The study focused on the experiences of students with independent learning through online modality during the COVID-19 pandemic. It was conducted in the Lyceum of the Philippines University Manila among fifteen (15) full-time third year level students. Three (3) participants were chosen from each of the following colleges: College of Arts and Sciences, College of Business Administration, College of International Relations, College of International Tourism and Hospitality Management, and College of Technology. Third year students were chosen because they experienced the first year of fully online learning in LPU Manila that was implemented effective AY 2020-2021. Nine (9) female students and six (6) male students participated in the research.

Methodology

The study utilized qualitative research design, particularly, descriptive phenomenology using an in-depth interview instrument to gather data from the participants. Colaizzi's approach to descriptive phenomenological analysis was used.

Ethical practices were exercised, and a data management plan was in place to ensure that data privacy was preserved. The research protocol was submitted to the Philippine Social Science Council-Social Science Ethics Review Board (PSSC-SSERB) for review and approval. The study was conducted only after approval of the said body.

Conclusion

Findings

The participants mostly describe independent learning as "learning on your own", "self-study", "learning to come from your own initiative", "having your own learning time or learning pace", "learning with little or no guidance" or "without the help of professors or teachers". These are consistent with earlier definitions of independent learning as gathered by the researcher.

Aside from self-organization, there is also a component of independent learning where the teacher does not play a central role in the learning process (Scheel et al., 2022). According to Moore (1973), independent learning and teaching constitute an educational approach where the learner operates autonomously, separated from the teacher by space and time, with communication occurring through print, electronic, or other non-human mediums (p. 663). This learning approach requires students to be active and independent in their learning. It focuses on student-centered learning, where students are encouraged to seek new knowledge on their own without being guided by others. This ability to learn independently is known as self-directed learning.

Based on the results of the study, students during the pandemic were forced to learn on their own. Thus, we can conclude that the online learning environment may have served as the driver for the development of independent learning skills among students. This also suggests that students became resilient; they were able to adapt to the new learning setup and found ways to learn on their own to survive or thrive in the new learning setup despite the difficulties brought about by the COVID-19 pandemic.

Five themes emerged as a result of the study - flexibility and adaptation, self-reflection and continuous improvement, openness to new perspectives, resourcefulness and self-reliance, and setting goals and measuring progress.

1.   Flexibility and Adaptation

Students often face changing circumstances, such as shifting from traditional classroom settings to online or self-paced learning. Independent learners demonstrate flexibility by adjusting their study routines, adopting new technologies or platforms, and embracing alternative methods of learning. They adapt their strategies and approaches to accommodate different learning environments and make the most out of the available resources.

Participant A stated that:

> "...We were mostly doing modules asynchronously, so basically the professors would explain to us that we need to study the modules on our own given that the synchronous classes are very limited."

Participant B stated that:

> "it was online and we had to adapt to the new way of learning. So, we did not have any choice. If we will not adapt, we will be left behind."

In independent learning, there is a shift in power dynamics between the teacher and the learner, favoring the learner (Chene, 1983). Additionally, the student must independently strive to solve problems (Abrosimova, 2020), and the ability to learn without direct teacher support is crucial for academic success, particularly in digital learning environments (Scheel et al., 2022). Digital learning necessitates a higher level of motivation and persistence, as learners must take greater responsibility for their learning process compared to face-to-face learning with direct instructions from a teacher (Yunusa & Umar, 2021).

2.   *Self-reflection and Continuous Improvement*

Independent learners engage in self-reflection to assess their progress, identify areas for improvement, and make necessary adjustments to their learning strategies. They actively seek feedback, evaluate their strengths and weaknesses, and use this self-awareness to refine their study habits and approaches. They are committed to continuous improvement and strive to enhance their learning experience by reflecting on their achievements and areas for growth.

Participant I mentioned that:

> "one [learning] strategy that I learned from a friend is the Microsoft To Do List. I downloaded this to-do list, an app where I could input my schedules and deadlines and it will remind me. Another strategy that I found effective is comparing notes and ideas with friends or classmates."

Participant J also utilized the Microsoft To Do List by stating that:

> "[the feature was] effective for me because during the pandemic it was very hard to go to bookstores to get highlighters and post-its materials."

Self-reflection has been a key aspect of this process. As students engage in independent learning, they must assess their strengths, weaknesses, and areas for growth. By reflecting on their progress and learning experiences, they can identify what strategies work best for them and what needs improvement.

Participant G stated that:

> "I realized that I am privileged in the sense that I had a lot of time to study during the online setup. So, I was able to set goals like I made sure to recite every meeting, participate in class activities, and pass academic requirements on time."

Participant H mentioned that:

> *"I became keener on learning. I like learning something new. So, every time I encounter something, I become curious, so I try to verify or read about it some more."*

Relatedly, Participant K suggested that:

> *"I am getting better at balancing everything out, like with time management and the quality of my work."*

Participant A also stated that:

> *"The basic skills needed for learning on your own are time management and self-discipline. These are the key factors for independent learning."*

Continuous improvement is also vital during this time. As the pandemic pushed students to learn independently, they had the chance to refine their study habits, time management skills, and approaches to learning new concepts. By consistently seeking ways to enhance their learning process, they can adapt and thrive in this new educational landscape. Furthermore, independent learning has brought about the importance of resilience and adaptability in the face of uncertainty. Independent learning has allowed the students to develop a growth mindset, enabling them to embrace challenges and view setbacks as opportunities for learning and improvement.

3.   *Openness to New Perspectives*

Independent learners embrace diverse viewpoints and perspectives, recognizing the value of learning from others. They actively engage with different sources of knowledge, collaborate with peers, participate in online forums, or seek mentorship to broaden their understanding and gain new insights. They remain open-minded and receptive to alternative viewpoints, promoting intellectual growth and expanding their horizons.

Participant L shared a similar sentiment by stating that:

> *"the pandemic has taught us many things, not only about lessons learned in the classroom but outside LPU as well."*

This coincides with a study conducted by Zhu et al. (2022). The focus of the research was on investigating the behavioral intentions of 193 university students regarding online learning before, during, and after the COVID-19 lockdown. The findings revealed a significant increase in students' inclination to engage in online learning during the COVID-19 pandemic, therefore increasing their academic performance.

Participant G stated that:

> *"Sometimes I ask my siblings when it comes to some topics that I cannot understand, or I ask them to check my grammar."*

Participant F stated that:

> *"My interactions with my classmates also contributed to a deeper understanding of our lessons because we share our thoughts with each other."*

4.　Resourcefulness and Self-reliance

Independent learners develop resourcefulness and self-reliance as they navigate their learning journey. They take the initiative in seeking out learning resources, such as online materials, books, and research papers, to supplement their knowledge. They leverage their problem-solving skills and creativity to find solutions to challenges they encounter along the way. They become self-reliant by taking ownership of their learning process and actively seeking opportunities for self-guided exploration.

Participant C stated that:

> *"I also learned to rely on my own and explore on my own as we could not rely 100% on our teachers. I also realized that I needed to exert extra effort. Those extra efforts paid off as my grades went higher."*

Participant F stated that:

> *"I usually used the desktop for my online classes, and I have another device, my cellphone, to take down notes or take pictures of the lecture slides."*

Participant F stated that*:*

> *"What I did during the online modality was to open my Mrooms, read and try to understand what I was reading and listed down keywords so I can easily recall them, and the concepts associated with these keywords."*

Participant H stated that:

> *"In my field, computer science, not all learnings are taught in the classroom, so you have to be resourceful enough. What I do is take free online courses."*

Participant G stated that:

> *"I think the initiative to learn on my own happened because communication was difficult during the pandemic. So, what I did was do further research on the topics or lessons."*

5.　Setting Goals and Measuring Progress

Research by Locke and Latham (2002) emphasizes the significance of setting short-term goals as they provide immediate direction, focus, and motivation. Short-term goals act as building blocks towards long-term objectives, facilitating progress and boosting self-efficacy. Additionally, studies suggest that individuals who regularly set and achieve short-term goals experience increased productivity, satisfaction, and overall well-being (Grant & Dweck, 2003; Oettingen, 2012).

As reiterated by Participant K:

> *"I think when I look at the deadline given by my professor, I would say my goal is to accomplish this a day before…"*

Gollwitzer's research on implementation intentions highlights the power of linking specific actions to goal attainment (Gollwitzer & Sheeran, 2006). By forming if-then plans, students may enhance their commitment to goal pursuit and overcome potential obstacles. Implementation intentions promote proactive behavior, increase self-control, and improve the likelihood of successful goal achievement.

Participant D admitted that their *"goal is to be productive every day, so I make sure to finish today what needs to be done today or to be submitted tomorrow."*

Likewise, Participant F stated that:

> *"I set a goal that every day, I accomplish or finish something, like one activity so my things to do will not pile up. And if there is free time, I do self-reading. I also allot time for rest and prepare myself for the next set of requirements or readings."*

While short-term goal setting is widely regarded as a beneficial practice, it is essential to explore the potential negatives associated with this approach. Setting overly ambitious or unrealistic short-term goals can lead to increased stress, pressure, and burnout (Locke & Latham, 2002). When individuals continuously strive for immediate results and push themselves relentlessly, they may experience physical and mental exhaustion, decreased motivation, and decreased well-being.

This may also be realized in the statements by Participant L by sharing that:

> *"I set a high standard and I always do SWOT analyses of problems, concerns, and projects. This is my way of knowing whether a certain project or activity that I need to undertake is feasible and what things I need to prepare. There were realizations that there are still things that I do not know or things that I needed to learn."*

Participant E stated that:

> *"I set goals in the long term and always take into consideration how it will benefit more people, not just for me, but for the community."*

Perfectionism, characterized by setting excessively high standards and a tendency to self-criticize, is often associated with unrealistic expectations (Hewitt & Flett, 2004). Research suggests that perfectionistic tendencies can contribute to burnout, as individuals may engage in relentless striving for flawlessness and experience distress when unable to meet their self-imposed standards (Stoeber & Otto, 2006). Perfectionism can intensify the negative effects of unrealistic expectations on well-being and increase the risk of burnout.

Participant A shared that:

> *"I realized that when it comes to learning goals, I set them high. I think I am a perfectionist. I would like to have a high position in a hotel later so I strive to perform well in my academics and graduate with Latin honors."*

Similarly, Participant H whose way of setting goals *"is that I aim for the best results. I am a bit of a perfectionist. I do not stop until I am satisfied with the results. I am bothered if I am not satisfied with the results."*

This may coincide with research that have shown a strong association between perfectionism and the presence of unrealistic expectations (Stoeber & Otto, 2006). Perfectionistic individuals tend to set impossibly high standards for themselves and others, leading to unrealistic expectations of achievement and performance. Unrealistic expectations often stem from the fear of failure, the need for external validation, and a desire to meet unattainable ideals.

> *"I set high goals when it comes to my grades and when it comes to my academic work. For example, I set high expectations for papers or reports. Let us say, something is difficult to produce, like posters or infographics. I go through them a lot of times and I ask other people to critique my work,"*

as stated by Participant E.

Monitoring progress is essential for goal attainment. Research suggests that regularly tracking and reviewing progress toward short-term goals enhances self-awareness, motivation, and self-regulation (Carver & Scheier, 1990; Kanfer & Ackerman, 2004). Additionally, receiving feedback, whether self-generated or from others, helps individuals assess their performance, adjust strategies, and stay on track (Locke & Latham, 2006).

Such were the responses by Participant B, who stated that *"I monitor my grades on quizzes, and I ask my teachers during consultation regarding the results of the assessment, especially areas where I did not do well or areas for improvement."*

Research suggests that monitoring progress enhances goal achievement by increasing self-awareness and providing a sense of control (Carver & Scheier, 1990). Regularly tracking progress allows individuals to assess their performance, identify areas for improvement, and make necessary adjustments. It also helps individuals stay motivated and maintain focus on their goals (Wulfert, 2018).

As observed from most of the responses of the students, they are able to set short-term goals like getting good grades, being able to comply with the requirements of the course/subject, or being able to meet deadlines given by their teachers.

There are also goals that pertain to achieving high academic standards like setting high expectations for academic outputs, getting good grades or to be in the dean's list, aiming for best results, or to be among the best students in class. However, some of these need to be SMART (specific, measurable, attainable, realistic and time-bound) so that the desired outcomes of a goal will be achieved.

Implications to Pedagogy

To fully realize the potential of students to become independent learners, the researcher recommends that the university to actively promote and support independent learning through a directed independent learning (DIL) approach wherein independent learning is explicit as a policy goal and incorporated into the curriculum, pedagogy and assessment as suggested by an in-depth study by Thomas, Jones and Ottaway (2015) on effective practice in the design of directed independent learning opportunities conducted in the United Kingdom as commissioned by the Higher Education Academic (HEA) and the Quality Assurance Agency for Higher Education (QAA). The learning environment should also support independent learning through the provision of appropriate learning materials such as books, online learning materials and physical learning spaces in the library and in the university. Academic support and non-academic staff should also be actively involved in engaging, enabling, and facilitating students to be able to avail of the opportunities or services of the university in support of their learning or create co-curricular and extra-curricular programs that foster independent learning. This will ensure that the benefits of independent learning will be fully realized by the students.

A whole-school approach or integrated approach to independent learning can have the following components:
   (1) A clear policy direction on independent learning that can be reflected in the vision and mission of the university. This will include a thorough orientation program for students and parents for them to appreciate the intent and purpose of the independent learning policy.
   (2) Inclusion of independent learning as a program outcome and a graduate attribute
   (3) Integration of independent learning into the teaching and learning approaches, including assessments, such that they are geared towards achieving independent learning.
   (4) Developing independent learning through student support services such as co-curricular and extra-curricular activities, leadership and welfare, and development programs.
   (5) Integration of a course on independent learning designed to develop or reinforce soft skills of students such as goal setting, time management, and self-discipline, which are some of the challenges experienced by the respondents during online and independent learning.

Limitations of the Study

The study focuses exclusively on the experiences of selected college students on independent learning through online modality during the COVID-19 pandemic. The research locale was limited to the Lyceum of the Philippines University Manila. The study was also limited to full-time second-year college students of the Lyceum of the Philippines University Manila who were enrolled for the Academic Year 2021-2022.

Forgetting Green Biographies:
Memories and Relationship With Plants in a Primary School

Rosa Buonanno, University of Modena and Reggio Emilia, Italy
Beate Weyland, Free University of Bolzano, Italy

Abstract

This research explored the experiences of children and parents in a primary school class in Reggio Emilia, Italy. Participants took to the green archives where they engaged in a process of exploration, rediscovery and appreciation of their relationship with plants. The researchers' approach, based on active listening and curiosity, brought the sleeping green memory to life. This facilitated a narrative practice that played a pivotal role in shaping a new ecological and cultural trajectory embedded in the multiple realities of everyday life. The stories revealed the central role of children as keepers of traditional plant knowledge, setting the stage for intergenerational transmission and sharing across different cultural contexts in the urban setting. Consequently, this promoted the dissemination of fluid and diverse knowledge. At the same time, parents became constructive participants in their children's activities. They invested time in sharing their own experiences. Ethnobotanical research analysed and evaluated the developing relationships that children and parents developed with the plants, thereby reviving ancestral links. In this context, education served as a vehicle to enable individuals to cultivate their inner gardens, embracing all plant species and promoting an integrated approach between theoretical knowledge and practical application. The design of this educational environment is a neutral space, capable of being home to different experiences. In addition, the act of storytelling about relationships with the natural world would create a deep sense of well-being for all participants and facilitate a new form of parent-child connection in the school environment.

Keywords: Narration, Green Biography, Ethnobotany, Plants, Biophilia

Introduction

The aim of this study was to explore children's and parents' relationships and perceptions with plants, using ethnobotany as the primary framework of investigation, an interdisciplinary science dedicated to the study of human interests and interactions with plants across historical periods (Caneva et al., 2013). The research methodology involved the meticulous observation of the relationship between parents and children with plants through the use of various modes of interaction such as discussions, verbal communication, drawing, and written expression. In addition, the study was also concerned with the analysis of the influence of memory on plant knowledge.

Memories were identified as an integral part of the learning process, serving as a conduit through which children acquire knowledge about plants and their environment. The accumulation of such prior knowledge built the basis for a heightened interest in and empathic connection with the plant world.

The results of the study suggested that engaging in discussions and sharing memories of plant-related experiences could potentially contribute to a pervasive sense of well-being. In addition, the data suggested a plausible influence of these nature-related memories on the parent-child relationship. It was hypothesised that dedicating time to recounting childhood experiences and relationships with plants may strengthen the emotional bond between parents and children, thereby fostering greater mutual understanding.

Background of Existing Literature and Information in Support of This Study

This study located itself in the framework of two synergistic approaches, specifically those described by Monica Guerra (2021; 2018) and Beate Weyland.

Monica Guerra, a distinguished pedagogue and professor at the University of Bicocca in Milan, led a research and action initiative in the Italian context, focusing on the importance of outdoor education and the enrichment of educational environments. Her work encompasses different contexts such as the street, the neighbourhood, the city, the park, the courtyard and the garden. Central to her research is an emphasis on fostering encounters and relationships with nature, facilitated through activities such as the collection and creative cataloguing of natural materials. Professor Guerra's academic efforts gave rise to the development of specialised courses and master's programmes aimed at spreading a profound understanding of the interplay between education and nature. Her influential studies have catalysed the establishment of a robust network of scholars working together to advance knowledge on the subject.

Beate Weyland is a distinguished scholar with a keen interest in the evolution of schools and their physical spaces. Currently a faculty member at the University of Bozen/Bolzano, she conducted interdisciplinary studies focusing on the nexus between pedagogy, architecture and design to bring about transformative changes in educational environments. Over the years, her research focused on various aspects of educational development, with a particular emphasis on cultivating a sensory approach to education, as described in her remarkable work (Weyland, 2017). This line of enquiry involves the investigation of mediators, artefacts and games designed to facilitate learning experiences through engagement with the five senses. The study under consideration aligns with the trajectories of the recently established EDEN LAB (Weyland, 2022) laboratory, a scientific initiative that brings together interdisciplinary

reflections on the interplay between pedagogy and architecture (Weyland, 2015; Weyland, Galateo, 2023). This laboratory, directed by Beate Weyland, combines a nuanced exploration of the relationship between pedagogical methodology and architectural design, focusing on integrating plants into educational and academic environments. The initiative introduced plants into indoor environments originated during the period of lockdown caused by the pandemic. The concept materialised through the implementation of an online course with students of Education Sciences, focusing on the theme of sensory education (Weyland, 2017). This course integrated the plant as a mediating element, perceived as a living subject with an educational role. Further exploration of this concept developed during a seminar called "Nature inside the home: before the green classroom", which conducted as part of a series of open dialogues on education offered during the three-month closure in 2020. This seminar explored the topic in-depth, involving teachers and educators in discussions. The overall aim investigated the feasibility of fostering "proximity relationships" with domestic nature in educational spaces. Since autumn 2020, in response to the need for physical distance imposed by the pandemic and to increase perceived well-being, resilience and quality of life, two green classrooms have been installed at the Faculty of Education of the Free University of Bozen/Bolzano. The initiative, based on studies by Raith and Lude (Raith & Lude, 2014) and Mancuso (Mancuso, 2018), involved the acquisition of 100 plants to be placed in two rooms originally designed for 100 students. With a focus on fostering didactic innovation in line with the "GreenComp" framework (Bianchi et al., 2022) and care (Mortari & Paoletti, 2021), group activities organised during the general didactic workshops. These activities aim to involve future teachers in the creation of materials and games that facilitate active interdisciplinary interactions with plants. This strategic approach aimed to equip future teachers with the necessary tools to reflect on and incorporate innovative teaching methods in the field of green education. While the initial proposal was to use plants as practical alternatives to facilitate physical distancing, the underlying rationale went beyond mere functional considerations. Indeed, the deeper purpose was to consider how the introduction of plants into indoor spaces could not only make academic and school environments more inviting and resilient (Aydogan & Cerone, 2021), but more importantly, to cultivate close relationships with plants that evoke emotional and affective dimensions. This deliberate integration of indoor nature was also intended to strengthen bonds of care and foster a sense of discovery (Goleman et al., 2012). Facilitating students' learning about plants and incorporating this knowledge into teaching practices in schools was also an opportunity to align with the provisions of the new law that came into force on 20 August 2019. This legislation mandates the inclusion of civic education in school curricula, with a special focus on promoting the health and well-being of children (Art. 3). It also emphasises the importance of providing education to cultivate a caring relationship with the environment and promote awareness of the 2030 goals. Integrating plant education into the curriculum not only contributes to botanical knowledge, but also serves as a vehicle for achieving the broader educational objectives outlined in the legislative framework.

EDEN (Educational Environments with Nature) (Weyland, 2020), focused to develop a comprehensive theoretical framework focusing on the intersection of education and sustainability, with a particular emphasis on the integration of plants into indoor educational spaces. The primary aim of promoting plant familiarity in such environments was to cultivate emotional-affective relationships with botanical entities. This deliberate engagement aims intended to initiate a heightened awareness and sensitivity to nature as a whole, extending beyond indoor environments to include outdoor environments and, in particular, emphasising the importance of plants in the wider natural context. One of the key goals of the workshop was to consciously cultivate intimate relationships with plants, in line with the wider quest

for an essential reconnection with nature, as exemplified by the sentiments expressed by Lucy Jones (2020). The research presented here is fundamentally concerned with meticulously examining the relationships that exist between parents and children and their interactions with plants. Through the use of green memories, the study tried to facilitate a nuanced process of awareness raising. This research was closely aligned with the overarching aims of the workshop, which evolved into a platform that fosters interdisciplinary interactions among scholars dedicated to advancing initiatives aimed at supporting and promoting the vital process of reconnecting with nature.

Rooted in Nature: Reconstructing Children's and Parents' Interests Using the Ethnobotanical Approach Through Green Memories

The connection between humans and the natural world had its roots in the earliest stages of human existence and embodies an intrinsic relationship that has continued throughout the ages. This constant connection evoked a deep sense of well-being, a sentiment supported by scientific literature that emphasises the importance of integrating our surroundings with plants and natural elements (Danon, 2021; Maas et al., 2009; Stuart-Smith & Zuppet, 2021). Furthermore, the act of expressing or narrating personal experiences (Demetrio, 2015) emerged as a conduit for individuals to achieve a sense of integration, allowing them to shape their moments in a creative and inspiring way.

In the essay entitled "Education and Nature" (Antonietti, 2022), Luigina Mortari examined the philosophical perspectives of Maurice Merleau-Ponty, focusing in particular on the concept that nature embodies life and sensible matter, with the human being serving as an integral link in the network of existence. The discourse placed significant emphasis on the role of thought in human life, drawing an equivalence between cognitive processes and the imperative of teaching children an ecological framework for interpreting their directly experienced realities. The essay argues that a deep connection to practical experience is essential for the cultivation of discursive intelligence, a capacity by which individuals interpret and understand the complexities of the world. The ecological philosophy of education is invoked as a guiding principle for a pedagogical practice that aims to rekindle early experiences of nature in the world. The proposal was to use existing knowledge and consciously engage the senses to cultivate a new form of attentive receptivity and emotional resonance in interaction with nature and the environment. The author emphasises the need to delve into the biological matrix of life and advocates an exploration that departs from entrenched cultural codes deeply rooted in the paradigm of modernity. This assertion underscores the notion that each individual archives memories and interpersonal encounters in his or her cognitive faculties. Sensory engagement with the environment, which impresses significant impressions on our minds, becomes a central aspect of our cognitive experience. This interactive process emerges as a substantive topic for discussion and takes on a formalised form when individuals find themselves immersed in situations of particular interest. The research aimed at influencing the learning process of the relationship with plants (Hidi & Renninger, 2006) wanted to support and maintain children's interest. Starting from an exploration of the children's prior knowledge, various conversations began with the explicit aim of understanding the depth of their knowledge and how they organized and internalised this knowledge, both in terms of conceptual understanding and mental representations. In industrialised areas, there is a clear lack of direct contact with nature among school-age children, often accompanied by deficiencies in the recognition of living organisms, their biological characteristics and their importance in ecosystems or their contribution to human existence (Tunnicliffe, 2001). Although it could be assumed that this condition is more

prevalent in urban areas (Tuan, 1978), some studies have shown a decline in environmental knowledge even among children from rural areas (Díez et al., 2018; Ianni et al., 2015). Forest loss poses a direct threat not only to the health of the planet, but also to human well-being, as highlighted in Goal 15 of the 2030 Agenda. There is therefore an urgent need to protect, restore and promote the sustainable use of terrestrial ecosystems. This requires the adoption of sustainable forest management practices, active measures to combat desertification and decisive action to halt and reverse both land degradation and biodiversity loss. Profound changes in urban development are having a significant impact on our well-being, encompassing both physical and psychological dimensions. The process of urbanisation imposes a wide range of selective pressures on people, with significant consequences such as changes in mortality rates, demographic patterns, the spread of disease and the presence of environmental factors such as air, water and soil pollution. Other critical aspects, such as hygiene, nutrition, social relations and the composition of the microbiota, are also subject to change, each playing a pivotal role in shaping the course of evolution (Mancuso, 2023).

How can children and parents be brought back to reconnect with Nature, with plants? What knowledge and memories are preserved about plants? What special moments emerge from the memory of children and parents?

In response to these inquiries, ethnobotanical studies have emerged as a valuable tool for the preservation of knowledge about plants, knowledge that would otherwise be at risk of fading with time (Briceño et al., 2017). The goal was to actively perpetuate the memory of the past and the historical relationships between humans and plants. This interdependence makes humans deeply dependent on plants, to the extent that it shapes our memories. Research that began with an attentive exploration of children's prior-existing knowledge and innate connection to plants underscores the notion of an active child (Dewey, 2019; Edwards et al., 1998; Giudici, 2011) who actively constructs his or her own learning process. Such a child was not simply a passive recipient, but rather an individual capable of absorbing and retaining information about experiences with nature, demonstrating competence in recognising the profound interdependence between humans and living beings. The archive of memory (Demetrio, 2015), in the realm of children and parents, consisted of a nuanced interplay of different elements, encompassing spatial dimensions, animals and plants. This archive played a central role in the development and maintenance of a «language of affect» (ivi, pag.21), highlighting the extent of children's awareness of plants. The research focused on exploring the evolving relationships over time and the children's methods of memorisation in this specific context. Using narrative as a medium, the aim was to encourage individuals to retrieve and articulate the content held in their memory, facilitated by emotional support. Demetrio (2020) proposed that a cognitive biography serves as a narrative that describes the gradual formation of a cognitive profile over time. This complex process developed as a social history in which the human mind organises and constructs its understanding of the world. At the same time, it experimented with cognitive styles that prove to be the most appropriate and functional for its purposes. An emerging paradigm articulated in the form of a new ecology of thought that seeks to establish a connection between humans and the planet based on a sense of belonging rather than a purely utilitarian relationship (Guerra, 2021). This expansive perspective should foster an awareness of our inherent interconnectedness with the natural world and cultivate a deep sense of belonging and responsibility towards the environment. This transformative paradigm promoted a view of the Earth as an integrated system, emphasising the importance of fostering sustainable and harmonious relationships with our habitat. It advocated a move away from viewing the environment as a resource to be exploited in isolation and instead promotes an integrated and impact-conscious approach. In

essence, it represented a shift in perspective designed to reshape the way we perceive and engage with our planet, advocating a more respectful and supportive attitude towards the surrounding environment.

Methodology

The research integrated into a Ph.D. dissertation in Reggio Childhood Studies, a programme that embodies interdisciplinary and international perspectives aimed at elucidating the educational philosophy associated with early childhood that originated in Reggio Emilia. Located in the Emilia-Romagna region of northern Italy, Reggio Emilia is famous for its pioneering educational methodology, known as the ″Reggio Emilia Approach″ (REA). The Reggio Schools were founded after the Second World War by a group of women who wanted a better education for their children. Women and men worked together to build different schools to educate their children differently and created community schools where children could actively participate in their learning and knowledge (Borghi & Frabboni, 2017; Giudici, 2011). The school chosen together with the research group on the basis of its specific characteristics in the Institute Comprensivo Manzoni. This school, in collaboration with the Reggio Children Foundation, partner of the PhD course, has long been committed to promoting quality education in the Reggio Emilia area. Data collected took place on a consistent weekly basis from November to April. The data collected underwent categorisation and analysis using Atlas.ti, with subsequent percentages calculated using an Excel spreadsheet. About 67% of the pupils in the fourth grade of a primary school were born in Italy (Figure.1), while the countries of origin of their parents showed a remarkable diversity (Figure.2). In addition, the parents of Italian origin had very different cultural backgrounds, reflecting the distinct socio-cultural characteristics of the different regions and cities of Italy, from the far north to the south. An ethnobotanical approach explored the interests of both children and parents. This method investigated how people develop their relationship with plants over time, including aspects such as food, rituals, textile fibres and other modalities (Caneva et al., 2013).
Figure 1: Place of birth children
Figure 2: Parents' place of birth

The methodology used in this study draws on ethnography to facilitate the collection of data from the group of children and parents. Ethnographic research was instrumental in reconstructing events and elucidating the local educational environment through the inclusion of multiple subjects and perspectives. The active participation of children, teachers and parents in the descriptive processes framed them as co-constructors of meanings, interactions and practices (Pastori, 2017), fostering a small community that is inherently rich in knowledge and expertise. The inclusion of narrative inquiry introduced additional complexity into the research framework as the researchers took an integral role in the construction of the narratives. Throughout the fieldwork, weekly sessions of approximately three hours each were scheduled with the children. These sessions included initial interviews aimed at gathering information about their relationship with plants. Following each session, the children were tasked with processing the information discussed. This process served the dual purpose of refining and focusing the information in their individual memories as well as collectively as a group. With regard to parents, semi-structured ″one-to-one″ (Rubin & Rubin, 2012) interviews were conducted. This method allowed for the formulation of opening questions, which encouraged flexibility in the order and wording of subsequent inquiries. In this context, the researcher assumed the role of a facilitator, maintaining the interviewee's full focus. This approach was designed to give interviewees maximum freedom to express themselves. Data collection involved audio recording and subsequent transcription by the researcher. Thematic qualitative analysis was used for data analysis. This method, known for its theoretical flexibility, serves as a comprehensive research tool capable of providing a detailed and rich account of the data, albeit with potential complexity (Braun & Clarke, 2006). The initial phase of data organisation involved the management of coded files, available in both paper and electronic formats, using Atlas.ti and Microsoft Office software. This was followed by the systematic structuring of the data into categories, using Kellert's ″The Values of Life″ as a theoretical reference (Kellert, 2004; Kellert & Wilson, 2013).

Results

The narratives of both participants and researchers were intricately interwoven, forming a common narrative that evolved throughout the research (Connelly & Clandinin, 1990). This paper extrapolated the values that underpin the construction of green narratives by children

and parents. In particular, these stories evoked a deep sense of well-being. This sense of well-being, derived from reflections on plants, goes beyond mere physical contact and includes the recollection of memories associated with the plant kingdom. In addition, well-being is derived from the time parents spend with their children sharing experiences and moments related to plants. Illustrative examples of such stories from both children and parents are given in Table 1.

Children's memories	Categories
I like watermelons because my grandfather is in Moldavia and has lots of them. Every day we go to pick them_S.R	Utilitarian
In Egypt I have a vegetable garden and a lemon tree and a peach tree. The roses are somewhere else, and I remember my grandfather was alone there_A.	Moralistic
The lemon reminds me of my grandfather. This tree was given to my father two or three years ago, and now we have it here at home in memory of my grandfather, who has died_T.	Moralistic
Parents' memories	
No, I don't have any plants. I remember my mother with this vegetable garden and this hall full of plants_M. A.	Aesthetic
I spend my childhood among plants. I want to pass that on to my daughter_M. N.	Umanistic
We used to eat mint both for the cold and to add flavour to our food_F. L.	Utilitaristic

Table 1: Examples of conversations

The values that we have identified as shaping different aspects of the physical and mental well-being of human beings are outlined below:

Aesthetic: the physical beauty of the natural world is without doubt one of its most powerful appeals to the human animal. From the contours of a mountain landscape to the ambient colours of a setting sun, to the fleeting vitality of a breaching whale, the complexity of the aesthetic response is evident.

Dominionistic: experience of nature reflects the desire to dominate the natural world. This perspective may have been more common in earlier periods of human evolution; its occurrence today is often associated with is often associated with destructive tendencies, lavish waste and the plundering of the natural world.

Humanistic: human beings can experience intimacy, trust and a sense of relationship and kinship through the development of a deep sense of affection for the natural world. These feelings of affection and connection with nature and other living beings can have a mentally and physically rejuvenating effect.

Moralistic: perception of universal patterns in nature can provide a basis for a moral code. It can make one feel connected and committed. These feelings promote mental and emotional well-being.

Naturalistic: being in contact with nature, feeling a sense of curiosity and wonder.

Scientific: our physical well-being can be positively influenced by the practical knowledge that can be gained through scientific activities. Mental wellbeing can be fulfilled and enhanced through intellectual activities.

Symbolic: the use of nature as a symbol is perhaps most critically reflected in the development of human language and the complexity and communication of ideas fostered by this symbolic methodology.

Utilitarian: when we recognise our utilitarian dependence on nature, physical and mental well-being improves. Recognising our dependence on the natural world for resources such as food, water and shelter can help us feel grateful and connected.

The data analysed shows that the most frequently cited categories are humanistic and utilitarian (Figure: 3). The sense of trust, intimacy and emotionality that develops through contact with the natural world. Both mental and physical wellbeing is generated through connection with other living beings.
Figure 3: Categories of value

A visible process of narrative reconstruction emerged as children articulated their associations with plants. This reconstruction involved an imaginative effort to elucidate connections with plants that go beyond the utilitarian perspective of seeing them solely as a source of food. The narratives created by the children take on a profound meaning. They symbolise a deep sense of tranquillity derived from contemplating their intricate connections with the plants. These stories, therefore, encapsulate the essence of peace that comes from a thoughtful engagement with the plant world, transcending the mundane and taking on a more sublime

status. Children's fascination with plants was evident in their propensity to explore and understand species from different cultural backgrounds. This curiosity went beyond mere botanical interest. It included a keen interest in the origins and nutritional properties of food derived from these plants. At the same time, there was a palpable desire to rejuvenate neglected gardens in their domestic environments. This tendency to revive neglected green spaces was indicative of a growing awareness of environmental responsibility and a proactive commitment to improving the environment. In essence, these manifestations emphasised the multifaceted nature of children's connection with the plant world, encompassing cultural curiosity, nutritional research and commitment to ecological restoration. In the narrative, the intrinsic links with plants were meticulously delineated, giving rise to references to people, contexts, places and experiences that are intimately linked to specific moments. These memories, firmly rooted in the reservoir of prior knowledge held by children and parents, function as powerful tools to cultivate their curiosity and empathy. By weaving these plant-centric anecdotes into the fabric of their shared experiences, the stories served as conduits for a nuanced understanding of the interplay between humans and the botanical world. These deep-rooted memories served as catalysts, not only stimulating interest but also fostering an empathetic connection with the intricate ecosystems and diverse range of individuals and environments associated with these plant-related experiences. In essence, the narrative became a conduit for the transmission and perpetuation of knowledge, shaping a collective consciousness that goes beyond individual memories to foster a broader appreciation of the interconnectedness between humans and the plants.The examples provided (Figure 3) illustrate experiences related to diverse contexts, highlighting the richness and complexity of the relationships between children and the plant world.
Figure 4: Relationship between children and plants

This report stressed the profound impact on the well-being of both children and parents as they articulate how their lives have been significantly improved. Shared experiences with plants emerge as not only valuable but transformative, with time spent together presented as an invaluable opportunity for mutual engagement. In this shared space, children and parents not only exchange anecdotes but also share practices rooted in their collective childhood experiences. These shared moments contribute significantly to an enhanced sense of well-being, fostering a positive environment where family bonds are strengthened through a shared appreciation of the natural world.

Conclusion and Discussion

How can children and parents be brought back to reconnect with Nature, with plants?
Through initiatives that explored children's and parents' interactions with plants and the intergenerational transmission of knowledge, there was the potential to foster a reinvigorated engagement with nature and mitigate what Kahn (2008) has identified as 'generational environmental amnesia'. The implementation of such projects should aim to rekindle ecological awareness and preserve the wealth of knowledge associated with plants, thereby acting as a mitigating force against the declining connection with the natural environment that has occurred over time.

What memories are preserved about plants?

Children and parents preserved memories of their relationships with plants and placed them in their own archives. These memories manifested as essential traditional knowledge to be passed on to future generations to deepen and consolidate our connection with nature (Kahn, 2008, cit. in Barbiero, 2012). The aim of the research was to stimulate children's and parents' interest in plants and to make them active subjects in the process of relating to the plant world.

What special moments do children and parents remember?

For both children and parents, memories were intrinsically linked to a variety of experiences that recall significant moments in their lives. These memories were contextual, arising from direct experiences, observations, listening to past stories. They were authentic emotional encounters that transform feelings into emotions (Barbiero, 2012).

Their memories, classified according to Kellert's values (S. Kellert, 2004), showed how the simple act of talking about plants is a great source of well-being. They also highlighted the important role that plants play in building positive relationships, both with others and with parents. Research demonstrated that a relationship with plants, in the various contexts in which they were present, promoted a solid sense of well-being in people. This approach recognised and nurtured the intrinsic human connection to nature for the benefit of both the individual and the planet as a whole. The primary goal was to inspire the field of education to cultivate a new form of connection and relationship with the natural world, ultimately contributing to a more sustainable future (UNESCO, 2021). It could also create new grounds for involving parents in primary education, where their participation is often underestimated. Parental involvement contributed to children's emotional and cognitive development. Such involvement provided parents with an opportunity to actively participate in their children's learning and to spend meaningful time-sharing precious moments with them (Edwards et al., 1998). It could be assumed that memory plays a crucial role in our relationship with nature, acting as a conduit for storing and recalling experiences, knowledge and emotions related to the natural environment. Through memory, past interactions with nature could influence our present and future attitudes and well-being. The integration of cultural perspectives was an essential means of gaining a fuller understanding of relationships with nature. Integrating nature-based education programmes into school curricula could contribute to the transmission of environmental memory. Involving students in practical and reflective experiences could strengthen the emotional connection with nature. In addition, sharing nature-related practices, traditions and memories between different cultural groups could promote a deeper mutual understanding and a shared awareness of the importance of environmental conservation.

Enhancing Mathematics Classroom Teaching Through Micro-Lessons and Increased Learning Interest

Zhou Xiaomin, Rajamangala University of Technology Thanyaburi, Thailand
Piyanan Pannim Vipahasna, Rajamangala University of Technology Thanyaburi, Thailand

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
This research discusses how to strengthen the teaching of mathematics class by using micro-lessons and improve students' interest in learning. In order to solve these problems, this study puts forward the application of micro-lesson in mathematics teaching. The needs analysis is carried out in advance with the aim of stimulating students' perceptions of learning using micro-lessons. The purpose includes of this study were: 1) To identify the efficacy of the proposed micro-lesson on mathematics classroom learning. 2) To compare students' learning achievement through pre-test and post-test the micro-lessons to study mathematics and 3) To assess satisfaction from using micro-lessons. The sample for this study included 30 third-grade students studying in a private school in Guangdong Province. Students were selected using a simple random sampling technique. The data were analyzed using mean, standard deviation and t-test. The findings showed that 1) The efficacy of the proposed system (E1/E2) were at levels greater than 80 percent. 2) The students' achievement based on the post-test was higher that pre-test significantly at the level of .05. 3) The student's level of satisfaction toward the system was at the highest level. The results show that the micro class is beneficial to the learners' interest in mathematics. The application of micro-lessons in mathematics classroom teaching reduces learners' anxiety in mathematics learning, and there is a significant difference between the experimental group and the control group.

Keywords: Micro-Lessons, Subject Teaching, Teaching Practice, Application

1. Introduction

Under the background of the high efficiency development of information technology, the teaching before, during and after class of teachers in primary schools has undergone new changes and developments. The transformation from the traditional single offline course and teaching to the "online + offline" mixed teaching model provides a convenient platform and rich resources for the extension of the classroom. Such massive resources provide more humanized technical support for the teaching of primary school teachers, and constantly optimize the teaching practice and classroom of primary school teachers, which also requires the continuous development and improvement of the information ability of primary school teachers, so as to better combine digital information with teaching.

"Micro-lessons" refers to the whole process of recording teachers' wonderful teaching and learning activities centering on certain knowledge points (key and difficult points) or teaching links in the course of education and teaching both inside and outside the classroom with video as the main carrier. Therefore, "micro-lessons" is not only different from the traditional single-resource teaching resources such as teaching examples, teaching courseware, teaching design, teaching reflection, but also a new kind of teaching resources inherited and developed on its basis. In education and teaching, the content taught in the micro-lessons is in the form of "points" and fragments.

2. Research Objectives

This study aims to combine micro-lecture with various courses to realize the deep integration of information technology and education teaching, which can meet the individual learning needs of students and change their learning methods.

2.1 To develop micro-lessons application to improve students' self-learning ability.

2.2 Students in the learning achievement test comparison before and after.

2.3 Students satisfied with using micro lessons to learn.

3. Research Hypothesis

The emergence of micro-lessons will break the traditional teaching methods, satisfy students' personalized learning of different subject knowledge points and select learning according to needs, which can check the gaps and make up for them, and strengthen and consolidate knowledge. It is an important supplement and expansion resource for traditional classroom learning.

4. Research of Methodology

4.1 Variables

4.1.1 Independent variable is a small video of learning mathematics curriculum knowledge in micro-lessons to improve students' learning interest.

4.1.2 The dependent variable is (1) Student learning achievement; (2) Student satisfaction toward the micro lessons.

4.2 The population: The objects of this study are 280 students and 20 teachers in Grade 3 of Country Flower City School, Shunde District, Foshan City, Guangdong Province, China.The sample of this study are 30 students and 4 teachers from Country Flower City School, Shunde District, Foshan City, Guangdong Province, China.

4.3 The research instruments

4.3.1 Small videos for learning subject knowledge in micro-lessons;

4.3.2 "Questionnaire star" APP.

4.3.3 The students were pre-test and post-test.

4.4 Content
This study will investigate the application status of micro-lessons in primary school mathematics teaching, so as to understand the shortcomings of the current micro-lessons in primary school mathematics teaching, collect the opinions of teachers and students on the application of micro-lessons in class, and then analyze, synthesize, compare and summarize, so as to provide suggestions and measures for primary school mathematics teachers to use micro-lessons in class.

5. Conclusion

The analysis result of the above information answers to the research objectives as follows:

5.1 The effectiveness of using Micro-lessons in mathematics classroom learning shows that the E1/E2 coefficient 1 of the learning process score (E1) is equal to 82.83, and the performance score (E2) is equal to 81.53, which is higher than the standard defined by 80/80. The research results clearly show that the mathematics classroom teaching effect is good in Country Flower City School.

Items	n	$\overline{X}$	Percentage	S.D.	Standard	E_1/E_2
Ongoing score	100	82.83	82.83	3.51	80	82.83
Post-test score	30	24.46	81.53	2.43	80	81.53

Table 1: E1/E2

5.2 The third grade students in Country Flower City School were taught Micro-lessons to improve their interest in learning mathematics. The results of the post-test results were higher than the pre-test results, with a significant level of 0.05.

5.3 The results of students' satisfaction show that students' satisfaction with Micro-lessons teaching is higher, and the average score is higher 4.22, especially in terms of access to teaching content and participation in other learning resources, students have higher satisfaction with Micro-lessons teaching and are more suitable for learning.

5.4 Summary
In this research, researcher have suggested that the results of the study should be applied as follows:

5.4.1 The development of Micro-lesson instruction should be carried out step by step according to best practices in the field, as this will enable researchers to achieve the goal of building Micro-lessons instruction courses to enhance teaching effectiveness and implement them more successfully.

5.4.2 Mathematics classroom teaching is a subject that has been studied in many aspects, and it has been found that using Micro-lessons teaching can successfully improve students' interest in learning mathematics, so it is necessary to further study the application of Micro-lessons to the learning and teaching of other subjects.

5.4.3 Taking into account the different learning styles of students, students should be given the opportunity to decide whether they wish to study independently or in groups. This will promote cooperative learning skills and peer correction.

5.5 Discussion

The research and discussion on carrying out Micro-lessons teaching in mathematics classroom in Country Flower City School to improve students' interest in learning mathematics are as follows:

5.5.1 Analysis of Using Micro-lesson to study mathematics in class of efficiency of $E_1/E_2 = 80/80$

The experiment construction based on the application of Micro-lesson in mathematics classroom teaching to improve the interest of third grade students in learning mathematics in Country Flower City School is divided into three stages, aiming to test whether E_1/E_2 efficiency value under the 80/80 efficiency standard can be reached before the experiment is implemented. The first stage is traditional teaching. 30 students are taught in traditional mathematics classroom. The second stage is called the use of Micro-lessons in mathematics classroom teaching. After this video for Micro-lesson teaching has been modified and refined, the final stage is called field testing. It was carried out by 30 students. The results show that the E_1/E_2 efficiency is 82.83/81.53. This result is consistent with the results of several related studies. Ye Ma (2023) conducted a study on the application of Micro-lesson teaching technology, and the results showed that the efficiency value of E_1/E_2 was 80/81.80. In addition, Yanghui Lu (2022) also showed that the efficiency of E_1/E_2 was 80/80 by analyzing the application significance of Micro-lessons in mathematics classroom teaching. Xinjun Zhao (2022) developed an innovative teaching model based on Micro-lesson teaching, and the results showed that the efficiency level of E_1/E_2 was 83.50/84.25, which met the standard.

5.5.2 A comparison of students' use of Micro-lessons in mathematics classroom learning tests

Through the comparison of students using Micro-lessons in mathematics classroom learning performance, the results show that students in the Micro-lesson learning group score higher in the mathematics classroom using Micro-lessons learning performance test, reaching a significant level of 0.05. When the content of Micro-lesson teaching is suitable, Micro-lesson teaching can produce effective learning effect. This is because the tool can help motivate users to use fascinating techniques such as motion graphics and images. Qiang Ma(2020) compared teaching using micro-lesson resources with traditional teaching methods and showed that students using Micro-lesson teaching had higher academic performance, with a significance level of 0.05.

5.5.3 Students' satisfaction with the use of Micro-lessons in mathematics classroom learning
According to the results of the experiment, the students have a high degree of satisfaction with the use of Micro-lessons in mathematics classroom learning. This is consistent with the findings reported in the literature (Ma Deng, 2022; Dan Ma, 2020; Xiaoyong He, 2021; Ping Chen, 2022 and Ying Chen, 2023). In these studies, two-thirds (2/3) of students were very satisfied with the use of Micro-lessons for math classroom learning. This is because they can use Micro-lesson resources anytime and anywhere. They benefit from learning new things at their own pace. In addition, their learning speed can be adjusted according to their learning ability.

Investigating Key Determinants Influencing the Improvement of Students' Potential and Employability via Smart Campus Platform at Guangdong Vocational College, China

Chen Kun, Rajamangala University of Technology Thanyaburi, Thailand
Kitipoom Vipahasna, Rajamangala University of Technology Thanyaburi,Thailand

Abstract

Building the essential competencies in the professional field that help increasing the employment rates are the major challenge for overall vocational colleges in China. As they are extremely difficult and limiting the in-depth analysis of this correlation of success factors. This study aims to delve into the current academic performance of students at Guangdong Vocational College and their employment status in their respective fields of study. We discovered how the Integrated Smart Campus Platform significantly affects academic achievements and the employability rate of graduates. We identified a series of key determinants that have a profound influence on student's academic success and employability rate based on a comprehensive statistical analysis. The sample comprised 100 students, 20 teachers, and 10 school administrators from Guangdong Vocational College, China. Through Principal Component Analysis (PCA) and Multiple Regression Analysis (MRA), we discerned that: 1) The Integrated Smart Campus Platform plays a pivotal role in elevating academic performance and the employability rate of graduates, accounting for 68% of the variance; 2) Approximately 83% of students, teachers, and administrators actively engaged with the platform, expressing a 76% satisfaction rate; 3) Technical support and professional training emerged as the key factors in enhancing the efficiency and satisfaction rate of platform usage, with respective influence values of 0.45 and 0.38. This research offers valuable insights into the realm of higher vocational education, showcasing the potential of technology in bolstering student potential and employability rate.

Keywords: Academic Achievement, Employability Rate, Smart Campus Platform, Educational Determinants, Vocational Education and Training

Introduction

With the accelerated pace of globalization and the rapid evolution of technology, the modern labor market is undergoing unprecedented changes. Emerging industries such as artificial intelligence, big data, and renewable energy technology are progressively replacing traditional sectors, bringing forth new career opportunities and challenges. In this context, businesses and organizations are increasingly seeking employees who possess interdisciplinary skills, innovative thinking, and self-learning abilities. Hence, providing students with forward-looking education closely linked to market demands has become paramount.

In recent years, China's government has attached great importance to the development of higher vocational education, pouring significant resources into this sector. Especially with the impetus of the "Dual High" strategy and the "New Engineering" initiative, vocational higher education has seen swift growth. Nevertheless, the employment rate and job quality of higher vocational students still pose certain challenges. According to the Chinese Education Statistical Yearbook, although the overall employment rate of vocational graduates has consistently remained above 90% in recent years, the quality of their employment (such as salary levels, job match, and career development opportunities) still requires improvement.

Guangdong Vocational College, a renowned vocational institute in Guangdong Province, China, has long been committed to nurturing highly skilled application-oriented talents. To better align with the labor market's requirements, Guangdong Vocational College has introduced the concept of a "Smart Campus" in recent years. By establishing an integrated platform encompassing teaching, management, and services, the institution aims to offer a more personalized and intelligent educational experience for its students.

The "Smart Campus" initiative is more than just a technological endeavor; it represents an exploration and practice of educational reforms. Through real-time data analysis, predictive models, and artificial intelligence, a Smart Campus can offer students more precise and tailored learning resources, helping them better tap into and develop their potential. Moreover, this initiative also provides school administrators with more scientific and objective decision-making insights, facilitating more effective educational and pedagogical reforms.

However, striking the right balance between technology and education, ensuring the "Smart Campus" truly benefits students' growth and development, remains a pivotal challenge. Based on this, the current research aims to thoroughly investigate Guangdong Vocational College's "Smart Campus" initiative, analyzing its tangible impact on boosting student potential and employment rates, while exploring potential challenges and opportunities.

Current State of Information Technology in Chinese Higher Vocational Education

In recent years, under the guidance of the Ministry of Education's drive to promote the informatization of vocational education, Chinese higher vocational colleges have taken concrete steps to unify their thoughts and actions. Seizing current opportunities, these institutions have propelled advancements in educational informatization, aiming to maximize the role and value of information technology in teaching and learning. In this backdrop, new educational management systems and models have emerged to achieve high-quality and inclusive education. To support these endeavors, the Chinese government has continually increased financial investments in education. During the "Twelfth Five-Year Plan", total

expenditure reached 12.2 trillion yuan, equivalent to the total educational investment of the first 30 years since the country's reform and opening up. Since 2015, China's fiscal allocation to educational informatization has been consistently increasing, with an annual budget allocation exceeding 4% of GDP. With substantial financial backing, the level of educational informatization in China has been on a steady rise.

In certain regions and institutions, the informatization of educational management has achieved interconnectivity and shared usage under national information systems, fulfilling schools' application needs and yielding significant results.

As early as 2012, the "Ten-Year Development Plan for Education Informatization (2011-2020)" was released, marking a milestone for China's educational informatization. By 2012, with the rise of internet applications in China, the informatization of vocational education was also rapidly advancing. Using 2012 as a reference point, the next three years, leading up to 2015, saw vocational education informatization entering an era of continuous exploration around emerging technologies. Two significant shifts occurred during this period. Firstly, the completion of multiple 100G backbone networks enhanced campus network speeds, drastically improving internet access experiences for teachers and students. Secondly, the rise of network clouds from 2012 brought a fresh direction to campus informatization, providing a new perspective for the evolution of educational informatization. Many institutions have now established data centers based on cloud architecture. In some of the more technologically advanced institutions, online learning has been made possible via network clouds.

Starting from 2016, the construction of one-stop services became a trend in vocational colleges. The emergence of these services symbolized a trend where informatization efforts should increasingly focus on improving the experiences of teachers and students. The primary goal is to "let data travel more, and teachers and students travel less, preferably not at all." Arguably, from the widespread adoption and evolution of one-stop services, higher education informatization in China began its initial foray into integrated development, allowing teachers and students to genuinely experience the various conveniences brought by informatization. This was a significant achievement of higher education informatization during the "Thirteenth Five-Year Plan" period. The outbreak of the pandemic in 2020 highlighted the pivotal supportive role of informatization in vocational colleges. Unlike the SARS outbreak in 2003, education could continue during the 2020 pandemic due to the maturity of informatization infrastructure and applications. Although there were initial challenges, subsequent developments steadily set the course right, effectively supporting primarily online-based teaching and related services.

Trends in Smart Campus Construction

The smart campus is often seen as a further enhancement and development of the digital campus, representing a higher form or phase of educational informatization. In 2010, Zhejiang University was the first to introduce the concept of the smart campus in China, in its "Twelfth Five-Year Plan" for informatization, where the smart campus was defined and described. Simply put, it encompasses ubiquitous networked learning, integrated innovative online research, transparent and efficient campus governance, diverse campus culture, and convenient campus life. In June 2018, the National Market Supervision and Administration and the National Standards Committee issued the GB/T 36342-2018 standard for the overall framework of smart campus construction. The construction of a smart campus mainly

employs key technologies such as the Internet of Things, cloud computing, mobile internet, and big data, combined with data resource development, to ensure resource and service sharing, accessible to anyone, anywhere, anytime. A smart campus offers a transparent and efficient management platform, real-time data analysis, flexible teaching methods, a ubiquitous learning environment, and convenient campus life. More and more institutions are now joining the ranks of smart campus construction, achieving notable results. The construction of a smart campus provides robust support for the promotion of educational informatization and the acceleration of educational modernization, holding significant practical value and profound implications.

Research Objectives

Following the guidance from policies including the "National Medium and Long-term Educational Reform and Development Plan Outline (2010-2020)", "Ten-Year Development Plan for Education Informatization (2011-2020)", "13th Five-Year Plan for Education Informatization", "Guiding Opinions of the Ministry of Education on Further Promoting the Development of Vocational Education Informatization", as well as the "Three Communications, Two Platforms", "Internet Plus" action plan, "Promoting Big Data Development Action Outline", "Education Informatization 2.0 Action Plan", and "Modernization of China's Education 2035".

This research analyzes the main problems that vocational colleges encounter in the application, management, and maintenance of teaching resources, and the reasons behind these problems. Combining theories of modern educational technology, creative education, non-directive teaching, constructivism, and educational communication, we aim to construct a teaching resource service platform for vocational colleges based on the smart campus concept. This study takes place in Guangdong Vocational College, China, The major concerns of this research include:
1. Investigating the academic performance issues at Guangdong Vocational College, and the employment status of graduates within their field of specialization.
2. Analyzing the significant factors affecting academic achievements and graduate employment rates via the Smart Campus Platform.
3. Evaluating the participation and satisfaction levels of students, teachers, and school administrators with the Smart Campus Platform.

The Smart Campus Platform of Guangdong Vocational College

Guangdong Vocational College is also committed to creating a comprehensive Smart Campus Platform, transforming it into a multifaceted system that simplifies campus management and enhances student services. The platform includes:

Intelligent Portal: This serves as the interface for various subsystems, allowing for seamless data flow and integrated services.

Internal Integration: This includes the administration, professors, and students. The system supports administrative operations, academic management, and student services.

Academic Management Information System: It oversees academic schedules, course materials, and performance tracking to improve the educational delivery.

Student Management Information System: This system manages student profiles, attendance, and engagement, fostering a personalized learning environment.

Financial Management Information System: It handles tuition fees, funding, and financial aid, ensuring financial processes are transparent and efficient.

Employment Information Platform: This platform connects students with job opportunities, internships, and career advice, enhancing their employability.

Infrastructure: The network, server, and database infrastructure form the backbone of the platform, ensuring reliable access to all services.

External Integration: The platform engages with parents, state bodies, and businesses, enhancing communication and collaboration.

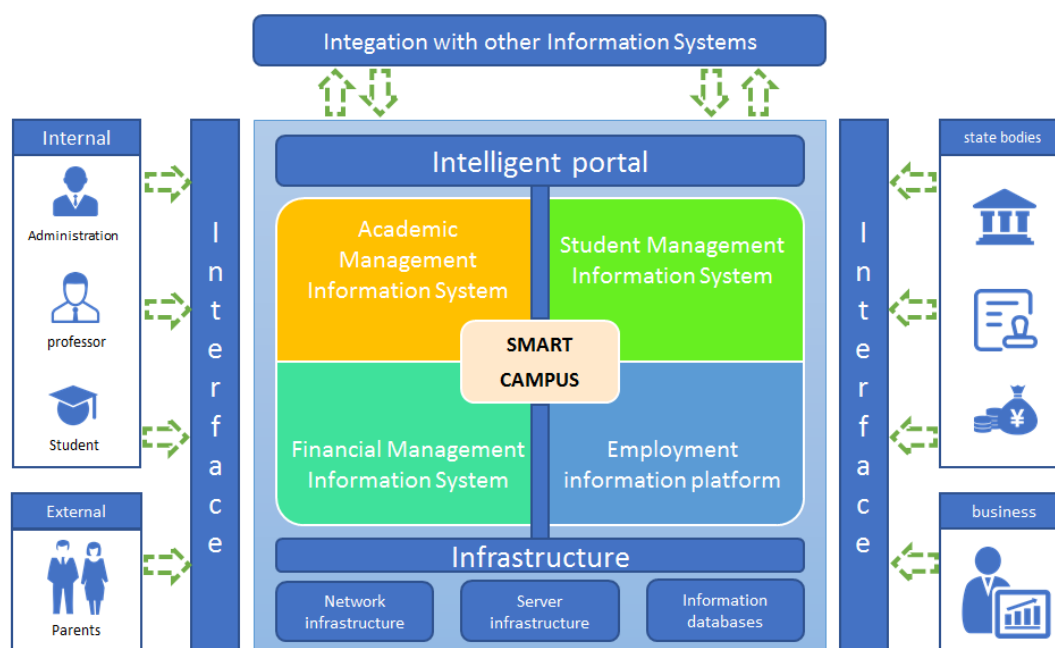
This integrated platform aims to dramatically improve students' lives, academics, and professional prospects through a technologically advanced, interconnected education Ecosystem.


Figure 1: The Smart Campus Platform

Conclusion

This comprehensive study undertaken at Guangdong Vocational College sought to evaluate the efficacy of the Smart Campus Platform in enhancing the academic performance and employability of students. Through a detailed exploration of various facets of this technological intervention, the research unearthed several pivotal findings, which hold profound implications for the realm of vocational education, particularly in the digital age.

Main Findings and Detailed Analysis:

1. Enhanced Academic Performance:A pivotal finding of this study was the marked improvement in students' academic performance following the implementation of the Smart Campus Platform. This platform provided a more engaging and personalized learning environment, which facilitated deeper understanding and retention of course material. The integration of technology in educational delivery was found to be a significant factor in enhancing the learning experience, leading to better academic outcomes. This finding is in line with current educational theories that advocate for personalized learning environments enabled by technology.

2. Increased Employability: Another significant outcome was the increased employability of students who utilized the platform. This facet of the study underscores the platform's role in bridging the gap between academic learning and the practical skills demanded in the job market. The platform provided students with real-world skills that are highly valued by employers, thus enhancing their job prospects upon graduation. This aspect of the study is particularly relevant in the context of vocational education's aim to prepare students for specific careers.

3. Positive Perception and Participation: The study also revealed a high level of satisfaction and positive reception among students, teachers, and administrators. This positive perception is crucial as it underlines the acceptability and adaptability of technological innovations in educational settings. The enthusiastic participation and feedback from these stakeholders suggest a readiness and openness to integrate such advanced platforms in the educational process.

4. Technical Support and Training: The success of the Smart Campus Platform heavily relied on the provision of robust technical support and training. This aspect was pivotal in ensuring smooth adoption and effective utilization of the platform's features. The study highlights the importance of technical support in the successful implementation of technological solutions in educational settings.

Broader Implications：

1. Educational Policy and Practice: The findings from this study advocate strongly for the integration of smart technology platforms in vocational education. This aligns with global educational trends towards more technologically integrated learning environments. The study suggests that similar platforms could be beneficial in other vocational institutions, potentially revolutionizing the standard of education and employability of graduates.

2. Curriculum Development: The results highlight the need for educational content to be in sync with industry trends and market demands. This alignment is crucial for equipping students with the skills that are relevant and in demand, thereby enhancing their job readiness upon graduation.

3. Technological Advancement in Education: The study reinforces the notion that effective use of technology can transform educational experiences, making learning more engaging, efficient, and aligned with the needs of the modern job market.

The study, while providing valuable insights, is not without its limitations. Primarily, its scope was limited to Guangdong Vocational College, which may restrict the generalizability of the findings to other educational contexts or cultures. Additionally, the reliance on self-reported data could introduce biases. The study primarily focused on immediate outcomes, and thus the long-term impacts of the platform remain unexplored.

Future research should aim to address these limitations. Expanding the study to include a diverse range of educational institutions would help in assessing the broader applicability of the findings. Longitudinal studies could shed light on the long-term effects of such platforms on student outcomes. Investigating the integration of such platforms in different cultural and educational settings would provide a more holistic understanding of the role of technology in education on a global scale.

In conclusion, the Smart Campus Platform at Guangdong Vocational College represents a significant advancement in the integration of technology into vocational education. Its impact on both academic performance and employability is a testament to the potential of such platforms to revolutionize educational practices. The study highlights the need for continued research and adaptation to emerging educational and technological trends for the broad adoption and sustained success of such initiatives. The insights from this study are instrumental in guiding future educational policies and practices, not just within vocational education, but across the educational spectrum.

The Application of TPRS Teaching Method for Chinese as Second Language Students

Fang Huang, Rajamangala University of Technology Thanyaburi, Thailand
Piyanan Pannim Vipahasna, Rajamangala University of Technology Thanyaburi, Thailand

Abstract

This study employs the TPRS teaching method to research elementary-level spoken Chinese instruction for foreign learners. It emphasizes moving beyond textbook content and focusing on cultivating students' oral output abilities. The purpose includes of this study were: 1) to applying TPRS in an experimental class for elementary-level spoken Chinese, comparing it with a control class, analyzing whether significant differences exist in oral test scores, assessing TPRS's suitability for basic oral teaching. 2) to assess satisfaction from using TPRS teaching method for Chinese as a second language students . The sample for this study included 44 undergraduate foreign students (aged 18-22) from Sichuan University of Science and Engineering. Students were selected using a simple random sampling technique. Each consisting of 44 students with no significant oral proficiency differences. Post-teaching, oral scores of both groups are compared. The findings showed that 1) Improved oral scores for both classes post-teaching, with significant differences favoring the experimental group, demonstrating TPRS's efficacy in enhancing oral proficiency. 2) The student's level of satisfaction toward the TPRS teaching method was at the highest level. TPRS aids vocabulary acquisition and real-world knowledge application.

Keywords: TPRS Teaching Method, Chinese as a Foreign Language, Basic Oral Instruction

1. Introduction

Oral teaching plays a crucial role in Chinese language learning. Several language education scholars emphasize the importance of oral training for students. Shih Pei-Wen(1983) believes that oral teaching aims to cultivate students' ability to express themselves in Chinese thinking, while Yang Huiyuan (1991)points out that oral skills are key to the vocal expression of phonetics, vocabulary, and grammar. Wang Ruojiang(1999) emphasizes the crucial role of oral skills in teaching Chinese as a foreign language, and Hou Yaguang(2005) highlights that international students need to engage in communication through listening, speaking, reading, and writing. Shen Xiuyan(1996) believes that students need to master the differences between oral expression and written language, and Guo Yingwen(2003) suggests that elementary oral teaching should incorporate everyday communication language. In summary, oral teaching is not only about imparting language knowledge but also an essential way to assess students' proficiency.

TPRS, formerly known as Total Physical Response Storytelling, and later as Teaching Proficiency through Reading and Storytelling since 2004, emphasizes reading and storytelling as the most important ways of language learning.

2. Research Objectives

2.1 To apply the TPRS method in an experimental class for elementary-level spoken Chinese and compare it with a control class, analyze whether significant differences exist in oral test scores, and assess the suitability of TPRS for basic oral teaching.

2.2 To assess the satisfaction of Chinese as a second language students with the use of the TPRS teaching method.

3. Research Hypotheses

3.1. Using the TPRS teaching method in elementary-level Chinese oral teaching results in significant differences in student performance.

3.2. Elementary-level students are satisfied with the effectiveness of the TPRS teaching method for Chinese as a second language.

4. Research Methods

4.1 Population: The sample for this study includes 44 undergraduate international students from Sichuan University of Science and Technology (aged 18-22). Students were selected through simple random sampling, with each class consisting of 22 students, ensuring no significant differences in oral proficiency. Oral test scores were compared between the two groups after the teaching intervention.

4.2 Research Tools Include:

4.2.1. *Teaching Methods to Improve The Oral Chinese Proficiency of Undergraduate International Students at Sichuan University of Science And Technology.*

4.2.2. *Enhancing Chinese Oral Expression Skills Through The TPRS Teaching Method.*

4.2.3. Expert Opinion Questionnaire on the TPRS Teaching Method.

4.2.4. Assessment Test of Oral Proficiency in Chinese as a Second Language Using The TPRS Teaching Method.

4.2.5. Satisfaction Survey Questionnaire on Improving Oral Proficiency in Chinese as a Second Language Using the TPRS Teaching Method.

5. Conclusion

5.1 Results and Discussion of Oral Scores Data

5.1.1 Pre-test Scores in the Experimental and Control Groups

In this study, a pre-test and post-test were administered to both the experimental and control groups, and the data were analyzed using SPSS. As shown in Table 5-1, the experimental group had 22 students, and the control group had 22 students, with a similar number of participants in both groups. The mean score for the pre-test in the experimental group was 59.55 (standard deviation: 12.141), while in the control group, it was 58.91 (standard deviation: 12.428). From the pre-test scores, there was little difference in the oral test scores between the two groups before the experiment, indicating that the two groups had similar oral proficiency levels before the teaching experiment. The independent samples t-test results in Table 5-2 show P = 0.864 (P > 0.05), indicating no significant difference in pre-test scores between the experimental and control groups. This suggests that both groups had similar oral proficiency levels before the teaching experiment and both needed instruction and practice in oral skills.

Table 5-1: Paired Samples T-Test Analysis Results of Pre- and Post-Test Oral Proficiency Scores for Experimental and Control Groups

Variable	Mean	Number of Participants	Standard Deviation
Experimental Pretest	59.55	22	12.141
Experimental Posttest	72.95	22	3.671
Control Pretest	5&91	23	12.428
Control Posttest	66.30	23	5.049

5.1.2 Pre-Post Test Scores in the Experimental and Control Groups

As shown in the table, both the experimental and control groups showed improvement in oral scores after the intervention, with significant differences between the post-test and pre-test scores in the experimental group (P = 0.00, P < 0.05) and the control group (P = 0.007, P < 0.05). This indicates that both groups demonstrated significant improvement in oral scores with the joint efforts of teachers and students. At the elementary stage, students have limited prior knowledge in oral skills, which results in a ceiling effect in oral production. Through learning, students acquired more oral knowledge and practiced oral skills during the oral classes, leading to significant improvements in both groups.

Table 5-2: Independent Samples T-Test Analysis Results of Pre-Test Scores between Experimental and Control Groups

Variable	t-value	Degrees of Freedom (df)	Significance (Sig.)	Experimental Group		Control Group	
				Mean	Standard Deviation	Mean	Standard Deviation
Pretest Scores	.173	43	.864	59.55	12.141	5&91	12.428

Note: $p < 0.05$

However, from Table 5-1, it can be observed that in the post-test scores, the mean score in the experimental group was 72.95 (standard deviation: 3.671), while in the control group, it was 66.30 (standard deviation: 5.049). The experimental group showed an improvement of 13.4 points, while the control group showed an improvement of 7.39 points, indicating a greater improvement in the experimental group. The use of the TPRS teaching method in the experimental group enhanced the students' understanding and retention of the content of the oral classes.

To answer research question one, whether there are significant differences in post-test scores between the two groups, the independent samples t-test results in Table 5-4 show P = 0.00 (P < 0.05). Therefore, it can be concluded that there is a significant difference in post-test scores between the experimental and control groups, with the experimental group scoring higher. The application of the TPRS teaching method significantly improved the oral scores in Chinese as a second language at the elementary level.

In summary, the data analysis results of the experimental and control groups suggest that after one semester of teaching, there is a significant difference in oral scores between the two groups, with the experimental group achieving significantly higher scores. The use of the TPRS teaching method for teaching elementary-level oral Chinese has been successful in significantly improving students' oral scores.

5.2 Differences between the Experimental and Control Groups

The differences between the experimental and control groups can be attributed to the following factors:

Difference in teaching methods: The experimental group used the TPRS teaching method, which emphasizes student engagement, interaction, and comprehensible input, aiding students in better understanding and applying oral knowledge. The control group may have used traditional oral teaching methods, with the difference lying in the choice of teaching methods.

Teaching interaction: The TPRS teaching method enhances students' intrinsic interaction with learning content, interaction between students and teachers, and interaction among students. This interaction helps students better grasp oral knowledge and improve their oral expression skills.

Individual differences in the learning process: Individual differences among students may also lead to differences in oral scores. Some students may be more actively involved in classroom activities, while others may need more time to master oral skills.

In conclusion, the differences between the experimental and control groups are primarily due to the advantages of teaching methods and increased teaching interaction. These factors work together to significantly improve the oral scores in the experimental group. Therefore, the results of this study support the effectiveness of using the TPRS teaching method to enhance elementary-level oral Chinese teaching for Chinese as second language students.

5.3 Significant Differences in Language Learning Satisfaction Between the Two Groups

Student recognition of the positive effects of the TPRS teaching method: Students in the experimental group believe that the TPRS teaching method helps them learn oral skills and greatly assists with vocabulary, while students in the control group may not have had such a positive response.

Advantage in vocabulary acquisition: Students in the experimental group believe that the TPRS teaching method helps them accumulate vocabulary, which aligns with the requirements of elementary-level students who need a substantial foundation in vocabulary learning. Students in the control group may not share the same positive perception.

Individual personalities and emotional handling: Students in the experimental group expressed that they have different emotional responses when answering questions in the TPRS teaching method. Some may feel nervous and require more support and encouragement, while others may feel more confident. This indicates that the TPRS teaching method pays more attention to students' individualities and emotional handling, enhancing engagement in learning.

Storytelling: Students in the experimental group find storytelling to be interesting and helpful in learning oral skills, and the stories do not necessarily have to be lengthy. This demonstrates that storytelling with students as protagonists in the TPRS teaching method increases students' attention to the course content without overwhelming them.

Reading aloud practice: Students in the experimental group believe that reading aloud stories is helpful for learning oral skills and helps them remember the content better. This indicates that reading aloud activities in the TPRS teaching method have a positive impact on oral learning and boost students' confidence in oral skills.

In summary, based on interview results, students in the experimental group generally hold a positive attitude toward the TPRS teaching method, believing it is beneficial for learning oral skills. This may lead to higher language learning satisfaction in the experimental group compared to the control group. However, specific differences need further data analysis and statistical validation to confirm.

5.4 Summary

Through the comparison of pre-test and post-test scores, this study found that the experimental class achieved a significant improvement in oral scores after using the TPRS teaching method, and when compared to the control class, the experimental class scored

higher. This indicates that the TPRS teaching method has a significant educational impact on elementary-level oral teaching. Questionnaires and interviews revealed that students have a positive attitude toward the TPRS teaching method, expressing the following main points and opinions:

Positive attitude and expectations: 72.7% of students in the experimental group reported liking the use of the TPRS teaching method in elementary oral classes, and 81.8% of students expressed the desire to continue using this teaching method in the future. This indicates that students are highly positive about the TPRS teaching method and anticipate benefiting from it in their future learning.

Positive impact of reading aloud: Students recognize the reading aloud component in the TPRS teaching method and believe that reading stories improves the fluency of oral expression and enhances their memory of the content. This suggests that reading aloud is an effective teaching method that helps improve students' oral skills and learning motivation.

Advantages in vocabulary learning: Students generally believe that the TPRS teaching method is more helpful in phonetics, vocabulary, and grammar, aiding in vocabulary acquisition. The creation of authentic story scenarios by teachers is seen as helpful in clarifying learning objectives, and teacher feedback aids in better understanding vocabulary meanings.

In summary, based on data and student feedback, the TPRS teaching method has been successful in elementary oral teaching, improving student performance, stimulating learning interest, enhancing vocabulary learning, and improving oral expression skills. Students generally perceive this teaching method as having a positive impact on their learning experience, making the continued use of the TPRS teaching method in elementary oral classes reasonable and beneficial for students in improving their oral skills.

5.5 Discussion

Implementing the TPRS teaching method for elementary oral teaching requires teachers to pay attention to the following key points:

Control classroom pace and diversify questioning methods: Teachers should be able to flexibly manage the classroom process, encourage active student participation through various questioning methods, intonation, facial expressions, and gestures, and avoid mechanical responses to questions. Students should understand that answering questions is about supplementing story details rather than simple sentence substitution.

Summarize grammar structures: Depending on students' age and needs, teachers should summarize grammar structures after the story. Adult learners may require more grammar explanations, while child learners may benefit from practical grammar understanding.

Streamline story content: When creating stories, teachers should ensure clear chapter structures and avoid overly lengthy story texts. Providing both pinyin and non-pinyin versions of the story for student learning is important. Story texts should be clear and concise for easy understanding and memorization.

Guide the rhythm and intonation of reading aloud: Teachers should pay attention to students' reading rhythm, intonation, pauses, and encourage various ways of presenting their achievements, such as retelling stories and role-playing, to help students better understand and apply oral knowledge.

Ensure coherence and progression: Teachers should ensure that teaching activities are coherent and progress sequentially, making full use of the cyclical input in the TPRS teaching method to promote students' oral expression and comprehension skills.

In conclusion, when using the TPRS teaching method, teachers should flexibly control the classroom pace, summarize grammar structures, streamline story content, guide the rhythm and intonation of reading aloud, and ensure coherence and progression in teaching activities to improve students' oral expression skills and comprehension levels. These key points help effectively implement the TPRS teaching method and enhance the quality of oral teaching.

Augmented Reality Technology on Chinese Vocabulary Teaching for International Undergraduate Students

Jiayi Zou, Rajamangala University of Technology Thanyaburi, Thailand
Piyanan Pannim Vipahasna, Rajamangala University of Technology Thanyaburi, Thailand

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
Studying basic Chinese as a foreigner poses challenges rooted in unfamiliarity with the language's characters and tones, compounded by cultural differences. These obstacles require state-of-the-art learning material which encourages participation, stimulates attention, and retains the learner's enthusiasm. This study deployed an active learning approach, examined the primary challenges faced by international students in Chinese character cognition, and proposed the utilization of Augmented Reality (AR) technology in teaching Chinese vocabulary to address these difficulties. The research employs various methods to collect data, such as tests, surveys, interviews, and classroom observation records. Through comprehensive analysis of these data, the effectiveness of AR technology in Chinese vocabulary teaching is thoroughly investigated. The purposes of this study were: 1) to compare the pre-test and post-test results of students' Chinese vocabulary learning when AR technology is employed and 2) to assess students' satisfaction with the application of AR technology in Chinese vocabulary teaching. The research focuses on 35 undergraduate international students at Sichuan University of Science and Engineering. The findings reveal: 1) the student's achievement based on the average score of the post-test was higher than the pre-test significantly, and 2) AR-enhanced vocabulary teaching enhances teaching effectiveness, stimulates students' learning interests and enthusiasm, fosters increased interaction and communication among students and between students and teachers, thus aiding students in mastering vocabulary more effectively.

Keywords: Augmented Reality Technology, Chinese Language Teaching, Vocabulary Teaching, Action Research

1. Introduction

With the burgeoning development of China's economy, an increasing number of foreigners are delving into learning Chinese. Within Chinese teaching, vocabulary and its instruction have garnered significant academic interest. The efficacy of vocabulary instruction directly impacts learners' proficiency in Chinese. Chinese harbours an extensive lexicon, necessitating an optimized design for vocabulary teaching to aid students in better word retention. It's imperative to synthesize experiences and refine vocabulary teaching methodologies continually.

Several innovative teaching methodologies have emerged amid the seamless integration of information technology, intelligent techniques, and pedagogy. Augmented Reality (AR) technology, capable of creating immersive virtual three-dimensional environments, seamlessly blends the virtual and tangible in education. Consequently, Bistaman et al. (2018) posit that AR substantially stimulates students' interest, bolsters enthusiasm, enhances learning efficiency, and catalyzes innovative teaching methodologies.

Presently, research on the application of AR technology in language instruction spans multiple languages, including Chinese, English, Thai, and others. In Chinese instruction, Prontip (2015) integrated AR technology for teaching Chinese vocabulary, yielding improved learning efficiency and heightened student motivation. Uiphanit et al. (2020) developed a mobile AR application for enhancing Chinese vocabulary learning for students who learn Chinese as a main subject, significantly improving their learning capabilities. Similarly, in Thai language instruction, Vongsripeng (2011) applied AR technology to teach Thai letters, enhancing learning efficiency and deepening students' comprehension and retention of Thai characters. In English instruction, Shaumiwaty et al. (2022) incorporated AR technology in primary school English classes, bolstering the teaching effectiveness of English literacy and pronunciation. Gawale et al. (2018) leveraged AR for English animal vocabulary instruction in Thai kindergartens, rendering abstract content vivid and comprehensible. Moreover, Meksamoot et al. (2017) designed electronic teaching materials for complex Thai consonants, improving learning efficiency and speaking prowess, thereby fostering student interest.

The exploration and evolution of AR technology in teaching diverse languages have spotlighted its potential in modern Chinese vocabulary instruction. While a few researchers have explored AR-based Chinese vocabulary teaching, complete teaching practices and detailed methodologies, models, and evaluation indicators remain scarce. Cai et al. (2022) pointed out that in language classes, AR applications should not be restricted to a specific instructional strategy only but be used diversely. Wen et al. (2021) highlighted that the research on integrating pedagogical designs with AR in language learning is less mature.

Hence, this study centers on Chinese vocabulary instruction for international students, undertaking action research by employing AR technology in Chinese vocabulary teaching. Devising a teaching blueprint leveraging AR technology alongside existing teaching materials, this study orchestrates AR Chinese vocabulary sessions for international students. A comprehensive survey and interviews evaluate the application's impact in Chinese vocabulary instruction.

The key contributions and significance of this research are outlined as follows:
  (1) Exploring teaching strategies and models compatible with AR technology in vocabulary instruction, fostering diversified approaches to vocabulary teaching.

(2) Pioneering the application of AR technology to innovate Chinese vocabulary instruction, fostering the evolution of Chinese pedagogy, and enriching digital resources for Chinese instruction.
(3) Within the information education landscape, utilizing AR technology as a blueprint for the reform of Chinese instruction.

2. Research Methodology

The primary research methodologies employed in this study encompass action research, questionnaires, and interviews.

(1) Action Research Method
The action research process involves several stages: firstly, formulating an action plan; secondly, implementing practical research; thirdly, assessing the exercise impact; fourthly, reflecting upon and refining the action plan; fifthly, re-implementing the program; sixthly, observing the outcomes; and finally, reflecting on the entire process. Through these steps, we conduct action research into the application of AR technology in Chinese vocabulary teaching. We aim to summarize experiences and shortcomings, propose improvement measures and recommendations, and derive conclusive findings that can substantiate the utilization of AR technology in Chinese vocabulary teaching.

(2) Questionnaire Survey Method
Upon the completion of the teaching period, an electronic questionnaire will be distributed among the teaching subjects to evaluate the effectiveness of AR technology in Chinese vocabulary teaching. This survey aims to analyze the impact of AR technology on Chinese vocabulary teaching effectiveness and gather students' feedback.

(3) Interview Method
Throughout the teaching process, interviews were conducted to gather teachers' perspectives on the effectiveness of AR technology in vocabulary teaching. These interviews aimed to analyze the challenges and potentialities associated with integrating AR technology into vocabulary teaching. Additionally, interviews with students using AR technology for Chinese vocabulary learning aimed to discern genuine classroom experiences, learning conditions, emotional shifts, and altered learning attitudes facilitated by AR technology.

3. Research Subjects

The subjects of this research encompass international undergraduate students enrolled in Chinese studies at the Sichuan University of Science and Engineering in China. The class consists of 35 students, 17 boys and 18 girls, aged between 17 and 19, with an elementary-level Chinese proficiency. Among them, three have successfully passed the HSK Level 3 exam. Most students have pursued Chinese language studies for over three years, commencing during their first year of high school. Each year, students engage in two courses—basic Chinese and vocational Chinese—amounting to 240 learning hours annually. The study involved action research on Chinese vocabulary teaching utilizing AR technology, spanning 19 weeks with four classes per week, each session lasting 50 minutes.

4. Research Design

(1) Research Process

This research focuses on Chinese vocabulary teaching and conducts action research on the application of AR technology in teaching Chinese vocabulary to international students. Initially, we used ZAPPAR software to design AR vocabulary teaching courseware. A targeted design for AR technology in Chinese vocabulary teaching was developed based on student materials, and teaching practices were implemented accordingly. The action research methodology was employed to continuously observe, reflect, and adjust teaching strategies throughout the process, providing a realistic record of the teaching practice. The actions in this study are divided into two rounds. The initial one spans the first ten weeks, encompassing 30 lessons. Pre-testing was conducted before its initiation. After completing AR-based Chinese vocabulary lessons, students underwent test assessments and post-testing to gather pertinent data. Synthesizing and reflecting on outcomes from the initial phase laid the groundwork for executing the second phase. According to the first-round results, the next one further adjusted and created AR-based vocabulary teaching materials. The second post-testing was conducted at the end of the second round. Subsequently, a combination of questionnaire surveys and interviews was employed to assess the impact of AR technology on vocabulary teaching. The primary research objectives of this article can be categorized into the following four aspects:

1) Designing a teaching plan for implementing AR technology in vocabulary teaching, grounded in the existing teaching materials.
2) Implementing action research methods to teach Chinese vocabulary using AR technology.
3) Gathering student feedback on the effectiveness of AR technology application in vocabulary teaching through questionnaires.
4) Conducting interviews with a Chinese teacher and students utilizing AR technology for learning Chinese vocabulary at school.

(2) Test Design

This research incorporated three evaluations: a pre-testing administered before the teaching interventions, a post-testing after the initial teaching action round, and a subsequent post-testing following the completion of the second round. Table 1 provides comprehensive details regarding these evaluations. Employing a systematic sampling approach, we selected ten vocabulary words per lesson, amounting to 80 words in total. Across the three assessments, there were a combined 80 questions. The compilation of vocabulary test items primarily assessed three facets: pronunciation/intonation, word meanings, and word forms, aiming to gauge students' grasp of the vocabulary.

Table 1: The specific details of three consecutive tests

Testing	Number of items
Pre-testing	A total of 40 questions
Post-testing after the first round of action	A total of 20 questions
Post-testing after the second round of action	A total of 20 questions

(3) Questionnaire Survey

After completing the second round of instructional interventions, a questionnaire survey is administered to students involved in AR-based Chinese vocabulary instruction. Structured on the Likert five-point scale, the questionnaire encompasses diverse aspects, including:

1) Basic personal information, such as ethnicity, gender, age, proficiency in the Chinese language, and duration of Chinese language learning.
2) Current utilization status of AR technology (1 item).
3) Students' experiences with AR usage (2 items).
4) Emotional attitudes of students (6 items).
5) Students' learning outcomes (7 items).

(4) Interviews

To further explore the implementation of AR in Chinese vocabulary instruction, students' experiences with AR, their attitudes, and detailed recommendations are investigated through post-teaching session interviews.

A total of 10 students were interviewed, comprising five males and five females. The interviews, lasting over 10 minutes each, were conducted face-to-face and over the telephone, encompassing two face-to-face sessions and eight telephone interviews.

These semi-structured interviews involved the author using prepared outlines before the sessions. The outlines were designed based on student's learning experiences and additional information needed from the questionnaire survey, encompassing a total of 6 questions. The interview outlines are provided in Appendix 5, featuring the following specific questions:
1) What vocabulary teaching methods are you familiar with?
2) What are your perspectives on using AR technology for vocabulary learning?
3) What are your most prevalent challenges when learning vocabulary using AR technology?
4) How do you address these challenges? Please share your insights.
5) What advantages have you encountered in learning vocabulary with AR technology?
6) Following the use of AR technology in vocabulary learning, what guidance and recommendations would you offer to the teacher?

5. Results and Discussion

(1) Analysis of Pre- and Post-test Scores Before and After the First Round of Actions

Figure 1 demonstrates a notable contrast between the pre- and post-testing overall scores among students following the initial round of action. The discernible increase in overall scores post the first round signifies the efficacy of AR in vocabulary instruction. Further scrutiny of student learning outcomes, specifically in word form, pronunciation, and meaning, unveils a significant enhancement in 'Form' and 'Meaning' scores between the pre and post-tests after the initial round of action. However, there's no marked improvement in 'Pronunciation' scores. This suggests that AR-based teaching in the initial round has had a restricted impact on students' proficiency in word pronunciation. Consequently, the focus will be on assessing the efficacy of AR in teaching Chinese word pronunciation during the second round of instructional actions.

(2) Analysis Of Pre- and Post-Test Scores Before and After the Second Round of Actions

Figure 2 illustrates a notable disparity between the pre- and post-testing overall scores among students after the second round of action. There's a marked enhancement in the overall scores of students before and after the second round of action, underscoring the efficacy of AR in vocabulary instruction. Further scrutiny of student learning outcomes concerning word form, pronunciation, and meaning unveils a noteworthy improvement in 'Form' and 'Pronunciation' scores in the pre and post-tests following the second round of action. However, there's no

substantial improvement in 'Meaning' scores. This indicates that AR-based teaching in the second round constrains students' command over word meanings. Thus, the author suggests that refining AR-based vocabulary instruction should prioritize enhancing the efficacy of AR in teaching Chinese word meanings.
Figure 1: Analysis of pre- and post-test overall score differences in the first round
Figure 2: Analysis of pre- and post-test overall score differences in the second round

(3) Analysis of Questionnaire Survey

The questionnaire survey encompassed 35 students engaged in AR-based Chinese vocabulary teaching. All 35 questionnaires distributed were collected, resulting in a 100% response rate, with 35 questionnaires deemed valid, indicating a 100% validity rate. Regarding prior AR technology usage, survey results revealed that 97.1% of students hadn't previously utilized AR or similar technologies in their Chinese language learning endeavours. In comparison, only 2.9% had some exposure to similar tools. This implies a relatively limited integration of AR technology in current Chinese language teaching practices. Regarding students' experiences with AR, survey findings showed that 57.1% of students found AR technology easy to operate, with 31.4% strongly agreeing. Only 11.5% expressed some uncertainty about its usability, indicating that most students perceive AR technology as user-friendly. Additionally, 54.3% agreed that AR technology enhances students' engagement in classroom activities, with 40% strongly agreeing. Conversely, a minority (5.7%) were somewhat uncertain. Notably, a few students encountered network issues, limiting their participation in class activities and contributing to a perception of AR technology as cumbersome among some students.

Figure 3 illustrates the impact of AR technology on word form, meaning, and pronunciation connections among students. Concerning the relationship between word form and meaning

facilitated by AR, 51.4% of students acknowledge its assistance in establishing these connections. Among them, 28.6% strongly agree, while 17.1% remain uncertain, and 2.9% disagree. This highlights AR's role in deepening students' understanding of vocabulary by associating word form with richer semantic content. Regarding connecting word form with pronunciation through AR, 57.1% of students express that AR aids in this association, with 28.6% strongly agreeing and 14.3% remaining uncertain. This demonstrates AR's capacity to link word characteristics with correct pronunciation, thereby enhancing reading fluency. Regarding pronunciation and meaning connections through AR, 57.1% of students believe it facilitates this association, with 31.4% strongly agreeing and 11.5% expressing uncertainty. AR notably assists in comprehending diverse meanings of words or phrases within varying contexts, aiding students in learning polysemous words. Notably, AR is observed to be most effective in linking pronunciation with meaning, followed by word form and pronunciation, and finally, word form and meaning.
Figure 3: Analysis of using AR to help students establish connections between word form and meaning, word form and pronunciation, and pronunciation and meaning
Figure 4: Students' perspectives on using AR for Chinese vocabulary learning

(4) Analysis of Interview Findings

Figure 4 portrays interview insights revealing unanimous student appreciation for AR course materials, with 100% of respondents describing them as visually appealing, remarkable, and enjoyable, offering a refreshing departure from conventional blackboard-based instruction. Moreover, 80% of students highlight AR's effectiveness in fostering student engagement, deeming it apt for vocabulary instruction. Additionally, 60% express a genuine fondness for AR-based learning, attributing it to creating a positive classroom ambience and enjoyable learning encounters. Half of the students (50%) perceive AR as a motivational tool for Chinese language acquisition, while 40% regard it as an innovative instructional approach. These findings collectively affirm that students universally recognize and appreciate AR-based instruction's engaging and enjoyable nature.

6. Conclusion

After conducting two teaching cycles and analyzing various materials and data collected during the instructional process, this study has yielded several conclusions regarding the implementation of AR in Chinese vocabulary education.

(1) Boosting Student Motivation

Through interviews, questionnaires, tests, and assessments of student assignments, it was evident that AR-based instruction effectively alleviates the monotony often associated with traditional teaching methods. AR engagement fosters a robust vocabulary foundation among students, heightens their classroom involvement, and cultivates positive interactions between teachers, students, and peers. Consequently, students exhibit increased enthusiasm and initiative in their learning endeavours. Notably, when encountering challenging tasks, students proactively seek solutions or guidance from teachers to stay on par with their classmates.

(2) Sparking Students' Interest And Drive to Learn

Action research, including student interviews and assignment evaluations, demonstrated a considerable surge in students' enthusiasm for learning Chinese vocabulary. The amalgamation of AR and real-world elements ignites students' interest and augments their intrinsic motivation, resulting in heightened attentiveness and engagement. In the classroom, students display diligence, active participation in class exercises, and completion of AR-related learning tasks, yielding commendable outcomes for AR-based instruction.

(3) Improving Learning Outcomes and Academic Performance

Two action research cycles revealed significant improvements in Chinese vocabulary acquisition in form, pronunciation, and meaning. This also suggests a positive correlation between AR instruction and enhanced Chinese language proficiency. AR-based vocabulary instruction solidifies students' vocabulary comprehension and bolsters their understanding of word forms, pronunciation, and meanings, enhancing overall Chinese language learning performance.

The Effects of the Flipped Classroom Model on Pre-university Students' Academic Performance and Learning Outcomes

Sahrunizam Kasah, Maktab Duli Pengiran Muda Al-Muhtadee Billah, Brunei

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This study investigates the implementation and impact of the flipped classroom model (FCM) on Year 12 pre-university students at one of the six form centres in Brunei Darussalam. Traditional pre-university education often revolves around time constraints to cover syllabi and prepare students for board examinations, leading to a reliance on conventional transmission-based teaching methods. However, the evolving educational landscape calls for a transition towards flexible, student-centred pedagogies. The FCM, an innovative iteration of student-centred learning, emerges as a potential avenue for facilitating this transition. Despite its potential, the application of FCM in pre-university education is relatively new, and its effectiveness across diverse subjects remains unexplored. To evaluate the efficacy of FCM in pre-university teaching and learning, a quasi-experimental design was employed across various A-Level subjects. Pre- and post-test scores were collected and analysed using independent sample and paired sample t-tests. Findings exhibit a substantial improvement in students' post-test performance across all subjects compared to their respective control groups. Furthermore, this study unveils positive effects of FCM on student learning outcomes, particularly in terms of independence, engagement, and collaborative attitude. Interestingly, no significant differences in mental effort and academic stress were reported between FCM and control groups. The accrued favourable outcomes underscore the potential of FCM as a contemporary and effective pedagogical model to be adopted in pre-university settings, contributing to enhanced teaching and learning approaches. This study thus advocates for the incorporation of FCM into pre-university education based on its observed benefits.

Keywords: Flipped Classroom Model, Quasi-experimental Design, Academic Performance, Learning Outcomes

Introduction

The origins of the Flipped Classroom Model (FCM) can be traced back to the innovative work of Jonathan Bergmann and Aaron Sams, chemistry educators in the United States. In 2007, their integration of explanatory content and the utilisation of recording software to create instructional videos marked a paradigmatic shift in educational practices, garnering widespread acclaim within the educational community. Subsequently, the FCM transcended geographical borders, becoming a globally recognised educational methodology.

The advantages of enabling students to learn independently, using online resources, and engaging in classroom activities have been extensively documented in several studies (Goodwin & Miller, 2013; Plunkett & Beckerman, 2014; Sams & Bergmann, 2014). This shift towards student-centered pedagogy not only offers insights into student learning preferences and challenges but also enhances the quality of classroom interactions. It emphasises active student participation, fosters critical thinking abilities, and boosts digital literacy, prompting educators to move away from conventional teacher-centered methods (Wright, 2022).

However, despite the evident advantages in skill enhancement and active engagement, persistent challenges, often associated with teachers, students, or technological demands, remain prevalent. Agung et al. (2020) highlighted technology-related barriers, where numerous students expressed disinterest in online learning due to limited internet access and inadequate technological resources, underscoring the issue of the digital divide. The abrupt shift to e-learning since 2020 uncovered tangible limitations, including an excessive dependence on technology functionality and the absence of interpersonal contact during out-of-class learning, contrasting starkly with traditional teaching settings (Clark-Wilson et al., 2020; Goksu and Duran, 2020).

Continuous research and ongoing reflection remain crucial for effectively integrating this innovative model within ever-evolving learning settings. This research endeavour seeks to enhance comprehension and tailor technology integration methods to adeptly address the evolving needs and dynamic demands of learners, particularly within the context of pre-university education.

Research Questions

The primary emphasis of this study revolves around two key research questions (RQ).
    RQ1: What are the effects of FCM on students' learning?
    RQ2: Does the extra workload in FCM affect students' learning?

Methodology

Quasi-experimental Design

The research involved students from Year 12, spanning various subjects including Chemistry, English/General Paper, History, Mathematics, and Psychology. The methodology integrated asynchronous learning strategies incorporating interactive resources such as pre-recorded video lectures and multimedia activities. These materials were supplemented by accountability quizzes or summaries, reinforcing independently acquired knowledge at home.

The educational content primarily targeted lower-order thinking skills in alignment with the revised Bloom's taxonomy.

During in-class sessions, students engaged in activities geared towards grasping the learning material, emphasising the refinement of advanced thinking abilities through collaborative group work. The experimental phase spanned three cycles, culminating in the presentation of the final cycle's outcomes. To assess mental effort and academic stress levels, students were exposed to one of three teaching models: the original Flipped Classroom Model (oFCM), the extended Flipped Classroom Model (eFCM), or the Traditional Classroom Model (TCM).

The research utilised a pre-test/post-test quasi-experimental setup to evaluate the influence of FCM on students' academic performance. This involved comparing two groups: one undergoing FCM (the experimental group) and the other receiving TCM instruction (the control group). With a participant pool of 201 students, the study sought a thorough analysis of FCM's effectiveness compared to traditional teaching. Before any instruction, both groups completed a pre-test to establish their initial knowledge or skills. Following the instructional period - where the experimental group experienced FCM and the control group received traditional teaching - a post-test assessed the progress of each group's learning. This design, backed by a substantial sample size, aimed to yield robust data for effectively evaluating FCM's impact on student performance and enabling valid instructional comparisons.

Furthermore, the study employed a comparative method to evaluate how FCM affected students' mental effort and academic stress. It compared results between students exposed to FCM in experimental groups and those taught using TCM in control groups. The oFCM adhered to standard procedures involving out-of-class assignments and active in-class learning sessions. In contrast, the eFCM integrated adjustments based on feedback and formative assessments from both out-of-class and in-class activities. Teachers flexibly adapted their teaching strategies, leveraging both in-class and out-of-class activities to enhance the overall learning experience for students.

Survey

The surveys were administered to participants involved in RQ1 (n = 201) and RQ2 (n = 46, 56, 32, 65, and 55 for Chemistry, General Paper, History, Mathematics and Psychology respectively).

Data Collection & Analysis

A comprehensive assessment approach was employed for data collection. Pre- and post-tests were utilised to quantify student learning outcomes, while pre- and post-surveys were conducted to elicit qualitative feedback on their FCM experiences. For the comparative analysis assessing the influence of FCM on students' mental effort and academic stress scale questionnaires were administered to students following the conclusion of the oFCM, eFCM, and TCM instructional approaches.

The pre- and post-tests were analysed using independent sample t-tests. Effect sizes (Cohen's *d*) were computed for each statistically significant inferential analysis. Descriptive statistical analysis was applied to the questionnaire survey (Zhao & Li, 2021), while the mental effort (Paas, 1992) and academic stress scale (Bedewy & Gabriel, 2015) surveys were subjected to one-way ANOVA.

Results

There Is a Significant Increase in the Mean Gain Scores of FCM Classrooms

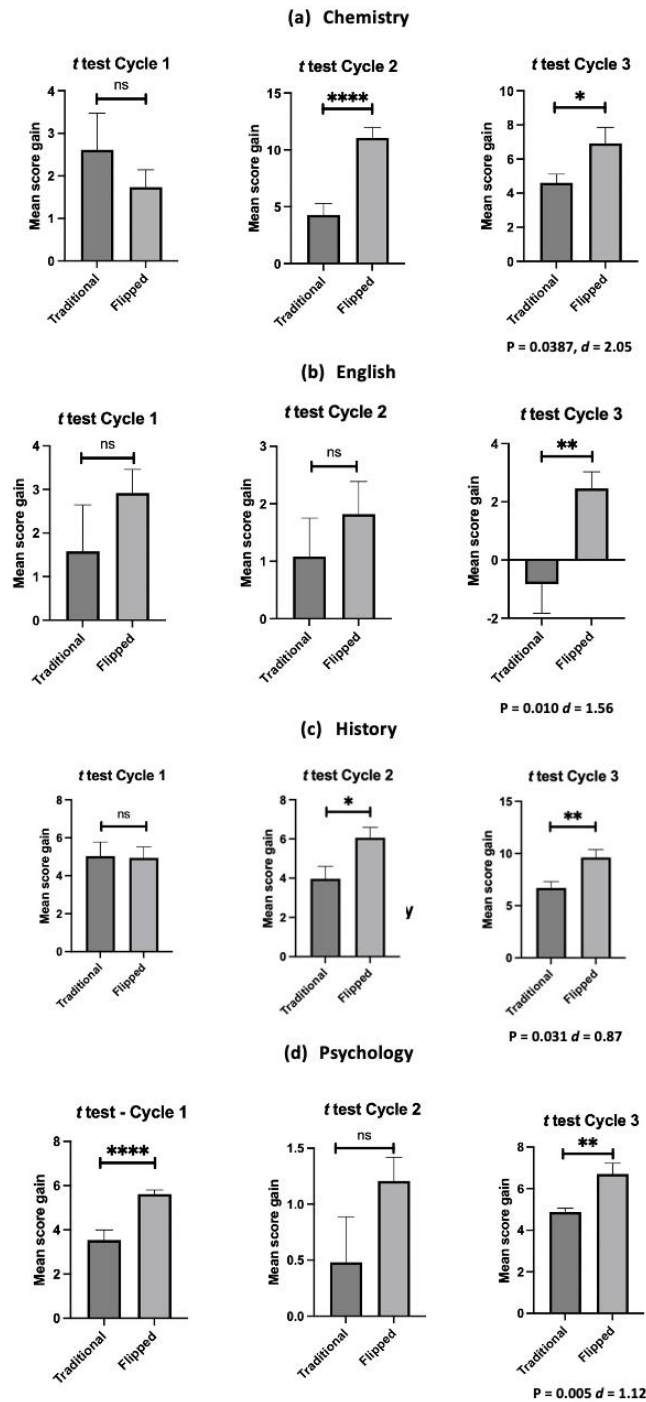
The statistical analysis, conducted through an independent sample t-test to assess mean score gains, yielded statistically significant results. The post-test scores in FCM classes exhibited a substantial increase when contrasted with those in TCM classes (Figure 1). This empirical evidence strongly supports the notion that students exposed to the FCM approach experienced markedly enhanced growth and comprehension of the subject matter.


Figure 1: The independent sample t-test reveals a breakthrough of significance in the second or the third cycle of FCM implementation.

During the third cycle of FCM implementation, the independent sample t-test indicates a notable distinction between the FCM and TCM groups This implies that, in this cycle, FCM classes had a more pronounced impact on the measured outcome compared to traditional classes. This change might be attributed to several factors. Students in the FCM classes could have grown more accustomed to FCM concepts and approaches, resulting in enhanced performance. Additionally, teachers might have refined their instructional techniques in the FCM classes over time, better engaging students and aiding their comprehension of the material. This underscores the likelihood that FCM principles require a cumulative understanding, gradually developed over time, with the third cycle possibly representing the point at which both students and teachers had fully adapted to this teaching and learning model.

The noteworthy high effect size in the FCM groups signifies a substantial impact on the studied outcome. This measure assesses the strength of the relationship or difference between groups. In FCM's context, a high effect size implies meaningful and significant changes, not just minor alterations. This indicates a considerable improvement in student performance or the specific variable studied. Moreover, high effect sizes in FCM not only hold statistical significance but also practical importance, suggesting notable improvements in learning outcomes due to FCM. Additionally, a high effect size reinforces FCM's ability to predict or explain changes, establishing a strong, reliable relationship between FCM and outcomes. It signifies a clear distinction between FCM and other methods or interventions, enhancing the study's statistical power and result reliability.

FCM Resulted in a Range of Positive Learning Outcomes

Furthermore, the investigation uncovers a range of positive learning attitudes stemming from students' engagement with the FCM. By analysing survey data (adapted from Zhao & Li, 2021) and conducting in-depth semi-structured interviews with students, valuable insights into the transformative effects of FCM were gained on various aspects of their learning experience.

Importantly, FCM appeared to enhance students' self-regulation which is their ability to manage and control their own thoughts, emotions, behaviors, and actions in order to achieve specific goals as well as their self-efficacy, indicating that they developed a stronger belief in their ability to comprehend and excel in their studies (Table 1). This newfound confidence could potentially lead to greater academic achievements and a more positive outlook on their educational journey. In addition, FCM fostered greater independence among students. They reported a heightened sense of autonomy in managing their learning, which can be attributed to the self-paced nature of FCM. This increased autonomy empowers students to take charge of their education, making them more self-reliant learners. Moreover, our findings revealed that FCM promoted collaboration among students. The interactive elements of FCM, such as group discussions and collaborative projects, encouraged students to work together effectively. This not only enhanced their social and teamwork skills but also enriched their learning experiences through shared insights and perspectives. Lastly, FCM was associated with heightened engagement in the learning process. Students expressed increased enthusiasm for their studies and a deeper involvement with the subject material. This heightened engagement can lead to more meaningful and long-lasting learning outcomes. These emerged themes were corroborated through semi-structured interview of students.

Table 1: The emerging positive learning outcomes of FCM as perceived by students.

Constructs	Question	Median	Mean	Mode
Self-regulation	I am willing to adjust my learning strategy to meet the learning objectives of the topic.	4	3.76	4
	I usually choose a comfortable place when completing the home assigned learning tasks.	4	4.18	5
	I know where I can learn/ complete the home-assigned learning tasks efficiently.	4	3.76	4
	I try to take more thorough notes when learning the out-of-class learning tasks.	4	3.61	4
	I try to overcome the distraction when watching video lectures/online videos.	4	3.70	4
	I seek help from classmates when meeting difficulties in learning/ completing out-of-class learning tasks.	4	3.81	4
Resources/ Independence	Out-of-class learning tasks equipped me to broaden the knowledge.	4	3.58	4
	Out-of-class learning tasks improved my English listening skill.	4	3.56	4
	With out-of-class learning tasks, I improved my independent learning.	4	3.67	4
Self-efficacy	I am confident in socially interacting with other students with respect.	4	3.87	4
	I developed friendship with my classmates.	4	3.87	4
	I am confident in my ability to complete all my out-of-class learning tasks.	4	3.54	4
Collaboration	I enjoy the collaboration experience in the in-class activities (pair-work/group work).	4	3.45	4
	I learned a lot from my in-class activities (pair-work/ group-work).	4	3.66	4
	Pair work/ group work enhanced my communication with classmates.	4	3.80	4
	The experience of cooperating with my partner/ group is pleasant.	4	3.62	4

In essence, the research indicates that FCM positively influences students' learning attitudes in multiple ways. It bolsters self-regulation, self-efficacy, promotes independence, fosters collaboration, and heightens overall engagement in learning. Ultimately, it contributes to more successful and rewarding educational experiences for students. The findings emphasise that FCM significantly enhances students' learning outcomes. This enhancement is evident through increased test scores (improved academic performance) and a deeper grasp of the subject matter. Students exposed to FCM demonstrate marked improvements in knowledge and skills compared to those in traditional classroom setups. Furthermore, our research underscores that FCM actively involves students in the learning process. This involvement is apparent through heightened participation in class discussions, collaborative activities, and exercises that encourage critical thinking (Findlay-Thompson & Mombourquette, 2014). The FCM transforms students from passive recipients of information to active contributors in their own educational journey. This shift in engagement holds significant value in modern education, where interactive and participatory learning experiences are highly prized.

FCM Does Not Impose Extra Mental Effort or Academic Stress

In educational research, understanding how instructional models such as FCM impact students' academic stress and mental effort holds great importance. To investigate this, researchers commonly use questionnaire scales crafted to capture students' perceptions, emotions, and encounters within their learning settings. Academic stress can manifest in various forms, including feelings of being overwhelmed, anxious, or pressured by coursework and learning tasks (Bedewy and Gabriel, 2015). Researchers employ these scales to gauge students' self-reported stress levels, covering aspects like stress-related feelings, time constraints, workload, and the overall perceived stress linked with a specific instructional approach.

Within the learning context, mental effort refers to the cognitive exertion needed to process information and engage in educational tasks, varying based on task complexity and the learning environment. Scales measuring mental effort typically include items relating to concentration, cognitive load, and perceived mental workload. This study investigated how oFCM and eFCM impact mental effort and academic stress compared to the TCM approach, utilising established scales (Paas, 1992; Sweller, 2018).

To evaluate if the increased workload resulting from oFCM and eFCM contributed to increased mental effort and academic stress among students, a one-way ANOVA analysis was performed. This analysis utilised students' feedback obtained through surveys measuring mental effort and academic stress after they completed lessons in TCM, oFCM, and eFCM. The results indicated that there were no statistically significant differences in mental effort and academic stress when implementing FCM (encompassing both oFCM and eFCM) in classroom settings compared to the TCM approach (Figure 2).

(a) Academic stress
(b) Mental effort
Figure 2: One-way ANOVA indicated that there is no significant difference in terms of students' (a) academic stress and (b) mental effort in the three instructional models.

The absence of significant differences suggests that implementing FCMs does not inherently increase students' academic stress levels compared to traditional teaching methods. This is beneficial as lower stress can promote a healthier learning environment. Additionally, the study implies that students can manage the mental effort needed in FCM without facing notably higher cognitive load. This indicates a viable transition to FCM without overwhelming students. These findings support FCM as a flexible, student-centered approach where students engage with materials at their own pace, potentially easing the constraints of fixed class schedules. With potentially lower academic stress and manageable mental effort in FCM, this could foster a more conducive environment for comprehensive understanding and improved learning outcomes.

These results suggest that FCM can be integrated as an alternative teaching approach without imposing additional academic stress or excessive mental exertion on students. This serves as a positive outcome, offering educators an effective teaching method that encourages active and self-directed learning while upholding a comfortable learning environment for students. This illuminates the practical implications of embracing FCM within educational environments.

Conclusions

In conclusion, this study strongly affirms the positive influence of FCM on students' academic performance and learning attitudes. FCM cultivates crucial 21st-century skills such as self-regulation and collaboration, while also fostering independence and heightened engagement in learning. These collectively contribute to more successful educational experiences, resulting in improved academic performance across all subjects compared to traditional classrooms. Observing the increasing significance of FCM classes over multiple cycles compared to TCM classes offers valuable insights into learning dynamics. This shift could be attributed to learning adaptation, refined teaching strategies, and a cumulative understanding of FCM concepts. Further qualitative research involving student and tutor feedback could refine teaching strategies and enhance the FCM learning process. Importantly, the study dispels concerns about heightened academic stress. Systematic analysis using established scales revealed that FCM implementations did not impose greater cognitive load or perceived academic stress on students compared to traditional classroom approaches. These findings offer reassuring insights for educators considering adopting FCM in their teaching practices without compromising students' well-being.

The Development of Public Relations Media on Online Platforms
for Organizational Communication of Educational Institution in Thailand, KMUTT

Thantika Kaewthae, King Mongkut's University, Thailand
Pimmada Pongkunaporn, King Mongkut's University, Thailand

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

The Faculty of Industrial Education and Technology, King Mongkut's University of Technology Thonburi (KMUTT), Thailand had a mission to communicate and publicize with a variety of target groups, including students, teachers, personnel, parents, enterprises, alumni and other agencies. Therefore, in the digital era it was necessary to rely on technology to play a role and act as an intermediary in communicating the institution content through the economical and fast channel such the online platforms. Therefore, the faculty corporate communication segment had designed and developed public relations media to communicate with 2 target groups: internal groups and external groups with 5 objectives and 8 types of communication channels on online platforms. The research tool used in this study was a satisfaction survey on the faculty public relations media. Using google form collected result from a sample of 20 people with purposive chosen from teachers and students who were the heavy users of the faculty public relations media (every day exposed). The result found that the sample were satisfied with the content aspect at the highest level ($\bar{x}$ = 4.61, S.D.=0.48), with the media presentation aspect at the highest level ($\bar{x}$ = 4.75, SD.= 0.43), and the overall aspect of public relations on online platforms at the highest level ($\bar{x}$ = 4.70, S.D.= 0.46), especially Facebook and Instagram media. Therefore, the designed and developed faculty public relations media could be used to communicate the faculty information with quality.

Introduction

In the present day, people are increasingly turning to use online social media instead of traditional media for communication and information sharing. Initially, the use of online social media was often for recreational purposes and communication among acquaintances. Then, it expanded and was applied to businesses for sharing various content to recipients through online networks. This has been widely accepted by people due to its ease of use, rapid access to groups of people, interactive discussions, and diverse types of shared media. The main reasons for the growing popularity of online social media are its user-friendly interface, quick access to groups of people, interactive discussions, and the diverse types of shared media it offers. Additionally, continuous advancements in communication technology and the internet have made it clear that online social media will likely become the primary medium for people in the future. Certainly, educational institutions' public relations work, which targets Generation Z students who primarily use online social media, must be designed, developed, and disseminated with various media types according to the receptivity of the target group.

The Faculty of Industrial Education and Technology at King Mongkut's University of Technology Thonburi (KMUTT) is locate in Bangkok, Thailand. It is an educational institution focused on science and technology and has been established for over 50 years. Therefore, it has a comprehensive public relations system and organizational communication that involves various target groups both internally and externally, such as students, teachers, staff, parents, businesses, alumni, and other organizations within and outside of KMUTT. These target groups collaborate, have mutual interests, and build relationships together. Public relations work is a method or process of disseminating information and news to strengthen relationships and understanding between the organization and its target groups, both internally and externally, to achieve organizational goals and gain widespread recognition, trust, and confidence among students, which impacts the education system and target group satisfaction [1]. This work is relevant to the target groups from the beginning, starting from their status as students before enrolling at the university until they become alumni. Additionally, there is internal and external faculty communication, which involves collaboration among faculty members and the network of communication strategy and marketing teams to ensure accurate, clear, and mutual understanding of the organization's policies and university directions. It also includes understanding the roles and mechanisms of communication in both crisis and normal situations. Furthermore, there are improvements in communication formats adapted to the context and current situations, including content creation, production, information dissemination, and public relations [2].

Apart from that, educational institutions are driven by data, and it is necessary to utilize technology as a central means of communication to connect and communicate through online social media, which is a relatively new form of media. It provides opportunities for people within the organization or faculty to exchange information, enhance collaborative work, and foster a sense of belonging among individuals within the organization. The distinctive feature of social media is that the sender of the information can share content in various formats with the recipients through online networks, enabling interactive communication between the sender and the receivers or among the receivers themselves [3]. Online social media can be categorized into various types commonly used by educational institutions for external communication, such as Facebook Pages, Instagram, and official Line accounts. Additionally, there are internal communication channels that involve bulletin boards, digital signage, Line groups, etc.

With the responsibility of communicating both internally and externally on various platforms, educational institutions aim to maintain high-quality communication with diverse target groups that have different objectives. Sometimes, organizations or faculties with numerous departments face challenges of repetitive or missing communication, leading to gaps in conveying critical information [4]. Therefore, this research seeks to analyze the linkages between media types and target groups through a Communication Matrix of organizational communication and assess the satisfaction of different target groups towards various communication channels. This research serves as a guideline for the continuous development of high-quality public relations media for educational institutions in the future.

Objectives

Faculty of Industrial Education and Technology at KMUTT, an educational organization, five objectives are outlined, which are to inform, create satisfaction, enhance learning, promote development, and foster understand.

1) To Analyze the network of connections between media types and target groups through an Organizational Communication Matrix
2) To assess the satisfaction of the target groups with various public relations media of the educational institution.

Literature Review

The importance of both internal and external communications for the success and sustainability of an organization. Internal communication helps guide, inform, motivate, and provide feedback to officers, ensuring efficient and effective work while meeting the needs of the audience. On the other hand, external communication plays a crucial role in presenting a positive image of the organization to the public and attracting partners and customers. Therefore, organizations should strive to make these communication aspects complementary to each other [5].

The general objectives of public relations are mentioned, including:
1) To create knowledge and understanding among the public about the organization's policies, objectives, activities, and various initiatives through different media channels.
2) To generate popularity among the public, gaining support for the organization's survival and encouraging trust and belief in its policies and activities.
3) To protect and maintain the organization's reputation and build positive relationships with the public, as a good reputation is essential for an organization's survival. Sometimes, an organization may need to sacrifice certain benefits to maintain its reputation because it directly affects how the public perceives the organization.
4) To seek cooperation and support from both internal and external target groups.

Social media has become a valuable tool for public relations professionals, enabling them to leverage its advantages in reaching a wider audience, tracking the success of campaigns, and monitoring potential crises or issues. PR professionals utilize their skills across various social media platforms to achieve their objectives effectively [6]. In Thailand, social media usage is widespread, with approximately 52.25 million users, accounting for 72.8% of the population,

particularly among the age group of 18 years and above, with a high usage rate of 84.8%. Thai people spend an average of 2 hours and 44 minutes per day on social media. The usage ratio between males and females is relatively close. The most popular social media platforms among Thais, ranked from the most to the least used, are Facebook (91%), LINE (90.7%), Facebook Messenger (80.8%), TikTok (78.2%), Instagram (66.4%), and Twitter (51.2%) [7].

As for the Faculty of Industrial Education and Technology at KMUTT, being an educational organization, it communicates with both internal and external target groups, requiring a multi-platform communication approach. The communication platforms used include bulletin boards, print media, website, Facebook/Instagram, Line groups, digital signage, Line Open chat, and Line OA.

Methodology

In the analysis of the linkage between media types and target groups through the Communication Matrix of the educational institution, the researchers focused on two target groups: internal groups and external groups. There were five main objectives and eight types of communication channels involved (2023).

To conduct the study, the researchers utilized a Google Form survey to evaluate the satisfaction of the target groups, who were heavy users, towards various public relations media used by the educational institution. The survey included 20 participants and was conducted in May 2023.

As part of the study, the research team developed and implemented examples of public relations media on various platforms.

Examples of public relations media developed and implemented by the research team on various platforms.

Results

Analysis of the Linkage Matrix Between Media Types and Target Groups Through the Organizational Communication Matrix

Table 1. The analysis of the linkage matrix

Communication (X) / Target (Y)	Target		Objectives					Channels							
	Internal	External	Informing	Creating satisfaction	Enhancing learning	Promoting development	Fostering understanding	Bulletin boards	Print media	Web site	FB / IG	Line Group	DS	Line Open chat	Line OA
Students in Schools		✔	●	X	●	X	●	X	X	●	●	X	X	X	●
Students in KMUTT	✔		●	●	●	●	●	●	●	●	●	●	●	●	●
Professors	✔	✔	●	○	●	○	●	●	●	●	●	●	●	○	○
Staff	✔		●	○	●	○	●	●	●	●	●	●	●	●	○
Parents		✔	○	○	○	○	●	X	○	●	○	○	○	X	○
Businesses/ Colleges		✔	●	○	○	○	●	X	○	●	○	○	X	X	X
Alumni		✔	●	○	●	●	●	X	○	●	●	X	X	○	X
Other units/ organizations with in KMUTT		✔	●	○	○	○	●	●	●	●	●	X	X	●	○
International organizations/ agencies		✔	●	X	●	X	●	X	X	X	●	X	X	X	X

○ Indirect communication channels used

● Direct communication channels used

X Not related to each other

From the analysis of the linkage matrix, two target groups were identified: internal groups and external groups, with five objectives and eight types of communication channels. The student group, which is an internal target group, was found to be able to perceive all 5 communication objectives and utilize all 8 types of communication channels effectively. Following that, the staff group, which is an external target group, was found to perceive only one communication objective, which is to create understanding, and they use the fewest communication channels, with only the organization's website being utilized.

Results of the Satisfaction Assessment of the Target Groups Towards Various Public Relations of the Educational Institution

Table 2. The results of the satisfaction assessment of the sample group

Title for evaluation	Results		
	$\bar{x}$	S.D.	Level of Satisfaction
1. Content aspect	4.61	0.48	The Highest
2. Media presentation aspect	4.75	0.43	The Highest
3. Overall aspect of public relations on online platforms	4.70	0.46	The Highest
Overall Average Evaluation Result	**4.68**	**0.45**	**The Highest**

The research findings indicate that the sample group has the highest level of satisfaction in terms of content ($\bar{x}$ = 4.61, S.D. = 0.48). This is due to the clarity, accuracy, reliability, and up-to-dateness of the information provided, as well as the use of appropriate language. Regarding presentation, the sample group expressed the highest level of satisfaction ($\bar{x}$ = 4.75, S.D. = 0.43) as the design was aesthetically pleasing and suitable for all communication channels and media that represent the Faculty of Industrial Education and Technology, KMUTT. Regarding the overall online media, the sample group reported the highest level of satisfaction ($\bar{x}$ = 4.70, S.D. = 0.46). Notably, the sample group ranked the online media types used by the organization in descending order of preference: Facebook, Instagram, and LINE Open Chat.

Discussion

The analysis of the linkage matrix between media types and target groups through the organizational communication matrix reveals that the student group, as an internal target group, can comprehend all 5 objectives of public relations and utilizes all 8 types of communication channels comprehensively. These findings align with the research conducted by Namaso, K.et al, 2022 [8] the research findings reveal that the sample group, consisting of 30 third-year undergraduate students from the Department of Education Communications and Technology, Faculty of Industrial Education and Technology, KMUTT in the first semester of the academic year 2021, has the highest level of satisfaction in the interactive multimedia and activities for new normal public relations aimed at promoting the public image of the Continuing Education Center ($\bar{x}$ = 4.68, S.D. = 0.48). This is in line with the concept of perception as defined by Saksri, K. [9], which emphasizes the use of various media formats to enhance perception.

Furthermore, the research also found that the sample group has the highest level of satisfaction in the content aspect, media presentation aspect, and overall aspect of public relations on online platforms, overall average evaluation result was at the highest level ($\bar{x}$ =

4.68, S.D.= 0.45). The organization employed infographics to facilitate easy and rapid understanding, which aligns with Rider, Z.'s work in 2013 [10], suggesting that compressing information into visual graphics makes it easier for people to comprehend compared to reading. The use of attractive graphics allows people to access and understand large amounts of information through a single image.

Additionally, the research aligns with the findings of Princhankol, P., et al., 2023 [11], who designed and developed infographic video clips on various online social media platforms of the Faculty of Industrial Education and Technology, KMUTT, including Facebook, Instagram, and TikTok, along with live contents on Facebook Fanpage. The research found that the perception and satisfaction of the sample group regarding the media development and special hybrid event during the Covid-19 pandemic were at the highest level ($\bar{x}$ = 4.79, S.D. = 0.45), ($\bar{x}$ = 4.76, S.D. = 0.45). The item with the highest mean score was "The technique in the presentation of media and activities" ($\bar{x}$ = 4.85, S.D. = 0.45).

Conclusion

The analysis of the linkages between media types and target groups through the Matrix of organizational communication revealed that the group of students, who are the internal target group, can perceive all five objectives of public relations and utilize all eight types of communication channels comprehensively. This indicates that Gen Z has the highest level of perception when it comes to online platforms compared to other target groups.

Furthermore, the research findings also showed that the sample group has the highest level of satisfaction in the overall aspect of online media, with the organization's online media types such as Facebook and Instagram being the most widely used. This highlights the power of online communication tools for the sample group. As designers and developers, consideration should be given to both content and media presentation aspects simultaneously.

Suggestion

1) The organizational communication department should review the matrix of linkages between media types and target groups by intensifying the connections with the parents' group, which has the lowest level of linkage. Following that, the next target group to focus on is the business/college, both of which are considered external target groups, and are of high importance in promoting the educational institution.

2)When designing content and presentation formats for various online platforms, it essential to consider them together. The advantages of online platforms lie in their convenience and speed of production and dissemination. However, PR practitioners should exercise caution in content design, such as selecting images that represent the organization's identity, university, and Thai culture, which has intricate details and hierarchical practices before dissemination. This filtering process should also apply to offline media, including printed materials and bulletin boards.

Unveiling Parental Perspectives: Determinants of Behavioural Intentions and Usage Behaviours in Ubiquitous Learning During Crises

Ghea Tenchavez, Assumption University, Thailand
Somsit Duang-Ek-Anong, Assumption University, Thailand

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
This study aims to investigate the determinants shaping the behavioural intentions and usage patterns of primary school parents within a private school in Samutprakarn, Thailand, specifically in the context of ubiquitous learning (u-learning). Employing a quantitative research design, the study engaged 500 respondents through an online questionnaire, utilising a non-probability sampling technique. Prior to administration, content validity and reliability of the questionnaire were ensured through Item-Objective Congruence and pilot testing. The data underwent analysis via Confirmatory Factor Analysis (CFA) and Structural Equation Modelling (SEM). The results reveal that perceived usefulness significantly influences both attitude and behavioural intention towards u-learning, while effort expectancy directly impacts the intention to embrace technology. Furthermore, behavioural intention emerges as a direct precursor to the actual use behaviour in the context of ubiquitous learning. In contrast, perceived ease of use, performance expectancy, social influence, and attitude were identified as non-significant factors. In conclusion, the study underscores the pivotal role of perceived usefulness, followed by effort expectancy, in shaping the acceptance of technology. This highlights the imperative for technology developers, curriculum designers, and educators to strategically incorporate these elements into the design of effective u-learning systems tailored for primary school learners, particularly during crises.

The International Academic Forum
www.iafor.org

Introduction

The onset of the COVID-19 pandemic brought about a seismic shift in the dynamics of education, compelling parents of school-age children to assume an active role in home-based learning while concurrently managing their daily work responsibilities. As schools transitioned to remote teaching, parents found themselves grappling with concerns over the quality of education, the well-being of their children, and the repercussions of remote learning on family life.

Some parents perceived online learning as less effective than traditional on-site learning, leading to potential repercussions on their children's academic progress (Huang et al., 2017).

In response to the challenges posed by school closures, education officials, school administrators, and teachers explored diverse modes of learning, including digital platforms, TV/radio broadcasts, and traditional paper-based methods, to mitigate the learning gap. Ubiquitous learning (u-learning), as described by Cope and Kalantzis (2013), encompasses traditional classroom elements but distinguishes itself by allowing students to study anywhere and anytime using technology. Haythornthwaite (2019) outlines key features of u-learning, emphasising flexibility in learning location, time, process, output, and the involvement of key individuals managing knowledge flow.

Technology plays a crucial role in u-learning, demanding learners' attention and fostering authentic, instinctive, and unconstrained knowledge acquisition (Li et al., 2005). Various platforms, such as Google Meet, Microsoft Teams, Zoom, and others, enable simultaneous participation, while asynchronous learning is facilitated through Learning Management Systems (LMS) like Google Classroom, Moodle, and others, accommodating different time zones and schedules (Ironsi, 2021; Serdyukov, 2021).

Despite the potential for successful learning experiences, the study recognises the need to consider available resources, including teacher expertise, infrastructure, technology access, and parental support. Concerns raised by parents and guardians in the study locale highlight challenges related to prolonged screen time, limited technical skills, and a lack of understanding of digital learning systems.

As the pandemic persisted, parents faced the inevitability of incorporating technology into their children's education, prompting requests for technical assistance and training on u-learning. The study focuses on the specific use of Google Meet and Google Classroom, where a regular timetable was established, and parents were given the option to choose between live sessions and recorded content for more flexible learning.

The research aims to delve deeper into the behaviour intention and use behaviour of primary school parents as they navigate the role of technology in bridging the gap between teachers and learners during the global health crisis. The study zeros in on the perceptions of parents with practical experience in using u-learning while assisting their children in the context of the pandemic. The results aim to contribute new insights to the intersection of Technology, Education, and Management, particularly in the context of primary school during crises.

Research Objectives

1. To examine the significant relationship between perceived usefulness and attitude.
2. To analyse the significant relationship between perceived usefulness and behavioural intention.
3. To explore the significant relationship between perceived ease of use and behavioural intention.
4. To discover the significant relationship between performance expectancy and behavioural intention.
5. To inspect the significant relationship between effort expectancy and behavioural intention.
6. To assess the significant relationship between social influence and behavioural intention.
7. To find the significant relationship between attitude and behavioural intention.
8. To scrutinise the significant relationship between behavioural intention and use behaviour.

Research Questions

1. What is the significant relationship of perceived usefulness towards attitude?
2. What is the significant relationship of perceived usefulness toward behavioural intention?
3. What is the significant relationship of perceived ease of use towards behavioural intention?
4. What is the significant relationship of performance expectancy towards behavioural intention?
5. What is the significant relationship of effort expectancy towards behavioural intention?
6. What is the significant relationship of social influence towards behavioural intention?
7. What is the significant relationship of attitude towards behavioural intention?
8. What is the significant relationship of behavioural intention towards use behaviour?

Research Framework

The current research articulates a refined conceptual framework, synthesising fundamental tenets from the Technology Acceptance Model (TAM) and the extended Unified Theory of Acceptance and Use of Technology (UTAUT2) Model. TAM, as elucidated by Davis (1989), provides a lens through which to understand the adoption and utilisation of technology. Core constructs such as perceived usefulness, perceived ease of use, intention, belief, and attitude delineate the trajectory towards technology use. Notably, TAM has demonstrated that perceived usefulness and perceived ease of use, as independent variables, wield a direct influence on behaviour intention and use behaviour—the dependent variables.

In contrast, UTAUT2, posited by Venkatesh et al. (2012), elucidates factors influencing consumer acceptance and use of technology in diverse contexts. Embracing seven key constructs—performance expectancy, effort expectancy, social influence, facilitating conditions, hedonic motivation, price value, and habit—UTAUT2 has found application in examining technology acceptance across various domains, including mobile learning, e-commerce, and e-health.

To fortify the foundations of the research model, the study draws upon seven theoretical frameworks. The first is derived from Jaiyeoba and Iloanya's (2019) exploration of perceived usefulness, perceived web-based privacy, e-learning use, perceived ease of use, attitude, and

learners' behavioural intentions in predicting technology adoption for e-learning. The second, grounded in Arteaga-Sanchez et al.'s (2013) investigation, explores the impact of technical support, computer self-efficacy, perceived usefulness, ease of use, attitude, and system usage on the adoption of the WebCT system. The third, based on Hu and Zhang's (2016) study, delves into the behavioural intentions of tertiary learners regarding mobile library (m-library), considering constructs like perceived usefulness, service quality, attitude, self-efficacy, system quality, information quality, subjective norm, and behaviour intention.

The fourth framework, from Gunasinghe et al. (2020), investigates the adoption of e-learning in higher education, incorporating nine constructs—performance expectancy, effort expectancy, social influence, hedonic motivation, habit, facilitating conditions, personal innovativeness in IT, behavioural intention to use e-learning, and e-learning adoption behaviour. The fifth framework, drawing on Sitar-Taut and Mican's (2021) research on mobile learning acceptance during social distancing, utilizes the Social Distancing- Unified Theory of Acceptance and Use of Technology (SD-UTAUT2) extended model to explore relations between original constructs and personal innovativeness, information quality, hedonic motivation, and learning value.

The sixth framework, inspired by Paola Torres Maldonado et al.'s (2011) study, probes into e-learning motivation, social influence, facilitating conditions, gender, region, behaviour intention, and use behaviour. The seventh, rooted in McKeown and Anderson's (2016) investigation of an online learning platform, employs the UTAUT framework to scrutinise factors influencing the behaviour intention and use behaviour of undergraduate and postgraduate students.

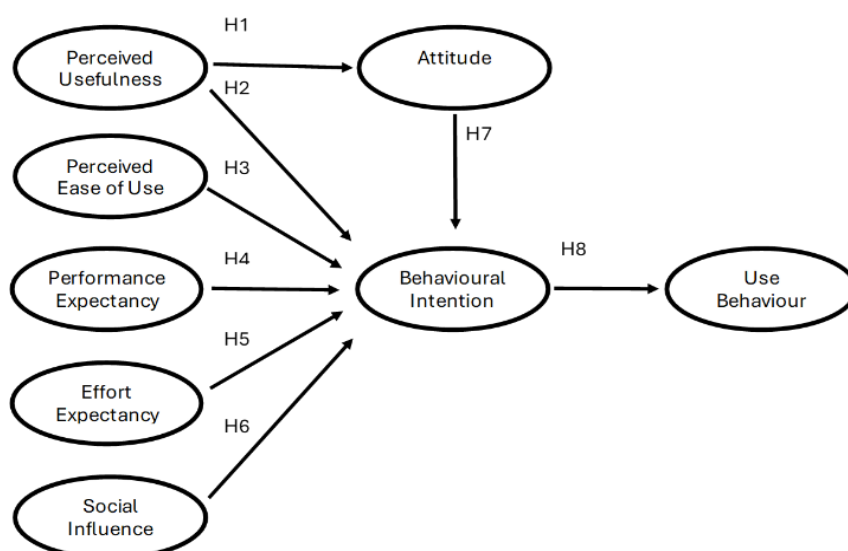
Synthesising these theoretical frameworks, Figure 1 presents the current conceptual framework, offering a comprehensive depiction of the interplay among various constructs in understanding the behaviour intention and use behaviour of individuals in the context of technology adoption during a global health crisis.


Figure 1: Research Conceptual Framework

Research Hypotheses

Based on the conceptual framework, the following hypotheses were developed.

H1: There is a significant influence between perceived usefulness and attitude.
H2: There is a significant influence between perceived usefulness and behavioural intention.
H3: There is a significant influence between perceived ease of use and behavioural intention.
H4: There is a significant influence between performance expectancy and behavioural intention.
H5: There is a significant influence between effort expectancy and behavioural intention.
H6: There is a significant influence between social influence and behavioural intention.
H7: There is a significant influence between attitude and behavioural intention.
H8: There is a significant influence between behavioural intention and use behaviour.

Research Design

This research employed a quantitative approach, utilising online survey questionnaires administered through the Google survey form platform. A set of 40 scale items, drawn from prior studies investigating technology use in learning, was meticulously crafted and subjected to rigorous evaluation through the Item-Objective Congruence (IOC) test and Cronbach's Alpha test to ensure both relevance and internal consistency. Following the successful completion of reliability testing, the online survey was distributed to a cohort of 500 primary school parents within a private school setting, each having a minimum exposure of one academic term, equivalent to approximately four months, to ubiquitous learning (u-learning).

The analysis of the gathered data involved a two-step process. Firstly, Structural Equation Modelling (SEM) was employed, utilising SPSS and AMOS for Confirmatory Factor Analysis (CFA) to establish convergent validity. Subsequently, SEM was conducted to unveil the causal relationships among all constructs outlined in the conceptual model, scrutinising the significant influences and testing the proposed hypotheses. The application of SEM offers a robust analytical framework, allowing for a comprehensive exploration of the factors shaping technology acceptance and use. This approach not only enhances our understanding of the Technology Acceptance Model (TAM) and Unified Theory of Acceptance and Use of Technology (UTAUT2) but also provides valuable insights into the intricate dynamics influencing these frameworks (Hair et al., 2010).

Results and Discussions

Confirmatory Factor Analysis

The application of Confirmatory Factor Analysis (CFA) stands as a crucial methodological tool within the realm of social and behavioural sciences, playing a pivotal role in bridging the gap between theoretical constructs and observed phenomena (Mueller & Hancock, 2001). In ensuring the comprehensive validation of our model, the researcher conducted assessments of model fit, convergent validity, and discriminant validity.

The outcomes of the CFA unveil the significance of all items within each construct, exhibiting factor loadings that adhere to discriminant validity criteria. Following Stevens' (1992) guidelines, items are considered satisfactory when their loadings exceed 0.40 with a p-value below 0.05.

To further substantiate the reliability of the model, Composite Reliability (CR) was evaluated against the established threshold of 0.70, as suggested by Fornell and Larcker (1981). The current study attains satisfactory CR values ranging from 0.712 to 0.856, as illustrated in Table 1.

Despite the Average Variance Extracted (AVE) values ranging from 0.369 to 0.576, falling slightly below the recommended threshold of 0.4, the study maintains convergent validity as the Composite Reliability (CR) surpasses 0.6 for all constructs, underscoring the reliability of the instrument.

Cronbach's Alpha, a widely accepted measure of internal consistency reliability, was employed to further validate the instrument's reliability, aligning with established practices in educational research (Tavakol & Dennick, 2011). The reporting of high Cronbach's Alpha values, consistently above 0.7, not only ensures reliability within the current study but also facilitates cross-study comparisons of instrument reliability in the broader field of u-learning research (Nunnally & Bernstein, 1994). As evidenced in Table 1, the reliability analysis values for all constructs in this study range from 0.705 to 0.856, affirming the overall reliability of the instrument.

Variables	Source of Questionnaire (Measurement Indicator)	No. of Items	Cronbach's Alpha	Factor Loading	CR	AVE
Perceived Usefulness (PU)	Arteaga-Sanchez et. al. (2013)	6	0.793	0.524 – 0.725	0.792	0.391
Perceived Ease of Use (PEOU)	Park et. al. (2015)	7	0.823	0.472 – 0.772	0.800	0.369
Performance Expectancy (PE)	Talukder et. al. (2019)	4	0.803	0.490 – 0.874	0.786	0.495
Effort Expectancy (EE)	Hew et. al. (2015)	5	0.856	0.656 – 0.807	0.856	0.544
Social Influence (SI)	Sobti (2019)	4	0.828	0.582 – 0.937	0.839	0.576
Attitude (A)	Fatima et. al. (2017)	4	0.705	0.545 – 0.665	0.712	0.383
Behavioural Intention (BI)	Lin (2013)	5	0.739	0.510 – 0.693	0.747	0.374
Use Behaviour (UB)	Sitar-Taut and Mican (2021)	5	0.815	0.534 – 0.862	0.820	0.486

Note: CR = Composite Reliability, AVE = Average Variance Extracted

Table 1: Confirmatory Factor Analysis Result

To confirm discriminant validity and ensure the precise encapsulation of constructs, the square root of each Average Variance Extracted (AVE) was meticulously computed, aligning with established procedures outlined by Fornell and Larcker (1981) and Stevens (1992).

Inspection of Table 2 reveals that the AVE square roots of the variables, listed diagonally, surpass all inter-construct and factor correlations, further affirming the discriminant validity of the measurement tool.

In addition to discriminant validity assessments, several indices were employed to gauge the measurement model's goodness of fit. These indices, including CMIN/DF, GFI, AGFI, NFI, CFI, TLI, IFI, and RMSEA, collectively underscore the alignment between the statistical values and empirical data, attesting to the model's overall goodness of fit. This comprehensive evaluation reinforces the reliability of the measurement model and its apt representation of the underlying constructs.

Variables	EE	PU	PEOU	PE	SI	UB	BI	A
EE	**0.737**							
PU	0.064	**0.625**						
PEOU	-0.035	0.177	**0.608**					
PE	-0.028	0.439	0.318	**0.704**				
SI	0.003	0.177	0.205	0.154	**0.759**			
UB	0.039	0.248	0.106	0.275	0.122	**0.697**		
BI	0.171	0.253	0.139	0.224	0.101	0.223	**0.611**	
A	-0.031	0.319	0.144	0.276	0.223	0.136	0.136	**0.619**

Note: The diagonally listed value is the AVE square roots of the variables

Table 2: Discriminant Validity

Structural Equation Model (SEM)

The current study employed Structural Equation Modelling (SEM) as the analytical framework for scrutinising the amassed data, offering valuable insights into the intricate factors influencing technology acceptance and use, thereby enriching our comprehension of established models (Hair et al., 2010). SEM's unique capability to simultaneously estimate multiple relationships (Kline, 2015) and account for measurement errors in the estimation of relationships among constructs from Technology Acceptance Model (TAM) and Unified Theory of Acceptance and Use of Technology (UTAUT2) contributes to the robustness of the analysis (Hair et al., 2010).

Beyond its simultaneous estimation prowess, SEM facilitates the comparison of competing models and the assessment of overall model fit to the data (Hu & Bentler, 1999). Moreover, SEM allows for the exploration of mediation and moderation effects, offering a rigorous statistical approach to testing and validating the theoretical model (Hair et al., 2010; Kline, 2015).

The goodness of fit for the structural model is meticulously evaluated and presented in Table 3, with the following results: CMIN/DF= 1.355, GFI= 0.915, AGFI= 0.901, NFI= 0.874, CFI= 0.963, TLI= 0.960, IFI= 0.964, and RMSEA= 0.027. These results illustrate values well within the acceptable range for each index, affirming the structural model's appropriateness for elucidating the relationships among the constructs and providing a sound basis for drawing meaningful conclusions.

Index	Acceptable Values	CFA Value	SEM Value
CMIN/DF	< 3.00 (Hair et al., 2006)	1.333	1.355
GFI	≥ 0.90 (Hair et al., 2006)	0.918	0.915
AGFI	≥ 0.90 (Hair et al., 2006)	0.904	0.901
NFI	≥ 0.85 (Kline, 2011)	0.878	0.874
CFI	≥ 0.85 (Kline, 2011)	0.966	0.963
TLI	≥ 0.85 (Kline, 2011)	0.962	0.960
IFI	≥ 0.85 (Kline, 2011)	0.967	0.964
RMSEA	≤ 0.05 (Browne & Cudeck, 1993)	0.026	0.027

Note: CMIN/DF = The ratio of the chi-square value to degree of freedom, GFI = goodness-of-fit index, AGFI = adjusted goodness-of-fit index, NFI = normalised fit index, CFI = comparative fit index, TLI = Tucker-Lewis index, IFI = Incremental Fit Index, and RMSEA = root mean square error of approximation

Table 3: Goodness of Fit

Research Hypotheses Testing Result

The results of the hypotheses testing for the structural model among primary school parents yield nuanced insights into the factors influencing their acceptance and utilisation of ubiquitous learning (u-learning) during the global health crisis.

H1 establishes a significant influence between perceived usefulness and attitude for primary school parents with an optimistic outlook on technology use in lieu of traditional face-to-face lessons. Their belief in the efficacy of u-learning during the pandemic, aligned with previous studies (Chen & Wu, 2020; Huang et al., 2014), underscores the positive impact of perceived usefulness on fostering favourable attitudes.

H2 confirms that parents' belief in u-learning's potential to enhance their children's academic performance significantly influences their intention to accept it during the health crisis. This relationship, consistent with prior technology acceptance studies (Davis, 1989; Wang & Chen, 2020), emphasises the pivotal role of perceived usefulness in shaping behavioural intentions amid challenging circumstances.

Contrary to expectations, **H3** negates the assumed significant influence between perceived ease of use and behavioural intention among primary school parents. The findings suggest that parents prioritise factors beyond their comfort level when considering u-learning, aligning with studies that highlight diverse considerations in technology adoption (Alzaza & Yaakub, 2018; Kim & Park, 2018).

H4 challenges the assumption that any technology promising improved learning performance would automatically gain support from primary school parents. The results diverge from expectations, echoing similar findings in related literature (Liu, 2015; Ma & Li, 2011), highlighting the need for nuanced considerations beyond performance promises.

In contrast, **H5** upholds the validity of the relationship between effort expectancy and behavioural intention. Parents perceive u-learning as easy and effortless to use, influencing their decision to accept and integrate the system during the pandemic. This aligns with findings in existing literature (Liu et al., 2021; Ma & Li, 2011) emphasising the importance of user-friendly interfaces.

H6, however, fails to gain traction as primary school parents do not consider external opinions and social influence in their intent to allow their children to use u-learning during the crisis. Similar results in other studies (Kim & Park, 2018; Song & Lee, 2020) indicate the insignificance of social influence in this context.

H7 highlights a lack of relationship between attitude and behavioural intention, suggesting that positive feelings may not necessarily drive parents' decisions to allow their children to participate in u-learning. This echoes similar findings in related studies involving primary and university students (Abaido & Al-Rahmi, 2021; Iqbal & Qureshi).

Lastly, **H8** provides evidence of the effect of higher intention on the actual use of technology among primary school parents. Those with a strong purpose and plan to use u-learning exhibit full participation in the system, aligning with conclusions drawn from studies among the same age group or older learners (Hwang et al., 2021; Baturay & Bayir, 2019). These findings collectively offer a comprehensive understanding of the complex dynamics influencing technology acceptance and utilisation in the context of primary school education during a global health crisis.

Summary of the Hypotheses Testing Result

Table 4 presents the statistical significance of each variable, elucidated through its standardised path coefficient (ß) and corresponding t-value. The relationships between the constructs are visually represented in Figure 2, where a p-value of <0.05 is essential to substantiate each hypothesis. In the graphical depiction, a solid line denotes support for the hypothesis, while a dashed line signifies a lack of validation for the proposed premise.

Hypothesis	Standardised path coefficient (β)	t-value	Testing result
H1: PU → A	0.367	5.426*	Supported
H2: PU → BI	0.178	2.371*	Supported
H3: PEOU → BI	0.068	1.113	Not Supported
H4: PE → BI	0.130	1.935	Not Supported
H5: EE → BI	0.166	2.988*	Supported
H6: SI → BI	0.032	0.587	Not Supported
H7: A → BI	0.033	0.507	Not Supported
H8: BI → UB	0.245	3.858*	Supported

Note: *Significant at p-value, $p < 0.05$

Conclusion

In accordance with the study's findings, significant relationships emerged between perceived usefulness and attitude, perceived usefulness and behavioural intention, effort expectancy and behavioural intention, as well as behavioural intention and use behaviour. These observed associations align with established frameworks such as TAM and UTAUT2.

Existing research consistently emphasises a positive relationship between perceived usefulness and attitude, where users perceiving a technology as useful develop a favourable attitude, enhancing the likelihood of technology adoption and usage (Davis, 1989; Venkatesh & Davis, 2000). Furthermore, literature on technology adoption consistently supports perceived usefulness as a significant predictor of both behavioural intention and use behaviour in the context of u-learning (Al-Fraihat et al., 2020; Hung et al., 2014). This underlines the pivotal role of users' perception that u-learning aligns with their learning goals and enhances academic performance.

Additionally, the study affirms the critical predictive role of effort expectancy in behavioural intention and use behaviour, suggesting that users are more inclined to adopt and use u-learning when it is perceived as easy and requires minimal effort (Al-Fraihat et al., 2020; Lee et al., 2020). These findings confirm that factors highlighted in TAM and UTAUT2, specifically perceived usefulness and effort expectancy, significantly influence behavioural intention and use behaviour. Consequently, designers and educators should prioritise the development and promotion of u-learning technologies perceived as useful, user-friendly, and positively evaluated by users.

On the contrary, the study delves into the implications for TAM and UTAUT2 theories arising from the insignificant influences between perceived ease of use and behavioural intention, performance expectancy and behavioural intention, social influence and

behavioural intention, and attitude toward behavioural intention. Discrepant findings across various studies indicate the complex nature of these relationships in the context of u-learning adoption. Some studies negate the relevance of perceived ease of use, performance expectancy, and social influence in u-learning adoption (Al-Fraihat et al., 2020; Hung et al., 2014), while others identify their significance (Lee et al., 2020; Kim and Park, 2018).

While attitude traditionally holds a strong association with technology adoption, instances exist where it does not significantly impact behavioural intention, as evidenced by Kim and Kankanhalli's (2009) study on web-based learning. This underscores the intricate nature of the attitude-behavioural intention relationship, dependent on various factors such as technology specificity, user characteristics, and contextual considerations. Users may harbour positive attitudes but refrain from using a technology due to factors like cost, time constraints, or social norms.

In summary, despite the importance of perceived ease of use, performance expectancy, social influence, and attitude in TAM and UTAUT2, the study emphasises the need for further research specific to the primary school context during a crisis. Gaining a comprehensive understanding of the factors influencing the adoption and use of u-learning necessitates exploration beyond traditional constructs, considering the unique challenges and dynamics present in this specific educational setting.

Implications

The outcomes of this study offer valuable insights into enhancing technology acceptance and usage, particularly among primary school parents during the COVID-19 pandemic or any natural or unnatural crises. In recognizing the factors with either weak or no influence on the adoption and use of u-learning, the following recommendations are proposed.

Firstly, given the insignificance of perceived ease of use, designers should prioritise simplifying the user interface through streamlined navigation and clear language, complemented by online tutorials and helpdesk support.

Secondly, as performance expectancy was found to have no influence, it is essential to enhance the perceived value by ensuring learning content is relevant, up-to-date, and engaging, incorporating gamification elements for a more enjoyable learning experience.

Thirdly, addressing the lack of impact of social influence involves promoting collaborative and social learning, encouraging peer feedback and integrating social media tools for enhanced connectivity.

Lastly, the insignificance of attitude calls for emphasising the benefits of u-learning, highlighting its convenience, flexibility, cost-effectiveness, and potential for personalised learning, alongside user support mechanisms such as tutorials and online help desks. By comprehensively addressing these aspects, educators and researchers can develop effective strategies to promote the adoption and use of u-learning platforms, catering to the specific needs of primary school learners in the context of the pandemic.

Limitations

It has to be noted that this study delves mainly into the determinants influencing the behaviour intention and use behaviour of u-learning among primary school parents in a private school in Samutprakarn, Thailand. To enhance the comprehensiveness and applicability of the research, a suggestion is made to augment the research methodology beyond the current quantitative approach. Integrating a qualitative dimension, such as Key Informant Interviews (KIIs) involving parents, educators, and students, can bring depth to the investigation and mitigate potential limitations. Additionally, conducting Focus Group Discussions (FGDs) with parents from both pre-school and primary school levels can yield a richer analysis of responses, allowing for a nuanced understanding of the phenomena. This mixed-methods approach would prove valuable in identifying any disparities between quantitative and qualitative findings.

Furthermore, in advancing the study's breadth, future research could incorporate a diverse array of participants, encompassing teachers, students, administrators, and technology designers. Expanding the study to include various school types, both government and private, in urban and rural areas would contribute to a more comprehensive exploration. Moreover, involving participants from different economic backgrounds would offer insights into the varying degrees of acceptance and utilisation of u-learning, considering potential discrepancies in technology access.

Finally, a prospective study could investigate the inclusivity of the u-learning system, specifically examining how learners with physical impairments and learning difficulties engage with and respond to u-learning. This examination could yield valuable insights guiding platform refinement, content adaptation, or system adjustments tailored to the diverse needs of these learners. Such enhancements would contribute to the overall effectiveness and accessibility of u-learning in diverse educational settings.

Development of a Java Source Code Analyzer for Learning Support That Runs in a Web Browser

Tatsuyuki Takano, Kanto Gakuin University, Japan
Takashi Kohama, Tokyo Denki University, Japan
Osamu Miyakawa, Tokyo Denki University, Japan

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Students make various mistakes in the process of practicing computer programming. For this reason, we have developed a source code analyzer, which evaluates the source code submitted by students from The tool can identify misspellings in the method names of source code and can judge the compiling and execution results. However, because the tool was developed to run on a teacher's PC, it does not easily fit into the format of general programming learning sites. The use of a programming learning site is advantageous in that it allows students to learn programming without having to build a programming environment. However, programming languages other than those that run in the client browser, such as JavaScript, must be compiled and evaluated on the server side, placing a heavy burden on the server side. Therefore, we decided to use a method of running the developed tools on the As a result, we confirmed that the basic functionality of the tool runs on the browser and outputs evaluation results. The basic functionality of the tool outputs the results of spelling errors in class names and method names, coding style, compilation results, and execution. The basic functionality of the tool outputs the results of spelling errors in class names and method names, coding style, compilation results, and execution results for source code written in Java.

Keywords: Programming Education, Source Code Analyze, Learning Support Tools

Introduction

In today's society, the role of ICT (Information and Communication Technology) is becoming more important as AI (Artificial Intelligence) is becoming an everyday part of our daily lives. Therefore, software development technology is one of the important elements for constructing information systems, and the importance of training programming engineers is increasing. In Japan, the Ministry of Education, Culture, Sports, Science and Technology (MEXT) is promoting education that incorporates programming in compulsory education (Ministry of Education, Culture, Sports, Science and Technology. 2021).

And in introductory programming education, knowing the learning elements necessary for beginning students to master programming is an important guideline for improving the effectiveness of education. It is also important to know the elements that cause stumbling blocks in learning programming, and learning programming requires practice that includes the experience of making mistakes (Martin, R.C., 2008).

Therefore, we have developed a source code analyzer that can perform unit testing from an educational perspective, considering spelling errors. This tool analyzes source code created by learners using both static analysis methods that evaluate coding styles and program definitions, and dynamic analysis methods that evaluate by executing unit tests. This tool was previously used as a core function of our system (Shin Hasegawa, et al. 2011) to evaluate learners' source code in real time during lectures. Currently, this tool is also used to evaluate programming assignments (Takano, T. et al. 2023).

A related study is AutoLEP (W. Tiantian, et al. 2009), a system for evaluating learners' source code. This system evaluates programs statically and dynamically and feeds back errors to students. The difference between this tool and AutoLEP is that AutoLEP evaluates program errors based on similarity to the correct program, whereas AutoLEP allows misspellings in definitions and dynamically evaluates the implementation through unit tests. However, since the tool was developed to run on a teacher's PC, it does not easily fit into the format of general programming learning sites. The use of a programming learning site is advantageous in that it allows students to learn programming without having to build a programming environment. However, programming languages other than those that run in the client browser, such as JavaScript, must be compiled and evaluated on the server side, placing a heavy burden on the server side of the programming learning site.

We decided to use Doppio (Vilk, John. at el. 2014), a Java Virtual Machine that runs as JavaScript in the browser, to run the developed tools on the client side.

Development Tool Overview

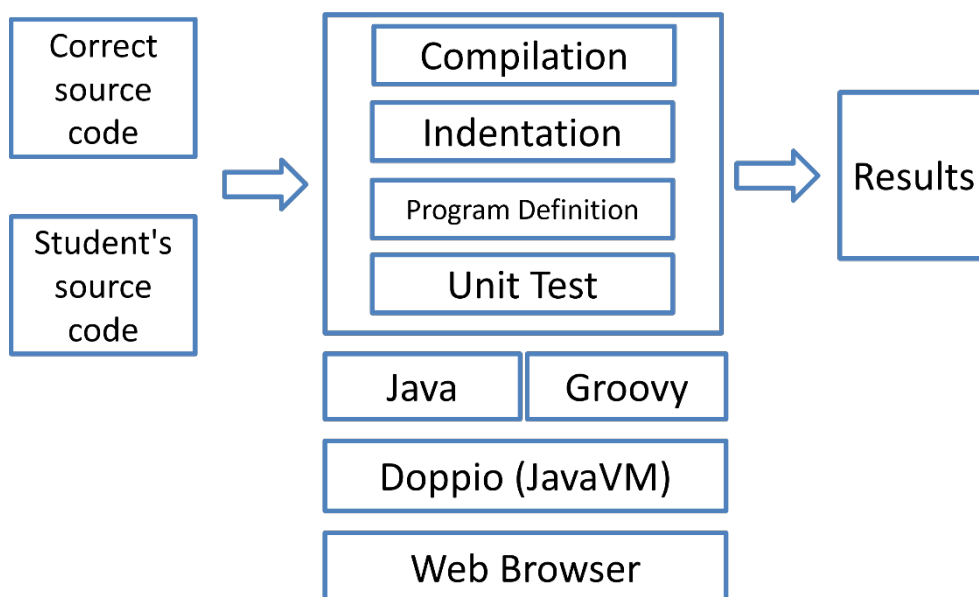
The Source Code Analyzer is intended for Java programs that create source code from new files. The tool is developed in Java and Apache Groovy (Figure 1).


Figure 1: Overview of source code analyzer

The tool makes judgments on the main items: compilation, indentation, program definition, and unit testing. The tool also determines misspellings at various points before the learner completes the program. The following is a list of the main areas where spelling errors are detected.

- File name
- Class name
- Constructor name
- Field Name
- Method name

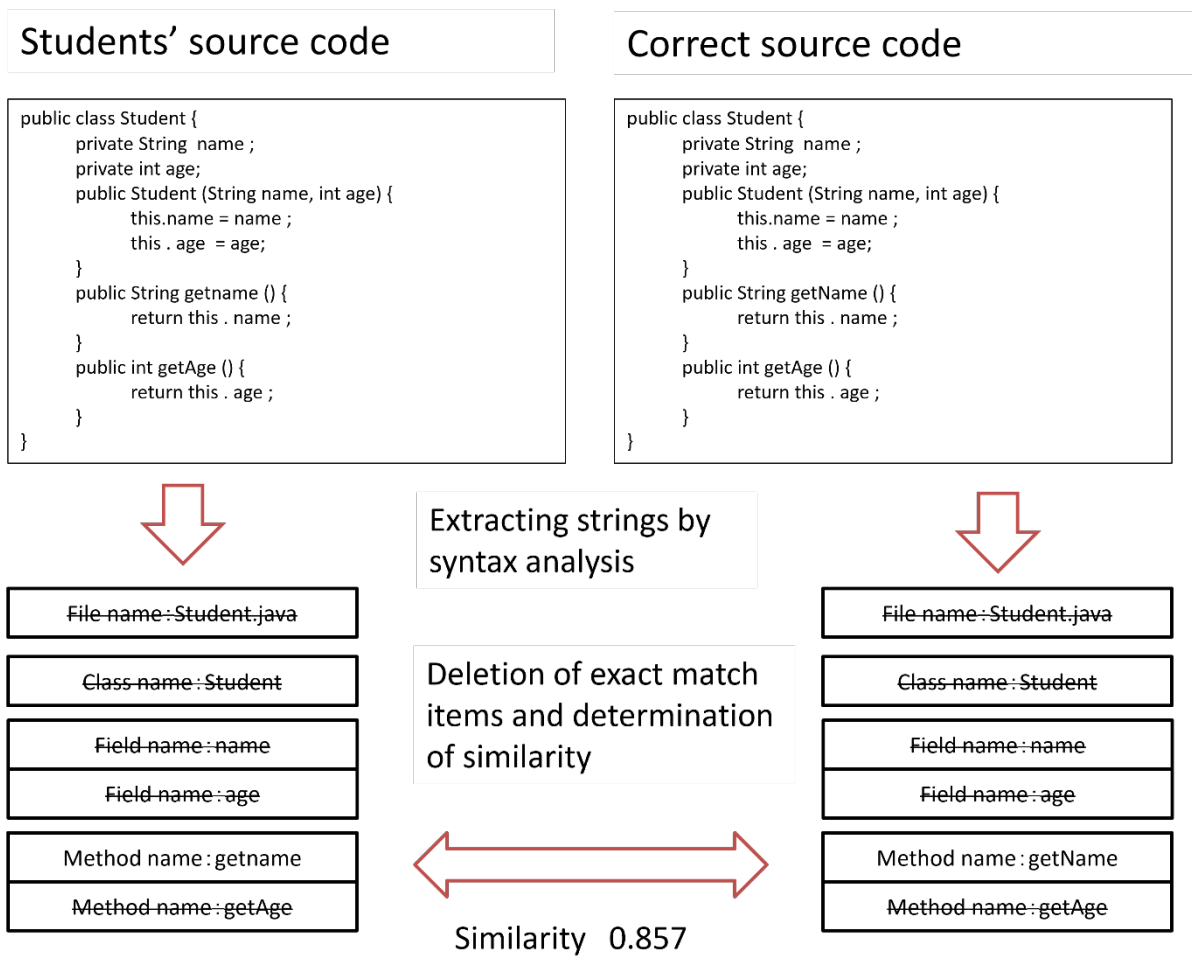
When determining misspellings, it is necessary to determine whether character strings are similar. One way to measure the similarity is to measure the distance between strings, and there are many algorithms for calculating this distance. This time, we use the Levenshtein distance, where the edit cost of a string is used as the distance. In this algorithm, the weighting of each of replacement, deletion, and addition used as the edit distance is set to 1. The normalized value is used as the similarity value based on the longest string compared by measuring the edit distance.


Figure 2: Example of algorithm for calculating similarity

Figure 2 shows an example of the algorithm for calculating the edit distance and similarity of the method names "getname" and "getName. First, a list of method names is created, and strings that match exactly are removed from the list. Then, misspelled strings are compared. Editing "getname" to "getName" requires a single edit, replacing "n" with "N". Since the strings compared have the same length of 7 characters, the similarity is 1 divided by 7 and the value subtracted from 1. In this example, the similarity is about 0.857. The Levenshtein distance was implemented using the API of Apache Lucene, a full-text search engine library.

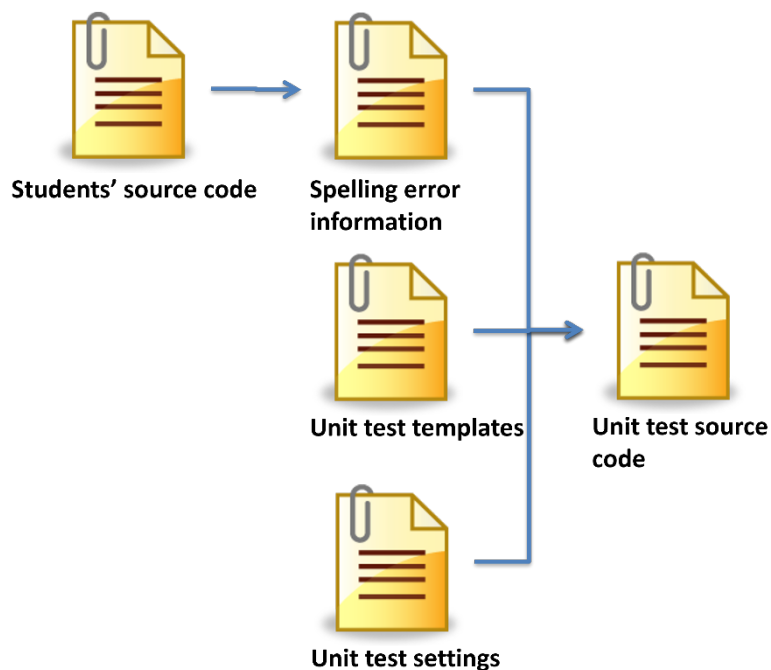
The resulting misspelling information is then used to generate unit test source code for evaluation. Figure 3 shows how the unit test source code is generated using the spelling error information.


Figure 3: Unit Test Source Code Generation Methodology

Spelling error information is obtained from the program definition. The unit test configuration provides information on the conditions of the test and the values to be passed as arguments. The template that forms the framework of the unit test can then be used to generate the unit test code based on the misspellings. The template is processed using Groovy, and the unit test code dynamically generated by Groovy is used to execute the unit test. The class loader obtained from the compilation process is used to manage and execute the unit test code with a different namespace, even if the class names are the same.

Implementation on the Browser

In order to check the functionality of the source code analyzer in a browser, the tool was configured as a single JAR (Java ARchive) file. The scripting language Groovy was converted to Java bytecode, and libraries and code that did not work on Doppio were modified. BrowserFS, a related project of Doppio, was used for the file system on the browser. The source code analyzer has functions such as unit testing on a sandbox using Java Security and determining the character encoding of files, but these functions were omitted from this implementation.

Evaluating Behavior on the Browser

A source code analyzer was used to evaluate one issue on a browser. Google's Chrome was used as the browser. Figure 4 shows the actual operation of the tool, and it was confirmed that the source code was evaluated and the evaluation results were output as a CSV file without any visual change from the PC operation. It was also confirmed that the source code analyzer program was not loaded into the class loader in some of the unit tests.

Figure 4: Evaluating behavior on a browser

Conclusions

With the increasing importance of software in society, it is increasingly important to train engineers to develop software. We have developed a source code analyzer to identify errors in the source code of novice programmers. We then applied the tool to run on JavaVM, which is created in JavaScript, to make it easier to use on a browser. As a result, we confirmed that the functions of the tool worked on the browser with some exceptions. In the future, we plan to fix class loader-related problems and improve performance, and to build a learning site for programming.

The Development on a Board Game to Promote an Information Literacy for Upper Secondary Students at the Srinakharinwirot University Prasarnmit

Kaimuk Laosunthara, Prasarnmit Demonstration School (Secondary), Thailand

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

In today's information-rich landscape, cultivating effective information literacy skills is imperative for upper secondary students. This study focuses on developing a board game as an innovative tool to enhance information literacy among students at Srinakharinwirot University Prasarnmit Demonstration School (Secondary). Learning can be more enjoyable when gamified, and this research aims to achieve just that. By creating a unique board game, akin to traditional tabletop games, the study aims to equip students with the ability to discern reliable information from dubious sources. The interactive game immerses players in diverse scenarios, prompting them to evaluate the credibility of information encountered. This puzzle-like experience nurtures critical thinking and analytical skills, thereby fostering improved information comprehension. It's essential to address copyright considerations as well. Similar to how authors hold rights to their books, game creators possess ownership of their creations. Thus, respecting copyright is crucial in how the game is utilized. To gauge the game's efficacy, selected students will participate, followed by a comprehensive assessment cosisting a both a pre-test and a post-test. This approach will determine if the game effectively enhances information literacy skills. This research contributes a dynamic learning method that not only engages but educates. By blending entertainment with education, this innovative approach empowers students to navigate the sea of information competently. Ultimately, the fusion of fun and learning may greatly contribute to students' cognitive development.

Keywords: Information Literacy, Board Game, Upper Secondary Student

Introduction

Information access has evolved significantly in the digital age. According to the Thai Library Association (TLA) (n.d.), libraries play a crucial role in driving society toward a knowledge-based and learning-oriented direction. Moreover, the way we engage with books has transformed. In today's digital era, various forms of knowledge are accessible via the internet and portable technologies like tablet computers and smartphones. This allows learners to access information not only within but also outside the classroom. In this digital context, students have the opportunity to acquire knowledge anytime and anywhere, which empowers them to become discerning evaluators of information sources and enhances their overall digital literacy.

Information literacy encompasses the vital skills of discernment and the evaluation of information source credibility. These skills are indispensable in everyday life and collectively form what we refer to as Information Literacy. As articulated by Kampanat Coosirirat and Kobsook Kongmanus (2015), the ultimate aim of information literacy is to equip learners with proficiency in information-related skills, enabling them to apply these skills effectively across their educational, professional, and daily life endeavors. This objective primarily centers on the learner, emphasizing their ability to define their information needs, access required information efficiently, evaluate both the information itself and its sources, incorporate selected information into their existing knowledge base, and utilize this information effectively for various purposes. Therefore, information literacy emerges as a critical skill with applications spanning education, the workplace, and everyday life.

Figure 1, adapted from the UNESCO Information for All Programme (Link: https://www.unesco.org/en/ifap/information-literacy), visually represents the components of information literacy.

Information literacy empowers individuals from diverse backgrounds to effectively seek, evaluate, use, and create information for personal, social, occupational, and educational purposes. Emphasizing the significance of copyright is essential when individuals engage in information creation and consumption.

In Figure 1, we present information literacy as a guiding light in the information age, illuminating pathways to development, prosperity, and freedom within society. In today's digital landscape, where information is abundant and easily accessible, understanding and respecting copyright laws are integral aspects of information literacy.

Individuals with information literacy skills can access information related to various aspects of life, and they also uphold copyright laws and respect intellectual property rights.

In the digital realm, information literacy includes proficiency in using information and communication technologies while adhering to copyright and intellectual property rights. It also involves computer literacy, which relates to information and communication technology, and media literacy, encompassing the comprehension of various media formats used for information transmission. Responsible navigation of the internet and interpretation of multimedia content require both technical competence and a solid understanding of copyright principles.

A board game is a type of recreational activity that employs various pieces, cards, or models played on a specialized surface or board designed specifically for that game. Beyond providing entertainment and enjoyment, board games offer valuable opportunities for players to enhance their analytical thinking, planning, and decision-making skills (Kingkarn Buranasinvattanakul, 2019).

Sarinee Achavanuntakul (2021) notes that board games have surged in popularity, evident from the proliferation of board game stores and cafes across the country. The increasing availability of Thai-translated games, numbering in the hundreds and continually growing, coupled with the expanding Thai game design community, underscores this burgeoning trend.Utilizing games as an educational tool can yield positive outcomes in education due to their inherent characteristics. Games are inherently inclusive, transcending boundaries of race and religion, and they inherently challenge players, compelling them to grasp the strategies required to succeed (Sadanand Kaewsri, 2020). Creating learning experiences through board games thus serves as a medium for knowledge dissemination and as a means to foster interpersonal relationships among students. This approach is both enjoyable and entertaining, subtly nurturing a passion for reading.

Kaimuk Laosunthara (2022) found that students at Srinakharinwirot University Prasarnmit Demonstration School (Secondary), particularly those less engaged in social activities, expressed a willingness to visit the library, often due to invitations from friends. Therefore, developing board games aimed at enhancing information literacy and promoting reading can serve as an incentive for students to frequent the library and engage more with books.

It is crucial to develop board games tailored to upper secondary students to promote information literacy. Such initiatives enable students to acquire essential information literacy skills, equipping them to access appropriate and credible information sources and understand how to reference information correctly, including the creation of bibliographies following American Psychiatric Association (APA) standards. These endeavors not only prepare students for university-level education but also contribute to the development of lifelong learning skills. Considering the importance of this matter, I have created a board game with the aim of improving information literacy among upper secondary students at Srinakharinwirot University Prasarnmit Demonstration School (Secondary).
Figure 1: Information Literacy Adapted from UNESCO information for
All Progreamme https://www.unesco.org/en/ifap/information-literacy

Material and Methods

The study collected data from Upper Secondary students of Srinakharinwirot University Prasarnmit Demonstration School (Secondary) in Thailand during the academic year 2023. A sample group was selected to participate in board games to assess information literacy before and after playing. The study focused on one classroom, employing a specific method due to a potentially non-normally distributed population and a small sample size of approximately 30 participants. As a result, traditional statistical test parameters were not applied. Instead, the study utilized the Wilcoxon Signed-Rank Test (Sheskin David J.,2011).

Development of the Board Game

I have created an educational gamified learning resource named "COPY RIGHT?" that focuses on Information Literacy and Copyright Law.

Gaming Equipment

The gaming equipment for "COPY RIGHT?" consists of three sets of cards, as shown in Figure 2 Types of Cards. This figure provides an overview of the various cards and components used in the "COPY RIGHT?" board game, which is designed to promote information literacy and copyright knowledge. (a) Information Literacy Question cards (Front-side): These cards contain questions related to information literacy on their front side. Players will listen to these questions during the game, (b) Information Literacy Question cards (Back-side), (c) Copyright Question cards (Front-side): Similar to the Information Literacy Question cards, these cards contain questions related to copyright law on their front side, (d) Copyright Question cards (Back-side),(e-1)(e-2) a card used for tallying scores in the final round, associated with question number. These cards are used for keeping track of scores, especially in the final round of the game. They are associated with specific question numbers to ensure accurate scoring. (f) e-1 and e-2 (Back-side), (i) Signs for use in answering: Yes and No. These signs are used by players to indicate their answers to the questions posed during the game. Players must quickly tap the "Yes" or "No" sign to answer each question. These components collectively make up the game's playing cards and scoring system, enhancing the players' experience while also educating them about information literacy and copyright law.

Figure 2: Type of cards (a) Information Literacy Question cards (Front-side)
(b) Information Literacy Question cards (Back-side), (c) Copyright Question cards
(Front-side) (d) Copyright Question cards (Back-side), (e-1)(e-2) a card used for tallying
scores in the final round, associated with question number (f) e-1 and
e-2 (Back-side) (i) Signs for use in voting: Yes and No.

Experimental Trial of the Developed Game

For the experimental trial of the developed game, participants were recruited 1 class. This class has a total of 43 students. Of these, 37 students actively participated in the research, comprising 10 male students and 27 female students. The experimental trial was conducted on October 11, 2023. The experimental trial followed a structured timetable as presented in Table 1:Timetable of the Experimental Trial. During the initial 10 minutes, a designated facilitator takes on the role of the conductor. Their responsibility is to provide a comprehensive explanation of the game rules to all the participants. This phase is essential to ensure that all participants have a clear understanding of how the game "COPY RIGHT?" is played, including its objectives, rules, and scoring system. It sets the foundation for a fair and informed gameplay experience. Figure 3 represented Explanation about the game rules.

 The next 15 minutes involve active participation from all the participants. They are tasked with responding to a pretest questionnaire. This questionnaire likely contains questions related to information literacy and copyright knowledge. The purpose of this pretest is to establish a baseline understanding of the participants' knowledge in these areas before engaging in the game. It serves as a reference point for assessing the impact of the game on their knowledge. Figure 5(a)-(d) represented Trial of game.

The most substantial portion of the trial, lasting between 25 to 30 minutes, is dedicated to the actual gameplay. All participants actively take part in playing the game "COPY RIGHT?" This phase involves listening to questions, making quick decisions, tapping the appropriate response signs, and competing to earn question cards. It is the core of the experimental trial, where participants put their knowledge and skills to the test. Figure 4 represented After the game concludes, the participants spend the final 15 minutes responding to a posttest questionnaire. Similar to the pretest, this questionnaire likely contains questions related to

information literacy and copyright knowledge. Figure 6 represented Response to the Posttest questionnaire.

The posttest aims to measure the impact of playing the game on the participants' knowledge. By comparing their pretest and posttest scores, researchers can assess the effectiveness of the game as an educational tool.

Duration	Conductor	Contests
1) 10 min	Facilitator	Explanation about the game rules
2) 15 min	All participants	Response to the Pretest questionnaire
3) 25-30 min	All participants	Trial of the game
4) 15 min	All participants	Response to the Posttest questionnaire

Table 1: Timetable of the trial

Figure 5(c): Trial of the game

Figure 5(d): Trial of the game

Figure 6: Response to the Posttest questionnaire

Results

Data Overview
In this analysis, data from two assessments (pre and post-learning) of 37 participants were used. The assessments covered 15 items and were divided into two categories: Category 1 (Information Literacy Skills) and Category 2 (Knowledge of Copyright Law).

Statistical Analysis
When a participant provides an incorrect answer, they receive a score of 0, while a correct answer earns them a score of 1.

Mean Scores and Standard Deviations
- The average score in Category 1 is 0.822 with a standard deviation of 0.130.
- The average score in Category 2 is 0.804 with a standard deviation of 0.141.

The Wilcoxon Signed-Rank Test for Both Categories
Category 1 (Information Literacy):
- Wilcoxon Signed-Rank Statistic: ($T = 28.5$)
- Two-Tailed p-Value: ($p < 0.001$) (indicating statistical significance)

The Wilcoxon signed-rank test for Category 1 indicates a statistically significant improvement in scores after the learning sessions.

Category 2 (Copyright Law Knowledge):
- Wilcoxon Signed-Rank Statistic: ($T = 15.5$)
- Two-Tailed p-Value: ($p < 0.002$) (indicating statistical significance)

The Wilcoxon signed-rank test for Category 2 also indicates a statistically significant improvement in scores after the learning sessions.

In both cases, the p-values are less than the conventional significance level of 0.05, suggesting that there is strong evidence to conclude that the learning program had a significant impact on improving scores in both Information Literacy and Copyright Law Knowledge.

Conclusions

The outcomes of the Wilcoxon signed-rank tests for both categories demonstrate a statistically significant improvement in scores after the learning sessions. In both cases, the p-values were less than the conventional significance level of 0.05, providing robust evidence to conclude that the learning program had a significant and positive impact on enhancing participants' Information Literacy Skills and Knowledge of Copyright Law. These results underscore the effectiveness of the educational intervention in improving participants' understanding and proficiency in these critical areas.

Reflections on Using a Monitoring System for Participating Students in Work-Based Learning (WBL) Aimed at Developing the Adversity Quotient (AQ) Through Cloud Computing Technology

Benjamaporn Jantorn, King Mongkut's University of Technology Thonburi, Thailand
Sumalee Chanchalor, King Mongkut's University of Technology Thonburi, Thailand
Surachai Suksakulchai, King Mongkut's University of Technology Thonburi, Thailand

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
The aims of this research are 1) To study the level of Adversity Quotient (AQ) and the level of work behavior of students practicing in the Work-based Learning (WBL). of a college in Thailand and 2) To study the level of satisfaction in using the student monitoring system for practicing students in the work-based learning (WBL). The sample group the study consisted of 20 intern students and 20 interns from business establishments. The researcher used a test of Adversity Quotient (AQ), a student behavior assessment form. And satisfaction assessment form it is a tool for collecting data. The statistics used in data analysis include basic statistics, Percentage, Mean and Standard Deviation and t-test dependent. 1) The results of comparing the average scores before and after training found that the average scores of the adaptability and problem-solving skills test were higher after training than before training, with a score of $143.05 > 125.50$, and the average scores of the student work behavior test were higher after training than before training, with a score of $109.10 > 76.15$, which is statistically significant at the 0.01 level. And 2) the overall average satisfaction level is in the highest level of satisfaction ($\bar{x}= 4.64$). The area with the highest level of satisfaction is the student tracking process, followed by the supervision from the advising teacher.

Introduction

Society is undergoing rapid changes in the present, so it is necessary to train oneself to have abilities and skills in order to live a happy and successful life. Success depends only 20% on intelligence, while the rest is about social skills and emotional management. (Goleman, 1995) Therefore, current education aims to develop students in physical, mental, intellectual, and social aspects, emphasizing the importance of students having the ability to develop themselves according to their goals, resolve emotional conflicts, and adapt. In addition, there are four important goals for students to achieve success: 1) EQ (Emotional Quotient) - emotional intelligence, 2) IQ (Intelligent Quotient) - intellectual intelligence, 3) MQ (Moral Quotient) - morality, and 4) AQ (Adversity Quotient) - the ability to face and overcome challenges. (Stoltz, 2001) The Adversity Quotient (AQ) is the behavioral response to life's challenges, which can be developed through Stoltz's training. Stoltz believes that individuals who have the Adversity Quotient (AQ) can plan ahead, control themselves, persevere, and understand and utilize the abilities of others for their benefit (Stoltz,1997).

Promoting students' Adversity Quotient (AQ), which requires development, is essential. The Adversity Quotient (AQ) leads to students' happiness and success in achieving their goals. This study conducted experiments with a sample group of students undergoing work-based learning (WBL) in the first year of their bachelor's degree program in Innovation Trade Management, at a college in Thailand. The research aims are as follows:
  1.1 To study the level of students' Adversity Quotient (AQ) and their work performance behavior in the work-based learning. (WBL)
  1.2 To study the level of satisfaction in using the student internship monitoring system in the work-based learning. (WBL)

Literature Review

1. The Concept of Adversity Quotient (AQ)

The Adversity Quotient (AQ) is crucial for people in the modern era, as it is a key factor that leads to success in life and work. AQ is a concept introduced by Stoltz (1997), who categorized individuals into three groups. The first group is "The Quitter," who avoids challenges and tends to lack vision, dislike risks, and have less motivation in their work. The second group is "The Camper," who seeks convenient ways to avoid facing new obstacles and chooses a simpler life when confronted with adversity. The third group is "The Climber," who possesses high resilience, does not give up easily, and often becomes good leaders.

Stoltz (1997) divided the components of the Adversity Quotient (AQ) into 4 dimensions, collectively known as CO2RE: 1) Control (C), 2) Origin and Ownership (O2), 3) Reach (R), and 4) Endurance (E).

The Adversity Response Profile (ARP) test by Stoltz (1997) measures one's Adversity Quotient (AQ). It also explains the meaning of different levels of adversity response and resilience, as follows.

Score	Meaning
166 - 200	There is a tendency to have great resilience to major obstacles and the ability to move forward. Can use AQ techniques to develop their own potential and that of others.
135 - 165	There is a tendency to work well and thrive in challenging situations and have the potential to develop oneself using AQ techniques.
95 - 134	Can work well and achieve success as long as there are no significant obstacles. Often carries accumulated concerns, which makes it difficult to face challenging tasks. However, can use AQ techniques to develop their potential.
60 - 94	Has low potential in work. Obstacles can lead to setbacks and it is difficult to move forward. Must contend with feelings of helplessness and hopelessness. Can overcome these by developing AQ.
0 - 59	There is a tendency to endure various forms of suffering and adversity. Can increase motivation, energy, health, happiness, vitality, and enjoyment. Results in job performance, perseverance, and hope, can be achieved by using AQ techniques.

Stolz (1997) proposed a technique for developing AQ called The LEAD Sequence, which consists of 1) L (Listen to your adversity response), 2) E (Explore all origins and your ownership of the result), 3) A (Analyze the evidence), and 4) D (Do Something).

2. The Concept of Online Training

Online training is a systematic approach to learning that utilizes technology as a medium for knowledge transfer in order to enhance and support learning, increase learning efficiency, and address limitations in terms of location and time (Pimpir, 2017). In addition, Angelo (1993, as cited in Vichuda, 1999) proposed five fundamental principles of online training management, which are: 1) promoting continuous communication between trainees and trainers, 2) supporting the development of collaboration among trainees, 3) encouraging trainees to seek knowledge independently as active learners, 4) providing immediate feedback to trainees to help them assess their own abilities, and 5) facilitating limitless learning opportunities for anyone interested (Angelo, 1993, as cited in Vichuda, 1999).

The online training program is a form of media that allows trainees to acquire knowledge on their own, similar to a self-learning module. Raphin (2006) mentioned the components of a self-learning module as follows: 1) having clear objectives, 2) identifying target groups, 3) having components of interconnected objectives, 4) providing instructions, content, activities, and assessments, and 5) having a manual that explains the methods and conditions of use, as well as the answer key.

The process of creating an online training program, proposed by Chaiyong (2008), consists of the following steps: Step 1: Content analysis, which involves categorizing the content into subunits. Step 2: Learning activity planning. Step 3: Production of supporting media for the activities. Step 4: Testing the effectiveness of the training program.

The learning management system for online training consists of 5 components. 1) the Course Management system, which considers 3 user groups: learners, instructors, and system administrators. 2) the Content Management system and tools for creating content. 3) the Test and Evaluation System, which includes a question bank, random question generation, timed exams, and automated grading, along with reports on scores and attendance. 4) the Course

Tools system, which includes various tools for communication between learners and instructors, as well as learners with each other, such as web boards and chatrooms, with the ability to store data history. 5) the Data Management system, which includes file and folder management. Instructors have their own storage space for lesson materials, as determined by the system administrator.

3. The Concept of Cloud Computing Technology

The meaning of cloud computing technology, as stated by Danielson (2008) and Lin and Chen (2012), is as follows: It refers to the way computer users access and utilize services over the internet, where service providers share resources with users. This concept has evolved from the ideas and services of virtualization and web services. Users do not necessarily need technical knowledge of the underlying workings of these services.

The types of cloud computing technology, as categorized by Johnston (2009), can be divided into three formats: 1) Public Cloud or External Cloud, 2) Private Cloud or Internal Cloud, and 3) Hybrid Cloud. In addition, Mell and Grance (2011) have classified the service models of cloud computing into three formats: 1) Software as a Service (SaaS), 2) Platform as a Service (PaaS), and 3) Infrastructure as a Service (IaaS).

For types of software on cloud computing technology, Arron (2017) has classified tools into 4 categories as follows: 1) File Storage tools, 2) File Synchronization tools, 3) Document Creation tools, and 4) Collaboration tools.

The aforementioned concept has been divided into three components by the researchers, which are 1) users, 2) the process of monitoring and caring for students, and 3) cloud computing technology. The student monitoring and care system is built on a Hybrid Cloud network, utilizing Software as a Service (SaaS) cloud services, and is connected to the Google Workspace for Education learning support toolset.

4. The Theory Related to Satisfaction

"Satisfaction" refers to the state of emotions and shared experiences that individuals have towards the effectiveness and success of activities that lead to a predetermined goal. In another sense, satisfaction is a feeling in terms of evaluation that is an important component of learning, which relates to the performance outcomes of individual learning experiences (Namluea, 2015; Morse, 1958; Good, 1973; Wolman, 1973; Davis, 1981; Vroom, 1990; Newstrom and Davis, 2002).

The method of evaluating satisfaction is to assess the value of feelings in terms of satisfaction and dissatisfaction, in terms of magnitude. There are three aspects to assessing satisfaction: 1) emotional aspect, 2) cognitive aspect, and 3) behavioral aspect. It is a measurement of readiness to act or respond to the causes of behavior.

Methodology

1. Population and Sample Group

The sample group used in this research consists of 1) 20 internship students and 2) training teachers from the workplace. The selection method for the sample group is purposive

sampling, which means selecting from the workplaces where the volunteer internship students are currently practicing.

2. Research Tools

> 3.2.1 Work-Based Learning (WBL) for Monitoring and Supporting Student Internships in the Learning-Work Integration System.
>
> 3.2.2 Development Plan for Enhancing Adversity Quotient (AQ) through Cloud Computing Technology.
>
> 3.2.3 Assessment of Students' Resilience and Adversity Quotient (AQ) during their Internship.
>
> 3.2.4 Evaluation of Students' Work Performance and Behavior during their Internship.
>
> 3.2.5 Satisfaction Survey for Students on the Work-Based Learning (WBL), which aims to enhance their resilience and Adversity Quotient (AQ) through cloud computing technology. This evaluation form consists of a 5-point rating scale.

3. Data Collection

This research is a single-group experimental design that measures the level of Adversity Quotient (AQ), as well as the work performance behavior of students, before and after the experiment (The One-Group Pre-test, Post-test Design). The duration of the experiment is 8 weeks in order to study the Adversity Quotient (AQ), as well as the work performance behavior of students. As follows:

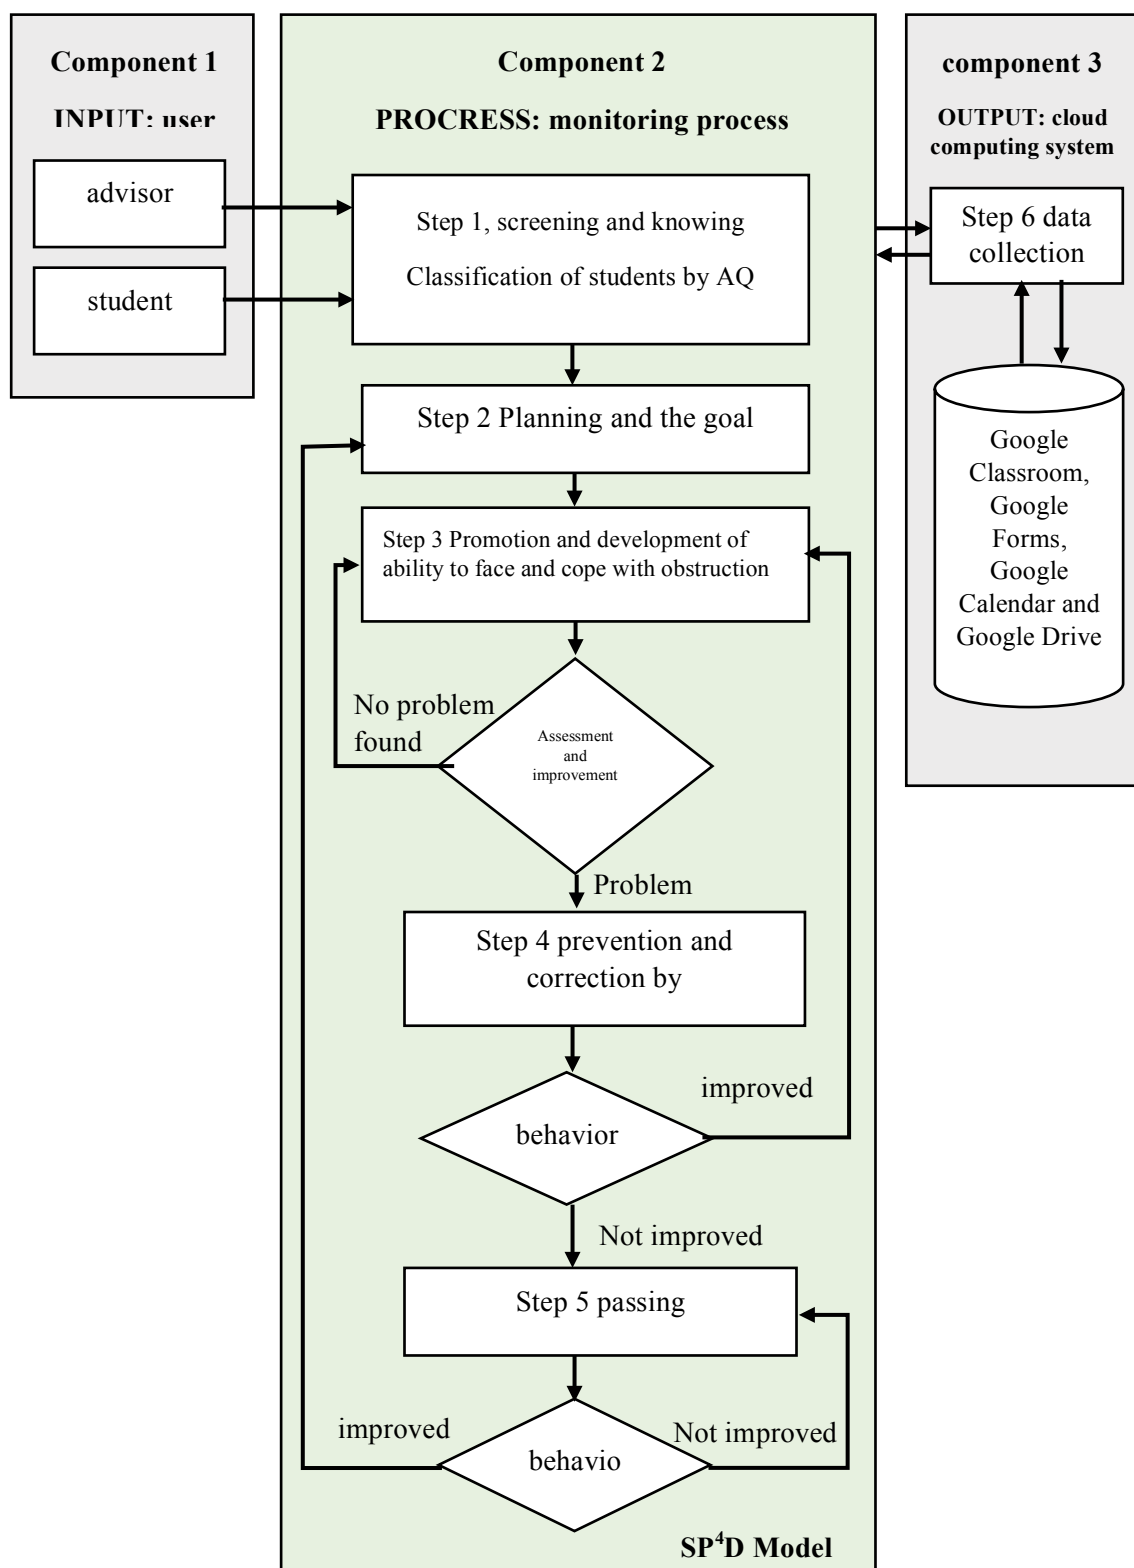
Step 1: Have the sample group participate in an 8-week trial of the Student Practice and Professional Development (SP^4D) tracking system. The system consists of 3 components:
- Component 1: INPUT, which includes the following users: 1) Faculty Advisors: They are responsible for managing content, activity rooms, and data of both faculty and students. They track and manage interaction data, exchange opinions between students and faculty advisors, as well as among students. They work together to follow the SP^4D Model's tracking and supervision process. 2) Students: They are responsible for recording data, taking tests, and participating in activities to develop their skills and overcome obstacles according to the SP4D Model's tracking and supervision process.
- Component 2: PROCESS, of the SP^4D Model 6 includes the following steps: 1) Introduction and screening, 2) Goal setting and planning, 3) Student support and development, 4) Prevention and correction, 5) Referral for problem-solving, and 6) Data collection and summarization.
- Component 3: OUTPUT, consists of Google Classroom/Meet for organizing activities, Google Forms for conducting tests, and Google Drive for storing student data, as shown in Figure 1.


Figure 1: A system for tracking and supervising students' work-based learning, in conjunction with their academic studies, to enhance their Adversity Quotient (AQ) through cloud computing technology.

Along with the internship students, participate in activities to develop skills in Adversity Quotient (AQ) through cloud computing technology. This can be explained from the example of an activity plan as follows:

Activity Plan for Developing Skills in Adversity Quotient (AQ) through Cloud Computing Technology:

Unit Activity 1: Introduction and Screening, with the following steps:

1) Students complete the activity "Who are you" through Google Form.

2) Students check their own scores to determine which personality group they belong to.

3) Use Google Slide to explain various personality traits.

4) Divide the students into small discussion groups according to their personality traits.

5) Each group of students completes the activity "Paths of Life" through Google Jamboard.

6) Students brainstorm and identify individuals they have encountered during their internship, and determine which component of the tree of life they represent, along with explaining the reasons and posing the question "How can the tree of life be nurtured and cared for to grow well?" This activity illustrates different roles, demonstrates the interconnectedness, and highlights the necessary skills.

7) Summarize the activities.

Step 2: Evaluate the students' Adversity Quotient (AQ) during their internship. Here are some examples of assessment questions.

---

1. Your coworker does not listen to your opinions or suggestions?
The reason why my colleague does not listen to my opinions or suggestions is because...

I can't control or manage.　| 1 | 2 | 3 | 4 | 5 |　I can control or manage.

C-

The reason why my colleague refuses to accept my opinion or proposal actually comes from...

Myself　| 1 | 2 | 3 | 4 | 5 |　Other people or other factors

OR-

---

2. **What if there is no response to your proposal at the meeting?**
The reason why no one accepts my proposal is because...

Myself　| 1 | 2 | 3 | 4 | 5 |　The situation at that time.

R-

The reason why no one accepts my proposal is...

Always happened to me　| 1 | 2 | 3 | 4 | 5 |　It will never happen to me again

E-

Step 3: weeks 4 and 8, deliver the student work behavior assessment form, version 1, to the company's training supervisor, a total of 20 sets. Explain the purpose of sending the assessment form, to request cooperation in data collection.

Step 4: conduct interviews and have the sample group complete the satisfaction assessment form regarding the student internship monitoring system, a total of 20 sets.

4. The Statistics Used for Data Analysis

Statistics in analyzing the level of abilities to Adversity Quotient (AQ), as well as the level of abilities and work behavior of students before and after the experiment using dependent t-test statistics, and analyzing based on the satisfaction of students towards the student internship tracking system using basic statistics such as percentage, mean, standard deviation, and interview findings.

Results

1. The Level of an Adversity Quotient (AQ) and the Level of Work Performance Behavior of Interns

The results of the comparison of average scores in the test measuring the level of Adversity Quotient (AQ) are presented in Table 1, and the results of the comparison of average scores measuring the level of performance in student internships are presented in Table 2.

(n=20)

level	Full score	$\bar{x}$	S.D.	t-test	Df	Sig.
Pre-training	200	125.50	15.35	6.90	19.00	0.00**
Post-training	200	143.05	8.26			

** Statistically significant at the level of .01

Table 1: The results of comparing average scores (means) measuring the level of Adversity Quotient. (AQ)

According to Table 1, the results of comparing the average scores of the Adversity Quotient. (AQ) of students before and after practical training showed that the level of Adversity Quotient. (AQ) after training is significantly higher than before training at a statistically significant level of .01 ($\bar{x}_2$ = 143.05, S.D. = 8.26), ($\bar{x}_1$ = 125.50, S.D. = 15.35).

(n=20)

level	Full score	$\bar{x}$	S.D.	Df	t-test	Sig.
pre-training	120	76.15	33.29	19.00	27.12	0.00**
post-training	120	109.10	81.88			

** Statistically significant at the level of .01

Table 2: The results of mean scores measuring the performance level of intern students in the Work-based Learning. (WBL)

According to Table 2, the average score of students' work behavior before and after training was compared. The average score after training ($\bar{x}_2$ = 109.10, S.D. = 81.88) was significantly higher than before training ($\bar{x}_1$ = 76.15, S.D. = 33.29) with a statistical significance of .01.

2. The Result of Satisfaction Levels in Using the Student Internship Monitoring System

The satisfaction of students undergoing work-based learning (WBL) in the learning and working system, coupled with cloud computing technology, is shown in Table 3.

Issues/Topics for consideration	$\bar{x}$	S.D.	Satisfaction level
Issue 1: Supervision from supervisory teachers.	4.57	0.50	The most
Issue 2: Student monitoring process	4.66	0.48	The most
Issue 3: Development activities AQ	4.48	0.60	The most
Issue 4: Cloud computing technology	4.23	0.73	The most
Total average	**4.64**	**0.53**	The most

Table 3: The level of satisfaction of the intern students towards the WBL monitoring system to develop the Adversity Quotient. (AQ) through cloud computing technology

From Table 3, the satisfaction level of internship students towards the student tracking system was found to be the highest overall ($\bar{x}$ = 4.64, S.D. = 0.53). When considering the individual aspects of satisfaction, the highest level of satisfaction was found in the aspect of student tracking and monitoring processes ($\bar{x}$ = 4.66, S.D. = 0.48). Following that, in descending order, were the aspects of supervision from advisors, AQ development activities, and finally, cloud computing technology.

The feedback reflects the feelings about the activities and the use of the student internship monitoring system from the student interviews.

> It is a good idea for this type of technology system. It is a comprehensive system that can help with problem tracking and student monitoring conveniently. Tracking through technology without difficulty and notifying in advance so that we can stay informed all the time, making us feel like there is a teacher taking care of us and providing assistance throughout. Impressed with the 3 steps of AQ development process, it helps us understand ourselves and others' personalities, which can be applied to work or to understand each customer's personality and how to handle it.

Another person said:

> The teacher pays great attention to details and takes good care. It is a good tracking system that is easy to understand and not overly complicated, allowing students to understand clearly, especially the development of AQ that is suitable for work and has AQ measurement.

Another comment is:

> I feel good because there is a teacher who always provides advice and thoughts. The teacher cares about following up with students during internships, making us feel close to the teacher and there is advance notification for appointments to solve problems, which allows us to prepare in advance. We receive systematic problem-

solving and have the opportunity to practice problem-solving on our own. It is very beneficial.

Discussion

1) The results of the study on the level of Adversity Quotient. (AQ) and the level of work behavior of Work-based Learning (WBL) students found that the average scores of Adversity Quotient. (AQ) and the work behavior were higher after training compared to before training.

This may be due to the Work-based Learning (WBL), which involves a process where 1) individual students are identified and screened through online training activities,2) goals and objectives are planned and established, 3) advisors help promote and develop students, 4) assistance is provided in identifying and solving problems, 5) systematic solutions are implemented for persistent issues, 6) data is collected and summarized, and continuous support is provided to students. However, a study by Thitinada and Yuwadee (2019) found that there were problems with the student tracking and support system, such as the lack of a process and operational steps, advisors lacking technical skills and knowledge in the system, and a lack of continuity. Therefore, advisors need to have a good understanding of the student tracking and support system, as well as engage in continuous development and collaborative work (Awutai, 2013). Additionally, Nattarin (2014) studied the management module of the student support system in a school under the Royal Patronage, which consists of four components: student data system, operational student support system, support services, and problem prevention and solving. The core of the student tracking and support system is control and coordination, effective communication, which can help reduce obstacles and challenges (Awutai, 2013).

2) The results of the study on satisfaction levels in using the student internship monitoring system found that the overall satisfaction level is the highest. This may be because the study follows a systematic process, examines the current situation, identifies problems, and analyzes and integrates appropriate tools. As a result, the evaluation of the monitoring process aligns with Kittisak et al. (2015), who found issues in supervision and monitoring, as well as the need for guidance and systematic monitoring of students, especially by teachers and educational institutions. It is recommended to establish a systematic and continuous monitoring system that includes tracking progress and promotes teacher knowledge and understanding of activities, leading to more practical implementation (Nanthawat, 2022). Furthermore, when considering the findings, the highest satisfaction level is "being able to apply the knowledge gained from participating in activities in daily life," followed by "being able to apply the knowledge gained from participating in activities in work." This may be due to the internship monitoring system, which includes online training activities that enhance students' abilities to face and overcome challenges through cloud computing technology. Some interesting points include:

- The process of developing and promoting the Adversity Quotient (AQ) using The LEAD Sequence technique by Stoltz (1997) focuses on training listening and perception skills to respond to problem-solving challenges. It involves researching the root cause of obstacles, analyzing the possibilities for solving them, and enhancing one's own capabilities. Choosing a method and taking action to eliminate obstacles can help control their impact on life. This is consistent with Jinda (2013) study on training methods to enhance the Adversity Quotient. (AQ) in early childhood education. It can

stimulate the growth of the Adversity Quotient. (AQ) within individuals and students become aware of the importance of training that directly influences their mental development to foster the Adversity Quotient (AQ).

- The steps for organizing online training activities result in students gaining hands-on experience from participating in activities and continuously evaluating themselves, enabling them to learn independently. They can engage in knowledge exchange, thoughts, experiences, and problem analysis that are of interest to them. There are techniques to promote team understanding and problem analysis together, making students feel capable, accepted, and valued, leading to their ability to ultimately solve problems. Activities foster collaboration, constant communication, even if students do not encounter problems and obstacles. According to Garg and Singh (2022), they studied the online training format in India and found that online training is an effective tool for transferring knowledge. It allows learning according to the abilities and potential of the trainees, as well as the necessity of using information technology.

- The selection of suitable cloud computing technology enables trainees to easily access and use data anytime, anywhere (Bindu, 2016). This helps reduce the burden of data storage and ensures relevance to keep up with changes, leading to the creation of knowledge that can be applied in future caregiver development by consulting teachers (Krittinicha, 2021)

As mentioned above, it demonstrates the alignment of the student internship monitoring system, which includes the steps of monitoring and activities to promote and develop students' Adversity Quotient (AQ).

Conclusion

The Work-based Learning (WBL) tracks and supports students' internships in conjunction with their learning process. It promotes students' readiness for practical work experience and equips them with information, media, and technology skills. It enhances both their personal and professional lives by integrating real-world professional experiences with classroom learning. This allows students to become familiar with the realities of the working world before completing their education. Learning in a professional setting is widely recognized as a means to develop students in various aspects beyond traditional classroom learning. Therefore, if educational institutions have a system in place to closely monitor and support students during their studies and internships, while also developing activities to enhance their Adversity Quotient (AQ), it would be of great benefit to students when they encounter challenges in their internships, studies, and daily lives. This ultimately results in equipping students with problem-solving skills, enabling them to overcome obstacles in the end.

Teaching Design in the Wake of Artificial Intelligence

David Campos-Delgado, Universidad Autónoma de San Luis Potosí, Mexico
Ricardo Alonso-Rivera, Universidad Autónoma de San Luis Potosí, Mexico

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

In order to maintain its relevance and pertinence throughout history, Design Teaching has been pushed to regularly evaluate its adequacy in the face of cutting-edge technologies and constantly renewed tools. In that respect, the new paradigm of Generative Artificial Intelligence pushes once more the territorial limits of Educational Research and Pedagogy. In this study, we describe the implementation of Educational Methodologies to teach Design to Architecture Students in a Professional Degree Program in Mexico. This Methodology makes students acquainted with Design Fundamentals and later incorporates internet technologies as a support tool that grants them access to an expanding database of form and geometry configurations. The incorporation of 3D Modeling Digital Tools complements a process that aims to endow students with the capacity to understand and create space from within the manipulation of form and geometry and promotes the burst of new formal configurations within the student´s creative process. We base this process on the notions of Systems Theory and claim Design Teaching is a cohesive cluster of interrelated components. It is under this premise that we also claim that the new possibilities granted by Artificial Intelligence can be seen as another component within this system. Beyond the initial reluctance to incorporate AI to its Design Methodologies, the Design Disciplines should see AI as a tool that generates variations with radical speed, and therefore invaluable in its role as an aid to the Design process but nevertheless, incapable of generating new formal configurations by itself.

Introduction

Like many of its foundational principles, the Bauhaus' visionary design curriculum remains to this date an undisputed reference, whether by emulation or by opposition, to most Design School's curriculum in the world. Its core pedagogy principles are taken from the 1919 manifesto written by Walter Gropius which was later integrated in the famous concentric ring stages diagram that defined studies through the Bauhaus' four and a half year courses.

The Bauhaus remained active from 1919 to 1933 and started its operations in the city of Weimar with Gropius acting as its first director. Gropius was profoundly influenced by the theoretical foundations of the *Deutscher Werkbund* founded by Herman Muthesius.[1] He was also deeply aware of the work and the discussions prompted by his contemporaries in other parts of Europe and America like Peter Behrens, Henry van de Velde, Josef Hoffmann, Joseph Maria Olbrich or Louis Sullivan.[2] His understanding of the *zeitgeist* and the fundamental change of paradigm within the new machine age has proven to be foretelling given the 100-year-old longevity of his ideas and pedagogical principles instilled in the Bauhaus.

One of the core principles embedded within the Bauhaus curriculum is the pedagogical strategy of immersing its students in a compulsory one-and-a-half-year Preliminary Course. Regardless of the final output of the following three-year workshop studies, the Preliminary Course was considered essential in the Bauhaus curriculum due to its emphasis on Basic Formal Studies. These were regarded as foundational within all design disciplines and considered a methodological bridge to the following stage of Spatial, Color and Composition Studies.

The Bauhaus curriculum tried to respond to the need of *"a new and powerful working correlation of all processes of creation"* (Bayer, 1938, p.30). Prioritizing an abstract level of Formal control and Geometric manipulation at the Preliminary Course proved then to be a revolutionary teaching strategy and it is still the basis of many contemporary Educational Methodologies. Despite one hundred years of technical developments within the realm of representation tools its core Pedagogical method remains practically intact in many Design Schools around the world.

---

[1] Being the youngest of the *Deutsche Werkbund* leaders (Bayer, 1938, p.13), Gropius can be considered an important link between this association's ideas of seeking a synthesis between the "machine style" and the "arts and crafts" movement, and the development of the objectives and theoretical fundaments of Modern Movement of architecture.

[2] These architects are the most direct representatives of the avant-garde movements, preceding the Modern architecture. Their work was parallel regarding ideas despite they were located in distinct geographical contexts such as Germany, Belgium, Austria and the United States.

The strength of this pedagogical system relies on the initial approach to Form, Matter and Space from a conceptual and abstract departure point in order to develop the following stages of figurative and technical development in parallel with the growth of the student´s level of technical knowledge. This system also allows a critical and analytical awareness to develop within the students' own process while releasing his or her creative input.

> Practical and theoretical studies are carried on simultaneously in order to release the creative powers of the student, to help him grasp the physical nature of materials and the basic laws of design. Concentration on any particular stylistic movement is obviously avoided. Observation and representation -with the intention of showing the desired identity of Form and Content- define the limits of the preliminary course. (Bayer, 1938, p.26)

Like many Design Schools founded during the second half of the XX century, the School of Habitat at the UASLP in Mexico, was founded owing a great degree of influence to the Bauhaus system.

The School opened in 1972 offering the Architecture degree program and its educational platform grew to offer degrees in Graphic Design and Industrial Design a couple of years later. The combination of these three degrees presented an ideal scenario for the implementation of a common Preliminary Course during their first year of training and a structured curriculum strategy that shared many common departmentalized courses the following years. The basic structure of the Architecture curriculum at the UASLP assimilated the three stages present in the Bauhaus curriculum: Conceptual, Instrumental and Specification.

One crucial difference between the two systems is the output in the UASLP curriculum final stage. Given the role of public professional education in Mexico, the capacity of granting a professional degree at the end of a six-year curriculum was considered of the utter most importance. The UASLP curriculum leads to a legal license to practice in the professional field. This third stage in the Bauhaus system was embedded from the beginning with a certain degree

of uncertainty. Its duration, level of academic and practical achievement defined by individual *"special circumstances"* (Bayer, 1938, p.26).

The above is mentioned to highlight the natural inclination in the UASLP system and its faculty to overstate the importance of the Specification stage and introduce knowledge based on technical and constructive skills from early conceptual stages. This, historically represented the risk of undermining the importance of the progressive evolution from conceptual to figurative in its educational system.

It is in this context where a recent interest among the School of Habitat faculty has risen to address the need to update and strengthen the transition between the Conceptual and Instrumental stages. This interest revolves around informing its Bauhaus methodology *vis-a-vis* contemporary theoretical developments, new lines of pedagogical inquiry and research as well as the undeniable presence of digital tools and new representation techniques.

The Theory of Form

A student enrolled in the Architecture program at the UASLP receives a practical course of Design Fundamentals during his/her first semester. This sets a practical foundation to understand the rules of form, composition, rhythm, proportion and scale. The following three semesters belong to the Conceptual stage which is developed through Design Studios that teach a consolidated methodology across project-based design exercises. This stage develops the skill to create architectural concepts capable to respond to any given programmatic needs and apply them to any imaginable site or context. And more importantly, do so while answering to the need of creating relevant form, space and geometrical configurations while responding to specific perceptual, existential and functional requirements. It is across the three levels that comprehend the Conceptual stage that an alternative methodology has been implemented. This strategy has been applied over the last six semesters at the Architecture program at the UASLP and its initial results are presented here.

A recurrent concern within this proposed Methodology is how to introduce and guide students properly into the world of Abstract Form and manipulation of Geometry as the steering Pedagogical strategy. In many ways, students enrolled to the Architecture program, whether they are aware of it or not, arrive with the natural expectation of understanding Architecture through the experiences occurred inside buildings they have inhabited. This implies that their understanding of Space, Form and Matter, previous to their arrival to the Architecture program is mediated by, or understood as, a confusing agglomeration of building components. It is very common to find students within the initial semester of the Preliminary Course eager to address Design, Architecture and Space as a consequence of hierarchizing very specific construction components such as walls, windows, doors, columns, ceilings, facades, stairs or hallways.

The strategy proposed here assumes that, at least during the initial stages of the student´s education, Architecture is not understood as a combination of construction components. It relies on the process taking place within the thematic progression from conceptual to instrumental stages proposed in the program curriculum. That process starts with an understanding of Geometry as a container of Space and with the students' abilities to develop, manipulate and control Abstract Form. At that point, it becomes crucial to make implicit the connection of subjects and skills developed by previous courses like Descriptive Geometry and the essential role they are about to play in the proposed Design Studio Methodology.

In this way, the initial tools given to the students within Design Studio are expected to be recognized as tools already present in their skill set. Among these are notions already studied as pure Geometry Typologies or as result of Geometrical Operations. It is expected that through the lens of design exercises the students understand these as Formal typologies used in the development of three-dimensional space: Orthogonal, Pyramidal, Polyhedral, Spherical, Curvilinear. In parallel, the students receive two more notions crucial to manipulate form: Formal Configurations of three-dimensional space (Solids, laminars, frames, voids) and Material Configurations of three-dimensional space (Transparency, translucency, shininess, texture, color). As mentioned before, these notions evolve from topics addressed in Geometry courses into Design Studio Tools through applied design exercises and, in most cases, these exercises imply the creation of physical models and formal archetypes already capable of responding to function, context or perceptual requirements.

A second crucial aspect of this Methodology is the conflict faced by the student *vis-à-vis* the need of creating variations of geometrical operations, iterations of physical models or recursive formal compositions given their early control over Geometry and Form. Here the question is how to introduce the students to grasp the myriad of possible configurations capable to emerge from manipulating Form at conceptual and abstract levels.

The proposed solution to this problem has been taken from the theoretical work of the German philosopher Niklas Luhman and his contribution to the field of Systems Theory. Luhman's work represents an approachable theoretical background to the challenge of developing new formal configurations within preexisting formal typologies. As explained before, this is an essential concern given the speculative nature of the work developed by students in the Design Studio exercises.

Luhman claims (2000, p.26-28) that the emergence (creation) of new Forms is done on the basis of processing its qualities within a Social System. He identifies the participation of perception and communication within this System and claims that these are principles active within the process of creating Art Forms. He explains that Art is, in its modern sense, a functional equivalent of language: its purpose is to launch a specific type of communication that uses the capacity of perception (or imagination) of Forms to undertake the "search of meaning". New Form is introduced into the environment of the System, differentiating itself from the rest and provoking communication that occurs from its perceived differences. The triggering effect of the specific difference launches a specific type of communication, a form that, by modifying the state of the system, becomes information: as a "difference that makes a difference."[3]

N. Luhmann deepens into the Theory of Form based on difference and claims that it is the operation of distinction which introduces Form into the world and makes it observable. Being able to observe one's difference from the rest becomes necessary to recognize one's own form and therefore, the specifics of Form are only possible to recognize in relation, in comparison, to everything else that exists in the world.

On the other hand, N. Luhmann also explains that when distinctions are marked as Forms two things are ensured: they can be distinguished and they can be reproduced. This is important because, while perception works with unformed distinctions, communication presupposes (is

---

[3] Although, in the field of social sciences, this phrase is usually attributed to Luhman, he actually mentioned to have taken it from the biologist, anthropologist, social scientist and linguist Gregory Bateson (2000, p.26).

based on) the elaboration of new Forms. This happens in two ways: First, as a condition within the concurrence of various psychic systems (the consciousness that perceives them) who notice the Forms due to their specific difference. Second, to guarantee the linking capacity of communication. Communication resorts to what has already been communicated and anticipates other possible communications, that is, the presence of *recursiveness* at the time of any communicative operation. This must be understood for all communication, and especially for the communication of Art that relies on self-produced Forms in the realm of the perceptible. It can also be deduced that the meaning of Art Forms is to make themselves available for subsequent operations within the communication system.

The way in which Luhman's theory gets inserted within this Pedagogic strategy relates directly to the aesthetic component within the Forms of Architecture. A component that has to do with its perception and what they communicate or contribute to us. Therefore, there are two elements directly related to this Methodology; the communicative quality within the aesthetic condition of the Forms of Architecture and the *recursiveness* of new Forms implicit in the creation of communication.

Thus, its application presupposes that the qualities of the Architectural Form are recognized and processed in the environment of the System of Architecture. Within this System each Form's contribution relates directly to its specific difference or to its own configuration characteristics.

It is possible to deduce then, that initial Formal configurations based on Geometrical qualities are already recognized typologies. Therefore, the knowledge of the already achieved Formal typologies becomes instrumental to the student's immersion in the System of Architecture. Hence the importance of providing from the early stages of this Methodology a documented or collected storage of Formal typologies.

Pinterest Database

Given the *recursiveness* necessary for operating and processing new Forms within the System of Architecture, it is important to remember that the storage of Architectural Forms and their qualities has historically occurred in archives, books and specialized magazines. However, digital resources and web-based digital archives offer new possibilities to the dynamics of processing and storing Formal typologies.

With this in mind, the use of the Pinterest platform has been integrated into this Methodology and into the workflow of Design Studio exercises of the first four semesters of the Architecture program. This promotes the student´s immersion into the management of Form and Space at an abstract level while offering tools that facilitate the student´s knowledge of existing Formal Typologies and configuration possibilities.

Pinterest ("All about Pinterest," 2023) is a platform that allows users to create and manage collections of images on themed personal boards. Its interface follows a structure of canvas or boards on which photos of the topics of interest are pinned.

Unlike other social network platforms, Pinterest´s workflow is not based on the possibility of users expressing themselves through texts and images of their exclusive authorship but rather through the selection of images already existing on the platform. This ability to search, select

and collect images on thematic boards is what represents a great technological advantage in the learning process described previously.
Í
Pinterest stands out for its ability to store, classify and order images in thematic boards. The platform generates and offers a series of similar images to follow the search process based on its user's preferences. Therefore, its constant use implies an enrichment between the user and the image suggestions.

The automatic update recommends a personalized feed, so that the following search is carried out in relation to the user's specific interests. This is not unlike the implemented algorithms in entertainment streaming platforms, web search sites or even the basic logic behind Artificial Intelligence.

The platform also offers the possibility of working on collective boards. This implies that several users deposit selected images which implies that the level of specificity and accuracy of the topic is enriched with a much greater speed.

Boards can be formed in advance by instructors and teachers who present a selection of images as a guideline to introduce purposes or objectives to be tackled on any given Design Studio exercise.

3D Digital Tools

It is important to highlight that beyond traditional media such as drawing or physical models, the technology behind architectural representation has also moved towards very advanced digital resources in the generation and manipulation of three-dimensional Form.

In the traditional sense of the discipline, Form along with its configurations and iterations have usually been worked on sketches or scale models. But since the 1980s, digital tools that enhance

the possibilities of this process have made an important mark in the field. It is important to emphasize that these tools, propelled by the speed of digital processes, are also inscribed within the mechanisms of communication, self-production and generation of recursion described by N. Luhmann.

Under this logic, digital tools cover the role of accelerated facilitators of these processes and become fundamental pieces of this teaching Methodology in line with the technological possibilities of our time. Just as the Pinterest platform becomes an accelerated mechanism to document, archive and document graphic collections, digital 3D tools generate accelerated processes to project, manipulate and visualize Geometry and Form and it becomes an invaluable tool to generate Formal *recursiveness* at an accelerated speed.

The specific interest in recognizing digital tools as a fundamental piece of this Methodology responds, in part, to the indisputable hegemony that digital media professes in every aspect of the production, representation and dissemination of Architectural Design and Discourse. It also responds to the need to explore and define the still emerging role that digital tools must play as part of the comprehensive learning process described here.

With this in mind, the following steps in this Methodology are grounded in the use of specific digital applications: Autodesk 3ds Max (formerly 3D Studio Max) and Rhinoceros from the company Robert McNeel & Associates (Rhino). This is presented as a progressive link within the process described so far and as a logical continuation to the process of learning through physical or analogue models.

One of the main challenges of this strategy lies in transcending and eliminating bad practices assimilated over more than 40 years of the popularization of 2D digital vector drawing software. Despite incorporating from its first version the possibility of constructing and manipulating 3D geometry, CAD software is still known primarily as a 2D drawing tool.

Therefore, the insertion of digital media as an integral part of Architectural Design has historically represented a challenge and has confined it to the territory of two-dimensional representation and production.

Which in turn, meant a tacit disconnection with what we have called here the System of Architecture, following the theoretical guidelines of N. Luhmann. To the extent that the limited operability of CAD as a two-dimensional representation tool grew, the gap that separated it from the Systems of Architecture grew as well.

In this context, it is important to point out the value of academic forums of Architectural speculation,[4] which have contributed enormously to the exploration and expansion of the capabilities of digital tools as mechanisms of formal/spatial manipulation. Today, academic forums around the world continue to concentrate Pedagogical discussions regarding a critical stance *vis-a-vis* innovative teaching tools and methodologies.

One of the guiding interests in the incorporation of digital tools into this Methodology, is to ensure that the student's formal repertoire is as abundant as possible, as well as to generate

---

[4] The paperless studios, an experiment conducted in in the mid-1990s at the Graduate School of Architecture, Planning and Preservation at Columbia University (GSAPP), is a particular example that illustrates the attention drawn by digital tools as means to expand discursive and disciplinary discussions regarding speculative experimentation with form and space.

recursive iterations as fast as possible. In order to create a clear evolution within the students′ learning process it is also important to translate the first approaches of physical models to digital interfaces in a coherent way. From this perspective, the 3ds Max software and its implicit functionality to manipulate basic solid objects offers an ideal link to achieve this purpose.

However, it is important to note that operations in 3ds Max exclusively contemplate manipulation of solids and, as we will see later, understanding the Geometric relationship between solids and surfaces is an essential notion of the Pedagogical approach of this Methodology.

It is important to remember that in Geometric terms solids are three-dimensional figures, which have length, width and height, occupy a place in space and define volume. Their faces are surfaces that can be flat, as in the case of polyhedra (cubes, pyramids) or surfaces with curvature, as in the case of solids of revolution (cylinder, cone, sphere). It is of particular importance to specify that the faces of a geometric solid enclose a finite interior space. The result of manipulating one or more of the surfaces that define a solid leave it exposed to the infinite volume of outside space.

This methodology tries to make evident the recognition of the interior space inscribed in the Form (finite), the perception of Geometric totality, its perception from the outside and its relationship with the context (infinite). This distinction seeks to highlight the interior/exterior relationship inherent to any Geometry, extending that relationship beyond its utilitarian and operational understanding (function) to also include its perceptual dimension and its contextual relationship.[5]

Because it is a software based on the creation of surfaces, Rhino becomes an essential piece within the progressive sequence of this Methodology. The level of precision and geometric rigor in its modelling processes make it the logical step after initially setting up Geometry in 3ds Max, which is a much more intuitive and flexible software.

At the same time, Rhino is a tool that efficiently incorporates the stages of development of a design project in a seamless way. First, Rhino has efficient and clear processes for extracting 2D information from a 3D digital model. Various attributes in its interface make these processes intuitive and very evident. This helps to emphasize the idea that any two-dimensional vector drawing (plans, sections, facades) is a mechanism to represent a three-dimensional object.

---

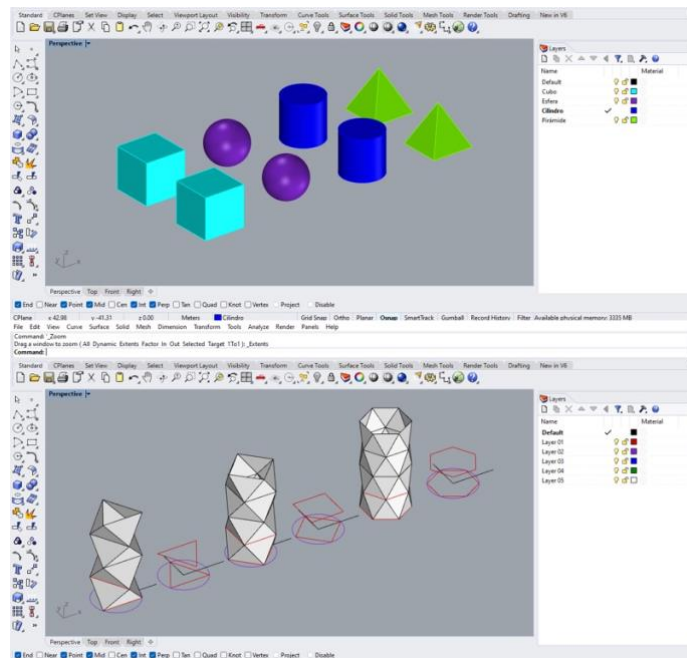
[5] In this stage, the understanding and control of concepts such as finite and infinite volume is essential. So are the different mechanisms to induce its perception and the way in which Form and Space relate with the context where architecture is immersed.


Figure 3: Rhinoceros software interface
© David Campos-Delgado, Ricardo Rivera-Alonso. 2023

Furthermore, by reinforcing basic principles of Descriptive Geometry, which are the foundations on which these representation tools are based, this Methodology helps create in the student the notion of progressive knowledge, essential in his/her training as a Design professional. The feedback capacity in the modelling process implicit in Rhino makes it a particularly versatile tool. The decisions that are made as the project progresses at any time can lead to rethinking assumptions made in the initial stages of the process.

Finally, it is important to mention that Rhino has a practically unlimited capacity to operate through different units of measurement, which emphasizes in the student the idea of Design as a tool to order the material world, regardless of its scale. This means that the qualities of the tool promote the understanding of Architecture in correlation with its context. And at the same time its coexistence and interrelation with its physical, material and constructive foundation.
Figure 4: Geometry under a solar incidence time lapse
© David Campos-Delgado, Ricardo Rivera-Alonso. 2023

Generative Artificial Intelligence

What has been described up to now is the recount of a process already taking place within the Pedagogic system of a limited number of Design Studios at the School of Habitat at the UASLP. As mentioned before, its implementation relies on the structure of the Architecture program curriculum and its courses. It has been tested with students enrolled up to the midpoint of the Instrumental stage where courses on Digital Modelling become available and thus, the Methodology reaches a limit where these tools can be applied. However, in the face of emerging digital tools that rely on a higher level of sophistication this document tries to speculate their role in key aspects that will affect Educational Methodologies in the future.

Artificial Intelligence is a reality already embedded in many aspects of contemporary life. Its most used applications so far are based on the fields of web search engines, recommendation systems or recognition of human speech. Recent breakthroughs on the core structure of its programming and the incursion into innovative neural architectures have opened up many fields previously thought unreachable to Artificial Intelligence.

Among these are the fields of the Arts and the creative (Design) disciplines. What we know today as Generative Artificial Intelligence and Computational creativity has started to create outputs showing puzzling levels of intelligence and creativity. So far, the core structure of deep learning programming for Generative AI has been made available through the platforms of three main field players: Stable Diffusion, Dall-E and Midjourney. Such is the impact of its early manifestations, that in many disciplinary forums serious discussions are taking place regarding authorship, creative validity or originality.

Leaving those really important discussions aside, we propose here to address its potential functionality within the field of Architectural Design and its insertion into the Pedagogical Methodology described previously.

Despite its initial appearance, Generative AI doesn't offer much beyond a very effective tool to generate repetition and variation. But neither difference nor *recursiveness*. Therefore, we claim that the use of Generative AI by itself is incapable of inserting itself into what we have called the System of Architecture.[6]

Nevertheless, used in a strategic and critical way, Generative AI could become an important asset along the process to generate *recursiveness*. If 3D digital tools offer an accelerated way to project, manipulate and visualize Geometry and Form, then Generative AI offers a hyper acceleration of that process.

A promising connection between the programming architecture of Generative AI and the Methodology described is the reliance of Generative AI on meaningful semantical prompts. These prompts keep an interesting relationship between query, key and value inputs at the programming level of the software.

If conduced properly these prompts could potentially draw parallels and unleash meaningful implications for keywords embodying perceptual, existential, functional or contextual requirements. And therefore, offer valuable insights into how recursive iterations of Form could respond to the complexities surrounding a project.

However, the risk of using Generative AI resides in its potential uncritical and simpleminded use. Disconnected from a proper Methodology, an analytical approach or a strategical insertion into the workflow of Architectural Design, it is easy to see Generative AI falling into the generation of irrelevant, superfluous or unnecessary visual information.

Conclusions

The main goal behind the Methodology presented here is to prioritize the use of Architectural Form at a conceptual level as the guiding strategy behind Architectural Pedagogy. The process described here, implemented across three years of practical exercises within the Design Studios of the Architectural degree at UASLP shows results where students are capable of driving Spatial, Functional, Perceptual and Existential requirements through the development of Formal typologies, manipulation of Geometric variations and improvisation of compositional iterations.

The work of Niklas Luhman is present along different stances across this Methodology. The definition of the qualities of Form or its insertion into a Social System of communication are logic and direct interpretations of his work. However, this Methodology owes a great debt to Luhman for laying the foundations of the concept of *recursiveness*. The employment of 3d digital tools as an accelerated strategy for creating *recursiveness* is a development result of this Methodology. This line of thought goes as far as claiming that the potential implementation of Generative Artificial Intelligence in Design Pedagogy could be seen as a manifestation of a hyper acceleration of *recursiveness*.

---

[6] Here, it is important to remember the quote attributed to Luhman regarding the importance of difference in order to trigger significant communication and the creation of Form.

The importance and constant awareness of archives of existing configurations of Architectural Form is also a direct reference to the work of Luhman, its practical application in this Methodology is carried out through digital means on the web-based platform of Pinterest. The results presented here confirm this strategy has achieved optimal results in the students' design process.

As an integral and evolutionary piece of this process, we also present the idea that the generation of Form is a central piece in Design Pedagogy. To this end, in addition to the traditional resources of sketching and physical models, modeling on digital platforms such as Rhino or 3dMax, constitute ideal means for the creation and manipulation of Form, with an increased speed to generate automatic variations and unlimited configurations. It has also been mentioned its limited use as two-dimensional representation tools has been harmful to the advancement of these objectives.

It has also been speculated that, as Generative Artificial Intelligence becomes more advanced and its availability and use become wider spread, its potential application in this Methodology could offer great advantages. However, as with any new technology, there are also latent risks implicit. Therefore, further practical application within this Methodology is strongly suggested before claiming Generative AI an integral part of the process.

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Designing educational games for children is a topic that warrants attention, particularly when using the ADDIE model as a game development framework. In this exposition, we evaluate three notable children's video games to highlight the complexities associated with designing games for children. Additionally, we present the ADDIE model, a well-known instructional design framework, to our audience to elaborate on its potential applications within the video game industry. The importance of creating educational video games for children is emphasized in this discussion. The ADDIE paradigm offers game designers a structured approach to creating educational video games that are both enjoyable and advantageous to a child's growth and education. To summarize, the process of developing a children's video game entails numerous stages and components that demand considerable effort. Game designers may employ established methodologies like the ADDIE model to create educational games that provide young children with a fun and informative experience. Games that require children to utilize their analytical and problem-solving abilities and decision-making skills can equip them with essential life skills that they can use throughout their lives. A combination of constructivist and social learning theories may be utilized to foster educational play by promoting exploration, cooperation, and reflection. Designing engaging and educational video games for children necessitates a thorough understanding of child development and various learning theories. And through the combination of theory to sort out the framework of children's video game design and detailed process.

Introduction

The potential of digital games to promote early childhood learning and development has been increasingly clear in recent years. In response, we created a video game for children age below 7 to promote the development of early reading, numeracy, social, and emotional abilities. We discovered that the ADDIE model has significant strength in educational games through case studies and market research of popular children's games. The ADDIE paradigm, which is a proven instructional design framework encompassing a systematic approach to analysis, design, development, implementation, and assessment, was used to create our games. We conducted a thorough examination of existing children's games, investigated effective game design methodologies, and contrasted our approach to discover areas for improvement. This article describes our design and development process, as well as the methodologies we employed to assess the game's effectiveness. According to our findings, the game has the potential to improve children's early education by delivering interesting and relevant learning experiences. This study's findings have significant implications for the development of effective play-based learning practices in early childhood education.

1. Related Video Game Analysis

Explanation Video Game Classification

In the past decade especially, video games have received a growing amount of attention, and children's video games constitute a substantial portion of the gaming market (Lenhart et al., 2008). Increasing numbers of researchers are emphasizing on game-based learning and the gamification of education and training. Video games, which use electronic products as a medium, are increasingly utilized as the popularity and development of electronic products increase. Educators recognize the potential educational and developmental benefits of video games for students (Papastergiou, 2009; Rosas et al., 2003). Some parents but with a skeptical attitude to video game (Steinkuehler, 2010). The content of children's video games is deemed appropriate for their age. The educational value of children's video games deserves recognition, and most of these games are intended to educate players in fundamental cognitive-related knowledge, mathematics, science, language, or art-based games. In addition, they have the potential to foster problem-solving, critical reasoning, and social and emotional intelligence.

In addition to the educational benefits they offer, video games for children can also be a source of amusement that is both enjoyable and interesting. After a hard day at school, they can help children relax, and they offer a healthy outlet for youngsters to use to deal with stress and worry. However, parents are responsible for keeping a close eye on their children's use of video games and ensuring that the games their children play are suitable for their age and current level of development. They should also limit the amount of time spent in front of screens and encourage alternative types of play as well as physical activity. Children's video games have the potential to be an educational and developmental asset if they are played appropriately and in moderation.

The categorization of video games into various genres has been a significant aspect of game design and development. As a result, game categories have emerged based on common themes and mechanics. These categories have unique characteristics and are often associated with specific types of games. Adventure games, for instance, involve exploration, puzzle-solving, and storytelling, while sports games simulate real-world sports and allow players to control individuals or teams. In addition to these genres, there are also several classifications of educational games, depending on their educational scope (Breuer & Bente, 2010). Subject-

specific games are designed to teach specific subjects, such as math, science, or language arts. On the other hand, cognitive skills games aim to improve cognitive skills like memory, attention, and problem-solving. Social and emotional learning games are designed to teach social and emotional skills, such as empathy, self-awareness, and conflict resolution. Serious games, which aim to have a real-world impact, can teach players about social issues or train them for specific jobs. Furthermore, augmented, and virtual reality games use immersive technology to create engaging learning experiences.

The classification of educational games is crucial to their design and intended learning outcomes. This categorization ensures that games are not only engaging and fun for children but also educational and aligned with specific learning objectives. Moreover, game developers and educators must ensure that the design of these games is based on sound pedagogical principles, such as scaffolding and social learning theory, to facilitate effective learning. By considering these aspects, developers can create effective and impactful educational games for children.

The Influence of Genres of Theory on Educational Games

Video game design and production have been heavily influenced by several theoretical genres. To encourage desirable player behaviors and discourage undesirable ones, behaviorist principles from the field of psychology have been incorporated into game design. In video games, players are often rewarded for successfully completing missions and punished for failing to do so. Games that encourage players to experiment, investigate, and discover novel solutions to issues have been designed using constructivism, a learning philosophy that places a premium on active learning and problem-solving.

According to social learning theory, people pick up new skills by emulating the actions of those they see and trust. Games that promote cooperative play and player-to-player instruction are a common application of social learning theory in the video game industry. For instance, in a multiplayer game, players may need to work together to accomplish a common goal, or the game may have leaderboards and other social elements that foster friendly competition amongst players. According to the hypothesis of cognitive load, the human brain can only take in so much information before it becomes overwhelmed. Cognitive load is frequently employed in game design to strike a balance between difficulty and immersion.

A game could, for instance, start off easy and get progressively harder as the player makes progress. Video games may be a fun and effective learning tool for kids if they use social learning theory and employ scaffolded lesson plans. Motive and interest in learning can be boosted by using video games because of its ability to provide instantaneous feedback, individualization of content, and opportunity for mastery. Furthermore, video games can offer a risk-free setting where kids can hone their interpersonal and problem-solving abilities including communication and teamwork. Social learning theory and scaffolded teaching sessions in video games have the potential to be useful educational tools that can help kids learn and grow.

Comprehensive Review of Children Video Games

To create a suitable video game, several critical criteria must be considered. The game's content—storyline, characters, and themes—should be assessed (Clarke et al., 2017). At the same time, the game should be enjoyable and informative without violent or upsetting elements

that might be damaging to children (Kirsh, 2011). The game's mechanics and gameplay should be enjoyable and challenging for children, promoting skill-building and learning (Kulman et al., 2014). Furthermore, the game's visuals and music must be entertaining for young players. Parents and educators can assist children select educational games by using a complete game review method.

A game that focuses solely on remembering and comprehending objectives may not require players to apply or analyze the acquired knowledge (Arnab et al., 2015). Conversely, a game that concentrates solely on higher-level objectives, such as evaluation and creation, may not provide the necessary foundational knowledge to support these higher-level skills (Carvalho et al., 2015). By integrating the objectives of each level of Bloom's Taxonomy, educational video games can provide a comprehensive learning experience that promotes critical thinking and foundational knowledge (Forehand, 2010). In addition, by integrating educational objectives with Bloom's Taxonomy, game designers and educators can assess student learning more accurately and modify instruction as necessary. Bloom's taxonomy of objectives is a well-established educational framework that divides learning objectives into six levels: remembering, understanding, applying, analyzing, and evaluating. The taxonomy provides a clear and systematic method for organizing educational objectives, making it simpler for educators to plan instruction and evaluate student learning. Czauderna and Guardiola (2019) by using the Bloom Taxonomy to classify the objectives of educational video games, game designers and educators can ensure that the games provide a well-rounded learning experience.

This research chose three games for children aged 3-6 years old that are now accessible on the iOS Online App Marketplace as well as the Google Online App Marketplace. The categories are shown in Table 1. These games were given the names X, Y, and Z. The selection process was based on Bloom's goals. In only one nation, X has 8.54 million downloads, but Y has just 2.76 million downloads (Marko Dimitrievski, 2023). It is generally agreed that the Z game is now the video game that has the greatest level of popularity.

Table 1. Classification of Three Types of Video Game Content

	Adventure	Role play	Sports	Simulation	Construction
Remembering		X, Y, Z			X, Y, Z
Understanding	Y, Z		X	X, Y, Z	
Applying	X			Y,	Z
Analyzing	X, Y		X		X, Z
Evaluating					
Creating	Y			Y,	X, Z

These categories are not mutually exclusive, and many instructional games may fall under more than one. The educational games in this study are classified based on their design and process. A careful classification can reveal the distinguishing characteristics and traits that make them useful teaching tools. Understanding the entire process of educational games allows us to better examine their impact and potential to give children with meaningful learning experiences.

Other types of educational games are classified according to their instructional scope. Subject-specific games, cognitive skill-based games, social and emotional learning games, serious games, and augmented reality and virtual games are all examples of educational games. As shown in Table 2. These classifications will be compared and summarized using Bloom's educational aims as a foundation.

Table 2. Classification of Three Types of Children Video Game Themes

	Domain-specific	Cognitive skills	Social Emotion	Serious Games	Augmented and virtual reality
Remembering				Y	
Understanding	Y, Z	X, Y			Z
Applying			X, Z	Y	
Analyzing	Y	X, Y			
Evaluating		Z			
Creating	X				

While there are educational children's video games that focus on cognitive skill development, it is difficult to locate games that handle numerous issues holistically through analysis. However, via play, these games can significantly improve children's skills and support social-emotional development, as well as aid in the learning and consolidation of subject-specific knowledge. Thus, designing and developing educational and engaging video games for children is a hard but necessary undertaking that demands careful consideration of the target population and their learning needs.

In video games, Kapp (2012) has identified several essential components. These components consist of objectives, rules, conflict, competition, and cooperation, reward structures, feedback, hierarchical narrative, interest curves, aesthetics, and repetitive gameplay. Each of these components contributes significantly to the overall experience of a video game. Goals provide participants with a distinct sense of purpose and direction and motivate them to actively participate in the game (Hoffman & Nadelson, 2010). The rules establish the parameters within which participants must operate, laying the groundwork for conflict and competition to develop (Stenros, 2017). In turn, conflict generates tension and excitement, driving participants to compete against one another or collaborate to achieve a common objective (Barnett & Coulson, 2010). Reward structures and feedback help reinforce positive behavior and encourage players to continue playing, while levelled storytelling and interest curves maintain player engagement by providing a sense of progression and difficulty. Aesthetics are also essential because they contribute to the creation of a world that players want to explore (Kim & Lee, 2015). Repetition is essential to the success of video games because it enables players to hone their abilities and grasp the game's mechanics over time. Game designers can create engaging, challenging, and rewarding experiences for players of all ages and abilities by incorporating these various elements into their designs.

2. Applying the ADDIE Model for Effective Game Development

2.1 ADDIE Model

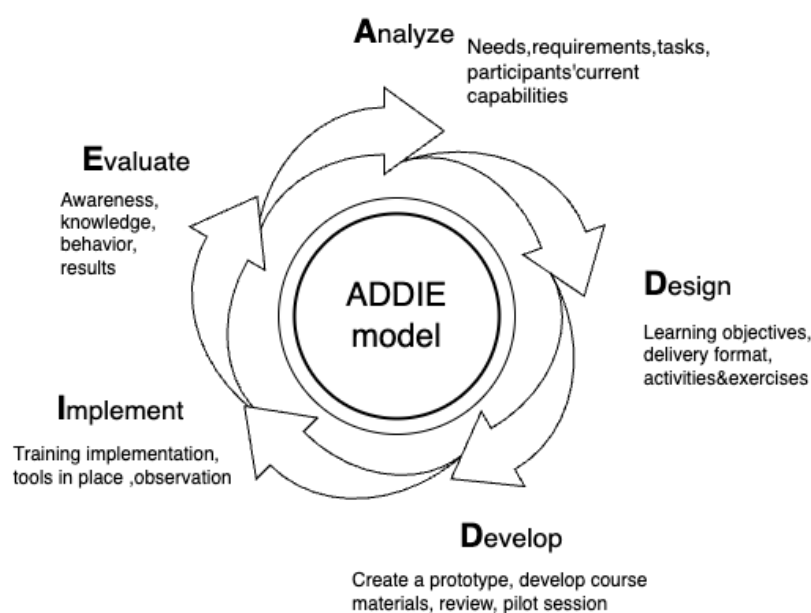
The ADDIE model is frequently used in instructional design and game development to ensure that the final product effectively meets the intended learning objectives. Analysis, Design, Development, Implementation, and Evaluation are the five phases of the ADDIE model, which provides a systematic approach to the design and development process (Davis, 2013; Muruganantham, 2015). Using this model, game designers can guarantee that the game is well-structured, meets the learning objectives, and is engaging for the target audience. The Figure 1. shows the ADDIE model's five phases: Analysis, Design, Development, Implementation, and Evaluation. Each phase of the ADDIE paradigm is crucial to game development success. Analyse the target audience, learning objectives, and needs. Design entails generating the game concept, mechanics, and a prototype. Game development includes programming, graphic design, and audio production. Implementation includes game launch, testing, and distribution. Finally, the Evaluation step evaluates the game's learning objectives and makes modifications depending on input. The ADDIE paradigm ensures that all aspects of game development are studied and addressed. It lets developers tweak and improve the game during development.


Figure 1: The ADDIE Model

The previous framework MDA (Mechanics, Dynamics, Aesthetics) was designed to analyse games, not necessarily to create them (Kim, 2015). These frameworks do not address specific aspects of game design beyond gameplay, they do not include telling a specific narrative, and they do not include having a completed story line, which emphasises the interplay between the game's laws (mechanics), the player's experience of playing the game (dynamics), and the player's overall emotional response (aesthetics). Another common game design paradigm is the LGD (Lean Game Design) framework, which emphasises quick iteration and feedback to develop a minimal viable product (MVP) before expanding the game (Coleman et al., 2014; Hyrynsalmi et al., 2018). Other models include the design thinking method and the human-centered design approach (Deterding et al., 2011).

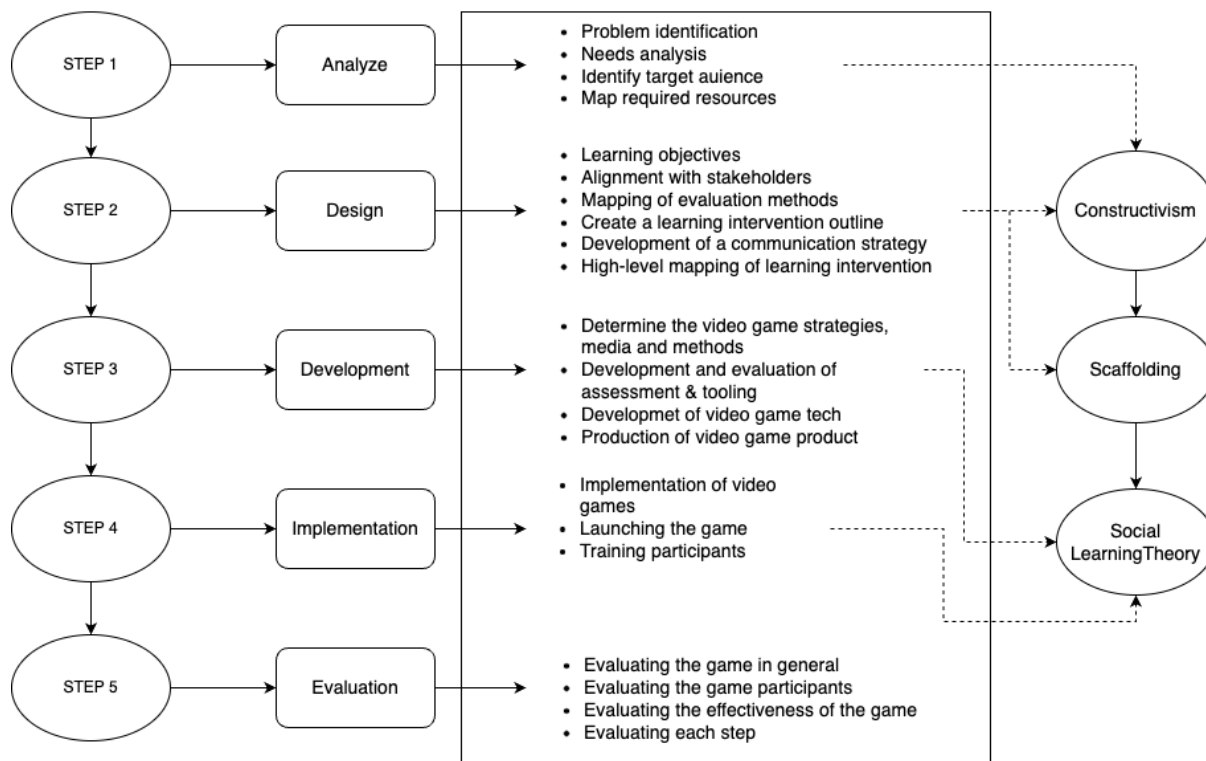
As illustrated in Figure 2., the ADDIE paradigm provides a systematic and structured approach to game development. This enables the unambiguous identification of goals and objectives. Provides a framework for team members to collaborate. Assists in ensuring that all components of the game are carefully planned and developed. Allows for more accurate evaluation and assessment of project progress.


Figure 2: The ADDIE Paradigm

Each step of the game design can be identified through the approach and methodology research design, as shown in the overall flow diagram in Figure 2. Explain how the ADDIE model can be carried out at each stage of video game design. and how theory can support video game design. Constructivism can be applied to all stages of game creation as defined by the ADDIE model, although it is essential during the Analysis and creation stages. Game designers can identify the skills and knowledge that players need to gain during Analysis, and they can create learning experiences that enable players to construct their understanding of the subject during Design. In the ADDIE-structured game design development phase, scaffolding theory plays a role. During this stage, game designers build learning experiences that steadily increase in difficulty while giving support and advice to assist players in acquiring and mastering new skills. Social learning theory can be applied to several stages of ADDIE-framed game design, most notably the Development and Implementation stages. Game designers can construct multiplayer games that enable players to interact and learn from one another during development. Through online forums and social media, game designers can give opportunities for players to share their experiences and learn from one another during implementation.

2.2 ADDIE Model in Game Design Process

The ADDIE model is a methodical approach that ensures that the game is built with a clear goal in mind and that it satisfies the intended audience's needs. Braad et al. (2016) study in

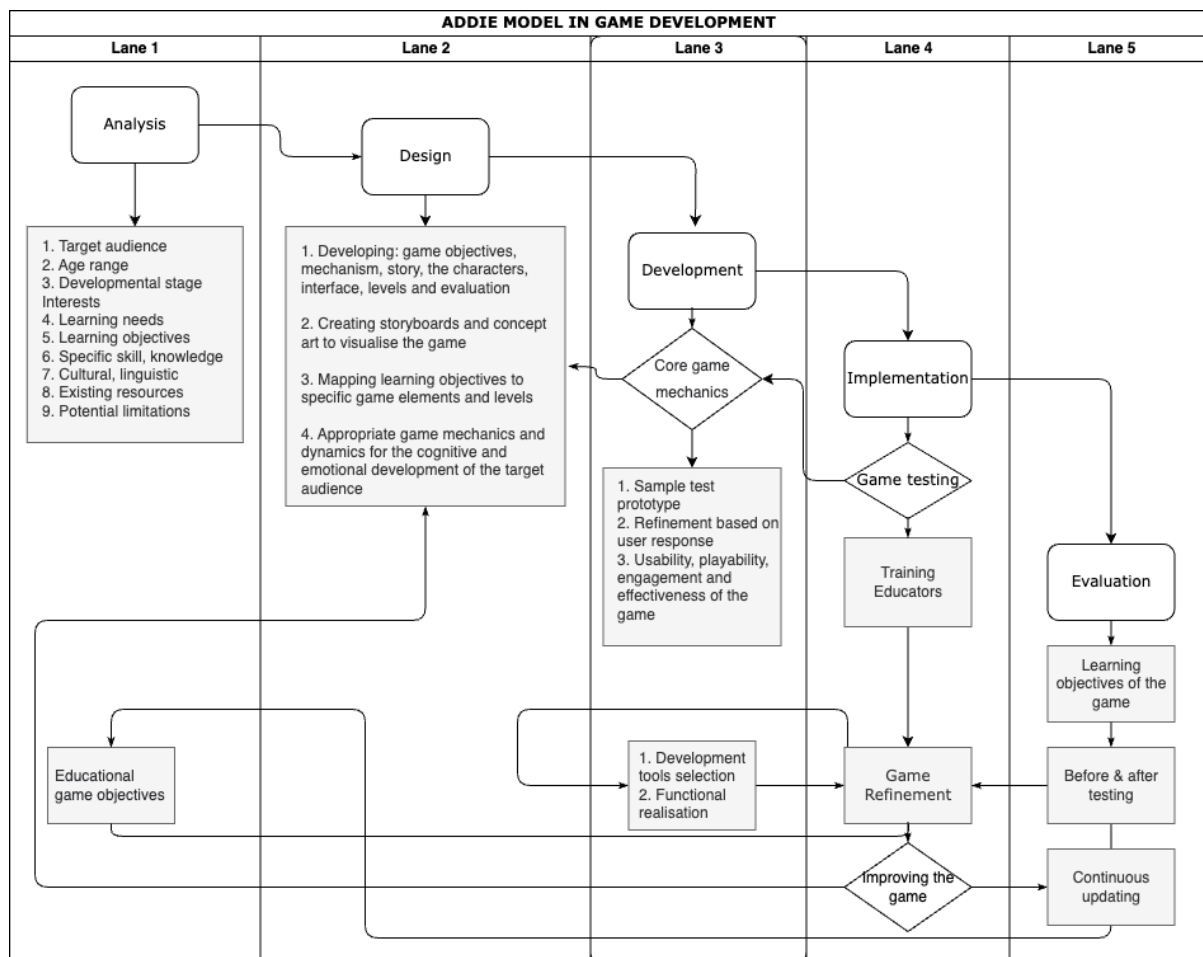
game design and found the ADDIE model is critical in the game development process since it provides an organized approach to game creation. It aids in the identification of learning objectives, target audiences, and game mechanics to meet the objectives. The methodology also ensures that the game's design is based on research-based best practices for learning and engagement. Using the ADDIE paradigm, game designers can construct effective and interesting games that meet their targeted learning goals. Figure 3. illustrates the ADDIE model's connections throughout the game design process.


Figure 3: The ADDIE Game Design Process

A box represents each step in the process, and the arrows indicate the flow of the process from one step to the next. The game designer will evaluate the game's intended players and any pedagogical or educational aims that must be met. The game designer then draws out a plan for the game, complete with all the features discovered in the analysis stage. The development process for a video game starts when its blueprint has been finalized. The development stage is where the game's code and mechanics are written and refined. All the game's mechanics and difficulty settings are fine-tuned and tested for any remaining issues during this phase. The ADDIE methodology culminates in an assessment phase in which the designer determines whether the game was successful in teaching the intended lessons. The ADDIE model is a useful framework for makers of educational games who want to maximize its impact.

Conclusion

Educational games can be a fun and efficient method for children to learn essential concepts and abilities. By employing the ADDIE model to the game development process, designers can ensure that the game is created with clear learning objectives in mind and that its content, mechanics, and activities are aligned with these objectives (Kapp, 2012; Lim et al., 2013). We saw the possibilities of applying the ADDIE model to drive the game production process, as well as analyzing how different design frameworks such as constructivism and scaffolding might be utilized to improve learning results, after analyzing three instances of educational games. The study emphasizes the relevance and breadth of designing educational games with children's specific needs and features in mind, as well as ensuring that games match educational objectives and learning results. The ramifications of this study extend to game creators and educators, as successful deployment of educational games can improve learning quality and classroom engagement. Finally, the development of educational games for children has considerable promise for boosting learning quality and classroom engagement. Developers can create learning games that are both interesting and effective by utilizing design frameworks such as the ADDIE model, constructivism, and scaffolding.

How Does Adult Learners' L1 Interact With Word Frequency in the Error Rates and Patterns of L2 Classifier Use: A Cross-Linguistic Comparison

Kun Yu, The Hong Kong University of Science and Technology, Hong Kong SAR
Yin-To Chui, The Hong Kong University of Science and Technology, Hong Kong SAR

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Previous literature has reported mixed findings on the effect of L1 (classifier languages vs non-classifier languages) on the acquisition of L2 classifiers. This study aims to investigate whether any effect of L1 may be modulated by the word frequency of the target classifiers. Chinese classifiers were categorized into pre-established frequency bands A to C in descending order of word frequency, and learner data was extracted from the HSK Dynamic Composition Corpus containing sentences with classifiers written by L1-Korean and L1-English learners, with a total of 5248 sentences analyzed. Two native Mandarin speakers reported the error rates, and errors were also further categorized into four different types (i.e. misuse, omission, overuse, misorder) to investigate any differences in error patterns across different L1 groups. Results showed a significant interaction between L1 and classifier word frequency, with comparably low error rates for both L1 groups on high-frequency classifiers, but a significantly higher error rate for L1-Korean learners on low-frequency classifiers. Aligned with exemplar theory, more frequently encountered classifiers may have a relatively robust representation in the mental lexicon for both L1 groups, as opposed to the less stable representation for less-frequently encountered classifiers which are more prone to transfer effects from L1 to L2.

Introduction

Previous literature has reported mixed findings on the effect of L1 (classifier languages vs non-classifier languages) on the acquisition of L2 classifiers. This study aims to investigate whether any effect of L1 may be modulated by the word frequency of the target classifiers.

Classifiers can be defined as "morphemes that classify and quantify nouns according to semantic criteria" (Senft, 2000). They are common in East Asian languages such as Mandarin Chinese, Japanese, and Korean, but are absent in most European languages. One example of a Mandarin classifier is *tiao2*, a mandatory grammatical unit between a number/determiner and a head noun that describes the noun as being a thin one-dimensional object (e.g. *yi4 tiao2 xian4 [a-CL-line]*). Another noteworthy classifier in Mandarin Chinese is *ge4*, a generic classifier that can be used with 40% of common nouns and which is often overused by both L1 and L2 speakers of Chinese (e.g. Zhang, 2007).

L1 Effects on the Acquisition of L2 Classifiers

An early hypothesis was that L1-speakers of a classifier language (e.g. Japanese, Korean) may learn L2 classifiers better than those of a non-classifier language (e.g. most European languages) by means of positive transfer. However, studies yielded mixed findings (e.g. Polio, 1994; Paul & Grüter, 2016). For example, Polio (1994) tested the use of Chinese classifiers by L1-English and L1-Japanese intermediate learners of Chinese. In their study, production data was elicited where participants narrated a story after watching the Pear Film. Results showed that although both groups of learners did not avoid using classifiers generally, no L1 effect was found.

Later studies have found that the existence of an L1 effect might depend on additional factors, such as learner proficiency of the target language and the actual linguistic task used. In terms of proficiency, Liang (2008) tested L1-English vs L1-Korean learners' use of eight Chinese shape classifiers on an object-classifier mapping task (e.g. *tiao2* for a one-dimensional object, *zhang1* for a two-dimensional object) across three proficiency levels (i.e. advanced, intermediate, beginner), and found that both Korean and English groups performed similarly at the beginner and advanced level, and a group difference was found only for the intermediate level, suggesting that any effect of L1 might be sensitive to where the learners are on their developmental path of L2 acquisition. In terms of task, Zhang & Gnevsheva (2022) compared L1-Japanese learners (classifier language) against L1-English and L1-Arabic learners (non-classifier languages) at the intermediate level, using three written tasks based around a description of the same picture – short composition, free-cloze, and multiple-choice cloze. The short composition was aimed at capturing naturalistic use of classifiers, while the two cloze tests captured compulsory application of classifiers in a more constrained manner. Results showed that L1-Arabic learners performed significantly worse than L1-Japanese learners only in the free-cloze test but not the composition task, suggesting that the effect of L1 might be sensitive to the actual task used for testing, and that learners might have used test-taking strategies (e.g. avoiding use of difficult classifiers) in certain tasks (e.g. composition) that led to an inflation of accuracy score. Both of the above results advanced our understanding that the effect of L1 (classifier vs non-classifier language) might be modulated by previously under-examined factors.

Importantly, Zhang & Gnevsheva (2022) also tested a hypothesis as to whether the types of classifiers themselves might modulate the effect of L1. Based on a typology by Gao and Malt

(2009), classifiers were categorized based on association with their head nouns – shape, animate, inanimate, and concept. For example, animate classifiers categorize animate nouns according to size and shape, and inanimate classifiers categorize inanimate nouns according to their function. Although results did not reach significance, a numerical trend was found where L1-English and L1-Arabic speakers performed disproportionately worse on concept classifiers than other types of classifiers.

Frequency Effects, and an Exemplar Account of Lexical Acquisition

As far as classifier type – as well as its potential interaction with L1 – is concerned, we put forward the hypothesis that the *word frequency* of the classifiers could be a potential interacting factor instead. At least two pieces of evidence may substantiate this claim. First is the observation that the typology of classifiers (based on association with head nouns) might be confounded with word frequency. For example, concept classifiers such as *cheng2* (associated with the concept of probability; e.g. *yi4 cheng2 sheng4 suan4 [1-CL-probability of winning]* often occupy the low frequency bands of Chinese word usage, in a classification of Chinese word/character frequency data officially published by the Ministry of Education of the People's Republic of China (Hanban, 2001).

Second, the construct of word frequency is closely tied to the exemplar theory of language processing that has become increasingly influential over the past two decades (Ambridge, 2020). The exemplar theory was proposed in response to the inadequacies of traditional abstractionist models that dominated the field in the 20th century, and has received support from fields encompassing phonological, lexical, and syntactic processing. It posits that instead of abstracting basic phonological/lexical/phonological units, learners store all instances of linguistic exposure in their episodic memory which subsequently alter their own usage of different sounds/words/grammatic structures. For example, listeners may not just abstract stable phonological word forms in the mental lexicon because recently heard exemplars will alter their own production and usage (Pierrehumbert, 2001). Crucially, in lexical acquisition, it has been found that novel words that are phonological neighbors of high-frequency words (i.e. more exemplars) were accessed faster than novel words that are neighbors of low-frequency words (Vitevitch et al., 2014). One possibility proposed by the authors of that study was that neighbors of high-frequency words have more exemplars to "latch on" to in memory. It is thus reasonable to assume that high-frequency words have a more stable representation in the lexicon *by means of* all the exemplars stored in memory.

Thus, for our current study, we suspect that L1 effects on the acquisition of Chinese classifiers might be similarly modulated by the word frequency of target classifiers, as high-frequency classifiers have a more stable representation across learners of different L1s and may have a low error rate that is comparable across L1 groups, while the representations for low-frequency classifiers are more transient and an L1 group difference may emerge.

Methods

Chinese classifiers were categorized into pre-established frequency bands A to C in descending order of word frequency, following the official statistics published under the Ministry of Education of the People's Republic of China (Hanban, 2001). This resulted in a total of 49 Band A classifiers, 42 Band B classifiers, and 20 Band C classifiers. Example classifiers for each Band are listed in Table 1 below.

Band A	Band B	Band C
ben3[本]	*zhu1* [株]	*juan3* [卷]
feng1[封]	*shou3* [首]	*ding3* [顶]
tiao2[条]	*fen4* [份]	*zhan3* [盏]
zhang1[张]	*duo3* [朵]	*xiang1* [箱]
zhi1[支]	*bu4* [部]	*cheng2* [成]

Table 1: Example classifiers from each frequency band

Learner data was extracted from the HSK Dynamic Composition Corpus which contains over 10,000 HSK composition papers of foreign exam takers. We extracted sentences with classifiers written by L1-Korean and L1-English (aggregate data from US, UK, Australia, Canada) learners. Because of the special status of *ge4* as a generic classifier that can be associated with over 40% common nouns and tends to be overused even by L1-Chinese speakers, we opted to omit *ge4* in our search.

Two native Mandarin speakers reported the error rates. Accuracy was binary-coded (1 for correct, 0 for incorrect). A sentence was considered to have a classifier error if it conformed to one of four conditions: 1. Misuse, where an incorrect classifier was substituted for the correct one; 2. Omission, where a classifier was omitted when it was required in the sentence; 3. Overuse, where a classifier was added when it should not; 4. Misorder, where a correct classifier was used but placed in the wrong position in the phrase. Results yielded an 85% inter-rater reliability. Only target sentences for which the raters agreed on the error status were included in subsequent analysis. This yielded a total of 5248 target sentences.

Results and Discussion

Figure 1 shows the overall group results. General observations reveal comparable error rates for L1-English and L1-Korean learners on high-frequency classifiers, but perhaps unexpectedly, a *higher* error rate for L1-Korean learners than L1-English learners on low-frequency classifiers.
Figure 1: Proportion of overall classifier errors by L1-English and L1-Korean learners

A 2 (L1: Korean vs English) x 2 (Frequency: High vs Low) ANOVA conducted on the error rates confirmed this trend. We found a significant main effect of L1 [$F(1,5244) = 6.62$, $p = .01$], with L1-Korean learners making more errors than L1-English learners. Expectedly, we also found a significant main effect of frequency [$F(1,5244) = 98.12$, $p < .001$], with more errors on low-frequency classifiers than high-frequency classifiers. Crucially, the interaction between L1 and Frequency was significant [$F(1,5244) = 14.66$, $p < .001$], suggesting that the L1 effect was different for high-frequency vs low-frequency classifiers. Separate analyses showed an L1 effect for low-frequency classifiers only [$t(285.1) = -4.24$, $p < .001$] and not for high-frequency classifiers [$t(871.5) = -0.89$, $p = .375$], with L1-Korean learners performing *worse* than L1-English learners on low-frequency classifiers.
Figure 2: Classifier error patterns for L1-English and L1-Korean speakers

Figure 2 further broke down the errors into the four error types (i.e. misuse, omission, overuse, misorder). Results seem to reveal a slight tendency to *omit* classifiers for L1-English learners, as opposed to a tendency to *overuse* classifiers for L1-Korean learners.

Overall, the results confirm our prediction that word frequency of classifiers plays a role in modulating the effect of L1 (classifier vs non-classifier language) in the acquisition of L2 classifiers. In particular, both L1 groups maintained a relatively low and comparable error rate for high-frequency classifiers, suggesting that the high-frequency classifiers may have occupied a more stable representation in the mental lexicon of both L1 groups and are more resilient to errors. For low-frequency classifiers, somewhat unexpectedly, L1-Korean learners performed worse than L1-English learners. This means that the interaction could *not* result from a positive transfer for L1-Korean learners and they did not manage to leverage existing knowledge about classifiers to acquire L2 classifiers that are less frequently encountered and thus may have a less robust representation. One possibility is that perhaps due to a lack of classifiers in their L1 inventory, L1-English learners might be more cautious in applying them in written sentences (indeed, we found a smaller number of sentences in L1-English data than L1-Korean data), while L1-Korean learners may be free from this constraint given the familiarity of classifiers in their L1 system, using them even erroneously. A second possibility, as revealed in Figure 2, is that the transfer from L1-Korean classifier system to

L1-Chinese classifier system may not be always positive. Since Figure 2 shows a tendency of L1-Korean learners to overuse classifiers, it may be the case that the L1-Korean learners have erroneously used classifiers that are present in Korean but not in Chinese.

Conclusion

The present study showed that an L1 effect (classifier language vs non-classifier language) exists for the acquisition of L2 classifiers, but is modulated by the word frequency of the target classifiers, with an L1 group difference emerging for low-frequency classifiers only. While the present study proposed explanations for the counter-intuitive trend of L1-Korean learners performing worse than L1-English speakers in terms of constraints of usage, or specific error patterns like overuse of L2 classifiers, further empirical research is needed to compare different classifier-L1s (e.g. L1-Japanese vs L1-Korean) in the acquisition of L2-classifiers across different word frequencies in order to confirm whether the transfer effects are universal to classifier languages or specific to Korean.

Official Conference Proceedings

Abstract
This study aimed to explore how to design teaching materials for the On-Demand Classroom within the context of the Thailand Lesson Study incorporated with Open Approach. Employing a qualitative research methodology, this research involved thirty-one elementary school students and a lesson study team comprising mathematics teachers, researchers, and mathematics and art educators. Data collected from the process of the Thailand Lesson Study incorporated with Open Approach – Collaboratively Plan, Do, and See. Besides these processes, Blended Learning Classrooms, On-Demand Classroom, and Virtual Live Classrooms have been employed. The results revealed that during the collaborative planning process, the LS team designed teaching materials for the On-Demand Classroom, including an on-demand video containing a problem situation, introducing the materials and detailed box assembly instructions, worksheets, and clear guidelines for work submission. Besides, the Problem Situation in the ODC video was meticulously crafted in alignment with 1) Context, which overlaps with the student's experiences and is essential to coping with and engaging Problem Situation, in this study where the box exists daily. 2) Condition, which is the various forms of instruction that play a critical role in supporting students to connect with the PS to cultivate self-learning, students must create a box and unravel it or create it themselves.

Keywords: Teaching Material, On-Demand Classroom, Thailand Lesson Study Incorporated With Open Approach

Introduction

The COVID-19 pandemic has disrupted education worldwide, leading to the closure of educational and other institutions. Many countries have adopted distance communication to address this, yet most countries encounter obstacles like insufficient infrastructure and limited access to computers and the Internet (Tadesse & Muluye, 2020). In Thailand, the sudden closure of educational institutions raised concerns about the continuity of learning for students at all levels. It was a crucial measure implemented to prevent the outbreak's spreading (Ministry of Education, 2022). While this process was essential for public health, it also brought significant challenges and disruptions to the education sector. The abrupt shift from face-to-face classroom learning to remote learning posed challenges for students, teachers, and parents alike. Notably, the transition to online learning highlighted existing disparities in access to technology and internet connectivity among students, particularly in rural and underserved areas (World Bank, 2021).

Even though learning has changed to distance learning, the ways to approach it are not as effective as studying in an actual classroom setting. This led to the challenge of student learning; some could not reach distance learning because of their economic affordance, staying home for a long time, affecting student learning efficiency, etc. Most educators and stakeholders seek to address this challenge.

However, in addressing this challenge, there is the impracticality of exclusive points out it was not practical to choose solely between online or on-site learning (Ohara, 2020). Notably, Inprasitha (2021; 2023) underscores the importance of effective blended learning, emphasizing the delicate balance between students' self-study time and their interactions with teachers and peers, and proposes the Blended Learning Classroom (BLC) as a teaching approach to address this challenge to improve students' self-regulated learning experiences and engagement by utilizing the Thailand Lesson Study incorporated with Open Approach (TLSOA) model (Inprasitha, 2006; 2011; 2022). As in the BLC model, the on-demand classroom, which contains problem situations in video format, is a critical component that allows students to engage in self-directed learning at their convenience (Inprasitha, 2023a). The problem situation, as designed in the video, plays a critical role in guiding students' self-directed learning and cultivating their ability to formulate and address their problems (Isoda & Katagiri, 2012). Understanding how to design problem situations within the ODC is a central focus of this study. Thus, this research aimed to explore how to design teaching materials in the On-Demand Classroom (ODC) within the context of TLSOA.

Teaching Material

Teaching Material is a meticulously designed lesson plan centered on designing problem situations derived from textbook translation projects of the Center for Research in Mathematics Education (CRME). Prioritizing problem-solving aims to foster the development of student's critical thinking skills by providing them with opportunities for independent thought. Aligned with Inprasitha (2016), a problem situation consists of two crucial components: context and condition. (1) Context: the segment intersecting with learners' direct experiences emerged as a meaningful anchor, particularly when students grappled with tasks, assignments, or problem situations. (2) Conditions: Encapsulated in concise instructions with "keywords," they played a pivotal role in accessing students' conceptualizations, enhancing their ability to navigate and effectively engage with future problems.

Thailand Lesson Study Incorporated With Open Approach (TLSOA)

TLSOA is an implementation model that integrates the Open Approach, a teaching approach for teaching mathematics problem-solving, with Lesson Study processes, and this model serves as a guideline for the school-based professional development of teachers (Inprasitha, 2015; 2022) (Figure 1).

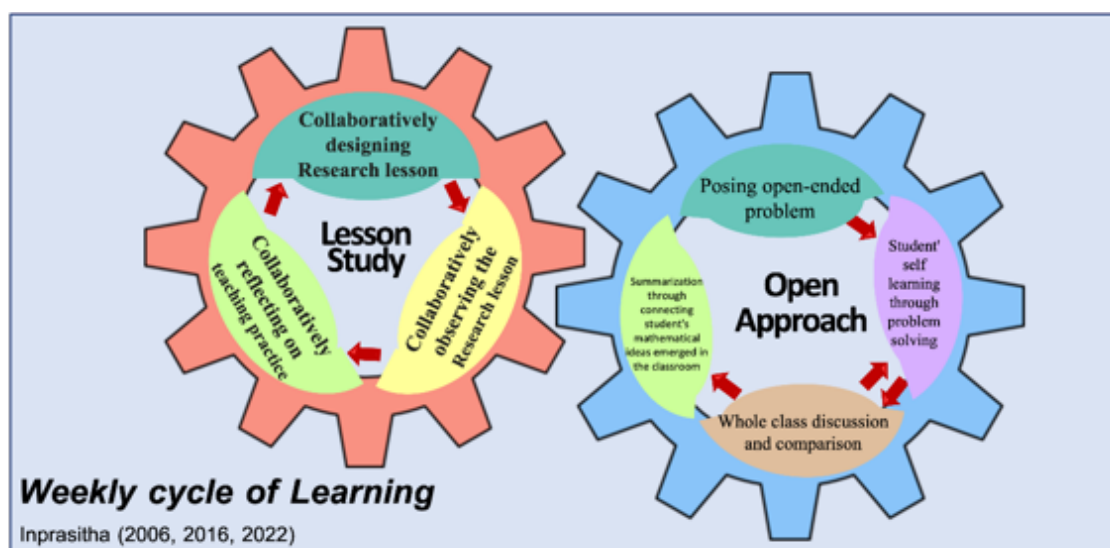
Lesson Study refers to a process/approach that is focused on collaboration among teachers to improve their own and their peers' teaching practices through a constructed cycle to enhance and develop teachers' learning process and professional growth, directly impacting student learning development it consists of three steps as follows (Inprasitha, 2006; 2016; 2022). (1) Collaboratively Plan (Plan): The lesson study team designs the lesson plan and its critical components, such as problem situations (Inprasitha, 2016; 2019), designing teaching material, anticipating students' problem-solving and difficulties toward designed problem situations, and other necessary. (2) Collaboratively Do (Do): one of the lesson study teams implements the planned lesson from Step (1) with the OA as a teaching approach (Inprasitha, 2011; 2015; 2022), and the rest of the members observe the learning activities, prioritizing students' learning process. (3) Collaboratively See (See): conducted once a week as a weekly cycle to discuss the process that they have done during steps (1) and (2), such as the student learning process, the objective(s) of the lesson, the anticipated ideas, and the ideas that take place during step (2), the design of teaching material, etc. (Inprasitha, 2011, 2022). This step makes the TLSOA distinct from other models that, rather than immediately post-lesson as practiced in the Japanese Lesson Study and other countries, focus intensively on the details of the quality of the lesson itself as Inprasitha (2023b).


Figure 1: Weekly cycle of Learning based on the concept of Inprasitha (2006, 2016, 2022)

The Open Approach is a teaching approach that emphasizes problem-solving and utilizing open-ended problem situations to encourage students to pose and solve their problems. It is more centered on process-oriented outcomes. As well as emphasizing the student learning process, this approach consists of four steps (Inprasitha, 2006; 2011; 2022):

(1) Posing open-ended problems: teachers propose the problem situation with the foundation of problem posing and solving, and students are motivated in problem situations and take a problem to themselves (Problematics).

(2) Students' self-learning: students will individually/group solve the problem and later share every single thought in the group to come up with the group ideas, and the teacher will turn his/her role to observing students' problem-solving and jotting down their ideas – similar to the idea of Kikan- shido or the between desk instruction.

(3) Whole-class discussion: students present their ideas to the whole class, and in this process, students ask questions to the presenter and discuss the idea together the responsibility of the teacher during this step is to guide mathematical discussions following each student's solution or ideas presentation.

(4) Comparison and summarizing by connecting students' mathematical ideas: from step (3), teachers and students collaboratively compare and summarize each idea or solution to develop the class ideas and learn "how to" learn.

On-Demand Classroom (ODC)

The On-Demand Classroom (ODC) is a crucial component within the Blended Learning Classroom (BLC) model (Inprasitha, 2021; 2023a), as shown in Figure 2. In this approach, the ODC focuses on fostering informal learning, where students independently engage with educational content based on the context and conditions of tasks or problem situations provided by their teachers. Unlike traditional classrooms, ODC does not require students to schedule appointments with their teachers, enabling them to manage their learning time independently.

Within the BLC model, which also includes the Visual/Virtual Live Classroom (VLC) and the Face-to-Face Classroom (FFC), the ODC stands out as a platform for self-directed learning. Students are encouraged to navigate their learning journey without fixed timelines, allowing flexibility and adaptability. This emphasis on independence aims to empower students to take control of their education, aligning with the broader goals of the BLC model.

The ODC, as part of the BLC model, plays a crucial role in the paradigm shift from a dichotomy of online versus onsite learning to a more nuanced blend of self-learning and interaction. Blended Learning (BL) in this context is defined as the harmonious integration of self-learning and interaction learning and the synthesis of live and on-demand teaching approaches. This strategic combination forms a new extended classroom learning approach designed to seamlessly merge students' self-directed learning with interactive elements, promoting active learning.

Inprasitha (2023a) findings highlight the effectiveness of blending ODC, VLC, and FFC components within the BLC model. This combination offers students flexibility, accessibility, and diverse learning experiences. The approach accommodates various learning styles, enhances student engagement, and caters to individual needs. However, the specific blend and implementation of these approaches may vary based on subject matter, learning objectives, available resources, and student and teacher preferences. The ODC, within this framework, emerges as a dynamic and adaptable space that empowers students to become active participants in their educational journey.

Figure 2: Blended learning classroom (BLC) teaching approach (Inprasitha, 2021; 2023)

Research Methodology

Research Context

The participants comprised The Lesson Study team, which consists of twelve members: one mathematics teacher, three mathematics education researchers, three art teacher educators, and five mathematics teacher educators. Additionally, thirty-one upper elementary students from a northern Thailand school are participating in this study. This school was selected because it has been implementing the TLSOA (Inprasitha, 2022) as school-based professional development and is familiar with this approach.

Research Procedure

Before the program commenced, ethical approval for research was secured from the supervising board. Participants, having read the information, agreed to partake in the program.

Several data collections were recorded in audio and video formats. The video, audio recording, and lesson plan were used as research instruments. The data was collected from students' written worksheets, video recordings in the virtual live classroom, observational recordings, Interviews, field notes, and post-lesson discussion transcripts.

Data Collection and Data Analysis

The research methodology was a qualitative method based on lesson study processes, and the data were analyzed employing a qualitative method (Creswell & Creswell, 2022). Descriptive analysis was applied to interpret the data. The data from the first step of the Lesson Study in the TLSOA model (Inprasitha, 2022) were interpreted considering the framework for designing the problem situation (Inprasitha, 2016). The data was collected from students' written worksheets, video recordings in the virtual live classroom, observational recordings, Interviews, field notes, and post-lesson discussion transcripts. The data provides a comprehensive view and ensures accuracy through triangulation.

Result and Discussion

This study was conducted within the context of the TLSOA and focused on collaboration between teachers to improve their own and their peers' teaching practices through the Plan, Do, and See (Inprasitha, 2006; 2016; 2022), which was divided into two cycles, consisting of: Cycle of Lesson Study 1 (LS1): The LS team designs problem situations for the ODC with

steps 1-2 of the OA. and brings ideas that arise in class to analyze students' ideas and find guidelines for designing teaching in the next session. Cycle of Lesson Study 2 (LS2): Based on reflections in Cycle 1, the LS team used student ideas to design problem situations in Cycle 2 for the VLC/FFC with 4-step OA, as shown in Figure 3.

Cycle of Lesson Study 1

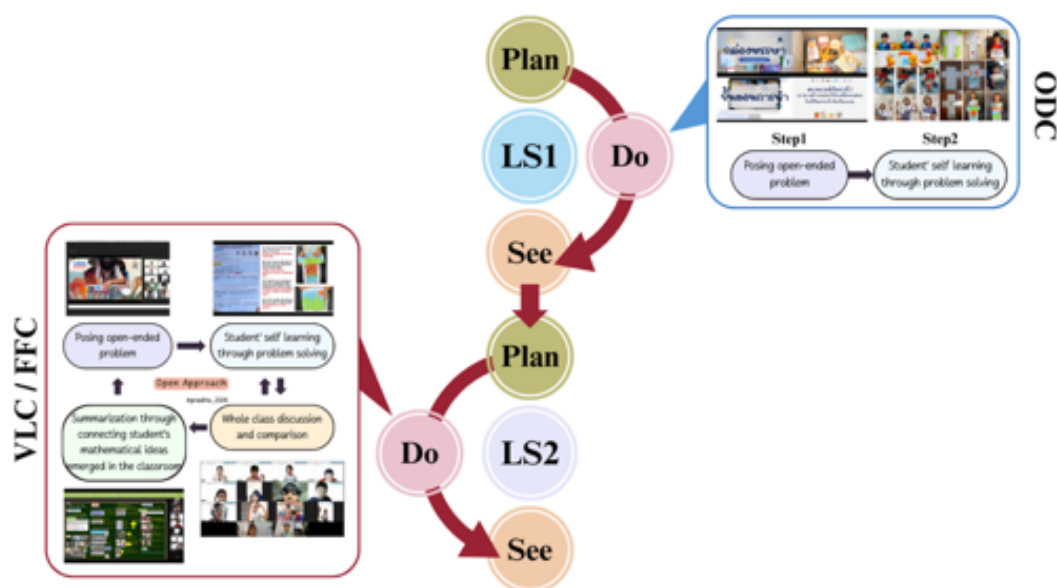
Within the first step – Collaboratively Plan, the lesson study team meticulously designed the students' learning activity, such as teaching materials and problem situations, emphasized the real-world context of students, and incorporated diverse perspectives in the psychomotor domain. This study's lesson plan is centered on crafting a joyful box to enhance students' spatial awareness by navigating between three-dimensional and two-dimensional concepts. The problem situation was separated into two problem situations. The first problem situation presents the task, "Let's create a box similar to those we encounter in everyday life." The conditions students are required to 1) trace each side of a box, 2) cut out the traced sides, 3) join each side together using adhesive paper, and 4) embellish the assembled structure to make it aesthetically pleasing. The second problem situation challenges students to consider the practicality of their creation by asking, "Can the crafted pieces be assembled into a functional box?" The condition is to let students construct a complete box from the pieces they have prepared (Figure 4).


Figure 3: The cycle of Lesson development

Figure 4: Problem Situation, Condition and Anticipating Student Ideas

Collaboratively Do

Students' Ideas Form ODC

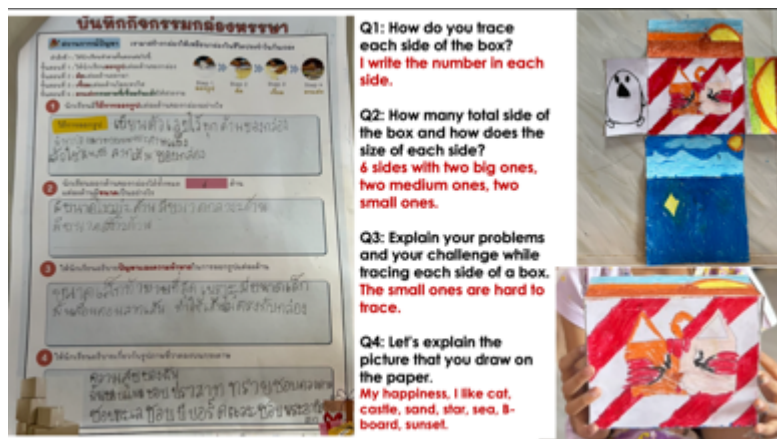
Through the activity, students demonstrated their ability to identify connections between two-dimensional and three-dimensional shapes. They successfully recognized relationships between the number of edges and faces. Furthermore, they showcased their creativity by constructing narratives on the unfolded box's faces through drawing and coloring, as shown in Figures 5 to 7.


Figure 5: Student worksheet from ODC (1)
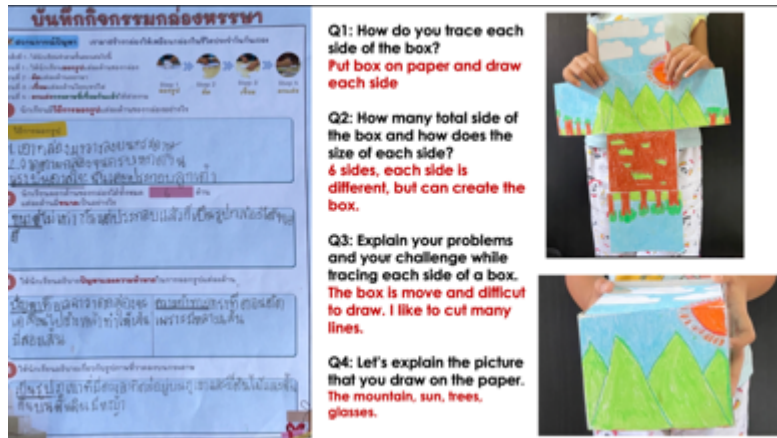

Figure 6: Student worksheet from ODC (2)
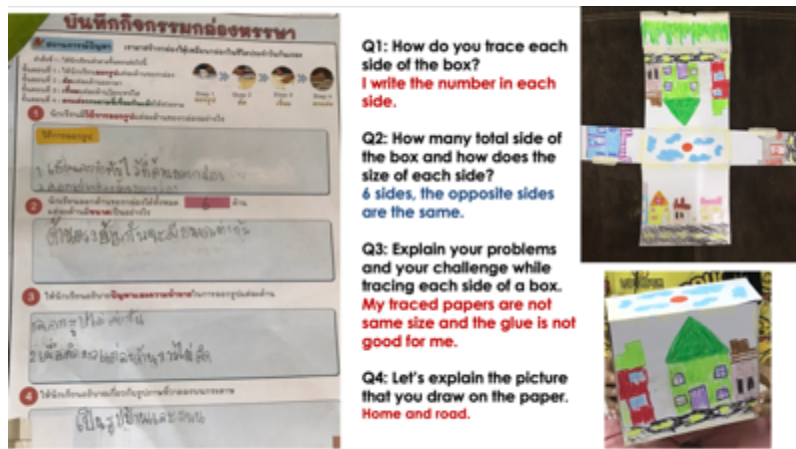

Figure 7: Student worksheet from ODC (3)

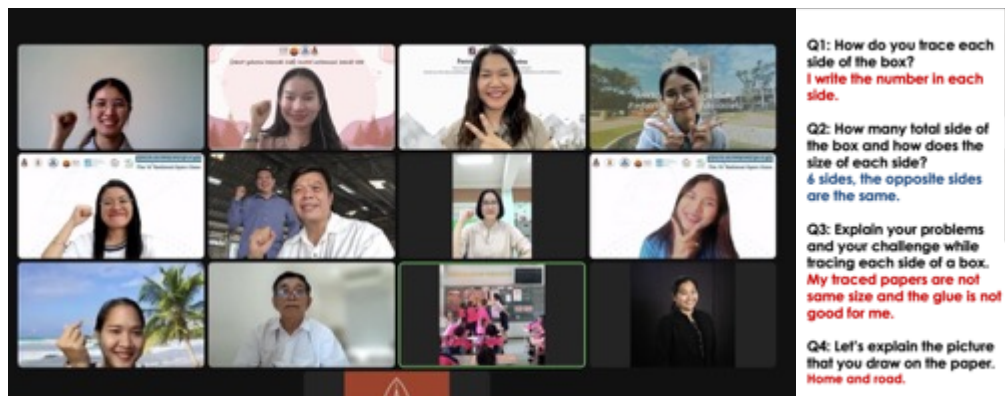
Taking the ideas generated from the students' preferences in the classroom, grouping them, and analyzing them to formulate questions for collaborative discussions in a virtual classroom has revealed that the questions elicited responses in the direction anticipated by the team (See Figure 8).


Figure 8: Collaboratively See and Questions

Students feel very confident in themselves and appreciate sharing their ideas in the classroom and appreciate others' ideas, as shown in Figure 9.

Figure 9: Student worksheet from VLC

Result ODC: Teaching Materials

The Lesson Study team responded to this challenge by creating a comprehensive set of teaching materials for the ODC. These materials included a box kit, an on-demand video, a worksheet, and a teaching guideline. The on-demand video introduced the necessary materials and provided step-by-step instructions for creating the box. Importantly, these teaching materials were deployed within the ODC, enabling students to engage in self-directed problem-solving in the comfort of their homes (Figure 10).

Result VLC: Teaching Material

Furthermore, the outcomes extended into the Virtual Live Classroom (VLC), where students' written works and assignments from the ODC (Figure 11) were utilized as additional teaching materials. This collaborative approach facilitated dynamic interactions between the teacher and students as they collectively presented and discussed ideas. Notably, students reported heightened confidence in expressing their thoughts and showed appreciation for both sharing their ideas and valuing others' contributions.

The results demonstrate successfully integrating carefully designed teaching materials into both the On-Demand and Virtual Live Classrooms. The multi-faceted approach enhanced students' problem-solving skills and fostered a sense of confidence and collaboration within the learning community.

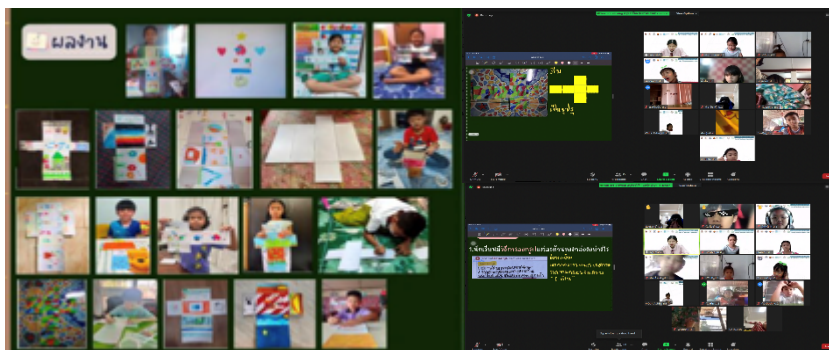
Figure 10: A comprehensive set of teaching materials for the ODC


Figure 11: students' written works and assignments from ODC

Conclusion

This study has shed light on the pivotal role of problem situations within the On-demand classroom (ODC) and the effective integration of innovative teaching approaches. The Lesson Study team designed problem situations for the On-Demand VDO, drawing upon the TLSOA principles (Inprasitha, 2022) and Problem Situations, which emphasized the crucial elements of Context and Conditions (Inprasitha, 2016).

The focus on Context and Conditions extended into the design of teaching materials within the ODC, aligning with the TLSOA implementation model. Integrating the BLC model, coupled with the collaborative efforts of a Lesson Study and an Open Approach, emerged as a potent combination. This synergistic approach not only heightened students' engagement in problem situations but also facilitated diverse modes of communication, including written work, visuals such as pictures and clips, and verbal articulation.

Official Conference Proceedings

Abstract

This study employed a blended learning approach, integrating a microlearning module on 'Change Management' into an undergraduate business course curriculum in the United Arab Emirates. This context being of interest because of the high 'Uncertainty Avoidance' dimension typical of the predominant Arab culture in the country. The study therefore, aaddressed the question of student adaptability and requisite support required for a successful blended learning experience in this cultural context. A cross-sectional survey was conducted with a sample group of 40 undergraduate students. A qualitative thematic analysis was applied, using Hofstede's cultural dimension of 'Uncertainty Avoidance', to measure student preference for either a structured or flexible learning environment. That methodological approach captured rich description from feedback, which allowed for an in-depth understanding of students' learning preferences and experiences with the micromodule. The study contributes to the field of academic knowledge about the influence of a cultural dimension for learner engagement. The dual value for teaching praxis from this study is firstly, consideration for the implemention of learning technology in international business classrooms and secondly, the implications of the introduction of pedagogical innovation for students in a nation experiencing rapid changes in both educational and economic spheres. The outcomes of this study provide insights into the practical application of rapid eLearning tools, offering strategies for educators and institutions of Higher Education.

Keywords: Rapid eLearning Development, Change Management Education, Cultural Adaptation in Learning, Hofestede's Cultural Dimensions, Arab Culture, Uncertainty Avoidance

Introduction

In an era marked by global uncertainty, the emergence of the COVID-19 pandemic catalyzed an unprecedented shift in education systems worldwide, which propelled Higher Educational Institutions (HEIs) toward online learning modalities. This sudden transition was not just a temporary measure, but became a catalyst for a longer term recognition of the potential for electronic learning (e-learning) within a traditional face-to-face (F2F) classroom. As HEIs emerged from the societal constraints wrought by the pandemic, the increased technical capabilities of faculty members, combined with the positive attitude of students, suggested the prolonged viability of a blended learning approach. More recently, the emergence of generative Artificial Iintelligence (AI) has increased the dilemmas and the potential of online learning. An increasing number of studies illustrate the feasibility of integrating technology in F2F education, demonstrating a growing interest in hybrid models (Singh et al. 2021). Blended Learning (BL) is traditionally defined as the integration of conventional classroom methods with online activities (MacDonald, 2006; López-Pérez et al., 2011), and has evolved significantly in response to educational challenges (McKeller & Barton, 2023).

This BL approach combines the strengths of asynchronous learning (such as self-paced modules) with the more traditional F2F instruction (including enhanced student-instructor interactivity), providing university students with a wider-ranging educational experience. An important factor in the decision to adopt BL and to explore AI tools, e.g. 'ChatGPT', is the capacity of technology-enhanced education to impact teaching and learning through offering unparalleled accessibility and flexibility to individual learners. Dimitrov and Kovatcheva (2022) expound on that aspect in emphasizing that BL benefits ensure it is more than just an educational trend. Instead, BL has evolved into a holistic approach, giving learners instantaneous and unlimited access to educational resources at the click of a button. Learners have immediate access to enhanced materials and having that access empowers them to engage with these resources at their convenience. This flexibility is instrumental in accommodating diverse learning styles and schedules, thus enhancing the overall efficacy of the educational process. The evolution of BL, especially in the context of higher education, signifies a paradigm shift in how knowledge is imparted in the digital age that generative AI will also accelerate.

The necessity for a BL approach was particularly underscored by critiques of earlier large-scale e-learning projects, which were criticized for lacking human interaction and support essential for student learning (Jones & Peachey, 2005; Jones & Lau, 2010). This criticism led to the enhancement of BL to include the flexibility of e-learning and vital human contact, thereby capturing the best of both worlds.

In the context of integrating online and traditional learning methodologies, which provide a spectrum of options to cater for learners' varied needs and preferences, Staker and Horn (2012) identified four primary models of hybrid education (part BL and part F2F). including the: 'Rotation' (students rotate on a schedule), 'Flex' (individually customized and fluid schedule), 'A La Carte' (pick and choose), and 'Enriched Virtual' (required F2F learning with instructor and then complete remaining coursework remotely). Each of these four models offer a unique approache to facilitate learning. The shift towards these models indicates the education sector's response to the challenges and opportunities presented by the necessity for remote learning during the pandemic and the subsequent transition back to the classroom. This has resulted in a renewed interest in the relevance of microlearning units, such as those created, like this study, on the platform 'Articulate Rise 360.'

In our study, it is the 'Enriched Virtual' that is the framework of exploration for integrating a microlearning module into a university-level traditional business course curriculum. This BL model was chosen for its flexibility, allowing students to supplement their classroom F2F instruction with additional online learning modules. This method aligns with the increasing preference for autonomous, self-paced learning experiences, which have become more prevalent after the pandemic's disruption to traditional education.

In this study, we also chose to explore microlearning. The concept further redefines BL by breaking down course content into smaller more manageable segments for the learner. Sometimes referred to as a "learning snack," microlearning focuses on a single topic and can be consumed quickly, making it ideal for students with busy schedules and immediate problem-solving needs. Unlike traditional eLearning courses, which resemble a complete meal with various components, microlearning provides concise, focused content that addresses a single objective or small number of learning outcomes.

Microlearning, as defined by Hug (2010), intersects with the domain of mobile learning, suggesting that educators can leverage microlearning tools to create content that is inherently compatible with mobile devices. This approach to learning is defined by its brevity and digital focus, allowing for quick, concentrated learning experiences. Practical applications of microlearning can range from short digital text excerpts and quick video clips, followed by a concise quiz, to micro podcasts that learners can consume on the go.

Microlearning has been integrated into BL strategies, mainly through using platforms such as 'Articulate Rise 360', which facilitates the creation of concise educational content. 'Articulate Rise 360', a tool known for its rapid development capabilities, allowed this investigative team to design and deploy microlearning content efficiently. We argue that our module on 'Change Management' aligned with learner and instructor demands for timely and relevant content dissemination in educational settings.

The mobile-friendly and multi-device compatibility of 'Articulate Rise 360' ensures that learners have access to educational material across various digital platforms, so they can watch content on their phones or their laptops at any time and in any place, thus accommodating the contemporary trend of mobile and flexible learning. The platform's design also allows for educational content to be readily updated, supporting the dynamic nature of knowledge and the necessity for continuous learning and enabling user feedback. Both these features were taken into account for development of the learner survey, as well as how the learners accessed information, plus respondant suggestions for improvement.

While not the only eLearning development software option, 'Articulate Rise 360' capacity to streamline the creation of micro-learning modules does align with the instructional needs of university educators and students and, therefore, facilitated the development of short, targeted learning experiences integral to a comprehensive BL strategy. This reflects a shift towards educational methodologies prioritizing flexibility, learner autonomy, and the efficient use of technological resources in the learning process, significant trends which will continue particularly given the increasing prevalence of generative AI.

In summary, microlearning in a BL environment serves a tripartite function: it prepares learners pre-training, enhances the in-session learning experience, and reinforces knowledge post-training. Microlearning aligns with the learner's journey, offering tailored content that is

both accessible and efficient, ensuring continuous engagement and assimilation of knowledge.

The advent of BL has revolutionized the educational landscape on a global scale and brought forth unique cultural dynamics within specific regions. As we transition from the broader context of BL to the particular milieu of the UAE, we argue that it is essential to consider the cultural dimensions that influence the adoption and implementation of BL.

With its rapid technological advancement and diverse international population, the UAE presents a distinctive case for the study of BL. Kemp's (2013) study delves into the impact of the cultural dimension of 'Uncertainty Avoidance' for the adoption of BL among management undergraduates in the UAE. This study revealed students' learning experiences were both positively and negatively affected by their cultural dimension of 'Uncertainty Avoidance' when introduced to BL, particularly notable because of their technological skills, their reactions to course organization, and their appreciation of online feedback. Furthermore, the results of the study underscored student challenges with the novelty of online activities and raised the demand for higher-quality research methods.

Kemp's (2013) findings are particularly relevant to our study, which aims to explore the effectiveness of a microlearning module centered around 'change management' within the UAE's business education sector. Our research considers the cultural backdrop of high 'Uncertainty Avoidance' characteristics in the UAE and how that shapes students' engagement with new and interactive learning technologies. By integrating rapid eLearning tools like 'Articulate Rise 360' within a structured pedagogical framework and local values, our study addresses the distinctions of student adaptability and the requisite support for successful BL experiences.

In this regard, our study seeks to contribute to the body of knowledge on implementing learning technology in international business classrooms. By examining the early stages of transformation involving microlearning, we aim to understand the implications of such pedagogical innovations for students in a nation navigating rapid changes in its educational and economic spheres. The outcomes of this inquiry will provide insights into the practical application of rapid eLearning tools, offering strategies to educators and HEIs for effectively harnessing technology to enhance teaching and learning, whilst also considering the cultural dimensions that influence learner engagement in the UAE.

In light of the evolving landscape of eLearning and its increasing adoption in higher education in diverse settings around the globe, understanding student preferences from a variety of cultures and their experiences becomes pivotal for effective course design and delivery. We argue that this is particularly crucial when considering undergraduate students studying in the UAE, who represent a diverse demographic with varying learning styles and cultural backgrounds. A key aspect in this context is the role of cultural dimensions, such as 'Uncertainty Avoidance', which significantly influence learning behaviors and attitudes. The feedback from undergraduate students on the change management module, developed using 'Articulate 360', offers a unique opportunity to delve into these aspects. Feedback not only sheds light on learner preferences for structured versus flexible learning approaches but also provides a window into how these choices align with broader cultural traits. Therefore, to deepen our understanding and enhance the effectiveness of eLearning modules, it becomes essential to ask:

> RQ1: *"How does Hofstede's cultural dimension of 'Uncertainty Avoidance' influence undergraduate students' preferences in the UAE for structured versus flexible learning approaches in an eLearning environment, as demonstrated by their engagement with the change management module developed in 'Articulate 360'?"*

This question aimed to investigate the impact of cultural factors, specifically 'Uncertainty Avoidance', on undergraduate students' learning preferences within an eLearning module. It seeks to understand how the local and regional cultural dimensions shape their attitudes towards structured and flexible learning methods.

> RQ2: *"What are the key factors contributing to the effectiveness of eLearning modules for multicultural undergraduate students, in the context of structured and flexible learning environments, as reflected in the feedback on the change management module?"*

This second question delves deeper in exploring the broader aspects of eLearning module design and delivery, to discover what resonates with undergraduate students. It is focused on identifying which elements within both structured and flexible learning environments contribute most significantly to the effectiveness of eLearning from the perspective of undergraduate students.

Designing the Microlearning Unit on 'Change Management'

The microlearning unit on 'Change Management' was crafted by two Mass Communication students of Arab origin, co-authors of this research paper, under the supervision of a multidisciplinary team of investigators. This project represents a collaborative effort combining academic insights and practical application. A subscription to 'Articulate' was secured to facilitate the design process, enabling the research team to tailor the content and structure based on the course material provided by the faculty member originally teaching the change management module.

Structure and Content

The unit's structure and content were purposefully organized to maximize learning effectiveness. The content creators reflected that they took special interest in portraying the students' characteristics by creating a persona (a united representation) that was catered to in order to create the best learning experiences. The module commences with an engaging welcome video from the faculty member, framing the context and purpose of the module. The content delves into the concept of change, highlighting both its inevitability and the common resistances to change when encountered by individuals and business leaders. Salient facts about change management underscore its complexity and associated challenges within the context of the third-year undergraduate course, 'Business Communication'. Definitions, such as 'Organizational Change' and 'Change Management,' were provided to lay a solid foundation for understanding.

The unit explored theories of both internal and external forces of change, illustrating the complex nature of the phenomenon of change. It introduces various change management tools, to empower students with practical solutions for navigating change. The conditions necessary for successful change implementation were also elaborated upon, offering insights into effective change management strategies.

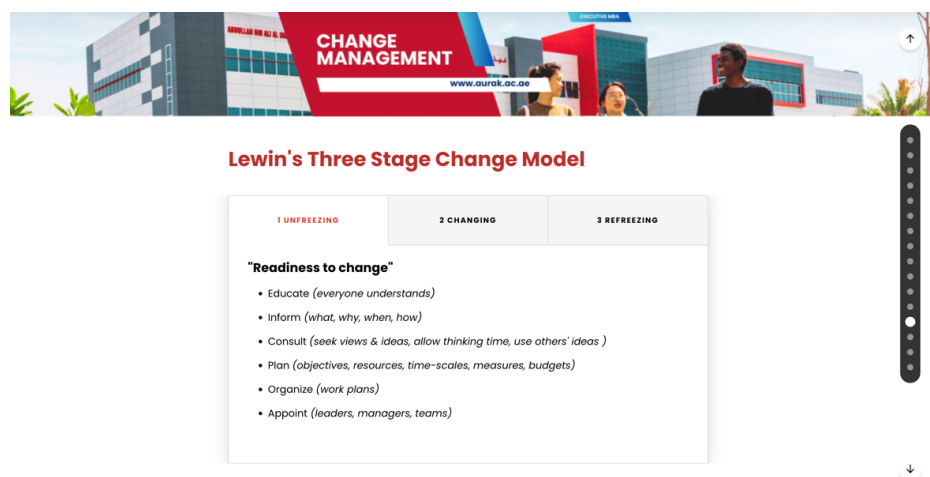
Notably, the module presents 'Lewin's Three-Stage Change Model', a classic framework for understanding organizational change. Additionally, it references the ADKAR (Awareness, Desire, Knowledge, Ability and Reinforcement) Model, providing an alternative perspective on managing change effectively. The unit culminates with a closing message from the professor, encapsulating key takeaways and offering a comprehensive summary of the topic. This curated assembly of content and structure is structured to provide as rich and impactful learning experience for students as possible as they engage with this microlearning unit.
Figure 1: Opening splash-screen of the 'Change Management' Microlearning unit
Figure 2: The unit opens with a video introduction by the faculty member


Figure 3: Example of interactive feature such as 'Accordion Interactivity' in the unit

Interactive Features

The 'Change Management' microlearning unit, developed with 'Articulate Rise', features several interactive elements to enhance learner engagement outlined below.

- **Accordion Interactivity:** Condenses extensive text into digestible sections under clickable headings, ideal for exploring complex concepts without overwhelming learners.
- **Tabs Interactivity:** Facilitates learning about related topics through clickable tabs, effectively organizing and presenting a large volume of information.
- **Flashcard Grid and Stack:** Interactive flashcards that reveal information upon clicking, with a grid layout for multiple cards and a stack format for sequential exploration.
- **Labeled Graphics:** Uses images with clickable hotspots, enabling learners to investigate different components or parts of an equipment visually.
- **Process Block:** Displays linear concepts in a step-by-step manner, functioning like a slideshow to guide learners through processes.
- **Button Navigation:** Offers navigational ease and external linking through clickable buttons, which can lead to external sites, different course sections, or facilitate email communication.

These features collectively offer designers the chance to create a dynamic and engaging learning environment and the flexibility to choose to provide more or less structure, present the learning material of the module as dynamic or more simply or to use a different color palate.

Methodology

This study combines methodologies in order to provide a comprehensive analysis of undergraduate student feedback on a change management eLearning module and to examine if there is a culturally-based connection between the use of a BL module and student satisfaction. Developed using 'Articulate 360', this module was utilized by predominately Arab students at an American University in the UAE, allowing exploration of the effectiveness of the module and to understand students' learning preferences and experiences in the context of structured versus flexible learning approaches.

Instruments and Data Collection

1. **Data Sources and Tools**:
    - The primary data source was an online 'Google' forms utilizing an 'Excel' spreadsheet, to capture feedback from undergraduate students through a structured feedback mechanism within the eLearning module.
    - Additionally, a confidential survey was administered to different cohorts of university students to evaluate their satisfaction and experiences with BL. This survey employed a narrative data collection approach, focusing on individual insights and interpretations.
    - 'Padlet', an online interactive bulletin board, served as a secondary tool for collecting student feedback. This platform allowed asynchronous submission of reviews and comments, offering diverse insights into student experiences with the module.

2. **Feedback Content and Data Points**:
    - The feedback included qualitative data in the form of text comments, where students shared their views on the module's structure, content clarity, and the flexibility of the learning path.
    - The survey sought to measure levels of student certainty and uncertainty regarding the introduction of BL, capturing their unique insights and interpretations.

3. **Demographics**:
    - The participants were primarily undergraduate students enrolled in a business course, with the survey extending to a broader demographic of university students in the UAE.

4. **Research Design**:
    - Adopting a cross-sectional survey design, this observational study analyzed information about a population of university students at a specific point in time, complemented by the longitudinal feedback data from the eLearning module.

5. **Data Collection Summary**:
    - The duration of data collection was aligned with the completion of the eLearning module, ensuring timely and relevant feedback.
    - The volume of data from both the survey and the eLearning module feedback provided a rich qualitative dataset for analysis.
    - Throughout the data collection process, student confidentiality was rigorously maintained to encourage genuine and honest responses.

Data Analysis Approach

- The study employed qualitative methods, primarily thematic analysis, to identify prevalent themes in the student feedback.

- The analysis was aligned with Hofstede's cultural dimensions, particularly focusing on 'Uncertainty Avoidance', to understand students' preferences for structured or flexible learning environments and their overall satisfaction with the BL experience.

Sample and Research Instrument

Sample
The study surveyed a total of 40 undergraduate students enrolled in a 'Business Communications' class at the XXX (name of university) during the Fall semester of 2023. Reflecting the diversity of the UAE's student population, the members of the sample group includes approximately 40 percent local Emirati students, 30 percent from Arab countries such as Jordan, Syria, Egypt, and Palestine, 15 percent from South Asian countries, e.g. Pakistan and India, and 15 percent from various nationalities including African countries such as Sudan, Tanzania, and Ethiopia. The School of Business was selected for its representative demographic spread which aligns with the broader student body of the UAE, allowing for potential generalization of the study findings to a wider population.

Research Instrument
The university maintains comprehensive demographic data on its student population, including age (with most students aged between 21-24 years), gender (approximately 55%

male and 45% female), and nationality. A notable portion of the student body, although nationals from countries other than the UAE, have been born and raised locally, with half of the foreign nationals enrolled indicating this background. This diverse cultural tapestry, with many students having been influenced by the dominant Arab culture and its high score for Hofstede's dimension of 'Uncertainty Avoidance', provides a rich context for examining the impact of cultural dimensions on elearning.

The learning module, along with the accompanying survey, was integrated into the university's learning management system (LMS), 'Blackboard Ultra'. The survey was designed to elicit in-depth student narratives, asking participants to reflect on four key areas: their review of the module, learning outcomes, applicability of the learned content, suggestions for improvement, and any additional comments they wished to share.

Following the precedent set by Kemp (2013), the survey was kept succinct with 'open' questions to foster detailed responses. Participation in the survey was not tied to any extrinsic monetary incentives. Anonymity and confidentiality were upheld using the LMS's features that ensure student names and identifiers are not disclosed.

Data Collection Approach

To garner in-depth insights and foster continuous improvement of the eLearning module, participants were engaged in a reflective exercise. The students were prompted to provide feedback on several aspects of their learning experience as the survey was structured to guide students through a sequence of reflective prompts. These prompts invited students to:

- Reflect on their process of engaging with the module and the duration of their review.
- Articulate their learning outcomes, specifically regarding change management concepts.
- Consider the practical application of these concepts within the realm of business communications and project their impact on future professional roles.
- Offer constructive suggestions for enhancing the module's structure and content to better facilitate student engagement and address knowledge gaps.
- Share additional thoughts or queries pertaining to the change management module.

The questionnaire eschewed the traditional five-point 'Likert' scale format to allow a more nuanced exploration of student experiences. Designed to align with 'Bloom's' taxonomy of critical thinking skills, the survey progressed from basic comprehension to application and evaluative judgement. The research team, comprised of three professors with expertise in BL, content creation, and digital media, meticulously reviewed the survey instrument to ensure content validity and relevance to the study's aims.

Findings

Hofstede characterized the national culture of Arab countries, through cultural dimensions, where they scored high 'Power Distance', relatively strong 'Uncertainty Avoidance', and more Collectivism than Individualism with moderate Masculinity/Femininity values. This cultural backdrop provided a critical lens through which the feedback on the eLearning module could be analyzed, particularly in the context of the UAE (Hofstede et al., 2010).

The qualitative analysis aimed to evaluate feedback from undergraduate students on a stand-alone eLearning module on 'change management' developed using 'Articulate 360'. This

module was introduced into a business course at the xxx University. Feedback was collected from a diverse group of undergraduate students (#40) to assess their learning experience.

Grounded in the cultural dimension of 'Uncertainty Avoidance' (UA), this analysis draws upon the findings of Kemp (2013), who noted a preference for 'risk avoidance' within the learning environment among undergraduate students in the UAE.

From the feedback, two predominant themes emerged, indicating the undergraduate students' learning preferences:

Structure
The feedback revealed a significant preference for structured learning, with 46 instances where students expressed a desire for well-defined course structures and content. For instance, an undergraduate student noted, "It was easy to follow the module because of its structured format." This preference aligns with a higher UA, suggesting that clear, organized content is essential to these students.

Clarity and Understanding
Clarity in instructions and content emerged as a crucial theme, noted 24 times in the feedback. Undergraduate students demonstrated a high value for straightforward and comprehensible learning materials, indicative of strong UA tendencies.

Appreciation for Flexibility
Despite the overall preference for structure, there was also an appreciation for flexibility in the learning process. This was reflected in 19 instances where students acknowledged the benefit of having control over their learning journey, as one student remarked, "The module allowed me to choose what to study first, giving me control over my learning."

Differential Insights From Undergraduate Feedback
The undergraduate feedback underscores a significant inclination toward clarity and structured formats, reinforcing the cultural tendency toward higher UA within this demographic. However, the recognition of flexible learning elements suggests a nuanced balance of preferences that eLearning design must accommodate.

Implications for eLearning Design
These findings from undergraduate students highlight the need for eLearning modules that are tailored to the cultural context of the UAE. A clear, structured learning environment, complemented by flexible learning options, is crucial to meet the diverse needs of the student body.

Student Reflections on Structured Clarity and Flexible Learning Paths

In analyzing the feedback from undergraduate students on the change management eLearning module, a distinct preference emerges for structured and clear learning experiences. This preference is rooted in a cultural context that highly values UA, as theorized by Hofstede. Students consistently expressed a desire for a learning environment characterized by well-defined objectives and straightforward content delivery. This inclination aligns with a higher UA, where predictability and order are paramount in educational settings. Simultaneously, there was an acknowledgment of the value of flexibility within this structure, allowing students to tailor their learning journey. The following student quotations illustrate these

themes, shedding light on the nuanced balance of structure and flexibility that caters to diverse learning preferences.

Quotes Reflecting Comfort With Structure and Clarity

- "It was easy to follow the module because of its structured format." - This quote suggests a preference for a well-organized approach to learning, consistent with higher UA.

- "The structured layout...appreciated." - Acknowledgement of structured content indicates a desire for clarity and organization.

- "I liked how the module was designed...to keep [us] focused." - A well-thought-out design that aids concentration aligns with a preference for structured learning environments.

- "It took me around 25 minutes to check out the module...spent on Lewin's three-stage transformation model..." - Focusing on specific models shows a methodical approach to learning.

- "The taking notes approach allowed me to learn...and also helped me to recall it later." - A systematic method of learning, indicating higher UA.

Quotes Reflecting Openness to Flexibility Within Structure

- "The module allowed me to choose what to study first, giving me control over my learning." - This indicates a balance of structured content with the flexibility of choice.

- "It took me 20 minutes to review my online self-paced activity..." - Comfort with self-paced learning suggests an openness to a certain degree of flexibility.

- "I reviewed the change management module online...I spent approximately an hour to fully view, understand, and receive the final message." - The time invested reflects a willingness to explore the content at one's own pace.

These insights from the feedback illustrate that while there is a significant inclination towards structured learning, as indicated by the multiple mentions of a "structured layout" and appreciation for "clear" and "focused" content, there is also an appreciation for the flexibility offered by the module. The ability to control the pace and path of learning, as some students highlighted, represents a balance between the need for structure and the benefits of a flexible learning environment. These findings should guide the design of future eLearning modules, ensuring they provide clear, organized content while also offering opportunities for learners to engage with the material in a way that suits their individual learning preferences.

Conclusion

The analysis of undergraduate feedback on the eLearning module emphasizes the importance of integrating cultural dimensions and learner preferences into eLearning design. By accommodating the varying degrees of UA and providing a balance between structured and flexible learning elements, educators can foster more effective and engaging learning

experiences for a diverse undergraduate cohort. Our study's findings resonate with certain aspects of previous research, illustrating common patterns in online learning behaviors.

Mirroring the findings of Fung (2004), this study also reveals a certain reluctance amongst learners towards specific aspects of online learning. In line with Fung's observations regarding students' disinclination to engage in online discussions, our data reflects a similar pattern among undergraduates. The participants in our study demonstrated a clear preference for well-organized and straightforward learning resources, favoring reading and structured study over interactive elements like discussion boards.

This preference for structured content over interactive online elements underscores a significant inclination towards traditional learning methods, even within online formats. Such findings highlight the need for eLearning platforms to evolve, offering features that enable students to tailor their learning journey to their personal preferences and learning styles.

In conclusion, the research underscores the critical role that cultural dimensions and learner maturity play in the design of eLearning experiences. Adapting content to suit different levels of learner understanding and ensuring a balance between structured and flexible components is key to enhancing engagement and learning outcomes. This approach becomes increasingly important in achieving successful educational results in diverse and multicultural academic settings, such as those found in the UAE. Our study contributes to the ongoing discourse on eLearning by confirming and extending the implications of previous research (Fung, 2004) within the context of the Arab Group's cultural characteristics as outlined by Hofstede (1991), providing a contemporary understanding that can be applied to the design of eLearning experiences in similar cultural settings.

An Assessment of TOEIC Listening and Reading Proficiency Tests of Foreign Graduate Students: Basis for Comprehensive Enhancement Program

Haydee Claire B. Dy, Lyceum of the Philippines University, Philippines
Jared Manalastas, Lyceum of the Philippines University, Philippines
Albert M. Navarra, Lyceum of the Philippines University, Philippines
Mariel Coleen F. Villanueva, Lyceum of the Philippines University, Philippines

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This study aimed to assess the current English Proficiency Program of the foreign students enrolled in the Claro M. Recto Academy for Advanced Studies at LPU Manila during the academic year 2021-2022. A Mixed Method research design was used in this study specifically an Explanatory Sequential, that explores both quantitative and qualitative data. The researchers collected and analyzed the TOEIC results of the 179 foreign graduate students about their English proficiency, both in listening and reading skills, and then collected an online survey to explain and elaborate on the significant experiences of the 25 students in taking up the English Proficiency program. It was revealed that most of the participants are classified in the Basic Working English Proficiency level which indicates further improvement in the language facility that will help them in the workplace and academic communication. These findings indicated that the respondents perceived the English Enhancement Program as having a positive and huge impact on their language acquisition in English. This implied that the existing program has an effective way to develop and improve the proficiency level of the English language. However, it was revealed in the findings that most of the respondents are still recommending the existing program to be revisited and improved that cater to the demands of the language learners.

Keywords: English Enhancement Program, Explanatory Sequential, Foreign Graduate Students, TOEIC

1. Introduction

English plays an important role in our everyday life. It is used in various fields such as business, academia, media, entertainment, and the international business community. To communicate across national borders and maintain correspondence with overseas business parties or professionals, English is essential. Moreover, English is important for higher education and specialized training. Most of the books on any subject are written in English or quickly translated into English. English is the medium of instruction in Education in most universities and higher education institutes of the world. This is essential for getting easy access to any information.

International students, many of whom are non-native English speakers are challenged by academic language demands and a new culture. Differences in educational systems and expectations, listening skills, professors' strategies and examples, the quantity of reading, direct writing styles, critical analyses, class participation, oral communication, and vocabulary present difficulties. Professors perceive international students to have difficulty with oral and written communication, which can affect course performance. Most international students need a minimum score on an English proficiency examination to achieve their respective career and academic aspirations. Thus, international English standardized examinations are very important to determine the level of their English proficiency. This can demonstrate the mastery of English and can be beneficial for resume building, job and internship qualifications, scholarship applications, and educational background.

Meanwhile, The TOEIC test was developed by the Educational Testing Service (ETS) in response to the request of the Japanese Ministry of Trade and Industry and was first launched in Japan in 1979 (M. Chapman, 2004). According to ETS, the test aims at assessing English-language skills in the workplace (ETS, n.d.-a); and it can be specifically used "to recruit, place and promote the most qualified employees"; "identify job-training requirements"; "assign 5 employees to positions overseas" (ETS, n.d.-c). For approximately the first 30 years of its existence, the test assessed only the two receptive language skills – listening and reading.

However, these tests can be inaccurate in showing a real level of academic knowledge about skills in speaking, reading, and writing English (Sawir, Marginson, Forbes-Mewett, Nyland, & Ramia, 2012). Hattingh (2016) discovered that international students were passing English-based tests such as the International English Language Testing System (IELTS) to gain entrance into other foreign institutions. Phakiti, Hirsh, and Woodrow (2013) proposed that personal considerations such as self-motivation, self-regulation, and self-efficacy significantly and positively influenced English proficiency for international students.

In this study, the researchers opted to determine the background in the English language and the English proficiency level of foreign students enrolled in the graduate program of the Lyceum of the Philippines University, Manila during the academic year 2021-2022. After further descriptive analysis of the respondents, the researchers assessed the existing English Proficiency Program of the institution to further improve its effectiveness and adequacy to strengthen their language fluency in the macro skills of the English language. Oxford (2017) emphasized that successful direct instruction training should teach students to identify the language learning strategies, practice the approach, and to evaluate its effectiveness.

1.2 Research Questions

The study aimed to assess the TOEIC listening and reading test scores of LPU Manila Foreign Graduate students as a basis for enhancing the English Proficiency program at the Graduate level. The following research questions will be answered at the end of the study:

1. How do the TOEIC listening and reading test scores of LPU Manila Foreign Graduate students serve as the basis for enhancing the English Proficiency program at the Graduate level?
2. How may the respondents be described in terms of?
   - Age
   - Current Job Position
   - Attitude in English language learning
3. What is the listening and reading proficiency level of the respondents?
4. What are the factors influencing the TOEIC listening and reading tests of the respondents?
5. What are the common challenges encountered by the students in taking the English Proficiency Program?
6. How may the findings of the study be utilized in improving the English Proficiency Program?

1.3 Significance/Rationale

This study would be beneficial to international students, educators, and the institution. The results of this study identified how educators in graduate studies might create programs that could be more efficient in teaching international students how to adjust and improve their English proficiency level. Educators should revisit the crafted syllabus of the program, based on these findings to ensure that international students are receiving the best educational opportunities.

2. Methodology

This study made use of **Mixed mixed-method research** design that explores both quantitative (numerical) and qualitative (descriptive) data to further understand the research problems and generate research findings and conclusions. Specifically, an **explanatory sequential design** was used as a method of investigation through an electronic questionnaire that included both closed- and open-ended questions. The researchers collected and analyzed the TOEIC results first as the basis of quantitative data about the English Proficiency Skills of the respondents both in listening and reading skills, and then conducted an online survey to explain or elaborate on the significant experiences of the foreign students in taking up English Proficiency course in the graduate program. According to Hassan (2022), the researcher may use the qualitative data to clarify unexpected or contradictory results from the quantitative analysis.

The researchers used purposive sampling. The respondents for the quantitative data were 179 foreign graduate students. Meanwhile, the 25 foreign graduate students were asked about their significant experiences in taking up the English Proficiency Program during the academic year 2021-2022 at Lyceum of the Philippines University, Manila. The researchers devised a research questionnaire based on the significant research experiences of the respondents.

The construction of the instrument was based on the statement of the problem and relevant research gaps in the literature and studies related to the study. The questionnaire was submitted to the three English language experts for approval and revision. All the suggestions and recommendations were incorporated into the final draft. Retrieval of the responses was undertaken as soon as the questions were answered. The researchers used the following instruments and techniques to obtain the data needed for this investigation:

The researchers used the TOEIC results and questionnaire as a primary source of data in obtaining relevant information. This is divided into two parts.

The First Part- *TOEIC Test Scores.* The researchers described the TOEIC listening and reading skills test scores of the participants and their demographic profile such as their age, nature of work, current job position, and attitude toward English language learning.

Second Part- *The Perceived Challenges and Opportunities in Learning English.* The second part of the survey describes the participants' challenges, initiatives, and opportunities in learning English.

The statistical techniques presented here are mixed methods. Descriptive statistics deals with the techniques used to describe the variables (median, frequency, percentage). Moreover, to analyze the qualitative data that is collected for the study, a thematic analysis was utilized. Thematic analysis is an effective method to analyze qualitative data in that allows researchers to summarize, highlight, and interpret multiple data sets, and the analysis method has great flexibility in terms of the type of research questions needed to be answered, and the type and amount of data needed to interpret (Kiger and Varpio, 2020). This is done by giving labels to important words or phrases in the data that represent the themes of the responses.

The data gathered were statistically treated using the Weighted Mean and Standard Deviation. This was done to establish the average of the collected data or the mean itself and the gap or the distance between each result. A low standard deviation indicates that the data points tend to be close to the mean. Percentage displays the data that specifies the percentage of observations that exist for each data point or grouping of data points. It expresses the relative frequency of responses and other data. On the other hand, frequency refers to the number of times a data value occurs. Lastly, SPSS Software v, 26 was used in the analysis of data.

During the conduct of this study, the researchers considered different ethical considerations.

The following ethical considerations were strictly observed:

Informed consent is a vital part of every research study. It is the responsibility of the researchers to protect the rights and freedom of the target respondents from forced participation. Respondents chose whether to participate in the information-gathering process. They were not forced to participate in any way. Respondents have the right to withdraw at any time and for any reason. If the respondents do not want to answer the questions, the researchers respect their decisions. The researcher adhered to the highest standards of ethical practice in research. Informed consent, autonomy, anonymity, dignity, and safety were given utmost attention.

To ensure the protection of participants' anonymity and confidentiality, their names or identities were disclosed at any stage of data collection, analysis, and reporting of the study results.   The privacy and confidentiality of the responses, as well as the participant's experiences, data analysis, and dissemination of the findings, were carefully managed throughout the study and the writing of the manuscript.

The researchers strictly adhered to the provisions of Republic Act No. 10173, also known as the Data Privacy Act of 2012. Participants' consent was obtained for the use of their data exclusively for research analysis purposes, and the information provided was not utilized for any other purposes unrelated to academic and research endeavors.

The participants in this study were given one week to complete answering the survey questionnaires. They did not pose significant risks or inconveniences in any other way. The data is kept private and confidential. Participation in this study was voluntary. No additional information was disclosed unless required by the study, and any relevant data was used solely for this study.

Benefits such as awareness and knowledge about the importance of English language learning can be gained by the participants taking part in this study.

The participants were assured that the results would be transparently reflected once the study was concluded. If participants need access to the study's results, they can send a message to contact the researchers, and the file will be accessible to the participants.

3. Results and Discussion

Firstly, a brief profile of the participants is presented. All initial codes relevant to the research questions were incorporated into a theme. Braun and Clarke (2006) also suggest the development of thematic maps to aid the generation of themes. These helped the researchers to visualize and consider the links and relationships between themes.   All the themes extracted from this study are interrelated, from analyzing the data it emerged based on the experience in the English Enhancement Program.

Figure 1: Profile of the Participants
According to Kramsch (2013) language, not seen as a linguistic system, but seen in context is a coherent symbolic system for making meaning. (Kramsch, 2013) In this sense, it cannot separate the study of language and language learning from culture and the context that

surrounds the learner, especially when it refers to the learning of a foreign language. From this study, the majority of the respondents, (fourteen) 14, speak Mandarin as their native/first language. A total of eleven (11) participants speak another native language. According to the National Clearinghouse for Bilingual Education Journal (2000), students who learn English and continue to develop their native language have higher academic achievement in later years. In this assertion, it is a good implication that the respondents have higher academic achievement in their education. It is strongly supported by the study of Madriñan (2014) that students who have strong first language skills can acquire a second language more easily due to language transfer. Furthermore, she stressed that the mother tongue could be used as support for the second language acquisition process, which makes the learning process easier for students and teachers. Hence, having a good foundation in the native language can scaffold the English language acquisition as the respondent's second language.

Figure 2: Age of the Respondents
The respondents are mostly adults. Most of the respondents of this study are in the age of 30s specifically from 31- 40 years old. It is stated in the study of Ruyun Hu (2016) that there is a critical period for second language acquisition. It further elaborated that children have a great advantage over adults or adolescents This critical period is used to refer to the general phenomenon of declining competence over increasing age of exposure. This hypothesis was first introduced by Penfield and Roberts (1959).

As well, Ellis (1986) observes that there is a period when language acquisition can take place naturally and efficiently, but after a certain age, the brain is no longer able to process language in this way. This critical period is defined by Scovel (1988) in the following manner: In brief, the critical period hypothesis is the notion that language is best learned during the early years of childhood and that after about the first dozen years of life, everyone faces certain constraints in the ability to pick up a new language.

Morford and Mayberry (2000) note that individuals who are exposed to language at earlier ages consistently outperform individuals exposed to language at earlier ages for first and second languages of both signed and spoken languages. This assumption agrees that people will perform well in language learning at an early age. This is the hypothesis for the "the younger the better" position.

Another opposite view is 'the older the better'. It illustrates that older language learners are more successful and efficient than young learners. Some studies have been done to support this view. Ekstrand (1976) reveals that L2 learning ability improves with age. In Harley's research (1986), he favors the faster acquisition rate among later beginners. Therefore, the older learners are the efficient language learner.

Figure 3: Current Job Position
Being the lingua franca of the world, the role of the English language in a globalized world is undeniable. Communicative skills in English could create countless opportunities for an individual in today's job market. Admittedly, proficiency in English could be a determining factor in leaving a good first impression in job interviews. Considering the different fields in a job sector necessitates English language proficiency. The participants are mostly educators. Nineteen out of twenty-five are in the academe field. Three (3) of them are in managerial/supervisory positions and others are in clerical and other fields.

Attitude in English Language Learning

Time and Ways of Learning by the Participants Before Enrolling to the English Enhancement Program

Twenty-one (21) of the participants claimed that they have been learning the English language since their primary school and junior middle school. Moreover, two (2) students answered that they just learned during the English course online. Mahmoud Samer (2018) recommended in his study that the students should be continually exposed to the English language e researcher recommended that students should be continually exposed to the English language daily to encourage them to overcome their weaknesses and improve their fluency as well as proficiency in acquiring the English language. Thus, longer exposure to the target language can enhance second language acquisition.

How Students Learned During the English Enhancement Program in Lyceum of the Philippines University

Most of the participants acknowledged that they had positive learning experiences under the English Enhancement Program. Twenty—four participants out of twenty-five responded positively to their learning experience under the program. A few factors that contribute to creating a positive learning environment are establishing a supportive learning culture, addressing a learner's needs, and encouraging a student's involvement in all activities. Also, online classrooms can be made interesting by using informative presentations, engaging activities, and formative assessments. Moreover, there is a teacher factor also in this aspect. Teachers should strive to create an environment that is more conducive to engagement and learning. A learning environment that is not positive and full of restrictions and rigid rules

impairs learning by narrowing a student's focus and inhibiting his/her ability to explore multiple viewpoints and solve problems. A positive learning environment helps improve attention, reduces anxiety, and supports the emotional and behavioral regulation of students.

When educators foster a positive learning culture, learners are more likely to acquire higher motivation which leads to wonderful learning outcomes.

Teaching Strategies of the Professors of the Program

Fifteen (15) participants asserted that they have good learning outcomes based on what they have experienced in the English Enhancement Program. Nine (9) participants focused their answers on the teaching style used by their respective teachers though their inputs were relatively positive on their learning experience. Teaching methods also should vary accordingly. How much a student can learn is also determined by the compatibility of the student's learning styles and the teacher's teaching styles. Therefore, teachers need to know their learners' preferred learning styles because this knowledge will help teachers plan their lessons to match or adapt their teaching and to provide the most appropriate and meaningful activities or tasks to suit a particular learner group at different stages. (Mai Zhou, 2011) Teachers are normally encouraged to use different types of teaching strategies that cater to different students' learning styles and needs (Gozcu & Caganaga, 2016). Understanding students' learning styles helps teachers to choose which types of teaching strategies are suitable for their individual students. However, using different strategies can be very difficult to attain especially with large classes and it is probably more realistic to find a balance, so all students understand the essence of the lesson being taught.

Learning Engagement During the English Program

The majority of the participants, twenty-one (21) in particular, claimed that they had active learning engagement during the English Enhancement Program. They perceived the program as more enjoyable, more meaningful, and more complete. Michel, Cater, and Varela (2009) hold that active learning is a phrase tossed around a great deal today on college campuses and it suggests an approach to classroom instruction in which students engage material through talking, writing, reading, reflecting, or questioning-in other words, through being active.

According to Gong (2003), active learning involves providing opportunities for students to meaningfully talk and listen, write, read, and reflect on the content, ideas, issues, and concerns of an academic subject.

On the other hand, there are four (4) students considered the program a passive one. They are not motivated to speak during the English Enhancement Sessions. This may fall under the theory of Stephen Krashen, Affective Filter. Krashen (1980) claims that learners with high motivation, self-confidence, a good self-image, a low level of anxiety, and extroversion are better equipped for success in second language acquisition. Low motivation, low self-esteem, anxiety, introversion, and inhibition can raise the affective filter and form a mental block that prevents comprehensible input from being used for acquisition. In other words, when the filter is up, it impedes language acquisition. As Figueroa (2019) explained students who exhibit a high affective filter can demonstrate many signs. They tend to feel very self-conscious about their abilities in the new language. Many may experience stress when asked to speak, read, or write in class, and they may have very little faith in their ability to learn. Students report breaking out into a cold sweat, becoming nervous, anxious, and even

surprised when incoherent speech comes out of their mouths since in their head, they understand the concepts. Students with a high affective filter are reluctant to participate in class discussions because they are afraid of making mistakes and being judged by the teacher or other classmates. They would much rather collaborate with classmates in a small group setting, as that allows them to lean heavily on peers for support or avoid work altogether. Boredom is another way that a high affective filter may manifest in a student. Students who don't comprehend what is happening in the classroom may stare into space with a slightly glazed look in their eyes. They are completely disengaged because they have no idea what is going on around them. These students believe that if they don't draw attention to themselves and pretend to know what is going on or demonstrate disinterest, they will be left alone. Thus, the goal of educators is to lower the affective filter so that students feel safe and comfortable and are able to learn.

Furthermore, analysis of the research literature (Xu, 2002), suggests that students must do more than just listen. Students must read, write, discuss, or be engaged in solving problems and most importantly, to be actively involved, and they must engage in such higher-order thinking tasks such as analysis, synthesis, and evaluation.

Usefulness of English Enhancement Program in the Workplace

The role of the English language in career advancement is undeniable in this era of globalization. According to a British Council report (Elizabeth J. Erling,2014), English language skills are extremely rewarded in the labor market. It also emphasizes that skills in English have a constructive impact on economic growth. As the data shows, there are twenty-two (22) participants who gained strength and positive skills to improve their productivity at the workplace. However, there are remaining two (2) participants who find their learnings beneficial in their workplace. And, one (1) participant has the uncertain answer. The study of T. Murugavel and A. Clement (2018), it shows that the necessity of English language skills in the workplace hasn't changed, and the participants have reiterated the role of English as the influencing factor during interviews and at the workplace. This study stressed that the results of the study have revealed that the employees are convinced that English language skills are required for getting a job and performing their responsibilities effectively.

Topics and Skills in English Program That Students Find Challenging

Learning a new language can be difficult, but studying as you are immersed in the language and the culture can make the process a bit easier. These are the most common challenges students face when learning English as a second language. All twelve (12) participants of this study emphasized that speaking is the most challenging skill/topic that they encountered in the English Enhancement Program. They further elaborated it using the various activities done in the programs such as impromptu speeches, question and answer sessions, speech presentations, reporting, and discussions. Next in line, four (4) participants find listening activities challenging. In addition, three (3) participants find the English language structure demanding. Three (3) participants have uncertain answers. The responses of these participants are not related to the question. Two participants find the reading comprehension and analysis difficult for them. One participant claimed viewing skills are challenging too.

Macro Skills That Students Need to Improve More After Taking the English Enhancement Program

Good ability in listening means having the competence to comprehend information during listening activities. However, listening skill is still considered one of the most difficult skills for English language learners although they have been learning English for few years. 16 out of 25 participants highlighted listening skills as the macro skill that they need to improve more. Several factors influenced students' listening skills, limited vocabulary mastery, accent, pronunciation, and lack of practice. Furthermore, their prior knowledge of English structure supported them to be able to figure out some challenges in listening skills. Hence, the students realized the importance of the listening activities, and having good listening skills still appeared as a challenge for most of the participants. Similarly, 15 of the participants noted that their speaking skills need to improve further since they are not mostly exposed to the target language. They find this skill that needs to be enhanced because they believe that the English language is essential for communication.

Moreover, writing and reading are also highlighted by the participants that they need to improve more. The ability to read and write effectively is an important workplace skill across professions and business sectors. In general, writing serves as a core medium for communication and activity in the workplace. Nearly all job postings advertise the so-called soft skills in a job position, frequently detailing descriptions such as strong command in writing skills or "excellent written communication skills" under preferred requirements (Messum et al., 2016).

Problems That Students Encounter While Learning English

English language teaching and learning in non-English speaking countries is a really challenging job. The English language is kept as the subject in school and university curricula and even many schools or universities have adopted English as a medium of instruction in countries where English is used as a second and foreign language, but many students find English a difficult subject to learn (Akbari, 2015; Phyak, 2016).

Seventeen (17) participants claimed that they had linguistic problems while learning English. Since most of them are second-language learners of the English language. Limited vocabulary knowledge limited grammatical knowledge and weaknesses in four language skills are the areas of the English language they find challenging. Akbari (2016) reported some problems in learning English in her research article that are similar to the problems encountered by the participants. She further stated that language learning difficulties may occur due to a lack of understanding of the key role English plays in their life which means motivation plays a vital role in learning a language. If learners are informed about the use of the English language in their lives, then they may be highly motivated to learn the English language. If learners are motivated, then they show their concentration in study and learning becomes faster.

Moreover, four (4) participants have environmental problems due to lack of exposure to the English language. Exposure to language can be defined as the contact that the learners have with the target language that they are attempting to learn. More practice and exposure to the target language are needed by these participants.

Personal problems of the two participants such as language retention and time management are also stated. It is stated that the behavior of the participants in learning the target language is the primary problem such as the motivation in learning the English language and time management. From the above expressions, it can be said that students are unable to develop their language skills due to their behaviors.

Lastly, two (2) participants didn't have any problems encountered while learning the English language.

Recommendations to Further Improve the English Enhancement Program at Lyceum of the Philippines University

Most of the participants suggested the existing Enhancement program be improved based on their concerns and needs. They emphasized the increase in class hours and reduced the number of students per class, language topics, and strategies. These areas must be taken into consideration by the curriculum developer to achieve its objectives in this program more effectively. In contrast, five (5) participants are satisfied with the existing English program of the university.

Conclusions

Based on the results 88% of the respondents considered English as an essential factor of their professional development. The use of the English Language will be also beneficial in their workplace communication, however, some of them find it challenging because of their cultural practices in their own countries.

Based on the TOEIC results majority of the students were able to get the target score required by LPU in their English Proficiency Level on listening and reading examinations.

The English Enhancement Program that they enrolled before the taking examination became helpful for them to reach the target score. The exercises given by their instructors helped the students to become more prepared to take the listening and reading test provided by Hopkins International.

The students were challenged in terms of linguistic capabilities. They need to improve their grammar and vocabulary to be more advanced at the graduate level. The environmental factors like lack of exposure to the language, cultural practices in their country, beliefs in the use of English Languages in their country, and teaching strategies they encountered as the English Language was introduced to them by their former teachers. The readiness of the learners in terms of acquiring the English language is another factor that challenges their ability to learn.

The findings of the study helped the researchers to further improve the program in terms of teaching strategies, classroom management, length of the program (not limited to 10 meetings only), providing remedial sessions for other students, who need more enhancements, giving more engaging activities for further exploration of the macro skills, positive motivation and reinforcement, and provide more exposures on oral and written communication.

Recommendations

To further enhance the effectiveness of the program and the scores of the students in terms of taking international examinations like TOEIC, the researchers recommend the following:

1. Promotion of the English Enhancement Program to other partner universities locally and internationally.
2. Speaking and writing international examinations are recommended aside from the listening and reading tests provided by Hopkins International.
3. Improve the syllabi of the English Enhancement Program considering the needs of the students according to their level.
4. Provide more English Enhancement Classes aside from the 10 preliminary sessions practiced.
5. Determine the other weaknesses of the students in terms of other skills to improve such as vocabulary development, grammar enhancement, listening and reading comprehension, discourse writing techniques, and speaking engagements such as participation in competitions to further motivate their enhancement of skills.
6. Faculty members teaching the program will have more training to further improve their teaching strategies both locally and internationally.
7. Categorize the students according to their level of proficiency after taking a preliminary or diagnostic examination before continuously enrolling in the program of their needs.
8. Exploration of the demographic profile of the students or language learners to further adjust to their needs with the means of preliminary interviews.
9. Recommendation to more face-to-face interaction with their instructors than online classes.
10. Benchmarking to other universities on their English Enhancement Practices.

Acknowledgment

Bridging Asynchronicity and Engagement: Data-Driven Insights Into Flipped Learning

Ivana Vulic, Xi'an Jiaotong Liverpool University, China
Alan Meek, Xi'an Jiatong Liverpool University, China

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Advocates of flipped and blended learning have reported on how these models encourage students to actively engage and become agents in their own learning. There is, however, limited evidence on the extent to which asynchronous online learning materials developed for flipped learning programmes support students to actively engage in their learning. Using back-end data analytics, this study aims to demonstrate the behaviour patterns exhibited by students in a programme where 30% of the flipped learning curriculum design is delivered asynchronously online. A cross-sectional case study research design within a quantitative framework was used. Online content used to teach foundational year students (n=3957) English for Academic Purposes at a British-Asian university in China was analysed. This included teacher-generated videos, comprehension quizzes, and activities linked to subsequent in-person sessions. A prominent finding of this study is that students do in fact take advantage of the unrestricted access to online materials, although overall asynchronous student engagement still needs in-class teacher action to be supported. In summary, data-led investigations into students' online behaviour can advance the pedagogical design and underpinnings of flipped learning along with enhancing educators' adeptness in navigating blended learning environments.

Introduction

Blended learning, an instructional methodology merging conventional in-person teaching with online educational components, has entrenched itself as a ubiquitous feature of contemporary higher education. Evidently, the pervasiveness of this approach is exemplified by the fact that 98% of U.K. universities embraced blended or hybrid learning courses by 2020 (Stacey, 2020). Within the context of the School of Languages (SOL) at Xi'an Jiaotong-Liverpool University (XJTLU), a discernible shift toward the adoption of blended learning has emerged, notably accentuated after the successful pivot to online education amidst the COVID-19 pandemic. This inclination became particularly conspicuous during the 2021/2022 iteration of the Year 1 English for Academic Purposes (EAP) modules, where a delivery model integrated approximately 3 hours per week of self-directed asynchronous online tasks with 6 hours of face-to-face learning. This deliberate hybrid approach aimed to optimize learning outcomes by synergizing traditional classroom experiences with innovative online pedagogy.

Moreover, the increasing internationalization of higher education in China has spurred the rapid expansion of English as a medium of instruction (EMI) institutions and programs, recognizing the critical need for bilingual teaching (Gill & Kirkpatrick, 2013) in order to prepare students for a globalized economy. XJTLU stands as an exemplar of this trend, operating as a transnational institution emphasizing bilingual teaching methodologies. The strategic integration of EAP courses within EMI universities in China, like XJTLU, reflects the recognition of the vital role EAP plays in equipping students with academic English language proficiency. This strategic inclusion is essential in enabling students to navigate academic conventions within specific disciplines, thereby enhancing their preparedness for international exchanges and bolstering their prospects in the global job market (Gao & Bartlett, 2014; Sun & Xu, 2012).

Furthermore, the evolution of education delivery in response to globalization has ushered in a paradigm shift toward virtual learning environments (VLEs) and English-medium instruction. VLEs encompass a spectrum of instructional methodologies that intertwine traditional pedagogical practices with innovative digital tools and asynchronous learning platforms (Smith et al., 2022). As institutions like XJTLU increasingly embrace these digital landscapes, the treasure trove of data generated by student interactions within these environments holds immense promise. By leveraging modern data tracking and analytics tools, educators gain invaluable insights into students' engagement levels, learning preferences, and utilization patterns within these dynamic learning ecosystems (Podgorelec & Kuhar, 2011). This transformative capability not only empowers course designers and instructors to tailor educational materials more effectively but also to optimize student learning experiences within the complex context of virtual education (Huggins-Manley et al., 2019; Smith et al., 2022).

Recognizing the potentially transformational role of data analytics in shaping contemporary educational paradigms, this paper embarks on a comprehensive exploration into the intricate landscape of data tracking within the context of XJTLU's blended learning environments and English-medium instruction. The increasing emphasis on VLE and the integration of EAP into curricular frameworks necessitates authentic case analyses of how data tracking mechanisms can be harnessed to optimize student learning experiences. Consequently, this study aims to utilize data tracking methodologies to investigate the dynamics of asynchronous educational delivery within XJTLU's context, aiming to elucidate its impact on

enhancing pedagogical strategies, facilitating student engagement, and fortifying the efficacy of later EMI learning.

Literature Review

Asynchronous EAP Learning Environments

In asynchronous EAP learning environments, various instructional methods are employed to facilitate language acquisition and academic skill development. These approaches often encompass multimedia resources, interactive activities, and self-paced modules (Gill & Kirkpatrick, 2013). Multimedia resources, such as videos, recorded lectures, and authentic materials like TED Talks, are frequently utilized to expose students to real-life language use and enhance their engagement (Sun & Xu, 2012). These resources serve to simulate authentic academic contexts, enabling students to comprehend academic conventions while improving language proficiency (Hadijah & Shalawati, 2021).

Furthermore, asynchronous EAP courses incorporate interactive activities like online discussions, forums, and collaborative tasks, aiming to foster communication skills and critical thinking within a virtual academic community (Gao & Bartlett, 2014). These activities often encourage student participation, facilitating language practice and creating opportunities for peer learning (Alves, 2015). The diverse array of instructional methods in asynchronous EAP learning environments caters to various learning styles and promotes autonomous learning experiences among students (Gao & Bartlett, 2014). Through these methods, students gain exposure to authentic academic language, engage in interactive learning activities, and develop crucial language and academic skills necessary for their academic journey.

Exemplar Videos

Exemplar videos can play a valuable role in the instructional design of EAP courses, offering diverse and comprehensive resources to enhance language learning. These videos serve as models for effective presentations, language use, and academic discourse, aiming to acquaint students with the common features of academic language and communication. TED Talks and authentic video materials often form the basis of these exemplar videos (Achaleke, 2021). They are carefully selected to illustrate essential presentation elements, storytelling techniques, effective use of signposting language, and appropriate integration of visuals and text (Shalawati et al., 2021).

Through these exemplar videos, students not only gain exposure to natural language use but also witness effective communication strategies demonstrated by expert speakers (Achaleke, 2021). The deliberate selection of videos aligned with specific course objectives aids in reinforcing academic skills while fostering an understanding of diverse communication styles and contexts (Wang, 2014). Exemplar videos are strategically integrated into the curriculum, encouraging students to analyse and emulate effective communication patterns and presentation techniques in their own academic endeavours. By engaging with these exemplars, students gain valuable insights into authentic academic communication, which in turn enhances their proficiency and confidence in using academic language (Hadijah & Shalawati, 2021). These videos serve as powerful pedagogical tools, providing tangible examples that aid in the development of students' language and presentation skills within the EAP context."

Instructional Videos and Student Engagement

Instructional videos within EAP courses serve as dynamic resources, fostering heightened student engagement and interaction with course content. Chen and Wu (2015) highlighted the efficacy of video lectures and screencasts in facilitating learning by offering visual and auditory stimuli that cater to diverse learning preferences. These videos not only present course material but also provide a personalized learning experience (Lowenthal, 2021). Lyons et al. (2012) noted that the inclusion of talking head presentations alongside slide presentations exhibited no significant difference in learning performance but showcased preferences among students for the instructor's face presence.

The flexibility of instructional videos in accommodating varied learning paces and preferences augments student control over their learning (Cohen, 2022). Students benefit from the convenience of accessing pre-recorded videos, allowing them to revisit and review materials as needed, fostering a sense of agency through pause, play, and rewind functionalities (Cohen, 2022). However, the effectiveness of these videos depends not only on their content but also on their relevance and context to the audience. Wood et al. (2020) emphasized that purpose-developed recorded videos specifically tailored for online students significantly enhanced their learning experience compared to repurposed lecture captures.

Furthermore, the integration of instructional videos aligns with contemporary student learning behaviours, promoting active participation and creativity (Boisvert, 2015; Stone, 2019). Digital video projects and online videos have been found to not only improve speaking abilities but also encourage creativity and diverse modes of expression (Boisvert, 2015; Jati, Saukah, & Suryati, 2019). These findings underscore the value of instructional videos in engaging students within the EAP context, providing a multifaceted approach to language learning and fostering active student involvement.

Data Tracking in VLEs

The significance of data tracking within VLEs cannot be overstated in the context of EAP. VLEs serve as expansive repositories of student interactions, offering a wealth of data that, when appropriately analysed, can yield profound insights into student learning behaviours, preferences, and needs (Hardy et al., 2004). The data generated within VLEs encompass a broad spectrum, ranging from user engagement metrics, time spent on specific tasks, to patterns in resource utilization (Huggins-Manley et al., 2019).

Through data tracking and analysis, educators can gain information of how students interact with course materials. Alves (2015) and Kuzilek et al. (2018) emphasized the pivotal role of tracking student activities within VLEs, enabling educators to model student dropout rates and monitor performance trends. Podgorelec & Kuhar (2011) extended this by highlighting the potential for advanced data analysis within VLEs to monitor student performance comprehensively.

Moreover, the use of data mining techniques within VLEs has shown promise in identifying not just the engagement levels but also learning patterns and misconceptions among students (Podgorelec & Kuhar, 2011). This information equips educators with the insights needed to tailor instructional strategies, identify areas requiring additional support, and even predict student outcomes.

Research Questions

Given the multifaceted potential of data tracking within VLEs in optimizing EAP course delivery, this study aims to use data tracking methods within the context of Year 1 EAP at XJTLU to investigate student engagement with the provided asynchronous materials. To narrow our focus and harness the insights gleaned from data tracking methodologies, the following research questions are posed:

1. How does data tracking provided by Moodle provide insight into student engagement with asynchronous learning materials?
2. What specific insights can be gained from student engagement data in XJTLU's Y1 EAP context?

Methodology

Student Numbers/Characteristics

The study was conducted on a Year 1 Undergraduate EAP module with 3,957 students during semester 2. The course was mandatory for all Y1 students and the required course exit was CEFR Low B2. Learning outcomes cover all four macro skills listening, reading, speaking and writing and it is taught across three 100-minute sessions a week in smaller groups up to 27 students.

Asynchronous VLE Design Approach

The module of this size requires a large number of EAP lecturers and due to COVID-19 pandemic, it was challenging to provide the required number of staff to support the delivery. The number of full-load lecturers needed to teach on the module had to be reduced from 80 to 53. The decision was made to create a blended curriculum with two independent, online asynchronous lessons per week to reduce the strain on staffing.

The structure of the Integrated Syllabus

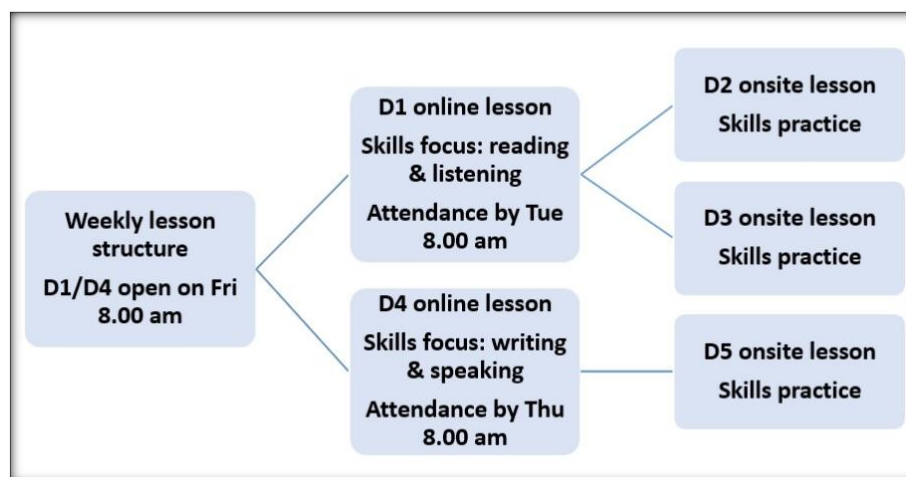
The weekly lesson structure comprised two online lessons (D1: 80-100 minutes and D4: 50 minutes) and three 100-minute onsite lessons. Online lessons introduced a particular skill with set homework and onsite lessons served as reinforcement and skills practice. The weekly structure can be seen in Figure 1 below.


Figure 1: Weekly Lesson Structure

Individual online lessons consisted of an instructional video introducing a skill with lecturer face and subtitles, a video comprehension quiz, and 1-2 practice quizzes depending on the number of individual skills practised. Each lesson was rounded off with a homework task sheet – usually a writing or a speaking preparation assessed in the corresponding synchronous class.

A Moodle attendance plugin was used to automatically take attendance for asynchronous lessons upon completion. A number of activity completion restrictions were used to ensure students only got attendance if they completed a whole lesson. For example, a student would only have access to the following activity if the previous one was completed. In case of Moodle quizzes, the completion requirement was 40% accuracy in responses to questions.

Data Tracking Approach

The lesson completion and student engagement were consistently tracked on weekly basis throughout the semester via Moodle analytics through several aspects. First, completion reports were generated for timely lesson completion within given timelines for attendance purposes. Secondly, another set of the reports were generated monitoring general student engagement with online content. Further, individual activity completion reports were generated for each week to gain insight into the completion trends within the individual asynchronous lessons. Over the course of the semester, the reports were used to monitor students' engagement and performance, and to follow up with the students with low performance. At the end of the semester all the data provided by Moodle was analysed and studied.

Results

The learning analytics revealed, contrary to a predisposed belief, that students' motivation for completing online lessons was not solely driven by getting attendance marked for the lessons. It can be seen in Figure 2 that the completion rate continued increasing after the attendance deadline had passed. Further, the graphs show that the student completion rate was higher for D1 than for D4 lessons. This was surprising considering that D4 lessons were shorter.

Figure 2: Lesson Completion Reports for W4 – 14

Next, we investigated the individual lessons to gauge whether the students were completing whole lessons and, as it can be seen in Figure 3, this was mostly not the case. Students tended to watch the instructional video, but they would not necessarily complete the follow up activities.
Figure 3: Individual Activity Completion Trends

Given the results above which indicated that the students were more likely to engage with instructional videos, we wanted to look at how students engage with the video content. Since all the video content was uploaded to Moodle via MediaSite, their analytical tools were used to look at video viewing trends. For the purposes of this study, one video was chosen to study the viewing trends namely one of the three provided model presentations which served as a preparation for assessed speaking coursework. MediaSite analytics offered comprehensive data for viewed video content.

MediaSite analytics clearly showed that the video showing the model presentation was viewed 15,794 times by 2,257 students over the semester. This equalled to over 324 hours of viewing for a video of 5 min and 22 seconds.

Total views: S2 AY21/22	15,794
Total time watched	324:29:19
Video duration	5:22
No. of users	2,257

Table 1: Model Presentation Video Views

Further, we looked at the data showing which video segments were most frequently viewed and the number of the times individual students watched the video. See Figure 5 below.

TOTAL VIEWS PER LENGTH

VIEWING TRENDS: S2 AY21/22
Figure 4: Viewing Trends of the Model Presentation

Finally, one representative student was chosen who viewed the video 23 times and the student's engagement with the video across the semester was analysed. The data was extracted from MediaSite analytics from the student's access logs. The Table 1 below shows the duration and the instances of watching the video in relation to key assessment dates during the semester.

Week	Access date/time	Time spent watching	Key dates
W1	2/21/22 12:04 AM	10:44	Sample presentation available
W1	2/24/22 11:08 PM	05:22	
W7	4/9/22 2:46 AM	03:02	Reading week
W7	4/9/22 3:22 AM	00:31	Formative SCW task sheet released in W6
W7	4/9/22 3:50 AM	05:08	
W7	4/9/22 11:01 PM	02:32	
W7	4/9/22 11:32 PM	01:29

Discussion

VLEs and Asynchronous Learning Design

The integration of blended learning strategies within EAP courses at XJTLU reflects an evolution responding to the global shift towards VLEs and bilingual instruction (Gill & Kirkpatrick, 2013). Asynchronous EAP learning environments, enriched with multimedia resources and interactive activities (Sun & Xu, 2012), have proven instrumental in nurturing language skills and academic competence among students (Hadijah & Shalawati, 2021). This aligns with the paradigm shift towards digital landscapes in education, underscoring the importance of incorporating innovative pedagogical tools such as exemplar videos (Achaleke, 2021; Shalawati et al., 2021).

The strategic incorporation of exemplar videos into EAP modules in the Year 1 EAP course at XJTLU signifies an intentional effort to immerse students in authentic academic discourse and presentation styles (Achaleke, 2021). These videos serve as models for effective communication, offering tangible examples of academic language use and presentation techniques (Hadijah & Shalawati, 2021). Furthermore, instructional videos within EAP courses have redefined the learning experience, catering to diverse learning preferences and enhancing student engagement (Chen & Wu, 2015; Lyons et al., 2012). The adaptability of these videos allows students to control their learning pace, fostering active participation and creativity (Boisvert & Rao, 2015; Cohen, 2022).

VLEs and Data Tracking

The transformative potential of VLEs lies not only in their instructional methodologies but also in the wealth of data they generate (Hardy et al., 2004). Data tracking within VLEs, as highlighted by Alves (2015) and Kuzilek et al. (2018), offers invaluable insights into student engagement patterns and performance trends. The comprehensive data analytics facilitated by VLEs enable educators to tailor instructional strategies, predict student outcomes, and identify areas requiring additional support ((Podgorelec & Kuhar, 2011). This resonates deeply with our study's findings regarding the utilization of Moodle analytics to track student engagement within asynchronous EAP lessons.

The data tracking analysis conducted during this study revealed intriguing patterns in student engagement with asynchronous learning materials at XJTLU. Contrary to initial assumptions, students' motivation for lesson completion extended beyond mere attendance marking, evidenced by increasing completion rates post-attendance deadlines (Figure 2). However, an interesting disparity emerged between completion rates for different lessons (Figure 2), indicating a complex engagement pattern that warrants further exploration.

Our study also investigated the depth of student engagement with instructional videos, particularly a model presentation video critical for an assessed speaking coursework. MediaSite analytics provided rich data reflecting extensive viewership and varied patterns of video segment engagement (Figure 5). Notably, one student's comprehensive engagement with the model presentation video, viewing it 23 times, revealed a deep immersion strategy evident around key assessment dates (Table 1).

These findings underscore the complexity of student engagement within asynchronous EAP learning environments and emphasize the multifaceted nature of data tracking within VLEs.

They reaffirm the potential for data analytics to illuminate pathways for enhancing pedagogical strategies and optimizing student learning experiences (Podgorelec & Kuhar, 2011). However, they also highlight the necessity for a more holistic understanding of student engagement patterns to inform future instructional design and interventions effectively, which could be achieved by qualitative and quantitative research methods informed by data tracking based research.

In light of these findings, the research questions posed in this study lay a solid foundation for future investigations into the intricacies of data tracking within VLEs, particularly within the context of EAP at XJTLU. Through the use of data tracking, the complexities of student engagement and learning behaviours within these digital landscapes may be begun to be unravelled, and educators can further refine their pedagogical approaches and harness data-driven insights to foster optimal learning experiences.

Conclusion

The exploration into data tracking within XJTLU's EAP modules within VLEs has unearthed valuable insights into student engagement and learning behaviours. The findings underscore the transformative potential of leveraging data analytics to optimize pedagogical strategies and enhance student learning experiences.

Key Recommendations

Enhanced Understanding of Engagement Patterns: Further studies should investigate further qualitatively into the nature of student engagement within asynchronous EAP lessons. This includes exploring varied completion rates across different lessons and deciphering the motivations driving engagement beyond mandatory attendance marking.

Fine-Tuning Instructional Video Integration: Educators can refine instructional video strategies by studying viewer engagement patterns more comprehensively. Tailoring video content and structure to align with students' learning behaviours and key assessment dates can enhance their efficacy.

Holistic Approach to Data Tracking: Implementing a holistic approach to data tracking within VLEs, beyond lesson completion rates, can provide further insights into student learning behaviours. Exploring additional metrics and engagement indicators can enrich the insights gained from analytics.

Limitations

Scope and Generalisation: This study focuses on a specific EAP module at XJTLU, limiting the generalizability of findings to other contexts. Future studies across diverse modules and institutions could provide a broader perspective.

Technical Constraints: The study relies on data generated by Moodle analytics and MediaSite tools, which might have inherent limitations in capturing certain aspects of student engagement and learning behaviours.

Contextual Specificity: The nature of student engagement within asynchronous EAP environments may be influenced by context-specific factors, such as cultural backgrounds or prior educational experiences, which this study does not extensively cover.

In conclusion, while this study provides valuable insights into data tracking within VLEs and its impact on student engagement within the EAP context, it also highlights the need for continued exploration and refinement. By embracing data-driven insights and refining instructional methodologies based on observed engagement patterns, educators at XJTLU and beyond can further optimize the delivery of EAP courses and enhance student learning outcomes.

Abstract

Quadratic equation is considered as the most challenging mathematics topic for secondary high school students in various countries, including Indonesia. Studies have been done to identify challenges in the teaching and learning of this topic. The three most common challenges discovered include dull teaching method that does not encourage active learning, difficulty in obtaining conceptual understanding on quadratic equations and its associated information, and difficulty in interrelating different solution methods, including the factor form, vertex form and graphical representation. Teaching aid in the form of digital technologies is commonly proposed to address these challenges. However, existing media may not fully address all the discovered challenges. Moreover, digital media adds additional challenges in the form of various distractions that can hinder students' focus in learning the material. Therefore, this paper discusses the development of a digital teaching aid that is specifically designed to help learn quadratic equations by mapping challenges to features of the digital media. As a result, an offline computer software has been developed with the following five features: it supports both English and Bahasa Indonesia, it has well-defined input mechanisms for ease of use, it is able to generate graph automatically from a given quadratic equation and highlight it with associated information of the equation, it has an "Exercise" menu with a simple game to maintain students' interest, and it has three "Form" menu to interrelate various forms of a quadratic equation complete with sliders to experiment with coefficients of a quadratic equation.

Introduction

As a subject that is used in various disciplines (Kim How et al., 2022), particularly in science, technology, and engineering (Reid O'Connor & Norton, 2022), mathematics is commonly considered as a compulsory subject for secondary school in various countries. In Indonesia, mathematics is not only a compulsory subject, but also the subject with the most study hours (Anggraini & Kartini, 2020). However, even with this much emphasis on mathematics, many students still find it to be a difficult and terrifying subject (Anggraini & Kartini, 2020; Fatoni et al., 2017; Tanu Wijaya et al., 2020). One topic that proves to be a challenge for secondary school students is algebra, which may be caused by its abstract nature (How et al., 2022). Students struggle to understand the concept of variables and how to solve equations with variables. Evidence can be seen from various research that showed algebraic mistakes made by students in solving related problems (Kim How et al., 2022; López et al., 2016; Reid O'Connor & Norton, 2022; Vaiyavutjamai & Ken Clements, 2006; Zakiyah et al., 2021). This problem needs to be addressed since algebra is one of the main components in mathematics and is considered as a key requirement to enter higher education (How et al., 2022). This becomes a concern since the difficulty in learning basic mathematics in junior secondary years may in turn reduce the number of students learning advanced mathematics subjects in later years (Reid O'Connor & Norton, 2022). Not having the necessary human resources will eventually hinder the development of science, technology, and engineering.

Among all algebraic topics taught in secondary school, quadratic equation is considered as the most challenging (Kim How et al., 2022). Various research has been conducted on the topic of quadratic equation in various countries, such as Australia (Reid O'Connor & Norton, 2022), Thailand (Vaiyavutjamai & Ken Clements, 2006), Puerto Rico (López et al., 2016), Malaysia (How et al., 2022; Kim How et al., 2022), America (Faghihi et al., 2017), and Indonesia (Anggraini & Kartini, 2020; Fatoni et al., 2017; Hidayah, 2020; Zakiyah et al., 2021). The recurring topic among the research is the difficulty faced by students and teachers in teaching and learning quadratic equations. Some difficulties that were repeatedly found are students' understanding of the concept of quadratic equation, the concept of a solution to a quadratic equation, and the various forms of quadratic equation. It is noteworthy that these difficulties persist over time, as evidenced by the same finding from research in 2006 (Vaiyavutjamai & Ken Clements, 2006) and in 2022 (Reid O'Connor & Norton, 2022). This is of high concern because quadratic equation is widely used in real-life situations and other disciplines, is helpful in establishing a connection among mathematical topics (How et al., 2022; Kim How et al., 2022), and is fundamental in understanding advance topics in mathematics (López et al., 2016; Reid O'Connor & Norton, 2022). Failing to understand basic mathematics concepts, such as quadratic equation, has long-term effects that can lead to misconceptions in other topics since topics in mathematics are interrelated (How et al., 2022).

One potential solution believed to help students learn quadratic equation is the utilization of technology (Vaiyavutjamai & Ken Clements, 2006). In fact, the use of various forms of digital technologies in mathematics education has been proven to be beneficial (Alabdulaziz, 2021). Some of the benefits include facilitating experimentation and increasing motivation in learning mathematics. The need of a teaching aid in quadratic equation has also been proposed in various recent research (Fatoni et al., 2017; How et al., 2022; Kim How et al., 2022; Vaiyavutjamai & Ken Clements, 2006). To answer this need, this paper discusses the development of a digital teaching aid in the form of computer software to help teaching and learning of quadratic equations. The resulting digital media provides a way for students to face common difficulties in understanding quadratic equations and grasping the meaning

behind each coefficient in various forms of quadratic equations through graphical representation. Thus, students can observe and experience the effect of each coefficient in a quadratic equation.

The remainder of this paper is organized as follows. Chapter II discusses previous research on the teaching and learning of quadratic equations in various countries. Challenges found in previous research are then listed and mapped to the requirements of the software in Chapter III. The resulting software is discussed and shown in Chapter IV. Chapter V contains concluding remarks.

Literature Review

Study on the teaching and learning of quadratic equations has long been conducted. In 2006, a study with 231 Grade 9 students in two government secondary schools in the Chiang Mai Province in Thailand was conducted (Vaiyavutjamai & Ken Clements, 2006). The teaching method used was the traditional teaching approach where teachers act as the primary source of information while students listen and follow given instructions. This approach was commonly used in many countries at that time. After analyzing the test results of 231 students along with the transcripts of interviews with 18 selected students, it was found that most students have problems in conceptual understanding of quadratic equations, especially on the notion of variables and solutions of a quadratic equation. The writers suggested the use of modern technology to help students in learning the material, particularly one that can generate graph of a function and pinpoint the important information of that function.

Various other studies have also been performed in more recent years in various countries. In Australia, a study was carried out with 25 Year 11 students from a coeducational high school in Queensland (Reid O'Connor & Norton, 2022). Written tests and diagnostic interviews were used to discover students' lack of conceptual understanding and problem-solving abilities. The challenges found were summarized into four main topics, which are the null factor law, nature of quadratics, algebraic conventions, and solving techniques. It is important to note that the same mistakes were made by students in this research and the previous one. Similar problems were found in another study conducted in Puerto Rico with eight beginning college students and 121 science and engineering student who took multivariable calculus course (López et al., 2016). Students in the study failed to understand the meaning of solutions of quadratic equations and the relationship between different solution methods for quadratic equations.

In line with the previous studies, some studies in Indonesia observed similar problems (Anggraini & Kartini, 2020; Hidayah, 2020; Zakiyah et al., 2021). The three studies conducted in three different cities in Indonesia found common difficulty faced by students in learning quadratic equations, that is interrelating different forms of quadratic equations to find solutions, both in factor and vertex forms. Moreover, two of the studies confirmed (Hidayah, 2020; Zakiyah et al., 2021) that students in their study had a hard time understanding conceptually the meaning of quadratic equations and their solutions. It is noteworthy that traditional teacher-centered approach is still widely used in Indonesia (Fatoni et al., 2017; Lan et al., 2021), which might also be the reason for the lack of conceptual understanding due to overemphasis on procedural knowledge in symbol manipulation, as suggested in (Reid O'Connor & Norton, 2022; Vaiyavutjamai & Ken Clements, 2006). The problem of teacher-centered approach was also observed in a study with 38 Grade 8 students in Jember, East Java (Fatoni et al., 2017). The authors commented on teacher-centred

approach that does not encourage students to be actively engaged in learning as the reason why students perceived mathematics subject as difficult. They proposed to use simple and exciting teaching and learning media to increase students' motivation in learning mathematics. This reasoning was also supported by another study with 10 Grade 9 students in Bangkinang, Riau (Anggraini & Kartini, 2020). In one study on gamification of statistical material, the use of interesting teaching and learning media increased students' engagement and motivations, which in turn resulted in better comprehension of the material (Rembulan & Putra, 2018).

Previous research already hinted on the use of digital technologies to help the teaching and learning of quadratic equations. In general, the utilization of digital tools to improve mathematics and science learning have been discussed and proven (Hillmayr et al., 2020). The study concluded that secondary school students who were taught using digital tools in science or mathematics classes had significantly more positive attitudes toward the subjects than their counterparts. Another study had also investigated the benefits of using various forms of digital technologies in mathematics education (Alabdulaziz, 2021). The author interviewed 120 mathematics teachers and found some benefits. Some notable ones are its potential to motivate and excite students by making mathematics more interesting and meaningful, improve learning, facilitate active learning through experimentation that enable students to better relate functions to graphs, encourage students to learn more, and provide in-depth learning strategy.

In the teaching and learning of quadratic equations, few research have been done to investigate the benefits of using digital media. Hawgent dynamic mathematic software was used to teach quadratic equations in (Tanu Wijaya et al., 2020). According to the research, students who were taught using the software were able to visualize and generalize the graphical form of a quadratic equation more effectively than those who were taught using traditional methods. However, the majority of the Hawgent dynamic mathematics software materials were still written in Chinese, which makes it less suitable to be used globally, particularly in Indonesia.

Another form of digital media was developed in the form of a game in (Faghihi et al., 2017). The study pointed out lower anxiety levels for adult participants who played the game compared to others who just waited before they were asked to solve a quadratic equation problem. However, the game itself did not have elements that could help students relate different solving methods, especially between a function and its associated graph. Moreover, an observation by (How et al., 2022) indicated that secondary school students are easily distracted with irrelevant elements on a digital media, which commonly exist in a game to build an exciting gaming environment.

Another approach was used in (Fatoni et al., 2017) that integrated GeoGebra to an online learning platform in Indonesia called KelasKita. GeoGebra is an online computer algebra system (CAS) that can help learn mathematics for all levels of education, while KelasKita is an online learning platform where teachers can interact with students through various features, such as forum, quiz, chat, etc. The study showed that the resulting online digital media was deemed interesting and motivating by the students. The author also verified the effectiveness of the media by showing that 89.5% of the students successfully passed the minimum required score for a test in quadratic equations. However, GeoGebra is an online CAS that is not specifically intended for learning quadratic equations. There are a lot more features for other topics that can be accessed and experimented with on GeoGebra, which may become a

distraction for students. This is in line with another observation by (How et al., 2022) that indicated secondary school students are easily side-tracked when they browse through online learning media, particularly YouTube. Another consideration is the availability of internet connection in developing countries, as observed in (How et al., 2022). Moreover, there is no readily available feature that can interrelate various forms of quadratic equations, particularly the factor and vertex forms.

Although digital media has been generally accepted as a teaching aid that can help students in learning mathematics, only a few research has attempted to develop one that can specifically address previously studied challenges in learning quadratic equations. In addition, the use of digital media to help teach mathematics is not a common practice in developing countries (Tanu Wijaya et al., 2020), including Indonesia. Therefore, this paper discusses the development of digital media with features that specifically mapped the challenges that have been identified from previous research. The research question that will be covered in this paper is how to develop a digital teaching aid that could help students face common challenges in comprehending quadratic equations.

Teaching Aid Design

Based on previous studies, the three most common problems in the teaching and learning of quadratic equations are the lack of conceptual understanding (Hidayah, 2020; How et al., 2022; Kim How et al., 2022; López et al., 2016; Reid O'Connor & Norton, 2022; Vaiyavutjamai & Ken Clements, 2006), the lack of ability to build connections among different solution methods (Anggraini & Kartini, 2020; Hidayah, 2020; López et al., 2016; Reid O'Connor & Norton, 2022; Zakiyah et al., 2021), and the use of dull teaching methods (Anggraini & Kartini, 2020; Kim How et al., 2022; Vaiyavutjamai & Ken Clements, 2006). Moreover, two additional problems from using digital media in developing countries need to be considered, which are students' limitation in accessing internet and resources in their language, and also and their tendency to get easily distracted and side-tracked with irrelevant contents (How et al., 2022). These problems are summarized and mapped to requirements in Table 1.

Conceptual understanding is defined as knowing both what to do and why as opposed to procedural understanding that is loosely defined as rules without reason (Vaiyavutjamai & Ken Clements, 2006). In terms of quadratic equations, misconceptions can occur on the concept of variables, solutions, and roots. Many students find difficulties in explaining the meaning of each component in the quadratic equation (Reid O'Connor & Norton, 2022; Vaiyavutjamai & Ken Clements, 2006). They may be able to solve the equation without understanding the meaning of their solution. In addition, these students may not be able to associate the equation with the graph as suggested in (López et al., 2016). Solving a quadratic equation and representing it in a graph are two sides of the same coin. Therefore, it is crucial to provide both equations and their graph simultaneously. Moreover, important information, which is intercepts and the extreme point, needs to be highlighted to help students in realizing the meaning of those.

Quadratic equations can be represented in various forms, such as standard form, factor form, vertex form, and graphical representation.

$$\text{standard form} \quad : \quad y = ax^2 + bx + c,$$
$$\text{factor form} \quad : \quad y = a(x - x_1)(x - x_2),$$
$$\text{vertex form} \quad : \quad y = a(x - x_v)^2 + y_v.$$

Each form emphasize different important information, and thus it is important for students to become familiar with each form and to identify which form is best for their needs. However, as evidenced in (López et al., 2016), students often find it difficult to express quadratic equations in factor or vertex form. Consequently, students tend to use inefficient procedures to obtain the required information that should be easily seen when students use the appropriate form. In addition, notice that each form has a different set of coefficients, which may cause confusion in relating the forms. To address these problems, the teaching aid should provide a way to represent a quadratic equation in those four forms as well as to display the relationships between coefficients in other forms. This requirement is consistent with the findings in (How et al., 2022; López et al., 2016) that suggested students should be able to explore alternative answers to improve their understanding of quadratic equations.

Teaching methods have a significant influence on students' comprehension, as supported by earlier findings. The use of teaching approaches that focus on procedural knowledge leads to students overlooking conceptual understanding (Reid O'Connor & Norton, 2022; Vaiyavutjamai & Ken Clements, 2006), which has been discussed in the previous paragraph. Another finding from (Anggraini & Kartini, 2020; Fatoni et al., 2017; Kim How et al., 2022) stated that dull teaching method that heavily stressed on teacher's explanation caused students to become passive and unmotivated. This needs to be addressed since (Alabdulaziz, 2021; Rembulan & Putra, 2018) have shown positive relationship between students' motivation and their comprehension. Hence, it is imperative that the teaching aid must be interesting and interactive to encourage students to actively experiment and explore the material.

Although the use of digital media in teaching mathematics has been proven to be beneficial, a study by (How et al., 2022) observed some drawbacks in the form of accessibility and distractions. The study mentioned students' difficulty in accessing the internet at home for self-study, which is also a common problem in Indonesia. Even after having Internet access, students faced difficulties in finding the right resources that match their linguistic ability. Another problem discovered is students' tendency to get easily distracted and side-tracked with irrelevant content, either other online content or elements in the digital media itself. To overcome these problems, an offline digital media needs to provide both English and Bahasa Indonesia. Moreover, to minimize distraction, the interface should be simple and intuitive. Ease of use has been suggested to increase students' motivation to learn (Fatoni et al., 2017).

Challenges	Requirements	Additional References
Inability to obtain conceptual understanding.	A mechanism to visualize a quadratic equation into graph complete with its associated information.	(Hidayah, 2020; How et al., 2022; Kim How et al., 2022; López et al., 2016; Reid O'Connor & Norton, 2022; Vaiyavutjamai & Ken Clements, 2006)
Difficulty in interrelating different solution methods.	A mechanism to represent a quadratic equation in various forms and to display the effect of changing a coefficient in one form to other forms.	(Anggraini & Kartini, 2020; Hidayah, 2020; López et al., 2016; Reid O'Connor & Norton, 2022; Zakiyah et al., 2021)

Challenges	Requirements	Additional References
Dull teaching method.	Interesting and interactive teaching aid.	(Alabdulaziz, 2021; Anggraini & Kartini, 2020; Fatoni et al., 2017; Kim How et al., 2022; Rembulan & Putra, 2018)
Difficulty in accessing the internet and finding resources in their languages.	An offline teaching aid that uses both English and Bahasa Indonesia.	(How et al., 2022)
Tendency to get easily distracted and side-tracked with irrelevant contents.	Simple and intuitive interface.	(Fatoni et al., 2017; How et al., 2022)

Table 1: Mapping from Students' Challenges to Requirement

Implementation

To ensure that the digital teaching aid can address all studied challenges, each requirement in Table I is then derived into features. First, note that from the fourth requirement, an offline teaching aid may be desirable since it has less distractions. Hence, the teaching aid is developed in the form of an offline computer application. Moreover, as stated in the requirements, users will be able to choose their preferrable language, either in Bahasa Indonesia or English. When the application is first launched user will be prompted to choose the language as shown in Figure 1. In this paper, however, the application will be shown only in English.
Figure 1: A dialog to choose between English and Bahasa Indonesia

The offline computer application is made to be simple and intuitive as required in the fifth requirement. In total, there are five menus in the application, which will be explained in the next few paragraphs. To ensure simplistic interface, each menu has a consistent design that consists of two panels. The panel on the left is used to input and control the quadratic equations, while the one on the right will display the graph of the given equations. To provide an intuitive interface, the application provides textboxes as the main input mechanism where users can enter the coefficients. Furthermore, clear error messages will be shown for every incorrect input. Figure 2 shows an example of an error message when users' input is not a number.
Figure 2: An error message when users' input is not a number

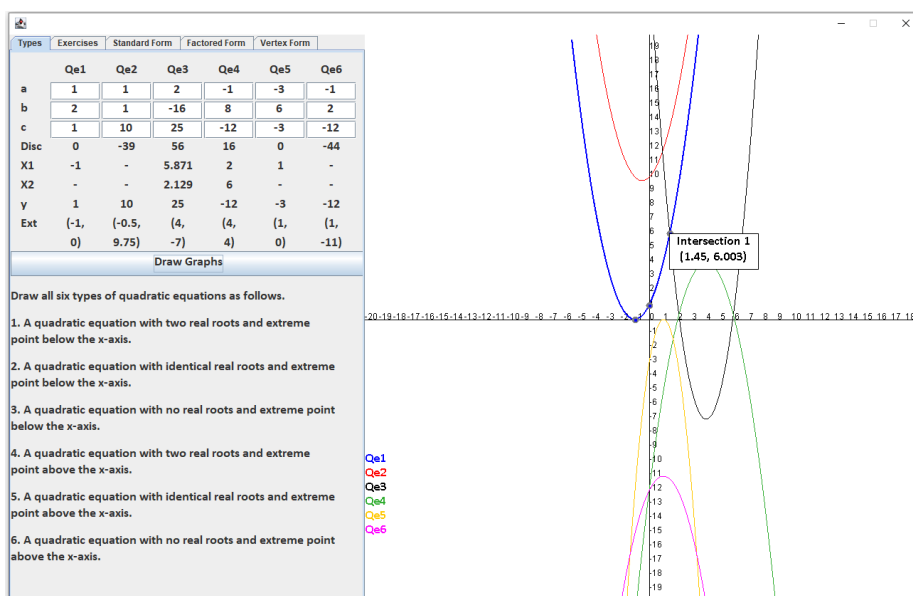
The next feature is developed to fulfill the first requirement, that is to show the equations and their graph simultaneously. A menu is specifically designed where users can specify at most six quadratic equations to be compared. The associated graphs will be displayed after users click the "Draw Graph" button. Each displayed graph can then be clicked to show the important information regarding the equation, which includes the intercepts, extreme points, and any intersections among the graphs. The actual coordinate of each point will appear when users click the point. This "Types" menu and its features can be seen in Figure 3.


Figure 3: The interface for the "Types" menu

Figure 4: The interface for the three "Forms" menu

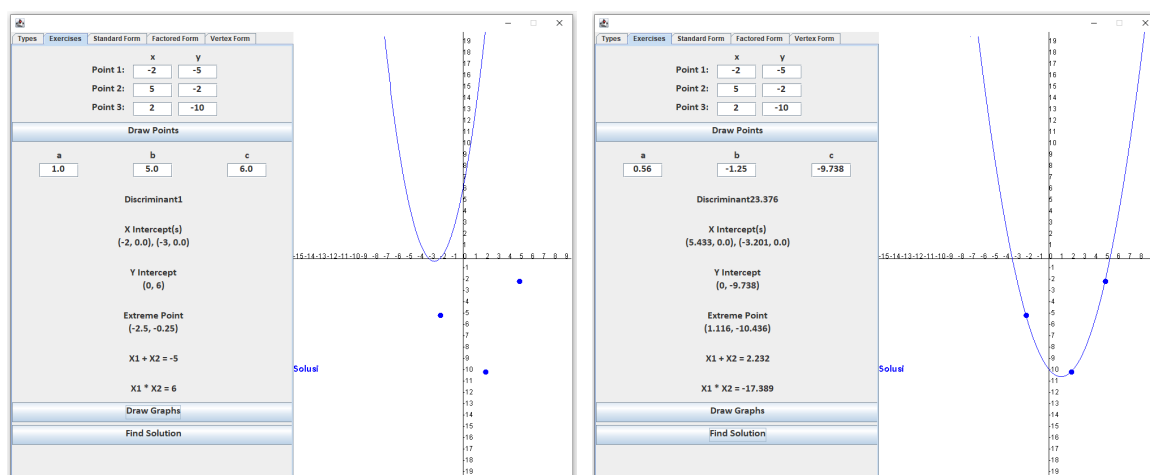
The second menu consists of three other menus to show the different forms of a quadratic equation, which is standard, factor, and vertex forms. These menus are meant to help students understand the relationship between the three forms. Through these menus, teachers can emphasize the different important information inherent in each form. These menus can also help students in see how each quadratic form can be used to find solutions of the quadratic equations. In addition, users should be able to experiment with the coefficients in one form and see how it affects the other quadratic form, which may enrich users' comprehension on interrelating different forms of a quadratic equation. Figure 4 displays these three "Form" menus.


Figure 5: The interface for the "Exercise" menu. The left shows the graph from students' input in the textboxes. The right shows the solution when the "Find Solution" button is clicked.

To provide an interesting and interactive teaching aid, sliders are used to ease the users in experimenting with each coefficient in each quadratic form, as can be seen in Figure 4. This reasoning is also supported in (Fatoni et al., 2017). Aside from that, the last menu called "Exercises" is developed with a simple game where teachers can assign three points and students can guess the quadratic equation that passes the given points. Students input their answer in the textboxes and click the "Draw Graph" button to see whether they give the correct answer. A "Find Solutions" button is provided to help solve the game by calculating the correct coefficients and drawing the associated graph. This menu is displayed in Figure 5. A summary of the derived features is given in Table 2.

Requirements	Features
An offline teaching aid that uses both English and Bahasa Indonesia.	Offline computer software that supports both English and Bahasa Indonesia.
Simple and intuitive interface.	An interface with well-defined input mechanisms, consistent design, and clear error message for each incorrect input.
A mechanism to visualize quadratic equations into graphs complete with its associated information.	Menu "Types" with automatic graphs-generation from given quadratic equations where each graph can be clicked to display associated information.

Requirements	Features
A mechanism to represent a quadratic equation in various forms and to display the effect of changing a coefficient in one form to other forms.	Three "Form" menus where users can enter and modify a quadratic equation in one form and see how it is represented in other forms.
Interesting and interactive teaching aid.	Menu "Exercises" with a simple game where teachers can assign three points and students can guess the quadratic equation that passes the given points. Sliders are added in the three "Form" to help modify the quadratic equation.

Table 2: Mapping from Requirement to Features

Conclusion

A digital teaching aid in the form of offline computer software has been developed to address challenges in the teaching and learning of quadratic equations. A literature review was conducted to identify common challenges discovered in various studies from Indonesia and various other countries. Three common challenges were identified, which are inability to obtain conceptual understanding, difficulty in interrelating different solution methods, and dull teaching methods. In addition, the use of digital teaching methods was found to cause additional challenges in the form of accessibility and distraction. In total, there were five challenges that was addressed in this discussion.

The five challenges were mapped to five requirements. To improve students' conceptual understanding, the teaching aid is equipped with the mechanism to visualize a quadratic equation into graph that students can interact with to display its associated information. Afterwards, a mechanism to represent a quadratic equation in standard, factor, and vertex forms are necessary to overcome students' difficulty in interrelating different solution methods. Furthermore, the ability to interact with the coefficients and see the immediate effects on its visual representation can help students in building the relation among the three forms. The teaching aid should also be interesting and interactive to help students to have more motivation to explore and learn the materials. To make the teaching aid accessible to students in Indonesia, it should have Bahasa Indonesia support and be available offline. Moreover, simple and intuitive interface is required to reduce distractions in learning.

To fulfil the five requirements, five features are developed. First, the teaching aid is built in the form of offline computer software that supports both English and Bahasa Indonesia. Moreover, the software is made with well-defined input mechanisms, consistent design, and clear error message for each incorrect input to satisfy simple and intuitive interface. This software has three menus, "Types", "Form", and "Exercises". The "Types" menu enables users to enter several quadratic equations and visualize the graphs where each graph can be clicked to display associated information. The "Form" menu consists of three other menus for standard, factor, and vertex forms. Through these menus, users can enter and modify a quadratic equation in one form and see how it is represented in other forms. Sliders are added in the three "Form" to help modify the quadratic equation. Lastly, menu "Exercises" has a simple game where teachers can assign three points and students can determine the quadratic equation that passes the given points.

Instructional Design Model of Virtual Reality Digital Integration: An Experimental Case Study in Managerial Control Education

Jean-Yves Le Corre, Xian Jiaotong-Liverpool University, China

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

Virtual reality immersive learning technology is widely recognised for offering the potential for fully immersive environments that can enhance learners' cognitive development. This paper introduces instructional guidelines for the creation and integration into the learning design of pedagogically structured virtual reality digital content to support cognitive learning. The learning prototype created for the study simulates a series of situated work-life scenarios where the learners must reflect on their behavioural intentions in response to socio-cognitive conflicts encountered during learners' creation of their knowledge. A learning management system and an immersive virtual reality learning platform support the virtual constructivist learning environment. The learning prototype constitutes a valuable tool for researchers aiming to demonstrate that immersion in a reality based environment, engagement with complex and ambiguous situations and information, and interaction with space can significantly enhance learning performance. This study features a management accounting course where learners prepare a dashboard of performance indicators for a business organisation.

Keywords: Situated Cognition, Immersive Learning, Virtual Reality

The International Academic Forum
www.iafor.org

Introduction

Several studies have examined the effects of situated learning on knowledge acquisition and evidenced that learning in situated environments makes knowledge transfer more efficient and facilitates the acquisition of transferable knowledge in real-life contexts. The core assumption of situated cognition is that learning inherently ties to the social and cultural contexts in which it occurs. Immersion in a virtual environment, engagement with complex and ambiguous situations and information, and interaction with space can significantly enhance learning performance. Zheng (2010) compared learning performance between situated and traditional learning and found a positive correlation between situated learning and learner performance.

Situated cognition represents another challenge for instructional designers and educators because it requires balancing what is known and what is currently being experienced (the incoming information and new knowledge). Existing literature on socio-cognitive conflicts suggests that learners demonstrate various types of behavioral intentions in response to socio-cognitive conflicts when learners interact in groups to develop new knowledge (Cheng, 2014).

Conflict regulation is defined as the meaning people attribute to conflict when facing another's idea that contradicts their own. It determines the conditions under which confronting diverging ideas results in positive cognitive and relational outcomes (Darnon, 2019). Darnon (2019) argued that socio-cognitive conflicts benefit learning because conflict is regulated through specific mechanisms to ensure that the conditions under which confronting diverging ideas results in positive cognitive and relational outcomes are met. Truhlar (2018) investigated the factors that influence students' engagement in synchronous online discussions and found that assigning roles increases the proportion of critical student–student interactions.

Research Background

In managerial control and accounting, scholars have claimed that more research should be conducted to examine the integration of management accounting and psychology. Hall (2016) argued that focusing on the individual level and dynamic perspectives is necessary to drive further theoretical developments in management accounting research. He said: "A prominent feature of organizational-level studies is the lack of explicit attempts to theorize the psychological processes through which management accounting practices are expected to influence individual behaviour and, in turn, how individual behavior is expected to combine to influence organizational-level outcomes such as organisational performance" (p. 66). Research in contingency-based management accounting has evidenced that Managerial Control Systems (MCS) lie on a continuum between two alternative models of transactional or relational types, representing an organisation's dominant behavioural orientations or preferences. Townley et al. (2013) argued that performance measurement should integrate two dimensions of rationalization in social action: communicative rationality (the pursuit of reason in human affairs) on the one hand, which brings to light the justifications by which actions and policies are pursued, and rationalisation on the other hand (which represents the cognitive dimension of instrumental rationality to specify the means and ends of organizational actions and activities). The combination of the 'interplay' of those two dimensions constitutes an essential factor in constructing performance systems.

Research Objectives

Our study aims to develop a learning prototype, called *MPP business simulation,* to help design a learning process and propose an underlying socio-cognitive model of the twin dimensions of rationality in social action explained above to support the design of the learning process. In the *MPP business simulation*, learners prepare a dashboard of performance indicators and encounter a series of real-life scenarios to support cognitive learning in constructing performance measures. Those scenarios are intended to simulate situations where learners respond to socio-cognitive conflicts by adopting different types of behavioral intentions. The learning process reflects the interplay between instrumental and communicative rationality in social action which is necessary. Those scenarios are supported by immersive learning environments combining a dual infrastructure of a Learning Management System (LMS) and a Virtual Reality (VR) technology platform.

Learning Prototype

In the *MPP business simulation*, learners prepare a dashboard of performance indicators by encountering a series of situated scenarios supported by the Virtual Reality platform to enhance learners' cognitive development. Cognitive learning is driven by learners' behavioural intentions in response to socio-cognitive conflicts when learners interact in groups through knowledge construction. Participants are invited to answer questionnaires on their behavioural intentions before interacting in meetings with other participants and reflecting on their behavioural learning styles. They are also invited to receive feedback and guidance from mentors to assist and give advice on preparing for meetings. Situated scenarios in a structured learning process supported by a dual infrastructure of an LMS and a VR technology platform greatly help to enhance cognition among learners in the process of knowledge construction of performance measures.

The pedagogical approach employs a multi-faceted viewpoint encompassing the learning environment, processes, tasks, socio-cognitive, technological aspects, and learning design. Forum discussion allows learners to engage and discuss online to get answers to their questions or corresponding feedback. Interactions with fictitious roles like *MPP CEO Office* or *MPP CFO Office* cannot be supported in real-time in the VR platform via avatars but are made possible by using discussion forums in the LMS on an asynchronous basis. Those activities aim to facilitate feedback and advice to project teams along the different preparation steps of their business case. Correspondingly, the objective of feedback sessions is to facilitate the process of data requests in *MPP business simulation*. Figure 1. Below is an example of a situated scenario.

Figure 1: Situated Scenario (Department Meeting Virtual Space)

Socio-cognitive Model

The socio-cognitive model underlying the instructional design strategy and learning process design is based on the central assumption that the construction of performance measures should embed 'socially constructed' two opposite dimensions as part of the same rationalization process: reasoned justification and instrumental mastery. Fig 2 below describes this model.

Figure 2: Socio-cognitive Model

Research Avenues

It is suggested that the socio-cognitive model underlying the instructional design strategy and learning process design could be investigated further through a series of scenario-based experiments to test a causality model to determine psychological determinants of collaborative behaviours in knowledge construction of performance measures. The purpose is to determine psychological factors influencing collective behaviors when individuals participate in the construction of a set of performance measures (performance dashboard) for a business organisation. The experiment is conducted in three steps. At each step, all students are asked to complete survey questionnaires to measure their behavioural intentions and the antecedents' variables to those intentions. Those questionnaires are completed in around ten minutes right before the start of three specific types of learning activities (virtual meetings), which are critical to constructing performance measures in terms of social interaction. When answering the questionnaires, participants are presented with short scenarios and asked to indicate how they would prefer to respond to the scene and how they would prefer to interact with other participants. Those short scenarios replicate the same situations and context that participants would encounter in the learning activity right after answering the questionnaire to ensure that their responses are consistent with the context in which students are immersed. In the next step, students from the experimental group must attend learning activities to change their attitudes and perceptions of social norms (treatment). Those learning activities are supposed to help students reflect on their learning experience and understand the reasons and benefits of collaboratively engaging in the learning activities. The originality of the experiments relies on a particular research design using a Virtual Constructivist Learning Environment.

Conclusions

Tycho (2021) acknowledged a dearth of practical guidelines for learning design in immersive environments. *MPP business simulation* learning prototype attempts to bridge this gap, by advancing the field of instructional design and helping to formulate strategies, methodologies, and tools for cognitive learning vital for the success of immersive educational environments.

An Analysis of Students' Mathematical Thinking Through Task Sequence on Division in Classroom Using Open Approach

Sitthiwat Saripan, Khon Kaen University, Thailand
Narumon Changsri, Khon Kaen University, Thailand
Maitree Inprasitha, Khon Kaen University, Thailand

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

The purpose of this research aimed to analyze students' mathematical thinking that occurred in task sequence on division. The participants were 9 students in grade 4. The research methodology was qualitative method based on Lesson Study processes: collaboratively plan 5 research lessons, collaboratively do with include 4 steps of Open Approach: 1) posing open-ended problems, 2) students' self-learning, 3) whole-class discussion and comparison, and 4) summarizing by connecting students' mathematical ideas. Finally process was collaboratively reflection after lesson. Data collected from students' worksheet, textbook, and field note. The results showed that in mathematics classrooms using the Open Approach, students' mathematical thinking occurred in order of task sequence on division from all 4 characteristics which were 1) The specification of the tasks allowed students to discover the rules of division by seeing the relations of the symbolic sentences generated from the tasks, 2) The generalization of tasks prompted students to generalize the relations of division rules discovered in tasks with specificity, 3) The extension of the tasks allowed students to apply division rules to expand learning to solve division tasks of tens and hundreds, and 4) The integration allowed students to integrate the rules of division and also the division of tens and hundreds in order to solve the division of large numbers.

Keywords: Mathematical Thinking, Task Sequence, Open Approach

The International Academic Forum
www.iafor.org

Introduction

The purpose of mathematics education extends beyond the acquisition of numerical proficiency. It is a vital tool for fostering essential human qualities and nurturing a creative and competent citizenry equipped to enhance societal harmony (Mangao, Ahmad, and Isoda, 2017). The basic principle of learning mathematics is that student should learn by or for themselves, and in every class we teach the methods of developing mathematics, mathematical ideas, and its values for student's further learning. By teaching mathematical thinking consistently, we can prepare student to think by or for themselves (Isoda & Katagiri, 2012).

Teaching by Open Approach aims that all students can learn mathematics in response to their own mathematical power, accompanying with certain degree of self-determination of their learning, and can elaborate the quality of their process and products toward mathematics (Nohda, 2000). Inprasitha (2022) stated that he incorporated the Open Approach into the Do step of Lesson Study to generate students' independent learning and transform teachers' traditional teaching approach. A classroom using the Lesson Study and Open Approach is a mathematics classroom where teachers use the Open Approach as a teaching approach and use the Lesson Study as a way to improve the teaching approach (Inprasitha, 2015). The Lesson Study process consists of 3 steps: Step 1 collaboratively design lesson (Plan), Step 2 collaboratively observe lesson (Do) which includes 4 steps of the Open Approach: 1) posing open-ended problems, 2) students' self-learning, 3) whole-class discussion and comparison, and 4) summarizing by connecting students' mathematical ideas, and Step 3 collaboratively reflect on teaching practice (See) (Inprasitha, 2011, 2022).

The Center for Research in Mathematics Education at Khon Kaen University translated Japanese mathematics textbooks for use in schools implementing Lesson Study and Open Approach as innovations in teaching mathematics (Inprasitha, 2006). In the textbook, tasks and problems are arranged according to the curriculum sequence. A task with various possible solutions is presented to help student distinguish between what they have already learned and the aspects that are yet to be learned, rather than focusing solely on the answer to the specific task. To solve these tasks, student need to make the unknown understandable. The textbook employs a sequence of extension based on what the student have learned previously and teaches them how to extend mathematical ideas using this extension sequence (Isoda & Katagiri, 2012). This approach is supported by Isoda & Olfos (2021), who highlight the outstanding feature of the textbook-well-configured task sequences for extension and integration. The opportunity for extension and integration is a chance to reorganize their mathematics by comparing what they already knew and their developed mathematical ideas. At the moment of extension and integration on the task sequence, students are able to establish the significant meaning.

Mathematical ideas serve as the basis of content knowledge related to promoting and developing mathematical thinking. (Mangao, Ahmad, and Isoda, 2017). The most important ability that needs to be cultivated in order to instill in student the ability to think and make decisions independently is mathematical thinking (Isoda & Katagiri, 2012). The ability to think mathematically and to use mathematical thinking to solv eproblems is an important goal of schooling. In this respect, mathematical thinking will support science, technology, economic life and development in an economy. Such mathematical thinking is foundational in preparing student to navigate the complexities of the world with analytical and reflective minds. If teachers are to encourage mathematical thinking in students, then they need to engage in mathematical thinking throughout the lesson themselves (Stacey, 2007).

Purpose

The purpose of this research was to analyze students' mathematical thinking that occurred in task sequence on division.

Methodology

Context of Study

The researcher has been taught mathematics with the Lesson Study and Open Approach during the pre-service within teaching practicum school. Currently, the researcher is an in-service teacher in Thailand and has been implementing the Open Approach as a teaching approach to teach mathematics at the present school which is a small school.

The target group comprised 9 students from a total of 9 students in grade 4. These students were enrolled in mathematics classrooms that implemented the Open Approach for 1 semester and were taught by the researcher.

The research content on division for grade 4 students is derived from a mathematics textbook produced in collaboration with the Center for Research on International Cooperation in Educational Development (CRICED), University of Tsukuba, Japan, and the Center for Research in Mathematics Education (CRME), Khon Kaen University, Thailand. In this book, tasks on division, specifically focusing on division rules, are arranged in the following sequence:
1. The rules governing the relationship between divisors and quotients.
2. The rules governing the relationship between dividends and quotients.
3. The rules governing the relationship between dividends and divisors.
4. Apply division rules to solve problems involving the division of tens and hundreds.

Research Procedure

The research methodology was a qualitative method based on Lesson Study and Open Approach (Inprasitha, 2011, 2022):

Step 1: Collaboratively Plan: The Lesson Study group gathers to discuss and design a lesson, taking into consideration students' mathematical thinking, and determines open-ended mathematics problems from the task sequence on division in the grade 4 textbook.

Step 2: Collaboratively Do: The Do step is implementing the planned lesson. The Lesson Study group observes the learning activities with the aim of focusing on students' mathematical thinking. The Do step is incorporated with 4 phases of the Open Approach: 1) Posing open-ended problems is the process in which the teacher presents a problem situation as a task to the student making problem posing, 2) Students' self-learning is the step where students take action to solve their problems, 3) Whole-class discussion and comparison is the stage where students present their ideas to the class, engage in collective discussions, and compare different perspectives. This provides students with the opportunity to learn from their classmates' ideas, and 4) Summarizing by connecting students' mathematical ideas is connecting various student ideas that arise in class. The teacher and students summarize the lesson together based on students' mathematical ideas.

Step 3: Collaboratively See: The Lesson Study group would meet to collectively reflect on the learning activities they have observed.

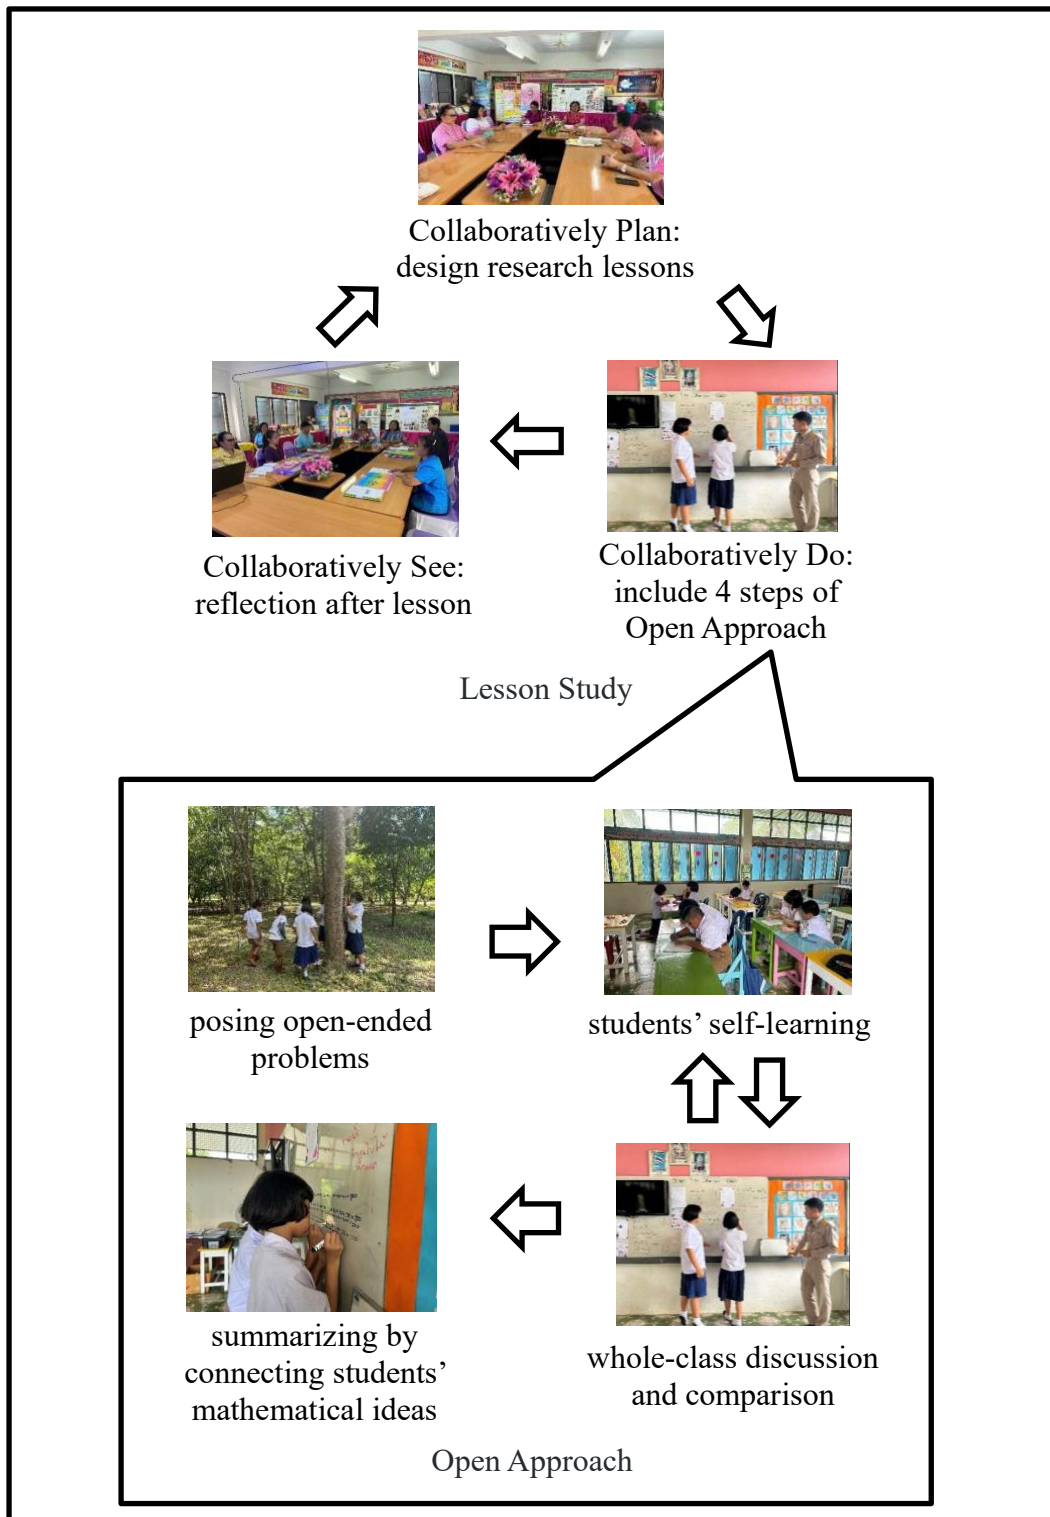

Figure 1: Research Procedure based on Lesson Study and Open Approach (Inprasitha, 2011, 2022).

Data Collection and Data Analysis

Data were collected from students' worksheets, textbooks, and field notes. The data were analyzed using the conceptual framework of Mangao, Ahmad, and Isoda (2017), which comprises the following components: 1) Specification, 2) Generalization, 3) Extension, and 4) Integration.

Results

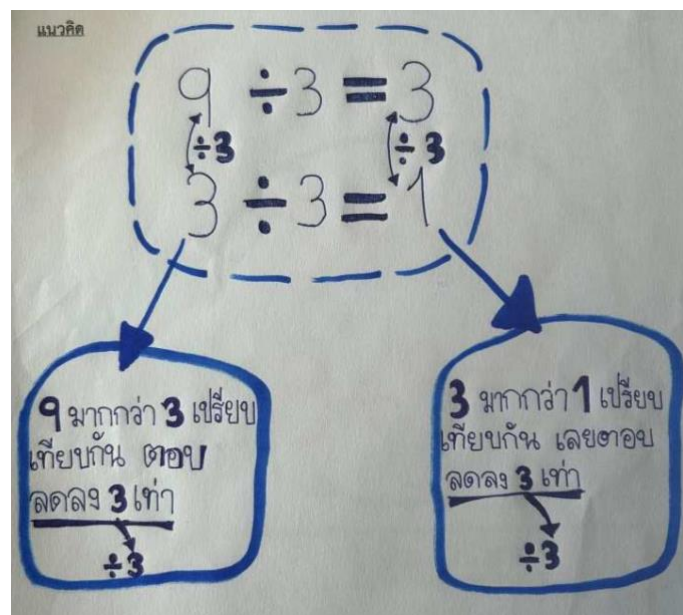
The research results, derived from empirical evidence collected in grade 4 mathematics classrooms using the Open Approach and implementing the task sequence on division from the grade 4 textbook, posing open-ended problems for students, students take action in solving their problems, students present their ideas to the class, engaging in collective discussions, comparing different perspectives, and summarizing by connecting students' mathematical ideas, demonstrate that students' mathematical thinking occurred in the order of the task sequence on division. These findings will be presented following the conceptual framework of Mangao, Ahmad, and Isoda (2017), encompassing all four characteristics, which are:

1. Specification: Students discover the rules of division by seeing the relations of the symbolic sentences generated from the tasks in Figure 2.

Figure 2: Tasks in textbook on Specification (Inprasitha et al., 2010).

In this task, the mathematical thinking of the students will be illustrated in Figure 3 and Figure 4.
Figure 3: Students' worksheet on Specification (1)

In Figure 3, Students discover the rules of division by examining the relationships in the symbolic sentences: $3 \div 3 = 1$ and $9 \div 3 = 3$. These symbolic sentences illustrate the rule of division that if the dividend is tripled, the quotient will triple as well.



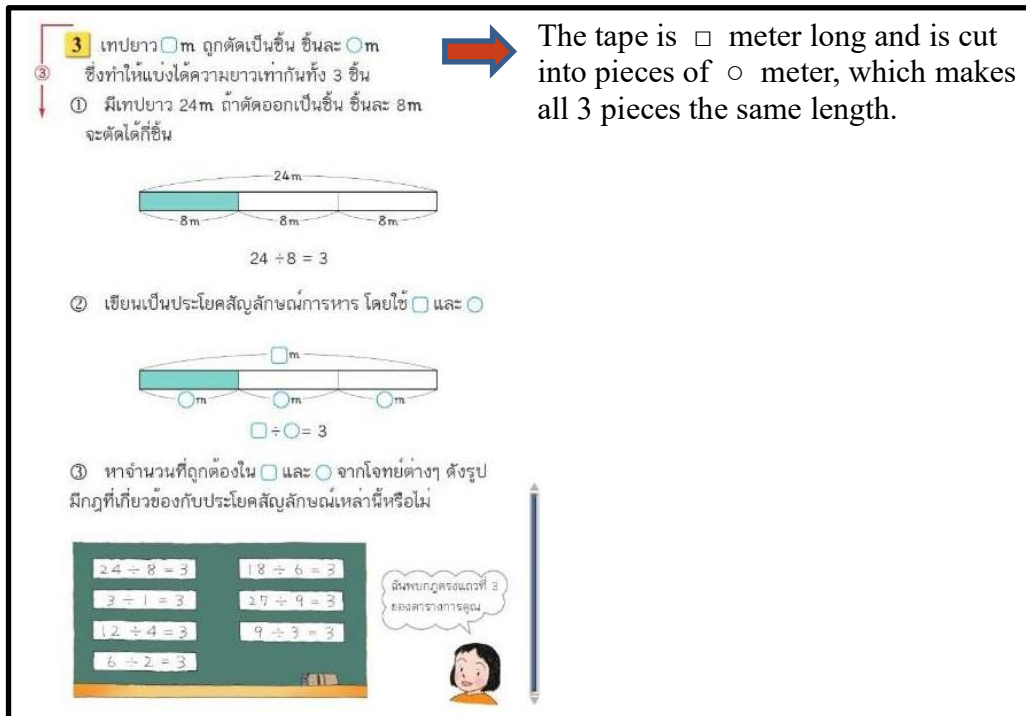


Figure 4: Students' worksheet on Specification (2).

In Figure 4, Students discover the rules of division by examining the relationships in the symbolic sentences: $9 \div 3 = 3$ and $3 \div 3 = 1$. These symbolic sentences illustrate the rule of division that if the dividend is divided by 3, the quotient will also be divisible by 3.

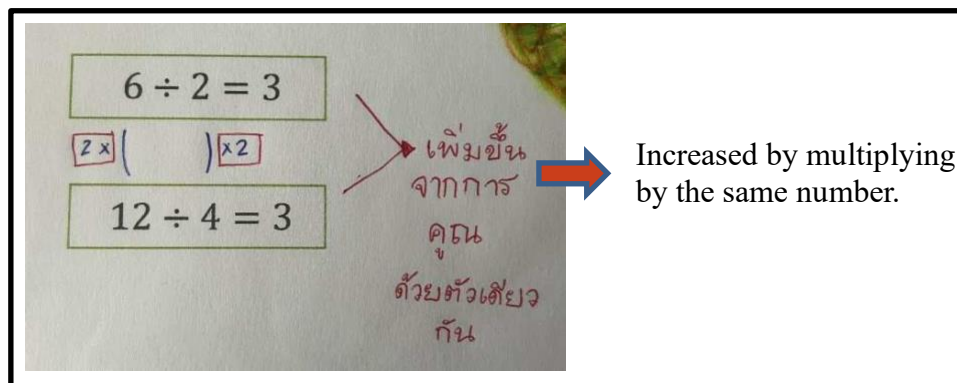
2.   Generalization: Students generalize the relations of division rules discovered in tasks with specificity in Figure 5.


Figure 5: Tasks in textbook on Generalization (Inprasitha et al., 2010).

In this task, the mathematical thinking of the students will be illustrated in Figure 6 and Figure 7.

Figure 6: Students' worksheet on Generalization (1).

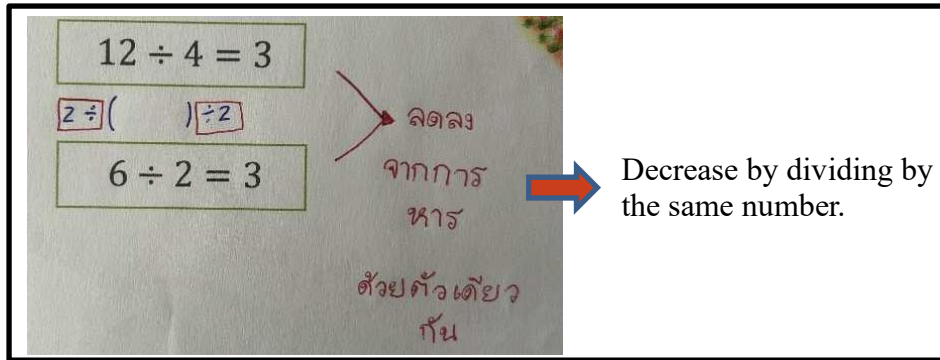
In Figure 6, Students can generalize by changing from multiplying the dividend by 2, and from multiplying the divisor by 2 to multiplying by the same number. This will result in the same quotient.


Figure 7: Students' worksheet on Generalization (2).

In Figure 7, Students can generalize by changing from dividing the dividend by 2, and from dividing the divisor by 2 to dividing by the same number. This will result in the same quotient.

3.　　　Extension: Students apply division rules to expand their learning to solve division tasks of tens and hundreds in Figure 8.

Figure 8: Tasks in textbook on Extension (Inprasitha et al., 2010).

In this task, the mathematical thinking of the students will be illustrated in Figure 9.

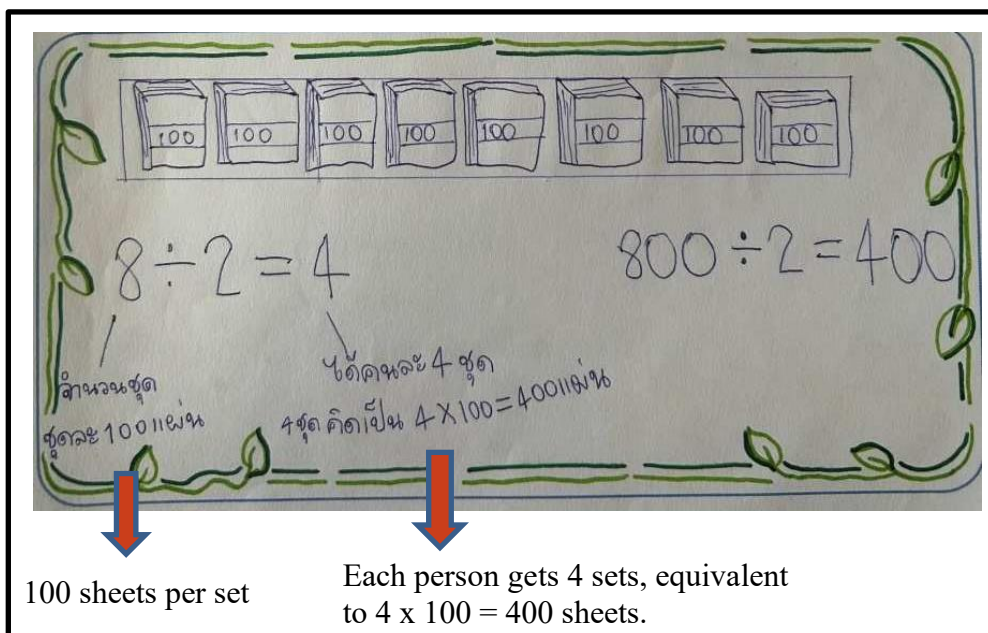

Figure 9: Students' worksheet on Extension.

In Figure 9, Students apply division rules governing the relationship between dividends and quotients to expand learning to solve division tasks of hundreds.

4.   Integration: Students integrate the rules of division and also the division of tens and hundreds in order to solve the division of large numbers in Figure 10.

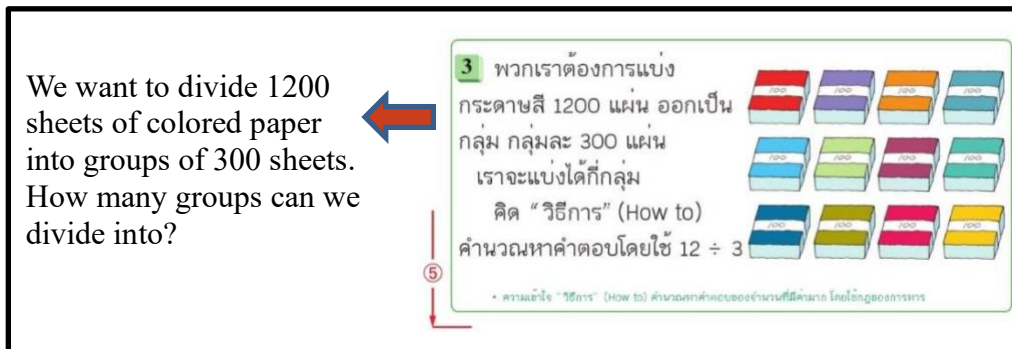

Figure 10: Tasks in textbook on Integration (Inprasitha et al., 2010).

In this task, the mathematical thinking of the students will be illustrated in Figure 11.

Figure 11: Students' worksheet on Integration.

In Figure 11, Students integrate the rules governing the relationship between dividends and divisors and also the division of hundreds in order to solve the division of large numbers.

Conclusion

The results showed that students' mathematical thinking occurred in order of task sequence on division from all 4 characteristics which were:
1. The specification of the tasks allowed students to discover the rules of division by seeing the relations of the symbolic sentences generated from the tasks.
2. The generalization of tasks prompted students to generalize the relations of division rules discovered in tasks with specificity.
3. The extension of the tasks allowed students to apply division rules to expand learning to solve division tasks of tens and hundreds.
4. The integration allowed students to integrate the rules of division and also the division of tens and hundreds in order to solve the division of large numbers.

Abstract

Virtual Reality is an emerging technology for immersive learning. A Virtual Reality Organ Bath Lab (VROBL) simulating the physical pharmacology laboratory practical was developed to help students to comprehend complex pharmacological principles. The study aimed to investigate the impact of VROBL adoption as a pre-laboratory experience on student learning experience, knowledge, and confidence levels. An experimental research study was conducted with a study sample of 17 health science students enrolled in a Biomedical Science module. The participants were divided into intervention (n=9) and control groups (n=8) using block randomization. The intervention group experienced virtual learning with VROBL before the laboratory session, while the control group was exposed to the software after the laboratory session. A pre-post study design was adopted, whereby questionnaires were administered before and after the VROBL and physical laboratory sessions. The completion times of physical laboratory tasks were recorded. Data collected revealed that the intervention group was satisfied with the simulation (mean±SD: 4.97±1.24) and learning content (mean±SD: 5.81±1.21) of VROBL. Furthermore, the intervention group reported an increased confidence in correctly explaining how to use the lab equipment and apparatus compared to the control group (mean: 4.77 vs. 3.50, p=0.044). The finding was supported by positive feedback of VROBL as a pre-laboratory exercise. However, there was no significant difference between both groups in knowledge quiz scores and completion times of physical laboratory tasks. Although VROBL did not improve student knowledge or performance in the physical laboratory, it had enhanced student learning experiences and confidence, which ultimately might improve student motivation and learning outcomes.

Introduction

The fourth Industrial Revolution (IR 4.0) is transforming the higher education from traditional learning into technology-based learning. Educators are encouraged to gain knowledge and skills and seek alternative approaches to fully maximize the students' learning experience (Aziz Hussin, 2018). This includes the incorporation of digital technologies in higher education. In recent years, a myriad of technological innovations, including Virtual Reality (VR) and Augmented Reality (AR), have been developed and leveraged by the educators in alignment with IR 4.0 (Ikhsan et al. 2020).

Pharmacology, being a complex subject, necessitates a conceptual understanding of drug effects and interactions with biological systems. Traditionally delivered through didactic teaching, students often face challenges in grasping these concepts due to the three-dimensional nature of both drugs and biological systems. This intricacy makes effective illustration and explanation difficult in both classroom and lab practical settings. Furthermore, although essential lab skills such as the micropipetting technique are integral for science students, limitations in teaching resources often restrict the inclusion of hands-on laboratory exercises in the curriculum. Despite the widely recognized need for practical laboratory training to enhance skill acquisition, the call to adhere to the 3Rs—reduce, replace, and refine animal usage—has further limited the availability of hands-on exercises involving animals.

Virtual Reality (VR) is an emerging technology increasingly used in higher education to offer students engaging and interactive learning experiences. It enables exploration and interaction with virtual environments, simulating real-world scenarios. VR is employed for hands-on training in fields like medicine, engineering, and architecture (Bermejo et al., 2023), fostering improved learning immersion and the development of critical thinking and problem-solving skills. As VR technology advances, it plays an increasingly vital role in higher education. The 3D perspective offered by VR proves invaluable in comprehending pharmacological concepts, surpassing the limitations of traditional 2D graphics (Hanson et al., 2019, Ventola et al., 2019 White et al., 2023). In addition, VR provides opportunity for users to practice laboratory skills unlimitedly in risk-free virtual environment, reducing the use of animals in laboratory (Glassey & Magalhães, 2020).

During the COVID-19 pandemic, students had restricted access to the laboratory due to physical distancing. To complement the physical pharmacology laboratory practical, we developed a prototype of VR Organ Bath Lab (VROBL) that mimics the physical laboratory practical with the aim to stimulate students' interest and engagement in the laboratory. To date, there are limited studies on the impact of using VR laboratory to supplement pharmacology laboratory, especially in Malaysia. Thus, our study aimed to investigate the effects of VROBL as a pre-laboratory exercise on students' learning experience, knowledge, and confidence levels.

Methods

Ethical approval was obtained from the University of Nottingham Malaysia Ethics Committee (ELZN090222). This study took place in the University of Nottingham Malaysia. Inclusion criteria were Year 2 students aged 18 years and older and enrolled in a Biomedical Science module, namely Pharmacological Basis of Therapeutics. Monetary compensation was provided for study participation. Study sample of 17 health science students were

recruited voluntarily and divided into intervention (n=9) and control groups (n=8) using block randomization. The intervention group engaged in virtual learning with VROBL about 1 to 3 days prior to the laboratory session, while the control group did not experience VROBL before the laboratory session. A pre-post study design was adopted, where 7-point likert scale survey questionnaires, ranging from 0 to 7 (extremely dissatisfied to extremely satisfied) were administered before and after the VROBL and physical laboratory sessions. Four questionnaires were adapted from Cheesman et al. (2014) and administered using the online questionnaire service, Qualtrics. Data collection took place from March to April 2022. Participants were asked to complete the questionnaires based on their groups as follows:

Questionnaire 1: VROBL User Experience Survey (administered to intervention group only immediately after the VROBL)

Questionnaire 2: Confidence Survey (administered to both control and intervention groups immediately before the physical lab)

Questionnaire 3: Knowledge Quiz (administered to both control and intervention groups immediately after the physical lab)

Questionnaire 4: VROBL Perception Survey (administered to intervention group only immediately after the physical lab)

The data were collected anonymously. Informed consent was obtained from every respondent and the data were kept confidential. Completion times of individual participant for physical laboratory tasks were recorded to compare students' performance. The control group participants were given the opportunity to experience VROBL after the laboratory to avoid disadvantages. Quantitative data analysis was performed through Independent Sample T-Test using GraphPad Prism softrware. Data are presented as mean ± standard deviation (SD). A p value >0.05 was considered statistically significant.

Results

Our results indicated that the intervention group had an overall positive user experience with VROBL (Figure 1). The participants expressed satisfaction with the simulation software and quality (mean±SD: 4.97±1.24) and the educational content of VROBL (mean±SD: 5.81±1.21). One participant suggested to improve the sensitivity of the touchpad in the simulation while another participant reported glitches in the VROBL. 75% of the participants were satisfied with the explanation of the laboratory procedure in VROBL (mean±SD: 5.88±1.25). Majority of the participants (87.5%) were satisfied that VROBL has increased their interest in the organ bath laboratory (mean±SD: 5.88±1.13) and helped them to visualize the concepts related to the laboratory procedure (mean±SD: 6.00±1.07). Besides, 62.5% of the participants found it challenging to navigate and master the VROBL.
Figure 1: User Experience of VROBL on the software quality and content.

There was no significant difference in the average score of the confidence questionnaire between control and intervention groups (Figure 2). However, the intervention group did exhibit an increased confidence in one of the questions in confidence questionnaire, namely confidence in correctly explaining how to use the lab equipment and apparatus compared to the control group (mean±SD: 4.77±1.20 vs. 3.50±0.54, p=0.044). The time taken to complete the physical laboratory task was not significantly different between the control and intervention groups (857.2 seconds vs 853.5 seconds; p>0.05). Notably, there was no significant difference in the average score of the knowledge quiz between the control and intervention groups (mean±SD: 6.63±1.69 vs. 7.75±1.39, p>0.05) (Figure 3).

Figure 2: Average scores on the confidence questionnaire, consisting of
20 questions - 10 related to understanding lab concepts and
10 pertaining to confidence in performing physical lab procedures.

Figure 3: Average scores of the knowledge quiz between the control and intervention groups.

In addition, we assessed the intervention group's perception of VROBL after completing the physical laboratory session. Overall, participants provided positive feedbacks on the VROBL expressing acceptance and acknowledging its usefulness as a tool for studying pharmacology (Figure 4). Qualitative feedbacks on VROBL are listed in Table 1. Overall, participants believed that VROBL, when provided as a pre-laboratory exercise, helped familiarize them with the physical laboratory procedure and reduced anxiety through pre-exposure to laboratory procedure. Besides, one participant recommended that a training session on how to use the VR controllers before VROBL may be helpful.

Figure 4: The intervention group's perception of VROBL
after completing the physical laboratory session.

How does VROBL experience affect the understandings and skills in performing hands-on laboratory tasks?	
1.	It helped me understand most of the experiment but I messed up the sequence of adding carbachol to the organ bath, which is my fault anyways. Overall the VR experience was great and helped me a lot
2.	It allows for familiarity
3.	Provide more help in calculations rather than the experiment set up
4.	VROBL helped me get used to how to administer carbachol into the organ bath and helped me visualise what an organ bath looked like and work.
5.	Give me heads up
How do your VROBL experience and its realism affect your confidence and anxiety in performing the hands-on laboratory tasks?	
1.	Less anxiety making the same mistakes
2.	I guess it's based on mindset? If you are confident that the VR helped you for the hands on lab experiment, then its easier
3.	The VROBL did help me understand what to do during the physical practical, and so was less worried about if I made a mistake. I think the VROBL can be improved by adding features that happen in real life, such as adding the pipette tips, throwing away the used tips, and allowing us to make mistakes and troubleshoot it (e.g. if we put the wrong concentration of carbachol)
4.	It helps me in knowing things I need to do during lab
How does your VROBL experience affect your confidence in answering the quiz questionnaire?	
1.	Not much, lesser exposure to quiz during VR. But the analysis of procedure helped alleviate anxiety answering quiz questions.
2.	Virtual is not the same as reality? Virtual gives me more confidence than reality
How can we use VR-based learning to improve your learning in this module?	
1.	Before face to face lab sessions
2.	Although VR is easy to use after we get used to it, I believe it was a bit hard to understand the VR controls the first time I used VR. Therefore I think we need a session to get used to the VR controls and features
3.	An extra exercise before doing real work

Table 1: The intervention group's feedbacks on VROBL and suggestion for improvement.

Discussion

To the best of our knowledge, this is the first report on the impact of the application of a VR pharmacology laboratory as pre-laboratory exercise on students' experience, confidence and knowledge.

Positive feedback on the explanation of the pharmacology laboratory procedure in the VROBL may be the key to the intervention group's increased confidence to explain the experimental procedures correctly. This is in line with the study by Cheesman et al. (2014) in which the students have demonstrated increased confidence in performing the physical laboratory procedures after completing the VR laboratory. Design of VR contents is a major part of the VR implementation, as Jiang et al. (2021) suggested that their participants were more interested and engaged when the content is relevant. The clear and detailed explanation of the laboratory procedures in VROBL could ensure that the participants were able to follow procedures and reduced their anxiety for physical laboratory. In contrast with previous study

showing that technical problems and time needed to learn to navigate the VR applications could cause a loss of interest and engagement (Cheesman et al., 2014), our study showed that participants had gained interest in the organ bath laboratory after VROBL session, which potentially has reduced their anxiety in turn. Notably, intervention group has significantly higher confidence in correctly explaining how to use the apparatus and equipment in the experiment. This may be because VROBL provided a simulated laboratory environment and guided them through the experimental procedures in simulated environment. Notably, most participants in both control and intervention group were not confident (Figure 2; mean score 3.59 vs 3.93) in the understanding of organ bath laboratory concept. This finding indicates that the familiarization with laboratory procedure may not improve the understanding of the theory or principle.

A study by Pan et al. (2016) demonstrated that visual quality and interface performance affect users' sense of presence experienced in the simulation. The glitches and lack of sensitivity of touchpad in VROBL may affect users' overall experience and engagement. Besides, more than half of the participants did not find it easy to navigate and use the VROBL. This might be due to the technical problems and glitches in VROBL. Hence, this should be improved to enhance user-friendliness of VROBL for better user experience.

The lack of significant differences in knowledge quiz scores between the control and intervention groups may be attributed to the small sample size of the study cohort, limited by the constraints of the Covid-19 pandemic and the necessity for physical distancing. Only 35 students were able to participate in the physical laboratory practical sessions, and we had recruited 48.6% (17 out of 35) of the cohort into the study. While most studies showed that VR applications could increase students' interest and motivation in learning, evidence showed that VR applications are not necessarily useful for gaining knowledge, and might even have detrimental effects depending on the design and subject (Cheesman et al., 2014, Hamilton et al., 2021). In this study, we do not advocate for VROBL to substitute the physical laboratory, but instead as a pre-laboratory exercise to supplement the physical laboratory. Undeniably, VR simulations are seldom too animated and lack realism. Hence, VR simulation can only be used as a complement to student learning instead of a substitution (Herga and Dinevski, 2012).

Despite the limitation of small sample size and the technical problems of VROBL, our students highly endorse VROBL as a pre-laboratory exercise, enabling safe practice and fostering familiarity with the physical laboratory. While traditional learning methods remain indispensable, a blended learning approach, integrating digital technology into didactic teaching and laboratory practicals, holds great potential for enhancing students' engagement and learning experience (Balakrishnan et al., 2021).

Conclusion

In conclusion, the participants have demonstrated positive user experience and satisfaction with VROBL developed and used as a pre-laboratory exercise to supplement a physical pharmacology laboratory. While the VROBL did not demonstrate a substantial impact on students' pharmacology knowledge, it enhanced the learning experience and confidence to correctly explain the use of lab equipment and apparatus. The participants believed that VROBL helped to relieve their anxiety by allowing pre-exposure to the physical laboratory procedures. This improvement in student experience and confidence may, in turn, positively influence motivation and overall learning outcomes. Feedbacks gathered from the study's

feedback are important in refining the VROBL and integrating it into the curriculum of health science students in the future.

Abstract
Gagné, a learning psychologist, defined four hierarchical elements of learning skills: problem-solving, rules, concepts, and discriminations. These intellectual skills form a hierarchical structure with problem-solving at the top, followed by rules, concepts, and discriminations. Mastering lower-order skills is essential for higher-order skill acquisition. We apply this theory to programming education. In programming education, students are sometimes given questions that require them to use a programming language to implement an algorithm or create a program that satisfies a certain specification. Such questions belong to the problem-solving type in the Gagné classification. Problem-solving is at the top of the hierarchy and may be difficult for beginning students to solve from the beginning. Ideally, students should start with simpler problems and progress to more complex ones as their understanding deepens. Programming is based on fundamental "concepts" like variables and methods, and "rules" such as syntax for transforming class diagrams into source code. These two skills are the lower level and are important for mastering programming skills. Hence, we have developed an automated system that generates problems promoting a step-by-step understanding of these concepts. The system marks programming concepts such as variables and methods, and outputs multiple-choice questions in PDF format that require the user to select the option that matches the specified concept. The system generated questions for approximately fifty study items that the authors defined. The system's output was improved by reviewing the problem and incorporating the feedback.

Introduction

The IT industry has developed remarkably in recent years and the demand for programmers has increased accordingly. In Japan, programming education has become compulsory in elementary and junior high schools since the 2020 academic year, as it allows students to learn logical thinking skills and programming languages (Ministry of Education, Culture, Sports, Science and Technology n.d.). In the high school curriculum, the information subject has been reorganised since the 2022 academic year and students learn the basics of programming through writing programs (Ministry of Education, Culture, Sports, Science, and Technology, n.d.). The environment for teaching IT-related technologies to young people has improved, thus promoting the development of human resources to realise an advanced IT society.

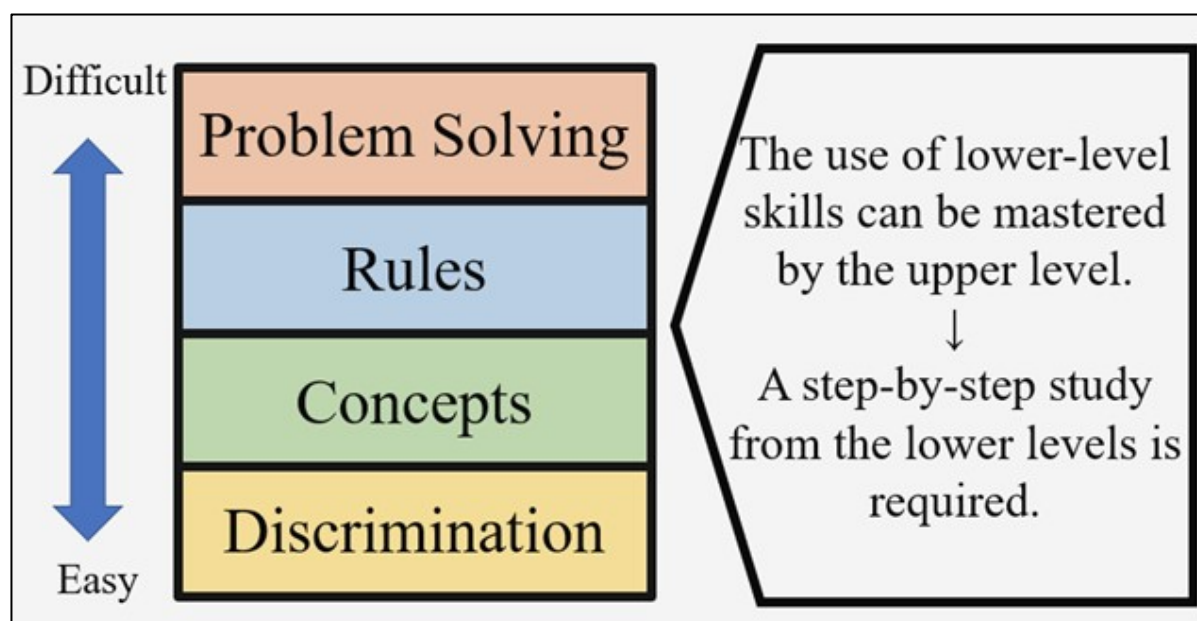
The concept of instructional design is important for creating learning materials. Gagné (1985), a learning psychologist, identified four skills, namely, problem solving, rules, concepts, and discrimination, as elements of a hierarchical structure of learned skills, which he collectively referred to as intellectual skills. In addition, behaviours that are demonstrated after these skills are acquired are shown. Problem-solving is at the top of this hierarchy, followed by rules, concepts, and discrimination. Higher-level skills include several lower-level skills, and the acquisition of higher-level skills requires the mastery of a lower-level skill.


Figure 1: Gagné's intellectual skills and hierarchical structure

This theory has been used to teach programming. Programming tasks, which is typically assigned in programming education, assess the capability of solving problems based on specific requirements and use the concepts and rules acquired in programming. Gagné's cognitive skills enhance the acquisition of problem-solving aptitude. Solving programming problems requires advanced intellectual skills, which renders it difficult for students to solve them while learning and retaining programming concepts in lectures. A better approach would be for students to begin at a lower level and progress to a higher level after they understand the subject better.

Programming comprises primarily 'concepts' such as variables and methods, and 'rules' such as syntax for creating source code from class diagrams and coding styles. The behaviour acquired by learning 'concepts' is 'identification and classification'. Identification refers to the action of detecting two or more objects that have the same characteristics, whereas classification refers to the action of classifying the objects based on the characteristics of the concept. Understanding unknown 'concepts' and 'rules' is necessary for acquiring the ability to create programs.

Exercises should be designed that enable students to learn the concepts and rules. Multiple-choice questions are useful in helping students understand the items. However, since the concepts and rules are at a lower level compared with the problem-solving phase, the questions are simpler and thus require more questions during the exercises. The preparation of such questions by the teacher can be a bottleneck in teaching. Therefore, we designed and developed a system that automatically generates questions to promote a stepwise understanding of these concepts and to smoothly shift to the 'problem-solving' stage.

Related Studies

Efforts to improve programming education are thriving (Makihara et al., 2016; Taguchi et al., 2007; Ichimura et al., 2013). Many methods have been investigated to automate the creation of selection issues.

Tsumori et al. (2009) analysed methods for generating choice questions adapted to learners' comprehension statuses. To help learners understand vocabulary with lexical structures, they attempted to generate questions whose difficulty varied depending on to the conceptual similarity of the vocabulary. The comprehension status was determined by the correctness and difficulty of the question. Furthermore, they assumed that the difficulty level was determined by the combination of the source code used for the question and the question choices.

Funaoi et al. (2010) generated multiple-choice questions for physics mechanics using a specific process, which resulted in the solution to the question. The process was classified into three categories, each of which contained a set of error candidates, and an incorrect answer option was generated by replacing one process with a wrong process. This study focused on generating math and physics questions that require computation through a process involving reading the question text, understanding the situation, selecting the knowledge necessary to solve the question, and performing calculations using the acquired knowledge. Programming was performed without calculations, thus allowing automatic generation to be realised by replacing the computational process. In addition, the questions generated included errors caused by factors other than the concepts.

Nagataki et al. (2008) proposed an automatic generation method for introducing error-detecting-type questions into algorithm learning [9]. They attempted to generate two-choice questions using a C program that described the algorithm as a subject. This study focused on learning algorithms.

Several similar programming concepts exist. Therefore, if we use Tsumori et al.'s method to generate questions, we are likely to generate questions from vocabularies with similar concepts, thus resulting in insufficient variation in the difficulty level. In addition, the difficulty level of a question is assumed to vary not only due to the combination of

alternatives but also due to other factors. Methods such as those of Funau et al. and Nagataki et al.'s, which generate questions by modifying section of an algorithm or calculation process, aim to measure one's comprehension of the processing contents and sequence but are unsuitable for confirming one's comprehension of the concepts. We believe that one of the reasons contributing to the difficulty of programming is the presence of many similar basic programming concepts before algorithms, and that programs cannot be created as desired because of confusion. Hence, these concepts must be clearly distinguished and questions that can systematically deepen one's understanding of these concepts must be provided.

In the current study, we focus on the concepts of programming languages and generate questions that require users to select one among multiple options for each concept. The number of options is varied to increase the degree of freedom of the questions that can be generated. The programming topics covered in this study can be learned by novice programmers to create basic programs.

Study Items in Programming Education

In this study, approximately 50 learning items, as shown in Table 1, were extracted from Java, which is a programming language with procedural and object-oriented paradigms. These items are critical for learning programming and essential for creating programs. They were extracted based on the basic elements of Java: variables, methods, data structures, syntax, and object orientation.

Item Name		
Argument	Comment	OperatorLogic
ArrayElement	CompileAndRun	Parameter
ArrayIndex	Constructor	ParameterArgument
ArrayIndexNumber	ForStatement	ParameterType
ArrayListElementType	Getter	PrimitiveType
ArrayType	Indent	ReferenceType
Brackets	InstanceMethod	ReturnType
CallConstructor	InstanceVariable	ReturnValue
CallInstanceVariableMethod	InstanceVariableDeclaration	ReturnValueDefault
ClassCall	Interface	Scope
ClassDiagram	InterfaceMethod	Setter
ClassDiagramToSourceCode	LiteralString	SourceCodeToClassDiagram
CodingStyleClassName	LocalVariable	StaticMethodCall
CodingStyleInstanceVariable	Method	Variable
CodingStyleMethod	ObjectDiagram	VariableSentence
CodingStyleParameter	OperatorAssignment	
CodingStyleVariable	OperatorComparison	

Table 1: List of extracted study items

Variable

A variable is a number or object managed in a program and whose role is rendered explicit via naming. Because Java is classified as a strongly statically typed language, the type information is important. Therefore, to manage the variables, one must understand their types. In addition, the roles of local variables, instance variables, and other variables change depending on the position of the variable declaration; therefore, the differences among them must be elucidated.

Method

A method defines an operation as a single coherent process and can be referred to as a function. Methods such as variables can be used to define methods. Once a method is defined, it can be reused elsewhere in the program; this eliminates the necessity to write the same process repeatedly, thus rendering the program more readable. To use this method, it must be called. At that time, the necessary information may be passed to the method or the information processed in the method may be returned to the calling program. To create and use one's own methods, minimal understanding of the method definitions, invocation methods, arguments, and return values is required.

Data Structure

Several different types of data exist in the program. In addition to numbers and strings, users can use their own data. Occasionally, a single dataset is used. In such cases, data structures are used. Arrays are one of the most widely used data structures and are used to implement other data structures, such as lists and queues. When arrays are available, more advanced programming tasks can be performed.

Syntax

Syntax is a programming language that is recognised by the programming language via a particular method that describes it. For a series of processes to be recognised as a single behaviour, the processes are enclosed in braces to clarify their scope. In Java, some items require brackets to define blocks when describing classes and methods. To express a string literally, it is enclosed with double quotation marks. The statement that expresses the repetition of processing is classified into three section by semicolons: an initialisation section to set the counter, a conditional section to set the repetition duration, and an iteration section to change the value of the counter variable during the repetition. The section enclosed by a slash and an asterisk, or the section after two slashes to a new line, is regarded as a comment and disregarded during compilation. An operator is an element of syntax used to express a mathematical or logical expression or to assign a value to a variable. All of these are defined as elements of the Java syntax, and their incorrect use will result in compilation errors; therefore, correct notations must be utilised.

Object Oriented

Java supports object-oriented paradigms. An object-oriented paradigm is a paradigm in which real-world entities are regarded as objects with attributes and operations in the memory space, and real-world processing is mimicked by messaging between objects. Classes define the data and methods to be managed by a program. Objects with actual data are created by

instantiating them based on the class information. Classes and objects can be represented as diagrams using (unified modelling language). Therefore, smooth system design and development can be realised by converting objects generated in the classes and methods described in the source code into diagrams and by creating source code from diagrams.

Question Format

Various formats exist in which exercises are assigned (Hidano, 1972). These include the essay format, in which students are instructed to express their opinions regarding a topic based on their knowledge, and a format in which students are instructed to fill in the blanks in a text with appropriate keywords. In this section, we examine the appropriate question formats in programming education for developing the ability to classify concepts and apply rules.

Essay/Description Format

In the essay/description format, students craft an answer to a specific topic based on their knowledge and provide a single deliverable. Many introductory textbooks and university lectures require students to write a program that implements an algorithm that satisfies a specification and a control flow that returns an expected result. These questions are categorised into essay/descriptive formats. When answering questions in this format, the learners are expected to apply the knowledge obtained to create a program. As mentioned in Section 1, this format belongs to the hierarchy of problem solving. When performing exercises, learners should attempt questions that consolidate and deepen their understanding at a lower level and then attempt questions such as example questions.

To deepen the learning of concepts, one may benefit from identifying and classifying them. For rules or principles, one may benefit from applying rules using concepts.

Multiple-Choice Format

A multiple-choice format is typically used to answer conceptual questions. This format is highly objective and easy to implement. Furthermore, it allows learners to include many questions in a single exercise because it does not require a significantly amount of time to perform the exercises. We believe that this question format is appropriate because it allows us to assess the learners' ability to apply the rules by providing options in which identification, classification, and rule applications are performed correctly and those in which they are not.

In a multiple-choice format, either single- or multiple-choice answers may be used. In the multiple-choice format, multiple correct answers can be set and the learner must consider the possibility that another option is the correct answer, which can be laborious. However, the single-choice method simplifies the process of solution identification as one correct answer exists.

Formats Considered in Current Study

The multiple-choice format allows beginners to perform the exercises more easily. In addition, it allows the correct answer to a question in the system to be determined more easily as compared with the written form. Therefore, we designed and developed a system that automatically generates single- and multiple-choice questions.

System Details

The system proposed herein uses source code and class diagrams as choices and materials for the questions. Therefore, a Java source code that can be compiled is provided as input for question generation, and choices are generated based on the compiled source code. Information is provided to the system in string form to generate a question for a specified study item. The output is a JSON file that describes the question information to be constructed when generating the questions and a PDF file if the questions are to be saved. The system user can freely specify the input and output directories.

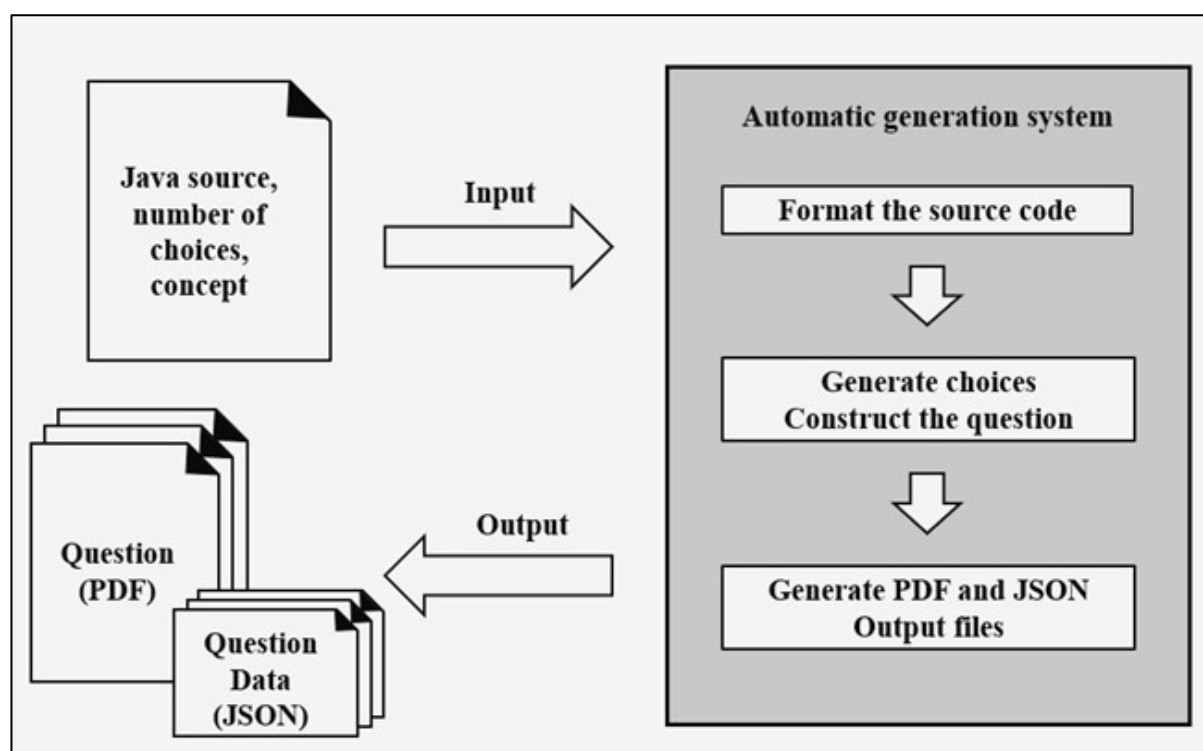
Figure 2 presents an overview of the proposed system. The processing of the system is divided into three main sections. The first is the input process, which processes the information provided as input to enable question generation; the second is the generation process, which generates questions using data such as the number of choices, number of correct choices, and question text; and the third is the output process, which generates a PDF file from the generated questions and a JSON file containing the information attached to the questions.


Figure 2: System overview

Input Process

The system uses Java source code and study items as inputs. First, the system determines whether the source code is available for each study item. This verification is performed to avoid cases in which the source code is not available for certain learning items. For example, if no method or constructor is available in the source code for a study item that asks a question regarding a parameter, then the source code cannot be used because a question cannot be generated.

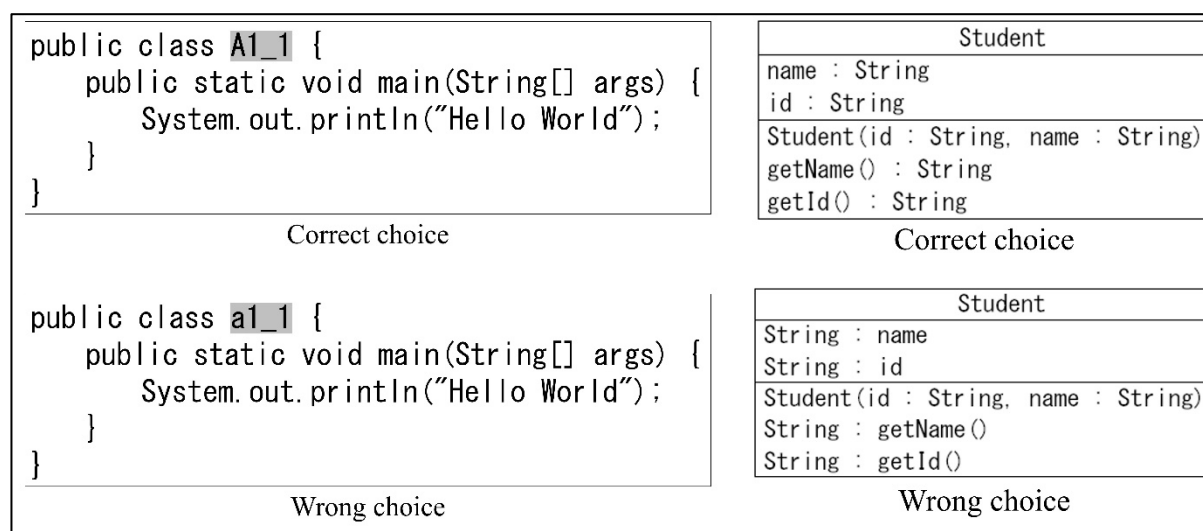
By specifying the directory in which the source code is saved, one can determine whether all internal source codes can be used for the learning item. In this case, a JSON file that shows the mapping between source codes and training items is saved in the directory. This file is rewritten whenever the source code in the directory is added or changed.

The source code used for question generation is formatted after selection to ensure the uniformity of whitespace and line breaks in the source code. Here, the indentation and white space in the source code are standardised.

Generation Process

A well-formed source code is used to perform different generation processes for the different study items. The concepts in the source code are obtained using parsing and regular expressions. Among the concepts obtained, those similar to the target concept are used as candidates for incorrect answer choices. Subsequently, one of the candidates is selected randomly and the source code is shaded or modified such that it becomes grammatically incorrect to generate incorrect answer choices. For questions that use class or object diagrams, the source code is converted such that it can be expressed in these formats; subsequently, shading and text changes are performed.

Figure 3 shows an example of generating alternatives that use the source code. The source code is shaded to indicate the class names, and the source code is modified such that the class names are in lowercase for incorrect choices. In the class diagram, the order in which instance variables are described varies. The generated incorrect answer choices are stored in the list of all choices, and the correct answer choice is inserted at the position of the correct answer number in the list to complete the choices. Using the number of choices, correct answer number, question text, question field, and the source code from which the question is generated, an object representing the question is constructed.



```
public class A1_1 {
    public static void main(String[] args) {
        System.out.println("Hello World");
    }
}
```
Correct choice

```
Student
name : String
id : String
Student(id : String, name : String)
getName() : String
getId() : String
```
Correct choice

```
public class a1_1 {
    public static void main(String[] args) {
        System.out.println("Hello World");
    }
}
```
Wrong choice

```
Student
String : name
String : id
Student(id : String, name : String)
String : getName()
String : getId()
```
Wrong choice

Figure 3: Example of generating choices using source code

Output Process

Based on the question information constructed in the question-generation section, PDF and JSON files containing the question's attached information are generated. Because the content of each study item is different, drawing is implemented for the text, class diagrams, object

diagrams, and source code; subsequently, they are combined to draw the question. Figure 4 shows the selection of the correct class diagram that can be created from the source code.

次のソースコードからクラス図を作成したい。
選択肢から、「正しいクラス図」を選択せよ。

Student. java

```
public class Student {
    private String name;
    private String id;
    public Student(String id, String name) {
        this.id = id;
        this.name = name;
    }
    public String getName() {
        return this.name;
    }
    public String getId() {
        return this.id;
    }
}
```

選択肢
1.

Student
name : String
id : String
Student(id : String, name : String)
getName() : String
getId() : String

2.

Student
name : String
id : String
Student(id : String, name : String)
getName() : void
getId() : void

Figure 4: Example of question generated by proposed system

The JSON file contains information regarding the question field, the source code that generated the question, the number of choices, the number of correct answer choices, the source code for the wrong answer choices, and all other changes to the questions. This file is intended for automating the scoring of exercises and regenerating the same questions.

Evaluation

To confirm that the developed system can generate sufficient questions for the exercises, several source codes were used to generate questions. The number of questions generated was calculated for each of the available study items using the following formula, where 'n' is the number of choices, 'a' the number of candidates for the correct choice, and 'b' the number of candidates for the incorrect choice. Questions with the same options in different orders were regarded as separate questions.

$$Number\ of\ questions = n! \times a \times {}_bC_{n-1}$$

The source code used for the generation was created during a programming course at the Tokyo Denki University. Only two-choice questions were posed in this evaluation.

Each of the five source codes was used to generate questions. Table 1 lists the training items and the number of questions that can be generated. As shown, multiple questions can be generated automatically from a single-source code. The number of questions generated increased significantly with the number of concepts in the source code.

The source code used in this experiment constituted a small proportion of the source code created in the lecture—more source codes will be created in practice. Therefore, the number of questions that can be generated increases with the number of source codes created. This implies that a sufficient number of questions can be prepared even when different exercises are provided in each lecture.

Source code	Number of study items	Number of questions
A1_1.java	12	92
Student.java	28	454
Decoration.java	29	1128
Castable.java	7	50
Cup.java	34	5414

Table 2: Result of generating questions from source code

Conclusion

A system that automatically generates programming exercises using source code was proposed in this study. Because this system can generate many practice questions, it is expected to reduce the cost of creating questions. The questions created were reviewed to determine the appropriateness of the question text and options. Several questions appeared to be inappropriate for presentation to students; therefore, they were modified to render them suitable for presentation. However, owing to the numerous questions generated by the system, only the necessary questions to be used in the exercises were determined. To prevent the generation of questions with similar content or completely different difficulty levels, one

must filter the questions by adding conditions at the time of generation, or implement a system that can select questions to be used from those generated.

Furthermore, data obtained from the exercises must be examined to determine whether the exercises in the question format promote a conceptual understanding of programming and thus realise the ability to create programs. Such data are currently being acquired and analysed.

Generative AI Tutors and Project-Based Learning: Boosting Financial Literacy in Japanese Students

Jon Gorham, Chuo University, Japan
Daniel J. Mills, Ritsumeikan University, Japan

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This research study aimed to investigate how generative AI-enhanced Japanese university students' financial knowledge, behavior, and attitude following a 15-week course on personal finance. An electronic instrument was distributed to 49 English as a Foreign Language (EFL) students in two elective courses focused on teaching the basics of personal finance at a private university in Eastern Japan. The survey included the following sections: (1) financial knowledge, (2) financial behavior, and (3) financial attitude. The inquiry results showed that participants' responses to the financial knowledge and behavior subscales in the pre-survey ($M = 7.63$, $M = 2.87$) increased by the end of the course ($M = 8.91$, $M = 3.38$). A paired *t*-test demonstrated that these changes were significant. However, participants' responses to the financial attitude items decreased slightly from the pre-survey ($M = 2.37$) to the post-survey ($M = 2.40$). Responses to the open-ended questions in the post-survey revealed that overall, participants had a positive experience in the course using generative AI for learning and planned to apply what they had learned in their future lives and studies.

Introduction

In an era where financial landscapes grow increasingly complicated, the importance of financial literacy has never been more evident, particularly among young adults preparing to enter the economic arena. As crucial turning points in the formative years of adult life, universities are responsible for equipping students with the understanding necessary to navigate personal finance confidently and competently. However, conventional pedagogical approaches often need to be revised to engage students and address their diverse learning needs, especially in financial education.

Recognizing this pedagogical gap, this study explores an innovative approach by integrating a generative AI tutor, ChatGPT, into a Japanese university elective class dedicated to financial literacy. The study aims to foster a more interactive and personalized educational experience by combining cutting-edge AI technology with project-based learning. This introduction to generative AI sets the stage for discussing the potential of such AI-powered tools to complement traditional teaching methods and potentially revolutionize the educational landscape regarding accessibility, engagement, and efficacy in fostering financial literacy among university students.

In recent years, issues such as the student loan crisis, housing affordability, and inflation have contributed to financial uncertainty, especially among young people. In Japan, these concerns have been exasperated by factors such as a rapidly aging and declining population, underfunded government social welfare programs, and the elimination of "lifetime employment" that many Japanese companies offered following the Second World War. In order to address these issues, the Japanese government has introduced tax-advantaged retirement accounts and private pension programs that have placed a greater burden on the individual to prepare for and manage one's retirement. Currently, 54% of Japanese household financial assets are kept in simple savings accounts, while only 16% are in bonds, stocks, and funds (Nagata, 2022). In 2022, the Ministry of Education, Culture, Sports, Science and Technology (MEXT) mandated nationwide financial literacy education in high school curricula (Financial Services, Agency, 2023).

While Japan is known worldwide as a highly technological country, the widespread usage of technology for education, especially in pre-tertiary education environments, was quite limited (Aoki, 2010; Funamori, 2017; Latchem et al., 2008). This has changed greatly since the COVID-19 pandemic forced schools to deliver content through technology at all levels. When ChatGPT was introduced to the general public in 2023, educators worldwide raced to understand how to prevent misuse of the technology and appropriately use it for educational purposes. Recent academic studies highlight the potential of AI in education. For example, Villasenor (2022) emphasized integrating AI-generated content in education to enhance learning and critical thinking. Another on using large language models in math education reveals that AI explanations significantly improve learning outcomes, particularly when students attempt problems independently (Kumar et al., 2023). Kumar et al. (2023) concluded that implementing the AI tutor, Khanmigo, in a Silicon Valley school demonstrated its effectiveness in actively engaging students in learning and offered a personalized approach. Finally, Mollick and Mollick (2023) discussed how AI can support evidence-based teaching strategies as a classroom learning catalyst.

These studies underscore the expanding role of AI in education, particularly in enhancing learning experiences and addressing pedagogical challenges. Our research seeks to contribute

to this evolving landscape by examining the integration of ChatGPT in financial literacy education, a critical area for empowering young adults in today's complex financial world.

Research Questions

This preliminary research study aimed to investigate how the use of generative AI-enhanced Japanese university students' financial knowledge, behavior, and attitude following a 15-week course on personal finance. The following research questions were addressed in this study:
1. What are Japanese university students' overall financial knowledge, financial behavior, and financial attitude pre and post a 15-week course on personal finance?
2. What are Japanese university students' intentions to use the knowledge learned in the personal finance course in the future?
3. What are Japanese university students' perceptions of generative AI for learning?

Methodology

Setting and Sample

The study was conducted at a private university in Eastern Japan, focusing on English as a Foreign Language (EFL) students. The university has approximately 11,000 students enrolled in undergraduate and postgraduate studies. There are approximately 1.000 faculty employed at the university across seven faculties. The sample for this study consisted of 51 students enrolled in two semesters of an undergraduate elective focused on learning the basics of personal finance in English.

Participants

Of the 51 students who participated in the elective personal finance course, 49 responded to the pre-survey, while 44 completed the post-survey. A slight majority (52.90%) of the students were female. The rest identified as male. The participants' class standing was as follows: 1st year (19.61%), 2nd year (35.29%), 3rd year (31.37%), and 4th year (13.73%). All participants in the study identified as ethnically Japanese, and Japanese was their first language. While no measure of English ability was given in the class, all students must have a minimum of 550 on the Test of English for International Communication (TOEIC) to take the class. The course catalog identifies the level of the course as B1 Common European Framework of Reference for Languages (CEFR).

Classroom Procedures

A significant aspect of the treatment involved using Chat GPT as a personal finance tutor. This innovative approach was central to the project-based learning component of the course.

Chat GPT was employed as an interactive, AI-driven tutor specifically tailored to assist students in understanding the foundations of personal finance. Its role facilitated learning by providing explanations, answering queries, and offering guidance on various financial topics. This approach aimed to create a more engaging and personalized student learning experience.

Students were tasked with creating Google Sites web pages as part of their assessment. These web pages served as a platform for students to demonstrate their understanding and

application of personal finance concepts. Chat GPT played a crucial role in this process by assisting students in conceptualizing, designing, and populating their web pages with relevant content. This task assessed students' knowledge and ability to communicate and present financial concepts in a digital format effectively.

Another innovative use of Chat GPT was developing speaking tasks. Students utilized the AI tutor to help them prepare and refine their spoken presentations on personal finance topics. These speaking tasks were recorded and uploaded to YouTube, providing a dynamic and accessible medium for showcasing their learning.

The YouTube videos of the speaking tasks were embedded into the students' Google Sites webpages. This integration presented each student's learning journey, combining written content, interactive elements, and video presentations. Using Chat GPT in this process ensured that students had continuous support in developing their written and spoken communication skills, which are crucial for effectively conveying an understanding of basic financial concepts.

This expanded use of Chat GPT as a personal finance tutor represents a novel approach in educational settings, particularly in enhancing students' financial literacy. The course provided students with a multifaceted educational experience by incorporating AI-driven tools in project-based learning, combining traditional learning with innovative technology-driven methods.

Instrument

The primary instrument used for data collection was a Personal Finance Questionnaire, administered before and after the course using Google Forms. This questionnaire assessed three key areas: financial knowledge, attitudes, and behavior (Appendix). The questionnaire included a range of question types, such as multiple-choice, Likert-scale, and open-ended questions, to capture a comprehensive view of students' financial literacy. The items for the questionnaire were adapted from a previously validated survey instrument (Potrich et al., 2020). The items were translated into Japanese from English by a researcher who is a native speaker of Japanese and possesses a high level of ability in English. A second native Japanese speaker checked the translation for ease of understanding.

Data Collection and Analysis

The data were collected during the Spring and Fall semesters of 2023 (April – December). The researchers created a Google Forms document administered to students through the university's learning management systems. The survey and cover letter were in Japanese and English. The cover letter gave potential participants information regarding the study and their rights as research subjects. It was made clear to the students that participation was voluntary and would not affect their course evaluation.

After the data collection phase, the researchers transcribed the data into an Excel spreadsheet for further analysis. Frequencies and descriptive statistics were calculated for all the scales and subscales. In addition, a paired t-test was conducted to investigate changes in responses between the pre-and post-survey.

Results

Research Question 1a: Financial Knowledge

The Financial Knowledge portion of the survey contained 12 items. In the pre-test, the participants' mean score was 7.63, which increased to 8.91 in the post-test. As Figure 1 shows, the most frequent pre-test score for the participants was a 5, while 9 was the most common in the post-test.

Figure 1: Distribution of Scores for Financial Knowledge

The most common questions missed in the pre-test were:

Imagine that you have received a donation and that you will keep the money in your safe at home. Considering that inflation is 5% per year, after one year, you will be able to buy:
      a.   Less than 5 years (correct answer)
      b.   From 5 to 10 years
      c.   Over 10 years
      d.   Do not know

Jon acquires a loan of $1,000 that has an interest rate of 20% per year compounded annually. If he does not make payments on the loan and at that interest rate, how many years would it take for the amount due to double?
      a.   Less than 5 years (correct answer)
      b.   From 5 to 10 years
      c.   Over 10 years
      d.   Do not know

Both questions were concerned with interest rates and compound growth. The latter was also the most frequently missed in the post-test.

A Paired Sample *t*-test was calculated to determine differences in pre- and post-scores to the Financial Knowledge test. The results of this analysis showed that participants' scores on Financial Knowledge increased significantly from the pre-test (M = 7.63, SD = 2.51) to the post-test (M = 8.92, SD = 2.30; $t(48) = 2.79$, $p = .0075$).

Research Question 1b: Financial Behavior and Attitude

The highest mean values were associated with Item 14 on Financial Behavior, with over 50% of participants in the pre-survey and over 72% in the post-survey indicating they *almost always* or *always* personally oversaw their finances. The greatest change between pre- and post-survey means in this category was seen in Item 15: "I set long-term financial goals and strive to achieve them."

Table 1: *Pre and Post Means and Standard Deviations of Financial Behavior*

	Pre		Post	
Item	*M*	*SD*	*M*	*SD*
13. I save money regularly to achieve long-term financial goals, such as educating my children, purchasing a home, and retiring.	2.43	1.06	2.86	1.17
14. I personally oversee my financial affairs.	3.45	1.29	4.00	.99
15. I set long-term financial goals and strive to achieve them.	2.73	1.18	3.30	1.02

Note. Scale ranging from 1 – *never* to 5 – *always*.

Responses to Items 16 and 18 on the Financial Attitude scale decreased slightly between the pre- and post-survey. The only item to increase was 17, where more participants disagreed with the statement, "Money is meant to be spent" in the post-survey compared to the pre-survey.

Table 2: *Pre and Post Means and Standard Deviations of Financial Attitude*

	Pre		Post	
Item	*M*	*SD*	*M*	*SD*
16. I find it more rewarding to spend money than to save for the future.	2.69	1.04	2.60	1.26
17. Money is meant to be spent.	1.97	.98	2.02	1.17
18. I tend to live today and let tomorrow happen.	2.73	1.10	2.59	1.30

Note. Scale ranging from 1 – *strongly agree* to 5 – *strongly disagree*.

A visual comparison of the pre- and post-survey means showed that the difference in Financial Attitudes before and after the course was negligible in comparison to Financial Behavior (Figure 2). A paired *t*-test was used to determine if the difference between pre- and post-suvey means significantly differed for each factor. It was found that the pre-survey responses to Financial Attitudes (M = 2.87, SD = 1.25) increased significantly in the post-survey (M = 3.38, SD = 1.15; $t(48) = -2.79$, $p = .0076$). There was no significant difference

between pre- (M = 2.37, SD = 1.08) and post-survey (M = 2.40, SD = 1.26) responses to the Financial Attitude scale.

Figure 2: Comparison of Pre- and Post-Survey Means for Financial Behavior and Attitude

Research Question 2: Use of Financial Knowledge

Information was gathered from participants about how they would use the information they learned in the course in the future. A thematic analysis of the open-ended responses allowed the researchers to categorize the information into three themes: 1. Reflective Spending Habits, 2. Strategic Financial Planning, 3. Interest in Financial Instruments.

The first of these, Reflective Spending Habits, was evident in responses about budgeting, impulse spending, and being thoughtful in how money was spent and saved. Participants also expressed an interest in Strategic Life Planning in their discussion of taxes, insurance, and retirement preparation. The last theme that emerged was Interest in Financial Instruments. Many responses focused on specific financial instruments introduced in the course, such as the Nippon Individual Savings Account (NISA) and the Individual Defined Contribution Pension (iDeCo).

Research Question 3: Perceptions of Generative AI

Participants were asked to identify the positive and negative aspects of using Chat GPT for learning. Based on the provided responses, three overarching themes emerge regarding participants' perceptions of the advantages of using ChatGPT for financial information. The first was Convenience and Accessibility. Participants appreciated the ease with which they could obtain information and how they could ask unlimited questions and receive feedback. Another theme was that of Educational Value. Participants valued ChatGPT's ability to explain unfamiliar topics and vocabulary in a simple way. In addition, the tool was seen as a valuable resource in increasing their ability to manage their personal finances. The final theme was Efficiency and Customization. The tool was seen as helpful in providing specific

advice to the financial questions asked and scaffolding the information to the students' level of financial knowledge and English proficiency.

Three further themes regarding the negative aspects were identified in the participants' open-ended responses. The primary concern was that of Uncertainty and Reliability. Participants reported that ChatGPT could often provide false answers to their queries and that the data was not up to date. While Customization was identified as a positive theme, several responses highlighted the negative. Some students complained that the tool only provided general advice about their financial circumstances. Finally, many participants expressed concern that the tool posed a risk of Overreliance and Laziness. They acknowledge that because of the ease with which one could obtain information using ChatGPT, learners might lose the ability to research and make decisions.

Discussion

The results of this study highlight the significant role of generative AI, specifically Chat GPT, in enhancing the financial literacy of Japanese university students. Using Chat GPT as a personal finance tutor in a project-based learning environment not only improved students' financial knowledge, as evidenced by the increased scores in the post-test but also positively influenced their attitudes and behaviors towards personal finance.

1. Enhanced Learning Experience: The integration of Chat GPT allowed for a more interactive and personalized learning experience. Students could engage with complex financial concepts in a more accessible and user-friendly manner. Creating Google Sites webpages and developing speaking tasks, supported by Chat GPT, provided practical applications of their learning, reinforcing their understanding of personal finance.

2. Digital Literacy and Communication Skills: The project-based approach, including creating webpages and video presentations, also enhanced students' digital literacy and communication skills. These are essential competencies in the modern digital world, further adding value to the educational experience provided by the course.

Limitations

While the study provides valuable insights, it has limitations. The sample size, though diverse, was limited to students from specific universities in Japan, which may affect the generalizability of the findings. Additionally, the study focused on short-term outcomes; thus, long-term financial knowledge and skills retention still need to be explored.

Implications for Practice

The findings suggest that incorporating AI-driven tools like Chat GPT in educational settings can be highly effective, especially in subjects like personal finance that require a blend of theoretical knowledge and practical application. Educators and curriculum designers might consider integrating similar AI tools to enhance learning experiences in various disciplines.

Need for Future Research

1. Long-Term Impact: Future research should assess the long-term impact of AI tutors on students' knowledge retention and the sustained change in their financial behaviors and attitudes.

2. Broader Applications: Exploring the application of AI tutors in other subjects and educational contexts would provide a more comprehensive understanding of their effectiveness and versatility.

3. Comparative Studies: Comparative studies involving different AI platforms and teaching methodologies could offer deeper insights into the most effective strategies for integrating technology in education.

4. Cultural and Linguistic Adaptations: Given this study's cultural and linguistic specificity, research in diverse cultural and linguistic settings would be valuable to understand the broader applicability of AI tutors in global educational contexts.

In conclusion, this study underscores the potential of AI-driven tools like Chat GPT in revolutionizing educational methodologies and outcomes. The positive results in enhancing financial literacy among Japanese university students pave the way for further exploration and innovation in education technology.

Conclusion

This study explored the impact of generative AI tutors, specifically Chat GPT, on enhancing the financial literacy of Japanese university students. The findings clearly indicate that integrating AI-driven tools in a project-based learning environment significantly improved students' understanding of personal finance. Using Chat GPT as a personal finance tutor facilitated a deeper grasp of financial concepts and encouraged a more engaged and interactive learning experience.

Creating Google Sites webpages and developing speaking tasks, supported by Chat GPT, demonstrated the practical application of financial knowledge. This approach enhanced students' financial literacy and developed their digital literacy and communication skills, preparing them for the demands of the modern, technology-driven world.

While the study presents promising results, it also highlights the need for further research. Future investigations should focus on the long-term effects of AI tutors on knowledge retention, the application of AI in diverse educational contexts, and the effectiveness of different AI platforms in various learning environments.

The implications of this research are far-reaching. It suggests a paradigm shift in educational practices, where AI-driven tools like Chat GPT can be pivotal in enhancing learning outcomes. As the field of education technology continues to evolve, integrating such innovative tools could become a standard practice, offering students a more personalized, engaging, and effective learning experience.

In conclusion, the study provides compelling evidence of the benefits of using generative AI tutors in education, particularly in specialized subjects like personal finance. It opens up new

avenues for research and practice, encouraging educators and policymakers to embrace AI technologies in crafting the future of education.

Appendix

Survey Instrument (Potrich et al., 2020)

Financial Knowledge

Item Code	Item	Answers
Item 1	Suppose you had €100 in a savings account and the interest rate was 2% per year. After 5 years, how much do you think you would have in the account if you left the money to grow? You do not make any other deposits or withdraw any money from this account.	More than €102.*; Exactly €102; Less than €102.; Do not know.
Item 2	Imagine that you have received a donation and that you will keep the money in your safe at home. Considering that inflation is 5% per year, after one year, you will be able to buy:	More than today.; Exactly the same as today.; Less than today.; Do not know.
Item 3	Typically, which asset has the biggest fluctuations over time?	Savings.; Stocks.*; Bonds.; Do not know.
Item 4	Do you think that the following statement is true or false? Buying a single company stock usually provides a safer return than a stock mutual fund.	True.; False*; Do not know.
Item 5	Suppose you took out a loan of $10,000.00 to be paid after 1 year and the total cost of interest is $600.00. The interest rate you will pay on this loan is:	0.3%; 0.6%; 3%; 6%*; Do not know.
Item 6	Suppose you saw the same TV in two different stores for the starting price of $1,000.00. Store A offers a discount of $150.00. while store B offers a discount of 10%. What is the best alternative?	Buy at store A ($150.00 discount).; Buy at store B (10% discount).; Do not know.
Item 7	Imagine that the interest rate on your savings account was 1% per year and inflation was 2% per year. After 1 year, would you be able to buv more than, exactly the same as, or less than todav with the money in this account?	More than today.; Exactly the same as today.; Less than today.; Do not know.
Item 8	Suppose you borrowed $100.00 from a friend and after a week paid $100.00. How much interest are you paying?	0%*; 1%; 2%; Do not know.

Item 9	An investment with a high rate of return will have a high rate of risk. This statement is:	True *; False; Do not know.
Item 10	When inflation increases, the cost of living goes up. This statement is:	True.*; False.; Do not know.
Item 11	John acquires a loan of $1,000.00 that has an interest rate of 20% per year compounded annually. If he does not make payments on the loan and at that interest rate, how many years would it take for the amount due to double?	Less than 5 vears.*; From 5 to 10 years.; Over 10 years.; Do not know.
Item 12	It is possible to reduce the risk of investing in the stock market by buying a wide range of shares. This statement is:	True *; False; Do not know

Financial Behavior

Item Code	Description	Scale
Item 13	I save money regularly to achieve long-term financial goals, such as educating my children, purchasing a home, retiring.	1 = Never, 2 = Almost never, 3 = Sometimes, 4 = Almost always, 5 = Always
Item 14	I personally oversee my financial affairs.	
Item 15	I set long-term financial goals and strive to achieve them.	

Financial Attitude

Item Code	Description	Scale
Item 16	I find it more rewarding to spend money than to save for the future.	1 = Strongly agree, 2 = Agree, 3 = Indifferent, 4 = Disagree, 5 = Strongly disagree
Item 17	Money is made to spend.	
Item 18	I tend to live today and let tomorrow happen.

Transformative Effect of Reading Activities on Critical Incident Scenarios in Fostering Cultural Empathy

Minami Hyodo, Emory University, United States

Abstract

In response to the evolving political and social landscape of the 21st century, the focus in foreign language (FL) programs has transitioned from proficiency across skills to "transformation". A key avenue through which this transformation can be achieved lies in FL classrooms, where the cultivation of "cultural empathy" is being pursued. However, this integration of language studies and cultural content, designed to stimulate self-reflection, critical analysis, and emotional engagement, presents notable challenges, particularly at introductory levels and in the context of Japanese as a Foreign Language (JFL) environment, due to learners' limited linguistic abilities, educators' hesitancy to use L1, and the lack of target-culture communities. To address this, the teacher-researcher conducted action research in an Elementary Japanese course: exploring students' transformation towards increased cultural empathy through a two-step exercise involving reading scenarios in Japanese and subsequently composing reflections and discussions in English. The reading materials explored value conflicts between Japanese people and individuals from different cultures. Qualitative thematic analysis of student reflections using MAXQDA (2022) revealed discernible patterns and outcomes indicating a sign of cultural empathy development. Notably, perspective transformation surfaced, especially in the context of punctuality. While the activity might not wholly transform students, it serves as a gateway to cultivating fundamental cultural empathy skills. Despite the limitations of this case study, it indicates that reading and discussion could effectively foster both FL skills and cultural empathy without the risk of real-world consequences.

Keywords: Transformative Language Learning and Teaching, Cultural Empathy, Critical Incident, Reading, Japanese as a Foreign Language (JFL)

Introduction

The realm of foreign language (FL) pedagogy finds itself at the crossroads of a significant paradigm shift in response to the multifaceted challenges posed by the political, social, and technological landscape of the 21st century (Kumaravadivelu, 2003, Paesani, 2016, Leaver et al., 2021, and Tohsaku, 2021). The dominance of communicative language teaching (CLT), particularly emphasizing the functional usage of language in oral communication, has characterized FL education since the 1990s. However, the contemporary context demands our attention to the profound influence of technological innovations, exemplified by machine/AI translation and learning apps, which, while fostering language learning, concurrently challenge the significance of FL classes, where language proficiency development has been the focal point (Tohsaku, 2021; Bourns, 2020). Amidst these shifts, the pivotal question emerges for language educators: what skills should we cultivate in future generations to ensure their resilience and success in the 21st century through FL education?

Aoun's (2017) "humanics framework" answers this question by highlighting essential human literacy skills, positioning them as indispensable tools to render individuals "robot-proof." Creativity, entrepreneurship, system thinking, empathy, cultural agility, and teamwork stand out as crucial components of this framework. Of particular significance is the notion of "cultural agility," elucidated by Aoun's colleague Paula Caligiuri as "the mage-competency that enables professionals to perform successfully in cross-cultural situations" (Aoun, 2017, p.70). The World Economic Forum's (2016) ranking reinforces these assertions, highlighting the demand for skills such as complex problem-solving, critical thinking, creativity, and, notably, empathy—the linchpin ability projected to be the most crucial in 2030 (OECD 2017, 2018).

This places FL classrooms in a unique position to effectively develop empathy and cultural agility skills (Bourns, 2020). "Empathy," defined as "feeling in oneself the feelings of others" (Strayer & Eisenberg, 1987, p. 391), takes center stage in this scenario, especially in the realm of cross-cultural situations, encapsulated as "cultural empathy." This form of empathy becomes a skill that FL classrooms can adeptly cultivate, considering the intrinsic connection between language and culture in shaping individual and societal perspectives.

Cultural empathy, however, is not a knowledge-based acquisition; rather, it necessitates a transformative shift in perspective. Within the transformative language learning and teaching (TLLT) framework, as outlined by Leaver et al (2021), the power of foreign language learning to instigate shifts in learners' "thinking, behavior, acceptance of the other, values, mindset, and/or emotion" is underscored (p. 16). Consequently, TLLT, with its focus on fostering personal change, stands out as an effective avenue for nurturing an increase in one's cultural empathy.

This action research delves into the intricacies of transformation in the context of culture and language learning, aiming to unravel how cultural empathy can be fostered and integrated into FL classrooms. As a tangible outcome of this action research, the teacher-researcher presents a classroom reading activity conducted in an Elementary Japanese II course (JPN 102) within a Japanese as a foreign language (JFL) context. Through this study, the teacher-researcher aspires to contribute to the ongoing dialogue surrounding transformative learning in 21st-century FL pedagogy and provide a practical exemplification of fostering cultural empathy in the FL classroom.

Literature Review

Increased Cultural Empathy as a Form of Transformation

Transformative learning, rooted in Mezirow's adult learning theory from 1978, distinguishes the learning experiences of adult and child learners, as "adults reevaluate previously held beliefs and attitudes and begin to interpret experiences in a new way" (Johnson, 2015, p. 18). In the context of Foreign Language (FL) education, this process facilitates a transformation in learners' perspectives and behaviors by exposing them to diverse sociolinguistic and cultural norms. One notable transformation that could occur in FL classrooms is the development of "increased cultural empathy." Wang et al (2003) define cultural empathy as the manifestation of empathy in cross-cultural settings. A parallel terminology "(inter)cultural awareness," has been used to refer to one's cultural sensitivity in cross-cultural situations. However, Zhu (2011 p.116) underscores the importance of "empathy" by asserting that "the mere realization of cultural awareness is far from sufficient... language learners in cross-cultural situations … should try by every means to cultivate empathetic concepts and precepts in the process of foreign language learning." Cultural empathy is not an innate ability but "a learned ability" (Ridley & Lingle, 1996, p. 32) through bi/multi-cultural experiences. The development of empathy requires individuals to internalize others' emotions and concerns, a depth of understanding that transcends the knowledge acquisition of different cultures. Hence, "disorienting dilemma," as originally proposed by Mezirow (1978), which is considered as a cross-cultural incident that "shakes learners' belief systems and causes them to reflect, dissect, and analyze" in TLLT (Leaver et al 2021:17), plays a significant role in cultivating cultural empathy.

Disorienting Dilemma and Critical Incident as a Trigger of Transformation

While many cases of learner transformation presented in TLLT occur in study-abroad or cross-cultural communication settings, Leaver et al (2021 p. 17) suggests that even in the observation of culture from afar, language learners can experience disorienting dilemmas. This is particularly relevant for FL educators teaching abroad, where there might be limited interaction with the people and culture of the target language, as in the present research case involving learners with minimal exposure to Japanese culture. There are many ways to observe the target culture from the outside, but Boris (2017) mentions that personal narratives resonate with audiences, making them relatable and memorable. Consequently, they hold the potential to create more immersive experience. It indicates that narratives have the potential to cause strong emotional conflicts and/or to increase empathy in one's mind. Thus, the present research draws on the concept of critical incidents, akin to those used in culture assimilators which was popular in the 1960-90s. A critical incident refers to a situation where there is a communication problem between people of different cultures due to a lack of understanding of each other's cultures (Kleinfeld, 1998; Tomalin and Stempleski, 1993). A culture assimilator can be described as "programmed learning experience designed to expose members of one culture to some basic concepts, attitudes, role perceptions, customs and values of another culture" (Knop, 1976; Fiedler, Mitchell and Triandis, 1971) and consists of three parts; a critical situation, four possible interpretations, four feedback explanations. The purpose of this program is to acculturate a person so that there are correct and incorrect choices of response to the specific critical situation. It is worth noting that while critical incidents were historically employed for acculturation, this study aims to leverage them for gaining diverse perspectives and fostering empathy and respect for different cultures.

Kleinfeld's (1998) utilization of critical incident scenario for teacher training in cultural diversity demonstrated that engaging in discussions surrounding these cases elicited emotional and intellectual responses from teachers, fostering a deeper understanding of the cases and each other's experiences. This finding suggests that a discussion format can be effective not only in building empathy and cultural understanding related to the target culture but also towards the cultures of students' home countries and communities. Similarly, previous research has incorporated critical incidents into foreign language (FL) classrooms to enhance cross-cultural understanding, particularly in intermediate or advanced levels (Stakhnevich, 2002). However, it is noteworthy that while the effectiveness of discussions based on critical incident stories is implied, there is a scarcity of research utilizing critical incidents as materials for introductory-level courses in the target language.

Another Challenge FL Educators Face When Fostering Cultural Empathy

Certainly, fostering cultural empathy in the FL classroom requires the incorporation of cultural content. Although cultural content has become even more significant (Paesani 2016, Leaver et al 2021), research by Sercu (2005) sheds light on the hurdles confronted by FL instructors, especially in introductory level courses, when integrating culture into FL classrooms. These challenges include limited student language proficiency, time constraints, curriculum limitations, and teacher reluctance to use the native/common language in class. Despite these obstacles, insights from Garrett-Rucks (2013) and Li, Mazzotta, and Liu (2022) underscore the effectiveness of employing English for meaningful cultural reflections in FL classrooms.

Motivation of the Present Study

A substantial body of research exists within the framework of Transformative Language Learning and Teaching (TLLT) and on the topic of cultural sensitivity and cultural empathy, there is a dearth of studies focusing on the development of cultural empathy as a distinct form of transformation. Additionally, limited research has explored the potential of critical incidents to serve as catalysts for disorienting dilemma/transformation in the context of learning target language as a foreign language remains under-investigated, signaling an opportunity for further inquiry. Moreover, the challenge of integrating culture learning in FL classrooms, especially at the elementary level, calls for innovative approaches and materials to facilitate cultural learning in the early stages of FL education. The present study, therefore, proposes a balanced approach to tackle these challenges: the implementation of critical incidents as reading materials in the target language, followed by in-depth discussions in English and aims to investigate the potential of utilizing a reading and discussion activity centered around critical incident scenarios to amplify students' "cultural empathy." The research questions (RQ) are as follows:

1. How does engaging in a reading activity focused on critical incident scenarios influence the development and augmentation of cultural empathy?
2. Does any sort of transformation happen to students through the activity?
3. Does this activity effectively tackle the challenges associated with culture learning in introductory-level language courses?

Method

Participants and Course

The present study was conducted as action research in a classroom setting. The study targeted thirty-eight undergraduate students enrolled in a Japanese elementary-level course (JPN101 and JPN102) at a university in the southern United States. Students cultural/language background are diverse, encompassing individuals from the U.S., Europe, Africa, East Asia, Southeast Asia, and the Middle East. Notably, the majority were East Asian students. They pursued diverse non-language related majors. The course was offered during the second semester of the 2022-2023 academic year to students who had no previous experience learning Japanese before the first semester. The course consisted of two 75-minute in-person sessions and one 50-minute Zoom meeting per week. The instructor primarily used English to explain target grammar items, while students had ample opportunity to engage in Japanese with their peers during the lessons.

Learning Material

The course utilized the Genki textbook, covering lessons L1-5 in first semester and L6-10 in second semester. Therefore, to enhance students' understanding of the topic and language forms they learned in the lesson, each narrative used as reading materials was carefully chosen to explore themes pertinent to lessons 6-10 of the Genki textbook. It consisted of scenario, each comprising 400-500 characters in Japanese and explored value conflicts between Japanese people and individuals from different cultures. Topics included educational system - "the meaning of silence in class," Family & kinship terms - "marriage between a Japanese and American," Foods in Japan - "chopsticks manners and taboos," Traditional cultures - "tradition and gender issues," and public transportation - "punctuality and flexibility." These narratives were thoughtfully reconstructed by the teacher-researcher to align with the proficiency levels of the students as the scenario were sourced from diverse outlets, including news, social media, personal connections of the teacher-researcher, and research articles.

Image 1: An Example of reading material

Procedures

The teacher-researcher conducted the reading activity at the end of each textbook lesson in-person, with each session taking 30-40 minutes of the regular class time. The session commenced with a 10–15-minute reading of the selected text on an online learning management system called Canvas, followed by a 5-minute Q&A session to ensure participants had a precise understanding of the presented scenarios. Subsequently, participants were given 15 minutes to engage in reflective writing, guided by questions formulated by the teacher-researcher. For lessons 6-7, this reflective process was followed by an enriching class discussion. While initial plans included a class discussion format for lessons 8-10 as well, time constraints and other commitments led to a modification where students read their peers' comments only. Despite this adaptation, valuable exchanges were facilitated, contributing to the overall success of the activity. At last, participants were engaged in overall reflective writing about the reading and class discussion/peer comments. Additionally, at the end of the semester, participants were tasked with crafting a 250-word reflective essay based on their cumulative experiences with the reading activity. The languages used in each segment of the activity are in image 2 below.

Session	Date	Content
Lesson 6	Jan 23	the meaning of silence in class
Lesson 7	Feb 6	marriage between a Japanese and American
Lesson 8	Feb 20	chopsticks manners and taboos
Lesson 9	Mar 1	tradition and gender issues
Lesson 10	Mar 29	punctuality and flexibility
End of semester reflection	Apr 3	Semester reflection

Table 1: The Schedule and Content of reading and discussion activity
Image 2: Language usage in each segment of the activity

The rationale behind employing reflective writing lies in its ability to unveil internal thoughts, provide a platform for reserved students to share, and aligns with recent research suggesting its transformative impact in language classrooms (Crane 2018, De Santis & Willis 2016, Johnson 2015). The utilization of a discussion format has proven to be effective in fostering connections and empathy among students within the classroom setting, as highlighted by Kleinfeld (1998). This format not only provides a platform for students to elaborate on their opinions initially shared on the Canvas discussion board but also serves as an avenue for a deeper exploration of Japanese culture and mutual understanding of each other's diverse cultural backgrounds. Particularly in introductory-level language courses, the role of the native language (L1) is pivotal in the process of meaning-making. Recognizing that the primary focus of this activity is on perspective transformation rather than the development of language skills, the choice of English as the common language in the classroom discussions becomes paramount. This strategic use of English promotes equal

participation among students, irrespective of individual differences in Japanese proficiency levels, ensuring an inclusive and enriching learning environment.

Data Collection and Analysis

Data collection took place in the early months of 2023, spanning the Spring semester. Out of the 38 initially targeted students, 34 consistently attended all sessions, and their responses form the focus of our analysis. Since transformation is a process that unfolds over time, semester-end reflective writings (minimum 250 words) serve as the primary source for potentially observing and analyzing transformation. This approach allows us to capture the evolving nature of students' experiences and perceptions throughout the course.

The teacher-researcher conducted thematic analysis, adhering to Braun and Clarke's (2006) approach. The qualitative research software, MAXQDA (2022), was employed for efficient organization and analysis of the rich qualitative data, facilitating a rigorous exploration of the themes emerging from students' reflective writings. Recognizing the intricate and subjective nature of personal transformation, the study acknowledges the diverse backgrounds and experiences of these 34 participants. Given the individualized and context-dependent character of transformation, the study refrains from seeking nomothetic generalization and instead opts for a qualitative research method to delve into the depth of each student's unique experience. The modest sample size further underscores the appropriateness of qualitative methods. The study prioritizes transferability, which as defined by Duff (2006) and Lincoln and Guba (2009), hinges on fittingness—the congruence between the original study's context and the potential application in other settings.

Results and Discussion

In order to answer the research questions (RQ), both quantitative and qualitative data are presented; accordingly, all names used for students' comments are pseudonyms.

The discerned patterns found from the data are as shown in table 2 and 3. Numerous students affirmed that they deepened understanding of Japanese culture and classmates' cultures, concurrently reevaluating their own values. Additionally, some recognized the importance of empathy. The comments labeled as "self-reflection on one's own values" and "importance of putting oneself in other's shoes" are the vital components of "cultural empathy," as defined by Zhu (2011) and Ivey, Ivey, & Simek-Morgan (1997), seeing the world through another's eyes and feeling and experiencing their internal world without mixing one's own thoughts and actions with those of the client. Thus, this activity successfully offered opportunities for students to develop and increase their cultural empathy.

Code	Count
Knowledge of Japanese culture and classmates' cultures	20
Self-reflection on one's own values	12
Importance of putting oneself in other's shoes	7
Importance of clear communication	7

Table 2: Participant's reflection on overall learning outcome throughout the semester

As shown in table 3 below, notably, the semester-end writings revealed genuine emotional responses to the scenarios, underscoring the enduring impact of these narratives on students'

feelings and reflections. As Boris (2017) stated, personal narratives resonate with audiences, making them relatable and memorable and it seems to be true in this case too.

Code	Count
Empathy (L6 - the meaning of silence in class)	6
Sadness (L7 - marriage between a Japanese and American)	2
Anger (L9 - tradition and gender issues)	9
Surprise (L10 - punctuality and flexibility)	5

*No participants mentioned emotions they recall from L8 reading

Table 3: Emotions participants recall about each critical incident scenario

As for RQ1 regarding the impact of critical incident scenario on the development of cultural empathy, this reading activity seemed to serve as a platform to foster fundamental cultural empathy skills, immersing students in the emotional journey of the story's characters. The emotional resonance many students demonstrated with the characters suggested a pre-existing level of cultural empathy before taking this course. Nonetheless, certain comments quoted from participants' writings below unveiled challenges, indicative of a potential disorienting dilemma. (Underline indicating a disorienting dilemma and bold font suggesting increased cultural empathy were added by the author).

1) *When I read about the time management readings, I felt troubled to accept the second type of time management (= Latin time) (John)*

2) *Such emotion (= frustration) taught me that sometimes I could not simply accept everything as it is. (Tim)*

For RQ2 where the focus was on whether transformation occurs through the reading activity, the data indicates that a profound transformation didn't unfold during the semester; however, notable shifts in perspective and mindset, indicative of increased cultural empathy, did transpire. Ethan expressed intentions to alter his behavior when interacting with Japanese individuals, signifying changes in his approach.

3) *My parents love to send food (chopstick to chopstick) to me to show their love. However, it seems disrespectful in Japanese culture. Also, we cannot stick the chopstick.* **Probably I will talk to my parents about this little story, and if I have a Japanese friends, I will pay more attention to it.** *(Ethan)*

The quotes below show that participants with a more relaxed approach to time, often associated with "Latin time," undertook a reconsideration of their behavior. Encouragingly, some expressed a commitment to understanding perspectives divergent from their own. This shift in mindset signifies a notable increase in cultural empathy following the reading activity.

4) *I am a extreme casual person and did believe that being late shouldn't be a big issue. But after reading the comments by my fellow classmate,* **I realized that showing up on time and keeping updates with schedules should be a more respectful thing**. *(Aline)*

5) *The last story I read is awe-inspiring to me. This also**, to some extent, changed my attitude toward time issues**. I previously have not realized that being late is a way of not showing respect to others. (Rin)*

6) ***This changed my behavior** as, after reading these stories, **I start to put more attention on my friends' feeling** and trying hard not to be late when I have appointments with my friends. (Edward)*

Meanwhile, on the same topic, a fascinating observation emerged. Students who prioritize punctuality demonstrated an awareness of the opposing viewpoint but retained a negative emotional response toward those with a more relaxed attitude towards time. It appears that while they acknowledged the difference, truly empathizing with the "Latin-time" perspective seems challenging for them. This insight implies that accepting diverse viewpoints on certain concepts may present greater difficulty compared to others.

Furthermore, some participants mentioned that they had been already exposed by different cultures since childhood, therefore, this activity offered them an opportunity to reflect on their own values and perspectives but did not give them disorienting dilemma and/or a new insights into cultural value conflicts. Thus,

Lastly, concerning RQ3 which questioned the effectiveness of this activity towards the issues at elementary level FL classroom discussed in the literature review, many students offered positive feedback as seen in table 4 below, citing the engaging nature and authentic content. Furthermore, they found the grammar and vocabulary challenges to be at a suitable level, enhancing language proficiency, particularly in reading skills. This underscores the activity's dual capacity to address both linguistic and cultural elements, even within the constraints of limited proficiency.

Category	Code	Count
Cultural content	Engaging way to learn culture in context than textbook	6
	Opportunity to learn Japanese and classmates' cultures	4
	Real examples – easy to relate and be emotional	5
Language content	Decent level of challenge (grammar and vocabulary)	7
	Contribution to improving reading speed	2

Table 4: Feedback on the learning activity

Conclusion

The exploration into the integration of critical incident scenarios in an elementary-level Japanese language course has yielded significant insights, enriching the discourse on transformative language learning and teaching (TLLT) and the cultivation of cultural empathy in foreign language (FL) education. This research aimed to assess the impact of a reading activity centered around critical incidents on students' cultural empathy, specifically addressing the challenges inherent in culture learning within introductory-level language courses.

Results indicate that the reading activity exerted a positive influence on students' comprehension of Japanese culture and their classmates' diverse cultural backgrounds. The

engagement with critical incident scenarios prompted a profound reflection on personal values and the intrinsic importance of empathizing with others. Noteworthy challenges, such as grappling with the concept of punctuality, hinted at the initiation of disorienting dilemmas—a pivotal element in transformative learning (Mezirow, 1978). Although a profound transformation did not transpire during the semester, notable instances of increased cultural empathy emerged. Students demonstrated a willingness to reconsider their behaviors and adopt a more culturally sensitive approach. The identification of disorienting dilemmas in some responses suggests that the reading activity triggered cognitive conflicts, prompting students to question their preconceived notions and consider alternative cultural perspectives.

Furthermore, the emotional responses expressed by students in their semester-end reflections underscored the enduring impact of the narratives. Feelings of empathy, sadness, anger, and surprise in response to specific critical incidents suggested a genuine connection with the characters and scenarios presented. This aligns with the notion that personal narratives, when adeptly employed, can evoke robust emotional responses, rendering the learning experience more relatable and memorable. However, it is crucial to emphasize the commitment to maintaining a safe and supportive environment for all participants involved. Given the sensitive nature of the research—exploring personal reflections, cultural perspectives, and potentially transformative experiences—FL educators must be steadfast in upholding ethical standards and ensuring the well-being of every participant.

The study also addressed challenges related to integrating cultural content in introductory-level FL classrooms. Positive feedback from students regarding the activity's engaging nature, its relevance to real-life examples, and its contribution to language skills improvement indicates that short reading activities featuring authentic cultural content can effectively navigate obstacles posed by limited language proficiency, time constraints, and curriculum limitations.

While this research provides valuable insights, acknowledging its limitations is essential. The study's timeframe was confined to one semester, relying primarily on semester-end reflective writings. This short-term perspective may not fully capture the long-term effects of the reading activity on students' cultural empathy and transformative learning. Disparities in language skills may have influenced the depth of engagement with critical incident scenarios and subsequent reflections. Additionally, focusing on Japanese language learners in a specific university setting might limit the transferability of outcomes to other language courses or institutions with distinct curricula, student demographics, and language learning contexts.

To comprehensively understand the impact of reading activities on cultural empathy, future research should explore the long-term effects beyond a single semester. This would offer valuable insights into the sustained influence on students' perspectives over an extended period. Delving into alternative topics that are more likely to trigger disorienting dilemmas could push the boundaries of cognitive conflicts, potentially leading to more profound transformative experiences. Exploring the integration of multimodal approaches, such as visuals or interactive elements alongside critical incident scenarios, could be pursued to assess their impact on cultural empathy.

In conclusion, the utilization of critical incident scenarios in an elementary-level Japanese language course proved to be a valuable approach for fostering cultural empathy and addressing the dual challenges of cultural and language learning. The study contributes to the existing literature on TLLT by providing practical insights into the implementation of

transformative pedagogy in introductory FL courses. As language educators navigate the evolving landscape of FL education in the 21st century, incorporating innovative and meaningful activities that promote cultural empathy remains a crucial aspect of preparing students for global citizenship.

Exploring Face-to-Face vs. Online Feedback Approaches in Academic Writing Courses

Matthew Armstrong, Kyushu University, Japan

The Asian Conference on Education 20223
Official Conference Proceedings

Abstract

There are various ways in which teachers and students provide feedback in L2 academic writing courses. This has been especially true over the past four years during and after the pandemic. This research presents two dimensions—how the teacher has changed his approach to giving feedback during and post-COVID interruptions, and key differences noted in students' comments in online and face to face contexts. This paper first gives a description of his changing approach in giving feedback in online and face to face contexts. Secondly, the researcher will present data findings showing the differences in quantity and quality of student feedback between October 2021—March 2022 (online) and April 2023—August 2023 (face-to-face). Data from feedback collected show that students' face-to-face comments have more length and depth, especially in being critical about content and logic, as opposed to the virtual environment where students gave mostly surface comments on grammar, spelling, and writing structure. The researcher will further provide results showing a comparison of quantity related to specific grading criteria as well as linguistic tone when communicating online and face to face. Key findings highlight the important role dialogue plays in academic writing when providing feedback in either online or face-to-face settings.

Introduction

Having strong written communication skills is essential in academia as well as beyond the classroom. How to write well academically at the tertiary level requires a substantial amount of reading (Linuwih, 2021), an understanding of formality and accuracy of academic vocabulary (Syarofi & Shobaha, 2023), and consistent practice of controlled writing covering a range of writing genres (Mallia, 2017). However, without receiving feedback or reflecting critically on one's writing, it is difficult for learners to identify areas to improve or gauge overall progress. Feedback approaches in academic writing courses vary depending on educational settings, cultures, institutional goals and expectations, proficiency levels, among others. Between 2020-2023 during the COVID-19 pandemic, approaches to feedback faced new challenges as many teachers and students were suddenly thrown into emergency remote learning environments. For teachers who had already been conducting academic writing in an online setting, feedback approaches may not have changed; however, for a substantial number of teachers, including those at the institution at which this research took place, new protocols had to be implemented to ensure the quality and quantity of feedback remained at a high level. During these three years, many fruitful discussions between teachers occurred which led to unplanned, but very welcome informal professional development sessions. One key realization that emerged among the teaching staff was that we all had to revisit teaching practices learned in our early teaching days and rethink best approaches for the new era. We had further acknowledged that many of us had comfortably settled into one pattern of teaching or were not fully up to date with useful technological tools and applications to assist students in becoming more critical writers.

This research presents two dimensions. First, it follows changes in feedback approach by the researcher before, during, and after COVID-19. Secondly, data findings will be presented showing the differences in the quantity and quality of student feedback comparing online and face-to-face contexts between October 2020—February 2023 (online, Semester 2) and April 2023—August 2023 (face-to-face, Semester 1). The research concludes by offering insights into benefits and drawbacks of face-to-face versus online feedback approaches in academic writing courses.

Research Context

This research took place in an academic writing course for freshman students at a national university in Japan. Research participants majored in various fields (Engineering, Letters, Agriculture, Science, and Economics) (Figure 2), but all students had to take English writing courses to gain the required number of credits for graduation.

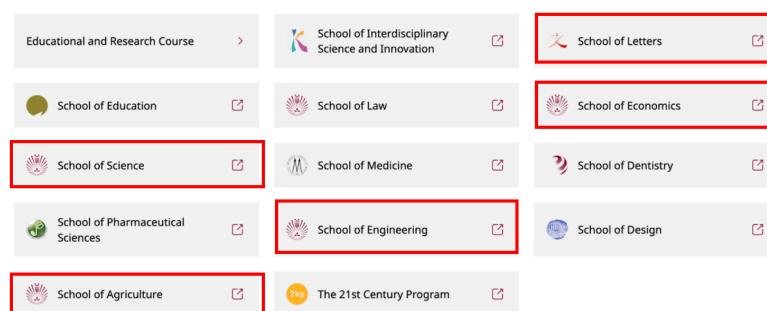

Figure 1: Student participants by faculty https://www.kyushu-u.ac.jp/en/faculty/

Proficiency levels ranged from B1 to B2 (English independent user) on the CEFR (CEFR, 2001) scale. The researcher taught five writing classes with an average of 20 students in each class. At the start of the semester, there were approximately 100 students. Due to the attrition rate over the 16-week semester in both online and face-to-face contexts, the final data set collected from feedback comments on Moodle (Moodle, 2024) and Google Docs (Google Doc, 2024) consisted of 90 students (90%) in the online course (semester 1) and 85 (85%) in the face-to-face setting (semester 2) respectively. The main reason for the higher attrition rate in the physical classroom was that many students find it difficult to maintain attendance throughout the semester and fail due to the policy of no more than 30% absences. In the online context, students were typically able to work at their own pace and at the most suitable time as the teacher did not organize virtual meetings on Zoom every week. The researcher was thus able to collect a significant amount of data from both contexts. Between 2022-2023, the researcher tried various feedback approaches which provide insights into the most effective method of providing feedback that would enhance student learning.

Teaching Journey: Changing Approach to Giving Feedback

This section describes the researcher's changing approach to giving feedback in the academic writing course. Through close observation of and reflection on the various approaches, it was possible to identify benefits and drawbacks of each method and understand which method was more effective in face-to-face and online contexts.

Pre-2018 (Face-to-Face)

The university's academic writing syllabus focuses largely on a process-style approach to writing essays with intermittent feedback, rather than the teacher grading only the final product. The approach described in Figure 2 was the style all teachers had been using at the time. Typically, the researcher would ask students to print out the first draft of their essay and then the teacher would give feedback. This was repeated a few weeks later with the students highlighting the revisions they made. The teacher checked the revised, highlighted sections and then the students wrote and submitted the final draft a week later, attaching all the previous drafts.

Face-to-Face (Classroom)
Students print out their essay on paper and submit to teacher (Draft 1)
The teacher gives feedback
Students submit their essay again (Draft 2 with revisions highlighted)
The teacher gives feedback
Students submit the final draft and teacher collects all drafts (Draft 1, 2, & 3)
The teacher grades the final draft

Figure 2: Feedback approach pre-2018

The benefit of this method was that the teacher could observe student progress after subsequent drafts, and help the student understand areas to improve. The drawback was that unfortunately, some students submitted the same essay three times without making or highlighting any revisions. This was demotivating for the teacher who had spent 3-4 hours grading each class. Thus, this style of feedback favored students who were intrinsically motivated and driven to improve their academic writing.

2018–2020 (Face-to-Face)

Class sizes had been increasing from 2015 and thus the previous method of giving feedback became unsustainable as it was leading to teacher burnout. Thus, an alternative approach was needed to maintain quality and quantity of feedback while lessening the workload (Figure 3). Discussions with a colleague (McCarthy & Armstrong, 2019) led to a new student-centered approach with the aim of increasing critical thinking and dialogue.

Face-to-Face (Classroom)
Students print out their essays on paper
Students give feedback on each other's essays using checklist from the teacher
The teacher responds to questions during class
Students revise and submit to teacher one week later (Draft 1)
Teacher gives feedback
Students submit their essay after revisions (Draft 1 with revisions highlighted & Draft 2)
The teacher grades the final draft

Figure 3: Feedback approach 2018-2020

In this approach, the researcher continued to provide feedback, but decided to give more responsibility to the students. The aim was to help students critically self-evaluate their own writing, thereby increasing self-awareness of their writing ability, as well as specific academic writing components. A checklist was given to students covering the four grading criteria: format, language, structure, and content. The researcher added more time for discussion among students and group questions with the teacher for any areas that were unclear. The benefit of this method was that students became more active in the learning process. Instead of seeing the teacher as "expert," students were now encouraged to think more deeply and critically of the writing process themselves. The disadvantage was that many students felt anxious about sharing and discussing their essay with others, especially those who had a lower proficiency of English. The researcher allowed students the option to have discussions in their L1 to reduce any concerns.

2020–2022 (Online/Hybrid)

At the start of the pandemic all classes in 2020 moved online for a year. The feedback style which the researcher had been using successfully had to be changed immediately as group discussions were more difficult to incorporate into online and hybrid classes (Figure 4). Again, through discussions with colleagues, a new feedback approach was developed to meet the expected standards at the university. Classes in 2020 were held as mostly on-demand lessons meaning that the researcher prepared videos and students had the freedom to learn at their own pace. Feedback was given only once by the teacher on paragraphs uploaded step-by-step as students wrote their essay. Zoom (Zoom, 2024) was used periodically to meet with students and explain points that students needed to improve generally as a class. By 2021, the researcher became aware that the most successful component of the feedback classes was student discussions and question time with the teacher. As such, more Zoom classes were added and Moodle was used to encourage written feedback. By this time, students were more familiar with how to use online tools such as Zoom and were able to share screens to discuss essays. The most significant changes made during this time was that students used the checklist before feedback classes to check their own essays and the researcher also asked students to pre-label the structural parts of their essay. In this way, the students were able to prepare in advance.

Online (On-demand and Zoom)
Self-check of essay structure, content, language, and format using the teacher's self-directed checklist
Students prepare to share their essay
Students label the parts of their essay by themselves
Students organized into breakout rooms (in pairs)
Students read and discuss each other's essay
Student asks teacher for advice if they have questions
Student submits final essay after revisions

Hybrid (Classroom/Moodle)
Students label the parts of their essay by themselves
Students upload essay to Moodle
Students organized in groups in Moodle and in the classroom
Students read and discuss each other's essay
Student asks teacher for advice if they have questions

Figure 4: Feedback approach 2020-2022

The benefit of the online approach was that students could learn at their own pace and at a time that was suitable to them. By adding specific self-checks, students could feel more prepared to give feedback as well as understand which areas were lacking in their essay writing. The disadvantage was that many students were unfamiliar with the various platforms and felt it was too much work to upload essays, share screens, meet in breakout rooms, and write comments on Moodle. Each platform required a different password, and the university had also began to put restrictions on certain settings to protect student identities.

2023–2024 (Face-to-Face)

When classes resumed face-to-face after the pandemic, the researcher reflected on the successes and drawbacks of previous methods. Once again, through dialogue with a colleague at another national university, the current feedback approach (Figure 5) was developed and implemented.

Face-to-Face (Classroom/Google Doc.)
Weeks 1-7: Teacher modeling of feedback
Weeks 8-16: Critical analysis of paragraphs and practice feedback sessions every 2-3 weeks
Self-check of essay structure, content, language, and format using the teacher's self-directed checklist
Students arranged in Google Doc groups and upload their essays (Draft 1)
Students individually label the parts of their own essay
Students write comments on Google Doc in English/bilingual as practiced in previous classes
The teacher checks the comments and provides feedback on comments (meta-feedback)
Students revise their essay
Teacher offers in-office consultation for students who have questions OR
invites students to ask specific questions on their writing via the Google doc
Students submit final essay after discussions and revisions

Figure 5: Feedback approach 2023-2024

The most notable change in this feedback approach was the addition of the critical analysis of body paragraphs which was done three times in the latter half of the 16-week semester. The researcher found that through critical analysis of writing, the students could better understand the grading process and give more effective feedback, whether in online or face-to-face contexts. The critical analysis was less effective in the first part of the semester as students did not yet have a complete understanding of essay components and grading criteria. As such, the teacher focused on modeling feedback in the first part of the semester and then followed up with paragraph analysis. In addition, along with talking with students in groups, the teacher offered consultation hours for students who needed more assistance. Google Docs became the platform to give written feedback as most students had a gmail account and could access and use it easily. This approach has been the most effective since returning to the classroom after the pandemic and has resulted in improved feedback comments and a higher standard of essay writing.

The next section of this paper presents data findings which illustrate differences in quantity and quality of student feedback between October 2021—March 2022 (online) and April 2023—August 2023 (face-to-face).

Learning Journey: Students' Ability to Give Critical Feedback

Data was collected from approximately 90 students in the online setting and 85 students in the face-to-face classroom. The data examines firstly the quantity of comments and then the quality.

Quantity

Feedback data collected from written comments on Moodle during online learning numbered 128 and comments after the pandemic when face-to-face classes resumed numbered 176. Even though there were more comments in the face-to-face setting by fewer students, the quantity of comments was satisfactory for both contexts. Data showed that sufficient comments were written across all faculties. Where they differed was mostly in length of comments as the more proficient students wrote in more detail. One point to note here is that instead of writing several small, specific comments throughout the reading of the essay, students were encouraged to write one or two longer, more general comments about areas they felt were strengths and areas in which they felt the essay could be improved. If they wanted to, they could then pinpoint specific examples from the essay. This ensured that the slower-proficiency students did not feel overwhelmed with the task and more advanced students could have more freedom in the way they approached the task.
Figure 6: Comparison of feedback quantity (online and face-to-face contexts)

The key findings illustrated in Figure 6 are in the percentage of comments observed when comparing online and face-to-face comments in the four grading categories. In the online setting, most of the comments written were about formatting (74%). Comments about language accuracy (42%), content (39%), and structure (43%) were somewhat similar in number. The researcher noted that students typically found it easier to provide feedback on format and structure since these areas are more objective and straightforward to check. Regarding accuracy in language, most of the comments were on spelling and grammar as students picked up many of the suggestions by the software editing checks. There were fewer comments on academic word choice as this was the most difficult part of language checks. In comparison, during face-to-face feedback, students rarely focused on formatting, but instead discussed the content of the essay. This shows that dialogue during feedback lessons enhances the writing process as students speak more deeply about the content as opposed to just reading and writing comments. In particular, students talked about reasoning and logic in

writing. Helping students to understand how to write strong content in an academic essay is an area that is difficult to teach to an entire class as each topic is decided by the students themselves. That is, students must research and decide which information they will include in the essay themselves and consider if the selected information has unity and coherence, as well as a logical flow.

Quality

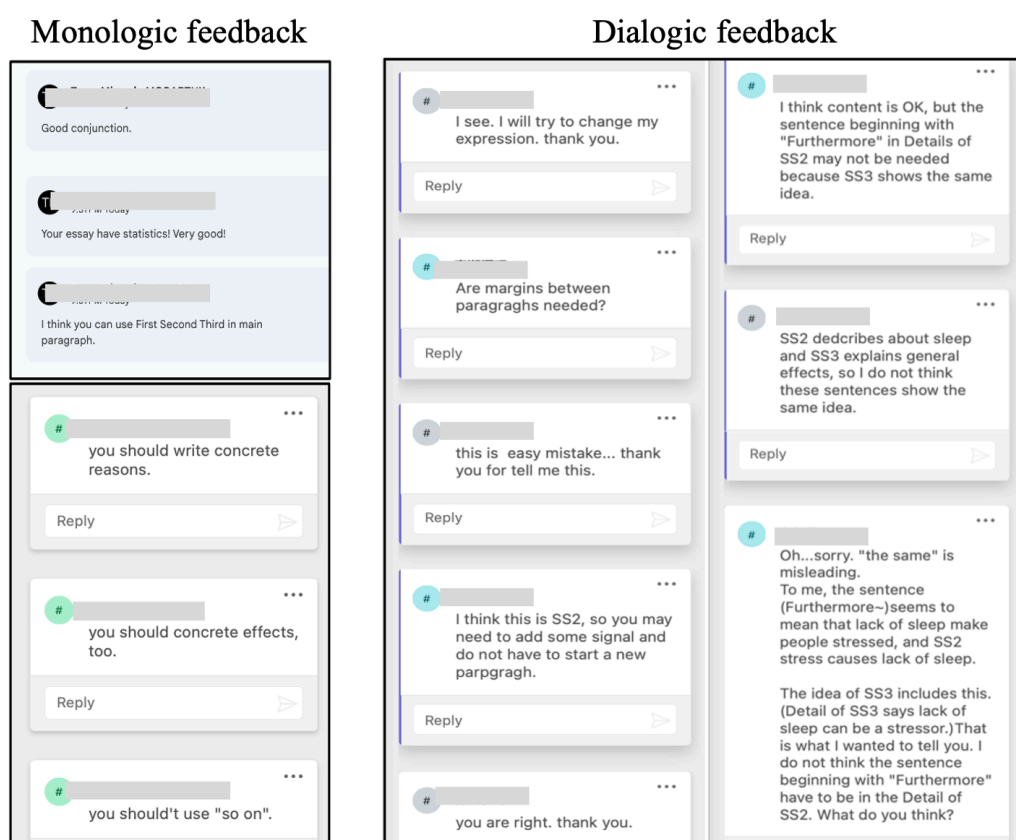
Regarding quality of feedback, the research sought empirical evidence showing differences in in online and face-to-face environments. However, interestingly, the quality in both learning environments, for the most part, was similar. The major difference observed was that lower proficiency learners wrote more surface comments (e.g., on format and grammar) as well as shorter sentences in a somewhat monologic style. However, they seemed to benefit more from the feedback received as they were able to revise their essay to a higher standard from the original Higher proficiency learners wrote more critical comments on key structural errors and weaknesses in content in a dialogic style and with a higher level of linguistic complexity. This finding is in line with Gao et al. (2023). What the researcher noted most significantly when analyzing the data is that the quality of feedback increased when meaningful dialogue during paragraph analysis were incorporated into feedback classes (see Schillings et al., 2018 for similar findings). Figure 7 shows the quality of feedback written when students were asked to quietly read their partner's essay and write comments (left side) and feedback written by students after paragraph analysis tasks and discussion were introduced into feedback classes (right side).


Figure 7: Quality of feedback

As can be seen in the figure, in the monologic style, the student reviewer wrote shorter comments that although insightful to the writer, did not provide much detail. There was no acknowledgment to the reviewer to show that the writer had read the comments. This was an issue to some students who felt like they had taken on the role of "teacher," and they did not feel that this was their responsibility. Linguistically, the tone is somewhat harsh with the expression "you should" appearing frequently in the comments.

> *you should write concrete reasons*
> *you should concrete effects*
> *you shouldn't use "so on"*

This style of feedback was observed in both online and face-to-face settings. On the right side, the feedback is more conversational as it includes words of thanks from the writer.

> *this is easy mistake…thank you for tell me this*
> *you are right. thank you.*

There are even moments of disagreement where students defend their writing positions which shows that through dialogic feedback, students are able to understand and explain writing conventions more deeply.

> *A: I think content is OK, but the sentence beginning with "Furthermore" in Details of SS2 may not be needed because SS3 shows the same idea.*
> *B: SS2 describes about sleep and SS3 explains general effects, so I do not think these sentences show the same idea.*

Because students were asked to label their essays in advance using coding symbols (SS2: Supporting sentence 2), they were able to easily incorporate this academic writing terminology into their feedback. A second observation was students adding "What do you think?" to the end of the comments. This is a technique the researcher often used when modeling feedback in the first part of the semester to help students develop a more critical mind when self-evaluating their writing. It was interesting to observe students using the modeling style in their own feedback. Based on the data findings, it can be concluded that modeling is a useful technique for teachers who are trying to incorporate more peer feedback into academic writing classes.

For students who need more detailed feedback, a second useful suggestion would be to ask students what kind of feedback they prefer and offer consultation hours to address specific concerns. In a previous study conducted by the researcher (Armstrong, 2023), students were asked about their preferences for receiving feedback. Figure 8 shows the results.
Figure 8: In order of importance, how would you prefer to receive feedback?

From the researcher's experience, only students who are either highly motivated or failing the course ask for extra assistance, thus this does not add to the teacher's workload. However, having students reflect on aspects of their writing they need specific help with before consultation helps to speed up the process and improve the quality of feedback.

Conclusions

This study first provided a description of the researcher's journey over a decade of giving feedback in an academic writing course culminating in his current dialogic approach. It then compared the quantity and quality of feedback in online and face-to-face learning contexts. The most significant findings observed from the collected data were that incorporating analytical tasks, feedback modeling, and discussion were the most beneficial in improving both the quantity and quality of peer feedback. Regarding quantity, the number of comments in classroom settings were slightly higher than in online settings mainly because students were able to discuss the essay while writing comments. The researcher found that the quality of feedback was similar regardless of learning environment. However, what was most interesting was that after doing several paragraph analysis discussion tasks before the main feedback class, students became more dialogic in their peer feedback style. They acknowledged each other's comments, used more linguistically complex sentences, and their language became more formal in tone. What the researcher gained mostly from this study which other teachers could benefit from is that successful peer feedback in academic writing courses requires three main elements: meaningful dialogue (critical discussion about academic writing components), self-directedness (a willingness to take more responsibility for the quality of one's own writing), and inquiry (reflecting on strengths and areas to improve and asking the necessary questions to improve one's writing). However, it is also important to be mindful not to fall into formulaic teaching, but rather be aware that each writing course, each group of students, and each teaching context often requires a tailored approach.

The Integration of Error Correction Codes in Five Introductory Writing Classes

Ann-Marie Simmonds, Rabdan Academy, United Arab Emirates

Abstract

Effective teacher feedback on second language writing cannot begin and end with surface error correction. However, many students equate 'good' writing with error free writing and see any attempt on their part to fix their errors as a way, and at times the only way, to improve their writing. Hence, instructors and students often hold contrasting opinions about improvement in the context of the second language writing classroom. This educator's reflection focuses on students' use of error correction feedback across five sections of an introductory writing class taught in Spring 2023. There is a brief discussion surrounding error correction, but the primary focus is on students' performance in three assessments in which error correction codes were a component. The findings show that there was a retention and application of some concepts, evidenced on the writing portion of the final exam. However, when judged independently, students struggle to identify and fix errors using codes. Error correction can therefore only be truly assessed and deemed effective when looked at in conjunction with other modes of corrective feedback as students engage in the writing process.

iafor
The International Academic Forum
www.iafor.org

Introduction

One of the primary goals of any L2 writing instructor is to help students produce comprehensible texts, and one of the ways they do this is by providing corrective feedback. As numerous studies (Boggs, 2019; Hadiyanto, 2019; Polio, Fleck, & Leder, 1998) have shown, learners do benefit from this kind of feedback as it can help improve their writing skills. Feedback can take the form of detailed narrative comments, individual conferences, peer review, or error codes. The latter involves not only identifying where the error has occurred and the type of error, but also examples of how to fix each error. This is seen as a viable option since it is less time-consuming in comparison to more detailed written feedback. Error codes are also useful as they allow students to work on fixing their errors independently. This is in contrast to direct or explicit feedback where students provide the correct linguistic form or structure.

According to Hyland (1990), one of the principal benefits of error correction codes is that they help to reduce the visible indicators of errors on students' writing; think of the dreaded red ink pen. Instead, instructors merely point out the location and type of error. In tandem with this is Lee's (1997) observation that inaccuracies in students' writing often occur because they fail to detect errors. However, when provided with symbols and/or abbreviations indicating such errors, students' can make corrections and reduce inaccuracies. In addition, the use of codes can help to reinforce principles that may have been previously taught as students can now see their application to their writing.

Unsurprisingly, there are some noted limitations of using error correction codes. In his 2011 study, Corpuz noted that students did not know how to use the codes to correct their sentences. Other participants stated that the process was time consuming, especially if they had to look at multiple codes and then correct their sentences. One additional issue that I have encountered in my practice is that students are often unable to retain or apply the use of the error correction codes outside the context of a specific writing assessment. So while learners may make corrections on a revised draft, the same mistakes often reappear in subsequent written assessments, with students having forgot the codes, their meanings and/or applications in the process of improving their writing.

Methodology

In Spring 2023, the writer taught five sections of ENG 210, an introductory writing course taken by undergraduate students at the academy. The class met once a week for 2.5 hours, over the course of fifteen weeks. Average class sizes ranged from 13 to 30; during the Spring 2023 semester, a total of 103 students were enrolled across the five sections.

On the first day of class, the instructor spent some time discussing the four learning outcomes (LO) stated on the syllabus:

    LO1   Produce a variety of texts written with appropriate organization and content.
    LO2   Apply phases of the writing process in the creation of written texts.
    LO3   Present a coherent oral argument justifying written texts.
    LO4   Use sources appropriately with correct APA citation.

Students received a physical copy of the error correction codes during this initial session, with a digital copy also available on Moodle.

symbol	meaning	incorrect sentence	explanation	correct sentence
SV	subject-verb agreement	The student work hard. There is five employees.	Subjects and verbs must agree in number.	The student works hard. or The students work hard. There are five employees.
pl	singular/plural	The internet has a lot of informations. You can make new friend easily.	Certain nouns are uncountable. Other nouns need an indication of how many.	The internet has a lot of information. You can make a new friend easily. or You can make new friends easily.
sp	spelling	The maneger is a woman.	Manager is spelled incorrectly.	The manager is a woman.
A	article (a, an, the)	Diners expect glass of water when they first sit down at their table.	Glass should be preceded by the article a.	Diners expect a glass of water when they first sit down at their table.
^	add word(s)	A camel is an animal lives in the desert.	A word is needed between animal and lives.	A camel is an animal that lives in the desert.
cap ≡	capitalization	Some people love to drive land cruisers.	Land Cruisers is a proper noun and needs a capital letter.	Some people love to drive Land Cruisers.
/	lower case	Earth is my home Planet.	Planet does not need a capital.	Earth is my home planet.
VF	verb form	I am live in the hotel.	Am live is the wrong verb form	I live in the hotel. or I am living in the hotel.

Table 1: First page of error correction codes sheet used by students in Spring 2023 – ENG 210

symbol	meaning	incorrect sentence	explanation	correct sentence
VT	verb tense	I see my friend yesterday.	Yesterday indicates the past tense.	I saw my friend yesterday.
WF	word form	This book is bored.	Bored is an active adjective.	This book is boring.
WW/WC	wrong word or word choice	My professor learns me many new things.	Learns is a receiving verb.	My professor teaches me many new things.
RO	run-on sentence	Abdulla failed the exam and he is upset he went home and his father said he shouldn't worry.	Independent clauses need to be separated by commas and conjunctions or full stops.	Abdulla failed the exam, and he is upset. He went home and his father said he shouldn't worry.
CS	comma splice	Mohammed is tired, he went to sleep.	Complete thoughts should be separated into sentences or combined into a compound sentence.	Mohammed is tired. He went to sleep. or Mohammed is tired, so he went to sleep.
frag.	sentence fragment incomplete sentence	He was tired. Because he always went to bed at 3:00am.	Because cannot start a sentence without a dependent clause after it.	He was tired because he always went to bed at 3:00am. or Because he always went to bed at 3:00am, he was tired.
WO	word order	You haven't seen yet London.	Yet should come after London.	You haven't seen London yet.
???	confusing	I don't understand what you are trying to say.		

Table 2: Second page of error correction codes sheet used by students in Spring 2023 – ENG 210

I explained the meaning of each symbol/code, and students read the incorrect sentences, explanations and corrected sentences with additional clarification provided as needed. I advised them to bring the sheet with them each week, highlighting its importance. During the semester, LO2 and by extension the application of the error correction codes was assessed three times: Assessment 1, Assessment 2 and the Final Exam.

Results

Students' performance on LO2 varied greatly by assessment. Of the five sections of ENG 210, only two sections scored 70 and above on LO2 attainment for Assessment 1. Only one section scored 70 and above on LO2 attainment for Assessment 2, while none of the sections scored 70 and above on LO2 attainment for the final exam.

	Assessment 1	Assessment 2	Final Exam	Spring 2023 Average
Section A (n=23)	60.87	26.09	13.04	53.7
Section B (n=17)	94.12	82.35	41.18	69.6
Section C (n=23)	65.22	34.78	8.70	56.7
Section D (n=17)	82.35	58.82	23.53	64.7
Section E (n=23)	65.22	8.70	8.70	50.1

Table 3: LO2 attainment – 70% and above

All five classes performed best on Assessment 1. Students submitted two typed paragraphs after receiving feedback on in class, handwritten paragraphs. Each paragraph was a minimum of 150-175 words, so this was not a lengthy assessment. I released the assessment in Week 3 as per institutional policy, and students submitted their final drafts in Week 5, giving them two weeks to complete the assessment. Sections B and D scored well on LO2 attainment, greatly surpassing the 70% target. And although the other sections scored below 70%, it is still noteworthy that each class attained a score in the 60s.

On the other hand, only one class earned over 70% on LO2 attainment for Assessment 2, the opinion essay. Using one provided research article and an article of their own, students submitted a four-paragraph essay of a minimum of 600 words. However, this time they only received feedback on one body paragraph as well as feedback on their introduction OR conclusion. As with the first assessment, first drafts were written in class and final drafts were typed and submitted two weeks after the release date. Section B scored very well on LO2 attainment with 82.35% while on the other end of the spectrum, Section E failed to attain even 10%. As for the other three sections, two scored below 40% and Section D came close to 60%, but still fell short of the 70% target.

The final assessment of the semester was the final exam held in Week 16. Here, we see a marked difference across all sections, except Section E which scored the same for LO2 attainment on both Assessment 2 and the final exam. For the other four sections however, the performance on the final exam showed a steep decline in LO2 attainment scores; this was especially evident for Sections B, C and D. The final exam consisted of three sections; students wrote two opinion paragraphs in Section 1, completed two error correction exercises in Section 2 and responded to a question related to APA citation in Section 3.

Discussion

Based on the results in Table 3, students struggled most with LO2 attainment on the final exam. I believe that one of the primary reasons for this was the fact that the errors were not named but instead students merely had to correct the circled mistakes.

The (hole) department meets every Thursday afternoon for two hours. (There is) twelve people in our department. All the people in our (department hard) workers. Everyone comes in early and leaves (late we) are all overworked. Nobody ever (complain) about the amount of work there (is do,) but nobody works hard enough to please (Sally our) boss. (Anybody) has ever seen her smile. Nobody has ever heard her say anything (complimentry) to anyone. When Constance enters the (room everybody) stops talking.

Figure 1: Question 4 on the Spring 2023 ENG 210 Final Exam

As seen in Figure 1 – one of the two questions of this nature on the exam – there are no abbreviations or symbols provided as on the error correction sheet. However, I am not sure if providing them with the symbols would have yielded different results. Unless the meaning of each error is known as well as the correct form, a student may have still scored poorly in this section of the exam.

A stronger argument can be made for the fact that on the final exam, LO2 attainment was only judged based on error correction. However, for both Assessment 1 and 2 completed during the semester, criteria such as improvement and similarity between drafts were also factored into LO2 attainment since this was a learning outcome related to the writing process. Since this was a timed exam, these criteria were not applicable, so students had no time to revise their work. And again, LO2 attainment on the final exam was only about error correction whereas during the semester, LO2 attainment focused on the writing process of which error correction was a single component.

The weighting of the error correction questions on the final exam also contributed to the lower scores. 40/100 points were attributed to this section of the exam; each corrected error was worth two points. If a student failed to score well in this part of the exam, it undoubtedly affected the final overall grade. It must be noted that this has since been amended, and the Fall 2023 final exam, which was recently administered, asked students to complete one error correction paragraph instead of two.

As for Assessment 2, a few factors contributed to the lower scores in LO2 attainment when compared to Assessment 1. Firstly, most students only made minor corrections on their final draft, even after they received both implicit and explicit feedback. Secondly, they did not seek extra help by visiting the Academic Support Center which was factored into their LO2 score for the opinion essay. And finally, many students scored lower in similarity in comparison to Assessment 1. In an attempt to earn the best grade, these students submitted final drafts that were completely different from their in class handwritten work, either in style, content or both. So while error correction was a crucial component of the writing process, it was not as previously stated, the only factor. Students who failed to engage in the overall writing process also failed to do well with LO2 attainment.

Conclusion

One of the principal findings of this reflective undertaking was that error correction is only a small part of process writing. More than one method to provide students with feedback must

always be considered in relation to second language writing. Students' failure to correct errors on the final exam was not indicative of a failure to self-edit or to incorporate what they had learned about the codes. This conclusion is supported by students' performance on LO1 – the learning outcome directly related to writing (grammar and mechanics, content, organization etc.) and specifically on the final exam.

	Final Exam LO1 attainment	Final exam LO2 attainment	Spring 2023 Average LO2	Spring 2023 Average LO1
Section A (n=23)	60.87	13.04	53.7	78.9
Section B (n=17)	70.59	41.18	69.6	79.2
Section C (n=23)	56.52	8.70	56.7	74.9
Section D (n=17)	58.82	23.53	64.7	79.8
Section E (n=23)	47.83	8.70	50.1	72.6

Table 4: – LO1 and LO2 attainment – 70 % and above

As seen in Table 4, all sections performed better on LO1 attainment in the final exam compared to LO2. Even more importantly, all sections earned above 70% on LO1 rewritten here:

LO1 Produce a variety of texts written with appropriate organization and content.

Therefore, while perhaps unable to distinguish between a comma splice and a fragment and while perhaps including both of these errors in their writing, students still produced comprehensible texts on the final exam, with no time for revising or editing. Given the tendency of some second language writers to memorize sentences or paragraphs before exams (Kabouha & Elyas, 2015), students produced texts that were for the most part coherent and cohesive. And in the final analysis, error correction codes were but one small cog in the writing wheel.

Official Conference Proceedings

Abstract

In response to the disruptive changes within society and technology, higher education institutions need to transform their content-centric curricula into learning pathways that effectively equip students for the workforce. Adapting to the challenges posed by evolving learner dynamics is a crucial approach for institutions to enhance their responsiveness to such changes. This research aims to investigate the categorization of potential students based on their learning preferences, study self-efficacy, and learning motivation. Furthermore, the study seeks to compare the attributes of students across these different clusters. The participants were secondary high school students from various school types in Thailand, using a multi-stage random sampling method for an online survey. Analyzing responses from 1137 students, a two-step cluster analysis identified three distinct clusters. The comparison of student characteristics among clusters showed significant differences according to the student's study self-efficacy, motivation, and learning preferences. Students in a cluster where the majority perceived their academic accomplishments to be at or above an average level exhibited significantly stronger preferences for non-traditional and traditional study approaches than the other clusters. The study also discussed how students' learning preferences and interests in academic disciplines are associated with their psychological attributes and perceived academic achievements. The distribution of cluster memberships holds significance for institutions, particularly in communicating innovative learning approaches to potential students.

Introduction

Amidst a social context that is highly volatile, uncertain, complex, and ambiguous, teaching curricula at various levels have turned the focus on creating "competencies and "learning outcomes" in replacing teaching formats and goals that focused on subject content. Higher education institutions (HEIs) have recently established new ways of acquiring skills to fill a gap between traditional higher education qualifications such as bachelor's, master's, or doctoral degrees and the skills that firms seek. Trends in self-paced, competency-based learning through terms such as Micro-credentials, Digital Credentials, and Alternative Credentials have been increasingly offered among HEIs. Although definitions and taxonomies to structure these targeted learning have yet to be widely agreed upon, they have changed the higher education delivery model (OECD, 2020).

Previous research indicated that students enroll in university with preconceived beliefs and expectations to acquire knowledge, develop competencies, and earn a degree according to formal education (Koul et al., 2012). As learners are in a dynamic context and do not belong to static characteristics, this study was conducted as a Scholarship of Teaching and Learning to explore patterns and groups of young learners' characteristics and preferences to further their learning journey at higher education. The focus was on the formal undergraduate level, where "traditional programs" increasingly shared the higher education market with emerging alternative approaches, which this paper termed "non-traditional programs."

In this paper, the term "traditional programs" involves learners enrolling in a university program that requires a time commitment of years, leading to the completion of a degree. This approach often includes a structured and fixed curriculum, set class schedules, and assessments. Degrees are widely recognized and accepted as a standard qualification for many professions. Meanwhile, the term "non-traditional programs" offers flexibility in duration and pacing. Learners might complete modules or courses to earn more minor, targeted credentials and study at their own pace. Additionally, a flexible pathway allows learners to accumulate accomplishments from smaller learning units to gain a certificate or a full degree. In this regard, the duration of an alternative or non-traditional program is often shorter than that of a formal higher education program that leads to the award of a degree. (Kato et al., 2020; Tanprasert, 2021; UNESCO, 2018).

Identifying learner characteristics and preferences patterns may contribute to developing the curriculum and teaching of higher education institutions that accommodate students' learning needs. Researchers have explored learner characteristics such as personality traits, cognitive and emotional aspects, and technology preferences to understand groups of learners. In this paper, the authors adopted self-efficacy and motivation as psychological characteristics under the study. Students' efficacy, as a central determinant of the success of high school to university transitions, was explored in the academic context (Svartdal et al., 2021), and their motivation was explained through the framework of achievement goal (Elliot, 1999) herein, referred to as learning motivation. Past research found that self-efficacy and motivation are significant predictors of academic achievement (Chemers et al., 2001; Rhew et al., 2018). This study will consider the two characteristics of Thai high school students in answering the research questions that ask:

    (1) Are there clusters of students based on their study efficacy, learning motivation, and learning preferences?

    (2) Are there differences in students' study efficacy, learning motivation, and learning preferences between student clusters?

Literature Review

Study Efficacy

Self-efficacy is a belief in one's ability to organize and execute actions required to succeed in particular circumstances (Bandura, 1997). Efficacy influences a person's effort and perseverance when facing challenges and failures. Generally, an individual's self-efficacy is related to persistence and achievement. Previous studies addressed the evidence that self-efficacy affected performance in specific cognitive abilities (i.e., longer persistence and better strategies in solving mathematical problems) (see Chemers et al., 2001).

Study self-efficacy (SSE) is students' belief in their ability to successfully plan and implement student activities (Bandura, 1997). In an academic context, a previous study found self-efficacy influenced academic motivation as the choice of activities, level of effort, persistence, and emotional reactions. Students with high academic self-efficacy use more effective cognitive strategies in learning and are better at monitoring and regulating their efforts. Compared to students with lower academic self-efficacy, those with higher self-efficacy tended to be more enthusiastic about participating in activities, persevering through setbacks, and experiencing fewer negative feelings when they failed (Zimmerman, 2000). Although academic self-efficacy is related to past academic achievement, studies have found that interventions based on social cognitive theory in educational programs (e.g., embedding mastery experiences) may enhance self-efficacy (Svartdal et al., 2021).

Chemers et al. (2001) studied the association between academic self-efficacy in first-year college students' performance and adjustment and found that self-efficacy beliefs affect academic commitment. According to Klassen et al. (2008), study self-efficacy is one key factor for applying study skills into action. They found that undergraduate students with lower self-efficacy were more likely to procrastinate on daily academic work and had significantly lower GPAs. In the study of Svartdal et al. (2021), self-efficacy influenced the relationship between study habits and procrastination but with different effects as a predictor of performance at early versus later study stages.

Learning Motivation

An essential process in motivation, according to Socio-cognitive theories, is goal setting. Elliot and Church (1997) researched the trichotomous conceptualization of achievement goals and found empirical support for the framework (see Elliot & Church, 1997). Two types of performance goals - performance-approach and performance-avoidance goals - represent separate, independent achievement orientations. Performance goal is associated with a task that focuses on demonstrating competence relative to others or competition, whereas performance-avoidance goals focus on not performing poorly relative to others. For mastery goals, the individual focuses on developing competence through task mastery, relevance, or meaningfulness. These three types of achievement goals are competence-based goals that are widely adopted in educational studies. While mastery goals positively related to the facilitation of interest and negatively related to evaluation focus and harsh evaluation, performance-approach goals were positively related to evaluation focus, and performance-avoidance goals were positively related to evaluation focus and harsh evaluation (Elliot, 1999; Elliot & Church, 1997).

According to Schunk et al. (2007), the performance-oriented individual is driven by the desire for public recognition and how one's competence will be evaluated in relation to others. Students with performance orientation will be motivated to be seen as the best in the group but to avoid judgments of low ability. On the contrary, students with mastery orientation are motivated to learn under one's standards, acquire new skills, improve competence, and accomplish something challenging. In the views of Zentall and Morris (2010), task persistence and self-evaluation are two potential underlying components of motivation. Students who negatively self-evaluate might think they would fail before starting the task or select an easy task to prevent unfavorable outcomes or to hide their inability.

Although motivation towards learning is a personal characteristic, some prior research found that institutional characteristics can influence students' goal orientations. In the study of Koul et al. (2009), students from vocational colleges were significantly more performance and identification goal-oriented than the students from higher education institutions. Performance-oriented students would be likely to engage in social comparison. Students who value the university degree program relative to the diploma program in vocational colleges could feel inferior or superior to other students.

Methods

Participants

The target populations were high school students in grades 10 and 11 from schools under the Ministry of Education (MOE) and Ministry of Higher Education, Science, Research and Innovation (MHESI) in Thailand. Public and private schools represent the school under MOE. Public school education in Thailand is free of charge for Thai nationals until grade 9. Public schools follow a standard, government-approved curriculum catered to students of all types. Resources are generally from their funding in private schools, and the tuition and fees are significantly higher than in public schools.

Under MHESI, the Engineering Science Classroom (ESC) and Demonstration School were included in the study. ESC is part of the Science Classrooms in University-Affiliated School Project (SCIUS) - a budget-funded project from MHESI. The primary mission of ESC is to build science, technology, and engineering human resources who have the skills to create and develop technology and innovation to meet the target industries according to the country's strategy. School administration and curriculum are associated with a university and used in teaching training programs for demonstration schools.

Samples were drawn from multi-stage random sampling. Finally, survey data was collected from 1,137 students. There were more female students (n=760, 66.8%) than male students (n=332, 29.2%). Over half of the students were Grade 10 (n=638, 56.1%), followed by students from Grade 11 (n=499, 43.9%). Equally, one-third of the students were from Demonstration and public schools (n=335, 29.5 %). The rest were from ESC (n=240, 21.1%) and private schools (n=227, 20 %).

Most students were from Science-Mathematics majors (n=789, 69.4%), while Mathematics-English majors and language majors were equally represented (n=174, 15.3%). Note that around one-third of Science-Mathematics students were from ESC (n=240, 30.4%), Mathematics-English students mainly were represented in Public school (n=82, 47.1%), and

Language-major students were closely distributed in Demonstration school (n=61, 35.1%) and private school (n=60, 34.5%).

Questionnaire

The online questionnaire comprised two parts. Part One used the checklist questions asking students to identify their characteristics, including age, year level, major, and perceived academic achievement. An open-ended question asks students about the discipline they would like to study in higher education or pursue as a career.

In Part Two, students were asked to rate 15 items on a 1-10 semantic differential scale. The questions were "How much are you interested in the characteristics of (study in higher education) listed below? Only the poles (1=Not interested and 10=very interested) were labeled. A principal components factor analysis was used because the primary purpose was to identify and compute composite scores for the factors underlying the items. Varimax and oblimin rotations identified two factors with an Eigenvalue > 1, explaining 59.39 % of the total variances for the items. Two factors were the preference for the traditional approach (three items), which accounted for 44.926 % of the total variance, and the non-traditional approach (twelve items), which accounted for 14.466% of the total variance. Sample items related to the traditional approach were "the length of study is generally semester-based to receive a degree certificate." Sample items related to the traditional approach were "Choose the study topic as you want, then submit evidence to evaluate whether you have the ability and do not care about the degree." Cronbach's alphas for the traditional and non-traditional approach items were .76 and .96, respectively.

Next, the Student Study Efficacy Scale (SSES) was adapted from Svartdal et al. (2021) to measure students' confidence in their ability to achieve desired academic outcomes. Items were rated on a five-point Likert scale (1=strongly disagree to 5=strongly agree). The three first items were reverse coded. Confirmatory factor analysis (CFA) was used to investigate the construct validity of the scales. The Root-mean-squared error of approximation (RMSEA) value = .09, Standardized Root Mean Square Residual (SRMR) = .00, Comparative Fit Index (CFI) = 1.00. The indicators show the model fit according to theoretical support. That means SSES comprises three aspects, including confidence in the utility of study skill habits (i.e., "I have little faith in my ability to study effectively"), general outcome expectations (i.e., "I am sure that I will accomplish the academic goals I have set for myself"), and persistence item ("When I have decided to complete something important to me, I continue even if it proves more difficult than I believed"). Cronbach's alphas for the utility of study skill habits and general outcome expectations items were .82 and .46, respectively. In the present study, low reliability in the items related to the general outcome expectations aspect could be due to the neutrality or non-specific study contents that the items addressed. As Honicke and Broadbent (2016) noted, self-efficacy measures that contain content-specific scales are likely to gain higher levels of internal reliability than general self-efficacy scales. It should be noted that the questionnaire used the Thai language. The authors used back translation to re-translate items from Thai to English. The wrong words or sentences were corrected to match the original English version.

Eighteen motivational items were adopted from Elliot (1999) and the Thai version from Paleenud et al. (2023). Items were rated on a five-point Likert scale (1=strongly disagree to 5=strongly agree). Confirmatory factor analysis indicates the model fit according to previous theoretical support: CFI = 1.00, RMSEA = .06, SRMR = .02. Sample items included "I am

striving to demonstrate my ability relative to others in this class." (performance approach goal), "My fear of performing poorly in this class is often what motivates me." (performance-avoidance goal), "In a class like this, I prefer course material that arouses my curiosity, even if it is difficult to learn." (mastery goal). Cronbach's alphas for the mastery goal, performance approach, and performance-avoidance items were .74, .77, and .86, respectively.

Results

Around half of the students perceived their academic achievement as average (n=633, 55.7%). Many said they were unsure or unable to rate their academic achievement (n=189, 16.6%). A minority of students perceived themselves as below-average (n=75, 6.6%) and as the top 10% of the class (n=67, 5.9%). Overall, students rated their study efficacy at the moderate level (M=3.41, SD=.62). The dimension of persistence had the highest scores (M=4.13, SD=.85), comparing to the general outcome expectations (M=3.64, SD=.72) and utility of study skill habits (M = 3.02, SD=.87). Students had higher scores in mastery motivation-learning approach (M=3.95, SD=.59) than performance motivation (M=3.13, SD=.84) and performance-avoidance (M=3.07, SD=.94). They indicated higher preferences in non-traditional learning approach (M=8.10, SD=1.50) than traditional learning approach (M=7.14, SD=1.81).

Patterns in Students' Learning Preferences, Study Efficacy, and Learning Motivation

Two-Step Clustering analysis resulted in three clusters of students including (1) Students who neither had a high preference for traditional approach nor non-traditional approach, low-to-moderate efficacy, and moderately mastery-motivated; (2) Students who had high favor for non-traditional learning, least likely of being performance-avoidant, having moderate mastery-motivation, with relatively high persistence; and (3) Students who had strong favor for non-traditional learning, high persistence in efficacy, most likely of being mastery-motivated, also potentially motivated by performance and performance-avoidance.

Students in Cluster One had the lowest preferences for the non-traditional learning approach (M=7.06, SD=1.74) and the traditional approach (M=6.15, SD=1.88) compared with students in other clusters. They had slightly low efficacy in study skill habits (M=2.66, SD=0.76) and moderate efficacy in terms of outcome expectation (M=3.14, SD=0.63) and persistence (M=3.38, SD=0.83). They belonged to a moderate level of mastery motivation (M=3.66, SD=0.54) than performance-avoidance (M=3.38, SD=0.74) and performance-motivation (M=3.24, SD=0.72).

In Cluster Two, students had higher preferences for the non-traditional learning approach (M=8.56, SD=1.01) than the traditional approach (M=7.21, SD=1.46). These students rated their efficacy according to study skill habits and outcome expectation at the moderate level (M=3.24, SD=0.81 and M=3.63, SD=0.60 respectively), except for the aspect of persistence that is rated at the higher level (M=4.38, SD=0.58). Among the three clusters, this group had the lowest scores for the performance- approach (M=2.49, SD=0.60) as well as the performance-avoidance approach (M=2.31, SD=0.73), while having moderate scores of mastery-motivated approach (M=3.85, SD=0.52).

In the last cluster, students preferred the non-traditional learning approach (M=8.74, SD=1.03) and the traditional approach (M=8.18, SD=1.51). This group had the most robust preferences for non-traditional learning among the three clusters. They had moderate efficacy

in their study skill habits (M=3.17, SD=0.95) and outcome expectation (M=4.22, SD=0.51) but high efficacy in the aspect of persistence (M=4.67, SD=0.49) compared to other student groups. This group had the highest scores of motivation aspects: mastery-motivated approach; M=4.40, SD=0.44; performance-motivated approach (M=3.78, SD=0.78); performance-avoidance (M=3.63, SD=0.78).

Differences in Students' Study Efficacy, Learning Motivation, and Learning Preferences Between Clusters

Table 1 showed significant differences according to the study efficacy and learning motivation between the three clusters. Students in Cluster Three had the highest efficacy among the three clusters in two areas: outcome expectation: $F(1137)$= 312.298, p <.01, $\eta2$ = 0.355; persistence: $F(1137)$= 405.637, p <.01, $\eta2$ = 0.417). For the area of study skill habits, students in Cluster Two had higher efficacy than the other groups (M=3.24, SD=0.81). However, the difference is not significant: $F(1137)$= 56.163, p <.01. Students in Cluster Three had the highest scores of motivation-learning approach in all dimensions, mastery: $F(1137)$= 209.672, p <.01, $\eta2$ = 0.270); performance: $F(1137)$= 357.797, p <.01, $\eta2$ = 0.387); performance-avoidance: $F(1137)$= 338.165, p <.01, $\eta2$ = 0.374). Students in Cluster Three have higher preferences for both traditional approach (M=8.18, SD=1.51) and non-traditional approach (M=8.74, SD=1.03) than other clusters and the difference is significant: traditional: $F(1137)$= 141.965, p <.01; non-traditional: $F(1137)$= 187.211, p <.01. Except for the slight mean difference (0.18) of preferences of non-traditional approach between Cluster Three and Cluster Two that is not significant.

Table1: *Means, Standard Deviations, and One-Way Analyses of Variance in Study-Efficacy, Learning Motivation, and Learning Preferences between Clusters*

Characteristics	Cluster 1 (n= 383)	Cluster 2 (n= 407)	Cluster 3 (n= 347)	Total (n=1,137)	F	P
	M (SD)	*M (SD)*	*M (SD)*	*M (SD)*		
Self-efficacy						
Utility of study skill habits	2.66 (0.76)	3.24 (0.81)	3.17 (0.95)	3.02 (0.88)	56.16	.000

Performance	3.24 (0.72)	2.49 (0.60)	3.78 (0.78)	3.14 (0.85)	357.79**	.000
Performance-avoidance	3.38 (0.74)	2.31 (0.73)	3.63 (0.78)	3.07 (0.95)	338.16	.031

Differences in Student Cluster Membership

A Chi-Square Goodness of Fit Test was performed to determine whether the student cluster membership proportion differed. As shown in Table 2, student cluster membership significantly differed according to the school type, $X^2(6, N=1,137)$ =24.05, p=.001; major, $X^2(4, N=1,137)$= 16.82, p=.002; and perceived academic achievement, $X^2(6, N=1,137)$=70.32, p=.000. The proportions also differed by students' interest to study higher education in Health, $X^2(2, N=1,137)$ =11.14, p=.004 and Natural Science-Math, $X^2(2, N=1,137)$ =9.28, p=.01. The distribution of students who did not address particular interest were also significantly different among clusters, $X^2(2, N=1,137)$ =16.34, p=.000.

Table 2: *The proportion of Students' Year Level, School Type, Major, Perceived Academic Achievement, and Higher Education Field of Interest between Clusters*

Characteristics		N	Cluster 1 (n= 383)	Cluster 2 (n= 407)	Cluster 3 (n= 347)	X^2	P

**p <.01.

Half of the students (50.7%) who perceived their academic achievement as below average and 43.9% of students who were not sure to rate their academic achievement represent Cluster One. Almost half of the students (49.2%) perceive they are above average, however, overwhelm the population in Cluster Three. The most extensive distribution of students who perceive they are at the average (39.1%) is in Cluster Two. Most students will likely opt for Health discipline in their higher education (n=393). They are closely represented in Cluster Two and Cluster Three (36.9% and 35.4% respectively). Around forty percent (41.1%) who reported their interest in Engineering belong to Cluster Two, followed by Cluster One (33.9%). Many students do not identify any discipline, and almost half (45.8%) are in Cluster One.

Almost half of the ESC students (44.2%) and Demonstration students (40.9%) are in Cluster Two, while a minority of them are in Cluster Three (ESC, 24.23%; Demonstration, 26.9%). At the same time, students from Public and Private schools are closely distributed in Cluster One (Public, 35.2%; Private, 35.7%) and Cluster Three (Public, 35.5%; Private, 35.2%). Regarding students' majors, the largest number of students in Science-Math are in Cluster Two (38.8%), while the rest of them are evenly distributed in Cluster One (31.3%) and Cluster Three (29.9%). The highest proportion for math-English and language students is Cluster One (Math-English, 38.5%; language, 39.7%).

Discussion

The findings showed patterns of student characteristics between clusters. Cluster One comprised most students who needed to be more sure of their academic performance level and over half of the students who viewed themselves as below average of their peers. Compared to other groups, they had low efficacy in study skill habits and moderate efficacy in outcome expectation. These students might need help to target their learning effectively and are less motivated to pursue any specific plan in continuing higher education because low study self-efficacy might negatively affect ambition, motivation, effort, and persistence (Bandura, 1986). Classroom anxiety (i.e., fear of failing and being negatively evaluated) is an essential aspect of negative motivation and self-efficacy (Bandura, 1997). Koul et al. (2012) found that classroom anxiety was positively associated with performance-avoidance goals toward learning biology and physics in male students. When students are not highly motivated to achieve specific academic goals, their choices and expectations in the transition to higher education could be very flexible. They were more likely to be less determined whether to follow the structure of a degree program or progress their study at their own pace. This was also consistent with the findings that this cluster significantly had more students who did not address particular interest in any discipline when furthering higher education than the other two clusters. For most of the language students who were clustered in this group, their motivation to initiate learning and sustain the learning process would be challenged by disruptive technology (Sumakul et al., 2022). The advancement of technology affects how teachers teach and students learn, particularly in language teaching and learning in the context of language learning (Dörnyei & Ryan, 2015). In addition, students' preferences might be dynamic and challenging to specify since language skills are transferable skills that can work across degrees and career paths.

Meanwhile, Cluster Three students with the strongest preferences for traditional and non-traditional learning reported a high degree of study efficacy and mastery of learning motivation. Two distinct learning approaches could be appealing options for developing competency due to students' confidence in their abilities. This aligned with the extensive distribution of Cluster Three students who perceived their academic achievement was above average and reported high study efficacy. For mastery-oriented students, traditional undergraduate degree programs or self-paced, competency-based learning approaches could match their study interests. For them, learning achievement was less likely to depend on the specific predetermined approach but on the relevance and meaningfulness of learning (Elliot, 1999). As these students indicated the moderate motivation in performance-oriented and performance-avoidance, negative or positive results of their expected learning could influence their decision to choose experiences in traditional undergraduate programs or other alternative credentials.

Although students in Cluster Three had the highest preferences for non-traditional learning, the slight difference between Cluster Three and Cluster Two was insignificant. Their preferences aligned well with low performance and performance-avoidance orientation. They tended to be less likely driven by competing for achievement and had less anxiety about avoiding failure in learning while feeling motivated to learn for their mastery. These students were not likely to pursue higher education with a priority of completing a degree with an impressive grade-point average (GPA). An appealing approach should allow them to fulfill their meaningful learning rather than to compare or compete with other students. This was consistent with the study of Abramovich et al. (2013) that argued for reframing badge use in educational deployment to be more intrinsic, in which students would use a badge to present

evidence of their learning and growth. Half of the ESC and Demonstration school students were clustered when considering the cluster membership from the school type. That means most preferred to pursue learning that allowed them to acquire skills in a less structured environment than traditional undergraduate degree programs offered. The predominant goal orientation could vary with learning opportunities and emphasis in different institutions (Koul et al., 2009). However, ESC and Demonstration school curricula are associated with the university and are under MHESI; students could be fostered, to a certain degree, through the school environment and curriculum that are affiliated with the university.

Implications

The large number of Science-Math students represented in clusters that addressed high preferences for non-traditional approaches indicated the opportunity that alternative learning platforms might apply to science and technology education. Higher education institutions aiming to deploy alternative learning approaches might prioritize Cluster Two students who explicitly preferred the non-traditional approach. In Cluster Two, most students were from Engineering Science Classrooms (ESC) and Demonstration schools where teaching and curriculum are associated with the university. Higher education institutions should enhance synchronization between the schools and universities to prompt students' interest and promote students' accessibility to non-traditional learning. As language-major students reported lower confidence and preferences for any learning approaches, approaching them with communication that empathizes with their concerns would be helpful, facilitating students to set academic goals, explore study choices, and review potential learning paths.

Limitations of the Study

The authors were aware of the potential limitations in generalizing findings across diverse populations. The study did not include students from international schools whose curricula adhere to a wide range of frameworks, such as American, Canadian, and Australian curricula.

Given the complexity of learner characteristics, consider adopting an interdisciplinary approach that incorporates insights from psychology, sociology, and other relevant fields to provide a comprehensive understanding of learners.

The Impact of Game-Based Learning on First-Year Undergraduate Students on Knowledge and Motivation: An Example From the Logistics Field

Pornthip Ueathammataworn, Rajamangala University of Technology Isan, Thailand
Theppharat Ueathammatawon, Nakhonratchasima College, Thailand

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
The paper aims to study the impact of utilizing the learner-centered framework on Game-Based Learning (GBL) on first-year university students. The objectives of the study are 1) Game-based learning can achieve knowledge for the learner. 2) Game-based learning can create student learning motivation. The game implemented in this study is called Beer Game, which is a web-based role-playing simulation of beer distribution in the supply chain. The sample was 42 students who studied the Introduction to Logistics and Supply Chain Management subject. To measure knowledge level, the samples got the tests before and after playing the game. (Pre-test and Post-test). To evaluate the learner motivation level, the study used satisfaction questionnaires. The result of the level of knowledge of samples showed that 95.12 percent of total sample students got a better score, on the Post-test than on the Pre-test. The learner motivation survey showed the average ($\bar{x}$) was 4.62/5.00 meaning it was very satisfied with game-based learning. In conclusion, Game-Based Learning (GBL) can create learning motivation and knowledge for first-year undergraduate students.

Keywords: Game-Based Learning (GBL), Beer Game, Supply Chain, Logistics, Learner-Centered

Introduction

In education, teachers are currently confronted with the dual challenge of cultivating student learning motivation while concurrently elevating their knowledge levels. The responsibility on teachers has intensified as they seek effective methods to render the learning process engaging and enjoyable. In light of this, Game-Based Learning (GBL) emerges as a promising pedagogical approach. Notably, for first-year students, educators grapple with a spectrum of challenges encompassing diverse backgrounds, motivation and engagement, the transition to higher education, foundational knowledge gaps, and the cultivation of study skills, technology integration, and more (Naong, M. et al., 2009). Consequently, creating an environment that captures the attention and provides a positive learning experience for first-year students is imperative for educators.

The primary objective of this research is to substantiate the notion that GBL holds the potential to enhance both student learning motivation and knowledge. By leveraging games as educational tools, teachers can create an environment that not only stimulates interest but also augments the overall learning experience for students.

Game-Based Learning (GBL)

Game-Based Learning (GBL) facilitates immersive learning experiences in a virtual environment, allowing students to practice and reinforce specific skills, knowledge, or behaviors (Jan & Gaydos, 2016).

Games, in this context, play a role in promoting logical and critical thinking, as well as contributing to the development of social skills, language abilities, communication skills, and creative and problem-solving capabilities (McFarlane et al., 2002).

Educational games are considered to have the potential of deeply engaging learners with any topic, allowing active participation in learning process (Wallner and Kriglstein 2011).

Beer Game

A well-known and widely used simulation game in the field of logistics and supply chain education is called the Beer Game. The Beer Game is a simulation that immerses participants in the common coordination challenges encountered in supply chains. Originally conceived at MIT (USA) in the 1960s, this role-play simulation offers an experiential understanding of supply chain dynamics. The purpose of the Beer Game is to experience systemic effects and to introduce the need for supply chain and network management, and to minimize inventory cost and backorder cost.

The Beer Game involves a four-part supply chain with a retailer, wholesaler, distributor, and factory, each managed by a separate person. In this team game, each player is responsible for managing the inventory of one echelon by placing orders. The orders and beer cases move in opposite directions. The goal is to minimize the total cost incurred by the team for each echelon, calculated by adding up inventory and backlog costs at the end of each simulated week (Sterman, 1989).

Lately, a developer has transformed the traditional board game of Beer Game into a web-based version available for free play on the internet. This study utilizes the web-based edition

developed by MA-system, a Swedish consulting company specializing in business logistics. Drawing inspiration from the original board game, this version streamlines the mechanics to make it more user-friendly.

Methodology & Research Design

The research aims to investigate two main objectives:
      1) Game-based learning (GBL) can achieve knowledge for the learner.
      2) Game-based learning (GBL) can create student learning motivation.

This study utilizes an experimental approach, wherein a designated class engages in playing a specified game. Data collection is conducted, and subsequent analysis is carried out to draw meaningful insights from the gathered information.

The Research Sample

- The participants consist of first-year students enrolled in the Logistics Technology bachelor's program at Rajamangala University of Technology Isan, Thailand.
- This research pertains to the Introduction to Logistics and Supply Chain Management subject.
- The game used for Game-Based Learning is the Beer Game Simulation, a web-based version created by MA-system, a Swedish consulting company specializing in business logistics.
- The sample size comprised 42 students (n=42).
- Experimental data collection occurred during the first semester of 2022 (October, 2022).

Data Collection and Data Analysis

1. To assess students' knowledge levels gained from Game-Based Learning (GBL) activity:
    - A Pre-test was administered before engaging in the game, comprising 10 questions covering all the knowledge objectives of the game.
    - Implementing a Post-test to determine whether students acquired the necessary knowledge to successfully complete the GBL activity; the post-test mirrors the pre-test.
    - Analyzing pre-test and post-test results using statistical measures such as Mean ($\bar{x}$), Standard Deviation (S.D.) and Percentage (%).
2. To evaluate learner motivation levels stemming from GBL activity:
    - Employing satisfaction questionnaires based on the Likert Scale.
    - The questionnaires are segmented into three sections: Learning Motivation, Learning Effectiveness, and Satisfaction Overview.
    - Examining the outcomes using statistical measures, including Mean ($\bar{x}$), Standard Deviation (S.D.), and Percentage (%).

Finding & Conclusion

1. To assess students' knowledge levels gained from Game-Based Learning (GBL) activity:

Before engaging in Game-Based Learning (GBL), the participating students were required to complete a pre-test using Google Form. They were allotted a time limit of 15 minutes to

answer a set of 10 questions. Subsequently, the teacher elucidated the rules and mechanics of the game.

The gaming session comprised two rounds. The first round served the purpose of familiarizing the students with the game's rules, while the second round involved actual gameplay, with a prize awarded to the winning team. Following the conclusion of the GBL session, the participants underwent a post-test through Google Form, with the post-test questions mirroring those from the pre-test. The comparison of students' scores is presented in Table 1.

Table 1: The comparison of the samples' scores between pre-test and post-test.

Sample	Score	Score	Different	% Different
	Pre-test	Post-test Score		
Student No.1	4	5	1	25%

Student No.42	2	3	1	50%
Total	168	320	152	
Average	4.00	7.62	3.62	90.50%
S.D.	1.958879604	1.88630314		

P.S.:* Participants who achieved a post-test score lower than their pre-test score

The findings indicate that 92.85% of the total sample, specifically 39 participants, achieved Post-test scores surpassing those of the Pre-test. The experimental outcomes align with the anticipated results. In specific numerical terms, the average Pre-test score stood at 4 out of 10, while the average Post-test score exhibited a notable increase to 7.62 out of 10, representing a 90.50% improvement.

The teacher conducted interviews with students who scored lower on the post-test compared to the pre-test. During these interviews, it was discovered that student's No. 20 and No. 29 both assumed the role of retailer in both game rounds. They expressed difficulties in managing the supply chain effectively, particularly in coordinating the flow between manufacturer, distributor, and wholesaler roles. As a result, they lacked a comprehensive understanding of supply chain management. Additionally, student No. 31, who played the distributor role, experienced a loss of focus during the game, leading to a lack of comprehension of the rules and underlying theories. This loss of attention contributed to their challenges in grasping the intricacies of the game.

In summary, based on the test scores, it can be concluded that Game-Based Learning (GBL) not only fosters learning motivation but also enhances the knowledge level of the learners. The participants were first-year students enrolled in the Logistics program. The research utilized the Beer Game as the selected gaming approach.

2. To evaluate learner motivation levels stemming Game-Based Learning (GBL) activity:

To evaluate students' learning motivation, the researcher distributed a questionnaire using Google Form, which participants filled out after completing the post-test. The questionnaire employed a 5-point Likert scale to gauge the satisfaction of the respondents, with the scale interpreted as follows: 5 points for extremely satisfied, 4 points for very satisfied, 3 points for neutral, 2 points for slightly satisfied, and 1 point for not satisfied at all. Additionally, the

questionnaires were organized into three sections: Learning Motivation, Learning Effectiveness, and Satisfaction Overview, with the results presented in Table 2.

Table 2: The satisfaction of the learner motivation level from Game-Based Learning (GBL)

Session 1: Learning Motivation	$\overline{x}$	Meaning	S.D.
Game-based learning helps make the classroom atmosphere more interesting.	4.65	Extremely satisfied	0.52
Game-based learning makes it fun for me.	4.60	Extremely satisfied	0.53
Game-based learning is new to me.	4.63	Extremely satisfied	0.57
Game-based learning makes me more interested in the lesson.	4.70	Extremely satisfied	0.51
Game-based learning allows me to understand lessons better.	4.53	Extremely satisfied	0.62
Total Average	4.62		
Session 2: Learning Effectiveness	$\overline{x}$	**Meaning**	**S.D.**
I understood the content logistics and supply chain from the game I played (Beer Game)	4.49	Very satisfied	0.59
The game I played (Beer Game), I was able to understand the process of logistics and supply chain operations.	4.51	Extremely satisfied	0.54
In the game I played (Beer Game), I was able to understand inventory costs in the supply chain.	4.51	Extremely satisfied	0.59
The game I played (Beer Game), I was able to understand an overview logistics and supply chain system.	4.49	Very satisfied	0.59
In the game I played (Beer Game), I was able to find ways to solve problems related to supply chains.	4.53	Extremely satisfied	0.54
The game I played (Beer Game) helped me learn basic logistics and supply chain management courses more easily.	4.56	Extremely satisfied	0.58
Total Average	4.52		
Session 3: Satisfaction Overview	$\overline{x}$	**Meaning**	**S.D.**
Satisfaction Overview of Game-Based Learning Activity	4.77	Extremely satisfied	0.42
Total Average	4.77		0.42

The survey conducted on a sample of students revealed a high level of learning motivation, with an average ($\overline{x}$) score of 4.62 out of 5.00, indicating an exceedingly satisfactory response to Game-Based Learning (GBL).

In terms of learning effectiveness, the survey results indicated that students concurred on the beneficial impact of Game-Based Learning in enhancing their understanding of subjects such as Supply Chain, Logistics, and Inventory Costs. The average ($\overline{x}$) score for this aspect was 4.52 out of 5.00, signifying a high level of satisfaction among the respondents.

Furthermore, the overall satisfaction level of the sample population was notably high, as evidenced by an average score ($\bar{x}$) of 4.77 out of 5.00. This result reflects an exceptional level of contentment with the Game-Based Learning approach.

In conclusion, based on the satisfaction results, it can be inferred that Game-Based Learning (GBL) has the potential to significantly enhance student motivation for learning.

Discussion

Knowledge Level: The research findings reveal that 92.85% of the total sample size, specifically 39 participants, achieved higher scores than the Pre-test. This indicates a favorable outcome in the experimental group, signifying improved knowledge levels among the majority of GBL participants. To enhance understanding of all positions within the supply chain, the teacher should establish a condition requiring participants to switch player roles during the game. Furthermore, playing the game more than twice is recommended to allow participants to rotate through all positions, ensuring a comprehensive understanding of supply chain management.

Learning Motivation: The learning motivation average of 4.62 out of 5.00 is a strong indicator that the game-based learning approach has successfully motivated students. This phenomenon can be attributed to the implementation of collaborative activities involving the students. Specifically, group work was incorporated, wherein participants engaged in playing games under specified conditions for the attainment of prizes. Notably, incentives were awarded to the group demonstrating proficiency in winning, fostering heightened enthusiasm among students for game participation. The deliberate structuring of incentives aimed to cultivate a heightened interest and commitment to the gaming experience, thereby fostering an environment conducive to enjoyable and stimulating learning.

Suggestion

Comparisons with Traditional Teaching Methods: Implications for future research, to provide a comprehensive view, the research should consider comparing the effectiveness of game-based learning with traditional teaching methods.

Student Engagement: Beyond satisfaction, it would be interesting to explore the level of engagement that students experienced during the game-based learning sessions.

Potential Challenges and Limitations: Acknowledge any challenges or limitations encountered during the implementation of game-based learning. This could include technical issues, time constraints, or any difficulties in adapting the method to different learning styles.

Acknowledgements

Syahrul Ridha, Universitas Syiah Kuala, Indonesia
Sri Wahyuni, Universitas Syiah Kuala, Indonesia
Yopi Ilhamsyah, Universitas Syiah Kuala, Indonesia

Abstract

STEM education based on local culture produces a more contextual and meaningful learning experience for students. However, the practical implementation has led to numerous issues. The study aims to describe the challenges teachers face in implementing STEM education based on local culture and explore the teacher practice related to understanding and teaching strategies in STEM education. The total participants were 143 teachers who taught science, social, and other subjects. The data were collected using the survey method and analyzed with descriptive statistics. The results show that 51% of teachers answered that integrating local culture into learning is essential because it can preserve local culture and introduce culture to the younger generation by presenting contextual learning. However, 59.4% of teachers have never applied STEM in learning, and 40.6% of teachers are still confused about its application, even though they have heard of STEM before. The data indicated that the teachers faced many challenges regarding their understanding, practical constraints, teaching strategies, and STEM integrated with local wisdom. Notably, the findings show that most teachers have a lack of understanding of how to link STEM education and local contextual values. The strategy of integrating culture into learning is considered the most effective if it is done by developing teaching materials based on STEM. The implications of teaching strategies of STEM education related to local wisdom are discussed.

Keywords: Local Culture, STEM, Contextual Learning

Introduction

Indonesia is known to have a rich cultural heritage, which is an important aspect of its national identity. The lack of culture-based learning in schools has become a major concern in education (Susilo & Irwansyah, 2019). Educational curricula tend to ignore society's rich and diverse cultural aspects. The current learning process only focuses on understanding general concepts, which do not integrate local cultural elements. As a result, students lose the opportunity to explore their cultural roots, hindering their understanding of cultural diversity (Affandy, 2017). In this context, the lack of integration of cultural elements in the curriculum affects the overall quality of education. Also, it affects students' understanding of cultural values that influence their daily lives.

One of the direct impacts of the lack of culture-based learning is that few students know their local culture. Students are often more familiar with global culture than their environment. This can result in indifference to local cultural heritage and a lack of appreciation for the values, traditions, and history that shape their regional identity. The small number of students who know their own local culture can lead to a loss of students' sense of attachment to their local community and culture, which is an important element in forming individual identity.

Apart from the lack of culture-based learning and a lack of understanding of local culture, a problem that often occurs in the classroom is an uninteresting and contextual learning process (Firmadani, 2020). Teaching methods that are monotonous and less relevant to everyday life make students feel bored and less motivated to learn (Insani, et al., 2023; Syaparudin, 2020). Contextual learning and linking the subject matter to local culture can make learning more interesting, relevant, and meaningful for students (Anikarnisia & Wilujeng, 2020). This way, students will be more involved in learning and naturally better understand and appreciate their local culture. In line with current technological developments, one of the efforts that can be made to make learning more interesting is to integrate learning with a STEM approach, thereby producing learning with a STEM approach based on local culture.

The STEM approach makes learning more interesting and relevant to everyday life and encourages students to be innovative and creative in designing solutions to face real-world problems. STEM education equips students with the knowledge and skills they need to succeed in the 21st century (Kennedy & Odell, 2023). The STEM approach is very relevant to the demands and developments of the 21st century because it provides a strong framework for teaching students how to think critically and creatively in solving problems (Prasadi et al., 2020; Anikatnisia & Wilujeng, Irhasyuarna, 2022). The STEM approach can also improve students' soft skills, such as communication, collaboration, and leadership, which are very important in the 21st century.

The learning process in Taiwan starts from the STEM curriculum and makes students the center of learning. The curriculum defines five main objectives: increasing students' abilities, involvement, and interest in STEM, increasing teacher capacity and the quality of teaching of STEM subjects, supporting opportunities for STEM education in schools, and promoting effective partnerships (Permanasari et al., 2021). Learning activities the application of the STEM approach can increase student involvement in the learning process so that students will be more motivated and enthusiastic to participate in the learning process. However, the integration of local culture into STEM-based learning is needed to increase cultural preservation (Agusty et al., 2021; Hikmawati et al., 2020; Kartini et al., 2021).

Research by Budiarti (2022) on the development of STEAM-based learning tools to promote the preservation of local culture in Indonesia shows that this approach can increase students' interest and understanding of local culture. However, the initial survey results show that many teachers still experience obstacles in integrating culture and STEM approaches in learning. Teachers do not yet understand the characteristics of STEM implementation, and there is a lack of socialization of local culture in learning at school, so researchers feel it is necessary to examine teachers' perceptions of local culture-based STEM learning. Therefore, this article aims to describe teachers' understanding of STEM approaches and local culture, implementation strategies, and experienced strategies.

Method

This research uses a descriptive approach with a survey method. The number of respondents involved was 143 teachers who taught science, social studies, and other subjects at the junior and senior high school levels. The instrument used in this research was a questionnaire distributed via Google Forms. Data was collected using a survey method and analyzed with descriptive statistics.

Results and Discussion

Researchers carry out needs analysis activities or needs assessments to collect information based on conditions in the field that have occurred so far. The information studied is related to the needs, problems, and challenges that have been faced by the research object and require overcoming.

Based on the survey results, information was obtained that 40.6% of teachers had heard the term STEM but were still confused about its application, 36.4% of teachers had often heard the term STEM but had not fully understood the concept of its application, and only 9.8% had often heard it and had applied it. Although it is not optimal, 11.2% of teachers have never heard of the term STEM. This finding is a reference for researchers that STEM application is still rarely implemented by teachers in schools.

Strategies of Implementation STEM

Besides a survey of teachers' understanding of STEM, researchers also investigated teachers' responses regarding effective STEM implementation strategies. This was done to determine teachers' responses regarding effective strategies for implementing STEM in the classroom learning process. The survey results can be seen in the following graph:

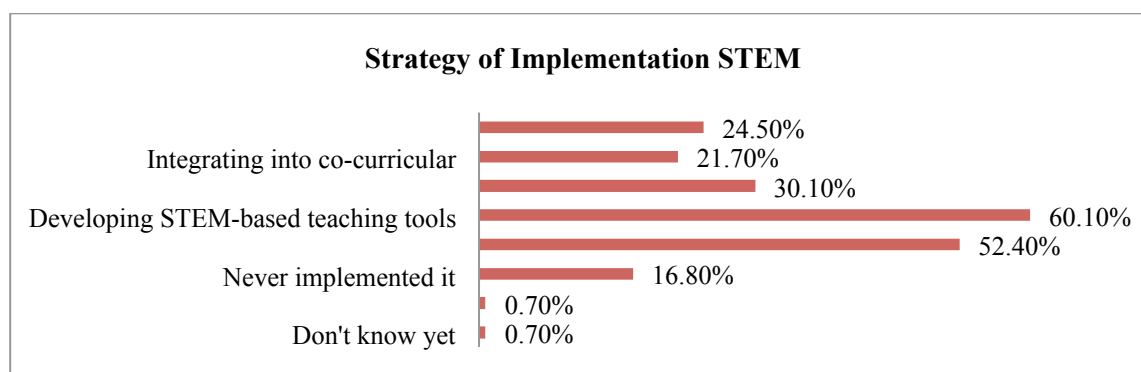

Figure 1. The Strategy of Implementation STEM

Developing STEM-based teaching tools is a strategy that is often chosen by teachers, with a percentage of 60.1%. This follows the results of research conducted by Widiyanti & Mizan (2020), who found that students effectively use the development of learning tools and can improve STEM abilities and 21st-century skills. Furthermore, 52.4% of teachers chose to develop STEM-based media. In addition, 30.1% of teachers chose to integrate STEM intra-curricular, and 24.5% considered integrating extra-curricular as an effective STEM implementation strategy. Based on the data, the researcher obtained information according to teachers' responses regarding the most effective strategy in implementing STEM, namely developing STEM-based teaching tools. Murphy (2023), in his research, found that leadership practices also contribute to the success of STEM education. There are five leadership practices identified as contributing to the success of STEM education in schools, namely utilizing community relations, utilizing local resources, empowering STEM teaching staff, promoting the value of STEM education and supporting STEM pathways.

The Urgency of STEM Education

According to the urgency of STEM, the data revealed teachers' responses regarding the important of STEM education in teaching and learning activities. Survey results regarding teachers' views on the importance of STEM will provide valuable insight into efforts to increase understanding and application of STEM in school learning. Researchers asked questions in multiple complex forms so that teachers could choose several answers to discover teachers' perceptions about the urgency of STEM in learning. The results obtained can be seen in the table 1.

No	The Urgency of STEM in Learning	(%)
1	Have never applied STEM in learning	59.4%
2.	It has been implemented even though the implementation concept has not been maximized	36.5%
3.	Have already implemented and understand the implementation strategy	2.1%
4.	Have applied STEM several times	2%

Table 1.The Urgency of Applying STEM in Learning

Table 1 shows that more than half of the respondents, 59.4% of teachers, have never applied STEM in learning, only 2.1% have implemented and understood implementation strategies, and 2% have applied it several times. This shows a need for follow-up action that can raise teachers' enthusiasm to apply STEM in learning. Based on the results of this research, researchers found that few teachers apply STEM in learning, even though as many as 62% of teachers think that STEM can help students solve problems. The application of STEM in learning activities can train students' skills in developing creativity, critical thinking, collaborating, communicating (4C), and problem-solving so that they can find solutions to problems faced in real life and can convey them well (Astuti et al., 2021; Sarwi et al., 2020). This is in accordance with research conducted by Sudarsono et al. (2022), which found that the problem-solving abilities of students who received learning through STEM improved better than students who received regular learning. Also, 54.5% of teachers think STEM can help students produce products. STEM programs have a positive and significant impact on various grade levels in schools. Overall, students in high school benefit from STEM programs, on average, students outperform their same-age and same-age peers who do not participate in STEM programs (Thomas & Larwin, 2023).

The Barriers of STEM Implementation

The survey in this research was also carried out to find out information regarding the obstacles experienced by teachers regarding the application of STEM in learning. The results obtained can be seen in the following graph:

Obstacles to Implementing STEM

| Obstacle	Percentage
The characteristics of STEM applications are not yet	70.60%
Facilities not yet supported	43.40%
Suitable learning tools are not yet available	28.70%
Inappropriate time allocation	9.10%

Figure 2. Barriers of Implementation STEM

Based on Figure 2 above, information is obtained that the biggest obstacle experienced by teachers in implementing STEM is that teachers experience problems with the characteristics of STEM implementation, which are not yet understood in depth. This aligns with research conducted by Diana & Turmudi (2021) that teachers' knowledge of STEM is still dominated by knowledge of what STEM stands for. Then, 70.6% of teachers chose this answer. Apart from that, as many as 43.4% experienced problems with unsupported facilities, 28.7% with unavailability of supporting learning tools, and 9.1% with inadequate time allocation. Based on this data, it turns out that many teachers do not understand in depth the characteristics of applying STEM in learning, so many teachers do not apply STEM in the learning process as per the results of research conducted by Oktavia (2019).

Cultural Integrating Strategies

The integration of local culture in learning is considered important by teachers, and this is proven by 51% of teachers who answered that integrating local culture into learning is very important because it can preserve local culture and introduce culture to the younger generation by presenting contextual learning.

Integrating local culture in teaching materials is the strategy considered the most effective by teachers, with a percentage of 66.4%. As many as 62.2% of teachers chose to package IT-based cultural content as a cultural integration strategy in learning. Other strategies are developing culture-based teaching tools by 53.1% and culture-based media by 42.7%. With this data, researchers can obtain information about an effective strategy for integrating culture in learning by integrating culture into teaching materials. Apart from that, the method of integrating local culture in learning that is considered the most effective according to teachers is the demonstration of local culture at school (75.5%), knowledge management system (57.3%), and local culture FGD between schools and indigenous communities (45 .5%). Integrating cultural values in the learning process has an important role in forming students' personalities (Syarif et al., 2016). Instilling local culture in education is important to instill national identity and identity. This is a strategic step to integrate local culture in learning (Prihatsari, & Widyaningrum, 2021). The presence of learning innovation is very necessary to make learning more enjoyable. One way is to link local culture to learning (Widyaningrum & Prihatsari, 2021).

Integrating Local Culture Methods

Using local culture in learning, either as a learning model, media, or teaching materials, both as a learning model or media, can introduce forms of local culture to students and internalize the values contained in that local culture (Syaputra, 2019). Local culture demonstrations in schools are the integration method most often chosen by teachers, with a percentage of 75%, knowledge management systems with a percentage of 57.6%, and 45.1% of teachers choose local culture FGDs between schools and indigenous communities. In addition, 51.4% of teachers think that teachers need to utilize ICT to integrate local culture into learning. ICT in integrating local culture can be used through a STEM approach. Technology aims to modify the world of science and technology to meet human needs. One of the goals of STEM education is for students to become problem solvers, inventors, innovators, independent, logical thinkers, and technologically literate and able to make connections between cultural history, education, and their knowledge which is applied in real life. Therefore, implementing STEM-based learning integrated with local culture needs to be encouraged among students (Limba & Jamarua, 2021). Technology is essential in shaping STEM identity; the two mutually reinforce each other. Based on research by Sumarni et al. (2020), local culture can also be integrated with religion. Combining religion and culture into science learning will be an exciting combination and a STEM identity needs to be developed based on the differences between students' religious beliefs and learning concepts in the classroom. Yuecheng (2023) stated that although traditional culture and STEM education seem different, there is a relationship between the two, integrating traditional culture and STEM education in education can provide students with more comprehensive and diverse content and broader skills and knowledge for their future careers. Tabarés & Alejandra (2023) in their research stated that culture can provide some potential to encourage an integrative vision of STEM education and other disciplines from the social sciences and humanities.

Conclusion

More than 50% of teachers have never applied STEM in learning. Only 2% of teachers have applied STEM several times, even though teachers think that STEM can help students solve problems, practice 4C skills, and help students produce products. Many teachers do not understand STEM characteristics, and no supporting facilities are available. Apart from that, 51.4% of teachers think integrating local culture into learning is very important, and teachers must utilize ICT to integrate local culture. ICT in integrating local culture can be used through a STEM approach by developing STEM-based teaching tools, as 60.1% of teachers chose to develop STEM-based teaching tools as a strategy for implementing STEM.

Ritual and Intent in a Renaissance Faire – Taiwan

Sara Neswald, Soochow University, Taiwan

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This action-research explores the effect of intentional embodied ritualization in an advanced college ESL experience. Forty-six sophomore students (from two different classes) were asked to work together to create a complete half-day Renaissance Faire experience for students and faculty at the Soochow University Campus, Waishuangxi, Taipei. Students worked in self-organized teams of 2-8 people. Each team took on the responsibility of bringing a Ren Faire activity to life: there were bards, madrigals, buskers, jugglers, swordfighters, dancers, board-game gamers, and more. Half the students (one class) was asked to create a ritual for their members to conduct prior to the start of the activity and a ritual greeting to use when welcoming attendees at their activity during the Faire. Half the students were asked to create *neither* a ritual for their members *nor* a ritual for greeting attendees/guests. Thus a "test" and a "control" group were established. Following the Ren Faire activity, students reported on their activity, what they learned from the experience, and, for the ritual-makers, how they felt their ritual affected the outcome or appreciation of the activity. Students' after-activity reports showed a distinctly higher sense of achievement when engaged in intentional ritualization. Moreover, after-activity examinations – examination to assess how much students learned from *other* groups – showed that the ritual-makers retained greater historical knowledge and could better express social significance of various aspects of Renaissance culture. Such students also reported greater appreciation for the gains attained during the Ren Faire experience as a whole. Results indicate that intentional ritualization, when properly explained to students and when properly engaged by students, provided markedly improved educational experience.

Introduction

As a researcher of East Asian history and religion, I understand how the concept of *ritualization* is significant to unpacking manifestations of cultural phenomena and social reason. Transformations in orthodoxy and rhetorical narratives are articulated through ritualizing behaviors. As a teacher of university students, I theorized that the concept of ritualization, familiar to anthropologists, might be employed in the educational field, as a tool to enhance students' integration into a topic and provide an embodied, deep learning experience. Ironically, whereas I am an East Asia scholar, my students here in East Asia are all in an English Department; I did not, therefore, bring this concept to life with an Asian-themed activity as I wished to accord more closely with learning objectives of English Department students. Instead, I chose to direct the Sophomore Business English project towards creation of a Renaissance Faire in order to ascertain how intentional ritualization might further learning gains. This allowed students to achieve the learning outcomes previously established for this project-based class, with the added benefit of absorbing additional historical and cultural understanding in their chosen field, English.

Literature Review

Ritual and Ritualization

Ritualization is distinguished from ritual. Ritual is a set of formalized actions that carry symbolic and substantive meaning, usually marking transitions in either personal or celestial conditions, or reaffirming membership in particular groups or sectors of society. Ritual is also purposive,

> …the participants believe that they are accomplishing their aim in what they do . . . this cannot be ignored . . . Day to day social life is perpetually changing; what is relatively constant in it is the part played by ideas and beliefs through which individuals both perceive events and evaluate their own and others' behavior -- what has been referred to has the moral order. To refer to it [moral order] as false, and the untidy process of living as real, is to make a judgement of value by comparing noncomparable [sic] entities, which cannot be helpful. (La Fontaine 1985, pp. 35-36)

Ritualization is a concept that might have been a bit 'avant-garde' in the 1990s but has become increasingly mainstreamed as it has moved from Religious Studies (Durkheim 1912, van Gennep 1906) and socio-anthropology (Tambiah 1979; Bell 1992, 1997) into the fields of political science (Kerter 1988, Fleischer 2010), business and finance (Gonzales); in education, however, the concept is under-utilized and generally understood in terms of a constraining and delimited set of rituals (McLaren 1986, 2000). A clearer and broader look at ritualization may help to lend a new perspective on what ritualization can be to education. Bell's work focuses on the broader social activities and embodied activities in which the performative *ritualization* provides social and symbolic meaning to significant activities. Bell explores four ways in which practices generate meaning: through strategic behavior, situationally, the necessary misrepresentation of its own enterprise, and its potential for redemptive hegemony in its discourse with power. As power is knowing (Foucault), the empowerment of ritualization possesses a powerful potential for learners and educators.

In essence, LaFontaine claims, participants in the ritual accomplish the aims through the ritual because they say they do. Van Gennep introduces the idea of a three-part sequence in

the ritual process which includes: first, separation from normal life or society; next, a liminal state during which the individual, set apart from the normal word (at the limins) experience transformation of self and status; and, finally, an aggregation or reintegration with normal society with the individual becoming 'reborn' into a new state or condition. Turner (1977) extends this 'liminoid' conception, focusing on the fluid, processual nature of ritual rather than the static and the structural. Tambiah focuses attention on contemporary ritual and its meaning in social and political stability and change. He defines ritual as "a culturally constructed system of symbolic communication. It consists of patterned and ordered sequences of words and actions, often expressed in multiple media, the content and arrangement of which are characterized in varying degrees by formality (conventionality), stereotype (rigidity), condensation (fusion) and redundancy (repetition)" (Tambiah 119).

With Catherine Bell's *Ritual Theory, Ritual Practice* (Bell, 1994) sought to break the limitations placed on 'ritual' intent and structure and, like Turner, looked more toward the dynamics of ritual performance. Bell focused on the broader social activities and embodied activities in which the performative *ritualization* provides social and symbolic meaning to significant activities. (Bell 1990) Bell explores four ways in which practices generate meaning: through strategic behavior, situationally, the necessary misrepresentation of its own enterprise, and its potential for redemptive hegemony in its discourse with power. Catherine Bell's seminal work, "Ritualization of Text and Textualization of Ritual in the Codification of Taoist Literature" (*History of Religions* 27.4 (May, 1988), pp. 366-392) explores how the codification of liturgical texts effectively "ritualized" these texts (e.g., made them performative ritual-like actions) by placing them within the spectrum of proper ritual performance. This in turn turned the ritual performance into a significant textual experience through the codification of the ritual texts and the inscription of the ritual itself. These two intertwining dynamics continuously reinforced one another through the empowerment of repeated practice and symbolic iteration that "effectively displaced revealed scriptures as a basis for religious authority and community in early sectarian Taoism." (Bell 367) Neswald (2023-2024) discusses how the intertwining dynamics that Bell has noted involved a concurrent formation of new *rhetorical spaces* – social and existential fields within which a new, potentially disruptive set of concepts and values could find discrete, coherent and socially accepted meaning. (Code 1995) These rhetorical spaces are self-legitimized by exactly those who form them; prosumers acting across social and literary networks whose consumptive patterns legitimize and affirm the legitimacy of the new valuations, actors and their products – poetry, ritual texts. By allowing ritual actors to independently create and be masters of their own ritualizing activities, I theorize that ritualization can form a powerful, creative and innovative classroom dynamic.

For a course in Business English, the Business context of ritualization is also meaningful. Business purposefully explores and employs *ritualization* to create (what Code might consider) "rhetorical spaces": brand communities and loyalty 'membership'. A quick search on Google Scholar or OCLC reveals nearly 3,000 busines-related studies published in the last few years with titles such as "Ritualization: A Strategic Tool to Position Brands in International Markets" (Sharma, Kumar and Borah, 2017), "Ritual and relationships: interpersonal influences on shared consumption" (Gainer, 1995), "Ritual Commerce" (Cook 2023), "Ritualization of Consumer Capitalism" (Gonzales, 2015), etc. In each of these studies, a dynamic relationship is found to arise in the intersection of consumption and ritualization, where ritualization spurs identification, branding and identity building while building reliable consumption patterns among users of particular brands such as "Dove" soap, "Downy" fabric softener or "Starbucks" coffee (See esp. Gonzales, pp. 24-28).

Within Education, ritualization has had a rather different history. A first attempt at bridging these two worlds (education and ritualization) is Peter McLaren's (1986, 2000), *Schooling as Ritual Performance: Toward a Political Economy of Educational Symbols and Rituals*. This study can be best understood as an ethnography of the schoolhouse. And yet, it provides key pedagogical insights. McLaren suggests that students vacillate between two major states, a 'street-corner state' in which students interact 'viscerally' and a 'student state' in which the intellectual is privileged.(McLaren, 218) Within the student state, McLaren suggests, teachers employ both *rituals* to establish intellectual framework for knowledge organization patterns and *ritualizing behaviors* to establish expectations of knowledge acquisition and production patterns. (McLaren, 147-156, 180-186 and 218-219) While McLaren views rituals frameworks and ritualizing behaviors as stultifying in the St. John's catholic school, manifesting negatively and being constraining of individual behavior, the author does provide interesting insight into the potential 'revivifying influence' these rituals could possess as 'conduits of power and creativity.' (McLaren, 218) I have found only one other education study found where a negative, constraining use of ritual/ritualization does not center the work: this is Helen Phelan (2008), where she explores the identity-building effects of ritualization in a musical setting, where community members, both young and old, come together to learn and to create music. In the process of practicing, Phelan finds group and self identity are formed through the storytelling habitus and creative improvisations of the musical community.

I suggest that, for students in project-oriented educational frameworks, ritualizing behaviors can be deployed for this "revivifying influence" as "conduits of power and creativity" where individuals can create spaces of self-authentication and self-affirmation in which they are able to actualize and rationalize current dynamics and situations, and innovate new relationships with the renaissance world to form creative rhetorical spaces for self-learning. These dynamics can be further legitimized through storytelling processes, such as occurs in certain Deep Learning activities. The combination of self-ritualizing, self-authenticating behaviors can help us to draw the perimeters of their real and imagined rhetorical spaces and may assist them to re-create or re-normalize the world and their place in it.

Interpretative Psychological Analysis (IPA)

Interpretive Psychological Analysis (IPA) is a methodology for analysis which aims to provide a "systematic exploration of personal experience" (Thomkins, 2017). As *ritualization* emerged from mythology studies and religious students to become a methodology applied across multiple disciplines, so too has IPA spread from its roots in psychology to become a qualitative method of analysis used across disciplines. (Charlick, Pincombe, McKellar and Fields 2016; cited in Noon). IPA's objective is to understand lived experiences and explore how individuals make sense of their personal and social worlds. (Noon 2018, 75) While Noon and others find IPA an excellent model for qualitative interpretation of personal experience, Noon notes the application to ESL learners and those with less-adequate command of English self-expression. While these issues are noted, the level of students' ability at Soochow and my experience with these students over the year – and for some, over two years – provided me with a reasonable assurance that all students were able to express themselves cogently and coherently. Moreover, the students had nearly three months to complete the project and

report; those with difficulty expressing their ideas had more than adequate time to consider how to express themselves during the oral report.[1]

**Implementation of the Student Project (The Renaissance Faire)**

Figure 1: Overview of Project Implementation

- o Pre-test: *Initial testing was conducted at the beginning of term in order to establish a baseline of knowledge.*

Prior to the start of this activity, these Sophomore students were questioned to assess their overall knowledge of Renaissance England. Most of these forty-six sophomore students were only vaguely aware of the idea of a "Renaissance" England; those that could place the Renaissance *conceptually* (four students), could not place the English Renaissance *historically*: given a multiple choice question, students universally placed the Renaissance in a period between 1850 and 1920. However, *every* student had heard the name *Shakespeare*. Indeed, students were able to name quite a few Shakespearean plays: six in one class, nine in another. One-third of these students were familiar with the play, *Hamlet;* however, *none* were able to name a single character from the play, including Hamlet himself. When asked about England's Red Queen and White Queen, four students asserted that they knew of both queens: upon further investigation, it became clear they were referring to the characters in *Alice in Wonderland*. Only one student, when prompted to name the *historical* Red and White Queens, was able to associate Queen Elizabeth with the White Queen.[2] When given the name Queen Elizabeth 1 (the White Queen), only one of forty-six had heard of her; oddly enough, this was *not* the same person named in the sentence above. Neither of these two ladies (above) were able to place Elizabeth 1 in history within a 200-year window of accuracy. When asked why Renaissance England is termed "renaissance", one student was able to

---

[1] That said, I plan to further enhance this rubric with the inclusion of DL (Deep Learning) with LSP (Lego Serious Play) as a means to prompt students to better express their ideas.

[2] This student spent the first fourteen years of her life in Malaysia. It is possible that this experience accounts for her familiarity with the White Queen: she had seen the BBC film by this name.

accurately guess; no student appeared to rightly know why. This assessment allowed me to proceed with the understanding that I was working with a relatively blank slate. The only real handhold these students had on the historical period was Shakespeare, and even that was, to some extent, fragile.

> o   What is it? *Introduction to the Renaissance English Marketplace and the individuals and businesses found therein.*

The next step was to get students to understand what the Ren Faire could be, and what activities were found there. This could then lead them to understand what they might choose for an organization they could establish within the Ren Faire. The Red and White Queens were invited guests in order to "keep the peace"; to avoid an Alice in Wonderland creation; and, to give students a more popular understanding of the individuals within the marketplace.

> o   Organization of student businesses/organizations and cold contemplation of social significance.

Table 1: Organizations and Companies Established by Student Groups

At this point, students were asked to assign themselves to a group or an activity. I provided a list of several; some students volunteered their own ideas. In all, some ten activity groups or "organizations" arose (see table 1). Students were asked, cold (without research), to guess at the historical and cultural importance of their chosen topic and, its significance in the lives of three categories of individuals:

a)   royalty & elite society
  a.   children (male, children female)
  b.   adults (male, female)
  c.   the very old (male, female)
b)   middle-class and merchant-class society
  a.   children (male, children female)
  b.   adults (male, female)
  c.   the very old (male, female)
c)   the poor, the indentured, the enslaved
  a.   children (male, children female)

       b. adults (male, female)

       c. the very old (male, female)

In order to facilitate engagement, students were rewarded (with fake money) *attempts* to engage, not rewarded for *correct* answers. Following the discussion, students created individual LINE groups (shared with the prof). They wrote out their answers in class. These responses allowed for a theoretical baseline, for which students could, through research, establish proofs and correct stereotypes.

I then instructed students to begin researching their area of expertise, and to confirm their suspicions about the historical and social importance of these activities at each level of society. Students were required to consult at least three references from books or peer-reviewed articles and to report back in two weeks. In this, students excelled: they had a clear and familiar task: research, summarize, report back. Students reported the results of their research during week 4.

Concurrently, we also began to work on short (20 minute) information-exchange sessions using only Shakespearean English ("conversational" Shakespearean English, including grammar and a limited vocabulary). These sessions began with short question-and-answer exchanges, "How are you?" and the like. Then progressed to "What did you do last weekend?" and on to more complicated response sessions. This segment continued weekly from the 2nd to the 9th week of class, until students were discussing their entire progress in groups using Shakespearean English. Success in this area was patchy: many students were very committed to the project of learning to really speak Shakespearean English; others, less so.

Once students had researched their area of expertise (week 5), they were asked to decide how to bring this activity to life *with authenticity.* The word *authenticity* had already become a hallmark word in both classes: it had been repeated by the instructor at least 3-5 times during each and every class in order to stress the importance of this idea. Students worked together to create as authentic an experience as was materially and financially possible: each student group had been given a budget of only NT\$2,000 (about US\$60). No students chose to do fund-raising to increase this amount;[3] some students took funds from their own pockets to attain results they desired.

As the date of the Faire approached, the concept of ritualization was introduced to the "test" group. One of the two Sophomore Business English classes was asked to incorporate **ritualization** into their activity. They learned the meaning of ritualization, the purpose of performing the ritual for themselves, the purpose of performing the ritual for others, and the desired effects of ritualizing their activity. They were then given an hour of class time to discuss, create and practice their rituals. Emphasis was placed on simplicity: the ritual should clearly be separated in space and time from other activities or actions. But the ritual should not be drawn out: a 30-second ritual was just fine. Because many students are familiar with the triple-bow (in Buddhist and Daoist traditions), the idea of a ritually significant but brief action was not difficult to convey.

---

[3] As noted above, this class has been a project-based course, usually involving the creation of a charity or other non-profit action group. In previous years, most projects were funded by student-organized fund-raising efforts; those previous year projects were, however, not organized around enactment of a Ren Faire.

Execution of the Faire: Although designed purposefully to be small, the Ren Faire event had nearly two hundred-fifty participants.[4] The event opening with the bard announcing the opening, and the White Queen and her knight valient welcoming the attendees into the event space. They then encountered the Red Queen and her army of knights. The Red Queen's knight valient threw down the gauntlet, challenging the White Queen's sole knight to a fight. Each of the Red Queen's five knights were defeated in turn in a sword fighting demonstration. Following this, the swordfighting 'business' offered two simultaneous activities: in one, the knights demonstrated to some the history of sword fighting and bladesmithing in Renaissance England; participants of this activity could engage in a series of student-designed games to test their knowledge. Other participants at the sword fighters' arena could learn the basic moves of sword fighting and engage in a duel with one of the knights. These activities continued throughout the four hours of the Faire with individuals in the group taking breaks in turn. At the same time, all other market activities were open and available to attendees. There were marzipan makers offering bread and sweets, and introducing the history of marzipan in Renaissance England and Europe. There were garland makers and bag makers teaching students how to make garlands and the history of fashion in Renaissance England. There were calligraphers demonstrating and teaching calligraphy and its history. Every half hour, there were dancers (two groups) demonstrating and teaching two popular dances of Renaissance England. And there were madrigals and a bard who joined together to announce events and to perform music of the period.

Faculty attendees: 23
Student attendees: 163+
Other attendees: 9+
Student entrepreneurs: 46
Coordinating faculty: 1
External assistants/actors: 2+2

Table 2: Attendance Figures

Each event 'business' had prepared posters conveying information about the history of their event and the social significance of the event (Ex. History and social significance of fashion, of swords and sword fighting, of bards and minstrels, etc.). Some of this information was conveyed in the form of a table game (sword fighters' activity) and engaged battles; some was conveyed by student event organizers as participants engaged in the event (all activities); some was conveyed by activity organizers (all activities); some was conveyed through student-designed games testing and imparting knowledge, some was conveyed via posters set about in the area of each individual activity. There was no attempt to assess the learning outcomes for non-organizing participants; there was an attempt to assess the audience appreciation.[5]

---

[4] Disclaimer: These numbers are estimated, as there was a major staff error in the registration of participants; numbers are based on a combination of names on a signup sheet, individuals personally witnessed at the Faire, individuals self-reported (staff, faculty) to be in attendance, and/or those found in video footage of the event.

[5] Audience appreciation was broken down into metrics through which students could assess the relative success of their activity; this relates to the *business* aspect of this Business English course. Details of these learning outcomes are not discussed in this report.

Data Collection and Tabulation

Two types of data collection were applied to this study. A quantitative analysis of results from a final oral exam; and, a qualitative (IPA) analysis of results from an oral report complete with students' self assessment.

Quantitative Analysis

Students were asked to respond to questions within a five minute timeframe. For each question, students were rated on a scale of 1-5 for oral expression, 1-5 grammar, 1-5 depth of knowledge, 1-5 connection of topic to social significance. Oral expression was assessed based on students' fluency, language use, speed of response, and coherence of answer. Grammar was based strictly on the use of appropriate use of tense, pronoun, etc.; if the word was used improperly but coherently (use of *speak* when *tell* would be required), this was considered under oral expression. The other two ratings related to questions that could be answered by anyone mindfully engaging in the Renaissance Faire that our classes put on; topics included court and commoner culture, calligraphy, music and entertainment, bladesmithing [6] and swordsmanship, dances and dancing, fashion and tailoring, food. [7] Because this data was gathered in real time during oral examinations to a large number of individual students, responses for this study were tabulated based only on these four parameters. Raw numbers were further valued as below:

Oral expression fluency, language use, speed of response, coherence	1-5 rating	10 points
Grammar	1-5 rating	10 points
Depth of knowledge Could they identify the subject matter? How much did they know about the history and development of the topic?	1-5 rating	40 points
Connection to social significance Could the students identify social significance at any level? (Level of realm, level of queen and court, level of commoners? Men? Women? Children?)	1-5 rating	40 points
Total points		100%

---

[6] Bladesmithing or swordsmithing is the art of making knives, swords, daggers and other blades using forge, hammer, anvil and other smithing tools. (Hriscoulas 1987) *Please note: Bladesmithing has a very deep and rich scholarshipThe definition above has been compiled from a large number of sources, including Wikipedia, OED, Collins and various specialist websites, articles and resources too great to be included in this footnote. As a nod to the recent Harvard scandal, I include this note for clarity. The references given are only partial.*

[7] Food during the Faire was limited to confiserie due to post-COVID considerations. Exam questions were, therefore, also limited to this narrow area of food consumption. There are plans to wide this scope of knowledge in future activities.

Qualitative Analysis (IPA)

Data for qualitative analysis was gathered students' final oral reports, presented in 20-40 minute sessions (depending on group size) over 2 weeks (4 hours) of class time. Students were provided with the questions for the oral report at the beginning of term, and were guided through developing an activity that could accomplish the goals of their term projects. After execution of the Faire, students were asked to privately evaluate one-another and themselves.[8] Students were then given additional self-assessment questions and were asked to consider how they might extend their performance, where they might go with the project should their "business" be incorporated into a formal Ren Faire circuit outside the school curriculum, and what they might do had they better used their funds or had additional funds (limited to NT$2,000 or about US$60) to expend. Finally, students were asked to consider what they learned from the experience and how this experience might help them into the future.

With Noon's very practical guide as reference (Noon, having beautifully considered and applied IPA principles from numerous sources), proceeded to tabulation of data. Reports had two parts:
   a) *a group report* covering various areas of mutual concern (organization of the business, mission and spirit statement, financial report, assessment of business metrics, authenticity of their performance to the specialization (fashion, sword fighting, etc.) , challenges encountered and overcome, etc.); and,
   b) *an individual report*, on what they learned from the experience and how this experience might help them into the future.[9]

Tabulation of data advanced in three steps. ***First***, I focused on individual students' individual performance within the first 'business' considered, the swordfighters. I re-played recordings for each student in the first group, noted down issues and my reflections/responses. I placed each issue into one of two tables, "group data" and "individual data". I then moved to the next student in the 'business', and continued until the first 'business' data was completely tabulated. I then moved on to the following nine student 'businesses.' ***Second***, I organized the various 'issues' into 'themes':
   • *Relationships* (family, friends and relationships, resolution of adversarial relationships);
   • *Education, immediate use:* use of time and efficiency, organizational skills; how to do research;
   • *Well-being and wisdom building:* appreciation of history, desire to travel to England, understanding of literature as a social dynamic, interest in specific cultural themes (dance (6), calligraphy (4), music (2), flight school (1), desire to pursue a career in education or literature (8));
   • *Post graduation interests and guidance*: education or literature (8), further education in business or sociology (6), engagement in business (3), flight school or other non-related interest (5), travel (6), did not mention or did not influence interests (7).[10]

---

[8] Freshman students attending this Faire were also asked to respond to a survey on the Ren Faire experience and what they learned from it. Their experiences are recorded in an independent analysis apart from this report.

[9] Students were also encouraged (but declined) to provide feedback to me on what I might have improved upon.

[10] Some students' responses fell into more than one category.

Third, I organized 'themes' across individuals and groups. As this discussion falls largely within the scope of individual experience, the focus herein lies with "individual data." An example of the tabulated data is below.

Relationships family	"This project helped me to better appreciate my mother's role in our family. I really had to get a lot of help from her…" "We ended up having to stay on campus some weekends. I really missed my family." "My sister is a grad student at XYZ university (in USA). She was really impressed… I felt really encouraged [when I spoke to her]."	My response: *unexpected. Student's relationship with mother and appreciation of mother improved.* My response: *workload stress on family relationships* My response: *Relationship with and appreciation of elder sister*
friends and relationships	"Some of the people I thought were my friends were really just using me…" "I felt like the others were not cooperating, and they [made me do most of the work]." "We worked together really well. X and Y have become two of my best friends."	My response: *student realizes used by friends* My response: *student realizes used by friends* My response: *teamwork leads to lasting friendships*
resolution of adversarial cooperation	"They just didn't show up. Finally, I quit this team and joined X."	Mu response: *resolution of adversarial teamwork situation, avoiding conflict; doesn't dare to speak up*

Discussion and Analysis of Results

IPA's objective is to understand lived experiences and explore how individuals make sense of their personal and social worlds. (Noon 2018, 75) For the purposes of the present study, I applied IPA to the analysis of students' final reports self-reflection. In this process, I followed Noon (2018), allowing the flexible nature of IPA frameworks to adjust various steps for the particulars of the present research. Students were asked to assess their own progress in terms of attaining the pre-determined project goals and to consider if/how what they learned during the term could be applied to their future goals. IPA is perhaps the best methodology for analysis, providing a "systematic exploration of personal experience" (Thomkins, 2017).

I also applied a simple oral test-based analysis to learning outcomes to ascertain levels of knowledge attained.

Business English (BE) Related Outcomes

In prior years, the Sophomore Business English Class was established with a) a practical component, b) a research and report component, and c) various conversational exercises. During this experimental year with the Renaissance Faire, these components were retained in modified form.

BE abilities (quantitative)	2024 Test group (ritualization)	2024 Control group (no ritualization)	Compiled data 2022-2023
Creation of *mission statement*	92%	90%	86%
Creation of *spirit statement*	86%	83%	93%
Creation of *project description*	96%	93%	88.5%[11]
Creation of DM (posters, etc.)	92%	86%	Not applied
Use of SMART principles	84%	63%	83%
Creation of *financial plan*	80%	72%	85.5%
Implementation of *financial plan*	84%	72%	84.5%
Reflection on financial planning: Useful considerations offered	52%	56%	Not applied
Ability to use advanced BE language	92%	83%	81%
Reflection on Project and its application to students' future	See IPA assessment	See IPA assessment	Data not recoverable
Self reflection (IPA qualitative)			

Mission and *spirit statements* were assessed based on the a) expression of idea, b) grammar, and c) language use. Scoring of this types remains subjective; however, the Faire groups, as a whole, seemed to have initiative in re-writing and finessing their mission and spirit statements *following* the Faire: their engagement in the activity was of great influence in how they experienced and related to the activity (calligraphy, juggling, etc.) in question. Examples produced and understanding of the use of the mission statement was consistently higher than with those engaging in the Renaissance Faire, with those in the *ritualization group* producing the best examples. However, a great number of students in both groups appeared unable to distinguish mission statement and spirit statement. I suspect this is due to the difficulty in bringing to life an event like the Ren Faire, an event for which students' lacked familiarity. Students in the 2022-2023 'businesses' had formed organizations set in contemporary Taiwan. By the time students were preparing their final report, they most likely set the spirit statement aside as less important than other areas of concern.

Project description scores were significantly higher in both 2024 classes (test/control group). I suggest this has a great deal to do with how seriously students researched their topics/markets. Students in the 2022-2023 groups were asked to research their markets whereas students in the 2024 classes were asked to research their topics. Each student group made great efforts and repeated returned to me for advice on finding resources on their individual topics; this occurred rarely among 2022-2023 groups. This lead to greater excellence in the finished reports and higher excellence in their product descriptions for their 'company profiles.'

---

[11] Prior year's groups (3+3 (2022), 4+5 (2023) with 3 disqualified for inclusion of students from different levels or universities, (86+82+73+98+96+92+88+86+97+89+88+87).

Financial planning was a major problem with the 2024 classes. In 2022-2023, no funding was offered to students. They, instead, had to run fundraising activities to raise funds for their 'businesses' and finance their activities. The 2024 classes were provided with funds ($2,000). Spending was erratic most groups underspent (used only part of the allotted funds) rather than make excellent use of the funds on offer. One group (gamers) had even greater, teamwork-related issues. The gamers had split itself into two, jugglers and stilt walkers. Jugglers spent 100% of the funds on juggling equipment, leaving the stilt walker with no funds for renting stilts. The stilt walkers were forced to change their activity late in the term, yet were able to produce an excellent event with near zero funds. An impressive feat.

On the use of *SMART terminology and concepts, t*he Renaissance Faire group members (2024) split dramatically: the Control group members' performance was on a part with the 2022-2023 group members' performance; the Test group members fell far below the Test and the 2022-2023 group members.

In the use of *advanced Business English vocabulary and phrases* (demographics, annuity, etc.)*,* the Control remained on par with the 2022-2023 group members' performance. In this area, however, the Test group members far outmatched both the Control and the 2022-2023 group members.

It appears that, the BE learning outcomes among individuals in the TEST (*ritualization)* group were greater than among those in the 2024 Control and 2022-2023 groups. The use of advanced business English language was best performed by individuals in the *ritualization* group (92%) compared to 81% and 83% among individuals in the Test and 2022-2023 groups, respectively. The greatest weakness among 2024 Control and Test groups was in the area of financial planning. The major difference between the 2024 groups and the 2022-2023 groups is in the provision of funds. I suggest the provision of funds removed from the students a sense of financial responsibility. In future, I plan to remove the provision of funds in future to assess whether this will return to students a sense of financial responsibility and allow them to apply their own financial planning strategies, thus enhancing their learning outcomes in this area.

Cultural/Historical Learning Outcomes

By far the greatest surprise was in the cultural and historical outcomes, where individuals in the Test (ritualization) group outperformed individuals in the Control (non-ritualization) group by an average of twelve points: 96:84. Clearly the cultural and historical knowledge garnered is impressive. How much of this is to due influences of other coursework and how much was due to the activity itself, this is difficult to isolate. However, the questions involved in the discussions (types of blades used in Renaissance England, when and how these blades first emerged, gun powder and guns in relation to swordsmanship's social meaning, the political meaning of Queen Elizabeth 1's adoption of Irish calligraphy, etc.) were closely related to the content to which students were exposed during the Faire. It is hard to imagine this knowledge derived from elsewhere; and, there is a clear indication of dramatic positive movement in these terms.

Personal and Wellness Outcomes

The IPA analysis likewise found that individuals in the Test (ritualization) group expressed much higher levels of satisfaction with the outcome of their performance, greater

appreciation with what they had learned from the experience and greater ability to connect their own learning outcomes with things they might do in the near-or-more-distant future. It was interesting to find that those least able to make these longer-term future connections were also those with difficulty coordinating and manifesting team-building skills.

Those in the 'business' with greatest difficulty coordinating funds (the buskers) (Control group), expressed more anxiety over relationships with both family and friends, and also had greater difficulty manifesting strong teamwork. The strongest and, perhaps, two of the best organized 'businesses' were those found in the Test (ritualization) group, and these individuals expressed zero or low anxiety with friendship, team-building or family relationships; high levels of satisfaction with their performance, and high levels of cultural/historical knowledge retention. This suggests that the use of intentional self-ritualization in this project-based activity has great potential from helping students to organize, plan and implement a longer-term project, to retain and sustain teamwork and a spirit of cooperation, to grasp and retain a sense of the meaningfulness of what they are doing in real time, and cultivate deeper fields of knowledge.

Conclusions and Future Considerations

The impressive differences in learning outcomes between the individuals in the Test (ritualization) and Control groups suggests that intentional ritualization, if properly implemented, can have positive effects on students' learning outcomes, their levels of satisfaction, and their ability to foresee future applications of what they have learned. It will be interesting to follow the careers of the students involved in the Faire, to assess their future choices, and consider how the organizational and cultural knowledge garnered may impact their lives and choices. It will be interesting to repeat this experiment with a second group of students, with enhanced instruction in *ritualization* in business and in self-authentication. The latter would have three aims: first, the aim to verify the results of the first study; second, the aim to create a stable instructional model to apply into the future; third, the aim to provide students with greater awareness of the importance of ritualization in marketing and commerce such that students may apply the techniques with greater zeal and gain greater understanding of the meritswiththeir own intentionally ritualizing actions. Finally, a repeat of the research may allow the implementation to be redesigned in such a way as to avoid the loss in learning gains in the area of budgeting and financial planning.

Note

Appendix can be provided by the author, upon request.

Nicola Baldissin, University of Udine, Italy

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract
This study introduces a game for social change designed to allow players to observe and understand the concept of gender privilege and its mechanisms. The game was developed in collaboration between Sapienza University of Rome and The Business Game srl, a company specialist in designing educational games and business simulations. The primary objective of this game is to enable managers and students to closely observe and reflect on the dynamics of gender privilege using a learning-by-doing approach grounded in empathy and critical thinking. Raising awareness about privilege dynamics is crucial for fostering a reconsideration of business activities from a social inclusion perspective, which holds significance for both current managers and the "managers of tomorrow" (i.e., the students). This article presents the rules, settings, and objectives of the game. Furthermore, it discusses the game's predicted outcomes considering relevant literature on privilege, the anticipated learning results and emerging dynamics during the game debriefing. Overall, the aim is to share this experiential learning opportunity and its related findings to encourage educational initiatives focused on sustainable business management and diversity management.

Keywords: Simulation Game, Diversity Management, Education, Privilege

Introduction

In contemporary society, the intricate web of social dynamics perpetuates a dualistic structure wherein certain individuals benefit from inherent advantages while others groups face systemic disadvantages within the same societal rules (Kolan and Sullivan, 2014; Nixon, 2019). This phenomenon is encapsulated by the concept of social privilege (McIntosh, 1988), which underscores the disparities in power and opportunities that manifest across various strata of society (McIntosh, 1989; Geiger and Jordan, 2014). The delineation of privilege is often evident in gender roles, where individuals find themselves on the social privilege spectrum (Hearn and Morgan, 2010). This paper delves into the exploration of social privilege structures, emphasizing the dichotomy between those who, by virtue of their roles, wield greater influence and those who, under identical rules, face inherent disadvantages.

Navigating the landscape of social privilege is a complex endeavor, requiring a nuanced understanding of the multifaceted dimensions that contribute to its perpetuation (de Beauvoir, 1949). Educating individuals on social privilege necessitates a comprehensive exploration of the intricate interplay between societal norms, historical legacies, and individual experiences (Crenshaw, 1989). Recognizing the complexity inherent in addressing social privilege becomes imperative for creating effective educational strategies that promote awareness and foster meaningful change (Kimmel and Faber, 2010; Volpato, 2013; Gasparrini, 2020).

Against this backdrop, the integration of game-based learning emerges as a compelling solution to navigate the intricate terrain of social privilege. This study introduces a transformative educational game developed collaboratively by Sapienza University of Rome and The Business Game srl, aimed at providing managers and business students (future managers) with a unique opportunity to observe and comprehend the mechanisms of gender privilege. Grounded in a learning-by-doing approach (Kolb et al., 1999; Kolb et al, 2018) the game seeks to cultivate empathy and critical thinking among managers and students alike (Campos Moreirsa et al., 2014; Booker and Williams, 2022). By immersing participants in a simulated environment, the game facilitates a nuanced understanding of privilege dynamics, transcending theoretical knowledge to instill practical skills that can be applied in real-world scenarios (Baldissin et al. 2013).

This paper not only presents the rules, settings, and objectives of the game but also delves into the anticipated outcomes based on relevant literature on privilege. Moreover, it explores possible expected learning results and emergent dynamics during the game debriefing (the post-game phase in which the experience is analyzed and the learning happens; see Crookall, 2010), offering insights into the transformative potential of experiential learning in reshaping perspectives on social inclusion (Hunicke et al. 2004; Kolb, 2015). The ultimate goal is to share this innovative educational initiative, advocating for a paradigm shift in educational approaches towards sustainable business management and diversity management. Through the lens of this game-based learning experience, the paper contributes to the broader discourse on fostering social awareness and equity within contemporary organizational contexts.

Social Privilege

Privilege in modern society is a multifaceted and deeply ingrained phenomenon shaped by historical and systemic structures. The definition of privilege, as posited by Sharma et al. (2018), encompasses a range of systemic advantages or disadvantages conferred upon

individuals based on factors such as gender, race, sexuality, ability, settler colonialism, and class. The concept of privilege, or more precisely, social privilege, originated in 1988 when Peggy McIntosh first used the term and defined privilege as the mechanism that allows a certain category of people to "be able to assume that one's own cultural norms are the norm" (McIntosh, 1988). Since then, various theories and ideas have developed around this theme. The history of the concept of privilege unveils its evolution as a pivotal aspect of social discourse. Over time, various social dualistic structures (such as sexism, heterosexism...) have contributed to the establishment of systemic forces that either privilege or disadvantage specific social groups. This historical context underscores that privilege and disadvantage are deeply rooted societal norms rather than personal developments or individual choices. (Sharma et al., 2018).

The concept of social privilege extends beyond individual behaviors, shedding light on ingrained social norms within various systems of inequality. Nixon's Coin Model (2019) offers a nuanced framework, likening social inequalities to a coin with oppression for disadvantaged groups on one side and privilege on the other. This model distinctly delineates the two facets, positioning them on opposite sides based on established societal rules. Analyzing the dynamics of privilege reveals unique experiences for diverse social groups, yet with a shared foundation, as articulated by M. Kolan and K. Sullivan (2014): privilege forms a self-reinforcing power structure wherein those in authority set the rules. These rules enable them to maintain a dominant position, perpetuating their structural advantage while concurrently exacerbating the structural disadvantage of marginalized counterparts. Illustrating this dynamic, Ferguson (2019) delves into heterosexism: some individuals, by virtue of their alignment with societal norms, openly express affection without fear of discrimination or violence, finding validation in legal frameworks and popular culture. Unlike straight individuals who naturally fit into this norm without choice, their advantage is inherited rather than earned. Often unaware of this unearned advantage, they continue to receive its benefits. In contrast, those identifying as gay, lesbian, bisexual, asexual, or two-spirit do not share the freedom from discrimination. Their natural preferences do not align with the dominant heterosexist norm, resulting in visible, unearned disadvantages. Despite not earning these disadvantages, non-straight individuals receive them nonetheless. The insights from Nixon's Coin Model and the reflections of Kolan and Sullivan collectively underscore the pervasive nature of privilege as a potent force shaping societal structures and reinforcing disparities. In essence, social privilege operates as a self-sustaining mechanism that not only maintains the status quo but also contributes to the perpetuation of systemic advantages and disadvantages among different social groups.

Moreover, to properly understand the concept of privilege, must be considered its intersectional impact, as emphasized by Aulenbacher and Innreiter-Moser (2013) and Fearfull and Kamenou (2010). Intersectionality considers a multitude of factors, including gender, ethnicity, age, disability, class, and sexuality, shaping the complex and interconnected nature of privilege (Williams and Mohammed, 2013; Bailey et al., 2017). Examining privilege through an intersectional lens further highlights the disparities experienced by different groups. While the dynamics of privilege affect men and women differently, black women, in particular, face compounded challenges resulting from the intersection of race and gender (Curti, 2007; Pepicelli, 2017). Similarly, non-binary individuals navigate unique challenges within the spectrum of privilege, emphasizing the need for a nuanced understanding of the intersections between various identity markers (Cancela et al., 2020).

To comprehend and address privilege effectively, individuals must cultivate specific skills such as empathy and critical thinking (Campos Moreirsa et al., 2014; Booker and Williams, 2022). Empathy enables individuals to understand and share the feelings of others, fostering a deeper connection with the experiences of those facing disadvantage (Ferdman, 2014). Critical thinking, on the other hand, allows individuals to deconstruct societal norms, question assumptions, and analyze the underlying structures that perpetuate privilege (Kanter, 1977; McIntosh, 1988; Minnich, 2005). Recognizing societal advantages not only requires an empathetic approach but also demands a critical examination of one's own beliefs and biases. The development of these skills is crucial for engaging in inclusive processes and practices, as well as for dismantling the myth of meritocracy, which assumes success is solely based on merit and ignores the privileges that accompany it (Sue, 2003). In essence, cultivating empathy and critical thinking is essential for navigating and challenging the systemic forces that underlie the concept of privilege in modern society.

Game Based Learning

The choice of Game-Based Learning (GBL) as an approach to the theme of social and gender privilege is due to the engaging and participatory nature of this educational tool. Games and videogames have been recognized as powerful experiences for training, information, and inspiration (De Lope and Medina-Medina, 2017). Games are structured activities that involve players following rules and objectives to achieve outcomes. They usually include elements of competition, cooperation (sometimes), and interaction, and they most of the time have a win or loss condition (Juul, 2005). The MDA framework (Hunicke et al., 2004) describes how games are designed by breaking them into three components: Mechanics, Dynamics, and Aesthetics. Table 1 shows the definitions of these components and their design counterparts.

Component	Definition	Design counterpart
Mechanics	the particular components of the game, at the level of data representation and algorithms	Rules
Dynamics	the run-time behaviour of the mechanics acting on player inputs and each other's outputs over time	Systems
Aesthetics	the desirable emotional responses evoked in the player, when they interacts with the game system	Fun

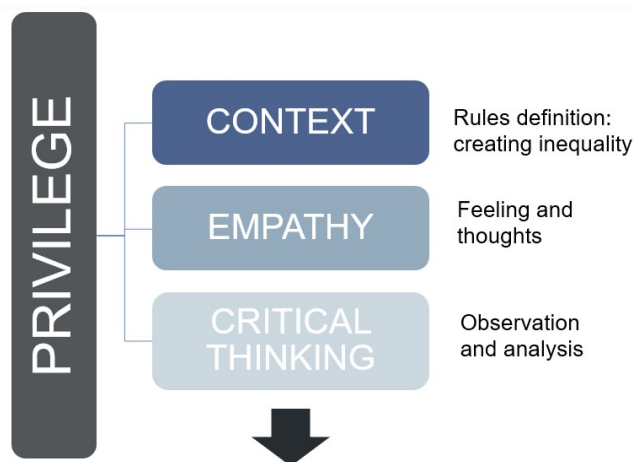
Table 1: The MDA framework. Source: Hunicke et al., 2004

GBL is an educational approach merging gaming principles with teaching methods, engages and motivates students in learning (Plass et al., 2015). It integrates problem scenarios and playful contexts to create captivating learning environments (Csikszentmihalyi, 1991). The design process focuses on balancing subject matter and gameplay for an optimal learning experience. GBL transforms students into explorers, encouraging discovery of new concepts instead of memorization (Garris and Diskell, 2002). The key idea is to use games as a central medium for delivering educational content and enhancing the learning experience.

According to Alaswad & Nadolny (2015), the design of learning activities in the GBL framework is intrinsically linked to assessments, game elements, learning goals, and game attributes. Game attributes are features and characteristics that are inherent in the game structure and are likely to initiate and maintain interest in gaming activities. Game elements are common blocks shared by games, but they are not necessarily essential for a game (Deterding et al., 2011). In digital game-based learning, some game attributes (e.g., feedback,

goals, interaction) and game elements (e.g., badges and leaderboards) play a major role in engaging and motivating players (Alaswad & Nadolny, 2015).

GBL enhances engagement on multiple levels, fostering a holistic and immersive experience that supports cognitive engagement (Plass et al., 2015). Unlike traditional learning, GBL includes various forms of engagement, such as affective and behavioral, making it more effective and appealing (Kiili, 2005). Game-based learning, akin to active learning, encourages participation, discussion, collaboration, and problem-solving for higher engagement and knowledge retention. Designing serious game for GBL involves creating educational games, for multiple players on any platform with non-entertainment purposes (Ritterfeld, 2009). Unlike traditional games, serious games prioritize learning outcomes, providing a fun experience for participants to learn about themselves and their interaction with the world (Di Loreto et al., 2012).

GBL in business extends beyond knowledge acquisition, integrating it into business processes and fostering a "systemic perspective" where individuals or teams make choices within the complexity of a company (Goold and Campbell, 1998). The game emphasizes the need for departments to maintain balance internally and with other functions. In the fast-paced business environment, knowledge absorption for new competencies is crucial, necessitating innovative and effective managerial training methodologies such as GBL (Baldissin et al., 2013).


Game Design

1.   The Game

The Social Privilege Simulation Game constitutes an innovative approach designed to address and illuminate societal inequalities through a structured three-step framework, as illustrated in Figure 1. This interactive experience unfolds in a manner that strategically mirrors real-world dynamics, thereby fostering a nuanced understanding of social privilege:

- *Step 1*: In the initial phase, participants are introduced to the game context, inherently instigating an awareness of the rules within the simulated society.
- *Step 2*: The subsequent step encourages participants to delve into the perspectives, thoughts, and emotions of the characters, thereby fostering empathy and facilitating identification with diverse viewpoints.
- *Step 3*: As the simulation progresses, participants are tasked with a comprehensive analysis of various events unfolding during the virtual festival. This critical examination enables players to discern the intricate ways in which these events can influence the participants and their likelihood of achieving success within the game's framework.

Passed these, the gameplay culminates in a pivotal moment of parallelism, drawing explicit connections between the simulated society and the real world. This final phase serves as a catalyst for profound reflection, prompting participants to confront the implications of the game in relation to broader societal structures.

The game incorporates two debriefing moments to facilitate reflection. The first, after Step 3, initiates participants' exploration of their experiences among the simulated society. The second, post-parallelism, delves deeper into the intricacies of social privilege, focusing on introduced categories. This deliberate sequencing enables a gradual unpacking of the concept,

ensuring a nuanced understanding. The Social Privilege Simulation Game not only engages participants in exploring societal inequalities but also strategically scaffolds reflection, offering a multifaceted lens to critically examine privilege within the simulated society and our broader reality.

Figure 1: Social Privilege Simulation Game structure.

2.   *The Application of the MDA Model*

The game is designed in order to reflect the MDA (Mechanics, Dynamics, Aesthetics) model by Hunicke et al. (2004), which is explicitly outlined in Table 2.

Component	Design counterpart	Social Privilege Simulation Game
Mechanics	Rules	• To have Unbiased/unjudged reflection, we decided for a single player game • To have a community reflection, we decided for a group debriefing • To overcome the need time to reflect, we opted for multiple steps • To have variegate reflections, we decided to have alternance of multiple-choice questions and open reflections
Dynamics	Systems	• Wanted: empathetic perspective and reflections so Dynamic: focusing on characters emotions and perceptions • Wanted: critical thinking so Dynamic: observation and analysis on unequal situations
Aesthetics	Fun	• Engaging and fantasy storytelling • Different way and moment of reflection and to express thoughts and feelings • Revelation afterwords

Table 2: The MDA framework by Hunicke et al. (2004) applied to
the Social Privilege Simulation Game

2.1. Mechanics

In the Mechanics section, we addressed the rules governing the gameplay experience. In order to foster unbiased and unjudged reflection, we intentionally designed the game as a single-player experience. For community reflection, a crucial element of our design, we opted for a group debriefing, ensuring a collaborative and shared experience. Recognizing the challenge of allocating sufficient time for reflection, we strategically incorporated multiple steps within the gameplay. Finally, to enhance a diversity of reflections, we implemented a combination of multiple-choice questions and open-ended reflections, promoting a rich and varied player experience.

2.2. Dynamics

Moving on to the Dynamics aspect of our game, we focused on creating systems that would elicit specific player behaviors and emotions. Our primary objective was to cultivate an empathetic perspective, and to achieve this, we emphasized dynamics that centered on characters' emotions and perceptions. Additionally, we sought to encourage critical thinking by designing dynamics that prompted players to observe and analyze unequal situations within the game environment. By integrating these dynamics, we aimed to create a nuanced and thought-provoking gameplay experience.

2.3 Aesthetics

In the Aesthetics section, we concentrated on ensuring an enjoyable and engaging experience for players. The storytelling aspect of our game was designed to be captivating, embracing elements of fantasy to immerse players in a compelling narrative. We introduced various ways and moments for reflection and expression of thoughts and feelings, contributing to the overall aesthetic appeal. Furthermore, we incorporated a revelation element after the gameplay, adding an extra layer of enjoyment and surprise for players.

Social Privilege Simulation Game

Participants find themselves situated amidst the intricate societal landscape of Privinia, an imaginary world all based around Gritte fruits cultivation and harvesting, where its serenity is currently disrupted by the onset of several social controversies linked to the planet's paramount cultural event: The Gritte Harvest Festival. In this nuanced setting, the participants are entrusted with the pivotal task of delving into the complexities of these emerging issues. Their overarching objective is not merely to witness but to comprehensively analyze the multifaceted aspects of these controversies from a spectrum of perspectives. The resultant analysis aims to furnish a report that will serve as an invaluable resource for the planetary government.

1.   Step 1 - Game Context

1.1. Privinia Planet

On the planet Privinia is divided into three regions—the Windy Lands of the North, the Western Isles, and the Lava Lands of the South; moreover, the convergence of these regions at the orchard area, a supposed common ground, is led by the team that actually wins the Gritte Harvest Festival, a particular celebration that sees the three lands compete to each

other in order to define which one of them will be the head and manager of cultivation ad harvest for the following year. This event is the main reason for the controversies of the past years, ad the planet activities that participants will be askes to analyze and observe.

To understand better the festival's dynamics is important to take a step back and consider the Privinian society, operating under the guise of specific roles determined by lineage: a four-tiered system—Emini, Abem, Alit, and Sabi—exists and define anyone place in the society. Emini, the supposed epitome of industriousness, are tasked with Gritte harvesting, dedicating their lives to the laborious activity. In contrast, Abem, responsible for orchard maintenance, face a structural slowdown, losing at least an hour of their daily time during the Gritte Harvest Festival (Gritte Harvest rules). The introduction of Alit, a subgroup of Abem admired for their attractiveness, further accentuates the disparity as they endure a significant loss of time due to societal expectations and reactions. The recent recognition of Sabi by the Council, those who does not recognize either in Emini or Abem/Alit, only serves to perpetuate the existing issues. Privinu categorically dismiss Sabi as lazy—an arbitrary classification assigned to those who refuse the roles of Abem or Emini. During the festival, Sabi face ostracization, relegated to higher branches to avoid encounters, limiting their harvesting opportunities to a mere two hours a day (Sabi festival constraints).

Regional distributions is also important to understand the Planet and its life. In the Windy Lands, the majority comprises Emini and Abem, with Alit and Sabi relegated to statistical anomalies (Windy distribution: 48% Emini, 48% Abem, 2% Alit, 2% Sabi). The Western Isles, while ostensibly diverse, is marred by a prevalence of Abem and Alit, with Emini and Sabi relegated to mere glimpses of beauty and laziness (Water distribution: 40% Abem, 35% Alit, 15% Emini, 10% Sabi). The Lava Lands of the South, touted as a haven for diversity, only serves to underscore the pervasive inequality—Sabi form a slight majority, while Emini, Abem, and Alit share an almost equal but marginalized presence (Lava distribution: 30% Sabi, 23% Emini, 23% Abem, and 24% Alit).

1.2. The Gritte Harvest

As the Gritte Harvest Festival approaches, the team lineups mirror the differences in societal distribution. The North Winds, a seemingly balanced team, masks the reality with eight Emini and only two Abem (North Winds lineup: 8 Emini + 2 Abem). West Waters, flaunting an alluring combination of Abem, Alit, and Sabi, further accentuates the pronounced social hierarchy (West Waters lineup: 4 Abem + 4 Alit + 2 Sabi). South Lavas, despite its diverse lineup, mirrors the societal distribution, emphasizing the prevalent differences (South Lavas lineup: 4 Sabi + 2 Emini + 2 Abem + 2 Alit).

With all these information, the objective of the game, therefore, is not merely to observe but to immerse oneself in the stark realities of the presented society, navigating the intricate web of social dynamics to bring to light the underlying issues that define life on Planet Privinia.

2.   Game Activities

Once the participant is presented with the context and has time and opportunity to analyze it thoroughly, the practical part of the simulation activity begins. As previously mentioned, this part is mainly divided into two moments, aimed to help participants in writing a meticulous report.

2.1. Step 2 - Empathy

Thus begins the first phase of interactions, which consists of an initial analysis. The participant is presented with data collected from a preliminary survey conducted across the entire population of Privina regarding the Festival. What emerges is a general discontent due to the constant victories of the North Winds over the centuries, not attributed to superior abilities but rather to the absence of barriers or operational limitations. In addition, comes out a significant frustration among certain, more " slowdowned" categories, unable to contribute effectively due to operational barriers imposed by social structures. Based on this, the participant is tasked with asking questions to a sample of targets, drawn from all categories of Privina and from every area of the planet. In this phase, the participant can choose from a set of questions, all focused on delving into the thoughts and feelings of the various interviewees. In this initial stage, the participant is encouraged to try to empathize with the characters through an analysis that goes from general to specific, almost like solving a mystery, to get to the heart of the matter.

2.2. Step 3- Critical Thinking

Once the investigation phase is complete, in order to finalize the report, the participant is asked to analyze some events that frequently occur during the festival. To do this, the player is presented with a typical situation and must answer specific questions that delve into:
- The impacts the event has on the various teams' chances of winning.
- The impacts the event has on individual players of each team in terms of participation in the harvest.
- Whether and which categories are limited or advantaged by the event.

On these three themes, the participant is presented with the following events:
1. A tornado, which uniformly interrupts collective harvesting efforts for everyone. However, this event, upon the resumption of harvesting, requires additional effort from some team members for maintenance and cleaning of the harvesting spaces. These two moments must be analyzed by the participant according to the points listed above.
2. At a certain stage of harvesting, a group, typically that of the North Winds (the favorites), completes their orchard area early and extends harvesting to other regions, introducing a dynamic that influences the tournament outcome and overall chances of winning. This is a very particular event because, once the participant's analysis is complete, unexpected feedback is provided: in past events, the team members that crossed boundaries experienced significant fatigue and discomfort, highlighting a negative impact on work capacity, even severe.
3. Towards the end of the festival, there is often the opportunity to introduce alliances. Typically, the last team can choose one of the teams to ally with. Here, the analysis requested from the participant is twofold: first, the impact of an alliance with the favorites is analyzed, and then with the other team. The aim in this case is to engage the participant in more complex considerations of impact not only on victory but also on the well-being and social capacity of the various team members.

2.3. General Reflection and Debriefing

At the end of these activities, participants are offered a moment of independent reflection on the dynamics of the game, which will serve as the basis for the first phase of collective

debriefing. The game dynamics aim to emphasize a specific concept: it is not necessarily the most skilled team that prevails, but rather the one that has fielded a team less disadvantaged by dominant social structures. These conclusions opens a spectrum of reflection for the participant, potentially prompting them to ask rudimentary questions about the concept of privilege: Is victory linked not to abilities but to the system of rules? Are there events that impact everyone in the same way? And events that impact differently are based on one's condition?

3.   Parallelism: What if Privinia is not just an imaginary society?

Closed the analysis phase of the game and its initial debriefing, it's time for the participant to discover the parallelism with reality. Also, for the discovery of information in the revelation, a mechanic in the form of an investigation is proposed to the participant: some statistics and sentences are presented, and participants try to guess the most realistic ones. Once the quest is completed, participants are prompted with the following reflections:

3.1. Emini

Within the framework of the hypothetical society of Privinu translated into our societal context, the revelations regarding Emini, analogous to white cisgender heterosexual Italian males, expose the complexities of workplace dynamics. These individuals confront positive discrimination but also contend with gender biases in hiring, wage disparities, and limited promotional opportunities. Traditional societal expectations press men to assume primary financial roles, contributing to stress and financial burdens. Moreover, the stereotype enforcing stoicism and the taboo surrounding mental health discourage men from seeking support, potentially leading to higher rates of male suicide (de Beauvoir, 1949; Volpato, 2013; Gasparrini, 2020).

3.2. Abem

The Abem, corresponding to white cisgender heterosexual Italian women, embody the historical burden placed on women concerning domestic responsibilities. This disproportionate burden, including cleaning and caregiving, constrains women's pursuit of careers and professional development. Gender stereotypes and biases affect workplace perceptions, with women facing challenges in promotions and career advancements due to assumed caregiving responsibilities. The unequal distribution of domestic duties perpetuates the gender pay gap, forcing women to make career sacrifices to meet familial caregiving needs (de Beauvoir, 1949; Volpato, 2013; Gasparrini, 2020).

3.3. Alit

The Alit, representative of black women, navigate a unique intersection of gender and racial discrimination. They encounter challenges related to traditional gender roles and expectations, compounded by racial stereotypes and biases. The intersectionality intensifies caregiving expectations and exposes black women to sexualization and objectification stereotypes. Media representations and societal attitudes contribute to these harmful stereotypes, impacting their self-esteem, mental health, well-being, and professional opportunities (Crenshaw, 1989; Curti, 2007; Pepicelli, 2017).

3.4. Sabi

Sabi, analogous to non-binary individuals, face discrimination and stigmatization based on their gender identity. This manifests as bias, harassment, or microaggressions, fostering a hostile environment. Concerns about mistreatment or job loss may lead some to conceal their gender identity in the workplace. Limited legal protections exacerbate challenges, making it difficult for non-binary individuals to seek remedies for discrimination. The stress and anxiety resulting from concealing their gender identity negatively impact mental and emotional well-being, fostering a sense of isolation and invisibility (Cancela et al., 2020).

3.5. General Reflection and Debriefing

As anticipated in the "game design" paragraph, at the end of this moment of revealing the game's intentions and its underlying theme, participants are reintroduced to the debriefing activity. This time, the focus is no longer on reasoning about the game itself but is concentrated on the new perspective offered. This moment serves even more to give space to the participants' growth and self-awareness journey. Having first experienced privilege in a simulated environment and then concretized its concept in everyday life, participants now have the opportunity to reflect deeply on the theme and consider questions of change: Am I aware of my privileges? Have I experienced situations of privilege? And non-privilege? Can I recognize it in the social mechanisms around me? These, along with many other similar questions, can be both reflections suggested by the trainer and emerging stimuli that each participant can take away after completing the simulation experience.

Conclusions

This research was undertaken with the primary objective of crafting an interactive learning experience dedicated to disseminating awareness and understanding of the intricate concept of social privilege. The resultant educational program, initially tailored for managers and subsequently extended to business and management students as aspiring future leaders, is strategically designed to influence participants' soft skills. This encompasses the elevation of listening potential, fostering empathetic behavior and leadership qualities, and strengthening critical thinking abilities, particularly in the context of decision-making processes. Beyond honing soft skills, the program also aims to instill a heightened sense of participant awareness. This involves promoting personal awareness concerning privilege and related topics, enhancing understanding of diversities within the workforce, and inspiring positive actions in response to newfound awareness of privilege-related matters.

In broader terms, the game aspires to contribute to the overarching goals of the Sustainable Development Goals (SDGs) of the Agenda 2030. Specifically, it seeks to align with Goal 5, championing gender equality as a symbol of profound societal transformation. Simultaneously, it actively participates in the pursuit of Goal 10, echoing a commitment to fostering an inclusive and equitable educational environment by reducing inequalities.

Sexual and Reproductive Health Education to Attain Inclusive Education in Indonesia

Alfiatul Khairiyah, Gadjah Mada University, Indonesia
Nefa Wahyuning Anggraini, Gadjah Mada University, Indonesia
Fitriatul Hasanah, Gadjah Mada University, Indonesia

Abstract

Education about Sexual and Reproductive Health and Rights (SRHR) needs to be implemented in inclusive education to establish social justice. SRHR is everyone's right because it is tightly related to success of human empowerment. The Indonesian Ministry of Education and Culture has issued guidelines for Sexual and Reproductive Health and Right program to implement inclusive education. The legal basis for SRHR education has been regulated in Health Law Number 36 of 2009. However, SRHR education has not been implemented optimally in the inclusive education policy. The problems include the amount of sexual violence that occurs in formal schools, pregnancies outside of marriage, and the high number of early marriages among students. Sexual and Reproductive health knowledge is essential for male and female students. This article aims to survey the extent to which inclusive education in Indonesia contributes to sexual and reproductive health issues based on the Salamanca education perspective and principles. This study employs a systematic literature review through UNESCO inclusive education guidelines, SRHR Education, and various cases of sexual violence among students in Indonesia. The results indicate that the implementation of inclusive education in Indonesia is not optimal because it does not prioritize SRHR education as a major priority to prevent sexual violence and pregnancy outside of marriage among students. As a result, students are vulnerable to sexual violence cases because they do not understand the importance of sexual and reproductive health in their bodies. The implementation of SRHR in schools is expected to build social justice in more comprehensive and gender perspective inclusive in Indonesia.

Keywords: Inclusive Education, Sexual Violence, SRHR

Introduction

Sexual and reproductive health education (HKSR) is a crucial element in building social welfare and justice, especially from a gender equality perspective. However, sexual, and reproductive health education in Indonesia has not been implemented properly. There are many phenomena of sexual violence against teenagers and children and even disabilities, early marriage, and unwanted pregnancies that occur in Indonesia. Sex education and sexuality discussion are still considered taboo and can encourage teenagers to have sexual relations (Miswanto, 2019).

In terms of the gender gap and problems of gender-based violence that occur in Indonesia, phenomena such as early marriage, sexual violence, and others lead women to be the most vulnerable group. Women and groups with disabilities, including children, are vulnerable groups in sexual and reproductive relations. Therefore, sexual and reproductive health education must be integrated into inclusive education in order to realize social justice projects. Sexual violence, child marriage, and sexual coercion are violations of human rights (Amporfu et al., 2020) showing that sexual and reproductive education is also a human matter.

According to UNICEF, Indonesia is one of the eight countries in the world with a high number of early marriages. By the end of 2022, the cases of early marriage in Indonesia reached 1.5 million cases. In this case, the number of married women under the age of 16 is more dominant than that of men. One out of nine women get married under the age of 18 and One out of 100 men marry under the age of 18. UNICEF also has released data that there are 1,220,900 girls who were married before the age of 18 (unicef.org, 2020).

Mostly, early marriages are triggered by pregnancies outside of marriage. Based on data from the Indonesian government, it is found that the majority of those who marry early because they are pregnant out of wedlock (unwanted pregnancy). Hence, applications for marriage dispensation for children under 18 years of age are also high. Marriage at an early age will affect women's physical, psychological, economic, and social health which has an impact on women's welfare. The physical and psychological unpreparedness of children will make women even more vulnerable to their bodies as well as in their families. Moreover, Indonesia's spending on health services remains low and below average compared to other middle-income countries (Bennett & Dewi, 2021). On the other hand, marriage at an early age also hinders children from accessing education and other economic resources.

In other cases, sexual violence in Indonesia is also high. According to the report published by the Ministry of Women and Child Protection in January 2023 (SIMFONI-PPA), sexual violence reached 24,271 cases. Most of victims are women who aged 13-17 years, 80%. Also, women with disabilities are vulnerable to becoming victims of violence. The National Commission on Violence Against Women recorded that there were 57 cases of sexual violence against women with disabilities in 2019. Women have special needs in sexual and reproductive organs because they are highly vulnerable to health risks (Khadijah & Palifiana, 2022).

The increasing number of early marriage cases, sexual violence, and unwanted pregnancies that harm one party need to be analysed critically. What is the role of our education system in overcoming such problems? How does sexual and reproductive education take place in Indonesia and become part of inclusive education? As inclusive education, it needs to accommodate various injustice problems including substantial issues such as SRHR. Women as subjects who often experience oppression in sexual relations are a specific group that also

needs to be observed. This is in accordance with the principles of the "Salamanca Statement" which mainstreams all children, especially those with disabilities and vulnerable groups.

Literature Review

Sexual and Reproductive Health Education

Sexual education remains debatable by many parties at the global level. This debate targets the wider political landscape in various countries, including Indonesia. In terms of terminology, sexual education has different definitions in each region. Some countries use the terms sex education, reproductive health education, or comprehensive sexual education (CSE). Discourses regarding sexuality are controversial, especially when discussed in public spaces. Sexuality is often interpreted as taboo, shameful, and should be kept secret, so that it does not need to be taught in formal education. On the other hand, stigmatization and stereotypes regarding sexual education are often considered westernized, tend to be liberal, allow sexual behavior, and still color the educational landscape in Indonesia.

At the global level, sexual education interventions continue to be developed by many parties over time. This includes the involvement of international organizations, such as the World Health Organization (WHO), the United Nations Educational, Scientific and Cultural Organization (UNESCO), social institutions, communities and the world community which are involved in implementing sexual education. This effort tries to touch issues of sexuality at the grassroots. Ine (2016) explained that sexual education which is comprehensively implemented in schools, is considered capable of providing knowledge to the community. This includes answering questions about the anatomy and function of reproductive organs, pregnancy, relationships, family roles, sexual diseases, contraception, and so on. Besides, sexual education is regarded a preventive measure to identify and prevent the possibility of sexual harassment among students.

Sexual education for vulnerable groups is exigent. This marks the need for appropriate sexual education to the target condition where sexual education intervention cannot take place by itself. Involvement of various parties including individuals, families, schools, communities, and formal policies underlies the accessibility of sexual education. This framework then allows the important consideration whether sexual education will stand alone or be integrated into the school curriculum (Robinson et al., 2019). Comprehensive sexuality education is a cost-effective way to put students on a path to healthy decision-making and away from risky or ill-informed sexual and reproductive choices. When teaching is inclusive and promotes equality and respect for all people, society and the whole world will benefit.

The positive impact of comprehensive sexuality education is real once it is implemented properly in educational institutions. According to UNESCO, sexuality education programs might contribute to delayed initiation of sex, fewer sexual partners, less frequent unprotected sex, increased use of protection, especially condoms, reduction of risky sexual behavior.

Comprehensive Sexuality Education (CSE) is a program which provides information about sexuality and sexual health based on the age of the young generation. CSE plays a very important role in the health and survival of this generation. CSE is based on an established curriculum that is scientifically accurate, age-relevant, and comprehensive in covering the topics of life skills, family life education, consent and bodily autonomy, puberty and menstruation, contraception and pregnancy, sexually transmitted infections, or HIV. Sexual

education provides children and adolescents with knowledge and skills in terms of values to protect personal health, develop respectful social and sexual relationships, and foster a sense of responsibility and understanding of others' right.

Inclusive Education

Inclusive education is a concept that has emerged as a contradiction in fighting inequality in every country in the world. This term has been popular since the Salamanca statement in 1994, which was signed by 92 member countries. In this case, education or schools with an inclusive orientation are considered the most effective way by creating a supportive environment for all students (McLeskey & Waldron, 2000), and appreciating students' creativity and shortcomings without any discriminatory elements (Clough & Corbett, 2000; Allan, 2007). Since then, the term inclusion has been widely studied with various definitions used by different authors.

Opertti, Walker dan Zhang (2013) stated that there are four primary ideas internationally which are relevant to inclusive education, including: First, inclusion is always related to human rights. Second, inclusion is also oriented towards children with special needs. Third, inclusion must embody and embrace marginalized groups. Fourth, inclusion can also act as a basis for transforming the education system. This idea was developed on the basis that educational equality has not been maximized between urban and rural areas in many countries. Therefore, it can be emphasized that the crucial problem for education is the low level of inclusiveness and learning opportunities for students with special needs and other marginalized groups.

Another review that has become an international standard trend in interpreting inclusive education is the ideas of Ainscow et al. (2006) dan Azorín & Ainscow (2020). They suggest ways of thinking about inclusion including: 1) inclusion is related to disability and the need for special education which is seen as the most common approach to the inclusive education concept, 2) inclusion as a response to disciplinary exclusion which means that inclusion is associated with students who have challenging behavior and are different from students in general, and 3) inclusion includes all groups that range from attitudes of social exclusion in society.

Moreover, the fourth (4) is inclusion as the promotion of schools for all. This approach is related to the term of a comprehensive school which is the school development by emphasizing the appreciation of innovation and creativity of each student. 5) Inclusion, as education for all people or students, refers to UNESCO's "Education for All" agenda focusing on increasing access and participation in education both nationally and internationally by setting certain goals that contribute to the progress of each country. 6) Inclusion, as a principled approach to education and society, has implications for inclusive values such as equality, participation, community, and respect for diversity, which are seen as important in guiding policies and practices to improve education and knowledge as a whole.

Therefore, according to these previous definitions, it can be concluded that the conceptualization of inclusive education is understood in different ways or adapt to the context of problems in each region. The main point of inclusive education is the desire to introduce attitudes and behavior to students, teachers, and parents to provide equal rights without looking at the shortcomings or social status of the students involved. On the other hand, inclusive education which prioritizes educational transformation also emphasizes the introduction of knowledge that is vulnerable to issues of gender, marginalization, and discrimination. It means that it has the potential to provide guidance for students and partners to be more vulnerable to

social problems (gender-based violence and social class) indirectly that often occurs in the surrounding.

Methodology

This research employs a literature review analysis. The type of literature review used refers to SLR (Systematic Literature Review). Calderón & Ruiz (2015) define the systematic literature review method as an approach to research that acts as a means of identifying, evaluating, and interpreting all research that will be carried out. The study collection is also selected or adjusted to the most relevant topics, questions, or research formulations to be studied as well as research phenomena that have a major contribution in ideas to the research being carried out.

The systematic review contained in the SLR method is a form of secondary research (Kitchenham & Charters, 2007). Furthermore, Kitchenham et al., (2009) state that the aim of a systematic literature review is to systematically examine library sources through the process of identifying, assessing, and interpreting similar previous research evidence. The research aim using this systematic literature review is to obtain a theoretical basis that can support solving the research problem and reveal relevant theories to the case. More specifically, this study tends to emphasize both national and international cases of inclusive education, as well as regulations declared by the UN or UNESCO in emphasizing the importance of gender-based education, especially on educational and reproductive rights for students and social layers in society.

The use of the SLR method in this research was carried out using the PICOC approach, which represents the scope of SRL. PICOC helps in analyzing literature data and answering research questions. It is also similar to feasibility screening (quality of the results of a literature review search that is in accordance with categories or standardization of research limitations). This approach includes several parts, including: (1) Population (P), representing the population or subjects in the research. The population in this study includes the interoperability of study criteria regarding women, students, teachers, government, NGOs (Non-Governmental Organizations) and the role of parents in initiating the formation of inclusive education that is sensitive to sexual and reproductive health.

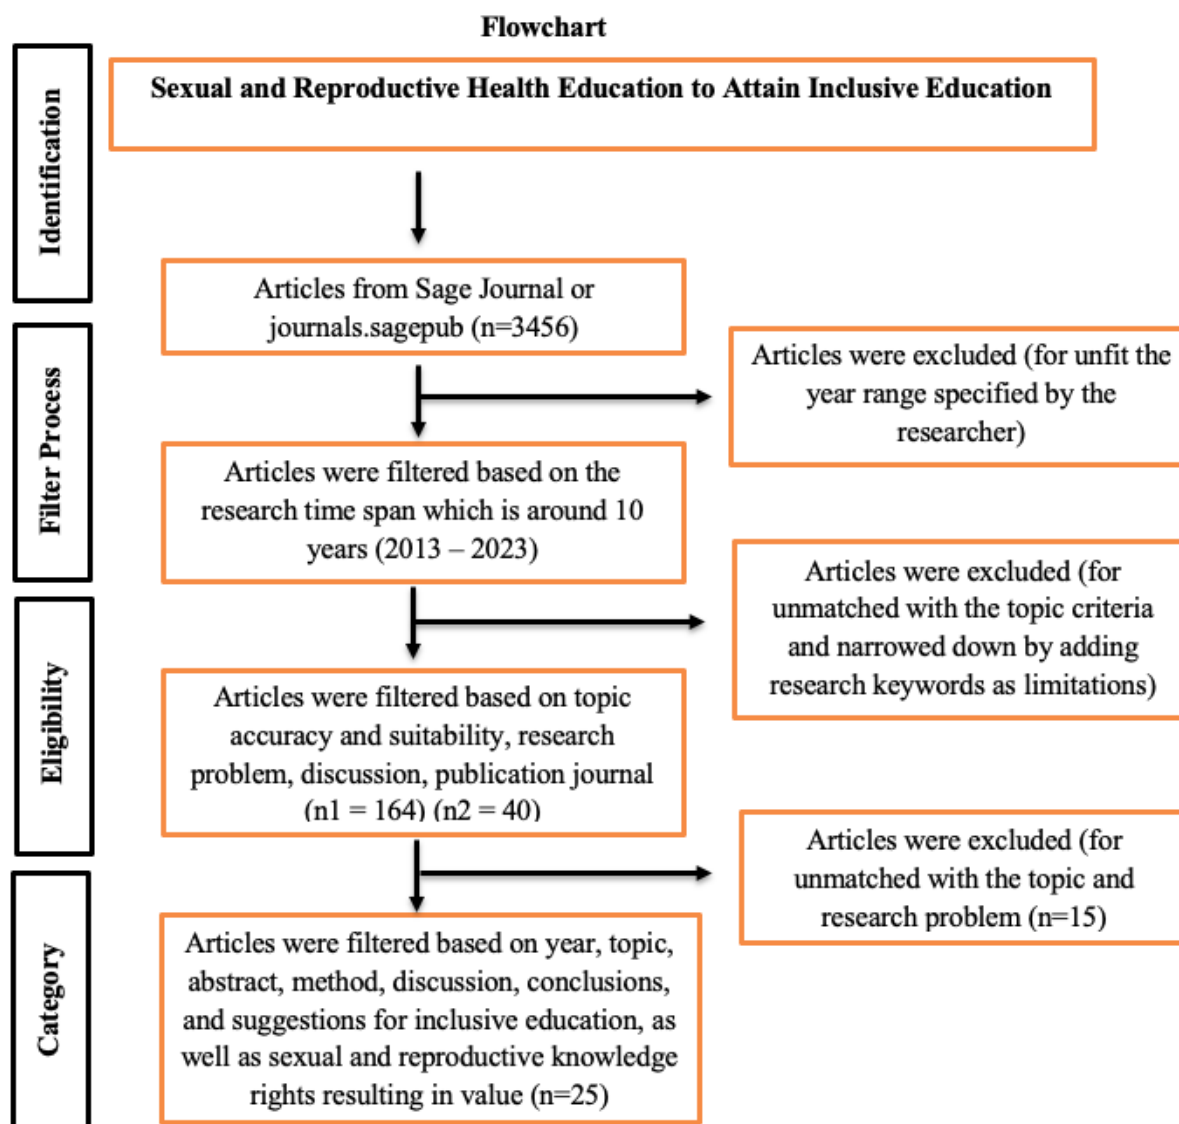
(2) Intervention (I) refers to pragmatic interoperability which includes an action carried out by the research subject. In this research, the intervention context was carried out to analyze regulatory policies in responding to social problems regarding violence, rape, pregnancy at a young age and early marriage at a minor or early adulthood. This stage is carried out to determine how much regulation can influence changes in social issues related to the weakness of inclusive education. (3) Comparison (C) is a comparative intervention. In this case, the researcher did not use comparison, because the researcher did not aim to compare the results of a literature review regarding the implementation of regulations or inclusive education policies among countries, but only in Indonesia.

(4) Outcomes (O)refers to how the results of the literature review relate to the research focus, namely the right to inclusive education in understanding sexual and reproductive knowledge from an early age. It means that outcomes refer to articles with similar results to research problems on inclusive education and sexual and reproductive health rights for students and teenagers in the community. (5) Context (C) is oriented towards contestation or research focus based on approaches to implementing national and international regulations on inclusive education in Indonesia.

In the next stage, researchers begin to identify literature from journal articles that is relevant to the topic and research problem. This stage is called the search process. In this case, literature review is defined as a series of search results based on research themes. This literature search was carried out on 14 August 2023 – 10 November 2023, based on secondary data obtained from the website of the journal article being studied. The secondary data was obtained from international journal articles with pre-determined topics and research problems through keywords.

The literature search used a database in the English language search engine "Sage journals". The keywords are also in English. As a limitation for data searches, researchers only select journal articles published in the last 10 years (between 2013 and 2023). Besides, as suggested by research limitations, the selected journal articles focus on sociology and social sciences journals & humanities.

It can be seen that the amount of data obtained was 40 articles based on the results of the latest literature review. These articles were then reviewed and analyzed based on title, abstract and relevant topics, hence it was decided to include 40 articles which were relevant. Then, the researcher implemented a quality assessment model to obtain more comprehensive literature review results. After an in-depth review and analysis of the 40 articles listed, it turns out that only 25 (twenty-five) articles passed QA. Therefore, this research will only discuss 25 related research articles.

Flowchart


Result Discussion

Sexual and Reproductive Health in Indonesia

Self-awareness is defined as an individual who has concern for maintaining self-function both physiologically, psychologically and in social welfare. One part of this awareness is maintaining the reproductive health system so that individuals have a safe sexual life for themselves. Individuals can plan the number of family members and produce offspring through reproductive health. Therefore, individuals could receive information about contraceptive methods, reproductive health services (delivery, postpartum, antenatal services), and health services for children and adolescents (Harahap, 2003).

Indonesia has a National Sexual and Reproductive Health policy including:
1. Maternal and Child Health Program aims to reduce maternal mortality during childbirth and the postpartum period. Preventive efforts can be carried out by providing antenatal care, labor, or parturition services, and postnatal or postpartum services. In addition, preventive efforts also include providing education regarding sexual relations that can

cause pregnancy. This is done to prevent unwanted pregnancies and reduce the percentage of life-threatening miscarriages (Rahayu et al, 2017);

2. Family Planning (KB) Program focuses on reducing population growth, improving maternal health and family welfare, regulating the spacing and number of births;

3. Adolescent Reproductive Health Program is carried out through education to prevent problems such as free sex, drug abuse and illegal drugs, unwanted pregnancies which lead to abortion, pregnancy and childbirth at a young age which poses a risk to the safety of the mother, and the emergence of sexually transmitted diseases (STDs) and HIV/AIDS infections.

4. Program for Prevention and Treatment of Reproductive Tract Infections (ISR)
Preventive measures to avoid this disease include not having free sex or frequently changing sexual partners, using condoms properly, maintaining personal hygiene, especially the reproductive organs, and carrying out examinations with the relevant health services.

5. Reproductive Health Program for the Elderly
The problems related to reproductive organs are disorders during menopause, cardiovascular disease, joint-pain, prostate cancer, and other degenerative diseases. Proper treatment efforts for reproductive health in old age can improve the well-being of the elderly.

Self-protection might not fully prevent someone from sexual violence. The cooperation from various elements to create a safe-space free of violence for society, especially women is required. Also, formal education plays a pivotal role in providing a safe space for victims of sexual violence. The education system must include learning topics related to human rights. In terms of peace, students are also taught to develop the ability to resolve personal and group conflicts through mediation and negotiation, without using violence. Teacher training to detect violence, including sexual violence in the school environment is also required (Purwanti, 2020).

Inclusive Education in Indonesia

A gender-biased education and a tendency to ignore reproductive health knowledge is one of key factors in education problems in Indonesia and other countries. WHO (World Health Organization) report suggests that various countries in the world are facing various challenges in providing sexual and reproductive health services evenly, increasing maternal and child mortality rates, gender-based violence, and low levels of information or knowledge regarding sexual and reproductive health both inside and outside school (WHO, 2015, 2018). Therefore, the United Nation (UN) participated in declaring a policy program on Sexual and Reproductive Health and Rights (SRHR) as a response to this issue.

SRHR aims to monitor or reaffirm the importance of knowledge about health rights and rights in understanding sexual and reproductive aspects for individual. It means that this SRHR declaration needs to be implemented and adopted by all countries because it is prominent in contributing to the reproductive health success index. In this case, gender and reproduction are also able to determine unique and specific health needs, especially for girls and other adult women. For this reason, Sen & Govender (2015) emphasized that Sexual and Reproductive Rights (SRR) are mandatory rights that all students and adults need to understand and obtain in order to achieve physical and mental well-being.

The integration of SRHR in inclusive education in Indonesia has been carried out through several programs, for example, the BERANI program. The BERANI program stands for Better Sexual and Reproductive Health and Rights for All in Indonesia, which has a vision in line with WHO, UNFPA (UN Reproductive Health Agency – for Women and Girls) and UNICEF (UN International Children's Fund), to combat sexual violence and reproductive problems for women and men (UNFPA Indonesia, 2018).

The right to obtain knowledge about sexual and reproductive health is a key aspect that needs to be disseminated and practiced since at the school age (Glasier et al., 2006; Chandra-Mouli et al., 2019). Moreover, inclusive branding is not only translated definitively to achieve equality. However, inclusive education should encourage the critical abilities of students, parents, and teachers to explore 'what kind of equality is appropriate to implement in order to reduce sexual violence'. A simple analogy of health and reproductive rights for the community (children to adults) needs to be provided, because it brings a huge influence on the quality of one's life as a nation. Specifically, not fulfilling these rights will certainly be an obstacle to women's self-empowerment. This is because it will further perpetuate patriarchal culture which leads to social inequality for men and women.

The government plays a role in supporting gender-based inclusive education at all levels of society in Indonesia indirectly through the BERANI program. This program was initiated in Indonesia due to: First, high maternal mortality is led by the suboptimal quality of reproductive health services. It has been convinced that in 2017, the rise in the proportion of births by medical personnel in Indonesia reached 91%, where this figure represents how high the birth rate is in Indonesia. However, based on this assumption it is reported that there are 305 maternal deaths (women) for every 100,000 births, due to late treatment by existing health workers. Moreover, there are only 50% of midwifery graduates from 700 midwifery schools in Indonesia annually (midwifery is a tertiary institution as the main provider of health and reproductive services for women in Indonesia) (UNFPA Indonesia, 2018).

The second factor is the unmet need for family planning. Mostly, young and old couples in Indonesia still do not fully understand and use proper contraception. As a result, it is undeniable that the birth rate and risk of death in pregnancies among young mothers are also increasing. Based on 2017 data, it was recorded that 10.6% of married women with childbearing age did not use a contraceptive method, even though they consciously did not want to experience a close-pregnancy distance (Irawaty et al., 2020). Meanwhile, in 2018, the death rate reached 12.4%, accompanied by an increase in the drop-out rate of 28.9%. This means that poor understanding in the use of contraceptives poses a high risk to the reproductive health of married couples, especially teenagers.

Third, teenage pregnancies in Indonesia (before marriage) are increasing. The key factor of teenage pregnancy, especially for those who are still in school (as students), is more likely led by poor access to accurate sexual and reproductive health information and services from schools and local health services. The challenge in accessing reproductive health and knowledge is also caused by several (unwritten) norms in society, which assume that providing reproductive knowledge to students is taboo. On the other hand, existing services have not yet comprehensively fulfilled young people's needs. Moreover, health and reproductive education remains not a mandatory subject in the national school curriculum. Thus, it is important to note that existing educational regulatory guidelines and resources have not met teachers' need to provide the knowledge and skills required by students.

The fourth factor is the high level of gender-based violence and harmful practices against women and girls. This problem occurs in both urban and rural areas where women and girls are the subjects of discrimination by the patriarchal culture. Therefore, violence and sexual harassment are unavoidable. According to the 2016 National Women's Life Experience Survey, it was recorded that one out of three women aged 15-64 years reported frequently experiencing physical or sexual violence (UNFPA Indonesia, 2018). Meanwhile, the group of girls aged 15-19 was reported experiencing the highest level of violence in Indonesia. The high prevalence of child marriage also drives domestic violence among girls under the age of 25. It was recorded that in 2018, one out of nine girls aged 20-24 years married before the age of 18 years. Thus, based on all of the above reproductive health problems, the government should reaffirm these rights through inclusive education in Indonesia.

Sexual and Reproductive Health Education to Attain Inclusive Education in Indonesia

Inclusive education accommodates all children to achieve equal and sustainable education. It means that inclusive education needs to highlight issues of women's vulnerability in social relations, especially in sexual relations, including women with disabilities who are also vulnerable to be victims of violence. Thus, a country has an obligation to protect and fulfil children's educational rights, including children's rights to sexual and reproductive education through inclusive education. This is pivotal to reduce the rate of early marriage, sexual violence, and unwanted pregnancies.

Sexual and reproductive health education is a comprehensive education that teaches about menstrual health, pregnancy, safe abortion, gender-based violence, infectious diseases, dangerous acts, and sexual diversity. Generally, this will cover gender education, reproductive health, human rights, violence, diversity, relationships, and others. Sexual health education in Indonesia remains limited because it is unavailable in schools (Utomo & McDonald, 2009). Meanwhile, sexual, and reproductive health education is expected to be implemented properly in inclusive education in Indonesia because every child and adolescent has the right to sexual and reproductive health which can be achieved through education.

Lack of sexual and reproductive education that occur in developing countries such as Indonesia are led by several factors such as customs, culture, religion, and limited knowledge from the right sources (Nehioshon et al., 2021). One limitation of this right source is educational institutions. After all, educational institutions in a region do not exist by itself but are also influenced by how local culture develops. Finally, there are still limitations, even in educational institutions, in providing understanding about sexual and reproductive health because it is still considered taboo and an inappropriate discussion for children and adolescents culturally.

This means that inclusive education in Indonesia is not fully in line with the shared principles of equality and justice. The justice values are reduced by the environment and adapt to societal stigma, especially in developing countries. Therefore, inclusive education needs a self-reconstruction in accordance with the principles of the Salamanca statement which creates equality and justice for others. In the Salamanca principle, education is expected to adapt to children's needs with different needs and abilities (UNESCO, 1994). Currently, sexual, and reproductive health education is crucial for every child and adolescent which should be included as a key element in learning.

Thus far, reproductive health education in Indonesia has only been one of contents in Biology which explains regarding reproductive organs, the pregnancy process, venereal disease, and

other health-related issues without involving affective aspects. Sexual and reproductive health does not extend to psychomotor education which embed skills and behavioural values in children regarding sexual behaviour. They include educating children to avoid the threat of sexual violence, knowing the vital organs that other people should not touch, teaching about safe and unsafe touch, and educating about how to build healthy relationships and access services for sexual health and reproduction. Up to now, young people in Indonesia have limitations and find it difficult to access sexual and reproductive health services (PPN/Bappenas et al., n.d.).

Sexual and reproductive health education in inclusive education provides knowledge about rights to guarantee and teaches every individual to make decisions regarding children's sexual and reproductive activities without discrimination, coercion, and violence, including access to services. Thus, there is no gap in knowledge even in access to services. Education should have high sensitivity to children's needs in accordance with inclusive education in the Salamanca principles. Sexual and reproductive health education that should be implemented in Indonesia needs national level support, starting from policies and organizations, educational institutions, recruitment and training of educational personnel, external service support, priority areas, community perspectives, and resource requirements (UNESCO, 1994). It means that educational sensitivity to the diversity of children's needs can be formed by developing non-discriminatory behaviour, building open and inclusive communities and societies, so that education can be achieved by every child/individual.

Salamanca principles can also be applied in sexual and reproductive health education such as how every child can receive reproductive health education, whether male, female, or disabled. Besides, it can be how does the education system and state build an external environment that supports well-implemented sexual and reproductive health education. A sustainable organization that advocates for sexual and reproductive health issues, adequate service infrastructure for sexual and reproductive health, and educational institutions that are aware of sexual and reproductive health rights are also required.

Conclusion

Sexual and reproductive health education should be included in an inclusive education curriculum which is adaptive to all educational institutions. This is an effort to equalize sexual and reproductive education so that there are no social disparities between regions and between genders. Sexual and reproductive health education requires strengthening organizations, communities, parents, and infrastructure according to the principles and framework of the Salamanca Statement. Some of them are carried out without gender bias and are inclusive of children and teenagers, including children with special needs who are also vulnerable to experiencing gender-based and sexual violence.

The Online Training to Create an Online Society That Connects Tourism for Employment and Preparation for Future Work

Surapon Boonlue, King Mongkut's University of Technology Thonburi, Thailand

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

This research aims to: 1. construct an online training system to convey knowledge and the production process of tourist media to communities and people during the coronavirus disease 2019 (COVID-19) pandemic; and 2. examine people's access to online training systems. Examine the performance of the online trainees. The findings demonstrated that: 1. The developed online training system is of high quality. There are both media and self-evaluations. It may be used as a learning center and for self-development by trainees. During the COVID-19 epidemic, participants were given three months of online training. 1348 individuals have participated in the program, and 267 individuals who have passed the course may submit their work to get certificates. The outcomes of the online trainees who have been taught during the duration of the project are capable of producing video media. The objective is to expose the community to its own attractions at the highest level possible.

Introduction

The tourist industry is one of the most significant industries in Thailand's economy, generating more foreign currency than other exports. Consider that the tourist industry contributes to the growth of the nation; provides jobs; distributes revenue; circulates currency in the economy; and enhances the country's image. This study has been deemed the nation's soft power. This initiative has been financed by the government. Developing the nation's personnel skills (reskilling, upskilling, and new skills) to secure employment and prepare for future employment. After the 2019 coronavirus epidemic.

This initiative has been financed by the government of Thailand to develop the nation's personnel skills reskilling, upskilling, and new skills to secure employment and prepare for future employment. After the 2019 coronavirus pandemic. Traveling is the human activities that make happiness. Traveling creates a relaxing environment in addition to having fun. It lifts our spirits, brings us joy, and facilitates our escape from life's stressors (Gilbert & Abdullah, 2002). According to psychology, travel enhances brain function and efficiency. It facilitates better thought processes and can strengthen interpersonal bonds. can also be improved upon. Traveling is a new industry activity that employ different elements of production are referred to as being in the tourism industry. Come develop one tourism service that brings comfort or happiness, then market such services to visitors. 1. The product is intangible. 2. The product is stationary and doesn't move toward the customer. 3. The product is non-degradable. 4. The product may or might not undergo a change of ownership (Preecha Treesuwan 2014). The impact of COVID-19 global travel. This effect was significant and continued for many years throughout Asia. The important thing is the ability of the next generation of individuals to improve themselves by reskilling, upskilling, new skills providing education at learning establishments Part of it can only be completed. Most people in society are not able to access. Due to the demanding and laborious course challenging to alter. Workers make up the workforce. Unable to acquire knowledge. A long way from schools Not enough time to work Inappropriate technique of instruction Providing education at learning establishments Part of it can only be completed. Most people in society are not able to access Due to the demanding and laborious course challenging to alter. Workers make up the workforce. Unable to acquire knowledge. A long way from schools Not enough time to work Inappropriate technique of instruction.

To train working people or people in the labor market who are working it is very important to adapt media training methods to suit the work being done. Therefore, the researcher, who is a media and technology teacher, introduced the concept of the designing process (Brown T, Wyatt T 2010), which is a process for developing work starting with creating something new step by step. To be used as a training process for the nation's workforce to further develop their own tourist attraction information.

Population and Sample

Population

There were 1348 people who applied to join the project. Self-employed people affected: 2. Laborers in the system who were laid off or returned 3. Labor in the system lacks skills and tends to decline. 4. Labor in the system that is currently valuable but needs upskilling or reskilling 5. Manpower to enter the labor system.

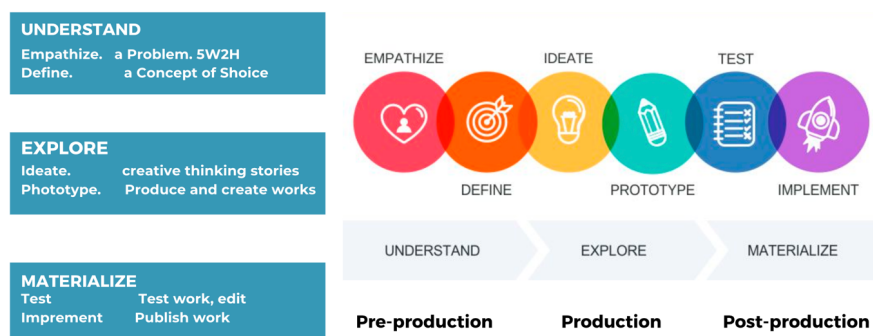
Sample Group

Those who have studied successfully and submitted a complete work number and people who passed the course: 267.

Methodology

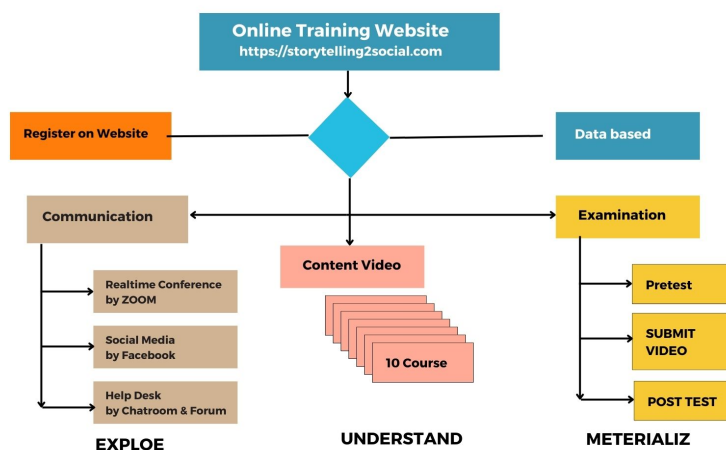
1. Construct an online training system to convey knowledge and the production process of tourist media to communities and people during the coronavirus disease of 2019 (COVID-19) pandemic.
2. Study the results of using the online training system.

Results

1. Create an online training system to transfer knowledge and processes for producing tourism media to communities and citizens during the coronavirus disease 2019 (Covid-19) pandemic. In this training Has used a training process Designing which has a process There are five steps. And to suit this, the participants will have to produce media using a three-step process. The researcher therefore adjusted the process to be the three steps in media production are pre-production, production, and post-production. The steps are as shown in the picture.


Design Thinking Process

Figure 1: The training process using the Design Thinking process
and tailored to a three-step production process.



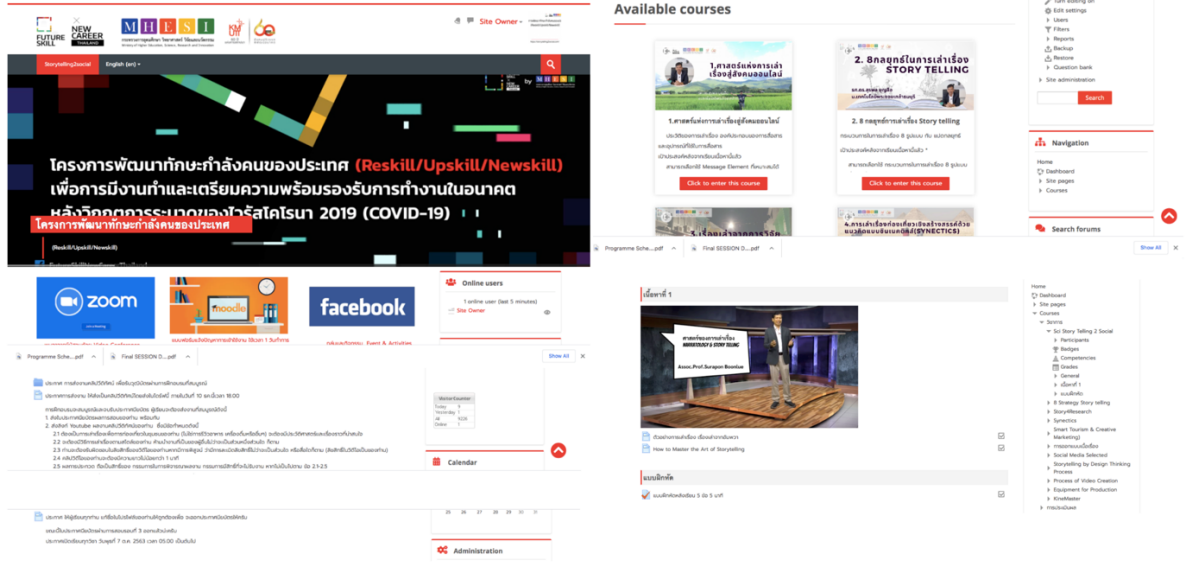


Figure 2: The components and media of the training website
using the Design Thinking process.

Figure 3: Image showing an example of media used in training
using the Design Thinking process.

2. Study the Results of Using the Online Training System

2.1 Number of visitors on the website shows how often the system is accessed in training and the percentage of website traffic of trainees.

Table 1. Number of visitors on the website

Trainee coming to study	Number of times coming to study	Number of pages viewed.
1348	3935	12746
	34 %	10.57 %

From Table 1 it shows that All users had 3925 visits and 1348 new users accessed 12746 pages from the website. When you click the link, you will have immediate access to most of them. and comes in second place with referrals from social networks. And it was found that most patients returned to study.

2.2 Age Level of Trainees and Classify Percentages According to Age Range

Table 2. Age level of trainees

No.	users.	There have been
1	18-24	29 %
2	25-34	27 %
3	35-44	19 %
4	45-54	11 %
5	55-64	8 %
6	65	5 %

From Table 2 it shows that Age level of trainee. The bulk of trainees are between the following ages: The first age group is 18–24. Ages 25 to 34 come in second. Ages 35 to 44 come in third. and fourth, people over 65 made up the least number. Most of the trainees are women. 60.6% female and 39.4% male, which, if one were a university professor The possibility to pursuing higher education will not be available to those in the second, third, or fourth categories. demonstrates the ability of online training systems to reach skill-development groups really.

2.3 Trainee Who Came to Study and Submitted Work Until the Project Was Completed

Table 3. Trainee who came to study and submitted work until the project was completed.

Number of Trainee coming to study	Number of Trainee who submitted work to complete	Number of %
1348	267	19.8

Table 3 shows that of the 1348 trainees, 267 people submitted work to complete the project, accounting for 19.8%.

Summary and Discussion of the Results

Training results, summary, and discussion of results from the development of online learning resources. on social networks or LMS systems so that everyone can come and study There were many people attending the training and from every region. of the country. Training in this way makes it possible to provide training in large quantities with the following objectives: Creating an online training deposit system It uses LMS features that make it accessible from any device. and can come to study from anywhere every time, making training possible.

The training process uses the Design Thinking in training process. This can be applied to all three steps of the process of producing media to promote one's own tourist attractions. It

starts with understanding local issues or problems, which is the production planning process. 2 processes for exploring, which are the production processes. Going out to film video clips and 3 processes in materiel That is, the post-production process involves checking the work and further presenting it in social networks.

Transferring knowledge and processes in producing tourism media to the community by allowing students and staff to be representatives of the community Most trainees are trained in the field of knowledge. Many test takers passed and received high scores. But the work produced by trainee's accounts for nearly half of the work submitted by the students until completion. This may be because the trainees may not have time due to Most of the trainees are students and may be close to exams. But the work submitted from the evaluation shows that the process of telling stories follows the principles of storytelling that have been trained and has creative ideas in finding strategies for telling stories in an interesting way.

Faculty members who join as lecturers can exchange knowledge with the community and trainees In a conversation, coordinate the time using the Zoom video conference system, resulting in information and stories about the community where the trainees live.

Strengthening the community in developing local tourist attractions from training this time It is believed that the trainees received knowledge. creativity and the ability to video media production Travel can be published on social networks.

Conclusion

From the results and information All that has been presented It shows that this online training is the training achieved the objectives it had set out very well, but there were some problems and obstacles, such as the trainee's internet system being insufficient because it was learning from video clips, making it difficult to used. The amount of information is large, and there should be a cost or compensation for the trainees to help alleviate the burden. and it is persuasive. Come to study until training is completed. Activities used in training include self-study. There is no group participation, which makes some students feel bored when they finish studying or have studied for a while. Field activities (workshops) should also be organized to ensure the continuity of training.

In this training, there are the work and training organizers would like to thank you. Human resource development project of the country (reskill, upskill, or new skills) to have work and prepare for work in the future. After the outbreak of the coronavirus 2019 (COVID-19), the budget was allocated to fund management. Training gives knowledge and benefits in every sector. trainees, lecturers, organizers, and universities who have had the opportunity to publish their work or participate in community development together.

A Comparison of High School English Textbooks in Japan, Korea, and China: Do the Differences Significantly Affect the Outcomes?

Anne C. Ihata, Musashino University, Japan
Takaaki Ihata, Nihon University, Japan
Mou Anyi, Musashino University, Japan

The Asian Conference on Education 2023
Official Conference Proceedings

Abstract

English education in Japan, Korea, and China may display certain similarities, since they are all fundamentally monolingual societies, where citizens may not have much need for English on a day-to-day basis. They are all now keen to take advantage of the opportunities of globalization and recognize the importance of English in this context. In all three countries, the English education system has recently moved towards more communicative approaches, with Korea perhaps originally leading the way in this (Yuasa, 2010). Japan still tends to rank lower on international measures for its citizens' English skills than China or Korea (So, 2019), despite promoting English language classes in primary schools since 2011. In China and Korea, compulsory English lessons begin in the 3rd grade of primary school, but not until fifth grade in Japan (as a fully-assessed academic subject, although "English Activities" classes begin in third grade since 2020). Textbooks and other learning materials play a significant role in school education, and their capacity to stimulate and motivate learners is especially crucial at the high school stage when students are reluctant to risk losing face in potentially embarrassing communication activities. So, if other conditions are similar, it seems possible that these materials may differ in some important way(s). This is the focus of our study, comparing typical high school textbooks from the three countries from the aspects of volume of English words used and sentences per book and per chapter, and the amount of visual illustration of all kinds relative to written text.

Introduction

English education in Japan, Korea, and China may display certain similarities, since they are all fundamentally monolingual societies, where many ordinary citizens may not have much need for English on a day-to-day basis. They all use non-alphabetic writing systems (although there are significant differences between them, which will be mentioned later in this paper). All three countries are now keen to take advantage of the opportunities of globalization, particularly in the areas of business and education, and recognize the importance of English in this context. In all three, the English education system has recently moved towards more communicative approaches (Kwon, 2009; Liu, 2009: Yamaoka, 2009) with Korea perhaps originally leading the way in this (Yuasa, 2010). Japan still tends to rank lower on international measures for its people's English skills than China or Korea (So, 2019), despite promoting English language classes in primary schools since 2011. Today, compulsory English lessons begin in the 3rd grade of primary school in China and Korea, but not until fifth grade in Japan (as a fully-assessed academic subject, although "English Activities" classes have begun in third grade since 2020).

Textbooks and other learning materials play a significant role in school education, and their capacity to stimulate and motivate learners is especially crucial at the high school stage when students are reluctant to risk losing face in potentially embarrassing communication activities. The materials' content can be an important source of information about the target language speakers and their cultures (Liu, 2009; Igarashi, 2022; Igarashi, 2023), and this is a key feature to appeal to young people learning English in a foreign language classroom, particularly where not all students have easy access to electronic devices and internet resources, or the inclination to make use of them to further their own learning (see Mao, 2020, on differences between urban and rural students' use possession and use of technology).

China has, undoubtedly, struggled most to overcome disparities in educational resources and achievement, owing to its huge geographical area, but much progress has been made since 1986, when the Compulsory Education Law was promulgated (China.org, n. d.). So, if other conditions are similar, it seems possible that these materials may differ in some important way(s). This is the focus of our study, comparing typical high school textbooks from the three countries from the aspects of volume of English words used per book chapter, number of sentences per page and per chapter, amount of visual illustration of all kinds relative to written text, and any special features that may be relevant.

It should be emphasized here perhaps that this is essentially an exploratory study, which should, hopefully, provide material or direction for further more in-depth research into relevant features.

1. Rationale for the Study

Japan ranked 80th out of 111 countries and regions whose native language is not English on the "English Proficiency Index" compiled by Switzerland-based EF Education First in 2022 (EF EPI, 2022). This placed it in the "Low Proficiency" bracket - "Low" being the second lowest of five groupings based on rank - and Japan's ranking is two places lower than the previous year, although the average score improved from 468 to 475. EF refers to "Japan's steady decline in English proficiency." This seems a little hard on Japan, although the

situation is shown quite dramatically in Fig. 1 below. Furthermore, the EF 2023 rankings indicate a further decline, to 87th out of 113 countries, with a score of only 457.

China, although also in the "Low" category at 62nd in 2022, with a score of 498, ranked 82nd in 2023, with a score of 464, and South Korea at 36th (score 537) in 2022 and 49th in 2023 with 525 (but still in the "Moderate Proficiency" level, according to the EF organization). Both continue to outperform Japan.

Figure 1: Japan's EF English Proficiency Ranking (Source: Nippon.com)

The Netherlands took the top spot in the 2022 rankings (a lead it maintained in 2023), followed by Sweden in second and Norway in third place. Obviously, learners in these countries are in a very different position from students in Asian countries due to linguistic and cultural factors as well as geographical proximity to English-speaking people and environment. In fact, Asia's regional average dropped slightly in 2022 and again this year, although three countries (Sri Lanka, Mongolia, and Kyrgyzstan) improved significantly and two more (Hong Kong and Vietnam) moved into a higher proficiency band in 2022. China and the Philippines were the main drivers of the declining regional score. Japan placed 15th among 23 Asian countries and regions, with South Korea and China in 5th and 14th positions respectively (China was 6th in 2022). Much of the decline in the 2023 rankings can be ascribed to the effects of COVID-19, which have disproportionately impacted the very significant 18-20 year old age band. Study abroad programs were cancelled and motivation severely affected.

While the EF Index does suffer from some shortcomings in terms of its methodology since instead of testing the level of English proficiency in the general population, it tests the level of English of those who self-select (Gazzola & Mazzacani, 2017), we feel that it does provide a measure that allows comparisons to be made. All the major internationally-recognized measures of English proficiency also suffer from the same biases, but provide at least some window on the actual situation, even if we need to be cautious about seeing their figures as representing the whole picture.

As far as basic teaching materials are concerned, in high schools across Japan, the use of government-approved textbooks is mandatory and most of the language input students receive is from these textbooks (Sugiura et al., 2020). This would appear to mirror quite closely the situation in China although in South Korea both prescribed and non-prescribed textbooks seem to be in common use (Song, 2021). Even in Japan, there is an element of choice available in that MEXT provides a list of over twenty books to choose from for 2nd-

year high school English Communication classes - 24 for academic year 2023 (MEXT, 2022). In South Korea and China, too there are different offerings from various publishers, although Yuasa (2010) does mention that there may not be such a wide selection available in South Korea. This appears to be similar to the situation in China (Mao, 2023).

MEXT's control of textbook content and format has been criticized over the years, and as recently as this year, Igarashi (2023) draws attention to the fact that the ministry's own language education policy of developing learners' intercultural communicative competence is not sufficiently reflected in the nine textbooks she examined from three different publishers.

2. Some Previous Studies Related to Textbooks in the Three Cultures

According to Yuasa (2010) aims differ for Korean and Japanese textbook producers, with the Korean materials' focus being on enabling learners to express themselves and exchange ideas in English, whereas their Japanese equivalents aim to stimulate students' interest in foreign culture and generally encourage a "communicative attitude".

Yuasa found that primary school children in Korea were much better prepared for English lessons at the higher level they would encounter in junior and senior high school than Japanese children of the same age, their English abilities already showing a noticeable difference which was linked to the level and types of language activity in their textbooks (Yuasa, 2010: 149). However, this difference was not observed at the senior high school stage, although the gap between junior and senior high school materials was larger in Japan.

All textbooks in the three countries emphasize the importance of learning about foreign cultures as well as language knowledge, and all of them include some focus on their native cultures in contrast to others. However, the Chinese seem to be more at pains to make sure that there is sufficient mention or illustration of Chinese elements. Lu and Wang (2020) state quite clearly that "The Chinese elements are a symbol and spiritual image, and a component of world element diversity". Lu and Wang do stress that they are concerned with improving teachers' cultural awareness in the context of English teaching and raising students' cross culture teaching and learning, but conclude that the proportion of Chinese elements presented should be increased. This was also supported by Shen (2019), who first describes how textbooks in the 2000s still tended to focus on language knowledge and cultural content was either lacking or not well organized. She expresses the view that EFL learners in senior high school need to "acquire a profound knowledge of culture in relation to native culture and target culture" in addition to a good command of linguistic knowledge. It is her belief that too much importance has been placed on target culture. In 2009, Liu was concerned about how the (then) new curriculum goal of Cultural Awareness – to include cultural knowledge and understanding, and also competence in cross-cultural communication – could be successfully implemented throughout China in view of the situation in which curriculum and textbooks changed, but not teaching methods, nor methods of assessment. His concern about the quality of teaching in rural versus urban areas, even though the same basic textbooks are set, is echoed years later by Mao (2018).

Kwon (2009) also mentions the significance of teacher training and abilities, referring to Korean English education. He does not consider that the government's solution of hiring English conversation instructors for schools would necessarily improve the standard of teaching, since individuals without formal teaching qualifications could be employed. Chang and Owada (2021) compared cultural diversity and cultural identity included in English

textbooks in Korea and Japan. They found that "both countries experienced cultural diversity through English education and introduced their cultural pride to Western culture to realize the goal of strengthening global capabilities." They believe that English textbooks in both Korea and Japan are still firmly oriented toward American and British cultures. They also observe that there is a disconnect in terms of featuring cultural sections, but failing to relate them to the learners' real-life experiences. They found that Japanese and Korean textbooks had similar formats and introduced cultural contents from many countries.

Both Chung and Owada (2021) and Igarashi (2022) advocate the need for textbooks to extend the range of English norms to include more diversity in varieties of English, especially from the outer/expanding circle. Igarashi quotes the MEXT (2012) goal of preparing learners to become part of a globalized world that is both linguistically and culturally diverse.

This brings us to our main question which concerns the relationship between the various forms of content and format of the textbook and outcome in terms of international rankings mentioned above.

3. Method

First, we must address the selection of textbooks for examination. Due to time restraints, affecting the availability of books and influenced by the fairly intensive nature of the study carried out, it was only possible to examine one textbook each from China and South Korea, as described here.

Two Japanese textbooks were examined, partly due to greater availability, but also since the Japanese materials were potentially contributing to poorer outcomes for their users than either the Korean or Chinese materials. The selection was based on comments from an experienced Japanese high school teacher (Igari, 2023) who has had the opportunity to use and assess various textbooks over her already long career. We chose to use those that were recommended, although our evaluation of some points might differ. The two books were *Crown: English Communication II,* published by Sanseido (Shimozaki, 2022), and *Vista: English Communication II*, also coincidentally published by Sanseido (Kaneko, 2022). *Crown* is a well-established series of English textbooks that have been employed in high schools for a very long time (we have in our possession a 1997 *New Crown* series, for example).

The Chinese textbook, *General English Textbooks (Compulsory), Level 2*, published by a division of the People's Education Press, was selected mainly through the suggestion of Anyi Mao (one of the authors) and proved to be more readily available than other officially published textbooks. The Korean choice was also based on the information provided by a former Korean student one of us taught. From Song's article, it appears that this is actually one of the non-prescribed books that is very widely used in the country (Song, 2021).

We began by considering relatively obvious points, including the appearance of the book covers and their size, and then counted and compared the number of units/chapters and the numbers of words and sentences used in each unit. We categorized words and sentences as carrying "main content" or serving purely "instructional" purposes, such as "Target", "Activity" or "Exercise". Words only listed in vocabulary lists in footnotes or side bars were not counted, although titles were included and captions with pictures, but not words that were part of a graphic illustration's design. Common abbreviations, such as *etc.* and *e.g.* were

counted as one word. Dates, such as *March 25th 1915* were counted as three words, and personal names were counted only once when they appeared repeatedly as the participants in a scripted model conversation. Sentences was taken to mean only full grammatical sentences and not parts of sentences as appearing in the exercises, unless these were readily completed with one easy word or with words/phrases readily available on the same page. We also quantified as accurately as possible the percentage of pages given over to illustration, pictorial or diagrammatic (which was roughly calculated separately, although later combined for statistical assessment).

We also further noted any special characteristics in terms of unit/chapter content, inclusion of audio scripts for listening material, extra practice materials in addition to the regular units/chapters, and layout.

4. Findings and Discussion

It must first be made clear that, although we were able to calculate some statistics for the purposes of assessing any potential relationships, our sample of only four textbooks could not hope to provide us with would be reliable enough to expect genuinely significant correlations to be found. Our aim was to examine the data in terms of word and sentence totals, the average number of sentences per page and the use of pictures and diagrams to see if such contents were likely to affect students' achievement in terms of EF EPI rankings or TOEIC scores.

The initial findings from the word and sentence counting can be found in Table 1 below, which for the sake of brevity does not include any of the category of "instructional" language.

Although the number of pages per book and the average number of sentences per page appear to be very obviously different, it must be borne in mind that the size of the pages was different for each country's textbooks. The Japanese books were both B5 format, as were other Japanese textbooks we did not examine, while the Korean textbooks we saw were all A4, including this one. The two sets of Chinese materials we were eventually able to obtain, including the one we analyzed, were an unusual slightly elongated A4 size. So, while it is a fact that the Chinese book had by far the highest average number of sentences per page, the pages were much larger than those of the Japanese textbooks.

Title	Pages	Words	Sentences	Av. Sentences per Page	% of Pages Devoted to Pictures	% of Pages Devoted to Pictures incl. Diagrams	EF (2022) Score	EF (2023) Score	TOEIC Score (2022)		
									Listening	Reading	Total
Vista：English Communication Ⅱ	98	8973	1018	10.39	20.07	20.69	475	457	309	252	561
Crown: English Communication Ⅱ	168	28151	2445	12.75	28.27	29.73	475	457	309	252	561
High School English Ⅰ	132	22135	1693	12.83	24.42	25.26	537	525	374	301	675
General English Textbook (Compulsory) Level 2	60	16548	1334	22.24	19.03	19.03	498	464	286	262	548

Table 1: Basic Findings
("Words" and "Sentences" in this table do not include instructional language.)

Our Japanese high school teacher informant (Igari, 2023) liked the *Vista* textbook because it had the vocabulary list in a side bar next to each reading passage, as well as at the end of the book, but it does mean that with the addition of footnotes the pages look rather crammed compared to the Chinese and Korean books, or even the *Crown* textbook. She found that the

Crown series was better suited to higher level students, especially those preparing to study English at university, since it was more intellectually stimulating. The *Vista* reading passages seemed especially designed for easier understanding, being printed in a larger font, with all instructional language being limited to either single word headings or two-word imperatives, such as "Study it!". This textbook also contained a considerable amount of Japanese language on every page, including the labeling of countries on maps. *Crown*, in contrast, used side bars and footnotes sparingly, and made little use of Japanese. There are many pages without either of these features. On the other hand, *Crown* makes more use of tables and charts to present background information. *Vista* exhibits considerable regularity in page layout from unit to unit, which particularly affects the style and quantity of illustrations, unlike Crown which shows regularity in the first half of the book, but variety in unit length in the latter half (presumably when students are becoming accustomed to the format.) This allows for more variety in layout where use of illustrations is concerned, especially in Unit 6, first in the second half, which contains a special double-page spread in full color on the topic of the Sagrada Familia (Shimozaki, 2022: 110-111). *Crown* also features focused exposure to words and cultural concepts from languages other than English in Unit 1 and an optional extra lesson, which consists of a reading passage and comprehension questions.

Both *Vista* and *Crown* contain Appendices with vocabulary lists and the scripts for listening exercises. *Vista* also has four additional reading passages and *Crown* has model answers for the writing tasks. The vocabulary lists in *Crown* are organized as all vocabulary in each unit, functional expressions by the unit, and whole text vocabulary, which seems designed to make accessing words and expressions for later revision or further use easier. The number of units was similar, with eight in *Vista* and ten in *Crown*.

High School English 1 and *General English Level 2* had a smaller number of units, six and five, respectively, and in each textbook the length of all units was unvaried. *High School English 1* makes little use of Korean and *General English Level 2* contains almost no Chinese. This indicates an approach based on having learners see English as a fully functioning language from the outset, not simply a subject of study in school, which may be of limited usefulness outside the classroom. (Also largely true of the *Crown* textbook.) Both exhibit variety in terms of layout and size of illustrations, breaking up any monotony in page appearance.

In *High School English 1*, information is often arranged in the form of tables, perhaps for quick access, or to make it easier to remember. There is a "Click on Culture" section at the end of every unit, which focuses on aspects of Korean and other cultures. An especially noticeable feature in the Korean textbook is that web addresses are included for the sources of information in the main reading passages and "Click on Culture" sections in every unit. This suggests that students are encouraged to further their own research into the topics and also be used to the idea of needing to cite sources in their own writings. At the end of this textbook, there is a special lesson based on a movie – mainly dialog and listening comprehension, that is exercises using language. The Appendices contain scripts for listening activities and answers to all exercises, and full details of all sources for the "Click on Culture" information and photos used.

General English Level 2 is unique in featuring a video component as an integral part of every unit, at the end of each unit, and in having an integrated workbook at the end of the main text which contains a wealth of extra practice material for each unit, especially grammar, reading and writing. Unlike the other textbooks, the Appendices do not contain any audio scripts or answers to exercises. They do contain a general vocabulary list, lists of words and expressions

used in each unit, points of grammar, and a list of irregular verbs. There are also notes for each unit, explaining particular expressions, but mainly concerning background information.

Potential Correlations

	EF (2022) Score (Pearson's r)	EF (2023) Score (Pearson's r)	EF Main Indications (All results non-significant)	TOEIC Score (2022) (Pearson's r)	TOEIC Main Indications (All results non-significant)
Words	0.2028	0.2549	Small positive relationship	0.2806	Small positive relationship
Sentences	**-0.0755**	0.03375	Very small positive relationship	0.1121	Small positive relationship
Av. Sentences per Page	0.152	**-0.1219**	Very small negative relationship / Large positive relationship	*-0.3164*	Medium negative relationship
% of Pages Devoted to Pictures incl. Diagrams	**-0.0208**	0.1574	Small positive relationship	0.2801	Small positive relationship

* Figures in bold indicate a very small negative relationship, but this is viewed here as something of an anomaly, probably related to the very small number of cases being compared. The TOEIC result (in italics) is much more remarkable, however.

Table 2: Initial Examination for Potential Correlations with EF Rankings/TOEIC Scores

	EF (2022) Score (Pearson's r)	EF (2023) Score (Pearson's r)	EF Main Indications (All results non-significant)	TOEIC Score (2022) (Pearson's r)	TOEIC Main Indications (All results non-significant)
Av. Words per Unit	0.4606	0.6279	Medium → Large positive relationship	0.5158	Large positive relationship
Av. Sentences per Unit	0.7099	0.5991	Large positive relationship	0.4887	Medium positive relationship
Av. Sentences per Page	0.152	**-0.1219**	Small positive relationship → Very small negative relationship	*-0.3164*	Medium negative relationship
% of Pages Devoted to Pictures incl. Diagrams	**-0.0208**	0.2108	Very small negative relationship → Small positive relationship	0.2801	Small positive relationship

* Figures in bold indicate a very small negative relationship, but this is viewed here as something of an anomaly, probably related to the very small number of cases being compared. The TOEIC result (in italics) is much more remarkable, however.

Table 3: Examination for Potential Correlations with EF Rankings/TOEIC Score: Average Words and Sentences per Unit

First, we tested for normal distribution using the Shapiro-Wilk test, which indicated a fairly normal distribution, although with the small number of groups compared caution is advisable. We calculated for both total word and sentence counts for the whole books and for the average number of words and sentences in each chapter or unit. As can be seen from Tables 2 and 3, there were no statistically significant results, but several noticeably more positive results in the case of average words and sentences per unit indicated potential relationships, which would require further investigation with a larger data set. The results for "Average Number of Sentences per Page" seem most unreliable, given how they vary from negative to positive on the different measures. The most promising relationship appears to be between "Words" and "Average Words per Unit" and the EF and TOEIC scores, which reinforces the idea of a link between exposure to volume of language and acquisition, echoing Kim and Krashen's advice on extensive reading of over 25 years ago (Kim & Krashen, 1997). Exposure to more sentences is also beneficial, although a weakening effect which we originally observed for the inclusion of instructional language is likely to indicate that, in order to be of benefit, the exposure should be to full grammatical sentences that carry more meaning than only basic one- or two-word instructions. The effects for pictures seem to be quite positive overall, and may be increased

through encouraging students to interact with the content of illustrations and make connections with the information presented in other forms (See Ihata, 2017).

Conclusions

As expected, we cannot draw any firm conclusions from the present study, but it has been a useful exploration to suggest areas for further investigation and to encourage Japanese schools to make efforts to engage their students more actively in their own learning. Certainly, South Korea is achieving better outcomes for its English education than either Japan or China, perhaps as a result of its tendency to emphasize the practical use of the language through more output activities and an active learning approach that is already well-established in its materials. However, now that elementary schools in Japan are also focusing on English education more earnestly, we may begin to see improvement, especially as the effects of the coronavirus pandemic recede and study abroad programs and international travel in general resume and recover, increasing possibilities for university students and other young people in particular. For language learning of any kind to be effective, it needs to be seen as meaningful, and not only for passing tests (although that can also motivate some learners). Children and young people are naturally curious about the world around them and, increasingly, the world outside their immediate surroundings. Expanding the range of cultures from a focus on native anglophone countries may be a good way to stimulate English learning, as some researchers mentioned here have pointed out.

Employability on Self-Perception Among IT Students: The Effects of Intrinsic Motivation and Academic Performance

Waraluck Maprasom, King Mongkut's University of Technology Thonburi, Thailand
Surachai Suksakulchai, King Mongkut's University of Technology Thonburi, Thailand
Prapassorn Wongdee, King Mongkut's University of Technology Thonburi, Thailand

Abstract

The primary objective of higher education in Thailand is to prepare students for future careers. However, some students are uncertain about their ability to find employment. Therefore, this study investigated the relationship between intrinsic motivation, academic performance, and self-perceived employability, and aimed to create a predictive model of IT students' self-perceived employability. The sample group for the study comprised 420 students from the Department of Information Technology, Faculty of Business Administration, Rajamangala University of Technology, from nine campuses across Thailand. Data was collected using online questionnaires and analyzed using Pearson's correlation coefficient and multiple regression analysis. The results showed that intrinsic motivation, academic performance, and self-perceived employability were positively correlated. The multiple correlation coefficient was between 0.75 and 0.95. Additionally, it was found that intrinsic motivation and academic performance can predict students' self-perceived employability with a significance level of 0.05. The findings of this study suggest that the teaching and learning process should be designed to improve intrinsic motivation and academic achievement. This may be accomplished through providing students with stimulating and engaging learning experiences, as well as chances to learn in a supportive setting. As a result, students may gain the confidence they need to find a job after graduation.

Keywords: Intrinsic Motivation, Academic Performance, Self-Perceived

Introduction

Rajamangala University of Technology (RUT) is a public university that was established in 1975 under the Rajamangala University of Technology Act of 2005. Since January 18, 2005, it has been under the supervision of the Office of the Higher Education Commission and comprises nine campuses across all regions of Thailand (Act Rajamangala University of Technology, 2005). The university's mission is to provide quality education that equips graduates with academic knowledge and practical skills to meet the demands of various sectors. Information Technology (IT) programs, such as business computing, digital business information systems, and others, are offered at all RUT campuses.

According to a survey by the Office of the Permanent Secretary for Industry, Science, Research, and Innovation in 2022, 73.96% of the respondents reported being employed, 2.91% were continuing their education, while 23.12% were unemployed (Office of the Permanent Secretary, M. o. H. E., Science, Research and Innovation, 2023). However, the employment outcomes of 10,542 RUT graduates in the past five years showed that 70.54% secured employment or self-employment within one year, 3.58% pursued further education, while 15.88% remained unemployed (Isan, Student Development Division Rajamangala University of Technology, 2023) This data suggests that despite most students finding a job, a considerable proportion of graduates failed to do so, which implies a waste of their educational investment (Coetzee et al., 2019).

The issue of graduate unemployment can be partly attributed to their low self-confidence in their abilities (Ergün et al., 2021) and their perceived skill gap with employer expectations (Coetzee et al., 2019). Some factors that can contribute to this lack of self-confidence are insufficient knowledge and skills in their field of work (Abelha et al., 2020), low socioeconomic status (Kassa et al., 2022), and lack of critical thinking application from academic studies. This can result in students having low self-perceived employability for the workplace (Yau Hsiung Wong, 2019).

One of the main goals of higher education is to prepare students for their future careers. Therefore, it is essential to implement educational strategies that foster the development of knowledge, skills, and relevant professional experiences before entering the labor market. One crucial indicator of student development is self-perceived employability (Räty et al., 2019). Self-perceived employability is the extent to which a student believes that they have the skills, knowledge, and abilities to secure and retain a job (Harry et al., 2018) and perform effectively according to the requirements of the organization (Ergün et al., 2021). Based on the literature, two factors affect employability outcomes: intrinsic motivation and academic performance.

Intrinsic motivation is an internal drive that stems from personal characteristics such as curiosity, autonomy, satisfaction, and enjoyment, which motivate individuals to engage in various activities voluntarily (Ryan & Deci, 2000; Richard & Ryan, 2020). Intrinsic motivation arises from one's own interests without expecting external rewards or pressures, involving interest, enjoyment, challenge, and personal exploration (Harter et al., 1981; Amabile et al., 1994; Deci et al., 1985).

Individuals who are highly intrinsically motivated tend to approach their tasks with enthusiasm, commitment, and accountability, and the drive to pursue goals without depending on external regulations (Buzdar et al., 2017).

Another important factor that can affect self-perceived employability is academic performance. Academic performance refers to the degree of satisfaction with educational outcomes that align with future career aspirations (Rothwell et al., 2008). Academic performance can be measured by grades or scores, attitudes (Alani et al., 2021) and readiness to learn through various types of assessments, such as performance, knowledge, skill, and self-assessments (Ergün et al., 2021).

Based on the above information, the present study aims to investigate the relationship between intrinsic motivation, academic performance, and self-perceived employability of IT students, and to create a predictive model of IT students' self-perceived employability of IT students at RUT's Faculty of Business Administration in Thailand using intrinsic motivation and academic performance as predictor variables. These variables are worth investigating because they can influence IT graduates' career decisions, satisfaction, and outcomes in a dynamic and competitive labor market. The findings of the study will inform the design of learning processes that enhance students' self-perceived employability and offer a guideline for revising the curriculum and supplementary teaching activities that enable learners to gain confidence and develop essential skills according to their needs and expectations for future employment.

Purpose of the Research

This study has two primary goals: (1) to investigate the relationship between intrinsic motivation, academic performance, and self-perceived employability of IT students; and (2) to create a predictive model of IT students' self-perceived employability. The specific research questions were:

− What are the correlations among intrinsic motivation, academic performance, and self-perceived employability among IT students at RUT's Faculty of Business Administration in Thailand?

− Can intrinsic motivation and academic performance predict self-perceived employability among IT students at RUT's Faculty of Business Administration in Thailand?

Methods

Participants and Procedures

The questionnaire respondents are made up of 420 undergraduate students majoring in IT from nine RUT campuses in Thailand. Table 1 shows the results of the general data analysis of the questionnaire respondents.

	Variable	Frequency	Percent
Gender	male	160	38.10
	female	260	61.90
Age	18-19 years	46	10.95
	20-21 years	222	52.86
	22-23 years old	111	26.43
	For more than 23 years	41	9.76
GPA	Less than 2.01	22	5.24
	2.01 - 3.00	166	39.52
	3.01 - 4.00	232	55.24

(N=420)

Table 1: Demographic profile of respondents

Table 1 shows the demographic characteristics of the respondents. There were 260 female students (61.90%) and 160 male students (38.10%) among the 420 responders. The respondents' ages ranged from 18 to 23 years, with the majority being 20-21 years old (222 students, 52.86%). The respondents' cumulative GPA varied from 2.01 to 4.00, with the majority having a GPA of 3.01 - 4.00 (232 students, 55.24%), followed by a GPA of 2.01 - 3.00 (166 students, 39.52%) and the lowest GPA of less than 2.00 (22 students, 5.24%).

Instrument and Procedure

Instrument Development

The questionnaire was developed by adapting and combining two existing instruments: (1) an intrinsic motivation questionnaire developed by Harter et al., (1981) which was applied by Lepper et al., (2005) to measure intrinsic motivation among university students; and (2) a self-perceived employability measurement questionnaire developed by Rothwell et al., (2008); Wittekind et al., (2010); and Álvarez-González et al., (2017) to assess employability among university students. The questionnaire consists of 61 items characterized by 5 levels of response: 5 = "Strongly agree," 4 = "Agree," 3 = "Moderately agree," 2 = "Disagree," and 1 = "Strongly disagree."

Instrument Validation

The questionnaire was evaluated by three experts in the fields of computer science and education. Content validity indices ranged from 0.60 to 1.00, with an average score of 0.67. After revising the questionnaire based on the experts' recommendations, it was piloted with a sample of 30 participants, who measured three key constructs: intrinsic motivation, academic performance, and self-perceived employability. The Cronbach's alpha coefficients for these constructs were 0.89, 0.79, and 0.93, respectively. According to Table 2, a Cronbach's alpha coefficient of 0.7 or higher indicates acceptable internal consistency (J. C. Nunnally, 1994).

Dimensions	Number of items	Reliability
Intrinsic motivation	16	0.89
Academic performance	4	0.79
Self-perceived employability	13	0.93

Table 2: Cronbach's α value of each dimension

Data Analysis

Correlation Analysis

The relationships between intrinsic motivation, academic performance, and self-perceived employability were analyzed using Pearson's correlation coefficient.

Regression Analysis

stepwise multiple regression analysis was conducted to develop a predictive model for students' self-perceived employability based on intrinsic motivation and academic performance."

Results

Analysis of the relation between intrinsic motivation, academic performance, and self-perceived employability.

Variable	Intrinsic motivation	Academic performance	Self-Perceived employability
Intrinsic motivation	-		
Academic performance	.83**	-	
Self-perceived employability	.95**	.91**	-
Mean	3.72	3.92	3.71
Standard deviation	0.15	0.10	0.12

**p<.001 (N=420)

Table 3: Descriptive data and Pearson correlations for the variables

Table 3 indicates that the variables of intrinsic motivation, academic performance, and self-perceived employability are statistically significantly correlated at the 0.01 level with correlation coefficients ranging from 0.83 to 0.95. The highest correlation coefficient was found between intrinsic motivation and self-perceived employability (r = 0.95), followed by academic performance and self-perceived employability (r = 0.91). The lowest correlation coefficient was found between intrinsic motivation and academic performance (r = 0.83).

A stepwise multiple regression analysis was conducted to create a predictive equation for students' self-perceived employability based on intrinsic motivation, extrinsic motivation, and academic performance.

Model		Unstandardized Coefficients		Standardized Coefficients		t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta				Tolerance	VIF
1	(Constant)	.035	.058			.604	.546		
	IM	.499	.017	.622		29.658	.000	.314	3.182
	AC	.464	.025	.390		18.604	.000	.314	3.182
Dependent Variable: Self-perceived employability $R^2 = 0.942$; Adj $R^2 = 0.936$ F = 3404.039; Sig. = 0.000									

Note: IM = Intrinsic motivation, AC = Academic performance
SPE = Self-perceived employability

Table 4: The standardized regression coefficients of the predictor variables
for students' self-perceived employability

Table 4 presents the standardized regression coefficients of the predictor variables for students' self-perceived employability. The results showed that intrinsic motivation and academic performance explained 94.2% of the variance in students' self-perceived employability (R^2=0.942). The adjusted R-squared value was 0.936 (93.6%). Both intrinsic motivation and academic performance were significant predictors of students' self-perceived employability at the 0.05 level. Intrinsic motivation had a beta coefficient of 0.499. This means that other variable are held constant if the importance of intrinsic motivation is increased by 1 unit, the self-perceived employability will be increased by 0.499.

Academic performance had a beta coefficient of 0.464, indicating that when other variable are held constant if the importance of academic performance is increased by 1 unit, the self-perceived employability will be increased by 0.464. The standardized regression equation for predicting students' self-perceived employability from intrinsic motivation and academic performance was as follows:

$$SPE = 0.35 + 0.499IM + 0.464AC$$

The above model shows that intrinsic motivation had a stronger effect on self-perceived employability than academic performance. Both of these independent variables had significant positive impacts on students' self-perceived employability.

Conclusion

This study investigated how intrinsic motivation and academic performance influenced self-perceived employability among IT students from nine campuses of the Faculty of Business Administration, RUT in Thailand. The results showed that intrinsic motivation was the strongest predictor of self-perceived employability. This finding implies that learning activities should be designed to enhance skills and training that foster intrinsic motivation and self-perceived employability among learners. Activities such as hands-on practice through experiential learning or the use of supplementary learning media to create problem-solving games, for example, can help learners better understand concepts, boost their creativity, and foster their enthusiasm, curiosity, and problem-solving skills (Ryan & Deci, 2000; Richard & Ryan, 2020). These skills are critical for increasing problem-solving, communication, and teamwork (Yau Hsiung Wong, 2019). These skills can help learners enhance their learning outcomes and perceive their employability more positively, increasing their chances of

finding work after graduation. Academic performance was also related to self-perceived employability in a positive way. Self-confidence, enjoyment of learning, motivation, effort, persistence, excitement for learning, and engagement in activities that improve learning experiences are some of the elements that might contribute to strong academic performance (Rothwell et al., 2008). As a result, developing activities that aid in the improvement of skills and learning outcomes, such as problem-based learning (PBL) (Ali et al., 2019), can assist raise self-confidence in work-related abilities (Hayat et al., 2020). This is because activities that enhance learning experiences through research processes and problem-solving in simulated settings allow learners to develop new information on their own, which can boost their confidence in their skills (Sheeba Sardar Ali, 2019; Shi et al., 2021). According to this study, the teaching and learning process should aim to increase intrinsic motivation and academic performance in students (Buzdar et al., 2017). This may be accomplished by offering interesting and dynamic learning experiences as well as fostering a supportive learning atmosphere (Alani et al., 2021). Consequently, students can improve their self-perceived employability and prepare for future careers.

University Student Perception Regarding the Poster Tour Method

Gilberto Mejía Salazar, Autonomous University of Nayarit, México
Julio César Cuauhtémoc Carrillo Beltrán, Autonomous University of Nayarit, México

Abstract

The following research is descriptive in nature and the proposed objective is to show the student's perception of the application of the poster tour method during the school semester. To obtain the sample we used the non-probabilistic sampling technique by convenience, this leads us to define a sample composed of 20 students who make up the group C2-6 of the Accounting career in a semi-school mode, of the Academic Unit of Accounting and Administration belonging to the Autonomous University of Nayarit. For the collection of information, a survey structured by closed type variables was used, without the participation of a pollster (self-administered), that is, automated by means of electronic mail, defining the survey as a data production technique. It should be noted that, within the results obtained, this type of method was effective for understanding, sharing and organizing information, having as main benefit the learning and teaching, demonstrating a greater participation by the student. Likewise, the student's perception is that it is an interactive and attractive method. Finally, the implementation of the poster tour is revealed as a valuable tool that successfully promotes benefits, increasing student confidence and interest in an effective way.

Introduction

The innovation of pedagogical tools that nowadays arise with school and academic changes, the teacher must update the way to implement strategies and methods that detonate the creativity and intellect of the students who are in their school development, this type of methods arise with the need to help teachers and students, allowing to clarify the understanding of the topics covered in class, in the same way, applying interactive teaching and learning.

Thus, the objective of this research is to know the student's perception of the application of the poster tour method during the school semester. That is why, teachers seek ways to have support with tools, techniques and teaching methods that facilitate the understanding of the topics. We can say that, in order to counteract this type of problems, the aforementioned method is made known.

In this way, a poster is more than an article or a simple exhibition, which stands out in another format, it should not be considered as a second-line communication tool. A good poster or poster should lead the audience to use visual logic with hierarchy, which emphasizes the main points of the work (De La Cruz-Vargas et al., 2016). Likewise, a poster can be complemented with photographs, graphics, testimonials, among other types of elements, then it can be defined that a poster is a large sheet in which students organize what they have learned, allowing them to share the information with their classmates or audience in general, thus being one of its important characteristics to have feedback and understanding of the topics discussed (Mejía and Kurita, 2023).

Similarly, the poster is a way of exposing and presenting the results of a research or school work, and its use has become frequent with the appearance of its electronic and virtual version, which in its entirety is a method and tool for pedagogical work (Barahona et al., 2023). This new type of teaching requires student-directed classroom activities. In this sense, the educational form exemplifies this model, since it does not allow the integration of skills in an efficient way, but organizes different teaching methods according to these learning (Marchante and Herrero, 2022). Ultimately, a poster is displayed in the context of a scientific or academic event, intended to announce the most relevant results and conclusions of a research work, through a combination of text with images, graphics, tables, forming a high potential communication channel (Giráldez et al., 2016).

Literature Review

What is a Poster

A poster in a scientific meeting is an enlarged graphic representation containing a title, the name of the authors, text and figures explaining a project, a research, an experience (ECOURBAN, n.d.). Therefore, posters are an enormously educational tool and perfectly valid even in the current era in which digital exhibitions predominate through various types of screens and image projections (Garcia-Manso, 2020).

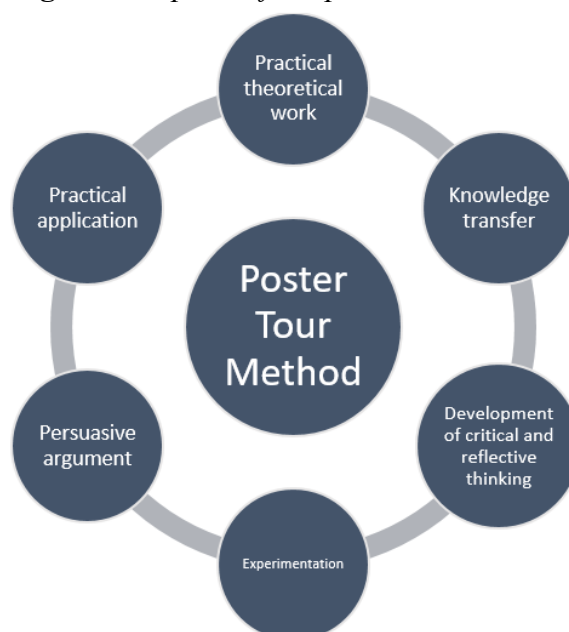
So an effective poster is a highly condensed version of a research paper, consisting mainly of a visual presentation of the data and enough supporting text to provide the appropriate context, interpretation, and conclusions of the research paper (Berbey-Alvarez et al., 2017). It is useful because it shows in a brief and organized way the results of actions and knowledge

developed in each discipline, solutions to problems, new paradigms, teaching strategies, etc. This type of communication is often carried out at conferences and academic events, and is accompanied by brief explanations or oral presentations designed to capture the attention of a specific audience (Pérez et al., n.d.). Likewise, posters are a method of dissemination of scientific knowledge in which relevant and interesting elements are articulated for universal communication in instances of scientific and academic events. In design, it proceeds in the form of a panel and is displayed physically or digitally (Lepez, 2020).

The Poster Tour in Teaching

The poster tour method determines the direct communication with students allowing to transmit in a harmonious and visual way the necessary information, enabling the improvement of understanding, comprehension, discussion and exchange of ideas (Clari et al., 2011).

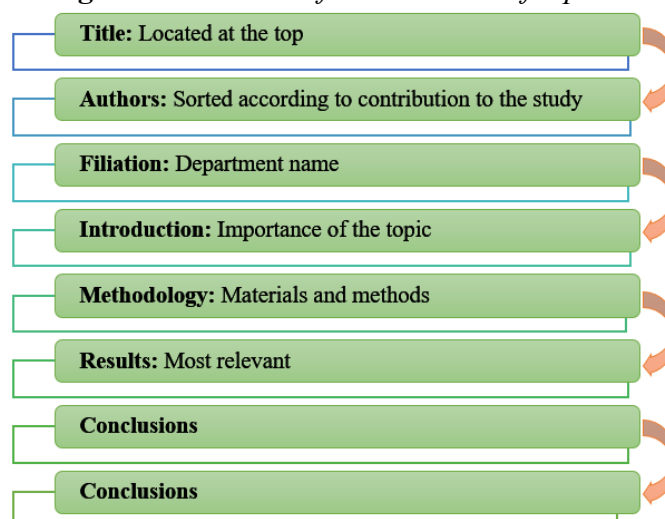
Likewise, the application of this type of method supports teachers and students in the transmission of knowledge, teaching and learning necessary for the development of academic activities, as can be seen in figure 1.

Figure 1. *Aspects of the poster tour method*


Source: own elaboration based on Clari et al. (2011)

From the above, the poster is an alternative to oral communication that has the same purpose but also offers the possibility of presenting studies, projects, experiences that for various reasons cannot be presented as oral communication (ECOURBAN, n.d.). In other words, starting from a basic scheme proposed by teachers, students are given the opportunity to be active constructors, discover, transform and manage their own knowledge, adapting the thematic demands to their own process of capturing and shaping knowledge (Vergara and Sanz, 2011).

It is worth mentioning that, the benefits for authors can establish new connections with other authors who work in similar fields and who have shown interest in what they present in their posters. On the other hand, authors who are not present can examine a large amount of

information quite quickly and can select the most interesting information and discuss it directly with the authors themselves (Conejero and Jordán, 2015). Their visual appeal and familiarity when read allows researchers to make comprehensive presentations and participate in the conversations and discussions that can be generated by the research objects presented (Barahona et al., 2023).


In this sense, the approach allows students to perform analysis of situations and empirical facts, and make predictions about results, experimental tests and structured and integrated conclusions for learning, focusing on the development of reflective, critical and higher-level thinking skills. In this way, it helps to address problem solving, leading students to reasoning, a process that involves innovation, discovery, mismatch with prior knowledge, and construction of new knowledge (Cuesta, 2019).

The Poster as a Pedagogical Tool

With the production of posters, students use a series of technological applications, such as mobile devices, computers, projectors, etc., which can increase their motivation and, therefore, improve their academic performance (Marchante and Sanz, 2021). With this in mind, the poster serves as a work tool and pedagogical support that establishes a link with teachers and students for school work, which encourages constant participation and interaction between work groups.

Accordingly, posters stand out as an alternative that presents research results through a combination of writing, reading and research. Its format facilitates public access to the information, in addition to allowing its reading and comprehension and in-depth review of the content (Rojas et al., 2022). The following are the elements of the structure of a poster (figure 2).

Figure 2. *Elements of the structure of a poster*

Title: Located at the top

Conclusions

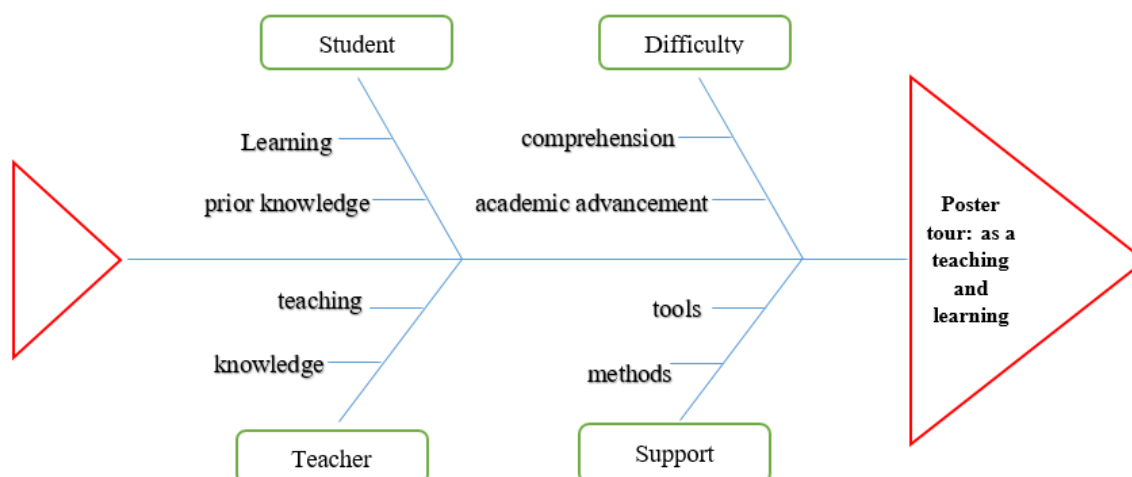
Conclusions

Source: own elaboration based on Pierdant et al. (2019)

Therefore, it is recognized that the poster models visualize and organize the information in such a way that the elements presented are capable of transmitting knowledge for a better understanding of the topics seen, having as a benefit the feedback to students or work groups.

Problem Statement

Starting from higher education, the objectives that are difficult as a teacher when teaching classes is the comprehension or understanding of certain topics seen by the student, making academic progress and performance during the semester impossible. That is why teachers seek alternatives to have support with tools, techniques and teaching methods that facilitate the understanding of the topics. We can say that, in order to counteract this type of problem, the poster tour method is used. To better illustrate the approach to the problem, the Ishikawa diagram (figure 3) is used to illustrate the problem.

Figure 3. *Problem statement represented with the Ishikawa diagram*


Note: That is why teachers seek alternatives to have support with tools, techniques and teaching methods that facilitate the understanding of the topics.

General Objective

The proposed objective seeks to explore and understand students' perception after the application of the poster tour method throughout the school semester.

Main Objectives

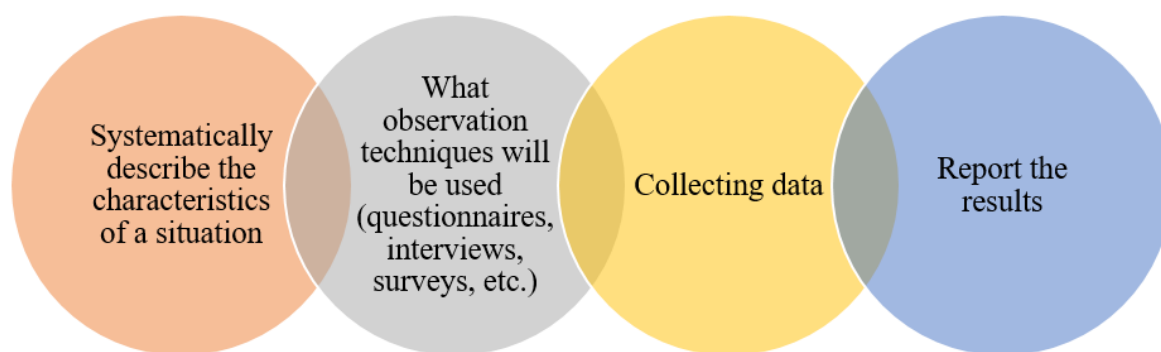
- To learn about the poster tour method
- To inquire about the benefits of the practice of the method in teaching-learning

Research Question

We can say that, from the above, the following research question is proposed: Has the implementation of this method contributed to the students' more active and effective understanding of the topics addressed?

Methodology

This research is descriptive in nature, which means that it aims to systematically address the characteristics of a particular situation. It is important to note that this type of study focuses on the description of situations or events, as illustrated in figure 4.

Figure 4. *Stages of descriptive research*


Source: Prepared by the authors based on Álvarez (2011).

According to Alban et al. (2020), they argue that the research describes some basic characteristics. Homogeneous phenomena, using systematic criteria that make it possible to establish the structure or behavior of the phenomenon. Under study, providing systematic information that can be compared with information from other sources.

Sample

To obtain the sample, the non-probabilistic convenience sampling technique was used, given that the sample is chosen according to the convenience of the researcher, allowing him to arbitrarily choose how many participants can be in the study (Hernández, 2021). This leads us to define a sample composed of 20 students who make up the group C2-6 of the Accounting career in a semi-schooling modality, of the Academic Unit of Accounting and Administration belonging to the Autonomous University of Nayarit.

Research Instrument

For the observation and data collection technique, a survey structured by closed-type variables was used, without the participation of an interviewer (self-administered), that is, automated by means of e-mail, defining the survey as a data production technique, which allows inquiring about the possible topics of the students (Katz et al., 2019).

Data Processing

For data processing, as indicated above, it was automated by means of email, where the survey was presented through Google forms, allowing data collection in the form of a survey (Faculty of Economics and Business, n.d.). Providing the relevant statistics for this research, where the results are presented in the form of graphs, performing their corresponding interpretation and analysis.

Results

Did you know the Poster tour method before, it is observed that 80% of the students do not know the referred poster tour method, while 20% refer that they already knew this method, in addition, the total (100%) of the students responded that the application of the method during the classes was easy for them, as shown in figure 5.

Figure 5. *Did you know the Poster tour method before?*

Is the practice of this method effective, students responded that the most effective practice focused on understanding information (100%), while 85% said that it is useful for sharing information, followed by 70% who mentioned that it is a method to achieve an optimal organization of information, as shown in figure 6.

**Figure 6.** *Is the practice of this method effective for?*
What benefits did the Poster tour method grant you, the student determines that learning-teaching (95%) is the most important benefit within higher education, while feedback (75%) and collective work (75%) follow the same trend as shown in figure 7.

Figure 7. *What benefits did the Poster tour method give you?*
How do you define this type of method? 75% of the responses consider this method to be interactive, 70% consider it attractive and 65% consider it to be effective and innovative, as shown in figure 8.

Figure 8. *How do you define this type of method?*
From the above, the practice of posters has shown very positive results in terms of students' commitment, interest and performance. It has contributed to the improvement of skills and attitudes such as information search and selection, synthesis capacity, independent work, group work inside and outside the classroom, oral and written communication, optimal time-space planning and good academic practice (Sánchez et al., n.d.).

Discussion

In this way, and following up on the research question: Has the implementation of this method contributed to students acquiring a more active and effective understanding of the topics addressed, the total (100%) of students surveyed gave a favorable and accurate opinion about the poster tour method, since they assure that this type of pedagogical tools promote interaction and active understanding in their studies and academic development, being a method of support for both teachers and students.

Similarly, the understanding of information and optimal organization are the most effective attributes for the practice of this method in students without leaving aside problem solving, i.e., the use of the poster tour as a tool for the effective presentation of research and academic results has a stable level of acceptance, being this a way to communicate and share in detail in the exhibitions (Almiñana et al., 2006).

Likewise, this method is defined as attractive, since it gives the opportunity to work the research and the proposed problems in a fluid way, having the interactive attribute, which defines the way of working as a team, consolidating the ideas of the members, who in a detailed way collaborate for the resolution of the practice or proposed research topics, giving the opportunity to be an innovative pedagogical tool for the learning and teaching of students, providing participation and critical thinking.

It should be noted that the strength of this method is developed in the feedback, which allows students to level their performance and performance within the educational institution, allowing solutions for the understanding of certain topics, in addition to carrying interactive learning dynamics that promote student motivation, since this type of method establishes the

dissemination of knowledge in society meetings and academic events (Castro-Rodríguez, 2022).

The use of posters as didactic tools has been suggested as a means to promote relevant skills in the professional training of students. The benefit of this approach is the social aspect, as it grants opportunities for academic networking, including teachers and other professionals (Canales and Schmal, 2013).

Conclusion

According to the results of the research, it can be observed that the application of the poster tour method is effective among students for the comprehension of information on certain topics discussed or seen during the semester. In the same way, the sharing of information by means of the poster generates motivation for the investigation of the proposed topics and in the resolution of problems derived from certain presentations, managing to capture the attention of the students.

Likewise, of the benefits shown and derived from the research, there is the learning-teaching, which proves to be a method for teachers and students, in support of academic and extracurricular activities, having also necessary and timely feedback for the fulfillment of the proposed objectives, another benefit is the collective work, since it teaches students the integration for the resolution of group activities.

In this way, the perception of the poster tour method is defined as an interactive method, which manages to implement the attractive and innovative, which effectively draws the attention of students, transforming the educational interaction, and also the way of giving objective and interactive classes. So from this, we can answer the research question posed: With the implementation of this method was acquired a more active and effective understanding of the topics covered by the student, in the affirmative can be answered, since the method applied during the semester was very useful and in the same way the student showed significantly an advance in their school activities, allowing this to develop skills and abilities that positively impact the university students, leading to another level of understanding the activities presented by the teacher, acquiring critical thinking and better participation. Finally, the implementation of the poster tour is a method that associates benefits to achieve the proposed objectives, which in an appropriate way generates greater confidence and interest in the students.
