been several attempts to structure the implementation of ML to education standards (Thoman & Jolls, 2004; Cope & Kalantzis, 2009; Mihailidis, 2014). The CML MediaLit Kit proposed a framework that boosts students' knowledge of current media content, practising applying that knowledge to new situations, analysing information, and communicating in a diverse global media culture. These skills include *Access* (ability to collect valuable information and comprehend its meaning); *Analyse* (ability to examine the form, structure, and sequence of the message); *Evaluate* (ability to relate messages to their own experience and make judgments about their quality and relevance); and *Create* (ability

to "write" their ideas and use of various communication technologies to create, edit and disseminate their message (Thoman & Jolls, 2004).

Mihailidis (2014) suggests the 5 A's framework: *Access* to media, *Awareness* of media power, *Assessment* of how media covers international and supranational issues, *Appreciation* for media's role in creating civil societies, and *Action* to encourage better communication across cultural, social, and political problems. This framework is developed to assist young learners in understanding their role as global citizens, respecting and valuing diversity, understanding how the world works in diverse contexts, contributing to communities to make the world a better place to live, and taking responsibility for their actions.

Both frameworks comprehensively structure classroom activities to implement ML in education. *In terms of LLT, a more tangible and meaningful approach to mastering learners' metacognitive skills is needed. This approach should reflect thoroughly on the realities of media content, exploring how words, issues, and ideas are formed, function, and are related across contexts.*

Table 1: Communication and Media Literacy

Learning Objectives: Training Critical Thinkers and Effective Communicators					
Learning Skills					
Lexical Skills		Language Skills		Communication & Media Skills	
Competencies					
Accessing	Detecting	Analysing	Adjusting	Creating	Communicating
Student-centred Teaching Methods					
Case-based learning	Inquiry-Based Learning	Problem-Based Learning	Project-Based Learning	Collaborative learning	
Learning Instructions					
Content-based		Technology-based		Competency-Based	
Resources					
Audio & visual materials		Print materials		Internet resources	
Learning outcomes					
1) evaluating the reliability of information obtained from various sources, 2) conveying a message through various forms of media with accuracy, clarity, and creativity, 3) encouraging students to compare different perspectives in media texts, 4) engaging students in research and critical thinking, 5) fostering students' collaborative autonomous learning abilities, 6) mastering students' proficiency in communicating and disseminating their thoughts and ideas, 7) acknowledging the values and perspectives embedded in the plot and 8) encouraging students' interest in various global and local issues.					

Considering the results of prior theoretical and empirical research, we propose a framework that takes students through all the necessary stages, ideas, and assumptions about media content and structure with which to empower their critical communication. *By critical communication, we mean the attainment of competence that fosters a critical understanding of how communication functions in different contexts by identifying key concepts, connecting multiple ideas, adapting messages to situations and audiences, and creating messages with compassion and mutual respect.* The Communication and Media Literacy (CML) Model is a pedagogical framework for organising and structuring classroom activities that create educational environments for applying theoretical concepts to tackle real, tangible issues, demonstrating the complexity and unpredictability of actual issues (Table 1). The CML framework can develop students' critical thinking and communication skills.

Bringing mass-mediated materials to LLT environments through well-organised and structured teaching models may be more effective and engaging than education focused solely on exposing media manipulation to bridge the gap between the students' classroom and real-life experiences with the media (Gee, 2009; Hattani, 2016). This approach encourages students to be aware of the choices they make in their life and career and how they fit into a greater societal context. Hence, integrated media and LLT classrooms are good environments for students to be exposed to natural language, extract accurate information from actual text, and react to trends and challenges like L1 speakers do.

Methodology

Practical Applications of ML for Language Instruction

This section aims to provide examples of practical applications of ML in LLT. This application can be significantly enhanced if it is contextualised within task-based activities. For this purpose, we designed a set of task-based activities within the comprehensive CML model that foster the abilities listed below:
- assessing the credibility of information from different sources,
- being aware of and appreciating diverse cultural perspectives,
- communicating accurately, clearly, and creatively using different forms of media,
- encouraging students to compare different perspectives in media texts,
- engaging students in research and critical thinking,
- fostering students' collaborative autonomous learning abilities,
- mastering students' proficiency in communicating and disseminating their thoughts and ideas,
- recognising values and points of view embedded in the plot and
- stimulating students' interest in various global and local issues.

These activities include instructions for reading, listening/viewing specific MM, and then reflecting on them by analysing questions. The advantage of devising teaching activities based on media products is that one can vary the degree of difficulty if you have to deal with diverse language proficiency levels within the same group of students (Yelubayeva et al., 2023). Practical applications at every stage are described in the following paragraphs.

Accessing and Detecting Messages

Access to various media products further to inform, engage, and provide varied viewpoints is the initial stage in facilitating, sharing, and expressing communication needs. Therefore, classroom instructions for accessing should be targeted at defining the source of information, obstacles to access, and how media technologies and platforms influence the accessibility of information. Classroom instructions for critically *Detecting* how messages are constructed to carry a specific message for a specific audience by recognising vocabulary, symbols, and information techniques should foster abilities to provide context, reflect values, develop ideology, and cultivate representation. These activities enable students to consider the origins of information and to define the prevalence of information in society.

Analysing and Adjusting Messages

Classroom activities that enable students to *Analyse* the design of the message's form, structure, and sequence include tasks for identifying the way messages are constructed in order to build meaning, examining consumers' interpretation of the messages using compare/contrast, fact/opinion, cause/effect, listing and sequencing strategies, deconstructing the physical attributes of messages used to develop a specific meaning or reinforce an idea and others. Message *Adjusting* is implemented by relating it to the evaluator's experience and judging its accuracy, quality, and significance to develop a specific meaning or reinforce an idea. Language instruction improves students' ability to evaluate message quality and judge value based on principles.

Creating and Communicating Messages

The task instructions for *Creating* MM address cultivating critical thinking skills and creating opportunities for enhanced dialogue that can lead to more diverse and varying viewpoints. These tasks foster abilities to use brainstorming, planning, composing, and revision processes, to use written and spoken language effectively and accurately and to use various types of communication technologies in constructing messages. Depending on the level, teachers can ask students to create presentations, videos, articles, or social campaign posters. *Communication* involves transferring messages effectively for various purposes and audiences. There is some evidence to prove that many students fail to communicate their ideas or points of view for various reasons. Enabling students to communicate ideas and information actively supports social participation, campaigns, and active citizenship.

Participants

Six groups (*n = 88*) of first-year master students in History and Archeology at al-Farabi Kazakh National University participated in the study. All participants were twenty-three and twenty-four years old. The goal was to study first-year graduate students mainly because it is a critical age in the education system when their self-esteem, self-expression, and self-image are gradually reinforced. The History groups *(n = 45)* were determined as the control groups (CG), and the Archeology groups *(n = 43)* were determined as the treatment groups (TG). The selection of Archeology groups as TG was based on the fact that the students from these groups were less active in sessions of questioning, answering, and discussion during learning before the experiment. In addition, the academic performance of these groups was lower than in CG, and we decided to attempt to raise these students' learning outcomes experimentally. During the experiment, the TG tested the application of ML to language learning based on the CML Model, whereas the CG was provided with the application of conventional learning.

Results

This study explored language proficiency pre-test, post-test, delayed post-test, a questionnaire, an interview and panel discussions with students to measure the effectiveness of the CML model in the media-incorporated language classroom and reply to the study research questions. The language proficiency test consisted of Writing (reading, listening and article critique) and Speaking parts. Articles came from news networking platforms such as BBC Global News (bbcglobalnews.com), The Guardian (https://www.theguardian.com), and Euronews (euronews.com), among others. The student's analysis of the text plot, key message, or character was followed by a contextual discussion and critical view during the

Speaking part. The tests were identical in scope and format and did not differ. The test validity was assessed by PhD language instructors teaching English for more than ten years. Pearson's correlations (Pearson's r) were used to calculate the interrater reliability, and the obtained coefficient ($r=80$) was confirmed to ensure the agreement between instructors.

The first step in performing a one-way MANOVA is to quantitatively compare the language proficiency of CG and TG students across four components: reading, listening, writing, and speaking. MANOVA results show that the two groups were homogeneous − without significant multivariate and univariate differences in English language proficiency level before receiving treatment sessions (Figure 1). Figure 1 demonstrates the results of the pre-test and post-test.
Figure 1: Pre- and post-experiment English Proficiency Test Results in CG and TG

The pre-test was held in the first week of the twelve-week treatment session (Spring Semester 2022), and in the last week of the treatment session, students had a post-test.

Following the language proficiency post-test, the students had a questionnaire. For this, the Satisfaction with Life Scale (SWLS) was employed to judge students' satisfaction with the introduction of ML in EL Classrooms. The scale contained four statements: (1) ML increases students' interest in learning English; (2) ML practice involves mastering four language skills (reading, listening, writing, and speaking); (3) Media products make English content more meaningful and flexible; (4) Media products master critical awareness. The participants were asked to indicate their level of agreement with a statement on a seven-point Likert scale (from 7 = 'strongly agree' to 1 = 'strongly disagree'). Total scores ranged from 1 to 35, where the lowest score indicates the respondent's *Extreme Dissatisfaction* (scores between 5-9), scores ranging from 10 to 14 indicate *Dissatisfaction*, 19-19 indicate *Slight Dissatisfaction*, 20 indicate *Neutral* position, 21-25 indicate *Slight Satisfaction*, 26-30 indicate *Satisfaction* and 31-35 indicate *Extreme Satisfaction*. The questionnaire results are given in Figure 2.
Figure 2: Students' Satisfaction with Introducing ML in EL Classrooms

The follow-up interview was conducted voluntarily. Twenty-one out of eighty-eight respondents attended a follow-up interview to interpret their answers to the questionnaire. About three-quarters of the respondents (73%) agreed that implementing ML education in English instruction fosters motivation for studying English. When students are instructed to apply their media experiences in educational settings, they are more motivated to master the language competency (Bates, 2019). 71% of the respondents indicated that ML education is closely related to teaching the four language skills. The Interviewees claimed it was natural for ML to be implemented in English lessons as they listened to different records/videos, read posts and articles, wrote messages/essays/emails, and commented/discussed various issues. Its meaningful and flexible content is another central argument for implementing ML in English classrooms. 67% of the respondents claimed that English teaching content is flexible for students' abilities and interests. 67% of the respondents approve that ML practice implies the students' broad erudition and capacities to analyse and synthesise various issues in MM. Active use of methods to analyse and structure the information independently, check the facts, and reach valid conclusions promotes students' cognitive activity and develops critical thinking. Respondents' generalised attitudes towards surveys demonstrate their willingness and readiness to participate in the experiment. They believe the experiment can substantially affect the quality of LLT and academic achievements.

Two weeks later, a face-to-face panel discussion was held after treatment sessions. The panel aimed to identify students' perceptions of the effectiveness of incorporating ML into their language learning. The analysis reveals positive dynamics in the answers to the questions:
1. *Do you feel your English has improved within media-oriented language classrooms?*
2. *Why is critical thinking important in language learning?*
3. *What is the impact of ML on language education?*

Participants found the sessions in the experiment satisfying. They confirmed the positive effect of language and ML incorporation in developing their receptive and productive skills. They stated that they had achieved higher reading, listening, and writing achievement scores than they had before. Most participants claimed that during experimental learning with media texts, they learned language faster, and they could express their ideas and views clearly, confidently, and meaningfully in communication as they came across real-life situations and real-time language used beyond the classroom. Another rationale for the efficiency of the experiment that students indicated was the ability to discover values and ideas embedded in MM, critically interpret them, and decide whether to accept or reject them.

Furthermore, they mentioned that during the experiment, they could explore new areas of their job and seek knowledge, clarification, and new solutions for raised problems, evaluate statements and arguments, and distinguish between facts and opinions creatively and critically. They were willing to examine their beliefs and admit a lack of knowledge or understanding when needed, showing humility. Perhaps most of all, they highlighted the relevance of the communication and social skills gained from the experience to their future professional needs, which create a positive environment to promote their understanding of the world by filtering the MM for distortions and bias issues of particular interest to them.

Overall, participants reflected positively on using media materials in LLT. Regarding the effectiveness and feasibility of the CML Model, it served as an efficient means to measure media literate communication skills when testing students. Most participants (85%) found the CML Model incorporated language and ML effectively, and 79% of the respondents declared

the feasibility of task-based assignments, whereas 21% found the tasks infeasible. Figure 3 reports the results of the students' perception of the CML Model.
Figure 3: Students' Perception of the CML Framework

Discussion and Conclusion

Further talks on the CML Model feasibility figured out factors that had contributed to the failure in the task accomplishment. The first factor for failure was poor communication. We discovered that some students needed to establish a positive communication channel. They concurred that their confidence increased over time, and their initial anxiety decreased as they got to know their peers and focused on understanding one another. This led to the teachers' decision to establish a task management system that enables smooth communication. The second is low language proficiency. Despite the group demonstrating an overall pre-intermediate Kazakh proficiency level, there were poor Kazakh students. Thus, we concluded that classroom activities still need to be adjusted for students' needs individually, and third was poor monitoring. During the experiment, we realised that assigning roles to all team members is insufficient; teachers should monitor progress regularly and appoint team members responsible for their actions. Once they feel responsible for their actions, they will perform better and demonstrate better results.

This paper attempts to justify that if students are guided to see, read, and listen beyond what is presented to them lexically and grammatically, they can become independent and critical thinkers. In this study, we found confirmation of our findings on the interrelation between ML and language proficiency, which results in students' academic success. They were able to gain access to various media formats and technologies to facilitate information to create, share, and communicate messages; analyse how messages are constructed to carry a specific message for a target audience; assess information extracted from the text; demonstrate high levels of critical judgment, interpretation skills; demonstrate greater mutual understanding, recognition of diversity in multicultural and multilingual societies and respect for such diversities; communicate effectively contextual information and critical perspectives extracted from a text. These skills led to significant improvements in critical thinking and creative written and spoken communication.

One of the challenges for students in applying critical and creative communication to their actions is fear that they might be left to encounter a cynical and defeatist judgment or opinion in response. This fear must be eliminated in the classroom by constant practice rather than being solved with quick tips. Thus, task-based instructions based on the CML Model call students for discussion and critical view to enhance their communication skills and critical thinking and promote social awareness and engagement.

Thinking Aloud Protocol Based Self-Report Questionnaire to Measure Metacognitive Skills in Mathematical Problem Solving

Uthpala Athukorala, Institute of Technology University of Moratuwa, Sri Lanka
Dileepa Fernando, Singapore University of Technology and Design, Singapore
Chanakya Wijeratne, University of Colombo, Sri Lanka

Abstract

Metacognitive skills play a major role in Mathematical problem solving. Metacognitive skills are required for monitoring and regulating the cognitive process of Mathematical problem solving. Different countries have declared that improving metacognitive skills is an essential component in Mathematics Education. Hence, having an instrument to effectively and efficiently measure metacognitive skills is important for both researchers and teachers. Think-aloud protocol is an endorsed method for assessing metacognitive skills in Mathematics. There, students verbalize their thoughts while working on the problem. However, this method has limited usability in large classroom settings due to the time consumed. Self-report questionnaires, on the other hand is an efficient metacognitive skill measurement instrument since it has ease of administration, suitable for larger classes and no need of special training on conducting. Though task general self-report questionnaires show low correlation with think-aloud which is an effective metacognition measurement tool, task specific questionnaires which were designed in line with think aloud show a significant correlation. To this date, there is no self-report questionnaire designed based on think-aloud for measuring metacognition in Mathematical problem solving. This study focuses on developing a task specific Likert type questionnaire for measuring metacognitive skills in Mathematical problem solving based on think aloud. The scale shows a high content validity (S-CVI/Ave=0.9), confirms the construct validity including both convergent and discriminant and higher internal consistency (ordinal alpha=0.89) assuring it as a successful measure for measuring metacognitive skills in Mathematical problem solving.

Introduction

Measuring metacognition is still debatable because it is a complex structure which is not visible from the outside. It is a process that happens inside the brain. There are currently various types of measurements used to assess metacognition. Questionnaires and interviews are offline measures while Think Aloud Protocol and systematical observations are online measures. This research specifically focuses on measuring the metacognition of students who learn in Digital Learning Environment (DLE). In DLEs, conducting Thinking Aloud or systematical observations may be impractical due to large number of students. These methods are individual-based and require more time for transcribing and analyzing students' language into a common coding system (Veenman & van Cleef, 2019). Different coding systems may create different results. Think Aloud Protocol has to be conducted by trained raters using well developed coding systems (Schellings et al., 2013). Quality of the online assessment depends on the adequacy of the coding system (Schellings et al., 2013). Further, there may be unrevealed thought processes even during think aloud tasks since students may not verbalize, all they think.

But many pieces of research confirm that online measures are the most effective method of assessing metacognition, especially in Mathematical problem solving (Veenman & van Cleef, 2019). Veenman and colleagues confirmed that self-report questionnaires exhibit a moderate relationship with the online Think Aloud method (Veenman & van Cleef, 2019). Veenman suggested that, for the assessment of metacognitive skills in Mathematics, online methods should be preferred over offline methods (Veenman & van Cleef, 2019). However, there are still numerous challenges in conducting the Thinking Aloud Protocol for larger classes. Schellings and colleagues concluded that the Thinking Aloud method is particularly suitable for research purposes rather than for practical aims due to its labor-intensive process (Schellings et al., 2013).

Hence, using the Think Aloud method for measuring metacognition in DLEs is not very practical due to large class sizes. However, there is still a possibility of creating a questionnaire based on the Thinking Aloud method. However, correlations between questionnaire data and think aloud measures are generally moderate to low (Schellings et al., 2013). When questionnaires are compared with Think Aloud, they present a varied picture. Researchers have found that general questionnaires exhibit a low correlation (0.22) with Think Aloud, whereas task specific questionnaires show moderately high (0.42) correlation (Schellings et al., 2013). Since questionnaires inquire about the activities that students performed, they rely on the long term memory. At times, questionnaires may not accurately represent the actual activities performed by students due to the limitations of memory (Schellings et al., 2013). Responses to the questionnaires may be influenced by varying reference points, such as comparing oneself with others, like the teacher or the best/worst student in the class. This also contributes to the low correspondence of the questionnaire. Even though students are using more strategic activities, they have to limit to the questionnaire given. Students report more activities to be effective not because they use them, but because they believe they are effective. Variations in rating the activities in questionnaires and Think Aloud create non-correspondence between the two. As an example, since Think Aloud uses a frequency scale, questionnaires measuring the usefulness of activities do not exhibit a high relationship (Schellings et al., 2013). Due to these reasons, self-report questionnaires and Thinking Aloud protocol suffer from low correlations.

Schellings and colleagues (2013) designed a questionnaire for measuring metacognition in reading activities based on taxonomy for coding Thinking Aloud protocols. Despite some validity issues with that scale, it showed a promising correlation (r=0.63) with Thinking Aloud. There is no such domain specific questionnaire built for Mathematical problem solving based on Thinking Aloud. In this present study, questionnaire was designed based on scoring system created by Veenman and colleagues (2000;2005) for systematical observations used in Thinking Aloud in Mathematical problem solving.

The objective of this research is to design a task-specific questionnaire aligned with thinking aloud in order to minimize administrative and time consuming issues while extracting maximum information comparable to an online measure. For Mathematical problem solving, no task specific questionnaire has been designed based on Thinking Aloud. If a task-specific questionnaire can be designed that closely measures metacognition skills, such as Thinking Aloud Protocol, this scale could be a successful alternative for Thinking Aloud Protocol.

Next sections will describe how the questionnaire was designed and how validity and reliability were tested for the designed questionnaire.

Methodology

Questionnaire Design

This questionnaire is aligned with systematical observations used in Thinking Aloud Protocol. Thinking Aloud Protocol is an online measure while questionnaire is an offline measure where students report what they do/have done. This self-report questionnaire contains the questions to measure the metacognitive skills in Mathematical problem solving.

Systematical observations during problem solving process were used to create the questions in the questionnaire (Veenman et al., 2005). That systematical observation process includes 15 activities which were used to evaluate students while they are thinking aloud. These 15 activities were designed and tested by Veenman (Jacobse & Harskamp, 2012; Veenman et al., 2000, 2005). Table no 1 shows the 16 questions designed in line with systematical observations in Thinking Aloud protocol.

From this self-report questionnaire, it is intended to measure how frequent, the student is applying metacognitive activities in Mathematical problem solving process. A three-point scale was used to score the items. A frequency scale was used, since Thinking Aloud is also measuring a frequency. The scale was same as the scale used by Schellings (Schellings et al., 2013). Respondents select an answer from three scales "almost never" (=1), "Sometimes" (=2) or "often" (=3). There are few reasons to select a three-point scale for the responses.

1. Due to the task-specific nature of the questionnaire's elements, it may be challenging for the respondents to distinguish between small distinctions between "often" and "very often" on a more complicated scale (Schellings et al., 2013).
2. Student's perception on the task they performed, are represented in self-reports. When they select an answer, they may use some reference points (their own individual standard, view point of their teacher, standards related to an ideal student or poor student). Therefore students who use one reference point may have a consistent reference point (Schellings et al., 2013).

3. A three-point scale may reduce the variation among students' choices of a reference point even though it cannot be fully eliminated (Schellings et al., 2013). This will produce high reliability and stability in the questionnaire.

After the design process, next step was the questionnaire validation and finding the reliability to ensure that how well the data is representative of the subject under examination and how well it provides stable and consistent results (Taherdoost, 2016).

	Activities Recommended (Jacobse & Harskamp, 2012; Veenman et al., 2000, 2005)	Question Included to verify the activity
1	entirely reading the problem statement (Planning)	1. I read the question entirely, before I start the solving process.
2	selection of relevant data (Planning)	2. I select/highlight all the relevant data from the question before starting the solving process.
3	paraphrasing of what was asked for(Planning)	3. I paraphrase the question. 4. I make clear what I have to find before starting the solving process
4	making a drawing related to the problem (Planning)	5. I usually draw a sketch related to the problem, before I start the solving process.
5	estimating a possible outcome (Planning)	6. Before I solve the problem, I estimate/think about the nature of the possible solution that I would get.
6	designing an action plan before actually calculating (Planning)	7. I usually design a plan (temporary) to solve the problem
7	systematically carrying out such plan (Monitoring)	8.Every time I execute the designed plan systematically to reach the answer.
8	calculation correctness (Monitoring)	9. I am always vigilant on the calculation process to verify that I am on the correct way to the solution.
9	avoiding negligent mistakes (Monitoring)	10. I pay attention to avoid negligent mistakes during the solving process.
10	orderly note-taking of problem solving steps (Monitoring)	11. I keep an eye on the problem solving steps which helps me to verify intermediate results.
11	monitoring the on-going process; (Monitoring)	12. I always monitor the ongoing calculation process.
12	checking the answer (Evaluation)	13. I check whether the final answer is acceptable and compatible with given data.
13	drawing a conclusion (Evaluation)	14. I confirm that the final answer is correct.

14	reflecting on the answer (Evaluation)	15. I refer the final answer to the problem statement and verify that the answer is acceptable.
15	relating to earlier problems solved (Evaluation)	16. I relate to similar problems solved earlier and reflect the accuracy of the answer.

Table 1: Initial questions included in the questionnaire

Questionnaire Validation and Reliability

To validate the questionnaire, content validation and construct validation were used. Internal consistency was calculated for reliability analysis.

Sample Selection for Validation and Reliability

Students were classified according to their field of study(strata). To have 95% confidence interval with 5% margin of error, ideal sample size for 800 populations is 260. Table 2 represents how 260 students were selected proportionately from each discipline. Specific student from each discipline was selected randomly using a random number generator. In this sample 33% are females and 67% are males.

Discipline (Strata)	Total Population	No of students from each strata
Chemical Engineering Technology	50	16
Civil Engineering Technology	200	65
Electronic Engineering Technology	100	33
Electrical Engineering Technology	100	33
Information Technology	100	33
Maritime Engineering Technology	20	6
Nautical Studies	20	6
Mechanical Engineering Technology	100	33
Polymer Engineering Technology	50	16
Textile Engineering Technology	60	19
Total	**800**	**260**

Table 2: Sample Selection Details

Content Validation

In general, content validity requires assessing a new survey instrument to make sure it has all the necessary items and omits any which are unimportant to a specific concept area (Taherdoost, 2016). In content validation, a survey is conducted to get the idea of the experts in the same field of research. Content validation questionnaire was distributed among one Advanced Level Mathematics Teacher, four Mathematics lecturers from higher education institutes (public and private) in Sri Lanka and two researchers from the field of Mathematics Education. According to the answers of those 7 experts, Content Validation Index (CVI) was calculated.

Construct Validation

Construct validity refers to how well a concept, idea or behavior was operationalized into a working, operable reality (Taherdoost, 2016). To measure the construct validity, the questionnaire was distributed among selected 260 diploma students from 1st Semester who follow IS1104 Mathematics and Statistics in Institute of Technology University of Moratuwa. The questionnaire was distributed as soon as the students finished a Mathematical problem solving exercise. After removing incomplete responses, only 200(77%) responses were used for finding two forms of construct validity; convergent and discriminant.

Convergent Validity

In convergent validity, it is studied that two measures of constructs that are theoretically related are, in fact related (Taherdoost, 2016). To validate the questionnaire, the Cognitive and Metacognitive Strategies section (30 questions) of the Motivated Strategies for Learning Questionnaire (MSLQ) was employed. Using Statistical Package for Social Sciences (SPSS) software, correlation was calculated between two questionnaires using Spearman's rho correlation analysis. If the newly designed questionnaire is convergent valid, it should exhibit a significant correlation with the MSLQ – Cognitive and Metacognitive Strategies questionnaire.

Discriminant Validity

In discriminant validity, it tests whether constructs that are not related are in fact not related (Taherdoost, 2016). The questionnaire designed and the questions on Test Anxiety in the MSLQ, which are theoretically unrelated, were subjected to correlation testing using Spearman's rho correlation analysis. If the newly designed questionnaire has discriminant validity it should not show any significant relationship with responses from MSLQ-Test Anxiety questionnaire.

Reliability Analysis

In the reliability analysis, internal consistency was assessed by calculating Cronbach's alpha from the data collected within the same sample.

Results

Content Validity

Item	Expert 1	Expert 2	Expert 3	Expert 4	Expert 5	Expert 6	Expert 7	Experts in agreement	I-CVI	UA
Q1	1	1	1	1	1	1	1	7	1	1
Q2	1	1	0	1	1	1	1	6	0.86	0
Q3	1	1	1	0	1	1	0	5	0.71	0
Q4	1	1	1	1	1	1	0	6	0.86	0
Q5	1	0	1	1	1	1	1	6	0.86	0
Q6	1	1	1	0	1	1	1	6	0.86	0
Q7	1	1	1	1	1	1	1	7	1	1
Q8	1	1	1	0	0	1	0	4	0.57	0
Q9	1	1	1	0	1	1	0	5	0.71	0
Q10	1	1	1	1	1	1	1	7	1	1
Q11	1	1	1	1	1	1	1	7	1	1
Q12	1	1	1	1	1	1	1	7	1	1
Q13	1	1	1	1	1	1	1	7	1	1
Q14	1	1	1	1	1	1	1	7	1	1
Q15	1	1	1	1	1	1	0	6	0.86	0
Q16	1	1	1	0	1	1	1	6	0.86	0
								S-CVI/Ave	0.88	
Proportion Relevance	1	0.94	0.94	0.68	0.94	1	0.68	S-CVI/UA		0.44
	Average proportion of items judged as relevance across 7 experts					0.88				

To measure the content validity of the questionnaire Content Validation Index (CVI) was calculated (Yusoff, 2019). Table 3 presents the calculation of CVI.

Table 3: Content Validation Index (CVI) Calculation

There three important CVI indices (Yusoff, 2019)
1. I-CVI (Item level content validity index)
2. S-CVI (scale-level content validity index based on the average method)
3. S-CVI/UA (scale-level content validity index based on the universal agreement method)

According to Lynn (Lynn, 1986; Yusoff, 2019), for 7 experts, minimum acceptable CVI value is 0.83. Except questions 3, 8 and 9 in designed questionnaire, all other questions are satisfying this minimum threshold value for I-CVI. S-CVI/Ave value is 0.88 and it also satisfy the minimum threshold value of 0.83. But S-CVI/UA is 0.44 and it does not satisfy the minimum requirement.

Construct Validity

For this, Convergent validity and Discriminant validity was calculated using Spearman's rho.

Convergent Validity

Table 4 shows the results of correlation analysis for convergent validity.

Correlations			New Questionnaire	Metacognitive and Cognitive Component of MSLQ
Spearman's rho	New Questionnaire	Correlation Coefficient	1.000	.288**
		Sig. (2-tailed)	.	.000
		N	200	200
	Metacognitive and Cognitive Component of MSLQ	Correlation Coefficient	.288**	1.000
		Sig. (2-tailed)	.000	.
		N	200	200
**. Correlation is significant at the 0.01 level (2-tailed).				

Results show a significant correlation at the 0.01 level (2-tailed). Hence it can be concluded that new questionnaire shows a convergent validity with a same type of a questionnaire.

Table 4: Results for Convergent Validity

Discriminant Validity

Table 5 shows the results of correlation analysis of discriminant validity. There is no any significant correlation between the new questionnaire and test anxiety component of MSLQ. Hence it doesn't show any relationship with Test Anxiety. These results ensure the discriminant validity.

Correlations			New Questionnaire	Test Anxiety component of MSLQ
Spearman's rho	New Questionnaire	Correlation Coefficient	1.000	.085
		Sig. (2-tailed)	.	.232
		N	200	200
	Test Anxiety component of MSLQ	Correlation Coefficient	.085	1.000
		Sig. (2-tailed)	.232	.
		N	200	200

Table 5: Results of Discriminant Validity

Reliability Analysis-Cronbach's Alpha

For evaluating the reliability, internal consistency was considered. For calculating internal consistency, Cronbach's alpha was calculated using SPSS (Table 6) (Schellings et al., 2013).

Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
0.546	0.545	16

Table 6: Reliability Statistics

It seems that Cronbach's alpha (Table 6) is a low value ($0.5 < \alpha < 0.6$) and this will interpret low internal consistency in the newly designed questionnaire. The reasons for low Cronbach's alpha value should be investigated for improving the internal consistency and hence assuring that all items are measuring the same variable (metacognitive skills).

How Questionnaire was Updated for High Validity and Reliability?

If the Cronbach's alpha is applied to a scale for calculating the reliability, three assumptions should be satisfied(McNeish, 2018). They are,
1. The scale items should be continuous and normally distributed.
2. The scale should adhere tau equivalence.
3. The errors of the items do not covary.

The observed covariance (or correlations) between items forms the foundation for a major part of Cronbach's alpha (McNeish, 2018). These item covariance is calculated using Pearson Correlation Analysis (PCA). It is well known that all variables in Pearson Correlation matrices are continuous in nature (McNeish, 2018). The scale described above is a Likert type questionnaire which contains discrete values. Hence, first assumption is violated.

By checking tau equivalence, it is assured that each item on the scale contributes equally to the total scale score (McNeish, 2018). To verify tau equivalence, exploratory factor analysis is run on the scale to verify that items have same relationship to underlying construct. For the scale developed above, exploratory factor analysis was run using SPSS.

Factor Analysis

This questionnaire is designed to measure the metacognitive skills in Mathematical problem solving. Metacognitive skills are composed with three components; planning, monitoring and evaluation. Questions in the questionnaire are designed to measure these three components. The questions are organized as follows. Q1, Q2, Q3, Q4, Q5, Q6 and Q7are designed to measure planning skills, Q8, Q9, Q10, Q11 and Q12 are designed to measure monitoring skills and Q13, Q14, Q15 and Q16 are designed to measure evaluation skills. Table 7 presents the groups of questions that are initially assumed to be in three groups. Hence, it is assumed that factor analysis of this questionnaire should lie within three factors/groups.

Planning
PL1.I read the question entirely, before I start the solving process.
PL2.I select/highlight all the relevant data from the question before starting the solving process.
PL3. I summarize the question and identify the main points.
PL4. I make clear what I have to find before starting the solving process
PL5. I usually draw a sketch related to the problem, before I start the solving process.
PL6. Before I solve the problem, I estimate/think about the nature of the possible solution that I would get.
PL7. I usually design a plan (temporary) to solve the problem
Monitoring
MO1.Every time I execute the designed plan systematically to reach the answer.
MO2. I am always vigilant on the calculation process to verify that I am on the correct way to the solution.
MO3. I pay attention to avoid negligent mistakes during the solving process.
MO4. I keep an eye on the problem solving steps which helps me to verify intermediate results.
MO5. I always monitor the ongoing calculation process.
Evaluation
EV1. I check whether the final answer is acceptable and compatible with given data.
EV2. I confirm that the final answer is correct.
EV3. I refer the final answer to the problem statement and verify that the answer is acceptable.
EV4. I relate to similar problems solved earlier and reflect the accuracy of the answer.

Table 7: How questions are assumed to be in groups.

Factor analysis for above mentioned groups were conducted in SPSS. Exploratory Factor Analysis (EFA) was conducted using a principal component analysis and varimax rotation. Using EFA, items with high correlations are grouped together. Minimum factor loading was set to 0.5.

Kaiser-Meyer-Olkin Measure of Sampling Adequacy (KMO)		.559
Bartlett's Test of Sphericity	Approx. Chi-Square	230.035
	df	120
	Sig.	.000

Table 8: KMO and Bartlett's Test

Since KMO< 0.6, it indicates that it needs corrective actions (Shrestha, 2021). Bartlett's Test of Sphericity is highly significant at $p<0.001$ and it indicates that there are significant correlations among at least few variables in the matrix. It rejects the null hypothesis (H_0) that correlation matrix is an identity matrix. Since significant value is <0.05, variables are suitable for factor analysis (Shrestha, 2021).

Communality represents that the degree of variance a variable shares with all other variables being considered (Shrestha, 2021). For a sample size in between 100 and 200, communality value in between 0.5 and 0.6 is acceptable (Shrestha, 2021). Items which does not satisfy this requirement are removed. In Table 9, communality values of all 16 items in the questionnaire is represented. Question no 1 and 5 (MO1 and MO5) in Monitoring Skills group is not satisfying the criteria. Based on this, these two questions can be removed. But for further analysis, those two were kept as they are without removing in this very first step.

Table 10 demonstrates the eigenvalues and total variance. Extraction method used for factor analysis is principal component analysis. Before extraction, there were 16 factors. There are seven unique linear components in the data set with the eigenvalue > 1 after extraction and rotation. The portion of the total variance explained by a factor is indicated by its eigenvalue. The factors that have an eigenvalue greater than one are kept in factor analysis (Shrestha, 2021). The reasoning behind this rule makes sense. An eigenvalue larger than one is regarded as significant and denotes that the factor accounts for more of the common variance than the unique variance (Shrestha, 2021).

It is suggested that the retained components should account for at least 50% of the total variation. It reveals that 59.2% common variance shared by 16 variables is now sharing among seven variables. But this result is violating the initial decision of keeping all factors in three factor groups (planning, monitoring and evaluating). This is also indicated by initial KMO value (0.559) which indicated the need of corrective actions.

Table 11 represents the rotated component matrix with factor loading values for all seven factors. Factor loading values less than 0.5 are not displayed. Hence, items PL2, PL6, MO1 and MO5 does not include in any factor structure. Remaining items are scattered among seven factors and does not agree with three factor groups which was used for initial questionnaire design. Hence, factor analysis for this questionnaire is failed and it reveals the reason for low Cronbach's alpha value which created low internal consistency in the questionnaire.

Variables in this questionnaire are ordinal ("Almost never", "Sometimes", "Often") and discrete. It is recommended to use ordinal alpha for calculating internal consistency for ordinal type of data (Gadermann et al., 2012).

Communalities		
	Initial	Extraction
PL1	1.000	.527
PL2	1.000	.646
PL3	1.000	.670
PL4	1.000	.598
PL5	1.000	.578
PL6	1.000	.600
PL7	1.000	.650
MO1	1.000	.498
MO2	1.000	.543
MO3	1.000	.612
MO4	1.000	.570
MO5	1.000	.371

Table 10: Eigenvalues and Total Variance Explained

According to the results obtained in factor analysis, questionnaire was updated by removing items PL2, PL6, MO1 and MO5. Then the questionnaire was distributed to the same sample again and calculated validity and reliability. This time ordinal alpha using R software was used to calculate internal consistency. The R code for calculating ordinal alpha is below.

```
>install. packages ("psych")        #polychoric correlation for ordinal data.
>require (psych)
>install. packages ("haven")        #loading SPSS files to R
>require (haven)
>data ← read_sav ("SPSS file path") #reading SPSS data file to R
>myfile ← polychoric (data)         #calculating polychoric correlation matrix
>alpha (myfile$rho)                 #calculating ordinal alpha
```

ExtractionMethod:PrincipalComponentAnalysis.
Rotation Method: Varimax with Kaiser Normalization.

Table 11: Rotated Component Matrix

Ordinal alpha calculated for the updated (12 questions) questionnaire was 0.89 (> 0.7). Content validity (S-CVI/Ave) was increased up to 0.9 and (S-CVI/UA) up to 0.50 by elevating the validity and the reliability of the questionnaire to an accepted level. Table 12 represents the updated content validity calculation.

Discussion

Measuring metacognition is not an easy process as it involves a mental process that is not directly observable. The search for an optimum scale which measures metacognition successfully is still under discussion. Online methods, such as the Thinking Aloud Protocol (TAP), are preferred over offline methods to measure metacognition in Mathematics. (Veenman & van Cleef, 2019). But measuring metacognition using TAP is not feasible for large classes, especially in online settings. The self-report questionnaire, designed here based on Think Aloud, is suggested as a solution to practical issues in TAP. A teacher who wishes to measure metacognition in Mathematical problem-solving should share this questionnaire soon after the exercise to minimize memory loss.

	Expert 1	Expert 2	Expert 3	Expert 4	Expert 5	Expert 6	Expert 7	Experts in agreement	I-CVI	UA

Table 12: Content Validity Calculation for Updated Questionnaire

This questionnaire initially contained 16 questions, corresponding to the 15 activities suggested in systematical observations by Veenman (2019) and colleagues. Despite confirming validity (content and construct), it exhibited very low internal consistency. First, Cronbach's alpha was used to measure internal consistency. However, it was later understood that Cronbach's alpha is not recommended for a scale with ordinal values, as it is associated with continuous values. (Gadermann et al., 2012). Questions with low factor loadings, which did not contribute at the same level to measuring metacognitive skills in Mathematical problem-solving, were identified after conducting an Exploratory Factor Analysis (EFA). After removing those questions, ordinal alpha was calculated to measure internal consistency, resulting in a value of 0.89, demonstrating high reliability. The removal of these questions also increased content validity to 0.9.

Conclusion

The questionnaire designed in this paper provides a solution for measuring metacognitive skills in Mathematical problem-solving for large classes. This is a viable option for online classes with a large number of participating students, where applying TAP is not feasible due to the additional time and effort it requires. High validity and reliability of the newly designed questionnaire confirms that it is an effective and efficient scale for measuring metacognitive skills. As the next step, the intention is to study the relationship between the Think Aloud Protocol and the designed questionnaire to understand the extent to which it aligns with TAP.

Science Students' Perception of Learning Environment and Its Impact on Their Performance

Oshodi Odunola Oriyomi, Lagos State University of Education, Nigeria

Abstract

In majority of schools, primary, secondary or tertiary, Learning Environment is being presented to be made up of only the curricular activities, undermining the co-curricular and extra-curricular activities. Whereas, Learning Environment as classroom social climate is not made up of only the learning aspect of the school, but also the interaction between the students and their teachers, the teaching-learning activities of the classroom, as well as the laboratories. Hence, this study investigates some science students' perception of their learning environment and its impact on their performance. The population of the study is all science students of all Colleges of Education in three Southern States of Nigeria. Sample for the study include all 200 level students offering five chosen science subjects in a College of Education each from the three states. Learning Environment Inventory (LEI) and data obtained from school's record of students' performance were the instruments employed in the study. The finding shows that the more positive the students perceived their learning environment, the higher their performance. It is therefore recommended that learning environment instrument be used in assessing the relationship between teachers and students, as well as the environment of learning institutions.

Keywords: Students, Perception, Learning Environment, Performance

Introduction

The academic study of the school environment, commonly called institutional research, offers invaluable insights for other researchers to make objectives operational. Researchers can show significant effects, clarify relationships, and expose consequences using analytical tools. For instance, class size may correlate with teaching methods, producing significant learning outcomes (Fraser, 1998).

The learning environment is complex, encompassing more than just the interaction between students and their teachers or tutors. It includes the teaching-learning activities of the classroom and the availability of appropriate facilities, such as laboratories, and extends beyond the physical school structure to include all activities. In schools with residential students, the learning environment also includes the physical campus, classroom activities (co-curricular activities), extracurricular activities, and the activities in the hostels. This comprehensive approach ensures that all aspects of the learning environment are considered, providing a holistic view of education in Nigeria –from primary through secondary to tertiary (Nwambam et al., 2018).

Understanding the students' perspective is a crucial aspect of education research. This study explores how students in Southwestern Nigeria perceive their learning environment. We will explore their sense of cohesiveness, speed of the class, equipment availability, difficulty in understanding, and satisfaction, which are all scales on the Learning Environment Inventory (LEI) (Fraser et al., 1982) (Fraser, 1998). Furthermore, we aim to establish whether a correlation exists between the learning environment and student achievement (Goh & Khine, 2002). By doing so, we hope to provide valuable insights that can be used to enhance the learning environment and, ultimately, student achievement.

Population

The population comprises all students offering the five chosen science subjects used in the study as teaching subjects in the chosen colleges of education.

Research Design

The study was carried out in three Colleges of Education in South-West Nigeria. The institutions are of higher education and award professional certificates to their graduates after three academic sessions using the same curriculum. The certificate awarded is the National Certificate of Education (N.C.E.), which makes the graduates professional teachers. The classroom perceptive approach to the learning environment was used in the study.

Sample

This comprises six hundred and six (606) second-year students of the chosen colleges. The students chosen are those offering science subjects (Biology, Chemistry, Physics, Mathematics, and Agricultural Science) as main teaching subjects along with Education, which is the principal and compulsory subject offered by all students. The second-year students were chosen because they have been in the colleges for more than three semesters and will be able to respond better to the items on the instrument than the first-year students who, at the time of the study, have not spent two semesters in the colleges. Third-year students were excluded from the study because they were in their final examination period.

Sampling Technique

Random sampling was used to select six hundred six (606) students offering the five chosen science subjects in the three Colleges of Education.

Sources of Data:

The primary source through which data was obtained is an inventory. Each student was given an inventory to respond to; the responses were quantified to obtain scores. The score of each student in the chosen science subjects in the first-semester examination of the 2020/2021 Academic Session was also obtained for the researcher to know the students' Academic performance in the perceived learning environment.

Instrument

The instrument is an inventory of the learning environment of the students referred to as the Learning Environment Inventory (LEI). The Learning Environment Inventory (LEI) is a well-established instrument designed to measure the social climate of learning within a classroom as perceived by its students. As an expansion and improvement of Walberg's (1966) Classroom Climate Questionnaire (C.C.Q.), the LEI encompass 18 scales that capture the nature of interpersonal relationships within the class, as well as the structural characteristics of the learning environment.

However, five scales constitute the LEI used for this study. The inventory has two parts. The first part covers personal information about the students – Name, Year of Study, and Subject. The second part consists of thirty items covering the five chosen scales. The students are expected to read each item and respond to each by putting a tick (✓) under the chosen option on the four-point scale to show the extent of their agreement or disagreement with each item. Six items were written for each scale for a consistent internal rating.

The scales are:

Cohesiveness: It is the intimacy that develops when several individuals interact for some time and separate group members from non-members.

Speed: This is the class's progress rate and tells how well the teacher can communicate with and adapt to the group's needs.

Equipment: These are learning materials available and provided during the teaching-learning process.

Difficulty: Difficulty in understanding shows how each student feels that he is learning in terms of ease, effect requirement, skill, or ability about the students.

Satisfaction: This shows whether students like or dislike the science subject they are offering, the teacher, classmates, or the class as a whole. Some of the items on these scales were modified, making the instrument an adapted form of the original LEI developed by Walberg & Anderson in 1968, which was revised in 1969.

Data Analysis

The data reported is based on a 1 to 4 score for each item. Strongly disagree is scored 1, disagree is scored 2, agree is scored 3, strongly agree is scored 4. Each student's score on any scale is based on adding scores for each item in the scale. Since each scale consists of six items, the range of scores on a scale is 6 to 24.

Krippendorff's (2011) alpha reliability shows the extent to which an individual respondent responds similarly to each item on the scale, that is, the internal consistency of each scale.

Table 1: Scale Reliability

Scale	Reliability (Co-efficient)
Cohesiveness	0.51
Speed	0.10
Equipment	0.41
Difficulty	0.44
Satisfaction	0.70

To describe the responses of students in each class offering the same subject to each scale, the percentage of low and high responses for each scale in each class was calculated and shown in the following tables.

Table 2: Frequency percentage of low and high responses for cohesiveness scale

Class	Low	High
Physics	-	100
Chemistry	-	100
Biology	-	100
Mathematics	5.9	94.1
Agricultural Science	10.4	89.6

All the respondents (students) in the Physics, Chemistry, and Biology classes had total scores of responses ranging from 13 to 24, which shows that all the respondents agree with the items on the scale. 5.9 and 10.4 percent had total scores for responses ranging from 1 to 12 in Mathematics and Agricultural Science classes, respectively. These two figures are the percentage of respondents who disagree with the scale items.

Table 3: Frequency percentage of low and high responses for speed scale

Subject	Low	High
Physics	19.0	81.0
Chemistry	12.0	87.9
Biology	38.9	61.1
Mathematics	11.3	88.7
Agricultural Science	6.5	93.5

In all classes, a minimum of 6.5 percent and a maximum of 38.9 percent of respondents having total scores ranging from 1 to 12 were recorded. These show the lowest and highest percentages of students who disagree with the speed scale items, which were recorded in Agricultural Science and Biology classes, respectively.

Table 4: Frequency percentage of low and high responses for equipment scale

Subject	Low	High
Physics`	76.2	23.8
Chemistry	57.6	42.4
Biology	44.4	55.6
Mathematics	62.7	37.3
Agricultural Science	64.9	35.1

Only the Biology class has less than 50 percent of the total respondents having total scores ranging from 1 to 12; all others have the majority of the respondents scoring low on the LEI scale. This shows that the science classes could be better equipped by the respondents. The respondents may usually be only allowed to use or come in contact with the equipment on their own in Biology classes, where a proportion of over 50% responded highly to the equipment scale.

Table 5: Frequency Percentage of low and high responses for difficulty scale

Class	Low	High
Physics	9.5	90.5
Chemistry	12.1	87.9
Biology	33.3	66.7
Mathematics	7.5	92.5
Agricultural Science	25.0	75.0

The biology class recorded the highest number of respondents having low total responses on this scale. This shows that 33.3 percent of the total respondents in the biology class disagree with items on the scale. This class was followed by the Agricultural Science class, with 25 percent of the respondents disagreeing with items on the scale. Most students in the remaining three classes agree with items on the difficulty scale.

Table 6: Frequency percentage of low and high responses for satisfaction scale

Class	Low	High
Physics	14.3	85.7
Chemistry	6.1	93.9
Biology	Nill	100
Mathematics	11.5	88.5
Agricultural Science	7.9	92.1

All the respondents in the Biology class had high total scores for responses on the satisfaction scale, which is a total score between 13 and 24. This shows that they all agree with the items on the scale, and most of the respondents in the other classes also agree with the items on the scale.

For all the scales, a more significant percentage of the respondents responded highly to each subject except for the equipment scale.

As a measure of item validity, each item was correlated with the scale to which it belongs using the total number of respondents (606). The coefficient values shown in Table 7 were obtained for the items on the LEI scale used.

Table 7: Correlation of Items with scales

Item	Correlation value
1.	0.34
2.	0.53
3.	0.33
4.	0.54
5.	0.66
6.	0.58
7.	0.45
8.	0.40
9.	0.61
10.	0.61
11.	0.55
12.	0.53
13.	0.37
14.	0.16
15.	0.58
16.	0.51
17.	0.32
18.	0.49
19.	0.48
20.	0.44
21.	0.53
22.	0.29
23.	0.30
24.	0.34
25.	0.68
26.	0.48
27.	0.30
28.	0.41
29.	0.42
30.	0.32

The validity of an item is the extent to which the interpreted results of a test is warranted, the extent to which it fits the scale on which the item is put Kimberlin & Winterstein (2008).

One item on the difficulty scale just slightly measures what it is expected to measure (item with correlation value of 0.16). Two items on the cohesiveness and satisfaction scales have low correlation values, three items on equipments and difficulty scales have low correlation values. All other items on the LEI scales have been shown to measure what they are supposed to measure substantially.

Table 8: Number of respondents used for each subject

Subject	Number of respondents
Physics	63
Chemistry	96
Biology	54
Mathematics	162
Agricultural Science	231
Total	606

Raw scores were obtained for each student in each class being used in the study in three courses taken in the first-semester examination of the 2020/2021 Academic Session. Two courses carry three credits each, and the third carries two credits. The weighted means of the scores were then calculated for each student by multiplying the raw score obtained by the students in the various courses by the number of credits each course carries. All these figures were added and divided by 8, the total number of credits for the three courses. This resulted in the weighted mean for each student in the subject.

To know the mean achievement score of all the students in each subject used for the study, the weighted means of all the students in each subject were added and divided by the total number of respondents. The mean achievement score and standard deviation values for each class are shown in Table 9.

Table 9: Mean Achievement and Standard Deviation Values for subjects

Subject	Mean Achievement Score	Standard Deviation
Physics	48.43	7.22
Chemistry	56.84	7.64
Biology	52.56	8.18
Mathematics	40.32	13.63
Agricultural Science	58.44	9.68

The standard deviation shows the amount of variability of all the scores in a distribution (sample in this study). Relating the sample sizes to the mean achievement scores obtained, it can be said that the smaller the sample size, the higher the achievement and the lower the variability among scores though this has been proved otherwise by the mean achievement score in Agricultural Science sample. However, the mathematics sample proves that the lower the mean achievement score, the higher the variability among students scores in the class.

Taking a mean achievement score of 40 as the pass mark, it will be observed that the mathematics class has the least mean achievement score of 40.32 which is just a little above pass mark chosen though the mathematics sample is not the largest sample.

Four null hypotheses were tested in the study and they are stated below:
1. There will be no significant relationship between cohesiveness and the performance of science students.
2. There will be no significant relationship between speed of the class and the performance of science students.
3. There will be no significant relationship between difficulty in understanding and the performance of science students.

4. No significant relationship will exist between satisfaction and performance of science students.

Table 10: Observed values of scale correlated with achievement scores

Scale	Observed
Cohesiveness	0.163
Speed	0.195
Difficulty	0.325
Satisfaction	0.865

An alpha (α) level of 0.01 r should be 0.0972 to be significant. All observed r values were more outstanding than 0.0972; thus, all the null hypotheses were rejected.

The alternative hypotheses were accepted that a significant relationship exists between the scales and achievement scores. This means that the scales show a pattern of relationship with achievement.

The difficulty scale also gives this type of meaning to its relationship pattern with achievement, which is only sometimes the case in a practical sense.

Finding of the Study

The reliability values obtained using coefficient alpha 8 ranged from 0.1 to 0.7, the highest being the satisfaction scale and the lowest the speed scale. These values show the extent of internal consistency of the scales on the LEI used.

The students' responses to each of the scales in the LEI showed that a more significant percentage of the students responded highly to the scales for each subject except for the equipment scale. This means that the students' learning environment agreed with the items describing the environment on the other four scales of LEI used. In contrast, the environment needs more equipment, or students are usually not allowed to come in contact with the instruments alone.

In biology alone, over 50% of the respondents agree with equipment availability for students. Respondents to all the scales in all other subjects disagreed with equipment availability, thus agreeing with the unavailability of equipment for the subject.

Most items in the LEI used were found to be valid. There are a few cases where the correlation values obtained from the correlation of each item with the scale it belongs to are low, indicating low validity of the items.

It was also found that there was a significant relationship between the cohesiveness, speed, difficulty, and satisfaction scales with the students' achievement.

The scales were identified as independent variables, while achievements were identified as the dependent variable.

Conclusion

The perceptual approach that entails recording or reporting by an individual with direct experience with the environmental situation over time will enable an individual to give a better and more reliable report/judgment of the environment he is describing. The use of the Learning Environment Inventory LEI in assessing class environments has undoubtedly contributed to the perceptual approach to measuring the classroom climate.

Recommendations

- Learning environment instruments should be used in assessing the relationship between teachers and students since this also affects students' academic performance. The findings will provide teachers feedback on improving relationships with students for higher academic performance.

- Instruments for measuring the environment of learning institutions should be used in institutions of learning and the various fields of learning. The findings will point out defects in the institution's programs and administration patterns, and improvement methods can be suggested.

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

The aims of this research were 1) The integration of project-based learning to enhance knowledge and creative thinking skills; 2) Comparative assessment of students' learning progress through the utilization of project-based learning; 3) Examination of the capacity for creative output via project-based endeavors; and 4) Student satisfaction regarding project-centered learning management. The study involves 14 students enrolled in Pre-Engineering curriculum. The instruments utilized in this study encompass the instructional activity arrangement plan, assessments measuring learning and creative output capabilities, and satisfaction surveys. Statistical employed comprise mean values, standard deviations, and independent paired t-tests.

The study results reveal that:

1. The project-based learning activities led to significant gains in knowledge, understanding, and learning skills. Students were able to apply their learning collaboratively and bridge existing knowledge with new insights. Additionally, they demonstrated the ability to develop their own projects, evaluate group outcomes, and take pride in their achievements. The overall average value for this aspect was 3.90.

2. The statistical analysis revealed a significant improvement in post-learning progress compared to pre-learning at a significance level of 0.01.

3. The ability to create innovative works through collaborative project-based learning across various activities showed an overall increase. This was assessed based on four aspects: Ability, Creative Ideation, Application of Ideas and Knowledge, and Appreciation. The overall average value for this aspect was 3.59.

4. Students expressed high satisfaction towards project-based learning, both in terms of learning activity organization and the educational benefits. The overall average value for this aspect was 4.26.

The International Academic Forum
www.iafor.org

Introduction

The Technology Foundation Science Laboratory Classroom under the supervision of the University (TU) represents an extension of collaborative efforts from a pilot program in vocational technology education management at the technical college level (Collaborative Learning Program between Lanna Rajamangala University of Technology and San Kamphaeng Technical College). This initiative transpired between the academic years 2018-2020 in Diploma of Mechatronic and a collaborative educational prototype development project based on technology has been jointly undertaken by Lanna Rajamangala University of Technology Lanna and the Office of the National Science, Technology and Innovation Policy Commission, encompassing an educational framework for a 3-year vocational certificate and/or a 2-year advanced vocational certificate, followed by a 4-year bachelor's degree. The jointly organized educational programs adhere to the central vocational certificate curriculum set by the Office of Vocational Education Commission. The educational approach follows the format of a continuous education system, encompassing the foundation vocational certificate level, higher vocational certificate level, and subsequently the bachelor's degree level. This framework is modeled after the Advanced Technology Preparatory School, Technical College, and Institute of Technology of Lanna Rajamangala University of Technology. This university-affiliated institution serves as a regular school and designates master's degree students as mentor teachers, who are responsible for student well-being, learning support, and project advising for vocational certificate students. Moreover, university and college faculty participate in teaching and knowledge dissemination in collaboration with industry professionals. This program also focuses on imparting fundamental practical skills to meet industrial standards. The curriculum is emphasis on integrating academic and practical knowledge which derived from industrial context that aims to cultivate student attributes congruent with pursuing further studies in advanced vocational technology education. From the reason above, graduates can pursue two educational aspects: 1) The productivity students are able to study in advanced vocational certificate program. 2) The students who have aptitude in ideation, design, and product development will be cultivated into innovative professionals.

The Office of National Economics and Social Development (2016) emphasizes that both the present society and the future are significantly influenced by science, as science pertains to the daily lives and professions of individuals. Various tools, products, and conveniences utilized for living and working which are the combination of scientific knowledge, creative thinking and other disciplines. Scientific knowledge provides human cognitive development, including causal and creative thinking, analytical thinking, critical evaluation, and skills crucial for systematic inquiry and comprehensive problem-solving. Moreover, the development of the labor market skills and life skills in the 21st century which is essential for individuals of all age groups. For instance, children, adolescents, and young adults need to have skills such as systemic analytical thinking and creative thinking, while also emphasizing preparedness for the skill development in various domains, work skills, and the ability for entering in the labor market, this is accordance with the ideas of Pacharee, Nakphong, Siriwan, Wanichawattanaworachai, Rujiraporn, Rammasiri, and Montchai Pongsakornnaruewong (2021). In the context of science education, it is imperative to foster the following qualities among the modern Thais: 1) effective communication skills, analytical thinking, problem-solving abilities, and creative thinking; 2) self-learning propensity, an inclination towards reading, and a lifelong commitment to learning, as demonstrated by the findings of Rewadee, Namthongdee (2015), which indicated that the labor requirements of employers and organizations with a transformation in 2014 by the organization for economic

cooperation and development (OECD) analysis presented that the most anticipated skills for employers in the new organizational era are analytical and creative thinking skills.

Based on the evaluation of the assessment of students' skills at the international level conducted by the Organization for Economic Cooperation and Development (OECD: PISA, 2018), it is presented that the evaluation of the aptitude of 15-year-old students in terms of knowledge application and essential competencies for real-life challenges, consisting of three aspects: reading, mathematics, and science. This assessment emphasizes analytical thinking and interpretation. The PISA 2020 assessment reported the performance of Thailand in the international arena, ranking 68th in reading, 59th in mathematics, and 55th in science in 2018. In the Asian-Pacific region, Thailand only surpassed Indonesia and the Philippines, with around 60% of students scoring below the minimum of proficiency level in reading, 53% scoring below the basic proficiency level in mathematics, and 44% scoring below the baseline proficiency level in science. This result indicates a declining proficiency in reading and also decrease continuously in scores of both mathematics and science for Thai students. This correlates with resource allocation and education development investment in various Thai schools.

From the problems mentioned above, the researchers intend to implement for problem resolving by organizing learning activities using project-based learning that integrate the disciplines of science, technology, engineering, and mathematics (STEM). These four competencies are essential for children and youth in contemporary and future societies as they foster experiential learning and practical engagement, nurturing analytical and creative thinking for problem-solving. This approach diverges from traditional methods that emphasize on memorization rather than practical application. Learning through project-based approaches encourages students to engage in hands-on experimentation and emphasizes the development of creative and analytical thinking skills. This correspond with the perspective of Israsena Na Ayudhya (2018), who proposes that design thinking must be practiced to truly understand. The main goal is to focus on fostering an understanding of design thinking through experiential learning, comparing outcomes derived from employing different tools or methods.

Then, summarized the content including the actual working method and illustrative examples. The purpose of organizing learning through project-based approaches is to enhance thinking and learning processes via practical engagement, instilling an appreciation of science, technology, engineering, and mathematics (STEM) education, and recognizing their applicability in daily life, as presented by Porntip Siripattrachai (2013). This approach characterized by project-based learning that is not only emphasized on content memorization of scientific and mathematical but also to understand the theories or laws via practical implementation with skill development in critical thinking, questioning, problem-solving, information retrieval, and analysis of discovered findings. Furthermore, students have the opportunities for problem analysis and innovation design for problem solving. Students are also recognize their weaknesses or limitations which this process enables them to successfully achieve their objectives and facilitates effective communication. It reflects their progress and accomplishments that demonstrated via the presentations and their contributions to enhancing problem-solving processes in subsequent endeavors.

From the circumstances and reasons outlined above, the research team aims to develop teaching and learning methodologies to enhance creative thinking skills via project-based learning for first-year preparatory engineering students at Rajamangala University of

Technology Lanna, Chiang Rai. This research focus on students' ability to create and develop knowledge via hands-on practice rather than content memorization. Moreover, students are encouraged to apply the knowledge in their daily lives with Re-Skilling, Up-Skilling for technological advancements and the changing era that leads to a transformative learning process which prepare the students for industry labor market.

Research Objectives

1. To integrate teaching and learning for enhancing knowledge and creative thinking skills via project-based learning.
2. To compare the progress of student learning outcomes via project-based learning.
3. To assess creative ability via the organization of learning activities based on projects.
4. To investigate student satisfaction to project-based learning.

Research Framework

The study investigates the creative capabilities within the framework of project-based learning for students of the vocational certificate program in engineering preparation. The relationships between independent and dependent variables are depicted in the following Figure 1.

Project-based learning management based on integrated learning activities	**Outcomes of project-based learning management, integrated learning activities**
Step 1 Determine the topic of study. **Step 2 Research and Collect information** **Step 3 Plan the project** **Step 4 Act according to the plan** **Step 5 Summary and discussion** **Step 6 Presentation and evaluation**	**1. The results of the integration of project-based learning management** **2. the ability to create works based on integrated learning activities** **3. The student's satisfaction towards the project-based learning management with the concept of integrating learning activities.**

Figure 1: Depicting the relationship between independent and dependent variables

Benefits Derived From the Research

1. The learning outcomes which create the collaborative learning between instructors and students by stimulating the students' self-learning.
2. The study enables students to transfer knowledge to new experiences.
3. The research generates learning for developmental outputs through systematic and continuous thinking and analysis.
4. The study provides experiential learning via the scientific methodological learning process.
5. The research engenders effective learning via students' collaborative work that achieved by analyzing, interpreting, and accepting the perspectives of others.

Research Methodology

This research employs a combination of research methods and pre-experimental research design in the form of the One-Group Pretest-Posttest Design, and quantitative research. The aim is to integrate learning and enhance creative thinking and knowledge using project-based learning, it also figures out the satisfaction to learning activities involving project-based learning.

Population

The population consists of 14 students enrolled in the first semester of the vocational certificate program in engineering preparation for the academic year 2023.

Research Instruments

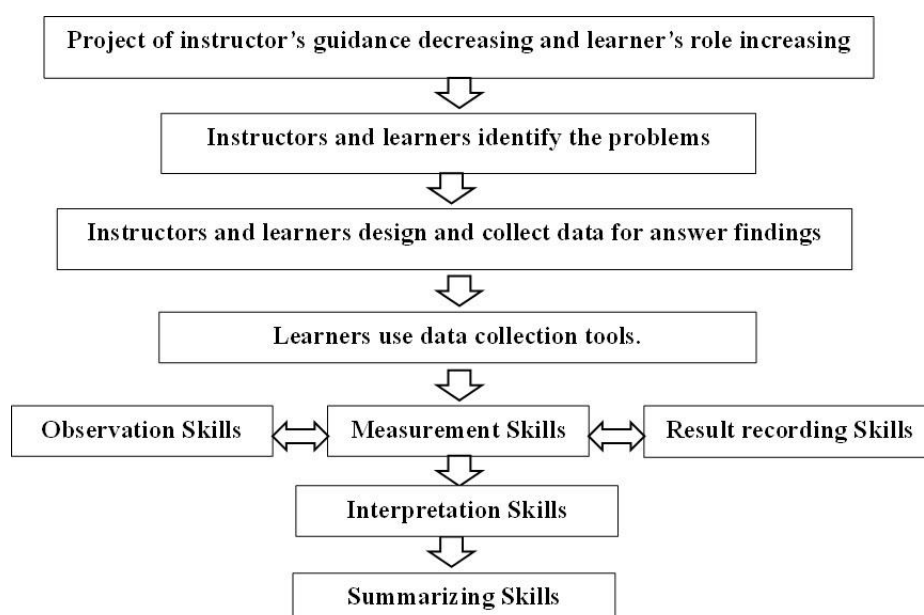
The research instruments for data collection are as follows:
1. Five learning activities integrated with the project-based learning which are:
    1.1 Ice Cream Stick Bridge
    1.2 Robotic Arm
    1.3 MBOT
    1.4 Application of Robotics and Automation Systems in CNC Machining
    1.5 Controlling Light via Smartphone, which serves as extracurricular activities as curriculum supplementing. The instructors have less role in guidance while assign more roles for the students, as shown in Figure 2.
2. Assessment questionnaire for measuring the level of creative abilities via project-based learning activities.
3. Progress assessment test for measuring learning progress via project-based learning activities.
4. Satisfaction survey questionnaire for measuring student satisfaction with learning activities that integrate project-based learning with learning integration concepts.


Figure 2: Project-based learning approach decreasing, Student's Role increasing

Steps for Developing Research Instruments

1. Literature Review and Research Exploration: Conduct a review of relevant literature, documents, and research related to organizing learning activities using project-based learning and integrating learning integration concepts. This is used for creative output and the evaluation process.

2. Development of Learning Activity Plan: Develop a learning activity plan by using project-based learning with learning integration concepts. This plan comprises of 24 class sessions.

3. Development of Creative Abilities Measurement Instrument: Design a measurement instrument for creative abilities based on learning activities that integrate project-based learning and learning integration concepts. This measurement assesses creative output across four aspects: 1) Project Execution Skills, 2) Innovative and Creative Thinking, 3) Application of Concepts and Knowledge in Relevant Sciences, and 4) Appreciation and Pride for individual and Group Achievements. This measurement employs a 5-point Likert scale, including "Very High," "High," "Moderate," "Low," and "Very Low."

4. Creation of Learning Outcome Assessment Test: Create a pre-test and post-test assessment test for learning outcomes of the organized learning activities using project-based learning. This multiple-choice test consists of 30 questions. Scoring criteria are set as follows: 1 point for a correct answer and 0 points for an incorrect answer.

5. Development of Satisfaction Survey Questionnaire: Develop a questionnaire to measure student satisfaction with the learning activities based on project-based learning used in this research. The researcher designs a closed-ended questionnaire using a 5-level evaluation scale:
     5: Very Satisfied
     4: Satisfied
     3: Moderately Satisfied
     2: Less Satisfied
     1: Not Satisfied

For the interpretation of the satisfaction score meaning regarding student satisfaction with learning activities based on project-based learning, the scores are interpreted as follows:
     4.50 – 5.00: Very Satisfied
     3.50 – 4.49: Satisfied
     2.50 – 3.49: Moderately Satisfied
     1.50 – 2.49: Somewhat Satisfied
     1.00 – 1.49: Not Satisfied

Quality Verification of Research Instruments

Research instruments comprising diverse data collection in this study. These instruments spanned the spectrum of learning activity organization utilizing project-based learning as a foundation. These instruments were:
     1. A measure of integrative creative thinking skills in project execution.
     2. A measure of creative output abilities.

3. A pre- and post-test assessment of learning outcomes based on project-based learning.
4. A satisfaction questionnaire regarding the learning activities for project-based learning.

The verification process involved three specialized experts: 1) innovation and invention development, 2) content and learning activity organization, and 3) assessment and educational evaluation. This panel of experts assessed the content validity and completeness of the instruments. The instruments' appropriateness was established by determining the Index of Congruence (IOC) falling between 0.65 and 1.00, alongside determining the level of difficulty ranging from 0.20 to 0.80 and the discrimination power more than 0.20. Furthermore, the instruments' reliability was established using the Cronbach's Alpha Coefficient, resulting in a reliability of 0.89.

These research instruments were tested with a non-sample group of 20 students from the Professional Certificate in Engineering Preparation Course under the Education Equitable Fund (EEF). The data collected from this preliminary testing was refined based on expert feedback and adjustments, culminating in the development of an authentic research instrument. This refined instrument will be employed with the actual target group.

Data Collection

1. Pre-experiment Stage: During this stage, the research team prepared various aspects, including:
1.1 Creation of research instruments.
1.2 Conducting orientation to introduce the learning approach based on project-based learning.
1.3 Administering a pre-test assessment of learning outcomes before implementing the learning activities, involving 5 activities with 30 multiple-choice questions to measure fundamental knowledge.

2. Experiment Stage: The research team implemented the learning activity plan utilizing project-based learning over 12 weeks, with two 60-minute sessions per week, totaling 24 sessions, for the target group of students.

3. Post-Experiment:

3.1 Post-Experiment Data Collection:

Post-experiment data was collected by using a post-test assessment of learning outcomes that related to learning activities of project-based learning. The assessment included 5 learning activities with 30 multiple-choice questions. Then, the test results were analyzed, and the differences in scores before and after the experiment were calculated.

3.2 Student Satisfaction Questionnaire:

Students were asked to complete a satisfaction questionnaire regarding their experience with the learning activities based on project-based learning. This questionnaire was used for research data analysis.

Research Data Analysis

The process of analyzing research data includes the following steps:

1. Analyzing Learning Outcomes:

Data analysis was conducted to study learning outcomes based on learning activities utilizing project-based learning. Pre- and post-test assessments were performed, and the results were used to calculate means, standard deviations, and a dependent samples t-test.

2. Analyzing Creative Abilities and Integration:

Data analysis was conducted to assess creative abilities and integration in accordance with the learning activity organization approach based on project-based learning. This analysis was conducted based on the mean and standard deviation of the results obtained from learning activities.

3. Analyzing Student Satisfaction:

Data analysis was carried out to measure student satisfaction with the learning activities organized using project-based learning. This involved calculating the mean and standard deviation of the results obtained from the satisfaction questionnaire.

Research Results

1. Integration of Teaching and Learning

The study focused on enhancing knowledge, creative thinking skills, and practical abilities via learning activities based on project-based learning. Topics included wooden bridge construction, ice cream making, robotic arms (MBOT), applying robotics, and automated systems in Computer Numerical Control (CNC) and remote control of lighting. The results indicated that students possessed knowledge, understanding, and learning skills that could be applied and transferred, facilitating the integration of prior and new knowledge and experience. See Table 1 for details.

Items	integrated learning ability	μ	σ	level learning progress
1	Cognitive	3.42	0.58	moderate
2	Thinking and analytical skills	3.60	0.55	high
3	Operational and integration skills	3.78	0.50	high
4	Communication skills	3.90	0.44	high
5	Applying and knowledge and practice linking	3.80	0.47	high
Average all aspects		**3.90**	**0.94**	**high**

Table 1: Integration of teaching and learning to promote knowledge creativity and work skills according to learning activities

2. Comparative Learning Outcomes

Comparative analysis of student learning outcomes was conducted by employing project-based learning in combination with various learning activities, such as wooden bridge construction, ice cream making, robotic arms (MBOT), applying robotics, automated systems in CNC, and remote control of lighting. Statistical analysis showed significant improvement in learning outcomes at a significance level of .01. Refer to Table 2 for specifics.

Learning outcomes	No. of students	Total score	μ	σ	t	p
Pretest	14	30	15.50	2.17	13.00	.00
Posttest	14	30	26.78	1.92		

$\rho \leq .01$

Table 2: Comparison of student learning outcomes using project-based learning management

3. Creative Abilities Enhancement

The enhancement of creative abilities via project-based learning integrated with learning concepts. The topics are wooden bridge construction, ice cream making, robotic arms (MBOT), applying robotics, automated systems in CNC, and remote control of lighting, was evaluated in four aspects: 1) project execution skills, 2) creative thinking, 3) application of ideas and knowledge in related disciplines, and 4) recognition and pride in group and individual accomplishments. Results showed overall improvement in creative abilities in all dimensions. See Table 3 for details.

The ability of creative learning activities	Assessment result		Progress difference	Skill level
	pretest μ	posttest μ	μ	
1. The ability to do projects	1.14	3.64	2.50	progressive
2. Creativity	1.50	3.57	2.07	progressive
3. Applying concepts and knowledge to relevant studies	1.21	3.21	2.00	progressive
4. Appreciation and pride of group and individual work	1.50	3.93	2.43	progressive
Average of all aspects	**1.33**	**3.59**	**2.25**	**progressive**

Table 3: Creative abilities using project-based learning management

4. Student Satisfaction

Student satisfaction regarding learning activity organization and perceived benefits of project-based learning was found to be high overall. This satisfaction encompassed both the learning activity structure and the benefits derived from the learning process. Refer to Table 4 for more information.

Items	Assessment Items	μ	σ	Level satisfaction
1	Learning activities	4.13	0.47	high
2	Benefits of learning management	4.40	0.54	high
Total average		4.26	0.46	high

Table 4: Student satisfaction towards project-based learning management

Conclusion

The usage of project-based learning as a foundation stimulates learners' potentials in knowledge acquisition, critical thinking, collaborative teamwork, and practical skills development. This approach involves engaging learners in scientific method to develop knowledge, thinking processes, and effective teamwork skills, leading to the creation of high-quality outcomes. This process also entails systematic self-monitoring and evaluation of progress at both individual and group levels. Therefore, teaching via project-based learning encourages observation, questioning, hypothesis formulation, and self-directed knowledge seeking, enabling students to answer their own inquiries, consolidate their learning outcomes, and comprehend their discoveries.

Project-based teaching methods can be integrated within or beyond regular class hours, adaptable to both individual and group settings. If aligned with specific subjects or content, it's referred to as a subject-based project, such as projects in Science or Mathematics. This is the concept of Nattaya Sareeto (2022), proposing that project-based learning, which involves experiential learning through investigation, empowers students to explore, leading to holistic solutions. This approach encourages systematic problem-solving, planning, and various levels of thinking, all facilitated by teachers who inspire, guide, and closely advise students throughout the learning process – from topic selection, data gathering, project planning, execution, to application.

Project-based teaching helps develop learners in terms of knowledge and attributes by involving them in activities that entail investigation, problem-solving, and real-world application of knowledge. This cultivates creative thinking and continuous development. Learners engage in genuine pursuits driven by their interests and aptitudes, leading to innovative outcomes derived from their learning experiences. Furthermore, they bridge learning experiences to novel creations and experiences, fostering personal pride and value recognition in their work. This aligns with the views of Pakawat Kwankaew et al. (2016), suggesting that project-based learning nurtures creativity and encourages learners to innovate, connecting learning to new experiences and creations.

Recommendations for Future Research

1. Research should focus on establishing a comprehensive link between various fields of knowledge through continuous interdisciplinary integration.
2. Short-term professional development courses centered based on project-based learning should be designed for all educational levels to cultivate teamwork, skills, thinking processes, and collaborative work.
3. Further studies should investigate the implementation of project-based learning in different subjects, enhancing analytical and critical thinking skills.
4. Research should focus on developing teaching methodologies that emphasize practical application across all levels and disciplines within universities.

Attitudes and Preferences of Nursing Undergraduates Towards Working Abroad: A Cross-Sectional Study in Vietnam

Hoang-Nam Tran, Tokushima University, Japan
The-Diep Nguyen, Thai Binh University of Medicine and Pharmacy, Vietnam
Thi-Hong Nguyen, Thai Binh University of Medicine and Pharmacy, Vietnam
Ngoc-Quang Phan, Thai Binh University of Medicine and Pharmacy, Vietnam

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This cross-sectional study investigates the attitudes of undergraduate nursing students in Vietnam towards international study and work opportunities, as well as the factors influencing their preferences. Data was collected through a web-survey questionnaire in April 2023, targeting students from a university in Vietnam, including participants in the Japanese language special program and regular program. The study findings emphasize the significance of international experiences, particularly in enhancing communication and cross-cultural skills, fostering personal development, and improving career prospects for nursing undergraduates. Moreover, students in the special program revealed distinct preferences when considering their ideal destinations for studying or working abroad. They placed a greater emphasis on factors like a clean and beautiful living environment, long-term job prospects, and festivities. Additionally, for those interested in pursuing postgraduate study abroad, the students favored universities that offered job hunting support, tuition exemption, and modern infrastructure. This study sheds light on the attitudes and preferences of Vietnamese undergraduate nursing students towards international study and work opportunities, highlighting the importance of such experiences for personal growth and career advancement in the nursing profession. The findings carry practical implications for educational institutions and policymakers, emphasizing the need to design programs that cater to the unique needs and preferences of nursing students seeking international opportunities.

Keywords: Nursing Undergraduates, Study Abroad, Preference, Work Abroad

iafor

The International Academic Forum
www.iafor.org

Introduction

The globalization of education and the job market has opened up new possibilities for undergraduates, especially from developing nations, seeking to explore the international landscape (Tran & Jin, 2021a). The decision to study or work abroad is a complex and multifaceted one, influenced by a myriad of factors, including personal aspirations, family expectations, financial considerations, and the perceived benefits of such experiences (Fakunle, 2021; Hung & Yen, 2020). In an increasingly interconnected world, the importance of international experiences in shaping individuals' personal and professional growth has become evident. The pursuit of study abroad (Salisbury et al., 2009) and work abroad has garnered considerable attention as a means to acquire valuable skills, foster cross-cultural competencies, and broaden horizons.

In the field of nursing, nurse migration is a phenomenon. It is common to observer many nurses migrate from Asian countries (Lorenzo et al., 2007), African countries (Clemens & Pettersson, 2008), to more developed countries. Programs such as EPA are being implemented in Japan to attract foreign nurses so far with some limited outcomes (Lan, 2018), or even disadvantaged for the future of the returnees (Kurniati et al., 2017). Language training and supporting policies are proven to be essential for the successful career of the candidates to be established (Otomo, 2022).

The genesis of this research stems from a noticeable literature gap regarding the attitudes and preferences of undergraduate nursing students in Vietnam toward international study and work prospects. Before engaging in this study, we investigated the concept of study and the intention to work in Japan in different circumstances. In previous papers, we had reported on the situation of Japanese language education in Vietnam (Tran, 2019; Tran & Jin, 2021a), studying in Japan (Tran, 2023; Tran & Jin, 2021b, 2022), and the decision to enroll in the degree programs in Japanese studies (Tran et al., 2023).

Figure 1 shows the conceptual framework proposed by the authors based on literature and previous research. Studies have shown that students who have the intention to work abroad, especially those from developing countries, usually choose study abroad as a mediating step to finding work abroad (Baruch et al., 2007). However, in some cases, undergraduates enrolled in specific programs may go for work abroad directly, such as in the field of nursing and caregiving (Ohno, 2012; Ortiga, 2014).
Figure 1. Conceptual framework proposed by the author.

This study is conducted in the context of a university in Vietnam specializing in healthcare (TBUMP, 2023). A foreign language is a mandatory subject in the curriculum. The special Japanese program was established for students who were willing to learn Japanese with the possibility of working in Japan after graduation if they could pass the Japanese language

requirements. Students are required to study English if they are not enrolled in a special program. This study aims to investigate the attitudes of Vietnamese undergraduate nursing students towards studying and working abroad, characteristics of the intended place to go, and the factors which may have influence on the attitude and intention to go abroad.

Methodology

This study employed a cross-sectional research design to investigate the attitudes of undergraduate students towards studying and working abroad. The target population were undergraduate nursing students at TBUMP. Data was collected in April 2023 through a web-survey questionnaire. The web-survey questionnaire was structured to obtain information in several key areas: Demographic information; Attitudes towards study and work abroad: general attitudes towards studying and working abroad, including desired duration of staying abroad; Preferred destination attributes. The questionnaire used five-level Likert-style questions from 1 to 5, where 1 stands for strongly disagree, 2 for disagree, 3 for neutral, 4 for agree, and 5 for strongly agree. The data were analyzed using IBM SPSS Statistics. Participants were provided with information about the study's purpose, their voluntary participation, and the confidentiality and anonymity of their responses.

Results

There were 147 respondents participating in the study. All participants were undergraduate students at a university in Vietnam, majoring in nursing, and were unmarried. The individual demographic characteristics (6 items). The average age of the students is 20.05 years, with a standard deviation of 1.43. Among the students, 91.2% are female, and 8.8% are male. The students are distributed across different academic years: 1st year 37.4%, 2nd year 26.5%, 3rd year 21.8%, 4th year 14.3%. There are international students (10.9%) and local students (89.1%). The students live in dormitory 21.1%, rental room 63.3%, and own home 15.6%. A third of the respondents were living alone (36.7%), while 48.3% were living with roommates, and 15.0% were living with family. The distribution of participants' family characteristics (4 items) is shown in Table 1.

Table 1. Family characteristics of participants.

Variable	Value	Total	
		n	*%*
Parents' highest education level	High school and below	122	83.0
	Undergraduate	25	17.0
Study abroad experience of family members	In Japan	19	12.9
	Not in Japan	5	3.4
	None	123	83.7
Hometown	Capital	5	3.4
	Provincial city	37	25.2
	Other	105	71.4
Perceived family income	High	2	1.4
	Mid	97	66.0
	Low	48	32.7

Table 2 shows the perceived importance of study abroad experiences in five categories: communication skills, cross-cultural competency, personal development, future income, and future career. The mean scores for each category indicate that communication skills and

cross-cultural competency are considered the most important aspects, with mean ratings of 3.70 and 3.64, respectively. Personal development follows closely with a mean rating of 3.54. Future income and Future career are perceived as relatively less important, with mean ratings of 3.40 and 3.22, respectively.

Table 2. Perceived importance of study abroad.

Important for	Mean	Median	Mode	SD
Communication skills	3.70	4.00	4	0.96
Cross-cultural competency	3.64	4.00	4	0.91
Personal development	3.54	4.00	4	0.90
Future income	3.40	3.00	3	0.96
Future career	3.22	3.00	3	0.89

Figure 2 shows over two thirds of the respondents reported a desire to work abroad for a maximum of five years, while only 8% wanted to work longer than 10 years.
Figure 2. Duration wanted to work abroad.

Table 3 shows the location preferences for studying or working abroad. The results suggest that students generally have stronger preferences for locations with attributes such as beautiful and clean mature environments, potential long-term job opportunities, local festivals, plenty of part-time job options, tourist spots, a low cost of living in suburban areas, and friendly rural settings compared to regular students. Preference for locations with plenty of compatriots, relatives or friends were not very high.

Table 3. Location of preference for studying or working abroad.

Feature	Mean	Median	Mode	SD
Beautiful and clean nature	3.71	4	4	0.88
Potential long-term job	3.62	4	4	0.81
Local festivals	3.56	4	4	0.83
Plenty of compatriots	3.52	4	4	0.80
Plenty of part-time job	3.50	3	3	0.81
Tourist spot	3.44	3	3	0.78
Having relatives or friends	3.41	3	3	0.85
Low cost of living sub-urban	3.37	3	3	0.83
Friendly rural	3.37	3	3	0.78

The data in Table 4 presents the preferences of respondents regarding specific factors related to their preferred university abroad. The data shows that students generally have stronger preferences for universities abroad that provide tuition exemption, job hunting support,

modern infrastructure, scholarships for international students, life support and counseling services, local culture events, exchange opportunities with local and international students. The following features are moderately desired: high employment rates, dormitory facilities, free language classes, student clubs they desire, disaster prevention activities, study courses they desire. Surprisingly, features such as English-speaking environment, high rankings, national university status, offer EMI courses, or have Nobel laureates seem have less meaning for the respondents.

Table 4. University of preference abroad.

	Mean	Median	Mode	SD
Tuition exemption	3.59	4	4	0.88
Job hunting support	3.57	4	4	0.86
Modern infrastructure	3.53	4	3	0.93
Scholarship for int'l students	3.50	3	3	0.85
Life support & counseling	3.50	3	3	0.88
Local culture events	3.48	4	4	0.86
Exchange with local student	3.48	4	4	0.83
High employment rate	3.46	3	3	0.89
Having dormitory	3.46	3	3	0.85
Exchange with int'l students	3.46	3	3	0.82
Free language class	3.45	3	3	0.86
Having student clubs wanted	3.44	3	3	0.83
Disaster prevention activities	3.41	3	3	0.80
Having study course wanted	3.37	3	3	0.85
English speaking medium	3.28	3	3	0.82
High ranking	3.18	3	3	0.79
National university	3.10	3	3	0.76
Having EMI courses	3.05	3	3	0.82
Having Nobel laureates	2.94	3	3	0.82

Discussion

The present study investigates the attitudes of undergraduate nursing students in Vietnam regarding international study and work opportunities offers a comprehensive understanding of their aspirations and preferences. The study's findings underscore the transformative potential of international experiences in the nursing education landscape. These findings, particularly within the context of the distinctive Japanese language special program, have implications for both educational institutions and policy development.

The study revealed perceptions about essential role of international experiences in augmenting communication skills, cross-cultural competencies, and personal development among nursing undergraduates (O'Brien et al., 2021). The recognition of these attributes' significance highlights the comprehensive nature of nursing education, aligning students' skills with the evolving demands of the global healthcare environment. This empirical evidence may add values for educational institutions in developing countries aiming to prepare nursing students to thrive in diverse healthcare settings (Chen et al., 2020) based on race-ethnicity and country of origin (Allensworth-Davies et al., 2007).

The distinct preferences exhibited by students within the special Japanese program add an intriguing layer to the discourse. While the government-supported EPA program may not be seen as sustainable in the long run (Ogawa, 2012), other initiatives may survive and thrive (Asato, 2012). The students emphasize factors such as a pristine living environment, enduring

job prospects, and cultural festivities when contemplating international destinations. This holistic approach, emphasizing both personal and professional dimensions, underscores the interdisciplinary nature of nursing and the potential for international experiences to shape well-rounded healthcare professionals. Nevertheless, evidence has shown that foreign nurses in Japan face various challenges and difficulties, even after they return to their home countries (Abuliezi et al., 2021). The students who are prepared to head abroad may need to know and to be prepared mentally and to be trained to deals with actual issues. If the special programs could solve these issues, it may improve the sustainability of the human resources and wellbeing of foreign-educated nurses in Japan.

While nursing students in developed countries may enroll in short-term study abroad (Abuliezi et al., 2021), the chance seems very rare for students in developing countries to join such a program. The findings of the current study show that the preferences of students interested in study abroad, which in fact a postgraduate study, paint a picture of pragmatism, with a focus on institutions offering robust job-hunting support, tuition benefits, and modern infrastructure. This strategic approach aligns education with future employability, revealing students' awareness of the pivotal connection between academic pursuits and professional prospects.

Certain limitations need to be considered. The scarcity and uniqueness of the Japanese program highlight the challenge of recruiting participants, thus underscoring the limitation imposed by program availability on the generalizability of the study's findings. The cross-sectional design may overlook the evolution over time. The single-university focus might limit generalizability. Reliance on web-survey data could introduce selection bias and miss in-depth insights. Therefore, this study's limitations emphasize the potential for refined research to shape a comprehensive narrative around nursing students' global aspirations.

Conclusion

This study contributes to the literature on nursing education and global experiences by shedding light on the attitudes and preferences of Vietnamese undergraduate nursing students. By emphasizing the substantial impact of international experiences on communication skills, cross-cultural competencies, personal growth, and career prospects, the study underscores the transformative potential of such encounters. The revelations from the special Japanese program participants and the preferences of those aspiring for postgraduate study abroad add depth to the discourse. Ultimately, the findings resonate with practical implications, advocating for a tailored approach to program design and policy formulation that caters to the evolving aspirations of nursing students within the global context.

Is Co-teaching a Sustainable Practice in Teacher Education?
Lecturers' Perception

Brigitte Lenong, Central University of Technology, South Africa

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

The purpose of sustainability is to improve human well-being and quality of life, but the definition of sustainability may depend on context. The core of higher education is to enable academic staff to implement education that is sustainable. Therefore, ensuring sustainability in co-teaching may require providing each lecturer with the skills, knowledge, and attitudes needed to collaborate. Co-teaching is a teaching strategy in which lecturers collaborate to learn from one another's knowledge and expertise while influencing the education environment. The problem is that lecturers in higher education often collaborate in research but seldom collaborate in teaching and learning. This mixed method study investigated lecturers' experiences of co-teaching, and the strategies the lecturers have devised to promote and sustain co-teaching. The participants were 12 lecturers involved in the teaching of compulsory Educational Foundations modules at an institution of higher learning in South Africa. The findings reveal that sustainability of co-teaching at an institution of higher learning means empowering every lecturer involved in collaborative co-teaching through promoting social equity and democratic values. Although co-teaching is practiced at institutions of higher learning, it is suggested that more training on co-teaching is developed, to enable academic staff to build a sustainable future for collaborative learning settings.

Keywords: Co-teaching, Teacher Education, Sustainability, Collaborative Teaching

Introduction

The main goal of higher education is to empower academic staff to carry out sustainability-focused education. Lecturers in higher education are at the forefront in implementing sustainable, collaborative co-teaching practices in diverse cultural context (Toledo, 2020). Therefore, to ensure the sustainability of co-teaching, it might be necessary to equip each lecturer with the abilities, information, and attitudes necessary for cooperation. Lecturers are distinctive in that they have a variety of expertise and experience and are from different cultures. The paper investigates lecturers' experiences in co-teaching, as well as pedagogical strategies in the collaborative mindset of sustainability in diverse cultural contexts. The paper begins by discussing the context of co-teaching as a sustainable practice, learning experiences in co-teaching, the theoretical framework and research methodology used for this study, perspectives on the study's contribution, and recommendations for further study.

Background

Recent debate has focused on how lecturers can be supported to make co-teaching sustainable in teacher education (Lock, Clancy, Lisella, Rosenau, Ferreira & Rainsbury, 2016, Härkki, Vartiainen, Seitamaa-Hakkarainen & Hakkarainen, 2021). The question is, how can co-teaching be implemented as a sustainable practice in teacher education? Co-teaching is a teaching method in which lecturers work together to improve the educational environment while benefiting from one another's knowledge and experience. The general curriculum, which is deemed necessary for nearly all students, can be made accessible through co-teaching (Rodriguez, 2022). Greater instructional intensity is achieved when the skills of the teachers are combined, which includes differentiating instruction for each student, and delivering instruction that is specifically tailored to their needs in different cultural enviroments (Celik, 2019). Sustainability is a fundamental aspect of collaborative co-teaching that should be included as an indicator of good teaching practices. Regarding sustainable learning processes for making progress in co-teaching, it is important that lecturers work together effectively in planning, delivering instruction and assessing co-taught classes (Rodriguez, 2022). Although co-teaching has a solid research base, there is little information on how to make it a sustainable practice in teacher education in South Africa. The paper explores lecturers' experiences in co-teaching, as well as pedagogical strategies in the collaborative mindset of sustainability in diverse cultural contexts. To achieve the purpose of the study, the following question was pursued: What are lecturers' experiences in co-teaching practices in teacher education programmes, and how can co-teaching be implemented as a sustainable practice in teacher education?

Co-teaching as a Sustainable Practice

Co-teaching is a well-known education strategy that encourages socialization, collaboration and learning at various academic levels and in a variety of subject areas, and is founded in inclusive education (Hazelitt, 2022). Several definitions of co-teaching have been developed and elaborated over the years. Co-teaching was initially developed as a method of instruction to help students who have disabilities (Morelock, Lester, Klopfer, Jardon, Mullins, Nicholas, & Alfaydi, 2017). Two or more lecturers work side by side to deliver instruction, design student assessments, and do classroom management, therefore, sharing teaching (Chitiyo, 2017). Co-teaching is an instructional learning method, in which academic staff work together to acquire knowledge and skills to shape the environment of their institution in diverse cultural context (Rabin, 2020).

Co-teaching can assume different approaches or models depending on students' education needs, and may be practiced in different contexts (Williams, 2023). The different co-teaching models are one teach, one assist; station teaching; alternative teaching; parallel teaching; and team teaching (Williams, 2023).

In order to learn more about co-teaching and the steps necessary to co-design, co-facilitate, and co-assess a graduate or doctoral-level course, Burns and Mintzberg (2019) carried out a study in Canada. They propose that co-teaching enables lecturers to experiment with various teaching pedagogies or pedagogical philosophies, create a more varied curriculum, build their confidence, and take greater risks in the classroom.

Roland and Jones (2020) used the theoretical and methodological intersection of critical performance pedagogy and critical autoethnography to analyse and contextualize classroom experiences. They found three pedagogical strategies that were effective when co-teaching challenging subjects: negotiating individual and collective space; navigating voice between collaboration and personal expression; and being aware of the role of affect in the learning environment. Collaborative co-teaching reduces lecturers' frustration, and its success is dependent on the professionalism and compatibility of those involved (Cook & Friend, 1995).

In teacher education programmes, lecturers need to provoke sustainable ways of thinking in student teachers. A modification of curricula and school programmes is crucial if student teachers are to be open-minded about participating in sustainable co-teaching practices. The traditional student teaching practicum is changed by co-teaching, into a paradigm of active collaboration, ongoing professional development, and shared leadership during teaching practice (Lenong, 2022). Therefore, developing effective, sustainable practices is crucial for student teachers who are beginning to work together in the classroom for the first time. Consequently, co-teaching practices should be sculpted for the professional development of student teachers. This suggests that effective co-teaching strategies in teacher education may entail providing lecturers and students with the abilities, drive, attitudes, and information necessary to carry out group tasks successfully.

Co-teaching and Learning Experiences

There are several benefits and positive learning experiences of co-teaching in teacher preparation programmes – also for lecturers – such as enabling them to give each student more individual attention, and to exchange professional knowledge (Sundqvist, Björk-Åman & Ström, 2021). In addition, co-teaching addresses issues, illustrates instructional strategies, supports professionals in leading or participating in professional development initiatives, shares resources, shares authority, gains fluency and forges connections with other professionals from outside organizations (Thompson, & Schademan, 2019). Graziano and Navarrete (2012) explored their individual experiences of working together and co-teaching. Because of their co-teaching experiences, they were able to reflect on their instructional strategies and students' learning. They recommend that institutions support faculty collaboration in the classroom, especially in pre-service education courses. Furthermore, in South Africa it was discovered that co-teaching within mentorship in teacher preparation provides student teachers with learning opportunities and development. Lenong (2022) conducted a study to learn about pre-service teachers' experiences with co-teaching during mentoring teaching practicums via the lens of transformative learning. The outcomes of the focus group discussion of 24 pre-service teachers revealed that pre-service teachers recognize

the relevance of co-teaching in transforming their learning during teaching practicum while working with mentor teachers.

However, there have also been reports of negative experiences of co-teaching. In their 2008 study, Dugan and Letterman looked at students' self-reported evaluations of collaborative teaching in 11 team-taught courses at three New England state universities. They found that co-teaching hampered students' ability to understand expectations clearly and achieve high grades, because of organizational and communication problems. However, students favoured team-taught courses that used co-teaching strategies. When lecturers co-teach, they must share the classroom and transition from an individual to a collaborative model of accountability and sustainable practice, which can be difficult for those who are accustomed to working alone (O'Dwyer, Hamilton & Bowles, 2020). In reviewing 17 studies on the professional development of co-teaching teams, Fluijt, Bakker and Struyf (2016) found that the interpersonal and normative aspects of team development were the main barriers to co-teachers' professionalization. In many ways, co-teaching illustrates both the potential and complexity of collaboration. The success of co-teaching is dependent on lecturers fostering collegiate, compassionate, and cooperative relations in diverse cultural contexts (Conderman, Bresnahan, Teacher, & Pedersen, 2008; Rabin, 2020).

Theoretical Framework

Transformative learning theory was used as the primary analytical framework for this article. According to the transformative learning theory, learning modifies students' frames of reference and leads to behavioural change (Mezirow, 2003). Transformative learning transformative learning is reflective, critical, emotionally adaptable, open and produces a more substantial, significant, and long-lasting learning experience in a supportive social, cultural, and physical environment (Mezirow, 2009; Halupa, 2017). One of the goals of transformative learning is to bring about social change to alter oppressive customs, beliefs, institutions, and socioeconomic frameworks and make it possible for individuals to interact with one another in diverse cultural contexts (Mezirow, 2009). Since people's expectations are not always met and things do not always turn out as they are supposed to, transformative learning theory helps people to modify their mental models and to make sense of their experiences (Mezirow, 2012). Transformative learning theory is relevant to this study because it is emancipatory and liberating for the individual as well as the community (Fleming, 2018). Because it is reflective and critical, transformative learning results in a more substantial, significant, and lasting learning experience (Halupa, 2017). Co-teaching gives lecturers the chance to change their perspectives, so they can collaborate and share knowledge in diverse cultural environments to enhance their classroom management; as a result, it has the potential to be a sustainable practice.

Methodology

The purpose of the article is to investigate lecturers' experiences of co-teaching practices in teacher education programmes and how co-teaching can be implemented as a sustainable practice. Thus, a mixed methods approach was employed to explore the lecturers' experiences of co-teaching and the pedagogical strategies used in a collaborative mindset of sustainability. To confirm findings, quantitative data was gathered first, then qualitative data was gathered that could both shed light on some of the quantitative findings and confirm the accuracy of the quantitative data. The purposive random sample comprised 12 lecturers at a university of technology in South Africa. All the lecturers were involved in co-teaching

teacher education students from first-year level to fourth-year level. Participants voluntarily completed an online questionnaire; confidentiality and anonymity were guaranteed. Ethics clearance and the required institutional authorization were obtained.

Data collection began with an initial survey that was sent to all participants. The questionnaire responses were collected and analysed using Question Pro, and the data was analysed using descriptive statistics. Frequencies were computed to ascertain participants' experiences of co-teaching. Thereafter, the participants were invited to participate in a follow-up interview. The semi- structured interviews were conducted virtually or face to face, one-on-one with each participant. The semi-structured interviews were recorded and transcribed, and the semi-structured interview data were subjected to thematic analysis. The themes were derived from the key research question.

Research Findings

The analyses indicate that participants in this investigation experienced opportunities and challenges in their experiences of co-teaching, and that the lecturers devised strategies to promote and sustain co-teaching. The researcher will present both the discussion and implications of the research in accordance with transformative learning theory. Descriptive statistics were produced from the data in the first stage, which involved the quantitative approach. In the second stage, semi-structured interview data from the qualitative phase were analysed and interpreted using text analysis.

Quantitative Data Findings

The composition of the sample of lecturers was that 70% of the respondents were women, whilst 30% were men. Only two (17%) of the participants had obtained Doctoral qualifications, while 4 (33%) had Master's degrees and 6 (50%) had Honours degrees in Education.

Summary of the Data From Questionnaire Survey

The data gathered by means of the questionnaire survey are presented below. Respondents selected their answers from a scale ranging from 1 to 4, ranging from Strongly agree, Agree, Strongly disagree to Disagree.

Table 1: Summary of responses to the questionnaire survey (N=12)

Statements per Category	Strongly agree %	Agree %	Disagree %	Strongly Disagree %
Lecturers 'experience				
I did not have knowledge on how to co-teach	90	1	1	8
I was trained on co-teaching practices before	10	0	9	81
I was never involved in co-teaching before	89	9	1	1
I enjoyed collaborating with colleagues in teacher education	92	6	1	1
I managed to experiment with various co-teaching pedagogies	85	10	2	3
I have gained co-teaching skills during teacher education collaboration	88	16	3	3
I was able to share successfully good practices during teacher education collaboration	90	8	1	1
Challenges				
Lack of communication during teacher education collaboration	88	4	3	5
A lack of resources during teacher education collaboration	60	30	5	5
Lack of knowledge and skills to collaborate during teacher education collaboration	89	8	1	2
Inadequate time to collaborate during teacher education collaboration	78	10	6	6
Sustainability				
Co-teaching requires both time and effort	78	10	6	6
Lecturers must be trained before they collaborate	90	7	1	2
Sustainability in co-teaching means equipping staff with skills	80	16	3	1
Sustainability in co-teaching means equipping staff with motivation	89	8	1	2
Sustainability in co-teaching requires active participation	85	10	2	3
Sustainable co-teaching practices leads to social change	90	7	1	2

Lecturers' Experience

It is apparent from Table 1 that lecturers' experience of co-teaching in the teacher education programme were positive. Regarding lecturers' knowledge of co-teaching practices, the majority of the respondents affirmed that they only came to know about co-teaching when they had to collaborate in the teacher education programme. The majority reported that they enjoyed collaborating, and that they shared co-teaching pedagogical practices. However, it is also apparent that few lecturers had had knowledge or skills relating to co-teaching before

embarking in collaborative co-teaching in teacher education. It is interesting that few lecturers had undergone training on collaborative co-teaching before starting to collaborate in teacher education.

Challenges
The participants agreed that lack of communication, lack of resources, lack of knowledge and skills and inadequate time are the barriers to sustainable co-teaching.

Sustainability of Co-Teaching
The third part of the survey sought information on the sustainability of co-teaching in teacher education. Table 1 shows that the majority of the respondents believed that co-teaching may be a sustainable practice in teacher education. The participants alluded the following as prerequisites for co-teaching to be a sustainable practice: it requires both time and effort, lecturers must be trained, equipped with skills, lecturers be motivated, needs active participation, and co-teaching leads to social change.

The results of the qualitative data analysis are discussed in the next session.

Lecturers' Qualitative Data
The following research questions guided the collection of qualitative data:
What are your experiences in implementing co-teaching in the classroom?
How can co-teaching be implemented as a sustainable practice in teacher education?

Experiences in Implementing Co-teaching in Teacher Education
The lecturers expressed the following statements about their experience of co-teaching practices.

Lecturer 9: *Co-teaching is a wonderful experience because you gain knowledge by working with a colleague. Training is important.*
Lecturer 4: *We collaborated well, and we had to research information about collaboration in order it to work.*
Lecturers 6: *My experience in working together was an effective one, though at first, I was a bit scared of going to class with my partner.*
Lecturer 2: *Co-teaching made things easier when we presented the lesson, planning and especially when we had to assess the students because were able to share knowledge. We came up with good practices.*
Lecturer 10: *Co-teaching is difficult at first if you didn't go for training or gained the knowledge or skills of collaboration.*
Lecturer 7: *We empowered each other, and we managed to solve co-teaching problems. But if we did go through training it could have been better.*
Lecturer 8: *Collaborative partners must be trained to effectively work together.*
Lecturer 3: *I wish there were regulations intended to educate and prepare co-teaching partners with the knowledge, disposition, and abilities necessary to carry out co-teaching practices successfully.*

A discussion of the co-teaching experiences is dealt with in the discussion section.

Implementation of Co-teaching as a Sustainable Practice in Teacher Education

Lecturers who were interviewed made various suggestions on how co-teaching can become a sustainable practice. These recommendations are captured in the following responses by lecturers.

Lecturers 5: *Empowering and equipping every member of teacher education with co-teaching skills and knowledge.*
Lecturer 1: *All parties must be committed effective co-teaching practices.*
Lecturer 8: *Lecturers must promote social equity and democratic values when working with co-partners.*
Lecturer 2: *Lecturers must use a variety of approaches, strategies, and models to meet the needs of the students.*
Lecturer 11: *Maintaining a positive relationship with another lecturer is of utmost important.*
Lecturer 7: *Co-teaching partners must create a co-teaching learning environment that engages all the students.*
Lecturer 3: *Training, training, training is important for collaboration.*
Lecturer 6: *Co-teaching must promote autonomy to make decisions.*
Lecturer 10: *Respect, effective communication and training are necessary.*
Lecturer 12: *Active participation by both partners.*
Lecturer 4: *Guidelines, policies and resources are necessary for sustainable co-teaching.*
Lecturer 9: *Lecturers need to encourage collegiate, sympathetic, and cooperative relationships for sustainable co-teaching practice.*

A discussion of co-teaching as a sustainable practice follows.

Discussion

The data from the survey and qualitative interview clearly show that co-teaching as instructional learning was a fruitful and positive learning experience for lecturers, though lecturers emphasised that, to be successful, co-teachers must be equipped with the necessary knowledge, skills, and attitudes. The lecturers enjoyed working with their colleagues in collaborative classrooms, and they were able to exchange pedagogical strategies for co-teaching. These results demonstrate that co-teaching cannot be person-centred, and lecturers need to be prepared with the knowledge, skills, and mindsets necessary for successful co-teaching (Conderman et al., 2008). Although at first co-teaching may seem like a terrifying, overwhelming task, it allows lecturers to share their best pedagogical practices and provides opportunities for learning.

The data from the qualitative and quantitative research methods concur with the findings of other researchers who also noted that, for co-teaching to be a sustainable practice, there are strategies or elements necessary, namely, it requires both time and effort and training is necessary; furthermore, co-teachers must be equipped with skills, motivation, active participation, effective communication, and respect, they must maintain positive relationships and autonomy, and they must guidelines, policies and resources, promote social equity and democratic values – then, co-teaching will lead to social change (Lock et al., 2016; Rabin, 2020). The lecturers in this study believed that co-teaching may be a sustainable practice in teacher education.

Conclusion

The article presented a mixed methods study that investigated lecturers' experiences of co-teaching practices in teacher education programmes, and asked how co-teaching can be implemented as a sustainable practice in diverse cultural contexts. The shift to sustainable practices involves a fundamental thinking-through of the basic issues of co-teaching. In teacher education at an institution of higher education, certain courses for student teachers implemented collaborative practices. The findings show that lecturers require considerable freedom or autonomy to make judgements, because they must draw on knowledge-based skills and values-based decision-making in non-routine and routine situations that are often complex and risky. Collaboration has repeatedly been found to be one of the best indicators of the adoption and sustainability of various school-based practices, including co-teaching. Lecturers' positive learning experiences of co-teaching, and the success and sustainability of co-teaching is rightfully ascribed to sharing pedagogies. To ensure the sustainability of the practices, co-partners must be trained, equipped with the necessary co-teaching skills, and motivated to use co-teaching approaches or models and techniques. The finding of this research also provides insights into designing sustainable co-teaching practices in teacher education. Therefore, higher education institutions should embrace co-teaching, and careful consideration needs to be given to training co-partners. Co-teaching has the potential to be a sustainable practice, because co-teaching gives lecturers the chance to adjust their perspectives, so they can work together and share knowledge to improve their classroom practices and enhance student learning. Co-teaching increases lecturers' awareness of social concerns, but different cultural experiences and backgrounds may generate resistance to change; hence, for co-teaching to be sustainable, lecturers must build new meaning perspective that permit transformative learning. From a South African perspective, the study provides insight into lecturers' experiences in co-teaching, as well as pedagogical practices in the collaborative mindset of sustainability in varied cultural contexts and has major implications for teacher education.

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

In outcome-based education, workplace-based assessment (WPBA) should accurately provide stakeholders with evidence of learner competencies. In undergraduate training (UGT), mini-clinical evaluation exercises (mini-CEX) and direct observation of procedural skills (DOPS) accurately reflect learner performance. The portfolio is far from an independent WPBA tool. This paper summarizes changes in the WPBA strategy for UGT during UMP curriculum renovation and discusses solutions that might improve WPBA validity. In the 2010s, the UMP began to build an accurate and suitable WPBA strategy. The first edition included four specific mini-CEXs and two specific DOPS. It enhanced learner performance but increased educator workload, therefore provoking negative educators' reactions. The second edition had one multipurpose mini-CEX. Its complexity negatively impacted learner orientation and educator acceptance. Digitalization characterized the third edition and aimed to improve user acceptance and database management. The educator workload was the main obstacle to running this edition. We removed DOPS from the two last WPBA editions due to license requirements. To date, we still consider that portfolio is for formative purposes. From the learned failures, we imagine solutions can improve our WPBA validity. Mini-CEX is still the primary tool, and portfolio is a secondary one. A series of specific mini-CEX seems better than one 'all-in-one'; mini-CEX should use detailed rubrics, which enhance the correlation score-performance; flexible agenda gives learners autonomy; preparing educators to conduct mini-CEX is mandatory. Concerning the portfolio, we prioritize crafting a comprehensive user guide and removing unnecessary fields from the current portfolio. Digital design and management allow ubiquitous use.

Introduction

Outcome-based education (OBE) characterises modern higher education. It targets standardised proficiency levels and aims to guarantee that all learners have a sufficient level of proficiency at the end of training. Through practising, learners acquire and develop professional competencies. Entrustable professional activities (EPAs) are units of professional practice; defined as tasks or responsibilities to be entrusted to the unsupervised execution by a trainee once the trainee has attained sufficient specific competence [10]. In OBE, it is crucial that curriculum developers ensure the alignment between assessment and expected learning outcomes (ELO). Assessment should accurately provide stakeholders with evidence of learner competencies, so it requires conducting various workplace-based assessment methods (WPBA) together [1].

In competency-based medical education (CBME), assessments could be simulation-based or workplace-based. The objective structured clinical examination (OSCE) is a series of simulations for assessing learner performance of basic skills (especially taking history, counselling and making decisions). Available evidence supports using OSCE as a primary simulation-based strategy for evaluating learner performance at the 'show' level [8]. Educators agree that, if conducted for assessing the first EPA milestones, OSCE is reliable and has constructive validity. Unfortunately, OSCE seems likely not suitable for assessing advanced EPAs. In real-life conditions, WBPA tools replace OSCE as an appropriate assessment strategy. WPBA seems suitable for assessing advanced EPAs but faces several issues related to its validity. Educators should not use a single WPBA for concluding or judging learner performance [5, 7]. Mini-clinical evaluation exercises (mini-CEX), direct observation of procedural skills (DOPS), portfolio, and case-based discussion (CBD) are the most popular WPBA tools. Available evidence demonstrates that mini-CEX and DOPS accurately reflect undergraduates' performance [2, 6], CBD seems likely not suitable for undergraduate training, and the portfolio is far from an independent WPBA tool.

Methods

This paper presents the UMP's experiences in implementing a variety of WPBA, lessons that the UMP have learned and discusses potential solutions that might improve the validity of WPBA.

Results

Table 1: Assessment in CBME. Comparison of simulation-based and WPBA		
	Simulation-based	**Workplace-based**
Conducting environment	Simulation	Real-life
Assessment tools	OSCE	mini-CEX, DOPS, CBD, portfolio
Standardisation	Standardised	Non-standardised
Validity	Reliable	Context dependant
Examiners	Educators	All stakeholders
Examinees	Novices, beginners	All EPA milestones
Subject characteristics	Simulated	Real being
	Realistic scenario	Authentic
	Simplified scenario	Multifaced

Mini-Clinical Evaluation Exercises (Mini-CEX)

The mini-CEX is a formative assessment tool that aims to provide learners feedback on skill performance in medical care; by observing an actual clinical encounter. Mini-CEXs should accurately evaluate learner performance and provide them with valued feedback on their performance. Conventionally, each mini-CEX should target a specific skill, use detailed rubrics and allow educators to provide relevant feedback to learners. The examined skills could be taking history, counselling or making decisions; rubrics could be analytical or holistic; feedback could be informal or formal, given by educators or peers [2].

Table 2: Continuous changes in the mini-CEX for UGT during UMP curriculum renovation			
	First edition	**Second edition**	**Third edition**
Mini-CEX	4 specific mini-CEXs Multiple attempts are not allowed	1 all-in-one mini-CEX Second attempt is allowed	1 all-in-one mini-CEX Second attempt is allowed
DOPS	2 specific DOPSs Multiple attempts are not allowed	DOPS removed Due to legal issue	DOPS removed Due to legal issue
Rubrics	Analytical, simplified Analytical only	Analytical, detailed Analytical only	Analytical, detailed Holistic for referencing
Feedback	Informal or formal Non-registered	Formal Registered	Formal Registered
Format	On A_5 sheet	On A_4 sheet	Digital or on A_4 sheet
Exam agenda	Flexible Learner's decision, learners' request	Fixed According to course agenda	Fixed According to course agenda
Inference	Scoring Generalisation possible	Scoring Generalisation impossible	Scoring Generalisation impossible
Acceptance rate	Moderate to high	Low to moderate	Low to moderate
Correlation M-CEX/OSCE	Good	Moderate	Moderate

The First Edition (2013)

Knowledge-based education dominated the UMP pedagogical approach until the 2010s. Before this date, case presentation was the sole WPBA tool for assessing learner performance at the end of their clinical clerkship. In the early 2010s, there was a shift from knowledge-based education to OBE, so the Department of Obstetrics and Gynaecology has to set up a modernised WPBA toolkit.

The first edition of WPBA (2013) addressed undergraduates completing their obstetrics clerkship. That included four specific mini-CEXs and two DOPSs. Those mini-CEXs targeted taking history (one mini-CEX), counselling (one mini-CEX) and examination skills (two mini-CEXs); used simplified three-level analytical rubrics (underperformance/meet requirements/better than expected); usually provided informal feedback. As formative tests, learners used those mini-CEXs for self-awareness, peer evaluation and formative purposes. They should continuously use mini-CEX until feeling ready to pass the final examination. We let learners decide when they pass the mini-CEX. As a summative test, we used scoring as a sole inference. This first WPBA attempt immediately impacted the teaching-learning processes. Positively, learners knew what they should learn and how they should perform to reach ELOs. The given autonomy encouraged learners to learn accountably.

There was a net enhancement in learner accountability and task performance. Unfortunately, implementing it provoked negative educators' reactions. We experienced a considerable increase in educator workload. Examiners should spend two working hours to complete this six-WPBA set (summative only, formative excluded). That finally encountered three hours of extra work per educator per week. That consequently led this attempt to its rejection.

The Second Edition (2016)

In 2016, we completed preparing and launched the renovated obstetrics-gynaecology course. This CBME course uses team-based learning (TBL) as a principal pedagogical approach; includes three modules (approximately 12 credits); distributed over three academic years (year 3rd, year 4th, and year 6th). Learners start this long-haul course with a pre-clinical integrated module (year 3rd) and then continue with two clinical interdisciplinary modules (year 4th and year 6th).

The second edition did not include DOPS due to changes in legal regulations. We have chosen mini-CEX as a WPBA tool for assessing real-life clinical performance and OSCE for assessing clinical performance and reasoning. There were changes in the mini-CEX format. The two clinical modules shared one multipurpose mini-CEX. This 'all-in-one' mini-CEX targeted mixed purposes, both formative and summative. It aimed to assess taking history, counselling and examination skills; used rating scales rubrics (one to ten); provided formal feedback. We encouraged learners repeatedly use mini-CEX for self-awareness or peer evaluation before passing the formative examination, which uses the same tool. Learners had to complete this mini-CEX quintuple (four without scoring and one with scoring) and follow the fixed exam agenda. In this edition, we continued to consider scoring as a sole inference.

Those changes have raised issues of learner accountability and human resources. We experienced the negative impact of the 'all-in-one' format on learner orientation. Learners felt disoriented due to its complexity. On the other hand, it seemed that the fixed exam agenda provoked pressure on learners. Some learners were not ready yet at the 'mini-CEX day'.

Learner disorientation and working under pressure negatively impact learner performance. Examiners should spend three working hours on the 'mini-CEX day', which finally encountered two hours of extra work per educator per week. Additionally, educators were not at ease when using 'all-in-one' rubrics. Those negative impacts led to a poor correlation between mini-CEX scores and OSCE results.

The Third Edition (2019)

In 2019, we attempted to edit our WPBA toolkit. There was no change in course syllabi. Two key features of this new edition are the digital mini-CEX and portfolio, those aimed to improve the formative effectiveness and acceptance rate of the pre-existing mini-CEX. We developed a ubiquitous tool possessing a user-friendly interface, able to put users at ease when processing WPBA. Digitalisation also aimed to improve database management.

Unfortunately, user feedback was generally negative. Network accessibility seemed likely the main obstacle to running digital mini-CEX. Issues related to the 'all-in-one' mini-CEX, such as the complexity and lack of specificity, remained unsolved. Again, time consumption discourages educators from running digitalised mini-CEX.

Discussion

Learner autonomy: Mini-CEX is the most popular formative assessment. Its contribution to assessing primary clinical skills performance and giving feedback is indisputable [2, 6]. In formative assessment, it is crucial to give learners autonomy in learning [10]. Respecting learner autonomy characterised the 2013' edition. In the 2013' edition, learners have decided when they pass their mini-CEX. Autonomy in timing has allowed learners to adjust their learning plan and continuously repeat the given task until feeling ready to pass the final examination. Hence, learners have given positive feedback on the 2013' assessment process. In 2016, there were changes in the course syllabi, which included a reduction in course duration (eight weeks instead of ten weeks) and a fixed mini-CEX date (on the Friday of the 5th week), that consequently advancing the exam day by two weeks and limiting the learner autonomy. Adversely, at the due date, some learners were not ready yet to pass mini-CEX. The limited learner autonomy has led to a decrease in their accountability and changed their mindsets. Hence, learners have shifted from 'practising for learning' to 'passing the exam'. Introducing technology into the third edition (2019) could not change the nature of the issue, so it did not improve the learners' attitude. We experienced the importance of giving autonomy to learners in ensuring their accountability, therefore suggest applying a flexible agenda rather than fixing the examination date.

Mini-CEX format: In OBE, elucidating the learning objectives is mandatory. Learners, especially novices, attempt to use rubrics for self-directing and improving task performance [2, 6]. The 2013' edition included specific mini-CEXs containing simplified rubrics, which provided learners with an effective self-learning tool and an accurate peer-evaluation tool. The 2016' edition used the 'all-in-one' mini-CEX instead of a specific mini-CEX, so unable to direct the novices. The digitalised edition (2019) has encouraged self-learning and improved its effectiveness by introducing detailed rubrics. Hence, we suggest designing a series of specific mini-CEX that contain detailed rubrics rather than an 'all-in-one' mini-CEX using the Likert scale.

Educator perspectives: There is a conflict between learner benefits and educator workload. Our experiences demonstrate that excessive workload is the most problematic issue. Educators must observe the entire performance and provide learners with feedback. Completing each specific mini-CEX requires at least fifteen minutes, which means more than one hour per student per course. Time consumption is inevitable. On the other hand, completing mini-CEX is mandatory. Therefore, applying flexible exam agenda, which allows for adjusting educator and learner work plans, seems likely an appropriate solution.

There is also a conflict between learner needs and educator comfort. Detailed rubrics support learner self-awareness and peer evaluation processes. Inversely, going into details makes the rubrics complicated and unfriendly. Additionally, the 'all-in-one' format contains several rubrics inside one mini-CEX, which makes the mini-CEX much more complicated. The complexity of the 'all-in-one' configuration also negatively impacts its ability to direct self-learning. We suggest breaking down the 'all-in-one' mini-CEX into a series of specific mini-CEX. It could enhance the educator acceptance rate and improves learning effectiveness.

Direct Observation of Procedural Skills (DOPS)

Our 2013' WPBA toolkit contained two DOPS, which included delivering a baby and suturing episiotomy; promoted scoring and generalisation inferences. Those DOPS played a crucial role in training essential obstetrical skills and received stakeholders' positive feedback. Since 2014, Vietnamese law has required a license to perform patient care procedures. According to that, undergraduates could not perform patient care procedures unless being under supervision when doing procedural skills. In 2016, at UMP, the educator-to-learner ratio was 1:20. This poor ratio did not allow educators to ensure safe supervision. Therefore, in 2016, we had to remove the two DOPS from the 2013' WPBA toolkit.

To date, we still consider the importance of these essential procedural skills and attempt to bring them back to our WPBA toolkit when reaching the appropriate educator-to-learner ratio.

Case-Based Discussion (CBD)

The case-based discussion (CBD) takes part in WPBA and mainly targets the ability to make decisions and think critically. In CBD, examinees should perform a series of tasks, which include taking history, performing a clinical examination, making decisions, and having face-to-face discussions with examiners. CBD does not target assessing knowledge. During the discussion, the examinee should present individualised and evidence-based management solutions. Evidence suggests addressing CBD to advanced learners (e.g. competent, proficient) rather than novices (e.g. novice, beginner) [7, 9].

Before 2010, we used case presentations for validating undergraduate clinical clerkship. Case presentations are different from CBD. It uses a given case as a context for the Q&A session rather than as a subject for managing; targets knowledge rather than clinical reasoning. Hence, in our current undergraduate curriculum, we consider using structured oral exams (SOE) to assess knowledge acquisition rather than case-based discussions to assess task performance.

Portfolio

Until 2016, we used the logbook to monitor learners' task performance and did not use the portfolio as a WPBA tool. It aimed to provide evidence of learner performance rather than support learners' competency judgement. In 2016, the OBE curriculum replaced the knowledge-based curriculum. Implementing it required radical adaptations, which included WPBA.

In 2019, we introduced a portfolio into our WPBA toolkit. This portfolio included a user guide, a learner diary, educator feedback and a holistic evaluation. It targeted supporting learner self-awareness rather than providing evidence for judging task performance [5]. Unfortunately, users were unfamiliar with the portfolio, which led to its transformation back to a logbook. Learners often filled the portfolio with cases instead of their feelings, while educators often gave marks instead of formal feedback. Consequently, educators could not use this portfolio as an inference, and the portfolio lost its validity in judging learner performance, as demonstrated by Driessen, Buckley and Yoo [4, 3, 11].

To date, we still consider that portfolio is for formative purposes. We ask learners to complete their portfolios adequately. On the other hand, we are now attempting to redesign our 2019' portfolio. The new portfolio should target learner self-awareness rather than providing evidence of task performance. We consider a comprehensive user guide elucidating the purposes of completing the portfolio and its requirements. We also consider removing unnecessary fields from the current portfolio.

Conclusion

From the failures that we have learned, we consider that it is mandatory to reform our current WPBA strategy. We imagine some solutions can improve the validity of our WPBA toolkit. Mini-CEX is still the primary tool, while a portfolio could be a secondary one. Concerning mini-CEX, a series of specific mini-CEX seems likely better than the 'all-in-one' mini-CEX; specific mini-CEX should use detailed and valid rubrics, which enhance the correlation between the examination score and learner performance; applying flexible exam agenda gives learners autonomy and sounds helpful; preparing educators to conduct mini-CEX is mandatory. Concerning the portfolio reform, we prioritise crafting a comprehensive user guide and removing unnecessary fields from the current portfolio. We also support digital design and management. Doing that allows ubiquitous use and effective management.

Teachers and Students' Perspectives in Current State, Problems and Needs of Multicultural Learning in Malay Language Communication in the Southernmost Region of Thailand

Norsaleeha Chemi, Narathiwat School, Thailand
Jirutthitikan Pimvichai, Mahidol University, Thailand

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This research aimed to explore the teachers and students' perspectives in current state, problems and needs of multicultural learning in the Malay language communication subject at the secondary in Narathiwat province. Data was collected by the questionnaires from 33 secondary school teachers and 36 students under of the Narathiwat Secondary Educational Service Area Office. Data was analyzed by mean and standard deviation (SD). The results indicated that, in overall, teachers held a high level of opinions regarding the current state (mean = 3.69, SD = 0.63), moderate level of opinions regarding the problems (mean = 2.89, SD = 0.73) and high level of opinions regarding the needs (mean = 4.14, SD = 0.79) of multicultural learning in the Malay language communication. In addition, in overall, students held a high level of opinions regarding the current state (mean = 4.03, SD = 0.68), moderate level of opinions regarding the problems (mean = 2.90, SD = 0.73) and high level of opinions regarding the needs (mean = 3.85, SD = 0.75) of multicultural learning in the Malay language communication. The teachers and students held the perspectives in current state, problems and needs of multicultural learning in the Malay language communication in the same direction.

Introduction

Thailand stands out as a nation marked by a rich tapestry of diversity, encompassing a wide array of ethnicities, languages, religions, customs, and ways of life, particularly in regions contiguous to its neighboring countries. This commitment to diversity is enshrined in the constitutional framework of the Kingdom, specifically articulated in Article 70, Section 5 of the Constitution of the Kingdom of Thailand B.E. 2560 (2017) (p. 18). This constitutional provision underscores the pivotal role of the state in fostering an environment that safeguards and promotes the rights of Thai citizens hailing from diverse ethnic backgrounds. It emphasizes their entitlement to live harmoniously within society in accordance with their respective cultures, traditions, and original lifestyles. This liberty is extended, provided that such expressions of diversity do not compromise public order, moral values, or present a threat to the security and public health, as elucidated in the Constitution of The Kingdom of Thailand (2017). In essence, Thailand's constitutional framework manifests a dedication to preserving the myriad cultural identities within its borders while upholding the broader interests of societal well-being. Furthermore, the National Education Act B.E 2542 (1999), as amended (2nd edition) in 2002, Article 10 Section 2 on Education Rights and Responsibilities, specifies that "…educational management must ensure that individuals have equal rights and opportunities to receive basic education for a minimum of twelve years, provided universally and with quality, without charge" (Office of the National Education Commission, 2002, p. 7).

The evolution of the education system, with a focus on fostering acceptance of diversity, acknowledging its inherent value, and underscored by an emphasis on the significance of involvement in various professions and stakeholders, is an integral component of the national objectives delineated in the National Education Plan (2017-2036).

> The plan addresses the increasing trends of conflicts and violence in society, the refusal to accept differing opinions, and the aggressive behavior of certain individuals spreading across various countries. The rise in conflicts of opinion within society results in unrest, leading to citizen apprehension and a lack of safety in life and property. (pp. 17-18)

Envisaged within the framework of the National Education Plan (2017-2036), the strategic blueprint for education management to fortify social stability and uphold national security. The southern border provinces of Thailand exhibit distinct characteristics in language, religion, and culture, necessitating a concerted effort to promote and support the education of multicultural societies. The Southern Border Provinces Development Strategy for the years 2022-2024 advocates for the advancement of multicultural understanding, national history, and local history through the formulation of curricula. This educational approach is designed to underscore the significance of comprehending multicultural societies, national history, and local history within the southern border provinces, with a pronounced emphasis on fostering unity and harmony among the diverse population.

Integral to this initiative is the enhancement of the identity and individuality of the people in the southern border provinces. This involves not only the promotion of Thai language but also the cultivation of proficiency in the Malay language, English, and other pertinent foreign languages at all educational levels. These linguistic skills are positioned as essential tools for communication, daily life, career development, and establishing connections with the Malay world, Arab world, and the broader international community. Thus, the strategy encapsulates a comprehensive approach to education that aligns with the distinctive characteristics of the

southern border provinces while concurrently fostering a sense of unity and interconnectedness within the broader regional and global context.

The southern border provinces of Thailand possess distinctive characteristics in terms of language, religion, and culture. Therefore, it is crucial to promote and support the learning of multicultural societies, as outlined in the Southern Border Provinces Development Strategy for the years 2022-2024, on page 13. The strategy provides 12 development directions, and one of them specifies: "Promote and support the learning of multicultural societies, national history, and local history through the development of curricula that emphasize the understanding of multicultural societies, national history, and local history in the southern border provinces, emphasizing the creation of unity and harmony among people in the area. Enhance the identity and individuality of people in the southern border provinces, including promoting the learning of the Thai language, Malay language, English, and other important foreign languages at all levels of education as tools for communication, daily life, career development, and relationships with the Malay world, Arab world, and international community" (Southern Border Provinces Development Strategy 2022-2024, pp. 11-12).

The Core Curriculum for Basic Education B.E. 2551 (2008) strategically organized learning management into eight subject groups, with Foreign Languages standing out as a pivotal category. This inclusion is notably influenced by the regional context of the southern border provinces adjacent to Malaysia, where Malay serves as the second foreign language. The central Malay language, specifically, plays a prominent role as a widely utilized means of communication in this region and stands as one of the primary languages within the ASEAN community.

Malay, whether referred to as Bahasa Malaysia in Malaysia or Bahasa Indonesia in Indonesia, Bahasa Melayu in Brunei, parts of Singapore, the Philippines, Myanmar, Cambodia, and the southern region of Thailand (in the form of the local Malay language), holds significance. Notably, its distinction lies in its use of the Roman alphabet, shared with English, and its straightforward language structure. The Core Curriculum acknowledges the pragmatic aspects of learning Malay, given its simplicity and widespread usage. Beyond regional borders, the utility of Malay extends, contributing to its potential as a lingua franca within the ASEAN community. This multifaceted language not only eases communication but also fosters an enhanced understanding of diverse lifestyles, cultures, and traditions across the region. Such linguistic inclusivity aligns seamlessly with the overarching vision of "One Vision, One Identity, One ASEAN Community," promoting unity and mutual comprehension within this dynamic and culturally rich collective (Prasert Yenprasit, 2013).

The Multi-cultural Literature Learning Model (McLL) can be flexibly incorporated into classrooms through diverse methods, aiming to enhance multi-cultural literature learning. One effective approach involves the utilization of Malay literature as a means to foster career-based communication. Nevertheless, an examination of the literature related to education in Thailand underscores a notable gap in research dedicated to exploring the current state, problems and needs concerning the McLL. Consequently, the researchers are motivated to delve into an inquiry aimed at comprehensively understanding the current state, problems and needs concerning the implementation of McLL in grade 11 level.

Research Questions

The research questions of this study were as follows: a) What are the current state, problems, and needs related to multicultural literature learning? b) What are desirable characteristics of the new McLL model emphasized career-based communication for teaching the Malay for Communication subject for grade 11 students?

Research Objectives

The research objectives of this study were two folds: a) to explore the current state, problems, and needs related to multicultural literature learning in Malay language educational context of Thailand; and b) to create a new Multi-cultural Literature Learning (McLL) model emphasis on career-based Malay communication for grade 11 students.

Literature Review

In this section, the authors reviewed the literature related to multicultural learning as follows.

Multicultural Learning

Multicultural Education is a concept that arose from the need to serve the diversity of races, classes, genders, languages, values, and beliefs in education. Multiculturalism is the social capital of cultural learning. It is an educational opportunity for learners from diverse cultures to learn together by developing positive values about cultural differences, and encouraging learners to develop their ability to learn in society happily. There is linguistic diversity within ethnic groups, using their own dialects as part of their identity, such as the local Malay, Thai Southern Jehe, and the Central Thai language; and there is also variation based on the accent of each locality. There is a diverse beauty that comes with the language exchange in learning the Malay language through use of literature as a medium of learning.

Literature is something that is expressed in the language of creation by humans through the imaginative process that aids in human communication, whether written or oral, in prose and poetry – a valuable asset contained within the elements of literature. Clearly, literature is thus the key in many ways, whether in Interdisciplinary learning, a model of learning management based on multicultural literature, and in multicultural literature alone is thus critical for learning in the 21st century era that emphasizes various skills. Teachers have emphasized professional communication skills in particular to develop effective learning management Cultural learning management places a pronounced emphasis on the integration of skills in a world where technology assumes a pivotal role. The conventional confines of learning, tethered to textbooks within classroom walls, have given way to a more expansive approach. In this paradigm, the learning experience transcends traditional boundaries, enabling access to information and educational resources on a global scale through the vast expanse of the internet. The overarching goal of this approach is to transform learning into an experience that seamlessly aligns with the unique interests and needs of each individual learner.

As technology solidifies its status as an indispensable tool, its integration into the learning process becomes imperative. Learners today don't solely rely on traditional textbooks; they also harness the power of the internet to access a wealth of information and educational resources on a global scale. Offering students the opportunity to leverage technology for creating works that manifest their knowledge and creativity is not just beneficial but essential.

Within the realm of cultural learning, a pivotal aspect lies in the development of skills across diverse learning styles. This acknowledgment underscores the importance of fostering adaptability and proficiency in various approaches to learning, recognizing that individuals may engage and interact with information in unique ways.

Cultivating proficiency in various learning styles constitutes a foundational element of cultural learning management. This approach goes beyond merely promoting self-directed learning and the use of technology; it also places a strong emphasis on nurturing critical thinking, problem-solving, communication, and collaboration skills through both formal and informal educational activities. The goal is to equip students not only with academic knowledge but also with the essential abilities to confront diverse perspectives and challenges that life presents. Recognizing the paramount importance of adaptability in our rapidly evolving world, cultural learning management further prioritizes the development of emotional intelligence, teamwork skills, and effective problem-solving capabilities. This strategic focus enables learners to adeptly navigate and adapt to changing situations, ensuring that they emerge not only academically proficient but also well-prepared to tackle the multifaceted challenges of life in the more complex world.

In summary, multicultural learning emerges as a response to the dynamic landscape of education in the digital age, where the pivotal roles of technology, adaptability, and diverse learning styles come to the forefront. The principles and concepts delved into in this research strive to be instrumental in shaping a more comprehensive and effective approach to education within the context of the contemporary world.

Research Methodology

This research employed survey research that targeted two distinct participant groups: teachers and students actively engaged in the teaching or learning of Malay Language within the multi-cultural classroom context. There were 33 teachers participated in the survey of current state, problems and needs of teaching with multi-cultural learning. They all had experience in teaching with multi-cultural learning for more than five years. In addition, 36 grade 11 students, who already had experience with multi-cultural learning classroom, were asked to respond to the survey of current state, problems and needs of teaching with multi-cultural learning. The participating teachers and students were affiliated with Narathiwat School under the jurisdiction of the Office of the Secondary Educational Service Area of Narathiwat.

Data Collection

To collect quantitative research data, the researchers utilized a questionnaire about the current state, problems, and needs in multicultural learning management. The items of Current State, Problems, and Needs in Multicultural Learning Management Questionnaire for teachers were five-level rating scale, which consisted of three main parts: a) Background of a respondent (3 items); b) Current state, Problems, and Needs in Multicultural Learning Management (21 items); and c) Suggestions for further improving multicultural learning management (1 open-ended item). In addition, the items of Current State, Problems, and Needs in Multicultural Learning Management Questionnaire for students were five-level rating scale, which consisted of three main parts: a) Background of a respondent (2 items); b) Current state, Problems, and Needs in Multicultural Learning Management (22 items); and c) Suggestions for further improving multicultural learning management (1 open-ended item).

Data Analysis

The researchers conducted an analysis of respondents' background data obtained from Part 1 of the questionnaire by tabulating frequencies and calculating percentages. Ratings from the five-level scale were interpreted as follows: Very High = 5, High = 4, Moderate = 3, Low = 2, and Lowest = 1. Then, the data from Part 2 was analyzed by calculating for mean and standard deviation (SD). The interpretation of mean ranges from each item in Part 2 of the questionnaire followed the guidelines outlined (Wongratana, 2007): 4.50 - 5.00: Indicates that the current state, problems, and needs were at a Very High level and 3.50 - 4.49, 2.50 - 3.49, 1.50 - 2.49, and 1.00 - 1.49 being interpreted as a High, Moderate, Low, and Very Low levels. Furthermore, the qualitative data Part 3 was subjected to content analysis.

Results and Discussion

The research results in accordance with the research questions as follows:

Teachers' Perspectives about Current State, Problems, and Needs in Multicultural Learning

From the survey of teachers' perspectives on the current state, issues, and needs in multicultural learning, there were 33 teachers responded to the survey. Predominantly, the respondents were female, constituting 72.7% of the sample. A breakdown by educational levels revealed that 51.50% of the participants were teachers from upper-secondary education (grades 10-12), followed by those from tertiary education (27.30%) and lower-secondary education (21.20%). The teachers' perspectives on the current state, issues, and needs in multicultural learning were presented in Table 1.

Item	Aspect	Mean	SD	Interpretation
Current state				
1.	Multicultural learning (ML) is suitable for school.	3.97	0.88	High
2.	ML is suitable for students.	4.03	0.92	High
3.	ML is important.	4.24	0.87	High
4.	ML is beneficial.	4.09	1.01	High
5.	A school administrator supports ML in school.	4.09	0.95	High
6.	Teachers support ML.	3.94	0.90	High
7.	The content of Malay language communication is suitable for ML.	4.30	0.73	High
8.	ML can develop students' central Malay language communication skills.	4.27	0.76	High
9.	ML management can develop students' career-based communication skills.	4.09	0.91	High
10	ML can raise students' awareness of cultural diversity.	4.15	0.75	High
	Overall average	**4.12**	**0.68**	**High**
Problems				
11.	The school is not yet ready for ML management.	2.67	0.96	Moderate

12.	Teachers are not yet ready for ML management.	2.70	1.07	Moderate
13.	Students are not yet ready ML management.	2.64	0.99	Moderate
14.	It is difficulty to conduct ML in my classroom context.	2.82	0.95	Moderate

17.	There is a lack of technology for ML.	3.03	1.14	Moderate
18.	There is a lack of ML resources.	3.18	1.18	Moderate
19.	Conducting ML takes too much time.	3.00	1.12	Moderate
	Overall average	**2.89**	**0.84**	Moderate
Needs				
20.	You want to keep ML management in your classroom.	4.24	0.79	High
21.	You want to keep ML in your school.	4.03	0.95	High
	Overall average	**4.14**	**0.79**	**High**

Table 1: Teachers' perspectives on the current state, problems and needs in multicultural learning

From Table 1, in overall, the teachers regarded the current state of multicultural learning at a high level (mean = 4.12, SD = 0.68). The top three items of current state, which were rated in a high level, were: Item 7: The content of Malay language communication is suitable for multicultural learning (mean = 4.30, SD = 0.73); followed by Item 8: Multicultural learning can develop students' central Malay language communication skills (mean = 4.27, SD = 0.76); and Item 3: Multicultural learning is important (mean = 4.24, SD = 0.87).

In addition, the responding teachers reflected a moderate level of problems in multicultural learning (mean = 2.89, SD = 0.84). The top three items of problems, which were rated in a moderate level, were: Item 18: There is a lack of multicultural learning resources (mean = 3.18, SD = 1.18); followed by Item 16: There is a lack of multicultural learning resources (mean = 3.12, SD = 1.02), and Item 17: There is a lack of technology for multicultural learning (mean = 3.03, SD = 1.24). In addition, the teachers stated a high level of needs of multicultural learning (mean = 4.14, SD = 0.79). They reflected that they highly needed to keep multicultural learning in their classroom (mean = 4.24, SD = 0.79) and schools (mean = 4.03, SD = 0.95).

Students' Perspectives About Current State, Problems, and Needs in Multicultural Learning

Of 36 students responded to the survey, the participating students were predominantly female, making up 82.9% of the respondents. Of all participants, 71.4% were 17 years old, 25.7% were 16 years old, and 2.9% were 15 years old. The students' opinions regarding the current state, problems, and needs in multicultural learning can be presented as Table 2.

Item	Aspect	Mean	SD	Interpretation
Current state				
1.	Multicultural learning (ML) is suitable for school.	4.06	0.84	High
2.	ML is suitable for students.	3.80	0.87	High
3.	You agree with ML.	4.00	8.80	High
4.	ML is suitable for the content of Malay language communication.	4.06	0.80	High
5.	ML is beneficial.	4.17	0.89	High
6.	ML is important.	4.09	0.78	High
	Overall average	**4.03**	**0.68**	**High**
Problems				
7.	The school is not yet ready for ML management.	2.97	0.92	Moderate
8.	Teachers are not yet ready for ML management.	2.80	1.02	Moderate
9.	Teachers lack skills in teaching with ML.	2.51	1.07	Moderate
10.	Teachers did not utilize enough technology in ML.	2.80	0.99	Moderate
11.	Students are not yet ready for ML.	2.91	0.85	Moderate
12.	Students have not yet developed sufficient communication skills in the central Malay language communication subject.	3.03	1.01	Moderate
13.	Students have not yet developed sufficient career-based communication skills in the Malay language communication subject at a satisfactory level.	3.00	0.84	Moderate
14.	Students have not yet developed a satisfactory level of awareness of cultural diversity in the Malay language communication subject.	3.14	1.06	Moderate
	Overall average	**2.90**	**0.73**	**Moderate**
Needs				
15.	The school should prepare more for ML.	3.86	0.94	High
16.	Teachers should develop readiness for multicultural learning.	3.74	1.07	High
17.	Teachers should enhance skills in ML.	3.74	1.01	High
18.	Teachers should increase the use of technology in ML.	3.83	0.89	High
19.	Students need to be developed their readiness for ML.	3.91	0.85	High
20.	Students need to develop central Malay language communication skills.	3.86	0.94	High
21.	Students need to develop career-based communication skills in the Malay language.	3.83	1.04	High
22.	Students need the develop of awareness of cultural diversity in the Malay language communication subject.	4.00	0.94	High
	Overall average	**3.85**	**0.75**	**High**

Table 2: Students' perspectives on the current state, problems and needs in multicultural learning

In summary, students stated the current state of multicultural learning at a high level (mean = 4.03, SD = 0.68). The three highest-rated items in the current state were: Item 5: Multicultural learning is beneficial (mean = 4.17, SD = 0.89); followed by Item 6: Multicultural learning is important (mean = 4.09, SD = 0.78); and Item 4: multicultural learning is suitable for the content of the Malay language communication subject (mean = 4.06, SD = 0.80). These three items were rated in a high level.

In addition, the students reflected the problems of multicultural learning in a moderate level (mean = 2.90, SD = 0.73). The top three problems of multicultural learning were: Item 14: Students have not yet developed awareness of cultural diversity in the Malay language communication subject (mean = 3.14, SD = 1.06); followed by Item 12: Students have not yet developed sufficient communication skills in the central Malay language communication subject (mean = 3.03, SD = 1.01); and Item 13: Students have not yet developed sufficient career-based communication skills in the Malay language communication subject at a satisfactory level, with a moderate level of problems (mean = 3.00, SD = 0.84).

The students stated the high level of needs of multicultural learning (mean = 3.85, SD = 0.75). The top three needs of multicultural learning were: Item 22: Students need the develop of awareness of cultural diversity in the Malay language communication subject (mean = 4.00, SD = 0.94); followed by Item 19: Students need to be developed their readiness for multicultural learning (Mean = 3.91, SD = 0.85); and Item 20: Students need to develop central Malay language communication skills (Mean = 3.86, SD = 0.94).

Desirable Characteristics of the Multicultural Learning Model Emphasized Career-Based Communication for the Malay for Communication Subject for Grade 11 Students

The researchers conducted a comprehensive review of literature pertaining to Literature-based Learning and Multicultural Learning. Subsequently, the Multi-cultural Literature Learning Model (MCLL) was developed.

The literatures related to multicultural learning or education include: Mitchell and Salsbury (1999), Banks (2001), National Council for Accreditation of Teacher Education (2002, Sungthong (2008), Institute of Research and Development for Health of Southern Thailand (2010), Choochuen (2012), Liewvarin (2009), Najib al-Attas (2002), Wati (1965), Sastera, Kualalumpur and Antara (1965), Dewan (2007), Uden (1994) and Saesong (2009). The key characteristics of Multi-cultural Literature Learning Model (MCLL) can be presented as Table 3.

Key Characteristics of Literature-based Learning	Key Characteristics of Multicultural Learning	Key Characteristics of MCLL
Literature is an art expressed through language, originating from human creativity and imaginative processes.	Education that embraces cultural diversity	**Learning approach utilized language literature from various cultures**
Literature yields diverse values for humanity and facilitates communication among individuals	Aim to foster positive attitudes and values regarding cultural diversity and enhance the ability to learn about different cultures	**Aim to use literature to promote learners' development of communication skills, socialization, cultural learning, and positive values related to cultural diversity**
	Encourages learners to develop the ability to learn and integrate into society with happiness	
Literature can be divided into literary works of art and literary works of expression, both in prose and verse forms.		**Language literatures are classified into literary works of art and literary works of expression, both in prose and verse forms**
The components of literature include rhythm, melody, word arrangement, clear meaning, and fundamental ideas		**The components of language literature include rhythm, melody, word arrangement, clear meaning, and fundamental ideas**

Table 3: Synthesis of key characteristics of Multi-cultural Literature
Learning Model (MCLL)

The Multicultural Literature Learning Model (MCLL) refers to an educational approach that utilizes language literature from diverse cultures. The objective of employing literature is to promote the development of communication skills, socialization, cultural learning, and positive values regarding cultural diversity among learners (Communication, Socialization, Culture Learning). Language literature is categorized into literary works of art and literary works of expression, both in prose and verse forms. The components of language literature include rhythm, melody, word arrangement, clear meaning, and fundamental ideas.

Discussion

In line with the finding from this study, Chomphu Phuengtham (2013) studied the current situation of schools under the jurisdiction of the Ministry of Education in the border provinces of Thailand that share borders with the Union of Myanmar. The finding indicated that the overall educational management situation of these schools falls at a Moderate level in almost every aspect, with the exception of the preservation of local culture, which is rated at a high level. The top three areas are the preservation of local culture, learning conflict resolution through peaceful means, and the continuous creation of educational opportunities.

Regarding cultural diversity research, Nantaburom and Na Ayuthaya (2015) studied the effects of multicultural education-based prejudice reeducation activities on understanding

diversity in races, religions and cultures among upper secondary school students in the ASEAN community. The results were as follows: 1) After the treatment, the attitude scores posttest of understanding of diversity in races, religions and culture in the ASEAN community of students taught by prejudice reduction were higher than pretest scores at 0.05 level of significance. 2) Students changed their attitudes by learning contents which based on the diversity of races, religions and culture in the ASEAN community. Students gained their social skills, thinking skills and learning from others' perspective through prejudice reduction activities which were cooperative activities, critical thinking activities, discussion, drama technique, role playing, simulation, case studies and facing with problems situation activities. This may fulfil the new teaching model created from this study so called the Multicultural Literature Learning Model (MCLL).

Conclusion

This study reveals insights into the current state, problems and needs in implementing multicultural learning of the Malay language communication for grade 11 students in southern region of Thailand. The current state indicates that the content of Malay language communication is suitable for multicultural learning. Implementing multicultural learning can enhance students' proficiency in Malay language communication.

School Leaders Perceptions on STEAM as a Pedagogical Approach in School Education in Nepal

Basanta L Lamichhane, Kathmandu University School of Education, Nepal

Abstract

In Nepal, there is a growing enthusiasm for the expansion of STEAM education within the school system, aiming to equip students with the skills necessary to navigate an increasingly challenging world and address complex problems. However, the implementation of STEAM in school education poses significant challenges for educators, teachers, and other stakeholders, requiring a comprehensive understanding of the necessity of integrating STEAM into the curriculum. This study seeks to investigate how school leaders perceive STEAM education and recognize its importance in the educational landscape. Employing a qualitative research design, the study utilizes narrative inquiry to gain insights into the perspectives of school leaders, who hold a pivotal role in the successful integration of STEAM in schools. The research delves into various perceptions of school leaders regarding STEAM as an integrated approach to teaching and learning activities. The findings reveal that there is a lack of sufficient awareness among school leaders about STEAM, emphasizing the need for a deeper understanding of its pedagogical significance. The study highlights the importance of regular engagement with leaders, teachers, and stakeholders to foster an awareness of the necessity of STEAM as a pedagogical approach. Despite recognizing the need for STEAM, school leaders express the allure of continuous support for both leaders and teachers to effectively understand and implement STEAM in Nepalese schools. In light of the study's results, it is recommended that further research be conducted to delve into this subject in more detail. Additionally, there is a call for the continuous expansion of workshops and training programs targeted at school leaders and teachers to enhance their understanding and ensure the sustainable implementation of STEAM in schools throughout Nepal.

Introduction

STEAM (Science, Technology, Engineering, Arts, and Mathematics) is an emerging pedagogical approach to education that empowers teachers in the classroom. There is a growing enthusiasm for STEAM education, recognizing its role in preparing students for an increasingly complex and competitive global environment (Boice et al., 2011). STEAM encourages teachers to utilize project-based, inquiry-based, and hands-on learning activities, fostering an inclusive and integrative learning environment where all students can engage and contribute productively. It serves as an access point for students' inquiry, creativity, critical thinking, and inclusive dialogue while teaching various subjects in an integrated form. STEAM education uses science, technology, engineering, arts, and mathematics as guiding sources for students to engage in dialogues, inquiry, and critical thinking (Riley & Solic, 2017).

Furthermore, STEAM assures students' engagement in creative work through group collaboration, resulting in innovative outcomes. The STEAM curriculum is learner-centric, incorporating instructional pedagogies such as inquiry-based, project-based, art-based, and research-based learning, with teachers serving as facilitators rather than direct problem solvers. Herro et al. (2018) suggest that these learning opportunities foster innovative thinking and creativity in solving authentic problems.

The use of the STEAM approach has become indispensable in school education, emerging as one of the latest and most influential teaching tools for the democratic and meaningful participation of students in the learning process through various activities, projects, and practical experiences. Hammad and Khan (2021) argue that implementing STEAM in school education engages students with cognitive tools and complex reasoning skills, involving them in scientific research, philosophy, and ethics. Integrating STEAM into teaching and learning activities in the classroom helps build 21st-century core skills, preparing students for growth and progress.

However, the current education system often neglects the teaching of problem-solving skills and collaboration. To address this, schools need to transition from traditional rote learning to a holistic interdisciplinary approach like STEAM (Lanthan, 2017). STEAM is considered an interdisciplinary to transdisciplinary approach to teaching and learning (Liao, 2016). Despite its potential, the execution of STEAM in school education remains limited, with school leaders holding different perspectives on how to conceptualize STEAM based on purpose, the nature of discipline integration, and their roles.

The awareness and perception of school leaders regarding STEAM play a significant role in its implementation in the teaching and learning process. The challenges lie in interpreting and enacting STEAM in classrooms, as leaders and teachers may not be sufficiently familiar with STEAM principles. Proactive and committed school leaders are essential to promoting high-quality education using STEAM instruction, given the inherent challenges. This is influenced by teachers' preparedness, attitude, and willingness. School leaders need to focus on motivating all stakeholders for STEAM implementation, and understanding leaders' perceptions of STEAM as pedagogical tools. Therefore, it is essential to investigate how school leaders perceive STEAM as a pedagogical approach and understand their views on its implementation, addressing the what, how, and why of their perspectives.

Problem Statement

The understanding of the STEAM pedagogical approach by school leaders is crucial for its effective implementation in classrooms. The growing demand for STEAM education at the school level emphasizes the need for learners to develop creativity and innovation by comprehending science, technology, and arts. Consequently, the leadership's skills, knowledge, and understanding become pivotal for the successful integration of STEAM into teaching and learning activities. However, the extent to which school leaders are aware of STEAM and their role in supporting teachers for its effective implementation remains uncertain. Through interactions with other school leaders, it has been observed that a significant number are unaware of STEAM. Thus, there is a pressing need to equip school leaders with the necessary knowledge and understanding through professional development strategies to enhance their capacity for STEAM implementation.

Purpose of the Study

The primary aim of this study is to enhance the perception of school leaders regarding STEAM as a pedagogical approach to education. The study seeks to analyze how leaders recognize and define the direction of STEAM education. Specifically, it explores leaders' perceptions of STEAM as a pedagogical approach and aims to provide recommendations for further steps to ensure the effective and meaningful integration of STEAM in school education.

Research Question

i) How do school leaders perceive STEAM Education?

Significance of the Study

This study holds significant importance in extracting the knowledge, understanding, and skills of leaders concerning STEAM as a pedagogical approach. It helps readers comprehend the role of school leaders in creating an environment conducive to STEAM activities. Additionally, the study conducts interviews with school leaders to understand their perceptions of STEAM and how, if at all, they are implementing it. Given that STEAM is a valuable tool for fostering problem-solving, creativity, and innovative skills in students, this research aids school management in integrating the STEAM approach into teaching and learning activities. The study also recommends policy changes in schools to incorporate the STEAM approach. Recognizing that teachers are key players in STEAM implementation, the study also explores the need for a STEAM professional development program for both school leaders and teachers.

Literature Review

In this section, I have reviewed various scholarly articles and journals related to STEAM in education. The literature indicates a global trend of increasing implementation of STEAM in schools worldwide. STEAM, an integrated pedagogical approach, represents a paradigm shift in learning methodologies, fostering innovation, creativity, and practicality in study. It amalgamates Science, Technology, Engineering, Arts, and Mathematics, engaging students actively in addressing real-world problems (de la Garza, 2021). This approach aims to equip

students with the knowledge, attitudes, and skills necessary for problem-solving, designing, and explaining natural phenomena (Harris & Bruin, 2018).

STEAM emerges as a powerful pedagogical approach, emphasizing interactive and activity-based learning, project-based learning, research-based learning, and innovative learning. Notably, STEAM enhances students' capacity to innovate (Taylor, 2016), making it an optimal educational tool. The linchpin for transforming traditional education to the new STEAM approach is the school leader, responsible for reshaping the vision and mission of academic success for all students. The perception of school leaders plays a pivotal role in promoting the high quality of STEAM as a pedagogical approach (Lewis, 2015).

However, my interactions with school leaders reveal a lack of clear understanding regarding STEAM and its transformative impact on students' creativity, critical thinking, and innovation. Many leaders remain unaware of STEAM, even those who have implemented it express limited knowledge. In Nepal, there is a growing interest in STEAM implementation, but leaders need to comprehend its importance in education.

Research indicates a significant gap between leaders' perceptions and actual STEAM practices in education (Byun et al., 2016). Therefore, leaders' professional development is crucial to bridge this gap in Nepal. Most school leaders are unconscious of the need to implement STEAM in education.

Moreover, the collaborative effort of teachers from various disciplines is vital for understanding and implementing STEAM effectively (Jho et al., 2016). Teachers should engage in collaborative work to develop interdisciplinary instruction and communicate effectively. Challenges in implementing STEAM include considering social and emotional perspectives of learning and adapting to ever-changing pedagogy and technology (Luitel et al., 2020).

However, resistance to change persists among some leaders and teachers who prefer traditional teaching methods. Young, self-motivated teachers are eager for change but face challenges such as insufficient time and a lack of educational materials for STEAM implementation (Lee & Shin, 2014).

Therefore, leaders' professional development based on STEAM becomes crucial. Cook and Bush (2018) emphasize the role of school leaders in setting a vision and mission that focuses on the research and integration of the STEAM approach. This shift from system leadership to instructional leadership supports school leaders in recognizing the need for STEAM to enhance student engagement and foster creativity.

Kim (2014) argues that sustainable professional development for leaders should involve designing courses and lesson plans based on content and the integration of the STEAM approach in school education. The government of Nepal, through its National Education Policy 2076, aims to integrate STEAM education into the curriculum at all levels (NEP, 2076). However, challenges related to infrastructure, the readiness of leaders, and the realization of this commitment remain to be addressed.

Theoretical Review

In the exploration of issues related to leaders' perceptions and attitudes toward the STEAM approach and its implementation in schools, two distinct theoretical perspectives were employed in this research study. To elucidate these issues effectively, the study drew upon the Person Perception Theory, focusing on the cognitive processes involved in forming impressions of others and deriving conclusions from these impressions (Bargh et al., 1996). Within the realm of social psychology, Person Perception Theory addresses the social processing issues that influence how individuals perceive, interpret, and extract attitudes and behaviors from others (Cunningham, 2019). This perspective is particularly valuable for understanding the personal attributes of school leaders and teachers and their role in the transformative process within education. The aim is to uncover the personal attributes relevant to the issues at hand and to examine how leaders perceive STEAM as an interdisciplinary approach.

Person perception is a subjective process influenced by various variables, including the observation of people, the context of the situation, personal traits, and experiences. It facilitates a critical analysis of leaders' thoughts and perceptions regarding the identified issues.

On the other hand, social constructivism emerges as another significant theoretical perspective for instruction and practice, grounded in social experiences. School leaders engage in diverse interactions and participate in workshops and training sessions regularly. These interactions, visits, and participations contribute significantly to shaping perceptions of STEAM as a pedagogical approach. Social constructivism emphasizes the fundamental role of social interactions in the cognitive development of learners (Vygotsky & Cole, 1978). Regular participation in workshops, interactions, and collaborations is crucial for the complete integration of STEAM in schools. This study aims to construct knowledge, understanding, and skills among school leaders regarding STEAM, ultimately facilitating the implementation of the STEAM approach in school education.

For the successful integration of various disciplines under the STEAM approach, consistent interactions with teachers from different disciplines and other stakeholders are essential. This interaction allows for the implementation of STEAM in schools by garnering ideas and perceptions from observations, interactions, and collaborations. The constructivism theory underlines the significance of authentic learning experiences reflective of students' environments, involving the acquisition of understanding through interaction and collaboration with others, such as teachers, leaders, and experts (Wilson, 1996). This dialectic perspective aids in interpreting personal perceptions on the raised or forthcoming issues through the qualitative research design.

Methodology

Research Approach

In this investigation, I employed interpretivism paradigms to elucidate leaders' perspectives on STEAM education. The focus was on uncovering leaders' perceptions regarding the implementation of STEAM as a pedagogical approach, exploring their experiences, beliefs, and how these factors influence the incorporation of STEAM in schools. To address the research question, a qualitative approach was chosen. Intensive, focused, and purposeful

interviews and interactions were conducted with four school leaders to gather qualitative data. The use of narrative in this study facilitated the extraction of personal perceptions from respondents based on their experiences and beliefs.

The qualitative approach was selected to enable an in-depth exploration of leaders' perceptions regarding STEAM and its integration into teaching activities at schools. This method facilitated a comprehensive understanding of school leaders' perspectives on using STEAM in educational settings.

From the total schools in Budhanilkantha Municipality, four school leaders were selected for in-depth inquiry, comprising two from public schools (one male and one female) and two from private schools (both males). To ensure varied information related to the issue at hand, one public and one private school where STEAM or STEAM-related activities were already underway were chosen. Additionally, one public and one private school were selected where such practices were not being implemented. Purpose sampling was adopted to capture diverse perspectives on the implementation of STEAM in schools.

Method of Data Collection

To gather comprehensive information, semi-structured open-ended interview questions were prepared. The interviews took place separately in the respective offices of the school leaders in physical mode. Open-ended questions provided participants with flexibility in responding, aligning with Creswell's (2012) recommendation. In-depth interviews and focus groups were considered ideal methods for collecting data, aiming to extract individual experiences and perceptions of STEAM in education as a pedagogical approach.

A detailed interview guideline and formulated questionnaires were utilized, with verbal consent obtained through mobile phone calls before conducting the interviews. The interviews were conducted on different days, with a single-day session for public school leaders and a subsequent day for private school leaders. Responses were recorded using a mobile device, and brief notes were taken during the interviews. Prompts were employed to encourage participants to expand on their responses. The recorded information was transcribed for further analysis. The qualitative data were gathered through in-depth interviews and conversations, focusing on participants' academic background, professions, core subject areas, and willingness to progress in understanding their perceptions of STEAM practices in schools.

In a qualitative study, ethical considerations are of particular importance due to the in-depth nature of the study process (Arifin, 2018). To uphold ethical values, measures were taken, including safeguarding the identity of schools and leaders, obtaining verbal consent via phone calls before interviews, informing respondents about the issues, and securing consent for audio recording. Interviews were conducted in the leaders' offices at their respective schools on different dates and times, with respondents participating voluntarily. To protect personal identity, school leaders were coded as respondents A, B, C, and D.

Participants

A purposeful selection of four school leaders within Budhanilkantha Municipality was undertaken to gather perceptual data for the study. The participants comprised two school leaders from different public schools and two from private schools. Among the four schools,

one public and one private institution had initiated the concept of STEAM. The demographic details of the participants are outlined as follows:

Participants	Sex	Age (in years)	Type of School	Academic Background	Work Experiences as Leader	STEAM Experiences
A	Female	52 years	Public	Science Background at first, M. Ed. in Nepali T. U.	27 years	Intermediate
B	Male	48 years	Public	B. Sc., M. Ed., EPM from KU	13 years	Heard term STEAM with little knowledge
C	Male	49 years	Private	Master in Economics	17 years	Intermediate
D	Male	47	Private	Master in English and M. Phil in English from PU	15 years	Heard term STEAM with little knowledge

Results and Discussions

This study aimed to investigate the perspectives of school leaders on the implementation of STEAM (Science, Technology, Engineering, Arts, and Mathematics) in education using a qualitative research approach. The study employed a purposive sampling method in the context of Budhanilkantha Municipality, involving respondents from both public and private schools. The findings, derived from four in-depth interviews and the researcher's observations, are presented in three overarching themes.

STEAM in Education: An Integrated Approach

This study aimed to perceive and recognize people's experiences and knowledge regarding the practice of STEAM in education. The information obtained from selected respondents explored the role of academic background, experiences, and participation in this context. Respondent A reported that, due to a science background, her academic starting enabled her to view STEAM in school as an integrated approach to learning. She emphasized the importance of long experiences and various pedagogical exposures, which supported her in employing effective teaching and learning approaches.

Respondent A further highlighted that STEAM, as an innovative and creative pedagogical approach, amalgamates Science, Technology, Engineering, and Mathematics. Involving students in STEAM enhances learning tendencies and outcomes, fostering problem-solving skills. Active, dynamic, and well-trained leaders, according to respondent A, play a significant role in understanding and implementing STEAM in school education. STEAM, as an integrated pedagogical approach, enhances students' understanding across multiple

disciplines, contributing to improved problem-solving skills, application of science concepts, and advancements in technology and engineering (Psycharis, 2018).

Arts and Mathematics in STEAM are deemed essential, with arts playing a pivotal role in fostering creativity, expression, emotions, feelings, and imagination. The aesthetic value of arts in STEAM contributes to students becoming more creative and critical thinkers (Tan et al., 2021). Respondent B, a science background professional with an M. Phil in Education Leadership, expressed that STEAM is crucial for fostering creativity, critical thinking, innovation, and problem-solving skills. He provided an example illustrating the fusion of Science, Technology, Engineering, Arts, and Mathematics in a comprehensive learning approach.

According to Respondent B, STEAM is an integrated method that necessitates a shift in teaching methods within the classroom. He emphasized the importance of teacher preparedness and willingness, which is achievable with energetic, dynamic, and change-making leaders in schools. Respondent B asserted that STEAM is the best pedagogical method for teaching and learning in schools in the 21st century, indicating a paradigm shift in educational practices (Tan et al., 2021).

Respondent C, a leader in a private school with a management background, enthusiastically participated in the interview. Despite not having a detailed understanding of STEAM, the respondent acknowledged its significance through collaboration with a social enterprise. The involvement in activities of this organization helped the respondent recognize STEAM as a robust and influential integrated pedagogical approach in teaching and learning in schools.

The curriculum is essential for teaching specific disciplines in schools, but the integration of different disciplines for lifelong learning poses challenges. The Nepalese government has introduced an integrated curriculum in primary education, aligning with the STEAM model (Yakman, 2010). Respondent C emphasized the importance of STEAM in meeting the goals of 21st-century education, focusing on creativity, critical thinking, collaboration, communication, imagination, global citizenship, problem-solving, and digital literacy.

21st-century education aims to enhance survival skills through soft skills and technological skills, demanding their integration into schools. However, this integration creates challenges in pedagogy and assessment, with curriculum, professional development, and assessment being intertwined factors (Soland et al., 2013; Erdem, 2020). Aligning STEAM in the curriculum is deemed essential for a better life in the world, fostering new entrepreneurship, sociability, and adaptability.

Respondent D, with an academic background in mathematics and literature, has served as a school leader in various institutions. As a member of the PABSON committee, Respondent D participated in discussions, training, and workshops, gaining insights into the use of STEAM in education as an integrated approach. Although not extensively aware of its implementation, Respondent D recognized STEAM as an integrated curriculum emphasizing science, technology, engineering, arts, and mathematics through multidisciplinary and interdisciplinary approaches.

STEAM education has gained popularity, emphasizing interdisciplinary and transdisciplinary learning approaches (Liliawati et al., 2018). Respondents in this study, through interviews, expressed STEAM as an integrated approach to teaching and learning, essential for 21st-

century education. STEAM incorporates innovative, creative, collaborative, and communicative skills, addressing real-world problem-solving.

Moreover, Richard & Biffle (2016) argue that STEAM is a multidisciplinary to transdisciplinary approach, focusing on problem-based inquiry, research, lifelong holistic learning, and enhancing problem-solving, critical thinking, and tactile skills (Maeda, 2014). Respondents highlighted that STEAM develops self-reflection, communication, collaboration, creativity, and innovation in students, facilitating holistic and innovative learning (Naithram, 2014). Although respondents acknowledged the importance of STEAM in school-level education, they expressed a lack of a clear concept on its implementation in existing classroom settings.

Implementation of the STEAM Approach Poses Challenges

This study aims to explore how school leaders perceive and act upon the practices of STEAM education within their schools, focusing on the integration of STEAM into classroom teaching and learning activities. Interview questions under this theme seek to identify the efforts STEAM leaders undertake to embed STEAM across various content areas in the school. Respondent A asserts that integrating STEAM into the teaching and learning process enhances liveliness, effectiveness, and creativity. The respondent emphasizes the successful initiation of the STEAM approach after training 40 teachers, leading to enthusiastic teacher adoption and effective teamwork. The gradual growth in this approach is illustrated through examples of traditional object displays, incorporating indigenous knowledge to enhance STEAM practices in the school.

The implementation of the STEAM approach at the school level is acknowledged as challenging but crucial, with the leader's role being pivotal in ensuring success. Proactive, dynamic, and committed leaders play a significant role in embedding STEAM in teaching and learning activities at the school level. Collaboration among teachers from different disciplines is deemed essential for developing STEAM-based curricula and lesson plans (Hammad & Khan, 2021). The integration of traditional and indigenous tools, techniques, arts, and artifacts further aids in aligning STEAM subjects with traditional ones.

Respondent B provides a different perspective, highlighting the difficulties faced in implementing STEAM practices in a government school setting. Resistance to change among teachers, coupled with concerns about job security, poses obstacles to the successful integration of the STEAM approach. Effective collaboration between leaders and teachers is deemed crucial for overcoming these challenges and ensuring the successful implementation of STEAM in school-level education.

Respondent C, a leader in a private school, emphasizes the inevitability of incorporating STEAM practices in teaching and learning processes. Despite challenges in perfect implementation across all grades and subjects, the leader underscores the role of leaders' perception in driving effective STEAM practices. Professional development, collaboration among teachers, and effective communication of concepts are identified as key factors supporting STEAM in the school curriculum (Hammad & Khan, 2021).

Respondent D expresses reservations about the feasibility of integrating STEAM during regular class hours, citing teachers' and parents' time constraints. However, acknowledging

the importance of incorporating new approaches in the curriculum, the respondent highlights the challenges associated with teachers' preparedness, attitudes, and interests.

The common theme among respondents is the unanimous recognition of the essential nature of STEAM in school education, despite facing challenges. Barriers include teachers' preparedness, willingness, and proactiveness, as well as national curriculum constraints, time limitations, and a marks-oriented mindset among guardians. Challenges in STEAM implementation reported by teachers include collaboration difficulties, increased workload, and a lack of understanding of STEAM integration (Harro et al., 2018).

Sustainability of the STEAM Approach in Schools Requires Regular Professional Development Programs

In Nepal, a paradigm shift in pedagogical approaches from traditional 'chalk and talk' to innovative, effective, and creative methods is imperative. STEAM, an integrated learning approach, amalgamates various disciplines to address and solve real-life problems. Given the multitude of challenges at the community, national, and international levels, as well as environmental concerns crucial for survival, integrating STEAM into teaching and learning becomes essential. This approach connects knowledge and skills with real-life situations and environments, fostering the development of better individuals for the future.

However, ensuring the sustainability of implementing STEAM in teaching and learning activities faces challenges. Respondent A emphasized the necessity of regular discussions, interactions, and participation in training and workshops for the effective and sustainable implementation of STEAM. Despite acknowledging STEAM's significance, challenges such as budget constraints, limited space, and primarily teachers' attitudes and behavior hinder the integration of STEAM in school education.

Respondent A highlighted that participation in various workshops and STEAM training sessions positively influenced her and motivated her to promote STEAM in her school. Despite the growing interest in STEAM education in Nepal, its sustainable implementation is hindered by factors such as teacher and leader awareness, training on STEAM pedagogy, teachers' attitudes, willingness, and budget constraints. Workshops and training sessions have proven to increase teachers' interest in implementing STEAM in their classrooms and enhance their enjoyment of teaching STEAM lessons (Boice et al., 2021). Continuous and robust support for teachers plays a crucial role in the sustainable implementation of STEAM.

In terms of sustainability, respondent B outlined plans to incorporate STEAM in their system, including STEAM-based training for teachers in the current academic session with the collaboration of Kathmandu University and other organizations. Kathmandu University School of Education (KUSOED) has introduced programs focusing on STEAM education, offering training and workshops for schoolteachers and leaders.

Respondent C demonstrated a proactive stance, emphasizing the importance of nurturing students' innovative attributes through engaging activities for a safer and wiser world. Commitment from school leaders and regular support to teachers is crucial for the perfect implementation of STEAM in schools. Leader awareness and proactiveness are essential for conducting training and workshops, enhancing teacher efficacy, and ensuring sustainable STEAM use.

In comparison, respondent D highlighted the importance of ongoing support through training, workshops, and interactions for effective STEAM implementation. The attributes of teachers can impact STEAM implementation negatively, necessitating leaders' roles in motivating teachers to understand and implement STEAM in teaching and learning activities. Implementing STEAM in the classroom presents challenges, requiring collaboration, increased workload, and an understanding of STEAM integration. Therefore, teachers should be continuously trained and encouraged for STEAM implementation through practical and interactive workshops.

Respondents collectively agreed that the perception of school leaders on STEAM is often insufficient, and regular support for both leaders and teachers is essential for effective STEAM implementation at the school level. Professional development programs for leaders and teachers increase confidence in planning and implementing STEAM, fostering interest, motivation, creativity, and collaborative abilities. Respondents emphasized the need for advanced professional development training and workshops that are practical, interactive, and hands-on, ensuring that educators can directly apply what they learn in the classroom.

Findings and Conclusion

In the context of Nepal, STEAM emerges as a novel integrated pedagogical approach in school-level education, garnering significant attention in educational forums and institutions. Kathmandu University School of Education (KUSoEd) has taken proactive steps by introducing Master and M. Phil courses in STEAM education. These programs aim to produce well-qualified and trained schoolteachers and leaders, enabling them to effectively implement STEAM in school-level education.

The qualitative narrative inquiry and discussions conducted for this study revealed key insights. The primary conclusion is that school leaders exhibit varying degrees of awareness about STEAM. Approximately half of the participants have initiated the implementation of STEAM in their schools to some extent, although they express uncertainty about the precise methods. The remaining respondents are aware of STEAM but have not yet initiated its implementation. All participants unanimously acknowledge the importance of STEAM in education, citing its positive impact on students' creativity, critical thinking, and engagement. However, the study underscores that the leadership's role is crucial, as school leaders directly guide teachers in integrating STEAM into their teaching practices.

Sanchez et al. (2020) highlight the unique role of school leaders in guiding and supporting the professional development of teachers. Consequently, the perception of school leaders regarding the practices of STEAM in school education plays a pivotal role. Effective implementation becomes more feasible when leaders possess a well-crafted understanding of STEAM and are committed to its application in schools. Respondents emphasize the need for sequential and continuous professional development training and workshops for teachers to successfully adopt the STEAM approach in teaching-learning activities.

The study participants, primarily from public schools, note the challenges posed by teachers' resistance to change and their hesitation to embrace a new system or approach, particularly when transitioning from traditional methods. Teachers' efficacy, interest, and attitudes emerge as consistent factors hindering the perception and implementation of STEAM in schools.

Collaboration among teachers of different subjects is identified as a key strategy for enhancing understanding and support for STEAM. The essence of STEAM education lies in applying knowledge to real-life situations and fostering problem-solving skills through innovation, creativity, critical thinking, and collaboration.

In the context of Nepal, the study finds that only a limited number of school leaders have a well-formed perception of STEAM and are committed to its practice. However, a majority of school leaders remain unaware of STEAM. Consequently, the study advocates for the widespread adoption of the STEAM approach across all schools. Achieving this goal requires comprehensive training, workshops, and continuous support for schoolteachers and leaders, enabling them to fully embrace and understand STEAM for the benefit of present and future generations.

Recommendation

Based on the results and discussions presented, several recommendations emerge for the effective implementation of STEAM (Science, Technology, Engineering, Arts, and Mathematics) education in schools. These recommendations aim to foster a conducive environment for nurturing students' creativity and problem-solving skills:

Commitment of School Leaders: The transformation from traditional schools to STEAM-based institutions requires a steadfast commitment from school leaders. To enhance students' creativity and problem-solving skills, school leaders should actively embrace and drive the necessary changes.

Professional Development for Teachers: School leaders play a pivotal role in facilitating the integration of STEAM into the curriculum. They should prioritize engaging teachers in professional development programs that focus on the integrated approach of teaching and learning within the STEAM framework. This ensures that educators are well-equipped to deliver STEAM-based education effectively.

Self-Motivation and Collaboration: Both school leaders and teachers must exhibit self-motivation and commitment to the practice of STEAM in schools. It is imperative that they approach this educational shift with positivity, willingness, and a keen interest in fostering discussions and collaborations. This collaborative spirit is essential for the seamless and effective implementation of STEAM education.

Further Research: To deepen our understanding of the perceptions of leaders and teachers regarding STEAM education, additional studies should be conducted. These studies could delve into the specific attitudes, challenges, and opportunities that educators encounter when transitioning to STEAM-based teaching methodologies.

Leadership in STEAM Integration: School leaders are encouraged to take on the role of STEAM leaders. By assuming this leadership position, they can actively equip, encourage, and motivate teachers to embrace the pedagogical changes associated with transitioning from traditional teaching methods to the more integrated and holistic approach of STEAM education. This leadership is crucial in fostering a positive and supportive environment for both educators and students.

Appendix

Questionnaires
Perceptions of School Leaders' on the Practices of STEAM as Pedagogical Approach in School Education

Questionnaire for quantitative information
Respondent's Information
Name of respondent: …………………………………………………………………....
Age.: ……………………..Sex: Male ☐   Female ☐
Subjective Background: …………………
Qualification………………………………
Experience: ……………… years   Pedagogy used in classroom: …………….
Training and workshop taken:………………. Times   Type: ……………………….
Name of school and address:
Types of school: Private ☐   Public ☐

Questionnaires for interview

1. Would you introduce yourself and little about family background?
2. How do you describe your experiences in school as leader, including elementary school, middle school, and high school?
3. How familiar are you with teaching pedagogy practiced in school?
4. Have been you involved in training or workshop related to pedagogical approaches in school? Please share your experiences
5. Describe your Understanding of STEAM in Education as a pedagogy?
6. What do you believe that STEAM is appropriate teaching learning pedagogy in this era? Elaborate based on your experiences.
7. What would you like others to know about how schools can better educate students through STEAM approach in learning process inside the classroom?
8. How often your teachers use STEAM approach in classroom teaching – learning activities?
9. Are you satisfied whatever teachers are using STEAM in teaching learning activities? If yes or no, present your argument over the statement.
10. What reformative efforts are required for effective implementation of STEAM in school?

Note: Some probing questions were asked for the extraction of further perception of respondents on STEAM as pedagogical approach i

Exploring Classroom Interactions to Facilitate the Tacit Knowledge Construction of International Baccalaureate Secondary School Students in Hong Kong

Aruna Venkatesh, The Hong Kong Polytechnic University, Hong Kong SAR

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

In an interconnected and global society that is rapidly changing, it becomes imperative to equip students with the required tacit life skills to meet the challenges of the modern world. The International Baccalaureate (IB) is a highly regarded educational system providing a holistic and interdisciplinary approach that nurtures its students as global citizens with a broad cultural perspective. This study investigates the acquisition of tacit skills and the construction of tacit knowledge of secondary school IB students in Hong Kong. The focus is on the role of social interactions in the classroom that facilitates its construction. A mixed-method approach was designed for data collection and analysis. The study's outcomes contribute towards developing a framework and suggest teaching strategies for effective tacit knowledge construction. The paper discusses the findings of a pilot study conducted in an IB school in Hong Kong.

Keywords: Tacit Knowledge Construction, IB Classroom Interactions, Social Interactive Spaces

Introduction

The International Baccalaureate (IB) educational program is becoming increasingly widespread as setting high standards for education. With its global vision and rigorous approach, it provides a qualification that universities around the world recognise. The IB seeks to foster its students with the knowledge and adaptability to succeed in a global society that is beyond the scope of traditional academic learning. Not only do IB students learn to think about global issues through multiple perspectives critically, but they also learn to appreciate other cultural perspectives.

The IB education system is popular in higher education because it focuses on teaching essential life skills like critical thinking, creativity, and problem-solving. However, in addition to these tacit skills, success in the modern world requires cultivating other soft skills like communication, collaboration, and compassion, all of which are emphasised. Furthermore, this holistic teaching approach equips students for lifelong learning and public engagement, making them well-rounded individuals. Thus, the IB method emphasises a student's academic success and development as a person, socially and emotionally.

Tacit knowledge is considered troublesome (Perkins, 2006) and difficult to teach and acquire. It is because "teachers' more seasoned presumptions can operate like conceptual submarines that learners can never manage to detect or track" (Perkins, 2006, p. 40). It can be demonstrated, but the onus is on the learner to grasp the meaning of the demonstration (Polanyi, 1966). Therefore, such knowledge is constructed by the learner through a self-reflective and interactive process. Though considered to be constructed mainly through hands-on learning, studies by Venkatesh (2021) in design education have revealed the multidimensional aspect of tacit knowledge construction. This study expands the research of Venkatesh's study on design students at the University to study the tacit knowledge construction of secondary school IB students in Hong Kong, an area with limited explorations.

What is the IB About, and When Did It All Start?

The IB was established in 1968 as a non-profit educational foundation in Geneva, Switzerland. Intending to address the issue of "curricula internalisation" for globally mobile students, the educators sought a "universal pedagogy" that would allow students to qualify in any university around the world (Hill & Saxton, 2014, p. 43). Its neoliberal approach and emphasis on international-mindedness appealed to countries like the US, where it spread rapidly. Subsequently, many other countries started to adopt the IB curriculum, expanding the IB community from private international schools for internationally mobile students to state and public schools (Hill & Saxton, 2014). More than 7,800 programs were being offered in 159 countries by the beginning of April 2023, spread among more than 5,600 schools. A growth of 34.2% in IB programmes was recorded from 2018 to 2022. 46.6% of the total number of programmes were taught in The Americas, 30.5% in Asia-Pacific and 23% in Africa, Europe and Middle-east (IBO, 2022a).

Four excellent international education programmes are implemented by schools with support from the IB. The Primary Years Programme (PYP) for ages 3 -12, Middle Years Programme (MYP) for ages 11 – 16, Diploma Programme (DP) for ages 16 – 19 and the IB Career-related Programme (CP) for ages 16 – 19. Centered around the learner, the IB learner profile

aims to nurture ten learner attributes using effective teaching and learning approaches through a "broad, balanced, conceptual and connected curriculum" (IBO, 2017, p. 1).

All IB programmes are grounded on the constructivist approach of teaching and learning, asserting that knowledge and meanings are actively constructed by the learner based on prior experiences and social interactions that constantly change with new situations (Mertens 2010; Lincoln et al., 2011). IB programmes are intended to foster intellectual curiosity in young people and provide them with the knowledge, conceptual understanding, skills, reflective practices, and attitudes" necessary to become independent lifelong learners (Hill & Saxton, 2014, p. 45). To aid constructivist learning, IB teachers use pedagogical approaches like project- and conceptual-based learning. IB programme students are "encouraged to explore and construct their own personal and cultural identities" (IBO, 2022b).

The IB in Hong Kong

The IB World School has been around in Hong Kong since 1988. As of 2023, 70 schools offer one or more IB programmes. Forty-one schools offer PYP, 16 offer MYP, 37 offer the DP programme, and seven offer Career-related programmes (IBO, 2022c). Sixty of these schools are private schools, and ten are state-owned. Seven schools that offer IB in Hong Kong are under the English Schools Foundation (ESF), Hong Kong's largest international educational organisation in teaching in the English medium. Nine schools that offer the DP programme come under Hong Kong's Direct Subsidy Scheme (DSS), which "provides a "middle way" in the education market between international schools and the national curriculum at local schools "(Lee et al., 2022).

A deregulatory policy in Hong Kong allows the DSS schools to run a flexible curriculum incorporating the IB programme. According to Lee et al. (2022), the IB as an international education of choice is driven by three factors – the policymakers' view that it is a progressive alternative to the local education system, its position as a global trend and its portrayal by the media as a "distinctively well-rounded education". The marketing may have prompted many affluent local families in Hong Kong to opt for IB international schools (p. 136).

Benefits and Challenges in the IB Educational System

Dickson et al. (2020) assess the benefits and challenges of the MYP programme in Australia by examining teacher and school leader perceptions of the MYP's effectiveness in fostering student learning. Results revealed that the inquiry-based approach made students better problem-solvers of global issues through an interdisciplinary approach that made students connect to real-world experiences. In addition, the participants reported the development of learning skills such as time management, independence, ownership, research, reflection, and resilience. Besides, the programme provides a "transferrable education" for mobile students to adjust to a familiar learning methodology as they move schools between different countries (p. 192). Finally, the researchers add that the well-structured assessment criteria allow MYP students to achieve higher learning results.

In contrast, in a study conducted on DP alums from Hong Kong, there was a perception that mainstream schooled students were more accustomed to a teacher-centric approach, memorisation, with no peer interactions, the acquisition of specialised knowledge and assessment-based examinations (Wright & Lee, 2022). The preparation for IB students' adaptation to the academic life of Hong Kong universities are therefore questionable (p. 703).

Among the challenges faced by the IB system, the main ones are the high expectations it entails from teachers and students. The IB requires higher teaching expertise and learning a new curriculum (Doherty & Shield, 2012). The problem is exacerbated when a school offers a dual curriculum. In this case, the high cost of running the IB programme causes a strain on teachers' time in running bifurcated classrooms, adopting different assessment modes, and strain on the school's resources (Doherty & Shield, 2012). Lower-ability Inquiry-based learning can demoralize non-academic students, making them feel alienated from the programme. (Dickson et al., 2020, p. 197).

What Is Tacit Knowledge Construction?

In the view of Nonaka and Takeuchi (1995, pp. 23-24):

Tacit knowledge is highly personal and difficult to formalise, communicate, or share with others. Subjective insights, intuitions and hunches fall into this category of knowledge. Furthermore, tacit knowledge is deeply rooted in action, an individual's commitment to a specific context, and the ideals, values, or emotions they embrace.

As tacit knowledge is subjective and individualist, constructivist theories resonate with tacit teaching. Burbules (2008) promotes tacit teaching that is neither standardised nor geared toward explicit learning outcomes (p. 669). Instead, it facilitates inquiry-based learning by enabling learners' inferences, connections, and comprehension. A constructivist approach is effective for teaching students to solve complex and ill-structured problems (Ertmer & Newby, 2013, p. 60). According to Andjomshoaa et al. (2011), emphasising knowledge as a constructivist process leads to significant learning outcomes and knowledge retention. The retained knowledge generates tacit knowledge over time.

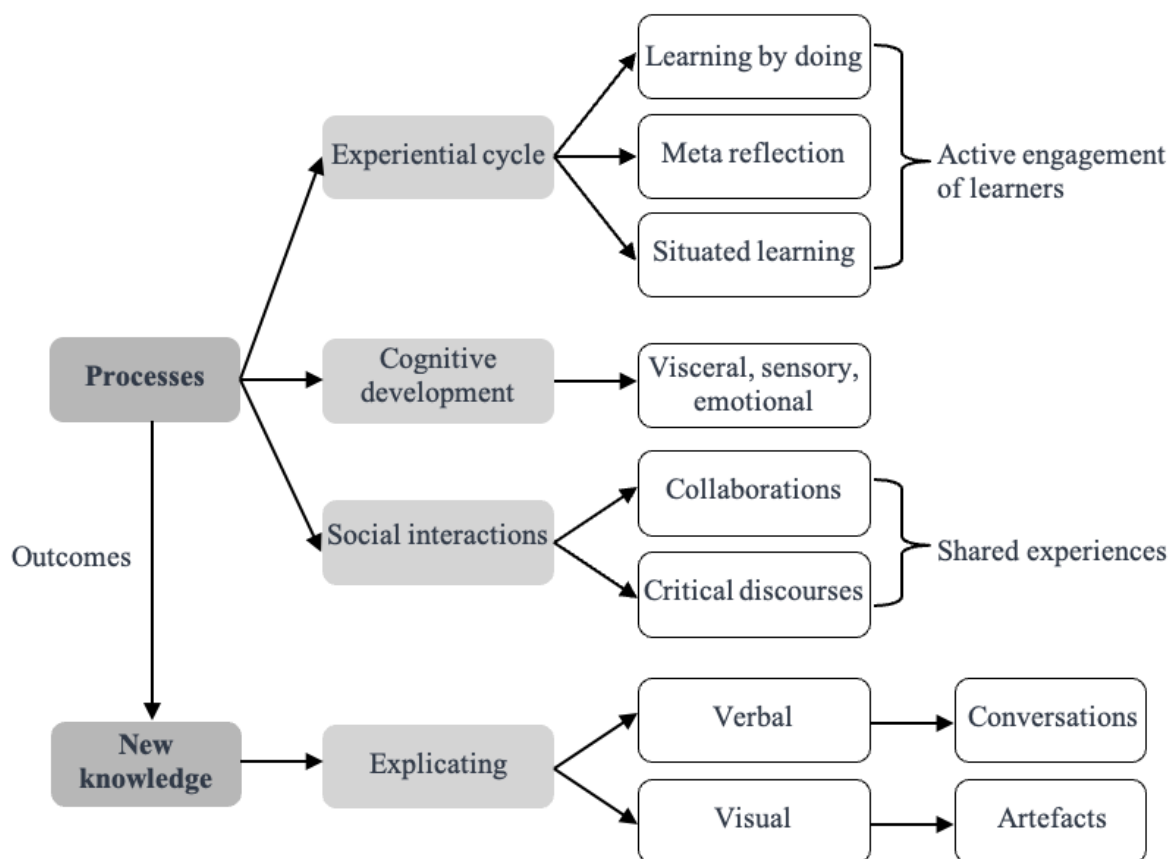
Constructivism suggests the active participation of learners in knowledge construction. Learners draw from prior experiences and go through an experiential cycle of making and reflecting. Engagement in generative activities results in the creation of new knowledge (Collis & Moonen, 2005). Meanings are shaped and re-shaped through social interactions and discourses. Activities such as brainstorming, concept development or problem-solving are creative pursuits that are tacit knowledge domains. Hence, tacit knowledge construction is "a generative process where an individual is actively engaged to create new and tacit outcomes" (Venkatesh & Ma, 2021a, p. 43). The new knowledge is explicated either visually or verbally. Figure 1 illustrates the components of tacit knowledge construction.


Figure 1: Components of Tacit Knowledge Construction,
adapted from Venkatesh & Ma (2021a, p. 44)

Social Interactions in the Education Environment and Tacit Knowledge Construction

Constructivism is a combination of a cognitive dimension and a socio-cultural dimension. Cognitive theorists like Jean Piaget emphasise that Constructivism is an internal process in which one constructs mental models that are unique to themselves (Von Glaserfeld, 2005). Notable socio-cultural perspectives of Constructivism, such as Vygotsky's Zone of Proximal Development and Bruner's Scaffolding theory, emphasise the influence of social interactions on learning. Lave and Wenger (1991) argue that knowledge is socially co-constructed and situated in a particular context and environment.

Personal experiences embody tacit knowledge. Continuous environmental change creates new mental models and learning (Koskinen et al., 2003). However, Loenhoff (2015) claims that the body can only communicate tacit knowledge through its relationships with other agents. Thus, tacit knowledge is collective, context-dependent, embodied in "social habituations" and includes "cultural capital" (Loenhoff, 2015; Mareis, 2012, p. 70).

According to Nonaka and Takeuchi (1991), knowledge conversion between the tacit and explicit is a social process (pp. 109-110). Social interactions in the classroom can occur between the teacher and student, between students, inside and outside the classrooms, in physical and virtual settings. Collaborative learning and peer learning are the many ways of interaction that facilitate tacit knowledge construction. Additionally, the cultural atmosphere of the educational setting has the potential to provide a wide variety of different sources of

learning experiences for the students, impacting the students' cycle of experiential learning (van Boeijen, et al., 2017).

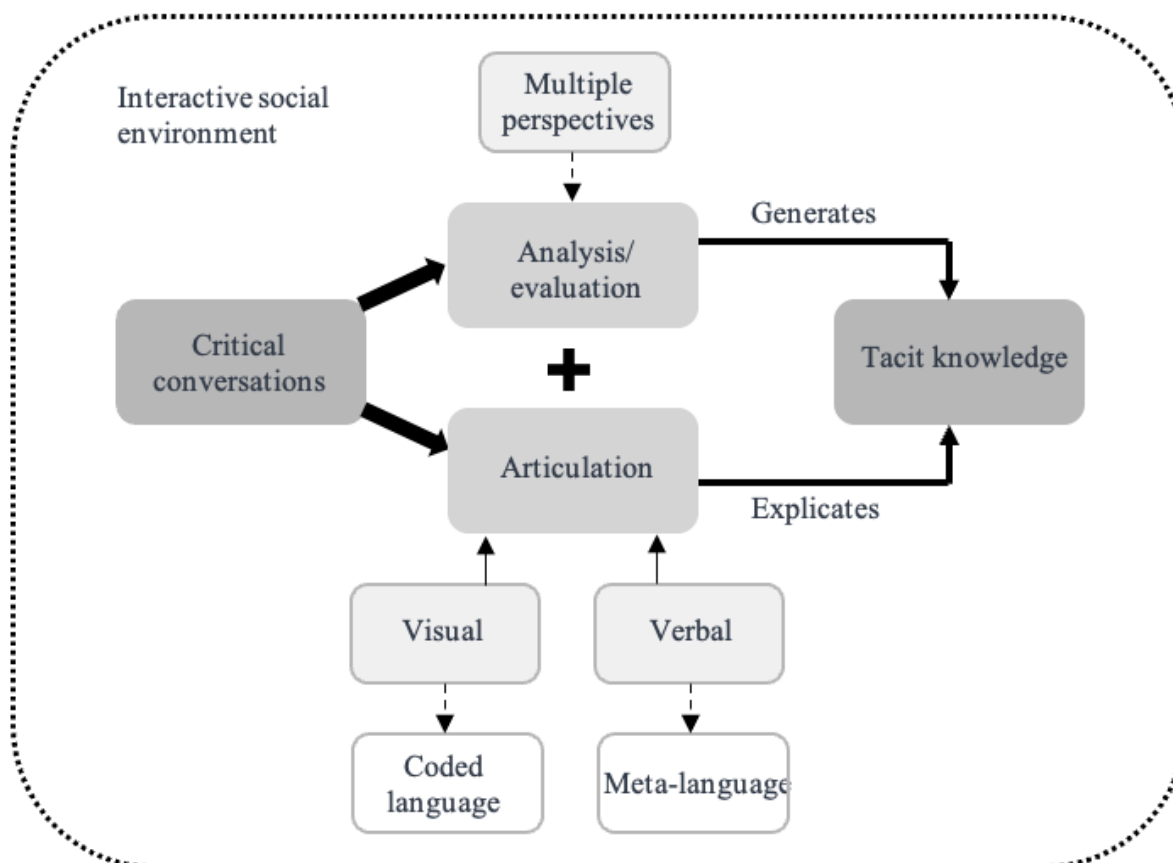
Venkatesh and Ma's studies (2021b) on conversations in the design studio reveal the link between critical conversations and tacit knowledge construction. They identify the components of critical conversations as socialisation, cognition and articulation. When multiple perspectives are critically analysed and assessed in the backdrop of social and collaborative environments, the result is the generation of new tacit sensibilities, values, and meanings (p. 7). Knowledge is also co-constructed through design artefacts in the social environment that are mediators, provokers or articulators of critical conversations (Figure 2).


Figure 2: Critical Conversations Lead to Tacit Knowledge Construction,
adapted from Venkatesh & Ma (2021b, p. 7)

Social interactions are increasingly taking place in online and virtual settings, as evidenced by the COVID pandemic. Supported by multi-media and virtual and augmented realities, online interactions expand the sharing of experiences, knowledge, values and beliefs (Oztok, 2013). The synchronous and asynchronous settings afforded by these environments act as a store for knowledge resources and provide opportunities for prolonged and flipped learning beyond the classroom. Besides, the current explosion of Artificial Intelligence chatbots such as the ChatGPT is redefining the sociocultural environment of educational settings. These are potential areas for educational research.

What is Missing?

Despite the many studies conducted on the IB programme, little is known about the tacit knowledge construction processes IB students engage in. Experience and hands-on learning are common sources of tacit knowledge. Developing tacit knowledge is aided by the IB's emphasis on inquiry-based learning and the cultivation of students' abilities to reflect on and articulate their own learning processes. On the other hand, studies have shown that social interactions externally influence tacit knowledge construction in the learning environment. Therefore, improving the efficacy of the IB curriculum and enriching students' learning experiences requires a deeper understanding of how IB students construct tacit knowledge.

Further studies are needed to learn how IB students get the tacit skills necessary to compete in the modern, rapidly changing global economy. In particular, there is a shortage of empirical studies on the role of social interactions in the IB classroom in constructing secondary school students' tacit knowledge. Therefore, this study attempts to address the knowledge gap by trying to answer the following research questions:

1. How does the interactive environment of the International Baccalaureate (IB) classroom facilitate the construction of tacit knowledge among secondary school students?
2. What are the perceptions of secondary school IB students about the role of the interactive environment of the classroom for the construction of their tacit knowledge?
3. What challenges do IB teachers face to facilitate an interactive environment for effectively constructing secondary school students' tacit knowledge?
4. How do IB teachers help secondary school students leverage their tacit knowledge?

The study aims to develop an understanding of teaching and learning practices for effective tacit knowledge construction.

Objectives of the research are:
- To identify and investigate the kind of interactive spaces in the IB classroom that facilitate IB students' tacit knowledge construction
- To understand the issues faced by IB teachers in creating interactive learning environments for tacit knowledge construction
- To examine IB teachers' strategies and techniques to help their students leverage their tacit knowledge
- To share the insights of the study with the IB teachers to help them develop effective strategies for students' tacit knowledge construction

Research Design

Participants of the study are chosen through a purposive sampling of secondary school students and their respective teachers in the MYP and DP programmes of two or three IB schools in Hong Kong. The study uses a mixed-method approach using quantitative and qualitative data collection methods conducted in two phases. Phase one is a pilot study that observes the interactions between teachers and students in secondary school classrooms of one IB school. This paper discusses the data collection, analyses and findings of the pilot study.

Phase two will involve conducting observations and semi-structured interviews with participants from other IB schools. Additionally, a subset of students will participate in a

focus group to encourage sharing experiences and knowledge, thereby capturing qualitative data through questioning and critical discussions.

A professional protocol with the participants was maintained throughout the research. Participants were communicated to seek their consent before the study. The researchers followed the ethical standards established by the University for conducting research involving human participants. Consent forms along with an information sheet were sent to all participants or their parents in case of minor-aged participants. Their identities remain anonymous. They were notified that they were free to leave the study at any point. All data was kept in the safe possession of the researchers.

Significance and Possible Outcomes of the Study

This study is anticipated to provide insights into the classroom interactions that support the construction of tacit knowledge among students attending IB secondary schools in Hong Kong, thus addressing the knowledge gap in this area. The study outcomes will be shared with all the participants and the wider educational community through reports and journal articles. It will bring critical awareness to educators and students of existing teaching and learning practices in the IB system.

Different interactive spaces that will be identified will be developed into a conceptual framework for tacit knowledge construction that may be adapted in various educational settings. The framework can be expanded as future studies add new knowledge to this field of study. The findings will lead to the development of effective pedagogical strategies for IB teachers to encourage tacit knowledge construction among the students in their classrooms. In addition, recommendations will be provided to schools and policymakers on improving the IB program's efficiency in encouraging students from various cultural backgrounds to create tacit knowledge.

A collaboration between the University and secondary school, such as this study, promotes knowledge sharing between the two parties. New teaching and learning practices developed through research can enhance student learning outcomes and prepare them for higher education and future careers. Universities, in turn, understand the skillset and mindset of students entering their programmes. In addition, a commitment to research and academic excellence can enhance institutional standing. Consequently, it opens new research opportunities that provoke further investigation.

Pilot Study - Research Setting and School Background

An IB school in Hong Kong was chosen as an appropriate school to conduct the preliminary study. It is a school that is dedicated to IB education, offers Primary Years Programme (PYP), Middle Years Programme (MYP) and Diploma Programme (DP). The school follows a pupil-centered approach that strives to instill a sense of community and responsibility among its students. It has an international outlook that promotes cross-cultural communication and collaboration amongst its members. An entrepreneurial spirit that encourages new ideas and allows students to take risks is part of its DNA. Learning through inquiry, hands-on learning, and project-based learning are ways by which experiential learning is emphasised.

The pilot study helped in understanding the research context such as the IB programme, the learning environment and the key members. It provided an opportunity to test methodological

procedures and research methods. More importantly, as stressed by Lofland et al. (2006), choosing the site is crucial in testing the feasibility of obtaining rich data and achieving familiarity with the participants.

Data Collection Methods

A total of 12 observations and four interviews were conducted between April 2023 and May 2023. The survey questionnaires were sent out in June 2023. Participants in the observations and interviews comprised 48 students and four teachers. Only the teachers were interviewed. The students ranged from year groups 9 to 12. The students were part of the 127 who had taken the design subject. Each observation session lasted for 55 minutes. The purpose of the observations was to capture the dynamic interactions in the natural settings of the classroom. Therefore, the researcher adopted an unobtrusive position of a non-participant observer. Data was captured through notes, photographs, audio, and video recording. Notes were transcribed on MS Word.

Each interview lasted for 45 to 60 minutes, conducted over Zoom meetings. Interview questions were semi-structured based on the literature review and observations. Questions started with background questions on educational and work experiences and teaching approaches. This was followed by questions on the project brief, scaffolding of the design process, facilitation of tacit skills, role of technology in classroom interactions, strategies for solving group problems, and learning after school hours. Transcriptions obtained from Zoom meetings were saved on MS Word.

Survey questionnaires were sent out to all 127 design students. Questionnaires consisted of five sections: 1) Statement of purpose of the research with working definitions of tacit knowledge and social interactions 2) Background information which collected the demographics of students, 3) The design process - attitudes of students towards designing, 4) The role of classroom interactions in tacit learning – perceptions of students on the importance of interactions, time and attitudes in participating in critical discussions, 5) Extended study – motivation to study after school hours.

Data Evidence

The data collection was guided by the research questions and conceptual framework developed from the literature review. Supporting evidence sources consisted of project briefs, lesson plans and assessment criteria shared by the design teachers from each year group.

Data Analyses

The qualitative data analysis was adapted from the works of Miles et al. (2014), Merriam and Tisdell (2016), and Schatzman and Strauss (1973). The process began with transcribing the field observations. A summary sheet for each observed session was created, noting insights and possible interview questions. It was followed by interview transcription and progressed via coding, note creation and consolidation, and the development and breakdown of analytic categories related to the study issue. The coding methods were developed using the conceptual framework. The MAXQDA program was then used to create codes and generate memos.

A descriptive analysis was performed to simplify the data, identify patterns, pinpoint problems, and evaluate sources of error in the quantitative data (Loeb et al., 2017). The statistical studies were performed using SPSS, including frequency analyses, cross-tabulation, and variable correlation.

Finally, insights were drawn from the memos, which along with the quantitative analysis are interpreted into research findings as discussed in the findings chapter. This part of the analysis followed the 'integrative data analysis' procedure described by Creswell and Creswell (2023, pp. 246-247). The intent was to connect the two types of data as a joint display of quantitative scores and qualitative themes.

Findings for the Research Questions

Since there were many, only significant findings for each research question are discussed below.

RQ 1: How does the interactive environment of the International Baccalaureate (IB) classroom facilitate the construction of tacit knowledge among secondary school students?

An unstructured, open and flexible interactive environment facilitates tacit knowledge construction: The physical and visual elements observed in the classrooms, such as the seating arrangements and artefacts, made it possible for interactions. Teachers Bryant and Smith mentioned that an open environment allows students to look at and question each other's work. It also includes accommodating different learning styles, exploring through play (teacher Edward), and the freedom to express through multiple mediums (Bryant). The embracing of AI by all teachers added to the multi-dimensionality of the learning experiences. The visual environment in the classroom triggered a learning spark or provided design inspiration for 22.2% of surveyed students.

The liminal space of self-reflection and learning awareness is required for tacit knowledge construction: Teacher Taylor encouraged students to make and reflect on mistakes through the design cycle. The reflective element in each unit further enables the students to be aware of their learning process. Teachers use tools like tracking sheets, learning studios and google sites for reflection. According to teacher Bryant, students continue reflecting on the project outside the classroom by making real-world connections. 19% of them mentioned that self-reflection led to a learning spark in them (q7).

Most surveyed students were aware that they had learnt something new through classroom interactions (68.6%). This is evidence for tacit knowledge acquisition. Following are examples of what students learnt through interactions:

> "A different view or approach to both the solution of a problem and the problem itself (empathy and experiences)".

> "New skills for easier production, stepping out of my comfort zone and learning from mistakes".

> "I learnt a lot about each and every person's individual strengths and weaknesses".

A celebratory culture and a trustful and comfortable environment can encourage the construction of tacit knowledge: Using technology to facilitate interactive discussions allows students to "express their thoughts and ideas in a safe and supportive environment" (Smith). It includes entrusting students to take on learning responsibilities, such as taking leadership and initiatives to enable collaborative learning by creating groups and assigning roles (Bryant & Edward). Therefore, an interactive environment encourages collaboration and learning from peers. Teacher Bryant mentioned that he attempts to prioritise social needs over academic ones.

Apart from that, as quoted by teacher Edward, a culture that is a "celebration, or even the rewarding of failure in the classroom, can lead to an appetite for risk-taking and creativity". Correspondingly, 48.6% of students in the survey responded that they agree that they were willing to take risks in designing without fear of failure. Age had no significance with risk-taking ($p = .197$). Teachers Edward, Smith and Taylor added that the learning community in the classroom is built by empowering students, giving them a sense of belonging.

RQ2: What are the perceptions of secondary school IB students about the role of the interactive environment of the classroom for the construction of their tacit knowledge?

Value for collaborative engagement and critical discussions: Students were equally comfortable sharing opinions and ideas with their teachers and peers (44.3%). The two had a significant positive correlation ($p = .004$, Spearman Correlation Coefficient = .343), (Figure 3). A statistically significant positive correlation was seen between challenging others and being challenged by others ($p = .001$, Spearman Correlation Coefficient = .522), (Figure 4).

Figure 4: Correlation between Challenging and being Challenged by Peers

52.9 % of students sometimes participated (Y10 and Y11) in critical discussions in the classroom, followed by 35.7 % who often participated (Y9 and Y12). 52.9% said a moderate about of time was spent on critical discussions, followed by 31.4% who responded that some time was spent on the discussions. The participation of students had a significant and positive correlation to the time spent on the discussions (p =. 002, Spearman Correlation Coefficient = .358), (Figure 5).

Figure 5: Correlation between Participation and Time Spent on Discussions

Tacit learning through interactions: 42.9 % of students responded that interactions were moderately important, and 37.1% responded interactions were very important in gaining tacit skills. 68.6% of surveyed students were aware that they had learnt something new through classroom interactions. Most students (56.3%) responded that critical discussions through interactions had triggered a learning spark or provided design inspiration for them.

Motivation to self-study: 51.4% of students partook in after-school learning through self-study, whilst 31.4% engaged in a combination of self-study and interaction with their peers. Regarding motivation, a majority of students (51.4%) indicated intrinsic motivation, and 41.4% cited extrinsic motivation. Examples of intrinsic motivation were enjoyment in learning, self-interest, exciting topic, passion for the topic, learning something new and curiosity. Extrinsic motivation came from meeting deadlines, getting better grades, using external aids like music and YouTube videos, and betterment in their career.

RQ3: What challenges do IB teachers face to facilitate an interactive environment for effectively constructing secondary school students' tacit knowledge?

Overcoming distractions: The difficulty for IB teachers is creating an engaging and focused learning atmosphere, despite distractions. Teachers overcame this challenge by providing external motivation through competition (Bryant & Taylor), active feedback sessions (Bryant) and grades (Edward). An exciting project could keep students internally motivated (Smith). On the other hand, a grade-driven mentality could hinder learning (Bryant & Edward). Smith commented that students didn't look at written feedback from teachers.

Cultivating favourable interpersonal relationships: Dealing with conflicts and tensions within the groups was a challenge faced by all the teachers. Reasons included differences in group personalities (Edward) and learning styles (Smith), and different strengths and weaknesses of students (Edward & Taylor). Teacher Taylor added that the COVID pandemic had affected the social interactive skills of students. Although collaborative projects are challenging to

assess, they help students "develop skills like project management, branding, marketing, negotiating, and delegating" (Edward).

Obstacles in creative endeavours: Teacher Taylor explained students could not generate design ideas which affected design thinking and creative skills. He mentioned the absence of fundamental drawing skills necessary for creating effective visuals. While the other teachers believed that an open design brief leads to interpretation and exploration, Taylor felt that a broad design brief was difficult to understand. Thirdly, a lack of time was a constraint in holding meaningful discussions that could trigger creative ideas.

RQ4: How do IB teachers help secondary school students leverage their tacit knowledge?

Using the iterative learning approach in design: All the IB teachers emphasised using the design cycle, through conceptual explorations, brainstorming, ideation, testing and prototyping to leverage students' tacit skills. While teacher Bryant stresses hands-on experiences through prototyping and testing, teachers Edward and Taylor stress the reflective element is inherent and implicit in the evaluation stage. 51.4% of the students agreed that prototyping was extremely important to gain tacit skills in the design process, and 30% strongly agreed.

Helping students make real-world connections and cultivating empathy: Teachers set the design problems in authentic contexts that help students connect to their previous learning experiences. Students are urged to use empathy while problem-solving as it allows them to think through other people's perspectives (Edward & Smith). In the words of teacher Bryant, "Empathy is a powerful design skill and one that is difficult to quantify. It encourages personal investment and motivation in the work".

Promoting student agency: Teacher Bryant considers the IB curriculum a "wonderful platform for pupil agency". Rather than prescribing a problem, he prefers giving a context to students to recognise the problem. Teacher Edward stated, "I'm just facilitating learning and putting in a culture where those kids can take ownership and personalise their learning for themselves. I'm not telling them what to do". Teachers Edward and Smith consider student-led critical discussions can lead to success in group work and lead to an "appetite for risk-taking and creativity" (Edward). From a pedagogical stance, teacher Edward was inclined towards positioning himself at the same or lower level as the students, expecting the teachers and students to learn from each other.

Students are also encouraged to select a topic of personal interest to foster emotional engagement in their learning. 48.6% of the students agreed they preferred to identify a design problem that suited their interest. 28.6% were neutral, and 14.3% strongly agreed. Age had no significance in identifying design problems (p = .4). Accordingly, teachers mentioned they vary their instruction style to engage students and allow their products to be executed in various ways. It further implies that teachers understand the strengths and weaknesses of their students (Edward).

Meta Inferences and Discussions

Tacit knowledge construction is a continuous process of development and transformation. It needs a dynamic and adaptive interactive environment that is flexible and open, accommodates different learning styles, uses various educational tools for learning, and

provides multiple mediums for exploring and expressing ideas. In other words, a multidimensional IB interactive classroom that embodies the physical, sensory, social, and technologically adapted stimulates tacit knowledge construction.

The interactive classroom environment supports experiential learning in the design cycle. Students' tacit knowledge develops throughout the iterative design cycle process, in which they are actively engaged in hands-on learning, problem-solving, and critical conversations. Working in authentic contexts and real-life problems gives students the opportunity to apply previous knowledge, try new approaches through risk-taking and learn from failures. Students can apply different perspectives to problem-solve and develop critical skills by challenging each other in a healthy environment. Empathetic skills are honed when seeing the world through others' worldviews. Critical conversations with peers ignite creative and learning sparks.

Tacit skills aid the learning-to-learn process. Interactions in the classroom for tacit knowledge construction occur in different interactive spheres and spaces (Venkatesh & Ma, 2021). Primarily it is an internal interactive process where the external environment shapes meanings and values unique to each student. Therefore, the environment that supports meta-learning and meta-cognitive processes through self-reflection and learning awareness leads to self-discovery. Empowering students to personalise their learning develops intrinsic motivation and makes them proactive in their learning. It develops their attitude and mindset as lifelong learners, promoting intellectual growth.

The learning community of the classroom nurtures tacit knowledge construction. Trust is an important factor in building learning communities. While it means teachers relinquish their authoritative stance and facilitate sharing of learning responsibilities, it also means they need strategies to resolve conflicts and emotional upheavals in group learning. Establishing connections, especially after the COVID pandemic, is vital to build interpersonal relationships in the classroom. Technology plays an important role in improving communication skills and extending learning beyond the classroom. Furthermore, as IB students engage in community projects as part of their Diploma curriculum, they leverage the tacit knowledge of members of the wider community through hands-on activities and meaningful dialogue.

Table 1 summarizes guidelines for IB teachers to facilitate tacit knowledge construction in the interactive environment of the classroom.

Attributes of tacit knowledge construction	Method of Facilitation
Tacit knowledge construction is a continuous process of development and transformation.	A multidimensional IB interactive experience.
Students' tacit knowledge develops throughout the iterative design cycle process.	Active engagement in hands-on learning, problem-solving and critical conversations.
Tacit skills aid the learning-to-learn process.	Supporting meta-learning and meta-cognitive processes. Empower students to personalise their learning.

Empathetic skills are honed when seeing the world through others' worldviews.	Facilitate a healthy environment to challenge each other.
The learning community of the classroom nurtures tacit knowledge construction.	Build trust, create a democratic environment, engage in meaningful dialogue, embrace AI.

Table 1: Guidelines for Facilitation of Tacit Knowledge Construction

Conclusion

This study sheds light on the effect of interactive learning environments on the construction of tacit knowledge among IB secondary school students in Hong Kong. In doing so, it hopes to contribute towards improving students' learning outcomes and offer suggestions for curriculum development and strategies for teaching practices in the IB programme. Furthermore, the framework which will be developed through the empirical study can serve as a guideline to create interactive spaces for tacit knowledge construction.

Since this is an ongoing study, the size and selection of participants may seem limited. Due to lack of time and resources, it was not possible to observe all design classes in the IB programme. Further data by studying other IB schools can provide comparative analyses and enrich the research outcomes. Subsequently, the designed framework could be tested in other IB curricula through an intervention research design.

Tacit knowledge deserves a prominent position in education as it has the potential to "transform students into efficient learners and harness their capabilities as future innovators" (Venkatesh, 2021, p. 298). Moreover, tacit skills are not only lifelong learning skills, but they are the skills that will set students apart from AI-dominated skills in the future. Therefore, the study's implications can be extended to any educational scenario. Finally, the excitement surrounding the explosion of chatbots suggests new frontiers for this research in terms of new interactive spaces in the classroom.

Students' Responses on Using Interactive E-module Based on Multimodal Text as a Self-Study Learning Resource for an English Structure Course

Afrianto Daud, Universitas Riau, Indonesia
Roza Linda, Universitas Riau, Indonesia
Zaldi Harfal, Universitas Riau, Indonesia

Abstract

This study aimed to see how English students at one university in Indonesia responded on the use of an interactive e-module based on multimodal text as a self-study learning resource for an English Structure course, this e-module was developed in supporting digital-based learning at one public university in Indonesia. The research followed a systematic Research and Development (R&D) approach and applied the ADDIE model, which encompasses five stages: analyze, design, develop, implement, and evaluate. The e-module was designed to include animated videos and interactive quizzes integrated into a Flipbook maker application. It comprised six chapters, each comprising several sections: video explanations, text descriptions, examples, interactive quizzes, and chapter summaries. After the e-module was assessed as a valid learning medium by both media and content experts, the e-module was piloted to a group of students at the university under investigation. Their feedback demonstrated a very positive response, with the e-module receiving high ratings for its attractiveness (3.63) and convenience (3.58) aspects. Data from qualitative feedback also show that the students found it useful and interesting to use the e-module. Thus, it can be inferred that the e-module exhibits excellent quality, encompassing both content and media elements, rendering it a well-suited digital learning resource for the Intermediate Structure course within the English Department at the university under investigation.

Keywords: Interactive E-module, Multimodal Text, Learning Resource, English Structure

Introduction

In the fast-changing landscape of education, the integration of digital technology has become a paramount driving force in transforming the way we learn and teach. This paradigm shift is evident across the globe, transcending geographical boundaries and making its mark in unexpected corners of the world. This shift is not only triggered by the fast developing nature of technology in every course of life in the last twenty years, but also facilitated by pandemic and life after pandemic itself (Kerres & Buchner, 2022). Digital based learning with a massive integration of technology into learning activities has been inevitable and a positive phenomenon in the education landscape (Susilawati & Budimansyah, 2019).

The integration of technology has been evidenced in many facets of teaching and learning, starting from learning resources, learning strategies, learning media, and learning tools. In the context of learning resources, in particular, many studies show that teachers have developed many e-learning resources which include learning media, video, game, as well as electronic module (Daud et al., 2022; Falloon, 2020; Rahman et al., 2019).

An e-module can be developed using multimodal text as it is evidenced that multimodal text can enhance the quality of communication, including the quality of learning resources such as e-module (Cahyaningati & Lestari, 2018). Multimodal text is a dynamic form of communication and diverse that combines various modes of representation in one text (Bezemer & Jewitt, 2010). This mode includes, however not limited to, written or printed words, images, sounds,symbols, gestures, and even spatial organization (Dicks et al.,2006). The essence of multimodal texts lies in their capacity to convey information, emotions, and messages through the interaction of these various modalities (Macken-Horarik, 2004). Unlike traditional text forms, which rely primarily on words to understand the meaning, multimodal texts make use of the power of various modes, which also create experiences that is richer and deeper for the audience.

This study is situated at on English Education Department oat one state university in Indonesia. It addressed issues of scarcity of digital based learning resources in this particular university. The need for developing e-learning resources is not only triggered by the fast developing of technology, but it is also pushed by the need for self-study learning resources for English students, particularly in the English Structure course. This study unravels a captivating journey into the implementation and impact of an interactive e-module infused with multimodal text elements.

Methodology

The interactive e-module was developed using a systematic Research and Development (R&D) approach, with the guiding principles of the ADDIE model – Analyze, Design, Develop, Implement, and Evaluate. This multimodal based e-module showcases an amalgamation of engaging elements, ranging from animated videos to interactive quizzes, all seamlessly integrated into a Flipbook maker application. It is a comprehensive six-chapter resource, each chapter meticulously structured to encompass video explanations, text descriptions, illustrative examples, interactive quizzes, and chapter summaries.

The e-module developed in this study was tried out and used by students under investigation. This particular study reports one of the ADDIE stages, which is the implementation phase,

and seeks to find out how the students responded to the e-module which has been developed. Their responses were recorded and collected by distributing a set of questionnaires.

The research participants consisted of 42 students from the batch of 2022 who were registered at Faculty of Teachers Training Program, English Department, at one university in Indonesia. Data collection was carried out through a Likert scale questionnaire consisting of statements asking for student responses to the use of the Interactive E-Module, where a score of 1 indicates disagreement and a score of 4 indicates high agreement. For the analysis of the data, the researcher used SPSS 25 and then classified them utilizing the criteria by Sugiyono (2016), as displayed in the table below:

Table 1. Validity Criteria

No	Interval Mean Score	Validity Category
1	$3.25 \leq x < 4$	Very Good
2	$2.5 \leq x < 3.25$	Good
3	$1.75 \leq x < 2.5$	Bad
4	$1 \leq x < 1.75$	Very Bad

Apart from the quantitative data, there is a comments and suggestions column at the end of the questionnaire which is intended to obtain qualitative data as support and enrichment of the quantitative data. This method was chosen to allow the researcher to measure student responses in more detail and to understand their perceptions and experiences of using Interactive E-Modules in the context of independent learning. With this approach, it is hoped that this research can provide deeper insight into the effectiveness and student acceptance of technological innovation in the context of English education.

Findings and Discussion

Quantitative Analysis

There are two aspects of the e-module that students were asked to evaluate. They are aspect of conveniences or user-friendliness and aspect of attractiveness. For each aspect, there are two indicators. For aspect of conveniences, students had to evaluate the ease of use and clarity of language used. Meanwhile, in the aspect of conveniences, there are display of the e-module and presentation of materials and questions.

1. Aspect of Attractiveness
The result of students' responses regarding the attractiveness of the interactive e-module:
Figure 1. Graphic of Attractiveness Aspect

According to the results of the Likert scale questionnaire, students gave the multimodal text-based Interactive E-Module a *very good* rating for its attractiveness in terms of the appearance of the learning medium (3.69) and the presentation of the content and questions in the learning medium (3.57). These scores are quite close to 4, showing that the E-Module's appealing look and the manner in which the information and questions are delivered have been well-received by students as a whole. An enticing display may include the use of attractive graphics, images, and colors, as well as a neat arrangement that effectively attracts students' attention. Presenting interesting material and questions may also include the use of interesting language, variations in question structure, and the use of relevant examples and illustrations.

The results suggest that multimodal text-based interactive e-modules have a lot of potential as engaging teaching resources for students. Success in achieving high scores indicates that students responded positively to the use of technology in education, especially when the display and presentation of the material is well designed and attractive. In light of this positive development, educational institutions and curriculum designers can concentrate more on creating engaging and interesting learning materials and using a variety of multimodal texts to pique students' interest in learning English and enhance the standard of instruction.

2. Aspect of Convenience
The result of students' responses regarding the convenience of the interactive e-module:
Figure 2. Graphic of Convenience Aspect

Figure 2 shows that students also responded favorably to the aspect of ease of use of the multimodal text-based Interactive E-Module. Of the two examined indicators, clarity of language used in the module obtained an average score of 3.57 (*very good*), while ease of use received an average score of 3.6 (*very good*). This suggests that students find the Interactive E-Module to be a useful learning tool and that they find the language used in the module to be simple and straightforward. The Interactive E-Module's display and navigation need to be properly planned so that students can easily access and understand the material. Increasing ease of access and clarity of language in this module can help upgrade the effectiveness and efficiency of students' independent learning, which in turn can produce better learning outcomes in their English Structure course.

As a whole, the result of students' responses on using interactive e-module based on multimodal text as a self-study learning resource for an English structure course is as follows:
Figure 3. Students Assessment of the E-Module

Based on these findings, using a multimodal text-based Interactive E-Module as a stand-alone learning resource in the English Structure course received favorable feedback from students. Particularly, the average convenience aspect scored 3.58 (*very good*), while the average attractiveness aspect earned a score of 3.63 (*very good*). These findings demonstrate that most students find the Interactive E-Module to be interesting and simple to use. These two characteristics complement one another and have about equal weight, proving that appeal and usability are important determinants of student adoption of digital learning material.

Qualitative Analysis

For qualitative analysis, the data came from students' opinions after using the Interactive E-Module. As a whole, students' comments about the e-module can be grouped as follows:

Table 2. Categorization of students' comments

No	Themes	Frequency
Reasons for Positive Responses		
1	Enhance students' understanding	10
2	Increase students' learning interest	6
3	Facilitate students' self-directed learning	1
Favorite Features		
1	Interactivity	9
2	Flexibility for the students' learning speed	1
3	Accessibility	2
4	Visualization	4
5	Language	1
6	Simplicity	1
7	Contents	1

As can be seen from the table above, many students agreed that the e-module can improve their understanding of the subject matter. Ten comments from students underlined its effectiveness as an interactive learning medium that makes the material more interesting and simple to comprehend.

> "*I feel that this e-module is easily accessible to everyone, and the materials provided are concise and clear, making them easy to understand.*"

> "*In my opinion, the development of this interactive e-module will have a very positive impact, especially in increasing students' understanding.*"

In addition, they complemented the high positive interactions in the learning process, including interactive media features such as video and audio. Students also stated that they appreciated the ease of access and convenience, which makes it easier for them to direct their own learning.

> *"Because it actively engages students, this interactive learning medium is, for me, very suitable for encouraging us to take an active role in our own learning. As students, using engaging media like audios and videos really improves our understanding."*

Then six students commented how this e-module helps improve their interest to learn. They emphasized how this cutting-edge medium successfully held their interest throughout the learning process.

> *"Really help us broaden our perspectives and enhance reading interests."*

> *"I think this innovative interactive E-Module is highly effective in generating interest in the learning process, especially in the English Structure course. The interactive learning style makes the study materials easier to understand and fun."*

The interactive nature of the learning media has sparked enthusiasm among students, providing a unique and compelling learning experience that fosters a deeper interest in the subject matter.

Seven essential elements of the E-Module have been recognized by the students as having made a major contribution to their successful learning process. First off, nine students made a comment about the module's interactivity. This makes learning more dynamic and interactive by getting them actively involved in the process.

> *"Very interactive. It's like a mood booster for students, making the learning experience more enjoyable.*

Secondly, because of its adaptability to various learning styles, a student commented about how the e-module lets students learn at their own pace. This ensures that everyone has a thorough comprehension on their own.

> *"The module gives flexibility for us, students, to study at our own pace. And I feel more engaged in the learning process."*

Thirdly, because it is easily accessible, a couple of students appreciated that they could learn without interruption at any time or location.

> *"I love that this e-module is easily accessible to everyone."*

Fourthly, several students praised the incorporation of visual components because it facilitates the clear and understandable presentation of difficult concepts, which in result improves the subject matter's overall comprehension.

> *"The images provided really help us understand the topics and keep our interest."*

In addition, a student complimented the English used in the e-module for its conciseness, so that students with different skill levels can easily learn from it.

> *"The language used in interactive learning media aids in understanding the conveyed materials."*

Also, the interface and design of the module are straightforward, which makes it simpler for students to use and ensures that they can easily navigate through the content.

> *"In my opinion, this e-module is a very interesting innovation because it has a simple, informative, and interactive design, utilizing digital technology."*

Finally, the module's extensive and diverse content covers a wide range of topics giving students a comprehensive understanding of the subject.

Discussion

In the quickly changing environment of 21st-century education, there is a growing understanding of the necessity for creative and dynamic learning tools (Henrikson et al., 2016; Cummings & Blatherwick, 2017). Evans (2001) noted that traditional teaching methods, which were largely centered on textbooks and lectures, are rapidly giving way to more interactive and technologically oriented ways (Alismail & McGuire, 2015). The dynamic requirements of 21st-century learning are demonstrated by the interactive e-module. It can enable students to interact with the content in ways that are in line with current learning trends by providing a variety of multimedia components (Nabayra, 2020; Sanova et al., 2022; Mahmudah et al., 2022).

The responses from the students show how user-friendly and engaging the e-module is. The reason is probably because lessons in multimodal media like this go right to the point most of the time (Purwaningsih et al., 2022) and maintain students' attention and interest longer than traditional learning methods do (Saryadi & Sulisworo, 2023). According to Kustandi and Darmawan (2020), if the medium being used is able to effectively and succinctly convey the lessons, the learning and teaching process will be successful. In order to capture and hold the students' interest, the e-module was also created to be straightforward and pleasing to the eye. This was in line with the premise that instructional materials needed to be compelling—for example, they needed to have appealing designs and layouts—in order to inspire students to study them (Midoro, 1993; Sari, 2021).

One of a multimodal e-module's major benefits for students is the capacity to cater to the various learning needs and preferences (Sankey et al., 2011; Campoy-Cubillo, 2019). Loo (2004) emphasized that students are not uniform. When it comes to learning, they each have particular aptitudes and manners (Cabual, 2021). Some individuals may learn best visually, taking advantage of pictures and diagrams, while others learn best audibly (Zhen, 2016). The multifarious character of the e-module in this case expands learning beyond customary text-based formats (Bouchey et al., 2021).

Although text is still crucial, adding visual, aural, and interactive features improves the learning process altogether (Mayer, 2017). In particular, visual learners benefit from visual aids like graphics, photos, and diagrams since they help improve concept comprehension and memorization (Vanichvasin, 2021; Al Said & Al Said, 2022). Audio elements, such as narration and instructional direction, additionally boost accessibility for auditory learners (Coombs, 2010). On top of that, interactive components like quizzes turn passive learning into active learning, encouraging critical thinking and problem-solving abilities (Mwalongo, 2014; Nurhasanah & Fauzan, 2021).

Besides fitting various styles of learning, the multimodal e-module provides other advantages. For instance, it raises motivation by increasing the enjoyment and engagement of learning (Girón-Garca & Gargallo-Camarillas, 2020). According to Sanmugam (2017) and Alsawaier (2018), adding interactive components, gamification features, and multimedia elements captures students' interest and boosts their intrinsic drive to learn. This makes this e-module an invaluable educational resource since it develops a deeper degree of involvement in addition to helping to improve comprehension (El-Sabagh, 2021; Logan et al., 2021). Also, quizzes and other interactive components in the e-module provide students with instant feedback. This feedback can be critical and beneficial when it comes to assisting students in identifying their strengths and limitations (Harvey, 2003; Mandouit, 2018). Feedback is crucial for learners since it clarifies what has been mastered and what still needs work. As a result, students can identify particular ideas that need more explanation and return to them as necessary.

Conclusion

To sum up, the adoption of the Interactive E-Module Based on Multimodal Text as a Self-Study Learning Resource for an English Structure Course has received favorable responses from the students, demonstrating its effectiveness in accommodating a variety of learning preferences and styles. This innovative technology has not only piqued students' interest but also fostered a deeper comprehension of difficult ideas through its dynamic and engaging approach by adding interactive and aesthetically pleasing aspects. In addition, the availability of immediate feedback has allowed students to pinpoint their areas of strength and development, resulting in a more individualized and successful learning experience. As evidenced by the overwhelmingly positive student feedback and supported by the scholarly literature, the integration of multimodal e-modules represents a crucial advancement in educational technology, marking a significant step towards creating an inclusive and effective learning environment for students in the 21st century.

As this study unravels, it becomes increasingly evident that this e-module is more than just a digital resource; it is a beacon of quality that extends its reach to both content and media elements. With these compelling findings, it is apparent that this innovative learning resource has the potential to redefine the landscape of education within the English Department at the university under investigation and holds the promise of becoming a model for digital learning resources in the region.

Using 5 Music Instructional Methods to Illustrate the Social Constructive
Music Teaching Framework in Hong Kong Primary Level Music Education:
A Comparison Study Between Private International and Public Schools

Lam Wing Yin, The University of Hong Kong, Hong Kong SAR

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Music education under the frame name of arts education has been integrated into the primary and secondary education curriculums in Hong Kong for more than 20 years, starting from 2001, the year of launching the *Learning to Learn* curriculum for the reconstruction of the education system for the younger generation. Music education, embedded into the arts education, was therefore regarded as one of the key subjects to cultivate and uplift student holistic development, focusing on aesthetic skill training and moral growth development. This research was an exploration study of music teaching practices from two private international and two general public school music teachers at the primary school level. The value of this study rested on borrowing the idea of Shulman's pedagogical content knowledge (PCK) principle to create a social constructive music teaching framework from five commonly-used instructional methods, namely Orff, Kodaly, Dalcrozes, Suzuki, and Gordon's approaches. Based on the evaluations of these four case studies, hypotheses on the differences in the PCK were tested with the types of schools and found to be no difference. The preliminary results suggested that music teachers in private international schools had similar pedagogical approaches to music instruction to teachers in aided-public schools. Additionally, the modeling, guiding, and training approach was identified as a grounded teaching method for music education at the primary school level regardless of different types of schools. Other implications like the further development of the framework were discussed.

Introduction

Music Education in Hong Kong

In Hong Kong, music education plays a predominant role in value education, which is to foster the holistic development of students and cultivate their positive values and attitudes for life-long learning. The curriculum reform in 2001, *Learning to Learn – The Way Forward in Curriculum Development classified music and visual art subjects into arts education, as one of the* eight Key Learning Areas (KLAs), comprising Chinese language education, English language education, mathematics education, science education, technology education, personal, social, and humanities education, arts education, and physical education (Education Bureau, 2021, 2023). According to the Curriculum Development Council (2017), the KLAs were positioned to help students develop aesthetic skills, meaning creativity, critical thinking, sensitivity, cultural awareness, effective communication skills, art knowledge, positive attitudes, and values. Under the frame name of arts education, music education had four pre-set learning targets including 1) developing creativity and imagination, 2) developing skills and processes, 3) cultivating critical responses, and 4) understanding arts in context. All these learning targets were clearly outlined in the primary and secondary curriculum reform. Also, there was no standardization of time, criteria, syllabus, and assessment for teaching music, but around the year 2003, a structural curriculum was published, informing every school should allocate at least 10% to 15% of the total lesson time to achieve better the long-term educational goal of all-rounded development of the students.

Qualifications of Music Teachers in Schools

Traditionally, to be qualified school music teachers in Hong Kong, they have to hold a government-funded postgraduate diploma in education and attain a bachelor's in music. Institutes in Hong Kong, like The University of Hong Kong, The Chinese University of Hong Kong, Hong Kong Baptist University, and The Education University of Hong Kong or abroad education can provide education and music training (Education Bureau, 2008). The qualification of registered music teachers is rigid and standard. Teachers generally need to meet the criteria of playing at least one instrument at grade 8 or above level from recognized music conservatories or universities. The known accreditations of instrumental examinations are issued by The Association of Board of the Royal Schools of Music, The Trinity College London, and The Hong Kong Trinity College Centre. Due to the fluctuation in the demand and supply of qualified music teachers, some teachers who are under education diploma training with supervision offered by their schools or holding a bachelor's degree in education with strong instrumental training are also eligible to teach, and the school principals have the final decisions to employ them during the teacher apprenticeship at managing schools.

Literature Review

The Nature of Private and Public Schools

Hong Kong was a colonized city under British rule before the handover in 1997. Thus, the education system followed the well-established United Kingdom's. According to the Census and Statistics, 593 primary schools were government fully funded or subsidized, and 39 international primary schools in Hong Kong (Education Bureau, 2023). The differences between these types of schools were the operation modals and the school fee payers and its supporters, reflecting the choices of curriculum and assessment design in education. Private

international schools are targeted to provide education specifically for immigrant children with the possibility of mixing cultures in Hong Kong. The program mainly follows the International Baccalaureate (IB), and it is an inquiry-based, transdisciplinary curriculum, with a student-centered approach to education for children as early as 3 years old until 12 years old (International Baccalaureate Organization, 2023). This curriculum is supported by social-constructive learning theories, stressing the collaboration and integration of different knowledge into one single learning element. Different from private international primary schools, public or subsidized primary schools follow the Education Bureau's Primary Education Curriculum Guide which is developed based on authentic and practical experiences of schools, local research, policy contexts of Hong Kong, and different perspectives of international development. This curriculum is also student-centered and framed for children aged 6 years old to 12 years old, while the best description of its design purpose is to cater to diversified learning and teaching through different assessments and strategies.

Music Instructional Methods

School music teachers not only need to learn to play an instrument skillfully but are equipped with thorough music knowledge for teaching. Their approaches to teaching can be varied while the music training owned are universal, meaning that they share the common ground of music instructional methods, developed by five profound music school educators, namely Carl Orff, Zoltan Kodaly, Emile-Jacques Dalcroze, Shinichi Suzuki, and Edwin Gordon.

Carl Orff

The Orff approach, which was also called Orff-Schulwerk (schoolwork), was child-centered with a philosophy that "children have not liked to study since the beginning of time" (Hughes, 1993). He strongly believed that children preferred to play, and a teacher should work on how to have their interests at heart to let them learn while they play. His approach was not systematic but sequential in training advanced learning skills from Bloom's Taxonomy perspective, from remember, understand, apply to analyze, evaluate, and create. As Orff's musical training was heavily involved with musical instruments, his approach was experimenting and improvising, it helped children to build their musical skills through four stages, including imitation, exploration, improvisation, and composition (Shamrock, 1997). Children simply learned music language, sounds, timbres, rhythms, melodies, and tonal material around them to create sounds. Orff's approach also stressed utilizing instruments, singing, movement, and speech to cultivate children's innate musical ability.

Zoltan Kodaly

Kodaly's method was another well-known approach to music education and child-centered. The music training of this method was singing, and he believed that singing provided a solid foundation for all beginners and children should learn to read music before having instruments to play along with (Kodály, 1974, p. 201, 204). His approach was highly sequential, and he taught children how to read scores, clap the rhythms, and sing the pitches, and each time added one new note or rhythm syllable. Compared with other educators, Kodaly preferred to tailor-make his teaching materials to suit his preference for quality teaching. Although he was notorious for his hand signs method which allowed children to visualize the spatial relationship between notes, he was not the inventor, but Sarah Glover's

Norwich and Curwen for their solfege system. Also, Kodaly was renowned for using body movement including clapping, walking, and running to enhance rhythm learning.

Emile-Jacques Dalcroze

Dalcroze's approach was called eurhythmics, meaning to incorporate rhythms, structure, movement, and music expression when playing music. He emphasized the sychrome of mind and soul. To develop musicianship, he/she should work on their sensitivity and expression which was the best way to awaken the physical, aural, and visual images of music in the mind through practising solfege, sight singing, ear training, improvising, phrasing the music, etc. (Anderson, 2012). The music learning was sequential. For instance, the demonstration of the teachers played an important role, students were encouraged to imitate and use body movement to learn, like walking, running, swinging, jumping, etc. Then, when the music changed in speed, the students needed to respond to this with verbal signals. The key was a quick-act reaction. After this learning, students could imitate and advance by echoing, which was called the interrupted canon. Students needed to clap a phrase, and their partners followed the same and clapped a phrase. A canon was to echo it back the pattern. This reflected and formulated group or peer learning.

Shinichi Suzuki

Shinichi Suzuki adopted a mother-tongue approach to learning music, which was an approach similar to language acquisition. For example, children started with reading and comprehension. After this sense of learning had been established, children were ready for any music learning or instrument learning. He preferred that children developed music in a loving and caring environment, with less competition. One important element of his approach was to encourage parent involvement and the training could be as early as three to four years old. The major essence of Suzuki's approach was focused on ear training, playing the repertoire, and group learning (Suzuki, 1993; Suzuki & Nagata, 1999).

Edwin Gordon

Edwin Gordon's method was called Music Learning Theory. He borrowed the idea of language development during infancy and proposed a new concept called 'audiation'. Audiation was a sequential learning process and was divided into 8 types, like listening, reading, writing, performing from recalling, creating and improvising (Gordon, 2007). According to Gordon (2007), children audiated music to develop music vocabularies through music thinking. Vocalization and recognition of the sound were started by repeated hearing of the rhythm chants, songs, rhythm patterns and tonal patterns. The expansion of the music vocabularies allowed them to imitate, improvise and communicate in music. In the classroom, school-aged children experienced music holistically, explored the tonal and rhythm patterns, as well as adding meaning to the music when they composed. Teachers gave guidance and intervened in their learning to fasten and consolidate the audiation process of the students.

Teaching Beliefs and Practices in Social Constructivism

In teaching, teacher knowledge and beliefs were intertwined to constitute teacher competency and professionalism, which could lead to different teaching outcomes and pupil performances (Bromme, 2005; Konig, 2012). The conduct of teachers was not only affected by the knowledge but also relied on the teachers' beliefs according to Konig (2012), Blomeke

(2002), and Ertmer (2005). For example, teachers tended to adopt a constructivist approach rather than a transmission view when they held a dynamic belief like the subjects instead of a static belief. The constructivist approach was derived from Vygotsky's social learning theory which proposed that children could develop their cognitive abilities and understanding from social environment, culture, and modeling. Social interaction was regarded as a process for learning and cooperative or collaborative dialogues were the facilitation of the cognitive development supported by adequate language ability to learn (Vygotsky, 1986). Some findings reflected that when the teachers held a belief in the good use of technology for student learning, it had a causal relationship with the impact on success (Basturkmen, 2012; Schoenfeld, 1998). Thus, scaffolding, allowing repeatedly brainstorming and poring over the questions, helps in shrinking the gap between the actual and potential learning, called the Zone of Proximal Development (ZPD). More dynamics and deep learning occurred when teachers believed in the advantages of social constructivism and applied technology tools in teaching. In the meanwhile, collaborative and group learning were facilitated among teacher-to-student and student-to-student discussions in class.

Shulman's Pedagogical Content Knowledge

Lee. S. Shulman (1985, 1987), as an education emeritus, evocated teaching professionalism. Teacher knowledge sufficiency was always put on the table to be discussed. The categories of this knowledge base had an array of requirements, including content knowledge, general pedagogical knowledge, referencing to the broad principles and strategies of classroom management and organization, curriculum knowledge, with a particular sense of program structuring, pedagogical content knowledge, referring to the special amalgam of content and pedagogy of the province of teachers, knowledge of students and their characteristics, knowledge of educational contexts, such as working groups, classroom, school finances, religions and cultures, and knowledge of educational ends, purposes, philosophy and historical grounds. Among the above knowledge base categories, the pedagogical content knowledge (PCK) was the interest in knowing the teaching practices, varying from different subjects since it represented the blending of content and pedagogy into an understanding of how particular topics, problems, issues, organized and adapted to the interest and ability of the learners, and presented for instruction. Blomeke (2002) suggested that content knowledge and pedagogical content knowledge could be viewed as epistemological beliefs, in which teachers could see the dynamic nature of the knowledge when they reached the mastery level, implying that teachers who saw those dynamics usually adopted the constructivist approach rather than didactic teaching style because of sufficient knowledge base and the deep understanding of their students.

Recent Music Education Research in Hong Kong Context

The idea of PCK was crucial since this was used to create a music education teaching framework under the social constructivism approach. Before that, recent studies were reviewed to understand different aspects or domains of music education in Hong Kong. For example, Ho (2007; 2013) conducted music education research with a focus on cultural value development. Leung (2021) showed that there was a trend of interest among Guangdong and Hong Kong music teachers to impart Cantonese operas at schools for both primary and secondary schools. Wong and her colleagues (2014; 2019) investigated the assessment practice and teachers' efficacy of 97 secondary school music teachers and 309 primary school music teachers. Cheng and Lam (2021) also put efforts into measuring the online teaching effectiveness in music education during the COVID-19 situation. The years of gap of

investigation and small group researchers reflected that the research development in music education was underdeveloped in Hong Kong.

Present Study

As mentioned, the concept of Shulman's PCK was the key in this study. It was a guideline to differentiate good teachings and bad teachings. The five music instructional methods that were the essence of social constructivist music teaching and the Bibles of the good teachings. It was also common knowledge among music teachers who should have shared music knowledge. This research author had identified the notions of different music teaching elements, and these were coded as nodes. For example, Orff's approach suggested learning from playing and Kodaly's was learning from singing. Then, there were two nodes. Some instructional methods shared the same way of teaching, like using movement among the founders of the music instructors. In this case, it was counted as one node. A social constructivist music teaching framework therefore was analysed and coded based on the literature review of the music teaching methodologies and nineteen nodes in total were identified with the understanding of the PCK (Appendix I). This study firstly could locate and explore the differences between private international and public-aided schools. Secondly, it tried to examine the possibility and effectiveness of the framework for showcasing music teaching in Hong Kong. The following were the hypotheses drawn:

H1: The higher the coverage number of music pedagogical content knowledge nodes the teachers have, the higher the chances the teachers adopt a social constructivist approach to teaching.

H2: There is a difference between private international schools and public schools in terms of the coverage number of music pedagogical content knowledge nodes.

H3: Teachers at private international schools tend to adopt the social constructive approach to teaching than teachers at public schools.

Methodology

Research design. The axis of this research was in-depth case studies of understanding the primary school music teachers' real teaching practices through the denoted pedagogical content knowledge nodes. It was a small-scale research, adopting the mixed methodology design including survey and interview (Denscombe, 2017). Teachers' backgrounds such as teachers' qualifications, years of experience, the preferences of pedagogies, and the uses of assessments were asked in the survey and further sought clarifications and elaborations during the interviews. Therefore, the teachers were required to complete the 20-minute long survey before half an hour of the interview, which was a one-on-one approach.

Participants. Four music teachers were recruited based on the criteria sets, in which the first criterion was to recruit current full-time music teachers who were working at primary schools in Hong Kong. The second rule was to have music teachers from public/ private/ international schools that have diversity in curriculums, syllabus, schools' mottos, values and resources, and development trends to address the find out the differences among different types of schools. In the end, two music teachers were working at international schools and the other two were teaching at aided public schools which matched the criteria set through convenient sampling.

Survey. The purpose of the survey was to collect the background information of the music teachers. It was a short-item survey, designed to be completed in 15 to 20 minutes. This provided a sense of what was going to be asked in the interviews and the survey was related to the personal and school background information, pedagogies, assessment design, generic skills, school resource allocation, and operation in musical activities. No personnel-identified data was collected. For example, the teachers did not need to disclose their names and which schools they were teaching at. Overall, the average completion time used was more than expected, which was 25 minutes on average.

Interview. A semi-structured interview was used and based on the pre-designed protocol (Appendix II) (Cohen, Manion, & Morrison, 2018). The researcher conducted the interviews on a one-to-one basis and in a sequential manner. Follow-up questions were allowed for the sake of getting more detailed explanations from the participants. The major reason for adopting a one-on-one approach was to collect a personal view on music teaching with fewer comparisons because of the prerequisite criteria sets, i.e. different school types. The total time needed for the interviews was from 30 to 45 minutes each.

Data collection. An interview protocol was tailor-made for this study. The data collection period was held between June and July 2022. There was around a month for distributing the survey and conducting the online interviews with the teachers. Once the consent form was signed, the interview session was arranged based on the teachers' suggested time slots. The whole interview processes were recorded and transcribed by the researcher. Each participant's recording was saved and renamed the teachers' files named 'MT', an abbreviation derived from the term 'Music Teacher'. Four cases were collected for analysis.

Data analysis. Descriptive statistics on teachers' and schools' backgrounds were tabled (Appendix III). The researcher worked on the transcription after all the interviews were done and coded it based on the social constructive music education framework. By counting how many different variations of music pedagogical content nodes each teacher had, the variations in teaching methods could be uncovered. A Wilcoxon signed-rank test was adopted to test out the significance between private international and aided-public schools. Content analysis was put forward to analyze the pedagogies and activities the students had. Since the study was conducted during pandemic times, some of the technological challenges and innovative solutions were identified and reported.

Results

Cases' Teaching Backgrounds

Music Teacher A was an international school male teacher with more than 10 years of teaching experience. He held a master's degree in music education and a certificate of teaching diploma. He attained the US Music Certified Music Exam level 10 piano and level 5 violin. The major pedagogies he used were experiential, inquiry, and cooperative learning. For the assessments, it had numerous types but mainly listening tests, peer assessments, and classroom performance. During the interview, he said that he was the solo music instructor at his school, managing all forms of the music curriculum, even extending to the kindergarten.

Music Teacher B was an international school female teacher with 4 to 6 years of teaching experience. She graduated with a master's degree of music education, as well as a teaching certificate. She got an Associate Level of Trinity College London in piano and Grade 8 in

theory. The major pedagogies used were inquiry, cooperative, and experiential learning. The assessment of the class included classroom performance, worksheets, and practical and listening tests. According to her interview, she claimed that the school decentralized the ways of teaching music since it was not the core subject, and the curriculum and format were solely designed and managed by her with one teaching assistant to support. She had more than 500 students and the schedule was always tight. Yet, she expressed that she was delighted to have a high degree of controllability in teaching and delivering her concept of music education.

Music Teacher C was a male teacher with more than 7 years of teaching experience. Different from the other teachers, he was also a mathematics teacher and worked at the aided public school. He held a bachelor of education, majoring in mathematics and minoring in music subjects. He had Grade 8 in piano and Grade 8 in theory. The major pedagogies he adopted were experiential learning, assessment & evaluation of student learning, and differentiated instruction. Worksheets and practical and listening tests were the typical strategies to impart music training to students. In the interview, he said that the school principal encouraged students to learn an instrument and he was part of the team to manage an orchestra with the students. This school had 5 music teachers responsible for different classes and he almost took charge of all forms of students in music, but it was expected the burden was less.

Music Teacher D was a male teacher with the least teaching experience, which had less than 3 years. He was currently studying for a master's degree of music education and a teaching diploma. He held a Grade 8 trumpet and worked at an aided public school. The major pedagogies used were assessment & evaluation of student learning, open-ended instruction, and integrated learning. Same as another public school music teacher, he graded students with worksheets and practical and listening tests. During his interview, he stressed that the school was result-oriented, thus he had to deliver student academic results to the principal. The test-based system was a plausible and effective way to show, and he reflected that he used many worksheets to explicitly reveal the grades. His school had 7 music teachers and he said that the workload was not high and was teaching primary 1, 2, 3, and 6 students.

Pedagogical Content Knowledge

Nineteen nodes were identified as the keys to the ways of teaching music at primary schools (Appendix I). It was hypothesized that there was a significant difference between private international and aided-public schools in the use of pedagogies. The Wilcoxon signed-rank test was applied due to the non-parametric distribution and the small sample size. With a 95% confidence level, there was no difference in the coverage number of pedagogical content knowledge nodes between the private international and aided-public schools, $V = 57$, $p = 0.40$, thus it was hard to conclude that the music teachers at the private international schools held a more dynamic teaching style than those at the aided-public schools.

Modeling, Guiding, and Training: Singing, Clapping, Movement

The similarities of the music teaching approach were using modeling, guiding, and training. All schools' teachers showed their music knowledge and pedagogies when sharing their experiences of teaching. Teachers as the sole educators in the classrooms need to pay attention to the body, control, and movement of the children's learning. They started by singing, added a little bit of body movement to express rhythms, and further learned to use

fine motor skills through instrumental learning in music education. Cognitively, the teachers raised the requirements when students turned to the higher grades.

> *"You have rhythm, melody, timber, harmony, dynamics, forms, and expressive elements. That is the basic of teaching music from the youngest one to the older ones…You cannot teach hemiolas to the younger ones because they won't understand that. You cannot teach syncopation to the younger ones because they won't be able to understand that as well... If you're going to teach regular beats or the basic unit of beats in grade five or grade six, they will get bored, so it should be taught according to the structures or concepts of beats, and the properties of beats."*

> *"One strand of the curriculum on PYP is instrumental playing. In the third year, we play the recorder. In the fourth year, it is angklung. In the fifth year, ukulele and angklung. In sixth year, ukulele."*

> *"Because I teach primary school students, I would like to use Kodaly as pedagogy. I would use the movement to clap or just feel the music movement. Also, I will make hand side Do Re Mi Fa and try to help them develop oral skills for singing."*

> *"For example, when they learn to play an instrument, they learn to appreciate music and think from different perspectives while composing."*

Generic Skills: Collaboration and Cooperation

As part of the generic skills development, collaboration and cooperation were emphasized and deserved the attention for training and development. To foster these skill sets, students should have adequate exposure to organization and group training. In primary schools, extracurricular activities or small projects were the strategies or preferrable platforms to empower students to work together to develop creativity through music performance or music appreciation, especially for senior primary school students. For the junior forms, they were engaged in music-related activities to learn socialization and develop stronger interpersonal and intrapersonal relationships with their classmates. The finding reflected that at the teacher level, all teachers had a mindset to push students to play or gamify music together, but at the school level, not all the schools were promoting it due to limited human capital and the hindrances of the pandemic.

> *"We have a choir, an orchestra, and a rock band. The choir is very popular, but the school only allows me to have 30 students."*

> *"Cooperative learning, because we always do a lot of activities that they need to be together. They need to be together, dance, or play games. I think that they need to be cooperative because if they don't cooperate, they will never learn and be in our lessons."*

> *"Playing in the orchestra is not just about playing instruments itself, they have to communicate and collaborate with the other students in the orchestra. I cannot tell and do an analysis that you have 10% better, but I can tell those students in the orchestra have better collaborative skills."*

"There are choirs in our school, but it is not very formal. It is not compulsory, meaning that if you want to join, you can join. There is a percussion class for them to learn percussion like marimba, and xylophone but thanks to COVID-19, there is no practice and contest this year."

Generic Skills: Technology-Supported Learning

The advancement of technology shed light on having more good practice of technology-supported learning during the pandemic situation. Facing the challenges of the change in the teaching environment, teachers could no longer educate vis-à-vis at schools but adapt to online teaching or online education. The attention spans of young children were around 12 minutes at the age of 6 years old and 30 minutes at the age of 12 years old (Brain Balance Achievement Centers, 2023). It was hardly asked primary school students to sit in front of digital monitors to learn music theory. The use of apps named Garage Band on iPads could allow students to improvise songs and enable a higher level of creativity in music creation and claimed to be effective.

"I think we were lucky because of the fifth wave in the second term. I have already taught them how to read the music, so they got the training in listening. Singing is really difficult in class because their singing is never synced together in the online teaching environment, thus I have to ask them to do that one by one."

"It [Covid-19] affects a lot. Our school orchestra has reduced the size and only the string session and percussion are left. We cannot practise in school. For those woodwind and brass sessions, we have to change it in Zoom. For regular school activities, like music lessons, let's say recorder teaching, we teach fingering inside the school and ask students to go back home to record the videos."

"For integrated learning, I always use an iPad with them. The project that I am doing with P4 students is that I get a video from cartoons like Disney. Then I mute the sound and they have to use the garage band app which is on the iPad. They have to compose the background music for that video."

"It is about how to use GarageBand on an iPad, like what elements in that software can be used."

Justification of the Framework: Common Training of Teachers

The social constructive music instructional framework had not yet been testified by the nature characteristics of the private international and aided public schools, but it was very generic instead of specific. Reflected by the interviews, these music teachers had gone through some but not the same Western music training. For instance, the common music educators they usually adopted were Kodaly, who was notable for singing and the solfege system, as well as Orff's approach and John Cage's. Others like Dalcrozes, Suzuki, and Gordon had not yet been mentioned.

"I'm using Kodaly because Kodaly is abstract before concrete. I would give the experiences first. By giving them all the experiences which let them feel everything before they go to conceptual learning, and then structural learning. If you are

following the Kodaly method to teach, you would follow the ta-ti-ti-ta. I will introduce how we are going to read the rhythm and listen. We then move on to reading, writing, and creating [music]."

"Because I teach primary school students, I would like to use Kodaly as pedagogy. I would use the movement to clap or just feel the music movement. Also, I will make hand side Do Re Mi Fa and try to help them develop oral skills for singing."

"Did you hear about Orff? It is a pedagogy that was invented by Orff."

"In composition, [let say] John Cage. He uses a lot of different sounds, but not precisely musical instruments. You can make a sound and he combined everything to make a piece of composition or piece of music."

Conclusion

This study not only aimed to reveal the teaching practices of music education in Hong Kong at the primary school level but also showed the characteristics of music teaching between private international and aided public schools. It was summed up in three dimensions: 1) Teaching foundation, 2) generic skills, and 3) common training of teachers. The teaching foundation was the same regardless of the different types of schools and all teachers took the initiative to be role models and gave intensive guidance to their students to learn how to sing, clap, and move, then catch the rhythms, tones, and beats, followed by the instrumental playing and song writing. The generic skills were cooperation and collaboration. Placing students in extra-curricular activities could leverage these skills in advance in which teachers reflected their performance in class. Lastly, technology-supported learning in music education was discussed, while the social constructive music framework did not include the technology element. Since it was coded based on traditional Western classical music instructional methods, this was considered a limitation of this framework in terms of comprehensiveness. In the 21st century, in no doubt that the existence of technology in learning needs to be addressed. The pedagogical content knowledge can be re-interpreted as technological pedagogical content knowledge (TPCK)(Angeli & Valanides, 2005; Koehler & Mishra, 2006), embedding the technology into music learning, such as the apps for music or song creation. It was of importance to investigate the technology development in music education to finetune the framework accordingly for future study purposes.

Appendix I

5 Music Instructional Methods & 19 Pedagogical Content Knowledge Nodes

Approach	Pedagogies	Activities	Procedures
Carl Orff	• Learn from playing • Learn with tools • Learn from singing • Learn gradually according to the developmental approach (E.g. Internalise the rhythm by learning the concept of rhythm first, then adding the body percussion)	• Imitate to build repertoire of pitches, rhythms, meter, tempo and dynamics • Hear movement of pitches, the content of rhythms, moment of meter and explore timbre of whatever instrument or voice • Develop musical framework • Analyze the musical material • Add music into drama/stories/tales	• Imitation • Exploration • Improvisation • Composition
Zoltan Kodaly	• Learn from singing • Learn gradually, and progress by adding one new note or rhythmic value at a time, from simple to complex • Learn from movement • Music should belong to everyone •	• Start with sight-reading and basic rhythms and pitches • Use self-developed teaching materials like folk music or songs to teach • Use solfege to teach sequence and incorporate rhythmic syllables	• Master sight singing • Sing along with the solfege system • Infuse walking, running and clapping while singing
Emile-Jacques Dalcroze	• Learn from rhythm, structure, musical expression and movement • Learn to be sensitive and expressive • Learn with purposeful movement, sound, thought, feeling and creativity • Learn in sequence • Combine movement	• Begin with ear training or solfege • Start with meter, dynamics, rhythms, tempo, duration, melody, form, phrase and pitch • Combine movement to learn solfege • Use improvisation to sharpen spontaneous reactions and physical responses to music	• Follow • Quick reaction • Interrupted Canon • Canon

Shinichi Suzuki	• Learn from sensitivity, discipline and endurance • Learn from training • Learn with encouragement • Learn in group • Learn as early as possible • Learn equally	• Start the ear development by repetition, followed by memorization for improving sensitivity of music and security in playing publicly • Play a repertoire in group	• Instrumental play • Deliberate practice
Edwin Gordon	• Naturally born with different music aptitude • Learn from interaction • Learn by guidance • Learn from sequence	• Experience music • Examine the tonal and rhythm patterns • Comprehend and understand music • Use solfege to assist students to recognize and audiate the characteristics patterns of each	• Acculturation (Aurally collect the sound, mimic, move and babble in response and attempt to relate with the environment) • Imitation (Recognise the movement and babbling, and imitate the tonal and rhythm patterns and other sounds) • Assimilation (Recognise the discrepancy and expected outcomes, and modify for better outcomes)

Highlights of Pedagogical Content Knowledge

1. Learn from playing
2. Learn with tools/instruments
3. Learn from singing
4. Learn music gradually and in sequence
5. Learn with body movement
6. Learn by modelling/guidance/training
7. Learn from interaction
8. Learn in supportive environment/with parent involvement
9. Learn from repertoire
10. Learn with solfege/ hand gestures
11. Learn as early as possible
12. Learn for morality/ discipline
13. Learn from structure
14. Learn from rhythm
15. Learn in group
16. Learn with purpose
17. Music is for all
18. Music is emotion expression
19. Naturally born with different music aptitudes

Appendix II

Interview Protocol

Personal Background
1. What is your educational background?
2. What is your degree major and minor?
3. Are you a holder of any teaching diploma? What is it?
4. Any other music-related certificates you are holding? (i.e. grade 8 piano, violin, vocal singing)
5. How long have you been teaching music curriculum?
6. What kinds of pedagogies you are using while teaching? Could you give some examples?
7. To what extent do you and other music teacher(s) follow the standard-driven approach, i.e., the music education curriculum suggested by the Curriculum Development Council (2003)?
8. What kinds of formative and summative assessments do you give to the students to develop the generic skills?
9. What is the type of your school? Government public school, aided public school, caput school, private school, private international school, and English schools' foundation?
10. Does your school adopt a small-class teaching approach? How many students are in one class?
11. How many music teacher(s) in your school?
12. How do you share the workloads with the music teacher(s)? Do you have any teaching assistants to support you?
13. Which primary levels you are responsible for?
14. How many music lessons per week in your school? How long is the music lesson?
15. In your school, what are the popular music activities? Is it outsourcing or led by you and the other music teacher(s)?
16. Does your school arrange concert visits or school performances each year? How many concert visits and performances happened inside/outside the school?
17. What kinds of rooms/venues you can use for musical activities, including teaching, and internal and external musical performances?
18. Do you think the facilities in your school are enough for training students to have instrumental/singing/brand/orchestra/other performances? If yes, may you give some examples? If not, kindly suggest what things can be improved.
19. What kinds of grants/ funding your school applied/received?
20. What are the major financial sources to support the musical activities in your school?
21. Are there any donations from parents, alumni, and other teachers?
22. What kinds of music-related activities you have to arrange for your school?
23. How often do you need to help and be involved in non-music-related activities? What kinds of duties do you usually need to perform?
24. Have you encountered any difficulties when teaching music during the pandemic situation? How do you tackle it and how the school support you? Interview
25. What kinds of technology and collaborative tools you have adopted for online music classes with students? What is the student's engagement level?
26. Are there any changes in assessments? What are they? Interview
27. Do you feel very stressed in the teaching arrangement when the pandemic alters the teaching practice? What kinds of activities have been disallowed and had a great influence on you and the students?

Appendix III

Table of Interviewed Music Teachers' Portfolios

Music Teacher A (MT01)	Music Teacher B (MT02)	Music Teacher C (MT03)	Music Teacher D (MT04)
Male	Female	Male	Male
Master of Music Education; USMCE Level 10 Piano; USMCE Level 5 Violin	Master of Music Education; ATCL Piano; Grade 8 Music Theory	Bachelor of Mathematics (minor in music); Grade 8 Piano; Grade 8 Music Theory	Master of Music Education Grade 8 Trumpet
>10 Years of Teaching	4-6 Years of Teaching	7-10 Years of Teaching	0-3 Years of Teaching
Private International School Experiential Learning; Inquiry Learning; Cooperative Learning	Private International School Inquiry Learning; Cooperative Learning; Experiential Learning	Aided Public School Experiential Learning; Assessment & Evaluation of Student Learning; Differentiated Instruction	Aided Public School Assessment & Evaluation of Student Learning; Open-ended Instructional; Integrated Learning
27 students per class; 40 mins; 2 lessons per week	25-27 students per class; 45 mins; 1 lesson per week	30 students per class; 30 mins; 2 lessons per week	30 students per class; 35 mins; 2 lessons per week
1 Full-time music teacher	1 Full-time (>20 classes); 1 part-time(8 classes)	5 Full-time music teachers	7 Full-time music teachers

Lexical Density in Academic Writing: Lexical Features and Learner Corpora Analysis in L2 Tertiary Students' Essays and Didactic Implications

Martina Lipková, Slovak University of Technology in Bratislava, Slovakia

Abstract

Academic writing is crucial for communicating ideas among scientists, researchers and academics across various disciplines. It may be an arduous process for students when composing academic texts to meet the university requirements and academic discourse conventions. This research study investigates lexical features of the independent technical essays related to academic writing proficiency in students of Mechanical Engineering. Examining the score of lexical density compared to lexical diversity help educators understand the difficulties that students encounter when composing essays around topics concerning various technical study areas. Correlation between academic and specialty vocabulary in relation to lexical density was investigated to measure the extent to which the variables are related. Lexical density shows the measure of linguistic complexity of 42 university student essays. Based on statistical analysis, a moderate correlation exists between the measure of the academic vocabulary used by the students and the lexical density. A low negative correlation between specialty words and lexical density was found. Syntactic and structural features of the texts are also significant indices of the academic writing proficiency. Computational tools and corpora-based analysis were used for statistical analysis. Outcomes of the research helped identify the students' lexical needs within academic and content-based discourse in tertiary education and have didactic implications in L2 academic writing courses in compliance with the conventions applied in the university academic context.

1. Introduction

Writing is a process that encompasses skills and strategies related to text analysis, critical thinking, text editing, generating, argumentation, effective communication. Understanding subject-matter content assumes such a learning environment in which thinking skills are developed, and students are taught to think critically. Higher-order thinking skills help students make their studies more effective and meaningful. The framework of educational objectives developed by Benjamin Bloom in his taxonomy (1956) consists of six major categories: knowledge, comprehension, application, analysis, synthesis, and evaluation (Armstrong, 2010). Teachers and university instructors are supposed to develop the needed skills and abilities, help students encounter problems and grow their intellectual skills (King, 1997). There are many concepts of describing higher order thinking, but implementing good teaching strategies aimed at tasks demanding critical, logical, reflective, metacognitive, and creative thinking are crucial for students' ability to enhance academic writing proficiency (Rhashvinder K. A. Singh, Charanjit K. S. Singh, Tunku M. T. M., Nor A. Mostafa1 & Tarsem S. M. Singh, 2017). "Higher order thinking skills in teaching academic writing is a challenging task nowadays since learners are exposed to an enormous information influx" (Klimova, 2013; Whittington, 1995).

The language and content awareness development in university students is a major factor of better understanding oral and written texts. With focus on English for academic purposes (EAP), including English for specific purposes (ESP), a precondition for academic writing within the field of studying areas, synergistic use of language is considered. To improve academic writing skills, academic reading is a crucial factor in understanding and dealing with a writing task properly. Writing is a process that assumes gaining appropriate knowledge in a specific scientific area. Thereby, accompanied by developing academic reading strategies, like reviewing, scanning, skimming, questioning, visualizing, summarizing (Sunggingwati, 2017), help students to achieve higher confidence to produce proper paragraph structure within the text where cohesion and coherence are important features of academic writing. Other practical skills, like searching for appropriate literature sources, referencing academic literature, final summarizing arguments demand application of higher order skills, also related to sorting and identifying reliable information based on strong evidence.

Based on the research analysis, the attempt is to identify students' needs aimed at vocabulary learning strategies in ESP, in combination with academic writing. In this, some views of vocabulary learning in ESP are provided. The lexis in scholarly texts has been analyzed in many types of research where it usually distinguishes between core vocabulary, technical vocabulary and semi-technical vocabulary (Baker, 1988, Widdowson, 1993, Zamfir, 2022). Another classification refers to academic vocabulary used across all disciplines, and content, or content-specific, vocabulary. The term academic language is often referred to as general academic vocabulary, "all-purpose terms that appear across content areas" (Baumann and Graves, 2010). It is the kind of vocabulary "used in academic contexts regardless of which discipline you are specializing in" (McCarthy and O'Dell, 2016). It does not include the specialist vocabulary of a particular content or subject.

On the other hand, specialist vocabulary, also referred to as domain-specific academic vocabulary (Meneses et al., 2018), or technical vocabulary (Fisher and Frey, 2008), is very specific and appears in studying and scientific content area texts, coursebooks, scholarly texts and published articles. The frequency of domain-specific or technical words occurs less

frequently in comparison with the academic vocabulary. Communication between scientific communities means that professionals from different scientific, technological and industrial environments are expected to interact and use a high level of specialist communicative competence. It includes very specific terminology to identify, for example, various processes, hypotheses, names of tools, machines and components, mathematical symbols, equations and specialty terms, including trends and proportions expressed by charts, etc. To participate in cross-border exchange of knowledge, from teachers' and students' perspectives, learning objectives must be considered to provide significant input for foreign language acquisition. A genuine and authentic environment creates good conditions for international communication strategies development in higher education. Authentic texts are used in L2 language training for a higher density of specialist lexis that conveys a real message. The notion of authenticity implies a question about how students-readers engage with them and learn from them. Efficient learning strategies, task-based activities that increase motivation in students contribute to enhancement of the language so that a learner is able to reproduce the information the authentic texts convey.

1.1 Lexical Density and Lexical Diversity

Lexical density, as one of the dimensions of lexical complexity, refers to the proportion of content (lexical) words (nouns, verbs, adjectives, and adverbs) to all words (tokens) in the texts within a particular discourse; the proportion of content-carrying lexical words to noncontent-carrying grammatical words (Ure, 1971; Camicottoli, p. 73, 2007). It is also sometimes expressed as the ratio of the number of content words to the number of clauses (lexical density of a sentence) based as Halliday (pp. 61-72, 1985) proposed.

Various ways of measuring language complexity have been applied across studies. The concept of language complexity is associated with and can be measured at various levels (Lahmann, Steinkrauss, Schmid, p. 173 – 191, 2019), for instance, at the level of the words, phrases, sentences, or syntactic complexity (Kuiken, Vedder, 2019, Larsson, Kaatari, 2020). It has been measured as the L2 complexity of the production, and for this research purpose, the lexical diversity of university students' essays was measured. Lexical diversity is defined as the measure of how many different words, phrases or sentences appear in a text. In this research, the lexical diversity was calculated as the type-token ratio, i.e. the ratio of the number of different or unique words (types) and the total number of words (tokens) in essays.

2. Methods

In this paper, the main focus lies on investigation of academic writing proficiency through analysis of the students' essays. For the needs of this research, not full essay texts were analyzed, as the texts of approximately equal length were included for further statistical analysis.

Correlation between academic and specialty vocabulary in relation to lexical density was investigated to measure the extent to which the variables are related. Next relationship strength was analyzed between lexical diversity and lexical density quantitative variables. Lexical density and lexical diversity show the measure of linguistic complexity of 42 university students' abstracts as a part of the assignment in the L2 ESP course.

3. Results

The relationship between the values was investigated with the use of Pearson's correlation. Whether the sample comes from a normal distribution, the values of the standardized skewness and standardized kurtosis were checked (Table 1). The values are not outside the range of -2 to +2, thus indicating that the statistical procedures can be normally applied to this data.

	Academic words	Specialist words	Lexical density
Count	42	42	42
Average	7,96119	10,9814	56,8333
Standard deviation	3,74925	4,60334	4,82835
Coeff. of variation	47,0941%	41,9193%	8,49564%
Minimum	2,48	1,92	46,0
Maximum	15,65	22,92	69,0
Range	13,17	21,0	23,0
Stnd. skewness	1,04472	1,93882	0,810887
Stnd. kurtosis	-1,18827	0,389734	0,156742

Table 1: Summary statistics

Based on statistical analysis, a moderate positive correlation exists between the measure of the *academic vocabulary* used by the students and the *lexical density*. Table 2 shows Pearson product moment correlations between each pair of variables. The correlation coefficients range between -1 and +1 and measure the strength of the linear relationship between the variables. The number of data values used to compute each coefficient are shown in parentheses. The third number in each location of the table is a P-value. It tests the statistical significance of the estimated correlations. P-values below 0.05 indicate statistically significant non-zero correlations at the 95.0% confidence level. The following pairs of variables have P-values below 0.05: *academic vocabulary* and *lexical density*. A low positive correlation between *specialty words* and *lexical density* was found (Table 2).

	Academic vocabulary	Lexical density	Lexical diversity	Specialty vocabulary
Academic vocabulary		0,5332	0,1375	-0,1794
		(42)	(42)	(42)
		0,0003	0,3853	0,2556
Lexical density	0,5332		0,3431	0,2789
	(42)		(42)	(42)
	0,0003		0,0261	0,0736
Lexical diversity	0,1375	0,3431		-0,1718
	(42)	(42)		(42)
	0,3853	0,0261		0,2765
Specialty vocabulary	-0,1794	0,2789	-0,1718	
	(42)	(42)	(42)	
	0,2556	0,0736	0,2765	

Table 2: Pearson product moment correlations between each pair of variables

Visualization of the Pearson correlation coefficient can also be seen in Fig. 1, which displays how close the points are falling to the line of best fit. Based on the slope of the line of best fit, the Pearson correlation coefficient is either positive (above-mentioned correlation coefficient between the academic vocabulary and the lexical density) or negative (above-mentioned correlation coefficient between specialty words and lexical density).
Figure 1: Visualization of the Pearson correlation coefficient

A moderate positive correlation exists between the values of *lexical density* and *lexical diversity* as can be seen in Table 3, where the Pearson correlation coefficient is between 0.3 and 0.5 indicating moderate strength and positive direction. The P-value is below 0.05 and thus considered statistically significant.

	Lexical diversity	Lexical density
Lexical diversity		0,3431
		(42)
		0,0261
Lexical density	0,3431	
	(42)	
	0,0261	

Table 3: Correlation between the values of lexical density and lexical diversity

Figures 2 and 3 refer to histograms for lexical diversity and lexical density variables frequency distribution. Summary statistics is displayed in Table 4.
Figure 2: Histogram for lexical diversity
Figure 3: Histogram for lexical density

	Lexical diversity	Lexical density
Count	42	42
Average	56,9048	56,8333
Median	58,5	56,5
Standard deviation	6,48379	4,82835
Minimum	39,0	46,0
Maximum	70,0	69,0
Range	31,0	23,0
Stnd. skewness	-2,3261	0,810887
Stnd. kurtosis	1,02987	0,156742

Table 4: Summary statistics

A weak negative correlation, statistically insignificant (P-value is higher than 0.05), exists between the values of academic and specialty vocabulary (Fig. 4).
Figure 4: Relationship between academic and specialty vocabulary

Figure 5 displays the relationship between the values of specialty vocabulary and lexical density. A low positive correlation, statistically insignificant (P-value is higher than 0.05), exists between the values.
Figure 5: Relationship between the lexical density and specialty vocabulary

As can be seen in Fig. 5 displayed above, a moderate positive correlation, statistically significant (P-value is lower than 0.05), is between the values of specialty vocabulary and lexical density. As regards the relationship between specialty vocabulary and lexical diversity, a weak negative correlation, statistically insignificant (P-value is higher than 0.05), can be seen in Fig. 1.

3.1 Learner Corpus Analysis

The extent to which particular lexical features are used by students, and how they correlate, has been analyzed with the use of Pearson's correlation.

The Sketch Engine corpus tool provides the data source for investigating the language use. For the purpose of the research, the learner corpus in mechanical engineering compiled from the students' essay abstracts, was applied. Word frequency counting, concordances, keywords, collocation analysis and automatically extracted grammatical relations based on statistical patterns in the corpus enable discourse analysis, thus providing an overview of language variation in students' academic writing. The general info about the corpus of 42 students' essays used in the research is provided in Table 5.

Tokens	7,991
Words	7,104
Sentences	399

Table 5: The total numbers of tokens, words and sentences are shown in the general info.

Some of the outcomes from the Sketch Engine tool are displayed in the following figures. For instance, the Word Sketch function was used to identify multiword collocations with the word "transmission", which stands on the 14th position of the wordlist based on how frequently the words occur in the corpus. Sample modifiers of the word used by the students are:

> **10-speed automatic** transmission
> **Hydraulic automatic** transmission
> **Dual-clutch** transmission
> **3-speed manual** transmission

Verbs used with "engine" as an object, the second most frequent word in the corpus, can be extracted:

> … type of vehicles that **combines** *an internal combustion engine …*
> *… they also **introduced** new engines from…*
> *… used to **power** the engine …*

The N-Grams function enables extracting the sequences of a particular number of items how they were mostly used by students. For example, the following most often 3-item sequences of words occurred:

> **Of the car**: *…can fully rely on the capabilities **of the car** on the roads …. ; … in the second last generation **of the car**.*
>
> **Internal combustion engine:** *… a type of vehicle that combines an **internal combustion engine** with … ; Heat is the product of the **internal combustion engine**.*
>
> **Zero energy house:** *In short we can say that the **zero energy house** produces… ; … equality between consumed energy and energy produced by **zero energy house**.*

Connection between patterns and meaning, as the examples mentioned above indicate, enables students to understand a particular technical term as part of a phrase rather than in isolation, thus leading to better understanding of authentic materials. "From this perspective, the lexical approach lies in teaching collocations, i.e. how lexical items co-occur and what grammar they tend to be associated with. In addition, knowledge of collocations supports effective sentence producing and enhances L2 proficiency development in students" (Lipková, 2021).

4. Conclusion

Concerning the moderate positive and statisticacally significant *(P-value is lower than 0.05)* correlation between the values of academic vocabulary and lexical density, it can be seen that with increased lexical density also more academic words are used by students in their written texts, and more frequently, compared to specialty words. Relationship exists between the variables and we can reject the null hypothesis.

With increased lexical density also more academic words are used by the students in their written texts, and more frequently, compared to specialty words. A relationship (moderate positive correlation, P-value is lower than 0.05) exists between the variables and we can reject the null hypothesis.

With increased lexical density also more specialty words are used by the students in their written texts, though very little (low positive correlation; statistically insignificant, P-value is higher than 0.05). We cannot conclude that the independent variable affects the dependent variable (if lexical density affects specialty vocabulary).

With increased density also lexical diversity, i.e. richness of vocabulary increases. Relationship exists between the variables (moderate positive correlation; statistically significant, P-value is lower than 0.05) and we can reject the null hypothesis.

If the number of the used academic vocabulary increases, it does not mean that specialty vocabulary word number increases too as a weak negative and statistically insignificant (Pvalue is higher than 0.05) correlation exists between the variables. We cannot conclude that the independent variable affects the dependent variable (if academic vocabulary affects specialty vocabulary).

If lexical diversity (richness) increases, there is still an insufficient number of specialty words used by students, based on the weak negative, statistically insignificant (P-value is higher than 0.05) correlation. We cannot conclude that the independent variable affects the dependent variable (if lexical diversity affects specialty vocabulary). As a result, teaching strategies aimed at developing specialist content-based terminology must be applied.

Currently, it is worth mentioning that a diverse approach to increasing the needed vocabulary considering the terminology used in translated texts has been investigated. Text complexity, including syntactic complexity (Vanmassenhove, Shterionov, Way, 2019), has been observed across research into comparison of machine translation, post-edited machine translation and human translation with special attention to lexical diversity, error rates and differences between the reference human translation and the machine translation, also with respect to their communicative function (Hudecová et al., 2021). Development of writing in a second language is a complex process and demands further expertise with respect to L2 learners' proficiency, including the ability to compose the texts. Studies examining learners' decision-making process when composing their texts followed by translating the texts into L2 have been surveyed to enhance text production skills in a second language (Jahangard, Holderread, 2017), as well as with the use of parallel corpora-based translation where, based on comparison of English texts and their corresponding translations, students studied lexical features and syntactical structures to be able to do back-translations from L1 to L2, thus becoming familiar with discourse patterns (Cappuzzo, 2020).

Corpus Query System (CQS) enables teachers, students, translators and other users to work with large amounts of texts according to their needs and objectives. From this perspective, computational linguistics and corpora-based teaching of L2 might be thought as an effective solution for teachers in their effort of designing study materials that meet teaching/learning objectives and learners' needs. This can be used to facilitate designing ESP lessons for professionals. Language structures and phrases typical for various text registers, or types of discourse, allow us to answer great number of research questions and hypotheses, or verify our intuition about the language. The relationship between vocabulary and the quality of written texts was examined in the research based on the lexical features analysis. The use of multi-word collocations is one of the indicators of the sophistication and complexity of the written compositions, along with vocabulary density and diversity lexical indicators.

An Initial Study of Integrating Bilingual and Science Instructional Modules for Elementary Science Teacher Preparation

Ying-Feng Wang, National Taichung University of Education, Taiwan

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

The study aimed to develop integrated English and Mandarin instructional modules for elementary science teacher preparation. The instructor played a researcher's role in implementing action research during science teaching and learning. Fifty university elementary pre-service students taking the three-semester hour course during the two semesters participated in the study. The researcher developed the multi-models of multimodalities, consulted with five science education experts, and modified them to apply in the science teaching and learning course. They were integrating English and science concepts to guide the pre-service students to learn by doing inquiry-based science activities, such as identifying plant characteristics, insect taxonomy, and a variety of science experiments.Data were collected from classroom observation, questionnaires, student assignments, and feedback; most pre-service students put their hearts into operating science activities and expressed their thoughts in bilingual ways through the integrated instructional modules. Some pre-service students wrote interesting poems and science stories and developed lesson plans across several disciplines, including science, Mandarin, English, art, and mathematics. On the other hand, some pre-service students needed help with science concepts and theories in English. Multimodality was effective in engaging their understanding of learning science. Two-thirds of pre-service students were interested in designing science activities in English. However, they needed to be more self-confident in expressing themselves in bilingual ways. Learning confidence needed to be enhanced to engage the elementary pre-service students using English as the medium of instruction, content, and language-integrated learning skills.

Keywords: Bilingual, Multimodality, Pre-service Students

Introduction

The new national education curriculum for the 12th year emphasizes that the English curriculum in national primary and secondary schools aims to develop students' abilities and habits in independent learning and lifelong learning of English. English learning should also follow the era of globalization and go beyond the framework of classrooms and textbooks so that English learning can be continuous. English is no longer just a language in school but can be learned from everything in life. English learning can also continue understanding the broader world by expanding life experience. Meanwhile, culture and nation enhance the ability of international participation and cultivate a global outlook for the learners.

In conjunction with the "2030 Bilingual National Policy Development Blueprint" announced by the National Development Council today, the Taiwanese Ministry of Education will aim to "comprehensively launch the bilingual activation of the education system and cultivate Taiwan's bilingual talents for the world" by accelerating teaching and learning activation. There are five significant strategies include adapting to daily life, expanding English human resources, making good use of technology to popularize individualized learning, promoting the internationalization of the education system, and relaxing regulations and establishing flexible mechanisms to strengthen students' ability to apply English in life and their future competitiveness in the workplace, and through joint efforts with various ministries.

To meet the goal of the "Blueprint for Developing Taiwan into a Bilingual Nation by 2030", it is essential to nurture pre-service students' capabilities in bilingual science activity design and to enhance their self-efficacies in bilingual science teaching. Therefore, examining the pre-service students' capabilities and self-efficacy is crucial to developing integrated English and Mandarin instructional modules for elementary science teacher preparation. Two research questions raised to guide this study were listed as the following.

1. How did the pre-service students perform their self-efficacies in bilingual science teaching?
2. How did the pre-service students exhibit their capabilities in bilingual science activity design?

Literature Review

Content and language integrated learning (CLIL) is not only language courses but also includes courses that focus on one subject and combine language learning. According to the 4C Principles proposed by Coyle (1999), successful curriculum implementation must consider four main aspects: content, communication, cognition, and culture, and design curriculum and teaching content per national conditions and cultural characteristics. CLIL practices are initially from Europe and are widely applied in European schools (Eurydice, 2017). Nowadays, CLIL practices are applied globally. To achieve the bilingual national education policy, a content, and language integrating learning approach is also used in bilingual classroom teaching in Taiwan. Content and language integrating learning (CLIL) encompasses subject knowledge and concepts, cognitive skills, and academic language needed to understand and illustrate subject knowledge (Lo & Lin, 2019). Students can learn both subject knowledge and language knowledge in the classroom at the same time through the CLIL approach.

Rabbidge (2019) indicated five translanguaging strategies enhance teacher-student interaction and English learning outcomes, including instructional, vocabulary-discovery, concept-checking, associative, and affective translanguaging strategies. Translanguaging is like cross-linguistic practice and is derived from both multiliteracy and multimodality. It comes from the concept that emphasizes the variability in language practice. When we use language, we usually combine languages and multiple media, such as gestures, text, images, and symbols, to construct meaning. The strategies of translanguaging can help students overcome language learning barriers and gain a deeper understanding of subject knowledge. The concept of multimodality is that meaning-making does not occur through language but rather through the multiplicity of modes (Kress, 2010). Content knowledge combined with multimodal teaching design makes content learning more enjoyable.

Meanwhile, students can understand subject concepts and principles directly while overcoming language barriers through multimodality. Graphic resources like charts, diagrams, and graphs are used in science. Science teaching and learning usually occur through multiple modes (Liu & Lin, 2021).

Methods

In two semesters, the instructor played the researcher's role in implementing action research during science teaching and learning. Fifty university elementary pre-service students took the three-semester hour course during the two semesters. Twenty-four pre-service and twenty-six pre-service students participated in the study during the first and second semesters. The researcher developed the instructional modules with multimodal approaches, consulted with five science education experts, and modified them to apply in science teaching and learning within two semesters. When pre-students have difficulty understanding concepts and principles, the approaches of translanguaging and multimodality were applied to engage students' learning understanding and effectiveness, such as pictures, videos, and teaching aids.

Both quantitative and qualitative methods were applied in this study. Triangulation was achieved by collecting data from questionnaires, classroom observation, pre-service students' assignments, and feedback. Five science researchers designed and validated the self-efficacy questionnaire of pre-service students concerning bilingual science teaching and learning. The meaning-making of science concepts and theories for the pre-service students was taught in the class. Bilingual instructional models emphasizing scientific inquiry were used in science teaching and learning. Science activities as the approach of instructional translanguaging. For instance, identify plant characteristics, insect taxonomy, and a variety of science experiments. The instructor integrated English and science concepts to guide the pre-service students to learn by doing inquiry-based science activities. The multimodalities, translanguaging, content, and language-integrated learning approaches were applied in science instruction. The pre-service students' capabilities were encouraged to present in bilingual science activity design.

Findings

By introducing basic English and books or media, almost all students can understand the content taught in this course. During the first semester, picture and word cards were used for bilingual science teaching and learning. Twenty-six pre-service students participated in the second semester; many multimodalities were applied in the course, such as science reading

and writing of picture books, picture cards, word cards, and board games. The above methods were used in the class. Multimodalities were effective in engaging their understanding of science learning. Most of the pre-service students feel interested in bilingual learning ways. However, some pre-service students needed help learning science concepts and theories in English. Data on the self-efficacy of pre-service students during the first semester and the second semester were collected from the questionnaires. For instance, they are interested in the application of listening, speaking, reading, and writing in English (52.8%; 43.9%). Like the course delivered in an English-speaking way (59.5%; 58.5%). They are interested in elementary science teaching using English as a bilingual method (66%; 63%). They are confident in incorporating English into elementary science teaching (39.6; 29.2%).

According to the data from the questionnaires on the self-efficacy of pre-service students in the 2nd semester, there were similar results in the first semester. The findings showed that the performance of pre-service students still has a long way to go. For instance, 48.8% of pre-service students understand and use translanguaging strategies in bilingual science teaching. The 43.9% know and use multimodalities to implement bilingual science teaching. The 48.8% of them understand and use CLIL strategies for bilingual sciences teaching. 53.6% of them understand and use question guidance strategies to teach sciences through English question-led discussions. Approximately sixty percent of pre-service students agreed with the course instruction and liked the course taught in English. Roughly fifty percent of pre-service students understand the approaches of translanguaging, multimodalities, and CLIL. Two-thirds of pre-service students were interested in designing science activities in English; however, they needed to be more self-confident in teaching in bilingual ways. Therefore, English proficiency for all the pre-service students must be enhanced step by step.

The English training in listening, speaking, reading, and writing was emphasized throughout the study. Forty percent of pre-students taking the course can answer various questions correctly in English, and other learners are studying hard. Nearly forty percent of the students taking the course can respond to course questions in English. They looked very hard, thought and discussed in English, and tried to respond to the teacher's questions in English. More than 90% of students can read and understand the English books and articles related to this course. More than 90% of students can read and understand professional vocabulary in science and teaching in English. Eighty-five percent of students can correctly answer worksheets and test questions and report writing assignments in English. Forty percent of students can write about the design and evaluation of scientific activities in English. Data were collected from classroom observation, pre-service students' assignments, and feedback. Most pre-service students put their hearts into operating science activities and express their thoughts in bilingual ways through integrated instructional modules. Some of the pre-service students wrote interesting poems and science stories. They developed science lesson plans across several disciplines, including science, Mandarin, English, art, and mathematics, such as bilingual STEAM instructional modules. Exciting stories were written by the pre-service students as follows.

Example 1:
Time Passing--
The banyan tree is so big and full of leaves; who knows how many years it has accumulated. His thick hands keep me cool whenever I walk under the banyan tree in the hot summer.

Example 2:

A traveling Frog in a Rainy Day--

I am a frog who likes to travel, and I like rainy days, too. It's raining today, so a lot of creatures came out. Butterflies, bees, and ants are my friends. They gave me many gifts.

This study was conducted during the preliminary implementation of bilingual teaching in Taiwan. All pre-service students worked hard to present imaginative works. Although they adapted to bilingual teaching and learning, the acceptance rate in all aspects is about 60%. However, pre-service students' acceptance of incorporating English into learning science has already exceeded 60% and is increasing day by day. The process and model of exploring cross-language and cross-semiotic practices as a scaffolding for classroom teaching in bilingual classrooms are helpful for students' English learning. This study focused on science teaching and learning for Taiwanese pre-service students and also obtained similar results as Liu did (Liu, 2020). Taking the English comprehensive humanities class of a junior high school in Hong Kong as an example, Liu (2020) collected and analyzed videos of teacher-student interactions in the classroom and students' after-class exercises to study teachers and students' cross-lingual and cross-symbol practice of expressing expressions, and proposed that these real-time spontaneous phenomena are called cross-lingualism. Inter- and trans-semiotic practices can support planned and systematic scaffolding (Liu, 2020).

Some pre-service students said they needed to improve at explaining scientific terms and specific subject knowledge in English. Therefore, more training in specific-subject knowledge is needed for the pre-service students. Kim and Graham (2022) stated that CllL teachers responded that they must take more training in developing specific-subject knowledge from the analysis of related research. Meanwhile, time-constraint is also a big challenge to deliver content in bilingual teaching. The problems that pre-service students encountered are the same as Massler (2012) found many teachers reported time constraints as a problem and found it influenced instruction owing to their heavy workload.

Conclusion

Pre-service students performed well in science activity design, emphasizing scientific inquiry. The motivation and interest of the pre-service students concerning bilingual science teaching and learning were successfully nurtured in the two semesters. Pre-service students' self-efficacy and confidence need to be gradually enhanced in bilingual science teaching, especially in interpreting science concepts and expressing skills in English. Scaffolding is essential for the learners to cross their learning zones of proximal development in bilingual science teaching and learning. Even though pre-service students are facing the challenge of implementing bilingual teaching and learning in Taiwan, most of them are optimistic and willing to make efforts to go for it. To engage the elementary pre-service students using English as the medium of instruction, content and language-integrated learning skills and learning confidence must be enhanced. Implementing bilingual instructional design is a good approach for nurturing the pre-service students' capabilities in science activity design and English proficiency. It is helpful to create a supportive learning environment for pre-service students to engage them in bilingual science teaching and learning.

Images As Catalysts: A Pedagogical Exercise Enhancing Writing Skills for First-Year PhD Design Students at the University of Porto

Susana Barreto, University of Porto, Portugal

Abstract

This paper introduces a pedagogical exercise that employs images as catalysts to facilitate the writing process for first-year PhD Design students at the University of Porto. The exercise pursues two fundamental objectives: firstly, to aid students in refining their research scope into a manageable territory, and secondly, to empower them to articulate the boundaries and intersections of their research, ultimately kickstarting their writing endeavours. The study has been carried out in the context of classes comprising approximately ten students who were applying design methodologies to address problems beyond the traditional design realm, encompassing areas such as medical equipment and communication design. These students were in their first year and engaged in the discipline of Research Methodologies; this exercise served as a valuable tool to enhance their writing abilities. The exercise's significance arises from the acknowledged challenge design students encounter when attempting to articulate their thoughts in writing. Their cognitive processes are inherently visual, and they often interact with knowledge primarily through images. In the context of writing a PhD thesis, where proficient writing skills are a prerequisite, these images serve as catalysts and gateways to the writing process. The study employed a comprehensive methodology that involved retrospective observation, visual analysis, and interviews with the participating students. The anticipated outcome of this research is the development of a model for effectively conducting this pedagogical exercise, with the intention of aiding future design students in honing their writing skills by leveraging visual analysis as a valuable tool.

Introduction

This article describes and analyses a pedagogical model of exercises conducted with doctoral design students enrolled in the PhD in Design program at the University of Porto (UP). The primary objective of this exercise was to stimulate and enhance the writing skills of these students, a task that has often posed challenges for them.

The significance of this exercise is rooted in the recognised difficulty that design students face when attempting to articulate their thoughts in writing. Design students typically engage with cognitive processes that are inherently visual (Ibrahim, 2020), relying on images as their primary mode of interacting with knowledge. In the context of pursuing a PhD in Design, where proficient writing skills are essential, these visual stimuli serve as catalysts and gateways to the writing process.

Fig. 1. Workshop of Visual Methods at the Faculty of Fine Arts, University of Porto, October 2022. Source: author, 2022.

The Problem

The field of design research poses challenges, especially in transitioning from visual ideation to articulate written expression. Visual analysis workshops contribute to the broader discourse on effectively integrating visual methodologies in design research, challenging the prevailing practice of individual research (Noble, 2005). In these workshops, students lend their thinking to a each others' projects.

The exercise serves as a transformative tool, acknowledging and leveraging the inherently visual cognitive processes of design students. It gives them a gateway to proficient writing skills essential for pursuing a PhD in Design. Design students navigate the complexities of form, function, and aesthetics through visual representations. However, when translating these thoughts into written language, they may encounter difficulties. This exercise recognises and addresses this challenge by acknowledging the cognitive processes of design students and creating a bridge between visual thinking and written expression.

Fig. 2. Workshop of Visual Methods at the Faculty of Fine Arts, University of Porto, October 2022. Source: author, 2022.

A comprehensive and articulate written discourse is essential for presenting research findings, communicating complex design concepts, and contributing meaningfully to the academic discourse. However, the conventional methods of teaching writing skills may not align seamlessly with the cognitive processes of design students, leading to a gap in their ability to express their ideas effectively. Whether sketching ideas, creating mood boards, or developing prototypes, the visual language, visual quotes (Esser, 2012), is central to their creative process.

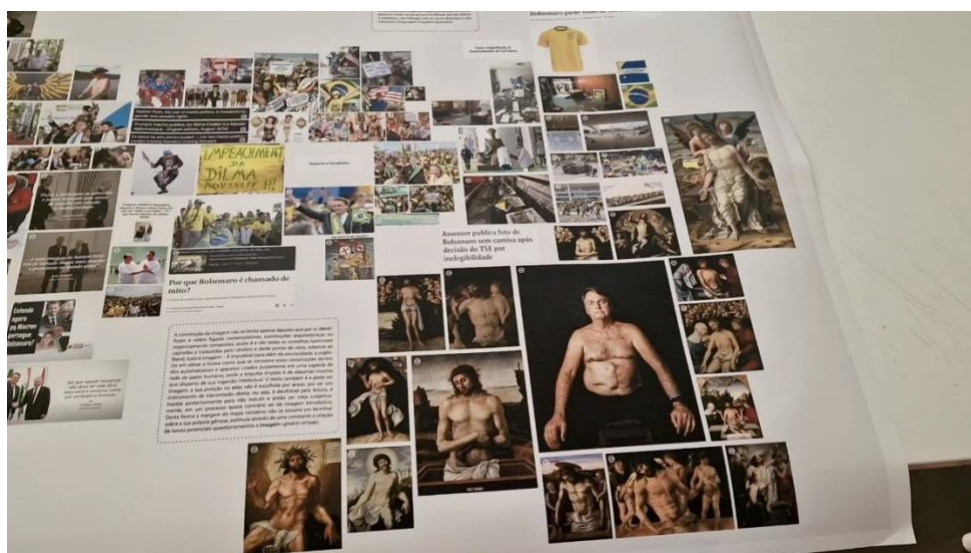
The exercise encourages students to construct a visual atlas—a dynamic representation of their research interests through images following Aby Warburg's Atlas Mnémosyne. This visual atlas allows for the intuitive arrangement of images, creating a personalised and evolving visual narrative.


Fig. 3. Atlas presentation by Guilherme Oliveira at the Faculty of Fine Arts, University of Porto. Source: author, 2023.

The Atlas Mnémosyne, created by the German art historian Aby Warburg (1866-1929), or as he liked to be called, "image or picture historian" (Russell, 2007) can be viewed as a significant intellectual and methodological upheaval, not confined solely to the field of art

history but extending its impact across diverse disciplines dealing with images in various capacities. Serving as a "visual form of knowledge," the Mnemosyne Atlas introduces a novel epistemic paradigm, concurrently unveiling a fresh aesthetic paradigm of visual expression. This paradigm shift, evident since the mid-20th century, has led to the gradual dissolution of previously distinct practices and discourses, fostering collaboration among historians, curators, theorists, and artists within a shared realm of activity.

Comprising over 1000 images distributed across 63 plates, the Mnemosyne Atlas initially presents itself as an "inventory of traces of Antiquity" that influenced the Renaissance's style of representing dynamic life, according to the author's introduction. Notably, the images span from Mesopotamia in the 17th century BC to regions around the Mediterranean, extending to Northern Europe and the 19th-century era of Manet. As a form of knowledge stimulating the imagination and embracing multiplicity, disparity, diversity, and proliferation, the Atlas invites a Baudelairian sense of "flânerie"—an exploration and wandering.

The exercise's significance lies not only in acknowledging the cognitive preferences of design students but also in fostering a holistic approach to education. It recognises that effective communication in the field of design goes beyond traditional written forms and encompasses a visual language that is inherent to the discipline. Additionally, the exercise aligns with the evolving nature of design research, where interdisciplinary approaches and diverse methods are increasingly valued. By incorporating visual analysis as a valuable tool in developing writing skills, the exercise prepares design students to navigate the complexities of contemporary design research that often transcend traditional disciplinary boundaries.

Context

The author has been actively engaged in teaching at the Doctoral Programme in Design at UP since 2012 (PhDDesign, 2024). Throughout this period, the pedagogical exercise has been consistently implemented, incorporating minor adjustments based on valuable student feedback.

The student cohort typically ranges from eight to ten individuals, representing diverse nationalities and distinct educational backgrounds. Initially, the exercise centred around selecting five research images, requiring students to justify their choices and elucidate the synergies between them during a 10-minute presentation. The students would then physically display their image boards on the wall, using them as a focal point for their presentations.

The inclusion of students from diverse academic backgrounds, including Economics, Design, Fine Arts, and Sociology, enhances the external validity of the study. This diversity allows for a broader range of perspectives and insights during the exercise.

Deconstructing chosen images in both an intuitive and systematic manner suggests an iterative process. This iterative approach allows for flexibility and adaptation, ensuring that the analytical process evolves based on initial findings and feedback.

The emphasis on stimulating critical thinking by analysing composition, subject matter, and potential meanings in photos suggests a targeted approach to developing analytical skills. This improvement focuses on specific aspects of critical thinking and visual analysis.

Including a step where students compare different photos to identify patterns, similarities, and differences enhances the depth of the analysis. This comparative approach adds a layer of complexity to the exercise, leading to a more comprehensive understanding of visual elements and themes.

Students experimenting with various techniques, such as converting photos to black and white, altering framing angles, and adjusting sizes, showcase a creative and exploratory aspect of the exercise. This experimentation contributes to a more nuanced analysis and interpretation of the images.

Fig. 4. Display of students' image boards on the PhD in Design studio walls
in December 2021. Source: author, 2021.

These poster presentations emerged as valuable resources for subsequent lecturers teaching other modules. It became a common practice at the beginning of each module for lecturers to inquire about the students' research interests, and the visual context provided by these posters facilitated a comprehensive understanding of the students' ongoing research endeavours.

The exercise has significantly transformed in the last twelve years, expanding into a more extensive initiative—a visual atlas inspired by Aby Warburg's Atlas Mnemosyne. Students are encouraged to construct a visual atlas, incorporating multiple images directly related to their research interests. The arrangement of these images on a metaphorical "wall" is left to the students' intuitive perception.

Various typologies emerge, with some opting for a left-to-right progression, others creating clusters of related topics, and some aligning their visual atlas either vertically or horizontally. The final shape is not prescribed by any specific rules; however, a consensus exists that there is no limitation on the number of images. Students can continually add and refine their atlas, employing editing procedures such as zooming in, cutting out, and other adjustments. As opposed to text editing, images are built in this atlas to the point of saturation of data.

Methodology

The methodology employed in this study is inherently qualitative, encompassing retrospective observation, visual analysis, and interviews with the participating students.

a) Retrospective observation spans a twelve-year period, reflecting on the evolution of the exercise and its current form. This involves examining the walls with images, recalling past conversations, and incorporating observations from colleagues. The outcome of the exercise, as well as the progress of the research, played a pivotal role in shaping its current structure.

b) The visual analysis comprises a thorough examination of the students' walls and the outcomes of their individual research endeavours. This analytical process materialised during their presentations, wherein they not only explored the existing synergies but also identified new connections. The group engaged in a form of photo elicitation analysis, actively participating in each other's visual analyses.

c) Interviews were conducted with participating students, some taking place during the exercise, while others occurred years after the course had concluded. Their feedback provides insights into their attitudes towards the study and the nature of their research.

The convergence of retrospective observation, visual analysis, and interviews in this research has yielded a comprehensive understanding of the exercise's evolution, its current structure, and the impact it has had on the participants. This methodological interweaving not only captures the multifaceted nature of the study but also contributes to a nuanced and holistic interpretation of the findings.

Work Sessions

The work sessions took place in the UPTEC baixa, a structure for supporting knowledge transfer between the University and the market. It fosters the creation of technological, scientific and creativity-based companies, enabling relationships between Portuguese and international innovation centres. We work at the PhD Design studio, and the first stage of the process is to identify gaps of knowledge that need to be addressed in this exercise, for example, how to create a working definition for an evolving thesis. How do we create categories of concepts? Based on these gaps, we first look at the theoretical framework of the problem and identify the actions that need to be taken to conduct the workshop.

Fig. 5, 6. UPTEC building premises and work session at the PhD em Design studio.
Source: author, 2021.

We target one session per student, which means that one student has the participation of his colleagues in a case study methodology. We would have the whole class brainstorming and actively engaged in the building of knowledge through visual analysis. Each student was allocated one session of three hours, but some students were allowed to extend it to two sessions.

The group is gender-balanced, and students range from 25 to 52 years old.

The exercise comprised various phases contingent upon the chosen topic. The initial phase involved image selection, during which students were encouraged to respond intuitively to the images, with guidance such as "Include it if you perceive a connection" and "When in doubt, include it!" Furthermore, students were advised that, in the realm of images, abundance was preferred over restraint, and there was no need for economic considerations. I occasionally emphasised that, unlike our inclination to render text intelligible and cohesive, the creation of the atlas did not impose any form of censorship; it served as a preliminary stage. Subsequently, we could engage in zooming in, generating additional sub-atlases, or editing fragments of the existing one. In essence, the process allowed for freedom of choice.

Data Analysis and Interpretation

The data analysis and interpretation of the pedagogical exercise involving images as catalysts for first-year PhD Design students at the University of Porto reveal rich insights into the evolution, impact, and significance of this innovative approach to enhancing writing skills.

The retrospective observation spanning twelve years provides a comprehensive understanding of how the exercise has evolved. Examining the walls adorned with images, recalling past conversations, and incorporating colleague feedback contribute to a nuanced picture of the transformation. This analysis highlights the shift from individual poster presentations to the more dynamic and flexible visual atlas format inspired by Aby Warburg's Atlas Mnemosyne. The evolution is not merely structural but reflects a deepening engagement with the cognitive.

Fig. 8. Work session of visual analysis with MA students at the Faculty of Fine Arts, University of Porto. Source: author, 2022.

The interviews conducted with participating students provide valuable insights into the impact of the exercise on their writing skills. Students acknowledge the inherent challenge of articulating their thoughts in writing and express how the visual stimuli provided by the exercise serve as catalysts and gateways to the writing process.

The exercise not only addresses the unique challenges faced by design students in expressing their thoughts in writing but also contributes to a collaborative and innovative learning environment. The individualised typologies of visual atlases, coupled with the positive impact on writing skills, position this pedagogical exercise as a valuable model for future design students seeking to hone their writing abilities.

Case Study: Two Workshops

Two visual analysis workshops held with doctoral students in the Design program at the University of Porto in 2022 have provided substantial insights into the domain of design research and the employment of visual methodologies. These workshops, characterised by a hands-on approach and collaborative involvement, have played a crucial role in shaping the research landscape for the participating doctoral projects. They not only facilitated the integration of researchers' perspectives into the analytical process but also fostered deeper engagement among participants. The multifaceted feedback stemming from this process acted as a catalyst, eliciting memories and emotions, thereby enhancing the richness of the research endeavours.

Moreover, these workshops have emphasised the importance of collaboration and interdisciplinary approaches in doctoral design research. Including students from diverse academic and cultural backgrounds has brought a wealth of fresh perspectives and insights to the research process.

The initial workshop, characterised by collaborative interpretation, showcased the potential contributions of colleagues in selecting and refining samples from the photographic collection. This collaborative effort significantly contributed to identifying suitable images for analysis and communication, enhancing the accuracy of emerging typological classifications, and leading to the adoption of a central type of definition for the research object.

The subsequent workshop facilitated the emergence of core concepts and terminologies rooted in analysing research images collected through fieldwork. These concepts, originating from the feelings, impressions, and perceptions expressed by the focus group, have played a crucial role in clarifying the research concept and proposing a taxonomy of approaches to existing project management templates.

In summary, the collective and exploratory application of visual methods in the analysis and communication of research findings, exemplified by these workshops, underscores the potential for harnessing enhanced data to generate new knowledge and plan tangible outcomes for research projects.

The insights garnered through these workshops are not only beneficial to the participating doctoral projects but also contribute to the broader discourse on the effective integration of visual methodologies in design research and facilitating the writing process. The workshops highlighted the potential for the development of doctoral studies in a collaborative environment, challenging the prevailing practice of individual research. Subsequent workshops will be conducted with this collaborative premise, aiming to provide recommendations applicable in further doctoral contexts.

Five-Step Model for the Writing Process

Step 1: Selecting Images
Begin by choosing a diverse set of images relevant to the writing topic or theme. Encourage participants to select images that resonate with them or evoke specific emotions. Emphasize an intuitive selection process, prompting participants to trust their instincts.

Step 2: Making Paths
Once the images are selected, guide participants in organizing them into a visual sequence or path. This could be a chronological order, a thematic progression, or any other logical flow that helps convey a narrative. The goal is to create a visual storyboard that represents the intended structure of the written piece.

Step 3: Identifying Patterns
Prompt participants to observe the selected images closely and identify recurring patterns, themes, or motifs. This step involves a critical analysis of the visual elements to uncover underlying connections. Encourage discussions on how these patterns might translate into written content or thematic threads within the text.

Step 4: Creating Categories
Based on the identified patterns, guide participants in creating categories or sections for their writing. These categories should serve as organisational frameworks for different aspects of the content. Discuss how each category contributes to the overall narrative and helps maintain coherence in the written piece.

Step 5: Building Concepts
In this final step, participants use the selected images, organised paths, identified patterns, and created categories to build conceptual frameworks for their writing. Encourage them to articulate the central concepts, themes, or arguments that will form the backbone of their text. This step involves synthesising visual observations into written ideas, laying the foundation for the writing process.

This Five-step model exercise not only enhances the writing process but also encourages a dynamic interplay between visual and verbal thinking, fostering a creative and structured approach to content development.
Fig. 11. Five-step model exercise employing images to facilitate the writing process.
Source. Author: 2023.

Conclusions

In conclusion, this paper highlights the transformative potential of a pedagogical exercise that employs images as catalysts to enhance the writing process for first-year PhD Design students at the University of Porto. The exercise not only addresses the fundamental objectives of refining the research scope and empowering students to articulate the boundaries of their research but also serves as a valuable tool for students enrolled in Research Methodologies.

The significance of this exercise is underscored by the inherent challenge design students face in expressing their thoughts in writing. In the context of design education, emphasise the importance of recognising and accommodating diverse cognitive processes, as evidenced by

the transformative nature of the pedagogical exercise. Recognising their cognitive processes as inherently visual, the exercise leverages images as catalysts and gateways to navigate the intricacies of writing a PhD thesis. This acknowledgement becomes particularly crucial as proficient writing skills become a prerequisite in pursuing a doctoral degree in design.

The study, conducted with approximately ten first-year students applying design methodologies to diverse problem areas, offers valuable insights into the effectiveness of the exercise. It serves as a bridge for students tackling issues beyond the traditional design realm, including medical equipment and communication design. The exercise's impact extends beyond immediate skill development, positioning it as a catalyst for interdisciplinary thinking and problem-solving.

The comprehensive methodology employed in this study, encompassing retrospective observation, visual analysis, and interviews, contributes to a nuanced understanding of the exercise's evolution and impact. Anticipating a model, the Five-Step model for the writing process, for effectively conducting this pedagogical exercise, the research lays the groundwork for aiding future design students in honing their writing skills. The proposed model, informed by insights from retrospective observations and student interviews, is poised to be a valuable resource for educators and institutions seeking to address the unique challenges design students encounter in expressing themselves in written form.

Ultimately, this research reinforces the importance of recognising and accommodating diverse cognitive processes within design education. By embracing the visual nature of design thinking and providing a structured approach to developing writing skills, this pedagogical exercise not only enriches the academic journey of current students but also lays a foundation for the continuous improvement of design education methodologies.

Cognitive Discourse Function and Multimodal Conceptualization: The Interactive Usage of Language, Multimodality, and Cognition in Bilingual Teaching Context

Tiffany Ying Yu Lin, National Taipei University of Education, Taiwan

Abstract

This study aims to examine the realization of Cognitive Discourse Function and multimodal conceptualization in the context of bilingual teaching materials in Taiwan elementary schools. Based on a usage-based cognitive analysis, our data will classify how different categories of Cognitive Discourse Function (CDF) can be realized through language and multimodality in bilingual teaching and learning contexts to enable bilingual teachers to instruct and guide the students to achieve the educational goals and to help the students comprehend and conceptualize the abstract, complicated, or new concept, take the actions, and present their ideas or opinions through the learning process. This study proposes to extend previous findings on language and multimodality and incorporate the tenets of Cognitive Discourse Function to adopt the cognitive usage-based analyses to examine the teaching materials, including bilingual text books and multimodal resources. This study aims to demonstrate that the interactive use of language and multimodality not only helps to achieve the cognitive discourse functions efficiently but also enables the students to (1) facilitate the interpretation process when they start to learn new things or difficult concept; (2) strengthen the motivations to achieve educational goals effectively; (3) create the opportunities to reach the shared goals; (4) learn to help, share, and cooperate with each other through multimodal conceptualization, interaction, and engagement in the classroom.

Introduction

Background: The Link Between Bilingual Education and Cognitive Discourse Function

As bilingual education received nationwide attention and developed rapidly in Taiwan, Content and Language Integrated Learning (CLIL) (Coyle, Hood & Marsh, 2010) has been a significant approach for bilingual teachers to integrate content, literacy, and language in several courses, including bilingual science, art, physical education, and integrative activities, in the elementary schools in Taiwan. CLIL is a dual-focused educational approach in which a second or foreign language is used for the learning and teaching of both content and language in an academic subject. However, previous CLIL research addressed the specific-subject learning goals and the language proficiency respectively over the past decades. While the importance of integration of "the content and language" is receiving more attention, more studies shift the focus to the issue of academic language competence that progresses knowledge construction and meaning-making, which contains cognitive structure and concept formation (Coyle & Meyer, 2021). In addition, according to Communicative Competence (Hymes, 1972), the original conception of concept is necessary to include communication in educational context. Therefore, recent studies on Cognitive Discourse Function (CDF) (Dalton-Puffer, 2013; Coyle & Meyer, 2021) claim that CDF could serve as the useful link to (1) connect between language learning and subject education, (2) integrate the process of conceptualization and communication, and (3) equip learners with the linguistic competences that are required for educational success with deeper learning in the CLIL classroom. Operating at the interface between thinking and language, CDF, the conceptual integration of subject and language pedagogies, plays a crucial role in deeper learning. The fundamental idea of CDF is to consider speech acts as verbal action, which means that verbalizations are connected to cognitive processes or strategies of the curricular content. CDF construct (Dalton-Puffer, 2013) links "subject specific cognitive learning goals" with the linguistic representations they receive in classroom interactions.

Previous research on Cognitive Discourse Function mainly focused on the usage via verbalization and classroom interaction in CLIL Physics, Finance, History, Chemistry (Breeze & Dafouz, 2017; Morton 2020, Evnitskaya & Dalton-Puffer 2020) which are the subjects for middle school, high school, or higher education in Austria, Spain, and other countries in Europe. However, CDF has rarely been examined and analyzed in the subjects of elementary education yet. Therefore, this study aims to fill the research gap by extending the CDF construct, which involves seven categorization of verbalizations that express acts of thinking about academic content in the classroom, into Taiwan elementary bilingual classrooms to find answers to the questions of what and how CDFs serve as the link between content and language in those contexts. This study would be using the CDF construct as a model of examining local CLIL bilingual educational context in Taiwan based on the multimodal data that combines not only verbalization but also the multimodality used to achieve learning goals through classroom interaction, hoping to provide a cognitive function-based analysis to contribute to bilingual education for teachers and students in elementary schools in Taiwan and worldwide.

Extending the previous studies on language, multimodality, and cognition (Lin, 2015; Lin & Chiang, 2016; Chen & Lin, 2021), this study incorporates the tenets of Cognitive Discourse Function (Dalton-Puffer, 2013) to adopt the cognitive function-based analyses to examine the multimodal aspects of bilingual classroom data, including the authorized teaching materials with open access. Although previous studies mainly focus on CDF emerged from

verbalization and classroom interaction, this study emphasizes that the interactive usage of "language/verbalization" and "multimodality" in CLIL classroom altogether helps to achieve the cognitive discourse functions efficiently, enable the students to facilitate the interpretation process when they start to learn new things or complex concept, strengthen the cognitive discourse functions to achieve learning goals, develop cognitive skills for creating joint attentions and shared goals, and learn to help, share, and cooperate with each other through multimodal conceptualization, interaction, and engagement in CLIL classroom activities.

The Cognitive Discourse Function (Cdf) Construct: The Link Between Content and Language

Based on the conceptual foundation of applied linguistics and education research, Dalton-Puffer (2013) points out that the CDF construct lies in the relationship of language and thought. Regarding the function of language, linguistic representation arises from usage events. Speech act theory also shows that intentional verbal actions could achieve a goal which might be non-verbal. In this case, CDF could reach the goal of making subject-specific thought observable; that is, students can interact the academic content verbally with each other, using recurring linguistic patterns in the classroom. Therefore, the basic idea of the CDF construct is that speech acts as verbal action, which means that verbalizations are connected to cognitive processes or strategies of the curricular content. It enables educators to communicate across subject boundaries as well. While the CDF construct could be thought as the crisscross of academic learning goals with the linguistic representations of cognitive process, it proposes seven basic categories that are called "CDF types". Each type is based on an underlying communicative intention formulated in pragmatics. In other words, these seven verbal actions are not only individual thought-processes but are acts of communication that are to be performed in fulfillment of curricular demands at the same time as shown in Table 1.

Function Type	Communicative Intention	Label
Type 1	I tell you how we can cut up the world according to certain ideas	CLASSIFY
Type 2	I tell you about the extension of this object of specialist knowledge	DEFINE
Type 3	I tell you details of what can be seen (also metaphorically)	DESCRIBE
Type 4	I tell you what my position is vis a vis X	EVALUATE
Type 5	I give you reasons for and tell you cause/s of X	EXPLAIN
Type 6	I tell you something that is potential	EXPLORE
Type 7	I tell you about sth. external to our immediate context on which I have a legitimate knowledge claim	REPORT

Table 1. CDF types and underlying communicative intentions (Dalton-Puffer, 2013)

Additionally, every CDF type does not stipulate which linguistic verb students have to perform. There is an accommodation of different (subject-) cultural models since its designations are not essentialist. What's more, to remember all the CDFs, the construct should be constrained, which can facilitate its operationalization and enhance its usefulness as a heuristic. Dalton-Puffer developed the CDF construct as illustrated in Table 2, including seven communicative intentions, the CDF types (central column), the performative verbs (right column), and the communicative intentions (left column). The construct of CDFs links "subject specific cognitive learning goals" with the linguistic representations they receive in

classroom interactions (Dalton-Puffer 2013:220). Each type is based on an underlying communicative intention (left column).

In other words, these seven verbal actions are not only individual thought-processes but are acts of communication that are to be performed in fulfillment of curricular demands at the same time.

Communicative intention	CDF type	Performative verbs
I tell you how we can cut up the world according to certain ideas	**Classify**	classify, compare, contrast, match, structure, categorize, subsume.
I tell you about the extension of this object of specialist knowledge	**Define**	define, identify, characterize.
I tell you details of what can be seen (also metaphorically)	**Describe**	describe, explain, label, name, specify.
I tell you what my position is vis a vis X	**Evaluate**	evaluate, judge, argue, justify, take a stance, critique, comment, reflect.
I give you reasons for and tell you cause/s of X	**Explain**	explain, reason, express cause/effect, draw conclusions, deduce.
I tell you something that is potential	**Explore**	explore, hypothesize, speculate, predict, guess, estimate, simulate.
I tell you about sth. external to our immediate context on which I have a legitimate knowledge claim	**Report**	report, inform, recount, narrate, present, summarize, relate.

Table 2. CDF construct (Dalton-Puffer, 2013)

Also, it should be noticed that these seven types of individual operations are co-dependent and interrelated. Additionally, every CDF type does not stipulate which linguistic verb students have to perform. The CDF construct has been empirically validated for different subjects in previous studies. For instance, the research in Austrian CLIL lessons (Dalton-Puffer et al., 2018) indicates that the CDF construct does occur in naturalistic CLIL classroom interaction across a range of subjects including social and natural science lessons as well as English as a Foreign Language lessons. Morton (2020) also argues that CDFs can be used as "building blocks" to build the bridge between cognition and language or thinking, speaking or writing.

In CLIL classroom, language and content are considered equivalently significant, which should not be delegated to the sole responsibility of language teacher or subject teacher. Accordingly, the integration that linking up language and content seems to represent a crucial issue, while communication and educational contexts could assist conception of concept (Hymes, 1972). In addition, in terms of pedagogy, preparing learners for their future is the aim of education; thus, it is essential to access and negotiate knowledge. As a result, to bridge the gap between language and content, cognitive discourse function (CDF) serves as the convergence of the curricular goals of the second language or foreign language education and subject-specific education.

Considering the notion of academic language, Dalton-Puffer (2013) states that it is the intertextual nature of language in educational contexts and the interdependence between

written and spoken language in the classroom. These discipline-specific discursive languages are visible in students' writing and use them as building blocks to develop their literacy (writing) skills. As a result, there is a need to look for convergences between the literacy and the specific text types (both oral and written) of communication (Morton, 2020), or so-called academic language, the language used to express knowledge and thinking in the classroom, with the regard of the context of use.

Research Gap and the Niche of This Study

Previous studies on CDF mainly focus on "verbalization" and show how cognitive processes could be linked to verbalization. However, this study aims to fill the gap by examining not just verbalization but the "multimodality and language" that teachers apply and share with the students in class. The interactive use of multimodality and language plays an important role for the bilingual classroom, especially during the increase of virtual learning due to the pandemic. As Dalton-Puffer claims, the goal of CDF is to serve as a "heuristic, operationalizability, interdisciplinary communication between educational linguists and subject teachers", this study believes it is important to include "multimodality" combined with verbalization as part of the analysis if meaning making process consisting of knowledge construction and knowledge communication are important to reach the cognitive goals of deeper learning in the CLIL classroom. Therefore, this study aims to collect and analyze the multimodal aspects of bilingual resources to explore how the interactive use of language and multimodality could enable the bilingual teachers to achieve CDF more effectively in CLIL classroom.

Aims of the Study

This study extends from the previous study on CLIL science in Taiwan elementary school (Chen & Lin, 2021) based on Cognitive Discourse Function construct as the model and further investigates the bilingual resources to find answers to the questions of what and how and to what extent CDFs occur in our elementary bilingual classroom in Taiwan. Extended from the CDF construct, the research questions raised in this study are listed as follows.

1. What is the general pattern and distribution of CDF applied in the bilingual resources in Taiwan elementary school?

2. What type of language and multimodality are often used to achieve specific CDF function(s), make learning visible, and reach the education goals effectively in bilingual classrooms?
3. Could it be possible that not only a single CDF function but also multiple CDF functions could be achieved through the teaching task?

With the emphasis on the interactive usage of language and multimodality, this study hopes to demonstrate how CDFs could be achieved as a useful link to efficiently connect and integrate language and content in bilingual classrooms, hoping to contribute to teachers and students to help them achieve their teaching and learning goals, develop cognitive skills for shared goals, and to cooperate with each other through multimodal conceptualization, interaction, and engagement in bilingual classrooms. By providing a cognitive function-based CDF analysis, this study hopes to shed light on the significance of interactive use of language and multimodality and raise the awareness of CDF, which could also contribute to the

effective process of course planning and teaching preparation for bilingual teachers in Taiwan elementary schools.

Method

By exploring and analyzing the usage of language and multimodality in bilingual resources, we hope to provide an account of the general pattern of the interactive usage of language and multimodality in educational context and how it can achieve specific cognitive discourse function. Data collection and research procedures would be introduced as follows.

Data Collection

The multimodal data analyzed in this study are collected from the teaching resource for bilingual lessons, including the subjects of Science and Integrative Activities, in Taiwan elementary school. In this study, the data is collected from the following categories:
1. Teaching resources: textbooks, teaching guides, teaching slides for instruction
2. Students' work: activity sheet, in-class activities, online assignment, show and tell group presentation, posters, etc.

Data Analysis

The data analysis is conducted with the following research procedures:

(1) **Language:** the use of performative verbs, sentence patterns, and keywords in academic language would be identified and analyzed based on its communicative intention and the CDF construct. Chinese and English will both be analyzed to see the general pattern and frequency of language use in bilingual classrooms.

(2) **Multimodality:** the use of multimodal teaching resources, including music, video, and hands-on activities, etc. is one of the main teaching strategies for bilingual classrooms in Taiwan elementary schools. In this step, we will investigate how multimodal teaching resources are incorporated with academic language to achieve the Cognitive Discourse Function(s) through different modes. The purpose is to see how language is combined with multimodality in an elementary educational context to achieve CDF and to help students comprehend and follow the instructions well.

(3) **Practice evaluation:** the language and multimodality analysis will be further evaluated with teachers during classroom observations, course evaluation interviews, and teacher's training workshops to discuss with teachers in practice and collect their opinions for detailed analysis to explain how and why specific CDFs are used and what goals are reached through the interactive use of language and multimodality.

Conclusions

Main Findings

In general, "classify, describe, and define" seem to be the most frequently occurring CDFs in our data. However, "explore and explain" are more emphasized in specific subjects like Science, while "evaluate and report" are more frequently found in Integrative Activities. This indicates that the bilingual teachers and students are achieving the CDF altogether effectively

through language and multimodality with different focus in specific subject based on the curriculum guidelines and the learning focus of the lessons. The pattern, distribution, and frequency of CDF are closely related to the content, the level, the fundamental belief and educational goals of specific subject.

To achieve CDF effectively, the performative verbs are not necessarily used in the instructions, instead, the bilingual teachers often convey the key concept through simple sentence structures, such as WH-questions and level-appropriate vocabulary while giving instructions, to achieve the cognitive discourse function and educational goals for better comprehension and classroom interaction. In addition, multimodality is often used interactively as the supporting resource to help students comprehend, scaffold the key concept, and reinforce through visual and aural modes, hands-on activities, and connection with daily life. Our discussion with local teachers and foreign teachers from bilingual classrooms also indicates that it is necessary for the teachers to simplify, design, and adjust their language and use the nouns, adjectives, and verbs that are suitable for their elementary school students based on the students' language proficiency level and the appropriate curriculum guidelines of English for each grade.

Multiple CDF functions could be achieved through integrative tasks designed for higher graders as there are more than one-on-one mapping relationships between the CDF and the language of/for learning (input) and language through learning (output), there may be more than one-on-one mapping relationships between the CDF, for example, the "more-than-one CDF integration" like "evaluate" and "explain" CDFs are sometimes achieved simultaneously by the teachers, "report", "explain", and "explore" could also be achieved altogether through the interactive use of language and multimodality in the teaching materials and classroom activities that require higher order cognitive skills. For further studies, more data and analysis need to be conducted to explain when and how such CDF integration plays a role and how it can benefit teaching and learning in bilingual classrooms in Taiwan elementary schools.

Implications and Future Research

This study aims to provide a usage-based account for the Cognitive Discourse Function and multimodal conceptualization in the bilingual educational context of Taiwan elementary schools. With the emphasis on the interactive usage of language and multimodality, this study hopes to demonstrate how cognitive discourse functions could be achieved as a useful link to efficiently connect and integrate language and content in bilingual classrooms, aiming to contribute to teachers and students to help them achieve the teaching and learning goals, develop cognitive skills for shared goals, and to cooperate with each other through multimodal conceptualization, interaction, and engagement in bilingual classrooms. Therefore, this study hopes to shed light on the significance of interactive use of language and multimodality and the awareness of CDF, which could contribute to the effective process of course planning and teaching preparation for bilingual teachers.

For further studies, we believe CDFs could be applied differently through language and multimodality based on different subjects, cognitive skills, and language proficiency level in bilingual classrooms. More data and analysis need to be conducted to discover the general pattern of CDF usage and provide an indexical account in a specific subject and explains how it can help the teachers and students to achieve the CDF and educational goals effectively and facilitate classroom interaction and engagement.

Abstract
This content-structured training course was developed within the conceptual framework of design thinking. It puts the thinking system in the design of content marketing according to the stages of the design thinking process so that the learner will have a system of ideas in design and will be able to create effective content marketing. It is capable of designing high-quality work. In this study, issues were investigated and examined to ascertain the root cause of social business entrepreneurs' content marketing designs, tackle unsuccessful Content Marketing design issues, and use design thinking. A study and description of the steps involved in creating effective content marketing are available. And to include components of the Design Thinking process, such as its processes, methodologies, and tools, into the development and structuring of the instructional content. This course consists of 7 modules: 1) Concepts and principles of content marketing design 2) The process of content marketing design using design thinking 3) Empathizing with the target group 4) Defining the problem's framework in content marketing design 5) The process of generating ideas for content marketing 6) Making a content marketing project prototype 7) Testing and evaluation of content marketing projects. It was determined that the consistency, linkage, comprehensiveness, and appropriateness of this training content structure in relation to the anticipated learning goals were all at a satisfactory level during the evaluation process.

Introduction

Business competition in the information age brings a lot of content into the digital world. It is like driving and indirectly controlling human behavior to feel good about the brand. Those things make consumers unconsciously become their customers. In business circles, this marketing strategy is called "content marketing." Content marketing has become a prevalent practice by designing business strategies and processes based on the creation and publication of valuable content in order to attract and retain a clearly defined audience and ultimately generate profitable customer actions (Champain, 2018). Content marketing has a moderate positive significant relationship with the consumer purchase decision (Ansari, et al., 2019), marketers can influence the sentiment of customers' digital engagement beyond their performance during customers' interactions, and for unfavorable event outcomes, informational marketer-generated content, more so than emotional content, can enhance customer sentiment. This study also highlights sentiment's role as a leading indicator for customer lifetime value. (Meire, et al., 2019), companies in Jordan could boost customer intention to purchase green products, by achieving word of mouth and presenting suitable marketing content (Al-Gasawneh and Al-Adamat, 2020).

Social enterprise is social innovation, which can be applied to business management principles to solve social problems. Interestingly, social enterprises in Thailand are mostly characterized by small community enterprises. (Techsauce Team, 2022) Obstacles that are not related to finance are a problem in understanding the general public's and consumers attitudes towards social enterprises. Building public buy-in will have a profound effect on the growth of social enterprises. This will create many opportunities for social enterprises, including increasing demand for social business products and services, solving the problem of attracting talented employees to work with social enterprises, and providing access to capital (Rojphongkasem, 2021).

Design thinking is a comprehensive customer-oriented innovation approach that aims to generate and develop creative business ideas or entire business models. Essentially, design thinking attempts to project designers' approaches and methods onto business processes. The approach is ultimately applicable to all kinds of business ideas, whether they have a product or service character. The first mouse for the Macintosh computer was created after a similar approach, as was the first toothbrush with a wider ergonomic shaft. (Müller-Roterberg, 2018) Stanford D. School, Serie, IDEO & Riverdale, and Google Design Sprints presented a model of the design thinking process in 5 stages (Rattanaphaisankit et al., 2021), which are as follows: empathize, define, ideate, prototype, and test. Design thinking is the combination of what humans want, what technology makes possible, and what is economically possible, so that those who have never trained as designers can use creative tools to solve a wide range of challenges. Design thinking is a course that focuses on deep understanding of problems by putting real users at the center of finding information and bringing those problems to creativity, design, testing, and development, resulting in innovations that respond directly to users. Thus, design thinking becomes a crucial instrument for ensuring that organizations operate efficiently and sustainably. (The101.world, 2019) The development of human comprehension with an emphasis on practice and learning from experimentation and iterative work processes, creative thinking, and user testing contributes to the development of novel ideas and superior solutions by continually learning from and minimizing mistakes and increasing the likelihood of mission success. In addition, user information is gathered throughout the process in order to improve the design and best accommodate the needs of the intended audience. The top design institutions and businesses in the world have been

continuously improving human-centered design processes and methods of work for decades. (Israsena-na-Ayudhya, Treerattanaphan, 2017) Tangpakdee (2017) used design thinking to investigate the outcomes of developing instructional design competencies for media production by combining the community-based teaching model with the design thinking process in students. It was discovered that students who studied with a community-based teaching model and the design thinking process had higher self-assessments in all aspects of instructional design competence for media production.

The majority of social enterprise entrepreneurs, according to the survey, manage their own content marketing but lack the skills necessary to create original material. (Sathapornwachana et al., 2020) And the majority of them have used design thinking before. Adopting the Design Thinking method as a framework for training in content marketing design courses will therefore make it easier to promote and develop the skills of social enterprise entrepreneurs in content marketing design.

As stated previously, the majority of social enterprise entrepreneurs conduct content marketing on their own but lack the ability to design content marketing. According to studies, design thinking is a process for producing quality design work. Consequently, using the Design Thinking process as a conceptual framework for creating training content in the content marketing design course will help promote and develop the capacity of social enterprise entrepreneurs to design content marketing.

Aim of the Study

This study aimed to analyze and develop a learning content structure for short-term training on the subject of "Content Marketing Design using the Design Thinking Process." and to verify the consistency, connection, comprehensiveness, and appropriateness of the content structure of the course "Content Marketing Design Using the Design Thinking Process."

Method

Participants, Procedure and Data Analysis

This research was conducted in two processes: the first step is the analysis and development of the course content structure of "Content Marketing Design Using the Design Thinking Process." We use documentary studies to examine strategies that facilitate successful content marketing, categorize efficient content marketing techniques based on the design thinking concept and employing backward design principles, and formulate the content framework for the content marketing design course. The second step is the assessment of the consistent, connected, comprehensive, and appropriate content structure of the course "Content Marketing Design Using the Design Thinking Process." We deliver the content structure file titled "Designing Content Marketing with the Design Thinking Process" along with the evaluation survey of how well the content structure aligns with the desired learning goals in terms of consistency, coherence, comprehensiveness, and appropriateness. Email a proficient in instructing Content Marketing and a proficient in instructing Design Thinking. Subsequently, proceed to aggregate all the available data and conduct a comprehensive statistical analysis employing measures such as the mean, percentage, and standard deviation. The analysis yields data that is then presented in a descriptive format.

The Findings and Results

In the first step, we analyze and develop the course content structure for "Content Marketing Design Using the Design Thinking Process." We use documentary studies to examine strategies that facilitate successful content marketing, categorize efficient content marketing techniques based on the design thinking concept and employing backward design principles, and formulate the content framework for the content marketing design course. We found the causes of the inefficiency of content marketing. From studying the opinions of marketers in articles on content marketing by Smart SME (2016), Molek (2017), Wongrianthian (2017), Elevation Marketing (2018), Rock Content Writer (2021), Brendan (n.d.), and Duris (n.d.). We have summarized the information into a fishbone diagram. As depicted in Figure 1 below: 1) Content distribution lacks continuity. 2) There is a lack of both an action plan and a strategy plan. 3) Content promotion is absent. 4) There is no review process in place to enhance content development. 5) The quality of the content is inadequate. 6) There is only a single channel.

Figure 1: The causes of the inefficiency of content marketing

We have identified the underlying factors contributing to the lack of effectiveness in content marketing. By examining the viewpoints of marketers in various articles on content marketing by Molek (2017), Wongreanthong (2019), S.Worapol (2020), The Growth Master Team (n.d.), Steps Academy (2017), Champion (2018), Hall (2020), Haden (2018), Forbes Agency Council (2020), Memon (2021), Gartner (2019), and Content Shifu (n.d.), we have synthesized information and summarized the key processes that contribute to the success of content marketing. These processes include conducting research and situation analysis, establishing goals and key performance indicators (KPIs), analyzing the brand, selecting the target audience, gaining a deep understanding of the target audience, identifying customer problems, developing content strategies, choosing the appropriate channel or format, generating ideas and conceptualizing them, selecting compelling content, conducting keyword or content research, creating a content calendar, establishing a production schedule, producing the content, publishing and promoting the content, and measuring results and making improvements. We have analyzed to find out the base of the problem and have identified consistent solutions based on the major processes that contribute to the success of content marketing, as presented in Table 1. Continue by categorizing efficient content marketing procedures using the design thinking process framework and create the conceptual framework of content marketing design using the design thinking process, as presented in Table 2 and Figure 2.

An inefficient content marketing cause	Solution for inefficient content marketing
1. No continuity 1.1 No publishing schedule 1.2 No production schedule 1.3 Unfinished content 1.4 Neglecting continuity 1.5 Not knowing how to do it	• Create a Content Calendar • Content production schedule • Content production schedule
2. No clear plan or strategy 2.1 Missing situation and problem analysis 2.2 Not appropriate for the target group 2.3 No analysis of competitor strategies 2.4 Not determining the goals 2.5 Using the Wrong Keywords	• Research and situation analysis • Writing content strategies • Research and situation analysis • Writing content strategies • Setting goals and KPIs • Writing content strategies • Setting goals and KPIs • Writing content strategies
3. No Promotion 3.1 Ignoring the importance 3.2 No key distribution channels 3.3 No sharing 3.4 No budget 3.5 No planning	• Choose the channel or format • Publish and promote • Writing content strategies • Create a Content Calendar
4. non-evaluation and improvement 4.1 Lacking KPIs 4.2 No following 4.3 Indicators not consistent with goals 4.4 Not knowing the tools to do it	• Setting goals and KPIs • Measure results and improvement • Writing content strategies
5. Poor Content Creation 5.1 Focus on content rather than customers 5.2 Emulate others content 5.3 Too much selling in the content 5.4 Unfocused Direction	• Deeply understand the target audience • Identify customer problems • Create and produce content • Choose attractive content • Writing content strategies • Brand's personal analysis • Brainstorm Ideas and conceptualize • Measure results and improvement
6. Single Channel 6.1 Ignoring the importance 6.2 No planning 6.3 Insufficient staff 6.4 Not knowing how to do it	• Writing content strategies • Create a Content Calendar • Choose the channel or format

Table 1: An effective solution for the inefficiency of content marketing

Design Thinking Process	Solution for inefficient content marketing
1. Empathize	• Choose the target audience • Deeply understand the target audience
2. Define	• Identify customer problems • Research and situation analysis
3. Ideate	• Setting goals and KPIs • Writing content strategies • Brainstorm Ideas and conceptualize • Choose the channel or format • Keyword or content research • Create a Content Calendar
4. Prototype	• Create production schedule • Create and produce content
5. Test	• Measure results and improvement

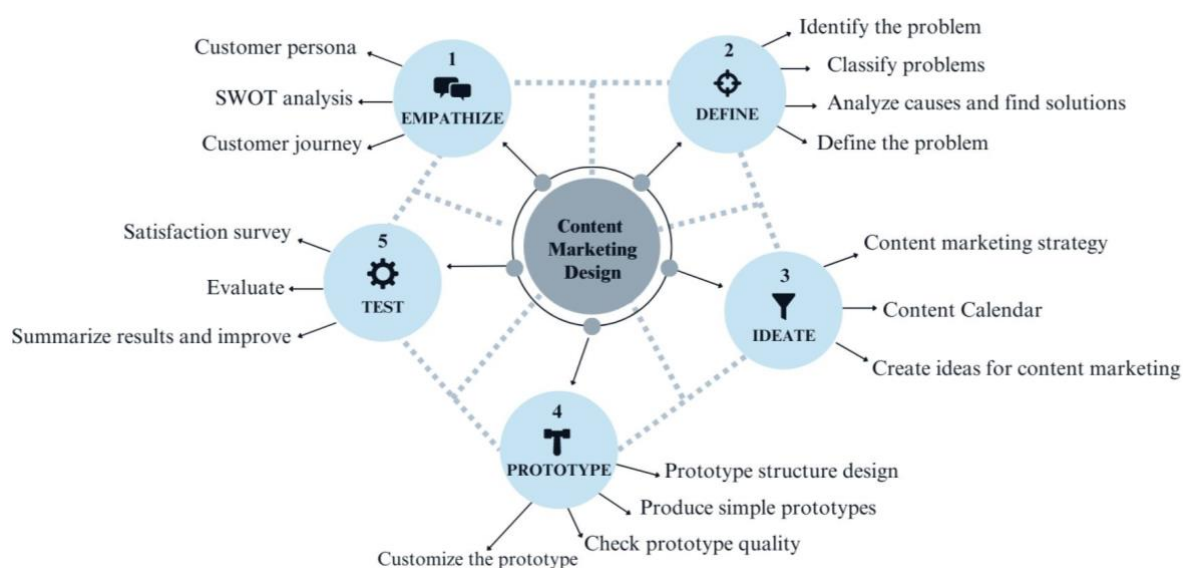
Table 2: Categorizing efficient content marketing procedures
using the design thinking process framework


Figure 2: Conceptual framework of content marketing design using
the design thinking process

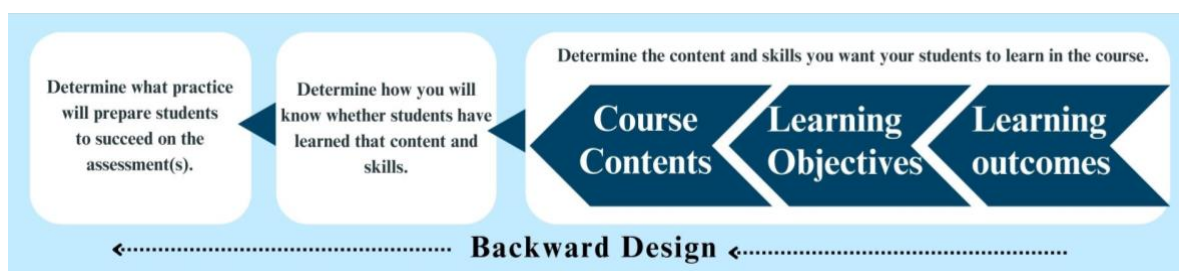
This content marketing design course is primarily designed using a design thinking process as a short-term training program (16 hours). We employ the principles of backward design, starting with setting learning goals and objectives (Table 3) and selecting relevant content. (Figure 3) The content is divided into 7 modules, which include: 1) Concepts and principles of content marketing design 2) The process of content marketing design using design thinking 3) Empathizing with the target group 4) Defining the problem's framework in content marketing design 5) The process of generating ideas for content marketing 6) Making a content marketing project prototype 7) Testing, as presented in Figure 4.


Figure 3: Processes for developing the course's content structure

Learning Outcomes	Learning Objectives
1. Learners are able to apply concepts and principles in designing content marketing appropriately.	1.1 Learners can define content marketing. 1.2 Learners can learn about the benefits of content marketing. 1.3 Learners can tell the heart of content marketing. 1.4 Learners can take examples of content marketing presentations. 1.5 Learners can take examples of content characteristics in content marketing. 1.6 Learners can take examples of content marketing objectives. 1.7 Learners can take examples of the video content concept.
2. Learners are able to use the design thinking process to design prototype content marketing projects.	2.1 Learners can describe the stages of content marketing design using the design thinking process. 2.2 Learners can classify the methods and tools used in each of the content marketing design steps using the design thinking process. 2.3 The students explained the importance of content marketing design through the design thinking process.
3. Learners able to deeply understand the target audience for content marketing.	3.1 Learners can do customer persona correctly. 3.2 Learner can analyze the SWOT of the client's representative. 3.3 Learners can accurately analyze the customer's journey.
4. Learners are able to define content marketing problems.	4.1 Learners can identify the problems of the target group. 4.2 Learners can classify the problems of the target group. 4.3 Learners can analyze the causes and identify solutions of problems. 4.4 Learners can identify problems that match the target group.
5. Learners are able to create ideas for content marketing.	5.1 Learners have a good content marketing strategy. 5.2 Learners completed the content calendar properly. 5.3 Learners find ideas for how to do content marketing properly.
6. Learners are able to create a prototype content marketing project.	6.1 Learners can design a project prototype properly. 6.2 Learners can easily produce project prototypes. 6.3 Learners can check the quality of the project prototype. 6.4 Learners can customize project patterns for quality.
7. Learners are able to test and evaluate a content marketing prototype.	7.1 Learners can explore content marketing satisfaction. 7.2 Learners can evaluate their content marketing project patterns. 7.3 Learners can summarize the content marketing outcomes.

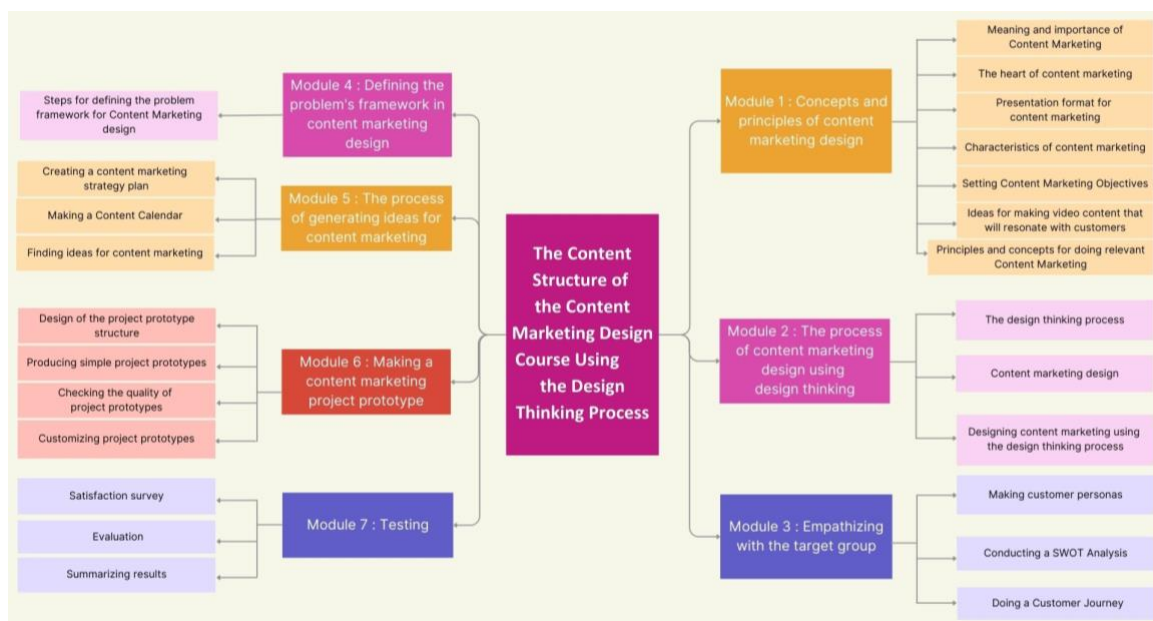
Table 3: Learning goals and objectives of course


Figure 4: The Content Structure of the Content Marketing Design Course
Using the Design Thinking Process

In the second step, the process is an assessment of the consistent, connected, comprehensive, and appropriate content structure of the course "Content Marketing Design Using the Design Thinking Process." According to the survey, the content structure of the course is consistent, connected, comprehensive, and appropriate, which total is at a good level ($\bar{X}$=4.45, SD=0.08). The course's learning outcomes ($\bar{X}$=4.55, SD=0.69) are at a very good level. The learning objectives of the course ($\bar{X}$=4.45, SD=0.52), the content structure of the course ($\bar{X}$=4.45, SD=0.52), and the conceptual framework of the course ($\bar{X}$=4.36, SD=0.50) are all at a good level, as presented in Table 4.

Evaluation list	Average	SD	Quality level
1. The conceptual framework for developing content marketing using the design thinking process is consistent, connected, comprehensive, and suitable.	4.36	0.50	good
2. The main content of the course is consistent, connected, comprehensive, and suitable.	4.45	0.52	good
3. The learning outcomes of the course are consistent, connected, comprehensive, and suitable.	4.55	0.69	very good
4. The learning objectives of the course are consistent, connected, comprehensive, and suitable.	4.45	0.52	good
5. The content structure of the course is consistent, connected, comprehensive, and suitable.	4.45	0.52	good
Total	4.45	0.08	good

Table 4: The results of the assessment of the consistent, connected, comprehensive, and appropriate content structure of the course "Content Marketing Design
Using the Design Thinking Process"

Conclusion & Discussion

We have analyzed and developed the content structure of the course "Content Marketing Design Using the Design Thinking Process" into 7 modules: 1) Concepts and principles of content marketing design 2) The process of content marketing design using design thinking 3) Empathizing with the target group 4) Defining the problem's framework in content marketing design 5) The process of generating ideas for content marketing 6) Making a content marketing project prototype 7) Through testing and evaluation, it was found that the content structures of the courses were consistent, connected, comprehensive, and appropriate at a good level. In the structure of course content in Module 1, there will be basic knowledge, concepts, and principles. Module 2 will provide basic knowledge of two main topics: the matter that we need design thinking to help in designing and the matter of design thinking, and modules 3–7 will be 5 steps of the design thinking process that apply tools in each step of the design thinking process to the course content, Bootchuy (2016) studied the development of a form of online knowledge sharing using design concepts combined with future analysis techniques to strengthen the business creativity of a graduate student in management. With the process of forming an online knowledge share, it consists of six stages, namely: 1) illuminating ideas 2) knowing future directions 3) analyzing target groups 4) creative ideas 5) developing ideas 6) presenting and publishing, which will be seen as the structural sequence of knowledge delivery in stages 3-6 is similar, the critical design thinking elements and not just use tools such as the business model canvas or processes like Lean Startup. Too often these tools are applied in a more cursory fashion when a deep dive approach is needed that focuses on the key elements of design thinking illustrated in Figure 5 (Sarooghi, et al., 2019).
Figure 5: Opportunity Design Framework (Sarooghi, et al., 2019)

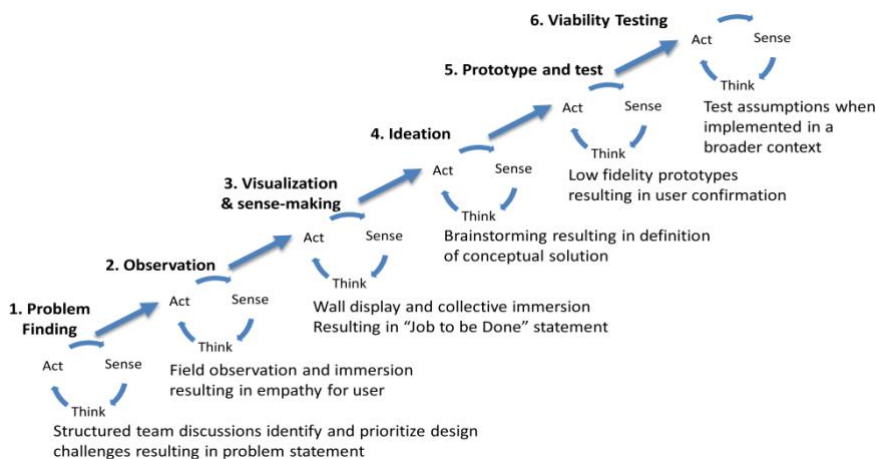
Incorporating design thinking in the business curriculum can provide students and instructors with a framework for dealing with unstructured problems and for managing the innovation process. However, many business students, like many business professionals, experience confusion and frustration when engaging in design thinking projects for the first time. This paper provides guidance for faculty who are considering incorporating design thinking projects into their business classes. For such projects, the complex, iterative process of design thinking is structured to include six phases: problem finding, observation, visualization and sense making, ideation, prototyping and testing (Glen, R., 2015), as presented in Figure 6.


Figure 6: Design thinking framework (Glen, R., 2015)

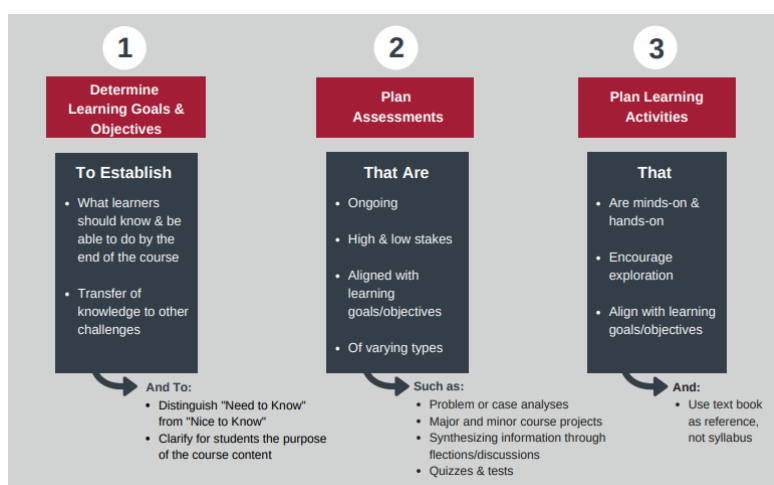
This content marketing design course is primarily designed using a design thinking process as a short-term training program (16 hours). We employ the principles of Backward Design, starting with setting learning goals and objectives and selecting relevant content, backward design is a process for designing courses that entails three steps: 1) determine the content and skills you want your students to learn in the course. (What are the course learning outcomes?) 2) determine how you will know whether students have learned that content and skills. (What assessment(s) will students complete to demonstrate measurably that they have met the course learning outcomes?) 3) Determine what practice will prepare students to succeed on the assessment(s). (What will the nature, frequency, and sequence of learning activities be in the course?) (Rochester.edu, n.d.), which in this research uses the conceptual framework of step 1) to design the structure and select the content in this course. Backward design has been widely adopted to develop college/university-level courses for both online and face-to-face environments. A major benefit of this model is that it centers us on teaching our learners what they need to know and not on covering textbook chapters (often filled with nice to-know). Another name for Backward Design is "Learner-Centered Design." Using it as the design model and communicating expected course learning outcomes grounds our courses, making it clear to learners why they are being presented with the selected course materials and assignments. (Muhlenberg College, n.d.) The backward design model is presented in Figure 7.


Figure 7: backward design model (Muhlenberg College, n.d.)

Measuring the Effects of Student Satisfaction and the Engagement Level of Personalized Adaptive Learning Using an AI-Enabled Learning Pathway Tool

Li Fern Tan, Temasek Polytechnic, Singapore
Poh Nguk Lau, Temasek Polytechnic, Singapore
Steven C.K. Ng, Temasek Polytechnic, Singapore

Abstract

Critical voices on the traditional "one-size-fits-all" education system, which assumes a uniform approach for all students, abound for not meeting individual student learning needs. Expecting teachers to cater to the diverse learning needs of each student is seen impractical and unrealistic. There is a growing demand for personalized student-centered education, aiming to accommodate the unique learning needs, abilities, and interests. Modern educational systems are incorporating innovations like Artificial Intelligence (AI), which not only personalize students' educational experiences but also make them adaptive. The concept of Personalized Adaptive Learning (PAL), which systematically tailor instruction to individual learners has gained prominence as a key educational reform effort in contemporary systems. As more teachers embrace PAL, it presents an opportunity to explore the relationship between student satisfaction and their level of engagement. In this study conducted in Singapore, PAL was implemented to 1061 students across three subjects – theory-based marketing, calculation-based statistics, and procedural airway bill calculation. The analysis is done by using factor analysis, Kruskal-Wallis test, Friedman test and Kendall tau correlation coefficient. The results revealed significant differences in the ratings of the three subjects between different constructs (lesson content, personalization and mobile devices) except for the system user interface construct. Moreover, there was a significant difference between all constructs among the students. Interestingly, the level of engagement is significant for three constructs: system user interface, lesson content and personalization. These findings provide insights into the factors that are likely significant antecedents for planning, designing and implementing PAL to enhance student satisfaction.

Keywords: Learning Pathway, Personalization, AI

Introduction

In recent years, there has been a remarkable increase in the adoption of education technology. Educators and policymakers have endeavored to personalize education to solve achievement gaps, lack of student motivation, and more effective and efficient instruction (Tetzlaff et al., 2020). In the Singapore context, to enhance teaching and learning, educational institutes are encouraged to embrace new teaching methods and technologies to cater to learners of diverse backgrounds to relieve teachers' workload and enable them to focus on areas such as learners' social-emotional development (Chan, 2022). According to Ng (2022), the integration of artificial intelligence into education systems could spark the greatest positive transformation in educational systems (Khan, 2023). Artificial intelligence could contribute to creating a personalized education system for each student that caters to his strengths and interests and adapts to the way they learn.

Personalized adaptive learning (PAL) seeks to tailor the learning experience to each student's individual learning style to address the individual needs and interests through "what, when, how and where students learn" (Costa, Rebeca & Tan et al., 2021). Along with AI bringing remarkable advancements to learning systems by enhancing their technology through the optimizing of key components - domain knowledge, the learner's current knowledge level, instructional measures like assessments, and the user interface. By integrating technologies such as AI as part of the digital learning environment, PAL platforms could build customized learning paths to meet the diverse needs of every learner based on the just-in-time profile of learners' motivation or learning gaps painted by AI-enabled data. Eventually, PAL suggests optimal choices of learning activities or pathways, departing from the traditional approach of delivering content through mass lectures. In the affordance of adaptive learning technologies, educators can rely on the analytics and learning algorithms generated based on the students' digital learning footprints to identify gaps in learning, analyze real-time updates of their performance and progress to improve their learning (Educause Learning Initiative, 2017).

The worldwide pandemic has accelerated the transformation of the traditional education system, resulting in a significant demand for asynchronous e-learning. This shift presented unique challenges to educators, in terms of mindset change and a change in skillset applied in classroom practice. While face-to-face contact in classrooms has been limited, both educators and learners must adapt to new technologies and teaching and learning methods. PAL empowers learners to take ownership of their learning experience (Yazon et.al., 2002) as they have greater control over the content they study and the pace at which they learn anytime anywhere and expedite their future continuous learning (Walkington, 2013). Despite its potential benefits, there are difficulties associated with designing, implementing and measuring PAL which is a complex undertaking fraught with challenges. These include user-perceived adequacy of the system user interface, user satisfaction with personalized learning packages, organizing content, and use of mobile devices to support learning.

A learning environment is made up of various dimensions elements that influence students' learning experiences and outcomes. According to Fraser et al. (2012), while the physical and social aspects are essential, instructional strategies and learning resources are also necessary to facilitate conceptual understanding and cultivate knowledge acquisition. Studies indicate that learner satisfaction and self-efficacy have an impact on learning and learning outcomes (Yakubu & Dasuki, 2018; Zogheib et al., 2015). Learner satisfaction is widely recognized as an indicator of the effectiveness of a learning system (Forster et al., 2020; Oho, 2017). Thus, learner satisfaction and acceptance should be considered when assessing a learner's

perception of any learning system. Learner satisfaction refers to how learners perceive a particular learning system's usefulness and effectiveness in enhancing student learning outcomes, reflecting their personal feelings and experiences during learning activities, and how they perceive the learning systems' quality and engagement. Typically, if learners are more satisfied with a particular learning system, they are more likely to continue engaging with it (Salam, 2022). Cidral, et al. (2018), hence the importance of measuring learner satisfaction in assessing the long-term success of the learning system.

According to Klem and Connell (2004), there is strong empirical evidence supporting the connection between engagement and academic achievement, with engagement explicitly tied to academic tasks and activities. The instructional design and how the PAL system provides each learner individualized learning paths in real-time by allowing them to progress along their unique learning path through the course based on their knowledge, skills and learning needs are interlinked with the student engagement level. Engagement is considered multidimensional encompassing students' emotions, behaviour such as participation, and academic learning time (Fredricks, Blumenfeld, & Paris, 2004) which is critical in connecting important contexts and consequently affecting desirable outcomes. Both learner satisfaction and engagement are essential in helping stakeholders comprehend system functionalities, pedagogical support, and instructional design for a productive learning experience for all users. Therefore, there is a need to evaluate the effects of student satisfaction on the engagement level of PAL. The authors of a forthcoming paper will discuss the direct and significant relationship between engagement level and learning outcomes.

Background and Aims of Study

The institution at which our research was conducted, Temasek Polytechnic, piloted the PAL using the LMS Brightspace Learning Pathway (Brightspace LeaP). LeaP is a PAL tool that builds personalized learning paths for learners without leaving the LMS (D2L, 2023). How does LeaP work? LeaP determines and recommends instant personalized learning paths based on course-specific learning objectives, activities and assessments that adjusts to each learner's learning state and needs as they interact with the tool by the semantic mapping of objectives, learning resource, assessment questions and mastery information of each learner. This can be useful for a range of personalized activities such as reviewing content, preparing for tests, providing remedial support for struggling learners, or even functioning as a primary or secondary source of learning. With this feature, teachers can save time and reduce their workload and thus enhancing work productivity.

In this study, we have implemented LeaP to 1,061 students across 3 subjects for a full semester, each offered by different school, at an educational institute of higher learning in Singapore with a total population of about 13,000 students. LeaP served as additional revision materials for Subject A and Subject C, aiding students in their preparation for the Mid-Term test. Additionally, it was utilized as a revision package to prepare students for the skill-based assessment in Subject B's Practical test. The LeaP packages are embedded in the LMS and was made accessible to students taking these 3 subjects at least 2 weeks prior to the respective assessments till the end of the semester for students to use the tool for final exam revision if needed. The breakdown of students is shown in Table 1. A brief orientation was provided at the beginning of the semester with the purpose of using LeaP and providing guidance on the use of LeaP packages during designated lesson weeks. At the end of the semester, we felt that it would be an opportune time to evaluate the effects of student satisfaction on the level of engagement in PAL. To achieve this, we employed a

questionnaire as our primary research instrument. Our objective was to ascertain whether there were any noticeable disparities in the constructs used for the questionnaire and to determine the relationship between satisfaction and engagement of PAL. Additionally, separate ethical consent for data collection is not obtained for several reasons. Firstly, LeaP is integrated as a learning tool within the existing learning system and is accessible to all students enrolled in the three subjects. As part of the course enrollment process, students have already provided consent for the use of the learning system and covers the use of LeaP as well. Furthermore, the data is collected in an aggregated form where the anonymity of the students are ensured.

The research questions for this study are as follows:
- Are there significant differences between perceived satisfaction among the students?
- Are there significant differences between perceived satisfaction within the subjects?
- Are there significant relationships between perceived satisfaction and engagement among students?

Our research is driven by a straightforward motivation - we firmly believe that higher levels of student satisfaction can boost student engagement in a course, leading to improved student learning outcomes (Gray and Diloreto, 2016). We aspire our study to contribute to the refinement of the instructional design of the PAL, with the goal of better catering to the needs of individual learners.

	Subject A (Offered by School A)	Subject B (Offered by School B)	Subject C (Offered by School C)
No. of Classes	24	20	2
Year of Study	1	1	3
No. of Teaching Staff	11	6	2
No. of Students taking the subject	539	484	38
No. of Students tried LeaP and took the survey	315	135	36

Table 1: Profile of participants

Methodology

As this study assumes a quantitative methodology, a questionnaire is employed as our primary research instrument, focusing on the learners' satisfaction with the system user interface, personalized learning packages generated, the content organized, and the effectiveness of accessing LeaP using mobile devices. Quantitative surveys are useful for obtaining a large amount of information from a large sample size in a relatively short period of time. The use of questionnaires can provide standardized and consistent data collection, which is helpful when measuring subjective opinions and attitudes (Kabir, 2016). Quantitative research is also useful for identifying patterns and relationships among variables, which can be helpful in identifying potential factors that may influence learners' satisfaction with the PAL system.

To have a more reliable comparison with the student engagement, LMS LeaP content reports for all 3 subjects were extracted. Diagnostic test results, which are also known as pre-tests, and activities the learner has done are used the rank the content's effectiveness in helping the learner understand the learning objective. Semantic algorithms are deployed to derive the relationship for each of the learning objectives, content items and questions within the course

content repository. Based on these three elements, LeaP makes intelligent individualized recommendation paths to offer reading content to the learners. Learners will then try the practice questions and take the post-test to evaluate their understanding of the defined learning objectives. Both the pre-test, practice questions and post-test attempts are recorded in the LMS LeaP content reports and are used for defining the 5 levels of engagement.

LeaP engagement level	Defined by
0	Attempted none of the tests
1	Attempted pre-test only
2	Attempted pre-test and practice questions
3	Attempted pre-test and post-test
4	Attempted pre-test, post-test and practice questions

Table 2: Level of engagement

In this study on learner satisfaction, a Likert Scale survey with 23 Likert Scale type questions that evaluated student satisfaction on 4 constructs (System User Interface (S), Lesson Content (L), Personalization (P) and Mobile Devices (M)). Additionally, 1 multiple-choice question was included to gain insight into why students did not use LeaP and 1 open-ended question was included to complement the quantitative data and enhance support for learning. Most of the survey questions were designed and adapted from prior research that focused on evaluating learner satisfaction and personalized learning by Lim, et al. (2022) and Zhang, et al. (2022). These learner satisfaction questions were validated in their research publications to support personalized learning experiences of students in high schools and tertiary institutes. However, an additional construct "M" is established to measure the mobile functionality provided by our learning. The validity of these constructs will be discussed in the findings later.

Data was collected using MS Forms, then analyzed using SPSS software and visualized using Power BI. Factor analysis was used to test the validity of the 4-constructs used, followed by reliability, Kruskal-Wallis and Friedman tests to determine if there is significant difference between the perceived satisfaction among students and within subjects. Lastly, Kendall's tau non-parametric correlation coefficient is used to measure the relationship between satisfaction and engagement.

Findings

Explanatory factor analysis is used to examine the factor structure of the 23-item instrument for a sample size of 486. This sample is large enough for factor analysis and the correlation matrix FOR all coefficients are greater than 0.3, suggesting that factor analysis is appropriate (Tabachnick and Fidell, 2007). The Kaiser-Meyer Olkin (KMO) measure of sampling adequacy is 0.968 and Bartlett's test of Sphericity have a significance level of 0.000 suggests that there is a high degree of correlation making factor analysis worthwhile.

Principal components factor analysis is applied as extraction technique with varimax as the orthogonal rotation method to extract underlying factors. The first 3 factors recorded eigenvalues of above 1 with a total of 73.916 per cent of the variance (Cumulative %). All the items in Figure 1 have absolute loading above 0.3.

Item Code and Description	Factor		
	1	2	3
P4_Enables me to choose what I want to learn	0.966		
P6_Records my learning progress and performance	0.894		
P3_Recommends the most suited pathway for my learning	0.856		
P5_Enables me to track my learning progress	0.845		
P9_LeaP was effective in personalizing my study for the Mid-Semester Test.	0.829		
P10_LeaP was effective in personalizing my learning on Marketing Fundamental topics	0.822		
P2_Provides me the flexibility to complete my learning	0.770		
P7_Has a positive impact on my learning	0.769		
P8_I enjoy learning using LeaP content packages	0.768		
P1_Provides me with multiple opportunities to bridge my learning gaps	0.764		
L3_Provides sufficient content	0.716		
L5_Enables me to learn the content I need	0.678		-0.309
L6_Supports my learning	0.667		-0.302
L4_Provides useful content	0.629		-0.333
L2_Provides content exactly fits my need	0.612		-0.336
L1_Provides up-to-date content	0.476		-0.429
M2_Little or no functional differences between the mobile and desktop devices		0.826	
M1_Easy access using mobile devices		0.777	
S2_User-friendly			-0.851
S1_Easy to use			-0.787
S4_Instructions are clear			-0.787
S3_Easy access to content and learning packages			-0.681
S5_Lesson goals are clear	0.380		-0.543

Figure 1: Pattern matrix

Factor 1 includes variables related to the effectiveness and flexibility of the LeaP learning platform. The high loadings on Factor 1 (P1-P10, L3) suggest that learners perceive LeaP as an effective and flexible platform for their learning. Factor 2 (M1-M2) includes variables related to the ease of access to LeaP using mobile devices. Factor 3 (L1-L2, L4-L6, S1-S5) includes variables related to the usability and clarity of instructions. Based on the theory behind the constructs and the content of the item, the L-items are more conceptually related to Factor 3 which may be more meaningful to be grouped with the S-construct, along with S5. S3, having a higher absolute loading for Factor 3, is decided to be grouped in the S-construct. Two reliability tests are run with one excluding L5 and L6 and the other including L5 and L6 to decide if L5 and L5 are invalid items that do not contribute much to the interpretation of factors. The Cronbach Alpha values are above 0.9 for all constructs for all the 2 runs should suggest very good internal consistency reliability for the sale in this sample. But based on Pallant (2000), the constructs have a small number of items (e.g. less than 10), the Cronbach alpha value may not be reliable. The mean inter-item correlation value is suggested.

There is a slight regrouping of the items into 3 factors. (S) and (L) are combined to become Usability and Clarity (U). Personalization (P) included L3 and Mobile Devices (M) remain unchanged. Reliability Run 1 test was conducted for the 21 items excluding L5 and L6 and Reliability Run 2 test was conducted including L5 and L6. The mean inter-item correlation values from Run 2 improved for (U) only. This may be an indicator not to exclude L5 and L6. L5 and L6 are included for all further analysis.

Run 1: 3-factors (21 items – excluding L5 and L6)			
Construct	No. of items	Inter-item Correlations	Cronbach Alpha
(U) Usability and Clarity [S+L]	8	0.667	0.941
(P) Personalization [+L3]	11	0.683	0.959
(M) Mobile Devices	2	0.747	0.855
Run 2: 3-factors (23 items – including L5 and L6)			
Construct	No. of items	Inter-item Correlations	Cronbach Alpha
(U) Usability and Clarity [S+L]	10	0.679	0.955
(P) Personalization [+L3]	11	0.683	0.959
(M) Mobile Devices	2	0.747	0.855
Run 3: Preliminary 4-factors (23 items – including L5 and L6)			
Construct	No. of items	Inter-item Correlations	Cronbach Alpha
(S) System User Interface	5	0.725	0.909
(L) Lesson Content	6	0.718	0.941
(P) Personalization	10	0.695	0.953
(M) Mobile Devices	2	0.748	0.855

Figure 2: Reliability tests

Run 3 was done on the preliminary 4 constructs using all 23-items in their initial grouping to confirm our hunch that that the preliminary grouping would be more advantageous. The improvement in the mean inter-item correlation values for all factors suggested that the items within these factors are measuring the intended construct in a consistent and reliable manner. Hence the researchers made the decision to fit a 4-factor model for all further analysis, with S5 grouped under L-construct using the results of the pattern matrix for the preliminary 4 constructs as they felt that S5 would land itself better to the L-construct based on its' item description. This grouping will be used for further analysis. Establishing content validity is essential to ensure construct validity. Notably, after conducting factor analysis tests, the 4-factor model appears to be more suitable, aligning with the constructs confirmed in the studies conducted by Lim, et al. (2022) and Zhang, et al. (2022) as shown in Table 3. The constructs and items underwent review by a panel consisting of LeaP administrators and piloted subject teams, ensuring the refinements before the survey was released. Kruskal-Wallis, Friedman test and Kendall's tau correlation coefficient are used to examine the differences between satisfaction and the relationship between satisfaction and engagement level based on the normalized sum of each of the 4 constructs (O'Rourke et al., 2019).

Item Code and Description											Adapted from
S1	S2	L1	L2	L3	L4	L5	L6	P3	P4	P6	Lim, et al. (2022)
S5	P1	P2									Zhang, et al. (2022)

Table 3: Question design

Initially, a mixed between-within subjects ANOVA is used to analyze both between subject grouping (Subject A, Subject B and Subject C) and within subjects' satisfaction ((S) containing S1-S4, (L) containing L1-L6+S5, (P) containing P1-P10 and (M) containing M1-M2) can be done using one analysis. Although the assumption of homogeneity of variances is not violated (by Levene's Test), but the Box's Test of Equality of Covariance Matrices assumption is violated due to unequal sample sizes across different subjects. Non-parametric Kruskal-Wallis and Friedman tests are deemed more appropriate instead.

Normalized Construct	Subject	Mean	Median	Std. Dev	Construct Mean	Construct Median	Construct Std. Dev	Mean Rank	Asym. Sig
(S) Construct	Subject A	3.7677	3.73	0.78226	3.744	3.78	0.80302	246.75	0.121
	Subject B	3.6323	3.73	0.86675				226.88	
	Subject C	3.9561	4.00	0.68563				277.42	
(L) Construct	Subject A	3.8625	3.97	0.76679	3.7969	3.905	0.78879	254.80	0.013
	Subject B	3.6167	3.68	0.83413				213.26	
	Subject C	3.8983	4.00	0.71320				257.99	
(P) Construct	Subject A	3.8130	3.89	0.76672	3.7435	3.82	0.77485	254.08	0.017
	Subject B	3.5561	3.51	0.78756				214.30	
	Subject C	3.8389	4.00	0.69481				260.44	
(M) Construct	Subject A	3.3992	3.00	0.96110	3.3748	3.00	.	246.90	0.001
	Subject B	3.1956	3.00	0.94084			0.95496	217.25	
	Subject C	3.8333	4.00	0.78457				312.19	

Figure 3: Descriptive Statistics & Kruskal-Wallis results

Using the Kruskal-Wallis test as shown in Figure3, there are significant differences in the ratings of the three subjects between the constructs (L), (P) and (M) with alpha less than 0.05. There is no significant difference in the ratings for construct (S) across the three subjects. Different subject learners do not rate (S) construct differently. As LeaP is an integrated tool in the LMS, students had similar levels of familiarity and experience with the LMS user interface, which affects their perception of the system user interface in LeaP. The design and usability of the LeaP are consistent across subjects, leading to similar perceived satisfaction across the board.

Subject B gave the lowest ratings for all constructs. Their cohort size is relatively huge and only one LeaP package was implemented as supplementary material for revision in preparation for the Term Test. The poor ratings may be attributed to a lack of LeaP exposure and poor communication at the beginning of the semester. Additionally, the independent sample test showed that learners from Subject A and Subject B rated the (L) construct differently. This is arguable as Subject A has launched 6 LeaP supplementary packages throughout the semester and learners have a higher degree of familiarity with the tool.

Subject C has the highest mean rank and highest median across all 4 constructs. Subject A and Subject B are introduced to LeaP at the start of the semester. As Subject A and Subject B are using LeaP as supplementary material for the first time, they may face some unfamiliarity and are the first to encounter any obstacles from using the PAL. Moreover, Subject C commenced using LeaP about two weeks after other subjects, and had the smallest cohort, making communication and control more manageable. Furthermore, as a result, they could have benefited from the prior issues experienced by Subject A and Subject B. By then, most technical difficulties had been resolved, and the introductory briefing was more streamlined, allowing learners to establish their own expectations for the tool. So, it's understandable that Subject C has the best perceived satisfaction level across all 4 constructs.

Construct (M) has the lowest median scale across all subjects. Subject B has the lowest median scale for constructs (L) and (P). These could be the area of foci for better user experience. Recommendations on these will be discussed in the next section.

Normalised Weighted	Mean Rank	Chi-Square	df	Asymp. Sig.
(S) Construct	2.53			
(L) Construct	2.68	136.871	3	0.000
(P) Construct	2.80			
(M) Construct	1.99			

Table 4: Friedman Test

From the Friedman Test shown in Table 4, there is a significant difference between all constructs. The students' ratings of the four different constructs are significantly different from each other. It is possible that the students have different preferences for learning styles and approaches, which may affect their perceptions of the usefulness and effectiveness of PAL. Additionally, the students may have different levels of prior knowledge and experience in the subject area, which could affect their engagement with and perceived satisfaction level of PAL. Other factors such as technological proficiency, motivation, and cognitive ability could also contribute to the differences in the students' ratings.

Using the Kendall's tau non-parametric correlation coefficient (Table 5), all four correlations ranged from 0.044 to 0.102 showing positive correlation with the overall engagement level. All have a statistically significant p-value less than 0.05 except for (M), which indicates that the likelihood of these correlations being a result of chance is low. The 3 factors (S), (L) and (P) have a significance level of less than 0.05, indicating that their correlation with overall engagement level is statistically significant, except for the (M) factor. These results can provide useful insights to guide future efforts aimed at enhancing engagement levels. The findings suggest that improving the (S), (L) and (P) factors could be key foci to have a positive impact on learner engagement level, while the use (M) factor may not have a significant influence on engagement.

| | | Normalised Weighted Sum of | | | |
		System User Interface (S)	Lesson Content (L)	Personalization (P)	Mobile Devices (M)
Overall Engagement Level	Correlation coefficient	0.102	0.065	0.093	0.044
	Sig. (2 tailed)	0.002	0.044	0.004	0.193

Table 5: Kendall's tau correlation coefficient

Conclusion and Recommendations

Based on the qualitative feedback, learners have varying levels of understanding about the benefits and functionality of PAL, which resulted in some learners being hesitant to try out the new AI-enabled self-study tool and prefer to revise the subject on their own. This presents an opportunity for school administrators and educators to come together and develop a shared playbook or detailed introduction to PAL for the learners to be familiar with the system user interface, lesson content and self-tracking reports to monitor learners' performance. Educators can reflect on their pedagogical strategies and adapt them to learners' needs by promoting the use of PAL. By considering the unique nature of the subjects and students with different levels of prior knowledge and experience in the subject area, we can create a scaffolding approach that will increase awareness, enhance motivation, and provide greater clarity on the use of this innovative tool. Effective communication is often considered the first and most critical step towards successful implementation which could be in the form of an engaging introductory video or a live demonstration shown at the beginning of each course. Clear and easy-to-follow step-by-step guide should be available for troubleshooting any common technical issues that may arise. Working collaboratively to develop a shared vision and detailed understanding of PAL and its benefits can ensure a positive and successful experience for all learners.

Although LeaP is an off-the-shelf product integrated into the LMS, we can still work towards improving the usability of the tool to improve the overall user experience. A well-designed

user interface and personalized learning content can increase learners' interest and engagement, leading to higher participation in the learning process (Thanyaluck et al., 2022). Our findings can be shared with the vendor as valuable customer feedback and we can collaborate with them to propose enhancements to the system user interface and the organization of LeaP content, making LeaP more user-friendly and beneficial for both learners and teaching staff.

The educational benefits and technological impact of personalized adaptive learning are highlighted in studies by Costa et al. (2021), Taylor et.al. (2021) and Murray et al. (2015). We believe that teaching staff can take advantage of personalized adaptive learning to plan the course delivery more efficiently and re-organise the learning resources into smaller portions to allow LeaP to recommend study paths more effectively. This will help to optimise the use of teaching resources, saving time and reducing the workload of teaching staff, while reducing the need for repetitive remedial and consultation sessions. LeaP can also be a valuable tool for assessment revisions. As successful learners share their experiences through word of mouth, this can create a positive ripple effect and inspire others to adopt this innovative approach to learning. By harnessing the capabilities of AI and embracing personalized adaptive learning, we can revolutionize the field of education and ultimately achieve greater success in education.

Limitations of Research

While our study highlights the importance of improving the usability and clarity of learning materials to increase learner engagement, we recognize that the findings may not be generalizable to other subject areas. However, we believe that our research provides a valuable foundation for future investigations. Despite our sample size being large enough for qualitative research, the findings are analyzed based on self-reported data using a questionnaire. Though efforts are made to validate and ensure the reliability of the data collection instrument, we acknowledge that the data may have an inherent bias due to the representation of a specific group of learners with its own characteristics which may not be representative of the population. We encourage further research on larger and more diverse groups of LeaP learners to gain additional insights and improve the generalizability of our findings. By building upon our study, we hope to enhance the quality of education and create a more positive and engaging learning experience for all students.

An AI-Enabled Learning System With Personalized Learning Pathways a Pilot Study of Its Impact on Learning of Statistics

Poh Nguk Lau, Temasek Polytechnic, Singapore
Steven Chee Kuen Ng, Temasek Polytechnic, Singapore
Li Fern Tan, Temasek Polytechnic, Singapore

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

AI-enabled systems offering personalized learning pathways or options are gaining imminence, showing immense potential to meet diverse learners' needs on a more practical scale. In this work, we piloted a learning resource that offers personalized learning pathways (or LeaP), powered by AI technology. The efficacy of the learning tool was evaluated using a skills test in a freshman statistics course. The results largely replicated what was found in the literature. For learners who used the resource, levels of engagement were not dependent on prior ability measured by past-semester GPA performance. The greatest difference in test scores was seen in the test task which the LeaP unit modelled after, with significant differences between learners who engaged with LeaP deeply versus those who did not attempt the unit at all. At-risk learners had poorer engagement levels and test performance compared to non-at-risk peers, which warrants a closer look at how intelligent tutoring systems (ITS) should be designed to meet their needs in online learning environments. Suggestions for future implementation and research were also proposed.

1.   Introduction

The COVID-19 pandemic has left an indelible mark on the delivery of traditional education on a global scale. The rapid rise of Artificial Intelligence (AI) technology is gaining traction in the delivery of a personalized learning experience that adapts to the specific needs of the learners (Pantelimon et al., 2021). Its broad application in educational settings has also been driven by technological advances, resulting in improved productivity and efficiency (Chassignol et al., 2018).

1.1   ITS and AI

Intelligent tutoring systems (ITS) and AI are the two key pillars that support just-in-time, adaptive learning in an online learning space. ITS can be seen as an antecedent to AI technology; both aim to inform instructors of learners' behaviors and interactions in an online learning environment. As described by Freedman et al. (2000), ITS is a computer system that provides personalized instruction and feedback without the intervention of a human tutor. ITS is a powerful educational tool that can be customized and integrated into learning systems and relies on computer programming to enhance the learning experience with tailored lessons. With the advent of technology, ITS has evolved from the traditional, rigid computer-aided instruction models associated with hard-coded links and has been under development for decades as Graesser et al. (2018) noted in their research. With ITS, customized instruction may be delivered to diverse learners at scale, achieving the benefits and effects of one-on-one coaching to improve academic performance (Bloom, 1984).

AI can be seen as the undergirding technology to augment ITS functions. Unlike ITS, where the learning paths are more or less hard-coded and static, AI revs up the backend technology to enhance the linkage and communication between the learner and the learning content by optimizing the four main components of the learning system: the domain knowledge, learner's current knowledge level, pedagogical or instructional measures (such as assessment) and the user interface (Pappas & Drigas, 2016; Pipitone et al., 2012). The integration and synchronization of these components is the cornerstone of AI-enabled tutoring systems and is pivotal in delivering customized instruction to meet diverse learners' needs.

1.2   Learning Outcomes and Engagement in Adaptive Learning Environments

ITS, whether AI-enabled or otherwise, have been experimented with in the teaching and learning of STEM subjects such as mathematics (Bang et al., 2023; Bartelet et al., 2016; Beal et al., 2010; Eryılmaz & Adabashi, 2020) and even in non-STEM domains such as sports and dance or in business courses (Ashwin et al., 2023; White, 2020). Positive learning outcomes were noted in terms of improvement in assessment scores or user satisfaction levels (Bang et al., 2023; Bartelet et al., 2016; Beal et al., 2010, Eryılmaz & Adabashi, 2020; White, 2020).

For at-risk learners, defined as those with poor academic performance and more likely to drop out of the course (Repetto, 2018, p. 163), an online learning environment seemingly affords a higher level of learner autonomy, control, and pace to their advantage. With AI-enabled self-study tools, some work reported positive outcomes with low attainment students. For example, Bang et al. (2023) reported that the use of an adaptive learning app for mathematics produced the greatest learning gains in assessment tasks for learners from at-risk socio-economic groups. Bartelet et al. (2016) also reported their mathematics ITS optional homework tool produced pre-post gains in all levels of learning ability, with the low

attainment learners benefitting more compared to the middle and high-level learners. The effects of more practice in the ITS environment (or interaction) on test gains were seen mainly in easier homework topics. Similar, Beal et al. (2010) found that learning gains were the most prominent in learners with the weakest initial mathematics aptitude, and learners who did more ITS sessions improved more than learners who accessed less of it.

1.3   Research Questions

Against the research, the current study aims to answer the following research questions (RQs):

1. What are the differences, if any, in learner engagement of an AI-enabled tool that offers personalized learning pathways (thereafter called LeaP), amongst learners of varying aptitudes in a freshman statistics course?
2. What is the impact of learner engagement in the LeaP tool on a statistics skills test?
3. How did the academically challenged (or at-risk) learners engage with the tool and what was the impact on the skills test?

2.   Method

2.1   Participants and Lesson Deployment

The LeaP lesson unit was implemented in the fall semester of a foundational statistics course in October 2022. It was used as a revision package prior to a skills-based assessment, which required learners to compute and interpret various regression coefficient estimates using Excel data-analysis tool pack or the R software. The unit was embedded in a learning management system (LMS) and was accessible to learners in the second week of November, leading up to the assessment in the third week. The unit remained available until the mid-semester term test as it was expected that some learners might use the tool for term test revision. To evaluate the impact of the tool, we removed late attempts submitted after the skills assessment week. The sample size decreased from an initial enrolment level of 484 to 357 learners (see the section on "Variables and data analysis"). No ethics approval was needed as the unit was presented to all learners as a learning resource.

2.2   Configuration of the LeaP Unit

LeaP is an off-the-shelf adaptive learning tool that is integrated within the LMS. It has three main components: a mapping engine, a ranking engine and a recommendation engine. The mapping engine receives content assets and resources such as learning outcomes, learning materials (lecture notes in word or presentation files, video lectures), question pool and learner's quiz results. The instructor needs to set up a .csv file format to capture the learning outcomes and question pool in pure text format, while ensuring a tight semantic association with the learning materials presented in the LMS. The backend semantic algorithm then ranks the extent of relatedness or relevancy between all the input assets. Lastly, the recommendation engine would combine the content relevancy and learners' quiz performance to propose the most optimal materials to close learning gaps. LeaP is adaptive in nature as content relevancy would change each time a learner repeats a test question, ensuring that already-learned materials are not recommended.

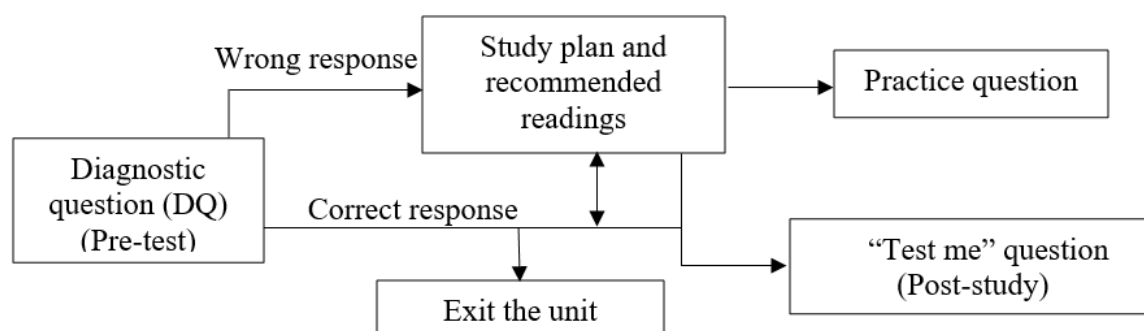
The LeaP lesson pathway as experienced by the learner is summarized in Figure 1. Figures 3 to 6 display the learner view in the LMS interface at various stages of the learning pathway.


Figure 1: The learning journey in LeaP.

The test bank for the diagnostic question (DQ), practice and post-study questions consisted of 20 MCQs based on raw data from four datasets. Questions in the test bank mirrored the actual test task. The interface randomly presents one MCQ each time the learning unit is launched, whether at the DQ, practice question or post-study stage (a maximum of three DQs could be posed for a higher workload). The trigger to the recommended learning pathway is learner's performance on the DQ, taken as an indication if the learning outcome was achieved. All interaction buttons are displayed within the same browser window so that the learner has full control in the whole process, whether to continue with the recommended resources, or proceed to take a practice or post-test question. A "thumbs up" or "thumbs down" button is also available for learners to recommend a learning resource depending on the perceived utility. This allows the AI backend to adjust the relevancy of the material. An example of a DQ is shown in Figure 2. Feedback is shown upon answer submission.

> Download the "Student grades" dataset. Using Excel or R/R-studio, (i) Determine the equation of the multiple linear regression trend line to predict English marks from Writing and Reading marks. (ii) What is the R^2 value? (iii) What does R^2 tell you?

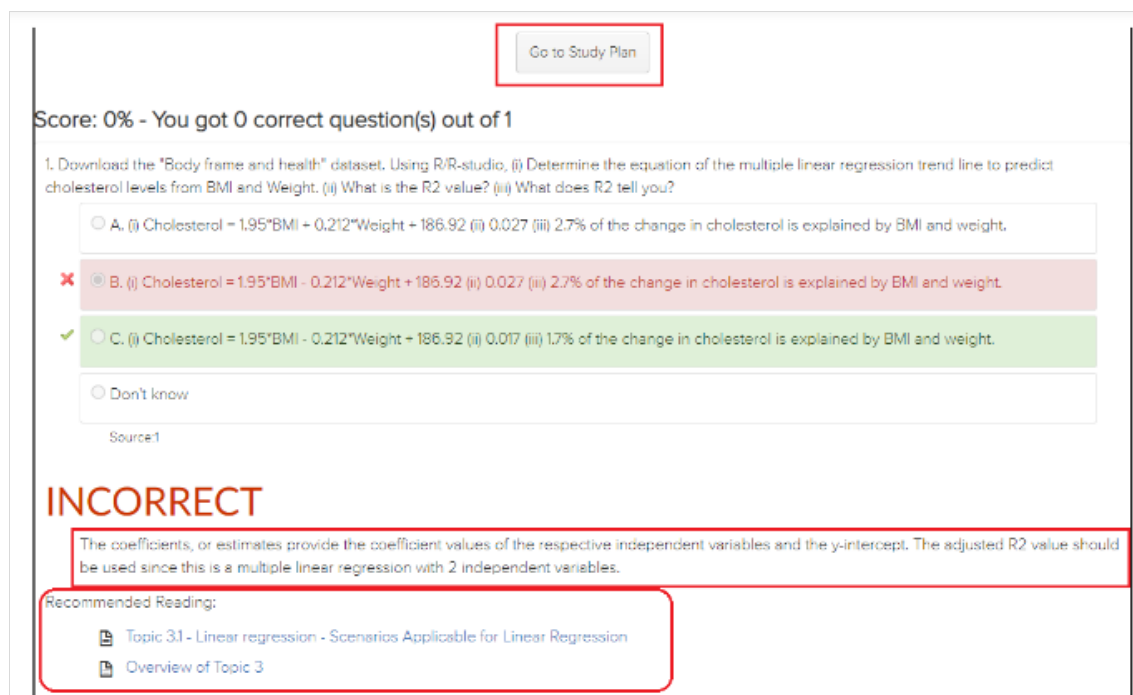

Figure 5: Incorrect response to the DQ with feedback, recommended revision resources.
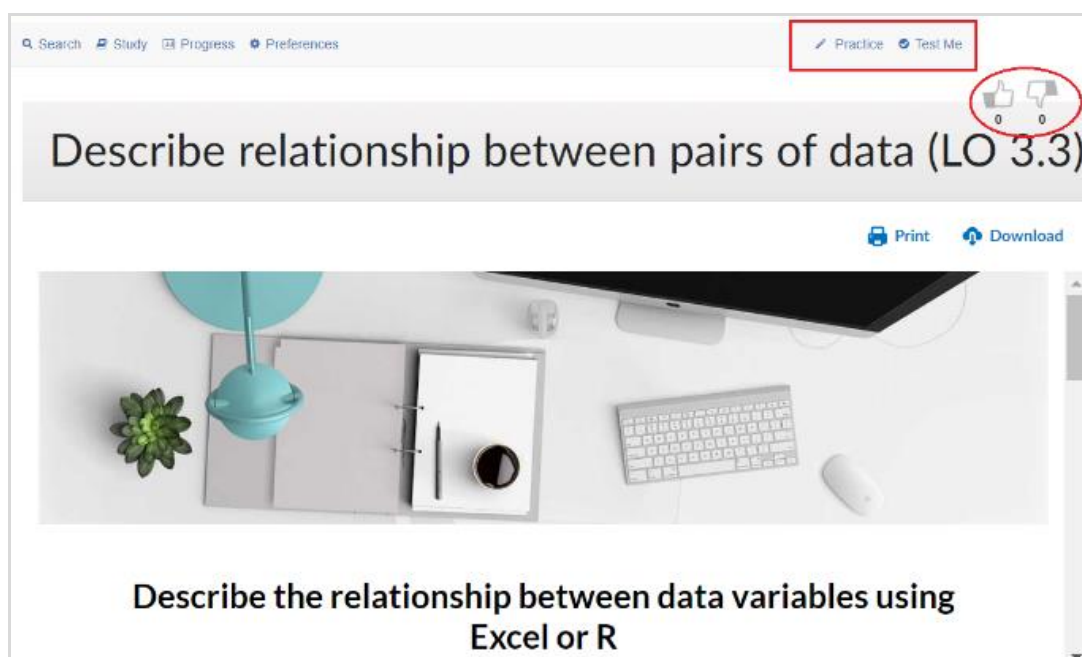

Figure 6: A study path in-progress, with the marked-out boxes showing the "thumbs-up/thumbs-down" buttons, practice and post-test question.

2.3 Variables and Data Analysis

The learner interaction data and the scores of the skills test were downloaded from the LMS. The number of trials or attempts in the pre-test, post-test and practice-test questions was used to define the LeaP engagement levels, as shown in Table 1.

Level	Description
0	Did not do the LeaP lesson at all
1	At least one attempt on pre-test but no post-test and practice question
2	At least one attempt each of pre-test and practice test but no post-test
3	At least one attempt each of pre-test and post-test but no practice test
4	At least one attempt each of pre-test, post-test and practice test

Table 1: Levels of LeaP engagement.

Prior ability was operationalized as previous semester GPA, with a maximum possible best of 4.0. The skills test comprised three questions out of a total of 20 points with one question similar to the LeaP pool. The other two questions tested concepts related to normality tests and correlation analysis. The scores were re-based to a total of 100%. Upon removing late LeaP attempts submitted after the skills test, we obtained a total of sample size of 357 learners (223 LeaP submissions and 134 non-attempts). There were 15 students who repeated the course, whose GPAs were unknown and thus excluded from GPA analysis where needed. The repeat learners were included in the academically-challenged pool for RQ3. SPSS Version 26 was used for all data analysis.

As the test scores (dependent variable) were non-normal, non-parametric tests such as the Kruskal-Wallis H-test and chi-square test were used for group differences. GPA was segregated into three levels, Low (0 to ≤2), Mid (2 to ≤3) and High (3 to ≤4). Where the assumption of a minimum expected cell counts of 5 was not fully met, the likelihood ratio was used as the chi-square statistic (Field, 2013, p. 724). The default significance level of .05 was used, except when multiple comparisons were made to illuminate paired differences. Effect sizes for paired comparison is calculated by dividing the standardized Z-statistic by the square root of the total sample size (Pallant, 2016, p. 233).

3.   Results

3.1   Relationship Between LeaP Engagement and GPA Levels

Table 2 shows the GPA bands distributed across the engagement levels, excluding the 15 repeat learners. GPA percentages in each level of engagement is shown in Figure 4.

GPA	Level 0	Level 1	Level 2	Level 3	Level 4	Total
Low	19	2	0	3	1	**25**
Mid	60	13	7	22	8	**110**
High	46	26	13	91	31	**207**
Total	**125**	**41**	**20**	**116**	**40**	**342**

Table 2: Levels of LeaP engagement and GPA

A chi-square analysis revealed a significant relationship in the levels of engagement and GPA levels ($\chi2$ (8, 342) = 56.9, p = .00). As shown in Figure 7, the proportion of learners in the Low and Mid GPA bands decreased as LeaP engagement levels increased. The Cramér's V value was .28, corresponding to a moderate effect size (Cramér's V, n.d.). If the no-LeaP learners were excluded, the chi-square analysis did not show a significant relationship between LeaP engagement levels and GPA ($\chi2$ (6, 217) = 6.24, p = .40).
Figure 7: The proportion of GPA in each engagement level.

3.2 Impact of LeaP Engagement on Test Scores

Table 3 shows the mean, median, standard deviation and the Kruskal-Wallis H-test statistic of scores for each test question by engagement levels. As the level of engagement deepens, the score in Question 3 (which the LeaP unit models after) increased.

	0 (None)		1 (Pre-test only)		2 (Pre and Practice)		3 (Pre and Post-test)		4 (Pre, Post and Practice)		Kruskal-Wallis χ^2 (4,357)
	M (SD)	Md	M (SD)	Md	M (SD)	Md	M (SD)	Md	M (SD)	Md	p-value
Q1	45.58 (38.83)	50	45.64 (37.42)	50	60.83 (32.23)	66.67	64.41 (36.29)	70.83	64.43 (36.61)	83.33	23.36 .000
Q2	38.06 (38.50)	50	50.57 (37.54)	50	62.50 (35.82)	50	64.30 (38.23)	50	67.07 (33.74)	50	35.31 .000
Q3	28.21 (31.47)	20	46.36 (34.96)	45	53.25 (39.94)	65	67.58 (28.52)	70	79.15 (22.10)	85	96.78 .000

Table 3: Descriptive statistics of test scores by question.
M=mean (standard deviation in brackets), Md = Median.

Figures 8 to 10 show boxplots of test scores in each question by engagement levels. As 10 pair comparisons were made, a more stringent criterion value of .005 (0.05 ÷ 10) was used. Based on this adjusted significance level, only Level 0 and 3 (none-versus-pre and post-group) had a significant difference in question 1. For question 2, besides Level 0 and 3, another pair produced significant differences in scores: the Level 0 and 4 (none-versus-pre, practice and post-test group). For question 3, the number of pairs with significant differences increased to three: Level 0 and 3 (none-versus-pre and post group), Level 0 and 4 (none-versus-pre, practice and post-test group) and Level 1 and 4 (pre-versus-pre, practice and post-test group). The effect sizes for the significant pair difference are presented in Table 4.

Question	Significant pair differences	Standard test statistic (*Z*)	Effect size
Q1	Level 0 and 3	-4.13	.22
Q2	Level 0 and 3	-5.24	.28
	Level 0 and 4	-4.13	.22
Q3	Level 0 and 3	-8.19	.43
	Level 0 and 4	-7.79	.41
	Level 1 and 4	-4.11	.22

Table 4: The effect sizes for significant pair differences per question. The effect size is calculated using the formula $Z/\sqrt{n}$, where n = 357 (Pallant, 2016, p. 233).
Figure 8: Boxplot for Excel test question 1. The dotted arrow represents significant differences between engagement levels. p-value = .000, adjusted for multiple comparisons.
Figure 9: Boxplot for Excel test question 2. The dotted arrow represents significant differences between engagement levels. p-value = .000, adjusted for multiple comparisons.
Figure 10: Boxplot for Excel test question 3. The dotted arrow represents significant differences between engagement levels. p-value = .000, adjusted for multiple comparisons.

3.3   LeaP Engagement of Academically Challenged Learners and Test Scores

For this analysis, the 15 learners (with missing GPA data) who repeated the course and the current-cohort learners with a GPA of 2 points or less were defined as at-risk. This formed a total pool of 40 at-risk learners, and 317 learners not at-risk. Table 5 summarizes the engagement counts between these two groups of learners and the mean, standard deviation and median scores. There is a significant relationship between academic status and engagement level, χ^2 (4, 357) = 25.4, p = .00. The Cramér's V effect size was .251. At-risk learners also performed significantly lower than their non-at-risk peers across all the three questions. For question 1, the Mann-Whitney U-statistic was 4,695 (Z = -2.72), p-value = .007. For question 2, U = 4,417 (Z = -3.28), p-value = .001 and for question 3, U = 3,278 (Z = -5.01), p-value = .000. As seen in Figure 11, there is a high proportion of at-risk learners who did not use the LeaP lesson unit to prepare for the skills test. Very few at-risk learners accomplished Level 4 engagement.

GPA	Level 0	Level 1	Level 2	Level 3	Level 4	Total	Q1		Q2		Q3	
							M (SD)	Md	M (SD)	Md	M (SD)	Md
Not at-risk	106	39	20	113	39	**317**	56.76 (37.66)	58.33	55.40 (38.63)	50.00	54.05 (35.27)	60.00
At-risk	28	5	0	5	2	**40**	39.58 (39.03)	37.50	33.75 (41.04)	0.00	24.25 (32.14)	5.00
Total	**134**	**44**	**20**	**118**	**41**	**357**						

Table 5: LeaP engagement levels and at-risk status and descriptive statistics by test question.
Figure 11: proportion of engagement level between the at-risk and not at-risk learners.

4.   Discussion

Our first RQ was to ascertain if there is a relationship between GPA and LeaP engagement level. The results showed that about 64% of the cohort (217 learners cumulated from Level 1 to 4) had at least attempted the DQ. Amongst the 36.5% of learners who did not use the resource, about 63% of them had a GPA track record of lower than 3 points (Low and Mid categories combined), about 37% of the non-submitters being learners with a high GPA track record of 3 points and above. In contrast, for learners who at least use some LeaP, the proportion of strong-GPA attainment was much higher, reaching a maximum of 78.4% for level 3 learners with a GPA track record of at least 3 or better (see Figure 4). However, when the non-submitters are excluded, the amount of effort exerted did not differ by GPA track record, thus answering the first research question.

The results also pointed to a polarization of test performance between the non-submitters and deeply engaged LeaP learner. For question 3, the task modelled after the actual assessment question, learners who did not access LeaP at all were worse off than learners who practiced the unit beyond just doing the DQ or pre-test. In fact, the largest effect sizes in the range of approximately 0.4 were observed in question 3 between the non-doers and those learners who diligently completed the pre-test, practice, or post-test. This illuminated the second research aim in that the more conscientious LeaP learners gained better outcomes. It is important to note that low GPA learners would also benefit if they spend effort and time to use the LeaP unit. Taken altogether, the results confirmed the evidence obtained in past studies (Bartelet et al., 2016; Beal et al., 2010; Eryılmaz & Adabashi, 2020), in that practicing tasks in an ITS or a learning environment that offers personalized learning routes has alleviating effects on academic performance. Low attainment learners also benefit if they choose to engage with the resource.

The differences in engagement became very pronounced when at-risk learners were compared to non-at-risk learners. Not only did the at-risk learners performed poorly in all the three questions, a large proportion of at them (70%) did not use the LeaP tool at all, as compared to about a third of the non-at-risk students who likewise did not access LeaP. The proportion of learners engaged in deeper learning for the at-risk group was also very much

lower than the corresponding levels for the non-at-risk group. There are two possible reasons for the poor levels of engagement exhibited by the at-risk learners. Firstly, due to the relatively short window of exposure (1 week), there was insufficient time for instructors to engage with learners, particularly the at-risk group (who might perhaps need more handholding and probing), to explain or communicate more clearly the goal of this instructional package. Secondly, there could be other needs troubling at-risk learners, such as family problems (Repetto, 2018, p. 165) that simply cannot be resolved by any well-intended online learning resource or system. Therefore, more work is required to understand how to support at-risk learners in a technology-based online learning space for our institutional context.

Although our study showed that learners with low GPA but engaged sufficiently with LeaP could still potentially benefit, we could not confirm any pre-post learning gains differentiated by prior ability as evidenced in the literature. This is because our outcome measure focused on a single assessment, rather than the change in score between the DQ and post-study question in the LeaP environment. While the system does generate scores on all question types, we did not choose to analyze differences because the learning scope of the LeaP module was rather narrow. Pre-post gains would be more meaningful when the environment is enriched with more content, tasks and highly varied learning pathways. Another limitation is that it could well be the case that learners simply skipped the recommended learning pathways or study plan and jumped directly to the practice or post-test questions. In other words, the better test performance may just be an effect of repeat practice, rather than a repeat study effect. Again, while the LeaP system could generate behavioral and interaction data (for example, the number of views of the recommended reading resources or study path), analyzing such data would be more meaningful with a larger content scope. However, in the light of learner choice and autonomy within a learning space offering personalized learning options, the issue of bypassing the recommended study plan may not be detrimental to learning. Akin to Bartelet et al. (2016), pre-post analysis and content engagement data could shed light on the choices and behaviors of all learners across a range of topics, including those at-risk. This could be a scope for future research.

Despite the limitations, both learners and instructors have benefitted from this simple pilot implementation. This is because classroom time was very limited, and instructors typically have very little or just no time to do revision or practice with students in class before an assessment. Based on the statistics generated by the system, we estimated that each learner spent between 1 to 2 hours self-studying the LeaP module. If we multiply this amount of time by about 500 learners, it is immediately apparent that one-on-one personalized coaching by human instructors within curriculum time is simply impractical and infeasible. We also questioned whether we could substitute the LeaP module with revision question sets or quizzes posted on the LMS, complete with automated feedback for learner's self-study. This is certainly possible, but the user interface would lack the feature that guides learners back to the lecture materials to review the concepts they faulted on. LeaP offers a more integrated interface and the advantage of recommending appropriate lesson contents to learners immediately upon answering the DQ.

5.   Conclusion

In conclusion, our results replicated the main findings of previous research to support the learning efficacy of ITS or AI-enabled systems offering personalized learning options. The experience and lesson gained in this pilot trial have guided us in terms of optimizing and

configuring our content to ensure that learning pathways are aligned to match learners' as-at needs. We may say with much conviction that compared to human instructors, AI-enabled personalized learning systems possess outstanding features that enable the scale-up of individualized instruction to suit the needs of diverse learners. This removes the need for tedious and constant monitoring by human instructors. We are perhaps not far away from a utopian vision of delivering personalized education to learners with reasonable effort, as Bloom (1984) hoped for.

Family Household Income and Children's English Proficiency in Malaysia: A Case Study

Nur Fatihah Syahirah Binti Nafrizam, Albukhary International University, Malaysia
Aini Syahira Binti Jamaluddin, Albukhary International University, Malaysia

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Malaysia is a diverse country where the population covers people with different races that results in most Malaysian being able to be either bilingual or multilingual. Although the differences is a common factor that might be influencing their English proficiency, yet many of the research that has been done to study the correlation of races and English proficiency prove that the relationship between those two is there. Most people tend to ignore the influence of household income towards their English proficiency which results in less research being conducted. Thus, this study aims to investigate the parents' experiences between family household income and children's English proficiency in Malaysia. A few interviews had been conducted to obtain the qualitative data from Malaysians with different family household income. This study reveals that there is a relationship between family household income and their children's English proficiency in terms of the level of awareness on the importance of English, the practice of English in daily life and the resources provided by parents.

Keywords: English Proficiency, Household Income, Awareness, Parents and Children, Malaysia

Introduction

The purpose of this research is to study the relationship between various family household incomes and their children's English proficiency in Malaysia. The household income in Malaysia can be divided into three categories which are B40, M40 and T20 which differ based on the salary range of the household income. The Table 1 below serves a better understanding of the mentioned term.

Definition of Terms

Term	Definition
B40	Romelli (2022) mentioned that the bottom 40% of Malaysian household income is known as B40. They make less money each month than RM4,850.
M40	The M40, or Middle 40%, group represents Malaysia's middle class. According to the 2019 Household Income and Basic Amenities Survey, the average monthly income in Malaysia is between RM4,851 and RM10,970.
T20	According to Rebecca (2022), The T20 group represents the top 20% of household income in Malaysia. They are regarded as high earners because they make more than RM10,971 every month.

Table 1: Definition of B40, M40, and T20 in Malaysia's Household Income Classification

This study focuses on how the household income could affect or to not affect their children's English proficiency especially in Malaysia where English is not the primary language unlike other countries like the United Kingdom and Singapore that use English as their mother tongue. In Malaysia, there is a noticeable difference in children's English proficiency from different households. Children from the urban area have an excellent English proficiency compared to the children from the rural area which has poor English proficiency. Yet, the English proficiency does not rely on the locality of the children but the household income instead. Thus, the focus of this study is to find the correlation between household income and children's English proficiency in Malaysia and it is divided into three parts which are the parents' awareness on the importance of English language, the practice of English language in their daily life, and the resources provided by parents.

This research is being conducted due to the fact that there is a noticeable difference of English proficiency in children from different backgrounds in Malaysia. The obvious differences of their background is the household income of the parents of the children. As cited from Winsler (2014), it is frequently challenging to separate the influence of English proficiency against poverty in predicting early school results for DLLs because a large portion of DLLs live in poverty (Capps et al., 2005). (Goldenberg, Rueda, & August, 2006).

In their 2002 study of DLLs in Miami's kindergarten, second, and fifth grades, Oller and Eilers discovered that socioeconomic status (SES) was a more reliable predictor of English language and literacy skills than language spoken at home. There is a lot of research outside of Malaysia that has been discussing how financial household income could affect their children's English proficiency yet there is still limited research involving Malaysia on the very same topic. This is concerning as the English language is being used widely in Malaysia. Regional English is not viewed as a distorted form of the English language, but rather as a flexible variant that is feasible for efficient communication (Ong L. T., & Stephanie, 2018). This is the solid reason for the relevancy of this study involving the parents' household income and their children's English proficiency.

This research aims to investigate the differences of family household income and their awareness on the importance of English proficiency in Malaysia, to explore the English proficiency of children from various financial backgrounds and to identify the effect of family household income and its relevance in influencing the children's English proficiency.

Literature Review

Parents' Awareness on the Importance of English Language

The English language in Malaysia is considered as the second language that has been widely used after Bahasa Melayu since Bahasa Melayu is considered as the national language. Most Malaysians have the capability to speak English fluently despite their different race that has their own mother tongue. According to a research that has been cited, Malaysia was recently classified as having the greatest level of English proficiency among Asian nations where English is not the native tongue (NST 7, April 2011; referenced in Thirusanku & Melor, 2012, p. 11). Malaysia came out on top, followed by Hong Kong, South Korea, Japan, and the EF EPI (Education First, English Proficiency Index), a global education center that specializes in academic degrees, educational travel, cultural interaction, and language instruction. Five competency levels—very high, high, moderate, low, and very low—were assigned to the Asian nations. According to the survey, which was published on March 30, Malaysia was the only Asian nation to be evaluated as having a high level of English proficiency. In regard to this, the main contributor of fluency is mostly from the parents themselves who have been encouraging their children to be able to have a good English proficiency. Majority of parents in Malaysia are fully aware of the importance of English language proficiency yet not the majority is taking it into practice in their real life and solely rely on their teachers at school. English Language Education in Malaysia: Challenges and Strategies, a 2016 study by Rabea Malik and Noraini Idris, found that despite parents' awareness of the value of English for their children's education and future employment, access to resources and high-quality English language instruction was still problematic. In order to assist English language development, the study also emphasized the need for improved communication and teamwork between parents, teachers, and schools.

The Practice of English Language in Daily Life

The usage of English language in children's daily life in Malaysia is varied as there are many factors that might be influencing them. Even the level of English proficiency of each child might differ from time to time. There is a probability that any factors could be affecting children's English proficiency. Ruzita Mohd Amin and Noraini Idris' (2013) study, "Children's English Language Utilize in Multilingual Homes in Malaysia," looks at how

children in multilingual families in Malaysia use the English language. According to the study, children in multilingual households in Malaysia regularly utilize several languages, including English. The study also discovered that factors like the languages spoken at home and by their classmates had an impact on how youngsters utilize language. To add more, The Influence of Parental Attitudes on Children's English Language Use in Malaysia is a 2015 study by Siti Zalina Ahmad and Zainab Mat Saad that discovered that parental attitudes have a significant impact on children's English language use in Malaysia and that positive parental attitudes towards English language use are positively related to children's English language use in their daily lives.

The Resources

In encouraging children's English language proficiency, parents play the major role. The resources provided by parents can also be in various forms such as physically or mentally. Parental involvement in English language learning among Malaysian families is the subject of one study, "Parental Involvement in English Language Learning: A Study of Malaysian Families," by Mohd. Nadzir Osman (2013). According to the report, parents in Malaysia use a range of tools to help their kids become more fluent in English, including hiring tutors, enrolling them in language programmes, and providing English language study materials. The study also discovered a positive relationship between parental support for children's language acquisition and their ability to speak English. The involvement of parents in providing resources can actually give a positive impact towards children's English proficiency. According to a 2016 study by Norlidah Alias and Shuhaida Sari titled "A Study of Parental Support for English Language Learning in Malaysia," parents in Malaysia offer a variety of supports to help their kids become more fluent in the language, including teaching them English, encouraging them to speak it, and enrolling them in language schools. Parental support is favourably correlated with children's English language proficiency, according to the study.

Research Methodology

The design of this research focuses on the qualitative method where all of the data is extracted from an interview session with a few respondents from various backgrounds that are related to the study. To ensure the findings and results of this research is accurate and reliable, a few interview sessions were conducted with different backgrounds and household income of parents. All of the parents that were being interviewed had adhered to the characteristics of the respondent that is being set before the research being conducted. In other words, a purposive sampling is being directed in this research. The characteristics of the respondents are as follows:

- The earning of the household according to the classification of Malaysian Household Income.
- The period of being parents is at least five years and above.
- The age of their children is at least 7 years old.

Biography of the Respondents

Respondents	Gender	Household Income Class
1	Female	T20
2	Female	T20
3	Male	M40
4	Female	M40
5	Female	B40
6	Male	B40

Table 2: Biography of the respondents

All of the interview sessions are being recorded and transcribed as proof and transparency of the interview conducted. All respondents are given the same set of questions covering the three research objectives.

All of the respondents chosen are willingly to participate and there was a thorough background check that had been done before they were being selected to be interviewed. All of the respondents were given the freedom to answer the questions based on their experience or opinion.

Themes of Findings

The interview that was conducted has resulted in a few themes including the prior theme set beforehand of the study.

The themes are as follows:
- Theme 1: The parents' awareness of on the importance of English language
- Theme 2: The practice of English language in their daily life
- Theme 3: The resources provided by parents

Results & Findings

Parents' Awareness on the Importance of English Language

Based on the interview conducted, it can be seen that all of the respondents from B40, M40 and T20 agreed that English language is important for their children. The outcome of the interview is parallel to a study that has been conducted by Malaysia's Ministry of Education. As mentioned by a respondent from the B40 family household income, now the age of technology has changed… so English is very important. This is also supported by respondents from M40 and T20 family household income in which they shared, "English is very important… we mostly have to use English," and "it is important… because English is basically an international medium." According to a Malaysian Ministry of Education study,

parents are extremely important in helping their children become proficient in English and understand its significance (Ministry of Education, 2019). According to the study, parents who understand the value of English language competence for their kids' future success are more likely to support their kids' education and give them chances to practise their English.

Practice of English Language in Their Daily Life

The practice of English in the children's daily life revolves around their communication between their parents, siblings and, also, their peers. Although there are other factors that could affect each child's English proficiency, to only rely on one factor that could affect it is unreliable. Thus, there are different responses from the respondents throughout the interview session on their children's daily practice of English due to different factors. Respondents from B40 and M40 family household income mentioned, "When with friends, they usually speak English. It seems like that. Sometimes it sounds like a mixture of English and Malay too." and, "They also speak English with their friends. I rarely listen to him speak Bahasa Melayu." However, a respondent from T20 family household income said that, "the school factor that influences my children to have a good proficiency in English… my children have a command of English from school and friends." Multilingual children in Malaysia typically have greater cognitive capacities and a higher level of metalinguistic awareness, per a study by the University of Malaya (UM, 2018). This is due to the fact that kids are exposed to many linguistic structures and languages, which can improve their cognitive growth and capacity for critical thought. Additionally, children who speak multiple languages may have greater career and social mobility chances. Although there are a few respondents who admit that there are challenges that come with the weight of being multilingual. This is align with the studies from the National University of Malaysia (NU Malaysia, 2020) and University of Malaya (UM, 2018) emphasise the necessity of comprehending the complexities of multilingualism and the difficulties multilingual children in Malaysia face, as well as the significance of providing support for their language development and academic performance.

Resources Provided by Parents

Going deeper into the research objectives, all respondents were being questioned as to whether their financial situation would have the tendency to give effect towards their children's proficiency and four out of six respondents clearly mentioned that their financial situation would not be affecting their children's English proficiency. Respondents from B40 and M40 family household income mentioned that, "Mastery of English actually comes from one's own interest." "It doesn't matter what our income is, it will not affect my children's English proficiency". To add more, respondents from T20 family household income clarify that, "It actually depends on their desire, not their economic status." According to a study by the Malaysian Ministry of Education (Ministry of Education, 2019), a number of factors can affect children's enthusiasm in studying the English language. Children who view learning the English language favourably and believe it will be beneficial and important to their futures are more likely to be interested in it. Additionally, kids who are eager to learn English are more likely to have high levels of self-esteem and confidence. To add more, all of the respondents children were sent to government school and not private school which would still require the use of Malay in other subjects than English and to not use English wholly. As for the other two respondents, they believe that their household income had given a significant impact on their children's English proficiency. According to them, the income they gained is the main reason that they are able to provide more resources and opportunities for the growth of their children's English proficiency. This is supported by one of the respondent from the

M40 family household income, "It is actually affecting my children because I cannot give them the usual things that I used to give back then.

Conclusion

In conclusion, the purpose of this study to find the correlation between family household income and children's English proficiency in Malaysia is achieved as to where the relationship between family household income and children's English proficiency exist in terms of the parents' awareness on the importance of English language, the practice of English language in their daily life, and the resources provided by parents, but it is not the major factor that is affecting the children's English proficiency. Yet, there would still be a minor effect on the capability for parents to provide resources to improve their children's English proficiency. This study also reveals that the responsibility to ensure children's English proficiency does not only rely on the parents but also the community and school. All of these parties should be able to work together to ensure there is a balance of empowering English and Malay proficiency in Malaysia where most of the people are bilingual and multilingual. To wrap this study up, there is a favourable correlation between household income and children's English competence, although this is not the only aspect to consider in Malaysia. To fully understand the relationship, additional study is required, and initiatives should be taken to guarantee that kids from all backgrounds have equal opportunities to advance their English-language skills.

University Female Leaders and Imposter Syndrome: An Exploratory Case Study in Malaysia

Nouran Tarek, University of Nottingham, Malaysia
Rozilini Mary Fernandez-Chung, University of Nottingham, Malaysia

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
Imposter Syndrome (IS) affects individuals, specifically high-achieving females, by causing them to experience self-doubt and feelings of being fraudulent. This study employed an innovative visual quasi-gamification tool to conduct semi-structured interviews aiming to investigate how IS affects female leaders in higher education in Malaysia and how IS could be managed. It concluded that IS is displayed differently than what literature shows, as the female leaders seem to be perfectionists who do not experience immense self-doubt but rather a pressure to appear ideal before colleagues and seniors. This Study shows that female leaders manage the negativities of IS through self-awareness and reflection. It recommends re-examining how IS is perceived by investigating multiple cultures and solutions, specifically focusing on females and how their background affects their leadership in education and other fields.

Keywords: Imposter Syndrome, Higher Education, Female Leadership

iafor

The International Academic Forum
www.iafor.org

Introduction

Impostor Syndrome (IS) has gained prominence in recent years, notably since Michelle Obama highlighted this phenomenon in her 2018 memoir. Despite its contemporary recognition, the roots of this concept trace back to the 1970s, when psychologists Clance and Imes (1978) observed that accomplished women often grapple with self-doubt and a sense of fraudulence, coining the term Impostor Syndrome.

While research on IS has been ongoing since the 1970s, it has shown inconsistencies, and there is a notable dearth of studies focusing on non-medical fields, such as education and educational leadership (Bhama et al., 2021; Freeman & Peisah, 2022; Zaed et al., 2022). Furthermore, the scholarly attention given to IS in Malaysia and Asia is generally limited, with a particular oversight of females in leadership positions (Alsaleem et al., 2021; Khan et al., 2022; Shahjalal et al., 2021).

This study endeavours to fill these gaps by examining the impact of IS on female university leaders in Malaysia and investigating how IS is managed in this context. Employing an innovative approach, the research utilises an exploratory case study methodology, incorporating visuals and quasi-gamification into semi-structured interviews. The ensuing sections will provide a background to the study, followed by a comprehensive literature review, culminating in a detailed analysis, discussion, and recommendations.

The Context and Background

Female Leadership in Malaysian Higher Education
In Malaysia, the landscape of female representation among academics in higher education, particularly in public universities, stood at 56.5% in 2020. This figure slightly decreased to 54.5% in the private sector, as reported by the Higher Education Department in Malaysia (Jabatan Pendidikan Tinggi, 2020). However, it is crucial to note that this percentage diminishes significantly as one ascends the hierarchical ladder within public universities. In 2020, data indicated that only 48.4% of female academics held the position of associate professors, and a mere 34% had reached the status of professors (Ahmad, 2021).

A recent study on female leadership in higher education in Malaysia revealed that despite the majority representation of women in academia, they encounter substantial challenges in attaining leadership roles, particularly in higher administration. The persisting patriarchal notion prevails, suggesting scepticism about women's capability to lead major institutions (Badrolhisam et al., 2022). Notably, the existing studies and data primarily concentrate on governmental and public institutions, leaving a void in our understanding of female leadership in private universities in Malaysia. This gap prompted the selection of a private university for the current study.

The University Context
The chosen university, an international campus from the United Kingdom, boasts two faculties—the Faculty of Arts and Social Sciences and the Faculty of Engineering and Sciences. Despite having 47.6% female academics out of 267, only 11 women hold significant positions such as vice-provost, head, interim, program director, and deputy dean. This aligns with the broader trend observed in Malaysia, where female representation declines as leadership positions increase in importance.

Literature Review

Imposter Syndrome Behaviours and Effects

As outlined by Clance and Imes (1978, p. 1), many accomplished women grapple with pervasive self-doubt, sensing an inadequacy for the elevated positions they occupy. These women often believe that they have somehow 'fooled' their colleagues to attain success. Imposter Syndrome (IS) manifests as an overarching sensation of being undeserving or "not good enough" for the role held. Individuals grappling with IS navigate a landscape of uncertainty in decision-making and an enduring fear of exposure as incompetent or "fake" despite their diligence and proficiency (Sherman, 2013, p. 57). Instead of attributing their success to competence and self-worth, they often ascribe it to luck or fortuitous timing, minimising their agency in their accomplishments (Clance & Imes, 1978; Mullangi & Jagsi, 2019). This dynamic gives rise to two prevalent fears associated with IS.

Firstly, the fear of failure exacerbates the stress levels experienced by individuals throughout their careers and personal lives (Crawford et al., 2016; Sherman, 2013; Wang et al., 2019). Importantly, the higher an individual's level of success and leadership, the more pronounced the stress becomes for those grappling with this phenomenon (Nihalani, 2021). Secondly, the fear of success manifests as a reluctance to embrace success due to apprehensions about potential losses, such as strained relationships with colleagues and acquaintances (Neureiter & Traut-Mattausch, 2016). These fears intricately complicate the experience of IS, exerting a discernible impact on both mental health and work behaviour.

Imposter Syndrome Effect on Mental Health and Work Behaviour

Characteristics associated with Imposter Syndrome (IS) have been linked to heightened anxiety, as evidenced by research (Bernard et al., 2002). Notably, studies indicate a higher prevalence of anxiety related to IS among females compared to males (Cusack et al., 2013), and this heightened anxiety has the potential to impact work patterns significantly.

Thompson et al. propose that IS can manifest in a cyclical pattern, initially marked by procrastination and followed by a phase of over-preparation frenzy (Thompson et al., 2000). Additionally, Bowker & Schubert's (2019) study establishes a direct correlation between IS and an individual's self-esteem, emphasising its significance as a critical factor impairing normal functioning (Neureiter & Traut-Mattausch, 2016).

Individuals grappling with IS often exhibit tendencies towards workaholism, perfectionism, and difficulties in delegating tasks (Bechtoldt, 2015). Apart from striving for perfection, IS individuals feel compelled to maintain an idealised image at all times in the workplace, focusing on how they are perceived by those around them (Fields, 2020; Hoben et al., 2022). It is noteworthy, however, that despite these negative aspects, individuals with IS consistently excel in fulfilling their work and tasks effectively (Sakulku & Alexander, 2011). The paradoxical nature of overworking oneself while still achieving tasks underscores the complexity of IS.

Given the intricate interplay between work behaviour and mental health in the context of IS, comprehending the effects of IS on females in academic leadership becomes particularly crucial.

IS characteristics could lead to anxiety (Bernard et al., 2002); a study found that more females suffer from anxiety emerging from IS than men (Cusack et al., 2013), which could affect work patterns.

Thompson et al. believe IS could lead to an initial phase of procrastination followed by a phase of over-preparation frenzy (Thompson et al., 2000). Furthermore, Bowker & Schubert (2019) conducted a study that revealed this phenomenon directly correlates with one's self-esteem (Neureiter & Traut-Mattausch, 2016). This is claimed to be one of the most important factors that impair one's ability to function normally when suffering from IS.

IS individuals experience workaholism, perfectionism tendencies, and struggles in task delegation (Bechtoldt, 2015). Besides perfectionism, IS individuals need to appear ideal all the time at work and focus on how they are perceived by those surrounding them (Fields, 2020; Hoben et al., 2022). However, despite all these negative notions, it must be explained that IS individuals fulfil their work and tasks very well (Sakulku & Alexander, 2011), even though they overwork themselves. Since work behaviour and mental health are involved in IS, an understanding of the effects of IS on females in academic leadership is important.

Imposter Syndrome in Academic Female Leadership

Academics experience IS since they believe the institution did them a favour by hiring them. They become reluctant to attend leadership meetings as they do not feel worthy of their position or future promotions (Ladonna et al., 2018). In addition, female academics could miss out on leadership opportunities due to the IS notions, as they might refuse leadership positions in higher education institutions since they feel undeserving of these offers (Arleo et al., 2021).

Delving deeper into women's experiences in academia, lecturers offer their insights through a published article that takes an anecdotal approach yet provides a unique perspective on Imposter Syndrome (IS). In an engaging narrative, Hoben et al. (2022) articulate how university lecturers often navigate a realm where they feel like they are merely playing the role of "princesses of academia," grappling with a persistent struggle to establish a sense of belonging in their academic pursuits.

Moreover, a study conducted by Arloe et al. (2021) sheds light on how IS acts as a formidable obstacle hindering women from assuming leadership roles and progressing in such positions. This corroborates the notion that female leaders are particularly susceptible to the impacts of IS (Sherman, 2013). Notwithstanding these challenges, the literature suggests the existence of management interventions aimed at addressing IS in academic settings.

Interventions and Solutions of Imposter Syndrome

Scholars have proposed various solutions and interventions to address Imposter Syndrome (IS). One organisational approach involves creating opportunities for women in leadership roles, recognising and commending their contributions, and routinely evaluating the organisational system to ensure inclusivity and fairness (Mullangi & Jagsi, 2019). Additionally, mentorship programs, strategic onboarding processes, and fostering a safe environment for individuals to share their challenges within a trusted professional network have been suggested as effective strategies (Lacey et al., 2017).

Conversely, Sherman (2013) advocates for a more personal approach, emphasising the importance of individuals engaging with mentors, actively acknowledging and monitoring their self-talk, avoiding the trap of perfectionism, and gaining a clear understanding of their strengths while working to overcome personal fears. This individualised perspective aligns with the notion that addressing IS involves a combination of self-awareness and proactive self-management. Similarly, seeking support from a therapist or confiding in a trusted person is highlighted as a viable personal strategy to cope with IS (Martinez & Forrey, 2019). The duality of organisational and personal interventions underscores the multifaceted nature of combating Imposter Syndrome.

Methodology

This section describes how the innovative visual and quasi-gamification instrument was drafted, how participants were chosen, and how the study met ethical requirements. This research is a case study employing qualitative methodology. Yin Field (2018) states that case studies explore answers involving how something happens, hence understanding the details of issues and their manifestations.

The Instrument

Interview questions in this study were based on the research questions relevant to recent literature on IS, drafted gradually, starting with simple and general questions to more specific ones (Britten, 2006). This followed a semi-structured interview methodology, where questions are designed and used to comprehend responses from participants regarding a phenomenon or situation they have experienced or have been subjected to via a relatively detailed interview (McIntosh & Morse, 2015).

The number of questions recommended for interviews is between five and ten (Creswell & Creswell, 2018). Therefore, an innovative methodology was employed; the same material used for the interview was transformed into a visual tool in a PowerPoint presentation (PPT). It was extracted from web pages about the topic, published by a website that raises awareness of mental illness and biological disease (Charleson & Gans, 2021; Cuncic & Morin, 2021). Images and infographics were designed to attract the participants' attention. Great value is gained by using visual tools to facilitate and simplify the process of interviewing participants in qualitative research since it enhances the understanding of the participants (Glegg, 2019). The interview was also interactive and similar to gamification methods, which fostered a higher level of motivation (Sailer et al., 2014). Participants viewed the displayed infographics, took a minute to process the information, and were asked to speak about how relevant it is to their lives and experiences.

Piloting the Instrument

Piloting the PPT interview resulted in positive feedback and a clear understanding of the topic and questions; only a few edits were made, such as adding animation to some slides and rewording some points. The methodology was interesting, kept participants engaged, and displayed information clearly. This aligns with the notion that piloting qualitative research aids in refining the instruments, whether questionnaires or interviews, revealing gaps and vague matters. This also contributes to maintaining ethics and research verification methods (Sampson, 2016).

The validity of qualitative research was taken under consideration is the investigator's responsiveness, including the categorisation of themes of the interview, what is omitted and what is kept, and the general decision-making process affecting the outcome of the analysis and results (Morse et al., 2016), in addition to sending the interview questions to a scholar colleague to achieve face validity (Noble & Smith, 2015). As for measuring the reliability of the results, the repeatability and frequency of common answers from participants ensure consistency, duplication, and unification of outcomes (Long & Johnson, 2000). Also, trustworthiness is of utmost importance in this research, particularly since it depends on collecting raw qualitative, in-depth data from participants relating to details, deep thoughts, and ideas. Therefore, the points noted down by Elo et al. (2014) was taken into account. This entails a non-biased, neutral and hospitable environment that allows the participant to respond freely during the interview without leading the dialogue towards certain answers, whether online or in person.

Interview Modes

There were two ways to introduce the semi-structured interview: one was virtual via the Zoom online platform, and the other was face-to-face. All potential participants were given the choice to provide them maximum comfort. The interviews were mostly conducted via Zoom; however, two interviewees opted for a face-to-face setting. It was a great chance for the author to notice the participants' body language, facial expressions, and reactions to understand what they experienced on a deeper level.

Transcription

The interviews were recorded, and the audio files were extracted and transcribed verbatim; transcription was done through a high-quality speech-to-text programme and then reviewed manually for errors. The verbatim transcription method was chosen to record all the interview details and interpret the participants' body language or facial expressions to increase reliability, validity, and trustworthiness (Easton et al., 2000; Seale & Silverman, 1997). After transcribing the data, a thematic analysis was conducted using the inductive methodology proposed by Braun and Clarke (2012). This approach allowed for the emergence of themes directly from the data, providing a comprehensive exploration of the content. The analysis delved into addressing the research questions in-depth and establishing connections with the relevant literature introduced at the study's outset, as outlined by Braun and Clarke in 2006.

The Participants' Sample Size

This study reached out to female leaders in a private university in Malaysia, and only females from the non-medical and non-STEM faculties were approached to bridge the gap in research by focusing on arts and social sciences. Participants were approached through purposive sampling via university email.

The choice of participants depended on the role they played in their department as leaders, where education leaders are the individuals who have the authority or autonomy of decision-making to influence learners' lives, outcomes, and learning environment (UNESCO, n.d.). Practically, this was applied by corresponding with female educators who lead teams or units, can shape the university, and influence students, such as programme directors, heads of schools, and directors of teaching and learning.

The headcount of the number of female leaders fitting the criteria was 28. Hence, all of them were approached. According to the literature, the average participant response rate in interviews is 36.6% (Yang et al., 2006). The response rate of this study is 42.2%, as it generated 12 participants. Finding the perfect sampling size for qualitative research is a challenging task. It could be based solely on the researcher's experience and instinct provided by the surrounding conditions of the study (DiCicco-Bloom & Crabtree, 2006). Yin (2003, 2018) does not recommend a specific number of participants in case studies specifically, and that in-depth semi-structured interviews that are designed to elicit the details of a social and emotional phenomenon would not profoundly rely upon specific sample size numbers but rather on the level of depth and saturation of data, the interviewees provide. This was conducted with ethical considerations in mind.

Ethical Considerations

The topic of IS does not hold any sensitivities in general, as it is a phenomenon that could affect any member of society and not only females (Abdelaal, 2020), even though this study focuses on females in particular. The name "imposter" could give the wrong impression to participants. Hence, explanations and infographics about the syndrome were presented. To address any sensitivities or socially awkward issues, the questions were drafted within a professional scope, graded from general to more specific, and subtly phrased not to trigger any participants, even though this point is minor in the study.

The confidentiality and anonymity of the participants were clearly stated in the information sheet and consent form. Coercion was not a concern in this study, as the interviewer did not know the participants in advance, except that they were education leaders in the university. There was also no conflict of interest, as the interviewer does not work at the university. The results provided by this study did not benefit the authors in any way other than fulfilling the investigation query. Bias was an irrelevant point, as the author is not Malaysian and is interviewing the participants as an international student; the only shared factor between the participants and the researcher is that both parties are female. Finally, this study fully complied with British Educational Research Association (BERA) guidelines (*Ethical Guidelines for Educational Research, Fourth Edition*, 2018), which ensured participants' protection while reaching valid results as displayed in the next section.

Analysis and Discussion

The results reveal how female leaders in higher education in Malaysia experience IS, what characteristics are displayed in this context, and the different solutions they use when faced with this issue.

Prominent IS Characteristics

Feeling Fraudulent and Experiencing Self-Doubt
Contrary to prevailing literature expectations, female leaders in this study did not exhibit a strong inclination towards Impostor Syndrome (IS), which encompasses doubts about one's deservingness of a leadership position and feelings of inadequacy (Clance & Imes, 1978; Sherman, 2013). The anticipated self-doubt commonly associated with IS was not a prevalent theme among the participants. In contrast to scholarly beliefs, these leaders did not express feelings of being fraudulent, fake, or incompetent. Some participants acknowledged experiencing self-doubt early in their careers, but such concerns diminished with time and

experience, a departure from the commonly held belief that seniority exacerbates IS-related stress (Nihalani, 2021).

Participant E exemplified this trend by recalling initial doubts about deserving the leadership position but noting that these doubts dissipated with two years of experience on the job. This unexpected finding challenges the conventional understanding of IS, suggesting a potential influence of the international campus setting and institutional policies on leadership perceptions.

Instead of grappling with personal doubts, female leaders in the study were notably preoccupied with how their colleagues perceived them. The need to maintain an ideal professional image was a recurrent theme, often interlinked with concerns about confidence in decision-making (Fields, 2020; Hoben et al., 2022). Participant G exemplified this by expressing anxiety about the consequences of not addressing a problem effectively, fearing it would tarnish her reputation. She emphasised the significance of colleagues' perceptions, stating, "I am very, very concerned... about how my colleagues perceive me and whether they think I'm good to work with and whether they're happy with the way the school is run."

This focus on external perceptions aligns with the experiences of well-established academics who face constant pressure to appear flawless and competent (Hoben et al., 2022). The study further revealed instances where female leaders admitted to struggling with confidence in decision-making, expressing uncertainty about their abilities compared to potential alternatives (Arleo et al., 2021; Sherman, 2013). Participant B exemplified this by suggesting that others might be more skilled in leadership roles, leading to apprehensions about their own efficacy.

In summary, the unexpected findings from this study challenge established notions about IS in female leaders. While the anticipated self-doubt associated with IS did not prominently feature in their experiences, concerns about colleagues' perceptions and the pressure to appear ideal emerged as significant factors. The emphasis on external validation and occasional doubts in decision-making point towards a nuanced manifestation of challenges faced by female leaders, distinct from traditional IS narratives.

Understanding the Fear of Failure and Success

Impostor Syndrome (IS), characterised by fears of success, fear of failure, and attributing success to luck, typically induces workplace stress (Crawford et al., 2016; Sherman, 2013; Wang et al., 2019). Surprisingly, female leaders in this study did not exhibit a pronounced fear of success; instead, the fear of failure emerged as a significant concern. Participants A, B, F, and K articulated apprehensions related to how failure might be perceived by others, highlighting stressors impacting both personal and career aspects (Crawford et al., 2016; Sherman, 2013). Notably, their fear of failure centred around external perceptions, emphasizing how colleagues view them rather than their own self-perception—a unique manifestation of IS in this context.

Furthermore, the study identified a weak tendency among participants to attribute success to luck or timing, contrary to established IS characteristics (Clance & Imes, 1978; Mullangi & Jagsi, 2019). Instead, success was often attributed to factors such as hard work, parental upbringing, and persistence, reflecting a divergence from conventional narratives.

Procrastination

Procrastination emerged as a coping mechanism employed by female leaders to manage burnout associated with overwhelming workloads. Contrary to the literature suggesting that procrastination is linked to anxiety and negative emotions (Thompson et al., 2000), participants attributed their procrastination to the sheer volume and complexity of tasks. For instance, Participant A acknowledged procrastinating when fatigued, while Participants E and J admitted procrastinating when faced with challenging tasks, opting to complete easier ones first as a strategy to alleviate stress.

Methods of Managing Imposter Syndrome

Self-Awareness and Personal Management of Imposter Syndrome

In terms of managing IS, several female leaders employed self-awareness and personal strategies. Participant D emphasized the importance of self-awareness, encouraging women to identify strengths, weaknesses, and set goals to counter IS negative emotions. This aligns with Sherman's (2013) recommendation of understanding one's strengths and weaknesses as a key strategy. Similarly, Participant J advocated for self-awareness in acknowledging problems, identifying their causes, and seeking solutions. Participant K suggested seeking professional help and engaging in hobbies as creative outlets, aligning with Martinez and Forey et al.'s (2019) emphasis on therapy and personal pursuits as remedies for IS.

Moreover, participants highlighted the significance of open communication with close associates—family, friends, and colleagues—as a means of seeking support for managing negative emotions associated with IS. Importantly, they stressed the need for females to openly discuss IS and related issues, emphasizing an individual responsibility rather than attributing it to organizational initiatives. Participant B articulated the transformative power of speaking up and sharing experiences, viewing it as a personal effort among females to foster change, contrary to the literature proposing organizational reforms (Mullangi & Jagsi, 2019).

Support Groups and Work Environment Enhancement

Regarding organisational interventions, mentoring, a safe work environment, and support groups were mentioned by participants as potential solutions. However, there was a lack of clarity on how these initiatives could be implemented. Participants acknowledged the need for trustful networks, indicating a preference for confiding in selected female colleagues and leaders, potentially forming the basis for the trust networks suggested in the literature (Lacey et al., 2017). Despite acknowledging some room for organisational improvements, participants expressed skepticism about the impact of gender equality programs and training initiatives, suggesting that these interventions may not address deep-rooted issues like IS effectively.

In conclusion, the study challenges traditional notions of IS among female leaders, revealing unique manifestations and coping mechanisms. The focus on external perceptions, the preference for personal strategies, and the emphasis on individual responsibility in managing IS shed light on a nuanced experience that diverges from mainstream literature. The study also highlights the importance of open communication and trustful networks among female leaders, providing insights for both individual and organisational interventions to address IS in the workplace.

Conclusion

This study investigated how IS affects female higher education leaders in Malaysia. It explores IS manifestations and management solutions in a private higher education institution in Malaysia. The study employed an innovative visual quasi-gamification method to facilitate and simplify the interviewing process with participants, which provided an appropriate environment to discuss the phenomenon in depth. Moreover, procrastination is regarded as an issue, and a lower level of self-confidence in decision-making exists, which impedes leadership.

This research concludes that IS manifests uniquely in the context of females leading higher education in Malaysia. Participants do not suffer from significant self-doubt notions or perceive themselves as fraudulent. However, they experience an immense need to appear ideal in the eyes of their colleagues and those who surround them, in addition to a need to perfect many work aspects.

As for the management of IS, female leaders believe that individual self-awareness and reflection are the solutions to the problem. According to the participants, awareness needs to be raised, and leaders need to educate their subordinates and colleagues about female leadership issues such as IS.

Recommendations

The outcomes of this study do not agree with many of the points in the literature, proving a need for further investigation of the phenomenon in different cultures and regions. What emerges from Europe, the US and the West does not necessarily apply and fit the context in other parts of the world due to cultural variations and norms. Hence, more studies focusing on Malaysian and Asian contexts are needed.

Moreover, this study recommends that higher education institutions in Malaysia and Asian countries raise awareness about IS as a female leadership issue. There is a need for IS empirical research in this context that could build the fundamental theoretical basis of awareness campaigns and programmes. These campaigns could be integrated into higher education as part of onboarding strategies. Mentoring, support groups, and professional therapy services for higher education leaders, especially females, are heavily required. These campaigns could also include undergraduate and postgraduate students as preventive measures to minimise the occurrence of IS at an early stage of female leaders' careers.

Furthermore, innovative visual aids and quasi-gamification methods have been very beneficial during the interviews. Thus, finding research methods outside the box is recommended to ease the interview process, specifically when tackling complex topics involving highly personal issues.

Limitations

The lack of literature about IS in Malaysia and Asia mentioned previously is considered a limitation, as it does not allow contextual comparison. Moreover, since it is a small-scope case study, the number of participants does not represent all Malaysia or all female leaders in Malaysia. However, it provides a preliminary indication of how IS affects female education leaders. Another limitation is the university, as it is a private international campus and not a

public one representing many of the universities in Malaysia. Nevertheless, the female leaders are Malaysians or females working and living in Malaysia under Malaysian law; hence, they are affected daily by the dynamics and work culture of the country.

Finally, the findings of this study are limited since an interpretation from a psychological perspective could further clarify many issues. Hence, a professional psychological understanding could have strengthened the results. In addition, the study focuses on female participants only and does not include any comparison to male leaders and how they experience IS.

Literature Review of the Relationship Between Physical Fitness, Physical Activity, Cognitive Functioning and Academic Success

Marko Sujica, Bussiness School Doba, Slovenia

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

The objective of this paper is to provide an extensive literature review of academic papers written in English about The Relationship Between Physical Fitness, Physical Activity, Cognitive Functioning and Academic Success. The research is showing that there are more and more benefits of physical fitness and physical activity on students cognitive (executive functions) and academic success, and it has been implemented into many different educational systems already. Usually, we can find many literatures review where authors compare how either physical fitness or physical activity benefits cognitive or academic success, but approach in each culture or education system is quite different. The studies reviewed suggest that physical activity and physical fitness are positively affecting academic performance and cognitive development, but it has been rarely compared how all 4 items are affecting each other and more research should be done from that perspective. Physical fitness and physical activity are definitely proven to be beneficial for students thinking and solving academic exams, but there is further investigation to be done to see how more beneficial physical activity and physical fitness can be regarding cognitive functioning (executive functions) and academic success.

Keywords: Cognitive Development, Executive Functions Physical Fitness, Physical Activity Benefits

Introduction

The benefits of every day including in physical action in childhood have been broadly examined, appearing reverse connections between physical movement and cardiovascular chance, and with advantageous impacts on a few mental wellbeing results (Bull et al., 2020, p. 1451-1462; Penedo & Dahn, 2005, p. 189-193). Moreover, physical movement has demonstrated to be an vital figure in corpulence and malady avoidance in children (Janssen & LeBlanc, 2010; Strong et al., p. 732-737). There's too prove proposing that physical action is related with a few angles of brain work and cognition (Ellemberg & St-Louis-Deschênes, 2010, p. 122-136; Fedewa & Ahn, 2011, p. 521-535; Hillman et al., p. 58-65). In this way, both intense and unremitting direct to incredible physical movement intercessions might deliver changes in brain structure and work in children matured 6 12 a long time, as well as cognition, and scholarly results (Erickson et al., 2019, Greef et al., p. 501-507). These changes may progress cognitive capacities such as concentration, consideration, official work, and working memory (Donnelly et al., 2016, p. 1197-1222; Hillman et al., 2008, p. 58-65) tha are significant for academic success (Fedewa & Ahn, 2011, p. 521-535). For occurrence a few controlled ponders have affirmed that physical action can improve scholarly substance learning such as language (Barnett et al., 2008, p. 299-313) or mathematics (e.g., Cecchini & Carriedo, 2020, p. 121-125). Subsequently, changes in these cognitive capacities as a result of expanded PA might, in turn, make strides children s scholastic accomplishment (Gonzalez-Sicilia et al., 2019, p. 135-141; Mullender-Wijnsma et al., 2016; Zeng et al., 2017). In this regard, the association between physical activity and physical and cognitive health outcomes is more consistent and consistent across higher and lower intensity physical activities. (Poitras et al., 2016, p. 197-239). This ponder pointed to look at the affect of students s physical movement on making strides their official capacities and accomplishing way better scholastic comes about. Preparatory center of this investigate will be to look at and degree in which arrange, integration of English, science and science into physical instruction lessons moves forward understudies cognitive and scholastic execution. It is proposed that the physical instruction profession essential concern ought to be for advancement of health related physical wellness, characterized as a state characterized by a an capacity to perform day by day exercises with vigor, and show of characteristics and capacities that are related with moo chance of untimely improvement of the hypokinetic infections. In expansion, physical wellness and engine execution are terms which will have utility for proficient physical teachers, in case agreement can be built around exact exacting and operational definitions(Pate, 2012，p.174-179; Rauschenbusch, 2013,p. 49-51). Both physical action and physical wellness produce normal inspiration, make enduring conditions of challenge, and minimize the affect of components repressing official capacities stretch, boredom, need of rest, and oxygen (Diamond and Ling, 2016). Number of thinks about reported positive joins between physical action and cognitive execution in preschool age children (Sibley and Etnier, 2003; de Greeff et al., 2018, p. 501-508). Advance, past inquire about pointed on critical connection between physical movement and physical wellness (Latorre-Román et al., 2016, p. 450-455). Hence, the degree of physical wellness in preschoolers may well be candidate altogether related to the degree of cognitive or official capacities (Visier-Alfonso et al., 2020). Indeed in spite of the fact that, later considers bolster this suspicion the part of physical wellness and its certain components a solid and b engine component in improvement of official capacities abilities is still open issue.

However, in all those considers, there's need of discoveries with respect to how really integration of other subjects into physical instruction course influences students cognitive capacities and how overhauling coordinates physical instruction Educational programs seem

influence understudies cognitive and scholastic execution. The relationship between physical activtiy, physical fitness and benefits on cognitive functioning and academic success is proved more than several times in this literature review and below there is detailed description where authors are combining one or two items and showing it's benefits to cognitive functioning and development.

Terminology

Physical activity, excercise, and physical wellness are terms that portray distinctive concepts. In any case, they are frequently befuddled with one another, and the terms are in some cases utilized traded. This paper proposes definitions to recognize them. Physical movement is characterized as any real development delivered by skeletal muscles that comes about in vitality use. The vitality consumption can be measured in kilocalories. Physical movement in way of life can be categorized into occupational, sports, conditioning, family, or other exercises. Exercise may be a subset of physical action that's arranged, organized, and tedious and has as a last or a middle of the road objective the change or upkeep of physical wellness. Physical wellness may be a set of qualities that are either wellbeing or skill related. The degree to which individuals have these qualities can be measured with particular tests. These definitions are advertised as an interpretational system for comparing ponders that relate physical action, work out, and physical wellness to wellbeing (Dishman et al., 1985). According to Green (1996) Cognitivism comes from cognitive physiology to other measurements like social physiology, identity, psychotherapy, improvement, and indeed assist. Word cognitive is regularly utilized as a synonymous with mental or mental. In this case, cognitive working co related with physical wellness and physical action appears us how critical physical action and physical wellness really is and how it creates official capacities which are portion of cognitive working and at the same time moving forward understudies' scholarly victory.

Relationship Between Physical Fitness, Physical Activity, Cognitive Functioning and Academic Success

Many authors are emphasizing the truth that physical wellness and physical action ought to not as it were center on wellness and don improvement but or maybe to consider human needs and values (Ryan & Ryan, 2020, p. 16–26). Our primary objective will be to characterize positive perspectives on understudies cognitive and scholarly execution utilizing one wear school considering to current angles of physical instruction. This inquire about will allow us answers how physical action and physical wellness can effectively create official capacities and help understudies accomplish way better scholastic comes about. Inquire about points to show that physical movement and physical wellness in wear school is exceptionally critical in open schools and on the off chance that it is utilized through certain period of a long time, it'll appear impacts on creating students official capacities in a way that recreations on English dialect they are playing amid physical instruction coordinates classes are unwittingly moving forward their official capacities. That being said, it is anticipated that due to continually utilizing English dialect amid coordinates physical instruction classes and taking after English dialect manual through physical instruction recreations, understudies will memorize it speedier and have superior understanding of English lexicon and language structure and accomplish way better scholarly English dialect comes about comparing to understudies in other open schools which are not utilizing English dialect amid physical instruction classes.

Benefits of Physical Fitness and Physical Activity

Executive function appears to be more sensitive to aerobic exercise than other aspects of cognition. (Colcombe & Kramer, 2003, p. 125-130). Executive function is the control of cognitive functions to achieve a goal and is mediated by circuits in the prefrontal cortex. Planning and executing the sequence of actions that constitute goal-directed behavior requires the allocation of attention and memory, the selection and inhibition of responses, goal setting, self-monitoring, self control, and the skillful and flexible use of strategies. (Eslinger, 1996, p. 367-395; Lezak, Howieson, & Loring, 2004). The executive function hypothesis was proposed based on evidence that aerobic exercise selectively improves older adults' performance on executive function tasks and leads to a corresponding increase in prefrontal cortical activity. (Colcombe et al., 2004, p. 3316-3321; Kramer et al., 1999, p. 418-419). Children s cognitive and neural advancement may be touchy to physical movement (Diamond, 2000, p. 44-56; Hillman, Erickson, & Kramer, 2008, p. 58-65; Kolb & Whishaw, 1998, p. 43-64). Hypothetical accounts of the joins between engine behavior and cognitive improvement amid childhood have extended from hypothesized brain systems to the development of perception action representations (Rakison & Woodward, 2008, p. 1209-1213; Sommerville & Decety, 2006, p. 179-200). According to Tomporowski, Bryan and McCullick 2015 children are profoundly persuaded by problem solving recreations, and the cognitive abilities they create whereas locked in in these diversions can be interpreted into their scholastic victory. Current issue understudies are confronting in English, science and science is classroom environment and not being able to imagine genuine utilization of those subjects.

Summary of the Literature and Key Findings by Relevant Authors

A review of previous studies relevant to this study may provide a basis for understanding how physical fitness and physical activity affect cognitive function and academic performance. We can compare the amount of daily exercise in different cultures and countries and how active they are when we talk about physical fitness and physical activity. This article focuses on the relationship between physical fitness and physical activity and how they affect cognitive and executive functions and how this impacts students' academic success.

Author	Research Focus	Key Findings
Marttinen et al., (2017)	Physical activity and academic performance	Positive effects on academic performance
Rauschenbach, (2013)	Physical education and general activity of students	Physical activity helped students in their daily duties
Bull et al., (2020)	Physical activity and mental health outcomes	Physical activity helps improve mental health
Penedo & Dahn, (2005)	Physical activity and mental health outcomes	Physical activity helps improve mental health and executive functions
Ellemberg & St-Louis-Deschênes, (2010)	Executive functions and physical activity	Physical activity positively affecting development of executive functions (cognitive functioning)
Fedewa & Ahn, (2011)	Executive functions and physical activity	Physical activity improved daily usage of executive functions
Erickson et al., (2019)	Executive functions and Physical fitness	This study shows the positive aspects of physical training in relation to cognitive performance and improved executive function.

Donnelly et al., (2016)	Physical activity, fitness, cognitive function, and academic achievement in children	One of the rare types of research that connects all four points. Research has shown that physical fitness and physical activity have a major impact on academic performance.
Hillman et al., (2008)	Exercise effects on brain and cognition.	This study shows effects on the brain and cognition. The results showed that getting enough exercise had a more positive effect on brain activity and cognitive function than those who did less or no exercise.
Barnett et al., (2008)	Educational effects of the tools of the mind curriculum: A randomized trial.	The results suggest that a developmentally appropriate curriculum with a strong emphasis on play can promote learning and development and improve both social and academic performance of young children.
Cecchini & Carriedo, (2020)	Effects of an interdisciplinary approach integrating mathematics and physical education on mathematical learning and physical activity levels.	Integrating physical activity into learning environments such as math has been shown to help develop tools that improve math learning (e.g., subtraction. Likewise, this interdisciplinary approach has proven useful in increasing children's physical activity throughout the day.
Gonzalez-Sicilia et al., (2019)	Prospective associations between participation in leisure-time physical activity at age 6 and academic performance at age 12.	The study shows that higher levels of leisure time physical activity at age 6 were associated with better teacher ratings in language and mathematics 0.075 and 0.102, respectively and self-ratings in language 0.103). and also with higher academic engagement 0.077) at age 12. Regression coefficients are standardized. All associations were significant p 0.05). Promoting leisure time physical activities can be an effective way to encourage children to exercise and help them improve their academic performance, leading to broader long-term benefits.
Mullender-Wijnsma et al., (2016)	Physically Active Math and Language Lessons Improve Academic Achievement: A Cluster Randomized Controlled Trial	Study result: Physically active school lessons significantly improved the performance of elementary school students in mathematics and spelling and is therefore a promising new way of learning.
Zeng et al., (2017)	Effects of Physical Activity on Motor Skills and Cognitive Development in Early Childhood: A	The results support causal evidence for the effects of physical activity on both motor skills and cognitive development in preschool children. Given the lack of

	Systematic Review	available research, future studies with larger, representative samples are needed to examine the associations between physical activity and cognitive domains and to strengthen and confirm the evidence for dose response responses in early childhood.
Visier-Alfonso et al., (2020)	Executive functions mediate the relationship between cardiorespiratory fitness and academic achievement in Spanish school children aged 8 to 11 years	Children who scored higher in both CRF and executive function performed better in math and language. The results showed that a significant portion of the positive effects of CRF on academic performance were mediated through improvements in inhibition and cognitive flexibility. Thus, this study supports the hypothesis that improving CRF may contribute to improved academic performance not only through a direct mechanism but also through improved executive function.

Conclusions

We took the following 15 research as our core to investigate effects on main research. In 5 out of 15 research we see positive aspects of physical activity and academic development (Marttinen et al., 2017, p. 37–49., Rauschenbach, 2013, p. 49-51., Bull et al., 2020, p. 1451-1462; Penedo & Dahn, 2005, p. 189-193). Most research are proving positive aspects physical activtiy and fitness has on executive functions and cognitive development (Ellemberg & St-Louis-Deschênes, 2010, p. 122-136; Fedewa & Ahn, 2011, p. 521-535; Hillman et al., p. 58-65., Erickson et al., 2019, Greef et al., p. 501-507., Donnelly et al., 2016, p. 1197-1222; Hillman et al., 2008, p. 58-65., Fedewa & Ahn, 2011, p. 521-535., Barnett et al., 2008, p. 299-313., Cecchini & Carriedo, 2020, p. 121-125., Gonzalez-Sicilia et al., 2019, p. 135-141; Mullender-Wijnsma et al., 2016; Zeng et al., 2017., Maurer and Roebers, 2019, p. 607-620; Visier-Alfonso et al., 2020).

As we can see from literature review there are not too many research about relationship between physical activity,physical fitness, cognitive functioning and academic success. Those we have shows significant connection between Physical activity, Physical Fitness and it's positive aspects on Cognitive functioning (executive functions) and automatically on Academic success.

Exploring the Impact of Digital Escape Rooms on Postgraduate Students' Academic Achievement and Intercultural Awareness in Management Education: A Case Study in the UK

Eleni Meletiadou, London Metropolitan University, United Kingdom

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

In the past few decades, educators have been questioning the effectiveness of traditional passive face-to-face learning and increasingly adopted innovative learner-focused digital game-based strategies which enhance student autonomy. This article presents an educational intervention that addresses the gap in the literature regarding the impact of Digital Escape Rooms (DERs) in Management Learning and Education offering insights of the adoption of this technique in the UK. This revolutionary method was used with 80 postgraduate students in terms of a Global HRM Course. Students were taught various Intercultural Management theories in terms of a module. The ultimate goal of this project was to increase students' engagement, academic achievement, and intercultural awareness responding to the increased demand for hybrid learning strategies catering for all learners' needs. DERs were used as a revision tool to enhance students' command of cross-cultural theories while working in teams. Learners offered anonymous feedback via Mentimeter after participating in a DER activity before their final assignment submission and wrote a report about their experience. Participants confessed that the use of DER had a positive impact on student teamwork and learning attitudes, academic achievement, development of intercultural awareness, attendance, retention, and progression. They revealed that the DER activity increased their autonomy, decision-making skills and team-bonding. It also helped even low-performing students better understand and retain the theories learnt. This project aspired to support educators, students, and academic managers by offering useful recommendations for the effective use of DER tasks into their existing teaching practices and activities.

1.   Introduction

Surrounded by technology from a young age, learners lately acquire new knowledge, process relevant information, and react in a different way to the old-fashioned face-to-face passive way of learning. Lengthy tutor-focused lectures in terms of which learners listen and keep notes belong to the past, and lecturers are recently challenged when they try to involve and interact with multilingual and multicultural cohorts of international students as is nowadays the norm in the increasingly internationalized Higher Education (HE) in the UK and globally. Traditional teaching, learning and assessment strategies belong to the past and there is a pressing need for new techniques which incorporate experiential and technology-infused learning and have a substantial impact on students' overall learning experience (Serdyukov, 2017). Therefore, lecturers around the world experiment with new approaches, especially in the post-Covid-19 era during which remote digital learning became the new norm for all educational institutions globally for almost 3 years. These innovative technology-enhanced techniques, which combine elements of digital and playful learning, seem to keep students' interest and involvement in learning alive, especially when theories are taught and applied within a playful game-oriented context. Several studies conducted in many universities around the world showed that the use of video games in HE enhanced learners' academic performance and approach towards learning as they may result in significant enhancement in students' understanding and application of theories, increased engagement, and more favorable attitudes towards learning (Fotaris et al., 2016). Furthermore, Barata et al. (2013) indicate that learners who attend a game-based course i.e., by using a Lego as a Serious Play game, attend classes with more enthusiasm, report that they find their classes more enjoyable, and believe that learning is more engaging and interactive.

Game-based learning (GBL) uses playful methods and techniques to make learning enjoyable, interactive, assist learners better understand and retain the theories learnt, and use them more constructively solving everyday challenges. This engaging highly interactive virtual learning context effectively promotes situated experiential learning. Unlike the repetitive lectures which foster passive learning, GBL can support participants' varying learning styles, preferences and needs promoting inclusion and Social Justice in learning thus preventing confusion, lack of engagement, and repetition enhancing participants' learning experience (Csikszentmihalyi, 1990). Several educators and researchers, who have examined how GBL could be implemented in HE classes, claimed that video games which participants could play either individually or as parts of a team could improve their comprehension of new theories (Giang et al., 2018) and enhance intercultural awareness and communication, exchange of ideas and problem-solving (Dietrich, 2018).

Digital escape rooms (DERs) were first employed by educational practitioners who could successfully use and were impressed by either recreational escape rooms or escape room video games (Veldkamp et al., 2020). Healy (2019) states that DERs, unlike other playful approaches, engage students by involving them in problem-solving tasks, which frequently require them to work in teams and complete the tasks within a strict time limit, using various quizzes, puzzles, problems and challenges based on suspense, educational challenge, cooperation, enthusiasm, and rewards (p. 24). Fotaris and Mastoras (2019) discuss the differences between ordinary games and DERs stressing that they have specific characteristics relevant to: game type (digital, face-to-face or mixed); location (home, class or lab); time limit (average of 30–60 min); and team size (3–10 members). Botturi and Babazadeh (2020) also talk about a star model which stresses that DERs have five characteristics: (a) the narrative - the story, (b) the game flow - the structure of the game, (c)

puzzles, (d) equipment items (digital), and e) learning process. Veldkamp and van de Grint (2020) indicate that tutors should align DERs with the classroom, and systematically assess learners' performance. To enhance the educational process, Eukel and Morrell (2020) suggest a cycle design process to improve learning and favourable students' attitudes comprising designing, experimenting, assessment, redesign, re-assess, and repetition. Fotaris and Mastoras (2019), who reviewed several projects examining the use of DERs, and Veldkamp and associates (2020) mention benefits in learning attitudes, cooperation, student interaction, learning, the creation of online learning contexts and interpersonal communication skills development.

DER activities are closely linked to many learning theories as scientists mention that they share characteristics of both social constructivism and behaviorism (Quariachi & Wim, 2018; Zhang et al., 2018) since gamers construct their knowledge based on realtime experiences within specific tasks in DERs (Franco & DeLuca, 2019; Quariachi & Wim, 2018) and behaviorism as positive behavior, cooperation and idea and knowledge exchange are further developed and retained through the use of DERs (Zhang et al., 2018). Moreover, as DERs are "live-action team-based games", they also have many characteristics which are closely linked to a socio-cultural approach to learning (Quariachi & Wim, 2018; Zhang et al., 2018), that is the influence of social settings that frame the players' social interactions which emerge among the gamers. In conclusion, DERs are employed for educational purposes and are seen as a solution to the challenges that tutors in HE face when they attempt to engage students in deep and meaningful communication and cooperation, other-awareness, critical thinking, decision-making and tolerance and active purposeful learning.

This article explored the use of a DER as a promising revision strategy that can be used to support learners while revising concepts they had learnt and enhance their understanding of existing theories and concepts by applying them while participating in entertaining but also well-designed games which support team-building, peer support, mental well-being and the enhancement of major professional skills, i.e., cooperation, problem-solving and critical thinking. The most prominent goal was to foster EDI and Social Justice in HE as DERs provide the necessary support for low-achieving learners, i.e., BAME, international and neurodiverse learners and develop their learning abilities while connecting at a deeper level with their fellow students. Instead of condemning students to isolation while revising for their exams or for writing their final assignment, tutors invite learners to work in teams, share their problems and find solutions to fun-loving puzzles while they try to make sense of the theories and apply them to meet challenges effectively. While they negotiate meaning with their classmates, they memorise and retain knowledge more easily getting support from their more knowledgeable peers. To sum up, the current project examined the impact of DERs on postgraduate MA Global HRM learners' academic achievement, learning attitudes, and Intercultural Intelligence Development by developing their intercultural and interlingual awareness as students tried to understand and use various cross-cultural management theories to solve real-world problems. It aimed to respond to the following research question:

- What are postgraduate students' perceptions of the impact of the use of a DER as an inclusive strategy that can increase learners' academic performance, develop their intercultural awareness, and improve their attitudes towards learning in Management Education?

2.   Methodology

The current study used a mixed-methods approach and a semi-experimental design. 80 postgraduate (MA Global HRM) students took part in this project. Participants were chosen randomly, and learners were predominantly multilingual and multicultural local and international students, aged 22-40. They formed two large mixed ability groups which were taught by the same tutor. Learners attended a module on Intercultural International Business Management in a hybrid mode for one academic term (12 weeks). The majority of the students were international (85%) who spoke English as a second or third language and came from various mixed cultural and linguistic contexts. The principal goal of this intervention and this module was to enhance learners' writing, negotiation, collaborative, and research skills so that they could successfully write their final assignment combining various theories of the module, reflecting on a real-world problem and finding the best possible solution. The overall aim was to increase student engagement, promote student reflection, development of their critical thinking skills and interaction thus enhancing these students' learning attitudes in HE and their negotiation skills in the post-Covid-19 era which traumatized and isolated students in tertiary education (Meletiadou, 2023b).

Participants in this study attended a 3-hour session every week in terms of this module on Intercultural Business Management, were taught various cross-cultural management theories and worked in various case studies in teams of 3-4 learners to reflect on the topic they would choose for their final assignment and how they would resolve a challenge using the theories they have learnt. Students found it hard to understand and remember all the theories they had learnt. They needed help and support, and the use of this DER would prepare them to work independently in order to prepare their final assignment (100%) which was due 3 weeks after the end of the semester.

Students were invited to participate in a DER task in week 11 to help them revise the theories, understand and retain them so that they could use them successfully in their final assignment. This fun-loving game offered students the opportunity to work in small teams, negotiate meaning and better understand the theories they had learnt i.e., by matching the major theorists with the right concepts and definitions. This was merely a preparation before writing their individual assignment in terms of which they had to provide a solution to a real-world problem by using the right theories thus providing an evidence-based response to the problem posed by the assignment question.

All students were taught by the same lecturer using the same material in terms of an Intercultural Management Module. In terms of this module, the researcher first taught the theories building on students' previous knowledge and then invited learners to work in groups on case studies to apply the theories in various contexts and face a number of problems. In terms of the final assignment (100% of the assessment for this module), learners had to act as consultants and offer plausible solutions to the company (advocacy) in the specific context included in the case study to assist them in facing the challenges and resolve their real-world problems which were closely related to Global Human Resource Management. In the end, to help them effectively revise all the relevant theories and engage them in successful retention of the most important concepts of the module while they were preparing their final assignment on a chosen topic (different for every student), the tutor decided to design a DER task to surprise the students and help them relax while having fun in terms of a multicultural and multilingual group. The tutor called this DER "Escape

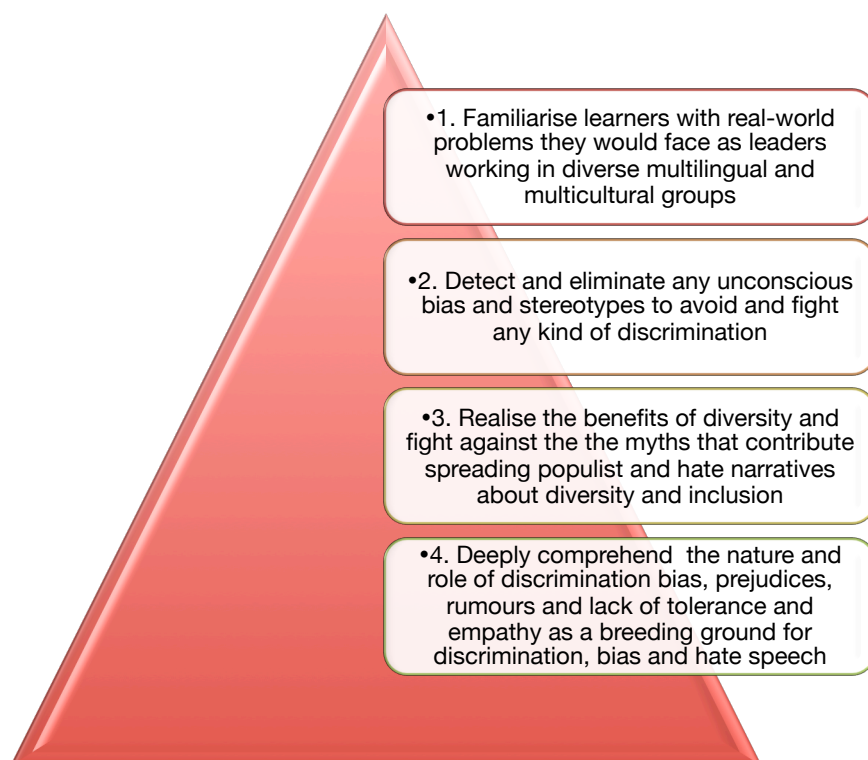
Unconscious Bias - Enhancing HRM leaders' Intercultural and Interlingual Intelligence". The goals of this DER activity can be seen in Figure 1.


Figure 1: Goals of the DER task

"Escape Unconscious Bias" was an online highly interactive, playful game designed and piloted to contribute to enhancing HRM leaders' intercultural skills and engage them in building unconscious bias-free communities of global HRM leaders who promote empathy, tolerance, and inclusion. Gamers had to solve a series of tests/questions related to the knowledge of human rights, unconscious bias, and discrimination, and find effective solutions to thought-provoking and hard to resolve problems and situations provoked by unconscious biases, rumours and stereotypes, so to understand how they work and which strategies are most efficient to reduce, if not eliminate, their negative impact.

Escape Unconscious Bias was an amazing fun-loving approach to enhancing learners' intercultural awareness and communication in an amusing way while also allowing them to prepare their final assignment in a stress-free environment. In terms of this DER, learners were asked to match definitions of major concepts with the theorists who developed them, go through short case studies in small groups and reach a consensus about the most appropriate recommendation they could offer as consultants, find the words (major intercultural management concepts) in a crossword when the answers would reveal a scrambled word that should then be unscrambled and used as a code, and find their way in a maze that the tutor created by typing a phrase (the definition of a theory). The tutor asked a question and gave clues to the participants to find their way out of the maze. Gamers were informed and invited to engage in the DER activity via an email and were asked to work online in groups of 4 to play the game. The teams had three hours to escape the room and were invited to provide anonymous feedback via Mentimeter and write a final individual report reflecting on their

experience when they submitted their assignment indicating whether they thought the DER was a useful experience or not and why.

In terms of their DER team activity, learners were encouraged to translanguage, that is to use words or small phrases from their own native language in their verbal exchanges, but to provide their main answers concerning the DER in English (English as a Lingua Franca) as this would enable international students to become more actively involved in conversations and better comprehend the game and the concepts used (Meletiadou, 2023a; 2022). The researcher also triangulated the data provided by the participants with the tutor's observations. This allowed a more in-depth exploration and qualitative triangulation (Flick, 2018) with the findings from participants' reports. Qualitative data from student feedback via Mentimeter and students' reports were analysed in QSR NVivo 9 by the researcher. The researcher analysed all data using thematic analysis (Nowell et al., 2017) to identify patterns in the data and use these themes to find answers to the research question. She also had an assistant who analysed 20% of the data, which were chosen randomly, to increase the reliability of the analysis. The researcher and her assistant identified and agreed on themes which provided a response to the research question of this study.

3.   Findings

The researcher analysed all findings taking into consideration the research question of the current study and detected the following dominant themes which were referred to by more than 50 students and were also included in the tutor's observations.

3.1.   Perceived Impact of DER on Students' Academic Performance

Participants in the present study testified that this task helped them delve deeper into the theories, ask questions about certain points that seemed obscure and better understand how they could apply them in practice (Figure 2). Students seemed unwilling to share their problems with the tutor and more willing to discuss them with more knowledgeable peers. The DER task offered the right space and abundant time for learners to share their concerns and use the new concepts in several real-life contexts leading to learning gains, improving their critical thinking skills, time management, interpersonal skills, resilience, problem-solving and creativity considerably (Adams et al., 2018; Foster & Warwick, 2018; Walsh & Spence, 2018). This innovative learning strategy had a very positive impact on their revision skills as they prepared their final assignment which required them to apply several of the new theories they learnt in real-world circumstances. It therefore supported students' sustainable learning development confirming previous research (Kinio et al., 2017). Students confessed that their performance, as indicated by their final assignment marks, improved by up to 25%. This was confirmed by their tutor who compared their marks with other assignments they wrote for similar modules.

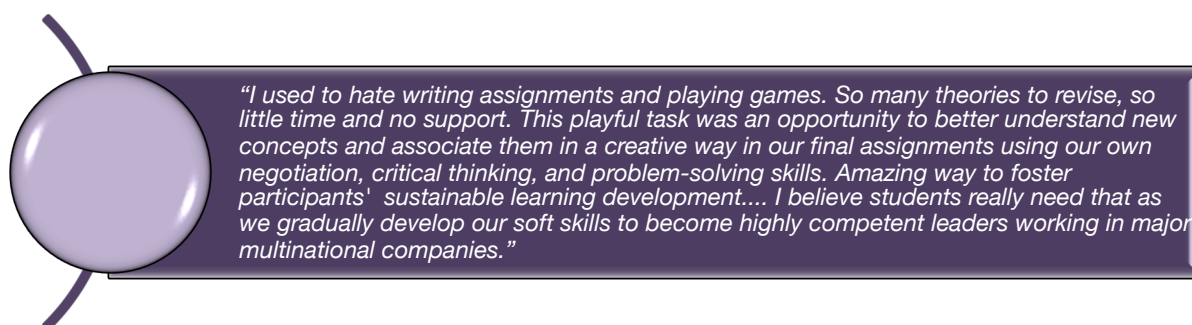
"I used to hate writing assignments and playing games. So many theories to revise, so little time and no support. This playful task was an opportunity to better understand new concepts and associate them in a creative way in our final assignments using our own negotiation, critical thinking, and problem-solving skills. Amazing way to foster participants' sustainable learning development.... I believe students really need that as we gradually develop our soft skills to become highly competent leaders working in major multinational companies."


Figure 2: Impact on Students' Sustainable Learning Development

Students also noted that DERs facilitated their own understanding of their final assignment tasks and instructions as they could receive valuable support and guidance from their peers. This enhanced their group efficacy during the game (Bandura, 1997) and their individual performance (increasing their self-reliance) in their final assignment. They all seemed to have exchanged ideas and offered some kind of help and support to their peers. This contributed to improving everyone's academic performance offering either ideas, knowledge, complementary insights, their keen eye for detail or for the identification of problems in their way of thinking or in their written texts. All students were happy and deeply involved in the game. In fact, they asked for more DERs in other modules as well as these combined enhanced learning, bonding, and peaceful collaboration among students.

"I could not believe my eyes…I never enjoyed spending time with my peers on an assignment before. This was an an opportunity to get to know my peers more and better understand the major theories of the module. We all helped each other and contributed equally to complete this game successfully. I helped my peers detect problems in their writing and they were able to help me better understand some dark points in the theories which did not allow me to use them efficiently in their final assignment. This was the first time I realised there are so many solutions to the same problem as people view the problem from different perspectives. Incredible gaming experience."

Figure 3: Development of Students' Collaborative Skills

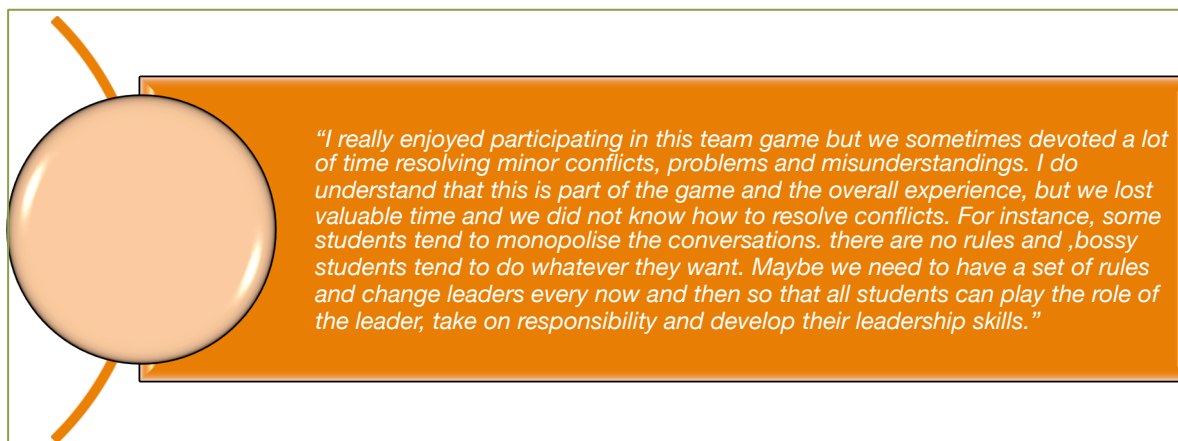
Nevertheless, few participants also confessed that they were sometimes minor conflicts among some of their peers as some local students wanted to dominate the conversations. Students admitted that these were quickly resolved by the tutor who closely monitored the whole procedure, but participants claimed that the use of specific written commonly agreed among students and the lecturer rules would ensure that all students had equal involvement and contribution in the DER.


Figure 4: Conflicts About Equal Contribution

To sum up, participants in this study referred to countless benefits for students involved in DERs but they also offered several suggestions and ideas to improve the overall implementation of DERs in Management Education.

3.2. Perceived Impact of DER on Student Engagement and Development of Intercultural Intelligence

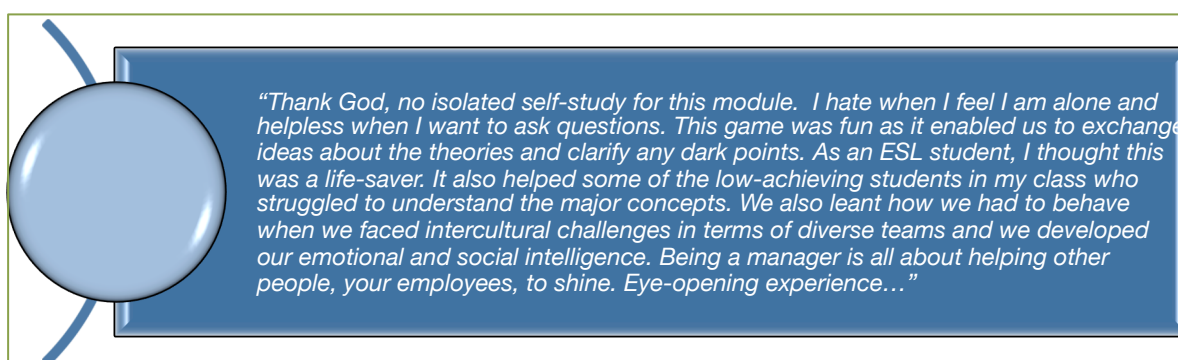
Participants repeatedly remarked that they felt inspired and relaxed with this new highly interactive and collaborative game as it fostered cooperation, intercultural communication, and negotiation while gamers tried to understand the underlying concepts and theories and use them effectively for their final assignment. They confessed that this DER increased their interest in the module, their engagement and improved their learning attitudes. This confirmed previous studies (Ho, 2018; Peleg et al., 209; Zhang et al., 2019) which also examined the application of DERs in HE, stressing the multiple gains it may offer to students. As indicated in students' feedback, this digital game-based strategy increased students' intercultural intelligence while fostering Social Justice.


Figure 5: Increased Level of Engagement and Interaction

However, some local students confessed that certain international learners created groups with their peers, with who shared the same native language, using their mother tongue rather than their target language (English) as they could not understand local students who spoke either too fast or used phrases or words they could not understand. Moreover, they felt intimidated and ashamed to express themselves in English and contribute their own ideas to their group. Local students quickly realised that and showing understanding and empathy

decided to talk more slowly and allow their international colleagues to contribute by offering them the first turn in every conversation showing intercultural intelligence and promoting inclusion. This helped them to prepare themselves as they would face similar challenges as managers in multinational companies in the future.

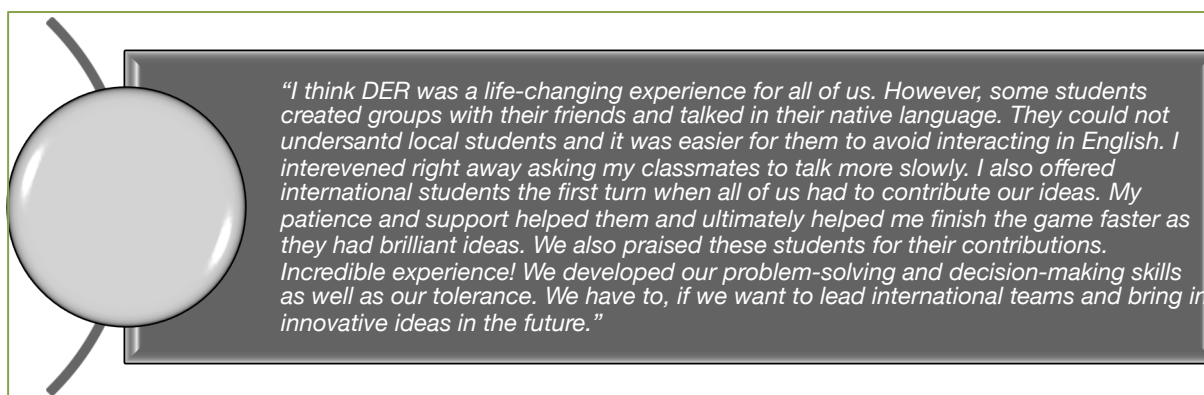
"I think DER was a life-changing experience for all of us. However, some students created groups with their friends and talked in their native language. They could not undersantd local students and it was easier for them to avoid interacting in English. I interevened right away asking my classmates to talk more slowly. I also offered international students the first turn when all of us had to contribute our ideas. My patience and support helped them and ultimately helped me finish the game faster as they had brilliant ideas. We also praised these students for their contributions. Incredible experience! We developed our problem-solving and decision-making skills as well as our tolerance. We have to, if we want to lead international teams and bring in innovative ideas in the future."


Figure 6: Empathy and Development of Students' Intercultural Intelligence

To sum up, the findings from the present intervention showed that learners enjoyed these fun-loving games as they thought the whole experience was inspiring and valuable for their future academic, personal, and professional development. Students developed various valuable professional skills, i.e., interpersonal skills, decision-making and strategic thinking and prepared themselves and their peers to become successful leaders by showing empathy and tolerance developing their intercultural and emotional intelligence and becoming more inclusive. They thus promoted Social Justice supporting their peers, irrespective of their background, tastes, needs and preferences. They did face some minor challenges, but they confessed they had to develop important skills i.e., emotional, cultural, linguistic, and social intelligence if they wanted to succeed as leaders in their future workplaces around the world.

4. Conclusion

The present intervention showed some of the gains and shortcoming of involving students in DERs while preparing them to become successful leaders and work effectively in terms of multinational and multicultural teams at their workplace. Working in terms of a multinational team can be quite challenging for the members of the team, but also for the leader of this group. As part of extended multinational and multicultural teams, members need to reach specific aims and goals and establish a common purpose, clarify the roles played by various participants to avoid conflict, and agree on specific rules for conduct, effective collaboration, and interaction (Earley & Gibson, 2002). This was also evident in terms of these learners' participation in the specific DER activity. Gamers disclosed these as some of the problems they faced and had to resolve to facilitate interpersonal communication and reach their final goals successfully so that they could complete the game and compete with their peers effectively.

The current project has many limitations and offers directions for further research. Initially, many factors that were not tested in this study might have influenced either positively or negatively these learners' attitudes towards DERs. For example, the impact of DER on student academic performance could have been assessed more reliably via a digital test or a face-to-face quiz given prior and post intervention, comparing the knowledge acquired by the research group and another group which would act as a control group. This would have

enhanced the reliability of our findings and claims about the impact of DERs on students' academic performance.

Moreover, the self-report features of this study could be enhanced by quantitative tools elaborating on the links between various characteristics of the intervention, i.e., impact on students' writing performance in their final assignment, impact on students' oral fluency etc. Further studies may benefit from interviews with participants eliciting their experiences with the use of DERs and revealing the impact of challenge for instance, or the mediation of cooperation between DER tasks and learning motivation. Interviews with tutors and observations of teaching via DER could be beneficial for understanding the pitfalls of the approach and the problems tutors may face when implementing DERs in class, whether online or face-to- face. Finally, the current project focused on postgraduate HRM students. Future studies could explore DER impact on undergraduate or foundation students and/or students in other courses, i.e., Digital Marketing, Law or International Management and compare their findings.

The need for gamers to collaborate in a time-specific but enjoyable context allows students to develop valuable interpersonal skills; it may also reduce the "free-rider" issue (i.e., students who take advantage of the gains, but do not contribute to the groupwork), which is one of the most significant challenges tutors and learners face in terms of traditional team-based learning tasks. Additionally, DERs provide an opportunity to bring technology to the classroom, as simulations, videos, or other interactive digital material can easily be combined with the various puzzles of any DER activity. Creating puzzles that meet the learning objectives and enable students to engage with the theories of the module, instead of just searching for clues, requires time, patience, the right context and critical thinking skills. Once the game has been designed though, it can be used repeatedly in forthcoming years, other modules and or courses. Any successful use of DERs should include pilot testing in order to estimate the time required to complete the digital game and to detect any challenges and/or mistakes that could prevent successful implementation of the game and successful completion. This would also develop tutors' confidence in supporting participants to complete the activity successfully.

During learners' participation in any DER task, the debriefing stage is their only chance for reflection; without reflection, experience cannot lead to long-term effective learning and retention of learning. Surprisingly, less than half of the studies conducted so far on DERs included debriefing in their escape room experience and only one fifth included details of the implementation process. Further projects incorporating debriefing with more rigorous evaluation are necessary to confirm the educational value for various designs, different kinds of content, and in various contexts. More research is also necessary to begin to gauge the "return of investment" of time, effort, and resources in relation to the achieved results. To sum up, the current study intends to contribute to instructional education design by providing additional evidence of DER's potential to support student learning experience in HE. The outcomes may extend the road map for future research, offer new insights to researchers and educators, and provide tutors with significant and valuable advice and recommendations on how to add DERs into their classes. Finally, it may indicate educational approaches to support the development of students' writing skills and enhance students' learning experience fostering Social Justice and Sustainable Development.

A Study of the Termination of Undergraduate Students Status
in the Faculty of Science and Technology, Thammasat University, Thailand

Roumporn Sittimongkol, Thammasat University, Thailand
Patarawan Sangnawakij, Thammasat University, Thailand
Sirichan Vesarachasart, Thammasat University, Thailand

Abstract

The objectives of this research were to study the survival function, median survival time, and hazard function of the termination of undergraduate students in the Faculty of Science and Technology, Thammasat University, Thailand. Moreover, we aim to compare the survival time of termination of student status classified by curriculum, gender and domicile. Secondary data of 624 students were collected by the office of Registrar, Thammasat University. The research results showed that the undergraduate students of the Faculty of Science and Technology had the highest risk of termination of student status equal to 0.18 in the second semester of the 1st Year. This may be caused by students dropping out to take entrance examinations at other universities because they received a cumulative grade point average lower than the level specified by the university. Some students did not like their field of study. Finally, when boredom occurs, they use the method of changing their field of study or changing universities. The median survival time could not be determined because there were no cases where half of the students lost their status during the study period. When comparing the survival time of termination of student status classified by curriculum, gender and domicile. It can be found that students in each curriculum had a significant difference in the survival time of termination of student status ($P\text{-value} = 0.005$). Male and female students had no difference in survival time of termination of student status ($P\text{-value} = 0.393$) and students residing in Bangkok and other provinces had a significant difference in the survival time of termination of student status ($P\text{-value} = 0.034$).

Keywords: Termination of Student Status, Survival Analysis, Thammasat University

www.iafor.org

Introduction

The termination of student status means an event in which a student has to leave the university before graduation. It is considered a "Wasting investment in education" because the education a budget comes from the people's taxes. Thailand allocates budget for education at a high rate and it is expected that in the future it will continue to increase, while the quality of the output of the education system continues to decline. In addition, the termination of education also causes losses in other areas such as loss of expenses, people, and materials for education. And most importantly, it is discouragement, wasted opportunities, and wasted time. Therefore, universities need to focus on developing and improving education management to have quality and standards. If an educational institution can provide education with quality standards and low cost of education Inevitably shows that educational institutions are able to manage education to meet the needs of society.

The purposes of this research are to find the survival function, median survival time and hazard function of the termination of undergraduate students status (4-year program) of the Faculty of Science and Technology, Thammasat University, and to compare the survival time of termination of student status classified by curriculum, gender and domicile.

Research Methodology

Data Collection

The information of 624 undergraduate students in the Faculty of Science and Technology, Thammasat University (4-year program: Graduating in the academic year 2020) including curriculum, gender, domicile, average grades at the high school and average grades before the termination of student status were collected by the office of Registrar, Thammasat University.

Survival Analysis

Survival analysis is a statistical technique that studies the timing of a critical event of an event of interest. It is to track the occurrence of an event for a certain period of time to observe whether the event of interest will occur or not. The event of interest may be illness, recovery, death or unemployment (Hosmer, Lemeshow, and May, 1999), etc. The period until the event is called "Survival time". The analysis therefore uses a percentage or the rate of occurrence of such events which often has incomplete data (censoring observation) due to many reasons, for example, the duration of the research is limited, causing some sample units to have events of interest after the end of the study; some units lost follow-up from the study for unknown reasons (Dancey, Reidy and Rowe, 2012).

In the survival analysis, there are two functions that are of interest to study, namely the survival function ($s(t)$) and the hazard function ($h(t)$).

1) The survival function: $s(t)$ is the basis of survival analysis, indicating the probability that an individual survives after time t. where each sample survives longer than the time point t or the likelihood of an event occurring after time t, as the equation.

$$s(t) \ = \ P[T \ > \ t] \ ; \ t > 0$$

At $t = 0$, the value $s(t) = s(0) = 1$ because no one has yet occurred. In other words, the probability of survival. or probability of survival or probability of event-free at the beginning of the study is 1.

At $t = \infty, s(t) = s(\infty) = 0$ because no one survives. Everyone has an incident that is, the probability of survival. or that which has not yet occurred when the study period is infinite is equal to 0.

2) Hazard Function: $h(t)$ is the ratio between the probability of an event occurring at time t $(f(t))$ to the probability of survival at time t. That $(s(t))$, with survival until then or the likelihood of an event of interest occurring at time t without the event occurring until that time. It is a conditional probability.

$$h(t) = \lim_{\Delta t \to 0} \frac{P(t < T \leq t + \Delta t \,|T > t)}{\Delta t}$$

t = beginning of time of interest in the study
T = end of study time
Δt = the absence of an event in the period $t - T$

$$h(t) = \lim_{\Delta t \to 0} \frac{P(t < T \leq t + \Delta t)}{\Delta t} \times \frac{1}{S(t)} = \frac{f(t)}{S(t)}$$

$$h(t) = \frac{f(t)}{1 - F(t)}$$

Survival Analysis: *Kaplan-Meier Estimate*

It is a method of estimating the conditional probability of the time an event will occur. The Kaplan-Meier model is based on estimating the conditional probability at each time point at which the event occurs. It starts with the survival times being arranged in ascending order. At the beginning of the study at t = 0, the event of interest has not yet occurred, so the probability of the event of interest is equal to 1. The event of interest can be estimated as follows:

$$\hat{s}(t) = \prod_{t_i \leq t} \frac{n_i - d_i}{n_i}$$

$\hat{s}(t)$ = probability of occurrence of the event of interest at time t.
n_i = number of exposures to risk factors
d_i = number of events
i = sequence of events at any time t

Survival Analysis: *The Log Rank Test*

Log-rank test is a hypothesis test to compare the survival distributions of two samples. The log rank test is a popular test to test the null hypothesis of no difference in survival between two or more independent groups. The test compares the entire survival experience between groups and can be thought of as a test of whether the survival curves are identical (overlapping) or not.

The statistics used for testing are $\chi^2_{cal} = \sum_{i=1}^{k} \frac{(O_i - E_i)^2}{E_i} \sim \chi^2_{\alpha, k-1}$

where k is the number of sample groups used for comparison.

For this research,

Survival time means the time when students start to study in the regular undergraduate program, 4-year program (Academic year 2017 to 2020), Faculty of Science and Technology, Thammasat University until the event of termination of student status.

Event means an event that occurs.
The value is 1 when it is an event of interest to study (termination of student status).
The value is 0 when it is a censored case.

Termination of student status means an event in which a student has to leave Thammasat University before graduation as specified by the curriculum for any of the following reasons : 1) Lack of qualifications or prohibited characteristics of being a university student 2) His name was withdrawn from the student register 3) The study period as specified by the regulations or the curriculum requirements has passed 4) Resign from being a student 5) Being subjected to severe disciplinary action to the extent of expulsion from student status 6) Died 7) Failure to register within the period specified by the university and did not request a leave of absence within 30 days from the opening date of that semester.

Censored case means the case where a student has completed a 4-year curriculum or has graduated but took more than 4 years to study.

The median survival time was not determined.

Table 1: Life table of Science and Technology undergraduate students

Figure 1: Survival function of Science and Technology undergraduate students

Figure 2: Hazard function of Science and Technology undergraduate students

From Table 1 and Figures 1-2, the Kaplan-Meier estimator is used to estimate the survival function. It was found that the undergraduate students of the Faculty of Science and Technology had the highest risk of termination of student status equal to 0.18 in the second semester of the 1st Year, and there was a chance that students would remain as students longer than the second semester of the 1st Year equal to 79%. It was also found that the median survival time could not be determined because there were no cases where half of the students lost their status during the study period.

Log-rank Test	Chi-Square	df.	P-value
Curriculum	29.769	13	0.005
Gender	0.731	1	0.393
Domicile	4.504	1	0.034

Table 2: Log Rank Test classified by curriculum, gender and domicile

From Table 2, it was found that there were significantly different survival times of termination of student status between students for each curriculum and domicile (P-value = 0.005 and 0.034, respectively). Male and female students had no difference in survival time of termination of student status (P-value = 0.393).

Figure 3: Survival function of Science and Technology undergraduate students classified by curriculum

From Figure 3, it was found that the top 3 curriculum with the highest cumulative proportion of students survival at the end of time were Computer science, Statistics and Environmental science. The last three subjects with the lowest cumulative proportion of student survival at the end of time were Biotechnology, Applied Mathematics and Physics.

Figure 4: Survival function of Science and Technology undergraduate students classified by gender

From Figure 4, it was found that male and female students had no difference in survival time of termination of student status.
Figure 5: Survival Function of Science and Technology undergraduate students classified by domicile

From Figure 5, it was found that students residing in Bangkok had the cumulative proportion of survival higher than students who domiciled in other provinces.

Conclusion and Discussion

The undergraduate students of the Faculty of Science and Technology had the highest risk of termination of student status in the second semester of the 1st Year. Students majoring in Physics, Materials Science, Food Science and Technology, Statistics, Computer Science, technology for sustainable development, Physics Electronic, Chemistry, Mathematics, Applied Mathematics, Textile Science and Technology and agricultural technology have the highest rate of danger of losing student status in the second semester of the 1st Year, biotechnology and environmental science students have the highest rate of danger of losing student status in the third semester of the 1st Year. Furthermore, curriculums and domiciles influence the termination of student status.

From the analysis results, it was found that students have the highest risk of losing student status in the second semester of the first academic year, which may be caused by students dropping out to take entrance examinations at other universities or other faculties that are more interested in or take the entrance examination to become a new student again in the same field of study due to academic performance below the criteria. There are many students who do not have a goal of what field they want to study or what is the motivation for studying. Some students have no purpose in learning. Finally, when boredom occurs, they use the method of changing their field of study or changing universities. In order to resolve such problems, the faculty may offer career guidance related to that field of study for students to aim in their studies. In addition, there should be activities to adjust the basic knowledge of the basic subjects of that field for first-year students for students to have better academic results. It is also a way to reduce the problem of losing student status of students as well.

Exploring the Impact of Teaching Design History on Creativity and Intrinsic Motivation: Curriculum Design and Learning

Jiayang Ma, Nanjing Forestry University, China
Yuejun Zhao, Jiangsu Second Normal University, China

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

The history of design is a basic course for design majors in universities all over the world, and is usually taught in a purely theoretical way, This study adjusts the form of teaching, changing the original "linear lecture"-based teaching to an exploratory teaching method centered on "design styles", using styles as the origin to guide students to radiate their learning of the temporal and spatial backgrounds, developmental reasons, representative figures, social influences, etc., and attracting them to explore the relevant knowledge through the stylistic manifestations of the designs, as well as superimposing their personal understandings of design styles to be applied to the practice of icon design. A total of 30 students participated in this study to examine the effectiveness of the teaching: a statistical T-test comparing the pre-study and post-study results confirmed that the "style-centered" approach was beneficial to students' creativity and intrinsic motivation, which means that the approach is effective in teaching design history; In addition, this study used linear regression analysis to understand the relationship between creativity and intrinsic motivation, and the results showed that creativity had a more pronounced positive effect on intrinsic motivation through "style-centered" design history learning. Lack of motivation is a pain point in history courses, but the style-centered approach to teaching design history has been proven to be useful, and future history classes should take students' learning mindset and desire into account to stimulate their enthusiasm for learning.

Introduction

One of the foundational required courses for design majors is history of design. The content of the course typically covers a range of topics, from the ancient civilization to the modern design movement, with the goal of supporting students in understanding the approaches, expressions, and meanings of design modifications, and also enhancing their professional growth and improving their design ability. Nonetheless, there are two main issues with the way design history is taught today: first, there is a disconnect between theory and practice; rather than emphasizing the ability to apply knowledge to practice, teaching frequently concentrates on introducing historical individuals, categories, and styles; second, the design style is out of date; design history education emphasizes "historical content" rather than having a strong connection to contemporary design content. The "historical content" that is taught in design history classes is prioritized over the contemporary design content. These two issues make it difficult for students to apply their understanding of design history to the development of their abilities and limit their ability to consider potential future trends in design. Students thus raise two concerns about the value and efficacy of design history courses: Would we really benefit from taking a course on the history of design? Which talents are enhanced by studying design history?

Literature Review

Learning Traits for Novices in Design

When it comes to students' cognitive approaches, thinking development, and performance characteristics, design differs from the learning characteristics of basic disciplines as a cross-disciplinary field that places an emphasis on practicality. The main approach to learning of design students is the "right-brain" perception of knowledge, and studies indicates that visual learners prefer to learn through images, icons, videos, movies, and other media (Demirkan, 2016; Demirkan and Demirbas, 2010); However, rather than emphasizing conceptual understanding and theoretical frameworks, novices in design are more engaged with visual style, that is, learning about proven facts and tangible materials (Demirkan, 2016). Second, a key learning characteristic of design students is their propensity for group discussion over independent thought, which is brought about by "interactivity" and plays a significant role in the process of acquiring new knowledge. Schon (1983) suggests that the process of "thought from action" is crucial to learning and that the learning experience is founded on self-reflection, defining the learner as an active practitioner. Schon (1983) studied design workshops as a mode of learning. Learning is facilitated by the "reflection from action" process. For those who are new to design, "active reflection" is an ability that needs to be built, and designers also need to possess it. Teachers should help students cultivate a sense of reflection and acquire the ability to reflect early in their design learning (Demirbas & Demirka, 2003). Students show the best learning when they evaluate the outcomes of their studies or work, and expert assessment supports their professional growth (Demirkan & Demirbas, 2008). Following the completion of the designs by the students, the experts provide professional feedback on the work's creation, which prompts further contemplation from the students; Furthermore, the reflection arising from "presentations" is an essential aspect of reflection as well. Through comments and discussions, groups can improve the quality of their practice by sharing ideas while also allowing teachers and students to discuss the same content in different ways (Demirkan, 2016).

According to earlier research, students studying design rely on their right brains to perceptual learning and are more likely to learn new information through group projects and discussions. With the main objective of fostering active, collaborative, and reflective learners, this study aims to investigate the history course's teaching methods based on the learning characteristics of design beginners. The core content of the study is to enhance students' creative self-confidence and intrinsic motivation in design professional knowledge.

Creativity

One of the most essential components of design work is creativity, and those who practice design are also practitioners of creativity, which serves as a major source of inspiration for new designs, and the assessment of creativity is especially crucial. In general, the expert consensus method—which involves first establishing a basic consensus and then evaluating the works in accordance with the criteria of individual experts, including professional knowledge or skills, style or strategy, individual attitude or preference, and logical cognition—is a common assessment method for evaluating the creativity of individual works (Albert & Runco, 1999; Amabile, 1996). Csikszentmihalyi (1997) expanded the scope of creativity assessment through the systematic perspective of creativity, which defines the source of creativity as the process of interaction between the individual and the environment. According to this perspective, creativity should be professionally assessed according to the three levels of individual, domain, and field. The term "creative self-efficacy" refers to the degree to individuals have faith that they can create innovative products. It was coined by Tierney and Farmer (2011) and is a combination of the theory. Based on this, Hung and Lin (2004) analyzed self-efficacy in creativity primarily through the lens of the various aspects of design practice, such as the three dimensions of creative product convictions, creative thinking beliefs, and fending off unfavorable assessments. The higher the overall score, the more self-efficacy in creativity. It is critical for individuals, organizations, and society as a whole to evaluate creativity. In addition to helping to evaluate and enhance the design quality of projects or products, the assessment of creativity is linked to design practitioners' recognition of their own creative potential. It also facilitates the most efficient use of social resources and fosters sustainable innovation and development thinking. Thus, the evaluation of creativity is crucial for talent development, professional research, and even the improvement of creativity in this industry.

Intrinsic Motivation

"Motivation" is regarded as a component of creative personality traits and is closely linked to creativity (Weiner, 1972). Conversely, intrinsic motivation describes a person's attitude toward completing a task out of personal curiosity or enjoyment. It includes the expression of competence, spontaneity, autonomy, interest, and enjoyment (Amabile, 1993; King, Walker, & Broyles, 1996). According to Glynn & Webster (1992) and Csikszentmihalyi (2000), design students are more likely to be interested in learning and creating in a group setting. Co-learning can foster creative motivate and concentration, and designers can be intrinsically motivated by a sense of fun in the process, which further prompts curious exploratory behaviors.

The theory of self-efficacy, which is concerned with an individual's assessment of whether or not their abilities match expected outcomes, typically dominates the assessment of intrinsic motivation. Similar to creative self-efficacy, self-efficacy is to look at how confident an individual is in a certain skill. According to Bandura (1999), an individual's self-efficacy is

typically influenced by the outcomes of their accomplishments in relation to their past achievements, alternative experiences that gauge their self-efficacy by comparing or observing themselves to others, and oral persuasion brought on by the opinions of others of their abilities in the social environment. Physical or emotional conditions in which the person evaluates their ability to reach goals in light of those circumstances or emotions, for a total of four influences. The robust correlation observed between intrinsic motivation and creativity highlights the significance of intrinsic motivation in creative endeavors, and scientific evaluation contributes to the comprehension and promotion of creativity.

Research Methods

Organization of the Course

Three stages constitute the course: pre-course planning, in-class instruction and feedback, and evaluation of course outcomes. In order to compare the efficacy of the self-assessment of the study of design history, the teacher selects "urban icon design" as the assessment topic in a national design competition during the pre-course preparation stage. The teacher then focuses on explaining the goals and focuses of the creation of this topic, and the students are required to fill out a subjective evaluation questionnaire dominated by creativity and intrinsic efficacy after completing their work.

This course's main priority is on design styles as a teaching and learning tool during the lecture and discussion sections. This is caused by two factors: first, the learning mentality of novices who wish to rapidly establish a certain style to demonstrate their professional skill; and second, the BTS teaching model, which promotes teachers guiding students and enhancing their investigation of information. Professor Yeh's "BTS Teaching Method" is based on the "Understanding + Guiding + Observing + Learning" teaching model, which emphasizes that teachers should give students opportunities for self-directed learning, teach them how to recognize and solve problems, and teach them how to learn through peer-to-peer learning in order to develop their capacity for thought, expression, and facing uncertainty (Yeh, 2018). Students are encouraged to investigate the theory underlying the knowledge points and the capacity to develop the theory by incorporating it back into their design work by using design styles as a starting point to increase learning interest. The major design styles and representative designers—Bourbon and Baroque/Rococo, Morris and Arts and Crafts, Mouchaux and Art Nouveau, Dunant and Art Deco, Corbusier and Bauhaus, Mondrian and De Stijl, Hockney and Pop Art, and Soutozas and Memphis—are combined in the course content, which also combines the idea of stylistic stimulation. The instructor begins each session with a slide show of classic designs from each design style to provide students a visual boost and basic knowledge of the works.

Students engage in exploratory, collaborative learning within the framework of the BTS teaching framework is the second primary target of classroom instruction and feedback. Beginners in design are guided to understand the ideas underlying design styles through collaborative work and teacher support in this course. Through active exploration rather than passive indoctrination, students in groups of three delve deeper into their understanding and awareness of the styles surrounding the contemporary background, reasons for development, social influence, representative figures, design ideas, and classic works; Depending on how well their studies are going, the teacher will pose pertinent questions to the students in order to help them expand the scope and depth of their research. Teacher will also offer advice to any groups who stray from the intended topic. The teacher will summarize the design

concepts of the time, which will act as a reminder of the past and the future—that is, finishing one of the items in the classroom feedback—when the students organize their study of the style into a learning report and present it orally at the start of the next lesson.

Supporting students in applying what they have learned to design practice—which culminates in a second iconography project with a competition serving as an effectiveness test—is the third main goal of teaching and feedback. Although there is no restriction on the extent of style imitation, the concept and style of the second icon design may differ significantly from the first. Once the students have completed their work, the teacher asks them to comment on each other's work in order to encourage their participation, excitement, and competitive spirit. Next, the industry experts are invited to provide an expert opinion and offer suggestions. Based on the findings of these two evaluations, the students modify their designs and submit it to the competition. Simultaneously, academic essay writing is an additional way to evaluate the efficacy of education. Every student must write a discursive essay of at least 3,000 words on design style in order to strengthen their knowledge organization, logical thinking, and critical expression skills as well as further develop their comprehension of the depth of the practical application of design style. Students are still needed to complete the same subjective assessment form from the previous round after finishing the second icon design.

Participants and Experimental Process

This study aims to conduct an in-depth investigation of the relationship between creativity and internal efficacy in order to evaluate the effectiveness of the new teaching model and the learning characteristics of design beginners, based on the confirmation that this teaching method is beneficial to the development of students' design ability. The pre-test and post-test were compared prior to and following instruction in order to perform the experiment, which was based on the self-assessment of icon design. 30 Chinese students, 10 male and 20 female, first-year university students majoring in design, ages 17 to 20, participated in the experiment, which was carried out in a normal class given by the researcher. The students underwent a design history study that was mostly centered around the BTS teaching framework over the 2.5 months that separated the pre-study and post-study icon design phases.

After finishing both designs, students were asked to provide feedback on their subjective degree of creativity and intrinsic efficacy using a 7-point Likert scale. Each of the 10 icons in the workload required by the designs took an equal amount of time to complete. Before to the questionnaire being finished, the researcher made it clear that it was to be done in person and that there were no right or wrong answers, nor would it affect the final course grade. Following data collection, the researcher utilized narrative statistics and the paired-sample T-test of SPSS statistical software to validate and draw conclusions. This allowed them to make preliminary conclusions about whether the students' design abilities differed before and after the study, and it also allowed them to explore the learning characteristics of beginning designers by using linear analysis to elucidate the relationship between creativity and intrinsic efficacy.

Questionnaire

Following the completion of the two icon designs, each student was requested to complete an exactly same subjective evaluation form that measured their degree of intrinsic motivation and creativity. This study uses the "Creative Self-Efficacy Scale" developed by Hung and Lin

(2004) as the foundational text, and the purpose of "creative self-efficacy" is to test the students' evaluation of their own creativity during the process of learning and applying design history. The wording of some of the questions is modified according to the actual content of the design history course, involving three dimensions: belief in creative products, creative thinking strategies, and resistance to negative evaluations, with a total of 11 questions. The researcher additionally evaluated the students' intrinsic feelings associated with creating icons after learning and being influenced by classical design styles using the self-stated questionnaire that Amabile (1996) proposed as a parent for measuring students' intrinsic motivation. The modified questions included four facets, namely, senses of fulfillment during the design work, degree of stress, degree of liking the work, and motivation perception, with a total of six questions. The majority of respondents finished the questions in less than three minutes, and both employed a seven-point Likert scale for subjective evaluation. The questionnaires were written in the respondents' native tongue.

Results

The results of this research evaluated how "utility" and "relationship" were used to analyze the new approach to teaching design history. The Creative Self-Efficacy Scale's Cronbach's α was 0.872, indicating that the internal consistency of the questionnaire items was sufficiently good, based on the reliability analysis of the scales. The Intrinsic Efficacy Scale's Cronbach's α was 0.666, still within an acceptable range. Consequently, statistical analysis of the information gathered from the two surveys is possible.

The Efficacy of a Novel Approach to Teaching Design History

In this study, paired-sample T-tests were used for pre- and post-study pairwise comparisons of creative self-efficacy and intrinsic motivation efficacy, respectively. Table 1 presents the findings. While the mean creativity results before and after the study were 4.939 (SD=0.568) and 5.324 (SD=0.823), respectively, the mean difference in students' creative self-efficacy before and after the study reached -0.384, and the significance reached the criterion (p=0.023, p<0.05*). This indicates that following the study of the new design history curriculum, results on the creativity self-efficacy assessment were significantly higher in the post-study than in the pre-study. The mean of the difference between intrinsic motivation efficacy before and after the study amounted to -0.486, with significance reaching the standardized value (p=0.022, p<0.05*). The mean of intrinsic motivation efficacy before and after the study was 5.040 (SD=0.741) and 5.526 (SD=0.844), respectively, indicating that the results of intrinsic motivation efficacy assessed in the post-study were significantly higher than those in the pre-study. In conclusion, the standard deviation findings of the post-study demonstrated a significant tendency to broaden compared to the pre-study for both creative self-efficacy and internal intrinsic drive.

Table 1: the results for Creative Self-Efficacy and Intrinsic Motivation Efficacy's mean and standard deviation

	Group	N	Mean	STDEV	SEM
Creative	Before	30	4.939	0.568	0.103
	After	30	5.324	0.823	0.150
Motivation	Before	30	5.040	0.741	0.135
	After	30	5.526	0.844	0.154

Table 2: Creative Self-Efficacy and Intrinsic Motivation Efficacy paired-sample
T-test results before and after learning

		Mean	STDEV	t	df	Sig.(2-tailed)
Creative	Before - After	-0.384	0.878	-2.401	29	0.023
Motivation	Before - After	-0.486	1.102	-2.418	29	0.022

The Impact of Creative Self-Improvement on Intrinsic Motivation

Exploring the relationship between creative self-confidence and intrinsic motivation is another purpose of this study, which aims to better understand the mental state of students' learning. Stepwise analysis was employed in the statistical processes using SPSS, with creative self-confidence being the independent variable and intrinsic motivation being the dependent variable.

This study phase evaluated the subjective assessment scores for the pre- and post-study independently in order to ensure the precision and comprehensiveness of the findings. Table 3 presents results. With an R-squared of 0.542, the fitted equation accounts for 54.2% of the variation observed in the dependent variable. While the unstandardized coefficient of creative self-efficacy on intrinsic motivation is 0.697 and meets the significant criterion (B=0.697, p=0.000**), the ANOVA test result in the overall evaluation for the entire model meets the significant criterion (F=68.724, p=0.000**), indicating that the fitted equation is meaningful. It suggests that intrinsic efficacy and creative self-efficacy can be positively correlated, meaning that the better the creative self-efficacy, the greater the intrinsic motivation to learn and create.

Pre-learning findings revealed a model R-squared of 0.391, meaning that 39.1% of the dependent variable in the pre-learning can be explained by the fitted equation, which is significantly less than the post-learning performance. The fitted equation was significant, according to the ANOVA test results, which also met the significance criterion (F=17.985, p=0.000**). However, the pre-learning model's F-value was significantly lower than the post-learning model's, indicating that the model's ability to explain variation in the dependent variable is not as strong as it is in the post-learning model; In final analysis, the pre-learning period's unstandardized coefficient of creativity self-efficacy on intrinsic motivation was 0.635, meeting the significance criterion (B=0.635, p=0.000**). This suggests that, even in the absence of knowledge about design history, creativity self-efficacy can positively influence intrinsic efficacy. The explanatory power of the model of students' creative self-confidence on self-efficacy increased when the pre- and post-study conditions were compared. This may mean that after learning through the new design history teaching method, students' creative self-confidence can have a greater impact on their self-efficacy.

Discussion

Design History Course Teaching Method

The study of design history is unquestionably important, but many students only recognize its significance after they have formed their knowledge framework. As a result, beginning designers are unable to devote enough time to the course due to their lack of theoretical knowledge and practical design experience. First, beginners lack skilled methods and have the learning motivation of wanting to quickly master a variety of design styles in order to show their professional ability. The classic styles shown in the early part of the course fit the learning psychology of beginners. Design students are adept at using images, charts, films, and other sensory forms of learning rather than reading through theory, so this approach can be used to enhance the attractiveness of the relevant knowledge and digging into the role. Second, collaborative exploratory learning within the BTS framework enhances most students' engagement and knowledge discussion, a phenomenon associated with design students' propensity to learn collaboratively and engage in peer discussions (Demirkan, & Demirbas, 2008; Demirkan, 2016); In order to become a guide rather than an indoctrinator of the theoretical construction, the teacher also assumes the role of a coach. This involves paying close attention to the students' performance and feedback during the collaborative exploratory instruction, as well as timing their questions and suggestions. This aligns with the bipolar perceive dimension (ACeCE) characteristic of freshman design majors, which is that they are more likely to independently construct theories and analytical techniques. The two icon creations that students completed before and after class enable them to fully understand the value of applying theory to practice. Most students are inspired by the classic style and apply it to the current icon design, though the degree and approach of application vary depending on each person's comprehension of the various points of knowledge. After the study, the majority of students demonstrate a noticeable improvement in the cohesiveness of the icon design, and some of them are even able to apply or even expand on the classic style. Lastly, the students' multiple prize wins at the NCDA Competition help to validate the effectiveness of the teaching method.

The Characteristics of Learning for Novices in Design

The innovative "style attraction + BTS teaching method" for teaching design history is beneficial for improving students' creativity, self-confidence, and intrinsic motivation, as evidenced by the comparison of pre- and post-study findings. Beginners can create in accordance with this visual layout if style guidance is reinforced in the teaching of design history and other theoretical training. The classic style does not always stifle creativity; rather, students' ability to learn and then borrow, incorporate, or expands their creative boundaries and fosters their imagination. Regarding intrinsic motivational efficacy, beginners typically lack design-related knowledge and lack confidence in their own designs. However, this teaching approach enables beginners to quickly grasp visual styles and the underlying

principles, providing a "quick fix" that boosts confidence in the design practice path and encourages beginners' intrinsic motivational efficacy toward design.

The association between creative self-confidence and intrinsic motivation efficacy was also investigated in this study. The findings indicated that intrinsic motivational efficacy was positively impacted by self-confidence in one's creative abilities, both before and after learning. This suggests that the "confidence" factor plays a pivotal role in igniting students' motivation to learn, and that the adage "confidence is the only thing that makes good grades possible" is no more meaningful than that. Due to this, this study makes use of a novel approach to teaching design history in order to boost students' creative self-confidence, which is essential for fostering intrinsic motivating effectiveness. Notably, after learning using the new teaching strategy, the students' standard deviation results on creativity and intrinsic motivation showed an expanding trend. This suggests that while the self-evaluation results were generally improved, the data were not uniformly distributed, and there were a few extremes or outliers, which suggested that different students absorbed the course content to varying degrees. Additionally, there was a widening of the differences in the effectiveness of creativity self-efficacy and intrinsic motivation, which could be related to the fact that each student's degree of self-efficacy was either raised significantly or not elevated. Simultaneously, the model connection demonstrating the differential explanatory power between pre- and post-learning on the impact of creative self-efficacy on intrinsic motivation efficacy was observed. While there was a positive relationship between creative self-efficacy and intrinsic motivational efficacy before and after learning, the explanatory power of the model was stronger and the standardized coefficient was higher after learning, indicating that creative self-efficacy had a greater impact on intrinsic motivational efficacy and that subjective evaluations performed better in terms of model validity after learning. Beginners found that the new design history teaching technique increased students' motivation for design practice by exacerbating the effect of their creative self-confidence on intrinsic motivational efficacy.

Conclusion

Using the BTS methodology as a guide, this study investigated a teaching model for a design history course and verified the effect of the teaching approach on design novices in terms of creative self-efficacy and intrinsic motivation. Beginners found the teaching approach to be effective, and their creative self-efficacy had a positive effect on intrinsic motivation. This phenomenon became more prominent after students experienced the new teaching strategy, indicating that the new teaching approach increased the impact of creative self-efficacy on intrinsic motivation. To have a more thorough grasp of the learning characteristics of starting design students, future study might examine the impact of exploratory learning on various student categories.

A Cross-National Study of Mathematics Achievement via Three-Level Multilevel Models

Youjin Lee, Hanyang University, South Korea
Miyazaki Yasuo, Virginia Tech, United States

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

The present study explored the effects of the national and cultural contexts on students' mathematics achievement. The study also investigated the nature and magnitude of student-level (level 1), school-level (level 2), and country-level (level 3) factors that are associated with math achievement. The Program for International Student Assessment (PISA) 2018 datasets were used. The findings of HLM analysis showed that mathematics achievement is associated with national and cultural contexts since the study found 31.30% of the total variation was accounted for level 3 in math achievement. Also, the study found that various predictors were statistically significant for explaining math achievement. Moreover, the study found several counterintuitive association phenomena due to the shift of meaning. These findings were explained regarding practical and theoretical implications for policymakers, educators, and researchers to improve students' mathematics achievement.

Introduction

The primary goal of the study is to explore the effects of the national and cultural contexts on students' mathematics achievement. Then, the nature and magnitude of country-level factors, as well as school- and student-level factors that are associated with math achievement was examined by using HLM analysis. Exploring country-level factors that contribute to the variation has been largely ignored in educational studies due to a lack of country-level data. Accordingly, studies investigating students' academic achievement heavily focus on the individual- and school-level factors. This study hypothesized that national and cultural characteristics are associated with math achievement. Also, the study hypothesized that there are several compositional factors strongly associated with math achievement as well. The specific research questions are presented in the following:

1. Is there significant variability in mathematics achievement across schools and countries? If so, how will total variation be allocated to student-, school-, and country-level?
2. How are country-level variables associated with the country-mean student's mathematics achievement?
3. Are there any school-level and country-level compositional factors strongly associated with mathematics achievement?

Theoretical Framework

The theoretical framework of this study is built on the multilevel paradigm. The development of multilevel analysis (Bryk & Raudenbush, 1992) and multilevel analysis software have promoted a multilevel paradigm in educational research. Since multilevel data should be explained by multilevel theories, researchers must define which direct effects and cross-level interaction effects can be expected in their studies by articulating specific theoretical models (Hox & Van, 2017). A cross-national study will be conducted in this study. Therefore, the study requires cross-level theorizing by identifying country-level characteristics that are associated with an individual- or group-level response (Tsui et al., 2007). Also, the hypothesis of the study is that country characteristics influence student achievement is underpinned by social cognitive theory (Bandura, 1986) and sociocultural theory (Vygotsky, 1978). Bandura's social cognitive theory stresses that learning occurs in social contexts with the interaction between personal factors and behavior (Bandura, 1986). Vygotsky's sociocultural theory emphasizes the influence of social interaction and culture in learning. Underpinned by both theories, this study hypothesized that mathematics achievement is influenced by not only individual characteristics but also environmental contexts.

Data

The data used in this study were obtained from the Programme for International Student Assessment (PISA) 2018, conducted by Organisation for Economic Cooperation and Development (OECD). Originally, PISA 2018 consisted of assessment of 612,004 students from 79 countries. In this study, 58 countries were selected for analysis. The number of students ranges from 3,209 to 34,925 and the number of schools ranges from 48 to 825. In this study, mathematics literacy results and variables from students' and schools' questionnaires in PISA2018 were used as student- and school-level. For country-level variables, data from various global reports and variables created by aggregating the school-level variables were used. As a dependent variable, the average 10 parameter estimates from the 10 plausible values (PVs) of mathematics proficiency was used.

Methodology

The analyses started with generating correlation matrixes between all variables in each level and the dependent variable. Then, hierarchical linear models (HLM) were implemented to explore the relationship between student-level, school-level, and country-level predictors and mathematics achievement. A three-level HLM was used as a primary analytic methodology in this study since the data has a nested structure, with students nested within schools, which in turn nested within countries. The HLM analysis of this study began with a fully unconditional model to determine whether the HLM is appropriate for the data. The fully unconditional model was formulated using mathematic achievement as an outcome variable with no level 1, level 2, or level 3 predictors. The HLM equations of the fully unconditional models are represented as follows:

Equation 1. *Equations for Unconditional Model*

Student-Level (Level 1) Model:
$$PVMATH_{ijk} = \pi_{0jk} + e_{ijk}$$

School-Level (Level 2) Model:
$$\pi_{0jk} = \beta_{00k} + \gamma_{0jk}$$

Country-Level (Level 3) Model:
$$\beta_{00k} = \gamma_{000} + u_{00k}$$

After running the unconditional model, the conditional model was built by adding all student-level, school-level, and country-level predictors. All the predictors in the country-level (level 3) were centered at grand-mean. Centering around grand mean at level 3 allows us to improve the interpretation of the intercept values. All the student-level (level 1) and school-level (level 3) variables were group-mean centered. When group-mean centering of the student-level predictors is used, the student-level predictor coefficients (γ_{k00}) represent within-school effects and the school-level predictor coefficients (γ_{0k0}) represent within-country effects.

Equation 2. *Equations for Conditional Model*

Student-Level (Level 1) Model:
$$PVMATH_{ijk} = \pi_{0jk} + \pi_{1jk}\,(FEM_{ijk}) + \pi_{2jk}\,(PARED_{ijk}) + \pi_{3jk}\,(ICT_{ijk}) + \pi_{4jk}\,(PARES_{ijk}) + \pi_{5jk}\,(BELN_{ijk}) + \pi_{6jk}\,(RSELF_{ijk}) + \pi_{7jk}\,(MAG_{ijk}) + \pi_{8jk}\,(FFAIL_{ijk}) + \pi_{9jk}\,(OA_{ijk}) + \pi_{10jk}\,(VSCH_{ijk}) + \pi_{11jk}\,(GM_{ijk}) + e_{ijk}$$

School-Level (Level 2) Model:
$$\pi_{0jk} = \beta_{00k} + \beta_{01k}\,(RURAL_{jk}) + \beta_{02k}\,(CITY_{jk}) + \beta_{03k}\,(PRIV_{jk}) + \beta_{04k}\,(STR_{jk}) + \beta_{05k}\,(PFT_{jk}) + \beta_{06k}\,(CSIZE_{jk}) + \beta_{07k}\,(CREA_{jk}) + \beta_{08k}\,(SBHL_{jk}) + \beta_{09k}\,(TBHL_{jk}) + \beta_{010k}\,(XFEM_{jk}) + \beta_{011k}\,(XPARED_{jk}) + \beta_{012k}\,(XICT_{jk}) + \beta_{013k}\,(XPARES_{jk}) + \beta_{014k}\,(XBELN_{jk}) + \beta_{015k}\,(XRSELF_{jk}) + \beta_{016k}\,(XMAG_{jk}) + \beta_{017k}\,(XFFAIL_{jk}) + \beta_{018k}\,(XOA_{jk}) + \beta_{019k}\,(XVSCH_{jk}) + \beta_{020k}\,(XGM_{jk}) + \gamma_{0jk}$$
$$\pi_{1jk} = \beta_{10k}$$
$$\pi_{2jk} = \beta_{20k}$$
$$\pi_{3jk} = \beta_{30k}$$

$$\pi_{4jk} = \beta_{40k}$$
$$\pi_{5jk} = \beta_{50k}$$
$$\pi_{6jk} = \beta_{60k}$$
$$\pi_{7jk} = \beta_{70k}$$
$$\pi_{8jk} = \beta_{80k}$$
$$\pi_{9jk} = \beta_{90k}$$
$$\pi_{10jk} = \beta_{100k}$$
$$\pi_{11jk} = \beta_{110k}$$

Conclusions

All results for the model can be found in the Table 5. In the fully unconditional model, the average mathematics achievement score (the intercept at level 1) is estimated to be 417.49. The estimated variance components from the model were $\sigma^2 = 4506.93$, $\tau_\pi = 2916.65$, and $\tau_\beta = 3382.67$ at the student, school, and country level (Table 6.). this model found that 41.71% of the variation in mathematics achievement was due to difference among students, and 26.99% of the total variance in math achievement was attributable to differences among schools. Lastly, 31.30% of the variance in math achievement was accounted for by difference among countries. Since the school variance component and country variance component are both significant and the variability in math achievement at the school- and country-level were large, conducting a HLM is necessary to be processed.

In the conditional model (See Table 5), the strict university admission system, the country-mean city, country-mean proportion of fully certified teacher, country-mean teacher behavior hindering learning, and country-mean ICT usage were positively associated with math achievement while country-mean student-teacher ratio, country-mean parental education level, and country-mean resilience self-efficacy were negatively associated with math achievement. One of interesting findings from the final model was that the partial correlation between country-mean resilience self-efficacy and country-mean students' math achievement became negative after controlling for other predictors in the model which was opposite of the results of the correlation matrix among the student-level predictors with the dependent variable. Figure 1 shows the scatterplot show the marginal correlation between student's resilience self-efficacy and math achievement with regression lines based on 58 countries. As shown in the Figures, student's resilience self-efficacy and math achievement had a positive relationship. This indicates that students who believe more strongly in their ability to cope with difficult or challenging experience show higher math achievement. From results of the conditional model, several compositional effects were detected for school- and country-level. Firstly, there was only one factor that compositional effects were detected from both school- and country-level, which was ICT usage. Meanwhile, the following three variables that were showed school compositional effects on math achievement: parents' emotional support, occupational aspiration, and growth mindset.

On the other hand, Figure 2 shows the scatterplot of country-mean resilience self-efficacy against country-mean math achievement. This figure does not indicate students with lower resilience self-efficacy show higher math achievement. Instead, shift of meaning plays a role in the macro-level relationship. The meaning of resilience self-efficacy variable that is aggregated to the country-level distinct from the meaning of student-level resilience self-efficacy. The occurrence of counterintuitive association might be due to shift of meaning. If we make inferences about student's resilience self-efficacy based on country-mean resilience

self-efficacy, an ecological fallacy may occur by ignoring the disparity between the country-level and student-level. The country-mean resilience self-efficacy refers to the cultural context of country. In the other word, the country-mean resilience self-efficacy means beliefs and values that are shared among people in a country. As shown in the Figure, East Asian countries generally show low country-mean resilience self-efficacy while those countries show high country-mean math achievement. This may represent cultural characteristics of those countries.

Second finding of this study was that the country-mean parental education level had a negative association with country-mean students' math achievement. This result was opposite to majority of previous literature that parents' education is positively associated with their children's academic outcomes. The study found that the coefficient for country-mean parental education level went from positive to negative when the country-mean ICT usage was added as the sole predictor. Scatterplots describing the relationship between country-mean parental education and country-mean math achievement were created to understand the results of the model. As shown in Figure 3, a group of countries have high level of country-mean ICT usage (larger than 50th percentile) showed a negative relationship between country-mean parental education and country-mean math achievement while a group of countries have low level of country-mean ICT usage (smaller than 50th percentile) showed a positive relationship between country-mean parental education and country-mean math achievement. This situation in which a relationship observed at the group reverse is known as Simpson's paradox (Blyth, 1972). The results of the model found that country-mean ICT usage plays a role as a confounding variable which reversed the association between country-mean parental education and country-mean math achievement.

Also, the final model found that country-mean teacher behavior hindering learning which represents school climate in school-level predictors had positive association with students' math achievement after controlling for other predictors in the model. As shown in school-level correlation matrix from Table 3, there was a negative correlation between the school-level teacher behavior hindering learning variable and school-mean students' math achievement. Figure 4 shows the scatterplot displaying the relationship teacher behavior hindering learning variable and school-mean students' math achievement. Such counterintuitive association phenomena may be due to shift of meaning. It shows that meaning of a micro-level variable aggregated to the macro-level is distinct from the micro-level variable. The average of the school-level variables may be used as an index for countries' cultural climate; hence higher scores of the country-mean teacher behavior hindering learning from countries may represent greater level of standard for school climate. In other words, country-mean teacher behavior hindering learning may represent the level of standard for teacher in countries. Figure 5 shows the scatter plot regarding relationship between country-mean teacher behavior hindering learning and country-mean math achievement. As shown in the scatter plot, East Asian countries including China, Chinese Taipei, Hong Kong, Singapore, Japan, and Korea generally higher than other countries. This may indicate that East Asian countries have higher standard for teacher behaviors.

The findings of the study provide important practical and theoretical implications for policy makers, educator, and researchers. First, the findings supported the hypothesis of this study that mathematics achievement was associated with national and cultural contexts because the study found 31.30% of the total variation was accounted for country level in math achievement. This result provided a justification that country characteristics should be examined in a context of cross-national comparison study.

One of the unique findings of the present study was that the shift of meaning played important roles in interpreting the country-mean teacher behavior hindering learning in the conditional model. The meanings of the variable were apparently distinct from the meanings as school-level variable. The country-mean teacher behavior hindering learning can be used as index for 'national standard for teacher'.

Also, the study found that the country-mean ICT usage played a role as a confounding variable which reversed the sign of the correlation between the country-mean parental education level and country-mean math achievement. The finding indicates that the school-mean ICT usage and country-mean ICT usage promote student's math achievement even after controlling for student-level predictors. This finding provided strong evidence in supporting previous research that ICT plays an important role in student's academic achievement. Accordingly, the finding provided practical implication for educators and policy makers that supporting ICT resources and providing good learning environment through ICT to students would facilitate student's mathematics achievement.

Development and Implementation of Science Boost Camp:
Impact on Student's Science Conceptual Understanding and Motivation to Learn Science

Chin Chen Yong, Ministry of Education, Brunei

Abstract

After COVID-19, the teachers in Brunei have been busy trying to catch up on the learning loss faced during the pandemic, especially the Year 11 science students who will be sitting for their Cambridge's 'O' Level examination this year as the first cohort of the new 5129 Combined Science syllabus. Switching back from online learning during COVID19 to face-to-face learning in school has been a great challenge for the teachers. In this paper, the researcher is trying to understand what motivates these students to learn Science and to adapt back to face-to-face teaching and learning. This study employed mixed method research (MMR) to understand the assumed causes of low achievement in the qualifying examination of the Year 11 science students. This study also sought to understand how the science boost camp could be adopted to improve students' achievement in the 'O' level examination and how the camp could be evaluated for their effectiveness. The initial analysis shows that the Science Boost camp was able to increase students' motivation and understanding of science concepts, the advantages of group work and active learning. In addition, the effectiveness of the boost camp was discussed and evaluated for the next boost camp as part of students' intensive examination preparation for their upcoming 'O' level examination. This study summarized the essential attributes of a Science Boost Camp weekly course as the future development as one of the strategies for examination preparation.

Keywords: Science Achievement, Science Motivation, Mixed Method Research (MMR), Science Boost Camps, Science Conceptual Understanding

Introduction

Background of the Study

This study reported in the design of a mixed method study aims to evaluate the effectiveness of a revision strategy called Get Your Credit (GYC) Science Boost Camp for GCE O level preparation with cooperative learning. The purpose of this study is twofold: i) to assess the impact of boost camp designed activities for Bruneian secondary students learning combined science and ii) to examine the process of students' motivation in learning science. The boost camp designed activities are designed using Technological, Pedagogical and Content Knowledge (TPACK) framework and known as Technological Enriched Learning Activities (TELA) in this research.

Hands on activities can be used to help students to visualize the correct concepts that are so challenging for them, due to the abstract nature of scientific knowledge (Dhindsa & Treagust, 2009). The importance of understanding 'overloaded' abstract concepts of science has been emphasized by many researchers (Dhindsa & Treagust, 2009; Simon, 1975; Garegae, 2009). Similarly, Good and Berger (2005) noted that understanding scientific representations of our physical world is essential for the achievement of higher levels of scientific literacy. However, achieving higher levels of scientific literacy and helping students to understand abstract science concepts requires those learners to visualize the correct concepts to avoid misconceptions. Hence, teacher's lessons preparation is very crucial to implant the correct scientific concepts in students.

The importance of integrating a teacher's competence in pedagogy and content was initially emphasized and visualized in Schulman's (1986) Pedagogical Content Knowledge model (PCK) and this PCK model was further developed by Mishra and Koehler (2009) into what is known as the Technological, Pedagogical and Content Knowledge (TPACK) model. TPACK is a knowledge-based teaching method that teachers need for effective technology integration. (Kurt et al., 2014).

Literature Review

To test teachers' knowledge base for designing lessons using a TPACK framework, Harris and Hofer (2009) developed taxonomies of learning activities (pedagogy) for specific subject matter domains. They then related those taxonomies to possible uses of technology to support the instructional planning of teachers. Learning activities could then be used as a planning tool to develop and describe plans for technology-enhanced learning. To achieve this goal, teachers need to understand the most powerful ways of embedding technology-based experiences in science teaching and learning (McFarlane & Sakellariou, 2002).

Therefore, further research and more concerted efforts among policy makers, science education researchers, and science teachers are needed (Symington & Tytler, 2004). Similarly, Duit and Treagust (1998) pointed out that research investigating students' conceptual progress is limited. In the same paper the authors also noted that there is no study that has investigated how / if students' conceptions change after instructions. As there is no study that has specifically investigated how students develop conceptual understanding in science, this study will adopt and refer to the literature that reports investigations into conceptual understanding in science. Even in Brunei Darussalam, the current priority of the

Ministry of Education is to prepare the teachers to teach students the new skills needed to overcome the challenges of the new era (Othman, 2019).

In recent years, the number of students learning science in Brunei has diminished as can be seen in the Cambridge General Certification Ordinary Level (GCE O Level) examination results. Upper secondary science involves a three-year upper secondary science syllabus from the Cambridge General (GCE) Ordinary Level, taught in English language. The examination is sat by students from all over Asia, such as Bangladesh, Mauritius, Sri Lanka, Singapore, Malaysia and Brunei Darussalam, in order to prepare candidates for advanced study either locally or internationally. The low-level performance has also been reported for other countries which take combined science in the GCE O Level examinations as shown in Table 1 below. The cumulative world total grades for combined science over the past ten years are presented in the following Table 1.

Year	Percentage of students obtaining grade C and above *(Grade C or above = Credit and Distinction)*
2022	24.4
2021	*Not applicable* 38.3 *COVID-19 School Assessment Grade*
2020	27.2
2019	20.3
J2019	23.9
N2018	20.0
J2018	30.0
N2017	21.0
N2016	62.0
N2015	21.0
N2014	24.0
N2013	24.0
N2012	22.0
N2011	21.0
N2010	22.0
N2009	24.0
N2008	24.0
N2007	30.0

Table 1: GCE O Level world grades for Combined Science subjects from 2007 to 2022
(https://www.cambridgeinternational.org/programmes-and-qualifications/cambridge-upper-secondary/cambridge-o-level/results-statistics/)

The current problem faced by schools in Brunei and some other parts of the world is the failing grades of combined science in the General Certificate Examination (GCE) O Level. This is shown in the cumulative world total grades for combined science in the Cambridge Assessment International Education (CAIE) over the past ten years; from 2007 to 2022. The grades are constantly below 30% of the passing marks of 50% (*see Table 1*). A grade below 30% is ungraded, meaning students do not get an 'O' Level after being exposed to the subjects for three years in their upper secondary school years. Low achievement is the situation where a child fails to acquire basic skills while: a) they do not have any identified disability and b) have cognitive skills within the normal range. In those cases, low

achievement may be considered as a failure of the education system to teach well, as much as the student to learn well (Report by Thematic Working Group on Mathematics, Science and Technology, 2010 – 2013).

The cumulative grades of below 30% for upper secondary science (combined science) has shown that students seem to learn by rote rather than cognitive understanding of the taught subjects. Researchers who advocate teaching and learning science by understanding, are trying to find ways to determine in detail what is involved in a person's mind when he learns and understands something (Dhindsa & Treagust 2009; Simon, 1975). Furthermore, the students' understanding of the concepts learnt is a sign of achievement to the teachers while to the student it means a furtherance of his / her education, hence a brighter future (Garegae, 2009). Hence the importance of understanding science concepts has led to the teachers trying to develop techniques for transforming rote learning into meaningful learning (Simon, 1975). Schools in Brunei use a science syllabus like that used in Britain (Sharifah, 1999). Science instruction is in English, which is very difficult for most students, as English is their second/third language.

Objective of Research

Reports compiled by the Ministry of Education; Brunei (2015) shows that a very low exam achievement in the Cambridge General Certificate of Education (CGC E 'O ' level) in combined science was due to the failure of students to acquire a basic conceptual understanding of the topic (Report by Brunei's Ministry of Education, Education Data and Information Management Section, 2015). Those students had great problems with analyzing abstract scientific concepts and processes.

In addition, the Brunei Ministry of Education has been introducing strategies for teachers to recognize the importance of technologically enabled devices to format teaching in classrooms. One example is the implementation of the Brunei's Teacher Standard (BTS) used to provide professional developments for teachers to use technology to teach and collect data in classroom action research. Another example is Whole School ICT Development (WSID) project which is designed to help teachers to plan their lessons from low order to the higher order thinking stages as the students and Inquiry-based science education (IBSE) projects are implemented to guide science teachers to plan their science lessons based on inquiry-based teaching and learning approaches with comprehensive teaching resources provided as references. A recent example is the outbreak of COVID-19 epidemic, teachers are left with no choice to teach virtually at home. Informed by these strategies, planning lessons needs to be very specific and informative; where teachers are required to be at one with their pedagogical content knowledge (PCK) (McCrory, 2008).

Research Questions

This study focuses on the effectiveness of the designed activities lessons of TELA to develop students' conceptual understanding of science. The research also hopes to see whether such understanding is retained even after the interventions for lifelong learning. Thus, the main research question is:

 "What are the effects of boost camp TELA on students' conceptual understanding of learning science?"

The main research question is used to understand how the science boost camps affect and develop students' conceptual understanding of science by comparing the pre-test as first (pre-test), second (post-test) and third (delayed post-tests) boost camps. The learning experiences themselves are understood by looking at students' interactions during the interventions in terms of KMO framework investigated.

As the study's research question needs to be answered both in numerical and narrative forms, a mixed methods research paradigm is used (Subedi, 2016; Yoshikawa and Kalil, 2008; Teddlie and Tashakkori, 2012 and Schulenberg, 2004).

Methodology Used

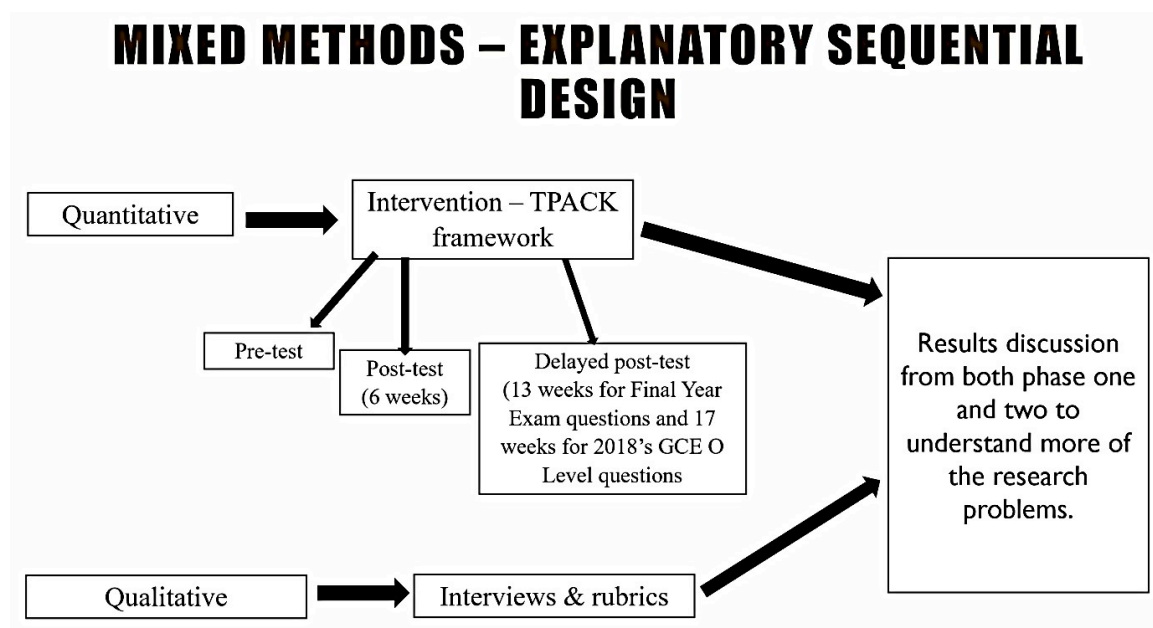
This research uses an explanatory sequential mixed methods approach to information gathering. The research model is designed to test the effectiveness of science boost camps lessons in developing a clear picture of combined science students' understanding of scientific concepts. As informed by Teddlie and Sines (2008), the quantitative and qualitative data are collected sequentially, analyzed separately, and then merged into a framework/ matrix/tabulation to reveal some indicators to the research questions' answers (*see Figure 1*).


Figure 1: Diagrammatic process of the sequential study

The rationale for choosing a mixed-methods design is outlined below. To develop a clear conceptual understanding of the issues being investigated both quantitative and qualitative data are collected, because each method only provides a partial view of the complete picture (Creswell & Plano-Clark, 2011). This study will use data derived from both boost camps, together with students' feedback, as well as in-depth follow-up interviews of the involved students. The researcher can demonstrate the full benefits of using mixed analytical methods to highlight students' understanding of the concept of science during the interventions with the TPACK designed lessons.

Using the sequential design, a complete picture can be developed to portray a clear understanding of the effect of the TPACK-in-TELA designed lessons on high school students' test scores in combined science and their conceptual understanding of science.

Merging the quantitative and qualitative sets of data, which are then analyzed, can reveal a general picture via their test scores of the extent to which students grasp and understand the science concept. The researcher can also interpret the students' learning experiences through the TPACK-in-TELA designed lessons.

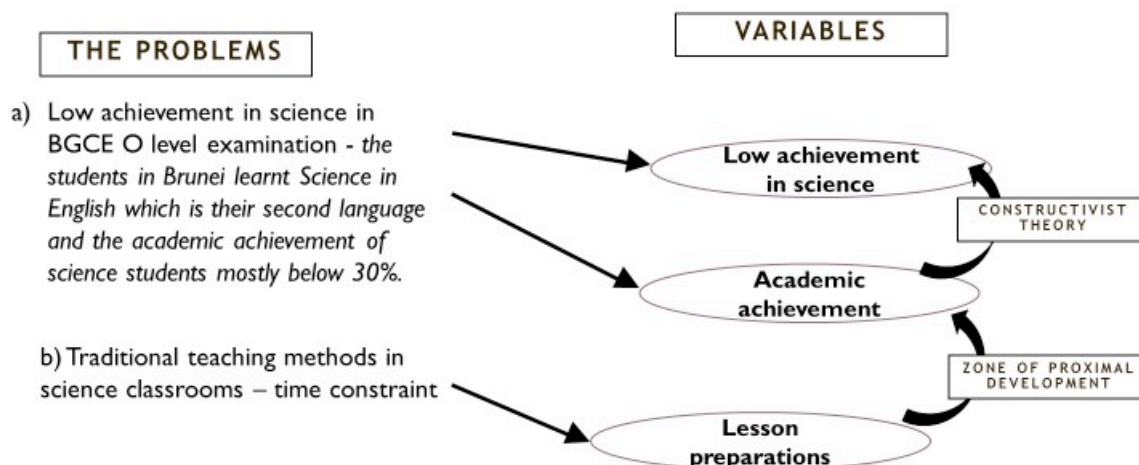
Teddlie and Tashakkori (2012) pointed out that the decision to use mixed methods should be based on research questions instead of focusing on the link between epistemology and methods. Similarly, Schulenberg (2004) noted out that the research questions should be the paramount focus of any investigation, rather than the study's methods (see Figure 2).


Figure 2: The representational diagram of this study's problems

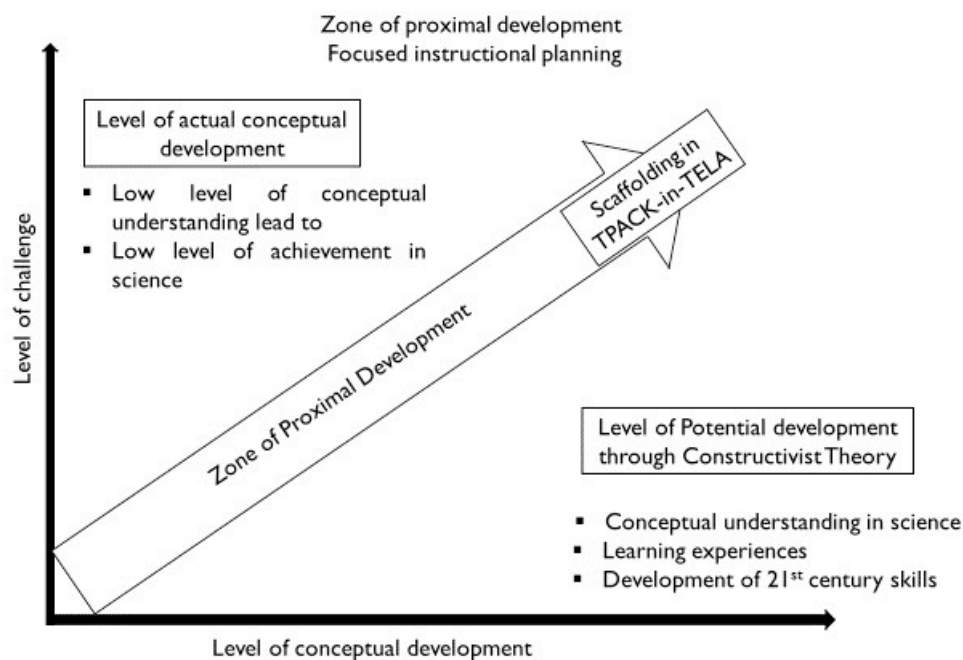
This study frames the problems by incorporating the theory of Zone of Proximal Development and Constructivist Theory of learning. Both theories are important in this study as they are used as the guiding lens to capture the problem within the context of Bruneian's science classroom. In addition, students' conceptual understanding in TPACK-in-TELA as supported by Vygotsky's ZPD, will be seen through social interaction (in terms of gaining learning experiences) that will develop individual student's mental structures. The research questions and conceptual framework derived from the literature review combine to help develop the study's overall theoretical framework (*Figure 3*).


Figure 3: The theoretical framework of this study

As presented in the theoretical framework, the level of actual development in the study is affected by how the teacher planned the lessons. This process, according to a Vygotskian perspective, is helpful to expand a student's zone of proximal development (ZPD) to maximize their learning performance (Sharbini, 2016). Sharbini (2016) also stated that technology has shown itself to serve as a reliable source of scaffolding to facilitate positive changes in students' learning processes. In this study, the students' progress in their ZPD can be seen in their post-test achievement scores.

Evidence from the literature review highlights some of the following research gaps. Kafyulilo (2010) identifies that teachers are not properly integrating/incorporating TPACK components into their teaching. Chai et al. (2013) pointed out that TPACK is not used in lessons to measure students' achievements. However, Janssen and Lazonder (2016) claim that teachers' current TPACK use levels can act as a starting point for designing TPACK integrated lessons. Janssen and Lazonder (2016) also point out that there is very little evidence in the literature that can really demonstrate how teachers with developed TPACK knowledge can apply that knowledge to teach students to achieve better scores in science.

Study Sample

The sample of this study is selected from Bruneian year 11 students taking combined science who will be sitting for the O level examination in October 2023 as the first cohort of the new revised syllabus of 5129 combined science subject. The student sample was selected by using a probability sampling technique that aims to achieve reliable representation (Teddlie and Yu, 2007) of year 11 combined science students from selected schools. The sampling procedure for this study is to have students with different academic achievements participating in the tests/designed lessons so they have equal chances to experience revising science in boost camps of TPACK-in-TELA designed lessons.

Having achieved the desired sample, this study used stratified probability sampling to understand the existing relationships between TPACK-in-TELA designed lessons and students' learning experiences, as shown in Figure 8 below. There are 4 classes/groups of year 11 students who are going to take the combined science GCE O Level examination in 2023. The 4 classes are streamed/ chosen based on their achievements in English, Science and Mathematics from the lower secondary assessment in 2020 during COVID-19. These classes include students of 11A (general science education) and 3 classes of students taking 'general applied education': namely students of 11B, 11C1 and 11C2.

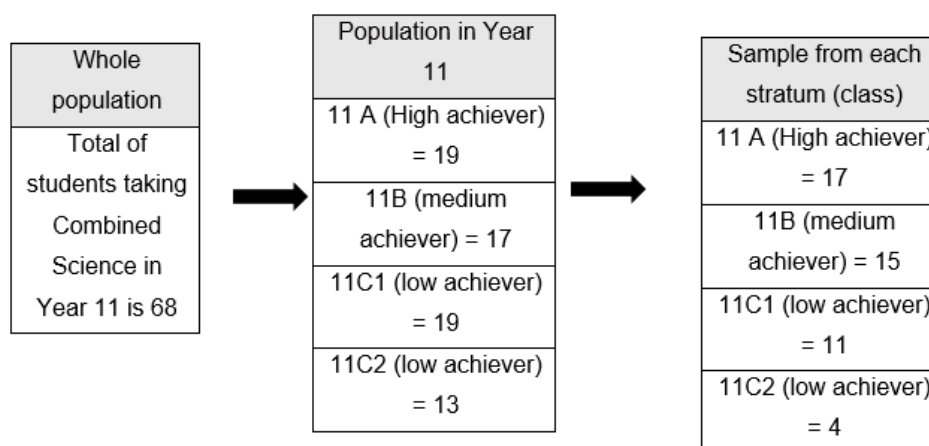
Students taking general applied classes (11B to 11C2) had scored below 40% in their lower secondary science assessment, whereas those students of 11 A achieved science scores of between 41% - 59%. Hence the students were selected from the same academic achievements/grades. Therefore, the students are already selected and arranged into groups of academic achievement levels in each of the 4 classes. In this case, the arrangement was employed simply to choose a representative sample from each stratum. The sampling process is further be clarified in Figure 4 below:


Figure 4: The process of probability stratified sampling

These students began learning science in the English language when they were still in the primary school. Combined science begins at the upper secondary level, i.e., year 9 until year 11; towards the end of the programme, students will be sitting for the Brunei Cambridge "O" Level examination. Schools in Brunei use the same science syllabus as is used in the United Kingdom (UK) (Sharifah, 1999). The objectives of assessment for this subject are focused mainly on conceptual understanding, handling scientific information, and solving problems related to daily life situations. The challenges that teachers faced during teaching the science lessons is that these objectives cannot be precisely specified in the syllabus content. Questions used in testing such skills are based on information which is unfamiliar to the students. In answering such questions, students are required to use principles and concepts that are within the syllabus and apply them to a novel situation in a logical, deductive manner.

The boost camps TELA lessons were designed using TPACK framework informed by constructivist theory. With the TPACK framework, Technological Enriched Learning Activities (TELA as the scaffolding) are injected into the boost camps lessons interventions in the four cycles of TPACK knowledge/learning programmes. The development of the interventions is explained in detail in the next section.

The third cycle was called the schematic knowledge dimensions where the students were required to collaborate with their peers to explain the solutions of the questions given to them. This boost camp took about 3 hours. The final cycle reflected on the strategic knowledge dimension of the TPACK framework focused on students' knowledge of 'where' and 'when'. At this phase, students learnt to apply the knowledge that they acquired from the previous cycles to come up with their solutions. The students are required to present their methodology using PowerPoint slides or video apps in the second boost camps. When all the cycles were done, the students were given post-tests.

Data Collection of Mixed Method

The sample for the qualitative data of this study was determined only after the post-tests; students with highest, medium, and lowest marks were chosen. The highest mark was the top scorer, medium was between 50% - 60%, whereas the lowest scorer was below 30%.
Figure 5: The sequential mixed methods design in which the research question of the second strand (QUAL) emerges from the findings of the first QUAN research questions. (QUAL = qualitative, QUAN = quantitative)

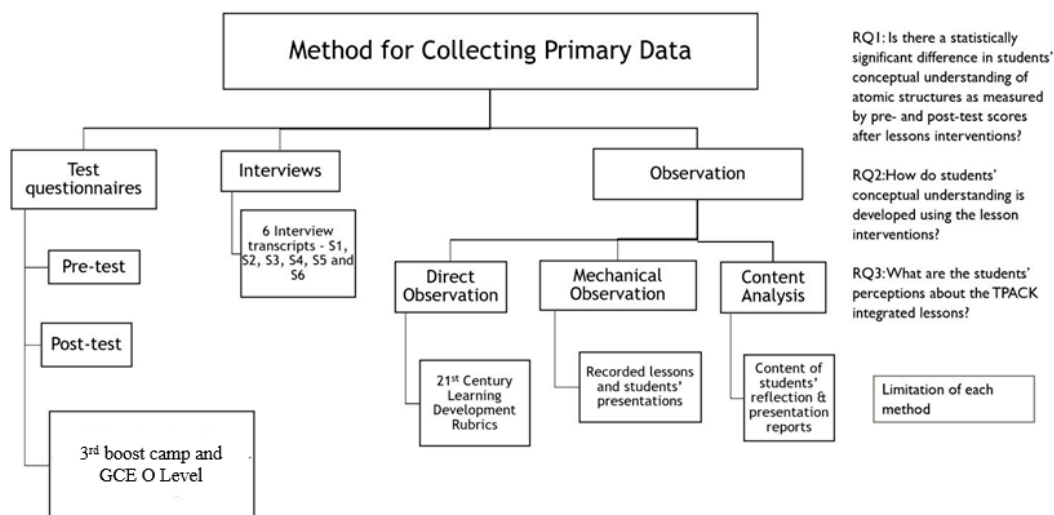
As for the types of quantitative and qualitative data collected, Figure 6 outlines the methods employed. There are 3 main types of data sources: i) test questionnaires (including pre-, post-, and delayed post-tests), ii) interviews and iii) direct observation during boost camps TELA lessons.


Figure 6: Methods for collection primary data

Details of the overall data collection and analysis are presented in the analytical framework, as shown in Table 2 below:

Phase	Procedure	Product
QUAN data collection	Pre-tests, posts-tests questions	Numeric data
QUAN data analysis	Descriptive statistics - paired-samples t-test or repeated measures ANOVA.	p value
Connecting QUAN and QUALI phase	Participants selection (random) and interview protocol development	Interview protocol
QUALI data collection	In-depth interview 21st Century LEAP learning rubrics	Textual data
QUALI data analysis	Coding and thematic analysis Theme development Cross thematic analysis	Codes and themes
Integration of both the QUAN and QUALI data	Interpretation and explanation of the QUAN and QUALI results	Discussion Implication Further research

Table 2: Analytical framework of this study

The initial analysis shows that the Science Boost camp was able to increase students' motivation and understanding of science concepts, the advantages of group work and active

learning. In addition, the effectiveness of the boost camp was discussed and evaluated for the next boost camp as part of students' intensive examination preparation for O level. This study summarized the essential attributes for a Science Boost Camp weekly course as the future development as one of the strategies for O level preparation.

This study adopts the process of mixing data from a method developed by Creamer (2018) to fully understand the effects of TPACK-in-TELA boost camps lessons on students' conceptual understanding of science and on their learning experiences. The process of mixing is summarized in Table 3 below:

Stages in this study	Strategies used to apply mixing
Research questions	The research questions are devised into 2 quantitative questions and 1 qualitative question, and 1 mixed method research question, denotes mixed method research questions.
Data collection	Analysis of the quantitative data in the first phase shapes the data collected in the second phase. Sequential mixed method (Creamer, 2018).
Sampling	Both the quantitative and qualitative samples are from the same sample. Stratified probability sampling is used.
Analysis	Merging both the quantitative and qualitative to answer mixed method research questions.
Interpretation and conclusions	Use of meta-inference to explain special phenomena discovered during analyses of both strands. Inconsistencies and consistencies are explained.
Reporting	Data analyses results are linked to the literature.

Table 3: The process of mixing of this study

Creamer (2018) mentioned the strategy of mixing both the quantitative and qualitative data during the analysis and interpretative stage to complement mixed methods research. She mentioned that both data can be integrated to produce a meta-inference that shows the whole phenomena of the study.

Cases	strategy	analytic focus	product
Each individual case: S1, S2, S3, S4, S5 & S6	Analytical immersion of each interview to identify important aspect of learning experiences	Within each case, close reading of each individual interview transcripts and summaries	Identification of learning experiences; coding themes
Across and within 2 high achievers, 2 medium achievers and 2 low achievers	Identify variations around themes of learning experiences across and within achievers	Data coding and representations	subthemes
Across all interview transcripts	Compares the themes of learning experiences across the 6 students	Meta matrices and cases summaries	Overall interpretations of learning experiences gained and 21st centuries skills developed.

Table 4: The analytical framework used in qualitative data analysis.

The interview transcripts labelled as S1, S2, S3, S4, S5 and S6 are transcribed by listening to the tape recorder again to look for themes related to the answer to the qualitative research question 3 of this study. This will be explained further after analysis of the interview transcripts and observation notes.

Research Question	Research objectives	Data sources	analysis
What are the types of learning experiences gained and how can those experiences be developed into participants' 21st century skills?'	To analyse the types of learning experiences that students gained in the interventions and to learn how those experiences shaped or helped the development of their 21st century skills.	(i) Students' interviews (ii) Students group presentations on their 3D model (iii) Observation notes	(i) Categorise each interview according to the types of learning experiences gained (ii) Use of 21st centuries and learning dimensions (CLD) presentation rubrics to look for types of 21st century skills developed. (iii) Re-categorise comments and notes that might indicate learning experiences or 21st century skills.

Table 5: The links between the research question, data sources and data analysis

Meta matrices approach of qualitative data analysis was employed to understand students' learning experiences gained in the study and how the students used these learning experiences to develop their 21st century skills for lifelong learning. This approach is done by combining microanalysis of the development of 21st century skills, the types of learning experiences gained and students' conceptual understanding of science as well as researcher's own experiences based on the strategy combinations listed in Table 5 above.

Results

Quantitative Results

The intervention is designed to increase students' science conceptual understanding. Students were given a range of questions on science concepts that required lower order thinking through to higher order thinking. The two variables used from the data were labelled as pre-testA and post-testA. Table 6 shows the results of the analyses from the pre- and post-tests of the students involved in the study.

Table 6: The results for the pre- and post-tests of the students involved in the study

The results, as shown in Table 6, were interpreted. A paired-samples t-test was conducted to evaluate the impact of the intervention on students' test scores regarding their science conceptual understanding. There was a statistically significant increase in the test scores from pre-test (M= 24.37, SD=18.17) to post-test (M=70.95, SD=21.82), t (37) =12.68, p < .001 (two-tailed). The mean increase in test scores was 46.58 with a 95% confidence interval ranging from 54.02 to 39.14. The eta squared statistics (.81) indicated a large effect size.

An analysis of the post-tests of the students who participated in the science boost camp for the three sessions is presented next. The research question is:

Quantitative research question 2: Is there a change in the 'conceptual understanding' test scores of the boost camp TELA interventions group over the three time periods?

Hypothesis: There is a significant difference in students' science conceptual understandings, as measured by the pre-tests, post-tests, and the delayed post-tests.

Quantitative research question 2 was used to evaluate the ability of students to retain science conceptual understanding; making sure students' learning was not just for the examination but lifelong. It was necessary to see the effectiveness of the boost camps intervention in the ability of the students to retain their science conceptual understanding on the same continuous scale at three different times through post-tests after: i) intervention, ii) end-of-year school examinations and iii) O- level examinations). To achieve this central objective one-way repeated-measures ANOVA analysis of variance was used to measure the test scores of the same participants at different points in time (within-subjects design).

A one-way analysis was employed because this study is looking at the impact of only one independent variable on the dependent variable. This technique will tell if or where there is a significant difference among the three sets of scores. Hence, a one-way repeated measure ANOVA was conducted to compares scores on the conceptual understanding with tests given at: a) pre-test (before the first boost camp intervention), b) post-test (after the first boost camp intervention) and c) the delayed post-tests (three weeks follow-up of third boost camp) on science concepts. The means and standard deviation are presented in Table 10. There was a significant effect of time as demonstrated by Wilks' Lambda = .02, $F_{(2,35)} = 7.43$, $p > .001$, multivariate partial eta squared = .30 (refer to Table 7 below).

Wilks' lambda	.702	7.432[a]	2.000	35.000	.002	.298
Hotelling's trace	.425	7.432[a]	2.000	35.000	.002	.298
Roy's largest root	.425	7.432[a]	2.000	35.000	.002	.298

Each F tests the multivariate effect of Time. These tests are based on the linearly independent pairwise comparisons among the estimated marginal means.

a. Exact statistic

Table 8: The differences of each pair of time point showing students' conceptual understanding of science concepts

From Table 8 above, the differences between each pair of time points shown are all significant values of less than .05; thereby indicating that each of the differences is significant. The p value is less than .05; therefore, it can be concluded that there is a statistically significant effect for time. This outcome suggests that the students were able to retain their science conceptual understanding throughout the delay period described above. The results of analyses of the quantitative data have filled the gap relating to the ways in which teachers can design their lessons using a TPACK framework to improve students' conceptual understanding of complex scientific concepts.

Qualitative Results

The use of themes is driven to seek answers to the research questions by summarizing and analyzing the qualitative data from: a) the group presentations and b) interview transcripts of the six cases into the two central themes: i) learning experiences and ii) motivation to learn science. The case-based and theme-based approach is built on the visual display of data in a matrix of primary data summarization formed from: i) the group presentations, ii) the interview transcripts and iii) the observation notes.

In this study, 3 main themes were constructed to allow multiple data sources related to each student's learning experiences and motivation to be collated. Both the learning experiences and the student's motivation that was acquired are presented in terms of quotations from: a) the interview extracts, b) the students' work and c) the observation notes. This enabled to link

student's individual's learning experiences to their development of 21st century skills which lead them to acquire the conceptual understanding of science.

As informed by the research questions driving this study, the themes that emerged from the interview data analysis are grouped into three categories: i) learning experiences, ii) development of conceptual understanding and iii) motivation to learn science.

Points of Mixing for Mixed Methods

The process of mixing differing classifications of data in an analysis, by merging both the quantitative and qualitative, is to answer the mixed method research question (Creamer, 2018). Creamer (2018) describes five strategies for mixing quantitative and qualitative data and analytical strategies: (i) blending, (ii) converting, (iii) extreme case sampling, (iv) cross-case comparisons, and (v) meta-inferences. For this study, to complement a mixed method study, data transformation is achieved by quantifying the qualitative data, in the form of frequency counts, to enable statistical analysis to take place whereas the mixing strategy used is meta-inferences.

This study found that besides understanding the science concepts, the students need pedagogical knowledge (PK) to explain to their peers the content knowledge (CK) of science concepts. It was interesting that from the data analysis, the students have a good background knowledge of using the internet and ICT (technological knowledge, TK) to prepare their solutions and technological pedagogical knowledge (PCK) when they prepared their group presentations.

The final synthesis from meta-inferences was collectively drawn from the findings that were yielded by both approaches. The quantitative findings suggest that the TPACK-in-TELA has helped to develop students' science conceptual understanding; particularly as students were able to retain their understanding over extended periods of time. This outcome suggests that TPACK-in-TELA can be used by science teachers to teach science to facilitate lifelong learning with and for their students. Based on the analysis, the meta-inferences for each individual case were constructed to link the learning experience to development of 21st century skills. The final categories were learning experiences in Content Knowledge (CK), Technological Knowledge (TK), Pedagogical Knowledge (PK) and Technological Content Knowledge (TCK).

As shown by the data analyses in this study, learning experiences gained by the students are associated with motivation to understand the concepts they learn in science. The students' conceptual understanding was shown through their 21st century skills development. The students gained science conceptual understanding when they develop their communication, knowledge building, self-regulation, the use of ICT, collaboration, and real-world problem-solving skills. The emergence of students' learning experiences and motivation from the qualitative data analysis are linked in meta-inferences in the next section to show a deeper understanding of those students' achievements in science.

The quantitative findings suggest that students' conceptual understanding changes after the boost camps interventions with TELA. Analysis from the qualitative interviews provided some evidence as to the possible changes. First, those students explained the learning experiences helped them to achieve science conceptual understanding. Second, the case study enhances our understanding that students with different abilities were able to increase the

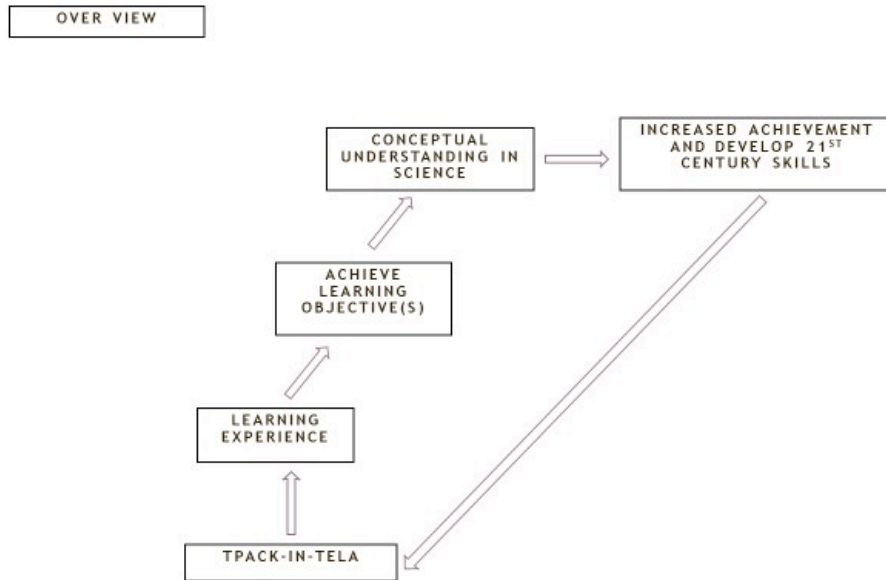
motivation to learn science and improve their 21st century skills through the learning experiences they described in the interviews. As informed by the results of both the qualitative and quantitative data analyses, the stages of developing students' science conceptual understanding during this study are summarized in Figure 7,


Figure 7: the stages of developing students' science conceptual understanding during this study

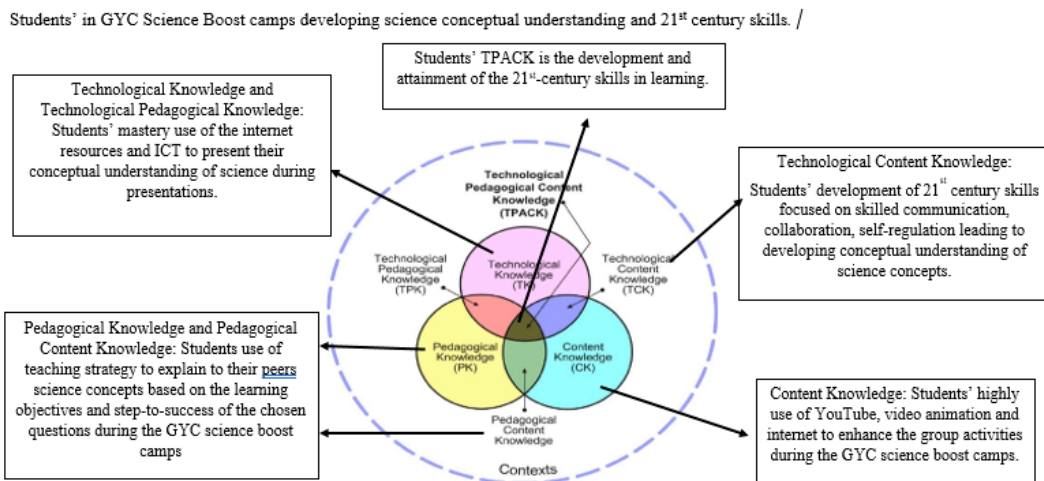
Third, the definition of the CK, TK, PK and TCK of TPACK components in the findings of this study based on Mishra and Koehler (2006) is presented in Figure 8, which shows the relationships between the students' PK, CK, TK and PCK in this study.


Note: Based on Mishra, P., & Koehler, M.J. (2006) Technological Pedagogical Content Knowledge: A new framework for teacher knowledge.

Teachers College Record, 108(6), 1017-1054.

Figure 8: Results of this study based on Mishra, P., & Koehler, M.J. (2006) Technological Pedagogical Content Knowledge: A new framework for teacher knowledge.
(Teachers College Record, 108(6), 1017-1054.)

The results of this study have shown that hands on activities helped students visualize science concepts and make connections between the concepts and the solutions to the questions. The effectiveness of the learning activities and instructions requires students to be able to visualize and make connections between representations of the same phenomena (Ardac and Akaygun, 2003). Second, the hands-on activities in the boost camps have shown that teachers can use these interventions to measure students' achievement in science filling the gap raised by Chai, *et.al.,* 2013 and Janssen and Lazonder, 2016. In line with the government's vision to improve students' achievement in the BGCE 'O' Level Examination in Combined Science, the results will also provide useful insights to policymakers or educators to design curriculum based on TPACK framework.

Supported by literature review in this paper, the ability of the students shown in constructing their presentation slides from their prior knowledge gained in the declarative stage fits into the constructivist framework which emphasize the importance of building on the learner's prior knowledge to construct new knowledge.

Discussion and Conclusion

The use of technology in teaching and preparation of technologically enriched learning environments in this study required high motivation from the teachers. The need to start to respond to the challenges of globalization and the digital age of teaching and learning as the world has been developing very rapidly with industrial revolution 4.0 resulting in all sectors seek to apply and integrate technology (Purwaningsih, et.al., 2019).

It can be concluded that teachers need to be given more trainings to plan their lessons using technology in curriculum design by giving them more professional development in technology integration. Correspondingly, Purwaningsih, et.al., (2019) mentioned that teachers must experience a paradigm shift in teaching and learning where technology does not only serve as a tool to aid instructions but also function as a tool that benefits students' learning.

Even Mishra and Koehler (2006) argued that TPACK knowledge is created when teachers employ their technological, pedagogical, and content knowledge to create specific technology integration strategies. Hence, the use of TELA in this study, the specific technology-integration strategies referred to pedagogical strategies in creating TELA for Bruneian students in learning science. Likewise, the integration of technological knowledge, pedagogical knowledge and content knowledge in TELA helped to accelerate students' conceptual understanding, improve students' motivation to learn science and develop students' attainment of 21st -century skills.

To develop and implement teaching techniques for meaningful learning, each teacher needs to be fully knowledgeable in terms of his or her content knowledge (CK) and pedagogical knowledge (PK). Even researchers (Mishra & Koehler, 2006; McCrory, 2008) have argued that besides CK and PK teachers also need to master technological knowledge (TK). When combined, these three bodies of knowledge (CK, PK and TK) form a framework for technological inclusion (Mishra & Koehler, 2006). Therefore, it is suggested that, when it comes to science subjects, science teachers need to upgrade not just their content knowledge and pedagogical knowledge, but also their technological knowledge.

The present study indicates that student achievements can be enhanced through TELA that are student-centred and characterised by TPACK's backward designs. Based on the findings of this approach, it could serve as a guide for teachers to implement the TELA, especially amongst students with different academic abilities, because the elements of the approach are suited for learners with different abilities (Arıkan, 2018).

Nevertheless, to drive the Brunei's Wawasan 2035 all parties (Ministry of Education, school leaders, teachers, researchers, students and parents) are interdependent of each other, and teachers can help the change by providing evidence from their own authentic classroom settings through the *ecology of educational change* (Deng, 2019).

Career-Related Parental Behaviours and Senior Secondary Students' Career Development in Underdeveloped China

Yixing YANG, The Education University of Hong Kong, Hong Kong SAR
Siu Wai WU, The Education University of Hong Kong, Hong Kong SAR

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Parents are major socializers for senior secondary students' career development. Prior research has investigated parental influence and highlighted typical types of parental support. While parental support highly interplays with other career-related behaviour, limited research explores the career-related parental behaviour (support, intervention, engagement) on senior secondary students' career adaptability, especially in underdeveloped areas of China. Therefore, this study investigated the impact of career-related parental behaviour on career adaptability among senior secondary students in underdeveloped regions of China. Drawing on a sample of 838 senior secondary students in Meizhou, Guangdong Province (Mage=17.51, SD=0.89, 50.7% Female), this study adopted a person-centred approach to evaluate career-related parental behaviour and their corresponding influence on students' career adaptability. Results recognised two types of parents ("authoritative" and "warm and supportive") regarding their career-related behaviour. Senior secondary students in the "warm and supportive" group show higher career adaptability than those in the "authoritative" group, specifically in control, curiosity, and confidence. However, no difference in concern is found between the two groups. These results emphasise the value of the person-centred approach in understanding parents concerning their career-related behaviour in underdeveloped China. Furthermore, it suggests that although filial piety is valued in Chinese culture, parents need to let their children go. It will benefit senior secondary students more through active support and engagement in career development. With a new understanding of parents and their impact on senior secondary students' career adaptability in underdeveloped China, this study lays a foundation for future research and practical interventions.

Introduction

Parents have a central role in senior secondary students' career development in the family context. Empirical research articulated that senior secondary adolescents rated their parents as one of the most important others (Ho, 2015) to discuss career-related topics (Otto, 2000). Besides, adolescents' career interests, intentions, and goals, as well as their career-related self-efficacy and outcome expectations are under the great influence of their parents through their daily interaction in the family context (Kenny & Medvide, 2013; Lent et al., 1994; Liu et al., 2015). Acknowledge the great impact of parents, prior research identified two types of influence in the family context: the structure variables (e.g., parents' education or occupation) and the process variables (e.g., parental aspirations, parental support, and parent–child relationships), with family process variables are suggested to shape youth's career decision-making self-efficacy more profoundly comparing with structural variables (Hargrove et al., 2005). However, parents are not simply influence their children through single and seperate variable, instead through combined and interrelated behaviours. The understanding of career-related parental behaviours will provide a more comprehensive picture of the way parents are involved in their children's career development, contributing to guiding parents to support their adolescent children's career development. Therefore, this research delves into career-related parental behaviours as the process variable to get insight into the types of career-related parental behaviour, and their effect on senior secondary students' career development.

Senior Secondary Students' Career Development and Career Adaptability

Globalisation and technological development have led to a changing and uncertain world (Santilli et al., 2020). In this context, it is hard to predict an industry's future, contributing to the challenges for adolescents to make a career decision (Savickas et al., 2009). Accordingly, in the world characterised by frequent transitions, Savickas (2005) proposed a career construction theory, which explains individuals' behaviour in managing vocational tasks, transitions, and traumas (Savickas, 2013).

As a core assumption in the career construction theory, career adaptability denotes the psychological resources adolescents seek in constructing their careers and dealing with developmental tasks in frequent transitions (Savickas, 2005). Career adaptability is a psychosocial construct that provides four sub-dimensions to evaluate adolescents' career development. The four sub-dimensions of the framework of career adaptability comprise career concern, career control, career curiosity, and career confidence (Savickas, 2005; Savickas & Porfeli, 2012). Career concern is the first and most important sub-construct that implicates individuals' orientation to future career acts and the awareness of planning for transitions. Career control refers to individuals' sense of control of the future and involves career decision-making skills. Career curiosity means curiosity about the self and the environment, involving information seeking about the self, the world of work, and the desired future. It appears when individuals think about themselves in different situations. Finally, confidence shows individuals' confidence in dealing with developmental tasks. It will aggregate during the exploration experience. As the world of work shifts from stable to ever-changing, career adaptability is viewed as a critical ability to face the challenges and uncertainties posed by the constantly changing society (Luthar & Brown, 2007; Rossier, 2015; Santilli et al., 2014). Empirically, career adaptability benefits individuals' career development (e.g., Rudolph et al., 2017; Yu et al., 2018), academic performance (Negru-Subtirica & Pop, 2016) and individuals' well-being (e.g., Wilkins et al., 2014; Santilli et al., 2020). Given that senior secondary students will soon face the transition from secondary

education to postsecondary education/employment and make their career decisions, investigating the antecedents of career adaptability will provide valuable implications to support their children's smooth transition.

Parents and Senior Secondary Students' Career Adaptability

Acknowledge the significance of career adaptability in a dynamic society, prior research has identified individual antecedents and relation factors of career adaptability. Individuals' hope, self-esteem, cognitive flexibility, and environmental exploration positively predict their career adaptability (Chong & Leong, 2017; Ginevra et al., 2016; Hui et al., 2018). Meanwhile, parents also play a profound role in shaping their children's career adaptability through interaction with children. For example, parental career support positively correlates with adolescents' career adaptability (Hirschi, 2009). Similarly, Lee (2018) investigated 581 Korean senior secondary students and found that parental career-related support mediates the association between students' family socio-economic background and their career adaptability. Besides, parental career expectation on their children has demonstrated an association with senior secondary students' career adaptability (Zhou et al., 2023). While parental structural variables (e.g., SES) and process variables (e.g., expectation, support) are pointed out to have a salient impact on adolescents' career adaptability, this research argues that the behavioural dimension is especially of value because it could inform career counsellors of the details understanding of how parents behave in their children's career development, contributing to providing interventions for parents to facilitate children's career development in the future.

Endorsing the importance of parental behaviours, Dietrich and Kracke (2009) identified three major components of parental career-related behaviour: support, interference, and lack of engagement. Parental support, which involves parental financial support, resources support, networking support (Borgen & Hiebert, 2006) and emotional support (Hou et al., 2010) for adolescents' career development, is widely investigated in existing research (e.g., Alfianto et al., 2019; Ginevra et al., 2015) and positively correlated with students' career development. Prior research articulated that greater parental support lead to students' higher career decision-making self-efficacy (Gushue & Whitson, 2006; Keller & Whiston, 2008), career self-efficacy (Turner & Lapan, 2002), career expectations (Zhou et al., 2023), career aspirations (Ma & Yeh, 2010), more career exploration (Dietrich & Kracke, 2009) and career certainty (Constantine et al., 2005), as well as lower career-related stress (Dietrich & Salmela-Aro, 2013) and career salience (Diemer, 2007). However, the consideration of parental support is accompanied by considering its type and the frequency. Besides, it also interconnects with other factors like time and resources. Some parents may also have barriers to engagement, such as a lack of time and knowledge to support their children's career development. Therefore, it needs further consideration of other interconnected factors. Previous research shows that some parents tend to place their views and expectations of individual career development on their children (Young et al., 2001), consistent with Liu et al.'s finding (2015) that parents try to influence their children's career aspiration by intentionally fostering children's career values, interests, attitudes, and even interpersonal skills rather than simply enforce their children to obey their views and expectation.

While empirical studies have recognized the pivotal role of career-related parental behaviours consisting of support, interference, and lack of engagement in shaping adolescents' career adaptability (Dietrich & Kracke, 2009; Guan et al., 2015; Liang et al., 2020), there is limited understanding of the profile of career-related parental behaviours received by senior

secondary students. Notably, Zhou et al. (2020) and Liang et al. (2023) have adopted a person-centred approach to identify different types of parents based on their career-related parental practices. However, few research focuses on the detailed impact on students' career adaptability and its sub-dimensions among students in underdeveloped areas in China. In case career and life planning education is limited available in the major cities in China (Xiao, 2018), senior secondary students from underdeveloped regions are vulnerable regarding their career development in China. Since family SES influence individuals' career development through parental career-related support (Lee, 2018), along with that parents are one of the social resources for senior secondary students' career development, parents' career-related behaviours for their senior secondary children in underdeveloped China may present different pattern as existing research. In view of the above literature review, the current study proposes the following two research questions guiding the investigation:

RQ1: What types of parents can be identified based on senior secondary students' perceived career-related parental behaviours in underdeveloped China?

RQ2: Are there differences in career adaptability among senior secondary students with different types of parents in underdeveloped China?

Methodology

Participants

This study adopted random sampling to obtain students' ratings of career-related parental behaviours and their career adaptability. In total, 838 senior secondary students (M_{age}=17.51, SD=0.89, 50.7% Female) from four public senior secondary schools in Meizhou in this study. Meizhou is a Hakka community on the border of Guangdong province, China. The GDP per capita income was less than half of the per capita income in China in 2020, indicating that it is an underdeveloped city.

Measures

The 15-item Parental Career-related Behaviors scale developed by Dietrich and Kracke (2009) is adopted to understand career-related parental behaviours. The scale comprises three sub-dimensions: support, interference, and lack of engagement. Each dimension consists of 5 items. As per the previous adoption by Zhou et al. (2020), this research adopted 5 points from 1 (does not apply at all) to 5 (fully perfectly) instead of the original 4 points. The reason for using the five-point Likert scale is its accuracy. The scale shows good validity and reliability (Zhou et al., 2020), and Cronbach's α in this research are .92 (support), .91 (interference), .90 (lack of engagement).

As for career adaptability, the Chinese version of the Career Adapt-Abilities Scale–Short Form (CAAS-SF) developed by Yu et al. (2019) is adopted in this research due to senior secondary students' heavy study task. It is a 12-item scale investigating concern, control, curiosity, and confidence. Each sub-dimension consists of 3 items. It is also a five-point Likert scale from 1 (not strong) to 5 (strongest). The scale shows good validity and reliability (Yu et al., 2019), and the Cronbach's α in this research are .92 (concern), .87 (control), .87 (curiosity), .88 (confidence).

Data Analysis

To identify the types of parents in terms of senior secondary students' reported parental career-related behaviours, cluster analysis is used to obtain a distinctive cluster of parents based on the parental career-related behaviours. Cluster analysis has been wildly seem and used as an appropriate technique to formulate clusters within data without explicitly label (Sun et al., 2017). It allows the identification of clusters of respondents according to the similarity of their responses to the given scale (Hair et al., 2014). This study first adopted hierarchical cluster analysis using Ward's clustering method based on "Euclidean distance" to decide the cluster number. A following k-means cluster was run to group parents into two types.

To further compare senior secondary students' career adaptability between students with different types of parents, five independent-sample t-tests were run to compare the means of senior secondary students' overall career adaptability and the sub-dimensions, namely concern, control, curiosity, and confidence.

Results

The hierarchical cluster analysis results (see Table 1) reveal that the highest percentage increase in heterogeneity is observed between the last two stages, i.e. 837 and 836 (25.25%). Therefore, this study decided to cluster parental career-related behaviour into two groups. The descriptive data of the two groups indicates that parents could be categorised into "authoritative group" and "warm and supportive group (see Table 2).

Table 1: Summary-statistics of hierarchical Clustering

Stage	Cluster 1	Cluster 2	Distance coefficient	No. of the cluster after the combination	Difference	% increase heterogeneity
835	1	571	15.53	3	0.31	2.46%
836	1	2	15.84	2	4.00	25.25%
837	1	21	19.84	1		

Table 2: Descriptive statistics of two groups of parental career-related behaviour

	Mean	
	Cluster 1	Cluster 2
Support	3.42	3.66
Interference	3.30	2.12
Lack of engagement	3.01[a]	4.01[a]

a. scores have been reversed.

The results of the independent-sample t-test reveal the differences in senior secondary students' career adaptability in Table 3. There are significant differences between authoritative group and warm and supportive group regarding senior secondary students' career adaptability, t (836)= -4.06, p＜0.001(two-tailed), 95% CI of the difference between means=(-0.26, -0.09); career control, t (836)= -4.78, p＜0.001(two-tailed), 95% CI of the

difference between means=(-0.32, -0.13); career curiosity, t (836)= -3.92, p＜0.001(two-tailed), 95% CI of the difference between means=(-0.28, -0.09); career confidence, t (836)= -3.53, p＜0.001(two-tailed), 95% CI of the difference between means=(-0.26, -0.07). However, there is no significant difference in career concern between the authoritative group and the warm and supportive group, t (836)= -2.41, p=0.016(two-tailed), 95% CI of the difference between means=(-0.23, -0.02).

Table 3: Summary-statistics of K-means Clustering

	Mean		SD		t
	Cluster 1	Cluster 2	Cluster 1	Cluster 2	
CA	3.55	3.73	0.63	0.63	-4.06***
Concern	3.40	3.52	0.72	0.77	-2.41
Control	3.62	3.85	0.69	0.68	-4.78***
Curiosity	3.59	3.79	0.70	0.70	-3.92***
Confidence	3.60	3.76	0.69	0.69	-3.53***

CA= career adaptability. ***P < .001.

Discussion

The Types of Parents

The k-means clustering analysis identified two types of parents, one shows intermediate support, interference, and engagement, while the other represents high-level engagement and medium-level support, as well as low-level interference. The former is similar to the authoritative parents, who are responsive and supportive but still maintain high control simultaneously (Baumrind, 1991). However, the later highly engaged and supportive parents expressed more warmth and presented less control with lower interference. While Meizhou city ranked as the last in Guangdong and only had half of the per capita income in China, students from Meizhou may be from socially disadvantaged backgrounds compared to their city counterparts. However, although prior research believes that parents' SES is linked to ideal parenting practices related to individuals' career and life development (Bryant et al., 2006), this research breaks the stereotype of parents in rural China to some extent. Although coming from geographically vulnerable areas, parents identified in this research show medium to high support and engagement based on senior secondary students' perceived parental career-related behaviours. Due to the underdevelopment of the Meizhou economy, there are few employment paths. The number of people employed by state-owned units accounts for a large proportion of the number of people employed by urban non-private units in the city, with 54.4% of people employed by state-owned units in Meizhou, which is stable and relatively easy to do (Meizhou Municipal People's Government, 2017). Therefore, they have more time and resources to invest in their children's development. Furthermore, despite the fact that more than half of the people work in state-owned organisations, they continue to value education, which allows their children to have a better development without being restricted by the underdeveloped region.

The Differences Between Students' Career Adaptability Between Students With Different Types of Parents

Independent t-tests confirmed the differences in senior secondary students' career adaptability, specifically career control, curiosity and confidence among senior secondary students with different parents in underdeveloped China. In other words, the results suggest

the impact of parental career-related behaviours on senior secondary students' career adaptability, except for the sub-dimension of career concern. The results are similar to previous research show different overall career adaptability among senior secondary students with different types of parents (Zhou et al., 2020). In terms of the insignificant differences in career concern among senior secondary students with different types of parents, it may be due to the overall relatively lower level of career concern among senior secondary students in China (e.g., Guan et al., 2015; Leung, 2022). Career concern refers to the consideration of future direction and planning awareness. Since students in the Chinese context are under great learning pressure and their major goal is to excel in the college entrance examination (Gaokao), thus they usually prioritise academic performance over career and life development. Even though parental career-related behaviours impact senior secondary students' career adaptability, parents also think education is a social ladder to move to a higher social status, contributing to the importance of academic performance in the Chinese context.

Conclusion

This study investigated the types of parental career-related behaviours and their impact on senior secondary students' career adaptability. The results categorised parents into "authoritative parents" and "warm and supportive parents". Senior secondary students with warm and supportive parents showed higher career adaptability, career control, career curiosity, and career confidence. However, there is no significant difference in career concern among students with authoritative parents and warm and supportive parents. The findings suggest that senior secondary students benefit from their parents' active support and engagement in their career development. Parents supporting their children could consider reducing their control on children and letting children go appropriately to explore themselves and the external environment.

However, this study is limited in two aspects. Firstly, the differences between senior secondary students' gender were not explored in this research; Secondly, this study only examined the impact of parental career-related behaviours on senior secondary students' career adaptability, ignoring the potential moderating effect of parental' structural factors (e.g., parents' education background, parents' work statues). Future studies could explore parental career-related behaviours for male students and female students. Future research could also consider the possible variables in senior secondary students' career adaptability in underdeveloped cities in China, for example, parents' work status and the differences between left-behind students and non-left-behind students.

The Use of Virtual Tabletop for Revising Electron Counting in Inorganic Chemistry

Maw Lin Foo, National University of Singapore, Singapore

Abstract

Electron counting of metal complexes is an important skill for chemistry undergraduate students learning inorganic chemistry. As part of game-based learning, we have developed a card game termed "CountQuest" for students to revise electron counting after learning this concept from conventional lectures. In this proceeding, we describe the use of a free web-based virtual tabletop platform, playcards.io for implementing an online version of CountQuest due to COVID-19 restrictions in 2021. Pre- and post- game surveys indicated that students' confidence in electron counting improved to a large extent. Pre- and post-game quiz results at 5% significance level indicated that there is a significant difference between quiz scores. The students' perception of confidence in electron counting showed improvement after playing CountQuest in all three years that the game was played, independent of the mode of delivery of the game (physical or online).

Keywords: Game-Based Learning, Virtual Tabletop, Electron Counting

www.iafor.org

Introduction

Electron counting is a foundational concept for inorganic chemistry. Metal complexes are compounds that consist of a central metal center (M) surrounded by electron donating ligands (L). The electron count of octahedral metal complexes is typically 18 (thus "18-electron rule") due to the filling of 9 bonding molecular orbitals while the antibonding orbitals are vacant (Sidgwick, 1934). As part of the learning objectives for the module CM2111: Inorganic Chemistry 2, students are expected to perform electron counting of metal complexes by adding the valence electron count from the metal center and ligands respectively. Achieving proficiency in electron counting after learning this concept in lectures typically involves voluminous practice. To enable students to practice electron counting in an interactive and fun fashion, we have adopted game-based learning. In the review by Plass et al. (2015), four key arguments were made for games as an effective learning environment, namely: motivation, player engagement, adaptivity and graceful failure. Inspired by a card game (Thammavongsy, 2020) in the literature, we have developed an educational card game termed "CountQuest" (Tan et al., 2022, Foo & Ang et al. 2023) for revising electron counting concepts taught during CM2111 lectures.

CountQuest utilizes separate metal and ligand card decks (Figure 1). The game is played in groups of 3-5 students and seven ligands cards from the ligand card deck are distributed to each player. Game play starts by revealing a metal card in the metal card deck, followed by players taking turns to place their ligand cards till a certain electron count (typically 18) is reached for the metal complex. Since education games allow for scaffolding of learning (Melero et al., 2011), the players will initially start off with labelled and then proceed to unlabelled ligand cards to increase the difficulty of the game since students will need to use their chemical knowledge to obtain the electron counts of ligands. Ligands were classified based on the Covalent Bond Classification (CBC) or LXZ method developed by Green (1995).
Figure 1: (a) Metal card (b) labelled Ligand card (c) unlabelled Ligand card

In 2019, the first version of CountQuest was mounted using physical cards and the game was played face-to-face in groups of three to five players. In 2020, due to Covid -19 restrictions, all tutorial classes were held online. The game was played online using Zoom with the group facilitator starting the game by screen-sharing a Powerpoint slide with a metal card, followed by the players sketching ligands using the Zoom annotate feature. We have written about this digital version of CountQuest in our previous publication (Tan et al., 2022). This version of CountQuest had some drawbacks as the card deck for each player was pre-assigned and

facilitator had to track each card played by the players, which was cognitively demanding for the facilitator.

In 2021, as Covid-19 restrictions continued, an alternative approach was used to mount CountQuest online using a web-based virtual tabletop found on www.playingcards.io for better game mechanics and experience. A virtual tabletop is a digital platform that enables players to meet online and play existing or customized tabletop games (such as board, card, role-playing games) with a playing experience resembling a physical game. Playingcards.io is web-based, free to use and many common card and board games can be found there. More importantly, it allows users to build customized game rooms and import customized card decks and boardgames via a user-friendly interface. This makes it a useful online platform for designing and hosting tailored educational games such as CountQuest. The use of playingcards.io for hosting educational card games during the Covid-19 pandemic is not new (Wilson, 2020). It is important to note that since there is no communication platform in this virtual tabletop, players will have to use existing digital platforms such as Zoom, Skype, WhatsApp, etc to communicate with each other.

Our current work attempts to investigate the following research questions (RQs):
> RQ1: What are students' perceptions of content mastery of electron counting after playing CountQuest?
> RQ2: Do students perform better in an electron counting quiz after playing CountQuest?
> RQ3: How do students perceive CountQuest as a method of learning?
> RQ4: How do students perceive playing CountQuest on a virtual tabletop?

Research Methodology

The study was carried out in a one-hour tutorial session of CM2111 (mandatory year 2 undergraduate inorganic chemistry course) during fall semester of 2021. Students learnt electron counting during a 1.5-hour lecture session and completed a tutorial on the topic about a month before the game session. 79 students participated in this study. Participants completed a pre-game survey and quiz before the game session and a post-game survey (with additional questions) and quiz at the end of the game session. Surveys and Quizzes were conducted in NUS's proprietary Learning Management System, LumiNUS.

Implementation of CountQuest in playingcards.io

The "Custom Room" feature of playingcards.io was used to create the customized game room for CountQuest (Figure 2). The game rules, simplified periodic table for transition metals, Turn and Metal card counter (Figure 2) were added to the gameplay area using the "Edit Table" function. Metal and Ligand cards were imported to their respective decks using the "Custom Card Deck" and "Custom Holder" features. Similar to a physical game, players use the mouse button to play Ligand cards from their hand to the gameplay area, draw and flip Metal and Ligand cards during gameplay. A game round begins by flipping a Metal card, players then play Ligand cards to increase the electron count of the complex to reach its required value. If a player runs out of Ligand cards in their hand to play or cannot play a Ligand card without exceeding the required electron count, they must draw a Ligand card from the deck. The player who played the Ligand card that fulfills the required electron count of the complex and correctly says the oxidation state and *d*-electron count wins the round. To

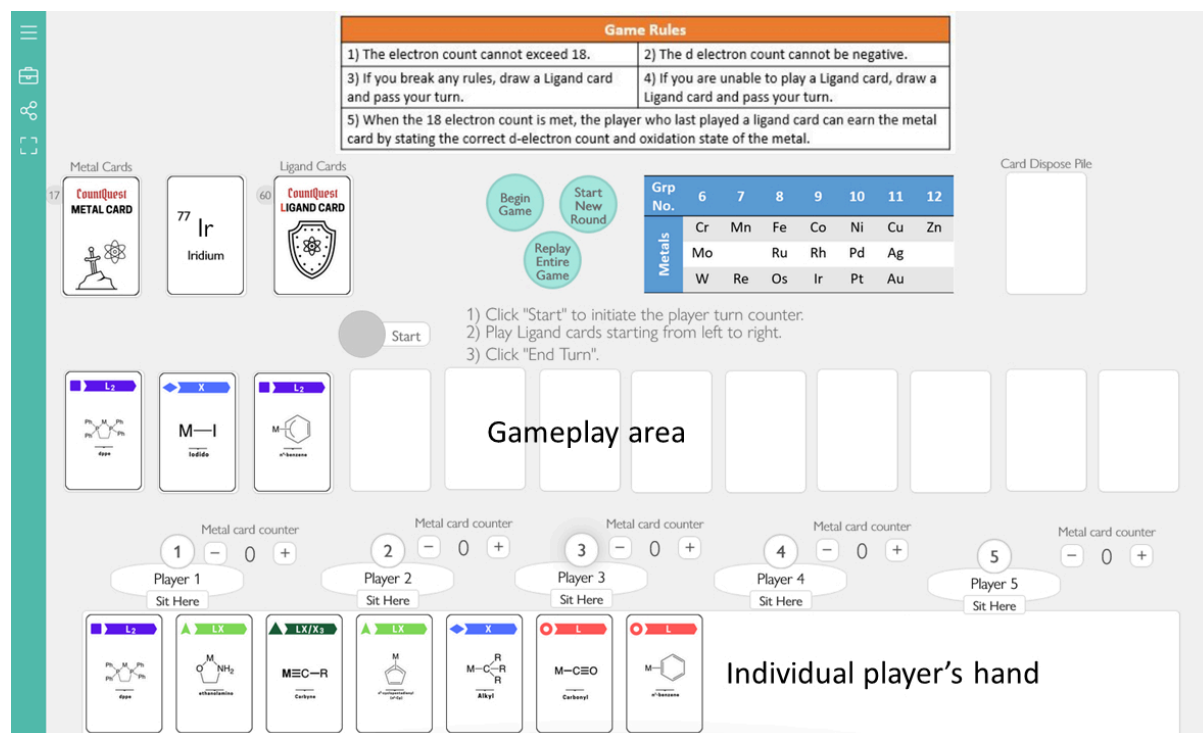
keep track of the number of rounds each player won, the facilitator will increase the respective player's Metal card counter for each round they win.


Figure 2: Customized playing table for CountQuest.
Note that the cards in the individual player's hand cannot be seen by other players.

Three levels of CountQuest were developed to scaffold students' learning on electron counting (Table 1). Customized Metal and Ligand cards decks were designed for each level.

Level	Purpose	Required electron count of complex	Ligand Cards
pre-level 1	Familiarize with game rules and refresh lecture on electron counting	18	Labelled
1	Appreciate not all metal complexes have 18 electrons and increase fun factor of the game	variable: 16-21	Labelled
2	Practice electron counting of ligands	18	Unlabelled

Table 1: The three levels of CountQuest played, along with the corresponding purpose, required electron count and the type of ligand cards used for each level.

Results and Discussion

To illuminate the research questions, a survey was administered to obtain student perceptions in the following areas:
  (i)   content mastery of electron counting
  (ii)   game design of CountQuest

   (iii)   CountQuest as a learning method
   (iv)   playability of CountQuest in a virtual tabletop setting

The results are shown in Tables 2 to 5.

No.	Question	(A+ SA)*% pre	(A+ SA)*% post
1	I had difficulties learning the concept of electron counting.	27.5	17.5
2	I can classify ligands according to the L and X convention.	60.0	77.5
3	I can state the oxidation state and d-configuration of the metal in the metal complex.	75.0	90.0
4	Overall, I am confident in electron counting for metal complexes.	32.5	72.5

Table 2: Pre-, post- game survey questions for content mastery (N=40). (A+ SA)% represents the percentage of respondents who rated agree (A) and strongly agree (SA).

From the pre- and post-game survey in Table 2, confidence in electron counting for metal complexes (Q4) has improved as the percentage of respondents agreeing and strongly agreeing more than doubled from 32.5% pre-game to 72.5% post-game (RQ1). This large increase in students' perception of their confidence in electron counting is very encouraging. In addition, the percentage of respondents agreeing and strongly agreeing to specific skills in electron counting such as classification of ligands, oxidation state and d-configuration of the metal also exhibited a marked increase post-game.

To determine whether playing CountQuest makes a difference in the quiz scores of students (RQ2), students took a pre- and post-game quiz. The pre- and post- game quiz consist of 5 questions with a total score of 15. The students were shown a different metal complex for each question and asked to write down its three key numerical attributes (electron count, oxidation state and d-electron count).

A paired sample t-test at 5% significance level was performed to evaluate whether there was a statistical difference between the score of the students in the pre-game quiz and the post-game quiz after playing CountQuest. The results indicated that the post-game quiz scores (M = 12.32, SD = 2.22) were significantly higher than the pre-game quiz scores (M = 14.12, SD = 1.41), $t(56) = 5.753$, $p = < .001$.

No.	Question	(A+ SA)*%
1	The instructions of the game were clearly defined.	87.5
2	The card game was easy to play with prior knowledge of the 18-electron rule.	89.6
3	The duration of the game was just nice	83.3
4	The number of players for the game is just nice	83.3
5	I enjoy playing the different levels of the game	89.6
6	The number of game levels is appropriate	91.7
7	The progression of the game level difficulty is suitable	93.7
8	I enjoy playing the game with the metal card conditions	91.7
9	The card game was fun.	93.7

Table 3: Survey questions for game design of CountQuest (N=48). (A+ SA)% represents the percentage of respondents agreeing and strongly agreeing.

For Table 3, regarding the game design of CountQuest, 89.6% respondents agreed and strongly agreed that the game was easy to play with prior knowledge of the 18-electron rule. In addition, respondents responded favorably to the number and different game levels of CountQuest. More importantly, 93.7% of respondents perceive CountQuest as fun (Q9). Fun has been identified to be pedagogically beneficial (Bisson & Luckner, 1996) as it enhances intrinsic motivation to learn and creates a safe learning environment.

No.	Question	(A+SA)*%
1	I prefer this method of learning compared to the conventional method.	60.4
2	This method of learning is more effective than the conventional method	60.4
3	This method of online learning is engaging.	85.4
4	Playing this game with my peers helps me to identify my misconceptions	83.3
5	I would recommend doing this card game session again for next year's CM2111 class	87.5
6	The different levels of the game reinforce my understanding of the relevant chemistry concepts	91.7

Table 4: CountQuest as learning method (N=48). (A+ SA)% represents the percentage of respondents agreeing and strongly agreeing.

On RQ3 about CountQuest as a learning method, only a slight majority (60.4%) preferred learning electron counting via CountQuest compared to the conventional method (i.e. lectures), with the same percentage saying that it is more effective (see Table 4, Q1 and 2). Interestingly, a large majority (85.4%) agreed and strongly agreed that "this method of online learning is engaging". This suggests that while students think CountQuest played on a virtual desktop is engaging, they are divided on whether it is an effective method for learning the concept compared to conventional method.

No.	Question	(A+SA)*%
1	It is easy to play the game on playingcards.io.	83.3
2	The layout of the virtual play area is clear.	81.2
3	I can play the game without a game master.	58.3
4	I prefer playing the game virtually than face-to-face with physical cards.	33.3

Table 5: Playability of CountQuest on virtual tabletop (N=48). (A+ SA)% represents the percentage of respondents agreeing and strongly agreeing.

For Table 5, regarding the playability of CountQuest on the playingcards.io virtual desktop (RQ4), more than 80% of the students agreed and strongly agreed that it was easy to play the game and the layout of the virtual play area is clear. This suggests that playingcards.io can be used for hosting educational card games and received favorably by students. However only one-third (33.3%) of the students preferred to play the online version of CountQuest than the face-to-face card game version. This is most probably due to the lack of social interactions between players playing an online game compared to a version which is face-to-face. As playingcards.io has limiting scripting ability, CountQuest was played with a game master (facilitator) for each group since the players need to be instructed on the rules and gameplay at the start. When asked whether CountQuest can be played without a game master, only a slight majority, 58.3% of respondents agreed. This indicates the presence of a game master is necessary for optimum gameplay for this version of CountQuest.

As CountQuest was played in CM2111 over three years with different modes of delivery, we compared the students' responses on selected questions regarding confidence in electron counting, peer help for identifying misconceptions and fun element of the game (Qn. A-C) in Table 6:

	2019	**2020**	**2021**
Mode of game delivery	physical face-to-face	online via Zoom annotate	online via playingcards.io (current work)
Qn. A (pre-game): Overall, I am confident in electron counting for metal complexes.	44.1	46.0	32.5
Qn. A (post-game): Overall, I am confident in electron counting for metal complexes.	86.1	81.0	72.5
Qn. B (post-game): Playing this game with my peers helps me to identify my misconceptions.	94.4	84.1	83.3
Qn. C(post-game): The card game was fun.	NA*	79.4	93.7

Table 6: Selected questions for CountQuest played with different modes of delivery for fall 2019 (N=72 for pre and post-game), 2020 (N=63 for pre and post-game), 2021 (N=40 for pre-game, N=48 post-game). Numbers represent the percentage of respondents agreeing and strongly agreeing. *Qn. C was not asked during 2019.

From Table 6, a marked increase in the students' perception of confidence for electron counting from pre- to post-game was seen in all three years showing that CountQuest was effective regardless of the mode of game delivery: physical or online. For Qn.B, a higher proportion of students perceived the physical version in 2019 to be more effective for peer help compared to the online versions played in 2020 and 2021. This suggests that peer learning is more effective in a physical face-to-face than in an online environment due to

increased social interaction. This finding is consistent with previous work in the literature which indicated that face-to-face mode of game-based learning is perceived more favorably than online on aspects such as overall effectiveness and fun element (López-Fernández et al., 2023). In addition, Qn.C indicated that students perceived the current online version of CountQuest mounted on playingcards.io (93.7%) as more fun than the online version via using Zoom annotate in 2020 (79.4%). This is most probably due to the smoother game mechanics/interface using a virtual tabletop compared to annotating on a shared screen in Zoom.

Conclusion

A web-based virtual tabletop, playingcards.io was used to mount an online version of an electron-counting card game, CountQuest developed at the National University of Singapore. Students from the module CM2111: Inorganic Chemistry 2 played this game for an hour in the fall of 2021 after lectures on electron counting. Pre- and post-game surveys demonstrated increased confidence in electron counting which is further corroborated with a statistically significant gain in post-game quiz scores. Comparison of different modes of delivery (physical, online) for CountQuest all indicate an increase in CM2111 students' confidence in electron counting after playing the game. These results are encouraging and demonstrate that appropriately designed tabletop games played physically or online can be used to revise classroom concepts with an increase in student confidence and learning.

Exploring the Landscape of Gamification in Higher Education: A Systematic Mapping Study

Weiwei Zhang, Bond University, Australia
Amir Ghanbaripour**,** Bond University, Australia
Tsunemi Watanabe, Bond University, Australia

Abstract

The concept of gamification is attracting significant attention and implementation in several industries. However, its use in higher education is still in its early phases. The use of game design aspects in non-game situations, sometimes called gamification, has emerged as a prominent trend in boosting learning experiences. This systematic mapping study investigates the utilisation of gamification in non-game contexts, specifically within higher education. By analysing peer-reviewed articles published between 2018 and 2022, the study explores various aspects, including the application of gamification, the variables under investigation, the game design elements employed, and the platforms utilised for implementation. This study focuses on the examination of the academic implications of incorporating game design components. It aims to identify and analyse this field's current patterns and future directions. The findings indicate that gamification is widely seen within Computer Science/Information Technology and Business domains. Majorly analysed variables include motivation, academic performance, and engagement. The research also highlights the increased use of gamification in online courses throughout the pandemic, emphasising its potential to enhance remote education experiences. Notably, platforms like Kahoot! have regularly shown favourable results in this area. This study comprehensively examines the current state and possibilities of gamification in higher education environments.

Keywords: Gamification, Higher Education, Systematic Mapping

Introduction

In the past decade, the concept of gamification has emerged as a compelling approach across numerous domains (Hamari, Koivisto, & Sarsa, 2014). In the realm of education, gamification has become recognized as a technique that is used by institutions and educators to enhance learners' engagement, and motivation, and promote learning outcomes (Manzano-León et al., 2021). The increasing interest in using gamified approaches in education highlights its potential to revolutionize traditional pedagogical methods. This paper aims to explore the implementation of gamification within the dynamic landscape of higher education by embarking on an exploration of the existing body of research on the usage of gamification.

Definition of Gamification

Gamification has evolved as a potent approach in a variety of situations to affect human behaviour throughout the past decade. However, it is still a relatively contemporary idea (Hosseini, Humlung, Fagerstrøm, & Haddara, 2022). Initially appearing in the digital media industry in 2008, gamification has been rapidly incorporated into marketing, management, health and wellness, ecology initiatives, and education (Deterding, Dixon, Khaled, & Nacke, 2011). Even before 2008, the concept of gamification had existed for significantly longer than it was noticed. Moreover, it had been used in several instances as Kim et al. (2018) concluded: as an early attempt to increase client loyalty in a company, the Sperry & Hutchinson (S&H) stamp was a good example in business. In 1981, American Airlines (AA) implemented gamification into its operations to attract new clients and retain existing ones. Holiday Inn launched a comparable loyalty programme across the States after AA in 1983. Kim et al. (2018) also listed examples for educational purposes, such as The Oregon Trail and Lemonade Stand were created in the 1970s, Master Type, Rocky's Boots, SimCity, and so on in the 1980s.

In 1996, Richard Bartle (1996) developed a taxonomy based on investigating people who play multi-user dungeons (MUDs) and observing their social patterns. Bartle categorized participants into four groups based on their inclinations for acting or interacting and their interest in these games: socializers, explorers, achievers, and killers.

In 2002, game designer Nick Pelling was responsible for creating a game-like interface for ATMs and vending machines. He invented the Term "gamification" and labelled it as a "deliberately nasty word" since it was used to describe "using game-like accelerated user interface design to make electronic transactions both enjoyable and fast" (Burke, 2014). Since then, the term has taken on a broader meaning and is used primarily to motivate and engage people in a particular environment (Perryer, Celestine, Scott-Ladd, & Leighton, 2016).

In 2009, a gamified map application Foursquare was launched. The appearance of Foursquare was ground-breaking. It allowed players to collect badges by checking in one area, exploring new areas, or being a mayor of multiple places (Burke, 2014).

Although the term was invented much earlier than being widely accepted, it has been defined from many perspectives by researchers and academics throughout the years. According to Zichermann and Cunningham (2011), gamification is "the process of game-thinking and game mechanics to engage users and solve problems." While Kappa (2012) focused more on the design perspective and described gamification as "using game-based mechanics, aesthetics and game thinking to engage people, motivate action, promote learning and solve

problems." However, the multiple definitions of gamification all centre on the same principle, defined by Deterding et al. (2011) as the use of game design elements in non-game contexts. More specifically, gamification refers to the following:

- the use (rather than the extension) of
- design (rather than game-based technology or other game related practices)
- elements (rather than full-fledged games)
- characteristic for games (rather than play or playfulness)
- in non-game contexts (regardless of specific usage intentions, contexts, or media of implementation).

Deterding et al. (2011) categorized game design elements into different levels of abstraction. Five levels from concrete: 1) Interface design patterns, 2) game design patterns or game mechanics, design principles, heuristics or 'lenses', 3) conceptual models of game design units, 4) game design methods, and 5) design processes.

Game Design Elements

As previously mentioned, Deterding et al. (2011) divided game design elements into five categories, but not everyone agreed. Dicheva et al. (2015) took the game design element "badges" as an example, stating that it has been used as a game interface design pattern in Deterding's categorization, a game mechanic (Zichermann & Cunningham, 2011), and a game component (Werbach & Hunter, 2012), and a game dynamic (Iosup & Epema, 2014), and a motivational affordance (Hamari, Koivisto, & Sarsa, 2014). Dicheva et al. (2015) classified "badges" into gamification design principles instead of simply using game design principles to distinguish gamification and game.

In general, game design elements are defined into multiple levels of abstraction. There are several widely accepted game design element classifications. Zichermann and Cunningham (2011) categorized game design elements into mechanics, dynamics, and aesthetics (MDA). Werbach & Hunter (2012) classified them into Dynamics, Mechanics, and Components (DMC), which correspond to the first two components of Zichermann and Cunningham's framework and gamification design principles by Dicheva et al. (2015).

Gamification in Education

Gamification aids learning (Kim, Song, Lockee, & Burton, 2018). In education, gamification has increased prompting further research on this topic (Furdu, Tomozei, & Kose, 2017). Kim et al.(2018) defined gamification as "A set of activities and processes", "To solve problems related to learning in education", and "By using or applying the game mechanics". Gamification is becoming more popular in academia (Alhammad & Moreno, 2018).

Borges et al. (2014) conducted a systematic mapping in education to generate an overview and identified computer-supported collaborative learning initiatives that employ gamification. The authors found that higher education uses gamification the most. They also summarised primary studies by research objective and identified that most of the studies were aimed at students. They also categorised other objectives, including improving learning, mastering skills, behavioural change, socialization, and challenging. In the end, they discovered that there is a dearth of methods that integrate gamification with computer-supported collaborative learning.

Caponetto et al. (2014) examined 119 papers published from 2011 to 2014. Over half of these papers were in primary school and higher education. A cloud-generated diagram showed motivation and engagement were the most frequently used words from the paper abstracts. The authors also noted considerable ambiguity surrounding the terms gamification and game-based learning. Most papers consistently use the term gamification as the "use of game mechanics in non-gaming contexts" (Deterding et al., 2011). Lastly, gamification has been used in a wide range of subjects such as science, maths, foreign languages, health and software engineering, and transversal attitudes and behaviours such as peer collaboration, creativity, and self-guided learning.

Dicheva et al. (2015) mapped educational contexts where gamification and game elements have been used. First, visual status, social engagement, freedom of choice, freedom to fail, and rapid feedback are the most common educational gamification design elements. Points, badges, and leaderboards are the most popular game mechanisms. Further, computer science and information technology is the most dominant area/subject that uses gamification. Among four other categories, including courses without online gamification support, MOOCS or online courses, E-learning sites, and gamification support platforms, blended learning courses are the most used for higher education. Dicheva et al. (2015) divided gamification into four categories: 1) manual implementation on student performance, implementation as a plug-in or extension for a learning management system or online learning environment, 3) third-party software, or 4) standalone application. They reported that a plug-in or extension is mostly used.

In the most recent year, several review papers from different aspects were published. Hamari et al. (2018) examined 128 studies to identify how it was implemented, the expected outcomes, and the results. Social-oriented, immersion-oriented affordances are seldom applied in education. The most common psychological outcomes are the user experiences and perceptions of the system and features, while the most common behavioural outcomes are grades, participation in a system, and speed of conducting tasks and assignments. Finally, they advised adopting gamification with greater social and immersion-oriented affordances in an educational context.

Manzano-León et al. (2021) revealed that university education increased across education levels in 14 quantitative experimental research. Academic achievement, engagement, and motivation was highly investigated. They also found that most studies report positive results of using gamification. Saleem et al.(2022) focused on online education, addressing the purposes of using gamification, challenges for both students and teachers and elements that enhance students' motivation and engagement. Gamification in online education aims to increase specific skills, discover goals that promote learning, engage students, maximise learning, and encourage attitude change. Gamification can be useful for teachers acquiring knowledge and enhancing vital skills such as decision-making, cooperation, and communication, and an additional technique to make the learning process entertaining, interactive, and useful. Additionally, Saleem et al. indicated challenges such as technology infrastructure, Internet service, and the willingness to use this tool.

Most gamification research examined how gamification positively influenced academic promotion (Fuster-Guillo et al., 2019; Ng & Lo, 2022; Sailer & Sailer, 2021; van Roy, Deterding, & Zaman, 2019), motivation and engagement (Ghawail & Yahia, 2022; Ortega-Arranz et al., 2019; Rincon-Flores & Santos-Guevara, 2021; Song, Shi, Wang, & Xu, 2018). Since digital technology has become more affordable and prevalent, it is easier to employ

gamification (Zainuddin, Chu, Shujahat, & Perera, 2020). Few scholars focused on technology adoption or combined technology acceptance to examine students' motivation. Ab Rahman et al. (2018) identified the correlations between gamification technology, students' attitudes toward using gamification, and students' engagement based on a modified TAM in IT subjects. Chen and Zhao (2022) integrated the self-determination theory and TAM to identify the impact of motivation on gamification technology acceptance in foreign language education.

Design of the Systematic Mapping

A systematic mapping design is employed in this study. A systematic mapping study is comparable to a systematic review, with the exception that it categorises the sort of research reports and results that have been published and frequently provides a visual summary of its findings, the map (Petersen, Feldt, Mujtaba, & Mattsson, 2008). The essential process steps of carrying out a systematic mapping study (Petersen, Feldt, Mujtaba, & Mattsson, 2008), including a definition of research questions, conducting a search, screening of papers, keywording of an abstract, and data extraction and mapping are followed.

Research Questions

This study attempts to provide an overview of existing research on gamification in higher education. The main objective is specified by five research questions:
  RQ1: What subject areas are gamification implemented in higher education?
  RQ2: Which variables have received the most attention in the realm of higher education gamification studies?
  RQ3: What game design elements have been applied in the higher educational context?
  RQ4: What platforms/tools are used to implement gamification in higher education?
  RQ5: What are the results reported in the studies?

Searching Criterion

The search in this study was limited to 1) experimental studies that discuss explicitly the use of game elements in higher education. Theoretical or reflective papers were excluded; 2) published in peer-reviewed journals, and full articles are accessible; 3) Published in English between 2018 to 2022; 4) Studies that focus on game-based learning, serious games, simulation, virtual reality, smart learning, or distance learning without game elements were excluded. Non-accessible articles, books or book chapters, review articles, conceptual papers. Editorials and conference proceedings were excluded.

Two major electronic databases Web of Science and Science of Direct were used to search a combination of the following keywords: Gamification AND ("higher education" OR university OR "tertiary education" OR college). Initially, 1231 primary papers from Web of Science, and 698 from Science of Direct were retrieved. Only 7 duplicates were removed after exporting all searched records to the RefWorks platform. Based on the abstracts, all publications that did not meet the inclusion criteria were removed. A second round of filtering was based on full text, although some studies were conducted in higher education, the publications are not explicitly related to students' learning, such as career development, awareness of sustainability, and library searching skills., etc were excluded. A total of 54 full-text articles that met the criteria were thoroughly examined.

Findings

RQ1 Subject Areas

RQ1 addresses the subject domain where gamification is applied in higher education. As Figure 1. illustrates, most studies among 54 selected articles applied gamification in Computer Science/Information Technology (CS/IT) and Business/Marketing/Management in higher education. Followed by Education, Medical/Health/Nurse, and Language learning. The rest 6 articles applied gamification in multiple disciplines, instead of focusing on any specific subject.
Figure 1: Distribution of Subject Areas

RQ2 Analysed Variables

RQ2 aims to identify the variables that have been frequently analysed in higher education. Motivation, academic performance/grades, engagement, class attendance/participation, and learning outcomes are five variables that have attracted the most attention among the selected studies. Figure 2. shows the distribution of studies by the analysed variables. Apart from these top 5 variables, satisfaction, attitude toward learning, and technology acceptance also have been analysed in these studies.
Figure 2: Distribution of Analysed Variables

RQ3 Game Design Elements

Although game design elements were distinguished by Deterding et al. (2011) into interface design patterns, game design patterns or game mechanics, design principles, heuristics or 'lenses', conceptual models of game design units, game design methods, and design processes, game design elements are not grouped in a way that everyone agrees on. Dicheva et al. (2015) took the game design element "badges" as an example and indicated that it has been used as a game interface design pattern in Deterding's categorization, a game mechanic (Zichermann & Cunningham, 2011), and a game component in (Werbach & Hunter, 2012), and a game dynamic in (Iosup & Epema, 2014), a motivational affordance in (Hamari, Koivisto, & Sarsa, 2014). Dicheva et al. (2015) classified "badges" into gamification design principles instead of simply using game design principles to distinguish gamification and games.

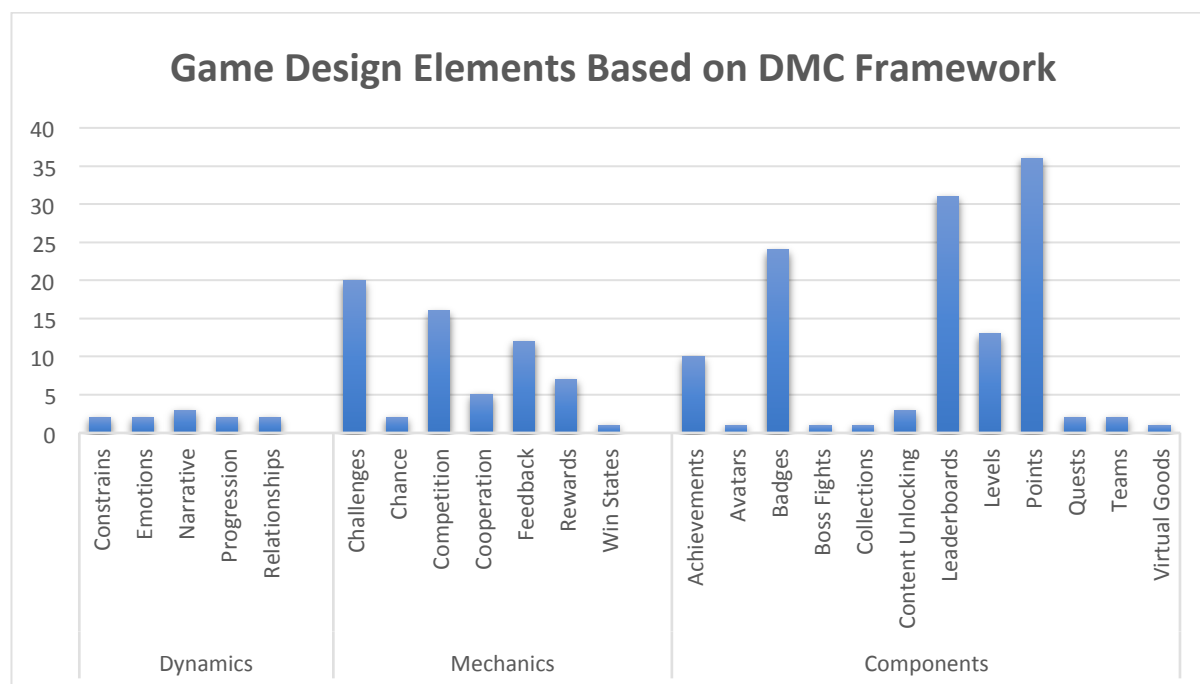
In general, game design elements are defined and categorized into several levels of abstraction. There are several widely accepted game design element classifications. For example, they are categorized into mechanics, dynamics, and aesthetics (MDA) by Zichermann and Cunningham (2011), classified into DMC (Dynamics, Mechanics, and Components) by Werbach & Hunter (2012), and grouped into game mechanics which correspond to the first two components of Zichermann and Cunningham's framework, and gamification design principles by Dicheva et al. (2015). In this research, Werbach & Hunter's DMC framework is selected to identify game design elements in the higher education context. All design elements covered by the DMC framework are recorded in this research. Fig 3. shows the distribution by dynamics, mechanics, and components. As a result, challenges, competition, and feedback are the top three mechanics that have been applied in higher education, and points, leaderboards, badges are the most popular components used in various subjects.


Figure 3: Game Design Elements

RQ4 Type of Implementation

This research question seeks to identify the platforms or tools created or utilised to employ gamification in higher education. The study of the selected papers resulted in four categories: An existing third-party gamification support platform including software, mobile application, and website application was used. In this category, 28 papers utilised an existing gamification platform. The most prevalent platform report in this study is Kahoot! 14 papers among them used Kahoot! which was employed either as an only gamification platform or integrated with other gamification platforms. For example, Leon & Pena used Mentimeter, Socrative, and Kahoot! to design and present subject content, assessment, and learning complexity in a dynamic, entertaining, and active way (2022). Apart from Kahoot!, other existing gamification platforms were reported. Examples include Classcraft (Ferriz-Valero, Osterlie, Martinez, & Garcia-Jaen, 2020), Horses for Courses (Legaki, Xi, Hamari, Karpouzis, & Assimakopoulos, 2020), Ace Your Self-Study (Baars, Khare, & Ridderstap, 2022), BioVL (Caño de las Heras et al., 2021), Khan Academy and Codecademy (van Roy, Deterding, & Zaman, 2019), Heureka (Sobrino-Duque et al., 2022), Q-Learning-G (Ibanez, Di-Serio, & Delgado-Kloos, 2014), QueryCompetition (Morales-Trujillo & Garcia-Mireles, 2021), G-SIDRA (Lopez-Jimenez et al., 2022), Rain Class and FIF Speaking (Chen, Zhang, & Yin, 2022).

A new gamification platform was developed. This comprises research that created a brand-new independent platform, either a mobile application or an online application that incorporates game design principles and gamification elements. BeHere (Pinter, Cisar, Balogh, & Manojlovic, 2020), ePS (Ngan, Tang, Chan, Chen, & Tang, 2018), and 2TSW (Polito & Temperini, 2021).

A gamification plug-in/extension to an existing online education system or a non-gamified platform was used in the university. For example, X points (Jusas, Barisas, & Janciukas, 2022) and Level UP (Bai, Hew, Gonda, Huang, & Liang, 2022) were plugged into the online learning system. Badgr tool was implemented on Massive Open Online Courses (MOOC)

(Ortega-Arranz et al., 2019), and the Question Board Platform was plugged into an online learning portal (Bouchrika, Harrati, Wanick, & Wills, 2021). Moodle is the most widely used online learning education system and gamification applications were added to it (Ahmed & Asiksoy, 2021; Bovermann, Weidlich, & Bastiaens, 2018; Garcia-Iruela & Hijon-Neira, 2020; Garcia-Iruela, Fonseca, Hijon-Neira, & Chambel, 2020; Ng & Lo, 2022; Tsay, Kofinas, & Luo, 2018).

No special gamification platform was used. This category includes research that employs gamification without using a gamification platform or extending a non-gamified tool. For example, a picture, stamp, or other evidence was sent through the What's App Group Chat when participation or assistance in institutional events and teamwork challenges were confirmed (Diaz-Ramirez, 2020).

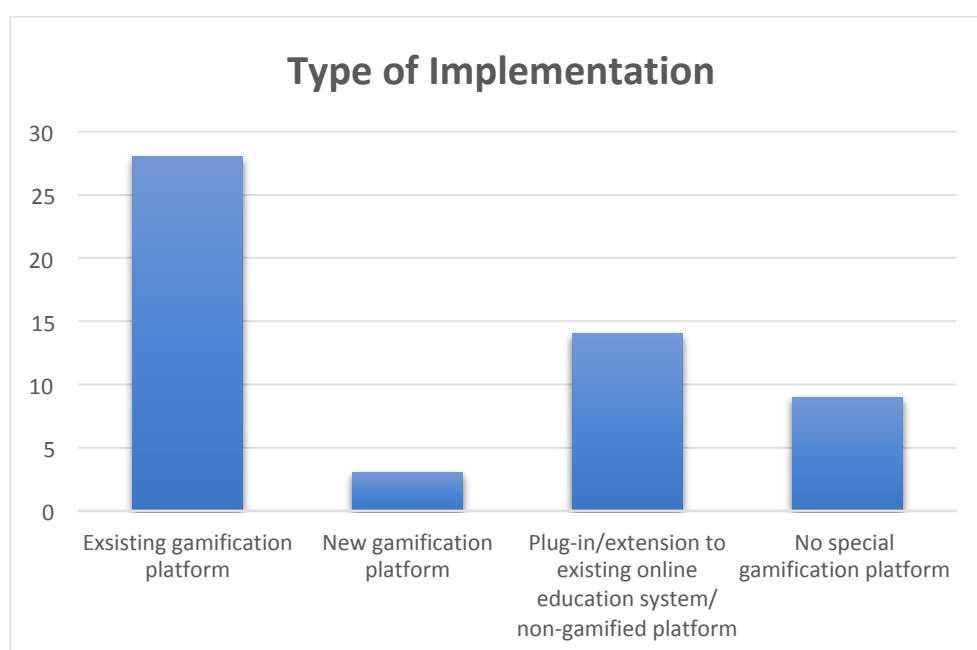
Figure. 4 illustrates the distribution of the studies by the type of implementation. More than half of the papers use existing gamification platforms in higher education, and plug-in or extension to existing online education/non-gamified platforms is also commonly utilised.


Figure 4: Type of Implementation

RQ5 Reported Results

Figure. 5 displays the distribution of the selected papers based on the type of reported results, which are classified into four categories: positive, negative, no significant difference, and mixed results.
Reported Resluts

Figure 5: Reported Results

Discussion and Conclusions

This systematic review examined 54 articles from 17 countries. The findings identified gamification applied subject areas in the context of higher education, and focused on analysed variables, gamification design elements, the implementation, and reported positive and negative aspects of gamification.

In this study, it was found that gamification most applied study area in higher education in Computer Science/Information Technology. Although gamification has been more commonly adapted to various disciplines in the higher education sector, CS/IT has become the most dominant study area that applies gamification. Dicheva et al. (2015) explained the reason was that many teachers lack the necessary skills and time to create, develop, and/or maintain a sufficient supportive technological infrastructure, the early application of gamification to learning occurred mostly in CS/IT fields. And this seems not been significantly changed based on the results found in this study. Although learning management systems (LMS) such as Blackboard, and Moodle and Virtual classroom technologies for synchronous teaching platforms such as Blackboard Collaborate, Teams, and Zoom have been widely used in higher education as technological support in recent years, the adoption of applying gamification in other disciplines is still limited.

This study also concludes that motivation, academic performance, and engagement are the most analysed variables, followed by class attendance, learning outcomes, satisfaction, attitude toward learning, and other cognitive variables. Most selected articles reported that motivation, as the most studied variable, can be promoted by applying gamification. Only Ferriz-Valero et al. (2020) found that students' intrinsic motivation does not change in their studies. It's interesting to notice that the majority of these studies made use of leaderboards, points/scores, or/and badges, which is why extrinsic motivation was fostered, with students executing tasks to get the points, scores, or/and badges.

Furthermore, engagement as another key component of successful learning in education is studied and discussed with motivation on most occasions. Students who reported high

motivation by badges at the end of the course demonstrated higher levels of engagement than those who were not motivated by badges (Ortega-Arranz et al., 2019). Meanwhile, the results are not always consistent when motivation is studied with another frequently analysed variable, academic performance. Both motivation and academic performance are improved in the study (Fuster-Guillo et al., 2019; Morales-Trujillo & Garcia-Mireles, 2021). However, intrinsic motivation does not change when academic performance is benefited (Ferriz-Valero, Osterlie, Martinez, & Garcia-Jaen, 2020). In addition, the group less involved in the gamification received better academic results, although motivation was improved in the subject (Hernandez-Fernandez, Olmedo-Torre, & Pena, 2020). It is reasonable to assume that when students have an assessment that they deem important surrounded by a pleasant atmosphere, they will be more motivated to complete the assessment. It would also be worthwhile to examine the impact of gamification on the modification of undesirable student behaviours, such as classroom disruption and absenteeism.

Interestingly, 14 papers used Kahoot! as an online gamification platform in higher education, and all reported results are positive. Ismal et al. (2019) used Kahoot! as a formative assessment tool in medical education and identify that Kahoot! is an attractive learning tool, a source of motivation, and learning guidance in the study. Likewise, Felszeghy et al. (2019) employed Kahoot! in histology teaching and reported that students are more enjoyable studying in a more relaxed atmosphere for discussions and are less reluctant to learn the lessons. At the same time, Kahoot! enables students to obtain just-in-time feedback and engage with instructors and peers. Apart from students' motivation, Campillo-Ferrer et al. (2020) also identified the impact on the acquisition of social and civic competencies. Kahoot! enable students to absorb knowledge in a novel manner and create a set of social and civic competence-related skills and talents. Kahoot! as an online gamification platform helps students to improve academic performance in business management subjects (Martinez-Jimenez, Pedrosa-Ortega, Liceran-Gutierrez, Ruiz-Jimenez, & Garcia-Marti, 2021; Ortiz-Martinez, Santos-Jaen, & Palacios-Manzano, 2022) and computer engineering degrees (Fuster-Guillo et al., 2019). As the empirical studies approved, Kahoot! as an application of gamification platform in the context of higher education has generated an environment for students learning to enhance various aspects, such as motivation, participation, engagement, formative assessment results, classroom dynamics, and peer interaction.

It is noticeable that all studies used online support even those studies which did not use a special gamification platform. Based on the review results, during the pandemic, gamification elements have been more frequently applied in online courses or online and face-to-face mixed courses. Students had to attend online classes and spent 6-8 hours per day on online learning in the past several years during the pandemic. Apart from the above-mentioned benefits of applying gamification, it also helps students reduce online fatigue and stress during the pandemic (Ropero-Padilla et al., 2021). To some extent, Covid-19 has not only drastically changed human life, but also significantly changed education patterns (Yang & Lee, 2021). It has compelled universities to be more innovative, adaptable, and agile in the teaching transition to online or blended learning (Ropero-Padilla et al., 2021).

Finally, it is crucial to note that gamification in the context of higher education needs to be implemented properly. Instructors need to consider the correct ways to integrate gamification into the learning process (Wirani, Nabarian, & Romadhon, 2022). It must be content-related or well-planned (Felszeghy et al., 2019; Ismal et al., 2019). Good preparation can avoid causing confusion and stress for both instructors and students. For example, instructors need

to know the conditions of the facilities and infrastructure when gamification is applied, such as the availability of the internet, mobile devices, or laptops.

While this systematic literature mapping has provided insights into the landscape of gamification in higher education, it is imperative to acknowledge certain limitations inherent in the study. One noteworthy limitation pertains to the source of articles. Despite the meticulous inclusion of all papers meeting the predefined criteria, the potential for oversight remains due to inaccessible full texts or constraints imposed by the selected database.

Furthermore, a notable challenge arises from the amalgamation of gamification with other closely related terminologies, such as game-based learning, serious games, and simulation, among others. The interchangeability of these terms in existing literature poses a potential obstacle to the exhaustive identification of relevant studies during the mapping process. This intrinsic complexity underscores the need for a nuanced approach in future research endeavours.

Moving forward, future investigations need to focus on both educators' and students' adoption and acceptance of gamification to comprehensively understand the implementation of gamification in higher education. To achieve this, both qualitative and quantitative studies should be conducted in specific study areas. Additionally, comparative studies across diverse student groups, considering variables such as gender, cultural background, and study programs, are crucial for discerning the intricate ways in which external factors influence students' gamification adoption process.

Reflection on My Interactions With Student J Within the Framework of Motivational Interviewing

Jiayi Song, Longqiong Primary School, China

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Current pedagogies for supporting academically struggling students mainly include tailoring learning contents to meet their differentiated needs or offering one-on-one interventions to improve their self-management. However, using counseling approach to elicit behavioral change has not been explored much. This case study analyzes my three conversations with an academically struggling student in a rural primary school English class in southwest China within the framework of Motivational Interviewing (MI). The goal is to evoke a behavioral change in the student and help him become more engaged in class. I had been teaching this student named J since Fall 2021. His initial disturbing behaviors (e.g., making noises, sprinkling ink over his desk) in class revealed that he might lack the confidence in learning English, so our interactions focused on making him realize his capacity of learning well and obtaining a sense of achievement through continuous effort. Through MI-embedded conversations, J became less disruptive and more engaged in class. He also became more accepted by his peers and perceived himself more positively. I applied MI strategies of Open-ended Questions, Affirmations, Reflective Listening and Summaries in interacting with J. After each conversation, I reflected on the stages of change that J went through, including his ambivalence and change/sustain talk. Finally, I evaluated my interaction with J centering around MI spirits: partnership, evocation, acceptance and compassion. I concluded about the three factors in cultivating a trustful partnership with an academically struggling student: acceptance, sustained attention and forward-looking approach (shift focus from past frustration to future possibilities).

Keywords: Motivational Interviewing, Primary School Education, Stages of Change

Introduction to Motivational Interviewing

This paper introduces Motivational Interviewing (MI), a counseling approach, and examines its potential application in evoking preferred behavioral change in educational settings by implementing a case study on an academically struggling student. According to Rollnick and Miller (1995), "Motivational Interviewing is a directive, client-centered counseling style for eliciting behavior change by helping clients to explore and resolve ambivalence" (p. 326). In other words, the core of the MI framework stresses gaining insights into clients' internal drives and values to guide them through ambivalence to enact behavioral change. This paper provides an overview of MI-related concepts and a case study on how MI techniques might be effectively used with a primary-aged struggling student.

MI Spirits in Classroom Relationship Building

The defining characteristic of MI is a set of essential concepts collectively referred to as MI spirits: partnership, acceptance, compassion, and evocation (Csillik, 2015). These can also be applied to teacher-student interactions in the education context. To establish rapport and a constructive partnership, teachers consider students in need as experts in their prior experiences and set a tone of mutual respect that permeates the entire community. They also believe in the students' "capacity to develop in a positive direction" and actively convey that belief to the students (Csillik, 2015). Acceptance is about recognizing students' "absolute worth and potential" as human beings and expressing "accurate empathy" to reinforce positive efforts (Csillik, 2015). Compassion is demonstrated by regarding students in need as equal and competent individuals who can shoulder "the primary responsibility for changing behavior" and bear the consequences (Csillik, 2015). Evocation can be an inspiration in teachers' work with academically struggling students, in which teachers "roll with resistance" instead of explicitly arguing for a change in their lives (Resnicow & McMaster, 2012).

A Case Study on J Within the Framework of MI

Methodology

This study was to examine the effectiveness of MI with a primary school student in rural China. A qualitative approach was adopted to allow a descriptive, exploratory, and detailed case study on behavioral interventions of the student.

Participant

J was a 9-year-old naughty and outgoing boy in third grade at the time of this study. Before the intervention, I had noticed some of J's behaviors, such as making weird noises in class or sprinkling ink all over his desk. J's parents got divorced when J was 2 years old and left their hometown for low-skilled jobs in cities. Being left at home, J suffered from emotional neglect and loneliness.

MI Intervention

All individuals considering change go through the 5 Stages of Change: Precontemplation, Contemplation, Preparation, Action, and Maintenance (Connors et al., 2013). J was first assessed about his Stage of Change. After that, MI strategies of Open-ended Questions,

Affirmations, Reflective Listening, and Summaries (OARS) were applied in the conversations with J to facilitate his growth and elicit his change talk.

Excerpts of MI-Embedded Conversations and Corresponding Analysis

Conversation #1: Background

In my third-grade English class, J diverted other students' attention frequently and never took out his textbook. At first I was surprised and annoyed, yet he refused to apologize and did not realize his misbehavior. We remained in confrontation in the first three weeks. In this period, I actively sought information about J's family background. After knowing his prior experience, I felt his misbehavior more understandable and I decided to give him more patience and attention. In my fourth week of teaching J, he asked me to give him up and neglect him in all future English classes. I refused and told him I would never give him up. He was surprised and gave me a collage as a gift. Then we had a conversation.

Conversation #1: Body

I: " I know you are frustrated by your past learning experiences, but English is a fresh start for you. I want to help you get rid of that frustration and gain confidence. What do you think of it?"
J:"I want to get rid of that frustration. It makes me feel I can do nothing well. But I am not sure how to catch up."
I:"It's nice of you to have the intention to catch up. How about starting from concentrating on my lecture in class? It may be hard to remain focused at first, but we can work on it together."
J: "That's a reasonable starting point. But I get distracted easily."
I: "Why would you become distracted easily?"
J: "Because when I could not understand the materials, I would feel bored and start to do other stuff."
I: "That's a fair observation. What do you think you can do to keep focused in class for, say, 15 minutes?"
J： "I can remind myself to listen in class. 15 minutes should not be too big a challenge for me."
I: "You are doing a good job getting out of your comfort zone and taking the challenge. How about after-class? What might you do to catch up?"
J: "May I come here to finish my homework and review the materials in textbook? But it's hard for me to do so everyday. What if I just play and forget to come?"
I: "I fully understand your concerns about distributing time between studying and playing. I could kindly remind you every afternoon. What else are you concerned?"
J: "I guess that's all I have for now. Please remember to call me in. "
I: "No problem! I am glad to see you thinking over catching up with classmates and figuring out an action plan!"

Conversation #1: Analysis

J's Stage of Change	J's Sustain/Change Talk	OARS Skills Used by the Teacher
Contemplation	"I want to get rid of that frustration. It makes me feel I can do nothing well."	Affirmation: "It's nice of you to have the intention to catch up." Open-ended question: "Why would you become distracted easily?"
Preparation	"I can remind myself to listen in class. 15 minutes should not be too big a challenge for me."	Open-ended question: "What might you do to catch up?" Affirmation: "You are doing a good job getting out of your comfort zone and taking the challenge."
Action	"Please remember to call me in."	Reflective listening: "I fully understand your concerns about distributing time between studying and playing." Affirmation: "I am glad to see you thinking over catching up with classmates and figuring out an action plan!"

Table 1. Analysis of conversation #1

J's intention to change surfaced when I communicated with him about regaining confidence and getting rid of frustration: he was unsatisfied with his past academic performance and wanted to catch up, yet he was unsure how to do it. My invitation to lengthen his focusing time in class and catch up after class ignited his interests, and J decided to move forward and take the initiative to change. Entering the preparation stage, J faced an ambivalence: he wanted to remain engaged in learning, yet he worried that he might not devote as much time to study as to play. With my support, J was assured and determined to take concrete actions to facilitate his academic progress and personal growth.

Conversation #2: Background

Rising from his previous fear of academic failure, J had worked hard on learning English towards the end of the semester. He reacted to my instructions actively and prepared for the final exam. Then somehow, he demonstrated disturbing behaviors and procrastinated on homework. He no longer seemed passionate about seeking my assistance in finishing English homework and reviewing materials covered in class. Having observed these, I had a conversation with J.

Conversation #2: Body

I: "J, you have made great progress in staying focused in class. You've also been persistently completing homework and reviewing knowledge points."
J nodded slightly and smiled in silence.
I: "Just curious, I noticed that recently you did not come to me often for homework support as you previously did, and you seemed a bit absent-minded in class. How do you feel about these?"
J: "I am not confident about my ability to do well in the final exam. You know, I always mess up in the finals. Why don't I give up if it is always the same poor results? It's easier."
I: "Your past unpleasant experience with final exams makes you doubtful about your efforts."
J: "Exactly."
I: "How did you feel when you gave up on yourself in learning in the past?"
J: "I felt helpless because I couldn't do anything well. I vaguely felt there was something wrong, but I could not tell exactly what it was."
I: "How did you feel when you accomplished something?"
J: "I was fulfilled because I made it. I could achieve something."
I: "What do you think makes the results different?"
J: "Before, I did not put much effort into learning and did not perform well academically. However, I made progress last time by listening and participating in class."
I: "You are saying that classroom engagement plays an important role in your academic success."
J: "Yes, I think so."
I: "How would you describe the state of being engaged in the classroom?"
J: "Like, follow the instructions in class, understand the learning points in the textbook, and take part in classroom activities."
I: "Great! And what do you plan to do to get closer to the engagement level?"
J: "Take out my textbook for each class and interact more in class. Maybe also finish the homework on time."
I: "Awesome. So, you see, you know clearly what you can do to improve your academic performance. What will you do next?"
J: "OK. I'll put more effort into learning English and give it a try for the final exam. I want to prove that I can achieve something. Please kindly remind me to come to your office to finish homework and other stuff in case I forget, will you?"
I: "Sure. I am glad to hear that. I believe your efforts will be rewarded!"

Conversation #2: Analysis

J's Stage of Change	J's Sustain/Change Talk	OARS Skills Used by the Teacher
Precontemplation	"Why don't I give up if it is always the same poor results? It's easier."	Affirmation: "J, you have made great progress in staying focused in class. You've also been persistently completing homework and reviewing knowledge points." Open-ended question: "How do you feel about these?" Reflective listening: "Your past unpleasant experience with final exams makes you doubtful about your efforts."
Contemplation	"I vaguely felt there was something wrong, but I could not tell exactly what it was." "I made progress last time by listening and participating in class."	Open-ended question: "How did you feel when you gave up on yourself in learning in the past?" Reflective listening: "You are saying that classroom engagement plays an important role in your academic success."
Preparation	"I'll put more effort into learning English and give it a try for the final exam."	Affirmation: "You know clearly what you can do to improve your academic performance."
Action	"Please kindly remind me to come to your office to finish homework and other stuff in case I forget, will you?"	Affirmation: " I believe your efforts will be rewarded!"

Table 2. Analysis of conversation #2

At the Precontemplation stage, ambivalence emerged in our conversation: J worried that his hard work would not pay off in the upcoming exam, and he was not sure whether to continue his efforts. I noticed his internal conflict and helped him move forward envisioning his future success instead of focusing on his past frustration. My use of OARS skills in my conversation with J helped him move beyond the Precontemplation stage and start to consider and prepare an action plan to better engage in the class. Through MI-embedded conversations, J was able to focus longer, maintain better posture, and engage more actively in classroom activities. He was gradually accepted by his peers, gained more confidence through learning, and perceived himself more positively.

Conclusion

This paper offers a brief overview of MI-related concepts and discusses MI's potential for application to education with a case study. These demonstrate the universal applicability of MI as a non-confrontational means of inducing client-led changes to resolve internal conflicts of interest under the directional guidance of MI practitioners. The MI approach's flexibility in adapting to different educational settings has earned it promising prospects in creating smoother schooling experiences for struggling students.

When MI is applied to teacher-student interactions in rural settings, some noteworthy points emerge. The main objective of subject teachers is to improve students' academic performance. Yet there are many underlying factors, such as psychological well-being, classroom participation, and peer relations, that may affect students' academic achievements. Being attentive to broader aspects of students' development and taking a holistic approach to students' education in rural China can be challenging. However, it is worthy of trying because an educator is not only there to teach, but also to coach, to mentor, to nurture, and to inspire.

Digital Media, Teaching and Learning:
Pedagogical Implications for Teaching and Learning in a Participatory Culture

Jianglong Wang, Western Washington University, United States

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

The era of digital media has come to create a youthful and pervasive participatory culture featuring different forms of affiliation, expression, problem-solving and information circulation among its members. The generation of digital media savvy individuals has now populated classrooms all over our college and university campuses. Concomitant with their arrival to the campus are the inevitable challenges for educators to instruct effectively members of this newly created powerful participatory culture. From the perspective of intercultural communication and based on research in cultural adaptation and teaching innovation, this paper examines (1) salient features of the current participatory culture; (2) primary characteristics of the digital media generation; (3) major components of cultural competence for educators teaching this digital media generation; and (4) specific relevant and applicable pedagogical strategies for educators to enhance their teaching effectiveness and students' learning outcome in their classrooms. Impact of participatory culture on teaching effectiveness is further analyzed and implications for educators' adaptation and teaching innovation are also explored and discussed.

Keywords: Digital Media, Education, Teaching and Learning

Introduction: The World of Digital Media

The world we live in today has quickly turned from a global village (McLuhan, 1960) to a networked society owing primarily to the development of information and communication technology (ICT). Social network sites such as Facebook, microblogging services such as Twitter, and content-sharing platforms such as YouTube have advance us all into a digital world full of opportunities for wide-scale, online social participation and media content creation and consumption.

Within education, particularly in higher education, ICT has begun to yield significant influences and substantial impacts on the way we teach and learn. Fundamentally speaking, education is a socially oriented activity and quality education has traditionally been offered by instructors with the highest academic degrees in their field. Teaching and learning primarily occur in a face-to-face interactive setting. Instructors with top credentials often teach students in a formal educational institution and teacher-centered instruction of knowledge characterizes the obtainment of information. The emergence of ICT in education has now shifted this traditional focus to a student-centered learning situation in which all members contribute to the creation and sharing of knowledge. The rapid development and fast spread of digital media on college and university campuses has changed education in this 21st century.

The purpose of this paper is to examine the development of a digital culture in education to uncover key features characterizing members in the learning community. From the perspective of intercultural communication and based on research in cultural adaptation and teaching innovation, the author discusses the different forms of affiliation, expression, problem-solving and information circulation among the members of this participatory culture. The paper further explores the development and application of cultural competence as an appropriate and effective pedagogical strategy for educators to succeed in this participatory culture in education.

The Participatory Culture in Education

In an effort to define the concept of participatory culture, Jenkins, Ito and Boyd (2016) proposed that we view participatory culture as "a culture with relatively low barriers to artistic expression and civic engagement, strong support for creating and sharing one's creations and some type of informal mentorship where by what is known by the most experienced is passed along to novices" (p. 4). In addition, they (Jenkins el al., 2016) further suggested that members of a participatory culture often share a feeling of social connection and each member's contribution to the whole community is viewed as equally important and valuable. Comparing with people in a traditional learning community, members in a participatory culture share different forms of affiliation, expression, problem-solving and information circulation.

While conventional teaching has typically emphasized the development and teaching of content and in most cases, content from the texts, contemporary teaching and learning are more focused on application and practices, that is, competence and performance. What the content is becomes less important than how the content will be applied and used. The ability to utilize the information is being emphasized. In other words, curricula now tend to be more performance-based, oriented to the development of learners' competence in applying what is taught. This orientation to competence and performance is catalyzed by the digital media

available to teachers and learners as they have access to a variety of information, including sources of information. The learning become more student- rather than teacher-centered as what the content is tends to be less important than how the content will be applied. Therefore, teachers are now functioning more like coaches and mentors rather than content experts. Concomitant with the change of their functionality in the educational setting, the affiliation between teachers and leaners in the learning community become different from what it was as sources of information are equally accessible to all members.

In addition to affiliation, with the wide spread of contemporary ICT, members of a learning community have numerous ways of expressing themselves. Teachers and students are no longer limited by physical environment of the learning place; they can express themselves whenever they like and wherever they are. Not only do they have the freedom in time and space, but also in platforms as well. There are a multiple levels of media platforms through which they creatively express themselves. Further, members of a participatory culture tend to collaborate more when dealing with challenges and solving problems as they are more connected with each other than ever before. Enhanced by the digital media available to them, they are much more likely to work in teams, formal and/or informal groups, online and/or online settings, which promotes collaboration amongst members of the culture.

Furthermore, in a participatory culture, the circulation of information is substantially facilitated by the wide spread of ICT on college and university campuses. Not only do learners learn from their textbooks, their teachers and peers, they also create meaningful content by themselves as they publish their views and constantly share their expressions with members of the communities. Because of the opportunities for members to freely publish their views via the media platforms available to them, the circulation of their published content is constant, speedy and widespread. Members of a participatory culture in higher education is on longer limited in creating and publishing relevant content as the barrier for information circulation no longer exists for the community.

In the last few decades, as pointed out by Lai (2008), learning has increasingly became a social and communal activity which has primarily turned into a constructive process in which learners actively participate in the construction of knowledge through close affiliation, creative expression, collaborative problem-solving and speedy and large scale circulation of content. All of these is made possible through the digital form of media.

The Digital Media Generation

Given learning as a social and communal activity, compared with the previous generations of learners on college and university campuses, the digital generation are much more capable in acquiring, generating and circulation information available to them. They become much more involved in their learning as the activities are more often self-spontaneous motivated by their desire for close affiliation and total inclusion. They are more satisfied with their learning outcome as well when they can actively involve themselves in expressing themselves and in creating content for circulation.

In their study of generation Z (born and raised in 1990s and 200os), Singh and Dangmei (2016) found the digital generation was born and raised with the social web and "they are digital centric and technology is their identity". They are most ethnically diverse and technologically sophisticated who prefer informal, individual and straight way of communicating. For this Do-It-Yourself generation, "Social networking is a vital part of their

lives" (Singh & Dangmei, 2016). Schawbel,(2014) found that the digital generation is "more entrepreneurial, trustworthy, tolerant and less motivated by money" as they tends to be more realistic and more optimistic about the future. This generation is also found to be impatient, instant-minded, lacking the ambitions of previous generations; they have acquired attention deficit disorder with a high dependence on the technology and a low attention span, individualistic, self-directed, most demanding, acquisitive and materialistic (Generation White Paper, 2011). They are sensitive about natural resources and conscious of environmental conservations (Mihelich, 2013); they desire to be heard, are technology savvy (Slavin, 2015), but have not demonstrated the ability to put things in perspective, analyze them and come up with a decision (Coombs, 2013).

As research findings demonstrate that learners on college and university campuses, the digital generation characterize themselves as technology savvy, instant-minded with a short span of attention. They are more socially connected with others around them and they are more realistic and practical in orientation. As such, they welcome curricula that are of diverse interests, practical and useful. In their eyes, learning is an activity-based acquisition of applicable information that enhances their performance and competence in life and at work. The ICT savvy digital generation are particularly strong in using all sorts of media tools and platforms to affiliate with others, to express themselves, and to involved in problem-solving, content creation and distribution. They are a group of strong participants who like to involve themselves in the community, have the skills needed to access information and share it with others in no time. They are also highly capable in creating content and distribute them. Thus, consistent with research findings, the kind of education they need is one that would enable them to critically evaluate the information available, synthesize what they have acquired and analytical skills for content creation.

Developing Participatory Cultural Competence

Given learning as a social activity in this digital media age, it's ideal for all educators to adapt to this participatory culture quickly, develop participatory cultural competence to enhance their teaching effectiveness for the digital generation. To begin to adapt to the participatory culture, digital competence (or skills) are necessary literacy skills for the twenty-first century. Jenkins et al. (2006) define this literacy as skills that enable us to participate in the new communities emerging within a networked society. According to them (Jenkins et al., 2006), these skills consist of:
- play (the capacity to experiment with the surroundings as a form of problem-solving)
- performance (the ability to adopt alternative identities for the purpose of improvisation and discovery)
- simulation (the ability to interpret and construct dynamic models of real world processes)
- appropriation (the ability to meaningfully sample and remix media content)
- multitasking (the ability to scan one's environment and shift focus)
- distributed cognition (the ability to interact meaningfully with tools that expand mental capacities)
- collective intelligence (the ability to pool knowledge and compare notes with others toward a common goal)
- judgment (the ability to evaluate the reliability and credibility of different information sources)
- transmedia navigation (the ability to follow the flow of stories and information across multiple modalities

- networking (the ability to search for, synthesize and disseminate information
- negotiation (the ability to travel across diverse communities, discerning and respecting multiple perspectives, and grasping and following alternative norms)

The main categories of 21st skills, based on The Assessment and Teaching of 21st Century Skills –project are:
  I.   Ways of Thinking
  II.   Ways of Working
  III. Tools for Working
  IV.   Living in the World

Specifically, these include:
1. Creativity and innovation
2. Critical thinking, problem solving, decision making
3. Learning to learn, Metacognition
4. Communication
5. Collaboration (teamwork)
6. Information literacy
7. ICT literacy
8. Citizenship – local and global
9. Life and career
10. Personal & social responsibility – including cultural awareness and competence
   'Tools for working' was the group which mainly focused on digital skills.

The concept digital competence is an emerging concept and related to the development of technology as well as the political aims and expectations for citizenship in a knowledge society. It consists of a variety of skills and competences, and its scope is on several areas: media and communication, technology and computing, literacy, and information science. Digital competence consists of 1) technical skills to use digital technologies, 2) abilities to use digital technologies in a meaningful way for working, studying and for everyday life in general in various activities, and 3) abilities to critically evaluate the digital technologies, and 4) motivation to participate in the digital culture. Digital competence is regarded as a core competence in policy papers; in research, however, it is not yet a standardized concept. Several policy- or practice-related projects are currently working to find a common and acceptable definition.

Conclusion and Implications

Digital technologies have the potential to support and shape a pedagogy which is more active, participatory, personalized, flexible, and inclusive (Laurilland, 2008).While it is acknowledged that the socio-political factors discussed in the previous sections may discourage institution-wide use of technologies in teaching and learning, and it is likely that these macro factors would not disappear in the short term, it is believed that at the micro or grass root level technology use can have an impact on student learning if there is a better understanding of the pedagogic potentials and a wider dissemination of exemplary and creative use of these technologies to show how they can be embedded in teaching to enhance student leaning outcome.

Stakeholder Engagement and Involvement Towards Child and Growth Development During Pandemic: A Framework on Correspondence Education

Jathry R. Redondo, PHINMA Saint Jude College, Philippines
Ronald C. Catapang, National University, Philippines

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

The COVID-19 pandemic has significantly impacted children and adolescents' lives, leading to psychological problems and PTSD symptoms. In the Philippines, research on child and growth development during the pandemic is limited, emphasizing the need for better preparedness and quality education. The study investigated stakeholders' involvement in child growth and development during the pandemic, providing a framework for correspondence education. The study used mixed method from division of Manila schools using four point likert scale. A study using Urie Bronfenbrenner's ecological model found that stakeholders are involved in accessing online modules but less engaged in planning and development. They are highly involved with teachers but less engaged with Barangay assistance. Stakeholders are also involved in teacher assessment and feedback but less engaged with school heads. Modular distance learning is used, but parents face difficulties in integrating their child due to work and chores. Stakeholders' involvement is low, and school heads should involve stakeholders in planning and utilizing local government assistance for financially challenged families. Teachers should adapt best practices, communicate progress updates, and minimize activities, while parents should improve the learning environment and reduce distractions.

Keywords: Modular Distance Learning, Child Development, Child Education, School Stakeholders

iafor

The International Academic Forum

Introduction

The COVID-19 pandemic has significantly impacted children and adolescents' daily lives, causing immediate and long-term impacts on their growth and development due to health, economic, and sociopolitical disasters. In China, some school-aged children, adolescents, and young adults have higher levels of psychological problems and PTSD symptoms (Liang et al., 2020; Zhou et al., 2022). In Italy, a nationally representative sample of Italian adolescents found that youngsters are concerned about the pandemic's detrimental scholastic repercussions (Buzzi et al., 2020). Educational concerns and depressive symptoms may be stronger during the pandemic for people in higher grade levels in both China and Italy (Buzzi et al., 2020; Zhou et al., 2022).

The Philippines has made progress in ensuring the rights of Filipino children through legislation, service improvements, and more accessible participation. However, research on child and growth development during the pandemic remains a gap, with mental health disorders impacting 10% to 15% of children and 16.8% of adolescents attempting suicide (Berger et al., 2019). Early detection of these disorders is crucial for proper treatment and prevention of poor health and social repercussions (Dix et al., 2020).

The COVID-19 pandemic threatens to exacerbate these figures, posing a threat to the delivery of healthcare services in the Philippines, including those related to children's growth and development. The study investigated stakeholders' involvement in child growth and development during the pandemic, providing a framework for correspondence education. It is crucial to examine how stakeholder engagement and involvement in child and growth development played out during the first year of the pandemic, particularly in the formulation and implementation of correspondence education. This will enable the government, educational institutions, and Filipino families to better prepare for future crises and ensure children continue to receive high-quality education.

Theoretical Framework

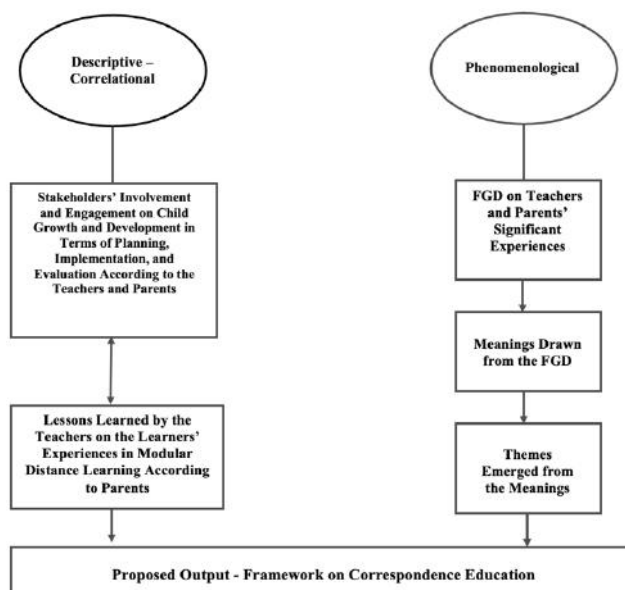
This study was anchored on Urie Bronfenbrenner's (1979) Ecological Model. Due to prolonged COVID19 duty hours-related mental stress and other mental health difficulties, these parents may be harsh with their children (Ramaswamy & Seshadri, 2020). The microsystem is a child's immediate environment, including relationships and organizations like family, peer group, and school setting. It is crucial to note that the microsystem remains intact during a crisis, providing research on its impact on development. Early data can help develop a plan to move forward and act quickly (Sim & How, 2020). This Theory provides a substantial explanation of a child's growth and development during a pandemic, as well as how children are influenced by it.


Figure 1. Conceptual Framework

This study utilized Descriptive-Correlational and Phenomenological designs to assess stakeholders' involvement in child growth and development during the pandemic. The Descriptive-Correlational part assessed stakeholders' involvement in planning, implementation, and evaluation, while the Phenomenological investigation involved teachers and parents providing insights on their experiences with the Modular Distance Learning Approach. The results were analyzed through Focus Group Discussion (FGD) responses, resulting in themes for Correspondence Education framework.

This study examined the stakeholders' involvement and engagement in child growth and development during pandemic. The results of the study were used to provide a framework for correspondence education. Following the conceptual framework presented the following hypothesis was measured:

Ho₁ There are no significant differences in the extent of the stakeholders' practices in correspondence education when grouped according to their responses.

Ho₂ There are no significant differences in the extent of the stakeholders' encounters with the issues or challenges in correspondence education when grouped according to their responses.

This study was conducted in using 4 point likert scale researcher-made instrument to gather data in four public elementary schools in the Department of Education - Division of Manila, Philippines. The study involved 110 teachers and 225 parents in quantitative and five (5) teachers and five (5) parents for qualitative sections, focusing on stakeholders' involvement and engagement in child growth and development during the pandemic. The respondents were teachers and parents from four public schools in division of manila. The schools used correspondence education during the Academic Year 2020-2021. The study utilized Slovin's formula and simple random technique to compute samples, with all respondents being elementary teachers from selected locales with firsthand experience in engaging school stakeholders.

Conclusions

The study reveals that teachers and parents have been involved in various aspects of correspondence education during the COVID-19 pandemic. Teachers have engaged themselves in planning, while parents have also been involved in implementation. Teachers have been involved in evaluation, reflecting their involvement in child and growth development. The teachers' encounters planning issues are related to converting activities and content into modules, online/distance learning, and lack of free resources and tools from education technology companies. In terms of implementation, both teachers and parents agreed that implementation is less involved due to unfavorable home learning environments and lack of experience with instructional technologies.

A one-factor analysis of variance with repeated measures showed significant differences between the variables, rejecting the null hypothesis and accepting the alternative hypothesis. The best practices of teachers and parents include health protocols, conducted online meetings, open communication with teachers, organization in module distribution and retrieval, provision of guidance, effective time management, and conditioning the child. However, parents face difficulties in managing their time, dealing with child attitude and behavior, keeping up with the study schedule, absence of more-knowledgeable others (MKO), being overwhelmed with module activities, and environmental distractions.

The effects of modular learning and teaching on child learners include the inability of parents to provide learning, learners struggling with parents, diminished performance and distorted study habits, poor learner engagement, learning from amusing topics, collision of parent work and academic involvement, and poor learning engagement due to the modality employed. The 'Redondo's Correspondence Framework' is proposed as a framework for executing the modular distance technique, known as Correspondence Education, which was widely adopted by most schools in the Philippines during the pandemic.

The study found no significant differences in the responses of teachers and parents to issues or challenges in correspondence education. However, there was a significant difference in their responses to planning in correspondence education. Teachers were more convinced about preparing content for modules and online/distance learning, while parents believed they lack free resources and tools from education technology companies. The study indicates that there are no significant differences in the extent of stakeholders' encounters with issues or challenges in correspondence education when grouped according to their responses, but there were indications that parents viewed differently in terms of parameters in correspondence education.

The learner is also overwhelmed with module activities, as they are overwhelmed by the activities that need to be completed for a week. Environmental or home distractions like noise, games, siblings, and peers can also pose a challenge.

Overall, parents face various challenges in managing their time between home and work, dealing with their child's attitude and behavior, keeping up with their study schedule, and dealing with environmental or home distractions. By addressing these challenges, parents can help their children succeed in modular classes and improve their overall learning experience.

The findings are congruent with Vonderwell's (2019) study on learner participation revealed that remote learner engagement and patterns are influenced by technology and interface

characteristics, content area experience, student responsibilities, instructional tasks, and information overload. Effective online learning requires interdependence, and instructors can detect student needs and scaffold learning by closely monitoring student involvement and patterns. During the COVID-19 pandemic, universities face challenges in providing and using online and e-learning systems, such as Blackboard. Understanding the adoption drivers and primary problems of contemporary e-learning systems is crucial for successful use. However, there is a gap in knowledge about the critical challenges and factors that shape e-learning usage. This study provides important recommendations for policymakers, designers, developers, and researchers to better understand the key factors of successfully using an e-learning system during the pandemic (Almaiah, 2020).

Framework on Correspondence Education for Enriched
Figure 2. Redondo's Correspondence Education Framework

The framework developed based on the result of the study indicated that modular distance technique, also known as Correspondence Education, is a widely adopted strategy in the Philippines during the COVID-19 pandemic. To effectively implement this technique, schools should involve all stakeholders, including teachers, parents, and learners, in the planning and development process. This involves teachers, module writers, parents, and publishers on digital platforms.

Stakeholders are involved in accessing online modules during the pandemic, but they are less engaged in planning and developing these modules. They are highly involved with teachers who can provide answers to their queries, but are less engaged with assistance from the Barangay, such as internet connection or financial assistance. Stakeholders are also highly involved with the assessment and feedback activities of teachers, but they are low in communicating with school heads on feedback regarding modular learning.

Teachers and parents have significant practices in employing modular distance learning on their children. They observe local/national health protocols for distributing, receiving, and retrieving modules, and implement 'kamustahan' to check on progress and how parents cope with providing guidance. However, parents face difficulties in getting their child on board

modular learning due to work and chores. In some cases, learners are left to independently answer their modules due to the absence of an MKO. Learned learners are observed to be overwhelmed due to the number of learning activities in the module, and distractions at home often beset them. This results in poor modular engagement due to demotivation due to abrupt changes in the learning platform.

Quantitative findings indicate that stakeholders are involved and engaged in the planning, development, implementation, and evaluation of modular distance learning during the pandemic. Parents face difficulties in facilitating learning engagement, such as internet disruptions and environmental distractions like noise, peers, and games. Evaluation and feedbacking are highly involved and engaged by stakeholders, but low in terms of planning and development and implementation.

Effective communication systems should be in place to provide updates and feedback mechanisms for learners' progress, including their challenges. Parents should inform teachers about home issues such as resources, discipline, and guidance provided to students. Curriculum planners and module writers should minimize the number of activities in modules to avoid overwhelm. Teachers should also undertake active home visits to provide relevant ways to interest students in learning through modules. Parents should also search for ways to improve the learning environment and decrease distractions while modular study is in progress.

Recommendation

School heads should involve stakeholders like parents, barangay officers, and the community in the planning and development of modular learning modules to provide individualized attention and support for students' growth and development during the pandemic. They should also tap into the local government for internet connectivity packages for families who cannot afford it. School heads should establish linkages with non-government units and the local government for assistance to financially-challenged families.

School heads should identify the best experiences of stakeholders and cascade it to teachers for adjustments or emulating best practices. School officials should ensure that teachers and parents are on the same page when implementing modular distance learning for child students. Teachers should be able to describe how modules should be used to increase student participation.

Effective communication systems should be in place to provide updates and feedback mechanisms for learners' progress, including their challenges. Parents should inform teachers about home issues such as resources, discipline, and guidance provided to students. Curriculum planners and module writers should minimize the number of activities in modules to avoid overwhelm. Teachers should also undertake active home visits to provide relevant ways to interest students in learning through modules. Parents should also search for ways to improve the learning environment and decrease distractions while modular study is in progress.

The study is limited to the teachers and parents from four public elementary schools in division of manila. The study does not include public schools in other cities in the national capital region (NCR) and private academic institutions. The study only takes the data and

information for the research during the duration of the school year 2020-2021 and does not cover other academic school year.

Acknowledgements

We would like to express our sincere gratitude to PHINMA Saint Jude College and National University Philippines (NU-Lipa) for their continuous support in completing this study.

Primary School English Teaching During COVID-19: Preliminary Results of Three Single Case Studies in Rural Schools in Costa Rica

Patricia López-Estrada, Instituto Tecnológico de Costa Rica, Costa Rica
Jonathan Elizondo-Mejías, Universidad Estatal a Distancia de Costa Rica, Costa Rica

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

COVID-19 emerged as a pandemic that paralyzed the educational world in 2020. The Costa Rican Ministry of Public Education (MEP) took up two modalities, distance education (2020) and combined education (2021), with in-person education finally restored in 2022. This multiple case study consists of three single case studies in three different educational directorates in Costa Rica's Huetar Norte Region: San Carlos, Norte-Norte, and Sarapiquí. The three studies collected and triangulated data from 15 primary-school English teachers using semi-structured virtual interviews, document gathering, video recordings, photo-elicitation, and body mapping. Content analysis was performed using WebQDA and ATLAS.ti to categorize the data. This multiple case study aims to describe the perceptions of primary English teachers regarding distance, combined, and in-person education to increase understanding of the educational context during the health crisis. The first study is completed, the second study is in the final stages of data interpretation, while the data are currently being analyzed for the third study. Some preliminary results include identification of the tensions experienced by teachers as well as the emergence of self-efficacy skills required to comply with the modalities, the lack of coordination and communication between the Ministry of Public Education and the school districts, and the distinctive characteristics and challenges of each modality. This multiple case study seeks to expand on existing literature and to better apprehend the phenomenon of the pandemic and its educational implications in rural communities in Costa Rica.

Keywords: Costa Rica, COVID-19, Combined Education, Distance Education, English Teaching, In-Person Education, Rural Schools, Qualitative Research

Introduction

In 2020, the pandemic imposed a pause in the world in all socio-economic aspects and had a particularly strong impact on educational matters. In Costa Rica, the Ministry of Public Education (MEP) analyzed various scenarios to better provide for the students who were sent home at the beginning of March 2020. That year, distance education (or emergency remote teaching) became the official teaching modality. The following year, combined education took place as a new modality. Lastly in 2022, in-person education was restored, after practically two years of pandemic. This study focuses on three single descriptive case studies in three regional directorates of education: San Carlos, Norte-Norte, and Sarapiquí. The units of analysis were the educational modalities, and the focus was on 15 primary school English teachers from the different directorates. The 15 teachers were selected under the same criteria of teaching in rural areas, in low-population schools. Inductive qualitative research was employed with the aim of comprehending the teachers' perceptions and experiences to come to a better understanding of teaching and learning processes during and after the pandemic.

Research Context and Methodology

The first study on distance education took place towards the end of 2020. This collected data on four English teachers (two males, two females) from the San Carlos Regional Directorate of Education via semi-structured virtual interviews, document gathering, and video recordings. The second study regarding combined education started in late 2021, in which data were collected on six teachers (two males, four females) from the Norte-Norte Regional Directorate of Education via interviews, document gathering, and photo-elicitation. Finally, at the beginning of 2023 the study on in-person education began collecting data on five teachers (three males, two females) from the Sarapiquí Regional Directorate of Education in the form of interviews, data gathering, and body mapping. All data collection techniques aimed at creative co-construction in the meaning-making process with respect to the distinctive educational modalities employed between 2020 and 2023. The selection criteria for the participants included these being English teachers with over five years' experience working for the Costa Rican Ministry of Public Education (MEP), with tenured positions, who working in small schools in rural communities. Prior to the data collection processes, the participants signed letters of informed consent that guaranteed confidential use of the data. The interviews and other video and visual information were transcribed prior to coding. Analytical memoing, to reflect of the data sets, was utilized during the three studies. Member checking was also used to validate the preliminary results.

The data analysis of the three single case studies was based on content analysis using two software programs for qualitative data: WebQDA (Costa et al., 2019) was used for the first study, while ATLAS.ti (ATLAS.ti Scientific Software Development GmbH, 2022) was used for both the second and third studies. Content analysis entailed full familiarization with the data sets, inductive descriptive coding, identification of semantic patterns within the codes, clustering categories, identifying, and naming domains, and description of salient themes (Hatch, 2002; Braun & Clarke, 2012). Once the last study is fully examined and the data interpreted, analysis will be made through a multiple-case study considering the evidence of the three studies to examine the educational phenomenon of teaching and learning via the distinctive modalities that took place in northern Costa Rican rural schools during COVID-19.

Results

For the proceedings, some results will be presented from single case studies 1 and 2, while only preliminary results are provided for case study 3. With respect to the distance education case study, though there were several results found, only two will be fully addressed. Interviews were carried out in Spanish, although quotations were translated into English for ease of reading in this paper.

Distance Education in the San Carlos Regional Directorate of Education (2020)

As a consequence of the abrupt interruption of the school year in March, 2020, and as a way of guaranteeing the continuation of the educational process in the country, the Ministry of Public Education (MEP) adopted the modality of distance education. This process was characterized by four scenarios created according to students' access to both internet connectivity and technological devices. Additionally, teachers were required to create self-study guides that included the contents to be studied along with brief explanations thereof, activities to promote the autonomous learning of students, and finally, a self-evaluation checklist that included the expected learning outcomes. In rural areas, these guides were collected from schools by parents on the days they picked up food packages, and students then had a month to complete and return them (MEP, 2020). Despite being called distance education due to the promotion of autonomy, self-regulation, and the physical distance between teachers and students, Hodges et al. (2020) point out that this modality in fact should be considered emergency remote teaching (ERT) since the model was unplanned, arising from the need to quickly respond to an unforeseen phenomenon affecting the educational system.

The teachers included in the study experienced a plethora of feelings at the beginning of the pandemic and during the 2020 school year. Though some of these had positive connotations, most can be seen as negative, including feelings of uncertainty, fear, nervousness, sadness, and stress. At the very beginning of the pandemic, the teachers felt doubt, concern, and confusion. They experienced a sense of helplessness, with no clear idea of how to go about the teaching process. Everything became more difficult as they had to plan and somehow continue to "teach" remotely. Numerous difficulties were encountered, including problems of lack of adequate internet connectivity, vagueness in the guidelines to be followed, and problems in communication processes with parents, among others. Every aspect of distance education was new to the teachers; thus, they rapidly began to feel tired, overwhelmed, and overworked. One teacher participant explained, "In order to teach, I had to immerse myself in virtual media, something I was not used to, at least for teaching. Also, designing the self-study guides for the first time, I did not know how to do them. It was very challenging, not impossible, but very difficult indeed. While designing the guides, it was very confusing, with so many changes and new guidelines happening all the time, some teachers understood things in one way while others understood something completely different. Nothing made sense, everything was confusing. We, the teachers, were scared since we did not know how to do anything, and all the responsibility was on us. It was very stressful and challenging."

In the rural context in which the participants worked, they experienced discrimination with regards to some of the decisions made by MEP. Another teacher participant expressed:

> At MEP, they make decisions "behind a desk" without fully understanding that some
> teachers live under very different circumstances, in poor areas, where children have

very limited or no access at all to many things. I felt limited too since I wish I could teach virtual classes but, in our case, it was remote teaching since the families did not have devices or connectivity, sadly.

Despite their negative feelings, the teachers developed a keen set of self-efficacy skills, which included personal, reflective, and technological skills. In terms of personal skills, the teachers developed the ability to proactively undertake various tasks as personal objectives with the main goal of continuing with the teaching process; for example, they paid for ink, printers, and paper to ensure that all students had access to the materials, they went to the schools to drop off and pick up students' work, and they drew on a wide range of mechanisms to communicate with the students' parents, such as calling them, sending notes, asking other parents to contact them, and taking the time to explain individually to each parent how to use the self-study guides. In terms of reflective skills, they developed empathy in analyzing the situation of students' families and their contexts to see what was required to meet the students' academic objectives, also modifying guidelines as necessary so that students could more easily continue with their learning paths. Generally speaking, they were very reflective on the issue of internet connectivity in areas where the families lived and when these had little money for telephone plans. Teachers engaged in professional development activities given that they were keenly aware of the importance of having new tools to enable students to continue to progress under such challenging conditions. With respect to technology skills, as part of their efforts to make the distance education process more accessible to students, teachers researched and learned how to better reach out to their students by creating videos to explain the self-study guides. They further collated lists of websites to use and recommend to students, and employed other technological platforms (such WhatsApp, the most used platform for education during the pandemic) so that students could access the materials and self-study guides.

Combined Education in the Norte-Norte Regional Directorate of Education (2021)

After almost an entire year of distance education and careful analysis of the public health crisis, the MEP decided to gradually open schools and allow students to go back to on-site, face-to-face classes under certain restrictions. 2021 thus became the year of combined education; a model that shared some similarities to blended learning and included the continuation of autonomous work from home with self-study guides and periodical classes at school. Every group was split-up into two or three sub-groups to comply with the protocol of social distancing; schools created special schedules and assigned students specific days in the week in which they were to work from home or go in to school; nevertheless, parents were given the chance to decide whether their children adopted this model or continued their education under a full distance education model (Elizondo-Mejías et al., 2023; MEP, 2021a). During face-to-face English as a Foreign Language (EFL) classes, teachers were required to work on activities from the self-study guides to develop oral skills: listening, and oral production. These activities were part of the four main "moments" incorporated into the self-study guides: connection, clarification, collaboration, and application (MEP, 2021b).

During 2021, teachers characterized the management processes both at a macro and micro level as highly challenging. MEP-based management was defined by teachers as focusing mostly on safety protocols and issuing guidelines regarding pedagogical mediation and logistics. Teachers felt that guidelines were sent abruptly and changed constantly. One of the participants stated, "When they [the MEP] change new norms and guidelines, we have to execute them and try to find solutions; these constantly change." These changes were visible

in the decision making; another participant pointed out, "There are things that change overnight; in the end, you don't know if instructions were privately sent to school principal or district supervisors which then need to be communicated to everyone else [teachers]." On the other hand, school management by the school principals was described as more flexible and supportive in terms of providing supplies for photocopies and schedule flexibility to those teachers working in more than one school.

One of the most revealing aspects during combined education was the fact that although the intention was to work under only two modalities (face-to-face and distance), many other sub-modalities arose, such as regular in-person education, irregular in-person education, synchronous distance education and asynchronous distance education. One of the participants stated, "There was a special schedule so that everyone was able to receive the same number of lessons; however, from five regular face-to-face lessons I had before the pandemic, only two were taught during combined education; the other lessons were used to work with students who were in the full distance modality, those who did not have to come to school on a given day, and those who were able to connect up virtually." These modalities arose as the result of school infrastructure, classroom size to respect social distancing, and the parents' decisions as to whether or not their children went back to school or kept studying from home.

In-person Education in the Sarapiquí Regional Directorate of Education (2022)

The 2022 school year was characterized by the return to face-to-face classes, with all students required to attend school every weekday. The only public health safety measure was the use of face masks from February to May and constant hand washing. In terms of methodology and content, everything was supposed to go back to the way it had been before the pandemic hit two years previously; for EFL classes, activities needed to promote the development of the four language macro skills, and all contents from the 2017 curriculum were supposed to be covered. The only difference was that in 2019, the school year had been divided into three terms of three months each; in 2022, the MEP decided to change to two terms a year. Finally, due to the educational lag provoked by the pandemic, teachers needed to carry out a diagnostic process to determine which contents from previous years needed to be reviewed and incorporated to help students level up and recover from the marked learning gaps that occurred in both 2020 and 2021.

During 2022, with the official recommencement of face-to-face classes, teachers faced several new challenges. The re-adaptation process was challenging to all study participants. This process affected the daily routines of the teachers since it implied cognitive, emotional, and educational transitions from the way things had occurred both prior to and during the pandemic. At the beginning, certain public health protocols remained in place, with mask-wearing, the need to maintain social distance among students, and the avoidance of using fans leading to difficulties including health problems for the teachers. They had to speak louder which affected their throats. Additionally, in the rural areas where they worked, the weather is very hot, yet they were not allowed to use the classroom fans as they had previously done, which caused discomfort both for teachers and students. The teachers further alleged that it was difficult for them to articulate English sounds correctly, which also made it difficult for the children to learn to pronounce words properly since the masks blocked the view of the pronunciation process. A participant stated, "Wearing the mask all day is tiring, plus while I wore it, I had to speak to the children, trying to pronounce words that as you know, especially in English, it is all about articulation as one speaks, one pronounces specific words and phonemes so that they [the children] can understand better."

Additionally, the re-adaptation process involved a reduction of class time because both teachers and students had to engage in more extracurricular activities than was customary prior to the pandemic. One teacher stated that "even when the students miss one day of class, everything gets behind significantly. Now there are the student games related to physical education, so the students get pulled out of school to attend different sport events. I know they [the students] are representing the school, but when they come back, they don't know the topic, don't bring homework, they just get behind; they are lost, and classwork is greatly reduced." This class reduction aspect is linked to work overload since teachers were also expected to coordinate and work on extracurricular activities, such as art and English festivals. One teacher reported, "Yesterday, for example, it was 6:15 p.m. and we [some teachers] were just leaving the school since we had spent the day decorating for the school festivals. Today, we began work at 7:00 in the morning and worked until 3:00 in the afternoon putting everything back in order after the festivals. It is too much work, and we don't get any acknowledgement for it. We do it for the children, we do it for them." Due to public health protocols and the extra work of other school activities, the participants in the study experienced general exhaustion including physical, mental, and emotional weariness. One participant expressed how she was totally "exhausted and drained to the point that all I want is to be on vacation, to simply rest and load batteries to continue teaching."

There were also challenges that impacted on the learners. Two specific ones stand out: lack of education competencies and educational lag. Lack of educational competencies refers to the lack of some competencies on behalf of the students such as socialization, a sense of accountability, collaborative skills, assertive communication, autonomy, and self-regulation, among others. One participant stated, "Social behavior was very affected. Some students were in second grade, yet their behavior felt more like they were first graders." Another teacher stated how the "discipline in the students had no limits, students were aggressive and not willing to collaborate." Students lacked motivation to come back to face-to-face classes; some students "did not click with the return to normal classes." In addition, the teachers in the study emphasized how the students in general were behind where they should be academically. As part of the educational lag, the students did not have the knowledge they were expected to have. One teacher reflected on how she had a class that she had taught using combined education in 2021, and half her class did not know the topics covered that year. She recalled 2022, the year in which students and teachers returned to normality, as a year "where students' minds where blank, as if they did not retain any information, as if all teaching was erased and all learning became nonexistent, as if they had not learned any English at all in two entire years. It was devasting, it happened in 2022, and I think it continues [in 2023, when the study data were collected]."

Conclusions

From all three single case studies, some preliminary conclusions can be drawn. From the study carried out in San Carlos (case study 1), it can be concluded that during distance education in 2020, of all the significant number of feelings expressed by the teacher participants, most of these had negative connotations. However, the self-efficacy skills of the teachers were key to coping with the distance education modality to promote the academic success of the students. In Norte-Norte (case study 2), even when combined education was meant to consist only of regular face-to-face classes and work at home, the modality employed in the rural schools the participants worked at was fragmented into 5 sub-modalities for two specific reasons: logistics in the schools (infrastructure, school management, size of groups) and family decisions (convenience of families to keep students

at home). During 2021, MEP-based management was characterized by ambiguous and changing guidelines that were open to interpretation; however, school-based management provided the support that teachers felt was lacking in the educational management. In Sarapiquí (case study 3), the re-adaptation process became a challenge due to students' lack of educational competencies and educational lag as a result of having stayed at home for almost two years. In addition, the teachers felt overworked, both due to classwork and other extracurricular and administrative tasks which led to a sense of general exhaustion.

As mentioned before, two of the studies have concluded while the last one is still undergoing processes of data analyses and interpretation, with a view to arriving at a consolidated outlook on the Huetar Norte Region in Costa Rica. The researchers advocate in favor of qualitative research as a reflective endeavor that can capture the essence of the human dimension in educational settings. It was the qualitative research approach that facilitated engagement with the participants during the harsh times of the pandemic. Qualitative research should be celebrated as it places greater value on social phenomena as experienced by teachers within their educational contexts.

A Qualitative Perspective on Student Teachers' Experiences of Social Science Teaching and Learning in South African Multicultural Classrooms

Titus Williams, Central University of Technology Free State, South Africa

Abstract

This qualitative study is an investigation of final years Social Science education students' perceptions of Social Science teaching and learning in South African multicultural classrooms. The current South African schooling landscape is of a multicultural setting, where learners from different racial, ethnic, cultural, and socio-economic backgrounds are admitted. This study seeks to ascertain the perceptions of student teacher's engagement with diverse learners in Social Science multicultural classroom and the influence it has on the teaching and learning project. Through a qualitative research methodology, data was gathered from Focus Group Discussion (FGD) sessions with three groups of five teacher education students from the same race, in their final year, specializing in Social Science teaching. The results of the study indicate that student teachers find the teaching of Social Science in a multicultural classroom very challenging, irrespective of their race, culture, or socio-background. The study therefore recommends regular exposure to diverse learners through mandatory teaching practice at multicultural schools, appropriate training, and development throughout the students' teacher training with supported policies and integration of social justice into the curriculum content.

Introduction

The South African Schools Act (SASA) (Act, 84 of 1996) is one the instruments designed to achieve equal and non-discrimination in education. By articulating the stipulations of the Constitution, this Act effectively advanced the opening of doors of learning to all races and created opportunities for all to attend the school of their choice. With this policy directive, the South African Department of Education demonstrated its intention to "redress past injustices in educational provision" (DoE 1995) and to advance the democratic transformation of society, combat racism and sexism and all other forms of unfair discrimination and intolerance, and to protect and advance our diverse cultures. Whilst the desegregation of schools implied the promotion of social equality, it anticipated the creation of solid relationships amongst various races at all schools, which would ultimately promote tolerance and strengthen social cohesion and unity in South African society. The downside of the status quo remaining about teachers, triggered challenges, such as teachers having little or no understanding of the learners' social, cultural, and socio-economic backgrounds, which resulted in uncomfortable situations, especially in the Social Science classroom.

This study investigates the student teachers' perceptions of Social Science teaching and learning in South African multicultural classrooms. This study identifies challenges and opportunities regarding South African student teachers' teaching of Social Science to diverse learners, with the objective of developing knowledge and understanding of the diverse learners in the South African Social Science classroom, creating and implementing an optimal classroom experience for both teachers and learners. To cultivate respect and acceptance for diversity, through the teaching and learning of Social Science.

Literature Review

Multiculturalism created a platform for the introduction of democratic initiatives in the curriculum; pedagogy; social relations in school settings; and an understanding of participation in diverse communities, which seems to support efforts towards the acquisition of social cohesion and cultural harmony (Arslan & Rata, 2015). Hopkins-Gillespie, (2011) views multiculturalism as an enabling form of education which focuses on harnessing the abilities, skills and commitments of teachers and learners in promoting social change, nation building and competent global citizenry. In the end, multicultural education should be directed at expounding the principles and values of the South African Constitution, whilst also instilling a conducive school culture which is geared at transformation, reconciliation, inclusion, nation building and quality education.

Despite various approaches for Social Science teaching, most teachers invariably institute some form of multicultural education as the primary goal for Social Science instruction. It is in this context that the National Council for Social Studies (1994) could be viewed as the proponent, through its mission, the inclusion and inculcation of civic competence in learners. However, Arslan and Rata (2015) observed that fundamental differences exist in the way in which individuals define multicultural education. For example, according to Aydin (2012), multicultural education in the broadest sense is concerned with helping students to acquire the appropriate knowledge, skills, and values in an increasingly ethnically diverse nation-state. The Curriculum Assessment Policy Statement (CAPS) in South Africa is built on the principles of providing all learners with knowledge, skills, and values. Like teaching for multicultural education, teaching Social Science involves teaching about and for multicultural perspectives and viewpoints; establishing respect for cultural diversity; and working towards

identifying and transforming areas of injustice that inhibit the goals of democracy (Castro, 2013).

Conceptual Framework

This study wishes to acknowledge that a critical multicultural framework requires a theoretical lens that recognises the importance of racial positionality and the role that community and family play in the expectations/aspirations of identity construction (Bolgatz, 2005). Norton (2001) asserts that identity reconfiguration is the impetus behind all learning and according to this author, learners participate in learning when such learning helps them to attain the identities they desire, and as such, increases their value within the social environment. Gray (2017) is of the opinion that learners' investments in certain imagined communities and identities influence positively or negatively participation in classroom learning. The influences of imagined communities for pre-service teachers then becomes an important factor in determining how the empowered feel about teaching the controversial topics of Social Science. This empowerment forms the sense of agency that serves as a key component in pre-service teacher decisions about whether and /or how to implement aspects of critical multicultural education e.g., taking up issues, such as social justice, power, and diversity as foundational in their teaching.

Advocates of multicultural education promote the revision of the total curriculum to reflect accurately the multicultural composition of society and diverse groups' contributions to society. However, a variety of influences on the prescribed content of the social studies curriculum may have an impact on the degree to which classroom teachers include it. I contend that the curriculum contents and specifically that of the Social Sciences has a bearing on how the teacher approaches it in the classroom, and to what extent the teacher deals with those controversial themes, while embracing the diverse nature of the class at the same time.

Methodology

As a fragment of a broader part of research, this qualitative study examines how student teachers from different race groups perceive and engage a subject such as Social Science in a multicultural classroom. Student teachers to think more deeply about the learners' beliefs, values, and identities in relation to what is being learned and how these influences teaching and learning.

The study was conducted at the University of Free State, where the subject Social Science as a specialisation in the intermediate phase is offered. The University has a diverse student population that caters for students from different cultures and socio-backgrounds. The diversity of the students was of interest to me and since it assisted me. For the purpose of this study, the sampling method that I used was a mixture of purpose and stratified sampling. In stratified sampling, all the people in the sampling frame are divided into 'strata' (groups or categories). With each stratum, a simple random sample or systematic sample is selected. In this research, the target population was the final year Bachelor of Education intermediate phase students, from the University of Free State. I chose the purposive sampling, 20 participants, and further sampled the students using stratified sampling, by dividing the group into race groups.

The table below, presents the students who participated in the focus group discussion.

Table 1: Participants of the focus group discussion

Focus group	Number of students who participated
FGA A (White students)	5
FGB B (Coloured students)	5
FGC C1 & C2 (African students)	10
Total	**20**

Methods of Data Collection

Assembling people belonging to similar backgrounds together to ascertain their insights, views, beliefs, and attitudes in a coordinated discussion, is regarded as a focus group discussion (McMillan & Schumacher, 2010). Participants in this type of research were, therefore, selected on the basis that they would have something to say on the topic; are within the age-range; have similar socio-characteristics; and would be comfortable talking to the facilitator and one another (Oladeji, 2012).

The discussions were conducted with final year Social Science student teachers at the identified university. I grouped the participants according to racial groups. The rationale behind this was to garner perceptions based on South Africa's main racial groups. The FGD had a white only group of five participants; a coloured group of five participants; and two groups of five each of black African participants. The aim of the research was to capture the richness and uniqueness of everyone's perception that emanated from the natural settings of the participants' environment. The division according to racial groups allowed participants to open-up and engage freely without fear of prejudice. Although the discussion was guided by a list of questions to be asked, the dialogue took the form of free conversation, and the participants were encouraged to talk without restraint.

The discussions were audio-taped and transcribed with the permission of the participants. This was done to capture the participants' responses. In total, 20 participants took part in the FGD. The participants were male and female, obtained by means of purposive sampling, selected for fitting a particular profile, which simply means selective sampling was followed to obtain their quantity.

Data Analysis

The conceptual framework shaped my data analysis. It assisted me to develop concepts and themes and test them with participants through analysing and interacting with the collected data, while also transcribing and coding the texts. The conceptual framework assisted me in understanding and explaining how the different practices of Social Science teachers have played significant roles in perceptions of South African learners in Social Science. It assisted me to interpret how racial, ethnic, socio-economic, and cultural identities of South African learners have intertwined and interacted with their perspectives on Social Science.

Findings

In this study, the student teachers interpreted their Social Science teaching and learning experiences in various ways. Several major themes emerged from my data analysis, for the purpose of this paper only two will be discussed.

Theme 1: Social Science Teaching and Learning Experience

A description of what the participants identified as their views on their experience of Social Science in the classroom as a learner and student teacher.

• Interesting, Fascinating, and Related to Politics

This section is the presentation of how the teacher education participants view the teaching and learning of Social Science. Social Science is regarded as not as other school subjects and is viewed by many scholars as closely related to politics, which makes it a very awkward subject to teach or learn (Ucus, 2018).

The participants (FGDA) indicated they found the subject to be interesting and challenging (FGDA A1, FGDA A2). Participant FGDA A3 said it was easy to understand and relate to because it relates to what is happening daily in communities, while participant FGDA A2 indicated it was interesting depending on the type of learners you have in front of you. In relation to the views of the latter mentioned, participant FGDA5 highlighted the following aspects:

> *"I found the subject very interesting and challenging, closely related to politics. I found myself at times very uneasy about expressing myself while teaching it during teaching practice."*

The participants (FGDB B5) responded that they also found the subject to be interesting with elements of politics and in admission to that, they (FGDB B1, FGDB B3 and FGDB B4) believed the fact that they grew up in the township and were confronted daily by politics, made the Social Science classroom both as learner and teacher fascinating and enjoyable. The participant FGDB B3 further indicated that Social Science connects one to one's environment and community and that the subject can assist in shaping us. In this regard FGDB B2, stated the following:

> *"I enjoy the subject SS because it is fascinating and one always learns something new about one's community, country, and the world. I enjoy teaching it because of the interesting facts around Social Science and the impact it can make on the learners."*

The participants (FGDC1 C2 and FGDC1 C4) concur with the two other groups that they found Social Science to be very interesting because of its relation to the human being and their environment (FGDC1 C2, FGDBC1 C5, FGDC2 C8 and FGDC2 C10). The participants (FGDC1 C4 and FGDC2 C6) indicated that the element of the subject's interrelatedness to politics, also contributed to their love for the subject. FGDC2 C7 articulated the following sentient regarding the nature of Social Science:

> *"I enjoy SS because it makes me understand where I come from as a black person and why my parents and grandparents struggled that much. This subject opened my horizons to how the earth operates and how people find in it a living space."*

• Debates and Discussions

Teacher education participants had mixed views on the role of debates and discussions in the Social Science classroom. Hess (2010) is of the opinion that debate, and discussion are key elements in a Social Science classroom and should therefore be encouraged.

The participants FGDC1 C1 and FGDC2 C7 had very strong opinions of enjoying the subject due to the debates and the discussions that normally takes place in the Social Science classrooms. This sentiment was echoed by the participants FGDB B1, B4 and B5, while participants FGDA A3 and A5 did not find the debate and discussion a factor that determined the interest or enjoyment of the subject. In relation to the previous participants, FGDC2 C9 stated the following:

> *"As a student I enjoyed it even more because the debate levels became even better at university and the discussions were at a much more mature level."*

Teacher neutrality and not veering outside the curriculum are parameters for having safe discussions about controversial issues in the Social Science classroom (Hess, 2009).

• Social Injustices and Inequalities in Communities

The teacher education participants engaged with terms, such as social injustice and inequalities, and some made first encounters with challenges in communities.

The participants FGDC1 C1 and FGDC2 C9 revealed that the subject caused them to have a better understanding of the social injustices and the unequal society they live in, and this was also revealed by FGDB B3 and FGDB B4 that the subject gave them a better understanding of the social ills and problems of people living in townships and in rural areas. Camicia and Dobson, (2010) assert that learners should leave school with a clear sense of their rights and responsibilities as citizens and be prepared to challenge injustice and to promote the common good. FGDC1 C3 stated:

> *"The subject made me understand why most black people are so impoverished and why there are such deep divisions between different racial groups in South Africa. I enjoyed SS because it gives perspective to why there are social injustices and inequality in the world. I think the interest in the subject comes from the fact that I see the subject as a vehicle that can assist in the redress process."*

• Understanding of the Environment

Participants in all the groups indicated that the subject gave them a better understanding of their environment and that it installs an awareness to care for the environment and to preserve it for future generations. Controversial issues, including those that are 'high risk', have curricular relevance, as well as importance to learners' lives, their character development, and their sense of safety and security (Haynes & Karin, 2008). FGDC2 C8 stated:

> *"I started to have a better understanding of my environment and how to preserve it for the next generation."*

Theme 2: Challenges Faced by Student Teachers in Multicultural Schools

This is a description of what the teacher education participants identified as the challenges for student teachers in multicultural schools. The teacher education participants had to indicate challenges that they thought they might face or have faced while teaching in multicultural schools. They had to rely on the experiences while on teaching practice or what they anticipated would be challenges.

• Understanding Different Cultures and How to Deal With Them

Participant FGDA A1 indicated that a lack of understanding of other cultures and customs could be a challenge for pre-service teachers in multicultural school settings. FGDA A2 and A3 agreed and indicated that a better understanding of the learners could contribute to successful teaching and learning in a multicultural classroom. In relation to challenges faced in multicultural schools FGDC1 C3 made the following comment:

> *"I think we might have a challenge understanding all our learners, because we are not really exposed to multicultural schools during teaching practice."*

The literature in chapter three emphasised the importance of a good understanding of different cultures in multicultural school settings. The findings of this study provide clear evidence that most of the teacher education participants lacked knowledge about other cultures and consequently, made them susceptible to attack by people from those cultures.

• Lack of Training to Deal With Diverse Groups

FGDB B1 emphasised that a lack of training to deal with diverse groups could be a challenge for pre-service teachers. The sentiments were also shared by FGDC1 C4, who in turn, indicated that because of the reality of facing multicultural schools, pre-service teachers should deal with this during training. Teaching is a profession that revolves continuously as knowledge and technology changes and require that teachers upskill themselves frequently, thus the opportunity for professional development is critical (Landsman & Lewis, 2011). In relation to the latter statement, teacher education participant FGDA A3 agreed by asserting the following:

> *"I think it is not easy to manage diverse groups, because we are not trained to deal with diversity, or the training is not adequate."*

I share the above-mentioned sentiment, that teachers in the multicultural classroom should be provided with knowledge about several cultures of their learners, their experiences, communication styles, and learning approaches that are harmonious for all learners in the multicultural classroom (Multicultural education & curriculum, 2012).

• Black Learners Blaming Whites for Poverty and Lack of Empathy

Participants FGDA A2, FGDA A3, FGDB B1 and FGDC1 C5 were blunt and indicated that race plays a major role in how to deal with diversity. Alsubaie (2015) supports the above-

mentioned view and argues that teachers should build interactional relationships between them and their learners, to allow learners to express themselves and not offend another race group. In corroboration with the latter argument, teacher education participant FGDA A4 mentioned the following:

> *"Black learners always blame us whites for the fact that they are poor and want to make our lives difficult or even threaten us."*

The above-mentioned assumptions are isolated views and not really the view of the majority of South Africans, and those views are in most instances excuses that some ill-informed people use to defend their own limitations about reaching out to diverse people. The view that race plays a role in diversity was not openly shared and the assumption that I could make was that teacher education participants were not ready to engage further on the sub-theme, because not even probing questions could induce further responses.

• Adaptation to School and the Surrounding Community

Participant FGDA A2 thought that a challenge could also be a slow adaptation to the school, learners, and the community, while FDGC1 C1 believed that pre-service teachers must adapt to the history and traditions of a school if they want to succeed. A study by Perso (2012) indicated that learners are reluctant to participate in activities or speak in multicultural classrooms because they are learning in a new environment, unfamiliar to themselves. This may result in teachers and learners having communication, teaching, and learning challenges, because learners do not acclimatise to the classroom's atmosphere. The example that FGDB B1 gave was if the tradition at the school was for male teachers to wear ties and a pre-service teacher does not adhere to that tradition, it will make it difficult for the pre-service teacher to feel part of the school. In relation to the adaptation to schools and communities, teacher education participant FGDA A2 made the following statement:

> *"Quick adaptation to the school and the community and make sure that I know my learners and their circumstances."* Regarding the latter statement, participant FGDC2 C6 commented: *"we will have to be given proper orientation and training on the ethos and traditions of the school, the learners and the community."*

My view is that novice teachers feel, in most instances, overwhelmed in their new positions and usually must deal with many challenges in their new environment; therefore, it will take them longer to adapt. Acceptance and support by parents and other members of the community might assist teachers to adapt quicker to the school.

• Lack of Training to Deal With Discipline for Different Groups

Participants FGDA A1, FGDA A5, FGDB B1, FGDC1 C1 and FGDC1 C3, indicated that the South African education system is silent on disciplinary measures in schools, and the lack of clarity about applying discipline would make it difficult in multicultural schools. Of all the things teachers are expected to do during their professional life, classroom discipline is perhaps the most significant and is clearly of concern to many parents and teachers alike (Landman & Lewis, 2011). In relation to the latter mentioned view, teacher education participant FGDC2 C10 agreed and articulated the following:

> *"I think we will have challenges dealing with difficult learners from other cultural groups, due to a lack of understanding of how to discipline diverse learners; that is one thing our training lacks and to now deal with diverse groups, will make it even more difficult."*

The South African education system's lack of policies that give guidance to teachers on how to deal with diversity is of great concern; thus, the fear and reluctance of some student teachers to embrace diversity in schools.

I observed that the mentioned sub-theme featured only in the focus group discussions, of the black teacher education participants and realised that the need to change during a lesson to their own indigenous language comes to mind, but due to the diversity in the classroom it would not be possible.

Discussion

This study explores how South African student teachers perceive and interpret Social Science teaching and learning in multicultural classrooms. The findings indicate that Social Science is difficult to teach in a school with learners from different cultures, races and social backgrounds. Makoelle (2014) explains why participants would find it difficult, by indicating that despite all the significant policy pronouncements by the South African Department of Education, there has been silence on the inherent racial and ethnic divide which perpetuates exclusive stereotypes and conceptions about those viewed as racially and ethnically different.

In general, student teachers find it uncomfortable teaching Social Science; most of them feel that more exposure and advanced further training would benefit and equip them with the required skills, knowledge, and values, to teach without fear or prejudice. Participants were also of the opinion that exposure to the teaching and learning of different societies, cultures and communities, would benefit student teachers in developing their skills on how to interact with learners different from them. Kallaway (2009) expresses concerns by indicating that part of the problem is that nobody has trained the trainer; it is simply expected that if someone who has been a good student teacher, will become a good teacher and will therefore be aware of the skills needed to in a multicultural school.

Fair policies, laws, systems and appropriate processes. Procedural justice concerns the fairness and the transparency of the processes by which decisions in a society are made. While a fair process on its own does not guarantee a socially tolerable outcome, a fair system of law and due process are important to social justice, because they provide the mechanism by which everyone in society applies the requirements of social justice to particular cases, which is vitally important for those who have less power in society. Mogoashoa (2014) argues that teachers receive training in the various teaching and learning policies; however, some policies are not deemed appropriate to what teachers are doing in the classroom. Knowledgeable teachers can be beneficial not only to themselves but to society at large.

Recommendations

This study made several recommendations to South African Social Science student teach on how to address the challenges in dealing with diverse learners in the Social Science classroom.

Extended Exposure to Multicultural Classes

Teacher education students are currently exposed only to multicultural classes by choice, if they decide to do their experiential training (teaching practice) at a multicultural school. This study would recommend that teaching practice at a multicultural school be made mandatory and support be granted to student teachers who have problems with doing teaching practice at multicultural schools. The study revealed that student teachers avoid doing teaching practice at multicultural schools due to a lack of understanding other cultures, beliefs, and customs.

Engagement With Communities in All Socio-Economic Groups

The inhabitants of many South African public-school classrooms are from different spheres of life and learners are also from different socio-economic groups. A considerate approach to the learners is critical for the success of teaching and learning; therefore, teachers should have a broad knowledge, understanding and empathy towards all learners, irrespective of their situations. Based on this assertion, this study recommends that regular engagement with communities of different socio-economic groups in both official and on social levels, would be prudent.

Inclusion of Social Justice and Multiculturalism in the Training Programme of Social Science Teachers

Institutions of higher learning are frequently revising their programmes ensure that the curriculum is relevant to a changing world; therefore, a curriculum that addresses the challenges of society would be beneficial to all stakeholders. The establishment of partnerships between stakeholders who have an interest in education, i.e., the state, parents, learners, teachers, and other members of the community, in the vicinity of a school is critical. The recommendation to include social justice and multiculturalism in the training programme of Social Science should be regarded as relevant and is therefore suggested. If it has been done already, the recommendation would be to advocate that it be listed as priority.

Conclusion

This study enriches the current literature on student teachers' perceptions of Social Science teaching and learning in South African Multicultural classrooms, adding to the limited research in this area. My study therefore strongly suggests regular exposure to diverse learners through mandatory teaching practice at multicultural schools, appropriate training and development throughout the students' teacher training with supported policies and integration of social justice into the curriculum content.

Science Mapping in Educational Leadership Research:
Bibliometric Analysis, 1907 to 2022

Run-Shan He, National Tsing Hua University, Taiwan

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Educational leadership stands as a prominent research domain in education, where leaders play a guiding role, impacting educational culture and quality. With the pandemic of COVID-19 has compelled a shift to online learning for students, with educators striving to effectively engage learners in this digital landscape. Financial constraints have led to layoffs and cost-cutting in educational institutions, though some schools innovatively expanded. In response, educational institutions must forge fresh leadership strategies tailored to these unique challenges. This study utilized VOSviewer to investigate network diagrams relevant to educational leadership research. By categorizing clusters and analyzing their positional relationships, the study discerned attributes and connections within structured network diagrams, bolstering its argument. This study performed a bibliometric analysis of 8,489 papers published in the Scopus database from 1907 to 2022. Four key themes emerged: educational leadership as a catalyst for equity, inclusivity, and professional growth; educational leadership's intricate interplay with teacher development, student achievement, and school climate; The transformative impact of educational leadership in the COVID-19 era; Educational leadership is a key element in driving school improvement and development. Based on research findings, the post-COVID-19 era necessitates novel educational leadership styles, propelling teaching and learning, nurturing talent, and advancing educational objectives.

Introduction

The analysis of leadership in education involves giving prominence to the roles of administration and management, scrutinizing alterations within the educational system and leadership frameworks facilitating the introduction of systemic changes in schools, centering on the learning procedures and curriculum enhancement, highlighting leadership within the realm of higher education, as well as considering narrative, historical context, and employing meta-analytical techniques.(Rutkiene & Tandzegolskiene, 2021)Lakomski and Evers (2022) referred to the role of methodology in the contemporary educational leadership. In general, it is common to explain how organisations, such as schools, operate to illustrate this. How to explain the value of educational leadership is an open question that relies on experience rather than analytical explanation using methodology as the default option. The ability to solve problems always takes place within certain constraints, and placing these constraints at the centre of research not only requires a wealth of remaining scientific resources, but also leads to a renewal of methodological understanding of how to study educational leadership. Yeh (2013) points out that the discipline of educational leadership is not only a sub-division of the broader study programme of leadership, but also a popular discipline in the field of educational research. Edoun (2011) shows that effective leadership and management of headmasters and school staff is a key factor in the achievement of high standards of student performance and school improvement. It is evident that research in educational leadership is essential for enhancing the effectiveness and outcomes of schools and education systems.

Educational Leadership Research

Educational leadership research has been influenced by external factors such as interdisciplinary integration, measurement and data analysis, resulting in the emergence of outcomes and issues such as disciplinary systems, theories and philosophies, metaphors, variations, levels and themes of analysis, and research orientations and methodologies (Yeh, 2013). Since the millennium, as the modern society has entered into the information age of the Internet, the ease and richness of access to information have been very different from the past. "Visual communication" is often considered as one of the most efficient communication methods in modern communication. Teams that are good at using visual aids in their work are more than twice as efficient as teams of the same level (Krum, 2013).

This research methodology allows for the visualization of past research patterns, and the conceptual clusters extracted from the analysed papers furnish solid support for our research arguments (Prelipcean & Bejinaru, 2021). The strength of infographics lies in their capacity to convey a significant amount of information within a minimal space while maintaining precision and clarity. As visual presentations, as opposed to oral or text-based presentations, they can swiftly narrate a story, illustrate relationships, and unveil structure. (Dunlap & Lowenthal, 2016). Yeh (2013) research affirms that educational leadership research is a constantly developing and evolving field that requires the consideration of multiple factors and the search for new research perspectives and themes to facilitate the development and practice of educational leadership. Future educational leaders will need to have new ways of thinking and use their wisdom to lead. This includes a deep understanding of events both inside and outside the organisation, and the ability to make sound judgements through keen knowledge. At the same time, future educational leaders will need to be adept at using network technologies to expand, disseminate and share knowledge, build partnerships, achieve leadership quality, and build competitive advantage within and outside their organisations (Tsai, 2009). The conceptual clusters retrieved from the analysed literature

therefore provide the researcher with a basis and help to identify research directions such as the most discussed issues related to educational leadership, links between practice research and emerging issues in the topic. It is clear that technological developments have influenced leadership research in various fields, but the impact on educational leadership research is rare.

The WHO has stated that there is a high risk of the COVID-19 virus spreading to the rest of the world (World Health Organization, 2020). In March 2020, the WHO made an assessment that COVID-19 could be characterised as an epidemic. The outbreak has forced most countries and regions around the world to put in place policies to prevent the epidemic, which include the closing of schools and switching to digital teaching. The spread of the novel coronavirus has led to profound changes in social interactions and organisation, as well as the education sector has not been spared (Murphy, 2020). This global crisis has not only changed the way people live their lives, but has also had a profound impact on the education sector.

This study analyses the status of educational leadership research recorded in the Scopus database, using bibliometric analysis for keyword co-occurrence network map analysis. This analysis provides a broad perspective on educational leadership research and a sequence of research priorities and hotspots to understand the impact of educational leadership research on the education sector, and the use of modern technological tools to be able to anticipate the future with foresight and bring new developments and achievements to schools and education. The following research questions are posed in this study:

    RQ1: What are some of the issues of concern in educational leadership research?
    RQ2: What are some of the implications of educational leadership research for teaching and learning?

To address these research questions, this study used the software tool VOSviewer to conduct a science mapping reviews analyse bibliometric, analysing an overview of 8,489 eligible published papers in the Scoups database. The bibliometric analysis included co-occurrence analysis visualisation.

Literature was clustered and analysed according to the network diagram to observe changes in the distribution and development of educational leadership research and to identify links between the thematic distribution of these research concerns. The findings will analyse the dialogue between scholars in the relevant fields, be analysed through knowledge mapping, and provide insights that can guide the further development of educational leadership research and greatly support the understanding of educational leadership in the post-epidemic process.

Conclusions and Discussion

Conclusion

The study identified four themes that address key aspects of educational leadership research that are critical to understanding and improving leadership in education systems. Below are the conclusions and summaries for each theme:

Educational leaders play a critical role in shaping school culture and climate to ensure equitable and inclusive educational opportunities. They can promote social equity through policy, resource allocation, and decision-making. Effective educational leaders also

encourage teacher professional development and provide training and support to improve the quality of education and promote student success.

Educational leaders' support and mentoring of teachers is critical to improving the quality of teaching and learning. They can empower teachers by providing feedback, resources, and professional development opportunities. Educational leaders' decision-making and leadership styles can have a direct impact on student achievement. Effective leaders can motivate teachers and students and promote academic achievement. School culture and climate are shaped by leaders, which is critical to the development and well-being of students and teachers.

The COVID-19 outbreak presents unprecedented challenges to education systems, requiring leaders to quickly adapt to changes and develop response strategies. Education leaders need to coordinate efforts in areas such as online learning, health and safety initiatives, and supporting student mental health. Their leadership is especially important during this period. This period also provides opportunities for education leaders to drive innovation and improve education systems.

Educational leaders play a key role in the long-term vision and goals of the school, and they can drive school improvement and development through strategic planning and goal setting. Leaders need effective communication and team-building skills to ensure that all stakeholders are involved in school improvement. Educational leaders also need effective resource management skills to ensure that the school is adequately supported to achieve its goals.

Overall, the study of educational leadership addresses several key areas, including social equity, educational quality, school culture, and crisis management. Educational leaders play a critical role in driving improvement in schools and education systems and need to constantly adapt to change and develop effective strategies. Examining these topics helps us better understand the importance of educational leadership and guides for improving educational quality and student success.

Discussion

It is recommended that further research should delve into the specific impact of different school cultures on students' academic achievement, especially in a multicultural environment. Educational leaders are encouraged to focus on specific strategies to effectively support teachers' professional growth, including what types of feedback, training, and professional development opportunities to provide and how to effectively integrate these supports.

It is recommended to study successful digital teaching cases of education leaders in coping with COVID-19 to extract best practices, especially focus on effective strategies for coordinating online learning, safeguarding health and so on.

These recommendations help to improve the practical application value of research in the field of education and provide more specific guidance for educational leaders to address current and future educational challenges.

Educating Communities for Survival:
Building, Resilience, Sustainability, and a Healthy Society

Pulane Adelaide Molomo, Central University of Technology, South Africa

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Complexities and challenges in the world around food security and poverty are bringing communities to the near brink of collapse. This paper explores how social learning, education, and management skills can enable communities to actively participate in their development and sustain resources. The aim is to develop desirable traits amongst communities to create resilience and change through social learning, self-management, and resource management. Qualitative data were generated from literature, a case study of Nog community in the Free state and a purposively sampled respondent group of six lecturers using interviews and reflections. Data were categorised and analysed into themes. It was found that higher education lays the foundation for knowledge and management skills that are replicated through social learning which result in the acquisition and application of sustainable principles. The study is underpinned by (Bandura and Walters, 1977) social learning theory essential for modelling desirable traits and management skills for people to learn and change from self-defeating tendencies. This study proposes an ongoing partnership and engagement between higher education and communities for the development of resilient, resourceful, capable, and healthy communities. The implication is that government is unable to curb the increasing population and to cater for the increased needs of communities. It is thus concluded that social learning, education, and management skills can influence positive results that contribute towards communities managing change and adopting sustainable strategies that enables resilience, self-sufficiency to create a sustainable and a healthy society.

Introduction

One of the goals of the Sustainable Development Goals is to eliminate poverty and hunger. In the same breath, the South African National Development Plan's priority also place emphasis on eliminating poverty and inequalities. Yet, according to Statistics South Africa, (2022) about (2,6 million) and 6 percent (1,1 million) are experiencing severe inadequate access to food, respectively. To exacerbate the problem unemployment also adds to the demise of households' food security. According to Brown and Hermes (2019) the Food and Agriculture Organization (FAO) indicates that world hunger has increased, to a figure of about 150 million since 2019. Even though unemployment, lack of income, lack of education and poor morale are seemingly contributing factors. However, more food consumption than production is a challenge that can bring communities to a brink of collapse. This suggests that communities need to learn ways of sustaining themselves to survive the onslaught of food security by unlearning certain traits but learn positive traits that can help them to sustain themselves because food shortage is also linked to health problems. Besides other socio-economic and environmental issues, the other challenge is that some of the community members lack education significant in changing people's mindsets including motivation and management skills that can help them to transform their personal lives and conditions. It is thus critical to rethink of ways of building resilient and healthy communities that can cope with complexities. To that effect, responsible investment on people's education is important in enhancing food security. It is against this backdrop that education, management skills and social learning strategies are needed to build collaborative initiatives to change the direction of lack but build a resilient capable and a healthy society. Also important is to foster learning of various skills that are necessary in the changing world therefore, education is necessary including the management of production and consumption to help communities to survive.

Although South Africa is known to be food secure, however, lately the level of food insecurity rates has risen in most parts of the country (Trefry, Parkins and Cundill, 2014). Without ruling out the safety net provided by government grants. It seems like they are not sufficient to cater for all the people's needs. Also, high food price is a major barrier to food security particularly to those living in poverty. Seemingly a participatory two-way learning approach that links both scientific knowledge and indigenous knowledge as stimulated in social learning operations can be an ideal intervention that can create some trade-offs and an integrated approach that can best benefit rural dwellers because it is two-way reciprocal strategy which can create an equilibrium that can benefit poor communities and remedy the situation of lack. Social learning is more than a participatory strategy, it embeds education which capacitate people towards accessing and promoting sustainable development (Davids and Theron, 2014). At the same time, it involves them in the identification and implementation of a solution to their challenges Fenster and Misgav (2014). Work Integrated Learning (WIL) in integrating communities and the university can be an enabler for social learning opportunities to enable engagement with communities to educate, exchange knowledge and skills as well as creating collaborations that can produce resilient, healthy communities who can manage personal barriers and cope with global complexities. It is within this backdrop that collaborative initiatives between the university and the community were formed to exchange knowledge and skills.

Literature Review

Within the quest to reduce poverty and food shortage along with the Sustainable Development Goals (SDG)s Higher Education Institutions (HEI)s need to play a leading role

in using curriculum to integrate principles of self-management, and management of resources for sustainability and for the survival of communities. Bell (2016) points out that the world population is increasing, and this has an impact on sustaining communities, therefore, education and management skills are greatly needed. The projection of population increases as posited by (Ibid) will reach a level of 9,7 billion by 2050.This brings a concern to all about the development of communities within the ambit of the Sustainable Development Goals (SDG)s to build capacity that can contribute towards reducing hunger and poverty. To that effect, higher institutions, and the broader community need to rethink ways of rebuilding communities to bring change. Freire (1970) indicates that poor communities need to think and understand their social conditions so that they can develop and overcome some of their barriers. Arguably, this means that within the educational and management discourse, the focus is to link knowledge with practical initiatives accompanied by knowledge and skills that will not only change communities thinking patterns but, to change and replace traits that do not yield productivity.

A multifaceted approach that embraces different stakeholders in establishing an educational foundation, and preparing people to acquire skills to enable them to cope with the changing world is needed. This makes social learning a relevant approach because it stimulates a deeper understanding between the learned with scholarly knowledge, and those who possess indigenous knowledge, who best understand their territory and their needs. It is thus prudent to co-construct, co-create, and share knowledge collectively with others to sustain humanity and restore a sense of identity (Wiziack et al., 2013). This brings the relevance of education and management skills in enabling communities to reciprocate knowledge and skills through active participation, teamwork and collective decision making. Yukawa (2015) recommends that communities must be prepared for the complexity and the problems arising from the world's adversities by employing learning transformation approaches. On the other hand, Kegan and Lahey (2016) points to collaborative efforts that are developmental, and practices where everyone is supported, where personal learning is targeted, where negative personal traits are identified, and strategies are devised to overcome them. This is the kind of learning which according to Freire's (1970) perspective, addresses people as a collective and for them to become critically literate about their circumstance. Since social learning does not confine communities to a mere passive participation but involves ownership of the process of development by communities as beneficiaries of development (Munzer and Shaw, 2015) it becomes a befitting intervention strategy to be used. This means that social learning can bring communities to a point of self-reflection and management of the environment through teamwork, active participation, and effective communication.

Social learning places an increasing demand in HEIs to promote education that does not leave communities behind but build a conscious society (Björkman, 2018). Thus, use is made of different mechanisms to embrace and capacitate communities to enable them to manage their lives and cope with challenges by applying management and sustainable principles (Peter and Wals, 2013). The implication is that communities are actively involved in the process of learning which involves an exchange of values and collaboration. Social learning thus serves as one of the elements of a participatory bottom-up approach which brings communities in the centre of development (Therron and Mchunu, 2014) to learn, manage, improve, and sustain their environment. Furthermore, the United Nations Educational, Scientific and Cultural Organization (UNESCO), have taken steps to promote a campaign that puts weight towards an increased recognition of the cognitive and socio-emotional features of learning about Sustainable Development Goals (SDG)s education (UNESCO, 2017). This can indirectly contribute towards the realisation of the link between education, food security and

poverty reduction. A major question around food security has been to capacitate and empower people to understand their potentials and believe in themselves that they can manage change. Notably, management skills that are applied in different organisations, companies or institutions are also applicable in the collaborative effort of changing needs of the community (Smit et al., 2011). In essence management principles fit anywhere. This means management skills such as planning, organisation, leading and control, communication, decision making, and interpersonal skills are in alignment to the social learning theory and can be applied and be used by individuals to manage themselves and resources to ensure survival and sustainability. According to Wamsler (2020) most of research findings revealed that research on sustainability and education concentrate more on external factors such as environmental aspects, socio-economic and governance issues rather also looking at inner personal challenges faced by individual community members. Nasibulina (2015) adds that education promotes lifelong learning which brings change in action and outlook towards life by laying the foundation of good morals, knowledge and skills enable communities to tackle complex problems in their development journey. To Brink and Wamsler (2019) engagement with others stimulate motivation and stimulate sensitivity and recognition for sustainable values.

Theoretical Framework

Social learning is a concept derived from Bandura (1977) learning theory as an adaptive management approach showing a change in understanding when a group of people learn from each other. According to (Bandura and Walters, 1977) learning is based on the observation of the behaviour of others including a form of social interaction within a group. Following (Bandura and Walters, 1977), such an interaction between people and the environment including other factors at their exposition influence the interchange of knowledge and skills, values, attitude, and the modelling of behavior to reciprocate and impact on transformation and educational development of people. Even though some of the negative elements demonstrated by others are not desirable, social learning can contribute towards the reshaping of good qualities and roles of different role players in the quest for development (Ibid). Green and Peil (2015) add that social learning is a theory which influences people's learning and development of certain traits whereas (Lave and Wenger, 1991) refers to it as an active social participation which reflect activities of a community in the process of learning and developing. It can thus be interpreted as a change resulting from educational foundation that is laid including the adoption of skills gained through interaction with others wherein people learn better traits and adopt new skills that can change their lives for the better. This implies that access to sound knowledge can lead towards producing better outcomes that educate and equip communities with knowledge and management skills that can instil desirable values and traits such as maturity, self-motivation, and self-management. Therefore, it becomes pertinent that, universities must engage and educate communities by laying foundational principles around sound traits, knowledge, and management skills using WIL to promote social learning.

Aim of the Study

The aim was to investigate the impact of social learning and education as facilitated through the Work Integrated Learning (WIL) module to help communities to thrive and secure food.

Research Objectives

1. To determine the extent to which education and social learning promote resilience and change in mindset.
2. To explore ways on how education can develop positive traits that contribute towards communities sustaining food.

Research Questions

1. Towards extent does education and social learning promote lifelong learning, personal development and change in mindset?
2. How can communities sustain food security through education, social learning, and management skills?

Methodology

Research Design

A qualitative research design, guided by an interpretive paradigm, was adopted. Through this paradigm, rich data were collected through a case study which is social sciences research and through a semi-structured interview schedule coded manually into themes (Devare, 2015; Creswell & Clarke, 2014).

Sample and Sampling

The population to which the study aimed at generalising its findings was limited to a sample of few purposefully selected cases, comprising of the Nog community, students, and lecturers.

Methods

To collect get rich qualitative data, use was made of a case study, and semi-structured interviews. According to Merriam and Tisdell (2016) a case study is an empirical inquiry that investigates a contemporary phenomenon in depth within a real-life context.

Case Description

Permission to do the study was sought. Data used in this study included a case of Nog community in the Free state province who together with students and lecturers were part of an educational and social learning session aimed at making participants lifelong learners who can use their land resources to produce food. Log is a rural area in the Free state province and has a small population of plus or minus sixty households. There is no school, no transport and learners must walk many kilometres to a nearby school at a nearby small town, and during rainy days or adverse weather conditions they do not go to school. The university through the office of the Community Engagement in collaboration with lecturers and students initiated an educative empowering social learning session for the Log community. Although the Log community has a vast land with the opportunity of planting and little resources but most of the members were idling, lost hope, negative, uncooperative, lack motivation and management skills. The first session was held in the university where lecturers, students and community members collaborated and learned together. The session was facilitated by lecturers and students were helping community members in interpreting certain difficult words in their mother tongue language and both students and lecturers seated together with community members in each table. The session was a conglomeration of an educational

information, personal skills, management skills and soft skills on problem solving, teamwork, human rights including participatory and sustainability principles.

After an introductory theory all the participants were given themes in groups to identify, discuss and reflect on them, followed by the identification of each one's strength and weaknesses. The session paved the way for the unlearning of undesirable traits and the learning of desirable ones to bring awareness and to help participants to identify resources they have and solve some of their barriers. In practising social learning principles, the first session was about sharing of ideas and best practices. The second session was about the formation of teams consisting of community members and one lecturer. It was followed by the third session which was hosted in the community big storage where they place their farming equipment to undertake a practical work and reflecting further on the application of what was learned which the community had to do independently and reflect orally and in a written form. The last session was the submission of files which included reflections and a some of the practical activities that communities undertook accompanied by photos. Vu and Feinstein (2017) posit that reflective writing within qualitative research qualifies as a data source tool which becomes part of the analytical processes. At the end of the four consecutive sessions there were positive outcomes that emerged such as a motivated community, change of behavioural patterns and a community that was willing to work diligently, produce food and sustain themselves. After completion of all the sessions certificates were issued, follow-ups, monitoring and support were also done by lecturers and students.

Data Analysis
Data were recorded, transcribed, and analysed systematically from content to codes, patterns and to emerging themes using content analysis (Creswell and Poth, 2016). Data used in this study included interviews, oral and written reflections of participants indicating personal development, adoption of new traits. change in outlook towards life and management skills.

Ethical Considerations
In the process of data collection participants were treated with respect, dignity, and sensitivity and were informed of the confidentiality and anonymity of the process.

Findings and Discussions

The findings revealed that through social learning different groups can work together, help each other, and share knowledge and skills that inspire mindset change.

"*Social learning sessions motivated me to remove false beliefs to embrace the belief that I can change my situation for the better,*" said one of the participants.

This reveals the importance of education in laying foundational principles and values that help people to manage their personal lives and their situation of lack. As indicated by (cf. Brink and Wamsler, 2019) motivation is an intrinsic attribute which stimulate positive and sound traits values needed for healthy living and sustainable living. This further   validate Bandura (1977) learning theory as an adaptive management approach that brings a change in understanding when a group of people learn from each other.

"Social learning educational sessions opened a reciprocal process of lifelong learning which considers the significance of different types of knowledge", reported one of the participants.

This reveals the significance of creating a broader space for knowledge sharing that embraces a bottom-up participatory approach where both communities, students and lecturers were operating as equal partners and were free to work on their weaknesses and build their strengths towards using the resources at their disposable to grow food. According to (cf. Brink and Wamsler, 2019) engagement with others stimulate motivation and awareness of good practices and sound values. The idea articulated by (Wiziack et al., 2013) becomes relevant here in making social learning a tool to be used to acquire knowledge and skills that inspire people to realise the importance of food security and sustainability as one of the goals of sessions held the Nog community.

The case study showed that poverty, and unemployment brought low morale which made people to be motivated and not idle. However, the learning session, whereby ideas were shared, help and support given by lecturers ignited hope, positivity, responsibility, activism, and the realisation by the Nog community to use their land as a valuable resource to plough food to reduce poverty and lack. According to (cf. Freire, 1970) the assertion is that the poor must have an understanding about their social conditions to be able to work on some of the weaknesses and overcome some barriers. Similarly, (cf. Yukawa, 2015) recommends that communities must be prepared for the complexity and the problems arising from the world's adversities by employing learning transformation approaches.

Another participant added that, *"Learning together and reflecting on outcomes about managing weaknesses contributed to my personal development and the ability to use resources we have to produce food and live healthy".*

Reflections revealed that, "Time management, planning and setting of objectives helped participants to improve on their weaknesses and build on their strengths.

"Discussions emanating from the educational sessions brought a whole new level of enlightenment of that made me to start planning, setting goals and started having interest in growing food and using resources at my disposable sustainably", reflected.

Another participant, whilst another said, *"Working on my weaknesses and building on my strengths made me to become resilient and to think of ways of improving my life and that of others".*

This suggest that education and social learning are supportive process that can stimulates individuals' interest to change their perspective about life, to become lifelong learners who build new habits and values.

"I also learned that not only western education matters but there is also wealth of knowledge that comes from indigenous knowledge", said another participant.

This showed the value of each knowledge type and values that are embraced within each knowledge type that society can tap into to develop healthy traits that lead to progress and sustainability.

Another participant said, *"Social learning sessions made me to realise that I can cope with complexities".*

This suggests that education and motivation enrich individuals with sound values and principles that enable communities to rise from poverty mindsets and handle complexities.

Another discovery was that management techniques such as planning, time management, motivation, decision making, conflict management that arose from the sharing of management skills motivated many people to join hands in the project of growing and selling food to sustain themselves, move out of the poverty trap and sustain a healthy lifestyle.

The case study and reflections further revealed the importance of education in contributing towards personal development. The view is supported by (cf. Nasibulina, 2015) who indicates that education promotes lifelong learning by laying the foundation of sound virtues, knowledge, and skills. Also revealed was the idea that social learning sessions stimulated self-belief and trust in one's abilities and change people's perspectives from being mere consumers to producers. This suggests that education and shared knowledge around issues of sustainability and management help to build a transformed society that is driven by sound knowledge and skills as well as building resilient communities who turns into producers that are involved in the food security drive. A critical finding was the significant relationship between education, management, and social learning which made people to move out of their comfort zones but to think of ways of dealing with their situation of lack and destitute.

Conclusion

It is evident that education, social learning, and motivation plays a significant role in broadening people's knowledge and bringing change in mindset to focus on strengths and work on their weaknesses to sustain their lives. Social learning laid the foundation for the survival of communities and for them to unlearn and learn traits and techniques that contributes towards better standards of living. This paper investigated how social learning and education promote lifelong learning and contribute towards a stimulus for self-management skills to change negative behavioral traits and practices. Education self-management skills and motivation forms part of lifelong learning contributing to personal development and the ability to use resources effectively and secure food because communities with sound values and an educational foundation are likely to be food secure than those without. This paper concludes that HEIs engagement with communities though the WIL module should follow strategies that do not subscribe to passive participation. Rather, they must engage in reflective, participatory social learning initiatives that motivate people to change their mindsets and gather knowledge and skills that enable them to manage their personal lives and resources. Knowledge and skills that were shared through WIL activities and a social learning approach where people shared knowledge and skills on an equal basis platform enabled a sense of taking charge, independence, responsibility, and the will to live better. It is thus concluded that social learning and education can bring positive results of self-management and sustainable living that can change a society from a downturn and collapse to an informed, a healthy resilient society that is able to secure food and reduce poverty.

Implications

The implication is that social learning allows equal status and recognition of different knowledge types. This is indicative of recognition of human centred approaches and the creation of balance between scientific and indigenous knowledge significant in developing informed, resilient, and a healthy society that can survive the onslaught of food security and poverty to decrease dependency on government with its limited resources in servicing a

growing population. Higher Education thus needs to use Work Integrated Learning (WIL) as an enabler for community engagement in the curriculum, to equip communities with knowledge and skills to be able to manage food security and poverty. This study proposes an ongoing educational support and engagement between higher education and communities with the implication of bringing change and sustaining communities. Since government cannot curb the increasing population and cater for their increased needs. It becomes mandatory for higher education to engage with communities and assist with continuous capacity building, whilst government provides agricultural resources.

Mentoring to Enhance Student Teachers' Self-Efficacy for E-portfolio Development During Teaching Practice

Ratokelo Willie Thabane, Central University of Technology, South Africa

Abstract

Teaching Practice is a critical phase of teacher education that provides opportunities for student teachers to reflect on the development of their teaching philosophies and put them into action. Student teachers' self-efficacy refers to their beliefs in their ability to effectively handle the tasks, obligations, and challenges related to their professional activity. In the South African context, e-portfolios are increasingly being considered in teacher training programs to enable student teachers to reflect in, on and about practice in a structured way, whereby they demonstrate their growth and development as professionals. Good quality mentoring during teaching practice contributes to the development of critical professional skills of student teachers and ensures the best quality learning experiences for pupils. This paper is arranged as an ideas paper that seeks to explore how mentoring may enhance student teachers self-efficacy for e-portfolio development during teaching practice. A qualitative research design was adopted in gathering information used for this study. A literature review process was used as a data collection tool and this involved activities such as identifying, recording, understanding, meaning-making, and transmitting information pertinent to the enhancement of student teachers self-efficacy for e-portfolio development during teaching practice through mentoring. Findings revealed that good quality mentoring may enhance the student teachers' self-efficacy for e-portfolio development and that e-portfolios are practical tools for self-directed, reflective and collaborative professional learning. Further findings show that formal mentoring programs are essential to meet student teachers professional learning needs. These findings will encourage mentor teachers to optimally assist student teachers to develop e-portfolios for their professional learning.

Keywords: Mentoring, Self-Efficacy, E-portfolios Development

Introduction

Teaching practice is an integral feature of any education-based program. During this period student teachers are afforded an opportunity to develop and refine teaching competency, expertise and quality. They practice how to plan and deliver content, how to asses learners, how to engage their learners in the learning process, and also how to reflect on their teaching experience. During this time student teachers are expected to develop electronic portfolios, also known as e-portfolios. These e-portfolios succeeded paper-based portfolios. E-Portfolios generally refer to "digital dossiers, in which students compile and reflect upon multimodal artefacts to review their learning journeys" (Yancey, 2019).

During teaching practice, student teachers are assigned mentor teachers whose duties are crucial in helping pre-service teachers hone their pedagogical abilities and grow as professionals in the classroom (Li, Sani & Azmin, 2021). Mentoring, in a pre-service teacher context, occurs during professional placements (or practicum) in which student teachers are being placed with classroom teachers (mentor teachers) to learn, develop and practise teaching knowledge and skills (The Queensland College of Teachers, 2007).

The Mentoring Context in Pre-service Teacher Education

During teaching practice student teachers attend schools to have a real life professional experience and develop their teaching skills under close supervision of expert mentor teachers. Ambrosetti (2014:31) argues that mentoring "concerns the development of the relationship between the mentor and mentee, which in turn provides the underpinning for the growth of the mentee's skills". In order to assume the tasks of welcoming, accompaniment, and direction in the dynamic engagement of the placement school or classroom and the student evaluation, the mentor teacher must have the necessary knowledge, leadership, and interpersonal skills (Fernamdez-Morante, Leranoz-Iglesias, Cabriero-Lopez & Abel-Pereira, 2024:2).

When mentoring pre-service teachers during their teaching practicum, mentor teachers must always act out their roles. They are expected to be role models as experienced professionals who demonstrate best practice for the student teachers to emulate.

The Teaching Practicum

Teaching practice, often called teaching practicum, involves learners, school administrators, mentor teachers, university supervisors, and student teachers. It is a mandatory course in teacher education programs that works with schools to try and acquaint student teachers with the teaching environment and its variables (Aghabarari & Rahimi, 2020:2). According to Aglozar (2017), the following sets of objectives have been established for why teaching practice is a mandatory component of teacher training: "to expose student-teachers to real life classroom experiences under the supervision of professional teachers; to provide the forum for student-teacher to translate educational theories and principles into practice; to enable student-teachers discover their own strengths and weaknesses in classroom teaching and provide opportunities to enable them address their weaknesses and enrich their strengths; to familiarize student-teachers with real school environment as their future work place; to provide student-teachers with an opportunity for further acquisition of professional skills, competencies, personal characteristics and experience for full-time teaching after graduation; to help student-teachers develop a positive attitude towards the teaching profession; and to

serve as a means of assessing the quality of training being provided by teacher training institutions" (102).

Teaching practice is also aimed at closing the gap between theory and professional practice. Mesa (2018:303) defines professional practice as "a range of opportunities for observation, analysis, and interpretation of what happens, how and when it happens in teaching situations, as well as experimentation in real contexts". Theory, on the other hand, is defined as "the knowledge needed to handle professional activities". In this sense, the placement schools effectively contextualize, apply, and reconstruct information for use in the classroom while the university disseminates knowledge through its teaching staff in the teaching professions that are mobilized in the programs of teacher education (Mesa 2018:303).

Teaching practice is designed to improve student teachers' ability to teach by providing them with the opportunity to apply the knowledge, beliefs, and skills they have been studying at the university (Badawi, 2021:692).Thus, teaching practicum gives student-teachers a chance to have contact with the real world of their profession. The content of teaching practicum therefore helps student teachers get acquainted with educational practice, practice the work of a class teacher, practice teaching and prepare final a portfolio of evidence for both developmental and assessment purposes.

The E-portfolio

An e-portfolio can be defined as a digitized collection of artifacts including demonstrations, resources, and accomplishments that represent an individual, group or institution. Using ePortfolios in teacher education programs has a number of benefits. Among these benefits include improved pedagogical and technical topic knowledge, reflective teaching abilities, values, beliefs, and positive attitudes, as well as improved lifelong learning (Thabane, 2022). In teacher education programs, e-portfolios are employed as instruments for reflection and empowerment. Pre-service teachers stand to gain the most from the usage of e-portfolios in the development of their reflective competences. A crucial component of a teacher's professional development is reflection. The e-portfolio captures the learning process itself because the student's progress can be monitored along the way . It also allows the exchange of ideas and feedback (López-Crespo1, Carmen Blanco-Gandía1, Valdivia-Salas, Fidalgoi & Sánchez-Pérez, 2022:5234). An e-portfolio therefore showcases a student teacher's personal growth and demonstrate specific knowledge and skills gained during the learning programme. This means that student teachers use the ePortfolio to reflect, engage, collaborate and enhance active, authentic learning. E-portfolios therefore provide a comprehensive way to document personal progress, to reflect on work activities, to support learning and to serve as a tool for feedback and evaluation (Totter & Wyss, 2019).

E-portfolios provide student teachers with an opportunity and a virtual space to critically assess their academic work through reflection. Student teachers use e-portfolios to provide evidence of competencies required for certification (Lorenzo & Ittelson, 2005:4). Student teachers are also able to make connections among different activities undertaken during teaching practice through the use of e-portfolios. Student teachers can benefit from e-portfolios in a number of ways, including the opportunity to incorporate multimedia, ubiquitus portfolio access, and an easier way to view their own development (Beckers, Dolmans, & Merrenboer, 2016).

The E-portfolio Development

Developing an e-portfolio involves skills essential for the 21st century learning such as organizing and planning material, giving and receiving feedback, reflecting, selecting and arranging content to communicate with others in a more effective way. E-portfolios help student teachers grow by encouraging continuous self-evaluation through reflection on their own strengths and weaknesses, identification of knowledge and competency gaps, celebration of accomplishments, assessment of future directions, and conversation with others (JISC, 2008).

Student teachers' experiences during teaching practice have a significant impact on their subsequent integration of technology upon entering the field. With the assistance of mentor teachers, student teachers become empowered to develop e-portfolios. Student teachers are assisted in technology integration. During this process student teachers are provided with knowledge on how to utilize content and technological and pedagogical expertise effectively for the benefit of pupils' learning (Hodges, 2018). The creation and management of an e-portfolio provides student teachers with opportunities to build digital fluency, using technologies to create, select, organise, edit, and evaluate their work.

Self-Efficacy in E-portfolio Development

Self-efficacy is built upon the tenets associated with Bandura's (1986) Social Cognitive Theory (SCT). SCT defines self-efficacy as people's judgement of their capabilities to organize and execute courses of action required to attain designated types of performance. During teaching practice student teachers are required to develop e-portfolios to demonstrate their capabilities to organize their teaching to benefit pupils' learning. Although electronic portfolios have numerous potential advantages, the process of constructing one involves several processes, such as gathering, choosing, reflecting, projecting/directing, and displaying (Yang & Wu, 2013:121). Unfocused instruction and/or poorly defined tasks result in low reliability for evaluations in portfolio assessment; the electronic portfolio requires a level of technological skill that not all teachers and students possess; it takes time for students to put together and for teachers to guide and provide feedback.

Method

The research issue in this paper is addressed through a critical literature evaluation on the role of mentoring in enhancing student teachers' self-efficacy in e-portfolio development, a task that student teachers are required to undertake since the start of the covid-19 pandemic going forward. A literature review process helped in identifying, recording, understanding, meaning-making, and transmitting information pertinent to the enhancement of student teachers self-efficacy for e-portfolio development during teaching practice through mentoring.

Discussion and Conclusions

Mentoring student teachers in developing e-portfolios provides a strong link between knowledge of theory and teaching practices with technology embedded. When technology, content and pedagogy are simultaneously considered, student teachers are more effective in responding to challenges in technology and can engage in reflective practice (Hodges, 2018).

As alluded to by Yang and Wu (2013:167), developing an electronic portfolio is quite challenging in practice. However, Syzdykova, Koblandin, Mikhaylova, and Akinina (2021:121) maintain that it is also important to provide technical support to students and teachers as it can significantly affect student motivation and their perception of e-portfolios.This technical support is best provided by the mentor teacher. Student comfort when using the e-portfolio technology is also an important aspect of motivation. Intrinsic motivation is the key to the acceptance of new technologies, and self-efficacy (competency) is a prerequisite for motivation. It is noted that problems with the IT infrastructure and the system used to create an e-portfolio negatively affect student motivation (Syzdykova, *et al*, 2021).

Student teachers usually hold their mentor teachers in high regard. The involvement of mentor teachers in the student teacher's activitities brings about hope and a wilingness to succeed, hence their believe to succeed in developing an e-portfolio is enhanced by the mentoring they receive.Mentor teachers carefully considered their students' design layouts and included materials after exploring the elements and the structures of some existing examples. Difficulties with integrating multimedia are more prevalent when schools do not provide predefined formats (Hsieh, Lee, & Chen, 2015).

Self-efficacy beliefs among new teachers have an impact on their levels of drive and tenacity in the face of challenges. Often, these teachers want to engage more and be autonomous, but experience limited support from their school management teams (Mokone, Palmer & Thabane, 2022). Self-efficacy is a powerful motivator that helps people decide how much work is necessary (Alexiou & Paraskeva, 2013). The mentor teacher needs to ensure that the student teacher spends sufficient time and effort in the development of an e-portfolio so as to realize self-improvement. Mentor teachers may enhance the student teachers' self-efficacy to develop an e-portfolio by helping to identify helpful resources that student teachers may access to develop their e-portfolios. Mentor teachers should foster meaningful dialogues between themselves and the student teachers. These dialogues should encourage exploration as thereby leading to deep learning.

Reflection as a process of making sense of ideas and concepts in relation to our existing knowledge structure and our feelings is a crucial aspect of e-portfolio development. Student teachers are unlikely to reflect successfully without considerable guidance from the mentor teacher. Therefore, in order to properly help the student teachers during their placements in schools, the university must make sure that mentor teachers are aware of their responsibilities. From the above trends in literature it may be concluded that good quality mentoring can enhance the self-efficacy of student teachers in the development of e-portfolios.

The Impact of Interaction via Social Media on Youth Mental Health Through Social Media Content and Communication Style of Indonesian Students

Harmita Sari, National Dong Hwa University, Taiwan
Ming-Chou Liu, National Dong Hwa University, Taiwan
Anita Hafid, National Research and Innovation Agency, Indonesia
Jamilah Akbar, National Dong Hwa University, Taiwan
Fatiha Khoirotunnisa Elfahmi, National Dong Hwa University, Taiwan

Abstract
During the COVID-19 pandemic most of students globally suffered of mental health. Bisedes virus wudespread, communication and interaction pattern on social media also play important role on their mental disorder including anxiety, depression, and mood disorders. It needs to confirm which content and interactions influence students and youth behavior. Methods: A total of 604 valid participant which obtain through online survey, aged 15-25 years at beseline. Structural Equation Modelling (SEM) was used to examine research hypotheses. Results: Social media interaction pattern has positive and significant effect on which content student discuss and sharem as well as their communication style. Furthermore, communication style has greater effect on student mental health than social content. Conclusions: the interaction of baseline students' emotional features with social media environment predicted divergent of social communication and interaction on social media. Both anxiety and depression from social influenced by communication and interaction pattern. Results: the results indicate that the main motivator of students in this context is the effectiveness and convenience of using social media, particularly in the use of content and communication with the determination of individuals and student communities. One way to predict the widespread of social media interaction options is to examine the motivation for using it individually, socially, and within the context of the student's environment. According to the findings, mental health is more particular, and choosing to participate in social media interactions is what drives students in these situations.

Introduction

The COVID-19 pandemic has caused significant changes in various areas of life, including education. Two years since the beginning of 2020, the public has been shocked by the outbreak of the COVID-19, which changed almost all human behaviors, such as the implementation of online learning, teacher-student and student-student communication taking place in social media groups, as well as assignments submission, and many other educational activities carried out online (Adedoyin & Soykan, 2020; Aristeidou & Cross, 2021). Several countries such as India, Africa, and the United States have been actively using social media to communicate during the COVID-19 pandemic (Adekoya & Fasae, 2021; Bordoloi et al., 2021; Kemp, 2020; Madge et al., 2019; Sharma & Kapoor, 2021), thereby increasing the number of active users (Mason et al., 2021). Apart from India and America, Indonesia has the third highest number of social media users worldwide, precisely 191 million people. In this regard, the COVID-19 pandemic has undoubtedly promoted student communication on social media, including creating learning communities in *WhatsApp*, *Facebook*, and *Instagram*, which made these platforms very popular among Indonesian students (Statista, 2022).

The restrictions on direct communication through conventional methos do not prevent learners from actively communicating and interacting, considering that using social media has become their daily habit (Sims et al., 2017; Zarzycka et al., 2021). As the focal point of long-distance communication, social media facilitates the exchange of information, knowledge, and daily activities that positively affect pupils' boredom while at home (Boyd & Ellison, 2007; Haand & Shuwang, 2020; Lin & Lu, 2011). Hence, such behavior occurs all the time and eventually becomes a daily routine (Kemp, 2020; Shen, 2020). In addition, remote or long-distance communication is compatible with the existing methods and technologies, enabling it to run effectively. It expands interactions outside the home and school and eliminates the limitations of distance and space encountered in conventional or direct interaction (Kemp, 2020). Nonetheless, these two methods should ideally be applied simultaneously to promote the dissemination of information and knowledge along with other activities.

Students seem to feel comfortable communicating on social media due to several factors such as fascinating content (sounds, images, texts, and videos), learning needs, entertainment, opportunities to share experiences, and daily communication (Boyd & Ellison, 2007; Lin & Lu, 2011). However, there were limited studies investigating the impact of active communication on social media on learners' mental health, either in a positive or negative context. Researchers argue that students' familiarity with social media might affect their mental health based on previous studies (Baccarella et al., 2018; Glazzard & Stones, 2016; Hou et al., 2019), changes in learning behaviors, communication at home, and decreased social awareness.

Some learners spend time interacting on social media all day without getting bored because of the variety of impressive content found on each social media platform (Ralph et al., 2022; Vraga et al., 2016; Zarzycka et al., 2021). For instance, *Facebook* provides many features such as storytelling, live broadcasts, instant article publishing, and a communication space (Bene et al., 2022; Bergström & Belfrage, 2018). *Instagram* offers quiz and giveaway content, regular posts, reels, and chat rooms (Voorveld et al., 2018). *WhatsApp* presents a simpler communication space, story-sharing feature, and a more effective learning group or community (Madge et al., 2019). In sharing or responding to content, each student has a different communication style, such as being self-centered by focusing on prominent issues,

commenting on posts positively and negatively, or simply sending *emoticons* and pressing the *like* or *unlike* button (Bene et al., 2022; Keller & Kleinen-von Königslöw, 2018).

Social media can be benefitted as a learning community (Madge et al., 2019; Zarzycka et al., 2021), a place for social interaction/daily communication (Bergström & Belfrage, 2018; Mason et al., 2021; Papoola, 2014), entertainment (Lin & Lu, 2011), and professional or work purposes (Boddy & Dominelli, 2016). In educational institutions, students and teachers have used social media to exchange knowledge, discuss, and share information (Madge et al., 2019). In the present study, researchers focused on *WhatsApp*, *Facebook*, and *Instagram*, as the most popular platforms, especially in Indonesia (Data Indonesia, 2022).

Daily interaction plays a crucial role in improving the quality of human life, one of which is the education process for students. Accordingly, scholars must explore the correlation between elements of daily communication (such as interaction on social media, content availability, communication style, and mental health) with students, teachers, and society by engaging various indicators. Pupils carried out two types of interactions: direct and indirect (First et al., 2020; Namkoong et al., 2016). In an indirect interaction, the use of social media likely motivates people to access the existing platforms frequently for a long time, resulting in a sort of addiction (Haand & Shuwang, 2020; Hilliard, 2019). Several empirical studies concluded that social media interactions correlated with content, communication style, and mental health (Glazzard & Stones, 2016; Hou et al., 2019; Vraga et al., 2016). In the context of student interaction, the discovered patterns included positive or negative communication, level of concern, and motivating content covering education, religion, and entertainment.

Anchored on previous study findings, Indonesia encountered a particular case in the form of students' mental health conditions affecting their interactions in life. Although mental health was investigated frequently, researchers still have not discovered the main problems and solutions, making the topic remain a polemic and a common issue. In addition, prior studies only focused on the existence of social media, the effectiveness of communication on social media, and mental health (Bergström & Belfrage, 2018; Haand & Shuwang, 2020; Kumar & Nayar, 2020), which oriented to the context of western countries and neglected the comprehensive concept of social media interaction such as variations in content and communication styles (Hilliard, 2019). Furthermore, (de Vries et al., 2017; Gambo & Musonda, 2022; Sajtos et al., 2022) suggested future studies to conduct an in-depth investigation of the impact of interactions via social media on students' mental health based on the context of eastern countries and education. Therefore, the present research aims to address the following questions:

RQ1. Does interaction via social media affect students' mental health?
RQ2. Does interaction via social media have a positive impact on social media content and communication style?
RQ3. Do mediating roles of social media content and communication style have a positive impact on students' mental health?

In an effort to answer the research questions, researchers examined the impact of students' active interactions via social media on their mental health in education by incorporating content and communication style as mediating variables. Therefore, this study was expected to provide some theoretical and practical contributions. *First*, this research correlated student interactions via social media, such as using learning groups in schools, organizations, and other communities through *WhatsApp*, *Facebook*, and *Instagram*. *Second*, previous scholars discussing the correlation between content and interaction on social media did not concern

the communication style and students' mental health conditions (Achen, 2019; Choi & Shin, 2016; Yuan & Lou, 2020). In the context of this study, both mediators and interaction were associated with content and communication style (Keller & Kleinen-von Königslöw, 2018; Vraga et al., 2016). Hence, it could assist academics and practitioners in comprehending the impact of interaction via social media on students' mental health, which further affected the content and communication styles that had an impact on psychological conditions such as positive or negative mental health.

Literature & Hypotheses

Social Media Interactions

The frequency of social media interactions among the public is increasing, particularly among teenagers/students. Increased social media interaction can be used as important research to determine its effect on students' conditions such as the impact of students' interactions with parents, teachers, friends, and other communities (Abar et al., 2017; Cunha et al., 2016; Miao et al., 2022). Several previous studies have focused on the use of social media as media of interaction that facilitate human activities such as daily communication processes, learning, buying and selling products, work meetings, and entertainment (Lin & Lu, 2011; Sims et al., 2017; Zarzycka et al., 2021). This is the time to know and pay attention to the students' condition during interactions on social media. Thus, this study provides important information about students' interactions on social media that have an impact on their mental health. There are several students' interaction media, such as WhatsApp, that help students form subject groups, schoolwork groups, discussion groups, communities both inside and outside of the school (social groups), and family groups (Madge et al., 2019; Lakmali et al., 2021). Facebook as interaction media function as a larger communication space for conveying and discovering information (such as education, politics, health, and social), and live streaming content to the world (Bene et al., 2022; Bergström & Belfrage, 2018; Ralph et al., 2022; Vraga et al., 2016; Zarzycka et al., 2021). Furthermore, as the popular interaction media among students, Instagram can provide entertainment such as quiz content, giveaways, reels content, chat rooms, regular post content, and a more flexible community among students (Voorveld et al., 2018). These three social media provide distinct platforms and have the appeal to be used on daily basis in the interaction space (Alaimo & Kallinikos, 2017). Interactions in social media will have an impact on students' mental health, such as positive or negative impacts (A. et al., 2022; Keles et al., 2020). In this study, interactions in social media were mediated by the provision of social media content and students' communication styles, which are expected to aid researchers in determining students' mental health conditions during interactions in social media.

Social Media Content

Social media content attracts students' attention to continue interacting. Therefore, they are becoming accustomed to using or sharing content on social media (Tang et al., 2012; Dedeoglu, 2019). Students consider social media content can meet their needs such as communication, entertainment (sharing reels, routines, watching live streaming videos, reading news about culture, food, movies, fashion, and so on), making it easier for learning communities, social communities, saving photo/video documents, looking for job opportunities, and utilizing social media content to earn money or work (Bergström & Belfrage, 2018; Kemp, 2020; Lin & Lu, 2011). In addition, students demonstrate their ability in creating content, such as videos, images, text, and other audio-visuals, and share them on

social media. This study focuses on social media content that affects students' mental health when they create or receive content such as written or text content, images, and audio-visual/video on WhatsApp, Facebook, and Instagram spaces (Kaushal & Dogra, 2021). Social media content will make a significant contribution to students' interactions in social media and positive mental health. According to (Thorsen & Jackson, 2018; Welbers & Opgenhaffen, 2018), the types of written content are in the form of copywriting, short stories, poems, promotional texts, email content, e-books, news texts, narrative texts, and writings for daily communication. Another type of content is image-based content (Alam et al., 2018; Bossio, 2021). Images are two-dimensional arts with the function to explain something, examples of image-based content are photos, memes, flyers, banners, and infographics. Furthermore, audio-visual content, such as voice notes, music, and streaming platforms, is popular among students; all of these contents can be shared easily on social media (Figueroa, 2008). Students can capture information more structuredly by using written, image-based, and audiovisual content (Pearce et al., 2018). Every student can create and select content she/he likes or even uses all of the content available in social media. Finally, content in social media will become a benchmark for students' mental health.

Communication Style

The presence of social media among students affects their communication style used to interact, convey aspirations, inspiration, and receive information. Social media is not new among students, but its usage has increased since the COVID-19 pandemic until now (Mason et al., 2021). Therefore, it is appropriate for academics, practitioners, government, or parents to know the communication style used by students in social media (Cunha et al., 2016; Zarzycka et al., 2021) to help students' mental health. Communication styles will provide new experiences to students, such as oral/verbal communication (talking directly by voice), written (replying to messages via text or commenting on posts via written text), and non-verbal communication, such as commenting on images, videos, stickers, emotions, or tapping like/unlike button (Bene et al., 2022; Keller & Kleinen-von Königslöw, 2018). In addition, the communication style used is formal, such as in learning groups with teachers, attending seminars, or meetings in a specific organization, and social media users use a standard/ formal language style when communicating important/formal information, (Welbers & Opgenhaffen, 2018). Meanwhile, non-formal communication styles are used for daily communication with family, friends, close friends, or social communities, this is a well-known and relaxed communication style (Bullock & Hubner, 2020; Venter, 2017). The various communication styles can have an impact on the productivity or interaction of social media use. Thus, social media content and communication styles are key factors in discovering students' mental health during social media use, such as happiness, self-confidence, addiction, depression, anxiety, and positive and negative mental health (Glazzard & Stones, 2016; Keller & Kleinen-von Königslöw, 2018; Vraga et al., 2016). In conclusion, those key factors function to find out the success of interactions in social media that have a positive impact on students' mental health in the future.

Youth Mental Health

Mental health is an inner state that can influence daily interactions whether it is in good or bad health. Students with positive mental health are calm and tranquility, so they enjoy life and appreciate those around them. Students who are mentally healthy exhibit characteristics, such as maximizing their potential in facing life's challenges, and establishing positiverelationships with family, teachers, friends, communities, andrelatives (Klineberg et

al., 2006; Maulik et al., 2011) particularly relationships or interactions in social media. On the other hand, students with mental health disorders experience impaired thoughts, moods, and emotional control leading to bad behavior (Ferrer & Mendes, 2017). Negative mental health damages interactions or relationships with others and reduces learning achievement and work productivity (Bergström & Belfrage, 2018). Examples of common mental health disorders that often occur in students are stress, anxiety disorders, anddepression (Keles et al., 2020). Some activities that can affect positive mental health are social/religious communities, worship/prayer, interaction or closeness with family, forming charitable communities in social media, public creative spaces, and sharing positive posts about various knowledge and learning (Cook 2020; Lakmali et al., 2021). In addition, an activity that can influence negative mental health is FOMO (Fears of Missing Out), which is one of the effects of frequent use of social media. FOMO refers to the fear of missing out on information or an opportunity to interact. Students who are addicted to social media will experience stress, which will negatively impact their mental health (Haand & Shuwang, 2020; Hilliard, 2019), and they will become emotionally attached to social media.

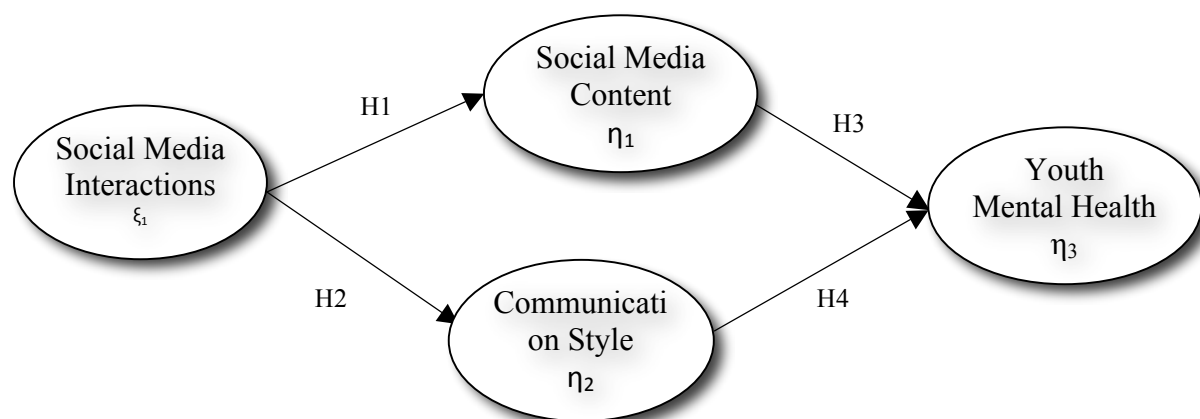

Figure 1: Proposed research model.

Methodology

Questionnaire Design, Pretest, and Pilot Study

This study adopts scales with high reliability and validity. It uses multi-item scales for all of the constructs from prior studies in the proposed model about conducting a pretest and pilot test to validate the measurement items' wordings of constructs for the social media content, communication style and youth mental health in Indonesia. It was used to ascertain whether the students understood each of the questions and revised wordings to prevent single-source bias (Podsakoff et al., 2003).

Sample and Data Collection

Indonesian students are asked to fill out an online survey; in addition, a cash prize of 2,000 Indonesian rupiah (IDR) must complete each study to increase their response rate. This online survey was conducted using Google Forms and samples were collected from convenience sampling at random. This study validates the relationship between social media content, communication style, and youth mental health.

Data Analysis

The data were analyzed using two statistical programs, namely SPSS 22 and AMOS 22 software. Furthermore, hypothesis testing was carried out by applying the structural equation model (SEM). According to Byrne (2016), SEM provides two essential aspects of the procedure. First, it is used to determine the causal effects of the observed variables, and (b) the structural relations among variables enable a clear description of the theory examined in this study. The hypothesized model is comprehensively used to validate all the variables to determine consistency with the study. Pearson correlation coefficients were also used to determine the relationship between predictors (social media interactions, social media content, and communicattion style) and criterion variables (youth mental health). Third, standard method variance (CMV) was adopted as a prevention and post-detection technique. Therefore, this study applies the Hayes bootstrap method (2018) to examine the influence of social media content and communication style on mental health mediated by social media interactions.

Results

The Pilot Study and Descriptive Statistic

This study conducted a measurement model by adopting AMOS software with maximum likelihood estimation. The model's fit indicated how well the CFA model reproduced the covariance matrix of the variable which was observed as seen in table 3. Each item loads significantly on its respective construct with factor loadings and squared multiple correlations of all measurement items and demonstrates good reliability for all item measurements, constructs, and convergent validity (Byrne, 2016). The mean score for the endogenous variable (Youth Mental Health) was above 3.00, while the standard deviation was above 0.70. This means that on average, social media content, communication style, social media interactions, and youth mental health had a strong correlation (table 2). The samples taken were 606 students and all samples were valid (see table.1).

Table 1: *Respondent Demographics*

Demographic Items	Frequency	Percentage (%)
Gender		
Male	184	30.4
Female	422	69.6
Age		
Below 20 years old	439	72.4
21~25 years old	167	27.6
Time range use social media		
1~5 year	285	47.0
6~10 Year	230	38.0
> 10 Year	91	15.0
Rang time use SNS in a day		
1~5 hours	248	40.9
6~10 hours	223	36.8
11~15 hours	90	14.9
➢ 15	45	7.4

Pearson Correlation

The pilot study was adopted to ascertain the content validity and respondents' identity; moreover, the reliability of measurement items was assessed using Cronbach's alpha (Hair Jr et al., 2019). The mean difference was indicated in the standard deviation. Therefore, an effect size greater than 3 indicated that the mean difference was half of the standard deviation. The mean score for all was above 5.00, while the standard deviation was below 1.00. It means that all observed variables had a strong correlation.

Measurement Result

The SEM was conducted to evaluate the proposed models and test the research hypotheses. A two-stage approach designed by (Byrne, 2016 & Hair Jr et al., 2018) was used in this study. First, the measurement model might be based on a confirmatory factor analysis (CFA) to test the reliability and validity of the research constructs. The structural model was used to test the strength and direction of the proposed relationship among constructs. The CFA results of the remaining 24 items showed the data had good suitability.

Table 3: *Measurement Results*

Constructs	MLE estimates factor loading/ measurement error		Squared multiple correlation (SMC)	Composite reliability (CR)	Average of variance extracted (AVE)	Cronbach's α

Fit statistics (N = 606)
χ^2/df = 2.801, Goodness-of-Fit Index (GFI) = 0.928, Nonnormed fit index (NFI) = 0.935, Comparative Fit Index (CFI) = 0.957, Incremental fit index (IFI) = 0.957, Tucker Lewis Index (950) and Root Mean Square Error of Approximation (RMSEA) = 0.055

Structural Model

The model that was fit for the data was sufficient. The summary in table 4 shows that there was a positive and significant relationship between social media content and social media interactions (0.792; $p < 0.001$), social media interactions and communication style (0.567; $p < 0.001$), which supported H1 and H2. Similarly, H3 and H4 were supported, which means a positive relationship between social media content and youth mental health (0.096; $p < 0.001$)

and communication style and youth mental health (0.256; p < 0.001). Therefore, H1, H2, H3, and H4 were supported in this study. Figure 2 shows the structural model adopted in this study.

Table 4: *Proposed Model Results*

Hypotheses	Symbol	Path		Coefficients	Test results
H1	γ_{31}	Social Media Interactions	→ Social Media Content	0.792***	Supported
H2	γ_{11}	Social Media Interactions	→ Communication Style	0.567***	Supported
H3	γ_{21}	Social Media Content → Youth Mental Health		0.096*	Supported
H4	β_{31}	Communication Style → Youth Mental Health		0.256***	Supported

Mediating Effect

This study adopted the procedure recommended by (Hayes, 2018) to validate mediator variables (e.g., social media content and communication style). Table 5 shows the mediation analysis showing that 95% of the CI of all indirect effects tested and partial roles did not include zero. It was concluded that social media interactions had a significant indirect effect on youth mental health without mediator variables (for example, social media content and communication style).

Table 5: *Mediation Effects*

Discussion

Key Findings

This study confirms that social media content has an important role in influencing youth mental health, it is necessary to be careful in choosing or sharing content on social media. They also believe that social media, particularly available content, plays an important role in facilitating interaction with teachers, other students, learning communities, and society, particularly for students. In addition, it will increase knowledge with the ease of information

available on social media. This is an innovative finding that, to our knowledge, has not been uncovered by previous research. In particular, the results show that social media content can meet their needs such as communication, and entertainment (sharing reels, routines, watching live videos, reading news related to culture, food, movies, fashion, etc.). Content plays an important role in social media interactions. This implies that social media and prepared facilities such as available content have a strong correlation with students' enthusiasm and health conditions. The study results confirm previous research which concluded that social media content has a positive and significant effect on social media interactions (Dedeoglu, 2019; Kemp, 2020; Lin & Lu, 2011).

This study also confirms that communication style on social media also plays an important role in influencing social media interactions. This means that communication styles provide students with new experiences, such as verbal and written communication, as well as non-verbal communication such as commenting on images, videos, stickers, emotions, or tapping the like/unlike button. In addition, it also motivates students to always use social media as a means of interaction. However, well-used social media has a positive and significant effect in bridging and enhancing the relationships between students and teachers; students with other students; students and families; Students and social communities. This proves that social media plays an important role in influencing student interactions on social media. Communication style and social media interactions also increase the frequency of social media adoption. As a result, it fosters a sense of belonging and familiarity between students and teachers, families, and others. This also proves that the student's primary motive is interaction on social media and it also reinforces that the communication style used or accepted will be very important in bridging students' thoughts and views when interacting or using social media. These results support previous research by (Vraga et al., 2016; Zarzycka et al., 2021) who concluded that communication style has an important role in influencing social media interactions.

The uniqueness of the concern is how the condition of youth mental health. Content and communication styles on social media are interesting tools for students to find out the student's mental health condition through interactions carried out on social media. The content and communication style used also play an important role in influencing youth mental health. Therefore, this study confirms previous studies (Goodyear et al., 2018; Granic et al., 2020; Kemp, 2020; Shen, 2020). Interestingly, social media content and communication style have a partial role in mediating the relationship between social media interactions and youth mental health. This implies that the students' pedagogical and comfort needs should be more focused on problem-based learning, service-learning, and project-based learning. It has a strong correlation between the convenience of interaction on social media and youth mental health experienced by students. These results are also in contrast to (Granic et al., 2020; Sims et al., 2017), who found that social media plays an important role in students' mental health.

Conclusions

The use of social media fosters critical thinking about communication interpretation and purpose. The provision of content/features and communication styles presented can shift students' focus to the important goals of using social media. A framework that integrates the driving factors of the interaction process on social media in the framework of developing positive communication, technology, social media content, communication style, and youth mental health. These guidelines help to maintain the bonding of students and teachers,

families, and other communities, which in turn affects student interaction, student communication, and positive mental health. The social motivation of students' contexts can be utilized as a use of the effectiveness of communication on social media. The results indicate that the main motivator of students in this context is the effectiveness and convenience of using social media, particularly in the use of content and communication with the determination of individuals and student communities. One way to predict the widespread of social media interaction options is to examine the motivation for using it individually, socially, and within the context of the student's environment. According to the findings, mental health is more particular, and choosing to participate in social media interactions is what drives students in these situations.

An Analysis of English Vocabulary in Hong Kong Textbooks for Bilingual Children

Chris Law, The Chinese University of Hong Kong, Hong Kong SAR
Stephen Matthews, The University of Hong Kong, Hong Kong SAR
Virginia Yip, The Chinese University of Hong Kong, Hong Kong SAR

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
Vocabulary acquisition is central to building literacy, yet there is little research on the vocabulary component of textbooks for school children. Acquiring the vocabulary of a language is commonly interpreted as simply "knowing the meaning of the words and being able to use the words", acknowledging the receptive and productive aspects of vocabulary. However, Nation proposes that knowing a word involves nine aspects (categorized into "form", "meaning", and "use") from the perspective of second language learning. This study shows that among the most popular primary English textbooks in Hong Kong (3 major publishers; 9 textbooks in total), "form and meaning" receives the most attention, while "grammatical functions", "spoken form" and "written form" receive comparable attention. The other five aspects of vocabulary knowledge, including "word parts", "concept and referents", "associations", "collocations", and "constraints on use" receive little or no attention. This study explores the phenomenon by drawing upon vocabulary literature and the primary curriculum in Hong Kong. It suggests that researchers and industry collaborators need to consider a more holistic view of vocabulary knowledge, thus enhancing children's L2 lexical diversity via their exposure to English textbooks with L1 input.

Keywords: Aspects of Vocabulary Knowledge, English Textbooks for Bilingual Children, Lexical Diversity

Introduction

What does it mean to learn a word? It is commonly thought that learning a word is equivalent to learning its meaning. According to Singleton (1999), vocabulary teaching is "addressing only the tip of the lexical iceberg". Literature has long discussed incidental and intentional vocabulary learning through exposure to input, yet there is little research on the vocabulary component of textbooks (Nordlund, 2015). We have especially limited understanding of how bilingual children (L1: Cantonese; L2: English) in Hong Kong acquire vocabulary from English textbooks.

In 2022/23, there were 593 primary schools and 333,551 students[1] in Hong Kong. Most primary students use English textbooks at school every day. As primary and compulsory learning material for such a significant number of bilingual primary school children (aged 6-11), this study examines the aspects of vocabulary knowledge (Nation, 2001) conveyed to students via the activities in nine English textbooks from three major publishers across three levels (Primary 1, 3, 5) which are widely used in Hong Kong primary schools.

Research Background

The majority of students in Hong Kong use textbooks at school as the primary learning materials. Textbooks undoubtedly play a dominant role in classroom practice and most teaching programs (McDonough & Shaw, 1993). Littlejohn (1998) even considered textbooks as "the most powerful device" to transmit knowledge from teachers to students.

As a source of language input, the vocabulary in textbooks builds a student's lexical diversity (LD), which is regarded an objective indicator of language development (Malvern, et. al., 2004) and language ability (Treffers-Daller, et. al., 2018). According to Jarvis and Hashimoto (2021), the essence of LD is the variety of words that appear in spoken and written discourse.

Other than variety (breadth), this article studies primarily various aspects of vocabulary knowledge (depth). Although acquiring the vocabulary is commonly interpreted as simply "knowing the meaning of the words and being able to use the words", Nation (2001) suggested that knowing a word involves three main aspects including form, meaning, and use, and each of these aspects contains three corresponding sub-aspects as shown in Figure 1 below:

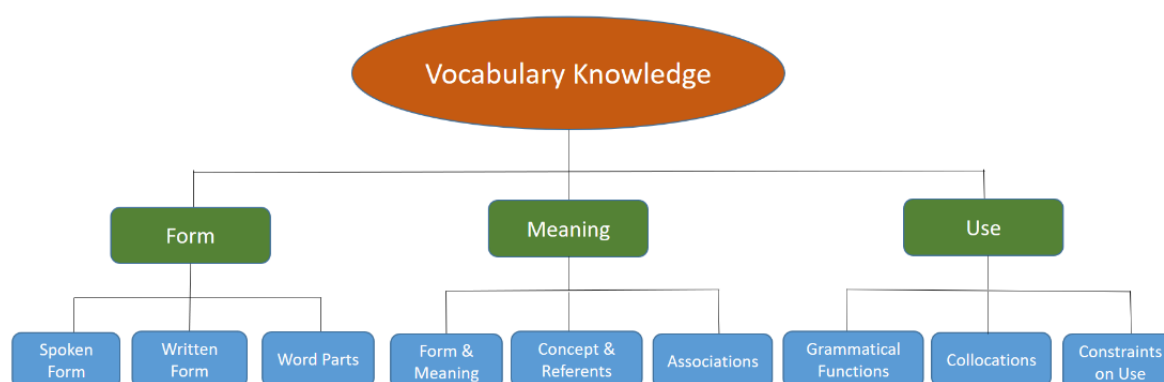

Figure 1: Aspects of vocabulary knowledge (Nation, 2001)

---

[1] https://www.edb.gov.hk/en/about-edb/publications-stat/figures/index.html

Each of the vocabulary aspects encompasses a productive and expressive part as shown in Table 1 below:

Form	Spoken form	R	What does the word sound like?
		P	How is the word pronounced?
	Written form	R	What does the word look like?
		P	How is the word written and spelled?
	Word parts	R	What parts are recognizable in this word?
		P	What word parts are needed to express the meaning?
Meaning	Form and meaning	R	What meaning does this word form signal?
		P	What word form can be used to express this meaning?
	Concept and referents	R	What is included in this concept?
		P	What items can the concept refer to?
	Associations	R	What other words does this make us think of?
		P	What other words could we use instead of this one?
Use	Grammatical functions	R	In what patterns does the word occur?
		P	In what patterns must we use this word?
	Collocations	R	What words or types of words occur with this one?
		P	What words or types of words must we use with this one?
	Constraints on use (register, frequency…)	R	Where, when, and how often would we expect to meet this word?
		P	Where, when, and how often can we use this word?

Note: R = receptive vocabulary; P = productive vocabulary

Table 1: Productive and expressive parts of vocabulary knowledge (Nation, 2001)

Brown (2010) carried out a study on vocabulary activities in English textbooks for secondary students in Japan. The study shows that a single aspect of vocabulary knowledge – form and meaning – receives the most attention in the textbooks, while two other aspects – grammatical functions and spoken form – also receive attention. The other six aspects – written form, word parts, concept and referents, associations, collocations, constraints on use – receive little or no attention.

Following Brown's study, one question calling for investigation is whether Hong Kong children's vocabulary depth is enhanced through acquiring other aspects of vocabulary knowledge from the textbook activities. This is not to say that students have to acquire every aspect of vocabulary items, and all aspects should receive equal attention. In many circumstances, knowing the meaning of the words would suffice for communicative purposes. This article argues that vocabulary activities in textbooks should cover all aspects to give a balanced exposure to students who may acquire various aspects in both receptive and expressive parts through incidental or intentional learning (Yeung et. al., 2020).

In a bilingual context such as Hong Kong, we need to consider the role of children's existing vocabulary knowledge in their first language, in this case Chinese. Hui et. al. (2016) compared Chinese-English bilingual students' L2 vocabulary acquisition with entirely no L1 support, principled L1 support (gloss provided), and full L1 support (bilingual texts provided). Students with a principled amount of L1 support (specifically, glosses provided in Chinese) performed best in L2 vocabulary learning, while those in the L2-only and bilingual texts conditions performed similarly. Some educational implications of these findings will be pursued in the discussion section.

Research Questions

This study attempts to answer three research questions:
1. What aspects of vocabulary knowledge are presented in Hong Kong primary English textbooks?
2. Why are only some aspects primarily covered whereas other aspects are not emphasized?
3. How can Chinese-English bilingual children acquire more aspects of vocabulary knowledge?

Methodology

We have examined nine primary English textbooks published by three major publishers in Hong Kong, across 3 levels for primary 1, 3 and 5.

Title	Author	Publisher	Year of publication
Head Start 1A	Taylor, C. A.	Educational Publishing House: Hong Kong.	2017
Head Start 3A	Beare, J. N. C.		
Head Start 5A	Manin, G. J.		
Primary Longman Elect 1A	Lanaway, J. & Monk, C.	Pearson: Hong Kong.	2023
Primary Longman Elect 3A			
Primary Longman Elect 5A			
Oxford Ready 1A	Pozzoni, A. & Leung, L. K.	Oxford University Press: Hong Kong.	2017
Oxford Ready 3A			
Oxford Ready 5A			

Table 2: Nine primary English textbooks examined in this study

This study defines a vocabulary activity as any activity that focuses on the form, meaning or use of the selected vocabulary specified in each chapter of the textbook. The vocabulary activities include question types such as multiple-choice questions, filling in blanks, matching questions and answers, etc. All vocabulary activities from these textbooks were counted and identified with the corresponding aspects of vocabulary knowledge to calculate the mean percentage.

In identifying the aspects of vocabulary knowledge involved in an activity, this study focuses on the aims of each activity. For example, many activities assess students' grammar knowledge, but only those that aim to pay attention to grammatical functions are counted as such.

This study is part of a larger project aiming to create the first Hong Kong Primary English Textbook Corpus for further linguistic analysis and research. We extracted all the vocabulary items from the nine textbooks across three levels by three publishers.

Table 3 shows the detailed figures from the nine textbooks in this study. It is evident that children are exposed to increasingly more target vocabulary as they progress from primary 1 to 3 and 5. The number of words in the textbooks also increases, showing greater lexical diversity as the level goes up.

	Primary Longman Elect			Head Start			Oxford Ready			
	1A	3A	5A	1A	3A	5A	1A	3A	5A	Total
Number of vocabulary activities	69	76	74	69	67	64	77	76	80	652
Number of target vocabulary items	60	65	83	62	78	62	51	52	60	573
Number of words	3762	6273	9873	4836	7532	10266	3853	6370	10214	62943

Table 3: Increasing trend of vocabulary activities, target vocabulary, and lexical diversity in primary 1, 3, and 5 English textbooks

Table 4 shows the percentage of various parts of speech in each book of a textbook series. In primary 1, children are mostly exposed to nouns and verbs, and when they get to primary 3, they learn adjectives. When they reach primary 5, the parts of speech in target vocabulary are more wide-ranging. In addition to nouns, verbs and adjectives, children get exposed to adverbs and prepositions.

	Noun	Verb	Adjective	Adverb	Preposition
Primary Longman Elect 1A	73%	10%	0%	0%	0%
Primary Longman Elect 3A	72%	28%	15%	0%	0%
Primary Longman Elect 5A	41%	33%	17%	7%	2%

Table 4: Enlarged parts of speech in primary 1, 3, and 5 English textbooks

Discussion

Research question 1 asks what aspects of vocabulary knowledge are presented in Hong Kong primary English textbooks. Table 5 gives a detailed picture of the mean percentage of all vocabulary aspects in Hong Kong primary English textbooks:

	Form and Meaning	Grammatical Functions	Spoken Form	Written Form	Collocations	Concept and Referents	Associations	Word Parts	Constraints on Use
Primary Longman Elect 1A	80%	57%	45%	38%	0%	3%	0%	0%	0%
Primary Longman Elect 3A	75%	50%	46%	29%	8%	3%	1%	0%	0%
Primary Longman Elect 5A	70%	42%	41%	32%	9%	0%	0%	4%	0%
Head Start 1A	70%	49%	41%	35%	4%	3%	1%	0%	0%
Head Start 3A	76%	52%	34%	46%	3%	1%	3%	0%	0%
Head Start 5A	67%	53%	28%	50%	5%	2%	3%	0%	0%
Oxford Ready 1A	65%	44%	42%	32%	0%	8%	0%	0%	0%
Oxford Ready 1A	76%	51%	45%	43%	3%	4%	0%	0%	0%
Oxford Ready 1A	78%	49%	35%	49%	4%	0%	1%	1%	0%
Mean (of percentage)	73%	49.70%	39.50%	39.40%	4%	2.60%	1.10%	0.60%	0%

Table 5: Mean percentage of all vocabulary aspects in Hong Kong primary English textbooks

Figure 2 gives a clear picture of the distribution of the vocabulary aspects covered in activities in Hong Kong primary English textbooks. Similar to Brown's study, "form and meaning" receives the most attention (73%), then grammatical functions (49.7%), then spoken form (39.5%), and finally written form (39.4%).
Figure 2: Vocabulary aspects in Hong Kong primary English textbooks

Below we illustrate the four most prominent vocabulary aspects with a corresponding activity extracted from the textbooks based on Brown's activity-aspect definitions in Table 6:

Aspects of vocabulary knowledge	Definitions
Form and meaning	An activity that involves matching forms and meanings (expressed as, for example, definitions or pictures). An activity that involves recalling forms from meanings or recalling meanings from forms. An activity that explains the meanings of items.
Grammatical functions	An activity that requires students to manipulate a word in some way with respect to a sentence, for example, by adding it to the sentence in the correct position. An activity that explains the patterns an item appears in or that asks learners to find these patterns. Activities that simply ask students to use the items in speech or writing are not included.
Spoken form	An activity that requires students to notice the pronunciation of an item or to produce its features. An activity that involves matching the spoken form the written form. Activities that include the pronunciation of items (for example, in a listening passage), but draw no special attention to the form are not included.
Written form	An activity that focuses students' attention on the spelling of items. Activities that involve reading or writing the items as part of the process of doing something else are not included.

Table 6: Vocabulary activity-aspect definitions (Based on Brown, 2010)

i.   Form and Meaning (73%)

This category refers to any activity that involves matching forms and meanings, expressed using, for example, definitions or pictures. In the following question, students have to find clues from the reading passage on p.63, and choose the correct picture to match 'kilt'' with the correct picture. This activity requires students' vocabulary knowledge of form and meaning.

Figure 3: "Form and meaning" as shown in a vocabulary activity
(*Longman Elect 1A,* p.65)

Here we may note that the choice of vocabulary is not culturally appropriate to the Hong Kong context, since a kilt is not part of children's experience (nor it is a useful target item).

ii.   Grammatical Functions (49.7%)

Grammatical functions refer to any activity that requires students to manipulate a word in some way with respect to a sentence, for example, by adding it to the sentence in the correct position. As shown in Figure 4, students are learning to use "do" and "does" in the correct position in a question, and to use gerunds in sentences after the verb "like", for example "I like doing ballet.". Then they have to talk about the activities Andy's friends like doing using the words given.

Figure 4: "Grammatical functions" as shown in a vocabulary activity
(*Oxford Ready 3A,* p.7)

iii.   Spoken Form (39.5%)

Spoken form refers to any activity that requires students to notice the pronunciation of an item. This activity requires students to correctly pronounce the /v/ sound as in "Vincent", "Visual", "Victor", and "voice".
Figure 5: "Spoken form" as shown in a vocabulary activity (*Head Start 3A, p.7*)

iv.   Written Form (39.4%)

Written form refers to any activity that focuses students' attention on the spelling of items. In this activity, students have to fill in the characteristics of the giraffes featured in the fact sheet, according to the reading passage.

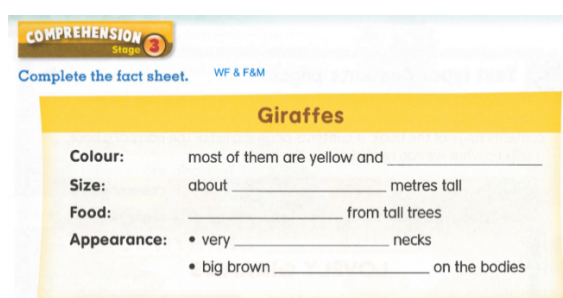

Figure 6: "Written form" as shown in a vocabulary activity (*Head Start 3A, p. 60*)

Research question 2 asks why only some aspects are primarily covered whereas other aspects are not emphasized. To address this question, we draw upon clues from the Hong Kong Primary English Curriculum devised by the Hong Kong Education Bureau.

Figure 7: English Language Curriculum Guide (Primary 1-6) in Hong Kong

Some key words in the curriculum explain why the four aspects of vocabulary knowledge are primarily covered.

- *... Vocabulary is best introduced **in context**. (p.18)*
- *... Tasks provide **authentic contexts** for vocabulary use... (p.18)*
- *… express a wide range of ideas and experiences for **communicative purposes**… (p.19)*

- *... **Communicative functions** set out what learners should be able to do in English through **listening, speaking, reading and/or writing**... (p.19)*
- *... Learners need to use a range of **grammar items and structures** to serve various **communicative functions**... (p.21)*

The Bureau advises that vocabulary is best introduced in an "authentic" context, so that students are taught to express a wide range of ideas and experiences for communicative purposes through listening, speaking, reading and/or writing. Moreover, they need to use a range of grammar items and structures to serve various communicative functions.

In short, the curriculum is about "communicative functions", "language skills" (reading, writing, listening, speaking), and "grammar", as shown in Figure 8.

Figure 8: Key learning outcomes in the English Language Curriculum Guide (Primary 1-6) in Hong Kong

In order to have teaching materials approved by the Bureau, developers aim to follow the curriculum framework with these key learning outcomes in the design of textbooks.

Research question 3 asks how Chinese-English bilingual children acquire more aspects of vocabulary knowledge. Here it is vital to consider the children's language environment. As an international city with rich linguistic culture and political history, Hong Kong has three principal languages, including Cantonese, English and Putonghua. While a large number of Hong Kong people are trilingual speakers of Cantonese, Putonghua and English to different degrees, Cantonese remains the most widely spoken language in Hong Kong, with more than 85%[2] of the Hong Kong population speaking Cantonese as their L1. Since 1997, the policy of the Hong Kong Special Administrative Region has been to promote "biliteracy and trilingualism" in education, which aims to enable students to become biliterate in written Chinese and English and trilingual in spoken Cantonese, English and Putonghua.

In our view the use of L1 in textbooks needs to be promoted. However, some parents and teachers worry that this will impede the acquisition of the second language. Research has shown that this is a misconception, and the first language can be helpful in learning English. 'Translanguaging' is a growing trend which encourages learners to use their whole repertoire of languages, whatever they are learning. In this perspective, using L1 to support L2 learning

---

[2] https://www.censtatd.gov.hk/en/

in the classroom is not only legitimate, but to be encouraged on the grounds that it leads to more effective learning (Li, 2018).

The textbooks reviewed in this study take a "monolingual" approach to the teaching of English, eschewing any use of Chinese. The one exception to this rule is that the *Oxford Ready* series includes a self-learning booklet in bilingual format designed to be used at home. The following page extracted from the self-learning booklet serves as an illustration of the use of L1 in teaching L2. The selected vocabulary, "a cinema" and its example sentence comes with their Chinese translation. "A cinema" goes with "電影院", and "I watch a film in a cinema." goes with "我在電影院看電影."

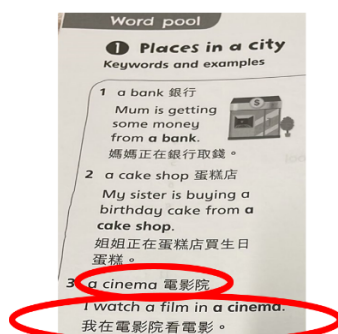

Figure 9: L1 (Chinese) gloss provided in L2 (English) primary textbook's
self-learning booklet in Hong Kong

Such materials are consistent with the research findings cited earlier, whereby glosses in students' first language are conducive to more effective L2 vocabulary learning (Hui et. al., 2016).

Future Research

This study is part of a larger project aiming to build the first Hong Kong primary English textbook corpus. To create the corpus, we will include data from 84 textbooks in 7 major series across primary 1 to 6. Other than English, this method can be extended to diverse target languages to create multilingual textbook corpora.

This corpus allows us to address a number of impactful research questions:
- What are the target vocabulary items and the total number of target vocabulary items in each level? Are they age-appropriate and culturally appropriate?
- What is the frequency of individual vocabulary items across textbooks for each level?
- What are the parts of speech of each word (e.g. noun, verb, adjective, adverb, preposition, determiner, etc.)?
- What are the lexical diversity indices (e.g. VOCD, MATTR, etc.)?

From the corpus we can see the similarities and differences between these vocabulary items, paving the way for further research in whether the differences are due to children's age, the themes required in the curriculum, or others. The corpus also shows the lexical diversity indices which are vital to reveal whether the textbooks are too difficult or too easy when we compare the lexical diversity between the textbooks and the children's everyday discourse.

Conclusion

The design of Hong Kong primary English textbooks is governed by the "communicative" approach in the curriculum recommended by the Education Bureau. Under such approach, the vocabulary activities primarily focus on "Form and Meaning" knowledge aspect, followed by "Grammatical Functions", "Spoken Form", and "Written Form".

For a balanced development, textbook publishers and industry collaborators may consider enlarging the spectrum of vocabulary knowledge in textbook activities. At present, L1 glossing is available in the self-learning booklet that goes with the textbook in one of the series examined. This approach is informed by childhood bilingualism research showing that "translanguaging" is a growing trend which encourages learners to use their whole repertoire of languages.

Moreover, the creation of our Hong Kong primary English textbook corpus enables us to conduct a systematic analysis of vocabulary in textbooks and identify the gaps in vocabulary knowledge. The findings can inform teaching and learning of vocabulary in bilingual children. The corpus answers many important research questions for the benefit of childhood L2 literacy development. In future, we can also compare materials with or without L1 support and see how effective they are as a source of input for bilingual children.

Research on the Training Mode of Indoor Design Majors Based on the Integration of Industry and Education

Yuejun Zhao, Jiangsu Second Normal University, China
Jiayang Ma, Nanjing Forestry University, China

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

In China, the integration of industry and education refers to the close integration, mutual support, and mutual promotion of industrial practice and school education emphasized by schools in accordance with the needs of their students. It is a significant initiative to adapt applied majors to social and economic development, realize high-quality teaching, and enhance the comprehensive strength of students. Given the needs of the interior design profession, the following four aspects were analyzed and elaborated: the optimization of the progressive school-enterprise cooperation design talent cultivation mode and the "subject system" professional course structure; the dual-mentor system of school-enterprise cooperation and dual-teacher training in parallel with the construction of teaching teams; the construction of an interactive digital professional teaching platform and shared resource library; and the construction of a whole-process professional ability and vocational quality assessment and evaluation system with participation by mentors from schools and enterprises. This study attempted to develop an effective study path for indoor design majors to deeply implement the integration of industry and education and efficiently change the talent cultivation mode, and to help indoor design majors to improve the quality of talent cultivation in the practice of integrating industry and education.

Keywords: Industry-Education Integration, Interior Design, Training Mode

Introduction

With the rapid development of contemporary society, China's educational philosophy, training mode, development goals and teaching methods for college and university talents are more and more demanding, so it becomes imperative for colleges and universities to promote the reform of education and teaching mode. As an application-oriented specialty with strong comprehensive and practical ability, "Interior Design" focuses on cultivating high-quality and high-quality innovative talents with rich professional knowledge, solid practical ability, and the ability to independently cope with multidisciplinary cross-disciplinary problems. The Outline of the National Medium and Long-term Educational Reform and Development Plan (2010-2020) emphasizes that the education of students should "insist on the emphasis on ability, optimize the knowledge structure, enrich the social practice, and strengthen the cultivation of ability." Therefore, for the teaching reform of "interior design", it is necessary to break the existing teaching mode stereotypes, single teaching method and a series of problems, continuous exploration of the relationship between theory and practice, to ensure the sustainable development of interior design education and teaching, attach great importance to the practical aspects of the teaching process, to improve students' practical and innovative ability, to cultivate students with creative thinking, and to improve students' ability to practice and innovation. In the process of teaching, the practice link is highly emphasized to improve students' practical and innovative ability, and to cultivate applied talents with creative thinking and able to adapt to the work of the real society.

"Talent cultivation mode" refers to the sum of the process of implementing talent education under the guidance of certain modern educational theories and ideas, and in accordance with specific cultivation objectives and talent specifications, with relatively stable teaching content and curriculum system, management system and assessment methods. The traditional university professional training mode generally refers to the universities under the guidance of the relevant education departments, according to their own characteristics, in order to achieve certain training objectives and specifications, the teaching concept, teaching content, teaching methods, teaching methods and teaching resources and other aspects of the organic combination of the development, in general, are based on the main body of school education to complete.

With the rapid development of contemporary society, China's education concept for college and university talents, training mode, development goals and teaching methods require more and more high, so colleges and universities to promote education and teaching mode reform becomes imperative. As an application-oriented specialty with strong comprehensive and practical ability, "Interior Design" focuses on cultivating high-quality and high-quality innovative talents with rich professional knowledge, solid practical ability, and the ability to independently cope with multidisciplinary cross-disciplinary problems. The Outline of the National Medium and Long-term Educational Reform and Development Plan (2010-2020) emphasizes that the education of students should "insist on the emphasis on competence, optimize the knowledge structure, enrich the social practice, and strengthen the cultivation of competence". Therefore, for the teaching reform of "interior design," it is necessary to break the existing teaching mode stereotypes, single teaching method and a series of problems, continuous exploration of the relationship between theory and practice, to ensure the sustainable development of interior design education and teaching, attach great importance to the practical aspects of the teaching process, to improve the practice and innovation ability of students, to cultivate students with creative thinking, to improve their ability to practice, to enhance their ability to learn, to develop their ability to think creatively, to develop their

ability to learn. In the process of teaching, the practice link is highly emphasized to improve students' practical and innovative ability, and to cultivate applied talents with creative thinking and able to adapt to the work of the real society.

"Talent cultivation mode" refers to the sum of the process of implementing talent education under the guidance of certain modern educational theories and ideas, and in accordance with specific cultivation objectives and talent specifications, with relatively stable teaching content and curriculum system, management system and assessment methods. The traditional university professional talent training mode generally refers to the universities under the guidance of the relevant education departments, based on their own characteristics, in order to achieve certain training objectives and specifications, the teaching concept, teaching content, teaching methods, teaching methods and teaching resources and other aspects of the organic combination of the development of the overall are based on the main body of school education to complete.

Modern society, the scientific and technological revolution is more rapid, the development of globalization is more obvious, and the flow of information is more rapid. Interior design as a typical practice-oriented professional, the traditional personnel training model can not adapt to the development of society, the requirements for personnel training no longer only stay in the design of theoretical knowledge, mastery of design skills and techniques of the basic stage, should also pay attention to the innovation and practice ability, teamwork ability, lifelong learning ability and vocational literacy training. How to build in line with the modern development requirements of the interior design personnel training model, this paper to the perspective of the development of industry-teaching integration, from the following four aspects of specific description.

Progressive School-Enterprise Cooperation Design Teaching Mode and Optimization of the Professional Curriculum Structure of "Subject System"

The rapid development of the society promotes the increasing demand for professional talents in all walks of life, and the requirements are getting higher and higher. Therefore, it is of great significance to accelerate the training of professional talents combining theory and practice for economic and social development. Since the domestic colleges and universities in the interior design professional teaching process is more focused on design theory and basic skills and techniques of training, coupled with the teacher structure and teaching resources and other reasons, practice teaching is in the initial exploration and development stage. The interior design industry has a large number of professional designers with outstanding practical ability and a rich variety of practical project resources, which is exactly what is lacking in the design teaching in colleges and universities. The teaching mode of school-enterprise cooperation refers to the use of schools and industry enterprises to collaborate on teaching activities, the purpose is to support the teaching process with the help of enterprises, resource sharing, complementary advantages, and jointly complete the training of professional talents in line with the requirements of the development of the times. Therefore, the teaching mode of school-enterprise cooperation plays a very important role in promoting the development of interior design teaching, and at the same time, the training mode of school-enterprise cooperation can also accurately cultivate the industry and enterprises in urgent need of professionals, which is more conducive to the development and progress of society.

Progressive school-enterprise cooperation design teaching mode can be divided into three stages, the first stage, in the school's daily teaching, the enterprise to send specialists to participate in the teaching, the teacher can be part of the curriculum content, especially the design of the practical aspects of the content of the teaching moved to the project site of the cooperative enterprise teaching, combined with the practice of the case and the site situation, by the practice of the enterprise instructor and the teachers to complete the teaching content, so that students in the project can prove their theoretical knowledge and test their professional skills in the project environment. In the second stage, the school and the enterprise build a training base together, simulating the working environment of interior design, so that the students can experience the professional design environment and working process in their study. The school makes use of the technical guidance of enterprises to make up for the deficiencies in practical teaching and improve the construction of teaching system. Enterprises utilize the school's student source, site and practical training equipment to realize order-type training and establish talent reserves. At the same time, students can experience the future working environment in school, learn more professional practical experience, and gradually strengthen their professional awareness and improve their professionalism. The third phase of the student all-day nature of the internship status into the enterprise for practical learning, the purpose is to learn in the students to learn professional practice knowledge at the same time, but also be able to learn to use. After the completion of the internship period, students can sign a formal labor contract with the enterprise in accordance with the principle of two-way choice, and become a full-fledged employee. Enterprises can also obtain more human resources through this model, reducing the cost of enterprise talent training.

Traditional design teaching courses are independent individuals, most teachers only stand on the narrow perspective of a single course to complete the teaching task, not too much attention to the linkage between the courses, not enough articulation between the courses, the lack of knowledge before and after the guidance. The teaching of interior design courses covers both theoretical teaching and practical application, but due to the teaching conditions, teaching environment, syllabus requirements and teacher background and other constraints, most of the practical teaching in the teaching process lacks effective real cases, and generally choose the "virtual subject" to complete, and the students are not familiar with the objective conditions such as spatial scale, architectural form, design needs, environmental composition and so on. Students have no intuitive feeling about the objective conditions such as spatial scale, architectural form, design demand, environmental composition, etc., and they rely on their feelings and imagination in the process of assignments, which lacks objective basis, thus leading to the lack of professionalism and design depth in the final assignments completed by students. Moreover, the assessment of the assignments is usually done by the teachers, and there is a lack of professional evaluation by the "third party" in this process.

The use of "project system" in interior design teaching is, first of all, an enhancement of the ability of teachers. Teachers should carry out the relevant practical courses of the proposition of the examination, research teaching process how to will be through the curriculum, how to guide the students to independent inquiry learning, enhance the interest in the professional learning process and concentration. Secondly, the implementation of the "project system" of real problems, how to choose the corresponding actual projects, set reasonable and effective design requirements and control of the practical learning process is also a major test of the practical skills of teachers. This prompts teachers to go out of the classroom and actively participate in the practical design projects, so that they can better combine theory and practice in teaching and promote the improvement of teachers' professional skills. In addition, the

teaching of "project-based" courses can effectively guide students to strengthen independent learning and stimulate their ability to explore new problems, think about new problems and take the initiative to solve problems. It is also conducive to students' systematic mastery of the design process, cultivation of practical application skills, and enhancement of the sense of teamwork. The development of the "project system" can effectively improve the communication and cooperation between students, students and teachers, teachers and teachers, promote the improvement of teachers' and students' ability to communicate with the outside world, build a bridge between the school and society, and lay a solid foundation for students' internships, graduation and even going to the workplace.

Teaching Team Building Through School-Enterprise Cooperation of "Dual-Mentorship" and "Dual-Teacher" Teacher Training in Parallel

Teachers - nowadays refers to the talents who can be teachers, from "Laozi", is the most important part of education. It is the most important part of education. It is an inevitable trend for the development of education and teaching in China to continuously strengthen the training of teachers, optimize the structure of the teaching team, and improve the competence level of teachers. With the development of society and the passage of time, the relative cross-sectionality, comprehensiveness and practicability of the interior design profession are increasing, and the trend of linkage and combination with multidisciplinary and fringe disciplines is also becoming more and more obvious. In order to truly combine theory and practice, guide students to correctly understand and master professional knowledge and skills, so for the interior design teaching faculty restructuring, teachers' professional ability to improve and teaching team building has become an important initiative of professional teaching reform.

Since 2009, China has fully implemented the "dual tutor system", which is an effective way to cultivate high-level, high-quality, practical and strong applied talents in line with the requirements of social development, and is a positive exploration of innovative talent cultivation and reform of the path of colleges and universities. "Dual tutor system" is based on teacher education in higher education institutions, supplemented by practical guidance from enterprise tutors. School tutors teach basic theoretical knowledge in a collective way according to the syllabus and lesson plan, while enterprise tutors guide students according to their job duties, determine the guidance mode according to the characteristics of the students and the practical needs, formulate the guidance plan and implement it, and carry out the skills and techniques in a practical way. The enterprise tutors will instruct the students according to their job duties, determine the way of instruction according to the students' characteristics and practical needs, formulate the instruction plan and implement it, and teach the skills and techniques by practicing. At the same time, school tutors should study in depth in the enterprises, and enterprise tutors should study in depth in the schools, so that both sides can help each other and collaborate to educate people, fully mobilize the enthusiasm and creativity of the tutors inside and outside the school, and undertake the task of cultivating talents together.

The implementation of "dual tutor system" can effectively combine the relevant basic courses in school, project-oriented comprehensive practical course training, enterprise professional knowledge lectures, project site observation and internship, etc., so that the students, on the basis of sufficient accumulation of theoretical knowledge and systematic vocational cognition, can apply what they have learned to the practice of the enterprise and solve the various problems encountered in practice. On the basis of sufficient accumulation of

theoretical knowledge and systematic professional cognition, students can apply the knowledge they have learned to enterprise practice, solve various problems encountered in practice, and then deepen their understanding of theoretical knowledge through their own practical experience, thus enhancing their practical innovation ability and improving their personal professionalism. On the other hand, the experimental training resources can be integrated to realize the sharing of resources between schools and enterprises. Promote the construction of dual-teacher teaching team in colleges and universities, and then enhance the level of teaching and research and business ability of school teachers. At the same time let the enterprise deeply involved in the training process of the future employer, can give priority to select and raise a number of high-quality talents belonging to the enterprise's own reserve army, greatly reducing the cost of enterprise talent training, improve the quality of the talent.

For interior design professional construction, in promoting school-enterprise cooperation "dual tutor system" at the same time, should actively build the university's own "dual teacher" teacher teaching team. In recent years, the Ministry of Education at the national level issued a series of relevant documents on the promotion of vocational education, the introduction of these documents for the construction of the "dual-teacher" teacher teaching team to create a favorable external environment and provide institutional safeguards. "Dual-teacher" teachers should not only have excellent teaching ability and quality, but also have the professional skills required by industry standards and professional positions, including theoretical knowledge, industry skills and core qualities, including the embodiment of the comprehensive ability of the profession. Therefore, the interior design profession should be combined with its own characteristics of the targeted construction of "dual-teacher" teacher training system, to create a full professional lifeline of teaching, practice two-way cultivation channels, and strive to achieve the effective integration of the theoretical quality of teachers and practical teaching ability, to achieve the high quality of the development of teacher teaching team. Firstly, the cultivation of "dual-teacher" teachers should be systematically planned from the practical operation level, including obtaining vocational qualification certificates, on-the-job training, and participating in or guiding professional skills competitions. Secondly, we should innovate the training method of "dual-teacher" teachers, expand the mode and platform of teacher training, and provide teachers with special practical content and technology training. The third is to strengthen the cooperation between schools and enterprises, establish stable and high-quality internship bases inside and outside the school, and provide a good environment and conditions for the practice and teaching of teachers in the school. The construction of high-quality "dual-teacher" teacher team is an important guarantee to enhance the ability of interior design professional industry-teaching integration of educators, so in the cultivation of "dual-teacher" teachers at the same time, we should pay more attention to the construction and development of professional teaching team.

Construction of Digital Professional Teaching Interactive Platform and Shared Resource Library

Interior design is a multidisciplinary intermingling, comprehensive and independent disciplines, in professional teaching focus on theoretical knowledge and practical skills in parallel. Modern interior design teaching is no longer only satisfied with the teacher's classroom lectures, students passively accept the knowledge transfer mode, should build "student-centered" active learning classroom. Conventional teaching is confined to the classroom, which also greatly limits the long-term accompanying teaching by experts and enterprise mentors outside the school. Therefore, promoting the construction of proprietary

digital teaching interactive platform and shared resource library is an important support for the development of interior design professional teaching.

Create a Visualized Digital Space for the Whole Chain of Design Teaching With Collaborative Development of Teachers and Students

Mapping the physical classroom space of the offline traditional classroom to the online virtual digital space, by extending the classroom to the online virtual digital space, the whole chain of teaching before, during and after the process of uplinking and visualization is realized, no longer subject to the constraints of space, time, and teaching equipment, and the teachers and students teach, learn, communicate and share resources in the digital environment. The introduction of digital space to realize the teaching interaction between teachers and students, students can not only learn through the blackboard, projection and other conventional forms of teaching, but also at any time with their own cell phones, tablets or computers to enter the digital space for active learning and classroom interaction, such as uploading documents to express their own point of view, follow the teacher's point of view to view the information of the courseware, for the courseware of the specific location or the video of the specific time to ask questions to annotate the collaborative discussion of the group and completing topic training, etc.

Optimize the design of the teaching mode, combining online and offline learning, individual learning and team learning, breaking the limitations of time and space, and optimizing from knowledge linear transmission to interactive learning mode. Enhance students' subjective initiative in learning, emphasize students as the main body and main participant in the learning process, and let teachers become the organizer of the learning process. Teachers constantly update the teaching content and courseware to improve the practicality of course teaching, enhance students' concentration, and attract students' interest in independent learning before and after class. Increase the interaction between teachers and students and students and students, break the indoctrination teaching method, enhance the learning mode combining group lectures + team seminars and Q&A, and emphasize the two-way interactive teaching of teachers and students based on students' discussion. With the advantage of the digital space platform, improve the frequency and depth of the participation of off-campus experts and enterprise tutors in course teaching, on-campus and off-campus tutors and experts online at any time to connect access, on-site teaching, after class to answer questions no longer subject to the restrictions of time and place, at any time to communicate and interact with the on-campus teachers of the course of study to achieve the "all-time", "long tracking", "long tracking", "long tracking", "long tracking", "long tracking", "long tracking", "long tracking", "long tracking", and "full time". The program is a collaborative effort of "full-time" and "long-tracking".

Building a High-Quality Teaching and Sharing Resource Base for the "Future Learning Center" Model

According to the spirit of promoting the pilot of "Future Learning Center" in the 2023 Work Points of the Department of Higher Education of the Ministry of Education, we will explore the construction of a new intelligent learning environment, build a new high-level platform to meet the needs of precise learning, and provide efficient services for students to learn in the future.

The digital space teacher-student collaboration platform can precipitate teaching experience and data in the teaching process, integrate lesson plans, courseware, exercises, cases, etc. in the database, realize long-term storage of teaching materials, and orderly transmission of inheritance among teachers. Meanwhile, the function of complete data collection and presentation of digital space provides data support for course evaluation and accurate teaching.

In addition, the common construction and sharing of digital teaching resources can break the multiple barriers of different skills, professions, disciplines and industries, and build a "professional-college-intra-school-inter-school-school-enterprise". Diversified construction and sharing of the implementation of the route, so that students can conveniently obtain knowledge and skills from different disciplines, highlighting the cultivation of cross-border thinking ability, comprehensive technical skills, focusing on the use of school and enterprise resources to train students' professionalism and skills and techniques, and comprehensively improve the students' professional design ability and innovative thinking ability.

Enrich the Dimensions of Performance Evaluation and Build Data-Supported Teaching Process Evaluation

Under the traditional teaching mode, students can only be graded by the final examination results and classroom performance after the course. The use of digital space can leave traces of the whole process of pre-study, questioning, group interaction, after-class review, etc., with automatic data statistics and centralized visual display, which facilitates accurate evaluation of students, realizes objective data + subjective assessment, and combines the university and enterprises to jointly formulate the professional evaluation standards, so as to realize the two sides to jointly carry out comprehensive assessment and evaluation of the process of professional talent cultivation and quality, and to establish a multi-dimensional evaluation system of talent cultivation.

Construction of an Assessment and Evaluation System for Whole-Process Professional Skills and Professionalism

Professional ability refers to the ability that must be possessed in order to be competent in a specific occupation, which contains professional skills. It includes professional skills, vocational literacy and career management ability, etc. The evaluation of professional literacy plays an important role of guidance and quality supervision for the implementation of professional literacy education. The Third Plenary Session of the 18th CPC Central Committee proposed to "comprehensively implement the Party's education policy, adhere to the principle of establishing moral character, enhance students' sense of social responsibility, spirit of innovation, and practical ability, and improve students' aesthetic and humanistic qualities. It is necessary to accelerate the construction of modern vocational education system, deepen the integration of industry and education, school-enterprise cooperation, and cultivate high-quality laborers and skilled personnel". Based on the national policy guidance and the basic needs of the society, it is very necessary to establish a complete and implementable assessment and evaluation system of professional skills and vocational literacy on the basis of the traditional assessment methods, combined with the evaluation standards of the schools, enterprises and the society for the teaching of interior design profession with strong practicability. The professional skills and vocational literacy assessment and evaluation system can be accomplished from two aspects: assessment objectives and evaluation methods.

The Assessment Objectives Are Specifically Constructed From Four Aspects: Ideological Literacy, Psychological Literacy, Professional Literacy and Behavioral Literacy

The first is the assessment of students' ideological literacy, including the individual's position, attitude and viewpoint on the principle issues, whether they can do to adhere to the truth, see the slightest knowledge, grasp the trend and so on, as well as the sense of social responsibility, values, and the responsibility of self-behavior and other aspects. Next is the assessment of students' psychological quality: including the degree of interest in professional learning, the vision of the future career and the degree of adaptation to the learning and time environment. Then, students are assessed on their professionalism, including vocational skills, creativity and professionalism. Finally, it is the assessment of students' behavioral literacy including expression ability, teamwork ability and lifelong learning ability.

Establish a Professional Quality Evaluation System That Combines Quantitative and Qualitative Evaluation, Static and Dynamic Evaluation, Result Evaluation and Process Evaluation, and Combines Schools and Enterprises

In order to ensure the teaching effect of interior design, in the course assessment and evaluation, change the single final grading method of teachers in the past, and instead divide the students' course results into two parts: process evaluation and summative evaluation, and take a certain proportion as the final grade. Process evaluation is mainly to evaluate students' learning status in the practical part, including learning attitude, participation in the practical process, and records of practical sessions. And the summative evaluation is mainly to evaluate the completion status of students' learning tasks, that is, to evaluate the quality of the completion of the submitted practical results, the rational use of the work and its value of use and so on. It can be said that the grades of process evaluation are mainly based on the students' learning status; while the summative evaluation is required to be given through the horizontal assessment and the feedback information of the work display. At the same time, in order to make the assessment more fair and reasonable, in the specific course assessment, an assessment group can be set up by other teachers serving in the same specialized course, enterprise experts and so on, to jointly assess the students. And the content of the assessment should focus on the standards and requirements of enterprises, and evaluate the students' design innovation, rationality and ability to solve complex problems comprehensively. In the evaluation method, it can take the combination of students' report, works exhibition, teachers' and enterprises' experts' questioning, students' defense, and teachers' and enterprises' experts' joint review and comment, so as to ensure that the quality of the course teaching is presented comprehensively.

Conclusion

The integration of industry and education emphasizes the close combination of industrial practice and school education, mutual support and mutual promotion, and is an important initiative for applied majors to adapt to social and economic development, realize high-quality teaching and enhance the comprehensive strength of talents. The in-depth implementation of industry-teaching integration and efficient change of talent cultivation mode will surely help the interior design profession to develop steadily, long-lastingly, orderly and innovatively in the new era.

Abstract

Mathematics is one of the important subject to be taught to children from an early age. Mathematics concept understanding can shape students' knowledge so as to help in the development of knowledge at a higher level of education. The purpose of this study was to determine the effect of mathematical communication, critical thinking and problem-solving skills on the understanding of mathematical concepts possessed by grade VI elementary school students in Lentera Harapan schools, Indonesia. This study was conducted using a quantitative approach by distributing five test items to 54 students. Instruments are tested valid and reliable. The results found that mathematical communication, critical thinking and problem-solving skills has positive effect on the understanding of mathematical concept.

Keywords: Mathematical Communication Skills, Mathematical Critical Thinking Skills, Problem Solving Skills, Mathematical Concept Understanding

Introduction

Sarwanto (2021), Nadia (2014), Maria, (2020), and Komariyah, (2018) agreed that mathematics, mother of sciences, is taught to children from an early age. Because it affects children's abilities to think critically, logically, and systematically. Ginanjar (2019) argued elementary school students need to learn mathematical concepts to develop their ability to think creatively, logically, critically, analytically, and systematically. In addition, according to Rusdawati (2019), understanding concepts that are formed from an early age will help students in forming knowledge that will be learned at higher level.

Understanding of mathematical concepts is influenced by many factors. Some students' internal factors are ability to think, motivation, health, learning style. Whereas students' external factors are family, community environments in Unaenah (2019). According to Helma (2017), mathematical understanding is an abstract thinking process using critical reasoning, the ability to solve problems and communicate mathematically, as well as the ability to use mathematical concepts and patterns in everyday life.

In current situation, students' ability to understand mathematical concepts in Indonesia tends to be low. This is indicated by the difficulty students face in solving mathematical questions that are slightly altered from the example teacher has given in Unaenah (2019). Students who cannot solve math problems indicate that they have not been able to understand mathematical concepts thoroughly stated by Radiusman (2020). Based on these problems, the purpose of this study is to examine the effect of mathematical communication, and critical thinking skills on grade VI students' problem-solving skills of mathematical concepts at Lentera Harapan School, Indonesia.

Literature Review

A.   Mathematical Concept Understanding

Mathematical concept understanding means grasping the basic principles, definitions, and operations associated with that concept. It involves knowing what the concept is about, how it works, and being able to perform basic calculations or operations related to it. It is important for students to know the procedure for solving problems. It can be the basis for students to focus on rules or procedures in solving mathematical problems in Tailor (2016). It can speed up to solve the problem. Hanifa (2016) argued that there are three characteristics of a person having a good understanding of concepts. They are the ability to do translation, the ability to interpret and the ability to extrapolate.

B.   Mathematical Communication Skills

According to Yati (2019), mathematical communication is one of the abilities in a person's cognition. It is the ability to convey and explain mathematical ideas appropriately. Mathematical communication can also be interpreted as a skill to explain mathematical concepts to others orally and in writing in Hodiyanto (2017). Mathematical communication skills help students to process and form the meaning of mathematical concepts so that they can be used to associate concepts with one another and explain the concepts in Sammon (2017).

Nurhasanah (2019) stated that the criteria for a person to have good mathematical communication skills are such as having the ability to interpret, solve, and write down problems and the process of solving the problems faced appropriately and systematically. Furthermore, NTCM (2003) argued that there are four criteria in measuring a person's communication skills, namely communicating thoughts in a sequence and clearly to peers and teachers, being able to use mathematical language to explain concepts, being able to use mathematical thinking through the communication process, and being able to analyze mathematical thinking appropriately. In conclusion, to have good communication skills, it is necessary to look at the following indicators, namely (1) Composing and connecting his mathematical thoughts through communication, (2) Communicate thoughts sequentially and clearly to peers and teachers.

C.　　Mathematical Critical Thinking Skills

Siswanto (2020) explained that mathematical critical thinking is the ability to analyze, process, and integrate received information so that it can provide logical and relevant conclusions. According to Fasha (2018). It shapes students' readiness to think at a more difficult and abstract level. Anugraheni (2018) stated that children can develop their mathematical critical thinking skills from an early age and can be formed in any mathematics learning planning at the elementary school level.

Ridlo (2020) proposed that the criteria in measuring a child's mathematical critical thinking skills are: (1) can provide a simple explanation, (2) can make a basic decision, (3) can conclude information, (4) can provide further explanation. Siswono (2020) and Facione (2015) agreed that there are six indicators of critical thinking, namely (1) interpretation consisting of categorization, decoding, signification, and clarifying a meaning, (2) analysis which is the ability to identify, examine, and analyze arguments or ideas, (3) evaluation which means an ability to assess the arguments given, (4) conclusion, meaning students have alternative thoughts and can draw a logical conclusion, (5) Explanation which means being able to state the results of thoughts using the right methods and procedures, (6) Regulation which means the ability to provide appropriate results and make appropriate assessments of procedures. Therefore, a person can be said to have good mathematical critical thinking skills if he or she can identify and formulate the problem, analyse information based on given data, provide conclusions from existing information.

D.　　Mathematical Problem-Solving Skills

According to Bariyyah (2021), mathematical problem-solving skills are the abilities to identify problems, search and select various alternative solutions and make decisions in solving all the problems at hand. NTCM (2003) claimed that there are characteristics of a student who has mathematical problem-solving skills, namely (1) can apply various problem-solving strategies, (2) can use mathematical concepts in different situations, (3) can build new knowledge from the problem-solving process carried out, (4) can reflect on the problem-solving process. Polya (2004) also explained that there are four characteristics in measuring a person's problem-solving skills, namely: understanding the problem correctly, compiling problem-solving steps, taking steps to solve the problem correctly, double-checking every information and calculations made. In this research the indicators of problem-solving skills are mathematical communication skills and mathematical critical thinking skills.

Methodology

A.   Instruments Design

Three independent variables are going to be measured. They are Mathematical communication skill (X_1), Mathematical Critical Thinking Skill (X_2), and Mathematical Problem-Solving Skills (X_3). One dependent variable called Mathematical Concept Understanding (Y). These independent variables are measured by using three instruments called Mathematical Communication Skill, Mathematical Critical Thinking Skill, and Mathematical Problem-Solving Skills. These instruments are constructed through a test instrument that consisting of five essay questions. The dependent variable is measured by averaging all mathematics test score within that semester. Design of the three Instruments are shows at Table I for X_1, Table II for X_2 and Table III for X_3. Score on brackets on each item indicates the maximum score on that item if students answer correctly.

TABLE I: MATHEMATICAL COMMUNICATION SKILLS INSTRUMENT

Indicators	Description	Numbers
Composing and connecting his mathematical thoughts through communication	Students can identify as well as compile existing information in writing for use in work steps	1a (20) 1b (20)
Communicate thoughts sequentially and clearly to peers and teachers	Students can communicate in writing the correct sequence of solving given math problems	3a (30) 4a (30)

TABLE II: MATHEMATICAL CRITICAL THINKING SKILLS INSTRUMENT

Indicators	Description	Question numbers
Formulate a problem from the questions given	Students can write down the questions asked from the questions correctly	2a (20) 2b (20)
Analyze information based on data, idea, and concepts	Students can write down everything they know about the problem correcly	3b (20) 4b (20)
Provide conclusions from existing information	Student can write the conculation of the problem solving	5 (20)

TABLE III: PROBLEM SOLVING SKILLS INSTRUMENT

Indicators	Description	Question numbers
Mathematical communication skills	Student can write the problem correcly	1a (10), 1b (10) 3a (15), 4a (15)
Mathematical critical thinking skills	Students can identify the right operations to solve the problems	2a (10), 2b (10) 3b (10), 4b (10) 5 (10)

B.   Population and Sample

This research was conducted in elementary schools in Tangerang Regency. The population of this study was 57 grade VI elementary school students in two classes. However, at the time of data was collected, the number of samples became 54 students because three students from class B were absent due to illness. The complete data in this study was tabulated at Table IV. and Descriptive data are tabulated at Table V.

C.   *Validity and Reliability of Instruments*

The three instruments should be tested whether they are valid and reliable. Validity and reliability test of Mathematical communication skills instruments is shown at Table VI. The standard correlation for 54 respondents with confidence interval 95% is 0.27 then it can be concluded that the instruments are valid and reliable. Other instruments, Mathematical critical thinking skill, and Mathematical problem-solving skills are found valid and reliable with Cronbach alpha equals to 0.68, and 0.83 respectively.

Result and Discussion

Data distribution of X_1, X_2 and X_3 are tested using Chi-square test. They are normal distribution. The frequency distribution data of X_3 is depicted in Fig. 1. The blue bar is the actual data of that interval whereas the orange bar indicates the frequency expectation data to be normal distribution. Regression analysis is used to see the effect between the three independent variables, X_1, X_2 and X_3 on dependent variable Y.
Figure 1. Students' Problem-Solving Skills Distribution

Testing for hypotheses is performed using linier regression tests. The effect of students' Mathematical communication skills on their mathematics concept understanding is stated in equation (1) and the Anova table is presented at Table VII.

$$Y = 47.13 + 0.36X_1 \dots\dots(1)$$

TABLE VII: Anova table of Mathematical Communication Skills toward Mathematical Concept Understanding

	DF	SS	MS	Fcal	Sig
Regression	1	3459.16	3459.16	17.56	0.00
Residual Error	52	10243.88	197.00	-	-
Total	53	13703.04	-	-	-

It is proven that Students' Mathematical Communication skill has a positive effect on their mathematical concept understanding. The R square coefficient is 0.25. It means that Mathematical Communication skill has influence 25 % of the students' Mathematical concept understanding. This finding is also supported in Pradipta (2018). Therefore, Students' ability to communicate his or her mathematically thoughts has a positive influence on their understanding of mathematical concepts.

The result is also applied for Students' Mathematical critical thinking skill has a positive effect on their Mathematical concept understanding. The R square coefficient is 0.23. The linier regression equations is stated in equation (2).

$$Y = 41.58 + 0.41X_2 \quad\text{...(2)}$$

This finding is also stated by Belanisa (2019). Belanisa explained that students with good critical thinking skills will be able to understand and master mathematical concepts clearly and well. These skills are used by students to analyze, process, connect that evaluate the concepts learned critically and rationally. This thinking pattern helps students understand and strengthen their understanding of mathematical concepts.

Further test has the same result that students' Problem-solving skills has positive effect on their mathematical concepts understanding. The R square coefficient is 0.30 and the regression equations is in (3).

$$Y = 37.91 + 0.47X_3 \quad\text{...(3)}$$

Similar findings were also found by Suraji (2018). They explained that the problem-solving skills influences positively on the mastery of the concepts.

Conclusion

Based on the results of data processing and analysis, it can be concluded that mathematical communication skills, mathematical critical thinking skills, and mathematical problem-solving skills have a positive effect on the mathematical concepts understanding of grade VI elementary school students. The better students can actively communicate, think critically and logically, solve mathematical problems then the better it will help students to have better mathematical concept understanding.

Abstract

Understanding the needs are one of the learning success determinants that can assist in an efficient and targeted learning process. The more parties who participate resulted the more comprehensive understanding of it. We aim to identify multiparty needs for the lab rotation model to fostering computational and critical thinking skills. Participants were 49 students, 3 graduates, 3 instructors, and 1 management representative. Data was gathered through interviews on the use of blended learning at each station of rotation model. While the questionnaire was only for students. We noticed that: (1) statistics learning strategy emphasizes teacher-centered and face-to-face learning. (2) incorporating a range of activities is critical since it keeps students interested, greater than single activities, and less stressful. (3) computational thinking could be improved by using step-by-step instruction, creating connections between each material component, and using a flowchart or mind mapping. Meanwhile, the critical thinking could be improved by conducting spontaneous exams, asking student involvement, rewarding them, etc. While descriptive analysis revealed that students tend to agree, 92% (45) that the lab rotation model activity should be employed, while 4% (2) disagreed. Student expected that needing more learning activities and rewarding. It means, learning activities using the lab rotation model meet the participants needs, which consists of initial learning station (ILS), traditional learning station (TLS), individual practice station (IPS), group learning station (GLS), and final learning station (FLS). In response, the learning process can employ the lab rotation model.

Introduction

One strategy to improve learning effectiveness is to employ the blended learning method. Several prior research have demonstrated that this technique was beneficial as a learning design (Ayob et al., 2020; Govindaraj & Silverajah, 2017). It highlights higher level thinking (Christina et al., 2019; Nederveld & Berge, 2015), as well as demonstrated active learning (Wichadee, 2017). This strategy involves the use of two learning models: traditional or face-to-face learning and online learning.

Students in the online learning can communicate with both their classmates and instructors by a camera, chat, or microphone. They can interact with each other in the same way that they would in a traditional classroom setting. Even while the combination of these two ways was in line with advances in information technology, it still faced several obstacles, notably those related to the learning habit through the online method, which is still relatively new, particularly for students from the city's borders. Interaction with camera assistance cannot be maximized due to unstable internet connections, limited internet quotas, doing something else while studying, and psychological issues such as lack of confidence, feeling uncomfortable while studying, and experiencing anxiety and stress (Alim et al., 2022).

However, virtual involvement cannot perfectly replicate the interaction process of a traditional class. It demands longer to shift the perspective of learning in line with the growth of the times as it is today, and equalization of internet network access must be increased significantly. As a result, this study focuses on the needs among various parties (students, alumni, instructors, and management representatives) to determine whether their thoughts and needs are connected to the use of blended learning methods, particularly in the statistics course. Additionally, we are exploring the viewpoints of instructors and management representatives, particularly in relation to learning approaches that might maximize students' computational and critical thinking. It will then be included into the learning process via the lab rotation blended learning framework.

Need assessments were used to gather detailed information about appropriate learning models. This evaluation involves several parties with varying capacities. At each learning station, they will take part in a series of activities to determine their thoughts about the importance of implementing the lab rotation model in statistical learning.
- Initial Learning Station (ILS): This station emphasizes self-study activities. This station is an out-of-class activity and uses a variety of learning sources, e.g., videos, journals, etc.
- Traditional Learning Station (TLS): Traditional or face-to-face learning approaches.
- Individual Practice Station (IPS): this station stresses on an independent practice, during class time at students' own pace (synchronous learning).
- Group Learning Station (GLS): It is the discussion process by conduct focus group discussions (FGD). This technique will improve students' social skills as well as their capacity to express themselves independently.
- Final Learning Station (FLS): This is the last station that students will experience in a traditional class. This station is led by an instructor. The instructor concludes the session and completes the activity by conducting evaluation process.

The implementation of the lab rotation model can assist students in quickly grasping the content. This method favors higher order thinking over lower-level thinking. As a result, it is intended that this strategy would be able to promote students' computational and critical

thinking, which are two forms of higher order thinking skills. This will then assist students in comprehending the subject offered. Furthermore, it allowed students to engage in several diverse learning experiences, both in terms of learning activities and from the perspectives of various instructors. Further, learning activities based on the lab rotation model approach can accommodate students' diverse learning characteristics. As a result, this technique will serve as a complete learning model.

We would undertake a needs assessment of various stakeholders involved in the educational process. This is essentially required to gain an accurate image of needs for the use of lab rotation model in statistics courses and its relationship to students' computational and critical thinking skill.

Method

Participants were divided into four categories: 49 students, 3 alumni, 3 statistics instructors and 1 management representative. Two methods are used to collect data: questionnaires and interviews. The questionnaire uses a five-point Likert scale. The questionnaire and interview cover the general concept of the lab rotation model. The quantitative approach would be used to investigate the needs of students and concludes with a descriptive analysis. 31 items were used to determine the needs of students for the lab rotation model. The validity analysis revealed that the validity index was in the range of 0.67 - 1.0 with reliability reached 0.90.

The questionnaire would be distributed via Google form for students, using anonymous identity to ensure the participants would be more open in providing the necessary information. While alumni, instructors, and management representative were interviewed. The quantitative data analysis focuses only on identifying the patterns of students' responses to the lab rotation model, which is presented in numerous learning stations.

Meanwhile, qualitative data analysis focuses on the significance of implementing the lab rotation model. Interview focused on: (1) How is the learning model used in current statistics lectures? (2) Is it important to include numerous activities for learning into statistics classes? (3) Is it possible to use blended learning in statistics classes? (4) How do you respond if students are instructed to study independently before joining class? (5) How do you respond when students practice independently after getting a lecture? (6) How are the ways to encourage computational and critical thinking among students during lectures? (7) What is the statistical learning model that you have gone through? (For alumni); (8) What are your expectations for the statistical learning model? (For alumni).

Result

1.　*Qualitative Approach*

The first stage, instructors and management representation were interviewed. They stated that the statistical learning process continues to use the traditional strategy, namely instructor-centered rather than student-centered. Sometimes online by synchronous and giving assistance outside class hours. They are explaining theory first, then practice to the end of the semester. To keep students interested, it needs to include more different learning activities in which students can actively engage, which could reduce feelings of monotony in lectures. The use of blended learning is important demanded because it is in accordance with government recommendations as well as the present situation. Furthermore, individual study

assignments must be completed before students attend class. Students will benefit from this since they will be able to grasp the content more easily.

Meanwhile, individual practice tasks can be completed immediately after the content is presented so that students do not forget the fundamental principles of the content. Moreover, students require gatherings to talk with their classmates to comprehend each other's points of view. Students will compare their views of earlier lessons they have learned. Computational thinking can be encouraged by describing the subject being taught step by step, explaining the relationship between each component, providing crucial questions that encourage them to find solutions to problems, explaining by using a flowchart or mind mapping, focusing on a single aspect before going on to the next. Meanwhile, critical thinking can be stimulated by asking critical questions, requesting student feedback on the content being taught, giving a spontaneous quiz, encouraging students to engage more actively, ask them crucial questions that push them to think, give rewards to stimulate them, etc.

The second stage, alumni were interviewed about their experiences when studying statistics. They mentioned that the statistical learning model that have gone through included tutoring, presentation, the same learning model as previously, etc. While students' expectation included: practicing soon after learning the theory to avoid forgetting, including additional learning activities to avoid bored, discussing in group to exchange understanding with other classmates, providing a great reward to encourage learning motivation.

2.   *Quantitative Approach*

In total, 49 students responded the questionnaire that contained various elements, including the components of the lab rotation model as a learning strategy and the blended learning concept in general – see Table 1.

Note: 5= Strongly agree, 4= agree, 3= neutral, 2= disagree, 1= strongly disagree.

Table 1: The Distribution of Students Needs

Based on the findings above, it is possible to conclude that learning activities using the lab rotation model (LRM) approach met the needs of the participants, which consists of five components: initial learning station (ILS), traditional learning station (TLS), individual practice station (IPS), group learning station (GLS), and final learning station (FLS).

Discussion

The present statistical learning technique is based on classical learning concepts and is usually performed offline. Learning with a blended approach is still not well implemented due to insufficient infrastructure support and students' learning preferences, which still necessitate face-to-face interactions. Blended learning has been used, particularly during the Covid-19 period. However, the learning process resumed as it had previously. Meanwhile, online learning is only done when it was needed. The use of a blended learning type lab rotation paradigm has occurred, but not in a systematic manner. The instructors only use a combination of online and offline learning without a specific learning structure.

All stakeholders agree that it is critical to incorporate a variety of learning activities into statistics classes. This has never been done before in the prior learning process; thus, it is

novel. It will improve students' understanding, keep them interested, will be more pleasurable and less stressful. As a result, students will not be restricted to boring tasks in the classroom but will be able to learn freely outside of the classroom. Students will benefit from the use of blended learning. They are given the freedom to learn while yet receiving virtual instruction. However, students still need face-to-face contact in offline classrooms, particularly for subjects that require substantial explanation and during the first meeting. It is important to familiarize instructors and students at the first lecture meeting. Online learning can take place after the primary subject matter has been explained that can be monitored by using video camera. The initial meeting is critical for establishing a psychological connection between the instructor and the students (Alim et al., 2023).

Students are also advised to study individually before coming to the class. Students who succeed are more conscious of autonomous study than those who do not. Meanwhile, they can perform a surprise quiz or ask random questions at the beginning of each lecture session to verify they have completed their own learning process. This greatly enhances student understanding of the content that will be presented. Student enthusiasm to actively participate in the independent learning process is a measure of student engagement in the lecture process. Students who have studied independently can be identified by their ability to respond the questions or involve in the class. In addition, they will raise questions or assist their peers who do not comprehend the topic being taught. Following that, students should practice independently after receiving a lecture so that the content may be implemented immediately rather than waiting until the end of semester. This reduces the likelihood of forgetting the content. To support students in carrying out the data analysis process independently, independent practical activities must be overseen by instructors or teaching assistant.

Meanwhile, one technique to stimulate critical thinking among students are to ask them questions that should be addressed scientifically, offering students unexpected quizzes or examinations, comparing multiple viewpoints on a subject and select the most appropriate opinion logically. Instructors might also ask student comments on content presented by instructors or other students. To keep students' critical thinking skills sharply it is vital to recognize students who are critical and actively participate, as well as continuing to push other students to be more involved in the following meeting. Furthermore, stimulating computational thinking may be accomplished by studying in stages, or by focusing on one problem before moving on to the next. This may also be done with the use of mind mapping or graphics to fully comprehend the situation. A problem's execution pattern can also be carried out gradually and systematically. Create a relationship between each content component so that students may grasp the relationship between each subject.

According to students who have attended statistics classes, the learning method so far still prioritizes teacher-centered rather than student-centered learning. This is inextricably linked to a lack of activities that might drive students to carry out activities autonomously and monotonously, as is typical in traditional courses. This may be remedied by introducing various types of learning stations, and it is intended that students would engage in more active learning than lecturers. Meanwhile, students wish to be able to practice soon after learning the theory to prevent forgetting. Students are also expecting including extra learning exercises to minimize boredom, talking in groups to exchange understanding with other students, and delivering a fantastic incentive to promote learning motivation.

The conclusions of the interview session were consistent with the findings of the questionnaire, in which every facet of the lab rotation model was positively addressed. As an

example, consider the importance of integrating blended learning in statistics courses, which is comprised of numerous claims (see table 1). The average student reaction is positive, with the majority agreeing. It suggests that students responded favorably to the use of the blended learning model when paired with the lab rotation model, particularly in statistics courses. This trend can be seen at each lab rotation model learning station, indicating that students are enthusiastic about using this model in statistics. Based on the data presented above, we can infer that using the lab rotation model in statistics learning may meet the needs of students and is supported by stakeholders engaged in the learning process.

Conclusion

The implementation of the lab rotation model in statistics was in acceptance with the needs of the stakeholders. Activities in each station tailored to stakeholders needs, such as studying before class, face-to-face meeting, online individual practicums, focus group discussion, and conclusions. Some of these activities have been implemented, although not consistently. Learning activities using a blended learning approach were only carried out when there was an urgent necessity.

Meanwhile, on the instructor side, instructors continue to promote teacher-centered learning rather than student-centered learning. However, face-to-face interactions were still required by stakeholders rather than fully online learning. Blended learning is supposed to make statistics easier to grasp. This strategy is intended to encourage students to use their computational and critical thinking skills. Future study can use this learning technique for another subject.

Community Based Learning in Business Education: Is It Effective and What Are the Challenges?

Lewis Liew Teo Piaw, Politeknik Kuching Sarawak, Malaysia
Melissa Audrey Adriana Liu Abdullah, Politeknik Kuching Sarawak, Malaysia
Khatijah Binti Ibrahim, Politeknik Kuching Sarawak, Malaysia

Abstract

Community Based Learning has been practiced by Higher Education Institution in Malaysia with the aspiration to produce graduates who are capable to apply the theories and concepts to real-life context. However, there has been little information about its' effectiveness. This study intends to investigate the effectiveness of Community Based Learning in Business Program particularly the capstone project in Business Program offered by Polytechnic Malaysia and the challenges faced by the students. The qualitative method is employed to gather the reflections on the process and outcome of the experience via interviews with 36 students from 2 cohorts. Thematic analysis is used to interpret the data and the findings show that the capstone project activates the learning outcomes of academic knowledge, general skills, practical competencies, personal growth and civic responsibility while lack of resources and self-incompetence are the two main challenges faced by students. The findings of this study offer insights into the process of aligning related policy with Community Based Learning as well as demonstrating support for Community Based Learning.

Introduction

Community-Based Learning (CBL) is a form of learning that enables students, in collaboration with local businesses, to directly address identified real-life issues related to their course subject. By putting their theoretical knowledge into practice, CBL students not only help the firms achieve their goals and missions but also help them build transferable abilities and become more prepared for the real world. This helps them gain experience and talents that will be useful in their future undertakings. Students who engage in this kind of learning have the chance to learn in non-traditional academic settings and gain practical experience in their chosen fields and future professions. Students collaborate in small groups to find creative answers to actual business challenges while also learning important lessons about the duties and demands of the working world. This provides an opportunity for students to demonstrate their leadership and management abilities and comprehend the effects of their choices in a "safe space".

The higher education institutions in Malaysia have been using community-based learning (CBL) as one of their teaching and learning methodologies with the goal of producing graduates who can apply theories and concepts to real-life situations in conjunction with the Malaysian Educational Blueprint (MEB) 2015–2025, which lays out the principles that higher education institutions must follow in order to generate graduates who can compete on a global scale and meet the needs of stakeholders in Malaysia. Higher education institutions in Malaysia have used a variety of approaches to implement community-based learning, including problem-based learning, project-based learning, community case studies, learning via volunteer work, discipline-based projects, and capstone projects (Maharam et al., 2019). These different approaches have been employed in courses that have been integrated, embedded, stand-alone, or infused.

When students graduate from higher education institutions and enter the workforce, they should be prepared with the necessary knowledge and skills. In business-related programs, this means knowing the technical skills and information required by the industry, as well as the business theories and concepts. Through the capstone project—a community-based learning that combines service learning and problem-based learning—Polytechnics in Malaysia, as TVET providers, give students the chance to apply the material they have learned in class to a real-world scenario, complete with the limitations and uncertainties inherent in practice. In this project, students not only apply the knowledge they have learned in a course but also assist the community partners, especially the small and medium enterprises.

The capstone project is a final assignment intended to evaluate the abilities, know-how, and proficiency that students have developed. It is the culminating experience of academic life, as the name implies, and occurs prior to graduation. All students are expected to complete the project because it provides them with the final credits needed to pass the course. Students must integrate relevant service work in the business community with the knowledge they have gained throughout their coursework for their capstone project. The goal is either exploring a new topic or synthesizing students' understanding of their discipline. Such a project could be as basic as conducting topic research, analyzing a novel approach or method, creating a business plan, investigating historical figures or events, or even coming up with the idea for a tool, product, or service. In addition to creating the written report, a capstone project presentation functions as a sort of exposition where the students showcase their project and demonstrate their preparedness to enter the business world.

Numerous tertiary education institutions have started offering capstone courses due to the widespread recognition of these programs as effective means of imparting knowledge and skills that are relevant to the workplace. As a result, a lot of study on capstone courses and their effects has been conducted. However, there has been little information about its' effectiveness from the perspective of students. Hence, this study intends to provide a coherent and compact view of business capstones by investigating the effectiveness of community-based learning in business programs, particularly the capstone project in business programs, from the students' perspective and also the challenges faced by the students.

Literature Review

Giving students hands-on experience with the tools, approaches, concepts, and best practices that are taught in previous courses more conceptually is the main goal of a capstone project. However, the majority of research on capstone design courses has focused primarily on course outcomes, pedagogy, structure, and assessment (Badir et al., 2023). Limited studies have addressed the perspectives of students with respect to the benefits of capstone courses. For instance, recent studies have linked community-based learning to a number of advantages, including increased student learning (Yusof et al., 2020) and practical experience (Meyer et al., 2016); civic engagement and the reciprocal relationship between campus and community (Olberding and Hacker, 2015); enhanced student civic leadership and social responsibility (Weiler et al., 2013); and deeper comprehension of course contents (Dienhart et al., 2016).

According to Carlisle et al. (2020), there is positive evidence supporting the integration of learning and community. This is particularly true in light of the fresh skill set that the students acquired on a personal and professional level, improving their sense of self-worth, social confidence, and public participation. In support, Arcos-Alonso et al. (2021) postulate that community-based learning improves students' learning effectiveness because they utilize the knowledge they acquire in the classroom to subsequently translate it into community contributions. This maintains their personal development and creates a bond of knowledge about the changing world. In addition, a recent study further reveals that students expressed a stronger sense of responsibility for their education and an appreciation for the long-term benefits of interacting with community partners (Goggins and Hajdukiewicz, 2022), while Shah et al. (2023) add to the literature by showing that community-based learning promotes students' understanding in a "real-world" context within the community (as a subset of workplace learning) and "beyond the confines of a university degree" in addition to helping them gain important employability skills through a workplace learning experience. Another noteworthy finding is by Hamzah et al. (2023), who demonstrate that the students were being prepared on how to handle interactions with other stakeholders. The skills needed, such as leadership and communication skills that are crucial for social interactions, were developed during this period.

Research Methodology

The aim of the study was to understand the students' perceptions of whether the capstone course is beneficial and what the challenges are. In order to gain in-depth insights, the qualitative method was employed. Individual in-depth interviews lasting approximately 20–30 minutes were conducted at Politeknik Kuching Sarawak in Malaysia. The questions centered on students' experiences in the capstone course in terms of the benefits they believed they gained and the challenges they encountered. The Business Project is a core

component in the final year of the three-year-long Diploma in Business Studies program. A total of 36 students from two cohorts were sought until saturation was achieved. Interviews were recorded, transcribed, and coded. Major themes were identified. The method of peer debriefing was employed to validate the coding framework and analysis of the findings, in which initial codes and preliminary themes were discussed with the entire research team. This method adheres to the RATS (relevance, appropriateness, transparency, and soundness) criteria for qualitative research.

Findings and Discussions

The thematic areas can be grouped into two broad categories: the perceived benefits of capstone projects by students and the challenges faced by students in capstone projects. A total of four themes emerged from the analysis of perceived benefits of capstone projects by students: (i) activating the learning outcomes of academic knowledge; (ii) promoting generic skills; (iii) sharpening practical competencies; and (iv) fostering personal growth and civic responsibility.

(i)   Activating the Learning Outcomes of Academic Knowledge

The capstone project helps students assess their competency and preparedness and acts as a culminating intellectual and academic experience for them. It requires students to apply the knowledge and abilities they have learned during their studies while working independently on a subject or issue that the firms are facing. The students also indicate that they gained higher generalized self-efficacy and skills via capstone projects when compared to the traditional course. The respondents highlighted that the capstone project involves students identifying problems in the real business world. They are then challenged to come up with solutions for the issue by conducting a thorough study and analyzing all of the available data to generate possible solutions for the problem. The respondents perceived the capstone project as an opportunity to collaborate on a project that calls for them to use the information and abilities they have gained in their individual subjects of study. Important topics covered in the course include problem-solving, communication, team building, project management, and project planning.

(ii)   Promoting Generic Skills

Students have to communicate with small and medium enterprises as part of the capstone course. Despite the fact that they had dealt with the community via other activities, a number of them noted that the communication style in the capstone course was different. Students conducted interviews to ascertain the enterprise's needs and negotiate the project scope. They also showcased their ideas to the enterprise during the project. The respondents thought that these skills had improved as a result of the capstone course. Many respondents mentioned that the project had been their first chance to communicate with a genuine client and that it had given them lots of opportunities to learn.

Students who complete a capstone project are better able to lead others and function successfully in a group. They communicate with others both orally and nonverbally for a variety of reasons, and they use a variety of media to convey ideas and convey meaning. Additionally, they acquire information, research concepts, and express their thoughts through the use of information and communication technologies. The respondents indicated that in order to identify an issue, create and carry out a project plan, and effectively communicate

their results, they must collaborate in teams. An effective communication strategy is also emphasized in a capstone project course, both with internal team members and external stakeholders. Students gain the teamwork, leadership, and critical thinking abilities necessary for success in their future occupations through this course.

(iii)   Sharpening Practical Competencies

Students have the chance to work on an analytics project in the real business world during their capstone course. Through their interactions with business stakeholders and their successful completion of team-based business analytics projects within a commercial firm using the firm's data, the students obtained actual experience in delivering self-directed and experiential learning. The capstone project is also intended to test students' critical thinking abilities, help them solve challenging issues, and show that they are prepared for jobs in their profession. It is frequently the high point of their academic career and can give them experience and abilities that will be useful in their future undertakings.

Apart from that, capstone projects require independent thought, time management, and self-direction. Students learn critical thinking, communication, flexibility, and project management through planning, carrying out, and commenting on their projects. It is noteworthy to highlight that the respondents perceived that, in contrast to standard exams or theoretical assignments, through this practical experience, they are able to close the gap between theory and practice, improving their ability to solve problems and getting ready for whatever obstacles they may face in the workplace in the future.

(iv)   Fostering Personal Growth and Civic Responsibility

The capstone project encourages students to plan their future more thoughtfully, identify their primary goals, explore career options, and get practical experience that will benefit them in the workplace. It is a relatively new approach to the typical "placement" or "internship," and it aids students in navigating their careers on a certain path. When students are given the opportunity to apply what they have learned in the classroom, they not only discover their own personal strengths and acquire a set of transferrable abilities, but they also gain professional knowledge from working with community partners. It also boosts personal inspiration, as these kinds of tasks necessitate creative effort on subjects that each person finds fascinating, which increases inspiration. The respondents also indicated that the capstone project provides them with the opportunity to realize their potential as first-time managers by enabling them to make decisions in the real world. This has resulted in a sense of accomplishment and pride in their achievements, as they have the opportunity to showcase their knowledge and skills to a wider audience, including lecturers, peers, and potential employers.

Through the capstone project activities, students also develop an inclusive and open view of the world around them by learning about other cultures and encouraging respect for those who are different from them. They can also speak with people who hold opinions and views that differ from their own. Besides, it also teaches students how to positively impact society, giving them greater confidence and clarifying their self-perception. In the end, these advantages help students develop into well-rounded individuals who not only have confidence in themselves but also work to improve the environment in which they live.

As for challenges faced by students, two themes have been identified: (i) lack of resources and (ii) self-incompetence.

(i)   Lack of Resources

Creating a successful solution for the capstone project that satisfies the objectives of the community partner and learning requires a lot of valuable effort. Success is less probable if logistical issues with scheduling, transportation, or communicating get worse. Inadequate support and direction from the community partners also contribute to the challenges encountered by the students. In this regard, the students faced difficulties connecting and communicating with their community counterparts in order to build ideas and consult with the community on its concerns. As a result, there may be instances while working with the community that present difficulties for lecturers and students since diverse viewpoints and understandings of the problems that call for certain solutions exist on both sides.

(ii)   Self-Incompetence

Notwithstanding the benefits of a capstone project, it is necessary to take into account the students' readiness to conduct the capstone project. Students may not be prepared well enough to complete a capstone project successfully, and this will limit the learning experience as well as fail to help their community partner. Failure can occur in any educational environment, but it can be especially concerning and more worrisome for educators and students because of the responsibilities they may have to community partners. Students were unable to optimize their knowledge and skills learned, especially if their lecturers did not have the experience to help them connect to real-world business scenarios. Unforeseen obstacles may be encountered that limit the project outcome in some way in the context of real-world complexities and challenges.

Conclusion

The inclusion of a community-based learning environment in business-related programs can enhance students' confidence in knowledge application and their ability to connect with the business world. Students are exposed to a broad variety of fresh viewpoints and experiences through their capstone project that are not covered in class. It is imperative to arm oneself with the information and abilities needed to make oneself a desirable candidate for recruiters. Capstone projects are a way for academic institutions to help students get ready for the workforce. Students would be required to solve actual business challenges while also honing their soft skills. The competencies and credentials acquired via a capstone project can greatly augment a student's preparedness for the labor market or for additional academic endeavors, making them more competitive in their selected domain. However, it should be noted that the particular advantages will vary based on the project's type and the student's level of dedication and work. Nevertheless, students, lecturers, institutions, and communities would all benefit from this kind of education since it would instill a sense of civic responsibility and citizenship traits like cooperation, leadership, tolerance for cultural differences, interpersonal skills, and the capacity to start change in the community.

Prior to engaging in capstone projects, a needs analysis with the community is required to guarantee that the capabilities of the students and business needs are matched. In order to optimize capstone project outcomes, higher education institutions need to strategically assign a single center to lead community networking initiatives. It would be feasible to optimize the

advantages of both "worlds" with students able to satisfy learning objectives and cultivate their own convictions and skill sets in addition to serving the real demands of the business sectors. Higher education institutions also need to be aware of potential problems that could occur when managing capstone projects, like conflicts and time management. These challenges highlight the importance of careful planning, resource allocation, and support for both students and lecturers in order to effectively implement the capstone course. Finally, this study has presented the students' perceptions of the benefits of a capstone course and the challenges they faced. Further studies, however, are needed to capture other stakeholders' views, especially the business stakeholder in the capstone courses.

E-Module in TVET: Unveiling Brazing and Riveting Methods Through VAK Learning

Suhaizal Hashim, Universiti Tun Hussein Onn Malaysia, Malaysia
Nur Alianni Mohamad Ali, Universiti Tun Hussein Onn Malaysia, Malaysia
Saiful Hadi Masran, Universiti Tun Hussein Onn Malaysia, Malaysia

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
The electronic module (e-module) concern within the realm of Technical and Vocational Education and Training (TVET) pertains to the obstacles related to the incorporation and proficient utilization of electronic learning resources in vocational education systems. The issues discussed involve several factors, including insufficient digital infrastructure, restricted technological accessibility, differing degrees of digital literacy among educators and learners, and the necessity for comprehensive training and assistance to facilitate the smooth integration of e-module. This research focuses on the creation of an educational e-module for vocational colleges, specifically targeting the refrigeration and air conditioning program. The instructional material is designed to cater various learning styles, including visual, auditory, and kinesthetic (VAK) approaches. The purpose of this e-module is to facilitate the acquisition of knowledge for both teachers and students through the utilization of high-quality reference materials for the Fabrication of Piping, Tubing, and Metal topics. The researcher employed a semi-structured interview as the research instrument to evaluate the usability of the learning e-module in this study. Subsequently, the interview data will undergo thematic analysis and subsequently be assessed using Cohen's Kappa statistic, which will ascertain the level of agreement over the usefulness of the e-learning module. The findings of this study indicate that the e-module created possesses attributes of interest and suitability, rendering it a viable resource for reference purposes. The development of this learning e-module is anticipated to yield benefits for both instructors and students in the teaching and learning process.

Keywords: Educational Module, E-Module, Technical and Vocational Education and Training (TVET), VAK Model

Introduction

The education system in Malaysia is experiencing changes in line with advancements in Information and Communication Technology (ICT) as it follows the trajectory of modernity (Lapammu & Mahamod, 2018). The advancement in the domain of ICT has the potential to bring about significant transformations in contemporary education, particularly in the teaching and learning practices of the present age. The current era of technological progress has led to a significant increase in the need for proficient and highly skilled labor across several industrial domains. Furthermore, the establishment of collaborations between TVET institutions and industry entities can encompass several aspects such as the provision of training facilities, practical on-the-job training, and internship opportunities. These collaborative efforts serve to enhance trainees' comprehension of industry requirements and equip them with the necessary skills to effectively tackle real-world employment demands (Ramamuruthy, Alias & DeWitt, 2021). Hence, the interconnectedness of TVET, e-modules and the industry serve to narrow the divide between formal education and the practical realm of employment, so enhancing the calibre and applicability of the workforce generated.

The e-module concern within the realm of TVET pertains to the obstacles related to the incorporation and proficient utilization of electronic learning resources in vocational education systems. The issues discussed involve several factors, including insufficient digital infrastructure, restricted technological accessibility, differing degrees of digital literacy among educators and learners and the necessity for comprehensive training and assistance to facilitate the smooth integration of e-modules (Johar & Abdullah, 2019). To effectively tackle this matter, it is imperative to adopt a holistic approach encompassing various measures such as allocating resources towards digital infrastructure, implementing comprehensive training initiatives for educators, and creating a supportive ecosystem that facilitates the seamless integration of e-modules (Abi Hamid, Yuliawati & Aribowo, 2020). These efforts will ultimately contribute to the improvement of both the caliber and availability of TVET programs.

This research focuses on the development of an educational e-module for vocational colleges, specifically targeting the refrigeration and air conditioning program by applying ADDIE Model. The instructional material is designed to cater various learning styles, including visual, auditory, and kinesthetic (VAK) approaches. The purpose of this e-module is to facilitate the acquisition of knowledge for both teachers and students through the utilization of high-quality reference materials for the Fabrication of Piping, Tubing, and Metal topics. Later, the developed e-module will be tested to understand the result of its' usability.

Upon these introductions, this paper is organized on the following sections: literature review, methodology (by of the application of ADDIE Model), results and discussions, and conclusion. The later part will contain acknowledgement and the list of references.

Literature Review

The transformation of vocational education represents a concerted endeavor to enhance the capacity and effectiveness of the vocational education system. According to Noridah (2020), it has the potential to facilitate the transition of the nation into a high-income country. The primary objective of technical and vocational education is to cultivate a cohort of individuals who has extensive expertise and proficiency in specific domains (Krismadinata et al., 2020). Hence, it is imperative that the instructional methods employed in vocational education be

engaging and have the ability to captivate students, thereby encouraging their enrolment in the various disciplines offered by institutions like Vocational Colleges, in alignment with the evolving era of information and communication technology.

According to Aziz & Sieng (2019), e-learning is considered an innovative approach inside the reformed education system, with the intention of supplanting the current educational framework. The utilization of ICT as a facilitator in the process of pedagogy and the promotion of self-directed learning is a prominent educational approach. This strategy proves to be highly effective, particularly with the implementation of computer-based learning modules, such as teaching aids. To optimize the efficacy of the teaching and learning process, it is imperative to incorporate teaching aids as a technological tool and learning resource to ensure a robust educational experience. The utilization of teaching aids has the potential to enhance the learning experience by captivating students' attention and facilitating a deeper comprehension of the instructional material (Bakhir, et al., 2016).

Hence, the utilization of teaching aids is strongly advocated for the purpose of online education. According to Siregar, Suhardi & Munandar (2022), teaching aids encompasses various categories, one of which pertains to non-electronic teaching aids that continue to be utilized in a manual manner. Subsequently, electronic teaching aids refer to instructional tools that employ electronic devices to elucidate educational slides to students. Consequently, the use of Adaptive Blended Learning Models has the potential to facilitate students' comprehension of course content. In contemporary times, educators persist in utilizing textbooks as the primary means of accessing reference materials (Alalwan et al., 2020). This finding indicates a higher prevalence of teachers employing traditional instructional approaches compared to e-learning methodologies. The utilization of the teaching aids through e-learning application approach has garnered significant attention and recognition. This phenomenon can be attributed to the widespread availability of online resources, which can be accessed conveniently from any location, as opposed to the traditional method of in-person learning (Saito & Tangkiengsirisin, 2023).

Alternative approaches such as the one mentioned are highly beneficial within the context of the Professional Development Program (Leary et al., 2020). Moreover, instructors have demonstrated a commendable commitment to staying abreast of contemporary advancements in technology. Nevertheless, there exist certain limitations, such as the prerequisite for instructors or students to maintain uninterrupted internet connectivity in order to avail themselves of reference materials. Enhancements to e-modules have the potential to enhance and foster pupils' cognitive abilities. Teaching aids strategies, such as the utilization of e-modules incorporating videos and pictures, are recommended to be emphasized due to their potential to enhance student comprehension.

Every student possesses an individualized learning style that facilitates their comprehension of the instructional material presented by the teacher. The learning style of a student is a significant determinant in enhancing the caliber of their learning experience. The incorporation of visual, auditory, and kinesthetic learning methods, sometimes referred to as VAK, is crucial in the educational process (Purwasih et al., 2022). Given this circumstance, the significance of learning style in the educational process cannot be overstated, as it enables educators to design instructional experiences and serve as a compass for tailoring teaching methods to suit individual students (Mahadi, Husin & Hassan, 2022). In order to accommodate the diverse learning styles of pupils, it is imperative for instructors to furnish a

range of learning tools. This facilitates an equitable learning experience for all students, enabling them to maximize their learning potential and get equal educational resources.

According to Rahman et al. (2015), vocational students often experience a sense of boredom during the instructional and learning procedures, leading to a lack of enthusiasm in acquiring comprehensive knowledge of learning theory. The impact of this issue has had a detrimental effect on students' knowledge and abilities, resulting in low theoretical scores in the context of teaching and learning in technical and vocational. This is particularly evident in disciplines that prioritize practical aspects over theoretical ones, leading to a lack of in-depth knowledge development among students (Mansurjonovich & Davronovich, 2023). The e-module that has been designed utilizes the VAK learning method, as it aligns well with the subject matter of Joining Metal by Brazing and Riveting. These particular topics necessitate students to engage in hands-on activities and possess a solid understanding of the subject matter in order to effectively carry out practical work.

The absence of well-defined modules and limited availability of reference materials provide challenges for students engaging in self-directed study. Vocational students encounter time limitations in their learning process and are often confronted with a shortage of appropriate resources and equipment (Akhmedov, 2019). Given the aforementioned circumstances, it becomes apparent that there exists a necessity to modify the pedagogical approach by including interactive learning tools, such as teaching aids, specifically e-modules. This implementation has the potential to enhance students' comprehension and engagement, particularly within the realm of technical subjects. Consequently, the implementation of this e-module will facilitate students' acquisition of knowledge pertaining to the subject matter at hand (Fahrurrozi et al., 2023).

Given the moderate level of student proficiency in the selected course and the absence of specific modules pertaining to this subject, the researcher has devised an e-module for the subjects of Joining Metal through Brazing and Riveting. This module is intended for students enrolled in the Refrigeration and Air Conditioning Technology program at the Vocational College. It serves as a high-quality, engaging, and adaptable medium for learning, as well as a valuable source of reference. Hence, it is anticipated that the creation of this e-module will enhance students' comprehension, abilities, and accomplishments, while also fostering a beneficial influence on the educational system, resulting in the production of well-rounded and competitive graduates.

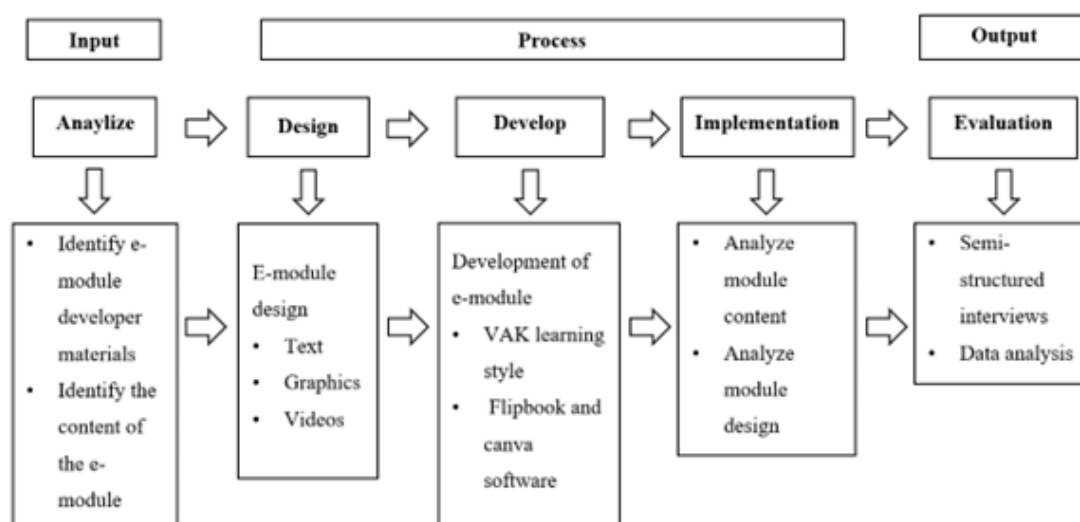
Thus, this study aims to create an educational e-module that focuses on the subject of Join Metal by Brazing and Riveting. The e-module is designed to cater primarily to students enrolled in the Refrigeration and Air Conditioning Technology program. The objective is to enhance students' proficiency in the subject matter and enhance their capacity to use the acquired information within the industry. In general, the incorporation of contemporary pedagogical approaches, namely through electronic learning, serves to augment the educational system and provide students with the necessary skills to meet the requirements of the ever-changing labor market. The emphasis placed on vocational education and the acquisition of specialized technical skills is in accordance with the demands of the nation's industrial sectors.


Figure 1: Research Procedure for the Development of Join Metal by
Brazing and Riveting E-Module

The VAK learning style encompasses three fundamental components, namely auditory, visual, and kinaesthetic modalities. This particular learning style encompasses three distinct modalities via which pupils acquire knowledge: visual, auditory, and kinaesthetic. A visual learner is an individual who demonstrates a preference for acquiring knowledge via the utilization of illustrations or pictures. Conversely, an auditory learner is one who exhibits a propensity for learning by actively listening to explanations or engaging in conversations with others. Lastly, a kinaesthetic learner is characterized by a preference for practical, hands-on learning experiences (Bakri, Rahman & Jabu, 2019). The primary focus of this e-module will be on the Joining Metal by Brazing and Riveting topic, which are integral components of the refrigeration and air conditioning technology program. The e-module was created as an educational resource for first-year students enrolled in the refrigeration and air conditioning technology program at the Vocational College. The objective of the e-module is to enhance students' proficiency in the subject matter and enhance their capacity to effectively use the acquired information within the industry. The emphasis placed on vocational education and the acquisition of specific technical skills is in accordance with the demands of the nation's industrial sectors.

Hence, the implementation of this e-module will facilitate students in acquiring knowledge pertaining to the relevant subjects. Given the moderate level of student proficiency in the selected course and the absence of specific modules pertaining to this subject, the researcher has devised a learning electronic module focusing on the concepts of joining metal through brazing and riveting. This module is intended for students enrolled in the Refrigeration and Air Conditioning Technology program at the Vocational College. It serves as a high-quality, engaging and adaptable learning tool, as well as a valuable source of reference material. Hence, the researcher anticipates that the creation of this e-module will enhance students' comprehension, abilities, and accomplishments, while also positively influencing the education system to cultivate well-rounded and competitive graduates.

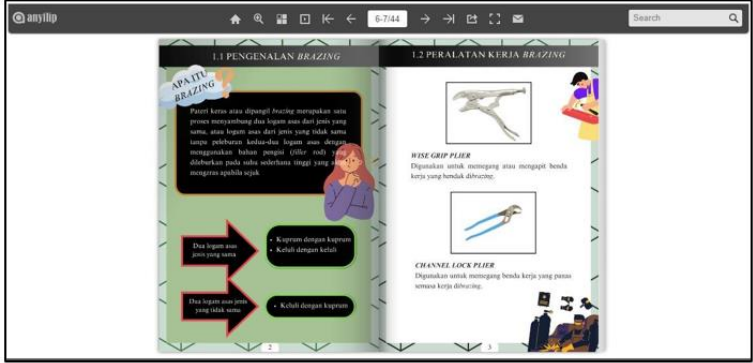
Methodology

This study employs the Design Development Research (DDR) framework, with a specific focus on utilizing the ADDIE model. The DDR is a method employed for the purpose of

constructing targeted goods. In the context of this study, the ADDIE model (Analysis, Design, Development, Implementation and Evaluation) has been selected as the framework for product creation. The process of data collection entails employing a quantitative data, which enables the researcher to acquire information from participants. The research will encompass a minimum of three participants who were educators (users of the product) in order to assess the usability of the e-module that has been developed. The study employs a combination of quantitative methodologies. The collection of data was conducted through interviews in order to evaluate the usability of the e-module, whereas quantitative approaches are employed to analyze the data derived from these interviews. The ADDIE model is chosen due to its compatibility with the development design of the e-module and its provision of an organized and systematic approach encompassing five distinct phases, namely analysis, design, development, implementation and evaluation (Molenda, 2003). The model is renowned for its ability to generate high-quality e-module. The appropriateness of the ADDIE model and the incorporation of quantitative approaches are crucial in attaining the study objectives and generating an authentic and dependable e-module for the Fabrication of Piping, Tubing and Metal course.

i. Analysis

The analysis step holds significant importance in the development of suitable instructional materials. In order to gather pertinent data for the study, the researcher implemented a series of procedures aimed at identifying the challenges encountered by students and teachers. To this end, a preliminary survey was done, employing a method including the search and analysis of the identified issues. The researcher has undertaken a survey by reviewing existing studies via an online search. The researcher systematically examines and evaluates all relevant data and information acquired from diverse sources, afterwards organizing and interpreting it in accordance with the conducted research. Furthermore, the researcher conducted an analysis of the suitable developmental resources employed for the creation of the electronic module, as well as the information encompassed inside such module. In order to ascertain the content of the e-module and identify suitable development materials for this instructional e-module, the researcher conducted a comprehensive analysis of the available information from diverse sources. Subsequently, the data was processed in accordance with the relevance to the ongoing study.

The objective of this study is to ascertain the primary challenges encountered by educators and learners during the instructional and educational process. Furthermore, the objective is to ascertain appropriate e-module development materials and information for incorporation into e-modules, and afterwards generate instructor and student-friendly e-modules as potential solutions. Hence, the researcher's investigation revealed that there is currently no precise learning e-module available for the Fabrication of Piping, Tubing, and Metal course. Furthermore, the study also identified the specific development materials employed for the creation of e-module, namely the flipbook and Canva software. Furthermore, the researcher has determined that the content to be created for this electronic module is grounded on the learning style known as VAK.


ii. Design

During this stage, the researcher integrates the gathered information, data and concepts from the analysis phase in order to develop a high-quality and engaging electronic module for learning purposes. In order to create an effective e-module, it is necessary to ensure that the

design incorporates text, graphics, and video elements that align with the VAK learning style. This learning strategy serves as the foundation for the development of the e-module. Subsequently, the researcher proceeded to formulate the e-module design by utilizing the storyboarding technique and employing Canva software, as informed by the analysis conducted.

The design of e-module encompasses several elements, including textual content, graphics and video components, which will be presented in a structured manner resembling a storyboard. The purpose of this endeavor is to provide a comprehensive understanding to the researcher in the creation of this electronic module, while also streamlining the development procedure of this educational electronic module. Storyboards serve as a form of documentation utilized in the production of interactive multimedia. The document has programming instructions, audio scripts, and comprehensive depictions of visual components, including text, video, graphics, and animation. Consequently, the researcher formulated a development plan grounded in the conducted analysis and employed suitable methodologies to generate an electronic module capable of attaining the aims and addressing the study inquiries.

The VAK learning style paradigm comprises three fundamental components, namely visual, auditory, and kinesthetic. Based on this particular learning style, it is posited that students acquire knowledge and skills through three distinct modes of learning. In educational settings, it is observed that students often employ visual aids such as illustrations or pictures to enhance their understanding and communication of concepts. Auditory learners, characterized by their preference for acquiring knowledge through auditory stimuli such as listening to explanations or engaging in dialogues, as well as kinesthetic learners, who have a propensity for practical learning, are two distinct types of pupils. The implementation details of each element are depicted in Figure 2.

| No.	Design	Display and Description
1.	Visual Elements	 Visual learners prefer visual learning tools. Visual learners enjoy visual learning. This class learns fast. Students can visually display and preserve information. This e-module offers visuals and intriguing writing to illustrate each explanation. Visual learners understand better. They like painting, sketching, manipulating images, building, and assembling. They can read, write, solve puzzles, and comprehend charts and graphs.

2.	Auditory Elements	
		Listening helps us comprehend what others say. Storytelling, education, comedy, and remembering can help these students. Thus, this e-module has an activity video for each topic. Students can read or listen to this video. The e-module has been designed based on the VAK learning method, which incorporates visual and aural components included in the produced activity videos. Given the circumstances, it is evident that this electronic module aligns with the preferred learning style of the intended audience.
3.	Kinesthetics' Elements	
		The e-module has been designed based on the VAK learning style, incorporating a range of activities and instructions for students to engage with following the acquisition of theoretical knowledge. Students that possess a kinesthetics learning style typically demonstrate a proclivity for acquiring knowledge through experiential or practical means. Given the aforementioned circumstances, it is evident that this electronic module aligns with the kinesthetics learning style, since the researcher incorporates many activities for students to engage in.

Figure 2: Design Criteria Development

iii. Development

Once the e-module completes the design phase, the subsequent phase of development must be executed in accordance with the plans set during the design phase. The utilization of the specified elements and media technologies from the analysis and design phase will be employed by the researcher to develop a high-quality e-module for learning purposes. This e-module will be grounded in the theory of visual, aural, and kinesthetic learning styles. The production phase of this e-module encompasses several aspects, including text, pictures, video, and audio, which have the potential to captivate students' attention.

The e-module was developed by the researcher through the utilization of various software tools. Canva was employed for incorporating text elements and graphics into the e-module, while Capcut software was utilized to create video activities based on the pre-determined storyboard. This approach was adopted in order to align with the VAK learning style and facilitate the development of the e-module. Furthermore, the production of a video entails a series of steps, including the capturing and editing of the footage, as well as the development of an appropriate script to be incorporated into this educational e-module. Upon completion of the development of the e-module, it will be integrated into the flipbook software, hence enabling seamless utilization of the e-module.

iv. Implementation

After the development of the e-module, the researcher will proceed to implement it in authentic settings and evaluate the usefulness of the learning e-module. The e-module will undergo an evaluation procedure, wherein three respondents will be interviewed to identify and address the shortcomings identified during the development phase. This method aims to improve the e-module. Subsequently, the researcher solicited input from the participants pertaining to the design and usability of the electronic module in effectively attaining the study's objectives, employing interviews as the chosen method of data collection. The researcher is required to gather input from respondents in order to conduct an evaluation of the generated e-module.

v. Evaluation

The researcher conducts an evaluation process to determine whether the usability of the generated e-module aligns with the objectives of the study, or conversely. The evaluation step involves the analysis of data collected from interviews in order to obtain insights into the development of the e-module, its ability to address the identified challenges, and its relevance to the study topics. If necessary, enhancements will be implemented prior to proceeding to the subsequent phase in order to effectively address any problems or issues that may develop. During the concluding phase, the data is subjected to analysis through interviews performed to assess the usefulness of the developed e-module, as well as to establish the extent to which the study's objectives have been met (Gholami & Bagheri, 2013).

The researcher utilized a product design in this study, employing semi-structured interview evaluations as research instruments to gather feedback from participants regarding the usability of the product. Subsequently, the collected data was quantified to determine the coefficient of agreement using the Cohen Kappa Index. The primary objective of the instrument supplied is to evaluate the degree of usability exhibited by the product. The semi-structured interview been done with three instructors specializing in refrigeration and air conditioning. The study involved a single interview session with participants, focusing on their perceptions of the functional capabilities of the e-module, as the research instrument separation in Table 1.

Section	Construct	No. of Questions
Item A	Respondent information	4
Item B	Content Quality	2
Item C	Potential usability	3
Item D	Overall satisfaction	1
Item E	Suggestion and improvement	1

Table 1: The Division of Items in Semi-Structured Interview

Two questionnaire experts will assess the semi-structured interview questions before questioning individuals. These questions are categorized intentionally. Open and closed questions require basic answers. The code will choose the conclusion from each question's topic. Finding this code yields frequency numbers. Semi-structured dialogues will determine product usefulness. Item A, B, C, D and E were the discussion questions for this study. Item A asks about the respondent's background and other pertinent information. Item B covers product benefits and use. Potential usability is on item C and overall satisfaction as item D. Then, item E seeks product suggestion and improvement.

Robinson (2014) suggests picking research subjects based on their willingness to participate. The participants in this study comprise teaching staff members who are responsible for instructing students enrolled in the Refrigeration and Air Conditioning Technology program at Vocational Colleges. The participants for this study were chosen based on shared characteristics in their utilization of the produced e-module. The participants of this study were selected from a Vocational College, namely three instructors specializing in refrigeration and air conditioning. These instructors were chosen to utilize the newly built teaching and learning e-module.

Thematic analysis can encompass multiple perspectives and is beneficial for novice researchers, according to Braun & Clarke (2006). Thematic analysis uses recorded interview data to identify themes. The system's main, unaltered data will come from selected users. The researcher recorded, collected, analyzed, and interpreted the interview data for this study. The researcher analyzes interview transcripts to evaluate terms, identify key data, and organize it. Data was coded using predetermined criteria. The analysis excluded irrelevant data. The Cohen Kappa index acceptance evaluation scale ensured that semi-structured interview answers were analyzed into appropriate themes and codes. This simplified product usability evaluation. Quantitative data from four semi-structured interviews was converted into tables and descriptions. These tables and explanations showed objects, percentages, and frequency.

Results and Discussions

Thematic analysis was employed to identify several aspects that could be inferred from the transcript of the interview. Each participant underwent an interview in which they were queried about their personal information, encompassing their name, age, place of origin, and educational attainment. The objective of this investigation is to enhance the researcher's comprehension of the individuals who were questioned. The responses made by each participant, based on the quality of their substance, are exemplified in the following interview question:

> 'In my view, the developed module does achieve the objective developed by the researcher.' (Sample 1)

'In my opinion the module developed by this student achieves the objective which can complete the teaching session at the vocational college.' (Sample 2)

'The module developed by this student can complete the teaching session at the vocational college because this module is very helpful for the teaching staff.' (Sample 2)

The coding process will be conducted by the researcher, who will determine the necessary coding criteria depending on the specific objectives of the study. The researcher generated a maximum number of codes in accordance with the recommendations of Braun and Clarke (2006). Consequently, the researcher derived a total of 30 codes from the data obtained through interviews. In the initial step, definitions are established for each code, followed by a subsequent stage where all codes undergo refinement. Table 2 presents the initial codes generated:

No.	Initial Code	No.	Initial Code
1	Achieve the objective	16	Interest
2	Complete the teaching session	17	Has a lot of information
3	Helping the teaching staff	18	Improve understanding
4	Easy to understand	19	Provide QR code
5	Total touching	20	Providing videos is very appropriate
6	Covers the entire content	21	Meet the characteristics that are appropriate for learning
7	Very organized	22	Includes Visual, Auditory, Kinesthetics teaching models
8	Very appropriate	23	Content that is relevant
9	Concise	24	Very appropriate
10	This module is interesting	25	Video preparation
11	Not boring.	26	Apply various teaching techniques
12	Not confusing.	27	Satisfied
13	Graphically shaped	28	Very effective
14	The best module	29	The usability of the module is very good
15	Infographic form	30	Neat writing

Table 2: Initial Coding of Interview Data

The process of re-examining themes was conducted using a two-tiered review approach, wherein sub-themes were carefully scrutinized and codes were derived from the interview data. During the initial phase, an evaluation was conducted to determine the extent of the interrelation between each code inside the sub-theme. The code will be excluded if it lacks compatibility with the sub theme. Consequently, at this juncture, several codes are excluded and consolidated into a singular code within a unified subtheme. The initial code generated during the coding process is decreased by two codes, resulting in a reduction from 30 codes to 28 codes. Table 3 presents the codes organized according to sub-themes:

No.	Sub Themes Developed	Number Code Arranged in Theme
1	The objective of the e-module	3
2	The content of the e-module	10
3	Presentation of e-module	8
4	E-module evaluation	6
5	E-module satisfaction	1
	Total	**28**

Table 3: Number of In-Sub Themes

The themes and features identified from the interviews will be validated by the researcher through the utilization of the Cohen Kappa method. This approach entails evaluating the level of agreement between two assessors or coders when assigning ratings to categorical variables. Interrater reliability pertains to the extent of concordance among two or more observers or raters in giving identical ratings or categories to an observation or textual piece. This finding underscores the importance of raters sharing a common perspective and engaging in comparable research practices in order to enhance the trustworthiness of results.

The presence of high reliability in a study suggests that efforts have been made to eliminate individual bias, hence increasing the likelihood that other researchers, employing the same categories, will arrive at similar conclusions when analyzing the data. This inquiry examines the concept of qualitative validity and the strategies employed to ascertain the precision and dependability of interview data. The incorporation of the Cohen Kappa technique and the notion of interrater reliability contributes to the scholarly nature of the research study, augmenting the robustness of the findings and the validity of the conclusions derived from the collected data. The Cohen's Kappa calculation procedure was utilized to determine the level of agreement between the two assessors in analyzing the interview data. The results indicate a substantial agreement value of 88%. A specific illustration of the Cohen's Kappa computation is provided in Table 4.

Type of data	Researcher	Interrater 1	Interrater 2	Coefficient of agreement	Cohen Kappa
Interview	$= \dfrac{28 - 14}{28 - 14}$	$= \dfrac{26 - 14}{28 - 14}$	$= \dfrac{25 - 14}{28 - 14}$	$\dfrac{1.0 + 0.86 + 0.78}{3}$	0.88
	$K = 1.00$	$K = 0.86$	$K = 0.78$	$= 0.88$	

Table 4: Calculation of Cohens Kappa

The Cohen Kappa agreement scale, as proposed by Cohen (1960) and further supported by Ghazali, Johare & Masrek (2011), is presented in table 5. In this scale, agreement values of 81% and 100% are considered high and indicative of very good agreement. Agreement values ranging from 61% to 80% are classified as good, while values between 41% and 60% are considered moderate. Agreement values falling within the range of 21% to 40% are categorized as weak, and values ranging from 0% to 20% are considered very weak. The proportion of scores achieved for the collected interview data is 88%. Hence, it can be inferred that the degree of consensus on the utility of the Join Metal by Brazing and Riveting e-module topic in Fabrication of Piping, Tubing and Metal course is quite favorable.

Score	Interpretation
0.81-1.00	Very good
0.61-0.80	Good
0.41-0.60	Moderate
0.21-0.40	Weak
0-0.20	Very weak

Table 5: Kappa Coefficient Value

The e-module for the subjects of Join Metal by Brazing and Riveting in the context of Refrigeration and Air Conditioning Technology, catered towards students enrolled in Vocational Colleges, has been developed with consideration for the VAK learning style. This module integrates various sensory modalities, including visual, auditory, and kinesthetic elements, to offer a comprehensive learning experience tailored to individual students' preferences. Visual components, such as images and video demonstrations, are incorporated, along with auditory elements like audio recordings and expert interviews. The VAK learning style hypothesis classifies persons into three categories: visual, auditory, or kinesthetic learners. This theory proposes that individuals possess preferences for obtaining information through visual stimuli, aural cues, or hands-on experiences (Litta & Budiarty, 2020).

Additionally, kinesthetic aspects were addressed through interactive simulations, practical activities, and project assignments that involve hands-on practice of brazing and riveting techniques. The objective is to provide a well-rounded educational encounter that accommodates diverse learning styles. VAK learning style approach encompasses several key steps, including an initial needs analysis, the development of content utilizing visual elements such as pictures and videos, the integration of auditory components such as audio narration and interviews, and the inclusion of kinesthetic elements such as interactive simulations and practical activities. Additionally, the e-module will feature assessments and project tasks to further enhance the learning experience. The technique emphasizes the integration of these aspects in order to facilitate complete and interactive learning, taking into consideration the individual student's preferred learning styles (Guo et al., 2020).

The assessment of the usability of the e-module is a crucial component of this research. The usability of the constructed learning e-module was assessed by the researcher in order to determine its effectiveness for vocational college students specializing in refrigeration and air conditioning. The objective was to evaluate the extent to which these students may benefit from utilizing the e-module as a learning tool. The evaluation of the necessity and significance of creating instructional aids and building teaching modules is conducted based on the usability and comprehensibility of the module by stakeholders engaged in teaching and learning activities (Nashir, Zainal, & Sulaiman, 2022). The e-module is distributed to vocational college instructors specializing in teaching courses on Fabrication of Piping, Tubing, and Metal. Its purpose is to gather comments and suggestions for enhancing the generated e-module through the utilization of the interview approach. According to Kamal, Jajuli, and Nafiah (2023), there is a need for enhancements in the delivery of content in order to increase its level of engagement.

This study primarily examines the usability of the e-module, with a particular emphasis on the agreement among respondents. The findings indicate a high degree of usefulness for the e-module. The researcher selected three participants who are educators specializing in the subjects covered by the e-module. These individuals were chosen to provide insights into the

development of the e-module through the means of interviews. Following the conclusion of the interview session, the researcher employed the thematic analysis method to extract significant information from the interview transcripts generated by the researcher. Through the application of thematic analysis, the investigator identified a number of sub-themes that facilitated the exploration of the third research inquiry (Byrne, 2022). Based on the sub-themes identified, the researcher can derive insights on the usability of the e-module in relation to its content, presentation, evaluation, as well as the level of user satisfaction with the generated e-module, along with recommendations for enhancing its effectiveness.

All participants provided affirmative responses and reached a consensus that the produced electronic module is characterized by user-friendliness and usability. Numerous research has indicated that the utilization of multimedia can provide beneficial outcomes in the context of pedagogy and professional development. According to Al Hashimi et al., (2019), the strategic utilization of media can enhance the pace and efficacy of learning, hence facilitating the successful attainment of learning goals. Furthermore, the analysis conducted on the usability component of this e-module unequivocally demonstrates its exceptional usability and its effective contribution towards assisting teachers in the teaching and learning process for the Fabrication of Piping, Tubing, and Metal course. The findings of Rashid & Bakar (2023) indicate that the utilization of teaching aids has resulted in a favorable perception among the participants, suggesting that its implementation has the potential to enhance the engagement and appeal of teaching and learning endeavors. The consideration of usability is crucial in maintaining the ongoing efficacy and pertinence of this electronic module designed for educators in Vocational Colleges.

Conclusion

Based on the preceding discourse, it can be inferred that the e-module produced by the researcher has effectively tackled the research inquiries posited as the research objective. The individual who participated in the study as a respondent is an instructor who specializes in the subject matter being taught. They show a willingness to collaborate and offered insightful comments to the researcher. The e-module was subjected to an evaluation by the researcher, which yielded a positive overall assessment. The feedback received highlighted the e-module's usability, encompassing several factors such as its format, content, visuals and design. The utilization of the ADDIE model proved advantageous for the researcher during the developmental phase of this instructional e-module, which serves as a comprehensive guide and reference, enhancing its efficacy as a significant educational resource in the teaching and learning process. The data indicates a significant level of consensus among respondents, suggesting that the usability of this e-module effectively supports teaching and learning in the Refrigeration and Air Conditioning program for both teachers and students. In conclusion, the results of the analysis and assessment undertaken indicate that the constructed educational electronic module effectively achieves its intended goals and has garnered favorable responses from the participants.

Official Conference Proceedings

Abstract

The purpose of this research was to explore ways in assessing students' mathematical competencies needed for the 21st-century goal. The creation of the Thailand Mathematics Festival was adapted from the original Moscow Mathematics Festival in providing various assessment activities to analyze students' mathematical competencies. The target group consisted of seventh-grade students who participated in the second Thailand Mathematics Festival 2020. The research instrument was the Olympiad activity as a part of the Mathematics Festival. This was used to collect their mathematical thinking/ideas related to mathematics contents defined by experts from the Moscow Center for Continuous Mathematical Education (MCCME, 2021) that will lead to the performance of the students' mathematical competence. Data were collected based on students' expressive ideas according to their problem-solving solutions, indicated in their worksheets. The data were analyzed by using the mathematical thinking framework of Isoda & Katagiri (2012). The findings indicated that the Mathematics Olympiad functions as a tool for assessing the mathematical competencies of seventh-grade students. The findings imply that students have the ability to exhibit their mathematical competencies through their mathematical thinking in terms of the following Mathematical idea: Idea of Sets; Units; Representation; Operation; Algorithms; Approximations; Fundamental Properties; Functional Thinking, and Idea of Expressions.

Keywords: Assessment, Mathematical Competency, Mathematics Festival

Introduction

In the 21st century, global transformations necessitate nations to prioritize workforce development and higher-order skills (Wandee et al., 2018). Educational systems must adapt to prepare individuals for rapid changes, emphasizing 21st-century skills crucial for addressing modern challenges (Jintana, 2015). Rizki and Priatna (2019) underscore the importance of mathematical literacy, aligning with competencies like critical thinking and collaboration (Berry, 2018). Effective mathematics education should shift from memorization to connected learning experiences (Lampert, 2001; NCTM, 2010). Classroom discourse activities promoting reasoning, interpretation, and collaboration are essential for students to apply mathematical concepts (Smit, 2016).

Responding to 21st-century demands, Southeast Asian countries, particularly Thailand, face a shortage of skilled labor in mathematics-related fields. Assessments like TIMSS and PISA reveal low mathematical competency among Thai students (Inprasitha, 2017). An education system aligned with 21st-century goals, focusing on practical application skills over standardized testing, is essential (Bellanca & Brandt, 2011). Thailand's participation in the Mathematical Festival showcases collaborative efforts to enhance math learning in a joyful context (Inprasitha, 2019).

The Moscow Mathematical Olympiad, held for 75 years, challenges students with diverse, difficult problems to stimulate creativity (Fedorov et al., 2011). The competition's "non-standard tasks" emphasize imagination and flexibility (Yashchenko, 2013). Mathematical Olympiads assess problem-solving abilities, focusing on clear and understandable mathematical concepts (IMO Foundation, 2015). The Olympiad incorporates "Mathematical Festival" activities, aligning with Moscow's efforts to promote cultural and mathematical understanding since 2009 (Moscow Center for Continuous Mathematical Education, 2022).

The Mathematical Festival, emphasizing mathematical thinking and joyful engagement, crucial for independent problem-solving in a changing world. The festival involves problem-solving and games, providing a positive avenue for students to experience the beauty of mathematics. This aligns with the modern educational shift towards cultivating Mathematical Thinking, particularly in connection with mathematical content, operation, algorithms, and expressions. The festival's non-standard tasks challenge students' imagination and problem-solving skills, addressing the global need for adaptable skills. Assessing students' mathematical competency during the festival reflects a departure from traditional standardized testing, emphasizing practical application skills (Bellanca & Brandt, 2011). The study aims to analyze the mathematical competency demonstrated by Thai high school students during the Mathematical Festival, using Isoda and Katagiri's framework (2012).

Methodology

The study focused on 124 seventh-grade students from 14 schools who actively participated in the second Thailand Mathematics Festival held in 2020. The research instrument chosen for this study was the Mathematics Olympiad, a key component of the festival. The selection of this instrument was grounded in its ability to elicit comprehensive responses from students, showcasing their mathematical thinking and problem-solving skills.

The mathematical contents targeted in the Olympiad were carefully curated by experts from the Moscow Center for Continuous Mathematical Education (MCCME, 2021). These

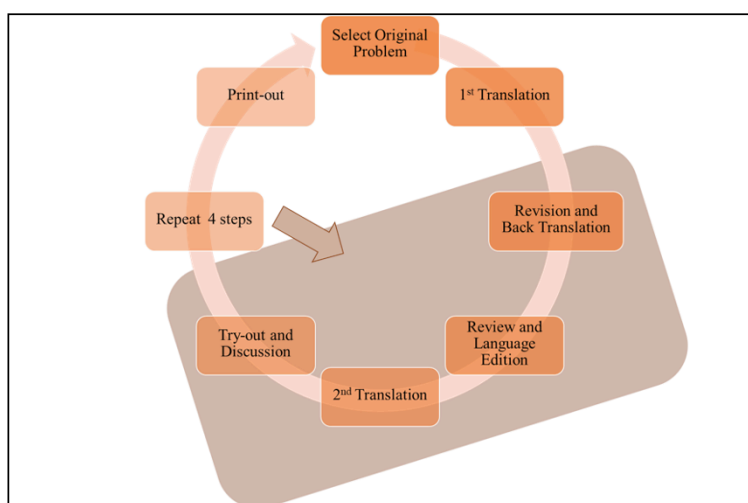
contents covered a wide spectrum of competencies, including geometric facts, decimal notation, constructive problem-solving, combinatorics, textual problem analysis, and logical reasoning. This alignment with expert-defined contents aimed to ensure that the assessment was not only meaningful but also reflective of globally acknowledged mathematical competencies.

Instruments

In this research, the researcher employed the Mathematical Festival as the primary instrument for data collection. The event, held for the second time in Thailand on December 19, 2020, at Moscow State University, Russia, has been a continuous tradition for over 30 years (since 1990). The target participants included students from 6th-grade to 1st-year high school, displaying an interest in mathematics-related fields. The festival comprised Olympiad activities, lectures for students and parents, mathematical games, mathematical cartoons, and various other activities as per the schedule.

Figure 1: Mathematical Festival Schedule (December 19, 2020)

Mathematical Olympiad Activities

This comprehensive methodology ensured the quality and appropriateness of the Mathematical Festival instrument for assessing mathematical competency among Thai high school students, as shown in Figure 1.


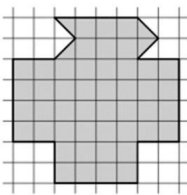


Figure 2: The Development Process of Mathematical Olympiad Problems.

1) Problem Set Development: A team of experts from Moscow Center for Continuous Mathematical Education (MCCME) selected 40 original problems used in Moscow Mathematical Olympiads.

2) Translation Process: Thai and Russian language experts translated the problem sets back and forth to ensure linguistic accuracy.

3) Thai Language Review: Experts in Thai language and mathematics from Thailand reviewed and selected 7 problems suitable for 1st-year high school students.

4) English Translation: The selected problems were translated into English by language and mathematics experts.

5) Trialing and Evaluation: The problem sets were tested by undergraduate and graduate students majoring in mathematics education, considering difficulty levels and appropriateness.

6) Collaborative Review: Faculty members and graduate students collectively reviewed the problems, focusing on language accuracy and alignment with educational objectives.

7) Final Language Check: A final check for language accuracy was performed according to the specified criteria.

8) Answer Sheet Design and Printing: The answer sheets were designed and printed for the 7 selected problems.

	Problem	Mathematical Olympiad Framework
1.	We can easily cut a 3x3x3 cube into 27 smaller cubes by making 6 cuts. Is it possible to reduce the number of cuts by dividing the cube to get multiple smaller cubes at once in a single cut, and rearrange the cut cubes?	Use of geometric facts
2.	There are a weighing scale and three weights. If we want to use the weighing scale and weights to measure anything with a weight ranging from 1 to 10 kilograms, what should be the weight of each of the three weights? Please provide an example of the weights of the three weights.	Divisibility or properties of decimal notation
3.	Please demonstrate how to cut the following picture into 12 equal parts (the conditions for equality are that they should be identical in both shape and size).	Constructive
4.	Nuit, the mystic writer, wants to pack 9 special animals with weights of 2, 3, 4, 5, 6, 7, 8, 9, and 10 kilograms into 3 travel bags. Each bag can only accommodate 3 animals, and the total weight must be less than 20 kilograms. If the weight of one animal is a multiple of the weight of another animal in the same bag, those two animals will fight each other. The question is, how will Nuit organize the special animals in the travel bags to prevent them from fighting?	Naive Combinatorics
5.	There are three triangular pieces of paper, placed on the table. Triangles 1 and 2 are smaller than Triangle 3. Is it possible to arrange Triangle 1 and Triangle 2 on top of Triangle 3 in a way that they completely fit, with Triangle 3 serving as the base for the other two triangles?	Use of geometric facts

Problem		Mathematical Olympiad Framework
6.	5 elephants and 7 hippos ate 11 round watermelons and 20 square watermelons for breakfast. In another group, 8 elephants and 4 hippos ate 20 round watermelons and 8 square watermelons. Each elephant ate the same number of round watermelons, and each hippo ate the same number of round watermelons. Likewise, each elephant ate the same number of square watermelons, and each hippo ate the same number of square watermelons. However, there is a type of animal that eats both round and square watermelons, while another type chooses to eat only watermelons of one shape. Which type of animal (elephant or hippo) eats only watermelons of one shape, and what is the shape of the watermelon they prefer?	Textual Problem
7.	In the magical land, there are a total of 15 cities. Each city is connected by paths to at least 7 other cities. Determine whether it is possible to drive from any one city to any other city using those paths.	Logical Tasks

Data Collection

The data for this research were collected from the Mathematical Festival, Thailand's 2nd edition, held for first-year high school students on Saturday, December 19, 2020. The assessment aimed to capture students' mathematical competencies in the form of expressing their thoughts and problem-solving methods during the festival. These data were instrumental for researchers to analyze and showcase students' mathematical competencies using the mathematical thinking framework of Isoda & Katagiri (2012), aligned with the content defined by the Moscow Center for Continuous Mathematical Education (MCCME, 2021).

4.1 Development of Data Collection Tools

A tool was created based on the structure of the Mathematical Festival's activities, modified from the original Moscow Mathematical Festival held at Moscow State University, Russia, for over 30 years. This tool facilitated the scheduling of activities for Thailand's 2nd Mathematical Festival on December 19, 2020.

4.2 Creation of Problem Sets for the Mathematical Olympiads

Problem sets for the Mathematical Olympiads were designed by translating and adapting original problem sets from the Moscow Mathematical Olympiads. These were developed by experts from the Moscow Center for Continuous Mathematical Education (MCCME) in collaboration with Thai experts. The problem sets covered six content areas to comprehensively assess students' mathematical competencies:
   1) Use of geometric facts
   2) Divisibility or properties of decimal notation
   3) Constructive
   4) Naive Combinatorics
   5) Textual Problem
   6) Logical Tasks

4.3 Development of Mathematical Games:

Mathematical games were created based on the original games used by MCCME in the Moscow Mathematical Festival. Trial plays were conducted to ensure a mutual understanding among the Thai organizing team. The games aimed to engage each student in various perspectives, emphasizing active participation to maximize learning outcomes.

4.4 Data Collection Process:

Data collection involved implementing the problem sets and mathematical games developed during the research tool creation process at the Mathematical Festival in Thailand, held on December 19, 2020. The participants were first-year high school students, totaling 124 individuals, as per the predetermined schedule.

Data Analysis

Qualitative data analysis was employed, utilizing information in the form of concepts, processes, or demonstrated methods for finding students' answers, as manifested on answer sheets. This analysis focused on students' explanations of concepts or methods used to arrive at solutions, aligning with mathematical thinking related to mathematical content. The content, as defined by experts from the Moscow Center for Continuous Mathematical Education (MCCME, 2021), covered six dimensions: 1) use of geometric facts, 2) division or properties of decimals, 3) constructive problem-solving, 4) combinatorics, 5) textual problems, and 6) logical problems. These dimensions were designed to assess students' mathematical competencies.

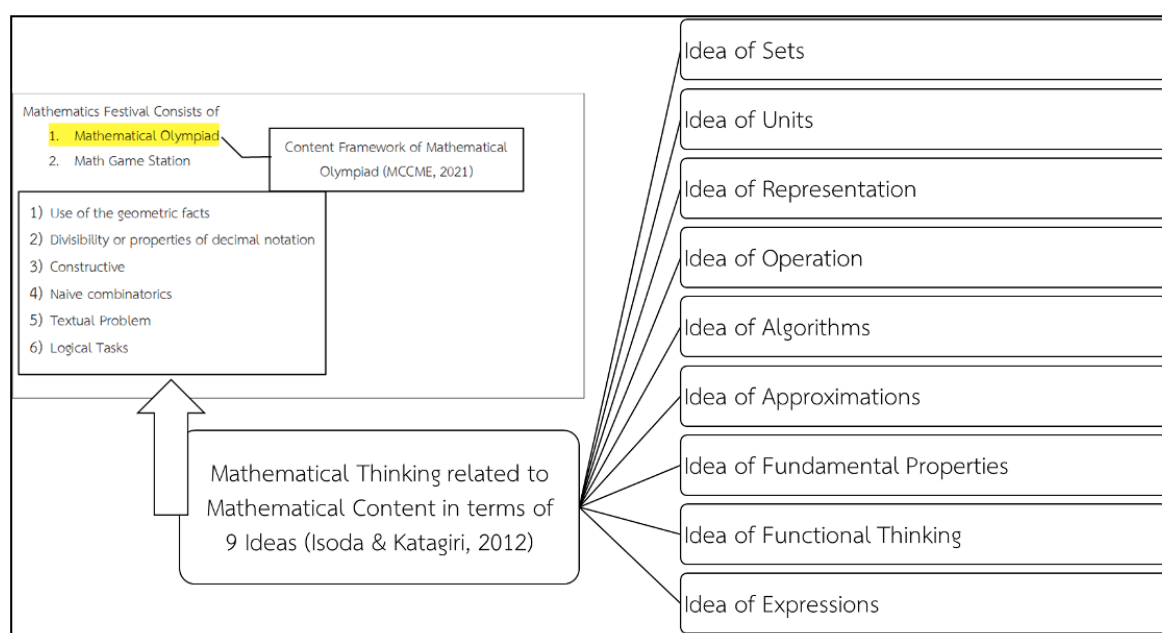
The study focused on nine mathematical ideas that represent various facets of students' mathematical competencies. These ideas are 1) Idea of Sets, 2) Units, 3) Representation, 4) Operation, 5) Algorithms, 6) Approximations, 7) Fundamental Properties, 8) Functional Thinking, and 9) Idea of Expressions. The analysis aimed to decipher students' mathematical competencies by exploring their mathematical thinking aligned with these nine concepts.


Figure 4: Data collection and analysis research framework.

In conclusion, the data analysis involved a comprehensive examination of students' responses using a qualitative approach. This approach, guided by the framework of Isoda & Katagiri (2012) and informed by the Moscow Center for Continuous Mathematical Education's content dimensions, aimed to unravel the depth of students' mathematical competencies across the identified mathematical ideas.

Results

From the analysis of mathematical competency assessments among first-year secondary school students, the conceptualization and problem-solving approaches adopted by students in tackling mathematical problems are presented. The analysis is based on the evaluation of students' mathematical competencies through the demonstration of mathematical reasoning related to the Mathematical Olympiad framework (MCCME, 2021). The framework encompasses content for each problem and is designed to cover various mathematical aspects. The analytical approach is aligned with the mathematical thinking framework proposed by Isoda & Katagiri (2012), as detailed in the following table.

Mathematical Thinking related to Mathematical Content in terms of 9 Ideas (Isoda & Katagiri, 2012)	Content Framework of Mathematical Olympiad by MCCME (2021)						
	Problem 1: Use of the geometric facts	Problem 2: Divisibility or properties of decimal notation	Problem 3: Constructive	Problem 4: Naive Combinatorics	Problem 5: Use of the geometric facts	Problem 6: Textual Problem	Problem 7: Logical Tasks
(a) Idea of Sets	✓	✓	✓	✓	✓	✓	✓
(b) Idea of Units	✓		✓			✓	
(c) Idea of Representation	✓	✓	✓	✓	✓	✓	✓
(d) Idea of Operation	✓	✓	✓	✓	✓	✓	✓
(e) Idea of Algorithms	✓	✓	✓	✓	✓	✓	✓
(f) Idea of Approximations	✓	✓				✓	
(g) Idea of Fundamental Properties	✓	✓	✓	✓	✓		✓
(h) Idea of Functional Thinking	✓			✓	✓	✓	
(i) Idea of Expressions	✓			✓	✓	✓	✓

Figure 5: Summary of mathematical ideas of students evident in the Mathematical Olympiad

Conclusion

In conclusion, this research indicated that the Mathematics Olympiad functions as a tool for assessing the mathematical competencies of seventh-grade students. The findings imply that students have the ability to exhibit their mathematical competencies through their mathematical thinking in terms of Isoda and Katagiri's (2012) conceptual framework: Idea of

Sets; Units; Representation; Operation; Algorithms; Approximations; Fundamental Properties; Functional Thinking, and Idea of Expressions.

Establishing Norm Reference for SLI Children in Mainland China

Cheng Hsu, Jiangsu Normal University, China
Li Jing, Jiangsu Normal University, China

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This study aims to establish a norm reference of children's language development level. As many psychological-medical assessing tools are available for testing children's language development or impairment, treatments from medical institutions and professions are often involved. However, a testing instrument designed for early detection of SLI children for in-service teachers is needed. The Assessment of Language Impairments in School-age Children Scale developed by the National Taiwan Normal University was used in this study to establish a norm reference for children of school age in northern Jiangsu Province in Mainland China. Modification and justifications of items were made for better cultural-historical adaption of being used. All 102 participants were from an elementary school in Xuzhou City of Jiangsu Province. The results of each school age were calculated and compared with a norm reference established in Taiwan. The results showed that although the means don't have much difference, the cut-off scores of M-1.5 SD showed significant differences. The results also showed 6 out of 102 were diagnosed against the new norm reference, while five were diagnosed against NTNU's norm reference in Taiwan. However, the one who wasn't diagnosed against NTNU's norm reference in Taiwan scored 60, which was very close to the cut-off of 59.77. Thus, the diagnostic odds ratio in our study was between 4.42%-5.30%, which falls into the generally understood range of 5%-7%. Further study is needed for more participants from different regions for all school ages.

Keywords: Specific Language Impairment (SLI), Reference Norm, Diagnostic

iafor

The International Academic Forum
www.iafor.org

Introduction

Specific Language Impairment (SLI) is a developmental disorder that affects language acquisition in children, leading to difficulties in linguistic skills without concurrent cognitive, sensory, or neurological impairments. While SLI has been extensively studied in Western countries, its recognition and understanding in China present a unique set of challenges and opportunities. This comprehensive exploration delves into the historical context, cultural influences, current state of recognition, diagnosis, and intervention strategies related to Specific Language Impairment in China.

According to statistics, the prevalence rate of language barriers among school-age children in Taiwan was 3.3% in the 2008 school year (Lin, B., 2016, p.2). According to The University of Kansas, the prevalence of children with specific language impairment is 7-10% (Rice, n/d, p.2). The prediction of the prevalence rate (morbidity rate) of SLI in the current academic circle is generally based on the Tomblin et al. (1997) study of 7.4%, 8% for males, and 6% for females. The prevalence rate of a class in the third grade of participating children in this study is 7.5-12.5%, which is higher than Taiwan and international references. However, it may also be due to the small number of test samples.

Specific Language Impairment (SLI) is a developmental disorder, also called the Developmental Language Disorder (DLD), in children with lower language capacity than average children in the same age group without vivid physical or mental illness. Characteristics of children with SLI are generally described by Dorothy V.M. Bishop (2006) and Leonard (2014) in terms of the criteria of SLI:
1. The children's language expression and compression on standardized tests are considerably less effective
2. Nonverbal IQ and nonlinguistic traits are within the normal range
3. Hearing loss, physical abnormalities of the speech apparatus or environmental deprivation cannot be accounted for as causes of language difficulties
4. Brain damage is not the cause of language difficulties

Children with SLI may experience the following, as depicted by Rice (2020) and Dorothy V.M. Bishop (2006) suggested that:
1. Have no hearing loss or other developmental delays
2. Affecting 7-10% of children
3. Usually persistent into adulthood
4. Not likely to be identified (clinically) for services to help with their language impairment, so:
5. A high risk for reading impairments
6. Lower-than-expected academic achievement
7. Difficulties in establishing peer relationships
8. A heightened risk for peer victimization as a student (bully, marginalized)
9. Increased risk of being identified as having an Attention Deficit Disorder (ADHD), Auditory Processing Disorder (APD), and Autism.

In addition, language disorders or impairments in children are under-recognized compared to other neurodevelopmental conditions such as attention deficit hyperactivity disorder (ADHD), autism spectrum disorder, and developmental dyslexia. (D. V. Bishop & Leonard, 2014, p. 2) In other words, SLI is more exclusive compared with Developmental Language Disorder, or DLD. DLD diagnoses include children with lower IQs and co-occurring conditions (e.g.,

ADHD, DCD, dyslexia), whereas DLD diagnoses include children with lower IQs and co-occurring conditions (Dorothy V. M. Bishop, 2017).

Understanding the historical context of language development and disorders in China is crucial to comprehend the trajectory of SLI recognition. Historically, Chinese culture has held a distinctive approach to education, emphasizing rote memorization and academic achievement. The focus on linguistic precision, as seen in the Chinese writing system, has shaped societal expectations regarding language skills.

In the past, developmental disorders, including language impairments, were often stigmatized or overlooked due to cultural norms and limited awareness. However, as China undergoes rapid societal changes and embraces a more inclusive approach to education, there is a growing acknowledgment of the importance of recognizing and addressing developmental challenges in children.

Chinese culture places a significant emphasis on collectivism, where conformity and harmony are highly valued. This cultural context may influence how language difficulties are perceived within the family, school, and community. The desire to maintain social harmony might contribute to underreporting or masking of language impairments, as families may be hesitant to acknowledge and seek help for issues that could be perceived as deviating from societal norms.

In recent years, there has been a noticeable shift in the recognition of developmental disorders, including SLI, in China. The government and educational institutions have made efforts to raise awareness and provide resources for identifying and supporting children with special needs. However, the understanding of SLI specifically may still be in the early stages.

Challenges in recognition include the lack of standardized screening tools in Mandarin Chinese and dialects, making it challenging to identify language impairments accurately. Additionally, the variability in language development across regions and diverse linguistic backgrounds within China adds complexity to the recognition process.

Research studies exploring the prevalence of SLI in Chinese-speaking populations are emerging, contributing to a better understanding of the scope of the issue. Collaborations between researchers, educators, and healthcare professionals are essential to develop culturally sensitive assessment methods and diagnostic criteria for SLI in the Chinese context.

Diagnosing SLI involves a comprehensive assessment of a child's language skills, considering both expressive and receptive language abilities. In China, the lack of standardized assessment tools tailored to the linguistic and cultural nuances poses a challenge. Adapting existing tools or developing new assessments that align with the linguistic characteristics of Mandarin Chinese and regional dialects is imperative for accurate diagnosis.

Moreover, the assessment process needs to consider cultural factors that may impact language use and comprehension. For instance, communication styles within Chinese families, hierarchical dynamics, and expectations regarding language proficiency may influence a child's performance during assessments.

Collaboration between speech-language pathologists, psychologists, educators, and parents is essential for a holistic evaluation. Integrating input from multiple sources can provide a more comprehensive understanding of the child's linguistic abilities and potential areas of difficulty.

In order to identify children with possible SLI, we need a norm reference to address the developmental level of children in different school ages of children. As the norm reference established in one cultural-historical area, it's more meaningful to evaluate those children and design appropriate help accordingly.

Method

The Specific Language Impairment Checklist evaluates certain aspects of language impairment that standardized language tests adequately assess. A preliminary regional norm was established based on a study of 102 school-aged children. Based on the Development of the Specific Language Impairment Checklist, the scale developed by Qi (2008) and published by the Center of Special Education, National Taiwan Normal University in Taiwan, we have preliminarily evaluated 42 school-aged children, consulted linguistic scholars and primary school Chinese language teachers to modify questions and pictures of this scale to adapt to the linguistical cultural-historical context of the Xuzhou region of Jiangsu Province in Mainland China. These check list items were then divided into eight scales, which include language-related learning difficulties, semantic difficulties, syntactic difficulties, narrative difficulties, word-finding problems, auditory perception/memory, auditory comprehension, and language-related communication problems. The scores obtained from the checklist were also able to distinguish between children who may have language learning problems and those who do not.

Results

First, the overall Mean and M-1.5 SD are reported against original data from Qi (2008) and published by NTNU. As shown in Table 1.

Table 1: *Overall comparison between Mean to NTNU/Qi (2008)*

	age	NTNU Mean	M-1.5SD	XuZhou Mean	M-1.5SD
Llanguage Comprehension	6	27.90	20.21	27.20	20.13
	7	30.69	23.84	31.53	28.09
	8	32.97	27.30	32.14	27.94
	9	33.54	27.39	35.05	29.67
	10	35.11	30.46	35.67	31.87
	11	36.09	31.77	35.45	33.01
	12	36.64	32.73	39.00	39.00
Oral Expression	6	35.20	23.30	34.60	27.76
	7	38.13	26.97	35.76	24.14
	8	40.38	30.61	39.64	33.37
	9	42.93	32.22	40.19	30.02
	10	45.21	34.73	44.14	38.29
	11	46.50	37.52	43.09	37.24
	12	47.50	37.83	46.50	41.20
Language Development	6	63.11	45.62	61.80	48.75
	7	68.82	52.76	67.29	53.63
	8	73.35	59.77	71.79	62.69
	9	76.47	61.65	74.05	55.00
	10	80.33	67.11	79.81	71.48
	11	82.59	71.14	78.55	71.59
	12	84.15	71.74	85.50	80.20

The Mean and M-1.5 SD Xuzhou data values aligned with NTNU's norm reference except for the 12-year-old age group due to sufficient samples participating.

Conclusion

A regional, localized norm reference is needed in the Xuzhou area as we are trying to help school-aged children in their early stages of SLI as soon as possible. Therefore, from an educator's perspective, we can distinguish between children with possible language learning difficulties in resource classrooms and children in regular classrooms. This study established a preliminary norm reference using data from 102 local children. Finally, the scores obtained from the checklist were compared against the original data from NTNU/Qi in Taiwan. The results are close, and further data collection is needed for a broader base of children in the Xuzhou area.

Confluence of Virtual Learning Environments and Virtual Reality Integration: An In-Depth Study in Digital Animation Education for Acceptance Among Learners

Ng Perng Jeu, University Tunku Abdul Rahman, Malaysia

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

As innovation continues to reshape educational landscapes, this study delves into the intricate intersection of virtual learning environments and the integration of virtual reality (VR) within the realm of advanced animation education. Drawing from the latest advancements and methodologies, this research examines the convergence of learner perceptions and acceptance within this dynamic context. Through a comprehensive case-study approach, encompassing learner engagement and adoption patterns, this investigation sheds light on the intricate interplay between virtual learning environments and the incorporation of VR technology. The findings provide valuable insights into the multifaceted factors influencing learner acceptance, anticipation of learner experiences, educational effectiveness, and technological affordances. A total of 86 digital animation learners who completed questionnaires based on the Technology Acceptance Model (TAM) and the quality of the learning activity were included in this study. The students perceived the value of the training activity as significant, with substantial correlations observed among various dimensions. This research illustrates the potential of VR as an educational technology and offers fresh perspectives for future research. By synthesizing these technologies with real-world applications, this study contributes significantly to the scholarly discourse surrounding innovative pedagogical frameworks and optimal models, thereby promoting a deeper understanding of how learners embrace and engage with virtual reality in advanced digital animation education.

Keywords: Virtual Learning, Virtual Reality, Technology Acceptance Model, University Education, Digital Animation

Introduction

The integration of digital animation and VR in higher education also revolutionizes skills development. Through the use of these technologies, students can practice and refine technical skills in a simulated environment, allowing for repetitive practice without the need for expensive equipment or physical resources (Pringle et al., 2022). For example, aspiring surgeons can perform virtual surgeries, engineering students can design and test prototypes, and art students can experiment with different artistic techniques, all within a virtual space. This not only enhances their proficiency in their respective fields but also fosters a sense of confidence and competence. Furthermore, the merging of digital animation and VR opens up new avenues for educational innovation. Traditional teaching methods often rely on lectures and textbooks, which can be passive and detached from real-world applications. However, with the immersive and interactive nature of these technologies, educators can create dynamic and engaging learning experiences that cater to different learning styles (Wang et al., 2020). Students can actively participate in their own education, exploring concepts and theories in a hands-on manner (Chuang, 2021). This promotes critical thinking, problem-solving, and creativity, skills that are highly valued in today's rapidly evolving job market.

Additionally, the connecting of digital animation and VR in higher education has the potential to democratize access to education. With the increasing availability and affordability of VR headsets and animation software, students from all backgrounds can have equal opportunities to engage in immersive learning experiences (Bodzin et al., 2020). This can bridge the gap between traditional classroom settings and remote or online learning, providing a more inclusive and accessible education for all. The merging of digital animation and VR in higher education has the power to redefine the way we learn and teach. By harnessing the unique capabilities of each technology, students can unleash their creativity, develop practical skills, and engage in immersive and interactive learning experiences (Sukirman et al., 2021). This transformative convergence holds immense potential for the future of higher education, paving the way for innovative approaches to creative expression, skills development, and educational exploration.

The merging of digital animation and VR will also revolutionize skill development, providing students with a comprehensive toolkit of industry-relevant expertise. While digital animation hone artistic expression, storytelling skills, and proficiency in animation software, VR expands technical capabilities to include 3D modeling, spatial design, and user experience (UX) principles. These skills are in high demand across a wide range of industries, including film, gaming, healthcare, education, and architecture, and open the door to a variety of career paths. Additionally, this fusion of technologies fosters interdisciplinary collaboration that leverages expertise in computer science, art, design, storytelling, and psychology. Students engage in interdisciplinary teamwork to navigate diverse perspectives and integrate knowledge to create innovative and impactful digital experiences. Such collaborations reflect the realities of professional creative industries and prepare graduates for the dynamic and collaborative nature of the modern workplace. Despite the transformative potential of these technologies, integrating these technologies into higher education is hampered by hardware and software costs, accessibility issues, and the need for specialized training for both faculty and students. Issues such as this arise. Overcoming these hurdles requires strategic investments, innovative educational approaches, and continued research to ensure equitable access and effective implementation. In summary, the convergence of digital animation and VR technology heralds a paradigm shift in higher education that redefines the boundaries of creative expression, skill development, and immersive learning experiences. Although

challenges remain, the potential to develop a generation of graduates with the artistic vision, technical skills, and collaborative mindset needed to succeed in a digitalized world is undeniable. By leveraging this convergence, institutions can help students shape a future where imagination and technology intertwine, creating endless possibilities for storytelling, innovation, and meaningful impact across diverse disciplines.

Methodology

The purpose of this study was to explore the willingness of students from university in Malaysia to use web-based virtual reality systems-based learning. To achieve this, the researchers adopted purposive sampling methods to select students who were taking or had taken courses related to digital animation production. Out of the 110 questionnaires distributed, 24 were found to be invalid, while 86 were valid. The questionnaires were completed online for convenience. The questionnaire consists of a 5-point Likert scale ranging from "strongly disagree" (1) to "strongly agree" (5), and 20 questions to measure variables that may affect the use of VR technology. We got 110 responses; 24 responses were excluded due to incompletion. After cleaning and preparing the data set, data were analyzed using SPSS version 26 and Excel.

This study specifically focused on full digital animation learning; However, the study specifically emphasized the importance of vr as the foundation of digital animation learning and development. By conducting the research, the aim was to contribute to the understanding and advancement of knowledge in the field of vr learning platform.

Semi-immersive virtual experiences offer participants a unique blend of virtual and physical reality, allowing them to feel as though they are in an alternate world while still maintaining a connection to their surroundings (Dincelli & Yayla, 2022). This type of technology utilizes 3D graphics to create a sense of depth and realism, known as vertical reality depth, which enhances the level of immersion. By incorporating more intricate graphics, the experience becomes even more lifelike.

One of the main advantages of semi-immersive virtual experiences is their applicability in educational and training contexts. These experiences can be used to simulate real-world scenarios and provide learners with a safe and controlled environment to practice and develop their skills (Bryant et al, 2019). For example, medical students can use semi-immersive virtual experiences to perform virtual surgeries, allowing them to gain valuable hands-on experience before working with real patients. To create these semi-immersive experiences, high-resolution displays, powerful computers, projectors, or sophisticated simulators are often used. These technologies replicate certain aspects of real-world mechanisms in a partial manner, allowing participants to interact with virtual objects and environments in a realistic way. This level of realism helps to enhance the learning experience and make it more engaging and memorable.

In addition to educational and training applications, semi-immersive virtual experiences can also be used for entertainment purposes. Virtual reality gaming, for example, often falls into this category. Players can immerse themselves in virtual worlds and interact with characters and objects in a way that feels incredibly real. This type of entertainment experience can be highly engaging and provide a unique form of escapism. This technology has found frequent application in educational and training contexts, as well as in entertainment. With the

continued advancement of graphics and technology, the possibilities for semi-immersive virtual experiences are only expected to grow.

Figure 1: The screenshot of learning materials on different animation techniques.

Data Collection and Analysis

The technology acceptance model can provide empirical explanation regarding users' acceptance of a new information technology. The concept of computer self-efficacy can enhance the explanatory potential of the model (Wang et al., 2023). Built on the theoretical foundation of the technology acceptance model and computer self-efficacy, this research produced a questionnaire to explore user's willingness to adopt a virtual reality assessment system.

This study used Cronbach α as a measure of internal consistency among technical areas included in the item bank. The Cronbach α value of the item bank as a whole was 0.85, proving that the reliability of the item bank was good. To establish expert validity, questions in the item bank were revised according to opinions from post-review discussions with experts and scholars. After the revision, professionals with more than five years of experiences in virtual reality production spent twenty-minutes each trying out the assessment system. Based on their feedback, those questions unclearly expressed were further revised to ensure good content validity. Hence, the item bank used in this study had excellent validity. Lists reliability and validity values of each dimension in the questionnaire and the questionnaire as a whole. internal consistency of each dimension in the questionnaire was evaluated. Cronbach alpha coefficients of dimensions of perceived usefulness, perceived ease of use, users' willingness, and computer self-efficacy are respectively 0.933, 0.851, 0.919and 0.963, respectively. All Cronbach α coefficients were between 0.85 and 0.96, indicating good reliability and good internal consistency of the questionnaire. Good convergent validity means factor loadings of all questions need to reach significant level. In other words, all values need to be above 0.5. In this research, all average variances extracted (AVE) were above 0.8, indicating good validity as shown at Table 1.

Reliability and validity of the questionnaire		
	Cronbach's α	AVE values
Perceived usefulness	0.933	0.90
Perceived ease of use	0.851	0.82
Users' willingness	0.919	0.92
Computer self-efficacy	0.963	0.89
Overall reliability	0.956	

Table 1: Reliability and validity of the questionnaire

Hypothesis	Relationship between Variables	Path Coefficient
H1	Self-efficacy positively correlates with perceived usefulness	0.812 **
H2	Self-efficacy positively correlates with perceived ease of use	0.793 **
H3	Perceived usefulness has a positive effect on users' willingness	0.681 **
H4	Perceived ease of use has a positive effect on users' willingness	0.292**

Table 2: The relationship between variables and the value of path coefficient

This study utilizes the technology acceptance model (TAM) as a foundational framework to investigate the connections between perceived usefulness, perceived ease of use, self-efficacy, and users' willingness in relation to a virtual reality platform's performance assessment system. A model of relationships was established based on the aforementioned findings. The findings revealed that users' perceived usefulness and perceived ease of use directly impact their willingness to adopt an e-book production assessment system.

Specifically, the influence of perceived usefulness (0.68) was found to be more significant than that of perceived ease of use (0.30). The study also found that subjects' computer self-efficacy had a significant and positive influence on their perceived usefulness and perceived ease of use as stated in Table 2. Furthermore, subjects' perceived usefulness and perceived ease of use had a significant and positive influence on their willingness to use the system. Therefore, individuals with higher computer self-efficacy and a greater perception of the usefulness and ease of use of the web-based assessment system are more inclined to use the system. Path analysis results from the study indicate that perceived usefulness and perceived ease of use act as mediators in the relationship between self-efficacy and users' willingness. Additionally, a high level of self-efficacy may contribute to improved learning performance among students. This finding aligns with previous studies that have explored the connection between computer self-efficacy and learning outcomes.

Conclusion

In conclusion, within the Malaysian context, the continuous collaboration between Virtual Learning Environments (VLEs) and Virtual Reality Integration (VRI) presents a groundbreaking and transformative approach to digital animation education. The integration of VLEs and VRI has garnered resoundingly positive engagement and feedback from students, reinforcing its efficacy in fostering a positive and immersive learning experience (Makransky & Petersen, 2021). In future work, the research would undertake as following: (1) increasing the sample size as this will give us a better indication of the acceptance of vr technology; (2) measuring other factors such as immersion, scalability, and diversity; (3) involve a diverse segment of educated and uneducated volunteers to fill out the questionnaire.

By measuring the previous factors in point 2 and examining the influence relationship between the factors with a large sample of diverse segment of educated and uneducated volunteers, research will bring a more detailed view of the Metaverse technology. By harnessing the power of VLEs and VRI, students are provided with a dynamic and interactive educational environment that transcends traditional teaching methods. This cutting-edge integration not only enhances student engagement but also nurtures their creativity and critical thinking skills.

The immersive nature of VRI allows students to experience real-world scenarios and challenges within the digital animation field, providing them with practical skills and preparing them for the demands of the industry. This experiential learning approach has been met with interest and appreciation from students, who report a heightened sense of motivation and excitement in their educational journey. Furthermore, the collaborative nature of VLEs and VRI encourages peer interaction and collaboration, fostering a sense of community among students. This collaborative learning environment not only enhances student learning outcomes but also cultivates teamwork and communication skills that are essential in today's interconnected world (Wu et al., 2021).

The overwhelmingly positive engagement and feedback from students serve as a testament to the immense potential of integrating VLEs and VRI in the Malaysian education system. This integration represents a significant step forward in shaping the future of immersive and engaging learning experiences, empowering students to become adaptable and well-prepared for the evolving digital animation landscape.

Integration's Learning Outcome Through Game-Based Learning and Cultural Practices Among Learners: Edutainment Platform

Pua Shiau Chen, New Era University College, Malaysia

Abstract

The integration of Game-based learning (GBL) with cultural learning is feasible and advantageous. GBL facilitates the comprehension of cultural education embedded within the gaming context. Numerous contemporary pedagogical and instructional approaches have transcended the conventional confines of classroom-based learning, extending their purview to encompass the integration of technology-enhanced educational paradigms. Among these approaches, GBL stands out as an unequivocal exemplar, seamlessly amalgamating technological tools into its framework. This pedagogical modality possesses the inherent capacity to invigorate learners' motivation to acquire knowledge while concurrently fostering moments of intellectual revelation. The edutainment platform offers opportunities for GBL and cultural practice. "The Confucius Roll Call" game is an exemplar of the games found within such edutainment platforms. A narrative dataset obtained through the observational method and open ended interview questions will be analyzed, focusing on the participation of 8 learners engaged in the study of Confucius' culture using the "Confucius Roll Call" game. The 8 learners were aged between 20 and 23. They were participants in cultural leisure class. This analysis aims to uncover insights into the positive and negative learning outcomes achieved through the integration of GBL and cultural practices within the context of Confucius' culture education. This research has the potential to offer educators and learners valuable insights into enhancing the effectiveness of learning and education through the integration of Game-Based Learning and cultural practices.

Keywords: Game-Based Learning (GBL), Learning Outcome; Cultural Leisure Class, Cultural Practices, Edutainment Platform

iafor

The International Academic Forum
www.iafor.org

Introduction

Definitions of game-based learning predominantly emphasize that it constitutes a form of gameplay designed to achieve specific learning outcomes (Shaffer, Halverson, Squire, & Gee, 2005). Game-based learning (GBL) broadly refers to the utilization of video games to facilitate and enhance teaching and learning. Various studies articulate and interpret this comprehensive definition in diverse ways. (Perrotta, 2013). GBL is the game itself serves as the primary instructional tool, in contrast to gamification, which entails the integration of game elements into conventional learning activities. (Buckley & Doyle, 2014). At the same time, the design process for educational games entails a delicate balance between covering the subject matter and prioritizing gameplay (Plass et al., 2015).

In the context of cultural learning, utilizing GBL can yield substantial educational benefits. In the realm of cultural learning, GBL can yield both positive and negative educational outcomes. So, GBL serves as an effective method for cultural education. Cultural knowledge is integrated into the content of GBL game design, facilitating a mutual enhancement between culture and GBL design. Through GBL, learners not only gain access to often mundane cultural information but also derive enjoyment from the learning process (Jossan et al., 2021).

At present, the edutainment platform hosts a myriad of games, some of which encompass cultural content. Hence, acquiring cultural knowledge via cultural games on the edutainment platform constitutes a method of learning within the framework of GBL. In contemporary times, numerous educational and entertainment platforms feature cultural games centred around Chinese culture or Confucian culture. These games serve as a conduit for acquiring knowledge about both Chinese culture and Confucian values. "The Confucius Roll Call" is a cultural game embedded with Confucian values and knowledge, available on an edutainment platform. This research will employ the aforementioned game as a means to investigate the learning outcomes resulting from the integration of GBL and cultural education.

Literature Review

Game-based learning can be applied to the acquisition of knowledge in various subjects and fields. Whether it is science, literature, language, or any other subject, all can be learned through the GBL approach. Consequently, numerous scholars have analyzed the learning scenarios associated with the implementation of game-based learning. G,S. (2008) study elucidates the effectiveness of Video Game-Based Learning in English Grammar at the sixth-grade level Noroozi et al. (2020) explore a systematic review provides an overview of the current state of the art concerning the utilization of Game-Based Learning (GBL) for enhancing argumentation skills in digital learning. Hsin-Yi Liang & Tien-Yu Hsu (2020) explore a game-based learning service for science museums that can offer a lifelong edutainment environment with flexible options for the public and serve as a valuable interdisciplinary learning resource to support competency-based education.

The design models for game-based learning are also a subject of considerable scholarly interest, as an effective game design model is known to yield positive learning outcomes. Shi & Shih (2015) presents macro design concepts that elucidates 11 crucial game-design factors to construct a game-based learning design model. Besides that, the study proposed the GBL design model to assist in designing educational games. Zuiker et al. (2012) develops a cultural analysis of learning to comprehend the intersections between conceptual change and

game-based learning in Singapore. Additionally, they illustrate how the technologies and methodologies of video games inform the design of learning environments, analysing these designs within the framework of a sociocultural theory of conceptual change. Abdul Jabbar & Felicia (2015) investigated game design features that enhance engagement and learning in game-based learning (GBL) settings. Furthermore, the study illustrates the impact of key gaming features in GBL at both cognitive and emotional levels. Plass et al. (2015) asserted that in game-based learning, a synthesis of cognitive, motivational, affective, and sociocultural perspectives is essential for both game design and game research to comprehensively grasp the educational potential that games offer. The findings of Liu et al. (2014) demonstrate that the design of an engaging, interactive environment through a game-based approach can assist students in enjoying the learning process.

Methodology and Findings

A. Participant

The study focuses on eight participants (5 males, 3 females) between the ages of 20 and 23. (Refer to Table 1). This eight participants (named as learner) actively participated in cultural learning during leisure classes employing the GBL method. This research will employ observations and interviews to analyse the learning outcome of learners in cultural practice through GBL.

Learner's Profile	Age	Gender
Learner A	20	Male
Learner B	20	Male
Learner C	21	Male
Learner D	23	Female
Learner E	22	Male
Learner F	21	Female
Learner G	23	Male
Learner H	21	Female

Table 1: Learner's Profile

B. Results and Discussion

Through interviews with some questions, this research can gain insights into learners' acquisition of cultural knowledge through GBL. Learners typically opt for GBL as a means of cultural practice, primarily for several reasons: (1) Enjoyable & Fun, (2) Current trend (3) Acquire cultural content quickly, (4) Curious, (5) Stimulate interest of learner, (6) refreshing, (7) Impressive graphics, (8) Dynamic learning (Refer to table 2).

Learner's Profile	Reasons
Learner A	*I believe it can be enjoyable; after all, a significant portion of the learning content related to Confucian culture or Chinese culture is often conveyed through words. Games make it easier for me to engage with the material.*
Learner B	*I'm just interested in knowing about the latest games, what cultural content they include, and staying with the current trends.*

Learner C	It's fun. I can learn and practice cultural knowledge while playing games at the same time.
Learner D	I aim to learn through games to acquire cultural knowledge more rapidly.
Learner E	I opted to engage with Confucian culture through GBL because it doesn't feel as dull, but I acknowledge the need for patience due to the inherent challenges in the game.
Learner F	I'm just curious, and the game can stimulate my interest in learning about this culture.
Learner G	It feels very refreshing, so I want to give it a try. At the same time, I like learning in a dynamic way.
Learner H	The game has impressive graphics. I appreciate the learning method involving sound and graphics, as it makes the process less tedious.

Table 2: Reason for Choosing the GBL for Cultural Practice

In this study, by acquiring insights into learners' experiences, we can discern the positive and negative learning outcomes of cultural exercises through GBL methods (Refer to table 3).

Learner's Profile	Answers
Learner A	Because games are engaging, it help me absorb cultural knowledge and practice cultural activities more easily compared to traditional textbook learning. It's a positive learning effect. However, the challenge lies in getting distracted by the goal of advancing to the next level. I find myself sometimes neglecting the learning of pertinent cultural knowledge in pursuit of scores or progressing in the game. Often, my primary focus is just on obtaining the correct answers to pass a level.
Learner B	Sometimes, I find myself forgetting the content after playing a game. It takes repeated plays of related games before I can recall the relevant cultural knowledge. Usually, I don't go through the game repeatedly, but in leisure classes where everyone is playing together, it's okay to repeat it a few times.
Learner C	I tend to focus on learning relevant knowledge to score or pass a level. After a few attempts, I eventually memorize the pertinent cultural information. For instance, in "Confucius Roll Call" game, I learned the names of Confucius' students and their preferences.
Learner D	I believe games can immerse me in the cultural world more quickly, and I become more engaged in the learning process. Dynamic and visually appealing elements make the learning experience more energetic for me.
Learner E	Games are beneficial for learning about culture, but patience is key. After all, games often have challenging levels. If you provide an incorrect answer, it can hinder your progress, and you won't be able to continue playing. This aspect sometimes leaves me pondering the learning process.
Learner F	Games can ignite my enthusiasm and interest in learning, leading to positive learning outcomes.

| Learner G | *Dynamic learning has always been my favourite. I play related games multiple times until I successfully reach the last level.* |
| Learner H | *Learning through games is more captivating than studying textbooks, helping me grasp that Confucian culture in Chinese society places significant emphasis on etiquette.* |

Table 3: The learning experience about the cultural practice through GBL

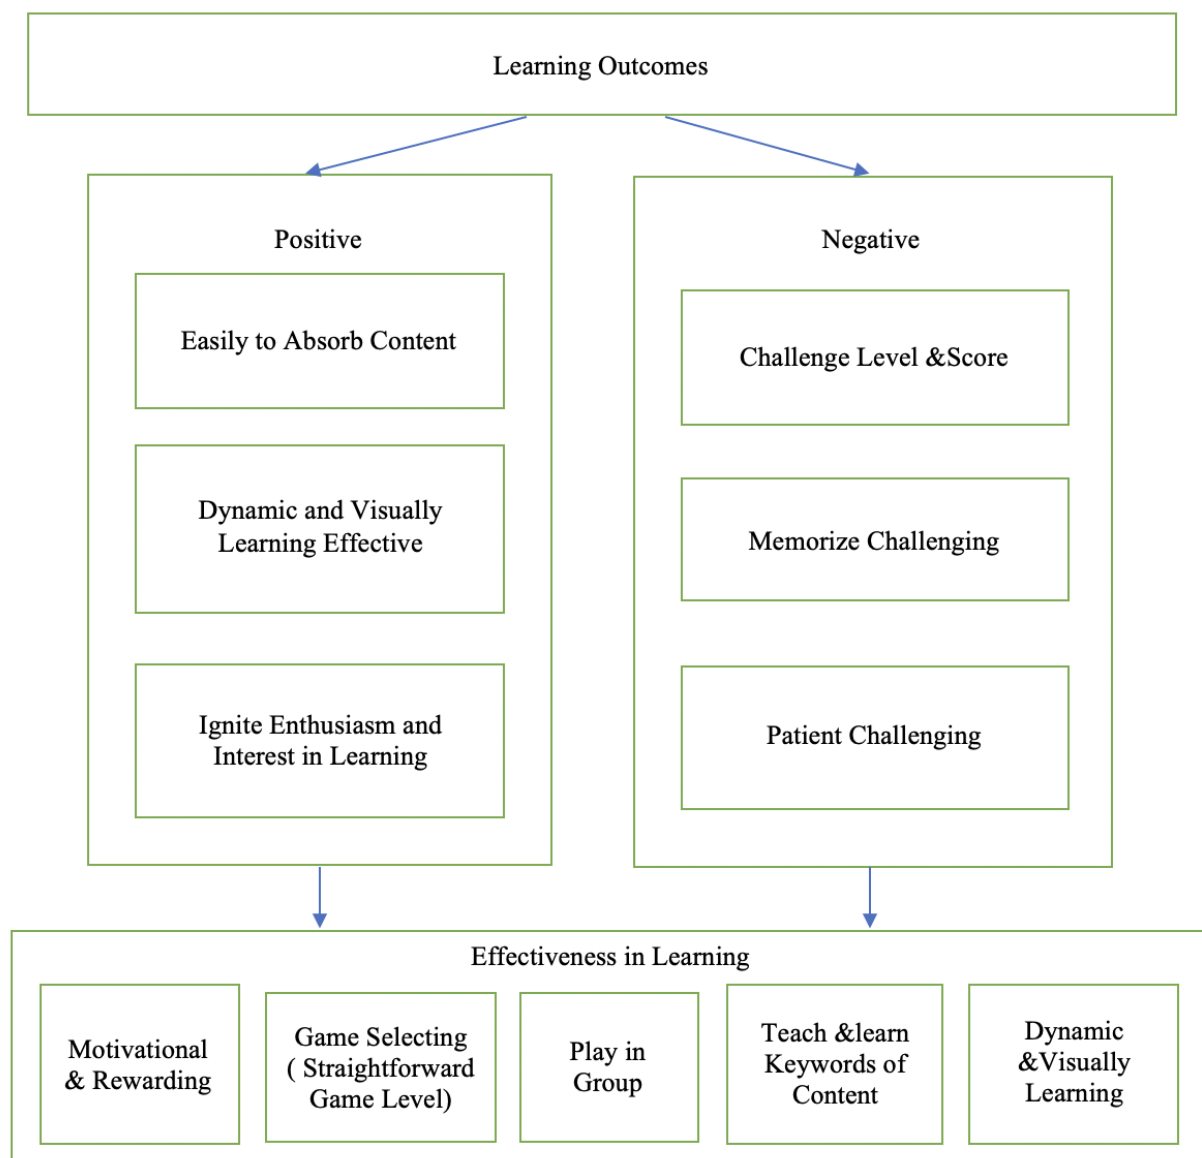
In Table 3, the positive and negative learning outcomes of cultural practice through Game-Based Learning (GBL) are illustrated. There have three positive learning outcomes, (1) Easily to Absorb Content, (2) Dynamic and Visually Learning Effective, (3) Ignite Enthusiasm and Interest in Learning. Besides that, there have 3 negative learning outcomes, (1) Challenge Level & Score, (2) Memorize Challenging, (3) Patient Challenging. In light of these outcomes, it is advisable for educators and learners intending to employ GBL for cultural education to take note of the following issues and proposal given. The proposal emphasizes the preservation of a predominantly positive discourse surrounding learning outcomes, while also addressing and rectifying any negativity associated with such outcomes. Consequently, the recommendation is structured around five key points, (1) Motivational & Rewarding, (2) Game Selecting (Straightforward Game Level), (3) Play in Group, (4) Teach & learn Keywords of Content, (5) Dynamic &Visually Learning (Refer to Figure 1).


Figure 1: Proposal of the Effectiveness in Learning through the GBL

Conclusion

From this, this research can conclude that the integration of Game-Based Learning (GBL) yields both positive and negative learning outcomes in cultural learning. As an educator, addressing the negative learning outcomes caused by GBL can enhance teaching results in cultural course instruction. Simultaneously, from the learner's perspective, the acquisition of keywords in cultural knowledge can be enhanced, potentially alleviating issues related to unlearning. Additionally, teachers should prioritize students' emotional and psychological states when utilizing GBL for cultural learning, emphasizing these aspects over strict adherence to game rules and elements. While learners using GBL for cultural practice may absorb knowledge more rapidly and find the experience enjoyable, the design elements of the game could potentially impede learning speed and outcomes. This poses a question that necessitates reflection from educators and even game developers. The dynamic and graphic learning method in Game-Based Learning (GBL) indeed facilitates greater learner engagement. Consequently, this strength can be preserved and augmented in GBL instruction.

Classroom Action Research
Using Peer Assessment as a Tool to Improve EFL Students' Speaking Skills

Madina Zhussipova, Nazarbayev Intellectual School in Aktau, Kazakhstan

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This study examines the impact of peer assessment and feedback on secondary school EFL (English as a Foreign Language) learners' speaking skills. By providing a platform for students to evaluate each other's performance, peer assessment can help overcome shyness and fear of making mistakes. The study employed CAR (Classroom Action Research) following Kemmis' cycle process (in McNiff: 1992:27) through planning, acting, observing, and reflecting in a spiral model. The evaluation focused on whether peer assessment was effective in developing EFL learners' speaking skills and how peer feedback affected students' speaking performance. The study involved 25 students of A2/B1 level at Nazarbayev Intellectual School in Kazakhstan. Personal observations, questionnaires, and speaking tests were used to collect data. Analysis of speaking results showed an increase from 63 in pre-test to 69 in Cycle 1 and 75 in Cycle 2, illustrating the effectiveness of peer assessment as a learning tool. However, giving feedback to peers was only effective in pair work between Higher- Average or Lower level students, with the latter sometimes struggling to implement constructive feedback to Higher level students. Despite drawbacks, most students had a positive attitude towards peer assessment and receiving feedback from their classmates. This form of assessment can be incredibly advantageous for students, offering a unique opportunity for self-learning and differentiation. Additionally, it provides teachers with a valuable tool for assessing their students' potential and enthusiasm.

Introduction

When working with English as a Foreign Language (EFL) student, it is often observed that they face difficulties in overcoming shyness and lack of vocabulary when it comes to speaking. To assist less able students, differentiation in the learning process is often employed, such as providing question cards with keywords for less able students and role-playing as group work to give them a chance to speak freely within their roles and involve all students in the speaking process. However, organizing group and/or peer work for students often presents a challenge. Many students struggle with shyness and lack of confidence when it comes to speaking. Active students with higher levels of English tend to take part and provide their answers during topic-related questions and/or discussions, while other students remain silent. Most EFL students often lack vocabulary or ideas, and they also feel embarrassed to speak in a foreign language. Assessing the performance of a certain student's contribution in pair or group work becomes difficult under such circumstances. The current study aims to address the following research questions: "Is peer assessment effective in developing EFL students' speaking skills?" and "How does peer feedback affect students' speaking performance?"

Literature Review

According to Topping (2009), the utilization of peer assessment as an assessment method in the field of education has risen in recent decades. This approach emphasizes collaborative learning with peers and is based on effective learning while being supervised by the instructor. Scholars such as van Zundert et al. (2010), Black and Wiliam (1998a), and Topping (1998) agree that assessment shapes much of the learning that students do, and changing the assessment method can change the way students learn and the content they learn. Nowadays, many scholars justify the use of self and peer assessment as it can lead to greater ownership of learning and motivation for learners. In the realm of EFL teaching, assessment is believed to be crucial in developing students' ability to evaluate their performance and improve it. According to John Cowan (2005), assessment is considered the driving force behind students' learning. Peer assessment can help learners develop several skills like reflection, critical thinking, and self-awareness while giving them insights into the assessment process. The study aims to investigate whether peer assessment can enhance EFL learners' speaking abilities and whether peer feedback can be as useful as teacher feedback, along with other benefits it may offer.

Topping (2017) defines peer assessment as an arrangement for learners to consider and specify the quality product, of other equal-status learners, which leads to learning further, by giving elaborated feedback to achieve a negotiated agreed outcome. In other words, peer assessment is a valuable pedagogical practice as it enables the learners to take part in assessment by evaluating their peers' learning process and products (Bryan & Clegg, 2019).

Peer assessment incorporating peer feedback leads to more beneficial outcomes as peer feedback provides the strengths and weaknesses along with recommendations for improvement. Furthermore, peer feedback means having a dialogue whereby students share knowledge and understanding with the intention of informing as ongoing learning (Zhu & Carless, 2018).

An important aspect of peer assessment and feedback practices is the link of these activities to Vygotsky's (1978) social development theory, which emphasizes the vital role of social

interaction in learning (Lundstorm & Baker, 2009; Topping, 2017). Further, it is claimed that the peer assessment process naturally constructs a favourable teaching environment for peers to work within the zone of proximal development (ZPD) (De Guerrero & Villamil, 2000). The learner's ZPD refers to the place between where learners are able to perform a task on their own versus with the help of a teacher or parent (Lundstorm & Baker, 2009). The theoretical framework of Vygotsky's social development theory refers to two important aspects of peer assessment and peer feedback: *cognitive development* and learning through social interaction which can be implied as *collaborative learning*.

According to one of the first advocates of peer assessment, cognitive and metacognitive benefits can accrue before, during, or after the peer assessment (Topping, 2009). Learners assess their peers speaking according to speaking criteria, in the process, they can see their own mistakes, strengths and weaknesses.

Methodology

To ensure the validity of the action research, a triangulation approach was employed with a variety of research instruments and techniques that could provide different views of the case. Qualitative and quantitative research methodologies were used, which encompassed three distinct data collection tools:
- Personal observations;
- Survey: speaking tests with assessment criteria;
- Survey questionnaire.

Survey participants:
　　25 students of NIS in Kazakhstan with English language levels A2 / B1.

Procedure

This study adopted a spiral model of Kemmis's classroom action research (2007). In general, the spiral model of classroom action research (CAR) describes a continuous process that includes two iterations where each cycle goes through the process of gathering information, planning, implementing actions, observing and reflecting on actions and then designing actions in the next cycle, which were based on facts and findings from the previous cycle (Figure 1). In planning stage, the researcher planned the implementation of question cards and peer assessment, prepared topic-related vocabulary, designed a lesson plan, made assessment sheet and determined criteria of success. In the implementation stage the researcher applied the strategy by pairing students randomly and in observation stage the researcher collected the data. In the reflecting stage, the researcher evaluated the result of the implementation of the strategy and drew the conclusion whether the strategy was success or not by comparing to the criteria of success.
Figure 1: Kemmis' cycle action research process

Findings and Discussion

The research lasted for 2 months of the last academic year 2022-2023 and divided into three main stages. In the first stage students were merely observed during speaking activities for 4 lessons, the researcher was trying to find out how free and fluently students can render their ideas when answering topic-related questions. By the end of the observations, it was possible to assess the participation of only the most active students but not all the students.

For the **first Cycle** (Cycle 1, Figure 1) a special assessment form with assessment criteria arising from the content of the lessons was designed. It required students to use topic-related vocabulary, and grammar learned during the unit. Students were randomly divided into pairs, they were given assessment forms and question cards. Each pair of students had to listen to each other and assess their speaking. At first, it was hard for students to assess their peer's speaking as most of them found it difficult to digest pronounced sentences and assess. Weaker students could not understand criteria in full or could not assess grammar part because of poor knowledge. But stronger students could assess their peers and comment on their assessment results.

Analyzing the outcomes of the 1st Cycle the following improvements of the peer assessment practice was made:
  – Ensure lower level students have some topic-related vocabulary in question cards
  – Ensure students understand assessment criteria by designing the criteria themselves
  – Give more time to prepare their answers (2 min instead of 1)
  – Put students in pairs of Higher – Average, Average – Lower level

The **second Cycle** (Cycle 2, Figure 1) was applied in 4 meetings; two meetings for teaching learning process, vocabulary and grammar, and designing assessment criteria related to the

learned materials. Students were encouraged to design assessment criteria to understand how and what to assess. Students were also given feedback by the Teacher to learn giving feedback.

Two meetings were designed to do peer speaking and assessment by the criteria as well as meeting time limits. Preparation time was prolonged up to 2 minutes, as weaker students had to prepare for speaking as well as for assessment and giving feedback.

The adjustment of the implementation brought a positive effect. It helped weaker students to gain more confidence in speaking and in giving feedback to their peers. Observations of Cycle 2 revealed the following progress in speaking:
- Students seemed to be more relaxed while speaking to their peers (in contrast to Teacher-student assessment);
- Peer evaluation allowed students to get acquainted with some assessment criteria and the process itself.
- Putting students into pairs with proximately different levels was more effective, as weaker students were able to listen to stronger level students, gain some topic related words and phrases, learn correct pronunciation and more able learners could help to correct their grammar;
- Apart from assessing each other's speaking students learned giving feedback and explaining their assessment. At first it was only Higher level students who could give feedbacks, but by the end of research all students were able to assess their peers' speaking and give detailed feedbacks.

Before treatment (Pre-test) and after each Cycle (Cycle 1 and Cycle 2) of speaking and peer assessment students' results were added up and divided into the number of students to receive the average score. The observed groups of students showed below progress:

Pre-test results – mean score 63
Cycle 1 – mean score 69
Cycle 2 – mean score 75

Based on the research findings the answer to the **Research question 1** if peer assessment was effective in developing EFL students' speaking skills, is positive. In both Cycle 1 and Cycle 2 have shown the gradual growth of mean score for speaking. The peer assessment corrected the students' mistakes and improved their speaking. The benefit of this activity is to enable students to overcome language barrier and gain confidence in speaking as well as to understand assessment criteria and assess their peers speaking. In learning speaking confidence is a pivotal aspect. The peer assessment enables to enhance the students' confidence as well as their motivation. Studies showed some advantages of peer assessment as well as disadvantages.

Advantages of using peer assessment in speaking:
- ✓ Students feel more relaxed while speaking to peers, therefore gain confidence in speaking;
- ✓ Take responsibility for and manage their own learning;
- ✓ Learn to assess and give others constructive feedback, and improve assessment skills;
- ✓ Enhance students learning through knowledge diffusion and exchange ideas;
- ✓ Motivated to engage with course materials more deeply.
- ✓ Become aware of self progress, strengths and weaknesses.

Disadvantages of using peer assessment in speaking:
- ✓ Students will have a tendency to award everyone the same score.
- ✓ Students will not be able to assess their peers due to low language level.
- ✓ Students may be reluctant to make judgements regarding their peers.

Research question 2 "How does peer feedback affect students' speaking performance?"

By raising above issue as a research question peer-assessment is viewed as another way of challenging students' dependence on the teacher for feedback and guidance in their learning. It emphasizes learner autonomy and cooperation. It is based on the assumption that students can learn as much from each other as they can from the teacher (Ashraf & Mahdinezhad, 2015).

The observation of the survey on the process of giving feedback has revealed that giving feedback to peers was mostly effective in pair work between Higher– Average and Average – Lower level students, with the latter sometimes struggling to implement constructive feedback to Higher level students.

Survey Questionnaire Results

Students answered the survey questionnaire to define student's opinions about using peer assessment and peer feedback to improve their speaking:
- 20 of 25 students answered that peer assessment helps to develop their speaking.
- Parts of assessment that were difficult for them: assessing peer's speaking – 14, giving feedback – 11.
Figure 2: Questionnaire about peer assessment

Based on the results, it can be inferred that the majority of students perceive peer feedback as a valuable tool for their learning and have provided positive responses regarding its usefulness. s per the feedback provided by the students, it appears that they find it equally challenging to assess the speaking of their peers and provide constructive feedback. This task involves a range of complex skills, such as speaking, analyzing errors, and evaluating performance based on predetermined criteria, which require the use of higher-order thinking

abilities. Engaging in such activities may contribute to the development of cognitive and metacognitive skills among students.

Figure 3: Questionnaire about peer feedback

The students' perception of the impact of peer feedback on their speaking skills was somewhat mixed, with some expressing positive views while others highlighting certain limitations of the peer assessment approach. The feedback provided by students revealed some advantages and drawbacks associated with peer assessment.

As for the answers above, peer assessment helps students to develop their assessment skills and learn to provide constructive feedback to their peers. One of the main advantages is that it promotes students to take responsibility for their own learning, as they have to assess and provide constructive feedback to their peers. This process also enhances their assessment skills and encourages them to engage with the course material on a deeper level. Additionally, knowledge diffusion and the exchange of ideas among students can improve the overall learning experience. Furthermore, peer assessment can raise students' awareness of their own progress, strengths, and weaknesses. However, there are also certain disadvantages of using peer assessment in speaking. For instance, students may have the tendency to rate everyone equally, which can undermine the validity of the assessment. Moreover, students with lower language proficiency may struggle to assess their peers accurately. Consequently, students with higher level of English may remain unsatisfied with their peer's feedback. Finally, some students may be hesitant to provide judgment on their peers or disagree with their assessment, which can negatively impact the effectiveness of the evaluation process.

Conclusion

The evaluation of students' learning progress is a crucial aspect of the educational process. A recent study has revealed that despite its limitations, peer assessment can offer significant benefits to students, such as promoting self-directed learning and motivation. By involving students in the evaluation process, teachers can accurately measure and enhance elements that would have been difficult to achieve otherwise. This approach can also serve as an additional tool for teaching, leveraging students' potential and enthusiasm to improve their performance. Furthermore, the presence of a competitive environment among peers during the assessment may encourage them to engage more actively and be stricter in their evaluations, ultimately leading to more efficient assessment practices. The use of peer assessment also fosters a sense of community among students, as they are invited to participate in an essential aspect of education. Feedback from peers plays a critical role in this type of assessment, allowing teachers to assess individual students with greater accuracy while reducing their workload.

Writing Conversations: Exploring How Metalinguistic Understanding Fosters Young ESL Learners' Writing in Classrooms

Nur Najla Zainal Anuar, Rabdan Academy, United Arab Emirates

Abstract

The purpose of this article has two main objectives: firstly, to investigate and identify the syntactic structures employed by young ESL writers in their compositions; and secondly, to explore how ESL writers' metalinguistic understanding of syntactical construction affect their writing. The study involved the analysis of essays from 92 ESL secondary students of advanced and intermediate proficiency levels. A manual linguistic analysis was conducted, utilizing a coding framework that assessed various syntactic complexity features at the sentence, clause, and phrase levels. The second set of data was obtained from semi-structured interviews and elicitation task with 12 students, chosen from the corpus sample. The results revealed a consistent pattern among advanced writers, characterized by a higher frequency of relative clauses, finite subordinate clauses, prepositional phrases, coordinate phrases, and adverbials as sentence openers. Despite inferential statistics suggesting a potential developmental pattern, a detailed examination of students' essays indicated that conceptualizing and measuring syntactic complexity solely based on the presence of specific syntactic features might be insufficient. The in-depth analysis showed that certain features, such as minor sentences, could not be adequately captured using the syntactic complexity measures employed in many prior studies. Additionally, the elicitation tasks also revealed that students' metalinguistic understanding of syntactical construction does affect their writing, which suggest explicit teaching of syntactical constructions and varied sentence structures could enable more effective written communication.

Introduction

Writing skills are crucial for academic success, employment, and effective communication. However, many second language learners, especially in Malaysia, continue to struggle with writing. Sentence construction plays a vital role in facilitating higher-order writing skills such as planning, editing, and revising impacting the effective translation of ideas (Graham, 2006). Previous research by second language scholars has aimed to address these issues by examining the essays of second language learners, particularly focusing on university students in Malaysia and identifying common errors in their writing (Abdul et al., 2004; Yasruddin et al., 2010; Mukundan, J. & Khojasteh, L., 2011; Mukundan, J. et al., 2013).

Despite the recent surge in interest in syntactic complexity in second language writing, many studies have presented mixed and inconsistent results (cf. Robinson 2007; Skehan 2009; Spada & Tomita 2010). Additionally, corpus linguistics studies investigating syntactic complexity in writing have typically reported results solely based on the presence of syntactic features. This paper contends that a systematic exploration of syntactic complexity is essential to uncover how writers of different proficiency levels employ these features to shape and modify their sentences, ultimately enhancing the effectiveness of their written communication. Furthermore, this study also looks at second language learners' metalinguistic understanding to investigate its relationship with students' syntactic constructions in writing.

Syntactic Complexity and Writing Quality

Numerous studies have explored the correlation between syntactic complexity and writing quality. These investigations were predicated on the belief that syntactic features play a pivotal role in assessing linguistic development, as more intricate syntactic structures are often associated with higher evaluations of writing quality (Crossley & McNamara, 2014). However, prior research has reported inconsistent results, with no comprehensive explanation provided for this variability. For instance, Crossley and McNamara (2014) examined the connection between syntactic complexity indices measuring second language (L2) development and human ratings in L2 writing. They found that essays featuring "a greater number of complex syntactic structures, including syntactic structures related to clause complexity ('that' clauses and 'to' clauses)," received higher ratings (Crossley & McNamara, 2014, p.75). Conversely, Biber (2006) and Biber et al. (2011) argued that dependent clauses are more characteristic of speech than academic writing. In another study by Bulté and Housen (2014), the *Language Use* scores from raters correlated with various syntactic complexity measures, including mean length of sentence, mean length of T-unit, mean length of noun phrase, subclause ratio, simple sentence ratio, complex sentence ratio, and compound-complex sentence ratio. Although these measures showed correlation with overall writing scores, not all were indicative of developmental sensitivity. For instance, the complex sentence ratio, used to measure subordination, significantly correlated with essay quality but did not signify developmental progression.

A review of syntactic complexity studies by Crowhurst (1983) concluded that the two most commonly used syntactic complexity measures, T-unit length and clause length, do not consistently relate positively to writing quality. Crowhurst argued that increased T-unit length can sometimes be associated with flawed writing, and the writing mode may influence the relationship between T-unit and quality. Importantly, Crowhurst (1983) emphasized that enhancements in writing quality should not solely rely on syntactic complexity scores; other

factors surrounding the writers must also be considered. Consequently, the idea that the presence of syntactic features unequivocally determines linguistic development and writing quality should be approached with appropriate caution.

Metalinguistic Understanding in Writing Classrooms

The debate surrounding the effectiveness of grammar instruction in second and foreign language pedagogy has persisted for over a decade. Early studies in Second Language Acquisition by Kessler and Idar (1977), Fabris (1978), and Krashen (1987) suggested a natural order and sequence in learners' acquisition of grammatical structures. According to this theory, the acquisition of grammatical structures progresses in an expected manner (Krashen, 1982). Scholars such as Krashen (1981) and Schwartz (1993) have argued that explicit knowledge of language is not advantageous for learners' acquisition (Ellis, 2008). This ongoing debate has prompted researchers to explore the effectiveness of various language instruction methods in second language learning, including form-focused instruction.

Long (1991) defined focus on form as the instruction which draws students' attention to linguistic elements as they arise incidentally in lessons whose overriding focus is on meaning or communication. However, Ellis (2001) pointed out potential issues with Long's (1991) definition, noting that previous research using it tended to overlook the second defining characteristic of focus on form – its incidental nature. According to Ellis (2001), form-focused instruction differs from meaning-making instruction by its primary focus on form and intensive treatment of preselected forms, requiring learners to concentrate intensely on specific forms for learning. Many second language researchers argue that form-focused instruction is an effective method in second language learning (Norris and Ortega, 2000), with Ellis (2008) supporting the idea that it enables learners to progress more rapidly along the natural order.

The teaching of writing in Malaysian classrooms, as observed by Lim (2014), has been noted to be form-focused, with grammar and writing often taught separately. While previous research has shown positive outcomes from explicitly teaching grammar knowledge to learners (Hammond, 2012; Moore and Schleppegrell, 2014), it is also essential for learners "to be able to think grammatically about language choices in writing" (Chen and Myhill, 2016, p. 101). This concept goes beyond viewing grammar as solely rules and compliance (Becker, 2006). Writing instruction in second language classrooms should emphasize not only explicit grammar knowledge but also the conscious awareness of language in shaping writing (Chen and Myhill, 2016, p. 101). In other words, teachers should guide students to move beyond "an abstract knowledge about language to apply that knowledge to their writing" (Chen and Myhill, 2016, p. 101). While this concept is relatively new in the Malaysian context, its introduction could significantly contribute to learners' writing development.

Methodology

The procedures for data collection were conducted simultaneously but separately, and the two data sets underwent separate and independent analyses. Corpus data were analyzed using statistical analysis, percentages, comparisons, and descriptive statistics. In contrast, interview and writing conversation data were analyzed by identifying patterns and conducting thematic analysis. The results from both data sets were subsequently organized thematically and

presented. The two datasets were combined to formulate a conclusive interpretation. The merged data is then presented, explaining how the diverse data types contribute to a more comprehensive understanding in the current study.

The Sample

Participants were assigned two essay prompts, with an effort made to ensure an equal distribution of argumentative and narrative essays. Half of the class received an argumentative task, while the other half received a narrative task. The requirement for the essays was a minimum of 350 words, and participants had one hour to complete the task. To maintain the reliability of the study, participants and teachers were not informed of the writing topics in advance to prevent students from planning their writing ahead of time, which could potentially impact the essays and, consequently, the findings. However, the topics or prompts provided were modeled after those found in the 1119 paper of the Malaysian Certificate of Education examination, as well as other Form four writing textbooks or exercise books, making them familiar to students and teachers. Out of 120 essays, only those that were complete and comprehensible were selected for inclusion in the research, resulting in a total of 92 essays.

Table 2: Syntactic complexity measures employed in the present study

In the second phase of data collection, writing conversations were carried out with 12 selected student participants from the writing sample. This writing conversations were conducted to address how students' metalinguistic understanding of syntactical structure affects their writing. The writing conversation, resembling a semi-structured interview, combines questions designed to extract perceptions and beliefs regarding writing and essay grading with tasks aimed at eliciting a metalinguistic understanding from students. The 12 student representatives for these writing conversations were chosen based on their proficiency levels, categorized as intermediate and advanced, determined by their English language results in the Lower Secondary Assessment or PT3—a public examination for Form three students in Malaysia. The selection process also considered the syntactic structures used in the chosen essays, ensuring they could serve as prompts during the writing conversation. The chosen essays exhibited specific syntactic features that were intended to be discussed in the elicitation task.

Discussion

The results obtained from the linguistic analysis of students' essays, categorized by proficiency level and genres, demonstrate distinct syntactical patterns. Proficient writers exhibit enhanced control over their sentence structures, evident in the increased frequency of relative clauses, finite subordinate clauses, adjectival and adverbial prepositional clauses, as well as adverbial sentence openings observed in advanced essays. Advanced writers display confidence in using these syntactic features to achieve various rhetorical effects in their writing, such as amusing, shocking, persuading, or prompting readers. This is considered a marker of more skilled writers, as it involves conscious decision-making to enhance writing effectiveness.

Intermediate writers, on the other hand, favor compound sentences linked by coordinate conjunctions (primarily 'and,' 'but,' and 'so'), emphasizing content delivery over the consideration of rhetorical effects achievable through more complex syntactical features. Notably, the increased use of adverbials as sentence openings among advanced writers demonstrates their ability to manipulate sentence structures for diverse effects, employing short or minor sentences strategically. This proficiency allows them to use adverbials to initiate sentences, focusing on different ideas to communicate their messages more effectively. While intermediate writers also utilize adverbials at the sentence beginning, these are mostly linking adverbs, and their overuse is highlighted in the qualitative analysis, potentially diminishing the effectiveness of their essays. This underscores the significance of manual linguistic analysis and emphasizes that relying solely on numerical occurrences for complexity assessment may yield misleading findings, as complexity alone does not guarantee quality or effectiveness.

	Proficiency Level	N	Mean	Std. Deviation	Independent T-test P value
Clause Length	Advanced	46	9.13	2.42	0.088
	Intermediate	46	8.41	1.44

	Intermediate	46	1.81	1.37	

*Note. *indicates that the difference between these two groups have a statistical significance*

Table 4: Syntactic constructions of Advanced and Intermediate learners

Furthermore, the findings indicate that argumentative essays exhibit higher mean sentence length, sentence complexity, mean clause length, coordinate phrases, and adjectival prepositional phrases. These features are likely influenced by the academic nature of argumentative essays, reflecting characteristics commonly found in academic writing. Additionally, the use of more post-modifiers in managing arguments and depicting cause-effect relationships contributes to these results. Interestingly, although argumentative essays are generally more complex than narratives, they display fewer adverbials as sentence openings. The prevalence of short or minor sentences in narratives may afford writers more opportunities to use adverbials at the sentence beginning. Writers may also feel more confident starting sentences with the typical subject-verb structure, as it facilitates argument management and presentation. This specific finding suggests that the syntactic variation in sentence openings could benefit from further exploration, particularly in diverse genres.

In addition, the study has also generated comprehensive interview data about students' metalinguistic understanding and their perceptions of what is important in essay writing. The results can be discussed in several evident themes.

Significance Lack of Confidence

Primarily, there was a noticeable lack of understanding in sentence syntax, extending beyond the basic subject and verb components to encompass clauses, phrases, and sentence variety. This inadequacy was evident in students' performance during the elicitation task, where most struggled and expressed low confidence in task completion. If they possessed a more comprehensive knowledge of sentence syntax, clauses, phrases, and sentence variety, their performance could have been improved. Increased metalinguistic comprehension of these elements might have empowered students to employ grammatical reasoning, thereby enhancing their ability to correctly respond to the task.

Misconceptions

Misconceptions among students regarding syntactic elements were further exacerbated by the lack of metalinguistic understanding. When tackling elicitation tasks, students struggled to employ grammatical reasoning and instead, relied on 'proxies' to decipher sentence structure. Misconceptions, such as viewing phrases as shorter than clauses, equating simple sentences with short sentences, and perceiving clauses as incomplete sentences requiring additional words, were among the various misconceptions causing difficulties for students.

The Importance of the Teacher, Exams and the Teaching of Writing

Students consistently emphasized the significance of adhering to teachers' guidance regarding exam priorities. This underscores their strong dependence on teachers, and the comments imply that teachers might be overly instructive. There is minimal indication that students are cultivating independence and authorship skills in English, which could pose challenges later on, especially in higher education where students are expected to be self-reliant learners.

Students' feedback indicates that the teaching of writing primarily emphasizes accuracy without giving due attention to communicative effectiveness. The instructional method employed by teachers, involving cloze passages and error analysis, is heavily focused on form rather than adopting a functionally-informed approach to grammar. While this approach may enhance the precision of students' essays, it may not contribute significantly to their

ability to effectively communicate ideas through writing. Interestingly, students seem to accept this form-focused approach, potentially influenced by the exam-oriented education system. It is noteworthy that the rubric emphasizes sentence variety without commensurate attention to it.

Ultimately, the teaching approach adopted by teachers appears to result in students prioritizing good grades over developing strong writing skills. Throughout the interviews with all students, the frequent use of the word 'memorize' to describe their learning approach is surprising. This suggests a preference for a spoon-fed learning style, potentially driven by the pursuit of good grades. Notably, none of the students expressed concern about how effectively they could convey their messages through their writing.

Conclusion

The results discussed in the study have uncovered information that could be valuable for various stakeholders in the field of education and linguistics. Developers of curriculum and educational materials can utilize these findings as guidelines when creating textbooks, modules, lectures, and other materials for L2 classrooms, particularly in the context of writing lessons. Moreover, the study underscores the significance of metalinguistic understanding in the teaching and learning of writing, potentially challenging the rigid concept of form-focused pedagogy in Malaysian classrooms. The outcomes of this research are also beneficial for educators, parents, students, and future researchers, offering insights into the current state of writing competence among Malaysian learners and shedding light on potential reasons behind writing challenges faced by these second language learners.

Code-Switching in Mathematics Teaching in Early Childhood Education: Switching From English to the Home Language

Jaysveree Louw, Central University of Technology, South Africa

Abstract

In communication and linguistics, code-switching (CS) refers to the process of using two or more languages in speech. South Africa is a multi-lingual and multi-racial society. Schools form part of societies, therefore it is to be expected that this 'multi-ness' will also be evident in schools. In many South African schools, children are taught two languages namely their 1Home Language (HL) and a Second Language (SL). Education policy proposes that subjects in *primary schools* be taught in the school's *Language of Learning and Teaching* (LOLT), which is often English. However, teachers often code-switch between the LOLT and their 2mother tongue. This article examines the disadvantages and benefits of CS in the teaching of Mathematics in South African primary schools. Interviews were conducted with thirty-five teachers and seventy-eight learners from primary schools that have English as a LOLT, but where most teachers and learners have *Sesotho* as a HL. The findings revealed that teachers generally code-switch because they express themselves better in Sesotho, and they believe that learners will understand Mathematics better if some concepts are explained in Sesotho. The majority of the Sesotho-speaking learners reported that they appreciate it when the teachers explain Mathematics in English and Sesotho. However, learners who do not speak Sesotho claimed that they feel lost when teachers 'teach' Mathematics in Sesotho. The study concluded that CS is beneficial for teachers and for some learners, but teachers need to be cognisant of the fact that there are learners in their classes who do not speak and understand Sesotho.

Keywords: Code-Switching, Mathematics, Language of Learning and Teaching, Second Language, Home Language, Sesotho

www.iafor.org

Introduction

South Africa, like many other countries, is a multi-lingual, multi-cultural and multi-racial country (Phatudi, 2015; Evans, 2015; Melysa, Sinambela & Pasaribu, 2022). South Africa has eleven official languages that are all recognised in the Constitution of South Africa of 1996. Despite this language diversity, English is a dominant language in many sectors of South Africa such as schools and businesses. English serves as a connecting thread among people of different linguistic backgrounds. The language diversity is not reflected in many schools and the language policy in schools is complex. Although the *Department of Basic Education* (DBE) is in favour of mother tongue instruction, especially in the *Foundation Phase* (Grades R-3), many primary schools have adopted English as the LOLT. In many of these schools, the learners' and teachers' mother tongue is not English. Rather, in most cases English is their SL. The focus on English as the LOLT poses many challenges for such schools. In the Foundation Phase learners are taught four compulsory subjects namely Mathematics, Life Skills, a HL (which can be English or any one of the official languages) and a SL. In schools where the LOLT is English, Mathematics and Life Skills have to be taught in English, whether or not English is the teachers' and learners' HL. This translates to the fact that many learners are being taught in a language that is not their mother tongue. In addition, many teachers have to teach in English, although they have English as a SL. The semantic, grammatical, morphological and syntactic structures for many languages are unique and learners and teachers whose HL is different from the LOLT are disadvantaged because they have to try and decipher subject content as well as English (Schoonen, 2015). This is because these learners' and teachers' English proficiency is lower than those who have English as a HL. The result is that many teachers use CS as one of the mechanisms to transfer content knowledge to learners. This study investigated the reasons why teachers code-switch, their attitudes towards CS and the advantages and disadvantages of using CS in the teaching of Mathematics.

Problem Statement

Globally many people are bilingual or multi-lingual. Schools are part of societies and therefore many schools are bilingual or multi-lingual. South Africa is a multi-lingual country but English is often used as the communal language in academia, business, schools, politics and social conversations (Van der Walt, Evans & Kilfoil, 2009). Many schools in South Africa have English as a LOLT, although the teachers and learners have a language other than English as a HL. In an English-limited context, many learners and teachers come from a background where they speak a language other than English at home. Although teachers can communicate and teach in English, many are not proficient in the language. The same applies to learners - many of them know English but are not proficient. The challenge is thus that teachers have to teach Mathematics in a language in which they are not proficient. In addition to this challenge is the fact that learners whose HL is not Sesotho, cannot understand Mathematics when the teachers code-switch from English to Sesotho.

Aim of the Study

Mathematics is regarded by many people as a difficult subject with complex terminology. Many learners struggle with inadequate mathematical skills which is often caused by challenges in grasping fundamental mathematical and numerical concepts. Learners who are taught Mathematics in a language that is not their mother tongue not only have to battle with difficult concepts but also have the added challenge of being taught in a language in which

they are not proficient. Unfortunately, teachers have to teach a complex subject in a language that is not their mother tongue. In order to address these challenges, many teachers opt to code-switch when they teach Mathematics. The study aimed to investigate:

(i) the positive and negative factors of CS in the teaching of Mathematics;
(ii) teachers' and learners' attitudes towards CS.

Motivation for the Study

Mathematics is a critical subject that forms the foundation of various disciplines. It is a basic skill that is used and needed in our everyday lives. It is long-standing knowledge that Foundation Phase learners in South Africa perform at a poorer level in Mathematics compared to their counterparts in other countries. One reason for this poor performance is the language barrier experienced by teachers and learners in many South African schools (Naude, 2017; Meier, 2019). The study was motivated by two factors: a) the manner (tell and listen) in which Mathematics is often taught in the Foundation Phase and b) the disadvantages of CS experienced by learners whose HL is not Sesotho. The researcher observed these factors when she visited the schools to evaluate students during teaching practice. Also, the researcher was a teacher for many years and observed the phenomenon of classroom CS.

Significance of the Study

Learners who are not proficient in the LOLT and in Sesotho, or those with a low proficiency, have a language deficit or barrier (Meier, 2019). They lack Cognitive Academic Language Proficiency (CALP), which is the proficiency needed to understand academic concepts and to perform the higher cognitive operations necessary to flourish in school. There are several reasons why the study is significant:

- The study hopes to assist teachers in adapting their classroom practices to meet the needs of learners who are learning through a SL.
- To provide possible solutions for the language challenges faced by minority group learners (those learners who speak languages other than Sesotho at home).
- To create awareness of the positive and negative implications of CS in the Mathematics classroom.

Theoretical Framework

The theoretical framework that underpins the study is Holmes's (1992) theory of CS, which occurs when speakers shift their speech from one language to another in verbal communication.

Literature Review

a) What is Code-Switching?

In bilingual and multi-lingual classrooms worldwide, CS is a frequent practice (Fachriyah, 2017; Abdulloh & Usman, 2021). Different definitions are suggested for CS by researchers. Generally, CS is regarded as the use of two language varieties in the same conversation. Mazur, Karolczak, Rzepka & Akari (2016: p. 55) define it as 'a phenomenon that exists in many multilingual societies where people use more than one language to communicate on a daily basis, such as Singapore, the Philippines, India, the USA, Spain and China". CS relates to switches between sentences in two different languages spoken by bilinguals or multi-

linguals. CS is when an individual who is bilingual alternates between two languages during his/her speech with another bilingual person. It is more than alternately using two languages because the communication that people hold is an interactional unit that embraces a two-way discourse. Often CS is used synonymously with code-mixing and code-changing. Such socio-linguistic phenomena can occur at two levels: a) the lexical level, when there is no instant equivalent for a word or sentence in the HL b) the semantic level, where an idea or a concept is better explained in the language currently spoken by a bilingual in a given language situation (Munoz & Fernanda, 2006; Hasan & Akhand, 2015; Almelhi, 2020).

b) Types of Code-Switching

There are mainly three types of CS namely inter-sentential CS, intra-sentential CS and tag CS.

(i) Inter-sentential CS: this type of CS takes place at the sentence level, where a speaker utters a sentence fully in one language or another (Almelhi, 2020).

E.g. Teacher: Is Jacob not at school today? *Ke kopa lenkarabe hle.* (English and Sesotho) (Please answer me). In this scenario the teacher speaks English but also inserts a full sentence in Sesotho.

(ii) Intra-sentential CS: these switches take place when a speaker inserts a word or words from their HL (or SL) in a sentence because they do not know, or have forgotten a word:

E.g. *Ke tlo tla le calculator hosane.* (Sesotho and English). The speaker speaks Sesotho but inserts an English word, calculator, in the sentence. I will bring the calculator tomorrow.

(iii) Tag CS: this type of CS typically includes the insertion of a tag or short expression in a sentence:

E.g. *O na le teng*, you know. (Sesotho mixed with English) He was there, you know.

c) Functions of Code-Switching

CS has a variety of functions which vary according to the topic, people involved in the conversation, and the context of the conversation. Below are some of the reasons why people usually code-switch:
- To emphasise a point.
- To substitute a word for an unknown word (or a word the speaker does not remember).
- To express a concept that has no equivalent in the 'switch-from' language.
- To clarify a point.
- To ease tension and inject humour into the conversation.
- To relay meaning more accurately.
- Quoting what someone else has said.
- Habitual experiences.
- When bilingual speakers want to convey their attitudes or emotions to each other.

- In situational CS such as in the classroom teachers usually code-switch to narrow the language gap between them and their learners.
- When there is no appropriate translation for the language used (Hasan & Akhand, 2015; Almelhi, 2020).

d) Advantages and Disadvantages of Classroom Code-Switching

The use of CS in the classroom is an issue of great importance for educators and learners because it is a resource that teachers and learners may use in order to achieve a specific communication goal**.** However, the use of classroom CS is a debatable issue in current education practices because there are two views on the phenomenon. The first view is from researchers who consider CS as conflictive, especially for learners who do not understand the language the teachers switch to. The second view is from those researchers who see it as positive in the classroom (Munoz & Fernanda, 2006; Shinga & Pillay, 2021). CS has negative implications for some learners. A major disadvantage of CS is that learners who do not speak the *'switch-to' language* feel lost. CS may thus create problems in the classroom because students who do not speak the 'switch-to' language may feel neglected and marginalised. It is a positive for learners who speak the 'switch-to' language because it helps maximise learning opportunities in a bilingual/multi-lingual classroom. It is a linguistic advantage rather than an obstacle for these learners.

Method

a) Data Collection Instrument

A qualitative research approach in the form of interviews was used to collect data. Open-ended questions were mostly asked. The interviews were conducted by the researcher herself over a period of five months. Purposive convenience sampling was adopted because the participants were easily reachable and willing to take part in the study. The interviews with the teachers were conducted in English. The interviews with the learners were conducted in English, Sesotho, *Xhosa*, and *Afrikaans*, depending on the learners' HL.

b) Sample

Focus group interviews were conducted with thirty-five teachers and seventy- eight learners during a period of four months. The learners and teachers were selected from seven primary schools in *Bloemfontein.*

	35 Teachers	**78 Learners (2 groups)**
	Foundation Phase teachers	Learners from Grades R-3
	Have Sesotho as their HL	Group A - 62 learners - Have Sesotho as their HL Group B - 16 learners - Speak other Home Languages (Afrikaans, Xhosa, *Zulu, Venda*). - These learners have a very limited or no understanding of Sesotho.
	Have English as their SL	
	26 were female, 9 were male	

Table 1: Profile of the participants

Findings and Discussion

Interactional analysis was used to analyse the data. Interactional analysis is one of the methods of narrative research. Narrative analysis is a method that focuses on interpreting human experiences and motivations by looking closely at the narratives of the participants. It is a branch of interpretive research where 'words do the work'. Narrative research is an attempt to increase understanding of central issues related to teaching and learning through the telling and retelling of participants' stories (Van Wyk and Taole, 2015).

Below is an extract of the interviews that I conducted with teachers and learners.

Interviews with teachers	Interviews with learners
Are you aware that you code-switch during Mathematics teaching? P1: *"Yes I'm aware. I use English mostly, but sometimes I put in Sesotho words".* Why do you use Sesotho and English? P2: *"Most of the time is when I see the children do not understand. Or sometimes they ask me to explain in Sesotho because they do not understand the English explanation. Sometimes I have to explain the English words in Sesotho. Sometimes I explain in Sesotho because it's my Home Language. So I think it's beneficial for me and the learners to translate to Sesotho".* Are there children in your class that do not have Sesotho as a Home Language? P3: *"I'm not sure. But I think maybe one or two do not speak Sesotho, out of 38 learners".* Do you think that those one or two learners understand the content if you use Sesotho also? P4: *"I never really thought about it. Now that I think about it. yes, I think it's a barrier. Shame. I wish I could code-switch and explain in their languages. And some of them are not very good in English. So, it would help a lot if the content could be explained in their languages. But who is going to do it? Maybe the parents can. There is one teacher at my school who speaks isiXhosa, but she teaches the intermediate phase".*	What is your favourite subject? P5: *"I like Maths".* Which part of Maths do you like? P6: *"Addition/ volume/...But I don't like long division and long multiplication. Those are so hard".* Would it help if the teachers explained Maths in your Home Language? P7: *"Yes, I think so. Because the teachers explain to Sesotho learners. And when he speaks Sesotho, I don't understand. I only understand a little Sesotho".* What language do you speak at home? P8: *"Xhosa, but sometimes English".* <u>Who helps you with homework?</u> P9: *"My sister"* P10: *"My mom"* P11: *"No one. I do it myself. My parents work late".*

Table 2: Extract of interviews

The findings from the interviews reveal the language challenges experienced by learners and teachers in South African schools, especially in the teaching and learning of Mathematics. Teachers state that they code-switch mainly to clarify content and terminology. Teachers do not seem to be aware that there are learners in their classes who do not understand Sesotho. The teachers who are vaguely aware that there are non-Sesotho speakers still continue to code-switch to Sesotho. Teachers feel that these learners are in the minority and that the majority should be catered for. Many of the learners who are non-Sesotho speakers reported that it is hard for them to comprehend Mathematics - even more so when the teachers code-switch to Sesotho. Some said they are scared to tell the teachers that they do not speak

Sesotho. The learners who speak Sesotho reported that they appreciate it when teachers explain content in Sesotho and English.

Conclusion and Recommendations

The extent to which a learner is proficient and competent in the mother tongue will to a great extent determine his/her academic performance. Learning in a language that is not one's mother tongue is usually an overwhelming and frightening experience. The article aimed to highlight the benefits and disadvantages of CS. From the interviews it can be extrapolated that learners and teachers acknowledge the importance of CS. However, CS from English to Sesotho benefits the learners who can speak Sesotho, it serves no purpose for non-Sesotho speakers. Non-Sesotho learners' academic performance is thus hampered. CS is a normal, natural and useful response in a bilingual classroom and is recommended due to its numerous benefits for teachers and learners. But it is only useful and beneficial for learners who understand both languages (the 'switch-to' and *'switch-from' languages*). It leads to language loss for non-Sesotho speakers. The minority of learners who do not speak Sesotho also need to be taken into consideration. Teachers need to establish when the school year starts if there are non-Sesotho speaking learners in their classrooms. If possible, teachers can offer extra classes to these learners to explain Mathematics. Schoonen (2015) recommends that teachers can use gestures, pictures, demonstrations and bilingual software programmes for the non-Sesotho speaking learners. Non-Sesotho speaking learners can benefit from having bilingual dictionaries, e.g. English-Xhosa. Teachers can ask bilingual learners to explain or code-switch terms for learners who speak other mother tongue languages (provided the learners who speak Sesotho can also speak other languages, e.g. Zulu).

Future Directions

Current literature mostly focuses on CS in bilingual classrooms, with the assumption that all learners speak the HL and the SL. Limited literature is reported on the pedagogical implications of CS for learners who do not speak the mother tongue that is spoken by the teacher and the majority of learners. The phenomenon of CS needs to be further explored, especially the effect it has for minority learners in a classroom where they do not speak the 'switch-to' language.

Clarification of Terms

Primary Schools	Schools for children between the ages of about five and eleven.
Language of Learning and Teaching	The language that is used to teach subjects in a school and is used for communication purposes. In this article the Language of Learning and Teaching is English.
Sesotho	One of the official languages that is spoken in South Africa. It is one of the dominant languages spoken in the province where the research was conducted.
Department of Basic Education	It is the local authority that is concerned with education. It develops, maintains and supports the South African school education system.
Foundation Phase	It is the first phase of formal schooling and comprises Grades R-3. Children enrol for Grade R when they are about five years old.
Switch-to language	In this study the 'switch-to' language is Sesotho.
Xhosa	One of the official languages spoken in South Africa.
Afrikaans	One of the official languages spoken in South Africa.
Bloemfontein	The city where the sample schools are and where the research was conducted.
Zulu	One of the official languages spoken in South Africa.
Venda	One of the official languages spoken in South Africa.
Switch-from language	The language teachers switch from when they CS. In this article the 'switch-from' language is English.

List of Abbreviations

CALP	-	Cognitive Academic Language Proficiency
CS	-	Code-switching
DBE	-	Department of Basic Education
HL	-	Home Language
LOLT	-	Language of Learning and Teaching
SL	-	Second Language

Note

1 and 2: In this article Home Language and mother tongue are used interchangeably.

Pursuing a Career in Logistics: Study Choice Motives and Career Expectations

Sandra Eitler, University of Applied Sciences BFI Vienna, Austria
Reinhold Schodl, University of Applied Sciences BFI Vienna, Austria

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
Major trends, such as digitalization and sustainability, are shaping the future of logistics. As a consequence, qualifications required in the professional field will significantly change, and the demand for logistics professionals with a graduate degree will generally increase. At the same time, the industry has to cope with a skills shortage. A sufficient number of well-educated logistics specialists is essential to master future challenges in the logistics industry. An understanding of the motives for choosing a logistics degree program is an essential basis for effective actions to promote studies and careers in logistics. Therefore, in this work, we explore logistics students' study choice motives. Based on the results, implications for the logistics industry, higher education institutions, and other relevant stakeholders are discussed. An existing model has been adapted to the specific situation of logistics programs at universities of applied sciences. On this basis, a survey among students of a bachelor and a master program in logistics was carried out at an Austrian university of applied sciences. Findings suggest that understanding study choice motives is a multidimensional problem that requires considering a wide range of motives. In conclusion, the motives identified by this work provide a starting point for designing measures to arouse interest in logistics.

Keywords: Career in Logistics, Study Choice Motives, Decision-Making Model

The International Academic Forum
www.iafor.org

1. Introduction

The logistics field, probably more than almost any other industry, is being strongly transformed by the megatrends of digitalization and sustainability (DHL, 2022). Long-term success in logistics means making the best out of the opportunities offered by the so-called twin transition (World Economic Forum, 2022), i.e., not only achieving economic goals in the most effective way possible, but also meeting ecological and social challenges by utilizing technology and data. These changes require appropriate adjustments in employees' skills and competences at all levels of qualification (McKinnon et al., 2017). Therefore, the logistics and supply chain industry need well-educated people who are ready for these challenges.

To provide the logistics industry well-trained people, schools and universities play an important role to arouse interest in logistics and teach the skills that students of logistics will need for their careers (Eitler & Schodl, 2019). This is particularly important, as the logistics sector is already suffering from a severe skills shortage (Puls, 2018; BVL, 2017). The shortage of skilled applicants might be due to the negative perception of career opportunities and occupations in logistics, as well as the labor force's demographic structure. Less attractive remuneration and working conditions compared to other sectors may have also contributed to the shortfall (Logistics UK, 2021). A major challenge for the logistics industry is its image. The perceived lack of opportunity for career growth and the perceived low status of professions in logistics negatively affect talent acquisition and retention. Although many tasks are still carried out manually, there is intense ongoing discussion about the application of digitization and automation in the logistics industry to alleviate the skills shortage (Ittermann & Eisenmann, 2019). Nevertheless, people will remain the focus of attention in transport and logistics in the future, and companies and educational institutions need to work on strategies to address the challenges in the labor market.

For higher education institutions (HEIs), it is of particular interest to find out why students decide to study logistics. There are several reasons it is important to understand how students make their study choice decisions:
- Identifying the motives for choosing a certain degree program allows stakeholders to identify the underlying reasons for low student enrollment.
- Knowing the factors influencing study choice allows recruitment activities to be improved and campaigns designed appropriately.
- Knowing young students' expectations allows the curriculum to be tailored not only to the requirements of the labor market but also to students' expectations and needs. This could increase satisfaction with the choice of degree program and lead to more positive word-of-mouth advertising.

Research is sparse concerning logistics students' study choice motives and students at universities of applied sciences (UASs), who are assigned different study choice motives than students at universities (Oberrauch et al., 2021). Therefore, the objectives of this paper are twofold: to explore the study choice motives and career expectations of logistics students at UASs and to propose measures for the logistics industry, tertiary institutions, and politics to encourage more young people to pursue a career in logistics.

The remainder of the paper is structured as follows. Section 2 presents a general overview of study choice motives, followed by an explanation of the methodology in Section 3. Section 4 discusses some empirical results. Section 5 concludes.

2. Study Choice Motives

Following general motivation theories, study choice motives can be divided into intrinsic, extrinsic, and altruistic motives (Heublein et al., 2017). Intrinsic motivation "is defined as the doing of an activity for its inherent satisfactions" (Ryan & Deci, 2000), e.g., studying a subject because it genuinely interests and excites. Most of the activities people do are not intrinsically but extrinsically motivated (Ryan & Deci, 2000). Extrinsic motivation involves "behaviors done for reasons other than their inherent satisfactions" (Ryan & Deci, 2020), e.g., studying hard to get good grades and receive praise or approval from parents or teachers. Altruistic motivation (Bar-Tal, 1985) is centered around the desire to contribute to others' well-being without expecting personal gain or external rewards. Nevertheless, it is not individual motives that are crucial for the decision to study a particular degree program, but the interplay of several motives (Oberrauch et al., 2021), and motivations can change over time and in different situations.

The decision to study and the choice of degree program depend on various factors. Study choice motives are fundamental to whether someone completes an education, whether someone later works in the sector, and how professional competences (and hence, professional success) develop (Ramm et al., 2014). Despite the increasing importance of extrinsic motives in choosing a degree program, intrinsic motives dominate the decision (Sobiraj et al., 2017; Ramm et al., 2014). Ramm et al. (2014) identify a special interest in the field of study, personal skills, the variety of career opportunities, good prospects for a secure job, and a good salary as important motives for choosing a degree program, and give the following insights: For students at UASs, the variety of career opportunities is a strong motive; in addition, income and career prospects are more important to them than to their fellow students at universities. The reasons for choosing a degree program also vary according to the chosen program. Interest in the field of study is particularly important for students in medicine, cultural studies, and natural sciences. For students in the cultural sciences, motivation is the most important motive for their choice of degree program. Job security is most important to students in medicine and economics, while income and career are more important to students in economics and law.

To summarize, choosing a degree program is a complex decision-making process in which several aspects must be considered under uncertainty (Sobiraj et al., 2017).

3. Methodology

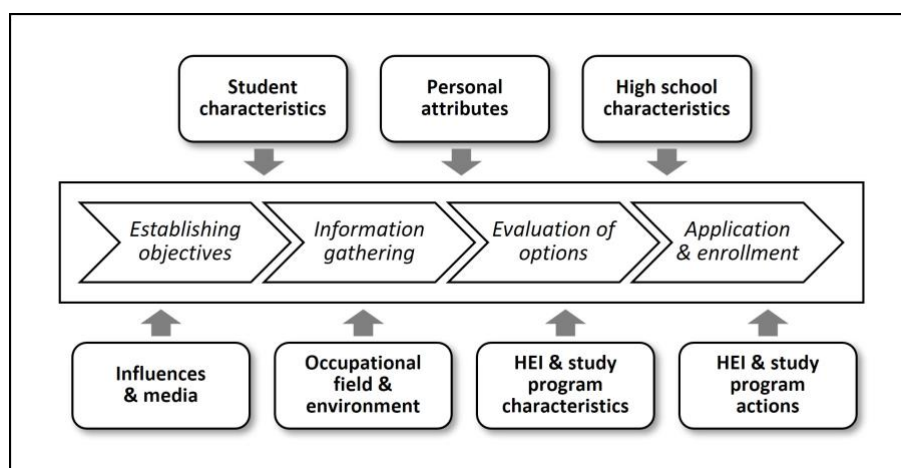
A lot of decision-making models attempt to provide an understanding of students' choice of which HEI to attend and which degree program to follow (e.g., Punj & Staelin, 1978; Harren, 1979; Chapman, 1981; Jackson, 1982; Cubillio et al., 2006; Vrontis et al., 2007). One of the most important uses for these decision-making models is to support HEIs to market themselves more effectively to their prospective students (Vrontis et al., 2007). The so-called integrated generic higher education student-choice model by Vrontis et al. (2007) combines various student-choice models into a single model and serves as basis for this study. For the purpose of this study, it was slightly adapted to the situation of Austrian UASs (See Figure 1).


Figure 1: Adapted integrated generic higher education student-choice model
(based on Vrontis et al., 2007)

Potential students' decision-making process starts with establishing the general objective to study and other study-related objectives. Then they seek and evaluate information about various universities and degree programs. After completing applications to degree programs and the admissions processes, enrollment in a degree program takes place. This decision-making process is affected by various factors (adapted from Vrontis et al., 2007): students' characteristics (gender, age, cultural background, family background, place of residence, financial situation, occupational situation, etc.), personal attributes (interests, personal values, personal goals, lifestyle, etc.), high school characteristics (type, quality, specialization, etc.), influences and media (peers, parents, teachers, traditional media, social media, etc.), occupational field and environment (labor market, working conditions, career opportunities, image, etc.), the HEI's and degree program's characteristics (curriculum, reputation, location, price, study organization, ambience, etc.), and the HEI's actions (recruitment activities, communication, admission policies and process, etc.).

An online questionnaire based on existing literature and studies already conducted on this topic, which covers central elements of these seven factors, was developed. The online survey was conducted among students at the UAS BFI Vienna from the bachelor's degree program Logistics and Transport Management and the master's degree program Logistics and Strategic Management from September to October 2023.

4. Results

The sample comprised 128 respondents; 77% were students from the bachelor's degree program and 23% from the master's degree program. 41% of the respondents were female and 59% male, approximating the distribution of the student population.

In the following, only some of the results relating to the motives for choosing a logistics degree program are presented. The motives were surveyed using the question "How important were the following reasons for choosing your degree program?" A 5-point Likert-Scale was deployed in which "1" represents "very important" and "5" represents "unimportant." Figure 2 shows the mean values of the most important study choice motives.
Figure 2: Mean value study choice motives I (1: very important, 5: unimportant, n = 128)

A future stable job (MV = 1.4, SD = 0.76) was the most important study choice motive for logistics students, followed by a wide variety of jobs in the logistics industry (MV = 1.5, SD = 0.76), the outlook of a high income (MV = 1.7, SD = 0.85), and a special interest in logistics and supply chain management (MV = 1.7, SD = 0.86) as well as in transport and mobility (MV = 1.7, SD = 0,87). Additionally, a well-organized course of study (MV = 1.8, SD = 1.05), good prospects for a future management position (MV = 1.8, SD = 1.08), the content of the degree program (MV = 1.8, SD = 0.80), interest in economic topics (MV = 1.9, SD = 0.93), and personal talents and aptitudes (MV = 1.9, SD = 0.85) were relatively important for the study choice. An analysis of the results by gender or degree program shows no significant deviations.

A comparison with existing studies that have not dealt with logistics degree programs, but with the choice of degree program in general, makes these results appear plausible. As mentioned before, students at UASs have different main motives for choosing a degree program than students at universities. While university students generally focus on personal development, students at UASs usually focus on the prospect of a stable job and the variety of career opportunities (Ramm et al., 2014). Results show that students do not necessarily see intrinsic and extrinsic motives as opposites; they are often quite compatible and can complement each other.

It is also interesting to note motives that were less important to the decision to choose a logistics degree program (see Figure 3). Not getting a place in the degree program of one's choice (MV = 4.1, SD = 1.35), having friends studying logistics (MV = 4.0, SD = 1.29), and published rankings of universities and UASs (MV = 3.9, SD = 1.29) were relatively unimportant study choice motives. Not having a better idea than going into logistics (MV = 3.8, SD = 1.19) was of no great significance either. The decision to study logistics seems to be a very conscious one, as recommendations from career counsellors (MV = 3.8, SD = 1.33), friends (MV = 3.5, SD = 1.25), or parents and relatives (MV = 3.5, SD = 1.34) do not have a major influence on the study choice.
Figure 3: Mean value study choice motives II (1: very important, 5: unimportant, n = 128)

It is also worth noting that the megatrends in logistics, digitalization (MV = 2.7, SD = 1.13), and sustainability (MV = 2.6, SD = 1.14) did not play a particular role in the decision to choose logistics as a degree program. Additionally, altruistic motives such as contributing to society (MV = 2.4, SD = 1.01) and protecting the environment (MV = 3.1, SD = 1.23) had no substantial influence on the study choice.

5. Conclusion

Although the logistics sector is suffering from a severe skills shortage, employability is the most important study choice motive for logistics students at a UAS, reflecting their uncertainty regarding the future. Therefore, UASs and the logistics industry should emphasize job security and the diversity of career opportunities to attract more young people.

In line with other studies, a high future income and the prospect for a management position are very important motives for choosing a degree program among students at UASs. Studying logistics can be seen as an opportunity for social advancement, which should be emphasized more strongly in the promotional activities for choosing a logistics program at an UAS as well as the logistics industry as a potential employer.

Sustainability and digitalization do not play a particular role in the decision to choose logistics as a degree program. This opens the opportunity to address those who are interested in sustainability or digitalization but do not realize the great possibilities for pursuing these interests within the logistics industry.

Pre-service Teachers' Perceptions Regarding Classroom Management and Learner Discipline During Teaching Practice

Victoria Mahlape Mokone, Central University of Technology, South Africa
Wendy Setlalentoa, Central University of Technology, South Africa

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Teaching practice is a type of work-integrated learning as a period during which students work in the relevant industry to acquire specific in-service training to put theory into practice. It is an exercise aimed to expose student-teachers to the practical aspects of the teaching profession and to allow them to put their theoretical knowledge gained through classroom exchanges with their lecturers into practice. Undergraduate teaching practice is often separated into two six-week sessions that require students to participate in all elements of school life, including teaching, evaluation, and co-curricular activities. The study aims were to investigate the pre-service teachers regarding their classroom management and learner discipline during their teaching practice, so that they can be able to develop and maintain an environment conducive to teaching and learning. The study sought to determine the perceptions of the pre-service teachers regarding their classroom management and learner discipline during teaching practice. The study used qualitative methodology. The participants were teacher education students enrolled at a University of Technology. The study interviewed (10) 3rd year and (10) 4th year. Purposive sampling was used to collect qualitative data for third- and fourth-years students respectively. Thematic data analysis was employed. The results revealed a need for the pre-service teachers to be supported and inducted during their teaching practice, particularly on how to manage their classrooms and maintain discipline. The ability of pre-service teachers to manage classroom behaviour needs to be enhanced as it not only impacts on whether students can learn, but also establishes the environment and conditions under which students must learn. Classroom management is concerned with teachers' capacity to establish a functional learning environment.

Keywords: Pre-Service Teachers, Classroom Management, Teaching Practice

1. Introduction

It is normally a great moment for schools to receive pre-service teachers to serve during teaching practice. Teaching is all about engaging students in learning; consequently, teaching is getting students involved in the active building of knowledge. A teacher must understand not only the subject content, but also how learners learn and how to transform them into active learners. Thus, good teaching necessitates a commitment to a systematic knowledge of learning. A teacher must also have basic teaching qualities to help with his or her performance, such as controlling the class, planning the lesson, grouping ability, starting, and closing a session, and recognising pupils' actions in the classroom. Busayanon (2018) emphasises that it is an important procedure for increasing learners' discipline and engagement during teaching and learning. Minami, Sanetti, and Collier (2019) investigate the complicated dynamics of classroom management, which involve enforcing proper discipline, which even experienced teachers struggle to implement consistently without the cooperation of other teachers. According to Atici (2007), classroom management is a collaborative endeavour and one of the most difficult duties for both pre-service and expert teachers. As a result, one of the most significant teacher education curriculums is pre-service teacher training. This criterion should be met by pre-service teachers since it prepares student-teachers to become effective and certified English teachers (Ulla, 2016).

Teaching Practice (TP) is at the heart of teacher training programs' preparation of aspiring and in-service teachers. Teaching, like other professions, requires specialized competencies for quality assurance and efficacy in classroom routines. This is because, in the twenty-first century classroom, effective teaching is vital since educational goals alter in parallel with the changing world. Classroom management is a critical component of every teacher's day-to-day professional experience (Korkut ,2007). Classroom management is defined by Atici (2007) as "deliberate actions taken to create and maintain a learning environment conducive to successful instruction. Teachers are the curriculum's primary drivers and direct implementers in the classroom. They provide guidance and direction to the students. Teachers, according to Mathew, Mathew, & Peechattu (2017), are the most valuable assets in any educational institution. Pre-service teachers are beginning to explore their teaching potential. As a result, teaching practice is a good place to start and the first step in implementing the principles they've acquired in academia over the past four years. Moradkhani, Raygan, & Moein (2017) claimed that teachers should be able to reflect on their own philosophy of teaching and learning. They can plan and organise learning as well as implement learning strategies (Ma'rufi, Buduyasa, & Juniati, 2017).

Pre-service teachers need to be guided and mentored during their TP. Having a mentor teacher simply means that you will be supervised, supported in your profession, coached in terms of curriculum, and assisted in improving your teaching skills. A mentor teacher is necessary to give more effective school-based help for pre-service teachers; they must understand the needs and obstacles that these pre-service teachers will face in their classrooms during their TP. Korkko, Ammala, & Turunen, (2016) argue that student teachers' learning should be promoted to the point of critical reflection, and that this should be included in the teaching practicum or in specific courses in the teacher education programme.

2. Aim of the Study

The purpose of this study is to investigate pre-service teachers' perspectives of classroom management and learner discipline in the classroom.

3. Objectives of the Study

Objectives of the study are as follows:
3.1. To determine how the pre-service teachers manage their classroom and learner behaviour.
3.2. To establish the strategies, they use for classroom management and learner behaviour.
3.3. To determine the effectiveness of the strategies.
3.4. To determine the impact that these strategies have on their self-efficacy as teachers.

4. Research Questions

4.1. How do pre-service teachers manage their classroom and learner behaviour?
4.2. Which strategies do the pre-service teachers use for classroom management and learner behaviour?
4.3. How effectiveness are those strategies they use for classroom management?
4.4. What impact does this have on their self-efficacy as teachers?

5. Review of Related Literature

Effective classroom management is a major concern for new teachers (Dicke, Elling, Schmeck, & Leutner, 2015), as well as for teachers' wellbeing (Sutton, Mudrey-Camino, & Knight, 2009) and their students' academic success (Evertson & Weinstein, 2013). Classroom management has been defined as a sequence of activities aimed at creating an environment in which students engage in learning activities designated by the teacher and disruptive behaviours are kept to a minimum (Emmer, 1984). Sahin (2015) defined classroom management as the process by which teachers develop the necessary organisation to create and sustain an environment conducive to learning. Wong and Wong (2014) define classroom management as "all that an educator does to organise the learners, space, time, and materials so that student learning can occur. According to Kellough & Kellough (2011), effective classroom management is the act of creating and running a classroom to maximise student learning. A poorly managed classroom is incompatible with the craft of teaching and learning. According to Sahin (2015), all teachers share the goal of promoting task-oriented instruction that fosters constant improvement of classroom management. Classroom management, according to Christofferson and Sullivan (2015), must include strategies that emphasise classroom norms, support efficient transitions, supervise student activities, and explain appropriate classroom behaviour. The function of classroom management tactics must be considered alongside the strategies used to deliver each lesson (Eisenman, Edwards, and Cushman ,2015).

Many teachers are unprepared for student behaviours in the classroom, which makes teaching and learning difficult (Flower, McKenna, & Haring, 2017). When their universal approaches fail, they should revert to them. Self-efficacy and the teacher's personality are also important elements in classroom management (Saleem and Muhammad 2020a). Classroom management self-efficacy refers to teachers' beliefs about their ability to execute classroom management tasks such as engaging with individuals and groups, setting classroom guidelines, expectations, and rules, and managing disruptive behaviour (Pfitzner-Eden, Thiel, & Horsley, 2015). Student behaviour is one of the most difficult challenges in the classroom; professional approaches are required to aid prospective instructors in developing strategies that encourage responsible attitudes and the use of analytical abilities in students (Hani, Muhammad, & Mahmood 2022).

5.1. Pre-service Teachers Regarding Classroom Management and Learner Behaviour During Teaching Practice

Classroom management is a significant contribution to the effective teaching and learning process in the classroom. Poor classroom management is usually associated to misbehaviors that interfere with teaching and learning and cause great stress (Rosas & West, 2009). The primary goal of classroom management is to guarantee that conduct is minimized rather than to minimize interruptions during the teaching and learning process (Sivri & Balci, 2015). Exposure to a real-world classroom environment equips the pre-service teachers with the necessary abilities to deal with crises that disrupt the teaching and learning process. However, this does not imply that the abilities they gained as teacher trainees are sufficient for them to supervise courses. However, exposure to fundamental classroom management skills implies that some may be well-prepared, but others may be unfamiliar with controlling classes as they present their lectures (Sethusa, 2020).

As a result, classroom management is frequently discussed alongside behaviour management, including positive and negative reinforcement. Challenging behaviour is a regular problem for special education teachers. If teachers do not deal with the challenging behaviour, it might disrupt the learning session and lead to fatigue (Yunus &Mohammed, 2019). Teachers who are skilled in classroom management, on the other hand, can effectively control students' behaviour difficulties. Many studies have shown that teachers who have a solid knowledge and comprehension of behaviour management may handle this issue confidently and positively (Butler and Monda-Amaya, 2016; Ahmad and Haifah, 2015). In essence, preservice teachers are expected to have learned how to govern and maintain order in the classroom during the teaching and learning process. Thus, if preservice teachers can effectively manage classrooms, there is a good chance that they will be able to assure effective teaching and learning to achieve learning outcomes.

5.2. Pre-service Teachers' Self-Efficacy and Professional Development in the Journey of Becoming Teachers

Self-efficacy beliefs are self-evaluations of one's ability to do an action successfully in a specific setting (Bandura, 1997). As a result, teachers' beliefs about their abilities to impact students' learning are self-assessments. Self-efficacy views (referred to hereafter as self-efficacy) are influenced by four sources that give individuals with knowledge about their own capacities, according to Bandura's (1997) social cognitive theory: (1) mastery encounters, (2) vicarious encounters, (3) social encounters, and (4) physiological and affective states. Influence their teaching behaviours (Bandura, 1997), pre-service teachers' self-efficacy beliefs at the start and end of practicum teaching experience would be helpful because these perceptions may have significant implications when they practice their profession. Pre-service teachers must therefore examine and analyse the effect of their self-efficacy beliefs on their ability to teach as well as their actual abilities during teaching practice. Even though teacher self-efficacy is important in assessing student involvement and implementing instructional strategies, teacher efficacy in classroom management has been a struggle for teachers (Carr, 2013). Dicke, Parker, Philip & Marsh, Herb & Kunter, Mareike & Schmeck, Annett & Leutner, Detlev (2014) studied 1227 German preservice teachers to see how teacher efficacy and student misbehavior influence teacher attrition. The findings revealed that emotional disturbance, as well as emotional exhaustion, was a stronger predictor of low self-efficacy in classroom management. Yin (2019) conducted an empirical study to assess a methodological course meant to increase the readiness of Chinese pre-service EFL teachers

to teach in a 4-week practicum in secondary schools. 15 pre-service teachers kept reflective notebooks during the practicum time. The results showed that the semester teacher training methodology course improved pre-service teachers' topic understanding by bridging the gap between theory and practice; however, the programme did not improve teachers' self-confidence in their communication skills.

5.3. Strategies Used by Pre-service Teachers for Classroom Management and Learner Behaviour and Its Effectiveness

According to a study conducted in Australia, preservice teachers regard classroom management as a significant issue (Peters, 2012). This view may imply that, despite having classroom management skills, preservice teachers have some difficulties. Some solutions to this problem include, but are not limited to, organising the physical layout of the classroom, organising teaching learning support material (LTSM), engaging instruction, matching learners' ability levels, routinizing procedures, applying positive behaviour supports and behavioural interventions, teacher monitoring, and delivering highly prepared lessons (Brophy, 2006). Christofferson and Sullivan (2015) argued that preservice teachers should set classroom rules, promote smooth transitions between teaching and learning activities, monitor learner performance, and communicate classroom behaviour awareness. These are the strategies that preservice teachers should be familiar with before beginning their teaching practice. If preservice teachers do not initiate and apply the above strategies for successful classroom management, they may find it difficult to control their classes during teaching practice.

6. Method

The study followed a qualitative approach. The interviews through focus group discussions were used to collect data as it enabled the researchers to interact with the participants in a way that allows them to openly express their feelings. Participation was solely voluntary. The conversations were guided by a focus group timetable. All participants were advised that the collected information would be kept confidential and that their names would not be used. The participants were referred as ST 1 to ST 10.

7. Findings

The pre-service teachers shared their views regarding their perceptions on classroom management and learner discipline during teaching practice. The participants indicated that they need support from their mentor teachers and assistance on how they should manage their classrooms as new teachers in the field. They also alluded that, during teaching practice they need to be informed of the things that they need to do, rather than being passive in some classrooms. Two research questions guided this study, and themes emerged from the data analysis. Student teachers' adequate preparation/ability to transfer theory into practice. In the study of Marais and Meier's (2000) where participants found a difference between theory and reality of teaching, and where respondents indicated that they could not reconcile the teaching methods as explained during their lectures with those used in schools by teachers, respondents in this study indicated that they were prepared and able to translate theory into practice, as well as that they were able to apply them.

The data revealed that, current practices that the pre-service teachers they can use in their classrooms, are with using positive reinforcement, they need to praise the learners on their

achievement they received on their tasks. The findings indicated that effective classroom management, on the other hand, entails more than just maintaining a sense of order or control; it also entails the development of healthy teacher-student connections as well as a grasp of instructional practices and environmental modifications. Classroom management and instructional management are intertwined since both processes include activities made by teachers to establish safe and effective learning environments that optimize instructional time (Alter and Haydon 2017; Cooper, Gage, Alter, LaPolla, MacSuga-Gage, & Scott 2018).

7.1. Research Question 1: *What Are The Current Practices Around Classroom Management for Third- And Fourth-Year Students in Teaching Practice?*

How Do Pre-service Teachers Manage Their Classroom and Learner Behaviour?

The findings revealed that the students' teachers need guidance regarding classroom management. The data also shows that the students teachers need the support of the mentor teachers, so that they can assist them in managing the behaviour of the learners in their classrooms. According to (Dicke, Elling, Schmeck, & Leutner 2015) strong classroom management can help to alleviate novice teachers stress and the "shock" of a new teacher's first classroom experience. As a result, it is not unexpected that new teachers across the country, particularly new special education instructors, seek mentorship, support, and further classroom management training (Fowler, Coleman, & Bogdan, 2019). Mentorship is an essential component of teacher induction, and new teachers who do not receive mentorship leave the field far sooner (Grey & Taie, 2015). According to Bistari (2017), effective teaching indicators include success in classroom management, success in the communicative process, good quality of students' responses, success in the learning process, and success in the lesson's objectives.

Which Strategies Do the Pre-service Teachers Use for Classroom Management and Learner Behaviour?

The findings indicated that pre-service teachers prefer to design activities that stimulate involvement and draw the learners' attention. These enjoyable exercises drew learners' attention to the lesson. Other techniques included having a good loud voice, being active in class by moving from one student table to the next, and the need to be severe. Merç and Subaşi (2015) stated that pre-service teachers' pay attention to them through making eye contact, reminding them, showing interest in them, rearranging students' seat rows, and having individual conversations after class.

How Effectiveness Are Those Strategies They Use for Classroom Management?

The findings revealed that the strategies that the pre-service teachers use in their classroom are more effective and they can draw the attention of the learners. The ultimate purpose of education is to enhance learners' competencies, and the message is conveyed to learners through words and gestures (Daskan &Yildiz, 2020). Body language is the component of teaching that draws the most attention from students. It is not essential what you say, but how you express it.

What Impact Does This Have on Their Self-Efficacy as Teachers?

The findings indicate that a teacher with a low self-efficacy might led to failure and teaching and learning won't be successful. As a result, self-efficacy can impact task selection as well as task persistence. Teacher self-efficacy (TSE) is referred to as instructors' beliefs in their abilities to organise, plan, and carry out actions necessary to affect students' valued educational objectives and results (Klassen, Tze, Betts, S & Gordon,2011). To increase instruction quality, it is necessary to recognise instructors' strengths and limitations in terms of their actual teaching practices.

Classroom management is the process through which teachers ensure that their pupils' disruptive behaviour does not interfere with the delivery of education. It encompasses both the proactive avoidance of disruptive behaviour and the appropriate response to it when it occurs.

Themes identified from the content analysis of student teachers' perspectives on classroom management include instruction management, behaviour management, teacher communication skills, and classroom physical Organisation. Pre- service teachers defined classroom management as all tactics and behaviour used by teachers to deliver content and conduct lessons effectively. One pre-service teacher stated:

8. Classroom Management and Communication Skills

> *It is difficult these days to reprimand the learners in the classroom, these learners are so misbehaving, I find it difficult to manage my classroom during teaching practice and it seems as if I am not doing my work.* (ST 1)

> *I discovered that learners became enthusiastic, and they actively participated in activities when they were praised and rewarded for their efforts and that's when you will be able to manage your classroom.* (ST 2)

> *Learners were unable to communicate in English, while I was unable to communicate in Sotho, resulting in pandemonium in my classroom.* (ST 3)

> *Another thing is the issue to teaching the learners, jooooooooooo, eish I struggle because what we are taught here is not what we experience in schools, if we can be given some opportunities on how to deliver or teach the learners during micro-teaching.* (ST 4)

This was support by (ST 5, ST 6 and ST 7) the pre-service students indicated that, if the module of SBX and Micro- teaching to be incorporated with the guidance on how to manage classrooms, deliver the subject content, they alluded that, they need strategies that they can employ in their teaching practice. Teachers who are confident in themselves and their teaching abilities have a greater impact on pupils and may easily influence them. They can recover from stress and maintain solid control over their teaching approach, all of which lead to pupils becoming extremely self-reliant (Hoy and Bandura, 2003).

> *Teaching practice is not difficult, I enjoy it but eish, when it comes to the issue of ill-discipline learners, it becomes difficult for you to teach them, how can you teach in a class full of noise.* (ST 10)

It is evident that the pre-service teachers need guidance during their teaching practice, they need to be assisted on how to deliver the subject content, manage the classroom. This had an impact on the student teachers' performance during teaching practice as well as their opinion of the teaching profession in general. This was also illustrated by Samu (2020), who stated that one of the major challenges faced by preservice teachers is the lack of physical connection with students, as well as the potential complexities associated with handling the emotional component of these meetings (Samu, 2020). Similarly, Sepulveda-Escobar and Morrison (2020) revealed that preservice teachers reported feeling very uncomfortable and having less passion to teach due to a lack of direct connection with pupils. Teachers should acquire classroom management strategies to establish a learning environment that improves both academic skills and social-emotional development of children to promote students' performance in school (Milliken, 2019). Unfortunately, data shows that most teacher training programmes devote little time to classroom management teaching. It has also been demonstrated that well-managed classrooms result in students who participate while achieving high levels of success (Milliken, 2019).

Learner Discipline

Similarly, to Marais and Meier's (2004) results, where respondents reported a decline in moral standards in schools and a lack of discipline, most respondents in the current research said that discipline was virtually non-existent in most institutions. One responder stated:

> *Learners were very unruly because there were no effective disciplinary measures in place. Cell phones were permitted in class, which I found quite distracting.* (ST 9)

> *Learners had the notion that we were their age peers, thus they did not respect us. There is absolutely no discipline. Learners are impolite. It is difficult to keep the class under control. Even when the teacher is there, students are playing cards and eating in class.* (ST 6)

Contrary to the negative responses above, respondents (ST 5 and ST 4) from one school stated that students were well behaved and actively participated in class activities.

> *Learners respect us as teachers, though some believe that because we are student teachers, we don't have the power/authority to punish them.*

Therefore, the manner student teachers were accepted and treated differed from school to school. Most student teachers in this study stated that they struggle with classroom management, learner discipline and subject content at their placement schools, which resulted in other teachers and learners not appreciating them. This had a considerable impact on student teachers' performance during classroom practice and a negative impact on their overall view of the teaching profession. Student teachers were severely constrained by learner discipline. The instructional atmosphere did not allow student teachers to put their academic education into practice. It's possible that student teachers weren't sufficiently prepared for the real-world situation in which they were intended to teach.

8.1. Strategies That Pre-service Teachers Can Use for Classroom Management and Learner Behaviour

Improving self-confidence: When beginning to teach for the first time, pre-service teachers are frequently frightened. Their nervousness is frequently caused by offering incorrect explanations throughout the session, which leads to pupil misunderstanding. However, no matter how frightened they are, they must be able to manage their anxiety. One solution is to provide clear, calm, and brief instructions as well as a strong visual assistance. It allows pupils to focus on what the pre-service teachers are saying and easily grasp the teaching. Merç and Subaş (2015) also stated that asking students to repeat the teaching is one technique to verify student comprehension. Therefore, pre-service teachers need to enhance their self-efficacy so that they may be able to deal with classroom challenges during their teaching practice.

Planning the lessons. When pre-service teachers lead a group discussion or activity, students may choose to do whatever they wish. Some kids may converse extensively with their peers, while others may keep mute in the group. This issue has the potential to disrupt class activities. In such a case, pre-service teachers should thoroughly prepare the lesson prior to their class lessons.

The results of this study revealed the pre-service teachers need guidance to improve on their teaching performance. They need to be empowered with strategies to improve on how their classroom management skills as well as dealing with ill-discipline learners. Teaching practice is an important tool that can enhance the pre-service teachers' teaching performance. The results also indicate that pre-service teachers require assistance from both their mentors and their principals to be able to improve on their self-confidence, how to deliver content effectively and efficiently and on how to plan their lessons thoroughly. Without their support and induction, students may develop poor self-esteem. Feedback is critical in assisting them to correct any flaws made throughout their teaching practice.

9. Conclusion

Teachers do require expertise to teach well in a variety of areas, such as criticism and praise, handling mistakes, student inquiries, and properly designed sessions. Also, to regions lowering anxiety and motivation. When praise is genuine and genuine, it is most effective. They must complement them with suitable gestures and behaviors. Teachers should aim to inspire kids so that they would be more inclined to pay attention. Respect is also essential while dealing with youngsters. Responding favourably to incorrect responses is a constructive method to teach. The classroom setting is crucial. Creating a healthy classroom atmosphere is one of the key reasons that children enjoy going to school, and children also enjoy learning. Teaching practice is an important part of personal development since it allows student teachers to achieve their objectives, such as improving their teaching performance and self-efficacy, as well as classroom management.

To successfully train future teachers, every educational institution should embrace micro-teaching. As a result, teacher educators in teacher education programmes, particularly those at higher learning institutions, should plan and conduct micro-teaching in pedagogical courses to improve student teachers' teaching competences and performance. Furthermore, professional instructors should supervise first-year student teachers in both the primary and

secondary levels of micro-teaching and observation activities so that the student may be able to enhance their teaching performance.

Official Conference Proceedings

Abstract

Nurturing students' inquiring minds is essential as it encourages curiosity and critical thinking, both of which are tools for independent learning and problem-solving. In this study, we examined the effects of AR-Quest activities integrating with the experiential learning approach on undergraduate students' inquiring minds. Thirty Thai undergraduate students participated in the study, which spanned a three-week period, where students were asked to do AR quests. The AR quests were designed to be inquiry-based, fostering students' discovery, collaboration, and reflection. The AR quests encompassed a confirmation quest, a discovery quest, and a collection quest. We used a 5-point Likert scale survey questionnaire to collect data on the students' curiosity, critical thinking skills, and willingness to explore new ideas. Descriptive statistics was employed to calculate mean scores and standard deviation. The findings revealed that the AR-Quest activities stimulated the students' curiosity, promoted their critical thinking, and enriched the learning experience. Additionally, the findings suggested that the experiential AR activities could foster an engaging learner-centred environment that encouraged exploration, questioning, and discovery. In this regard, integrating experiential learning with AR technology facilitated a shift from a conventional classroom paradigm to a more dynamic, interactive learning regime, making learning meaningful and nurturing students' inquiring minds. However, in future studies, researchers/educators are recommended to consider a controlled group comparison to provide a comparative baseline to measure the effectiveness of the experiential AR-Quest activities.

Introduction

Teaching and learning processes should inspire and captivate students' minds and imaginations (Pugh & Girod, 2007). McDougall (2014) states that students achieve their best in learning when they are involved in the learning content and focus on the subjects being learned. In experiential learning, practical learning activities form the core of meaningful learning experiences (Itin, 1999). This engagement unfolds across various levels of student participation (Hawtrey, 2007).

In traditional teaching approaches, having students explore learning quests usually ends with boring learning (Warda & Mohammed, 2016). However, learning quests where experiential learning and augmented reality are integrated can improve student engagement in learning activities (Carmigniani & Furht, 2011; McDougall, 2014). By providing students with hands-on experience related to the learning content, students, experiential learning and augmented reality facilitate a more meaningful and impactful knowledge learning (Masood & Egger, 2019; Yardley, Teunissen, & Dornan, 2012).

Lessons integrated with experiential learning and augmented reality technology can engage students more than many traditional lessons do (Gopalan, Bakar, & Zulkifli, 2017; McDougall, 2014). Combining the two approaches encourages students to look deep into what they are learning and critically apply, analyze, synthesize, and evaluate what they learn (Carmigniani & Furht, 2011; Haynes, 2007). The experiential augmented reality approach transforms the learning environment into a dynamic space that fosters inquiry-based learning, enabling students to develop and refine their inquiring minds. (Cannon & Feinstein, 2014; Carmigniani & Furht, 2011).

When lessons are experiential, situated, authentic, and contextual, the learning will be evocative, germane, memorable, and entertaining for students (Hawtrey, 2007). Consequently, these improve students' learning outcomes and encourage them to develop their inquiring mind of the love of learning (McDougall, 2014). In this paper, we explored how augmented reality quests based on the experiential learning approach can promote student inquiring minds.

Literature Review

Experiential Learning in Education

Experiential learning is a dynamic, student-centered approach that promotes active engagement, critical thinking, and problem-solving skills (Yardley et al., 2012). It plays a crucial role in education by providing students with hands-on, real-world experiences that enhance their learning and development (Haynes, 2007; Yardley et al., 2012). Experiential learning can engage students in learning, moving beyond passive listening and reading. This pedagogical approach encourages active participation in activities, experiments, and real-world simulations (Yardley et al., 2012), fostering deeper understanding, critical thinking, and problem-solving skills (McDougall, 2014). The shift from passive reception to active engagement represents a fundamental aspect of experiential learning, aligning with educational concepts emphasizing the importance of hands-on involvement in the learning process (Choi & Hwang, 2017). Moreover, experiential learning strongly emphasizes the practical application of knowledge and skills (Murphy, 2007). When students are provided with opportunities to transfer theoretical concepts into real-world situations, this approach

enables them to perceive the relevance and practicality of their academic pursuits. Applying knowledge in practical contexts enhances students' problem-solving abilities and facilitates bridging gaps between theoretical understanding and real-world implementation (Yardley et al., 2012).

Augmented Reality in Education

AR technology has gained significant attention in education due to its ability to create interactive and immersive learning environments (Masood & Egger, 2019). By overlaying digital content onto the real world, AR enhances students' understanding of abstract concepts and promotes active learning (Carmigniani & Furht, 2011). Previous studies have demonstrated the effectiveness of AR in various educational domains, including science (Gopalan et al., 2017), mathematics (Bujak et al., 2013; Estapa & Nadolny, 2015), and language learning (Eang & Na-Songkhla, 2020).

However, integrating augmented reality in education comes with certain challenges. One of the primary challenges is the cost and accessibility of AR devices and software (Rabbi & Ullah, 2013). Content development poses another challenge, requiring teachers to ensure alignment with learning objectives and provide meaningful learning opportunities (Lee et al., 2021). Technical considerations, including connectivity and device compatibility, must be addressed to ensure seamless implementation (Masood & Egger, 2019). Ethical and privacy concerns, especially relating to the collection and analysis of student data, represent additional dimensions warranting careful consideration in the implementation of AR technologies in educational settings (Bodkhe, Verma, Saraswat, Bhattacharya, & Tanwar, 2022).

Inquiring Minds via Experiential Learning

Houle (1961) is the first person to explain adult learners' motivation for learning and learning outcomes in non-formal education. His famous book, The Inquiring Mind (Houle, 1961), published concepts about adult education and self-learning basics. Houle describes many features of adults in informal learning activities. For example, each student is committed to what they learn, has educational goals, is happy with the learning process, and sees the value of education (Houle, 1961). In addition to research on the learning characteristics of adults, Houle classifies students into three groups:
1. Goal-Oriented Learners: this group of students will use education to achieve their goals. They believe education is a way to solve problems and respond to their interests.
2. Activity-Oriented Learners: this group of students will participate in activities or do things of interest to them in the learning context. This group will admit directly that they come to study for reasons other than learning.
3. Leaning-Oriented Learners: this group of students will participate in activities to learn about what they have in mind. They are committed to learning activities and see education as fun. This group of students can guide themselves to learn better than other groups.

Houle (1961) believes that experiential learning is one effective method used in promoting students' inquiring minds, which can engage students in the lessons by using experiences as the primary approach to learning. Lessons where there is the integration of an experiential

learning approach foster student inquisitiveness and nurture their inquiring mind, allowing them to get on well with the technologically driven world (Houle, 1961).

Nurturing Inquiring Minds Through Augmented Reality

There are few research studies on using AR-Quest activities to nurture students' inquiring minds. However, it is interesting to look at how the quest activities with AR technology shed light on this field. AR-Quest activities can be designed to confirmation quests that allow students to validate or confirm existing knowledge or concepts (Eang, 2019). These quests allow students to apply their prior knowledge and verify its accuracy through interactive AR experiences. By engaging in confirmation quests, students can deepen their understanding of concepts and develop confidence in their knowledge (Hill & Knutzen, 2017). Nurturing students' inquiring minds can also be done through discovery quests, designed to foster curiosity, exploration, and independent learning (Supratman & Wahyudin, 2021). These quests encourage students to investigate and discover new knowledge or concepts through AR experiences. Discovery quests promote active engagement and critical thinking as students explore virtual environments, analyze information, and make connections between different concepts (Kaur & Kauts, 2018). Collection quests can also be used to nurture students' inquiring minds. This type of quest usually involves students gathering and organizing information or objects related to a specific topic or theme (Eang, 2019).

AR-Quest Framework

Eang and Na-Songkhla (2020) developed an AR-Quest framework for teachers to adapt to design interactive and effective language learning. Table 1 gives a brief summary of the framework.

Table 1. Overview of AR-Quest Framework by Eang and Nasongkhla (2020)

Characteristic
• Learning activities are inquiry-based.   • Students learn together in a semi-structured approach.   • Learning activities are linked with real situations, and students learn by experiencing them.   • Authentic learning tasks promote both students' social and physical engagement. The authentic learning experience is promised.
Grounded theories
• AR-Quest Model is based on experiential learning theories and inquiry-based learning theories.
Process
• *Analyze objectives*: objectives are what keep teachers on the right track. To analyze learning objectives, the existing curriculum and syllabus are to study.   • *Analyze the context*: teachers determine who the students are and also identify the learning context.   • *Plan*: teachers need to be clear with the learning objectives and determine learning resources that students will need to solve the quests.   • *Prepare*: teachers prepare resources and other necessary tools and make sure everything is in place when needed to be used.   • *Design*: script the learning activities based on the ideas and preparation from the previous steps.

• *Facilitate*: teachers hold back to give students assistance to complete answers to their questions. Instead, teachers help students through quest exploration and encourage to discover the solution on their own. • *Evaluate*: teachers use the assessment techniques/tools which are planned in the earlier steps. Students' learning progress can be assessed in discussion and reflection sessions.	
Resource	**Assessment**
• Learning resources are to be well-prepared before the quest discovery. • Primary resources for AR-Quest activities include worksheets, AR materials (AR markers), and AR mobile application.	• Assessment tools for the quests of augmented reality vary to each quest's design. Students can be assessed by observation and tests.
Teacher's role	**Students' role**
• Teachers explain the purpose of experiential learning to students. • Teachers are less dominant in the AR activities classroom. • Teachers promote authentic learning experience positively. • Teachers provide a situation or an experience that attract students' interest. • Teachers link learning objectives with authentic situations or experiences. • Teachers provide students any helpful resources to help students solve the AR quests. • Teachers allow students to explore, investigate, and uncover answers on their own.	• Students have their hands on practically authentic problems. • Students are involved in difficult and challenging tasks while exploring the AR quest. • Students are given freedom in the whole learning process if they make positive progress. • Students do self-evaluation on their learning progress. • Students learn from challenging tasks and become willing to change. • Students form new knowledge from the learning activities.

Methodology

Sample

The study involved a sample of thirty Thai undergraduate students who participated in a three-week exploration of AR-Quest activities. The students were exposed to experiential learning approaches integrated with augmented reality (AR) technology through confirmation quests, discovery quests, and collection quests.

Procedure

This research study lasted for three weeks, with 3 hours each. Before introducing the treatment, the students were asked to complete a self-evaluation survey questionnaire. In each week, students were introduced a new AR-Quest activity. In the first week, a confirmation quest was introduced to the students. The quest was a vocabulary verification activity where students used the mobile with AR application installed to scan printed images (markers) related to specific vocabulary words. The AR application then provided audio and/or visual cues to confirm the correct pronunciation and meaning of the words. This interactive experience allowed students to validate their Khmer vocabulary knowledge and reinforce their understanding of word meanings and pronunciation.

In the second week, they were asked to complete a discovery quest. This quest was designed to encourage students to explore the linguistic connections between Khmer and Thai, sparking curiosity about the similarities and differences in vocabulary. In this discovery quest, students were to analyze linguistic patterns and connections, requiring critical thinking skills as students later on reflected on the shared and distinct characteristics between the two languages. The quest also promoted a willingness to explore linguistic diversity and cultural connections, fostering an open-minded approach to language and communication.

In the last week, the students were asked to complete a collection quest. Students were required to listen to audio and observe 3D models representing Khmer words for stationery tools. To complete the worksheet, they needed to apply critical thinking skills to match the Khmer words with their Thai equivalents. The use of AR technology added a dynamic and interactive element that made the learning experience more enjoyable and fostered a positive attitude toward exploring new concepts.

After the last session, the students were administered the same survey questionnaire used to compare with their previous questionnaire data.

Figure 1: Students are doing AR-Quest activities.

Research Instrument

The research instrument for data collection in this study was a self-evaluated questionnaire. The questionnaire consisted of three independent sections, including 1) curiosity, 2) critical thinking, and 3) willingness to explore new ideas, with five items each to assess students' inquiring minds.

Data Collection

The data from the questionnaire during the pre- and post- treatment were calculated to find the mean and standard deviation (SD). Then, the paired sample t-test was used to examine the changes in students' inquiring minds before and after the treatment.

Results and Discussion

In this study, we used the T-test analysis to assess the impact of the AR-Quest activities on the students' perceived inquiring minds. Thirty participants were involved in the study, and the paired differences between pre- and post-treatment self-assessment scores were examined.

Table 2. T-test results of the students' inquiring minds before and after the intervention

Self-Assessment	N	Paired Differences		Sig
		Mean	SD	
Post – Pre	30	5.466	1.105	0.001*

Based on Table 2, the mean was 5.466, representing the average change in students' self-assessment scores, with a standard deviation of 1.105, indicating the variability among participants, with the p-value of 0.001, indicating a highly significant difference in students' perceived inquiring minds after engaging in the AR-Quest activities. This suggests that the AR-Quest activities were effective in fostering students' inquiring minds.

Table 3. Inquiring Mind Components

Pair (Post – Pre)	N	Paired Differences		Sig
		Mean	SD	
1 Curiosity	30	1.700	1.022	0.001*
2 Critical Thinking	30	2.100	0.711	0.001*
3 Willingness to Explore	30	1.666	1.061	0.001*

The research findings, as presented in Table 3, provide a detailed examination of the impact of AR-Quest activities on specific components of the students' inquiring minds. While Table 2 initially indicated a potential improvement in the students' inquiring minds, Table 3 delves into the nuances by investigating the three key elements: Curiosity, Critical Thinking, and Willingness to Explore.

Regarding the curiosity component, the mean paired difference of 1.700 indicates a significant increase in students' self-perceived curiosity following the engagement in the experiential AR-Quest activities, with a p-value of 0.001, providing strong evidence that these activities effectively fostered curiosity among participants. This aligns with foundational principles of experiential learning, as argued by Huang (2019) and Moorhouse, tom Dieck, and Jung (2019), who argue that hands-on experiences and active engagement by augmented reality promote curiosity by encouraging students to explore and question their surroundings.

Examining critical thinking, the mean paired difference of 2.100 signifies a substantial improvement in the students' critical thinking skills from the experiential AR-Quest activities, with a p-value of 0.001. This indicates that the experiential AR-enhanced learning activities positively contributed to the development of critical thinking among students. This finding supports prior research highlighting the benefits of experiential learning activities in fostering critical thinking skills, as emphasized by Rogers et al. (2023) and Huang (2019), who argue that experiential learning creates authentic environments requiring students to apply critical thinking skills in problem-solving tasks.

Lastly, regarding the willingness to explore, the mean paired difference of 1.666 indicates a noteworthy increase in students' openness to exploring the subject matter, with a p-value of 0.001. This emphasizes the positive impact of experiential AR-Quest activities on fostering a sense of exploration among the students. The perceived improvement in students' willingness to explore aligns with experiential learning literature, emphasizing the importance of hands-on experiences in promoting openness to new ideas and experiences, as articulated Konak, Clark, and Nasereddin (2014) and Huang (2019).

Conclusion

The research findings offer valuable insights into the transformative potential of experiential learning and augmented reality (AR) in fostering student inquiring minds. The integration of AR technology with experiential learning approaches emerges as a promising approach for teachers, providing a dynamic and learner-centric framework that nurtures active and inquiry-based learning.

The observed statistically significant improvement in the students' inquiring minds underscores the effectiveness of the experiential AR-Quest activities in fostering a holistic development of students' cognitive abilities. These findings carry implications for teachers and curriculum developers as they emphasized that augmented reality, when incorporated into learning experiences, presented a valuable opportunity to transcend traditional teaching methods. By recognizing the potential positive impact of AR-Quest activities, teachers can design innovative learning experiences that captivate students' interest and stimulate their inquiring minds.

Recommendations

This study employed a one-group pre-test and post-test design involving a 3-week intervention. For future research studies, researchers should consider incorporating a controlled and experimental group comparison. This addition would offer a comparative baseline, allowing for a more comprehensive assessment of the effectiveness of experiential AR-Quest activities. Additionally, extending the duration of the study to a longer time frame is recommended for a more nuanced understanding of the sustained impact of the intervention.

The Contradictions of Implementing Flipped Classrooms at Pre-university Education: An Activity Theory Perspective

Sahrunizam Kasah, Maktab Duli Pengiran Muda Al-Muhtadee Billah, Brunei
Muniratul-Ain Adnan, Maktab Duli Pengiran Muda Al-Muhtadee Billah, Brunei

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

A limited body of research has investigated on the factors that primarily affect the implementation of Flipped Classroom Model (FCM) at pre-university education. This study aims to uncover the contradictions that emerge when applying a whole-school FCM approach in a pre-university institution in Brunei Darussalam. The Activity Theory (AT) lens was applied to examine the intricate dynamics of FCM activities from various perspectives. Combining questionnaire data with semi-structured interviews revealed a multi-faceted view of the participants, shedding light on both the adoption and non-adoption of FCM. The discursive manifestations of the identified contradictions unveiled numerous dilemmas, conflicts and critical conflicts within the activity system. Interestingly, teachers' positive attitude and disinterest for FCM co-exist, primarily due to the 'conflicting' nature of the A Level curriculum within the pre-university education system. A range of contradictions emerged encompassing disparities in pedagogical approaches, lack of ICT skills and insufficient familiarity with FCM amongst teachers. Furthermore, the study underscored contradictions evident in students' struggle to embrace self-directed learning, coupled with a preference for procedural learning over conceptual learning, further exacerbating the conflicts within the activity system. These findings substantially contribute to our understanding of how participants are affected by contradictions inherent within and between the elements of the FCM activity system. By utilising AT as an analytical tool, educators, administrators, and researchers can proactively anticipate challenges and devise solutions to address contradictions that might hinder the effective integration of FCM within the existing pre-university education framework.

Keywords: Flipped Classroom Model, Activity Theory, Contradictions

Introduction

Aligning pre-university education with the Flipped Classroom Model (FCM) may seem straightforward in theory, but its practical application presents challenges in effectively merging efforts to benefit pre-university students. Despite its intuitive appeal and promising outcomes, achieving this alignment proves complex due to various factors, such as overly mechanistic viewpoints and a lack of strong theoretical foundations. To deepen our understanding of this dynamic interplay between educational domains and teaching methodologies, we propose adopting a theoretical perspective rooted in Activity Theory (AT). Through this lens, we aim to address limitations in existing research and explore the complexities and obstacles of aligning pre-university education with the FCM.

This analytical approach aims to enrich our understanding of the shift towards blended learning in a pre-university setting by presenting a well-grounded theoretical viewpoint. Building on AT, we argue that pre-university education and the flipped classroom model constitute interconnected yet distinct activity systems. AT provides a structured framework for analysing these systems, their elements, and their intricate connections. By leveraging AT's concept of tensions, it enables the identification and resolution of misalignments within and between these systems, driving their mutual development. Thus, AT offers a comprehensive framework for describing and examining the intricate relationships between these two domains.

To illustrate the effectiveness of AT in understanding the alignment between pre-university education and the FCM, we conducted an extensive case study focused on this institution. Our analysis spanned three school terms of implementing the FCM and delved into how pre-university education and FCM evolved within the intricate organisational setting. Our empirical findings highlight that consistently addressing emerging tensions within and between these systems, coupled with implementing necessary adaptations, fosters the co-evolution of both systems. While more research is necessary to validate this framework's practicality, our initial evidence suggests that employing activity system analysis empowers practitioners to systematically identify and resolve misalignments.

Utilising AT for School Transformation Initiative

AT stands as a contemporary paradigm for analysing and reshaping collaborative activities embedded within social contexts and their associated networks. At its core, this theory asserts that human psychological processes' structure and evolution stem from culturally mediated and historically evolving practical activities (Leont'ev, 1978; Luria, 1979; Vygotsky, 1978). Cole (1996) underscores the importance of incorporating the social-institutional context of the activity when conducting a cultural-historical analysis.

Originating from Vygotsky (1978) and Leont'ev's (1978) foundational work, AT builds upon the premise that human activity inherently aims toward an object (Engeström, 1995) and is mediated by various tools that enhance achieving desired outcomes (Blackler, 1993). This mediating network is typically represented as a fundamental activity system model, depicted as a triangle involving a subject, object, and tools (Vygotsky, 1978).
Figure 1: Engeström third generation AT triangular system (Engeström, 2001)

The "object" in an activity is the central focus guiding human agents' efforts to achieve specific goals within a culturally defined framework (Engeström, 2001). This object serves as a motivating and organising force driving the activity's progression (Kaptelinin, 2005; Nicolini et al., 2012). To improve goal achievement, individuals use cognitive and physical "tools" (Blackler, 1993; Engeström, 1995), which draw from accumulated experience and skills while aligning with their capacities (Kuutti, 1995). Therefore, the success of human activity hinges on the availability and suitability of these material or symbolic artifacts.

Engeström (1987) expanded the foundational triangular model of human activity by introducing community, division of labour, rules, and norms, emphasising their interplay within activity systems. This framework highlights that human activity involves more than just subject, object, and tools. Engeström underscores that a community, with varied motivations, rules, norms, and labour divisions, emerges around the object, mediating between the subject and the broader community. This approach acknowledges the conflictual nature of human activity, marked by ambiguity, interpretation, sense-making, and potential for change (Engeström, 2001).

This extension of AT reveals how complex work systems evolve, viewing activities as networks of interacting systems (Blackler et al., 2000). These activities are open systems, capable of adopting external elements or being influenced by related systems. New mediating artifacts may emerge from the community or through related activities, potentially introducing contradictions. These contradictions, tensions within or between elements or activities, challenge objectives and create instability. While problematic, contradictions also prompt opportunities for change, driving collaborative efforts towards evolution (Allen et al., 2013).

Contradictions fuel human progress (Engeström, 2001), where stability is rare, and disruptions and innovations are commonplace (Cole and Engeström, 1993). Development involves iteratively altering elements within activity systems to address emerging contradictions, often historically rooted. Culturally advanced systems evolve through these

transformations, fostering expansive learning cycles where objectives and motives broaden. Organisations adept at expansive transformations gain a competitive edge.

AT is instrumental in school transformations, offering a structured framework to analyse and improve educational processes. It promotes a holistic view of educational systems, encourages collaboration, and guides interventions for better teaching and learning practices. The study's framework involves flipped learning for out-of-class activities and active collaborative learning for in-class instructions, aiming to cultivate effective habits and skills. Flipped learning was used outside class, leveraging video lectures for new information and exercises targeting basic cognitive skills. Students assessed their understanding through self-reflection forms, using technology as a tool for autonomous knowledge construction beyond traditional homework assignments.

Incorporating flipped learning and structured collaborative learning rooted in socio-constructivist principles, this study aims to assess both the benefits and challenges of employing the flipped approach in pre-university education. It specifically focuses on its potential for positive learning outcomes and addressing any tensions revealed through the lens of AT.

Rationales of the Study

The goal is institution-wide adoption of FCM for transformative change. AT is pivotal for comprehensive analysis of educational processes, providing a structured approach to pinpoint contradictions, encourage collaboration, guide design, and align with educational objectives. This multi-layered approach empowers institutions to navigate complexities and improve teaching practices in today's dynamic educational setting.

Research Question

This study primarily focuses on a fundamental research inquiry: What contradictions arise during the implementation of FCM within the institution?

Methodology

i. Surveys and Participants

The study involved various participants: 860 Year 11 and Year 12 pre-university students completed the FCM questionnaire, while 108 teachers responded to one questionnaire about their experience, and 99 provided insights into their perceptions. Additionally, 164 parents shared their views on their children's blended learning experiences. Descriptive statistical analysis was used to uncover emerging themes from the surveys.

In addition, the research integrated semi-structured interviews involving 35 participants, comprising 25 students and 10 teachers selected through purposeful sampling criteria.

ii. Student Group Interviewees

Twenty-five students from Year 11 and 12 pre-university institutions were selected for interviews. The selection criteria for student participants included their experience with the FCM, academic performance and willingness to participate. Efforts were made to ensure

diversity among student participants, considering factors such as age, gender, and academic achievement.

iii. Teacher Group Interviewees

Ten teachers who were actively involved in implementing the FCM in various subjects were selected for interviews. Teacher participants were chosen based on their expertise in the subject matter, experience with the FCM, and willingness to contribute to the study. All participants provided informed consent, and their confidentiality and anonymity were rigorously maintained throughout the study. Pseudonyms were used to protect the identities of the participants in any study reports or publications.

Thematic analysis was employed to interpret and process the interview transcripts.

Results

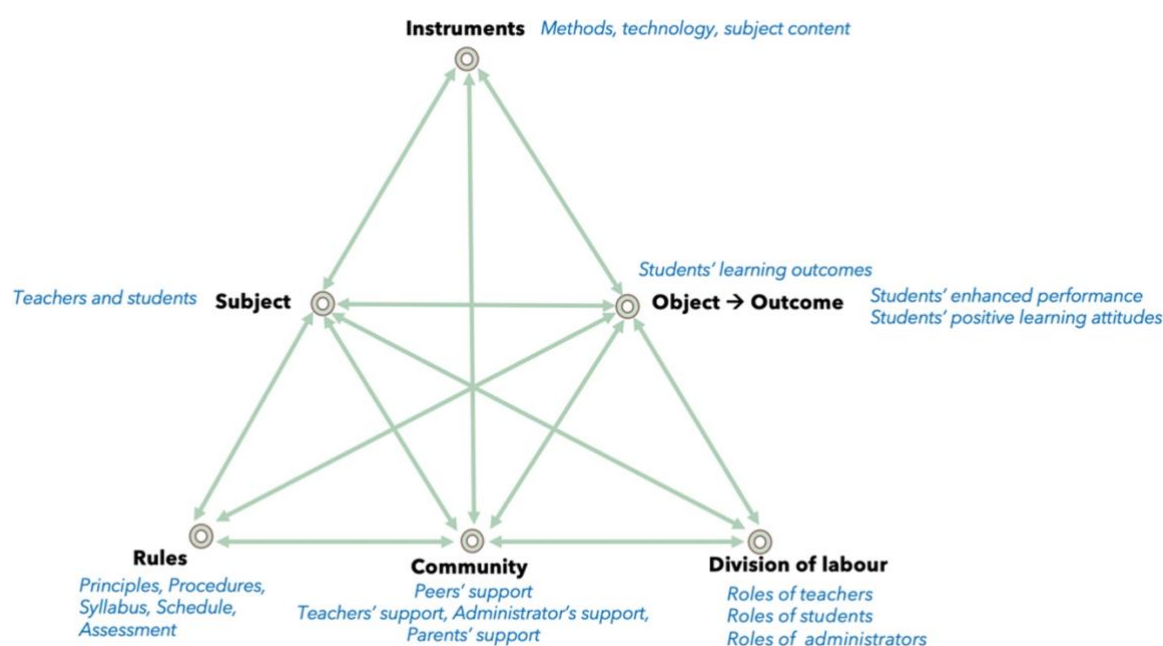
By utilising Engeström's third-generation model of the activity system (2001), we analysed how goal-oriented actions are mediated by a wide array of pertinent factors, encompassing psychological, technical tools, and even social structures within the activity system for implementing FCM across the entire school. The activity system (Figure 2) is depicted below:


Figure 2: The activity system of FCM implementation in the pre-university institution

The survey results reveal a multitude of advantages associated with integrating the FCM at the activity level for both students and teachers. The implementation of FCM has yielded numerous benefits that significantly influence both students and teachers within the educational sphere. This innovative pedagogical approach has resulted in positive outcomes, particularly evident in terms of students' self-regulation, self-efficacy, independence, collaboration, and engagement (Table 1). FCM plays a crucial role in empowering students by enhancing their self-regulation skills. By transferring the responsibility of acquiring foundational knowledge to individual out-of-class preparation, students are encouraged to

oversee their own learning pace and style. This approach nurtures students' self-awareness regarding their learning needs and preferences, ultimately leading to enhanced self-regulation. This newfound autonomy not only equips students with essential skills for their academic journey but also for continuous learning throughout their lives.

Table 1: The emerged themes resulting from survey analyses

Instrument	Item	n	Quantitative	Emerged themes
Student's perception on FCM	34	860	Cronbach's α = 0.95	Self-regulation, self-efficacy, independence & collaboration among students
Tutors' perception on blended learning - FCM	19	108	Cronbach's α = 0.91	
Tutors' understanding of FCM	21	99	Cronbach's α = 0.97	
Parents' perceptions and experiences with FCM	28	164	Cronbach's α = 0.91	

Additionally, the FCM contributes significantly to the cultivation of students' self-efficacy. Within the dynamic learning environment shaped by FCM, where students actively participate in problem-solving and critical thinking exercises, a sense of competence and confidence in their academic abilities is instilled. As students successfully navigate complex content and tasks, their belief in their academic capabilities strengthens, potentially enhancing their overall academic performance. Moreover, FCM plays a pivotal role in fostering collaboration among students. In-class sessions often feature collaborative activities that encourage interactions among peers, promoting cooperative learning. These interactions facilitate the exchange of knowledge, diverse perspectives, and teamwork, thereby nurturing a sense of community and belonging among students. This collaborative approach not only enriches their learning journey but also prepares them for future collaborative efforts in professional settings.

Most importantly, FCM enhances student engagement. The interactive and participatory nature of flipped classrooms captures students' attention and enthusiasm. They are actively involved in discussions, problem-solving, and knowledge application during in-class sessions, which creates a dynamic and stimulating learning environment. This increased engagement can lead to heightened motivation and a deeper understanding of the subject matter. All in all, the integration of FCM presents significant advantages for both students and teachers, encompassing enhanced self-regulation, improved self-efficacy, boosted collaboration, and heightened engagement. These positive effects not only contribute to students' academic achievements but also equip them with essential skills and attitudes that extend beyond the classroom, shaping their future endeavours.

Affordances can be used as a valuable framework for generating interview questions, particularly in the context of educational research or when studying how individuals interact with specific environments or technologies. By identifying the specific affordances, we can explore valuable insights into how individuals perceive and interact with the features and possibilities offered by a particular environment, technology, or context. This approach can be especially useful in user experience research, educational research, and studies involving the evaluation of technologies or systems. It can also be a useful framework for identifying contradictions within an activity system. Contradictions in an activity system arise when

there are conflicts, tensions, or inconsistencies between different elements or components of the system. Affordances, which refer to the opportunities and possibilities that an environment or technology offers, can help pinpoint where these contradictions may occur. By identifying the specific affordances within the activity system to examine. These might be features or aspects of the system that are relevant to your research or analysis, assess how each identified affordance functions within the activity system and influences the actions, behaviours, or interactions of the participants. By using affordances (Table 2) as a lens to examine the interactions and relationships within an activity system, we can uncover contradictions that may affect the system's functionality, effectiveness, and the experiences of participants. Identifying and addressing these contradictions is essential for improving the design and implementation of the system.

The interview questions were carefully crafted to probe deeper into any contradictions or discrepancies that participants might have experienced. For instance, questions were framed to inquire about situations where students felt both highly engaged and, at times, disengaged within the FCM. Similarly, teachers were asked about moments when they observed students demonstrating self-regulation effectively and instances when they struggled with it. During the data analysis phase, researchers paid close attention to responses that indicated conflicting experiences, viewpoints, or challenges faced by participants. These discrepancies were noted as potential contradictions within the activity system of FCM implementation. Contradictions signify areas of tension, conflict, or inconsistency within the FCM's implementation and operation. Recognising these contradictions provides valuable insights into the complex dynamics at play within the educational setting. It allows educators and researchers to pinpoint challenges that students and teachers may face, facilitating the development of targeted solutions and interventions. Moreover, understanding contradictions helps refine the FCM's design and implementation, aligning it more effectively with educational objectives. By addressing these contradictions, educators can harness the full potential of FCM, enhancing its impact on students' self-regulation, self-efficacy, collaboration, and engagement. Therefore, the identification of contradictions is not merely a research endeavour; it is a strategic tool for refining and optimising the FCM to create a more conducive and effective learning environment. Based on interview data analysis, several contradictions were uncovered in the FCM activity system (Table 2).

By integrating this approach into the research process, the study aimed to not only highlight the affordances but also uncover and analyse the contradictions within the FCM activity system. This comprehensive examination provided a more nuanced understanding of how FCM impacted both students and teachers, encompassing both positive and challenging dimensions of the educational approach. Students' experiences with the FCM reveal several noteworthy affordances and contradictions within their activity system. The affordances corroborate the positive emerging themes from the survey outcomes. The contradictions, on the other hand, encompass challenges related to a heavier workload caused by FCM's out-of-class assignments, disparities in technology access and technical issues, difficulties in providing constructive feedback during peer assessment, the absence of immediate feedback during out-of-class activities, a preference for teacher-created video content over generic resources like YouTube, the need for precise instructions when assigning out of class tasks, struggles in adapting to the autonomy required for in-class active learning, and a tendency to focus on procedural learning for exam preparation rather than the desired conceptual understanding. These contradictions underscore the need for careful consideration and adjustments when implementing FCM to ensure its effectiveness in fostering student learning outcomes.

Table 2: Thematic analysis of students' affordances and contradictions on FCM

Theme	Students' Learning	Affordances	Contradictions
Active learning	Organisation	Students generally have a positive attitude and are open to both out-of-class and in-class tasks and activities.	Students unable to complete out-of-class task due to a busy schedule with other subjects and extracurricular activities.
	Engagement	Clear lesson objectives in FCM tasks ensure students actively participate.	No specific contradictions in this area.
	Independence/ Initiative	Students show independent learning behaviors when they can watch videos at their own pace and take the initiative to do additional research and make notes or summaries.	Some responses show that students need the teacher's guidance or feedback right away during out-of-class activities.
Student-centered learning	Collaboration	Students have a very positive attitude toward group activities, provided everyone shares the responsibility for completing the task. They mentioned that their speaking skills and confidence have improved, leading to more interactions with both peers and the teacher, who acts as a facilitator.	Most responses pointed out that group members did not contribute equally. Others mentioned they could not give helpful feedback during peer assessment.
Integration of ICT in learning	Use of ICT	Students have a positive attitude toward using technology in education. Different tech tools have been used for both at-home and in-class activities to encourage independent and group learning.	Some students mentioned problems with internet connections, data costs, and not having enough devices as their main challenges.
Effective use of resources	Use of resources	Students' responses show that the out-of-class task was used well and improved their understanding of the topic. They also mentioned how this gave them more time for meaningful learning in class.	Some students said teachers should give shorter videos and clear instructions for homework. They like when teachers made their own videos rather than using YouTube.

Teachers' Activity Contradictions

The activity system of teachers implementing the FCM reveals several notable contradictions (Table 3). Firstly, there is a contradiction related to the increased workload associated with designing a flipped class. While FCM aims to optimise learning, teachers find themselves

dedicating more time and effort to create suitable flipped materials, including videos and interactive activities. This increased workload can be at odds with the goal of reducing teachers' burdens.

Table 3: Thematic analysis of teachers' contradictions on FCM

Theme	Contradictions
Increase in workload	Responses show that making flipped learning materials takes a lot of time. Teachers struggle to find or make videos that match their lessons. Designing in-class activities, resources, and tests that fit FCM and TPA criteria is hard and stressful for teachers. Some students need extra supervision to finish their out-of-class work, which makes teachers' work even busier.
Accessibility of technology and other technological issues	Responses show that only a few students have these issues.
Lack digital competence	All interviewed teachers show strong digital skills, with some even conducting training for other departments on teaching apps. However, according to their feedback, many teachers lack the digital competence needed for effective integration of ICT in the flipped classroom.
Lack understanding of FCM (based on one of the 4 pillars of flipped learning)	Teachers expressed concerns about the need to use exam-style questions/resources to maximise curriculum time, which may not be suitable for the flipped classroom.
	Some teachers may not fully understand how to prepare 'intentional content' for in-class activities, where students are expected to apply learned concepts and engage creatively to build new knowledge.

In addition, there is a significant contradiction concerning teachers' digital competence. While some educators demonstrate proficiency in using digital tools and resources, others lack the necessary skills to effectively incorporate technology into their FCM lessons. This contradiction highlights the need for ongoing professional development to ensure that all teachers can leverage technology to enhance their teaching. Another contradiction emerges in terms of accessibility and technological issues. Teachers may assume that students have equal access to technology, but this is not always the case. Variations in students' access to devices and internet connectivity can hinder the successful implementation of FCM, leading to unequal learning opportunities.

Furthermore, there is a contradiction related to teachers' pedagogical knowledge. Some educators may not possess up-to-date pedagogical knowledge, particularly regarding student-centered approaches like FCM. This discrepancy can result in inconsistent instructional practices. A lack of understanding of FCM among teachers is another contradiction. Some educators may not fully grasp the principles and benefits of this pedagogical approach, which can lead to resistance or sub-optimal implementation.

Lastly, there is a contradiction tied to the prevalent exam-oriented mentality among teachers. While FCM encourages a shift towards conceptual learning and active engagement, teachers entrenched in exam-focused teaching methods may struggle to align their practices with

FCM's objectives. Table 4 provides a summary of the primary contradictions identified among teachers and students within the institution. These contradictions highlight the need for a shift in teachers' and students' mindsets and priorities regarding educational outcomes.

Table 4: Main contradictions of students' and teachers' on FCM

Student	Teacher
Heavier workload	Heavier workload to design a flipped class.
Accessibility of technology/ technological issues	Lack of digital competence.
Inability to provide constructive feedback during peer-assessment	Accessibility of technology/ technological issues (students).
No access to immediate feedback during out-of-class activities.	Lack of current pedagogical knowledge
Preference for teacher-made video lectures instead of YouTube videos.	Lack understanding of FCM
Need for specific instructions when assigning out-of-class activities	Exam-oriented mentality
Inability to meet higher demand in self-discipline and structure to prepare for in-class active learning	
Focus on procedural learning for exam preparation contrary to teacher's desire to elicit conceptual learning	

Discursive Manifestations of Contradictions

Conducting a discursive manifestation analysis and classifying interview excerpts of contradictions into dilemmas, critical conflicts, or conflicts involves a systematic approach to understanding the contradictions and tensions within the discourse. In this study, the discursive manifestation of contradictions that unfold can be categorised into either dilemma, critical conflict or conflict.

When asked if the FCM is suitable for A-Level subjects, it became apparent that both students and teachers were skeptical of its appropriateness. Here are some excerpts of teachers and students' responses to FCM that indicate contradictions that exist in FCM activity system:

- In response to question (*What do you think of the FCM preparation?*)

> "*It's time consuming, because you have to figure out the topic, content and then the script (for the lecture videos) and then you have to figure out the in-class activities.*" – Teacher A

> "*Sometimes we would be assigned more a lot of videos, which were mostly short videos, and the deadlines are on the same day, so sometimes, I'll get overwhelmed. After school, I may also have other priorities, or I may not be home at the moment. And at times, the videos are assigned quite late.*" – Student B

"*Selecting the right video, with the right topic and duration is very tough and takes up time but I also get support from my departmental PD.*" – Teacher D

"*It'll be easier for the, to prepare notes for the traditional compared to the flip classroom because for the flip classroom, you don't want to tell everything. You don't want to give all the content because you want to use the content during the flip classroom.*" – Teacher C

"*A-levels are rigorous and time-bound. There's not much room for experimentation and implementing FCM effectively while meeting the curriculum's demands can be a real challenge.*" – Teacher E

"Sometimes I procrastinate so the work piles up. Also I have essay-based subjects so it does pile up and I do get overwhelmed to do everything so like I couldn't do some of the subjects." – Student H

- In response to question *("Some people do not like to work with technology. Do you have this kind of feeling? Did you encounter any problems using the technology")*

"*It depends on the teacher also, if they are not innovative or tech-savvy so they will not use ICT.*" – Teacher C

"*Lack of knowledge of the use of the apps, perhaps. 'cause not, not all of the teachers are knowledgeable to use one particular app. I myself have to teach my, my colleagues as well to use the Class Point app.*" – Teacher A

"*One of the challenges I faced was the internet connection or maybe not enough data.*" – Student L

- In response to question *("Do you think the FCM aligns with the teaching approach expected of the A-level curriculum?")*

"*I don't believe so, yeah. I, I, because I believe, I believe in chalk and talk and, and once the syllabus is done, like over the past few years we've been doing this over the past, I've been doing this for the past few years. Once the finish of the syllabus, uh, is completed, um, we do a drilling method. Okay. Yeah. Meaning we, we, we really drill the students, we do the past papers, and it works. It works and it helps the students, uh, the lower operator students to, um, to at least get a pass. Okay. At least get a pass.*" – Teacher A

"*I prefer using traditional methods because it allows me to complete as some time, uh, which gives, which gives me more time to do, um, to do more of the past papers with, uh, to do revision with the students. So, when you finish the syllabus on time or even before that, you have more time to do past papers with the students.*" – Teacher D

Interview transcripts offer rich insights into conflicts, dilemmas, and critical conflicts. Participants express inner conflicts and uncertainties through spoken words, revealing dilemmas as they weigh pros and cons and critical conflicts when deep contradictions emerge. Both overt and subtle conflicts are discernible from their language, tone, and non-

verbal cues, showcasing differing viewpoints. These transcripts capture nuances, offering insights into decision-making, disagreement, and conflict resolution. Table 5 outlines the verbal expressions evident in discussions with students and teachers, showcasing emerging discursive manifestations.

Table 5: Main contradictions of students' and teachers' on FCM

Issue/contradiction	Manifestation
Disagreement over pedagogy	Dilemma A
Desire for autonomy over teaching preference	Dilemma B
Preference for teacher-made video lectures instead of YouTube videos.	Dilemma C
Different expectation over the division of labour between teachers and students (students' autonomy vs teachers' guidance during out-of-class)	Critical conflict A
Unwilling to see beyond the exam and spending time on FCM	Critical conflict B
Inadequate instructions to facilitate students' completing the out-of-class tasks autonomously	Conflict A
The nature of A-level course	Conflict B

Mapping contradictions into the triangular activity system of AT can help visualise how these tensions affect different components of the activity system (Figure 3).
Figure 3: Mapped contradictions in the FCM activity system. Dilemma A (DA), Dilemma B (DB), Dilemma C (DC), Critical Conflict A (CCA), Critical Conflict B (CCB), Conflict A (CA), Conflict B (CB)

Mapping contradictions into the triangular activity system can provide a structured way to visualise and analyse the complex interplay of tensions within the FCM context. It can gain

insights into how these contradictions affect different aspects of the teaching and learning process and inform strategies for resolving or managing them effectively. This framework offers a visual representation of the interplay between various elements involved in teaching and learning, including the subject (teachers and students), the object (learning objectives), and the mediating tools and rules (technology, curriculum, pedagogical approaches). When contradictions emerge, they often involve these elements, and mapping them onto the triangular activity system elucidates their interactions.

By doing so, it becomes possible to identify the specific areas within the FCM environment that are most affected by these tensions. For example, if a contradiction relates to students' self-regulation, it may primarily impact the subject (students) and their capacity to manage independent learning. Conversely, contradictions concerning technology access may directly influence both the subject (teachers and students) and the tools (technology). This visual representation helps educators and researchers understand the focal points of each contradiction, facilitating targeted interventions and solutions.

Understanding how contradictions manifest within this framework informs the development of strategies to effectively address or manage these tensions. For instance, if a contradiction is rooted in students' difficulties with self-discipline during out-of-class activities, educators can use this insight to design interventions that support students in developing better self-regulation skills. Likewise, if technological access poses a challenge, educators can explore ways to enhance accessibility or provide alternative resources. Mapping contradictions into the triangular activity system encourages a holistic perspective of the educational ecosystem. It underscores that tensions within one element of the system can have ripple effects throughout the entire FCM, impacting other components. This holistic viewpoint encourages comprehensive and integrated solutions, moving away from isolated fixes for individual issues.

Ultimately, this approach supports continuous improvement within FCM. By identifying and addressing these tensions, institutions and educators can adapt and enhance their FCM implementations over time, making it a more effective and responsive approach to teaching and learning. These discursive manifestations reflect the nuanced interactions and perspectives within the FCM context, highlighting the need for a comprehensive understanding of these contradictions to develop effective strategies and solutions. Addressing these tensions might facilitate a more unified and efficient assimilation of FCM within the pre-university institution, mirroring the successful practices adopted by this establishment. Consequently, this approach has shown promising outcomes in students' learning achievements, attitudes, and teachers' professional practices. This is evident from the positive outcomes within the activity system following the completion of three full terms of comprehensive whole-school implementation of FCM at the institution.

Conclusion

In summary, this research strongly supports the positive impact of FCM on students' learning attitudes and essential 21st-century skills. FCM fosters self-regulation, collaboration, independence, and heightened engagement, contributing to successful educational experiences. It encourages active participation, critical thinking, and aligns with modern learning approaches. However, it reveals contradictions at student and teacher levels, necessitating collaborative efforts to address these challenges. Contradictions within FCM should guide a more effective, student-centered approach rather than being seen as barriers.

This study provides insights for refining FCM implementation, leveraging AT to address diverse elements like students, teachers, technology, and socio-cultural contexts. AT's adaptability for longitudinal studies aids in tracking changes and interventions, making it vital for educational research and reform efforts. Overall, these findings endorse FCM as a transformative teaching method amid evolving educational landscapes.

Construction of Instructional Design Model Using Picture Books on Children With Specific Language Impairment

Li Jing, Jiangsu Normal University, China
Cheng Hsu, Jiangsu Normal University, China

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Compared with ordinary children, children with specific language impairment (SLI) have delayed language development, poor reading comprehension, and greater difficulties in learning. This study tested 5 SLI children at a primary school in northern Jiangsu Province in China in the last two years. This study aimed to develop and implement an instructional design model for SLI English learners using picture books. The instructional model was developed through three stages. In the first stage, a literature review of the progress, challenges, and prospects of the Intervention of picture books on SLI children was conducted, and the results were integrated into the design of the instructional model. In the second stage, the results of the first stage, the instructional model, were evaluated and revised by expert review and interview. At the last stage, after the results of the previous stages were integrated, the final instructional model using picture books for SLI children's instructional design practice was developed. Using picture books, the instructional design model emphasizes SLI children's language learning motivation and understanding activities and systematically integrated experience-learn-apply-reflect-revise activities and language expression and interaction activities through all stages.

Introduction

English Language Learning (ESL) poses unique challenges for children with Specific Language Impairment (SLI). These challenges demand innovative and effective instructional approaches. One such method of gaining recognition is the use of picture books. This essay explores the significance of picture book instruction in ESL for children with SLI, emphasizing its benefits, strategies, and potential impact on language development. This study aimed to develop and implement an instructional design model for SLI English learners using picture books.

It is crucial to grasp the nature of SLI to comprehend the implications of TEFL for SLI children. SLI is a developmental language disorder characterized by difficulties acquiring language skills despite normal hearing and intelligence. These challenges extend to second language acquisition, making TEFL instruction particularly complex for this population.Picture books provide visual support, aiding in comprehension. For SLI children, visuals can serve as a bridge to understanding, making it easier to grasp the meaning of words and sentences. Exposure to diverse vocabulary is essential for TEFL learners. Picture books offer a rich source of words in context, facilitating vocabulary development in a more engaging and memorable manner. Well-crafted sentences in picture books contribute to the understanding of English sentence structure and grammar. By presenting grammatically correct language in context, children with SLI can better internalize language rules. Many picture books follow a narrative structure, helping SLI children understand story organization. This not only enhances their storytelling abilities but also improves overall comprehension skills.

Selecting suitable picture books is crucial. Opt for those with clear illustrations, simple language, and themes that resonate with the children. Consider the cultural background and experiences of the learners to ensure relevance. Engage children actively during reading sessions. Encourage them to express their thoughts, ask questions, and make predictions. This interactive approach fosters language development and communication skills. Design activities that target vocabulary acquisition. For example, create word cards from the book's content, play word games, or have discussions about the meanings of specific words. After reading, encourage SLI children to retell the story in their own words. This enhances their ability to sequence events and reinforces comprehension. Appeal to various senses by incorporating multisensory elements. Use props, gestures, or interactive games related to the story, providing a holistic learning experience.

An important prerequisite for conducting research on children with SLI is to clarify the symptoms of their language impairment deficits. Only on this basis can it be possible to determine its cause and then propose an intervention or correction plan. However, there are large differences in the language impairment performance of children with different language SLI. Firstly, the most pronounced language deficits in children with SLI are morphological-syntactic problems, and their language problems vary from language to language. For example, the use of tense can be used as a clinical sign for the diagnosis of English SLI children. English SLI children will have difficulties in expressing third-person singular -s, be verbs, auxiliary verbs, etc. when using sentences (Rice & Wexler, 1996), and it is difficult to use accurately The position of -ed in the past tense of verbs and specific usage rules(Dalal & Loeb, 2005). German SLI children have expression problems in the use of subject-verb agreement, mainly in the first, second and third person singular forms of transitive verbs, and the accuracy of understanding the object beginning declarative sentences

is relatively low (Stegenwallner-Schuetz & Adani, 2021). In the processing of relative clauses, Korean SLI children have lower accuracy in offline comprehension tasks of clauses and lower efficiency in online processing tasks(Yoo & Yim, 2021). However, the main problem of Spanish and Italian SLI children is not the tense, but the obvious expression problems in the use of articles and direct object attachment forms, and the obvious delay in comprehension compared with ordinary children(Bedore & Leonard, 2005). Japanese SLI children misexpressed the continuum of pronouns and adjectives when understanding relative clauses(Sasaki, Schwartz, Hisano, & Suzuki, 2021).

Picture books often explore emotions and social situations. Use these stories as a springboard for discussing feelings, social interactions, and appropriate language use. Picture book contributes to both language and emotional development. Foster a sense of community and collaboration through group activities related to the picture book. Picture books improve language skills and enhance social communication and teamwork.

Recognize the unique needs of each child with SLI. Tailor picture book activities to address specific language challenges, providing individualized support. ESL instruction can be daunting for SLI children. With their visual support and interactive nature, picture books create a low-pressure environment that boosts confidence and encourages participation.

The Design

There are 11 children aged 8-9 participated in this study, including 5 SLI kids and 6 TD kids from a typical primary school in Xuzhou, Jiangsu Province in China. The picture book was selected according to those kid's pre-tests by TOEFL Primary sample tests. The TOEFL Primary Step 1 pre-test scores were converted to Lexile Levels for picture book selection. This score conversion used a converting scale provided by the English Test Service (ETS).

The procedure proceeded with a brief, authentic, interactive activity with the kids. After the introduction activities, the teacher and kids played with the book in a situated context. Using picture books, the instructional design model emphasizes language learning motivation and understanding activities systematically integrated experience-learn-apply-reflect-revise activities, language expression, and interaction activities throughout all stages for SLI children.

Conclusion

In conclusion, picture book instruction holds immense potential for enhancing ESL learning for children with Specific Language Impairment. Educators can create a supportive and effective language learning environment by addressing the unique needs of SLI learners and capitalizing on the visual and interactive aspects of picture books. The strategies outlined in this essay serve as a foundation for developing tailored ESL programs that cater to the diverse linguistic needs of SLI children, fostering language development and a love for learning. As research in this field continues to evolve, educators can refine and expand these strategies to further optimize ESL instruction for children with SLI.

Surveillance on College Students' Experiences During Online Modality: Towards an Independent Learning Approach

Jennifer D. Tucpi, Lyceum of the Philippines University Manila, Philippines

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

With the COVID-19 pandemic that resulted in lockdowns in the Philippines starting in March 2020, learning had to be immediately shifted to an online modality, a setup where students studied mostly on their own forcing them to become independent learners. Using descriptive phenomenology by Paul Colaizzi as a research design, the study investigated the lived experiences of college students under the online learning modality during the COVID-19 pandemic. Through in-depth interviews, data was gathered from (15) full-time third-year college students during the Second Semester of the Academic Year 2022-2023 at a Philippine higher education institution. Findings showed that participants mostly describe independent learning as "learning on your own" or "self-study". As a result of learning alone during the pandemic, they were able to develop independent learning skills and capabilities such as flexibility and adaptation, self-reflection and continuous improvement, openness to new perspectives, resourcefulness and self-reliance, and setting goals and measuring progress. Results further revealed that students became resilient; they were able to adapt to the new learning setup and found ways to learn on their own to survive or thrive in the new learning setup despite the difficulties during the COVID-19 pandemic. Recommendations included promoting independent learning through explicitly creating a policy and incorporating it into the curriculum, pedagogy, assessment, and support service programs of the university, to fully realize the potential of students to become independent learners.

The International Academic Forum
www.iafor.org

Introduction

The COVID-19 pandemic has radically changed the educational landscape. The Philippines faced a critical situation due to the said health crisis. For higher education institutions, avoiding and limiting the risks of infection in the academic community has become a primordial concern. Hence, with the implementation of community quarantine, the conduct of classes needed to be immediately suspended. The herculean challenge then was how to continue teaching and learning beyond the usual face-to-face instruction.

Even before the pandemic, several higher education institutions (HEIs) in the Philippines had already started using the blended learning modality which is a combination of face-to-face and online learning through a Learning Management System (LMS). Most universities had to immediately shift to full online learning when lockdown was declared in March 2020 (2nd Semester, Academic Year 2019-2020).

Whether flexible learning was done online or using printed modules, the reality that confronted students was that they had to become independent learners – they had to go through their modules independently, now the teacher becoming a facilitator rather than the transmitter of knowledge.

A literature review done by the researcher revealed that there have been many studies conducted about independent learning but most of them were done in Western countries and very few in the Philippine setting. This may be attributed to online learning being something new in the Philippines. In addition, no study yet has been conducted on independent learning in the Philippines at the time of the COVID-19 pandemic. With online learning as the new norm, independent learning must be a primary competency of students.

Purpose of the Study

The purpose of the study was to explore the experiences of college students on independent learning under the online learning modality during the COVID-19 pandemic. Specifically, the study intended to answer the following: 1) How do the participants describe independent learning? 2) What are the lived experiences of college students on independent learning in the online modality? 3) What program and strategies can the university adapt to develop independent learning among students?
