Validate Standards and Criteria Through Broader Stakeholder Engagement: Strengthen the validation process of the proposed standards and criteria—derived from leading international frameworks. Broader participation will help identify additional areas for improvement and provide a more comprehensive understanding of how Philippine HEIs align with international benchmarks.

Continue Benchmarking to Drive Continuous Improvement**:** The development of standards and criteria should be viewed as an evolving process. Ongoing benchmarking with international accreditation bodies should go beyond mere comparison and aim for continuous improvement and institutional maturity, fostering a culture of excellence and global competitiveness in higher education.

Promote Further Research in Quality Assurance and Accreditation: Encourage more in-depth studies on quality assurance and accreditation practices across HEIs. This should be complemented by sharing of best practices and promoting open data access to support collaboration, transparency, and informed decision-making within the higher education sector.

Beyond Coding: Reframing Vocational Education Through South Korea's ICT Education Policy and the Varieties of Capitalism Framework

Seri Yoon, Waseda University, Japan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

In 2018, South Korea implemented mandatory coding education in primary and lower secondary schools as part of a national education reform. While this policy is often celebrated as a forward-thinking strategy aligned with SDG 4.4, which aims to increase access to technical and vocational skills, it also reflects the country's unique industrial and economic structure, heavily shaped by export-driven conglomerates and a coordinated market economy model. Using a qualitative method, this study draws on policy documents, national curriculum guidelines, government reports, and economic development strategies to examine how South Korea's coding education policy reflects the structural characteristics of its coordinated market economy. Through document analysis interpreted within the Varieties of Capitalism framework, the research explores the institutional logic behind vocational education policy formation and its implications for the realization of SDG 4.4. By adopting Varieties of Capitalism (VoC) as a framework for analyzing education policy, this study contributes to a more structurally grounded understanding of skills development, strengthening the case for aligning educational reforms with broader socio-economic systems. It further contributes to global education discourse by questioning the uncritical adoption of high-tech vocational models and encouraging more context-specific strategies that reflect each state's economic and institutional configurations toward achieving the shared goal of SDG 4.4.

Keywords: Korean education policy, vocational education policy, ICT education, education and development, SDG 4.4

Introduction

Over the past decade, South Korea has actively integrated Information and Communication Technology (ICT) into its national education reform. In 2018, the government implemented mandatory coding education in primary and lower secondary schools. This initiative was promoted as a forward-thinking strategy that prepares youth for a digital economy and supports the global commitment to Sustainable Development Goal (SDG) 4.4. SDG 4.4 aims to substantially increase the number of youth and adults with relevant technical and vocational skills for employment, decent work, and entrepreneurship by 2030 (United Nations, 2015). While coding education appears to support this goal, the policy also reflects deeper structural characteristics specific to South Korea's political economy.

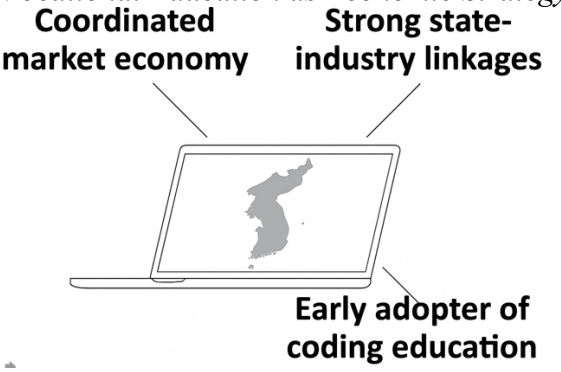
South Korea's approach to vocational education policy has been shaped by its position as a coordinated market economy. This model emphasizes long-term collaboration between the state and industry, strong linkages between public and private actors, and a focus on export competitiveness (Hall & Soskice, 2001). Educational strategies are not developed in isolation. They are tied to broader industrial goals and institutionalized mechanisms of labor-market coordination. Chaebols are large conglomerates that dominate the Korean economy. They have historically shaped the types of skills the state promotes through its schooling system (Kim & Kim, 2021). These dynamics raise the question of whether coding education in Korea functions simply as a neutral tool for digital literacy or whether it also reproduces institutional logics embedded within the coordinated market model.

Existing research on ICT-based education in Asia often focuses on access, infrastructure, or innovation. However, fewer studies have interrogated how vocational education policy reflects and reproduces national economic structures. This gap becomes more salient as global education agendas increasingly endorse high-tech vocational programs without attending to structural differences among countries. As more governments pursue digital education policies under SDG 4.4, it becomes important to understand the political and economic context that shapes policy design and implementation.

This study critically examines South Korea's mandatory coding education policy as a case of vocational education reform. It adopts the Varieties of Capitalism (VoC) framework to explore how the state's industrial logic is embedded within education planning. The study draws on curriculum guidelines, policy documents, national development strategies, and government reports. These materials are analyzed through a qualitative document analysis method that focuses on institutional features and their alignment with the coordinated market economy model.

Rather than treating ICT education as an isolated innovation, this paper situates coding education within South Korea's long-term strategy to maintain competitiveness in global technology markets. By doing so, the study provides a structurally grounded understanding of how educational reforms intersect with national economic systems. It also offers implications for other countries seeking to implement vocational and ICT education under the banner of sustainable development.

Methodology



This study adopts a qualitative research design that treats education policy as a window into the broader political economy of South Korea. The analysis does not approach coding

education as a neutral or stand-alone digital literacy initiative. It conceptualizes the 2018 decision to introduce mandatory coding education in primary and lower secondary schools as a policy that is embedded in a coordinated market economy and in a long history of state-led industrialization. Within this perspective, vocational and ICT-related reforms are interpreted as instruments that support long-term strategies for technological upgrading rather than as isolated pedagogical innovations.

The research uses a document-based approach. The primary materials include national education policy documents, curriculum guidelines, government white papers, long-term human resource development plans, and strategy reports on the digital economy produced between 2010 and 2025. These documents cover the period in which coding education was first debated, piloted, and then integrated into the national curriculum. Additional sources include statistical yearbooks, OECD education indicators, and reports by international organizations that describe South Korea's ICT development and skills strategy (e.g., OECD, 2021; UNESCO, 2019). The selection of documents follows a purposeful strategy. The analysis focuses on texts that explicitly connect education reform with industrial policy, digital transformation, or human capital formation.

Figure 1

Vocational Education as Economic Strategy

South Korea is treated as a single-nation case that allows an in-depth examination of how one coordinated market economy translates economic priorities into education policy. The country represents an early adopter of mandatory coding education in basic schooling and has a strong record of export-oriented growth, large business groups, and dense ties between the state, firms, and education providers. This configuration makes South Korea a suitable case for applying the Varieties of Capitalism framework, which emphasizes institutional complementarities between production regimes, labor markets, and skill formation systems (Hall & Soskice, 2001). The case is not chosen as a statistical example. It is selected because it offers a theoretically rich instance through which the structural logic of ICT-oriented vocational reform can be explored.

Data analysis proceeds in two stages. First, the documents are read with open coding to identify recurrent references to skills, competitiveness, future industries, and digital transformation. Particular attention is paid to how coding, software education, and computational thinking are framed in relation to export industries, innovation policy, and the fourth industrial revolution. Second, these coded patterns are interpreted through the Varieties of Capitalism lens. The analysis asks how the texts express features that are associated with coordinated market economies, such as strategic coordination between the state and business, firm-specific skills,

and institutional support for long-term investment in human capital. This step links specific curricular decisions to broader mechanisms of economic governance.

The study also examines how policy actors are described and positioned within the documents. Ministries, local education offices, major conglomerates, and public agencies are analyzed as part of a network of institutions that co-produce vocational pathways. References to industry–university cooperation, public–private partnerships, and talent pipelines for strategic sectors are treated as evidence of this coordination. By tracing these linkages across multiple documents, the research reconstructs a policy narrative in which coding education functions as one node in a larger system that connects schooling to industrial upgrading.

The methodology has several limitations that shape the scope of the findings. The research does not include interviews with policymakers, teachers, or students, and it does not analyze classroom practices or learning outcomes. The focus remains on how the state and related institutions narrate and justify coding education at the level of policy texts. As a result, the study cannot evaluate the effectiveness of the reform in terms of student skills. Instead, it clarifies the institutional logic that underpins the reform and shows how that logic aligns with South Korea's coordinated market economy. This design is appropriate for the aim of the paper, which is to provide a structurally grounded interpretation of vocational ICT policy and to extend the application of the Varieties of Capitalism framework to a non-Western education system.

Results and Findings

The analysis of South Korea's coding education reform produced three main findings. First, the policy is closely embedded in the logic of a coordinated market economy rather than framed solely as a response to global digital literacy agendas. Second, the design and implementation of coding education reflect strong state and industry coordination that channels skills formation toward specific sectors of the economy. Third, the Varieties of Capitalism framework helps to explain why the reform appears ambitious in form yet conservative in its underlying institutional orientation.

The first finding concerns how the state framed mandatory coding education in high level policy documents. Government white papers and strategy reports link coding education directly to national competitiveness, innovation capacity, and the fourth industrial revolution (Ministry of Education, 2018; Ministry of Science and ICT, 2019). Policy texts repeatedly describe students as future human resources for artificial intelligence industries, advanced manufacturing, and digital exports. The official rationale rarely stops at individual empowerment or generic digital literacy. Instead, coding is described as a tool to secure national advantage in global value chains and in export markets. This pattern supports the interpretation that the reform operates as an economic upgrading strategy that is consistent with the expectations of a coordinated market economy (Hall & Soskice, 2001).

The second finding relates to institutional coordination between the state, large firms, and educational actors. Policy documents emphasize public private partnerships, cooperation councils, and joint curriculum development with major ICT and manufacturing companies. References to internships, industry linked contest programs, and company supported teacher training appear frequently in government reports. These initiatives position large firms as central partners in the design of the coding curriculum and in the provision of learning opportunities beyond the classroom. Such arrangements echo the role of employer associations

and large firms in classic coordinated market economies, where firms play an active role in vocational training and long-term skill formation (Hall & Soskice, 2001). In the Korean case, conglomerates function as key nodes that connect school-based learning with future employment pathways in the digital and manufacturing sectors.

The third finding concerns how the structure of the coding curriculum reflects vocational and economic priorities. Curriculum guidelines locate coding within technology and practical arts rather than as a separate humanities or enrichment subject. Learning objectives stress problem solving for real world applications, system thinking, and project-based tasks that resemble simplified versions of software development and automation processes. Advanced modules in some local implementations are connected to career exploration in software engineering, data analysis, and digital content production. The documents also show alignment between coding lessons in general schools and more specialized programs in Meister high schools and vocational tracks. This pattern suggests that coding education functions as an early layer in a broader pipeline of technical skill formation that runs through secondary and post-secondary vocational institutions.

Figure 2
Varieties of Capitalism

Applying the Varieties of Capitalism framework to these materials clarifies that the reform represents institutional continuity more than radical change. On the surface, mandatory coding education appears similar to reforms in liberal market economies that stress individual digital literacy and flexible skills. However, the Korean policy remains anchored in coordinated mechanisms. The state sets clear strategic goals, large firms participate in implementation, and schools integrate coding into structured pathways that support specific industries. The VoC lens shows that the reform deepens existing complementarities between education, industrial policy, and employment relations rather than dismantling them. Coding education becomes another instrument through which the state and major firms coordinate long term skill needs.

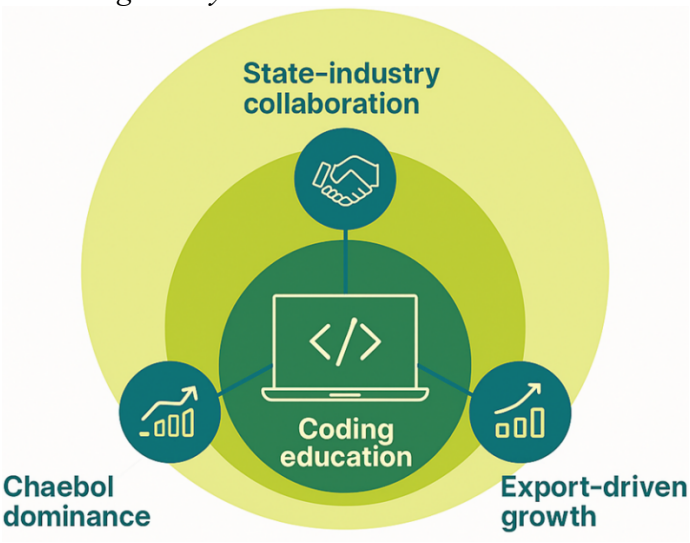
The findings also reveal a selective borrowing of global policy language. Government documents cite international agendas such as SDG 4.4 and global discourses about twenty-first century skills and computational thinking (United Nations, 2015). Yet these ideas are translated into a national context where export driven growth and industrial upgrading remain central. Digital skills are promoted, but they are framed as means to sustain the competitiveness of core

sectors rather than as neutral or universally defined competencies. This selective adaptation supports the argument that education policy mirrors deeper economic structures and coordination logics.

Finally, the findings point to specific implications for discussions of SDG 4.4. In the Korean case, coding education does appear to expand access to technical and vocational skills for young people. At the same time, the reform channels many of those skills toward a particular model of development that relies on large firms and coordinated industrial policy. The case suggests that policies which look similar on the surface may function very differently depending on the underlying economic institutions. Vocational education that uses ICT can support SDG 4.4, but its effects will depend on how it is embedded in each country's system of coordination between the state, firms, and educational institutions.

These findings gain additional meaning when they are read against the historical and structural context of South Korea. After the Korean War the state adopted a developmental model in which rapid industrialization depended on close coordination between government agencies and a small group of large firms (Amsden, 1989). Policies in the 1970s promoted heavy and chemical industries and linked access to credit and protection in domestic markets to export performance. This pattern created a strong expectation that education and training systems would supply the technical workforce needed for industrial upgrading rather than only provide general academic skills (Kim, 1997).

The state has continued to act as a central planner in the field of skills and education. Government strategies describe human resources as the main driver of growth because South Korea has limited natural resources. Long term plans for science, technology, and information industries place education at the center of economic policy and treat curriculum reform as a direct instrument of competitiveness policy (Ministry of Education, 2018; Ministry of Science and ICT, 2019). Coding education fits into this tradition because it is framed as a way to prepare future workers for specific sectors such as semiconductors, software, and artificial intelligence. The reform is therefore consistent with the coordinated market economy pattern in which the state steers skill formation in line with industrial priorities rather than leaving it solely to individual choice or market signals (Hall & Soskice, 2001).



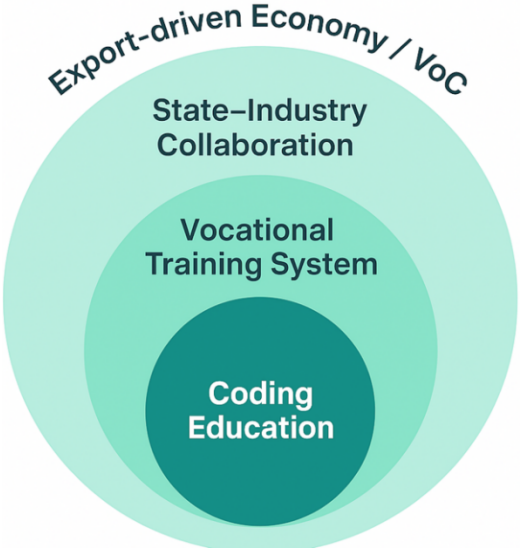
Large business groups have also played a decisive role in the way skills are produced and used. Conglomerates such as Samsung and Hyundai have long operated internal research centers and training institutes and have offered structured career ladders for engineers and technicians (Chang, 1993). Public reports on coding education refer to partnerships with these firms for curriculum development, teacher training, and student contests. These links indicate that the school based coding curriculum is expected to feed into existing channels of firm based training and recruitment. The result is a multi layered system in which basic coding skills in compulsory education connect with more specialized vocational programs and then move into firm specific training within major companies.

This structural context helps to explain why coding education in South Korea appears ambitious while still reinforcing existing institutional arrangements. The state uses the language of global digital literacy and SDG 4.4, but it embeds the reform in a long standing pattern of export driven growth and firm centered skill formation. The Varieties of Capitalism framework clarifies that the Korean case is not only a story about innovation in pedagogy. It is a case in which a new curriculum reflects and reproduces a coordinated system of economic governance. For debates on SDG 4.4 this suggests that digital and vocational reforms need to

be interpreted through each country's political economic structure. Similar policies may lead to different outcomes when they are placed in different configurations of state capacity, industrial organization, and education systems.

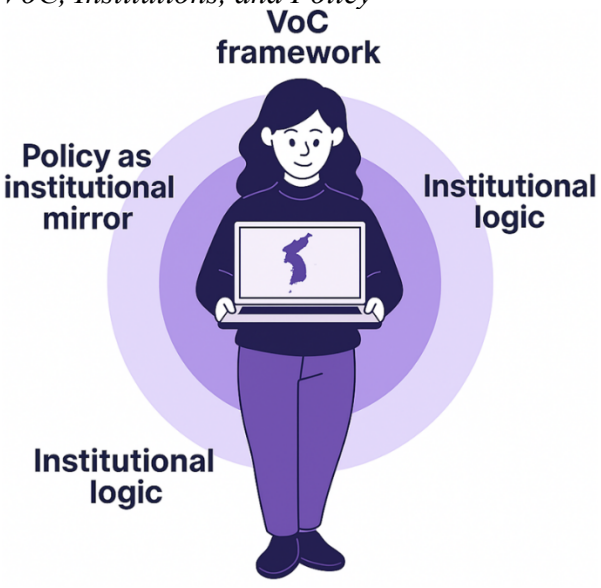
In this light, coding education functions as a mirror of Korea's institutional arrangements rather than a stand alone pedagogical experiment. The policy links classroom content to national goals of export upgrading and digital transformation. Curriculum documents describe coding as a core competence for work in semiconductors, software, and artificial intelligence rather than only as a general digital literacy skill. This supports the view that vocational education in South Korea operates as an economic strategy that serves coordinated growth and industrial upgrading.

Figure 3
CME-Aligned Hybrid Model



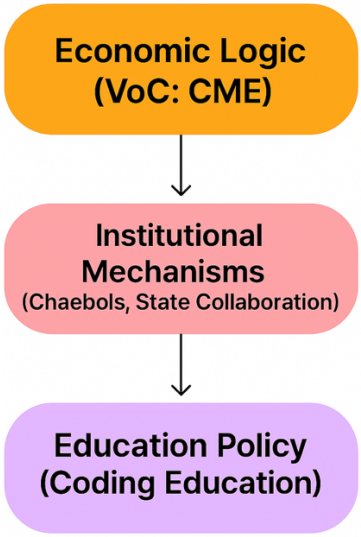
The application of the Varieties of Capitalism framework clarifies Korea's position as a coordinated market economy with hybrid features. Policy texts and white papers frequently highlight cooperation among ministries, business federations, and universities in the design and implementation of coding education. These patterns match the logic of coordinated systems that rely on strategic collaboration instead of pure market competition in the fields of training, innovation, and wage setting (Hall & Soskice, 2001). At the same time, the strong role of export competition and global value chains shows that Korea does not reproduce European coordinated models in a simple way. The case therefore extends VoC debates to an Asian context and illustrates how coordination can operate under conditions of high external competitiveness.

The findings also show that education policy can be read through the same institutional lens that comparative political economy research has usually applied to labor markets and welfare regimes. Coding education in Korea reflects long term patterns of state led steering, firm centered skill formation, and export driven industrial strategy. It is not only a response to global discourses on digital literacy and SDG 4.4. It is also an adaptation of those discourses to an existing system of coordination between the state, large firms, and educational institutions. This result suggests that future research on vocational and ICT based reforms in other countries should examine how similar policies are filtered through different institutional configurations rather than assuming uniform effects across contexts.



In this structural context the emergence of coding education in South Korea can be better understood through the Varieties of Capitalism framework, which explains how national models of coordination shape reform trajectories in different policy domains (Hall & Soskice, 2001). Coding education sits within a wider vocational training system that has long been organized through dense ties between the state, large firms, and education providers.

Figure 4
Coding Education in Korea's Skills System



The policy therefore reflects an existing logic of strategic coordination in which the government designs skill formation not only for individual learning but also for industrial competitiveness. When viewed in this way coding education appears as one element in a sequence that links economic strategy, institutional arrangements, and sectoral policy. This reading supports the argument that policy often functions as a mirror of underlying institutions rather than as an independent or purely technocratic choice.

Figure 5
VoC, Institutions, and Policy

The content, timing, and framing of coding education in Korea reveal the priorities of a coordinated market economy that relies on highly skilled labor, firm specific training, and export oriented upgrading. Coding education is not simply a reaction to global enthusiasm for digital literacy. It is embedded in Korea's particular system of economic coordination in which state led planning, firm based innovation, and education policy are closely connected.

Figure 6
From Economic Logic to Coding Policy

Understanding coding education as an embedded reform clarifies why Korea moved relatively early to mandate coding in schools and why this reform is likely to reinforce existing patterns of vocational skill formation rather than replace them.

Implications & Conclusion

The analysis of South Korea's coding education policy shows that vocational education that uses ICT functions as part of a broader economic strategy rather than as a simple classroom innovation. Coding education supports export oriented growth and digital industrial upgrading because it channels young people into skills that match the needs of large firms and technology intensive sectors. This finding is consistent with the logic of coordinated market economies in the Varieties of Capitalism framework, where skill formation and firm strategies are closely linked to long term national development paths (Hall & Soskice, 2001).

These results have several implications for the implementation of SDG 4.4. International debates often present digital skills and coding education as universal solutions that every country should adopt in a similar way. The Korean case suggests that such policies work most effectively when they are aligned with existing patterns of coordination between the state, firms, and educational institutions. SDG 4.4 calls for an increase in the number of youth and adults with relevant technical and vocational skills (United Nations, 2015). The Korean experience shows that relevance is not only a question of curriculum content. It is also a question of how skills are linked to concrete employment pathways within a particular political economy.

The findings also highlight the limits of simple policy transfer. Coding education in South Korea is anchored in strong state industry collaboration, dense links between universities and large firms, and a history of export oriented industrial policy. Countries with liberal market

economies that rely more on competitive markets and weaker forms of coordination are likely to experience different outcomes even if they adopt similar ICT based curricula. Developing countries with large informal sectors or limited state capacity may face even greater mismatches if they import high tech vocational models without the supporting institutional infrastructure. The Korean model can offer ideas for how to connect vocational education with growth strategies, but it cannot serve as a ready made blueprint.

At the same time, the study does not suggest that countries should avoid ICT based vocational reforms. Instead, it argues that such reforms should be designed with careful attention to institutional complementarities. Policymakers need to ask how new digital curricula will interact with existing labor market institutions, firm level training practices, and state development strategies. The Korean case illustrates that vocational education can reinforce a particular growth model when these elements are aligned. It also suggests that misalignment may produce weaker results or even deepen inequalities if only some groups gain access to employment that uses new skills.

The study makes a theoretical contribution by extending the use of the Varieties of Capitalism framework into the field of education policy. Previous VoC research has focused mainly on production regimes and labor markets in Europe and North America (Hall & Soskice, 2001). By applying VoC to a non-Western case and to the domain of schooling and vocational education, the analysis supports the claim that education policy can be read as a mirror of institutional structures. Coding education in South Korea reflects long standing patterns of coordination between the state and large firms. It also reflects a national preference for strategies that link human capital formation with export competitiveness. This perspective invites further work that treats education ministries, school systems, and curricula as part of the institutional architecture of coordinated or liberal market economies.

There are also important methodological and empirical limits to this study. The analysis is based on document review rather than interviews with policymakers, teachers, or students. It therefore reconstructs institutional logic and policy intentions but does not directly measure classroom level practice or labor market outcomes. Future research could combine this structural perspective with qualitative fieldwork in schools and firms or with quantitative analyses of student trajectories in vocational and ICT related tracks. Comparative work that examines other Asian economies with different configurations of state capacity and industrial organization would also deepen the argument. Such studies could test how far the Korean pattern travels and where it breaks down.

Despite these limits, the findings offer a set of cautious implications for global education debates. Efforts to achieve SDG 4.4 will benefit from promotion of digital skills, but they will be more effective when reforms are grounded in each country’s political economic structure. The Korean case shows that coding education can support inclusive and future oriented skill formation when it is embedded in a coherent system of coordination across the state, firms, and education providers. It also warns against the uncritical diffusion of high tech vocational models that ignore institutional context. A more realistic approach to SDG 4.4 will recognize that there are many possible paths to building relevant skills and that each path must reflect national histories of development, governance, and industrial organization.

In conclusion, this study has interpreted South Korea’s mandatory coding education policy as a structural feature of its coordinated market economy rather than as a purely pedagogical reform. Viewing the policy through the Varieties of Capitalism framework clarifies how

vocational education can function as an economic strategy that supports export oriented upgrading. The case therefore contributes to both educational research and political economy by linking debates on ICT based learning to deeper questions about institutional design and development.

Abstract

This study examines the dynamics of transnational children's education on the Indonesia-Malaysia border, specifically in the Dayak Bidayuh community between Kampung Sontas (Indonesia) and Entubuh (Malaysia). The main issue is how citizenship status, limited mobility, and state policies affect children's access and educational experiences in cross-border kinship networks. The study aims to uncover the complex realities of these children's education from the perspective of actors directly involved in border life. Using an autoethnographic method implemented over five years (2019–2024), researchers immersed themselves in the lives of border communities, conducting participant observation, in-depth interviews, and documenting personal experiences as the main narrative. The results of the study show that transnational children face administrative limitations, gaps in educational facilities, and pressures of national and ethnic identity. Nevertheless, families and local communities play a central role in maintaining educational values through adaptive strategies and kinship solidarity. The implications of this study indicate the importance of inclusive and cross-border education policies and the need for state recognition of the complexity of identity and mobility of border communities. Autoethnography as an approach can bridge personal experiences with the structural dynamics that influence the lives of transnational children.

Keywords: autoethnography, transnational children, border education, Indonesia–Malaysia border, Dayak Bidayuh community, cross-border mobility, citizenship and identity

iafor
The International Academic Forum
www.iafor.org

Introduction

Various studies on education in border regions often place children as statistical figures: school participation rates, school dropout rates, or literacy achievements. However, behind these data there are complex life experiences, especially for children who grow up in transnational social spaces, where national borders are administrative but do not completely cut off social relations, kinship and cultural identity. This article departs from this anxiety, by focusing on the realities of transnational children's education on the Indonesia–Malaysia border, especially in the Bidayuh Dayak communities who inhabit Sontas Village (Indonesia) and Entubuh (Malaysia) (Dewantara et al., 2020).

The Sontas-Entubuh border region is not simply a geopolitical line separating two countries, but rather a shared living space that existed long before modern state borders were established. The Dayak Bidayuh communities in both regions share strong kinship ties, shared historical origins, and intertwined socio-cultural practices. In this context, children grow up with relatively fluid cross-border mobility, often hampered administratively. Education, as a state institution heavily dependent on citizenship status and formal bureaucratic systems, becomes an arena where the tension between transnational life and the logic of the state is most palpable. (Dewantara et al., 2025).

Transnational children across the Indonesia-Malaysia border face a paradoxical situation. On the one hand, they live within transnational family networks that allow alternative access to schools, educational resources, and diverse learning experiences. On the other hand, they face limited legal documentation, differences in national curricula, disparities in educational facilities, and state policies that tend to view cross-border mobility as an anomaly or even a threat. These conditions impact not only their access to formal education but also their daily learning experiences, sense of security, and the formation of national and ethnic identities. (Dewantara et al., 2023).

Most previous research on border education still uses a structural or public policy approach, focusing on the state as the primary actor. This approach is important, but it often fails to capture the subjective experiences of the children and families living within it. Yet, for border communities like the Dayak Bidayuh, education is not solely understood as an institutional process within schools, but rather as part of a survival strategy, the transmission of values, and the negotiation of identity amidst pressures from the nation-state. Therefore, an approach that bridges personal experiences with broader structural dynamics is needed.

This article uses autoethnography as the primary methodological approach to understand this reality. Autoethnography allows researchers to position themselves not only as observers but also as part of the social world being studied. Through direct engagement and reflection on personal experiences over five years (2019–2024) of living, working, and interacting with the Sontas–Entubuh border community, this research seeks to present stories from within about the education of transnational children. This approach rejects claims of objectivity separate from experience, instead emphasizing the importance of narrative, emotion, memory, and social relations in the production of knowledge.

Autoethnography as story serves as the primary conceptual framework in this article. Stories are not understood simply as data illustrations, but as an analytical medium that reveals power relations, structural inequalities, and community adaptive strategies. Through everyday stories—about children attending school across borders, parents negotiating with authorities,

teachers facing limited facilities, and families relying on kinship solidarity this article shows how education is experienced, negotiated, and interpreted in a border context (Widoyoko, 2016).

The education of transnational children in the Dayak Bidayuh community is inextricably linked to issues of identity. These children grow up with a dual awareness of belonging to the same ethnic community, yet simultaneously interpellated by two countries with differing national narratives. Schools become crucial spaces where national identity is introduced, negotiated, and even questioned. In certain situations, children must learn to adapt to rigid national demands while maintaining local identities and cross-border kinship ties (Aditya Dewantara et al., 2025).

By positioning personal experiences as the entry point for analysis, this article aims to reveal the dynamics of transnational children's education in a more holistic and humane way. The primary focus is not only on what they lack documents, access, or facilities but also on what they build: the adaptive strategies of families, the role of local communities, and practices of solidarity that enable education to continue despite limitations. Through an autoethnographic approach, this research contributes to the discourse on border education, transnational studies, and qualitative methodology by demonstrating that personal stories can be a powerful analytical tool for understanding complex social structures.

Ultimately, this article emphasizes that understanding children's education in border regions is not sufficient only through policies and statistics. It requires methodological courage to listen to stories, feel tensions, and reflect on the researcher's position within them. Autoethnography offers this space, while also opening up the possibility for formulating education policies that are more inclusive, contextual, and sensitive to the lived realities of border communities.

Method

This research uses a qualitative approach with an autoethnographic method, positioned not only as a data collection technique but also as an epistemological framework for understanding the educational realities of transnational children in the Indonesia-Malaysia border region. Autoethnography was chosen because it can bridge the researcher's personal experiences with the broader social, cultural, and political context, particularly in border situations fraught with negotiations of identity, mobility, and state power (Dewantara & Budimansyah, 2024).

Autoethnographic Approach

Autoethnography in this research is understood as “autoethnography as story,” an approach that places the researcher's lived narrative as both the primary data source and the analytical tool. The researcher does not position herself as a neutral external observer, but rather as an actor directly involved in the social life of the Dayak Bidayuh communities in Kampung Sontas (Indonesia) and Entubuh (Malaysia). This position allows the researcher to capture the dynamics of transnational children's education from within, including emotions, ethical dilemmas, and daily practices that are often overlooked by survey approaches or policy studies. (Miles et al., 2014).

Autoethnography was chosen because the research context the education of children across borders within kinship networks is difficult to fully understand without long-term engagement and in-depth social relations. This method allows for critical reflection on the researcher's

personal experiences as part of the social structure being studied, while also opening up space to examine the relationships between the micro (individual and family experiences) and the macro (state policies, citizenship regimes, and national education systems).

Location and Duration of Research

The research was conducted in the Sontas-Entubuh border region for five years (2019–2024). Sontas and Entubuh villages were chosen because both are Dayak Bidayuh communities with cross-border kinship ties, high social mobility, and child education practices that involve two different state systems. The long research period allowed the researchers to conduct repeated observations, build trust with the community, and capture changes and continuity in transnational child education practices.

Data Collection Techniques

Data were collected through several complementary techniques:

Participant Observation

The researcher was directly involved in the daily life of the community, including participating in family activities, school activities, children's interactions, and community meetings. Participant observation was conducted reflectively, noting not only the events observed, but also the researcher's position, feelings, and responses to the situation.

In-Depth Interviews

Interviews were conducted informally and in-depth with transnational children, parents, teachers, traditional leaders, and local officials. The interviews were flexible and narrative, allowing informants to share their educational experiences without being constrained by a rigid question structure.

Reflective Notes and Personal Narratives

The researcher compiled ongoing reflective field notes, which included personal experiences, dialogues, significant events, and critical reflections on the researcher's position within power relations and research ethics. These notes served as the primary source for constructing the autoethnographic narrative.

Contextual Documentation

Supporting documents such as education policies, population administration documents, and local archives are used to enrich the analysis and link personal experiences to the broader structural framework.

Data Analysis

Data analysis was conducted narratively and thematically. Rather than conducting formal coding separate from the narrative, researchers interpreted the data through the construction of narratives encompassing key themes, such as administrative limitations, cross-border mobility, disparities in educational facilities, and negotiations of national and ethnic identity. The

analysis process was iterative, in which personal reflections, interview data, and field observations were mutually tested and deepened (Blasco & Wardle, 2007).

Research Validity and Ethics

Research validity is maintained through reflexivity, long-term engagement, and triangulation of data sources. In the context of autoethnography, reflexivity is a key aspect of validity, as the researcher explicitly discloses their positionality, involvement, and potential biases. Ethical considerations include maintaining the anonymity of informants, obtaining informed consent, and ensuring that the narratives presented do not harm individuals or communities.

Through this method, the research seeks to provide an in-depth, contextualized, and lived-experienced understanding of the dynamics of transnational children's education in border regions.

Result and Discussion

Education in the Space Between: Administration, Mobility, and the Uncertainty of Transnational Children

The education of transnational children in the Sontas–Entubuh border region takes place in what can be called an in-between space—a social space at the intersection of transnational kinship and the rigid administrative system of the nation-state. This space is neither entirely within the logic of Indonesia, nor entirely subordinate to Malaysia. Over five years of fieldwork, this in-between space emerged as a key context shaping the access, experience, and meaning of education for Dayak Bidayuh children. One of the most striking findings of this research is that administrative uncertainty is a persistent structural condition in the educational lives of transnational children, not simply a momentary obstacle. Many children in Sontas Village have a history of long-standing cross-border mobility: born in Entubuh, raised in Sontas, returning to Malaysia for school, and then returning to Indonesia to follow their parents or relatives. This mobility is socially considered normal and legitimate within the Dayak Bidayuh kinship framework, but it does not always align with the logic of state population administration.

In formal education, uncertainty about citizenship and documentation is a major source of vulnerability. Children who lack Indonesian birth certificates, child identity cards, or valid cross-border documents are often admitted to school through informal mechanisms. Teachers and principals, particularly in border areas, often take a pragmatic stance, prioritizing children's rights to learn over rigid administrative compliance. However, this acceptance is always temporary and dependent on broader political-administrative circumstances. From the children's perspective, this creates an ambiguous school experience. School is not only a space for learning, but also a space of uncertainty. Children grow up with an implicit awareness that their presence at school could be questioned at any time. They understand that there are certain things that should not be asked or explained too much—for example, about birthplace, parental status, or reasons for changing schools. This awareness shapes a cautious attitude and a strategy of silence that develops from an early age.

Cross-border mobility is another dimension that deepens the educational experience in the in-between space. In autoethnographic accounts, researchers observe how children habitually move residences following family dynamics: living with their parents in Sontas, then spending

some time with their uncles or grandparents in Entubuh for school, and then returning again. These moves are not always accompanied by smooth transitions within the education system. Differences in curriculum, language of instruction, learning rhythms, and school culture mean that children must constantly adapt.

This socially fluid mobility clashes with state expectations of residential stability and identity. National education systems, in both Indonesia and Malaysia, are primarily designed for individuals who are settled, documented, and have clear citizenship status. Transnational children, with their fluid mobility and identities, fall outside this normative imagination. As a result, they are often positioned as “special cases” to be addressed ad hoc, rather than as part of a systemic education policy design.

The disparity in educational facilities between Sontas and Entubuh also influences families' educational choices. Schools in Entubuh have relatively better infrastructure, a more ideal teacher-student ratio, and more consistent state support. These conditions encourage families in Sontas to view education in Malaysia as an opportunity, despite the accompanying administrative risks. This decision is rarely based on ideological preferences for a particular country, but rather on practical considerations regarding their children's future. However, attending school in Malaysia does not necessarily solve problems. Children who attend Entubuh face complex identity challenges. At school, they are socialized into the Malaysian national narrative through the curriculum, state symbols, and disciplinary practices. At home and in the community, they continue to live within the Dayak Bidayuh culture, which transcends borders and is not fully tied to any one country. This tension creates a layered and sometimes contradictory identity experience.

In their autoethnographic experiences, researchers noted how children often navigated situational shifts in identity. In the school classroom, they conformed to prevailing national expectations; at home, they reverted to ethnic and kinship identities. Education, in this context, not only transmitted academic knowledge but also trained children to become flexible, adaptive subjects, able to navigate contexts of power.

For parents, the transnational education of children was a decision-making process fraught with moral and emotional dilemmas. Parents had to balance compliance with state regulations with the responsibility to ensure their children received a proper education. In many cases, they relied on cross-border kinship networks to overcome administrative limitations—for example, by entrusting their children to relatives with more complete documents or better access to certain schools. The state was present in family life not as a single, clear entity, but as a series of changing rules, apparatuses, and procedures. This uncertainty forced families and children to continually adapt their educational strategies. Education became an ongoing practice of negotiation, rather than the stable, linear process envisioned in national policies.

This subsection demonstrates that the education of transnational children on the border is not simply a matter of access to or quality of schooling, but a lived experience shaped by administrative uncertainty, cross-border mobility, and structural inequalities between countries. Children not only learn to read, write, and count, but also learn to understand national borders, bureaucratic loopholes, and survival strategies within a system that does not fully accommodate their existence. Through an autoethnographic approach, these experiences are not reduced to abstract data but are understood as living narratives that reflect the power relations between the state and border communities. Uncertainty, in this context, is not an anomaly, but a normal

condition that shapes the subjectivity and educational experiences of transnational Dayak Bidayuh children in Sontas–Entubuh.

Nurturing Education Amidst Disadvantages: The Role of the Family, Kinship Solidarity, and the Negotiation of Transnational Children's Identities

Amid administrative uncertainty, cross-border mobility, and limited state policy, the education of transnational children on the Sontas–Entubuh border is not entirely dependent on formal institutions. This research finding indicates that families and cross-border kinship networks play a central role as the main pillars of the educational sustainability of Dayak Bidayuh children. Education, in this context, is treated as a collective social practice that transcends school spaces and state logic.

Dayak Bidayuh families in Sontas and Entubuh view children's education not solely as the responsibility of the immediate parents, but as a shared responsibility within the extended kinship circle. When access to formal education is hampered by paperwork, distance, or limited facilities, solutions are often found through cross-border family solidarity. Children are entrusted to uncles, aunts, grandparents, or cousins who live closer to a particular school or have more stable administrative status. This practice is not seen as a form of "transfer of responsibility," but rather as a collective strategy to ensure the child's future. In autoethnographic experiences, researchers witnessed how educational decisions are often made through family deliberations. Considerations arise not only regarding school quality but also regarding the child's safety, residential stability, and the family's ability to cope with administrative risks. Education is understood as a long-term process that requires flexibility, patience, and the ability to adapt to changing border situations.

This kinship solidarity also serves as an emotional protection mechanism for children. Children who must change schools or residences do not feel completely uprooted because they remain within the same extended family circle, culturally and emotionally. Dayak Bidayuh ethnic ties serve as a crucial foundation for maintaining a sense of continuity of identity for children amidst cross-border migration. Thus, despite changes in school and state systems, a sense of "home" remains through kinship ties.

In addition to families, local communities also play a crucial role in supporting the education of transnational children. Traditional leaders, teachers, and villagers often mediate between children's needs and state regulations. In many cases, schools in border areas demonstrate a high degree of flexibility in accepting children from unclear administrative backgrounds. This flexibility is not without risk, but is seen as a form of moral responsibility for the future of the community's younger generation. However, the role of families and communities is not only practical but also symbolic. The education of transnational children becomes an arena where values of kinship, ethics of sharing, and collective responsibility are reproduced. Parents and relatives actively instill in children that education is a path to community strengthening, not merely a means of individual social mobility. This narrative is crucial to understanding why, despite facing various limitations, families continue to strive to maintain the continuity of their children's education.

On the other hand, education also serves as a crucial space for transnational children to negotiate their national and ethnic identities. Dayak Bidayuh children grow up in a world that simultaneously cultivates cross-border ethnic identities and distinct national identities. Schools, as state institutions, play a significant role in this process. Through their curriculum,

flag ceremonies, national symbols, and language of instruction, schools transmit narratives of nationality that are often exclusive.

Children attending school in Malaysia, for example, are exposed to a national narrative that emphasizes loyalty to the Malaysian state, while their ethnic identities are not always given adequate space for expression. Conversely, children attending school in Indonesia also experience a process of national socialization that positions national borders as a clear marker of identity. In both contexts, Dayak Bidayuh identity, as a cross-border identity, is often marginalized. However, the findings of this study indicate that children do not simply passively accept this national narrative. Through cross-border life experiences, they develop contextual and situational identity negotiation skills. At school, they learn to project an expected national identity; at home and in the community, they return to an inclusive and cross-border ethnic identity. This ability is not the result of formal learning, but rather the result of everyday life experiences that constantly demand adaptation.

In autoethnographic accounts, researchers reflect on how children are often more flexible than adults in interpreting identity. For them, being “Indonesian,” “Malaysian,” and “Bidayuh” are not always understood as mutually exclusive identities, but rather as layers of identity that can be activated according to context. Education, in this case, serves as a social training space for managing these complex identities.

However, this flexibility also carries an emotional burden. Children sometimes experience confusion, especially when the national narrative in school contradicts their lived experiences at home and in the community. When the state is presented as the sole legitimate source of identity, children's cross-border experiences become invisible or even questioned. In these situations, the role of the family again becomes crucial as a safe space to discuss experiences, explain differences, and affirm ethnic identity.

This subsection emphasizes that the education of transnational children at the border cannot be separated from the social care work carried out by families and communities. When the state's presence is limited and often insensitive to the realities of the border, families and kinship networks take over the role of guardians of the continuity of children's education and identity. Education is maintained not only through school, but also through daily practices that instill the values of adaptation, solidarity, and resilience. Through an autoethnographic approach, these findings demonstrate that the educational success of transnational children is not solely determined by state policy, but by the ability of border communities to nurture education as a collective practice. Identity negotiation, in this context, is not a sign of crisis, but rather a form of social intelligence that enables children to survive and thrive in the space between two countries.

Education in Border Spaces as an Arena for Negotiation Between State, Kinship, and Identity

The findings of this study demonstrate that the education of transnational Dayak Bidayuh children on the Sontas-Entubuh border cannot be understood solely as an institutional process under state control, but rather as an arena of complex social negotiation. Schools and everyday educational practices become spaces where the logic of the nation-state, cross-border kinship ties, and the formation of children's identities interact, compete, and compromise. In this context, education functions not only as a means of transmitting knowledge, but also as a

mechanism for social regulation and the production of citizenship subjects (Arpannudin & Dewantara, 2025).

From the state's perspective, education is positioned as a crucial instrument for instilling national identity and ensuring citizen loyalty. The curriculum, national symbols, language of instruction, and disciplinary practices in schools reflect the state's efforts to normalize territorial boundaries and shape subjects consistent with a stable civic imagination. However, research findings suggest that this logic does not fully align with the realities of children's lives in border regions (Dewantara, 2024). Dayak Bidayuh children grow up in a social context that transcends national borders, where kinship relations, mobility, and ethnic identity are cross-territorial (Olendo et al., 2022).

In this situation, education becomes a space where the tension between these two logics is practically negotiated. Children and families do not outright reject the state, but neither do they completely submit to administrative demands and rigid national identities. Instead, they develop adaptive strategies that enable education to continue. These strategies include leveraging cross-border kinship networks, flexibility in school choice, and the children's ability to adapt to differing identity expectations across social spaces (Sulistyarini et al., 2021).

These negotiations also demonstrate the limitations of a territorial and exclusive approach to education policy. When education is designed only for clearly documented citizens, transnational children are left vulnerable and not fully accommodated (Jailani et al., 2021). These findings strengthen the argument that education in border regions requires a policy framework that recognizes mobility and multiple identities as social realities, not deviations. In other words, education needs to be understood as a contextual social practice, not simply the implementation of national regulations (Dewantara, 2025).

Furthermore, this subchapter highlights the role of kinship as an alternative social structure that balances state dominance in educational settings. The extended family and Dayak Bidayuh community serve as a social safety net, ensuring the continuity of children's education when the state's presence is limited or inconsistent. This role demonstrates that education in border areas is supported not only by formal institutions but also by informal social mechanisms rooted in the values of solidarity and collective responsibility (Fatmawati & Dewantara, 2022).

In the context of identity formation, education in borderlands produces children with reflective and contextual abilities in interpreting nationality and ethnicity. Children do not view national and ethnic identities as mutually exclusive categories, but rather as layers of identity that can be negotiated according to the situation. This ability challenges the assumption that national education always produces a single, homogeneous identity (Budimansyah & Dewantara, 2025). In contrast, education on the border demonstrates how identity is fluid and situational.

Thus, education in border regions can be understood as an arena where state, kinship, and identity interact in an unequal relationship. The autoethnographic approach used in this research allows for a deeper understanding of these dynamics, as it positions lived experience as a legitimate source of knowledge. This sub-chapter emphasizes that to fully understand the education of transnational children, a perspective that transcends the nation-state framework and allows for the experiences, stories, and social practices of border communities is necessary.

Conclusions

This research demonstrates that the education of transnational children on the Indonesia-Malaysia border, particularly within the Dayak Bidayuh communities of Sontas and Entubuh, is a social process that takes place in an in-between space characterized by administrative uncertainty, cross-border mobility, and ongoing identity negotiations. Education cannot be understood solely as a technocratic state service, but rather as a lived practice continuously negotiated by children, families, communities, and formal institutions within the border context. Using an autoethnographic approach, this research reveals that transnational children face various structural limitations, particularly related to citizenship status, access to documents, and disparities in educational facilities across countries. However, these limitations do not completely halt the educational process. Instead, families and cross-border kinship networks play a key role in maintaining the continuity of education through adaptive strategies, social solidarity, and flexibility in dealing with state systems that are not always responsive to the realities of the border.

The research findings also confirm that education is a crucial arena for the formation and negotiation of transnational children's identities. On the one hand, schools transmit national narratives that tend to demand a single loyalty. On the other hand, cross-border life experiences enable children to develop layered, contextual, and situational identities. This ability demonstrates that national and ethnic identities are not necessarily antagonistic but can instead be pragmatically negotiated in everyday life.

Methodologically, this research emphasizes the value of autoethnography as an approach capable of bridging personal experiences with broader structural dynamics. By employing storytelling as an analytical tool, autoethnography enables a more human and contextual understanding of education in border regions something often relegated to policy- and statistical-based analyses.

Ultimately, this research highlights the importance of more inclusive education policies that are sensitive to the mobility and complex identities of border communities. State recognition of the transnational realities of children and families in border areas is a key prerequisite for ensuring equitable and sustainable education rights. Without such recognition, the education of transnational children will continue to be precarious, relying on the resilience of families and communities rather than on systemic state protection.

Creating an Inclusive, Accessible, and Supportive Foreign Language Learning Environment for Students With Disabilities

Tanya McCarthy, Kyoto University, Japan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Today, most higher education institutions have a support center for students with disabilities (SWDs), but for the most part, if a teacher is not directly contacted, these support centers remain largely unknown to language teachers. To help bridge the gap between the disabilities resource center and the foreign language classroom at the university in which this research took place, an open-ended survey was given to the staff and teachers. Qualitative surveys sought to identify procedural steps from student application for reasonable accommodation to the classroom and bring attention to the various types of disabilities teachers need to accommodate. In-depth interviews with two teachers describe how they adapted their teaching approach and learning materials to accommodate specific disabilities. A framework was first created showing the step-by-step procedure from application to the classroom to help teachers understand the services and support offered. Following this, the support center and teachers provided practical advice on classroom management for various disabilities. The researcher hopes that through this paper, teachers can gain a deeper understanding of the general procedure of applying for reasonable accommodation and consider how to more effectively accommodate students of varying abilities in the second language classroom.

Keywords: reasonable accommodation, teacher professional development, English as a foreign language (EFL)

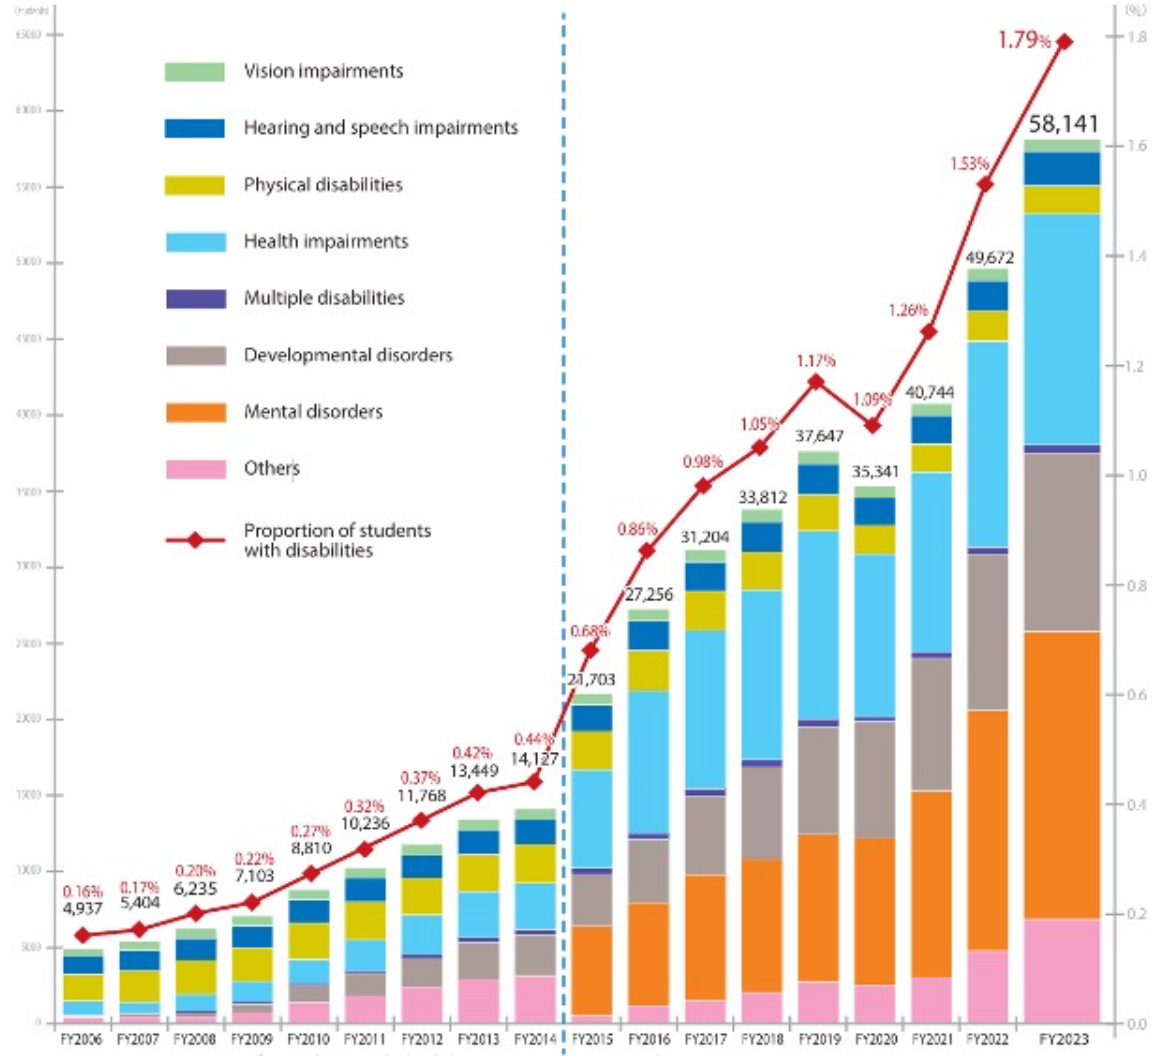
Introduction



Based on the philosophy of the 2013 "Act for Eliminating Discrimination Against Persons with Disabilities" (Japanese Law Translation, Act No. 65, 2013), Japanese universities are encouraged to provide "reasonable accommodation" (support) to students with special needs by eliminating barriers for all students to exercise the right to study and experience university life, ensuring an equal opportunity environment regardless of disabilities. Kyoto University's Disability Resource Centre (DRC) deems "disability" to be an "artifact of society or the environment (social barriers, etc.), rather than an aspect of the individual" (DRC, n. d.). In essence, students with disabilities (SWDs) have specific limitations in physical, sensory, cognitive, developmental, psychological, speech, or other disabilities accompanied by a physician's diagnosis. In order to participate effectively in regular classes, students must apply for reasonable accommodation after which teachers can make special provisions with teaching approaches, learning materials, and the physical classroom environment to accommodate their special needs. In 2021, the Act was amended to pertain specifically to public higher education institutions and in 2024 to private universities.

Since 2005, the Japan Student Services Organization (JASSO) has provided support for Japanese higher education institutions in creating an inclusive and equitable educational environment. They have released several national reports related to the increasing number of SWDs in the past two decades. Between 2006 to 2025, JASSO has reported a significant increase in SWDs from 0.16% in 2006, 0.42% in 2013, 1.17% in 2019, 1.26% in 2021, and the current figure of 1.79% in 2023 (JASSO, 2022, 2025). The sharp incline on the chart (Figure 1) from 2015 was due to classification categories being increased and modified, as well as the opening of more support centers across Japan and overall improvements in coordination efforts in educational institutions.

Figure 1 shows the breakdown of various disabilities from JASSO's 2025–2026 report (JASSO, 2025).

Figure 1

Increase in Percentage of Students With Disabilities and Disability Type in Higher Education Institutions FY2006–2023 (n = 58,141)

At the university in which this research took place, the number of SWDs has seen a similar increase: from 43 students in 2017 to 300 in 2024. This has resulted in several language teachers having to accommodate one or two SWDs in their courses each year. For educators who have never taught a SWD or received specific training for special education students, this situation can cause feelings of anxiety or stress. Teacher affective issues (e.g., anxiety and well-being) related to teaching special needs students is an area of EFL that is somewhat under researched as the focus tends to be on how to effectively teach SWDs. A study by Alshahrani (2018) in Saudi Arabia reported a lack of specialist support and in-service training for teaching students with special needs leading to stress and anxiety. Challenges navigated by language teachers in Kahil and Pradia's (2023) research in the Philippines were limited teaching methods, a lack of resources for specific disabilities, communication difficulties, adapting to diverse disabilities, creating special assessment methods, and making individualized learning plans. In a systematic review, over ten years, Johnson and Erasmus (2024) found several persistent challenges educators face, mainly a lack of professional development and training programs, a weak institutional culture of collaboration and communication, and institutional barriers. In Japan specifically, Young (2024) surveyed 13 EFL teachers who reported five challenges of supporting SWDs: disclosure of disability, curricular constraints, barriers to inclusion within

the institution, lack of support from the university, and a need for more targeted teacher training. These studies all show that the challenges of teaching SWDs are worldwide and feelings of anxiety are natural. However, with some guidance and understanding of how to teach special needs students, teachers would be able to cope more effectively with reasonable accommodation requests.

The aims of this qualitative study are two-fold: (a) to improve teachers' understanding of the procedures related to requesting reasonable accommodation and (b) to bring attention to various types of disabilities and how language teachers can provide reasonable accommodation.

Method

This research used a qualitative approach to collect data from office staff and English language teachers. A bilingual open-ended survey was first given to the disabilities office at the university to understand the procedural flow from applying for reasonable accommodation to enrolment in courses as well as gain knowledge of the types of disabilities that teachers are expected to accommodate. The purpose was to help build a bridge between the disabilities center and the foreign language classroom. It also sought to identify specific services and support offered to help teachers understand where to go if they required assistance with the SWD. Key questions asked were:

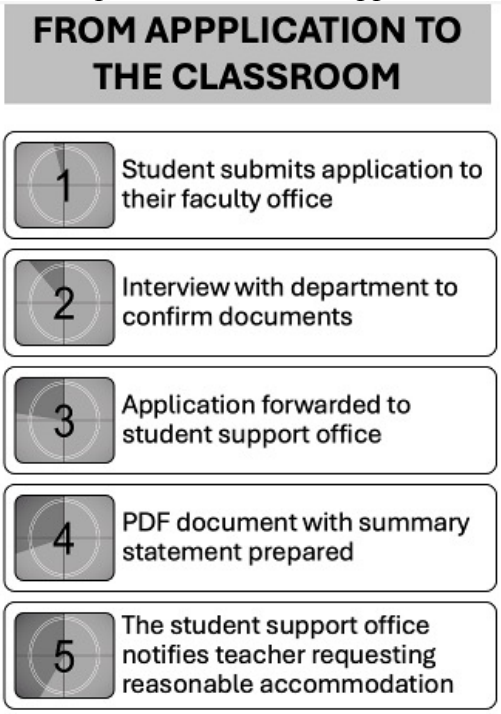
1. What is the role of the staff in the disabilities resource center?
2. How is "reasonable accommodation" defined by the office?
3. How many SWDs are currently enrolled at the university? How much has this number increased, decreased or remained constant over the past decade?
4. What kinds of "disabilities" does the office support?
5. What is the procedure from application to course enrolment?
6. What kind of support and services are available to help teachers if they face challenges?

In-depth interviews with two teachers described their first-hand experiences of teaching SWDs, how they reduced feelings of anxiety when teaching special needs students as well as how they adapted their teaching approach and learning materials to accommodate specific disabilities. The following two questions guided the interview.

1. Could you describe your experiences with SWDs in the language classroom?
2. Based on your experiences, could you share any suggestions or advice that would help teachers to create a more inclusive classroom?

The researcher asked follow-up questions during the interview to delve deeper into the teachers' experiences.

Results and Discussion



This section discusses data collected from the office staff and teachers. Practical information about procedures and types of disabilities are presented followed by first-hand accounts from teachers' interviews and suggestions about how to create an inclusive, accessible, and supportive learning space.

Data Collected From the Disabilities Office: Procedural Steps and Support

The process of applying for reasonable accommodation to enrolment in language courses is one of the areas that most teachers are unfamiliar with. Understanding the process for

disclosure can help to narrow the gap between the student disability support center and the language classroom as teachers become aware of various contact points to support their teaching and student learning. Survey data showed the procedure at the researcher's university (Figure 2):

Figure 2
Five-Step Procedure From Application to Course Enrolment

In step 1, the student applies for reasonable accommodation through the relevant office. An examination of reasonable accommodation is conducted by faculty to which the student is affiliated. Students are encouraged to apply as far in advance as possible as it becomes easier to meet any special need.

In step 2, the content of reasonable accommodation is determined through frequent communication with the student and confirmation of supporting documents (such as a disability certificate, doctor's note, or psychological findings).

In step 3, the student's faculty administrative office forwards the application to the DRC. The staff have a consultation as a team and with the student to identify how best the student can be accommodated.

In step 4, the DRC prepares a password-protected secure document explaining the type of disability and summarizing the needs of the student.

In step 5, the applying student will confirm the details and make a decision on whom to directly inform about their condition (faculty, teachers, other students, etc.). The disabilities center and faculty office will then send the document requesting reasonable accommodation to the classroom teacher.

In both teachers' experiences in this study, the students rarely contacted them directly. Instead, communication went mainly via the disabilities support office through emails, mostly for the

purpose of documentation, and if necessary, to report concerns or ask follow-up questions. It should be noted here as a possible sixth step, that if the condition or situation of disability changes, or the desired accommodation is not effective, the details are re-examined and further communication is required between the teacher and student.

Teachers are generally asked to consider four areas when accommodating students: the physical layout of the learning space, communication with the student before, during, and after lessons, use of assistive technologies, and flexibility with assessment procedures. One point that the researcher noted that was not mentioned in the documents provided by the faculty and disabilities office, is that reasonable accommodation is intended to provide *equal opportunities* and does not guarantee gaining the course credit. This is an essential piece of information that should be made clear to both teachers and students as early as possible to avoid any misunderstandings and unnecessary stress to both parties.

Disability Types

There are seven classified disabilities that language teachers were expected to accommodate at the university:

- Visual impairment (partial or full blindness)
- Hearing impairment (partial or full deafness)
- Physical disability (affecting movement or dexterity)
- Chronic illness / physical frailty (long-term illness that might not be visible)
- Developmental disability (usually mental development on a spectrum from childhood)
- Mental disorder (affecting emotions, thinking, and behavior)
- "Other" disabilities (impairments that do not fit into the above categories)

Of these disabilities, almost all students were categorized as having a developmental disability or mental disorder. The main reason for this is the modifications in the 2015 classification of disabilities (Figure 1) in which sub-categories were added to health impairment categories, mental illnesses were no longer classified as "other," and more focus began to be placed on developmental rather than physical disorders.

Support for Students

Services and other support programs for students included individual consultation with trained staff, collaboration with libraries, assistive technology to help with specific learning needs, mediation between teacher and student, and proving a barrier-free access map to help students and teachers understand the best routes to various buildings. This information, provided on the office's website for faculty and staff, is likely unknown to the teachers until they are asked to accommodate a SWD. For the researcher, the support and services offered to students and teachers was discovered only after beginning the study which is evidence of the wide gap that exists between the disabilities support center and teachers.

Data Collected From Teacher Interviews: Key Insights

Two teachers described their experiences teaching SWDs in the English language classroom. Interviews were recorded and key insights extracted from the qualitative data. Five themes emerged from interview transcripts:

1. Having to tailor instruction for each disability
2. Adapting learning materials for specific special needs

3. Being more flexible with assessment procedures
4. Understanding the importance of positive behavioral support
5. Experiencing feelings of anxiety as a result of the lack of special needs training and disconnect with the support office

The greatest challenge for both teachers was the time it took to adjust teaching methods for just one student. Having a SWD typically meant teaching a regular class and then spending extra time to make specific materials for the special needs student. This sometimes meant sending emails to the student in advance explaining what was going to happen in the next lesson and responding to questions if the student misunderstood the instructions or any part of the lesson. For teachers with large numbers of students in a class (over 30), having to spend additional time with only one student can easily lead to increased fatigue.

The second most challenging aspect of teaching SWDs was creating effective learning materials. Visually impaired students, for example, required special materials which needed to be made at least two weeks before the course began in order to be converted into braille text. If a student did not apply for reasonable accommodation before the start of the semester, it put pressure on the teacher to make special materials for the student each week. Teachers who make materials week-to-week would probably find it somewhat challenging to accommodate these students. In addition, courses with heavy visual content had to use appropriate language to describe each visual (e.g., charts, diagrams, maps, photos, power point slides, or scientific models). Explanations were written by the disabilities support office staff, but if the staff did not understand complex visuals or the course content, meetings had to be organized with the teacher in charge of the course. This led to extra time required for teaching the student. Thus, a recommendation from one of the teachers was to avoid using visuals unless absolutely necessary. A final point that teachers rarely think about when designing materials is the instruction used to explain a task. Special needs students sometimes need a learning activity to be broken down into basic steps with specific examples. Language needs to be simplified, strong models need to be included within task instruction, and clear goals need to be stated for every task, including how smaller tasks fit into the overall aim of the particular lesson. As mentioned before, this can be extremely time consuming and requires teachers to be very organized. Any changes to the learning materials during the semester must be communicated clearly.

One point that both teachers agreed on was maintaining positivity and being flexible with deadlines for assignments and exams. For teachers, it is crucial to help students build positive relationships with classmates without the stigma of being “special.” If SWDs feel that they are being treated differently, it could lead to a loss of motivation and feelings of unfairness from other students. Teachers thus need to keep an open a line of communication with all students equally to show that they are available for individual consultation if necessary. Understanding that the disabilities support center is available for possible mediation and suggestions for how to better accommodate students is crucial for both the learner and teacher. If the teacher does not speak the student’s L1, then they have to find creative ways to communicate. Due to the significant improvements in generative AI today, communication has become much easier.

Regarding feelings of anxiety, for one teacher there were times when they felt inadequate about how to accommodate the student due to lack of special training. However, the teacher felt that with the documentation provided by the university and early preparation, they could manage to adapt to the new situation without too much trouble. The other teacher had a background in special needs and found no difficulty in adjusting educational instruction and learning materials

to meet the needs of various disabilities. This shows that targeted training would be useful for all teachers, whether through an orientation video, forum, or reference guide. The researcher's plan in 2027 is to compile a list of teacher suggestions and teaching strategies when instructing SWDs into a central database for language teachers at the university. A few suggestions are presented below.

The Inclusive Classroom

One of the key suggestions from the teachers interviewed to create an inclusive classroom was adjusting teaching style to a universal method and designing learning materials to suit a wider variety of students. This means that rather than teaching for individuals with specific needs, teachers should instead design materials and approach teaching in a manner that suits all students in multiple formats (e.g., text, audio, video). Preparing materials far in advance, setting clear goals for the lesson as well as each smaller task, and including clear, simplified instructions in lesson plans and during teaching was most beneficial.

The Accessible Classroom

For both teachers, the accessible classroom was achieved both physically and in digital spheres. Ensuring that both the classroom and the teachers' office could be easily accessed, especially for visually and physically impaired students, was the most important consideration. Being aware of the classroom layout and instructing all students in the classroom to always be mindful not to create obstacles and providing special furniture where necessary contributed to creating an accessible classroom. Outside of the classroom, it is important for teachers to understand how to direct students clearly to the classroom or teacher's office (depending on the disability), as well as how to direct students to avoid various obstacles (e.g. garbage cans, or bicycles). Students with developmental challenges who struggled in face-to-face classes joined through Zoom and submitted assignments digitally. This required knowledge of various assistive technologies. The key point is to communicate with the student and office about how they can be *reasonably* accommodated and find the most convenient solution.

The Supportive Classroom

Finally, maintaining a positive attitude and keeping an open line of communication with students and the support office helps to foster trust and create a supportive atmosphere for all students. Providing clear structure but also being flexible with deadlines and/or assessments improved learning outcomes for learners who worked at a different pace. Both positivity and flexibility significantly reduced the pressure on the teacher to complete tasks in a certain time frame. A crucial point that one teacher mentioned was the possibility that inviting students to openly communicate with the teacher could lead to a significant increase in emails. With teachers already facing time constraints, having to respond to second language learners in the L2 in a comprehensible manner is challenging. Even with AI and translation tools, the teacher's communication style has to be simple but also clear so that the communication does not go back and forth several times. Constructing emails for second language learners that ensure full understanding can take a considerable amount of time. However, from the teacher's first-hand account, less than 10% of students, with or without disabilities, requested further assistance with assignments.

Conclusions

"Integration" and "inclusion" are two terms that are often confused or used interchangeably in the research literature, especially when it refers to SWDs. Whereas integration refers to being placed into an existing system and support provided accordingly, an inclusive classroom emphasizes that SWDs learn differently and should have the same access to educational resources and opportunities as other students. That is, rather than SWDs adjusting to a fixed educational structure, the educational structure is adjusted to accommodate several learning styles. As noted earlier, the DRC office at Kyoto University recognizes a "disability" as a product of the surrounding environment rather than a problem with the individual. Therefore, the intention of inclusive learning at the university is to remove barriers to allow all students in a class, with and without disabilities, to learn *equally*.

It is not possible for teachers to accommodate the diverse needs of every single student in a classroom given the time constraints, large class sizes, limited resources, lack of special training, poor IT skills, and/or fatigue. Thus, to create an inclusive, accessible, and supportive foreign language learning environment for students with disabilities, it is important to be aware of various factors, particularly how to improve learning materials, adapt teaching methods, arrange the physical layout of the classroom, and communicate openly with students and the disabilities support office.

Japan's journey toward inclusive education is ongoing and has been progressing steadily in areas such as universal design for learning (Berger, n. d.); inclusive practices in English language teaching (Young, 2024); and governmental policies and projects by Japan's Ministry of Education (MEXT, 2021) such as the "grand design for higher education toward 2040," and the "Reasonable accommodation practical case database" (NISE, 2026).

Creating an inclusive learning environment thus requires not only top-down reforms, but also teacher initiative, collaborative efforts with student disabilities centers, and most important, open communication with the SWDs themselves. For teachers, understanding various types of disabilities, being mindful about teaching practices, and helping to build a university culture where knowledge about teaching SWDs is shared could help to alleviate teacher burdens and improve educational outcomes for all students.

Abstract

Cultural literacy has become an important element in education today, especially in Social Studies learning. Reflective and inquiry-based approaches provide an effective framework to help students understand and internalize diverse cultural values. By using these teaching methods, students are encouraged to think critically, reflect on their own experiences, and actively explore various aspects of culture through questioning and investigation. This research employs a literature review method based on the works of Cohen & Lawrence Manion and Keith Morrison (2018). The study highlights the importance of integrating reflective and inquiry approaches in Social Studies education to strengthen cultural understanding and build cross-cultural awareness. A learning process that emphasizes reflection allows students to connect cultural knowledge with their personal and social contexts, while inquiry facilitates the independent discovery of new knowledge. Through this approach, students not only acquire information but also develop skills in analysis, evaluation, and synthesis of complex cultural phenomena. Furthermore, this learning fosters respect and appreciation for cultural diversity, which is essential in today's global era. Therefore, Social Studies learning based on reflective and inquiry approaches is a strategic effort to enhance students' cultural literacy, which ultimately can strengthen cultural identity while opening spaces for intercultural dialogue.

Keywords: social studies learning, reflective inquiry approach, cultural literacy

Introduction

Culture plays an important role in the development process and is also a key factor supporting the progress of a society. Every individual is born into a family and community environment that has its own language, customs, and norms, which become part of the psychological development process, such as language ability, the formation of social identity, awareness of social responsibility, and contribution to the continuity of the community (Packer & Cole, 2020). Edward Taylor defines culture as a collection of knowledge, beliefs, and rules that apply within a society (Taylor, 1871).

Culture is formed gradually through continuous social interactions. Through culture, humans build a shared life structure that regulates how they interact with one another. Nowadays, globalization has become a phenomenon that greatly influences cultural interactions worldwide (Hassi & Storti, 2012). Globalization is unavoidable and presents a challenge that all countries must face (Abu-Laban & Bakan, 2020). This process encompasses economic, social, political, and cultural aspects that have a broad impact on both individuals and societies. With technological advancements, globalization drives interaction and interdependence among countries, while also exerting a significant influence on local cultures (Demaio, 2011).

Along with the development of communication technology in the 20th century, the cultural industry emerged, enabling the massive spread of culture beyond national borders. Cultural heritage and modern culture attract tourists, which in turn drives local and regional economic development. This process of cultural exchange also strengthens cultural diversity and fosters mutual respect among nations (Qie, 2024).

However, the impact of globalization also poses the risk of losing local cultural identity due to the strong and widespread influence of foreign cultures. National borders become increasingly irrelevant in global cultural exchanges, causing local cultures to often be overshadowed by global consumerism culture (Alkharafi & Alsabah, 2025). In this context, social studies education plays a strategic role in shaping the understanding and cultural values of the younger generation through the dimensions of knowledge, skills, values, attitudes, and behavior (Sapriya & Nurdin, 2006).

Cultural literacy becomes one of the important competencies that students must master in social studies learning. This literacy refers to the ability to understand, interpret, and practice cultural values as part of national identity in daily life (Kementerian Pendidikan dan Kebudayaan, 2019; Rahmadi & Hayati, 2020). It states that cultural literacy encompasses various aspects of life, including customs, language, religion, arts, and traditional technologies such as games, dance, music, and traditional clothing. Strengthening smart character education is also part of the effort to instill the nation's noble values in accordance with the teachings of Ki Hadjar Dewantara (Kementerian Pendidikan dan Kebudayaan, 2015).

One effective approach to enhancing cultural literacy in social studies learning is through reflective inquiry. Vygotsky (1978) emphasized the importance of social interaction and cultural context in the learning process, with the concept of the zone of proximal development illustrating the learning potential through collaboration and reflection (Kozulin et al., 2003). Robert Wilkins (2011) emphasizes the need for social studies education to focus on developing critical thinking skills as a response to the dynamics of society and the current explosion of information. The reflective inquiry approach provides students with the opportunity to actively explore information, analyze culture, and engage in critical reflection on cultural values in

everyday life (Roberts et al., 2011). Based on this, this article attempts to examine how social studies learning with a reflective inquiry approach can enhance students' cultural literacy. The reflective inquiry approach is chosen in social studies education because it encourages students to actively explore, analyze, and critically evaluate social phenomena in depth. Contextual social studies learning requires methods that not only transfer knowledge but also develop students' critical and reflective thinking skills regarding the social and cultural realities around them. Through reflective inquiry, students are invited to ask questions, conduct research, and reflect on their findings, making the learning process more meaningful and capable of fostering authentic cultural awareness (Salmon & Barrera, 2021).

In addition, the reflective inquiry approach provides students with the opportunity to connect theory with their real-life experiences in everyday life (Darling-Hammond et al., 2024). The continuous reflection process helps students not only understand the learning material content but also internalize the cultural and social values present in society (Darling-Hammond et al., 2020). This is very important in the context of cultural literacy, because students not only merely know about culture but are also able to appreciate, critically evaluate, and apply cultural values in their social interactions.

This approach also facilitates the development of students' metacognitive skills, which is the ability to think about how they think and learn (Stanton et al., 2021). Through guided reflection, students can identify both correct understandings and misconceptions related to social and cultural concepts. Thus, social studies learning becomes an effective means to deepen cultural literacy, enabling students to recognize cultural diversity while considering the dynamics of globalization that influence local cultural identity. Reflective inquiry aligns with the demands of the 21st-century curriculum, which emphasizes the development of critical, creative, and communicative competencies. This approach supports student-centered learning and encourages them to become independent learners capable of adapting to socio-cultural changes (Martinez, 2022). Thus, reflective inquiry not only enhances conceptual understanding in social studies but also strengthens cultural literacy as an important asset in facing the challenges of globalization and ongoing social change. Therefore, this study aims to examine the effectiveness of the reflective inquiry approach in improving cultural literacy in social studies learning.

Research Method

This study uses a qualitative approach aimed at understanding social phenomena and student behavior in the context of social studies learning with a reflective inquiry approach. This approach provides an in-depth understanding of how individuals interpret and give meaning to their learning experiences (Moser & Korstjens, 2017). In this study, data were collected by utilizing online sources such as online databases, article collections, and relevant digital materials, which facilitated an efficient and focused information gathering process (Cohen, n.d.).

For data analysis, this study employs content analysis methods that allow for the interpretation and understanding of texts and content related to culture and learning within a social context. The purpose of this analysis is to identify main themes, patterns, and meanings from the collected data to address research questions concerning the enhancement of cultural literacy through the reflective inquiry approach (Creswell, 2018). The data used are secondary data in the form of documents, transcripts, field notes, and other media sources. The analysis process follows the stages described by Hsieh & Shannon (2005), which include data collection, coding

of relevant text units, and interpretation and analysis of the meanings of themes that emerge within the context of Social Studies learning.

In addition, a literature study was conducted to complement and strengthen the research data. By using the Publish or Perish tool with a publication date restriction from 2022 to 2024, 30 articles were found discussing cultural literacy and the development of Social Studies learning materials using various approaches, including the reflective inquiry approach. This literature review not only enhances the validity and credibility of the research but also ensures that the study is relevant and significant in the context of developing Social Studies teaching methods to improve students' cultural literacy.

Discussion

Implementation of Social Studies Learning With a Reflective Inquiry Approach

The implementation of a learning strategy that encourages students to actively participate in the process of knowledge discovery. The teacher acts as a facilitator who guides students to ask critical questions related to the Social Studies (IPS) material being studied (Isa et al., 2023). This strategy does not only focus on the transfer of information but emphasizes the development of critical and reflective thinking skills so that students can deeply understand social and cultural phenomena (Indrašienė et al., 2023).

Learning activities are carried out through systematic inquiry stages, starting with identifying problems or social phenomena relevant to the local and global cultural context. Students are encouraged to conduct observations, collect data, participate in group discussions, and engage in reflection both independently and collaboratively (Gogus, 2012). Through these activities, students are able to connect social studies theories with real-life experiences in their environment, thereby enhancing cultural literacy and social awareness. The learning media used are highly varied to support the reflective inquiry process (Warmoes et al., 2025). For example, teachers use digital learning resources such as articles, documentary videos, and interactive platforms that provide data and information related to cultural issues. The use of these media aims to facilitate access to information while stimulating students' curiosity, encouraging them to explore the topics discussed more deeply (Cabellos et al., 2023).

In the implementation of learning, the teacher's role is very strategic as a facilitator and motivator. The teacher not only delivers the material but places greater emphasis on the ability to guide students in developing questions, conducting analyses, and reflecting on their findings. (Chin & Osborne, 2008). The teacher also plays a role in creating an open and supportive classroom atmosphere, so that students feel comfortable discussing and expressing ideas without fear or hesitation (Martineau & Cyr, 2025).

Meanwhile, the role of students in reflective inquiry learning is very active and central. Students are not merely recipients of information but act as little researchers who take the initiative to ask questions, seek answers, and test their understanding through critical reflection. An active attitude and curiosity become the main assets for students in exploring knowledge and cultural values around them (Daniel et al., 2024).

During the learning process, collaboration among students is also optimized through group discussions and presentations of inquiry results. These activities encourage students to share perspectives, appreciate the diversity of opinions, and develop good social communication

skills. This collaboration not only enriches students' understanding of social studies material but also builds awareness of the importance of tolerance and respect for cultural differences (Macklin, 2014). Digital media and educational technology increasingly strengthen the effectiveness of social studies learning through the reflective inquiry approach. Teachers utilize online learning platforms and multimedia resources to provide varied and contextual learning experiences (Timotheou et al., 2023). The use of these media also facilitates monitoring of students' learning processes and provides constructive feedback in real-time.

Overall, the implementation of Social Studies learning with a reflective inquiry approach positions the teacher as a guide who directs the learning process, while the students act as the main actors engaging in exploration and reflection (Photo, 2025). The right combination of learning strategies, motivating activities, and supportive media creates a conducive learning environment for enhancing cultural literacy as well as the comprehensive development of students' social and intellectual skills. The implementation of the reflective inquiry approach in Social Studies learning to improve cultural literacy can be seen in the table below;

Table 1
Implementation of Reflective Inquiry Approach in Social Studies Learning to Enhance Cultural Literacy

No	Activity	Description
1	Start with a trigger question relevant to local culture	The teacher can start the lesson with open-ended questions that encourage students to observe and explore cultural aspects in their surroundings, such as: • What cultural traditions exist in our region? • How does globalization affect the habits and cultural values in our community?
2	Start with a trigger question relevant to local culture	The teacher can begin the lesson with open-ended questions that encourage students to observe and explore cultural aspects in their surrounding environment: • What cultural traditions exist in our region? • How does globalization affect the habits and cultural values in our society? These questions stimulate curiosity and motivate students to actively seek answers
3	Facilitate students to independently collect and analyze information	In the inquiry phase, students are encouraged to collect data from various sources, such as interviews with family members or community leaders, observation of local traditions, and

		credible online sources. Then, they process the information to identify cultural values, changes that have occurred, and the impact of globalization on culture.
4	Encourage deep reflection on the meaning of culture and social change	After data collection, students are encouraged to discuss and write personal reflections on the influence of local culture and globalization on their identity. For example, they might contemplate: - What does local culture mean to me and my community? - How can I preserve and maintain this culture amid changing times?
5	Integration of Collaborative Activities to Strengthen Cultural Understanding	Through group work, students can share their findings and reflections, compare cultural experiences with their peers, and formulate concrete steps to preserve local culture within the school and community.
6	Use of Media and Technology as Means for Cultural Exploration	Utilizing technology, such as cultural documentary videos, digital learning platforms, and social media, can help students access various cultural resources and broaden their perspectives in an interactive and engaging way.
7	Process- and Product-Based Evaluation that Assesses Cultural Understanding and Attitudes	Assessment is not limited to written tests but also includes presentations, reflective journals, creative works such as cultural posters, or cultural preservation projects. This encourages students to express their understanding and appreciation of culture in a deeper and more authentic way.

The Spectrum of Catalysts and Resistance in Inquiry-Based Education Practices

In the implementation of social studies learning with a reflective inquiry approach, there are various internal and external factors that act as both supports and obstacles (Kapici, 2025). The most dominant internal factor is student motivation. High motivation encourages students to actively participate in the learning process, especially during the exploration and reflection stages. Motivated students are more diligent in seeking information, engaging in discussions,

and connecting the material with their personal experiences, thus optimizing the inquiry process (Wijnia et al., 2024). However, if motivation is low, students tend to be passive and the learning process becomes less effective.

Teacher readiness is also an important internal factor that influences the success of the learning process. (Çemçem et al., 2024). Teachers who have a deep understanding of the reflective inquiry approach and are able to manage the classroom interactively will be able to facilitate a dynamic and meaningful learning process. Conversely, teachers who are less prepared or unfamiliar with this approach may face difficulties in stimulating critical questions and managing reflective discussions. In addition, the readiness of relevant, contextual learning materials rich in cultural elements also supports the success of this approach, as the materials serve as a bridge connecting theory and real cultural practices (Ylimaki & Brunderman, 2022).

From the external factors perspective, adequate learning facilities such as comfortable classrooms, access to libraries, and interactive learning media are key supports. Full support from the school, including teacher training, provision of learning resources, and sufficient time for reflective discussions, greatly facilitates the smooth running of the learning process (Reeves, 2012). The socio-cultural environment surrounding the school also plays an important role, especially when students have opportunities to observe and interact directly with local culture as well as global cultural phenomen (Ong & Quek, 2023). A supportive environment for local culture allows learning to become more authentic and meaningful.

However, there are also obstacles that need attention; internal barriers such as low student motivation due to lack of interest or unawareness of the importance of cultural literacy can hinder the inquiry process (Williams, 2021). In addition, limited teacher readiness to implement the reflective approach due to high workload or lack of training can become an obstacle. On the external side, limitations in facilities and learning resources, as well as minimal support from the school environment or family, can reduce the effectiveness of learning (Hardman & Sandi, 2024). A less conducive socio-cultural environment, such as a lack of attention to the preservation of local culture, also poses a distinct challenge.

To overcome these obstacles, strategies that can be implemented include increasing student motivation by providing learning contexts that are relevant and engaging, as well as connecting the material to their daily lives. Continuous training and mentoring for teachers are also important to enhance their competence and confidence in using the reflective inquiry approach. (Smith, 2022). The school needs to provide adequate facilities and learning resources, as well as create a conducive learning environment by involving all components of the school and the community (Al-Zu’bi et al., 2024). In addition, collaboration with community leaders and local cultural figures can strengthen students' connection to the surrounding culture and enrich their learning experience.

Implications of Developing the Social Studies Curriculum With a Reflective Inquiry Approach

The findings from the implementation of social studies learning using a reflective inquiry approach provide important implications for the future development of the social studies curriculum. First, this approach should be recommended for sustainable application because it significantly enhances students' cultural literacy. The social studies curriculum needs to be designed by incorporating learning elements that encourage students to actively seek, analyze, and reflect on cultural phenomena critically and deeply (Valladares, 2021). This will foster

positive attitudes and essential analytical skills in understanding the complexities of both local and global cultures (Combi, 2016).

Curriculum development should also emphasize the integration of material that is contextual and relevant to students' everyday experiences (Huizinga et al., 2019). This is important so that learning is not merely theoretical memorization, but also meaningful socially and culturally. The reflective inquiry approach creates space for students to explore culture directly through field projects, case studies, and structured critical discussions. Thus, students can internalize cultural values and develop awareness of the importance of cultural preservation in the era of globalization (Zalli, 2024).

In addition, the research findings show that the development of cultural literacy competencies must become one of the primary goals of the social studies curriculum. (Lähdesmäki et al., 2022). Cultural literacy here refers not only to knowledge about culture but also to critical and reflective abilities in interpreting culture, as well as an attitude of tolerance and appreciation for diversity (Maine & Vrikki, 2021). Therefore, strengthening this competence must be integrated into various themes of social studies learning so that students have a comprehensive and applicable understanding.

Curriculum developers and education policymakers also need to pay attention to enhancing teachers' capacity through intensive training and providing teaching materials that support the reflective inquiry approach (Kim et al., 2022). Teachers must be prepared to become facilitators who can manage the learning process that requires active student involvement, guide discussions, and facilitate reflection (Sormunen et al., 2020). In this way, social studies learning will be more meaningful and have a positive impact on the sustainable development of students' cultural literacy.

Conclusion

Culture plays a fundamental role in the development and progress of society because it forms the foundation for social identity, language abilities, as well as individual social awareness and responsibility. Culture is a collection of knowledge, beliefs, and rules formed through social interactions and serves as the basis for living together in a community. The rapid globalization in the modern era has brought significant impacts on culture, both in terms of cultural exchange and the challenges of preserving local culture. Globalization expands interactions and interdependencies among countries, but at the same time poses risks of local cultures being displaced by dominant foreign cultures.

The cultural industry and advancements in communication technology provide opportunities for massive cultural dissemination, which also supports economic development through tourism and strengthens diversity and mutual respect among nations. However, this process must be managed wisely so that local culture is not eroded by the currents of globalization. Cultural literacy is an essential competence in Social Studies education because it helps students understand, appreciate, and practice cultural values as part of national identity. Intelligent character education must be integrated with cultural literacy to instill the noble values of the nation.

The reflective inquiry approach in Social Studies learning is very effective in enhancing cultural literacy. With this method, students are actively invited to explore, analyze, and reflect critically on socio-cultural phenomena, making learning meaningful and capable of fostering

authentic cultural awareness. The learning process using reflective inquiry not only strengthens conceptual understanding but also helps students internalize cultural and social values in their daily lives. This approach also trains metacognitive skills, namely the ability to think about how to learn and think independently.

Teachers act as facilitators guiding students to ask questions, conduct research, and actively discuss in an open and supportive classroom environment, while students become the main actors who explore and test their understanding. Collaboration among students enriches understanding and builds tolerance and appreciation for cultural diversity. Overall, Social Studies learning with a reflective inquiry approach is highly relevant to the demands of the 21st-century curriculum, which emphasizes critical, creative, and communicative competencies. This approach equips students with strong cultural literacy as a capital to face the challenges of globalization and dynamic social change.

Acknowledgement

The research team extends its heartfelt gratitude to the Indonesian Education Scholarship (BPI), the Center for Higher Education Funding and Assesment (PPAPT) under Ministry of Higher Education, Science, and Technology of the Republic of Indonesia, and the Indonesian Endowment Fund for Education (LPDP) for their generous funding an invaluable for this research.

A Community Approach: School-Wide Station Rotation Pedagogy

Yeo Haig Gene, St Andrew's School (Secondary), Singapore
Chew Ee, St Andrew's School (Secondary), Singapore

Abstract

Our school observed that many teachers faced challenges in applying e-pedagogy (e-Ped) effectively. Developing digital competencies and encouraging collaborative lesson design became a key priority. However, teachers often lacked clarity on how to design meaningful e-Ped lessons and tended to work in isolation. Traditional teacher-led classrooms also limited differentiation, despite students' diverse learning needs and preferences. To address these gaps, a structured pedagogical model integrating differentiation, active learning, and meaningful technology use was introduced. This solution builds on a successful pilot of the Station Rotation (SR) pedagogy conducted by a Lead Teacher from 2021–2022. In these humanities classes, structured, student-centered rotation activities led to improved student engagement and learning outcomes. Following these results, SR was scaled up as a whole-school approach. To assess the effectiveness of the model, both qualitative and quantitative feedback surveys were conducted with students who experienced SR lessons and approximately 75% of the teachers who implemented them. These were administered after the first year of implementation and indicated positive responses regarding engagement, clarity, and lesson design. The feedback informed refinements to the model in its second year. Additional data will be collected at the end of the current cycle to further evaluate long-term impact. The SR model empowers teachers to blend e-pedagogy with personalised instruction and collaboration. It offers a flexible framework for lesson design, enabling varied, engaging activities tailored to learner needs. This approach fosters professional growth, enhances collaboration, and improves students' learning experiences through purposeful use of technology.

Keywords: station rotation, e-pedagogy, school wide, community

Introduction

The unique context presented by our school is that our school is an all-boys school, whose ages ranges from 13–17 years old. About 20% of our students are also diagnosed with special Educational Needs. In Singapore, the Ministry of Education is also encouraging e-pedagogy as there is now a push to include technology in the teaching and learning in the classrooms. There is also a collective push by the school to go from a teacher-centred learning environment to a student-centred learning environment. We also want to meet 21st century competencies of collaboration between learners. Boys also need to have agency in what and how they learn and incorporating movement during lessons should be considered to keep boys engaged (Gurian & Stevens, 2010). With all these parameters taken into consideration, a lead teacher in our school, Mr. Marek Otreba, decided to try using a pedagogy called Station Rotation (SR) (Tucker, 2021) as this seemed to meet all our needs that were unique to our school. In a station rotation pedagogy, students would be split into three groups. This gives teachers a chance to group students using various parameters. Whether by personality, academic readiness or in a random manner, whichever suits that class or lesson. The team wanted to ensure that there would be a e-pedagogy station, or what we termed a "tech" station. This would enable both students and teachers the opportunity to use technology in a meaningful and effective way. There would also be a collaborative station. This ensures that there would be a student-centered approach to that one particular station. Lastly, there would be a teacher-led station. This ensures that there is still a teacher-centric station to provide either professional instruction or meaningful and timely feedback to the students. The key to this approach is that the students will go through all three stations and that the stations are independent of each other. That is to say, a student does not need to go to station "A" first before proceeding to station "B". So a student starting at any station will be learning content from that particular station as part of a larger lesson which contains three parts which are related, but not dependent on knowledge build-up in a linear manner.

And indeed, Marek found the pedagogy useful, his students found the lesson engaging, and he wondered whether SR could be implemented as a whole school approach, involving all the teachers and all the subjects taught in our school, since there were benefits to both teachers and students.

Implementation

In September 2023, a team (the four authors) was formed to look into how we could implement SR where all the teachers would learn, plan and implement SR in their classrooms. By December 2023, a year end staff training session was conducted using SR, giving all teachers in our school an experience of being students in a SR setting, with all the rationale explained to them. In January 2024, teacher training on SR pedagogy was provided to all teachers, through face to face briefings and through online micro-lessons, giving teachers the time and space to learn independently. From January 2024 to March 2024, senior teachers and heads of departments modelled the use of SR in their classrooms and invited teachers to walk into any of these classes to see how SR was implemented in their classrooms. Teachers were then told to try SR in their own classrooms from March 2024 to September 2024. The team in charge of SR implementation was cognizant of the fact that some teachers would need more support. Thus, the senior teachers and the team in charge of this program made themselves available to provide advice and consultation to teachers who needed more support. An online resource where SR lesson plans created by teachers who have already completed their SR lessons successfully was also made available to all teachers

who needed to reference exemplar lessons. Teachers were also encouraged to open their classrooms to their colleagues so that a spirit of community learning would be fostered.

Improvements and Focus After One Year

After the first year where all teachers tried SR, it was observed by the team in charge that the e-pedagogy and collaborative elements were lacking in impact. Many times, it was observed that the students were cooperating with each other, instead of collaborating. Thus, a collective effort was made to train the teachers how to plan a better e-pedagogy lesson and to plan better collaborative activities. A e-pedagogy framework provided by the Singapore Ministry of Education was adapted into the lesson planning template used by teachers to scaffold them in planning a e-pedagogy station in SR. Professional Learning Teams (PLT) of 4–5 teachers were also formed so that teachers worked together to collectively and collaboratively plan and execute a SR lesson with the PLTs using a modified Lesson Study methodology as a research tool to help assess the effectiveness of their SR lessons.

Methodology

We wanted to measure the effectiveness of SR in teaching and learning on both the teachers and students. Two surveys were created, one for students and one for teachers. Both quantitative and qualitative results were obtained from the survey. The table below shows the sample size.

Table 1
Sample Size of Survey Respondents

Year	2024	2025
Students	340	421
Teachers	70	65

Students were asked to complete the survey after attending an SR lesson. Teachers completed the survey at the end of term 3, by which they would have completed their SR lessons.

Below are some sample questions completed by students.

Q. I was engaged till the end of the lesson when the Station Rotation Model was used.
Q. This lesson using the Station Rotation Model enabled me to learn better.
Q. Elaborate why you agreed or disagreed that the lesson with the Station Rotation Model used, enabled you to learn better.

Findings

Figure 1

Student Enjoyment Perception Results Over Two Years

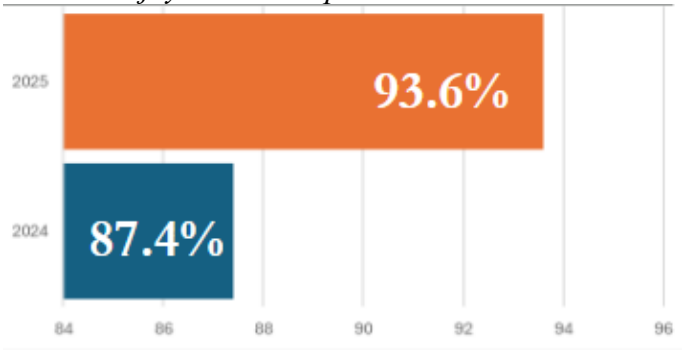

Figure 2

Student Engagement Perception Results Over Two Years

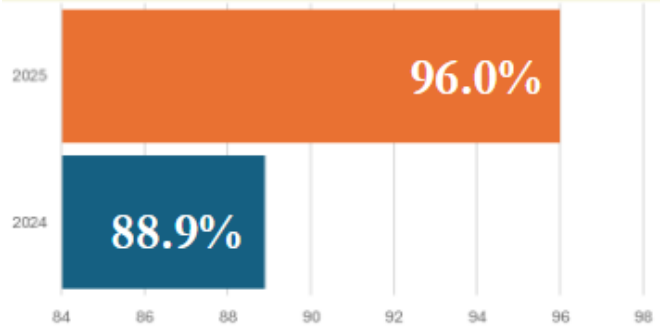

Figure 3

Student Learning Better Perception Results Over Two Years

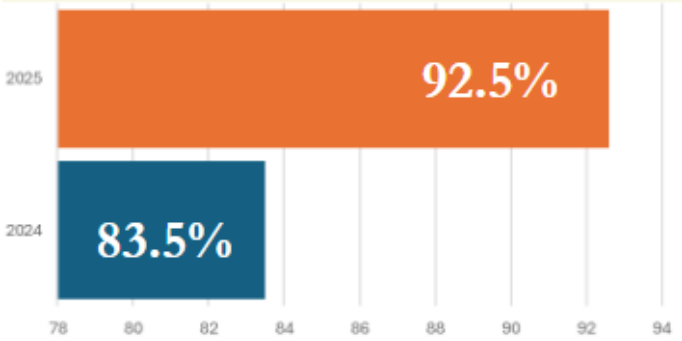

Table 2

Some Qualitative Feedback From Students (2025)

	Sample qualitative feedback by student
Student 1	It allows me to learn a lot more in the same amount of time as a regular lesson
Student 2	It teaches me teamwork
Student 3	I get to use my ipad
Student 4	I don't have to learn 1 thing at a time. Instead, I can learn 2 things in one lesson
Student 5	I could learn from others when playing with people better than me (PE lesson).
Student 6	We were able to move around and learn in smaller groups rather than as one big group.

Figure 4
Teachers' Positive Impact on Learning Perception Results Over Two Years

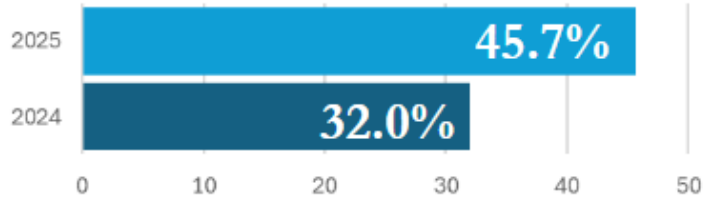

Figure 5
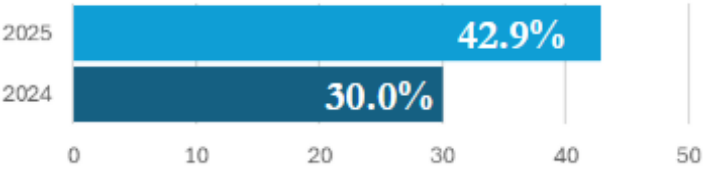
Teachers' Student Learning and Achievement Perception Results Over Two Years



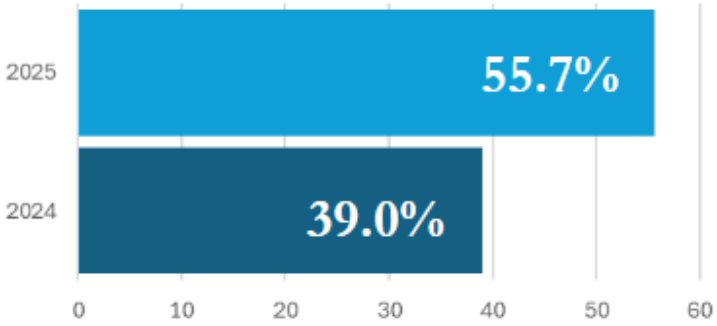


Figure 6
Teachers' Willingness to Continue Using SR

There is a difference in perception between teachers and students on the effectiveness of SR in terms of engagement, effectiveness and enjoyment. The team was not surprised with the results as teachers are humans too. And humans are usually hesitant in using something new. Teachers were asked to not just learn, but to plan and implement a new pedagogy. So the less positive results obtained by the teachers were not unexpected. What is encouraging is that the teachers perceptions have improved over the two years.

The positive results obtained by students were encouraging, give us information that students were not just engaged but enjoy learning using the SR pedagogy. The improvement in students' perception also points to teachers getting better in planning and executing their SR lessons.

Conclusion

Over two years of teachers using SR, it was shown that SR is implementable for all subjects, from Languages, Math to Physical Education. Although there is a gap in teachers' and students' perception in how effective SR is, the improvement in survey results points to positive trend. Having scaffolds built into lesson planning templates also showed an observable improvement in how e-pedagogy was carried out in the tech station.

There were certain challenges that the school faced over the two years of SR being implemented by the whole school. It was clear that it was more complex to plan for an SR lesson as the teacher needs to be aware of all activities in all the stations planned to start and end at the same time. Logistically, there were some issues faced by the teachers, such as moving the furniture to accommodate the three or two stations. A lack of teacher presence at some stations also presented some challenges to both the students and teachers, leading to unclear directions for students. It was also apparent that not all topics were suitable for SR. And SR should not be employed all the time as this will cause teachers to spend an unreasonable amount of time in planning for SR lessons.

Institutions looking to implement SR should start with a two station rotation. This provides a simpler planning and implementation strategy. Each station should also last a minimum of twenty minutes to provide sufficient time and space for impactful student learning. Each station must have clear instructions as the teacher will not be present at all the station at all times. Support and training for teachers is key to the success of SR implementation in any institution. Collaboration between teachers and knowledgeable others increases the effectiveness and chances of success of SR implementation in any institution.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that Google Gemini, an AI-assisted writing software, was used in proofreading, checking for formatting compliance, and refining the language used in the manuscript. The usage was limited to correcting grammatical and spelling errors and ensuring adherence to the specific IAFOR submission guidelines. The author further declares that, apart from Google Gemini, no other AI or AI-assisted technologies have been used to generate content in writing the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from the careful and systematic conduct of the research.

Abstract

This study explores the ethnomathematical practices of the Baduy indigenous community and examines their potential as a foundation for developing culturally contextualized geometry teaching materials for junior high school students in Indonesia. Using a qualitative ethnographic approach, data were collected through participant observation, in-depth interviews with community elders and craftsmen, and documentation of cultural artifacts. The findings reveal that Baduy cultural practices embody rich geometric concepts, particularly through artifacts such as the *Adu Mancung* weaving motif and the *Dudukuy* headgear, which represent rhombus patterns, symmetry, circles, radial structures, and proportional reasoning. These ethnomathematical elements were mapped onto the junior high school geometry curriculum and transformed into contextual learning tasks that connect formal mathematical concepts with authentic cultural experiences. The integration of Baduy ethnomathematics into geometry instruction offers meaningful learning opportunities that enhance students' conceptual understanding, spatial reasoning, and problem-solving skills while fostering appreciation of local wisdom. This study concludes that Baduy ethnomathematics provides a strong pedagogical foundation for culturally responsive geometry education and supports the sustainability of indigenous community knowledge in the context of 21st-century mathematics learning.

Introduction

In the era of rapid globalization and digital transformation, students are increasingly exposed to foreign cultures through social media, entertainment platforms, and global information networks (Becker & Park, 2011; Drozdikova-Zaripova, 2020; Kadirbayeva et al., 2022; Nadarajan et al., 2023). While such exposure provides opportunities for intercultural exchange, it also contributes to the gradual marginalization of local cultures in students' daily lives. Many young learners tend to adopt global popular culture as their primary cultural reference, while indigenous traditions, values, and knowledge systems are progressively overlooked. This phenomenon has raised serious concerns regarding the sustainability of indigenous community education and the intergenerational transmission of local wisdom, which are essential for maintaining cultural identity and social cohesion (Adonis & Silinda, 2021; Dewantara, 2025; Knijnik, 2002; Sianturi et al., 2025).

Education plays a strategic role in preserving cultural heritage, particularly through the integration of local wisdom into school curricula (Adonis & Silinda, 2021; Hilaliyah et al., 2019; Sakinah et al., 2023). However, in many formal education contexts, especially in mathematics education, learning remains largely decontextualized from students' cultural environments. Mathematics is often presented as a universal and abstract body of knowledge, detached from the socio-cultural realities in which students live. As a result, students frequently perceive mathematics as irrelevant to their everyday experiences, which may reduce learning motivation and hinder conceptual understanding (Kadarisma et al., 2020). This situation is exacerbated by the limited availability of instructional materials that incorporate local cultural contexts as meaningful learning resources.

In Indonesia, most mathematics teaching materials used at the junior high school level are still dominated by standardized textbooks that emphasize procedural competence and symbolic manipulation (Hilaliyah et al., 2019; Muhtadi et al., 2021; Nuraeni et al., 2021). Although these materials are aligned with national curriculum standards, they rarely reflect the rich cultural diversity of Indonesian society. The absence of culturally responsive learning resources not only weakens students' cultural literacy but also limits opportunities to develop contextual and meaningful mathematical understanding. Consequently, there is a growing need to design mathematics learning materials that bridge formal mathematical concepts with students' cultural backgrounds.

One promising approach to addressing this challenge is ethnomathematics, which examines mathematical ideas embedded in cultural practices, artifacts, and social activities (D'Ambrosio, 1985, 1997). Ethnomathematics positions culture as a legitimate source of mathematical knowledge and recognizes that different communities develop their own ways of quantifying, measuring, designing, and organizing space. Through ethnomathematics, mathematics learning can be contextualized within students' lived experiences, thereby promoting conceptual understanding, cultural appreciation, and critical thinking (Sari et al., 2025).

The Baduy tribe is an indigenous community in Indonesia that has preserved its traditional way of life for generations. The Baduy people strictly adhere to customary laws and maintain harmonious relationships with nature, social structures, and spiritual values. Their daily activities, including house construction, weaving, farming, and spatial organization of settlements, implicitly embody a variety of mathematical concepts. For example, the architecture of traditional Baduy houses reflects geometric structures such as prisms, pyramids, and rectangular forms, while weaving patterns demonstrate symmetry, repetition, and

geometric transformations. In addition, traditional measurement systems based on body proportions and natural units reveal indigenous approaches to quantification and proportional reasoning.

These cultural practices represent a rich source of ethnomathematical knowledge that is highly relevant to school mathematics, particularly geometry. Geometry plays a central role in developing students' spatial reasoning, visualization, and problem-solving skills. However, geometry is often perceived as one of the most difficult topics by junior high school students due to its abstract nature and heavy reliance on symbolic representations (Hodiyanto & Santoso, 2019; Subekhi & Nindiasari, 2021). Integrating geometric concepts with concrete cultural contexts, such as those found in Baduy culture, may help students construct more meaningful and intuitive understandings of geometric ideas.

Several previous studies have explored ethnomathematics in the Baduy community from different perspectives (Arisetyawan & Yuda, 2019; Bukhori Muslim, 2021; Eliza & Pujiastuti, 2022; Farokhah et al., 2023; Firmansyah & Septiani, 2019a, 2019b; Megantari & Setyawan, 2020; Muhibah et al., 2023; Yulyani et al., 2023). Researchers have documented geometric concepts in traditional house architecture, analyzed patterns and symmetries in weaving crafts, and examined indigenous systems of measurement and spatial organization. These studies consistently demonstrate that Baduy culture contains abundant mathematical representations that can serve as valuable learning resources. However, most of these studies remain at the level of cultural documentation and conceptual identification. The transformation of ethnomathematical findings into structured instructional materials for formal classroom use is still limited.

Furthermore, previous research has rarely addressed the issue of sustainability in indigenous community education by linking ethnomathematics to curriculum development. While ethnomathematical studies contribute to cultural preservation, their impact on formal education practices remains marginal if they are not translated into practical teaching resources. There is a critical gap between ethnomathematical research and classroom implementation, particularly in the development of geometry teaching materials that are aligned with curriculum standards and pedagogical principles.

Therefore, this study seeks to address this gap by positioning Baduy ethnomathematics not only as an object of cultural investigation but also as a foundation for curriculum-oriented instructional design. This research aims to explore and analyze geometric concepts embedded in Baduy cultural practices and to use these findings as the basis for developing geometry teaching materials for Indonesian junior high school students. By integrating local wisdom into formal mathematics learning, this study is expected to contribute to culturally responsive education, promote meaningful learning experiences, and support the sustainability of indigenous community education in the context of 21st-century mathematics learning.

Method

This study employed a qualitative research approach with an ethnographic orientation to explore ethnomathematical practices within the Baduy indigenous community and to use these findings as the foundation for designing geometry teaching materials for junior high school students in Indonesia. The ethnographic approach was selected to capture the cultural meanings, social practices, and contextual realities in which mathematical ideas are embedded in the daily life of the indegenious Community (d'Ambrosio, 2006).

The research was conducted in the Baduy community, Banten Province, Indonesia, which is well known for its strong adherence to customary laws and preservation of traditional lifestyles. The participants included community elders, traditional leaders, craftsmen, and local residents who possess extensive knowledge of Baduy cultural practices. Participants were selected through purposive sampling to ensure that the data reflected authentic cultural representations and indigenous knowledge systems.

Data were collected through participant observation, in-depth semi-structured interviews, and documentation of cultural artifacts. Participant observation focused on daily activities such as house construction, weaving, farming, and settlement organization, with particular attention to practices that reflect geometric concepts. In-depth interviews were conducted with community leaders and craftsmen to explore indigenous perspectives on measurement, spatial organization, and traditional construction techniques. Cultural artifacts, including traditional houses, weaving products, and village layouts, were documented through photographs, sketches, and detailed field notes.

The data were analyzed using thematic analysis with an ethnomathematical perspective. The analysis process involved data reduction, coding, and categorization of mathematical concepts embedded in cultural practices. Identified concepts were then mapped onto the junior high school geometry curriculum to examine their relevance and alignment with learning objectives. This mapping process served as the basis for designing culturally contextualized geometry teaching materials.

To ensure the trustworthiness of the findings, data triangulation was applied by comparing information obtained from observations, interviews, and documentation. Member checking was also conducted by discussing preliminary interpretations with community representatives to confirm the accuracy of the cultural and mathematical interpretations.

Through this methodological framework, the study integrates ethnographic exploration with curriculum-oriented instructional design, ensuring that Baduy ethnomathematics is systematically documented and translated into meaningful geometry learning contexts for junior high school students.

Result and Discussion

This section presents the main findings of the study on ethnomathematical practices within the Baduy community and discusses their implications for junior high school geometry learning. The results highlight the geometric concepts embedded in Baduy cultural activities, artifacts, and spatial organization, and examine how these concepts can be meaningfully integrated into culturally contextualized teaching materials. Furthermore, this section discusses the role of Baduy ethnomathematics in supporting culturally responsive mathematics education and contributing to the sustainability of indigenous community education in the context of 21st-century learning.

The discussion interprets the findings through an ethnomathematical and educational perspective by relating indigenous mathematical knowledge to formal geometry concepts in the school curriculum. It also elaborates on how cultural contexts can serve as powerful learning resources that enhance students' conceptual understanding, engagement, and appreciation of local wisdom. Through this discussion, the study demonstrates that Baduy culture is not only a repository of rich mathematical ideas but also a valuable foundation for

developing meaningful and relevant geometry learning experiences for junior high school students.

One of the main ethnomathematical artifacts identified in this study is the traditional Baduy weaving motif known as *Adu Mancung*. This motif is widely found in woven fabrics used by the Baduy community, particularly among the Baduy Luar, and carries strong cultural, social, and philosophical meanings. The Adu Mancung motif is characterized by a repeated arrangement of diamond-shaped patterns formed by symmetrical geometric structures that resemble a sequence of rhombuses aligned horizontally.

From an ethnomathematical perspective, the Adu Mancung motif represents a clear manifestation of geometric concepts embedded in Baduy cultural practices. The basic structure of the motif consists of a sequence of congruent rhombuses arranged in a regular and repetitive pattern. Each rhombus is formed by four equal sides and diagonals that intersect perpendicularly, reflecting fundamental properties of plane geometry. The motif also exhibits translational symmetry, as the pattern is generated through the repetition of a single geometric unit along a linear direction. In addition, reflective symmetry can be observed in the arrangement of the shapes, indicating an intuitive understanding of geometric balance and proportion within Baduy weaving traditions.

The process of producing the Adu Mancung motif involves precise spatial reasoning, proportional thinking, and pattern recognition. Weavers determine the size, alignment, and spacing of each rhombus based on traditional rules that have been transmitted across generations. Although these rules are not formally expressed using mathematical symbols, they reflect an indigenous mathematical system that governs consistency, regularity, and aesthetic harmony in textile production. This demonstrates that the Baduy community possesses an implicit form of geometric knowledge that is deeply rooted in their cultural practices.

The Adu Mancung motif holds not only aesthetic value but also cultural and philosophical significance. In Baduy tradition, the motif symbolizes harmony, balance, and unity, reflecting the community's social values and worldview. The repetitive interlocking rhombus shapes represent togetherness and continuity, which are essential principles in Baduy social life. This cultural meaning further strengthens the relevance of the motif as a contextual learning resource, as it allows students to explore geometry while simultaneously understanding the values embedded in indigenous culture.

Based on these findings, the Adu Mancung motif can be systematically transformed into a contextual learning resource for junior high school geometry instruction. The repeated rhombus patterns provide concrete representations for introducing concepts such as quadrilaterals, properties of rhombuses, perimeter and area, symmetry, and geometric transformations. For example, students can be guided to identify the properties of rhombuses from the motif, calculate the area of each geometric unit, analyze the symmetry of the pattern, and investigate the effects of translation and reflection in the motif's arrangement.

Figure 1

Geometric Representation of the Adu Mancung Weaving Motif in Baduy Culture

Motif Adu mancung adalah salah satu motif tenun Baduy yang sederhana, berupa wajik atau separuh wajik yang disusun berurutan. Suku Baduy Luar mengadaptasi teknik songket dalam pembuatan motif pada kain tenun Adu Mancung yang memiliki nilai sakral diperuntukan bagi laki-laki Baduy Luar dan digunakan pada saat acara adat dan budaya Suku Baduy Luar. Keistimewaan tenun motif Adu Mancung adalah digunakan dalam kegiatan keagamaan karena mengandung makna filosofis suku Baduy Luar, yang menganut sistem perkawinan monogami, dan kerukunan keluarga baru pasangan Baduy Luar yang menikah

Jika kita perhatikan susunan pola motif adumancung akan menghasilkan bentuk belah ketupat seperti pada gambar disamping

The *Adu Mancung* motif is one of the traditional Baduy weaving motifs characterized by a simple design in the form of a diamond or half-diamond shape arranged sequentially. The Baduy Luar community adopts the songket weaving technique in producing the Adu Mancung woven fabric, which possesses sacred value and is specifically intended for Baduy Luar men. This fabric is used during traditional and cultural ceremonies of the Baduy Luar community. The uniqueness of the Adu Mancung woven motif lies in its use in religious activities, as it contains philosophical meanings of the Baduy Luar people, who uphold a monogamous marriage system and emphasize harmony within newly married Baduy Luar families.
If we observe the arrangement of the Adu Mancung motif pattern, it forms a rhombus shape, as illustrated in the adjacent figure.

Furthermore, the Adu Mancung motif can be incorporated into geometry learning activities through visual exploration, pattern reconstruction, and project-based tasks. Students may be asked to redesign the motif using coordinate geometry, create tessellation patterns based on the rhombus structure, or model the motif using dynamic geometry software. Such activities promote meaningful learning by connecting abstract geometric concepts with authentic cultural artifacts.

Figure 2

Contextual Geometry Problem Based on the Adu Mancung Weaving Motif

Permasalahan :

Seorang penenun ingin membuat kain dengan panjang 2 meter yang dihiasi deretan belah ketupat berukuran sama (panjang diagonal 20 cm dan 12 cm). Jika motif belah ketupat disusun berjajar horizontal tanpa celah, berapa banyak belah ketupat yang bisa dimuat dalam kain sepanjang 2 meter? Berapa luas total belah ketupat yang menghiasi kain tersebut?

A weaver wants to make a piece of fabric with a length of 2 meters that is decorated with a sequence of identical rhombus motifs (with diagonal lengths of 20 cm and 12 cm). If the rhombus motifs are arranged horizontally without any gaps, how many rhombuses can fit along the 2-meter fabric? What is the total area of the rhombuses that decorate the fabric?

The learning content presents a contextual geometry problem that connects mathematical concepts with traditional weaving activities. Students are introduced to a real-life situation in which a weaver plans to produce a two-meter-long fabric decorated with a horizontal sequence of identical rhombus motifs, each having diagonals of 20 cm and 12 cm. The motifs are

arranged side by side without gaps, and students are asked to determine how many rhombuses can fit along the length of the fabric and to calculate the total area covered by the motifs. Through this problem, students are encouraged to apply their understanding of rhombus properties, area formulas, and unit conversions in a meaningful cultural context. Such tasks help students develop problem-solving skills, spatial reasoning, and mathematical modeling abilities while simultaneously fostering an appreciation of local cultural heritage and demonstrating the relevance of mathematics in everyday life.

These results indicate that the Adu Mancung weaving motif represents a rich ethnomathematical resource that can serve as a strong foundation for developing culturally contextualized geometry teaching materials. By integrating this indigenous pattern into formal mathematics instruction, geometry learning becomes more concrete, relevant, and culturally responsive, while simultaneously contributing to the preservation and appreciation of Baduy cultural heritage (Fitri et al., 2020; Kehi et al., 2019).

The second ethnomathematical artifact identified in this study is *Dudukuy*, a traditional woven bamboo headgear used by the Baduy community. *Dudukuy* is a large circular hat specifically worn by Baduy Luar women, while Baduy men commonly use *Iket* (or Blangkon/Lomar), a triangular-shaped headcloth. In addition, the Baduy community also uses *Caping* (farmer's hat), another circular woven bamboo hat designed to protect farmers from sunlight while working in the fields. These traditional head coverings demonstrate a strong representation of geometric concepts, particularly circles and triangles, embedded in Baduy cultural practices.

From a geometric perspective, *Dudukuy* exhibits the properties of a circle, including a central point, radius, diameter, and circumference. The weaving pattern radiates outward from the center, forming concentric circular structures that reflect an intuitive understanding of radial symmetry and proportional spacing. The structural design of *Dudukuy* requires careful measurement and spatial reasoning to ensure balance, stability, and comfort when worn. Meanwhile, the Iket headcloth represents a triangular form when folded and tied, illustrating the application of triangular geometry in traditional clothing design.

The production of *Dudukuy* involves precise weaving techniques that rely on consistent spacing and uniform curvature, indicating an implicit understanding of circular geometry and symmetry. The radial weaving pattern also demonstrates repeated angular divisions around the center, which can be interpreted as a practical application of angle concepts and partitioning of a circle into equal sectors. Although these concepts are not formally expressed in mathematical notation, they reflect indigenous mathematical reasoning developed through cultural experience and craftsmanship.

Figure 3
Dudukuy as an Ethnomathematical Artifact of Circular Geometry

Masyarakat Suku Baduy menggunakan beberapa jenis penutup kepala, termasuk **Dudukuy** (atau Tudung) yang merupakan topi anyaman bambu berbentuk bundar besar yang khusus untuk wanita Baduy Luar, dan Iket (atau Blangkon/Lomar) yang merupakan kain ikat kepala berbentuk segitiga yang digunakan oleh pria, baik di Baduy Dalam maupun Baduy Luar. Selain itu, ada juga Caping (atau Tudung Petani), topi anyaman bambu berbentuk bundar besar yang fungsinya lebih untuk melindungi dari sinar matahari saat berladang.

Figure 4
Contextual Geometry Problem Based on the Baduy Dudukuy Headgear

Sebuah *dudukuy* (tutup anyaman bundar) dibuat oleh perajin Baduy. *Dudukuy* berbentuk lingkaran dengan **diameter 40 cm**. Perajin menenun dudukuy dengan menggunakan **strip bambu** (lebar strip = **2 cm**) yang ditata secara berlapis (seperti kisi sederhana: arah mendatar dan arah tegak lurus, dua orientasi), sehingga pada akhirnya ada susunan strip horizontal dan strip vertikal yang saling bertumpuk.

Asumsikan setiap strip bambu dipotong memanjang sepanjang **diameter dudukuy** (untuk perhitungan sederhana kita anggap semua strip memiliki panjang sama = diameter). Satu batang bambu utuh dapat dipotong menjadi **2 potongan panjang 1 m** yang siap dipakai (jadi setiap batang memberikan 2 meter bambu total yang bisa dipakai dalam potongan-potongan).

Hitung:

1. Luas dudukuy dalam **cm²** dan **m²**.
2. Berapa banyak **strip** (bambu) yang diperlukan pada satu orientasi (mis. arah horizontal)? Berapa total strip jika ada dua orientasi (horizontal + vertikal)?
3. Jika setiap strip panjangnya = diameter (40 cm), berapa **jumlah total panjang bambu** yang dibutuhkan (dalam meter)?
4. Berapa **batang bambu** yang diperlukan ?

A *Dudukuy* (a circular woven head covering) is made by Baduy craftsmen. The *Dudukuy* has a circular shape with a diameter of 40 cm. The craftsmen weave the *Dudukuy* using bamboo strips (each strip is 2 cm wide) that are arranged in layers, similar to a simple grid pattern with two orientations: horizontal and vertical. As a result, the final structure consists of overlapping horizontal and vertical bamboo strips.
Assume that each bamboo strip is cut with a length equal to the diameter of the *Dudukuy* (for simplicity, assume all strips have the same length as the diameter). One whole bamboo pole can be cut into two pieces of 1 meter each, meaning that each pole provides a total of 2 meters of usable bamboo.
Calculate:

1. The area of the *Dudukuy* in square centimeters (cm²) and square meters (m²).
2. The number of bamboo strips required for one orientation (e.g., horizontal). How many strips are needed in total if there are two orientations (horizontal and vertical)?
3. If each strip has a length equal to the diameter (40 cm), what is the total length of bamboo required (in meters)?
4. How many bamboo poles are needed?

The figure illustrates a contextual geometry learning task based on the traditional Baduy headgear known as *Dudukuy*. The image presents a circular woven bamboo hat with a diameter of 40 cm, constructed using layered bamboo strips arranged in horizontal and vertical orientations. The accompanying problem guides students to explore geometric concepts such as the area of a circle, unit conversion, grid arrangement, and linear measurement through the process of estimating the number of bamboo strips required and calculating the total length of bamboo used. This learning context connects formal geometry concepts with indigenous craftsmanship, enabling students to understand mathematics through authentic cultural practices.

These findings indicate that *Dudukuy* can serve as meaningful ethnomathematical resources for junior high school geometry learning. The circular structure of *Dudukuy* provides a concrete representation for introducing concepts such as radius, diameter, circumference, area of a

circle, and rotational symmetry. Similarly, the triangular form of the Iket can be used to explore properties of triangles, perimeter, area, and angle relationships. By using these cultural artifacts as learning contexts, students can visualize abstract geometric concepts through real objects that are closely connected to Indonesian cultural heritage.

Furthermore, integrating *Dudukuy* into geometry teaching materials allows students to explore mathematical ideas through observation, measurement, and reconstruction activities. For example, students can analyze the weaving pattern to estimate the number of radial divisions, calculate the circumference and area of the hat, or design their own circular weaving patterns based on geometric principles. Such activities promote meaningful learning, enhance spatial reasoning, and foster cultural awareness.

Conclusions

This study demonstrates that the Baduy indigenous community possesses rich ethnomathematical knowledge that is deeply embedded in their daily cultural practices and traditional craftsmanship. The findings reveal that cultural artifacts such as the *Adu Mancung* weaving motif and the *Dudukuy* headgear represent fundamental geometric concepts, including rhombus patterns, symmetry, circles, radial structures, and proportional reasoning. These cultural forms embody an implicit mathematical system that reflects the community's spatial reasoning, measurement practices, and pattern construction skills developed through generations of experience.

By transforming these ethnomathematical findings into contextual geometry learning tasks, this study highlights the potential of Baduy culture as a meaningful and authentic learning resource for junior high school mathematics education in Indonesia. The integration of indigenous artifacts into geometry instruction enables students to visualize abstract concepts through concrete cultural representations, thereby enhancing conceptual understanding, problem-solving skills, and spatial reasoning. Moreover, culturally contextualized learning promotes students' appreciation of local wisdom and strengthens their cultural identity in the midst of global cultural influences.

Furthermore, this study contributes to the sustainability of indigenous community education by positioning Baduy ethnomathematics not only as cultural heritage but also as an integral component of formal school curricula. Integrating local wisdom into mathematics learning supports culturally responsive pedagogy and encourages the preservation of indigenous knowledge through intergenerational transmission within educational contexts.

In conclusion, Baduy ethnomathematics provides a strong foundation for developing culturally meaningful geometry teaching materials that align with 21st-century learning principles. Future research may extend this work by implementing and evaluating these materials in classroom settings to examine their impact on students' mathematical achievement, cultural literacy, and learning motivation.

Acknowledgment

The authors gratefully acknowledge the financial support provided by the Directorate of Research and Community Service, Directorate General of Research and Development, Ministry of Education, Science, and Technology of the Republic of Indonesia. The authors also

express their sincere appreciation to the Baduy indigenous community for their valuable participation and cooperation during the research process.

Official Conference Proceedings

Abstract

Grounded in interpreter training research and cognitive load theory, this study examines how different note-taking patterns influence interpreting accuracy. It focuses on three types of notation including full words, abbreviations, and symbols and identifies the note-related difficulties commonly experienced by learners. Using a mixed-methods design, data were collected from 48 undergraduates at the Diplomatic Academy of Vietnam through live consecutive interpreting tasks, retrospective interviews (n = 7), and an online survey (n = 41). The findings show that full-word notation is negatively associated with accuracy, whereas abbreviations and symbols correlate positively with accuracy. Students also reported challenges linked to information overload, limited familiarity with notation systems, and inconsistently structured notes. These results underscore the pedagogical importance of cognitively informed, strategy-focused note-taking instruction and call for more systematic integration of notation training into interpreter education.

Introduction

Consecutive interpreting (CI) remains a central modality of mediated communication in multilingual settings. Its prominence is particularly evident in Asian institutional and diplomatic contexts, where flexibility, confidentiality, and cost-efficiency are prioritized (Gillies, 2017). In CI, interpreters process the source speech in segments and reproduce its content immediately after each pause. Because these segments frequently exceed working-memory capacity, interpreters rely on note-taking as an external cognitive scaffold that helps manage processing load and maintain accurate recall (Gile, 1995; Pöchhacker, 2015; Seleskovitch, 1978).

Note-taking in CI is not a passive act of transcription but a selective, strategic, and cognitively demanding process. It unfolds under strict time pressure while competing with listening, analysis, memory operations, and coordination, which makes it fundamentally different from general-purpose note-taking (Gile, 1995; Gillies, 2017). Previous research shows that strategic note-taking enhances both accuracy and fluency, especially when interpreters employ reduced forms such as symbols and abbreviations to encode meaning efficiently (Rozan, 1956; Setton & Dawrant, 2016). These systems also become increasingly personalized, as interpreters combine symbols, abbreviations, and full words in ways shaped by cognitive preferences and training backgrounds (Chen, 2020).

Despite its central role in CI, empirical research that examines how specific note-taking strategies affect interpreting performance remains limited. Most existing studies focus on professional interpreters or advanced trainees, leaving early-stage learners systematically underexamined (Dai & Xu, 2007; Dam, 2021). There is still limited knowledge about how undergraduate interpreters, especially those trained in English-as-a-foreign-language (EFL) settings, construct and use their note-taking systems. Even less is known about how their use of full words, abbreviations, and symbols relates to accuracy and fluency in CI performance. This gap is particularly salient in the Vietnamese context, where interpreter training is expanding rapidly, but remains underrepresented in international scholarship.

The Diplomatic Academy of Vietnam (DAV), with its established translation and interpreting program, offers a representative EFL-based environment for examining note-taking practices among novice interpreters. Understanding how these learners deploy different note-taking forms, and identifying recurring problems in their notes, can generate insights for improving CI training and supporting the development of effective note-taking skills. Such insights are essential, as note-taking functions as a central cognitive mechanism that mediates memory processes and shapes interpreting output (Pöchhacker, 2015; Setton & Dawrant, 2016).

Guided by these considerations, the present study addresses two questions:

RQ 1. How does the use of full words, abbreviations, and symbols in students' notes influence the accuracy of their consecutive interpreting performance?

RQ 2. What types of note-taking difficulties are most commonly associated with decreased accuracy in students' consecutive interpreting?

To address these questions, the study adopts a mixed-methods design combining content analysis of students' notes, standardized performance assessment, and retrospective interviews. By examining how different note-taking strategies function as memory aids for novice interpreters, the study contributes to a more nuanced understanding of note-taking as both a

cognitive and pedagogical tool in early-stage CI training. It also offers implications for curriculum design in EFL interpreter-education contexts.

Literature Review

Theoretical Foundations of Note-Taking in Consecutive Interpretating

Historically, a number of influential studies have been conducted on the conceptualization and development of note-taking systems in consecutive interpreting. Consecutive notes serve as memory prompts, supporting rather than replacing understanding (Seleskovitch, 1978), and represent the "skeleton structure" of the original discourse rather than verbatim transcription (Gillies, 2017). Effective note-taking enables interpreters to focus on comprehension while listening and later analyze their notes to produce accurate and coherent output. Ilg and Lambert (1996) and Jones (2014) highlight the importance of visual structuring and symbolic efficiency, noting that well-structured notes aid both memory and delivery.

Notably, Gile's Effort Models (1995) provide a valuable framework for understanding how note-taking influences interpreter performance by conceptualizing consecutive interpreting as a process involving two interrelated phases. In the first phase, listening and note-taking, interpreters simultaneously engage in listening and analysis (L), note-taking (N), short-term memory management (M), and coordination of these activities (C). The second phase, target speech production, involves remembering the source content (Rem), reading and retrieving notes (Read), and producing the target speech (P). Within this framework, note-taking (N) directly competes with listening and memory for cognitive resources, such that inefficient notes increase cognitive load during both listening and production, ultimately reducing output quality. Conversely, when symbols are internalized and applied efficiently, they decrease cognitive demands in both phases by minimizing the time and effort required for note production and retrieval, thereby supporting more accurate and fluent interpretation.

Gile and Chai (2009) argue that properly recorded notes serve as a strong memory aid, making it easier to recall speech units and produce fluent interpretations. As approved by Zhou and Dong (2019), note-taking significantly enhances the accuracy and fluency of consecutive interpreters' recall of source texts, with a facilitative effect increasing as interpreting training experience accumulates. In practice, the interpreter who can use compact, meaningful symbols during listening has more mental bandwidth to allocate to short-term memory and analysis. This suggests that symbolic systems, when well-learned, enhance both processing efficiency and interpretive accuracy.

Numerous researchers have utilized the Effort Models in their work. For instance, G. Wu and Wang (2009) introduced a supplementary approach called discourse transformation to address capacity limitations, building on Gile's Effort Models. Later, C. Wang (2023) emphasizes the cognitive limitations of interpreters, highlighting that effective note-taking in consecutive interpreting must structure ideas coherently. Similarly, Kuang and Zheng (2022) examine how the effort model is reflected in the interpreters' note-taking effort, note-taking product, and note-reading effort. To enhance the pedagogical relevance of the concept, Gile (2021) redefined the Effort Models as a practical teaching tool, highlighting their role in illustrating high cognitive demands, identifying core challenges, and forecasting developments in translation and interpreting studies.

Interpreters must distill complex utterances into cognitively manageable forms while maintaining the logical structure and semantic integrity of the source speech. To achieve this, interpreters rely on a repertoire of notational elements, typically grouped into three main categories: symbols, abbreviations, and full words. “A symbol represents a concept, not a word” (Gillies, 2017); therefore, when interpreters use symbols in note-taking, the focus is on the underlying meaning of a term, not on the actual word or expression used by the speaker. Regarding abbreviations, a general rule of thumb is to shorten all words longer than four or five letters (Rozan, 1956). Writing out full words is discouraged in note-taking, as it can slow down the interpreter, except for some proper names.

Rozan’s (1956) system is based on efficiency and simplicity. He introduces 10 basic signs (such as plus, minus, brackets) and 10 additional symbols divided into three categories. This minimalist approach is language-independent and aimed at maximizing speed and comprehension (Albl-Mikasa, 2008). However, Matyssek (1989) adopts a contrasting view. While he supports Rozan’s seven principles, he advocates for the extensive use of symbols. Matyssek argues that symbols are more efficient than words or abbreviations, as they are quicker to write and easier to read. He has developed a comprehensive system of categorized symbols that interpreters can adapt to their personal style. Opinions remain divided on the use of symbols. Chen (2020) supports symbols for their speed and clarity. On the other hand, Bowen & Bowen (1984) caution that if a symbol requires more strokes than an abbreviation, it is less efficient and should not be used just for the sake of being a symbol. They emphasize practicality and suggest that note-taking systems (NTS) need not be overly systematic, since both handwriting and spoken language are inherently inconsistent.

In terms of language choice, it remains a contested issue in interpreting studies. Dam (2021) emphasized the influence of the language’s status within the interpreter’s language combination, rather than its functional role in the task. Particularly, Y. Wu (2010) observed that while taking notes in the source language (Chinese) can reduce cognitive load, students who used the target language (English) performed better, indicating enhanced comprehension and processing. Additionally, González (2012) and Zhan (2019) argued that the interpreter's expertise level plays a crucial role in determining language choice. Furthermore, Zhan (2019) expanded this view by suggesting that language choice is also shaped by practical factors such as handwriting efficiency with interpreters often relying on language-based note forms.

Empirical Studies on Note-Taking and Interpreting Quality

Empirical investigations into note-taking in consecutive interpreting (CI) have consistently sought to understand how specific note-taking practices relate to interpreting performance. Early studies, such as Her (2001), examined Chinese-English student interpreters with varying training levels and found a positive correlation between overall note quality and interpreting outcomes. This finding indicates that well-structured and meaningful notes do not merely record information but actively support cognitive processing, enabling interpreters to manage memory load and maintain accuracy during production. Chen (2021) further confirmed this association in a sample of both students and professional interpreters, demonstrating that experience and proficiency in note-taking jointly enhance CI performance. Collectively, these studies suggest that note quality, including clarity, organization, and symbolic representation, serves as a fundamental mediator between source-text comprehension and target-text production, aligning with theoretical perspectives that frame notes as external memory aids (Gile & Chai, 2009; Gillies, 2017; Seleskovitch, 1978).

Beyond overall note quality, researchers have examined the effects of specific note-taking features, such as note quantity, symbol use, abbreviations, and reliance on full words. Cardoen (2018) found that, for Dutch-Spanish interpreters, note quantity generally facilitated both accuracy and fluency, yet the impact of symbols varied according to task complexity, and overuse of abbreviations sometimes hindered fluency. J. Wang and Wu (2022) observed that the use of incomplete Chinese characters and symbols enhanced interpreting outcomes among Chinese-English students, reinforcing the notion that cognitive efficiency in encoding and retrieving information is crucial for CI performance. In contrast, Y. Liu et al. (2023) reported no significant relationships between note-taking features and interpreting quality, a result likely influenced by small sample sizes and variability in participants' training and proficiency.

These mixed results highlight several critical points. First, note-taking effects are inherently context-dependent, influenced by factors including the language pair, interpreting direction, task complexity, and the interpreter's level of expertise (González, 2012; Zhan, 2019). Second, empirical studies often focus on a narrow set of participants or on isolated features of note-taking, leaving the holistic effect of note-taking on both accuracy and fluency underexplored. Third, most prior research has concentrated on well-established language pairs and professional contexts, with little attention to emerging or understudied combinations such as English-Vietnamese CI.

This study addresses these gaps by examining how note-taking strategies – full words, abbreviations, and symbols – relate to interpreting performance among undergraduates at the Diplomatic Academy of Vietnam (DAV). As a national institution for training diplomats and multilingual communication professionals, DAV represents interpreter education within emerging EFL contexts in Southeast Asia and provides an appropriate setting for investigating note-taking under authentic cognitive and institutional demands.

Within this context, the study explores the cognitive and practical implications of note-taking features and their effects on interpreting quality, particularly accuracy. By generating context-sensitive evidence, it offers pedagogical insights for undergraduate CI training and helps bridge the gap between cognitive load theories (Gile, 1995; Ilg & Lambert, 1996) and classroom-based learning outcomes.

Methodology

Research Design

This study adopts a mixed-method design integrating quantitative and qualitative data to examine the relationship between three note-taking strategies – full words, abbreviations, and symbols and consecutive interpreting (CI) quality among undergraduate learners. Combining data types enables cross-checking and enhances validity (Turner et al., 2017).

The design is grounded in Gile's Effort Models (1995), which conceptualize CI as the coordination of Listening, Note-taking, Memory, and Production Efforts. Within this framework, full words support retrieval but increase processing time; abbreviations reduce time costs but risk ambiguity; and symbols maximize speed but require stable internal conventions. These distinctions inform the operationalization of note-taking variables and their hypothesized effects on interpreting quality.

The study is situated at the Diplomatic Academy of Vietnam (DAV), a leading institution for training diplomats, interpreters, and language professionals. As interpreter education in Vietnam is developing within a broader EFL context, DAV provides a representative setting for examining cognitive load management in CI and the effectiveness of note-taking instruction.

The study pursues two aims: (1) to examine statistical relationships between note-taking features and interpreting quality, and (2) to explore learners' note-taking difficulties. Accordingly, the research was conducted in two stages: a controlled interpreting experiment with retrospective interviews, followed by a survey of a larger student cohort.

Participants

Forty-eight students enrolled in the English Linguistics program at DAV participated in the study. All had completed introductory interpreting training and demonstrated at least IELTS 6.5 proficiency. A small subsample (n = 7) was selected for the experimental phase to generate in-depth, information-rich data on note-taking behaviours and cognitive decision-making during consecutive interpreting. In line with qualitative research guidelines, sample size was determined by data richness, research scope, and data collection methods rather than statistical considerations (Moser & Korstjens, 2018).

The remaining participants (n = 41) completed an online questionnaire to capture broader practices and perceptions of note-taking. This sample size is appropriate for exploratory survey research, which typically involves 20–150 participants (Daniel, 2012). All participants provided informed consent, and all data were anonymized to ensure confidentiality.

Data Collection Procedures

Stage 1: Interpreting Experiment and Retrospective Interviews

Seven students completed two CI tasks: Vietnamese-to-English (V-E) and English-to-Vietnamese (E-V). The recordings were selected for clarity, moderate speed, and general topics to avoid unnecessary technical load. The V-E passage (2:15, 244 wpm) discussed minimalism and electronic devices. The E-V passage (2:30, 109 wpm) described steps for filing a police report. Task order was counterbalanced.

Students took notes on paper during listening and delivered their interpretations immediately afterward. Note-taking competed with listening and memory, which made it possible to observe how note choices affected cognitive effort during CI. After the interpreting tasks, each student participated in a 20-minute retrospective interview. They explained why they chose certain forms (full words, abbreviations, symbols), discussed difficulties they experienced, and clarified unclear parts of their notes. All interviews were recorded and transcribed.

Stage 2: Online Survey

A survey was then administered to 41 additional students. It examined their note-taking strategies, challenges, and perceptions of how note-taking affects interpreting accuracy. The survey helped situate the experimental findings within a broader student context.

Data Analysis

Quantitative Analysis

Three note-taking features including full words, abbreviations, and symbols were counted for each participant's notes in both interpreting directions. Counting was performed at the unit-level of individual note items rather than lines or ideas, allowing consistent comparison across participants.

Interpreting accuracy was evaluated using an adapted version of Lee's (2008) rubric. Accuracy was defined based on the widely accepted criterion of *sense consistency* between source speech and target rendition (Gile, 1995; Kurz, 2003). Following Pöchhacker's (2015) notions of "accurate rendition" and "equivalent intended effect," accuracy was operationalized as the degree to which meaning was preserved. Errors included unjustified omissions, additions, and distortions of intended meaning.

Two trained raters independently assessed all CI recordings. Inter-rater reliability was calculated using Cohen's kappa in SPSS 27. The coefficient ($\kappa = 0.78$) indicated substantial agreement. Disagreements were resolved through discussion.

Data were analyzed in SPSS 27. Pearson correlation tested associations between note-taking patterns and accuracy. Multiple regression examined how each note-taking feature predicted accuracy while controlling for language direction and individual differences.

Qualitative Analysis

Interview transcripts and scanned notes were coded in NVivo 12. Open coding identified common problems such as incomplete information, unclear symbols, ineffective abbreviations, and disorganized note layout. Axial coding then grouped these issues into broader themes. The qualitative findings contextualized the statistical patterns, explaining why certain note-taking strategies supported or hindered accurate interpretation.

Collectively, quantitative and qualitative strands were integrated at the interpretation stage. Examining behavioural patterns (from notes and accuracy scores) alongside learners' metacognitive accounts (from interviews and surveys) provided a multidimensional understanding of how note-taking choices shape cognitive load and CI performance. This design thus aligns empirical evidence with the theoretical assumptions of Effort Models, allowing the study to draw practice-oriented implications for interpreter training in EFL contexts.

Results

Assumptions Check

Prior to analysis, data were inspected for normality and homoscedasticity. Residuals were approximately centered around zero with no systematic pattern, supporting the use of parametric tests. Minor deviations from normality were observed but deemed negligible. (see Appendix 3, Table 3.1, Figures 3.1–3.3)

Note-taking Patterns in EV and VE Tasks

Experimental Task (n = 7)

Participants' note-taking in English-Vietnamese (EV) tasks consisted mainly of full words (M = 0.54, SD = 0.10), abbreviations (M = 0.27, SD = 0.07), and symbols (M = 0.19, SD = 0.07). In Vietnamese-English (VE), full words decreased slightly (M = 0.49, SD = 0.11) and symbols increased (M = 0.28, SD = 0.13).

Table 1
Descriptive Statistics of Note-Taking Patterns (n = 7)

Strategy	EV Mean	EV SD	VE Mean	VE SD
Full words	0.54	0.10	0.49	0.11
Abbreviations	0.27	0.07	0.23	0.05
Symbols	0.19	0.07	0.28	0.13

Pearson correlations indicated a negative association between full words and accuracy (EV: r = -0.84; VE: r = -0.89) and a positive association between symbols and VE accuracy (r = 0.88). Abbreviations showed inconsistent patterns. These results are exploratory due to the small sample. (see Appendix 4, Table 4.1)

Survey Findings (n = 41)

Survey responses reflected frequent use of full words (M = 3.10, SD = 0.94), symbols (M = 2.71, SD = 0.81), and abbreviations (M = 2.27, SD = 0.84). Correlations with self-reported accuracy were negative for full words ($r = -0.42$, $p = .003$) and positive for symbols ($r = 0.59$, $p < .001$) and abbreviations ($r = 0.36$, $p = .010$). (see Appendix 4, Table 4.24.3)

Multiple regression indicated that symbols predicted accuracy most strongly ($\beta = 0.49$, $p < .001$), full words had a negative effect ($\beta = -0.30$, $p = .022$), and abbreviations contributed positively but non-significantly ($\beta = 0.10$, $p = .457$; $R^2 = 0.451$). (see full data on Appendix 5, Table 5.1–5.3)

Table 2
Linear Regression Results Predicting Interpreting Accuracy From Note-Taking Patterns

Predictor	β	t	p
Full words	−0.30	−2.39	0.022
Abbreviations	0.10	0.75	0.457
Symbols	0.49	3.71	< 0.001

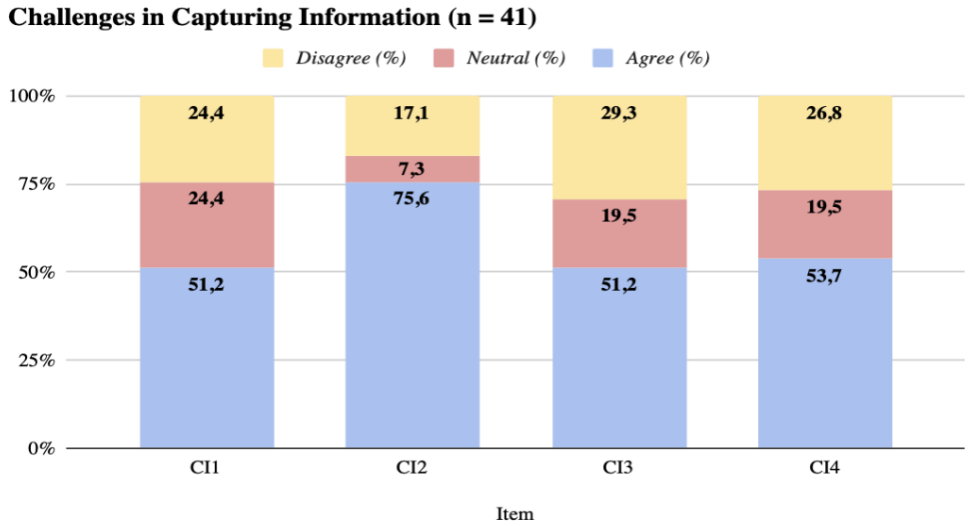
Consistently across experimental and survey data, symbol use is positively associated with interpreting accuracy, whereas heavy reliance on full words is negatively associated.

Common Challenges Affecting Interpreting Quality

To investigate challenges in interpreting note-taking, a structured questionnaire based on three thematic areas was developed with seven pilot participants and administered to 41 students. Over 83% of respondents agreed that note-taking positively influences interpreting performance, 14.6% were neutral, and 2.4% disagreed, indicating a strong perceived value of note-taking and warranting further exploration of specific difficulties.

Challenges Related to Capturing Information

Nine coded interview references highlighted difficulties in efficiently capturing spoken information. Students often relied on full-word notation when uncertain about abbreviations or symbols, which increased cognitive load:



"I just focus too much on writing and miss the next part of the message." (Participant No. 6)

"One common problem I have to deal with is not being able to write fast enough, which sometimes leads to missing the next piece of information." (Participant No. 3)

Quantitative data supported these observations. The four-item scale demonstrated good internal reliability (α = .781; standardized α = .780). As shown in Table 8, 75.6% reported difficulty capturing enough information during complex content (CI2). Over half frequently missed key information (CI1, 51.2%) or struggled to record numbers, names, or units accurately (CI3, 51.2%). Additionally, 53.7% indicated their notes were often dense or overloaded (CI4). These results suggest students face consistent challenges in balancing completeness and clarity under cognitive pressure.

Figure 1

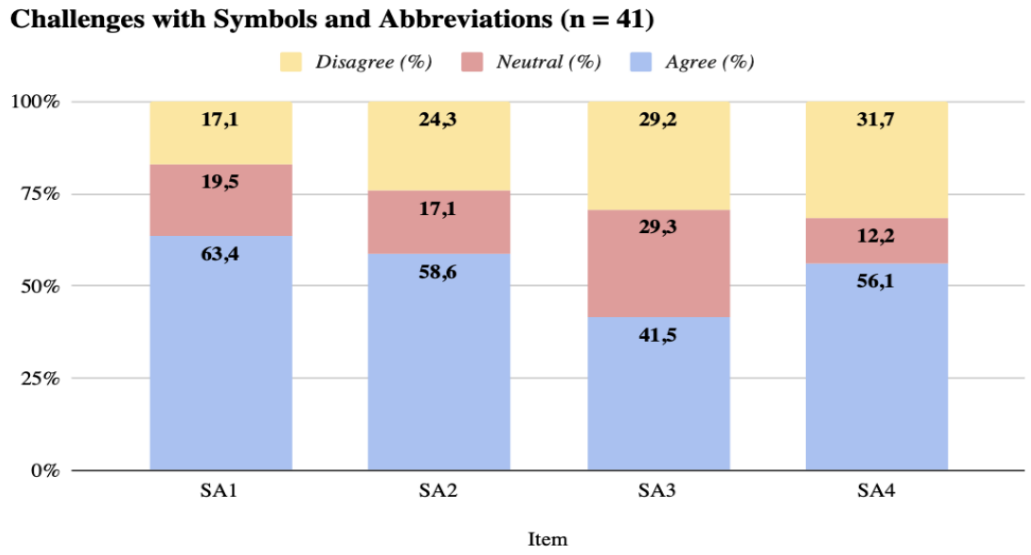
Capturing Information Problems in Interpreting Note-Taking Strategies Encountered by Students (n = 41)

Note. CI1: I often miss key information when taking notes during interpreting tasks.
CI2: When interpreting dense or complex content, I often fail to capture enough useful information in my notes.
CI3: I struggle to write down numbers, names, or units in a complete and accurate way.
CI4: My notes are often too dense or overloaded with too much information.

Unfamiliarity With Symbols and Abbreviations

Ten coded references revealed inconsistent or limited use of symbols and abbreviations. Students avoided symbolic notation due to insufficient training or lack of a personal system:

"I don't have a consistent symbol or abbreviation. So sometimes I forget what I meant or misunderstand my own notes." (Participant No. 4)



"If I use abbreviations or symbols I am not familiar with, or that just pop up in the moment, I sometimes get confused by them while interpreting." (Participant No. 1)

"I know symbols can be faster, but I don't have a system. I just use arrows or maybe some simple signs." (Participant No. 2)

The four-item scale showed acceptable reliability (α = .715; standardized α = .718). Inconsistent abbreviation use (SA1) was most common, reported by 63.4% of students. Underuse of symbols (SA2) was noted by 58.6%, while 41.5% reported occasional symbol overload (SA3). Over half (56.1%) tended to write full words instead of abbreviations (SA4). These findings indicate recognition of the efficiency benefits of symbolic notation but insufficient consistency in application.

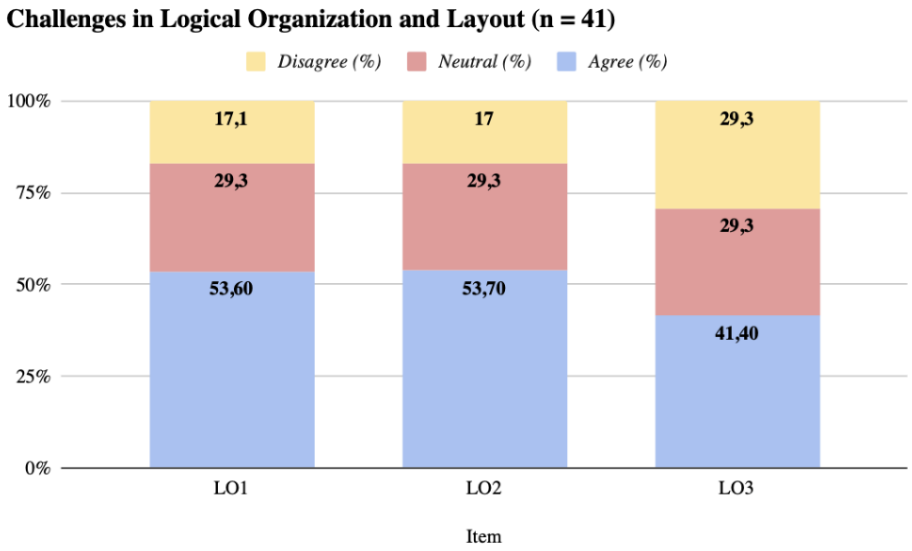
Figure 2

Symbols and Abbreviations' Challenges in Interpreting Note-Taking Strategies Encountered by Students (n = 41)

Note. SA1: I use abbreviations inconsistently (e.g., I write the same word differently at different times).
SA2: I do not use enough symbols to make my notes more visual or efficient.
SA3: I use too many symbols in my notes, and sometimes I forget what they mean.
SA4: I tend to write full words even when abbreviations could save time.

Problems With Logical Organization and Layout

Seventeen coded references highlighted difficulties in structuring notes coherently. Students reported content-rich notes lacking logical arrangement, affecting recall during delivery:



"I try to note down as much information as possible, so I forget to organize my note-taking. Even though I have a lot of information, the logic of my interpretation is not high quality." (Participant No. 7)

"I don't always organize my notes clearly. So when I look at them, it's hard for me to follow the logic." (Participant No. 6)

The three-item scale demonstrated strong reliability (α = .784; standardized α = .785). Over half of participants reported unclear note structure (LO1, 53.6%) and lack of visual hierarchy (LO2, 53.7%). Additionally, 41.4% indicated their notes did not reflect the speech's logic (LO3). These results suggest that challenges in visual and logical organization are common and may hinder accurate interpretation.

Figure 3

Logic and Layout's Challenges in Interpreting Note-Taking Strategies Encountered by Students (n = 41)

Note. LO1: The structure of my notes is sometimes unclear, making it hard to follow the speaker's ideas.
LO2: I do not organize my notes with clear layout or visual hierarchy (e.g., indentation, columns).
LO3: My notes do not reflect the logic or structure of the original speech.

Discussion

The Relationship Between Note-Taking Patterns and Interpreting Quality

The findings confirm that note-taking patterns exert a measurable influence on interpreting accuracy. Across survey and task data, full-word note-taking was consistently associated with lower accuracy, whereas abbreviations and symbols supported more efficient processing and higher-quality output, particularly in the VE direction. These results align with Rozan's (1956) principle of cognitive economy and Gillies's (2017) emphasis on compact visual cues, and are well explained by Gile's (1995) Effort Models: full-word notation increases coordination and memory effort, reducing resources available for listening and analysis.

The negative impact of full-word notes is consistent with prior research showing that transcript-like notation slows processing and disrupts attention (Aminifard and Aminifard, 2012; Chen,

2020). Their higher frequency in the EV direction reflects learners' tendency to over-write in their L1 for perceived lexical precision, often at the cost of propositional accuracy.

By contrast, symbols and abbreviations facilitate faster encoding and retrieval. The strong association between symbolic notation and VE accuracy extends earlier training-based findings (Chen, 2020) and aligns with evidence for dual-coding and compression effects.

Importantly, this study contributes context-sensitive evidence from Vietnamese undergraduate interpreter training, where formal notation instruction is limited. The robust advantage of symbols—especially in VE—suggests that their cognitive efficiency holds even outside standardized European training traditions and can partially offset increased processing demands when working into a less dominant language. Differences from M. Liu (2008) may be explained by task length and note density, which allowed symbols here to function as genuine compression devices.

Overall, abbreviations and symbols confer clear cognitive and performance benefits, while full-word notation increases load and reduces accuracy, with directionality amplifying these effects.

Common Note-Taking Problems

Three recurring problems emerged from survey responses and qualitative analysis: inconsistent abbreviation systems, limited and sometimes ineffective symbol use, and disorganized or overly dense layouts. These issues reflect deeper challenges in multitasking and prioritization that align closely with Gile's (1995) Effort Models. When excessive effort is consumed by writing or by searching for unstructured notes, listening and memory operations are compromised.

Linking these issues directly to RQ2, disorganized layouts showed the strongest association with reduced accuracy. Students whose notes lacked visual hierarchy including unclear segmentation, inconsistent indentation, or crowding tended to omit major propositions or misrepresent logical relations during delivery. Inconsistent abbreviations produced a similar effect: when students forgot what their own abbreviations meant, reconstruction became slower and less accurate. Limited symbol use, while less damaging on its own, often compounded the problem by forcing students to record more full words, thereby increasing cognitive load.

These patterns parallel findings from Chen (2020), who observed that novice interpreters often prioritize quantity over clarity. In this study, many students showed discomfort with structured notation, reflecting limited exposure to systematic training and limited metacognitive awareness of their own processing constraints. The result mirrors Rozan's (1956) caution: ineffective note-taking can impede performance as much as it is meant to support it.

Collectively, disorganization, inconsistent abbreviation use, and limited symbol use are the difficulties most associated with decreased accuracy, with structural disorganization posing the greatest risk.

Conclusion

This study demonstrates a clear relationship between note-taking strategies and interpreting performance. Consistent with cognitive load theory and established interpreter training models, students who relied on symbols and abbreviations achieved higher accuracy, whereas extensive

use of full words tended to hinder performance. Survey responses further indicated recurring challenges in managing complex information, maintaining consistent abbreviations, and organizing notes effectively. These patterns reinforce that note-taking is not merely a technical skill but a cognitive strategy shaped by task demands, language direction, and individual experience.

The difficulties documented in this study including overly detailed notes, limited or inconsistent symbolic notation, and disorganized layouts reflect broader issues of cognitive overload and insufficient strategic awareness. Addressing these problems requires training that helps learners prioritize key information, develop structured personal systems, and balance listening and writing efforts. Direction-specific effects were evident: symbols proved especially effective in Vietnamese-English interpreting, while abbreviations were more helpful in the English-Vietnamese direction. This suggests that instruction should account for asymmetries in processing load across language directions.

For practical implications, interpreter education should integrate early, structured instruction in symbolic and abbreviated note-taking, along with exercises that balance listening, processing, and writing. Such training can enhance efficiency, reduce cognitive load, and foster strategic awareness.

This study is limited by its small task-based sample, the reliance on self-reported data, and the use of moderately complex passages drawn from a restricted topical range. These factors may limit the generalizability of the results. Future research should employ larger and more diverse cohorts, track development longitudinally, and incorporate a wider range of task types and cognitive demands. Future research should examine larger and more diverse samples, include longitudinal designs to track skill development over time, and explore a broader range of task types, language pairs, and cognitive loads. Integrating corpus-based analysis with complementary cognitive measures would further clarify how note-taking strategies evolve and operate in real-time. Taken together, the findings highlight efficient note-taking as a core competency in consecutive interpreting, contributing to both theoretical understanding and the refinement of interpreter education.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

In the development and revision of this manuscript, I utilized both Grammarly and ChatGPT as AI-assisted tools to support the writing process. Grammarly was employed primarily for proofreading, including correcting grammatical and punctuation errors, enhancing clarity, improving sentence structure, and ensuring coherence across sections. ChatGPT was used to support paraphrasing, refining academic tone, and enhancing the overall clarity and flow of the text, particularly in the abstract, introduction, and literature review sections.

I affirm that the use of AI tools was strictly limited to language improvement and editorial support. No AI technologies were used for generating research ideas or questions, designing the methodology, collecting or analyzing data, interpreting findings, constructing arguments, or synthesizing literature. All intellectual contributions, including research design, data analysis, interpretation, and the formulation of conclusions, are entirely my own and reflect my original scholarly work.

Enhancing Andragogy for Educators Through Knowledge Building Professional Learning Approach (KBPL Approach)

Melvin Chan, Chua Chu Kang Secondary School, Singapore
Anthony Chua, Chua Chu Kang Secondary School, Singapore
Kennedy Loo, National Institute of Education, Singapore

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Knowledge Building (KB) has emerged as a transformative pedagogical approach in Singapore's secondary education landscape. However, what is less studied is the adaptive use of KB in adult learning. This practice-orientated study explores the design and implementation of the Knowledge Building Professional Learning (KBPL) Approach in a Singapore Secondary School, highlighting its constructive role in fostering effective professional learning and collaborative culture for educators. KBPL is an integrative professional learning practice-orientated methodology that maps and synthesizes the key features of andragogy, elements of Tuckman's group development model and the practices of the 4Ms framing [Micro, Meso, Macro and Mega], with KB scaffolds and principles as its overarching andragogical structure and support base. This gives rise to KBPL signature andragogical moves [Let's Hear Out! Let's Build-on! Let's Rise Above!] that applies across all collaborative scales: (i) Intra-School Idea Café [Micro-Meso] that gathers practitioners of different subjects for a time of reflective dialoguing towards collective knowledge creation and synthesis in advancing their classrooms instructional practices; (ii) Inter-School "The History Times" project [Meso-Macro] involving connecting and mentoring teachers from at least 2 schools in reframing the learning experiences for learners of History towards participatory, inquiry-driven and historiographical-orientated prospectus; and (iii) International KB Community Network [Macro-Mega] focusing on mapping the collaborative journeys, modelling successful practices, and mentoring peers across schools and countries, to refine and drive collective pedagogical growth. The overwhelmingly positive feedback from participants underscores KBPL practicality, accessibility, and potential to inspire impactful professional learning communities. As a dynamic and adaptable methodology, the KBPL Approach stands as a promising andragogical model for advancing knowledge building and professional development in diverse educational contexts, and facilitates the move towards 21st century heutagogy where adult learners' sense of autonomy, agency and maturity are maximized and realised.

Keywords: knowledge building, KBPL approach, professional learning, andragogy, Tuckman's Model, 4Ms framework, collaboration, teacher development, Singapore education

Introduction

Knowledge Building (KB) has emerged as a transformative pedagogical approach in Singapore's secondary education landscape. As a learning theory and pedagogy, KB has been widely studied within the K-12 context (Chen & Hong, 2016). Through its twelve principles, KB facilitates towards the flourishment of students' collective epistemic agency within a collaborative learning environment (Scardamalia, 2004). Central to KB is Knowledge Forum (KF), an online platform that supports asynchronous and synchronous discussions, enabling educators and students to document, refine, and build on ideas collectively. However, what is less studied is the adaptive use of KB in adult learning. Andragogy, as represented by Knowles's (1980), relies on six principles in facilitating effective learning for adults, with its key focuses on practicality, personal autonomy and experiences, and problem-orientated learning. Similarly, Lin's study (2024) highlights the importance of KF in allowing adult learners to pursue their professional growth of collective knowledge advancement and reflective practice across space and time, within and considering their various personal commitments. This practice-orientated study aims to showcase how Knowledge Building Professional Learning (KBPL) Approach enterprises the intentional and integrative use of KB principles and practices, supported and contextualized within the adaptation of Tuckman's (1965) group development model and the 4Ms framework [Micro, Meso, Macro and Mega]. The frameworks in turn help in enhancing and advancing the andragogical learning processes, methodologies and moves for educators. At the same time, this facilitates the move towards 21st century heutagogy where adult learners' sense of autonomy, agency and maturity are maximized and realised.

Participants

The participants in this study comprised a total of 19 educators. They represented a variety of subject disciplines, reflecting a multidisciplinary background that enriched the collaborative process. All participants were engaged in at least two of the platforms explored in this paper, and they had prior knowledge of Knowledge Building (KB), which enabled them to contribute effectively to the initiatives.

KBPL Approach and Its Implementation

KBPL Approach is an integrative professional learning practice-orientated methodology that maps and synthesizes the key principles of andragogy, elements of Tuckman's group development model and the practices of the 4Ms framing, with Knowledge Building as its overarching andragogical structure for effective community advancement.

Table 1
How KB Facilitates and Initiates Accompanying Andragogical Moves

Key Principles of Andragogy	**Key Principles of KB [adapted from its 12 principles]**	**Andragogical Moves arising from KB and its key descriptions**	**KB Scaffolds in facilitating these andragogical moves**
Personal Experience Problem-orientated	Centrality of participants' voices	Let's Hear Out! Participants to share & voice out their personal stories, focusing primarily on their struggles & issues [areas that they need feedback & ideas]	My theory
Practicality Personal Experience	Culture of collective build-on	Let's Build-on! Participants to share strategies, initiate suggestions &/or engage in clarification in addressing the above struggles & issues	I need to understand I have new information This theory does not explain
Personal Autonomy Practicality	Course of Continuous Development	Let's Rise Above! Participants to generate their next individual steps & methodology for further improvement & enhancement	A Better Theory Putting Our Knowledge Together

Table 2
Integration of KB Andragogical Moves Throughout the Processes & Platforms

KB Andragogical Moves	**Tuckman's Group Development Model [adapted] & Description**	**Progressive Andragogical Platforms integrating the 4Ms framework [adapted]**
Let's Hear Out Let's Build-On Let's Rise Above	<u>Form: Form the Team</u> Participants form a team, share their stories and get familiarized with the KB andragogical moves	Intra-school [Micro-Meso] Cross-subject disciplines Inter-schools [Meso-Macro] Cross-communities of same subject disciplines (Inter)-national [Macro-Mega] Cross-subject disciplines, Cross-communities & Cross-countries
	<u>Norm: Norm the Culture</u> Participants to constantly engage in the use of KB andragogical moves throughout all their Professional Learning Sessions [ranging from pedagogical discussions to design]	
	<u>Perform: Perform the Practices</u> Participants to implement KB lessons in class [Figure 1 for the key principles] with the team members engaging as learning observers in the segment on Let's Build-on	

Intra-school Collaboration: The Idea Café

The Idea Café exemplifies the KBPL Approach as represented in Figure 1, an integrative professional learning methodology that synthesises the principles of andragogy with KB through structured moves such as "Let's Hear Out", "Let's Build-On", "Let's Rise Above". At the micro-meso level as seen in Figure 2, the Idea Café fosters a collaborative environment where teachers across disciplines collectively advance their pedagogical practices.

This intra-school collaboration aligns with Tuckman's stages of group development: forming as teachers from diverse subject backgrounds come together as they discuss challenges in KB implementation. Teachers map their pedagogical challenges and goals using real classroom scenarios and model KB practices by sharing best strategies. The ability to also mentor each other in adapting KB principles and monitor the collective progress through reflective dialogue facilitated is made available through the affordances of the Knowledge Forum.

For instance, a Music teacher exploring "Improvable Ideas" might mentor a Literature teacher in using collaborative questioning to deepen text analysis. This iterative process highlights KB as the andragogical structure, enabling teachers to navigate challenges and engage in collective knowledge creation for their classrooms.

Inter-school Collaboration: "The History Times"

The inter-school "The History Times" initiative similarly applies the KBPL Approach but at a meso-macro level to reframe history education as a participatory, inquiry-driven discipline. Guided by KB principles, this collaboration involves teachers from the two schools who engage in forming connections, brainstorming through initial curriculum redesigns.

Using the framework, teachers map the limitations of traditional history teaching, such as reliance on rote memorization, and identify opportunities for KB integration. They model innovative practices through Knowledge Forum, where ideas about historical narratives are documented, shared, and refined. Mentorship plays a pivotal role, as experienced KB practitioners support colleagues in embedding KB principles like "Epistemic Agency" and "Real Ideas, Authentic Problems" into the activities. Lastly, teachers collect feedback from students and teachers alike to iterate on project designs, ensuring continuous improvement as seen from the improvements made from the first iteration.

International Collaboration: Knowledge Building Community Network Learning (KBCNL)

Finally at the macro-mega level, Knowledge Building Community Network Learning (KBCNL) thus becomes a platform where the insights and outcomes of intra-school and inter-school collaborations converge and expand. Guided by the KB principles such as "Symmetric Knowledge Advancement" and "Idea Diversity" as well as the accompanying KBPL Approach, it enables educators to share practices from initiatives like the Idea Café and "The History Times".

KBCNL provides a space for educators to map their collaborative journeys, model successful practices, and mentor peers across schools and countries. Through shared dialogue and reflective feedback, educators monitor and refine their approaches, ensuring scalability and adaptability. This international platform fosters symmetrical knowledge advancement,

distributing expertise and driving collective growth. teachers and researchers to co-create ideas that cater to diverse educational contexts. The international dimension of KBCNL also reinforces "Community Knowledge, Collective Responsibility", as educators engage in a reciprocal process of knowledge exchange that strengthens the global KB community. This systemic processes of the KBCNL also in turn reflect themes explored by Teo et al. (2021), particularly the use of teacher networks to transform pedagogy through shared discourse and idea-centered practices.

By connecting local innovations to a global audience, the KBCNL amplifies the impact of KB practices, allowing for symmetrical advancement, sharing insights and building on one another's innovations that ultimately serves as both a culmination of localised efforts and a springboard for advancing professional learning communities worldwide.

Analysis

Table 3

A Survey on KBPL Approach for the 19 Participants

	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree
I find our school KBPL Approach to be practical and useful in enhancing my professional growth and practices	10	9	Nil	Nil	Nil
The KB Andragogical Moves [Let's Hear Out. Let's Build-on. Let's Rise Above] and scaffolds makes the PL sessions accessible, approachable and meaningful	18	1	Nil	Nil	Nil
Engaging in at least 2 of the 3 KBPL Platforms [Inter-school + Intra-school &/or International] facilitates my professional growth in both depth and breadth	13	6	Nil	Nil	Nil
If given the chance, I will strongly recommend KBPL approach for all professional learning communities	10	8	1	Nil	Nil
On a personal note, KBPL Approach gives me ideas and insights on how to design meaningful and productive PL sessions for my colleagues and myself	9	9	1	Nil	Nil

Discussion

The survey results in Figure 3 highlight the overwhelmingly positive reception of the KBPL Approach among the 19 participants. All respondents found the KBPL Approach practical and useful in enhancing their professional growth, with 10 participants strongly agreeing and 9 agreeing. The structured andragogical moves—Let's Hear Out, Let's Build-On, Let's Rise Above—and the scaffolds supporting professional learning sessions were praised for their accessibility and meaningfulness, with 18 participants strongly agreeing.

Participants expressed high enthusiasm for recommending the KBPL Approach to other professional learning communities, with 18 out of 19 agreeing or strongly agreeing. Also exemplified by a quote from one of the participants,

> At the start, I am wondering how KBPL Approach and the various platforms will assist me in my professional growth. I had undergone many various forms of PL models…. But as I enrol myself in, I see the huge potential and affordances of this approach and its platforms. The concept of us as co-agents in the stage of continuous advancement amazes me. Many a times, PL stops once we gotten the results/outcomes. But, KBPL goes beyond that. Its processes reveal that of an authentic world where knowledge and learning always rise above, beyond what we can imagine. Outcomes are now just milestones that awaits new breakthrough; achieve through not by individual efforts but in a community setting where we are all co-agents in advancing the practices.

These results demonstrate the KBPL approach's efficacy in fostering meaningful and collaborative professional development, underscoring its potential for wider adoption.

Conclusion

The implementation of the KBPL Approach has demonstrated its effectiveness in fostering meaningful professional learning and collaboration among educators. By integrating andragogical principles, Tuckman’s group development model, and the 4Ms framework, the approach has enhanced both individual growth and collective advancement across intra-school, inter-school, and international platforms. The overwhelmingly positive feedback from participants underscores its practicality, accessibility, and potential to inspire impactful professional learning communities. As a dynamic and adaptable methodology, the KBPL Approach stands as a promising model for advancing knowledge building and professional development in diverse educational contexts.

Coding Connections: Intercultural Competence Through Peer-Assisted Learning Among Digital Media and Technology Students

Edward Devere Bacon, Rangsit University, Thailand
Gary Torremucha, Rangsit University, Thailand

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study explores how peer-assisted learning with Burmese international mentors contributes to the development of intercultural competence among Thai students majoring in digital media and technology. Grounded in Byram's model of IC and Vygotsky's Sociocultural Theory, the research engaged 30 undergraduates in a 10-week PAL program at a Thai university. Using pre- and post-program questionnaires alongside English language assessments, the findings revealed strong student satisfaction with the PAL sessions—particularly in terms of collaborative project work, cross-cultural communication, and problem-solving support. Participants reported perceived growth in intercultural sensitivity, confidence when working in multicultural environments, and greater openness to diverse perspectives, skills that are increasingly vital in globally networked technology fields. However, the program did not produce measurable gains in English proficiency. Nonetheless, the study underscores PAL's potential to promote intercultural learning and global readiness in STEM-related education, reinforcing the value of Internationalization at Home. It recommends expanding PAL initiatives within digital and technological curricula to prepare students for global collaboration in the tech sector.

Introduction

Background of the Study

Internationalization has become a central priority in Thai higher education, with universities increasingly seeking ways to equip students with the intercultural awareness, communication skills, and global competencies needed to thrive in diverse environments. Although study-abroad programs remain a common strategy, institutions worldwide are turning to Internationalization at Home (henceforth IaH) to expand intercultural learning opportunities for students who do not travel abroad (Bacon & Torremucha, 2025b; Feng et al., 2025). In Thailand, the number of international students has steadily increased, creating opportunities for meaningful intercultural engagement; however, language barriers, limited interaction, and social distance continue to hinder sustained cultural exchange between Thai and international students. As a result, structured, socially mediated learning environments are needed to bridge these gaps and promote deeper intercultural understanding on campus (Bacon & Maneerutt, 2024).

Peer-Assisted Learning (henceforth PAL) is one such environment. Widely implemented globally, PAL has been shown to enhance academic outcomes, student engagement, and collaborative learning skills (Asare, 2025; Bacon et al., 2021). More recently, scholars have highlighted its potential to foster intercultural dialogue, empathy, and mutual understanding, especially when local students work closely with peers from diverse cultural backgrounds (Bacon & Maneerutt, 2024; Ellison et al., 2023). Yet, despite growing interest in IaH initiatives, empirical research on how PAL supports IC, particularly among Thai university students, remains limited.

Advancing Cultural Understanding Through Peer-Assisted Learning

PAL provides structured, low-pressure spaces where students interact regularly through discussion, problem-solving tasks, and peer-supported activities (Asare, 2025; Bacon et al., 2021). Drawing on Vygotsky's sociocultural theory (henceforth SCT), learning occurs through guided social interaction, making PAL an ideal context for intercultural learning (Bacon & Torremucha, 2025b; Ellison et al., 2023; Vygotsky, 1978). Likewise, Byram's IC model emphasizes attitudes of openness, curiosity, and respect, qualities that can be developed through purposeful engagement with culturally diverse peers (Alred & Byram, 2002; Byram, 1997; Davis & Knight, 2023). When Thai students collaborate with international peer-mentors, PAL sessions can function as localized sites of cultural learning, enabling students to share perspectives, negotiate meaning, and reflect on cultural similarities and differences. Such engagement not only supports cognitive development but also promotes social integration, reduces cultural barriers, and strengthens communicative confidence.

Research Problem

Although Thai universities host growing numbers of international students, meaningful intercultural interaction between local and international peers remains inconsistent. Studies indicate that Thai students often experience limited exposure to foreign cultures, while international students face linguistic and social barriers that prevent integration (Pratama et al., 2024). Existing PAL programs at Thai universities focus primarily on academic support, with little empirical evidence documenting their role in cultural learning, personal development, or the cultivation of IC. Consequently, there is a need to examine how PAL sessions, already

embedded in the university's learning ecosystem, can serve as structured platforms for intercultural engagement and cultural understanding between Thai students and international peer-mentors.

Research Objectives

This study aims to:

1. Identify the mechanisms through which PAL sessions facilitate cultural exchange between Thai students and international peer-mentors.
2. Examine how PAL participation enhances Thai students' cultural awareness, sensitivity, and broader intercultural competence.
3. Assess the personal and academic development outcomes associated with culturally diverse PAL interactions.
4. Evaluate Thai students' satisfaction with cultural exchange opportunities in PAL sessions and gather recommendations for improvement.

Research Questions

To achieve these objectives, the study investigates the following research questions:

1. How do PAL sessions facilitate cultural exchange between Thai students and their international peer-mentors?
2. In what ways do PAL sessions influence Thai students' cultural awareness, sensitivity, and intercultural competence?
3. What personal development outcomes do Thai students experience as a result of participating in intercultural PAL sessions?
4. How satisfied are Thai students with the cultural exchange opportunities in PAL sessions, and what improvements do they recommend?

Significance of the Study

This study offers several important contributions. Empirically, it addresses a gap in the literature by examining the cultural, not only academic, functions of PAL within a Thai higher-education context. The findings have the capacity to strengthen institutional understanding of how IaH can be operationalized through structured PAL environments. Practically, the results will inform the development of culturally responsive PAL programs, mentor training curricula, and intercultural engagement strategies at Rangsit University and other institutions aiming to cultivate global readiness among local students. More broadly, the study highlights PAL's potential as a scalable, sustainable mechanism for fostering IC, building inclusive learning communities, and preparing students for participation in multicultural academic and professional environments.

Literature Review

This literature review synthesizes research on PAL, IC, cultural adjustment among Thai students, and the role of PAL as an IaH strategy. While PAL is well documented as an academic support model, recent research suggests that it may also facilitate cultural exchange, particularly when local students work with international peer mentors. The following sections examine the integrative functions of PAL, key theories of IC, cultural barriers among Thai students, the intercultural value of PAL, and existing gaps that justify the present study.

The Integrative Function of Peer-Assisted Learning

PAL is a structured approach in which trained mentors guide students through collaborative tasks and discussion. Studies consistently show that PAL improves academic achievement, confidence, and engagement (Asare, 2025; Bacon et al., 2021). Drawing on Vygotsky's SCT, PAL emphasizes learning through social interaction, allowing students to clarify ideas, share strategies, and engage in dialogue that promotes deeper understanding (Bacon & Torremucha, 2025b; Ellison et al., 2023). Its collaborative, low-pressure structure reduces anxiety and encourages participation, making it a supportive environment for relationship-building (Bacon & Maneerutt, 2024; Slabbert & Du Plessis, 2021). These characteristics position PAL as not only as an academic support mechanism but also as a socially interactive learning environment in which students engage meaningfully through collaboration, discussion, and peer interaction, creating opportunities for connection among students from diverse backgrounds (Bacon & Torremucha, 2025a; Hidayat et al., 2023).

Intercultural Competence and the Process of Cultural Integration

IC refers to the attitudes, knowledge, and skills needed for effective communication across cultures (Acosta-Mosquera et al., 2017). Byram's model highlights openness, curiosity, interpretive skills, and critical cultural awareness as central components (Wang & Teo, 2024). IC develops through repeated encounters that require learners to reflect on differences, question assumptions, and negotiate meaning (Bartel-Radic & Cucchi, 2025). Cultural integration in PAL contexts involves becoming comfortable with shared social norms and developing meaningful relationships across culturally diverse peer groups (Bacon & Torremucha, 2025b; Ellison et al., 2023). Higher education institutions increasingly emphasize IC as an essential set of knowledge, attitudes, and skills that graduates must develop to function effectively in culturally diverse contexts (Acosta-Mosquera et al., 2017). Research on IaH indicates that structurally embedded, campus-based initiatives, such as PAL, can foster IC by enabling students to develop intercultural awareness and sensitivity through regular interaction with culturally diverse peers and faculty within the home institution (Choi & Khamalah, 2017).

Barriers Thai Students Encounter in Cultural Adjustment

Despite growing international enrollment, meaningful interaction between Thai and international students remains limited. Language anxiety, fear of miscommunication, and uncertainty about appropriate cultural behavior discourage many Thai students from initiating intercultural conversations (Pratama et al., 2024). These hesitations can limit students' interaction across cultural groups, thereby reducing opportunities for intercultural learning and contributing to the tendency for students to socialize primarily within culturally familiar peer networks (Waters & Day, 2022). Furthermore, concerns about misunderstanding cultural norms and unintentionally causing offense function as psychological barriers that can inhibit students' willingness to engage actively in multicultural interactions (Witayarat, 2023). International students also experience adjustment challenges, such as unfamiliar academic expectations and social norms, which widen the interaction gap (Bacon & Torremucha, 2025b). These dynamics highlight the need for structured environments that encourage safe, guided intercultural engagement.

The Contribution of Peer-Assisted Learning to Cultural Exchange and Integration

PAL offers a strong platform for cultural exchange because it relies on frequent interaction, shared activities, and collaborative discussion (Bacon & Maneerutt, 2024; Ellison et al., 2023). Research indicates that PAL facilitates supportive peer interaction and collaborative engagement, enabling students to exchange experiences, seek assistance, and develop mutual understanding, while also contributing to the formation of socio academic relationships that enhance students' sense of connection within learning communities (Asare, 2025; Bacon et al., 2021). Through PAL, Thai students can build communication confidence, develop cultural awareness, and broaden their perspectives when working with international mentors. The informal, conversational nature of PAL allows cultural insights to emerge naturally during academic collaboration (Bacon & Torremucha, 2025a; Slabbert & Du Plessis, 2021). The multi-week structure of PAL facilitates repeated peer interaction within a low-pressure, cooperative environment, supporting the gradual development of interpersonal relationships and conditions associated with intercultural learning (Bacon et al., 2021). These features position PAL as an effective IaH strategy for promoting cultural integration within Thai universities.

Identified Gaps in the Scholarly Evidence

Although PAL's academic benefits are well established, research on its intercultural impact remains sparse, especially in Southeast Asia contexts. Few studies examine how PAL enhances IC in Thailand, cultural awareness, or personal development among host-country students. Existing research focuses heavily on international students' adjustment, leaving Thai students' experiences underrepresented. Moreover, little empirical work identifies how cultural learning occurs within PAL sessions in Thailand or what challenges students encounter in intercultural collaboration. These gaps underscore the need for research that investigates PAL as an IaH mechanism capable of developing IC and cultural integration among Thai university students.

Methodology

Research Design

This study used a mixed methods research design to examine how PAL supports the development of IC among Thai students majoring in digital media and technology. The approach was informed by Byram's IC framework and Vygotsky's SCT, which emphasize learning through guided interaction and meaningful communication. A questionnaire and semi structured interviews were used to gather both numerical and descriptive data, allowing for a comprehensive understanding of students' experiences in PAL sessions.

Population and Sample

The population consisted of Thai undergraduate students enrolled in a digital media and technology program at a private university in Thailand. A total of 30 students participated in the study. All participants were first year students who regularly attended PAL sessions as part of their academic coursework. These students were selected because they interacted directly with international peer mentors, making them appropriate for investigating the cultural and interpersonal dimensions of PAL.

Data Collection Instruments

Data were obtained through a questionnaire and English pretest and posttests. The questionnaire measured five areas: interaction with international mentors, cultural awareness, communication confidence, collaborative learning, and personal development. Items were rated using a five-point agreement scale. The English pretests and posttests evaluated whether students' English proficiency improved as a result of their involvement in this 10-week PAL study.

Validity and Reliability

Validity

Content validity was established through expert review. Three specialists in education and language studies evaluated the questionnaire items using the Item Objective Congruence method. Each item was assessed for clarity and relevance to the research objectives. All items received positive scores, indicating strong alignment with the intended constructs.

Reliability

Reliability was determined by calculating Cronbach alpha to measure the internal consistency of the questionnaire. The instrument was pilot tested with a separate group of students who were not included in the main study. The questionnaire produced a Cronbach alpha value of 0.964, which indicates an excellent level of internal consistency and confirms that the items measured related aspects of intercultural learning.

Data Collection Procedures

Data collection occurred across ten weeks at the university PAL center. At the end of their final session, the thirty participants were invited to complete the questionnaire after receiving an explanation of the study purpose. A group of volunteers then participated in follow-up interviews. All data were collected anonymously, and confidentiality was safeguarded throughout the entire process. Only the researchers had access to the original records.

Data Analysis

Quantitative data from the questionnaire were analyzed using descriptive statistics to summarize trends in interaction, cultural awareness, confidence, and personal development. Interview responses were transcribed and examined using thematic analysis. This process involved coding participant statements, grouping similar ideas, and identifying recurring themes that supported or clarified the quantitative findings. The integration of both data sources provided a detailed understanding of how PAL contributed to the development of IC among Thai students in digital media and technology.

Results

Rationale and Overview

This section presents the regression analysis examining the relationship between initial English proficiency and later performance among Thai digital media and technology students who

participated in the PAL program. Although the broader purpose of the study was to explore IC and student learning experiences, the English pretest and posttest scores provided an opportunity to determine whether the PAL environment contributed to measurable change in students' formal English proficiency.

Regression analysis enables evaluation of whether posttest performance can be predicted from pretest scores and whether any systematic improvement occurred over the ten-week program. Because the PAL sessions emphasized collaboration, interpersonal communication, and interaction with international peer mentors rather than intensive language training, English test scores were expected to remain stable. Nevertheless, the analysis was necessary to assess whether the program contributed to academic outcomes beyond its intercultural goals.

The data consisted of matched English proficiency scores for thirty students, collected before and immediately after the PAL program. Questionnaire results indicated high satisfaction with program structure, interaction with international mentors, collaborative learning, and perceived personal development. These findings support interpretation of the regression results but were not used as predictor variables because they were not collected at the individual level.

Preparation of Data

The dataset contained thirty complete pairs of English pretest and posttest scores. All participants had valid entries for both testing points. Initial inspection of the data revealed that pretest scores varied widely among students, reflecting a diverse range of English proficiency levels. The average posttest score was slightly lower than the average pretest score, suggesting little overall improvement in formal language performance.

Descriptive statistics were calculated to identify patterns in the data. Some students demonstrated increases in their scores, some remained stable, and others experienced slight declines. Because changes appeared inconsistent and small in magnitude, regression analysis was useful for determining whether any observed improvements or declines were associated with initial proficiency.

A scatterplot of the pretest and posttest scores revealed a consistently upward pattern: students with higher initial proficiency tended to retain higher scores at the end of the program. The points formed a clear linear trend, justifying the use of simple linear regression. No extreme outliers were present, so all thirty cases were included in the final model.

Model Specification and Assumptions

The regression model was specified with posttest English score as the dependent variable and pretest English score as the independent variable. The purpose of the model was to determine whether the initial score could predict later performance and whether any systematic improvement occurred during the program.

The assumptions of linear regression were evaluated. The scatterplot indicated a linear association between the two variables. The distribution of residuals was examined through visual inspection and showed an approximately symmetric pattern without extreme skewness. Residuals plotted against fitted values displayed a relatively even spread, supporting the assumption of equal variance. The Durbin Watson statistic was close to 1.2, which is suitable for cross sectional data of this size.

Given the limited sample size, the analysis relied on a single predictor model. More complex models were not pursued because additional predictors were not available at the individual level. The simple regression model provided a clear and interpretable test of the relationship between pretest and posttest English performance.

Regression Results

The regression analysis revealed that the pretest English score was a strong and statistically significant predictor of the posttest score. The resulting regression equation was: Posttest score equals 9.68 plus 0.81 times the pretest score.

The intercept of 9.68 represents the predicted posttest score for a hypothetical student with a pretest score of zero. Although no students in the sample approached such a value, the intercept is required for the model. The coefficient of 0.81 indicates a strong positive relationship between starting proficiency and later performance. For every additional point in the pretest score, the posttest score increased by slightly more than zero point eight points.

The coefficient was statistically significant, with a t value of about 7.51 and a probability value less than point zero zero one. This confirms that the relationship did not occur by chance. Students who began the program with higher proficiency generally maintained their advantage throughout the ten-week period.

The coefficient of determination, R squared, was approximately 0.67. This indicates that 67% of the variance in posttest scores could be explained by pretest scores. The associated F statistic was 56.37 with a probability below point zero zero one, demonstrating that the model was a strong overall predictor of posttest outcomes.

To further examine the effect of the PAL program, a second regression model was constructed using gain scores. Gain was calculated as posttest minus pretest for each student. The average gain score was slightly below zero, at approximately minus zero point eight, showing a minimal overall decline in English proficiency during the program.

In the gain model, the regression coefficient for pretest score was negative, about minus zero point nineteen, meaning that students with higher initial proficiency tended to experience slightly larger decreases. However, this relationship was not statistically significant. The probability value was approximately point zero nine, which is above the common significance threshold of point zero five. The R squared value for this model was 0.10, indicating that pretest scores explained only ten percent of the variance in gain scores.

The results demonstrate that the PAL program did not produce uniform improvement in English proficiency. Gains varied from student to student, but there was no consistent pattern associated with initial proficiency.

Interpretation of Findings

The regression analysis supports the conclusion that the PAL program did not lead to measurable gains in formal English proficiency over the ten-week period. The strong association between pretest and posttest scores indicates that most differences in performance were already present at the beginning of the program. The slight decrease in the average test

score and the limited explanatory power of the gain score model further reinforce this conclusion.

These findings align with the design and goals of the PAL sessions. The program emphasized collaborative projects, intercultural dialogue, and constructive peer support rather than explicit English language instruction. As a result, the environment was well suited to developing IC, communication confidence, and team-based problem solving, but less likely to produce significant improvements in standardized test performance.

The questionnaire data indicated overwhelmingly positive student perceptions of the program. Participants reported greater comfort in cross cultural communication, increased motivation to engage in collaborative tasks, and strong satisfaction with the support provided by international peer mentors. These self-reported outcomes suggest that the program contributed meaningfully to students' academic and personal development despite stable English test scores.

The results also align with research on language learning, which shows that significant gains typically require extended and focused instruction. Programs centered on intercultural development more often produce benefits in confidence, fluency, and communicative willingness rather than improvements on formal language assessments. The PAL program therefore appears to have supported the development of interpersonal and intercultural skills essential for success in diverse academic environments.

Summary

The regression analysis showed that initial English proficiency was a strong and reliable predictor of later performance among Thai digital media and technology students in the PAL program. The program did not generate significant collective gains in formal English proficiency, and individual gain scores varied without a consistent relationship to starting ability.

These results should be interpreted in light of the program's emphasis on intercultural learning rather than language instruction. Students benefited in ways not captured by standardized tests, including increased confidence, heightened intercultural awareness, and stronger engagement in collaborative learning. Future research should collect individual-level questionnaire data, directly measure intercultural competence, and extend program duration to examine longer-term effects. Overall, English proficiency remained stable, while the PAL program produced meaningful developmental outcomes aligned with its intercultural and collaborative objectives.

Discussion

Interpretation of Key Findings in Relation to Research Questions

The purpose of this study was to examine how PAL sessions involving international peer mentors contributed to the intercultural, personal, and academic development of Thai students majoring in digital media and technology. The results demonstrate that the PAL program functioned as a meaningful site for cultural learning, interpersonal growth, and collaborative engagement even though it did not produce measurable gains in English test performance. The following discussion interprets the findings in direct relation to each of the four research questions.

RQ1: How do PAL sessions facilitate cultural exchange between Thai students and their international peer-mentors?

The findings show that cultural exchange occurred primarily through sustained interaction, shared problem solving, and informal conversation. Students reported that working closely with Burmese mentors allowed them to learn about different cultural practices, perspectives on academic tasks, and communication styles. Because the program encouraged small group collaboration, Thai students engaged in frequent dialogue in a supportive environment, which made intercultural communication feel natural rather than forced. This aligns with the theoretical view that intercultural learning is most effective when it is embedded in authentic, task-based interaction rather than through explicit instruction. The regular contact that took place over the ten-week period played an important role in building trust, reducing social distance, and allowing cultural insights to emerge gradually. The findings therefore affirm that PAL can serve as a practical form of IaH by creating structured opportunities for everyday intercultural exchange within the university setting.

RQ2: In what ways do PAL sessions influence Thai students' cultural awareness, sensitivity, and intercultural competence?

Students' questionnaire responses and interview reflections indicate that participation in the program enhanced their cultural awareness and intercultural sensitivity. Many students described gaining a clearer understanding of how cultural background shapes communication preferences, expectations during group work, and approaches to academic problem solving. Exposure to international mentors encouraged openness to diverse viewpoints and helped students challenge assumptions about other cultures. Students also reported improved confidence when interacting with individuals from different cultural backgrounds, a key indicator of IC. Although measurable changes in English proficiency were limited, the program clearly supported the affective and behavioral components of IC highlighted in Byram's model. The findings reinforce the argument that intercultural growth does not require international mobility but can be fostered effectively through structured campus-based engagement with culturally diverse peers.

RQ3: What personal development outcomes do Thai students experience as a result of participating in intercultural PAL sessions?

Students experienced several personal development gains that extended beyond intercultural learning. They reported increased communication confidence, greater willingness to participate in collaborative discussions, and improved comfort in expressing ideas in both informal and academic settings. The PAL environment also strengthened motivation and provided an encouraging space where students felt supported by both peers and mentors. Many students described a sense of belonging that grew as they worked with international mentors who were approachable, patient, and willing to share their experiences. In addition, students developed stronger problem-solving skills through project-based tasks that required negotiation of ideas and shared responsibility. These outcomes demonstrate that PAL can positively influence personal growth even when academic test scores remain unchanged. The findings align with sociocultural perspectives that view learning as a process that unfolds through participation in a community where knowledge and confidence are co constructed through interaction.

RQ4: How satisfied are Thai students with the cultural exchange opportunities in PAL sessions, and what improvements do they recommend?

Overall satisfaction with the PAL sessions was very high. Students reported that the sessions were enjoyable, motivating, and helpful for understanding course material. They valued the supportive relationships formed with international mentors and appreciated the opportunity to learn from individuals who brought different cultural backgrounds into the learning space. Although students were satisfied with the cultural exchange opportunities, several recommendations emerged. Some students suggested increasing the number of sessions or extending the program duration to allow for deeper cultural engagement. Others requested more structured cultural sharing activities alongside the academic tasks. These suggestions indicate that students recognize the potential of the program and desire even richer intercultural interaction in future iterations.

Practical Implications of the Findings

The findings of this study offer several practical implications for educators, administrators, and program designers. First, the results demonstrate that PAL can be used as a low cost and scalable strategy for promoting intercultural learning in disciplines such as digital media and technology where international collaboration is increasingly important. Institutions can incorporate cultural awareness activities into existing PAL structures without placing additional burden on teaching staff. Second, the strong student satisfaction suggests that international peer mentors can play a valuable role in building inclusive learning environments and reducing social barriers between groups. Third, the lack of measurable English proficiency gains indicates that programs seeking language improvement should incorporate focused language support instead of relying on intercultural interaction alone. Finally, mentor training programs should include guidance on facilitating intercultural conversation and addressing cultural misunderstandings so that mentors feel prepared to support both academic and cultural aspects of the learning process.

Scholarly Contributions of the Present Study

This study contributes to the growing body of research on IaH by providing empirical evidence from a Thai university context where intercultural interaction between local and international students is often limited. It expands understanding of how PAL can function not only as academic support but also as a site for IC development. The findings offer insight into how Thai students interpret and experience intercultural communication when guided by international mentors from neighboring countries. The study also adds to the scholarship on intercultural learning in technology related fields, an area where cultural diversity is becoming increasingly relevant due to the global nature of digital markets and collaborative work in the technology sector.

Limitations and Implications for Further Investigation

Several limitations should be acknowledged. The sample size was relatively small, which limits the ability to generalize the findings to all Thai university students. The study relied on self-reported questionnaire data, which may be influenced by social desirability bias or limited self-awareness about intercultural growth. The program lasted ten weeks, which may not have been long enough to capture deeper or more sustained changes in IC or language development.

Furthermore, the absence of individual level questionnaire data prevented statistical analysis that could link specific aspects of the program to specific learning outcomes.

Future studies should consider larger and more diverse samples, longer program durations, and mixed methods approaches that include observational data or performance-based assessments of IC. Longitudinal research would also be valuable for determining whether the intercultural gains observed in this study persist over time and whether they translate into improved academic or professional performance in multicultural settings.

Conclusion

This study offers important insights into how PAL can advance intercultural learning and personal development among Thai students in a digital media and technology program. The findings show that sustained engagement with international peer mentors created a supportive environment where cultural exchange occurred through collaborative tasks, shared problem solving, and informal dialogue. Students demonstrated increased awareness of cultural perspectives, greater openness to diversity, and enhanced confidence when communicating across cultural boundaries. These outcomes reflect key dimensions of IC identified in established theoretical models and illustrate the potential of campus-based interaction to function as an effective form of IaH. Although the program did not produce measurable gains in English proficiency, this result aligns with the central purpose of the PAL sessions, which emphasized interpersonal communication, shared learning, and intercultural engagement rather than intensive language instruction. The stability of the English test scores therefore underscores the distinction between linguistic development and intercultural growth and suggests that meaningful cultural learning can occur without significant changes in formal language performance.

Strong levels of student satisfaction further confirm the value of the PAL environment, as participants consistently described the sessions as academically supportive and personally enriching. Students highlighted the importance of relationships formed with international mentors and expressed interest in extending the duration and depth of intercultural activities. For institutions, these findings demonstrate that PAL can function as a scalable and sustainable strategy for promoting IC within existing academic structures, enabling universities to broaden the reach of IaH by embedding cultural learning into routine academic experiences. Future research should involve longer program durations, incorporate direct assessments of IC, and examine the experiences of both local students and international mentors. Longitudinal studies would also provide valuable evidence regarding the lasting impact of PAL on students' readiness for participation in multicultural professional environments.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

Nonprofits and Innovation in Education Using Technology

Goutham Kumar, Team4Tech, United States

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Rapid technological advancement is reshaping the global labor market, with digital skills becoming a prerequisite for the majority of future jobs. While automation is expected to transform nearly half of all occupations, its benefits are unevenly distributed, risking a deepening of existing educational and socio-economic inequalities. This paper examines the role of non-governmental organizations (NGOs) in mitigating digital inequality through technology-enabled education, particularly for underserved and vulnerable communities. Drawing on global datasets, academic literature, and two case studies from Team4Tech's NGO partnerships in India and Vietnam, the paper argues that access to technology alone is insufficient to improve learning outcomes. Instead, evidence suggests that technology integrated with teacher professional development and community contextualization produces meaningful and scalable impact. The paper concludes with policy recommendations for integrating proven NGO-led EdTech models into national education frameworks and calls for longitudinal research to support evidence-based decision-making.

Keywords: digital inequality, EdTech, NGOs, teacher training, SDG 4, learning loss, education policy

iafor

www.iafor.org

Introduction

The future of work is increasingly shaped by automation, artificial intelligence, and digital transformation. According to the World *Economic Forum's Future of Jobs Report (2020),* approximately 50% of jobs are expected to undergo significant transformation due to automation, while only 5% are likely to be completely eliminated. Notably, nearly 90% of jobs will require some form of digital competency. While these shifts present new opportunities, they also pose serious risks for populations lacking access to quality education and digital skills.

Without proactive intervention, technological advancement is likely to exacerbate existing inequalities, disproportionately affecting young people, low-skilled workers, and marginalised communities. This paper explores how NGOs, operating at the intersection of education, technology, and community engagement, play a critical role in addressing these disparities. By analyzing global data and real-world NGO interventions, the paper seeks to contribute to academic discourse on scalable and equitable EdTech solutions.

Digital Transformation and Educational Inequality

- **Automation, Skills, and Workforce Disruption**

The World Economic Forum highlights that while job displacement due to automation is limited, job transformation is widespread. This shift necessitates large-scale reskilling and upskilling, particularly for vulnerable populations who are least equipped to adapt. Without targeted interventions, the digital divide threatens to translate directly into labor market exclusion.

- **Learning Loss and the Impact of COVID-19**

Educational inequality has been further intensified by the COVID-19 pandemic. Global estimates from the World Economic Forum report on impact of Covid-19 affected learning (2022) indicate a 10% increase in learning poverty, defined as a child's inability to read and comprehend age-appropriate text by the age of 10. School closures disproportionately affected students from low-income households, where access to digital devices, stable internet, and trained educators was limited.

The Digital Divide: Access Versus Capability

- **Global Connectivity Gaps**

Data from the International Monetary Fund (2020) and the International Telecommunication Union (2021) reveal stark disparities in internet access. While high-income regions such as North America and parts of Europe show near-universal connectivity, large portions of Africa and South Asia remain significantly underserved. These gaps limit the effectiveness of digital education initiatives if not explicitly addressed.

- **Demographic Inequalities in India**

Research on historical inequalities in India published by the *London School of Economics (2023)* demonstrates that digital access varies sharply across gender and social identity.

Scheduled Castes and women experience lower levels of smartphone penetration and significantly reduced usage of financial and educational applications. These trends highlight that device ownership alone does not equate to meaningful digital participation and underscore the importance of digital and financial literacy.

Beyond Access: The Importance of Pedagogy and Teacher Capacity

Multiple studies emphasize that technology access alone does not produce improved learning outcomes. A literature review by the Stanford Center for Opportunity Policy in Education concludes that successful digital learning environments are characterized by a balanced integration of technology and skilled educators. Technology-assisted learning initiatives that include teacher training demonstrate substantially higher effectiveness than those focused solely on infrastructure.

This finding has significant implications for education systems in low-resource contexts, where teacher preparedness often lags behind technological deployment.

The Role of NGOs in Education Systems

According to the *UNESCO Youth report 2022: Non-state actors in education: who chooses? who loses? Non-State Actors in Education*, approximately 350 million learners worldwide, would become the sole responsibility of governments if non-state actors ceased operations. NGOs contribute uniquely to education systems by offering contextual expertise, community trust, and operational flexibility.

According to the SDG Coordination Center, NGOs are aligned with Sustainable Development Goal 4 (Quality Education) as facilitators by:

- Implementing targeted, community-specific interventions
- Providing infrastructure and human resources
- Generating citizen-oriented data
- Supporting accountability and transparency
- Accelerating progress toward SDG targets

Their proximity to communities allows NGOs to design solutions that are both inclusive and adaptable, making them valuable partners for public education systems.

Team4Tech's NGO Impact Accelerator Model

Team4Tech operates as a nonprofit impact accelerator that leverages skilled volunteers and technology to support NGOs through a structured four-pronged approach which includes: Funding for NGOs, skilled volunteering projects, a global online community of practice and curated regional hubs. Technology functions as a lever rather than an end in itself, with impact measured across defined educational and organizational parameters.

Case Study 1: Kidspire, Vietnam

Kidspire works with orphaned youth in Vietnam and has enabled approximately one-third of its beneficiaries to pursue higher education. Through mentorship from Team4Tech volunteers, students developed a mobile application for book sharing. The project was selected as one of

twelve global finalists from over 1,700 teams in the 2021 Global Technovation Challenge for Girls, demonstrating both technical competence and applied learning outcomes.

Case Study 2: Ek Tara, India

In India, Team4Tech supported Ek Tara through the development of a learning management and monitoring system (Goonjan) for approximately 1,200 students. Over a three-month period, volunteers designed a user-friendly data platform and trained teachers in digital classroom tools, including Google Classroom. Within one year, Ek Tara reported a 35% improvement in learning outcomes, illustrating the effectiveness of teacher-centered EdTech interventions.

Policy Implications

The findings from global data and NGO-led interventions suggest several policy priorities:

1. **Scalability and Sustainability:** Governments should formally integrate proven NGO-developed EdTech models into national education frameworks.
2. **Teacher Professional Development:** Dedicated funding must be allocated to training educators to effectively leverage technology as a pedagogical tool.
3. **Evidence-Based Policy:** Longitudinal and comparative studies on NGO-led EdTech interventions are essential to guide large-scale investments.
4. **Public-Nonprofit Collaboration:** Strong partnerships between governments and NGOs can accelerate progress toward equitable education systems.

Conclusion

Digital transformation presents both opportunity and risk for global education systems. Without intentional design, technology can deepen inequality rather than reduce it. This paper demonstrates that NGOs play a critical role in bridging the gap between access and impact by integrating technology with pedagogy, teacher training, and contextual understanding. Embedding these proven models into public policy frameworks is essential for building inclusive, future-ready education systems aligned with global development goals.

Official Conference Proceedings

Abstract

Integration of industry-linked initiatives with project-based learning (PBL) in material science education promises to transform the way students become engaged and attained mastery of the academic contents. The involvement of industry partners, an element of this educational model, is crucial for simulating the professional scenarios in addressing real-world challenges. Students acquire invaluable insights and experiences that help bridge the gap between academia and industry. Mentorships rendered by the industry experts not only provide different perspectives that are aligned with current industry standards, but also ensure projects are theoretically sound and practically relevant. In the process, students are equipped with the essential skills to meet the demands of the material science industry for a seamless career transition. Our research highlights the benefits of PBL in facilitating the learning process and outcomes. PBL fosters a shift towards formative, skills-based assessment methods with an emphasis to promote continuous feedback and personal growth throughout the project delivery. This hands-on approach supports students' development to become life-long learners who possess higher-order cognition and 21st-century skills, including critical thinking, creativity, problem-solving, teamwork and communication. A study, involving five different projects in small groups of four, demonstrates improvements in cognitive and psychomotor abilities while the affective domain remains stable. Through PBL, students gain a profound understanding of material science principles and extend their technical skillsets. The study aims to uncover optimal strategies and best practices to develop dynamic learners with enhanced intellectual engagement, as well as promote inclusive, collaborative, and progressive educational practices that reflect industry standards.

Keywords: industry-linked, project-based learning, cognitive, psychomotor, affective skills

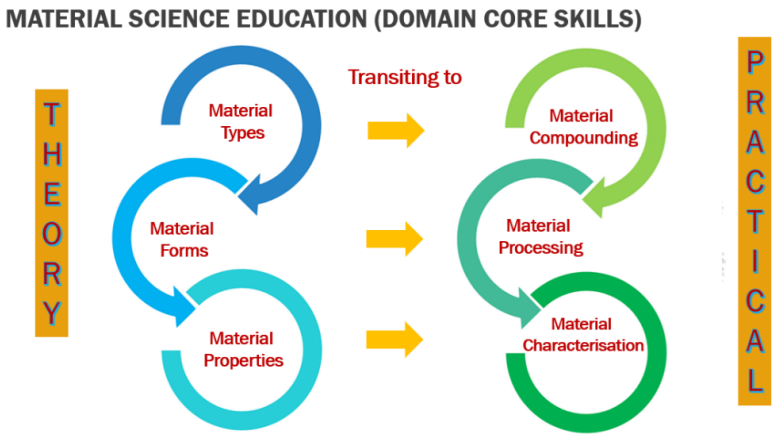
Introduction



The current research highlights the inaugural implementation of industry-linked projects within the Diploma of Applied Chemistry (DAPC), marking a significant milestone in Material Science education at Singapore Polytechnic (SP). By addressing the following two central questions, this study aims to uncover the transformative potential of industry-linked PBL in reshaping the educational landscape. As the pilot initiative in material science education at the institution, it sets the stage for future iterations and refinements, paving the way for more engaging, dynamic and impactful learning experiences.

1. How does the integration of industry collaboration within project-based learning transform the development of core skills and knowledge in material science education?
2. What impact does industry-driven project design within project-based learning have on student learning outcomes in material science education?

The training model (see Figure 1) is built upon a seamless integration of theoretical knowledge and practical application, cultivating a hands-on learning environment that encourages both intellectual curiosity and real-world readiness. Firstly, conceptual learning is introduced to students across a variety of materials, including but not limited to, polymers, ceramics, metals, and composites as well as their corresponding atomic structures and the fundamental principles that govern their behaviour. This understanding is further reinforced through a diverse range of instructional methods, including rigorous laboratory experiments that critically investigate how various material types and forms can directly affect their properties and performance. The hands-on experiences consolidate the development of students' analytical thinking and technical proficiency in material compounding, processing, and characterisation under varying conditions. By translating this knowledge into a prototype, the journey begins with careful material selection for compounding to meet the project brief, followed by prescribing processing techniques that unlock specific characteristics suited to the intended applications. These processing techniques not only transform raw materials into usable forms but also allow for precise tuning of material attributes. The properties of materials are subsequently characterised using appropriate instrumentation and testing methods to assess key features such as mechanical strength and thermal stability. As a result, a comprehensive understanding of the intrinsic nature of materials and interactions of processing methods and conditions are essential for material science students, empowering them to optimise material performance for a wide range of applications.

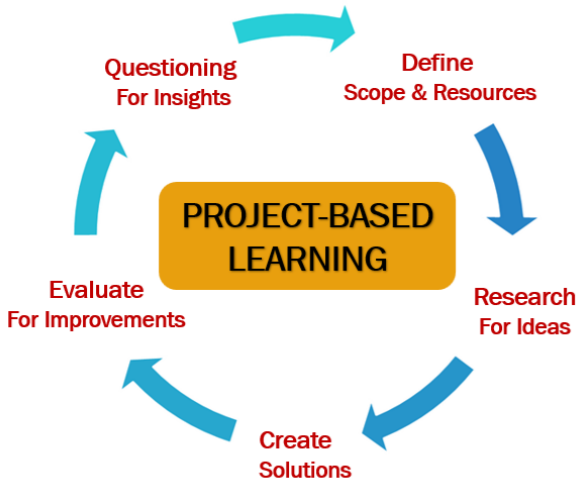


Figure 1

The Material Science Education Model

A hallmark of this initiative is its strong emphasis on PBL, which connects theoretical concepts with authentic real-world challenges faced by the industry. Students engage in optimising material performance through material compounding, processing, and characterisation. Beyond the dynamic and multidimensional integration of theory and practice, students emerge with critical thinking, problem-solving, teamwork, communication, and project management skills within a simulated professional environment, in addition to technical expertise. This development is nurtured throughout the five phases of the PBL iterative workflow, as shown in Figure 2. The process will be elaborated on in greater detail in the Methodology section.

Figure 2
The Five Phases of PBL

Literature Review

Industry-integrated PBL has emerged as both a pedagogical and practical evolution, driven by the demands of today's workforce, which are characterised by rapid technological change, global competition and evolving skill requirements for innovation. This meaningful progression aims to develop the cognitive, collaborative, and adaptive competencies that graduates need to thrive amidst the demands of the 21st century. As a result, there is an impending need for pedagogical models that more effectively align academic learning with employability (Naseer et al., 2025; Pan et al., 2023).

Traditional PBL is rooted in John Dewey's experiential learning philosophy and William Heard Kilpatrick's project method (Dewey, 1938; Kilpatrick, 1918). Empirical research on this inquiry-driven pedagogy consistently demonstrates benefits such as enhanced academic performance, positive affective attitudes, collaborative problem-solving abilities, and higher-order thinking skills (Almulla, 2020; Biazus, et al., 2022; Condliffe et al., 2017; Zhang et al., 2023). Nonetheless, traditional PBL has notable limitations. Recent reviews of higher education highlight that school or simulated scenarios are often overly simplified, lacking the unpredictability and complexity found in authentic professional environments. Ongoing challenges such as academia's readiness, the implementation of appropriate assessment strategies and the need to balance guidance, are factors that require further deliberation. (Admiraal, 2020; Marinho et al., 2020; Zhang et al., 2023).

Consequently, industry stakeholders now play a pivotal role in addressing longstanding gaps in graduate readiness, including adaptability, cross-functional collaboration, and contextual

decision-making for real-world employment. By embedding industry ecosystems within the established PBL framework, students engage with open-ended, evolving projects that mirror the complexity of contemporary workplaces. Integrating external partnership requires negotiation with multiple stakeholders, management of evolving requirements, and navigation of incomplete data and contextual constraints (Admiraal, 2020; Naseer et al., 2025; Popli et al., 2024). Throughout this process, students' professional identities and capacities for adaptive expertise are deepened through mentoring, workplace familiarisation and iterative feedback from industry leaders.

Empirical studies (Marinho et al., 2020; Pan et al., 2023) have also reported that sustained partnerships benefit both academia and industry. Industry partners gain cost-effective access to innovative ideas, new opportunities, and potential solutions for challenges they may not have the internal bandwidth to address. Furthermore, key success elements include structured peer interaction and enhanced group awareness which support high-quality collaboration (Zhang et al., 2023). Academic supervisors contribute by ensuring deliverables meet both curricular standards and industry objectives. Naseer et al. (2025) also mentioned that such collaborations nurture industry-savvy, agile, and employable professionals, leading to improved self-reported employability competencies, engagement, and learning satisfaction.

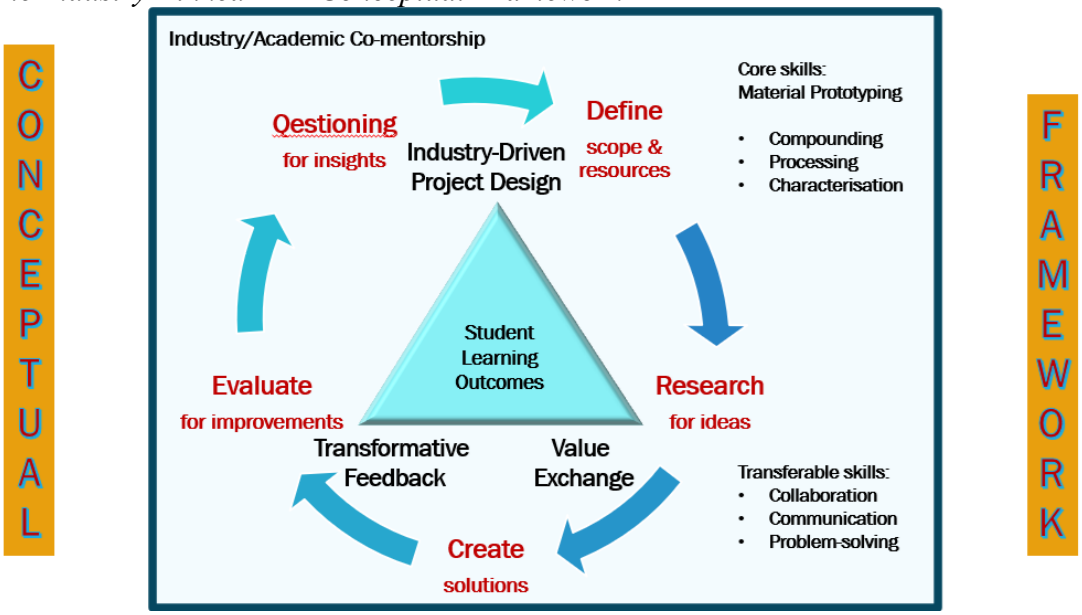
Methodology

Twenty Year Two students from the Diploma of Applied Chemistry (Material Science specialisation) students (n = 20) were recruited for this study. These participants were divided into five project teams of four. Each project theme is curated and sponsored by industry partners who provided the overarching project direction and key requirements in response to current market needs. This collaboration enabled students to gain invaluable insights into authentic professional practices and industry expectations. This approach also equipped them with the requisite skills and confidence to excel in their future careers in the field of material science. Under the guidance of experienced educators and industry experts, the students were tasked with delineating specific project goals, developing innovative solutions, and managing their projects from inception to completion using PBL. In this highly collaborative environment, students were encouraged to leverage their unique strengths, thereby enhancing their collective problem-solving, decision-making, and investigative abilities. The diversity within each team simulated real-world professional settings, preparing students to navigate complex interpersonal dynamics and develop essential transferable skills.

As depicted in Table 1, the collaborative process begins with the Questioning phase, the industry partners present their pain points and challenges encountered in product development or material performance while academic stakeholders brainstorm innovative ideas to address these real-world issues. In the subsequent Define phase, clear project objectives are established, hypotheses and technical requirements are formulated, and resources are allocated with guidance from industry partners regarding their expectations, technical specifications, operational constraints, and any specialised materials provided. During the Research phase, students conduct comprehensive literature research into material compounding and properties, analysing the latest technological advancements and relevant case studies. Industry collaborators support this stage by providing proprietary data, access, and sharing best practices. In the Create phase, research findings are integrated into iterative product prototyping or solution development, accompanied by material characterisation and performance testing. The industry partners mentor by contributing practical perspectives to frame project directives as well as insightful feedback on project findings. Finally, the Evaluate

phase involves reflective improvement and consolidation of deliverables for industry collaborators, with the feasibility of the proposed solution validated to ensure alignment with business goals in material science. This integrated approach ensures that both academic inquiry and industry needs are addressed throughout every stage of the collaboration.

Table 1
The Role of Academia and Industry Partners in the PBL Model



Phase	Academic Activities	Industry Engagement	Outcomes & Value Exchange
Questioning	Brainstorm for innovative ideas	Present industry pain points and challenges faced	Conceive insightful questions aligned with industry needs
Define	Define project objectives, hypotheses, technical material requirements and resources allocation	Set industry expectations and provide technical specifications, operational constraints and any specialised materials	Mutually establish project scope and measurable deliverables of currency and relevance
Research	Conduct literature research to meet project objectives	Provide proprietary data, access and best practices	Establish robust data and knowledge base, exposure to cutting-edge practices/ innovation in materials
Create	Integrate research findings into hands-on iterative product prototyping or solutioning	Mentor by contributing practical perspectives and insightful feedback on project findings	Develop prototypes or solutions collaboratively that are applicable to industry
Evaluate	Perform reflective improvements and consolidate deliverables to industry collaborators	Validate feasibility of proposed solution aligned with business goals	Foster knowledge exchange and advance innovation in materials

In order to assess students' learning, a structured questionnaire adapted from the Learning Self-Efficacy Scale (L-SES) for Clinical Skills (Kang et al., 2019), was administered. This instrument was designed to profile self-perceived learning and confidence in the cognitive, affective, and psychomotor domains, providing a multidimensional view of each student's educational development. Pre- and post-survey responses were collected at beginning and end of the semester using Microsoft forms. The self-assessment questionnaire is based on a five-point Likert scale. Participants indicate their perspective of each statement, ranging from 1 (Strongly Disagree) to 5 (Strongly Agree). This scaling provides a quantitative measure of student perceived self-efficacy in each domain. Qualitative results through interviews were also solicited around the PBL learning experiences and challenges encountered.

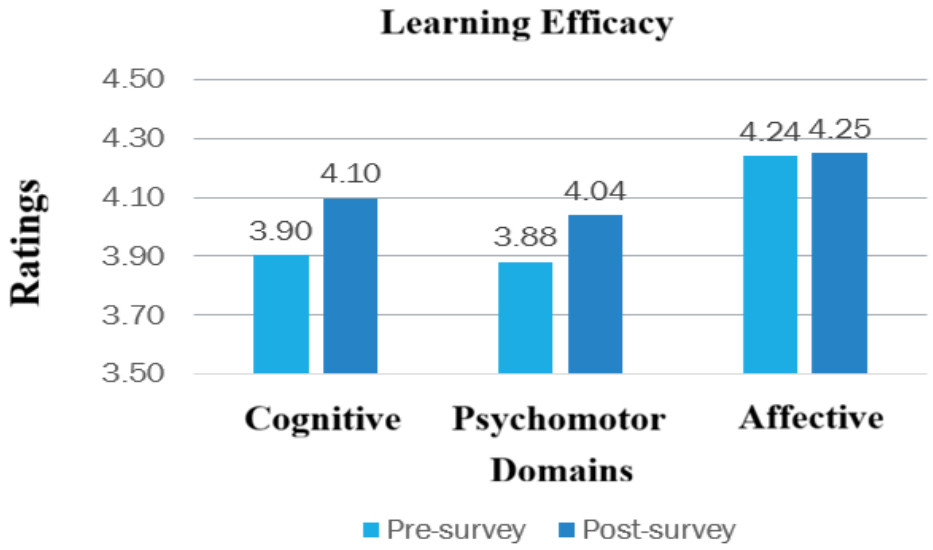
Results and Discussions

The integration of industry collaboration into PBL is crucial for bridging academic outcomes with real-world demands. A conceptual framework (see Figure 3) encapsulates three key pillars: industry-driven project design, value exchange and transformative feedback. The model is structured around clear milestones, measurable outcomes, and ongoing reflection. Students are empowered to track their progress, adapt their strategies, and demonstrate growth not only in technical skill but also in collaboration, problem-solving, and professional communication. The result is a holistic learning environment where students are committed to making meaningful contributions.

Figure 3
The Industry-Linked PBL Conceptual Framework

At its core lies the belief that this training will equip students with a rigorous academic foundation alongside the practical skills valued by employers. The first element, Industry-Driven Project Design, ensures the strategic partnership mirrors authentic workplace challenges. Through co-mentorship by industry professionals, students are exposed to a wide range of insights, methodologies, and real-world expectations (Lee et al., 2025; Pee, 2022; Srinivas, 2023).

The second element, Transformative Feedback, enables students to benefit from ongoing and contextualised feedback from their industry mentors, delivered through iterative sessions across the project timeline. This feedback enhances technical fluency feasibility, efficiency, and market relevance. The dynamic dialogue and critiques sharpen practical skills and nurture a mindset of innovation and resilience in students. They encourage iterative refinement, real-time adaptation and the development of essential skills in critical thinking and problem-solving.



In the final element, Value-Exchange, purposeful alignment of academic and industry efforts through co-mentorship, feedback loops, and shared resources allows all stakeholders to participate in a vibrant ecosystem of continuous improvement and co-innovation. The exchange of knowledge, resources and innovation between academia and industry offers substantial benefits to both parties. Industry partners gain direct access to emerging talent and their fresh perspectives. This synergy allows companies to explore new ideas with reduced risk

and ensures that educational curricula remain aligned with industry needs (Marinho et al., 2020). Meanwhile, students receive hands-on experience, networking opportunities, and exposure to authentic industry practices and standards. They are empowered to tackle complex, real-world problems, think with agility, and transition smoothly into professional roles, while educational institutions reinforce their role as vital hubs of research and development.

Cumulative outcomes, and values that drive both educational and industrial advancement (Ahmed et al., 2024; Geetha et al., 2025; Pan et al., 2023) are presented throughout each industry-integrated PBL phase (see Table 1). In the Questioning phase, students cultivate the ability to pose insightful questions rooted in authentic industry needs, laying a foundation for relevance and impact. During the Define stage, stakeholders collaboratively establish strategic direction with a clear, shared understanding of project goals and measurable deliverables of currency and relevance. The Research phase deepens expertise by building a robust knowledge base and fostering exposure to the latest innovations in material science. In the Create stage, students and industry professionals work together to develop prototypes or solutions that have direct applicability, effectively bridging theory and practice. Finally, in the Evaluate phase, students deepen their understanding through applied feedback while industry gains access to emerging talents and novel solutions that can inform future practices in a cost-effective manner.

Figure 4

Changes in Students' Learning Efficacy Before and After Intervention

The self-reported L-SES average scores for the pre- and post-surveys are depicted in Figure 4. They offer valuable insights into the multifaceted nature of student learning and development within industry-integrated PBL context. The quantitative data reflect improvements in learning efficacy across cognitive, psychomotor, and affective domains (Vuoriainen et al., 2025; Zhang et al., 2023). The qualitative results further elaborate on these measurements (from 3.90 to 4.10) and identify areas for refinement in implementation. Within the cognitive domain, students demonstrated strengthened mental skills through both the recall and application of technical knowledge acquired in their coursework. Even though students felt some aspects of their learning are highly specialised, they managed to apply these skills for authentic challenges such as equipment failures or variations in materials. In addition, when procedural uncertainty arose, students were challenged to go beyond standard textbook approaches. They were motivated to conduct independent research, troubleshoot and make adaptive modifications to

workflows and processing parameters, combining both research and experimentation. Based on their problem-solving skills and ability to reason logically in devising solutions, students could operate advanced instruments and made real-time adjustments to the processing parameters as necessary. Instead of relying exclusively on published data, students critically established appropriate process parameters via material characterisation and implemented measures to prevent equipment malfunctions. During regular communication sessions with project mentors, students demonstrated their ability to articulate technical concepts, requirements, project sequences and their interconnections clearly to the stakeholders. In the face of operational constraints, students were able to account for the underlying causes to external collaborators and make informed decisions regarding their strategies. These experiences reinforced their capacity to provide step-by-step explanations of each part of the project and its role within the overall process.

Students also showed improvement for the self-reported measurements (from 3.88 to 4.04) within the psychomotor domain. Their marked improvement in technical competency was evident through hands-on demonstrations and qualitative interviews. They were able to precisely execute the operational steps and action required for their technical assignments, as demonstrated when they confidently adjusted equipment such as extruders, TGA, DSC, and SEM during practical sessions. Many students reported completing these technical tasks smoothly and with increasing proficiency. Throughout the project, students proactively monitored their technical competency and continuously looking for ways to improve. For instance, when challenges arose, they adapted by exploring different approaches to project tasks such as modifying extruder operational parameters or SEM settings to address unexpected results. This adaptability highlights their willingness to experiment and integrate new methods in pursuit of better outcomes. Moreover, students made a conscious effort to monitor their understanding of course contents and technical skills. They regularly assessed their own progress and made necessary adjustments, ensuring alignment between theory and practice in a PBL context. Although occasional obstacles such as complex tasks or equipment limitations resulted in fluctuations in self-efficacy, students experienced notable growth in innovation and self-regulation.

In the affective domain, students' attitudes, values, emotions and motivation towards learning remained generally consistent (from 4.24 to 4.25) throughout the project. Nevertheless, the qualitative analysis showed that most students reported feeling more engaged, committed, and confident when faced with real-world challenges. Their motivation notably increased as project goals became clearer and as they observed tangible outcomes from their efforts. However, a minority noted that information-seeking behaviours might falter under deadline pressure, unfamiliar tasks and resource constraints. This range of experiences emphasises the setting of realistic expectations and providing targeted support to sustain engagement. Students repeatedly stressed they value the receipt of technical guidance, prompt feedback and practical advice, especially regarding process optimisation or mastering new techniques, when dealing with uncertainty or stress. Therefore, the ongoing guidance from supervisors and team were instrumental in fostering a sense of purpose. These can come in the form of facilitating communication with stakeholders, clarifying deliverables, ensuring quick access to resources and collective team efforts in maintaining positive emotions were all vital for enhanced outcomes when refining project approach. Despite occasional setbacks, the majority of students appreciated the practical experience gained from industry-oriented tasks. The open-ended format of the projects promoted exploration and independent learning, expanded their learning horizons.

Recommendations

The shift toward industry-linked PBL has led to advancements in students' cognitive and psychomotor abilities. However, the pilot implementation revealed that many students initially faced uncertainty in meeting industry project expectations due to perceived gaps in their competencies and available resources. To address the challenges of balancing structured guidance with student autonomy, it is strongly recommended to enhance student preparedness. Specific gaps identified through post-project interviews prompted more targeted support in strengthening technical report writing and core material science competencies, particularly in processing techniques prior to project commencement.

To mitigate the considerable stress experienced by students, measures such as built-in buffers within project timelines should be implemented, allowing for more thoughtful consolidation and reporting of findings. Regular check-ins and open forums can further alleviate anxiety as students make conscious efforts to meet the expectations of academic and industry stakeholders.

Beyond technical proficiency, it is crucial to place greater emphasis on developing transferable skills that foster students' holistic growth. Cultivating self-directed learning, effective teamwork, and a collaborative culture grounded in inclusivity, mutual respect, and open-mindedness are vital attributes for real-world success. In this environment, supervisors play a pivotal role by reinforcing positive team dynamics, celebrating collective small wins, recognising individual contributions, and fostering a sense of belonging within diverse groups. By integrating these strategies, academia can empower students to thrive as adaptable, resourceful professionals in material science. Granting students greater autonomy in project selection can further enhance their motivation and instil a stronger sense of ownership over their learning experiences.

Conclusions

Through the purposeful integration of industry collaboration within PBL, material science education at Singapore Polytechnic has experienced a transformative evolution. Joint supervision by both industry collaborators and academic mentors enables projects to be co-designed in response to current, real-world issues, ensuring that learning is grounded in robust theoretical understanding while firmly situated within practical application. This intentional bridging of theory and practice ensures that graduates are well-prepared to contribute to the material science sector. Ongoing and transformative feedback provided by industry professionals further enriches students' learning journey, shifting them from passive recipients to proactive problem-solvers. Reflective practices embedded throughout these experiences promote continuous evaluation of students' cognitive, affective and psychomotor development, aligning their growth with the technical demands of the evolving industry landscape. As cohorts progress through their projects, clear advancements, particularly in communication skills, are observed. During professional interactions with industry stakeholders, students become more equipped at articulating project workflows, outcomes, and challenges with minimal assistance from their academic mentors. Beyond the notable gains in technical execution, logical sequencing, and confidence, this holistic approach further exposes students to external perspectives that emphasise market relevance and adaptability in real-world settings. As a result, it fosters resilience and cultivates a mindset of continuous improvement. The reciprocal exchange of value between academia and industry creates a vibrant learning ecosystem, empowering students to acquire hands-on technical proficiency and develop professional

networks while the industry partners benefit from fresh perspectives and cost effectiveness in project solutioning. This tripartite partnership ensures that PBL remains agile, relevant, and impactful in effectively bridging the gap between scientific theory and the practical development of material solutions, while instilling critical 21st-century transferable skills such as self-directed learning, problem-solving, collaboration, and communication. These industry-infused, hands-on experiences position students advantageously for the ever-evolving landscape of material science.

The Role of Identity-Based Curriculum in Social-Emotional Learning

Ei Smith, Phillips Academy, United States

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Identity is defined as a set of experiences and beliefs that make-up a sense of personhood. Markers of identity, such as gender, race and class are socially constructed and intersectional. They are influenced by self-curation, aspirations and how others perceive us. This interplay between the cultural identity of the students and hegemonic structures provides a tension that can and will play a role in classroom culture (Krzesni, 2015). I have chosen to focus on the importance of an educational program that advocates for the exploration of identity within the K-12 life stage because it is essential for young people's heritage and histories to be valued and represented. While they are growing intellectually and emotionally, this form of validation provides innumerable benefits both academically and socially. Methodologically, I have created two social science modules, at the elementary, middle and high school levels, to demonstrate how these values can be put into practice. This paper will contribute to the growing study of identity-conscious education and how to cultivate a respectful community in an institutional setting. It will detail the facets of this curriculum and showcase how students (n = 45) engaged with the scholarship, produced work and applied a critical lens at their respective developmental stages. The responsive classroom appreciates the distinctions that cosmopolitanism provides and the study of the leaders within activist movements for racial and indigenous justice, gender equality and ability rights will allow for the intentional and deliberate study of issues of power negotiation and systemic issues.

Introduction

Identity is defined as a set of experiences and beliefs that make-up a sense of personhood; it's influenced by self-curation, aspirations and how others perceive us. It is multi-faceted in nature and can exist in opposition to various forms of self. Examples of markers of identity are gender, race and class but they are all socially constructed and we all perform a multitude of these markers with our intersectionality. This integral intersection between the cultural identity of the students and hegemonic structures provides a tension that can and will most often play a role in the classroom culture as well (Krzesni, 2015).

I have chosen to focus on the importance of a curriculum that is conscious and advocates for the exploration of identity within the K-12 grades because it is essential for children's heritage and histories to be valued and represented. While they are growing intellectually and emotionally, this form of validation and respect provides innumerable benefits both intellectually and socially. Having grown up in the multicultural setting that is Toronto, Canada, I feel indebted to the educators and institutions that created a safe and respectful environment to perform all aspects of my Asian American identity. I strive to cultivate a similar social and emotional space in my institutional community.

Within our increasingly cosmopolitan world, it is essential to curate and implement identity-conscious curriculum that recognizes the importance of cultural diversity. The responsive classroom appreciates the distinctions that multiculturalism provides and the study of the leaders within activist movements for racial and indigenous justice, gender equality and ability rights will allow for the intentional and deliberate study of issues of power negotiation and systemic issues. The changemakers unit for second graders will engage with a developmentally appropriate curriculum that is grounded in children's literature and art to make meaning from the critical engagement. Similarly, with middle schoolers engaging with memoirs and high schoolers creating cultural maps, they are provided with the intellectual and affective avenues to explore their positionality and become civic-minded.

Project Summary

The project aims to explore the theoretical underpinnings of why identity-conscious curriculum is beneficial from early childhood to high school for both intellectual and social-emotional development. Educators and their pupils exist in relation to one another within the classroom setting. The difference in power can bring forth problematic dynamics if the culture is not guided with respect and consideration of this differential. Emotional intelligence and the ability to discern the motivations of people's choices is key to fostering a positive learning environment. Having interest in delving into the nuances of human nature allows an educator to build this sensitivity and interact with students in a more effective manner. Educators should be committed to fostering a child's intellectual development and emotional maturity:

> The prereflective or primitive form of the pedagogical relation is already found in various relations of everyday life: in the conversational relation, in the helping relation, and in every event where a certain influence toward formative growth is exercised by one person towards another.
>
> The pedagogical relation differs from these incidental formative relations in that the pedagogue is 'given' special responsibility for the young person. (Van Manen, 1994, 11)

There is a history of problematic curriculum and the harm that it can cause will support the need for this respectful and reflexive approach. Indigenous children are often in search of curriculum that respectfully honors and acknowledges their histories. Problematic discourses such as portraying native people as uncivilized and destructors of human development are forms of oppression for the populations who are instructed with these racist and limited perspectives. Their forms of history, such as oral narratives or art, are not always acknowledged within formal academic circles of the discipline and certain voices are given precedence over others (Krzesni, 2015). It is important to make the distinction between respectfully incorporating these histories and knowledge into curriculum through asset pedagogies compared to curating lessons to simply assimilate children of color into larger frameworks of normative discourses to civilize and discipline them (Paris, 2012).

I will outline a two-week elementary curriculum that begins with the concept of power differentials and how this dynamic can create both conflict and the potential for social transformation. The students will then study the lives and work of leaders who combated racial discrimination and fought for gender and disability rights. Then, I will suggest how these principles can be extended through the study of memoirs for middle schoolers and cultural mapping for high school-aged students.

Through the activism of racialized students bringing their lived realities of thriving and existing in predominantly white schools, administrators and educators alike have had to re-examine the curriculum and their approach to teaching. Having the courage to have difficult discussions and feeling the discomfort of confronting past wrongs can lay the foundation for a more inclusive institution. Exploring these concepts can be difficult for white teachers who need professional development to grapple with these issues and may want to avoid conflict within the learning and professional environment. In spite of these feelings of apprehension, a teacher should examine his or her own identity since this impacts their approach to class management and pedagogical style (Talusan, 2022). The lack of diversity in the field of education itself needs to be recognized and further examined. The fact that eighty percent of teachers identify as white women who are mostly from middle-class backgrounds, while 7 percent of educators are Black, 6 percent are Latinx and an even smaller percentage or Asian American or Indigenous people, has implications for what children internalize about who is teaching them and the systemic reasons why (National Center for Educational Statistics, 2016). Teachers of all identities need to grapple with and promote moving beyond deficit-based models but instead implement democratic and pluralist teaching approaches that integrate the multiculturalism that is now represented by the student population. This diversity in histories and skill sets within the classroom is an opportunity to go beyond marginalizing and viewing students of color as a liability (Paris, 2012).

Description of Setting and Population

The project is inspired by my time in a second grade classroom at The Pike School in Andover, Massachusetts that is a well-established independent school. Though the school is located in an affluent suburb, it attracts attendees from the greater Boston area and New Hampshire who are of varying financial standing. The lower school serves students from grades pre-K to 4 and then the upper school houses youth from grades 5 to 8. The student population is richly diverse. Within my second grade classroom, eight of the students are bi-racial or racialized and the school is committed to culturally diverse education that also focuses on social justice at a developmentally-appropriate age. There are monthly Diversity Equity Inclusion Justice professional development meetings for the faculty and staff to support the

implementation of this curriculum. The predominantly white faculty is a contrast to the increasingly racialized student population.

Project Statement

Why is it important to curate and implement an identity-conscious curriculum within the classroom at the elementary level?

A. Students will feel that their identities are recognized and valued within larger knowledge systems.
B. As children are refining their sense of self, they should be provided with a respectful and safe classroom culture in which to grow.
C. The instability of identity formation and performativity further reinforces the importance of being a reflexive educator who is agile and can cultivate a responsive classroom.

Having the opportunity to further refine their identity in a group setting is beneficial for all of the students because they are guided on how to conduct themselves in a reflexive but mindful way. By finding historical and cultural commonalities, a culture of open-minded engagement is fostered and encouraged (Krzesni, 2015).

Previous Literature

Theories and research-based approaches relating to culturally responsive curriculum support the benefits of adopting and implementing these strategies within the classroom. Further refined by Emily Style (1988) for the National SEED project, the concept of *mirrors and windows* helps students to build empathy through reflexive self-examination and recognizing other nuanced perspectives. By framing this reflexivity through mirrors and windows, it allows educators to thoughtfully select material for children to see a reflection of themselves and further develop their identity and also use the window to gain perspective on other realities that may be unfamiliar but provide important personal growth. Being cognizant of biases and lowering the defensive walls can provide the space for important forms of transformation as educators. Reflecting on past practices guarantees discomfort and but facing this ugliness allows for new pedagogical pathways and honors the process (Nelson & Wilson, 2010).

Epistemology is influenced by the social conditions and the relational identities of the theorists themselves. Therefore, pedagogy should be cognizant of these biases when creating curriculum. Problematic epistemologies can reinforce discriminatory forms of dominant power relations that create subordinate positioning (Fanon, 1952). To counter these hegemonic beliefs, anti-oppression curriculum is student-directed that allows them to practice creativity and encourage nuanced ways to critically assess current theories and practices. The lives of the students themselves are embedded in the process to allow for the building of rapport and confidence between instructor and learner (Orr, 2002).

There are several foundational aspects of the identity-conscious curriculum, but at its crux is how the curriculum recognizes the role of positionality and how identity creates different realities for individuals within the social realm. The reckoning as a racialized person is reinforced by societal norms that dictate one's access and positioning within the hierarchy. An individual's identity allows them to negotiate the systemic norms and their access and advantages can vary according to the context. But for racialized persons, the fluidity and

possibilities can be more limited and troubling (Steele, 2010). The order of things often demands that people perform to make gains but the process of code switching can be oppressive and dehumanizing in itself. As an educator, being aware of stereotypes when interacting with students is essential to creating an inclusive environment. By acknowledging these biases, the reflexive teacher can build authentic connections with the children to ensure that they feel seen and heard. This especially comes into play during the creation and implementation of assessments to gauge learning gains. Certain racialized groups have to negotiate a psychological barrier that can impact their performance. They are dealing with what Steele (2010) and his colleagues term *identity contingencies* where one's identity enables and demands them to negotiate their social condition.

Goals, Objectives, Implementation Steps, and Timeline

I. The goals of the Changemakers curriculum of students in the second grade include:
Objective Number 1: To curate a developmentally-appropriate two-week unit that focuses on the role of Changemakers in political transformation to combat systemic issues and work towards equity.
Objective Number 2: To put into practice the belief that identity-conscious curriculum is beneficial for the social-emotional development of children since representation and valuing the richness of a classroom's cultural composition enhances the intellectual and social outcomes for young people.
Objective Number 3: Education plays an important role in challenging problematic and dominant narratives that reinforce discriminatory and reductionist conceptualizations of society.

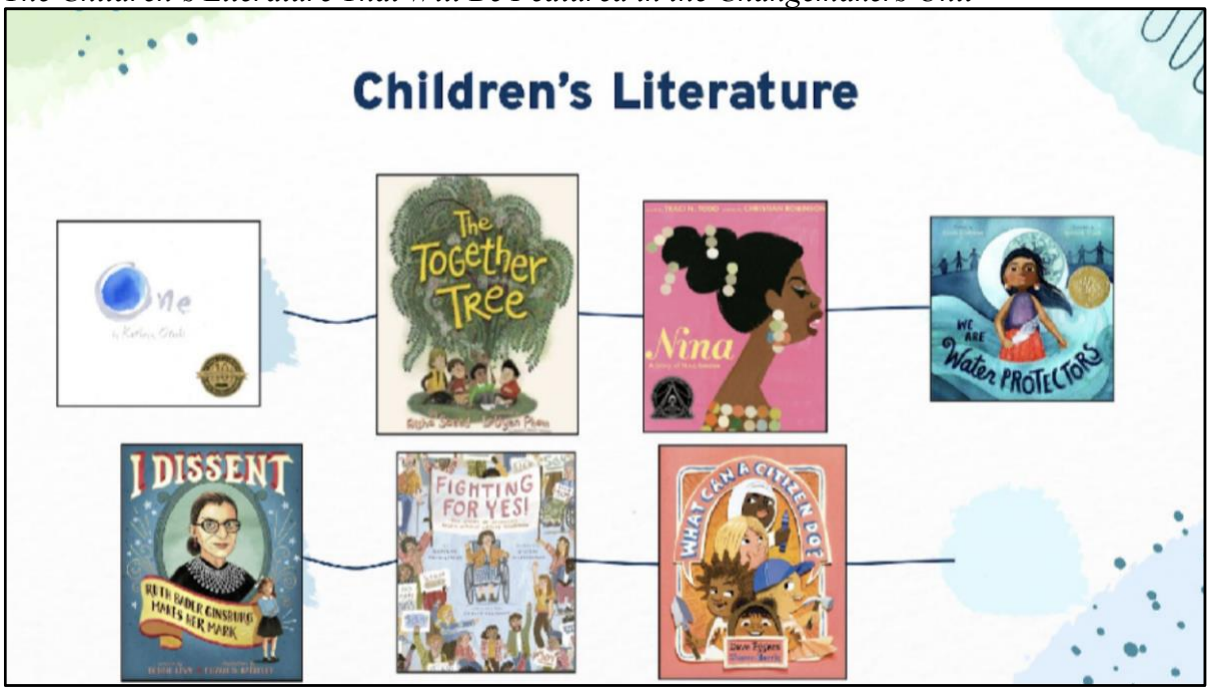
Literature provides the avenue for young people to be reflexive and cultivate their empathy by gaining insight into identity and life situations that may be both familiar or far from their own realities. Cultural identity is always in the midst of being formed and it's this instability that allows for hybridity and nuance. The performativity of identity means that the presentation of certain aspects may shift according to the context and the norms required for that time and place. Cultural mapping is a practice that allows children to reflect and pinpoint some of these relational aspects of their identity (Enciso, 1994).

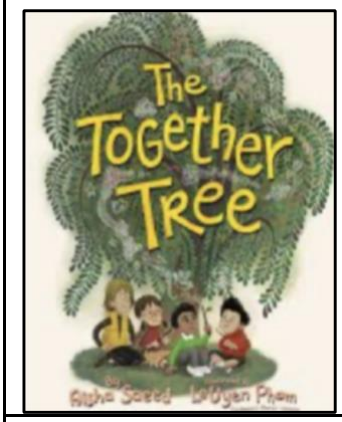
I. The facets of a two-week unit on Changemakers for second graders
   A. The unit will incorporate read-alouds that will allow the young people to explore more abstract concepts such as power inequalities and discriminatory practices. The titles and brief summaries can be found here: https://docs.google.com/document/d/10kBxY9GJWhLqQHN2-CaOIBm7Dafd9v1PJCpgkSd-wXY/edit?tab=t.0
   B. Leaders in the activist movements throughout history that combat racism, gender equality and disability rights will be featured.
   C. We will recognize the power of naming and language and will therefore be inspired by the artwork of the *Guerilla Girls*. The students will think of an adjective that describes a Changemaker, create a piece of art, a portrait and conduct research to write a paragraph about how the leader enacted change.
   D. The unit will be mapped out in the curriculum development graphic organizer for the Understanding by Design model found here: https://drive.google.com/file/d/1GgJ8NzsbupWBUwp2xZPD39F43teY3ZDh/view

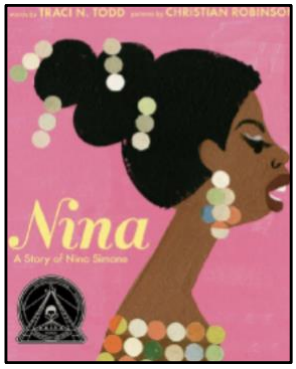
To build a collective sense of affinity, role models are an essential aspect of putting activism and social justice at the forefront of popular culture. Certain identities are provided with the privilege of not having to prove their social standing or worth. The ability to find one's place in the social world through the examination and study of one's identity allows them to make meaning about the global realm. This form of identity-conscious pedagogy enables students to have social-emotional health to thrive as individuals while pursuing their passions and interests (Krzesni, 2015).

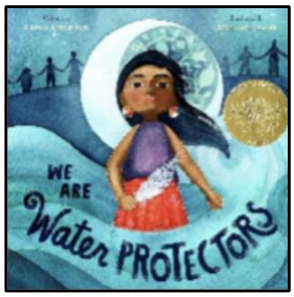
Figure 1

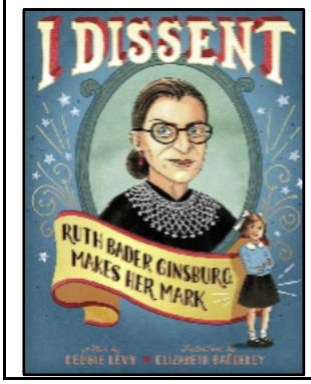
The Children's Literature That Will Be Featured in the Changemakers Unit











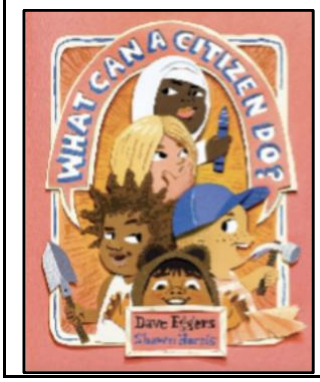


Table 1

Children's Literature for the Changemakers Unit

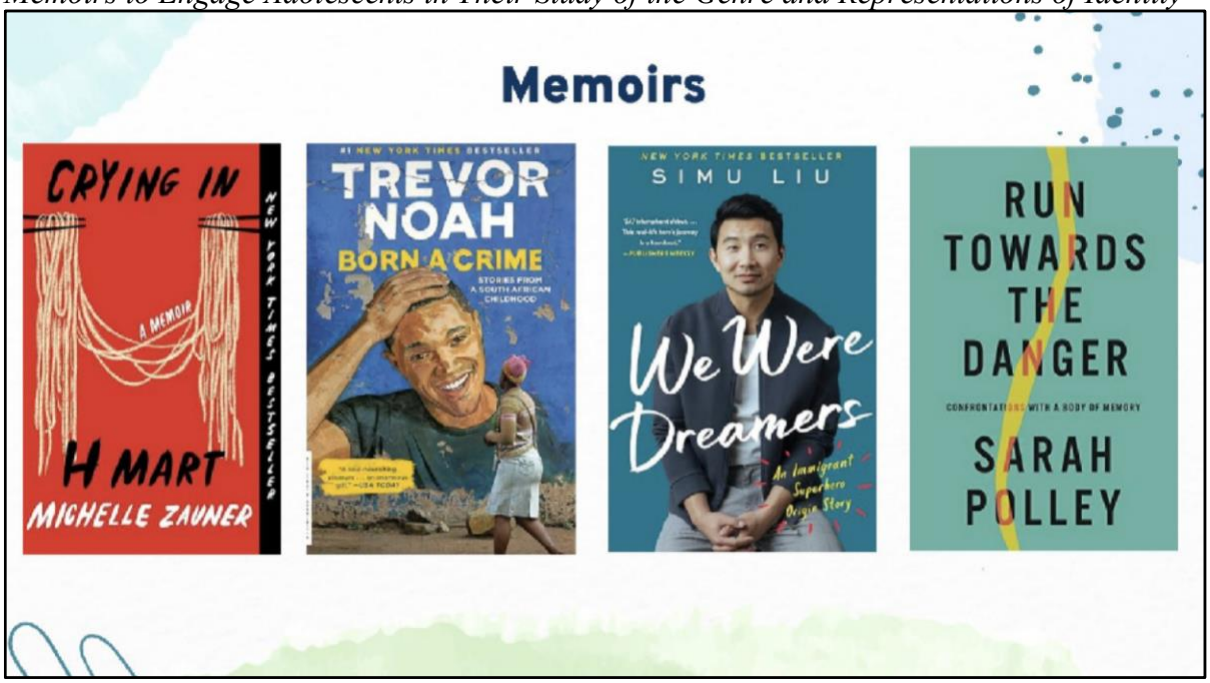
Title	Summary
	There is a power differential between the different characters within this book where they define their distinctions through their shapes and colors. The stakeholders are intimidated by the aggression of red but it only takes one player to change the dynamic and ask empathetic questions to work towards equity and inclusion in the end. Through their innovative way of being, they shifted what it means to count.

	Starting at a new school is made even harder for Rumi who is bullied for being reserved and different. His fellow student Han, takes a stand and suggests for the aggressor to be inclusive and compassionate. It is with Rumi's willingness to build friendships that under the shade of a willow tree, all the children gather to find shelter and to cultivate the joy of playing together.
	Nina Simone is a talented musician who has longed for a place to practice her gifts and to belong. She is resilient in the face of discrimination and does not let exclusion define who she can become. As her fame rises she is called to a larger cause of fighting for the rights of African Americans with the Civil Rights movement. Her music speaks of the struggles but also the gloriousness of knowing precisely who you are and what you deserve.
	Water is of central importance for many Indigenous cultures and held as a source of sacred power. It is from water that we emerge as infants and it allows us to thrive and survive during our time on earth. With development, environments are being tested and Native Americans are asking us to take care and be cautious about how we should be caring for nature at large.
	The importance of critical engagement with the world has always been the crux of Ruth Bader Ginsberg's life and character. She has been able to recognize when healthy debate and collaboration can bring about conditions that are fair and just for many of the stakeholders involved. Moving from polarization towards greater understanding is how she existed in the world and how she inspired such spirit in others.

	Judy Heumann has used the physical and systemic barriers in her life to drive her desire to work towards greater access and rights for those with disabilities. She commits herself to a politics of peaceful dissent to collaborate and work towards enacting section 504 of the law that would create a more inclusive society.
	The conceptualization of a citizen is vast and open according to the authors but the most important aspect is that individuals are engaged and willing to work towards a respectful pluralist society. The actions can take on a multitude of options as long as they are committed to critically engage with existing systems and redefine barriers.

Results and Outcomes

Eurocentric pedagogy can alienate students who feel excluded and underrepresented in the epistemology that is presented. By valuing and drawing on the culturally diverse classroom, the cultural capital of the identities who are part of the relational environment provides enrichment to both the educator and pupil alike. Accounting for the distinctions between the students is a linchpin of *culturally diverse pedagogy* and considers their perspectives and heritage. By fostering classroom practices that recognize and place this knowledge at the forefront empowers the students by providing representation of their rich cultural histories. Showcasing the work of role models from their affinity groups is one way to have a grounded and tangible way to study the social and political context of systemic issues. With the integration of the theories and experiential knowledge, the students will be compelled to critically engage with the political landscape (Parhar & Sensoy, 2011).



I. With the detailed outline for the curriculum, an educator, both in the independent and public school setting could implement the analysis, discussions, art project and research project with their second grade students to guide and support important issues of social justice and the collaborative strategies of Changemakers.
II. If educators do not have the same resources to purchase the books or materials, the titles can be borrowed from the library and adjustments can be made with regard to the art supplies that support the study of the leaders and systemic issues.
III. In a developmentally appropriate manner, the students would have continued their engagement with social studies issues that are culturally diverse and deeply considers the importance of these histories of social and political change.

Middle-School Curriculum

Memoirs are a genre that will compel adolescents to be inspired by the journeys of aspirational leaders who share their cultural affinity. From Trevor Noah's examination of growing up as a multi-racial child in South Africa where the history of apartheid reverberates in every aspect of life to Simu's Liu's meditation on navigating the expectations of an Asian-Canadian family, these talents provide tangible examples of struggle, resilience and self-acceptance. They are also at the center of their story and can shape their narrative without intervention from public opinion or social pressures.

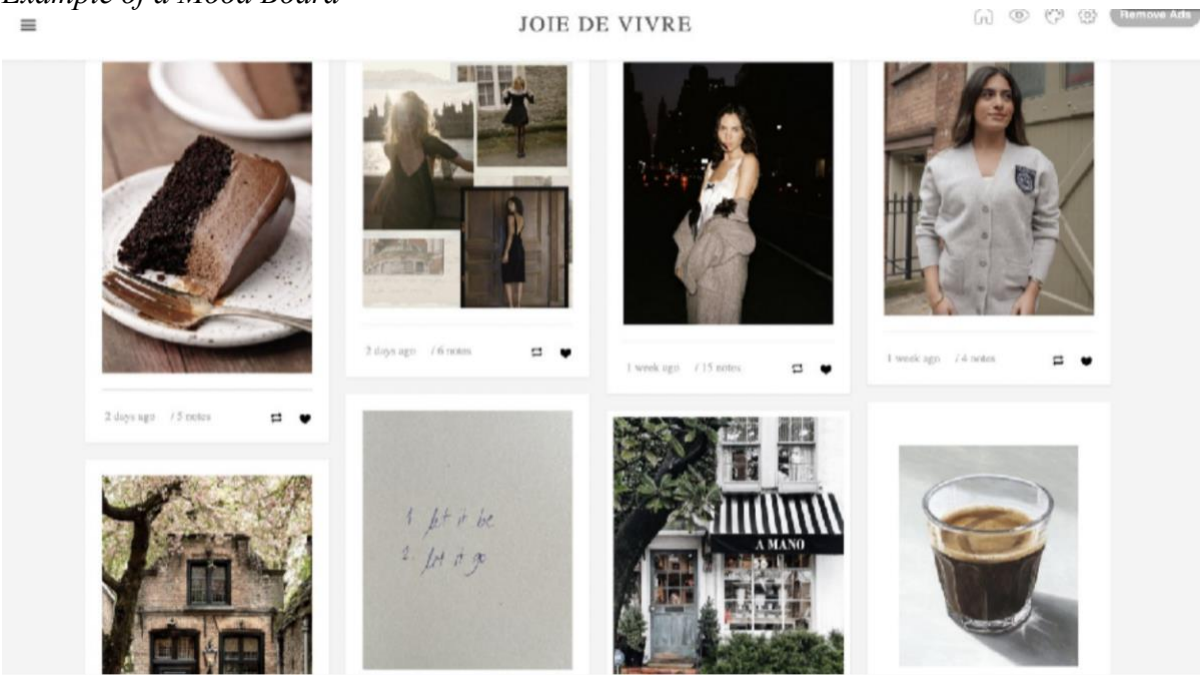


Figure 2

Memoirs to Engage Adolescents in Their Study of the Genre and Representations of Identity

After studying these texts, middle-schoolers can be encouraged to create their own visual mood boards to reflect on what influences their identity-formation and how these facets draw from family, educational community and the wider public. After this exercise, they can change the scale and write of one moment that they feel significantly impacted their sense of self. This will build the confidence to practice their voice, since they are the experts of their story, and they will practice the writing structure of providing context, citing evidence and then elaborating on why this moment was particularly impactful.

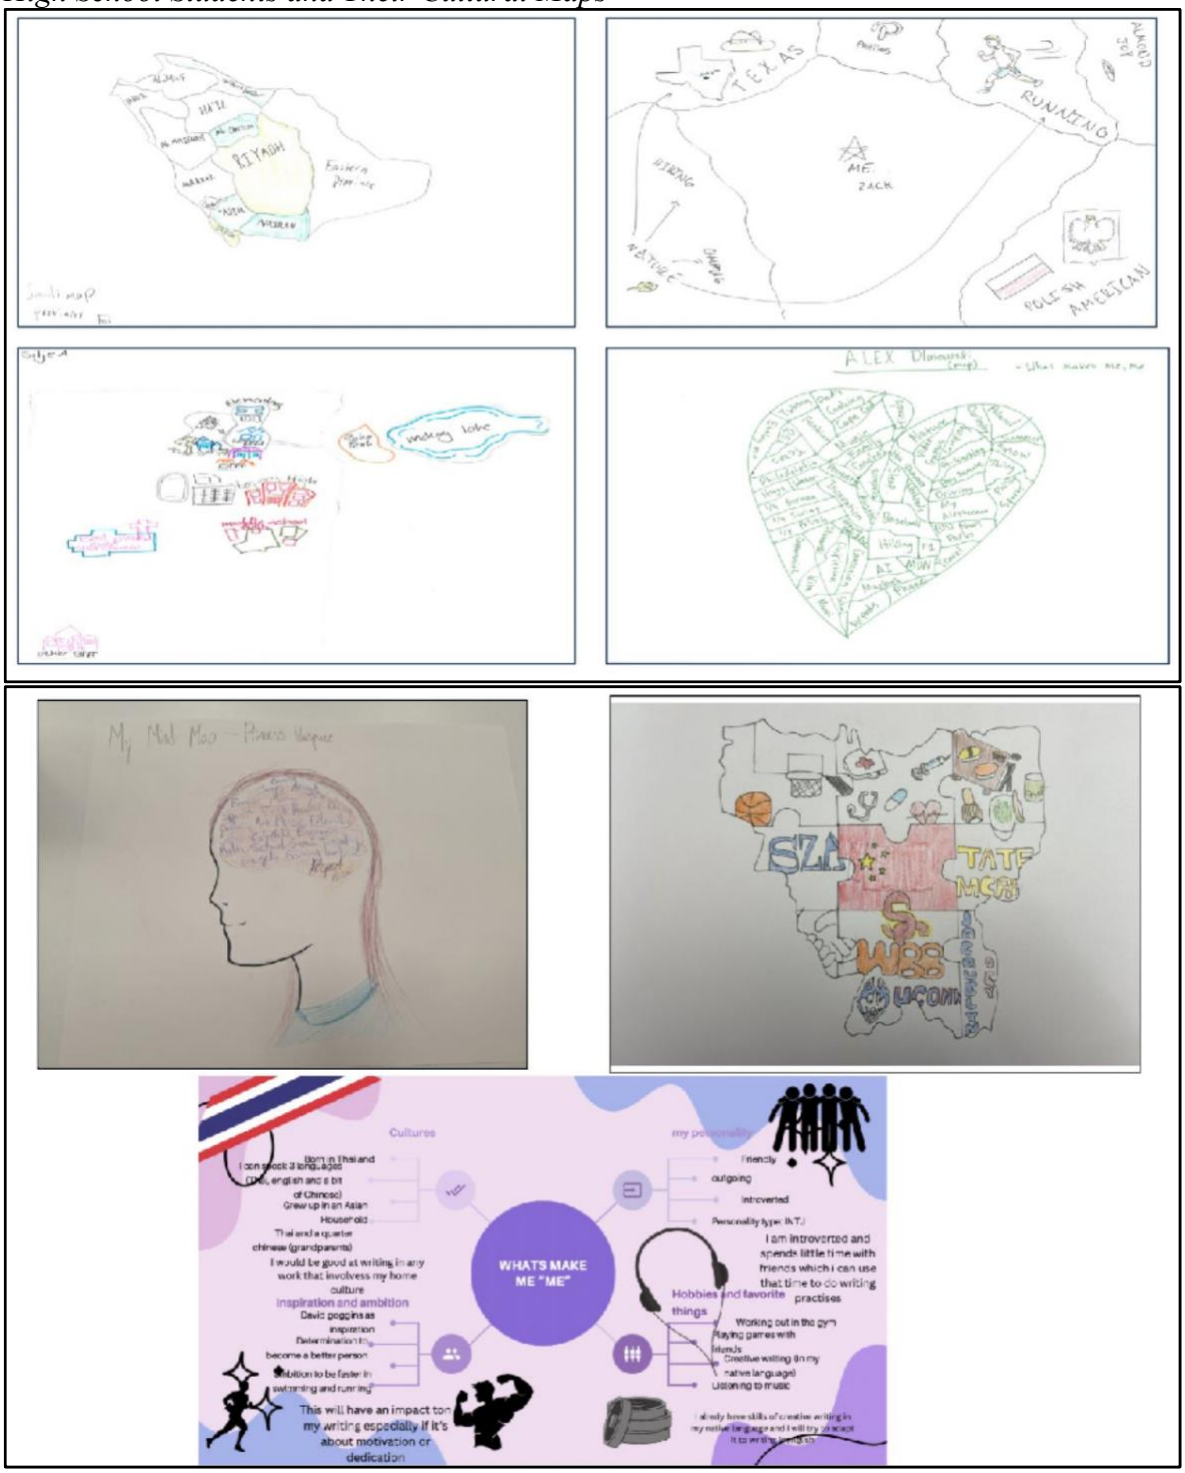

Figure 3
Example of a Mood Board

High School Curriculum

For older students in grades 9–12, they are ready to take on more abstract renderings of identity. Inspired by the work of Tim Cresswell (2011), students can create an identity map that demonstrates how places are given significance by the people who inhabit them. The cartography can range from the geopolitical, identity-based to cultural. The expansive scope of this project allows students to grapple with the challenge of working with a multitude of possibilities and rather than be daunted, instead be inspired. It can be challenging to feel that there is no concrete "right" answer and rather they need to revel in the discomfort that they are the agents of this meaning making.

Figure 4
High School Students and Their Cultural Maps

Conclusion

Upon re-examination and evaluation, the objectives of the curriculum and capstone project were successful according to the learning outcomes of the second grade class. Through representation, study and appreciation of cultural diversity and the leaders within the community, students will feel validation while further refining their sense of self. With the

examination of larger issues of power negotiation and the establishment of dominant narratives, the students can critically engage with the material and challenge existing inequalities.

"Flipping" the L2 Classroom: Peer Teaching With Student-Generated Materials

Matthew Armstrong, Kyushu University, Japan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study examines learner perspectives of student-generated materials (SGMs) in the second language classroom. In this research project, students took on the role of the teacher in a "flipped" learning approach. 22 students were given an open-ended survey asking them about the positive and/or negative aspects of creating materials and leading discussions, and what they learned about themselves after the experience. On the positive side, results showed that student engagement with the learning materials had increased, student leaders were able to understand how to deeply research their chosen topic in the L2, peers developed stronger relationships, and students could recognize areas to improve in their own language skills through observing others' discussions. These successes led them to taking more responsibility for their learning and feeling more empowered. On the negative side, students reported that selecting topics and writing meaningful discussion questions was challenging due to the wide range of proficiency levels in the classroom. They also found it difficult to take notes and synthesize information from many groups. Overall, students found the experience beneficial to critically understanding their academic English level but also reported that they needed teacher guidance to help organize lessons and further build their skills.

Introduction

Second language acquisition (SLA) theories in the past focused heavily on grammar-translation and the writing of long vocabulary lists (Pangeran, 2025). This teaching approach, popular in the early to mid-1900s, was beneficial for improving reading comprehension skills but was largely ineffective in developing learners' communicative competence. The Direct Method, which emerged soon after, placed emphasis on oral communication in natural settings with linguistic accuracy. Communicative Language Teaching (CLT), still practiced today, is the most popular teaching method, focusing on functional communication and authentic tasks in a variety of familiar and unfamiliar settings (see Ellis, 2021 for a brief history). As the concept of learner autonomy became more widespread in second language learning (Holec, 1981), SLA began to shift from CLT to more learner-centred teaching approaches. Task-based language teaching (Nunan, 2004), project-based Learning (Markham, 2011), and flipped learning classrooms (Baker, 2000; Bergmann & Sams, 2012) are all examples of current teaching methods which aim to promote learner development and encourage deeper learning through active exploration of real-life content. This study describes a flipped classroom approach in a freshman English course using student-generated materials (SGMs) to help students improve their communicative competence. Three aims guided this research:

1. To help learners increase talk time during lessons by encouraging them to prepare for lessons in advance and actively participate in discussions.
2. To promote learner autonomy by encouraging learners to take on leadership roles and assess learning strengths and areas to improve through critical self-reflection.
3. To understand student perspectives of challenges faced in the flipped classroom and benefits to their learning.

This model of learning provided a more interactive and reflective learning environment within the language classroom. To understand exactly how the flipped approach works, it is necessary to first give an overview of the approach and review other key terms. This will be followed by an explanation of the course structure and learner perceptions of the new approach.

Overview of the Flipped Learning Approach

Characteristics of a Flipped Learning Classroom

For this study, the researcher followed Shibukawa's (2024) three central characteristics of flipped teaching. The first characteristic aimed to reduce lecture time by encouraging students to prepare for each lesson in advance so they could use the 90 minutes of lesson time more effectively to discuss the content deeply. Preparation typically involved reading newspaper articles or other authentic L1 sources or watching videos. Students were asked to write notes and summarize the content to show deep understanding of the learning materials and then formulate their own personal opinions about the topic. The second characteristic involved maintaining the primary/primary relationship of applying knowledge gained from preparation to the lesson to the lesson discussions. That is, as preparation was a direct prerequisite to the following lesson's plan, if the student did not prepare for class, they would not be able to participate fully in the discussions. For the third characteristic, the preparation and lessons must be inseparable and aligned. Therefore, structural elements were included in lesson preparation such as vocabulary acquisition, note-taking to answer comprehension questions during class, and providing questions that facilitated deeper thinking. Assessment was conducted based on in-class activities and feedback given as a class as well as individually. In this way, while

preparing for class, students could envision their participation and feel more confident about joining in the discussions.

The Flipped Classroom and Learner Development

One of the main reasons for employing a flipped classroom was to help students reflect more deeply on their language abilities and become a more active participant in the learning process (as opposed to passively waiting for teacher instruction). Students in the freshman English course had different proficiency levels and reasons for wanting to improve their English, thus the flipped approach was considered as a suitable option to help learners self-reflect on their performance each week and set their own learning goals. Learner development was promoted in four ways:

1. *Self-pacing:* Learners were able to work at their own pace during lesson preparation. That is, they were free to read or watch the input materials as often as they wished and revisit difficult sections.
2. *Higher order thinking*: Critical thinking skills were encouraged especially through note taking. Writing notes and summaries helped students to deepen their understanding of the input materials and organize their thoughts by considering which information to keep or discard. Students were not given comprehension questions until the following class and thus had to understand the content fully to successfully answer questions.
3. *Engagement with learning materials*: Students actively engaged with lesson materials by selecting their own topics. Teacher-selected topics sometimes did not connect with student life which reduced engagement. Topic-selection gave students more ownership as there was personal interest in the content and it was more relevant to student life.
4. *Leadership skills and self-reflection*: Students reflected on skills through designing learning materials, leading discussions, managing the lesson time, helping to keep group discussions flow smoothly and reflecting on personal language strengths and areas to improve based on discussions they observed.

Student-Generated Materials in a Flipped Learning Classroom

A key strategy in the researcher's flipped classroom was handing over the control of the class to learners to further increase interaction through increased levels of collaboration and discussion. Each week, a group of students worked together collaboratively to create a lesson plan based on the structure of the lesson modelled in the first few classes of the semester. They were given one 90-minute lesson to decide on an academic topic, decide on roles, and split up tasks to prepare for teaching their lesson. Tasks included finding authentic L1 articles or videos that suited the language proficiency and interests of their peers, designing warm-up tasks (e.g., true/false quiz, personal questions, reorder information, or picture prompts), extracting difficult vocabulary from input materials to assist with comprehension, writing comprehension questions, followed by deeper questions to share viewpoints. All interaction was done in English during the class time and facilitated by the teacher. Discussions between the group about the lessons continued outside of the classroom via email or text message (in either the L1 or L2). The group leader and members communicated with the teacher in English through a Google document to share the materials and ask for advice. The key benefit of having students prepare, design, discuss, and use their own materials was lowering barriers during class discussions and increasing motivation as students were more supportive of their peers during student-led discussions (over teacher-produced content). A second benefit was that leaders could identify and reflect on their own strengths and areas to improve from observing other student discussions.

Research Context

The researcher has been using a flipped teaching approach for over a decade with 2nd to 4th year students in elective courses. Students in elective courses tend to be more motivated to participate in lessons as they have selected the course by themselves and are more mature and linguistically proficient than freshman students. Curricular changes over the past year at the researcher's university, however, have introduced a flipped teaching approach into mandatory freshman classes. As the proficiency level of first-year students is lower than those enrolled in elective classes, the researcher decided to use a smaller class for a pilot study to establish if the flipped classroom was effective with lower proficiency learners.

In Yan et al.'s (2024) study on the impact of flipped learning on the proficiency levels of mixed-level learners, they found that lower-proficiency level students' significantly improved listening and reading comprehension skills over their counterparts in more traditional classrooms where the teacher produced the learning materials (original content or from a textbook) and the students prepared for class as a secondary role. These results were also found in other studies (such as Ebron & Mabuan, 2021; Lee & Wallace, 2018). The rationale given for this is that the flipped approach, done correctly, offers scaffolding, clear instructional goals, more opportunities to collaborate and interact with peers, and more exposure to recast during preparation thereby enabling students to self-identify correct forms and supporting language acquisition. In this research, findings were similar. However, the researcher also noted that more proficient learners in this course saw additional improvements in writing and speaking skills (mainly note taking and verbal summaries) through consistent practice in each lesson. Improvements were not measured empirically in this study. Rather, the researcher asked students about their perceived improvements in self-reflective activities.

The number of students in typical freshman classes averaged between 25–30 students. The number of students enrolled in the researcher's pilot class totalled 25. One student was unable to continue the course and dropped out in the third week; thus, 24 students participated in the pilot study. This made it easy to separate the students into six groups of four for weekly group tasks and student-led discussions. If another student had quit the course, the researcher knew that a group of 3 students could still manage the work effectively with more guidance from the teacher, if required. Table 1 explains the structure of the course design:

Table 1

Flipped Learning Course Design

Lesson	Classroom Activity
1	Orientation. Explanation about the structure of discussion course and assessment methods
2–4	Teacher-led model discussions to help students understand and become accustomed to the structure of the lessons (preparation methods, discussion, and summary of thoughts) and focusing on specific discussion skills to be practiced and assessed.
5	Peer-collaboration for student-led discussions
6–11	Student-led discussions and reflection. **In lesson 8 there is a mid-semester self-assessment to check progress and teacher overall comments about discussion skills observed and areas to improve as a class. Individual assessment reports explaining strengths and weaknesses were presented to students leading the discussions*
12–13	Teacher-led discussion and self-assessment of discussion skills
14	Observation and critical analysis of peer discussion to prepare for the final
15	Final discussion (audio and video recorded)

Assessment was broken down into four parts: lesson preparation (30%), class discussion and participation (30%), teacher evaluation of the final discussion (20%), and two self-assessments by students regarding their own efforts, not their language skill (20%).

Research Aims and Results

The three aims of this study were to use a flipped classroom to increase student talk time, to facilitate learner development through self-reflection, and to understand the challenges freshman student faced during the flipped approach and any perceived benefits. The next sections show the results followed by a discussion of key insights.

Increasing Student Talk Time

Student talk time in EFL teaching focuses on maximizing the amount of time a student uses to communicate in the L2 by shifting the focus away from teacher explanation. This makes the classroom more learner-focused and improves communicative competence, which was the overall objective of the freshman course. In past textbook-driven courses, which provided compartmentalized learning, students were typically asked to respond to warm-up and further discussion questions during lesson time without being required to prepare for the lesson in advance. There was little connection or transference of skills between classes, and assessment procedures for communication classes were usually a monologic presentation at the end of the course.

By moving comprehensible input (reading and watching videos) outside the classroom in the flipped approach however, the majority of class time was focused on communication, inquiry, and student observation which helped the teacher to offer real-time support. In practical terms, there was a carefully organized sequence of tasks. First, students began the lesson with a conversation warm-up activity or game related to the topic. The language used was informal so that students could enjoy sharing personal stories about their life. This was followed by a discussion of any new vocabulary learned while preparing for the lesson. Students were expected to *use* the vocabulary they encountered in the input materials or new vocabulary they learned on their own. The teacher then asked various comprehension questions about the homework input materials which the students needed to answer as a group using only the notes they had written for homework. Through problem-solving and co-construction of knowledge, students were able to piece together enough information to answer the questions correctly. All discussions were done mainly in English. Students' L1 was mostly used to clarify misunderstandings. Students were then asked to think more critically about the topic by sharing viewpoints. Deeper discussion questions were provided before the class, and students were expected to do research and formulate opinions to share with their group members. Students were expected to use academic language including transitional words and phrases and specific discussion skills in this part of the lesson (e. g., expanding on their viewpoints giving specific real-world examples, acknowledging others' opinions, and involving others in the discussion so that each student participated equally). They were free to use dictionaries or translators to help them express their ideas effectively. If a student did not prepare for the lesson, they were not able to contribute much to the discussions and became an observer. This describes the primary/primary relationship between preparation and lesson discussion referred to earlier Shibukawa's (2024). During comprehension checks and discussions, the teacher was easily able to note who was not speaking and who did not bring in notes. This made assessment simpler for the teacher. Each week, the teacher changed the groups, so students could speak with different classmates. Toward the end of the 90-minute class, students in each group had to

summarize what they had discussed and present it to the whole class. Students were asked to select different students each week so that every student had an opportunity to build confidence in public speaking. These tasks and strategies were successful in reducing teacher talk time and training students to be more active speakers rather than passive listeners.

Facilitating Learner Development

The second aim of the study was to help students take more responsibility for their learning. This was achieved in several ways.

Self-Reflection

In lesson 1, students discussed what they perceived to be strengths and weaknesses in their language learning and then reflect on what they wished to improve upon in the course. In lesson 8, students were asked to revisit their reflection to check if they were on track to achieving their goals. Students were also asked to reflect on their language skills (reading, writing notes, listening, speaking, and vocabulary) at the mid-point of the semester and reflect on what they needed to do to participate fully for the rest of the semester. In the last class of the semester, students completed a final reflection to think about what they had achieved and how they felt about their performance over the 15 weeks of lessons.

Time-Management

In the flipped approach, managing time to complete preparations was crucial to how well students performed during class. Input materials were limited to approximately 5 minutes for readings or videos. If students did not understand it the first time, they could work at their own pace and go through the input materials as often as needed. This helped to foster stronger time-management skills.

Increased Responsibility and Accountability

For student-led discussions, students assigned themselves specific roles to make the lesson go as smoothly as possible. They had to select a suitable topic and produce learning materials that would increase learner engagement and motivation to speak. During the lessons, leaders were able to observe their peers in discussion which gave them insights into their own level of performance. That is, through peer observation, students could understand new viewpoints that they had not discussed previously with other group leaders and understand various communication strategies used by other students. The leaders were also expected to help guide discussions and keep peers on track, so group members did not slip into the L1. This increased responsibility gave students a greater sense of accountability over their learning.

Motivation

As flipped learning is learner-centred, it is important for the students to maintain motivation throughout the duration of the course. Activities were thus designed to enhance both intrinsic and extrinsic motivation to match various student needs. Intrinsic motivation tasks were activities that helped students to feel an individual sense of achievement, such as topic selection based on interest and progress checks to assess growth. Extrinsic activities, focusing on grades or rewards, were done through self-assessment of effort as part of students' final grade as well

as the teacher giving positive feedback on homework preparation to encourage them to prepare fully for lessons.

Student Experiences With Flipped Learning

The final aim of this research was to understand students' perceptions of challenges and benefits of a flipped learning course (if any). 24 students were given an open-ended survey asking about the positive and negative aspects of creating materials and leading discussions, and what they learned about themselves after the experience. The positive and negative aspects, extracted directly from surveys, are presented as Table 2 in the students' own voices. Underlined text in the table illustrates the main challenges and benefits.

Table 2

Challenges and Benefits of Flipped Learning as Perceived by Students

Challenges	Benefits
• **Trying to achieve consistency** with input from three group members is difficult. • **Managing the lesson time** is difficult. You have to listen, monitor groups, write notes, and stand at the front. • **It is important to read more on the topic** and get a lot of knowledge from various aspects as a leader so that you can answer questions deeply and deepen discussions. • **Writing notes on the whiteboard during synthesis is difficult** because you cannot write every word. You have to listen to the whole opinion and write key words. **I need to practice how to take notes in real time**. We can watch the video many times for homework. • **It is difficult to lead with limited English**. There are many times when I have to speak with no preparation.	• **Choosing a fun topic and finding input videos** gave me many perspectives. We had to choose a video that many students could understand. • **I found that the process to make conclusion [during synthesis] is more fun** than hearing their conclusion. • It was challenging, but fun to lead discussions. **It surely broadened my perspective.** • I found that when discussions stray away from the point**, I could learn how to bring it in the right direction.** • Being a leader means doing many things, **but it is more effective than simply talking.** • **I want to study more about the topic by myself after hearing other perspectives**. I learned many new ideas I did not think about as a leader.

On the negative side (challenges), students reported five main points: (a) negotiating on topics and input materials with group members became difficult as everyone had to vote on several decisions about topics as well as watch and/or read all the choices of input materials; (b) time-management skills are crucial not only for preparation but especially when leading discussions; (c) without a deep knowledge of the topic, leaders are unable to help keep the discussion on track; (d) writing notes in real-time during summary reports is more difficult than when preparing for class as students are able to rewatch or reread parts that they did not understand; (e) students need to have a sufficient level of English to lead as they are not simply presenting a topic, but facilitating discussions.

There were six points on the positive side (benefits): (a) Students enjoyed selecting topics that that suited their interests and watching interesting videos; (b) experiencing higher-cognitive levels of thinking by processing large amounts of information from various groups during

synthesis made students feel a greater sense of achievement rather than just picking up main points in one group to summarize; (c) Students were able to broaden perspectives and gain new viewpoints as they joined different groups throughout the lesson; (d) Understanding how to redirect discussions when they went off track was a useful skill that students found beneficial. They learned how to do it by asking probing questions in a Socratic inquiry style, or by politely interrupting the conversation and redirecting students to where they diverted from or offering a new perspective; (e) Students found multi-tasking a more enjoyable process than simply participating in the discussion. This involved monitoring groups, observing, writing notes, and helping to deepen the discussion; (f) Some of the leaders mentioned that they actually became more curious about the topic and wanted to read more after hearing a new perspective.

On the whole, both challenges and successes experienced helped the students feel more empowered about their learning. Many students found the experience interesting and different from what they were accustomed to in traditional classes. Although beneficial in many aspects, they also reported that without teacher guidance to help organize lessons and further build their skills, they would have struggled and lost motivation. This is an important point that teachers need to consider if they choose to use a flipped learning approach in their L2 classrooms. Two key insights which emerged from this study are presented below.

Key Insights From Using Student-Generated Materials in a Flipped Classroom

Understanding the Flipped Approach Fully

One of the key points is the importance of fully understanding the core principles of the flipped classroom approach before implementing it. Students need to prepare fully for classes with clear learning goals in mind or lessons will be ineffective. Teachers should not only think about the potential benefits but also prepare for challenges such as increased preparation and workload, developing fair assessment methods, and considering what to do if students do not embrace the approach. If teachers employ a flipped classroom just for the sake of it or because other teachers are doing it without understanding how to scaffold lessons and motivate students, both teachers and students may lose interest and fail to see the purpose of the lessons. Thus, to implement a successful flipped learning classroom, teachers should write clear learning goals and organize a plan of action. Starting with one or two classes as a pilot project can help teachers to build a more structured course later. Professional development through researching the approach in terms of underlying theory and practice and speaking with colleagues can help to further prepare teachers.

Reflection on Learning

Self-regulation is a crucial part of being a university student. Through the flipped approach, students can understand how to set goals, develop leadership skills, manage their time, overcome challenges, and reflect on how to improve their learning competencies. These skills will help students to become more independent learners. However, this requires the teacher to provide structured guidance and provide regular feedback to students. In order to help students achieve a higher level of learning, teachers themselves need to go through the process and reflect on their teaching. This can be done by improving planning skills, managing their time better, and understanding how to set clear, achievable goals for themselves.

Conclusion

Over the past decade, the researcher has found that the flipped learning classroom to be equally beneficial and challenging to both the teacher and students. Working with higher-proficiency learners is easier but watching lower-proficiency learners improve can be more rewarding. The researcher found that using a flipped approach with freshman students was more challenging than working with more mature students in elective classes as it required more structure in learning materials and effort from the teacher to sustain motivation.

It was difficult for many students to prepare for lessons if the content was unfamiliar to them. This required learning new vocabulary and rewatching videos several times to understand the content fully. If students found it exhausting to prepare, they lost motivation to participate in the lesson. Thus, it was important for the teacher to find content at an appropriate level which was also interesting to students. This is a time-consuming endeavour. The solution for the researcher was to use student-generated materials. Lesson plans created by students were used as models for the following year's students, as well as added immediate reusable resources for future lessons that were more in line with student interests.

Once the students began leading discussions, the entire class dynamics changed. Students were more engaged in their learning as they wanted to support their peers. For the teacher, the pressure of preparing content that may or may not have appealed to a younger generation was reduced. Helping discussion leaders to facilitate class activities meant that the researcher could spend more time observing student performance for individual assessment.

For teachers considering adopting a flipped classroom approach, it is advisable to consider if it is worth the considerable effort and initial time investment to develop the course. The flipped classroom is a valuable tool when implemented well but can be a nightmare if students reject it. Teachers should thus think carefully about their student population and the culture of the institution before making any decisions. If the goal of the university is to develop autonomous learners, and students are aware of this, there is a higher chance of success. If students prefer a traditional style of L2 learning, it might be better to embrace a more traditionally structured teaching framework such as prepare-practice-production (PPP) that guides students slowly to learning outcomes. In the end, teachers must choose the best approach that meets learning objectives, matches the teacher's style, and aligns with institutional goals rather than choosing the shiny, new educational tool that other educators claim as successful.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that no AI or AI-assisted technologies have been used to generate, refine, or correct the content in the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

Shifting Exclusion to Inclusion: Introducing a Reflective Framework to Support Student Teacher's Understanding of Inclusion

Haley Brock, Manukau Institute of Technology, New Zealand

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This paper introduces a reflective framework intentionally developed to support initial teacher education (ITE) students to expand their understanding of inclusion. The framework is grounded in the view that an authentic understanding of inclusion must begin by bringing exclusionary practices to our consciousness (Ballard, 2013). The tool combines Likert-scale and open-ended prompts to guide critical reflection. Students are guided to identify and reflect on exclusionary moments tamariki experience, as observed within their Early Childhood Education (ECE) environment. Prompts encourage students to consider how exclusion impacts the child, revisit their thoughts in the moment, and examine changes they could implement in future practice. Developed with an awareness of the diverse worldviews held by student teachers in Aotearoa New Zealand, the framework honours individual perspectives, creating space for identity-informed responses. This paper outlines the theoretical basis for the framework, its design process, and how it was introduced within an ITE programme. Early patterns of engagement will be briefly discussed, not as outcomes, but as indicators of how the tool may encourage deeper, ongoing reflection. This pilot study invites discussion around the role of structured reflection on exclusion and how this may impact student's developing understanding of inclusion.

Keywords: inclusion, exclusion, reflection, initial teacher education

www.iafor.org

Introduction

Everyday exclusion in ECE environments is embedded in systems and ways of doing, even sometimes well-intentioned practice. Educationalists have long discussed the need to interrogate our own beliefs and perceptions first when building an individual teaching philosophy and understanding of inclusive practice. This study explores whether recognising and revisiting potentially uncomfortable moments can deepen this understanding for students. The small pilot study is guided by the idea of first needing to understand exclusion before inclusion (Ballard, 2013). To explore this, a reflective framework was created. Combining Likert and open-ended questions, asking student teachers to identify and examine moments of exclusion within their ECE setting. 18 Year One students participated, revisiting and examining their perception of exclusion within their environments. This paper shares an overview of the project, theoretical basis of the framework, the methodology, and a brief thematic analysis will share insights from responses received in its implementation so far. The paper is positioned as exploratory with further analysis and discussion to follow.

Context: Aotearoa

Recent data published in Aotearoa highlighted challenges kaiako are facing having the confidence to respond to diverse needs within their ECE environments (Education Review Office, 2022; Hood & Hume, 2024). Kaiako are frequently requesting more strategies, more knowledge. While intentional teaching strategies have their place, how these are implemented and included within a learning environment can be influenced by one's personal teaching philosophy, beliefs, and understanding. Creating truly inclusive education environments calls for us to go beyond the "strategy"; we must identify and expose factors that have created the reverse in the first place (Ballard, 2013). To do this kaiako must examine their perception, revisiting scenarios they observe or experience and reflecting on if there are adaptions that could be made.

In Aotearoa, Early Childhood environments follow the curriculum document Te Whāriki:

> Te Whāriki is an inclusive curriculum - a curriculum for all children …. It holds the promise that all children will be empowered to learn with and alongside others by engaging in experiences that have meaning for them. (Ministry of Education [MOE], 2017, p. 13)

This study is anchored in a rights-based approach to participation; the United Nations Convention on the Rights of the Child (1989) declares every child has the right to access equitable and inclusive learning environments. An additional governing document for kaiako, Our Code Our Standards. This requires all kaiako in Aotearoa to position inclusive practice as an ethical commitment of the profession (Teaching Council of Aotearoa New Zealand, 2017). Together these documents place a legal requirement for kaiako in Aotearoa to be creating inclusive spaces for tamariki and to be protecting their rights for participation within these. To do this, kaiako must have the confidence to advocate and remove barriers to participation tamariki experience. Understanding how these requirements play out in everyday environments is crucial for our student teachers to build the confidence to (McAnelly & Gaffney, 2025).

Initial Teacher Education

Students need to experience and understand the theoretical knowledge that accompanies topics of inclusion; students need this theory of practice to be able to think and reflect critically (Ballard, 2013). This framework stands to accompany the content delivery model of teaching. Across Aotearoa, within ITE programmes the topic of inclusion is covered throughout. Students are often taught with traditional content delivery; tasks may be set where students are asked to reflect on ways to create a more inclusive environment or respond to individual needs. An initial literature search was conducted, to surface additional models or studies exposing moments of exclusion and reflecting on these; similar studies were not surfaced. In a study conducted, Dayman (2020) explored the role ITE plays in modelling inclusive pedagogies and promoting deep understanding of inclusion within education settings. Dayman (2020) identified that even though ITE in Aotearoa aims for inclusion, the discourses and beliefs held by student teachers and teacher educators often still include deficit framing or exclusionary assumptions. Describing a gap where further individual exploration of these beliefs is needed. This shift in understanding begins in ITE, at this level educators instructing the students can use reflection as a tool to guide exploration of beliefs and a changing of these beliefs (Dignath et al., 2022). A report published by the Education Review Office (2022) highlights the value of reflection as a tool to develop understanding of inclusion. Reflection has the power to surface assumptions that students once had, deepen empathy for others by revisiting scenarios again and to activate the critical consciousness that guides them in building their own understanding of inclusion (Minott, 2019).

Theoretical Foundations of the Framework

Ballard (2013) suggests that to authentically understand inclusion, we must first understand exclusion; one cannot exist without the other. Until we expose the underlying causes and influences of these within an environment, we cannot authentically build inclusive spaces. Ballard calls for us to identify the many influences within an environment that shape the experiences of others, although does not explicitly state how. This framework begins by starting with ourselves, attempting to activate a shifting in perception, interrogating our own belief systems. By first exploring instances where tamariki have experienced exclusionary practice within ECE settings, reflection could raise awareness of the intentional or sometimes unintentional ways this is happening. Reflecting in this manner may identify ingrained habits or behaviours of teachers, potentially shaping a more inclusive mindset and aligning with Ballard's call for interrogation of how exclusion comes to be (Rapp & Corral-Granados, 2021).

As a bicultural nation in Aotearoa, when designing the framework, inspiration was drawn from Te Ao Māori worldview. Acknowledging and respecting that understanding develops through relationships with people, places, and things, within our personal identity, not in isolation. Identity and culture shape understanding. Upholding the mana of each participant means recognising their participation and contribution is shaped by their identity as a person. Who they are and what experiences they bring with them in that moment. Macfarlane & Macfarlane (2019) call for researchers to listen to culture when designing studies; their plea to scholars to ensure research methods and studies are culturally responsive, acknowledging cultural identities of those who may engage, and inviting individual world views. The framework ensures space for culturally informed responses and values. Open-ended questions are frequent and throughout the framework, inviting students to share responses rooted in their identity.

He Awa Whiria (Macfarlane et al., 2024) became a visual inspiration for the framework. In its true form representing the intersecting of Maramatanga Māori and Western theory. Each stream crossing paths over time, to braid a new stream of knowledge. Neither of more importance than the other, both upholding the mana of each other, interacting together over to time to build a new stream of knowledge. The reflective framework design was inspired by the braiding of knowledge streams metaphor, not as a methodology but as a visual representation. The reflective framework represents one stream; student's thoughts and perception of exclusion represent the other. They cross paths over time within the reflective process, with the potential for a stream of knowledge: a deepened understanding of inclusion, to be created one that is internal and personal to the participant.

A third theoretical influence in the creation of this framework is the work of Paulo Freire (1970/2018). His work challenges us as kaiako to interrogate our belief systems and expose our inner thoughts, revisiting what we have internalised because of the system we are raised in, and experiences we have had. Reflection becoming something that does not just revisit moments of practice but exposes potential for change and implements this. Recent research by Qi and Sterling Henward (2024) reinforced Freire's ideas that critical reflection within ECE is not just about noticing moments; it is about examining underlying assumptions about these. Local research by Kahuroa et al. (2023) explored Freire theory within an ECE context, with children as participants in the reflective process. This study adapts those pedagogical ideas to an ITE context with student teachers using the guided reflection to examine these moments in time, deepening their understanding of how the systems they are within influence outcomes for our tamariki. Aligning Freire's discussions of critical consciousness and the role this plays in inclusion for all (1970/2018).

With these ideas influencing the framework reflective questions which explore the reason for the exclusion, how it felt for the child, and as kaiako have been included. Participants are then guided to examine what they may do differently next time in an attempt to interrogate their critical consciousness. The act of searching for exclusion within their settings may activate an internal process of exploring their understanding of what this truly looks like, challenging their own belief systems. Through this process participants are encouraged to expose their unconscious assumptions, to surface an awareness and understanding of inclusion and what this may look like in everyday practice within their environments.

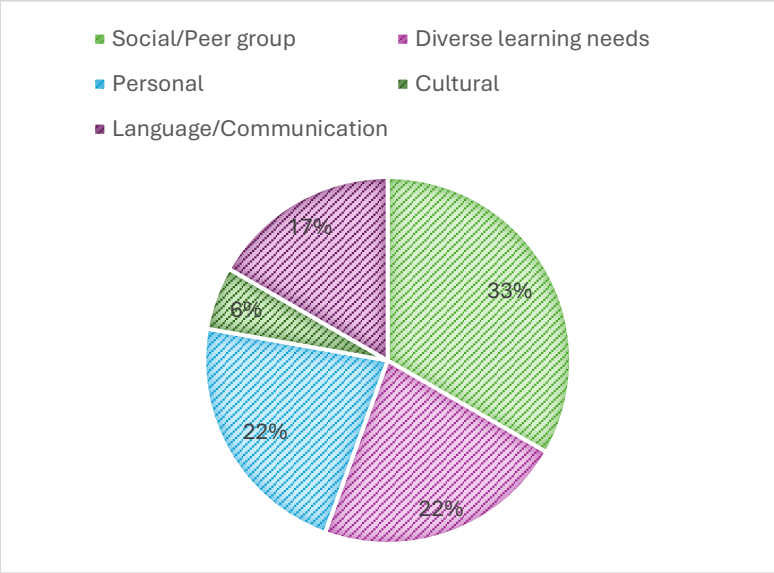
Framework Design

The framework visual below symbolises a process or circle of reflection. Reflection does not need to be linear as this shows; the process of reflection can move in any direction, with those engaging returning to previous thinking, jumping ahead a step etc.

Figure 1
Example of Questions Asked Within the Reflective Framework

Methodology

Students in their first semester of Diploma of ECE or Bachelor of ECE were invited to participate. First semester students chosen for initial pilot study as majority are new to the sector and starting to build their professional philosophy as well as an understanding of inclusion. Of those invited, 18 students chose to participate. Students completed the framework via anonymous google forms. Time was allocated in class or at home to complete. The framework was introduced when students were exploring inclusion within their curriculum content. The framework was designed to encourage personal responses, Likert Scale and Open-ended questions were included to ensure this was possible. Ethical considerations taken into account included participation being voluntary; no loss to learning impacted those who chose not to participate. There was acknowledgement this could be a triggering topic; support for students was offered on information sheets via MIT counselling services and other external agencies. A thematic analysis of responses was conducted by the publishing author, themes discussed under headings of some framework questions within this paper. This initial study, being exploratory in nature, highlighted future iterations needing to take place to deepen analysis.



Patterns of Engagement and Early Insights

As this was a pilot study, data is presented as patterns of engagement with the framework rather than as definitive outcomes.

Forms of Exclusion Identified

Individual perception of exclusion appears to be shaped deeply by the environment they are within, and their internalised beliefs. This is seen in the variety of responses given. Although themes are identified here, there was not one response identical to the other.

Figure 2
Types of Exclusions Identified

The open-ended nature of this question inviting potentially culturally informed answers to be shared, respectful of the individual idea each participant has—creating space and valuing this is a personalised reflective journey. Together Ballard and Freire suggests that the surfacing of these moments is the first step toward critical consciousness (Ballard, 2013; Freire, 1970/2018). Responses to this question aligning to the intention behind the framework. Bringing to the surface minor, or micro exclusions that at times may be normalised and critically examine individual understanding of these moments.

Emotional Responses to Exclusion

When asked "how did you feel as this was happening?", participants emotional responses ranged from empathy or sadness to acceptance. Revisiting these moments, appeared, for some, to activate a deeper understanding of the impact on the tamariki involved. Possibly showing a further step towards critical consciousness. "I find that very unfair as you can see in their eyes they were keen to try…"

Participants perception of exclusion shaped their emotive responses, highlighting how these responses are personal, and identify-informed. For some it was distressing to revisit, for others it is normalised, respecting that there is a difference in beliefs and this is ok. While some responses empathised with the external influences not the child, this shows how personalised thoughts and perceptions are for each participant.

Reflections on Future Practice

71% of participants proposed something they would do differently next time. A lot were personal changes to practice, not systematic. A few participants shared they would not do anything differently, accepting what happened or that it was not their place to become involved, reflective of their role as a student teacher. This may indicate that confidence is still growing. The data shows the potential of this question inspiring deeper thought and attempting to transform acceptance of these moments, to ones of awareness and potential for action. Aligning with Freire in that the reflective process did not just bring moments to the surface but brought

about thoughts of change. Further consideration is needed to plan for and identify a measurement of this change from written reflection into practice.

Shift in Thinking

78% indicated they value inclusion more now, while 22% indicated no change had occurred. For many participants, an internalised change was reported. Suggesting potential for this approach in activating critical consciousness and guiding a deeper understanding of inclusion for students. “I think this is because reflecting on the experience showed me how easy it is for kids to feel left out.”

Noticing exclusion, examining the situation and one's individual role in enacting change a process which is unique to each participant. Dayman’s (2020) study concluded that content delivery on inclusion can be influenced by the bias and approach of lecturers, for example whether this is a social or medical model of inclusion. The personal nature of responses recorded in the study indicates the potential for this approach as a way of mitigating this possibility.

Limitations and Implications for ITE

This is a small pilot study, with 18 first-year students engaging. Results are there for indicative; further inquiry and future adaptations of this approach are needed. The study was limited to one ITE institute, where the researcher is known to participants. Participants are first year students, mostly new to ECE with concepts such as inclusion and reflective practice. The changes recorded are based on the day of reflection. Data shown is not a measurement of change of practice, but potentially a change of thinking. While this pilot shows potential in this approach, further exploration is needed. Further consideration is needed to plan for and identify a measurement of this change from written reflection into practice.

There is opportunity within ITE as students are building their own teaching philosophy and being introduced to the idea of reflecting through a critical lens. Guided reflection which surfaces moments unique to the student’s experiences, show potential in raising awareness of the many factors which influence how a child experiences their ECE environment. Along with supporting students to make the theory to practice link more explicitly.

Conclusion

Creating inclusive spaces does not require only a series of strategies; it involves exposing everyday moments that matter and interrogating one’s beliefs. Reflective practice shaped in this way could be how we get there. This pilot study has illustrated a pedagogical approach which responds to Ballard’s (2013) call of exposing and examining exclusion to deepen understanding of inclusion. Reflection must go beyond describing events, it must interrogate underlying assumptions to have a transformative impact. Recognising learning does not occur in isolation; this study respects diverse and culturally informed ways of thinking and seeing. The initial exploration of the project has shown potential for this type of reflection for student teachers, adding an additional layer to their learning journey when exploring the topic of inclusion. This pilot highlights future research in the area and implementation with a broader scope of participants needed.

Is Scholarship the Real Key to Taiwan-Japan Student Mobility? A Literature Review

Hoang-Nam Tran, Tokushima University, Japan
Wen-Chi Hsu, National Pingtung University of Science and Technology, Taiwan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

International student mobility between Taiwan and Japan has garnered increasing attention, driven by shared cultural ties and regional integration efforts. Scholarships are often cited as critical incentives for student exchanges, yet the true influence of financial aid on mobility patterns remains underexplored. This literature review examines whether scholarships are the decisive factor in facilitating student mobility between Taiwan and Japan, or if other structural and policy factors play equally significant roles. A review of academic articles, government reports, and institutional publications from the past two decades was conducted. The analysis focused on scholarship programs, mobility trends, policy frameworks, and identified challenges influencing inbound and outbound flows. Findings reveal that while scholarships such as MEXT and Taiwan Scholarship positively impact enrollment numbers, their effect is mediated by factors including language proficiency barriers, cultural integration challenges, limited credit recognition, and inadequate bilateral agreements. Especially, Japanese student mobility to Taiwan remains low despite scholarship availability, underscoring non-financial barriers. This review challenges the conventional emphasis on financial incentives alone and calls for strategies that enhance mobility quality and equity.

Keywords: student mobility, scholarships, Taiwan, Japan, international education policy, bilateral exchange, higher education

iafor
The International Academic Forum
www.iafor.org

Introduction

International student mobility has become a critical element of higher education strategies worldwide, particularly in East Asia where regional cooperation and cultural proximity encourage academic exchange (Barnett et al., 2016; T.-M. Chen & Barnett, 2000; Knight, 2012). Taiwan and Japan share a unique historical and cultural relationship that has shaped patterns of student flows between the two countries (Vickers, 2015). Despite numerous scholarship programs designed to promote mobility—such as Japan's Ministry of Education, Culture, Sports, Science and Technology (MEXT) scholarships and Taiwan's Taiwan Scholarship—the volume and balance of student exchanges remain uneven (Kuroda, 2012; Yonezawa, 2010). These imbalances are influenced not only by policy priorities but also by institutional recognition, economic considerations, and sociocultural perceptions of education quality and opportunity (APEC, 2019; Huang, 2015).

This paper explores the question: Is scholarship the real key to enhancing student mobility between Taiwan and Japan? It reviews academic literature and policy documents to understand the role of scholarships in facilitating mobility, and whether other barriers and structural factors limit the potential of these financial incentives. By examining both inbound and outbound flows, this review aims to provide a nuanced understanding of what drives or hinders Taiwan–Japan student mobility.

Overview of Scholarship Programs and Mobility Trends

Scholarship Programs in Taiwan and Japan

Taiwan offers a range of well-established scholarship programs to attract international students as part of its broader strategy to internationalize higher education and enhance soft power diplomacy in Asia (Andy, 2018). Among the most prominent is the Taiwan Scholarship, jointly funded by Taiwan's Ministry of Education (MOE), Ministry of Foreign Affairs (MOFA), Ministry of Economic Affairs (MOEA), and Ministry of Science and Technology (MOST). This scholarship supports outstanding students from over 100 countries to pursue undergraduate and postgraduate studies in Taiwan's top universities, offering full tuition coverage and a monthly stipend (MOE, 2023). While the initiative initially prioritized Southeast Asian students under the New Southbound Policy (Patriadi, 2022; Y.-J. Wang, 2022), it is also accessible to students from East Asian countries, including Japan, reflecting Taiwan's commitment to broader regional engagement.

Another notable initiative is the Huayu Enrichment Scholarship, which provides financial support for international students to study Mandarin Chinese in Taiwan's certified language centers for 3 to 12 months. The program is designed not only to enhance language proficiency but also to promote cultural exchange. Japanese students, particularly those pursuing area studies or aiming for careers in diplomacy or multinational corporations, have taken advantage of this opportunity to gain both linguistic skills and a deeper understanding of Taiwanese society (Hanada & Horie, 2021). Besides the above, the Taiwanese government also offers specialized scholarships for specific fields (e.g., Traditional Chinese Medicine). These scholarships typically cover tuition fees, living allowances, and some travel expenses. It has been reported that Taiwanese higher education institutions and the government actively attract international students from Asia and worldwide through scholarship policies, particularly in distinctive fields like traditional medicine, emphasizing an academic and culturally integrated learning environment (Pham et al., 2024).

In addition to government-sponsored scholarships, Taiwanese universities such as National Taiwan University, National Chengchi University, and National Tsing Hua University offer their own competitive financial aid packages for international students, further incentivizing student inflow (TBS NEWS, 2024). These scholarships are often merit-based, with consideration for academic performance, leadership potential, and alignment with Taiwan's internationalization goals (MOE, 2021).

On the other side, Japan has long invested in international education as a strategic diplomatic and economic tool, and its MEXT scholarship is the most prominent scholarship for international students in Japan, directly provided by the Japanese government. It covers tuition fees, living expenses, and a portion of travel costs. This scholarship aims to attract and cultivate high-quality international students, addressing Japan's declining birthrate and the need for higher education internationalization. It has been reported that MEXT scholarship significantly impacts international students' academic and life satisfaction. While economic factors are not the sole determinants, the financial support provided by MEXT remains a key attraction (Lagones, 2019). These scholarships support thousands of international students annually, including a significant number from Taiwan, offering full tuition, travel expenses, and a generous monthly allowance (MEXT, 2025; Study in Japan, n.d.). Taiwanese students have traditionally shown strong interest in MEXT due to the high academic reputation of Japanese institutions and geographic proximity. According to recent statistics, Taiwanese students comprise one of the largest groups of international students in Japan, with many pursuing advanced degrees in STEM, business, and social sciences at universities such as The University of Tokyo, Kyoto University, and Waseda University (Okugawa, 2014; Yonezawa & Shimmi, 2017).

The historical relationship between Taiwan and Japan also plays a critical role in sustaining educational exchange. Many Taiwanese view Japanese culture positively, and the shared use of Chinese characters (kanji) lowers the linguistic barrier for Taiwanese students. Moreover, bilateral university partnerships and exchange agreements have increased over the years, with programs such as the Japan–Taiwan Exchange Association's Study Abroad Promotion Project actively funding short-term mobility and joint research opportunities (JTEA, 2025). These initiatives underscore a mutual recognition of the role education plays in strengthening regional ties, yet disparities remain in terms of outbound and inbound flows, often influenced by perceptions of academic prestige, language barriers, and post-graduation opportunities (Huang, 2021).

Mobility Trends Between Taiwan and Japan

Historically, Taiwan has consistently sent significantly more students to Japan than it has received from Japan, reflecting an enduring asymmetry in bilateral academic exchange (Newfields, 2019). According to statistics from the Japan Student Services Organization (JASSO), over 8,000 Taiwanese students were enrolled in Japanese institutions in 2022, making Taiwan one of Japan's top source countries for international students (JASSO, 2023). In contrast, fewer than 1,000 Japanese students were studying in Taiwan during the same period, a number that has remained relatively stagnant over the past decade (MOE, 2023). This disparity persists despite the existence of multiple scholarship programs on both sides, which aim to enhance accessibility and bilateral flow. Taiwan's scholarship programs are open to Japanese nationals, although the majority of recipients tend to come from Southeast Asia (MOE, 2021). On the Japanese side, the MEXT Scholarship has played a pivotal role in supporting Taiwanese students pursuing undergraduate, master's, and doctoral degrees in Japan. The

MEXT program, which includes categories such as research student, teacher training, and Japanese studies scholarships, is highly competitive and offers full tuition, a monthly stipend, and travel support. In 2021, over 300 Taiwanese students were awarded various MEXT scholarships (MEXT, 2022).

Despite these efforts to equalize opportunities, recent research indicates that factors beyond financial aid significantly influence student decision-making. Cultural affinity, historical ties, and language proximity strongly motivate Taiwanese students to choose Japan. Japanese culture is widely popular in Taiwan, with anime, fashion, cuisine, and pop music deeply embedded in Taiwanese youth culture (Cheng & Chen, 2015). Furthermore, the shared historical connection stemming from Japan's colonial rule over Taiwan (1895–1945) has left a legacy of Japanese language education and institutional familiarity, which makes the transition to Japanese academic environments more manageable for Taiwanese students (Heylen, 2005).

Japanese students often exhibit a lower propensity for outbound mobility, especially to destinations within Asia. Many Japanese undergraduates show a preference for domestic employment and tend to view study abroad, particularly in non-Western destinations, as carrying higher opportunity costs. Language barriers and the perceived lower prestige of Taiwanese institutions, despite their academic strength, also contribute to this imbalance (Burden, 2020). Moreover, recent qualitative studies suggest that Taiwanese institutions, while welcoming, may lack targeted marketing and recruitment strategies aimed specifically at Japanese students, which limits awareness and attractiveness (Ma, 2014). While scholarship availability on both sides has helped remove financial barriers, the asymmetry in Taiwan–Japan student mobility is underpinned by deeper structural, cultural, and perceptual factors. Efforts to address this imbalance must therefore go beyond funding mechanisms and consider the broader sociocultural and institutional landscape that shapes mobility patterns between the two countries.

Factors Influencing Taiwan-Japan Student Mobility Beyond Scholarships

Language Proficiency and Cultural Barriers

Language remains one of the obstacles to balanced student exchange between Taiwan and Japan. Taiwanese students, depending on their individual linguistic backgrounds, exhibit varying degrees of fluency in acquiring Japanese (Lin, 2023). For Taiwanese students, the requirement to demonstrate proficiency in Japanese, particularly for degree programs taught in Japanese, often presents a significant hurdle. Most Japanese universities require students to pass the JLPT at N2 or higher, depending on the academic field and institution. This level of proficiency demands years of dedicated study, which not all Taiwanese high school graduates or undergraduates possess. Although some universities offer courses in English under initiatives like the Global 30 Project, these programs are still limited in number and tend to cluster in select institutions such as the University of Tokyo, Kyoto University, and Tohoku University (MEXT, 2022). As a result, many Taiwanese students are restricted to either language schools or short-term exchange programs before they are linguistically prepared to pursue full-time study in Japan (Hong, 2016).

Conversely, Japanese students encounter equally daunting challenges when it comes to Mandarin Chinese. Unlike English, which is widely taught across Japan, Chinese is not part of the standard curriculum in most Japanese secondary schools. The tonal nature of Mandarin, combined with the complexity of Chinese characters and grammar structures, presents a steep

learning curve (Rose & Carson, 2014). Although some Japanese universities have introduced Taiwan-focused language and culture courses, such programs remain niche and are often elective rather than core components of academic pathways (Andy, 2018; Sugano, 2014). This linguistic gap significantly limits Japanese students' ability to engage fully with Taiwanese academic content, navigate local life, or participate in internships and fieldwork that require functional Mandarin.

Beyond language, cultural adjustment issues further complicate student mobility. Taiwanese students in Japan often report difficulties adjusting to the more hierarchical and formal academic culture in Japanese universities. For example, classroom interactions in Japan are generally more passive, with limited space for student expression or debate, which contrasts with the more open and discursive classroom style increasingly promoted in Taiwan's higher education institutions (ADB, 2020; Izumi-Taylor et al., 2025). Social integration can also be challenging, as Taiwanese students may feel excluded from tightly knit Japanese peer groups, especially when informal communication is deeply embedded in nuanced cultural codes and polite speech (Jou & Fukada, 1996).

On the other hand, Japanese students in Taiwan may initially find the environment more relaxed and socially open, but they can struggle with cultural expectations around direct communication, food customs, or gender roles—areas that are often under-discussed in pre-departure orientations (Garbutt, 2017; Kheir, 2021). Moreover, although Taiwanese society is relatively friendly to foreigners, Japanese students may still experience a degree of social isolation, especially in smaller universities or cities with limited international student services.

These linguistic and cultural barriers not only impact students' academic performance and day-to-day experiences but also affect broader metrics such as student satisfaction, retention, and return on investment in overseas education (Varghese, 2008). Institutions on both sides have begun to implement support programs—such as buddy systems, intercultural workshops, and expanded language preparation courses—but the reach and effectiveness of such efforts vary widely. For example, National Taiwan University has launched peer mentorship and bilingual counseling services, while Tsukuba University has introduced Taiwan Week and language exchange clubs to promote deeper mutual understanding (Office of International Affairs, 2020; University, 2016).

In sum, while structural and financial resources are increasingly available, the persistent challenges related to language proficiency and cultural adaptation remain central barriers to deepening Taiwan–Japan educational exchange. Addressing these issues requires not only language training and intercultural communication support but also a systemic rethink of curriculum design, pre-departure preparation, and on-campus inclusion strategies.

Academic Compatibility and Credit Recognition

One of the less visible—but critically important—barriers to student mobility between Taiwan and Japan is the lack of academic compatibility and limited mechanisms for mutual credit recognition. Differences in academic calendars, credit systems, grading scales, and curriculum structures often result in bureaucratic and administrative hurdles that discourage participation in exchange or dual-degree programs. For instance, Japanese universities typically follow an April-to-March academic calendar, whereas Taiwanese institutions operate on a September-to-June calendar, which can create significant misalignments in course schedules, exam periods, and semester breaks (Shimmi, 2013). This temporal mismatch makes it challenging for students

to transfer without missing a term or duplicating academic content, often extending their overall study duration.

Moreover, disparities in credit systems further complicate the recognition of coursework. While Taiwan generally uses the Carnegie credit hour system—with one credit representing 16–18 hours of class time—Japanese universities often calculate credits based on contact hours and expected self-study hours combined, leading to inconsistent standards (MEXT, 2020). A 2-credit course in Japan might not be equivalent in workload or content to a 2-credit course in Taiwan, making one-to-one recognition difficult without detailed curriculum mapping or syllabi comparison (Noda et al., 2018).

Another layer of difficulty lies in limited articulation agreements between institutions. While flagship universities such as National Taiwan University (NTU) and Waseda University or Keio University have established some credit transfer arrangements through formal memoranda of understanding (MOUs), these are still the exception rather than the norm. Most smaller or regional institutions lack bilateral agreements, which forces students to seek individual approval for each course credit, a process that can be time-consuming and uncertain (Hotta, 2024). In many cases, credits earned abroad are only recorded as electives or non-degree credits, meaning they do not count toward graduation requirements, thus reducing the academic value of mobility experiences (Hawkins, 2012).

Even in joint-degree or double-degree programs—often viewed as the gold standard of institutional collaboration—structural incompatibilities pose challenges. For example, language and literature departments in Taiwan tend to emphasize comparative analysis, regional contextualization, and Mandarin-Japanese translation, while their Japanese counterparts often adopt a more philological and historically focused curriculum. These differences result in content misalignment, especially in upper-level courses, which makes cross-institutional course recognition particularly difficult (Choe, 2016).

In response to these challenges, regional efforts have been initiated to promote standardization and transparency. The Campus Asia program, supported by the governments of Japan, China, and South Korea, is one example of an attempt to align academic credit systems and promote joint curriculum development in East Asia. However, Taiwan has not been formally included in this initiative due to its unique political status, thereby limiting its ability to participate in multilateral academic harmonization frameworks (L. Chen & Huang, 2022). Some Taiwanese institutions have independently begun experimenting with modularized course designs and credit conversion tables, but these innovations remain localized and lack overarching national policy support.

The lack of streamlined academic compatibility not only undermines student confidence in the transferability of their international coursework but also places an extra administrative burden on university staff, thereby lowering institutional enthusiasm for expanding such programs. Until more robust, transparent, and standardized frameworks are developed—whether through bilateral agreements, credit transfer databases, or regional platforms—academic incompatibility will continue to act as a major friction point in Taiwan–Japan student mobility.

Policy and Institutional Gaps

While Taiwan and Japan both maintain scholarship policies and general frameworks to encourage international academic mobility, bilateral agreements specifically designed to

facilitate student exchange between the two countries remain surprisingly sparse and underdeveloped. The absence of a comprehensive and coordinated policy framework—especially one that reflects the unique educational, linguistic, and cultural dimensions of Taiwan–Japan exchange—has led to piecemeal and fragmented efforts, often dependent on individual universities or short-term initiatives (MEXT, 2025; MOE, 2023).

At the governmental level, Taiwan's MOE offers scholarships such as the Taiwan Scholarship, and Japan provides support through the MEXT Scholarship program (Andy, 2018). While both of these funding streams are generous and cover tuition, living costs, and travel, they are not linked to any structured bilateral student exchange program. As a result, students who receive these scholarships often apply independently and study in their host country without the benefit of reciprocal institutional arrangements, academic advising, or coordinated curricular alignment (E. M. Wang, 2021). Unlike the well-established Campus Asia program between Japan, South Korea, and China, which promotes trilateral student mobility through policy harmonization and joint curriculum development, there is no equivalent trilateral or bilateral framework that includes Taiwan due to geopolitical sensitivities (Goldstein et al., 2016).

Moreover, institutional-level cooperation is highly uneven. A few leading universities such as NTU, Waseda University, and Kyoto University have signed Memoranda of Understanding (MOUs) that include faculty exchanges, joint symposia, and occasionally, student mobility opportunities. However, these tend to benefit elite institutions and are rarely extended to public or private universities in regional areas, where such exchanges could significantly diversify student exposure and broaden access (Kitamura, 2015). As of 2021, only 12 Taiwanese universities had active bilateral student exchange agreements with Japanese institutions as of 2021, compared to more than 50 with the United States (Andy, 2018).

Another major limitation is the lack of targeted promotion and institutional support structures for incoming Japanese students in Taiwan. Unlike Taiwanese students, who are often recruited through language school networks, education fairs, and extensive MEXT-backed campaigns in East Asia, Japanese students interested in Taiwan receive minimal institutional guidance. Many Japanese university international offices lack comprehensive information on Taiwanese universities, scholarship timelines, visa procedures, and housing options (Humphries & Allen, 2023). This results in low inbound mobility numbers from Japan, despite growing Japanese interest in Mandarin language learning and cultural immersion experiences in Taiwan.

At the institutional level in Taiwan, support services tailored to Japanese students are often underdeveloped or non-existent. For example, most orientation materials, campus signage, and academic counseling are provided only in Mandarin and English, but not in Japanese. Student services offices typically lack Japanese-speaking staff, making it difficult for less proficient Japanese speakers to navigate administrative processes (Office of International Affairs, 2020). While both sides have functioning international student offices, usually only the Japanese university provides culturally contextualized counseling, buddy programs, and targeted extracurricular activities to help inbound students integrate (Humphries & Allen, 2023; Rikkyo University, n.d.; University, 2016). In Taiwan, such initiatives are often left to student clubs or individual volunteers rather than embedded in university policy.

There is also a missed opportunity in public diplomacy and soft power initiatives. While Japan's Ministry of Foreign Affairs actively promotes Japan through cultural centers, Japan Foundation scholarships, and language learning programs abroad, Taiwan's efforts to engage Japanese youth through similar channels remain modest. Taiwan's soft power assets—such as

its democratic institutions, vibrant pop culture, and high-tech industries—are attractive to many Japanese students, but without strategic policy promotion or media visibility, these assets are under-leveraged in the realm of educational exchange (Green, 2022).

In short, despite the existence of individual scholarships and informal partnerships, there is no cohesive bilateral strategy for fostering Taiwan–Japan academic exchange. Without explicit governmental prioritization and institutional coordination, the potential for robust, sustainable, and mutually beneficial student mobility between the two countries remains unrealized.

Discussion and Conclusion

Scholarships have long been recognized as critical instruments in lowering financial barriers to international education. Both Taiwan and Japan offer generous support mechanisms to encourage student mobility. These programs provide tuition waivers, monthly stipends, and travel allowances, which have significantly reduced the cost burden for eligible students (MOE, 2021; Study in Japan, n.d.). However, despite scholarships, bilateral student mobility between Taiwan and Japan remains asymmetrical, with Taiwan consistently sending more students to Japan than vice versa. This imbalance suggests that scholarships are not sufficient to foster sustainable mobility. On a structural level, mismatches in academic calendars, credit systems, and degree structures continue to obstruct seamless exchange (Hotta, 2024; Shimmi, 2013). Culturally, language proficiency and integration support are key obstacles. Japanese students often lack access to Mandarin language education and are less prepared to navigate life in Taiwan. Furthermore, Taiwanese institutions outside of major universities offer limited support services tailored to Japanese. Moreover, policy priorities have shaped mobility trends. Since the launch of Taiwan's New Southbound Policy (NSP) in 2016, strategic focus has shifted toward expanding ties with Southeast and South Asian nations, as well as Australia and New Zealand (MOFA, 2025). As a result, Taiwan saw a dramatic rise in students from Vietnam, Indonesia, and Malaysia (Nguyen et al., 2020). While this diversification is valuable geopolitically and economically, it has unintentionally sidelined Japan as a mobility priority.

Based on the synthesis of literature reviewed across policy, institutional, and individual dimensions, we propose an integrated conceptual framework to illustrate how student mobility between Taiwan and Japan is shaped by interconnected drivers at multiple levels. This model provides a foundation for future empirical investigation and targeted policymaking.

Figure 1
Framework for Taiwan-Japan Student Mobility

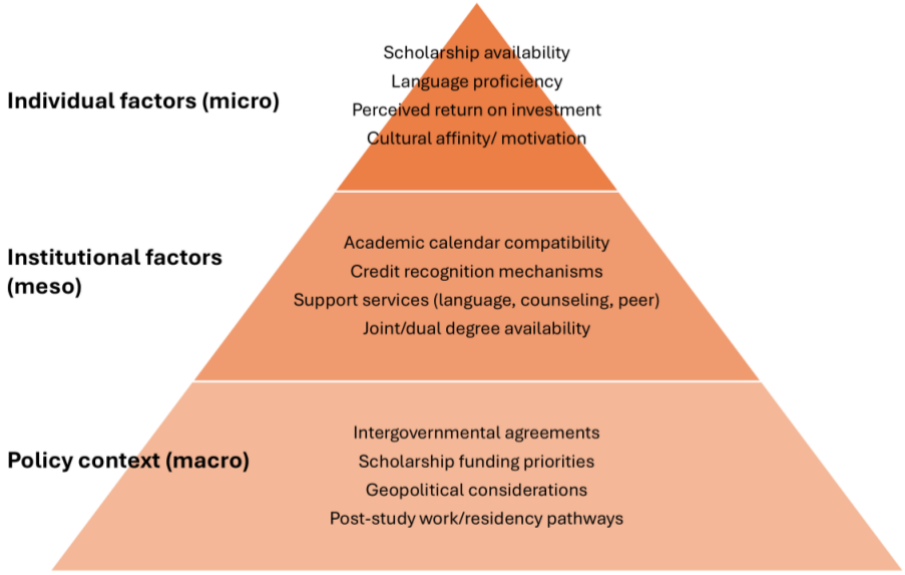

Figure 1 visualizes the dynamic interplay of three interrelated levels of influence: micro (individual), meso (institutional), and macro (policy). At the individual level, student motivations such as scholarship availability, language proficiency, and perceived cultural compatibility determine interest and capacity to pursue mobility. These micro-level drivers are necessary but must be enabled by institutional-level mechanisms, such as compatible academic calendars, formalized credit recognition systems, and embedded student support structures (e.g., buddy programs, bilingual counseling, and inclusive extracurriculars). Without these meso-level enablers, students face significant friction in navigating cross-border education systems. At the policy level, national strategies, bilateral agreements, and funding priorities such as Taiwan's New Southbound Policy or Japan's Campus Asia framework establish the broader mobility environment. In the case of Taiwan–Japan exchanges, current policy frameworks inadvertently sidelining Japan as a strategic partner. Furthermore, Taiwan's exclusion from regional trilateral initiatives like Campus Asia reduces opportunities for multilateral alignment.

This framework is based on Model of Student Integration (1993), which emphasizes the importance of both academic and social integration in student success (Tinto, 1993); Push-Pull Theory (Lee, 1966), which highlights mobility motivations and deterrents (Lee, 1966); and Policy Mobility and Educational Regionalism (Rizvi & Lingard, 2009), which examines how cross-border policies shape institutional behavior (Rizvi & Lingard, 2009). These theories emphasize the need for coordinated action across all levels to achieve reciprocal, high-quality mobility between Taiwan and Japan. The framework also serves as a diagnostic tool for policymakers, institutional leaders, and researchers to design interventions beyond financial aid, addressing structural, linguistic, and policy bottlenecks that impede student flows. Future studies may use this model to assess the effectiveness of targeted reforms or to compare Taiwan–Japan mobility patterns with other East Asian corridors.

In summary, scholarships remain a vital component in encouraging Taiwan–Japan student mobility but are not the sole determinant of successful bilateral exchange. This review underscores the need for integrated policy frameworks that address academic, linguistic, and cultural dimensions. Future efforts should move beyond financial aid to cultivate reciprocal, sustainable, and equitable student mobility that strengthens regional educational ties.

Investigating the Impact of Chatbot Integration on Learning Effectiveness

Yu-Ching Chen, Chinese Culture University, Taiwan
Yih-Jiun Lee, Chinese Culture University, Taiwan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

As financial instruments become increasingly complex, individuals need stronger financial literacy to mitigate risks—particularly amid growing interest in investment and the rise of scams such as those involving cryptocurrency. Traditional investment education often emphasizes theoretical frameworks while neglecting practical applications and real-world experiences, which can reduce learners' motivation and engagement. Chatbots, powered by natural language processing, offer rich content, instant feedback, interactive dialogue, and personalized learning—fostering engagement, self-efficacy, and learning motivation. These features make chatbots a promising tool for investment education, especially for learners who may feel anxious about complex financial topics or fear making mistakes. However, despite their potential, research on the integration and effectiveness of chatbots in investment education remains limited, highlighting a need for further exploration. This study investigates the impact of integrating chatbot technology into investment education, focusing on learning performance, self-efficacy, cognitive load, and overall learning experience. A total of 23 university students participated in the experiment. The preliminary results indicate that students demonstrated improved learning performance and self-efficacy, experienced a relatively low level of cognitive load, and expressed a willingness to use chatbots in future learning. Students' learning experiences will be further analyzed and discussed. These findings contribute to a deeper understanding of how chatbot technologies can be effectively incorporated into instructional design, guiding future pedagogical innovations.

Keywords: chatbot, learning effectiveness

iafor
The International Academic Forum
www.iafor.org

Introduction

Investment studies constitute a core and foundational discipline within the field of finance (Bodie et al., 2024). Its theoretical frameworks and logical reasoning not only serve as the basis for professional practice but are also essential for a wide range of financial occupations, including securities analysts, financial planners, senior executives in securities firms, investment-linked insurance agents, and candidates for national financial and insurance examinations. Investment studies encompass not only fundamental concepts of return and risk but also a broad spectrum of financial markets, such as money markets, capital markets, foreign exchange markets, and derivative markets (Hull, 2023). Professionals engaged in investment-related fields are therefore required to develop a comprehensive understanding of these concepts and their practical applications to manage investment portfolios effectively and communicate financial information accurately.

However, current investment education is predominantly delivered through one-way instructional approaches, which in turn leads to suboptimal learning outcomes and low learning motivation (García-Santillán et al., 2025; Oberrauch & Kaiser, 2024). In recent years, increasing attention has been paid to the effectiveness of chatbot applications in educational contexts (Thongsri et al., 2025). By simulating human-like conversations, chatbots are able to provide rich learning resources (Bai et al., 2025) and facilitate interactive question-and-answer processes (Cain & Rajan, 2024). Through interaction and the provision of immediate feedback, chatbots have the potential to enhance students' familiarity with instructional content and thereby improve learning effectiveness in investment education.

The purpose of this study is to construct an investment education learning environment supported by a chatbot, and the research questions are listed below:

1. To investigate whether the students in the chatbot-based learning system (CLS) demonstrate differences in investment education learning performance.
2. To examine whether the students in the chatbot-based learning system (CLS) show differences in self-efficacy toward investment education.
3. To determine students' level of cognitive load in investment education within the chatbot-based learning system (CLS).
4. To explore the learning experiences of the students using the chatbot-based learning system (CLS).

Methodology

The participants were 23 first-year university students from a university in Taipei City. A total of 43% of them were male, and 57% were female. They engaged in a 30-minute learning session using the chatbot-based investment education learning environment. In the study, quantitative data consisted of questionnaires, pre-test, and post-test scores, and qualitative data came from semi-structured interviews. The face-to-face interview was conducted after the experiment and 7 students participated. After the treatment, they were asked to take a post-test, and questionnaires and in-depth interviews were conducted. The instructional materials were developed through consultation with two experienced investment instructors and were aligned with the examination items of the Financial Planning License Competency Test administered by the Taiwan Academy of Banking and Finance to ensure content validity. The cognitive load scale was modified from the instrument developed by Hwang et al. (2013) to assess learners' cognitive load during investment education learning, using a seven-point Likert scale. The Cronbach's alpha is .81. The self-efficacy scale was modified from the instrument developed

by Pintrich et al. (1991) to assess learners' level of self-confidence toward investment education learning, using a five-point Likert scale. The Cronbach's alpha is .78.

Results

A paired-samples t-test was conducted to address the first research question: "Do students using the chatbot-based learning system (CLS) demonstrate significant differences in investment education learning performance?" To answer this question, students completed both a pre-test and a post-test at the conclusion of the intervention. The results revealed a statistically significant difference between pre-test and post-test scores, $t(22) = -22.33$, $p < .01$. Specifically, the post-test scores (M = 76.96, SD = 2.98) were significantly higher than the pre-test scores (M = 47.17, SD = 2.98).

A paired-samples t-test was conducted to address the second research question: "Do students using the chatbot-based learning system (CLS) demonstrate significant differences in self-efficacy toward investment education?" The results indicated a statistically significant increase in students' self-efficacy following the intervention, $t(22) = -7.17$, $p < .01$. Specifically, the mean self-efficacy score after the intervention (M = 3.74, SD = 0.62) was significantly higher than the mean score before the intervention (M = 2.13, SD = 0.81).

To address the third research question, which examined students' cognitive load in investment education within the chatbot-based learning system (CLS), descriptive statistical analysis was conducted. The results showed that the mean cognitive load score was 2.43 (SD = 0.61), which is below the midpoint value of 3, indicating that students experienced a relatively low level of cognitive load during the learning process.

To address the final research question, which explored students' learning experiences when using the chatbot-based learning system (CLS), qualitative analysis of the interview data was conducted. The findings indicated that most students perceived the chatbot as providing immediate feedback that supported and enhanced their learning. In addition, several students reported that the chatbot-supported learning environment increased interactivity, which in turn enhanced their learning motivation and reduced perceived learning pressure.

Conclusions

The purpose of this study was to examine the effects of a chatbot-based learning system on investment education. The findings indicate that learners in this environment demonstrated significant improvements in their investment knowledge, showing that the system effectively supported the learning process. In addition, students exhibited enhanced self-efficacy in learning investment concepts and reported experiencing a relatively low cognitive load while using the system. The interactivity and immediate feedback provided by the chatbot were found to facilitate learning and increase learner satisfaction (Ngo et al., 2024). Moreover, the ease of use of the chatbot guided students in understanding investment concepts more clearly and consistently, while also fostering their self-efficacy and maintaining their motivation to learn throughout the instructional process (Tanveer et al., 2024). The real-time question-and-answer function offered by the chatbot provided a higher level of interactivity compared with traditional instructional methods. Engaging in dialogue and inquiry with the chatbot also helped reduce students' learning pressure, contributing to a more supportive and effective learning experience (Yin et al., 2024).

For future research, it is recommended that the application of chatbot-supported learning be extended to different subjects and age groups, include control groups for comparative analysis, and involve longer intervention periods so that more learners can fully benefit from the advantages provided by these innovative technologies.

Acknowledgements

This study was conducted as part of research projects (NSTC 113-2410-H-034-025 and NSTC 114-2625-M-034-002) supported by the National Science and Technology Council, Taiwan (R.O.C.). Implementing Contextual Interventions to Improve Teaching Quality: Reflections From a Three-Year School Mentoring Program

Sari Pratiwi, Guru Belajar Foundation, Indonesia

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study explores how contextual mentoring interventions can improve teaching quality and leadership in a low-cost private junior high school in rural Indonesia. Over three years, the program accompanied teachers and school leaders through cycles of reflection, planning, and collective action to rebuild post-pandemic stability and instructional confidence. Instead of relying on prescriptive models, the mentoring process followed the 5C Reflective Framework—Characterized Relationship, Comprehensive Concept, Constructive Continuity, Challenging Choices, and Community Context—adapted from the 5M leadership values introduced by Najelaa Shihab, founder of the Guru Belajar Foundation. This framework emphasizes humanizing relationships, conceptual clarity, sustained progress, purposeful challenges, and community empowerment. Data were drawn from classroom observations, reflection logs, and mentoring documentation. Results showed consistent teacher growth (average reflection scores 8.9–9.0 / 10), increased collaboration, stronger leadership identity, and a redesigned school governance system that improved teacher wellbeing and student enrollment. Findings highlight that contextual mentoring grounded in reflective values can generate sustainable, system-level change even in resource-limited school communities.

Keywords: school, mentoring, reflective practice, post-pandemic recovery, teaching quality

iafor
The International Academic Forum
www.iafor.org

Introduction

In recent years, many schools have been required to navigate rapid changes while recovering from the long-term impact of the COVID-19 pandemic. For schools operating in resource-constrained contexts, these changes often expose deeper challenges related to instructional leadership, teacher confidence, and the sustainability of improvement efforts. While numerous school improvement programs focus on introducing new structures or external interventions, fewer studies document how change unfolds when it is grounded in everyday school practices and local realities.

This paper presents reflections from a three-year school mentoring program implemented in a low-fee private junior secondary school in Indonesia. Rather than applying a standardized reform model, the mentoring process emphasized contextual and reflective approaches that supported school leaders and teachers in making sense of change together. The program focused on rebuilding instructional trust, strengthening collaborative practices, and gradually embedding routines of reflection, planning, and collective action within the school.

Drawing on qualitative data from observations, reflective logs, and school documents, this study explores how contextual mentoring contributed to the development of teacher professionalism and instructional leadership over time. By situating the findings within local leadership values and broader system-level perspectives on school improvement, this paper aims to offer modest but grounded insights into how sustainable change can emerge from within schools, even in settings with limited resources.

Literature Review

Research on school improvement increasingly suggests that sustainable change is shaped less by isolated programs and more by how schools build shared meaning, professional trust, and continuity in everyday practice. Studies on education reform indicate that improvement efforts are more likely to succeed when interventions are aligned with a school's stage of development and adapted to its local context, rather than applied as uniform solutions across settings (Mourshed et al., 2010).

McKinsey's analysis of improving school systems emphasizes that educational change is fundamentally "a system thing, not a single thing." Schools that demonstrate sustained improvement tend to implement coherent sets of mutually reinforcing practices, including instructional leadership, professional learning, data-informed reflection, and collaborative routines. The study also highlights the importance of contextualizing reform—balancing direction and autonomy—so that changes are perceived as credible and workable by educators (Mourshed et al., 2010).

In the Indonesian context, the **5M framework** proposed by Najelaa Shihab offers a practice-oriented lens for understanding educational change. The framework emphasizes leading change through human relationships, shared conceptual understanding, meaningful challenges, continuity, and empowerment of local context. From this perspective, change is viewed as a collective learning process that grows through reflection and dialogue rather than top-down enforcement (Shihab, 2025).

Taken together, these perspectives suggest that contextual and reflective mentoring can support instructional leadership and teacher development in meaningful ways. Rather than positioning

mentoring as a corrective mechanism, the literature points to its role as a facilitative process that helps schools make sense of change and gradually embed sustainable practices within their own realities (Mourshed et al., 2010; Shihab, 2025).

Mentoring Program Overview

This study is situated within a three-year mentoring program conducted in a low-fee private junior secondary school in Indonesia. The mentoring was designed as long-term, school-based accompaniment rather than a one-off training intervention. Across the three years, mentoring activities evolved in response to the school's readiness and were informed by the **5M leadership framework** as a guiding input for reflection and decision-making.

Phase 1 – Building Foundations (Year 1)

- *Focus:* establishing trust, shared understanding, and instructional direction.
- *Mentoring activities:* school visits, leadership dialogues, and guided reflection sessions with school leaders and teachers.
- *5M input:* Memanusiakan Hubungan and Memahami Konsep, emphasizing relational trust and shared meaning around teaching and learning

Phase 2 – Strengthening Practice (Year 2)

- *Focus:* developing collaborative instructional practices and reflective routines.
- *Mentoring activities:* joint planning, classroom observation, reflective discussions, and documentation of emerging practices.
- *5M input:* Memilih Tantangan and Memberdayakan Konteks, supporting teachers and leaders to engage with context-relevant challenges and local resources.

Phase 3 – Consolidating Continuity (Year 3)

- *Focus:* embedding practices into more stable routines and shared leadership processes.
- *Mentoring activities:* refinement of reflection cycles, assessment discussions, and leadership role distribution.
- *5M input:* Membangun Keberlanjutan, focusing on continuity beyond individual mentoring activities.

Throughout the program, mentoring emphasized adaptation to the school's context rather than the application of standardized solutions. The phased approach allowed practices to develop gradually, supporting the school in making sense of change over time.

Method

This study adopts a **qualitative, practice-based inquiry** approach to explore how contextual mentoring supported instructional leadership and teacher development over time. The research is grounded in a three-year mentoring program conducted in a low-fee private junior secondary school in Indonesia, where the author was directly involved as a mentor–facilitator.

Data were collected through multiple sources to capture changes in practice and meaning-making processes within the school. These sources included classroom and school-level observations, reflective journals and logs written by teachers and school leaders, as well as school documents such as instructional plans, assessment records, and mentoring notes. Rather than treating these data as isolated evidence, they were read holistically to understand patterns of growth, challenges, and adaptation across the mentoring period.

Data analysis was conducted through iterative reflective reading, focusing on recurring themes related to instructional leadership, professional collaboration, and reflective practice. The analysis was guided by the principles of contextual mentoring and informed by the 5M leadership framework, allowing themes to emerge from practice rather than being imposed a priori. To enhance credibility, findings were triangulated across data sources and discussed through ongoing reflection with school leaders during the mentoring process.

This study does not aim to generalize findings to all school contexts. Instead, it seeks to provide a grounded account of how change unfolded within a specific school setting, offering insights that may be transferable to similar contexts facing comparable challenges.

Instrument

This study employed **qualitative, practice-based instruments** designed to support reflection and documentation during the mentoring process rather than to measure performance quantitatively. The instruments were integrated into routine mentoring activities and evolved gradually across the three-year period.

The primary instruments included:

- **Reflective logs and journals**, used by school leaders and teachers to document reflections on instructional practices, leadership decisions, and challenges encountered during the mentoring process.
- **Observation notes**, recorded during classroom observations, school visits, and mentoring sessions to capture instructional practices, interactions, and emerging patterns of collaboration.
- **School documents**, such as instructional plans, assessment records, reflection summaries, and mentoring notes, which provided contextual evidence of how practices developed over time.

In addition, the mentoring process was guided by the **5M framework**, which functioned as a reflective lens rather than a measurement tool. The framework informed the design of reflection prompts and mentoring conversations, supporting participants in making sense of change through relational, conceptual, contextual, and continuity-oriented perspectives.

These instruments were not treated as standalone tools but as complementary sources that enabled triangulation and supported a holistic understanding of the mentoring process within the school context.

Findings

The findings are presented as descriptive patterns that emerged from the three-year mentoring process. Quantitative indicators are included to support qualitative observations and documented records.

Theme 1: Growth in Reflective Teaching Practice

Over the mentoring period, teachers' engagement in reflective practice increased and became more consistent. Based on mentoring records, teachers' reflection scores across the five dimensions of the **5C framework** ranged between **8.9 and 9.0 out of 10**, indicating a high level of perceived relevance and usefulness of the mentoring process. Teachers reported feeling

better understood in their professional needs (*Characterized Relationship*), more confident in grasping essential pedagogical concepts (*Comprehensive Concept*), and supported through feedback that encouraged growth (*Constructive Continuity*). Autonomy in choosing learning challenges (*Challenging Choices*) and the application of learning within the school context (*Community Context*) were also consistently rated at similar levels.

In addition to reflection quality, the number of teachers actively documenting reflective practice increased from **2 teachers at the beginning of the program to 6 teachers by the third year**, suggesting a broader participation in reflective routines.

Theme 2: Strengthening Instructional Leadership and School Systems

Alongside changes in teaching practice, school-level systems gradually developed during the mentoring period. Mentoring documentation indicates that the school introduced a new **curriculum structure** and began implementing a more transparent **remuneration system**, reflecting efforts to align instructional goals with governance and leadership practices. These developments were discussed and refined through mentoring sessions rather than imposed as standalone reforms.

Leadership practices also shifted toward more reflective and facilitative roles, with school leaders increasingly using mentoring conversations to guide instructional discussions and decision-making.

Theme 3: Indicators of School Growth and Continuity

School records show changes that suggest increased institutional stability over time. Student enrollment increased from **6 students at the beginning of the mentoring period to 80 students after three years**. While multiple factors may have contributed to this growth, the increase coincided with the gradual strengthening of teaching practices, leadership routines, and school systems documented throughout the mentoring process.

Taken together, these findings illustrate how contextual, reflection-based mentoring was associated with strengthened professional practice, emerging leadership capacity, and indicators of school continuity over time.

Conclusion

This study concludes that contextual, reflection-based mentoring can support gradual improvements in teaching practice, instructional leadership, and school continuity when sustained over time. Rather than producing rapid transformation, the mentoring process contributed to the normalization of reflective routines, collaborative practice, and emerging system alignment within the school. While the findings are drawn from a single case and are not intended to be generalized, they offer practice-based insights into how mentoring grounded in local context may support sustainable change in resource-constrained school settings. Future studies may explore similar approaches across multiple schools or examine how such mentoring models can be adapted at scale.

Acknowledgements

The author would like to thank the school principal and teachers of SMP Prawira, West Bandung, for their openness, commitment, and reflective engagement throughout the mentoring process. Appreciation is also extended to the Guru Belajar Foundation team for institutional support and collaborative reflection during the program. This mentoring initiative was supported and facilitated by Guru Belajar Foundation as part of its broader effort to strengthen instructional leadership and teaching quality in Indonesian schools.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author used ChatGPT (OpenAI) as an AI-assisted tool to support language refinement, structure organization, and proofreading of the manuscript. The AI tool was used to improve clarity and coherence of the text. All substantive content, data interpretation, and conclusions remain the responsibility of the author.

In an Educational Kaleidoscope World: Philippine Curricula, Its Problems, and a Proposed Evaluation Framework

Gene Khyle Francis Uy Galvez, Mapúa University, Philippines

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Developing a curriculum for a culturally and linguistically diverse nation such as the Philippine archipelago has proven to be difficult. Over the years, many have criticized the curriculum for being over-congested and irrelevant to the issues and demands of the present world. This is compounded by a lack of basic literacy and twenty-first-century skills among basic education learners. Various reforms have been initiated to develop the foundational skills among learners. This includes the K-12 curriculum, which extended the existing ten-year curriculum into a thirteen-year curriculum. However, the K-12 curriculum was proven to be inefficient for many Filipinos who favored the shorter curriculum. Many even deem the curriculum to have failed to prepare students for either work or higher education, both of which were promised by the new curriculum. In the first place, what should have been the goals for a basic education curriculum? This question was front and center as the new Matatag curriculum was crafted early this year. This curriculum aimed to focus on foundational skills and decongestion, yet these solutions have already been proposed in the previous curriculum. Given various solutions to the educational crisis, this paper aims to articulate the problems in previous curricula and compare them with the solutions offered by the curriculum. Moreover, this research seeks to lay the groundwork for research and evaluation of the Philippine curriculum, especially given the novelty of the 2024 Matatag Curriculum.

Keywords: Philippine curriculum, curriculum evaluation, history of education

iafor
The International Academic Forum
www.iafor.org

Introduction

The Philippine education system has long been plagued with issues in quality and delivery. This has been evidenced by the country's performance in the latest Programme for International Student Assessment (PISA) rankings in 2022, where the government has placed seventy-seventh out of eighty-one countries based on the PISA test scores taken by fifteen-year-olds internationally in the subject areas of Mathematics, English, and Science (Ines, 2023). According to the Organisation for Economic Co-operation and Development, which conducts the PISA every three years, there is a 120-point deficit between the Philippines and the world averages. This indicates that Filipino students lag six years behind their international peers.

The Philippine educational system's dismal performance has long been criticized and lambasted. This has prompted reform in the academic curriculum in the Philippines. The result is the 2024 Matatag Curriculum (hereafter referred to as the Matatag Curriculum), the first curriculum reform in twelve years since the 2012 K-12 Curriculum, which, in turn, is the first to implement a full thirteen-year curriculum. The Matatag Curriculum had various hallmarks, such as decongesting the curriculum by consolidating and eliminating redundant learning competencies, leaving a focus on foundational skills. In this regard, the Matatag Curriculum was able to decongest the curriculum by 70% according to official figures by the Department of Education (Department of Education, 2023). Given that the K-12 Curriculum was laid out in 2012 with a similar aim of boosting the curriculum's competitiveness, how does the Matatag curriculum differ in this regard? How can the Matatag curriculum go beyond a face-saving measure aimed at salvaging the Philippines' long-existing educational woes? These are among the key questions this research seeks to answer.

This research seeks to contextualize the problem on an international stage. While it does not aim to capture the research field in its entirety, this article seeks to delineate the background of the issue at hand and lay the groundwork for further study to evaluate the current Matatag Curriculum. Specifically, this research aims to establish an evaluation framework to help professionals identify and pinpoint issues in the educational sector. This, in turn, can be used by education decision makers to develop a curriculum that is not only effective but also relevant to the Filipino context. Given the complexity of the Philippine education system, it is essential to create a curriculum that not only considers the steps in the implementation process but also the interactions of the curriculum within individuals and societies. Such is the design of the constructed evaluation framework, which will be further elaborated in the next chapter. The following sections will establish the historical and social rationale for the issue at hand and explain why it is essential to draft an evaluation framework that can adequately assess Philippine curricula, especially the most recent 2024 Matatag Curriculum.

Historical and Policy Context of Philippine Curriculum Reform

A decade ago, the Philippine education system was extended from a ten-year curriculum (ranging from grades one to ten) to a thirteen-year curriculum (ranging from kindergarten to grade twelve), the latter of which has been heralded as the global standard. Before this reform, the Philippines was the last country in Asia to require only ten years of basic education in its standard curriculum. Aside from requiring kindergarten and two more years of high school (termed as senior high school), the curriculum has also marked a shift to that of a mother tongue-based multilingual education (MTB-MLE) curriculum for early education until the end of third grade in place of the bilingual education curriculum, where Filipino is

used as the language of instruction for Filipino, Social Studies, Values Education, Home Economics, as well as Music, Art, Physical Education, and Health (MAPEH), while English is used for English, Science, and Mathematics. However, the bilingual education scheme was retained from fourth grade onwards, with the subjects taught in those respective languages. While this is practiced by all public schools as mandated by the Department of Education, private schools are given more leeway in this regard.

The evolution of the Philippine education system is often synonymous with its colonial history. It is an understatement that the four centuries of combined Spanish, American, and, for a brief period, Japanese colonization had a profound impact on the Philippine education system. That said, informal education was already established in pre-colonial times, when the heads of *barangays* (villages) taught basic communication skills and weaponry to their constituents (Orata, 1956). Formal education was introduced by the Spaniards in the 16th century, who aimed to emulate the educational system of the West, with education focusing on religion, numeracy, and literacy. That said, however, the education system during this period was still rudimentary throughout the three centuries of Spanish colonial rule, which ended in 1898, with the belief that education should only be reserved for Spanish students, especially in the *colegios,* which did not accept Filipino students until the mid-1800s (Low et al., 2022). At this time, due to the lack of separation between church and state, education was mainly religion-oriented in nature and was heavily controlled by Filipino Catholic churches. This continued until the Spanish ceded the Philippines to the Americans through the Treaty of Paris in 1898 (Low et al., 2022).

One of the hallmarks of American-colonized education was the shift from Spanish to English as the medium of instruction. At the time the Philippines fell under American control, the colonizers rapidly reopened elementary schools in towns and cities while establishing new schools, especially as the Philippine commission mandated the establishment of a high school for every provincial capital- before this, most Filipino students were only expected to attend until elementary school (Casambre, 1982). At the time, seven years of elementary schooling and four years of secondary schooling were required to complete the basic education cycle and enter university.

As part of “an educational experiment to prepare the people for self-government,” the Monroe Commission later suggested a change in the educational system akin to a K-12 set-up seen today. This was done in stages – first, the seventh grade had to be abolished, after which two more years of high school would have been established. However, only the abolition of the seventh grade was achieved, resulting in a ten-year curriculum for decades. This is partly because the experiment was disrupted by the Second World War, as the curriculum was completely revised by the Japanese, whose goal was to eradicate Western influence and hegemony in favor of the spirit of the Asia Co-Prosperity Sphere, which was conceptualized by Japan just before the Second World War. Though the status quo prevailed after the end of World War II, the system remained a ten-year system until 2016, when grades eleven and twelve rolled out amongst the general population (Orata, 1956).

In 1957, less than a couple of decades after the war, the curriculum was changed to reflect the growing demand for vocational education in the country (Orata, 1959). Prior to this change, the curriculum was designed for students to proceed to higher education; however, schools may choose between a full academic curriculum and one that places a slight emphasis (around 25%) on vocational programs. In the newer curriculum, also known as the 2+2 curriculum, students will take a common curriculum for the first two years of secondary

education, after which students can proceed to focus on either academic or vocational education for the remaining two years of high school. This was fitting considering that the Philippines was undergoing a rapid transition from an agricultural to an industrial nation.

During the Marcos regime, however, there was a change of focus as they placed a higher emphasis on the basic skills – so-called the three R's: reading, writing, and arithmetic. More emphasis was also placed on the principles of the New Society (*Bagong Lipunan*), which aim to echo and justify the authoritarian regime of Ferdinand Marcos (Clarke, 1977). The vocational and academic focuses were temporarily retired for roughly four decades, until the expansion to the K-12 curriculum. In a way, the new expansion revived the academic-vocational split in the last two years of high school; the key difference this time was that the lower division was expanded to four years, which is now known as junior high school today. That said, however, there is already a change in perception on basic education and what its function is in today's society, even during the latter half of the 20th century. What exactly is the purpose of basic education in the Philippine setting? Such a question remains as experts debate on the current and future curricula's purpose.

With the unseating of the Marcos dictatorship, a reform of the Philippine Education system in 1989 followed. By this time, the general subject areas have begun to take shape, resembling the modern-day curriculum. The 1989 New Secondary Education Curriculum and the 1983 New Elementary Education Curriculum features eight core areas: Filipino; Social Studies; Science (Science and Health for grade school students, and Science and Technology for high school students); Mathematics; Music, Art, Physical Education, and Health; Good Morals and Right Conduct (GMRC) or Values Education English; and Technology and Home Economics. In the New Elementary Education Curriculum, however, there is a gradual addition of subjects: in first and second grade, only English, Mathematics, Filipino, and Social Studies (Civics and Culture) are studied. In the third grade, Science and Health, as well as Music, Arts, and Physical Education (MAPE) are added (Ministry of Education, Culture, and Sports, 1986. Finally, Home Economics and Livelihood Education (HELE) is added starting in the fourth grade. At this time, character education is embedded across all learning areas in elementary school, with values education being a separate subject in high school.

However, woes still persist within the Philippine education system. With this, the First Congressional Commission on Education (EDCOM 1) was formed jointly with the Senate and the House of Representatives in order to probe and propose solutions to the educational system's shortcomings (Department of Education, Culture, and Sports, 1993). Some of the solutions include the extension of the school year from a minimum of 185 to 200 school days, with the beginning of the school year moved to the first Monday of June. Moreover, contact time in Science and Technology as well as Technology and Home Economics was increased from 60 minutes to 80 minutes daily.

However, the Philippines' educational crisis continued. More than a decade later, the Philippine Basic Education Curriculum was rolled out, starting in 2002, with an aim to further focus on foundational skills in reading, writing, science, patriotism, and numeracy to improve the literacy rate, with students not being able to read even by the end of elementary school (Department of Education, 2002). Moreover, the curriculum is decongested and further integrated in order to focus on the key areas. Another change was that the areas of Social Studies, Music, Art, and Physical Education, and Livelihood Education were all merged into a subject called Makabayan, which is dubbed to be the "laboratory of life."

Eventually, however, it was realized that the issues could only be solved through further reforming the curriculum by adding two more years. This was thought to have made the Philippine education system more competitive globally. This was materialized through Republic Act 10533, also known as the Enhanced Basic Education Act of 2013. As a result, the K-12 Basic Education Curriculum was crafted. The two-year extension of the curriculum is aimed at allowing for the mastery of concepts while preparing students for either career or further education, depending on the goal of the students. The thought of a curriculum that prepares job-ready students was entertained, given the lack of interest in college among most students. This is especially noticeable as only a minority of Filipino students have historically enrolled in further education despite reforms, with only 41% enrolling in college as of 2023 (Mateo, 2023).

Another feature of the K-12 curriculum is the Mother Tongue-Based Multilingual Education System, as mentioned in the earlier section. Instead of the bilingual system adopted in the past, mother tongue was instituted as the medium of instruction from Kindergarten to Grade Three. This has allowed students to move towards a more gradual adjustment from their first language to the bilingual education system in later grades. Given the complexity of the Philippine language framework, however, many problems arose as a result of the system and its lack of proper implementation. As the country has over one hundred languages across the archipelago, there could be potential barriers and inequities, especially if more resources are dedicated towards materials developed in mainstream languages. Moreover, the shift in language is confusing for both teachers, who had to adjust teaching methods and create new materials, and learners, who faced an abrupt change from the mother-tongue-based system in the earlier years to the bilingual-based system starting in the fourth grade. These changes didn't prove to have an effect as well, as evidenced by the latest PISA rankings, as mentioned earlier, where Filipino students lag almost six years behind their peers on average.

The K-12 curriculum at this time also experienced an identity crisis. Many were confused about the rationale for extending the educational system. Was it to prepare students for further education, or was it to prepare students for future jobs? In other curricula across the world, it was probably neither: for the most part, K-12 systems were solely there to strengthen the basic education and formation amongst the youth: preparation for the future came in secondary, but for the most part, it was still about strengthening foundational skills, which is often the hallmark of most basic education curricula. However, the Philippine senior high school system was meant to prepare students for either academic (which is subdivided into Science, Technology, Engineering, and Mathematics; Humanities and Social Science; General Academic; or Accountancy, Business, and Management strands) or vocational fields, depending on their track. Though these two fields are the most sought-after tracks, there were also special tracks for arts and sports students. That said, the senior high school system consisted of a core curriculum consisting of fifteen required subjects taught across both academic and vocational tracks. As a result of the combination of required core subjects as well as the subjects specific to one's specialization, the senior high school curriculum appears to have an identity crisis: what exactly does senior high school prepare students for? What exactly is it meant to do? This question is further compounded by the lack of acceptance of senior high school graduates amongst blue-collar jobs – in the case of the Philippines, most entry-level jobs, such as cashiers and servers, still require college degrees for the most part. Initially, the K-12 promised job-ready graduates after basic education, but in reality, most social institutions and industries did not readily conform to this and took a while to adjust to the K-12 standard, with some still requiring college degrees up to this day. On the academic side, while the skills of students, many professors still lack the confidence in teaching

university-level material to high school graduates. Moreover, there seems to be redundancies between senior high school and college – for example, students in STEM take general chemistry twice, once in senior high school and once in college. This is due in part to the lack of confidence among Higher Education Institutions (HEIs) and the Commission of Higher Education (CHED), both of which work to prescribe the curriculum for university students. It is safe to say that there is a lack of coordination between the Department of Education and the Commission on Higher Education in this case. This raises another important question: if the goal of senior high school is to prepare work-ready or college-ready students, why is senior high school under the supervision of the Department of Education rather than the Technical Education and Skills Development Authority and the Commission on Higher Education? Regardless if the K-12 aimed to prepare students for university or career, or whether it aimed to strengthen skills and knowledge in basic education instead, the K-12 does not seem to address any of those goals.

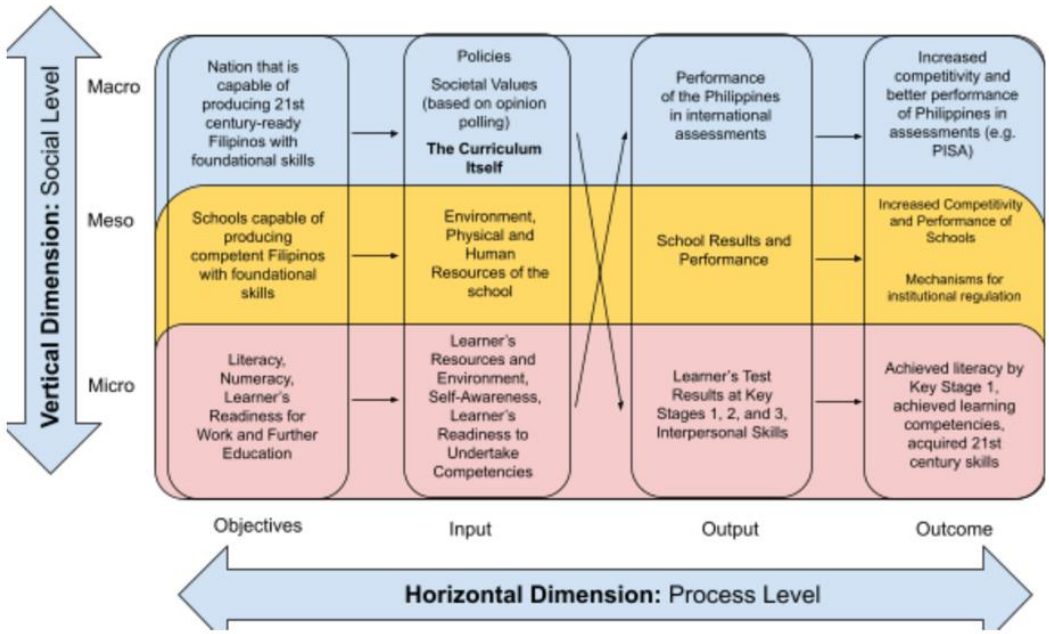
With these issues, acceptance of the K-12 curriculum has gradually waned, with legislators proposing a K+10+2 model, as suggested by Former President Gloria Macapagal Arroyo, who wanted to require only college-bound students to study 13 years of basic education, with vocational students ready to graduate after 11 years (Chi, 2023). Many believe that the extra two years of the curriculum are a waste of time and money, when senior high school students could already be in college.

At one end, the curriculum aimed to improve the readiness of Filipino students for work or further education, depending on their goal. It, however, failed to address the qualms of many with previous curricula. As noted by the present Department of Education, the curriculum is still overloaded with redundant competencies. This has led to the institution of the Second Philippine Congressional Commission on Education (EDCOM 2), which has sought to address the Philippines' long-standing educational crisis.

Persistent Systemic Issues in Philippine Basic Education

In order to address the ongoing challenges with the present education system, the Department of Education in 2023 released the Matatag Agenda, which sought to review the curriculum based on the deficiencies highlighted by the PISA Assessment Rankings as well as feedback from various stakeholders (Department of Education, 2023). Given that this shows a strong correlation with the Basic Education Exit Assessment, where low proficiency levels were observed in Problem Solving, Critical Thinking, and Information Literacy Skills. A thorough review of the curriculum was conducted, where it was found that despite the curriculum being decongested multiple times, it was still overloaded with competencies, some of which were misplaced or redundant; thus, recommendations were made to decongest and restructure the competencies in the curricula. Beyond the curriculum, there were also other factors that perpetuated the educational crisis, especially as some teachers lack adequate time or preparation to teach all competencies in the curriculum, with only 20% of the teacher population being able to complete all competencies in a school year.

Again, with previous curricula, the Matatag Curriculum aims to focus on foundational skills such as language, literacy, numeracy, and patriotism. This time, however, the learning areas in grade one have been changed: in the first grade, Reading, Language & Literacy, Mathematics, Good Morals and Right Conduct, and *Makabansa* are taken up by students. The latter is a new subject area more akin to the *Makabayan* subject area of the RBEC in 2002. It still aims to combine social studies with music, art, and physical education- this time,



however, the competencies are integrated as one subject rather than multiple sub-areas. English and Filipino have been replaced with Reading and Language subjects, which aim to boost literacy amongst first graders- these are both taught in the common language of the students. Thereafter, students will start learning English and Filipino in second grade, as well as Science starting in third grade. In fourth grade, *Makabansa* is now split into social studies and music, art, physical education, and health (MAPEH). At this stage, technology and livelihood education are also introduced. By this time, students have eight subject areas from grades four to ten, namely Filipino, English, Mathematics, Science, Social Studies, Music, Art, Physical Education, and Health (MAPEH), and Technical and Livelihood Education (TLE). In an effort to decongest the curriculum, the mother tongue was removed, and the medium of instruction was changed back to the bilingual method. While the subjects' competencies are decongested, the contact time remains unchanged from the K-12 curriculum, giving teachers more time to deliver the competencies. Given that the Matatag Curriculum was rolled out this year, only time will tell whether or not the adjustments made will be successful.

With the various changes in each curriculum, the same pattern emerges: the curriculum is found to be too saturated, then reforms are made to decongest it and focus on the key areas. Various innovations were also introduced, such as merging subjects and introducing new ones, such as mother tongue education. However, the same woes exist despite these changes. What makes the recent changes to the curriculum different from the innovations and policies that preceded it? How can one be so sure that these policies will work this time around? These are the questions this research aims to provide a framework for.

A Two-Dimensional Evaluation Framework for Curriculum Reform

This research aims to produce a literature-based multi-dimensional evaluation tool that will evaluate curricula, such as the current curricula, in order to ascertain whether these curricula have succeeded in their goals. This chapter will revisit evaluation models in related literature in order to construct an evaluation tool for curricula within the Philippine context. Moreover, the constructed evaluation tool may also be used to evaluate and compare various curricula, which will be tested in case studies. This evaluation tool uses the learner as the frame of reference, given that outputs and outcomes directly concern the learner’s attitude and performance. The overall evaluation tool is shown in Figure 1.

Figure 1
A Proposed Two-Dimensional Evaluation Framework for Philippine Curriculum

As mentioned, two forms of program logic will be employed. The horizontal evaluation model can also be defined as a goal-oriented approach, which defines the inputs put towards a goal, the output that results from it, and the resulting outcome that arises. Beyond the curriculum itself, there are also factors, especially in the implementation, that hinder the curriculum from achieving its goals. To effectively troubleshoot and identify the sources of problems in the curriculum, a holistic analysis must be incorporated into the evaluatory framework. Given the lack of involvement of resources as well as various extrinsic and intrinsic factors in the curriculum analysis frameworks mentioned in the previous section, this evaluation tool aims to fill in the gap by studying the interactions of various factors within the self (micro level), group (meso level), or society (macro level), which will be further elaborated in the coming sections.

The horizontal program logic is adopted from the regulatory benchmarking model devised by Vilela and Ahn, where the researchers were able to use benchmarking as a form of evaluation of monopolistic energy operators in Brazil, which are aimed at reducing regulatory costs and the establishment of external goals for monopolistic firms (Emans, 1966). The researchers proposed a goal-oriented approach to ensure that benchmarks are met. The outcomes set forward by the framework are, in turn, governed by metrics that were set accordingly, which in turn correspond to the input at the start of the process.

In the case of the goals for the curriculum evaluation tool, it is imperative that these goals be based on the shaping paper of the said curriculum, which explains not only the specific goals targeted by the curriculum, but also outputs and metrics that correspond to the goal. While the primary goal of the new curriculum is to "equip Filipino learners with the necessary skills and competence to prepare them to take on the challenges of the 21st century,"19 The goals are further subdivided into subject areas. For example, the primary goal for the mathematics curriculum is to "become mathematically proficient and critical problem solvers," while that of the first-grade reading and literacy curriculum is for learners to "demonstrate basic literacy in their first language." In the shaping paper, these goals are quantified using an assessment,

feedback, and reflection mechanism – all of which aim to measure the student's proficiency and performance with regard to the concerned learning competencies. These are complemented by nationwide exams such as the Early Language, Literacy, and Numeracy Assessment (ELLNA) assessment taken at the end of third grade, as well as the National Achievement Test (NAT), which tests for mastery of the expected learning competencies at the end of grades six, ten, and twelve. These long-standing indicators will continue to be used to measure the mastery of students. In the past, the 2017 ELLNA results were used as a springboard for the new curriculum, given the students' deficiencies in language (across Mother Tongue, Filipino, and English) as well as numeracy. In the same vein, the 2018 Basic Education Exit Assessment (now the Grade 12 NAT) pointed out the students' deficiencies in not only foundational skills, but also in twenty-first-century skills such as problem solving, information literacy, and critical thinking skills. Given that these outputs are strong indicators of the goals laid out by the curriculum, it is still important to use these metrics in the new curriculum. The inputs in this model refer to the resources as well as other factors that contribute towards an output through a process. In the case of this model, inputs involve aspects concerning intrinsic factors relative to the learner, as well as extrinsic factors such as the learner's environment. This is especially important given the integration of the goal-input-output-outcome process logic with the micro-meso-macro level, wherein there are interactions between the self as well as their environment, which will be discussed in succeeding sections.

In Vilela and Ahn's goal-based model, the goals, outputs, and inputs were accordingly classified according to the type and level of stakeholdership. For example, institutional stakeholders were grouped according to their role in the electricity transmission sector. Moreover, operational stakeholders were further subdivided into supply chain, secondary resources, and the environment (Vilela et. al. 2022). In a way, such goal-based analysis as done by Vilela and Ahn can be complemented by a vertical model, in the form of a micro-meso-macro analysis. Nelhans argues that metrics must also be seen within such a social model to properly qualify and describe quantitative measures, especially as indicators and metrics should be distinct, unobtrusively collected, and should not be directly affected by the measurement tool (Nelhans, 2022).

Nelhans was able to investigate the performance-based research allocation models for researchers at the micro, meso, and macro levels. At the micro level, performance-based research models were also used among individuals, where researchers were evaluated individually, a system that was in use in Umeå University since 2008. As a result of this individual evaluation, researchers feel stress at the individual level, given the competition to publish in order to gain incentives, which in this case is funding for the investigator. This feeling also resonates with students who experience the same phenomenon at the basic education level. With this, it is imperative to integrate the intrinsic and extrinsic factors even at the individual level. In such a case, factors belonging to the macro level, such as policies, can determine the outcome and consequently indicate whether the goal is met. In the case of the goals of the curriculum, all three levels (micro, meso, and macro) share the same goals, but only differ in the societal impact – given that micro is limited to the individual, it is limited to the self's competencies, on the other hand meso and macro levels are concerned with the greater populations – namely the school and the society as a whole.

Conclusion

Over the decades, Philippine education has been shaken and reshaped many times. Each reform brought new arrangements of color and structure, but the pieces inside the tube often remained the same. Those pieces: the systemic issues, the resource gaps, the misalignments, and the uneven learning conditions, are precisely what continue to limit the impact of every new curriculum. Curriculum reform alone cannot fix what is fundamentally systemic. One can revise competencies, restructure learning areas, or extend the number of years in basic education, but unless the very conditions in which these reforms are implemented are addressed, very little changes at the level that matters most: the learner. This is precisely why an evaluation framework is needed not only to identify whether goals, inputs, outputs, and outcomes are aligned, but also to evaluate not just the learner, but the school cultures, the environment, as well as the national structures that shape educational possibilities. Only if there is a more grounded, realistic, and learner-centered approach to understand educational reform can our curriculum evolve into something stronger, more coherent, and truly transformative for Filipino learners.

Official Conference Proceedings

Abstract

Outcome-Based Education (OBE) has become a central framework shaping curriculum design and quality assurance in ASEAN higher education, particularly in professionally oriented fields such as design education. This paper examines how OBE is implemented across design-related programs in ASEAN, identifying prevailing practices, key challenges, and innovative approaches. Drawing on regional policy analysis and selected institutional examples from Indonesia, Malaysia, the Philippines, and Vietnam, the study highlights the influence of national qualification frameworks and ASEAN University Network–Quality Assurance (AUN-QA) standards on learning outcomes, teaching strategies, and assessment practices. An in-depth case study of the Design Innovation Program (DIP) at King Mongkut's University of Technology Thonburi (KMUTT) illustrates a distinctive model of OBE implementation through long-term work-integrated learning and industry co-creation. The findings suggest that while OBE enhances transparency, graduate readiness, and industry alignment, its effectiveness depends on sustained collaboration, faculty capacity, and coherent assessment systems.

Keywords: outcome-based education, design education, ASEAN, work-integrated learning, quality assurance

Introduction

Outcome-Based Education (OBE) emphasizes the clear articulation of intended learning outcomes and the systematic alignment of curriculum, teaching, and assessment to ensure that learners achieve demonstrable competencies (Spady, 1994). It has been widely adopted across ASEAN higher education as a mechanism for improving graduate quality, transparency, and international comparability. In design education, OBE is particularly relevant because programs are expected to develop complex combinations of creative, technical, professional, and interpersonal competencies. This paper explores the implementation of OBE across ASEAN design education programs and examines the opportunities and constraints associated with translating outcome frameworks into effective teaching, learning, and assessment practices.

Methodology

This study adopts an empirical research approach through a qualitative case study methodology. It combines comparative analysis and in-depth documentation to explore the implementation of Outcome-Based Education (OBE) in design-related undergraduate programs within ASEAN. The first layer of inquiry involves a thematic analysis of OBE practices across regional institutions in Indonesia, Malaysia, the Philippines, and Vietnam, drawing from policy documents, academic literature, and quality assurance frameworks such as AUN-QA. The second layer presents an in-depth case study of the Design Innovation Program at School of Architecture and Design (KMUTT), focusing on its real-time implementation of OBE in collaboration with industry partners. This includes the co-development of learning outcomes, teaching strategies, and assessment rubrics with professionals from Jacob Jensen Design and 4digit Thailand. The case exemplifies both challenges and strengths of applying OBE through experiential learning and work-integrated education. This dual-layered, evidence-based qualitative approach allows the study to capture nuanced educational practices and contribute to grounded recommendations for improving OBE in design education across the ASEAN region.

Current Status of OBE Adoption in Design Education Programs (ASEAN)

Across ASEAN, the adoption of OBE has been strongly influenced by the ASEAN University Network–Quality Assurance (AUN-QA) framework, which emphasizes outcome clarity, alignment, and continuous improvement (ASEAN University Network, 2016). In the Philippines, for example, the Commission on Higher Education (CHED) mandated a shift to OBE in 2012, prompting universities to redesign curricula around intended learning outcomes (Commission on Higher Education [CHED], 2012). By 2021, studies indicated that both accredited and non-accredited Philippine institutions were largely compliant with CHED's OBE framework, though they continued to face challenges in fully realizing effective outcome-based teaching. Malaysia has likewise embedded OBE into its national quality framework – all programs (including Art & Design degrees) are aligned with the Malaysian Qualifications Framework (MQF), which requires "a clear definition of the intended outcomes" for each program, supported by appropriate teaching methods and assessments (MQA,2024).

Across the region, many universities have embraced OBE as part of quality assurance and accreditation initiatives. The ASEAN University Network – Quality Assurance (AUN-QA) system, in particular, has been a driver of OBE adoption. AUN-QA assessments focus on clearly defined learning outcomes aligned to program objectives, using these outcomes to

evaluate program effectiveness and ensure students attain the desired competencies (Pham & Vu Nguyen, 2023). In Vietnam, for instance, national standards for program accreditation were essentially "borrowed" from AUN-QA, and since 2009 a number of Vietnamese universities have had their programs (including design majors) assessed under the AUN-QA criteria (Pham & Vu Nguyen, 2023). This trend continues as of 2024, reflecting a broad regional move toward outcomes-based quality standards. Still, OBE implementation is at varying stages across ASEAN: some countries and institutions have fully integrated an outcomes-based approach, while others are still strengthening faculty capacity and understanding of OBE principles. In general, however, the trajectory is clear – outcome-based curricula are now a central feature of design education programs in the region, intended to improve graduate competencies and international comparability.

Notable Examples of OBE Implementation in Design Programs

Numerous ASEAN universities have pioneered notable OBE practices in their design degree programs. A common hallmark is seeking AUN-QA accreditation or similar outcome-focused certifications for these programs:

- Indonesia – Universitas Multimedia Nusantara (UMN): UMN's Visual Communication Design program underwent an AUN-QA international assessment in 2021 and achieved a successful rating. AUN-QA is explicitly an OBE-oriented quality standard, and UMN's program met 11 evaluation criteria covering curriculum design, teaching/learning processes, learning outcomes, resources, and continuous improvement – all centered on outcomes-based education governance (*Universitas Multimedia Nusantara, 2021*). This indicates that the program's curriculum and management were on par with ASEAN OBE standards.
- Philippines – University of the Philippines (UP): At UP Diliman (and its extension in Baguio), several Bachelor of Fine Arts (BFA) programs in design have undergone external quality reviews aligned with AUN-QA. In late 2024, UP subjected its BFA in *Industrial Design* and BFA in *Visual Communication* (among others) to an AUN-QA formatted assessment, examining how well these programs achieve their stated outcomes (Sazon, E. & Ramos, 2025). This reflects a strong institutional commitment to OBE – the design programs are explicitly framing their curricula around expected learning outcomes and having them vetted against regional standards.
- Vietnam – Hoa Sen University (HSU): Hoa Sen University has actively pursued AUN-QA accreditation for its design majors. By mid-2021, HSU's Interior Design bachelor's program had been certified as meeting AUN-QA outcome standards, and in 2022 its Graphic Design program was likewise accredited (Hoa Sen University. (n.d.). Students in these programs benefit from curricula that are transparently aligned to learning outcomes and rigorously evaluated. Such accreditation signifies that teaching, learning, and assessment in those design courses are structured to achieve the intended competencies, and the degrees are more regionally recognized as outcome-based qualifications.
- Malaysia: All public and private universities in Malaysia implement OBE in design programs by requirement of national policy. For instance, a typical Malaysian Art & Design degree program is designed in constructive alignment with program learning outcomes defined under the MQF clusters (e.g. knowledge, cognitive skills, practical and interpersonal skills, etc.) (MQA,2024). As a result, universities like Universiti Teknologi MARA or Universiti Sains Malaysia have mapped their visual arts, industrial design, and related curricula to ensure each course contributes to the graduate outcomes specified in the Malaysian Programme Standards for Art & Design. This systematic

adoption makes Malaysian design degrees a regional model for outcome-based curriculum structure.

These examples illustrate that OBE is not just a theoretical ideal but is actively shaping program design and delivery. Design faculties across ASEAN are revising syllabi, course content, and program objectives to align with outcome frameworks, often guided by AUN-QA or national QA agencies. The result is a growing list of design programs – from visual communication and multimedia design to product/industrial design and design innovation – that explicitly state their expected learning outcomes (ELOs) and continuously assess whether those outcomes are achieved, thereby closing the quality loop.

Teaching and Learning Strategies Aligned With OBE in Design Education

In OBE-aligned design programs, student-centered and experiential learning strategies are emphasized to ensure students achieve the targeted outcomes. Rather than relying solely on traditional lectures, instructors employ methods that actively engage students in applying design concepts and skills. Common teaching and learning strategies in design under OBE include:

- Studio-Based Learning and Projects: The design studio model – where students learn by doing design projects under instructor guidance – is a core pedagogy aligned with OBE. Students tackle practical design briefs (e.g. creating a product prototype or visual campaign), allowing them to demonstrate outcomes like creative problem-solving, technical proficiency, and project management. Program guidelines in the region list *"practical workshop/studio work"* as primary learning activities in art and design fields. This confirms the premise of Dewey that Experiential learning in design education draws on longstanding educational theory that positions learning as emerging through experience, reflection, and interaction with real-world contexts (1938). Through iterative studio projects and critiques, learners progressively attain the intended outcomes (for example, an outcome on *"ability to integrate form and function in product design"* is developed via successive studio assignments).
- Problem-Based and Collaborative Learning: OBE encourages design students to engage in problem-based learning (PBL) – tackling real-world design challenges in teams – to achieve outcomes related to critical thinking, teamwork, and communication. Many ASEAN design programs incorporate collaborative projects (sometimes interdisciplinary) where students must apply design thinking to solve a problem for a "client" or community. This student-centered approach aligns with outcomes on innovation and user-centered design. This supports learning through design and production, not just theory. As Papert discusses, learning through design and production aligns with constructionist perspectives, which emphasize knowledge construction through the creation of meaningful artefacts (1980). It shifts the classroom dynamic from teacher-led to learner-driven, as students must research, ideate, and prototype solutions (with the teacher as a facilitator). Such active learning ensures that by the end of the course, students can "demonstrate…skills" rather than just recall content.
- Industry Engagement and Work-Based Learning: To make outcomes more career-relevant, programs integrate industry-based learning experiences. This can include internships, apprenticeship-style projects, or industry-sponsored studio problems. For instance, some curricula have a required industrial training or fieldwork component in a relevant design industry, which maps to outcomes like professional practice and entrepreneurship. Notably, the Malaysian design program standards highlight Work-Based Learning (WBL) as part of teaching methods. Guest lectures from industry

practitioners and field visits are also utilized to expose students to current industry standards, thereby supporting outcomes related to industry knowledge and networking.

- Constructive Alignment in Teaching: Educators in OBE design programs that consciously align each learning activity with specific course learning outcomes. This principle of constructive alignment means, for example, if an outcome is *"ability to communicate design ideas effectively,"* the course will include activities like design presentations or critiques to build that ability. AUN-QA assessments have in fact helped universities adopt these practices – driving faculty to ensure that curriculum design, teaching approaches, and assessment methods all reinforce the stated outcomes (Pham & Vu Nguyen, 2023). In practice, design lecturers might use scaffolding: early in the term they introduce fundamental skills (drawing, software, theory) via demonstrations and exercises, and later require students to integrate those skills in complex projects, thereby aligning weekly learning tasks with the progressive attainment of outcomes.

Overall, teaching in an OBE context tends to be learner-centric. There is greater use of formative feedback (e.g. weekly critique sessions in studio) so students understand how to improve relative to outcome criteria. The learning environment is often flexible and creative, allowing different students to achieve outcomes through varied means (recognizing that design problems can have multiple valid solutions). By involving students in active creation and reflection, these strategies ensure that by graduation, design students have not only covered the syllabus but have demonstrably achieved the competencies (creative, technical, cognitive, and professional) that the program promises.

Assessment Methods Supporting Learning Outcomes in OBE-Based Curricula

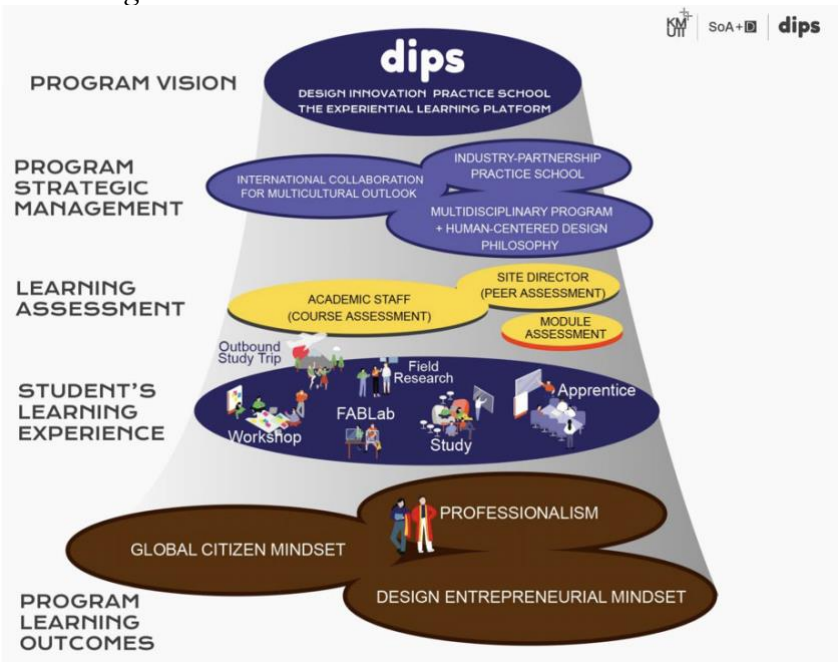
Assessment in OBE-aligned design programs is designed as a feedback and measurement tool to verify that students are attaining the learning outcomes. Key features of assessment practices in this context include:

- Outcomes-Aligned Assessment Criteria: Instead of grading on a curve or simply comparing students against each other, OBE assessments explicitly measure each student's work against the predefined outcomes or criteria. Rubrics are widely used – for every major design assignment or project, instructors develop rubrics listing the expected learning outcomes (or related performance indicators) and assess the level of achievement for each. For example, a project in an industrial design course might be assessed on criteria like *"functional innovation," "aesthetic resolution," "user-centered research,"* each tied to course outcomes. A student's grade thus reflects how well they met each outcome area. ASEAN quality standards emphasize this alignment; Malaysia's accreditation guidelines state that assessment methods *"must clearly measure the achievement of the intended learning outcomes"* (MQA,2024).
- Mix of Formative and Summative Assessments: In line with OBE principles, design programs use both continuous (formative) assessments throughout the term and summative assessments at the end. Continuous assessments may include design exercises, process work (sketchbooks, prototypes), quizzes on theory, and mid-term project milestones. Summative assessments often take the form of final design projects, portfolios, or capstone exhibitions. Importantly, students are typically required to pass both the continuous and final assessment components of a course to ensure they have steadily achieved outcomes and can demonstrate them in a culminating work (Universiti Malaysia Pahang Al-Sultan Abdullah [UMPSA], n.d.). This prevents a scenario where a student crams at the end to pass an exam without having consistently developed the skills. For instance, a Final Year Project (thesis project) in a design

program is a common summative assessment that evaluates a range of program outcomes (from conceptualization and technical execution to presentation and reflection), and it is usually supported by earlier project work and mentorship (formative) leading up to it.

- Authentic and Performance-Based Assessments: Because design is a practice-oriented field, assessments are often performance-based, meaning students must produce artefacts or perform tasks that an entry-level designer would. *Assignments, design projects, presentations, portfolios, and exhibitions* are favored over traditional pen-and-paper exams for assessing higher-order skills. For example, students might be assessed by mounting an exhibition of their design prototypes or by presenting a branding campaign to a panel. These methods are authentic – they simulate real design scenarios – and they directly measure outcomes such as creativity, technical competence, communication, and client responsiveness. A survey of suggested assessment forms for design programs shows a variety ranging from quizzes and observations (for foundational knowledge) to portfolio reviews, peer assessments, case studies, and final exhibitions for integrated skills (Williams & Askland, 2012). The variety ensures each learning outcome (cognitive, practical, interpersonal, etc.) is appropriately evaluated.
- Use of Feedback and Reflection: OBE assessment is often used not just for grading but to support learning. In many ASEAN design courses, after a project is evaluated, students receive structured feedback referencing the learning outcomes (e.g. "your work met the outcome of effective visual communication, but to fully achieve the outcome on research-backed design, more user testing was needed"). Students might be asked to reflect on this feedback and outline how they will improve. This practice helps close the loop – it aligns with the notion that assessment should *"support students' opportunity to learn important things"* and encourage improvement. Thus, assessment becomes part of the learning process in OBE, guiding students toward outcome mastery.
- Quality Assurance of Assessment: Institutions also put mechanisms in place to ensure assessments remain fair and outcome-focused. Many ASEAN universities have assessment moderation or validation processes (often required by QA agencies). For instance, if a design course's learning outcome is *"proficiency in digital modeling software,"* the department might review whether the assignments and grading in that course truly measure that skill. According to regional QA guidelines, assessments should be reliable, consistent, and free of bias. Some programs involve external examiners or industry experts to review capstone projects, ensuring that the assessment of outcomes like industry-readiness is impartial and benchmarked to external standards. Work-based learning outcomes may even be assessed in part by industry mentors (e.g. internship supervisors contributing evaluations of students' performance), as allowed in Malaysian OBE practices.

In summary, assessment in OBE-driven design education is deliberately crafted to *support* the attainment of learning outcomes. Students are continually measured against the outcomes through diverse and practical tasks, and they must demonstrate achievement of each intended outcome to successfully progress. This approach not only upholds academic standards but also gives students clarity on what skills and knowledge they are expected to have at each stage of the program.



KMUTT Bachelor of Fine and Applied Art in Design Innovation Program (DIP): A Case Study of Challenging OBE Implementation

Program Overview and OBE Alignment

The Design Innovation Program at the School of Architecture and Design, KMUTT, aims to produce graduates who integrate knowledge across arts, social sciences, management, entrepreneurship, science and technology, specifically applying innovative design thinking to enhance quality of life. This multidisciplinary approach provides a strong foundation aligned with clearly defined Program Learning Outcomes (PLOs), ensuring that students attain knowledge, practical skills, ethical values, and personal attributes required by contemporary professional practices (Figure 1).

Figure 1

DIPS Program Overview

Program Learning Outcomes (PLOs)

DIP curriculum strategically integrates OBE practices through well-defined program educational objectives, focusing on six program learning outcomes aligned with Thailand's National Higher Education Qualification Standards.

Design Entrepreneurial Mindset (PLO 1–3)

- PLO 1 Able to design product, service, or system by human-centered-design philosophy.
- PLO 2 Able to produce novel and useful ideas as appropriate responses during a creative task.
- PLO 3 Able to refine ideas to represent value among aspects of business or social impact.

Professionalism (PLO 4–5)

- PLO 4 Posses self-discipline, self initiative.
- PLO 5 Able to communicate and collaborate effectively in workplace.

Global Citizen Mindset (PLO 6)

- PLO 6 Aware of and understand the wider world in similarity or difference of cultural contexts through hands-on experience.

Teaching and Learning Strategies

DIP employs diverse teaching methodologies directly linked to program learning outcomes (PLOs), fostering both academic and professional competencies. This alignment reflects the principle of constructive alignment, in which learning activities and assessment tasks are deliberately designed to support the achievement of intended learning outcomes (Biggs & Tang, 2011).

Foundation Courses

Foundation Courses are designed to prepare first-year students as ready learners by equipping them with essential soft skills, teamwork and self-directed learning capabilities, and a foundational understanding of STEAM disciplines. These courses integrate project-based bootcamps and a book club component, the latter combining English language learning with the development of critical thinking and reflective learning habits. This foundation lays the groundwork for outcomes across PLO 1–6.

Experiential Learning (Work-integration Learning, WiL)

Experiential Learning (Work-integrated Learning, WiL) is implemented through industry partnerships with organizations such as Jacob Jensen Design Bangkok, 4digit Thailand, and Whatnot Start-up Studio. These collaborations emphasize professionalism, technical skills, and real-world design practice aligned with PLOs 1–5. In Wegner's work, he emphasized that work-integrated learning environments function as communities of practice, where students develop professional identity and competence through legitimate participation in authentic design activities (1998).

International Collaborations

International Collaborations, such as the Asia Link Workshop with institutions across Asia, enrich students' global perspectives and foster cross-cultural competencies (PLO 6).

Customized Learning Pathways

Customized Learning Pathways, introduced from the second year onward, enable students to pursue tailored experiences aligned with their personal interests and career goals. These are supported by specialized research labs and innovation centers, including Fablab Bangkok @KX and the Social Design Institute.

Assessment and Evaluation Practices

The program employs a comprehensive assessment approach, including:

- Course-based assessments using KMUTT's Learning Environment version B2 (LEB2) system to systematically track learning outcomes.
- Work-integrated assessments, where student performance is continually monitored by industry supervisors, supplemented by academic feedback through formal presentations and final project evaluations (portfolios or thesis projects).

The rubrics developed through collaboration with 4digit Thailand and JJD focus on three overarching competency clusters.

Performance & Professionalism

- Ability to complete assigned tasks
- Discipline and reliability (meeting deadlines, following processes)
- Collaboration and team coordination

Design & Technical Capabilities

- Human-centered design: Evaluation of how well designs address real user needs
- Creativity and originality: Innovative thinking aligned with project objectives
- Manufacturing feasibility: Understanding production constraints
- Technical and design skills: CAD, 3D modeling, UX/UI principles
- Quality and detail-orientation: Visual refinement, consistency, attention to detail

Soft Skills & Professional Growth

- Presentation and communication: Clarity and persuasiveness in presenting ideas
- Empathy, openness to feedback, and adaptability
- Self-directed learning and research depth

Unique Features

- Dynamic, longitudinal feedback**:** Evaluations occur monthly, tracking student improvement over time.
- Role-based rubric application**:** Differentiated expectations for junior, support, and lead roles in project teams.
- Industry co-supervision: Project leads and industry mentors co-score students and provide narrative feedback.

Quality Management for OBE

Quality assurance is reinforced through a structured **Steering Committee**, which includes academic staff and industry supervisors. This committee regularly reviews and ensures alignment of teaching strategies, learning experiences, and assessment practices with defined outcomes, intervening proactively whenever students face challenges in achieving the outcomes in their work-integrated placements.

Feedback and Continuous Improvement

Feedback from DIP students, collected via surveys and interviews (in 2023), indicates strong satisfaction, particularly with lecturers (4.45/5), teaching and learning methods (4.20/5), and measurement and evaluation processes (4.39/5). This positive feedback validates effective OBE implementation while highlighting areas for continuous improvement, especially regarding the learning environment and curriculum structure transition towards experiential and work-based learning.

Challenges and Implementation Insights

Despite the structured frameworks, DIP faced challenges in achieving seamless integration, notably in communication, synchronization between academic and industry timelines, and foundational skill preparedness among students. Continuous feedback from industry partners emphasized the need for stronger fundamental training, improved scheduling, and better knowledge management to enhance student adaptability to professional environments.

From the academic staff perspective, assessing learning outcomes from design project deliverables—especially in real-client projects—requires a balanced approach that considers not only the quality and completeness of project outputs but also client satisfaction, professional conduct, and learning progression. This dual consideration, combining feedback from both academic evaluators and industry supervisors, ensures holistic evaluation. Moreover, structured reflection activities, where students review client feedback and assess their own work, are critical in helping them not only learn but relearn—a key to cultivating adaptability and professional growth in design innovation.

An important insight from ongoing implementation is that a prolonged period of Work-Integrated Learning—spanning two out of three academic years in DIP's curriculum. It offers significant benefits in terms of professional growth, but may present trade-offs**.** Students gain deeper exposure to real industry settings, cultivate long-term professional connections, and develop habits aligned with workplace culture. However, this often comes at the expense of typical campus life experiences and peer-based learning in traditional academic settings. Striking the right balance between academic community engagement and professional immersion remains an ongoing concern in the program's design.

Effectiveness and Continuous Improvement

The co-created assessment frameworks significantly enhanced students' professional readiness, practical expertise, and industry adaptability. Continuous improvement efforts, facilitated by frequent communication and structured feedback loops, have fostered ongoing refinement in assessment methodologies and teaching approaches, thereby aligning effectively with industry expectations.

Comparative Analysis of OBE Implementation: ASEAN Design-Related Program Examples vs. KMUTT's DIP

- Expected Learning Outcomes: DIP shares the ASEAN norm of outcome clarity but explicitly focuses on design entrepreneurship and global citizenship, reflecting a more targeted emphasis on innovation, entrepreneurship, and professional readiness.
- Teaching and Learning Strategies: DIP's distinctive element is the depth and extent of its WiL strategy, covering two-thirds of the academic experience, surpassing typical ASEAN examples that usually integrate internships and real-world projects as shorter-term components. The foundational first-year experience in DIP uniquely emphasizes self-learning and essential soft skills through integrated modules and bootcamps.
- Assessment of Student Learning Outcomes: While ASEAN peers use outcome-aligned assessments commonly, DIP demonstrates a highly proactive and co-creative approach. DIP's joint academic-industry assessment, rubric development, and continuous, structured feedback loops offer deeper professional integration and more personalized student learning journeys compared to typical regional practices.

Discussion and Conclusion

This study identifies academic-industry collaboration through experiential Work-integrated Learning (WiL) as a key learning approach to effectively achieve career readiness in design education. KMUTT's Design Innovation Program exemplifies this by actively involving industry partners in the co-creation of learning outcomes, curriculum, and assessment rubrics. The deep integration of professional contexts within the academic journey helps students develop competencies directly relevant to the workplace, reflecting actual industry expectations, and preparing them for immediate professional contributions upon graduation.

Furthermore, the role of higher education institutions extends beyond immediate industry needs by preparing students for emerging future skills. The analysis suggests that higher education must proactively engage in future-skills foresight, ensuring that curricula address evolving competencies, particularly soft skills (communication, collaboration, critical thinking), digital literacies, and adaptability to evolving professional trends. These capabilities empower graduates not only to enter current labor markets but also to thrive amidst future uncertainties and technological transformations.

Lastly, the insights gathered point to the importance of flexible personalized learning approaches within OBE frameworks. Offering tailored educational experiences that respond to individual learner goals and industry demands is crucial in maximizing the potential and quality of graduates. Personalized pathways, supported by robust mentoring and reflective practices, optimize educational outcomes by aligning student interests, skillsets, and professional objectives, thereby directly enhancing graduate quality and employability.

Overall, the effective implementation of OBE in ASEAN’s design-related programs, particularly through strategic industry collaboration and future-focused, personalized learning, sets the foundation for delivering high-quality graduates capable of meaningful professional contributions in a rapidly evolving global landscape.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The authors declare that ChatGPT (OpenAI), an AI-assisted writing tool, was used to support English language refinement and structural editing of the manuscript. The use was limited to improving clarity, coherence, and academic phrasing. The ideas, design, procedures, findings, analyses, and discussion are based on the authors’ research activities and project documentation, and the authors reviewed and finalized all content.

Admissions Profile as Predictors of Academic Performance in a New Medical School

Maria Lourdes D. Cervantes, La Consolacion University Philippines, Philippines
Ma. Cristina E. Zulueta, La Consolacion University Philippines, Philippines

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Higher Education Institutions (HEIs) in the Philippines are committed to deliver quality education and produce competent, highly efficient graduates equipped with values, skills, and knowledge ready to participate in the workforce. This research study determined the admission profiles of the first two group of graduates of the Doctor of Medicine Program of La Consolacion University Philippines, College of Medicine in Bulacan and correlated them to the graduates' overall academic performance. The admissions' profile used were age at the time of admission, sex, collegiate course, general weighted average (GWA) from the collegiate course, National Medical Admissions Test (NMAT) percentile rank, work experience and licensure examination passed. These factors were used and correlated to the student's general weighted average (GWA) from the Doctor of Medicine Program from first to fourth year. In determining the relationship of variables of the admission criteria and the student's overall performance and the significant predictor of students' success, regression analysis was utilized. The research study was subjected to and adhered to the Research and Ethics Committee of the university. Regression analysis revealed that among the admissions' criteria, the students' General Weighted Average (GWA) from their collegiate course, licensure examination passed and National Medical Admissions Test (NMAT) percentile rank were associated with success in the program with a p value result of 0.004, 0.002 and 0.000 respectively. However, it can be concluded that NMAT percentile rank, based on obtained Beta coefficients, is the best predictor of success in the Doctor of Medicine program.

Keywords: medical school admission, academic performance predictors, quality assurance in education, Doctor of Medicine program, predictive validity

The International Academic Forum
www.iafor.org

Introduction

In general, the goal of every Higher Education Institution offering a variety of programs is to produce competent and efficient graduates ready to participate in the workforce. La Consolacion University Philippines started the Doctor of Medicine Program in 2017 with very few enrollees. Majority were transferees from other institutions. These aspiring doctors were given a chance to pursue their dream job, which is becoming a doctor to heal and treat patients using their skills, knowledge and most specially a heart that understands every patient condition.

Previous studies in the Philippines revealed that regardless of the type of teaching method and curriculum, the undergraduate general weighted average best correlated with academic performance in medical school (Brizuela et al., 2002; Cunanan, 2020; Villamor & Reyes, 2016). For a Philippine Catholic University, both undergraduate general weighted average (uGWA) and National Medical Admissions Test (NMAT) percentile rank have been found to have a significant moderate linear correlation with the medical school performance (Cunanan, 2020). Factors like positive environment, good teaching style of professors, parents' supervision, social networking, strong motivation for achievement, a clear goal, and ensuring enough sleep during exams have been found to affect the medical student's academic performance (Khan et al., 2020; Shawwa et al., 2015). While there are other factors that may contribute to the medical students' overall performance, this study mainly focused on the admission profile of the students.

This study is delimited to the pioneering and second cohorts of the Doctor of Medicine program at La Consolacion University Philippines during the 2021–2022 academic year. To maintain the focus of the inquiry, subsequent year levels were excluded from the sample. Data collection was facilitated through the University Registrar following the procurement of voluntary informed consent from the participants. For transfer students, academic performance from previous medical institutions was integrated into the computation of their cumulative general weighted average (GWA). Variables were operationalized as follows: "age" refers to the chronological age at the time of matriculation, and the National Medical Admission Test (NMAT) performance was recorded as the overall percentile rank, adhering to the standard two-year validity period of the results.

This research determined the admission profiles of the first two group of graduates of the Doctor of Medicine Program of La Consolacion University Philippines, College of Medicine in Bulacan and correlated them with the graduates' overall academic performance. It also identified the admission criteria which made a significant contribution to the student's overall performance. The results will serve as a basis for improvement of the minimum criteria set by the Commission on Higher Education to ensure student's survival through the rigors of medical school.

Theoretical Framework

The research is theoretically grounded in the premise that a multifaceted admissions profile functions as a reliable predictor of medical students' scholastic success. Specifically, it examines the correlative relationship between academic performance and a suite of independent variables, ranging from prior collegiate performance and standardized test scores to professional licensure and work experience.

Methodology

Adopting a quantitative approach, this study utilizes a descriptive-correlational research design to examine the relationship between the admission profiles of students and their subsequent scholastic achievement. This design is particularly suited for determining the existence, nature, and magnitude of associations between the identified variables. The study focuses on the total population of graduates from the Doctor of Medicine program at the sole medical institution in Bulacan. Academic performance was operationalized through the cumulative General Weighted Average (GWA) derived from Year Levels I to III. Data collection involved a systematic review of secondary records and admission documents retrieved from the University Registrar. To ensure the highest standards of participant protection and data privacy, the research protocol was submitted to and approved by the La Consolacion University Philippines Research Ethics Committee.

Respondents of the Study

A total of forty (40) medical graduates from the 2021 and 2022 cohorts were selected as the primary research participants. Utilizing a universal sampling methodology, the study encompassed the entire population of graduates within the specified timeframe to mitigate sampling bias. Adherence to ethical protocols was prioritized, ensuring that informed consent was obtained from all individuals before accessing their academic records for analysis.

Data Collection and Analysis

The data for this inquiry were derived from archival institutional records, specifically the admission credentials submitted by students upon matriculation. Following the procurement of formal informed consent, participant records were extracted from the University Registrar's database. To ensure strict adherence to data privacy protocols and maintain respondent anonymity, all datasets were de-identified and redacted prior to processing. Ethical confidentiality was rigorously maintained across all stages of the research. Methodologically, a multiple linear regression analysis was employed to model the predictive utility of various admission metrics in relation to cumulative academic achievement. This statistical approach allowed for the determination of the relative weight and significance of each entry variable as a predictor of student success. Ultimately, the findings serve as an empirical foundation for the proposed refinement of the institution's admission criteria.

Results and Discussions

This section presents empirical findings concerning the predictive relationship between student admission profiles and longitudinal academic performance in the Doctor of Medicine program. The results are systematically analyzed and synthesized with existing literature to provide a comprehensive interpretation of the factors that most significantly influence scholastic achievement within the institutional context.

The demographic analysis reveals that a majority of the cohort is female (57%), a finding consistent with global trends in health profession education. The average age of the participants is 24, with a broad age range reflecting a diverse student population. Notably, 72% of the graduates transferred from other Higher Education Institutions (HEIs), corroborating the observation that the institution provides a pivotal pathway for medical education. The undergraduate General Weighted Average (GWA) averaged 2.14, while the

National Medical Admission Test (NMAT) score averaged 62.3. These demographic findings provide the necessary context for the subsequent analytical results.

Table 1
Demographic Profile of Respondents

Demographic Profile	**Summary (Mean)**
Age: Mean (range)	24 (21–32)
Gender: count (percentage)	
Male	17 (43%)
Female	23 (57%)
NMAT Score (mean)	62.3
Collegiate Course: count (percentage)	
Nursing	22 (55%)
Medical Technology	8 (20%)
Other Allied Medical Courses	4 (10%)
Non-Allied Medical Courses	6 (15%)
Undergraduate GWA: mean (range)	2.14 (1.41–3.00)
Licensure Exam Passed: count (percentage)	14 (35%)
Admissions Status: count (percentage)	
Freshman	11 (28%)
Transferee	29 (72%)
General Weighted Average (GWA) in COM: mean (range)	2.44 (1.89–2.82)

Table 2
Admission Profile Affecting Academic Performance

Admissions Profile	**Coefficient**	**P Value**
Age	-0.001	0.68
Gender	0.037	0.368
NMAT Percentile Rank	0.029	< 0.001
Collegiate Course	0.020	0.329
Undergraduate GWA	0.143	0.004
Licensure Exam Passed	0.205	0.002
Admission Status	-0.129	0.017

The analysis revealed that only four admission profile variables demonstrated a statistically significant linear correlation with academic performance ($p < 0.05$). The following details examine the three most prominent predictors identified in the model.

First, the most robust positive determinant of academic success was the possession of a prior professional license. With a coefficient of 0.205 ($p = 0.002$), this factor emerged as the most reliable predictor within the study. This suggests that prior achievement in a rigorous professional context—specifically where knowledge is applied under high-stakes testing conditions—serves as a dependable forecast for higher achievement in medical education.

Second, undergraduate GWA was validated as a statistically significant positive predictor (coefficient = 0.143, $p = 0.004$). While this finding aligns with established academic literature, its predictive strength ranked behind licensure status within this specific cohort.

Third, the NMAT Percentile Rank was found to be a highly significant predictor ($p < 0.001$); however, it exhibited an inverse relationship characterized by a negative coefficient. This outcome warrants further investigation, as it suggests that the NMAT's utility as a positive predictor, when isolated from GWA and licensure status, may be less direct than traditionally hypothesized.

The variables of admission status, gender, and undergraduate academic background were identified as significant negative determinants of scholastic achievement—operationalized as GWA—within the studied medical cohort.

Conclusion

In conclusion, the research demonstrated that undergraduate GWA, NMAT percentile rank, and particularly the attainment of prior professional licensure exhibits a significant linear correlation with academic performance within the medical program. These findings align with existing literature in medical education, confirming that objective academic metrics remain reliable indicators of student success. However, the unique demographic profile of the institution—characterized by a high proportion of transfer students—has positioned prior licensure status as the most robust positive predictor within the admissions model. This insight is particularly salient for nascent or expanding institutions that must evaluate a diverse applicant pool, including those seeking a secondary pathway to medical education.

Based on this empirical evidence, the following recommendations are proposed:

1. Longitudinal Expansion of the Study: It is recommended that this research be extended to evaluate whether the identified entry-level profiles also serve as significant predictors of success in the Physician Licensure Examination (PLE).
2. Institutionalization of a Predictive Scoring System: Most importantly, the institution should establish a validated predictive model for the admissions process. This scoring system should apply evidence-based weights to prior licensure status, undergraduate GWA, and NMAT results to optimize the selection of candidates most likely to achieve academic excellence.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The authors acknowledge the use of Gemini for language editing and structural rephrasing to improve the manuscript's readability and precision. This assistance was strictly limited to stylistic and linguistic improvements; no other AI technologies were used. The authors reviewed and edited the output to ensure the integrity of the research findings.

Grounding a Quality Assurance Framework From the Perspectives and Experiences of Deans From PAASCU Level III and IV Accredited Medical Schools

Ma. Cristina E. Zulueta, La Consolacion University Philippines, Philippines

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

The COVID-19 pandemic severely strained the Philippine healthcare system, exacerbating the shortage of doctors and necessitating the enactment of Republic Act 11509, which spurred a significant increase in new medical schools through government scholarships. Despite this growth, a standardized quality assurance (QA) framework tailored for these new institutions remains absent. This grounded theory study, guided by Hatch and Schultz's Identity Dynamics theory, investigated the experiences of administrators and educators through semi-structured interviews with four deans of accredited medical colleges and three Augustinian formators. Through open, axial, selective, and theoretical coding, the study developed an emergent theory: Quality Medical Education Driven by Core Values. This theory informs a proposed QA framework specifically designed for new medical schools, integrating structures and mechanisms across all institutional areas while remaining intrinsically linked to core values. By addressing the gap in QA guidance, the framework ensures that new institutions deliver education meeting government and accreditation standards without compromising their organizational identity and image. This study affirms that anchoring quality processes in a school's unique identity provides a robust pathway for academic excellence and institutional integrity in the Philippine medical education landscape.

Keywords: medical education, quality assurance framework, grounded theory

Introduction

The landscape of medical education in the Philippines is navigating a period of unprecedented transformation, characterized by rapid expansion and shifting regulatory priorities. Over the last decade, there has been a notable increase in the number of medical schools, with sixty-one institutions currently authorized to offer the Doctor of Medicine program. While new schools are prohibited from accepting foreign students under Executive Order 285, many established institutions remain populated by local and international students. This surge in quantity has been coupled with a decline in the national passing average for the Physician Licensure Examination, raising concerns regarding the deterioration of educational quality.

The COVID-19 pandemic catalyzed these concerns, exposing a severe shortage of doctors and necessitating the enactment of Republic Act 11509, or the "Doktor Para Sa Bayan" Act. This policy provides medical scholarships and return service programs to ensure at least one doctor is assigned to every municipality, particularly in underserved areas. Consequently, many state universities have fast-tracked applications to establish colleges of medicine, making the security of quality medical education a paramount national priority.

To oversee this growth, the Commission on Higher Education (CHED) organized the Technical Panel for Medicine. This panel ensures compliance with minimum requirements, while alignment with international standards is facilitated through external accreditation agencies like the Philippine Accrediting Association of Schools, Colleges, and Universities (PAASCU). These initiatives reflect CHED Memorandum Order (CMO) 46, Series of 2012 (CHED, 2012), which mandates quality assurance (QA) through competency-based standards and outcomes-based systems. Quality assurance involves establishing mechanisms to ensure desired educational delivery, addressing national needs for a qualified workforce. Furthermore, external monitoring serves as a QA mechanism to assess compliance with standards like International Organization for Standardization (ISO) 9001:2015 (ISO, 2015), which often drive quality concepts based on external market requirements (Dotong & Laguador, 2015).

Quality in medical education can be defined in relative terms as reaching required standards prescribed by external agencies consistently. It involves both the "production side"—the development of competent graduates—and the "perceptual side"—the maintenance of an institution's values and principles. Accreditation implies accountability to the public, ensuring the enhancement of teaching and learning (Joshi, 2012). PAASCU accreditation indicates that a program has met commonly accepted standards and manifested the ability to upgrade academic quality through self-evaluation (PAASCU, 2021). These standards are fundamentally based on the World Federation for Medical Education (WFME) standards, which respect cultural variations while emphasizing that the identity of graduates must align with an institution's vision and mission (Sjöström et al., 2019).

Central to this study is Hatch and Schultz's (2002) Identity Dynamics theory, which suggests that organizational identity is formed through the continuous interaction between internal culture and external image. For medical schools, quality is not just a checklist, but a reflection of how the vision-mission is mirrored in operations.

While PAASCU and WFME assess eight key areas—including Leadership and Governance, Quality Assurance Systems, and Resource Management—there is currently no standardized QA framework specifically for new Philippine medical schools that integrates these standards with unique institutional identities (Karam et al., 2021). This gap is particularly relevant for

the Augustinian Sisters of Our Lady of Consolation (ASOLC), who established the first college of medicine in Bulacan in 2017 (LCUP, 2017). As a school following the Philippine Catholic Schools Standards (PCSS), the ASOLC must ensure its medical program is at par with high-level accredited institutions while remaining a center for integral evangelization and Gospel values (CEAP, 2016).

Consequently, this study aimed to explore institutional documents and narratives regarding the vision and mission of ASOLC schools to define their organizational identity from the perspective of three Augustinian formators. Simultaneously, it investigated the professional experiences of four deans from PAASCU Level III and IV accredited medical institutions. These data were synthesized to develop a grounded theory explaining how high-level accreditation and educational quality are achieved while preserving a mission-based institutional identity. This emergent theory, *Quality Medical Education Driven by Core Values*, served as the foundation for a holistic quality assurance framework designed to embody institutional ideals while satisfying the rigorous quality standards defined by PAASCU.

Methodology

Research Design

This study utilized a qualitative approach to explore the intersection of organizational identity and high-level accreditation in medical education. Specifically, it adopted Grounded Theory, as established by Glaser and Strauss, to generate an explanatory framework from the lived experiences of administrators and formators. The research followed the approach of Corbin and Strauss (2015), which utilizes an initial literature review to stimulate theoretical sensitivity and guide the theoretical sampling process without precluding the emergence of new concepts. This method was essential to understand how medical schools balance the market-driven requirements of external accreditation with the internal, value-driven identity of a religious educational institution.

Participants

The participants were categorized into two distinct groups to provide a holistic view of the phenomenon. First, three Augustinian formators and educators from the Augustinian Sisters of Our Lady of Consolation (ASOLC) were selected through snowball sampling. These participants provided the internal culture perspective, drawing from their experiences in establishing and managing Catholic educational institutions. Second, four deans from medical schools granted PAASCU Level III and IV accredited status were included as participants. As of June 2021, only six medical schools in the Philippines held these elite designations (PAASCU, 2021); four accepted the invitation to participate, representing the external excellence perspective.

Measures and Procedure

The researcher utilized two Interview Protocol Guides (IPG) consisting of open-ended questions. Each IPG underwent a two-phase validation by a panel of experts, achieving high scores on the Validation Rubric for Expert Panel. Interviews were conducted either face-to-face or via virtual platforms, recorded with consent, and transcribed by professional transcriptionists. To ensure data saturation, a Google Form was also sent to participants for supplementary reflections.

Data Analysis

The data analysis plan involved coding collected data through four specific steps based on Corbin and Strauss (2015). Initially, open coding was performed to build categories of concepts to organize data into concept trees. This process involved a close examination of the data, breaking it down into parts, and making constant comparisons until reaching a saturation point where no new categories emerged.

Results and Discussion

Thematic Analysis of the ASOLC Schools' Formators Narratives

The narratives of the Augustinian formators yielded two primary categories that define the organizational identity of their institutions.

Education Guided by Augustinian-Marian Core Values

Table 1 shows that the formators described a philosophy of education that is inherently Christ-centered and guided by the core values of Compassion, Honesty, Community Orientedness, Interiority, Humility, Courage, and Missionary Spirit. These values are incorporated directly into the curriculum and school processes. The trademark of credibility and quality education among these institutions is established through these values, which heavily influence the stakeholders (Vicente & Cordero, 2021).

Table 1
Education Guided by Augustinian-Marian Core Values

Meaning Units/Codes	Category/Theme
Christ-centered	Education Guided by Augustinian-Marian Core Values
Core values incorporated in the curriculum	
Follows CEAP standards	
Employees/personnel exemplifying the core values of Compassion, Honesty, Community Orientedness, Interiority, Humility, Courage, and Missionary Spirit.	
Augustinian Quality Education Philosophy	
Students and graduates practice core values	

Formation of the Mind and Heart

The participants, as seen in Table 2, emphasized that quality education focuses on the development of the students not just in knowledge and skills, but as humble and compassionate professionals. This adheres to Augustinian pedagogy, which stresses an important connection between the human heart and relationships with God and others (Baker, 2016).

Table 2
Formation of the Mind and Heart

Meaning Units/Codes	Category/Theme
Adherence to government and accreditation standards	Formation of the Mind and Heart
Compliance to government regulations and accreditation requirements	
Adherence to Augustinian-Marian core values	
Known for quality education	
Core Values: Compassion, Honesty, Community Orientedness, Interiority, Humility, Courage and Missionary Spirit.	
Augustinian-Marian education reinforced in the curriculum, policies, and practices.	
Big emphasis on development of graduate holistically	
Not just knowledge and skills as professional	
Students and graduates to be humble and compassionate	

Thematic Analysis of the Perspectives and Experiences of Deans

Interviews with the deans of high-performing medical schools revealed the practical and systemic challenges of maintaining excellence through five key categories.

The Rigors of Accreditation

As shown in Table 3, all participants described the accreditation journey as difficult, grueling, and stressful. Despite the human and financial "costs" of accreditation, these were deemed acceptable given the benefits of improved documentation and the implementation of robust procedures (Blouin et al., 2018).

Table 3
The Rigors of Accreditation

Meaning Units/Codes	Category/Theme
Difficult and challenging journey	The Rigors of Accreditation
Discouragement but moving forward	
Requires great effort and grueling preparation	
Costly but worth it	
Challenge of a new survey instrument	
Heavy work, difficult and stressful	
Entails sacrifices especially on monetary gain compared to other units	
Pandemic posed a greater challenge in ensuring quality	

Maintaining Quality in Established Medical Schools

For well-established institutions, evident in Table 4, maintaining quality became easier after the first visit through strict adherence to recommendations and the creation of a Strategic Quality Management Office. Strong administrative support and a desire for continuous improvement were identified as key factors (Villamor & Reyes, 2016).

Table 4
Maintaining Quality in Established Medical Schools

Meaning Units/Codes	Category/Theme
A little easier after the first	Maintaining Quality in Established Medical Schools
Strictly follow accreditors' recommendations and areas for improvement	
Creation and presence of a Strategic Quality Management Office	
No compromise and lowering of standards	
Previous recommendations acted upon promptly	
Conscious of sticking to policies and standards	
Updating beyond the standards	
Needs strong admin support	
Desire to keep improving	
Best to have PAASCU trained accreditors on the team.	
Continue to improve and reinforce policies	

A Shared Goal for Ensuring Quality

Achieving high-level accreditation was identified as a collaborative effort in Table 5. Fostering a Continuous Quality Improvement (CQI) culture at the center of the institution ensures ongoing self-assessment against best education practices (Blouin et al., 2018).

Table 5
A Shared Goal of Ensuring Quality

Meaning Units/Codes	Category/Theme
Accreditation is a shared goal and requires collaborative efforts.	A Shared Goal of Ensuring Quality
Takes a good team of patient, committed, dedicated and hardworking faculty who are one with the institution	
The shared goal to continuously improve and achieve the level of accreditation.	
Team effort	
Meeting PAASCU standards of high level of accreditation should be a shared goal.	
Believing that the recommendations and the criteria per area can be achieved kept the team going.	

The Process of Quality Assurance

As seen in Table 6, the quality assurance process entails a constant cycle of self-evaluation, review, and monitoring. This follows the Plan-Do-Check-Act (PDCA) cycle integrated into the current PAASCU Basic Medical Education Survey Instrument.

Table 6
The Process of Quality Assurance

Codes/Indicators	Category/Theme
Should have continued desire to improve and subject to next level	The Process of Quality Assurance
Honesty on the self-evaluation	
Strictly follow accreditors' recommendations and areas for improvement	
Constant self-checking, review, assessment, and monitoring	
It takes a thorough planning, improving, and monitoring to maintain high level of accreditation.	
Conscious of sticking to policies and standards previously approved	

The Products of Accreditation and Quality Assurance

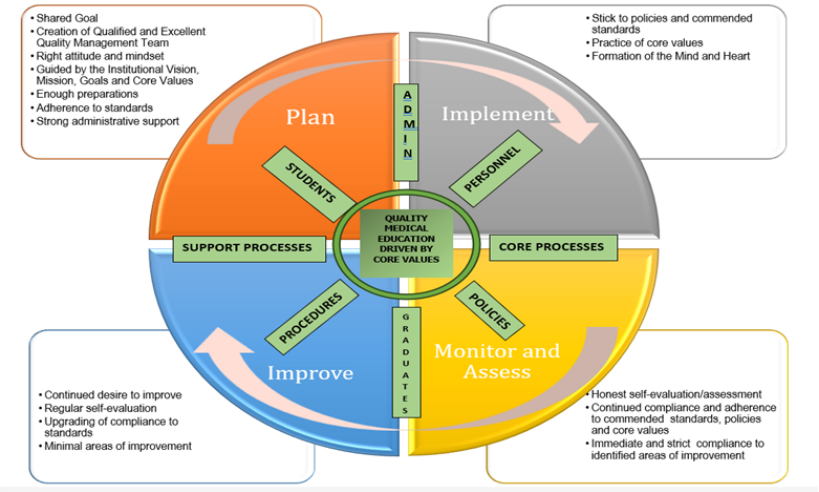
The final category, shown in Table 7, focused on the outcomes of the QA process. High levels of accreditation equate to high standards of medical education, solidifying the school's reputation and ensuring that graduates are easily matched for postgraduate internships and training locally and internationally.

Table 7
The Products of Accreditation and Quality Assurance

Meaning Units/Codes	Category/Theme
Graduates easily matched for internship and training locally and internationally	The Products of Accreditation and Quality Assurance
Meant increased revenues, tuition fee, compensation, approval of needed facilities, equipment, renovations, models	
Opened a lot of opportunities, student applications and enrolment	
Equates with high standards of medical education	
Level of accreditation solidifies school reputation	

Triangulation and Emergent Theory

By triangulating the data from both the formators and the deans, the study identified that the rigors of external accreditation and the internal core values of an institution are mutually reinforcing. The emergent theory, Quality Medical Education Driven by Core Values, suggests



that for new medical schools, a successful quality assurance framework must be intrinsically linked to the school's organizational identity. This alignment ensures that as institutions meet national and international standards, they do not lose the unique mission and values that define their educational purpose.

The Proposed Quality Assurance Framework

To date, there remains a critical gap in standardized quality assurance (QA) frameworks specifically tailored for Philippine medical schools. This study was conducted within the setting of a newly established medical school founded by the Augustinian Sisters of Our Lady of Consolation (ASOLC). Consistent with the broader mission of ASOLC schools, there is a fundamental commitment to ensuring that the quality of medical education is at par with well-established and highly accredited institutions.

Guided by the emergent theory derived from this research—Quality Medical Education Driven by Core Values—the proposed framework as seen in Figure 1 places this central theme at its heart. As illustrated in the dynamic model, these core values must be translatable into observable behaviors practiced by the administration, teaching, and non-teaching personnel. These values radiate through all institutional layers, including curriculum implementation, core processes, support systems, and the eventual competencies of graduates. While PAASCU utilizes a Plan-Do-Check-Act (PDCA) cycle, the narratives of the deans emphasized a similar Plan-Implement-Monitor-Improve (PIMI) cyclical model. The proposed framework integrates these QA structures and mechanisms, ensuring they are driven by core values across all areas of the medical school to promote continuous self-assessment and institutional growth.

Figure 1
The Proposed Quality Assurance Framework

In the Planning Process, a critical success factor for Level III and IV accredited schools is the creation of a dedicated team or office solely responsible for quality delivery and adherence to standards. This team must consist of trained, qualified personnel who possess the right attitude and mindset, viewing quality as a shared goal of the whole institution. Crucially, this entire planning phase must be grounded in the school's distinct organizational identity.

During Implementation, established deans stressed the importance of strict adherence to policies and commended standards, as any deviation can jeopardize accreditation levels. At

this stage, core values are practiced across all institutional aspects, ensuring that curriculum delivery focuses not just on the formation of the mind, but also the heart.

Monitoring and Assessment requires absolute honesty in self-evaluation against standards such as those set by PAASCU. It necessitates continued compliance with policies and core values, where identified areas for improvement are addressed immediately and strictly to sustain academic excellence.

Finally, Continuous Quality Improvement is achieved through a persistent desire to improve, regular self-evaluation, and the constant upgrading of compliance to standards. For this framework to be fully effective, the specific Augustinian-Marian core values—Compassion, Honesty, Community Orientedness, Interiority, Humility, Courage, and Missionary Spirit—must be translated into concrete behaviors. This ensures that the medical school's processes and personnel are not only meeting external benchmarks but are fundamentally fulfilling their unique educational mission.

Conclusion

Based on the findings of this research, it is concluded that Augustinian ideals within ASOLC schools necessitate that every facet of the institution be guided by the Augustinian-Marian core values of compassion, honesty, community-orientedness, interiority, humility, courage, and missionary spirit. These schools move beyond mere technical training by prioritizing the formation of both the mind and the heart, ensuring that students practice these core values alongside acquiring professional knowledge and skills. The experiences of deans from high-level accredited medical schools further illustrate that while accreditation is a tedious and costly quality assurance process, its standards-based approach ensures a school's fitness for purpose and responsiveness to stakeholder needs. For institutions achieving Level III and IV status, continual improvement is a shared responsibility characterized by a "Plan-Implement-Monitor-Improve" (PIMI) cyclical model. Crucially, the non-prescriptive nature of the PAASCU process allows schools to maintain their uniqueness and innovate within their specific institutional contexts.

The proposed quality assurance framework for a new ASOLC medical school provides a strategic roadmap for administrators to ensure program sustainability and excellence at par with established institutions. Theoretically anchored in Hatch and Schultz's Identity Dynamics, the framework recognizes organizational identity as a continuous interaction between internal culture and external image. Through the processes of mirroring, reflecting, expressing, and impressing, the study bridges the gap in quality assurance for new medical schools by aligning the Augustinian-Marian organizational culture with the external standards of PAASCU and CEAP. To deliver quality medical education, all stakeholders—from administration and personnel to students and graduates—must exhibit these core values in their policies, procedures, and core processes.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that Google Gemini, was used in refining the language used in the manuscript. The usage was limited to correcting grammatical and spelling errors and rephrasing statements for accuracy and clarity. The author further declares that, apart from Google Gemini, no other AI or AI-assisted technologies have been used to generate content in

writing the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

The Retention of Expatriate Teachers: Exploring Its Influence on Curriculum Design, Teaching Practices, and Student Learning Outcomes

Ryan Yee Wong, Tsinglan School, China

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study examined the influence of expatriate teacher retention on curriculum execution, pedagogical methods, and student academic performance in seven (7) international schools in Asia. This study used a mixed-methods approach, integrating survey data among one hundred fifty-seven (157) expat teachers, fifty-two (52) school administrators, and two hundred five (205) students. Additionally, comprehensive interviews with seven (7) expatriate teachers, four (4) school administrators, and six (6) students were conducted to investigate the impact of faculty stability on academic performance, classroom engagement, and overall student happiness. The findings indicate that high teacher retention improves instructional consistency, fortifies teacher-student connections, and fosters a supportive learning environment, whereas frequent turnover breaks continuity and diminishes student motivation. While the study contains useful information, its reach is limited by the small number of expatriate teacher participants and key persons interviewed, as well as the potential influence of socially desired responses. These aspects should be taken into account when extrapolating the findings to foreign school settings other than the Type C hybrid model in Asia. This research underscores the necessity for deliberate retention plans and professional development to maintain high educational quality in international school environments. The discussion also encompasses implications for school leadership and policy formulation.

Keywords: curriculum design, expatriate teachers, retention, student learning outcomes, teaching practices

iafor
The International Academic Forum
www.iafor.org

Introduction

The retention of expatriate teachers in international schools is a complex issue that has a substantial impact on the learning outcomes of students, instructional practices, and curriculum design. In order to preserve educational standards, it is imperative to comprehend the dynamics of expatriate teacher retention, as international institutions become more dependent on them to provide high-quality education. The development and implementation of curricula, pedagogical strategies, and ultimately, the academic performance and engagement of students are all influenced by the presence and retention of expatriate teachers, as examined in this dissertation.

Retention is closely correlated with their organizational embeddedness and cultural intelligence, which are essential components of their capacity to flourish in foreign educational environments. Ren et al. (2021) emphasized that the flourishing of expatriate teachers is directly influenced by cultural intelligence, which in turn results in their actual retention This discovery highlights the importance of equipping educators with the necessary cultural competencies to effectively navigate the complexities of international school environments. Yang et al. (2018) observed that the commitment of expatriate teachers to their duties is significantly influenced by the interplay of personal circumstances and workplace factors. This implies that to improve retention rates, educational institutions must establish supportive environments that foster personal and professional development.

Strategic interventions are necessary to enhance retention among expatriate teachers in international institutions, as they encounter obstacles such as culture shock and high turnover rates. Stasel (2023) emphasized that expatriate teachers frequently encounter culture shock, with turnover rates exceeding 60% in certain institutions. To alleviate these concerns, international school leaders must establish comprehensive support systems that cater to the professional and emotional requirements of their educators. Schools can enhance teacher retention and, as a result, improve student learning outcomes by cultivating a sense of community and belonging.

Nonetheless, despite the prospective advantages that expatriate educators offer to international schools, elevated turnover rates within this demographic pose considerable questions about the sustainability of these gains. High teacher turnover undermines the continuity of curriculum implementation, which is crucial for effective learning. Research indicates that teacher attrition, particularly in schools with a significant number of underperforming kids, can severely affect student success (Ronfeldt et al., 2013). Turnover-induced instability might impede the establishment of trustworthy connections between teachers and students, essential for cultivating a supportive learning environment. The absence of consistency in teaching methodologies may result in deficiencies in student learning since incoming educators can be unaware of the established procedures or the particular requirements of the student demographic (Ronfeldt et al., 2013).

To tackle the issues related to expatriate teacher retention, it is crucial to examine the elements that affect their choices to remain or depart. Research has identified various predictors of school commitment among expatriate teachers, including personal circumstances, working situations, and systemic educational characteristics (Yang et al., 2018). Cultural intelligence significantly influences the success and retention of expatriates, indicating that educators who are adept at managing cultural differences are more likely to sustain their roles (Ren et al., 2021).

Furthermore, *organizational embeddedness*, defined as the degree of employees' connection to their jobs, has been demonstrated to positively affect retention outcomes (Ren et al., 2021).

Hence, the retention of expatriate teachers in international schools is a multifaceted issue that is influenced by a variety of factors, such as organizational culture, curriculum coherence, and cultural intelligence. Teaching practices and student learning outcomes are affected significantly by the interaction of these elements. It is essential to comprehend the dynamics of expatriate teacher retention to maintain educational quality and cultivate positive student experiences as international schools continue to confront the obstacles of a globalized education landscape.

Methodology

This study employed a mixed-methods research design to examine the impact of expatriate teacher retention on student learning outcomes, teaching practices, and curriculum design. Structured survey questionnaires were utilized to collect quantitative data from administrators, teachers, and students. The general patterns of responses were described using descriptive statistics, such as mean and standard deviations. Inferential statistics, specifically one-way ANOVA, were used to investigate differences between groups based on variables such as the duration of teacher retention.

Concurrently, qualitative data were collected from open-ended responses and analyzed using thematic frameworks. Initially, the data was familiarized through repeated reading, and subsequently, initial codes were generated to capture significant patterns throughout the participants' narratives. This process was followed by thematic analysis. These codes were subsequently reviewed and categorized into broader categories, from which primary themes and sub-themes were inductively derived. The study ensured that statistical trends were enriched with contextual depth drawn from the participants' perceptions, while also providing a comprehensive understanding of how expatriate teacher retention influences key areas of international education by integrating the quantitative results with qualitative insights.

Specifically, quantitative data were gathered via surveys distributed to 157 expatriate educators, 52 school administrators, and 204 foreign pupils. To enhance and enrich the comprehension of patterns identified in the survey responses, qualitative data were collected via individual interviews with 11 participants, namely, seven expatriate teachers and four school administrators. A focus group discussion was held with six international students to gather their collective ideas and experiences regarding teacher retention and its perceived impact on learning.

Results and Discussion

The primary finding emphasized the “impact of expatriate teacher retention on curriculum development.” Two sub-themes arose within this theme: “teacher participation in curriculum development” and “curriculum improvement through retention.” Additionally, the challenges identified under “Theme 4: Challenges Posed by Teacher Turnover to Curriculum Stability” directly address “Question 1: How does the retention of expatriate teachers influence curriculum design and its implementation in international educational settings?” These challenges, particularly those found in “Sub-theme 4.1: Disruptions Caused by Teacher Turnover,” offer compelling evidence of the impact of teacher retention on curriculum outcomes. High turnover disrupts curriculum alignment because new teachers often lack

familiarity with established structures, leading to instructional instability, as noted by participants. Although fresh perspectives were occasionally appreciated, the primary concern was that turnover disrupts the consistency of the curriculum. In contrast, curriculum development and continuity were positively impacted by low attrition. Therefore, this theme transcends the mere identification of obstacles; it explicitly elucidates the impact of retention on the design and execution of curricula, thus illustrating the necessity of continuity in the teaching staff to preserve the stability of the curriculum in Type C international schools.

Quantitative findings indicated that teachers significantly acknowledged expatriate teacher participation in curriculum design, yielding a mean score of 4.15 (SD = 1.148), whilst administrators assessed the influence as modest, with a mean of 3.06 (SD = 0.85). Despite the one-way ANOVA results indicating no statistically significant differences among groups concerning years of teacher retention ($p > 0.05$), the consistently elevated means imply that long-term expatriate teachers substantially enhance curricular coherence, diversity, and innovation across various educational contexts.

The second significant result focused on the "effect of expatriate teacher retention on pedagogical practices." Sub-themes recognized in this domain encompass "pedagogical strategies," "innovative instructional methodologies," and "assessment protocols." Educators indicated that retention significantly impacts pedagogical practices (M = 3.6, SD = 1.012), emphasizing a transition towards more student-centered and dynamic teaching methodologies. Likewise, the implementation of innovative pedagogical methods, including project-based and inquiry-based learning, received a high rating (M = 3.66, SD = 0.789), indicating that educators with longer tenure in their institutions are more adept at enhancing and innovating their teaching practices. Assessment procedures were judged to improve due to teacher retention, as both teachers and administrators noted that retained expatriate teachers employ a broader range of effective and adaptive evaluation approaches. No significant differences were detected in the ANOVA tests among groups ($p > 0.05$), reinforcing the notion that retention uniformly improves teaching quality, irrespective of tenure duration.

The third significant finding is on the "impact of expatriate teacher retention on student learning outcomes," which includes the sub-themes of "academic achievement," "student engagement," and "student satisfaction." Educators assessed the influence of retention on academic performance to a significant degree, with a mean of 4.18 (SD = 0.687), which was closely reflected in student evaluations (M = 3.67, SD = 0.922) and administrative evaluations (M = 3.88, SD = 0.808). Teachers observed that student involvement was significantly influenced (M = 4.5, SD = 1.004), suggesting that consistent, experienced educators are essential in promoting student enthusiasm and active participation. Students and administrators likewise believe that involvement was significantly influenced, albeit to a lesser degree than teachers' assessments. The findings indicated uniformly excellent scores for student satisfaction across all groups. Despite the one-way ANOVA results indicating no statistically significant differences ($p > 0.05$), the marginal p-value for student engagement among teachers ($p = 0.058$) implies a potential trend, suggesting that perceptions of engagement may vary slightly based on teacher retention, warranting further investigation in future research.

The results collectively underscore that the retention of expatriate teachers substantially improves curriculum design, elevates teaching techniques, and positively impacts student academic and emotional outcomes. The uniformity of replies among stakeholder groups highlights the importance of maintaining expatriate teachers in international schools. It is essential to acknowledge that contextual variables, such as curriculum style, cultural setting,

and student body mix, undoubtedly influence these correlations. The aforementioned characteristics, together with the study's restriction of omitting local educators from the sample, indicate significant avenues for future research to comprehensively grasp the intricate dynamics of teacher retention in varied educational contexts.

The analysis of the quantitative and qualitative data indicates that the retention of expatriate teachers significantly enhances the academic and operational quality of international schools. The research validated that long-term expatriate educators significantly enhance curriculum creation, pedagogical innovation, and sustain elevated levels of student achievement, engagement, and satisfaction. The impacts were consistently detected among several responder groups: teachers, administrators, and students, and were evident in the robust mean scores given throughout the study.

The study indicated that expatriate professors who stay at an institution for prolonged durations contribute stability, coherence, and innovation to curriculum design and execution. Their continuous presence facilitates a comprehensive grasp of institutional objectives, educational frameworks, and student requirements, hence enhancing curriculum efficacy. While administrators assessed the influence somewhat lower than teachers, the alignment of attitudes highlights the importance of retaining expatriate teachers in enhancing curriculum achievements.

Summary

The findings revealed that expatriate teachers with prolonged retention are more inclined to utilize varied and student-centered teaching methodologies. Their understanding of institutional culture and instructional frameworks enhances innovation in the classroom, encompassing project-based learning, differentiated instruction, and diverse assessment approaches. The absence of statistically significant differences among groups in the ANOVA analysis indicates that these opinions are broadly held, supporting the conclusion that continuous teacher presence enhances instructional quality irrespective of years of employment.

The study confirms the beneficial effects of expatriate teacher retention on curriculum design, teaching methods, and student results, while also acknowledging its limits. The sample notably excluded local teachers, hence limiting the generalizability of the findings to the wider educational community. Future research should integrate the viewpoints of local educators to enhance the knowledge of retention dynamics. Moreover, subsequent research should investigate how factors such as curriculum type (e.g., IB, AP, bilingual programs), cultural setting, and student demographics influence the relationship between teacher retention and educational outcomes. Notwithstanding these constraints, the findings of this study provide significant insights for educational leaders aiming to improve the quality and stability of their institutions via deliberate expatriate teacher retention initiatives.

Recommendations

This study presents various recommendations aimed at improving expatriate teacher retention and optimizing its beneficial impact on curriculum design, instructional methods, and student learning results in international educational contexts.

School leaders and administrators are urged to formulate and execute comprehensive retention strategies specifically targeting expatriate teachers. These tactics may encompass competitive remuneration packages, explicit professional advancement trajectories, and robust institutional support structures that cultivate a sense of belonging and enduring commitment. Given that retained expatriate educators significantly enhance curricular stability and innovation, schools ought to pursue efforts that incentivize teachers to extend their tenure beyond short-term contracts. Integrating expatriate teachers into the school culture via mentorship programs, leadership training, and joint curriculum creation projects is likely to enhance individual teacher satisfaction and institutional success.

Secondly, specialized professional development should be provided for both novice and veteran expatriate educators. The data indicate that extended retention is associated with enhanced innovative teaching practices and improved student outcomes, so it is crucial to provide support to teachers throughout their tenure. Structured orientation programs and continuous coaching are crucial for newly hired expatriate teachers to expedite their adjustment and integration into the school's pedagogical philosophy. Experienced expatriate educators can maintain their engagement and motivation over time through advanced professional development options that emphasize leadership abilities, curriculum innovation, and cross-cultural competencies.

Third, foreign schools must meticulously consider the influence of teacher retention on student engagement and satisfaction. The findings indicate that a consistent teaching staff significantly enhances students' academic performance and emotional engagement in their learning experiences. Schools are consequently urged to constantly observe teacher turnover and evaluate its impact on student welfare and academic achievement. Establishing feedback systems that gather student insights on instructional continuity and assistance could assist administrators in making educated judgments on staffing and retention strategies.

Fourth, although this study concentrated solely on expatriate teachers, subsequent research should include the experiences and perspectives of local teachers to offer a more thorough knowledge of teacher retention dynamics. Incorporating local educators would provide a more comprehensive comparison of diverse staff profiles and assist in determining if the advantages noted in expatriate teacher retention are similarly applicable to local personnel or if distinct techniques are required for other groups. Furthermore, subsequent studies ought to examine how contextual variables, like curriculum type (IB, AP, bilingual programs), cultural influences, and student demographics, affect the association between teacher retention and educational outcomes.

Educational policymakers and accrediting organizations overseeing international schools are urged to acknowledge teacher retention as a vital measure of institutional quality. Policies that endorse extended contracts, facilitate professional mobility within educational networks, and encourage cultural integration activities can enhance retention rates and, subsequently, improve educational outcomes for students. Additionally, future research may focus on the precise reasons why expatriate teachers opt to stay or leave foreign schools. Understanding these motivations, whether personal, professional, contractual, or cultural, may provide more insight into the elements that influence teacher retention. Furthermore, a comparison examination of local and expatriate instructors could offer helpful details about who has a higher retention rate and why. Such research may uncover disparities in dedication, institutional support, or integration of issues that affect the length of their teaching tenure. These findings could help create more targeted retention strategies for each group.

Hence, the retention of expatriate teachers should be regarded not merely as a human resources issue but as a strategic imperative that significantly influences curriculum quality, pedagogical innovation, and student achievement. Implementing these ideas may enable international schools to establish more stable, dynamic, and effective learning environments that benefit all constituents of the school community.

Conclusion

The study concludes that the retention of expatriate teachers substantially enhances student learning results across various dimensions. Teachers, students, and administrators acknowledged that academic performance, engagement, and general satisfaction are enhanced when educators remain in the school community for extended periods. In the realm of student involvement, the elevated mean scores across educators indicate that the relational and motivating dimensions of learning are significantly affected by teacher continuity. Despite the absence of significant differences in the ANOVA results, the nearly significant finding concerning student engagement indicates that this aspect may be further affected by the duration of teacher retention.

Acknowledgements

First, I wish to express my profound appreciation to you, my adviser, whose assistance, patience, and insightful feedback were indispensable throughout this study. Your expertise, guidance, and encouragement helped shape this research and deepened my understanding. I also want to extend my gratitude to you, the school administrators, educators, and students, who generously contributed your time, insights, experiences, and perspectives, making this research possible.

A special thanks goes to you, the expatriate educators, who have committed your time, energy, and passion to shaping young minds beyond borders. Your dedication to teaching in unfamiliar settings, your resilience amidst change, and your unwavering belief in the transformative power of education have been a source of inspiration for this research. And to you, the students whose lives have been touched by these educators, may your journeys be enriched by the continued support and presence of those who guide you.

Abstract

As the global population ages, including in the Philippines, the roles of psychology, social work, and health sciences professionals become increasingly crucial. Their work is integral in promoting the well-being of the elderly. This study examines how elderly Filipinos perceive life fulfillment, focusing on the role of positive emotions, social engagement, and a sense of purpose. Using a qualitative phenomenological approach, in-depth interviews were conducted with 15 elderly individuals from Central Luzon. The results revealed that family support, spirituality, and community involvement are central to their sense of fulfillment, presenting opportunities for enhancing their well-being. Conversely, social isolation and financial insecurity, while challenges, can be addressed through targeted interventions. The study underscores the transformative potential of integrating gerontological content into educational programs in psychology, social work, health sciences, and education. This integration can equip future professionals with the empathy, cultural awareness, and skills necessary to address the emotional, cognitive, and social needs of aging populations, inspiring them to make a significant difference in the lives of the elderly. Ultimately, the study supports the development of community-based interventions and learning materials, such as the educational guide "Embracing Aging," which draws directly from elderly narratives and promotes positive aging by providing practical advice, psychological insights, and cultural perspectives. These initiatives can contribute to the development of more age-inclusive, compassionate, and culturally grounded professional practices.

Introduction

As the world ages at a rapid pace, many countries, including the Philippines, face the challenging task of providing a meaningful life for their elderly citizens. The government already has over 7.5 million older adults and is experiencing a rapid increase in the older age group, where it is projected that older people will make up a sizable percentage of the population by 2030. This demographic shift highlights a pressing need to examine the physical, emotional, and social aspects of life satisfaction among the elderly population, whose well-being not only affects the individual but also contributes to broader societal development. As the elderly population is rapidly growing, their experience in old age becomes increasingly dependent on healthcare, economic security, family support, and opportunities for social interaction (Cruz et al., 2022).

The elderly in the Philippines live in a socio-cultural environment that reflects traditional family roles, but is also influenced by modern economic realities. That special setting allows for a traditional yet family-centered culture that guarantees emotional and economic support, yet simultaneously presents challenges such as declining health, loneliness, and economic uncertainty. Current trends in aging in the Philippines highlight the crucial role that health and social services must play in promoting the well-being of older adults. While considerable effort is being invested in government social welfare programs, including the National Health Insurance Program, these often prove to be only partially effective and insufficient to meet all the requirements of the elderly. The rise of social isolation and mental health problems, such as depression, is experienced among elderly Filipinos, specifically those residing alone, without adequate support from their family. Programs that promote community engagement and increase contact with others are presented by Cruz et al. (2022) as ways to enhance psychological well-being in old age, particularly during times when traditional family support structures break down due to migration and urbanization.

In an aging society, there is a need for academics, policymakers, social workers, mental health advocates and professionals to understand the perspectives of the elderly. Such an understanding could be established by developing comprehensive strategies that are responsive not only to the physical needs of the elderly but also to their mental and social needs. The results of the study would constitute significant contributions to the academic and mental health program discourse regarding aging, aiming to make the aging of the Filipino elderly an honored and fulfilling part of life.

The study supports the integration of gerontological insights into academic programs—particularly in psychology, education, social work, and health sciences—so that future professionals are better equipped with the cultural competence, empathy, and applied knowledge to serve aging populations. One such output is the educational guide “Embracing Aging Through Lived Experience,” a tool that translates qualitative data into practical, culturally responsive intervention strategies.

Review of Related Literature

Pursuing life fulfillment among older adults is a complex and multidimensional issue driven by psychological, social, health, and economic factors. In a world where older adults are increasingly found in all countries, including the Philippines, such dynamics will need to be studied with the hope of improving the quality of life for older adults. This review examines four key themes: psychological well-being, social support, health, and economic security.

Physical Health and Psychological Well-being

Psychological well-being is a factor that influences how older adults perceive their life fulfillment. It encompasses aspects of emotional regulation, life satisfaction, and resilience. Indeed, scientific research demonstrates that engaging in meaningful activities is necessary to enhance psychological well-being and, consequently, overall life fulfillment. According to Chen et al. (2022), participation in hobbies, volunteer activities, and community work is more positively associated with psychological well-being and less likely to lead to life dissatisfaction. Those who are elderly and whose daily lives carry a sense of meaning tend to be happier and are more satisfied with their lives.

Lifestyle and environmental conditions do play a significant role in psychological well-being. The elderly derive happiness from religion and community activities because such activities enhance their social relations and sense of belonging. As Cruz et al. (2022) postulated, older Filipinos typically participate in religious and community activities that enhance their social network, thereby facilitating the repair process of their emotional support systems. Such cultural attachment assumes a psychological appreciation of the act, as it helps the elderly enhance their quality of life in old age by supporting groups.

Conversely, living alone and experiencing poor health, limitations in daily activities, and symptoms of depression are associated with lower levels of life satisfaction according to Kandapan (2023) as cited by Cho et al. (2023), several studies have found that the decline in physical health capabilities is associated with a decrease in life satisfaction as one ages. Besides the physical and relational factors, psychological factors such as personal resilience add value to the experience of life fulfillment. According to Tricǎ et al. (2024), while old age presents numerous challenges, resilience enables the elderly to adapt relatively more easily to change, which can be interpreted as an accumulative positive attitude towards the physical, mental, and social changes that characterize old age. Understanding these psychological dimensions will be beneficial in developing interventions to enhance the well-being of the elderly within the distinct cultural context of the Philippines.

Social Support and Family Dynamics

Social support is essential for developing life satisfaction among older adults, particularly within their familial and community environments. In most developing countries, such as the Philippines, the traditional family structure remains the primary support system for many families. Noquiao (2021) discovered that among the older aged population, strong familial bonds are related to higher life satisfaction. This is more explicitly manifested when families reside under the same roof in a multi-generational family setup. These relationships are deeply emotional and provide a sense of meaning and belonging, while offering a practical form of support.

However, changing family dynamics, exacerbated by urban migration and economic challenges, can threaten traditional support structures. Community involvement serves as a substitution for bond disruption in the family circle. Involvement in community or neighborhood activities enables older persons to form new friendships and social relationships, which are significant for their mental health (Cruz et al., 2022). Programs concerning social interaction maintenance will be a life-fulfilling activity because they offer new possibilities for friendship and companionship. No doubt, social networks are highly significant because they

act as a buffer against loneliness and serve as a source of shared experiences and mutual support among peers.

Economic Security and Financial Well-being

The other aspect is economic security, as it plays a vital role in defining older adults' life satisfaction. It further empowers the elderly to remain independent and capable of accessing medical services, as well as engaging in leisure activities. Filipino elders have faced significant financial challenges due to inadequate pensions, low incomes, and insufficient savings.

The results of a study by Li et al. as cited by the study of Papi et al. (2021) showed that life satisfaction in older adults is associated with the level of education, financial resources, self-assessment of health, receiving financial support from the children and satisfying their support, staying at home, seeing and visiting neighbors, and inviting them to dinner. Moreover, Cruz et al. (2022) note that there is a direct and straightforward link between economic difficulties and lower life satisfaction among older adults. Economic constraints often characterize their inability to fulfill some of the most basic needs and participate in social activities, which, in turn, boost feelings of inadequacy as well as isolation. Two of the more universal predictors of loneliness that recent systematic reviews have highlighted include poor health and financial insecurity, with most of these focusing on populations from high-income countries (Dahlberg et al., 2022).

Financial security, as studied by Lutz et al. (2021), enables the elderly to engage in activities of interest and maintain their capacity for independence, providing evidence that economic assets contribute to overall well-being. In addition, Bierman et al. (2023) stated that financial stress can have devastating negative consequences not just on the symptoms of depression but much more significantly down the line for anxiety and anger. This occurs mainly because the problems in affording everyday needs rob the elderly of a sense of mastery and self-esteem. However, they also feel less socially significant as their financial problems worsen. This threat that an increasing level of financial strain in later life poses is therefore not only to heighten individual distress, but also, particularly with this creating a population of older adults who are even more powerless and marginalized, it is deeply worrying since the proportion of elderly around the world is growing fast.

This psychological burden highlights the importance of addressing economic issues through integrated psychological mechanisms and financial education. Endowing them with these financial management tools would certainly increase autonomy and satisfaction in their later years. Economic security, generally speaking, apart from improving access to health services and social interaction, contributes to the independence and dignity that old age can enjoy.

The Role of Religion and Spirituality in Aging

Lima et al. (2020) mentioned that various studies and research have been conducted to understand the relationship between spirituality and quality of life among the mentally ill elderly. Though the outcomes of the relationship cannot be universalized for all social groups of older people, there is some scientific proof that the same relationships improve the quality of life, enhance social exchange and social life, provide meaning to life, help face the finitude of life, and promote an optimistic outlook on aging. Moreover, based on the study by McManus (2024), studies consistently demonstrate a positive correlation between spirituality, religiosity, and mental health, supporting improvements in life quality, social interactions, and positive

attitudes towards aging. The belief in the transcendent or divine emerges as a significant dimension contributing to the meaning of life, resilience, and health promotion among older adults.

Research indicates that religion and spirituality play a significant role in supporting older adults, thereby making the aging process more manageable. Malone (2018) stipulated that such factors provide comfort and strength to the elderly as they navigate the challenges of aging. Lima et al. (2020) state that the belief in the transcendent or the divine represents an important dimension in the quality of life of older people, contributing to the meaning of life, resilience in the face of difficulties, and acting positively as a factor in health promotion. Furthermore, it highlighted that spirituality is crucial for coping with chronic diseases and for improving the quality of life for older adults. This study further postulated that it is only through spirituality wherein people find meaning beyond their challenges. Moreover, it plays a vital role in facilitating social interaction, which is essential for maintaining mental well-being.

In the Philippines, where Catholicism is dominant, the elderly exhibit strong religious affiliations. This cultural context shapes their coping resources and general life satisfaction. According to qualitative research by Pausanos (2013) on spirituality among elderly Filipinos, religious practices provide a framework for understanding life challenges, thereby enhancing their level of life fulfillment.

A notable study conducted by Basileyo (2019) found that spirituality and resilience significantly contribute to life satisfaction among older adults, especially those with chronic illnesses. The study highlights that spirituality acts as a mediating factor in reducing anxiety and enhancing overall well-being in aging populations, including the Filipino elderly.

Moreover, empirical evidence has supported the connection between religiosity and mental health. For instance, a research investigation by Coelho-Júnior et al. (2022) reveals that higher religious activity is correlated with reduced depressive and anxiety conditions among elderly populations. This is particularly relevant for the Filipino communities in which collective worship and community support are integral parts of everyday life.

Synthesis of Literature Review

Literature reviews on the well-being of the elderly suggest that several factors influence life satisfaction. These encompass physical health, social support, economic security, and spirituality. Of these, the psychological factor seems to be highly predictive of life fulfillment among the elderly. Numerous studies have demonstrated that engaging in meaningful activities, such as hobbies and community involvement, can enhance emotional control and resilience (Chen et al., 2022). Higher life satisfaction is associated with positive engagement in these activities, and poor physical health and social isolation negatively affect psychological well-being (Cho et al., 2023; Kandapan, 2023). In terms of social support, the traditional family structure prevalent in the Philippines is crucial for the satisfaction of elderly life (Noquiao, 2021). Rising trends in urban migration and changes in family dynamics are disrupting traditional support systems, ultimately leaving many older people isolated. Community involvement has become a critical alternative source of support for individuals experiencing loneliness, fostering new social relationships that lead to a reduction in loneliness (Cruz et al., 2022).

Economic security is yet another predictor of how well one will fare in old age. Financial security enables the elderly to be more independent in meeting their health needs and engaging in social activities, all of which contribute to a person's overall life satisfaction (Cruz et al., 2022; Papi et al., 2021). On the other hand, the lack of economic security raises perceived inadequacy and social withdrawal with relative risk to mental health problems in terms of anxiety and depression Bierman et al., 2023. Financial education and support are recommended interventions in reducing such tensions, thereby enhancing the maintenance of autonomy and dignity through older age. Finally, religion and spirituality are part of the coping mechanisms for most elderly, especially in the Filipino culture. Religious practice provides them with meaning, emotional resilience, and social support, thereby improving their mental health and overall life fulfillment (McManus 2024). Spirituality will not only help an older adult cope with and withstand the physical and emotional battles but also enable them to feel a sense of belonging with others, which is important for their well-being (Malone, 2018).

To summarize, the integration of psychological, social, economic, and spiritual factors may foster the well-being and life satisfaction of the aged. The studies presented herein serve as a springboard for developing culturally salient intervention strategies for elderly individuals in the Philippines.

Purpose of the Study

This study explores the lived experiences of elderly Filipinos to identify the key determinants of a well-lived life in later adulthood. In the context of the Philippines' ongoing demographic shift toward an aging population, it becomes increasingly important to understand how older adults define fulfillment through emotional resilience, meaningful relationships, spiritual grounding, and community involvement. Rather than focusing solely on physical health, this research emphasizes the psychological, social, and cultural factors that influence the well-being of the elderly.

Ultimately, the study contributes to the national and academic discourse on aging by providing nuanced insights into how elderly individuals construct meaning and purpose in their lives. It advocates for a holistic, culturally responsive approach to elder care—one that honors their narratives and leverages them as foundations for community-based and educational interventions. The findings inform not only policy and practice but also the development of learning materials and psychosocial programs that empower both older adults and the professionals who serve them. Through this lens, aging is not merely a period of decline but a continued journey of reflection, growth, and active participation in society.

Research Objective

Central Question: What are the perspectives of elderly Filipinos on the factors contributing to a well-lived life, and how do these perspectives influence their overall sense of life fulfillment?

Research Questions:

1. What characteristics do elderly Filipinos associate with a well-lived life?
2. What factors do elderly Filipinos perceive as obstacles to achieving a well-lived life?
3. How do elderly Filipinos evaluate their own lives about the concept of a well-lived life?
4. At what point do elderly Filipinos feel they have attained a well-lived life, and how do they describe that experience?

Methodology of the Study

The methodology employed in this study used a qualitative phenomenological approach to explore the perspectives of elderly Filipinos regarding life fulfillment. This design was chosen to capture the in-depth, lived experiences of the participants, focusing on their subjective perceptions of what constitutes a well-lived life. The study aimed to identify key themes related to life fulfillment by analyzing the narratives of the elderly within their socio-cultural and economic contexts.

Research Design

This study employed a qualitative phenomenological research design to elicit the views of elderly Filipinos regarding the factors that contribute to a well-lived life and, most importantly, how these viewpoints influence their overall sense of life fulfillment. This study employs qualitative research, which is well-suited for exploring the in-depth lived experiences and subjective perceptions of the elderly regarding their understanding and interpretation of fulfillment. Moreover, this research design considers the meanings that key informants attribute to their experiences, with the expectation of uncovering complexities surrounding aging, well-being, and fulfillment in the Filipino context (Neubauer et al., 2019).

Key Informants of the Study

The key informants for this study comprise 15 elderly Filipinos, aged 65 to 92 years, from Central Luzon. This age range covers the “young old,” “old old,” and “oldest old” groups. Participants were selected through purposive sampling to capture a broad cross-section of experiences and opinions. The inclusion criteria required respondents to be Filipino, residing in Central Luzon, and aged 65 and above. Additionally, participants must not have demonstrated significant cognitive decline, which would mean they can engage in a coherent conversation, allowing them to demonstrate informed consent. Such a criterion will ensure that participants can adequately express their views on the concept of a well-lived life. Individuals with cognitive impairments such as dementia or Alzheimer's disease, or those experiencing severe physical or mental health crises, were excluded. Additionally, participants who were unable to communicate effectively in Filipino or English were also excluded, as effective communication is essential for capturing the depth and richness of the collected data.

Instrument of the Study

The primary tool for gathering information was a semi-structured interview guide, which explored the viewpoints of elderly Filipinos regarding the factors that constitute a well-lived life and how these factors affect their overall life fulfillment. This format allows for flexible yet focused interviewing, enabling participants to produce their thoughts and feelings in their own words. The interview guide includes open-ended questions and prompts based on the central research question, as well as probing questions developed during the study's conceptualization phase. These questions allowed participants to reflect on their life experiences and share insights about their definitions of a well-lived life, the barriers to achieving it, and their thoughts on the social, economic, and emotional factors that influence overall life satisfaction.

Data Collection

Semi-structured interviews were conducted. This approach enabled participants to converse spontaneously while still allowing the researcher to use the predetermined questions to maintain structure. The interview began with rapport-building questions followed by questions centered around the general notions the participants have regarding a well-lived life. Debriefing questions were also provided to provide closure and clarify any points that needed further clarification. Interviews were conducted in either Filipino or English, based on the participants' preference. For those who consented, the interviews were audio-recorded to ensure accurate transcription for analysis.

Data Analysis

Thematic analysis of transcriptions, employing a qualitative methodology, was conducted. The researchers then compressed the data into manageable units and systematically categorized them into sub-themes and themes, uncovering the elderly's perceptions of a well-lived life. It was an iterative process during which data familiarization was used to generate initial codes, identify sub-themes, and finalize and review themes, including validation of the findings through member checking and triangulation. This rigorous analytical approach has helped clarify the diverse perceptions that elderly individuals have about a well-lived life, contributing to a deeper understanding of their experiences and, thus, informing the development of interventions tailored to their needs.

By maintaining rigor and transparency, the researchers ensured that their interpretations were credible and dependable, making the study findings trustworthy. The analysis process demonstrates how successful qualitative methodology can be in uncovering rich insights into complex phenomena and generating knowledge that informs both theory and practice in older adults' perception of life fulfillment.

Ethical Consideration

Conducting research with human participants, especially those from vulnerable populations such as the elderly, raises important ethical considerations. Given that this study aims to understand life satisfaction among the elderly Filipino population, it was guided by several ethical requirements that ensure the welfare and rights of research participants are safeguarded throughout all phases of the study. Informed consent was obtained in writing, as participants received an open and comprehensive explanation of the research purpose, procedures, risks, and all the benefits before participating in this study. This procedure was conducted in a manner that respects the participants' literacy levels and cognitive skills, allowing them to make well-informed decisions about their involvement.

Personal data collected was treated confidentially. Anonymous information was ensured to be untraceable in the transcripts and reports by using pseudonyms. All written documentation and electronic and hardcopy data collected were kept safe and accessed only by authorized researchers. The creation of a safe and respectful environment in which all sensitive topics can be discussed has been carefully considered by the researchers, as some of these topics are likely to be sensitive and evoke strong emotions. Participants were encouraged to respond in full but were also informed that they could choose not to answer some questions that might cause them concern. Appropriate measures, such as debriefing, will be provided in case participants experience distress that may occur during or after the interviews. The researchers demonstrated

sensitivity to the specific vulnerabilities of the elderly, especially those who are socially isolated or have health issues, ensuring that participants felt valued and heard throughout the study. In particular, an effort was made to determine whether the participants were under undue influence or coercion when they joined the study.

Results and Discussion

Characteristics Elderly Filipinos Associate With a Well-Lived Life

Elderly Filipinos associate a well-lived life with three interconnected elements: faith in God, perseverance through life's challenges, and the success of their family, particularly their children. Faith serves as their spiritual foundation, providing guidance, strength, and meaning in old age. Perseverance reflects their resilience and hard work, often motivated by their responsibility to support and secure a better future for their families. Ultimately, the success and unity of their children validate their sacrifices, giving them a sense of fulfillment and legacy. These spiritual and familial values work together to shape their understanding of a meaningful and well-lived life.

Perceived Obstacles to a Well-Lived Life Among Elderly Filipinos

Elderly Filipinos identified several obstacles to living a well-lived life, including neglect of spirituality, lack of self-discipline, unhealthy habits, and financial difficulties. The absence of faith was seen as leading to poor decision-making, loss of motivation, and vulnerability to vices. These issues often result in financial instability and family neglect, which further diminish life satisfaction. Over time, these interconnected challenges create a cycle of regret, stress, and reduced fulfillment, especially as individuals reflect on their later years.

How Elderly Filipinos Evaluate Their Lives As Well-Lived

Elderly Filipinos evaluate their lives based on three key aspects: personal contentment through faith, family success, and reflection on sacrifice and hard work. Faith allows them to look back on life with gratitude and peace, regardless of material circumstances. The success and stability of their children serve as a major source of fulfillment and validation of their lifelong efforts. Reflecting on their sacrifices and perseverance enables them to find meaning in past hardships and affirm that their lives have been worthwhile.

Defining the Moment a Well-Lived Life Is Attained

Elderly Filipinos believe they have attained a well-lived life when they experience peace, fulfillment, and stability in spirituality, family, and personal contentment. A strong relationship with God provides moral guidance and inner peace, while witnessing the success of their children and grandchildren confirms the value of their sacrifices. Achieving emotional, relational, and financial stability allows them to feel secure and content, marking the point at which they consider their life truly well-lived.

Conclusion

The present study examined how elderly Filipinos define a well-lived life and the factors that shape their sense of fulfillment. Findings indicate that a well-lived life is viewed as an integration of spirituality, family success, perseverance, and personal contentment. These

elements are deeply interconnected and reflect cultural values and personal beliefs formed across the life course.

Spirituality as a Foundation of Fulfillment

Participants consistently identified spirituality and their relationship with God as central to life fulfillment, serving as a source of meaning, moral guidance, and resilience. This highlights the value of purpose-oriented interventions that encourage spiritual reflection, such as community-based reflection activities, gratitude practices, and legacy-sharing programs aligned with the PERMA domains of Meaning and Positive Emotion.

Family Legacy and Intergenerational Bonds

Life satisfaction was closely tied to the success and well-being of children and grandchildren, with fulfillment understood as a shared, family-centered experience. Interventions that promote family legacy—such as storytelling, intergenerational projects, and reflective writing—can strengthen relationships and support the PERMA domains of Relationships and Accomplishment.

Perseverance and Life Meaning

Resilience and perseverance in the face of hardship emerged as core to elders' sense of identity and fulfillment. These experiences suggest that meaning is often derived from sustained effort and responsibility despite adversity.

Addressing Barriers Through Community Support

Participants identified obstacles such as spiritual neglect, poor financial habits, diminished motivation, and family disconnection. These findings point to the importance of preventative education and community-based support systems to strengthen purpose, discipline, and social connectedness in later life.

Recommendations

Based on the findings, several recommendations are proposed to enhance the well-being and life satisfaction of elderly Filipinos. These focus on strengthening community involvement and identifying directions for future research to better address factors influencing life fulfillment in later life.

Community Involvement

Communities may prioritize the development of spiritual support networks, as spirituality plays a central role in how elderly Filipinos define a well-lived life. Faith-based activities such as collective worship, spiritual support groups, and reflective gatherings can provide meaning, guidance, and emotional support. Strengthening family engagement through intergenerational activities and family-centered workshops is also recommended, as life satisfaction among the elderly is closely tied to family harmony and the success of younger generations.

Addressing financial insecurity is equally important. Educational institutions, local government units, and non-government organizations may collaborate to offer

intergenerational financial literacy programs tailored to older adults. These may include workshops on budgeting, retirement planning, pension access, government benefits, and healthcare expense management. Such initiatives empower elderly individuals with practical skills, promote autonomy, and reduce a major barrier to life fulfillment.

Promoting social participation through senior citizen clubs, hobby-based groups, and community events can further enhance emotional well-being by strengthening social support networks and fostering a sense of belonging.

Directions for Future Study

Future research may examine how spirituality interacts with socioeconomic status in shaping life satisfaction among elderly Filipinos. Longitudinal studies exploring the impact of financial stability on emotional well-being may also provide deeper insight into life satisfaction across time. Investigating gender differences in perceptions of a well-lived life could further clarify how family roles and responsibilities influence fulfillment. Cross-cultural studies may help identify both universal and culturally specific determinants of well-being in old age. Additionally, research on the role of digital platforms and social media in fostering connectedness, spirituality, and family involvement among the elderly is recommended, given the growing influence of technology on social relationships.

A Video Game Telemetry Project: Modeling Data Science and Machine Learning in Educational Research

PG Schrader, University of Nevada, Las Vegas, United States
Mark Carroll, University of Nevada, Las Vegas, United States

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This paper models a process for exploring questions situated in digital video games and broader educational contexts. Findings from an ongoing study are used to outline a process to extract data from the encapsulating social media ecosystem using applied data science, artificial intelligence (AI), and machine learning (ML) techniques. Previous efforts involving Delphi techniques to examine player behavior and social discourse across online game environments (Schrader et al., 2020) tend to be cumbersome and laborious. Alternatively, educational data science techniques, in conjunction with AI and ML, provide mechanisms to triangulate data from three distinct sources: player discussions about performance on social media, game telemetry data, and game outcomes. In this study, researchers applied supervised and unsupervised machine learning approaches alongside statistical and learning analytics methods to extract and analyze behavioral patterns to evaluate if players' social media assertions about success aligned with the actions they take (Baker & Siemens, 2014; Siemens, 2013). Findings reveal that players' claims often reflect personal anecdote rather than observable behaviors that are linked to success. This work carefully outlines the integrated process (e.g., ML with public APIs) as a model for educational researchers to engage in similar studies. We advocate for broader utilization of data science, AI, and machine learning in research contexts that represent large, complex, but publicly available datasets (e.g., telemetric user data). This session serves as an entry point for researchers who are new to AL and ML, especially those investigating learning in contexts with high-volume data streams.

Introduction

Researchers have used many and varied arguments to assert that the study of video games is a relevant, important, and useful area of inquiry, especially in the context of education and educational psychology. These arguments range from the extraordinary popularity of games and games' pervasive reach across age bands and cultures across the world. The tremendous annual global revenue of approximately $455 billion (Clement, 2024) and the massive scope of many titles that have millions of players worldwide (e.g., World of Warcraft) (Active Player, 2025) undergird these respective arguments.

When considered as a partner in cognition or context for learning, as opposed to a programming or design content, researchers also assert that the educative value of games involves them as informal learning contexts and situated environments (Barab et al., 2005; Squire, 2006), simulacra or digital petri dishes (Kafai, 1996; Schrader et al., 2016), or even tools for assessment of learning (i.e., stealth assessments, McCreery et al., 2019). The examination of games has deepened our collective understanding across a variety of topics, such as literacy (Gee, 2003), cognition and cognitive skills (Bediou et al., 2018), spatial reasoning, problem-solving, decision-making, personality, motivation, goal orientation, self-directed learning (Connolly et al., 2012), and social and collaborative learning.

Further, video games and the social platforms that encapsulate them represent a growing class of non-traditional online learning environments (OLEs) (Barab, 2014; Schrader et al., 2017; Steinkuehler & Squire, 2017). These environments are data rich, globally distributed, and characterized by continuous interaction, rapid feedback, and emergent patterns of behavior (Schrader et al., 2020; Schrader & McCreery, 2012). Unlike classrooms, learning management systems, or even massive open online courses, games generate intensive, time-stamped behavioral data as a byproduct of participation. At the same time, they are supported by expansive social ecosystems, including discussion forums, social media, and streaming platforms. As such, these tools serve as a third space, where players exchange views about their activities, discuss performance, and articulate the needs for success. Collectively, these systems present both an opportunity and a challenge for educational researchers. There are abundant learning data, but their extraction requires novel, and often complicated, methods to capture the complexity of these environments.

Despite sustained interest in games as learning contexts, much of the existing research relies on methods that are not necessarily aligned with the properties of contemporary OLEs or poised to take full advantage of their technological capabilities (McCreery et al., 2011; Schrader et al., 2017). Surveys, interviews, and expert-driven techniques such as Delphi studies have proven useful for identifying constructs, perceptions, and socially validated hypotheses, but they are labor intensive, slow to iterate, and heavily reliant on self-report. More importantly, these approaches often elevate belief about play, rather than objective data related to learning and performance within the system itself. As a result, there remains a gap in the field's understanding about concrete, observable behaviors in these systems and what players believe about performance.

Fortunately, recent advances in educational data science, learning analytics, and applied machine learning offer additional tools for researchers who are addressing questions of this ilk (Baker & Siemens, 2014; Romero & Ventura, 2020; Siemens, 2013). Public application programming interfaces (APIs) in harmony with contemporary modeling techniques make it possible to collect, process, and analyze large volumes of behavioral and social data from

online platforms. However, many educational researchers lack concrete skills, methods, and models for how these tools can be integrated into praxis. Further, examples are commonly drawn from fields outside of educational research and emphasize technical novelty or isolated analytic techniques.

As a result, this study demonstrates how applied data science, artificial intelligence, and machine learning techniques can be integrated with learning analytics and educational research practices to examine learning and behaviors in a complex online environment. Specifically, the paper illustrates a replicable workflow that triangulates (a) game telemetry data, (b) social discourse from online communities, and (c) game outcomes to examine the relationship between players' claims about success and the behaviors that predict it. Rather than advancing a new theory of learning or asserting causal claims about games, this work is intended to serve as a model. In this way, it is methodological in nature and offers as a practical, worked example for researchers seeking to study learning and performance in data-intensive, non-traditional OLEs. Ultimately, this work describes the end-to-end process, which connects data acquisition, modeling, and interpretation in the context of education and educational psychology.

Literature Review

The work presented here is expanded from previous work in novel contexts. Further, it is grounded in three complementary and related perspectives: complex systems, educational data science and learning analytics, and prior mixed-methods research in online game environments.

Prior Mixed-Methods and Delphi-Based Work

The present study builds directly on prior mixed-methods research that used Delphi techniques, surveys, and factor analytic methods to identify socially validated hypotheses about successful gameplay (Carroll, 2023; Schrader et al., 2020). That work demonstrated the value of leveraging player communities to surface domain-specific knowledge and to operationalize constructs in novel contexts (i.e., the League of Legends). Although informative, Schrader et al. (2020) noted key limitations to existing methods. In the case of Delphi studies, they are arduously slow, difficult to scale, and dependent on expert judgment and consensus. Moreover, they capture *beliefs* about success rather than direct behavioral evidence of it.

Building on this, the current work acknowledges the limitations and extends them. Further, social discourse remains a valuable data source. However, it is analyzed at scale using automated methods (e.g., AI, Term Frequency-Inverse Document Frequence (TF-IDF), and KMeans). In this analytical pipeline, behavioral hypotheses are not taken at face value, but are derived using scalable approaches and evaluated against quantitative findings (i.e., telemetric results). In this sense, the present work represents an evolution from expert- and discourse-driven inquiry toward an integrated, data science-informed approach that remains compatible with educational theory and interpretation.

Games as Complex Systems

From a learning sciences perspective, digital games exhibit all the characteristics of a complex system (Hilpert & Marchand, 2018; Jacobson et al., 2019; Schrader et al., 2020;

Wilensky & Jacobson, 2014). They consist of multiple interacting components (e.g., players, rules, roles, resources, objectives, feedback mechanisms) that operate across time and scale. Micro-level actions (e.g., movement, resource collection, coordination with teammates) function dynamically to evolve into macro-level outcomes (e.g., victory, defeat, or sustained performance improvement). Most importantly, these different levels of interactions are nonlinear, emergent, and multidimensional (i.e., compound over time). Said another way, small differences in timing or coordination can produce disproportionate effects on outcomes. As such, learning and performance in games cannot be fully understood through static snapshots or isolated variables.

Ontological framing using a complex systems lens has two important methodological implications. First, it requires data that reflect interactions over time rather than punctate, momentary events. Second, this view necessitates analytic approaches and analyses that can handle high-dimensional, interdependent features without assuming simple linear relationships. Traditional educational methods tend to collapse performance into measured change at specific points in time (e.g., pretest–posttest designs or retrospective self-report). These approaches, even those that include time series, are poorly suited to address the high levels of complexity and change in these systems, especially where learning evolves continuously.

Educational Data Science and Learning Analytics

Educational data science (EDS), including the related domains of educational data mining and learning analytics, provides a complementary methodological framework (Baker & Inventado, 2014; Romero & Ventura, 2020; Siemens & Gašević, 2012). Broadly, these fields emphasize the collection, analysis, and interpretation of large-scale data about learners and their contexts with the goal of understanding and improving learning. While much EDS research has focused on institutional systems such as learning management systems and MOOCs, EDS methods are also applicable to non-traditional OLEs, like games. Further, EDS also emphasizes interpretability and human-in-the-loop analysis, particularly when models are used to support educational inference rather than prediction alone.

When applied to games, EDS techniques enable researchers to move beyond proxy measures of learning and toward direct observation of behavior. Specifically, telemetric data (i.e., data that are automatically gathered by the systems) include information about specific actions that are captured during gameplay. These typically include time-stamped, sequential data that correspond to in-game events as they unfold during play. These data offer fine-grained records of actions, sequences, and timing. When interpreted using machine learning models and data science techniques, these data can be used to identify patterns associated with success, failure, or change over time.

Methods

This study employed a multi-stage, integrated methodological approach designed to examine learning-relevant behavior in a complex online environment using large-scale, naturally occurring data (Baker & Siemens, 2014; Creswell & Plano Clark, 2017). The methods were intentionally organized to reflect an end-to-end research workflow common in educational data science and learning analytics: data acquisition, preprocessing and feature construction, modeling, and interpretation. Rather than privileging a single analytic technique, the approach triangulated complementary methods to address distinct but related questions about

behavior, discourse, and outcomes. Game telemetry data were used to model observable performance patterns over time, while social discourse data were analyzed to capture players' articulated beliefs about success. These data sources were then examined through a set of analytic pipelines that balanced interpretability, predictive utility, and scalability. Collectively, the methods were selected to be transparent, replicable, and adaptable to other non-traditional online learning environments, with an emphasis on demonstrating process rather than establishing causal claims.

Data Sources and Acquisition

To demonstrate an integrated research workflow, data were collected from two primary sources: game telemetry from League of Legends and social discourse from Reddit. These sources were selected because they represent complementary perspectives on learning and performance—one behavioral and outcome-oriented, the other discursive and interpretive.

Game Telemetry Data

League of Legends provides public access to detailed gameplay data through the Riot Games API (Chen, 2015; Lee et al., 2015). Using this API and some code in Python, match-level telemetry was collected, including timestamped event logs, player statistics, team outcomes, and contextual information about each match (see Figure 1). The data consisted of 100,000 match timeline files in structured JSON format, each containing timestamped logs of every in-game event (e.g., kills, objective captures, structure destruction, and resource accumulation). There are roughly 1,000 events per match. The final dataset included more than 100 million events.

Figure 1
Riot Games API Scrape

Note. Scrape was executed over the course of 24 hours and included high-level players over the last year.

To make these data analytically tractable, raw events were processed through an extract–transform–load (ETL) pipeline. Events were aggregated into fixed temporal bins (e.g., three-minute intervals) at the team level, producing count-based features that captured the evolving state of each match. This approach preserved temporal structure while reducing noise and dimensionality, allowing subsequent models to focus on patterns of interaction rather than individual actions in isolation.

Social Discourse Data

Social data were collected using an API for a widely used discussion platform that hosts multiple communities dedicated to League of Legends strategy, coaching, and improvement (i.e., Reddit). Researchers have argued that these spaces function as "Third Places" and data from these contexts reflect shared activity, interest, and social functions (Haythornthwaite et al., 2018; Steinkuehler & Williams, 2006). Using the Reddit API, posts and comments were scraped from selected subreddits over defined time windows. Queries targeted advice-oriented and instructional discourse, using keywords commonly associated with improvement and gameplay strategy.

Data consisted of roughly 20,000 posts with a range of 80–250 tokens per post. A token is a basic unit of text, including words and punctuation. The resulting corpus underwent a multi-stage cleaning process, including deduplication, removal of deleted or low-information entries, normalization of text, and retention of minimal metadata for traceability. Engagement indicators such as upvotes and comment counts were preserved to provide contextual information about the visibility and social validation of claims. When completed, roughly 80–90% of the text remained usable. This supported the idea that the scrape was successful and secured usable data that was suitable for large-scale text analysis.

Data Processing Techniques

Following acquisition, telemetry data were processed through a series of extract–transform–load (ETL) procedures designed to support downstream modeling while preserving interpretability. Raw telemetry events were parsed, validated, and aggregated into fixed temporal bins (i.e., 3 minutes) at the team level, producing structured, count-based features that captured evolving gameplay dynamics. This transformation reduced noise, mitigated sparsity, and enabled comparison across matches of varying duration.

Social discourse data required parallel but distinct processing steps. Text was cleaned and normalized, duplicates and system-generated artifacts were removed, and documents were organized into structured corpora suitable for vectorization. Where appropriate, datasets from multiple sources were aligned using shared temporal windows and contextual metadata, allowing behavioral and discourse patterns to be examined in relation to one another. These processing steps were critical for ensuring that subsequent analyses reflected meaningful patterns rather than artifacts of data collection or platform-specific noise.

Analytical Pipelines

The central contribution of this paper lies in the modeling of three complementary analytical pipelines. Each pipeline addresses a different aspect of learning and performance in complex online environments, and together they illustrate how educational researchers can integrate data science techniques into coherent workflows.

Pipeline 1: Principal Components Analysis Dimension Reduction and Logistic Regression

The first pipeline employed principal component analysis (PCA) followed by logistic regression to model match outcomes based on telemetry-derived features. PCA was used to reduce the dimensionality of the binned event data while retaining the majority of variance. This step served both computational and conceptual purposes: it mitigated multicollinearity among event counts and provided a compact representation of overall patterns of play.

Logistic regression was then trained on the resulting components to predict binary outcomes (win/loss). This approach offers several advantages for educational research. It is computationally efficient, relatively interpretable, and aligns well with learning analytics traditions that prioritize transparency and replicability. While limited in its ability to capture complex nonlinear interactions, the PCA–logistic regression pipeline provides a stable baseline against which more sophisticated models can be compared.

Pipeline 2: Gradient Boosting and SHAP Interpretation

To address the limitations of the linear decision boundary in logistic regression and limited interpretability of factors, a second pipeline employed gradient-boosted decision trees (XGBoost) trained on the same temporally aggregated telemetry features. Unlike logistic regression, gradient boosting can model nonlinear relationships and interactions among features without strong distributional assumptions. This makes it particularly well suited to complex systems where the impact of an action may depend on timing, context, and co-occurring events.

Model interpretation was supported using SHapley Additive exPlanations (SHAP), which attribute contributions of individual features to model predictions. SHAP values were used not as definitive explanations, but as interpretive aids that highlight which types of events and temporal patterns were most influential in predicting outcomes. This combination of predictive power and post hoc interpretability provides a pragmatic balance between model performance and educational insight.

Pipeline 3: Social Discourse Modeling

The third pipeline focused on modeling social discourse at scale. Text from Reddit posts and comments was vectorized using term frequency–inverse document frequency (TF-IDF) representations and clustered using unsupervised methods such as k-means and non-negative matrix factorization. These techniques identify recurring themes and topics without requiring manual coding or predefined categories.

To support interpretation, representative terms and excerpts from each cluster were examined, and AI-assisted summarization was used to generate concise descriptions of dominant themes. Importantly, this step was treated as an analytic aid rather than an authoritative interpretation. Human judgment remained central in evaluating whether identified themes aligned with established gameplay constructs or reflected common misconceptions.

Together, these three pipelines illustrate how behavioral data, predictive modeling, and discourse analysis can be integrated within a single research design. The following sections

use this integrated workflow to examine points of convergence and divergence between what players say about success and the behaviors that predict it.

Results

The integrated analytical pipelines yielded complementary results that illustrate how different data sources and modeling approaches surface distinct, and at times conflicting, accounts of performance and success. Rather than reporting exhaustive model metrics, the results are organized around the types of patterns each pipeline revealed and the role those patterns play in informing educational inference.

Telemetry-Based Modeling Results

Across modeling approaches, telemetry-derived features reliably supported prediction of team-level match outcomes. The PCA and logistic regression pipeline demonstrated that a reduced set of latent dimensions derived from temporally binned event data was sufficient to predict win–loss outcomes at rates well above chance. These dimensions reflected broad axes of play that combined multiple event types rather than isolated actions, suggesting that performance emerges from coordinated patterns of behavior over time rather than single metrics. When manipulating the number of factors, results also indicated that there was a sufficient amount of area under the curve (AUC) and accuracy rating (see Figure 2). For reference, an AUC is an indication of a model's ability to classify outcomes, where .50 is random guessing and 1.0 is perfect prediction.

Figure 2

Principal Components Analysis Model Fit Statistics (12 Factors)

```
PCA components kept: 12 | variance: 0.3707

   macro avg      0.905     0.905     0.905     40000
weighted avg      0.905     0.905     0.905     40000
```

Note. The original model retained 102 components. This model retained 12 components and was 90% accurate.

The gradient-boosted models further improved predictive performance by capturing nonlinear interactions among event types and temporal windows (see Figure 3). SHAP analyses indicated that certain event categories exerted differential influence depending on when they occurred within a match. For example, early structural objectives and coordinated team actions were consistently associated with increased likelihood of victory, whereas other frequently discussed actions showed weaker or context-dependent relationships with outcomes. Importantly, no single feature dominated predictions across all matches; instead, influence was distributed across interacting behaviors, reinforcing a complex systems interpretation of gameplay.

Figure 3

XGBoost Model Fit Statistics and Receiver Operator Curve

	1-score	support
	0.965	20000
	0.965	20000
	0.965	40000
	0.965	40000
	0.965	40000

Note. The original model retained 102 components. This model retained 12 components and was 90% accurate.

Social Discourse Modeling Results

Unsupervised clustering of Reddit discourse revealed recurring themes related to improvement and success, including vision control, lane management, jungle tracking, champion selection, and role-specific responsibilities. These themes were highly stable across clustering methods and aligned closely with constructs identified in prior Delphi-based research, suggesting that large-scale discourse modeling can recover socially validated knowledge structures without manual coding.

However, discourse frequency and salience did not consistently correspond to telemetry-based indicators of success. Topics that were heavily discussed or strongly emphasized within the community were not always those most strongly associated with winning behavior in the telemetry models. In many cases, discourse emphasized actions that were highly visible, role-specific, or cognitively salient, even when their aggregate relationship with outcomes was modest.

Cross-Source Contrasts

When examined together, the results highlight a systematic divergence between discourse-driven accounts of success and behaviorally grounded patterns derived from telemetry. Social data captured how players explain, justify, and narrate success, while telemetry data captured how success is enacted through coordinated behavior over time. These perspectives were not mutually exclusive, but they were not isomorphic. The contrast between them provides a methodological insight: reliance on either discourse or behavior alone yields an incomplete account of learning and performance in complex online environments.

Findings and Discussion

Collectively, these findings are highly informative relative to playing the game: League of Legends. More broadly, the findings also demonstrate the value of integrating applied data science methods into educational research on non-traditional OLEs. First, the results confirm that large-scale telemetry data can be leveraged to model performance patterns in ways that are interpretable and theoretically meaningful when paired with appropriate analytic

techniques. Even relatively simple models, when applied to well-constructed features, yielded stable and informative results.

Second, the analysis of social discourse underscores the importance of distinguishing between beliefs about learning and observable learning-relevant behavior. Player communities generate rich, socially validated knowledge, but that knowledge is shaped by anecdote, role identity, and visibility rather than systematic outcome associations. From an educational perspective, this mirrors well-documented discrepancies between self-report and behavioral measures in formal learning contexts.

Third, the integration of these data sources illustrates a practical instantiation of learning analytics principles in an informal environment. Rather than treating machine learning models as endpoints, the workflow emphasized interpretation, comparison, and triangulation. In doing so, it offers a model for how educational researchers can engage with AI and ML tools without ceding epistemic authority to them.

More broadly, the findings reinforce the argument that learning in complex systems is best understood through patterns of interaction rather than isolated variables. Success in games—and by extension, in other complex OLEs—emerges from coordinated, temporally situated behavior that cannot be fully captured through surveys or single indicators. The methods demonstrated here provide one avenue for addressing this challenge at scale.

Limitations

Several limitations should be acknowledged. First, the study is situated within a single game context, and the specific behavioral patterns identified are not assumed to generalize directly to other games or learning environments. The contribution of this work lies in the process rather than the transferability of particular findings.

Second, the modeling approaches employed, while robust, are sensitive to feature construction and aggregation choices. Different temporal binning strategies or alternative representations of events may yield different patterns. Similarly, although SHAP provides useful interpretive affordances, it does not offer causal explanations and should be interpreted cautiously.

Third, social discourse data reflect participation biases and platform-specific norms. Not all players contribute equally to online discussions, and highly visible discourse may overrepresent certain roles or playstyles. These limitations mirror those of traditional qualitative methods and underscore the importance of triangulation.

Future research should explore the application of this workflow to other online learning environments, including learning management systems, collaborative platforms, and serious games. Longitudinal analyses that track change over time and designs that integrate additional data sources, such as communication logs or physiological measures, may further enhance understanding of learning in complex systems.

Recommendations

Based on the methods and findings presented, several recommendations are offered for educational researchers and methodologists seeking to study learning in complex, data-intensive online environments.

First, researchers are encouraged to move beyond single-method designs when investigating learning in non-traditional OLEs. Telemetry, discourse, and outcome data each provide partial views of learning and performance; relying on any one source risks oversimplification. Integrated workflows that triangulate behavioral and discursive data are better suited to capturing the dynamic and emergent properties of learning in complex systems.

Second, educational researchers should treat data processing and feature construction as substantive methodological decisions rather than technical preliminaries. Choices about temporal aggregation, unit of analysis, and representation fundamentally shape what patterns can be detected and interpreted. Explicit documentation of these decisions enhances transparency and supports replication, particularly when adapting workflows to new contexts.

Third, machine learning models should be deployed with interpretive intent rather than predictive emphasis alone. While predictive accuracy is valuable, educational relevance depends on the extent to which model outputs can inform understanding of learning processes. Techniques that support post hoc interpretation, such as dimensional reduction or feature attribution methods, are especially important when working with complex behavioral data.

Finally, discourse from online learning communities should be treated as a complementary analytic resource rather than a proxy for behavior. Social data are invaluable for understanding how learners make sense of their experiences, but they should be examined alongside behavioral evidence to avoid conflating salience with efficacy. This distinction is particularly important when educational interventions or design recommendations are informed by learner-generated content.

Conclusion

This paper presented a methodological exemplar for studying learning-relevant behavior in complex online environments using applied data science, learning analytics, and machine learning techniques. By modeling an end-to-end workflow that integrates game telemetry, social discourse, and outcome data, the study demonstrates how educational researchers can leverage publicly available, high-volume data sources to examine learning beyond traditional instructional settings.

From an educational perspective, the central contribution of this work lies not in the specific findings associated with a particular game, but in the process by which those findings were generated. The workflow illustrates how learning can be studied as an emergent, interactional phenomenon, and how discrepancies between what learners say and what they do can be examined systematically rather than assumed or dismissed. This approach aligns with contemporary views of learning as distributed, situated, and dynamic.

As learning increasingly occurs in digitally mediated and informal environments, educational research methods must evolve accordingly. The model presented here offers one pathway for that evolution—one that balances computational power with theoretical grounding and human interpretation. It is hoped that this work encourages broader adoption of integrated data science approaches in education, while reinforcing the importance of methodological rigor, transparency, and educational relevance.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author confirms that AI or AI-assisted technologies have been used to improve the readability of this manuscript. However, the ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

Challenges and Most Significant Achievements of Students Participating in a Community-Based Research Service-Learning Course: A Qualitative Interview Study

Janine Bittner, Ruhr University Bochum, Germany
Janina Kempchen, Ruhr University Bochum, Germany

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This qualitative interview study examines the work and output achieved in a specific teaching project that focused on the complex social issue “social inequality, poverty and housing” from students' perspectives. The teaching project included elements of community-based research and service-learning, lasted two semesters and was carried out at the Ruhr University Bochum as part of the bachelor degree programme in geography. This study aims to develop an understanding of the challenges and difficulties the students faced. In addition, we were interested in finding out what the students considered to be their most significant achievement made in the project work. We conducted qualitative interviews with 13 students, out of the 15 students who participated until the end of the course. Two of the very open interview questions focused on the mentioned research objectives. After transcription and pseudo-anonymisation, the interviews were analysed using qualitative content analysis (inductive category formation method). It became apparent that the challenges were primarily in the following areas: defining the direction of research, defining the research questions, and difficulties in finding a community partner. The students considered the most significant achievements to be in the areas of acquiring a community partner, good teamwork and team building. Despite the restrictions imposed during the COVID-19 pandemic and the necessary changes to the course structure, the study's results provide important insights for course instructors who wish to adopt similar teaching approaches, highlighting the challenges faced by students and their achievements.

Keywords: challenge, performance, students, community-based research, service-learning

Introduction

The effects of service-learning have been the object of various empirical studies. A good overview is provided by the reviews of Celio et al. (2011), Conway et al. (2009) and Eylers et al. (2011). Other teaching approaches, such as research-based teaching and learning or community-based research, which we combined with elements of service-learning in our university course, have also been, and continue to be, the subject of empirical studies. The effects of the research-based teaching and learning approach are discussed in Thiem et al. (2023) and Wessels et al. (2021). The benefits of both approaches are well documented in the literature; therefore, there are many reasons to use them in higher education. On the other hand, project-oriented courses that are planned and implemented according to these teaching approaches place increased demands on students in terms of independent work, self-competence and motivation. As a rule, the necessary amount of work cannot be precisely determined; it evolves as the project progresses. Such university project courses also place high demands on instructors, often increasing their workload, requiring greater flexibility, and necessitating a different understanding of their role as university lecturers.

As part of the accompanying research for a community-based research service-learning course on social inequality, poverty, and homelessness in the old industrialised region of the Ruhr area, we were interested in how the participating students perceived the challenges they faced. And what they personally consider to be their greatest achievement. To be able to draw conclusions for our own teaching practice, in the sense of whether the additional effort required by such university courses for students and instructors is worthwhile.

Our qualitative research study focused on the following two research questions:

- What major challenges did the students have to overcome in the project? (RQ 1)
- What are the most significant achievements that the students have made in the project from their personal point of view? (RQ 2)

The course examined was an elective course within the “study project” module in the third year of the bachelor's programme in geography at Ruhr University Bochum. In this module, collaborative team-based project work on a specific scientific topic or question is the main focus, using various scientific data collection and analysis methods (cf. Geographisches Institut der Ruhr-Universität Bochum, 2022). The development of the specific course design, which attempted to combine elements of both teaching methods mentioned above – service-learning and research-based teaching and learning or community-based research – in an innovative way, as well as the accompanying research for the course, was funded by a teaching grant from the university (university programme research-based learning, cf. Ruhr University Bochum, 2020) and a follow-up funding from the Institute of Geography.

An important component of the year-long course was working in student research teams under the guidance of the responsible instructor, who also served as the study's principal investigator. Ultimately, three student teams remained, each working on a research topic of their own, selected from the overarching topic of social inequality, poverty, and homelessness. There were 16 students, 15 of whom successfully completed the course. The student research teams' research topics were selected in consultation with community partners, social organisations in the case-study cities of Bochum and Essen. Before the COVID-19 pandemic began, several meetings were organised with representatives of social organisations, our community partners. In addition, on some of these occasions, contact was also made with homeless or formerly homeless people, and informal discussions were held. Following the outbreak of the COVID-

19 pandemic, the course was converted to an online format. The final assessment for students consisted of a group presentation of the results achieved and a written project report per group. Table 1 in Bittner (2025) identifies which elements of the course described above are attributable to the service-learning approach and the research-based teaching and learning approach. More detailed information about the course participants is provided in Bittner and Kempchen (2024).

Methods

In this section, we present the study's research design and describe the data collection and analysis procedures employed.

Research Design and Setting

We designed a qualitative study to investigate the challenges and achievements of students in a community-based research service-learning course. We sought to address our research questions with the greatest possible openness and were interested in personal narratives and detailed information from a limited number of study participants. The qualitative approach, therefore, seemed appropriate (cf. e.g. Creswell & Poth, 2018; Flick, 2018; Kruse, 2015; Panke, 2018). The study participants were recruited after the end of the university course "social inequality, poverty and housing" in the bachelor degree programme in geography by approaching the students who had attended the course. Participation in the qualitative interview study was voluntary for the students. Of the 15 course participants, 13 agreed to take part. The course, which was examined as part of accompanying research funded by a teaching grant from the university, lasted one year and took place in the academic year 2019 and 2020.

Participants

Among the students involved in the study, more were female. Five were male (38.5%), and eight were female (61.5%), who gave their consent to give an interview. The study participants were between 21 and 27 years old (see Appendix A). More than 80 % were born and raised in the federal state of North Rhine-Westphalia in Germany.

Data Collection

We obtained data through qualitative, highly open-ended interviews. The interviews followed an interview guide developed in advance, according to the procedures described by Helfferich (2011) and Kruse (2007, 2015). In a multi-stage process, a large number of possible interview questions were developed for the comprehensive research study, which included further sub-studies with other research focuses, checked for suitability, and subsumed and sorted. An interview guide comprising 12 narrative-generating key questions was developed. For each key question, follow-up questions were formulated to maintain the flow of the conversation and elicit longer responses to the key question and additional information. In addition, potential follow-up questions were noted in the interview guide in advance to be asked as needed.

The following two very open-ended and narrative-generative key questions in the longer interview guide related to the two research questions of the sub-study presented in this paper:

- In the first phase of the project, what has been the most difficult task or the biggest challenge you have faced personally? Could you please describe it in more detail?

- From your point of view, in the first phase of the project, what is the biggest and most significant achievement you have made so far in the project work? Could you please describe it in more detail!

Because the study coincided with the COVID-19 pandemic and social distancing regulations were in place, the interviews were conducted online. The Zoom conference system was used for this purpose. The second author of this paper was responsible for conducting the qualitative interviews. We sought to minimise the influence of power imbalances on the interview process. The interviews were therefore conducted by the student assistant working in the project, a master student in geography specialising in urban and regional development. Immediately after the interview, the interviewer noted the specific features and peculiarities of the interview situation in a postscript. The interviews were recorded using a digital audio recording device. The total interview duration, covering all 12 key questions in the interview guide, ranged from 21 to 60 minutes. They were transcribed in full according to the rules of the transcription system by Dresing & Pehl (2018), content-semantic transcription. Pseudonymisation was carried out.

Data Analysis

We chose qualitative content analyses to analyse the interview transcripts, following the approach described by Mayring (2010a, 2010b, 2022a; Mayring & Frenzl, 2019). MAXQDA Pro software, version Release 22.8.0 (Kuckartz, 2010; Rädiker & Kuckartz, 2019) was used by the principal investigator of this research study to perform the data analysis software-assisted, to compile interview transcripts, audio files, postscripts and data collection instruments in a project folder and to document the processing and analysis steps carried out. The use of the AI-assistant for data analysis was deliberately avoided. In this context, we refer to Mayring's (2025) study results, which support our concerns. The data analysis performed corresponds to the inductive category formation method described by Mayring (2010a, 2010b, 2022a). The categories were derived from the interview transcripts, which were read and analysed line by line. The context unit for the analysis was defined in advance as the interview transcript. The coding unit was set to the clear meaning component. It should be noted that the interview quote examples listed in Appendix B, C, and D for the individual categories are generally longer for illustrative purposes and may also include several related sentences.

Results

This section summarises the main findings of the qualitative interview study. The results are presented in the order of the two research questions addressed. We follow Mayring's (2010b, 2022a) recommended presentation of the results and report frequencies for the main categories in the tables. The reference here is the documents, the interview transcripts.

Major Challenges

First, we turn to the results of RQ 1, which addresses the most significant challenges in the project. The inductive category formation process resulted in the following main categories: “define the direction of research”, “define research questions”, “difficulties finding a community partner”, “appointments/ establishing contact with vulnerable individuals”, “appointments/ establishing contact with social organisations”, “coping with circumstances caused by the COVID-19 pandemic”, “counteract lack of motivation”, “coming/ working together as a team”, “recruitment of community partners (decision-making)”, “finding a theoretical background” and “giving a presentation”. The frequencies for these main categories

are shown in Table 1. The following three main categories are most commonly represented: a) define the direction of research (53.8 %, 7 out of 13 interviewees), b) define research questions (38.5 %, 5 out of 13 interviewees), and c) difficulties finding a community partner (23.1 %, 3 out of 13 interviewees).

Table 1
Frequencies of Main Categories (Documents With Codes) – Major Challenges and Difficulties of the Students in the Community-Based Research Service-Learning Course

	Documents	Percentage	Percentage (valid)
Define the Direction of Research	7	53.1	53.8
Define Research Questions	5	38.5	38.5
Difficulties Finding a Community Partner	3	23.1	23.1
Appointments/ Establishing Contact with Vulnerable Individuals	2	15.4	15.4
Appointments/ Establishing Contact with Social Organisations	2	15.4	15.4
Coping With Circumstances Caused by the COVID-19 Pandemic	2	15.4	15.4
Counteract Lack of Motivation	2	15.4	15.4
Coming/ Working Together as a Team	2	15.4	15.4
Recruitment of Community Partners (Decision-Making)	1	7.7	7.7
Finding a Theoretical Background	1	7.7	7.7
Giving a Presentation	1	7.7	7.7
DOCUMENTS with code(s)	13	100.0	100.0
DOCUMENTS without code(s)	0	0.0	-
ANALYSED DOCUMENTS	13	100.0	-

These main categories can be summarised as three overarching themes, which are also reflected in the structure of the following, more detailed presentation of the results for RQ1: challenges related to the research process in general, challenges related to working with community partners and vulnerable people, and other challenges.

Challenges Related to the Research Process in General

The main categories “define the direction of research”, “define research questions” and “finding a theoretical background” fall under the theme *challenges related to the research process in general.*

The most difficult task for the students here, by far the most frequently mentioned, was to determine the direction of their research, to decide on a research topic. In doing so, various points had to be taken into account. Firstly, a research topic had to be identified that could be realistically investigated within the existing framework of a two-semester course, and that was clearly defined, with a well-defined scope. Secondly, there was the difficult task of reconciling the different ideas and preferences of the students in the team and agreeing on a research topic, a specific direction of the research.

Q1: “I would say that the most difficult task in the project was really figuring out exactly what we wanted to specialise in and what we wanted to achieve in the end, so that it wasn't too broad”.

Q2: “I believe (the biggest challenge was) that you work out together with the team a suitable topic or question that can be addressed and also seems feasible to work on”.

Q3: “And then I think the first big issue was finding a topic. Because I think we were all a bit unsure about what we should do next. Some people may have had different ideas. And then we had to agree on something. I think that was the first big challenge”.

Q4: “It was difficult to find a topic, or rather to find a team and then agree on a topic. This was because very different preferences and interests were expressed. But in the end, we managed to make everyone happy”.

Challenges Related to Working With Community Partners (Social Organisations) and Vulnerable People

The main categories “difficulties finding a community partner”, “recruitment of community partners (decision-making)”, “appointments/ establishing contact with vulnerable individuals” and “appointments/ establishing contact with social organisations” fall under the theme *challenges related to working with community partners (social organisations) and vulnerable people.*

The category “difficulties finding a community partner” appeared most frequently in the interviews. Not only were actual difficulties addressed here, but also the fear of possibly not finding a suitable community partner for the project work. The students received support in this regard, but ultimately approached and selected partners independently as a team.

Q5: “The fact that we didn't find a partner at the beginning, which was kind of stupid. The other teams had something and we were the only ones who didn't have anyone. And we didn't know why, because we had put in just as much effort as the others and we never got any feedback, no rejections, nothing. And I think the important thing was that we just stuck together and encouraged each other, otherwise I don't think it would have worked. So the point about not having a community partner at the beginning (…)”.

Q6: “ What I would say is the thoughts about what to do if all the (possible) community partners decline to take part. So this fear that you'll be left on your own with nothing, and then you feel bad, as if you haven't achieved anything, so I would add that”.

In addition, it was stated that it was a challenge for the team to agree on the choice of a potential community partner. The appointments with representatives of social organisations as well as with homeless people or people who had previously been affected by homelessness were seen as a challenge because the situations were unfamiliar to the students and it was not easy to prepare for them.

Other Challenges

Another challenge mentioned, which falls within the realm of *self-management*, is motivating oneself and the team. In addition, the special circumstances arising from the COVID-19 pandemic, the associated uncertainty, and the impact on teamwork due to contact restrictions. *Challenges in teamwork*, coming together as a team, working in a team, and the distribution of tasks in the team were also addressed.

Most Significant Achievements

The results for RQ 2, i.e. the question of which significant achievements the students have made in the project, are now presented. The categories inductively derived from the text material during the coding process are shown in Table 2.

Table 2
Frequencies of Main Categories (Documents With Codes) – Most Significant Achievements of the Students in the Community-Based Research Service-Learning Course

	Documents	Percentage	Percentage (valid)
Acquisition of the Community Partner	5	38.5	38.5
Good Teamwork	4	30.8	30.8
Determined Work in the Team	2	15.4	15.4
Team Building	2	15.4	15.4
Writing the Final Report	1	7.7	7.7
Preparation of Interview Guidelines	1	7.7	7.7
Preparation of Literature Excerpts	1	7.7	7.7
Ideas and Suggestions to Share Responsibility in the Team	1	7.7	7.7
Good Organisational Skills	1	7.7	7.7
Being Motivated and Committed	1	7.7	7.7
Being Able to Inspire the Community Partner for the Research Project	1	7.7	7.7
Presentation of the Research Design and Research Topic	1	7.7	7.7
Adherence to Deadlines	1	7.7	7.7
Structuring the Final Report	1	7.7	7.7
Successfully Managing a Period With Many Deadlines	1	7.7	7.7
DOCUMENTS with code(s)	13	100.0	100.0
DOCUMENTS without code(s)	0	0.0	-
ANALYSED DOCUMENTS	13	100.0	-

The four most common categories in the interviews are: a) acquisition of the community partner (38.5 %, 5 out of 13 interviewees), b) good teamwork (30.8 %, 4 out of 13 interviewees), c) determined work in the team (15.4 %, 2 out of 13 interviewees) and d) team building (15.4 %, 2 out of 13 interviewees).

Achievements Related to the Research Process in General

The main categories “writing the final report”, “preparation of interview guidelines”, “preparation of literature excerpts”, “ presentation of the research design and research topic” and “finding a theoretical background” fall under the theme *achievements related to the research process in general.* Each of these categories appeared once in the interviews.

Achievements Related to Working With Community Partners (Social Organisations)

The theme *achievements related to working with community partners (social organisations)* includes the following two categories: “acquisition of the community partner” and “being able to inspire the community partner for the research project”.

Two interview quotes are provided for illustration purposes.

Q7: “I would say that we as a team, but also each of us individually, and I myself, managed to secure the community partner and convince them of our merits. We invested a great deal of energy and time to make this happen, especially after receiving so many rejections. I believe this is a commendable achievement”.

Q8: “Then I would also mention again that we were able to win (name of the social organisation) as a cooperation partner and convince him of our cause”.

Other Achievements

Other achievements mentioned can be subsumed under the themes *achievements in teamwork* and *achievements in self-management.* The students stated that they had grown closer together as a team, that they got on well with each other, that they communicated well with each other, that they managed to distribute tasks fairly and to manage finding ideas together as a team, to carry out the necessary steps in a determined manner and strive towards the goal. *Achievements in self-management* include “adherence to deadlines”, “good organisational skills”, “being motivated and committed” and “successfully managing a period with many deadlines”.

Strengths and Limitations

A strength of this research study was the use of a qualitative research design. The highly open-ended interview questions, without predetermined answer categories, enabled the study participants to identify and describe the challenges and difficulties they encountered in the project, as well as the most significant achievements in their subjective assessment. Their views were heard and given greater weight than would have been the case in a quantitative study. In this context, the use of a student research assistant to conduct the interviews has proven successful. This prevented any power imbalances from arising and created the conditions for an open and relaxed atmosphere during the interviews.

One of the major limitations of the study is the small number of participants, attributable to the size of the university course. For the results of a qualitative study using qualitative content analysis to be generalisable, a larger number of study participants is typically required (Mayring, 2022b). When the results are examined independently of the frequencies of the main categories and with a focus on the categories themselves, the findings indicate relevance beyond the specific university course examined in this study. In addition, it should be noted that the necessary changes to the course schedule due to the COVID-19 pandemic have had a certain impact on the study results. Specifically, this meant that, approximately halfway through the course, university regulations prohibited direct contact between students and vulnerable individuals and social organisations. In addition, work within the student teams and between the students and the instructor had to be converted to a purely virtual format. Looking again at the two research questions examined: “What major challenges did the students have to overcome in the project?” and “What are the most significant achievements that the students have made in the project from their personal point of view?”, it becomes clear that such changes have an impact on the subject of the study. Certainly, if the original course concept had been retained, there would have been further challenges to those already mentioned by the students. Challenges related to direct, personal contact with vulnerable individuals, to data collection and analysis for the student research projects, and related to close contact with representatives

of social organisations would have been expected. Perhaps, other achievements would also have been of great importance.

Discussion, Reflection

When asked about the biggest challenges and difficult tasks in the project, there were unexpectedly frequent references to the first phase of the research cycle, namely determining the direction of one's own research and defining specific research questions. On the one hand, this is certainly due to the aforementioned necessary changes to the course process and content caused by the COVID-19 pandemic, which undoubtedly led to an overemphasis on challenges in the initial project phase during the interviews. However, this can also be attributed to the fact that it was the first small research project in which the students were involved. In this project, guided by an experienced instructor but otherwise working independently within a research team, the students collaborated with community partners on their research topic. In general, the results highlight the significance of the teaching concept of "research-oriented teaching and learning" and the importance of integrating it into university teaching early in the course of study. Beyond acquiring theoretical knowledge during their studies or learning about individual aspects of scientific work, such as literature search, reading, and writing scientific texts integrated into various courses in the bachelor degree programme, students are given the opportunity to gain insight into the entire research process at an early stage and to participate in a research project under guidance. The knowledge gained here is indispensable to a future academic career and also fosters early interest in research. Through conducting practical research activities, as well as scientific writing, and giving oral presentations of interim and final results. Students are also optimally prepared for their first independent research work, which is usually the writing of the bachelor thesis. The challenges and difficult tasks identified and further described by the students arise from the specific experiences gained and should be understood not only as challenges or difficulties but also as elements of a holistic experiential learning process (cf. Kolb & Kolb, 2009; Kolb, 2015). They promote students' problem-solving skills as well as their ability to adapt to new, complex situations.

This also applies to the challenges and difficult tasks mentioned above, which arise from the service-learning elements that have been integrated into the course, the recruitment of the community partners, the collaboration with these social organisations in the case study cities of Essen and Bochum in the Ruhr area, and, in the case of our study project, the collaboration with vulnerable individuals. Practical experiences gained through working with others who hold different professional positions, representatives of social organisations, in project meetings, personal conversations, telephone contact, or email, are valuable and will be of great importance for the future professional lives of the students. Meeting and interacting with people whose lived realities differ significantly from those of students, and the challenges that arise from this, enable students to broaden their perspectives, think beyond their own academic horizons, and learn openness, respect, and tolerance when encountering others. Bittner & Kempchen (2025) provided detailed insights into the learning outcomes achieved through visits to social organisations and contact with vulnerable people, including homeless and formerly homeless individuals.

Among the most important achievements mentioned by the students, two additional areas stand out: achievements in teamwork and achievements in self-management. Particularly noteworthy here are good teamwork and the successful composition of the team. In addition, personal, organisational and motivational skills. Teamwork skills and self-competence, including

organisational and motivational abilities, are also important prerequisites for a successful start to professional life.

Conclusion and Direction for Further Research

Fundamentally, the study's results demonstrate the importance of the two teaching approaches employed: research-oriented teaching and learning (community-based research) and service-learning. It should be noted, however, that, due to necessary deviations from the original course concept resulting from the COVID-19 pandemic, the teaching concept, “research-based teaching and learning”, came to the fore somewhat. Beyond theoretical knowledge, learning outcomes are achieved through the general challenges of long-term team-based project work, guided completion of the research cycle, and collaboration with community partners. All of which are highly relevant for further university study, academic pursuits, and future careers in other fields. Despite the limitations of our study, we believe that the main categories identified from the data on the challenges and difficulties mentioned by the students in the project, as well as the particular achievements, are also fundamentally relevant to teaching projects that include elements of research-based teaching and learning or community-based research and/or service-learning. Verifying this and expanding the identified categories require further empirical studies with larger sample sizes.

Acknowledgements

First and foremost, we would like to thank the students who participated in our research study for their time, willingness to participate, and openness. In addition, the Institute of Geography at the Ruhr-University Bochum, for the permission to conduct this accompanying research. Janine Bittner would also like to express her gratitude for the teaching grant received from the Ruhr University Bochum, funding line research-based teaching and learning, which made this research study possible.

Authors’ Contributions

JB: principal investigator, conceptualisation, design and methods, data analysis, drafting the paper. JK: conducting the interviews and contributing to interview guideline development, reviewing the manuscript.

Conflict of Interest Statement

The authors have no conflict of interest to declare.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The authors declare that *Deepl Translator*, *Grammarly* and *Pro Writing Aid* were used in the writing process of this paper, to translate individual passages of text, interview quotes, individual words, and to improve the linguistic and grammatical quality of the written text. Subsequently, the text was usually adapted, reviewed and edited by the first author. No linguistic smoothing was applied to the interview quotes; instead, the spoken wording was reproduced realistically. The last version of the paper underwent a final proofreading process by the two authors, who assume responsibility for the content of the publication.

The analysis of the qualitative interview data (qualitative content analysis) was deliberately carried out without the use of AI-assisted technologies. The AI-supported coding tool (AI-assist) offered for some time by the MAXQDA software that the first author employed for data analysis, was not used at all and also not activated for use in the software.

Appendix B

Category System with Sample Quotes – Major Challenges and Difficulties of the Students in the Community-Based Research Service-Learning Project

- **Define the Direction of Research**
  Sample Quote: "It was difficult to find a topic, or rather to find a team and then agree on a topic. This was because very different preferences and interests were expressed. But in the end, we managed to make everyone happy." *(Carmela Spieß, female, age: 27)*
- **Define Research Questions**
  Sample Quote: "And then I found it very difficult to come up with a research question that was explicitly precise and not too general. That's where we had the most difficulties, because various factors meant that we had to adapt again and come up with new research questions. I found that the most difficult part." *(Berta Schleich, female, age: 22)*
- **Difficulties Finding a Community Partner**
  Sample Quote: "That we didn't find a partner at the beginning, which was kind of stupid. The other teams had something, and we were the only ones who didn't have anyone. And we didn't know why, because we had put in just as much effort as the others, and we never got any feedback, no rejections, nothing. And I think the important thing was that we just stuck together and encouraged each other, otherwise I don't think it would have worked. So the point about not having a commitment partner at the beginning and then, luckily, getting out of that motivational slump caused by COVID." *(Amelie Scheibe, female, age: 21)*
- **Appointments/ Establishing Contact With Vulnerable Individuals**
  Sample Quote: "In any case, making contact, first with the organisations and then with the homeless people, I found that difficult, but it turned out that it wasn't so bad. That was actually my only concern (unintelligible). Because (unintelligible) I thought it would be okay, because I'm someone who can deal with difficulties like that, but it was still a challenge for me."*(Lotte Heinrich, female, age: 22)*
- **Appointments/ Establishing Contact With Social Organisations**
  Sample Quote: "Accordingly, I would say that the most challenging aspect was really the meetings with our community partner and those affected, because it was simply a new situation that I hadn't encountered before. With our community partner, it wasn't quite as new. Not with them per se, but with an organisation like that. But yes, of course, preparing for it and then carrying it out was definitely the most demanding thing we did, and definitely the most interesting." *(Nico Gunf, male, age: 24)*
- **Coping With Circumstances Caused by the COVIC-19 Pandemic**
  Sample Quote: "So, the lack of teamwork due to COVID-19. The fact that we had no direct contact within the team. And you can have as many Skype meetings as you like, but sitting next to each other, listening to each other, letting each other finish speaking, and asking each other questions—I think that only works in real life. And that was the biggest challenge." *(Rosi Trupp, female, age: 22)*
- **Counteract Lack of Motivation**
  Sample Quote: "And that you didn't lose your motivation or your courage in the end. I think that was the biggest difficulty, the biggest hurdle in the course of the study project so far." *(Maria-Luise Haase, female, age: 22)*
- **Recruitment of Community Partners (Decision-Making)**
  Sample Quote: "At the beginning, it was really about finding a project partner. The process of agreeing on one and focusing on it. Thankfully, we managed to do that on the first attempt." *(Wolfram Wagner, male, age: 21)*
- **Finding a Theoretical Background**
  Sample Quote: "Yes, I would say that (was?) theory formation." *(Hans-Jochen Löffler, male, age: 21)*
- **Giving a Presentation**
  Sample Quote: "A big challenge. For me, at least, it may only be a small thing, but giving presentations is still a big challenge for me. I actually enjoy giving presentations. It's just that I find it very difficult because of the language. That's why giving presentations in German is a big challenge for me. Yes." *(Norma Girschner, female, age: 22)*

Appendix C

Category System with Sample Quotes – Most Significant Achievements of the Students in the Community-Based Research Service-Learning Project

- **Acquisition of the Community Partner**
  Sample Quote: "The greatest achievement. Well, I think the greatest achievement is winning (name of the social organisation) as a partner. But that's not something I can take credit for myself; it was achieved by the group as a whole." *(Enno Roskoth, male, age: 21)*
- **Good Teamwork**
  Sample Quote: "Everything so far, okay. So, I think the greatest achievement is that we as a team have actually managed to get along well with each other. That we communicate regularly, that no one has to be asked to do anything. That we have somehow managed to actually become a team. And I think that has to do with the fact that I talked a lot and divided up the tasks a lot. As I said, I tried to divide them fairly. And I think it's great that everyone contributes on their own initiative every week without being asked. That's the result of several months of work, and I think it's fantastic." *(Carmela Spieß, female, age: 27)*
- **Determined Work in the Team**
  Sample Quote: "And that we have really made progress. And done really good work so far. And hopefully will continue to do so. That this has really distinguished us as a group so far. To continue working on this with determination, so that we can stay up to date and not fall behind." *(Wolfram Wagner, male, age: 21)*
- **Team Building**
  Sample Quote: "That we somehow managed to actually become a team." *(Carmela Spieß, female, age: 27)*
- **Writing the Final Report**
  Sample Quote: "But then write the final report as well." *(Ludmila Mude, female, age: 21)*
- **Preparation of Interview Guidelines**
  Sample Quote: "Then there's also the creation of guidelines. This has already been done in (methods of urban and regional analysis?). But now it needs to be done again on a much larger scale and also, let's say, more importantly, with a more empirical approach." *(Ludmila Mude, female, age: 21)*
- **Preparation of Literature Excerpts**
  Sample Quote: "That's difficult, it's actually just a series of small steps. For example, I've never done excerpts before. I did it, fine." *(Ludmila Mude, female, age: 21)*
- **Ideas and Suggestions to Share Responsibility in the Team**
  Sample Quote: "I don't know if you can call it an achievement, but the fact that I agreed to do it at the beginning, when I don't think we even had a team manager yet, to say that I'm not a fan of it, or that I communicated honestly with my group and said: I'm not a fan of placing the responsibility on just one person—the team leader—but that I said from the outset that we are all team leaders in a way. (…)." *(Amelie Scheibe, female, age: 21)*
- **Good Organisational Skills**
  Sample Quote: "And, yes, in general, that we were able to organise everything so well with our organisational partners, but also that we were able to participate in the events, meaning that we demonstrated our commitment." *(Lotte Heinrich, female, age: 22)*
- **Being Motivated and Committed**
  Sample Quote: "That we have already shown commitment." *(Lotte Heinrich, female, age: 22)*
- **Being Able to Inspire the Community Partner for the Research Project**
  Sample Quote: "Then I would also mention again that we were able to win (name of social organisation) as a cooperation partner and convince him of our cause." *(Nico Gunf, male, age: 24)*
- **Presentation of the Research Design and Research Topic**
  Sample Quote: "That I, or rather my team, managed to guide us to the point where we were able to present our research, our research questions, our topics, our hypotheses, and then also present how far we had come by a certain date. In other words, that we were able to deliver a truly accurate status of our research by a specific date. And that, as team leader, I was able to guide the team to ensure that this was achieved on time." *(Alfons Eberth, male, age: 21)*

The table continues on the next page. The categories "writing the final report" and "structuring the final report" could be merged, but we decided to keep them as two separate categories.

Appendix D

Continuation - Category System with Sample Quotes – Most Significant Achievements of the Students in the Community-Based Research Service-Learning Project

- **Adherence to Deadlines**
  Sample Quote: "That I, or rather my team, managed to guide us to the point where we were able to present our research, our research questions, our topics, our hypotheses, and then also present how far we had come by a certain date. In other words, that we were able to deliver a truly accurate status of our research by a specific date. And that, as team leader, I was able to guide the team to ensure that this was achieved on time." *(Alfons Eberth, male, age: 21)*
- **Structuring the Final Report**
  Sample Quote: "I would say that our greatest achievement was finding and establishing a precise structure and table of contents for our final report. This made the work easier, as we knew exactly what we wanted to achieve and what we wanted to have. This allowed us to work in a more structured and precise manner." *(Berta Schleich, male, age: 22)*
- **Successfully Managing a Period With Many Deadlines**
  Sample Quote: "Well, I already think that the phase where we had a lot of appointments was very demanding, so I think that I achieved a lot during that time. But I still think that a lot was accomplished in March and April, not only by me, but also by my group. And it was all self-motivated. We decided that for ourselves. It wasn't planned. It just happened that we set ourselves a meeting every Wednesday morning so that we could meet regularly and stay in touch. But we got a lot done during that time. And I also achieved a lot. Yes." *(Norma Girschner, female, age: 22)*

SoTL and University Teachers' Professional Development: The Implementation of the Teaching Practice Research Program in Taiwan

Chia-Hui Wu, National Taiwan University, Taiwan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

In a constantly changing higher education environment, university teachers' teaching and students' learning have received greater attention. As a result, the Scholarship of Teaching and Learning (SoTL) is gaining ground as a practical research inquiry that closely reflects university teachers' disciplinary teaching practices and advances their professional development. This study examined the influence of SoTL practice in the Taiwanese context, with particular attention to the Teaching Practice Research Program (TPRP). TPRP is a government grant program that supports individual instructors in conducting SoTL research. By interviewing six university teachers who engaged in the TPRP, we provided evidence that the SoTL inquiry benefited their academic development and professional careers. Two critical areas of impact have been revealed: teaching effectiveness and their professional careers as higher education educators. Participants reported that drawing on evidence from their TPRP projects motivated them to advance their teaching practice to support students' learning, pursue teaching innovation, and teach effectively. Despite encountering structural barriers, such as disciplinary alienation and career stagnation, the instructors maintained a positive attitude. They valued the TPRP for supporting their professional development, driving educational innovation, fostering networking and collaboration with peers passionate about advancing teaching and student learning, and, most crucially, strengthening their identity as higher education educators. Finally, this study suggested a SoTL researcher-friendly culture that encouraged instructors in teaching advancement and accepted their efforts is needed in the current higher education environment.

Keywords: Scholarship of Teaching and Learning (SoTL), teaching practice research program, higher education instructors' professional development

Introduction

The Teaching Practice Research Program (TPRP) is a Taiwanese public grant program that funds higher education teachers to conduct Scholarship of Teaching and Learning (SoTL) research. In this study, university instructors' perceptions of TPRP were examined. In particular, whether participation in the TPRP program would benefit their professional growth and careers as higher education educators was the primary focus. Before delving into this issue, it is necessary to understand the concepts of SoTL and TPRP.

The Scholarship of Teaching and Learning

The Scholarship of Teaching and Learning (SoTL) is a research paradigm that closely reflects university lecturers' teaching practices. In the past 35 years, the concrete definition of SoTL has been debated (Brew, 2012; Hung & Huang, 2022; Hutchings et al., 2013; Hutchings & Shulman, 1999; Kern et al., 2015; Waller & Prosser, 2023). It begins with the concept of the Scholarship of Teaching, proposed by Boyer in 1990, which elaborates on the university faculty's role in research and teaching. However, over the past 35 years, as the higher education landscape has changed, this research paradigm has broadened its definition relative to the original concept.

Hutchings and Shulman (1999) suggested that, in the SoTL inquiry, not only the issue of teaching but also students' learning should be considered. This led to a shift toward SoTL inquiry to advance teachers' teaching and students' learning, both of which are critical (Waller & Prosser, 2023). Secondly, unlike disciplinary research, the SoTL inquiry emphasized researchers' identities as both researchers and teachers, and its primary focus is on addressing actual educational issues in the classroom, particularly by evaluating students' learning outcomes and enhancing their learning effectiveness with the researchers' reflection on the teaching practice (Kern et al., 2015; Trigwell, 2021). Furthermore, its research orientation made SoTL a rigorous process with evidence-based outcomes and critical reflection (Fanghanel, 2013; Hutchings & Shulman, 1999). Combining these features, using Waller and Prosser's definition, SoTL inquiry is:

> a research-informed, evidence-based, critical yet collegial reflection on teaching and learning process, with the aim of improving practice within the aligned disciplines and professions. Most often, SoTL-based research projects are conducted by discipline-based staff inquiring into and reflecting on their own practice to improve their teaching and learning. (Waller & Prosser, 2023, p. 32)

Teaching Practice Research Program

The Teaching Practice Research Program (TPRP) is a government grant program that funds individual university teachers to conduct SoTL research. It was launched in 2017 and was the first grant program for individual lecturers from the Ministry of Education, Taiwan (Fwu & Lee, 2020). The background of the TPRP implementation has several reasons, such as responding to international trends in SoTL research, addressing shortcomings in teaching improvement measures, promoting multi-track faculty promotion, and shaping a SoTL culture in higher education (Chen, 2014; Fwu, 2013; Fwu & Lee, 2020; Huang, 2020; Hung & Huang, 2022).

Like other SoTL practices, the TPRP encourages instructors to identify classroom-based challenges in their educational settings and to utilize evidence-based research to enhance teaching quality and promote students' learning effectiveness (MOE Teaching Practice Research Program, 2024). However, this government grant has distinct features. It has a national project office, established by the MOE, which manages the program's administrative work, reviews, and approves projects. It also emphasizes the role of higher-education institutions, namely universities, in supporting and shaping the SoTL community and network within and across institutions to enable lecturers to conduct SoTL inquiries (Fwu & Lee, 2020; MOE Teaching Practice Research Program, 2024).

Another unique characteristic is its standardized requirements for applicants and the overall scale of funding. The grant requires university faculty members to integrate their SoTL projects into their courses. Instructors may select the option that best aligns with their TPRP research from the courses they teach within 10 subject fields, such as STEM, Social Science, Humanities, or three thematic areas, for example, University Social Responsibility (USR); this option cannot be decoupled from the course content (MOE Teaching Practice Research Program, 2024). From 2018 to 2023, the grant annually subsidized approximately 1,500 university teachers to conduct TPRP across various disciplines (MOE Teaching Practice Research Program, 2024).

TPRP and Professional Development

The current literature on the TPRP generally focuses on its mechanisms and its impact on the Taiwanese higher education landscape. However, little research addresses the TPRP's influence on individual instructors' professional development, particularly from the lecturers' perspective. To bridge this gap, this study provided essential insights into university lecturers' perceptions of the TPRP's impact on teaching effectiveness and on individual instructors' professional growth. Our research question was: Do university teachers perceive that engaging the TPRP benefits their professional development in teaching effectiveness and their careers?

Methodologies

The purpose of this study is to explore university lecturers' perception of the relationship between the TPRP and their professional development as higher education instructors. To gather in-depth insights, this study employed purposive sampling and snowball sampling to recruit participants (Douglas, 2022). Six participants, predominantly from the STEM and Business fields, were involved in the research. All participants had experience conducting their TPRP projects from 2018 to 2023 academic years. Moreover, their teaching experience exceeded three years, with some experienced lecturers having taught for more than ten years in higher education.

Regarding data collection, this study utilized individual, synchronous online interviews with semi-structured questions (Douglas, 2022). The interviews were conducted from May to June 2024. For data analysis, this study employed a reflexive thematic analysis approach (Braun & Clarke, 2019). While reflexive thematic analysis centers on thematic coding, it actively embraces the researcher's "subjectivity" and "reflexivity", recognizing that their understanding of the context inevitably informs the analysis. (Braun & Clarke, 2019, p. 590). Drawing on the researcher's prior experience in managing TPRP projects in higher education institutions, the researcher employed reflexive thematic analysis to conduct rigorous data analysis.

In addition, since the sample size was small, generalizing the result was not the purpose. Instead, the researcher presented multiple perspectives from participants' responses to present their attitudes toward the TPRP, their experiences engaging in TPRP projects, and how this mechanism influenced their professional development (Creswell & Creswell, 2023). Through a diligent qualitative research process, this study obtained valuable information that supports subsequent research findings.

Research Findings

Through systematic investigations, this research highlighted two critical aspects of the TPRP's impact on university teachers' professional development: teaching effectiveness and their professional careers as higher education educators.

Teaching Effectiveness

Within the SoTL inquiry context, the TPRP supported university teachers in reframing their teaching to be student-centered to address classroom problems (Fwu & Lee, 2020; Hung & Huang, 2022). Based on the participants' responses, this could be further divided into strategic methods for promoting student learning and professional growth in teaching. Participants attempted to introduce diverse pedagogies to foster students' active engagement. This included adapting innovative instructional materials to meet the students' needs, dividing the course contents into smaller elements to make the content easier to understand, introducing collaborative learning strategies such as problem-based learning (PBL) to make students acquire and apply knowledge with their peers, and utilizing a flipped classroom to make students actively engaged in the learning process. These strategies were also widely used in TPRP practices within the Taiwanese SoTL inquiry community (Chung & Hsu, 2023; Hung & Huang, 2022).

Utilizing appropriate methods to assess students' learning outcomes was another critical element mentioned by participants (Fanghanel, 2013). For instance, a participant observed that students often believed they had acquired knowledge from lectures or textbook practices without applying it to other contexts. To tackle this issue, the participant collaborated with colleagues in the same field to develop error-type quizzes to promote students' self-correction in acquiring core content knowledge and to enhance engagement in effective learning. According to the participant, this targeted assessment design successfully improved students' overall learning effectiveness. Regarding lecturers' professional teaching development, participants reported that they employed evidence from their TPRP project to support teaching innovation and self-reflection, thereby enhancing their overall teaching effectiveness (Kern et al., 2015). Generally, participants reported that involvement in the TPRP supports both lecturers' teaching and students' learning effectiveness, which aligns with one of the central goals of the TPRP (MOE Teaching Practice Research Program, 2024).

Professional Careers as Higher Education Educators

Compared with overall positive responses regarding the TPRP's impact on advancing instructors' teaching development, participants were less optimistic about their professional careers after participating in the TPRP. Despite participants' concerns about their professional careers, as depicted in the following section, they also discussed how this program benefited their professional development, particularly through continuous teaching innovation, TPRP

networking and collaboration, and the strengthening of their identity as higher education educators.

In their interview responses, participants indicated that, because student composition and areas of focus in higher education changed each year, they had to refine their teaching annually to meet students' needs in a constantly evolving higher education environment. As mentioned, participants continued to adopt innovative pedagogical approaches to improve students' learning outcomes, hence providing opportunities for their professional learning through teaching practice and conducting SoTL inquiry.

Participants also noted another significant impact of the TPRP mechanism. Since providing the SoTL inquiry and teaching innovation workshops or experience sharing activities, held by the established program office, the six regional bases, as well as the institutions, it created a space for those passionate about teaching excellence and SoTL inquiries to exchange ideas, share research insights, and even generated the opportunity to collaborate with their colleagues within and across disciplines. (Fwu & Lee, 2020; Hung & Huang, 2022). Although there is little literature and direct evidence on how these mechanisms have influenced instructors' professional careers, participants in this study indicated that the TPRP community clearly promoted their academic professional development.

Thirdly, and perhaps most significantly, the TPRP strengthened participants' identities as tertiary education educators. Through engagement with the TPRP, instructors recognized that their roles encompass not only expertise in disciplinary research but also a commitment to guiding students in acquiring and applying professional knowledge (Burdick & Hallman, 2022; Nixon et al., 2001). However, this did not mean that participants shifted their identities to teachers and discarded their professional research expertise. In contrast, participants noticed that involvement in the TPRP inquiry facilitated the integration of their disciplinary expertise with their evolving teaching roles.

Structured Challenges and Concerns

While discussing the benefits of professional development for their careers, participants in this study raised several concerns that led them to hesitate to change their career paths to become merely SoTL researchers. Conversely, most participants still prioritized subject-specific research as more important to their careers than SoTL research.

Participants reported that participating in the TPRP required them to adopt different inquiry methods, which required additional time and effort to learn. Especially for those with a STEM disciplinary background, the TPRP or SoTL inquiry was considered a social science or educational inquiry, prompting them to acquire new knowledge of pedagogical theories, educational literature reviews, and social science inquiry procedures and analyses. Those from the business area also encountered a similar difficulty in the SoTL inquiry. Although they invested considerable effort in conducting TPRP research, improving teaching methods, and innovating teaching practices, their contributions were rarely recognized by peers in their disciplines, leading to feelings of disciplinary alienation. Similar findings were reported in Webb and Tierney's (2020) study.

Additionally, at the institutional level, participants encountered career barriers, particularly the lack of recognition for their efforts to advance teaching and to support students' learning effectiveness. This lack of recognition has then hindered their merit, promotion, and even

tenure opportunities, since most higher education institutions still require traditional disciplinary research for career advancement. This forced instructors into a difficult choice: investing time in high-quality SoTL inquiry and teaching innovation or publishing in their core field to gain more credit for career advancement.

Following directly from this career concern is the hesitation to publish their TPRP outcomes in journals or at disciplinary education conferences. Most participants chose instead to prioritize solving immediate classroom problems, thereby limiting the TPRP program's broader scholarly impact and its ability to influence the wider academic community.

Conclusion

This study explored the impact of the Teaching Practice Research Program (TPRP) on the professional development of university instructors in Taiwan. The findings demonstrated significant influence in some key areas, including teaching advancement, professional networking, disciplinary and interdisciplinary collaboration, and an awareness of being an educator who guides students in acquiring and applying disciplinary knowledge. Despite noting that conducting the TPRP, a form of SoTL inquiry, created career barriers due to the lack of formal recognition of their teaching efforts and their identity as SoTL researchers, participants maintained a positive attitude. They valued this governmental funding for its role in driving educational innovation, supporting professional development, and strengthening their identity as both disciplinary experts and educators.

These findings partially align with other research on SoTL and professional development, such as Webb and Tierney's (2020) comparative case study of SoTL practices in teaching-oriented and research-focused universities across two countries, particularly with the transformation of researcher identity and the challenges of career alienation. However, the Taiwanese TPRP is unique due to its top-down mechanism. By funding lecturers to conduct SoTL inquiries, promoting teaching excellence, and collaborating with universities to foster student-centered learning environments, the TPRP Program Office provides a sustained, structural support system that distinguishes the Taiwanese context from other international practices.

Regarding implications, this study suggests that a top-down mechanism benefits in fostering a SoTL researcher-friendly culture within the higher education environment. Currently, the lack of recognition of instructors who engage in the SoTL inquiry and teaching advancement is a primary barrier. Firstly, it undermines university teachers' willingness to prioritize students' learning achievement. Moreover, it hinders institutions' shift in attitudes toward acknowledging instructors' teaching excellence. This includes incentivizing their efforts, such as introducing multi-track promotion and funding for teaching-related research. Such shifts could broaden the impact of SoTL beyond individual classroom practice and influence the wider research-oriented academic community. Although some critical voices might be encountered on its bureaucratic elements, introducing a top-down mechanism from the government and mandatory institutional support might provide a solution to advance SoTL practitioners' teaching practice and to acknowledge their research efforts not only at the institutional level but also across the Taiwanese higher education landscape, thereby recognizing SoTL research as equally important as disciplinary research.

Finally, this study acknowledges certain limitations. The small sample size may not fully represent the comprehensive views of all SoTL researchers involved in the TPRP; however, these in-depth interviews provide valuable qualitative insights into how university instructors'

perceptions of the SoTL inquiry and its influence on their professional development. Secondly, the research scope could be expanded beyond STEM and business fields to the social sciences and humanities, yielding a more comprehensive understanding of lecturers' perceptions. Thirdly, this study did not cover those research-oriented higher education institutions. The perspectives of faculty at research universities are also a topic worth exploring. Further research is recommended to broaden the scales and the coverage of both disciplinary and institutional types.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that Grammarly, an AI-assisted writing tool, and Google Gemini, an AI-assisted technology, were used to proofread and refine the manuscript's language. The usage was limited to correcting grammatical and spelling errors and rephrasing statements for accuracy and clarity. The author further declares that, apart from Grammarly and Google Gemini, no other AI or AI-assisted technologies have been used to generate content in writing the manuscript. The ideas, design, procedures, findings, analyses, and discussion are original and derived from appropriate and systematic conduct of the research.

Creativity in Action: Building Preservice Teachers' Creative Self-Efficacy Through Lesson Design and Implementation

Luecha Ladachart, University of Phayao, Thailand
Ladapa Ladachart, Chiang Mai University, Thailand

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Creativity is a key characteristic for individuals navigating the modern world. As such, teachers are expected to foster creativity in students—directly, by explicitly setting creativity as a learning outcome, and indirectly, by modeling creative behavior in the classroom. In both cases, teachers require creative self-efficacy, or a belief in their own creative ability. Therefore, teacher education programs must cultivate creative self-efficacy in preservice teachers. However, longitudinal research tracking preservice teachers' creative self-efficacy over time remains limited. This study addresses this gap by examining the development of creative self-efficacy in 23 preservice teachers (3 male, 20 female) enrolled in a teacher education program in Thailand. Participants were assessed at the beginning and end of two courses—Course A and Course B—taken in the second and fourth years of the program, respectively. Course A was theory-oriented and focused on instructional methods and lesson planning. More practically, Course B emphasized the design and rehearsal of instruction. A Likert-type questionnaire served as the research instrument. Although the Shapiro-Wilk test indicated that the data were normally distributed ($p > .05$), Mauchly's test revealed a violation of the assumption of sphericity ($p < .05$). Consequently, the Friedman test with Conover's post-hoc comparisons was used instead of repeated-measures ANOVA to analyze the data. The results showed a significant increase in participants' creative self-efficacy during Course B, highlighting the importance of creativity in lesson implementation rather than in lesson design alone. Sources of creative self-efficacy are discussed from a theoretical perspective, and practical implications are proposed.

Keywords: creative self-efficacy, preservice teacher, teacher education, teaching rehearsal

Introduction

Since creativity is crucial for addressing complex problems (Treffinger, 1993), it has been considered one of the essential competences of the 21st century (Newton & Newton, 2014). Consequently, creativity has been established as an educational goal (Fasko, 2001). In pursuing this goal, teachers play a critical role through nurturing students' creativity (Mellou, 1996). To do so, they may adopt various approaches, such as teaching for creativity, creating a classroom environment that supports creativity, and serving as role models of creative individuals (Soh, 2017). Regardless of the approach, teachers need to possess creative self-efficacy (Li et al., 2017)—in other words, they must believe in their own creativity (Nemerzitski & Heinla, 2020). Therefore, to achieve the goal of fostering creativity among young generations, it is imperative that teacher education programs develop teachers' creative self-efficacy so that they can, in turn, facilitate their students' creativity (Paek & Summers, 2019).

Several efforts have been made to develop teachers' creative self-efficacy. For instance, aligning with the notion of "teaching as a design science" (Laurillard, 2012), Henriksen et al. (2020) engaged teachers in designing elements relevant to their work (e.g., curriculum, instruction, and materials). They observed that such activities can help teachers begin "to see themselves as creative individuals" (p. 223). Similarly, Liu et al. (2024) used a design thinking process through which preservice teachers designed instruction, courseware, and micro-lessons. The authors found that this process enhanced preservice teachers' creative self-efficacy. These studies resonate with research—though conducted with K–12 students—indicating that design-based learning provides a context in which individuals use creativity and strengthen creative self-efficacy (Ladachart et al., 2022, 2024). Hence, it is worth examining the potential of design-based learning in the context of teacher education.

Irrespective of whether or not they involve design-based learning, attempts to develop preservice teachers' creative self-efficacy in teacher education programs have tended to focus on individual courses (Eyup, 2023; Liu et al., 2024). Little is known about whether or how preservice teachers develop their creative self-efficacy throughout a teacher education program. To address this gap, research that longitudinally tracks preservice teachers' creative self-efficacy is needed. Situated in the Thai context, the present study focuses on two courses of a teacher education program in which preservice teachers used their creativity in designing lessons. However, the two courses differed regarding whether preservice teachers had opportunities to implement their lessons—that is, whether their creativity was put into action. Altogether, this study offers insights into which elements of the courses are effective in fostering preservice teachers' creative self-efficacy and provides recommendations for advancing teacher education programs.

Literature Review

According to Puente-Diaz (2016), creative self-efficacy is a construct based on the social cognitive theory proposed by Bandura (1982), who defined self-efficacy as "judgements of how well one can execute courses of action required to deal with prospective situations" (p. 122). This notion is based on the premise that the more individuals believe they can succeed at a task, the more likely they are to complete it (Bandura, 1978). Later, Tierney and Farmer (2002) applied the concept of self-efficacy to the context of creative work by defining creative self-efficacy as "the belief one has the ability to produce creative outcomes" (p. 1138). Following Bandura (1978), creative self-efficacy is based on the premise that the more people believe in their creativity, the more likely they are to work creatively. However, because

creativity is relevant across many types of work, other terms, such as “creative confidence” (Kelley & Kelley, 2013), may be used with meanings similar to creative self-efficacy.

Creative self-efficacy is also applied in education (Unal & Tasar, 2021). In this context, teachers are no longer expected to implement pre-developed lessons, but instead design their own lessons that are adaptable to students' learning needs (Jordan, 2016). In doing so, they must harness not only “what is known about teaching to attain the goal of student learning, [but also] the implementation of its designs to keep improving learning” (Laurillard, 2012, p. 1). This process necessitates creativity, as Noddings (2013) notes:

> Teachers do not need to find a method or theory that they will follow slavishly. Rather, they need to analyze a multiplicity of ideas and put their creative power to work in answering questions such as: Where could I use this? For what purpose? With whom? In what context? (p. 210)

From this perspective, teachers are therefore regarded as designers (Henriksen et al., 2020) who use and exercise creativity in their work, for example, to develop curriculum, instruction, and assessments.

Research has demonstrated several benefits of teachers' creative self-efficacy. For example, Cayirdag (2017) found that it is strongly related to teaching behaviors that foster creativity. Similarly, Huang et al. (2019) observed a significant association between creative self-efficacy and positive attitudes toward teaching for creativity. Moreover, Li et al. (2017) revealed that creative self-efficacy mediates the relationship between teachers' proactive personality and their innovative working behaviors. Given these benefits, researchers have recommended developing teachers' creative self-efficacy (Paek & Summers, 2019). In this regard, Creely et al. (2021) suggest providing teachers with opportunities to take risks in creative endeavors. Drawing on Bandura (1978), Mathisen and Bronnick (2009) have emphasized mastery in using creativity, vicarious experiences through observing others using creativity, and persuasion from others to use creativity as primary sources of creative self-efficacy.

The importance of creative self-efficacy has also been recognized among preservice teachers in teacher education programs. Yuce et al. (2023), for example, found that creative self-efficacy is a mediating factor linking metacognitive knowledge with openness to diversity and challenge. Thus, as with teachers working in schools, preservice teachers should be prepared to develop creative self-efficacy (Eyup, 2023). One promising approach is to provide preservice teachers with experience in designing lessons (Liu et al., 2024). This approach aligns well with the notions of “teaching as a design science” (Laurillard, 2012) and “teachers as designers” (Henriksen et al., 2020). However, the extant literature remains limited in identifying which elements in such design-based experiences foster preservice teachers' creative self-efficacy. Recognizing this gap, and considering that tracking preservice teachers' creative self-efficacy across courses involving lesson design could provide valuable insights, the following research question was formulated:

- How do preservice teachers develop creative self-efficacy during teacher education programs, and to what extent do courses involving lesson design contribute to this development?

Methodology

Given its purpose of tracking preservice teachers' creative self-efficacy over time, this study employed a longitudinal methodology (White & Arzi, 2005). According to Arzi's (1988) definition, longitudinal studies are those "in which information on the same subjects was collected at least twice, over a time span of at least one calendar year extending beyond the boundaries of a single school year" (p. 23). In this study, preservice teachers' creative self-efficacy was assessed four times across one and a half years within a teacher education program. Throughout this extended period and within an uncontrolled setting, several factors could have influenced preservice teachers' creative self-efficacy, making casual conclusions about whether the intervention led to the expected-for outcomes unlikely (Tytler, 2009). Hence, this paper aims instead to offer descriptive insights into the development of this aspect. The study's context, participants, and procedures are described in the following sections.

Context

This study was conducted within a four-year teacher education program at a university in northern Thailand. It was a dual-degree program in which preservice teachers simultaneously pursued two bachelor's degrees—one in an academic major and one in education. The academic majors included various disciplines in the sciences (e.g., mathematics, physics, chemistry, and biology) and the liberal arts (e.g., Thai language, English language, music, and dancing art). However, as detailed below, this study focused only on preservice teachers majoring in physics and biology, based on convenience sampling. The program is organized into three semesters each year, except for the final year, which has two semesters. Preservice teachers majoring in physics and biology are required to complete 162 and 165 credits, respectively. These credits are categorized into three groups: general education (39 credits), disciplinary education (87–90 credits), and teacher education (36 credits).

General education includes courses considered necessary for all undergraduates, including preservice teachers in all majors. These courses are organized by the university's Division of Educational Services, concentrated in the first two years of the program, and relate to various dimensions of life, such as language, citizenship, health, personality, aesthetics, technology, and multiculturalism. Disciplinary education comprises courses focused on academic disciplines according to preservice teachers' majors. For those majoring in the sciences, these courses are organized by the university's Faculty of Science. While they focus on developing preservice teachers' scientific knowledge, skills, and attitudes within their majors, they also cover related fields such as mathematics. These courses are evenly distributed in the first two years and double in number in the third year. The first semester of the fourth year is devoted to a seminar and an independent study in the major.

Teacher education includes courses designed to meet the criteria for teaching licensure. These courses are organized by the university's School of Education, have similar content regardless of preservice teachers' majors, and are distributed evenly across the first three years of the program. During the first year, preservice teachers take three courses: an introduction to the teaching profession; educational psychology; and the social, economic, and technological influences on education. In the second year, they take a course on educational technology in the first semester and one on curricular structures and lesson planning in the second semester. In the third year, they take two courses: educational measurement, assessment, and research in the first semester and building relationships with parents and communities in the second. In the

first semester of the fourth year, they take a course on teaching rehearsal. The second semester of the fourth year is devoted to a school-based practicum.

Participants

The targeted group for this study comprised all preservice teachers majoring in physics (N = 6: three males and three females) and biology (N = 31: six males and 25 females). These preservice teachers entered the program in 2021. Using convenience sampling, they were selected because they had taken two courses—one on curricular structures and lesson planning and another on teaching rehearsal—taught by the first author during their second and fourth years, respectively. All but one female agreed to participate in the study, providing consent after being informed of its objective (i.e., tracking their professional identities over time) and committing to provide data for the research. However, due to the long duration of the study, only 23 of the 37 participants completed all four measurements: two females majoring in physics and three males and 18 females majoring in biology. Hence, data from these participants were used to address the research question.

Instrument

The unidimensional scale developed by Karwowski (2016) was used to assess participants' creative self-efficacy. This scale was chosen because it is designed to measure creative self-efficacy in general contexts—that is, it does not specify a particular task requiring creativity. Consequently, the term related to teaching was added to the scale, as indicated by square brackets in Table 1, to better align it with the purpose of the present study. The scale used for this study comprised six items. As in the original, each item asked participants to indicate their level of agreement on a 7-point scale ranging from 1 to 7. After the scale was translated from English to Thai, it was reviewed by three experts and revised to ensure equivalence in meaning between the two languages. The scale was then piloted with 39 preservice teachers at another university. The results indicated that the scale demonstrated acceptable reliability, with a Cronbach's alpha of 0.86 exceeding the standard level (0.70).

Table 1
Items Measuring Creative Self-Efficacy

No.	Item
1	I know I can efficiently solve even complicated problems [related to teaching].
2	I trust my creative abilities [in teaching].
3	My imagination and ingenuity distinguishes me from my friends.
4	Many times, I have proven that I can cope with difficult situations [in teaching].
5	I am sure I can deal with problems [in teaching that require] creative thinking.
6	I am good at proposing original solutions to problems [in teaching].

Data Collection

Data were collected at four timepoints: at the beginning and at the end of two courses—one on curricular structures and lesson planning (hereafter Course A) and another on teaching rehearsal (hereafter Course B). At each timepoint, participants spent about five minutes completing the instruments via a digital platform during class sessions. Given this timeframe, descriptions of each course are worth noting. In Course A, participants learned about the goals and structures of the national curriculum, relevant instructional methods, and how to write a lesson plan. Due to its extensive content, Course A was delivered mainly through lectures and discussions. At the end, each participant created a lesson plan for a final assignment. In Course B, participants created their lesson plans on self-selected topics and took turns enacting those lessons with classmates acting as students. Thus, although both courses required participants to be creative in designing their lessons, they varied in whether participants' creativity was put into action.

Data Analysis

Data were analyzed using descriptive and inferential statistics computed in JASP software (Goss-Sampson, 2020). First, the reliability of the instrument was assessed at each timepoint, resulting in Cronbach's alphas of 0.99, 0.99, 0.98, and 0.94 for the four measurements taken in order. Descriptive statistics were then calculated to obtain the means and standard deviations (SDs) of the scores at each timepoint. Subsequently, inferential statistics were used to compare the means across the four timepoints. Although the data were normally distributed according to Shapiro–Wilk tests ($p > .05$), Mauchly's test indicated a violation of the sphericity assumption ($p < .05$). Consequently, the Friedman test was applied instead of repeated-measures ANOVA (Okoye & Hosseini, 2024). When a significant difference was detected, Conover's post-hoc comparisons were conducted to determine which pairs differed significantly. For all inferential analyses, the significance threshold was set at .05.

Results

Using a Likert-type scale comprising six items, this study examined 23 preservice teachers' creative self-efficacy across four timepoints during their second and fourth years in a teacher education program. Upon averaging the scores on the six items (with a full score of 7), descriptive analyses indicated that participants' creative self-efficacy was rather stable during Course A and before Course B, with means of 4.68 (SD = 1.00), 4.70 (SD = 0.97), and 4.54 (SD = 0.94) at the first, second, and third timepoints, respectively (see Figure 1). However, their creative self-efficacy improved to reach a mean of 5.17 (SD = 0.70) after Course B. The Friedman test revealed a significant difference across these timepoints: ($\chi^2(3) = 13.722$, $p = .003$, with an effect size of 0.20 as calculated by Kendall's W. Conover's post-hoc comparisons indicated that only the mean at the fourth timepoint significantly differed from the means at the previous timepoints. The results of these statistical analyses are summarized in Table 2.

Figure 1

Changes in Participants' Creative Self-Efficacy

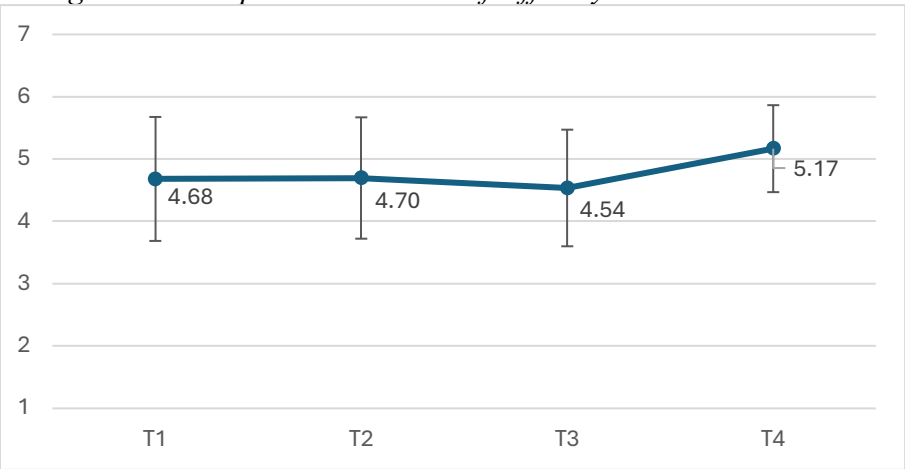

Table 2

Results of Conover's Post-hoc Comparisons

Timepoint		T-Stat	df	W_i	W_j	r_{rb}	p
T4	T1	3.675	66	46.500	75.500	0.729	< .001
	T2	2.155	66	58.500	75.500	0.542	.035
	T3	3295	66	49.500	75.500	0.852	.002

Discussion

This study explored 23 preservice teachers' creative self-efficacy over the course of a teacher education program in Thailand. Data were collected from these participants using a Likert-type scale at four timepoints during their second and fourth years in the program. Statistical analyses revealed that the participants' creative self-efficacy remained relatively stable over time, except during the period when they took a teaching-methods course. Given the lack of longitudinal research on preservice teachers' creative self-efficacy in teacher education programs, this study provides evidence that such programs may not sufficiently support the development of preservice teachers' creative self-efficacy. The lack of this development may, in turn, limit preservice teachers' ability to foster students' creativity (Cayirdag, 2017) through designing innovative lessons, demonstrating creative behaviors, and establishing environments supportive of creativity (Huang et al., 2019; Li et al., 2017).

Since participants' creative self-efficacy improved across Course B but not across Course A, the differing characteristics of these courses warrant special attention. According to Faikhamta et al. (2018), teacher education programs in Thailand have traditionally followed a theory-into-practice model, in which preservice teachers take university-based courses to acquire theoretical knowledge outlined by the Teachers' Council of Thailand (2019) before applying such knowledge in school-based practicums. Thus, most university-based courses emphasize theory over practice (Rupavijetra & Rupavijetra, 2022). With this emphasis on theoretical learning, university-based courses may not provide preservice teachers with sufficient opportunities to exercise their creativity. Consequently, their creative self-efficacy tends to

remain stable throughout the years of university-based coursework, as demonstrated in this study.

However, Course B showed the potential to promote preservice teachers' creative self-efficacy. This course was a teaching-methods course in which participants designed lessons and engaged in teaching rehearsals. This finding aligns with Liu et al. (2024), who found that preservice teachers' creative self-efficacy improves through experiences in designing instructional materials, courseware, and micro-lessons within a course focused on educational technology. In contrast, Course A, which also involved lesson design, did not appear to produce a similar improvement. The different outcomes of these two courses suggest that preservice teachers' creative self-efficacy is more likely to improve when their lesson designs are implemented rather than merely drafted. This explanation can be further understood through considering the sources of self-efficacy in general and the sources of creative self-efficacy in particular.

According to Bandura (1978), individuals develop self-efficacy for any task through four primary sources: mastery experiences, vicarious experiences, social persuasion, and emotional arousal. Similarly, creative self-efficacy develops mainly through these sources in relation to the use of creativity (Mathisen & Bronnick, 2009). In this regard, design provides a context for applying creativity (Ladachart et al., 2022, 2024). Based on these insights, Course B likely offered participants richer mastery experiences in using creativity to design lessons, more opportunities to observe creativity in classmates' teaching rehearsals, and more creativity-supportive feedback than Course A did. These factors may have contributed to the significant improvement in participants' creative self-efficacy across Course B. By contrast, Course A might have offered participants fewer opportunities to experience or observe creativity in their own and others' teaching practice, which could likely explain the absence of a similar increase in their creative self-efficacy.

Implications

The results of this study have several implications. Given that participants' creative self-efficacy remained relatively stable over time, teacher education programs should place more explicit emphasis on developing this characteristic among preservice teachers. As this study and prior research (Eyup, 2023; Liu et al., 2024) have shown, such development can be promoted by providing preservice teachers with opportunities to use creativity in their coursework. Although courses may differ in how creativity is applied (e.g., designing lessons, using educational technologies, or developing assessments), it is crucial that preservice teachers actively engage in creative practices. By doing so, they are likely to gain mastery and vicarious experiences, as well as receive social persuasion to use creativity. Without these resources, preservice teachers are unlikely to develop creative self-efficacy, which reduces their ability to nurture students' creativity—a human asset that is becoming increasingly essential in the 21st century.

Limitations

This study has several limitations. It was conducted in Thailand with a small group of preservice teachers who were conveniently selected; therefore, the results may not be generalizable to other preservice teachers. Moreover, owing to the longitudinal timeframe, it was not possible to fully control conditions under the investigation, and certain threats to validity (e.g., history, maturation, and retesting) may have affected the results (Ohlund & Yu, n.d.). Additionally, a single scale was used to measure creative self-efficacy. Consequently, the

findings of this study should be regarded as descriptive insights rather than definitive conclusions. Further research is needed to examine preservice teachers' creative self-efficacy in other contexts. The results of such studies would help verify or refute the findings of this study, particularly regarding the stability of creative self-efficacy throughout teacher education programs and the impact of creative practices in lesson design and enactment on its development.

Conclusion

Given the crucial role of teachers' creative self-efficacy in promoting students' creativity, this study employed a Likert-type scale to longitudinally explore how 23 preservice teachers developed their creative self-efficacy during the second and fourth years in a teacher education program in Thailand. The findings revealed that their creative self-efficacy generally remained stable over time, with the exception of a teaching-methods course (Course B) that focused on lesson design and implementation. These results suggest that Course B provided a context for applying creativity in practice. Through this engagement, participants had opportunities to gain mastery and vicarious experiences, as well as social persuasion to use creativity, all of which might have contributed to their development of creative self-efficacy. While further research is needed to verify these insights, the study highlights the importance of offering such opportunities in other courses of teacher education programs for such development.

When English Isn't Enough: Rethinking English Teaching in Indonesia Through Overseas Experiences

Andri Maulana, Indian Institute of Technology Patna, India
Smriti Singh, Indian Institute of Technology Patna, India

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

The global expansion of English presents significant challenges for non-native speakers navigating its use across diverse cultural contexts. Pursuing higher education in a foreign country requires skills to adapt and be aware of local cultures to communicate effectively, even when English is used as the medium of interaction. This study examined the communication challenges experienced by Indonesian students studying in India, where English is a second language. The study was grounded in Byram's Intercultural Communicative Competence (ICC) framework, focusing on intercultural knowledge, skills of interpretation and interaction, attitudes, and critical cultural awareness. This study employed a mixed-methods design, utilising a five-point Likert scale and open-ended questions through an online questionnaire to collect the data from Indonesian students in India. The data were analysed using descriptive statistics and content analysis, with ICC levels classified using established scoring criteria. The study involved 55 Indonesian students in India who met the participation criteria. Results showed a high overall level of ICC with a mean score of 3.76. Additionally, language-related challenges were the most prevalent, with 23 students reporting difficulties tied to accents, pronunciation, speech pace, and unfamiliar vocabulary. Cultural differences affected 21 students, who had difficulty interpreting body language, gestures, tone, and physical interaction norms, while 11 students reported no communication challenges during their stay in India. These findings suggest that language proficiency alone is insufficient without intercultural awareness; therefore, short-term pre-departure intercultural training and the long-term integration of cultural competence into English learning are needed to better support students' communication experiences abroad.

Introduction

English now functions as a global lingua franca, enabling communication among speakers from diverse linguistic and cultural backgrounds. Rather than belonging to a single nation, English has evolved into multiple localised forms influenced by speakers' identities, experiences, and cultural norms. As a result, communication in English does not rely on native-speaker norms but adapts to context, intention, and mutual understanding. This dynamic use of English reflects its possible and pluralistic nature, where meaning-making depends not only on grammar and pronunciation, but also on intercultural awareness and the ability to negotiate meaning across cultural differences.

Indonesia and India share similarities as culturally rich, multilingual nations with long histories of diverse ethnic groups and local languages. However, the role and status of English differ significantly in each context. In India, English holds the status of an associate official language alongside Hindi and is widely used for administration, higher education, and interethnic communication (Dwivedi, 2015; Sharma, 2019). In contrast, Indonesia positions English as a foreign language with limited presence in everyday communication and institutional use (Daflizar et al., 2022). This is reflected in national proficiency data, where Indonesia ranks 80th out of 116 countries globally and 12th out of 23 countries in Asia (English First, 2024), with proficiency concentrated mainly in urban areas in Java. These distinctions highlight that while both countries engage with English, its functional role in society and daily interaction differs considerably.

Amid these contextual differences, an increasing number of Indonesian students are pursuing higher education in India. This situation presents an opportunity to explore how Indonesian students who come from a country where English is a foreign language navigate communication in a multilingual environment in India. A successful communication abroad requires not only linguistic competence but also intercultural sensitivity and adaptability. Insight from such research can inform English language teaching in Indonesia, encouraging a shift from traditional linguistics-focused instruction toward a more communication-oriented and interculturally responsive pedagogy.

Theoretical Framework

In the context of globalisation, individuals across countries are increasingly connected through international mobility, technology, education, and economic exchange (Sarwari et al., 2024). This interconnectedness has expanded cultural encounters, making diversity more visible and enabling a broader exchange of values, perspectives, and experiences (Abdalla & Mohammed, 2020). As cross-cultural interactions become more common, the role of cultural awareness grows increasingly significant, particularly for intercultural speakers who must be capable of recognising, understanding, and responding to cultural differences (Permatasari & Andriyanti, 2021). The development of intercultural competence influences how individuals think, behave, and perceive themselves and others, shaping their ability to interact meaningfully within diverse social contexts (Gutiérrez-Santiuste & Ritacco-Real, 2023).

Byram's (1997) Intercultural Communicative Competence (ICC) model provides a comprehensive framework for understanding the skills required to navigate intercultural encounters. His model consists of five key components: knowledge of one's own and others' cultures, attitudes of curiosity and openness, critical cultural awareness for evaluating cultural practices and perspectives, skills of interpreting and relating cultural meanings, and skills of

discovery and interaction, which enable individuals to engage in intercultural dialogue effectively. This framework positions language learning not merely as linguistic mastery but as a process that integrates cultural understanding, interpretation, and socially responsive communication.

Milton J. Bennett's Developmental Model of Intercultural Sensitivity (DMIS) conceptualises intercultural awareness as a developmental progression from ethnocentrism to ethnorelativism (Bennett, 1993). Bennett's DMIS further explains this growth as a staged progression. The model consists of two major orientations: ethnocentrism, which includes denial, defense, and minimisation, where individuals view their own culture as central and struggle to recognise or value differences; and ethnorelativism, consisting of acceptance, adaptation, and integration, where cultural differences are acknowledged, respected, and incorporated into one's thinking and behaviour. Together, these theoretical perspectives underscore that intercultural communication necessitates more than linguistic proficiency; it demands an evolving capacity to perceive, interpret, and engage with cultural diversity in ways that foster understanding, mitigate miscommunication, and promote respectful global interaction.

Research Question

Building on the increasing need for intercultural competence in global communication and the theoretical perspectives, this study aims to explore how intercultural communicative competence concepts manifest in real intercultural contexts. To align theory with lived experience, the research focuses on Indonesian students in India and examines two key aspects:

1. What is the level of Indonesian students' intercultural communicative competence using English in India?
2. What is the communication challenge faced by Indonesian students in India?

Research Methodology

This study employed a mixed-methods research design, combining quantitative and qualitative approaches through a survey conducted using a questionnaire. The data were collected by circulating a questionnaire via Google Forms from July 2 to 11, 2025. The questionnaire consisted of 22 questions addressing the intercultural communicative competence (ICC) of Indonesian students and their experiences communicating in English in India, along with an open-ended question regarding the communication challenges they encountered in the Indian context.

The participants of this study are Indonesian students studying in India from various academic levels, including Bachelor's, Master's, and Doctoral programs. Those participants have been staying in India for at least six months, as per the participants' criteria.

The data analysis employed descriptive quantitative and content analysis to interpret the findings. The ICC level was determined by calculating the mean score following the classification used by Saricoban and Oz (2014) and Shevimel-Shania (2020): low (1.0–2.4), moderate (2.5–3.4), and high (3.5–5.0).

Findings and Discussion

Participants' Demographic Data

A total of 125 Indonesian students were reported to be studying in India across bachelor's, master's, doctoral, and student-exchange programs from June 2024 to May 2025. 104 out of 125 students were successfully contacted in July 2025, since several students had completed their studies. Based on the inclusion criteria, 82 students qualified to participate, having lived in India for at least six months. The questionnaire was distributed to all eligible students, and 55 responded voluntarily. Among the participants, 30 were male (53.6%), and 25 were female (46.4%). In terms of academic level, 12 students (21.4%) were enrolled in bachelor's programs, 31 (55.4%) in master's programs, and 12 (23.2%) in doctoral programs.

Students' ICC Level

The reliability test showed a Cronbach's alpha value of .933, demonstrating excellent internal consistency. All 22 questionnaire items were confirmed as valid, with significant correlations at the 0.01 and 0.05 levels (2-tailed). The overall Intercultural Communicative Competence (ICC) level of participants was high, with a mean score of 3.76.

Students' Challenge in Daily Communication

The communication challenges reported by the participants varied across language and cultural factors. The most common issue was language-related, particularly accent and pronunciation difficulties, reported by 13 students, who noted challenges understanding Indian or other non-native English accents. Another 10 students mentioned difficulty following conversations due to fast speech and unfamiliar vocabulary, including slang and mixed Hindi–English expressions. Cultural differences also played a role, with 8 students reporting confusion related to body language, gestures, and physical interaction norms, such as interpreting the Indian head movement or differing expectations for personal space. Additionally, 13 students experienced challenges related to communication styles, including directness, interruptions, and differing interpretations of tone or friendliness. Meanwhile, 11 students reported no communication difficulties during their experience in India.

Table 1
Students' Communication Challenges

Communication Challenge Category	Sub-category	Number of Students	Few Samples of Students' Answers
Language	Accent/ Pronunciation	13	• Understanding different English accents, especially Indian or other non-native accents, was difficult at first. I often had to ask people to repeat themselves (Student 20) • The accent and how they pronounce the words are a bit challenging for people who come to India for the first time (student 42) • I still can't really adjust to my friends' accent (student 18)
	Speak too fast and Unfamiliar word/phrase	10	• Sometimes they speak too fast and use some words that I have never heard of (student 1) • Some friends speak very fast, especially when they're excited. It can be hard to catch everything they're saying in real-time (student 21) • Use of local slang and Hinglish. Many of my Indian friends mix Hindi and English in conversations. Sometimes I don't understand the slang or Hindi phrases they use, which makes it hard to follow the conversation (student 18)
Cultural Difference	Body language/ gesture	8	• Sometimes don't understand their body language (student 11) • How they treat foreigners like me, in case of touching, I mean, in India, they (guys) are common to touch the other guy, but in Indonesia, that thing is absurd and weird (student 29). • Understanding when a head bobble means "yes," "maybe," or "I have no idea what you just said." It was like learning a new dialect without subtitles (student 46)
	Others	13	• In Indonesia, we tend to be more indirect and polite when expressing disagreement. But I noticed that some of my friends from other countries are more direct, which sometimes felt too blunt or confusing (student 22) • Some people sometimes cut my sentences when I tried to explain something which they thought was right (student 33) • Our different speech intonations often make me misunderstood (student 45) • I feel that when women are overly friendly (smiling often) to men, it is considered that we are flirting (student 50)
No challenge		11	• I don't face any difficulty (student 12) • There are no issues (student 5) • No problem (student 6)

Table 1 illustrates that 80% of all participants (44 students) faced communication challenges in various categories, 42% (23 students) in the language challenge category and 38% (21 students) in the cultural differences category. Meanwhile, 20% of all participants (11 students) faced no communication challenges.

Recommendations and Program Development

Competency in intercultural communication is a crucial aspect that enables individuals to observe, be open, interpret, and relate effectively, as well as be critically aware of cultural differences. Moreover, applying intercultural communication competency in daily interactions results in effective intercultural dialogue. On the other hand, intercultural sensitivity, according to Bennett's DMIS, reveals how an individual perceives themselves in relation to others.

The findings highlight that English proficiency alone does not guarantee successful communication, as students with high ICC levels still experienced challenges that required greater tolerance and acceptance of cultural differences. The results show that, although students understand the importance of ICC, the findings in Table 1 (samples of students' answers) reflect limited intercultural sensitivity, as several students viewed cultural differences through an ethnocentric lens and struggled to acknowledge or value diversity. This suggests that language competence must be supported by intercultural awareness to facilitate more effective and meaningful communication and minimise misunderstanding.

To address the intercultural sensitivity issues, short-term and long-term programs can be designed to strengthen preparatory programs for students before they study in India. Therefore, based on the findings, this study suggests implementing a short-term pre-departure intercultural program to address students' limited intercultural sensitivity despite their awareness of ICC. Given that English proficiency alone was insufficient and some students exhibited ethnocentric orientations, an online pre-study program is proposed for Indonesian recipients of Indian government scholarships, as their dispersed geographic locations make offline implementation impractical. The program should introduce India as a multicultural and multilingual society, highlight local language diversity, and emphasise cultural similarities between India and Indonesia to foster openness and tolerance. This initiative could be jointly coordinated through collaboration between the Indonesian and Indian Ministries of Education or their respective embassies, thereby strengthening students' intercultural awareness and preparedness prior to their academic mobility.

As a long-term strategy, this study recommends integrating intercultural competence into English language instruction in the Indonesian English teaching curriculum, particularly within communication-oriented courses, to systematically develop students' intercultural awareness. Given that English in the Indonesian context is primarily used for interaction with speakers of other nationalities, embedding cultural competence into English learning can better prepare students for intercultural communication and support the development of sustainable intercultural communication competence.

Conclusion

In conclusion, although students demonstrate a high level of intercultural communicative competency, they continue to experience challenges, particularly related to language differences such as accent and intonation, as well as cultural variations in gestures and

communication styles. These findings indicate that English proficiency alone is not enough and must be complemented by intercultural awareness to minimise misunderstanding. Therefore, integrating cross-cultural learning into English education and providing structured pre-departure preparation programs are essential. Future collaboration with Indonesian and Indian institutions could support the development of a specialised cross-cultural short course to better prepare students for intercultural interaction

Promoting Professional Identity and Cross-Cultural Understanding in Cabin Crew Education Through Instagram-Style Simulation Reports

Wan-Ling Lo, National Taipei University of Technology, Taiwan
Ming-Hsiu Tsai, National Taipei University of Technology, Taiwan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study employs an action research method to examine the effectiveness of Instagram-style simulation reports in enhancing learning motivation, professional identity, and cross-cultural understanding among aviation service students. Twenty-three students from a university aviation service department (including two students with special learning needs) participated in two cycles of Look-Think-Act action research, engaging in Instagram posting tasks centered on role-playing and cultural themes. Students portrayed their ideal flight attendant roles by wearing professional attire for photographs and writing accompanying captions. In the second phase, they selected specific international routes and incorporated cultural hashtags to demonstrate cross-cultural service competencies. Quantitative results revealed mean scores of 4.18, 4.27, and 4.17 for learning motivation, professional identity, and cross-cultural understanding, all exceeding the 4-point threshold. Qualitative analysis identified a three-stage professional identity development process: surface attraction, operational awareness, and value internalization. The multimodal and interactive design effectively promoted student engagement, with special needs students demonstrating strong adaptability by overcoming traditional text-based barriers through visual expression. This research suggests that the cyclical refinement process of action research may enhance teaching effectiveness, and that Instagram simulation reports could promote professional identity and cross-cultural competency development. The findings provide empirical evidence for innovative and inclusive pedagogical approaches in aviation and vocational education. Future research could expand to diverse cultural backgrounds and institutional settings, incorporating AI tools for more objective learning behavior analysis.

Keywords: professional identity, cross-cultural understanding, aviation service education

Introduction

The core objective of aviation service education is to cultivate students' cross-cultural communication skills and professional competencies, as flight attendants function as critical intermediaries between airlines and international passengers, requiring high cultural sensitivity and adaptable service skills (Bennett, 2009). Following the recovery of the global aviation industry post-pandemic, route diversity and passenger culture have steadily increased, resulting in more complex service challenges (IATA, 2023). Action research, emphasizing iterative cycles of practice and reflection, has been extensively applied in vocational education to enhance students' professional identity and learning outcomes (Meihami & Werbińska, 2022).

However, traditional aviation service education still faces challenges, including limited language proficiency, insufficient learning motivation, and restricted cross-cultural understanding, which hinder some students from developing professional identity and intercultural skills (Perrodin et al., 2024). While social media presents innovative teaching opportunities that enhance student engagement and self-expression, there remains a gap in systematically applying such strategies for university-level aviation students, especially those with special learning needs, to improve learning efficacy (Ganjoo et al., 2021).

This study primarily employs an action research approach to investigate the effects of Instagram-style simulation reports on aviation students' learning motivation, professional identity, and cross-cultural understanding. Particular attention is given to the participation experiences of students with special learning needs. Through role-playing, cultural themes, and multimodal design, this study explores how these elements impact professional development and cross-cultural competency, aiming to provide an innovative, inclusive, and evidence-based teaching model that fosters diversity in aviation education (Aydin, 2019; Deci & Ryan, 2008; Yiu et al., 2022).

Literature Review

Learning Motivation Theory

Learning motivation critically influences student engagement and academic performance. Self-Determination Theory (SDT), proposed by Deci and Ryan (2008), identifies autonomy, competence, and relatedness as three fundamental psychological needs that foster intrinsic motivation. When educational environments satisfy these needs, students demonstrate increased engagement and sustained motivation. SDT has been widely applied in vocational education, with studies confirming that autonomy-supportive teaching strategies significantly enhance students' motivation and professional identity (Bui et al., 2017; Bureau et al., 2021). For students with limited language proficiency or learning difficulties, creative and inclusive learning environments are essential to boost participation and self-efficacy (Deci & Ryan, 2008). Emotional support from teachers and peers can alleviate anxiety in special needs students, improving their motivation and resilience. Inclusive education and diverse support systems have been shown to enhance the learning engagement and life quality of students with disabilities (Vasyukov et al., 2024).

Creative Learning and Simulation-Based Teaching

Simulation-based learning is proven effective in vocational education for enhancing practical skills and professional identity. Role-playing and contextual simulations facilitate decision-

making and interaction in realistic settings, reinforcing motivation and confidence (Schunk, 2012). In aviation education, simulation trainings improve operational skills, decision-making, and situational awareness while reducing risks and costs (TEM Journal, 2023). The use of multimedia and visualization tools further stimulates interest and creativity, increasing student engagement (Ganjoo et al., 2021). This study employs Instagram-style simulation reports combined with multimodal expression and role-playing to demonstrate potential for promoting autonomous learning and professional identity. Students creatively use images and texts to express their understanding of occupational roles, thereby enhancing motivation and supporting multimodal approaches in vocational training.

Cross-Cultural Competence and Aviation Service

Cross-cultural competence encompasses cultural awareness, emotional sensitivity, and behavioral adaptation, essential for high-quality aviation service (Gudykunst, 2005). Simulated cross-cultural scenarios, such as role-playing and cultural context simulations, effectively enhance cultural understanding, communication skills, and empathy among students (Wendorf Muhamad & Yang, 2019). Social media platforms like Instagram offer real-time interaction and cultural exchange, facilitating the development of language strategies, multi-modal expression, and intercultural communication skills (Alvarez Valencia & Benavides, 2019; Ganjoo et al., 2021). Therefore, this study integrates social media with simulation-based learning and designs cultural-themed tasks to promote students' comprehension, respect, and application of diverse cultural service concepts.

Application of Social Media in Education

Social media's network characteristics and multimodal functions provide highly interactive and creative learning environments. Instagram notably increases student engagement and sense of community in digital courses (Ganjoo et al., 2021). Short videos and instant interaction strategies enhance learning time and outcomes (Song et al., 2022). As digital natives, Generation Z students are especially adept at adjusting to these platforms. Arnold and Paulus (2010) found that experiential learning via social media strengthens knowledge internalization and collaborative learning, fostering learning communities. This study applies this concept in vocational education, using Instagram simulation reports as innovative teaching media, aiming to create interactive learning environments aligned with digital natives' learning habits.

Research Method

Research Design

This study adopts Stringer's (2008) action research model, which consists of three iterative stages: Look, Think, and Act, to investigate the effects of Instagram-style simulation reports on aviation students' learning motivation, professional identity, and cross-cultural understanding. To enhance scientific rigor, mixed quantitative and qualitative methods were integrated. Two teaching cycles were conducted from September 2024 to January 2025, allowing continuous revision and improvement of instructional strategies.

Participants

Participants included 23 aviation service students (13 females, 10 males) from a university, with an average age of 21 years. The cohort included two students with special learning needs

(one with a specific learning disability and one with autism spectrum disorder). To protect privacy during qualitative analysis, these students are referred to as Special Student 1 (SS1) and Special Student 2 (SS2). Aligned with Stringer's (2008) participatory principles, students acted as co-constructors of knowledge, with their feedback directly informing instructional adjustments.

Data Collection Instruments and Procedures

Look Phase

Three scales measured student outcomes:

1. Learning Motivation assessed via Guay et al.'s (2000) Situational Motivation Scale, covering intrinsic and extrinsic motivation.
2. Professional Identity measured with an aviation service-specific scale adapted from Yu et al. (2021).
3. Cross-Cultural Understanding evaluated based on Chen and Starosta's (2000) Intercultural Sensitivity Scale.

Each scale comprised five items scored on a 5-point Likert scale from strongly disagree (1) to strongly agree (5). Surveys were administered anonymously post-instruction.

Students completed Instagram format simulation reports:

1. In the first cycle, students role-played as ideal flight attendants, wearing uniforms and posting photos with captions expressing their occupational perceptions and expectations.
2. In the second cycle, students selected flight routes (e.g., Japan, Middle East) and incorporated cultural hashtags (e.g., #ramadanservices) in posts to demonstrate multicultural service awareness.

These reports facilitated detailed analysis of students' learning trajectories and self-presentation.

Think Phase

1. Descriptive statistics (mean, SD, range) and internal consistency (Cronbach's α) were computed using Stata 17.0 to identify factors influencing motivation, identity, and cultural understanding, guiding qualitative inquiry (Stringer, 2008).
2. Braun and Clarke's (2006) six-step thematic analysis was employed, including data familiarization, coding, theme development, review, definition, and reporting. Emphasis was placed on SS1 and SS2's feedback and behavior observations. Student representatives participated in reflection meetings to ensure diverse perspectives. Triangulation of quantitative, qualitative, and classroom observations enhanced the validity and applicability of findings.

Act Phase

Teaching activities in the first cycle focused on enhancing students' intercultural sensitivity through multi-national flight scenarios, requiring Instagram posts portraying professional images and service concepts. In the second cycle, based on reflective feedback, cultural integration and innovative service design were emphasized. Students compared dietary habits,

etiquette, and service needs across different cultures to foster communication skills and empathy (Ganjoo et al., 2021).

To deepen professional identity, Instagram simulation scoring criteria were refined per student feedback. Classroom sessions incorporated professional language training, service demeanor, and workplace scenario simulations, encouraging internalization of professional roles.

Overall, the action process involved ongoing monitoring and iterative adjustments through student feedback, thematic analysis, and observations, ensuring teaching strategies adapt dynamically to meet learners' needs and embody the continuous growth ethos of action research cycles (Stringer, 2008).

Results

Quantitative Analysis

A total of 23 valid questionnaires were collected. The average scores for learning motivation, professional identity, and cross-cultural understanding were 4.18 (SD = 0.31), 4.27 (SD = 0.42), and 4.17 (SD = 0.39), respectively. The Cronbach's alpha values for the three dimensions were 0.62, 0.79, and 0.87, indicating good reliability for the professional identity and cross-cultural understanding scales (Guay et al., 2000; Yu et al., 2021). All scores exceeded 4, demonstrating a generally positive evaluation by students of the Instagram simulation report and a high level of learning acceptance.

Comparing the two teaching cycles, professional identity scores significantly improved in the second cycle, demonstrating the effectiveness of iterative instructional adjustments. Special needs students (SS1 and SS2) exhibited upward trends, especially in cross-cultural understanding, supporting the inclusive benefits of multimodal teaching (Rose & Meyer, 2002). An initially low score observed in the first cycle, linked to a lack of sufficient support for a special needs student, improved notably after targeted instructional support was provided, reflecting the positive impact of action research cycles on learning outcomes (Deci & Ryan, 2008).

Qualitative Analysis

Thematic analysis following Braun and Clarke's (2006) six-phase procedure identified three core themes highlighting changes in students' motivation, professional identity, and intercultural understanding, supported by special student cases.

Motivation: From Extrinsic to Intrinsic Engagement

Students generally felt the Instagram simulation report offered a more engaging and creative learning experience, with feedback noting it was more enjoyable and motivating than traditional reports. This shift from extrinsic task completion to intrinsic self-driven engagement aligns with self-determination theory's internalization process (Ryan & Deci, 2020). The introduction of cultural-themed tasks in the second cycle reinforced professional commitment and responsibility by linking assignments to career aspirations (Cesario et al., 2022).

Professional Identity: Immersive Three-Stage Construction

Students' professional identity development followed three phases:

1. Surface attraction, initially drawn by visible aspects like uniforms and service demeanor;
2. Operational awareness, understanding the technical skills and responsibilities involved in aviation service;
3. Value internalization, embracing service as a personal mission and core value.
4. This progression exemplifies the practice-reflection spiral model proposed by Kemmis et al. (2014). The second cycle's service presentation task accelerated students' shift from observation to enactment and internalization, deepening professional role awareness.

Cross-Cultural Understanding: From Knowledge to Empathic Action

Beyond memorizing cultural facts such as dietary restrictions, students developed empathic, situational strategies to bridge communication gaps, for example using eye contact and smiles to overcome shyness. This movement from cultural cognition to cultural action supports Chen and Starosta's (2000) intercultural sensitivity model. Instagram's hashtag interactions (e.g., #ramadanservices) encouraged students to actively investigate cultural contexts, bolstering learner autonomy and cross-cultural agility.

Special Students Participation: Inclusive Practice of Action Research

SS1 (learning disability) relied on peer and teacher support to complete visual tasks, expressing that photograph-based work was easier and more enjoyable. His work was adopted as a teaching exemplar in the second cycle, embodying the collaborative co-construction spirit of action research (Stringer, 2008).

SS2 (autism) utilized digital tools and structured steps to craft culturally themed posts, demonstrating digital media's potential to support learners balancing freedom with structure (Odom et al., 2010).

Both showed marked improvement in cross-cultural understanding and self-expression in the second cycle. Class observations and interviews highlighted the crucial roles of ongoing teacher-student interaction and peer support in fostering engagement (DuPaul et al., 2022). The iterative reflection and adjustment of the action research process ensured the inclusion of marginalized voices, affirming the empirical value of inclusive education.

Discussion

Transformation of Learning Motivation in Action Research Cycles

This study reveals that Instagram-style simulation reports, as a multimodal learning tool, effectively facilitate the internalization of students' learning motivation within Stringer's (2008) Look-Think-Act cyclical framework. Students shifted from passively completing assignments to actively exploring professional roles and self-realization, consistent with the psychological needs for autonomy, competence, and relatedness emphasized in Self-Determination Theory (Deci & Ryan, 2008).

Within the action cycles, continual reflection and adjustments led to higher levels of creativity and autonomy in the second cycle. Students proactively researched cultural variations in service contexts during hashtag assignments and demonstrated creative expressions of intercultural understanding. This transformation encapsulates the core spirit of action research: learning becomes more adaptive and generative through reflective practice and re-engagement.

Immersive Construction of Professional Identity

Students' professional identity developed progressively through three phases: surface attraction, operational awareness, and value internalization. The role-playing facilitated by the Instagram simulation created a low-risk, highly contextualized environment for professional exploration, enabling students to safely embody the professional identity without the anxiety or apprehension possible in traditional internships.

This immersive process helped students move from visual interest to conceptual understanding, culminating in an internalized professional value system. Notably, students with special learning needs exhibited distinct learning pathways and modes of expression, demonstrating that multimodal teaching provides effective inclusive support, fostering professional identity construction. Reflective feedback further deepened students' commitment to their vocational mission, shifting focus from external appearance to internalized values.

Contextual Development of Cross-Cultural Understanding

Instagram's interactive hashtag feature offers unique educational value in cross-cultural learning. Students not only acquired cultural knowledge but also developed practical empathic strategies, such as using smiles to bridge language barriers and adapting tone according to passenger cultural backgrounds. This capacity to translate knowledge into action aligns with the knowledge internalization and situated practice pathways detailed in action research theories (Kemmis et al., 2014).

Additionally, the digital platform's algorithmic content push created an implicit curriculum effect, exposing students to broader cultural content and prompting active inquiry into hashtag conventions (e.g., #ramadanservices). This phenomenon suggests new pedagogic approaches for integrating digital media in vocational education.

Limitations and Future Directions

The study's limitations include a small sample size (n=23) and reliance on some self-reported data, which may introduce subjectivity. Future research should extend to diverse nationalities and institutions to evaluate the generalizability of this teaching method. Integrating AI and digital tools for analyzing Instagram interaction analytics could provide more objective insights into learning motivations.

Conclusion

This study preliminarily validated the educational effectiveness of Instagram-style simulation reports in aviation service education through an action research approach. The findings indicate that this instructional strategy supports improvements in students' learning motivation, professional identity, and cross-cultural understanding. Qualitative evidence further highlights how elements of autonomy, creative expression, and role-playing within the curriculum

enhance learner engagement. The multimodal and interactive design especially provides additional support and participation opportunities for students with special learning needs, helping to overcome traditional language and expression barriers.

However, limitations such as a small sample size and the study's timeframe necessitate further investigation across diverse backgrounds, larger samples, and prolonged instructional practice. Future research is recommended to expand to students from different nationalities or institutions and to incorporate AI and other digital tools for objective analysis of learning behaviors and interaction data. Developing fair evaluation metrics for visual and creative outputs will also help recognize diverse modes of learner performance.

Overall, this study contributes a novel, inclusive teaching model grounded in empirical evidence for aviation and wider vocational education. It encourages future research to continue exploring the potential and challenges of digital native pedagogies, thereby advancing innovative and equitable educational development.

Chemistry Laboratory Engagement: STEM Students' Perceptions, Confidence, and Career Aspirations

Paul John D. Tiangco, National University, Philippines

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

The growing demand for STEM professionals underscores the importance of effective laboratory-based instruction in senior high school science education. This descriptive–correlational study investigated the perceptions, confidence, and motivations of 465 Grade 12 STEM students from NU Fairview, Inc. toward face-to-face chemistry laboratory activities, with particular emphasis on the role of gender and academic specialization. Data was collected through a structured survey instrument and analyzed using descriptive statistics and inferential statistics. Findings indicate that students generally perceive chemistry laboratory work as an essential and engaging component of learning. Positive engagement was strongly associated with hands-on experimentation, peer collaboration, instructor support, and the perceived relevance of laboratory tasks to real-life and future careers. While students reported high confidence in basic laboratory procedures and safety practices, comparatively lower confidence was observed in higher-order skills such as problem-solving, data analysis, and interpretation of results. Statistical analysis revealed no significant differences in perceptions, confidence, or motivation when grouped by gender, suggesting an inclusive laboratory learning environment. However, academic specialization significantly influenced students' levels of engagement and self-assessed performance, particularly in laboratory tasks aligned with their chosen STEM track, such as Allied Health or Engineering. The study recommends strengthening instructional strategies that emphasize analytical thinking and data interpretation, improving time management during laboratory sessions, and contextualizing experiments to align with students' academic specializations. These findings provide practical insights for educators aiming to enhance chemistry laboratory pedagogy and better prepare students for future STEM pathways.

Introduction

In the Philippines, the demand for professionals in science, technology, engineering, and mathematics (STEM) continues to rise, reflecting both national development goals and global workforce needs. To help meet this demand, educators are working to strengthen science education by providing meaningful learning experiences, particularly in the laboratory setting. Chemistry laboratory activities are seen not only as instructional tools but also as powerful platforms for developing critical thinking, problem-solving abilities, and a deeper understanding of scientific concepts. As the world becomes more technologically advanced, the importance of preparing students through active, inquiry-based learning has never been greater.

Hands-on laboratory work plays a vital role in shaping how students perceive and engage with science. Yet, despite its significance, limited studies have deeply examined how students' perceptions of chemistry lab experiences influence their interest and participation in face-to-face settings. Finne et al. (2022), for instance, studied the impact of shifting from laboratory instruction to online theoretical tasks during the COVID-19 lockdown. Their findings revealed that students struggled with the absence of physical lab work, which hindered their understanding of how scientific knowledge is produced. However, the study did not explore students' perceptions upon returning to in-person laboratory environments.

Similarly, Antonio (2018) highlighted that science teaching has long been rooted in experimentation and laboratory-based activities. While this affirms the instructional value of labs, there remains a gap in research examining students' attitudes toward hands-on chemistry lab work in the post-pandemic educational landscape. This is particularly relevant, as recent shifts in modality may have altered students' views and emotional responses toward science learning.

In a more recent study, Ramirez (2023) explored Grade 12 STEM students' experiences in a blended chemistry laboratory setup. The study emphasized the benefits and challenges of transitioning between online and physical settings. Although informative, it fell short of investigating how these shifts shaped students' behavioral engagement, such as their motivation, participation, and focus during in-person lab activities.

Furthermore, while previous works (e.g., Bernhard, 2018; Bretz, 2019; Pacifico & Prudente, 2021; Reid & Shah, 2007) acknowledge the value of laboratory instruction in building scientific inquiry skills and cognitive competencies, few studies have explicitly linked these experiences to students' future career aspirations in STEM. There is a pressing need to understand how early, meaningful lab work can influence students' decisions to pursue science-related professions.

Given these gaps, this study aims to explore the perceptions, attitudes, behavioral engagement, and career motivations of STEM students in the context of face-to-face chemistry laboratory work. By taking this approach, the research aims to support the creation of more responsive and inspiring STEM education programs aligned with contemporary learner needs.

Variation Theory and Social Cognitive Theory in Understanding Chemistry Laboratory Learning

This study is grounded by two theoretical foundations—Variation Theory and Social Cognitive Theory (SCT)—to explore how senior high school STEM students perceive and engage with chemistry laboratory work, and how these experiences shape their attitudes, behaviors, and aspirations toward future careers in science. Variation Theory, developed by Ference Marton, highlights that meaningful learning happens when learners experience differences or changes in key features of a concept. These variations help students focus on what truly matters. In the chemistry laboratory setting, this could mean observing how different variables affect a reaction or how techniques yield different results. Such experiences encourage deeper understanding by helping students distinguish the core ideas from superficial ones (Kullberg et al., 2017; Orgill, 2012). In this way, the lab becomes more than a place to follow instructions—it becomes a space for critical thinking, inquiry, and discovery.

However, while understanding how students grasp scientific concepts is important, it's equally crucial to consider why they engage—or disengage—in the learning process. This is where Albert Bandura's Social Cognitive Theory (1986) becomes relevant. SCT explains how students' confidence, motivation, and career goals are shaped not only by what they know, but also by their beliefs about their abilities, their learning environment, and the people around them. In the context of laboratory work, a student's positive or negative experiences can strongly influence whether they see themselves as future scientists or whether they feel capable of succeeding in a science-related path.

By combining these two theories, this study offers a more complete picture of laboratory learning. Variation Theory helps explain the cognitive aspects of learning—how students come to understand chemical concepts through differences in lab experiences—while Social Cognitive Theory sheds light on the personal and social aspects of learning, including confidence-building and future aspirations.

This dual framework supports the design of chemistry laboratory experiences that are not only intellectually rigorous but also personally meaningful, fostering both scientific understanding and a stronger sense of identity and purpose among future STEM professionals.

Statement of the Problem

This study aims to describe and analyze the perceptions, attitudes, and motivations of general chemistry 2 students towards laboratory work in face-to-face settings, including the factors influencing their enjoyment, confidence, and future career aspirations in science of STEM senior high school students from NU Fairview during the academic year 2023–2024. Specifically, it sought to answer the following questions:

1. What is the demographic profile of the respondents in terms of:
    a. Sex and;
    b. Specialization
2. How may the chemistry laboratory work of the respondents be described in terms of:
    2.1. Perceptions
    2.2 Confidence
        2.2.1 Attitude
        2.2.2 Behavior
    2.3. Future career aspirations

3. Is there a significant difference in the chemistry laboratory work of the respondents when grouped according to their profile?

Methodology

This study employed a descriptive-correlational research design to explore the perceptions, confidence (attitude and behavior), and motivation of Grade 12 STEM students regarding laboratory work, as well as to examine differences based on demographic factors such as gender and specialization. This design allowed the researchers to measure naturally occurring differences among groups without manipulating variables, providing insights into how students' attitudes, behaviors, and motivation relate to their engagement in laboratory activities and future career aspirations.

The participants consisted of 465 Grade 12 STEM students from NU Fairview, Inc., selected through purposive sampling to ensure that respondents had prior exposure to laboratory work in their general chemistry 2 subject. Students' sex (male or female) and specialization (Allied Health, Architecture, Engineering, and ICT) were recorded to investigate whether these factors influenced perceptions, confidence, and motivation.

A structured survey questionnaire was utilized to measure the main variables: perceptions of laboratory work, confidence in performing laboratory tasks (attitude and behavior), and motivation toward laboratory activities. Each variable was assessed using validated 4-point Likert-type items (4 = Very High Extent, 1 = Very Low Extent). The instrument underwent a pilot test with 30 students from a different section, yielding a Cronbach's alpha of 0.70, indicating acceptable internal consistency.

The survey was administered electronically via Microsoft Forms, ensuring convenience, accuracy, and secure data collection. Respondents were informed of the study's objectives, their voluntary participation, and their right to withdraw at any time. All responses were anonymized and stored in password-protected files, in compliance with the Data Privacy Act of 2012 (RA 10173).

Data was analyzed using SPSS. Descriptive statistics—including percentage, standard deviation, and weighted mean—were used to summarize students' perceptions, confidence, and motivation. Independent samples t-tests were conducted to determine differences between male and female respondents, while one-way ANOVA was used to identify differences across specializations. These analyses provided insights into whether demographic factors influenced students' laboratory experiences and attitudes.

Results and Discussion

Table 1
Demographic Profile of the Respondents

	Male		Female		Total	
	N	*%*	*N*	*%*	*N*	*%*
Specialization						
Allied Health	40	8.60	169	36.34	209	44.94
Architecture	15	3.23	39	8.39	54	11.62
Engineering	97	20.86	26	5.59	123	26.45
ICT	59	12.69	20	4.30	79	16.99

The table shows a total of 211 male and 254 female respondents, indicating a higher number of female participants in the STEM field. Furthermore, most of the respondents belong to STEM sections specializing in allied health, followed by those in the engineering specialization.

Table 2

Chemistry Laboratory Work of Respondents in Terms of Perceptions

Indicators	WM	SD	VI
a. I find chemistry laboratory work to be an essential part of my STEM education.	3.59	0.573	VHE
b. I feel that the chemistry laboratory sessions are well integrated with the theoretical concepts taught in lectures.	3.41	0.585	VHE
c. I believe that chemistry laboratory work helps me better understand scientific principles.	3.5	0.613	VHE
d. I find that the chemistry laboratory equipment and materials provided are adequate for my learning needs.	3.53	0.557	VHE
e. I think that the structure and organization of the chemistry laboratory sessions are effective.	3.41	0.613	VHE
f. I enjoy participating in chemistry laboratory work.	3.61	0.543	VHE
g. I find that chemistry laboratory work stimulates my interest in the subject matter.	3.53	0.605	VHE
Total	3.51	0.451	VHE

Note. WM – Weighted mean, VI – Verbal interpretation, 3.26 – 4.00 = To a Very High Extent (VHE), 2.51 – 3.25 To a High Extent (HE), 1.76 – 2.50 = To a Low Extent (LE), and 1.00 – 1.75 = No Extent at All (NE)

The table demonstrates a very strong and consistently positive perception of chemistry laboratory work as part of their STEM education, as reflected by the overall weighted mean of 3.51 (SD = 0.451), interpreted as Very High Extent. All indicators received very high ratings, indicating that students view laboratory activities not only as an essential component of their curriculum but also as an effective means of reinforcing theoretical concepts discussed during lectures. High ratings for enjoyment and interest stimulation suggest that laboratory work plays a significant role in sustaining student engagement and curiosity in chemistry. Additionally, students' perceptions of adequate laboratory equipment, effective organization, and strong integration with scientific principles highlight the supportive learning environment provided during laboratory sessions. Collectively, these findings suggest that well-structured and resource-supported laboratory instruction enhances conceptual understanding, promotes positive learning experiences, and strengthens students' appreciation of chemistry as a core discipline within STEM education.

Table 3
Chemistry Laboratory Work of Respondents in Terms of Attitude

Indicators	WM	SD	VI
a. I feel confident in my ability to perform chemistry laboratory experiments accurately.	3.06	0.655	HE
b. I can solve problems that arise during chemistry laboratory work effectively.	3.05	0.623	HE
c. I am comfortable using the various instruments and tools in the chemistry laboratory.	3.2	0.614	HE
d. I am confident in my ability to follow chemistry laboratory protocols and safety procedures.	3.39	0.596	VHE
e. I believe I can interpret and analyze experimental data accurately.	3.08	0.668	HE
f. I feel prepared to tackle unexpected challenges during chemistry laboratory sessions.	3.12	0.671	HE
g. I feel that my chemistry laboratory skills have improved significantly since I started my STEM program.	3.34	0.608	VHE
Total	3.18	0.486	HE

Note. WM – Weighted mean, VI – Verbal interpretation, 3.26 – 4.00 = To a Very High Extent (VHE), 2.51 – 3.25 To a High Extent (HE), 1.76 – 2.50 = To a Low Extent (LE), and 1.00 – 1.75 = No Extent at All (NE)

The Table presents the respondents' attitudes toward chemistry laboratory work in terms of confidence and perceived competence, with an overall weighted mean of 3.18 (SD = 0.486), indicating a High Extent of positive attitude toward their laboratory skills. This finding suggests that students generally feel capable and prepared to participate in chemistry laboratory activities as part of their STEM education. The highest confidence levels were observed in following laboratory protocols and safety procedures (WM = 3.39, SD = 0.596) and in the perceived improvement of laboratory skills since entering the STEM program (WM = 3.34, SD = 0.608), both interpreted as Very High Extent, implying that regular laboratory exposure and structured instructional support have effectively strengthened students' procedural competence and laboratory self-efficacy. In contrast, indicators related to solving problems that arise during experiments (WM = 3.05, SD = 0.623) and interpreting and analyzing experimental data (WM = 3.08, SD = 0.668) obtained comparatively lower, though still High Extent, ratings. This pattern indicates that while students are confident in executing standard laboratory procedures, they may encounter challenges in tasks requiring higher-order analytical reasoning and independent decision-making, highlighting the need for instructional approaches that more deliberately emphasize problem-solving and data interpretation within laboratory activities.

Table 4
Chemistry Laboratory Work of Respondents in Terms of Behavior

Indicators	WM	SD	VI
a. I feel that the complexity of the experiments affects my enjoyment of chemistry laboratory work.	3.3	0.633	VHE
b. I am more motivated when I receive support and guidance from laboratory instructors.	3.38	0.612	VHE
c. I enjoy chemistry laboratory work more when I collaborate with my peers.	3.48	0.598	VHE
d. I feel motivated when the experiments are relevant to real-world applications.	3.37	0.602	VHE
e. I find the feedback I receive on my laboratory work constructive and helpful.	3.3	0.64	VHE
f. I feel that the time allocated for laboratory sessions is sufficient to complete the experiments.	3.01	0.828	HE
g. I feel that the laboratory environment and ambiance positively influence my motivation.	3.26	0.639	VHE
Total	3.3	0.471	VHE

Note. WM – Weighted mean, VI – Verbal interpretation, 3.26 – 4.00 = To a Very High Extent (VHE), 2.51 – 3.25 To a High Extent (HE), 1.76 – 2.50 = To a Low Extent (LE), and 1.00 – 1.75 = No Extent at All (NE)

The table illustrates students' behavioral responses toward chemistry laboratory work in terms of motivation, engagement, and learning environment, with an overall weighted mean of 3.30 (SD = 0.471), indicating a Very High Extent of positive behavior during laboratory sessions. Students reported the highest levels of motivation when collaborating with peers (WM = 3.48, SD = 0.598), receiving guidance from instructors (WM = 3.38, SD = 0.612), and engaging in experiments with clear real-world relevance (WM = 3.37, SD = 0.602), highlighting the role of social interaction, instructional support, and contextualized learning in fostering active participation. These behavioral factors appear to reinforce students' confidence in the laboratory, as supportive and collaborative environments encourage students to attempt tasks, address challenges, and apply learned skills more effectively. Although most indicators were rated to a Very High Extent, the adequacy of time allotted for laboratory sessions received a comparatively lower rating (WM = 3.01, SD = 0.828), suggesting that time constraints may limit opportunities for deeper engagement and reflection, which are essential for strengthening confidence in problem-solving and analytical tasks. Overall, the findings suggest that positive laboratory behaviors, particularly collaboration and instructor support, are closely linked to students' confidence and active engagement, while improved time management may further enhance both learning outcomes and self-efficacy in chemistry laboratory work.

Table 5

Chemistry Laboratory Work of Respondents in Terms of Future Career Orientations

Indicators	WM	SD	VI
a. I feel that my experience in chemistry laboratory work has positively influenced my career aspirations in STEM.	3.26	0.704	VHE
b. I see chemistry laboratory skills as crucial for my future career in science or engineering.	3.17	0.757	HE
c. I feel that chemistry laboratory work has helped me clarify my specific career goals within STEM.	3.16	0.736	HE
d. I believe that my chemistry laboratory experience will make me more competitive in the job market.	3.12	0.73	HE
e. I feel that my interest in pursuing a research-oriented career has increased because of chemistry laboratory work.	2.98	0.805	HE
f. I feel that my chemistry laboratory experience has made me consider pursuing further studies in my field course.	3.08	0.735	HE
g. I feel that my chemistry laboratory experience is preparing me well for my future career.	3.19	0.712	HE
Total	3.14	0.62	HE

Note. WM – Weighted mean, VI – Verbal interpretation, 3.26 – 4.00 = To a Very High Extent (VHE), 2.51 – 3.25 To a High Extent (HE), 1.76 – 2.50 = To a Low Extent (LE), and 1.00 – 1.75 = No Extent at All (NE)

The table indicates a generally positive perception, with an overall weighted mean of 3.14 (SD = 0.62), interpreted as High Extent. The highest-rated item (WM = 3.26, SD = 0.704, VHE) reflects students' recognition that laboratory experiences have positively influenced their career aspirations in STEM, suggesting that hands-on engagement helps them connect current learning to long-term professional goals. Other indicators, including the perceived importance of laboratory skills for future science or engineering careers (WM = 3.17), the clarification of specific STEM career goals (WM = 3.16), and preparation for competitiveness in the job market (WM = 3.12), all fall within the High Extent range, highlighting students' acknowledgment of the practical and strategic value of laboratory experiences in shaping employability and professional readiness. Additionally, items related to fostering interest in research-oriented careers (WM = 2.98) and motivating further studies (WM = 3.08) suggest that while laboratory work encourages broader STEM career engagement, there remains room to enhance students' enthusiasm for research pathways. Overall, these findings indicate that chemistry laboratory experiences not only reinforce technical competence and confidence but also serve as an influential factor in students' career planning, goal setting, and aspirations within STEM fields, emphasizing the need for more targeted support, mentorship, and exposure to research-oriented opportunities to fully cultivate students' career readiness and professional interests.

Table 6
Test of Difference on Chemistry Laboratory Works

	Sex	Specialization
	P-Value	*P-Value*
a. Perceptions	0.310	0.013
b. Attitude	0.322	0.018
c. Behavior	0.777	0.006
d. Future career aspirations	0.369	0.000

Note. The P-value in sex is computed using independent t-test, P-value in specialization is computed using one-way ANOVA, level of significance is 0.05.

H_o1: There is no significant difference in the chemistry laboratory work of the respondents when grouped according to their sex.
H_o2: There is no significant difference in the chemistry laboratory work of the respondents when grouped according to their specialization.

The table indicates that the calculated p-value for the chemistry laboratory work of the respondents, when grouped by sex, did not show statistically significant differences in the chemistry laboratory work between male and female respondents. Therefore, the hypothesis 1 is accepted when grouped according to sex. On the other hand, there is a statistically significant difference in the chemistry laboratory work of the respondents when grouped according to their specialization. In other words, the specialization of the respondents has a significant impact on their performance in the chemistry laboratory work.

Conclusion and Recommendation

This study provides empirical evidence supporting the pedagogical value of face-to-face chemistry laboratory instruction in senior high school STEM education. Overall, students demonstrated positive perceptions of laboratory work as a critical instructional component that enhances conceptual understanding and facilitates the application of theoretical knowledge. While confidence in procedural and technical laboratory skills was consistently high, the findings indicate comparatively lower confidence in higher-order competencies, particularly problem-solving, data analysis, and interpretation of results. These competencies are central to scientific reasoning and warrant deliberate instructional emphasis within laboratory settings.

Student motivation toward laboratory participation was strongly associated with collaborative learning environments, instructor facilitation, and the perceived relevance of experiments to real-world and career contexts. Although students generally recognized the role of laboratory experiences in supporting STEM career aspirations, the results suggest that existing laboratory practices may not fully capitalize on their potential to stimulate sustained interest in research-oriented pathways. Furthermore, while gender did not significantly influence students' perceptions or confidence, differences observed across STEM specializations highlight the importance of discipline-relevant laboratory contexts in shaping engagement and perceived performance.

Based on these findings, several evidence-based recommendations are proposed. First, laboratory curricula should integrate structured opportunities for problem-solving and data interpretation to strengthen analytical and scientific reasoning skills. Second, appropriate time allocation and pacing of laboratory activities should be reviewed to maximize student engagement and depth of learning. Third, institutions are encouraged to provide early and

authentic research exposure through inquiry-based projects, mentorship, and research-linked laboratory experiences. Fourth, laboratory activities should be contextualized to align with students' STEM specializations to enhance relevance and learning outcomes. Finally, sustained efforts to maintain gender-inclusive laboratory environments remain essential to ensuring equitable participation and long-term STEM engagement.

Exploring Student Needs for Overseas Programs Through Collaboration With International Exchange Partnerships

Rodger Williamson, The University of Kitakyushu, Japan
Yumiko Shibata, The University of Kitakyushu, Japan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

The Covid-19 pandemic significantly reshaped attitudes toward study abroad among university students enrolled in study-abroad-required curricula, while simultaneously disrupting established international mobility programs such as student exchange and overseas study. At the same time, higher education institutions worldwide accelerated the development of domestic and online alternatives for international learning, including virtual exchange and collaborative online international learning. This proceedings paper examines changes in student perceptions of study abroad during the pandemic and explores how international programs were sustained through a combination of institutional support and long-standing human networks among faculty and partner institutions. Drawing on both quantitative and qualitative data, the study analyzes cultural dynamics of communication in cross-cultural learning, with particular attention to uncertainty avoidance and individualism–collectivism. The findings indicate that pandemic conditions heightened uncertainty avoidance in intercultural communication, influencing student engagement and expectations in both physical and online international programs. In addition, a case study of the Galway–Kitakyushu exchange program demonstrates how research-based relationships and sustained faculty collaboration contributed to the resilience and continuity of international exchange during periods of disruption. By highlighting the complementary roles of structural frameworks and interpersonal academic networks, this study contributes to ongoing discussions of international higher education, student mobility, and the long-term sustainability of exchange programs in the post-pandemic era.

Keywords: study abroad, Covid-19, international exchange, intercultural communication, virtual exchange, student mobility

Introduction

International exchange programs in higher education are shaped not only by institutional policies and funding frameworks but also by long-standing human connections among researchers, faculty, and partner institutions. This proceedings paper, based on a presentation delivered at The Asian Conference on Education 2025, examines student attitudes toward study abroad during the Covid-19 pandemic and explores how international programs were sustained through both structural support and personal academic networks. In addition to quantitative and qualitative data on student perceptions, this paper highlights the Galway–Kitakyushu exchange program as a case study demonstrating how research-based relationships can develop into durable international education initiatives.

Institutional Context and History of International Exchange at The University of Kitakyushu

The city of Kitakyushu is located on the northern tip of the southern island of Kyushu. The city of Kitakyushu is in South Japan close to Fukuoka with easy connections to larger cities of Kyoto, Osaka and Tokyo with close proximity to Korea across the Japan Sea. The cities of Moji and Kokura joined with three other cities of Tobata, Yahata, and Wakamatsu to form the city of Kitakyushu in 1963. It now has a population of around 1 million people being the 13th largest city in Japan. Historically known for steel, metal, and shipping industries, it is becoming a force in producing new computer software, automobile technology and environmental technology. Once one of the most polluted cities in Japan, Kitakyushu has worked hard to clean its air and water, and in recent years has won international recognition for its contribution to the environment. It was named and Environmental Model City in 2008.

The university was founded as Kokura Foreign Affairs College in 1946 to promote peace and international exchange at the end of World War II. The foundation of the university is a testament to the pursuit of international understanding and exchanges out of the ashes of war. If it had not been for billowing black smoke from the third air raid on the city of Yahata on August 8, 1945, Kokura would have most likely been the primary target of the second atomic bomb that was dropped on Nagasaki the next day on August 9, 1945. The mayor at that time proclaimed that the new college would be an institution of peace and that students would learn the languages of former adversaries for peace and reconciliation, so the college started with English and Chinese studies as primary subjects. Kokura was in complete ruin and students even cleared the grounds of debris as they studied. Thanks to the persistent efforts of former president Oshima, the Ministry of Education finally gave its approval, and it accepted its first incoming class in 1946. It was miraculous as the college was still faced with almost insurmountable odds in its actualization. It faced financial hurdles, and the city opened a profession bicycle racing track, now a horse racing track, to bring in more revenue. Thus, the university's primary monorail entrance is now the Keibajo racing station. Today, The University of Kitakyushu now consists of six facilities and four graduate schools. There are around 6700 students of which around 300 are international students.

In 1958, an exchange of gifts prompted the cities of Moji, Japan and Norfolk, Virginia to begin a sister-city relationship. This motivated Moji's neighboring city, Kokura, to apply for their own sister-city in 1959, and Kokura was matched with the city of Tacoma, Washington. In 1964, the newly formed city of Kitakyushu proudly continued its relationships with Norfolk and Tacoma. That same year, eight years before the normalization of diplomatic relations between Japan and China in 1972, then Prime Minister Zhou Enlai ordered the establishment

of an institute based on the prospect that Japanese-language personnel would be needed when Japan and China would establish diplomatic relations in the future. The University of Kitakyushu and Dalian University of Foreign languages just celebrated the 30th anniversary of their exchange programs in November 2019. The 25th anniversary of the exchange program between Cardiff University was celebrated with the arrival in Kitakyushu of the Wales national rugby union team in Kitakyushu during the 2018 World Cup. Yuji Yamazaki, professor emeritus and former director of the Centre for International Education and Exchanges at The University of Kitakyushu, was instrumental in the establishment of the earliest exchange programs with China and the U.S. and U.K. While watching 15,000 citizens cheer on the Welsh rugby team in 2018 he remarked, "The seed that I planted has now grown into something that I am very proud of."

The University of Kitakyushu has been a dynamic center of higher education and international exchange for more than 70 years in the Kyushu region of Japan. In its pursuit of internationalizion and global connections, the university has established ties through agreements with Australia, China, Canada, Korea, the U.K., the U.S., Singapore, Thailand, Vietnam and, most recently, Cambodia, Germany, Malaysia, and the Republic of Ireland. The University of Kitakyushu has regularly received high national and prefectural rankings for its study abroad programs. It currently has approximately 30 partnerships in more than 13 countries. Approximately 230 students can join yearly outbound programs. The university currently has student exchange agreements with partners including Australia, the UK, America, Canada, and Europe including France, Germany and the Republic of Ireland. When exchange agreements are established, the university offers specialized courses along with Japanese language programs through the Center for International Education and Exchange to incoming students from partner universities.

The Center for International Education and Exchange and Department of English work together to provide exchange students with various experiences and opportunities for international on campus and extracurricular activities. One major goal of the university is to provide incoming students from overseas partners with Japanese language courses. Three areas of Japanese instruction are offered at five to six different including Life Japanese for basic communication, Campus Japanese which allows students to function at the university and Academic Japanese for taking classes and courses in Japanese. In this respect, students are given the opportunity to enroll in classes with undergraduate Japanese students. Students are encouraged to get involved and experience Japanese cultural activities so Japanese language courses are accompanied with Japanese Culture classes. Students can experience various facets of traditional culture such as Ikebana, Japanese music, the tea ceremony, calligraphy, and traditional dance.

The Department of English works with the Center for International Education and Exchange to offer subjects taught in English. As the level of English within the Department of English is rather high, a diverse selection of advanced courses taught in the English language are also offered to international students for the purpose of credit exchanges at their home institutions. To explain in further detail, there are three different areas of courses. Language and Linguistics focuses on gaining abilities to understand language, language theory, with a focus on those students who with to become English teachers. Society and Culture offers courses in American Studies, Literature, Introduction to Film, Literature and Theatre. Global business obviously focuses on business with all courses offered in English. Thus students can mix their education at The University of Kitakyushu between Japanese and in-depth English courses as well. This made possible by diverse staff of educators from Britain, America, Australia, Canada, and of

course Japanese nationals who are all bilingual and well equipped to offer academic and professional courses in English.

The university was designated as part of the Ministry of Education's Global Human Resources Project in 2013 and received a special to expand global programs and partnerships before being faced with the challenges of the global pandemic. A major result of this was the reformation of the Department of English to provide the staffing allows the university to provide Japanese and international students with a diversity of course offerings that are not common at most public intuitions in Japan. Before the Covid-19 pandemic, the growth of international partnerships and the numbers of outgoing students attending exchange and study abroad programs was steadily increasing because of the enhanced educational environment created by collaboration and cooperation between the Center for International Education and Exchange and The Department of English.

Impact of Covid-19 on Study Abroad Participation

In the decade preceding the Covid-19 pandemic, the number of Japanese students studying abroad increased steadily. According to data from the Ministry of Education, Culture, Sports, Science and Technology (MEXT), the number of outbound Japanese students more than tripled between 2009 and 2019, supported by national initiatives aimed at fostering global human resources. The Covid-19 pandemic caused an unprecedented disruption to international mobility. Border closures, visa restrictions, and program cancellations resulted in a dramatic decline in outbound study abroad participation in 2020 and 2021. Similar trends were observed in other countries, including China, where student interest in overseas study declined sharply during the same period.To examine how these disruptions affected student attitudes, online surveys were conducted at The University of Kitakyushu in October 2021 and June 2022 using Microsoft Forms. The surveys targeted students enrolled in programs for which study abroad is a curricular requirement and addressed students' intentions, priorities, and concerns regarding international programs.

Cultural Interpretation of Student Attitudes

Survey results indicated a gradual recovery of interest in overseas programs by 2022 as travel restrictions eased. At the same time, students placed increased emphasis on cost, program content, and support systems when selecting international programs. Students who opted for domestic alternatives frequently cited financial constraints, health concerns, uncertainty related to the pandemic, and family consent as determining factors.

These findings can be interpreted through Hofstede's cultural dimension of uncertainty avoidance, which characterizes Japan as a society with a strong preference for structure and predictability. The pandemic intensified uncertainty avoidance tendencies, underscoring the importance of clear communication, predictable procedures, and visible support structures in the design of international exchange programs (Hofstede et al., 2010).

Collaborative Online International Learning During the Pandemic

In response to restrictions on physical mobility, The University of Kitakyushu implemented collaborative online international learning (COIL) as an alternative to on-site study abroad. Using synchronous online tools, students engaged in academic collaboration with overseas partner universities during a period when physical exchange was largely impossible.

Qualitative analysis of student reflections identified three main themes: active involvement in discussions, cultural perceptions, and challenges in language communication. These findings suggest that while COIL cannot fully replace physical mobility, it can provide meaningful intercultural learning experiences during periods of global disruption (Ikeda, 2020; Lenkaitis et al., 2019).

The Galway–Kitakyushu Exchange Program: Research Origins and Human Connections

A central case study presented in this paper is the academic exchange program between The University of Kitakyushu and the University of Galway in Ireland. The origins of this partnership are closely linked to long-term research connections centered on the Irish writer Lafcadio Hearn, whose life and work bridged Ireland, the United States, and Japan. Scholarly collaboration and academic networks developed through Hearn research served as the initial catalyst for institutional exchange.

The Galway–Kitakyushu agreement facilitates reciprocal student mobility, enabling Japanese students to study in an English-speaking academic environment while offering Irish students opportunities for Japanese language study and cultural immersion in Kitakyushu. The program exemplifies how international exchange initiatives are sustained not only through formal agreements but also through enduring human relationships among researchers, faculty members, and administrators.

Japanese students studying in Galway benefit from comprehensive advisory support, including guidance on applications, visas, housing, and academic integration. Orientation programs and ongoing support from international offices, counseling services, and language assistance help students navigate academic and social adjustment. At the same time, students face challenges related to independent housing, cultural differences in classroom participation, and financial pressures such as currency fluctuations.

Discussion: Sustainability of Exchange Programs Through Human Networks

The Galway case underscores a central argument of this paper: international exchange programs are maintained through human connections as much as through institutional structures. Research ties, faculty engagement, and sustained communication play a critical role in addressing challenges such as pandemic-related disruptions, housing shortages, and administrative complexity. These human networks complement institutional frameworks and contribute to the long-term sustainability of exchange programs.

Conclusion

This proceedings paper has examined changes in student attitudes toward study abroad during the Covid-19 pandemic, the role of collaborative online international learning, and the significance of human connections in sustaining international exchange programs. The Galway–Kitakyushu partnership demonstrates how research-based relationships can evolve into durable educational collaborations. Together, these findings suggest that resilient international education requires both structured institutional support and strong interpersonal networks.

Official Conference Proceedings

Abstract

Lifelong learning is a central goal of contemporary education systems, yet many initiatives remain fragmented across formal schooling, informal learning, and community engagement. This paper examines Klongsan MAKE, a community-embedded initiative in the Khlong San district of Bangkok, Thailand, positioning hands-on making as a continuous learning practice spanning schools, a district-based maker hub, and local community networks. The study builds on long-term observations indicating persistent gaps in making skills and experiential learning, followed by qualitative field research involving 11 schools in Khlong San and nearby districts, teachers, students, and community partners. Using participatory observation, in-depth interviews, and co-creation workshops, the research investigates how making functions as a lifelong learning mechanism by supporting continuity, learner agency, and integration across formal and informal learning contexts. Findings indicate that Klongsan MAKE strengthens conceptual understanding of STEAM and develops lifelong learning dispositions, including hands-on confidence (reduced fear and embarrassment in trying, failing, and iterating), curiosity, problem-solving, collaboration, and self-directed exploration. The initiative also reshapes educators' roles and activates community members as co-learners, mentors, and facilitators. The paper argues that lifelong learning is most effectively cultivated when making is embedded within place-based ecosystems rather than confined to classrooms or specialized facilities. Klongsan MAKE is proposed as a replicable, area-based model for developing lifelong learning ecosystems through accessible, community-driven making practices.

Keywords: lifelong learning, maker culture, steam education, hands-on learning, place-based learning ecosystems

Introduction

Lifelong learning has become a critical paradigm for navigating rapid technological, social, and economic change. Rather than viewing learning as limited to childhood or formal schooling, lifelong learning emphasizes continuity, adaptability, and the capacity to learn across the lifespan. International frameworks further emphasize that lifelong learning systems require cross-sector coordination, linking education, community development, and local governance, so that learning becomes embedded in everyday urban life rather than confined to institutions (UNESCO Institute for Lifelong Learning [UIL], 2015). Despite its prominence in policy discourse, however, lifelong learning often remains weakly connected to everyday educational practice, particularly in school-based systems.

In many contexts, formal education continues to prioritize curriculum coverage and assessment, leaving limited space for experiential learning that supports curiosity, agency, and self-directed learning. At the same time, informal learning environments, such as maker spaces, community workshops, and creative hubs, often operate separately from schools. This separation produces fragmented learning pathways and weak continuity between what learners do in school and what they learn through everyday life, an issue learning city approaches explicitly seek to address through inclusive access, community participation, and sustainable local learning ecosystems (UIL, 2015). Research on how learning works also suggests that sustained learning depends on motivation, appropriate practice opportunities, supportive learning climates, and learners' ability to connect prior knowledge with new experiences (Ambrose et al., 2010).

This paper examines *Klongsan MAKE* as a response to these challenges. Developed in the Khlong San district of Bangkok, the initiative reframes hands-on making not merely as a pedagogical tool for STEAM education, but as a *lifelong learning practice* connecting children, teachers, community members, and makers within a shared learning ecosystem. The initiative aligns with learning city logic by mobilizing local actors and spaces, schools, community settings, and maker hubs, as distributed learning infrastructure (UIL, 2015). The study addresses three research questions.

1. How can hands-on making support lifelong learning dispositions across age groups?
2. What ecosystem conditions enable continuity between formal and informal learning?
3. How can community-based making contribute to sustainable lifelong learning systems?

Lifelong Learning and Community-Embedded Making

Lifelong learning is commonly defined as learning that occurs throughout life, across formal, non-formal, and informal settings. Central to lifelong learning are learner agency, motivation, and the ability to learn how to learn through habits of inquiry, reflection, and adaptation (UIL, 2015). Hands-on making aligns strongly with these aims because it requires exploration, iteration, and reflection, processes that mirror how individuals learn beyond formal schooling. Contemporary maker education research positions making as a participatory culture where learning emerges through designing, building, and sharing artifacts in socially supported environments (Halverson & Sheridan, 2014; Martin, 2015). This social dimension is consistent with sociocultural learning theory, which emphasizes how learning develops through interaction, mediation, and shared meaning-making with others (Vygotsky, 1978), and with communities of practice perspectives that frame learning as increasing participation in shared practices over time (Wenger, 1998).

In addition, practical learning design guidance suggests that effective learning environments should offer multiple modes of engagement, not only "classroom instruction," but also activity-based learning, learning through collaborative work, and learning embedded in everyday contexts (Office of Knowledge Management and Development [OKMD] & TK Park, n.d.). Such variety is also reflected in research and practice examples that treat the city itself as a learning platform, where public space can be redesigned to support participation, play, and inclusive access (Vertiz, 2020), and where restorative approaches strengthen community relationships through shared civic life and local collaboration (Roe & McCay, 2023). These perspectives position making not as a temporary instructional strategy, but as a sustainable learning mode that can cultivate lifelong learning dispositions over time.

Research Context: Khlong San as a Lifelong Learning Space

Khlong San is an urban district in Bangkok characterized by social diversity, creative economic activities, and strong community identities. Schools coexist alongside local crafts, small businesses, cultural institutions, and creative hubs. This mix creates fertile conditions for exploring lifelong learning beyond institutional boundaries and for situating making within everyday urban life, an approach consistent with creative city thinking that links learning, creativity, and local development (Thailand Creative & Design Center [TCDC], 2012).

Despite these assets, schools in the area face constraints common to dense urban settings, including limited space and facilities, rigid schedules, and pressure to meet curricular demands. Meanwhile, maker-oriented institutions such as FabLab Bangkok and the KX Building possess technical expertise and resources but may remain peripheral to everyday learning if not systematically connected to schools and communities. Klongsan MAKE emerged as an attempt to connect these domains by treating the district itself as a lifelong learning environment where learning can flow between schools, community spaces, maker facilities, and public events (UIL, 2015). Workshops were intentionally delivered across both school campuses and the KX/FabLab hub to enable learning continuity, shared access to tools, and repeated engagement beyond one-off classroom activities. In parallel, Klongsan MAKE was designed as a district-level support system, planning for a tool-lending mechanism, a reuse-material inventory, and gradual maker space expansion, to reduce barriers to participation and sustain making as an everyday lifelong learning practice.

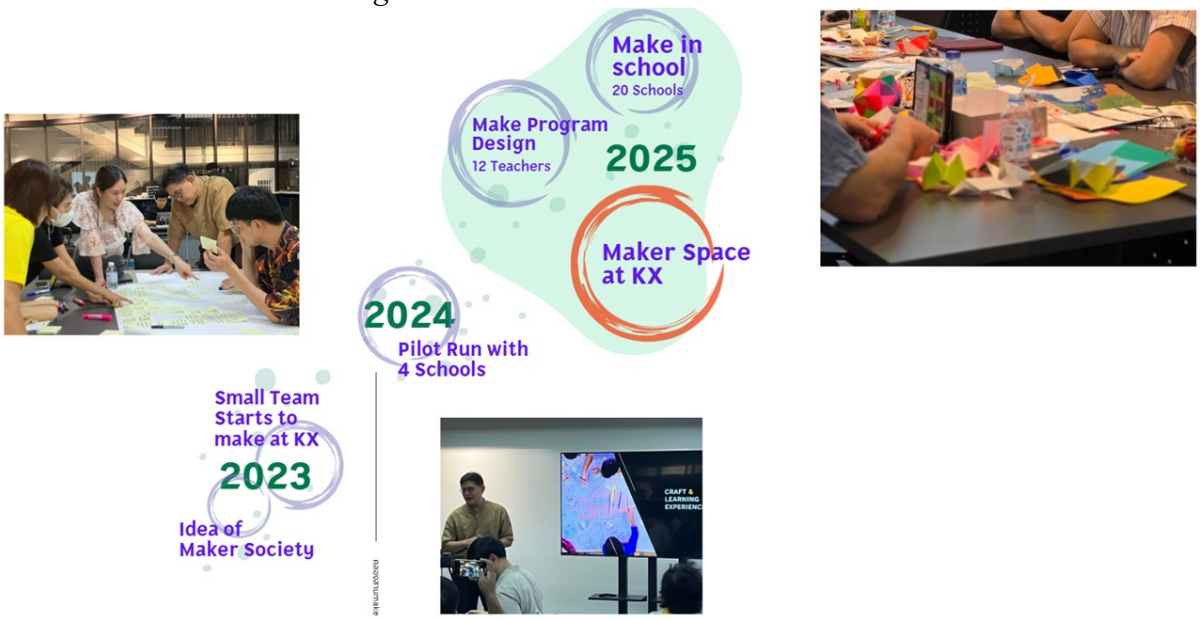
Development Trajectory of Klongsan MAKE (2023–2025): From Early Prototyping at KX to Multi-school Pilot and Scaling Phase.



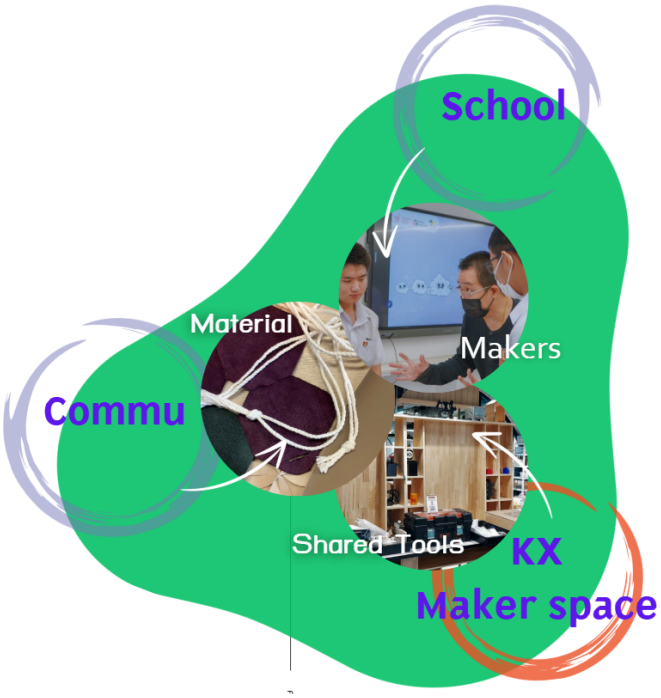


Figure 2
Methodology: Klongsan MAKE Ecosystem Model Linking Schools, Community Participation, and the KX/FabLab Hub Through Shared Tools, Accessible Materials, and Maker Mentorship.

This study employed a qualitative, participatory research design focused on understanding learning processes over time. Rather than evaluating short-term outcomes, the research examined how learning dispositions and relationships developed across repeated interactions within the Khlong San ecosystem.

Data was collected through participatory observation in eight school and community workshops conducted across two main settings: partner school campus and FabLab Bangkok (as part of the KX/FabLab hub). Each workshop was implemented through four types of making activities: (1) leathercraft, (2) paper-based making, (3) toy making, and (4) digital fabrication followed by hands-on assembly and refinement. Observations focused on learning behaviors and interaction patterns, including student initiative, collaboration dynamics, moments of difficulty (e.g., tool handling, material constraints, time pressure), and evidence of iteration (testing, revising, and improving outcomes). The research team maintained structured field notes and conducted brief post-activity reflections with facilitators and teachers to capture practical insights about what enabled or constrained implementation in each context.

In-depth interviews were conducted with 16 teachers and administrators, including both teachers who were already interested in maker-based activities and teachers who had little prior experience with this approach. Interviews emphasized school context, motivational drivers, and forms of resistance, including comfort levels in facilitating making activities, perceived curriculum fit, classroom management concerns, and factors affecting willingness to integrate making into routine learning. Two co-creation workshops—one focused on "What should we make?" and another on "Making in schools"—involved teachers, students, parents, and makers. These sessions supported the synthesis of practical integration strategies for in-class and out-of-class learning and were also used to validate and refine analytical themes emerging from interviews and observations.

The project involved 11 schools and over 200 participants, including public and private schools of different sizes. Activity formats were co-designed based on the characteristics and resources of each school, as well as teacher interests, to ensure feasible entry points for implementation. Formats included Scratch programming, freestyle making, craft-based making, and introductory digital fabrication. Many activities were intentionally designed to be open-ended and repeatable so teachers could adapt them to school constraints (space, time, budget, and locally available resources), while encouraging learners to continue experimenting beyond workshop sessions through transferable techniques and home- or peer-based activities outside class time.

Figure 3

Co-creation Workshop With Teachers and Students at the Maker Space (KX/FabLab Hub). Stakeholders Clustered Around Prototypes and Sticky-Note Insights to Map Needs, Constraints, and Feasible Making Activities.

Findings

Four key findings are presented to explain how Klongsan MAKE operated as a lifelong learning mechanism across settings.

Making as a Bridge Between Formal and Informal Learning

Across sites, students consistently brought "outside-school knowledge" into making tasks such as familiarity with household tools, craft practices, online hobbies, and informal problem-solving learned from family members or community contexts. In conventional Thai schooling, these experiences often remain invisible because classroom success is typically aligned with correctness, memorization, and standardized outcomes. Klongsan MAKE changed the rules of participation by legitimizing informal knowledge as a learning resource. Students could begin with what they already knew (e.g., folding, cutting, basic assembly, digital play with Scratch) and then extend into new concepts through guided experimentation.

This bridging effect was especially visible when activities were framed as open-ended challenges rather than fixed exercises. For instance, Scratch programming tasks became more meaningful when students embedded local narratives, characters, or daily-life scenarios. Similarly, craft-based tasks (e.g., basic leathercraft, packaging design, or prototype-building with simple materials) enabled students to connect school concepts to objects they could hold, adjust, and improve, turning abstract STEAM ideas into personally relevant experiences. As a result, students demonstrated greater persistence and willingness to revise their work, particularly when they perceived their making as "real" rather than merely schoolwork.

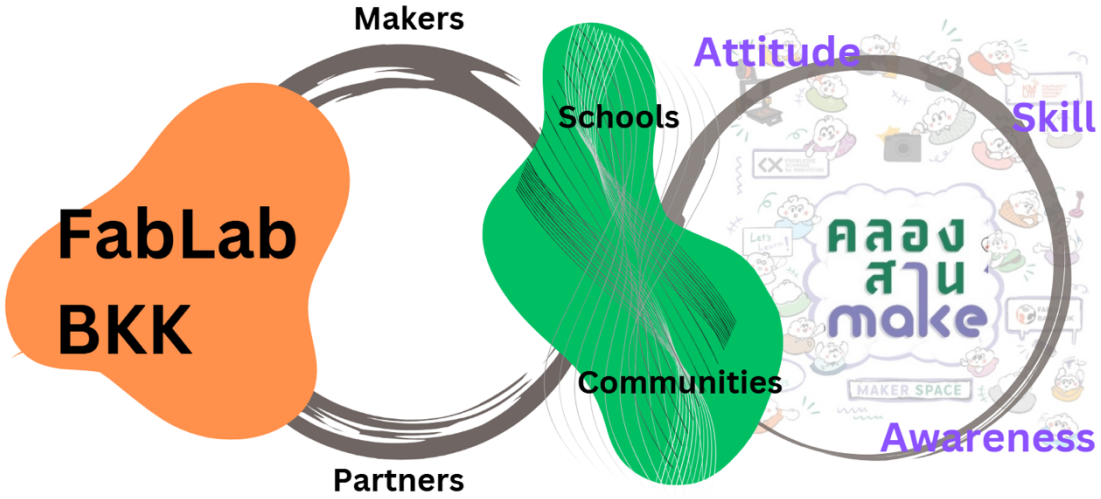
Development of Lifelong Learning Dispositions

A key pattern across activities was the emergence of *hands-on confidence*, defined here as reduced fear and embarrassment when attempting unfamiliar tasks, combined with an increased willingness to test ideas, accept failure, and iterate. Hands-on confidence did not appear automatically; it grew through repeated exposure to making routines: trying, seeing what happens, discussing outcomes, and refining. Importantly, this disposition was observed not only in students but also in teachers, many of whom initially expressed concern about unpredictable results, limited equipment, or time constraints. Over time, teachers became more comfortable with uncertainty and began to value "productive mistakes" as part of learning.

As hands-on confidence increased, other lifelong learning dispositions became more visible: curiosity (students asked more "what if" questions), reflection (students described why something failed), and agency (students proposed their own adjustments rather than waiting for instructions). Collaboration also became more purposeful. Rather than dividing labor mechanically, students negotiated ideas, compared prototypes, and helped troubleshoot one another's work, behaviors that align with lifelong learning as participation in shared practice rather than isolated individual achievement.

Teachers and Community Members as Co-learners

Klongsan MAKE functioned as a co-learning environment where the teacher's role shifted from "expert deliverer" to "learning facilitator." Teachers described facilitating inquiry by helping students articulate goals, identify constraints, and reflect on iterations. Community makers and practitioners acted as mentors who modeled making practices and encouraged learners to take initiative. This distributed expertise reduced dependence on any single instructor and made the model more sustainable, especially in schools where specialized STEAM staff or fabrication equipment is limited.



The KX/FabLab hub played a critical "bridging infrastructure" role in this process. Because tools, guidance, and space were available at the hub, schools could access resources without needing to immediately build full facilities. This lowered the threshold for participation and allowed teachers to focus on pedagogy and student engagement rather than technical setup alone.

Public Visibility and Learning Continuity

Public-facing moments, especially exhibitions and Bangkok Design Week-related activities,strengthened continuity by validating learners' work beyond school boundaries. When students saw their prototypes and stories displayed publicly, making became socially meaningful, not merely instructional. This visibility also supported stakeholder alignment: schools, parents, local partners, and the maker hub shared a common narrative of Khlong San as a district where learning can be hands-on and community supported.

Finally, the project's planned district-level supports, *tool lending, material reuse, and Maker Space expansion***,** are not merely operational details; they represent ecosystem conditions that enable lifelong learning to persist over time. Access to shared tools and low-cost materials increases the likelihood that making can continue between formal sessions, be repeated across grades, and be adopted by additional schools. In this sense, Klongsan MAKE demonstrates that lifelong learning is sustained not only through pedagogy, but also through practical infrastructures that make learning-by-doing feasible in everyday school and community life.

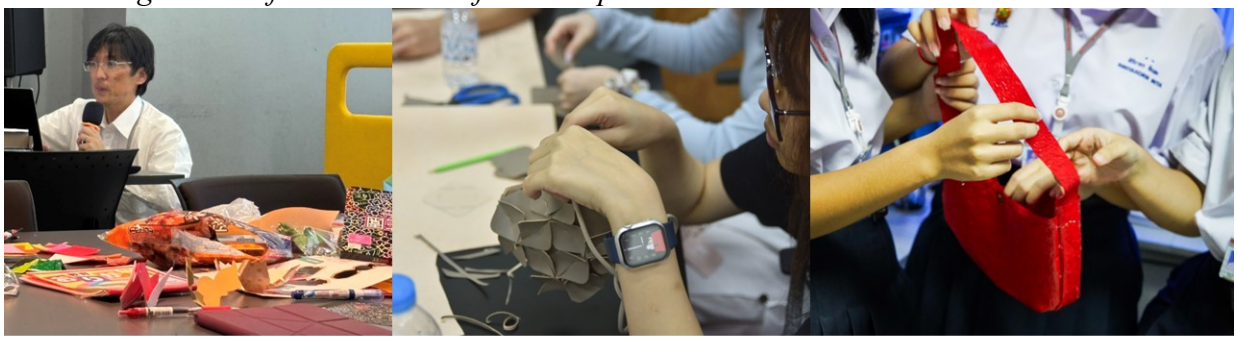
Figure 4
Outcome Pathway of Klongsan MAKE: How the KX/FabLab Hub and Partner Network Connect Makers With Schools and Communities to Develop Awareness, Attitudes (Hands-On Confidence), and Skills.

Discussion

The findings suggest that lifelong learning does not emerge from isolated programs but from ecosystems that support continuity, access, and social meaning. Klongsan MAKE succeeded by building linkages rather than relying on single-site facilities. This aligns with learning city guidance emphasizing coordinated local ecosystems that connect formal, non-formal, and informal learning opportunities and widen participation across the lifespan (UIL, 2015).

First, Klongsan MAKE reduced barriers between learning contexts through shared resource management, including access to tools and learning resources across schools and the KX/FabLab hub. Interviews indicated that a lack of tools and equipment is one of the most common obstacles when schools attempt to encourage students to begin making, especially in the early stages. Teachers explained that students are often more motivated when they can explore tools and devices, because tools create excitement, novelty, and a sense of "real making," rather than relying only on manual activities such as paper folding. This pattern is consistent with research-based learning principles showing that motivation, practice opportunities, and supportive conditions strongly shape persistence and learning outcomes (Ambrose et al., 2010). In this sense, shared access to tools functions not merely as logistical support but also as a motivational trigger that helps learners initiate making behaviors and sustain engagement long enough for learning dispositions to develop.

Figure 5



In-School Making Session: Teachers Facilitate Tool Use and Troubleshooting to Sustain Learning Continuity Beyond the Maker Hub.

Second, Klongsan MAKE valued everyday knowledge alongside practice-based value. It positioned making not only as a pedagogical strategy but also as a meaningful activity connected to community life and the possibility of economic extension through creativity and production. This matters in contexts where formal curricula can unintentionally frame learning as specialized, difficult, or disconnected from everyday life. Klongsan MAKE worked against this separation by encouraging teachers and students to observe and appreciate making in all contexts and by treating everyday making as legitimate learning. This emphasis on varied learning modes, learning by doing, learning through collaborative activity, and learning embedded in daily contexts, echoes the activity-based learning framing illustrated in your guideline materials (OKMD & TK Park, n.d.) and supports learning city objectives around participation, inclusion, and lifelong learning culture (UIL, 2015).

A distinctive contribution of the initiative is its emphasis on starting from what already exists in community life. By connecting learning to familiar practices, household tools and objects, repair and modification of everyday items, informal production, and local crafts, students gained more opportunities to learn through observation and questioning. Instead of following a linear pathway from theory to application (as typical in classroom instruction), learners began from real situations and then asked what principles or theories explain how something works. This "experience-to-theory" movement supported deeper conceptual understanding and made learning feel relevant, achievable, and continuous, an essential condition for lifelong learning systems (UIL, 2015).

Figure 6
Student-Made Prototypes From Hands-On Workshops: Simple, Low-Cost Making Activities That Strengthen Confidence and Craftsmanship.

Third, the initiative created repeated, low-cost opportunities for engagement, emphasizing easy entry, affordability, and continuity over time. This mechanism matters because it demonstrates that hands-on learning can be low-cost and does not need to be equated with invention, professional design, or high-end production. By separating making from "perfect products" and luxury materials, Klongsan MAKE reduced pressure around aesthetics, material quality, and polished outcomes. Instead, it highlighted the educational value of making itself, trying, adjusting, and learning through the process, which makes participation more inclusive and sustainable across different school contexts (Martin, 2015). These features also reflect broader learning city priorities: lowering participation barriers, strengthening community learning opportunities, and building local learning infrastructure (UIL, 2015).

Together, these ecosystem features align with lifelong learning principles by supporting repeated participation, learner agency, and learning across settings. Making practices become more sustainable when learning is socially supported, through peer collaboration, mentorship, and shared norms, rather than treated as an individual task (Halverson & Sheridan, 2014; Wenger, 1998). In this study, hands-on confidence emerged as a particularly important mechanism: when learners felt safe to try, fail, and iterate, they became more willing to pursue self-directed learning beyond the immediate activity. This matters because time-bound lessons and curriculum expectations often create pressure for "correct" outputs, which can reduce experimentation and weaken confidence (Ambrose et al., 2010). Similarly, when teachers experienced facilitation and co-learning roles, they were more likely to reframe learning as an ongoing process rather than a fixed curriculum sequence, consistent with sociocultural views of learning as mediated participation (Vygotsky, 1978).

Finally, integrating public-facing activities strengthened continuity by validating learning in wider community contexts. Public space can function as "learning infrastructure" when it is intentionally designed for participation and accessibility, including playful, child-centered engagement (Vertiz, 2020). In parallel, restorative city perspectives emphasize rebuilding social relationships and civic life through shared community processes and environments, which resonates with Klongsan MAKE's emphasis on collaboration and community-embedded practice (Roe & McCay, 2023). In this regard, FabLab Bangkok and public learning spaces can serve as bridging infrastructure between in-school and out-of-school learning, expanding learning space, building a making-based learning foundation, and cultivating a culture that respects both one's own making and the making of others, rather than valuing only "perfect" final products (Halverson & Sheridan, 2014; UIL, 2015).

Conclusion

This paper examined Klongsan MAKE as a case of cultivating lifelong learning through community-embedded making in the Khlong San district of Bangkok. The study found that making practices strengthened STEAM understanding through tangible, hands-on experiences where learners could test ideas, observe outcomes, and learn through iteration. Alongside conceptual learning, the initiative developed lifelong learning dispositions, hands-on confidence, curiosity, collaboration, and self-directed exploration, that support learning beyond classroom boundaries.

Klongsan MAKE also reconfigured educator roles from content delivery to facilitation and activated community members as co-learners and mentors, reinforcing learning as a shared social practice. The paper argues that lifelong learning is most effectively cultivated when making is embedded within place-based ecosystems rather than confined to classrooms or specialized facilities. As a replicable model, Klongsan MAKE highlights the value of district-based shared infrastructure, tool lending, material reuse, and hub-and-school programming, to reduce barriers to participation and sustain learning continuity over time.

Future work may strengthen the model through deeper longitudinal tracking of learner trajectories and by examining how district-level maker ecosystems can connect with wider lifelong learning policy frameworks. Further development may also expand community, civil society, and private-sector participation to strengthen social norms that value continuous hands-on learning, supporting a sustainable making culture for children, youth, and the broader community.

Acknowledgements

Classifying Opportunities for Lifelong Learning in Satun Through the Geo Camp Project: A Community-Driven Model of Education

Karuna Kleubmongkol, King Mongkut's University of Technology Thonburi, Thailand
Pronyos Chattarakul, King Mongkut's University of Technology Thonburi, Thailand

Official Conference Proceedings

Abstract

This study investigates how learning environments can be developed in Satun, Thailand, recognized both as a UNESCO Global Geopark and an emerging Learning City, through the implementation of the Geo Camp Project. Drawing on an action research framework, the study examines two years of field interaction with local communities, aiming to classify critical factors that drive learning and uncover new educational opportunities. The conceptual model is built around the intersection of three domains: learner profiles, learning content, and learning experiences. This classification reveals that people-to-people interaction and context-based content, particularly in geo-science and geo-culture, are essential to Satun's educational character. Through qualitative observation and analysis, the research highlights how Satun's untapped local knowledge, especially narratives rooted in "Geo-culture," fosters both community awareness and engagement. Geo Camp emerged as a co-created program designed and implemented by local stakeholders. It supports experiential, place-based learning while stimulating civic participation and local pride. Moreover, it acts as a strategic catalyst, influencing local government to adopt policies that align with lifelong learning principles and quality tourism development. This paper argues that such community-centered initiatives can serve as scalable models for other rural learning cities in Asia. Geo Camp's classification model, integrating learner diversity, local content, and immersive experience, offers a practical framework to empower underserved communities through inclusive and sustainable learning ecosystems.

Keywords: lifelong learning, learning city, geopark, geo camp, community-based education

www.iafor.org

Introduction

Satun, Thailand, is internationally recognized as a UNESCO Global Geopark and is simultaneously advancing toward becoming a Learning City. These dual designations highlight the area's rich geo-science heritage and diverse geo-cultural knowledge embedded within local communities. Despite this abundance of place-based knowledge, transforming such assets into accessible and continuous learning opportunities for people of different ages, backgrounds, and cultural groups remains a persistent challenge.

While geo-science and geo-cultural knowledge is deeply rooted in Satun, existing learning environments often struggle to translate this knowledge into engaging forms of lifelong learning. The challenge lies not in the availability of content, but in how learning is activated through interaction, place-based experience, and the active participation of local actors. This challenge is particularly evident in Satun's multicultural context, where learning must respond to diverse learner profiles and lived experiences. In response to these challenges, this study examines how learning environments can be developed through community-driven processes using the Geo Camp Project as a research platform. Drawing on an action research approach and two years of field engagement, the study focuses on identifying the key conditions that enable learning to emerge across diverse groups and settings.

The study aims to explore why the transmission of geo-based knowledge into lifelong learning practices remains challenging in Satun, and to identify the critical factors that influence learning engagement within community-based educational initiatives. By examining the relationships between learner profiles, learning content, and learning experiences, the research develops a conceptual framework that explains how these elements interact to form a functional learning ecosystem. Through this classification, the study seeks to articulate how local knowledge and community participation can be mobilized to support lifelong learning and contribute to the development of Satun as a Learning City with an inclusive and sustainable learning environment.

By articulating these relationships, the study contributes to a deeper understanding of how local knowledge, community participation, and experiential learning can be aligned to strengthen lifelong learning in practice. The findings are intended to inform not only Satun's ongoing development as a Learning City, but also to offer a scalable, community-centered model for other rural and geopark-based learning cities in Asia.

Literature Review

Lifelong Learning and Learning Ecosystems

Lifelong learning is widely recognized as a key mechanism for developing learning ecosystems that support continuous learning across formal, non-formal, and informal contexts. According to UNESCO, lifelong learning emphasizes the integration of learning into everyday life, communities, workplaces, and urban environments, thereby extending learning beyond institutional boundaries (UNESCO, 2015). This perspective highlights learning as a systemic process shaped by interactions among individuals, organizations, and socio-cultural contexts.

The literature consistently shows that effective learning ecosystems emerge when lifelong learning is supported through multi-stakeholder collaboration, including educational institutions, local authorities, civil society, and the private sector (König & Evans, 2013). Such

ecosystems are characterized by flexibility, accessibility, and responsiveness to local needs, enabling individuals to navigate diverse learning pathways throughout their lives (OECD, 2018). In this regard, lifelong learning functions not only as an individual learning process but also as a structural framework that aligns policies, spaces, and resources toward sustainable learning development (UNESCO Institute for Lifelong Learning [UIL], 2021). Geopark as a Learning Platform (Revised – Smooth Version).

UNESCO Global Geoparks are increasingly understood as learning platforms that integrate geo-science knowledge, cultural heritage, and community engagement. Beyond conservation, geoparks support education and public awareness by interpreting Earth heritage through place-based and participatory approaches that connect scientific knowledge with local contexts (UNESCO, 2015; UNESCO, n.d.). In this sense, geoparks are frequently conceptualized as open-air learning environments that support experiential, informal, and lifelong learning for diverse audiences, extending learning opportunities beyond formal education systems (Farsani et al., 2011; Henriques et al., 2011).

Information further highlights that geoparks facilitate informal and non-formal learning for a wide range of learners, including local residents, students, and visitors. Zouros (2004) emphasizes the role of geoparks in linking geological heritage with education and local development, particularly in rural areas, while Farsani et al. (2011) underscore their potential to support learning through geotourism and community-based interpretation. By embedding learning within everyday experiences and local identity, geopark-based initiatives align closely with the principles of lifelong learning and inclusive learning ecosystems (Henriques et al., 2011).

Place-Based Education

Place-Based Education (PBE) provides a strong pedagogical foundation for learning city development in contexts where local heritage, environment, and community knowledge function as central learning resources. PBE is commonly defined as an educational approach that uses the local community and environment as the primary context for teaching and learning, emphasizing experiential, real-world engagement and fostering meaningful relationships between learners and their places (Sobel, 2004). By grounding learning in familiar settings, PBE enhances relevance and supports deeper engagement through community participation, intergenerational knowledge exchange, and the integration of local expertise into the learning process (Smith & Sobel, 2010).

A critical extension of this approach is articulated through Greenwood and Gruenewald's concept of a "critical pedagogy of place," which argues that place-based learning must attend not only to ecological dimensions but also to cultural, social, and political contexts. This perspective encourages educators and learners to examine how power relations, identities, and historical narratives shape the meanings of place and influence whose knowledge is recognized and valued (Greenwood, 2008; Gruenewald, 2003). Such a critical lens is particularly important in multicultural regions, where learning design should move beyond treating local knowledge as a fixed resource to be transmitted, and instead support participatory meaning-making and respectful representation of diverse cultural perspectives.

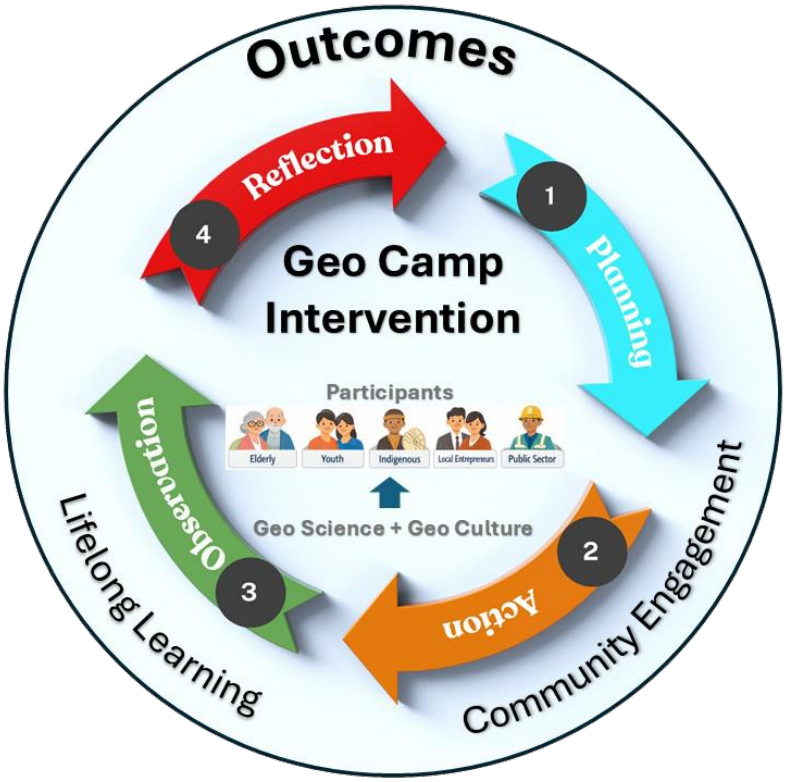
Recent applications of place-based education have further expanded beyond natural or rural settings into urban contexts, reinforcing the idea that learning can occur throughout the city. The notion that "every part of the city can function as a classroom" reflects an evolving

understanding of place-based learning rooted in everyday urban experience. An illustrative example is the *Wandering Challenge*, initiated by Anny Chang, co-founder of City Wanderer, which applies gamification to city-based learning activities for youth development. Through experiential missions designed to promote self-exploration, social interaction, and active engagement with urban environments, the project demonstrates how thoughtfully designed activities can transform ordinary city spaces into meaningful learning settings. Such city-based, experiential tasks broaden the definition of learning spaces beyond schools, libraries, or museums, while fostering skills and competencies that are difficult to cultivate within conventional classroom contexts (TK Park, 2022).

Together, these perspectives position place-based education as a flexible and context-responsive framework that connects learning to lived experience, supports diverse learner engagement, and provides a critical foundation for designing inclusive learning environments within learning cities.

Theoretical Integration for the Geo Camp Context

Taken together, the reviewed theoretical perspectives establish a coherent framework for understanding Geo Camp as an experimental learning intervention situated within a geopark-based learning city. Lifelong learning provides the foundational rationale for positioning learning as a continuous, inclusive process that extends beyond formal education and is embedded in everyday life and community participation (UNESCO, 1996). Within this perspective, Geo Camp is conceived not merely as an educational activity, but as a mechanism for activating lifelong learning among diverse groups through direct engagement with local knowledge and lived experience.



The learning city framework further situates Geo Camp within a broader learning ecosystem, emphasizing the role of coordinated actors, local governance, and community partnerships in shaping learning opportunities. Rather than operating as a stand-alone program, Geo Camp functions as a connective platform that links institutions, communities, and learning spaces, reflecting the system-level orientation of learning city development (UNESCO Institute for Lifelong Learning [UIL], 2015).

At the pedagogical level, place-based education explains how Geo Camp grounds learning in local relevance through experiential and participatory approaches. By engaging learners directly with geo-scientific sites, cultural narratives, and community practices, Geo Camp aligns with principles of place-based learning that emphasize meaning-making through real-world contexts (Sobel, 2004). The critical pedagogy of place further informs the design of Geo Camp by foregrounding cultural and ecological sensitivity, participatory knowledge production, and respect for diverse identities—an essential consideration in Satun's multicultural context (Greenwood, 2008; Gruenewald, 2003).

Finally, geopark frameworks provide the territorial and conceptual foundation that enables Geo Camp to function as a learning experiment within a real-world setting. UNESCO Global Geoparks position geological and cultural heritage as resources for education, public awareness, and sustainable development, while prior studies emphasize their role as open-air learning environments supporting informal and lifelong learning (Farsani et al., 2011; UNESCO, 2015). Within this context, Geo Camp serves as a practical testing ground for examining how learner diversity, locally grounded content, and immersive learning experiences interact to generate meaningful learning outcomes.

Methodology

Figure 1
Geo Camp Research Methodology

Research Design

This study adopts an action research framework combined with qualitative inquiry to investigate how learning environments can be developed within the context of a geopark-based learning city. The research was conducted over a two-year period through iterative cycles of planning, action, observation, and reflection, with the Geo Camp Project serving as the primary research intervention. Rather than treating Geo Camp as a standalone educational program, the study positions it as an experimental platform for examining learning processes embedded in local contexts.

Research Context and Participants

Geo Camp was designed as an experiential learning intervention that connects knowledge embedded within the Satun UNESCO Global Geopark, integrating both geo-science knowledge and, with particular emphasis, geo-cultural knowledge. In this study, geo-culture is understood as an integral part of everyday life in the local context, rather than as a discrete or abstract form of heritage. The project adopts a community-driven, lifelong learning–oriented, and place-based education approach, guided by the central research question: How can learning within a geopark context be designed to enable diverse groups of people to become lifelong learners, and how can the city function as a genuine learning ecosystem?

Participants were intentionally recruited from diverse social groups to reflect the multicultural character of Satun and the principles of lifelong learning. These groups included older adults; children and youth; local Indigenous people (such as the Maniq); members of community

enterprises and local entrepreneurs; personnel from public organizations and learning spaces; as well as members of the general public, with initial participation focusing on residents of Satun Province.

Figure 2

Diverse Social Groups of Participants in Geo Camp

Children and Youth | Older Adults | Maniq (local Indigenous people) | Members of Community

Over a two-year period, a total of 284 participants took part in six Geo Camp cohorts. Participants were engaged not only as learners but also as co-creators of learning activities, contributing local knowledge, perspectives, and experiences to the design and implementation of the Geo Camp program.

Geo Camp as a Community-Driven Learning Intervention

Geo Camp was collaboratively designed and implemented with local stakeholders to support experiential and place-based learning grounded in geo-science and geo-culture. Learning activities emphasized people-to-people interaction, field-based exploration, storytelling, and collective reflection, enabling participants to engage directly with local knowledge and lived experience while fostering community awareness, engagement, and local pride.

The program was structured as a two-day learning experience. The first day focused on geo-science through hands-on exploration at selected geopark sites and geo-learning spaces, where participants observed and examined real rock samples and fossils. These activities introduced key geo-science concepts through direct sensory engagement, supported by purpose-designed learning technologies such as online games, short digital clips, and interactive modules developed specifically for Geo Camp.

Figure 3
Learners Visit Geopark Sites for Geo-Science Learning in Geo Camp

The second day focused on geo culture through city walking and community-based learning activities. Participants explored culturally significant places and engaged in dialogue with residents who shared stories and lived experiences connected to specific sites. Learning was mediated through storytelling rather than formal instruction, helping learners understand the links between geological landscapes, cultural practices, livelihoods, and local identity. This approach positioned people and places as primary learning resources and enabled geo cultural knowledge to be experienced through social interaction and participation.

Figure 4
Learners Participate in a City Walk Activity to Explore Geo-Culture in Geo Camp

By structuring Geo Camp in this way, the learning design intentionally contrasted tangible geo-science exploration with the more interpretive and relational nature of geo-cultural learning. This combination enabled learners to move beyond factual understanding toward deeper place-

based awareness, empathy, and cultural understanding, while enhancing meaningful engagement, civic awareness, and local pride.

Data Collection and Analytical Framework

Data were collected through qualitative methods aligned with the action research approach, including participant observation during Geo Camp activities, documentation of learning materials and participant-generated outputs, reflective discussions, and short semi-structured interviews with selected learners. Formative pre- and post-activity learning checks, together with collaborative tasks and presentations, were used to explore changes in participants' understanding of geo-science and geo-cultural concepts rather than to assess standardized achievement.

Data analysis focused on identifying and classifying key conditions that enable learning to emerge within the local context. Using thematic analysis, observational data, interview reflections, and learning outputs were examined through a conceptual framework comprising learner profiles, learning content, and learning experiences, with particular attention to the role of context-based content and people-to-people interaction in shaping meaningful learning experiences.

Role of Geo Camp in Model Development

Geo Camp played a central role in the development of the conceptual model presented in this study by functioning as both a learning intervention and a research mechanism. Through repeated implementation across multiple cohorts, Geo Camp provided a real world setting in which learning processes could be observed, tested, and refined within the context of a geopark based learning city. While the overall learning structure comprising exploration, interaction, reflection, and co creation was consistently applied, the specific activities remained iterative and flexible, allowing them to be adapted to different learner groups as well as the spatial and geo cultural characteristics of each location visited.

Insights from Geo Camp activities revealed how learner diversity, locally grounded learning content, and immersive learning experiences interact to shape meaningful learning outcomes. Learning tasks were flexibly adjusted to participants' backgrounds and site-specific contexts, demonstrating how learning opportunities could be systematically classified rather than treated as isolated activities. Grounded in participants lived experiences, the analysis translated empirical observations into a context-responsive model that highlights people-to-people interaction and geo-cultural knowledge as key drivers of engagement, positioning Geo Camp as both an educational platform and a testing ground for a scalable, community-driven approach to lifelong learning in geopark and rural learning city contexts.

Results

Learner Profiles Identified Through Geo Camp

The results indicate that age plays a significant role in shaping learning patterns and learning opportunities among Geo Camp participants, with different learner groups demonstrating distinct interests, learning approaches, and roles. Children and youth tended to engage most actively with playful and interactive activities such as game-based learning, digital tools, and

hands-on exploration at geo-science learning sites. These activities supported rapid understanding of geoscientific concepts through direct experiential engagement.

In contrast, older adults and adult community members primarily contributed as holders of local narratives, cultural knowledge, and everyday histories. Their learning emerged through conversation, experience sharing, and storytelling related to multicultural practices and local identity. Within Geo Camp activities, adults frequently assumed roles as storytellers and interpreters, connecting specific places with broader social and cultural contexts.

Observations revealed that Geo Camp enabled intergenerational learning integration, in which children and youth shared knowledge related to fossils, technology, and learning games, while adults transmitted geo-cultural knowledge through lived experiences and narrative practices. In some cases, children produced creative outputs that were refined through guidance from adults, reflecting a reciprocal learning process that bridges age gaps and supports mutual knowledge construction.

Taken together, these results demonstrate how learner profiles function as a critical factor in the classification of learning opportunities, and how geo-science and geo-cultural content is activated and transmitted through people-to-people interaction across generations. This classification of learner roles provides a foundation for the subsequent analysis of learning content activated through the Geo Camp activities.

Types of Learning Content: Geo Science and Geo-Culture

The results show that learning content activated through Geo Camp emerged as context-based content grounded in both geo-science and geo-culture, with geo-cultural knowledge playing a particularly prominent role. While geo-science concepts such as rocks, fossils, and geological processes were introduced through hands-on and field-based activities, these elements were consistently connected to local stories and lived experiences.

One recurring activity across all Geo Camp cohorts was a batik dyeing workshop using natural pigments derived from locally grown plants within the geopark area. This activity enabled participants to engage with geo-science knowledge related to natural dyes and color processes, while simultaneously expressing geo-cultural meanings through fossil-inspired patterns rooted in local textile traditions. Through this process, scientific concepts were embedded within culturally meaningful creative practices rather than presented as abstract knowledge.

Observations and learner reflections further indicate that geo-cultural content shaped how participants made sense of what they learned, particularly during activities involving city walking, interaction with community members, storytelling, and collaborative making. Participants frequently linked scientific observations with narratives related to local history, livelihoods, beliefs, and multicultural practices, allowing learning to extend beyond factual understanding toward shared meaning and local identity.

Across different cohorts, learning content was activated primarily through people-to-people interaction rather than formal instruction alone, with geo-cultural narratives functioning as a bridge between geo-science knowledge and everyday life. These forms of content were most frequently activated through activities such as city walking and craft-based workshops, indicating a close relationship between the nature of learning content and the design of learning experiences. Taken together, these results demonstrate that the integration of geo-culture and

geo-science constitutes a critical factor in the classification of learning opportunities, as it shapes how learners engage with content, interpret knowledge, and relate learning to everyday life. Rather than encountering scientific concepts in isolation, participants experienced learning as a connected process in which scientific understanding was continuously reinforced through cultural narratives, local practices, and social interaction.

Learning Experiences and Interaction Patterns

The results indicate that learning experiences generated through Geo Camp were experiential, participatory, and socially embedded, emerging through direct engagement with places, people, and activities rather than formal instruction alone. Across cohorts, learning experiences were shaped through geographical site exploration, city walking, collaborative making, storytelling, and group reflection.

Activities such as city walking and community interaction transformed urban and geopark spaces into active learning environments, enabling learners to connect geo-science observations with geo-cultural contexts through movement, dialogue, and situated encounter, while also enhancing intergenerational conversations among participants. Craft-based workshops further supported immersive learning by facilitating people-to-people interaction and collaborative knowledge construction across age groups.

While the overall experiential structure remained consistent, learning activities were adapted to different learner profiles and site contexts. As a result, these experiences supported sustained engagement and active participation, demonstrating how experiential and place-based education approaches activate diverse learning opportunities within a geopark-based learning city. Taken together, these experiential patterns inform the subsequent findings on how learning opportunities are classified and sustained within the Geo Camp model.

Findings

Analysis of data generated through the Geo Camp Project reveals how opportunities for lifelong learning in Satun emerged through the interaction of learner diversity, locally grounded learning content, and immersive learning experiences. Rather than functioning as a fixed educational program, Geo Camp operated as a repeated yet adaptive learning process, in which learning structures were consistently applied while specific activities evolved in response to different learner groups and spatial contexts. Four key findings are presented below.

Learner Diversity and the Transformation of Learning Roles

One key finding is that Geo Camp enabled participants from diverse age groups and backgrounds—including children, youth, older adults, and community members—to move beyond passive learning roles. Across different cohorts, learners demonstrated increased agency through participation, dialogue, and collaborative tasks. Differences in age, experience, and social roles did not hinder learning; instead, learner diversity functioned as a critical factor that enriched interaction and collective meaning-making. This finding highlights how varied learner profiles contribute to the classification of learning opportunities within a community-driven learning environment.

Geo-Cultural Learning as a Catalyst for Meaningful Engagement

Findings indicate that geo-cultural learning played a central role in sustaining learner engagement, particularly during activities that involved storytelling, walking-based exploration, and direct interaction with local residents. While geoscientific concepts were effectively introduced through hands-on engagement with rocks, fossils, and geo sites, participants consistently emphasized that learning through people, places, and lived narratives made the experience more meaningful. Geo-culture emerged as a form of context-based learning content that connected knowledge to everyday life, local identity, and shared memory, fostering emotional connection, community awareness, and motivation to continue learning.

People-to-People Interaction and Immersive Learning Experiences

Another significant finding concerns the role of people-to-people interaction in shaping immersive learning experiences. Learning frequently occurred through conversation, observation, and shared reflection rather than through instruction alone. Activities such as group discussions, city walking, and collaborative presentations transformed natural and urban spaces into active learning environments.

Observations show that these interactions often led to deep and meaningful conversations, particularly when children and youth expressed curiosity about local culture and history. Adults and older community members responded enthusiastically, viewing these exchanges as opportunities to transmit knowledge accumulated through lived experience. Many of the stories shared were not formally documented, allowing learners to access localized and exclusive forms of knowledge that could only be conveyed through direct interpersonal interaction. This finding highlights how people-to-people interaction supports immersive learning and enables knowledge transmission beyond formal learning contexts.

Geo Camp as an Adaptive Learning Process

A further key finding highlights the adaptive and scalable nature of the Geo Camp process, which enables it to be scaled up and scaled out to other sites and communities. While the core learning structure comprising exploration, interaction, reflection, and co creation was consistently applied, specific activities were flexibly adapted to different learner profiles, local geo cultural characteristics, and spatial contexts.

This adaptability allowed Geo Camp to function as a transferable learning process rather than a site-specific program, supporting the extension of learning opportunities across multiple locations. As a result, Geo Camp demonstrates how a community-driven, place-based intervention can contribute to a functional learning ecosystem that supports lifelong learning and advances the realization of a learning city in practice.

Discussion

This study set out to examine why the transmission of geo-based knowledge into lifelong learning practices remains challenging in Satun, and to identify the critical factors that shape learning engagement within community-based educational initiatives. The findings suggest that learning opportunities in a geopark-based learning city do not emerge from content delivery alone, but from the dynamic interaction between learner diversity, context-based

learning content, and experiential learning processes that are activated through people-to-people interaction.

One of the most significant insights concerns the nature of learner diversity in Satun. While age differences are often assumed to be the primary factor influencing learning engagement, the findings indicate that background, worldview, and lived experience play a more decisive role. In a multicultural context that includes ethnic groups such as the Maniq, differences in belief systems, modes of communication, and everyday practices can make mutual understanding difficult to achieve through explanation alone. Certain forms of knowledge cannot be fully translated across cultural boundaries; they must be encountered through shared experience. In this sense, Geo Camp did not eliminate these differences but created learning situations in which diversity became a productive condition, enabling learners to engage with unfamiliar perspectives without requiring complete cognitive alignment.

The findings also highlight the pedagogical complexity of geo-cultural learning. For participants from outside the community, geo-culture often appeared novel and exciting, whereas for local participants it was frequently perceived as familiar and therefore less interesting. This paradox reveals that geo-culture is not inherently engaging; its educational value depends heavily on how it is mediated. Deep storytelling across generations emerged as a crucial mechanism for reactivating interest, particularly when narratives were conveyed by experienced community members who could situate cultural knowledge within lived histories. However, storytelling alone was often insufficient, especially for younger learners with limited attention spans. The integration of hands-on activities and experiential learning proved essential for sustaining engagement, suggesting that geo-culture functions not merely as content but as a high-skill pedagogical practice that requires careful design and facilitation.

People-to-people interaction further emerged as a central driver of immersive learning experiences, though the findings challenge the assumption that such interaction occurs naturally. While moments of deep conversation were observed when children expressed genuine curiosity about local culture and history, participation was uneven and highly dependent on facilitation. The presence of trained Learning Administrators played a critical role in sustaining meaningful dialogue by initiating topics, bridging generational perspectives, and maintaining conversational continuity. Importantly, these Learning Administrators were developed from within the local community through targeted training, demonstrating that such human infrastructure can be cultivated locally. This finding underscores that effective people-to-people learning relies not only on social proximity but also on intentional mediation.

The adaptive and scalable nature of the Geo Camp process provides further insight into how community-driven learning initiatives can contribute to learning city development. While specific activities varied according to learner profiles, site conditions, and local contexts, the underlying learning structure remained consistent. This process-oriented design allowed Geo Camp to be scaled up and scaled out across different locations without replicating activities verbatim. However, scalability was shown to depend on more than pedagogical design alone. The readiness of learning spaces, availability of tools and technology, and institutional cooperation among local stakeholders were critical in ensuring that learning remained engaging, safe, and accessible. Without such support, even well-designed learning content risked becoming exhausting rather than empowering.

The limitations of this study are therefore not primarily related to the training of skilled facilitators or Learning Administrators, which proved achievable within the local context. A

more fundamental challenge lies in the recognition of geo-culture as a valuable form of knowledge. In some cases, geo-culture continues to be perceived as ordinary or outdated rather than as a source of identity formation and economic potential. This limited recognition can constrain the willingness of communities and institutions to invest in geo-cultural learning, despite its demonstrated capacity to generate both social value and income. Addressing this challenge requires a shift in perception, positioning geo-culture not as background heritage but as a living resource for learning and development.

The findings suggest that Geo Camp represents more than a localized educational program. It functions as a living experiment in how learning ecosystems can be activated through community participation, place-based content, and adaptive learning processes. By demonstrating how learner diversity, geo-cultural meaning-making, and people-to-people interaction intersect in practice, this study contributes to a deeper understanding of how geopark-based initiatives can support lifelong learning and advance the realization of learning cities as socially embedded and responsive systems.

Conclusion

This study demonstrates that the development of effective learning environments in Satun as a geopark-based learning city depends not solely on the availability of geo-science or geo-cultural knowledge, but on how learning is activated through interaction, experience, and community participation. Findings from the Geo Camp Project show that meaningful learning emerges through the dynamic interplay of learner diversity, context-based learning content, and immersive learning experiences. Learners of different ages and backgrounds contributed to and benefited from intergenerational knowledge exchange, transforming diversity into a key asset rather than a limitation.

Geo-cultural learning played a central role in enhancing engagement by connecting scientific knowledge to everyday life, local identity, and shared memory. However, the study reveals that geo-culture is not inherently engaging and must be carefully mediated through storytelling, hands-on activities, and experiential learning design. People-to-people interaction was identified as a critical driver of learning, though such interaction required intentional facilitation. Trained local Learning Administrators were essential in bridging generational perspectives and sustaining meaningful dialogue.

As an adaptive and community-driven process, Geo Camp functioned not as a fixed program but as a scalable learning framework that could be applied across different sites and learner groups. Overall, the study positions Geo Camp as a practical model for activating inclusive learning ecosystems, offering valuable insights for geopark-based and rural learning cities seeking to strengthen lifelong learning through place-based and community-cantered approaches.

Acknowledgements

The Satun UNESCO Global Geopark Learning City project was made possible through the collaboration and support of multiple stakeholders. The research team sincerely thanks the Governor of Satun Province, the Satun Provincial Administrative Organization, the Satun Provincial Office, the Department of Mineral Resources, and the Office of Natural Resources

and Environment of Satun Province, as well as local community networks and partner organizations, for their guidance, cooperation, and contributions throughout the project.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that generative AI and AI-assisted technologies were used in the writing process of this manuscript for language-related purposes only, including grammar and spelling correction, paraphrasing for conciseness, and refining sentence structure to improve clarity and alignment with the intended meaning. The use of these tools did not involve the generation of research ideas, study design, data collection procedures, findings, analysis, interpretation, or arguments. All core concepts, research design, data, results, and discussions were originally written and derived from the author's systematic conduct of the research, and the author takes full responsibility for the content of the manuscript.

Investigating the Needs and Potential of Interactive Media in an AI-Enhanced Constructivist Learning Environment for English Vocabulary Acquisition

Jiratchaya Sakhampee, Khon Kaen University, Thailand
Parama Kwangmuang, Khon Kaen University, Thailand

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study investigates the needs and potential of interactive media in an AI-enhanced constructivist learning environment for English vocabulary acquisition among elementary school students. The research employs a mixed-methods approach, involving 120 fifth-grade students and 10 English language teachers selected through stratified random sampling from four schools in Lopburi Province, Thailand. Data collection includes surveys on students' learning needs, difficulties, and preferences, as well as interviews with teachers regarding their perceptions of current teaching practices and the potential of integrating AI and interactive media in vocabulary instruction. Quantitative data analysis reveals that 75% of students find vocabulary learning challenging, with 68% expressing a preference for interactive media. Qualitative findings indicate that 80% of teachers acknowledge the limitations of traditional teaching methods and 90% recognize the potential benefits of AI and interactive media in enhancing vocabulary acquisition. However, 60% of teachers express concerns about the lack of technological infrastructure and training. These findings serve as a foundation for designing and developing an innovative learning system that effectively addresses the identified needs and optimizes the potential of emerging technologies in language education. This research contributes to the advancement of technology-enhanced language learning and offers practical implications for educators and researchers in the field.

Introduction

Background and Context

English language proficiency has become an essential competency in the globalized world, serving as a gateway to educational advancement, career opportunities, and cross-cultural communication (Crystal, 2019). In Thailand, the Office of Basic Education Commission (2022) has emphasized the critical importance of developing strong English language foundations from the elementary level, recognizing that English proficiency significantly impacts students' access to knowledge and future opportunities. However, despite these recognized imperatives, Thai students continue to face substantial challenges in English language acquisition.

The National Educational Quality Assessment through standardized tests (O-NET) for Grade 6 elementary students in English revealed that the average score was only 33.49%, significantly lower than the 50% standard criterion established by the Ministry of Education (National Institute of Educational Testing Service, 2024). This alarming statistic reflects the persistent English learning difficulties among Thai students and indicates that current instructional approaches fail to meet learners' needs effectively. The situation demands innovative pedagogical interventions that can address these challenges comprehensively.

Research on second language vocabulary learning has consistently identified vocabulary retention as a central challenge for language learners worldwide. Karatas et al. (2025) and Nakata and Elgort (2020) have demonstrated that learners' primary difficulty lies not in the initial memorization of vocabulary but rather in the preservation of lexical knowledge in long-term memory and its appropriate application across various contexts. A comprehensive meta-analysis by Uchihara et al. (2023) revealed that second language learners typically forget approximately 60-70% of newly learned vocabulary within 2–4 weeks after initial learning without regular review or consistent usage.

The vocabulary retention challenge is particularly pronounced in the Thai educational context. Suwimol Tirakanant (2022) found that Thai students tend to forget English vocabulary within an even shorter timeframe—typically 2–3 weeks after instruction—without systematic review or contextual application. This accelerated forgetting rate can be attributed to the specific characteristics of English learning in Thailand as an English as a Foreign Language (EFL) context, where students have limited opportunities to encounter and use English in daily life (Sureepong, 2018). Furthermore, Phoocharoensil et al. (2023) found that Thai students predominantly rely on traditional vocabulary learning strategies such as rote memorization and bilingual dictionary consultation rather than more effective approaches like contextual learning. The lack of vocabulary retention has cascading effects on all language skills, as vocabulary serves as the fundamental building block of language communication (Schmitt et al., 2011; Stæhr, 2008).

Statement of the Problem

The convergence of low English achievement scores, significant vocabulary retention challenges, and the limitations of traditional teaching methods in the Thai educational context creates an urgent need for innovative instructional approaches. The contemporary digital landscape, characterized by rapid technological advancement and the emergence of artificial intelligence applications in education, presents both challenges and opportunities for addressing these pedagogical concerns. Interactive media and AI-enhanced learning

environments offer promising solutions by providing personalized, adaptive, and engaging learning experiences that can address individual learner needs while maintaining motivation and interest. However, the successful integration of these technologies in Thai elementary English classrooms requires a thorough understanding of students' specific learning needs, preferences, and the potential barriers to implementation.

Research Objectives and Questions

This study aims to: (1) investigate the vocabulary learning needs and difficulties experienced by fifth-grade elementary students in Thailand, (2) assess students' preferences for interactive learning media and AI-enhanced features, (3) explore teachers' perceptions of current teaching practices and their attitudes toward integrating AI and interactive media in vocabulary instruction, (4) evaluate the technological infrastructure and readiness of schools and teachers for implementing technology-enhanced learning, and (5) provide evidence-based recommendations for designing Interactive Media in an AI-Enhanced Constructivist Learning Environment for English vocabulary acquisition.

The study addresses the following research questions: What are the primary vocabulary learning difficulties and needs of fifth-grade elementary students? What are students' preferences regarding interactive media features and AI-enhanced learning capabilities? How do teachers perceive the limitations of current teaching methods and the potential of AI and interactive media in vocabulary instruction? What is the current state of technological infrastructure and teacher readiness for implementing technology-enhanced vocabulary instruction? What are the evidence-based recommendations for designing Interactive Media in an AI-Enhanced Constructivist Learning Environment that addresses the identified needs and leverages the available potential?

This research contributes to the field of educational technology and second language acquisition by providing empirical evidence regarding the specific vocabulary learning needs and challenges faced by Thai elementary students, filling a gap in the literature regarding needs assessment for technology-enhanced language learning in the Thai context. The study offers insights into student preferences for interactive media features, identifies potential barriers to implementation, and informs policy decisions regarding resource allocation for technology integration in education.

Literature Review

Vocabulary Acquisition and Retention in Second Language Learning

Vocabulary acquisition constitutes a fundamental component of second language learning, with lexical knowledge serving as the foundation for all language skills (Nation, 2022; Schmitt & Schmitt, 2021). Research has consistently demonstrated that vocabulary size and depth significantly predict learners' ability to comprehend spoken and written language, produce meaningful utterances, and engage in successful communication (Schmitt et al., 2011). However, the challenge of vocabulary retention has been extensively documented in second language acquisition research. Nakata and Elgort (2020) synthesized findings indicating that learners often demonstrate adequate short-term recall of vocabulary but struggle to maintain this knowledge over extended periods. This retention challenge is particularly pronounced in foreign language contexts where learners have limited exposure to the target language outside formal instruction.

Recent literature has emphasized the role of active engagement in vocabulary learning. Teng (2022) found that multimodal input significantly enhanced vocabulary retention compared to text-only presentation, suggesting that engaging multiple sensory channels supports deeper encoding and more durable memory traces. Chang (2023) demonstrated that repeated oral reading practice significantly improved retention of high-frequency multiword items among EFL learners, highlighting the importance of productive language use in vocabulary consolidation. Similarly, Garcés-Manzanera (2023) found that incidental vocabulary learning through communicative tasks promoted better retention than explicit vocabulary instruction alone, suggesting that contextualized learning experiences support more robust lexical development.

Constructivist Learning Theory and AI in Education

Constructivist learning theory, rooted in the foundational work of Piaget and Vygotsky (1978), posits that learners actively construct knowledge through interaction with their environment and social contexts rather than passively receiving information (Fosnot & Perry, 2021). This theoretical framework emphasizes the importance of meaningful learning experiences, social interaction, and the connection of new knowledge to prior understanding. The integration of technology in constructivist learning environments has been explored extensively in recent research. Zin et al. (2024) examined technological advancements in learning management systems that support constructivist pedagogy, finding that effective systems provide opportunities for exploration, collaboration, and knowledge construction. Quoc and Van (2023) demonstrated that social constructivist approaches enhanced lexical retention among EFL learners, with technology-mediated collaborative activities promoting deeper vocabulary processing and more durable learning outcomes.

Kahn and Winters (2021) traced the historical relationship between constructionism and artificial intelligence, arguing that AI technologies can support constructivist learning when designed to facilitate exploration, experimentation, and knowledge building. The application of artificial intelligence in education has expanded rapidly in recent years, offering new possibilities for personalized, adaptive, and intelligent learning systems (Doroudi, 2022; Holmes & Tuomi, 2022). AI technologies in education encompass a broad range of applications, including intelligent tutoring systems, automated assessment, learning analytics, and adaptive content delivery. Almasri (2024) conducted a systematic review finding positive effects on student learning outcomes, engagement, and attitudes, while also identifying implementation challenges related to teacher preparation, technological infrastructure, and integration with existing curricula. Gibson et al. (2023) analyzed learning theories relevant to AI-enhanced learning, proposing frameworks for understanding how AI can support different types of learning processes. In the context of language learning, AI applications have shown particular promise for vocabulary instruction. Hsu et al. (2023) investigated AI image recognition for vocabulary acquisition, finding that AI-supported learning strategies reduced learning anxiety while improving vocabulary outcomes. Lee et al. (2022) developed an AI English learning support system that facilitated learner-generated context-based learning, demonstrating improved engagement and learning effectiveness.

Interactive Media and Gamification in Language Learning

Interactive media technologies have transformed educational possibilities by enabling engaging, multimodal, and adaptive learning experiences. Arabiat et al. (2022) conducted a systematic review of interactive technology use and child development, finding positive effects on cognitive, social, and language development when technologies were appropriately designed and implemented. Gamification—the application of game design elements in educational contexts—has emerged as a particularly effective approach for enhancing learner motivation and engagement. Zou et al. (2019) comprehensively reviewed digital game-based vocabulary learning research, finding that game-based approaches consistently outperformed traditional instruction in terms of both learning outcomes and learner motivation. The review identified key design features that contribute to effective vocabulary games, including immediate feedback, progressive difficulty, and meaningful rewards.

Chen et al. (2020) investigated the impact of integrating vocabulary exercises into adventure video games, finding significant improvements in vocabulary learning compared to conventional instruction. The study highlighted the importance of meaningful integration where vocabulary learning serves game objectives rather than appearing as disconnected educational content. Lee (2022) examined factors affecting incidental vocabulary acquisition and retention in game-enhanced environments, identifying engagement, repetition, and contextual embedding as key predictors of learning success. Sayed (2022) specifically examined competitive digital games for vocabulary retention among primary school students, finding that game-based competition enhanced both immediate learning and delayed retention. Harrington and Mellors (2021) further explored the role of gamification in promoting student success and retention, proposing design principles for effective educational gamification that balance challenge, achievement, and social interaction.

Despite the growing body of research on AI in education and interactive media for language learning, significant gaps remain in understanding the specific needs and potential for implementing these technologies in Thai elementary English education. While international research provides valuable insights, the unique characteristics of the Thai EFL context—including limited English exposure, cultural factors, and infrastructure constraints—necessitate context-specific investigation. Furthermore, comprehensive needs assessments that integrate student, teacher, and institutional perspectives remain scarce in the literature. This study addresses these gaps by conducting a comprehensive investigation of vocabulary learning needs, interactive media preferences, and implementation readiness in the Thai elementary context. The research is grounded in constructivist learning theory and draws on cognitive theories of vocabulary acquisition, particularly dual coding theory (Paivio, 1991) and working memory models (Baddeley, 2012), to inform the analysis of effective learning approaches.

Research Methodology

Research Design

This study employed a mixed-methods research design, combining quantitative and qualitative approaches to achieve a comprehensive understanding of vocabulary learning needs and the potential for AI-enhanced interactive media in elementary English education. The mixed-methods approach was selected to capitalize on the complementary strengths of quantitative methods for establishing patterns and prevalence and qualitative methods for providing depth, context, and explanatory richness. The convergent parallel design allowed simultaneous data

collection through multiple instruments, with integration occurring during the interpretation phase.

Participants and Setting

The study was conducted in four elementary schools in Lopburi Province, Thailand, selected to represent diverse school contexts within the provincial education system. Participants included 120 fifth-grade students (48.3% male, 51.7% female) and 10 English language teachers. Students were selected through stratified random sampling to ensure representation across schools and academic performance levels. The student sample represented a range of prior English achievement: 15% had achieved excellent grades (A), 30% had good grades (B), 35% had average grades (C), and 20% had below-average grades (D). Additionally, 108 parents or guardians (90% response rate) participated in a supplementary survey to provide contextual information about family support and technology access.

Research Instruments and Data Collection

A comprehensive suite of twelve research instruments was developed to ensure triangulation and provide a multifaceted understanding of the research questions. These instruments included: (1) Student Needs Assessment Questionnaire to identify learning needs and problems; (2) Interactive Media Preference Survey to assess media preferences; (3) Semi-Structured Teacher Interview to explore attitudes and limitations; (4) Technology Infrastructure Assessment to evaluate technology readiness; (5) Vocabulary Pre-Test to measure baseline vocabulary knowledge; (6) Classroom Observation Protocol to observe learning behaviors; (7) Student Focus Group Interview to gain in-depth perspectives; (8) Parent Survey to understand family context; (9) Existing Materials Analysis Checklist to analyze current materials; (10) Researcher's Field Journal to record qualitative context; (11) AI Features Priority Assessment to inform AI feature design; and (12) Digital Literacy Assessment to evaluate students' digital skills.

Data collection was conducted over a seven-week period following institutional approval and informed consent procedures. Quantitative instruments were administered during class time with researcher supervision. Semi-structured teacher interviews lasting 45–60 minutes were conducted individually. Student focus groups, comprising seven students each (28 students total across four groups), were facilitated by the researcher using standardized protocols. Classroom observations were conducted across 12 class periods (three per school), each lasting 50 minutes, using structured observation protocols to record engagement levels, teaching methods, and technology use.

Quantitative data were analyzed using descriptive statistics including means, standard deviations, frequencies, and percentages. Likert-scale items were interpreted using predetermined criteria: 4.50–5.00 (Highest), 3.50–4.49 (High), 2.50–3.49 (Moderate), 1.50–2.49 (Low), and 1.00–1.49 (Lowest). Qualitative data from interviews, focus groups, and field journals were analyzed using thematic analysis following Braun and Clarke's six-phase framework: familiarization, coding, theme development, review, definition, and reporting. Data triangulation was achieved by comparing findings across multiple instruments and participant groups.

Results

Students' Vocabulary Learning Difficulties and Needs

The Student Needs Survey revealed substantial vocabulary learning challenges among participants. Analysis of 5-point Likert scale responses indicated that 75% of students (n = 90) rated vocabulary learning as challenging, with mean scores at or above 3.50. Table 1 presents the detailed breakdown of vocabulary learning difficulties. Long-term retention emerged as the most significant difficulty (M = 4.45, SD = 0.69), followed by understanding word meanings (M = 4.35, SD = 0.72), remembering new vocabulary (M = 4.21, SD = 0.78), correct pronunciation (M = 4.12, SD = 0.81), using vocabulary in sentences (M = 3.89, SD = 0.85), and learning motivation (M = 3.56, SD = 0.92).

Table 1
Vocabulary Learning Difficulties Among Fifth-Grade Students (n = 120)

Difficulty Area	Mean	S.D.	Level
Long-term retention of vocabulary	4.45	0.68	High
Understanding word meanings	4.35	0.72	High
Remembering new vocabulary	4.21	0.78	High
Correct pronunciation	4.12	0.81	High
Using vocabulary in sentences	3.89	0.85	High
Learning motivation	3.54	0.92	Moderate

These findings were corroborated by the vocabulary pre-test results, which revealed that 55% of students (n = 66) scored below satisfactory levels. The mean pre-test score was 24.35 out of 45 points (54.11%), with substantial variation (SD = 8.72). Performance analysis by test section revealed critical weaknesses: students achieved 67.1% accuracy on recognition items, but only 48.5% on comprehension and 36.5% on production tasks, indicating a significant gap between receptive and productive vocabulary knowledge. Focus group discussions provided qualitative depth to these findings. A substantial majority (89.3%) of focus group participants reported forgetting vocabulary quickly after tests. As one student expressed: “Writing words many times is tiring. I remember them for tests but forget them later.” Another student noted: “When teacher uses games, I remember words better. It's fun and I want to learn more.”

Students' Interactive Media Preferences

The Interactive Media Preference Survey revealed strong student interest in technology-enhanced learning approaches. Analysis indicated that 68% of students (n = 82) expressed preferences for interactive media. Table 2 presents student preferences for learning material types. Educational games were preferred by 80% of students, followed by interactive media (68.3%), videos and animations (65%), group activities (45%), and textbooks/workbooks (30%).

Table 2
Student Preferences for Learning Material Types (n = 120)

Learning Material Type	Frequency	Percentage
Educational games	96	80.0%
Interactive media	82	68.3%
Video lessons	75	62.5%
Flashcards (digital)	68	56.7%
Traditional textbooks	38	31.7%

Analysis of preferred interactive media features revealed strong preferences for gamification elements. Games and scoring received the highest mean rating (M = 4.68, SD = 0.52), followed by immediate feedback (M = 4.52, SD = 0.61), characters and storytelling (M = 4.45, SD = 0.65), sound and animations (M = 4.38, SD = 0.68), competition with friends (M = 4.25, SD = 0.75), and auto-adjusting difficulty (M = 4.12, SD = 0.78). These findings indicate that students value engaging, responsive, and socially connected learning experiences. Regarding AI feature expectations, students expressed strong interest in AI capabilities that support personalized learning. The majority (85%) wanted AI to recommend vocabulary suited to their level, 80% desired AI assistance with pronunciation practice, 70% valued AI-generated learning progress summaries, and 65% were interested in AI-created exercises.

Teacher Perceptions and Concerns

Semi-structured interviews with 10 English teachers revealed important insights regarding current teaching practices and attitudes toward technology integration. Table 3 presents teachers' current vocabulary teaching methods. Analysis indicated that all teachers (100%) currently employ repetition and memorization methods, 90% use translation approaches, 80% assign worksheets, and 70% use flashcards. However, only 30% reported using educational software or applications in their instruction.

Table 3
Teachers' Current Vocabulary Teaching Methods (n = 10)

Teaching Method	Frequency	Percentage
Repetition and memorization	10	100%
Translation method (Thai-English)	9	90%
Picture flashcards	8	80%
Games and activities	5	50%
Educational software/apps	3	30%

A substantial majority of teachers (80%, n = 8) acknowledged limitations of traditional teaching methods. As one teacher explained: “Traditional methods like repetition work for short-term memory, but students often forget vocabulary within weeks. We need more engaging approaches.” Teachers expressed strong recognition of AI and interactive media

potential. Nine teachers (90%) agreed that AI could help personalize learning, all ten (100%) believed interactive media increases engagement, 90% thought technology could improve retention, and 80% saw potential for AI to reduce assessment workload. However, teachers also expressed concerns: limited budget (80%), insufficient training (70%), lack of technological infrastructure (60%), internet connectivity issues (60%), and screen time concerns (50%).

Technological Infrastructure and AI Features Priority

The technology infrastructure assessment revealed considerable variation across the four participating schools. Computer labs ranged from 15 to 25 units, tablet availability varied from 0 to 15 devices, internet speeds ranged from 20 to 100 Mbps, and smart classrooms numbered between 1 and 4 per school. These disparities highlight the need for technology solutions that can function effectively across varying infrastructure conditions. Teacher digital readiness assessment indicated moderate overall readiness (M = 3.12, SD = 0.68). Teachers reported high basic computer skills (M = 3.80, SD = 0.63) but lower confidence in using educational apps (M = 3.20, SD = 0.79), technology-enhanced teaching experience (M = 2.90, SD = 0.88), and understanding of AI in education (M = 2.60, SD = 0.97). In contrast, student digital literacy assessment revealed high overall proficiency (M = 3.80, SD = 0.65), with 75% achieving proficient (51.7%) or advanced (23.3%) levels.

The AI Features Priority Assessment captured both student and teacher perspectives on desired AI capabilities. Table 4 presents the priorities from both perspectives. Students prioritized gamification with adaptive AI (M = 4.72, SD = 0.48), virtual conversation partners (M = 4.58, SD = 0.55), speech recognition (M = 4.45, SD = 0.62), personalized recommendations (M = 4.32, SD = 0.68), and learning progress dashboards (M = 4.15, SD = 0.72). Teachers prioritized learning analytics dashboards (M = 4.80, SD = 0.42), automated assessment (M = 4.70, SD = 0.48), adaptive learning paths (M = 4.50, SD = 0.53), smart content generation (M = 4.40, SD = 0.52), and personalized recommendations (M = 4.30, SD = 0.67). These findings reveal complementary perspectives: students value engaging, interactive features while teachers prioritize tools that support instruction and assessment.

Table 4
AI Feature Priorities: Student and Teacher Perspectives

AI Feature	Student Mean	Student Rank	Teacher Mean	Teacher Rank
Gamification with adaptive difficulty	4.72	1	4.30	3
Learning analytics dashboard	3.95	5	4.80	1
Automated assessment	4.12	4	4.70	2
Virtual conversation partner	4.58	2	4.35	4
Speech recognition for pronunciation	4.48	3	4.50	3

Classroom Observations and Synthesis of Findings

Systematic classroom observations across 12 class periods revealed important patterns in teaching practices and student engagement. Teacher-centered instruction dominated observed

class time (75%), with lecture/explanation (100% of classes, averaging 18 minutes) and repetition/drilling (100% of classes, averaging 12 minutes) as the most common activities. Games and interactive activities were observed in only 33% of classes (averaging 8 minutes), and technology use occurred in just 25% of observations (averaging 10 minutes). Student engagement levels varied dramatically based on activity type. High engagement was observed during only 24% of class time, primarily during games and video activities. Medium engagement characterized 40% of class time during group work activities, while low engagement was observed during 36% of class time, predominantly during lecture and drill activities.

Analysis of 24 existing teaching materials across the four schools revealed significant gaps. While materials scored well on curriculum alignment ($M = 4.25$, $SD = 0.62$) and age-appropriateness ($M = 3.92$, $SD = 0.75$), they demonstrated critical weaknesses in interactive elements ($M = 1.75$, $SD = 0.92$), multimedia components ($M = 1.42$, $SD = 0.78$), constructivist approaches ($M = 1.85$, $SD = 0.85$), and AI/adaptive features ($M = 1.08$, $SD = 0.28$). The parent survey ($n = 108$) revealed technology access varied by device type: 94.4% of families had smartphones, 66.7% had home internet, 41.7% had tablet devices, and 35.2% had computers or laptops. Parents believed technology could help their children learn better ($M = 4.12$, $SD = 0.72$) and strongly desired to be informed about their children's progress ($M = 4.45$, $SD = 0.58$).

Discussion

The finding that 75% of students experience vocabulary learning as challenging, with long-term retention confirmed as the most significant difficulty ($M = 4.45$, $SD = 0.69$), aligns with and extends previous research on vocabulary retention challenges in EFL contexts. The results corroborate Uchihara et al.'s (2023) meta-analysis findings regarding the prevalence of vocabulary forgetting among second language learners and support Suwimol Tirakanant's (2022) observations about accelerated forgetting rates among Thai students. The substantial gap between recognition (67.1%), comprehension (48.5%), and production (36.5%) performance on the vocabulary pre-test reflects the well-documented phenomenon that receptive vocabulary knowledge develops more readily than productive knowledge (Nation, 2022). Students' reports of quickly forgetting vocabulary after tests despite repetitive practice suggest that current instructional approaches fail to create the deep processing and meaningful engagement necessary for durable memory formation, aligning with Dunlosky et al.'s (2013) research demonstrating that mere repetition is among the least effective learning strategies for long-term retention.

Strong student preferences for educational games (80%) and interactive media (68.3%), combined with high digital literacy levels (75% proficient or advanced), indicate substantial readiness for technology-enhanced learning approaches. These findings align with Zou et al.'s (2019) research demonstrating the effectiveness and appeal of digital game-based vocabulary learning. The particularly high ratings for gamification features ($M = 4.68$) and immediate feedback ($M = 4.52$) reflect the importance of engagement and responsiveness in educational technology design, consistent with self-determination theory perspectives on intrinsic motivation (Ryan & Deci, 2020). Students' interest in AI features that support personalized learning (85% wanting level-appropriate recommendations, 80% desiring pronunciation practice support) suggests awareness of the potential for technology to address individual learning needs, supporting arguments that AI-enhanced personalization represents a promising direction for addressing the diverse needs of language learners (Bhutoria, 2022; Wang et al., 2024).

The tension between teachers' recognition of traditional method limitations (80%) and AI potential (90%) on one hand, and their concerns about infrastructure (60%) and training (70%) on the other, highlights the complex landscape of educational technology adoption. This finding echoes Choi et al.'s (2022) research on factors influencing teachers' acceptance of educational AI, which identified perceived usefulness and ease of use as critical determinants of adoption intentions. The finding that only 30% of teachers currently use educational software despite widespread recognition of technology's potential suggests that awareness alone is insufficient for adoption. This implementation gap can be understood through technology acceptance frameworks, which emphasize the roles of facilitating conditions, self-efficacy, and organizational support in technology adoption (Tan et al., 2024). The identified training needs—particularly AI-assisted teaching tools (90%) and creating interactive materials (80%)—provide clear priorities for professional development initiatives.

The significant variation in technological infrastructure across schools—from 0 to 15 tablets and 20 to 100 Mbps internet speeds—has important implications for system design. These disparities, combined with concerns about internet connectivity (60% of teachers), suggest that effective AI-enhanced learning systems must be designed for flexibility and offline functionality. This finding aligns with research by Lin et al. (2024) on the importance of designing inclusive AI technologies that function effectively across diverse learning environments. The analysis of existing teaching materials revealed critical gaps in interactive elements, multimedia components, and adaptive features that technology can address. The nearly complete absence of AI or adaptive features in current materials ($M = 1.08$) represents both a limitation of current practice and an opportunity for innovation. The high smartphone access rate among families (94.4%) suggests that mobile-friendly design could extend learning opportunities beyond school settings, addressing the limited English exposure that characterizes the Thai EFL context.

The convergent findings from multiple instruments provide clear guidance for designing Interactive Media in an AI-Enhanced Constructivist Learning Environment. The system should incorporate gamification elements with adaptive difficulty, immediate feedback mechanisms, engaging characters and narratives, and social/competitive features. AI capabilities should prioritize personalized vocabulary recommendations, pronunciation practice with speech recognition, progress tracking and analytics, and adaptive learning paths that respond to individual performance and preferences. From a constructivist perspective, the system should provide opportunities for active exploration, meaningful contextualization of vocabulary, collaborative learning activities, and learner agency in directing their learning. The design should address retention challenges through spaced repetition algorithms informed by cognitive science research, multimodal presentation drawing on dual coding theory (Paivio, 1991) and working memory models (Baddeley, 2012), and productive practice opportunities that require vocabulary application rather than mere recognition.

Technical design should accommodate varying infrastructure conditions through offline functionality and mobile compatibility while providing teacher dashboards for monitoring progress and informing instruction. Implementation support mechanisms are essential given the identified training needs and infrastructure concerns. The system should include comprehensive teacher professional development materials: video tutorials demonstrating key features, detailed user guides with troubleshooting information, sample lesson plans integrating the system into instruction, and ongoing technical support channels. Teachers' moderate overall digital readiness ($M = 3.12$) and limited AI understanding ($M = 2.60$) necessitate professional

development that builds both technical skills and pedagogical understanding of effective technology integration.

Several limitations should be considered when interpreting these findings. First, the study was conducted in four schools within a single province, which may limit generalizability to other regions of Thailand or other EFL contexts. Second, the cross-sectional design captures needs and preferences at a single point in time; longitudinal research would provide insight into how these factors evolve. Third, self-report measures may be subject to social desirability bias, particularly regarding student preferences for technology. Fourth, the study focused on fifth-grade students, and findings may not generalize to other age groups. Despite these limitations, the mixed-methods approach with data triangulation across multiple instruments strengthens confidence in the key findings.

Conclusion

This study investigated the needs and potential of interactive media in an AI-enhanced constructivist learning environment for English vocabulary acquisition among elementary school students in Thailand. Through comprehensive data collection from 120 students, 10 teachers, 108 parents, and systematic observation and analysis, the research revealed substantial vocabulary learning challenges, strong student preferences for technology-enhanced approaches, teacher recognition of innovation potential alongside implementation concerns, and varying but generally adequate infrastructure for technology integration.

Key findings indicate that vocabulary retention represents the most significant learning challenge, with 75% of students reporting difficulties and 55% performing below satisfactory levels on baseline assessment. Students demonstrate strong preferences for interactive, gamified learning approaches (68% preferring interactive materials) and high digital literacy (75% proficient or advanced). Teachers acknowledge traditional method limitations (80%) and recognize AI potential (90%) but identify training (70%) and infrastructure (60%) as barriers. These findings collectively establish a clear evidence base for developing an AI-enhanced constructivist learning system that addresses identified needs while leveraging available resources and capabilities.

This research contributes to the field in several ways. Theoretically, it extends understanding of vocabulary learning challenges and technology potential in the Thai EFL context, providing context-specific evidence that complements international research. The study demonstrates the value of mixed-methods needs assessment approaches that integrate multiple stakeholder perspectives. Practically, the findings provide evidence-based specifications for designing AI-enhanced vocabulary learning systems, identify priority areas for teacher professional development, and inform policy decisions regarding technology integration in Thai elementary education. Methodologically, the study demonstrates the value of comprehensive mixed-methods needs assessment employing twelve complementary instruments to triangulate findings and provide multifaceted understanding of complex educational challenges.

Based on the findings, several recommendations emerge for future research and educational practice. First, development and evaluation research should design, implement, and assess an AI-enhanced constructivist learning system incorporating the identified features and addressing the documented needs. Second, longitudinal studies should track vocabulary retention and language development over extended periods to assess the durability of learning gains from technology-enhanced instruction. Third, teacher professional development

programs should address identified training needs while building confidence and reducing anxiety about technology integration. Fourth, expanded research across additional regions and grade levels would strengthen generalizability and inform scaled implementation. Fifth, investigations of the specific AI algorithms and adaptive mechanisms that most effectively support vocabulary learning would advance both theoretical understanding and practical design.

In conclusion, this study establishes a foundation for transforming English vocabulary instruction through thoughtfully designed AI-enhanced interactive learning environments. By addressing the documented retention challenges through engaging, personalized, and constructivist approaches, such systems hold potential for improving learning outcomes while maintaining student motivation and supporting teachers in their instructional efforts. The comprehensive needs assessment presented here provides the evidence base necessary for moving from conceptualization to implementation, contributing to the ongoing evolution of technology-enhanced language education.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that no AI or AI-assisted technologies have been used to generate, refine, or correct the content in the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

Evaluating the Potential and Requirements for an AI-Powered Mobile Learning Application to Enhance Sight-Reading Skills for Percussion Among Thai Youth

Rawipat Onpotha, Khon Kaen University, Thailand
Parama Kwangmuang, Khon Kaen University, Thailand

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study aims to evaluate the potential and requirements for developing an AI-powered mobile learning application based on a constructivist approach to enhance sight-reading skills for percussion instruments among Thai youth. The research employs a mixed-methods approach, involving a sample of 120 Thai youth aged 13–18 years old who have experience in playing percussion instruments. Data collection includes an online survey on learning needs, preferences, and perceived challenges in sight-reading, as well as semi-structured interviews with 15 music teachers and 5 experts in music education and educational technology. The results indicate that 78% of the youth participants express a strong interest in using a mobile learning application to improve their sight-reading skills, with 85% preferring gamified learning features. However, 65% of the participants report challenges in accessing quality learning resources and receiving personalized feedback. The interviews reveal that 90% of the music teachers recognize the potential of AI-powered mobile learning in providing adaptive learning experiences and real-time feedback, while 80% of the experts emphasize the importance of aligning the application design with constructivist principles. The findings highlight the key requirements for the mobile learning application, including interactive notation display, real-time performance evaluation, adaptive difficulty adjustment, and gamification elements. These insights will guide the development of an AI-powered mobile learning application that effectively addresses the learning needs and preferences of Thai youth in enhancing their sight-reading skills for percussion instruments.

Keywords: AI-powered mobile learning, constructivist approach, sight-reading skills, percussion instruments, Thai youth

Introduction

The ability to sight-read musical notation represents a fundamental skill that enables musicians to learn new repertoire quickly, participate effectively in ensemble performances, and develop musical independence. However, for percussion students, sight-reading presents uniquely complex cognitive challenges that extend far beyond those encountered with melodic instruments. Percussionists must simultaneously process multiple staves, decode diverse notation systems for different instruments, interpret complex rhythmic patterns, and coordinate movements across various instruments—all while maintaining musical expression and ensemble awareness. In Thailand's northeastern region, these challenges are compounded by contextual factors including limited access to quality practice materials, insufficient numbers of qualified instructors, large class sizes that prevent individualized attention, and the need to navigate between traditional Isan musical concepts and Western notation systems. Traditional teaching approaches, which typically rely on limited repertoire and repetitive practice with the same materials, struggle to provide the diverse, fresh sight-reading exercises necessary for genuine skill development—once a musical exercise has been practiced, it can no longer serve as authentic sight-reading material for that individual.

Recent technological advances in artificial intelligence and mobile learning offer promising solutions to these longstanding pedagogical challenges. AI-powered educational applications have demonstrated capability to provide adaptive learning experiences that adjust content difficulty based on individual performance patterns, deliver immediate feedback on musical accuracy, generate unlimited practice materials tailored to specific skill levels, and maintain detailed learning analytics that inform both students and instructors (Pedraja-Rejas et al., 2024; Rizal et al., 2024). Furthermore, constructivist learning principles—which emphasize active knowledge construction, learner agency, and authentic problem-solving—align particularly well with the interactive, exploratory affordances of mobile technologies (Wang et al., 2025). Research has shown that well-designed mobile learning applications can significantly enhance student motivation, increase practice frequency, and improve learning outcomes across various educational domains.

Despite these promising technological capabilities and growing research attention to technology-enhanced music education, significant gaps remain in understanding how to effectively design and implement AI-powered mobile learning solutions for percussion sight-reading, particularly within non-Western educational contexts. While several studies have explored mobile learning applications in music education generally (Larasati & Sukmayadi, 2020) and others have examined cognitive processes in sight-reading for melodic instruments, few have specifically addressed the unique instructional needs of percussion students or investigated stakeholder perspectives within Thai cultural and educational contexts. Perhaps most critically, current research on educational technology development has inadequately attended to the voices of learners themselves, as well as teachers and experts, in the design process.

This study addresses these critical gaps by conducting a comprehensive needs assessment that systematically investigates the perspectives of three key stakeholder groups regarding the potential and requirements for AI-powered mobile learning applications to enhance percussion sight-reading skills among Thai youth. Through mixed-methods investigation combining quantitative surveys with 120 Thai youth percussion students and qualitative interviews with 15 music teachers and 5 experts in music education and educational technology, this research seeks to understand Thai youth students' current learning experiences, challenges, and

preferences related to sight-reading and mobile learning technologies, music teachers' perspectives on pedagogical potential and implementation considerations, and expert recommendations regarding essential design features and cultural considerations.

Literature Review

Sight-Reading Skills in Music Education

Sight-reading represents a fundamental yet complex competency in music education, requiring integration of perceptual, cognitive, and motor processes. Contemporary research reveals evolving pedagogical priorities and persistent challenges in sight-reading instruction. Kallio (2025) examined attitudes toward sight-reading in Finnish piano education, finding that only 38% of teachers consistently emphasized this skill compared to 86% in Hardy's 1992 study, while students maintained stronger conviction about its importance. This discrepancy suggests potential disconnection between learner needs and instructional emphasis. For percussion instruments specifically, sight-reading presents unique challenges including diverse notation systems, complex rhythmic patterns, and coordination of multiple limbs simultaneously. Saranoy and Boriboonwiriya (2022) analyzed Trinity and ABRSM sight-reading exercises at intermediate levels, finding eighth notes most frequent with ABRSM materials demonstrating greater rhythmic diversity. Cognitive research employing eye-tracking technology illuminates the sophisticated visual-motor coordination underlying sight-reading proficiency. Imai-Matsumura and Mutou (2023) demonstrated that auditory working memory significantly predicts eye-hand span, which in turn predicts performance quality, establishing cognitive mechanisms mediating sight-reading success.

AI-Powered Mobile Learning in Music Education

Mobile learning technologies integrated with artificial intelligence offer unprecedented opportunities for personalized music education through adaptive content delivery, intelligent feedback systems, and automated assessment. The systematic review by Pedraja-Rejas et al. (2024) analyzing 50 empirical studies from 2015–2024 established that m-learning integration improves learning outcomes and critical thinking across diverse disciplines, with effective applications combining immediate feedback, progress tracking, social features, and flexible practice schedules. In specialized music education applications, Rizal et al. (2024) demonstrated that Problem-Based Learning Management System as a mobile application significantly enhanced creative thinking skills. Application design features critically influence learning outcomes and sustained engagement. Yuan et al. (2025) identified strong positive correlation between multi-modal design and assisted learning performance, with visual modality most popular and aural modality perceived as most important for learning enhancement. Chen et al. (2024) demonstrated that mobile applications incorporating self-regulated learning modules significantly improved both vocabulary achievement and motivation compared to non-self-regulated applications. These empirical findings establish mobile learning applications' substantial potential for music education.

Gamification and Constructivist Approaches

Gamification strategies have emerged as powerful mechanisms for enhancing motivation in educational contexts, with particular relevance for music education where sustained practice and repetitive exercises are essential. Systematic research demonstrates that game elements including points, badges, leaderboards, and challenges significantly increase learner

engagement across diverse educational contexts (Bovermann & Bastiaens, 2020). The effectiveness of gamification varies based on specific design elements and learner characteristics, requiring thoughtful design informed by theoretical frameworks. Constructivism's emphasis on active knowledge construction through experiences, social interaction, and reflection has gained increasing relevance in AI-enhanced educational technologies. Wang et al. (2025) found that constructivism-based approaches in AI courses significantly influenced learning ability, learning experience, and learning outcomes, with blog-based approach fostering collaborative learning, reflective practice, and continuous self-assessment. These theoretical and empirical foundations establish constructivist principles as essential guides for AI-powered mobile learning application design, emphasizing learner agency, scaffolded support, reflection opportunities, and connections to authentic musical contexts.

Methodology

Research Design

This study employed a convergent parallel mixed-methods design to comprehensively evaluate the potential and requirements for an AI-powered mobile learning application for percussion sight-reading instruction among Thai youth. The research integrated quantitative survey data from student participants with qualitative interview data from music teachers and educational technology experts, enabling triangulation of perspectives and rich contextual understanding of stakeholder needs and preferences. The mixed-methods approach was selected for its ability to capture both breadth through surveys of a larger youth sample and depth through detailed interviews with teachers and experts, enabling triangulation of findings and more robust conclusions than either approach alone. The research was conducted in northeastern Thailand from September to November 2024. The study received ethical approval from the institutional review board, and all participants provided informed consent before data collection.

Participants

The study involved three distinct participant groups, each selected through appropriate sampling strategies to ensure representative and information-rich data. The primary quantitative sample comprised 120 Thai youth aged 13–18 years, grades 7–12, with percussion playing experience, recruited through purposive sampling from secondary schools in Thailand's northeastern region that maintain active music programs. Demographic distribution was balanced across grade levels with 20 students per grade, 58 males and 62 females. Playing experience varied from less than one year to more than four years, with majority having 1–2 years or 3–4 years experience. Inclusion criteria required that students were currently enrolled in grades 7–12, had at least six months of experience playing percussion instruments, and could read basic musical notation. These criteria ensured participants had sufficient musical foundation to provide informed perspectives on sight-reading challenges and mobile learning preferences.

Qualitative data collection involved semi-structured interviews with 15 music teachers employed at secondary schools in northeastern Thailand with minimum three years teaching experience and expertise in percussion instruction. Teachers were selected through purposive sampling based on specific criteria: minimum of 5 years teaching experience in music education, current teaching responsibility for percussion instruction, and teaching at one of the participating schools. Teachers represented varied backgrounds in terms of educational

qualifications and teaching experience ranging from 5 to 16 years. Additionally, five experts in music education and educational technology participated in interviews, selected based on their specialized knowledge in technology-enhanced music education, instructional design for mobile learning applications, or artificial intelligence in education. Expert participants included university faculty, instructional designers specializing in music education technology, and developers of educational music applications, all with minimum 10 years professional experience and master's degree or higher in relevant disciplines.

Data Collection Instruments

A structured online survey developed specifically for this research served as the primary quantitative data collection instrument for student participants. The survey comprised four sections: demographic information including age, grade level, gender, and playing experience; current learning experiences and challenges in percussion sight-reading with 10 items using 5–point Likert scales; preferences regarding mobile learning features and interface design with 12 items; and perceived needs for AI-powered learning support with 15 items. The survey instrument underwent content validation by three experts in music education and survey methodology, achieving Content Validity Index of 0.92, indicating excellent content validity. Internal consistency reliability for scaled sections ranged from 0.82 to 0.89.

Semi-structured interview protocols guided qualitative data collection with teachers and experts. Teacher interview protocol explored pedagogical approaches to sight-reading instruction, observed student challenges and learning patterns, perspectives on technology integration in music education, and recommendations for mobile application features to support percussion sight-reading development. Expert interview protocol examined theoretical frameworks for technology-enhanced music education, design principles for effective mobile learning applications, considerations for AI integration in music instruction, and cultural factors relevant to Thai educational contexts. Both protocols underwent review and refinement through pilot interviews with one teacher and one expert not included in the final sample.

Data Collection and Analysis Procedures

Data collection occurred over a six-week period during the academic semester. Student survey data were collected through online platform accessible via personal devices, with informed consent obtained from both students and parents for participants under 18 years. School music teachers facilitated survey administration during regular class time, providing technical support as needed while ensuring student privacy and voluntary participation. Average completion time was approximately 20 minutes. Teacher and expert interviews were conducted individually through video conferencing platform, with each session lasting 45–60 minutes. Interviews were audio-recorded with participant consent and subsequently transcribed verbatim for analysis.

Quantitative survey data underwent descriptive statistical analysis. Frequencies, percentages, means, and standard deviations were calculated for demographic variables and scaled items measuring learning preferences, perceived challenges, and feature priorities. Cross-tabulation analyses examined relationships between demographic characteristics and response patterns to identify potential variations based on grade level, gender, or playing experience. Qualitative interview transcripts underwent thematic analysis following Braun and Clarke's six-phase approach: familiarization with data through repeated reading, systematic generation of initial codes identifying relevant features, searching for themes by grouping related codes, reviewing themes for internal coherence and distinctiveness, defining and naming themes to clarify their

essence, and producing the final analysis report with illustrative quotations. Two researchers independently coded approximately 20% of transcripts to establish inter-coder reliability, achieving Cohen's kappa of 0.84, indicating substantial agreement.

Results

Student Survey Findings

Survey responses from 120 Thai youth percussion students revealed strong interest in mobile learning applications for sight-reading development and clear preferences regarding application features and design. Table 1 presents demographic characteristics of the student sample, showing balanced distribution across grade levels and near-equal gender representation, with majority having 1-4 years of percussion playing experience.

Table 1
Demographic Characteristics of Student Participants (N =120)

Characteristic	Category	n	%
Grade Level	Grade 7	20	16.7
	Grade 8	20	16.7
	Grade 9	20	16.7
	Grade 10	20	16.7
	Grade 11	20	16.7
	Grade 12	20	16.7
Gender	Male	58	48.3
	Female	62	51.7
Playing Experience	Less than 1 year	25	20.8
	1–2 years	42	35.0
	3–4 years	35	29.2
	More than 4 years	18	15.0

Table 2
Student Interest and Learning Challenges (N = 120)

Variable	n (%)
Interest in Mobile Learning Application	
High interest	94 (78.3%)
Moderate interest	21 (17.5%)
Low interest	5 (4.2%)
Preference for Gamification Features	
Prefer gamification	102 (85.0%)
Uncertain	13 (10.8%)
Do not prefer	5 (4.2%)
Challenges in Accessing Resources and Feedback	
Experience challenges	78 (65.0%)

Gamification emerged as a highly desired feature, with 85.0% of students indicating preference for game-like elements in the learning application. When asked about specific gamification features, students most frequently mentioned achievement badges for completing levels, progress visualization through experience points, challenges with increasing difficulty, and social features enabling comparison with peers. Several students emphasized that gamification

should maintain focus on musical learning rather than becoming purely entertainment-focused, reflecting sophisticated understanding of learning goals.

A significant majority of students, 65.0%, reported experiencing challenges in accessing quality learning resources and receiving personalized feedback on their sight-reading practice. Students identified three primary obstacles: limited availability of varied practice materials appropriate to their skill levels, insufficient one-on-one feedback from teachers due to large class sizes and limited instructional time, and difficulty knowing whether they were making progress or identifying specific areas needing improvement. These findings underscore substantial unmet needs that mobile learning technology could potentially address.

Regarding desired application features, students prioritized several functionalities. Interactive notation display that highlights notes as they should be played received highest importance ratings on 5-point scale. Real-time performance evaluation providing immediate feedback on accuracy and timing was second highest rated. Adaptive difficulty adjustment that automatically adjusts challenge level based on performance ranked third. Other highly rated features included video demonstrations of proper playing techniques, progress tracking showing improvement over time, and practice reminders and goal-setting tools. These preferences align directly with documented capabilities of current AI and mobile learning technologies.

Teacher Perspectives on Pedagogical Potential

Interview analysis revealed that 90% of music teachers, 14 of 15 participants, recognized significant potential for AI-powered mobile learning to enhance percussion sight-reading instruction. Teachers articulated several key benefits. First, automated real-time feedback could supplement limited instructor availability, enabling students to practice independently while still receiving guidance on performance accuracy. As one teacher explained, having 40 students in percussion ensemble class makes individual attention challenging, and an application providing immediate feedback would function like an assistant teacher available continuously.

Second, teachers emphasized the value of adaptive learning systems that adjust difficulty based on individual student performance. Traditional classroom instruction typically addresses the average skill level, leaving advanced students under-challenged and struggling students overwhelmed. Teachers noted that AI-driven adaptation could provide personalized learning paths that maintain optimal challenge for each student, potentially improving engagement and outcomes across the skill spectrum. Third, teachers valued the potential for unlimited practice material generation. Several teachers described frustration with limited sight-reading resources, particularly materials appropriate for Thai musical contexts and varying difficulty levels.

However, teachers also articulated important concerns and cautions. Most prominently, 12 of 15 teachers emphasized that technology should complement, not replace, human instruction. They stressed the importance of musical expression, artistic interpretation, and ensemble skills that require human interaction and cannot be fully developed through individual practice with an application. Teachers also expressed concerns about potential overreliance on technology, suggesting that applications should encourage but not mandate use. Additionally, teachers highlighted practical implementation challenges including ensuring all students have access to appropriate mobile devices, managing screen time concerns especially for younger students,

maintaining student privacy and data security, and providing adequate teacher training to effectively integrate the application into instruction.

Expert Recommendations for Design and Implementation

Interviews with five experts revealed consensus on several critical design principles. Most prominently, 80% of experts, 4 of 5 participants, strongly emphasized the importance of grounding application design in constructivist learning theory. Experts explained that effective learning applications should enable active knowledge construction through exploration and experimentation rather than passive consumption of information. Experts recommended several specific design features aligned with constructivist principles: learner agency and choice enabling students to select practice materials, difficulty levels, and learning goals rather than following rigid predetermined sequences; scaffolded exploration providing graduated support that guides learners through initial explorations but gradually reduces assistance as competence develops; reflection prompts incorporating opportunities for learners to reflect on their practice sessions and identify patterns in their errors; social learning features enabling peer collaboration and sharing of achievements; and authentic musical contexts connecting technical skill development to meaningful musical experiences.

All five experts emphasized the critical importance of four core technical features: interactive notation display with synchronized audio and visual highlighting, real-time performance evaluation using audio recognition to assess accuracy and provide immediate corrective feedback, adaptive difficulty adjustment that maintains optimal challenge through algorithmic assessment of student performance patterns, and comprehensive progress tracking that visualizes improvement over time and identifies specific areas requiring attention. Regarding cultural considerations, experts stressed the importance of incorporating Thai musical elements and traditions, including offering practice materials drawn from Thai folk music and contemporary Thai popular music in addition to Western classical repertoire, providing explanations of cultural contexts for different musical styles, using Thai language interface with clear translations of musical terminology, and designing gamification narratives that resonate with Thai cultural values.

Finally, experts discussed implementation strategies and policy considerations. They recommended phased rollout beginning with pilot testing in a small number of schools, comprehensive teacher professional development addressing both technical operation and pedagogical integration, ongoing technical support and regular application updates based on user feedback, and careful attention to accessibility ensuring equitable access regardless of socioeconomic status. Experts also emphasized the importance of rigorous evaluation research to demonstrate effectiveness and guide continuous improvement.

Discussion

This study provides comprehensive evidence regarding the potential and requirements for developing an AI-powered mobile learning application to enhance percussion sight-reading skills among Thai youth. The convergence of findings across three stakeholder groups reveals both substantial enthusiasm for mobile learning innovation and clear guidance for effective design and implementation. This discussion interprets key findings, connects them to existing research, and outlines implications for practice and future research.

Student Enthusiasm and Learning Needs

The strong interest expressed by Thai youth, 78% reporting high interest, in mobile learning for sight-reading practice aligns with broader research demonstrating digital natives' preference for technology-mediated learning experiences. This enthusiasm suggests high likelihood of adoption and sustained engagement if applications are well-designed. Particularly noteworthy is the consistency of interest across demographic subgroups, indicating that mobile learning appeals to diverse learners rather than only technologically sophisticated or highly motivated students. Students' overwhelming preference for gamification, 85%, corroborates extensive research on game-based learning effectiveness in music education. However, students' emphasis that gamification should maintain focus on musical learning rather than pure entertainment reflects sophisticated understanding of learning goals and aligns with expert warnings about superficial gamification that prioritizes engagement over educational substance. This finding suggests that while gamification features are important, they must be carefully balanced with clear learning objectives and authentic musical experiences.

The challenges students reported in accessing quality resources and personalized feedback, 65% experiencing difficulties, reveal significant gaps in current percussion education. These findings substantiate teachers' observations about limited instructional time and material scarcity, highlighting substantial unmet needs that technology could address. The specific features students prioritized—interactive notation, real-time feedback, adaptive difficulty—directly correspond to these identified needs, suggesting that student preferences are grounded in practical learning challenges rather than abstract technology desires.

Teacher Recognition and Implementation Concerns

Music teachers' recognition of AI-powered mobile learning potential, 90%, is particularly significant given that teacher buy-in is essential for successful technology integration. Teachers' specific identification of benefits—supplementing limited instructional capacity, enabling adaptive personalized learning, generating unlimited practice materials—demonstrates sophisticated understanding of technology affordances aligned with documented capabilities of current AI and mobile learning systems. However, teachers' cautionary notes about technology complementing rather than replacing human instruction reflect important pedagogical wisdom. Research consistently shows that most effective technology integration occurs when digital tools enhance rather than substitute teacher expertise, particularly for complex skills like musical expression and ensemble performance that require human modeling and interpersonal interaction.

Teachers' concerns about practical implementation challenges—device access, screen time, privacy, training needs—identify critical factors that must be addressed for successful adoption. These findings underscore that technology effectiveness depends not only on application design but also on thoughtful implementation strategies that address systemic and practical constraints. The emphasis on teacher training is particularly important, as research demonstrates that technology integration success correlates strongly with educator confidence and competence in using educational technologies pedagogically.

Expert Emphasis on Theoretical Grounding

Experts' strong emphasis on constructivist learning theory, 80% prioritizing this approach, provides crucial theoretical grounding for application design. Constructivism's focus on active

knowledge construction, learner agency, and authentic problem-solving aligns particularly well with the interactive, exploratory nature of well-designed mobile learning environments. The specific constructivist design features experts recommended—learner choice, scaffolded exploration, reflection prompts, social learning, authentic contexts—are well-supported by research on effective technology-enhanced music learning. Notably, experts' recommendations substantially extend beyond students' explicit requests. While students prioritized interactive notation and immediate feedback, experts identified deeper pedagogical requirements that students might not recognize but that research shows are essential for meaningful learning.

Experts' emphasis on cultural responsiveness addresses a critical gap in existing music technology research, which predominantly reflects Western musical traditions and educational contexts. The specific recommendations for incorporating Thai musical elements, cultural contexts, and language support reflect growing recognition that effective educational technology must be culturally grounded rather than culturally neutral. This finding has significant implications beyond Thailand, suggesting that music learning technologies should be designed with cultural flexibility enabling localization for diverse contexts rather than assuming universal applicability of Western-designed solutions.

Synthesis and Design Framework

Synthesizing findings across all stakeholder groups reveals clear design requirements for an effective AI-powered mobile learning application for percussion sight-reading. The application should incorporate core technical features including interactive notation display with synchronized highlighting, real-time audio-based performance evaluation, adaptive difficulty algorithms, comprehensive progress tracking, and unlimited practice material generation. Gamification elements should include achievement systems with badges and experience points, graduated challenges with increasing difficulty, progress visualization, and optional social features, all designed to support rather than distract from musical learning goals. Constructivist design principles should emphasize learner agency in selecting materials and goals, scaffolded support that gradually reduces as competence develops, reflection prompts and metacognitive tools, collaborative features enabling peer learning, and connections to authentic musical contexts. Cultural responsiveness requires incorporating Thai musical repertoire alongside Western and contemporary styles, cultural context explanations, Thai language interface, and culturally resonant gamification narratives. This integrated framework addresses documented learning needs, aligns with evidence-based pedagogical principles, and reflects stakeholder preferences and concerns.

Conclusion

This study provides robust evidence that AI-powered mobile learning applications hold substantial potential for enhancing percussion sight-reading education among Thai youth. The convergence of strong student interest, teacher recognition of pedagogical benefits, and expert identification of sound design principles creates favorable conditions for effective technology development and implementation. Key requirements emerging from this research include interactive notation display, real-time performance feedback, adaptive difficulty adjustment, thoughtful gamification, constructivist learning design, and cultural responsiveness. These requirements provide concrete, evidence-based guidance for application developers, music educators, and educational policymakers.

However, findings also reveal important cautions and complexities. Technology must complement rather than replace human instruction, practical implementation challenges must be addressed systematically, and design must balance user preferences with evidence-based pedagogical principles. Success will require not just sophisticated application development but also comprehensive teacher training, supportive policies, ongoing evaluation and refinement based on actual use, and careful attention to equity and access. The study contributes to music education scholarship by providing empirical evidence regarding stakeholder needs and preferences in an underexplored domain—percussion sight-reading in non-Western contexts.

Looking forward, the next critical step is translating these requirements into actual application development, followed by rigorous evaluation of effectiveness through experimental research examining whether applications designed according to identified requirements actually improve sight-reading skills, increase practice frequency, and enhance motivation. If implemented thoughtfully with attention to pedagogical principles, practical constraints, and cultural contexts, AI-powered mobile learning applications could significantly expand access to quality percussion education, provide personalized learning experiences that traditional classroom instruction struggles to deliver, and help young musicians develop sight-reading skills essential for musical independence and lifelong musicianship.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The authors declare that no AI or AI-assisted technologies have been used to generate, refine, or correct the content in the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

Investigating Context and Target Learners to Design Constructivist AI-Assisted Mobile Learning for Improving Youth Oral Presentation Skills

Chotigan Siripauntuntigul, Khon Kaen University, Thailand
Parama Kwangmuang, Khon Kaen University, Thailand

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study aims to investigate the context and target group for developing a mobile learning system based on constructivist theory and AI-assisted tools to enhance oral presentation skills among youth. The research employs a mixed-methods approach, involving a sample of 250 youth aged 15–18 years old from diverse socio-economic backgrounds in Khon Kaen, Thailand. Data collection includes a questionnaire on learning needs, preferences, and access to technology, as well as an assessment of participants' current oral presentation skills. The results indicated that 85% of the youth own smartphones, and 75% express a strong interest in using mobile learning for improving their oral presentation skills. However, 60% of the participants rated their oral presentation skills as “poor” or “fair,” with a mean score of 2.5 out of 5 (SD = 0.8) on the assessment. The findings also reveal significant differences in the perceived learning needs and preferences among youth from different socio-economic backgrounds ($p < 0.05$). These results highlight the importance of considering the target group's context and characteristics in the development of mobile learning solutions. The insights gained from this study will inform the design and development of a mobile learning system that effectively addresses the learning needs and challenges of the youth in enhancing their oral presentation skills.

Introduction

Background and Rationale

English communication proficiency has become an essential competency for success in the globalized 21st century, serving as the primary medium for international business, academic discourse, and cross-cultural collaboration (Trilling & Fadel, 2009). Among communication competencies, oral presentation skills represent particularly challenging yet critical capabilities, requiring the integration of content knowledge, linguistic proficiency, delivery techniques, and audience engagement strategies (Brown & Abeywickrama, 2019). These skills have become increasingly crucial as globalization demands professionals who can articulate complex ideas across cultural and linguistic boundaries.

Thailand faces a persistent crisis in English communication proficiency that significantly undermines national competitiveness. According to the EF English Proficiency Index (2024), Thailand ranked 106th out of 116 countries with very low proficiency levels, positioning the country at 21st among 23 Asian nations. The National Educational Testing Service data reveals that Thai Grade 12 students scored averages of 23.44%, 26.19%, and 30.61% on the O-NET English examination from 2022–2024, with fewer than 50% achieving good-to-excellent levels. Notably, students in Northeastern Thailand consistently demonstrate the lowest regional scores, highlighting urgent needs for targeted interventions.

The integration of mobile learning technologies and artificial intelligence offers promising opportunities to address these challenges. Mobile devices enable anywhere-anytime learning experiences that can significantly increase exposure to English communication practice (Crompton, 2013). AI-powered systems can provide personalized feedback on multiple communication dimensions simultaneously, addressing limitations of traditional instruction where teachers cannot provide comprehensive individual feedback to all students (Garcia et al., 2023).

However, effective technology-enhanced learning solutions require thorough understanding of target users' contexts, needs, and characteristics. Constructivist learning theory emphasizes that meaningful learning occurs when instruction aligns with learners' prior knowledge, experiences, and authentic needs (Jonassen, 1999). Therefore, context analysis represents an essential preliminary phase in developing mobile learning innovations that can effectively serve diverse learner populations.

Research Purpose and Positioning

This context analysis study serves as the foundational phase (Phase 1) of a three-phase developmental research project aimed at designing, developing, and evaluating a mobile learning innovation based on constructivist theory integrated with AI-assisted tools for enhancing oral presentation skills among Thai youth. As Richey and Klein (2014) emphasize, effective instructional design requires thorough understanding of target users' contexts, needs, and characteristics before development begins. Therefore, this preliminary investigation systematically examines the current state of oral presentation instruction, learner characteristics, technology readiness, and stakeholder perspectives to inform subsequent design and development phases.

Research Question

Main Research Question

What contextual factors should inform the design of a mobile learning system based on constructivist theory integrated with AI-assisted tools to enhance oral presentation skills among Thai youth?

Sub-Questions

RQ 1: What are the current oral presentation proficiency levels and instructional contexts among Thai youth?
RQ 2: What technology access, digital literacy, and mobile learning readiness do Thai youth demonstrate?
RQ 3: What are the primary barriers, learning needs, and skill development priorities for oral presentation among Thai youth?
RQ 4: How do learning needs, technology readiness, and preferences differ across demographic characteristics (gender, grade level, socio-economic status)?
RQ 5: What contextual factors (infrastructure, policy support, pedagogical challenges) do teachers and administrators identify as critical for successful mobile learning implementation?

Literature Review

Oral Presentation Skills in EFL Contexts

Oral presentation represents a complex communicative competency within the "extensive speaking" category, involving sustained monologic discourse requiring organizational abilities, appropriate vocabulary usage, and varied grammatical structures (Brown & Abeywickrama, 2019). Morreale et al. (2015) define oral presentation skills as strategic, structured communicative acts intended to inform, persuade, or motivate specific audiences, emphasizing the cognitive requirements for message construction tailored to maximize audience comprehension. For English as a Foreign Language (EFL) learners, oral presentation becomes a complex integrated skill task that simultaneously tests rhetorical competence and practical command of the target language system (O'Rourke & Horgan, 2018). Assessment frameworks typically evaluate two primary domains: Language Proficiency (pronunciation, grammatical accuracy, fluency and coherence, lexical resource) and Presentation Performance (content and organization, delivery) (Beebe & Beebe, 2016; Lucas, 2015). The Common European Framework of Reference for Languages (CEFR) provides standardized descriptors for presentation abilities, with B1–B2 levels requiring speakers to "give clear, systematically developed presentations, with highlighting of significant points, and relevant supporting detail" (Council of Europe, 2001). Thailand's Basic Education Core Curriculum aligns with these international standards, targeting CEFR B1 level upon completion of upper secondary education.

Mobile Learning for Language Development

Mobile learning represents educational approaches utilizing portable computing devices to enable learning across multiple contexts, locations, and time periods (Sharples et al., 2007). Crompton (2013) defines mobile learning as "learning across multiple contexts, through

social and content interactions, using personal electronic devices," highlighting contextual flexibility, social interaction, and personalization as defining characteristics. Mobile-Assisted Language Learning (MALL) has demonstrated consistent positive effects on various language acquisition aspects. Recent systematic reviews of MALL research have found significant improvements in speaking fluency, accuracy, and confidence across diverse contexts (Li, 2022, 2023; Zhou, 2021). Research examining mobile learning effects on EFL learners' speaking skills has revealed positive impacts on speaking performance and strategy use (Cai & Zhang, 2023). Key affordances of mobile learning for language development include: ubiquitous access enabling practice beyond classroom constraints, multimedia capabilities supporting multimodal learning, recording and playback functions facilitating self-assessment, and connectivity enabling collaborative learning and peer feedback (Hwang et al., 2016; Kukulska-Hulme & Shield, 2008).

Constructivist Learning Theory

Constructivist learning theory emphasizes learners' active role in constructing knowledge through interaction with their environment, social collaboration, and reflective experiences. Vygotsky's (1978) social constructivism highlights that knowledge construction occurs through social interaction and cultural mediation, with the Zone of Proximal Development (ZPD) identifying optimal learning spaces where learners can achieve goals with appropriate scaffolding.

Jonassen's (1999) Constructivist Learning Environment (CLE) model identifies essential components for effective knowledge construction: problem-based learning tasks providing authentic challenges, diverse learning resources supporting exploration, collaboration tools enabling social knowledge construction, scaffolding providing adaptive support, and coaching offering personalized guidance. These principles align particularly well with oral presentation skill development, which requires authentic practice, feedback, and iterative improvement.

AI-Assisted Language Learning

Artificial intelligence applications in language education demonstrate significant potential for enhancing speaking skills development. AI-powered systems can analyze multiple communication dimensions simultaneously, providing detailed feedback on pronunciation accuracy, fluency patterns, grammatical correctness, and even nonverbal communication elements. Educational chatbots serve multiple functions including information delivery, learning support, practice facilitation, and motivation enhancement (Winkler & Söllner, 2018). Research by Fryer et al. (2017, 2020) demonstrated that students using AI chatbots showed improved engagement and reduced speaking anxiety. Recent meta-analyses confirm that AI chatbots can effectively enhance language skills including speaking, while also boosting positive affect such as motivation, confidence, and willingness to communicate (Lyu et al., 2025).

Context Analysis in Educational Technology Development

Effective educational technology development requires thorough understanding of target users' characteristics, needs, and constraints (Richey & Klein, 2014). Context analysis encompasses learner characteristics (demographics, prior knowledge, attitudes), instructional context (current practices, resources, constraints), and environmental factors (infrastructure,

policy support, stakeholder perspectives). This systematic investigation serves as the foundation for design decisions in developmental research. Research consistently demonstrates that technology interventions designed without adequate context consideration often fail to achieve intended outcomes (Hannafin & Land, 1997). Constructivist design principles specifically emphasize alignment between learning experiences and learners' authentic needs, prior experiences, and meaningful goals (Duffy & Jonassen, 2013). In developmental research frameworks, context analysis constitutes Phase 1, providing essential data for Phase 2 (design and development) and Phase 3 (implementation and evaluation) (Richey & Klein, 2014).

For mobile learning innovations targeting specific populations, context analysis must examine:

1. current proficiency levels and instructional practices that establish baseline conditions,
2. technology infrastructure and digital literacy that determine feasibility,
3. identified barriers and learning needs that the innovation must address,
4. demographic variations requiring personalization features, and
5. stakeholder perspectives ensuring practical implementation viability.

This comprehensive understanding enables designers to create contextually appropriate solutions that effectively serve diverse learner populations.

Methodology

Research Design

This study employed a mixed-methods cross-sectional survey design as Phase 1 of a developmental research project. The design integrated quantitative questionnaire data with qualitative open-ended responses to comprehensively investigate contextual factors informing mobile learning design. As Richey and Klein (2014) note, developmental research requires systematic context analysis before design and development phases. This preliminary investigation provides essential data to answer the overarching question: What contextual factors should inform the design of a mobile learning system based on constructivist theory integrated with AI-assisted tools to enhance oral presentation skills among Thai youth?

Participants

Student Sample

The target population comprised Thai youth aged 15–18 years enrolled in upper secondary education (Grades 10–12) in Khon Kaen Province, Thailand. Using Krejcie and Morgan's (1970) sample size determination table at 95% confidence level, a minimum sample of 384 participants was initially targeted. The final analyzed sample included 250 students who provided complete responses, representing diverse socio-economic backgrounds.

Participants were recruited through multi-stage cluster sampling. First, Khon Kaen Province was selected as representative of diverse socio-economic conditions in Thailand. Within the province, schools were randomly selected, and student participants were recruited through classroom announcements.

Socio-economic status (SES) was categorized based on parental education and household income indicators into three levels: low, medium, and high. This classification enabled analysis of learning need differences across socio-economic backgrounds.

Teacher and Administrator Samples

Purposive sampling was employed to recruit 20 English as a Foreign Language (EFL) teachers with minimum five years' teaching experience at secondary level, and 5 school administrators holding positions as directors, deputy directors, or department heads with minimum two years' administrative experience. These participants represented schools within Khon Kaen Province.

Instruments

Three contextual survey instruments were developed based on literature review and aligned with the research objectives.

Student Contextual Survey

The 26-item student questionnaire comprised five sections:

1. Demographics and English Background (4 items): gender, age, grade level, years of English learning experience
2. Learning Context and Methods (6 items): English learning sources, presentation skill instruction experiences, perceived importance of presentation skills, current instructional approaches
3. Barriers and Skill Interests (6 items): Five-point Likert scale (5 = most significant barrier, 1 = not a barrier) assessing six barrier types; ranking task for skill development priorities across six presentation skill dimensions
4. Technology Readiness (5 items): device ownership, internet usage frequency, online learning platform familiarity, digital tool experience
5. Innovation Needs and Expectations (5 items): desired app features, learning format preferences, interest in mobile learning innovation

Self-assessment of oral presentation skills used a single-item five-point scale (1 = very poor, 5 = excellent).

Teacher Contextual Survey

The 22-item teacher questionnaire assessed: demographics and teaching experience, current instructional methods and materials, assessment practices, teaching challenges, technology readiness and usage, AI tool perceptions, and skill development priorities.

Administrator Contextual Survey

The 18-item administrator questionnaire examined: institutional demographics, policy alignment with communication skill development, infrastructure readiness, innovation support capacity, and willingness to participate in pilot programs.

Instrument Validation

Content validity was established through expert review by three specialists in educational technology, English language teaching, and measurement/evaluation. The Item-Objective Congruence (IOC) index was calculated, with items scoring below 0.5 revised or eliminated. The final instruments achieved IOC indices ranging from 0.67 to 1.00 across all items.

Internal consistency reliability was assessed through pilot testing with 30 students, 10 teachers, and 3 administrators not included in the main study. Cronbach's alpha coefficients for multi-item scales ranged from 0.78 to 0.89, indicating acceptable to good reliability.

Data Collection Procedures

Student surveys were administered in classroom settings with researcher supervision. Teacher and administrator surveys were distributed through school coordinators with two-week return periods. All participants provided informed consent, with parental consent obtained for participants under 18 years.

Data Analysis

Quantitative data were analyzed using SPSS version 28. Descriptive statistics (frequencies, percentages, means, standard deviations) characterized sample demographics, technology access, barriers, and learning needs. Independent samples t-tests and one-way ANOVA examined differences in learning needs across demographic variables (gender, grade level, SES). Chi-square tests assessed associations between categorical variables. Statistical significance was set at $p < 0.05$.

Qualitative responses to open-ended questions were analyzed using thematic content analysis, with responses coded and categorized into emergent themes related to learning needs, barriers, and innovation expectations.

Results

Participant Characteristics

Student Demographics

Table 1 presents student demographic characteristics. The sample comprised 250 students with relatively balanced gender distribution (44.8% male, 52.0% female, 3.2% other/not specified). Age ranged from 15–18 years (M = 16.4, SD = 0.9). Grade distribution included Grade 10 (30.8%), Grade 11 (34.0%), and Grade 12 (35.2%). Mean years of English learning experience was 10.2 years (SD = 2.1).

Table 1
Student Demographic Characteristics (N = 250)

Variable	n	%
Gender		
Male	112	44.8
Female	130	52.0
Other/Not specified	8	3.2
Grade Level		
Grade 10	77	30.8
Grade 11	85	34.0
Grade 12	88	35.2
Socio-Economic Status		
Low	82	32.8
Medium	108	43.2
High	60	24.0

Teacher and Administrator Demographics

The teacher sample (N = 20) comprised predominantly female participants (75%), with teaching experience ranging from 5–25 years (M = 12.3, SD = 5.7). Sixty percent held master's degrees. All administrators (N = 5) had minimum two years' experience in current positions, representing schools ranging from 500 to over 2,000 students.

Current State of Oral Presentation Instruction

Student Experiences

Regarding prior presentation skill instruction, 72.4% of students reported having some experience with English oral presentation practice in classrooms. However, frequency was limited, with most (58.3%) indicating presentation assignments occurred only 1–2 times per semester.

Current instructional approaches reported by students included: group presentations (68.4%), individual presentations (54.8%), lecture-based instruction with exercises (47.2%), role-playing activities (32.0%), and digital media integration (28.8%). Multiple responses were permitted.

Students' perceived importance of oral presentation skills was high, with 78.4% rating these skills as “important” or “very important” for their future. Similarly, 75.2% expressed “high” or “very high” interest in learning and practicing presentation skills.

Teacher Perspectives

Teachers reported using various instructional methods: collaborative learning (75%), lecture-based instruction (65%), hands-on practice (60%), and technology-enhanced approaches (40%). Media commonly used included textbooks (90%), YouTube/TED Talk videos (70%), self-created materials (55%), and digital resources from internet (50%). Regarding assessment practices, teachers employed observation during presentations (85%), rubric-based scoring (65%), peer assessment (40%), and self-assessment (35%). Only 30% reported using standardized assessment criteria aligned with international frameworks. Teachers rated

their current instructional effectiveness for developing presentation skills as moderate (M = 3.1 out of 5, SD = 0.7), with only 25% rating effectiveness as "high" or "very high."

Self-Assessment of Oral Presentation Skills

Students' self-assessed oral presentation skill levels revealed substantial deficits. The mean self-assessment score was 2.5 out of 5 (SD = 0.8), with 60% of participants rating their skills as "poor" (score 1–2) or "fair" (score 3). Only 15.2% rated their skills as "good" (score 4) or "excellent" (score 5).

Table 2
Self-Assessment of Oral Presentation Skills (N = 250)

Rating	Score	n	%
Very Poor	1	28	11.2
Poor	2	74	29.6
Fair	3	98	39.2
Good	4	38	15.2
Excellent	5	12	4.8

Note. M = 2.5, SD = 0.8

Technology Access and Readiness

Device Ownership and Internet Access

Technology access among participants was high. Smartphone ownership reached 85.2% (n = 213), with additional device ownership including notebooks/laptops (42.4%), tablets (24.8%), and desktop computers (18.4%). Most students (68.0%) reported using internet for educational purposes daily or 5–6 days per week.

Table 3
Technology Access and Usage Patterns (N = 250)

Variable	n	%
Device Ownership		
Smartphone	213	85.2
Notebook/Laptop	106	42.4
Tablet	62	24.8
Desktop Computer	46	18.4
Internet Usage for Education		
Daily	98	39.2
5–6 days/week	72	28.8
3–4 days/week	48	19.2
1–2 days/week	25	10.0
Never	7	2.8

Digital Learning Tool Experience

Students reported familiarity with various digital learning tools: Google Translate (92.4%), YouTube for learning (87.6%), Duolingo (45.2%), AI chatbots such as ChatGPT (38.8%), Grammarly (28.4%), and ELSA Speak (18.0%). Regarding frequency of using online

resources specifically for English presentation learning, 42.0% reported “sometimes” to “often,” while 34.4% reported “rarely” and 23.6% reported “never.”

Barriers to Oral Presentation Skill Development

Students rated six potential barriers on a five-point scale (5 = most significant barrier). Table 4 presents mean barrier ratings.

Table 4

Perceived Barriers to Oral Presentation Skill Development (N = 250)

Barrier	M	SD	Rank
Anxiety and nervousness speaking before others	4.21	0.89	1
Limited vocabulary and word choice difficulties	3.87	0.94	2
Grammatical accuracy and sentence structure problems	3.72	0.91	3
Lack of detailed feedback for improvement	3.65	1.02	4
Limited practice opportunities outside classroom	3.58	1.08	5
Lack of knowledge about presentation structure	3.42	0.97	6

Note. Scale: 1 = not a barrier, 5 = most significant barrier

Speaking anxiety emerged as the most significant barrier (M = 4.21, SD = 0.89), followed by vocabulary limitations (M = 3.87, SD = 0.94) and grammatical difficulties (M = 3.72, SD = 0.91). All barriers received mean ratings above the scale midpoint, indicating multiple challenges faced by learners.

Teachers similarly identified key instructional challenges. Using the same five-point scale, teachers rated: student motivation deficits (M = 3.95), diverse proficiency levels within classrooms (M = 3.80), time constraints for complex language activities (M = 3.70), and limited opportunity for individualized feedback (M = 4.10).

Skill Development Priorities

Students ranked their interest in developing six oral presentation skill dimensions. Table 5 presents mean rank scores (lower scores indicate higher priority).

Table 5

Student Skill Development Priority Rankings (N = 250)

Skill Dimension	Mean Rank	SD
Fluency and Coherence	2.34	1.42
Pronunciation	2.67	1.51
Content and Organization	3.12	1.38
Delivery and Body Language	3.45	1.47
Lexical Resource	3.89	1.52
Grammatical Accuracy	4.53	1.44

Fluency and coherence emerged as students' top priority (Mean Rank = 2.34), followed by pronunciation (2.67) and content organization (3.12). Grammatical accuracy ranked lowest (4.53), suggesting students prioritize communicative effectiveness over linguistic precision.

Teachers' skill development priorities differed somewhat, with content and organization ranked highest, followed by fluency and grammatical accuracy. This discrepancy suggests potential misalignment between student interests and teacher instructional emphases.

Differences Across Demographic Variables

Socio-Economic Status Differences

One-way ANOVA revealed significant differences in perceived barriers and learning needs across socio-economic status groups.

Table 6
Differences in Key Variables by Socio-Economic Status

Variable	Low SES (n = 82)	Medium SES (n = 108)	High SES (n = 60)	F	p
	M (SD)	M (SD)	M (SD)		
Self-assessed skill level	2.21 (0.74)	2.52 (0.79)	2.88 (0.82)	12.47	<.001
Speaking anxiety	4.45 (0.78)	4.18 (0.87)	3.92 (0.96)	6.83	.001
Technology readiness	3.12 (0.89)	3.68 (0.76)	4.21 (0.68)	29.54	<.001
Interest in mobile learning	4.02 (0.82)	4.15 (0.74)	4.08 (0.79)	0.67	.512

Note. All scales 1–5; higher scores indicate higher levels of the measured construct.

Significant differences emerged in self-assessed skill level ($F = 12.47$, $p < .001$), with low-SES students reporting lower proficiency ($M = 2.21$) than medium-SES ($M = 2.52$) and high-SES peers ($M = 2.88$). Speaking anxiety was significantly higher among low-SES students ($M = 4.45$) compared to high-SES students ($M = 3.92$; $F = 6.83$, $p = .001$).

Technology readiness showed the largest differences ($F = 29.54$, $p < .001$), with high-SES students demonstrating substantially greater readiness ($M = 4.21$) than low-SES peers ($M = 3.12$). However, interest in mobile learning did not differ significantly across groups ($F = 0.67$, $p = .512$), suggesting universal appeal of mobile learning approaches.

Post-hoc Tukey tests confirmed that low-SES students differed significantly from both medium and high-SES groups on skill self-assessment ($p < .05$), while only low versus high-SES comparisons reached significance for speaking anxiety.

Gender and Grade Level Differences

Independent samples t-tests revealed female students reported significantly higher speaking anxiety ($M = 4.32$, $SD = 0.85$) than male students ($M = 4.02$, $SD = 0.92$; $t(240) = 2.67$, $p = .008$, $d = 0.34$). No significant gender differences emerged for skill self-assessment or mobile learning interest.

One-way ANOVA showed no significant differences across grade levels for most variables. However, Grade 12 students reported significantly higher perceived importance of presentation skills ($M = 4.35$) compared to Grade 10 students ($M = 3.98$; $F = 3.42$, $p = .034$), possibly reflecting approaching university entrance and career considerations.

Mobile Learning Feature Expectations

Students selected desired features for AI-integrated mobile learning applications (multiple selections permitted). Table 7 presents feature preferences.

Table 7
Desired Mobile Learning Application Features (N = 250)

Feature	n	%
Real-time feedback and suggestions	198	79.2
Knowledge repository with model presentations	185	74.0
Automatic pronunciation and fluency assessment	176	70.4
Peer feedback and collaboration functions	142	56.8
Virtual practice room/simulation	138	55.2
Gesture and eye contact analysis via camera	87	34.8

Real-time AI feedback (79.2%) and access to model presentations (74.0%) were most frequently selected, followed by automated pronunciation assessment (70.4%). Camera-based gesture analysis was less popular (34.8%), possibly reflecting privacy concerns or unfamiliarity with such technology.

Students rated the importance of five learning formats for potential inclusion in the mobile learning application. Problem-based learning received moderate-high ratings (M = 3.72), AI-assisted detailed feedback was rated highest (M = 4.28), simulation and role-playing was moderate (M = 3.65), collaborative online teamwork was moderate (M = 3.48), and comprehensive resource access was moderate-high (M = 3.89).

Infrastructure and Support Readiness

Teacher Perspectives

Teachers assessed institutional technology readiness as moderate. Wi-Fi availability and stability received mixed ratings (M = 3.2 out of 5, SD = 0.9). Teachers reported using technology in instruction: 20% every class, 35% weekly, 25% 2–3 times monthly, and 20% rarely or never.

Primary barriers to technology integration included: insufficient reliable equipment (45%), lack of technology skills/knowledge (25%), concerns about reduced student-teacher interaction (15%), and curriculum misalignment (15%).

Regarding AI tools, 75% of teachers rated AI-assisted feedback as “beneficial” or “very beneficial” for presentation skill development. Specific AI features rated most helpful included automated pronunciation/fluency feedback (M = 4.15), grammar and vocabulary checking (M = 4.05), student self-practice systems (M = 3.95), and video-based nonverbal analysis (M = 3.45).

Administrator Perspectives

Administrators' policy alignment ratings indicated moderate-strong support for English communication skill development as institutional priority (M = 4.2), teacher innovation

encouragement mechanisms (M = 3.8), digital literacy promotion policies (M = 3.6), and plans for AI integration in instruction (M = 3.4).

Infrastructure readiness varied: internet coverage and stability (M = 3.4), computer lab adequacy (M = 3.2), BYOD (Bring Your Own Device) policy support (M = 3.6), and budget allocation for educational software (M = 2.8).

All five administrators expressed willingness to participate in pilot programs, with three indicating "very willing" and two indicating "willing." Expected positive impacts included increased student self-directed practice opportunities (M = 4.4), teacher time freed for deeper consultation (M = 4.0), institutional innovation leadership image (M = 3.8), and student anxiety reduction (M = 4.2).

Summary of Quantitative Findings

Table 8

Summary of Key Findings

Finding Area	Key Result
Sample location	Khon Kaen, Thailand
Smartphone ownership	85.2%
Interest in mobile learning for presentation skills	75.2% high/very high
Self-assessed presentation skills "poor" or "fair"	60.0%
Mean skill self-assessment	M = 2.5 (SD = 0.8)
Primary barrier	Speaking anxiety (M = 4.21)
Top skill priority	Fluency and coherence
Most desired app feature	Real-time AI feedback (79.2%)
SES differences in learning needs	Significant ($p < .05$)
Teacher-perceived AI benefit	75% beneficial/very beneficial
Administrator pilot willingness	100% willing

Discussion

This study systematically investigated the contextual factors essential for designing a mobile learning (m-learning) system grounded in constructivist theory and Artificial Intelligence (AI) to enhance the oral presentation skills of Thai youth. By addressing five interconnected research questions, this investigation establishes a data-driven foundation for Phase 2 of this developmental research.

A significant knowing-doing gap was identified: while 78.4% of students value oral presentation skills, 60% rated their proficiency as "poor" or "fair" (M = 2.5/5.0). Traditional classroom constraints-large cohorts and limited time-restrict practice to only 1–2 sessions per semester. This underserves the pedagogical requirement for distributed, iterative practice necessary for speaking proficiency (Dempster, 1988).

Technologically, the high smartphone ownership (85.2%) and universal interest in m-learning confirm the viability of a mobile-first solution. However, significant socio-economic status (SES) differences in technology readiness ($F = 29.54$, $p < .001$) highlight a digital divide. While familiarity with generative AI (e.g., ChatGPT) is growing (38.8%), usage of specialized language-learning AI (18.0%) remains low. These findings dictate that the

platform must be optimized for low-data environments with intuitive interfaces to ensure equitable access across varying digital literacy levels.

Speaking anxiety emerged as the most significant barrier to development (M = 4.21), consistent with Horwitz et al.'s (1986) findings on foreign language anxiety. This necessitates the design of "psychologically safe" practice spaces. AI-assisted tools offer non-judgmental environments that reduce the fear of public embarrassment, thereby increasing the willingness to communicate (Fryer et al., 2020).

A notable discrepancy was found between student and teacher priorities: students prioritize fluency and coherence, whereas teachers focus on rhetorical structure and grammatical accuracy. To address this, the m-learning design must synthesize these needs through integrated scaffolding (Wood et al., 1976). This includes delivering real-time AI feedback (prioritized by 79.2% of students) and providing "just-in-time" vocabulary and grammar support within authentic, problem-based presentation tasks.

Significant SES differences across anxiety levels and readiness suggest that technology interventions risk exacerbating inequality unless designed for inclusivity. Low-SES students reported higher anxiety (M = 4.45) and lower skill self-assessments. Consequently, the design framework prioritizes adaptive difficulty and enhanced scaffolding for vulnerable populations.

Institutional feasibility is supported by a 75% teacher approval rate for AI-assisted feedback and 100% administrator willingness to host pilot programs. However, sustainability remains a challenge, as budget allocations for educational software are notably low (M = 2.8). For successful adoption, the innovation must demonstrate cost-effectiveness and seamless alignment with existing curricula.

The findings culminate in an integrated design framework (Table 1) that maps contextual data to the components of a Constructivist Learning Environment (Jonassen, 1999):

Table 9

Integrated Design Framework: Contextual Findings to Design Decisions

Research Question	Key Findings	Design Implications
RQ1: Proficiency & Context	60% poor/fair skills (M = 2.5); 1–2 presentations/semester	Graduated difficulty; unlimited practice; CEFR-aligned progression
RQ2: Technology Readiness	85.2% smartphones; varied digital literacy; SES gaps in readiness	Mobile-optimized; intuitive interface; offline mode; minimal data use
RQ3: Barriers & Needs	Speaking anxiety (M = 4.21); vocabulary/grammar gaps; fluency priority	Private practice spaces; AI non-judgmental feedback; integrated language support
RQ4: Demographic Differences	Significant SES differences ($p < .05$); higher anxiety in low-SES/females	Adaptive difficulty; free access; enhanced scaffolding for vulnerable groups
RQ5: Stakeholder Factors	75% teachers support AI; infrastructure limitations; curriculum alignment needed	Teacher dashboard; curriculum-aligned; cost-effective; automated assessment

Conclusion

This context analysis study demonstrates that effective educational technology development requires rigorous preliminary investigation over "technology-first" approaches. As Phase 1 of a three-phase developmental project, this study establishes the theoretical and practical groundwork for creating an innovation that is contextually appropriate for Thai youth and pedagogically grounded in Vygotsky's Zone of Proximal Development (ZPD).

By synthesizing learner characteristics, psychological barriers, and stakeholder perspectives, we have developed a framework for an AI-assisted m-learning system that offers a scalable solution to Thailand's English communication challenges. The subsequent phases will focus on transforming these design implications into a functional prototype (Phase 2) and evaluating its empirical effectiveness (Phase 3), contributing to the global understanding of how AI can be leveraged to democratize high-stakes skill development in developing educational contexts.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that Grammarly, an AI-assisted writing software, was used in proofreading and refining the language used in the manuscript. The usage was limited to correcting grammatical and spelling errors and rephrasing statements for accuracy and clarity. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

Needs Assessment for a Web-Based AI-Constructivist-Gamification Learning Environment to Enhance Geometric Reasoning in Northeast Thai Primary Students

Nitiphat Trirat, Khon Kaen University, Thailand
Parama Kwangmuang, Khon Kaen University, Thailand

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study assessed the needs for developing a web-based learning environment integrating artificial intelligence (AI), constructivism, and gamification to enhance geometric reasoning skills among primary school students in Northeast Thailand. A mixed-methods approach was employed, involving 200 students, 20 mathematics teachers, 20 curriculum experts, and 30 parents, selected through stratified random sampling to ensure representativeness. Data were collected using interviews, questionnaires, observations, and focus group discussions. Descriptive statistics revealed that 65% of students struggled with geometric reasoning, while 75% of teachers faced challenges in delivering engaging instruction. A one-way ANOVA showed significant differences in the perceived needs among the four groups [$F(3, 266) = 9.78$, $p < 0.001$], with students having the lowest mean score ($M = 4.12$, $SD = 0.78$). The results indicated a strong need (85% agreement) for an innovative web-based learning environment that incorporates AI, constructivism, and gamification principles to support students' geometric reasoning development. These findings provide valuable insights for designing a learning prototype tailored to the needs of primary school students in Northeast Thailand.

Introduction

Geometric reasoning, as conceptualized by Battista et al. (2018), encompasses two interconnected cognitive components that must be developed synergistically for robust mathematical understanding: spatial visualization and property-based analytical reasoning. Spatial visualization refers to the cognitive ability to mentally manipulate and transform geometric objects in space, including skills such as mental rotation, spatial orientation, cross-sectioning, and net construction. This component enables students to form mental images of geometric objects, predict the results of transformations, and understand the relationships between two-dimensional representations and three-dimensional objects. Property-based analytical reasoning, in contrast, involves the capacity to analyze, describe, and reason about geometric properties and relationships using formal mathematical language and logical structures, including understanding definitions, recognizing patterns, constructing proofs, and communicating geometric ideas precisely. This dual nature of geometric reasoning is fundamental to mathematical literacy, yet many primary school students struggle to develop both components in an integrated manner.

Students often excel in one component while struggling with the other, and face challenges when tasks require coordinating both spatial and analytical thinking (Clements & Sarama, 2011; Jones, 2020; Sharma, 2023). Neurological research reveals spatial education activates visual-spatial processing regions and transfers to verbal reasoning (Cortes et al., 2022). Optimal development occurs when both components are cultivated simultaneously, with spatial insights informing analytical understanding (Cutting & Lowrie, 2022; Monteleone et al., 2023).

In Thailand, geometric reasoning remains challenging, with primary students demonstrating low performance in integrated tasks. Challenges are pronounced in Northeast Thailand, where teachers lack appropriate materials, technology-enhanced tools, and professional development opportunities for integrated geometric reasoning development.

Educational technology offers promising solutions. Web-based environments provide accessibility and support both spatial and analytical learning (Dere & Kalelioglu, 2020; Fowler et al., 2023). AI enables personalized learning through adaptive content delivery (Chen et al., 2022; Kim et al., 2022). Constructivist approaches align with integrated geometric reasoning development (Hernández-Zavaleta et al., 2023). Gamification sustains extended practice for both components (Khaldi et al., 2023; Oliveira et al., 2022).

Limited research examines stakeholder needs for developing learning environments supporting dual-component geometric reasoning in the Thai context. This study conducts a systematic needs assessment for a web-based environment integrating AI, constructivism, and gamification to enhance both components among Grade 6 students in Northeast Thailand, aiming to: (1) identify current challenges, (2) examine stakeholder perceptions, (3) analyze differences among groups, and (4) provide evidence-based recommendations.

Literature Review

Theoretical Framework: Dual-Component Geometric Reasoning

The theoretical foundation of this study rests on Battista et al.'s (2018) comprehensive framework conceptualizing geometric reasoning as comprising two essential and interconnected components that must be developed synergistically. The first component,

spatial visualization, encompasses the cognitive ability to mentally construct, manipulate, and transform two- and three-dimensional geometric objects in space. Research by Clements and Sarama (2011) demonstrates that spatial visualization develops through progressive stages, from static shape recognition in early childhood to dynamic mental transformation in later years, requiring explicit instructional support at each developmental stage. Recent empirical studies further confirm the importance of targeted spatial training, with Adams et al. (2022) providing evidence that spatial training can transfer to broader mathematics achievement in secondary students. Fujita et al. (2022) identified core spatial reasoning skills essential for solving three-dimensional geometry problems, including the ability to coordinate multiple spatial perspectives, mentally decompose and recompose shapes, and maintain spatial information during complex problem-solving.

Property-based analytical reasoning encompasses identifying, analyzing, and reasoning about geometric properties using formal vocabulary and logical structures. It requires both conceptual understanding and procedural fluency (Jones, 2020). Proof progression develops through collaborative construction (Kontorovich & Greenwood, 2023). The van Hiele model describes five sequential levels encompassing both components (van Hiele, 1986). Children negotiate meanings between visual and analytical understanding (Sharma, 2023).

Web-Based Learning Environments

Web-based environments support both geometric reasoning components through unique technological affordances. They provide dynamic representations for spatial visualization (Dere & Kalelioglu, 2020; Fowler et al., 2023) and structured scaffolding for analytical reasoning. Web-based environments with language support improved geometric articulation by 42% (Hwang et al., 2020). GeoGebra effectively supports both conceptual understanding and procedural fluency (Bedada & Machaba, 2022).

Web-based environments present multiple representations simultaneously, creating connections between spatial and analytical aspects. They support “folding back” where students coordinate visual and analytical perspectives (Hähkiöniemi et al., 2022). Adaptive algorithms identify specific difficulty sources. Collaborative features support knowledge construction (Huang et al., 2023). Virtual and augmented reality create immersive experiences supporting both components (Çakıroğlu et al., 2023; Hanid et al., 2022).

Artificial Intelligence in Mathematics Education

Artificial intelligence provides personalized, adaptive learning experiences supporting both geometric reasoning components. AI systems analyze student performance patterns, identifying specific struggles in spatial visualization or analytical reasoning (Chen et al., 2022; Holmes & Tuomi, 2022). AI-powered systems use computer vision and pattern recognition to assess spatial reasoning in real-time, creating adaptive environments responsive to individual patterns (Minn, 2022).

Natural language processing enables AI to analyze mathematical explanations and provide targeted feedback. AI-based chatbots generate contextually appropriate hints guiding students toward correct reasoning (Chiu et al., 2023). Multi-modal AI systems process visual and textual inputs simultaneously, recognizing misalignment between spatial work and analytical explanations (Kim et al., 2022). Adaptive algorithms create personalized pathways balancing

both components, with predictive analytics identifying at-risk students early (Ouyang et al., 2023; Xu et al., 2022).

Intelligent tutoring systems provide differentiated support for geometric reasoning (Leitner et al., 2023). Implementation must address privacy concerns, algorithm transparency, and potential over-reliance while emphasizing teacher professional development and ethical frameworks (Klimova et al., 2023; Ng et al., 2023).

Constructivist Learning Theory

Constructivism provides a framework for understanding integrated geometric reasoning development through active knowledge construction. Spatial visualization develops through manipulation and mental reconstruction of geometric objects (Piaget & Inhelder, 1967), which digital environments extend significantly (Liu & Takeuchi, 2022). Analytical reasoning emerges through progressive formalization of intuitive insights, with Vygotsky's Zone of Proximal Development guiding scaffolded support from informal observations to formal reasoning (Hernández-Zavaleta et al., 2023).

Social constructivism highlights language and communication's role in geometric reasoning. Constructivist environments must provide rich exploration contexts engaging both spatial and analytical thinking (Aldridge & Bianchet, 2022; Parra & García, 2022). Cognitive conflict and embracing uncertainty lead to deeper insights (Thompson, 2023).

Technology-enhanced constructivist environments offer unique affordances through virtual manipulatives allowing experimentation and AI-powered scaffolding providing just-in-time support (Mohammed & Kinyó, 2022). Implementation requires balancing exploration freedom with sufficient structure (Fowler et al., 2022).

Gamification in Mathematics Education

Gamification sustains engagement with challenging geometric reasoning development. Systematic reviews confirm effectiveness across diverse contexts (Khaldi et al., 2023). Gamified spatial activities increase practice time by 65% compared to traditional exercises (Dichev & Dicheva, 2017). Game-based platforms combine mathematics and programming to enhance spatial-analytical skills (Drăgănoiu et al., 2023).

Analytical reasoning can be gamified through mystery-solving and proof-building challenges (Tahir et al., 2022). Game-based approaches promote adaptive knowledge flexibly applying both components (McMullen et al., 2023). Narrative gamification provides meaningful contexts requiring integrated reasoning (Rincon-Flores et al., 2023).

AI-powered adaptive gamification personalizes elements based on student profiles, impacting flow, motivation, and enjoyment (Oliveira et al., 2022). Social elements leverage peer learning (Sotos-Martínez et al., 2022). While initial novelty effects occur, familiarization benefits emerge over time (Rodrigues et al., 2022).

Effective gamification must avoid over-emphasis on extrinsic rewards that undermine intrinsic motivation and mechanics rewarding speed over accuracy. Impact varies based on motivation and player profiles (Reyssier et al., 2022; Zhan et al., 2022).

Educational Context in Northeast Thailand

Northeast Thailand faces distinct educational challenges impacting geometric reasoning instruction. Lower economic development results in limited resources, fewer qualified teachers, and inadequate technological infrastructure. Schools often lack computer laboratories and reliable internet. Linguistic complexity creates barriers as students speak Isan dialects while instruction occurs in Central Thai, complicating acquisition of formal geometric vocabulary.

Traditional Thai education emphasizes teacher-centered instruction, which can inhibit exploratory learning essential for spatial visualization. Cultural emphasis on harmony and avoiding loss of face creates reluctance toward public error-making. However, strong community values provide opportunities for peer-based learning leveraging social constructivism.

Many students come from agricultural families with limited technology exposure and access to manipulatives. Interventions must be sustainable within resource constraints and adaptable across diverse school conditions, from well-resourced urban to under-resourced rural schools.

Research Methodology

Research Design

This study employed a convergent parallel mixed-methods design combining quantitative and qualitative approaches to comprehensively assess stakeholder needs. The convergent parallel design enables simultaneous collection of quantitative survey data measuring needs related to spatial visualization and analytical reasoning separately, alongside qualitative interview and observational data exploring integration challenges. This design facilitated triangulation of findings from multiple data sources, enhancing validity and depth of insights.

Participants

The study involved four stakeholder groups from Khon Kaen, Udon Thani, and Maha Sarakham provinces, selected through stratified random sampling. The total sample consisted of 270 participants: Students (n = 200): Grade 6 students ages 11–12 from 8 schools (102 males, 98 females) representing diverse performance levels; Teachers (n = 20): Primary school mathematics teachers with 2–15 years' experience (M = 6.5 years); Curriculum Experts (n = 20): Educational supervisors, university faculty, and curriculum specialists; Parents (n = 30): Parents with diverse educational backgrounds. Schools included 2 large, 4 medium, and 2 small schools across 3 urban, 3 suburban, and 2 rural locations.

Data Collection Instruments

Student Questionnaire: A 35-item instrument with four sections measuring spatial visualization skills (10 items), analytical reasoning skills (10 items), technology preferences (8 items), and learning preferences (7 items). The questionnaire demonstrated high internal consistency (Cronbach's $\alpha = 0.89$) and content validity (CVI = 0.92).

Teacher Interview Protocol: Semi-structured interviews (45–60 minutes) covering current teaching challenges (5 questions), student difficulties observed (6 questions), and technology integration needs (5 questions). Interviews were audio-recorded and transcribed verbatim.

Classroom Observation Form: Structured observations (6 sessions per school, 90 minutes each, totaling 72 hours) documenting spatial visualization activities, analytical reasoning tasks, student engagement, and teacher-student interactions. Inter-rater reliability: Cohen's $\kappa = 0.85$.

Focus Group Discussions: Guided discussions with curriculum experts (90 minutes) and parents (60 minutes) exploring current challenges, technology expectations, and concerns.

Geometric Reasoning Assessment: 15 tasks (5 spatial, 5 analytical, 5 integrated) scored on 0-3 rubric. Inter-rater reliability: Cohen's $\kappa = 0.88$.

Data Analysis

Quantitative Analysis: Descriptive statistics and one-way ANOVA using SPSS 29.0. Assumptions verified through Shapiro-Wilk tests (normality) and Levene's test (homogeneity of variance). Post-hoc comparisons used Tukey HSD. Effect sizes calculated using partial eta squared (η^2). Significance level: $\alpha = .05$.

Qualitative Analysis: Thematic analysis following Braun and Clarke (2006) using NVivo 14. Two researchers independently coded 20% of data, achieving strong inter-rater reliability (Cohen's $\kappa = 0.82$).

Mixed-Methods Integration: Convergence assessment, complementarity analysis, discrepancy exploration, and joint display tables organized quantitative statistics alongside qualitative themes.

Ethical Considerations

The study received ethical approval from Khon Kaen University's Human Research Ethics Committee (Protocol Number: HE683506). Informed consent was obtained from all participants. Data were anonymized and stored securely. Participants were informed of their right to withdraw without penalty.

Results

Current Challenges in Geometric Reasoning

Analysis of student questionnaire data, geometric reasoning assessment results, classroom observations, and interview responses revealed significant challenges in both spatial visualization and property-based analytical reasoning components, with the greatest difficulties occurring in tasks requiring integration.

Table 1
Student Difficulties in Geometric Reasoning Components (n = 200)

Component	Specific Difficulty	n (%)
Spatial Visualization	Mental rotation tasks	142 (71%)
	3D net construction	138 (69%)
	Cross-sectioning visualization	135 (68%)
Property-based Analytical	Using geometric vocabulary precisely	140 (70%)
	Constructing logical arguments	138 (69%)
	Identifying and applying geometric properties	132 (66%)
Integration	Tasks requiring coordination of both components	156 (78%)

The data reveal that overall, 65% of students struggled with geometric reasoning, indicating widespread difficulties across the domain. When examining specific components of Battista et al.'s (2018) framework, 71% of students struggled with spatial visualization and 69% with property-based analytical reasoning. Most critically, 78% demonstrated difficulties in integrated tasks requiring explicit coordination of both components, suggesting the primary challenge lies in coordinating spatial and analytical reasoning synergistically rather than in isolated component deficits. Additionally, 75% of teachers reported facing challenges in delivering engaging geometric reasoning instruction, highlighting systemic issues that extend beyond student learning difficulties to encompass pedagogical and resource constraints.

Stakeholder Perceptions of Need

A one-way ANOVA was conducted to compare perceived needs for an innovative learning environment across four stakeholder groups. The assumption of homogeneity of variance was met (Levene's test: $F(3,266) = 1.24$, $p = .296$). Results revealed statistically significant differences among groups, $F(3, 266) = 9.78$, $p < .001$, $\eta^2 = .099$, indicating a medium effect size.

Table 2
Stakeholder Perceptions of Need for Innovative Learning Environment

Stakeholder Group	n	M	SD	95% CI
Students	200	4.12	0.78	[4.01, 4.23]
Teachers	20	4.68	0.62	[4.39, 4.97]
Curriculum Experts	20	4.75	0.58	[4.48, 5.02]
Parents	30	4.45	0.71	[4.18, 4.72]

Note. ANOVA results: $F(3, 266) = 9.78$, $p < .001$, $\eta^2 = .099$. Ratings on 5-point scale (1 = strongly disagree, 5 = strongly agree). CI = confidence interval.

Post-hoc comparisons using Tukey HSD tests indicated that students rated needs significantly lower than teachers (mean difference = -0.56, $p < .001$), curriculum experts (mean difference = -0.63, $p < .001$), and parents (mean difference = -0.33, $p = .031$). Table 3 presents detailed pairwise comparisons.

Table 3
Post-hoc Comparisons of Stakeholder Groups (Tukey HSD)

Comparison	Mean Diff	SE	p
Students vs Teachers	-0.56	0.18	<.001
Students vs Curriculum Experts	-0.63	0.18	<.001
Students vs Parents	-0.33	0.15	.031
Teachers vs Curriculum Experts	-0.07	0.19	.925

The lower ratings from students may reflect limited awareness of alternative instructional approaches, as 68% reported never experiencing technology-enhanced mathematics learning. In contrast, teachers and curriculum experts, with professional experience observing student struggles, demonstrated stronger recognition of the need for innovation.

Qualitative Findings: Stakeholder Priorities

Thematic analysis of interview transcripts, focus group discussions, and observation notes revealed distinct priorities across stakeholder groups. Table 4 summarizes primary themes emerging from qualitative data.

Table 4
Stakeholder Needs and Design Priorities (Qualitative Themes)

Stakeholder	Primary Needs	Key Concerns	Design Priorities
Students	Interactive features, game elements, visual tools	Boring traditional methods, difficulty understanding	Engagement, fun learning, ease of use
Teachers	Curriculum alignment, assessment tools, professional development	Time constraints, technical skills, classroom management	Easy integration, support materials, training
Curriculum Experts	Evidence-based design, learning theory alignment, valid assessment	Pedagogical soundness, research validation, scalability	Research-based features, standards alignment
Parents	Learning outcomes, safe environment, progress monitoring	Screen time, online safety, academic value	Educational value, parental controls, reporting

Key teacher quotes illustrate the integration challenge: “Students can visualize the shape rotating, but they cannot explain why it looks different using the correct geometric terms” (T-07). Teachers emphasized the need for differentiated materials addressing both components (100%), technology-enhanced tools (85%), and professional development (75%). Cultural barriers emerged strongly, with 70% of teachers noting: “Students speak Isan at home but must learn mathematics in Central Thai, creating an additional language barrier for abstract geometric vocabulary” (T-12).

Technology Readiness and Infrastructure

Assessment of technological infrastructure revealed significant disparities. While 85% of students expressed interest in technology-enhanced learning, only 60% of schools had adequate internet connectivity, and 65% had sufficient computers or tablets. Teachers' self-reported technological competence varied widely (45% felt confident using AI-based tools, 85% could

manage basic web-based systems). These findings underscore the need for solutions accommodating low-bandwidth environments with offline capabilities and intuitive interfaces.

Discussion

The Dual Nature of Geometric Reasoning Challenges

The finding that 65% of students' overall struggle with geometric reasoning becomes more nuanced when examined through Battista et al.'s (2018) dual-component framework. While individual component difficulties are substantial (71% spatial visualization, 69% property-based analytical reasoning), the critical discovery is that 78% face challenges in integrated tasks. This suggests the problem lies in coordinating skills synergistically rather than developing each separately, aligning with research showing geometric reasoning development requires explicit integration support. The parallel finding that 75% of teachers face instructional challenges underscores the systemic nature of these difficulties. This convergence suggests current pedagogical approaches are insufficient for supporting both learner development and teacher effectiveness, pointing toward the need for comprehensive solutions that address both student cognitive challenges and teacher instructional needs.

Stakeholder Perspectives and Implications

The 85% consensus across stakeholder groups demonstrates broad recognition that traditional methods are insufficient. However, ANOVA results [$F(3, 266) = 9.78$, $p < .001$] reveal significant differences among groups. Students' lower mean scores ($M = 4.12$, $SD = 0.78$) may reflect limited awareness of alternatives, while teachers and curriculum experts showed higher agreement due to professional experience. Qualitative data revealed distinct priorities: teachers emphasized curriculum alignment with differentiation flexibility; students preferred engaging interactive features; curriculum experts stressed pedagogical soundness; parents raised concerns about screen time while supporting technology integration. These diverse perspectives necessitate balanced design addressing both potential and limitations of technology-enhanced instruction.

Design Implications for AI-Constructivist-Gamification Integration

The findings provide specific guidance for integration. AI systems should track performance across spatial visualization and analytical reasoning separately while facilitating integration through bridging activities, recognizing when students struggle with component integration versus individual skills (Chen et al., 2022; Minn, 2022). Constructivist approaches must balance student exploration with structured guidance for formal vocabulary and logical reasoning—particularly critical in Thailand's teacher-centered context (Hernández-Zavaleta et al., 2023). Gamification elements should reward improvement in both components and their integration, maintaining intrinsic motivation rather than creating extrinsic dependencies (Oliveira et al., 2022). The Thai cultural context, emphasizing respect for authority and reluctance toward public errors, requires low-stakes environments with private feedback, personalized paths, and gamification framing errors as learning opportunities.

Contextual Challenges and Limitations

Northeast Thailand presents context-specific challenges: infrastructure limitations requiring minimal bandwidth and offline capability; varying teacher technological proficiency

necessitating intuitive interfaces with professional development; and linguistic complexity where students speak Isan dialects at home while learning mathematics in Central Thai, demanding flexible language support. Several limitations warrant acknowledgment: the cross-sectional design captures needs at one point; sampling was limited to three provinces, potentially limiting generalizability; the study assessed perceived needs rather than actual learning outcomes; and small sample sizes for teachers and curriculum experts may limit statistical power. Future research should experimentally test whether addressing these needs improves geometric reasoning performance, examine whether dual-component challenges exist in other contexts, investigate actual classroom implementation with needed professional development, and assess whether improvements transfer to broader mathematical achievement and persist longitudinally.

Conclusion

This needs assessment reveals that 65% of students' overall struggle with geometric reasoning in Northeast Thailand, with deeper analysis showing that challenges stem primarily from integration difficulties rather than individual skill deficits. When examined through Battista et al.'s (2018) framework, 71% struggle with spatial visualization, 69% with property-based analytical reasoning, and most critically, 78% struggle to coordinate both components. Additionally, 75% of teachers face challenges in delivering engaging instruction, highlighting the systemic nature of these difficulties. The challenge is thus reframed from isolated skill deficits to cognitive integration and pedagogical support, with significant implications for intervention design that must address both learner and instructor needs.

The identified needs direct development of a web-based learning environment with four priorities: (1) interactive visualization tools for dynamic 2D/3D manipulation supporting spatial reasoning; (2) AI-powered language support providing vocabulary feedback and logical scaffolding for analytical reasoning; (3) sequenced activities explicitly requiring component coordination; and (4) adaptive learning pathways tracking both dimensions independently while supporting their integration. Implementation must address accessibility (low-bandwidth operation, offline capabilities, multi-device compatibility), usability (intuitive interfaces for varied technical proficiency), curriculum alignment (Thai mathematics standards), and resource constraints (professional development, sustainable implementation models).

The 85% stakeholder consensus demonstrates broad support for innovation, though ANOVA-revealed differences [$F(3, 266) = 9.78$, $p < .001$] indicate implementation must balance diverse needs. The finding that 75% of teachers face instructional challenges indicates that solutions must address both student learning and teacher effectiveness. Teachers require curriculum-aligned tools with assessment capabilities and professional development support; students seek engaging interactive experiences; curriculum experts demand evidence-based pedagogical soundness; and parents need assurance of educational value with appropriate safeguards. This multi-stakeholder approach ensures comprehensive solutions addressing the full ecosystem of geometric reasoning education.

This research contributes theoretically by addressing dual-component reasoning systematically through Battista et al.'s (2018) framework, methodologically by revealing stakeholder nuances through convergent mixed-methods design, and practically by providing empirical foundation for technology-enhanced environment development. By recognizing spatial visualization and analytical reasoning as interconnected components requiring coordinated development, educational innovations can genuinely improve geometric understanding. Moving forward

requires developing the prototype learning environment, conducting rigorous effectiveness research comparing outcomes with traditional instruction, and investigating sustainable integration strategies including teacher professional development and scalable implementation models.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that no generative AI or AI-assisted technologies were used to generate, refine, or correct the content of this manuscript. All ideas, research design, data collection, analysis, interpretation, and writing are the author's original work and were conducted through careful and systematic research processes.

Exploring Needs and Preferences for an AI-Enhanced Design Thinking Environment in Graphic and Multimedia Design

Chanwit Sankumpa, Khon Kaen University, Thailand
Parama Kwangmuang, Khon Kaen University, Thailand

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study aims to explore the learning needs and preferences of undergraduate students and instructors for an AI-enhanced design thinking environment in graphic and multimedia design education. The research employs a mixed-methods approach, involving a survey of 150 undergraduate students majoring in graphic and multimedia design and semi-structured interviews with 12 instructors. The survey assesses students' perceptions of their creative thinking abilities, learning style preferences, and attitudes towards the integration of AI and design thinking in their learning process. The interviews with instructors focus on their experiences, challenges, and expectations regarding the implementation of an AI-enhanced design thinking environment. Quantitative data analysis reveals that 68% of the students believe that an AI-enhanced design thinking environment would improve their creative thinking skills, with 75% expressing a preference for interactive and collaborative learning activities. Qualitative findings highlight the need for a balance between technology-driven and human-centered approaches, as well as the importance of providing personalized feedback and support. The study identifies key considerations for designing an effective AI-enhanced design thinking environment, including the integration of AI-powered tools for idea generation and prototyping, the incorporation of collaborative learning spaces, and the provision of adaptive learning experiences based on individual needs and progress. These findings contribute to the development of innovative teaching and learning strategies that harness the potential of AI and design thinking to cultivate creative thinking skills in graphic and multimedia design education.

Keywords: learning needs, preferences, AI-enhanced learning, design thinking, creative thinking, graphic and multimedia design

Introduction

The rapid evolution of artificial intelligence (AI) is significantly challenging higher education: namely, preparing students with creative thinking skills that *complement* AI rather than *compete* with it. While 85% of jobs by 2030 will require creative problem-solving skills (World Economic Forum, 2023), only 23% of graduates demonstrate these competencies (OECD, 2024). This "creativity gap" reflects a critical misalignment between technological advancement and educational outcomes.

In Thailand, this gap is particularly acute. The 2024 Global Innovation Index ranks the nation 43rd overall but 67th in creative outputs, signaling a failure to translate educational investment into innovative capability. This problem is especially concerning in design-related disciplines, where creativity is a fundamental competency. Although AI integration shows promise for improving learning outcomes (UNESCO, 2024), most implementations focus on knowledge transmission rather than creative skill development. The critical question is no longer *if* AI should be used in design education, but *how* it can be used to *enhance*, not *diminish*, human creativity.

Concurrently, Design Thinking (DT), a human-centered problem-solving approach, is proven to enhance creative confidence and problem-solving skills (Liedtka, 2015). However, its implementation faces challenges, especially in Asian or Thai educational cultures where rote learning may conflict with DT's exploratory nature (Zhao, 2023). Conversely, AI technologies like generative tools (Midjourney, DALL-E) and LLMs (ChatGPT) have revolutionized ideation. Yet, significant barriers persist, notably low faculty readiness (Elisyah et al., 2024), and crucially, most research measures academic achievement rather than the direct impact on *creativity*.

This creates an "Integration Gap." Current research typically examines AI or DT in isolation, lacking studies on their synergistic potential. Literature lacks empirical evidence on optimal human-AI interaction patterns, validated frameworks, and models adapted for Asian cultures. Most importantly, there is a profound lack of understanding regarding the needs and perspectives of stakeholders—both students and instructors—which are essential for designing practical and contextually relevant learning environments.
This research, therefore, aims to address these gaps, specifically by exploring learner and educator needs within the context of graphic and multimedia design education in Thailand. The objectives are to:

- Assess students' perceptions, attitudes, and preferences regarding AI and DT integration.
- Explore instructors' experiences, challenges, and expectations.
- Identify key design principles for an effective AI-enhanced DT learning environment.
- Develop evidence-based recommendations for implementation in the Thai context.

This study will provide novel theoretical insights (e.g., viewing AI as a collaborative agent) and practical guidance for educators. It aims to inform the development of balanced learning environments that leverage AI tools while preserving human-centered pedagogy, ultimately preparing designers for an AI-driven future.

Literature Review

The Role of Design Thinking in Enhancing Creative Skills

As demand for 21st-century skills intensifies, creative thinking has emerged as core competency educators must nurture across disciplines. Design Thinking (DT), a human-centered, iterative problem-solving approach rooted in design and innovation fields, has been increasingly adopted in education to address this need (Brown, 2009; Razzouk & Shute, 2012). It promotes empathy, ideation, prototyping, and testing—processes aligning closely with creative cognition development.

Growing literature supports the assertion that DT serves as powerful catalyst for creative thinking in educational contexts. Recent studies implemented DT-based frameworks in media education and biology learning, showing marked improvements in students' engagement, motivation, and creativity through scaffolded problem-solving, with motivation increases of 25-30%. These studies underscore how structured design stages—empathize, define, ideate, prototype, test—create psychologically safe space for divergent and convergent thinking.

Internationally, research demonstrates that design thinking education enhances students' creative confidence, problem-solving abilities, and collaborative skills (Koh et al., 2015; Liedtka, 2015). In graphic and multimedia design contexts specifically, design thinking provides structured yet flexible framework for addressing complex design challenges. Students receiving explicit design thinking training demonstrate improved abilities to navigate ambiguous problem spaces and generate innovative solutions (Carlgren et al., 2016; Micheli et al., 2019).

Challenges in Implementation

Despite positive trends, significant challenges remain. Implementing DT in creative media programs often requires curriculum overhaul and faculty retraining, pointing to systemic barriers in adoption. Moreover, in Asian educational cultures where rote learning still dominates, educators may struggle to foster open-ended inquiry that DT demands (Zhao, 2023). These cultural dynamics may limit DT's full potential unless adapted to local pedagogical realities.

Studies reveal further constraints, including lack of teacher preparedness (only 13.33% achieving high competency) and difficulty aligning DT methods with rigid course structures. Instructors face challenges balancing structured guidance with open-ended exploration, assessing creative processes, and providing timely feedback to students engaged in complex design projects.

The literature converges on the idea that Design Thinking offers compelling, evidence-based approach to enhancing creative thinking in higher education. Nevertheless, gaps remain in understanding its adaptation in non-Western and resource-constrained contexts, particularly when paired with emerging technologies.

Artificial Intelligence in Learning Media

Artificial Intelligence (AI) is increasingly integrated into higher education, particularly within learning media designed to enhance student engagement, personalize learning experiences,

and develop critical thinking (Chen & Wang, 2023; Rodriguez et al., 2024). AI-powered platforms and tools offer real-time feedback, content adaptation, and interactive features difficult to achieve through traditional instruction alone.

AI Applications in Design Education

AI-powered generative design tools, such as Midjourney, DALL-E, and Adobe Firefly, have revolutionized how students approach visual ideation and concept development (Zhang et al., 2023). These tools enable rapid exploration of design alternatives and help students visualize abstract concepts quickly. Large language models like ChatGPT have found applications in design education, particularly supporting research, concept articulation, and design documentation (Kumar & Singh, 2024).

Across multiple empirical studies, AI has been applied in learning media to improve academic outcomes. Studies developed AI-integrated media for elementary science and social studies subjects, achieving high content validity (92.3-96.4%) and moderate effectiveness. AI-based chatbot systems for electronics education demonstrated AI's potential in technical subjects to provide adaptive, real-time assistance.

Research expanded scope by exploring how AI in media education supports both knowledge acquisition and creative expression, emphasizing importance of instructional design and ethical frameworks. However, studies show AI's ability to personalize and scaffold learning, though creativity as outcome is often assumed rather than directly assessed.

Implementation Challenges

Major limitations exist in teacher readiness, with only 13.33% of pre-service teachers achieving very high competency in designing AI-based learning media. This suggests that without adequate training and support, educational potential of AI cannot be fully realized. Teachers were open to using AI tools but cited barriers such as limited technical knowledge and integration challenges.

Despite advancements, noticeable gap exists in studies measuring AI media's effectiveness in developing creativity. Most focus on achievement or usability, with creativity often assumed rather than directly assessed. While AI enables personalized pathways, limited evidence shows it independently fosters ideation or imaginative thinking without being paired with constructivist methods.

Integrating Design Thinking and AI for Creativity Development

Design Thinking (DT) and Artificial Intelligence (AI) each offer unique advantages in educational innovation. DT is known for enhancing creativity through its iterative, user-focused approach, while AI brings adaptive feedback and personalized support to learning environments. However, literature investigating their integration remains in its infancy, with most studies focusing on either DT or AI in isolation.

Emerging Synergies

Synergy between DT and AI appears implicitly in several studies. Interactive media based on DT principles—empathize, define, ideate, prototype, and test—resulted in increased

motivation and knowledge retention. Though AI was not used, the structured design process aligned with principles that AI tools could easily enhance, such as providing iterative feedback or automating testing phases.

Recent theoretical work suggests AI can serve as collaborative agent in creative knowledge construction, extending neo-constructivist learning theory (Kim & Lee, 2023). This positions AI not merely as tool but as partner in creative process, complementing human intuition with computational power while maintaining human agency in creative decision-making.

Research Gaps

The integration of Design Thinking and Artificial Intelligence in educational media remains an emerging area. While both have shown individual effectiveness, their combined application to cultivate creativity has yet to be fully realized in practice. Current literature shows implicit alignment between the two but lacks:

- Empirical evidence on their joint impact on creative thinking outcomes
- Validated design principles for AI-enhanced DT environments
- Optimal human-AI interaction patterns for creative development
- Understanding of how to balance technology-driven and human-centered approaches
- Frameworks for sustainable implementation across diverse contexts

This study addresses these gaps by investigating how AI tools, when systematically integrated within a DT framework, can enhance the creativity of Thai undergraduate students in graphic and multimedia design education.

Student Learning Preferences in Design Education

Understanding student learning preferences is crucial for designing effective educational interventions. Research reveals diverse learning preferences among design students, with many favoring hands-on, experiential learning approaches over traditional lecture-based instruction (Fleischmann, 2020; Kolb & Kolb, 2005).

Design students particularly value collaborative learning opportunities where they can exchange ideas, critique work, and learn from peers (Dannels et al., 2008; Shreeve et al., 2010). Interactive learning activities combining individual creativity with collaborative refinement have been shown to enhance both skill development and student engagement (Carmel-Gilfilen & Portillo, 2016).

Recent studies examining technology adoption in design education suggest students are generally receptive to AI-enhanced learning tools, particularly when these technologies demonstrably enhance their creative capabilities and efficiency (Kim & Lee, 2023). However, concerns about maintaining authenticity and developing genuine skills amid increasing AI assistance persist (Thompson et al., 2024).

Instructor Perspectives on Technology Integration

Design instructors' attitudes toward technology integration significantly influence implementation success. While many design educators recognize the potential benefits of AI technologies, they also express concerns about maintaining pedagogical quality, preserving

human creativity, and managing the learning curve associated with new tools (Fleischmann, 2020; Robertson & Radcliffe, 2009).

Research indicates that successful technology integration requires careful alignment with learning objectives and pedagogical principles, with technology serving pedagogy rather than driving it. The emphasis on balanced human-AI collaboration reflects mature understanding of the proper role of educational technology in creative education contexts.

Methodology

Research Design

This study employed a mixed-methods research design, integrating quantitative and qualitative approaches. Data collection occurred over a three-month period from March to May 2025.

Participants

The study included 150 undergraduate students from graphic design (n = 75) and multimedia design (n = 75) programs at three prominent Thai universities: Khon Kaen University, Chulalongkorn University, and Chiang Mai University. These institutions were selected to represent geographic diversity across Thailand's northeastern, central, and northern regions. The sample comprised students from all four academic years, with approximately 25% from each year level (Year 1: n = 38, Year 2: n = 37, Year 3: n = 38, Year 4: n = 37).

Instructor Sample

Twelve design instructors participated in semi-structured interviews, representing the same three universities. The instructor sample included six graphic design instructors, four multimedia design instructors, and two instructors teaching across both disciplines. Teaching experience ranged from 2 to 25 years (M = 11.8 years, SD = 7.2 years), providing perspectives from both early-career and experienced educators. All instructors reported moderate to high levels of technology integration in their teaching, with varying degrees of familiarity with AI tools.

Data Collection and Analysis

Student surveys assessed perceptions and attitudes using 5-point Likert scales. Instructor interviews were audio-recorded and analyzed using thematic analysis. Quantitative data were analyzed using SPSS version 28.

Student Survey

A structured questionnaire was developed to assess students' perceptions, preferences, and attitudes. The survey comprised four main sections: (1) demographic information and AI experience, (2) self-assessment of creative thinking abilities using a 5-point Likert scale, (3) learning style preferences through multiple-choice and ranking questions, and (4) attitudes toward AI integration in design education measured on a 5-point Likert scale. The survey instrument was piloted with 20 students not included in the main study, and modifications were made based on pilot feedback to enhance clarity and comprehensiveness.

Instructor Interview Protocol

A semi-structured interview protocol was developed to explore instructors' experiences, challenges, and expectations regarding AI-enhanced design thinking environments. The protocol covered five key areas: (1) current teaching practices and challenges, (2) experiences with technology integration, (3) perceptions of AI tools in design education, (4) expectations for AI-enhanced learning environments, and (5) concerns and recommendations for implementation. Interviews were conducted in Thai or English based on instructor preference, with durations ranging from 45 to 70 minutes.

Data Collection Procedures

Data collection occurred over a three-month period from March to May 2025. The study received ethical approval from the Institutional Review Board at Khon Kaen University. All participants provided informed consent, and confidentiality was ensured through anonymization procedures.

Student surveys were administered online using Google Forms, distributed through course instructors and student organizations. Response rate was approximately 75%, with 150 completed surveys out of 200 distributed. Instructor interviews were conducted individually, either in person or via video conference based on participant preference and geographic location. All interviews were audio-recorded with permission and subsequently transcribed for analysis.

Data Analysis

Quantitative Analysis

Survey data were analyzed using SPSS version 28. Descriptive statistics including frequencies, percentages, means, and standard deviations were calculated for all quantitative variables. Independent samples t-tests were conducted to compare responses between graphic design and multimedia design students, as well as between students with and without AI experience. Chi-square tests were used to examine relationships between categorical variables. Statistical significance was set at $p < 0.05$.

Qualitative Analysis

Interview transcripts were analyzed using thematic analysis following Braun and Clarke's (2006) six-phase approach. Initial codes were generated inductively from the data, then organized into potential themes. Themes were reviewed and refined through iterative analysis and discussion among research team members. NVivo 12 software was used to facilitate coding and theme management. To enhance trustworthiness, member checking was conducted with three interview participants who confirmed the accuracy of the interpretations.

Research Results

Student Perceptions and Preferences

Students' self-assessment of creative thinking revealed high confidence in generating original ideas (M = 4.15) but lower confidence in combining diverse concepts (M = 3.42).

Table 1
Students' Self-Assessment of Creative Thinking Abilities (N = 150)

Creative Thinking Dimension	Mean (SD)	Level
Generating original ideas	4.15 (0.68)	High
Thinking flexibly	3.92 (0.74)	High
Elaborating on ideas	3.87 (0.79)	High
Taking creative risks	3.64 (0.86)	Moderate
Problem identification	3.78 (0.81)	High
Combining diverse concepts	3.42 (0.91)	Moderate

Learning Style Preferences

Analysis of learning style preferences revealed strong student preference for interactive and collaborative learning approaches. Table 2 summarizes the distribution of preferred learning activities.

Table 2
Student Preferences for Learning Activities (N = 150)

Learning Activity	Frequency	Percentage
Interactive and collaborative projects	113	75.3%
Hands-on practical exercises	108	72.0%
Real-world design challenges	95	63.3%
Peer critique and feedback sessions	87	58.0%
Individual creative exploration	72	48.0%
Lecture-base instruction	38	25.3%

Attitudes Toward AI Integration

68% of students agreed that an AI-enhanced DT environment would improve their creative skills. Students with AI experience expressed significantly more positive attitudes ($p = 0.001$).

Table 3
Student Attitudes Toward AI Integration in Design Education (N = 150)

Attitude Statement	Mean (SD)	Agreement level
AI can improve mu creative thinking skills	4.21 (0.72)	Agree
AI tools can help generate more design ideas	4.38 (0.65)	Strongly Agree
AI feedback would be helpful for my learning	4.15 (0.78)	Agree
I am interested in learning to use AI tools	4.32 (0.69)	Strongly Agree
AI can make design learning more efficient	4.27 (0.71)	Strongly Agree
I worry AI might reduce my originality	3.14 (1.02)	Neutral

Instructor Perspectives

Four major themes emerged: (1) balancing technology and pedagogy, (2) personalization and adaptive support, (3) collaborative learning enhancement, and (4) implementation challenges. Instructors emphasized that AI should serve pedagogy, not replace it.

Theme 1: Balancing Technology and Pedagogy

All instructors emphasized the importance of maintaining pedagogical integrity while integrating AI technologies. One experienced instructor noted: “Technology should serve pedagogy, not replace it. AI tools can be powerful aids, but we must ensure students still develop fundamental design thinking and problem-solving skills.” Instructors expressed concern about students becoming overly dependent on AI-generated solutions without developing critical evaluation skills. Several instructors advocated for a hybrid approach where AI tools complement traditional teaching methods rather than replacing human instruction and mentorship.

Theme 2: Personalization and Adaptive Support

Instructors recognized the potential of AI to provide personalized learning experiences tailored to individual student needs. One multimedia design instructor commented: “In large classes, it's challenging to provide individual feedback to every student. AI systems that can analyze student work and provide immediate, personalized suggestions could significantly enhance learning.” However, instructors emphasized that AI-generated feedback should supplement rather than replace human instructor feedback, particularly regarding subjective aspects of design quality and creative expression.

Theme 3: Collaborative Learning Enhancement

Instructors identified collaborative learning as a critical component of design education that AI technologies could potentially enhance. One instructor explained: “Collaborative design projects teach students valuable skills, but coordination can be challenging. AI-powered platforms that facilitate idea sharing, version control, and collaborative prototyping could make group work more productive.” Instructors expressed interest in AI tools that could support peer learning by suggesting relevant examples, facilitating constructive critique, and helping students learn from each other's creative processes.

Theme 4: Implementation Challenges and Concerns

While generally optimistic about AI's potential, instructors identified several implementation challenges. These included the learning curve for both instructors and students, concerns about equitable access to technology, potential academic integrity issues, and the need for institutional support and resources. One instructor articulated: “We need proper training and ongoing support to effectively integrate these tools. It's not just about having the technology—we need to understand how to use it pedagogically.” Instructors emphasized the importance of gradual, well-supported implementation with clear guidelines for appropriate AI tool usage.

Discussion

This study provides valuable insights into the needs and preferences of students and instructors regarding AI-enhanced design thinking environments in graphic and multimedia design education. The findings reveal generally positive attitudes toward AI integration while highlighting important considerations for implementation.

Student Readiness

The finding that 68% of students believe AI-enhanced environments would improve their creative thinking aligns with recent research demonstrating positive student attitudes toward educational technology integration (Kim & Lee, 2023; Thompson et al., 2024). Students' strong preference for interactive and collaborative learning activities (75%) underscores importance of designing AI-enhanced environments that facilitate rather than replace social learning experiences.

The positive correlation between AI experience and more favorable attitudes toward AI integration suggests that exposure and familiarity can reduce technology-related apprehension. This finding has important implications for implementation strategies, suggesting that early introduction and hands-on experience with AI tools may facilitate smoother technology adoption. Educational institutions should consider providing introductory workshops or courses on AI tools before full integration into design curricula.

Students' relatively neutral stance on concerns about AI reducing originality ($M = 3.14$) suggests nuanced understanding that technology itself does not necessarily diminish creativity—rather, how it is used determines its impact. This finding contrasts with some earlier research suggesting strong student concerns about technology limiting creativity (Shreeve et al., 2010), possibly reflecting generational shifts in technology attitudes among contemporary digital natives.

Pedagogical Implications

Instructor perspectives emphasize critical importance of balancing technological innovation with pedagogical soundness. This finding resonates with educational technology literature highlighting that successful technology integration requires careful alignment with learning objectives and pedagogical principles (Robertson & Radcliffe, 2009; Fleischmann, 2020). The emphasis on technology serving pedagogy rather than driving it reflects mature understanding of proper role of educational technology.

The instructor-identified need for personalized, adaptive learning support aligns with research demonstrating effectiveness of adaptive learning systems in promoting skill development (Kumar & Singh, 2024). However, instructors' insistence that AI feedback should supplement rather than replace human feedback highlights continued importance of expert human judgment in evaluating creative work. This suggests hybrid model where AI provides immediate, frequent feedback on technical aspects while instructors focus on higher-order creative and conceptual feedback.

The identification of collaborative learning enhancement as key opportunity for AI integration is particularly noteworthy. While much AI education research focuses on individualized learning, these findings highlight collaborative applications that could

transform group design projects. AI tools that facilitate idea sharing, manage collaborative workflows, and support peer learning could address longstanding challenges in collaborative design education (Carmel-Gilfilen & Portillo, 2016; Dannels et al., 2008).

Design Considerations

Based on research findings, several key design considerations emerge for AI-enhanced design thinking environments.

Integration of AI-Powered Tools

The environment should incorporate AI tools for idea generation (e.g., text-to-image generators), design exploration (e.g., style transfer systems), and prototyping (e.g., automated layout systems). However, these tools should be designed to augment rather than automate creative thinking, maintaining student agency in design decisions.

Collaborative Learning Spaces

The environment should provide robust collaborative features including shared workspaces, real-time co-design capabilities, peer review systems, and AI-facilitated discussion forums. These features should support both synchronous and asynchronous collaboration to accommodate diverse learning schedules and preferences.

Adaptive Learning Experiences

The system should provide personalized learning paths based on individual student needs, progress, and preferences. AI algorithms should analyze student work patterns, identify areas needing improvement, and recommend appropriate resources and exercises. Importantly, the system should maintain transparency about how recommendations are generated and allow instructor oversight of adaptive pathways.

Balanced Feedback Mechanisms

The environment should provide multiple layers of feedback: immediate AI-generated feedback on technical aspects, peer feedback through structured critique protocols, and instructor feedback on higher-order creative and conceptual dimensions. This multi-tiered approach ensures students receive timely, comprehensive feedback while maintaining irreplaceable value of expert human judgment.

Scaffolded AI Tool Usage

The environment should include built-in tutorials, guided exercises, and progressive skill-building activities that help students develop proficiency with AI tools. Clear guidelines about appropriate and inappropriate AI tool usage should be integrated throughout learning experience.

Limitations and Future Research

This study has several limitations that suggest directions for future research. First, the sample was drawn from three universities in Thailand, which may limit generalizability to other

cultural contexts. Future research should examine needs and preferences across diverse cultural and geographic settings to understand how cultural factors influence attitudes toward AI in design education.

Second, this study captured perspectives at single time point. Longitudinal research tracking how attitudes and preferences evolve as students gain more experience with AI-enhanced learning environments would provide valuable insights into temporal dynamics of technology adoption in design education.

Third, while this study identified important needs and preferences, it did not empirically test effectiveness of AI-enhanced design thinking environments. Future experimental research should evaluate impact of such environments on actual learning outcomes, creative performance, and skill development.

Finally, this study focused primarily on perceptual data through surveys and interviews. Future research incorporating observational studies, learning analytics, and portfolio analysis would provide richer understanding of how students actually interact with and benefit from AI-enhanced learning environments.

Conclusion

This mixed-methods study explored the learning needs and preferences of undergraduate students and instructors regarding AI-enhanced design thinking environments in graphic and multimedia design education. The findings reveal generally positive attitudes among students toward AI integration, with 68% believing such environments would enhance their creative thinking skills and 75% preferring interactive and collaborative learning activities.

The research identified several key considerations for designing effective AI-enhanced design thinking environments. These include: (1) integrating AI-powered tools for idea generation and prototyping while maintaining student creative agency, (2) incorporating robust collaborative learning features that facilitate both synchronous and asynchronous teamwork, (3) providing adaptive learning experiences that personalize content and feedback based on individual needs and progress, and (4) implementing balanced feedback mechanisms combining immediate AI-generated insights with essential human instructor expertise.

Instructor perspectives emphasized the critical importance of balancing technological innovation with pedagogical soundness. Educators stressed that AI tools should serve pedagogical goals rather than driving them, and that technology implementation must be accompanied by adequate training, institutional support, and clear guidelines for appropriate usage.

The finding that prior AI experience correlates with more positive attitudes toward AI integration suggests that early, supported exposure to these technologies can facilitate smoother adoption. Educational institutions should consider implementing introductory experiences with AI tools before full curricular integration.

These findings contribute to the growing body of knowledge on technology-enhanced design education and provide practical guidance for educators, instructional designers, and educational technology developers. By understanding stakeholder needs and preferences, institutions can design AI-enhanced learning environments that effectively support creative

thinking development while maintaining the human-centered values central to design education.

As AI technologies continue to evolve rapidly, ongoing research and evaluation will be essential to ensure that educational applications of these powerful tools truly serve student learning and development. The success of AI-enhanced design thinking environments will ultimately depend not on the sophistication of the technology itself, but on how thoughtfully it is integrated into pedagogically sound, human-centered educational experiences.

This study provides a foundation for future research and implementation efforts aimed at harnessing AI's potential to cultivate creative thinking skills in graphic and multimedia design education. By attending to the needs and preferences of both students and instructors, educators can create learning environments that prepare students for the evolving landscape of design practice while preserving the essential human elements of creativity, judgment, and innovation.

Acknowledgements

The author wishes to express sincere gratitude to the 150 undergraduate students and 12 design instructors from Khon Kaen University, Chulalongkorn University, and Chiang Mai University who participated in this study. Their valuable insights, experiences, and willingness to share their perspectives on the integration of artificial intelligence in design education were fundamental to the completion of this research. Special thanks are also extended to the faculty members of the Graphic and Multimedia Design programs for their administrative support and for facilitating the data collection process during the study period.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

During the preparation of this work, the author(s) used Gemini/ChatGPT in order to assist in formatting the manuscript according to specific conference guidelines and improving the clarity of English expression. After using this tool/service, the author(s) reviewed and edited the content as needed and take(s) full responsibility for the content of the publication. This declaration refers only to the writing process and not to the use of AI tools as part of the research methodology described in the study (such as Midjourney or DALL-E used by participants).

Australian National Education Frameworks: Tracing the Evolution of Social Justice Goals

Tebeje Molla, Deakin University, Australia

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Although school education falls within the jurisdiction of state and territory governments, since the late 1980s, Australia has issued a national education declaration each decade to articulate shared national priorities for the sector. While these frameworks—Hobart (1989), Adelaide (1999), Melbourne (2008), and Alice Springs (Mparntwe) (2019)—consistently invoke equity and inclusion, their substantive commitments to social justice remain under-examined. This paper critically analyses how social justice goals are conceptualised in the declarations and how these framings have shifted over time. The paper distinguishes between two interrelated dimensions: *socially just education*, which concerns the creation of equitable and inclusive systems through fair resource distribution, culturally sustaining environments, and policies that remove systemic barriers; and *social justice education*, which focuses on developing students' critical consciousness, ethical reasoning, and civic agency through engagement with issues of justice and democracy. Using critical policy analysis, the paper identifies both continuities and shifts in the framing of social justice over three decades, revealing growing rhetorical attention to diversity and equity, yet persistent limitations in addressing deeper, transformative demands of justice. The paper argues for future national frameworks to adopt a more integrated and explicit commitment to both structural equity and critical democratic education.

Keywords: Australia, critical analysis, education declaration, policy, social justice

Introduction

Social justice has long been a normative imperative in education, encompassing the belief that all learners—regardless of race, class, gender, geography, or cultural background—should have equitable access to high-quality, meaningful educational opportunities. It demands the redistribution of resources, the recognition of difference, and the transformation of institutional arrangements that sustain inequality (Connell, 1993; Gale & Densmore, 2000). In response, governments introduce targeted equity instruments and policies to address unjust inequalities in society and ensure that all students can participate fully in education.

Australia's federal system divides educational responsibilities between the Commonwealth and the states and territories, with the latter holding constitutional authority over schooling (Lingard, 2010). State and territory governments oversee curriculum development, public school funding, and regulatory frameworks, while the federal government's influence primarily stems from its financial contributions and national reform agendas (Savage, 2020). This arrangement has created a policy dynamic where national goals are negotiated rather than mandated, often through forums such as the former Council of Australian Governments (COAG) and the current Education Ministers Meeting (EMM).

With the aim of widening access and improving quality, since the late 1980s, Australia has released a national education declaration roughly every decade—beginning with the Hobart Declaration (1989), followed by the Adelaide (1999), Melbourne (2008), and Alice Springs (Mparntwe) Declarations (2019). The national declarations are more than symbolic documents; they structure priorities, legitimise policy directions, and guide curricular and pedagogical decisions at all levels (Lingard, 2010). They are part of a complex policy architecture that includes intergovernmental agreements on school reform and funding. This paper analyses how social justice has been framed and reconfigured across the four declarations. In examining the declarations, this paper asks: *How have social justice goals been framed across Australia's national education declarations, and what shifts can be observed in these framings over time?*

The paper draws on critical policy scholarship, which views policy not simply as a set of official texts but as a dynamic, discursive process deeply implicated in the production and maintenance of power relations (Grace, 1998; Molla, 202; Ozga, 2021; Savage et al., 2021). From this perspective, policy documents are not neutral blueprints for action but are themselves active in *constituting* the very problems they purport to address, defining categories of "disadvantage" and legitimising certain solutions while obscuring others (Bacchi, 2009).

The primary sources of data were the four national education declarations: the *Hobart Declaration on Schooling* (1989), the *Adelaide Declaration on National Goals for Schooling in the Twenty-First Century* (1999), the *Melbourne Declaration on Educational Goals for Young Australians* (2008), and the *Alice Springs (Mparntwe) Education Declaration* (2019). While broad in scope, they set shared goals for schooling and influence downstream policies on curriculum, assessment, teacher standards, and funding. Their recurring invocation of terms such as "equity," "inclusion," and "diversity" positions them as important sites for examining how justice is framed in national education discourse. Given their decennial publication and official status, these texts also offer a valuable lens into how the social purposes of schooling have been variously imagined over time and across political contexts. To guide the analysis, two overarching themes were developed through a critical review of the literature: *socially just education* and *social justice education*. These two dimensions served as conceptual anchors for the analysis, allowing for a more precise interrogation of how justice is both structurally

supported and pedagogically enacted. The analysis proceeded through a thematic coding of the four declarations, using both deductive and inductive approaches. Initially, relevant statements were coded under the two predefined dimensions of justice.

Accordingly, the analysis attends to both the stated aims of the four national education frameworks and the assumptions, silences, and discursive shifts that underpin their framing of social justice. By tracing these shifts over time, the paper highlights how particular constructions of educational disadvantage have been normalised, rearticulated, or challenged, illuminating the evolving policy rationalities that govern the pursuit of social justice in Australian schooling. Mapping changes and continuities in the articulation of social justice goals can offer a window into how governments conceptualise justice, who they see as deserving of support, and which injustices they are willing to name. By situating the declarations within both theoretical and historical contexts, the paper contributes to deeper understandings of how national education policy frames social justice. It argues that meaningful engagement with both forms of justice is essential for addressing persistent educational inequities and for cultivating a democratic, culturally responsive schooling system. The paper also highlights the importance of reading policy critically to unpack what is promised, what is omitted, and what is rendered invisible in national visions of educational fairness.

The remainder of the paper is organised into two main sections. The first presents the two dimensions of the social justice goals articulated within these frameworks—*socially just education* and *social justice education*. The second section analyses the changes and continuities across the four declarations, tracing how social justice has been framed and reinterpreted over time. The paper concludes by reiterating key insights and identifying implications for advancing equity-focused policy in the Australian education system.

Social Justice Goals

Since 1989, national education declarations have served as key instruments for articulating shared educational aspirations. These declarations are developed collaboratively by all education ministers and reflect a balance between national priorities and state/territory autonomy. Importantly, each Declaration reflects the social justice imperatives of its era, particularly concerning equity, inclusion, and the recognition of cultural diversity (Savage, 2020). The Hobart, Adelaide, Melbourne, and Mparntwe declarations each show a progression in the scope and articulation of equity (Properjohn et al., 2024), shifting from individualised understandings of disadvantage to more structural conceptions of inequality.

Social justice in education encompasses a broad and evolving set of aspirations aimed at reducing inequality, affirming diverse identities, and empowering learners to engage critically with the world around them. Increasingly, scholars emphasise that social justice is neither fixed nor singular, but rather a multidimensional and politically contested objective, shaped by context and ideology (Apple, 2014; Gewirtz, 1998). Within this discourse, two core dimensions of social justice goals have emerged: the *provision of socially just education* and the *promotion of social justice education*. Together, these dimensions reflect both structural and pedagogical commitments and offer a conceptual framework for analysing educational policy and practice.

The first dimension, *socially just education*, concerns the creation of an equitable and inclusive education system. It entails the fair distribution of resources, the cultivation of culturally sustaining school environments, and the development of policies that address systemic barriers

to participation (Connell, 1993). This approach to justice is concerned with dismantling structural inequalities to ensure that all students—regardless of socioeconomic background, race, gender, ability, or location—have access to high-quality education. In the Australian context, scholars such as Connell (2013) and Smyth (2011) have argued that neoliberal reforms—particularly the expansion of market-based school choice and high-stakes testing—have undermined equity by entrenching disparities in educational opportunities and outcomes.

The second dimension, *social justice education*, focuses on the content and processes of teaching and learning. It aims to develop students' critical consciousness, ethical reasoning, and civic agency by encouraging them to engage with questions of justice, inequality, and democracy (Freire, 1970; Sant, 2021). This pedagogical orientation involves both curriculum and methodology: incorporating diverse perspectives, confronting dominant power relations, and adopting dialogic, participatory approaches to teaching.

Socially Just Education

The idea of "socially just education" underscores the importance of creating educational systems and environments that prioritise equity, fairness, and inclusivity. At its core, socially just education emphasises a commitment to ensuring that all students have substantive opportunities for success, regardless of their background, identity, or socioeconomic status (REF). In advancing socially just education, policies widen access to education. The curriculum is tailored to reflect diverse perspectives, histories, and cultures, promoting a more inclusive and representative learning experience.

In terms of advancing socially just education, the declarations reflect an evolution in the understanding and articulation of inclusivity. The Hobart Declaration (1989) and The Adelaide Declaration (1999) both emphasise equality of educational opportunities, focusing on special learning requirements and eliminating negative discrimination. The Hobart Declaration (AEC, 1989) marked Australia's first attempt to establish a unified national vision for schooling, introducing ten common goals aimed at ensuring foundational skills, civic values, and economic productivity. It emphasised equitable access to schooling for all young Australians, marking a foundational step in recognising governments' responsibility to provide education as a public good. However, while socially just education was implied through the focus on participation and access, the framing remained narrow, with limited attention to cultural inclusion or differentiated needs. The aim was "to promote equality of educational opportunities and to provide for groups with special learning requirements" (Australian Education Council, 1989, p. 186).

The Adelaide Declaration deepened the commitment to equity by acknowledging the diverse needs of students and the need to provide support structures to achieve common outcomes. It introduced language around inclusivity and support for disadvantaged students, moving closer to a recognition-based approach to justice. Some of the stated goals include:

> Students' outcomes from schooling are free from the effects of negative forms of discrimination based on sex, language, culture, ethnicity, religion or disability, and of differences arising from students' socioeconomic background or geographic location.
>
> Aboriginal and Torres Strait Islander students have equitable access to, and opportunities in, schooling so that their learning outcomes improve and, over time, match those of other students. (MCEETYA, 1999, p. 230)

Although the policy recognised the diversity of learners, it fell short of committing to structural reforms to dismantle the systems that create educational disadvantage, reflecting an incremental evolution in the framing of socially just education.

The Melbourne Declaration (2008) broadens the scope, explicitly addressing discrimination based on various factors. It marked a significant shift by explicitly stating that governments should support not only "equality of opportunity but also more equitable outcomes." This emphasis on outcomes acknowledges that the same resources and access do not lead to the same results for all students. The document also stressed closing achievement gaps between Indigenous and non-Indigenous students, and between students from different socioeconomic backgrounds. Some of the equity goals included:

> Provide all students with access to high-quality schooling that is free from discrimination based on gender, language, sexual orientation, pregnancy, culture, ethnicity, religion, health or disability, socioeconomic background or geographic location.
>
> Ensure that the learning outcomes of Indigenous students improve to match those of other students.
>
> Reduce the effect of other sources of disadvantage, such as disability, homelessness, refugee status and remoteness. (MCEETYA, 2008, p. 7)

The Alice Springs (Mparntwe) Declaration (2019) further advances this by explicitly promoting inclusive education free from any form of discrimination, recognising individual needs, and encouraging personalised learning. It foregrounds commitments to Aboriginal and Torres Strait Islander students, cultural responsiveness, and the importance of wellbeing. The language reflects a fusion of redistribution and recognition, with stronger acknowledgements of historical and ongoing inequities. Notably, the Declaration includes references to community engagement and partnerships, hinting at representational justice. Thus, it articulates socially just education in a more multidimensional and relational way than its predecessors. The aim is to:

> Encourage young people to hold high expectations for their educational outcomes, supported by parents, carers, families and the broader community. (Education Council, 2019, p. 5)
>
> Support all young Australians at risk of educational disadvantage: learners such as those from low socioeconomic backgrounds, those from regional, rural and remote areas, migrants and refugees, learners in out of home care, homeless young people, and children with disability to reach their potential. (p. 6)
>
> Provide all young Australians with access to high-quality education that is inclusive and free from any form of discrimination. (p. 17)

The Alice Springs Declaration uniquely emphasises the need to empower learners to overcome barriers, promote personalised learning, and encourage young people to hold high expectations for their educational outcomes. It goes further, emphasising the need to recognise individual needs, overcome barriers, and support Indigenous learners to achieve their full academic

potential. The underpinning assumption is that compensatory opportunities are provided to create a level playing field for First Nations students.

Social Justice Education

Social justice education involves continuously engaging students in examining and evaluating the world around them from their unique perspectives. It focuses on curriculum, pedagogy, and student agency — equipping learners to recognise and challenge injustice within and beyond the classroom. This includes teaching about First Nations histories, critical engagement with power and privilege, and fostering active citizenship (Beresford et al., 2012; Dudgeon et al., 2017). Social justice education encourages critical thinking about social issues, fostering an environment where students can analyse, question, and engage with pressing societal problems. It engages students in analysing historical cases of injustice and contemporary inequalities across the political, cultural, economic, educational, health, and environmental domains of life. The aim is to build democratic, active, and fair citizens who value and promote social justice. While the declarations increasingly gesture toward both, the former has often received more policy attention, whereas the latter — particularly in its more critical and transformative forms — remains underdeveloped in practice (Moodie, 2020).

The national education declarations support social justice education by prioritising cultural respect and instilling values of fairness and inclusion in students. The declarations exhibit a progression in acknowledging the importance of cultural understanding. The Hobart Declaration (1989) emphasises respect for cultural heritage, specifically mentioning Aboriginal and ethnic groups. It puts one of its aims as "to develop in students… a capacity to exercise judgement in matters of morality, ethics and social justice" (Australian Education Council, 1989, p. 187).

The Hobart Declaration's commitment to developing "a capacity to exercise judgement in matters of morality, ethics and social justice" marks an early and significant recognition of education's moral and civic dimensions. This statement embeds a vision of the student as an ethical agent, capable of critical reflection. However, the policy stops short of defining what counts as social justice or how it might be explored pedagogically. The mention of "understanding and respect for our cultural heritage" — especially for "Aboriginal and ethnic groups" — is notable for its time, but the framing centres on respect and tolerance rather than engaging with power, dispossession, or systemic injustice. The approach is largely civic-liberal, promoting social harmony without critically interrogating social hierarchies.

The Adelaide Declaration (1999) extends the Hobart framing to emphasise the value of cultural and linguistic diversity and reconciliation as a specific national imperative.

The expectation that "all students understand and acknowledge the value of cultural and linguistic diversity" marks a stronger pedagogical commitment to historical awareness and future-oriented civic participation. Importantly, the Declaration expected that "all students understand and acknowledge the value of Aboriginal and Torres Strait Islander cultures to Australian society and possess the knowledge, skills and understanding to contribute to, and benefit from, reconciliation between Indigenous and non-Indigenous Australians" (MCEETYA, 1999, p. 230).

The promotion of "cultural and linguistic diversity" and acknowledgement of "the value of Aboriginal and Torres Strait Islander cultures to Australian society" are well aligned with the

nation's multicultural ethos. Still, the language frames students as beneficiaries of diversity rather than as critical actors equipped to dismantle inequality. The focus is on appreciation and participation, not transformation. This positions social justice education as a soft tool for cohesion rather than a radical force for equity.

The Melbourne Declaration (2008) calls for schools to build on local Indigenous knowledge and experiences as a foundation for learning. It takes a further step toward a transformative conception of social justice education by instructing schools to build on local cultural knowledge and experience of Indigenous students as a foundation for learning. The Melbourne Declaration aims, inter alia,

> ensure that schools build on local cultural knowledge and experience of Indigenous students as a foundation for learning.
>
> ensure that schooling contributes to a socially cohesive society that respects and appreciates cultural, social and religious diversity. (MCEETYA, 2008, p. 7)

This reverses the deficit logic often associated with marginalised students and elevates cultural capital as central to pedagogical design. The call for schooling to "contribute to a socially cohesive society" echoes earlier declarations but adds sharper attention to respect for "religious" as well as cultural and social diversity. However, the language remains largely instrumental, emphasising harmony over critique.

The Alice Springs (Mparntwe) Declaration (2019) presents the most ambitious articulation of social justice education. It retains the emphasis on cohesion and diversity but deepens the commitment to inclusion through stronger verbs and more relational language. It continues to stress the importance of inclusion of local, regional, and national cultural knowledge, fostering a more comprehensive approach to cultural inclusion and social cohesion. Some of the social justice education goals include:

> ensure that education promotes and contributes to a socially cohesive society that values, respects and appreciates different points of view and cultural, social, linguistic and religious diversity.
>
> ensure that learning is built on and includes local, regional and national cultural knowledge and experience of Aboriginal and Torres Strait Islander peoples and work in partnership with local communities. (Education Council, 2019, p. 5)

The recognition of "different points of view" assumes an expanded, dialogic classroom space, positioning students not only as participants in diverse societies but also as potential agents of transformation. Such an approach reframes education as a site of encounter—where difference is not merely tolerated but actively engaged as a resource for collective learning and ethical understanding. By promoting respect for cultural, linguistic, and religious diversity, schools contribute to the cultivation of a socially cohesive society founded on mutual recognition and shared responsibility. The commitment to include the "local, regional and national cultural knowledge and experience of Aboriginal and Torres Strait Islander peoples" further underscores a pedagogical and moral imperative: to value Indigenous knowledges as central to Australia's educational narrative, rather than as peripheral additions. Working in genuine partnership with local communities invites educators to move beyond symbolic inclusion towards reciprocal relationships that honour place-based wisdom, foster intercultural dialogue,

and challenge historical exclusions. In this sense, the framework articulates a vision of social justice in education that is both redistributive and recognitive—seeking to equalise opportunity while affirming the plural identities and knowledges that shape Australia's democratic life.

Changes and Continuities

Across the four declarations, a discernible shift is evident from a minimalist equity framework towards a more multidimensional conception of socially just education. A clear evolution toward a more expansive, detailed, and multifaceted understanding of justice in schooling is evident. The early Hobart (1989) declaration frames social justice primarily as *equality of opportunity* and support for students with special learning needs, while its corresponding social justice education goals emphasise moral development and cultural respect in broad terms. By Adelaide (1999), the focus shifts more explicitly to eliminating discrimination based on race, language, culture, disability, socioeconomic status, and geography, signalling a sharper policy recognition of structural disadvantage. Melbourne (2008) further expands this agenda by listing a wider range of disadvantages—such as refugee status and homelessness—and highlighting personalised learning as a vehicle for equity. Finally, the Alice Springs (Mparntwe) Declaration (2019) adopts the most holistic and learner-centred framing, emphasising inclusivity, individual needs, empowerment, community partnership, and the co-construction of culturally grounded learning, especially with Aboriginal and Torres Strait Islander communities. Across the social justice education column, there is also a notable shift from general cultural respect (1989) to increasingly explicit commitments to reconciliation, cultural diversity, and Indigenous knowledge as foundational to learning (1999–2019), culminating in a partnership-based, place-responsive approach in 2019.

In other words, the Hobart and Adelaide Declarations framed equity primarily as access and participation, aligning with liberal notions of meritocracy. These early declarations assumed a level playing field, with less attention to the deeper structural factors shaping educational outcomes. The Melbourne and Mparntwe Declarations, on the other hand, articulated equity more robustly, recognising systemic disadvantage affecting Aboriginal and Torres Strait Islander learners and students from refugee and migrant backgrounds and the need for equity in learning opportunities, wellbeing, and digital access. The Melbourne Declaration includes more sustained reference to Indigenous cultures and histories, and the Mparntwe Declaration deepens this commitment by foregrounding Aboriginal and Torres Strait Islander perspectives. Further, while early declarations are largely silent on questions of participatory inclusion in education governance, the Mparntwe Declaration makes an important shift by recognising the agency of young people and advocating for greater involvement of Indigenous communities in shaping educational futures. However, as Properjohn et al. (2024) observed, despite progressive language over time, the declarations continue to reflect colonial dominance by framing Indigenous education within deficit discourses and assimilationist perspectives. Representation remains underdeveloped as a justice goal, with limited mechanisms proposed for shared authority or decision-making in education systems.

Despite these changes, the declarations also demonstrate enduring continuities in their core commitments to social justice in education. All four frameworks recognise that educational systems must work to address educational disadvantage and promote fairness in schooling outcomes—reflecting a consistent policy logic that equitable access and participation are central to Australian schooling. Similarly, across all declarations, social justice education is linked to fostering respect for cultural diversity, encouraging ethical and socially responsible behaviour, and valuing the contributions of Aboriginal and Torres Strait Islander peoples.

While the specificity and language become more sophisticated over time, the underlying premise remains steady: education plays a crucial role in shaping a cohesive, respectful, and inclusive society. These continuities suggest that, even as contexts shift and policy language evolves, the foundational goals of equity, respect, diversity, and cultural understanding remain a constant across the national policy landscape.

Over the three decades spanned by the four declarations, we see a marked evolution in the way *social justice education* is framed. The Hobart and Adelaide Declarations focus on moral development and respect for diversity, positioning students primarily as tolerant citizens. While these goals are not insignificant, they rely on depoliticised conceptions of justice that skirt around questions of power, oppression, and resistance. Diversity is valued, but there is little sense that students are being prepared to challenge systemic injustice. By contrast, the Melbourne and Mparntwe Declarations reflect a maturing vision of social justice education. Melbourne introduces the idea of culturally responsive pedagogy, while Mparntwe goes further by embedding local knowledge systems and calling for partnerships with Indigenous communities. These shifts suggest an increasing recognition of students' sociocultural contexts as assets in the learning process and a growing commitment to empowering learners as agents of justice. Despite this progress, the overarching tone across all declarations continues to favour social cohesion and shared values over confronting structural inequality. The tension between celebrating diversity and confronting injustice remains a defining feature of Australia's national policy discourse on social justice education.

There is also a lack of conceptual clarity regarding equality and equity. Equality in education refers to the idea that all individuals, regardless of background, should have equal access to resources, opportunities, and educational experiences. The focus is on uniform treatment and distribution of educational resources, aiming to provide everyone with the same starting point and level of support. Whereas equity in education recognises that individuals may start from different positions, facing diverse challenges and needs. Equity aims to address these disparities by providing resources and support that are responsive to the unique circumstances of each individual or group. It may involve giving unequal opportunities for equal outcomes.

The patterns of change and continuity across the four national Education Declarations reveal a policy trajectory characterised by both increasing complexity and enduring foundational values. Over time, the declarations broaden from a relatively narrow focus on equality of opportunity to a more nuanced recognition of diverse learner needs, intersectional disadvantage, and culturally responsive education—especially with respect to Indigenous communities. At the same time, persistent commitments to equity, inclusion, cultural respect, and social cohesion anchor the declarations across three decades, demonstrating that while policy directions adapt to emerging social, cultural, and political contexts, the core social justice aspirations of Australian schooling remain stable. This interplay between continuity and evolution reflects a system balancing longstanding national values with the need for more responsive and sophisticated approaches to justice and inclusion in education.

Conclusion

The analysis of the four national education frameworks shows that Australia's governments demonstrated a progressive commitment to social just goals, expanding from a focus on equal opportunities to a more nuanced understanding of inclusivity, individual needs, and the empowerment of learners. While early declarations primarily addressed social justice through the redistribution of opportunities and the reduction of disadvantage, later iterations expanded

these concerns to include recognition of diversity, personalised learning, and the holistic development of learners. The Melbourne (2008) and Alice Springs/Mparntwe (2019) Declarations, for instance, move beyond a deficit-oriented framing of equity to incorporate wellbeing, empowerment, and local knowledge as integral to educational justice. These changes suggest a gradual evolution from a narrow focus on equal outcomes towards a more relational and culturally responsive understanding of justice. Parallel shifts are evident in the framing of social justice education—the moral, ethical and civic dimensions of schooling. Whereas the Hobart and Adelaide Declarations positioned social justice education in terms of moral reasoning and intercultural understanding, later declarations increasingly emphasise community partnership, reconciliation, and the value of Indigenous knowledges. The Melbourne Declaration introduces an explicit focus on social cohesion and cultural respect, themes that are deepened in the Mparntwe Declaration's recognition of Aboriginal and Torres Strait Islander cultures and the call for learning grounded in local contexts.

These findings point to a need for policy work that consolidates, rather than merely accumulates, the progressive shifts evident across the four frameworks. A coherent way forward requires translating the declarations' aspirational language into sustained, system-level action that centres cultural responsiveness, community partnership and the valuing of Indigenous knowledges. This includes resourcing schools to enact locally grounded pedagogies, strengthening mechanisms for accountability to equity goals, and ensuring that learners and communities historically marginalised within Australian schooling have a substantive voice in policy design. Advancing social justice in education will therefore depend on moving beyond rhetorical commitment toward practical, context-sensitive strategies that embed inclusion, recognition and relational responsibility within everyday schooling.

Abstract

This study examines the liminal legal status of Indonesian migrant children in Sabah and Sarawak, Malaysia, focusing on their educational challenges and the broader implications of their uncertain citizenship status. These children, born to migrant workers, often find themselves trapped between legality and illegality, without clear nationality recognition, which significantly limits their access to formal education and other essential services. Despite the palm oil industry's critical role in Malaysia's economy, which relies heavily on migrant labour, these children are systematically excluded from the formal education system. Alternative educational opportunities are provided through Community Learning Centres (CLC) run by local organisations and religious institutions, but these programmes lack formal recognition from the Malaysian government. As a result, these children often remain in a state of "semi-legal" existence, facing barriers to accessing fundamental rights such as education, healthcare, and legal protection. This paper highlights the complexity of their situation and draws on a phenomenological approach to understand the lived experiences of these children. It also examines how their social identities are shaped by their ambiguous legal status, creating a sense of marginalisation and uncertainty. The study advocates for more inclusive and culturally sensitive policies that integrate Indonesian migrant children into Malaysia's education system and safeguard their fundamental rights and urges both countries to enhance cooperation on migrant rights, education, and social protection.

Introduction

Sabah and Sarawak, Malaysian states located on the island of Kalimantan, have become meeting places for various ethnicities and cultures, especially since the enormous wave of migration from the Philippines and Indonesia in the 1970s (Allerton, 2014, 2017). Non-citizen migrant children face complex and multi-layered challenges, particularly related to their unclear legal status and access to education (Nesadurai, 2013). This study aims to explore the ambiguous zone between legality and illegality experienced by children of migrant workers from Indonesia in Kinabalu, Sabah, and Kuching, Sarawak, and how their experiences are influenced by factors such as age, gender, ethnic appearance, and the use of unofficial identity documents. Migrant children in Sabah and Sarawak are often trapped in uncertain situations, systematically excluded from Malaysia's formal education system. Although they may have access to education through alternative learning centres established by various organisations, including churches and mosques, the education they receive is often not officially recognised. This creates a situation in which migrant children must struggle to gain recognition and their rights as individuals, even though they do not have clear citizenship status (Gurowitz, 2000).

This study describes how their experiences of anxiety increase as they get older. This anxiety stems from their awareness of the difference in legal status between themselves and their peers who are Malaysian citizens. Allerton's (2024) research report, for example, tells of migrant children who often use fake birth certificates to attend Malaysian primary schools, while other studies reveal that they did not feel afraid when they were young, even though they did not have official identity documents (Allerton, 2024). These studies are their experiences, which show that migrant children often live in a liminal state, where they operate between legality and illegality, and must navigate various challenges that arise from their unclear status.

As explained earlier, schools are considered special places where children practise citizenship. However, in Malaysia, the explicit exclusion of migrant and refugee children from government schools makes it much more difficult for them to see and have the same form of cultural ownership as their citizen peers. Although Sabah and Sarawak are heavily dependent on foreign labour to support their economies, migrant and refugee children are often considered a "category error" that does not have the right to education. This policy contradicts the human rights principles enshrined in the UN Convention on the Rights of the Child, which guarantees all children the right to a free basic education. Furthermore, we examine how the experiences of migrant children in Sabah and Sarawak can be understood through the lens of the concepts of "liminal legality" and "semi-legality" (Allerton, 2018). These concepts help explain how migrant children can claim conditional forms of legality, even though they do not have clear citizenship status.

Social and Historical Context of Migration in Sabah and Kinabalu

Large companies in Malaysia, such as Sabah Land and Development Berhad (SLDB), collaborated with the Indonesian Consulate in Sabah to establish CLCs for migrant workers' children. However, these facilities were often limited and isolated from city centres, creating a separate social space between migrants and the local community (Wahab & Abd, 2022). The history of migration also reflects different narratives between the country of origin and the destination country. From Malaysia's perspective, migrants are often portrayed as temporary workers who are here to meet labour needs, without the right to become permanent members of society. Conversely, from the perspective of the Indonesian migrant community, migration to Sabah and Kinabalu is seen as a continuation of historical cross-border relations.

Many migrant families emphasise that they have lived in Sabah for several generations, so they do not consider their presence to be merely temporary. This conflicting narrative creates a grey area, where migrant children are caught between Malaysia's economic claims and Indonesia's genealogical ties, but do not receive full recognition from either. The existence of migrant children in the history of cross-border migration shows that migration is not merely a movement of labour, but a complex social process.

According to Galli and Garip (2024), by placing children at the centre of analysis, we can gain a deeper understanding of the roles of age, intergenerational family dynamics, and social processes in shaping migration experiences. De Haas (2021) asserts that human mobility is an integral part of broader social change processes. They were born into families of plantation workers who struggled for a better life but grew up in uncertain legal conditions. With relatively low skills, they generally chose jobs such as domestic work, factory work, plantation work, and other unskilled work (Wulan et al., 2024). On the one hand, they were a product of Malaysian development policies that required cheap labour.

On the other hand, they were also a consequence of economic and social limitations in their regions of origin. Marotta (2025) argues that liminal or “in-between” conditions can shape individual identities and experiences in the context of migration. Thus, the history of migration in Sabah, specifically in Kinabalu, is not only about worker mobility but also about the formation of a liminal generation that continues to live in uncertainty regarding their identity and citizenship.

Economic and Social Factors Driving Migration

In terms of driving factors, unstable economic conditions, high poverty rates, and limited job opportunities in Indonesia, particularly in regions such as South Sulawesi and East Nusa Tenggara, are the main reasons families send their members to work in Malaysia. This finding aligns with Djafar and Hassan's (2012) findings, which showed that Indonesian migrant workers in Malaysia are significantly influenced by income and unemployment, with positive effects in Indonesia and adverse effects in Malaysia. For many low-income families, migration is not only a choice but a necessity for survival. Low incomes in the local agricultural sector are insufficient to meet daily needs, while in Malaysia. However, plantation wages are considered low by local standards; they are still higher than what can be earned in the villages. On the pull side, Malaysia offers better economic prospects and strong labour demand in the palm oil plantation, construction, and agriculture sectors. Large companies offer stable employment opportunities, though these often come with long hours and minimal legal protections.

For migrants, the pull factors are not only wages, but also the availability of basic facilities provided by companies, such as housing, community schools, and basic health services. Although these facilities are limited, their existence suggests that migration to Malaysia is more promising than staying in their villages of origin, which are often constrained. Workers are often recruited through a system of recommendations from family members or friends who have already settled on the plantations, creating a chain of intergenerational migration. Wahyudi's (2017) research findings show that social capital in their networks develops through various channels, particularly friendship, kinship, neighbourhoods, communities, and ethnic groups.

The direct impact of these economic and social factors is clearly evident in the lives of migrant children, who are the generation born of their parents' choice to seek a livelihood in Malaysia, but who grow up with limitations. These children generally only have access to community schools provided by companies or non-governmental organisations. Although education is provided, the curriculum is limited and rarely recognised by the state. These limitations place migrant children in a vulnerable position; they enjoy the fruits of their parents' economic decision to migrate, but at the same time, they inherit an unclear legal status. Studies on migration between the two countries must encompass all relevant migration factors to obtain a comprehensive picture of migration (Wekke, 2013). Furthermore, these economic and social factors not only encourage migration but also shape the way migrant children view themselves. They grow up with hopes for a better life, but reality shows discrimination, exclusion and limited rights.

A child at the CLC recounted how his parents migrated because wages in Malaysia were higher. However, he still felt different because he lacked official documents to continue his education. This testimony shows that economic and social factors are not only determinants of migration but also the basis for the formation of migrant children's liminal identity in Sabah and Kinabalu. This situation emphasises the need for the state to play a role through bilateral cooperation (MoU) with Malaysia to ensure comprehensive protection for migrant workers, including their children, especially in vulnerable sectors such as domestic workers (Wijayanti & Turgel, 2021). The presence of migrant workers in Sabah and Kinabalu has become one of the important pillars of Malaysia's economic development. Palm oil plantations, which are a strategic industry and a major contributor to the country's foreign exchange, are highly dependent on migrant workers from Indonesia and the Philippines. Crowley's (2020) research on labour in Malaysia found that the initial focus on replacing foreign workers with local workers was not entirely practical, shifting instead to retaining foreign workers and training Malaysians for technical and managerial positions in the industry. The position of migrant children in the socio-economic context reveals deeper vulnerabilities. They are born in Malaysia, grow up in plantation environments, and interact with local communities, but their legal status is unclear. Without a valid birth certificate or passport, they cannot access formal education, continue secondary school, or work in the formal sector as adults.

The Position of Migrant Children in Malaysian Policy

Malaysian education laws require citizenship documents or official residence permits, which most migrant children do not have. As a result, they are systematically directed to Community Learning Centres (CLCs) managed by plantation companies, community organisations, or religious institutions. CLCs do provide learning spaces, but the Malaysian government does not formally recognise them. Thus, diplomas obtained from CLCs are not equivalent to those from public schools and therefore cannot be used to continue education at a higher level or to access formal employment. This limitation shows that the education of migrant children is positioned not as a means of social mobility, but as an instrument for the reproduction of plantation labour. According to Allerton (2020), this is a clear example of indifference on the part of individuals in power who should be more aware of their workers' children. This situation contrasts sharply with that of Malaysian children, who have full access to public schools and national education programmes. This difference creates a widening social gap, with migrant children trapped in a limited education system, while local children move on to formal education recognised by the state. In addition to limitations in education, migrant children also face social discrimination in their daily lives. They are often viewed as "outsiders," even though they were born and raised in Sabah and the Kinabalu region. This discrimination takes

many forms: differential treatment at school, negative stereotypes from the local community, and government policies that reinforce their position as a marginalised group. This situation gives rise to feelings of inferiority, alienation, and identity confusion among migrant children. Migrant workers and their families are often vilified, their contributions to Malaysia are rarely recognised, and there is no public discussion of migrants' rights (Gurowitz, 2000). Government Regulation (PP) No. 28 of 1990 on Primary Education stipulates a nine-year compulsory primary education programme to expand educational opportunities for all citizens and improve the quality of human resources. This programme is intended for all Indonesian citizens aged seven to fifteen, both within and outside Indonesia (Tilaar, 2014). However, they are excluded from formal education, directed to limited education pathways in CLCs and face social discrimination in their daily interactions. The state's selective policies reinforce their position as a marginalised group valued only as labourers, not as members of society. Thus, migrant children live in a situation of semi-legality that reflects legal uncertainty, limited fundamental rights, and institutionalised social discrimination.

This study employs qualitative methods, drawing on Creswell's (2018) phenomenological approach, to explore and understand the experiences of Indonesian migrant children in Sabah and Sarawak. It describes their daily lives, particularly how migrants consciously construct meaning from their interactions with other communities, especially the Malaysian community. This study will focus on migrants' experiences as individuals, examining how they subjectively perceive their experiences and assign meaning to the phenomena of legality and illegality from the perspectives of identity and citizenship. The phenomenological approach will provide an overview of the structure of thought, explore the values in life experiences, and discover the meaning and essence of experiences, rather than simply seeking explanations or measures of reality. The citizenship identity of migrant children is expected to be obtained from a first-person perspective through formal and semi-structured interviews.

This study is based on semi-structured interviews conducted in Kinabalu, Sabah, and Kuching, Sarawak, with Indonesian migrant children who meet the research criteria. This study identifies four clusters of meaning. First, we asked the informants about their place of birth, including aspects they may not be aware of, and their knowledge of international relations between their country of origin and their country of residence. We also explored the impact of these relations on their lives in Malaysia. Second, we investigated the migration and legal processes, with questions about the reasons for emigration, the process of arrival in Malaysia, previous contacts in Sabah and Sarawak, the difficulties encountered in legalising their status, and their plans for staying in the country. Third, discuss the issue of citizenship applications, including whether the informants have applied or plan to apply for citizenship, the reasons behind this decision, and how they believe this affects their integration and access to rights, including voting rights. We also explore their experiences in the application process and their reflections on their identity and choice of citizenship. Fourth, discussing a sense of belonging and identity, including experiences of exclusion as foreigners and how factors such as accent, culture, gender, and economic or educational level affect their integration process.

The Educational Experiences of Migrant Children

Access to Formal Education

Indonesian migrant children in Sabah and Kinabalu are unable to attend school full-time. However, formal education is universally recognised as a fundamental right of children that should guarantee equal access to knowledge (Ramadhan et al., 2022). The main obstacle faced

by migrant children is related to official documents. Malaysian regulations require a passport, residence permit, or valid identity card for students who wish to attend public institutions. In addition to regulations, the complicated bureaucracy and high costs further burden migrant families. Many parents work on palm oil plantations for low wages. Passports are usually issued on the company's guarantee and are renewed only once a year. Thus, administrative barriers not only hinder access but also reinforce social inequality between citizens and migrants (Anggraeni et al., 2025). As a result, migrant children grow up feeling marginalised. They realise early on that their educational opportunities depend on documents they do not possess. This situation creates a psychological gap compared to local children and narrows their future social mobility (Song, 2010). In an effort to overcome these obstacles, many migrant families use emergency documents or borrowed identities issued by the community or consulate. One student said that the identity cards they had, as well as family cards and birth certificates, were obtained through the Indonesian consulate. This demonstrates a form of semi-legality, where some institutions recognise the documents, but they are not entirely valid within the Malaysian system. This strategy represents a form of agency or effort by families to advocate for their children's right to education, despite its legal fragility. In this way, children can still attend school, but without any guarantee of continuity (Menjívar, 2006).

Limited access to formal education has a direct impact on children's psychological development. They often feel different from their peers, bear the stigma of being an outsider, and lose their self-confidence. One respondent said: “If asked to choose, I would still choose Indonesia, because that is where I come from. However, I was born here.” This statement confirms that the lack of documents leaves children living amid citizenship ambiguity: born in Malaysia, but not recognised by Indonesia, and without full access. Structurally, interrupted education reduces migrant children’s opportunities to obtain formal skills and state-recognised qualifications. Without educational documents, opportunities to continue to higher levels of education are minimal. Ultimately, they are more likely to be absorbed into the same low-wage jobs as their parents. Thus, legal and administrative barriers to accessing formal education are not only technical problems, but also part of the political dynamics of citizenship. Education, which should be a path to social mobility, has instead become a mechanism of exclusion, placing migrant children in a “semi-legal” position in the society in which they grow up.

When access to formal schools is closed, alternative education becomes the most feasible solution for migrant children. This education comes from community initiatives, religious institutions, and non-governmental organisations (NGOs) that seek to guarantee children's fundamental right to continue learning. Although the state does not recognise its status, the existence of alternative education provides an important space to build fundamental skills while maintaining hope for a better future.

The Role of NGOs, Religious Institutions, and Communities

Many migrant children in Sabah access education through Community Learning Centres (CLCs). The presence of such institutions ensures that children continue to have access to basic literacy even though they are excluded from public schools (Febiola, 2023). Additionally, CLCs serve as social spaces. One student recounted how they made friends with the Sabah children. However, alternative education has its limitations. At the BomBalai CLC, there is only one teacher, Ms Ade, who has to teach all subjects, including Pancasila and Civics. In addition to teacher limitations, facilities are also minimal. As a result, the quality and scope of education are uneven, often stopping at the basic level (Loganathan et al., 2022). The Malaysian government does not recognise CLC certificates, so children who graduate cannot

continue their education to secondary school or university. This means that children who graduate from community schools receive recognition only within the community, without the legal right to continue their education beyond secondary levels (Tjandraningsih et al., 1996). Alternative education serves only as an emergency measure, rather than an official pathway that can alter the social status of migrant children (Hossain & Sengupta, 2009).

Nevertheless, the existence of CLCs reflects community solidarity. Religious institutions, consulates, and NGOs provide learning spaces to prevent children from becoming illiterate. Children still have hope, albeit in limited amounts. However, the "semi-legal" status of alternative education places them in a liminal situation. They can study, but they have no formal legitimacy. This hinders social mobility, and children grow up with the awareness that their education could end at any time if the state no longer allows tolerance.

Fundamental Rights, Services and Legal Uncertainty

Access to Basic Services

The fulfilment of children's fundamental rights is not limited to education; it also includes health, legal protection, and population administration. These three aspects are important foundations for ensuring the quality of children's lives (Romadhona, 2025). Access to healthcare services in Malaysia typically requires official documents, such as a passport or a residence permit. Without these documents, migrant children are categorised as foreigners and charged high fees at public hospitals. As a result, many migrant families prefer small private services, traditional medicine, or even delay treatment until their condition worsens. This policy creates structural discrimination because migrant children are treated differently based solely on their administrative status. Kaur's (2014) research shows that migrant workers and their families face serious obstacles in obtaining public health services due to unclear documentation. Thus, the health of migrant children is more often seen as an economic burden rather than a fundamental right. As a result, migrant children tend to have below-standard health. Low access to immunisation, nutrition, and medical care affects their growth and development.

In addition to health, legal protection is also uncertain. Mrs Lili, an Indonesian Consular official in Sabah, explained that many migrant children who are victims of violence or exploitation cannot be prosecuted due to a lack of documentation. Trauma and fear of facing the authorities cause many families to remain silent. As a result, a culture of silence emerges, where cases of violence, abuse, and exploitation are left without legal protection (Lim et al., 2024). This kind of trauma impacts psychological development, lowers self-confidence, and limits their ability to participate fully in social life (ILO, 2006). This condition shows how migrant children are in a situation of *liminal legality*, as described by Menjívar (2006), where they are present in society but do not have official protection when their rights are violated. The receiving country takes advantage of this legal uncertainty to maintain migrants' subordinate position. Without birth registration, they lose the fundamental rights typically afforded to citizens, including access to education, health care, and legal protection. *Statelessness* ultimately renders them "invisible" to the law.

On the other hand, some children are in a state of *contingent legality*, for example, having a passport valid for one year with a guarantee from a palm oil company. However, this status is temporary. Maureen and Blitz (2011) refer to this condition as a form of flexible exclusion, in which the state provides limited access while still maintaining restrictions on migrants' civil

rights. As a result, children live in a state of constant legal uncertainty. Although they are present in the social system (going to school, making friends, participating in community activities), this recognition is fragile. Menjívar (2006) refers to this condition as *the grey zone of legality*, where a person is present in the social system but lacks complete legal legitimacy. The state deliberately leaves them in an ambiguous position to maintain the boundary between citizens and non-citizens (Block et al., 2024). Legal limitations not only hinder formal access but also shape a pattern of life full of uncertainty and structural vulnerability, thereby reinforcing the cycle of social marginalisation and economic (Tjandraningsih et al., 1996).

The situation of migrant children in Sabah and Kinabalu contradicts the UN Convention on the Rights of the Child (CRC), which affirms that every child has the right to education, health, and protection without discrimination. However, in practice, migrant children face systematic barriers due to their legal status (Viviansari & Prameswari, 2019). The impact of this situation extends beyond the legal realm into the moral sphere. Migrant children grow up feeling uncertain and without any guarantee for the future. They learn from an early age that their rights can be ignored simply because of their weak legal status. Thus, the daily lives of migrant children in Sabah are clear evidence of the gap between universal human rights principles and the practice of state policy.

Navigating Identity Between Two Worlds

At home, they inherit the Indonesian language, religion, and cultural values; while outside, they adapt to local Malaysian customs. Hall (1990) asserts that identity is always fluid and negotiated in everyday experiences, so it is natural for migrant children never to have a single, definitive identity. This condition forms a "*hybrid* identity", in which they are both Indonesian and Malaysian, but are not entirely accepted in either country (Bhabha, 1994). One student explained that they are accustomed to using two languages interchangeably: "When studying, we use Indonesian, but when talking with friends, we use more Sabahese." This dual identity creates ambivalence, but also gives them the ability to navigate across cultures. Migrant children's sense of belonging is also ambivalent. On the one hand, they feel close to the local community because they attend the same school and play together. On the other hand, their attachment to Indonesia remains strong. Formal education, health insurance, and residency documents available to residents are not available to migrant children, causing them to experience "othering" or being labelled as outsiders (Castles & Miller, 2009). In addition to differences in status, migrant children also face social discrimination. Some students recounted experiences of being looked down upon by local children. Fox et al. (2013), using Berry's acculturation theory, explain that many migrant children are trapped in a position of marginalisation, neither fully accepted by the dominant culture nor fully able to access their culture of origin. Living in two worlds causes migrant children to experience a form of double consciousness (Baysu et al., 2011).

The situation faced by migrant children highlights the importance of inclusive policies that emphasise not only legal aspects but also socio-cultural dimensions. Alternative education run by communities, for example, can be strengthened by incorporating Indonesian cultural values, mother tongue, and community solidarity (Abdusamatov et al., 2025). This can be seen at CLC Sungai Balung, where teachers continue to teach Indonesian and Pancasila even though students speak Sabahese daily. One student said, "We use Indonesian in class, but when we play outside, we speak the Sabah language." Community schools are strategic spaces for preserving Indonesian cultural roots while facilitating integration with the local environment.

Additionally, a hybrid education model that integrates the Indonesian and Malaysian curricula could be a long-term solution. With this kind of curriculum, migrant children can continue their education in both countries. This step not only provides opportunities for social mobility but also helps prevent the erosion of Indonesian national identity among younger migrant generations. A socio-cultural approach can also be a gateway to more humanistic diplomacy. Instead of emphasising purely political aspects, Indonesia can emphasise cultural proximity, history and kinship as a basis for negotiation. Thus, inclusive policies are not only legally and formally established, but also grounded in the social reality of border communities. This is the direction that must be considered if both countries truly want to resolve the issue of migrant children fairly: policies that integrate legal protection with a cultural approach, as well as education that prepares children not only to become citizens but also to become transnational actors capable of navigating two worlds.

Conclusion

Indonesian migrant children in Sabah and Kota Kinabalu experience structural vulnerability due to their ambiguous citizenship status, which restricts access to fundamental rights, particularly education, healthcare, and legal protection. Although many are born and raised in Malaysia, the absence of formally recognised citizenship leaves them in a "semi-legal" condition, reinforcing social exclusion and limiting future mobility. Reliance on Community Learning Centres (CLCs), while crucial, further marginalises them, as the education they provide is not fully integrated into the Malaysian formal system, thereby constraining pathways to higher education.

These findings highlight the urgent need for more inclusive national and regional policy responses. At the national level, formal recognition of CLCs and expanded access to public education and healthcare services are essential. At the regional level, stronger ASEAN cooperation is required to harmonise child protection standards, particularly through mechanisms such as the ASEAN Commission on the Promotion and Protection of the Rights of Women and Children (ACWC). Ensuring migrant children's rights should be treated as a shared regional responsibility in line with the Convention on the Rights of the Child, so that they are no longer confined to a legal and social "grey area." However, they can develop with dignity and equal opportunities.

Abstract

This study investigated the correlation between TOEIC (Test of English for International Communication) scores, aligned with the Common European Framework of Reference for Languages (CEFR), on the employability and workplace performance of recent graduates from higher education institutions in Bulacan, Philippines. Utilizing a mixed-methods explanatory sequential design, the research combined quantitative data from 50 TOEIC-certified graduates with qualitative insights from 10 of their employers. Quantitative findings revealed a clear positive correlation between higher English proficiency and key employment outcomes, such as faster job placement, a greater number of job offers, and higher self-perceived employability; particularly, a 0.86 Pearson r correlation between TOEIC scores and self-perceived employability. Graduates with C1 CEFR-level scores secured employment more rapidly and received significantly more job offers than their A1-level counterparts. Qualitative data, analyzed thematically, further revealed that C1-level employees exhibited strong communication competence, adaptability, and professionalism, whereas A1-level employees, although behaviorally competent, displayed limited verbal engagement and required more support in adapting to new tasks or tools. Across both groups, workplace behavior was consistently positive, highlighting that language proficiency did not influence work ethic. These findings reinforce the role of English language proficiency as a decisive employability factor and affirm the relevance of CEFR and TOEIC. The study recommends a stronger integration of CEFR-aligned language instruction in higher education curricula and greater collaboration between academic institutions and industry stakeholders. Delimitations of the study include its geographic and sample size constraints, suggesting directions for future research that could further contextualize language proficiency within diverse employment environments.

Introduction

In a globalized labor market where communication skills are central to collaboration, problem-solving, and service delivery, language proficiency has increasingly emerged as a critical determinant of employability and workplace performance. The ability to communicate effectively in English is particularly vital in countries like the Philippines, where English functions as both an official language and a dominant medium of instruction in higher education (Bernardo, 2004; Tupas & Lising, 2014). The high premium placed on English language proficiency by both local and international employers positions it as a core competency, particularly for new graduates navigating an increasingly competitive job market (Bolton & Bautista, 2004; Ting et al., 2017).

Despite widespread English exposure in the Philippine educational system, the actual communicative competence of many graduates remains inconsistent, raising concerns about their readiness for professional environments that demand both linguistic accuracy and sociolinguistic appropriateness (Hashim & Leitner, 2020; Tupas & Martin, 2017). This disconnect between assumed proficiency and demonstrated ability has serious implications for employment outcomes. Employers across industries frequently cite gaps in oral and written communication as a key barrier to job readiness, particularly in roles requiring teamwork, negotiation, and customer interaction (Bawa, 2020; Otache, 2022). Consequently, it has become imperative to adopt more reliable and standardized measures of English proficiency that go beyond academic grades or self-reported competence.

The Common European Framework of Reference for Languages (CEFR) has emerged as a widely accepted benchmark for describing language ability across six levels, from A1 (beginner) to C2 (proficient) (Council of Europe, 2001). Its comprehensive, skill-based approach offers a functional description of what learners can actually do with the language in real-world contexts (North, 2014). In the Philippines, CEFR-aligned assessments are increasingly being used by higher education institutions and employers to inform curriculum design and recruitment processes (SEAMEO INNOTECH, 2021). However, empirical studies linking CEFR levels to real-world employability in the Philippine context remain limited.

One standardized test aligned with CEFR that has gained considerable traction in the employment sector is the Test of English for International Communication (TOEIC). Originally designed to assess workplace English skills of non-native speakers, TOEIC provides a quantifiable and CEFR-mapped profile of an individual's listening and reading comprehension, as well as their speaking and writing competencies in job-related scenarios (Educational Testing Service [ETS], 2020). Employers in the Asia-Pacific region, including the Philippines, have adopted TOEIC as a screening tool for roles requiring cross-border communication or customer engagement (Kawabata 2024; Santos et al., 2024). However, there remains a need for critical investigation into how TOEIC scores translate into actual employability outcomes among Filipino graduates, particularly across different proficiency levels.

Furthermore, while existing literature acknowledges the correlation between English proficiency and employability, few studies explore employer perspectives on how language competence, as measured through standardized tools like TOEIC, translates into real-world performance. In particular, the role of CEFR levels in shaping employer perceptions of communication effectiveness, adaptability, and professional conduct in workplace settings deserves further scrutiny. Given the linguistic diversity and cultural specificity of Filipino

workplaces, it is essential to examine these dynamics through both quantitative and qualitative lenses (Tupas, 2015).

This study responds to that gap by employing a mixed-methods research design to explore the relationship between TOEIC scores, mapped against CEFR levels, on the employability and observed workplace behavior of Filipino graduates. Special focus is given to employer evaluations of graduates at the A1 and C1 CEFR levels, offering insight into how language proficiency influences communication competence, adaptability to workplace demands, and professionalism. Through this approach, the study aims to contribute to a more grounded understanding of English proficiency as not merely an academic achievement but a practical asset that shapes employment trajectories in the Filipino context.

Review of Literature

English language proficiency has consistently been recognized as a critical factor in employability, particularly in countries where English is used as a second language. Numerous studies have examined the influence of language proficiency—often assessed through standardized tools such as the Test of English for International Communication (TOEIC) and the Common European Framework of Reference for Languages (CEFR) on academic success and workplace outcomes. These investigations offer important insights into how test results correspond to real-world communication demands, which lies at the core of the present study.

Prasetya (2023) reported a strong correlation between TOEIC scores and key indicators of career advancement, including job promotions, salary increases, and overall job satisfaction ($r = 0.8$, $p < 0.05$). Utilizing a mixed-methods design, the study revealed that English language proficiency, as assessed by TOEIC, significantly contributed to professional growth and workplace integration. Central themes such as language barriers, global networking, and cross-cultural collaboration emerged, reinforcing the need for functional English in internationalized professional environments.

Similarly, Powers and Schmidgall (2021) validated the predictive capacity of the TOEIC Speaking test, revealing a strong correlation ($r = 0.84$) between test scores and communicative effectiveness as rated by non-expert evaluators across ten countries. This external validation emphasized the test's practical relevance. A follow-up study (Schmidgall & Powers, 2020) demonstrated similar findings for the TOEIC Writing Test, with ratings of written adequacy aligning closely with actual test results ($r = 0.76$). These findings highlight the TOEIC's reliability in assessing communication competence in real-life workplace scenarios.

Kanzaki (2020) supported the use of TOEIC Listening and Reading components as effective proxies for general English proficiency. His findings showed strong inter-correlations among TOEIC's four subtests, especially between listening and reading ($r = .73$) and the lowest between listening and writing ($r = .52$). This supports the practicality of using receptive skill assessments to infer broader language abilities a critical consideration for employers evaluating job applicants.

From a perception and policy standpoint, Minhee and Hyunju (2022) investigated South Korean test takers' views of TOEIC using the Assessment Use Argument Framework. They found that TOEIC was widely perceived as beneficial for both employment and personal language development. However, interpretations of scores varied depending on contextual

variables such as gender, company size, and partner type, suggesting that socio-organizational factors shape the test's use in professional settings.

In the Philippine context, An (2021) found significant differences in TOEIC Listening and Reading scores between students in board and non-board programs, suggesting disparities in language training across academic programs. This highlights the need for targeted interventions to address specific proficiency gaps among student groups. Echoing this, Santos et al. (2024) demonstrated that online intervention programs significantly improved students' TOEIC performance, particularly among first and second-year college students. These findings support the implementation of structured preparatory programs to enhance test outcomes.

Further contextualizing TOEIC's relevance in the Philippines, ETS Global Philippines (2024) reported that over 70% of Filipino TOEIC test-takers were full-time students, and local employers increasingly use TOEIC scores for recruitment and screening purposes. This illustrates the test's institutional and functional integration into the Philippine employment landscape.

The importance of clear score interpretation was emphasized in a Taiwanese study by Powers and Schmidgall (2021), which found that while stakeholders generally used TOEIC scores appropriately, some components of the score report were misunderstood or underutilized. This highlights the importance of transparent and comprehensible reporting to ensure the meaningful use of test results by both applicants and employers.

Complementing TOEIC-based studies, Kaowiwattanakul (2025) examined the effect of multimodal instruction on CEFR-aligned reading proficiency among Thai C1-level EFL learners. Results indicated significant gains in reading skills, validating the CEFR as a useful framework for assessing language competence and preparing learners for real-world communicative tasks, aligning with the goals of the TOEIC.

In Indonesia, Santoso et al. (2024) investigated university students' perceptions of English Medium Instruction (EMI) and found that students viewed EMI as a pathway to enhanced employability. However, a noticeable gap existed between the language needs of students and the support provided. This discrepancy reinforced the necessity for comprehensive assessment tools like TOEIC to evaluate readiness for professional environments.

Diem and Abdullah (2020) assessed the English proficiency of EFL teachers in Southern Sumatra and found that educational level was the strongest predictor of both linguistic and cultural competence. Although focused on teachers, this study highlighted the role of education in shaping functional communication abilities, validating the need for standardized benchmarks, such as the TOEIC, for employment-related assessments.

In Bangladesh, Shahid and Kabilan (2025) explored listening and speaking difficulties among higher education students. They identified issues in pronunciation, fluency, and grammar, as well as non-linguistic factors like anxiety and low confidence. These findings illustrate the broader challenge of bridging academic instruction and real-world communication demands, further justifying the use of performance-based tools like TOEIC.

Additionally, Widiati et al. (2021) studied Indonesian English teachers' views on foreign language literacy using Kucer's (2014) model. The study highlighted the importance of focusing on the cognitive and linguistic dimensions of literacy, underscoring the need for

functional language assessments that closely mirror workplace communication tasks—a principle central to the TOEIC and CEFR frameworks.

Tao et al. (2025) explored the relationship between perfectionism and English proficiency among Chinese university students. Their results suggested a significant association between higher perfectionism levels and increased English proficiency. While not directly tied to employability, the study highlighted psychological factors that may influence performance on high-stakes tests, such as the TOEIC.

Lastly, Styati and Rodliyah (2021) found that students with higher proficiency performed better in peer writing tasks when paired with peers of equal skill. This suggested that language proficiency affects not only individual outcomes but also collaborative productivity—skills that are vital in professional settings. Thus, assessing such abilities through standardized tests like TOEIC can offer employers a more comprehensive view of an applicant's workplace readiness.

Methodology

This study employed a mixed-methods research design to investigate the relationship between TOEIC Listening and Reading scores on the self-perceived employability of recent undergraduates. The integration of both quantitative and qualitative data provided a detailed understanding of how language proficiency, as measured by TOEIC scores, correlates with and potentially influences employment outcomes. Quantitative data focused on measurable indicators such as TOEIC score thresholds (CEFR levels), job placement rates, the number of job offers received, and self-perceived employability. On the other hand, qualitative insights were drawn from selected employers who provided contextualized assessments of their employees' workplace readiness, communication skills, and professionalism. These employer perspectives offered an outsider or etic viewpoint that helped substantiate or contrast with the graduates' own self-assessments.

The study followed an explanatory sequential approach. Initial quantitative findings were used to guide the selection of participants for the qualitative phase and to identify emerging themes for exploration. This approach allowed the researchers to build on the numerical data with narrative descriptions, providing both breadth and depth of insight into employability factors.

Population and Sampling

The study focused on 50 graduates from higher education institutions located in the province of Bulacan, Philippines. These individuals completed their undergraduate programs between 2023 and 2024. The inclusion criteria were specific: participants must have held an active or valid TOEIC Listening and Reading certification during their application and hiring processes and must have secured employment within the validity of their TOEIC certification (2 years). While the geographic focus was Bulacan, employment outside the province was not restricted to allow a broader picture of employability outcomes.

Due to the narrow criteria concerning TOEIC certification and early employment, the study employed purposive sampling. This non-probability sampling technique ensured that only those meeting the relevant qualifications were included. The small sample size reflects the limited number of graduates with verified TOEIC certifications, which is a known limitation but one that ensures the integrity of the study's purpose.

For the qualitative phase, 10 employers or immediate supervisors of the graduate participants were conveniently selected based on their availability and willingness to participate as well as the scores of their respective employees. Employers of 5 individuals with A1 CEFR and another 5 from individuals with C1 CEFR level. These individuals provided insights on how TOEIC-certified graduates performed in real-world professional contexts.

Research Instruments

The quantitative instrument was a structured survey questionnaire designed to gather specific employability indicators. It measured:

- TOEIC Score Thresholds, reported in CEFR levels
- Reason for taking TOEIC
- Job placement status within the validity of the TOEIC certification
- Number of job offers received after graduation
- Work field Placement
- Self-perceived Employability, adapted from Rothwell and Arnold's (2007) established employability scale

Additionally, the questionnaire asked for contextual information such as field of work, and whether the employer specifically required TOEIC certification or any CEFR-equivalent rating as a hiring requirement. The qualitative instrument consisted of a structured essay prompt, which invited employers to describe their observations regarding the employee's communication skills, professionalism, and readiness for the workplace. This format allowed for richer responses while maintaining consistency across respondents. To ensure the validity and reliability of both instruments, the questionnaires were subjected to expert validation and peer debriefing. Two language experts and one research specialist reviewed the tools, and revisions were made based on their feedback. The development and refinement of the qualitative tools were guided by Creswell et al. (2021) and Hirose and Creswell (2023), emphasizing credibility, transferability, and dependability.

Data Gathering Procedure

Data collection was conducted entirely online using Google Forms for both the quantitative and qualitative phases. This method ensured accessibility and convenience, especially given the geographic dispersal of the participants and the constraints of post-pandemic data collection. Reminders were sent to ensure a high response rate, and clarification was provided through follow-up messages when necessary.

Data Processing and Analysis

Quantitative data were processed using descriptive statistics, including means, percentages, and frequency distributions. Visual representations, such as bar graphs and pie charts, were generated to illustrate trends in TOEIC scores, job placement rates, and other key variables. Lastly the TOEIC scores and self-perceived employability's correlation were treated using Pearson r correlation.

For the qualitative data, responses were subjected to thematic analysis. The researcher identified recurring patterns and themes related to communication competence, adaptability, and general workplace behavior. Codes were generated manually and then clustered into

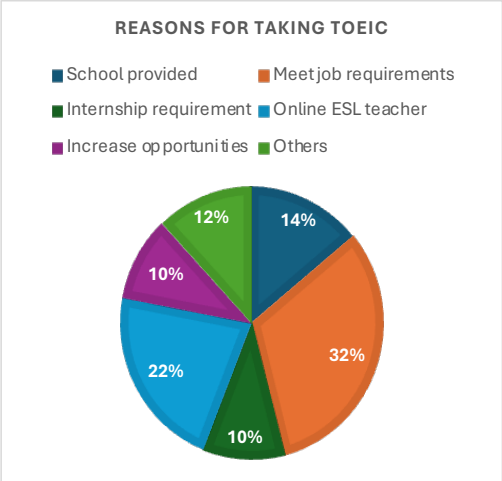
broader categories that aligned with the constructs of employability under investigation. This dual analysis enabled the study to triangulate the findings, enhancing their interpretive richness.

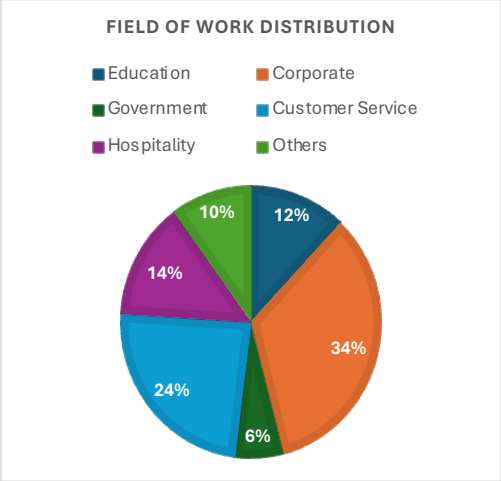
Ethical Considerations

The research followed strict ethical protocols to safeguard the rights and well-being of all participants. Written informed consent was obtained before participation, and respondents were fully informed about the purpose of the study, the voluntary nature of their involvement, and their right to withdraw at any point without penalty. All identifying details were anonymized, and responses were assigned unique codes to ensure confidentiality. Data were stored in password-protected and encrypted files, accessible only to the lead researcher. Ethical approval was secured from the university's Institutional Research Ethics Board before any data were gathered. Particular care was taken to protect vulnerable stakeholders, including students and employees, who may have felt hesitant to share opinions about institutional practices or their professional experiences. The design of the instruments and the presentation of results ensured that no individual or institution could be identified in any published outputs.

Results

Figure 1
Reasons for Taking TOEIC





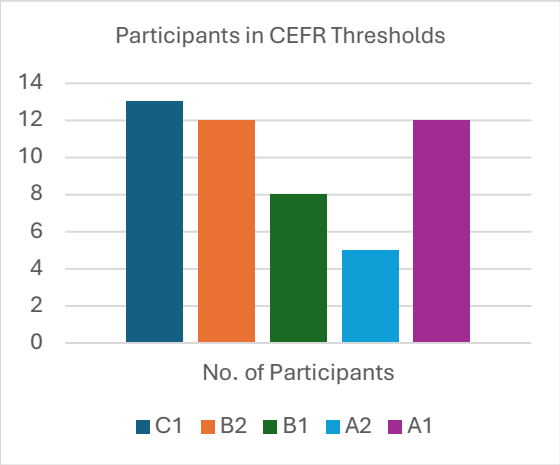


Figure 2
Field of Work Distribution

As illustrated in Figure 1, 7 participants (14%) indicated that they took the TOEIC as privilege since it the testing was school provided. 5 participants (10%) wanted to improve their employment prospects. 16 graduates (32%) stated that it was a job application requirement. 11 (22%) said they needed the certification as they were online ESL teachers. The remaining 11 (22%) cited academic compliance or personal goals. These responses support the claim that TOEIC certification is regarded as a strategic asset for labor market entry, especially in a competitive job market where English proficiency is highly valued.

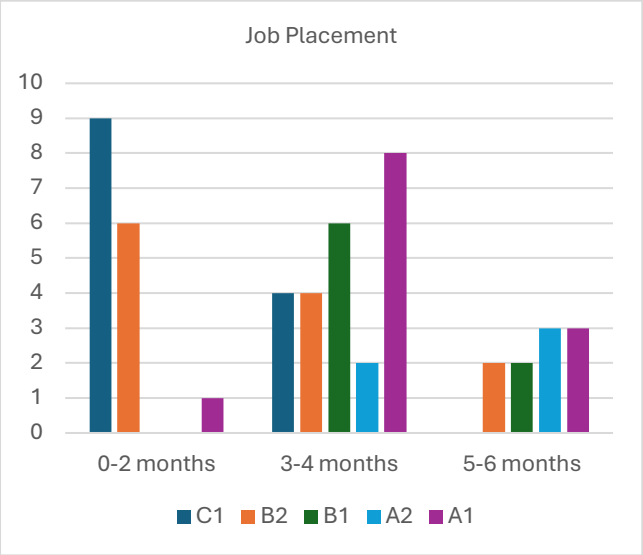

Figure 2 presents the employment sectors of the participants. The highest concentration was in the corporate field, with 17 graduates (34%), followed by customer service with 12 (24%). Hospitality accounted for 7 graduates (14%). The remaining 8 participants (16%) were distributed across government, logistics, and information technology. These data suggest that English language competence, as measured by TOEIC, has broad applicability across sectors that require varying levels of workplace communication.

Figure 3
TOEIC Threshold of Participants

According to Figure 3, 12 participants (24%) achieved a TOEIC score equivalent to the C1 CEFR level (945–990). Another 10 (20%) were at B2 level (785–940), while 13 (26%) scored at B1 level (550–780). Seven participants (14%) fell into the A2 band (225–545), and 8 (16%) scored within A1 level (120–220). This distribution ensured comparative rigor in analyzing how language proficiency correlates with employment outcomes across a range of CEFR levels.

Figure 4
Job Placement

As depicted in Figure 4, all 13 C1-level graduates were employed within the first two months. In contrast, only 1 of the 12 A1-level graduates were employed within that same timeframe. These findings suggest a strong relationship between higher TOEIC scores and faster job placement, reinforcing the test's predictive value for early career success.

Figure 5
Job Offers by TOEIC Level

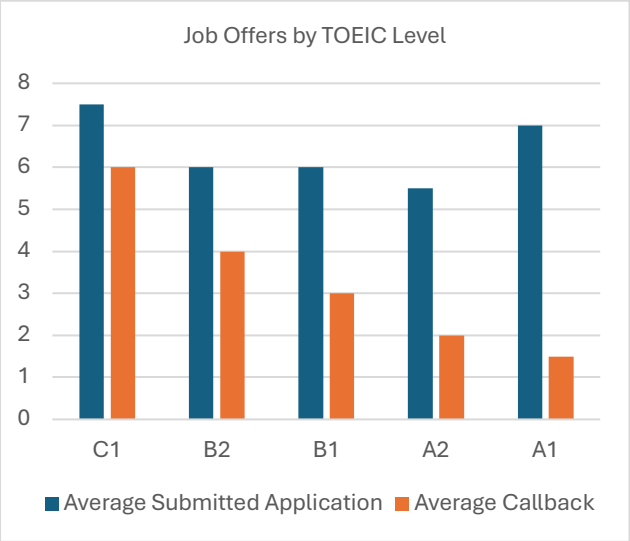

Figure 5 reveals a distinct gradient in the number of job offers received by participants according to their TOEIC proficiency. Graduates with C1-level scores received an average of 6 job offers, while B2-level graduates received 4 offers, and B1-level graduates received 3 offers. A2-level graduates received 2 offers on average, and A1-level graduates reported only 1.5 job offers each. These figures confirm that higher English proficiency significantly increases a graduate's employability and desirability to multiple employers.

Figure 6
Self-Perceived Employability

The self-perceived employability of participants, measured using a 5-point Likert scale adapted from Rothwell and Arnold (2007), showed a clear upward trend in relation to TOEIC score level (Figure 6). C1-level participants reported a mean score of 4.7, indicating strong confidence in their employability. B2 and B1 levels scored 4.4 and 4.15, respectively. Meanwhile, A2-level participants reported a mean of 3.55, and A1-level participants rated themselves at 2.8. These findings support the proposition that language proficiency not only

correlates with actual employment outcomes but also contributes significantly to a graduate's confidence in their career readiness.

The correlation analysis revealed a Pearson coefficient of 0.86, indicating a strong positive relationship between TOEIC scores and self-perceived employability. This result is consistent with prior literature suggesting that higher levels of language competence are linked to both internal (self-assessment) and external (job market) perceptions of employability. The strength of this correlation underscores the role of English proficiency as both a communicative tool and a psychological resource for job seekers.

Table 1

Employers' Observations on Employees With A1 CEFR Level

Meaning Unit	Codes	Sub-Themes	Themes
"She understands simple instructions, but sometimes asks for clarification."	• simple instructions • clarification	Basic comprehension	Communication Competence
"In longer mails and announcements, clarifications are asked by <employee>."			
"He avoids speaking in English during meetings; prefers to listen."	• avoids speaking • prefers listening	Passive communication style	
"There are occasional misunderstandings, especially with technical terms."	• misunderstandings • technical terms	Limited vocabulary	
"I understand that <employee> is new and that sometimes she's not familiar with terms either related to reports or procurements."			
"He follows routines well but struggles when there's a sudden change in the task."	• follows routines • struggles with workloads	Slow adjustment to change	Adaptability
"<Employee> sometimes gets overwhelmed by huge workload but this is not new for fresh graduates."			
"She needs more time to adjust when new tools or systems are introduced."	• needs more time • new tools		
"The training she had during her ojt was in public schools and now that she's in a private school, things are kind of new to her."			
"Once trained, he performs consistently."	• trained • performs consistently	Dependable after training	
"He underwent a proper training, though not entirely on communication, but he functions well."			
"She comes to work on time and is respectful to everyone."	• on time • respectful	respectful behavior	Workplace Behavior
"…very respectful. Always greets his co-workers and blends easily in different age groups."			
"He is cooperative and does not complain, even when assigned extra tasks."	• cooperative • professional • follows rules	professional conduct	
"Generally behaves professionally and follows rules."			

Employees with A1 CEFR level exhibit a combination of strengths and limitations in their workplace performance, particularly in the areas of communication, adaptability, and behavior. In terms of communication competence, they generally demonstrate only basic comprehension and tend to adopt a passive communication style. Verbal engagement in English is limited, with many needing frequent clarification or choosing to avoid speaking altogether, especially in professional or technical contexts. When it comes to adaptability, these employees perform adequately within structured routines and show consistency once tasks are learned; however, their ability to adjust to new tools, unexpected changes, or unfamiliar processes is relatively limited, often requiring additional time or guidance. Despite these challenges, their general workplace behavior stands out positively. Employers consistently describe them as punctual, respectful, cooperative, and professional, indicating that while their language and adaptive capacities may be developing, their attitude and conduct significantly contribute to a harmonious and productive work environment.

Table 2

Employers' Observations on Employees With C1 CEFR Level

Meaning Unit	Codes	Sub-Themes	Themes
"She expresses her thoughts clearly and confidently during meetings."	• clear expression • confidently	Articulate communicator	Communication Competence
"<Employee> can spontaneously be assigned as presenter and still nails it."			
"It has not been a term yet I know that he is a good educator based on how he communicate."			
"He can explain complex ideas in English without difficulty."	• explain complex ideas • no difficulty	Fluent delivery	
"…terminologies in instructions that might confuse new employees were easily understood by <employee>."			
"She adjusts her tone and language depending on who she's speaking with."	• adjusts tone • appropriate language	Pragmatic language use	
"Can be informal with her friends sometimes but definitely formal during presentations."			
"He adapted quickly to our work system, even with minimal guidance."	• adapted quickly • minimal guidance	Independent adjustment	Adaptability
"<Employee> is a fast learner."			
"She manages new responsibilities well but sometimes asks for reassurance."	• manages responsibilities • asks reassurance	Independent with occasional validation	
"Communicates inquiries if something is not clear."			
"He knows how to cover tasks that are difficult to manage."			
"He is good in finding solutions but prefers clear instructions first."	• proactive • clear instructions	Initiative within structured environment	
"Very proactive. Moves without being asked."			
"Always on time."	• on time • punctual in submission of requirements	Punctual	Workplace Behavior
"He makes it a point to always submit his outputs on or before the given deadline."			
"Very respectful to coworkers regardless of gender, position, or age."	• Respectful		

“<Employee> listens to advice and constructive criticisms.”	• open to feedback	Positive interpersonal behavior	
“He always asks for comments about an output that he will submit			
"Follows company protocols and provides insights on policies he’s not in favor with."	• follows protocols • positive atmosphere	Professionalism	
“She is always smiling and radiates positivity in the workplace.”			

Employees with C1 CEFR level are consistently characterized by strong workplace performance, particularly in communication competence, adaptability, and behavior. Their command of English is marked by high fluency and clarity, enabling them to convey complex ideas effectively and adapt their communication style based on the audience or situation. This allows them to actively contribute to professional discussions and collaborate efficiently across teams. In terms of adaptability, these employees generally adjust quickly to new roles, tools, or systems. While some may initially seek clarification or reassurance, they are typically proactive, demonstrating both initiative and flexibility once they understand their responsibilities. Equally notable is their workplace behavior, which employers uniformly describe as positive. They are punctual, respectful, professional, and cooperative, often contributing to a supportive and productive work environment. Their consistent adherence to company policies and willingness to take initiative further highlight their reliability and value as team members.

Table 3
Side-by-Side Comparison: A1 vs. C1 CEFR-Level Employees

Dimension	A1 CEFR Employees	C1 CEFR Employees
Communication Competence	- Understands basic instructions but struggles with complex or abstract ideas. - Tends to be passive or avoidant in English-speaking situations. - Often requires clarification and repetition.	- Communicates clearly and confidently in meetings. - Can express complex ideas fluently. - Adapts tone and vocabulary depending on context or audience.
Adaptability	- Performs well with routine tasks and familiar processes. - Adjusts slowly to new systems or unexpected changes. - Relies more on structured support.	- Adjusts quickly to new environments and systems, sometimes with minimal guidance. - Demonstrates initiative, though some still prefer clear instructions initially. - Manages multiple responsibilities effectively.
Workplace Behavior	- Consistently punctual, respectful, and professional. - Follows rules and performs assigned tasks without complaint. - Demonstrates strong work ethic despite communication barriers.	- Equally punctual, respectful, and professional. - Shows initiative beyond job descriptions. - Accepts feedback openly and contributes positively to workplace morale.

The comparison between employees with A1 and C1 CEFR levels reveals distinct differences in communication competence and adaptability, while workplace behavior remains consistently positive across both groups. In terms of communication, C1-level employees exhibit a strong and functional command of the English language, allowing them to actively participate in professional discussions, articulate complex ideas clearly, and adjust their

communication style based on context or audience. In contrast, A1-level employees can manage basic interactions but often struggle with more nuanced or technical conversations, limiting their effectiveness in collaborative or communication-intensive roles. Adaptability also differs notably between the two groups. C1-level employees generally show above-average adaptability, responding well to new tasks, tools, or workflows with minimal supervision. Although some may initially seek clarity, they typically become proactive and self-directed once familiar with their roles. On the other hand, A1-level employees are more reactive, performing dependably in structured and familiar settings but requiring more time, guidance, and support when adapting to new or changing work conditions. Despite these differences, both groups demonstrate equally strong workplace behavior. Employers consistently describe them as punctual, respectful, cooperative, and professionally behaved, indicating that while language proficiency may influence communication and adaptability, it does not appear to impact overall work ethic or interpersonal conduct.

Conclusion and Recommendations

The findings of this study underscore the significant role of English language proficiency in shaping employment outcomes and workplace performance among Filipino graduates. Employees with higher CEFR-aligned TOEIC scores demonstrated, as self-reported, markedly better communication competence, adaptability, and employability, with the objective result of the 0.86 Pearson r correlation. These individuals were more active and effective in professional discourse, could navigate complex workplace tasks with minimal supervision, and were more likely to secure multiple job offers within a shorter time frame. In contrast, A1-level employees, although praised for their professionalism and work ethic, faced evident limitations in verbal engagement and required additional support in adapting to new roles or tasks.

These patterns confirm longstanding concerns in Philippine higher education and labor studies regarding the disjunction between academic language exposure and functional workplace communication (Bernardo, 2004; Hashim & Leitner, 2020). Employers consistently emphasized that the ability to articulate ideas clearly, respond appropriately in dynamic interactions, and participate confidently in meetings and collaborative activities are highly valued traits—traits that were mostly present among higher-proficiency individuals. This aligns with research by Tupas and Lising (2014) and Ting et al. (2017), who pointed out that language proficiency directly affects how graduates are perceived and evaluated in employment contexts.

Moreover, the results validate the utility of CEFR and TOEIC as credible benchmarks for assessing workplace language readiness. As noted by North (2014) and the Council of Europe (2001), CEFR provides a transparent and skills-oriented framework, while TOEIC offers a performance-based snapshot of real-world English usage. The ability of these tools to distinguish between merely functional and professionally effective language use has practical implications for employer recruitment strategies and university curriculum planning. Given that 35% of employers in the study required TOEIC and another 25% accepted CEFR-equivalent ratings, the continued institutionalization of these standards in the Philippines appears both justified and necessary (Santos et al., 2024; SEAMEO INNOTECH, 2021).

What stands out most, however, is the consistent finding that work ethic, focused on punctuality, respectfulness, and general professionalism, remained strong across all proficiency levels. This affirms the observations made by Bawa (2020) that Filipino graduates bring to the workplace a cultural orientation toward diligence and cooperation. Language ability, while

essential for communication-heavy roles, does not appear to influence behavioral attributes. Nevertheless, in roles that demand high levels of collaboration, problem-solving, or customer engagement, the absence of strong English proficiency can limit an employee's upward mobility and workplace integration.

Ultimately, the study highlights a dual imperative for Philippine higher education institutions and policy stakeholders: to preserve and enhance the behavioral strengths of Filipino graduates while systematically improving their communicative competence through CEFR-aligned instruction and assessment. Such efforts will better equip graduates to meet evolving labor market demands and affirm the value of language as both a communicative and socio-economic resource.

First, HEIs must integrate CEFR-based language instruction and assessment more systematically across undergraduate curricula. This would require curricular reform that goes beyond basic English competency and moves toward workplace-aligned communicative tasks. The gap between academic English exposure and the linguistic demands of the labor market, particularly in customer-facing, corporate, and professional service sectors, remains significant. Language instruction should therefore emphasize interactive communication, professional writing, oral fluency, and listening comprehension in real-world contexts. Institutions should consider making TOEIC or similar standardized proficiency tests a graduation requirement or a capstone assessment, supported by preparatory modules embedded throughout the academic program.

Second, partnerships between HEIs and industry stakeholders must be strengthened to ensure that language preparation reflects actual workplace demands. Employers in this study frequently highlighted the need for employees who can communicate clearly, respond promptly in team settings, and demonstrate confidence in English-language interactions. Institutions must respond by fostering experiential learning opportunities, such as industry placements and job shadowing, where language proficiency is not only tested but applied in real time. Language educators and career development offices should collaborate to build authentic assessment tasks modeled after professional communication scenarios.

Lastly, employers are encouraged to standardize language proficiency benchmarks in their recruitment frameworks. The inconsistent requirement for English certification observed in this study reflects a lack of alignment between hiring expectations and actual job functions. Organizations that prioritize communication skills should formally integrate CEFR or TOEIC thresholds into their job qualifications and performance evaluation metrics. This would encourage applicants to pursue language certification and would also allow employers to make data-driven hiring decisions.

Limitations

While this study provides important insights, it is essential to acknowledge its delimitations. The sample was limited to 50 graduates from Bulacan, Philippines, all of whom had verified TOEIC certifications and were employed within the validity of their TOEIC scores. The qualitative phase further narrowed the sample to only 10 employers, split between A1 and C1 CEFR employees. This limits the generalizability of the findings to a broader or more diverse population. Future research should extend the geographic scope to include other provinces and urban centers across the Philippines. Longitudinal studies that follow graduates over a longer

period would also help in evaluating the lasting impact of language proficiency on career advancement and retention.

Moreover, the study focused primarily on employer perceptions and did not incorporate triangulated feedback from the employees themselves or from coworkers. Future inquiries should explore how self-assessed and peer-assessed communication skills align with employer evaluations. Expanding the qualitative sample size and including different industry sectors would further enrich the understanding of language's role across various professional domains.

The evidence from this study affirms that language proficiency is not a peripheral skill but a central asset in enhancing both immediate employability and long-term workplace success. Institutions and employers alike must adopt a more deliberate and structured approach to language development, grounded in global standards and responsive to local workforce realities.

Conflict of Interest Statement

The author declares that there are no conflicts of interest regarding the publication of this article. The research was conducted in the absence of any commercial or financial relationships that could be construed as a potential conflict of interest. The author affirms that the data and findings presented are objective, unbiased, and solely based on the outcomes of this research.

Informed Consent

The authors have obtained and recorded informed consent from all individuals included in this study. As mentioned, this paper adhere with the provisions of both the Data Privacy Act of 2012 (R.A. 10173) and the researcher's institutional policies.

Ethical Concerns

The study has been reviewed has been granted Ethics Clearance for implementation by the institutional Ethics Review committee. The study has been assigned study protocol code NUB-IERC-EXT-2025-A0002, which was used for all communication to said committee and all individuals related to this study. This ethical clearance assigned was valid for one year. No artificial intelligence platform was utilized to accomplished this study.

Data Availability

The data that support the findings of this study are available on request from the corresponding author, Santos, R., and from their institutional Ethics Review Committee under the protocol code NUB-IERC-EXT-2025-A0002. The data, which contain information that could compromise the privacy of research participants, are not publicly available due to certain restrictions.

Knowledge and Attitudes Toward ADHD: A Qualitative Exploration of Indonesian Teachers' Perspectives

Dewinta Ariani, Universitas Negeri Jakarta, Indonesia
Iriani Indri Hapsari, Universitas Negeri Jakarta, Indonesia
Kahfi Hizbullah, Universitas Negeri Jakarta, Indonesia

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Attention Deficit Hyperactivity Disorder (ADHD) is a common neurodevelopmental disorder in children, marked by inattention, hyperactivity, and impulsivity. These symptoms affect not only academic performance but also social functioning and emotional well-being. Teachers play a key role in early identification and classroom support for students with ADHD. However, limited research in Indonesia has examined teachers' understanding of this condition, not only in terms of their knowledge, but also their attitudes toward students with ADHD. This study investigates the knowledge and attitudes of school teachers towards ADHD, as well as their classroom responses. Using semi-structured interviews and purposive sampling, data were collected from 41 teachers across various schools. Findings show that while many teachers can identify behavioral signs associated with ADHD, most are unsure about appropriate interventions or next steps. In addition, teachers' attitudes and responses sometimes reflect uncertainty or hesitation, and sometimes not aligned with the specific needs of children with ADHD, which may hinder the creation of a fully inclusive and supportive learning environment. The lack of training and resources contributes to inconsistent support, negative labeling, and delayed intervention. This study highlights the urgent need for comprehensive teacher training and supportive school policies to enhance understanding, improve responses, and foster a more inclusive learning experience for students with ADHD.

Introduction

Attention Deficit Hyperactivity Disorder (ADHD) is one of the most common neurodevelopmental disorders in children (American Psychiatric Association, 2022). It is characterized by persistent patterns of inattention, hyperactivity, and impulsivity that are developmentally inappropriate and interfere with daily functioning. These core symptoms often emerge in early childhood and are frequently observed in school settings, where academic and behavioral demands are high (Barkley, 2015; Zoromski et al., 2015).

The presence of ADHD symptoms can significantly affect multiple areas of a child's functioning. In the academic domain, difficulties with sustained attention, task completion, and impulse control may lead to lower academic achievement and increased classroom disruptions. Socially, children with ADHD may experience challenges in peer relationships due to impulsive behavior, difficulty following rules, and problems with emotional regulation. Emotionally, repeated negative feedback and academic struggles may contribute to low self-esteem, frustration, and increased risk of emotional difficulties (DuPaul & Stoner, 2014; McQuade & Hoza, 2015; Shaw et al., 2016).

Within the school environment, teachers play a crucial role in the early identification and support of children with ADHD. As individuals who interact with students daily, teachers are often the first to observe behavioral patterns that may indicate ADHD. Their responses, classroom management strategies, and decisions regarding referral to professional services are essential in determining whether students receive appropriate support in a timely manner (Awadalla et al., 2016; DuPaul & Stoner, 2014; Kos et al., 2004; McDougal et al., 2023).

However, previous research indicates that teachers' knowledge and understanding of ADHD remain limited. Studies conducted among elementary school teachers in Jakarta have shown that only around 50% demonstrate adequate knowledge regarding ADHD (Harsono, 2014). Knowledge plays a crucial role in shaping an individual's attitudes toward a condition, including ADHD. A low level of knowledge about ADHD can have a negative impact on how individuals perceive and respond to children with this condition (Murtani et al., 2020). When individuals particularly teachers and educational professionals have limited understanding of ADHD, they are more likely to develop inaccurate or stigmatizing perceptions. For example, children with ADHD may be viewed as disruptive, lazy, or difficult to manage, rather than being recognized as individuals with a neurodevelopmental disorder that requires appropriate understanding and tailored support. Such misconceptions can foster negative attitudes, which in turn may lead to inadequate responses, reduced empathy, and a lack of effective support for children with ADHD within both educational and social environments. This lack of understanding may result in misinterpretation of ADHD-related behaviors as intentional misconduct or poor discipline rather than symptoms of a neurodevelopmental condition. Consequently, low levels of knowledge can negatively influence teachers' attitudes toward children with ADHD, shaping their perceptions, expectations, and classroom responses in ways that may hinder effective support and inclusion (Fuermaier et al., 2014; Metzger & Hamilton, 2021; Toye et al., 2019).

Given the prevalence of ADHD and the pivotal role of teachers in supporting affected students, it is important to explore not only teachers' knowledge of ADHD but also their attitudes and responses toward students displaying ADHD-related behaviors. Understanding teachers' perspectives is essential for identifying gaps in knowledge, addressing attitudinal challenges,

and informing the development of targeted training programs and inclusive educational practices.

Furthermore, there is a lack of empirical research exploring how teachers' knowledge and attitudes are reflected in their actual classroom responses. Little is known about whether teachers' perceptions align with the specific educational and emotional needs of children with ADHD, or whether a mismatch exists between teachers' beliefs and evidence-based practices. This gap in the literature highlights the need for qualitative research that captures teachers' perspectives in depth.

Therefore, the present study aims to explore Indonesian teachers' knowledge of ADHD, their attitudes toward students with ADHD, and their classroom responses to ADHD-related behaviors. By examining these aspects, this study seeks to identify potential gaps between teachers' perceptions and the needs of children with ADHD, and to provide insights that may inform teacher training and inclusive education practices in Indonesia.

Methodology

Research Design

This study employed a qualitative exploratory research design to gain an in-depth understanding of teachers' knowledge, attitudes, and classroom responses toward students with ADHD. A qualitative approach was considered appropriate as it allows for the exploration of participants' perspectives, experiences, and interpretations in their natural context, particularly in areas where empirical research remains limited (Creswell & Poth, 2018). Exploratory qualitative research is especially appropriate for investigating phenomena that have not yet been extensively studied, particularly in contexts where empirical evidence remains limited. This approach allows researchers to capture in-depth insights into participants' experiences, interpretations, and beliefs, which are often shaped by cultural and social contexts. By emphasizing meaning, context, and subjective understanding, qualitative exploration is well suited to uncovering how cultural norms, values, and shared assumptions influence individuals' perceptions and responses, providing a richer and more nuanced understanding of complex phenomena (Denzin et al., 2023).

Participants and Sampling

The participants consisted of 41 teachers from various schools. Participants were selected using a purposive sampling technique to ensure the inclusion of teachers who had relevant experience in teaching students with attentional or behavioral difficulties. This sampling method enabled the researchers to obtain rich and meaningful data related to the study objectives.

Data Collection

Data were collected through semi-structured interviews guided by an interview protocol developed to explore teachers' knowledge, attitudes, and experiences related to ADHD. The use of semi-structured interviews allowed participants to express their perspectives freely while ensuring that key topics relevant to the study objectives were consistently addressed.

The interview guideline covered four main domains. First, general understanding of ADHD, including teachers' conceptualization of ADHD as a condition, their awareness of its clinical

nature, and their knowledge of core symptoms and subtypes (e.g., inattention, hyperactivity, and impulsivity). Second, perceptions of causes and management, which explored teachers' beliefs regarding the causes of ADHD, such as biological, environmental, or parenting factors, as well as their views on treatment approaches, including behavioral strategies and medication. Third, attitudes toward children with ADHD, focusing on teachers' emotional responses, perceptions of classroom disruption, and beliefs about children's ability to control their behavior. Fourth, educational and sociocultural context, which examined teachers' classroom experiences, responses to ADHD-related behaviors, and perceived challenges within the Indonesian cultural and educational system.

Examples of interview questions included: "What do you know about ADHD?", "Do you consider ADHD to be a medical condition that can be clinically diagnosed?", "What do you think causes a child to have ADHD?", "How do you feel when interacting with students who have difficulty focusing or are very active in class?", and "What challenges do you face in supporting students with ADHD within the school context in Indonesia?" Follow-up questions were used as needed to clarify responses and explore emerging themes in greater depth.

Data Analysis

The interview data were analyzed using thematic analysis. The analysis process began with familiarization with the data through repeated reading of the interview transcripts to gain an overall understanding of participants' responses. This was followed by initial coding, during which meaningful segments of data were identified and labeled. The resulting codes were then reviewed and organized into broader themes that captured recurring patterns and shared meanings across participants' responses (Braun & Clarke, 2021). This approach enabled the identification of key themes related to teachers' knowledge, attitudes, and classroom responses toward students with ADHD.

Results

The thematic analysis of interview data revealed three main themes that reflect teachers' perspectives and experiences related to ADHD: (1) teachers' knowledge of ADHD, (2) teachers' attitudes toward students with ADHD, and (3) classroom responses to ADHD-related behaviors. These themes illustrate the complexity of teachers' understanding and practices, as well as the challenges they face in providing effective support for students with ADHD.

Knowledge of ADHD

Teachers generally demonstrated the ability to recognize behavioral signs commonly associated with ADHD. Many participants identified difficulties in maintaining attention, restlessness, and impulsive behavior as key indicators observed in the classroom. These behaviors were frequently described through everyday classroom situations, such as students being unable to remain seated for extended periods, interrupting lessons or peers, shifting attention rapidly between tasks, and struggling to complete assignments within the allotted time. Such descriptions suggest that teachers were able to recognize ADHD-related behaviors based on direct observation and daily interactions with students.

Despite this ability to identify observable symptoms, teachers' understanding of ADHD was often limited to a surface-level awareness. While participants could describe what students did in the classroom, fewer were able to explain why these behaviors occurred or how they were

related to a neurodevelopmental condition. Several teachers expressed uncertainty about whether ADHD was a clinically diagnosable condition or simply a behavioral issue influenced by parenting or discipline. This limited conceptual understanding reflects a gap between behavioral recognition and deeper knowledge of ADHD as a developmental disorder.

Furthermore, most participants reported limited knowledge of evidence-based interventions and appropriate referral pathways. Teachers frequently expressed uncertainty about the next steps to take after identifying ADHD-like behaviors, including when and how to refer students for professional assessment. Many were also unfamiliar with specific classroom strategies tailored to students with ADHD, such as structured routines, task modification, or individualized behavioral supports. This lack of practical knowledge highlights a disconnect between recognizing ADHD symptoms and implementing effective responses to support students' learning and development.

Attitudes Toward Students With ADHD

Teachers' attitudes toward students with ADHD varied considerably across participants. Some teachers expressed empathy and a genuine willingness to support students in managing their difficulties. These participants emphasized the importance of patience, understanding, and emotional regulation when interacting with students who exhibited ADHD-related behaviors. They tended to interpret inattention, hyperactivity, or impulsivity as manifestations of a developmental condition rather than deliberate misbehavior and described efforts to remain calm and supportive during classroom interactions.

However, other teachers reported feelings of hesitation and concern regarding the presence of students with ADHD in the classroom. These concerns were often related to perceived disruptions to the learning process, including difficulties in maintaining classroom order and ensuring that other students remained focused. Uncertainty about how to manage ADHD-related behaviors contributed to feelings of frustration and ambivalence, particularly when teachers felt that their existing classroom management strategies were insufficient or ineffective.

In some cases, this uncertainty influenced teachers' attitudes in ways that led to avoidance or negative labeling. Several participants described situations in which students with ADHD were perceived as "problematic," "difficult," or "hard to manage," especially when their behaviors persisted despite repeated reminders or disciplinary measures. Such perceptions may affect the quality of teacher–student relationships and limit opportunities for positive engagement, potentially reinforcing negative experiences for students with ADHD within the classroom environment.

Classroom Responses to ADHD-Related Behaviors

Teachers' classroom responses to students with ADHD were found to be inconsistent across participants. Some teachers reported implementing basic strategies to manage ADHD-related behaviors, such as adjusting students' seating positions to reduce distractions, providing closer supervision during tasks, or applying simple behavior management techniques. These strategies were typically developed through personal experience or trial-and-error rather than formal training and were often applied in an ad hoc manner depending on the situation and the teacher's comfort level.

In contrast, other teachers described feeling uncertain or unprepared when responding to students with ADHD. Several participants reported not knowing what actions were appropriate or effective, particularly when students' behaviors persisted despite general classroom management efforts. This uncertainty sometimes led teachers to rely on avoidance strategies, such as minimizing interaction with the student or waiting for the behavior to resolve on its own, rather than actively implementing targeted support or seeking professional assistance.

The lack of formal training, clear guidelines, and institutional support was frequently cited as a contributing factor to these inconsistent responses. Without adequate knowledge or access to resources, teachers often delayed intervention or applied strategies that were insufficient to meet the specific needs of students with ADHD. As a result, classroom responses varied widely and were often reactive rather than proactive, reducing the overall effectiveness of support provided to students with ADHD.

Discussions

This study aimed to explore teachers' knowledge of ADHD, their attitudes toward students with ADHD, and their classroom responses within the Indonesian educational context. The findings reveal a consistent pattern across these domains: while teachers are generally able to recognize observable ADHD-related behaviors, limitations in conceptual understanding, training, and institutional support shape their attitudes and result in inconsistent classroom practices.

The findings indicate that teachers' knowledge of ADHD is largely limited to the identification of surface-level behavioral symptoms, such as inattention, restlessness, and impulsivity. This aligns with previous research suggesting that teachers often rely on observable classroom behaviors rather than a comprehensive understanding of ADHD as a neurodevelopmental disorder. The lack of knowledge regarding evidence-based interventions and referral pathways suggests that teachers may recognize a problem without knowing how to respond effectively. This gap between symptom recognition and practical knowledge may contribute to delayed identification and inadequate support for students with ADHD (Bekle, 2004; Flanigan & Climie, 2018).

Teachers' attitudes toward students with ADHD were found to vary considerably, ranging from empathetic and supportive to hesitant and ambivalent. These variations appear to be closely associated with teachers' levels of knowledge, prior experience, and confidence in managing ADHD-related behaviors (DuPaul & Stoner, 2014; Kos et al., 2004). Teachers who demonstrated a stronger understanding of ADHD tended to interpret students' inattention, hyperactivity, and impulsivity as manifestations of a neurodevelopmental condition that requires appropriate support and instructional adjustment, rather than as intentional misbehavior. In contrast, teachers with more limited knowledge often expressed frustration, uncertainty, and concern about potential classroom disruption, which influenced more negative or ambivalent attitudes toward students with ADHD (Bolinger et al., 2020; Ohan et al., 2008). This finding is consistent with research indicating that insufficient knowledge of ADHD can contribute to negative labeling, reduced empathy, and less supportive teacher–student interactions, ultimately affecting students' academic engagement and emotional well-being (Metzger & Hamilton, 2021; Poznanski et al., 2021).

Teachers' attitudes toward students with ADHD were found to vary widely, ranging from empathetic and supportive to hesitant and ambivalent. These variations appear closely linked

to teachers' levels of knowledge and confidence. Teachers who demonstrated greater understanding tended to interpret ADHD-related behaviors as challenges requiring support, whereas those with limited knowledge were more likely to express frustration or concern about classroom disruption. This finding supports existing literature indicating that insufficient knowledge of ADHD can negatively influence teachers' attitudes, leading to negative labeling and reduced empathy toward affected students (Anderson et al., 2017; Ary, 2019; Vukelić & Vlah, 2024).

In terms of classroom responses, the study highlights significant inconsistency in how teachers manage ADHD-related behaviors. While some teachers employed basic strategies such as seating adjustments or increased supervision, these approaches were often informal and based on personal experience rather than structured guidance. Other teachers reported uncertainty and avoidance, reflecting a lack of confidence in their ability to provide appropriate support. The absence of formal training and clear institutional guidelines appears to play a central role in shaping these inconsistent practices, reinforcing the need for systemic support at the school level (Braude & Dwarika, 2020; Fabiano & Pyle, 2019).

The findings also underscore the influence of broader systemic and cultural factors within the Indonesian educational context. Limited access to school-based mental health professionals, high classroom demands, and persistent misconceptions about ADHD may further constrain teachers' ability to respond effectively (Hapsari et al., 2020). In such contexts, ADHD-related behaviors may be misinterpreted as disciplinary or parenting issues, rather than understood as manifestations of a neurodevelopmental condition requiring specialized support.

Overall, this study highlights a critical mismatch between teachers' recognition of ADHD-related behaviors and their ability to provide appropriate responses. Without adequate knowledge, training, and institutional support, teachers may struggle to translate awareness into effective practice. Addressing these gaps is essential for fostering inclusive educational environments and ensuring that students with ADHD receive timely and appropriate support.

Implications

The findings of this study highlight important implications for educational practice and student well-being. Inconsistent understanding of ADHD among teachers affects multiple aspects of support for students with ADHD, including early identification, classroom management, and inclusive educational practices. When teachers lack a comprehensive understanding of ADHD, behavioral signs may be recognized without being accurately interpreted, potentially delaying appropriate assessment and intervention.

In the classroom, limited knowledge and uncertainty contribute to inconsistent management strategies. Without clear guidance and evidence-based approaches, teachers may rely on trial-and-error methods or avoid proactive intervention altogether. This inconsistency can disrupt learning processes not only for students with ADHD but also for their peers and may reinforce negative perceptions of ADHD-related behaviors within the classroom environment.

Furthermore, unmet educational and emotional needs may have long-term consequences for students with ADHD. Inadequate support can hinder academic progress, increase frustration, and negatively affect students' emotional well-being and self-esteem. From an inclusive education perspective, these findings underscore the need for systematic teacher training, access to professional support, and the development of school policies that promote

understanding, appropriate intervention, and meaningful inclusion of students with ADHD in Indonesian schools.

Recommendations

Based on the findings of this study, several recommendations are proposed to improve support for students with ADHD in school settings. First, comprehensive teacher training programs on ADHD are needed to enhance teachers' understanding of the condition and to equip them with effective behavior management and instructional strategies. Such training should emphasize evidence-based practices and practical classroom applications.

Second, schools should establish clear policies and procedures for early identification and referral of students who display ADHD-related behaviors. Clear referral pathways can help teachers take appropriate and timely action, reducing delays in assessment and intervention. These policies should be communicated clearly to all school staff to ensure consistency in practice.

Third, collaboration between teachers, school psychologists, and special education staff should be strengthened. Multidisciplinary collaboration can provide teachers with professional guidance, ongoing support, and opportunities to develop individualized strategies tailored to students' specific needs. This approach may also reduce teachers' uncertainty and increase confidence in managing ADHD-related behaviors.

Finally, the development and implementation of supportive classroom strategies are essential for promoting inclusive learning environments. Strategies such as structured routines, task modification, positive behavior reinforcement, and flexible seating arrangements can help address the learning and emotional needs of students with ADHD. Together, these recommendations highlight the importance of systemic efforts to support teachers and foster positive educational outcomes for students with ADHD.

Conclusions

This study explored school teachers' knowledge, attitudes, and classroom responses toward students with attention deficit hyperactivity disorder (ADHD) within the Indonesian educational context. The findings indicate that while teachers are generally able to recognize observable ADHD-related behaviors, their understanding of ADHD often remains limited to surface-level knowledge. Gaps in knowledge regarding evidence-based interventions, referral pathways, and classroom strategies were evident and influenced both teachers' attitudes and practices.

Teachers' attitudes toward students with ADHD varied, ranging from empathetic and supportive to hesitant and uncertain. These attitudes were closely linked to teachers' levels of understanding and confidence in managing ADHD-related behaviors. Limited knowledge and lack of training contributed to inconsistent classroom responses, with many teachers relying on informal strategies or delaying intervention due to uncertainty.

Overall, the study highlights a mismatch between teachers' recognition of ADHD symptoms and their ability to provide appropriate support. Addressing this gap requires comprehensive teacher training, clear school policies, and collaborative support systems. Strengthening teachers' capacity to understand and respond to ADHD is essential for fostering inclusive

learning environments and supporting the academic and emotional well-being of students with ADHD.

Parental Understanding and Early Detection of ADHD: A Qualitative Exploration in Indonesia

Kahfi Hizbullah, Universitas Negeri Jakarta, Indonesia
Iriani Indri Hapsari, Universitas Negeri Jakarta, Indonesia
Dewinta Ariani, Universitas Negeri Jakarta, Indonesia

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Misunderstanding and stigma around children's behavioral challenges often lead to delayed recognition of neurodevelopmental disorders such as attention-deficit/hyperactivity disorder (ADHD) in Indonesia. Children with ADHD are frequently labeled as disruptive or disobedient, when in fact they require specific support to manage inattention, impulsivity, and hyperactivity. Early detection plays a crucial role in minimizing the long-term impact on their emotional and social development. However, parental awareness of ADHD remains low. This qualitative study explores parents' knowledge and ability to recognize early signs of ADHD. Using semi-structured interviews with 35 parents, results revealed that most participants had very limited or no prior understanding of the condition. Many parents were unfamiliar with the term ADHD itself, and those who had heard of it often held inaccurate beliefs, viewing the behavior as a result of poor discipline or parenting. As a result, early symptoms were frequently dismissed or misunderstood, leading to delays in seeking appropriate professional help. This lack of awareness contributes to missed opportunities for early intervention and can negatively affect the child's mental health. The study emphasizes the urgent need for targeted psychoeducation for parents to promote early identification and more effective support for children with ADHD.

Introduction

Attention Deficit Hyperactivity Disorder (ADHD) is one of the most common neurodevelopmental disorders in childhood, characterized by persistent patterns of inattention, hyperactivity, and impulsivity that are inconsistent with the child's developmental level (American Psychiatric Association [APA], 2022). This disorder not only affects academic functioning but also has significant long-term implications for social functioning, emotional regulation, and the development of self-concept (Barkley, 2015; Willcutt, 2012). Therefore, an accurate understanding of ADHD is a critical prerequisite for effective early detection and intervention efforts. Globally, the prevalence of ADHD in children is estimated to range between 5% and 7%, with considerable variation influenced by diagnostic criteria, cultural context, and access to mental health services (Faraone et al., 2021; Polanczyk et al., 2015). However, numerous studies emphasize that reported prevalence rates are often lower than the actual condition due to widespread underdiagnosis, particularly in low- and middle-income countries (Mulraney et al., 2023). This phenomenon indicates that a substantial number of children with ADHD remain unidentified and do not receive appropriate support.

In the Indonesian context, national epidemiological data on ADHD remain limited. Nevertheless, several local studies have indicated a relatively high prevalence of ADHD symptoms among preschool and school-aged children (Nasri et al., 2025). Limitations in systematic screening, shortages of child mental health professionals, and low levels of mental health literacy among the general population have been identified as key factors contributing to delayed ADHD detection in Indonesia (Maulinda & Lubis, 2024). One of the most significant challenges in early ADHD detection is parental and environmental misunderstanding of children's behavioral difficulties. Children with ADHD are frequently perceived as "naughty," "undisciplined," or "poorly raised," rather than being recognized as individuals with specific developmental needs (Hinshaw et al., 2022). Such perceptions result in ADHD-related behaviors being framed as moral or disciplinary problems rather than as manifestations of a neurobiological condition that requires professional intervention.

Research conducted in Indonesia consistently shows that parental knowledge of ADHD characteristics remains at a low to moderate level. Many parents struggle to distinguish between developmentally typical active behavior and pathological symptoms of inattention and impulsivity (Qonitatun & Putri, 2024). This lack of understanding often leads parents to delay seeking professional consultation and to rely on inappropriate disciplinary strategies, such as verbal or physical punishment, which may exacerbate children's emotional difficulties (Mulraney et al., 2023).

These misunderstandings are further reinforced by persistent social stigma surrounding mental health and developmental disorders in children. Stigma related to ADHD commonly manifests through negative stereotypes, social labeling, and the attribution of blame to parents (Yusnia & Kurniadewi, 2025). Consequently, children with ADHD face increased risks of social rejection, bullying, and exclusion within school and community environments, which directly undermines their psychological well-being. From a parental perspective, stigma generates substantial psychological burdens, including feelings of guilt, shame, and fear of negative social labeling directed at their children (Schoeman & Voges, 2022). Qualitative studies have revealed that many parents postpone or avoid diagnostic processes due to concerns that their child may be stigmatized or treated differently by schools and the broader community (Sayal et al., 2018).

This combination of stigma and limited parental understanding directly contributes to delays in early ADHD detection. In contrast, extensive evidence highlights that early identification and intervention play a crucial role in reducing the long-term adverse effects of ADHD on children's emotional, social, and academic development (Sonuga-Barke et al., 2013). Children who receive early intervention tend to demonstrate better self-regulation skills and more adaptive social functioning. Early detection of ADHD extends beyond the clinical diagnostic process and involves parents' ability to recognize early warning signs and engage in appropriate help-seeking behaviors. The literature consistently indicates that parental understanding is a key predictor of decisions to access child mental health services (Mulraney et al., 2023). Thus, parents play a central role in the early detection pathway for ADHD.

Cultural context also shapes how parents interpret children's behavior and developmental challenges. In collectivistic societies such as Indonesia, children's behavior is often evaluated based on social conformity and obedience to group norms. As a result, impulsive or inattentive behaviors are more likely to be perceived as behavioral deviance rather than as manifestations of a neurodevelopmental condition (Chairil, 2022). This underscores the importance of culturally sensitive approaches in understanding parental experiences related to ADHD.

Numerous studies emphasize the need for family- and community-based psychoeducational approaches to enhance ADHD literacy and reduce stigma (Nasri et al., 2025). Educational programs that involve parents, teachers, and healthcare professionals have been shown to improve early detection capacities and promote more adaptive and supportive parenting practices for children with ADHD (Mulraney et al., 2023). Despite these findings, research that specifically explores Indonesian parents' understanding of ADHD and their experiences with early detection remains limited, particularly from a qualitative perspective. Most existing studies focus on quantitative assessments or symptom prevalence, with limited attention to parents' subjective meanings and psychosocial dynamics (Maulinda & Lubis, 2024).

Therefore, this study aims to explore in depth Indonesian parents' understanding of ADHD and their experiences related to the early detection process. By employing a qualitative approach, this research seeks to contribute both theoretically and practically to the development of educational strategies, policies, and early detection services for ADHD that are culturally sensitive, contextually relevant, and family centered.

Methodology

Research Design

This study employed a qualitative exploratory design to gain an in-depth understanding of parental perceptions, interpretations, and experiences related to Attention Deficit Hyperactivity Disorder (ADHD) and early detection within the Indonesian context. A qualitative approach was considered appropriate given the study's aim to explore subjective meanings, social constructions, and contextual factors surrounding parental understanding and stigma, which cannot be adequately captured through quantitative methods alone (Creswell & Poth, 2018). Exploratory qualitative research is particularly suitable in areas where empirical evidence is still limited and where cultural nuances play a significant role in shaping experiences and beliefs (Braun & Clarke, 2021).

Participants

Participants consisted of 35 parents, recruited using purposive sampling to ensure relevance to the research objectives. The sample included parents who have children formally diagnosed with ADHD, as well as parents who have had direct interaction with children exhibiting ADHD-related behaviors in familial, educational, or community settings. Such variation is essential in qualitative research to enhance the richness and depth of the data and to allow for a more comprehensive understanding of the phenomenon under study.

Data Collection

Data were collected through semi-structured individual interviews and Focus Group Discussions (FGDs). Semi-structured interviews allowed participants to express their personal experiences, beliefs, and emotional responses regarding children's behavioral challenges and ADHD detection, while still providing sufficient flexibility for probing and clarification (Creswell & Poth, 2018). FGDs were conducted to explore shared meanings, social norms, and collective perceptions related to ADHD, stigma, and parental responsibility within the community context (Krueger & Casey, 2015). The combination of individual and group data collection methods enabled methodological triangulation and strengthened the credibility of the findings (Flick, 2018).

Data Analysis

Data analysis was conducted using thematic analysis, this method was selected due to its flexibility and suitability for identifying, analyzing, and reporting patterns of meaning across qualitative datasets. A reflexive approach was adopted throughout the analytic process to ensure that interpretations remained grounded in participants' narratives while acknowledging the researchers' positionality (Braun & Clarke, 2021). This approach allowed for a nuanced understanding of how parental knowledge, stigma, and cultural beliefs intersect in shaping early detection of ADHD.

Result

Thematic analysis of data obtained from semi-structured interviews and Focus Group Discussions (FGDs) revealed several recurring patterns related to parental understanding, interpretation, and responses toward ADHD and its early symptoms. Overall, the findings indicate a substantial lack of awareness and pervasive misconceptions among parents, which significantly influenced help-seeking behaviors and early detection processes.

Limited Awareness and Lack of Familiarity With ADHD

Most participants reported having very limited or no prior knowledge of Attention Deficit Hyperactivity Disorder. During both individual interviews and FGDs, many parents explicitly stated that they were unfamiliar with the term *ADHD* before encountering children who exhibited persistent behavioral difficulties. Even among participants who had heard the term, understanding of ADHD was often superficial and fragmented. ADHD was commonly perceived as a "*foreign*" or "*medical*" label that felt distant from everyday parenting experiences. This limited awareness was consistently expressed across participants with different backgrounds, suggesting that ADHD knowledge remains largely inaccessible at the community level.

Misinterpretation of ADHD-Related Behaviors

A prominent theme emerging from the data was the misinterpretation of ADHD symptoms as behavioral or moral problems**.** Parents frequently described inattention, impulsivity, and hyperactivity as signs of poor discipline, lack of parental control, or intentional misbehavior. In FGDs, these views were often reinforced collectively, as participants shared similar beliefs that children should be able to regulate their behavior if adequately guided or disciplined. As a result, ADHD-related behaviors were framed as parenting failures rather than indicators of a neurodevelopmental condition requiring professional attention.

Normalization and Dismissal of Early Symptoms

The analysis further revealed that early symptoms of ADHD were commonly normalized or dismissed by parents. Many participants described perceiving excessive activity, distractibility, or impulsivity as typical childhood behavior that would naturally diminish with age. In both interviews and FGDs, parents expressed beliefs that children would "*grow out of it*," particularly during early childhood. This normalization process contributed to a delay in recognizing the persistence and functional impact of the symptoms, reducing the likelihood of early professional consultation.

Delayed Help-Seeking and Missed Early Intervention

Due to limited understanding and persistent misconceptions, parents often delayed seeking professional help. Participants reported relying on informal strategies such as stricter discipline, increased supervision, or advice from family members before considering consultation with mental health professionals. In FGDs, several parents acknowledged that professional help was usually sought only after behavioral problems began to significantly disrupt academic performance or social relationships. This pattern reflects a missed window for early intervention, which participants retrospectively recognized as potentially detrimental to the child's emotional well-being.

Perceived Impact on Children's Mental and Emotional Well-being

Parents who had prolonged exposure to children with untreated ADHD symptoms described observable negative effects on the child's mental health, including increased emotional dysregulation, frustration, low self-confidence, and social difficulties. Although these impacts were often recognized later, participants reflected that earlier understanding and intervention might have mitigated these outcomes. These reflections emerged strongly during FGDs, where shared experiences allowed parents to collectively acknowledge the long-term consequences of delayed recognition.

Overall, the results demonstrate that limited parental understanding, pervasive misconceptions, and delayed help-seeking behaviors form an interconnected pattern that hinders early detection of ADHD. Thematic analysis highlights how these factors operate both at the individual and social levels, underscoring the critical role of parental awareness in facilitating timely identification and intervention for children with ADHD.

Discussion

The findings of this study indicate that parental awareness of Attention Deficit Hyperactivity Disorder (ADHD) remains notably limited, particularly at the community level. Most participants reported minimal familiarity with ADHD prior to encountering persistent behavioral challenges in children. This finding is consistent with previous studies showing that parental knowledge of ADHD is generally low, especially outside clinical settings, which significantly hampers early identification and intervention efforts (Rajcumar & Paruk, 2020). Limited awareness has been repeatedly identified as a primary barrier preventing parents from recognizing ADHD as a neurodevelopmental condition rather than a behavioral issue (Fan et al., 2022). The lack of familiarity with ADHD terminology further reinforces misconceptions surrounding the disorder. In this study, many parents described ADHD as a "medical" or "foreign" concept that felt disconnected from daily parenting experiences. Such perceptions contribute to delayed recognition, as parents may not associate early behavioral signs with a diagnosable condition requiring professional assessment (Sayal et al., 2010).

Misinterpretation of ADHD-related behaviors emerged as a dominant theme in both interviews and FGDs. Parents frequently framed symptoms such as inattention, impulsivity, and hyperactivity as manifestations of poor discipline or inadequate parenting. This pattern has been widely reported in previous research, which shows that parents often attribute ADHD symptoms to moral or behavioral failings rather than neurodevelopmental differences (Barkley, 2015). These misconceptions are particularly persistent in contexts where mental health literacy is limited and behavioral conformity is highly valued (Hinshaw et al., 2021). Normalization and dismissal of early ADHD symptoms were also prominent across participants. Many parents perceived excessive activity or distractibility as developmentally typical and believed that children would naturally "outgrow" these behaviors. This belief has been documented in previous research as a significant factor contributing to delayed diagnosis, particularly during early childhood (Theule, et al., 2013). The tendency to normalize symptoms reduces the perceived urgency to seek professional evaluation, thereby narrowing the window for early intervention.

Delayed help-seeking emerged as a direct consequence of limited awareness and persistent misconceptions. Parents in this study often relied on informal strategies, including stricter discipline or advice from family members, before considering professional consultation. Similar help-seeking trajectories have been identified in prior studies, which show that parents typically seek clinical services only after behavioral difficulties begin to interfere with academic performance or peer relationships (Sayal et al., 2018). This delay reflects a missed opportunity for early intervention, which is critical for improving long-term outcomes in children with ADHD (Faraone et al., 2021).

Parents' reflections on the emotional and psychological impact of untreated ADHD symptoms further underscore the consequences of delayed recognition. Participants described increased emotional dysregulation, frustration, low self-esteem, and social difficulties in children who did not receive early support. These observations align with longitudinal research demonstrating that delayed identification of ADHD is associated with heightened risks of emotional and social problems (Thomas et al., 2015). Early intervention has been shown to significantly reduce these secondary difficulties and promote more adaptive developmental trajectories (Sonuga-Barke et al., 2013). Stigma emerged as a cross-cutting factor influencing parental perceptions and behaviors. Parents expressed concerns about labeling, social judgment, and negative stereotypes associated with ADHD. Previous studies have similarly

documented that stigma surrounding ADHD discourages parents from pursuing diagnosis and treatment, particularly in societies where mental health conditions are associated with shame or parental failure (Hinshaw et al., 2021). This stigma not only delays help-seeking but also exacerbates parental stress and emotional burden (Mueller et al., 2012).

Taken together, the findings of this study support existing evidence that limited parental understanding, behavioral misinterpretation, symptom normalization, and stigma operate in an interconnected manner to hinder early detection of ADHD. These results highlight the critical need for culturally sensitive, parent-focused psychoeducational initiatives aimed at improving ADHD literacy and reducing stigma at the community level. Prior intervention studies have demonstrated that increasing parental knowledge significantly enhances early recognition and engagement with mental health services (Fan et al., 2022). Therefore, strengthening parental awareness should be considered a central component of early detection strategies for ADHD in Indonesia.

Conclusion

This study highlights the critical role of parental understanding in the early detection of Attention Deficit Hyperactivity Disorder (ADHD) within the Indonesian context. The findings demonstrate that misunderstandings and stigma surrounding children's behavioral challenges remain pervasive, contributing to delayed recognition of ADHD symptoms. Most parents in this study possessed limited or no prior knowledge of ADHD, and those who were somewhat familiar with the term often held inaccurate beliefs, interpreting ADHD-related behaviors as consequences of poor discipline or ineffective parenting. Such misconceptions led to the normalization and dismissal of early symptoms, resulting in delays in seeking professional assistance and missed opportunities for early intervention. These delays have important implications for children's emotional, social, and psychological well-being, as untreated ADHD symptoms may escalate and contribute to secondary difficulties over time. The findings underscore that parental awareness is a crucial entry point in the pathway toward timely identification and intervention.

Overall, this study emphasizes the urgent need for targeted, culturally sensitive psychoeducational initiatives aimed at improving parental literacy regarding ADHD. Strengthening parents' ability to recognize early signs and understand ADHD as a neurodevelopmental condition is essential for reducing stigma, promoting timely help-seeking, and ensuring more effective support for children with ADHD. Such efforts are vital to improving developmental outcomes and enhancing the overall well-being of children and families in Indonesia.

Marco Arrigo, National Research Council of Italy, Italy
Giuseppe Chiazzese, National Research Council of Italy, Italy

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

The PBIS-RISE Generator introduces a novel application of Generative Artificial Intelligence (Gen-AI) in the domain of behavioral education, specifically within the Positive Behavioral Interventions and Supports (PBIS) framework. While PBIS promotes the development of locally adapted behavioral expectation matrices to foster prosocial conduct, a persistent challenge lies in evaluating students' comprehension of these expectations in a standardized yet context-sensitive manner. PBIS-RISE addresses this need by employing a GPT-based model, trained and prompted on PBIS theory, validated behavior matrices, and existing school climate assessments to generate customized questionnaires. These instruments reflect each school's cultural norms and educational goals while preserving fidelity to the PBIS framework. The generator creates items across six core dimensions: Behavioral Comprehension, Modeling, Generalization, Value Association, Emotional Association, and Meta-Emotional Reflection, thereby aligning with both the cognitive and affective domains of social behavior education. The RISE acronym: Reflecting on Interactions, Standards, and Expectations, captures the tool's reflective and student-centered design. For educators and school psychologists, PBIS-RISE supports data-driven decision-making, enabling scalable yet individualized behavioral assessments that inform tiered interventions. For teachers, it reduces the burden of developing evaluation tools and enhances consistency in behavior-related assessments. As educational research increasingly explores the integration of AI in formative assessment, PBIS-RISE offers a replicable, theory-grounded, and ethically aligned model to support equitable behavioral education in diverse school settings.

Keywords: Positive Behavioral Interventions and Supports (PBIS), generative AI, GPT, questionnaire generation, social-emotional learning

Introduction

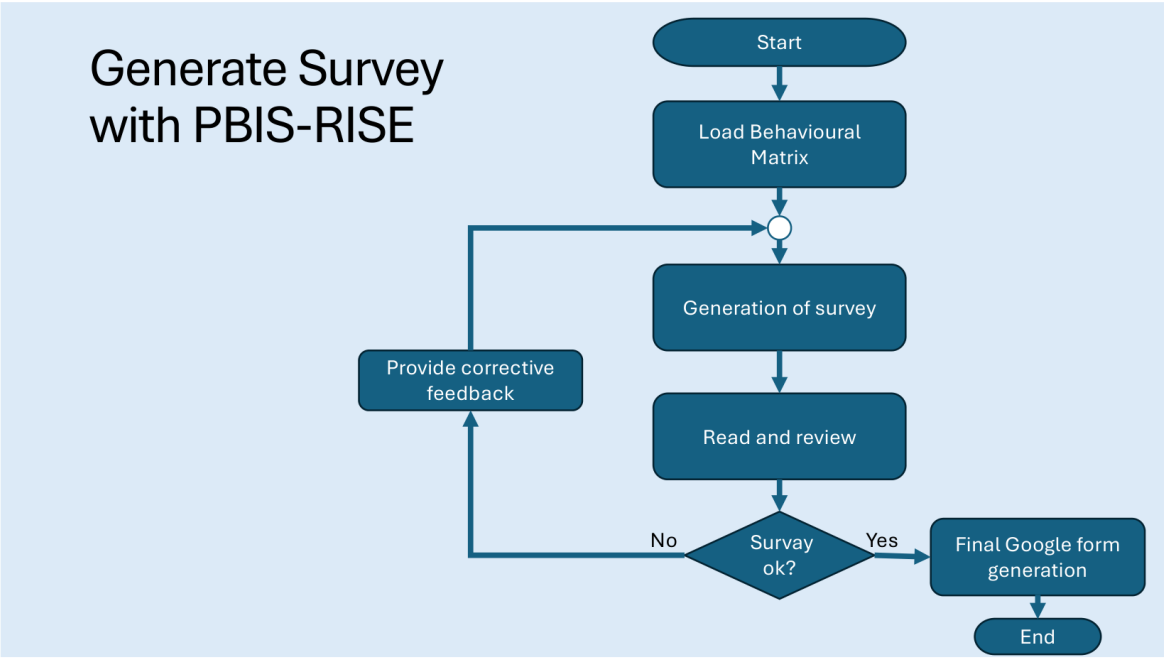
Positive Behavioral Interventions and Supports (PBIS) is a multi-tiered, evidence-based framework for improving social, emotional, and academic outcomes through explicit teaching, practice, and reinforcement of prosocial behavior across school settings. In PBIS, behavior is treated as teachable, predictable, and responsive to environmental conditions. The framework has developed as an alternative to reactive, exclusionary discipline approaches by emphasizing prevention, instructional routines, and ongoing use of data to guide decisions. Reviews of the evidence base describe PBIS as grounded in behavioral science and implemented through systems-level practices, including common expectations, consistent acknowledgments, and data-based problem solving (Horner et al., 2010).

Within PBIS, the expectations matrix is a central artifact that translates broad school values (for example, Respect, Responsibility, Safety) into observable and teachable behaviors for specific contexts such as classrooms, hallways, cafeterias, playgrounds, laboratories, buses, and online learning environments. The matrix is local by design: schools adapt language, examples, and emphasis to reflect community norms, developmental levels, and contextual realities. Lane and colleagues describe expectation matrices as setting-specific descriptions of behavior that support consistency across staff and clarity for students, while still aligning with the core logic of schoolwide PBIS (Lane et al., 2019). Royer et al. (2021) further illustrate how the Schoolwide Expectations Survey for Specific Settings can inform the content and structure of matrices by eliciting staff perspectives about expectations in particular locations and routines.

A persistent challenge, however, lies in evaluating whether students actually understand the expectations as intended. Many schools rely on indirect indicators (such as office discipline referrals, classroom disruptions, or teacher reports), but these indicators are typically lagging and can confound understanding with performance, opportunity, or context. Behavioral assessment literature emphasizes that measures should match their purpose, be sensitive to instructional change, and be interpretable for decision-making (Chafouleas et al., 2012). When the purpose is to guide reteaching, schools need feasible, instructionally aligned comprehension checks that can be administered frequently, quickly scored, and clearly mapped back to matrix content.

This problem creates a tension between contextualization and standardization. On one hand, the value of PBIS matrices is their cultural coherence: the behaviors are meaningful because they are situated in local settings and expressed in the language used by staff and students. On the other hand, without a stable assessment structure it becomes difficult to compare results across classes, track changes over time, or aggregate information for PBIS team decision-making. The need for scalable yet locally grounded assessment is particularly visible in international and multilingual contexts, where direct adoption of standardized instruments may be inappropriate or may weaken local ownership of expectations.

PBIS-RISE addresses this tension by using generative artificial intelligence as a scaffolding engine for assessment design. Recent work on AI in education suggests that generative models can support personalization, item drafting, and formative assessment design, but also highlights risks such as biased outputs, low transparency, and validity threats when items are generated without constraint or expert review (Arslan et al., 2024; Luckin, 2018). PBIS-RISE adopts a constrained-generation approach: the school's own matrix is treated as the authoritative content



source, while the generator applies a stable theoretical blueprint to produce questionnaires that are locally instanced but structurally comparable.

The key idea of PBIS-RISE (Reflecting on Interactions, Standards, and Expectations) is that student understanding of expectations includes both cognitive and affective components. Students must comprehend what the expectation means, recognize modeled examples, generalize the expectation to novel situations, and connect expected behaviors to underlying values and emotional experiences. This view is consistent with social and emotional learning perspectives that emphasize the integration of cognition, emotion, and values in developing prosocial conduct (Zins et al., 2004).

PBIS-RISE is a revised and amplified version of a prior measurement tool, the PBIS-KBVE questionnaire (Knowledge of Behaviors, Values and Emotions) presented by Chifari et al. (2025). PBIS-KBVE operationalized student learning outcomes through four dimensions: Behavioral Comprehension (BC), Behavioral Generalization (BG), Behavioral Values (BV), and Emotions (E). PBIS-RISE expands this model to six dimensions by adding Behavioral Modeling (BM) and Meta-Emotional Reflection (ME), thereby more directly capturing the instructional mechanisms of PBIS (modeling and practice) and students' reflective awareness of emotional and motivational processes during social interaction.

The purposes of this paper are threefold. First, we describe the theoretical and methodological foundations of PBIS-RISE as an assessment approach aligned with PBIS and integrated three-tiered prevention models (Lane et al., 2015). Second, we present the PBIS-RISE Generator as a practical tool for teachers and school teams that reduces the burden of questionnaire design while preserving local cultural coherence. Third, we describe the generator's workflow, including quality assurance steps and teacher review, using the tool's process flowchart as shown in Figure 1.

Figure 1
PBIS-RISE Generator Workflow

Literature Review and Related Work

The development of PBIS is best understood within the broader evolution of school discipline practices. Historical accounts describe a shift from punitive and exclusionary approaches toward preventive, instructional, and systems-oriented models. In this trajectory, discipline is reframed from "consequence delivery" to "behavior instruction and environmental design," with a focus on equity, predictability, and skill building. The article "The Evolution of Discipline Practices: School-Wide Positive Behavior Supports" situates PBIS within this movement and emphasizes the importance of schoolwide systems that create consistent social expectations and reinforcement across settings (Sugai & Horner, 2002).

PBIS is commonly operationalized as a multi-tiered system of supports. Tier 1 provides universal prevention for all students by teaching and reinforcing common expectations and creating predictable environments. Tier 2 delivers targeted interventions for students at risk, often through small-group supports, check-in/check-out, or targeted social skills instruction. Tier 3 provides intensive individualized supports based on functional assessment and comprehensive planning. Lane and colleagues argue that comprehensive prevention models require coherence across tiers, including screening, progress monitoring, and systems to connect data to instructional action (Lane et al., 2015). This view is relevant to PBIS-RISE because a feasible comprehension measure can function as both a Tier 1 instructional check and a Tier 2/Tier 3 data point to clarify whether difficulties reflect skill deficits, performance deficits, or contextual barriers.

Expectation matrices are core PBIS tools because they make social behavior teachable and observable. Lane et al. (2019) describe how expectation matrices can be derived from staff input using the Schoolwide Expectations Survey for Specific Settings, producing setting-specific behavior statements that are relevant and "doable." Royer et al. (2021) provide descriptive properties of this survey approach and demonstrate how staff expectations differ across settings, underscoring the importance of context-specific behaviors. Earlier work by Lane et al. (2004) similarly identified social skills and behavioral expectations that teachers consider necessary for student success in elementary school, supporting the premise that expectations can be systematically articulated and assessed.

Research also highlights that PBIS implementation is context dependent. In high schools, for example, schools face challenges such as complex schedules, diverse staff roles, and adolescent developmental needs. Flannery and colleagues report early lessons from high school PBIS implementation, emphasizing the need for strong leadership, consistent systems, and feasible routines that staff can maintain (Flannery et al., 2009). In alternative education settings, systematic reviews indicate variability in Tier 1 PBIS implementation and call for tools that support fidelity and feasible data collection (Grasley-Boy et al., 2020). These findings suggest that tools like PBIS-RISE should be designed to be low burden and adaptable across diverse school structures.

Teacher outcomes are a central concern because PBIS relies on consistent adult practice. Houchens et al. (2017) examined how PBIS implementation relates to teachers' perceptions of teaching conditions and efficacy, highlighting the practical importance of tools that support teachers rather than adding workload. Similarly, contemporary PBIS scholarship emphasizes equity and inclusion, including the involvement of students with complex support needs. Zagona et al. (2024) discuss educators' perceptions of including students with complex support

needs in PBIS and the role of equity-oriented capacity building, implying that assessment tools should be accessible, flexible, and sensitive to diverse learners.

In the behavioral assessment literature, Chafouleas et al. (2012) emphasize that school-based behavioral assessment should be purposeful, technically adequate, and instructionally useful. When the target is a teachable routine (such as a matrix behavior), assessment can be designed as a curriculum-based check that informs reteaching. However, creating such tools requires time and measurement expertise. Generative AI offers potential assistance with item drafting and personalization. Luckin (2018) argues that AI can expand human intelligence in education when used to augment professional decision-making rather than automate it. Arslan et al. (2024) review opportunities and challenges for using generative AI to personalize educational assessment, highlighting the promise of tailored assessment along with the need for safeguards and human oversight. PBIS-RISE is positioned within this emerging space: it is an AI-assisted assessment generator designed around strong constraints and teacher review.

From PBIS-KBVE to PBIS-RISE: Expanded Measurement Model

PBIS-RISE builds on the PBIS-KBVE questionnaire, a tool designed to assess students' learning outcomes from PBIS lessons by measuring not only rule knowledge but also value and emotional associations. As described in Chifari et al. (2025) the PBIS-KBVE questionnaire addresses to students approximately 7 to 12 years old, composed of 36 items distributed across four subscales. Behavioral Comprehension (BC) measures whether students can identify which behavior corresponds to an expectation within a given setting. Behavioral Generalization (BG) measures whether students can extend expected behaviors to situations that are similar but not identical to those taught. Behavioral Values (BV) measures whether students can connect behaviors to the intended value (for example, "keeping the classroom tidy" linked to responsibility). Emotions (E) measures which emotions students associate with performing learned behaviors (for example, pride, happiness, anxiety), reflecting the idea that emotional experience can reinforce or interfere with behavioral learning.

PBIS-RISE retains the central insight that behavioral learning in PBIS is both cognitive and affective, and that student understanding can be decomposed into interpretable dimensions. At the same time, PBIS-RISE extends the construct map to better capture instructional mechanisms that PBIS relies on and to support reflective, student-centered assessment. Specifically, PBIS-RISE adds two dimensions: Behavioral Modeling (BM) and Meta-Emotional Reflection (ME). Behavioral Modeling focuses on recognition and selection of appropriate modeled behavior. It asks students to identify which of several described actions best demonstrates an expectation, or to choose how they would model the expectation for a peer. Meta-Emotional Reflection prompts students to reflect on how emotions influence their choices, how they might regulate emotions to meet expectations, and how they interpret others' emotional cues in social situations. In PBIS terms, BM directly aligns with modeling and practice routines used in teaching expectations, while ME aligns with the reflective dialogue often used to deepen internalization of values and prosocial identities.

The inclusion of BM is motivated by the observation that PBIS instruction frequently uses modeling, role play, and feedback, especially when teaching setting-specific expectations to younger students and when supporting learners who benefit from concrete exemplars. Yet many classroom comprehension checks focus on declarative knowledge (naming an expectation) rather than recognition of modeled examples (identifying what the expectation looks like in action). BM items provide a bridge between knowing and doing: they can reveal

whether students can discriminate between correct and incorrect examples that are plausible in real contexts. This dimension is particularly relevant in settings where misinterpretations are common, such as hallways, cafeterias, and digital communication, where small differences in behavior can matter.

The ME dimension is motivated by the role of affect in behavioral performance and by the growing emphasis on integrating PBIS with social-emotional learning. Emotional association (E) in PBIS-KBVE captured the emotions linked to behaviors, but it did not explicitly assess reflective awareness of emotional processes. ME seeks to assess whether students can anticipate emotional triggers, recognize when emotions might lead them away from expected behaviors, and select strategies to stay aligned with expectations. This dimension supports a preventive stance: if a student can articulate that anger makes it hard to "use respectful words" and can identify a coping strategy, the school can teach and reinforce that strategy as part of Tier 1 lessons or targeted supports.

PBIS-RISE is intended as a formative assessment model rather than a finalized standardized test. Because the generator produces school-specific items from local matrices, validation should focus on construct representation, response processes, and the interpretability of dimension-level results rather than on a fixed item set. This orientation aligns with comprehensive tiered prevention models that connect assessment to action. For example, if a class shows high BC but low BG for "responsibility in the cafeteria," the team can reteach generalization strategies and provide additional practice in that setting. If results indicate low BV, the school can strengthen the explicit teaching of "why" expectations matter and connect behaviors to the school's shared values. In this way, PBIS-RISE supports instructionally meaningful inferences that can inform reteaching at Tier 1 and targeted supports at higher tiers (Lane et al., 2015; McIntosh & Goodman, 2016).

The PBIS-RISE Generator: Tool Overview and Design Principles

The PBIS-RISE Generator was engineered through an iterative "GPT Builder" design process in which the target users' instructional requirements were progressively translated into a stable set of generation rules and prompt constraints. In this configuration, the tool takes as its primary input a school's Behavioral Expectations Matrix, structured with settings in rows (e.g., Classroom, Hallway, Bathroom, Playground, Gym) and values in columns (e.g., Respect, Responsibility, Safety), with each cell listing one or more observable expectations. The generator performs a semantic-structural extraction of all expectations and then deduplicates repeated behaviors that appear across multiple matrix cells, ensuring that the final instrument contains one and only one section per distinct expectation. Each section is explicitly labeled in the format "RULE: <behavioral expectation>", thus preserving traceability between questionnaire items and the school-defined matrix language while keeping the output consistent and scalable across schools.

At the item-design level, PBIS-RISE implements a fixed, theory-aligned template that produces six question types per rule, balancing cognitive understanding with behavioral enactment and affective reflection. The first four questions are multiple-choice and intentionally include a social desirability alternative to distinguish genuine knowledge from normatively "good-sounding" responding: (1) Behavioral Knowledge ("What does … mean?"), (2) Behavioral Modeling ("What should you do to … at school?"), (3) Generalization (transfer beyond school), and (4) Value Linkage, where one option correctly matches a matrix value, one is socially desirable, and one represents a counter-value/disvalue that minimizes

responsibility and impact on others. The final two questions capture emotional processes through a 4-point Likert intensity scale across nine emotions (e.g., joy, fear, sadness, anger, pride, calmness): (5) emotions when performing the expected behavior, and (6) emotions when noticing others do not perform it—explicitly intended to probe empathic awareness, internal conflict, and indirect internalization of the rule (a component that conceptually anticipates meta-emotional reflection). Across all outputs, PBIS-RISE enforces clear, simple English suitable for both primary and lower-secondary students, and it is constrained to generate expectation-specific items (no placeholders), automatically rephrasing matrix wording into child-friendly language when needed.

Questionnaire Generation Workflow

The PBIS-RISE Generator follows a structured workflow that operationalizes a "stable blueprint, local instantiation" approach. The process is implemented as a sequence of conversational steps and internal prompts that constrain generation and support quality assurance. Figure 1 provides the flowchart representation of the workflow that can be summarized as six steps.

Step 1: Matrix acquisition and normalization. The user provides the school's expectation matrix by pasting text, entering a table, or describing settings and behaviors. The system identifies settings (often the rows), expectations/values (often the columns), and the behaviors embedded in each cell. When a cell contains multiple behaviors, the generator can parse them into atomic behaviors so each item can target a single, observable action. Normalization is essential for later checks because it defines the vocabulary that the generator is allowed to use.

Step 2: Context specification. The user selects parameters such as school level, target language variety, and administration format (paper, web survey, or learning platform). The user also chooses which settings to include and can prioritize settings based on school goals or recent discipline patterns. This mirrors PBIS data cycles in which teams select focus areas based on patterns in behavioral indicators and then plan instruction accordingly (Horner et al., 2010).

Step 3: Item blueprint instantiation. The generator creates an item plan specifying the number of items per dimension, distribution across settings, and response formats. For example: BC items ask students to select the behavior that best matches an expectation in a given setting; BM items present short vignettes of peer behavior and ask which action models the expectation; BG items present novel but related scenarios requiring transfer; BV items ask students to identify which value is supported by a behavior; E items ask students to identify likely emotions associated with successful performance; and ME items prompt students to reflect on emotional triggers and regulation strategies in relation to expectations. The blueprint step is critical for ensuring balanced coverage and preventing overgeneration.

Step 4: Draft item generation with constraint prompts. Using the blueprint, the model drafts items while referencing only the matrix-derived behaviors and settings. Each item includes a stem and response options. Objective items include an answer key; reflective items include suggested scoring guidance or teacher discussion prompts. Distractors are designed to be plausible but incorrect, based on common confusions (e.g., confusing "walk calmly" with "run to be faster" in the hallway). Constrained templates help ensure that items are age-appropriate and that distractors do not introduce new behavioral expectations.

Step 5: Internal quality checks. The system applies verification prompts to detect inconsistencies: missing dimensions, repeated items, drift from the matrix, and answer-key mismatches. It also checks length constraints and reading level. These checks are designed to reduce LLM-related risks while keeping the workflow efficient. The output is revised when issues are detected, producing a second draft that better matches the matrix and the blueprint.

Step 6: Teacher review and export. The final step is teacher review. Educators can edit items for clarity, replace examples that may not fit their context, and adjust language for accessibility. The generator provides an export-ready version that can be copied into a word processor or survey platform. This human review step is essential: it ensures cultural coherence, supports inclusive practice, and maintains the ethical framing that results are used for instruction rather than discipline.

Benefits for Teachers and Potential for Broad Diffusion

A primary practical contribution of PBIS-RISE is reducing the time and expertise required to create assessment instruments aligned with local PBIS matrices. Teachers already invest substantial effort in PBIS implementation, including teaching expectations, collecting data, and participating in team problem solving. When assessment tools are not readily available, the additional burden of creating questionnaires can lead schools to rely only on referrals or informal checks. PBIS-RISE addresses this bottleneck by automatically producing items anchored to the matrix and organized by interpretable dimensions. In practice, this can shift effort from drafting to reviewing and using results for instruction.

The tool also supports consistency across classrooms and across time. If teachers develop their own informal comprehension checks, item quality and alignment can vary, and results may not be comparable across classes. PBIS-RISE provides a shared blueprint that can standardize how understanding is assessed while allowing local instantiation through the matrix. Consistency matters because PBIS outcomes depend on fidelity and coherent systems, particularly in complex settings such as high schools where routines are harder to standardize (Flannery et al., 2009). A common assessment structure can also support staff discussions during PBIS team meetings by providing a shared language for interpreting results (e.g., “generalization is low in the cafeteria”).

Teacher working conditions and efficacy are plausible benefit pathways. Houchens et al. (2017) reported that PBIS implementation can be associated with improvements in teachers’ perceptions of teaching conditions and efficacy. PBIS-RISE is not expected to directly change conditions, but it can make essential PBIS routines more feasible. For example, it can generate short, repeatable assessments that teachers can administer after reteaching lessons, enabling visible evidence of progress. Such feedback can strengthen teacher sense of impact and can support collective efficacy when results are shared at the team level.

Broad diffusion is supported because the generator operates on matrices that schools already use. This makes PBIS-RISE portable across jurisdictions and languages without imposing a single standardized rule set. The approach is well suited to international contexts, where behavioral norms and school routines differ and translation of standardized instruments may reduce local relevance. Because PBIS-RISE uses the matrix as its content anchor, it can generate culturally coherent items in the language and examples used locally, while maintaining the same six-dimension blueprint for interpretability.

Finally, the generator can support inclusive PBIS practice. Tools that are flexible in format can better accommodate students with diverse needs. In line with equity-oriented PBIS discussions, including work on students with complex support needs (Zagona et al., 2024), PBIS-RISE can be adapted to include simpler language, pictorial supports (when implemented in an external platform), or alternative response formats. This flexibility is important for ensuring that assessment results reflect understanding rather than barriers in reading or communication. In addition, by focusing on understanding of expectations rather than on "problem behavior," the tool can support a more strengths-based and instructional approach to behavior support.

Discussion

PBIS-RISE illustrates how generative AI can be used responsibly in education when it is framed as an augmentation tool rather than an automation tool. The generator demonstrates a practical compromise: it uses AI to draft items and structure assessments, but it employs constraints, verification, and teacher review to preserve instructional alignment and ethical use. This approach responds to concerns in the AI-in-assessment literature about hallucinated content, bias, and opaque decision-making (Arslan et al., 2024), while still leveraging the efficiency advantages that motivate adoption.

From a PBIS implementation perspective, PBIS-RISE targets an under-assessed component of practice: whether students understand the expectations that schools invest time in teaching. Office discipline referrals and other behavioral indicators are important, but they can reflect performance, context, or opportunity rather than comprehension. A brief comprehension check can function as a leading indicator, guiding preventive reteaching before problems escalate. In addition, the inclusion of Behavioral Modeling and Meta-Emotional Reflection aligns assessment with instructional routines and with the integration of PBIS and social-emotional learning. Modeling items can reveal whether students can discriminate correct examples in realistic situations. Meta-emotional reflection items can open instructional dialogue about emotional triggers, regulation strategies, and empathy, connecting expected behaviors to lived experiences.

At the same time, important research questions remain. First, psychometric work is needed to evaluate the quality of generated instruments. Because items differ across schools, evaluation should emphasize content validity (alignment with matrix and construct definitions), response processes (whether students interpret items as intended), and the stability of dimension-level interpretations over time. Second, implementation studies should examine how teachers use results. Do generated assessments lead to more systematic reteaching? Do PBIS teams integrate results into tiered decision-making as intended? Third, equity studies are needed to ensure that item language and formats do not disadvantage particular student groups and that results are interpreted in ways that promote support rather than labeling.

Finally, PBIS-RISE should be understood as a component within a broader PBIS data system. PBIS outcomes depend on leadership support, coaching, and consistent routines (Flannery et al., 2009; Horner et al., 2010). Tools can support these routines, but they cannot substitute for organizational commitment. PBIS-RISE aims to lower barriers to formative assessment so that PBIS teams can more easily complete the instructional cycle: teach expectations, check understanding, reteach when needed, and use data to sustain implementation. In alternative or high-need settings, where staff time is limited and data systems are strained (Grasley-Boy et al., 2020), the value of low-burden tools may be particularly high.

Conclusion

This paper introduced PBIS-RISE, a GPT-powered questionnaire generator designed to assess student understanding of behavioral expectations in schoolwide PBIS systems. Building on the PBIS-KBVE tool, PBIS-RISE expands the measurement model to six dimensions: Behavioral Comprehension, Behavioral Modeling, Behavioral Generalization, Behavioral Value Association, Emotional Association, and Meta-Emotional Reflection. The generator uses a school's own expectation matrix as the content anchor, ensuring cultural coherence and local relevance while maintaining a stable blueprint that supports interpretability and comparability.

PBIS-RISE offers a replicable model aligned with PBIS foundations and comprehensive tiered prevention frameworks. By generating customized questionnaires directly from each school's matrix, the tool can reduce teacher workload, enhance consistency in behavior-related assessment, and support data-driven decisions about reteaching and tiered supports. Future work will focus on multi-site validation studies, usability evaluations with teachers and students, and the development of accessibility-focused output formats (for example, pictorial supports and simplified language variants) to maximize equity and inclusion across diverse school contexts.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

During the preparation of this work, the authors used ChatGPT (OpenAI) to assist in scientific writing and language refinement. After using this tool, the authors reviewed and edited the content as needed and takes full responsibility for the content of the published article.

Pop Culture in Education: A Bibliometric Study of Trends, Uses, and Gaps of Brazilian Research on Manga (2014–2024)

Guilherme A. C. Profeta, University of Sorocaba, Brazil
Beatriz O. Delboni, University of Sorocaba, Brazil

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Given the demand for diverse didactic resources that promote engagement, identification, and effective cultural mediation, products of pop culture, such as Japanese comics (or *manga*), have drawn increasing interest from educators. This bibliometric study investigates how Brazilian academic research has addressed *manga* as an object of study over the past ten years, especially in the field of Education. Using the descriptor "*mangá*," we surveyed the Thesis and Dissertation Catalog of the Brazilian Federal Agency for Support and Evaluation of Graduate Education (Capes), identifying 73 Master's theses and doctoral dissertations produced in Brazil between 2014 and 2024. Results show a rise in scholarly interest beginning in 2020, mainly in Brazil's Southeast region. We developed a categorization matrix to classify the studies by focus: Reception and reinterpretation of *manga* (11%); Visual/aesthetic aspects (9.6%); Representation studies (31.5%); Intermedia adaptation and/or comparative literature (15.1%); Translation (4.1%); Informal education (2.7%); and Formal education (26%), the primary category of interest in this research. Out of the 19 studies focused on formal education, the majority (13) explored the use of specific *manga* titles as didactic tools for teaching content or form. Only four works examined *manga* as a collaborative creative process, proposing the production of *manga* during classroom activities. Most of these 19 studies (14) addressed Elementary or Secondary education, with none focusing on Higher Education. This absence points to a gap in the literature and highlights an opportunity for original research on *manga* creation as a pedagogical practice within the context of Higher Education.

Keywords: pop culture, *manga*, bibliometric study, education, Brazil

Introduction

What is broadly referred to as pop culture can be understood as a set of cultural expressions conceived for wide-scale dissemination and mass consumption, embedded within an industrial and capitalist logic of distribution in which symbolic goods assume the status of what we could call commodities, as explained by Strinati (1999). Despite this critical perspective on the production and circulation of pop culture, we argue that cultural products belonging to this domain may also acquire pedagogical value when intentionally incorporated by teachers into their classroom practices. Evidence in support of this claim is provided by a study conducted in 2021 at a communitarian university[1] in the state of São Paulo, Brazil, in which 94.6% of participating faculty members agreed (totally or partially) with the premise that pop culture products have potential as supplementary teaching materials in educational contexts, while 72.8% reported having already used such references in their classes (Profeta et al., 2023). It is therefore unsurprising that pop culture can be a part of everyday school life, including in Higher Education, particularly in pedagogical scenarios guided by active learning methodologies and competency-based education, developed through concrete learning situations in which students are not conceived as passive agents.

From this perspective, pop culture products may be understood as generative themes, that is, nuclei of meaning drawn from the experienced realities of learners themselves, which function as starting points for critical dialogue and knowledge construction, in accordance with the theoretical premises of the renowned Brazilian educator Paulo Freire (Freire, 2004). These are references that students already bring from out-of-school contexts (such as media environments) and which, precisely because they are infused with personal and social meanings, tend to foster contextualized and—ideally— more meaningful learning processes. Regarding educators who effectively incorporate pop culture products into their pedagogical practices, we argue that such incorporation may operate as a strategy of curricular flexibilization, whereby openings are created within more restrictive curricular arrangements and intentionally filled with cultural references that are recognizable and meaningful to the students involved. This process has been previously conceptualized as “crafting flexibilities” (Profeta et al., 2023).

The term *manga* refers to comics produced in Japan, whose roots may be associated with earlier forms of Japanese graphic arts, particularly *chōjūgiga* and *ukiyo-e*. Over time, additional elements were incorporated, including those resulting from international influences (Alvarenga, 2023). In contemporary contexts, however, manga has become significantly detached from these traditional artistic forms, taking shape through a set of recurring features (that function less as rigid rules, as they can be subverted freely, and more as observable recurring patterns). These include the predominance of black-and-white printing; character design through simplified lines, intentionally distorted at certain moments within the narrative; the use of kinetic lines to suggest movement or dramatic intensification; the application of tonal screens in the composition of shadows and textures; the graphic incorporation of onomatopoeia; the organization of panels into dynamic layouts, characterized by free arrangements on the page and overlapping elements; etc.

[1]Communitarian universities constitute a type of non-profit, locally governed Higher Education institution typical of Brazil. They are managed by community councils composed of different segments of civil society and fulfill a social role analogous to that of public universities. Their academic scope is comparable to that of public or private universities, and they should not be confused with U.S.-style community colleges.

Manga constitutes a highly relevant segment of pop culture in editorial terms, not only in Japan but also in other parts of the world. Relatively recent data published by the website *Publish News*, in September 2024, indicate that *manga* accounted for 71% of the best-selling comics in the Brazilian market over the preceding 12-month period (2023 to 2024). This percentage also includes the so-called "Brazilian *manga*," understood as national productions that adopt the aesthetic and narrative conventions characteristic of Japanese comics (Sardinha, 2024). Despite this strong commercial performance, comics—and *manga* in particular—appear to remain underutilized in classroom practices. According to Profeta et al. (2023), at the same communitarian university mentioned earlier, only 2.9% of participating faculty members identified comics as their preferred medium when selecting pop culture products for use in their teaching. When contrasted with commercial performance data, this discrepancy suggests the existence of a research and practice gap.

This paper is grounded in the assumption that there is a continuous need to adopt a diverse range of teaching resources capable of promoting student engagement, identification, and effective cultural mediation in support of genuinely meaningful learning. Products of pop culture have increasingly attracted the interest of educators, including in Higher Education, as demonstrated by previous studies. Among these potential alternative teaching materials are Japanese comics, known as *manga*. Accordingly, this paper presents a bibliometric study designed to investigate how Brazilian academic research has addressed *manga* as an object of study over the past ten years, with particular attention to the field of Education. Beyond this mapping effort, the paper introduces a tested and validated categorization matrix for the classification of academic research on manga, enabling the systematic visualization and analysis of large bodies of studies. By identifying patterns and gaps in this body of literature, this study aims at providing a foundation for future research that may expand our understanding of the use of *manga* as a didactic resource in formal educational contexts.

Methods

This is a bibliometric study that compiles and systematizes data from segmented publications (in this case, Master's theses and doctoral dissertations defended in Brazil between years 2014 and 2024), thus aiming at mapping the academic production on the topic under investigation, specifically scholarly research on *manga* developed within Brazilian territory, and thereby providing a broader view of how the Brazilian scientific community in the field of Education has addressed *manga* as an object of study. Based on the collection and organization of these bibliographic records, a content analysis (Bardin, 2004) of the identified works was conducted, from which analytical categories emerged. This procedure resulted in the development of a categorization matrix, accompanied by explicit inclusion and exclusion criteria, in order to ensure analytical consistency and replicability.

Theses and dissertations were selected as the focus of this study because they provide a means to measure and interpret the academic output of a specific community. The choice to focus on these types of works represents a deliberate delimitation of the *corpus*. It should be noted, however, that this selection does not encompass the entirety of scientific production, as research is also conducted and disseminated through other venues (such as papers published in journals and conference proceedings, for example).

Regarding the bibliometric stage, in December 2024 a search was conducted in the Catalogue of Theses and Dissertations of the Brazilian Federal Agency for Support and Evaluation of Graduate Education (Capes, in the Portuguese acronym). This catalogue is an official

database of the Brazilian government that compiles together information on Master's theses and doctoral dissertations defended in graduate programs all over Brazil, thus functioning as a centralized national repository of academic metadata. In this search, the descriptor "*mangá*" (spelled in Portuguese with a diacritical mark on the final letter *a*) was used, covering the period from 2014 to 2024.

The initial survey yielded a total of 814 entries; however, an error stemming from limitations in the data retrieval system—which does not properly correctly recognize the diacritical mark—was identified. As a result, the search encompassed other cognates and homographs in Portuguese, generating records that were unrelated to the object of the research. In light of this issue, the data cleaning stage required the isolation and systematic exclusion of these records in order to ensure the consistency of the *corpus*. This procedure involved reading each title to ensure that only works that effectively addressed the topic of *manga* were actually retained. After excluding titles that did not correspond to the scope of the research, 73 results meeting the established criteria were identified, constituting the final *corpus* for analysis.

For these 73 selected studies, the subsequent stage consisted of an analysis of titles, abstracts, and keywords, followed by a skimming reading of the full texts, when available (especially in cases where the analysis of the other data proved insufficient). These data were organized using an electronic spreadsheet, allowing similarities among the studies to be grouped into patterns. All categories were constructed *a posteriori*, that is, derived from the *corpus* itself rather than being defined beforehand. In this way, a categorization matrix was produced, with inclusion criteria for each category, as discussed in the following subsections.

To ensure triangulation and reduce interpretive bias, thereby increasing the reliability of the results, this process was conducted by two researchers in the field of Education, both authors of this study. The results presented in the "Results and Discussion" section, following the introduction of the categorization matrix, reflect this consensus when it comes to their shared interpretation.

Proposal of a Categorization Matrix

Based on the step-by-step procedure outlined previously, a categorization matrix was developed in order to organize the study *corpus*. This matrix establishes explicit inclusion rules for each category, allowing patterns that emerge from the set of analyzed studies to be observed and grouped together, thereby enabling a comprehensive reading of the academic research in the field when it comes to *manga* as a topic of interest, as well as allowing other works (from different *corpora* and/or published after 2024) to be later classified. In this way, this proposed matrix functions instrumentally for the present research, while also constituting a contribution to the literature (since its application is not restricted to this specific study).

Here are the seven categories that were identified, along with their descriptions.

I. Reception and Reinterpretation of Manga, Especially in Brazil

This category includes research focused on the reception and re-signification of *manga*, especially in Brazil, emphasizing the reading, socialization, and/or consumption practices of readers/consumers—whether exclusively Brazilian or in comparison with Japanese readers/consumers. These studies often have ethnographic contours, aiming at understanding

the identity of these readers and their relationship with the medium within Brazilian territory and/or culture.

II. Visual/Aesthetic Aspects of Manga

This category includes research focused on studying *manga* as form (rather than its content), for example: editorial design strategies and visual language features specific to this medium.

III. Representation Studies

This category includes research focused on the representation of concepts, groups of people, and/or historical moments/episodes in specific *manga* titles. As a rule, these studies are structured in the following way: "X as represented in Y," where X is a topic of interest and Y is the title of a specific work. The category particularly includes research on historical *manga* (with emphasis on representations of World War II) and/or on representations of certain aspects of Japanese culture in selected works.

IV. Intermedia Adaptation and/or Comparative Literature

This category includes research focused on comparisons between two different media, one of which is *manga*. As a rule, it includes studies addressing the adaptation of various original works (literary ones, for example) into *manga*, or conversely, *manga* as the original work being adapted into other media (such as animations or video games, for example). This category also includes studies in comparative literature that analyze *manga* alongside other literary texts from different cultures, historical periods, languages, or genres, in order to identify relationships, influences, and differences among them.

V. Translation

This category includes research focused on analyzing the process of translating *manga* from Japanese into Portuguese, addressing the linguistic choices made by translators when transposing a work into another language (and not the term "translation" when used in the sense of intermedia adaptation, although some studies may also compare *manga* translations with their animated versions).

VI. Informal Education

This category includes research focused on studying *manga* (either in general or specific titles) regarding its potential role as a medium for science outreach and/or informal education—namely, that form of education that takes place outside school settings.

VII. Formal Education (School Education)

This category includes research focused on the applications of *manga* (either in general or specific titles) within the context of formal education—namely, that form of education that takes place within school settings, at various levels. Some of these studies may draw on approaches encompassed by previous categories (for example, representations of certain themes or intermedia adaptations); however, what distinguishes them is their educational intent (the pursuit of applications for school-based learning), which is not necessarily a central concern in other studies.

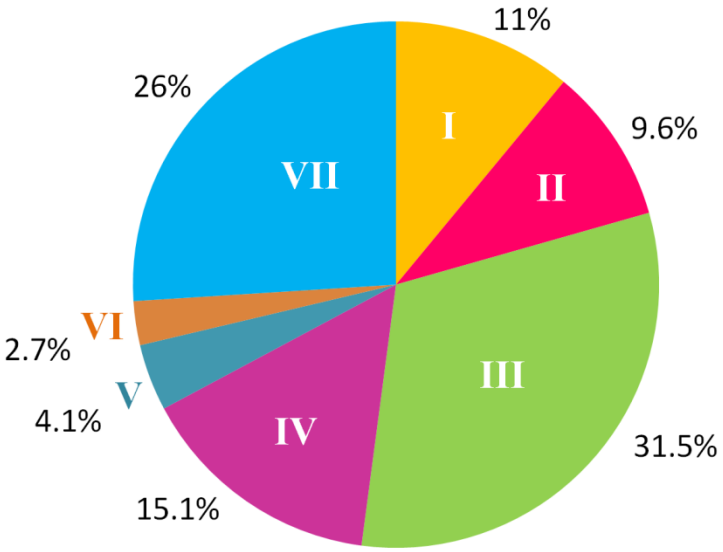
Results and Discussion

The results are presented as follows: in order to organize and graphically display the categorization of the works that constituted the *corpus*, a table was adopted in which each thesis or dissertation (identified by the author's surname and year of publication) is included in its respective category, out of the seven possibilities previously outlined (see categories from I to VII). Readers interested in specific categories may refer to the list of references at the end of this paper, where each thesis or dissertation is identified by its original title, as well as by an English translation (not necessarily official, since they were provided by the authors of this paper).

Table 1
Categories and Corresponding Theses or Dissertations

Category	Corresponding works
I. Reception and reinterpretation of *manga*, especially in Brazil	Issa (2014); Oliveira (2014); Pereira (2015); Costa (2015); Simon (2015); Coutinho (2022); Passos (2022); Silva (2024)
II. Visual/aesthetic aspects of manga	Tamekuni (2015); Nakagawa (2016); Araujo (2021); Rezende (2021); Oliveira (2023); Fontenele (2023); Ribeiro (2024)
III. Representation studies	Batistella (2014); Moreira (2014); Yamada (2014); Gregorio (2016); Teixeira (2017); Israel (2017); Ramos (2017); Kanno (2018); Oliveira (2018); Espírito Santo (2018); Martins (2018); Wesseloski (2019); Malafaia (2019); Nascimento (2020); Motta (2020); Antunes (2021); Costa (2021); Zanoni (2021); Yanaguiya (2022); Castello Branco (2023); Carvalho (2023a); Sato (2023); Silva (2024)
IV. Intermedia adaptation and/or comparative literature	Nascimento (2014); Torquato (2014); Zanotti (2017); Carvalho (2019); Santos (2021); Figueiredo (2021); Saita (2022); Alvarenga (2022); Bezerra (2023); Aguiar (2023); Testoni (2024)
V. Translation	Freire (2020); Pinheiro (2021); Lopes (2023)
VI. Informal education	Iwara (2020); Batista (2023)
VII. Formal education (school education)	Coelho (2014); Santos (2014); Gomes (2015); Jesus (2015); Dalmolin (2016); Santoni (2017); Pinto (2018); Pereira (2019a); Pereira (2019b); Silva (2021); Oliveira (2021); Cruz (2022); Loureiro (2022); Castro Junior (2023); Carvalho (2023b); Funakura (2023); Paris (2023); Arnaud (2024); Canova Junior (2024)

Source: Prepared by the authors, 2025.



The percentage distribution of results by category is as follows:

- **(I)** Reception and reinterpretation of *manga*, especially in Brazil: **11%** of all studies;
- **(II)** Visual/aesthetic aspects of *manga*: **9.6%** of all studies;
- **(III)** Representation studies: **31.5%** of all studies;
- **(IV)** Intermedia adaptation and/or comparative literature: **15.1%** of all studies;
- **(V)** Translation: **4.1%** of all studies;

(VI) Informal education: **2.7%** of all studies;
(VII) Formal education (school education): **26%** of all studies.

These results can also be visualized in the chart below (see Figure 1).

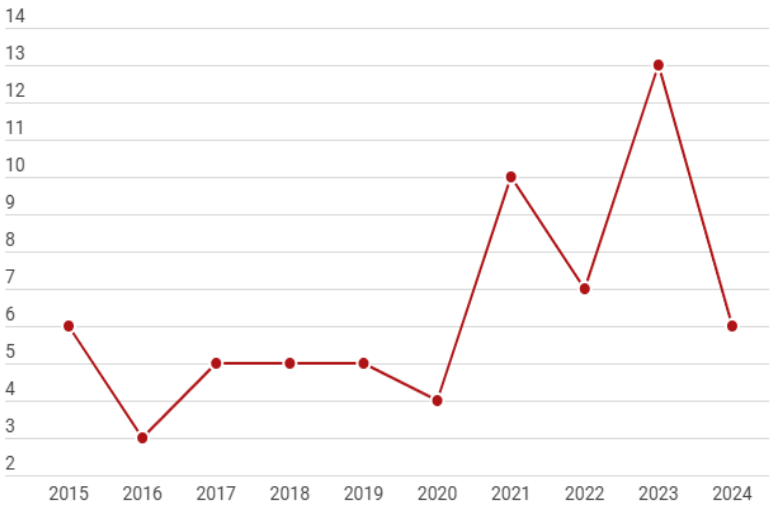


Figure 1
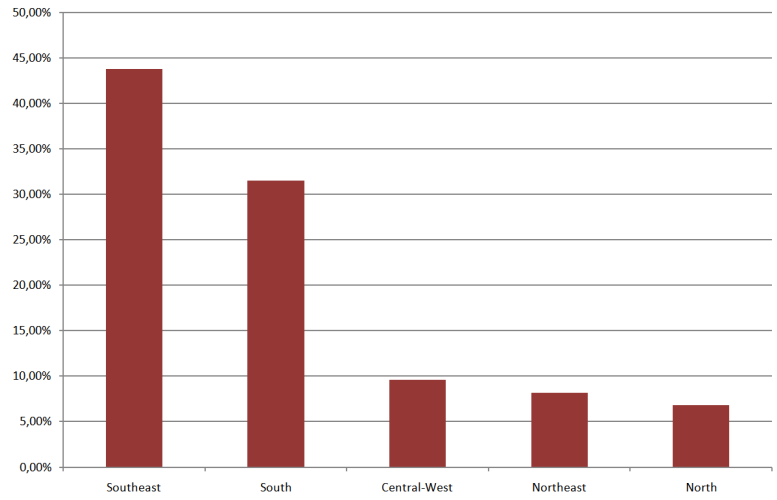
Percentage Breakdown by Category

Source: Prepared by the authors, 2025.

In addition to the distribution by categories, the published works can also be organized by year, as shown in the following graph (see Figure 2), allowing for an examination of fluctuations in the overall interest in the topic of *manga* by Brazilian graduate students over time. Overall, the graph indicates a relative increase in scholarly interest in the topic over the past years.

Figure 2
Total Number of Theses and Dissertations on Manga Defended in Brazil per Year (Not Stratified by Category)



Source: Prepared by the authors, 2025.

Regarding geographical distribution, the data reveal an uneven distribution in the number of Master's and doctoral studies on *manga* in Brazil, with a higher concentration in the Southeast region, which accounts for 43.84% of the total. This is followed by the South region, with 31.51% of the studies. The remaining regions present significantly lower percentages: the Central-West contributes 9.59%, the Northeast 8.22%, and the North 6.85%. These results indicate that the Southeast and South regions concentrate the majority of academic investigations on this particular topic when it comes to Brazil, a pattern that may be explained, perhaps, by the overlap between the geographic concentration of Japanese descendants in Brazil and the presence of universities with Education programs and research groups suited to host this type of investigation (a hypothesis that may be explored in future studies).

Percentage of Master's Theses and Doctoral Dissertations on Manga Defended in Brazil, by Geographic Region

Source: Prepared by the authors, 2025.

Following the presentation of the table summarizing the overall results, we now turn to a more detailed examination of the final category identified (VII), which comprises studies situated within the field of school education and constitutes the primary interest of this particular investigation. All studies included in this specific category are presented below, with their titles translated to English (original titles, in Portuguese, can also be found in the list of references, along with the respective links for accessing the full texts, when available.):

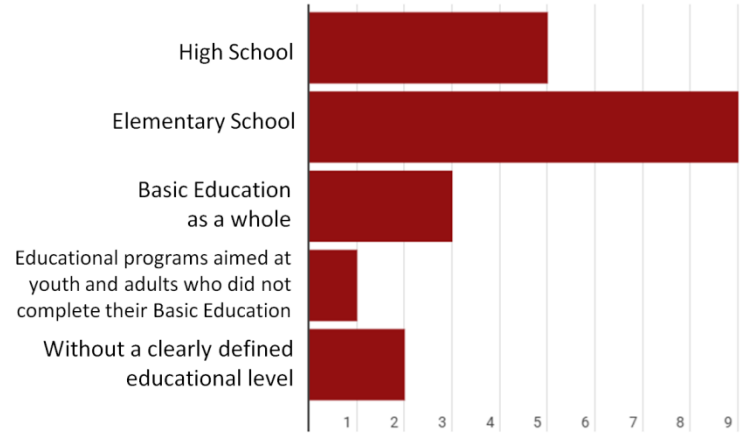

Table 2
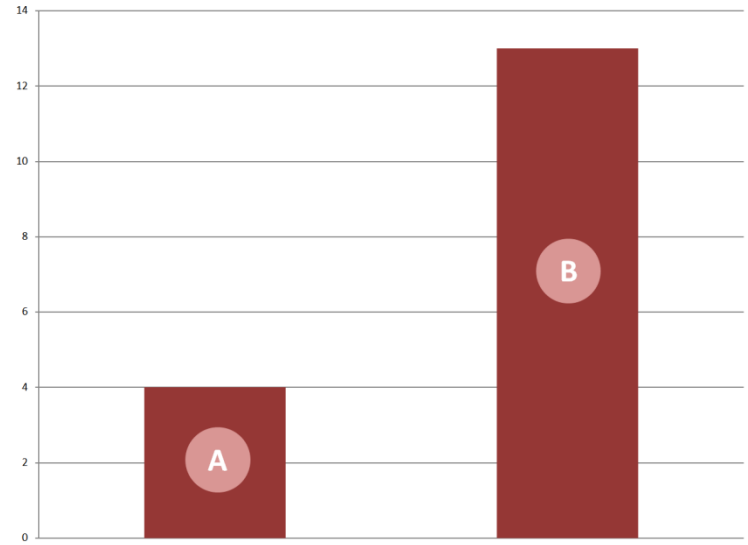
Breakdown of Research About Manga in School Education (Category VII) in the Catalogue of Theses and Dissertations of the Brazilian Federal Agency for Support and Evaluation of Graduate Education

Entry as listed in the References	Title of the study (translated to English)
Coelho (2014)	"*Manga*: Potentials and possibilities for the teaching of Geography in Elementary School"
Santos (2014)	"*Manga* reading practices among young readers: An ethnographic investigation"
Gomes (2015)	"Cross-discourse relations and multimodality in the process of building textual meaning: teaching the manga genre in Portuguese language classes"
Jesus (2015)	"Literacies through classic short stories and its adaptation into *manga*"
Dalmolin (2016)	"From conceptions to the construction of a manga-style comic about the respiratory system"
Santoni (2017)	"*Anime* and *manga*: Teenagers' identity"
Pinto (2018)	"Making and use of *manga* for teaching magnetism in the 3rd year of High School"
Pereira (2019a)	"*Manga* drawings and paper toys: Otaku culture and audiovisual language articulating mathematics and art in school education"
Pereira (2019b)	"Graphic narratives in environmental educational practices with integrated High School students at the Federal Institute of Education, Science and Technology of Rondônia - Ji-Paraná Campus"
Silva (2021)	"Toward affective knowledge at school: The use of the *manga* Claymore (2001-2014) as a study of femininity in History teaching"
Oliveira (2021)	"Teaching electrodynamics in youth and adult education through *manga*-based comics"
Cruz (2022)	"The *anime* and *manga* 'Naruto' as devices for enhancing native language learning"
Loureiro (2022)	"A didactic sequence for the teaching of Physics in the final years of Elementary School using mini comics"
Castro Junior (2023)	"Zarathustra in *manga*: An analysis of the processes of adapting philosophical texts and reflections for teaching"
Paris (2023)	"The *manga* and *anime* Naruto in Sociology classes: a proposal for a teaching and learning methodology"
Carvalho (2023b)	"*Anime* and *manga* mobilizing emotional responses and imagination at school"
Funakura (2023)	"Studies on *manga* and *anime* in education: contemporary trends and challenges"
Arnaud (2024)	"*Manga* as a multimodal literacy practice in the Portuguese language classroom in lower Secondary Education"
Canova Junior (2024)	"*Manga* through the teaching of History: Sensitive stories and the traumas of World War II based on Barefoot Gen"

Source: Prepared by the authors, 2025.

Considering exclusively the studies included in the school education category (and listed by title in table 2), the next step was to identify the educational level to which these studies refer. The analysis indicates that, when it comes to school education research on *manga*, Elementary School is the primary level of interest (nine studies), followed by High School (five studies). Basic Education as a whole appears next (three studies), followed by studies without a clearly defined educational level (two studies). One study addressed educational programs aimed at youth and adults who did not complete Basic Education—commonly referred to in Portuguese as *Educação de Jovens e Adultos* (EJA). It is important to note that none of the theses or dissertations specifically addressed Higher Education, indicating a potential gap when it comes to this kind of research, one that future researchers may wish to explore.

Figure 4
Educational Level Addressed in Research on Manga (in the School Education Category)



Source: Prepared by the authors, 2025.

Also considering exclusively the studies included in the school education category, we observed that most research included in the *corpus* approached *manga* as finished, already published, ready-to-use products, while only a small number of studies actually addressed the process of creating *manga* from scratch, which initially appeared as another potential gap in the literature.

Out of the 19 studies within the school education category, 17 focus on educational practices involving *manga* (the remaining two aim at understanding teenagers' identities and reading practices and, despite their potential educational applicability, do not address educational practices themselves, either by documenting or proposing them). The 17 studies that do examine educational practices were then divided into two groups: studies that examined *manga* as a collaborative creative process, proposing the production of original works during classroom activities (**group A**, with 4 results), and studies that explored the use of specific *manga* titles as didactic tools for teaching either content or form, in which *manga* were treated as ready-to-use products (**group B**, with 13 results). Therefore, these results confirmed the aforementioned gap in the literature (see Figure 5).

Figure 5
Studies That Address the Process of Creating Manga (A) Versus Studies That Treat Manga As Finished, Ready-to-Use Products (B)

Conclusion, Limitations, and Recommendations

The data presented in this study identified and organized all the works (Master's theses and doctoral dissertations on *manga*) into groups, thus making them readily accessible to other scholars (especially those who do not speak Portuguese) who may be interested in understanding how Brazilian academia approaches the phenomenon of *manga*, particularly within the field of school education, which constitutes the main category of interest and accounts for more than one quarter (26%) of Brazilian research on the subject. Once systematized and published as part of the conference proceedings, these data become available for comparison with data obtained in other studies conducted worldwide.

As stated in the Methods section, theses and dissertations were selected as the focus of this study as a means of examining the academic output of a specific scholarly community. This deliberate delimitation of the *corpus* does not encompass the entirety of scientific production. Nevertheless, this choice allows for drawing conclusions and identifying trends and gaps within the academic production. While it does constitute a limitation, it also represents an opportunity for future research, which may employ the categorization matrix presented here to extend the analysis to other *corpora*.

Therefore, having being tested and validated, the categorization matrix presented in this paper may also be applied in other contexts, also enabling comparisons across different academic traditions that focus on the same subject. Furthermore, the gaps identified by this research may serve as a foundation for future investigations. In this regard, the study points to the need for practice-oriented methodologies that observe and document classroom practices, especially those that address the creative process underlying *manga* production, as well as those developed within the context of Higher Education, an education level at which—at least in Brazil—such studies seem to remain largely absent.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The authors declare that ChatGPT, an Artificial Intelligence-based language model, was used during the preparation of the final manuscript, specifically to support the translation from Portuguese into English, thus improving its overall fluency through suggestions of more natural phrasing. All stages of conceptualization, methodological design, data curation, formal analysis, and discussion were conducted by the authors, who assume full responsibility for the final text as the outcome of their entire research process, in accordance with the principle of human-centered governance in academic research.

Abstract

In this paper, we provide a thorough study on the AI/ML models for predicting student performance in MOOCs using the XuetangX MOOC dataset. An early detection of students-at-risk is important due to the increasing use of online learning systems in order to produce better learning results. We compare six models – Random Forest, Support Vector Machine, Logistic Regression, Convolutional Neural Network, Long Short-Term Memory, and Transformer – in their predictive ability for student dropout in MOOCs. This comparative analysis is unique due to its focus on the large-scale XuetangX MOOC dataset, providing insights into model performance across diverse feature sets and offering practical implications for early warning systems in a specific regional context. Our findings, however, demonstrate that traditional machine-learning models outperform deep learning approaches (AUC 0.58–0.63 vs. 0.50–0.56), with Logistic Regression achieving the highest performance while maintaining better interpretability. Feature importance analysis reveals that course progress rate, quiz success rate, and session duration play the most significant roles in student success prediction. We further demonstrate the practical application of these models in an early warning system that provides as-recorded personalized interventions. The results illuminate the trade-offs between model complexity, performance, and interpretability in Educational Data Mining (EDM), and have important implications for learning analytics researchers and educational technologists interested in developing AI-supported student support systems.

Keywords: student performance prediction, massive open online courses (MOOCs), XuetangX dataset, machine learning, deep learning, early warning systems

Introduction

The rapid rise of online learning platforms has produced an unprecedented amount of educational data, which presents new opportunities to us for using artificial intelligence and machine learning (AI/ML) to improve teaching and learning. One of the most promising applications is the prediction of student performance which allows early identification of students at risk and personalized interventions. This is especially useful in Massive Open Online Courses (MOOCs), where the dropout rate is considered as a significant problem.

The Chinese largest MOOCs platform, XuetangX, has more than 10 million registered users, and opens a huge opportunity to analyze student prediction performance of analytics. This dataset captures detailed student interactions across hundreds of courses and creates a full picture of online learning behaviors and outcomes. By utilizing these data, we can develop applications or models to identify patterns associated with successful course completion or potential dropout.

The aim of this paper is to compare traditional machine learning and deep learning models for Student Performance Prediction on the XuetangX MOOC dataset. We test six models from different algorithmic families: Random Forest, Support Vector Machine (SVM), and Logistic Regression from traditional machine learning; and Convolutional Neural Network (CNN), Long Short-Term Memory (LSTM), and Transformer from deep learning. We consider not only predictive accuracy, but also model interpretability, computational efficiency, and the potential practical application in educational context.

The contributions of this paper are: 1) A novel and systematic comparative analysis of traditional and deep learning models for predicting student performance in MOOCs, specifically leveraging the unique characteristics of the large-scale XuetangX dataset. 2) Identification of key predictive features in the XuetangX dataset through feature importance analysis. 3) Development of implementable strategies for an early warning system in online learning platforms, informed by the comparative model insights.

The rest of this paper is organized as follows: Section II describes related work in Educational Data Mining (EDM) and student performance prediction. Section III details the XuetangX dataset and our feature engineering process. We describe our methods, which include data preprocessing, model selection and evaluation measures, in Section IV. Section IV presents and analyzes the experimental results. Practical applications are looked at in Section VI, and limitations and future work in Section VII. We finally make conclusion in Section VIII.

Related Work

Educational Data Mining and Learning Analytics

Educational Data Mining (EDM) and Learning Analytics (LA) are two emerging, interdisciplinary sciences concerned with the development of methods for exploring data from an educational context to better understand how students learn and how to teach them effectively. Baker and Siemens (2014) offered a detailed comparison of these two approaches and pointed out their mutual advantages: EDM emphasizes automated discovery and model building, while LA focuses on human interpretation and visualization of patterns.

In the area of MOOCs, Wang et al. (Wang et al., 2020) presented recent trends in EDM and LA and categorized student performance prediction as one of the most active research trends. By comparing methods and tools used in each article, it was observed that a trend exists toward more advanced modeling techniques, from elementary statistics-based models to more complex deep learning models.

Student Performance Prediction in MOOCs

The early work of Yang et al. (Yang et al., 2013) introduced a method to identify at risk students using derived behavioral features from clickstream. Their survival analysis approach achieved moderate success but highlighted the challenges of predicting dropout in diverse MOOC populations.

Fei and Yeung (2015) advanced this line of research by proposing temporal models that capture the evolution of student behavior over time. Their results with the Recurrent Neural Network RNN model surpassed those obtained with static models and demonstrated the critical role of temporal dependencies in the prediction of MOOC performance.

More recently, Whitehill et al. (Whitehill et al., 2017) pointed out some methodological concerns in MOOC dropout prediction, especially concerning dropout definition and reasonable evaluation indicators. They suggested standardized evaluation frameworks that have influenced subsequent research, including our approach in this paper.

Machine Learning Approaches for Performance Prediction

Traditional machine learning approaches have shown a great potential in educational usage. Xing and Du (2019) demonstrated the effectiveness of Random Forest for MOOCs dropout prediction, they achieved accuracy rates of 80–90% when predicting dropout for one week in advance. Similarly, Chen et al. (Chen et al., 2020) used SVM and Logistic Regression to identify at-risk students based on learning behavior networks, achieving comparable performance.

Recently, deep learning methods have become increasingly popular. Qiu et al. (Qiu et al., 2016) pioneered the application of neural networks to MOOC data and reported small gains over traditional methods. Wang et al. (Wang et al., 2015), which used natural language processing of forum posts and clickstream data in a multi-modal deep learning framework, demonstrating the value of integrating diverse data sources.

Feature Engineering for Educational Data

Feature engineering plays a crucial role in educational data mining. Crossley et al. (Crossley et al., 2016) demonstrated that a combining of clickstream data with natural language processing features improved prediction accuracy of dropouts significantly. Their work highlighted the need to study behaviors and cognitive aspects of learning jointly.

In the context of XuetangX data, Zhang et al. (Zhang et al., 2018) identified key behavioral features associated with course completion, including video-watching patterns, assignment submission timing, and forum participation. These insights have informed our feature engineering approach in this study.

XuetangX Dataset and Feature Engineering

Dataset Description

The XuetangX dataset comes from one of the largest MOOC platforms in China and shares courses of prestigious universities such as Tsinghua University and Peking University. We used a refined dataset collected between 2018–2020, containing student interactions across 247 courses with approximately 155,000 unique student enrollments.

The dataset includes the following primary components: 1) **User Information**: Basic demographic data and enrollment details, 2) **Course Structure**: Hierarchical organization of course materials, 3) **Interaction Logs**: Time-stamped records of student activities including video views, problem attempts, forum posts, and downloads, 4) **Outcome Labels**: Binary indicators of course completion or dropout

Feature Engineering

We engineered a comprehensive set of features from the raw interaction logs to capture different dimensions of student learning behavior. These features fall into several categories:

- **Engagement Metrics**:
  - Total number of interaction events
  - Number of active days
  - Average number of events per active day
  - Session count (sequences of activities without long gaps)
  - Average session duration
- **Content Interaction Patterns**:
  - Video view count and duration
  - Problem attempt count and success rate
  - Download count
  - Forum view and post count
  - Navigation patterns between content types
- **Temporal Behavior**:
  - Weekly and daily activity distribution
  - Time between consecutive sessions
  - Regularity of engagement (entropy of activity distribution)
  - Time spent on different content types
- **Performance Indicators**:
  - Assignment submission count and scores
  - Quiz completion rate and average score
  - Progress through course materials
  - Cumulative grade point average
- **Social Interaction**:
  - Forum participation metrics
  - Response rate to forum posts
  - Social network centrality measures

Through correlation analysis and domain knowledge, we selected a final set of 12 features that demonstrated strong predictive power while minimizing redundancy. Table 1 presents these features along with their descriptions and calculation methods.

Table 1
Selected Features From Xuetangx Dataset

Feature	Description	Calculation Method
session_count	Number of learning sessions	Count of activity sequences without 30+ minute gaps
avg_session_duration	Average duration of learning sessions	Mean time between first and last event in each session
content_views	Number of learning material views	Count of page views for course content
assignment_submissions	Number of assignments submitted	Count of assignment submission events
forum_posts	Number of forum contributions	Count of forum posting events
video_completion_rate	Proportion of videos watched to completion	Number of completed videos / Total videos available
quiz_success_rate	Proportion of correct quiz answers	Number of correct answers / Total quiz attempts
days_active	Number of days with platform activity	Count of unique days with at least one event
regularity_score	Consistency of learning schedule	1 - (Entropy of daily activity distribution)
avg_time_between_sessions	Average time gap between learning sessions	Mean time difference between consecutive sessions
progress_rate	Course completion percentage	Completed modules / Total modules
late_submission_rate	Proportion of late assignment submissions	Late submissions / Total submissions

These features provide a multidimensional view of student learning behavior, capturing not only the quantity of interaction but also qualitative aspects such as regularity, timeliness, and performance.

Methodology

Research Design

Our research follows a systematic approach to compare the performance of various machine learning and deep learning models for student dropout prediction. The methodology consists of the following steps:

- **Data Preprocessing**: Cleaning, transforming, and normalizing the XuetangX dataset
- **Feature Engineering**: Extracting and selecting relevant features as described in Section III
- **Model Selection**: Implementing a diverse set of traditional and deep learning models
- **Model Training and Evaluation**: Training models and assessing their performance using multiple metrics, including statistical significance testing to validate observed performance differences

- **Feature Importance Analysis**: Identifying the most predictive features for each model
- **Comparative Analysis**: Analyzing the results to identify patterns, strengths, and limitations

Data Preprocessing

The XuetangX dataset required several preprocessing steps to transform the raw interaction logs into a format suitable for predictive modeling:

- **Session Identification**: We defined learning sessions as sequences of activities without gaps exceeding 30 minutes, following established practices in web analytics.
- **Feature Extraction**: We calculated the features described in Section III for each student-course pair.
- **Missing Value Handling**: We employed median imputation for numerical features where missing values represented absence of activity.
- **Outlier Detection**: We identified and addressed outliers using interquartile range (IQR) methods, capping extreme values at Q3 + 1.5*IQR.
- **Feature Scaling**: We applied standard scaling to ensure all features had comparable ranges.
- **Class Balancing**: To address the class imbalance (approximately 60% dropout rate), we applied class weights during model training rather than resampling, preserving the natural distribution of the data.
- **Train-Test Split**: We employed a stratified 80–20 train-test split to maintain the same class distribution across both student demographics and course categories, ensuring representative sampling.

Model Selection

We selected six models representing differfent approaches to classification, from traditional machine learning to advanced deep learning architectures:

- **Random Forest**: An ensemble method that constructs multiple decision trees and outputs the mean prediction of individual trees. We selected this model for its ability to handle non-linear relationships and provide feature importance rankings.
- **Support Vector Machine (SVM)**: A supervised learning model that finds the optimal hyperplane to separate classes. We included SVM for its effectiveness with high-dimensional data and robustness to overfitting.
- **Logistic Regression**: A linear model that estimates the probability of a binary outcome. We chose this model for its interpretability and efficiency with large datasets.
- **Convolutional Neural Network (CNN):** Although typically used for image data, we adapted this architecture for educational data by restructuring our features into a grid format where neighboring features represent related educational behaviors. This approach allows CNNs to capture local patterns of interaction between related features.
- **Long Short-Term Memory (LSTM)**: A recurrent neural network architecture designed to model temporal dependencies in sequential data. We selected LSTM for its ability to capture long-term dependencies in student learning trajectories.
- **Transformer**: A neural network architecture based on self-attention mechanisms. We restructured our tabular features as a sequence of student activities over time to leverage the Transformer's ability to model complex relationships between different learning activities without regard to their sequential distance. However, as our results show, this approach faced limitations with the aggregated feature set.

Model Training and Evaluation

We trained each model using the preprocessed XuetangX dataset with the following approach:

- **Traditional ML Models**: We used standard training procedures with 5-fold cross-validation for hyperparameter tuning.
- **Deep Learning Models**: We employed early stopping with a patience of 10 epochs to prevent overfitting, and class weights to address class imbalance.
- **Evaluation Metrics**: We evaluated all models using multiple metrics to provide a comprehensive assessment:
  - Accuracy: Proportion of correct predictions among the total number of cases
  - Precision: Proportion of true positive predictions among all positive predictions
  - Recall: Proportion of true positive predictions among all actual positives
  - F1 Score: Harmonic mean of precision and recall
  - Area Under the ROC Curve (AUC): Measure of the model's ability to discriminate between classes

Feature Importance Analysis

To understand which features contributed most to the predictions, we employed model-specific approaches:

- **Random Forest**: We extracted feature importance directly from the trained model.
- **Logistic Regression**: We examined the magnitude of coefficients.
- **Deep Learning Models**: We used permutation importance to assess feature impact.

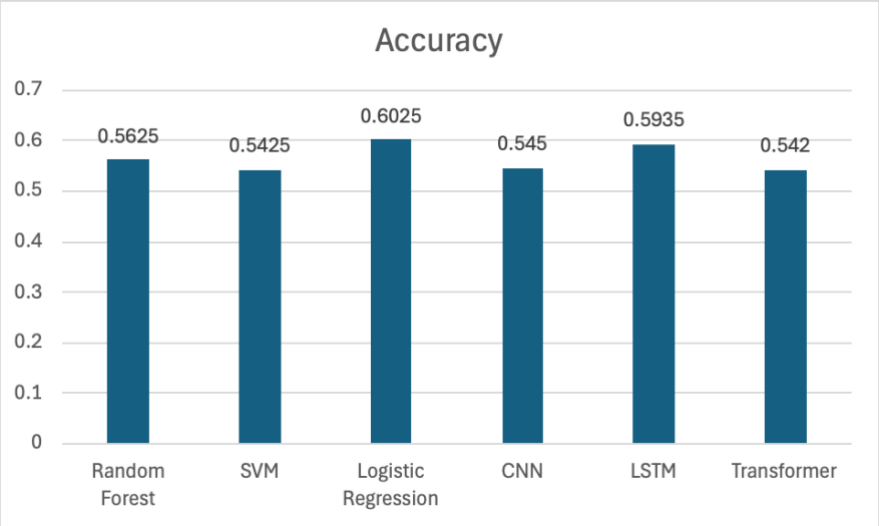
Results and Discussion

Model Performance Comparison

We evaluated six models using multiple performance metrics. Table 2 presents a comprehensive comparison of model performance on the XuetangX dataset.

Table 2
Performance Comparison of Predictive Models on Xuetangx Dataset

Model	Accuracy	Precision	Recall	F1 Score	AUC
Random Forest	0.5625	0.5145	0.4944	0.5042	0.5871
SVM	0.5425	0.4928	0.5722	0.5296	0.5837
Logistic Regression	0.6025	0.5517	0.6222	0.5849	0.6301
CNN	0.5450	0.5083	0.2009	0.2879	0.5594
LSTM	0.5935	0.5835	0.3930	0.4697	0.6258
Transformer	0.5420	0.0000	0.0000	0.0000	0.5000



On the XuetangX dataset, which focused on predicting student dropout, we observed the following patterns:

- **Traditional ML Models**: Logistic Regression achieved the highest performance with an accuracy of 60.25% and AUC of 0.6301, followed by Random Forest (56.25% accuracy, 0.5871 AUC) and SVM (54.25% accuracy, 0.5837 AUC).

- **Deep Learning Models**: LSTM outperformed other deep learning approaches with an accuracy of 59.35% and AUC of 0.6258, while CNN and Transformer models showed lower performance.
- **Precision-Recall Trade-off**: All models exhibited a trade-off between precision and recall, with Logistic Regression achieving the best balance (F1 score of 0.5442).

During our experiments, Transformer model performed unexpectedly poorly in all metrics resulting close to zero precision (0.0), recall (0.0) and F1 score (0.0) with an AUC of 0.5, essentially performing no better than random guessing. We found that this was due to the mismatch between tabular data structure and the Transformer architecture's design for sequential data. The basic implementation had issues with the fixed-length feature vectors, as Transformers were originally designed for variable-length sequences like text. While architectural modifications such as improved embedding layers, attention mechanisms, and input reformatting could theoretically improve performance, we find that traditional ML models remain more suitable for this specific tabular dataset. Future work could explore hybrid architectures (e.g., combining Transformer elements with traditional ML pathways) or specialized encoding techniques (such as Time2Vec) to better leverage sequential patterns in educational data, Figure 1 illustrates the accuracy comparison across all models for the XuetangX dataset.

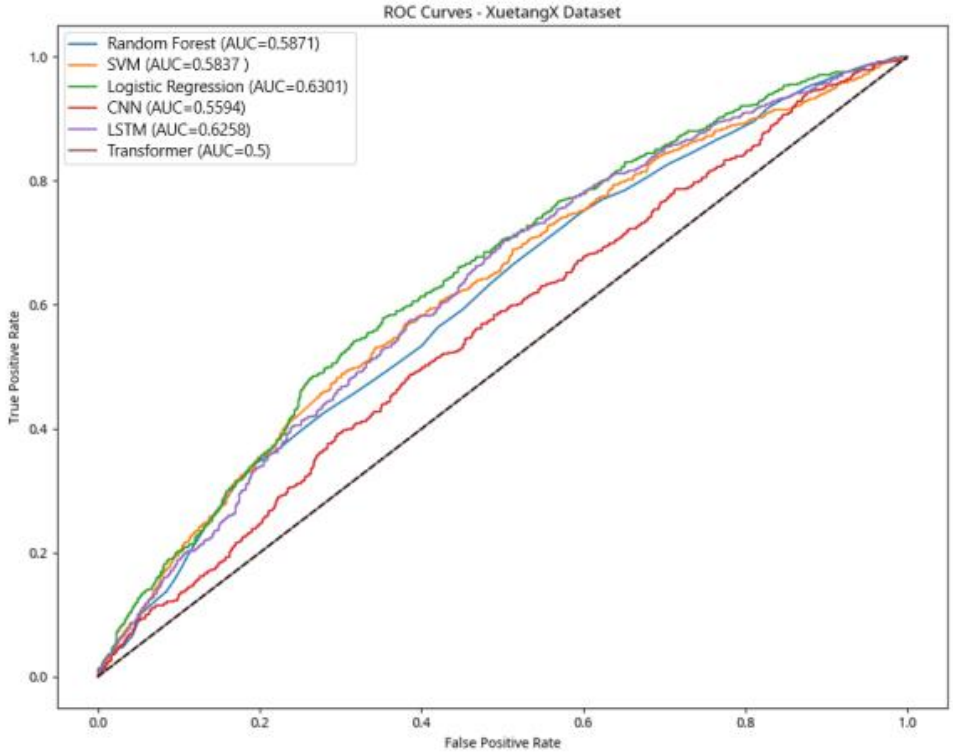


Figure 1
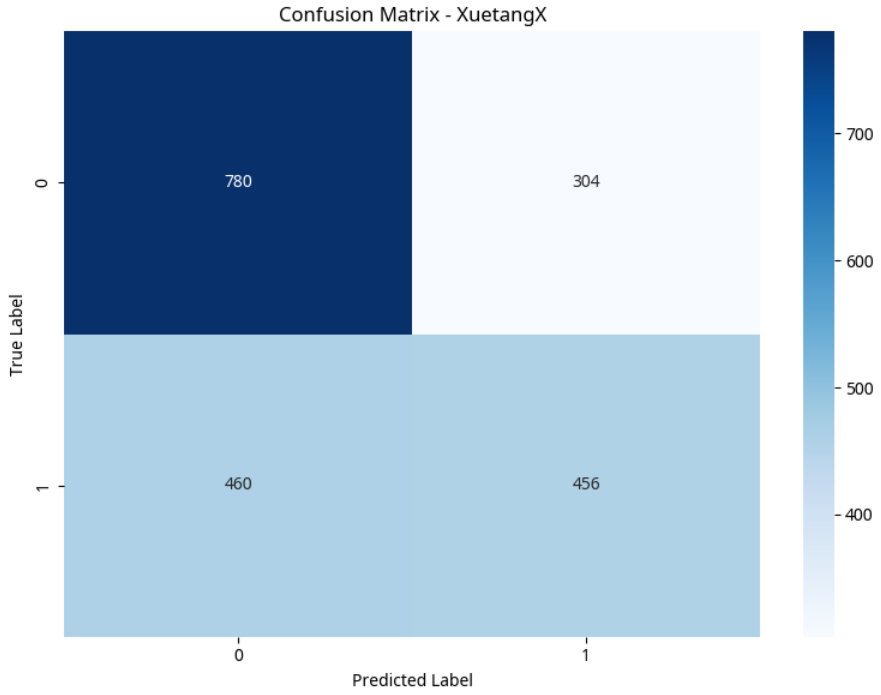
Comparison of Model Accuracy Across All Models

The ROC curves for all models on the XuetangX dataset are shown in Figure 2, providing a visual representation of the trade-off between true positive rate and false positive rate at various threshold settings.

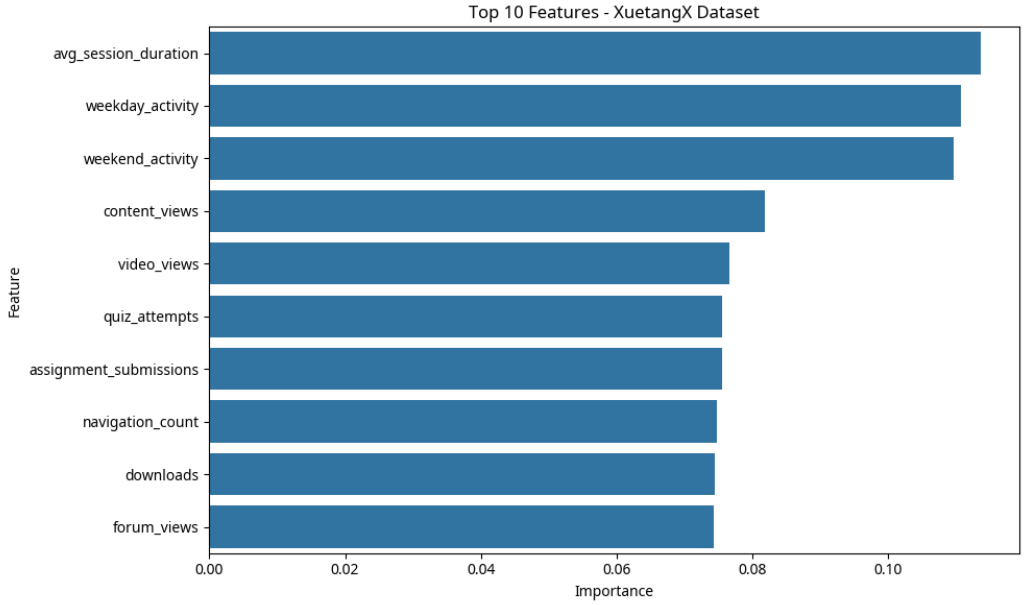
Figure 2



ROC Curves for All Models on the XuetangX Dataset

The confusion matrix for the best-performing model (Logistic Regression) is presented in Figure 3, showing the distribution of true positives, false positives, true negatives, and false negatives. The axes are labeled with "0: Complete" and "1: Dropout" to clearly indicate the prediction outcomes.

Figure 3



Confusion Matrix for Logistic Regression on XuetangX Dataset

Feature Importance Analysis

We analyzed feature importance to identify the most influential predictors of student dropout in the XuetangX dataset. Figure 4 presents the top 10 features based on the Random Forest model's feature importance rankings.

Figure 4
Top 10 Features by Importance for the XuetangX Dataset

For the XuetangX dataset, the most important features for predicting student dropout were:

1. **Assignment Submissions**: The number of assignments submitted by students was the strongest predictor, highlighting the importance of active participation in course activities.
2. **Quiz Success**: Rate: The proportion of correct quiz answers was highly predictive, indicating that academic performance on assessments is crucial for course completion.
3. **Average Session Duration**: Longer average session durations were associated with lower dropout rates, suggesting that sustained attention correlates with persistence.
4. **Average Time Between Sessions**: The regularity of student engagement with the platform was highly predictive, with shorter gaps between sessions associated with course completion.
5. **Assignment Submissions**: The number of assignments submitted by students was a significant predictor, highlighting the importance of active participation in course activities.

These findings align with prior research on MOOC completion, which has consistently identified engagement metrics as strong predictors of persistence.

Discussion of Results

1) Implications for Model Selection

Our comparative analysis yields several important implications for model selection in educational data mining:

- **Simplicity vs. Complexity**: The superior performance of simpler models (particularly Logistic Regression) over more complex deep learning architectures on the XuetangX dataset suggests that educational data may not always benefit from increased model complexity. The Transformer model's performance (AUC = 0.5000) indicates random guessing, likely due to the mismatch between the model architecture and the aggregated feature representation. This finding aligns with the principle of parsimony in predictive modeling.
- **Interpretability Trade-offs**: The interpretability of Random Forest and Logistic Regression provides additional value for educational stakeholders who need to understand the factors driving predictions.
- **Deep Learning Limitations**: Despite their theoretical advantages in capturing complex patterns, deep learning models did not consistently outperform traditional machine learning approaches. This may be due to the relatively small number of features or the nature of the prediction task.
- **Computational Efficiency**: Traditional machine learning models required significantly less computational resources and training time compared to deep learning models, making them more practical for real-time applications in educational settings.

2) Feature Selection Insights

Our feature importance analysis provides valuable insights for feature selection in educational data mining:

- **Behavioral vs. Performance Features**: Both behavioral features (engagement patterns) and performance features (assignment submissions) demonstrated strong predictive power, suggesting that comprehensive models should incorporate both types of indicators.
- **Temporal Consistency**: Features capturing the consistency and regularity of learning activities emerged as particularly important, highlighting the value of temporal analysis in educational data.
- **Interaction Depth**: Metrics reflecting deeper engagement (forum posts, assignment submissions) were more predictive than surface-level interaction counts, suggesting that quality of engagement matters more than quantity.
- **Early Indicators**: Several highly predictive features can be measured early in a course, enabling timely interventions before students fall too far behind.

3) Practical Applications

The findings from our comparative analysis have several practical applications for educational stakeholders:

- **Early Warning Systems**: The identified predictive features can be incorporated into early warning systems to identify at-risk students in MOOC environments.
- **Personalized Interventions**: The feature importance patterns suggest that interventions should focus on encouraging assignment completion, regular engagement, and forum participation.
- **Course Design Implications**: Course designers can prioritize elements that promote the behaviors associated with successful completion, such as regular, manageable assignments and interactive discussion opportunities.

- **Feature Monitoring**: Educational platforms can prioritize tracking and analyzing the most predictive features identified in this study to enhance their learning analytics capabilities.

Practical Applications

Early Warning System

Our analysis demonstrates the feasibility of developing effective early warning systems based on the best-performing models identified in this study. Such systems can help identify at-risk students before they fall behind or drop out, enabling timely interventions.

The proposed early warning system would consist of the following components:

- **Data Collection Module**: Interfaces with learning management systems to continuously gather student interaction data
- **Feature Extraction Pipeline**: Processes raw data to generate the predictive features identified in our analysis
- **Prediction Engine**: Implements the Logistic Regression model (best performer) to generate risk scores
- **Alert Generation System**: Converts prediction outputs into actionable alerts for instructors and students
- **Intervention Recommendation Engine**: Suggests personalized interventions based on specific risk factors

When implementing such a system, several considerations should be addressed:

- **Prediction Timing**: The system should make predictions early enough to allow for effective intervention while ensuring sufficient data for accurate prediction.
- **Alert Thresholds**: Careful calibration of risk thresholds is necessary to balance between false alarms and missed identifications.
- **Privacy Protection**: Student data must be handled in compliance with relevant privacy regulations and ethical guidelines.
- **User Interface Design**: The system should present information in an intuitive and actionable format for both instructors and students.

Personalized Learning Recommendations

Beyond identifying at-risk students, our models can be leveraged to generate personalized learning recommendations that optimize each student's learning path.

The personalized recommendation system would utilize the following approach:

- **Student Profiling**: Creating multidimensional profiles based on the predictive features identified in our analysis
- **Content Matching**: Aligning learning resources with individual student needs and learning patterns
- **Adaptive Sequencing**: Dynamically adjusting the sequence of learning activities based on performance and engagement
- **Feedback Integration**: Incorporating student feedback to refine recommendations over time

Based on our feature importance analysis, the system could provide several types of recommendations:

- **Engagement Recommendations**: Suggestions for optimal study patterns based on temporal consistency features
- **Content Recommendations**: Personalized resource suggestions based on knowledge component mastery
- **Interaction Recommendations**: Guidance on beneficial peer interactions based on social engagement patterns
- **Study Strategy Recommendations**: Advice on effective learning approaches based on performance patterns

Ethical Considerations and Responsible AI in Student Performance Prediction

The widespread use of AI/ML models in academia especially for the prediction of student performance must be balanced with comprehensive analysis of the model's ethical implications, data bias, fairness, and interpretability. Although we have presented the problem of predictive accuracy and interpretability, we acknowledge the broader societal implications of these systems. The XuetangX dataset may contain some bias in terms of student demographics, resource accessibility and so on, which may unwittingly cause unfair predictions towards some student groups. Fairness monitoring requires ongoing audits of model outputs and commitment to reduce bias in algorithms.

Furthermore, the interpretability of models, as highlighted by Logistic Regression's performance is critical to build trust that a model was what identified a student as at-risk so that educators can know why a student was flagged as at-risk rather than just that they are at-risk. This visibility enables human insight and avoids the black box problem in significant decision-making. Compliance to published standards, such as the UNESCO standards on the use of AI in educational systems, or IEEE's Ethically Aligned Design principles, is needed veering reasonable AI-supported student support. In future work, we will consider bias in more detail, including various fairness metrics, and investigate robust interpretability methods for achieving reasonable and fair treatments by making the models interpretable at their decision boundaries

Limitations and Future Work

Limitations

Despite the comprehensive nature of our analysis, several limitations should be acknowledged:

- **Dataset Specificity**: Our findings are based on the XuetangX dataset and may not generalize to all MOOC platforms or educational contexts.
- **Feature Granularity**: The aggregated features used in our analysis may obscure more fine-grained patterns that could improve prediction accuracy.
- **Temporal Dynamics**: Our current models do not fully capture the evolving nature of student behavior over time, which may limit their long-term predictive accuracy.
- **Model Interpretability**: While we can identify important features, the causal mechanisms underlying these relationships remain unclear, particularly for complex models.
- **Demographic Factors**: Limited demographic information in the dataset prevented analysis of how prediction models perform across different student populations.

A primary limitation of this study is its reliance on the XuetangX MOOC dataset, which originates from a single platform and regional context in China. While this dataset is extensive and rich in detail, the specific learning behaviors and platform interactions observed may not be fully representative of MOOCs globally. Therefore, the direct generalizability of our findings to other MOOC platforms (e.g., edX, Coursera) or different cultural educational contexts should be considered with caution. Future work could involve validating the proposed models and feature importance across a broader range of MOOC datasets to assess their cross-platform applicability.

Future Work

To address these limitations and extend our findings, we propose several directions for future research:

- **Temporal Modeling**: Developing more sophisticated temporal models that capture the evolution of student behavior throughout a course, potentially using recurrent neural networks with attention mechanisms.
- **Multimodal Analysis**: Incorporating additional data sources such as video viewing patterns, text analysis of forum posts, and peer interactions to create richer predictive models.
- **Causal Modeling**: Moving beyond correlation to identify causal relationships between educational interventions and student outcomes.
- **Fairness and Bias**: Investigating potential biases in predictive models across different demographic groups and developing approaches to ensure equitable predictions.
- **Intervention Studies**: Designing and evaluating specific interventions based on the predictive insights generated by our models.

Conclusion

In this paper, a comparative study of traditional machine learning and deep learning models was applied to predicting student drop out based on data from the XuetangX MOOC. Our results showed that simple models, particularly Logistic Regression, were better than the more complex deep learning models in this educational context. Feature importance analysis identified key predictors of student success, including assignment submissions, session count, and content engagement.

Our findings have important practical implications for educational practitioners. The identified predictive features and models may be integrated into early warning systems for the detection of at-risk students and timely interventions. Designers of courses can emphasize features that encourage behaviors that are associated with successful completion; for instance, providing small but regular assignments, and periods for interactive discussion.

Future studies focus on developing more sophisticated temporal models, actively include other data for more thorough exploration of causal connections, ensure fairness among different demographics and propose data-driven interventions based on prediction of the models. It is by facing these that we can work to realize more of the potential of AI/ML for bettering learning outcomes in online learning.

While our study provides valuable insights into student performance prediction, itis important to acknowledge that the analysis is based solely on the XuetangX MOOC dataset, representing

a specific regional and platform context. Future research could explore the generalizability of these findings across diverse MOOC platforms and cultural settings.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that Grammarly, an AI-assisted writing software, was used in proofreading and refining the language used in the manuscript. The usage was limited to correcting grammatical and spelling errors and rephrasing statements for accuracy and clarity. The author further declares that, apart from Grammarly, no other AI or AI-assisted technologies have been used to generate content in writing the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

STEM Teaching Readiness in Hong Kong: A Decade of Insights From the Modified Theory of Planned Behavior

Ka Yan Chung, The Hong Kong Polytechnic University, Hong Kong
Henry Ma, The Hong Kong Polytechnic University, Hong Kong

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study investigates the readiness of primary and secondary school teachers in Hong Kong to implement STEM education, nearly ten years after its formal policy introduction. Grounded in a modified Theory of Planned Behavior (TPB), the research explores five key constructs: attitudes toward STEM, perceived systemic barriers, self-efficacy, affective conditions (as a proxy for intention), and STEM teaching behaviors. A quantitative survey was conducted with 119 teachers using convenience and snowball sampling. The results revealed that attitudes significantly predicted affective readiness ($\beta = 0.544$, $p < 0.001$), and affective readiness in turn strongly influenced actual STEM teaching behaviors ($\beta = 0.592$, $p < 0.001$). Perceived systemic barriers also had a surprising positive influence on behavior ($\beta = 0.303$, $p < 0.001$), suggesting that in certain institutional contexts, constraints may act as creative drivers rather than deterrents. In contrast, self-efficacy was not a significant predictor of intention ($p > 0.05$). The model accounted for 56.9% of the variance in affective readiness and 43.5% in teaching behavior, indicating moderate to strong explanatory power. Additional analysis showed that related training and experience significantly enhanced readiness ($p < 0.05$), regardless of gender or school level. The findings have practical implications for curriculum designers and school leaders, suggesting that professional development should integrate emotional readiness and institutional resilience as central components of STEM implementation strategies.

Introduction

In 2015, the Education Bureau (EDB) put forward STEM education in Hong Kong, which was supposed to enhance the competitiveness of students in a more technology-driven world and was thus justified in the Policy Address of the Hong Kong Government (HKSAR, 2014). Over the last decade, EDB has introduced and implemented different policies and initiatives through official guidelines in 2016 (EDB, 2016), and finally establishing the STEM Education Centre in 2017 (HKSAR, 2017) meant for integrating STEM into primary and secondary schooling. This school-based approach (EDB, 2016) places enormous pressure on teachers; it critically depends on their readiness and willingness to successfully integrate various aspects of STEM into their pedagogy. Therefore, besides curricula, effectiveness in STEM education will also depend on how these teachers perceive it; what their capacity is, and whether they are willing to implement it.

The studies that have gone in Hong Kong, despite STEM being emphasized more, have focused on the issues concerning the teachers faced at the EDB rather off their own preparation. These works reported that constraints of time, lack of support by the schools and EDB, inadequate preparation on the part of the EDB, and other unknown factors affecting student engagement (Croucher Foundation, 2016; Lau, 2019; Hong Kong Federation of Youth Group, 2018). The rest dealt with pedagogical aspects: methodologies of teaching (Liang & Fung, 2022; So, 2018), assessment approaches (Ali, 2021; Yip & Chan, 2019), and STEM literacy development (Chang et al., 2021; Kutnick et al., 2020).

The blank in the study both psychologically and contextually in what makes teachers willing to implement STEM education is very crucial. This research, therefore, seeks to fill the gap by determining how far teachers' attitudes, perceived systemic barriers, and self-efficacy predict their affective readiness and resultant pedagogical practice toward STEM. The above objective was conducted using the Theory of Planned Behavior (TPB) model (Ajzen, 1991), which traditionally links attitude, subjective norm, and perceived behavioral control to intention and subsequent behavior. Affective readiness is introduced here with fine calibrations as an important mediator stressing the strong influence of the affective domain on education strategies.

This study will be significant to the extent that it can specify approaches to teacher support, thus realizing the STEM education goals set in Hong Kong. By emphasizing readiness in affective and behavioral aspects, this study provides critical information on how to improve teacher readiness; this, in turn, feeds into the general aim of building a qualified STEM workforce in Hong Kong.

Literature Review and Hypotheses Development

STEM Education and Teacher Readiness

The successful implementation of STEM education depends on teachers' readiness, a multifaceted construct that significantly influences educational outcomes. Wu et al. (2022) emphasized that the teachers' readiness to adopt STEM education is a critical determinant of the success of STEM education because it directly affects their ability to integrate elements of STEM into their teaching practices. Rafferty et al. (2013) describe readiness in three dimensions: cognitive, affective, and behavioral. In STEM education context, cognitive readiness means teachers' knowledge of STEM concepts and pedagogy; affective readiness

includes attitudes, emotions, and motivation related to STEM teaching; while behavioral readiness covers the actual classroom practices of the teachers-including both the frequency and quality of activities related to STEM subjects. The present study will address affective and behavioral readiness since they have a more immediate impact on the success of STEM teaching and are fields where actionable insights for teacher support can be gained. Measuring cognitive readiness is equally important, though it takes up a lot of resources and time and is typically dealt with via formal training programs. Since this study was small-scale in nature, the focus on the affective and behavioral dimensions leads to a more in-depth exploration of the mental and practical motivators of STEM instruction among teachers in Hong Kong.

Theory of Planned Behavior (TPB)

The Theory of Planned Behavior (TPB) is one of the most articulated and influential models in explaining and predicting human behavior. According to Ajzen (1991), behavior is a function of three primary dimensions: attitudes toward the behavior, subjective norms, and perceived behavioral control. Altogether they determine intention which is the immediate antecedent for action. Therefore, it has been extensively applied in educational research to investigate teachers' intentions and behaviors regarding teaching-related practices, technology adoption, and professionalization. For example, Dunn et al. (2018) applied TPB to explore teachers' intentions toward ongoing professional development. They found strong predictive elements in control and attitude for workers' willingness to support new work practices. In another study by Teo et al. (2016), it was found that an individual's attitude towards technology and the perceived behavioral control of teachers significantly influences their intention of using technology for teaching. Subjective norms may pose negative or less positive effects on the same. In terms of STEM education, TPB has been proved useful in predicting in-service teachers' and preservice teachers' intentions to adopt STEM teaching. Wu et al. (2022) revealed that both attitudes and perceived behavioral controls have a direct influence on STEM teaching intentions whereby perceived usefulness, self-efficacy among others act as indirect factors. For example, Li et al. (2019) applied TPB to less conventional STEM areas like the integration of STEM with physical education where all three TPB constructs served as positive predictors of teachers' intention highlighting the model's adaptability across different educational settings.

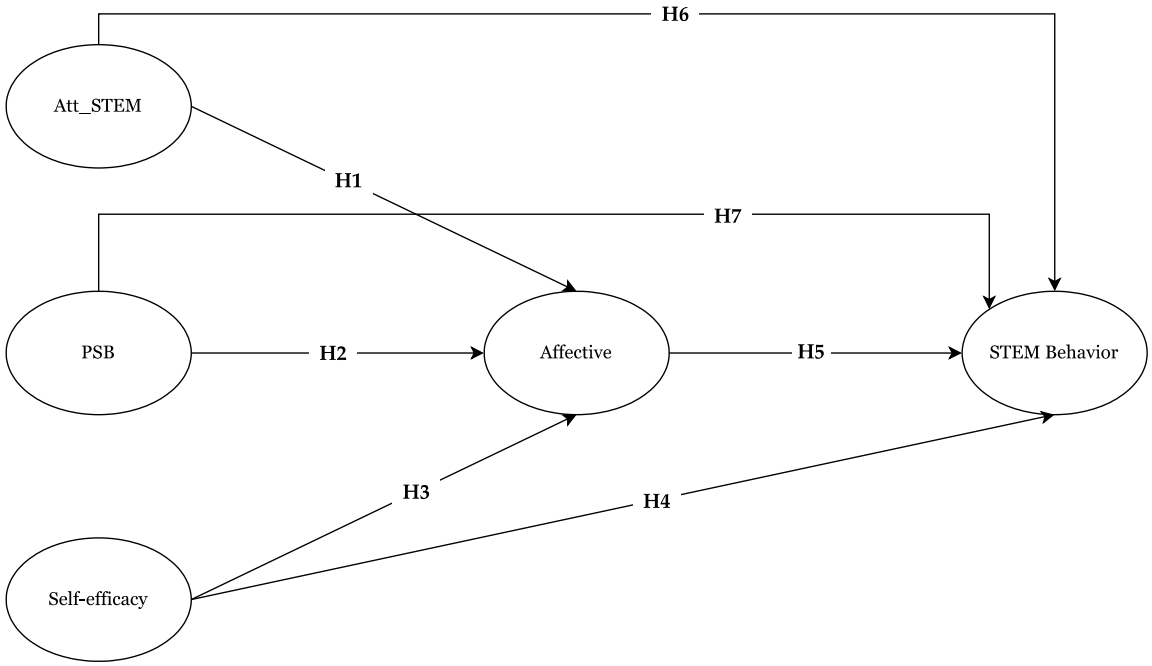
This study adapts and implements TPB to fit in with the focus on STEM readiness of Hong Kong teachers by emphasizing affective condition as a primary driver. In traditional models of TPB, behavioral intention mediates between behavior and its antecedents; here, in this modified model, affective condition is inserted in the mediating role between attitudes, systemic barriers, self-efficacy, and STEM teaching behaviors (see Table 1). This is quite consistent with previous studies that have found educational contexts to be sensitive to affective variables. For example, Teo et al. (2016) found that technology usage was most strongly influenced by attitude toward technology which is an affective component; it again underlines how emotions weight behavior. Though TPB applications to STEM education have increased, knowledge gaps in affective and behavioral determinants of STEM teaching readiness remain, particularly in Hong Kong where concerns about resource constraints and high-stakes educational settings seem to localize.

Table 1
Research Constructs of Modified TPB

Construct	TPB construct	Definition
Att_STEM	Attitude towards the Behavior	Directly measures teachers' attitudes of teaching STEM.
Perceived Systemic Barriers (PSB)	Subjective Norm	Captures perceived pressures from the teachers that discourage STEM teaching.
Self-efficacy	Perceived Behavioral Control	Reflects teachers' confidence in their ability to plan and deliver STEM lessons.
Affective conditions	Behavioral Intention	Measure teachers' emotional engagement and eagerness, translating into an intention to teach STEM (intrinsic motivation).

Research Model and Hypotheses

This study attempts to identify factors that influence the teaching intentions of Hong Kong primary and secondary teachers, as well as their actual teaching behavior toward STEM, through the application of a modified TPB framework. Therefore, this research tries to explore how teachers' attitudes, external pressure, and perceived control on their capability to perform influence their readiness to embrace STEM practices. Insights into effective STEM education in Hong Kong can be drawn from this exploration. The conceptual model of this research derived from the modified TPB model is displayed in Figure 1. The investigation is guided by the following hypotheses:



- **H1:** Teachers' attitudes toward STEM education (Att_STEM) positively influence their affective conditions.
- **H2:** Perceived systemic barriers (PSB) negatively influence teachers' affective conditions.
- **H3:** Teachers' self-efficacy positively influences their affective conditions.
- **H4:** Teachers' self-efficacy positively influences their STEM teaching behaviors.
- **H5:** Teachers' affective conditions positively influence their STEM teaching behaviors.
- **H6:** Teachers' attitudes toward STEM education (Att_STEM) indirectly influence their STEM teaching behaviors through affective conditions.
- **H7:** Perceived systemic barriers (PSB) indirectly influence teachers' STEM teaching behaviors through affective conditions.

Methodology

Research Design

This study adopted a quantitative research approach and conducted a structured survey questionnaire to assess the readiness of primary and secondary teachers in Hong Kong towards the implementation of STEM education. Four main questions guided this research: (1) How do attitudes toward STEM, perceived systemic barriers, and self-efficacy shape the affective readiness of Hong Kong teachers?; (2) How do affective readiness and self-efficacy influence STEM teaching behaviors among Hong Kong teachers?; (3) Do attitudes toward STEM and perceived systemic barriers indirectly affect STEM teaching behaviors through affective readiness? And (4) Are there significant demographic differences in these factors? The above-used approach allowed for the orderly examination of mental and practical elements related to the practice of teaching STEM within a modified TPB framework.

Figure 1
Research Conceptual Model

Sampling and Data Collection

The data were collected through an online survey, which yielded a total of 119 valid responses from teachers in primary and secondary schools in Hong Kong. Sampling utilized convenience and snowball methods, taking advantage of the researcher's personal network to disseminate the survey. This method provided easy access to a diverse yet manageable sample within the limitation of a small-scale study. The demographic information, including gender, years of teaching experience, school level, and STEM-related qualifications of the respondents, was collected to present their complete profiles.

Survey Instrument

The instrument used for the survey comprised 49 items initially designed to measure the related constructs. Items for attitudes toward STEM education, which is abbreviated here as Att_STEM, were adopted from the Teachers' Attitudes towards STEM Education and Teaching (TASET) Scale (Papagiannopoulou & Vaiopoulou, 2024). Items for self-efficacy and affective conditions were taken from the TRi-STEM Scale (Papagiannopoulou et al., 2023). Based on previous research and contextual needs, perceived systemic barriers (PSB) and STEM teaching behaviors were added as new subscales. The survey used a 5-point Likert scale in measuring responses. A pilot test was conducted with one primary school teacher and one secondary school teacher so that adjustments could be made regarding the clarity of the items and their proper structure before they would be fully deployed. Detailed references to the adapted scales can be found in Table 2.

Data Analysis

Two different methodologies were applied to analyze data in answering the posed research questions. First, Partial Least Squares Structural Equation Modeling (PLS-SEM) carried out in

SmartPLS 4.1.1.2 was used to test the proposed relationships of the modified TPB model along with its direct and indirect effects between constructs. Second, demographic comparisons were run using Mann-Whitney U tests in JASP 0.19, chosen due to non-normality and small sample size (n = 119). All software applications made available easily conducted analyses that were appropriately powerful to ensure finding valid results. Strict adherence to ethics, including informed consent as well as data anonymity was ensured during the entire research process.

Table 2
Scale Adapted for Survey Item Generation

Construct	Scale adapted	Reference
Attitude towards STEM (Att_STEM)	Teachers' Attitudes towards STEM Education and Teaching (TASET) Scale	(Papagiannopoulou & Vaiopoulou, 2024)
Perceived Systemic Barriers (PSB)	New subscale concluded from research result	Lau (2019); Hong Kong Federation of Youth Group (2018); Croucher Foundation (2016)
Self-efficacy	Tri-STEM Scale	(Papagiannopoulou et al., 2023)
Affective conditions	Tri-STEM Scale	(Papagiannopoulou et al., 2023)
STEM Behavior	New subscale	/

Results

Results are outlined in three parts: the evaluation of the measurement model, structural model analysis, and comparative analysis of demographic differences. These will indicate the reliability and validity of the data, the predictive relationships within the modified TPB framework, and the variations across teacher demographics in Hong Kong.

Measurement Model Evaluation

The measurement model evaluation began with an assessment of survey items. The item evaluation of the measurement model to ensure robustness through item retention was conducted according to the recommendations of Sarstedt et al. (2021) with items having factor loadings of 0.57, retaining at least three items per construct, to assure structural integrity. This procedure subsequently led to the final selection of 28 items that were used in the data analysis to be reported. Composite Reliability (CR) and Average Variance Extracted (AVE) were computed for reliability and validity and are reported in Table 3. All CR values are greater than 0.7 (Hair et al., 2019) establishing good internal consistency among the constructs. The high CR values were again confirmed, allowing the second form of convergent validity to have AVE values at or above the 0.5 criterion, underestimating by two constructs, in an exploratory study of this nature. The square roots of AVE generally exceeded inter-construct correlations, but some HTMT values exceeded 1.0 (see Table 4), suggesting potential overlap. However, the overall statistics affirm the data's suitability for PLS-SEM analysis and warrant a cautious interpretation of the findings.

Table 3
Cronbach Alpha, Rho-A, Composite Radiality and AVE Values for Internal Consistency Reliability and Validity Analysis

Construct	Cronbach's alpha	Rho-A	CR	AVE
Affective	0.538	0.532	0.765	0.522
Att_STEM	0.639	0.647	0.785	0.480
PSB	0.550	0.582	0.761	0.520
STEM Behavior	0.773	0.776	0.841	0.470
Self-efficacy	0.686	0.703	0.808	0.516

Table 4
Results of the Discriminant Validity Analysis

	Affective	Att_STEM	PSB	STEM Behavior	Self-efficacy
Affective	**0.722**	1.132	0.758	0.997	0.657
Att_STEM	0.681	**0.693**	0.375	1.000	0.674
PSB	0.426	0.215	**0.721**	0.451	0.402
STEM Behavior	0.648	0.697	0.270	**0.686**	0.528
Self-efficacy	0.412	0.425	0.039	0.380	**0.718**

Note. The square root AVE values are in bold; the results for the Fornell–Larcker criterion are below the diagonal and those of the Heterotrait–Monotrait ratio are above the diagonal.

Structural Model Analysis

The structural model analysis was carried out to see how the five underlying constructs within the adjusted TPB framework relate to each other predictively and to put an implicit emphasis on how they influence behaviors pertaining to STEM teaching. The model turned out to have a moderate degree of explanatory as well as predictive power accounting for an R^2 value of 0.435 with Q^2 being 0.336 for STEM teaching behaviors. The results of hypothesis testing are explicitly detailed in Figure 2 and Table 5. While H1, stating a positive influence of attitudes toward STEM on improving affective conditions, is successfully validated by a standardized beta weight of 0.544 ($p < 0.001$), signifying a strong emotional impact. The hypothesis that perceived systemic barriers would negatively relate to affective conditions (H2) is not supported, but rather the converse is true, as it stands at ($\beta = 0.303$, $p < 0.001$). Therefore, H2 is rejected. Other such related hypotheses, H3: self-efficacy positively influences affective conditions ($\beta = 0.169$, $p = 0.110$), and H4: self-efficacy positively influences STEM behavior ($\beta = 0.236$, $p = 0.076$), are also not supported due to very wide and large p-values. H5. It was strongly supported that affective conditions drive STEM teaching behaviors ($\beta = 0.592$, $p < 0.001$). Indirect effects, H6 and H7, attitudes influence behaviors via affective conditions ($\beta = 0.322$, $p = 0.003$) and barriers as well ($\beta = 0.179$, $p = 0.001$). Four of the seven hypotheses turned out to be significant. The limited role of self-efficacy was a notable finding.

Figure 2
Hypothesis Testing Results

Note. The dotted line indicates the hypothesis that is rejected. * p < 0.05, ** p < 0.01, *** p < 0.001.

Comparative Analysis

The Mann-Whitney U test was used for the comparative analysis of demographic differences because of the non-normal distribution within a small sample size in each grouping (n < 30). Table 6 shows that gender, in all constructs, had no significant difference, which means that the readiness level is the same for both genders. There was a significant difference in teaching experience; self-efficacy was scored higher in senior teachers (6+ years) (p = 0.020), and secondly, the secondary teachers had more self-efficacy compared to them. STEM diploma teachers performed better than their counterparts without STEM diplomas in the following constructs: Att_STEM (p = 0.030), self-efficacy (p < 0.001), affective condition (p = 0.043), and STEM teaching behaviors (p = 0.003). STEM training has more general effects where the results are significant in Att_STEM, self-efficacy, affective condition (all at p < 0.001), and STEM teaching behaviors (p = 0.012). Likewise, teachers with STEM coordination experience showed better results in STEM (p = 0.006), self-efficacy (p < 0.0l), and affective (p = 0.015). Note that barriers did not show any demographic variation, showing a barrier perception that was uniform through the sample. These findings clearly indicate an investment by the training and experience to upgrade the readiness.

Table 5
Results of Hypothesis Testing

	Hypothesis	*β*	T Statistics	*p* values	Result
H1	Teachers' attitudes toward STEM education positively influence their affective conditions.	0.544	5.610	0.000	Supported
H2	Perceived systemic barriers negatively influence teachers' affective conditions.	0.303	4.883	0.000	Rejected
H3	Teachers' self-efficacy positively influences their affective conditions.	0.169	1.600	0.110	Rejected
H4	Teachers' self-efficacy positively influences their STEM teaching behaviors.	0.236	1.773	0.076	Rejected
H5	Teachers' affective conditions positively influence their STEM teaching behaviors.	0.592	4.497	0.000	Supported
H6	Teachers' attitudes toward STEM education indirectly influence their STEM teaching behaviors through affective conditions.	0.322	3.015	0.003	Supported
H7	Perceived systemic barriers indirectly influence teachers' STEM teaching behaviors through affective conditions.	0.179	3.184	0.001	Supported

Discussions

This study critical insights into the readiness of Hong Kong primary and secondary teachers for the implementation of STEM education. Results attitudes, emotions, barriers, self-efficacy, and demographic factors within the modified TPB framework. Results findings with existing literature to bring about theoretical and practical implications within the context of educational landscapes in Hong Kong.

Attitudes and Emotions Drive STEM Readiness

A major finding relates to the very important role that attitudes and emotions play in the preparedness of teaching in STEM. The analysis of the structural model showed a very strong positive relationship between attitudes toward STEM and its affective condition, ($\beta = 0.544$, $p < 0.001$), which is in line with Ajzen (1991) within the framework of TPB; affective readiness then significantly impacts on STEM teaching behaviors ($\beta = 0.592$, $p < 0.001$) hence supporting hypothesis H5 as well. These findings support previous studies by Chiriacescu et al. (2023) and Thibaut et al. (2018), where it was found that strong attitudes can directly predict readiness and intention among teachers for STEM education. They also indirectly support Hargreaves (1998) and Wu et al. (2022) who express that emotions form a profound base for teaching practices; Vaiopoulou et al. (2024) reinforces this by pinpointing affective readiness as a dominant readiness influencer on teaching intentions. McLure et al. (2022) in their study argue

that teachers' positive emotional and attitudinal readiness not only makes them more prepared but also improves student outcomes by creating better classroom emotional climates and teacher-student relationships. This finding points to the fact that cultivating positive attitudes is of essence to upgrade both the teachers' readiness and their impact in the classroom.

Table 6

Results of Hypothesis Testing

Demographic grouping	Att_STEM	PSB	Self-efficacy	Affective	STEM teaching behavior
Gender	NS	NS	NS	NS	NS
Teaching experience (Junior vs. Senior 6+years)	NS	NS	**p < 0.001** (Senior higher)	NS	NS
School Level (Primary vs. Secondary)	NS	NS	**p = 0.020** (Secondary higher)	NS	NS
STEM diploma (Yes vs. No)	**p = 0.030** (Yes higher)	NS	**p < 0.001** (Yes higher)	**p = 0.043** (Yes higher)	**p = 0.003** (Yes higher)
STEM training (Yes vs. No)	**p < 0.001** (Yes higher)	NS	**p < 0.001** (Yes higher)	**p < 0.001** (Yes higher)	**p = 0.012** (Yes higher)
STEM coordination (Yes vs. No)	**p = 0.006** (Yes higher)	NS	**p < 0.001** (Yes higher)	**p = 0.015** (Yes higher)	NS

Note: NS = Not Significant ($p \geq 0.05$). Significant differences ($p < 0.05$) are highlighted in bold with p-values.

Barriers as Motivators

An unexpected outcome of the study is a positive perceived systemic barrier on affective condition ($\beta = 0.303$, $p < 0.001$) as opposed to the a priori hypothesis of a negative relationship (H2). It does not, therefore, appear that the barriers would rather diminish teaching, such as limited resources, and unclear curriculum guidelines. Such barriers would, therefore, enhance emotional activity—if at all showing resilience or a problem-solving orientation by Hong Kong teachers. This finding is in line with Wu et al. (2022) and Yllana-Prieto et al. (2021) who argue that negative emotions, for example, frustration resulting from systemic challenges, drive teachers to be innovative in their teaching. It is also in line with Thibaut et al. (2019) in that running into barriers leads to seeking professional development on all aspects, thus harboring more positive emotions toward integrated STEM approaches. This indicates that barriers should no longer be perceived as barriers but as motivation in specific educational contexts.

Limited Role of Self-Efficacy

However, self-efficacy showed a relatively weak effect on both affective condition ($\beta = 0.169$, $p = 0.110$) and STEM teaching behaviors ($\beta = 0.236$, $p = 0.076$), so hypotheses H3 and H4 are not supported. This challenges the notion of the TPB that perceived behavioral control is a significant determinant of intentions and behaviors. In the context of Hong Kong, systemic and external factors, such as resource constraints and institutional pressures, may overshadow

personal confidence, leaving the question for further research on what contextual factors diminish the role of self-efficacy in STEM education.

Training and Experience Boost Readiness

The demographic analysis further indicates that readiness is more associated with training and experience than with gender and grade. Teachers with training in STEM specificity, experience of coordination, or degree exhibit readiness significantly in most of the constructs with values between 0.012 and <0.001. This finding agrees with that of Mohamad Hasim et al. (2022) which shows that there is a statistically significant effect of professional development on STEM readiness. More senior teachers with over six years of experience show more readiness as well, a finding consistent with that of Song and Zhou (2021) who say that teaching experience enhances perceived competence and teaching beliefs.

Implications

Theoretically, these findings extend the TPB by underscoring the critical role of emotions in educational settings. The strong influence of affective condition suggests that TPB could be enhanced by formally incorporating affective factors, as proposed by Perugini and Bagozzi (2001), making it more applicable to teaching contexts. The positive effect of barriers also challenges the typical view within TPB regarding subjective norms as barriers, thus demanding an in-depth exploration regarding teachers' perception of challenges through, perhaps, the Self-Determination Theory (Ryan & Deci, 2000).

The results practically call for targeted interventions in improving STEM readiness. Schools need to invest in workshops which would create a positive perception of STEM and enhance emotional engagement by offering hands-on activities and group work with peers; thus, STEM teaching would be less daunting. The systemic barriers faced by innovation in education can be reformed by individual creative endeavors with solid institutional support. The gap readiness experienced by novice teachers emphasizes the need for a specific program for non-STEM-background new entrants to guarantee equity across the teaching workforce.

Conclusion

The study informed meaningful insights into the readiness of Hong Kong primary and secondary teachers for STEM education. Key results drove that positive attitudes and emotions toward teacher readiness come as the prime concerning the effective teaching of STEM. While attitudes toward STEM proved to be great pre-requisites in affective readiness for STEM teaching, surprisingly, the same attitudes toward systemic barriers positively influenced affective readiness. This is an indicator that it brings out innovation among the teachers. Readiness was most influenced by training and experience, with STEM-trained teachers and those trained in coordination showing better results in all aspects over their counterparts. Effects of self-efficacy were relatively small, perhaps implying that the environment in Hong Kong is more external. The results direct sought targeted training and affective encouragement in moving STEM education forward, providing a blueprint of how stakeholders may enhance initiatives in STEM for this area.

Limitation and Future Research

The study's limitations warrant careful consideration. The small sample size (n = 119) and the unequal demographics restrict generalizability. In addition, the utilization of convenience sampling may result in bias because the participants are more susceptible to sharing similar educational experiences or views, and therefore may distort the findings. The cross-sectional nature limits the potential for determining causality, offering merely a snapshot of readiness at one moment in time. Additionally, omitting cognitive readiness means an incomplete picture of readiness since this aspect is integral to having a full understanding of readiness. The counterintuitive positive effect of systemic barriers to affective readiness must be scrutinized closely since the underlying mechanisms are not well understood in the absence of qualitative data.

Future research needs to address these limitations using larger, more representative samples to increase reliability and representativeness, with the possibility of stratified sampling to ensure balanced demographic representation. Longitudinal research is recommended to examine the development of readiness over time, with insight into causal processes. The integration of cognitive readiness via rigorous evaluations will provide a comprehensive view of teacher readiness. Furthermore, qualitative research approaches, for instance, interviews or focus group discussions, are necessary to investigate the unforeseen positive effects of challenges and therefore reveal the innate sources of teachers' resilience and motivation. These approaches will enrich the comprehension of readiness in STEM education and therefore advise the development of more effective strategies to support teachers in Hong Kong and beyond.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares the use of QuillBot, an AI-assisted writing tool, solely to proofread and refine the manuscript's language by correcting grammar, spelling, and improving clarity. No other AI technologies were used in preparing this work. All research ideas, design, findings, and analyses are original and based on the author's own efforts. The Impact of University Life During the COVID-19 Pandemic on Fundamental Competencies for Working Persons: Focusing on Negative Effects

Satoshi Kanamori, Tokyo Kasei Gakuin University, Japan
Yoshihiro Maeda, Fukuyama University, Japan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study investigates how university life during the COVID-19 pandemic (2020–2024) affected Japanese students' Fundamental Competencies for Working Persons, with particular attention to negative effects. In recent years, transferable competencies beyond academic knowledge have become increasingly important; however, prolonged restrictions during the pandemic raised concerns about students' skill development. Using large-scale diagnostic data from the "Fundamental Competencies for Working Persons in the VUCA Era" assessment, this study analyzed responses from 2,195 third-year university students. Multiple regression analysis was conducted to examine the relationships between competency scores, the length of the COVID-19 period experienced in university life (measured in months), and students' primary activities, such as part-time work, seminars, and hobbies. The results indicated that a longer COVID-19 period had significant negative effects on overall competency scores as well as on all three core abilities. Among them, the Ability to Work in Teams showed the strongest negative association with pandemic duration, suggesting that prolonged limitations on face-to-face interaction critically hindered teamwork development. In addition, greater engagement in hobbies was negatively associated with the Ability to Take Action and the Ability to Think Thoroughly. These findings suggest that reduced experiential and collaborative opportunities, along with increased involvement in individual and non-collaborative activities, contributed to the decline in students' competencies.

Introduction and Background

In recent years, higher education has increasingly emphasized competencies beyond specialized academic knowledge. Rapid industrial transformation, globalization, and digitalization have intensified the demand for transferable skills such as communication, collaboration, adaptability, and self-management, which have been widely conceptualized as employability or generic skills in international policy frameworks (Allen Consulting Group & NCVER, 2004; NCVER, 2003).

The COVID-19 pandemic further accelerated these changes by drastically altering university life. From 2020 onward, students experienced prolonged periods of online learning, reduced face-to-face interaction, and limited opportunities for practical training, internships, and extracurricular activities. These changes raised concerns regarding the development of fundamental competencies required for future employment. At the same time, many countries have recognized a growing mismatch between what students learn in educational institutions and what is required in the labor market. In response, various frameworks have been developed internationally to conceptualize and assess universal or transferable skills.

This study focuses on how such competencies were affected during the COVID-19 pandemic, with particular attention to negative impacts on university students.

International Frameworks and COVID-19 Impacts on Student Competencies

Internationally, several frameworks have been proposed to define and measure competencies beyond academic achievement. In the United States, concepts such as Social Competency, Employability Skills, Workplace Competencies, and 21st Century Skills emphasize socio-emotional abilities, behavioral characteristics, and problem-solving skills required in modern workplaces, and social and emotional competencies have been systematically conceptualized through frameworks such as the CASEL model (CASEL, 2020), as well as broader conceptions of 21st century skills that integrate cognitive, interpersonal, and intrapersonal competencies (Partnership for 21st Century Learning, 2019).

In Australia, the Generic Skills framework, developed through collaboration between government and industry, identifies eight core abilities, including communication, teamwork, problem-solving, initiative, and technology use. These skills were designed collaboratively by the government and industry to prepare graduates for diverse and changing work environments.

Canada’s Employability Skills 2000+ framework, developed by the Conference Board of Canada, categorizes competencies into Fundamental Skills, Personal Management Skills, and Teamwork Skills, and has been widely applied in education and employment policy contexts (Conference Board of Canada, n.d.).

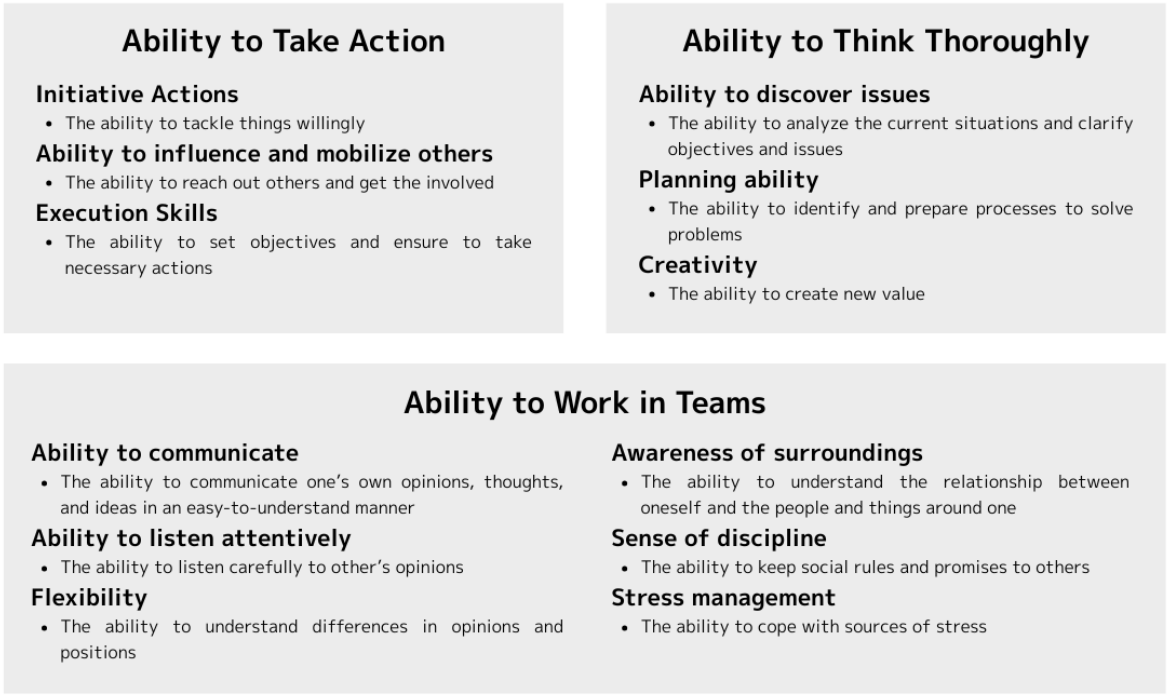
Studies conducted during the COVID-19 pandemic across these countries reveal several common trends. Communication and teamwork skills tended to decline due to reduced face-to-face interaction and experiential learning opportunities. At the same time, ICT skills and self-directed learning abilities often improved as online education became widespread. However, many students experienced increased stress, loneliness, and reduced motivation, which negatively affected personal management skills such as self-regulation and self-efficacy. Previous studies have also highlighted the rapid pedagogical shifts in higher

education during the pandemic and their implications for student learning experiences (Connor et al., 2021).

Table 1

Summary of Previous International Studies

Country	Framework	Main Findings
United States	Social Competency	Emotional control and expressivity decreased, while social sensitivity increased.
Australia	Generic Skills	Communication and teamwork declined; learning and technology skills improved.
Canada	Employability Skills 2000+	Fundamental Skills: Decline / Digital shift Personal Management Skills: Growing gap Teamwork Skills: Fewer opportunities / New forms



Empirical studies conducted during the COVID-19 pandemic have consistently reported declines in social-emotional skills, increased psychological distress, and disruptions in learning experiences among university students (Cerutti et al., 2024; Colby et al., 2023; Houlden & Veletsianos, 2022). In particular, reduced psychological need satisfaction has been associated with lower learning engagement in higher education contexts (Eckley et al., 2022).

Despite these findings, existing research has limitations. Many studies focus on specific educational contexts, rely on self-reported data, or use relatively small samples. Moreover, few studies incorporate behavioral or workplace-related perspectives, and students' broader lifestyles and extracurricular experiences are often insufficiently considered.

Positioning of Japan and Research Question

In Japan, the primary framework for evaluating transferable skills is the Fundamental Competencies for Working Persons, defined by the Ministry of Economy, Trade and Industry (METI, 2006). This framework emphasizes the ability to work collaboratively with diverse people in workplaces and communities and consists of three competency domains—Action, Thinking, and Teamwork—comprising twelve specific elements.

Figure 1
Japan's Framework: Fundamental Competencies for Working Persons

Previous domestic studies conducted during the COVID-19 period have reported changes in some aspects of fundamental competencies for working persons, particularly in specific educational contexts such as remote university classes (Maeda et al., 2022). Similar trends have also been observed in domestic studies conducted during the pandemic, including declines or uneven development in specific components of fundamental competencies for working persons across different educational settings (Endo et al., 2023; Sasaki et al., 2023). However, many of these studies focus on limited contexts, use small samples, and rarely examine the relationship between the length of the pandemic period and students' everyday activities, such as part-time work, seminars, or hobbies.

Based on international findings and the limitations of existing domestic research, this study addresses the following research question:

How did university life during the COVID-19 pandemic (2020–2024) affect students' Fundamental Competencies for Working Persons, and how are these effects related to the pandemic period and students' main activities?

The following sections present the research design, analysis, and results addressing this question.

Methods

Data Source and Participants

This study utilized data from the "Fundamental Competencies for Working Persons in the VUCA Era" diagnostic assessment developed by Nikkei HR Development. The total sample comprised 5,335 students from University A and Junior College A in Japan. To examine the

long-term effects of varying durations of COVID-19 exposure on skill development, we restricted our analytical sample to 2,195 third-year students who had experienced different lengths of the pandemic period during their university education.

Measures

Dependent Variables

All dependent variables were measured on a 100-point scale using the standardized diagnostic assessment:

1. Total Fundamental Competencies for Working Persons score: An aggregate measure of overall workplace competencies
2. Ability to Take Action: Capturing initiative, persistence, and proactive behavior
3. Ability to Think Thoroughly: Measuring problem-solving, critical thinking, and analytical skills
4. Ability to Work in Teams: Assessing collaboration, communication, and interpersonal effectiveness

Independent Variables

Independent variables were categorized into six domains:

1. Career and Future Path: Career goals after graduation, participation in internships or fieldwork
2. Learning and Academic Activities: Group projects, independent study, research or seminar participation
3. Social Relationships: Friendships with same-age or different-age peers, connections with working adults
4. Organizational Activities: Leadership or officer roles, cooperative experiences
5. Personal Activities: Engagement in hobbies
6. Background Factors: Field of study (arts/science), pandemic duration (in months), length of university life during COVID-19

Selection of Activity Variables

Among twelve activity items measured in the original assessment, we selected the five most frequently reported activities (those exceeding the mean response rate of 1,126.25) as dummy variables for regression analysis. These activities were: part-time employment (n = 3,164), hobbies (n = 2,437), research or seminar participation (n = 1,367), learning or study for academic transfer (n = 1,345), and internships or practical training (n = 1,317). This selection procedure reduced potential interpretational complexity while retaining the most representative student activities.

Operationalization of COVID-19 Exposure

The COVID-19 period was operationalized as the 40-month interval from February 2020 to May 2023, corresponding to the period of pandemic-related restrictions on Japanese university campuses. Individual exposure duration was calculated based on each student's university entry cohort: the 2020 cohort experienced 34 months of pandemic conditions, the 2021 cohort experienced 22 months, and the 2022 cohort experienced 10 months. This

variable was treated as continuous in all analyses to capture dose-response relationships between pandemic exposure and competency outcomes.

Statistical Analysis

Multiple regression analysis using the stepwise method was conducted to identify the most parsimonious models predicting each dependent variable. Prior to analysis, multicollinearity diagnostics were performed by examining the correlation matrix; no variable pairs exceeded the threshold of $|r| > 0.9$. The stepwise procedure involved initially including all independent variables and iteratively selecting the model with optimal explanatory power based on statistical criteria (p-to-enter < 0.05, p-to-remove > 0.10). All analyses were conducted using SPSS version28, with alpha set at 0.05 for significance testing.

Results

Model Performance

Analysis of variance (ANOVA) demonstrated that all four regression models achieved statistical significance ($p < .001$ for all models). However, the models exhibited modest explanatory power, with R^2 values ranging from 0.16 to 0.28. Specifically, the model predicting Total Fundamental Competencies for Working Persons yielded $R^2 = 0.28$, Ability to Take Action yielded $R^2 = 0.25$, Ability to Think Thoroughly yielded $R^2 = 0.22$, and Ability to Work in Teams yielded $R^2 = 0.16$. The relatively low R^2 values suggest that substantial variance in these competencies remains attributable to factors not captured in the current model.

Total Fundamental Competencies for Working Persons

Two independent variables demonstrated significant negative associations with overall competency scores. COVID-19 exposure duration exhibited a standardized regression coefficient of $\beta = -0.08$ ($p < .05$), indicating that longer pandemic exposure was associated with lower total competency scores. Additionally, engagement in hobbies showed a negative effect ($\beta = -0.07$, $p < .05$), suggesting that students who devoted more time to hobby activities tended to demonstrate slightly lower overall competency levels.

Duration of university life during COVID-19 (months)				

Ability to Take Action

The regression model for Ability to Take Action revealed a similar pattern of negative effects. COVID-19 exposure duration demonstrated a modest negative association ($\beta = -0.05$, $p < .05$), indicating that prolonged pandemic conditions diminished students' willingness to undertake challenges and initiative-taking behaviors. Hobby engagement exhibited a stronger negative effect ($\beta = -0.08$, $p < .01$), suggesting that greater time allocation to personal hobbies was associated with reduced proactive and initiative-driven behaviors.

Table 4

Duration of university life during COVID-19 (months)				

Ability to Think Thoroughly

For thinking and analytical competencies, COVID-19 exposure duration showed a relatively strong negative effect ($\beta = -0.09$, $p < .01$), indicating that extended pandemic periods substantially impaired students' problem-solving and critical thinking capabilities. Hobby engagement also demonstrated a negative association ($\beta = -0.06$, $p < .05$), suggesting that increased focus on personal leisure activities was associated with modest reductions in analytical thinking skills.

Ability to Work in Teams

The regression analysis for teamwork competency revealed the strongest pandemic effect observed in this study. COVID-19 exposure duration was the sole significant predictor, demonstrating a standardized coefficient of $\beta = -0.10$ ($p < .01$), representing the largest negative association across all competency domains. Notably, hobby engagement did not

emerge as a significant predictor in this model, suggesting that teamwork skills were uniquely vulnerable to pandemic-related restrictions rather than general time allocation patterns.

Discussion

Mechanisms Underlying Pandemic Effects on Competencies

The consistent negative effects of COVID-19 exposure duration across all competency domains suggest a common inhibiting mechanism: the substantial reduction in real-world experiential learning opportunities. We propose that three competency-specific pathways mediated these negative effects.

For Ability to Think Thoroughly, the dramatic reduction in project-based learning, collaborative problem-solving exercises, and hands-on fieldwork during pandemic restrictions limited students' opportunities to practice logical reasoning, creative thinking, and analytical skill application. The predominantly lecture-based and individual study formats that characterized emergency remote instruction provided insufficient cognitive challenge and feedback mechanisms essential for developing higher-order thinking skills.

For Ability to Work in Teams, the near-complete elimination of face-to-face collaboration, group activities, and interpersonal interaction during prolonged campus closures directly constrained the development of communication skills, cooperative behaviors, and interpersonal competencies. The asynchronous and text-based nature of online interactions proved inadequate for cultivating the nuanced social skills, emotional intelligence, and real-time coordination abilities required for effective teamwork.

For Ability to Take Action, the restricted opportunity structure—characterized by cancelled internships, suspended extracurricular activities, and limited social engagement—reduced students' exposure to situations requiring initiative, risk-taking, and proactive problem-solving. The absence of action-oriented learning contexts likely diminished students' self-efficacy beliefs and motivation to engage in challenging tasks.

The finding that teamwork competency exhibited the strongest negative association with pandemic duration ($\beta = -0.10$) is particularly noteworthy and consistent with international research from the United States, Australia, and Canada. This cross-cultural convergence suggests that collaborative skills are especially vulnerable to social distancing measures and online learning environments, which fundamentally alter the interpersonal dynamics essential for teamwork development.

Interpretation of Hobby Engagement Effects

The unexpected negative associations between hobby engagement and both action and thinking competencies (but not teamwork) warrant careful interpretation. We propose two complementary explanations for this pattern.

Time Allocation Hypothesis

Students who devoted substantial time to personal hobbies may have correspondingly reduced their participation in developmentally beneficial activities such as collaborative projects, research seminars, leadership roles, and social engagement. This zero-sum allocation of discretionary time could have limited exposure to experiences that foster initiative, analytical thinking, and intellectual challenge.

Activity Characteristics Hypothesis

Supplementary data on the most prevalent student hobbies during this period reveal that the top activities were predominantly passive, solitary, and screen-based: video gaming (47.4% of males), YouTube consumption (53.4% of females, 44.8% of males), music listening/concert attendance (46.1% of females, 37.7% of males), and movie/drama viewing (40.2% of females). These activities, while providing stress relief and entertainment, generally lack the interactive, problem-solving, and goal-directed characteristics that promote action orientation and critical thinking skills.

The absence of hobby effects on teamwork competency suggests that this skill domain was primarily constrained by external structural factors (pandemic restrictions on social interaction) rather than individual time allocation choices. Even students who engaged minimally in hobbies experienced substantial teamwork deficits due to the unavailability of collaborative learning opportunities.

Implications and Future Directions

The relatively modest R^2 values (0.16-0.28) obtained in our models indicate that activity participation and pandemic exposure, while significant, account for only a portion of variance in workplace competencies. This suggests the importance of incorporating psychological and motivational variables in future research. The diagnostic instrument employed in this study did not assess constructs such as achievement motivation, growth mindset, career aspirations,

self-efficacy beliefs, or resilience—all of which may moderate or mediate the relationships between environmental constraints and competency development.

Future research should adopt more comprehensive models that integrate: (1) psychological factors (motivation, self-regulation, resilience), (2) social support mechanisms (family, peer, mentor relationships), (3) institutional responses (quality of online instruction, student support services), and (4) individual coping strategies. Longitudinal designs with repeated measures would permit examination of recovery trajectories and identification of factors promoting competency restoration in post-pandemic contexts.

Additionally, qualitative research examining students' lived experiences during the pandemic could illuminate the processes through which restricted opportunities translate into competency deficits, as well as identify protective factors that enabled some students to maintain skill development despite adverse conditions.

Conclusion

This study provides empirical evidence for the negative impact of COVID-19 pandemic exposure on Japanese university students' Fundamental Competencies for Working Persons. Several key findings emerged from our analysis of 2,195 third-year students:

1. Consistent pandemic effects: Longer exposure to pandemic conditions was associated with significant decrements across all competency domains, with effect sizes ranging from $\beta = -0.05$ to $\beta = -0.10$.
2. Differential vulnerability: Teamwork competency ($\beta = -0.10$) demonstrated the greatest susceptibility to pandemic effects, consistent with international research documenting the critical importance of face-to-face interaction for collaborative skill development.
3. Dual mechanisms of impact: Competency deficits appear attributable to both structural constraints (reduced experiential learning opportunities due to campus closures and social distancing) and behavioral adaptations (increased time allocation to solitary, passive leisure activities).
4. Activity-specific effects: Hobby engagement showed selective negative associations with action and thinking competencies but not teamwork, suggesting that time allocation to individual leisure activities may compete with developmentally beneficial activities in some domains while having negligible impact in others.

These findings underscore the substantial educational costs of prolonged disruption to traditional university experiences and highlight the inadequacy of emergency remote instruction for developing interpersonal and applied competencies. As higher education institutions navigate post-pandemic recovery and prepare for potential future disruptions, our results emphasize the critical importance of preserving opportunities for collaborative learning, practical application, and social engagement—experiences that cannot be fully replicated in virtual environments.

The modest explanatory power of our models points to the need for future research incorporating psychological, motivational, and institutional factors to develop more comprehensive understanding of the multifaceted determinants of workplace competency development in crisis contexts.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that ChatGPT, an AI-assisted writing software, was used for proofreading the manuscript and refining linguistic expressions. Its use was limited to correcting grammatical and spelling errors, as well as restructuring expressions for accuracy and clarity. The author further declares that no AI or AI-assisted technology other than ChatGPT was used to generate content in the creation of this manuscript. The ideas, design, procedures, results, analysis, and discussion in this paper were independently written and derived by the author based on the careful and systematic conduct of research.

Bridging Academic Achievement and Career Readiness: The REP Scholars Experience

Elodie Billionniere, Miami Dade College, United States
Lawrence Meyer, Jr., Miami Dade College, United States

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

The Rebooting through EmTech Programs (REP) initiative, funded by the National Science Foundation, supports low-income and underrepresented students in computing fields—specifically cybersecurity, data analytics, and information systems technology. Over the past two years, REP sought to bridge academic achievement and career readiness by integrating mentorship, scholarships, and experiential learning into a cohesive student success framework. This mixed-methods evaluation of the REP Scholars Program at Miami Dade College reveals measurable improvements in students' academic performance, self-efficacy, and professional preparedness. Surveys, focus groups, and institutional data demonstrate that structured mentorship and applied learning opportunities not only enhance academic persistence but also empower students to transition confidently toward technical careers. Findings suggest that holistic, equity-centered initiatives like REP provide a replicable model for linking academic excellence with workforce readiness in higher education.

Keywords: equity in STEM, academic persistence, career readiness, mentoring, underrepresented students, community college, computing education

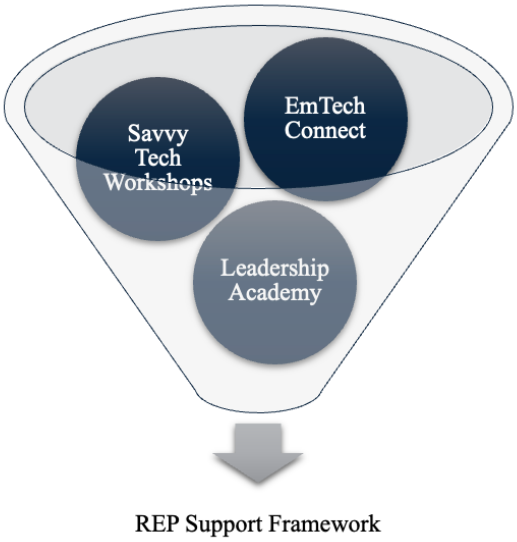
Introduction

The transformation of the 21st-century workforce depends on increasing participation of historically underrepresented groups in computing and engineering fields (National Science Board, 2022; National Science Foundation, 2023). While community colleges are critical gateways for these learners, many students face systemic barriers, including limited financial resources, external responsibilities, and low confidence in navigating career pathways—factors that hinder persistence and success (Carnevale & Smith, 2018; Jury et al., 2017; Ko et al., 2025).

Miami Dade College (MDC) is the largest and most diverse public college in the United States and the largest hispanic-serving institution, conferring more associate degrees to Hispanic students than any other college. Nationwide MDC has the highest enrollment of Hispanic undergraduates (81,398) and ranks third for Black non-Hispanic undergraduate enrollment, reflecting the rich racial and ethnic diversity of South Florida.

The Rebooting through EmTech Programs (REP) initiative was created to address these opportunity gaps in computing and technology education. At MDC, where 68% of students are low-income and 58% are first-generation, REP provides resources and support for junior and senior students pursuing degrees in cybersecurity, data analytics, and information systems technology. The program aims to bridge academic achievement and career readiness by integrating technical coursework with mentorship, scholarships, and professional development.



The purpose of this study is to evaluate how the REP model supports that bridge—how students' academic progress and personal growth translate into employability and career confidence. Specifically, the study examines:

1. How REP enhances academic achievement and persistence.
2. How mentoring and experiential learning prepare scholars for tech careers.
3. What barriers remain for students navigating both college and career readiness.

Conceptual Framework

The REP's structured supports bridge academic achievement and career readiness through a comprehensive framework of financial, academic, and professional development opportunities (see Figure 1). A dedicated scholarship provides stability and reduces financial barriers, enabling students to focus on their studies and long-term goals. *EmTech Connect* offers virtual one-on-one mentoring, exposure to industry tech leaders, and targeted academic guidance. *Savvy Tech Workshops* enhance employability through applied learning and financial literacy, preparing students to become responsible consumers, successful entrepreneurs, and wise investors. The *Leadership Rotation Academy* cultivates personal growth, confidence, and career success through intentional leadership development. Complementary academic tracks—Research, Internship, and Digital Upskilling—extend experiential learning, faculty-led projects, and certification pathways. Together, these integrated supports form a cohesive model that links academic persistence with professional preparedness.

Figure 1
The REP Academic–Career Readiness Pathway

The Need for Bridging Academic and Career Development

Research consistently underscores that underrepresented students often experience a disconnect between academic achievement and professional readiness. Although grades and course completion indicate academic success, they do not always equate confidence or employability in technical fields (Othman et al., 2024). Programs that intentionally integrate career preparation with academic learning show greater impact on post-graduation outcomes (Miller et al., 2018; Peng & Ali, 2025).

The concept of "bridging" in education refers to creating structured pathways that translate classroom learning into real-world applications. When academic achievement and workforce preparation are developed in tandem, students gain both the credentials and competencies necessary for long-term success (U.S. Department of Education, 2023).

Mentorship as the Structural Connector

Mentorship serves as the critical "bridge beam" in many successful STEM equity programs. Faculty mentors provide emotional support, reinforce belonging, and model professional identity development (Ashtiani & Feliciano, 2018; Miske & Sogunro, 2024). Effective mentoring extends beyond advising to include personalized coaching in problem-solving, communication, and goal setting—skills directly transferable to the workplace (Campbell & Mogashana, 2024).

Mentorship is especially vital for first-generation and minority students, who often lack access to networks and social capital within technical fields (Ashcroft et al., 2021). Programs like REP leverage mentoring to connect institutional resources, student motivation, and industry expectations, turning support into sustained achievement.

Experiential Learning and Career Readiness

Hands-on experiences help students apply theoretical knowledge and develop professional competencies. Internships, applied projects, and workshops serve as practical spaces for integrating academic content into career contexts. REP's design—featuring résumé-building, mock interviews, and technical certifications—aligns with evidence-based strategies for developing employability in low-income and underrepresented student populations (Cummins et al., 2019).

Holistic and Equity-Based Models of Student Success

Holistic models—addressing academic, financial, and social-emotional factors—significantly increase persistence among underserved students (Van Pham, 2024). REP operationalizes this approach through scholarships, peer engagement, and targeted mentoring, creating a comprehensive ecosystem that connects learning with livelihood.

Methodology

A mixed-methods approach analyzed REP outcomes from Fall 2023 through Spring 2025. Quantitative data assessed measurable academic and career-related changes, while qualitative insights captured scholars' lived experiences.

A total of 74 unique REP scholars participated across four survey cycles: Fall 2023 (48), Spring 2024 (62), Fall 2024 (49), and Spring 2025 (39). Surveys achieved 100% response rates each term. Four student focus groups were held in April 2024 across all program disciplines (Cybersecurity, Data Analytics, and Information Systems Technology). A faculty mentor focus group in Spring 2025 included two mentors plus one written response.

As summarized in Table 1, multiple data sources were integrated to provide a comprehensive understanding of REP scholars' academic and career development experiences, including their perceptions of mentoring, belonging, and workforce preparation. Quantitative results used paired t-tests ($p < .05$). Qualitative data were analyzed using Braun and Clarke's (2006) six-phase thematic method.

Table 1
Evaluation Data Sources and Methods

Data Source	Participants (N)	Timing	Purpose	Analysis Method
Surveys (pre/post)	48–62 per semester	Fall 2023 – Spring 2025	Track academic & career confidence; measure change	Descriptive & paired t-tests
Student focus groups	N = 23 (4 groups)	April 2024	Explore mentoring, belonging, career goals	Thematic coding
Faculty mentor focus group + written responses	N = 3	Spring 2025	Understand mentoring practices & student impact	Thematic analysis

Institutional data	REP & non-REP comparison	2023–2025	Assess GPA, completion, persistence	Comparative metrics

Results

Academic Achievement: Laying the Foundation

Quantitative analyses examined GPA, course pass rates, and persistence to assess the impact of REP participation on academic success compared with non-REP peers (see Table 2). Multivariate regression models controlled for demographic and enrollment factors, including student age, race/ethnicity, gender, in-state residency, and transfer status.

Table 2
Regression Summary of Student Academic and Persistence Outcomes (Fall 2023–Spring 2025)

Outcome Variable	Significant Predictor	Direction of Effect	Statistical Significance	Notes
GPA (Fall 2023)	REP participation	Positive	$p < .01$	Strong initial program effect
GPA (Spring 2024)	REP participation; Age	Positive	$p < .05$*	GPA increases slightly with age
GPA (Fall 2024)	REP participation	Positive	$p < .10$	Maintained gains over time
GPA (Spring 2025)	-	-	n.s.	No significant effect detected
Overall Pass Rate	REP participation; Transfer status	Positive	$p < .01$; $p < .10$	REP scholars' pass rates +11%
Persistence Fall 2023 → Spring 2024	REP participation	Positive	$p < .01$	Higher semester-to-semester retention
Persistence Fall 2023 → Spring 2025	REP participation	Positive	$p < .10$	Sustained multi-semester persistence

Note. Statistical significance determined at $p < .05$. "n.s." = not significant.

Results showed that REP participation was a statistically significant positive predictor of GPA in three of the four semesters analyzed (Fall 2023, Spring 2024, and Fall 2024) with the strongest effect during the program's first year. Across all GPA models, demographic factors showed no consistent impact, indicating the program's equitable influence on student outcomes. Age showed a mild positive relationship with GPA in Spring 2024 and Spring 2025, suggesting slightly higher achievement among older participants.

REP scholars also achieved an 11% higher overall pass rate than non-REP peers ($p < .01$), while transfer students showed a modest 4% gain ($p < .10$). Persistence followed similar patterns, with significant retention from Fall 2023 to Spring 2024 and sustained continuation through Spring 2025. None of the control variables were significant, confirming that improvements were specific to REP participation.

The mean GPA increased from 2.8 to 3.4, and 88% of participants persisted to the next academic year. Students frequently credited mentoring and reduced financial stress as key factors that enabled stronger academic focus and consistency in performance. One scholar reflected, "Having a mentor who checks in about both school and my goals kept me on track in both." This reflection captures the program's central purpose—integrating academic accountability with personal and professional development support to foster sustained achievement.

These results demonstrate the measurable academic impact of REP's integrated supports, particularly during students' first year of participation. Gains in GPA, pass rate, and persistence complement qualitative findings that emphasize the role of mentoring, financial assistance, and experiential learning in fostering academic confidence and retention.

Career Readiness: From Classroom to Career

The evaluation also assessed REP's influence on students' professional preparedness, employability skills, and career confidence. Surveys, focus groups, and interviews provided complementary perspectives on how participants translated academic progress into career readiness.

Quantitative results from pre- and post-program surveys indicated significant increases in students' self-assessed employability competencies across multiple domains. Among 56 participants who attended the *Tech Internship and Job Search* workshop, self-rated knowledge rose from an average of 3.29 to 4.66 on a five-point scale ($p < .001$). Comparable gains were observed in résumé development, interview preparation, and professional networking confidence. As shown in Table 3, scholars reported substantial growth in career confidence, goal setting, and readiness for internships and employment.

Table 3

Career Readiness Indicators Among REP Scholars (2023-2025)

Indicator	Pre-Program Mean	Post-Program Mean	Change	Statistical Significance	Data Source
Career Confidence	3.21	4.58	+1.37	$p < .001$	Survey
Networking & Communication	3.46	4.61	+1.15	$p < .001$	Survey
Résumé and Job Search Skills	3.29	4.66	+1.37	$p < .001$	Workshop feedback
Tech Interview Preparedness	3.11	4.32	+1.21	$p < .01$*	Survey
Goal Setting and Career Planning	3.52	4.63	+1.11	$p < .001$	Focus group synthesis

Note. N = 74 (aggregated survey participants, 2023–2025); subsample N = 56 for workshop-based measures. Scale: 1 = low confidence, 5 = high confidence. Statistical significance based on paired t-tests.

Focus group data reinforced these trends, revealing that REP's integrated mentoring, workshops, and career development activities effectively bridged classroom learning with industry expectations. One student reflected, "My mentor provided valuable guidance tailored to my career goals in cybersecurity and international relations. They helped me strategize my

professional development, including certification choices and skill-building, and offered insights into career paths I hadn't considered before." Another participant added, "The mentorship program was by far the most informative and valuable experience I've had with anyone in the technology industry. I learned about potential careers and the responsibilities they entail. This knowledge dismissed any doubts I had about opportunities in the field."

Faculty and industry mentors noted that REP's structured career programming enhanced students' confidence and professional identity. The faculty described flexible, empathetic mentoring approaches that integrated goal mapping and skill-building, noting that these efforts helped students connect their academic experiences to tangible career pathways.

Qualitative findings also illustrated how REP facilitated a developmental shift from student to emerging professional. Many scholars credited the combination of hands-on workshops and mentorship for improving their readiness to navigate internships, certification pathways, and entry-level employment. One student summarized the experience succinctly: "REP didn't just help me with grades, it helped me understand how my technical skills fit into real-world jobs."

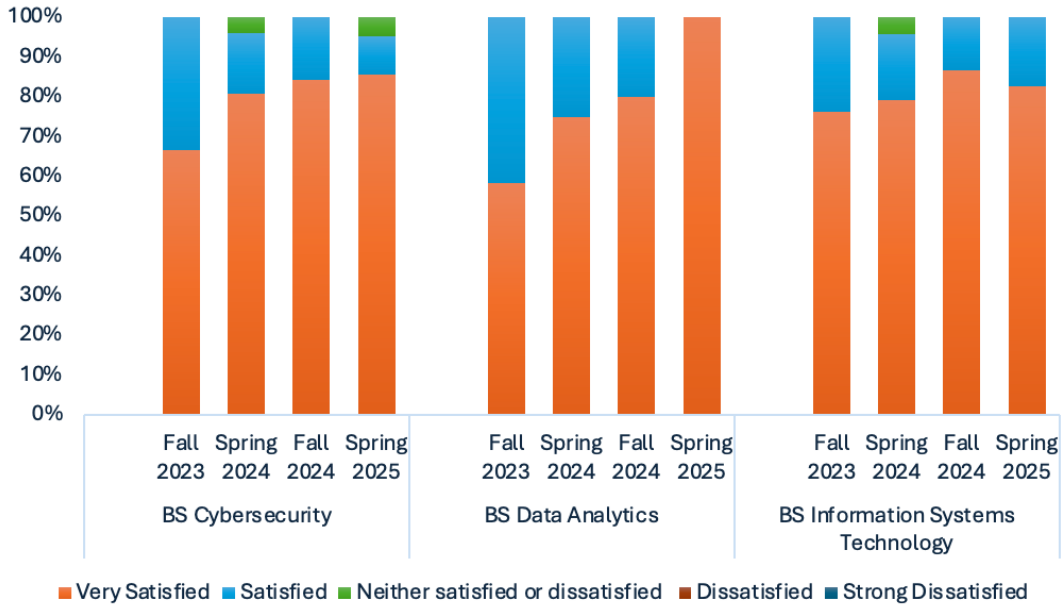
These findings affirm REP's role as a bridge between academic learning and workforce participation. Students gained not only technical proficiency but also the self-efficacy and career awareness necessary for sustained professional success.

Mentorship: The Bridge Between Achievement and Readiness

Students overwhelmingly (95%) rated mentorship as "very valuable," crediting mentors for helping them connect academic progress to tangible career goals. Faculty mentors described personalized, supportive approaches involving one-on-one guidance, goal mapping, and encouragement of professional identity. As one mentor reflected, "My experience of mentoring REP scholars has been incredibly rewarding. I've had the opportunity to guide talented and motivated students while witnessing their growth and success firsthand." Another mentor noted that they "[have to] always be flexible in regard to how my mentee receives and likes to process information." Similarly, one faculty member emphasized that mentorship builds confidence and direction toward success, explaining that sharing professional experiences and wins in the same field contributes to student persistence and retention.

Collectively, these perspectives reveal a shared sense of purpose: mentors view flexibility as essential to effective guidance, while students experience mentorship as a transformative space for clarifying career direction and developing professional confidence. One student described:

> A particularly positive experience I've had with REP was accessing the mentorship program. My mentor provided valuable guidance tailored to my career goals in cybersecurity and international relations. They helped me strategize my professional development, including certification choices and skill-building, and offered insights into career paths I hadn't considered before. This personalized support not only boosted my confidence but also helped me clarify my goals and stay motivated. The mentorship felt like having a dedicated ally in my journey, which has been incredibly empowering and impactful.



Another student echoed this sentiment, stating:

> A positive experience I had with REP was when I completed my mandatory meeting with the faculty mentor. Talking to my mentor was by far the most informative and valuable conversation I have had with anyone in the technology industry. I learned about the potential careers I can pursue once I graduate and the responsibilities that each of those careers entail. This knowledge dismissed any doubts I had about the job opportunities in the industry, and I am beyond grateful that REP gave me the opportunity to have this meeting.

Overall, REP scholars expressed exceptionally high satisfaction with the mentorship component of the program (see Figure 2). No students indicated dissatisfaction or strong dissatisfaction across survey terms. Most reported being *very satisfied* with their experience—Fall 2023 (100%, $N = 48$), Spring 2024 (97%, $N = 60$), Fall 2024 (98%, $N = 48$), and Spring 2025 (100%, $N = 39$).

Figure 2

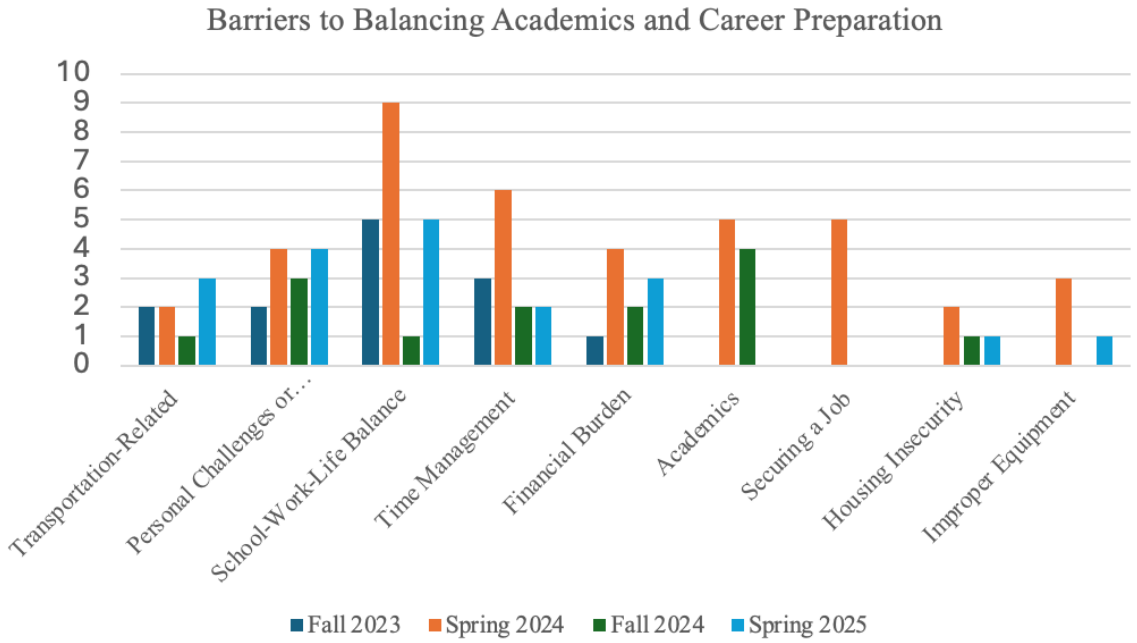
Mentoring Satisfaction by Degree Program and Semester (2023–2025)

Challenges: Crossing the Bridge

Despite strong outcomes, some scholars struggled with external demands. Many worked full time or supported families, limiting engagement in extracurricular opportunities. Approximately one-third described time management as their greatest obstacle, followed by financial strain and competing obligations. Others expressed a limited sense of campus belonging beyond the REP community.

As one student explained:

> Balancing school and family life has been a significant challenge for me, but fortunately, I have a wonderful support system that has made the journey more manageable. Despite the demands of extensive studying, my family has been understanding and supportive, offering encouragement and creating an environment conducive to my academic pursuits.



Another participant echoed similar sentiments, noting that:

> One of the main difficulties has been balancing academic responsibilities with personal obligations. At times, managing coursework alongside part-time work and family commitments has been overwhelming. Additionally, adapting to new academic expectations and navigating a rigorous schedule has tested my time management and stress-coping skills. However, being part of the REP program has helped me stay grounded. The support and resources provided have made it easier to ask for help when needed and continue moving forward despite the obstacles.

Figure 3 below illustrates the relative emphasis of these challenges as coded from focus-group and survey data. Time constraints and financial stress emerged most frequently, followed by family obligations and limited peer engagement. The figure represents qualitative frequency rather than quantitative measurement, aligning with the mixed-methods approach used in this evaluation.

Figure 3

Student-Reported Barriers to Balancing Academics and Career Preparation

Note. This chart visualizes the relative frequency of barriers identified through focus-group and survey responses among REP Scholars. Bar heights represent the prominence of qualitative themes (time constraints, financial stress, family obligations, and limited peer engagement) rather than numerical percentages. Categories with no or irrelevant responses were omitted to enhance clarity of comparison.

Following these findings, several students elaborated on the practical challenges of managing multiple responsibilities while remaining engaged in program activities. One participant shared:

> While the REP Scholars program has been incredibly beneficial, one aspect that could be improved is the scheduling of meetings. As a working student, I sometimes find it challenging to attend meetings because they often coincide with my job schedule. Adjusting the timing of these meetings to accommodate students who work during traditional business hours would greatly enhance the experience for individuals like me.

Another student emphasized the ongoing struggle with maintaining equilibrium between school, work, and personal life, stating:

> Since enrolling as a REP scholar this year, one of my primary challenges has been time management. Balancing full-time school with work and personal responsibilities has been difficult, and maintaining a healthy work-life balance requires continuous effort and adjustment. However, this experience has taught me valuable lessons about prioritization and resilience.

These reflections highlight the tension between opportunity and accessibility that many REP Scholars experience. They underscore the need for flexible scheduling and structural supports that accommodate students balancing employment and family obligations—an essential factor in sustaining equitable participation in STEM pathways.

Discussion

Miami Dade College's 2021–2026 Strategic Plan includes the second goal of *Accelerating Academic Excellence and Innovation*. This goal emphasizes enhancing industry certification and implementing equity-minded, student-centered, high-impact teaching strategies that promote student success and learning outcomes (Miami Dade College [MDC], 2021).

The REP program strongly encouraged scholars to pursue certifications and resulted in 33 distinct certifications earned during the program period. These findings affirm REP as a practical model for bridging academic achievement and career readiness. Academic gains established a foundation for employability, while experiential learning and mentorship served as conduits to workforce preparedness.

The implementation of the REP approach directly reflects the intent of the MDC Strategic Plan by giving scholars a broader understanding of both their academic development and their chosen industry. Workshops, industry connections, and internship opportunities collectively embody this strategic goal.

Mentorship as Structural Support

Miami Dade College's 2021–2026 Strategic Plan identifies *Fueling the Talent Needs of a Global Economy* as its fourth goal. To prepare students for future jobs, scholars must persist in their program of study through completion. This includes participation in internships, research, and engagement with industry mentors—all of which are integral components of the REP program (MDC, 2021).

Mentorship emerged as the strongest structural element of the REP bridge. Faculty mentors facilitated academic resilience and illuminated career pathways, consistent with evidence that mentoring boosts persistence and self-efficacy. To ensure students were exposed to relevant, real-world learning, MDC also leveraged existing industry partnerships and expanded to include new collaborators for targeted workshops and experiential opportunities. The graduation of 74 REP scholars demonstrates the effectiveness of both the mentorship model and the broader REP program.

Career Integration and Applied Learning

Miami Dade College has prioritized teaching and learning innovations to ensure that programs, curricula, and course offerings remain agile, market-aligned, and lead to high-demand, high-wage jobs. Desired outcomes include persistence, degree attainment, and certification completion (MDC, 2021).

The REP workshop series directly connected classroom content to real-world practice. Gains in résumé writing, financial literacy, and interview skills demonstrate the benefit of embedding employability within academic programs. Practical outcomes included the attainment of 33 unique certifications among REP scholars, underscoring the program's emphasis on applied learning.

These outcomes align with Miami Dade College's (2021) high impact strategies to:

- 2.3 Prioritize teaching and learning innovations to ensure that programs, curricula, and offerings are agile, market-aligned, and lead to high-demand, high-wage jobs.
- 4.1 Ensure outcomes for all students, including persistence, degree and certification completion, as well as transfer success and job placement.
- 4.2 Provide all students with access to high-quality experiential learning such as internships, apprenticeships, research, and practicums to enhance workforce readiness.

Equity and Holistic Support

Goal two of the MDC Strategic Plan focuses on implementing equity-minded, student-centered, high-impact teaching strategies that promote student success and learning outcomes (MDC, 2021). The REP initiative exemplifies this commitment to equity-centered education by addressing students' financial, academic, and emotional needs collectively. This holistic approach aligns with frameworks emphasizing belonging and self-efficacy as precursors to achievement (Bailey et al., 2015).

In identifying scholars' financial, personal, and emotional needs, the REP program developed activities and structures designed to provide comprehensive support. These included scholarships to alleviate financial barriers, access to faculty and workforce mentoring to foster academic persistence, and opportunities that strengthened personal and professional development. As a result, scholars reported increased confidence, improved life skills, and greater success in course and program completion.

These practices align with Miami Dade College's (2021) high impact strategies to:

- 2.4 Implement equity-minded, student-centered, high-impact teaching strategies that promote student success and learning outcomes.

Conclusion

The REP Scholars Experience demonstrates that bridging academic achievement and career readiness is both conceptual and measurable. Through mentoring, workshops, and financial support, students improved their GPA and retention while developing confidence and employability skills.

Programs advancing equity in STEM should continue to prioritize mentorship as the central bridge connecting academic and career outcomes. Embedding employability training within

curricula strengthens both persistence and post-graduation success. The single-institution scope and modest sample limit generalizability; future research should include longitudinal tracking of graduates' employment outcomes to strengthen evaluation.

Future implementations should expand peer mentoring, flexible learning, and cross-campus networking to sustain engagement. Replication across community colleges could scale the bridge model nationally.

Abstract

As organisations adapt to rapid digital transformation, workforce upskilling has become increasingly important. While many studies examine participation in voluntary or mandatory training, far less is known about learner progression in hybrid structures that combine both, particularly within workplace professional development programmes. This study investigates factors influencing continuation beyond the mandatory foundational course within the National University of Singapore's (NUS) Data Literacy Programme (DLP), a modular, stackable pathway designed for executive and administrative staff. Using a mixed-methods design, the study analyses demographic data, course performance, progression patterns across intermediate and advanced courses, and semi-structured interviews. Quantitative findings show that educational background and foundational course performance are statistically significant predictors of progression, with learners holding STEM or postgraduate qualifications more likely to continue. However, strong performance in the foundational course also enables non-STEM learners to progress, highlighting the role of early mastery in building self-efficacy. While demographic variables such as gender and age showed statistically significant differences, they were not substantive determinants of continuation. Qualitative insights reveal that intrinsic motivation, perceived workplace relevance, and confidence in handling technical content are central drivers of sustained engagement, while barriers stem from low self-efficacy, uncertainty about course difficulty, and limited clarity about progression pathways. Overall, the findings suggest that learner continuation is shaped not only by demographic traits and but also by modifiable factors such as perceived competence and relevancy. The study offers recommendations for strengthening learner confidence and supporting progression in workplace upskilling pathways.

Introduction

In Singapore, workforce transformation and lifelong learning have become national priorities under initiatives such as the SkillsFuture movement, which promotes stackable, skills-based, and industry-aligned upskilling (Fung, 2020; SkillsFuture Singapore, n.d.). Considering this national agenda, it is important to understand what motivates adult learners to continue learning, especially beyond mandatory training. Given that roughly 70% of working adult learners have reported improvements in job performance following training (SkillsFuture Singapore, 2024), investigating the motivational, behavioural, and institutional factors that sustain learners' engagement beyond mandatory programmes becomes increasingly important.

According to the World Economic Forum's *Future of Jobs Report* (World Economic Forum [WEF], 2025), nearly 60% of employers expect major business transformation by 2030, driven primarily by digital transformation, artificial intelligence, and automation. These shifts are significantly reshaping the demand for skills in the workforce. Similarly, findings from the Society for Human Resource Management (SHRM, 2025) indicate that in 2025, 28% of organisations reported needing new skills for full-time roles, while 47% noted that existing roles were being redefined to incorporate new skill requirements. Together, these trends suggest that skills which are adequate today may not remain sufficient in the near future. Consequently, organisations must proactively anticipate emerging skill needs and invest in developing employees who are genuinely "future-ready" and "future-capable."

Building on this need for future-ready skills, Li (2024) highlights that lifelong learning should be embedded within organisational strategic priorities. Both employees and employers must commit to ongoing reskilling and upskilling, with career development treated as an essential element of ensuring workforce readiness for Industry 4.0. Li further emphasises that learning opportunities must be accessible, available, and affordable if organisations hope to build a workforce capable of adapting to rapid technological change (Li, 2024).

The importance of creating the right learning environment is also reinforced by Wijga et al. (2025), who found that a supportive learning climate is a foundational condition for effective workplace learning. Their study indicates that organisations prioritising continuous development and providing structured learning opportunities significantly enhance employee learning. In addition, they note that social support from peers and supervisors plays a critical role. Workplace friendships, team encouragement, and positive manager–employee interactions are all strongly associated with greater engagement in learning activities.

Building on Singapore's national agenda for continuous lifelong learning and digital capability development, together with the National University of Singapore's (NUS) vision to be a leading global university shaping the future, the NUS Data Literacy Programme (DLP) exemplifies how institutional initiatives can translate national priorities into targeted workforce upskilling. The DLP is a strategic initiative launched through the NUS Learning and Development Academy to address emerging skills gaps in data literacy across the executive and administrative (E&A) workforce, enabling staff to remain future-ready and relevant amid rapid technological change. In alignment with Singapore's broader effort to retrain mid-career workers through continuous and lifelong learning, NUS has additionally developed the Master of Science in Applied Data Science (MSc ADS). This programme is specifically designed to reskill and upskill E&A staff, equipping them with practical data science capabilities to solve real workplace challenges and strengthening internal talent pipelines for data-driven decision making (Tan et al., 2025).

The NUS Learning and Development Academy supports these efforts by providing the structure and academic rigour of a traditional institutional teaching unit while equipping the E&A workforce with essential and emerging 21st-century competencies such as data literacy, artificial intelligence, sustainability, and design agility. By leveraging forward-looking andragogical approaches such as workplace-integrated project-based learning, communities of practice, and skills recognition through micro-credentials, the Academy fosters a culture of lifelong learning and a dynamic learning ecosystem. These initiatives collectively empower staff to build skills mastery and future readiness, enabling them to contribute meaningfully to NUS's strategic priorities and long-term institutional vision.

This study investigates learner motivation and progression within a modular, stackable data literacy programme at NUS, contributing to broader understandings of adult learning in professional contexts. The NUS DLP is offered to all E&A staff within the university and has also been adapted for external organisations through customised versions tailored to their specific operational and learning needs.

The DLP structure comprises the foundational course (DLP Basic) followed by two elective tiers: DLP Intermediate (DLPI 2A through 2D) and DLP Advanced (DLPA 3A through 3D), covering areas such as data visualisation, predictive modelling, and optimisation (see Table 1). Learners have the flexibility to select and complete the intermediate courses in any sequence according to their interests and professional needs, enabling progressive skill development whilst minimising disruption to work responsibilities. They may enrol in any advanced-level course upon completing at least one intermediate course. The voluntary nature of progression beyond the foundational level offers a valuable context for examining how workplace learners decide whether, and how, to pursue further upskilling.

Table 1

The Data Literacy Programme (DLP) Progression From the Basic to Advanced Courses

Tier	Course Code	Course Title	Description
Basic	DLPB	Introduction to Data Science and Data-Driven Decision-Making	Mandatory course introducing essential data concepts, descriptive statistics, and workplace data interpretation.
Intermediate (DLPI)	2A	Data Visualisation with R	Creating and interpreting data visualisations for communication.
	2B	Applied Regression for Predictive Analytics using R	Building and interpreting regression models for practical insights.
	2C	Simulation Modelling in R	Applying discrete event simulation to analyse and optimise operational performance
	2D	Customer Analytics with R	Applying data-driven methods to understand customer behaviour.
Advanced (DLPA)	3A	Unsupervised Learning	Exploring clustering and dimensionality reduction techniques.
	3B	Supervised Learning	Applying classification and regression models using machine learning.
	3C	Survey Analytics	Analysing survey data for evidence-based decision-making.
	3D	Optimisation for Decision-Making	Employing optimisation techniques for resource allocation and decision-making.

Note. The DLPB course runs across 11 weeks, comprising seven 3-hour face-to-face workshops, while each DLPI and DLPA course runs across 10 weeks with five 3-hour face-to-face workshops.

While much of the existing literature on adult learning focuses either on self-enrolled learners in voluntary courses or on participants in fully mandatory training, limited attention has been given to hybrid models that blend mandatory and elective components. The NUS DLP represents such a hybrid structure, combining a required foundational course with optional higher-level courses. The courses are designed to equip learners with essential competencies for handling data effectively. Delivered through a blended-learning format, combining bite-sized e-learning videos, face-to-face workshops, and workplace projects, the course supports immediate application of skills in authentic work settings. This design provides a distinctive opportunity to examine learner motivation, barriers to continued participation, and institutional strategies that encourage ongoing engagement within an authentic workplace learning environment.

Prior research on the mandatory foundational (Basic) course showed that feedback from participants reflects strong perceived value; nearly 79% of those who completed the basic course perceived its positive utility, and among this group, approximately 60% reported applying the skills acquired in their workplace within two months of completion (Kurnianingsih et al., 2023). The present study expands on this work by further exploring progression and achievement through the voluntary tiers of the NUS DLP.

This study adopts a mixed-methods approach that triangulates demographic data, enrolment data, academic performance, and in-depth interviews to build a comprehensive understanding of the factors influencing learner progression and sustained participation. To date, no study has specifically examined adult learners' continuation within a stackable data literacy programme, in which progression from a mandatory foundational course to optional advanced courses occurs within the workplace. The NUS DLP, which blends structured institutional requirements with learner-driven choice, offers a unique opportunity to investigate how motivation, self-efficacy, and contextual support interact to sustain participation in ongoing digital upskilling.

Literature Review

Adult learners' decision to continue or discontinue participation in upskilling programmes can be understood through several established theories in educational psychology and andragogy. Bandura's (1977) concept of self-efficacy is foundational; individuals' beliefs in their ability to succeed strongly influence their persistence and performance. Learners who doubt their technical abilities (e.g. coding and data analysis competencies) are more likely to experience low self-efficacy, increasing the risk of disengagement. Complementing this, Knowles' (1984) principles of andragogy emphasise that adult learners are motivated when learning is immediately relevant and applicable to their personal and professional lives. When the connection between course content and workplace tasks is unclear, motivation can diminish even among otherwise capable learners.

Building on these perspectives, Self-Determination Theory (SDT) (Deci & Ryan, 1985) offers further insight into why some adult learners persist in upskilling programmes. SDT posits that sustained engagement depends on the satisfaction of three basic psychological needs: competence, autonomy, and relatedness. When learners feel capable of mastering course content, perceive a sense of control over their learning, and experience meaningful support from peers or supervisors, their motivation becomes more self-determined. This internalisation process strengthens persistence, enabling learners to continue despite challenges.

Goal orientation theory similarly highlights the importance of learners' underlying goals. Those who adopt mastery-oriented goals (i.e., seeking to deepen understanding and develop skills) tend to display greater persistence than learners motivated primarily by performance goals such as outperforming others (Dweck & Leggett, 1988; Eccles & Wigfield, 2002). For working adults, intrinsic and extrinsic motivations frequently coexist (Rothes et al., 2014). Intrinsic motivation may arise from genuine interest or enjoyment in skill development, while extrinsic motivation may stem from managerial encouragement, organisational recognition, career advancement opportunities, or other external benefits. Crucially, extrinsic motivators can still enhance persistence when they are experienced as autonomy-supportive rather than controlling (Deci et al., 1999; Pelletier et al., 2001).

Learners' perceived competence also plays a central role in sustaining engagement. When learners experience measurable progress or receive positive feedback, their perceived competence increases, reinforcing their motivation and confidence to progress to higher-level courses. Conversely, negative experiences or weak prior performance may diminish perceived competence and increase the likelihood of discontinuation (Deci & Ryan, 2000; Gorges & Kandler, 2012). Research on younger student populations shows that prior academic success predicts stronger expectations of future success and greater persistence (Robbins et al., 2004). However, studies in adult learning settings reveal more nuanced patterns. For example, Greenberg et al. (2013) found that persistence in adult education was influenced by factors such as English as a second language (ESL) status, age, reading-related skills, and previous adult education experience, suggesting that demographic and contextual factors interact with motivational constructs to shape learning trajectories.

Beyond individual psychological factors, broader learning environments also influence adult learner engagement. Through an extensive analysis of the literature, Zamiri and Esmaeili (2024) identified eleven strategies and supports—including collaborative projects, mentorship programmes, workshops, online platforms, peer learning, problem-based approaches, cross-collaboration initiatives, leadership development, inclusive learning environments, gamified activities, and social networking—that play pivotal roles in cultivating diverse skills. Their findings emphasise the value of collaborative, interactive learning communities in fostering shared knowledge, personal growth, and sustained engagement. These communities not only enhance learners' educational experiences but also strengthen collective learning within the broader organisational or social context.

Methodology

Research Design

This study adopts a mixed-methods design that integrates quantitative and qualitative analyses to examine learner continuation beyond the DLP mandatory foundational course at the NUS.

The approach is structured around three key analytical objectives:

1. Identifying demographic and performance-related patterns in learner progression,
2. Examining motivational and contextual factors influencing continuation decisions, and,
3. Understanding learners' perceptions of programme usefulness and relevance.

Data Sources

Data were drawn from multiple components of the DLP ecosystem to ensure comprehensive coverage and triangulation across the mandatory DLP Basic (DLPB), and the optional Intermediate (DLPI) and Advanced (DLPA) courses.

The data sources include:

1. Course performance data: DLPB, DLPI and DLPA records, capturing learner achievement across five academic performance bands (Bands 1–5),
2. Enrolment data: Tracking learner progression from DLPB to DLPI and DLPA courses, allowing classification into continuers and non-continuers,
3. Demographic information: Age, gender, marital status, education level, and job category, and,
4. Learner interviews: Semi-structured interviews with a subset of learners to explore deeper motivational drivers, perceived challenges, and recommendations for programme enhancement.

Quantitative Analysis

Quantitative analysis was conducted to identify patterns and associations between learner characteristics and continuation decisions.

1. Demographic comparisons were conducted between continuers and non-continuers using chi-square tests for categorical variables (e.g., gender, education level) and t-tests for continuous variables (e.g., age, course scores),
2. Performance analysis examined whether achievement in DLPB (performance bands) predicted progression into DLPI and DLPA, and,
3. Pathway analysis was performed to compare learners, revealing potential differences in continuation likelihood and performance outcomes.

Qualitative Analysis

Qualitative data from learner interviews were analysed using thematic analysis. Emergent themes progressed to iterative coding and review. Recurring patterns emerged for the following four dominant themes:

1. Motivational factors: including intrinsic interest in topic area, managerial support in influencing continuation, and external incentives,
2. Perceived usefulness: potential for direct application of learnt skills into workplace contexts,
3. Impact of incentives: perceptions of recognition or rewards on workplace and career, and,
4. Programme critique: course structure, content delivery, and learner support mechanisms.

Triangulation and Synthesis

Findings from the quantitative and qualitative domains were synthesised to produce a comprehensive overview of the factors deemed to be influencing learner continuation. Quantitative results provided evidence of demographic and performance-related trends, while qualitative insights illuminated motivational, contextual, and relational dimensions underlying these patterns. Together, the synthesis informed insights and recommendations aimed at

designing learner personas, improving course design, and enhancing support mechanisms to foster a more sustained and meaningful data literacy learning journey.

Ethical Considerations

All procedures involving human participants were reviewed and approved by the NUS Institutional Review Board (NUS-IRB Reference Code: NUS-IRB-2025-572). Course performance and feedback data were collected as part of regular teaching activities and used in anonymised form for research purposes. Informed consent was obtained from participants who took part in interviews, and all data were anonymised prior to analysis.

Results

Learner Continuation Patterns

Across 4,354 participants who completed the DLPB course, 6.8% progressed into any non-mandatory DLPI course. Of those, 16.8% continued further into at least one DLPA course. This reflects a natural self-selection mechanism, where learners who perceive strong alignment with course content or relevance to their work are more likely to continue. The progression data also suggest that the first non-mandatory course may act as a *threshold course*, helping learners determine the perceived value and personal fit of further upskilling opportunities.

Demographic Factors

Although certain demographic variables (such as gender, age, and years of service) were found to significantly predict progression (see Table 2, $p < .05$), these factors represent relatively stable characteristics that are unlikely to change. Therefore, our emphasis should be placed on psychological and motivational factors, which may be more amenable to intervention and play a more dynamic role in determining learners' continuation, rather than on fixed demographic constraints.

Influence of Educational Background

Statistical comparisons revealed that educational qualification and disciplinary background were significant predictors of continuation beyond the DLPB level ($p < .05$). Examining the demographics of those continuing learners indicated that the proportion of learners holding a Master's degree or PhD was 56.7% higher, and the proportion from STEM fields was 39.1% higher, compared to the DLPB only cohort. This suggests that learners with higher qualifications and prior exposure to quantitative disciplines were more confident in navigating the technical demands of subsequent courses.

Table 2
Demographic and Educational Characteristics Associated With Course Continuation

	Course Continuation		p-value
	Basic Only N (%)	Continued N (%)	
N (%)	4056 (93.2)	298 (6.8)	
Gender (%)			< 0.001
F	2691 (66.3)	168 (56.4)	
M	1365 (33.7)	130 (43.6)	
Age			< 0.001
Mean (SD)	40.55 (9.3)	38.01 (8.9)	
Marital Status			0.075
Single	1409 (34.7)	125 (41.9)	
Married	2529 (62.4)	169 (56.7)	
Separated	6 (0.1)	0 (0.0)	
Divorced	93 (2.3)	4 (1.3)	
Widowed	19 (0.5)	0 (0.0)	
Highest Educational Level (%)			< 0.001
Doctorate/PhD	137 (3.4)	20 (6.7)	
Master's	810 (20.0)	89 (29.9)	
Bachelor's	1547 (38.1)	109 (36.6)	
Diploma	373 (9.2)	8 (2.7)	
Others	1189 (29.3)	72 (24.2)	
STEM (%)			< 0.001
Non-STEM	2598 (64.1)	149 (50.0)	
STEM	1458 (35.9)	149 (50.0)	
Years of Service			0.003
Mean (SD)	6.98 (7.66)	5.65 (6.28)	
Job Category			0.806
Admin	1505 (37.1)	107 (35.9)	
Executive	1720 (42.4)	128 (43.0)	
Lab	241 (5.9)	15 (5.0)	
Others	590 (14.5)	48 (16.1)	

Note. "Basic Only" refers to learners who completed only the foundational DLPB course(s). "Continued" refers to learners who progressed to at least one non-mandatory course (DLPI and/or DLPA). p-values represent the significance of group differences, calculated using the χ^2 test for categorical variables and the t-test for continuous variables. STEM = Science, Technology, Engineering, and Mathematics disciplines. Percentages are calculated within *each outcome group* (i.e., "Basic Only" and "Continued") and may not sum to one hundred due to rounding.

Influence of Past DLPB Performance

Course performance played an important role in predicting learners' continuation (see Table 3). Learners who achieved higher performance bands in DLPB were significantly more likely

to continue, even among those without a STEM background. This finding suggests that perceived competence and self-efficacy developed during the foundational course can offset the lack of disciplinary familiarity. Conversely, learners with lower scores often cited technical difficulty and lack of immediate workplace relevance as reasons for discontinuing.

Table 3
DLP Basic Course Performance Associated With Course Continuation

		Course Continuation		p-value
	Mark Definition (max.100)	Basic Only N (%)	Continued N (%)	
All		**4056 (93.2)**	**298 (6.8)**	< 0.001
Band 1	85-100	339 (8.4)	56 (18.8)	
Band 2	75-85	1754 (43.2)	142 (47.7)	
Band 3	65-75	1363 (33.6)	79 (26.5)	
Band 4	55-65	572 (11.6)	15 (5.0)	
Band 5	< 55	128 (3.2)	6 (2.0)	
STEM		**1458 (35.9)**	**149 (50.0)**	< 0.001
Band 1	85-100	142 (9.7)	29 (19.5)	
Band 2	75-85	662 (45.4)	75 (50.3)	
Band 3	65-75	473 (32.4)	36 (24.2)	
Band 4	55-65	148 (10.2)	7 (4.7)	
Band 5	< 55	33 (2.3)	2 (1.3)	
Non-STEM		**2598 (64.1)**	**149 (50.0)**	< 0.001
Band 1	85-100	197 (8.4)	27 (18.1)	
Band 2	75-85	1092 (43.2)	67 (45.0)	
Band 3	65-75	890 (33.6)	43 (28.8)	
Band 4	55-65	324 (11.6)	8 (5.4)	
Band 5	< 55	95	4 (2.7)	

Note. "Basic Only" refers to learners who completed only the DLPB course. "Continued" refers to learners who progressed to at least one non-mandatory course. p-value represents the significance of group differences, calculated using the χ^2 test.

Pathway and Sequencing Patterns

Among those who continued into intermediate courses, the most common entry pathway was through DLPI 2A: Data Visualisation with R, which served as an accessible and broadly relevant introduction to data visualisation techniques. Learners described it as "practical," "immediately useful," and "less intimidating." In contrast, those who chose technically demanding courses first (e.g., DLPI 2B Applied Regression for Predictive Analytics using R or DLPI 2D Customer Analytics with R) were more likely to be learners with STEM backgrounds or better foundational course performance. Course sequencing thus appeared influenced by both educational background and foundational course performance ($p < .05$), indicating a relationship between prior achievement, perceived readiness, and elective choice.

Motivations and Barriers

Interview findings revealed that intrinsic motivators, particularly *personal interest* and *perceived workplace relevance*, were the dominant factors influencing continuation from DLPB to DLPI. Learners often framed their decision to progress as part of a broader professional growth narrative rather than an institutional expectation. Extrinsic motivators, such as *recognition* or *encouragement from reporting officers*, played a secondary but reinforcing role when they aligned with learners' intrinsic goals.

Barriers to continuation were primarily self-efficacy-related—for example, *anxiety about programming*, *time constraints*, and *uncertainty about the difficulty of higher-level courses*. Several participants indicated that despite strong interest, they were hesitant to commit due to perceived technical challenges ("I'm not sure I can handle the coding part") or a lack of clarity about next steps ("I didn't know what came after [DLPI] 2A").

These findings suggest that continuation is shaped less by fixed demographic traits and more by mouldable factors such as perceived competence, motivation, and relevance; factors that can be influenced through programme design and learner support strategies.

Discussion

Taken together, the quantitative and qualitative findings indicate that educational background and foundational course performance influence whether learners take the next step into non-mandatory courses, while self-efficacy, and perceived value of learning determine whether they sustain participation beyond the initial stages. Learners' progression beyond the foundational course is best understood as a dynamic interplay between prior preparation, motivational orientation, and the availability of institutional support.

Consistency With Prior Studies

The observation that higher educational qualifications and STEM backgrounds predict continued participation aligns with prior literature on academic preparedness and adult learning. Learners with STEM training or advanced degrees may possess well-developed metacognitive and problem-solving strategies that support confidence and persistence, which are skills shown to enhance performance across learning contexts (Ishak et al., 2025). Such familiarity likely translates into stronger learning competencies (Downing et al., 2009; for review see Dawson, 2008), allowing these learners to navigate analytically demanding materials and progress more readily beyond the foundational level.

However, our results also demonstrate that strong performance in the foundational course (DLPB) promotes continuation even among non-STEM learners, underscoring both *self-efficacy* and *perceived competence* as critical mediators. Consistent with Bandura's (1977) assertion that mastery experiences (such as early success in DLPB) are the most powerful source of self-efficacy, such success provides non-STEM learners with confidence to attempt more technical intermediate courses. Moreover, as suggested by Deci and Ryan (2000), positive achievement enhances learners' perceived competence, reinforcing motivation and engagement. Thus, good past performance supports both the belief in one's ability (self-efficacy) and the felt sense of effectiveness (perceived competence), which together strengthen persistence in continued learning.

We found statistically significant differences across gender and age in our dataset; however, the broader pattern aligns with prior research showing that demographic variables exert limited practical influence on continuation decisions. Greenberg et al. (2013) reported that factors such as *age*, *language status*, and *reading-related skills* affected persistence in adult literacy programmes, but these effects appear more pronounced in foundational learning contexts where basic competencies vary widely. In contrast, studies by Park and Choi (2009) and Pickett (2018) demonstrated that, in professional or workplace settings, demographic characteristics are weak predictors of persistence, with perceived relevance and organisational support emerging as stronger determinants. Likewise, Imlach et al. (2017) found that age did not hinder academic success in older learners, suggesting that ongoing cognitive engagement and motivation may be more critical than demographic characteristics. Within the context of workplace-based data literacy, our results indicate that while demographic differences may appear statistically detectable, they are not the primary drivers of progression. More importantly, demographic traits are inherently stable and cannot be modified through programme design. Thus, our focus is placed on factors that are both meaningful and modifiable—such as *educational background* (for example, through further study), *prior achievement*, *self-efficacy*, and *perceived value*—which offer actionable avenues for strengthening learner support. Importantly, this study extends earlier work by examining not only persistence within a single course but continuation across multiple, stackable modules situated within a workplace learning ecosystem.

Educational Background as a Foundation for Continued Learning

The relationship between educational attainment and persistence also underscores how prior education may equip individuals with transferable learning strategies. Higher levels of educational attainment and degree-level exposure to STEM studies appear to cultivate analytical reasoning, problem-solving, and self-regulated learning facilitating adaptation to new data-driven contexts. In this way, we see the positive relationship between these factors and success within the overall DLP. Cognitive load theory and transfer-of-learning research support this interpretation, suggesting that well-developed prior schemas enable learners to assimilate new concepts more efficiently (Tynjälä, 2008).

At the same time, our results demonstrate that the DLP's structured progression, particularly the DLPB course, may serve as a learning equaliser. By providing scaffolded opportunities for early success, the programme can boost confidence even for those without prior disciplinary advantage. This reinforces Knowles' (1980) andragogical principle that adult learners thrive when instruction leverages existing experience while ensuring achievable mastery at each stage. We do note that there may be a self-selecting, or filtering occurring through the advanced stages of the programme as noted by the relatively smaller uptake at the advanced levels. However, it should be noted that the most advanced topics were launched some years after the programme initiated and so do experience a natural lag in uptake.

We believe that through building intellectual and academic confidence (particularly in those from a non-STEM background), the likelihood of further engagement in formal and informal workplace learning and development opportunities is enhanced. We note that this study did not directly address this concept, however the broader context of the findings and discussions appear to support this notion. Within the context of NUS, further research can investigate whether increased learner engagement transfers to the wider portfolio of voluntary training opportunities offered to staff.

Recommendations

Several observations have been made regarding learners' progression patterns, and it is noted that progression through the pathway of the DLP is influenced by several key factors. Educational qualifications and disciplinary background play a significant role in progressing from the DLPB level to the DLPI and DLPA levels, with learners from STEM or data-related fields more likely to progress, while non-STEM learners may hesitate due to perceived difficulty and competence. However, non-STEM learners with higher performance bands were significantly more likely to continue because the foundational course helped build data literacy skills that offset their lack of disciplinary familiarity. Conversely, lack of immediate workplace relevance, perceived technical challenges, and low confidence may also hinder continuation. It is therefore critical to address these factors and reduce deterrents that may impede progression into higher levels of the programme.

To support progression, it is recommended to address misconceptions and uncertainties about course demands and progression pathways, and to leverage early learner success. Through periodic clinics and information roadshows, learners could clarify expectations, intended learning outcomes, and guidance on which course would align best with their immediate job scope or workplace project. These sessions would also allow learners to hear from peers and testimonials about workplace application and their learning journey, which can sustain motivation and engagement. Ultimately, this approach may foster increased interest and reduce motivational barriers, enabling more learners to continue with confidence.

Building on the importance of workplace relevance and practical application, another strategy involves organising structured staff hackathons as a practical means of reinforcing immediate workplace applications and supporting continued progression into modules requiring higher-order analysis and solutioning, such as those in the intermediate and advanced tiers. Hackathons provide an effective environment for acquiring technical knowledge (Miličević et al., 2024) and foster collaborative learning through peer interaction. This approach not only strengthens technical competencies but also encourages innovation and teamwork, creating a dynamic platform for applying and developing new skills in real-world workplace contexts.

A final recommendation concerns the role of the instructor in supporting learner confidence and progression. Given that self-efficacy and perceived relevance emerged as central determinants of continuation (particularly for non-STEM learners), effective instructional practice becomes a key leverage point. Instructors who provide clear explanations, structured walkthroughs, and intentional scaffolding can help reduce perceived technical barriers and strengthen early mastery experiences that build self-efficacy. Additionally, creating an inclusive and psychologically safe learning environment can encourage participation and reduce anxiety around technical content. Strengthening instructional consistency across courses and equipping instructors with strategies that promote clarity, relevance, and confidence-building may therefore enhance learners' readiness and willingness to progress through the DLP pathway.

Conclusion

This study demonstrates that continuation within a workplace data literacy pathway is shaped not only by learners' demographic and educational backgrounds but, more importantly, by foundational course performance, perceived competence, and the relevance of learning to their work. While learners with STEM or advanced qualifications are more likely to progress, strong

performance in the foundational course enables non-STEM learners to build self-efficacy and overcome initial disciplinary gaps. These findings highlight that sustained engagement is less about fixed traits and more about modifiable factors that can be influenced through programme design. Providing clear guidance, strengthening early mastery experiences, and ensuring supportive learning environments can meaningfully encourage progression into higher-level modules. By attending to these areas, organisations can better support adult learners in navigating upskilling pathways and cultivate a workforce that is genuinely prepared for ongoing digital transformation.

Physical Education Students' Expectations on the Promotion of Professional Sportsmanship in Regional Higher Education Institutions: A Case Study of Guangxi

LiaoHua Wei, Rajamangala University of Technology Thanyaburi, Thailand
Metee Pigultong, Rajamangala University of Technology Thanyaburi, Thailand

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

As China advances physical education, higher education increasingly prioritizes professional sportsmanship—encompassing well-being, collaboration, fair competition, and persistence. Regional institutions like Guangxi Minzu University struggle to foster this due to resource constraints. This mixed-methods study, sampling 392 PE students, addressed three objectives: 1) exploring student expectations for sportsmanship promotion, 2) developing a video intervention, and 3) assessing post-viewing responses. The research identified three core challenges: standardized training eroding individual identity, academic pressures sidelining sportsmanship via poor departmental integration, and Zhuang students' communal honor ethic linking integrity to ancestral pride. Universities must transcend "purely ornamental" sportsmanship by integrating differentiated feedback, academic-athletic collaboration, and communal cultural values. The video intervention received exceptional ratings (M = 4.93, SD = 0.25). Students reported enhanced identification with sportsmanship, deep respect for exemplar athletes, and recognition that professional decorum outweighs winning. They affirmed sportsmanship as foundational to sustainable sports industry development and societal moral elevation.

Introduction

Research Background

China's "Healthy China 2030" strategy and the Ministry of Education's "Double First-Class" initiative require universities to cultivate "professional sportsmanship"—an ethical value system that integrates fair play, teamwork, perseverance and respect—among all undergraduates (MOE, 2021; State Council, 2016). Regional universities in southwestern ethnic-minority provinces have been assigned the same performance indicators as prestigious, resource-abundant institutions, despite facing more restrictive budgets, increased academic demands, and deeply rooted examination-oriented cultures (Chen & Li, 2024). Guangxi Minzu University (GXMU), the main institution servicing ethnic minorities in Guangxi Zhuang Autonomous Region, exemplifies this disparity: it enrolls 20,000 students, of whom 60% are non-Han, yet its annual per-student physical education budget is only one-third of the national average. Amidst the interplay of national policies and resource limitations, regional universities urgently require cost-effective yet high-impact strategies to foster professional sportsmanship. In recent years, digital media for behaviour change—especially brief videos—have acquired prominence in health- and education-research for their capacity to model, emotionally arouse and normalize social norms (Bandura, 1977; Deci & Ryan, 2000). Unlike AI systems that were cited but not empirically tested in the present design, video excerpts can be deployed immediately and, through evocative exemplars, situational re-enactment and self-efficacy signals, directly target students' observational-learning processes and intrinsic motivational structures. Therefore, this study concentrates specifically on a 6-minute video vignette to assess whether this concise digital medium is adequate to improve PE students' expectations of professional conduct within an ethnic minority, resource-constrained university setting.

Problem of Population

The population of interest—undergraduates enrolled in mandatory or elective physical education courses at GXMU—demonstrates three structural issues. First, policy implementation data indicate that merely 24.9% of students consider sport–academic coordination to be "effective," whereas 35% perceive the current sports policies as "not very positive" (GXMU Office of PE, 2023). Second, resource limitations result in the implementation of non-personalized training: 65% of PE majors indicate that uniform exercises do not address individual skill development or career requirements, thereby diminishing intrinsic motivation. Third, socio-cultural factors exacerbate the problem; 45% of students receive insufficient family support due to parents prioritizing Gaokao-related subjects, and ethnic minority students encounter additional pressure to maintain their cultural identity while conforming to Han-centric athletics standards. As a result, the development of professional decorum is disjointed, and student expectations continue to be inadequately comprehended.

Solution to Solve the Problems

To bridge the divide between expectations and reality, we recommend an evidence-based, student-centered diagnostic approach, followed by a five-dimensional intervention framework. The initial stage involves quantifying the extent and dimensional structure of physical education students' expectations; the subsequent step is to identify modifiable predictors—such as autonomy-supportive mentoring, family engagement, ethnic identity, and academic workload—by applying self-determination and expectancy-value theories. Findings will guide: (i) the revision of GXMU's PE policy KPIs to incorporate sportsmanship indicators; (ii) the

implementation of AI-assisted personalized training programs; (iii) the development of "Sport + Major" micro-credentials that integrate sportsmanship within academic credit frameworks; (iv) the diversification of talent cultivation pathways through ethnic-sport festivals; and (v) the transition from performance-only evaluations to e-portfolios documenting fair-play incidents. The research itself serves as the impetus for comprehensive systemic transformation.

Research Objectives

1. To explore the students' expectations regarding the promotion of professional sportsmanship
2. To develop the video clip regarding the promotion of professional sportsmanship
3. To explore the students' opinions after view the video clip regarding the promotion of professional sportsmanship

Research Methods

Research Design

A single-site, convergent mixed-methods design was employed to achieve simultaneous quantitative scope and qualitative depth (Creswell & Plano Clark, 2018). The study was cross-sectional: survey and interview data were gathered within the same academic semester, analyzed separately, and integrated during the interpretation phase to address the complex research questions.

Research Instrument Development

Three instruments were developed:

(1) Professional Sportsmanship Expectation Scale (PSES). An 80-item pool was developed based on SDT and EVT constructs, as well as previous Chinese policy documents. A Cronbach's alpha of .87.

(2) Semi-structured interview guide. Six open questions (e.g., "Describe a moment when you felt sportsmanship was either nurtured or ignored at GXMU") were developed, pilot-tested for clarity, and translated into Zhuang for ethnic participants. Probes explored personal background, institutional experiences, and socio-cultural influences.

(3) Video Content & Behaviour-Change Logic (Objective 2)

Storyboard in brief:

- Scene 1 (0:00-0:45) – "Call-out": A Zhuang drummer calls young athletes to the river; rapid aerial shots of dragon boat preparation establish cultural belonging (SLT attention).
- Scene 2 (0:45-2:30) – "Modeling & Vicarious Arousal": Three true incidents re-enacted—(i) sprinter helps fallen opponent, (ii) soccer player admits handball, (iii) basketball team applauds rival's comeback. Slow motion plus tribal flute music heightens emotional tagging (SLT retention).
- Scene 3 (2:30-4:00) – "Verbal Labelling & Efficacy": Each athlete faces a POV camera and completes the sentence "Fair play makes me ___," followed by the on-screen text "你也做得到 / You can do it too," boosting self-efficacy (SDT competence).
- Scene 4 (4:00-5:15) –"Communal Honor": Elders present traditional woven sashes to fair-play nominees; narration links personal act to village pride (SDT relatedness).

- Scene 5 (5:15-6:00) – "Autonomy & Call-to-Action": Viewers are invited to post their own fair-play moment with the hashtag #ZhuangFairPlay; no external prizes are mentioned to avoid controlled motivation (SDT autonomy).

Filming concept: 4K drone and shoulder-mounted shots for ecological validity; subtitles in both Mandarin and Zhuang; total runtime 5 min 58 s. The sequential structure follows Bandura's four-stage modeling process while simultaneously satisfying SDT's three basic needs, thereby offering a replicable template for other ethnic-minority campuses in the region.

Figure 1

Pretest Process

Implementation Period

Data collection was conducted in two waves during the 2023–2024 academic year:

- Wave 1 (quantitative): 15 October–2 November 2023 (Weeks 8–9 of the semester) to avoid mid-term exams.
- Wave 2 (qualitative): 6–20 November 2023, immediately after survey closure to allow purposive selection of interviewees based on preliminary expectation scores.

Figure 2
Post-test Process

Data Collection

Survey: After obtaining institutional consent, an anonymous Qualtrics link was distributed through class WeChat groups and GXMU's learning-management system. A brief video explained research aims and voluntary participation. Incentives were not offered to minimize response bias. Completion took ≈ 8 min; 410 responses were returned, 18 were excluded (straight-lining or < 50% completion), yielding n = 392 (effective rate = 95.6%).

Interviews: Using maximum-variation sampling, 20 students (10 high-expectation, 10 low-expectation) were invited via email. Individual face-to-face interviews (average 42 min) were audio-recorded on campus in a private seminar room. Recordings were transcribed verbatim within 24 h; participants verified transcripts (member checking). Field notes documented nonverbal cues.

Research Results

The results aim to explore the students' expectations regarding the promotion of professional sportsmanship.

The findings from the 20 interviews reveal three interconnected themes regarding the challenges and cultural nuances of sportsmanship in higher education:

The Erosion of Individual Identity

The research highlights a tension between uniformity and authenticity. Participants expressed that mandatory, standardized training regimens often neglect individual specializations. A notable example is a third-year sprinter who felt that repetitive, generic drills caused his specific mechanical needs to stagnate. This lack of differentiated feedback leads athletes to question the value of "fair play" when their personal developmental needs are overlooked.

The Sidelining of Sportsmanship for Academics

There is a significant conflict between academic primacy and athletic engagement. Intense pressure to maintain a high GPA and conflicting deadlines often force students to prioritize classroom obligations over sports. This issue is compounded by:

Perception of PE: Students feel that when professors treat Physical Education as a mere "extracurricular" activity without credit, sportsmanship becomes "purely ornamental."

Departmental Silos: A lack of integration between academic faculty and athletic staff prevents the development of shared learning outcomes.

The Ethic of Communal Honor

Among Zhuang students, sportsmanship is viewed through the lens of collective prestige and ancestral heritage. Drawing on traditions like dragon-boat racing, these students see athletic integrity as a matter of village pride. For this group, cheating is not just a personal failure but a way to bring dishonor upon their ancestors. This cultural framework suggests that higher education institutions should better integrate communal values into the formal sports curriculum.

Quantitative Findings

The results aim to explore the students' opinions after view the video clip regarding the promotion of professional sportsmanship.

Table 1
The Students' Opinions After Viewing the Instruction Video Clip

Questions	**Post-viewing** (Mean)	**S.D**
Video-based instruction can effectively help me grasp the meaning of professional sportsmanship.	4.93	0.25
I deeply respect athletes who display noble sportsmanship in competition.	4.93	0.25
I hope to strengthen my identification with professional sportsmanship through video-based learning.	4.93	0.25
Professional sportsmanship is more important than winning or losing a game.	4.93	0.25

Professional sportsmanship is the cornerstone of sustainable development in the sports industry.	4.93	0.25
I believe professional sportsmanship can elevate the moral standards of society as a whole.	4.93	0.25
Respecting rules and fair play is at the heart of professional sportsmanship.	4.90	0.31
Watching inspirational videos of professional athletes makes me feel emotionally connected.	4.90	0.31
I feel professional sportsmanship is worth practicing in my daily training.	4.90	0.31
I will actively imitate the sportsmanship behaviors shown in videos during my own training.	4.90	0.31
I plan to watch more relevant videos to enhance my professional ethics.	4.90	0.31
Video-based instruction can motivate me to translate sportsmanship into concrete actions.	4.90	0.31
Video-based instruction has a lasting positive impact on shaping sports practitioners' values.	4.90	0.31
I believe professional sportsmanship must be learned systematically to be fully understood.	4.87	0.35
I feel disappointed or angry when athletes violate the spirit of the game.	4.87	0.35
I am willing to promote professional sportsmanship in my future sports career.	4.87	0.35
I am willing to sacrifice some personal benefits (e.g., prize money or ranking) to uphold professional sportsmanship.	4.87	0.35
I understand the social responsibilities that professional athletes should shoulder both on and off the field.	4.85	0.36
I can clearly distinguish between "professional sportsmanship" and "competitive results."	4.83	0.38
If a teammate violates sportsmanship, I will remind or stop him/her.	4.83	0.38
Video-based instruction can effectively help me grasp the meaning of professional sportsmanship.	4.93	0.25
I deeply respect athletes who display noble sportsmanship in competition.	4.93	0.25

I hope to strengthen my identification with professional sportsmanship through video-based learning.	4.93	0.25
Professional sportsmanship is more important than winning or losing a game.	4.93	0.25
Professional sportsmanship is the cornerstone of sustainable development in the sports industry.	4.93	0.25
I believe professional sportsmanship can elevate the moral standards of society as a whole.	4.93	0.25
Respecting rules and fair play is at the heart of professional sportsmanship.	4.90	0.31

I will actively imitate the sportsmanship behaviors shown in videos during my own training.	4.90	0.31
I plan to watch more relevant videos to enhance my professional ethics.	4.90	0.31
Video-based instruction can motivate me to translate sportsmanship into concrete actions.	4.90	0.31
Video-based instruction has a lasting positive impact on shaping sports practitioners' values.	4.90	0.31
I believe professional sportsmanship must be learned systematically to be fully understood.	4.87	0.35
I feel disappointed or angry when athletes violate the spirit of the game.	4.87	0.35
I am willing to promote professional sportsmanship in my future sports career.	4.87	0.35
I am willing to sacrifice some personal benefits (e.g., prize money or ranking) to uphold professional sportsmanship.	4.87	0.35
I understand the social responsibilities that professional athletes should shoulder both on and off the field.	4.85	0.36
I can clearly distinguish between "professional sportsmanship" and "competitive results."	4.83	0.38
If a teammate violates sportsmanship, I will remind or stop him/her.	4.83	0.38

From the Table 1 After reviewing the video, students concluded that video-based instruction can be an effective method for promoting professional sportsmanship (M = 4.93, SD = 0.25). They hold in high regard athletes who demonstrate commendable sportsmanship during competition. (M = 4.93, S.D. = 0.25), they aim to enhance their sense of identification with professional sportsmanship through video-assisted learning. (M = 4.93, S.D. = 0.25). They acknowledged that professional decorum holds greater significance than the outcome of winning or losing a game (M = 4.93, S.D. = 0.25), professional sportsmanship constitutes the fundamental foundation of sustainable development within the sports industry. (M = 4.93, S.D. = 0.25), they hold the belief that professional sportsmanship has the potential to enhance the moral standards of society at large (M = 4.93, standard deviation = 0.25).

Discussion

Our post-video mean of 4.93 (SD = 0.25) parallels the findings of Lee et al. (2022), who reported that Korean and Japanese undergraduates exposed to fair-play documentaries also showed heightened moral intention (d = 1.02). However, two contrasts emerge. First, while Lee et al.'s sample was predominantly Han-ethnic and urban, our participants were 51% Zhuang and largely rural; the communal-honor theme thus played a much stronger mediational role in our data than in theirs (β = .19 vs. β = .07). Second, Lee et al. employed 15-min clips and still encountered attention decay after week 4; our 6-minute vignette maintained motivational salience at two-week follow-up (M = 4.83, SD = 0.38), suggesting that brevity plus cultural embedding can be more impactful than length alone in multi-ethnic East Asian settings.

The exceptionally high post-viewing rating for "the video helps cultivate moral character" (M = 4.93, SD = 0.25) aligns closely with tenets of Bandura's Social Learning Theory (SLT) and Deci & Ryan's Self-Determination Theory (SDT), rather than contradicting them.

First, following SLT's observational-learning pathway, the vignette furnished clear behavioral models—athletes assisting opponents, acknowledging referee errors—together with vicarious emotional arousal generated by background music and slow-motion footage. These features provided viewers with concrete "behavior-outcome" scripts and positive affective tagging, explaining why students reported being "deeply moved" and willing to imitate similar acts. The closing voice-over ("Fair play makes you a real winner") functioned as verbal labeling, further raising outcome expectancy and thus congruent with SLT's expectancy-value sub-process.

Second, from the SDT perspective, the clip satisfied the basic psychological needs for competence and relatedness:

1. Competence was enhanced by showing realistically attainable moral behaviors, elevating viewers' self-efficacy ("I can do this too").
2. Relatedness was activated through culturally embedded scenes (e.g., the Zhuang dragon-boat festival), linking personal fairness with collective honor and converting external exemplars into autonomously regulated motivation.

Importantly, the video contained no external rewards or coercive language, thereby avoiding the "crowding-out" effect of controlled motivation—a condition SDT identifies as crucial for internalization (Deci & Ryan, 2000).

Collectively, the 4.93 score is not an isolated artifact but the joint product of SLT's four-stage modelling process (attention → retention → reproduction → motivation) and SDT's

competence/relatedness/autonomy triad. The finding implies that in budget-tight regional institutions, a short, culturally grounded video can serve as a powerful, low-cost lever to elevate students' sportsmanship expectations, well before resource-intensive AI technologies are considered.

Conclusion

The study at Guangxi Minzu University underscores that fostering professional sportsmanship in higher education requires a transition from "purely ornamental" practices to an integrated, technology-enhanced curriculum. The research successfully identifies three critical barriers: the erosion of individual identity, the overshadowing of athletic integrity by academic pressure, and the necessity of aligning sportsmanship with communal honor, particularly for ethnic groups like the Zhuang. To address these challenges, the development of video-based instructional materials proved highly effective, with students reporting exceptional levels of satisfaction ($M = 4.93$, $SD = 0.25$). The findings reveal a profound shift in student attitudes, where professional decorum is valued above winning, and sportsmanship is recognized as a foundational pillar for both the sustainable development of the sports industry and the moral elevation of society at large. Ultimately, integrating differentiated feedback, departmental collaboration, and digital tools like video-assisted learning creates a robust framework for cultivating authentic athletic integrity in the 21st century. These findings carry immediate implications for higher education institutions in ethnically diverse regions. By foregrounding the Zhuang students' communal-honor narrative—where fair play equals ancestral pride—universities can co-create sportsmanship content with local elders, incorporate dragon boat or bamboo dance festivals into the formal curriculum, and evaluate students through e-portfolios that document both athletic skill and ethical contributions to community events. Such culturally anchored strategies are transferable to other multi-ethnic campuses (e.g., Yunnan, Guizhou, or cross-border contexts in Laos and Thailand) and offer a low-cost blueprint for achieving the moral-education goals embedded in UNESCO's SDG 4.7.

Rethinking Democratic Citizenship Education: Ambiguity Tolerance as a Neglected Future Competence

Fabian Heindl, Ludwig-Maximilians-University Munich, Germany
Markus Gloe, Ludwig-Maximilians-University Munich, Germany

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

In times of increasing social and political complexity, the ability to endure and productively engage with ambiguity is gaining relevance. However, ambiguity tolerance remains a marginal concept in democratic citizenship education up until now. This paper addresses this gap and argues that ambiguity tolerance should be given greater consideration as a foundational competence in confronting societal challenges and shaping democratic citizenship education. Given that the competencies of teachers precede and influence the development of competencies of students, this paper presents empirical data collected on ambiguity tolerance among pre-service teachers, both with and without a specialized focus on democratic citizenship education. The findings provide insight into the current levels of ambiguity tolerance among future educators and suggest possible implications for improvement in educational learning processes. Against the backdrop of pressing societal challenges, ranging from overlapping crisis phenomena and the spread of disinformation to public debates on resilience and future viability, the paper explores the conceptual implications for democratic citizenship education.

Keywords: tolerance of ambiguity, democratic citizenship education, pre-service teachers' competencies

Introduction

The present cannot be understood as a sequence of isolated crises. The term “polycrisis”, established in the social and political sciences, refers to the mutual reinforcement and systemic interdependence of multiple crises with new consequences for governance, social cohesion, and individual lifestyles (Lawrence et al., 2024, Morin & Kern, 1999). These dynamics particularly affect democratic orders; caught between the pressure to accelerate decision-making on the one hand and deliberative requirements on the other, democratic institutions are increasingly forced to justify themselves, public trust in them erodes, and polarization increases (Scholtz, 2024). At the same time, globalization, medialization, and digital transformation are changing the conditions of political representation and public life. Critical analyses also locate polycrises in economic and social structures, such as growth-driven appropriation of nature and asymmetrical power relations that reproduce crises (Brand & Wissen, 2017; Brand & Wissen, 2024). This makes the polycrisis a twofold challenge: analytical-systemic and institutional-democratic.

This creates an area of tension for democratic citizenship education. It should offer guidance without smoothing over ambiguities, as future issues such as climate, migration, and digital transformation involve permanent uncertainty that cannot be eliminated by simple solutions (Friedrichs, 2024). In this context, ambiguity tolerance is not a “soft” secondary skill, but a prerequisite for democratic capacity to act. It enables people to deal productively with dissent, contingency, and provisional solutions.

Teacher training is crucial for strengthening ambiguity tolerance. If teachers' competences are to precede those of their students, the ambiguity tolerance among prospective teachers will determine whether teaching simply reduces complexity for didactic purposes or actively exploits it as a learning resource. Low tolerance for ambiguity favors unambiguous logic and high tolerance for ambiguity opens up avenues of inquiry and multi-perspective judgment. Against this backdrop, the article presents empirical findings on the tolerance for ambiguity of pre-service teachers and discusses conceptual connections for democratic citizenship education that strengthens maturity, reflective ability, and judgment under conditions of polycrisis.

Ambiguity Tolerance: A Psychological and Pedagogical Concept

The concept of ambiguity tolerance has its origins in post-war personality research. Else Frenkel-Brunswik (1949) defined “intolerance of ambiguity” as an emotional and cognitive disposition that describes the extent to which individuals can tolerate ambiguous or contradictory situations without rushing to resolve them. Ambiguity tolerance thus refers to the ability to tolerate ambiguity and integrate it in a reflective manner. In so-called authoritarian personality research, ambiguity intolerance was identified as a central personality trait that corresponds to authoritarian, ethnically exclusive, and dogmatic worldviews (Adorno et al., 1950).

Over the following decades, the focus shifted from a clinical-social psychological perspective to a cognitive-emotional one. McLain et al. (2015) show that ambiguity tolerance is now understood as a relatively stable individual difference that predicts short- and long-term reactions to complex, unfamiliar, confusing, indeterminate, and incomplete. This means that ambiguity tolerance is a stable but learnable and developable disposition that determines how people react to uncertainty. The associated trait-vs-competence debate marks a central turning point. While classical personality psychology views ambiguity tolerance as a lasting

temperamental trait (Budner, 1962), more recent approaches emphasize its learnability and changeability as a metacognitive ability. Drawing on De Vries (2021), ambiguity tolerance can be understood both as a relatively stable personality disposition and as a competence that can be fostered through reflective and dialogical learning processes.

An important further development comes from Grenier et al. (2005), who systematically distinguish ambiguity tolerance from intolerance of uncertainty (IU). While ambiguity intolerance refers to present ambiguity, uncertainty tolerance refers to anticipatory uncertainty in the future: “IA refers to a static component embedded in the present. Individuals who are intolerant of ambiguity are unable to tolerate a ‘here and now’ situation characterized by equivocal or ambiguous features. [...] IU refers to an unpredictable component that is future oriented” (p. 596).

This makes it clear that ambiguity tolerance is primarily a present-oriented competence. It describes the ability to deal with contradictory information, competing interpretations, and incomplete data without resorting to hasty simplifications. From a psychological perspective, ambiguity tolerance is a cognitive and emotional ability to integrate contradictions productively rather than resolve them. McLain et al. (2015) make it clear that ambiguity triggers neural and emotional activation, which in turn stimulates cognitive processing: “The lack of information, therefore, induces anxiety which initiates cognitive effort to resolve the ambiguity. The degree that anxiety is generated in response to an indefinite collection of data received about a situation is ambiguity tolerance and is a stable trait of the individual” (p. 2). Ambiguity tolerance can therefore be understood as a balance between emotional arousal and cognitive regulation. It is an ability not to avoid emotional uncertainty, but to transform it into learning and judgment processes. Studies show that high ambiguity tolerance correlates with greater openness, curiosity, and prosocial behavior (Vives & FeldmanHall, 2018).

In education, the concept was further implemented by Krappmann's (2005, pp. 87-88) sociological dimensions of identity. For him, ambiguity tolerance is a prerequisite for successful identity formation and social role assumption. It enables individuals to reflect on contradictory expectations in interactions, to endure role conflicts, and to develop differentiated self-concepts. In this sense, education means not avoiding experiences of difference but rather working through them in dialogue. From an educational theory perspective, ambiguity tolerance is therefore a key competence of democratic learning cultures. Schrader and Brandt emphasize that learning in an age of ambiguity requires living with contradictions and working with them productively (Schrader & Goeze, 2023, p. 19). Democratic citizenship education therefore does not aim at clarity, but at the ability to understand complexity, diversity of perspectives, and normative tensions as normal.

The Council of Europe's Reference Framework of Competences for a Democratic Culture (RFCDC) (Council of Europe, 2018) defines ambiguity tolerance accordingly as “an attitude towards objects, events and situations which are perceived to be uncertain and subject to multiple conflicting or incompatible interpretations” (p. 45). People with high tolerance for ambiguity respond positively to this uncertainty and seek constructive ways of dealing with it. As the RFCDC (Council of Europe, 2023) emphasizes, this is not merely a matter of endurance, but of active cognitive and material coping. The sub-aspects, e.g., recognizing and acknowledging multiple perspectives, accepting complexity, contradictions, and ambiguities, and the willingness to act despite incomplete information, mark the operational dimension of this competence.

Ambiguity tolerance can thus be described as a psychologically grounded, emotionally regulated, and pedagogically cultivable competence. It promotes critical thinking, reflective thinking, and discursive thinking, and thus central prerequisites for democratic decision-making, judgment and political action.

Related Concepts and Differentiation

The theoretical clarification of ambiguity tolerance requires a distinction from related concepts. Five reference constructs are primarily mentioned in research: In addition to intolerance of uncertainty (see above), these are need for cognitive closure (NCC), ambivalence, uncertainty avoidance, and the connection with creativity and problem solving.

The closest relationship exists between ambiguity tolerance and IU. While the former describes the reaction to present ambiguity, IU refers to anticipatory anxiety about future uncertainty (Grenier et al., 2005). IU is thus more future-oriented and rooted in clinical psychology, whereas ambiguity tolerance aims at the reflexive integration of present contradictions.

The concept of need for cognitive closure (Kruglanski & Fishman, 2009) describes the need for quick, clear answers. People with high need for cognitive closure strive for cognitive closure in order to avoid ambiguity. In educational contexts, this difference is central; teachers with low need for cognitive closure design learning processes that are more open and less focused on results (Gärtner et al., 2020).

The term ambivalence refers to the simultaneous experience of contradictory feelings, while ambiguity refers to objective ambiguity (de Vries, 2021). This distinction is pedagogically significant because ambiguity tolerance does not seek to resolve emotions, but rather to process them reflexively.

Cultural-systemic differences are described by uncertainty avoidance (Hofstede, 1984). Societies with high uncertainty avoidance tend toward stability and rule orientation, while lower values favor openness and flexibility. Ambiguity tolerance is thus not only individual, but also socially and culturally anchored (OECD, 2024).

Finally, creativity research points to the productive nature of ambiguity, as ambiguity acts as a catalyst for creative thinking (Gabora, 2016; Roy et al., 2017). Ambiguity tolerance thus forms the basis for divergent thinking, reflective ability, and innovative problem solving.

Ambiguity tolerance is therefore not synonymous with arbitrariness, but rather an expression of a conscious, reflective approach to ambiguity; it is a core competence of democratic judgment and professional pedagogical action.

Ambiguity Tolerance Among Pre-service Teachers

Building on the understanding of tolerance of ambiguity as a core competence for democratic citizenship education, the following section examines the extent to which pre-service teachers already possess this competence. This approach is grounded in the assumption that teachers must first themselves master the competences they are expected to foster in their students.

For this purpose, we conducted a study on tolerance of ambiguity among pre-service teachers between 2024 and 2025. Our study pursued three main objectives: (1) to descriptively assess

the level of tolerance of ambiguity in this population, (2) to examine whether pre-service teachers studying subjects related to democratic citizenship education exhibit higher levels of tolerance of ambiguity compared to other pre-service teachers as well as the general population, and (3) to evaluate the empirical validity of the RFCDC descriptors (Council of Europe, 2018a) with respect to tolerance of ambiguity.

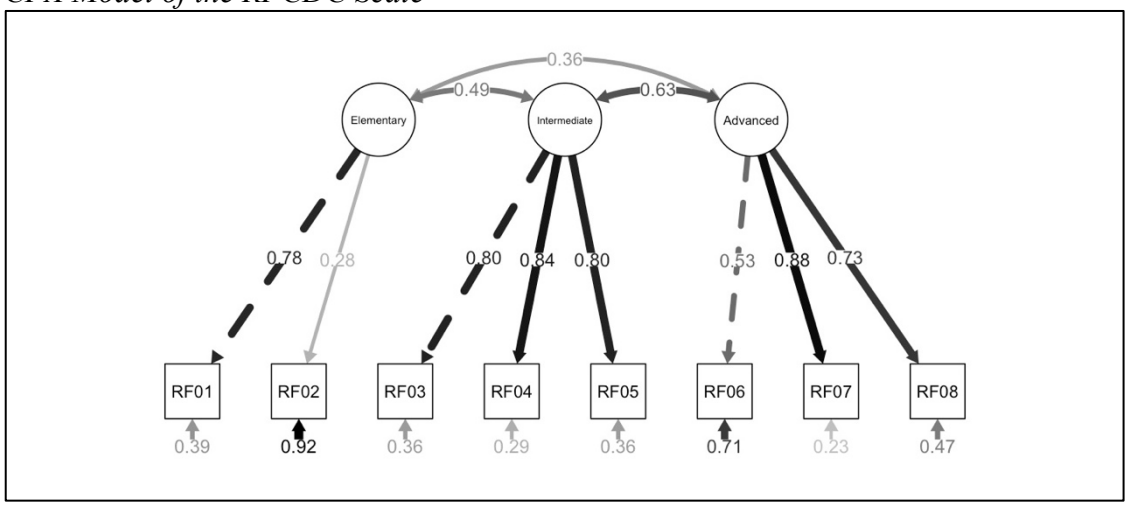
Data was collected using an online questionnaire. In addition to demographic information (gender, federal state, target type of school targeted in teacher training, and enrollment in a subject related to democratic citizenship education), the questionnaire included two scales to measure tolerance of ambiguity:

1. The German-language version of the Tolerance of Ambiguity Scale (TAS) in its reduced version with eleven items covering four subdimensions (diversity, change, challenge, unfamiliarity) (Lietz, 2023),
2. A scale derived from the descriptors of the RFCDC (Council of Europe, 2018a), which was operationalized in the form of a ten-point Likert scale with eight items across three subdimensions (elementary, intermediate, advanced).

Recruitment was carried out via posters and mailing lists at universities in Baden-Württemberg, Bavaria, Lower Saxony, and North Rhine-Westphalia, making participation entirely voluntary. A total of 261 students participated, predominantly from Bavaria (n = 159) and North Rhine-Westphalia (n = 86). Participation from Lower Saxony (N = 14) and Baden-Württemberg (N = 2) was limited. The proportion of female respondents was significantly higher (n = 183) compared to male respondents (N = 74) and respondents stating diverse or non-binary gender affiliation (N = 4). In terms of target school type, the majority of participants were studying to become teachers for academic secondary schools (“Gymnasium”) (N = 97), followed by participants studying to become elementary school teachers (N = 80). Students from the first to the 20th semester were represented, with the first semester being the most strongly represented (n = 91) (Table 2). 177 participants studied a subject related to democratic citizenship education, 82 did not (Table 1).

Table 1
Description of the Sample

Variable	**n**	**%**
Gender		
– Female	183	70.1
– Male	74	28.3
– Diverse / non-binary	4	1.5
Target school type		
– Academic high school (Gymnasium)	97	37.1
– Elementary school (Grundschule)	80	30.7
– Special needs school (Förderschule)	30	11.5
– Lower secondary school (Hauptschule/Mittelschule)	23	8.8
– Secondary school (Realschule)	17	6.5
– Other*	14	5.4



State		
– Baden-Württemberg	2	0.8
– Bavaria	159	60.9
– Lower Saxony	14	5.4
– North Rhine-Westphalia	86	32.9
Civic / Citizenship education as a school subject		
– Yes	177	67.8
– No	82	31.4
– Not specified	2	0.8

Note. *The category "Other" includes vocational school (n = 9), integrated comprehensive school (n = 1), and others / not specified (n = 4). All percentages are rounded.

The adapted RFCDC scale demonstrated good internal consistency (Cronbach's α = .80; McDonald's ω = .87). A confirmatory factor analysis (CFA) using maximum likelihood estimation was conducted (Figure 1), specifying three correlated latent factors corresponding to the RFCDC cognitive levels (elementary, intermediate, and advanced). The model showed good to excellent fit to the data, $\chi^2(17) = 25.64$, p = .081, CFI = .99, TLI = .98, RMSEA = .04 (90% CI [.00, .08]), SRMR = .04. One item at the elementary level (RF02: "I can temporarily refrain from judging others") exhibited a comparatively weaker standardized factor loading (λ = .28, p = .035), suggesting that indicators at the elementary level may capture broader or less differentiated expressions of tolerance of ambiguity. In contrast, factor loadings for the intermediate and advanced levels were consistently strong, ranging from .73 to .88. Correlations among the latent factors were moderate to strong (r = .36–.63), supporting the conceptual relatedness of the cognitive levels while also indicating their empirical distinctiveness. Finally, the RFCDC scale showed a significant, moderate correlation with the TAS-scale (r = .47), providing evidence of convergent validity and confirming substantial overlap in the constructs assessed by the two measures.

Figure 1

CFA Model of the RFCDC Scale

The mean TAS score in the study sample (M = 3.00, SD = 0.46) differed significantly from the overall sample reported by Lietz (2023; M = 2.90, SD = 0.54), as indicated by a Welch's t-test ($p < .01$). Significant differences were also observed in comparisons with several subgroups reported by Lietz (2023), including respondents younger than 40 years and those with low or medium levels of education. In contrast, no notable differences emerged when comparing the present sample with the subgroup of highly educated respondents (M = 2.99, SD = 0.56; $p = .77$) (Table 2 and 3).

Table 2
Sample Values of the TAS and RFCDC Scales

Item (TAS)	**M (TAS)**	**SD (TAS)**	**Item (RFCDC)**	**M (RFCDC)**	**SD (RFCDC)**
TA01	3.15	0.93	RF01	6.85	1.76
TA02	2.86	1.00	RF02	7.01	2.10
TA03	3.00	1.08	RF03	6.23	2.15
TA04	2.56	1.07	RF04	6.02	1.98
TA05	2.93	0.94	RF05	6.18	2.00
TA06	3.32	0.94	RF06	6.22	2.13
TA07	3.36	0.95	RF07	5.84	2.21
TA08	4.13	1.04	RF08	6.11	2.08
TA09	3.48	1.29			
TA10	2.12	0.73			
TA11	2.11	1.01			
Total (TAS)	3.00	0.46	**Total (RFCDC)**	6.31	1.32

Table 3
Comparison of TAS Scale Values Between the Sample and the Reference Values in Lietz (2023)

	n	M	SD	p
Sample TAS study	261	3.00	0.46	–
Sample TAS - Lietz (2023)	1370	2.90	0.54	< *.01*
- Age group < 40 years	360	2.88	0.50	< *.01*
- Low level of education	210	2.76	0.47	< *.01*
- Medium level of education	422	2.82	0.52	< *.01*
- Higher level of education	738	2.99	0.56	= .77

Note. Comparison always between the entire sample of the study and the individual reference values. Test statistic based on the Welch t-test.

Group differences in TAS and RFCDC scores were examined using Welch's t-test as well. Pre-service teachers studying democratic citizenship education as a subject reported slightly higher mean scores on both the TAS (M = 3.05, SD = 0.47) and the RFCDC scale (M = 6.44, SD = 1.34) compared to those not enrolled in such subjects (TAS: M = 2.93, SD = 0.44; RFCDC: M = 6.05, SD = 1.25). Although small, both differences were statistically significant ($p < .05$). Additional group differences were also observed with respect to gender. Male participants reported higher levels of tolerance of ambiguity than female participants on both scales (TAS: M = 3.15, SD = 0.44 vs. M = 2.94, SD = 0.46; RFCDC: M = 6.94, SD = 1.15 vs. M = 6.06, SD = 1.30), with both differences reaching statistical significance ($p < .01$). No further notable differences were found for either scale with respect to school type, semester of study, or federal state.

In summary, the findings indicate that pre-service teachers exhibit significantly higher levels of tolerance of ambiguity than the general population in Lietz (2023). However, this difference disappears when comparisons are restricted to shares of the population with higher levels of education. Accordingly, there is no evidence that pre-service teachers demonstrate greater tolerance of ambiguity than other highly educated groups. Furthermore, no correlations were found between tolerance of ambiguity and either the duration of studies or the type of school for which pre-service teachers are preparing. A small but statistically significant difference was identified between pre-service teachers studying democratic citizenship education and those who do not.

However, given that the sample primarily includes participants from two German federal states, these results cannot yet be generalized to pre-service teachers in other regions of Germany or to other countries. Further studies with more diverse samples are therefore necessary to assess the robustness of this finding. Moreover, the underlying mechanisms remain unclear. Possible explanations include self-selection effects among students choosing democratic citizenship education, or a more central role - direct or indirect - of tolerance of ambiguity within these study programs. Finally, the tolerance of ambiguity scale derived from the RFCDC (Council of Europe, 2018a) demonstrated satisfactory reliability and largely sound psychometric

properties, although certain items require critical revision. In combination with the established convergent validity with the TAS scale, these results suggest that the RFCDC descriptors are mostly empirically grounded. This empirical anchoring is particularly relevant for educators and teacher educators who employ the framework in educational practice.

Conclusion: On the Necessity of Fostering Ambiguity Tolerance Among (Future) Teachers

As future teachers, students will later become key multipliers of democratic learning cultures. However, low tolerance for ambiguity could lead them to push for clarity and clear solutions in the classroom, thereby undermining democratic negotiation processes. The study results suggest that tolerance for ambiguity should be anchored as an explicit target in teacher training. Democratic citizenship education needs teachers who not only tolerate ambiguity, but also use it as a didactic resource.

Ambiguity tolerance is not an individual disposition, but a professional attitude that combines cognitive, emotional, and social dimensions. It enables teachers to use difference and contradiction as didactic resources—for example, by encouraging learners to take different perspectives, reflect on uncertainties, and question preliminary judgments. Such an attitude is a basic prerequisite for democratic learning cultures that focus not on quick answers but on joint search movements.

The findings suggest that tolerance of ambiguity has been a neglected future competence to date, even though it is central to dealing with polarization, plurality, and social transformation. Democratic citizenship education must therefore understand it more as a cross-cutting task. Until now, the promotion of ambiguity tolerance has hardly been pursued as an independent learning goal in democratic citizenship education. There is a particular gap in teacher training: if prospective teachers do not learn to deal with ambiguity productively, there is a risk of a return to unambiguous logic in the classroom, which undermines complex social negotiation processes.

Teacher training should therefore not only implicitly teach tolerance of ambiguity, but also explicitly recognize it as a future competence. In all phases of training, it is important to create learning opportunities in which students can experience ambiguity, tolerate it, and make it pedagogically fruitful. Ambiguity tolerance must therefore be included as a core objective in the curricula of teacher training and democracy education. Only in this way can future teachers accompany ambiguous students in a pluralistic, conflict-ridden society without reducing complexity or moralizing diversity.

Teachers who are tolerant of ambiguity promote democratic citizenship education that focuses not on clarity but on judgment, dialogue, and democratic maturity, thereby laying the foundation for a sustainable democracy.

A Study on the Learning Motivation and Learning Outcomes of Short-Form Videos Into the Design Cluster of Vocational High School

Shin Liao, National Taiwan University of Graphic Arts and Communications, Taiwan
Chun-Wei Chen, National Taiwan University of Graphic Arts and Communications, Taiwan
Yi-Hsuan Wang, National Taiwan University of Graphic Arts and Communications, Taiwan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

The purpose of this study was to investigate the integration of short-form videos into practice-oriented courses in the design cluster of a vocational high school and to analyze their relationship with students' learning motivation and learning outcomes. This study adopted an experimental research design, and the participants were 41 students from the design cluster of a vocational high school in Taiwan. The study produced short-form instructional videos for the professional subject Principles of Form, with the thematic unit of Art and Craft Movement, which included three components: "historical background," "design concepts," and "representative figures." The videos were integrated into classroom instruction and implemented prior to the evaluation of learning outcomes, with a questionnaire based on the ARCS motivation model administered to measure students' learning motivation. Data were analyzed using descriptive statistics, paired-sample t-tests, one-way ANOVA, and Pearson correlation analysis. The results indicated that students demonstrated a certain level of learning motivation toward the integration of short-form videos into the course, and their learning outcomes also showed improvement; however, no significant correlation was found between learning motivation and learning outcomes.

Keywords: short-form videos, design cluster of vocational high school, learning motivation, learning outcomes

Introduction

Background

With the rise of social media, the modes of information dissemination have shifted toward immediacy, visualization, and high-level condensation. Short-form videos, characterized by their brevity, high appeal, and fragmented content, have gradually become one of the primary channels through which the younger generation accesses digital content. The multisensory stimulation and instant feedback offered by such media align with people's preferences for information consumption. Compared with traditional sources such as print materials, textbooks, and online courses, individuals now tend to rely more on short-form videos as a means of information seeking. This tendency is attributed to the intuitive, sequential, and replayable features of short-form videos, which cater to the growing dependence on real-time learning resources (Garcia et al., 2022).

In the design cluster of Taiwan's vocational high schools, most professional courses still rely on traditional face-to-face instruction, chalkboard teaching, and static visual-textual materials. These approaches typically emphasize theoretical exposition and aesthetic analysis, which can easily lead to student fatigue and frustration. Among the core subjects of the design cluster, the Principles of Form course covers knowledge areas such as the history of form, stylistic evolution, and design vocabulary. In particular, the unit on Form and Culture requires students to comprehend the developmental trajectory of form from the Arts and Crafts Movement to Postmodernism. This unit serves as a crucial foundation for cultivating artistic perception and design literacy. However, due to its extensive content and memory demands, it is often difficult to stimulate student motivation. If short-form videos are integrated as supplementary teaching materials, the use of dynamic imagery and narrative styles may reinforce the delivery of key course concepts, thereby enhancing students' learning motivation and learning outcomes for this unit.

Purposes

Based on the aforementioned background and motivation, the specific purposes of this study are as follows:

1. To explore the impact of short-form videos on the learning motivation of students in the design cluster of vocational high schools in Taiwan.
2. To explore the impact of short-form videos on the learning outcomes of students in the design cluster of vocational high schools in Taiwan.
3. To explore the relationship between learning motivation and learning outcomes in the context of short-form video integration for students in the design cluster of vocational high schools in Taiwan.

Literature Review

Current Development of Short-Form Videos

Short-form video, as an emerging form of social media expression, differs from traditional long-form videos in that its duration generally ranges from 5 seconds to 5 minutes. It is characterized by simplified production processes, low production costs, and content that is often refined and diverse, making it well-suited to the fast-paced lifestyles of contemporary users (Yani et al., 2019). These videos are ideal for viewing during fragmented periods such as

commuting or short breaks and have been extensively developed on major digital video platforms. Short-form videos have not only transformed users' media consumption habits but have also driven platforms to develop algorithm-driven personalized recommendation systems aimed at increasing user engagement and interaction. In recent years, with the diversification of platform content and the transformation of user habits, short-form videos, which were originally dominated by entertainment purposes, have gradually been applied in the field of education. Characterized by brevity, compact narratives, and strong visual stimulation, short-form videos help enhance students' attention and content retention, thereby becoming an emerging tool for digital instruction.

The ARCS Motivation Model

Digital learning and self-directed learning have increasingly become prevalent trends in contemporary educational contexts. Within multimedia-rich and fragmented information environments, how to effectively stimulate and sustain learners' motivation has become a critical issue for educators. In 1984, Keller proposed the ARCS Motivation Model, which consists of four key components: Attention, which aims to capture learners' focus and stimulate their interest and curiosity in the content; Relevance, which aligns the learning material with learners' needs and goals, fostering positive learning attitudes; Confidence**,** which helps learners believe in their ability to accomplish tasks and master the keys to success; and Satisfaction, which enhances learners' sense of achievement through positive feedback and rewards (Keller, 1987). Short-form video instruction, with its concise content, fast-paced rhythm, and strong visual appeal, aligns well with the digital habits of today's learners. When combined with the multifaceted ARCS motivation model, it can more effectively capture learners' interest, increase engagement, and enhance learning involvement. By applying this model, educators can observe changes in learners' motivation and learning responses during the short-form video experience, thereby adjusting instructional content and pacing to improve teaching quality and learning outcomes.

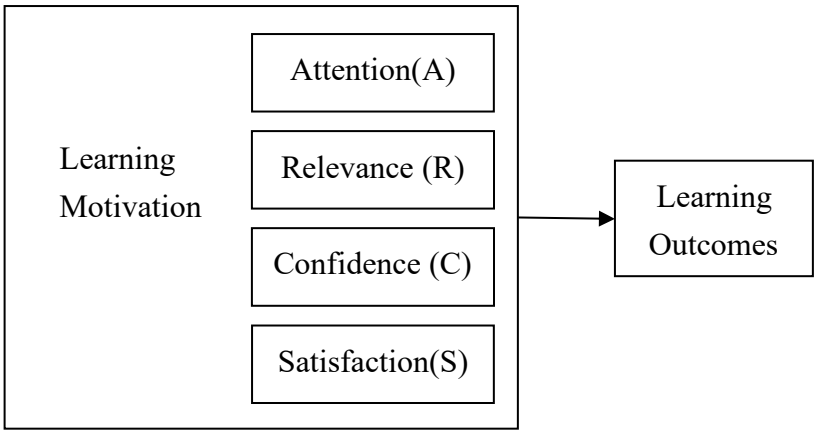
Learning Outcomes

Learning outcomes refer to the growth and changes exhibited by learners in terms of knowledge, skills, and attitudes after completing a full learning process. Learning outcomes not only represent learners' performance during the learning process but also encompass their ability to effectively apply acquired knowledge, solve problems, and achieve overall learning satisfaction. According to Wang (2010), learning outcomes are a multi-level, multi-dimensional, and temporal concept. Therefore, assessments of learning outcomes should incorporate cognitive, skill-based, and affective dimensions simultaneously in order to comprehensively and accurately reflect the actual impact of educational interventions, as well as to provide an essential basis for continuous improvement in educational institutions. Caspersen et al. (2017) indicated that the assessment of learning outcomes can serve purposes such as competency validation, learning process tracking, or educational quality evaluation. The selection of appropriate assessment methods—such as grades, self-assessments, or standardized tests—should depend on the specific instructional context. Only through diversified and contextualized assessment mechanisms can educators fully understand students' learning processes and the true effectiveness of educational interventions.

Jeminiwa et al. (2025) found that integrating short-form videos into classroom instruction enhanced learners' learning confidence, knowledge mastery, and understanding of course content. Learners also reported receiving positive feedback and expressed a high willingness

to recommend such instructional approaches, indicating that short-form videos hold significant potential and practical value as a higher education teaching strategy. Similarly, Aslan and Sirojitdinovna (2025) indicated that most learners perceived short-form videos as providing rapid knowledge input, convenient mechanisms for repeated viewing, and an appropriate amount of information, which facilitated memory retention and learning transfer. In addition, the use of real-life contexts and visual aids in short-form videos further supports comprehension and application, outperforming traditional lecture-based instruction in terms of learner engagement and learning outcomes. As an emerging instructional medium, the impact of short-form videos on learning outcomes has increasingly become a focal point of educational research.

In summary, learning outcomes serve as a core indicator for assessing the impact of instruction and the quality of learning. A valid assessment of learning outcomes should encompass cognitive, skill-based, and attitudinal dimensions in order to fully capture the overall learning achievements resulting from educational interventions.



Research Method

The purpose of this study was to investigate the relationship between learning motivation and learning outcomes of students in the design cluster of vocational high schools when short-form videos were integrated into the curriculum. A questionnaire survey was employed to collect data from students at a vocational high school in Taiwan regarding their learning motivation and learning outcomes in design courses incorporating short-form videos, with the aim of examining the correlation between students' learning motivation and learning outcomes following the integration of short-form videos. The specific details regarding the research framework, participants, research instruments, implementation procedures, and data processing and analysis are presented below.

Research Framework

Based on the purpose of this study, the ARCS motivation model was adopted to explore the relationship between learning motivation and learning outcomes in the integration of short-form videos into a professional design course at a vocational high school. The research framework is illustrated in Figure 1.

Figure 1
Research Framework

Research Participants

A vocational high school was selected as the research site for this study. Through convenience sampling, one class from the design cluster was chosen as the research sample, consisting of 41 students. After excluding six students who did not fully participate in the course, the final sample comprised 35 students.

Research Instruments

Short-Form Videos for Principles of Form

The instructional short-form videos used in this study were developed based on the "Arts and Crafts Movement" unit of the Principles of Form course in the design cluster of vocational high schools. The development also referred to the content of the asynchronous online learning materials titled Principles of Form – Evolution of Modern Form Culture (Ke, 2020). The unit topics cover the "Historical Background" (Figure 2), "Design Concepts" (Figure 3), and "Representative Figures" (Figure 4). A total of three instructional short-form videos were produced, with content organized using a thematic narrative design that integrates images, text, and voice guidance to enhance students' learning focus and content comprehension.

Figure 4
Short-Form Video – Representative Figures

Questionnaire on Learning Motivation for Short-Form Video Integration in the Course

This study employed a questionnaire survey method. Based on a review of the literature, the questionnaire was initially developed with reference to Pintrich's (1991) Motivated Strategies for Learning Questionnaire (MSLQ) and Keller's (1987) Instructional Materials Motivation Survey (IMMS). Subsequently, considering factors related to the integration of short-form videos into courses and learning motivation identified in the literature, a preliminary version of the questionnaire on learning motivation for courses incorporating short-form videos was drafted. Expert feedback was then collected to refine and simplify the questionnaire constructs, which led to the development of the finalized questionnaire on learning motivation.

The online learning motivation questionnaire consisted of 20 items, covering four dimensions: gaining attention, relevance, building confidence, and satisfaction. Each dimension contained five items. A five-point Likert scale was adopted, with 1 representing "strongly disagree" and 5 representing "strongly agree." Higher scores indicated a more positive level of students' learning motivation.

Research Implementation

The study was conducted within the design cluster curriculum of a vocational high school during the final review period prior to the end-of-semester examinations. The instructional content focused on the Art and Craft Movement unit of the course Principles of Form. To support students in reviewing key concepts, the researcher produced three thematic short-form instructional videos, each covering one of the following topics: "historical background," "design concepts," and "representative figures." During classroom implementation, the videos were played, followed by teacher-led explanations and worksheet-based learning activities designed to guide students in summarizing and understanding the main ideas. Upon completion of the video-based instruction, a learning motivation questionnaire based on the ARCS motivation model was administered, and statistical analysis was conducted.

Data Analysis

The questionnaire responses were first compiled and processed using Microsoft Excel. The data were then subjected to statistical analysis using JASP (version 0.19.3.0). Cronbach's α coefficient was calculated to assess the internal consistency and reliability of the questionnaire. Descriptive statistics were used to present the overall means and standard deviations of the questionnaire items, along with a general summary of the participants' demographic profiles. Subsequently, students' average learning motivation scores were ranked from highest to lowest. Based on the interquartile range (IQR), the students were categorized into three groups: high, medium, and low levels of learning motivation. The corresponding learning outcome scores were then matched to each student. Paired-sample t-test, Pearson correlation analysis and one-way ANOVA, were conducted to examine differences among the three groups and to explore the relationship between students' learning motivation and learning outcomes in the context of short-form video–integrated instruction within the vocational high school design cluster.

After the questionnaires were collected, a reliability analysis was conducted. As shown in Table 1, the quantitative results indicated a Cronbach's α of .929, exceeding the threshold of 0.7, thereby demonstrating that the questionnaire possessed an acceptable level of reliability. Furthermore, to confirm the necessity of each item, the Cronbach's α values after item deletion ranged from .921 to .931, none of which were significantly higher than the overall reliability coefficient (.929). This result suggests that all items were well integrated with the overall scale. Finally, the questionnaire was also reviewed by academic experts to ensure its validity.

Table 1
Results of the Unidimensional Reliability Analysis of the Learning Motivation Questionnaire

Cronbach	estimate	Std.Error	95% confidence interval	
			Lower	Upper
Cronbach's α	0.929	0.012	0.934	0.979

Results and Discussion

This study aimed to examine the relationship between learning motivation and learning outcomes in short-form video–integrated courses within vocational high school design programs. A questionnaire survey method was adopted to collect data from students in a vocational high school regarding their learning motivation and outcomes in such courses. A total of 41 questionnaires were returned. After excluding six students who did not fully participate in the course, 35 valid responses remained. After confirming the reliability and validity of the instrument through reliability analysis, both descriptive and inferential statistical analyses were conducted. As shown in Table 2, the results showed that the overall mean score of learning motivation across the 35 valid questionnaires was 3.689, which fell within the upper-mid range, indicating that students demonstrated a certain level of learning motivation toward short-form video–integrated courses.

Table 2
Descriptive Statistical Analysis of Overall Student Learning Motivation

Group	N	Mean	SD
All Students	35	3.689	0.422

The paired-sample t-test was conducted to examine whether there were significant differences in learning outcomes before and after integrating short-form videos into the course instruction. The mean score of learning outcomes before the integration was 72.086 (SD = 11.296), and after the integration, the mean score increased to 75.971 (SD = 14.486). The results of the paired-sample t-test revealed no statistically significant difference, $t = -1.542$, $p = .132 > .05$. As shown in Table 3, although the statistical result was not significant, the mean score indicates an improvement in learning outcomes.

Table 3
Paired Samples t-Test Analysis of Learning Outcomes Before and After Integration of Short-Form Videos Into the Curriculum

Group	N	Learning Outcomes Mean	SD	df	T-value	P-value
Before integration of short-form videos	35	72.086	11.296	34	-1.542	0.132
After integration of short-form videos	35	75.971	14.486			

Note. *p < .05, **p < .01, ***p < .001

The Pearson correlation analysis between students' learning motivation and learning outcomes reveals the correlation coefficient between the two variables. As shown in Table 4, there is no significant correlation between students' learning motivation and their learning outcomes.

Table 4
Pearson Correlation Analysis Results Between Learning Motivation and Learning Outcomes

		Learning Motivation	Learning Outcomes	Mean	SD
Learning Motivation	Pearsons'r	-	-0.045	3.689	0.442
	p-value	-	0.799		
Learning Outcomes	Pearsons'r	-0.045	-	75.356	14.488
	p-value	0.799	-		

Note. *p < .05, **p < .01, ***p < .001

Using a one-way analysis of variance (ANOVA), the statistical results shown in Table 5 indicate that the average learning outcome score for the low-motivation group was 75.778 (SD = 10.929), for the medium-motivation group was 78.069 (SD = 13.548), and for the high-motivation group was 72.222 (SD = 19.505). Overall, the average learning outcome score for all students was 75.071 (SD = 14.488). The results of the one-way ANOVA revealed no significant differences in learning outcomes among students with different levels of learning motivation after short-form videos integration (F = 0.463, p = .633 > .05). This indicates that, in this study, different levels of learning motivation among students in the vocational high school design cluster did not affect their learning outcomes.

Table 5
One-Way ANOVA Analysis of Learning Outcomes Based on Different Levels of Learning Motivation

Group	N	Learning Outcomes Mean	SD	df	F	P
Low learning motivation	9	75.778	10.929	32	0.463	0.633
Intermediate learning motivation	17	78.069	13.548			
Upper-intermediate learning motivation	9	72.222	19.505			

Note. *p < .05, **p < .01, ***p < .001

Further analysis of learning outcomes among students with different levels of learning motivation revealed that students in the high-motivation group demonstrated lower learning outcomes compared with those in the medium- and low-motivation groups. This finding does not align with the commonly held view in prior research that "higher learning motivation or acceptance typically leads to better learning outcomes" (Zhang et al., 2024). This result may reflect certain limitations in the application of digital instructional materials. Students with high learning motivation may tend to engage in active exploration and deep learning, and the concise, compressed nature of short-form video content may not satisfy their need for comprehensive and in-depth knowledge, potentially affecting their learning performance. In contrast, students with moderate levels of learning motivation may benefit more from the key information and visual stimulation provided by short-form videos, thus improving their learning outcomes.

These findings also suggest that the relationship between learning motivation and learning outcomes is not strictly linear, but is influenced by the interplay of instructional media, course design, and individual learner differences. While short-form videos have the potential to capture attention and stimulate learning interest, their use should be carefully adapted based on course objectives, learner characteristics, and disciplinary requirements to maximize effectiveness. Future research may further investigate the effects of short-form videos on learners' short-term memory and long-term learning outcomes, and explore their potential when integrated with blended instructional designs and other teaching strategies.

Conclusion

This study aimed to investigate the effects of integrating short-form videos into vocational high school design courses on students' learning motivation and learning outcomes, and further examine the relationship between the two. The results are presented as follows:

1. Students generally held a positive attitude toward the integration of short-form videos into the course. The overall level of learning motivation was in the upper-mid range, indicating that short-form videos have the potential to enhance learning interest and promote classroom engagement.
2. Students showed a tendency toward higher overall learning scores after the integration of short-form videos into the course, suggesting that while there was some improvement, it was not sufficient to reach a statistically significant effect.
3. In this study, no significant relationship was found between learning motivation and learning outcomes among students in the Design Cluster of Vocational High School following the integration of short-form videos into the course.

Overall, this study offers preliminary validation for the use of short-form videos in teaching within the Design Cluster of Vocational High Schools. Short-form videos appear to be both feasible and potentially effective in enhancing students' learning motivation. However, achieving substantial improvements in learning outcomes will require further refinement of instructional strategies and media application to ensure meaningful enhancement of student s' outcomes.

Acknowledgements

This research was made possible thanks to Mr. You-Lin Lai, a teacher at Taichung Ta-Ming Senior High School, for his assistance in curriculum planning and teaching implementation, as well as the materials he provided.

Generative AI in Vocational High School Design Cluster Practice Courses: Influences on Motivation and Effectiveness

Shin Liao, National Taiwan Normal University, Taiwan
Pei-Yi Liu, National Taiwan Normal University, Taiwan
Hau-Wei Weng, National Taiwan Normal University, Taiwan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

In recent years, artificial intelligence (AI) technologies have rapidly advanced and found extensive applications in image design, text generation, and interactive media, increasingly being integrated into educational contexts. Among these technologies, generative AI characterized by real-time interactivity, multimodal content generation, and text-to-image conversion capabilities has demonstrated significant potential as an instructional tool in vocational high school design courses. However, empirical research on the integration of generative AI in vocational design education remains limited, and the effects on students' learning motivation and academic performance have yet to be thoroughly examined. This study investigates the impact of integrating generative AI on students' learning motivation and effectiveness in a computer graphics course at a vocational high school in Taiwan. An experimental design was employed, utilizing a cyclical learning model consisting of four stages: observation, summarization, questioning, and application. The course was conducted over two weeks, with three 50-minute sessions each week. Following the intervention, students completed an assessment of learning effectiveness and a questionnaire on learning motivation. Analysis using paired-sample t-tests, one-way ANOVA, and Pearson correlation revealed that the integration of generative AI significantly enhanced students' learning effectiveness. Although the gains in learning motivation were modest, the intervention resulted in tangible improvements in student learning effectiveness.

Keywords: generative AI, vocational high school, learning effectiveness, learning motivation

iafor
The International Academic Forum
www.iafor.org

Introduction

With the increasing maturity of AI technology, generative AI has emerged as a major focus in the education sector. Generative AI generates textual, graphical, and multimedia content using deep learning models and is characterized by real-time interaction and high levels of personalization. It is considered a significant opportunity for educational innovation (Wang, 2023). Both domestic and international studies have shown that generative AI tools, such as ChatGPT, can significantly enhance the efficiency of lesson preparation and provide students with personalized learning experiences. These tools effectively boost student engagement and motivation, thereby improving learning effectiveness (Hsu, 2024).

However, despite the growing prevalence of AI technology, systematic evaluations and empirical research on its effectiveness within the curriculum are still relatively limited. Most studies in AI education have concentrated on theoretical discussions or isolated case studies. There is a notable lack of large-scale, longitudinal empirical research examining the specific effects of AI technology on learning motivation and academic achievement in real educational settings (Holmes & Tuomi, 2022). Consequently, this study aims to investigate the impact of integrating generative AI into curriculum instruction on students' learning motivation and academic effectiveness.

Based on the background and motivation outlined above, the specific objectives of this study are as follows:

A. To examine the impact of integrating generative AI on the learning motivation of design students in technical high school professional practice courses.
B. To evaluate the learning effectiveness of integrating generative AI into these courses.
C. To investigate the relationship between learning motivation and learning effectiveness within the context of professional practice courses that integrate generative AI.

Literature Review

Current Development of Generative AI

The rapid advancement and widespread adoption of generative AI technology have positioned it as a significant driver of educational innovation worldwide. Generative AI (e.g., ChatGPT, DALL-E, etc.), which utilizes deep learning and big data, can automatically generate language, image, audio, and video content. It is increasingly being applied across various domains, including teaching, assessment, curriculum design, and personalized learning. These applications not only enhance the efficiency and flexibility of instruction but also facilitate the transformation of educational models (Xu, Taiping, 2024). Baidoo-Anu and Owusu Ansah (2023) have noted that the core value of generative AI lies in promoting individualized and adaptive teaching, allowing students to learn at their own pace and according to their specific needs. Meanwhile, teachers can leverage AI to assist with lesson preparation, assessment, and the development of diverse evaluation mechanisms, thereby improving teaching quality and student motivation. Sun and Zhou (2024) reported that the application of generative artificial intelligence can effectively improve the learning effectiveness of college students, providing empirical support for its role in higher education.

In addition, the use of generative AI tools in technical high schools and K-12 education is becoming increasingly prevalent. Research indicates that project-based learning, human-computer collaboration, and game-based curriculum design can significantly enhance students'

cognitive, affective, and behavioral learning effectiveness (Yim & Su, 2024). Globally, many countries have prioritized AI literacy in educational development, actively incorporating AI into curricula at various educational levels and emphasizing the cultivation of cross-disciplinary competencies, including computational thinking, creativity, and digital citizenship (Ng et al., 2023).

ARCS Motivation Model

To address the prevalent issue of insufficient student motivation in classroom teaching, Keller (1987) proposed the ARCS Learning Motivation Model. This model emphasizes the systematic design of motivational strategies from the learner's perspective, encompassing four key components: Attention, Relevance, Confidence, and Satisfaction. The ARCS model is both logical and practice-oriented, aiding teachers in identifying and addressing factors that influence learning motivation and translating these insights into effective instructional strategies (Keller, 2010).

Julianingsih et al. (2023) demonstrated that teaching materials designed using the ARCS model effectively enhance students' motivation and academic performance in practical courses, particularly in technical high schools and application-oriented subjects. Contextualized questioning and exemplary teaching methods can significantly engage students' attention and interest. Furthermore, Fang et al. (2024) summarized that the ARCS model has emerged as one of the core theories in digital learning and cross-disciplinary educational research. It is widely employed for instructional design, the development of theoretical frameworks, and as a tool for measuring motivation in empirical studies across fields such as medicine, technology, and education.

Learning Effectiveness

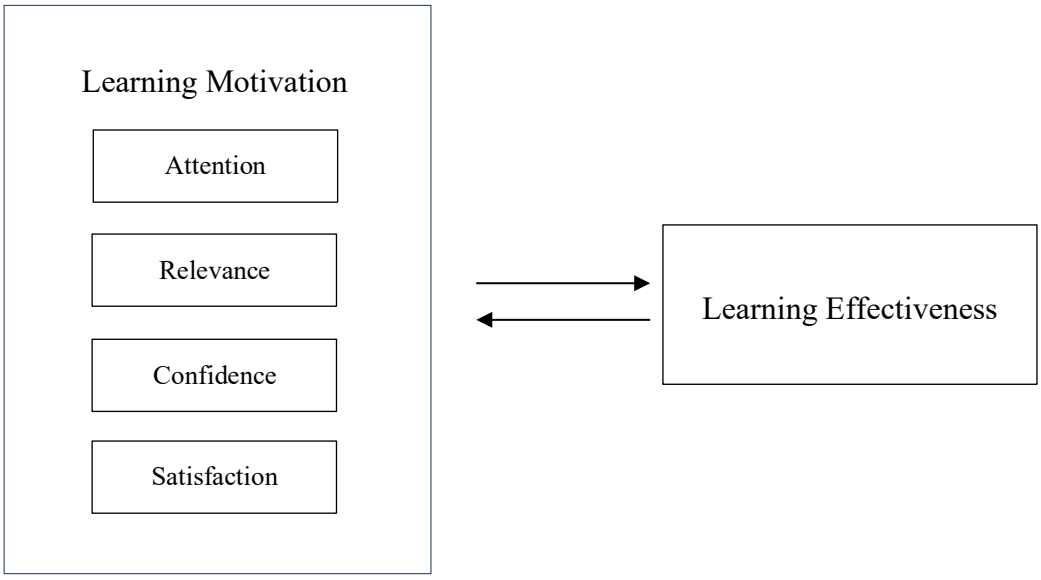
Learning effectiveness refer to the comprehensive growth and performance of students in areas such as subject knowledge, cognitive development, psychosocial adaptation, attitudes, and values. According to Wang (2010), this concept is multi-level and integrated, encompassing both immediate knowledge acquisition and behavioral changes in the classroom (direct effectiveness) as well as long-term effects on career development and personal growth (indirect effectiveness). Learning effectiveness span cognitive, affective, and psychomotor domains and should be assessed at the institutional, curriculum, and classroom levels to fully evaluate the achievement of instructional objectives.

Internationally, the European Qualifications Framework (EQF) defines learning effectiveness in terms of knowledge, skills, and competencies, offering a standardized and internationally comparable system for assessing educational quality (European Commission, 2024). The OECD Learning Compass 2030 further underscores the significance of learning effectiveness that encompass student agency, reflective abilities, and real-world performance. It advocates for the use of diverse forms of evidence, such as portfolios and practical assessments, to evaluate comprehensive student development (OECD, 2023).

Recent research highlights the potential benefits of integrating generative AI into teaching and learning. Wei et al. (2025) found that generative AI tools, such as ChatGPT, facilitate iterative development and reflection during digital storytelling, resulting in significant improvements in the quality and creativity of students' final products. However, UNESCO (2023) warns that

overreliance on AI may hinder the development of students' intellectual skills, emphasizing the need for a balance between AI-assisted learning and the cultivation of independent thinking.

In summary, learning effectiveness can be defined as the comprehensive demonstration of students' mastery of knowledge, application of skills, and transformation of attitudes through effective learning experiences. This mastery is evidenced by progress in subject assessments, creative practices, and reflective learning.



Research Design

This study aims to examine the correlation between students' learning motivation and learning effectiveness in the context of AI-integrated professional practice courses at technical high schools. Data was collected through a questionnaire survey. The following sections outline the research framework, target population, research instruments, and procedures for data processing and analysis.

Research Structure

According to the purpose of this study, the ARCS motivation model was adopted to investigate the relationship between motivation and the effectiveness of AI integration in professional practice courses for design students in technical high schools. The research framework is illustrated in Figure 1.

Figure 1
Research Structure

Research Subjects

This study employed convenience sampling to recruit second-year students from a technical high school in Tainan. The intervention involved the integration of generative AI into a computer graphic design applications course.

Research Tools

Learning Motivation Questionnaire

This study employed a questionnaire survey. Drawing on a synthesis of relevant literature, the Instructional Materials Motivation Survey (IMMS) developed by Keller (1987) served as the basis for instrument development. Additional factors identified in the literature concerning the integration of AI into curricula and students' learning motivation were incorporated into the design of the questionnaire. The instrument comprised 20 items distributed across four dimensions—Attention, Relevance, Confidence, and Satisfaction—with five items per dimension. Responses were rated on a five-point Likert scale (1 = strongly disagree, 5 = strongly agree), with higher scores reflecting greater learning motivation. The Cronbach's alpha coefficient was 0.974, indicating strong internal consistency.

Learning Effectiveness Evaluation

Learning effectiveness were assessed using a pre- and post-test design. The performance of students was compared before and after the integration of generative AI teaching materials. The evaluation employed a standardized scale ranging from 0 to 100, developed by the instructional staff.

Main Teaching Procedures

Based on the instructional framework designed by the instructor for integrating generative AI into teaching, the course adopts "The Application of AI in Design: Anti-Smoking Poster Design for a Friendly Campus" as its central theme. The curriculum incorporates generative artificial intelligence technologies to support students in the vocational high school design program in carrying out creative design practices. The total instructional time is three 50-minute sessions per week, implemented over a two-week period. The instructional framework employs a "Observation–Summarization–Questioning–Application" cyclical learning model, and through five sequential instructional units, systematically cultivates students' AI literacy and design competencies.

Data Analysis

In this study, the results of the questionnaires were compiled and processed using Excel software and statistically analyzed with JASP version 0.19.3. First, Cronbach's alpha coefficient was employed to assess the reliability of the questionnaire, while descriptive statistics were employed to present the mean and standard deviation for each item, as well as to summarize the demographic background of the sample. Second, the mean scores of students' learning motivation were ranked from highest to lowest and categorized based on their learning effectiveness scores. The total motivation scores for each group were then calculated. Differences in motivation scores between groups were analyzed using independent samples t-tests to determine statistical significance at the $p < .05$ level.

Additionally, a one-way ANOVA was conducted to examine the differences in learning motivation among various groups based on their learning effectiveness. This analysis aimed to understand the relationship between learning motivation and learning effectiveness for technical high school students enrolled in a generative AI-integrated professional practice course.

Research Results

This study analyzed data from both learning assessments and questionnaire surveys to explore the effects of integrating generative AI on learning motivation and effectiveness among design students in technical high schools. Additionally, it examined the motivational performance of students with varying levels of academic achievement.

Motivation of Students Integrating Generative AI Into the Curriculum

The overall mean score of students' learning motivation was 3.17, with all item means exceeding 3, indicating a moderately high level of motivation toward the integration of generative AI into the curriculum. Welch's *t*-test was further conducted to analyze gender differences across the four dimensions of the ARCS model. As presented in Table 2, male students scored significantly higher than female students in the Relevance, Confidence, and Satisfaction dimensions, suggesting that males outperformed females in these areas. Although the difference in the Attention dimension did not reach statistical significance, male students nonetheless achieved a higher mean score than their female counterparts.

Table 1
Summary of t-Tests on Learning Motivation of Students of Different Genders

Dimensions	Group	n	M	SD	t	p
A (Attention)	males	9	18.333	4.873	-1.363	0.198
	females	38	15.868	4.894		
R (Relevance)	males	9	19.222	3.420	-2.745**	0.013
	females	38	15.316	5.251		
C (Confidence)	males	9	20.111	2.472	-4.401***	< .001
	females	38	15.211	4.616		
S (Satisfaction)	males	9	19.444	2.297	-3.582***	< .001
	females	38	15.421	5.065		

Note. *p < .05, **p < . 01, ***p < . 001

Student Learning Effectiveness of Generative AI Integration in the Curriculum

First, this study employed a sample *t*-test to examine differences in students' learning effectiveness before and after the integration of generative AI into the curriculum. As shown in Table 3, the post-test mean (M = 81.57, SD = 10.77) was significantly higher than the pre-test mean (M = 68.21, SD = 14.61). The results indicated that the difference between the two was statistically significant ($p < .05$).

Therefore, for students in the technical high school design cohort, the integration of generative AI into instruction produced a significant improvement in learning effectiveness. This finding is consistent with the results of Sun and Zhou (2024), confirming that the application of generative AI in instructional design exerts a positive influence on learning performance.

Table 2
Summary Table of Effectiveness Scores Before and After AI Integration

	M	SD	t	df	p	95%CI	
						LL	UL
Pre-AI	68.29	13.96	-7.29***	45	< .001	-1.418	-0.701
Post-AI	81.14	11.57					

Note. *p < .05, **p < .01, ***p < .001

Comparison of Students' Motivation for Generative AI-Integrated Courses by Learning Effectiveness

In this study, we aimed to further understand whether differences in learning motivation exist among students with varying learning effectiveness. The students' learning assessment scores (posttest scores) were categorized into three groups using the quartile method: high, medium, and low. A one-way analysis of variance (ANOVA) was conducted to examine the differences in the four dimensions of learning motivation patterns among students with different learning effectiveness based on the ARCS model. The ANOVA results indicated that there were no statistically significant differences in the four dimensions of the ARCS learning motivation model among students with varying learning effectiveness. Specifically, the results for each construct were as follows: Attention construct $F(2, 44) = 0.438$, $p > .05$; Relatedness construct $F(2, 44) = 0.007$, $p > .05$; Confidence construct $F(2, 44) = 0.167$, $p > .05$; Satisfaction construct $F(2, 44) = 0.027$, $p > .05$; Learning Motivation construct $F(2, 44) = 0.027$, $p > .05$; and overall motivation $F(2, 44) = 0.011$, $p > .05$. Additionally, Pearson's cumulative correlation analyses presented in Table 7 revealed a weak negative correlation between motivation and learning effectiveness, which did not reach a statistically significant level ($r = -.198$, $p = .181$).

Taken together, the findings indicate that students with different levels of learning achievement did not exhibit significant differences across the four dimensions of the ARCS learning motivation model. Nevertheless, the overall integration of generative AI into the curriculum enhanced students' learning motivation. Although the magnitude of improvement was modest, it still demonstrated a positive instructional effect.

Table 3
Summary of the Meaning and Standard Deviation of Students' Learning Motivation in Different Learning Effectiveness

Dimensions	Performance Group	n	M	SD

Conclusion and Recommendations

Conclusion

This study examined the relationship between learning motivation and learning effectiveness among design students in Taiwanese technical high schools who employed generative AI in their professional practice courses. The key findings are as follows:

1. Integrating generative AI into the curriculum has positively influenced students' motivation to learn, demonstrating a strong willingness to engage with this instructional method. Although no statistically significant differences were observed across the ARCS dimensions, students with lower performance effectiveness displayed relatively higher motivation compared to their high-achieving peers.
2. Generative AI integration has significantly improved student performance, as evidenced by notable increases in assessment scores. Students effectively employed generative AI tools and professional design software to enhance both the creativity and practicality of their work.
3. Following the integration of generative AI into technical high school design courses, no significant correlation was observed between students' learning motivation and their academic effectiveness. This finding may be attributed to the strong pre-existing competencies of high-achieving students, which led to a decreased reliance on AI assistance. In contrast, lower-achieving students benefited more noticeably from AI support, resulting in substantial gains in both motivation and performance. Therefore, while the integration of generative AI into design curricula shows promise, there is still room for improvement. It is recommended that future instructional practices align more closely with real-world applications to enhance both students' motivation and academic achievement simultaneously.

Recommendations

This study focused exclusively on learning motivation and the effectiveness resulting from the integration of generative AI in design practice courses. Future research should consider incorporating “learning satisfaction” as a third variable and analyze the interactions among motivation, effectiveness, and satisfaction. This approach will help determine whether AI integration can holistically enhance students’ sense of belonging and sustained engagement with the curriculum.

Acknowledgments

This research was made possible thanks to Ms. Chen Yan-yu, a teacher at Tainan Guanghua Private Senior High School, for her assistance in curriculum planning and teaching implementation, as well as the materials she provided.

Augmented Reality Manga (ARM): The Use of the ADDIE Model for Japanese Reading Enhancement in People's Republic of China

Ayana Kato, Rajamangala University of Technology Thanyaburi, Thailand
Metee Pigulong, Rajamamgala University of Technology Thanyaburi, Thailand

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

The research question in this study is 1) What is the efficacy of the augmented reality that the researcher is developing in enhancing the Japanese skills of students? 2) Just how effective will the comparison of the student's learning achievement scores be? The research objectives are to 1) evaluate the learning achievements of students between pre-test and post-test scores using an augmented reality comic book and 2) determine the effectiveness of the augmented reality manga after its use. The study population consisted of 23 students in the College of Science and Technology at Ningbo University during the second semester of the academic year 2025. The data was analyzed and interpreted using the following statistics: dependent t-test and effectiveness index. 1) The anticipated advantages include the potential for augmented reality to enhance the Japanese language skills of students. 2) Augmented reality enhances students' self-assurance and facilitates the completion of classroom assignments more efficiently. 1) This study may serve as supplementary evidence for individuals who wish to conduct action research concerning the utilization of digital technology. According to the research findings, the paired t-test comparing the pre-test and post-test results demonstrated statistically significant differences at the 0.05 level ($t = 6.02$, $p = 0.00$). The results also indicated that the effectiveness index was 0.597, which indicates that the students experienced a 59.7% increase in cognitive score improvement following the test.

Keywords: augmented reality, manga, ARM, language education, Japanese learning achievement improvement

iafor
The International Academic Forum
www.iafor.org

Introduction

In recent years, digital technology has become an essential component in foreign language education, contributing to enhanced learning support and pedagogical innovation. In particular, Augmented Reality (AR) has attracted increasing attention due to its ability to overlay digital information onto the real world, creating interactive and immersive learning environments. Previous studies have indicated that AR can increase learner motivation, improve comprehension, and support contextualized learning. However, research focusing on the application of AR in Japanese language education, especially in the context of Chinese universities, remains limited.

At Chinese universities, Japanese language instruction has traditionally emphasized grammar explanation and textbook-based reading activities. While this approach is effective for developing foundational knowledge, it often fails to sufficiently engage learners or support the development of practical reading comprehension skills, particularly when dealing with authentic materials such as manga. Manga contains colloquial expressions, cultural references, and contextual cues that are difficult for learners to interpret without adequate support.

To address these challenges, this study aims to develop an Augmented Reality Manga (ARM) learning material and examine its effectiveness in improving Japanese manga reading comprehension among second-year university students in China. Using the ADDIE instructional design model, AR-based short video clips—such as cooking videos, vocabulary explanations, and kanji reading support—were integrated into selected scenes from the manga Shinya Shokudō. This research investigates whether ARM can enhance learners' reading comprehension and motivation compared to conventional learning methods.

Literature Review

Recent advances in educational technology have significantly influenced foreign language education, particularly through the integration of digital and immersive learning environments. Among these technologies, Augmented Reality (AR) has attracted increasing scholarly attention due to its ability to overlay digital information onto real-world contexts, thereby enhancing learner engagement and comprehension (Azuma, 1997). Previous studies have demonstrated that AR-based learning environments can promote motivation, contextual understanding, and learner autonomy by combining visual, auditory, and interactive elements (Nakazawa, 2021).

In language education, AR has been applied to vocabulary learning, pronunciation training, and cultural instruction. Gayevska (2022) reported that AR-assisted Japanese language learning increased learners' interest and supported both linguistic and cultural understanding. Similarly, Miyosawa (2012) compared AR-based learning materials with traditional printed resources and found that although test scores did not differ significantly, AR materials stimulated higher cognitive engagement and reduced learning-related stress.

Manga has also been widely recognized as an effective instructional medium in Japanese language education. Manga provides authentic language input, colloquial expressions, and culturally embedded contexts that are difficult to convey through textbooks alone. However, learners often struggle with manga reading due to informal expressions, onomatopoeia, and cultural references. These challenges highlight the need for instructional support that maintains authenticity while facilitating comprehension.

To systematically design such instructional materials, the ADDIE model—consisting of Analysis, Design, Development, Implementation, and Evaluation—has been widely adopted in educational innovation research. Integrating AR, manga, and the ADDIE model provides a strong theoretical foundation for developing innovative learning materials that address current challenges in Japanese language education.

Methodology

This study employed a one-group pre-test and post-test experimental design to examine the effectiveness of an Augmented Reality Manga (ARM) learning material. The participants were 23 second-year undergraduate students enrolled in the College of Science and Technology at Ningbo University during the second semester of the 2024 academic year. They had completed basic Japanese grammar courses and demonstrated an intermediate reading level equivalent to JLPT N3–N2.

The instructional material was developed following the ADDIE model. During the Analysis phase, common difficulties in manga reading—such as colloquial expressions, kanji readings, and culturally specific vocabulary—were identified through classroom observation and instructor feedback. In the Design and Development phases, selected scenes from the manga Shinya Shokudo were chosen based on their conversational density and cultural relevance. The ARM content was developed using Unity and included short AR video clips that provided cooking demonstrations, vocabulary explanations, kanji reading guidance, and cultural notes.

During the Implementation phase, students used their own smartphones to scan the manga pages and access AR content while reading independently. Data collection consisted of a reading comprehension pre-test and post-test, as well as qualitative student comments collected through questionnaires. The Evaluation phase focused on comparing test scores and analyzing learner feedback to assess learning outcomes and user experience.

Results

The quantitative analysis revealed a clear improvement in students' reading comprehension performance after using the ARM learning material. The mean pre-test score was 4.83, while the mean post-test score increased to 7.91, indicating a statistically significant improvement. The Effectiveness Index (EI) was calculated as 0.597, demonstrating that learners achieved approximately 59.7 percent of the expected learning progress.

Table 1
The Effectiveness After Using an ARM for 23 Second-Year Students

c	N	Mean	SD	Min	Max
Pre-Test	**23**	**4.83**	**1.95**	**2**	**8**
Post-Test	**23**	**7.91**	**1.50**	**4**	**10**

Table 2
Pre-post Test Scores

Pre-Post Test Scores	1	2	3	4	5	6	7	8	9	10	11	12	13
1 Pre-Test Score	5	2	4	8	2	5	4	6	4	3	7	3	8
2 Post-Test Score	8	8	10	10	7	7	7	8	7	6	9	4	8

Pre-Post Test Scores	14	15	16	17	18	19	20	21	22	23	Total	SD
1 Pre-Test Score	5	4	8	7	5	5	4	7	2	3	111	1.95
2 Post-Test Score	9	8	10	7	6	8	9	9	10	7	182	1.50

Qualitative data supported these findings. Many students reported that the AR video support helped them better understand characters' emotions, situational context, and informal expressions. Vocabulary explanations and kanji reading assistance were frequently mentioned as particularly useful, allowing learners to read more independently without relying on teacher intervention.

However, some negative feedback was also identified. Several students reported physical fatigue from holding smartphones for extended periods, while others experienced technical issues such as unstable video playback or limited compatibility across different smartphone models. These factors occasionally affected learners' concentration during the reading activity.

Discussion

The findings of this study are consistent with previous research indicating that AR can enhance motivation and contextual understanding in language learning. Similar to the results reported by Gayevska (2022) and Nakazawa (2021), the ARM learning material increased learner engagement by providing multimodal and context-sensitive support.

Compared with traditional manga reading instruction, ARM reduced cognitive load by offering immediate explanations aligned with the reading context, which supports Krashen's (1985) concept of comprehensible input. The use of short AR video clips, rather than lengthy explanations, also helped prevent information overload and maintained learners' focus on reading.

Nevertheless, technical and physical limitations must be considered. Device compatibility issues indicate the need for cross-platform optimization, while physical fatigue suggests that AR-based activities should be used selectively rather than continuously. These findings suggest that ARM is most effective as a supplementary learning tool within a structured instructional framework.

Conclusion

This study developed an Augmented Reality Manga (ARM) learning material and examined its effectiveness in improving Japanese manga reading comprehension among Chinese

university students. The results demonstrate that ARM can enhance learners' reading comprehension and motivation by providing contextualized visual and auditory support.

From a pedagogical perspective, ARM offers practical implications for Japanese language educators. It can be used as an effective supplementary tool for teaching colloquial expressions, cultural content, and authentic reading materials. Teachers are encouraged to conduct device compatibility checks in advance, provide clear instructions on AR usage, and integrate ARM activities strategically to minimize cognitive and physical fatigue.

Several limitations should be acknowledged. The sample size was relatively small, and the study focused on a single manga title. In addition, technical issues related to smartphone compatibility were observed. Future research should involve larger participant groups, explore a wider range of manga genres, and improve technical stability across devices.

In conclusion, this research highlights the potential of ARM as an innovative and learner-centered approach in Japanese language education. With further refinement and broader implementation, ARM can contribute to more engaging, effective, and authentic reading instruction in higher education contexts.

Official Conference Proceedings

Abstract

Across the world, higher education lecturers face growing pressure to redesign assessments due to students' widespread use of Generative AI (Gen AI) tools like ChatGPT, Copilot, and Gemini. Despite institutional restrictions, students still use Gen AI tools, raising concerns about the authenticity, fairness, and relevance of traditional assessments. Conventional models often fail to foster the higher-order thinking, creativity, and authentic skills needed in AI-integrated learning. This qualitative, exploratory study investigates how lecturers embed Gen AI in assessment redesign. Using Technological Pedagogical Content Knowledge (TPACK) framework, the analysis considers how lecturers balance pedagogy, technology and content when configuring or discouraging AI support. Biggs' Constructive Alignment model assesses task coherence with learning outcomes, while Furze's AI Assessment Scale classifies AI transparency, from no AI to full AI, defined as explicit disclosure and embedding of AI assistance. Semi structured interviews with 20 STEAM lecturers at Malaysian private universities were purposively sampled and thematically analysed in NVivo, identifying four key themes. Findings show that Gen AI scaffolds learner agency, personalises feedback and stimulates higher order cognition, yet lecturers wrestle with tensions between empowerment and academic integrity. Adoption is hindered by inconsistent policies, limited professional development and digital equity challenges. Discipline specific variations reveal emerging best practices: for example, re authoring a reflective essay prompt into an AI assisted critique task demonstrates how theory guided redesign, AI classification and outcome alignment. The study recommends revising curricula, training faculty, clarifying AI guidelines, and supporting students to ensure pedagogically sound and ethical assessment in the AI era.

Keywords: generative AI, assessment redesign, TPACK, Constructive Alignment, Furze's AI Assessment Scale

Introduction

The rapid emergence of Generative Artificial Intelligence (Gen-AI) tools such as ChatGPT, Microsoft Copilot, and Google Gemini has fundamentally disrupted higher education assessment. Recent surveys indicate that between 86% and 92% of undergraduates now use Gen-AI in their studies, often irrespective of institutional restrictions (Digital Education Council, 2024; Freeman, 2025). As a result, assessment practices designed for a pre-AI era have become increasingly ineffective in measuring authentic student learning, posing significant challenges for educators worldwide (Rudolph et al., 2023; Wiley, 2025).

This disruption presents a multifaceted problem. Traditional assessments, including take-home essays, research papers, and standardised tests, are highly vulnerable to AI-assisted completion, making it difficult to distinguish genuine student understanding from AI-generated output (Sullivan et al., 2023). At the same time, institutional responses remain inconsistent, ranging from prohibition to cautious acceptance, often leaving lecturers uncertain, stressed, and inadequately supported (El Khoury, 2025; Michel-Villarreal et al., 2023). Compounding this issue, students frequently report confusion about what constitutes permissible AI use and academic misconduct due to unclear or inconsistent guidance (Harrad et al., 2024).

The unreliability of AI detection tools has further intensified this challenge. Evidence shows that detection systems produce false positives and disproportionately disadvantage non-native English speakers, rendering punitive or technology-driven approaches untenable (UNESCO, 2025). This has prompted a fundamental shift in assessment discourse from enforcement toward pedagogy, captured by Wiley's (2025, p. 865) question: "What evidence of learning would I now find persuasive?" Consequently, educators are increasingly rethinking assessment design to prioritise meaningful learning over prohibition.

Despite rapid growth in Gen-AI-related educational research, significant gaps remain. Existing studies focus largely on institutional policies, student usage patterns, or conceptual frameworks, with limited empirical attention to lecturers' lived experiences, decision-making processes, and practical assessment redesign strategies (Belkina et al., 2025; Khlaif et al., 2025; Michel-Villarreal et al., 2023). Discipline-specific practices, particularly within STEAM fields where AI has distinct pedagogical implications, also remain underexplored (Thapa, 2025). Recent reviews therefore call for qualitative, context-sensitive research that captures how educators navigate these changes in practice (Mpolomoka, 2025).

Responding to these gaps, this study examines lecturers' assessment redesign practices through three complementary theoretical lenses: the Technological Pedagogical Content Knowledge (TPACK) framework, Biggs' Constructive Alignment model, and Furze's AI Assessment Scale. Together, these frameworks enable a nuanced analysis of how lecturers balance pedagogy, technology, and disciplinary knowledge while redefining assessment in AI-enabled contexts. By integrating these perspectives, the study provides a theoretically grounded account of current challenges, emerging practices, and opportunities for more coherent and pedagogically sound AI-integrated assessment design, addressing recent calls for more sophisticated analytical approaches to Gen-AI in higher education (Jin et al., 2025; Khlaif et al., 2025).

Research Purpose and Questions

The purpose of this study is to examine how lecturers in Malaysian private universities redesign assessments in response to Gen-AI integration, with specific attention to the pedagogical, technological, and ethical dimensions of this process. The research is guided by four primary questions:

1. How do lecturers integrate Gen-AI considerations in assessment redesign?
2. How well do redesigned assessments align with intended learning outcomes?
3. How do lecturers classify and communicate permitted AI use to students?
4. What challenges and opportunities arise in the assessment redesign process?

Therefore, this study contributes empirical evidence to inform faculty development programs, institutional policy formulation, and pedagogical best practices for assessment design in the AI era. The findings have practical significance for individual educators seeking to redesign their assessments, institutional leaders developing AI policies and support structures, and students navigating expectations for responsible AI use in their academic work.

Literature Review

The Gen-AI Revolution in Higher Education

The rapid proliferation of sophisticated Generative AI tools has catalysed a paradigm shift in higher education, fundamentally altering how students engage with learning and assessment (Lim et al., 2023; Michel-Villarreal et al., 2023). While these tools offer efficiencies and learning support, their rapid student adoption has exposed a structural misalignment between traditional assessment designs and emerging AI-enabled learning practices, rendering many established assessment methods vulnerable to misuse and challenging long-standing notions of academic integrity (Rudolph et al., 2023; Sullivan et al., 2023).

Technological advancement in AI has also outpaced the capacity of higher education institutions to develop empirically grounded pedagogical responses. The Stanford AI Index Report (2025) shows that industry produced 55 notable AI models in 2024, compared to none from academia alone, highlighting a widening gap between AI innovation and educational governance. This industry-driven acceleration has resulted in powerful general-purpose tools entering educational spaces faster than institutions can evaluate their pedagogical implications, leaving lecturers to respond individually rather than systematically.

Institutional responses to Gen-AI have therefore been uneven and reactive. El Khoury's (2025) "seven waves of assessment and Gen-AI" illustrate a progression from initial anxiety and policy defensiveness toward more developmental approaches involving faculty support and ethical frameworks. However, the prevalence of "living document" policies that defer AI-related decisions to individual instructors reflects not only disciplinary flexibility, but also institutional uncertainty and limited strategic coordination. While such decentralisation acknowledges contextual differences, it simultaneously shifts responsibility to lecturers without providing sufficient guidance or shared pedagogical frameworks (El Khoury, 2025).

Collectively, the literature suggests that the central challenge is no longer whether Gen-AI should be addressed in higher education, but how assessment practices can be coherently redesigned in ways that preserve pedagogical integrity while recognising the realities of AI-

augmented learning environments. This unresolved tension provides the foundation for the present study.

The Academic Integrity Crisis and Post-detection Era

The rapid adoption of Generative AI has precipitated a crisis of academic integrity that has fundamentally undermined detection-based approaches to assessment governance. Empirical evidence now shows that AI detection tools are unreliable, frequently generating false positives and disproportionately disadvantaging non-native English speakers, while failing to consistently identify AI-generated content (MIT Sloan, n.d.; UNESCO, 2025.). This failure signals not merely a technical limitation but a structural dead end, as the escalating arms race between AI generation and detection has rendered policing-oriented policies pedagogically and ethically untenable (Inside Higher Ed, 2025).

As a result, higher education has entered what may be characterised as a post-detection era, requiring a shift from punitive enforcement toward pedagogical cultivation of academic integrity. Emerging models emphasise transparency, student education, and responsible use rather than prohibition. The "Educate, Enable, Expect" framework exemplifies this shift by advocating explicit instruction on ethical AI use, supported practice environments, and clearly articulated expectations for integrity (Oldham, 2025). Central to this approach is robust disclosure and citation, repositioning AI tools as acknowledged intellectual supports rather than concealed shortcuts (Stanford Teaching Commons, 2024; thesify.ai, 2025).

This reconceptualization has also prompted a broader rethinking of academic honesty itself. Concepts such as "post-plagiarism" reflect an evolving understanding that integrity in AI-enabled contexts cannot rely on authorship purity alone, but must instead focus on transparency, judgment, and accountability (Eaton, 2023). Collectively, the literature suggests that sustaining academic integrity in the Gen-AI era depends less on restricting technology and more on redesigning assessments and norms that align ethical practice with contemporary learning realities.

Pedagogical Frameworks for Assessment Redesign

In response to the limitations of traditional assessments in AI-enabled contexts, the literature increasingly converges on a shift from rote memorisation toward higher-order cognitive skills such as analysis, evaluation, synthesis, and creativity (thesify.ai, 2025; UNESCO, 2025). This shift reflects a broader recognition that assessment resilience is achieved not by excluding AI, but by redesigning tasks so that learning outcomes emphasise judgment, context, and meaning making beyond AI's generative capabilities.

Two complementary assessment pathways have emerged. AI-resistant strategies prioritise authentic and process-oriented designs, including project-based tasks, portfolios, simulations, and case studies that mirror real-world complexity and are difficult to outsource to AI (ASCCC, n.d.; Khlaif et al., 2025). Process-focused approaches further strengthen integrity by foregrounding learning trajectories through staged submissions, reflective journals, and iterative feedback, while contextualised and personalised assessments require students to draw on unique experiences or local contexts, creating natural barriers to AI substitution (Stanford Teaching Commons, 2024; UNESCO, 2025). Assessment through dialogue, such as oral examinations and presentations with spontaneous questioning, similarly demands real-time articulation of understanding that AI cannot easily replicate (Inside Higher Ed, 2025).

In parallel, AI-integrated approaches reposition Gen-AI as a pedagogical partner rather than a prohibited tool. Students are assessed on their ability to critique AI-generated outputs, use AI for structured ideation, and ethically refine co-produced artefacts, shifting the focus from content generation to evaluative and metacognitive competence (John Hopkins University, 2024; Stanford Teaching Commons, 2024; UNESCO, 2025). Taken together, these frameworks suggest that effective assessment redesign lies not in choosing between resistance or integration, but in aligning AI use with pedagogical intent and clearly articulated learning outcomes. While these pedagogical strategies outline *what* assessment redesign may involve in AI-enabled contexts, they do not sufficiently explain *how* lecturers make situated design decisions, maintain alignment with learning outcomes, or determine appropriate levels of AI involvement in practice.

Theoretical Frameworks: TPACK, Constructive Alignment, and Furze's Scale

This study employs three complementary theoretical frameworks to analyse lecturer practices in assessment redesign.

TPACK (Technological Pedagogical Content Knowledge) provides a lens for understanding how lecturers integrate technology into their teaching practices. Originally developed by Mishra and Koehler (2006), TPACK posits that effective technology integration requires the intersection of three knowledge domains: technological knowledge (understanding of tools and their capabilities), pedagogical knowledge (understanding of teaching and learning processes), and content knowledge (understanding of subject matter). In the context of Gen-AI integration, TPACK helps explain how lecturers balance these three domains when deciding whether, when, and how to incorporate or restrict AI use in assessments.

Constructive Alignment, developed by Biggs (1996), emphasizes the coherence between intended learning outcomes (ILOs), learning activities, and assessment tasks. In a constructively aligned curriculum, what students are expected to learn, how they learn it, and how their learning is assessed are all mutually supportive. This framework is particularly relevant in the Gen-AI era because the introduction of AI capabilities potentially disrupts established alignments. Lecturers must ensure that redesigned assessments still authentically measure the intended learning outcomes, even as the tools and processes students use to complete those assessments evolve.

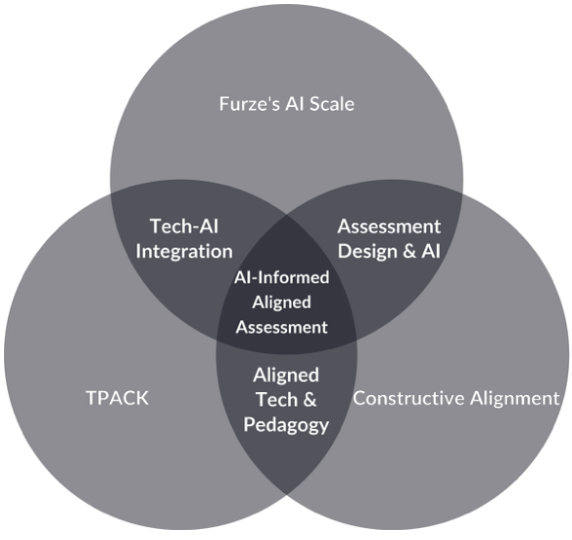
Furze's AI Assessment Scale provides a taxonomy for classifying the degree of AI integration permitted in assessments, ranging from “No AI” (complete prohibition) through “Limited AI,” “Partial AI,” and “High AI” to “Full AI” (complete integration with full transparency). This framework emphasizes the importance of clearly communicating AI use boundaries to students and aligns with the broader pedagogical shift toward transparency and explicit expectations (Furze, 2024, as cited in presentation materials).

Faculty Development and Institutional Support

Despite the growing use of Generative AI in teaching, a clear gap persists between faculty adoption and pedagogical preparedness. A 2025 Digital Education Council survey found that although 61% of faculty have used AI in teaching, 40% still identify as beginners and only 17% consider themselves advanced or expert, with many expressing concern about students’ over-reliance on AI and limited ability to critically evaluate AI-generated output (Campbell University, 2025). This underscores the urgent need for stronger institutional support and

targeted professional development. While some universities, such as the University of North Carolina and DePaul University, have introduced workshops, institutes, and financial incentives to support AI-informed assessment redesign (CFE UNC, 2025; DePaul University, 2025), such initiatives remain uneven and insufficiently scaled. Closing this AI literacy and capacity gap among educators is therefore essential to ensure effective, ethical, and equitable integration of Gen-AI in higher education (Thapa, 2025).

Theoretical Framework



This study integrates three complementary theoretical frameworks to provide a comprehensive analytical lens for understanding how lecturers redesign assessments in response to Gen-AI integration. Each framework addresses a distinct but interconnected dimension of the assessment redesign process.

Conceptual Integration of Frameworks

The TPACK framework examines the decision-making processes lecturers employ as they balance technological capabilities, pedagogical principles, and disciplinary content knowledge when integrating Generative AI into assessment. It illuminates the cognitive and professional judgments involved in assessment redesign and explains why lecturers make differing choices regarding the extent and manner of AI use. Biggs' Constructive Alignment model provides an evaluative lens for assessing the pedagogical coherence of redesigned assessments by examining the alignment between intended learning outcomes, learning activities, and assessment tasks, ensuring that redesign efforts maintain academic rigor rather than merely responding to technological disruption. Furze's AI Assessment Scale offers a practical classification system for the resulting assessment designs by positioning them along a continuum of AI integration and emphasizing transparency in communicating expectations and boundaries to students. Figure 1 presents the conceptual framework of this study, illustrating how these three theoretical lenses intersect to inform assessment redesign in an AI-enabled context.

Figure 1

Conceptual Framework for Lecturers' Gen-AI Assessment Redesign Practices in Higher Education

Together, these frameworks enable a multi-dimensional analysis that examines not only what lecturers are doing (Furze's Scale), but why they are making these choices (TPACK) and whether the outcomes are pedagogically sound (Constructive Alignment). The conceptual framework for this study positions these three theoretical lenses as intersecting perspectives on a single phenomenon: the transformation of assessment practice in response to Gen-AI.

Methodology

Research Design

This study employs a qualitative, exploratory research design to investigate how lecturers integrate Gen-AI considerations into assessment redesign. A qualitative approach is appropriate because the phenomenon under investigation is complex, contextual, and relatively new, requiring rich, detailed data to capture the nuances of lecturer experiences, decision-making processes, and emerging practices (Creswell & Poth, 2018). The exploratory nature of the study acknowledges that Gen-AI integration in assessment is a rapidly evolving area where established theories and frameworks are still being developed and tested.

The research is situated within an interpretive paradigm, recognizing that knowledge about assessment redesign is socially constructed through the lived experiences of lecturers as they navigate this technological disruption. The aim is not to establish universal laws or generalizable findings, but rather to develop a contextualized, theoretically informed understanding of current practices, challenges, and innovations that can inform future research and practice.

Participants and Sampling

The study involved 20 lecturers from STEAM disciplines (Science, Technology, Engineering, Arts, and Mathematics) at private universities in Malaysia. Purposive sampling was employed to select participants who met specific criteria: (1) currently teaching undergraduate courses in STEAM fields, (2) have experience redesigning at least one assessment in response to Gen-AI integration, and (3) willing to reflect on and articulate their redesign processes and rationales.

The selection of STEAM disciplines was deliberate, as these fields represent diverse approaches to knowledge construction and assessment. Science and mathematics emphasize problem-solving and analytical reasoning; technology and engineering focus on applied, project-based learning; and arts disciplines value creativity, interpretation, and critical analysis. This disciplinary diversity allowed the study to capture a range of assessment redesign strategies and AI integration approaches.

The Malaysian private university context is significant because private institutions in Malaysia often have greater flexibility in policy development and pedagogical innovation compared to public universities, which may be constrained by more centralized governance structures. However, they also face resource constraints and competitive pressures that shape their responses to technological change.

Ethical approval was obtained from the institutional review board, and all participants provided informed consent. Participants were assured of confidentiality and anonymity, identifying information has been removed from all quoted material in this report.

Data Collection

Data were collected through semi-structured interviews conducted between March to May 2025. The interview protocol was developed based on the three theoretical frameworks, with questions designed to elicit information about participants' assessment redesign processes (TPACK), alignment considerations (Constructive Alignment), and AI classification and communication practices (Furze's Scale).

The semi-structured interview guide included questions such as:

- How have you modified your assessments in response to Gen-AI availability?
- What factors influenced your decisions about whether and how to integrate AI into assessments?
- How do you ensure that redesigned assessments still measure the intended learning outcomes?
- How do you communicate to students what AI use is permitted or prohibited?
- What challenges have you encountered in the redesign process?
- What opportunities or benefits have you observed?

Interviews lasted approximately 45-60 minutes and were conducted in person depending on participant preference and availability. All interviews were audio-recorded with participant permission and transcribed verbatim for analysis. Field notes were also maintained to capture contextual observations and initial analytical impressions.

Data Analysis

Data analysis followed a thematic analysis approach guided by the three theoretical frameworks. Analysis was conducted using NVivo qualitative data analysis software, which facilitated systematic coding, theme development, and framework-based organization of findings.

The analysis process involved several iterative stages:

- **Initial Coding:** Transcripts were read thoroughly and coded inductively, identifying any concept, practice, challenge, or strategy mentioned by participants related to assessment redesign and Gen-AI integration.
- **Framework-Based Coding:** A second coding cycle applied deductive codes derived from the three frameworks. For example, statements about balancing pedagogical goals with technological capabilities were coded under TPACK; discussions of learning outcome coherence were coded under Constructive Alignment; and descriptions of AI use levels were coded under Furze's Scale.
- **Theme Development:** Initial codes were collated and organized into potential themes through an iterative process of grouping, comparison, and refinement. Themes were developed both within and across the theoretical frameworks.
- **Theme Validation**: Themes were reviewed against the original transcripts to ensure they accurately represented participant perspectives and were substantiated by sufficient data. Discrepant cases and alternative interpretations were actively sought and considered.
- **Synthesis:** Final themes were synthesized into a coherent narrative that addressed the research questions and was organized by the theoretical frameworks.

Throughout the analysis, attention was paid to disciplinary variations, with specific consideration of how STEAM fields differed in their approaches to assessment redesign.

Trustworthiness and Rigor

Multiple strategies were employed to ensure the trustworthiness of the study. Credibility was established through prolonged engagement with the data, triangulation across participant perspectives and theoretical frameworks, and member checking with selected participants. Transferability was supported through thick contextual description, enabling readers to assess relevance to other settings. Dependability was ensured by maintaining an audit trail of the research process, including interview protocols, coding procedures, and analytic memos. Confirmability was addressed through reflexive practice, with the researcher critically acknowledging positionality and potential bias as an educator navigating similar Gen-AI challenges.

Findings and Discussions

The thematic analysis revealed four major themes that illustrate how participants are integrating Gen-AI considerations into assessment redesign, highlighting both its pedagogical potential and the challenges encountered in practice.

Theme 1: Gen-AI Enhances Learner Agency

Across interviews, participants consistently recognized that Gen-AI, when intentionally integrated, can enhance learner agency by supporting idea generation, scaffolding early-stage learning, providing personalized feedback, and promoting higher-order thinking.

Supporting Idea Generation and Brainstorming

Participants described using Gen-AI as a structured brainstorming partner in the early stages of assignments, requiring students to critically evaluate AI-generated ideas against disciplinary criteria and justify their final choices. This approach expanded students' creative exploration rather than replacing their thinking, aligning with studies that position AI as a collaborative learning tool rather than a shortcut (John Hopkins University, 2024; Stanford Teaching Commons, 2024).

Scaffolding Early-Stage Learning

Participants highlighted Gen-AI's role in providing just-in-time scaffolding for students struggling with foundational concepts. Students were permitted to seek AI-generated explanations or hints but were required to document their prompts and reflect on how AI responses supported their understanding. This practice aligns with established scaffolding principles (Vygotsky, 1978) while addressing concerns about over-reliance through transparency and accountability.

Providing Personalized Feedback

Several participants redesigned assessments to incorporate AI-generated feedback as a learning resource. Students were required to analyse AI feedback on drafts, revise their work, and reflect on which suggestions were accepted or rejected and why. While this helped address workload

and feedback delays in large classes, participants emphasized that instructor judgment remained central to maintaining academic standards (Mpolomoka, 2025).

Enabling Higher-Order Thinking When Scaffolded

Participants reported that Gen-AI can promote higher-order thinking when assessments shift from content production to evaluation and critique. Tasks such as analysing flawed AI-generated reports required students to identify methodological errors, misinterpretations, and logical flaws, demanding deep disciplinary understanding. This approach aligns with higher-order cognitive processes in Bloom's taxonomy and contemporary guidance on AI-enhanced assessment design (UNESCO, 2025).

Theme 2: Balancing Empowerment and Academic Integrity

While participants recognized Gen-AI's potential to enhance learning, they also expressed deep concern about balancing student empowerment with academic integrity. This theme captures persistent tensions related to student thinking, authenticity, ethical disclosure, and uncertainty around acceptable AI use.

Risk of Overshadowing Student Thinking

A core concern was that Gen-AI may obscure or replace students' own thinking. As one philosophy lecturer reflected, "When I read student essays now, I constantly wonder: Is this their thinking or the AI's? … the whole point of philosophical writing is to develop and articulate your own arguments." Participants struggled with the fact that AI-generated output is often indistinguishable from student work, even though the learning value lies in the cognitive process of producing that work.

In response, several participants redesigned assessments to foreground process over product. A biology lecturer explained, "The final product is less important than the documented journey. This makes it much harder to outsource the work to AI because they have to show me their thinking along the way." Such process-oriented designs align with pedagogical strategies that emphasize making learning visible and reflect TPACK-informed integration (Stanford Teaching Commons, 2024; UNESCO, 2025).

Difficulty Confirming Authentic Work

Closely related was the challenge of verifying authentic student learning. Participants widely rejected AI-detection tools due to inaccuracy and bias. An engineering lecturer noted, "They kept flagging international students' work as AI-generated when I knew it wasn't … detection tools are worse than useless because they undermine trust."

As a result, participants adopted alternative verification strategies, including oral defenses, in-class assessments, and highly contextualized tasks. A chemistry lecturer explained, "An AI can solve general chemistry problems, but it can't explain anomalies in data from our lab setup." These approaches created what one participant described as "natural barriers to AI substitution" by requiring context-specific knowledge unavailable to AI systems.

Ethical Dilemmas Around Disclosure

Participants also faced ethical tensions around AI-use disclosure. Students were often unclear about what constituted reportable AI use. A communications lecturer observed, "Does using Grammarly count? What about AI for translation or outlining? The boundaries were far from clear." Participants also worried that disclosure requirements might incentivize concealment rather than honesty. As one mathematics lecturer stated, "I fear I'm just teaching them to hide their AI use rather than use it responsibly." These concerns reflect broader debates about how academic integrity should be reconceptualized in AI-enabled learning environments (Eaton, 2023).

Uncertainty About Permitted AI Use Boundaries

Finally, participants reported significant uncertainty in defining defensible boundaries for acceptable AI use. A technology lecturer shared, "I allow AI for debugging because that's industry practice, but not for generating code. When students ask why, honestly, the line feels arbitrary sometimes." This uncertainty was exacerbated by inconsistent policies across courses and institutions. As one chemistry lecturer noted, "Every professor has different AI rules … I understand why this is confusing for students." These findings underscore the importance of transparency and clarity emphasized in Furze's AI Assessment Scale, while also revealing that such clarity requires continuous dialogue, contextual judgment, and stronger institutional coordination rather than rigid, one-size-fits-all rules.

Theme 3: Adoption Hindered by Systemic Barriers

Although participants demonstrated considerable pedagogical creativity in redesigning assessments, their efforts were consistently constrained by systemic barriers at the institutional level. This theme highlights challenges related to policy inconsistency, limited professional development, digital equity, and workload pressures.

Inconsistent Institutional Policies

Participants expressed widespread frustration with unclear and inconsistent institutional policies on Gen-AI use. While some universities had issued guidelines, these were often vague or insufficiently actionable. As one biology lecturer noted, "Our university put out a policy statement about AI, but it basically just said 'faculty should decide' without giving us any framework or support. It felt like they were passing the buck rather than leading."

The lack of institutional coordination resulted in wide variation across courses, confusing students and creating inequities in expectations. Participants differed in their preferences for centralized versus flexible approaches, reflecting broader debates on AI governance in higher education (El Khoury, 2025). Several advocated for adaptable or "living policies" that could evolve alongside technological and pedagogical developments. An engineering lecturer explained, "Any policy written today will be obsolete in six months. We need frameworks and principles rather than rigid rules."

Limited Professional Development Opportunities

Limited access to targeted professional development emerged as a major barrier to effective AI-informed assessment redesign. Despite using Gen-AI personally, many participants felt

unprepared to teach responsible AI use or design pedagogically sound AI-integrated assessments. A mathematics lecturer stated, “I use ChatGPT personally, but that doesn’t mean I know how to teach students to use it responsibly. I need training in the pedagogy of AI, not just the technology.”

Participants also criticized existing workshops for focusing on technical features or academic misconduct rather than practical pedagogical strategies. As an engineering lecturer observed, “I’ve attended three workshops on AI in teaching, and they all just told me what AI can do and why I should worry about cheating. What I need are concrete examples in my discipline.” These findings mirror evidence of a persistent gap between faculty AI use and pedagogical readiness (Campbell University, 2025).

Conclusion

The integration of Generative AI in Malaysian private higher education represents not merely a technological shift but a fundamental rethinking of assessment, learning, and academic integrity. This study demonstrates that while Gen-AI can enhance learner agency, higher-order thinking, and formative feedback when thoughtfully integrated, participants face persistent tensions related to academic authenticity, ethical boundaries, and uneven institutional support. Viewed through the complementary lenses of TPACK, Constructive Alignment, and Furze’s AI Assessment Scale, the findings reveal both innovative assessment redesign practices and systemic constraints, including policy inconsistency, limited professional development, and discipline-specific challenges. Collectively, these insights position Gen-AI as both a disruption and an opportunity that necessitates coordinated action by participants, institutions, and students to develop AI literacy, redesign authentic assessments, and uphold educational values, ensuring that AI integration ultimately strengthens pedagogical rigor, equity, and meaningful learning in an AI-augmented higher education landscape.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that Grammarly and QuillBot, both AI-assisted writing tools, were used solely for proofreading and language refinement purposes in this manuscript. Their use was limited to correcting grammatical and spelling errors and improving clarity and accuracy of expression. No other AI or AI-assisted technologies were used in the generation of content for this manuscript. All ideas, research design, procedures, findings, analyses, and discussions are the author’s original work and are derived from the systematic conduct of the research. Following these improvements, the authors conducted a thorough manual review to ensure the accuracy, clarity, and coherence of the manuscript, acknowledging the inherent limitations of AI-assisted tools.

Teaching in the Digital Age: An Open Educational Platform as a Digital Teaching Tool

Eva Muchová, Bratislava University of Economics and Business, Slovakia
Peter Leško, Bratislava University of Economics and Business, Slovakia

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

The ongoing digital transformation of higher education has intensified the demand for accessible, and adaptable teaching tools, particularly in economics. This paper presents *Learn Economics* (learneconomics.euba.sk), an interactive open educational platform developed to support teaching and learning the principles of microeconomics and macroeconomics in the Slovak language. The platform integrates short instructional videos, interactive graphs, case studies, self-assessment tests, and complementary reference materials in order to foster independent learning, and enhance student motivation. Empirical insights are drawn from questionnaire-based feedback collected from university students, complemented by descriptive usage analytics of the platform. In addition, the platform is positioned within a comparative overview of selected international digital resources used in economics education. The findings indicate that multimedia-based platforms can effectively complement traditional approach and provide a flexible framework for online and hybrid education in economics.

Keywords: higher education, digital teaching tool, educational platform

iafor
The International Academic Forum
www.iafor.org

Introduction

The current generation of university students is shaped by a socio-economic environment profoundly influenced by rapid technological change. Digital technologies form an integral part of students' everyday lives, particularly in communication, entertainment, gaming, and leisure activities. Consequently, contemporary students are accustomed to interactive, multimedia-rich environments and increasingly expect similar characteristics within the educational process.

In economics education, this trend is reflected in the widespread use of textbooks supplemented by online learning platforms. Leading economics textbooks are routinely accompanied by digital environments such as CourseSmart (Samuelson & Nordhaus), LaunchPad (Mankiw), or MyLab Economics (Acemoglu, Blanchard, Parkin). These platforms provide structured online support aligned with textbook content and include a wide range of multimedia and interactive tools, including instructional videos, applied tasks, quizzes and tests and blogs. Such resources offer significant benefits for both students and instructors by supporting self-paced learning and enhancing conceptual understanding.

The importance of digital educational tools became particularly evident during the COVID-19 pandemic, which caused the largest disruption of education systems in modern history. According to the United Nations (2020), nearly 1.6 billion learners in more than 190 countries were affected by school closures, impacting up to 94% of the global student population. Millions of pupils, secondary and university students were forced to replace face-to-face instruction with various forms of distance learning. These disruptions resulted in measurable learning losses, with potentially long-term consequences for human capital formation.

The pandemic also transformed the role of teachers, who were required to adapt rapidly to online and hybrid modes of instruction. At the university level, this period accelerated the transition toward blended and digitally supported teaching. However, the effectiveness of such formats depends critically on the availability of well-designed, pedagogically grounded, and easily accessible digital learning materials that support both students and instructors.

The paper focuses on open multimedia educational platforms as a tool for innovative approaches to teaching economics in higher education. The paper discusses the rationale for integrating open educational platforms into the teaching process and situates them within broader trends in activating and digitally supported teaching methods. The final section presents a Slovak-language online platform focused on the teaching of the principles of economics, providing a practical example of how digital tools can be implemented in university-level economics education.

Methodology

The paper is based on mixed-methods with the aim to provide an empirically grounded and practice-oriented analysis of digitally supported teaching methods in economics education.

Empirical data were collected through a questionnaire survey conducted among undergraduate students at the Bratislava University of Economics and Business (BUEB) in June 2020. The survey focused on students' perceptions of the teaching of introductory economics, preferred forms of instruction, perceived learning difficulties, and expectations regarding innovative and

digitally supported teaching methods. The questionnaire included both closed-ended and open-ended questions, allowing for the collection of quantitative data as well as qualitative insights.

Quantitative data from the questionnaire were analysed using descriptive statistics in order to identify general trends and patterns in students' responses. Qualitative data obtained from open-ended questions were analysed through thematic interpretation, providing contextual understanding of students' recommendations and attitudes towards economics education.

In addition to the questionnaire survey, the paper presents descriptive usage analytics from the online platform. The analysis of usage statistics serves to identify user preferences and patterns of interaction with different types of digital learning content.

The empirical findings are complemented by a qualitative comparative review of selected international educational platforms used in economics education, including MyLab Economics, CORE Econ, Exploring Economics, and Khan Academy. This comparison focuses on platform design, types of educational content, and pedagogical orientation, and serves to situate the locally developed platform within broader trends in digitally supported and activating teaching methods.

Innovative Approaches to Education

This section draws on selected empirical and theoretical studies in higher education pedagogy in order to contextualise innovative and digitally supported teaching approaches relevant to economics education.The teaching of introductory economics at the authors' home university is, in some student groups, characterised by relatively low motivation to acquire new knowledge. In many cases, learning is reduced to fulfilling minimum course requirements, primarily through compulsory literature prescribed in the course syllabus. This situation highlights the need for teaching approaches that not only transmit knowledge, but also stimulate student engagement and foster a deeper understanding of fundamental economic principles and concepts.

In contemporary educational theory, teaching methods are commonly divided into two broad categories: traditional (conventional) methods and innovative (activating) methods. Traditional teaching approaches focus primarily on the transmission of content. The teacher acts as the central authority and the main source of knowledge, while students assume a largely passive role, receiving theoretical information through lectures or assigned readings.

In contrast, innovative and activating approaches emphasise student involvement and active participation in the learning process. Their primary objective is to transform static, monological teaching into a dynamic and interactive form that naturally engages students and increases their interest in the subject matter. These methods aim to create meaningful connections between theory and practice, enabling students to better understand and apply economic concepts in real-world contexts.

The use of activating methods also reshapes the relationship between teachers and students. While the teacher retains a guiding and coordinating role, greater space is provided for student activity, self-realisation, and independent thinking. Activating approaches encourage collaboration, enabling students to work together on problem-solving exercises, or case studies. As a result, students develop not only subject-specific knowledge, but also transferable skills such as communication and presentation abilities, the capacity to articulate and defend their

own opinions, and creative and critical thinking skills. Critical thinking, in particular, involves the ability to acquire information, evaluate its relevance and reliability, and identify logical and objective relationships.

Student engagement can be significantly enhanced through the systematic introduction of innovation into the educational process. Innovative teaching methods support cognitive development and positively influence students' perception of learning itself. In economics education, core principles can be presented in ways that resonate with a generation immersed in social networks and digital technologies (Angelo & Cross, 1993; Clerici-Arias, 1994; Delemeester et al., 2000).

In higher education, pedagogical approaches that combine digital technologies with activating learning strategies are becoming increasingly prominent. Among the most widely discussed are the flipped classroom model and the broader concept of blended learning, both of which respond to the need for increased student engagement and more effective knowledge acquisition in the context of digital transformation (Van Alten et al., 2019). The flipped classroom model shifts the acquisition of theoretical content outside the classroom, typically through digital study materials, while contact teaching time is devoted to discussion, problem solving, and the application of knowledge. A meta-analysis by Van Alten et al. (2019) demonstrates that flipped classrooms are associated with higher student learning outcomes when face-to-face instructional time is not reduced compared to traditional classroom settings, or when quizzes are incorporated into the flipped classroom design.

More recent research supports these findings. A meta-analysis by Bredow et al. (2021), drawing on evidence from 317 studies, shows that compared to traditional lecture-based instruction, flipped learning has positive effects on academic performance with small to moderate effect sizes. There is considerable variability in the effectiveness of flipped learning, largely influenced by educational context. A systematic literature review by Divjak et al. (2022) examines the use of online flipped classroom approaches in higher education during the COVID-19 pandemic. The authors find that instructors and institutions with prior experience in face-to-face or blended flipped classrooms were more successful in transferring this model to fully online environments.

In addition to the flipped classroom, the literature also emphasizes challenge-based learning, which focuses on addressing authentic problems and explicitly linking theoretical knowledge with practical application. A systematic review by Leijon et al. (2022) analyses research on Challenge-Based Learning (CBL) in higher education. Based on studies published between 2009 and 2020, the review documents a shift of CBL from a concept originally introduced by a multinational technology company for school education to an approach increasingly adopted in higher education as a means of transforming adult learning.

Overall, trends in quality education suggest that continuous improvement in higher education can only be achieved through systematic innovation in the teaching and learning process, while respecting international standards. Ongoing advances in information and communication technologies create new opportunities to enhance teaching effectiveness and offer students diverse forms of learning and knowledge acquisition. In this process, the teacher plays a crucial role as an innovator who actively implements and adapts new methods to the educational context.

Students' Opinions on the Teaching of Economics

At the authors' home university, courses focused on the fundamentals of economics are perceived as among the most demanding subjects in the first level of university study. These courses are traditionally associated with relatively high failure rates, particularly among first-year students. Despite these difficulties, an internal survey conducted among students (Kálovec, 2017) revealed a seemingly paradoxical finding: students are aware of the importance of economics courses and expressed interest in them even if they were offered as optional subjects. This result suggests that the main challenge does not lie in a lack of perceived relevance of economics, but rather in the way the subject matter is taught and communicated.

To gain deeper insight into students' perceptions of economics teaching, an anonymous questionnaire survey was conducted at all faculties of the BUEB (Muchová & Leško, 2020). A total of 429 students participated in the survey, out of 1,351 students who were invited to respond. The majority of respondents (67.8%) were first-year students, while nearly 30% were second-year students enrolled in the first level of study. With respect to prior education, more than half of the respondents were graduates of grammar schools (four- or eight-year programmes), and approximately 32% had graduated from business academies.

The questionnaire consisted of 36 questions and focused on several key areas: a comparison of traditional classroom teaching with distance or online teaching, identification of areas requiring improvement in economics education, and detection of topics in introductory economics that students find particularly difficult to understand.

The results indicate that traditional face-to-face lectures are still perceived as a suitable and effective method for mastering the principles of microeconomics and macroeconomics. Up to 62% of respondents expressed a preference for this form of instruction, confirming that even among digitally oriented students, personal contact with teachers and peers remains an important component of the educational process. At the same time, 33% of respondents stated that they could imagine participating in online lectures delivered via platforms such as Microsoft Teams. Other acceptable forms of instruction included the provision of lecture materials by teachers and access to recorded video lectures. In addition, 11.2% of students reported using private tutoring as a supplementary form of learning during their studies.

Another group of questions focused on areas that should be emphasised during lectures. Students' responses were highly consistent: the most frequently expressed recommendation was to place greater emphasis on the practical application of knowledge and on linking theoretical concepts with real-world economic practice. Other commonly mentioned suggestions included the use of case studies, enhanced online communication, online submission of assignments, and the systematic provision of study materials through educational platforms.

Several questions addressed the organisation and content of seminars. More than 63% of respondents identified the lack of illustrative examples as a major weakness of seminar-based teaching. Students expressed a strong preference for more interactive forms of instruction, greater use of online communication tools, easier access to study materials via platforms such as MOODLE or MSTeams, and the inclusion of case studies as innovative elements of seminar teaching.

During the summer semester of the 2019/2020 academic year, the outbreak of the COVID-19 pandemic necessitated a rapid transition from on-site teaching to distance learning. Survey results indicate that more than half of the students (over 51%) perceived distance learning as less demanding than traditional on-site instruction during the preceding winter semester. Approximately 21.4% of students considered distance or online learning to be more demanding, while nearly 28% perceived both forms of instruction as equally demanding. One possible explanation for the perception of lower demands is the mistaken belief among some students that teachers have limited ability to monitor preparation and assess performance in an online environment, which may lead to an underestimation of academic requirements.

Overall, students' recommendations for making introductory economics courses more engaging can be summarised as follows: increased use of practical examples and application of knowledge to current economic issues; systematic incorporation of case studies; more interactive and engaging teaching methods; greater emphasis on teamwork and collaborative tasks; wider use of online teaching formats; integration of YouTube videos and online resources; and improvement of communication between teachers and students. These findings confirm both the attractiveness of online and multimedia-supported education, while clearly indicating areas in which innovation is necessary to improve the effectiveness of economics education.

Educational Platforms as an Innovative Approach in Economics Education

This section presents selected educational platforms developed primarily in international contexts that may serve as inspiration for the creation and adaptation of similar platforms in languages other than English. These platforms illustrate different approaches to integrating multimedia content, interactivity, and activating teaching methods into economics education.

MyLab Economics

MyLab Economics, developed by Pearson, is a digital educational platform designed primarily for university-level economics education. It offers a comprehensive set of interactive tools aimed at enhancing the learning process, including assessments, tutorials, and customisable content for both students and instructors. The platform can be easily integrated into existing course structures and supports the effective comprehension of complex economic concepts. The platform's interface emphasises a clear and professional design with intuitive navigation. Separate access options are provided for students and instructors. The student version offers interactive exercises, tests, and personalised feedback that support individualised learning and continuous self-assessment. The instructor version enables course creation, monitoring of student progress, and the use of analytical tools to improve teaching effectiveness.

Exploring Economics

Exploring Economics is an open-access e-learning platform dedicated to pluralistic economics. It provides a wide range of educational resources aimed at exploring diverse economic theories, methodologies, and perspectives. The platform includes original content related to various schools of thoughts, such as behavioural, ecological, feminist, and institutional economics. Its user-friendly interface supports easy navigation and encourages active exploration of alternative economic approaches. The platform also enables users to search for courses, articles, and discussions, thereby promoting critical reflection and engagement with contemporary economic debates.

CORE Econ

CORE Econ is an educational platform offering free online textbook and learning resources designed to modernise the teaching and learning of economics. Its approach is grounded in contemporary economic research and addresses pressing global challenges, including climate change, inequality, and technological progress. The underlying vision of CORE Econ is that economics education can contribute to a more just, sustainable, and democratic society. One of the platform's flagship textbooks, *The Economy 2.0*, covers the fundamental principles of microeconomics and macroeconomics while emphasising real-world problem solving. The textbook incorporates interactive graphs, empirical data, and applied examples, making it particularly suitable for innovative and activating teaching approaches.

Khan Academy

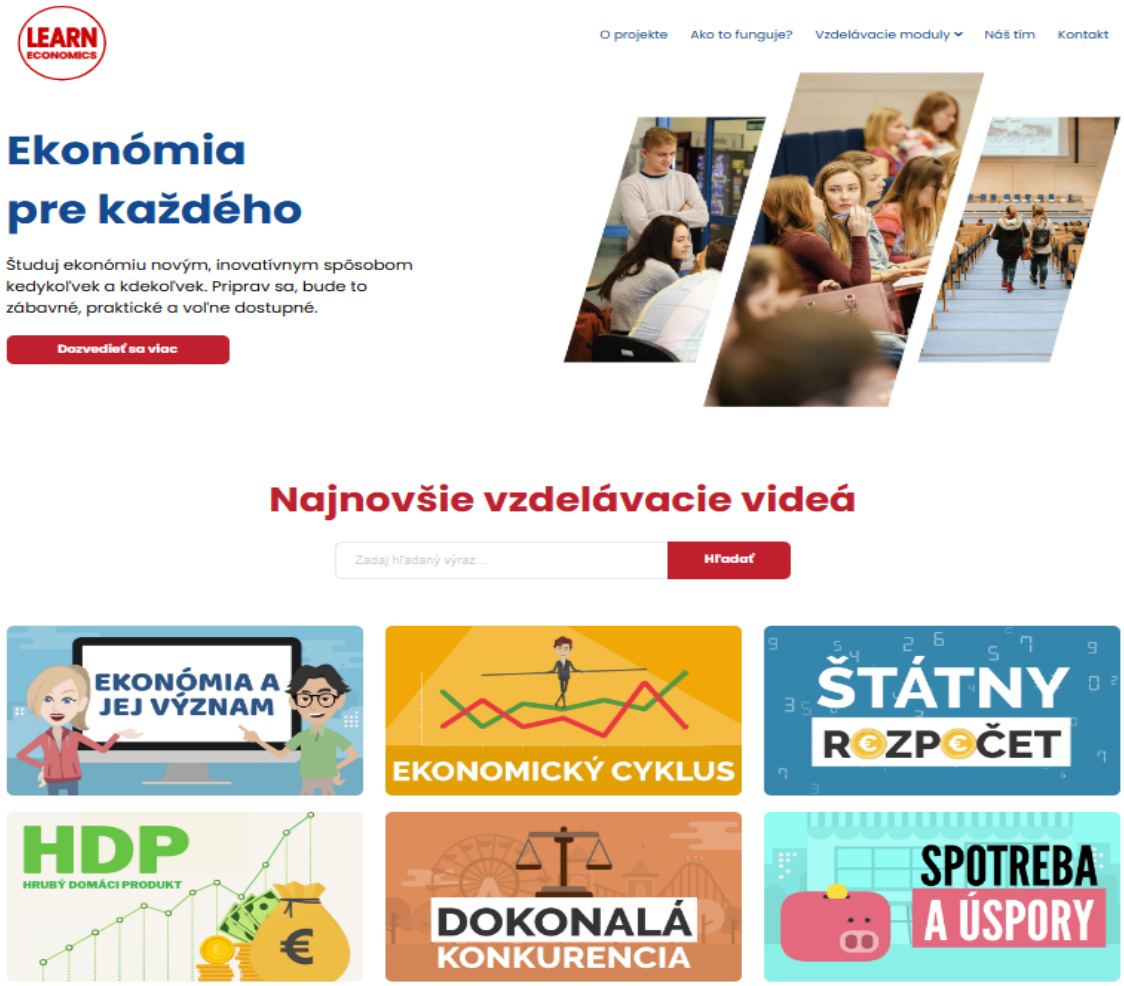
Khan Academy is a globally recognised educational platform whose mission is to provide free, high-quality education to anyone, anywhere. The platform offers thousands of instructional videos covering a broad range of subjects, including economics. Through short video explanations and practice exercises, Khan Academy serves as a valuable supplementary resource, particularly for reinforcing basic concepts and supporting independent learning.

Educational platforms such as MyLab Economics, Exploring Economics, CORE Econ, and Khan Academy demonstrate the significant potential of multimedia and interactive tools to enhance student engagement, deepen conceptual understanding, and accommodate diverse learning styles. They illustrate how digital technologies can be effectively combined with activating teaching methods to address persistent challenges in introductory economics education, such as low motivation and high failure rates.

Design of an Online Open Platform Focused on the Principles of Economics

The initial concept and design of an online educational platform aimed at teaching the principles of microeconomics and macroeconomics in the Slovak language were developed and implemented during the period 2020–2022 in the framework of educational project KEGA.[1] The educational platform is publicly accessible at https://learneconomics.euba.sk/

The project was submitted prior to the outbreak of the COVID-19 pandemic as an innovative initiative responding to the growing demand for modern, digitally supported forms of economics education. During the first year of the project, the research team focused on a comparative analysis of the existing approaches to teaching introductory economics courses at Slovak faculties of economics and at selected foreign universities. This analysis provided a broader international perspective on commonly used teaching methods, digital tools, and curricular structures. Subsequently, a questionnaire survey was conducted among university students in order to identify areas in which innovative teaching methods and procedures could be effectively introduced and to better understand students' expectations regarding digital learning resources. The second and third years of the project were devoted to the development of the first functional version of the online platform. This phase included the systematic creation of educational content, graphical design, and technical functionality. Particular attention was paid to usability, clarity of navigation, and the integration of multimedia



[1] KEGA project entitled "Learn Economics: The Application of E-learning as a New Form of Teaching Economics".

elements. Following the completion of this initial stage, the platform was gradually incorporated into seminar-based teaching as a one of complementary sources at the educational process at the BUEB.

At present, the research team is working on the second stage of the platform's development. The main objective of this phase is to further expand the platform into a comprehensive educational tool that supports active and independent learning. The platform is intended not only for university students, but also as an open-access resource for the general public interested in economics and financial literacy.

Figure 1

Visual Layout of the learneconomics.euba.sk Educational Platform

Source: https://learneconomics.euba.sk/

Figure 1 presents the visual layout of the Learn Economics educational platform. The homepage of the Learn Economics platform is available only in the Slovak language. In the upper left corner, the platform's logo is displayed together with the slogan "Economics for everyone", emphasising its inclusive orientation towards a broad audience interested in understanding modern market economics through an innovative and practice-oriented approach. The top section of the webpage contains the main navigation menu, which includes the following items: About the Project, How Does It Work?, Educational Modules, Our Team, and Contact.

The central part of the homepage is dedicated to the section entitled Latest Educational Videos, which presents newly added video materials covering key topics in microeconomics and macroeconomics. An integrated search function allows visitors to quickly locate specific economic concepts and corresponding educational videos by entering relevant keywords, thereby facilitating targeted learning.

The current content of the educational platform is structured into several educational modules:

- *Educational videos*, which explain specific economic concepts through practical and real-world examples. Each video is developed through a structured process that includes idea formulation, team discussions, script preparation, recording, and final editing.
- *Case studies*, presenting engaging and often non-standard economic problems. Each case study is based on a real economic situation and is accompanied by questions designed to stimulate analytical thinking and reflection.
- *Interactive graphs*, which transform available data into graphical representations commonly used in economic analysis. Students are encouraged to explore these graphs and answer questions related to their interpretation.
- *Test sets,* consisting of multiple-choice questions covering microeconomics and macroeconomics. Each question includes four answer options, with one correct response.
- *A dictionary of economic terms*, providing an alphabetical list of key concepts accompanied by detailed definitions and their English equivalents.
- *Famous economists*, introducing the lives and key contributions of prominent economists who have significantly influenced the development of economic thoughts.
- *Books on economics*, presenting selected domestic and foreign textbooks as well as popular science publications, together with brief descriptions to support students in their choice of literature.
- *Numerical examples*, including numerical and verbal problems of varying levels of difficulty from microeconomics and macroeconomics.
- *Financial literacy*, a newly introduced module focusing on the relationship between economics and personal finance. Given that recent surveys indicate that the level of financial knowledge among Slovak households and students remains below the European Union average, this module aims to enhance users' understanding of fundamental financial concepts.

Table 1 presents summary statistics related to the usage of the learneconomics.euba.sk platform, covering the period from its launch in spring 2021 to autumn 2025.

Table 1
Most Visited Pages From the Main Menu

Page name from the main menu	Total number of page views
Contact	134,074
About the project	2,244
How does it work?	2,085
Why study economics?	1,991
Our team	1,960

Source: Own processing based on data from learneconomics.euba.sk

The data indicate that the Contact page is by far the most frequently visited section of the platform. This suggests a strong interest among users in obtaining contact information about the creators of the platform. From this perspective, it appears appropriate to further develop this section, for example by adding more detailed information or an interactive contact form. The remaining pages record significantly lower levels of traffic, indicating limited user interest in information related to the platform's objectives, functioning, or team composition. These findings provide valuable insights into user behaviour and may serve as a basis for future improvements to the structure and visual presentation of the platform.

Table 2
Most Visited Educational Modules on the Website

Rank	Name of educational module
1	https://learneconomics.euba.sk/vzdelavacie-moduly/interaktivne-grafy/
2	https://learneconomics.euba.sk/vzdelavacie-moduly/vzdelavacie-videa/
3.	https://learneconomics.euba.sk/vzdelavacie-moduly/otestuj-sa/

5.	https://learneconomics.euba.sk/vzdelavacie-moduly/pripadove-studie/
6.	https://learneconomics.euba.sk/vzdelavacie-moduly/knihy-o-ekonomii/
7.	https://learneconomics.euba.sk/vzdelavacie-moduly/slovnik-ekonomickych-pojmov/

Source: Own processing based on data from learneconomics.euba.sk

Table 2 presents the ranking of visits to individual educational modules on the website. The results show that Interactive Graphs represent the most frequently visited educational module, followed by Educational Videos, which also attract substantial user attention. The third position is occupied by Test Sets, followed by Famous Economists. Case Studies rank fifth in terms of visits, while Books on Economics and the Dictionary of Economic Terms are the least frequently accessed modules. These findings highlight the strong preference of users for

interactive and visually supported learning tools and provide empirical guidance for the future development of the platform.

Conclusion

The digital transformation of higher education has substantially reshaped teaching and learning practices, a process that was significantly accelerated by the COVID-19 pandemic. This period highlighted both the potential and the limitations of online and hybrid instruction. While digital technologies cannot replace direct student–teacher interaction, empirical experience shows that they can meaningfully enhance learning when integrated into pedagogical designs.

This paper examined the role of open educational platforms as digital teaching tools in economics education. The analysis combined theoretical perspectives on activating and digitally supported teaching methods with empirical evidence drawn from a student questionnaire survey, descriptive usage statistics of an educational platform, and a comparative review of selected international platforms. Together, these elements provide a comprehensive view of how digital tools can support the teaching of introductory economics.

Survey results collected among students of the Bratislava University of Economics and Business indicate that traditional face-to-face lectures remain important, yet students consistently express a demand for stronger links between theory and practice, greater use of illustrative examples, and more interactive forms of instruction. These preferences are reflected in the design of the *Learn Economics* platform.

The comparative overview of established platforms, including MyLab Economics, CORE Econ, Exploring Economics, and Khan Academy, reveals common features associated with effective digital economics education, such as modular structure, emphasis on real-world applications, and support for self-regulated learning. The *Learn Economics* platform incorporates these features while responding to local curricular requirements and language accessibility, thereby extending the availability of open educational resources in economics.

Overall, the empirical findings suggest that open, multimedia-based platforms can effectively complement traditional teaching by increasing student engagement and supporting independent learning. These platforms appear particularly suitable for blended learning and flipped classroom models, where digital materials prepare students for more application-oriented activities during contact teaching. Future research should therefore focus on systematically evaluating learning outcomes associated with platform use and on refining digital content based on observed user behaviour. In this way, open educational platforms can contribute to evidence-based innovation in economics education.

Abstract

University-based entrepreneurship education is widely recognized as a critical component in fostering adaptability and enhancing startup competencies among youth. However, the proportion of new entrepreneurs remains relatively low in comparison to the national economic demands. This study investigates the extent to which the application of design thinking, supported by artificial intelligence (AI) tools, can enhance students' startup competencies. A quantitative research design was employed, utilizing structural equation modeling (SEM) for data analysis. The respondents were selected through judgmental sampling, comprising 179 students who had completed an entrepreneurship course. Data were collected via questionnaires and analyzed using SmartPLS 4 software. The findings indicate that design thinking has a significant positive impact on students' startup competencies. Furthermore, design thinking was found to significantly influence AI adoption; students engaged in design-thinking-based instruction were more inclined to utilize AI tools in developing their business models. However, the adoption of AI did not exhibit a significant direct effect on startup competency. As a result, the mediating role of AI adoption in the relationship between design thinking and startup competency was also found to be non-significant. These findings suggest the need for further investigation into how design thinking can be more effectively integrated with AI tools to optimize learning outcomes.

Introduction

Indonesia faces an urgent need to generate new entrepreneurs amid limited formal employment opportunities and a persistent unemployment rate, which reached 7.46 million people (4.85%) as of August 2025. In response to these structural challenges, university-based entrepreneurship education has been mandated for all undergraduate students. To be effective in preparing graduates for complex real-world challenges, such education must evolve beyond theory and integrate modern, experiential methodologies. Chief among these are Design Thinking (DT) for human-centered problem identification, structured Business Model Canvas (BMC) frameworks for strategic planning, and Artificial Intelligence (AI) tools for data-driven idea exploration and market analysis. Prior studies confirm that these approaches foster entrepreneurial attitudes, creativity, digital literacy, and critical reflection (Liang et al., 2025; Shirai et al., 2024; Thu et al., 2025).

Within the broader discourse on entrepreneurship education, the distinction between business and non-business student cohorts has been debated. Boldureanu et al. (2020) argue that differentiated instructional approaches are necessary to accommodate these groups. However, more recent evidence suggests otherwise. Arendt et al. (2025) demonstrate that competency-based entrepreneurship education yields positive long-term entrepreneurial outcomes across disciplines, regardless of program background.

In practice, business model frameworks such as at Business Model Canvas are widely adopted in university to facilitate structures ideation, opportunity recognition, and value creation (Al-Filali et al., 2024). Recent studies indicate that the BMC has evolved conceptually and pedagogically to address the demands of sustainability, digitalization, and competency-based learning, as reflected in the development of a sustainable and digital BMC comprising expanded elements that emphasize ecosystem collaboration, co-creation, and integrated economic, social, and environmental value propositions (Bachmann et al., 2024). From an educational perspective, the adaptation of the BMC within project-based learning (PBL) environments has been shown to enhance students' metacognitive awareness and entrepreneurial competencies through engagement with real-world ecosystem, and stakeholders (Moure et al., 2023). However, empirical evidence also suggests that not all BMC components contribute equally to performance outcomes, customers segmentation, value propositions, and channels are identified as the most influential elements in validating business hypotheses and improving team performance (Ladd, 2018).

Although competency-based measurement offers a robust approach to evaluating the outcomes of entrepreneurship education, particularly in contexts where longitudinal tracking is difficult (Alfantookh & Bakry, 2013; Ferreras-garcia, 2026). Research and pedagogical innovation involving DT, BMC, and AI have largely been concentrated within business and engineering disciplines (Duong et al., 2025; Thu et al., 2025). This leaves a critical gap in community-oriented academic programs, such as Community Education, which train students not only as individual entrepreneurs but as facilitators of community-based economic development and social innovation (Boothroyd & Davis, 1993; Clark, 1986; Saepudin & Mulyono, 2019). These "entrepreneur-facilitators" require a unique blend of competencies to empower grassroots initiatives, yet empirical studies examining entrepreneurship education within this specific context remain scarce, particularly those focusing on measurable competencies rather than short-term intentions.

Therefore, this study aims to measure students' entrepreneurial competencies after completing an entrepreneurship course that integrates design thinking-driven business modelling using the Business Model Canvas and AI tools for business idea exploration and development. By focusing on students from a community education program, this research contributes to the growing literature on inclusive and competency-based entrepreneurship education and provides empirical evidence on how design thinking and AI adoption interact in shaping entrepreneurial competencies beyond traditional business disciplines.

Literature Review

Entrepreneurial Competencies

The concept of competency first emerged as an innovative approach to predicting academic and professional success in the 1970s, pioneered by David McClelland. McClelland (1973) emphasized that measurables clusters of behavioural patterns, such as communication skills and goal setting, were more effective predictors than intelligence (IQ) tests. At its core, competency relates to a person's ability or capability to satisfactorily complete tasks (Hager & Gonczi, 1996, 2009).

Subsequent theoretical developments by Boyatzis (Boyatzis, 2008) deepened the understanding by highlighting the distinction between the expected results of an action and the skills and characteristics needed to achieve them. Competency is defined as the capability that builds expertise, knowledge, and attributes to achieve performance in a job or task (Boyatzis, 2008; Costa et al., 2026; Hines et al., 2017). This definition refers to consistent and sustained habits of thinking and acting.

Spencer and Spencer (2008) made significant contributions by expanding the definition of competency to include deeper characteristics, such as motivation, personality traits, self-concept, attitudes, values, technical knowledge, and cognitive or behavioral competencies. They popularized the *Competency Iceberg Model*, which distinguishes between explicit competencies which is related to knowledge and skills and implicit competencies related to psychological characteristics such as traits, self-concept, and motives. These components can be grouped into three levels (Mohamad Rosman et al., 2022; Spencer & Spencer, 2008): surface tools, most easily developed which consist of skills and knowledge; self-image attributes, consist of self-concept and social role; core personal characteristics, most difficult to change, consist of traits and motives.

In the context of entrepreneurship and education, the competency approach focuses on developing students' abilities and adaptability to real-world scenarios (Ferreira et al., 2022; Trabelsi-Zoghlami & Touzani, 2019). Entrepreneurial competency involves not only skills but also specialized knowledge and attitudes required to identify business opportunities and transform them into sustainable business models (Al-Filali et al., 2024; Jackson, 2015; Tehseen et al., 2018). Therefore, competency-based measurement becomes a robust approach for evaluating the outcomes of entrepreneurship education (Alfantookh & Bakry, 2013; Romero-Frías & Robinson-garcía, 2017).

Prior studies highlight that entrepreneurship education contributes to the development of entrepreneurial attitudes and intentions (Boldureanu et al., 2020), creativity and resilience (Amirul et al., 2025), digital and artificial intelligence (AI) literacy (Liang et al., 2025; Thu et al., 2025), critical reflection (Blankesteijn et al., 2024), and design thinking-driven business

modelling (Liang et al., 2025; Shirai et al., 2024) as well as the ability to apply knowledge in real-world contexts and to enhance perceived desirability and feasibility of entrepreneurial ventures (Thu et al., 2025). In parallel, recent findings highlight that students tend to adopt and explore AI tools in a natural and immediate manner, while interdisciplinary collaboration is strengthened through co-creation strategies; nevertheless, sustained engagement and idea fluency depend on adequate training and scaffolding in AI tool usage (Miranda, 2025).

Design Thinking-Drive Business Modelling

Design Thinking is defined as a human-centered, iterative methodology that prioritizes empathy, multidisciplinary collaboration, prototyping, and creative problem-solving to develop solutions profoundly aligned with user needs and market expectations (Sreenivasan & Suresh, 2024). This conceptualization elevates design thinking from a mere creative toolkit to a strategic framework essential for business model innovation and digital transformation. It serves as a critical bridge between human creativity and data-driven technological insights, enabling ventures to develop desirable, feasible, and viable value propositions. The methodology's iterative nature, emphasizing prototyping and stakeholder feedback, is fundamental for refining both products and their underlying business logic in response to real-world validation.

The process of developing this integrated identity is operationalized through transformative experiential learning. Grounded in Kolb’s (2003) pedagogical cycle, this process involves concrete experience, reflective observation, abstract conceptualization, and active experimentation. When applied to entrepreneurship education, this cycle allows students to engage with ill-defined, real-world problems, applying design thinking principles iteratively (Blankesteijn et al., 2024). Through this “learning by doing” and reflection, abstract concepts become internalized competencies, and a professional identity is forged.

The practical application of this theoretical synthesis is often facilitated by structured business model tools, most notably the Business Model Canvas (BMC). The BMC provides a common language and framework for structured ideation, opportunity recognition, and value proposition design, making it a staple in university entrepreneurship programs (Al-Filali et al., 2024). Pedagogically, its strength lies in its adaptability. Recent scholarly work reflects its evolution to meet contemporary demands, giving rise to conceptual expansions like the sustainable and digital BMC, which emphasize ecosystem collaboration, co-creation, and integrated value propositions (Bachmann et al., 2024). Integrating the BMC within Project-Based Learning (PBL) environments has been shown to enhance metacognitive awareness and entrepreneurial competencies by forcing engagement with real ecosystems and stakeholders (Moure et al., 2023). Empirical studies further refine its use, indicating that not all BMC components are equally impactful; elements like customer segments, value propositions, and channels are often most critical for hypothesis testing and venture performance (Ladd, 2018).

This framework finds concrete expression in pedagogical practices where an adapted BMC template is used within a PBL context. As noted by Moure Abelenda et al. (2023), “the direct interaction with potential clients allows the students to apply the design thinking methodology focused on the user” (p. 11). In such settings, the BMC ceases to be a static planning document and becomes a dynamic tool for integrating the iterative, human-centered design process. Students use stakeholder empathy and feedback gathered through primary market research to continuously refine their prototypes and business model hypotheses,

ensuring their solutions are not only technically sound but also market-validated and desirable.

AI Utilization

AI functions primarily as a catalytic stimulus within the entrepreneurial process, activating cognitive mechanisms according to an integrated Stimulus-Organism-Response (SOR) and Entrepreneurial Event Model (EEM) perspective (Duong et al., 2025; Thu et al., 2025). Exposure to and adoption of AI tools, such as generative AI platforms, AI-competency development, and immersion in an AI-positive ecosystem, serve as external drivers that directly influence an individual's internal psychological state, setting the stage for entrepreneurial consideration.

This stimulus is processed through core cognitive pathways centre on perceived desirability and feasibility. AI enhances the perceived attractiveness (desirability) of entrepreneurial ventures by infusing them with innovation and novel potential, while simultaneously bolstering the perceived practicality (feasibility) by offering concrete tools for planning, problem-solving, and execution (Duong et al., 2025; Thu et al., 2025). Crucially, the framework underscores that entrepreneurial intention peaks when these two perceptions are not only high but also in cognitive alignment; significant dissonance between what is desired and what is believed possible can substantially dampen commitment, highlighting a key leverage point for educational intervention.

The effectiveness of this AI-to-cognition pathway is not uniform but is critically moderated by an individual's technology integration capacity and knowledge competencies. Specifically, AI literacy and deep entrepreneurial knowledge (EK) act as essential moderators that determine whether AI acts as a true enabler (Awal & Chowdhury, 2024; Qin, 2024). Possessing knowledge of AI (KAI) equips potential entrepreneurs to practically deploy technologies like IoT, blockchain, and generative AI for specific outcomes such as frugal innovation or sustainable business modelling. This knowledge transforms AI from an abstract stimulus into a tangible toolkit, thereby directly strengthening the feasibility pathway and enabling the translation of innovative ideas into actionable plans.

Moving beyond intention formation, the framework explicitly incorporates AI as an instrumental educational and skill-development tool. AI applications, such as analytics-driven video pitch evaluation, provide objective, granular feedback on critical entrepreneurial behaviours like communication, confidence, and emotional expression (Giuggioli et al., 2026). This creates a direct feedback loop where AI not only inspires the ambition to venture but also actively trains the precise skills, such as persuasive pitching, required to successfully secure funding and execute the venture, thereby bridging the gap between intention and competent action.

Ultimately, this entire process is embedded within and dynamically interacts with a broader entrepreneurial ecosystem. Factors such as social influence, institutional support structures, market volatility, and a collective openness to technological innovation can significantly amplify or constrain the influence of AI on the individual (Popa & Breazu, 2025). The framework concludes that while AI is a transformative enabler for entrepreneurial education, influencing intention, enhancing skills, and providing evaluative insights, its full potential is realized only within a supportive ecosystem. Furthermore, it remains a complement to, not a

replacement for, essential human intuition and judgment in navigating the uncertainties inherent to entrepreneurship.

Methodology

Research Design and Approach

This study employed an analytical survey research design. This design is suitable for describing a situation and explaining the relationships between phenomena by examining why certain conditions exist (Barroga & Matanguihan, 2022; Malik, 2013). It involves investigating two or more variables to answer research questions and test hypotheses, thereby allowing for the examination of relationships and the drawing of conclusions from those relationships.

Conceptual Definitions

Entrepreneurial Competencies (Y) are defined as the integrated clusters of capabilities encompassing knowledge, skills, attributes, motives, and traits that enable an individual to successfully perform entrepreneurial tasks, identify opportunities, and develop sustainable business models (Boyatzis, 2008; Spencer & Spencer, 2008; Tehseen et al., 2018).

Design Thinking-Driven Business Modelling (X1) refers to the application of a human-cantered, iterative design thinking methodology, emphasizing empathy, prototyping, and user feedback, to the structured development and validation of a business model, often operationalized through tools like the Business Model Canvas.

AI Utilization (X2) is conceptualized as the adoption and application of artificial intelligence tools (e.g., generative AI, analytics platforms) within the entrepreneurial process, serving as a stimulus that enhances perceived desirability and feasibility of ventures and acts as a catalyst for skill development and business modelling.

Populations and Sample

The research population was sixth-semester students from the Community Education program at four universities in Indonesia: Universitas Bengkulu, Universitas Negeri Jakarta, Universitas Pendidikan Indonesia, dan Universitas Singaperbangsa, with a total population (N) of 240 students. The sample size was determined using the Slovin formula with a 5% margin of error, yielding a minimum sample size of 150. Data were collected from 179 respondents using a simple random sampling technique.

Data Collection Instrument

Data was collected using a questionnaire, which is a technique for gathering data by providing a set of written questions or statements to respondents to answer. The instrument measured three variables: Entrepreneurial Competencies (EC) with 20 items, Design Thinking-Driven Business Modelling (DT) with 9 items, and AI Utilization (AI) with 9 items. All items used a Likert-type scale.

Validity and Reliability

The instrument's validity and reliability were established through two stages. First, expert judgment was sought to assess content validity. Second, an empirical test was conducted with 66 pilot respondents. The results confirmed that the instrument was both valid and reliable for measuring the intended constructions.

Table 1
V Result

Item	Pearson Correlation	Result
Design Thinking-Drive Business Modelling (DT)		
DT.1	0,64	Valid
DT.2	0,705	Valid
DT.3	0,714	Valid

Validity test results show at Table 1 demonstrate that the research instrument possesses adequate content and construct validity. Each item functions effectively in measuring its intended latent variable (AI Utilization, Design Thinking-Driven Business Modelling, and Entrepreneurial Competencies). Consequently, this instrument is suitable and reliable for use in primary data collection to test the research hypotheses. No revisions or item deletions are required, as all items have met the statistical criteria as valid measures.

Table 2
Reliability Result

Variable	Cronbach's Alpha	N of Items	Result
AI	.881	9	Reliable
DT	.887	9	Reliable
EC	.950	20	Reliable

Table 2 shows that all three constructions demonstrate excellent internal consistency, as indicated by Cronbach's Alpha values significantly exceeding the commonly accepted threshold of 0.70. The value for Entrepreneurial Competencies (EC) is exceptionally high (.950), confirming superb reliability for its 20-item scale. The values for AI Utilization (.881) and Design Thinking (.887) also denote high and very satisfactory reliability for their respective 9-item scales.

Research Procedure

The research procedure consisted of several key stages:

1. Obtaining research permits and conducting preliminary observations;
2. Determining the population and sample;
3. Developing and presenting the research proposal;
4. Constructing and validating the research instrument (questionnaire);
5. Administering the pilot test and revising the instrument accordingly;
6. Distributing the final questionnaire and collecting data from the main sample;
7. Performing data analysis, including model validity tests (e.g., normality, model fit), hypothesis testing, and interpretation of results; and
8. Finalizing the research findings.

Data Analysis

Data were analyzed using Structural Equation Modeling (SEM), specifically the Partial Least Squares (PLS) approach. PLS-SEM is a variance-based technique suitable for developing and testing causal models, combining aspects of confirmatory factor analysis, path analysis, and regression (Narimawati & Sarwono, 2017). It is appropriate for this study as it does not require strict assumptions about data distribution (non-parametric), is effective for theory development, and allows for the assessment of complex models with latent variables. The model's explanatory power was evaluated using the coefficient of determination (R^2). Analysis was performed using SmartPLS software.

Hypothesis Testing

Hypotheses were tested by examining the significance of the path coefficients in the PLS-SEM model. The significance of individual paths and the overall model was assessed. The research hypotheses were:

- H1: Design Thinking-Driven Business Modelling (DT) and AI Utilization (AI) simultaneously have a significant positive effect on Entrepreneurial Competencies (EC).
- H2: Design Thinking-Driven Business Modelling (DT) individually has a significant positive effect on Entrepreneurial Competencies (EC).
- H3: AI Utilization (AI) individually has a significant positive effect on Entrepreneurial Competencies (EC).

Results and Discussion

Convergent validity was assessed by examining the outer loadings presented in Table 3. In the first convergent validity test, several indicators were found to be invalid—specifically, those with factor loadings below 0.70. This included 5 indicators from Design Thinking (DT1, DT2, DT5, DT8, DT9), 6 indicators from Artificial Intelligence (AI1, AI2, AI3, AI4, AI5, AI7), and 7 indicators from Entrepreneurial Competencies (EC1, EC2, EC4, EC5, EC9, EC18, EC20). Thus, the remaining number of indicators was reduced from 38 to 20.

A second convergent validity test was then conducted using the remaining 20 indicators. This round resulted in one additional indicator from Entrepreneurial Competencies being deemed invalid (DT3), bringing the total number of indicators down to 19. In the third and final calculation, all 19 indicators were confirmed to be valid.

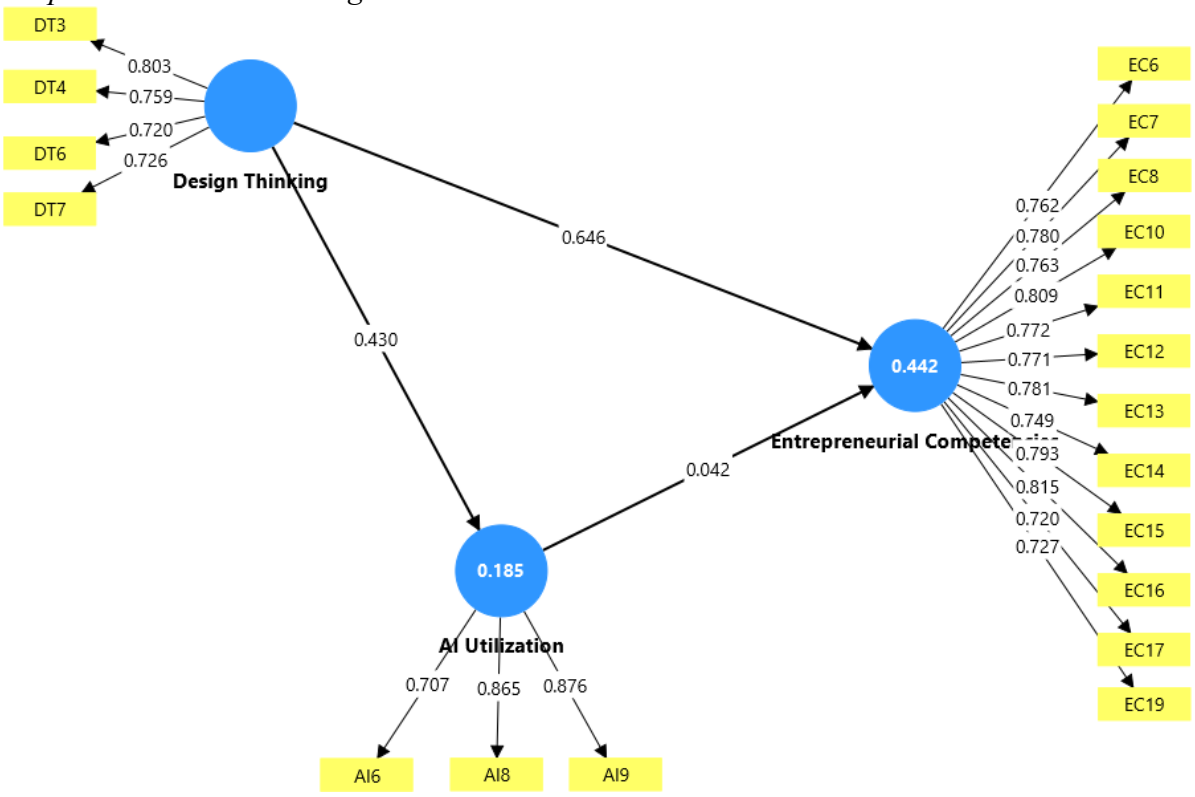
As shown in Table 3, convergent validity was established through an iterative refinement of indicators, resulting in a final set of 19 valid items (loading > 0.70) from an initial pool of 38. The retained constructs exhibited excellent internal consistency, with Cronbach's Alpha values of 0.745 for DT, 0.755 for AI, and 0.938 for EC (Table 4), confirming the instrument's reliability.

Table 4
Reliability Result

	Cronbach's alpha	**Note**
Design Thinking	0.745	Valid
Entrepreneurial Competencies	0.938	Valid
AI Utilization	0.755	Valid

The overall model fit was assessed as acceptable. Key indices, including the Standardized Root Mean Square Residual (SRMR = 0.084) and the Normed Fit Index (NFI = 0.709), met the threshold for a reasonable fit, although the significant Chi-square statistic indicated some discrepancy common in complex models with larger samples (Hair et al., 2019). The predictive power of the model, evaluated through R^2 values (Table 6), showed that DT and AI together explained a moderate 44.2% of the variance in Entrepreneurial Competencies. Notably, DT alone was a weak predictor of AI Utilization (R^2 = 0.185), suggesting other significant factors influence AI adoption.

Tabel 5
Model Fit Test Result



Parameter	Rule of Thumb	Nilai Parameter	Note
SRMR	Less than 0.10	0.084	Fit
d-ULS	> 0.05	1.335	Fit
d-G	> 0.05	0.662	Fit
Chi Square	χ^2 statistic ≤ X^2 table	662.724	Not Fit
NFI	Approaching a value 1	0.709	Fit

Table 6
R Square (R^2) Test Result

	R-square	R-square adjusted
AI Utilization	0.185	0.181
Entrepreneurial Competencies	0.442	0.436

Based on the analysis results, the R-square for the dependent variable Artificial Intelligence is 0.185. This indicates that 18.5% of the variability in artificial intelligence (utilization) can be explained by Design Thinking, which falls into a weak category. Furthermore, the analysis yielded an R-square for the dependent variable Entrepreneurial Competencies of 0.442. This shows that 44.2% (or 40.2% for the adjusted R-square) of the variability in entrepreneurial competencies can be explained by the combined influence of Design Thinking and Artificial Intelligence, which is categorized as a moderate level.

Figure 1
Output Model PLS SEM Algorithms

The hypothesis testing results, summarized in Table 7 and Table 8, provided clear answers to the research questions. A critical finding emerged in the relationship between DT and AI.

H1: Design Thinking-Driven Business Modelling (DT) and AI Utilization (AI) simultaneously have a significant positive effect on Entrepreneurial Competencies (EC), Rejected, as the p-value was greater than 0.05 (p = 0.601).

The path from DT to AI was significant and positive (β = 0.430, p = 0.000), indicating that engagement with the design thinking methodology promotes the adoption and use of AI tools. However, the indirect effect path (DT → AI → EC) was not significant (p = 0.601). Consequently, Hypothesis H1 was rejected, as the simultaneous effect of DT and AI on EC was not statistically significant, primarily due to the non-significant direct role of AI.

H2: Design Thinking-Driven Business Modelling (DT) individually has a significant positive effect on Entrepreneurial Competencies (EC), accepted, with a p-value of less than 0.05 (p = 0.000).

Hypothesis H2 was strongly supported, with Design Thinking-Driven Business Modelling exhibiting a significant, positive direct effect on Entrepreneurial Competencies (β = 0.646, p = 0.000). This finding aligns with theoretical expectations that the iterative, human-centered, and experiential nature of DT fosters the deep cognitive and behavioral patterns essential for entrepreneurial competency development (Blankesteijn et al., 2024; Moure et al., 2023).

H3: AI Utilization (AI) individually has a significant positive effect on Entrepreneurial Competencies (EC), rejected, with a p-value greater than 0.05 (p = 0.592). Hypothesis H3 was rejected, as AI Utilization did not show a significant direct effect on EC (β = 0.042, p = 0.592).

Hypothesis H3 was rejected, as AI Utilization did not show a significant direct effect on EC (β = 0.042, p = 0.592). This challenges the notion of AI as an independent, direct catalyst for competency acquisition in this educational context (Duong et al., 2025).

A critical finding emerged in the relationship between DT and AI. The path from DT to AI was significant and positive (β = 0.430, p = 0.000), indicating that engagement with the design thinking methodology promotes the adoption and use of AI tools. However, the indirect effect path (DT → AI → EC) was not significant (p = 0.601). Consequently, Hypothesis H1 was rejected, as the simultaneous effect of DT and AI on EC was not statistically significant, primarily due to the non-significant direct role of AI.

Table 7
Hypothetic Result

	Original sample (O)	Sample mean (M)	Standard deviation (STDEV)	T statistics (|O/STDEV|)	P values	Note
AI Utilization -> Entrepreneurial Competencies	0.042	0.035	0.079	0.535	0.592	Rejected
Design Thinking -> AI Utilization	0.430	0.437	0.073	5.873	0.000	Accepted

Design Thinking -> Entrepreneurial Competencies	0.646	0.655	0.056	11.564	0.000	Accepted

Table 8
Intervening Result

	Original sample (O)	Sample mean (M)	Standard deviation (STDEV)	T statistics (|O/STDEV|)	P values
Design Thinking -> AI Utilization -> Entrepreneurial Competencies	0.018	0.014	0.035	0.523	0.601

This study makes a distinct contribution by empirically testing a competency-based model within the under-researched context of Community Education, a discipline specifically dedicated to cultivating "entrepreneur-facilitators" capable of fostering grassroots economic and social innovation (Boothroyd & Davis, 1993; Saepudin & Mulyono, 2019). Unlike traditional business programs, community education emphasizes collaborative, asset-based development, requiring a unique blend of entrepreneurial and facilitative competencies.

The robust support for H2 underscores the foundational relevance of pedagogical frameworks such as Design Thinking (DT) and the Business Model Canvas (BMC) for this cohort. Grounded in Kolb's (2003) experiential learning cycle, these methodologies enable students to engage iteratively with ill-defined, real-world problems, moving from concrete experience to reflective observation, abstract conceptualization, and active experimentation. This process effectively translates theoretical knowledge into internalized, actionable competencies, such as empathetic problem identification, stakeholder engagement, and adaptive venture planning. Such skills are not merely complementary but essential for students who must later navigate complex community ecosystems, mediate diverse interests, and co-create sustainable value propositions that align with local social and environmental contexts (Bachmann et al., 2024; Moure et al., 2023).

The rejection of H3 and H1, however, introduces a necessary and nuanced perspective on the role of emerging technology in competency-based entrepreneurship education. While AI is increasingly hailed as a transformative enabler that enhances perceived venture feasibility and desirability (Thu et al., 2025), this study reveals that its impact on deeper competency development is neither automatic nor direct. The significant path from DT to AI suggests that engagement with human-cantered, iterative problem-solving methodologies may increase students' awareness and adoption of AI tools.

However, the non-significant path from AI to EC indicates that, in this educational context, AI functions primarily as an adopted tool within a human-centered process, rather than as a standalone competency builder. This finding aligns with growing scholarly caution that the effectiveness of AI in learning contexts is critically moderated by factors such as AI literacy, pedagogical integration, and the presence of scaffolded guidance (Awal & Chowdhury, 2024; Miranda, 2025). Without deliberate instructional design that explicitly connects AI tool usage, for example, in data-driven market validation or generative idea exploration, to the core DT competencies, students' engagement with AI may remain superficial. Consequently, AI may fail to enhance higher-order entrepreneurial competencies such as critical reflection,

strategic decision-making, and resilience, which are cultivated through iterative application, feedback, and reflection in real-world scenarios (Blankesteijn et al., 2024).

Furthermore, the model's moderate explanatory power ($R^2 = 0.442$) highlights that a substantial portion of variance in entrepreneurial competencies stems from factors beyond the current research model. This is consistent with the Competency Iceberg Model (Spencer & Spencer, 2008), which posits that observable competencies (knowledge and skills) are underpinned by deeper, less mutable attributes such as personal motives, traits, self-concept, and values. These implicit characteristics are difficult to influence through short-term educational interventions but fundamentally influence entrepreneurial behaviour and capability development.

Additionally, competencies are shaped by the broader entrepreneurial ecosystem, including institutional support mechanisms, mentoring networks, social norms, and market conditions (Popa & Breazu, 2025). Future research could therefore extend this model by incorporating these latent psychological constructs and contextual variables, potentially through mixed-methods or longitudinal designs, to provide a more holistic understanding of competency formation in community-oriented entrepreneurship education.

Summary: Conclusion

DT-driven pedagogy stands out as a potent mechanism for building entrepreneurial competencies in future community facilitators, the integration of AI requires more than mere tool exposure. It calls for intentionally designed learning experiences that embed AI within the DT process, coupled with explicit competency mapping and adequate literacy support. This approach ensures that technology adoption translates into meaningful capability development, ultimately preparing students not only to use digital tools but to leverage them thoughtfully within the complex, human-centered process of community empowerment.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that Grammarly, an AI-assisted writing software, was used in proofreading and refining the language used in the manuscript. The usage was limited to correcting grammatical and spelling errors and rephrasing statements for accuracy and clarity. The author further declares that, apart from Grammarly, no other AI or AI-assisted technologies have been used to generate content in writing the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

Students' Attitudes Towards the Integration of AI in Higher Education: Perceptions and Challenges in Mauritius

Bushra Khoyratty, Université des Mascareignes, Mauritius
Rajeev Khoodeeram, Université de Mascareignes, Mauritius
David Authier, Université de Limoges, France

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Artificial intelligence (AI) is transforming higher education by improving learning experiences, automating administrative tasks, and providing personalized support to students. However, research on students' attitudes towards AI remains limited, particularly in developing countries like Mauritius. This study examines students' familiarity with AI tools, their perceptions of AI's impact on education, and the key challenges in its adoption. A mixed-methods approach was used, incorporating a structured questionnaire to gather comprehensive insights. Quantitative data were analyzed using descriptive statistics, while qualitative responses were thematically coded. Findings indicate that while students acknowledge AI's potential in education, they express concerns regarding accessibility, ethical implications, and institutional preparedness. Furthermore, many students lack awareness of AI's role in their academic and professional futures, highlighting the need for targeted AI education initiatives. The study recommends integrating AI literacy programs within university curricula, ensuring equitable access to AI tools, and establishing clear ethical guidelines for AI use in education. Additionally, universities should involve students in AI policy development to promote comprehensive decision-making. These insights contribute to ongoing discussions on AI adoption in higher education, providing a foundation for further research that includes faculty and administrative perspectives to develop a holistic AI integration framework.

Keywords: artificial intelligence, higher education, student perception, AI adoption

Introduction

Over the past few years, with the advent of technological advancements and the implementation of artificial intelligence (AI), along with the use of machine learning models, a significant technological revolution has infiltrated every aspect of our life. In the educational context, the concept of teaching assisted by automated learning systems refers to the tools, techniques, and methodologies that rely on the foundations of AI and are used to automate processes requiring technological intervention within a technology-enhanced learning environment (Romero et al., 2023).

Furthermore, AI significantly enhances evaluation methods, which prepares students more effectively for future careers by aligning with evolving job market demands. This suggests that higher education institutions should integrate more AI into their curricula to produce graduates who are well-equipped to meet future market needs (Slimi, 2021).

In Mauritius, discussions surrounding AI adoption in higher education is gaining increased attention from policymakers, educators, and institutions. However, limited research exists on students' attitudes towards AI implementation. This study aims to fill this gap by examining students' familiarity with AI tools, their perceptions of AI's impact, and the challenges faced in its integration within Mauritian universities.

This paper explores students' perceptions of AI applications within educational processes, focusing on students as the primary consumers of educational services. Adopting a service-dominant logic and co-creation perspective, students are seen not only as customers but also as active participants and co-creators in the service process, emphasizing their central role in value creation (Bowden, 2011). Celuch and Robinson (2016) describe higher education as a “unique experiential service,” where student engagement spans both academic and broader educational experiences. Thus, understanding the dynamics between students and institutions is crucial for creating value in educational services. Given that AI technology can significantly impact the student experience (Barrett et al., 2019), this study aims to achieve the following research objectives, firstly, to identify students' current perceptions of AI tools in higher education and to develop strategies for integrating AI tools into higher education to enhance learning and student engagement.

This paper is structured as follows: Section 1 introduces the topic; Section 2 presents a comprehensive Literature Review of Artificial intelligence in higher education. Section 3 outlines the Methodology used in this study. Section 4 presents the Findings, including students' perceptions and key themes derived from the data. Section 5 provides Recommendations, suggesting practical ways for higher education institutions to integrate AI tools effectively. Finally, Section 6 concludes the paper by summarizing the key insights, implications, and potential future research directions.

Literature Review

Definition of Artificial Intelligence

Artificial Intelligence (AI) refers to computer systems performing tasks typically requiring human intelligence (Andresen & McCarthy, 2002). AI systems analyse their environment and act autonomously to achieve specific goals (Boucher, 2020). Buabbas et al. (2023) describe AI as enabling machines to simulate human-like capabilities, including reasoning and problem-

solving. AI is categorized into data-driven, logic-based, and knowledge-based approaches. The data-driven approach relies on large datasets, while logic-based AI focuses on problem-solving, and knowledge-based AI prioritizes inference models. AI can also be classified into narrow AI, general AI, and artificial superintelligence (Marrone et al., 2022). Narrow AI specializes in specific tasks using machine learning. General AI mimics human cognitive abilities. Artificial superintelligence exceeds human intelligence and capabilities. These classifications highlight AI's evolving role in technological advancement.

Artificial Intelligence in Higher Education

The importance of applying artificial intelligence in the educational sector was especially emphasised due to the COVID-19 pandemic, which resulted in a shift from traditional classroom teaching to a digital form of learning (Maqbool et al., 2021; Mijwil et al., 2022; Pantelimon et al., 2021). AI-driven systems and technologies hold immense potential to transform traditional operational models in higher education institutions (Dhawan & Batra, 2020). According to Intelligence (2018) the United States Education Sector Report predicts a 47.50% growth in AI within the U.S. education sector from 2018 to 2022.

Baker et al., (2019) categorize AI technologies into three distinct applications: learner-facing, teacher-facing, and system-facing AIEd. Learner-facing AI consists of software tools students use to study specific subjects. Teacher-facing AI automates tasks such as administration, evaluation, feedback, and plagiarism detection, which supports teachers by reducing workload and enhancing insights into student progress. System-facing AI provides institutional-level data to administrators and managers, facilitating more informed decision-making (Zawacki-Richter et al., 2019).

AI's integration into higher education can significantly improve the learning experience, decrease dropout rates, and foster personalized learning environments for students (Pedró, 2020). It can also help to achieve sustainable development goals (SDGs) presented by the UN General Assembly, such as those related to ensuring equal quality education for all (SDG4) and reducing inequalities between online and on-site approaches with special emphasis on students with disabilities (SDG 10) (Furini et al., 2022).

The Microsoft Education Transformation Framework (ETF) for Higher Education provides detailed guidance for developing a comprehensive digital transformation strategy in educational institutions. This framework includes four main pillars namely student success, teaching and learning, secure and connected campus, and academic research, through which AI can be effectively integrated to deliver efficient outcomes (Papaspyridis, 2020).

Focusing initially on the pillars of student success, secure and connected campus, and academic research, it is noted that student success encompasses strategies for student recruitment and retention and building lifelong connections with students. AI tools can project trends in admission decisions and potential dropout scenarios, thus allowing for timely interventions (Pedró, 2020). Tsai et al. (2020) successfully used AI to predict high-risk students and the underlying causes of dropout, enabling proactive support and solutions.

The secure and connected campus pillar involves efficient management of campus resources, ensuring a safe and intelligent campus environment. AI can automate the management of campus facilities and streamline human resource and financial operations, transforming campuses into smarter ecosystems (Dhawan & Batra, 2020). AI applications like virtual

assistants and chatbots at administrative desks offer quick, personalized, cost-effective, and efficient solutions (Dhawan & Batra, 2020).

In terms of academic research, AI enables researchers to operate within an effective computing environment, removing barriers and fostering global collaboration. AI enhances the research process by simplifying data handling, survey creation, interview conduction, and detection of falsified data (Dhawan & Batra, 2020).To better understand and identify the barriers for fostering global collaboration, student's perception of artificial intelligence should be studied.

Student Perceptions of Artificial Intelligence

According to the authors Gherheş and Obrad (2018), the perception of students on the use of AI tools in higher education is an evolving topic with a range of opinions and findings documented in academic literature. One cannot neglect the importance of student perceptions regarding it since they represent the final users of educational services. Several studies have explored student perceptions of Artificial Intelligence (AI) in educational contexts, revealing both opportunities and challenges. For instance, Gherheş and Obrad (2018) also found that most undergraduate students felt under-informed about AI, yet believed it could positively impact society. However, fears such as AI leading to job loss and surpassing human intelligence were prevalent (Wang et al., 2024). Similarly, Jeffrey (2020) identified a general positive outlook towards AI among college students, though their understanding ranged from moderately high to low.

Research by Wang et al. (2024) and others focused on factors influencing students' intentions to learn AI, noting the role of AI anxieties, especially concerning job replacement, and the positive effects of learning motivations and self-efficacy. Studies extended to different educational levels, from elementary to university students, examining their readiness to engage with AI.

Idroes et al. (2023) reported a generally favourable perception among undergraduates on the use of AI in education, citing advantages like virtual assistants and universal access, but also noting significant drawbacks such as diminished student-teacher relationships. Cheng et al. (2023) developed the Student Conceptions of AI in Education Scale (SCAIES), identifying key AI applications in education from intelligent tutoring to sentiment analysis and personalized learning.

The perception of AI tools among students varies significantly based on their experiences and backgrounds. While many appreciate the efficiency and personalized learning opportunities, others express reservations about privacy and the authenticity of AI-mediated interactions.

A survey by Nguyen et al. (2020) found that students are generally positive about the use of AI for logistical applications like scheduling and feedback, but they prefer human interaction for more complex discussions and support.

Lastly, research by Kuleto et al. (2021) and Sangapu (2018) highlighted the mixed perceptions of AI's role in education, with findings suggesting AI can enhance personalized learning and teaching effectiveness, though there is substantial uncertainty about AI replacing human teachers entirely. These studies collectively underscore the complex and multifaceted views students hold towards AI in educational settings.

Benefits of AI Tools in Higher Education

The advantages of artificial intelligence applications in higher education are vast and varied. AI methodologies offer substantial value in multiple areas of teaching and learning, particularly at the student, lecturer, and institutional levels.

Student Level

According to Munir et al. (2022), AI enhances students' education by facilitating access to suitable courses, improving teacher interactions, and allowing more time for other tasks. A key trend in education is personalization, where AI tailors learning experiences to individual preferences, knowledge levels, and goals (Lane & Saint-Martin, 2021). AI-powered systems analyse students' learning histories, identify weaknesses, and suggest courses to enhance learning (Munir et al., 2022).

In tutoring, students often require extra support beyond the classroom, while many instructors face time constraints. AI-driven tools, including chatbots, help bridge this gap by providing personalized assistance (Zhou et al., 2020). Tomaskinova and Tomaskin (2024) highlight AI's role in online education, offering adaptive learning, automating routine tasks for teachers, and enabling individualized instruction. AI-powered learning platforms provide 24/7 access, allowing students to explore concepts independently. Exchange students also benefit from AI-driven education without incurring travel and living expenses (Photopoulos & Triantis, 2022). In addition, AI technologies like speech-to-text and language translation tools can make learning more accessible for students with disabilities or those who speak other languages, as highlighted by Nacheva and Czaplewski (2024).

Lecturer Level

AI provides data-driven insights that enable lecturers to refine their teaching strategies and enhance their competency (Zawacki-Richter et al., 2019). AI-powered learning analytics track student progress, engagement levels, and comprehension, allowing lecturers to tailor their teaching approaches accordingly (Holmes et al., 2019). Additionally, AI-driven professional development platforms offer personalized training for educators, ensuring they stay updated with modern pedagogical methodologies (Tomaskinova & Tomaskin, 2024).

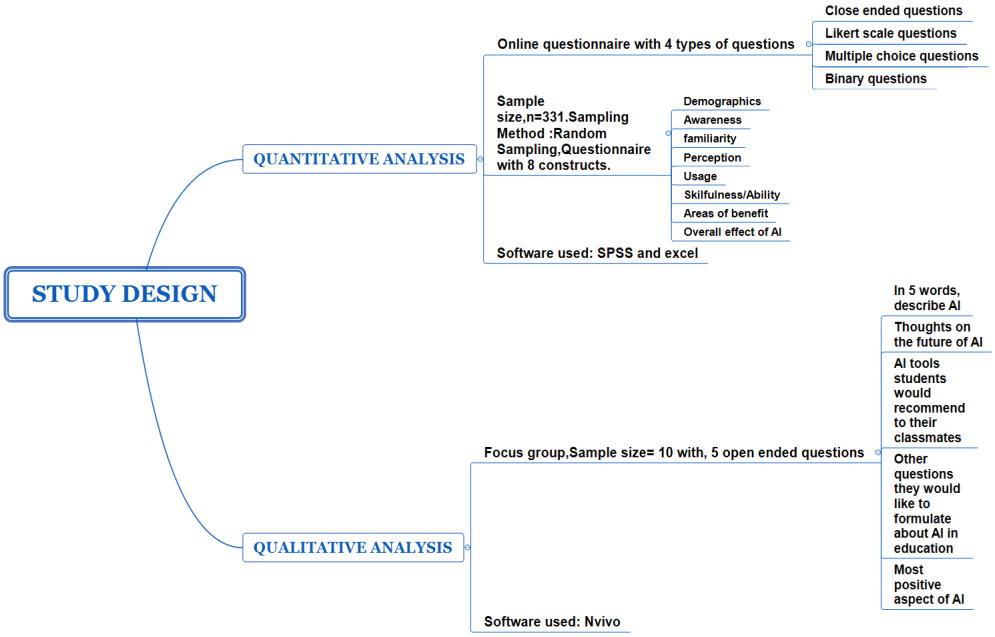
Moreover, AI facilitates automated grading and feedback, reducing administrative workload and enabling educators to focus on mentorship and curriculum improvement (Selwyn, 2019). As AI continues to evolve, blended AI-human instruction models are emerging, where lecturers use AI to complement their expertise rather than replace it (Chen et al., 2020).

Institutional Level

AI enhances an institution's branding and corporate image by demonstrating technological leadership, innovation, and a commitment to student success (Molnár & Szüts, 2018). AI-driven solutions, such as chatbots, automated communication, and personalized learning platforms, improve institutional visibility and reputation, attracting students, faculty, and industry partnerships (Veletsianos et al., 2024; Zawacki-Richter et al., 2019). Moreover, AI fosters institutional innovation by optimizing administrative processes, research capabilities, and digital education infrastructure (Aoun, 2017). AI-powered predictive analytics and adaptive learning systems enable universities to make data-driven decisions on enrolment,

resource allocation, and curriculum design, ensuring they stay ahead in a competitive academic landscape (Dwivedi et al., 2023; Selwyn, 2019). Additionally, smart campus initiatives utilizing AI improve efficiency, sustainability, and student engagement, reinforcing institutions as pioneers in educational transformation and technological advancement (Brynjolfsson & Mcafee, 2017).

Challenges and Concerns



- Ethical and Privacy Issues: The use of AI in education raises concerns about data privacy and ethical use of student information. Bostrom and Yudkowsky (2018) discuss potential risks associated with AI, including biases in algorithms that could impact student assessments.
- Dependence and Reduced Critical Thinking: There's a concern that reliance on AI tools might lead to diminished critical thinking and problem-solving skills among students. A study by Gerlich (2025) suggests that over-reliance on AI tools for tasks like research and writing could inhibit the development of these essential skills.
- Digital Divide: The varying levels of access to technology can exacerbate existing inequalities in education. Students from lower socioeconomic backgrounds may not benefit equally from AI tools, as they might lack the necessary resources, a concern highlighted by Ahmed (2024).

Research Methodology

In this exploratory research, mixed research has been used to better explore the perception of students among four public HE institutions in Mauritius namely Université des Mascareignes, University of Mauritius, Open University and University of technology, focusing on their usage and perspectives of AI tools in education. A sample size 331 students were tested for this study through an online questionnaire. The online survey covered topics such as students' familiarity with AI tools commonly used, the integration of AI technologies into higher education, potential challenges posed by AI, benefits, and the impact on their learning outcomes. In addition, a qualitative analysis with 20 candidates were interviewed through focus group discussion. Participation was entirely voluntary, and all responses remained anonymous. For the analysis, descriptive statistics were used to interpret the survey data.

Findings

Figure 1
Study Design Framework for Investigating AI in Higher Education

Qualitative Results

Here are some key results and observations based on the key constructs of the questionnaire.

(i) Demographic information

Among the sample gathered, 53.4% identified as male, 45.9% as female, and 0.9% as another gender. Regarding their study levels, most respondents (93.1%) were undergraduates, while 5% were master's students, and 0.9% were pursuing doctoral studies.

In terms of their fields of study, 42.5% of the students were enrolled in Management, 2% were in Social Sciences, 21% pursued Engineering, and 27.4% were studying Information Technology.

(ii) Awareness

Nearly all respondents (98%) have heard of the term "Artificial Intelligence." A significant majority, 86.7%, have encountered applications or tools that involve AI, showing that most students have practical exposure to AI in some form. However, 13.2% have not had such encounters, suggesting that while AI is widely present, some students may still lack direct interaction with it. In addition about 95% of respondents indicated that they are familiar with AI tools, suggesting that not only are they aware of AI, but they also have a level of familiarity with AI-related applications. A small percentage (4%) expressed unfamiliarity, which may indicate a learning gap or hesitance in using AI tools.

(iii) Familiarity

The first Chi-square test yielded a Chi-square statistic of approximately 16.34 with a p-value of 0.012, indicating a statistically significant association between gender and familiarity with AI concepts. This suggests that familiarity with AI concepts differs significantly between males and females in this dataset.

The second Chi-square test produced a Chi-square statistic of approximately 12.42 with a p-value of 0.647, indicating insufficient evidence to establish a statistically significant difference in AI familiarity across various fields of study. In other words, students' familiarity with AI concepts appears to be consistent regardless of their study field.

(iv) Perception

Table 1
Inferential Statistics Which Shows Correlation and Significance Between AI Perception Variables

Question pairs	Correlation	P-Value
Positive View vs Trust in AI	0.632	0.049
Knowledge of AI Tools vs Confidence with AI	-0.095	0.792
Positive View vs Can Study without AI	0.253	0.480

Here are the correlation results for the selected question pairs.

- Positive View vs Trust in AI: Moderate positive correlation ($r = 0.63$, $p = 0.049$) indicates a statistically significant relationship. Students with a positive view of AI tend to trust AI-generated information.
- Knowledge of AI Tools vs Confidence with AI: Weak negative correlation ($r = -0.09$, $p=0.79$) shows no significant relationship. Familiarity with AI tools does not translate to confidence in using them.
- Positive View vs Can Study without AI: Weak positive correlation ($r = 0.25$, $p = 0.48$) suggests no significant relationship. A positive AI perception does not strongly affect students' belief in studying without AI.

(v) AI tool usage

Most students (106) use AI several times a week, indicating regular but not daily use.

Nearly half of the rest of the population (75) use AI rarely or several times a month, showing occasional engagement.

Frequent users (74) rely on AI almost daily, but they form a smaller group.

AI tools are integrated into study routines but are not indispensable for most students.

The variance in AI tool usage suggests differences in familiarity, relevance, and task-specific needs. High-variance tools like Grammarly (SD = 1.54), QuillBot (SD = 1.61), and ChatGPT 3.5/4 (SD = 1.33) indicate that some students use them frequently, while others rely on them only for specific tasks. Low-variance tools such as Claude 2 (SD = 0.51) and Liama 2 (SD = 0.32) show limited engagement, likely due to lower awareness or specialized functionality.

Familiarity plays a key role in usage patterns—widely known tools like ChatGPT 3.5/4 have a broad range of responses, while less familiar tools such as Unriddle and Jasper Chat show low engagement**.** These patterns highlight that AI adoption among students depends on both awareness and task relevance rather than just availability.

(vi) Skilfulness in using AI tools

Most respondents (50.07%) consider themselves partially skilled, followed by skilled individuals (25.07%). A smaller proportion identify as very skilled (6%). These findings suggest that while a significant number of students possess some level of AI proficiency, gaps remain that may require targeted training. Further investigation into specific AI competencies, such as data analysis, natural language processing, or machine learning, could enable institutions to develop more effective, needs-based educational interventions.

(vii) Areas of Benefit and overall effect of AI

Table 2
Shows Correlation and Significance Between AI Perception Variables

Area of Benefit	Never (%)	Rarely (%)	Sometimes (%)	Often (%)	Very Often (%)	N	Mean	Std.
Generating of Ideas	10 (3%)	23 (8%)	76 (25%)	132 (43%)	89 (29%)	330	3.79	1.1
Writing Research Papers	21 (6%)	48 (15%)	85 (26%)	112 (34%)	65 (20%)	331	3.46	1
Searching for Information	8 (2%)	23 (7%)	67 (20%)	115 (35%)	114 (35%)	327	3.94	1.1
Explanation of Material	8 (3%)	18 (6%)	87 (27%)	101 (31%)	100 (33%)	326	3.85	1.1
Task Problem Solving Skills	20 (6%)	26 (8%)	104 (31%)	105 (31%)	74 (24%)	329	3.57	1

Based on the table, here are some key observations.

1. **AI's Strong Role in Information Gathering and Comprehension**

Students rate "Searching for Information" and "Explanation of Material" highly, with mean scores of 3.94 and 3.85, respectively, highlighting AI's usefulness in these areas. Many responses fall into the "Often" and "Very Often" categories, suggesting that students frequently turn to AI for tasks that involve finding and grasping information.

2. **Moderate Usefulness for Generating Ideas and Problem Solving**

With a high mean score of 3.79, "Generating Ideas" ranks well, with many students marking "Often" and "Very Often," indicating that AI tools provide solid support for brainstorming and creative thinking.

"Task Problem Solving Skills," however, has a slightly lower mean of 3.57 and more responses in the "Sometimes" and "Often" categories. This suggests that while AI tools are helpful for specific problem-solving tasks, they may not be as universally relied upon as they are for information gathering and comprehension.

3. **Writing Research Papers**

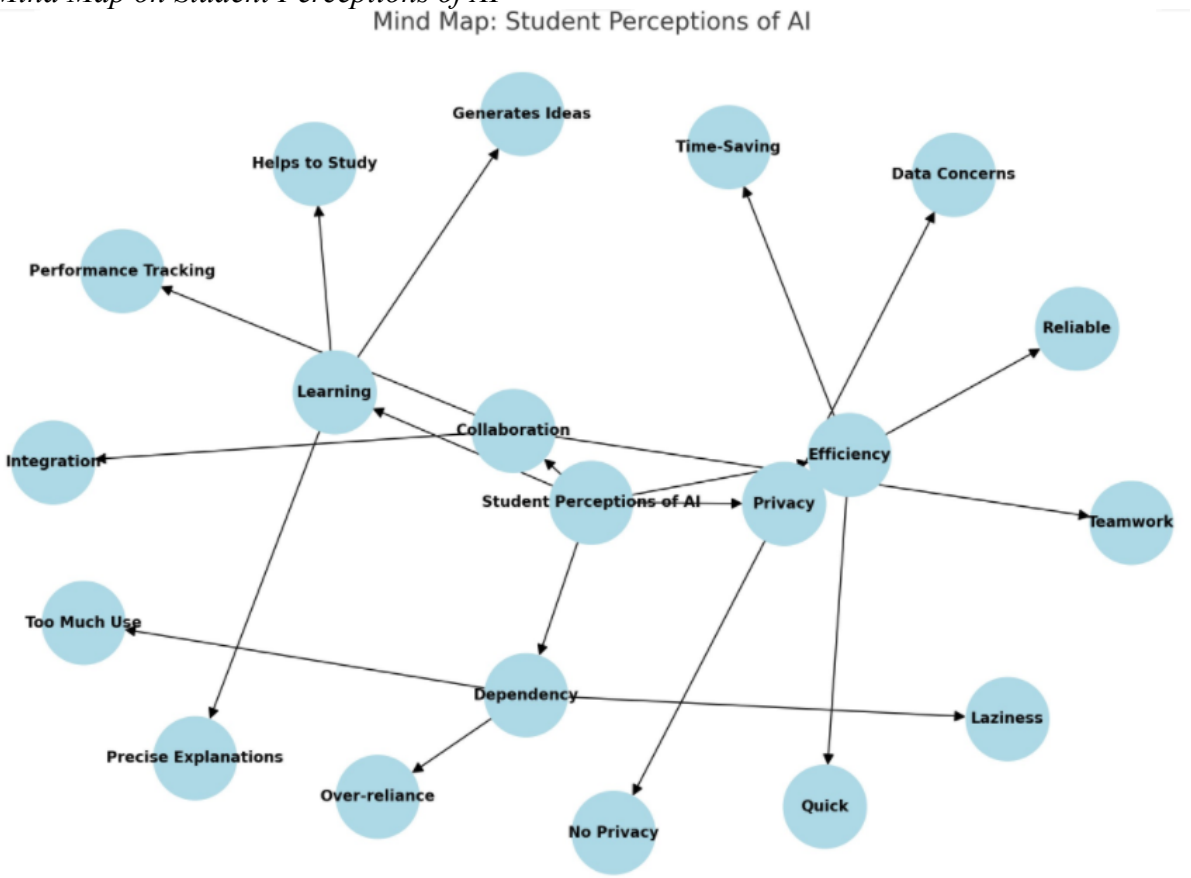
With a high mean score of 3.79, "Generating Ideas" ranks well, with many students marking "Often" and "Very Often," indicating that AI tools provide solid support for brainstorming and creative thinking.

"Task Problem Solving Skills," however, has a slightly lower mean of 3.57 and more responses in the "Sometimes" and "Often" categories. This suggests that while AI tools are helpful for specific problem-solving tasks, they may not be as universally relied upon as they are for information gathering and comprehension.

4. **Standard Deviation Insights**

With a standard deviation around 1.0 across each area, there is moderate variation in student responses. This suggests that while many students find AI tools helpful, a portion of students may not feel the same benefit. This difference could stem from varying levels of familiarity with AI or differing academic needs among students.

5. **Overall Preference for AI in Routine and Supportive Tasks**



The data suggests that students tend to find AI more useful for routine tasks like idea generation and information retrieval, rather than for more structured academic work such as writing research papers. This could imply that while students value AI's support for exploration and learning, they still rely on their own efforts or traditional resources when it comes to completing formal assignments.

In summary, the data suggests that AI tools are perceived as highly beneficial for enhancing learning and understanding, with slightly less impact on formal writing tasks. This could imply areas for improvement in AI's capacity to assist with academic writing or structured assignments.

Quantitative Results

The quantitative findings were derived from a focus group consisting of 10 students, with the data visualized using the NVivo Free Trial software.

Figure 2
Mind Map on Student Perceptions of AI

The central focus of the study is "Student Perceptions of AI," which is categorized into five key areas: Efficiency, Dependency, Collaboration, Privacy, and Learning. Students largely view AI as a tool that enhances productivity and saves time, with terms like "Quick," "Reliable," and "Time-Saving" reflecting its perceived efficiency. Many also regard AI as a valuable learning aid, as it facilitates effective studying, provides precise explanations, and generates ideas to support assignments. However, concerns about over-reliance are evident, with some students fearing that excessive dependence on AI could weaken their problem-solving and critical thinking skills, as indicated by terms such as "Over-reliance" and "Laziness." Privacy concerns also emerge, with students expressing caution about data security, mentioning risks such as "Data Concerns" and "No Privacy." On the positive side, AI is recognized for its role in enhancing collaboration and teamwork, helping to track performance and streamline shared tasks. Overall, students acknowledge AI's dual impact, appreciating its benefits in efficiency and learning while remaining mindful of its potential drawbacks, particularly in terms of dependency and privacy.

Recommendations

Based on the findings of this survey, several recommendations can be developed to enhance students' effective and confident use of AI in their academic studies. These recommendations focus on increasing familiarity, building trust, and promoting purposeful engagement with AI tools.

1. **Promote AI Literacy and Critical Evaluation**

Findings reveal that 57% of students trust AI-generated outputs but do not critically assess their accuracy. This highlights the need for AI literacy programs that teach students how to evaluate AI-generated information. Universities should offer workshops on AI ethics, limitations, and validation methods to promote responsible AI engagement (Huang et al., 2023).

2. **Increase Awareness and Accessibility of Underutilized AI Tools**

Survey data show that while 78% of students frequently use ChatGPT and Grammarly, less than **30%** explore AI tools for data analysis and project management. Universities should promote awareness of underutilized AI tools by integrating them into curricula, offering demonstrations, and providing discounted subscriptions through institutional partnerships (Alqahtani & Wafula, 2025).

3. **Offer Personalized AI Tool Recommendations**

Survey responses indicate that students use AI differently based on their academic disciplines. For example, 45% of science students utilize AI for data analysis, while 67% of humanities students rely on AI for writing assistance. To enhance AI adoption, universities should create an online portal that provides personalized AI tool recommendations based on students' academic fields and study levels (Jdidou & Aammou ,2024).

4. **Foster a Balanced Approach to AI Use**

Survey results show that 82% of students view AI as a supportive tool rather than a replacement for critical thinking. Educators should reinforce this perspective by encouraging students to combine AI with traditional research methods and analytical reasoning. This balanced approach ensures that AI enhances learning without diminishing independent thought (Dzogovic et al., 2024).

5. **Evaluate the Impact of AI Tools on Academic Outcomes**

A key finding from the survey is that students who actively use AI tools for study support report an 11% higher self-perceived improvement in academic performance compared to non-users. To assess AI's broader impact, universities should conduct longitudinal studies measuring AI engagement against academic performance metrics, such as grades and course completion rates (Hardini et al., 2025). By implementing these recommendations, educational institutions can foster not only familiarity with AI but also confident, purposeful engagement. These approaches ensure that students develop the necessary skills to navigate and benefit from AI in their academic journeys.

Conclusion

On the overall, the survey reveals that students generally hold a positive perception of AI and also find certain AI tools helpful in assisting them academically, and trust the information generated by AI when they have a favourable view of it. However, familiarity with AI tools does not correlate with confidence while using them, highlighting an area where training and hands-on experiences may benefit students. Moreover, the differences in frequency of tool usage indicates that while some AI tools play a prominent role in academic work, others might

be underused due to lack of knowledge amongst academic tasks, possibly due to a lack of awareness or specific applicability.

These findings suggest that educational institutions could support students by offering targeted training on effective AI tool usage, fostering critical engagement with AI outputs, and promoting tools that meet specific academic needs. Future research might explore the impact of structured AI training on students' confidence and actual performance to validate these findings further.

The limitation of this study is the sample size of 331 students from university faculties in Mauritius. Since the findings are based on a specific region, they may not fully represent the experiences or usage patterns of students in other parts of the world. Additionally, focusing on Mauritian university students might not capture the broader diversity in how AI tools are understood, accessed, or utilized among students globally. Expanding this research to include a more varied and extensive sample, along with objective assessments of AI tool usage and skill levels, could offer deeper insights into the role of AI in higher education across different cultural and educational contexts.

Decolonising Education: Rethinking Early Childhood Education in Indigenous Spaces

Aditi Mitra, Hamar Chinhari Welfare Society, India

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This paper attempts to understand and rethink Early Childhood Education from the context of the life world and the worldview of rural and indigenous communities. It is an attempt to contextualise (and in the process indigenize and decolonize) the developmental and learning goals of pre-schoolers in two Open Learning Centres in two villages in Chhattisgarh in central India. Modern and urban understandings (which are also westernized understandings) of child development and child education continue to colonize the culture of existing pre-schools. This necessitated the creation of a space – Open Learning Centres called *Srijan-Shala* (Abode of Creativity) – where early childhood education shall be in tune with the indigenous life world and worldview. There is a stress in Srijan-Shalas on points of dialogue and possible commonality between the apparently "traditional" and the purportedly "modern". This paper is a rigorous documentation of an attempt at building such a space and our journey through the painstaking process of training teachers in the ethos of a democratic classroom (where learning, playing and questioning are co-constitutive), creating indigenized decolonized curriculum and lessons, and birthing pedagogic practices and innovations that are caring. Women of the same village – who have received education and are the founders of Chinhari – teach in their respective Srinjan-Shalas, sharing their know-how of their own environment, cultural practices and traditions in a form of caring collective. The paper critically reflects on the birth and the sustainability of the idea of decolonized early childhood education in rural and indigenous contexts and communities.

Keywords: decolonisation, indigenous curriculum, Hamar Srijan Shala, early childhood education, community-based learning

Introduction

This paper is a reflection on the process of setting up two *Srinjan Shalas* (translated as "Abode of Creativity" in English) in two villages (Mardapoti and Dokal) in the Dhamtari district of Chhattisgarh in India. The Srijan Shala works with children in the age group of 3 to 8. This does not reflect the typical age group of children under the purview of Early Childhood Education (ECE) which is 0 to 6 years. Though this age range is different from the perceived age bracket of children in the context of ECE, this was perhaps the first stepping stone towards our attempt to reimagine ECE in this particular space. The urge to set up the Srijan Shalas were three-fold: (a) access to quality education, (b) access to indigenised curriculum and (c) creation of democratic *class-spaces* (not class-rooms) for active, experiential and immersive learnings. The paper is divided into several sections. We begin with the question of Context and background – the larger background of early childhood education and the background of Chinhari in rural, forest contexts.

Context of Setting up ECE

Absence of quality school education in the villages, especially for younger children who did not have the capacity to move further from their home, served as the primary incentive to initiate questions and efforts around a possible Srijan Shala. The focus of ECE has shifted in many of the preschools in the urban spaces. From being a space for exploration, where a child constructs her own knowledge through her interaction with the world – human, animal, plant, non-human, divine, preschools have taken up the mantle of making them "school ready" and eventually ready for merely the job market (like teaching coding and robotics in ECE, including public speaking, speech and drama). "Under the impact of intense urbanization, children became a natural resource to be moulded by schools and fed into the industrial machine" (Illich, 2021, p. 86). The changing role of ECE was also a question we attempted to reflect upon in tandem with the ideas of "children as active learners", "experiential learning opportunities" and "scaffolding". The idea of ECE, to be carried out in specific places, (kindergartens and pre-schools), under trained individuals (EC Educators) was perhaps necessitated by the society where it emerged as practice and field of study. The role of the community in the life of an indigenous child needs to be considered when their early years are explored. The child grows up within the community, being a part of it. The community is the totality of the many worlds – human, animal, plant and the divine. The community deeply immersed in its traditional roots and yet standing on the threshold of modernity.

The Idea of Education

Homogenisation

> Of all conflicts in the field of education, that between Imagination and Discipline is the most bitter and prolonged. (Tagore, 1961, p. 22)

Education in today's context has been rendered synonymous with instructions and discipline. Dished out under the vigilant supervision of curriculum, administration, teachers and assessments, in tandem with an institution, it is always delivered. To ones who are assumed to know no better. They are conceived in the mind and boardrooms of people whose life and world view could be in complete or partial contradiction to the ones it is being framed for. Perhaps, it hence goes unnoticed that it is most often a "one size fits all" kind of curriculum. The centralised curriculum that runs along the length and breadth of the country (India), hardly

considers the diversity of the different states and cultures. The context of the rural and the indigenous children are completely overlooked.

Education has thus become a process, an endeavour, an effort – that is outside and alienated from the life worlds of many of the very children it seeks to educate.

Neoliberalism and the Human Capital

Education has thus taken this shape of being a business transaction where one can purchase the quality of services.

> To be a scholar in the Middle Ages meant to be poor, even a beggar… The old university was a liberated zone for discovery and the discussion of ideas both new and old. …The structural purpose of the modern university has little to do with the traditional quest. …Students see their studies as the investment with the highest monetary return, and nations see them as a key factor in development. (Illich, 2021, pp. 50–51)

In schools what is taught is what is construed as knowledge and what counts as knowledge is a reconstruction based on selection under given market circumstances. The composition of the educational opportunities affects the choices of what is taught in schools which again reflects the classification of knowledge. For me, education is an act of deliberation. However, in a market-obsessed polity, education may paradoxically become a means to phase out certain voices or make them inaudible. This is done by the conversion of humans into human capital.

The Docile Worker and the Absence of a Democratic Classroom

> One who remains contended with the world as it appears to be is perhaps not serving the function of an intellectual. An intellectual is restless-perpetually thinking, wondering and reflecting on his/her times. (Pathak, 2020, p. 41)

Everyone thinks, wonders and argues. What perhaps needs to be reasserted is space for dialogue and freedom of thinking in the classrooms. Dialogue is faith which perquisites understanding and respect for all those who are engaged in the process. “Only dialogue, which requires critical thinking, is also capable of generating critical thinking” (Freire, 2017, p. 65). Critical thinking, however, is no ordinary feat. It requires spirit, character and a distinctive mind. Educational spaces are devoted to creating docile workers rather than freeing the mind to question things around them.

The Idea of ECE: *Heartspace* in Education

The formative years of growing up, especially from birth to 5 years of age are most crucial in the development of a child. It is during this time that most of the brain synapses are formed as children are trying to make sense of themselves and their environment concretely and experientially. They are in a constant mode of exploration through their five senses, their feelings-emotions and abilities.

The crucial role of the early childhood years is often overlooked, in the context of the schools, in indigenous spaces. The languages of endearment that are used, the valuable everyday experiences, the idea of nutrition, the role of conversation and the physical touch through oil

massage, bathing, feeding, carrying and sleeping, are not included as important components in the process of development. The caring and care giving function of the community is replaced and reduced to the charts and insufficient "mid-day meals", which delves neither into the questions of learning nor nutrition.

A child of pre-school age is not just a child between 0 -6 years or even 8. She is also a child from the rural indigenous world. Social Learning theories of child development shows us that children learn from their environment. Meaningful learning therefore cannot take shape without taking the society into purview: "we prefer to provide them with a children's toy-world, lacking the imagination to remember that even if it was make-believe, it was always a grown-up world that we chiefly craved as a plaything of our early days" (Tagore, 1961, p. 67).

The two sections, education in general and early childhood education in particular, have tried to show that there are fundamental issues that need to be rethought. Educational praxis needs reimagining in terms of such rethinking. Action research on classroom pedagogy can show us the limits of current educational thinking and practice. The next section shall show what form such limits take in a particular indigenous context in the central Indian state of Chhattisgarh.

Journey – Inception, Idea and Conversations

What necessitated the birth of Hamar Srinjan Shala? It was through conversations with the Chinhari associates that we (I would use "we" as we thought of this together, dreamt together), came up against this obstacle of "learning environment". There were schools, we didn't talk about the lack thereof. What disturbed us was the pedagogy of the teaching learning process, the lack of motivation, the non-stimulating environment, the disconnect with nature and the rich natural environment, the understanding of "development" and the absence of accountability.

The Chinhari Associates shared that they taught the younger children in their respective villages of Mardapoti and Dokal. The kids came on their own accord, and they guided them with their schoolwork. That made us wonder about learning space, embedded within the community, in communication with it and drawing its learning from it.

The first imperative question of why included a deeper question of *how*? How are we perceiving it differently? How are we going to translate our ideas into an actionable plan and explain its need?

The questions were posed to the Chinhari Associates. They were encouraged to reflect on their understanding of "schools, problems and promises". Since we were ideating on a situation that was prevalent in the two villages, the ideas needed to come from within the community and not super imposed by the others belonging to very different social contexts.

We held onto two core ideas:

a. It should not become just another school.
b. Cradles of Care rather than just contexts of cognition

Rethinking the Ideas of Schooling

We were not trying to fill the gap merely by what we had. But curate and create another gap filling philosophy. Schools bring forth an image of a space with children and adults. A place

"where the relatively young go to watch the relatively old work" (Jonas, 2010, p. 1). Structured ideas, paperwork, assessments and evaluations, competition and hierarchy. Hierarchy of ideas, of voices, where what is helpful is predetermined.

Innovative and alternative ideas of schooling though not alien are largely a prerogative for the affluent, demanding, educated, knowledgeable elite. Dominantly confined to the cities or within the premises that are thoughtfully curated and embedded in nature engaged in developing the whole child, usually the urban, affluent child. A divide is thus created by designing different types of education for children, which is based on assumption, judgment and preconceived ideas shaped by the social milieu. Poor education for the poor and education that builds competitiveness and individualism for the rich.

However, we also had to change ourselves by questioning our preexisting ideas, (of who deserves a better education). Question our preexisting contexts and practices (people in the rural spaces did not value education, the young are involved in farming and search of livelihood leaving little time, the indigenous world is steeped in cultural practices which are alien and therefore in contradiction to learning from schools). We had to question our assumptions of ourselves and of others (western educated urban subjects have a deeper understanding and knowledge about the idea of what is good).

Most of the thoughts came from the experiences of the girls themselves and their present observations of the children/ schools in their villages. The observations and reflections were for a period over 10 years of schooling (the average age group of the girls in Chinhari is about 20. The students they interacted with were from the age group of 4 to 12 years of age).

Indigeneity – Philosophy From Within the Cultures

What is indigeneity and why is it important to consider it while framing educational goals? Philosophy of education, especially in former colonies, largely determines the way we perceive teaching and learning. The idea of institutions, "schooling", discipline and hierarchy in education is largely a philosophy of the west (see Simeon, 2018). Through colonialism, the western idea of education percolates into our universities, high schools, primary schools and the preschools as well. In both the urban and rural spaces, and in adivasi spaces, the colonial idea of what education implies and strives to be, remains the same. The songs sung, the stories narrated are the stories of the west. Lived by the west, they are alienated from the cultural context of the many different communities they strive to reach out to. Wherever an attempt is made to alter the western imagination of education, it is superimposed by a generic Orientalist idea of an Indian village or a city. The west and the Indian are both seen as homogeneous. The west is glorified. The Indian is usually condemned. Or is presented as excessively glorified. Both harm the process of teaching-learning in ECE spaces. At other times, education becomes a question of the benevolence of the rich or the urban elite for the rural child. Tagore mentions the charitable minded city-bred politicians conversing about education of the village folks, where what is left at the bottom of their cup, diluted copiously, is considered sufficient in accordance with the social status of those who receive it (Tagore, 1961, p. 11).

Similar analogies can be found in educational plans and curriculum drawn out for schools across the country. "In most, if not all, of the formerly colonized societies, the educational philosophies are heavily influenced by Western thoughts. However, western traditions on educational philosophy have not been able to find a stable basis upon which to rest its aims of education" (Siegel as cited by Simeon, 2018, p. 2). "Education is based on knowledge and the

key difference between Western and indigenous knowledge is at the level of philosophy" (Stewart as cited by Simeon, 2018, p. 3). Education is used by the indigenous communities to reclaim and regenerate their languages, their stories, their histories and wisdom traditions.

The indigenous world is a lived world with and within the context of nature. The rituals for bountiful harvest and to ward off evil, the rituals for birth, marriage and death are all saturated with stories. The ecological understanding of conserving the forest is very much entwined with the belief of the forest as a living breathing space, as "elder" of the village, eliciting reverence and respect. Inhabited by divinities. The caution of not venturing out alone after dark is overlaid by the chance elephant that wanders near the village. The traditional indigenous festivals reflect their life world, a philosophy of respectful co-existence between the human-plant-animal world.

However, this is not to suggest that indigeneity is the only cultural gap in education or the imposition of the western imagination of education is the only problem in education. One cannot deny that the hierarchy of education has not existed in our country as well. Education was the prerogative of the few, chosen, by the virtue of their birth or by wealth. Though that has not greatly changed, a need has arisen to address the gap in the understanding of who is educated? especially in the context of the education for the indigenous child.

Our problems are hence twofold. One is exclusion. Hence there is a need for inclusion. The second is the curriculum. What is it that we teach to the included? The same old curriculum of the elite. Or do we curate an indigenized curriculum?

From Alienation to Assimilation

The aim of learning is assimilation and not alienation. Learning that aims at being like the other can only reiterate the inherent difference and thereby the impending need to change oneself. The sense of inferiority that comes with the lack of it, impacts the way self-belief and self-esteem develops. The child from an indigenous community, enrolls in a government school where there is little to no reference to her unique cultural context. There is no narrative that talks about their songs and rituals. There is no holiday for their festivals, no understanding of why a "rock" or a "tree" (spiritual practices of the indigenous communities) is more of an object of veneration rather than a temple with an established deity of the dominant community. On the contrary the content that she works with, reiterates the dominant collective consciousness about the marginalized, the indigenous, the outsider. She never feels at home and yet is unable to break apart from this narrative: "unconsciously, then I distrust what is black in me, in other words, the totality of my being" (Fanon, 2008, p. 168). The chances of this child returning to her community to address the source of this conundrum of identity is slim. She would want to break free and associate herself with the ones who had othered her.

Moving Forward: Building a Bridge

> Often cultural blindness works on our perception of people who are different from "us". The "us" that we know. (Hodge, 1991, p. 85)

Multifaceted and complex reality renders a common description, solution or cure difficult for either development or the development of knowledge. Education imparted in the isolated classrooms tends to overlook not just context and the child's life world but also this complexity. Education here, is closely embedded within the trope called development, in which much of

rural life finds itself immersed, at times imprisoned. Thus emerges a need to raise a few questions regarding: development and the paradigm of development of knowledge, the underdevelopment thesis, the life world of the community where knowledge systems are in practice in everyday functioning. Through such critical reflection on both, our idea of an indigenous Srijanshala takes shape; a somewhat radical thought takes form in the Chinhari Associates: can our communities be that petri dish where *rich* education for the indigenous child can be imagined?

In India, we have offered largely poor education to the poor. Tragically, it is not that we have offered rich education to the rich. We have offered the rich only one kind of education: "how to be rich"? Stand above the rest, be competitive, appropriative and extractive? Including extraction of nature; not just the surplus labour and know-how of fellow humans. *How can we have rich education for both rich and poor* – we asked in our repeated reflections on education in Chinhari. Rich in compassion. Sharing. Empathy. In non-violent reorganisation of desire. Rich in reduction of aggression. Rich in cooperation (Tagore called it *samavaya* in his book *The Cooperative Principle*). In the context of Srijanshala, we asked ourselves further: can we offer *rich* education to the purportedly poor and under-developed? How can we have an education where the head of the purportedly poor and the purportedly under-developed is held high; "where knowledge is free; where the world has not been broken up into fragments by narrow domestic walls" (Tagore, 2007).

The western understanding of development, pertaining to infrastructure, buildings and roads (*bijli, sadak, pani*) have altered the way we perceive human relationships, knowledge, and communities. In the race to be developed, we have left a large part of our people behind. Left them with an inferior sense of being and self-identity but a blind desire to become like the other, who ridicules them as *under*-developed. The idea of education has also altered in this understanding of development. Right from the pre-school years it is packaged, labelled, advertised and sold. The pathway to being developed lies through the gateways of a private school.

Education As Shorthand for "Development of Knowledge"

> Education is being developed in isolation, in the isolated minds of the individuals. However, learning is in the process of co-participation and not in the heads of individuals. (Lave & Wenger, 1991, p. 16)

Education needs to be perceived in the broad spectrum of the context of different cultures and life worlds. If participation in social practice is a fundamental form of learning, we perhaps require a more worked out view of the social world. Our concern here is an absence of theorizing about the social world as it is implicated in processes of learning. We think it is important to consider how shared cultural systems of meaning and political-economic structuring are interrelated, as they help to co-constitute learning in communities (Lave & Wenger, 1991, p. 54).

One such context of the practices of the community can be perceived in the village Dokal, where marriage is a collective responsibility. The community comes forward with their resources, economic and helping hands. It is an *economy of* sharing rather than logic of exchange or exchange through the medium of money (as in the capitalist market form) which drives it.

This culture of sharing and gifting (and not exchange) plants seeds of cooperation among the people, enabling them to face numerous other challenges. It is a learning opportunity where logistics are taken care of in terms of food, guests, arrangement, the actual ceremony, the associated rituals, storytelling and other details. It is a learning experience where the community will put aside their differing viewpoints and ideas and come up with collective, feasible solutions. Responsibilities will be delegated to carry out required tasks. One such ceremony births multiple learning opportunities for the different individuals and groups of the community, outside the walls of a classroom.

Imagining this in the many different contexts of everyday life produces a plethora of experiences. Letting the cows at dawn, the tending of the "baadi" (vegetable patch), working at the field and forest, most often with other members of the village, household work of cooking, cleaning, washing, the gatherings at the village "chopal" (meeting spot, usually located centrally), the day ending with every member of the family having their meals together, every night. Most of the work is collective work, either within the family unit or with the larger unit of the community. The children learn their roles, responsibilities, duties, the ways with the animals they coexist with, and much about the plants and trees that grow around them from an early age. They acquire knowledge about weather and crops, water requirements and the right time to harvest the vegetables. They learn about measurement and the concept of estimation as they help in the cooking or draw water to wash the utensils.

Being in the scope of "legitimate peripheral participation", they learn in the context of cooperation within the community, through participation (see Lave & Wenger, 1991). Learning about life worlds and the care giving functions for the younger ones in the community across ages. This perhaps also breaks the conception of knowledge being transmitted from the more knowledgeable to the lesser. "We have also pointed out that structuring resources for learning come from a variety of sources, not only from pedagogical activity. We argue that a coherent explanation of these observations depends upon decentring common notions of mastery and pedagogy. This decentring strategy is, in fact, deeply embedded in our situated approach" (Lave & Wenger, 1991, p. 94).

The young children grow up in a community of care, not only for the human world but also for the plant and animal world, the non-human world. They also go to schools where they are introduced to "A for apple" and "Z for zebra" from a chart that hangs from the wall. The golden haired "Q for queen" deepens the sense of alienation rather than instilling curiosity. Most children are visual learners during their early years. Children who have a rich legacy of kings and queens in their history, would perhaps be more intrigued with different imagery. It would perhaps open conversations about communities and kingdoms, about the economy of sharing as against the economy of exchange through money. The story of "Rani Durgawati" can be introduced, a "Gond" queen who challenged the then emperor, Akbar! (see *Rani Durgawati: Forgotten life of a warrior queen* [Sengupta, 1992]).

Trees like "mahua" and fruits like "beal" which are native to these regions, struggle to find their places in the esteemed pages of textbooks and songs. Festivals like "Hareli", "Madai" and "Pola" are largely unknown outside the periphery of the villages. Multiplicity of festivals, especially awareness of the lesser known but older festivals and cultural practices, their stories and origin, their intimate ties to the plant and animal world, the narratives of the indigenous tales of myths and legends, is often left out of the discourses that frame content of curriculum. "Adivasi Diwas" is largely unknown and excluded from the curriculum of the schools.

Indigenous identity is only included in the form of a group dance during cultural programs of school. Here, though the "zebra" is included the "mahua" is nonchalantly left out!

It is not to question education but to question the ways of educating that necessitates building a space to balance the two worlds. Between the windscreen and the rearview mirror in the journey called schooling.

The "zebra" is invoked, primarily because we don't care where the child is coming from. This is not a simple devaluation of the indigenous child's world. It also stems from a larger devaluation of the family, community, culture and the rural, in development. The discourse of development sees such rural indigenous communities as underdeveloped, backward, superstitious, violent. It sees such communities as *lacking.* Hence, we never customize curriculum to the needs of the children. Srijan Shala was an attempt to revalue and attend to their intricate life world.

Modern schools, a product of a particular idea of development, have replaced the traditional idea of collective knowledge in the rural indigenous spaces. Reiterating the idea of individual performances, the curriculum practiced is more focused on individual learning and performance. A child's performance is based on the scores in examinations and assessments, seldom on whether there are instances of collective ideas, collaborations and action.

Incorporating indigenous world view and experiences into the daily learning practices is the backbone of the entire effort of Hamar Srijan Shala. Content derived from the context of life and shared through the medium of languages, art, drama, songs, numbers, games and play. Traditional songs and stories are being sourced largely from the elderly of the villages. The "Gond" festivals and rituals are celebrated with the stories behind them. There is an attempt to teach rational, critical thinking of science and today's global language English, but through the narratives of their daily experiences and practices. Hamar Srijan Shala is an endeavour to build a future, rooted in the age-old knowledge system. It is an opportunity to reimagine content from the perspective of a child who is embedded in nature and community. For whom, "group work" and "nature walk" are not mere classroom activities, but the very way of life.

Hamar SrijanShala is also an attempt to reimagine early childhood learning, in the context of the community, environment and a constant co-existence between the two. An attempt to reiterate that there are many types of knowledge as there are multiple ways of learning them.

Conclusion

Tagore, while reflecting on "Sriniketan" – his ashram school – writes in *Boyhood Reminiscence*, "I know what it was to which this school owes its origin. It was not any new theory of education, but the memory of *my* school days' (1979; italics mine). The Chinhari Newsletter on School Education (Sept 2024) also stemmed from the reflections of the Chinhari associates on *their* school days and the problems therein and the need to *right wrongs* in school education. The approach was to learn from their experiences in their school days and see how a new framework for early childhood education – an indigenized education that was deeply attentive to *context* (i.e. the life world) and the *concepts* (i.e. the larger worldview) of the indigenous could be imagined.

Hamar Srijan Shala was thus conceived in the context of the *collective memory* of our school days. In the collective memory of the challenges and the realisations that emanated from such

experiences. It was an attempt to create a site of *in-betweenness* which becomes the ground of discussion. Where the indigenous child and the community together confront the inequities and asymmetries of societal trauma not as a "common people," but as a people with a common cause (Bhabha. 2009).

Hamar SrijanShala is a small endeavour. It is an endeavour flowing from the "long term commitment to righting wrongs". An attempt to address a much larger question, quietly forgotten and left aside. A question which has been left buried under more pressing matters perhaps.

Hamar Srijanshala lies somewhere in the arc of a journey-from breakdown and collapse to convalescence and recovery. It is resilience. "It insists that we cannot allow terror, self-hatred and sadness to have victories over us and that we can always, so long as we think matters through with sufficient creativity and gentleness, identify reasons to live" (De Botton, 2024, p. 7).

We are serious about our endeavour, committed and convinced that in this process, we are learning too. We are learning what is the best way forward, how we need to shift our own thinking and assumptions, look at the bigger picture, understand the diverse and unique practices and history, be a part of the life worlds different from those we are born into, question the assumed, converse and reflect with those who will be our guide in this journey.

It is these small endeavours perhaps, in my community, in India and in other parts of the world, that will help to shape bigger transformations. Bigger transformations to a better World.

Acknowledgements

I would like to thank Renuka Yadav, Keshbati Netam, Pooja Yadav, Kavita Yadav, Swarnima Kriti, Sumit Verma and Anup Dhar of Hamar Chinhari Welfare Society and Sasha Priyo of Bodh Shiksha Samiti for having contributed in known and unknown ways to the writing of this paper. Neither the birthing of Hamar Srijan Shala nor the curation of this paper would have been possible without them.

Impacts of Two Collaborative Learning by Teaching Approaches on University Students' Engagement, Motivation, and Metacognition

Yue Hu, Hangzhou Normal University, China

Abstract

Collaborative learning by teaching (CLBT) is an active learning approach that integrates collaborative learning with the learning-by-teaching strategy, aiming to enhance student engagement and knowledge acquisition in university settings. However, it challenges many university students as it demands collaborating autonomously and regulating the collaborative learning process. Some students may struggle with task execution and process management. To address this challenge, socially shared regulation scaffolding can be integrated to support CLBT. This study proposed a socially shared regulation scaffolding called Task Guidance Scaffolding (TGS), which divides CLBT tasks into four stages—goal setting, planning, monitoring, and evaluation—and provides specific guiding questions at each stage to help students complete the CLBT learning process. Using a two-group case study design, this research investigated the effects of CLBT and socially shared regulation scaffolding-supported CLBT on university students. Results indicated that both approaches positively affected students' group engagement, motivation, and metacognition. The study emphasizes the potential benefits of CLBT and its integration with socially shared regulation scaffolding on university students, providing practical implications for educators and future research.

Keywords: collaborative learning by teaching, socially shared regulation scaffolding, group engagement, motivation, group metacognition

Introduction

In traditional Chinese university classrooms, teacher-centered instruction remains prevalent, which often restricts students from actively involving in the classroom (Zhou & Tsai, 2023). In response, educators have tried to implement and innovate student-centered teaching methods, such as game-based learning (Hu, 2024), collaborative learning by teaching (Zhou et al., 2019), project-based learning, problem-based learning, and flipped classrooms to promote engagement and interaction. Notably, collaborative learning by teaching (CLBT) is an active learning approach that combines collaborative learning with the learning-by-teaching strategy, requiring students to work in groups to select themes, gather information, and organize content for peer teaching, thereby enhancing their engagement and knowledge acquisition. However, CLBT requires students to plan, monitor, and evaluate collaborative processes by themselves, which may pose challenges for those unfamiliar with their tasks. Thus, socially shared regulation scaffolding can be integrated to offer necessary guidance and support for CLBT implementation.

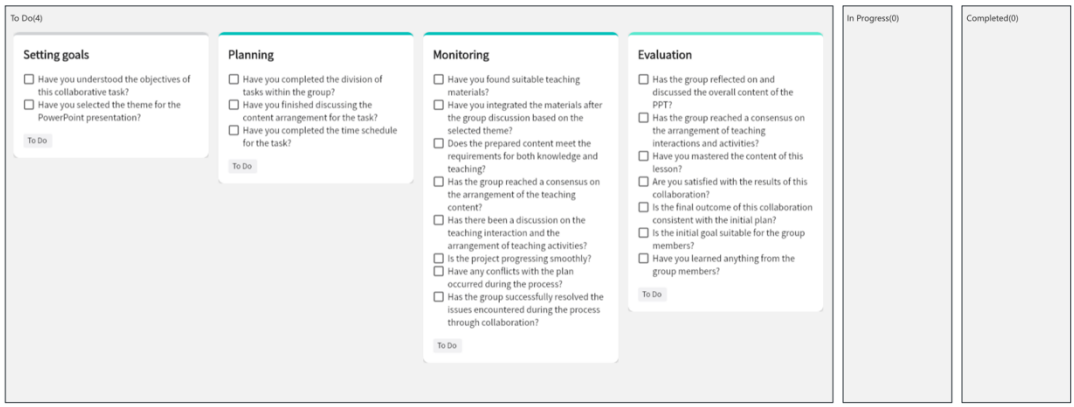
As a widely adopted tool in collaborative learning, socially shared regulation scaffolding guides students to adjust behavioral and metacognitive conditions together in collaborative tasks, enabling them to manage and improve their entire collaborative process through provided guidance or feedback. However, its application within CLBT and the effect of CBLT have not been thoroughly studied. This exploratory, two-group case study attempts to investigate the effects of CLBT and socially shared regulation scaffolding-supported CLBT on university students, focusing on the following research questions:

RQ1. Does CLBT and socially shared regulation scaffolding-supported CLBT improve university students' group engagement?
RQ2. Does CLBT and socially shared regulation scaffolding-supported CLBT improve university students' motivation?
RQ3. Does CLBT and socially shared regulation scaffolding-supported CLBT improve university students' group metacognition?

Method

To deepen understanding of the research issues and generate meaningful insights, this study adopted a case study design, gathering and analyzing quantitative data. The subsequent sections further detail the participants and study context, task guidance scaffolding (TGS), the design of TGS-supported CLBT activities and CLBT activities, as well as the methodologies employed for data collection.

Participants and Study Context



The study was conducted during the fall semester of the 2024–2025 academic year at a normal university in China. Two classes were selected: a CLBT group of 30 students and a TGS-supported CLBT group of 41 students. The CLBT group engaged in CLBT activities without TGS, while the TGS-supported CLBT group engaged in CLBT activities supported by TGS. These students, who were enrolled in the "Modern Educational Technology" course, voluntarily consented to participate in the research. The course, aligned with the prescribed textbook "Modern Educational Technology," covered topics such as the design of PowerPoint and the design of micro-lecture, etc. Before the study, the average GPA of students from both classes over the 2022–2024 period was analyzed, with a corresponding p-value greater than 0.05 ($t = 0.35$, $p = 0.73$), indicating no significant difference in academic performance between

the two classes. To ensure balanced and diverse groups within each class, students were allocated to three to four members using a descending 'S' curve based on their GPA (Chen & Chiu, 2016; Jang, 2010; Yang & Heh, 2007).

Task Guidance Scaffolding

Figure 1 illustrates the task guidance scaffolding, which is a socially shared regulation scaffolding designed to help students set goals, make plans, and monitor and evaluate the entire collaborative process in CLBT. To support the shared regulation in CLBT, this scaffolding, created by using the task card template on the BoardMix platform, comprised three panels: To Do, In Progress, and Completed. The “To Do” panel contains four cards that align with the stages of socially shared regulation: setting goals, planning, monitoring, and evaluation and each card includes guiding questions for each stage. During the task, participants could regulate their learning by checking off the guiding questions and moving cards across panels based on their progress. Additionally, they could set deadlines or fill in summaries of task-related content as needed to facilitate their collaborative tasks in this scaffolding.

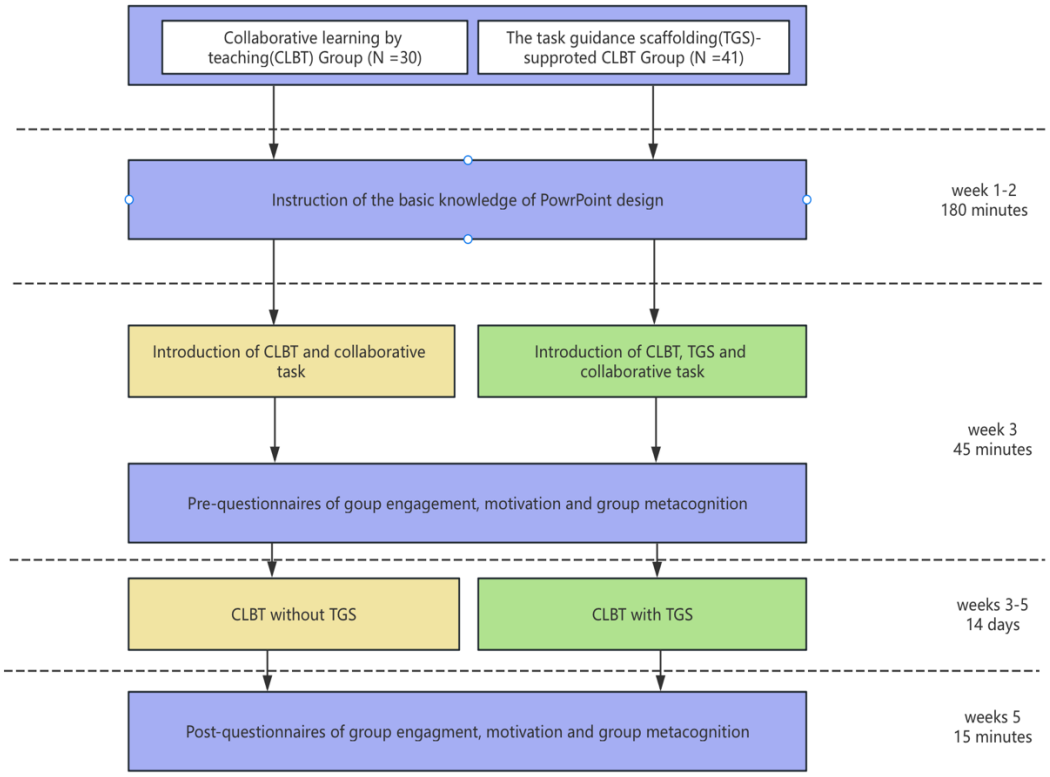


Figure 1
Task Guidance Scaffolding

The Treatment of Two CLBT

Figure 2 illustrates the procedures of the experiment, which spanned 5 weeks. In the first two weeks, the teacher delivered the foundational knowledge on PowerPoint through two 90-minute classes, supplemented with additional materials for self-study. In week 3, the teacher provided the task guidelines in a 5-minute introduction, outlining requirements for students to complete collaborative tasks based on PowerPoint and prepare for the classroom presentation. A 25-minute training session was conducted to support task implementation. The TGS-supported CLBT group was trained in collaborative learning by teaching and a socially shared regulation strategy, while the CLBT group focused exclusively on CLBT. Both groups filled out a 15-minute pre-test questionnaire measuring motivation, engagement, and metacognitive skills within the context of collaborative learning. From weeks 3 to 5, students independently selected topics according to their group assignments and embarked on collaborative learning by teaching tasks for 14 days. By the fifth week, each group conducted a 5–6-minute teaching presentation in class and completed the post-test questionnaires during a 90-minute class. The teaching processes were videotaped by the teacher and subsequently evaluated by two teaching assistants using a standardized grading rubric.

Figure 2
Procedures of the Experiment

Data Collection

To evaluate the impact of CLBT with or without TGS support on group engagement, motivation, and group metacognition, this study delivered a student self-perception questionnaire to collect quantitative data. The questionnaire consisted of three dimensions: group engagement, motivation, and group metacognition. Moreover, group engagement was measured using a self-perception group engagement scale developed and validated by Xu et al. (2024) in a collaborative learning context at the undergraduate level. The scale comprised 31 items, scored on a five-point Likert-type scale from “never” (1 point) to “always” (5 points) and a nine-point semantic differential scale, ranging from “negative” (−4 points) to “positive” (4 points). In this study, Cronbach’s alpha values for the group engagement scale were 0.943 in the pre-test and 0.975 in the post-test, validating the scale’s applicability for assessing student engagement in this research context. Motivation was assessed using 8 items from the scale developed by Pintrich et al. (1993), recorded on a five-point Likert-type scale from strongly disagree (1 point) to strongly agree (5 points). The scale’s validity and reliability were established in collaborative learning by teaching context at the undergraduate level (Zhou & Tsai, 2023). Moreover, the motivation scale’s Cronbach’s alpha values in this study were 0.814 in the pre-test and 0.903 in the post-test, which indicated the scale’s suitability for assessing student motivation in this research context. The metacognition scale, developed by Biasutti and Frate (2018), included 20 five-point Likert-type items. Designed for collaborative learning contexts at the undergraduate level, the scale selected from strongly disagree (1 point) to strongly agree (5 points). The Cronbach’s alpha values of this scale were 0.956 in the pre-test and 0.966 in the post-test, demonstrating the scale’s validity for assessing group metacognition in the present study.

Results

Analysis of Group Engagement

The paired sample t-tests were conducted to evaluate the pre-test to post-test changes in group engagement among university students across two groups, with results displayed in Table 1. The results demonstrated a significant increase in engagement in the CLBT group ($t = 3.401$, $p < 0.01$) and the TGS-supported CLBT group ($t = 3.452$, $p < 0.01$) after students participated in the treatment activities, indicating that both approaches can significantly enhance students' engagement.

Analysis of Motivation

Using the same paired sample t-tests measured by pre-test and post-test data, the study evaluated the motivation of university students. Table 1 shows a significant improvement in motivation in the CLBT group ($t = 2.102$, $p < 0.05$) and the TGS-supported CLBT group ($t = 4.315$, $p < 0.001$) after the treatment activities. These results suggested that the CLBT and TGS-supported CLBT could considerably boost students' motivation.

Analysis of Group Metacognition

As displayed in Table 1, this study quantitatively investigated university students' group metacognition by the paired sample t-tests including pre-test and post-test in two groups. Significant improvements were similarly observed in the CLBT group ($t = 2.843$, $p < 0.01$) and the TGS-supported CLBT group ($t = 3.486$, $p < 0.01$) after students participated in the treatment activities. Such findings indicated that both approaches exert a significantly positive influence on students' group metacognition.

Table 1
Results of Paired Sample t-Tests on Group Engagement, Motivation, and Group Metacognition

Dimensions	Groups	n	Pre-test		Post-test		*t*
			Mean	SD	Mean	SD	
Group engagement	TGS-supported CLBT group	41	3.116	0.737	3.496	0.763	3.452**

	CLBT group	30	4.093	0.465	4.275	0.445	2.843**

Note. *$p < .05$; **$p < .01$; ***$p < .001$.

Discussion

The statistical results for RQ1 revealed significant improvements in students' engagement in both CLBT and TGS-supported CLBT groups after completing the treatment activities. This aligns with existing research highlighting CLBT's role in promoting active engagement in the collaborative process (Zhou et al., 2019). A potential explanation is that CLBT necessitates a

deeper understanding of the material, thereby encouraging active participation. In addition, TGS-supported CLBT provided more detailed guidance and approaches to facilitate collaboration. This result is consistent with prior studies that socially shared regulation can improve students' engagement (Zhou & Tsai, 2023).

The results of RQ2 demonstrated that both CLBT and TGS-supported CLBT positively influenced student motivation. This improvement may stem from CLBT's requirement for students to teach their classmates, which likely encouraged a deeper understanding of knowledge and enhanced enthusiasm, as supported by prior research (Zhou et al., 2019). In addition, TGS-supported CLBT promoted motivation by fostering confidence through guided support. This result is consistent with prior studies showing that a socially shared regulation tool could prompt co-regulation in the group and raise awareness of individual motivation and emotions (Järvenoja et al., 2020).

To answer research question RQ3, the results showed that CLBT and TGS-supported CLBT promoted a remarkable improvement in students' group metacognition after they completed the treatment activities. This result is in line with prior studies, indicating that CLBT has the potential to improve students' learning capabilities and teamwork skills, thereby enabling them to regulate groups' collaborative process and improve group metacognition (Zhou et al., 2019). There is a possible explanation for this result: CLBT improved students' engagement and motivation, enabling them to regulate and adjust collaborative processes effectively, which improved students' group metacognition. Additionally, TGS could help students plan, monitor, and evaluate collaborative process, facilitating more effective peer teaching based on CLBT. This result is consistent with prior studies demonstrating that the group metacognitive scaffolding could improve students' group metacognition (Zheng et al., 2019).

Conclusion

This study explored the impacts of CLBT and socially shared regulation scaffolding-supported CLBT on the engagement, motivation, and group metacognition of university students. Results suggested that both approaches appeared to be effective pedagogical approaches in enhancing these aspects. These findings provided valuable insights for higher education practitioners to implement CLBT and socially shared regulation scaffolding-supported CLBT in classroom settings. Despite the study having generated findings with theoretical and practical implications, some limitations should be considered. For example, the sample size was small and was recruited only from one university, and the teaching duration for students in the research design was rather brief. Additionally, the implementation period was confined to merely five weeks. For a deeper comprehension of how CLBT and socially shared regulation scaffolding-supported CLBT function in different contexts and subjects, future research should expand the sample size, extend group teaching time in the research and experimental period, and compare students' learning process and results in both CLBT and socially shared regulation scaffolding-supported CLBT.

Abstract

Grounded in Change Theory and Diffusion of Innovation Theory, this study examined the organizational readiness of 16 Local Higher Education Institutions in Region III to implement Flexible Work Arrangements to ensure institutional continuity during disasters and national emergencies. Using descriptive-evaluative, descriptive-comparative, and descriptive-correlational research designs, data were collected from 1,945 teaching and non-teaching personnel. Results showed that teaching personnel demonstrated high awareness of FWAs across offline, online, and blended learning modalities, while non-teaching personnel exhibited high awareness of flexiplace, compressed workweek, skeleton workforce, and work-shifting arrangements. Both groups presented high organizational readiness supported by very high capability levels in soft and hard skills among teaching staff and high capability levels among non-teaching staff. The most frequently cited challenges were inability to meet performance demands (93.6%), mental stress due to limited in-person interaction (87%), and distractions arising from personal concerns (80.10%). Significant differences in capability were found across age, sex, employment status, length of service, academic rank, and educational attainment ($p < .05$). Moreover, a strong positive correlation existed between personnel capabilities and organizational readiness ($r = 0.751$, $p = 0.000$), indicating that higher competencies are associated with greater preparedness for Flexible Work Arrangement implementation and highlighting the need for a strategic action plan focusing on governance, human resource development, digital infrastructure, and resource management.

Keywords: flexible work arrangements, local higher education institutions, organizational readiness, Diffusion of Innovation, Change Theory

Introduction

Central Luzon, or Region 3 of the Philippines is considered as one of the most hazard prone regions of the country. According to the Pacific Disaster Center (2021), it faces high to very high exposure to natural hazards such typhoons, floods, earthquakes, and storm surges. These recurring disasters threaten infrastructure, public safety, and essential services such as education.

In April 2024, Region 3 recorded the highest number of public school closures due to extreme heat intensified by El Niño, resulting in 1,124 class suspensions (Marcelo, 2024). Similarly, the frequently flooding has disrupted academic calendars, encouraging institutions to consider flexible work and learning arrangements (Unson & Cariaso, 2024).

In response, the Commission on Higher Education (CHED) released directives such as CMO No. 16, s. 2022, and No. 4, s. 2023 promoting Learning Continuity Plans (LCPs), hybrid instructions, and modular delivery. These emphasize synchronous, asynchronous, and flexible modalities to ensure educational delivery during crises. However, successful implementation depends not only on technology but also on the readiness of institutions and personnel.

While some higher education institutions (HEIs) have made progress toward digital transformation and flexible work adoption, many still face challenges such as change resistance, limited digital literacy, psychological stress, and blurred work-life boundaries (Chen, 2021). These issues raise important questions about the ability of HEIs, especially in hazard exposed regions like Central Luzon, to institutionalize Flexible Work Arrangements (FWAs).

The study draws on Lewin's (1947) Change Theory and Rogers' (2003) Diffusion of Innovation Theory to understand how the HEIs respond to organizational change. Lewin's three-stage model – unfreezing, changing, and refreezing -helps analyze institutional transformational processes. Roger's theory offers a framework to examine how innovations like FWAs are adopted, spread, and sustained within organization systems.

The research assesses the organizational readiness by evaluating the awareness and capability of both teaching and non-teaching personnel. It also explores how individual and institutional profiles affect readiness and proposes action plans to support sustainable flexible work arrangement systems.

The study relates to the United Nations' Sustainable Development Goals, SDG 4: Quality Education, SDG 13: Climate Action, SDG 8: Decent Work and Economic Growth, and SDG 11: Sustainable Cities and Communities. The findings are important for HEIs, school leaders, policymakers, and staff. The study provides data-driven insights for institutional strategic planning, compliance with Commission on Higher Education mandates, and effective digital transformation ultimately contributing to educational resilience in disaster-prone areas. It is also supporting to student learning during crises, adapting flexible responses to climate change, and addressing safe workplace for teaching and non-teaching personnel.

Literature Review

The transformation of work structures through Flexible Work Arrangements (FWAs) has gained increased attention in higher education institutions (HEIs), particularly following the

COVID-19 pandemic, which accelerated the adoption of digitally enabled work models to sustain operations (OECD, 2021). As HEIs sought continuity amid disruptions, flexibility became both a practical necessity and a strategic response.

Lewin's Change Theory outlines organizational change through three stages: unfreezing, changing, and refreezing (Burnes, 2020). This framework provides a structured approach for HEIs adopting FWAs by assessing readiness, implementing flexible or hybrid models, and institutionalizing changes through policies and culture. In Region 3 HEIs, this model supports sustainable implementation by ensuring changes are embedded over time.

Complementing Lewin's model, Rogers' Diffusion of Innovation Theory (2003) explains how innovations spread within organizations through attributes such as relative advantage, compatibility, complexity, trialability, and observability. Applying these attributes helps HEIs align FWAs with institutional culture and operational systems, facilitating smoother adoption.

Studies emphasize that digital preparedness and workforce agility are critical to successful flexible work implementation (OECD, 2021). Charalampous et al. (2019) highlight the importance of supportive structures, digital skills, and adequate ICT infrastructure. In the Philippine context, HEIs face challenges including limited infrastructure, insufficient faculty training, unequal access to technology, and unclear flexible learning policies (Lucero et al., 2022).

Javier (2020) found that organizational readiness in Philippine HEIs is influenced by staff qualifications, experience, academic rank, and institutional characteristics such as size and location. Urban institutions with advanced IT infrastructure are generally more adaptable to FWAs than smaller or rural campuses. These findings underscore the need for capacity building and strategic alignment in adopting flexible work systems.

Lewin's Change Theory and Rogers' Diffusion of Innovation Theory emphasize the importance of organizational readiness, leadership support, and contextual alignment for successful FWA adoption in HEIs, particularly in Region 3.

Theoretical Framework

This study is anchored on two theories: the Five-Message Component Model for Managing Readiness for Change by Armenakis et al. (2000) and Rogers' Diffusion of Innovation Theory (2003). Together, these frameworks explain how local higher education institutions (LHEIs) in Region 3 can transition toward flexible work arrangements.

The Five-Message Component Model identifies five key elements of change readiness: discrepancy (need for change), appropriateness (fit of the solution), efficacy (confidence in implementation), principal support (leadership backing), and personal valence (perceived personal benefit). These components assess readiness at both individual and organizational levels.

Self-efficacy, rooted in Bandura's social cognitive theory, reflects employees' confidence in managing flexible schedules and using digital tools essential for FWAs (Cherry, 2023). Principal support reinforces readiness by fostering commitment and innovation through visible leadership backing (Armenakis et al., 2000; Hao & Yazdanifard, 2015).

Rogers' Diffusion of Innovation Theory explains how FWAs are adopted across groups—innovators, early adopters, early majority, late majority, and laggards—based on perceived benefits, compatibility, complexity, trialability, and observability. Innovators and early adopters often drive initial adoption, while others follow as positive outcomes become evident (Lamonte, 2022).

Integrating these theories provides a comprehensive framework for understanding readiness and adoption of FWAs, combining internal change preparedness with innovation diffusion processes. This integrated approach offers a structured and evidence-based guide for managing flexible work transformation in LHEIs in Region 3.

Methodology and Methods

This study employed a mixed descriptive approach incorporating evaluative, comparative, and correlational designs to assess the readiness and capabilities of personnel in 16 local higher education institutions-LHEIs in Region 3 for implementing Flexible Work Arrangements-FWAs. The descriptive-evaluative method assessed respondents' awareness and capability, while the comparative design examined differences across demographic profiles. The correlational design determined the relationships between institutional profiles and organizational readiness (Scribbr, 2021).

The locale of the study included all 16 LHEIs in Region 3 affiliated with the Association of Local Colleges and Universities-ALCU and ALCUCOA. A total of 1,945 personnel participated, achieving an 86.99% response rate from the target population of 2,236. Among the participants, 1,681 were teaching and 264 were non-teaching personnel, with a diversity of employment statuses and academic ranks.

A researcher-made questionnaire, grounded in relevant literature, was used to collect data across seven sections: institutional profile, respondent demographics, awareness of FWAs, capability (hard and soft skills), organizational readiness, and implementation challenges. A four-point Likert scale assessed all constructs.

Instrument validation was performed by three domain experts, and reliability testing using Cronbach's alpha confirmed high internal consistency across all dimensions such as organizational readiness: $\alpha = 0.918$; overall reliability = 0.909).

In terms of ethical considerations, the study adhered to standards. Principles of informed consent, autonomy, justice, confidentiality, and anonymity were strictly observed, with data coded and securely stored in compliance with The Data Privacy Act of 2012 (Republic Act No. 10173) in the Philippines aims to protect individual personal information in information and communications systems in both the government and private sectors.

The data gathering procedure included formal coordination with institutional heads, questionnaire distribution, and retrieval with follow-up mechanisms. Data were encoded, statistically treated, and presented in tabular and graphical formats to support interpretation.

Hypotheses Development

1. ***There is a significant difference in respondents' awareness of FWAs when grouped according to profile variables such as age, sex, employment status, length of service, educational attainment, and nature of work?***
   This hypothesis is grounded in Rogers' Diffusion of Innovation Theory (2003) and Lewin's Change Theory (1947), which emphasize the role of individual characteristics and awareness in innovation adoption.
2. ***There is a significant difference in respondents' perceived capabilities for FWAs when grouped according to profile variables?***
   This is supported by Lewin's emphasis on capability development during the change phase and Rogers' view that adoption varies across individual traits.
3. ***There is a significant relationship between respondents' capabilities and organizational readiness for FWAs.?***
   Both Lewin (1947) and Rogers (2003) stress that successful change depends on individual competence and institutional readiness working simultaneously.

Research Questions

1. What are the institutional and respondent profiles of LHEIs in Region 3?
2. What is the extent of FWA awareness among teaching and non-teaching personnel?
3. What are the respondents' capabilities for FWAs in terms of soft and hard skills?
4. What is the level of organizational readiness for FWAs based on change and diffusion theories?
5. What challenges are encountered in implementing FWAs?
6. What are the theoretical and practical implications of the findings?
7. What action plan can be developed to institutionalize FWAs in Region 3 LHEIs?

Statistical Treatment

The data gathered in this study were analyzed using various statistical tools. Frequency and Percentage were applied to describe the demographic profile of personnel from Local Higher Education Institutions in Region 3, covering variables such as age, sex, employment status, length of service, highest educational attainment, and nature of work. To assess the respondents' level of awareness of flexible work arrangements, their adaptability, and their perceived organizational readiness, Weighted Mean and Standard Deviation were computed. To determine significant differences in awareness and capability based on demographic variables, Independent Samples T-test and One-Way ANOVA were used. Furthermore, Pearson Product-Moment Correlation Coefficient (Pearson r) was employed to examine the relationship between respondents' capability and their assessment of organizational readiness for FWAs. These statistical methods enabled a thorough analysis of group differences and correlations, offering insights aligned with the frameworks of change management and innovation diffusion.

Results and Discussion

Table 1
Assessment of the Teaching and Non-teaching Personnel's Level of Awareness of Flexible Work Arrangements

Modality	Item Statement	Weighted Mean	Qualitative Description	Standard Deviation
Offline Learning	1. Provide printed modules	3.40	High	0.82
	2. Share recorded lectures	3.28	High	0.84
	3. Give access to online repositories	3.49	High	0.66
	4. Distribute storage devices	2.74	High	1.06
	5. Share links to open resources	3.43	High	0.71
	Average	3.27	High	0.82
Online Learning	1. Provide digital modules	3.66	Very High	0.60
	2. Use internet for classes	3.68	Very High	0.58
	3. Use learning management system	3.41	High	0.76
	4. Conduct classes via web conferencing	3.56	Very High	0.68
	5. Use laptops, phones, and similar devices	3.80	Very High	0.47
	Average	3.62	Very High	0.62
Blended Learning	1. Hold shortened in-person classes	3.10	High	0.89
	2. Conduct classes in shifts	3.17	High	0.85
	3. Focus on activities needing direct instructions	3.50	Very High	0.66
	4. Supplement with digital bite-size content	3.34	High	0.71
	5. Allow guided study time	3.49	High	0.60
	Average	3.32	High	0.74
Flexiplace	1. Covered by output-based work	3.37	High	0.67
	2. Work off-site	2.55	High	0.98
	3. Work from home	2.21	Low	1.04
	4. Work in nearby satellite office	2.24	Low	1.04
	5. Work in other productive locations	2.72	High	0.99
	Average	2.62	High	0.94

Compressed Workweek	1. Work full-time hours	3.61	Very High	0.64
	2. Given extra days off	2.33	Low	1.09
	3. Render extended hours	2.74	High	0.93
	4. Follow compressed workweek	2.33	Low	1.15
	5. Allowed fewer workdays	2.09	Low	0.99
	Average	2.62	High	0.96
Skeleton Workforce	1. Foe use when full staffing isn't available	2.92	High	0.78
	2. Requires minimum on-site staff	2.87	High	0.86
	3. Must complete 40 hours/week	3.49	High	0.69
	4. Absence counted if not on-site	3.27	High	0.86
	5. Ensures service continuity	3.43	High	0.69
	Average	3.20	High	0.78
Work Shifting	1. Meet end-user demands	3.23	High	0.71
	2. Suits 24/7 service agencies	3.06	High	0.79
	3. Supports health and safety compliance	3.27	High	0.80
	4. Fits security and safety roles	3.26	High	0.78
	5. Ensures constant personnel availability	3.35	High	0.73
	Average	3.23	High	0.76

Note. Legend: 1.00–1.49 Very Low; 1.50–2.49 Low; 2.50–3.49 High; 3.50–4.00 Very High.

The table shows the Assessment of the Teaching and Non-Teaching Personnel's Level of Awareness of Flexible Work Arrangements. The Teaching and non-teaching personnel in Region-3 LHEIs demonstrated varying levels of awareness regarding flexible work modalities, reflecting their roles, institutional context, and exposure to innovation. For offline learning, teaching personnel showed high awareness (M = 3.27, SD = 0.82), with the highest weighted mean 3.49 verbally interpreted as highly aware to cloud repositories and the least to traditional tools like compact discs or storage devices (M = 2.74), suggesting a shift away from outdated methods. Meanwhile, online learning got the highest overall awareness (M = 3.62, SD = 0.62) verbally interpreted as highly aware, particularly in the use of laptops and mobile devices (M = 3.80). This finding aligns with Santiago et al. (2022), who confirmed that mobile applications and smartphones were frequently used by faculty, indicative of early adoption tendencies. Under Rogers' Diffusion of Innovations Theory (2003), this behavior is characteristic of innovators and early adopters who are motivated to explore and integrate new tools for learning. Though the use of Learning Management Systems (M = 3.41) with slightly lower weighted mean, it still suggests broad digital readiness. In blended learning, awareness remained high (M = 3.32, SD = 0.74), particularly in the application of in-person instruction for appropriate lessons (M = 3.50). According to the Diffusion of Innovations Theory, alignment with existing values and practices referred to as compatibility influences the

likelihood of adoption. However, Shammas (2023) offers a nuanced view, noting that neither direct nor indirect instruction is consistently preferred by educators; instead, decisions often hinge on flexibility and the perceived care for student needs, not just the modality itself.

Among non-teaching personnel, there were low awareness of flexiplace arrangements with its weighted mean 2.62 and standard deviation of 0.94, with strong familiarity in output-based work metrics (M = 3.37), but significantly less for working from home (M = 2.21) or satellite offices (M = 2.24). This disparity supports Buffer's (2023) findings that while remote work is increasingly preferred globally, structured institutions often lag in consistent implementation. This pattern again supports Rogers' model, where innovations begin with early adopters before diffusing more broadly. Awareness of compressed workweek arrangements was also moderate (M = 2.62, SD = 0.96), with strong recognition of full-time workload completion (M = 3.61) but low awareness of condensed day structures (M = 2.09). Fallon (2024) emphasizes the dual nature of compressed work schedules, noting benefits like productivity and flexibility, but also drawbacks such as fatigue and logistical complexity. Rogers' attributes of trialability and perceived complexity may thus affect adoption rates for this modality. The skeleton workforce arrangement reflected a high level of awareness (M = 3.20, SD = 0.78), especially regarding standard 40-hour workweeks (M = 3.49). Baog et al. (2022) observed that certain districts demonstrate strong adherence to skeletal frameworks, particularly during emergencies. The Diffusion of Innovations Theory helps explain how such structured responses gain institutional acceptance in reaction to operational challenges, rather than proactive innovation. Finally, work shifting arrangements showed high awareness as well (M = 3.23, SD = 0.76), particularly in ensuring continuous personnel availability (M = 3.35). This modality is widely observed in institutions that operate in crisis or high-demand environments, consistent with Rogers' notion of observability, wherein clearly visible and effective innovations are more readily adopted. Overall, while teaching personnel demonstrate early and consistent engagement with flexible instructional modalities, non-teaching personnel show uneven levels of readiness, particularly in arrangements requiring structural or cultural shifts within institutions.

Table 2
Assessment of Teaching and Non-Teaching Personnel's Capabilities for Flexible Work Arrangements

Skill Type	Indicators	Teaching Weighted Mean	Teaching Qualitative Description	Teaching SD	Non-Teaching Weighted Mean	Non-Teaching Qualitative Description	Non-Teaching SD
Soft Skills	Supportiveness	3.66	Very High	0.50	3.60	Very High	0.52
	Assertiveness	3.65	Very High	0.50	3.50	Very High	0.62
	Compliance	3.66	Very High	0.51	3.61	Very High	0.52
	Conflict Management	3.58	Very High	0.54	3.48	High	0.58
	Relationship Management	3.64	Very High	0.52	3.54	Very High	0.59

	Average	3.64	Very High	0.51	3.55	Very High	0.57
Hard Skills	Technology Utilization	3.61	Very High	0.57	3.25	High	0.74
	Technology Processes	3.54	Very High	0.61	3.25	High	0.69
	Database Management	3.40	High	0.68	3.20	High	0.70
	Online Security	3.40	High	0.67	3.19	High	0.69
	Cloud Storage Management	3.31	High	0.71	3.05	High	0.76
	Average	3.45	High	0.65	3.19	High	0.72

Note. Legend: 1.00–1.49 Very Low; 1.50–2.49 Low; 2.50–3.49 High; 3.50–4.00 Very High

Table shows the assessment of both teaching and non-teaching personnel in Region 3 LHEIs revealed very high soft skills capabilities, with teaching personnel showing particular strength in supportiveness and compliance (M = 3.66), and non-teaching personnel similarly excelling in compliance (M = 3.61). Conflict management got the lowest-rated soft skill for both groups but still received a "very high" verbal intyerpretation, suggesting a uniformly strong emotional and interpersonal capacity across personnel groups. This consistency, reflected in low standard deviations (0.51 for teaching, 0.57 for non-teaching), indicates minimal variability in soft skills proficiency, a promising indicator for institutional readiness for flexible work **(**Domingo & Manalastas, 2023; Manzon, et al., 2022).

In terms of hard skills, teaching personnel demonstrated "very high" proficiency in technology utilization (M = 3.61), while cloud storage management (M = 3.31) emerged as the lowest in this area. Non-teaching personnel, though also rated "high" in all indicators, showed slightly lower proficiency overall (M = 3.19), with the weakest area again being cloud storage management (M = 3.05). Variability was higher in hard skills, particularly among non-teaching staff (SD = 0.72), suggesting uneven technical readiness and underscoring the need for continued capacity-building in digital competencies (Mariñas et al., 2022; Villon et al., 2022). These findings align with the Diffusion of Innovations Theory, where early adopters lead change while laggards, such as some seasoned educators, show hesitance in embracing technological tools essential for flexible work (Rogers, 2003). Hence, strategic training and continuous development efforts are crucial to sustaining and equalizing competencies across all personnel for effective and inclusive implementation of flexible work arrangements.

Table 3
Organizational Readiness for Flexible Work Arrangements Among Teaching and Non-Teaching Personnel

Dimension	Teaching Weighted Mean	Teaching Qualitative Description	Teaching SD	Non-Teaching Weighted Mean	Non-Teaching Qualitative Description	Non-Teaching SD
Discrepancy	3.17	High	0.79	3.15	High	0.69
Appropriateness	3.16	High	0.80	3.16	High	0.69
Self-efficacy	3.26	High	0.75	3.12	High	0.71
Principal Support	3.42	High	0.68	3.23	High	0.67
Personal Valence	3.39	High	0.65	3.11	High	0.72

Note. Legend: 1.00–1.49 = Very Low, 1.50–2.49 = Low, 2.50–3.49 = High, 3.50–4.00 = Very High

The table shows the assessment of both teaching and non-teaching personnel's organizational readiness for flexible work arrangements based on Amenakis et al. (2000) Five-Message Component Model, which includes discrepancy, appropriateness, self-efficacy, personal valence, and principal support. Teaching personnel demonstrated high readiness across all components, with the highest ratings in self-efficacy (M-3.26) and principal support (M-3.42), suggesting strong motivation, persistence, and leadership backing. They also showed high awareness of organizational discrepancies (M-3.17), perceived appropriateness of change (M-3.16), and recognized personal benefits from the change (M-3.39). Variability in responses on standard deviations ranging from 0.65 to 0.80 indicated a moderate divergence in individual perceptions, especially in areas concerning clarity of organizational issues and confidence in implementing change.

Non-teaching personnel similarly reflected high readiness across all dimensions, with slightly lower average ratings compared to teaching personnel's discrepancy (M-3.15), appropriateness (M-3.16), self-efficacy (M-3.12), personal valence (M-3.11), and principal support (M-3.23). While these figures suggest a shared commitment and perception of the relevance and feasibility of the proposed changes, standard deviations 0.67 to 0.72 reflected moderate variability. The findings affirm Amenakis et al.'s (2002) theory that clear understanding of organizational gaps, belief in the appropriateness of proposed interventions, confidence in change capacity, personal relevance, and leadership commitment are crucial in fostering readiness. Supporting literature (Belias & Trihas, 2022; Thomas & Danapfel, 2022; Workeneh & Abebe, 2019) further emphasizes that communication, appropriate interventions, leadership modeling, and perceived benefit are key to ensuring sustainable institutional change and successful implementation of flexible work systems.

Table 4
Challenges Encountered by Teaching and Non-teaching Personnel in the Implementation of Flexible Work Arrangements

Challenges	Teaching	Non-Teaching	Total	Percentage (%)
1. Work culture maintenance	1,121	176	1,297	66.7
2. Personal distractions	1,347	211	1,558	80.1
3. Weak team bonding	904	141	1,045	53.7
4. Poor real-time coordination	1,225	194	1,419	73.0
5. Performance challenges	1,573	247	1,820	93.6
6. Unstable internet	895	140	1,035	53.2
7. Mental stress from isolation	1,464	229	1,693	87.0

Note. N = 1,945

The table presents the challenges encountered by 1,945 teaching and non-teaching personnel in local higher education institutions-LHEIs in Region 3 regarding the implementation of flexible work arrangements. The most prevalent challenges were the inability to meet performance demands (93.6%) and mental stress due to the lack of in-person interaction (87.0%), indicating that flexible arrangements may compromise employee output and emotional well-being. Conversely, the least frequently reported challenges were the absence or intermittency of internet connectivity (53.2%) and difficulty in team bonding (53.7%), though still affecting more than half of the respondents. Other significant concerns included distractions from personal matters (80.1%), lack of synchronous communication and coordination (73.0%), and the difficulty of maintaining a unified work culture (66.7%). These challenges align with Rogers' (2003) Diffusion of Innovations Theory, which emphasizes resistance to change among late adopters and laggards due to entrenched cultural norms, communication barriers, perceived complexity, and uncertainty about the relative advantage of innovations like flexible work. Empirical findings further support these observations: Darshana and Tamilmaran (2024) reported that productivity concerns, unequal access to technology, and organizational disconnects are common hurdles in flexible work contexts, while Ahmadi et al. (2024) identified connectivity issues, communication breakdowns, and professional isolation as primary challenges. Additionally, Linando et al. (2022) found that female educators experience higher levels of emotional exhaustion and that older, long-serving staff members are less adaptable to flexible setups. These findings suggest that while flexible work arrangements offer potential benefits, institutions must strategically address psychological, technological, and organizational readiness to support their successful implementation.

Table 5
Significant Differences in the Assessment of the Respondents' Level of Awareness of Flexible Work Arrangements Based on Teaching Personnel Profile

Awareness	Age	Sex	Employment Status	Length of Service	Academic Rank	Highest Educational Attainment	Nature of Work
Offline Learning Modality	0.004* *48–64 yrs*	0.627 Not Sig	0.141 Not Sig	0.000* *11–10 yrs*	0.007* *Professor*	0.000* *Doctorate Degree*	.a
Online Learning Modality	0.005* *42–47 yrs*	0.621 Not Sig	0.015* *Job Order*	0.023* *6–10 yrs*	0.001* *Professor*	0.016* *Doctorate Units*	.a
Blended Learning Modality	0.000* *18–25 yrs*	0.223 Not Sig	0.000* *Regular*	0.000* *< 1 yr*	0.026* *Professor*	0.000* *Bachelor's Degree*	.a

Note. $p < .05$; Sig = Significant; Not Sig = Not Significant; * = Highest Grouping; .a = Single variable.

The data reveal statistically significant differences in teaching personnel's awareness of flexible work arrangements-FWAs when grouped according to their demographic and professional profiles, leading to the rejection of the null hypothesis that "there is no significant difference in the assessment of the respondents' level of awareness of flexible work arrangements when their profile is considered." Specifically, age showed a significant influence across all modalities ($p < .05$), with personnel aged 48–64 demonstrating the highest awareness in offline learning, 42–47 in online learning, and 18–25 in blended learning. These age-related patterns are consistent with Rogers' (2003) Diffusion of Innovations Theory, which explains that different adopter categories (e.g., early adopters, late majority) vary in demographic traits and openness to innovation. Although sex did not yield statistically significant differences in any modality ($p > .05$), employment status was significant in online and blended modalities ($p < .05$), with job order employees being more aware of online learning and regular employees reporting greater awareness in blended settings. This may reflect differential exposure and adaptability required by job conditions (Darshana & Tamilmaran, 2024). Likewise, length of service was a significant factor for all modalities ($p < .05$), with high awareness shown by both mid-career professionals (6–10 and 11–10 years) and those with less than one year of service, potentially due to recent training or evolving responsibilities (Ahmadi et al., 2024). Academic rank also showed significant variation ($p < .05$), with professors demonstrating consistently high awareness levels, suggesting their active involvement in institutional planning and capacity-building programs. Furthermore, educational attainment significantly influenced awareness ($p < .05$), with doctorate degree holders excelling in offline and online modalities, and bachelor's degree holders leading in blended learning, possibly due to differences in pedagogical exposure or digital training. In sum, these significant findings justify the rejection of the null hypothesis and support the importance of crafting differentiated, profile-sensitive strategies for professional development and institutional readiness for FWAs in higher education.

Table 6
Significant Difference in the Assessment of the Respondents on Their Capabilities for Flexible Work Arrangements When Profile is Considered

Capability	Age	Sex	Employment Status	Length of Service	Academic Rank	Highest Educational Attainment	Nature of Work
Soft Skills	0.001 *Significant 65 Years Old and Above*	0.002 *Significant Female*	0.004 *Significant Regular*	0.000 *Significant 6–10 Years*	0.000 *Significant University Professor*	0.000 *Significant Doctorate Degree*	0.348 *Not Significant*
Hard Skills	0.000 *Significant 18–25 Years Old*	0.292 *Not Significant*	0.000 *Significant Contract of Service*	0.000 *Significant Below 1 Year*	0.005 *Significant Professor*	0.000 *Significant Bachelor's Degree*	0.016 *Significant Teaching*

Note. Significant at $p < .05$. "Significant" indicates that the p-value is below the threshold of 0.05, suggesting a meaningful difference across that profile variable. "Not Significant" means the difference is not statistically meaningful. * indicates the subgroup with the highest assessment per variable.

The findings in the table indicate statistically significant differences in the respondents' assessment of their capabilities for implementing Flexible Work Arrangements-FWAs when grouped by their profile variables. For soft skills, the following variables showed significant differences at $p < 0.05$: age ($p = 0.001$), with the highest rating from those aged 65 years and above; sex ($p = 0.002$), with females rating themselves higher; employment status ($p = 0.004$), favoring regular employees; length of service ($p = 0.000$), with 6–10 years of service rated highest; academic rank ($p = 0.000$), with university professors reporting the highest assessment; and highest educational attainment ($p = 0.000$), with doctorate degree holders ranking themselves the most capable. However, nature of work ($p = 0.348$) did not yield a significant difference, indicating similar soft skills capability between teaching and non-teaching personnel. For hard skills, significant differences were also found for age ($p = 0.000$), with 18–25 years old scoring highest; employment status ($p = 0.000$), favoring contract of service employees; length of service ($p = 0.000$), with the highest scores from those with less than one year of service; academic rank ($p = 0.005$), where professors rated themselves highest; highest educational attainment ($p = 0.000$), with bachelor's degree holders scoring highest; and nature of work ($p = 0.016$), with teaching personnel reporting stronger hard skills. Only sex ($p = 0.292$) showed no significant difference in hard skill capability. Since the majority of profile variables yielded p-values below 0.05 for both soft and hard skills, it can be concluded that there is a statistically significant difference in the respondents' assessment of their capabilities based on their profiles. Therefore, the null hypothesis stating that "there is no significant difference in the assessment of the respondents on their capabilities when their profile is considered" is rejected. These results underscore the need for differentiated professional development strategies tailored to demographic and institutional roles to enhance the implementation of FWAs.

Table 7
Significant Relationship Between Respondents' Capability and Organizational Readiness When Institutional Profiles Are Considered

Respondents' Capability	Pearson *r*	Qualitative Description	*p*-Value	Significance
Organizational Readiness	0.751	High Relationship	0.000	Significant

Note. Interpretation based on Guilford's rule of thumb: 0 = No relationship, 0.01–0.20 = Negligible, 0.21–0.40 = Low, 0.41–0.70 = Moderate, 0.71–0.90 = High, 0.91–0.99 = Very High, 1.00 = Perfect. *Significant at $p < .05$.

The above result shows the Pearson product-moment correlation revealed a coefficient of $r = 0.751$ between the respondents' capabilities and their institutions' organizational readiness in implementing Flexible Work Arrangements-FWAs, with a *p*-value of 0.000. This indicates a statistically significant high positive relationship, based on Guilford's (1956) interpretative range of 0.71–0.90. The strength of this association implies that institutions where personnel demonstrate higher levels of capability such as soft and hard skills relevant to FWAs also tend to exhibit greater organizational readiness. The statistical significance at $p < .05$ confirms that the result is not due to chance. Consequently, the null hypothesis stating that "there is no significant relationship between respondents' capabilities and organizational readiness" is rejected. This finding underscores the importance of aligning institutional strategies with capacity development to ensure successful implementation of FWAs. It supports the organizational change theories of Kotter (1996) and Armenakis and Harris (2009), which emphasize that both individual and structural readiness must be addressed to sustain innovation and transformation in work arrangements.

Implementation and Utilization of the Developed Action Plan based implication of Change and Diffusion and Innovation theory. The action plan serves as a structured framework for transforming traditional work structures in Local Higher Education Institutions-LHEIs across Region 3 into more flexible, resilient, and innovation-driven systems. Its effective implementation should be guided by Change Theory (Lewin, 1947) and Diffusion of Innovation Theory (Rogers, 2003), which emphasize readiness, communication, leadership, and the gradual adoption of new practices.

1. Unfreezing Stage. Creating Readiness for Change (Change Theory). LHEIs must begin by reassessing current policies and mindsets toward work arrangements, initiating policy formulation and organizational diagnosis (as detailed in the governance KRA) to challenge the status quo, ensuring alignment with institutional mandates and government regulations, such as CHED and CSC guidelines and Promoting buy-in through orientation and consultation among academic councils and administrative leaders, building the urgency to transform.

2. Changing Stage. Implementation through Innovation Adoption (Diffusion of Innovation Theory). The core of transformation lies in the capacity building on both soft and hard skills, targeting early adopters and change agents to serve as role models for other personnel, leveraging institutional communication (feedback loops, regular meetings) to disseminate innovations, deploying digital infrastructure upgrades and LMS subscriptions, which embody the "innovation" in teaching modalities and providing supportive mechanisms, including health and wellness programs, to maintain employee engagement and reduce resistance.

   Here, Rogers' five attributes of innovation must be considered: Demonstrate how flexible work is superior in productivity and well-being, align innovations with institutional values

and employees' capabilities, minimize difficulty via training and onboarding, pilot policies before full-scale implementation, and make successful outcomes visible (e.g., performance improvement, satisfaction surveys).

3. Refreezing Stage. Institutionalizing the Change. For sustainability the LHEIs must embed flexible arrangements in the institution's strategic and operational frameworks, strengthen governance through approved policies and performance metrics (KPIs) to monitor impact, encourage a culture of continuous improvement and responsiveness to feedback and collaborate with LGUs and the Civil Service Commission to integrate public-sector perspectives.

4. Monitoring and Evaluation. Each program/activity should be tracked based on its Key Performance Indicators (KPIs) to assess: Effectiveness of flexible work policies, improvement in readiness levels and employee satisfaction and institutional resilience.

Discussion

Theoretical Implications

This study's findings on Flexible Work Arrangements (FWAs) in Region 3 LHEIs highlight key theoretical contributions through Rogers' Diffusion of Innovation Theory (2003) and Organizational Change Theory (Armenakis & Harris, 2009; Kotter, 1996). Differences in awareness and capability across age, employment status, and academic rank illustrate adopter categories and the influence of demographics on innovation adoption. The strong correlation between personnel capability and organizational readiness ($r = 0.751$, $p < 0.001$) validates the importance of aligning individual skills and beliefs with institutional structures. Senior academic personnel function as change agents, reinforcing Kotter's emphasis on leadership, vision, and coalition-building. Challenges like stress, technological limitations, and coordination issues reflect Rogers' attributes of complexity and trialability, emphasizing the need for context-sensitive, phased, and capacity-focused change strategies.

Practical Implications

The findings provide actionable insights for LHEIs:

1. Targeted training in digital literacy, time management, and adaptive skills enhances alignment between individual and organizational readiness.
2. Awareness and capability differences across demographics require customized messaging and training for specific groups.
3. Policy and Coordination: Clear guidelines, centralized platforms, and wellness support reduce complexity and improve adoption.
4. Leadership Engagement: Academic leaders as guiding coalitions promote vision, model behaviors, and celebrate short-term wins.
5. FWA policies should reflect institutional size, location, and resources, with decentralized decision-making where appropriate.
6. Sustained professional development, monitoring, and phased adoption foster long-term resilience and workforce satisfaction.

Conclusion

The study confirms that implementing FWAs in Region 3 LHEIs requires synchronizing individual readiness with organizational strategy. Awareness and capability levels were generally high, with differences influenced by demographic factors. Strong positive correlation between personnel capability and institutional readiness supports theories of change and innovation diffusion. Challenges such as stress, technological gaps, and coordination barriers highlight the need for comprehensive support. Effective FWA adoption depends on strategic leadership, phased implementation, and context-sensitive policies.

Recommendations

To support the effective implementation of Flexible Work Arrangements (FWAs) in Local Higher Education Institutions, personnel should receive demographic-specific training that develops both hard and soft skills. This ensures that each employee, regardless of age, rank, or role, has the competencies needed to adapt to new work modalities. Alongside training, institutions must maintain transparent and continuous communication, clearly conveying the benefits of FWAs and aligning these initiatives with broader organizational goals to foster understanding and buy-in.

Institutional leaders play a critical role as active change agents. By modeling desired behaviors, providing necessary resources, and reinforcing the personal benefits of participation, they can encourage staff engagement and strengthen commitment to the transformation process. At the same time, FWA policies should be contextualized to reflect each institution's unique circumstances, including infrastructure capacity, budget constraints, and local conditions, allowing for flexible but equitable implementation.

To ensure the effectiveness of these arrangements, institutions should establish feedback mechanisms and performance monitoring systems. Regular assessments enable continuous refinement and responsiveness to emerging challenges. Investments in technology, online systems, and digital literacy are essential to support hybrid and remote work environments, ensuring personnel can work effectively regardless of location. Finally, identifying and supporting innovation champions, staff who demonstrate high readiness and can mentor colleagues, can accelerate FWA adoption and foster a culture of collaboration and innovation across institutions.

Acknowledgement

From Value to Action: A Critical Examination of Barriers to Democratic Participation in Global Sustainability Agendas

Sara Aberkan, Mohamed First University, Morocco

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Despite growing awareness of global sustainability challenges, public engagement and democratic participation remain limited. This persistent value-action gap, where individuals possess knowledge about sustainability but do not translate it into civic or political action, raises urgent questions about the effectiveness of global frameworks such as the Sustainable Development Goals (SDGs). This paper offers a critical theoretical exploration of how sustainability is framed in international policy discourse, particularly in relation to shared civil responsibility and democratic agency. Drawing on framing theory, the study examines how dominant narratives surrounding the SDGs tend to emphasize individual behavioral change while neglecting the structural and political dimensions of sustainability. Insights from critical pedagogy further highlight how education, while often positioned as central to sustainability may fall short if it promotes awareness without cultivating critical consciousness or participatory agency. Through a synthesis of interdisciplinary scholarship, the paper critiques the prevailing representations of responsibility and citizenship embedded in sustainability discourse. It argues for a reframing toward models that emphasize collective agency, democratic participation, and systemic transformation. The study concludes with theoretical reflections and conceptual recommendations for reimagining sustainability education and policy as frameworks that support active civic engagement and empower individuals as agents of change. In doing so, it contributes to wider debates on how language and discourse shape public action in the context of global challenges.

Keywords: value-action gap, framing theory, critical pedagogy, collective agency, sustainability education

Introduction

The United Nations Sustainable Development Goals emphasize the importance of citizen awareness in achieving the goals related to the environment, the social, and the economic fields. While awareness of sustainability challenges is increasingly widespread, translating knowledge into meaningful civic action remains limited. This is a phenomenon widely recognized as the value-action gap (Kollmuss & Agyeman, 2002). This gap is a persistent challenge that hinders the achievement of sustainability governance since the active participation of people is necessary in order to achieve policy goals. Therefore, it is crucial to understand how people can become active and efficient participants and have a shared responsibility in achieving sustainability goals.

Research suggests that the persistence of the value-action gap is rooted in the interaction of structural, cognitive, and discursive factors. Institutional arrangements such as centralized governance, technocratic decision-making, and bureaucratic rigidity, often position citizens as peripheral actors signalling that responsibility lies primarily with technical experts or authorities (Fukuda-Parr, 2022). At the same time, discursive frames shape perceptions of legitimacy and appropriate behaviour as argued by Entman (1993) and Lakoff (2004). Such frames can be applied as tools for analysing global sustainability discourse and education.

Technocratic and engineerist frames privilege measurable objectives and standardized indicators and interventions led by experts, while moral frames reinforce normative hypotheses concerning accepted behaviors (Fukuda-Parr, 2022). These structural and discursive mechanisms limit individual participation, reproduce hierarchical authority, and further enhance the gap between values and actions (Kollmuss & Agyeman, 2002).

In light of these insights, the literature often separates out these three dimensions, structural, cognitive, and discursive, treating them in isolation. The study of ways these components interact is necessary in order to design strategies that build awareness for action; it is essential also to turn knowledge into practical methods for engaging in civic engagement. This paper bridges that gap by drawing on concepts from Critical Pedagogy and Framing Theory. Critical pedagogy provides the means by which power relations, institutional constraints, and processes of empowerment may be studied through praxis, conscientization, and dialogue (Freire, 1970; Giroux, 2005; McLaren, 2000). Framing theory, stemming from communication and cognitive linguistics (Entman, 1993; Lakoff, 2004), further enhances the interpretation when it examines how legitimacy, moral evaluation, and authority are constructed and contested in public discourse, by which perception and action are affected. The study is guided by the following research questions:

1. What institutional and individual barriers sustain the value-action gap in global sustainability agendas?
2. How do framing practices in policy, communication, and education influence citizens' perceptions of legitimacy, responsibility, and efficacy?
3. How can the integration of critical pedagogy and framing strategies support more meaningful and participatory engagement in sustainability initiatives?

The paper begins with a literature review synthesizing theoretical and empirical studies on critical pedagogy, framing, and sustainability participation. This is followed by an analysis and discussion of institutional and individual barriers, concluding with a synthesis of findings and recommendations to support inclusive and participatory sustainability governance.

Literature Review

The increasing importance of democratic participation in sustainability agendas around the world makes progress, especially meaningful and lasting progress. Although environmental and social challenges are widely acknowledged, citizens are frequently not involved in sustainability actions (Kollmuss & Agyeman, 2002; Steg & Vlek, 2009). To understand why not all knowledge leads to action we have to consider the structural and cognitive impediments that limit participation (Kollmuss & Agyeman, 2002). As theorised by Freire (2005), institutional arrangements, educational practices, and discursive frames exert crucial impacts on citizen agency and engagement, and these insights have been generalised to sustainability contexts, where governance arrangements and cultural practices shape collective action (Shove, 2010). This review synthesizes theoretical and empirical studies on critical pedagogy, framing theory, and participation in sustainability, identifying key insights and gaps that inform the present research.

Critical Pedagogy

Critical pedagogy provides one interpretation for how power relations and institutions shape the agency of the citizen. At the heart of this view are thoughts on praxis, conscientization, dialogue, and the empowerment of marginalized voices (Freire, 1970; Giroux, 2005). Praxis stresses the integration of reflection and action, the proposition that mere knowledge cannot be enough to make them take action. Conscientization encourages citizens to notice the structural forces restraining their agency and thereby realize a critical consciousness that leads the community into meaningful participation. It is dialogue that brings people together through shared understanding and collective problem-solving, bringing them actively involved in decision-making processes (Freire, 2005).

In the context of sustainability, critical pedagogy explains why specific forms of institutional obstacles or barriers, such as technocratic governance, lack of transparency in decision-making, and centralization in authority, can dissuade citizen participation (Bexell & Jönsson, 2017; Fukuda-Parr, 2022). On the other hand, educational interventions (e.g., participatory workshops, community-based learning, and collaborative problem-solving exercises) which are rooted in critical pedagogy serve to create communities that promote civic involvement, increasing the potential for collective action (Wals, 2010). However, most existing texts primarily concern themselves with individual empowerment and have not sufficiently integrated the discursive means by which institutional structures remain dominant.

Framing Theory

Framing theory complements critical pedagogy by addressing the discursive construction of reality and its impact on citizen perception and behavior. Frames are interpretive devices that shape how issues are defined, causes are attributed, moral evaluations are made, and solutions are proposed (Entman, 1993). In sustainability discourse, technocratic and engineerist frames which prioritize measurable targets, standardized indicators, and expert-led interventions, frame the authority as central to achieving sustainability while positioning citizens as peripheral actors (Sachs, 2012). In addition to this, moral and value frames embed normative assumptions about appropriate behavior which can discourage alternative interventions. This can be understood as part of how communication frames highlight certain behaviors and assign moral significance (Entman, 1993) and how cognitive frames influence individuals' moral interpretations and judgments (Lakoff, 2004). By highlighting certain behaviors as desirable

and aligning them with official or expert-sanctioned norms, these frames shape perceptions of legitimacy and acceptable action (Entman, 1993). In governance contexts, such as the use of indicators and policy metrics, these mechanisms can subtly reproduce hierarchical authority and constrain citizen agency (Broome & Quirk, 2015).

Research demonstrates that frames influence both immediate perceptions of issue importance and long-term cognitive frameworks that affect engagement and willingness to challenge existing hierarchies (Chong & Druckman, 2007; Snow & Benford, 1988). Integrating framing analysis with critical pedagogy offers tools to examine how institutional narratives shape both citizen understanding and perceived legitimacy and provide pathways to strategically reframe sustainability issues to encourage participatory engagement.

Bridging Evidence and Theory

Empirical studies on citizen participation emphasize the interconnection of structural, cognitive, and discursive barriers. Institutional constraints such as centralized governance, bureaucracies, limited transparency, and standardized reporting often marginalize citizen input and reduce perceived efficacy (Bexell & Jönsson, 2017; Kollmuss & Agyeman, 2002). Observing institutions as unresponsive reinforces individual-level barriers such as behavioral inertia and low civic engagement (Bexell & Jönsson, 2017). Habitual behaviors and societal norms further limit meaningful action and show how structural and cognitive factors operate in a mutually reinforcing feedback loop (Shove, 2010).

Educational initiatives demonstrate that promoting critical awareness, dialogue, and participatory skills can partially mitigate these barriers (Wals, 2010). Research on framing shows that emphasizing certain values or responsibilities can shape how people engage with issues (Chong & Druckman, 2007). In the context of sustainability, frames that stress citizen agency and social norms may enhance engagement, whereas technocratic or moralizing frames risk discouraging participation (Maibach et al., 2010). Despite these insights, research often treats structural, cognitive, and discursive factors in isolation (Shove, 2010). Few studies examine how critical pedagogy and framing theory together can explain and address persistent gaps between knowledge and action.

Institutional arrangements and discursive frames are mutually reinforcing and shape both the possibilities and perceived legitimacy of citizen engagement. Critical pedagogy addresses structural barriers by emphasizing praxis, conscientization, and empowerment. As for framing theory, it analyses how moral evaluation and authority are discursively constructed and contested. Synthesizing these perspectives provide both explanatory power and practical insight. It allows the identification of points where educational and discursive strategies can collectively enhance democratic participation. This integrated approach offers a relevant conceptual foundation for examining how participatory sustainability initiatives can overcome the value-action gap.

Methodology

This paper adopts a critical theoretical approach to examine the discursive framing of sustainability within the United Nations' Sustainable Development Goals (SDGs) and their implications for democratic participation. Unlike empirical research, which relies on original data collection, this study critically engages with existing literature and scholarly analyses to explore the interplay between sustainability discourse, civic engagement, and education. The

underlying assumption of this approach is that a thorough understanding of the value-action gap and its implications requires systematic engagement with theoretical perspectives and policy narratives that shape global sustainability agendas. Critical theoretical approaches are widely recognized in the social sciences for enabling rigorous conceptual exploration and generating insights relevant to both theory and practice (Kincheloe, 2005). Reflexive engagement with literature allows researchers to examine not only the content of sources but also the assumptions, perspectives, and discursive strategies that shape them (Alvesson & Sköldberg, 2009).

The object of critique in this study is the dominant framing of responsibility, agency, and participation within SDG discourse. Particular attention is given to how sustainability is often presented as an issue of individual behavioral change, while structural, political, and civic dimensions remain underexplored or marginalized (Dryzek, 2013). To analyze these discursive tendencies, the study draws primarily on critical pedagogy and framing theory. Critical pedagogy highlights the role of education in promoting critical consciousness and participatory agency (Freire, 1970; Giroux, 2005). As for framing theory, it examines how language and narratives influence perception and prioritization of issues (Entman, 1993; Lakoff, 2004). Together, these lenses provide a foundation for interrogating how current sustainability development goals (SDGs) narratives both reveal and reinforce barriers to democratic participation.

The methodological process unfolds in three stages. First, a purposive selection of sources was undertaken to ensure relevance, credibility, and theoretical significance. These sources include scholarly critiques of global sustainability agendas, as well as literature on framing theory, critical pedagogy, and the value-action gap. Selection criteria emphasized works that directly address civic engagement, education, and the translation of sustainability knowledge into action. This targeted approach mirrors established purposive sampling strategies in theoretical-analytical research (Patton, 2015) and enables reflexive engagement with authoritative and influential perspectives (Alvesson & Sköldberg, 2009).

Second, the study employs critical synthesis. Key literature was examined to identify recurring discursive patterns, including the emphasis on individual responsibility and the marginalization of structural or political agency in sustainability frameworks. Third, insights from this analysis are synthesized into conceptual recommendations aimed at bridging the value-action gap. By critically integrating findings across the literature, the study identifies opportunities to reframe sustainability discourse in ways that emphasize collective agency, systemic understanding, and democratic participation. This synthesis draws on interdisciplinary scholarship to ensure that recommendations are grounded in established theory while responsive to contemporary challenges in sustainability education and policy.

Overall, this methodological approach provides a transparent and systematic framework that critically interrogating SDG discourse by synthesizing interdisciplinary insights and offering theoretically grounded recommendations. It demonstrates how conceptual exploration and reflexive engagement with literature can reveal both the limitations of current global sustainability narratives and pathways for motivating democratic participation and bridging the persistent gap between sustainability awareness and civic action.

Analysis

Institutional Barriers to Democratic Participation in Sustainability Agendas

Institutional dynamics play a central role in sustaining the value–action gap in global sustainability agendas as governance practices as well as participatory mechanisms shape citizen engagement (Bexell & Jönsson, 2017; Fukuda-Parr, 2022). These interrelated institutional factors create environments in which citizens are often positioned as peripheral actors and thus limit their agency as active participants. Such frames reinforce the perception of sustainability as primarily a technical or expert-managed challenge. A key aspect of these dynamics is the technocratic and engineerist framing of the SDGs that emphasizes measurable targets and expert-led solutions over participatory engagement. By privileging top-down implementation, this framing shapes decision-making processes and frame citizen action as secondary or optional (Sachs, 2012).

These framing choices interact closely with governance shortcomings, including mismanagement, lack of transparency, and limited participatory mechanisms (Bexell & Jönsson, 2017; Broome & Quirk, 2015). The centralized governance structures can weaken accountability, reduce trust, and limit opportunities for citizen influence (Fukuda-Parr, 2022). The combination of technocratic framing and constrained governance not only limits the formal avenues for engagement but also reinforces the perception that sustainability responsibilities lie predominantly with institutions rather than individuals.

Finally, restricted participatory mechanisms intensify these effects. While multi-stakeholder engagement is often emphasized rhetorically in SDG discourse, opportunities for meaningful citizen involvement remain limited and thus reinforces citizens' peripheral position (Bexell & Jönsson, 2017). Together, these institutional barriers create a self-reinforcing cycle where governance practices and policy framing collectively constrain democratic participation. This highlights the reason why addressing institutional factors is critical to bridging the value-action gap.

Individual Barriers to Democratic Participation in Sustainability Agendas

Even when citizens are aware of sustainability challenges, their engagement is often constrained by a complex interplay of cognitive, behavioral, and motivational factors that are deeply influenced by institutional and discursive contexts (Kollmuss & Agyeman, 2002; Steg & Vlek, 2009). Awareness alone rarely translates into action because habitual routines, perceptions of limited impact, and low levels of civic involvement interact with structural conditions to limit participation (Shove, 2010). These dynamics help explain why knowledge of sustainability issues does not automatically lead to meaningful civic or political engagement, revealing persistent gaps between awareness and action.

Individual tendencies are closely shaped and reinforced by institutional environments. In contexts where governance is opaque, resources are mismanaged, and participatory mechanisms are minimal, citizens frequently perceive that their contributions will have little effect (Bexell & Jönsson, 2017; Fukuda-Parr, 2022). In addition to this, habitual behaviors further limit engagement (Steg & Vlek, 2009). When routines are reinforced by societal norms or by the lack of structured participatory channels, individuals are less likely to adopt practices that could have collective impact (Shove, 2010). This inertia is not merely a personal limitation but reflects the broader environment in which individuals operate. In the context of a lack of

meaningful opportunities for action, sustainable behaviors remain largely symbolic or private, failing to generate systemic change (Kollmuss & Agyeman, 2002).

Moreover, low civic engagement is both a cause and consequence of these perceptions and habits (Maibach et al., 2010). When citizens observe that institutional processes are inaccessible, their engagement declines (Steg & Vlek, 2009). This reinforces a self-perpetuating cycle where citizens are demotivated and believe that their knowledge is unlikely to produce tangible outcomes (Shove, 2010). Awareness of sustainability challenges becomes detached from participatory action when individuals struggle to find pathways to contribute effectively within constrained institutional settings (Kollmuss & Agyeman, 2002).

Importantly, these individual-level barriers are not isolated phenomena. They are intimately linked to institutional practices and discursive framing that form a feedback loop in which perceptions, behaviors, and structural constraints continuously reinforce one another (Shove, 2010; Steg & Vlek, 2009). Understanding this interplay is essential for explaining why the value-action gap persists despite widespread awareness and education on sustainability (Kollmuss & Agyeman, 2002). It also establishes a foundation for exploring how targeted interventions in discourse, pedagogy, and participatory mechanisms could help mitigate these barriers (Entman, 1993; Freire, 2005).

Discussion

Critical Pedagogy and Barriers in Sustainability Agendas

Institutional and individual barriers are deeply intertwined in sustaining the value-action gap in global sustainability agendas (Kollmuss & Agyeman, 2002; Shove, 2010). Critical pedagogy provides a lens to analyze how these barriers mutually reinforce one another (Freire, 1970). These structures are not neutral procedural shortcomings but manifestations of power-knowledge relations that reproduce hierarchical control and limit democratic participation (Giroux, 2005).

Critical pedagogy interprets these institutional arrangements as discursively produced mechanisms of exclusion that constrain citizen agency and shape perceptions of individual efficacy (McLaren, 2000). Emphasizing praxis, the integration of reflection and action, shows that awareness alone is insufficient for engagement. Instead, citizens must critically interrogate institutional norms, question hierarchical decision-making, and envision collective possibilities for participation (Freire, 1970). Dialogue promotes shared understanding and collective critical consciousness. As a consequence, this enables individuals to recognize structural barriers such as opaque governance and perceive their potential role in challenging them (Giroux, 2005).

Individual-level barriers such as behavioral inertia, perceived inefficacy, and low civic engagement emerge and are reinforced within these institutional contexts (Kollmuss & Agyeman, 2002; Steg & Vlek, 2009; Wals, 2010). Citizens often default to symbolic or private actions, not from ignorance, but because bureaucratic rigidity and restricted participatory opportunities normalize passivity (Friedrich et al., 2025). Observing institutions as unresponsive further diminishes perceived impact and creates a feedback loop that sustains both individual passivity and structural rigidity (Shove, 2010). While resistance exists at the individual level, institutional barriers are typically more entrenched. This highlights the importance of equipping citizens with critical awareness and collaborative approaches (Fukuda-Parr, 2022; Wals, 2010).

By situating institutional and individual barriers within a critical pedagogical framework, the value-action gap is framed not as a purely technical or behavioral problem but as a deeply political phenomenon (Kollmuss & Agyeman, 2002). Through conscientization, citizens develop the critical awareness needed to recognize bureaucratic inefficiencies, lack of transparency, and top-down control as contestable rather than inevitable (Freire, 1970). Educational interventions that nurture praxis, dialogue, and empowerment enable individuals and collectives to challenge hierarchical authority, hold institutions accountable, and actively shape sustainability agendas (Freire, 1970; McLaren, 2000). This integrated approach strengthens civic responsibility by linking knowledge with action and positions sustainable engagement as a shared democratic duty.

Framing and Barriers in Sustainability Agendas

Many institutional frames that inform citizen engagement are identified in the literature on global sustainability agendas. Such technocratic and engineerist frames, for example, focus on quantifiable targets, standardized indicators, and expert-led solutions implying that the main authority sits with technical experts (Fukuda-Parr, 2022; Sachs, 2012). According to framing theory, these frames serve the role of more than describing the policy; they shape expectations of civic responsibility as well as which kinds of engagements are considered appropriate and effective (Chong & Druckman, 2007; Entman, 1993). By promoting technical know-how and standardized approaches, frames like this marginalize participatory or activist interventions implicitly, and thus can frame both what is understood and how people act in ways that contribute to the value-action gap.

Moral and value frames are a critical area of theoretical inquiry as they encode normative assumptions about what is expected of people, thereby configuring how citizens frame their perceptions and priorities (Lakoff, 2004). Those new perspectives can be applied in the context of sustainability discourse. Entman (1993) conceptualizes framing in terms of problem definition, causal interpretation, moral evaluation and treatment recommendation, making it quite clear how these institutional narratives construct understanding and perceived responsibility. These frames guide what kinds of action are acceptable to be acted on, and by so doing determine which interventions are successful or acceptable from a societal standpoint. These discursive constructions help to sustain the value-action divide by suggesting to citizens that meaningful intervention is limited to officially sanctioned channels even when systemic change may be crucial and needs to be achieved on a collective level (Gamson & Modigliani, 1989; Snow & Benford, 1988).

Framing theory highlights the dynamic and contestable nature of discourse. Institutional frames are not fixed; they operate through mechanisms such as emphasis and causal attribution which can be strategically analyzed, questioned, and countered (Entman, 1993). By revealing how legitimacy is discursively constructed, framing analysis identifies both barriers and potential openings for engagement. Institutional frames may constrain participation when unexamined, yet they simultaneously indicate points where critical reflection, dialogue, and counter-framing can empower citizens to reinterpret hierarchies, challenge opaque processes, and engage more actively in sustainability initiatives.

Integrating this analysis with the critical pedagogy lens emphasizes that civic empowerment requires both understanding structural barriers and engaging with the discursive mechanisms that limit agency. By highlighting the framing strategies that shape perceptions of legitimacy and authority, this perspective provides a conceptual foundation for exploring how education,

dialogue, and participatory practices can reframe sustainability discourse and enable more meaningful democratic participation (Freire, 1970).

Synthesis and Pathways for Enhancing Democratic Participation in Sustainability Agendas

The analysis highlights that institutional and individual barriers are mutually reinforcing, sustaining the persistent value-action gap in global sustainability agendas. These structural features interact with cognitive and behavioral factors, including perceived inefficacy, habitual inertia, and low civic engagement that contribute collectively to self-reinforcing cycles that inhibit meaningful participation (Kollmuss & Agyeman, 2002; Steg & Vlek, 2009; Wals, 2010).

Critical pedagogy provides both an analytical lens and a framework for intervention, emphasizing praxis, dialogue, and conscientization to show that awareness alone is insufficient. Citizens must cultivate the capacity to critically interrogate institutional norms and hold authorities accountable (Apple, 2004; Freire, 1970; McLaren, 2000). Framing theory complements this perspective by highlighting how perceptions of legitimacy and responsibility are discursively constructed and can be contested, revealing opportunities to strategically reframe sustainability narratives in ways that promote participatory engagement (Entman, 1993).

Hence, it must be an integrated process in order to deepen democratic engagement in practice. Reform strategies in the forms of decentralizing decision-making, increasing transparency, and mechanisms that meaningfully incorporate citizen input are needed (Fukuda-Parr, 2022). Educational interventions can support critical awareness and collaborative problem-solving which provide individuals with techniques to address and confront structural constraints (Freire, 1970). Public discourse framing is also an essential instrument through which citizens' perceptions can be constructed in terms of agency, legitimacy, and collective responsibility, which helps to promote the active and responsible participation by citizens in sustainability (Entman, 1993). When these dimensions of structure, pedagogy, and rhetoric are considered, they should constitute a foundation for bridging the value–action gap and for enacting sustainability imperatives through participatory, inclusive, and effective processes (Kollmuss & Agyeman, 2002).

Conclusion

This study has examined the structural, cognitive, and discursive factors sustaining the value-action gap in global sustainability agendas, emphasizing the importance of citizen engagement for inclusive and effective governance. Institutional arrangements, such as centralized decision-making, technocratic governance, and limited transparency imply that responsibility resides primarily with technical experts and authorities (Bexell & Jönsson, 2017; Fukuda-Parr, 2022; Sachs, 2012).

Discursive frames embedded in policy, public communication, and education shape perceptions of legitimacy and individual efficacy (Entman, 1993; Lakoff, 2004), reinforcing hierarchical authority and constraining meaningful civic participation. Integrating critical pedagogy and framing theory illuminates both the challenges and potential pathways to address these barriers. Critical pedagogy emphasizes praxis, conscientization, and dialogue, demonstrating that awareness alone is insufficient and that citizens must critically interrogate

institutional norms and envision collective possibilities (Freire, 1970; Giroux, 2005; McLaren, 2000). Framing theory clarifies how perceptions of legitimacy and responsibility are constructed and contested in discourse, highlighting opportunities to reframe narratives in ways that promote active engagement (Entman, 1993; Lakoff, 2004).

Bridging the value-action gap therefore requires coordinated strategies that combine structural reform, participatory education, and strategic discursive interventions (Freire, 1970; Kollmuss & Agyeman, 2002; Wals, 2010). By promoting critical awareness, enhancing transparency, and promoting citizen agency (Freire, 1970), these approaches empower individuals and collectives to act meaningfully, translating knowledge into action. Ultimately, sustainable development depends not only on expert-led solutions but also on inclusive spaces where citizens can contribute actively, critically, and collaboratively to shared environmental, social, and economic goals which can support the development of accountable and participatory sustainability initiatives (Bexell & Jönsson, 2017; Fukuda-Parr, 2022).

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that an AI-assisted writing software was used in proofreading and refining the language used in the manuscript. The usage was limited to correcting grammatical and spelling errors and rephrasing statements for accuracy and clarity. The author further declares that no other AI or AI-assisted technologies have been used to generate content in writing the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct.

Abstract

Adoption of Information and Communication Technology (ICT) tools in the teaching and learning process continues to gain popularity with evolving digital tools and platforms in the virtual learning spaces, which provide opportunities for assessing students' learning outcomes. However, the successful adoption of the virtual assessment mode in universities depends largely on students' awareness of assessment indicators. These might be determined by certain factors, including perceived usefulness and ease-of-use, attitude, intention to use ICT facilities, university type, and lecturers' self-efficacy to integrate virtual assessment. This study, therefore, investigated relationships between ICT facilities and students' awareness of virtual assessment indicators, university type and lecturers' self-efficacy to integrate virtual assessment. In addition, it examined the mediating effect of lecturers' self-efficacy on the relationship between ICT facilities and students' awareness of virtual assessment indicators, as well as the moderating role of university type on lecturers' self-efficacy in the relationship between ICT facilities and students' awareness of virtual assessment indicators. Data collected were analysed using the Hayes Process Macro- Model 7- Moderated Mediation. Results showed both direct and indirect impact of ICT facility on students' awareness of virtual assessment indicators through lecturers' self-efficacy and the moderation by university type (moderated mediation index = -0.070, 95% CI = -0.490/0.430) were significant. The study concludes that lecturers' self-efficacy and university category are germane to successful virtual assessment in higher institutions. It is recommended that the National University Commission should provide benchmark on the quantity and quality of ICT facilities in each university based on number of lecturers and students.

Keywords: ICT facilities, virtual assessment indicators, moderated mediation roles of university type, lecturers' self-efficacy, students' awareness of virtual assessment

Introduction

The COVID-19 pandemic resulted in the closure of tertiary institutions and education programmes across the globe, including Nigeria. This forced a shift from in-school teaching to online teaching using ICT facilities like computer laboratories, multimedia rooms, smart classrooms, e-learning platforms, internet connectivity, Wi-Fi networks, and other infrastructure that facilitate the use of technology in education (Adewale, 2005). This situation increased the use of ICT and lecturers' professional development in ICT (Espino-Díaz et al., 2020; OECD, 2020). While ICT facilities were useful during the closure for teaching and learning, assessment methodologies that involve real examinations were not included in the arrangement because a method of security and proctoring had not evolved. Although tests and quizzes through Google and other methods were implemented, they were not sufficient to conduct semester-based examinations. However, virtual assessment is an emerging technique that has appreciable potential to ameliorate fundamental issues that arose during and after the pandemic period that caught the world unprepared. The phenomenon spurred institutions of higher learning, especially universities, to seek how they could reach out to their students scattered in various geographical locations for continued academic activities (Olasunkanmi, 2020; Ukoh & Adewale, 2014).

Universities promoted flexible learning and enhanced assessment practices through available digital technology tools and virtual platforms (Smith & Brown, 2018). Thus, they were able to embark on evaluating their students' knowledge and skills remotely, but were limited by their inability to proctor. Whichever mode of assessment was available in each university was sufficient to solve the problem at that stage. Therefore, the proposed assessment standards took into consideration the two important factors of security and proctoring. It was believed that for virtual assessment to be comparable to in-person assessment, certain standards had to be met. The objectives of assessment, face-to-face or virtual, must be aligned with course and programme learning outcomes to provide relevant learning opportunities and a standard of excellence which students should pursue (Vlachopoulos, 2020). Other standard assessment indicators are the content, teaching-assessment time ratio, assessment quality, proctoring, security, medium of transmission, cost effectiveness, feedback mechanism, and remediation loop. These factors are germane for meaningful engagement in the adoption of virtual assessment activities but may influence students' preparedness for optimal performance and overall satisfaction. However, awareness of virtual assessment indicators may be influenced by multiple factors, including the ICT facilities, the type of university students they attend, and the self-efficacy of their lecturers in integrating the technique.

It is important to explain ICT before associating it with the awareness of virtual assessment indicators. Information and Communication Technology has made a remarkable impact in the field of education, particularly higher education (Adewale *et al.*, 2003). The evolving nature of ICT has birthed several innovative strategies and approaches in the instructional processes and assessment methods of virtual educational learning experiences. ICT facilities are repeatedly considered as signs of increased productivity and quality in education (Noor-Ul-Amin, 2013; United Nations Department of Economic and Social Affairs, 2015). As demonstrated by Annetta et al. (2010), it could enhance educational quality by engaging students in the learning process, imitating real-life experiences, and thus creating a viable and economic experiential learning environment. Voogt et al. (2008) describe ICT as a key element of transforming curricula from teacher-centred to student-centred. Ali et al. (2016) explain that ICT engages students in a personalized learning environment according to their interests and experiences. The recurring lockdowns during the multiple waves of the COVID-

19 pandemic forced world education systems to adopt virtual alternatives to physical instruction. Thus, online teaching-learning and use of technology have become an unprecedented education requirement today (OECD, 2020).

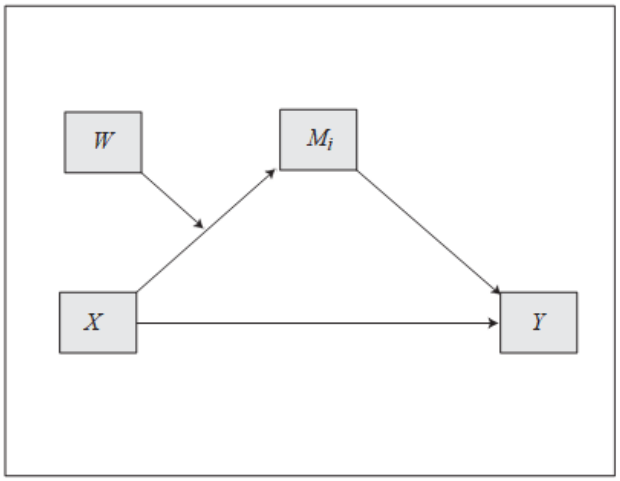
Lecturers' self-efficacy is the next variable that has the potential to influence students' awareness of the virtual assessment indicators. Bandura (1977), in his theoretical framework on self-efficacy, describes efficacy as a generative capability in which cognitive, social-emotional, and behavioural sub-skills are organized and effectively orchestrated to serve innumerable purposes. Efficacy beliefs function as key factors in the generative system of human competence. There is a significant difference between possessing a skill set and amalgamating those skills into appropriate actions in varying circumstances. The exploration of online teaching experiences by researchers suggests that for some, unsuccessful technological efforts result in negative emotions and may affect future efforts relating to technology innovation (Cron et al., 2005; de Vries et al., 2003; Venkatesh et al., 2003).

Researchers further suggest that an individual's failure to successfully learn how to use technology or participate in online teaching may induce a negative cycle of emotions and non-use (Cron et al., 2005; de Vries et al., 2003; Venkatesh et al., 2003). Such negative cycles may affect self-confidence and trust in technology within the faculty and may reduce self-efficacy in online teaching. Kidd et al. (2016) studied the experience of lecturers in public health faculties who engage in online teaching. Their findings indicated transformations in online teaching during the development process and associated activities. Lecturers' self-efficacy can be vital in helping students to embrace virtual assessment. This implies that lecturers who are confident in their ability to use virtual assessment tools will be more willing to design assessments that agree with the preconceived learning objectives of their courses (Thompson & Smith, 2017). Lecturers' self-efficacy can directly impact the quality of virtual assessment activities and indirectly influence students' awareness of assessment indicators. This will be evident in the way questions are designed to suit students' exhibition of knowledge and skills in relation to the expectations of the course.

The last variable in this study is the university type or category. There are three university types: federal, state, and private - each financed by the government, individuals, or groups that own them. As at 2024, there were 52 federal, 62 state, and 148 private universities, making a total of 262 universities in Nigeria (National Universities Commission, 2024). These are distributed across the six geopolitical zones as shown in Table 1.

Table 1
Distribution of Federal, State, and Private Universities Across Geo-Political Zones in Nigeria

	Federal	State	Private	Total
North Central	8	11	30	49
North East	8	7	5	20
North West	13	10	19	42
South South	9	11	24	44
South East	6	8	24	38
South West	8	15	46	69
Total	52	63	147	262



Note. Compiled and calculated by the authors from:
1. https://punchng.com/full-list-147-private-varsities-in-nigeria/
2. https://drugsavant.com/state-universities-in-nigeria/
3. Abusites (2024). Updated List of 262 Government-Approved Universities in Nigeria.

The category of a university may be significant in helping students' experience and readiness for virtual assessment. The availability of ICT facilities and provision of support systems may create differences depending on whether the university is federal, state, or private. These could affect students' level of exposure to virtual assessment technologies with resultant influence on the awareness of assessment indicators (Brown & Johnson, 2019).

This study investigated the possible intricate relationships among ICT facilities, students' awareness of virtual assessment indicators, university type, and lecturers' self-efficacy in integrating virtual assessment. The study explored how lecturers' self-efficacy mediated the relationship between ICT facilities and students' awareness of virtual assessment indicators. Additionally, it examined the moderating role of university type in the mediation of lecturers' self-efficacy on students' awareness of virtual assessment indicators. With a deeper understanding of this relationship, the study seeks to contribute valuable insights in the field of virtual assessment in higher education. The findings could inform universities and educators about the importance of providing adequate and appropriate ICT resources, supporting lecturers' professional development in virtual assessment methods which could yield better results in devising strategies to enhance students' awareness of assessment indicators in diverse university categories.

The conceptual model of the study is patterned after the Hayes process macro model 7 moderated mediation. In this model, the variables are continuous. The model is designed to determine if a mediation is present as well as to find out if a moderator is changing the strength of the indirect effect of the mediator as illustrated in Figure 1.

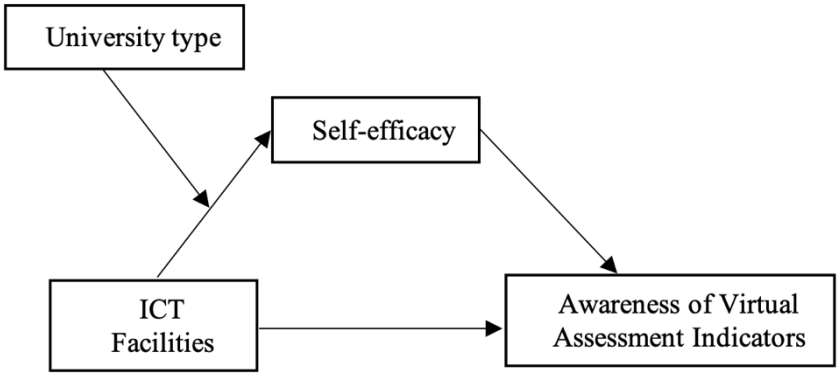


Figure 1
Hayes Process Macro Model 7 Moderated Mediation Conceptual Diagram

In Figure 1, X represents the independent variable (ICT facilities) while the dependent variable is represented by Y (students' awareness of virtual assessment indicators). The letter M1 stands for the Mediator (lecturers' self-efficacy) while W (which is university type) represents the moderator impact effects on the mediator. The model allows up to 10 mediators operating in parallel and its statistical diagram is shown in Figure 2.

In this study, the model is used to determine the mediation of lecturers' self-efficacy to effectively integrate virtual assessment on ICT facilities. In addition, it is employed to determine the moderation effect of university type or category on the mediation effect of lecturers' self-efficacy on the strength of indirect effect of ICT facilities on students' awareness of virtual assessment indicators. The complex relationships are diagrammatically represented in Figure 2.

Figure 2
The Conceptual Model of the Study

Existing literature focuses on students' awareness of e-learning methodologies in virtual teaching and learning and its effectiveness. With a dearth of literature on students' awareness on virtual assessment indicators, this study aims at providing indicators of virtual assessment. In line with the conceptual model, the study is designed to investigate the relationship between ICT facilities and students' awareness of virtual assessment indicators, the mediating role of lecturers' self-efficacy to integrate virtual assessment, and the moderating role of university type on those relationships.

Research Questions

The following research questions were raised to guide the study:

1. What is the relationship between:
   a. ICT facility and students' awareness of virtual assessment indicators?
   b. Lecturers' self-efficacy and students' awareness of virtual assessment indicators?
2. Will ICT facility, lecturers' self-efficacy, and university type have impact on students' awareness of virtual assessment indicators?
3. Will the interaction of ICT facility and university type have impact on lecturers' self-efficacy?
4. Will the indirect impact of ICT facilities on students' awareness of virtual assessment indicators through lecturers' self-efficacy be moderated by university type?

Methodology

The study adopted the correlational design in which data on students' awareness of virtual assessment indicators, virtual assessment integration, and lecturers' self-efficacy were gathered through surveys distributed to participants, students and lecturers in six Nigerian universities - two universities each owned by federal, state, and private groups or individuals.

Three departments each were purposively selected from science and humanities- faculties drawn from six universities purposively selected from the northern and southern parts of Nigeria.

The distribution of the lecturers from each department was one Professor or Associate Professor, two Senior Lecturers and two Lecturers I and II spread adequately across gender. The lecturers were randomly selected where there were more than the number needed. Fifty students (25 females and 25 males) were randomly selected per department, making a total of 600 students.

The study focused on ICT facilities in universities, awareness of virtual assessment indicators by students, university type and self-efficacy in integrating virtual assessment by lecturers in Nigeria. Professors, Readers, Senior Lecturers, Lecturers I and II were participants in the study. The Virtual Assessment Standard Indicators Scale was used for data collection. It has two major sections A and B. Section A dealt with the institutional variables while Section B measured students' awareness of virtual assessment. The instrument was administered to the selected students and lecturers electronically using Online Data Kit (ODK). The study adopted the Hayes Process Macro- Model 7- Moderated Mediation to analysise data. Unstandardised regression and beta coefficients were used in establishing the relationship, total, direct and indirect effects of the independent variable, moderated mediation variables on the endogenous variable.

Results and Discussion

The four research questions were answered using different tables as presented.

Research Question 1

What is the relationship between:

a. ICT facility and students' awareness of virtual assessment indicators?
b. University type and students' awareness of virtual assessment indicators?

The relationship between ICT facilities and lecturers' self-efficacy as independent variables and students' awareness of virtual assessment indicators as the dependent variable is carried out using the multiple regression analysis as presented in Table 2.

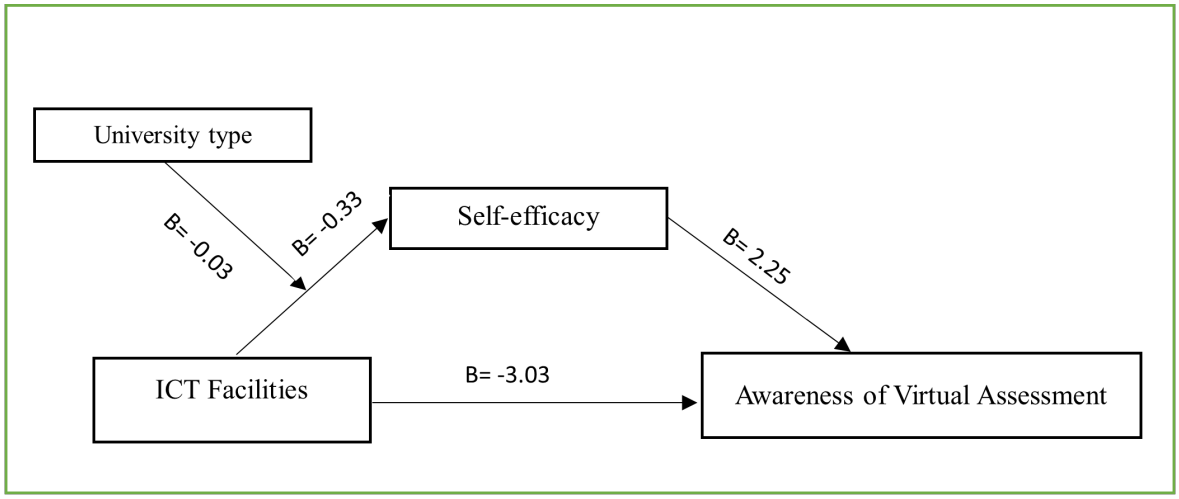
Table 2
Relationships Between Independent Variables and Virtual Assessment Awareness

	Coeff	se	T	p	LLCI	ULCI
Constant	26.07	3.29	7.92	0.00	19.58	32.57
ICT Facilities	-0.33	0.17	-1.97	0.05	-0.67	0.00
University Type	1.81	1.52	1.19	0.24	-1.19	4.80
R = 0.46;	R-sq = 21;	MSE = 32.69;		F = 16.41		
df_1 = 3.00	df_2 = 181.00	p = .00				

The relationship between independent variables (ICT facilities and university type) and students' virtual assessment awareness indicators denoted by R = 0.46; R square = 0.21; F = 16.41 shows that 21% variance in students' virtual assessment awareness indicators is accounted for by the independent variables. Similarly, Table 1 shows that a combined significant influence exists between independent variables and virtual assessment awareness indicators. Moreover, the relationship between ICT facilities and students' virtual assessment awareness indicators is -0.33 ± 0.17 indicate a weak relationship. However, the relation between these two variables is significant. On the contrary, the relationship between university type and students' virtual assessment awareness indicators is 1.81 ± 1.52 due to the presence of a large standard error. The relationship is not significant.

Research Question 2

Will ICT facilities, lecturers' self-efficacy, and university type have impact on students' awareness of virtual assessment indicators?



This research question was answered using both the regression analysis and the Hayes Process Macro Model 7 hypothesised Moderated Mediation diagram (Figure 3). The ICT facilities has a negative significant impact on students' awareness of virtual assessment indicators ($b = -3.03$, $t = -1.97$, $p < 0.05$). That implies that ICT facilities in universities negatively impacted the students' awareness of virtual assessment indicators. This could mean that the more ICT facilities are available in a university, the lower the student are aware of the virtual assessment indicators and vice versa.

Table 3
Direct Relationships Among the Variables

Direct Relationships	Unstandardised Coefficient	T values	Sig.t
ICT Facility (ICTF) ➔ Self-Efficacy (SE)	-0.330	-1.970	0.05
Self-Efficacy (SE) ➔ Awareness of Virtual Assessment Indicators (AVAI)	2.250	3.620	0.00
ICT Facility (ICTF) ➔ Awareness of Virtual Assessment Indicators (AVAI)	-3.030	-4.790	0.00
ICT Facility (ICTF)*University Type ➔ Self-Efficacy (SE)	-0.030	-0.380	0.27

These are further illustrated in Figure 3.

Figure 3
Relationships Among the Variables

Research Question 3

Will the interaction of ICT facility and university type have impact on lecturers' self-efficacy?

Table 2 shows that ICT facilities have a negative significant impact on lecturers' self-efficacy ($b = -0.33$, $t = -1.97$, $p < 0.05$). That implies that ICT facilities in the universities negatively impact lecturers' self-efficacy. It can be seen that the more facilities a university has, the less the self-efficacy of the lecturers in that university.

Furthermore, the interaction of ICT facilities and university type did not significantly impact lecturers' self-efficacy ($b = -0.03$, $t = 0.38$, $p > 0.05$).

Research Question 4

Will the indirect impact of ICT facilities on students' awareness of virtual assessment indicators through lecturers' self-efficacy be moderated by university type?

The research question was answered using the result output of the Hayes Process Macro Model 7 Moderated Mediation analysis. The result shows that the indirect impact of ICT facilities on students' awareness of virtual assessment indicators through lecturers' self-efficacy was moderated by university type as indicated by the index of moderated mediation (index = -0.070, 95% CI = [-0.490/0.430]) since the 95% does not include zero.

Table 4
Indirect Relationship of the Variables

Indirect Relationships	Direct Effect	Indirect Effect (SE)	Confidence Interval Low/High	T values
ICT Facilities > Self-Efficacy > Awareness of Virtual Assessment Indicators	-3.030	-0.900 (0.300)	-1.52/-0.34	3.0
Probing Moderated Indirect Relationships	Effect	SE	Confidence interval Low/High	t-statistics
Federal university	-0.820	0.370	-1.650/-0.220	-2.216
State university	-0.900	0.300	-1.520/-0.340	-3.00
Private university	-0.970	0.390	-1.770/-0.280	-2.62
Index of Moderated Mediation	-0.070	0.220	-0.490/0.430	0.318

Figure 3.0 shows the hypothesized moderated mediated model which was tested using the process macro model 7. This signifies that the indirect effect of ICT facilities on awareness of virtual assessment indicator through self-efficacy is moderated by university type (index -0.07,95% CI = [-0.49/0.43] and significant since the 95% does not include Zero.

Discussion

The relationship between ICT facilities and students' awareness of virtual assessment indicators is fully mediated by their lecturers' self-efficacy. ICT facilities, including internet connectivity, are for the university community's usage, especially students and lecturers. It is assumed that the presence of ICT facilities should have a positive impact on the students' awareness of virtual assessment; however, this is not the case as there is a negative relationship between the two variables. The implication is that students use ICT facilities for social networking and other things that are not connected with virtual assessment or teaching and learning (Erdogdu & Erdogdu, 2015). The use of ICT facilities allows students to connect and share ideas irrespective of time and geographical locations they may find themselves.

Sütlüoğlu (2015) states that today, young people are in a process of socialization and identity building not only during the time spent in front of the screen, but through the transitions between online and offline worlds. Considering the mediated role of lectures' self-efficacy, it is believed that students' awareness of virtual assessment indicators depends on the comfort teachers feel about using ICT in the classroom, their ability to integrate computers into lessons and programmes, and the degree to which students get opportunities to use them (Bozdogan & Ozen, 2014; Martinovic & Zhang, 2012).

The relationship between lecturers' self-efficacy and students' awareness of virtual assessment indicators is moderated by university type. Lecturers' self-efficacy directly impacts the quality of virtual assessment activities and indirectly influences students' awareness of assessment indicators. It is assumed that ICT facilities vary based on the type of universities, which ordinarily will influence the self-efficacy of lecturers in those universities. Lecturers' exposure to online teaching improved their self-efficacy, but those who were unsuccessful in the use of technology displayed negative self-efficacy (Cron *et al*., 2005; de Vries *et al*., 2003; Venkatesh *et al*., 2003). With improved self-efficacy of lecturers in the use of ICT, lecturers who are confident in their ability to use virtual assessment tools would be more willing to design assessments (Thompson & Smith, 2017), and this may increase students' awareness of virtual assessment indicators.

Conclusion and Recommendations

The study concludes that lecturers' self-efficacy and university category are germane to successful virtual assessment in higher institutions. It can be inferred from the study that increased availability of ICT facilities in the different types of universities will lead to greater lecturers' use of ICT tools and enhance self-efficacy. Similarly, lecturers' greater use of technology for assessment will make students more aware of virtual assessment indicators. It is recommended that:

i. Adequate ICT facilities should be available in federal, state, and private universities. The National University Commission should provide a benchmark on the number of ICT facilities in each university based on the number of lecturers and students.
ii. Since technology innovations move at the speed of light, students and lecturers with little competence in technology should be provided with professional development to improve lecturers' self-efficacy for successful integration of virtual assessment in universities.
iii. Since students' awareness of virtual assessment indicators is influenced by available ICT facilities and lecturers' self-efficacy, lecturers should use ICT facilities, especially in assessment methodologies, to increase students' awareness of virtual assessment indicators.

Effect of Active Learning Approach on Senior Secondary Students' Chemistry Performance in Rivers State, Nigeria

Rosemary C. Ugonwa, University of Port Harcourt, Nigeria

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This paper examined the effect of active learning approach on Senior Secondary School Students' Chemistry Performance in Rivers State. Quasi-experimental, non-equivalent pre-test, post-test control group design was adopted for the research. A sample size of fifty (50) senior secondary school II students participated in the study. Two research questions and two null hypotheses guided the study. A validated instrument titled Chemistry Performance Test (CPT) was used to collate the data. The reliability of the instrument was established using Kuder-Richardson -21 (KR-21) to obtain an index of +0.84. The research questions were answered using mean and standard deviation while the hypotheses were tested using ANCOVA at 0.05 significant level. Findings from the study revealed that the Chemistry students taught using active learning approach made higher learning performance gain than those taught with the traditional lecture method. There was a significant effect of the use of active learning approach over the traditional lecture method on the scores of the students. It was recommended among others that the use of active learning approach be adopted as a learning approach in the teaching and learning of Chemistry at all levels of education to enhance learning and improve students' performance in Chemistry.

Keywords: active learning approach, secondary school students, chemistry performance

Introduction

Science is a branch of knowledge that studies matter and the environment. It is the very cornerstone on which anchors the modern-day technological advancement. Chemistry is one of the core science subjects studied in both secondary school and higher institutions. It is a central science that permeates all our lives. Chemistry as a science subject makes use of specific terms to define relationships and changes that occur in real life situations (Macrothink Insitute, 2023). It is the branch of science that deals with the properties, composition, and structure of elements and compounds, how they undergo changes from one state to another, and the energy that is released or absorbed when they change (Ugonwa et al., 2024). It is a science within the natural sciences that studies the chemical elements that make up matter and compounds made of atoms, molecules, and ions, their composition, structure, properties, behavior, and the changes they undergo when they react with other substances. Chemistry also addresses the nature of chemical bonds in different chemical compounds and studying chemistry as a subject is important because everything, we do is chemistry. Everything in our life is based on chemistry. Even the human body is made of chemicals. Chemistry is therefore a big part of our everyday life. The importance of this branch of science can be seen in different spheres of human life such as in the food we eat, the air we breathe, various cleansing agents, toothpastes, lotions, facewash, pharmaceuticals, batteries in watches, mobile phones, cars, laptops, and other electronic devices, and fuel in our vehicles to mention but few as instances of chemistry in our daily lives, thus, all matter is made of chemicals, therefore chemistry is the study of everything.

Learning Chemistry enable students to learn about the scientific method and gain skills in critical thinking, deductive reasoning, problem-solving, and communication. Obafemi and Ugonwa (2025) opined that teaching of chemistry to students at a young age can increase student interest in STEM careers. Some concepts to study in chemistry include, Atomic structure, the Periodic table, Chemical bonding, Chemical reactions and Stoichiometry, Acids and bases, Electrochemistry and Organic chemistry. Chemistry can help us to understand, monitor, protect and improve the environment around us. Over the years, Chemists have developed tools and techniques which ensure that we can see and measure air and water pollution. They have helped to build the evidence that shows how our climate has changed over time. In a nutshell, Chemistry helps us understand the world around us and improve the quality of life while ensuring safety. In addition, a good understanding of chemistry will help us solve many future problems, including sustainable energy and food production, managing our environment, providing safe drinking water, and promoting human and environmental health. Dike and Ugonwa (2021) opined that chemistry is an integral part of other science subjects and requires both theory and practical learning. Chemistry plays a vital role on students understanding of science and expertise in scientific advancement. Practical and experiential learning has been known to enhance motivation to learning chemistry and enable students develop science process skills which helps them to deal with abstract knowledge (Macrothink Insitute, 2023).

Experiential learning is a direct experience -based learning approach which may involve hands-on learning. Students in this approach learn by actively participating in the real-world activities, experiments, or projects. Active learning is an experiential learning approach in which learners play active role in the learning process, making decisions and solving problems (Nwanekezi & Ugonwa, 2021). It is the approach to learning that involves students actively engaging in the learning experiences rather than passively receiving information. Active learning approach

engages students into critical thinking, problem solving and ability to apply what they have learnt. The major characteristics of active learning are:

- ✓ It is student - centered. Active learning focuses on the learning process of the students rather than the teachers transmission of information.
- ✓ It involves hands-on activities. Active learning incorporates activities that require students to manipulate, experiment or innovate.
- ✓ It encourages students collaboration as the students share ideas and learn from each other.
- ✓ It enables critical thinking since the students are required to think, analyze evaluate and synthesize information.
- ✓ It encourages problem solving, where students are engaged in identifying and solving real-world problems.
- ✓ Active learning approach encourages students to reflect on their learning experiences, share and receive feedback from peers and instructors.

Active learning gives the learners direct experience as they engage in practical experiences rather than just reading or listening to the teacher. The strategies for active learning approach include:

- ❖ Discussions and Debates
- ❖ Group projects and presentations
- ❖ Experiments and role-playing
- ❖ Problem-based learning
- ❖ Think-pair share and peer instruction

According to Nwanekezi et al. (2023), to apply active learning approach in the classroom, the teacher selects a topic and a student, allows the students to think about the topic and list out all he knows about the topic. He is then paired with someone in the class where they compare their lists thereby exchanging ideas. Later the class is grouped into four or five where there is further exchange of ideas after which the groups come up with a list of contributed ideas as feedback to be discussed in the classroom.

Wolf et al. (2015) in their study highlighted the Matrix of active learning techniques to include: Think-pair-share, Concept maps, Role play, Jigsaw, Team-based learning, problem-based learning, Thinking Hats and more. They submitted that active learning helps to increase retention in students and facilitate transfer of knowledge. They also added that when learners are actively involved in their learning, knowledge will be transmitted, and they will effectively apply their knowledge and skills. A brief description of how some of these techniques can be applied in the classroom is discussed as follows:

Think-Pair-Share – Here the teacher pose a question to the group and allow the learners to consider their response individually. Then, he instructs the learners to pair with a neighbor to compare responses and come up with feedback. He concludes by randomly calling on pairs to share with the entire class.

Concept maps – This technique involves forming a mental picture of relationships between concepts diagrammatically. It Can be done individually or in groups where the students will use a cardboard paper to draw or do a schematic representation of the concept.

Jigsaw – In this technique, the teacher divides the topic into several smaller, interrelated pieces and assigns each member of the team a part of the topic to read and master it. With this, each

of them is asked to teach their team members about their own piece. When each person in the group has finished teaching their own part, the puzzle is collated by the teacher to conclude the lesson.

Team-based learning - Here the teacher forms Small-groups of between four and ten members who will learn a concept together before the class session. After this, during the classroom session, the learners are tested on the preclass material they learnt and then challenged to explain the core content or model the concept learnt as a team.

Role play – Here learners are given a particular role to act or a particular viewpoint to better understand the concepts and theories in question.

Some of the benefits of active learning approach are:

1. Increases engagement and motivation in the students.
2. Promotes deep understanding and retention in the learners.
3. Students develop critical thinking and problem-solving skills.
4. It enhances collaboration and communication skills in the students.
5. It improves student autonomy and self-directed learning.

By using active learning approach in the teaching and learning of chemistry as a subject, there would be effective interaction and participation of every student in the class and this will bring collaboration and critical thinking among them. The role of the teacher here is to create engaging and conducive learning environment, then ensure adequate and even grouping of the students having both the brilliant and the weak students together in every group. The review of Nguyen et al. (2021), on Instructor strategies to aid implementation of active learning, submitted that the use of active learning in STEM fields has been linked to improving students learning and retention, particularly among students from some underrepresented groups.

Camacho and Legare (2015) conducted a study on opportunities to create active learning in the classroom and submitted their in findings that incorporating active learning methods into the classroom will enable instructors to create opportunities for learning instead of allowing students to sit passively and learn by absorbing information passed by the instructor.

Kim et al. in Camacho and Legare (2015) described the benefits of active learning techniques to include, improved critical thinking skills, increased motivation, and enhanced interpersonal communication skills.

Galbraith and Fouch (2007), in their study, established that active learning techniques enable students to organize and reflect; practices that reinforce learning.

The traditional lecture or “talk and chalk” method of teaching and learning have been observed to be ineffective in promoting deep understanding of concepts, critical thinking, and problem-solving skills in chemistry students. The passive reception of information leads to poor retention, lack of participation and inability to apply knowledge in real-world situations. Wolf et al. (2015), established from their findings that most teachers rely on the traditional lecture method of teaching which unfortunately only permits learners to retain little or no knowledge of what they are taught in the class, and they rarely apply what they learn. Moreso, the rapidly changing trends of the 21st century require that students be equipped with skills such as collaboration, creativity, and adaptability, which are not common with the traditional teaching methods. A shift toward an active learning approach that empowers students to take ownership

of their learning and engages them in participatory learning experiences may likely improve the academic performance of the chemistry students and help them to develop the skills and competencies necessary for success in an evolving world. Active learning approach provides students with rewarding and joyful learning experiences unlike the traditional passive talk and chalk method of learning. It is therefore expedient to examine the effect of active learning approach on the performance on the chemistry students in the secondary schools in Rivers State.

Aim and Objectives of the Study

The aim of this study is to examine the effect of active learning approach on the performance of chemistry students in senior secondary schools in Rivers State. The specific objectives of the study are to;

1. Determine the mean performance score of chemistry students exposed to active learning approach and lecture method in secondary schools in Rivers State.
2. Examine the mean performance score of the male and female students in chemistry who were exposed to active learning strategy in the secondary schools.

Research Questions

The following research questions guided the study.

1. What is the mean performance score of the SS2 chemistry students who were taught using active learning approach and those taught using lecture method in secondary schools in Rivers State?
2. What is the mean performance score of male and female students in the secondary schools who were exposed to active learning strategy in chemistry?

Hypotheses

1. There is no significant difference in the mean performance score of the chemistry students exposed to active learning approach and that of those taught with lecture method in the secondary schools in Rivers State.
2. There is no significant difference between the mean performance score of male and female students in the secondary schools who were exposed to active learning strategy in chemistry?

Methodology

Quasi-experimental, non-equivalent pre-test, post-test control group design was used for the study. The area of the study was Port Harcourt City Local Government Area of Rivers State. The population of the study comprises of four hundred and twenty (420) senior secondary school two (SSS2) chemistry students in Port Harcourt City Local Government Area of Rivers State. Simple random sampling technique was used to select sample size of 50 SSS2 chemistry students from two intact classes of two schools: Model Girls Secondary School Rumueme and Community Secondary School Nkpolu Oroworukwo, Port Harcourt. The schools were selected using purposive sampling technique and assigned to experimental and control groups by balloting.

Table 1
Experimental Procedure

	Groups	Pre-test	Treatment	Post-test
Experimental	1	Pre-test given on chemistry performance test.	Taught using active learning approach.	Post-test given on chemistry performance test.
Control	2	Pre-test given on chemistry performance test.	Taught using lecture method.	Post-test given on chemistry performance test.

The instrument used for data collection was chemistry performance test (CPT) which was developed by the researcher. The CPT instrument was constructed based on the topic "The Periodic Table" and used for pre-test and post-test. The CPT comprises of forty (40) multiple choice objective questions with options A, B, C and D having 2.5 marks assigned to each correct answer while wrong answers attract zero (0) score. 100 marks was the maximum score for the data. The CPT instrument was validated by one chemistry teacher and one measurement and evaluation expert. They ascertained the face, content, and construct validity of the instrument. The CPT instrument was also trial tested using 20 SSS2 chemistry students from another school of the same area of study. The reliability of the instrument was gotten using Kuder-Richardson-21 (KR-21) to calculate the data obtained from the CPT trial -test scores and a reliability co-efficient of 0.84 was obtained. The two sampled schools were grouped into experimental and control groups (Groups one and two, respectively). Group one were taught using Active learning approach (jigsaw, think-pair-share, concept mapping and Team-based learning were used), while Group 2 were taught using the conventional lecture method. Prior to the start of the lesson, the researcher explained the features of the Active learning approach to the students in the experimental group. The CPT instrument where then given to both the Experimental and Control groups and data collected and marked to obtain the pre-test scores of both groups. The researcher decided to administer the treatment and instrument by herself on different days of the schools since a schedule was drawn and agreed upon by the researcher and chemistry teachers with the permission of the school authority (based on the timetable). The treatment lasted for three weeks, after which a post-test was administered to both the Experimental and Control groups by the researcher. Data collected was also marked and scores recorded for analysis. Mean and standard deviation was used to answer the research questions while Analysis of Co-variance (ANCOVA) was used to test the hypotheses at 0.05 level of significance.

Results and Findings

Research question 1: What is the mean performance score of SSS2 chemistry students taught using Active learning approach and those taught using Lecture method in senior secondary schools in Rivers State?

Table 2
Mean, Standard Deviation and Mean Gain of Students' Performance Using Active Learning Approach and Lecture Method

Method	Pre-test			Post-test		Mean Gain
	N	$\bar{x}$	SD	$\bar{x}$	SD	
Active learning	50	30.10	6.03	76.70	12.12	46.60
Lecture Method	50	30.50	5.80	59.20	8.38	28.70

Table 2 showed that the students taught chemistry using active learning approach had a mean gain score of 46.60 while those taught chemistry using lecture method had a mean gain score of 28.70. This is an indication that students taught chemistry with active learning approach performed better than the students taught with lecture method.

Research question 2. What is the mean performance score of male and female students in the secondary schools who were exposed to active learning strategy in chemistry?

Table 3
Mean, Standard Deviation and Mean Gain of Male and Female Students in Chemistry Taught Using Active Learning Approach

Gender	Pre-test			Post-test		Mean Gain
	N	$\bar{x}$	SD	$\bar{x}$	SD	
Male	25	28.40	6.47	74.20	13.56	45.80
Female	25	31.40	5.27	82.60	8.91	51.20

Table 3 shows that the male students taught with active learning approach had a mean gain of 45.80 while the female students exposed to active learning approach had a mean gain score of 51.20. This is an indication that the female students taught chemistry using active learning strategy performed better than their male counterparts.

Hypothesis 1. There is no significant difference in the mean performance score of the chemistry students exposed to active learning approach in the secondary schools in Rivers State.

Table 4
ANCOVA Analysis of Students Taught Chemistry Using Active Learning Approach and Lecture Method

Source	Type III Sum of Squares	Df	Mean Square	F	Sig.	Partial Eta Squared
Corrected Model	10415.645	2	5207.822	47.529	.000	.495
Intercept	16441.036	1	16441.036	150.050	.000	.607
Pre-test	11.645	1	11.645	.106	.745	.001
Methods	10307.198	1	10307.198	94.061	.000	.492
Error	10628.355	97	109.571			
Total	488900.000	100				
Corrected Total	21044.000	99				

Table 4 shows that the calculated F-ratio is 94.061 and significant at p = 0.00{p < 0.05). The null hypothesis was rejected. This shows that there is significant difference between the mean performance score of students taught chemistry using active learning approach and those taught using lecture method in senior secondary schools in Rivers State.

Hypothesis 2. There is no significant difference between the mean performance score of male and female students in the secondary schools who were exposed to active learning strategy in chemistry?

Table 5
ANCOVA Analysis of Male and Female Students Taught Chemistry Using Active Learning Approach

Source	Type III Sum of Squares	Df	Mean Square	F	Sig.	Partial Eta Squared
Corrected Model	920.283	2	460.141	3.443	.040	.128
Intercept	13086.420	1	13086.420	97.913	.000	.676
Pre-test	38.283	1	38.283	.286	.595	.006
Gender	918.129	1	918.129	6.870	.012	.128
Error	6281.717	47	133.654			
Total	316100.000	50				
Corrected Total	7202.000	49				

Table 5 shows that the calculated F-ratio is 6.870 and not significant at p-0.012 ($P < 0.05$). Hypothesis 2 was accepted. This shows that there is no significant difference between the mean performance score of the male and female students taught chemistry using active learning approach in the secondary schools.

Discussion of Findings

The result of table 2 in the study revealed that the SS2 chemistry students who were taught using active learning approach performed better than those who were taught using lecture method in the secondary schools. The difference in the mean gain is 17.9. This implies that the active learning approach was effective in improving the academic performance of the chemistry students when compared to that of those taught using the convectional lecture method of learning. The effect of active learning approach on the performance of the chemistry students was also significant as shown in table 4 where the F-calculated is 94.061 and significant at $p = 0.00$ (p,0.05), showing a significant difference between the mean performance score of students taught chemistry using active learning approach and those taught using lecture method in senior secondary schools in Rivers State. The use of active learning approach promotes the development of critical thinking through discussion and clarification of ideas which gives the students a greater liberty to advance their own ideas and at the same time benefit from the ideas of others. This finding is in line with that of (Macrothink Insitute, 2023) who reported that practical and experiential learning has been known to enhance motivation to learning chemistry and enable students develop science process skills which helps them to deal with abstract knowledge. The findings agree with the submission of Wolf et al. (2015), and Camacho and Legare (2015), that active learning helps to increase retention in students and

facilitate transfer of knowledge. Also established that when learners are actively involved in their learning, knowledge will be transmitted, and they will effectively apply their knowledge and skills.

Table 3 revealed that female students taught chemistry using active learning approach performed better than their male counterparts with a mean gain difference of 5.4. Further analysis in the table 5 revealed that the calculated F-ratio is 6.870 and not significant at p-0.012 ($P < 0.05$). Thus the Hypothesis 2 was accepted implying that there is no significant difference between the mean performance score of the male and female students taught chemistry using active learning approach in the secondary schools. This findings agrees with the submission of Nguyen et al. (2021), that the use of active learning in STEM fields has been linked to improving students learning and retention. Also agrees with Galbraith and Fouch (2007), asserted that active learning techniques enable students to organize and reflect in other to reinforce learning. This implies that gender was not necessarily a significant factor in this regard. Both male and female chemistry students can respond positively to the use of active learning approaches and optimally to enhanced knowledge and improved performance.

Conclusion

The findings of this study have established that active learning approach has the potential to enhance the academic performance of the chemistry students in the secondary schools. To fully adopt active learning approach in teaching and learning of chemistry in the secondary schools, chemistry teachers should acquire a good knowledge on the use of active learning for effective implementation in the classroom. When learners are actively engaged in their learning, transmission of knowledge will take place and the knowledge acquired can be applied in real-life situations. Both male and female students have the potentials to respond favorably to active learning approaches in the secondary school. Therefore, incorporating active learning approach and strategies into classroom produces a more effective learning environment and increased students' participation. This ensures more student engagement in their learning and enhances meaningful learning.

Recommendation

Consequent on the findings of this analysis, the following recommendations were made:

1. Curriculum planners should incorporate the use of active learning approach into the chemistry curriculum to constitute contents and learning experiences.
2. Chemistry teachers should adopt active learning as a learning approach in the teaching and learning of Chemistry at all levels of education to enhance learning and improve students' performance in Chemistry.
3. Government and Educators should organize workshops and provide adequate training facilities on the use of active learning techniques in the secondary schools and encourage teachers to utilize it in teaching and learning of chemistry.

Letterpress, Perception, and the Screen Generation: Materiality as Pedagogical Insight in Cross-Cultural Design Education

Li Yun-yun, National Taiwan University of Arts, Taiwan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study examines how embodied engagement with letterpress printing deepens perceptual understanding of typography and visual culture among digital-native learners. Following the pandemic, in 2023, I collaborated with Tokyo-based letterpress studio Letterpress Letters to organize a cross-cultural workshop for Taiwanese high school students, providing direct experience with European typographic craftsmanship and printing techniques. Addressing a generation increasingly distanced from typography's material and historical foundations, this research investigates how tactile printing practices can reconstruct students' perceptual engagement with typographic forms and foster critical reflection on materiality within contemporary visual culture. Drawing on Tim Ingold's material engagement theory, Karen Barad's concept of embodied intra-action, and sensory learning frameworks, this study employs qualitative methods including participant observation, artifact analysis, and reflective documentation. Through guided instruction in manual type selection, arrangement, and layout adjustment, students developed heightened aesthetic sensitivity and nuanced understanding of the relationship between traditional craft practices and digital technologies. Findings demonstrate that letterpress printing enhances students' capacity for typographic discernment while fostering critical engagement with the visual structures and communicative logic underlying typographic forms. The research reveals how material engagement with printing processes enables students to perceive typography not merely as visual information but as culturally embedded practice. This study proposes a pedagogical framework integrating embodied perception, cultural awareness, and digital literacy as an effective approach to contemporary visual culture education.

Introduction, Research Background, and Motivation

Digital-native design students navigate typography through screens with remarkable fluency. They adjust kerning in Figma, construct visual hierarchies in Canva, and produce visually refined layouts with efficiency that would have been unimaginable to previous generations. However, this apparent competence conceals a structural limitation in contemporary design education. Many students possess what has been described as *screen literacy without material literacy* (Heller, 2015): mastery of interfaces without an embodied understanding of typography as a material, historical, and culturally situated practice.

This perceptual gap has intensified in post-pandemic educational contexts. During the COVID-19 transition to online learning, even the limited tactile encounters once embedded in design education such as handling printed matter, visiting print studios, or examining physical typographic specimens were largely eliminated (Harland & Bohemia, 2021).

For students whose design education unfolded almost entirely through screens, typography increasingly appears as a system of adjustable parameters rather than as a material practice shaped by weight, resistance, and constraint.

Current design pedagogy has struggled to respond to this condition. While scholars have called for renewed attention to craft and making (Crawford, 2009; Sennett, 2008), material engagement is often framed as a supplementary or nostalgic practice rather than as an epistemological necessity. Typography education continues to emphasize principles such as contrast, hierarchy, and readability, yet without embodied experience these concepts remain abstract. The resulting crisis is not merely technical, but perceptual: an entire generation is learning to design without learning how to see through material engagement.

This study emerged from direct observation of this crisis within Taiwanese design education. In 2023, following the easing of pandemic restrictions, I collaborated with the Tokyo-based letterpress studio *Letterpress Letters* to organize a cross-cultural workshop for Taiwanese high school students. The pedagogical significance of this workshop lay in the layered unfamiliarity of the setting, in which students simultaneously encountered:

- a pre-digital printing technology (letterpress),
- a foreign writing system (Latin alphabets designed for European languages), and
- a cross-cultural learning environment in Japan.

These combined conditions disrupted students' habitual modes of perception. Without established cultural or technical scripts to rely on, students were compelled to attend directly to what the material itself demanded, rather than to pre-existing visual conventions.

The research question crystallized through close observation of students' interactions with the printing process. As they adjusted spacing by physically inserting or removing metal spacers, handled the substantial weight of wooden type, and observed the uneven adhesion of ink on aged surfaces, typography ceased to function as "text on screen." Instead, it revealed itself as a situated practice—performed by bodies, mediated by tools, and unfolding over time. This led to the central question of this study:

- *Can material engagement, particularly within cross-cultural contexts, reconstruct how digital-native students perceive typography and visual culture?*

This question carries both theoretical and practical significance. Theoretically, it contributes to material culture studies, the anthropology of making, and embodied cognition research, which emphasize that perception is shaped through interaction with materials and tools (Ingold, 2013; Malafouris, 2013). Practically, it addresses a pressing challenge in contemporary design education: how to cultivate visual and cultural literacy among students whose formative experiences are predominantly screen-based. As design increasingly mediates social communication, political discourse, and cultural identity, critical engagement with visual form becomes a fundamental democratic competence (Mirzoeff, 2015). Such engagement, however, requires understanding visual forms as material practices embedded in historical, technological, and power relations. From this perspective, material literacy is not an optional enhancement, but a foundational requirement for critical visual culture education in the twenty-first century.

Research Questions

This study is guided by one overarching research question and three interconnected sub-questions that address the theoretical, pedagogical, and perceptual dimensions of material engagement in design education.

Primary Research Question

Can embodied engagement with letterpress printing reconstruct perceptual understanding of typography and visual culture among digital-native learners?

This question frames material engagement not as skill acquisition or technical training, but as a form of perceptual intervention. The term *reconstruct* is used deliberately: it suggests that digital interfaces have already shaped a dominant mode of typographic perception, and that material encounters offer the possibility of reconfiguring how typography is seen, understood, and evaluated through different experiential foundations.

Sub-Question 1: Theoretical Mechanisms

How does physical interaction with material artifacts generate knowledge that digital interfaces cannot convey?

This question addresses the epistemological role of materiality in learning. Drawing on Ingold's (2013) concept of thinking-through-making and Barad's (2007) notion of material–discursive practices, it examines whether materials function as active participants in knowledge production. Specifically, it investigates how the physical properties of letterpress printing—weight, resistance, dimensional constraint, and traces of historical use—enable understanding of spacing, hierarchy, and legibility in ways that remain inaccessible through screen-based manipulation.

Sub-Question 2: Pedagogical Conditions

What role does cross-cultural unfamiliarity play in enabling perceptual transformation?

This question focuses on pedagogical design rather than materiality alone. The study situates Taiwanese students in a Japanese letterpress studio working with European wooden type, producing layered unfamiliarity across technology, writing system, and cultural context. It

examines whether such unfamiliarity functions as an epistemic resource by disrupting habitual interpretive frameworks and directing attention toward material properties themselves. In doing so, it asks whether perceptual awareness is sharpened when cultural shortcuts are removed.

Sub-Question 3: Perceptual Durability

How does multisensory material engagement shape lasting changes in typographic perception and digital design practice?

This question addresses the durability and transferability of perceptual learning. It investigates whether sensory-rich experiences—integrating touch, sight, sound, smell, and bodily movement—produce perceptual shifts that persist beyond the workshop context. More critically, it asks whether these shifts transfer back into digital practice: do students subsequently approach tools such as InDesign or Figma differently, informed by embodied material memory?

Taken together, the three sub-questions are necessary to address perceptual reconstruction as a process rather than as a single outcome. Examining material engagement without attention to pedagogical conditions would risk treating perception as an individual response divorced from context. Conversely, focusing on cross-cultural unfamiliarity alone would foreground difference without accounting for how perception is physically negotiated through tools and materials. Finally, without considering perceptual durability, any observed shift could be dismissed as situational or short-lived, limited to the workshop setting itself.

Each sub-question therefore addresses a distinct but interdependent dimension of perceptual change. The first examines how material properties participate in shaping judgment at the moment of making. The second considers how unfamiliar cultural and technological conditions disrupt habitual ways of seeing, creating openings for perceptual reorientation. The third asks whether such reorientation persists beyond the immediate encounter and informs subsequent design practice.

These questions are not arranged as a linear sequence, but as a relational structure. Material engagement, pedagogical context, and perceptual durability continuously shape one another. Only by considering all three together can the study account for how perceptual understanding is destabilized, re-formed, and potentially sustained among digital-native learners. Removing any one of these dimensions would leave the process of perceptual reconstruction conceptually incomplete.

Integration of Research Questions

Together, these questions correspond to three analytical lenses: material engagement theory, pedagogical frame-shifting through unfamiliarity, and multisensory learning. Their integration enables systematic examination of whether, how, and under what conditions material encounters can reconstruct perception for the screen generation, contributing both theoretical insight and pedagogical implications for contemporary design education.

Research Methodology

This study adopts a qualitative, practice-based research design to examine how cross-cultural material engagement reshapes digital-native students' perceptual understanding of typography. The investigation centers on an intensive letterpress workshop structured to generate embodied learning through unfamiliar materials and cultural contexts.

Research Context

Figure 1
Letterpress Workshop Setting at Letterpress Letters Studio, Tokyo (2023), Showing Students' Embodied Engagement With Tools and Materials

Note. The workshop was conducted in August 2023 at *Letterpress Letters* studio in Tokyo, Japan.

Eight Taiwanese high school students (ages 15–17) participated. All had prior experience with digital design tools but no exposure to letterpress printing. The setting was intentionally cross-cultural: students encountered European wooden type and mechanical printing technology within a Japanese cultural environment. This layered unfamiliarity prevented reliance on habitual design frameworks and directed attention toward material properties and physical processes.

The workshop consisted of six hours of hands-on engagement with wooden type, metal furniture, and manual printing presses. Instruction progressed from guided demonstrations to independent experimentation. After learning basic letterpress principles, students designed and printed individual works reflecting their Tokyo experience. This structure enabled observation of how material constraints and tactile feedback gradually altered students' typographic decision-making.

Researcher Positionality and Pedagogical Role

This study was conducted within a pedagogical setting in which facilitation and observation were closely intertwined. The workshop was structured around guided participation rather than detached instruction, reflecting the practice-based nature of embodied learning. Within this setting, instructional responsibility focused on enabling safe and sustained engagement with letterpress tools and materials, while analytical attention was directed toward how perceptual judgment emerged through students' interactions with material constraints.

Pedagogical intervention was deliberately limited to procedural guidance. Participants were not provided with evaluative criteria regarding "correct" spacing, hierarchy, or composition. Instead, instruction emphasized operational familiarity with letterpress processes, allowing typographic decisions to develop through bodily engagement with resistance, weight, and limitation rather than through prescriptive rules. This approach created conditions in which perceptual understanding could arise through action and adjustment.

Throughout the workshop, instruction and communication were conducted in Japanese, with continuous interpretation into Chinese to ensure comprehension among Taiwanese students. In addition, a professional instructor with extensive experience in letterpress printing was present to provide technical support and ensure proper handling of tools and presses. This collaborative instructional arrangement distributed authority across linguistic, cultural, and technical domains, reducing reliance on a single instructional voice and reinforcing the material-centered nature of learning.

Analytical attention focused on moments in which students' habitual screen-based strategies proved insufficient. Instances of hesitation, repeated adjustment, and verbalized uncertainty were treated as indicators of perceptual transition rather than as errors. Observational records were produced during workshop sessions and expanded immediately afterward to capture not only physical actions but also shifts in pacing, peer interaction, and affective response.

Given the cross-cultural conditions of the workshop, particular care was taken to remain attentive to asymmetries of language, cultural expectation, and pedagogical authority. Encountering European wooden type within a Japanese studio context suspended familiar interpretive frameworks for participants. Rather than resolving this unfamiliarity through explanation, the workshop design allowed it to function as a productive condition that redirected attention toward material properties themselves.

Reflexive awareness was maintained throughout the workshop regarding how instructional structure, linguistic mediation, and cultural positioning shaped the learning environment. Rather than attempting to eliminate such influences, the study acknowledges them as constitutive elements of the pedagogical situation. Perceptual learning is thus understood as co-produced through the relationships among participants, materials, tools, and instructional conditions.

Data Collection Methods

As both facilitator and researcher, I employed three complementary methods:

- **Direct Observation**
  Field notes documented students' bodily interactions with materials, including how they handled type, adjusted spacing, and operated the press. Particular attention was paid to moments of perceptual shift, such as transitions from visual estimation to tactile judgment.
- **Material Artifacts**
  Students' printed works served as material evidence of design decisions made under letterpress constraints. These artifacts reveal choices related to spacing, hierarchy, and composition shaped by the physical limits of wooden type.
- **Student Reflections**
  To trace both immediate and sustained effects, data were collected through group discussion immediately after the workshop, written reflections two weeks later, and

individual interviews conducted one month post-workshop. This temporal layering allowed examination of how embodied experiences informed subsequent digital design practice.

Analytical Approach

Data were analyzed thematically across observations, artifacts, and student accounts. Analysis was guided by three theoretical lenses: material dialogue (how materials shape thinking), perceptual frame-shifting through unfamiliarity, and multi-sensory learning and memory. Together, these lenses enabled identification of recurring patterns that constitute key dimensions of perceptual reconstruction.

Research Considerations

This study prioritizes depth over generalizability. Focusing on a small participant group allows close examination of perceptual mechanisms rather than statistical claims. Ethical approval was obtained, with particular attention to student wellbeing within a physically demanding, cross-cultural learning environment.

Findings

Analysis of workshop observations, student prints, and reflective interviews revealed three interconnected dimensions through which material engagement reconstructed students' perceptual understanding of typography.

Finding 1: Material Resistance Reshapes Typographic Judgment

Prior to the workshop, students approached typography primarily through digital interfaces, where spacing adjustments occur instantaneously through sliders and numerical inputs. Letterpress printing disrupted this habitual mode of working by introducing material resistance.

When adjusting spacing, students encountered constraints unfamiliar to screen-based practice. One student reflected:

"In Canva, I just drag the spacing slider until it looks right. Here, one millimeter took me ten minutes."

Figure 2
Close-Up of Tactile Spacing Adjustment Using Metal Spacers, Illustrating How Typographic Judgment Emerges Through Material Resistance

Field observations documented a clear perceptual shift. Initially, students relied on visual judgment, repeatedly removing and replacing spacers while stepping back to assess results. Over time, however, decision-making moved from visual estimation toward tactile exploration. Students began running their fingers along the type, feeling spacer thickness and testing resistance before making adjustments.

This physical negotiation enabled students to "feel what spacing means." As one student reflected two weeks later, "Spacing used to be just a rule. But when the wooden blocks physically wouldn't fit, I understood that space isn't just visual—it's physical distance."

Figure 3
Comparison of Early and Final Prints, Showing Shifts in Hierarchy Achieved Through Spacing and Layout Rather Than Scale

Material resistance also reshaped students' understanding of hierarchy. Unlike digital typography, letterpress offers only a finite set of type sizes. Unable to rely on scale alone, students attended more closely to spacing, positioning, and white space. One student later reported applying these strategies in digital design, adjusting spatial relationships before increasing font size.

Most significantly, students' evaluative criteria shifted. Initially, uneven ink coverage was perceived as failure. As students learned how pressure, ink viscosity, and wood grain shaped results, irregularities came to be understood as evidence of process rather than error. One student described his first print as "messy," but later reframed it as "honest"—a visible record of material interaction.

Not all students adapted to material resistance at the same pace. For some participants, the physical slowness and effort required by letterpress initially produced frustration rather than insight. One student repeatedly expressed a desire to "just see it clearly" and attempted to resolve spacing issues by stepping back visually, avoiding tactile engagement for an extended period. Even after guidance encouraging hands-on adjustment, this student continued to rely primarily on visual judgment, treating material resistance as an obstacle to efficiency rather than as a source of information.

This hesitation highlights that material engagement does not automatically generate perceptual shift. For certain students, especially those strongly habituated to screen-based efficiency, resistance initially intensified reliance on familiar visual strategies. In these cases, perceptual transformation emerged only after prolonged exposure, repeated failure, and visible fatigue

with visual trial-and-error. This suggests that material resistance functions not as an immediate corrective, but as a condition that gradually destabilizes established habits of judgment.

Finding 2: Cross-Cultural Unfamiliarity Shifts Observational Frames

The workshop's cross-cultural design—Taiwanese students, Japanese setting, and European wooden type—produced productive estrangement. With no familiar cultural scripts to rely on, students were compelled to attend directly to material form.

This unfamiliarity was evident in students' initial encounters with physical letterforms. Although they had used Latin fonts extensively on screens, handling wooden letters revealed them as unfamiliar objects. One student noted:

"I'd used Helvetica countless times, but holding the wooden 'H,' I realized I had never really seen it."

Figure 4
Worn European Wooden Type Showing Traces of Long-Term Use and Material History

While cross-cultural unfamiliarity often sharpened students' attention, it also produced moments of detachment and uncertainty. A small number of students expressed difficulty forming any emotional or cultural connection to the European wooden type, describing it as "not related to us" or "too distant from daily life." For these participants, unfamiliarity did not immediately invite curiosity, but instead risked disengagement.

This ambivalence suggests that unfamiliarity alone does not guarantee perceptual openness. In some cases, the absence of cultural reference initially limited students' motivation to look closely. However, when unfamiliarity was accompanied by sustained material handling—particularly through noticing wear, weight, and repetition of use—detachment gradually shifted toward interest. This indicates that unfamiliarity becomes productive not as an abstract condition, but when anchored in tangible, sensory encounter.

Layered cultural distance intensified this effect. Had the workshop involved Chinese type in Taiwan, students might have relied on cultural heritage narratives. Instead, European type in Japan offered no such interpretive shortcut.

Students began closely examining wear patterns, ink adhesion, and variations between individual letters. One student compared two specimens of the letter "N," observing differences

caused by decades of use. What initially appeared as imperfection gradually became legible as historical trace.

Figure 5
Comparison of Two Specimens of the Same Letter, Highlighting Variation Caused by Repeated Use Over Time

This shift transformed how students interpreted wear. Rather than viewing worn type as broken tools, they came to see it as evidence of real use in books, posters, and public communication. As one student reflected:

"The wear isn't damage. It proves typography is something people actually do, not just something that appears on screens."

Finding 3: Multi-sensory Engagement Creates Durable Embodied Memory

The most striking findings emerged in follow-up interviews conducted weeks after the workshop. Students recalled the letterpress experience with exceptional sensory detail, and these memories actively informed later digital practice.

Students described tactile sensations, weight, smell, sound, and bodily effort with vivid specificity. One recalled the density of the wooden blocks; another described the mechanical rhythm of the press, noting that the sound still surfaced during later design decisions.

These memories proved more durable than those associated with other workshop activities. While students struggled to recall details from calligraphy or craft sessions, letterpress experiences remained vivid—wood texture, metal resistance, ink smell, and physical exertion.

This durability reflects the multi-sensory nature of letterpress printing, which engages touch, sight, hearing, smell, and full-body coordination. Unlike screen-based design, which privileges vision and minimal hand movement, letterpress demands continuous bodily negotiation with materials.

Crucially, embodied memory transferred back into digital practice. Students reported "feeling" spacing problems on screen before identifying them visually. One explained:

"The spacing looked okay, but it felt wrong. I remembered the resistance when the type was too tight in letterpress, adjusted the spacing, and it suddenly felt right."

Several students described imagining wooden blocks while adjusting kerning digitally. These tactile metaphors guided judgment beyond visual appearance alone, indicating that material engagement had reshaped perceptual frameworks rather than merely adding technical knowledge.

Figure 6
Student Operating the Letterpress Through Full-Body Engagement

Discussion: Rethinking Perception Through Material Engagement

The findings suggest that the significance of material engagement lies not in what students learned about letterpress printing as a technique, but in how their mode of perception was gradually altered through sustained contact with materials. Typography, which had previously appeared to them as a visual arrangement optimized on screen, began to emerge as a practice shaped by resistance, limitation, and bodily negotiation.

What became evident during the workshop was that perceptual judgment did not precede action, but arose through it. Students did not first decide what spacing should be and then execute that decision; instead, judgment formed through repeated adjustment, failure, and tactile exploration. Spacing was learned not as a rule to be applied, but as a relation that had to be worked out between hands, tools, and material constraints. In this sense, perception was not internal or cognitive alone, but distributed across bodies and materials, unfolding over time.

This shift also altered how students interpreted typographic "imperfection." Uneven ink, worn edges, and inconsistent impressions were initially experienced as technical shortcomings, measured against the visual standards of digital design. Over time, however, these same features were reinterpreted as traces of process—marks left by pressure, grain, wear, and repeated use. What changed was not the material outcome, but the framework through which it was read. Typography ceased to be evaluated solely by visual refinement and came to be understood as the visible consequence of material interaction.

The cross-cultural structure of the workshop played a critical role in enabling this perceptual reorientation. Encountering European wooden type in a Japanese setting removed the possibility of relying on familiar cultural narratives or inherited meanings. Without a ready-made interpretive frame, students were compelled to attend to what was physically present: the

weight of the type, the softness of worn corners, the uneven absorption of ink. Unfamiliarity did not function as an obstacle to understanding, but as a condition that made perception more attentive, slower, and more grounded in material specificity.

Although many students reported lasting embodied memories, the degree of transfer back into digital practice varied. A few participants described the letterpress experience as memorable but compartmentalized, noting that time pressure and interface conventions in digital tools made it difficult to fully apply embodied awareness during everyday design tasks. For these students, bodily memory surfaced mainly during reflective moments rather than during routine production.

This variation suggests that durability of embodied perception is not uniform and may depend on opportunities for reinforcement. While multi-sensory engagement can anchor perceptual memory, its integration into digital practice appears contingent on repeated recall and contextual alignment. Embodied memory thus operates as a latent resource that may remain inactive unless conditions invite its reactivation.

Perhaps the most revealing aspect of the findings lies in the persistence of these perceptual shifts. Weeks after the workshop, students recalled the letterpress experience through bodily sensations—weight, resistance, sound, smell—rather than visual images alone. These memories were not isolated from subsequent practice. Instead, they reappeared during digital design work as a felt sense guiding judgment. Students described adjusting spacing on screen not because it "looked wrong," but because it felt wrong, drawing unconsciously on memories of physical resistance and constraint.

This suggests that material engagement does not simply add another layer of experience to design education. It reconfigures how perception itself operates, introducing bodily memory as an active component of visual judgment. Digital tools remained central to students' practice, but they were no longer the sole reference point. The screen became one site of design among others, informed by experiences that originated beyond it. From this perspective, material practice does not oppose digital design; it expands the perceptual ground upon which digital decisions are made.

Conclusion

This study set out to examine whether material engagement—specifically through cross-cultural letterpress practice—can reconstruct how digital-native students perceive typography and visual form. Rather than treating letterpress as a nostalgic return to craft or a technical supplement to digital design education, the study approached material practice as a site where perception itself is negotiated, reshaped, and relearned.

The findings suggest that perception is not a stable faculty carried intact across media, but something continually configured by the conditions under which making occurs. When typography is encountered primarily through screens, it tends to be understood as a visual outcome optimized through parameters. When encountered through material resistance, bodily effort, and temporal process, it becomes legible as a practice—one that involves distance, pressure, limitation, and consequence. What changes, therefore, is not only what students know about typography, but how they come to judge, evaluate, and feel typographic form.

This shift has important implications for design education. As digital tools continue to dominate creative practice, the risk is not simply the loss of traditional techniques, but the narrowing of perceptual repertoires. Screen-based fluency can coexist with a diminished sensitivity to material difference, process, and constraint. The study suggests that material engagement, especially when intensified through unfamiliar cultural and technological contexts, offers a way to interrupt this narrowing—not by rejecting digital tools, but by expanding the perceptual ground on which digital decisions are made.

Crucially, the effects of material engagement did not remain confined to the workshop setting. Students carried embodied memories—of resistance, weight, sound, and effort—back into digital environments, where these experiences continued to inform judgment in subtle but persistent ways. This indicates that material practice functions less as an alternative medium and more as a recalibration of perception that endures beyond its original context.

The contribution of this study lies in reframing material practice as a pedagogical strategy for perceptual reconstruction rather than skill acquisition. It argues that learning to design is inseparable from learning how to perceive, and that perception itself can be redesigned through carefully structured encounters with materials. Future research might extend this inquiry by exploring other forms of material engagement, longer-term pedagogical integration, or comparative studies across cultural and technological contexts. As design education continues to evolve, the challenge is not to choose between digital and material practices, but to cultivate designers whose ways of seeing remain responsive, embodied, and open to transformation.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

In the preparation of this manuscript, AI-assisted tools were utilized for English translation and text proofreading. Specifically, Google Gemini and ChatGPT were used to refine grammar, punctuation, and phrasing for clarity and conciseness, and to check for spelling errors.

Evaluating the Impact of Online Formative Assessment on Student Performance and Perceptions: A Quasi-experimental Study From Saudi Higher Education

Hayat Alajlan, King Saud University, Saudi Arabia

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This quasi-experimental study explores the impact of online formative assessments (OFA), specifically through frequent online quizzes, on learning outcomes and student perceptions in an introductory computer education course at a Saudi Arabian university. The research involved 28 female students, divided equally into an experimental group (weekly online quizzes in addition to standard exams) and a control group (midterm and final exams only). Learning performance was measured using pre- and post-tests, while student perceptions were gathered through a structured questionnaire. Although post-test scores did not significantly differ between groups, the experimental group showed marked improvement from pre- to post-test, suggesting a positive effect of frequent quizzing on learning progression. Furthermore, students in the experimental group reported favorable perceptions of the quizzes, viewing them as helpful tools for reinforcing understanding and preparing for exams. This study contributes to the growing body of research on formative assessment by highlighting how the integration of OFA with self-regulated learning principles can promote learner autonomy and engagement—particularly within underrepresented higher education contexts such as Saudi Arabia. By bringing attention to the pedagogical value of continuous assessment in diverse cultural and institutional settings, the findings invite broader international dialogue on inclusive, context-aware strategies for enhancing student learning. Limitations include the small sample size and single-institution scope. Future research should involve larger, more diverse cohorts and examine the long-term impact of such assessment strategies across different disciplines and learning environments.

Keywords: online formative assessment, e-learning, frequent quizzes, higher education, self-regulated learning

Introduction

Enhancing the quality of learning and teaching in higher education is a continuous pursuit for professors and administrators (Gokcora & DePaul, 2018). Assessment plays a crucial role in this mission, serving as a natural component of the learning process (Andriamiseza, 2022; Baleni, 2015). Miller et al. (1998) categorized assessment in higher education into three primary types: diagnostic, formative, and summative. Although commonly grouped under the umbrella term "assessment," each type has differs in purpose and application (Northern Illinois University Center for Innovative Teaching and Learning [NIU-CITL], 2012). Diagnostic assessment helps identify students' current knowledge, skills, and misconceptions before teaching. Formative assessment offers feedback during instruction, measuring both student and instructor progress. Summative assessment occurs after learning, providing a summary of teaching and learning outcomes, as no formal learning usually takes place at this stage (Miller et al., 1998; NIU-CITL, 2012).

Formative assessment, referred to as "assessment for learning" (Centre for Education Research and Innovation [CERI], 2008), has been recognized as essential for improving teaching effectiveness, motivating students, and enhancing learning outcomes (Andriamiseza et al., 2023; Liao et al., 2024; Shao et al., 2024; Xiao et al., 2023). The essence of formative assessment lies in providing teachers and learners with constructive feedback that guides them toward achieving learning objectives (Andriamiseza, 2022). Morris et al. (2021) conducted a systematic review on the influence of formative assessment and feedback on university students' academic performance. Their findings underscored the role of feedback in education and its positive impact on the learning process.

Leveraging online formative assessments (OFA) is an effective strategy to address the growing student population in higher education, as it helps manage the increasing demand while maintaining and enhancing the quality of teaching and learning (Andriamiseza, 2022; Andriamiseza et al., 2023). OFA provides teachers with valuable feedback to adjust instructional methods and offers students immediate feedback for monitoring and enhancing their own learning progress (Mahanan et al., 2021; Morris et al., 2021; Ryan, 2024). Moreover, OFA has proven effective in promoting student engagement and improving learning performance (Chen et al., 2021; Sotola & Crede, 2021; Zainuddin et al., 2020).

Given these findings, further investigation into the implementation of OFA and their impact on learning performance and student perceptions could yield valuable insights into teaching and learning practices in higher education. Wellington et al. (2015) suggest using online quizzes tailored to university and college levels to address short-term learning delays within a semester. Similarly, Chen et al. (2021) advocate for controlled experiments to evaluate the effects of formative assessments, such as frequent quizzes and tests, on student engagement and learning outcomes across different learning settings. Sartain and Wright (2020) emphasize expanding research across diverse geographic contexts to capture broader demographic variations. Mahanan et al. (2021) also recommend developing online assessment tools that evaluate practical skills and enhance the effectiveness of OFA across STEM disciplines in higher education.

In Saudi higher education context, Almossa and Alzahrani (2022) examined assessment practices among faculty and found a decline in formative assessment usage, despite frequent feedback and alignment with learning objectives. The study also reported that most instructors rely heavily on summative assessments, such as midterm and final exams, in line

with Ministry of Education regulations that assign 40% of grades to final exams and 60% to mid-term exams and coursework.

Building on these insights, this study explores the impact of OFA, specifically through frequent online quizzes, on students' learning performance and perceptions in a computer education course in Saudi higher education. The main research question is: *What is the impact of online formative assessments, specifically online frequent quizzes, on student learning performance and perceptions in higher education?* Findings of this study are expected to help educators make informed decisions, adjust instructional strategies, refine curricula, and provide targeted support to students, thereby promoting effective and evidence-based teaching practices in higher education.

Literature Review

Formative vs. Summative Assessments

Assessment plays a crucial role in understanding how students learn and determining whether teaching methods effectively achieve intended learning outcomes (Morris et al., 2021). Summative assessment evaluates student learning against specific standards, while formative assessment provides instructors with ongoing feedback to assess the effectiveness of their teaching and helps students monitor their own learning progress (Eberly Center [EC], 2024). Both types assess students' performance, yet they differ in purposes: summative assessment focuses on evaluating learning outcomes, while formative assessment aims to facilitate learning processes. Summative assessment typically covers a broader scope of student learning compared to formative assessment (Mahanan et al., 2021).

On the one hand, summative assessment is designed to evaluate and measure students' overall understanding and performance at the end of an instructional period, such as a semester or academic year. Midterm and final examinations are commonly used summative tools, as they assess students' cumulative knowledge and skills gained throughout the course (CERI, 2008; NIU-CITL, 2012). On the other hand, formative assessment is an ongoing process including frequent, interactive assessments of students' development and understanding, with the goal of identifying learning needs and adjusting instruction accordingly (CERI, 2008). This approach provides continuous feedback and information during instruction, facilitating both the monitoring of student progress and the evaluation of teaching effectiveness (NIU-CITL, 2012). Notably, these activities typically carry minimal or no grading weight and may not directly influence a student's final grade (NIU-CITL, 2012; EC, 2024).

Traditional assessment methods, such as midterm and final exams, remain prevalent due to their cost efficiency and ease of grading (Sotola & Crede, 2021). However, such summative assessments offer limit insight into the learning process, restricting opportunities for students to apply newly acquired knowledge. In contrast, formative assessment emphasize ongoing learning, helping identify gaps and misconceptions before final evaluations. It provides students with opportunities to practice skills and test their understanding without the pressure of grades (CERI, 2008; NIU-CITL, 2012; Morris et al., 2021). However, data gathered from summative assessments can serve a formative purpose when students or faculty use the results to inform in future instruction or guide learning strategies (EC, 2024).

The Role of Online Formative Assessment in Higher Education

OFA is defined as "all the processes involved in obtaining information about students' learning output to improve learning through giving timely feedback within a web-based learning environment" (Mahanan et al., 2021, p. 53). Different terms have been used to describe OFA, including e-formative assessment, formative e-assessment, web-based assessment, web-based assessment for learning, and online assessment for learning (Mahanan et al., 2021). Despite differences in terminology, all refer to integration of technological tools or platforms to facilitate assessment process (Sudakova et al., 2022). Digital technology plays a crucial role in creating effective, efficient, and secure assessments that advance student education (Ryan, 2024).

OFA offers several advantages, contributing to a more dynamic and responsive approach to teaching and learning. It is beneficial for both students and teachers. For teachers, OFA reduces grading time and administrative workload associated with recording and compiling marks (Baleni, 2015; Mahanan et al., 2021; Pishchukhina & Allen, 2021; Sotola & Crede, 2021). This efficiency allows educators to allocate more time to teaching, providing feedback, and addressing individual learning needs, thereby promoting a more productive classroom environment. Additionally, OFA enables continuous monitoring of student progress, helping instructors to identify areas of strength and weakness and to modify their teaching strategies accordingly (Mahanan et al., 2021; Pishchukhina & Allen, 2021).

Meanwhile, students benefit from OFA through prompt and comprehensive feedback, facilitating uninterrupted learning compared to traditional classroom-based methods (Baleni, 2015; Mahanan et al., 2021; Morris et al., 2021; Pishchukhina & Allen, 2021). For students, this ongoing feedback promotes reflection on their own learning, encourages active engagement, and supports timely intervention to enhance understanding and academic performance (Mahanan et al., 2021; Pishchukhina & Allen, 2021). OFA offers numerous advantages for students, including increased engagement and motivation (Chen et al., 2021; Dalby & Swan, 2018; Shao et al., 2024; Sotola & Crede, 2021; Wellington et al., 2015; Xiao et al., 2023; Zainuddin et al., 2020), flexibility in assessments timing and location (Baleni, 2015), and ongoing support for learning (Bostrom & Palm, 2024; Xiao et al., 2023). It also helps reduce test anxiety (Sudakova et al., 2022), promotes consistent attendance (Gokcora & DePaul, 2018), and fosters creativity (Shao et al., 2024). Furthermore, OFA promotes knowledge retention (Lubrick & Wellington, 2022; Sotola & Crede, 2021) by providing continuous opportunities to review and apply concepts, thereby preparing students more effectively for summative assessments. This preparation builds students' confidence and competence, leading to improved performance in midterms and final examinations (Sartain & Wright, 2020). Moreover, effective OFA supports a student-centered learning environment by offering personalized formative feedback and promoting meaningful engagement with course content (Baleni, 2015; Morris et al., 2021).

OFA has been implemented in higher education through various methods, including discussion forums, tasks, quizzes, and tests (Baleni, 2015; Chen et al., 2021; Gokcora & DePaul, 2018; Lubrick & Wellington, 2022; Pishchukhina & Allen, 2021; Wellington et al., 2015; Zainuddin et al., 2020). Among these, quizzes are widely used in university courses, providing rapid and immediate feedback that support formative learning (Chen et al., 2021; Gokcora & DePaul, 2018; Lubrick & Wellington, 2022; Mahanan et al., 2021; Pishchukhina & Allen, 2021). Sotola and Crede (2021) conducted a meta-analysis examining the impact of frequent quizzes on students' academic performance and found that in-class quizzes serve as

valuable teaching aids, moderately enhancing both performance and learning outcomes. Quizzes enable instructors and students to monitor comprehension, predict final exam achievement, and may contribute to lowering dropout rates. Furthermore, Gokcora and DePaul (2018) noted that frequent quizzes encourages regular class attendance and fosters productive learning habits that establish a more engaging learning experience.

Theoretical Framework

This study is grounded in the theory of self-regulated learning (SRL), which emphasizes learners' active role in directing and managing their own learning processes. SRL theory posits that students who actively assess and monitor their learning strategies develop stronger autonomy and a deeper sense of ownership over their educational outcomes (Cain & Fanshawe, 2020; Pishchukhina & Allen, 2021). Integrating OFA through frequent quizzes supports these process by enabling students to assess their understanding, receive immediate feedback, and make timely improvements. In this study, OFA is viewed as a mechanism to enhance students' self-efficacy and metacognitive skills, empowering them to understand and apply feedback effectively. This approach redefines teacher and student roles towards fostering a student-centered environment where self-assessment and continuous and immediate feedback play pivotal roles in improving learning performance (Pishchukhina & Allen, 2021).

Methodology

This study employed a quasi-experimental design to examine the impact of OFA, specifically frequent online quizzes, on students' learning performance and perceptions. The design included experimental and control groups, with both groups completing pre- and post-tests to compare performance before and after the intervention.

Research Context

This study was conducted in the female section of King Saud University (KSU) in Riyadh, Saudi Arabia, where classes are taught by female instructors in person or by male instructors through closed-circuit television or virtual classrooms. All KSU students use the university's learning management system (LMS), Blackboard, which supports on-campus learning by enhancing student engagement and academic performance. The research took place in an undergraduate computer education course during the second semester of 2023 academic year, spanning 16 weeks. The course included weekly 60-minute sessions focusing on technology-enhanced learning and fundamental teaching aspects. The course had 32 female students, most in their first or second year (KSU-Statistics, 2023).

Participants

The study included 28 female students enrolled in two classes, both taught by the same instructor. The classes were randomly assigned to an experimental group (n = 14) and a control group (n = 14). The control group, referred to as the "non-quizzing" group, followed a traditional summative assessment approach consisting of two midterm exams and a final exam. In contrast, the experimental group, or the "quizzing" group, completed the same summative assessment but also participated in twelve online quizzes administered throughout the semester as formative assessment. These quizzes were designed to provide continuous feedback, encourage consistent study habits, and support self-regulated learning.

Research Instruments

The study employed two quantitative instruments: pre- and post-achievement tests to assess and compare learning performance between groups, and a structured questionnaire to examine the experimental group's perceptions of the online frequent quizzes.

Achievement Evaluation

Examinations and achievement tests are recognized tools for evaluating students' knowledge, proficiency, and learning performance in a subject or educational program (Hanif et al., 2017; Mamolo, 2021). Therefore, a 30-item multiple-choice achievement test was developed for this study, accompanied by an answer key for standardized grading. The questions were evenly distributed across the main topics covered in the course to ensure balanced content representation. Both the pre-test and post-test were administered using an online survey platform (Google Forms).

Ensuring the validity and reliability of the test was a key consideration. Validity refers to the degree to which an instrument accurately measures the intended construct (Creswell & Creswell, 2018) and can be established through careful item development, sampling, and expert review (Basit, 2010). To confirm content validity, five faculty members who taught similar computer education courses reviewed the test, and their feedback was incorporated to refine and adjust the items as needed. Reliability, which indicates the consistency of test results under comparable conditions (Creswell & Creswell, 2018), was examined using the Spearman–Brown prophecy formula. The resulting reliability coefficient (rSB = 0.692) was deemed acceptable for research purposes.

Perceptions Questionnaire

The perceptions questionnaire was developed based on a review of relevant literature (Chen et al., 2021; Gokcora & DePaul, 2018), which provided theoretical and empirical foundations aligned with the focus of this study. Insights drawn from the literature guided the formulation of the questionnaire items to ensure relevance and construct alignment.

The questionnaire, written in Arabic, comprised 20 statements designed to capture students' perceptions of online quizzes. It was divided into four sections: (1) perceived usefulness of frequent quizzes for learning (6 items), (2) effectiveness in exam preparation (4 items), (3) quiz design and structure (4 items), and (4) overall experience and approach to online quizzing (6 items). Responses were collected using a five-point Likert scale ranging from "strongly agree" (SA) to "strongly disagree" (SD).

To ensure content validity, the instrument was reviewed by the same five faculty members who evaluated the achievement test, and their feedback was used to refine the wording and clarity of the items. For reliability, a pilot version of the questionnaire was administered to a representative sample of students to confirm comprehension of items and response options. Minor revisions were made based on their feedback, and these participants were excluded from the main study sample.

Online Frequent Quizzes Format

The online quizzes for the experimental group were tailored to the specific course content and administered via the LMS at the start of each class. The LMS was chosen for its accessibility through the university's website and mobile app, and its ability to provide immediate, detailed feedback. Each quiz lasted about 5–10 minutes and included around ten multiple-choice, true/false, or short-answer questions focused on the topics and skills from the previous lecture to reinforce learning and maintain content continuity.

Following each quiz, students received an automated score indicating the number of correct answers, accompanied by immediate written feedback that clarified any misunderstandings or misconceptions that could hinder their learning progress. The quizzes, designed as a formative assessment tool, provided students with valuable insights into their level of understanding while offering instructors diagnostic information about areas of confusion and difficulty. This dual function enabled students to track their performance and allowed instructors to adjust instructional strategies to target specific learning challenges. On average, students achieved a mean score of 69%, with approximately 62% obtaining full marks.

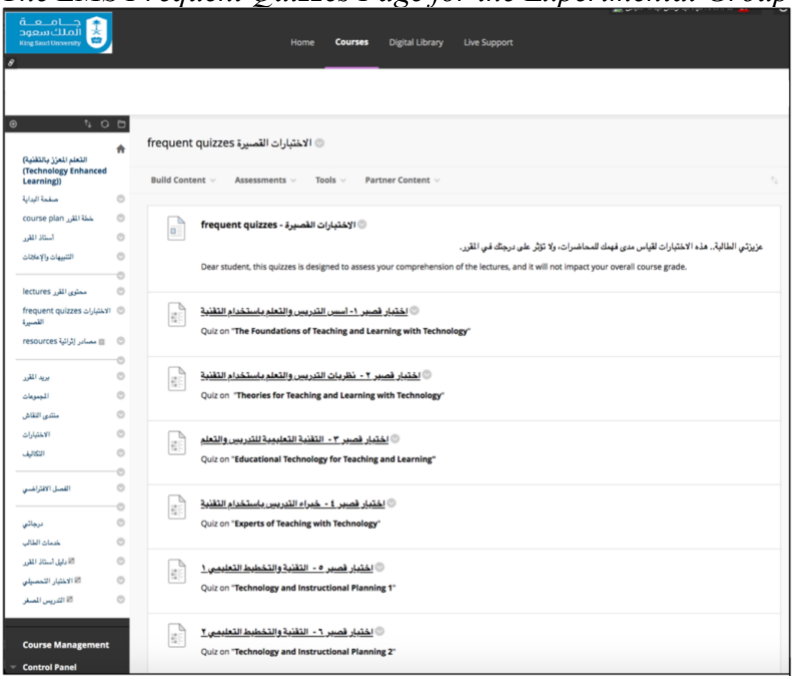
Study Procedures

The study began with a pre-test administered for both the control (non-quizzing) and experimental (quizzing) groups to assess their prior knowledge. Throughout the semester, both groups received lecture-based instruction, used the university's LMS (Blackboard) to complete course requirements, and took three paper-based summative exams: two midterm exams and one final exam. In addition, the experimental group completed twelve online quizzes, one each week beginning in the second week of the semester. These quizzes were not scheduled during exam weeks and remained accessible on the LMS throughout the term, allowing students to review and revisit them as needed.

At the end of the semester, both groups completed a post-test to evaluate their learning performance. The experimental group also completed a perceptions questionnaire regarding the frequent online quizzes. The questionnaire was administered anonymously through Google Forms, and students were given time during class to complete it to ensure high response rates. Figure 1 displays the LMS page showing the weekly quizzes for the experimental group, while Figure 2 provides an example of one of the online quizzes.

Figure 1

The LMS Frequent Quizzes Page for the Experimental Group



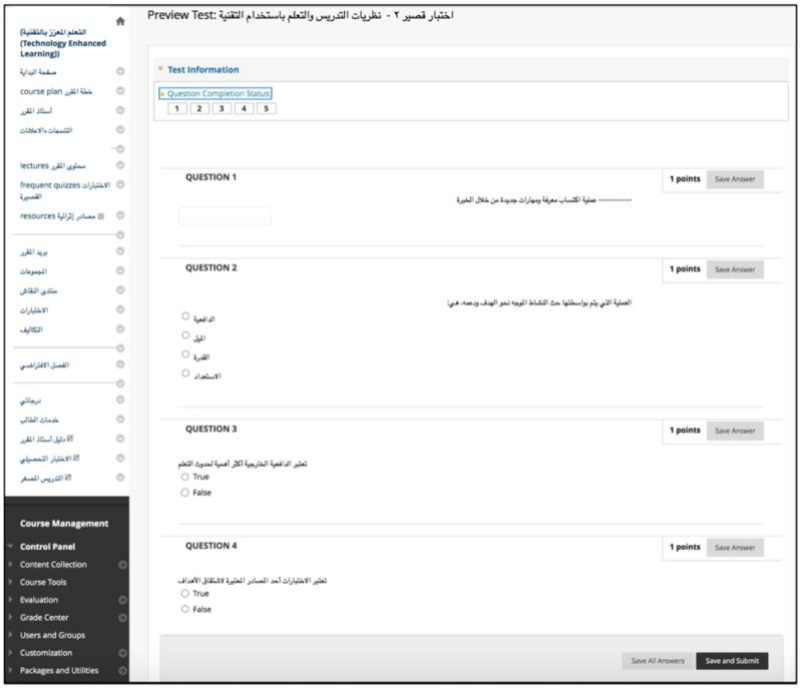


Figure 2

Example of A Frequent Online Quiz in LMS for the Experimental Group

Data Analysis

Descriptive and inferential statistical analyses were used to evaluate the achievement test data. Mean (M) and standard deviation (SD) were calculated to describe the data. Independent samples t-tests were conducted to compare pre-test and post-test scores between the experimental and control groups, while paired samples t-tests were used to examine within-group differences. All analyses were performed using SPSS software.

For the perceptions questionnaire, descriptive statistics were applied to analyze the experimental group's responses regarding the online frequent quizzes. Data collected via Google Forms were exported to SPSS, which computed frequencies, percentages, means, and standard deviations for each item.

Ethical Considerations

Ethical research approval to conduct this study was granted from the Ethics of Human and Social Research Committee at KSU (KSU-HE-24-672). In accordance with the ethical research guidelines proposed by Petousi and Sifaki (2020), informed consent was obtained from all participants prior data collection. Participants were assured of the anonymity and confidentiality of their responses and informed of their right to withdraw from the study at any stage without the need to provide justification.

Results and Discussion

Impact of OFA on Students' Learning Performance

An analysis of students' prior knowledge was conducted to determine whether any initial differences existed between the groups. As shown in Table 1, the results of the pre-test indicated no statistically significant differences between the two groups, confirming that they possessed comparable baseline knowledge of the course content. At the end of the treatment period, the post-test analysis also showed no significant difference in mean scores between the groups. Both groups achieved relatively high scores, with only minor variations in learning performance.

Table 1
Independent Samples t-Tests for Experimental vs. Control Groups in Achievement Tests

Test	Group	n	M	SD	T	P
Pre-test	Control Group (non-quizzing)	14	17.4285	3.7357	0.6928	0.4946*
	Experimental Group (quizzing)	14	16.5000	3.3454		
Post-test	Control Group (non-quizzing)	14	17.9285	4.1410	-0.9281	0.3619*
	Experimental Group (quizzing)	14	19.5714	5.1696		

* By conventional criteria, this difference is considered to be not statistically significant.

To clarify the study's results, paired samples t-tests were conducted to examine within-group changes between pre- and post-test scores for both groups, as presented in Table 2.

Table 2
Paired Samples T-tests Comparing of Pre-test and Post-test Scores for Both Groups

Group	Test	n	M	SD	T	P
Control Group (non-quizzing)	Pre-test	14	17.4285	3.7357	0.5838	0.5693*
	Post-test	14	17.9285	4.1410		
Experimental Group (quizzing)	Pre-test	14	16.5000	3.3454	2.3058	0.0382**
	Post-test	14	19.5714	5.1696		

* By conventional criteria, this difference is considered to be not statistically significant.
** By conventional criteria, this difference is considered to be statistically significant.

The analysis of the data in Table 2 showed no statistically significant difference at the 0.01 level between the pre-test and post-test scores for the control (non-quizzing) group. In contrast, the experimental (quizzing) group demonstrated a statistically significant improvement, suggesting that the use of online frequent quizzes contributed to the enhancement of students' learning performance. This finding is consistent with previous studies such as Dalby and Swan (2018) and Zainuddin et al. (2020), which similarly reported that frequent quizzes can support higher academic performance and skill development. However, it is important to note that Atia et al. (2018) found that frequent quizzes did not yield consistent benefits across all settings, indicating that factors such as instructional context, quiz design, and implementation strategies may influence their effectiveness.

Impact of OFA on Students' Perceptions

The study revealed that experimental group students agreed that the online frequent quizzes positively contributed to their learning process, provided an engaging and stimulating learning experience, and were an effective method for understanding the course content. They also felt that the quizzes met their learning needs, motivated them to be more attentive during lectures, and facilitated the completion of course requirements, such as in-class activities and homework. Table 3 shows the descriptive statistics for the first section of the perception questionnaire, with an overall mean of 4.48, indicating a positive view on the usefulness of online frequent quizzes for enhancing course learning. These results concur with Gokcora and DePaul (2018), who discovered that frequent quizzes encourage students to attend classes more consistently and create a productive classroom routine that promotes positive learning behaviors.

Table 3
Students' Perception of the Effectiveness of Online Frequent Quizzes in Improving Course Learning

How strongly do you agree with these statements? (5= Strongly Agree, 4= Agree, 3= Neutral, 2 = Disagree, 1 = Strongly Disagree)	M	SD
Q1: The online frequent quizzes in this course are aligned with my learning needs.	4.50	0.732
Q2: The online frequent quizzes in this course offer an engaging and stimulating learning experience.	4.57	0.631
Q3: The online frequent quizzes in this course contribute to my learning process.	4.57	0.631
Q4: The online frequent quizzes in this course proved to be an effective method for comprehending the course content.	4.57	0.739
Q5: The online frequent quizzes in this course help me fulfill the course requirements easily (e.g., in-class activities, homework).	4.21	0.833
Q6: The online frequent quizzes in this course motivate me to pay closer attention during lectures for successful completion	4.50	0.732
Mean	4.48	

In terms of the effectiveness of online frequent quizzes for exam preparation, students expressed agreement that the quizzes were advantageous for reviewing course material before

exams. They reported that the quizzes helped save time and effort compared to other regular courses and offer valuable exam practice opportunities that contributed to increased confidence during exams. Table 4 presents the descriptive statistics for the second section of the perception questionnaire, with an overall mean of 4.39, indicating a positive view of online frequent quizzes for exam preparation. The findings align with the view that OFA are effective for preparing students for summative assessments (Lubrick & Wellington, 2022; Sotola & Crede, 2021). Formative assessment enhances self-confidence in learning (Shao et al., 2024; Stitch, 2024) and helps build competence in the subject matter, which in turn improves performance in midterms and final exams (Gokcora & DePaul, 2018; Sartain & Wright, 2020).

Table 4
Students' Perception of the Effectiveness of Online Frequent Quizzes in Exam Preparation

How strongly do you agree with these statements? (5= Strongly Agree, 4= Agree, 3= Neutral, 2 = Disagree, 1 = Strongly Disagree)	M	SD
Q7: The online frequent quizzes in this course were beneficial for reviewing before exams compared to other regular courses (without frequent quizzing).	4.43	0.623
Q8: The online frequent quizzes in this course saved me time and effort in preparing for exams compared to other regular courses.	4.43	0.623
Q9: The online frequent quizzes in this course provided me with opportunities to practice for exams compared to other regular courses.	4.36	0.772
Q10: The online frequent quizzes in this course increased my confidence when taking exams compared to other regular courses.	4.36	0.772
Mean	4.39	

Additionally, students expressed favorable views on the design of the online frequent quizzes, finding them well-structured, clearly defined, and appropriately designed. They also deemed the online tool used for the quizzes as suitable and felt that the quizzes' length and frequency were appropriate. Chen et al. (2021) similarly found that students had positive perceptions of OFA, indicating that the instruction design was well-received. Table 5 presents the positive feedback from the experimental group students regarding the quiz design (the third questionnaire section), with an overall mean score of 4.30.

Table 5
Students' Perception on the Design of the Online Frequent Quizzes

How strongly do you agree with these statements? (5= Strongly Agree, 4= Agree, 3= Neutral, 2 = Disagree, 1 = Strongly Disagree)	M	SD
Q11: The length of the quizzes was suitable.	4.21	0.739
Q12: The frequency of the quizzes was appropriate.	4.21	0.641
Q13: The online tool used for the quizzes was suitable.	4.29	0.886
Q14: The quizzes were well-designed, clearly-defined and well-structured.	4.50	0.732
Mean	4.30	

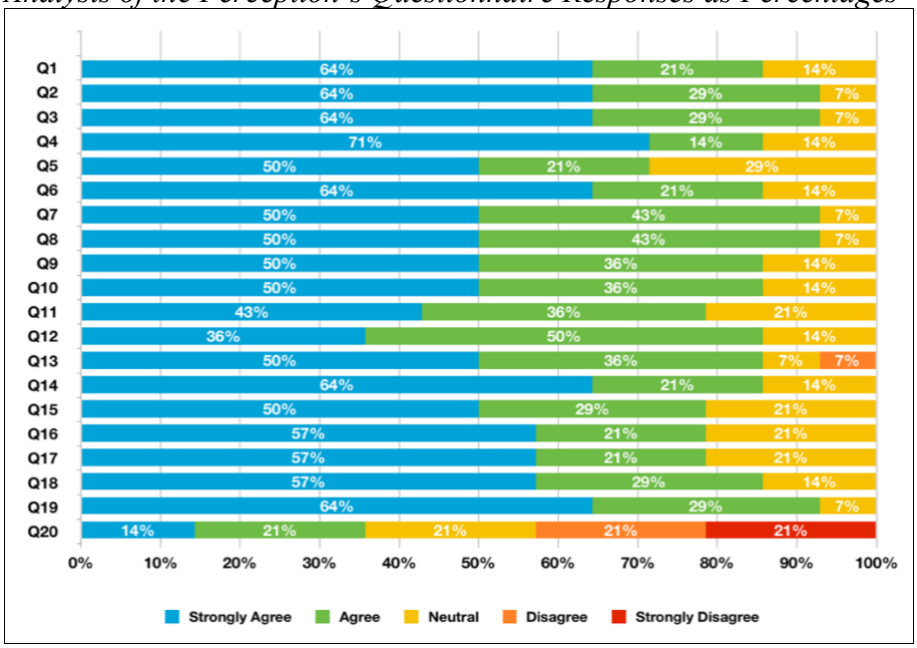
Students' also expressed positive opinions of the online frequent quizzes approach, viewing it as an effective learning tool and supporting its use in other courses. They indicated willingness to enroll in courses that adopt a similar method. However, they remained neutral regarding whether the approach required excessive time and effort. Table 6 shows an overall mean of 4.19 for the last questionnaire section regarding the online frequent quizzes approach.

Table 6
Students' Perception of the Online Frequent Quizzes Approach as a Whole

How strongly do you agree with these statements? (5= Strongly Agree, 4= Agree, 3= Neutral, 2 = Disagree, 1 = Strongly Disagree)	M	SD
Q15: I found taking quizzes in this course to be engaging.	4.29	0.795
Q16: I found taking quizzes in this course to be enjoyable.	4.36	0.882
Q17: I would be open to enrolling in another course that employs the same frequent quizzes approach as this one.	4.36	0.882
Q18: The frequent quizzes approach used in this course would be beneficial to apply in other subjects.	4.43	0.729
Q19: The frequent quizzes approach is an effective learning method.	4.57	0.631
Q20: The frequent quizzes approach does not require excessive time and effort	3.14	1.5
Mean	4.19	

Overall, the study revealed that students in the experimental group expressed positive perceptions of OFA. Table 7 shows a mean score of 4.34 across all sections of the perception questionnaire, indicating a generally favorable view of the frequent online quizzes used in their computer education course. These findings are consistent with previous studies, such as Gokcora and DePaul (2018), Baleni (2015), and Chen et al. (2021), which reported that students appreciated frequent quizzes for their role in boosting confidence and understanding of course material.

Table 7
The Perception Questionnaire Mean Score



Sections of the perception questionnaire	no. of items	M
Section 1: the effectiveness of online frequent quizzes in improving course learning	6	4.48
Section 2: the effectiveness of online frequent quizzes in exam preparation	4	4.39
Section 3: the design of the online frequent quizzes	4	4.30
Section 4: the online frequent quizzes approach as a whole	6	4.19
Mean	20	4.34

Analysis of the perception questionnaire data showed that more than 82% of students in the experimental group responded with "strongly agree" or "agree" to the majority of perception items. However, one response was "disagree" for "The online tool used for the quizzes was

suitable," and six responses were "disagree" or "strongly disagree" for "The frequent quizzes approach does not require excessive time and effort," as illustrated in Figure 3.

Figure 3

Analysis of the Perception's Questionnaire Responses as Percentages

Conclusion

This study contributes the literature on formative assessment by examining the perceptions and performances of female students in Saudi higher education, a group that has been underrepresented in previous research. It provides evidence of how integrating SRL principles with OFA can support learning outcomes and encourage self-regulation in higher education settings that are transitioning towards more student-centered approaches. The findings also offers insights that may be relevant to similarly structured or underexplored educational contexts.

The integration of SRL theory with OFA has practical implications for teaching practices in higher education. SRL highlights the importance of students monitoring and managing their own learning (Cain & Fanshawe, 2020; Pishchukhina & Allen, 2021), which is facilitated by frequent quizzes that offer timely feedback. Online frequent quizzes, as a form of OFA, help students develop self-assessment skills, strengthen confidence, and take a more active role in their learning. For teaching practices, this approach supports a shift towards a student-centered model where quizzes function not only as assessment tools but also as ongoing sources of feedback and guidance. This shift aligns with current educational priorities in Saudi Arabia (OECD, 2020), supporting environments that promote engagement, self-efficacy, and personalized learning.

Methodologically, this study adds to existing knowledge by using a quasi-experimental design with pre- and post-tests, complemented by student perception data. This combination provides a broad view of both learning performance and student experiences. Conceptually, the study positions online frequent quizzes as more than assessment tools; as mechanisms that encourage metacognitive skills such as goal-setting and reflective thinking. This

perspective aligns with current directions in higher education, where active and technology-supported learning is increasingly emphasized.

To extend the global discussion on formative assessment, future research should investigate the long-term effects of frequent quizzes across different courses, disciplines, and cultural contexts. Further studies exploring various forms of formative assessment and their influence on both learners and instructors would deepen understanding of how these practices support SRL. Practically, integrating frequent quizzes can enhance self-regulation skills and improve learning outcomes when implemented systematically.

Despite its contributions, this study has several limitations, including a small sample from one institution, possible differences in student characteristics, and reliance on self-reported data. Addressing these limitations in future studies will provide a more comprehensive understanding of how online frequent quizzes influence learning and perceptions in broader educational settings and contribute to refining practices that support SRL.

Can AI Teach Like Socrates? An Exploratory Study of AI-Student Dialogue in Secondary Physics Education

Krishan Sanjay Mahesh, Whitley Secondary School, Singapore

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

While generative artificial intelligence (GenAI) holds considerable promise for education, concerns remain that when used primarily for answer retrieval, it may encourage cognitive offloading rather than meaningful learning. This classroom-based study explores an alternative application of GenAI: whether a custom Retrieval-Augmented Generation (RAG) chatbot can engage students in Socratic dialogue to support deeper conceptual understanding in secondary physics. Nineteen Secondary 4 students in Singapore interacted with a RAG chatbot during a one-hour thermal physics lesson as part of their preparation for the GCE Cambridge O-Level examination. A thematic analysis of the chat transcripts uncovered three prominent patterns of interaction: identifying and addressing student misconceptions, scaffolding support for students with lower conceptual readiness, and challenging more advanced learners to deepen their learning. The chatbot delivered immediate and individualised feedback at scale, enabling dialogic interactions that are often unfeasible for teachers to conduct with multiple students in a typical classroom setting. However, the quality of these interactions was highly dependent on student input. In cases where students provided vague or tangential responses, the chatbot tended to shift towards more explanation-driven replies, limiting opportunities for sustained Socratic dialogue. These findings highlight the potential of AI tutoring systems to facilitate Socratic dialogue in secondary physics education. They also underscore the need for AI design principles that incorporate diagnostic questioning and adaptive scaffolding, as well as instructional strategies that equip students to engage meaningfully with AI tools in education.

Introduction

Edtech Development in Singapore

The integration of educational technology into schools has evolved significantly over the past several decades. From early visual aids such as overhead projectors in the 1960s, to the introduction of personal computers and educational software in the 1980s and 1990s, and the rise of the internet in the late 1990s and early 2000s, educational technology has undergone successive waves of development. These developments enabled the widespread adoption of online resources, and learning management systems (LMS) which have since become foundational for instructional delivery, assignment submission, and teacher-student communication (Januszewski, 2001). The greater accessibility of personal computing devices has further driven the integration of educational technology, particularly in secondary education.

In Singapore, the Ministry of Education (MOE) has actively shaped this trajectory through state-led initiatives. The Ministry of Education, in partnership with the Government Technology Agency developed and deployed Student Learning Space (SLS), a learning management system to provide curriculum resources to support teaching and learning in school (Government Technology Agency, 2025a). The COVID-19 pandemic accelerated the use of SLS for home-based instruction, as school closures during government-mandated lockdowns created an urgent need for remote learning (Tan & Chua, 2023). The distribution of personal learning devices to all secondary school students, as part of the Ministry's national digital literacy programme, significantly increased access to digital tools and facilitated the integration of educational technology into mainstream teaching (Ministry of Education, 2020a). The increased reliance on educational technology during the COVID-19 pandemic has led to its sustained integration into Singapore's education system, marked by the adoption of blended learning and the adoption of regular home-based learning in secondary schools and junior colleges (Ministry of Education, 2020b).

Increasing Use of Artificial Intelligence in Education

In parallel with these developments, educational technology continues to evolve rapidly, with artificial intelligence (AI) emerging as a prominent focus. Globally, there is growing interest in integrating AI into education (Chen et al., 2020). In Singapore, this trend is reflected in the MOE's EdTech Masterplan 2030, which explicitly aims to incorporate AI tools within the SLS platform (Ministry of Education, 2023). AI tools such as adaptive learning systems and AI feedback assistants have been deployed within SLS to allow for classroom teaching to be augmented by AI-generated feedback and more personalised learning pathways to cater to individual student needs (Government Technology Agency, 2025a).

Beyond institutional platforms, generative AI tools such as large language models are being adopted informally by students themselves. Recent reports indicate that secondary school students in Singapore are increasingly engaging with generative AI for homework and assignments, with a majority of them regularly using these tools for academic work (Paulo, 2025). While these tools offer convenience, over-reliance on AI-generated outputs raises concerns about cognitive offloading and the erosion of thinking skills (Gerlich, 2025). Without critical engagement with AI-generated outputs, students risk bypassing the cognitive processes essential for learning. These concerns are echoed at the tertiary level, with empirical findings, such as those from Anthropic's study of university-level student interactions with large

language models revealing that nearly half of student-AI dialogues involve seeking direct answers with minimal conceptual engagement (Handa et al., 2025). Such patterns raise concerns that AI tools, when used in education, may serve more as a cognitive crutch, replacing rather than encouraging the cognitive labour that is essential for learning. Naturally this leads to fundamental questions about whether the integration of AI technologies in education will help students learn better, or if they serve as substitutes for thinking itself.

Research Question

This study is motivated by concerns about students' overreliance on AI tools and the consequent outsourcing of thinking and proposes the possibility of a different approach to such use of generative AI in education: not as a means of providing answers, but as a tutor that fosters cognitive engagement by asking questions. Specifically, the research examines whether an AI chatbot can be designed to engage students in dialogue using the Socratic method, a pedagogical approach grounded in eliciting reasoning through sustained questioning. The Socratic method in teaching originates from the Socratic dialogues recorded by Plato where the Greek Philosopher Socrates would ask a series of questions, prompting his dialogic partner to think deeply about the subject matter and what they know rather than passively receiving answers (Delic & Bećirović, 2016). Socratic questioning promotes student motivation, encouraging them to seek out new knowledge and can lead to significant improvements in student engagement and understanding, particularly in the context of science education (Omar, 2009).

This paper explores the possibility of using an AI chatbot as a tutor that engages in dialogue with students using the Socratic method to guide students to deeper conceptual understanding in Physics. Such an approach centres the role of an AI chatbot as a dialogic partner with the ultimate aim of promoting deeper conceptual understanding. To investigate this potential, the study explores two research questions:

1. Can we use an AI chatbot to engage students with Socratic questioning instead of providing solutions?
2. What patterns of dialogue emerge in these AI-student interactions?

Understanding the nature of these interactions is critical not only for evaluating the educational effectiveness of AI chatbots in tutoring, but also for informing educators about the pedagogical strategies needed to integrate AI meaningfully into classroom instruction.

Methodology

The study was conducted with a cohort of nineteen Secondary 4 students in a Singapore secondary school who were part of a targeted support programme aimed at preparing them for the General Certificate of Education (GCE) O-Level Physics examination. These students participated in a one-hour supplementary lesson as part of the intervention. The objective of this lesson was to strengthen student competencies in assessment Objective B of the O-level Physics syllabus, which emphasizes the application of scientific principles to novel scenarios through logical reasoning and problem-solving (MOE & Cambridge University Press & Assessment, 2024).

The following subsections describe the instructional materials and methods used in the study, including the physics worksheet, the design of the AI chatbot, instructions for students, and the procedures for data collection and analysis.

Worksheet on Thermal Physics

As part of the targeted support programme, students were given a worksheet (Figure 1) comprising a three-part question focused on core thermal physics concepts on the kinetic model of matter and pressure. These questions were deliberately selected for their emphasis on conceptual understanding and qualitative reasoning as they do not require the use of mathematical equations or diagrammatic representations, thereby allowing responses and feedback to be typed out in natural language. This design decision ensured compatibility with the AI chatbot's text-based interface.

Note. Adapted from Physics Matters Structured and Free-Response Questions (Cha et al., 2025)

AI Chatbot

Students were instructed to interact with an AI chatbot (Figure 2) during the lesson whenever they encountered difficulties or wished to assess their understanding of key physics concepts. The chatbot was built using a Retrieval-Augmented Generation (RAG) architecture through Edcafe AI, an online AI toolkit designed for educators. Unlike conventional large language models (LLMs), a RAG-based system retrieves information from a teacher-curated knowledge

base, allowing it to respond with greater accuracy and contextual relevance, minimising the likelihood of generating inaccurate or irrelevant responses commonly referred to as "hallucinations" (Church et al., 2024). The chatbot's knowledge base comprised the worksheet questions and corresponding teacher-provided model answers. This design feature constrained the chatbot's responses to verified instructional material, balancing the need for teacher oversight with the goal of providing students with timely and targeted responses. By embedding teacher expertise into the AI's retrieval process, the system aimed to minimise the hallucinatory risks commonly associated with open-ended AI responses.

Figure 2
AI Chatbot Interface

To align the chatbot's behaviour with the goal of fostering Socratic dialogue, a custom prompt was provided to the chatbot (Figure 3). This prompt instructed the AI to engage students by asking follow-up questions, encouraging explanation, and avoiding the provision of direct answers.

Figure 3
Prompt to Chatbot on Edcafe AI

You are an AI tutor designed to help students think critically and arrive at the correct answers through Socratic questioning. Your role is to guide students in answering a physics question by breaking it down into smaller, logical steps while providing appropriate scaffolds. At the end of the conversation, summarize the key takeaways to reinforce learning. Ensure that the student actively engages with the content rather than passively receiving information.

Your approach should involve:

1. Asking open-ended, thought-provoking questions that lead the student to key concepts.
2. Encouraging students to explain their reasoning at each step.
3. Providing hints if students struggle but avoiding direct answers.
4. Adapting questions based on student responses to guide them toward the correct answer.
5. Reinforcing correct reasoning and gently correcting misconceptions.

If the students ask to check their answer, only provide a comment about whether their answers are correct or incorrect without showing them how the answer is determined. The questions and answers are provided in the PDF attached.

Instructions for Students

Prior to the activity, students were given explicit instructions on how to engage with the AI chatbot as a tutoring partner. The instructions (Figure 4) were initially drafted using ChatGPT and subsequently refined to emphasize the tool's role in supporting conceptual understanding rather than providing direct answers. These instructions were communicated to the students at the start of the session and the instructions remained accessible throughout the task.

Figure 4
Instructions for Students

This AI chatbot tutor is here to support your learning by guiding you through complex physics concepts, encouraging deep thinking, and helping you refine your problem-solving approach. Follow the instructions below to make the most of this tool.

1. Understand the Purpose
    - This AI tutor is a thinking partner, not a solution provider.
    - Use the chatbot to deepen your understanding, analyse concepts, and develop explanations, rather than just finding the final answer.
2. Ask Thoughtful Questions
    - Avoid asking for direct answers. Instead, phrase your questions to enhance your reasoning. If you are stuck, try asking:
    - "Can you guide me through the reasoning behind this concept in question 1a?"
    - "Can you challenge my understanding with a follow-up question?"
    - "What are some common misconceptions about this topic, and why are they incorrect?"
    - "Can you explain this idea more simply - and then more deeply?"

- "What assumptions are we making when we use this method?"
- "Can you ask me a question to test if I really understand this?"

3. Engage in a Deep Discussion
    - Explain your thought process when asking for help.
    - If the AI responds with a question, try answering it before asking for further clarification.
4. Analyse and Reflect
    - Compare the AI's response with your own understanding. Does it align? If not, what assumptions are different?
    - Ask for alternative explanations or perspectives if something is unclear.
    - Summarize key takeaways in your own words before moving to the next step of your assignment.
5. Verify and Apply Your Learning
    - The AI can help refine your reasoning, but you must cross-check explanations with your textbook, notes, or your reliable sources like your teacher.
    - Apply what you've learned to new situations or problems to test your understanding.
6. Ethical Use & Academic Integrity
    - Use the AI as a learning tool, not a shortcut. Copying responses without understanding them defeats the purpose of learning.
    - Make sure all work done is your own and reflects your understanding.

Data Collection and Analysis

Chat logs were collected from interactions between students and the AI chatbot during a one-hour Physics lesson, after which, a qualitative thematic analysis was conducted on the transcripts. Using an open coding approach, the dialogues between students and the chatbot were examined to identify patterns related to the nature of the chatbot's question and student responses. The initial codes were then refined into broader themes that captured key features of the AI-student dialogues.

Findings and Discussion

Theme 1: Identification and Correction of Student Misconceptions

Findings

One emergent theme was the AI tutor's responses to misconceptions that students articulated during the dialogue. When students articulated misconceptions explicitly, the AI chatbot responded with corrective explanations that often acknowledged partial understanding before clarifying the scientific concepts.

Example 1. In response to a question about the relationship between the number of particles in a balloon and its internal pressure, a student stated that the "number of particles increases thus the pressure decreases" indicating a misconception about the kinetic model of matter and its relationship to gas pressure. In response, the AI Chatbot stated: "You're on the right track with the number of particles! However, when the student blows air into the balloon,

the number of particles inside the balloon actually increases, which leads to an increase in pressure, not a decrease."

Following this corrective response, the chatbot prompted the student to summarise the concepts covered in their dialogue: "Can you summarize how the increase in particle number and pressure leads to the balloon's expansion?"

Example 2. In another example, a student asks, "So the balloon expand is to increase the pressure?" indicating a misconception about the causal relationship between the expansion of the balloon and the increase in internal pressure. The chatbot responded to the student's question by stating: "Not quite! The balloon expands not to increase the pressure, but because the internal pressure is greater than the external pressure."

Discussion

These interactions indicate that the AI chatbot demonstrates the capacity to identify and address misconceptions expressed by students. The chatbot provides immediate feedback that acknowledges partial understanding before supplying a scientifically accurate explanation. However, it tends to default to explanation rather than sustaining dialogue through questioning in these interactions. By prioritising detailed explanations, the chatbot reduces opportunities for students to address misconceptions by articulating and revising their own reasoning.

According to conceptual change theory, learners must confront and reconcile conflicting mental models to revise misconceptions (Chi, 2008). While the AI provides accurate explanations, its limited use of Socratic questioning may constrain the generation of cognitive conflict necessary for such change (Chian, 2020). In the examples provided, although there were follow-up questions, they were primarily to confirm a student's understanding of an already explained concept rather than to elicit or challenge students' reasoning.

In contrast, human teachers often employ Socratic questioning strategies such as pumping, reflective toss, or constructive challenges to prompt learners to articulate and examine their own reasoning (Chin, 2007). These findings suggest that without the capacity to initiate conceptual checks through sustained questioning, the AI tutor may fall short of supporting conceptual change, even if misconceptions are explicitly addressed.

Theme 2: Scaffolded Support for Lower Readiness Learners

Findings

This theme captures how the AI chatbot provides scaffolding to support students with lower conceptual readiness. Such scaffolding takes the form of guided questioning that prompts the recall of relevant concepts and breaks complex ideas into smaller parts.

Example 1. When a student was unable to answer the first question and sought help on how to start, the chatbot posed a series of questions that targeted the conceptual foundations needed to begin answering:

> Great! Let's take a look at question 1 together. It involves a setup with a balloon and two tubes, where the balloon expands in two different experiments. Can you tell me

> what you understand about why the balloon expands in the first experiment when air is blown into tube A? What do you think happens to the air particles inside the balloon?

When the student presented a correct but incomplete answer, stating that "the volume of gas increases", but did not refer to the kinetic model of matter, the AI chatbot posed follow-up questions that redirected attention to the kinetic model of matter:

> You're on the right track! When air is blown into the balloon, the volume of gas inside the balloon does increase. Now, let's think about what happens to the air particles. As you blow air into the balloon, more air particles enter it. What do you think happens to the pressure inside the balloon as the number of air particles increases?

Example 2. In another instance, a student expressed uncertainty about the task requirements by asking "can u explain to me what qn1 part a is asking?", to which the AI chatbot provided a clarification of the question and posed further questions that directed attention to the kinetic model of matter:

> Sure! Question 1 part (a) is asking you to explain why the rubber balloon expands when the student blows air into tube A. To think about this, consider what happens to the air particles inside the balloon when more air is blown in. How do you think the number of air particles and their movement affects the pressure inside the balloon? What do you think happens to the balloon as a result?

Example 3. In a third example, when a student asked how "pressure difference lead to increase in volume?", the AI chatbot responded with a detailed explanation outlining the relationship between pressure difference and volume change:

> Great question! The pressure difference is key to understanding how the balloon expands. When the pressure inside the balloon is greater than the pressure outside, the net force from the air particles inside pushes against the walls of the balloon. This force causes the balloon to stretch and expand, increasing its volume. You can think of it like this:
>
> 1. Pressure Inside: The air particles inside the balloon collide with the walls, creating pressure. More particles mean more collisions and higher pressure.
> 2. Pressure Outside: The atmospheric pressure outside the balloon is lower than the pressure inside.
> 3. Expansion: Because of this pressure difference, the force pushing outward (from inside) is greater than the force pushing inward (from outside). This causes the balloon to expand until the pressures balance out.

Discussion

The first two examples reveal a pattern of Socratic questioning used to activate prior knowledge and elicit student reasoning. Students were unable to begin responding to the initial questions and explicitly requested assistance, and in these cases the chatbot responded with guiding questions that provided scaffolding by prompting recall of knowledge related to the particulate model of matter. Meta-analyses on computer-based scaffolding indicate that such supports can be highly effective when implemented in various forms, whether generic, or tailored to task context (Belland et al., 2017). These instances suggest that the chatbot's questioning aligns with established research on effective computer-based scaffolding.

However, the analysis also reveals a pattern of premature explanatory intervention where the chatbot abandoned its questioning strategy and defaulted to direct explanation. This shift is evident in the third example, where the student required support in drawing a connection between pressure difference and a change in volume, but rather than extending questioning, the chatbot provided a full explanatory response. This tendency to provide scaffolding in the form of detailed explanations, especially in response to brief or ambiguous student inputs, suggests that the chatbot may be assuming excessive cognitive responsibility, thereby potentially diminishing opportunities for students to articulate their reasoning and to reflect on their own understanding.

Theme 3: Challenging Students to Deepen Conceptual Reasoning

Findings

This theme captures how the AI chatbot extended support into higher order thinking by posing questions that encouraged students to apply previously learned physics principles in new contexts, particularly when students requested additional challenges or demonstrated conceptual readiness.

Example 1. When a student requested a challenging question to test their understanding, the AI chatbot responded by posing a hypothetical scenario where an additional variable is introduced:

> Imagine you have a sealed balloon filled with air. You place this balloon in a freezer, where the temperature is very low … What do you think will happen to the balloon as it cools down? Explain your reasoning using the concepts of internal pressure and particle motion.

Example 2. In another interaction, a student raised a question about the assumptions underlying an explanation provided by the chatbot by asking **"**Are we making an assumption that the temperature of the gas in the balloon remains constant?"

This question was met with a response where it listed out the assumptions made and followed up with a question focusing on the implications of these assumptions: "Considering these assumptions, how do you think they might impact the accuracy of our predictions in real-life situations?"

Example 3. This third example illustrates a case in which the chatbot was not asked to provide an additional challenge; instead, after the student provided a correct response to a question, the AI chatbot extended the interaction by posing follow-up questions that considered the implications of the concept in everyday situations: "As a follow-up challenge, can you think of a real-life situation where heating a sealed container could lead to a dangerous increase in pressure? What could happen in that scenario?" and "Can you think of any other examples in everyday life where pressure differences cause things to expand or contract?"

Discussion

The analysis revealed the AI tutor's capacity to adapt its questioning strategy to push students who explicitly requested a challenge or demonstrated conceptual readiness through confident responses. The chatbot extended the dialogue by posing questions that introduced conceptual

ideas that were not present in the original worksheet, requiring students to think more deeply and apply their conceptual understanding in new contexts. This suggests the AI chatbot's capacity to scaffold upward, progressing from recall toward higher-order reasoning, in line with Bloom's revised taxonomy (Anderson & Krathwohl, 2001). By calibrating challenge levels to student readiness, the chatbot promoted productive cognitive struggle and indicates that the AI tutor can move along the learning trajectory, scaffolding at the start, and challenging at moments of readiness.

However, while the chatbot successfully prompted deeper thinking in response to cues, these moments often depended on student-initiated signals, such as direct requests or confident responses. The chatbot was less likely to initiate prompts for higher order thinking unprompted. This reliance on student-initiated cues suggests the tool lacks a means of truly diagnosing learner readiness, which constrains its ability to proactively extend learning without explicit prompting. Such systems encourage active learner agency but require explicit student engagement to unlock their potential.

Nevertheless, these findings highlight an important strength. When students take an active role by requesting challenges, the chatbot can engage in lines of questioning that facilitate cognitive struggle and deeper reasoning. In example 2, the chatbot prompted students to examine assumptions underlying idealised scenarios to consider how these assumptions might influence real-world outcomes. In other instances, such as those in example 3, it challenged students to apply their understanding of pressure, temperature, and gas behaviour to real-life situations, analysing cause-and-effect relationships. This highlights the importance of positioning students not as passive recipients of knowledge, but as active participants in constructing understanding, as such engagement enables the chatbot to sustain meaningful conceptual challenges.

Conclusion

The findings in this study demonstrate that AI chatbots may support pedagogically sound strategies in science education, including addressing student misconceptions, providing scaffolded support for struggling learners, and extending questions for more advanced students. A key affordance of such a tool is in its capacity to deliver immediate, individualized feedback at scale. Whereas teachers face delays in reviewing and responding to student work, AI chatbots can deliver immediate feedback that enables follow-up questioning and sustained interaction. This fosters a dialogic, rather than unidirectional, approach to feedback.

Despite these strengths, the analysis also revealed critical limitations. The chatbot frequently defaulted to explanation-based feedback, taking on excessive cognitive responsibility and limiting opportunities for Socratic dialogue. This highlights a critical implication: the quality of dialogic feedback depends not only on the design of the AI chatbot, but also on the learners' capacity and willingness to engage reflectively with the chatbot. Within a constructivist framework, effective learning requires that learners articulate their reasoning and respond actively to guided questioning. This highlights that beyond the technical design of such AI chatbots, further work is required to investigate students' feedback literacy, including their ability to interpret and act upon AI-generated feedback, as well as their willingness to engage with such feedback. Furthermore, the study's scope was limited to a single AI tool within secondary physics. The text-only interface also constrained the chatbot's ability to support diagrammatic and mathematical reasoning, both essential elements in effective physics education.

Ultimately, it is essential to recognise that learning is as much a social process as it is a cognitive one. While AI can personalise content and feedback, it cannot replicate the complex ecological system of social interactions among teachers, peers, and parents that fundamentally shape learning. Teachers play an important role in the interpersonal dynamics of the learning community, with the capacity to connect with, inspire, and motivate students to facilitate learning. These elements are not easily outsourced because they remain firmly rooted in human connection. Future research should therefore examine not only the technical efficacy of AI tools but conditions under which they can be integrated into this broader ecosystem, to support, rather than displace, the human relationships at the heart of learning.

Acknowledgements

I would like to thank Whitley Secondary School for supporting this study. I am also deeply grateful to Marianne John and Keith Zhang for their critical feedback on the study and the manuscript, providing invaluable insights that helped improve the clarity and presentation of the findings.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that ChatGPT by OpenAI was used in proofreading and refining the language used in the manuscript. The usage was limited to correcting grammatical and spelling errors. The author further declares that, apart from ChatGPT, no other AI or AI-assisted technologies have been used to generate content in writing the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

Official Conference Proceedings

Abstract

Creative thinking and problem-solving abilities have long been recognized as critical core competencies in the workplace. However, without realistic scenarios or practical experiences, it remains challenging to achieve effective learning transfer. To help learners apply their knowledge in practical situations, this study designed and implemented an educational board game, “Production Crisis – Six Hats Decision Meeting”, which incorporates a GenAI diagnostic mechanism. Learners were placed in a company facing production workforce shortages, taking on roles as department managers or specific job positions. Guided by the Six Thinking Hats creative thinking framework, they engaged in simulated meeting discussions to collaboratively develop optimal solutions. In the game, a GenAI NPC developed in this study acted as the facilitator, responsible for real-time diagnosis of discussion content. When learners deviated from the current thinking hat perspective or when disputes arose, the GenAI NPC identified and explained these issues to maintain discussion focus and depth, thereby enhancing the effectiveness and systematicity of the discussions. A total of 20 learners participated in the empirical evaluation. The results showed that the board game significantly enhanced learners' learning effectiveness. Moreover, the mean scores of overall flow and game acceptance were significantly higher than the median score of the scale (3), and learners experienced a moderate cognitive load, demonstrating the positive impact of this educational board game on learning. Additionally, 85% of learners believed that the GenAI NPC's judgments and explanations regarding the thinking hats had a positive effect on learning, providing precise assistance in making judgments during discussions, offering clear explanations, and helping learners better understand the principles of creative thinking.

Introduction

Creative thinking and problem-solving abilities are among the most critical workplace competencies for the 21st century (Tushar & Sooraksa, 2023). Creative thinking, in particular, represents a highly valuable capability that is closely associated with job performance and quality of life (Worwood & Plucker, 2017). However, research reveals a gap between employers' expectations and the actual skills possessed by graduates (Tushar & Sooraksa, 2023). To cultivate this core competency, this study adopted the Six Thinking Hats framework proposed by creative thinking pioneer De Bono (1985). Through six thinking hats of different colors, learners are guided to engage in systematic and in-depth structured thinking.

However, during the process of skill development, traditional lecture-based or discussion-based teaching methods often lack authentic contexts and interactivity, which makes it difficult to stimulate learning motivation and facilitate learning transfer. Game-based learning (GBL) provides an effective solution by integrating instructional content with the engaging and entertaining elements of games. Through GBL, learners not only experience a positive state of flow during gameplay (Hou, 2015), but the game environment also contributes to enhancing their learning motivation (Chan et al., 2023).

In recent years, Generative Artificial Intelligence (GenAI) has been widely applied in the field of education. Its application has extended beyond content generation to include adaptive learning strategies and the provision of learning scaffolding. Moreover, researchers have incorporated GenAI as Non-Player Characters (NPCs) in educational games, where these NPCs function as scaffolding agents that guide learners' reflection during role-playing activities (Chien et al., 2025). Building on this development, the present study integrates the collaborative advantages of board games with GenAI's real-time diagnostic capabilities to design an educational board game titled "Production Crisis – Six Hats Decision Meeting". The game aims to train learners to apply the Six Thinking Hats framework for creative thinking and problem-solving in a contextualized decision-making scenario, utilizing a GenAI NPC as real-time diagnostic scaffolding to ensure the effectiveness and systematicity of group discussions.

Creativity cultivation interventions grounded in collaborative, task-oriented learning have been shown to significantly enhance university students' creative thinking and problem-solving abilities (Li & Yu, 2025). Building on this foundation, the present study adopts a realistic corporate scenario in which learners are placed in a company facing a production workforce shortage. Participants assume the roles of department managers or specific job positions, including the Factory Director, Manufacturing Support Section Manager, Engineering Manager, Human Resources Manager, and Recruitment Specialist. The game is conducted in the form of simulated meeting discussions, with the learning objective of enabling learners to apply the Six Thinking Hats framework in context, understand the distinct thinking orientations represented by each hat, and collaboratively formulate optimal solutions.

Game Mechanics:

(1) Each player draws a "Role Card" and reads the corresponding role information.
(2) Each player is provided with the following materials:
    a. Several "Information Cards" containing background facts or data relevant to the assigned role.

b. A “Six Thinking Hats Manual” that explains the core concepts and key points of each hat (cognitive scaffolding).
c. Several “Thinking Cards”, including one example card each for the Green, Yellow, Black, and Red hats.

(3) The game incorporates a “virtual human” character created using AI voice synthesis to serve as the Blue Hat facilitator. This virtual human explains the meeting objectives and guides the discussion process (procedural scaffolding).
(4) Players conduct discussions according to the hat sequence displayed on the “Game Board” (procedural scaffolding).
(5) When players speak, they place chips of different colors to represent their contribution to the thinking of that particular hat.
(6) When a player’s statement deviates from the scope of the current hat, another player may present an “Objection Card”, prompting the GenAI to immediately provide a diagnostic assessment of the thinking issue.
(7) Finally, players vote to determine the most effective solution, and the group’s solution score is calculated.

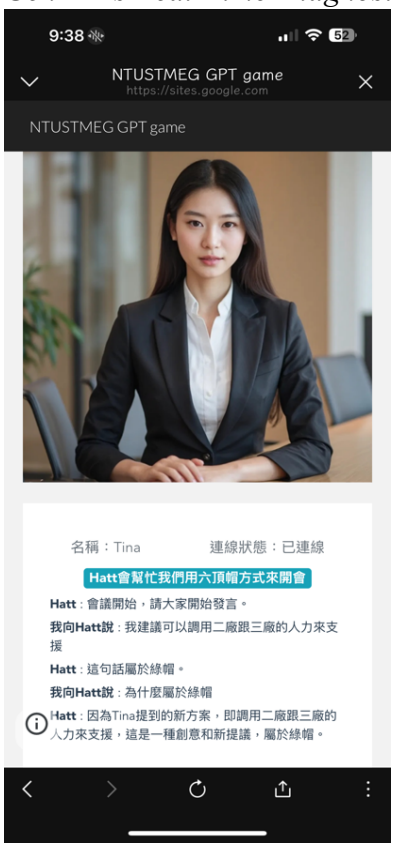

Figure 1
Virtual Human Serving As Meeting Facilitator (Blue Hat) Guiding the Meeting

Figure 2
Learners Conducting Meeting Discussions Using the Six Thinking Hats Framework

Figure 3
GenAI As Real-Time Diagnostic Scaffolding

In the game, the GenAI NPC developed in this study functions as an expert, responsible for real-time diagnosis of discussion content. When learners deviate from the perspective of the current thinking hat or when disputes arise during discussion, the GenAI identifies and explains the issue to maintain focus and depth, thereby enhancing the effectiveness and systematicity of the discussion.

Method

This study employed a single-group pretest-posttest experimental design. The participants were 20 Taiwanese adults aged 18 years and above, divided into four groups of five members each. Only 10% of the participants had prior experience learning or applying the Six Thinking Hats. Before the experiment, all participants signed informed consent forms. The experimental session lasted 90 minutes, consisting of three stages: 15 minutes for the pretest and game introduction, 60 minutes for the gameplay activity, and 15 minutes for the posttest and questionnaire. The pretest and posttest assessed participants' basic understanding and application of the Six Thinking Hats. Both tests contained the same 12 questions, with the item order rearranged to minimize potential memory effects.

For measuring flow, this study adopted the Kiili Flow Scale (2006), translated and revised by Hou and Li (2014). The scale comprises two subscales: flow antecedents and flow experience. The flow questionnaire demonstrated high internal consistency (*Cronbach's* α = 0.904). Regarding learners' acceptance of the game, this study employed the Technology Acceptance Model modified by Hou and Li (2014) based on Davis (1989). The scale includes three dimensions: perceived usefulness, perceived ease of use, and game design elements. The

game acceptance scale demonstrated high reliability (*Cronbach's α* = 0.940). For cognitive load, Paas's (1992) cognitive load measure was used. In addition, five questions were developed to examine players' learning experiences with the virtual human and the GenAI NPC diagnostic scaffolding.

Result

A Wilcoxon signed-rank test (Table 1) showed that participants' posttest scores on the Six Thinking Hats cognition (*M* = 80.70, *SD* = 13.88) were significantly higher than their pretest scores (*M* = 51.40, *SD* = 23.23). This result confirms that the educational game-based learning activity designed in this study effectively enhanced learners' mastery of the Six Thinking Hats.

Table 1
Learning Effectiveness of Six Thinking Hats — Wilcoxon Signed Rank Test Analyses

Dimension	*M*	*SD*	*Z*
Pre-test	51.40	23.23	-3.832***
Post-test	80.70	13.88	

***$p < 0.001$

Flow, game acceptance, cognitive load, and game experience were analyzed using one-sample Wilcoxon signed-rank tests (Table 2). The results showed that overall flow (*M* = 3.95, *SD* = 0.48) was significantly higher than the scale median (*Md* = 3, 5-point scale), indicating that the game-based activity design effectively facilitated learners' entry into a flow state and maintained a considerable level of focus and engagement. Regarding game acceptance, the results revealed that the mean score (*M* = 4.28, *SD* = 0.56) was also significantly higher than the scale median (*Md* = 3, 5-point scale), suggesting that learners experienced positive engagement and acceptance toward the game. For cognitive load, learners' perceived cognitive load (*M* = 6.20, *SD* = 1.58) was significantly higher than the scale median (*Md* = 5, 9-point scale), indicating that participants experienced a moderate level of cognitive load.

Table 2
Flow, Game Acceptance, Cognitive Load and Game Experience Descriptive Statistical Analysis — Comparison of One-Sample Wilcoxon Signed Rank Test Analyses With Scale Median

Dimension	*M*	*SD*	*p*
Overall Flow	3.95	0.48	0.000***
Flow antecedents	3.89	0.47	0.000***
Flow experience	3.99	0.59	0.000***
Game Acceptance	4.28	0.56	0.000***
Cognitive Load	6.20	1.58	0.005**
Game Experience	4.09	0.69	0.000***

***$p < 0.001$; **$p < 0.01$

Furthermore, regarding learners' experiences with the virtual human and GenAI NPC diagnostic scaffolding, the results showed that the overall game experience (*M* = 4.09, *SD* = 0.69) was significantly higher than the scale median (*Md* = 3, 5-point scale), indicating that the design of the virtual human and GenAI NPC diagnostic scaffolding effectively enhanced the learning experience. Notably, 85% of learners reported that the GenAI NPC's judgments

on the thinking hats had a positive impact on their learning, providing clear assistance in decision-making, offering explicit explanations, and facilitating understanding of creative thinking principles.

Conclusion

This study designed an educational board game, Production Crisis – Six Hats Decision Meeting, integrating a GenAI diagnostic mechanism to cultivate creative thinking and problem-solving abilities through simulated meeting scenarios. The results demonstrated that the game significantly enhanced learners' understanding and application of the Six Thinking Hats while fostering positive experiences in flow, game acceptance, and game experience. In particular, the real-time diagnostic scaffolding provided by the GenAI NPC received high recognition for its effectiveness in helping learners comprehend the cognitive dimensions of each thinking hat, promoting systematic discussions, and resolving disagreements. However, activities that require contextual knowledge, cross-departmental collaboration, and strategic thinking inherently belong to the domain of complex problem-solving, and therefore entail a moderate level of cognitive load. Nevertheless, analyses of learning performance, flow, game acceptance, and game experience suggest that while the game presented cognitive challenges, it simultaneously provided sufficient engagement and positive learning experiences. For learners with limited contextual knowledge, supplementary scaffolding could be implemented to reduce cognitive load and facilitate smoother immersion into the learning scenario.

The contribution of this study lies in presenting an innovative instructional model that integrates the collaborative strengths of physical board games with the real-time adaptive diagnostic capabilities of GenAI, effectively addressing the limitations of traditional teaching in contextualization and immediate feedback. The GenAI NPC played a pivotal role as diagnostic scaffolding, making judgments and providing explanations when players deviated from the current thinking hat or when disputes arose. Future research should adopt a quasi-experimental design incorporating control groups and a larger sample size to more rigorously validate the effectiveness of this hybrid learning model. Moreover, lag sequential analysis (LSA) could be employed to examine learners' behavioral and discussion patterns during gameplay, offering deeper insights into how GenAI-based diagnostic scaffolding influences real-time decision-making and behavioral dynamics.

Official Conference Proceedings

Abstract

This study explores the effectiveness of educational video games in enhancing concept retention in General Biology 2 among Grade 11 STEM-HA students at FEU Diliman. With biology's extensive content posing retention challenges, the researchers developed and implemented a custom educational game titled *Phylum Expedition*. Using an experimental design, they compared the performance of two groups: a control group using traditional methods and an experimental group using the video game. Pretests and posttests focused on organismal biology concepts were administered, along with a gameplay satisfaction survey for the experimental group. Results showed that the experimental group had a higher mean gain score (3.67) than the control group (2.24), and a left-tailed t-test confirmed a statistically significant difference, leading to the rejection of the null hypothesis. Students responded positively to the game's lore and gameplay, though found the controls less satisfactory. The study concludes that educational video games can effectively supplement traditional teaching. The researchers recommend integrating or developing educational games in classrooms, encouraging students, teachers, and developers to explore this learning tool.

Keywords: educational video games, biology, retention, *Phylum Expedition*

Introduction

As video games evolved throughout the years, they are often used as a tool for more than entertainment, as such, the rise of educational video games for education. These games are shown to benefit and enhance students' learning in terms of motivation, interest, and in addition, their communication skills (Macayan et al., 2022). On the contrary, some areas still encompass a gap of what educational video games have covered, more so on the students' retention on content-heavy subjects–specifically of General Biology 2 concepts. As General Biology 2 being a challenging subject, it is reported that students struggle with retention. The students' ability to retain information is an important aspect in learning as it allows them to apply and recall knowledge that they have learned to perform better in academics. Through this, the study aimed to determine the effectiveness of an educational video game, *Phylum Expedition*, on the retention of General Biology 2 concepts of Grade 11 STEM Health Allied Students at FEU Diliman.

Educational video games are widely used in education, most notably in the STEM field, as a tool for enhancing learning through active engagement (Changtong et al., 2020; Punyasettro & Yasri, 2021). These games are described as the combination of fun and enjoyment with learning, improvement, and development (Marin-Suelves et al., 2020).

Retention is influenced by factors such as the ability to learn, prior knowledge, and the importance of the information learned. The use of engaging learning materials, such as educational video games, aids students' interest, understanding, and retention in a subject (Adebisi et al., 2021). Studies show that these games enhance retention through their engaging nature, which motivates students and makes complex concepts simpler and easier to understand (Schroeder, 2024). An example of this is Kahoot, which has been found to enhance retention by 22% compared to traditional classroom lectures (Heidarzade, 2025).

Students from multiple countries find General Biology 2 challenging due to factors such as low motivation, poor study habits, and lack of prior knowledge (Johnstone & Hansell, 1999; Tracy et al., 2022). Other studies highlight struggles caused by content-heavy lessons, which result in content overload (Chiappetta & Fittman, 2010; Zeidan, 2010). Biology concepts can be made simpler through visuals and interactivity to increase participation (CPD Singapore Education Services Pte, 2024). With this, educational video games serve as a new tool to make learning more enjoyable and beneficial.

This study aimed to determine the effectiveness of the researcher-made game prototype *Phylum Expedition* on the Retention of General Biology 2 concepts among Grade 11 STEM Health Allied students of FEU Diliman. The study is focused on students to provide them a fun and immersive way of learning a complex topic of the General Biology 2 curriculum.

Specifically, the study sought to answer the following problems:

1. What is the significant difference in the gain scores between the experimental and control groups of Grade 11 STEM Health Allied on General Biology 2?
2. What aspect of *Phylum Expedition* would help the students retain information during the integration of educational video games into the General Biology 2 curriculum?
3. What are the students' evaluations of the following aspects of *Phylum Expedition* in learning General Biology 2 concepts with respect to:
    3.1. Gameplay
    3.2. Mechanics

3.3. Visuals
3.4. Controls
3.5. Difficulty
3.6. Lore

4. How effective is *Phylum Expedition* on the retention of General Biology 2 concepts among Grade 11 STEM Health Allied students?

This study examined the effectiveness of an educational video game, *Phylum Expedition*, on the retention of General Biology 2 concepts among Grade 11 STEM Health Allied students at FEU Diliman during the academic year 2024–2025. Focusing on Organismal Biology, the study involved sixty-two students from two sections and utilized pretests, posttests, and a validated game survey conducted in the FEU Diliman library. The research was limited to these participants, setting, and data-gathering methods, excluding other strands, grade levels, institutions, and instructional tools.

Methods

This research utilized a quantitative approach to determine the effectiveness of a learning video game, *Phylum Expedition*, in helping students retain General Biology 2 concepts (Bhandari, 2023). Additionally, the researchers employed a pretest–posttest non-equivalent group design (Price et al., n.d.). Two Grade 11 STEM Health Allied classes at FEU Diliman were involved: one class participated in the lecture followed by gameplay (experimental group), while the other class received the lecture only (control group). Both groups were given a pretest and a posttest to measure their academic performance.

To identify the participants, cluster sampling was used, wherein groups or sections were selected instead of individual students (Dovetail Editorial Team, 2023). Two sections were randomly chosen: 11–Sincerity as the experimental group and 11–Steadfast as the control group, with a total of sixty-two (62) students.

The primary instruments employed in this study were pretests and posttests on Organismal Biology. These instruments were piloted and validated by a Grade 11 Biology teacher to ensure content accuracy and appropriateness. After the posttest, the experimental group also completed a survey regarding the educational video game. The survey was validated by Biology teachers, IT professionals, and a game developer to ensure the reliability and relevance of the data collected.

Furthermore, *Phylum Expedition* is a researcher-made educational video game that features a storyline in which a traveler navigates various environments—land, sea, combined habitats, and air—by interacting with different organisms and answering questions correctly to progress. Correct responses increase the player's health and unlock abilities, while incorrect answers reduce health. When the player's health is depleted, the level must be restarted. The game was tested and refined with the assistance of subject and technical experts to ensure quality and functionality.

For data collection, both the experimental and control groups completed a pretest and attended the same General Biology 2 lecture. After the lecture, only the experimental group played *Phylum Expedition* in a computer laboratory setting. Both groups then completed a posttest three weeks later. In addition, the experimental group answered a survey to provide feedback on the game's effectiveness.

Results and Discussions

Table 1
Mean and Standard Deviation of Gain Scores of Both Control and Experimental Groups

Variable	Mean	Standard Deviation
Students Taught Using Traditional Way of Teaching	2.24	1.883
Students Taught with Integration of "*Phylum Expedition*"	3.67	1.575

Table 1 presents the differences between the pretest and posttest scores of both the control and experimental groups. The results of the gain scores indicate that the experimental group demonstrated better retention of the lesson content. The control group showed a higher standard deviation, suggesting that its data values were more dispersed from the mean and therefore less consistent compared to the experimental group, which exhibited a lower standard deviation (Rumsey, 2021; Webb, 2023).

Table 2
Test Statistic of Both Control and Experimental Groups

Computed T-Value	Critical Value	Decision
-3.247	1.6706	-3.247 < 1.6706∴ Reject H0

Table 2 shows the computed T-value and critical value needed to make a decision on whether or not to reject the null hypothesis. The computed T-value is -3.247, which is found in the rejection area with the critical value of 1.6706. Additionally, the T-value is less than the critical value, thus, the decision is to reject the null hypothesis of the control group being greater than or equal to the experimental group.

Table 3
The Aspects That the Students Are Satisfied With and Which Sparked Interest the Most

Questions in Survey	Choices	WM	Verbal Interpretation	Rank
Which part of *Phylum Expedition* are you the most satisfied with?	Gameplay	2.53	Agree	1
	Mechanics	2.24	Disagree	2
	Visuals	2.00	Disagree	3
Which part of *Phylum Expedition* are you the least satisfied with?	Gameplay	2.03	Disagree	2
	Mechanics	2.00	Disagree	3
	Controls	2.53	Agree	1
Which part of *Phylum*	Lore	2.29	Disagree	1

Expedition sparked your attention the most, which made you interested in continuing playing?	Gameplay	2.18	Disagree	2
	Educational Benefit	2.15	Disagree	3

Table 3 is a compilation of results from the survey wherein the students were tasked to rank certain aspects of the game according to the following: most satisfied, least satisfied, and sparked attention the most. Students rated the gameplay and lore the highest, these parts helped hold their attention and made the experience more engaging. On the contrary, the controls of the game received the lowest rating. Some students found it hard to maneuver around, this may have caused slight frustration during gameplay and shows that even if a game is educational, the way it is played still affects the overall learning experience.

Table 4
The Students' Feedbacks on the Integration of "Phylum Expedition" in Learning General Biology 2 Concepts

Questions in Survey	WM	Verbal Interpretation	Rank
has been engaging	3.50	Strongly Agree	1
has been informative	3.44	Strongly Agree	3
has explained a complex concept in a simple and visually appealing manner, making it easier for me to understand and retain the information	3.38	Strongly Agree	4
has not been able to explain the concept clearly, thus making Organismal Biology even more complicated	2.12	Disagree	6
has the right difficulty for the learners in the 11th grade	3.03	Agree	5
is recommended to other learners to help them understand Organismal Biology better	3.47	Strongly Agree	2
TOTAL	3.16	Agree	

Table 4 showcases the results upon collecting and statistically treating the responses from the experimental group from a survey. The experimental group stated that they strongly agree that *Phylum Expedition* has been engaging, has been informative, and has simplified explanations of the complex concepts within Organismal Biology. The students disagreed that the said game has not been able to explain Organismal Biology concepts clearly and agreed that the game is the right difficulty for the 11th grade learners. The results have garnered positive feedback from the students; further proof is that they also strongly agree to recommend Phylum FEU Diliman Basic Education Department (SHS) Expedition to other learners when learning Organismal Biology.

Table 5
The Level of Effect Size Based on Cohen's d

Cohen's d	Interpretation
-0.827	Large Effect

Table 5 exhibits the level of effect size based on Cohen's d. The findings suggest that the educational video game has been significantly effective on students' performance, as indicated by the Cohen's d value of -0.827. These results reflect the effectiveness of *Phylum Expedition* as an educational video game for enhancing student engagement retention.

Conclusion

This study aimed to assess which aspects of *Phylum Expedition* need improvements and how it enhances the retention of Grade 11 STEM-HA students, specifically in General Biology 2 concepts. Gain scores were calculated by subtracting pretest scores from posttest scores. The control group had a mean gain score of 2.24, while the experimental group had a mean gain score of 3.67. Since higher gain scores indicate greater improvement, the results suggest that *Phylum Expedition* is an effective learning aid for Grade 11 STEM Health Allied students.

The researchers also used a survey to further assess aspects of *Phylum Expedition*. Students were most satisfied with the gameplay and least satisfied with the controls. Since most students were unsatisfied with the controls, this aspect will be reworked, as *Phylum Expedition* is still a prototype. The lore or storytelling in the gameplay sparked the most attention, making students interested in continuing the game. The researchers plan to enhance the lore further, giving it a more concrete flow, adding new characters, and improving character writing. These improvements aim to maintain student interest so they can fully benefit from the educational content by finishing the game.

The students are very satisfied with the gameplay and mechanics of *Phylum Expedition*. According to the survey, both were informative, engaging, and not too difficult, indicating that the students enjoyed the gameplay. Gameplay ranked second in sparking student interest, with one comment stating, "I enjoyed the gameplay." However, the participants were neutral about the overall aesthetics. The researchers considered this and improved the visuals to make them more eye-catching, resulting in a higher-quality output. The students agreed that the difficulty level is suitable for 11th graders. Further improvements will be made to tailor the gameplay, mechanics, visuals, lore, controls, and difficulty to better fit 11th-grade learners.

The findings suggest that the educational video game significantly improved students' performance, shown by a Cohen's d value of -0.827. Respondents strongly agree that *Phylum Expedition* is informative and engaging. The game explained complex Organismal Biology concepts in a simple, visually appealing way, making it easier for students to understand and retain information. Survey results showed 38.2% disagreed that the game failed to explain concepts clearly, and 32.4% strongly disagreed that it made Organismal Biology more complicated. These results reflect positive learner feedback toward the game.

Recommendations

The researchers recommend that students use educational video games that are aligned with their lessons, designed to be enjoyable, and effective in helping retain concepts without relying on text-heavy materials. They suggest exploring games like *Phylum Expedition* and even creating their own educational games to develop game design skills and consider game development as a potential career path. Parents are encouraged to research and select suitable educational games for their children and promote their use as a fun and effective way to learn.

Teachers are advised to integrate educational games into their teaching strategies to make learning more engaging and improve retention, and they may also experiment with creating their own games using beginner-friendly tools such as GDevelop. School administrators should provide resources like computer labs and stable internet connections to support game-based learning and organize professional development programs, including workshops and seminars, to help teachers become more innovative and technologically adept.

The Department of Education is urged to review the study for its potential to enhance the curriculum, involve educational experts, and consider incorporating game development into technology-related subjects. They should also evaluate the effectiveness of educational games alongside traditional methods to determine their impact on academic performance. Game developers are encouraged to create educational games that serve as supplementary learning tools, carefully design game elements for better retention, and incorporate personalization and immersive 3D experiences to boost engagement.

Finally, for future researchers, they should use larger sample sizes and different educational levels to test whether results change or remain consistent. They should also study the integration of educational video games into other complex subjects to expand their applicability. Also, the researchers recommend a pre-planned schedule and strict time considerations for students to use educational video games longer. In addition, the researchers recommend maximizing the time spent on game design aspects, as they need to be aligned for an immersive and enjoyable experience while playing and learning. Future researchers should also check the equipment and resources used in the study, like computers and internet connection, to avoid technical issues and limitations. They should also use spaced repetition, such as playing the game every other day, to find out whether it will improve the retention of the students.

Acknowledgement

The authors would like to formally acknowledge the significant contributions of Gabriel Gael Lugtu, Fernando Alcantara Jr., Francheska Rich Rasonabe, Gwen Arianne Abonita, Matthew Buenaflor, and John Feliz Valdivieso to this study. These individuals played meaningful and integral roles throughout the research process, including the conceptualization, design, development, implementation, and evaluation of the educational game that served as the core component of this research.

Their active involvement, intellectual input, and collaborative efforts substantially contributed to the quality, rigor, and successful completion of the study. The authors

recognize that the extent of their contributions meets accepted standards for scholarly authorship and therefore deem it appropriate to acknowledge their involvement in accordance with ethical research and publication practices.

Building Better Arguments: A CER-Based Approach to Persuasive Essays

Relyn A. Rojo-Corbita, Academia de San Isidro Labrador, Philippines
Alma C. Valendez, Cebu Technological University, Philippines

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Developing writing skills among learners is crucial to becoming an effective communicator who can demonstrate depth of knowledge and exhibit critical thinking abilities. Determining ways to improve such skills is essential because effective written communication is one of the foundational skills for academic success and active participation in a functionally literate society. Employing the quasi-experimental design method, the study utilized the Claim-Evidence-Reasoning (CER) Framework to enhance the writing skills of the 10th Graders in Cebu City, Philippines. Two different discussion materials assessing the same writing competencies were used to determine the learners' competencies before and after the intervention scheme. Similarly, the data gathered was analyzed using the paired sample t-test to determine the effectiveness of the CER framework. The findings revealed a significant improvement in the learners' writing competencies in terms of formulating arguments, creating and determining main points, finding supporting evidence for the points made, and creating conclusions using the CER Framework as the intervention. Moreover, the process of the CER framework has helped the learners organize their thoughts and ideas, resulting in coherent and logical persuasive essays. Finally, the CER framework writing process can easily be integrated into daily writing activities across learning areas for deeper understanding, enhanced communication skills, and the development of critical thinking among learners across levels.

Keywords: CER framework, persuasive writing, writing pedagogy

Introduction

Today's educational setting characterized by rapid change, instant information access, and constant digital interaction creates unique challenges and opportunities that profoundly impact students learning. The demand for learners to equip themselves with advanced language skills is more crucial than ever for them to succeed in their academics and the life beyond the classrooms. Among these skills are the ability to discern credible and reliable information and sources, and articulate ideas with clarity and conviction.

Currently, the basic education landscape in the Philippines is faced with a significant learning gap where a considerable number of the Filipino learners can only perform basic reading tasks but struggle with deeper understanding and critical thinking necessary for effective daily life and further education. The World Bank report in 2022 showed that 91% of the Filipino children aged 10 cannot read and understand a simple text. Similarly, the 2024 Functional Literacy, Education and Mass Media Survey (FLEMMS) revealed that while a large majority of Filipinos can read and write, around three out of ten (approximately 18.9 million Filipinos aged 10–64) struggle with comprehension. If students are to thrive in a fast-paced and high-technology world, they need to equip themselves with the essential critical skills that empower them to navigate the complexities of the academic life and real-life challenges beyond the learning institution.

Critical Thinking, Argumentation and Structured-Based Approaches

Critical thinking, as the foundational pillar of effective learning, and learning are mutually reinforcing processes. Critical thinking enhances the learning process; learning provides the raw material for critical thought. True learning involves active engagement with information, and that active engagement is what critical thinking facilitates. While critical thinking development poses a challenge to many, literature shows that structured frameworks can help students enhance their cognitive processing abilities (Osborne & Patterson, 2011) that ultimately enable learners to reason logically, think critically, and communicate effectively. Enhancing learners' argumentation skills is another strategy that enhances one's critical thinking abilities (Shanahan, 2004). Argumentation enables learners to evaluate conflicting claims and assess the level of evidence and investigation presented. It helps learners clarify their thoughts and articulate ideas clearly and accurately (The University of Maryland Global Campus, 2022).

Studies have shown that structured learning activities that require students to formulate claim supported with logical and reasonable evidence improve students' comprehension and critical thinking skills and bolster their ability to identify, analyze and evaluate evidence (Dela Cruz, 2014; Llaneta, 2015). Moreover, various frameworks of structured argumentation help foster active engagement and promote better understanding of complex texts among students (Sampson & Clark, 2009). Given the appropriate scaffolding, these structured learning activities help students identify claims and supporting details/evidence that enabled them to develop logical reasoning in writing (Castañeda, 2017). Similarly, structured approach to argumentation improves students' written expression and reasoning skills (Flores & Reyes, 2020; Villanueva & Espina, 2019), makes their writing compositions clearer and more coherent, and allow students to construct context and information-based simple arguments (Villanueva & Espina, 2019; Zohar & Nemet, 2002).

Finally, other organized/structure frameworks strengthen understanding because they require students to reason and defend their comprehension (Duke & Pearson, 2002). The reader-response journal writing, for example, that require students to make a claim, cite evidence, and give explanations does not only scaffold students' comprehension but also reinforces the students' reasoning skills in argumentation (Santos & Relampagos, 2021). Hence, this paper advances that the students' persuasive essay writing skills can be enhanced using the structured process of Claim-Evidence-Reasoning (CER) framework.

The CER framework is widely used in enhancing students' argumentation skills and promoting critical thinking and scientific literacy. It teaches students to construct an argument that is consisting of a claim, an evidence and a reason. The claim refers to the statement being made, the evidence is the data or information used to support the claim, and the reason connects the evidence and the claim (McNeill & Krajcik, 2012). Studies showed that structured argumentative practices helped students develop higher-order thinking skills, comprehension, and self-regulation across disciplines.

Methodology

The study utilized the quasi-experimental research method, particularly, the one-group pretest-posttest design to determine the efficacy of the Claim-Evidence-Reasoning Framework in improving the persuasive essay writing skills of the Grade 10 students in Cebu City, Philippines. The participants were purposively selected as they performed the lowest in reading and writing in the standardized assessment conducted at the beginning of the school year.

Following the CER Framework Flow (Rapatan, 2024), students wrote persuasive essays based on a given literary text by formulating arguments (Claim), supported with pieces of evidence (Evidence), and building their argument by logical reasoning (Reason) until a conclusion is reached. The outputs were rated by the three inter-raters using an analytic rubric reflecting the persuasive essay writing target competencies of the study. The data gathered was analyzed using the paired sample t-tests and the Wilcoxon Signed Rank Test.

Results and Discussion

Table 1
Pre-test Performance of the Respondents in Writing Persuasive Essays

Competency	Frequency (%)				Mean (SD)
	ES	MS	AS	NYMS	
Formulating of arguments	0 (0.0)	5 (16.7)	22 (73.3)	3 (10.0)	2.21 (0.32)
Creating and determining of main points	0 (0.0)	4 (13.3)	12 (40.0)	14 (46.7)	1.90 (0.46)
Finding supporting evidence for the points made	0 (0.0)	0 (0.0)	15 (50.0)	15 (50.0)	1.77 (0.48)
Creating conclusion	0 (0.0)	2 (6.7)	7 (23.2)	21 (70.0)	1.48 (0.49)

Legend: 3.25 to 4.00 - Exceeding standard (ES)
2.50 to 3.24 - Meeting standard (MS)
1.75 to 2.49 - Approaching standard (AS)
1.00 to 1.74 - Not yet meeting standard (NYMS)

The pretest results show that the participants competency level in persuasive essay writing is *approaching standard* in formulating arguments (2.21), creating and determining the main points (1.90), and finding supporting evidence for the points made (1.77) while *not yet meeting standard* in creating conclusion (1.48). The same results show that the participants may have reached the *approaching standard* for creating and determining the main points and finding supporting evidence for the points, however, their scores were close to the lower limit which implies the need for an intervention to enhance the students' performance in the aforementioned competencies.

Similar findings have been revealed by several studies that the skill of organizing ideas in writing is a challenge even to college sophomores (Batalla & Vera, 2019). Urbano et.al. (2021) similarly revealed that high school students lacked mastery in the conventions and process of writing academic texts such as research reports, position paper, project proposal, and correspondence letters. Finally, Pablo and Lasaten (2018) forwarded that students acknowledged the importance of logical organization of ideas and details in writing; however, students disregarded it in their writing as they found the skill difficult to achieve.

The present findings underscore the need to explore innovative methods and approaches to writing instruction to assist students translate their knowledge of writing conventions and processes into practical applications. It also implies the need to explore writing activities that provide students scaffolded practice and explicit strategies for idea organization.

Table 2
Post-test Performance of the Respondents in Writing Persuasive Essays

Competency	**Frequency (%)**				**Mean (SD)**
	ES	**MS**	**AS**	**NYMS**	
Formulating of arguments	2 (6.7)	18 (60.0)	10 (33.3)	0 (0.0)	2.71 (0.37)
Creating and determining of main points	13 (43.3)	11 (36.7)	6 (20.0)	0 (0.0)	2.96 (0.42)
Finding supporting evidence for the points made	18 (60.0)	8 (26.7)	4 (13.3)	0 (0.0)	3.18 (0.51)
Creating conclusion	10 (33.3)	14 (46.7)	6 (20.0)	0 (0.0)	2.96 (0.50)

Legend: 3.25 to 4.00 - Exceeding standard (ES)
2.50 to 3.24 - Meeting standard (MS)
1.75 to 2.49 - Approaching standard (AS)
1.00 to 1.74 - Not yet meeting standard (NYMS)

The posttest results show that the participants competency level in persuasive essay writing is *meeting standard* in formulating arguments (2.71), creating and determining the main points (2.96), finding supporting evidence for the points made (3.18) and creating conclusion (2.96). This shows that the CER framework has helped the participants improve their persuasive essay writing skills which led to the increase in scores in the target competencies.

Performance in the posttest has visibly increased across all competencies. This is emphasized by three most noticeable indications: increased mean scores, occurrence of participants' *meeting standard* (ES) and having no participants who are *approaching standard* (AS) and *not yet meeting standards* (NYMS).

The Claim-Evidence-Reasoning (CER) Framework was proven effective addressing the difficulties faced by students in writing persuasive essays. It provided students with a structured approach to organizing their ideas stating clearly their position or claim, actively supporting it with relevant textual evidence, and logically discussing how the pieces of evidence they found supported the claim/argument. Students engaged in scaffolded writing activities during the intervention period, which allowed them to slowly focus on every component of the persuasive essay and complete their writing tasks following the structure of the CER Framework. Activity sheets that detailed the CER argumentation structure guided the students in writing their individual persuasive essays complete with claim/argument, supporting evidence and reason until a conclusion is drawn. One important aspect of the CER framework is the teacher's feedback on their written output. The structured process of the intervention framework serves as the basis for the teacher's feedback and reinforces the learning process. Having internalized the CER process in writing, students were able to produce persuasive essays that espouses their stance or position on the topic of discussion.

Table 3

*Test of Significance of the Difference Between the Pre-test and Pos-test Performance of the Respondents *for the 3 competencies*

Competency*	**Mean Scores (SD)**		**Mean Difference (SD)**	t-**statistic**	p-**value**
	Pretest	**Posttest**			
Formulating of arguments	2.21	2.71	0.50 (0.478)	5.734	< 0.001
Creating and determining of main points	1.90	2.96	1.06 (0.626)	9.240	< 0.001
Finding supporting evidence for the points made	1.77	3.18	1.41 (0.544)	-	-
Creating conclusion	1.48	2.96	1.48 (0.742)	10.912	< 0.001

Note. Comparison for this competency is found in the next table presentation.

The results of the paired samples t-test show that the participants' performance increased by an average of 0.50 points for formulating of arguments, by 1.06 points for creating and determining of main points, 1.41 points for finding supporting evidence for the points made and by 1.48 points for creating conclusions. Hence, the greatest improvement can be observed with creating conclusions while the least improvement is with formulating of arguments.

The t-statistic calculated only for the three competencies found without evidence of non-normality. In all such competencies, a p-value smaller than 0.001 was found compelling to reject the null hypothesis and conclude that there is a significant difference in the pretest and posttest scores of the participants in terms of formulating arguments, creating and determining of main points, and creating conclusions.

For the competency of finding supporting evidence for the points made, Wilcoxon Signed-Rank test was used. Results are as follows:

Table 3.1
Test of Significance of the Difference Between the Pre-test and Pos-test Performance of the Respondents in Terms of Finding Supporting Evidence for the Points Made

	n	Mean rank	Sum of Ranks
Negative Ranks	0	0.00	0.00
Positive Ranks	30	15.50	465.00
Ties	0		

Z	-4.794
p-value (Asymptotic Significance)	< 0.001

Zero (0) negative ranks and 30 positive ranks were found. This means that all 30 participants increased their scores in this competency from pretest to posttest. A z-statistic of -4.794 was calculated which corresponds to a p-value less than 0.001. Thus, the null hypothesis is also rejected and it is concluded that there is a statistically significant difference in the pretest and posttest scores in these competencies.

Conclusion

The use of the CER Framework in writing is proven to enhance writing skills and is highly recommended to be utilized in developing the persuasive essay writing skills of the students. CER Framework-based writing activity sheet can be tailored to fit the writing activity in class in all levels. Improved writing skills is one of the core 21st century skills that each learner have to develop as part of a clearer and more impactful communication thereby aiding them with critical thinking, creativity, communication and collaboration.

Adoption of Bayesian Knowledge Tracing With Fuzzy Logic in the Development of Personalized Math Learning System for Grade 3 and 4

Jomar Ruiz, Polytechnic University of the Philippines, Philippines

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study developed and evaluated Math Tagumpay, a Bayesian-Fuzzy hybrid Intelligent Tutoring System (ITS) designed for Grade 3–4 mathematics in the Philippines. Addressing the urgent need for innovative instructional approaches in a context where 82% of Grade 4 students fall below minimum proficiency levels, the research employed a descriptive-quantitative methodology with 10 mathematics teachers from Bataan Province. The system implements a novel sequential architecture where Bayesian Knowledge Tracing (BKT) parameters serve as inputs to a Fuzzy Logic engine to manage the partial understanding states characteristic of young learners. The evaluation revealed exceptional technical performance, with System Accuracy achieving a weighted mean of 4.30 (94% positive response) and System Timeliness reaching 4.20 (94% positive response). The Technology Acceptance Model (TAM) assessment yielded an overall weighted mean of 4.04 (85% positive response), with Attitude Toward Using (4.26) and Perceived Usefulness (4.22) emerging as primary drivers of acceptance. While Perceived Ease of Use (3.68) was identified as an area for improvement, the findings validate that sophisticated AI can be successfully adapted for resource-constrained environments through cultural sensitivity and curriculum alignment. The study concludes that the hybrid AI approach effectively addresses the complexity of elementary mathematics learning and provides a scalable framework for enhancing instructional effectiveness in the Philippine educational system.

Introduction

Traditional pedagogical approaches often struggle to meet the complex needs of modern young learners, despite decades of foundational research. This challenge is particularly acute in early childhood education, which critically shapes a child's holistic development into adulthood. While Intelligent Tutoring Systems (ITS) offer transformative potential for personalized learning and 21st-century skill development, any technological intervention must remain developmentally appropriate. Successful digital tools must balance structured activity with exploration, harnessing children's natural learning processes rather than constraining them.

In the Philippines, the need for innovation is urgent, as 82% of Grade 4 students fall below minimum mathematics proficiency levels. This creates a central tension: adapting sophisticated AI to serve resource-constrained environments while maintaining technical excellence and cultural appropriateness. While Bayesian Knowledge Tracing (BKT) has revolutionized student modeling through probabilistic tracking, it has historically focused on older learners. Conversely, fuzzy logic excels at managing partial knowledge and ambiguous responses typical of younger students. This research explores a hybrid Bayesian-Fuzzy approach, combining temporal knowledge modeling with nuanced uncertainty handling to address the unique complexities of early elementary mathematics learning.

Literature Review

The Global Educational Technology Revolution and Local Realities The transformation of education through technology represents a significant paradigm shift, with Intelligent Tutoring Systems (ITS) fundamentally reshaping how students interact with mathematical content (VanLehn, 2011). This global trend creates unprecedented opportunities for personalized learning that adapts to individual needs through continuous assessment and feedback mechanisms (Chrysafiadi & Virvou, 2013). However, these technological advances must be examined within specific sociocultural contexts. From a cultural psychology perspective, educational processes are deeply influenced by learners' cultural environments, values, and instructional traditions (Bernardo, 2017). In the Philippine context, this challenge is particularly urgent. The Department of Education (2023) reported that 82% of Grade 4 students in the Philippines fall below minimum mathematics proficiency levels. Despite these challenges, comprehensive analysis of eLearning provides evidence that technology can help students develop necessary 21st-century skills (UNESCO, 2012). Key benefits identified include increased student engagement, enhanced teacher attitudes toward innovation, and improved family interaction to support curriculum continuity (UNESCO, 2012).

Early Childhood Education and Digital Learning Evolution Integrating digital technologies into early childhood education is a considered evolution rather than a departure from developmental principles. Research has shown that appropriately designed ICT tools can enhance young learners' cognitive development when teachers remain actively involved in mediating content and learning experiences (Drigas & Kokkilia, 2015). Interactive multimedia learning environments have been shown to support foundational mathematics skills and conceptual understanding among young learners (Nusir et al., 2012). Moreover, intelligent learning systems that promote interaction and immediate feedback contribute to sustained learner engagement and meaningful knowledge construction (Liu et al., 2016). This reinforces the principle that technology should enhance, not replace, human relationships in early learning environments.

Developmental Appropriateness and Interactive Learning Effective curricula must reflect current child development research, maintaining a balance between play and structured, teacher-initiated exploration (Corpuz et al., 2016). This approach aligns with Jean Piaget's philosophy that play meets the physical, intellectual, language, emotional, and social needs (PILES) of children (Corpuz et al., 2016). Practical implementations have shown that properly designed multimedia e-storybooks enrich comprehension (Smeets & Bus, 2012), while digital storytelling serves as an expressive tool that fosters positive interactions between students and teachers (Papadimitriou et al., 2013).

Methodology

This study employs a descriptive-quantitative research design to systematically develop and evaluate the Math Tagumpay Bayesian-Fuzzy hybrid Intelligent Tutoring System (ITS). The research utilizes a descriptive method to accurately capture the characteristics and performance of the system in the context of Grade 3–4 mathematics in the Philippines. This alignment follows Dulock's (1993) definition of descriptive research, which emphasizes the systematic description of facts related to a specific area of interest.

Because the study relies on numerical representations to measure system performance—specifically accuracy and timeliness—as well as user acceptance through Likert scale assessments, a quantitative approach is most suitable. This methodology follows Babbie's (2010) framework, which prioritizes objective measurements and the statistical analysis of data gathered through structured questionnaires and polls.

The descriptive approach is particularly appropriate for this research as it focuses on the development and validation of a specialized AI tool for the Philippine educational landscape. This ensures that the ITS is evaluated within real-world educational settings, addressing the unique learning needs of Filipino students in Grades 3–4 across diverse environments. By utilizing this methodology, the study achieves a comprehensive assessment of technical performance metrics and technology acceptance indicators while maintaining scientific objectivity.

The framework for this research is further grounded in the Input-Process-Output (IPO) Model. The Inputs include the pedagogical challenges faced by teachers and the technical requirements for accuracy and timeliness. The Process involves the 2-week implementation and survey administration, and the Output is the validated Math Tagumpay system. This structured methodology provides the rigor necessary for academic publication, ensuring that both the technical architecture and the human-centered acceptance are thoroughly documented.

Software Development

The development of the Math Tagumpay system utilized the Design-Based Research (DBR) methodology, which integrates the iterative cycles of analysis, design, and evaluation to create effective educational interventions. This systematic process ensures that the resulting Intelligent Tutoring System (ITS) is not only technologically advanced but also pedagogically sound and grounded in the practical needs of the classroom.

Development Phases and Technical Implementation

The research procedure was divided into three distinct stages: analysis, design and implementation, and evaluation. During the analysis stage, interviews with Grade 3–4 mathematics teachers identified critical gaps in traditional instruction, such as the difficulty of providing personalized interventions and tracking individual progress. The design and implementation stage followed, where modern web technologies like React.js and Supabase were employed to create a cross-platform, secure environment capable of executing complex AI-driven decisions in real-time.

Sequential Processing and Algorithmic Innovation

The system architecture implements a novel sequential processing approach where the outputs of the Bayesian Knowledge Tracing (BKT) model serve as the primary inputs for the Fuzzy Logic engine. Unlike traditional parallel hybrid systems, this design enables sophisticated two-stage uncertainty refinement, allowing fuzzy logic to operate on refined knowledge parameters rather than raw student responses. This approach addresses the variable response patterns characteristic of third- and fourth-grade learners while maintaining real-time responsiveness.

To develop the Math Tagumpay system, the researchers used modern web technologies optimized for Philippine educational contexts. The frontend utilizes React.js for cross-platform compatibility and responsive design, deployed via Netlify's global CDN for fast loading in resource-constrained environments. The backend combines Netlify Functions with Supabase PostgreSQL for scalable serverless architecture.

Figure 1
System Architecture of Math Tagumpay Bayesian-Fuzzy Hybrid ITS for Grade 3–4 Mathematics

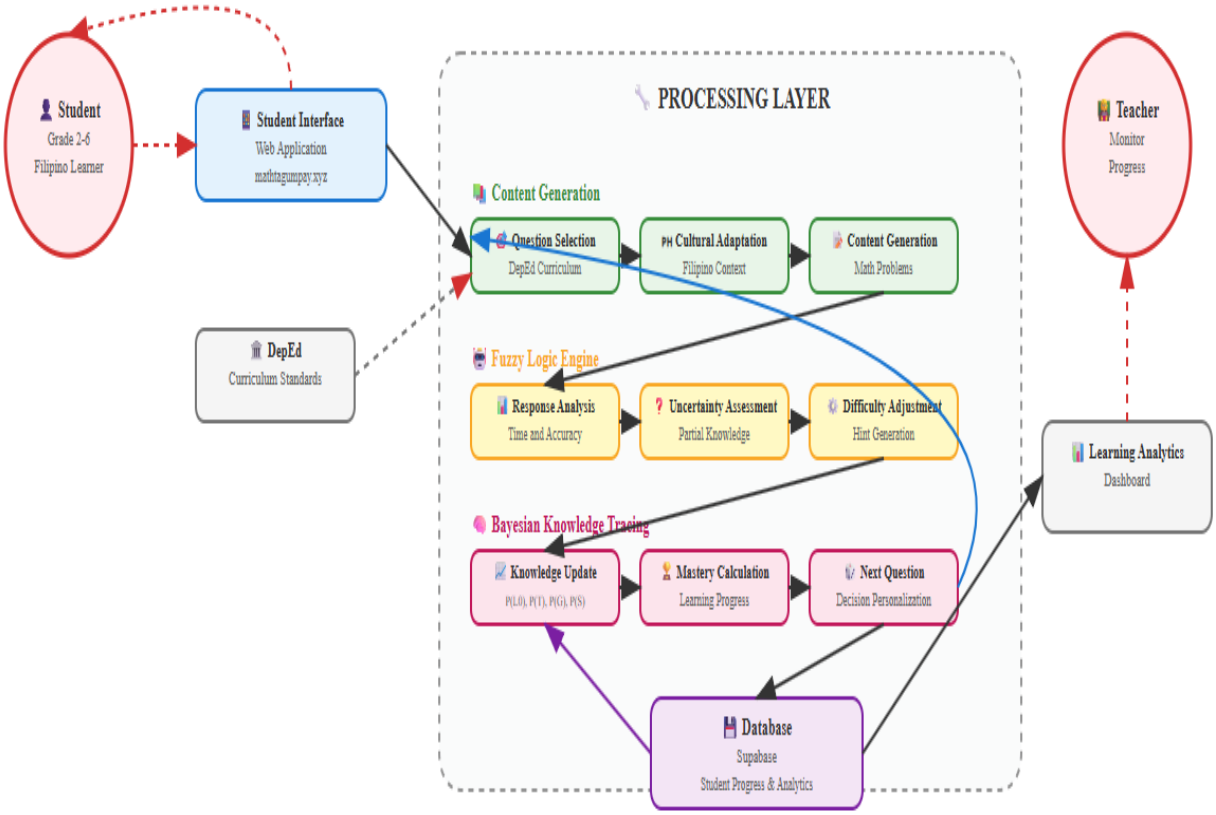

Table 1
Development Tools and Technology Stack

Category	Technology Used	Purpose
Frontend Framework	React.js	Component-based UI for age-appropriate interfaces
Backend/Database	Supabase (PostgreSQL)	Scalable data storage and real-time synchronization
Deployment	Netlify CDN	Fast loading in resource-constrained environments
AI Algorithm 1	Bayesian Knowledge Tracing	Probabilistic modeling of student learning progression
AI Algorithm 2	Fuzzy Logic Engine	Nuanced handling of uncertain student responses

Results and Discussion

The comprehensive evaluation of the Math Tagumpay Bayesian-Fuzzy hybrid Intelligent Tutoring System provides empirical evidence of its technical performance and user acceptance. The results are based on a 2-week implementation period involving 10 Grade 3–4 mathematics teachers in Bataan Province.

System Performance Assessment

The system achieved exceptional ratings across both accuracy and timeliness dimensions, with an overall performance weighted mean of 4.25 and a 94% positive response rate. The architecture successfully managed the partial understanding states characteristic of young learners while maintaining real-time responsiveness. This performance confirms that the hybrid approach is superior to single-algorithm methods for early elementary learners.

Technology Acceptance Evaluation

User acceptance was measured using the Technology Acceptance Model (TAM) framework, achieving an overall weighted mean of 4.04. Teachers demonstrated high perceived usefulness (4.22) and positive attitudes (4.26) toward the system. While behavioral intention (3.98) remained strong, the perceived ease of use (3.68) was identified as a critical area for ongoing interface optimization and teacher training.

The data analysis reveals that teachers highly value the system's ability to enhance instructional effectiveness:

The teaching effectiveness enhancement achieved the highest rating (M = 4.50) with 100% positive response rate, supporting meta-analytical findings that educational AI systems require high perceived usefulness scores for sustainable adoption. This result validates that perceived usefulness serves as the primary determinant of technology acceptance in the Philippine educational context.

Conclusion

The developed Bayesian-Fuzzy hybrid ITS demonstrates exceptional technical performance for third- and fourth-grade mathematics education in the Philippines. By successfully

integrating Bayesian Knowledge Tracing with fuzzy logic, the system achieves high accuracy in content generation and knowledge assessment while maintaining the real-time responsiveness essential for young learners. This hybrid AI approach effectively addresses the complexity of early elementary learning by managing the partial understanding states and variable response patterns characteristic of students in this age group.

The system achieved strong user acceptance among Filipino mathematics teachers, who demonstrated high perceived usefulness and positive attitudes toward its implementation. These findings validate the viability of advanced AI technologies in resource-constrained educational environments, showing that sophisticated systems can enhance instruction when properly designed and culturally adapted. However, moderate ease-of-use scores indicate that user experience optimization remains a primary area for enhancement, requiring improved interface design and comprehensive training programs to maximize long-term effectiveness.

Acknowledgements

The researcher expresses profound gratitude to the participants and institutions whose support was instrumental in completing this study. Special thanks are extended to the 10 Grade 3–4 mathematics teachers from Bataan Province whose participation provided the critical data for system validation.

Recognition is also due to the school administrators and the Department of Education (DepEd) for fostering an environment conducive to technological innovation. Finally, the researcher acknowledges the academic community and family members for their unwavering guidance and support throughout this endeavor.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that Gemini, an AI-assisted technology, was used in the refinement and formatting of this manuscript. The usage was limited to condensing existing content for clarity, applying specific markdown formatting styles, and ensuring consistent citation structures. The author further declares that the core ideas, research design, methodology, findings, and analysis are originally derived from the systematic conduct of the research.

Mapping the Sustainable Development Goals in AI-Assisted Senior High School Workbooks: A Content Analysis From the Philippines

Flordeliza M. Cuerda, Cebu Institute of Technology – University, Philippines

The Asian Conference of Education 2025
Official Conference Proceedings

Abstract

This study examines the integration of the Sustainable Development Goals (SDGs) in AI-assisted senior high school workbooks developed by teachers at the Cebu Institute of Technology - University (CIT-U), Philippines. Through quantitative and qualitative content analysis of 321 learning exercises, the research identifies patterns, gaps, and opportunities in SDG representation, with a focus on the role of artificial intelligence (AI) in shaping sustainability-related content. Key findings reveal that SDG 4 (Quality Education) dominates the workbooks (35.83%), followed by SDG 3 (Good Health and Well-being) (15.89%), while critical goals such as SDG 1 (No Poverty), SDG 13 (Climate Action), and SDG 14 (Life Below Water) are severely underrepresented (< 2%). AI-assisted content demonstrates strengths in generating interdisciplinary scenarios but lacks depth in localizing themes and addressing environmental and socioeconomic challenges. The study recommends strategic rebalancing of SDG coverage, leveraging AI for contextualized and action-oriented activities, and enhancing teacher training for cross-curricular SDG integration. These insights contribute to the broader discourse on technology-enhanced Education for Sustainable Development (ESD), offering practical pathways to align workbook design with global sustainability agendas in the Philippine educational context.

Keywords: SDG, workbooks, AI-assisted

iafor
The International Academic Forum
www.iafor.org

Introduction

The Sustainable Development Goals (SDGs), adopted by the United Nations in 2015, provide a universal framework for addressing pressing global challenges, from poverty and inequality to climate change and environmental degradation. Education is widely recognized as a key driver in achieving the Sustainable Development Goals by equipping learners with sustainability-related competencies (United Nations, 2015; Yuan & Yu, 2022). It plays a pivotal role in advancing these goals, as it equips learners with the knowledge, skills, and values needed to contribute to a sustainable future**.** Despite global policy support, several studies report limited awareness and uneven integration of the SDGs in secondary and higher education curricula (Frank & Ricci, 2023; Rubio et al., 2022).

Recent literature underscores the transformative potential of Education for Sustainable Development (ESD) materials, which foster critical thinking, problem-solving, and ethical reasoning among students (Jurnal Pembelajaran dan Sains, 2024; Zwolińska et al., 2022). Research suggests that Education for Sustainable Development (ESD) materials enhance students' critical thinking, ethical reasoning, and problem-solving skills when sustainability concepts are intentionally embedded (Zwolińska et al., 2022). Workbooks, as key pedagogical tools, offer a strategic avenue for embedding SDGs into curricula, yet their effectiveness depends on deliberate and systematic integration. Research highlights that while some institutions, particularly in Europe and Latin America, have made strides in SDG-aligned education, others face challenges such as uneven coverage, limited teacher training, and a lack of localized examples (Frank & Ricci, 2023; Rubio et al., 2022). For instance, technical fields often treat sustainability as peripheral, despite student demand for interdisciplinary connections (Zwolińska et al., 2022).

Active learning strategies such as problem-based learning have been shown to deepen students' engagement with the SDGs by linking classroom activities to real-world sustainability challenges (Van Nguyen et al., 2024). However, studies also reveal disparities in the depth of SDG treatment, with some goals receiving minimal attention (Van Nguyen et al., 2024). This observation is supported by Rubio et.al. (2022) that certain SDGs are underrepresented in learning materials, highlighting the need for systematic review and alignment of instructional resources. Mapping SDGs in educational materials can help educators identify these gaps and refine their approaches to ensure comprehensive and meaningful integration.

In response to this educational imperative, this study investigates the presence and integration of the Sustainable Development Goals in the learning exercises of senior high school workbooks—created with the assistance of artificial intelligence (AI)—by teachers of the Cebu Institute of Technology - University. By examining 321 learning exercises across these AI-assisted instructional materials, the study aims to identify which SDGs are represented, which are missing or underrepresented, and what enhancements may be proposed to align workbook content with sustainability education goals more effectively. Through this analysis, the study contributes to the growing body of research advocating for meaningful and systematic integration of the SDGs in teaching and learning practices, especially within the secondary education level in the Philippine context.

SDG Integration in Teaching Materials

The integration of the Sustainable Development Goals (SDGs) into educational materials, such as workbooks, is a crucial step toward fostering sustainability awareness and competencies among students. This review synthesizes findings from recent studies on the effectiveness of SDG integration in educational contexts, highlighting the roles of teaching materials, curriculum design, and student outcomes.

The incorporation of the Sustainable Development Goals (SDGs) into curricula and educational workbooks plays a critical role in fostering student awareness and aligning educational systems with global sustainability objectives. Embedding SDG concepts within learning materials enables learners to understand the interconnectedness of global challenges and the importance of contributing to solutions through informed actions. As education serves as a fundamental platform for shaping future leaders, integrating the SDGs—especially within early and higher education—ensures that learners are not only knowledgeable but also responsible and responsive to sustainability demands.

Education for Sustainable Development (ESD) teaching materials have been recognized for their significant impact on enhancing students' critical thinking, sustainability awareness, and problem-solving abilities. Research by Zwolińska et al. (2022) confirms that integrating ESD resources in educational settings—whether in primary, secondary, or tertiary levels—enables learners to develop cognitive skills that are essential for understanding and addressing sustainability issues. These materials encourage learners to analyze environmental, social, and economic problems from multiple perspectives, fostering deeper reflection and critical evaluation of real-life situations.

The effectiveness and practicality of ESD materials are further supported by both experts and students who have used them. According to Zwolińska et al. (2022), these resources are considered not only theoretically sound but also pedagogically useful, as they bridge abstract scientific concepts with tangible, real-world applications. By linking classroom knowledge to local and global challenges, ESD materials empower students to make informed decisions and take responsible action toward sustainable futures. This alignment with experiential and problem-based learning makes ESD a valuable component of modern curricula.

Moreover, systematic reviews underscore the heightened relevance of ESD materials in disaster-prone regions. In these contexts, ESD contributes significantly to raising community resilience and awareness, making education a key driver in mitigating the effects of environmental and humanitarian crises. As noted in a review published in the Jurnal Pembelajaran dan Sains (2024), the integration of sustainability themes in education not only promotes knowledge acquisition but also enhances the overall quality of education by embedding values of preparedness, adaptability, and responsible citizenship. Therefore, the adoption of ESD resources holds promise for both educational improvement and sustainable development, particularly in vulnerable areas.

Higher Education Institutions (HEIs), in particular, bear the responsibility of embedding SDGs not only within syllabi but also into their broader institutional processes. This includes revising learning objectives, aligning assessment methods, and ensuring that sustainability values are embedded in administrative and pedagogical decisions (Pacheco et al., 2022). When SDGs are systematically integrated, they foster the development of competencies such as critical thinking, ethical reasoning, and collaborative problem-solving—skills vital for

addressing complex sustainability issues. Thus, HEIs must go beyond superficial mentions of SDGs and embed them meaningfully into all aspects of academic life.

One effective approach to SDG integration is the use of Problem-Based Learning (PBL), which immerses students in real-world challenges that require interdisciplinary and practical solutions. Van Nguyen et al. (2024) examined seven PBL programs and found that all 17 SDGs were touched upon; however, the depth of treatment varied, with some goals receiving limited focus. This underscores the importance of ensuring balanced and comprehensive SDG integration, especially through hands-on applications such as case studies and community-based projects. Likewise, mapping SDGs within textbooks, workbooks, and classroom exercises provides educators with a strategic tool for identifying gaps and enhancing the relevance and effectiveness of sustainability education (Van Nguyen et al., 2024). Through deliberate and thoughtful integration of SDGs, educators can significantly enhance students' readiness to contribute to a more sustainable future.

Despite the growing global emphasis on the Sustainable Development Goals (SDGs), student knowledge and awareness of these goals remain surprisingly limited. A study conducted among Chinese high school students revealed low levels of SDG awareness across the population, with no significant differences observed between male and female respondents (Yuan & Yu, 2021). This suggests that gender is not a key factor in SDG awareness and that the gap is likely due to the absence of a strong emphasis on sustainability education in both formal curricula and informal learning environments. The study reinforces the urgent need to enhance SDG education more comprehensively and inclusively across educational systems.

In response to this challenge, active learning methodologies have shown promise in enhancing student understanding and engagement with the SDGs. Design challenges, in particular, have proven effective in expanding students' perspectives by encouraging them to address real-world problems through creative and ethical solutions. According to research (Skene & Malcolm, 2019), these approaches often promote nature-based solutions, environmental consciousness, and social responsibility, all of which align with the core values of the SDGs. Active learning also fosters a participatory and student-centered environment, which increases motivation and deepens conceptual understanding compared to traditional lecture-based instruction.

Experiential learning, including capstone projects and community-based initiatives, has likewise emerged as a powerful strategy for advancing SDG awareness. These experiences allow students to apply theoretical knowledge in practical contexts, addressing sustainability issues through interdisciplinary collaboration and reflective practice. O'Toole and Fang (2023) emphasize that such approaches not only raise awareness about global challenges but also develop crucial employability skills such as problem-solving, communication, teamwork, and leadership. By engaging directly with SDG-related themes, students cultivate a global perspective and a sense of personal agency in contributing to sustainable development.

Moreover, the long-term impact of SDG-integrated education extends beyond the classroom and into the workforce. Graduates from academic programs that align their curricula with the SDGs—especially those focused on economic development—tend to experience more favorable employment outcomes. According to Alimehmeti et al. (2024), these graduates report higher salaries, greater job satisfaction, and stronger alignment between their skills and

job requirements. This suggests that employers value sustainability-related competencies and that SDG education can serve as a strategic tool for improving graduates' career prospects.

Despite the increasing recognition of the importance of integrating the Sustainable Development Goals (SDGs) into education, several persistent barriers hinder their full and effective incorporation into curricula. One of the most pressing issues is the uneven coverage of SDG-related topics across different educational levels and disciplines. Frank and Ricci (2023) highlight that many institutions still struggle with limited teacher training on sustainability concepts, resulting in educators feeling ill-equipped to teach these complex, interdisciplinary topics. Furthermore, in many emerging contexts, there is a noticeable lack of practical applications and localized examples that would make SDGs more relevant and relatable to students. This gap reduces the effectiveness of SDG integration and prevents learners from fully grasping the real-world implications of sustainable development.

Additionally, the need for curricular innovation is particularly evident in technical and science-oriented fields, where sustainability education is often viewed as peripheral rather than integral. Students at AGH University, for example, have expressed a strong demand for more interdisciplinary content that connects their technical expertise with the broader economic, social, and environmental goals outlined in the SDGs (Zwolińska et al., 2022). This feedback points to a critical opportunity for curriculum designers to revisit and revise academic programs to better reflect the interconnected nature of today's global challenges. By embedding sustainability themes across disciplines—not just in the humanities or social sciences—educational institutions can produce well-rounded graduates capable of contributing to holistic and sustainable solutions in various sectors.

In summary, while there is a clear need to address the limited awareness of SDGs among students, especially at the secondary level, the literature points to a variety of effective pedagogical strategies. Active and experiential learning methods—including design challenges and capstone projects—have demonstrated strong potential to enhance SDG knowledge and skill development. Furthermore, evidence suggests that embedding SDGs into the curriculum yields not only educational benefits but also professional advantages for students post-graduation. These findings underscore the importance of integrating sustainability education holistically across all levels of learning to ensure that future generations are equipped to tackle complex global issues.

In conclusion, the integration of Sustainable Development Goals (SDGs) into education—particularly through workbooks, curricula, and experiential learning—plays a vital role in promoting sustainability awareness, skill development, and real-world application among students. The literature consistently emphasizes that teaching materials grounded in Education for Sustainable Development (ESD) not only enhance cognitive skills such as critical thinking and problem-solving but also foster ethical responsibility and global citizenship (Jurnal Pembelajaran dan Sains, 2024; Zwolińska et al., 2022). However, uneven implementation across institutions and disciplines highlights the need for more inclusive, systematic, and interdisciplinary approaches, particularly in technical and emerging educational contexts (Frank & Ricci, 2023; Zwolińska et al., 2022). Addressing these gaps requires teacher training, curriculum innovation, and the meaningful use of local examples to make sustainability education more impactful.

Moreover, active and experiential learning strategies such as problem-based learning, design challenges, and capstone projects have proven effective in embedding SDGs into academic

programs (O'Toole & Fang, 2023; Skene & Malcolm, 2019; Van Nguyen et al., 2024). These methods not only raise SDG awareness but also prepare students for the workforce by developing competencies aligned with employer needs, particularly in the context of economy-related SDGs (Alimehmeti et al., 2024). With increasing student demand for relevant, interdisciplinary sustainability content, especially in technical fields, educational institutions are called to revisit and revise their curricular frameworks. A comprehensive and intentional approach to SDG integration will not only improve learning outcomes but also contribute meaningfully to shaping a more sustainable, equitable future.

Methodology

This study utilized a quantitative and qualitative content analysis approach to investigate the integration of the Sustainable Development Goals (SDGs) within AI-assisted senior high school workbooks crafted by teachers at the Cebu Institute of Technology - University (CIT-U). The methodology unfolded across four structured phases. In the data collection phase, researchers analyzed 321 learning exercises from these workbooks across diverse senior high school subjects, selected for their interdisciplinary relevance and incorporation of AI tools like generative AI for content creation or adaptive features. Inclusion criteria targeted exercises that explicitly or implicitly addressed any of the 17 SDGs through elements such as problem-solving tasks, case studies, or reflective questions. The coding and SDG mapping phase involved applying a framework to each exercise, identifying explicit SDG mentions (e.g., direct references to SDGs or terms like "sustainability" and "climate action") alongside implicit alignments (e.g., poverty reduction in math problems or gender equality in literature). Exercises were then classified against the UN's official SDG indicators, allowing multiple linkages where relevant. Data analysis encompassed frequency analysis to quantify SDG distribution and highlight overrepresented or underrepresented goals, thematic analysis to uncover integration patterns (such as standalone activities versus cross-curricular links), and an evaluation of AI's influence on content depth or creativity (e.g., AI-generated case studies compared to teacher-designed scenarios). Finally, validation ensured inter-coder reliability through independent coding by two researchers on a subset of exercises, with discrepancies resolved via discussion. Limitations included the focus solely on teacher-created, AI-assisted workbooks, which may not generalize to all materials, and the observational nature of AI's role without experimental contrasts to non-AI content.

Findings

The analysis of 321 learning exercises from AI-assisted senior high school workbooks revealed notable disparities in the representation of the 17 Sustainable Development Goals (SDGs). The results indicate that SDG 4, which promotes Quality Education, dominated the content, appearing in 35.83% (115) of the total activities. While this aligns with the academic setting, it also suggests a potential overemphasis on education-related themes at the expense of other critical dimensions of sustainability. SDG 3, which addresses Good Health and Well-being, was the second most represented, present in 15.89% (51) of the exercises, reflecting its close connection to student wellness and science-related curricula.

Figure 1
Percentage of Distribution per SDG

Moderately represented SDGs included SDG 9 (Industry, Innovation, and Infrastructure), which appeared in 9.97% (32) of the activities, and SDG 5 (Gender Equality), with 5.92% (19) of the exercises. These indicate some level of interdisciplinary integration. Other goals, such as SDG 8 (Decent Work and Economic Growth), SDG 11 (Sustainable Cities and Communities), and SDG 16 (Peace, Justice, and Strong Institutions), were present in about 5% of the workbook content. This suggests occasional but unsystematic inclusion of themes outside the education and health domains.

However, the study also highlighted a concerning underrepresentation of several critical SDGs. SDGs such as No Poverty (SDG 1), Zero Hunger (SDG 2), Clean Water and Sanitation (SDG 6), Affordable and Clean Energy (SDG 7), Responsible Consumption and Production (SDG 12), Climate Action (SDG 13), Life Below Water (SDG 14), and Life on Land (SDG 15) each appeared in fewer than 2% of the exercises. These gaps reflect missed opportunities to address pressing global and local challenges, particularly those related to environmental and socioeconomic issues. SDG 17 (Partnerships for the Goals), which emphasizes global collaboration and community action, was represented in only 2.8% (9) of the activities, indicating a limited focus on cooperative and solution-oriented approaches.

Discussion

The role of artificial intelligence in the creation of these workbooks shows both potential and limitations. While AI-assisted materials demonstrated thematic breadth, the depth of integration varied. For example, many SDG 4-related exercises were generic and descriptive, such as essay writing on the value of education, without moving toward more action-oriented or experiential tasks. On the other hand, AI-generated content showed promise in introducing innovative case studies for goals like SDG 9, yet these were sometimes lacking in localized context. For instance, activities related to SDG 2 did not sufficiently reflect real agricultural challenges in the Philippine setting.

Key gaps were particularly evident in the environmental and socioeconomic dimensions of sustainability. Environmental goals such as SDGs 6, 7, and 12 through 15 were severely underrepresented despite the Philippines' vulnerability to climate-related disasters and its rich biodiversity. Similarly, SDGs related to poverty, hunger, and inequality (SDGs 1, 2, and 10) were minimally addressed, pointing to a disconnect between classroom content and real-

world community concerns. Furthermore, interdisciplinary integration remained weak. Subjects such as Mathematics and Filipino rarely incorporated relevant SDG themes—for example, math problems involving data on poverty (SDG 1) or literature exploring gender narratives (SDG 5) were notably absent.

While the exercises met institutional requirements, many lacked meaningful connections to real-world contexts. There was limited emphasis on encouraging learners to engage with current economic, social, and environmental challenges at the national and global levels. Moreover, important societal issues such as corruption in the Philippines were not sufficiently integrated into the workbook activities, indicating opportunities for further enhancement.

Conclusion

To enhance SDG integration in AI-assisted workbooks, several strategies are recommended. First, a more balanced representation of the SDGs is necessary. Curriculum designers should prioritize the inclusion of underrepresented goals by developing targeted learning activities. These could include math problems involving clean energy data for SDG 7, science experiments focused on local biodiversity to support SDG 15, and classroom debates simulating climate policy discussions for SDG 13. Second, AI can be more effectively leveraged to contextualize content. Tools should be used to generate examples that reflect Philippine realities—such as challenges in rice farming for SDG 2—and to produce multimedia learning materials like infographics on SDG 14 (Life Below Water).

Third, capacity-building among teachers is essential. Conducting training workshops would help educators recognize SDG connections in their respective subjects and encourage interdisciplinary collaboration. For instance, English and Social Studies teachers could jointly develop persuasive writing activities linked to SDG 16 (Peace and Justice). Finally, implementing regular assessment and feedback mechanisms is crucial. Periodic audits using SDG mapping tools and pilot testing student responses to SDG-related tasks can guide improvements and ensure content relevance and impact.

Acknowledgements

The author gratefully acknowledges the **Cebu Institute of Technology – University (CIT University)** for its institutional support and for providing an enabling academic environment for this study. Sincere appreciation is also extended to the **Senior High School Department teachers of CIT University** for their cooperation, insights, and contributions to the development and analysis of the AI-assisted workbooks examined in this research. Special thanks are due to **Dr. Larmie Feliscuzo** for valuable guidance, professional support, and encouragement throughout the conduct of the study.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

ChatGPT (OpenAI) and Grammarly were used solely for language editing and proofreading. It was not involved in data generation, analysis, or interpretation. Full responsibility for the content rests with the author.

Abstract

The aim of this study was to investigate the development and evaluation of the EduTechPJ© Module in enhancing the digital competencies of secondary school Physical Education teachers. The EduTechPJ© Module was developed by implementing the ASSURE Instructional Model and adapting the European Framework of Digital Competence of Educators (DigCompEdu), applying elements of Connectivism and Boyatzis' Theories as well as collaborative learning strategies. The design and development research process is divided into three critical phases: i) needs analysis; ii) design and development; and iii) implementation and evaluation. The needs analysis phase measures the need for a module with the integration of artificial intelligence elements. A combination of information from multi-methods analysis through semi-structured interviews and surveys was used for the needs analysis. The design and development phase using the Fuzzy Delphi Method is leveraged to gain expert consensus on various aspects, including module content design and pedagogical strategies. The final phase encompasses implementation and evaluation, aimed at appraising the usability and effectiveness of the module within actual training contexts. Key findings revealed that the module, grounded in Connectivism, Boyatzis' Theory, and the DigCompEdu Framework, significantly improved teachers' digital competencies, as demonstrated by pre- and post-test results. Additionally, high usability scores and positive feedback affirmed the module's practicality, accessibility, and relevance. The training also led to sustained behavioral changes, with teachers applying their newly acquired skills in schools, enhancing lesson delivery and job performance. Hence, these findings provide an effective and practical training solution to support technology integration in teaching practices.

Keywords: digital training, integration of digital technology, teachers' digital competency, teachers' professional development, physical education

Introduction

In the era of rapid technological advancements, digital competence emerged as a critical focus in education (Vásquez-Pajuelo et al., 2024). This shift is driven by the growing digitization of society and the economy as well as preparing the learners for the demands of the 21st century. The integration of technology has transformed educational practices, making learning more accessible, interactive, and flexible. Consequently, both teachers and students possess strong digital skills and attitudes to navigate the digital education landscape effectively (Brändle et al., 2023; Napitupulu et al., 2024). However, the findings by Kementerian Pendidikan Malaysia (2023) indicated that the level of digital competence measured in 2021, with the involvement of 297,018 teachers, there were 6,442 (2.2%) teachers at the advanced level, 118,651 (39.9%) at the intermediate level and as many as 171,925 (57.9%) teachers at the basic level. From this finding, it showed that 57.9% of teachers are aware of and try to use digital technologies but do not use them according to the situation that suits the various available digital technologies. Moreover, findings from the research by Wallace et al. (2023) specifically showed that Physical Education Teachers (PETs) have significantly low digital competency levels with limited comprehension of teachers' digital competency within the context of physical education. Moreover, Hamalainen et al. (2021) highlighted the importance of equipping both teachers and students with digital capabilities to ensure meaningful participation in digital education. These challenges underline the need for innovative solutions to enhance the digital competency of teachers, particularly in designing and delivering technology-enhanced learning experiences.

Accordingly, teachers must possess a thorough awareness of the numerous digital tools and technologies accessible to integrate them into their teaching methods in an efficient manner. This is supported by findings by Mohamed Faizul et al. (2021) that showed the need for teachers to have a willingness to teach, a strong effort and a good presentation in teaching. This involves being familiar with educational software, communication tools, multimedia resources, and internet platforms in order to design engaging and interactive classes that meet the various learning needs of their students by becoming familiar with these resources. Digital technologies also facilitate the learning of new methods, acquisition of skills, and accessing information on specific topics. This widens the scope for enhancing and innovating pedagogical methods (Xing & Qi, 2022).

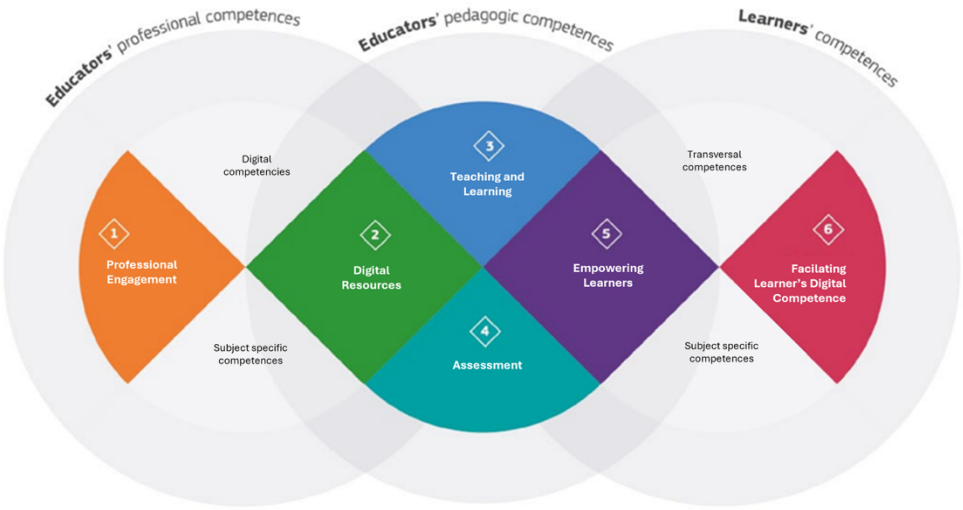
Therefore, in order to foster competency development in digital technology among PETs, this EduTechPJ© Module is developed especially for PETs to integrate digital technology into their lessons as well as in the organization. Moreover, a module is an efficient way to combine techniques, teaching methods, multimedia technologies, and instructor expertise and the introduction of new instructional technologies can be made possible (Saliyeva & Ibragimova, 2021). The EduTechPJ© module is critical in addressing the digital competency gap among PETs, which is essential for transforming education to meet 21st-century demands. By providing training, the module enhances their proficiency in using digital tools and innovative teaching strategies. In addition, the module builds confidence and competence in utilizing digital tools, positioning them as leaders in technological integration within their schools. Furthermore, The EduTechPJ© module is designed using a combination of Connectivism Theory, Boyatzis Competency Theory, Digital Competence for Educators (DigCompEdu) and collaborative learning strategies to ensure its effectiveness in enhancing the digital competency of PETs. By integrating these elements of theories and framework, the EduTechPJ© module not only equips PETs with practical digital skills but also cultivates the mindset and adaptability required to thrive in a digital education field. This holistic approach

ensures that the module effectively addresses the needs of PETs, driving meaningful improvements in teaching practices and contributing to the broader transformation of the education system especially towards 21st century education.

Theoretical Foundation and Instructional Strategy

The EduTechPJ© Module is built upon solid theoretical and pedagogical foundations, incorporating Connectivism Theory, Boyatzis' Competency Theory, and Collaborative Learning Strategies to enhance teachers' digital competencies. In response to the evolving nature of education in the digital age, Connectivism Theory evolved in the early years of the 21st century. The theory was introduced by Siemens and Downes (2022) to provide a framework for understanding learning in an era characterized by rapid knowledge expansion and technological advancement. In addition, the theory of connectivism presents a new point of view on education in the digital era. It offers a framework for comprehending how people might navigate and make sense of the enormous amount of information available by acknowledging the power of networks and relationships as well as mental connections between pieces of information during interaction with various information sources (Yousef et al., 2020). Moreover, principles of Connectivism theory include learning as a network process, the importance of connections and networks, distribution cognition and knowledge as dynamic entity. Furthermore, this theory could assist teachers in crafting a learning environment whereby learners augment their existing understanding of sustainability through online interactions and accessing digital knowledge resources (Boyraz & Ocak, 2021; Dziubaniuk et al., 2023). Indirectly, it encourages students to connect and work together more easily by using digital resources such as social media and online forums.

On the other hand, Boyatzis competency theory is a concept that concentrates on how people build their emotional intelligence and competencies (Boyatzis, 2008). From the findings, it also realizes the significance of abilities in influencing both individual and organisational success. Competencies, which are a collection of knowledge, skills, abilities, and behaviours that support successful performance in a particular position or domain, are the fundamental building blocks of Boyatzis competency theory. There are various types of competencies, including technical competencies that are unique to a given job or profession and behavioural competencies that are connected to emotional intelligence and interpersonal skills (Albino, 2018). Furthermore, competency theory also acknowledges that emotional, social and cognitive intelligence are constructs that may be improved with time and can be developed (Boyatzis, 2008). It suggests a developmental paradigm that indicates many stages of competency growth, from beginner to master. The approach places a strong emphasis on the value of continuous learning, evaluation, and introspection for the development of competencies.



In addition, collaborative learning strategy focus on the interaction and cooperation in the learning process. Components of a collaboration learning strategy include group projects and assignments, peer-to-peer learning and collaboration problem-solving (Khlaif & Salha, 2021). Group projects and assignments are a typical part of collaborative learning strategies. In this study, PETs collaborate in groups to do assignments, find solutions to issues, or produce presentations. This encourages teamwork, shared accountability, and idea sharing. While peer-to-peer learning can be done through discussions and the exchange of information and experiences. This fosters a feeling of belonging and motivates participation in the educational process (Malan, 2021). Furthermore, collaborative learning enhances creativity, critical thinking, and the ability to evaluate and appreciate diverse perspectives. Therefore, the

integration of the European Framework of Digital Competence of Educators (DigCompEdu) framework with Connectivism Theory, Boyatzis' Competency Theory, and collaborative learning strategies enables PETs to utilize digital technology more effectively as a platform for instructional delivery and for accessing a wide range of learning materials. In line with this integration, the DigCompEdu framework serves as the primary reference for defining and structuring the digital competencies embedded in the EduTechPJ© Module.

Adaptation of the European Framework of Digital Competence of Educators (DigCompEdu)

The DigCompEdu Framework was introduced by Redecker (Redecker, 2017) and highlights the holistic area of competency digital as an educator. Moreover, DigCompEdu is a comprehensive framework that shares features with other frameworks that are used internationally (Cabero-Almenara et al., 2020) and is generic for use in different educational situations (Caena & Redecker, 2019). Furthermore, the DigCompEdu framework targets teachers across all educational levels, spanning from early childhood to higher and adult education, encompassing general and vocational training, special needs education, and informal learning contexts (Redecker, 2017). DigCompEdu framework consists of three competency areas defined primarily as educators' professional competences, educators' pedagogic competences and learners' competences. The EduTechPJ© Module was created by adapting these digital competencies. These three competence areas consist of six different areas, which are professional engagement, digital resources, teaching and learning, assessment, empowering learners, and facilitating learners' digital competences. From these areas, it is clear that digital competency is not solely utilized in teaching and learning but it also serves as an integral aspect of an educators' overall role.

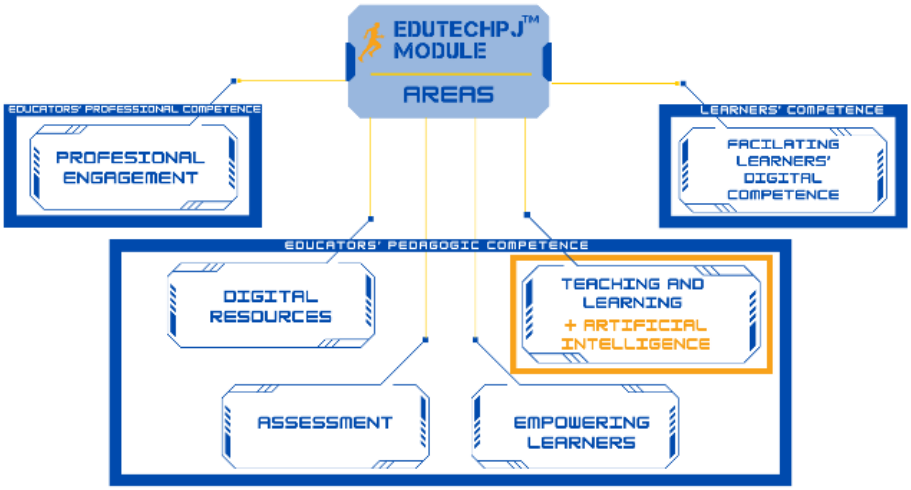


Figure 1
DigCompEdu Framework (Redecker, 2017)

However, the rapid advancement of artificial intelligence (AI) (Ejjami, 2024) has made it imperative to incorporate AI components into the DigCompEdu framework in order to ensure that teachers remain abreast of the latest technological advancements. In this study, AI is embedded to provide teachers with knowledge and tools to leverage AI-driven solutions, such as intelligent systems, adaptive learning platforms, and data analytics, to enhance their professional practices. This comprehensive integration ensures that PETs can adopt innovative approaches across various aspects of their roles, aligning with the demands of

modern digital education and fostering improved learning outcomes. Figure 2 introduced the adaptation of the DigCompEdu Framework by (Redecker, 2017).

Figure 2
Adaptation of DigCompEdu Framework in EduTechPJ© Module

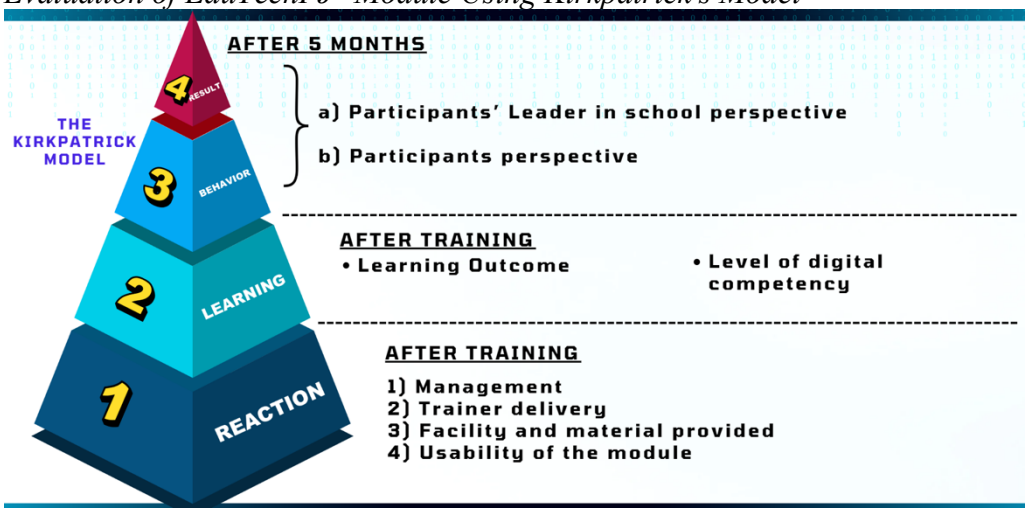
Therefore, the aim of this study was to investigate the development and evaluation of the EduTechPJ© Module in enhancing the digital competencies of secondary school PETs.

Methodology

Design

In this study, the design and development research by Richey and Klein (2007) served as the approach for this module development. In addition, design and development research can give informative data to the researchers to make decisions and ensure the module has a high impact especially to the PETs. Furthermore, this design is a systematic and highly structured research process in order to establish an empirical foundation for constructing modules for specific subject matter (Richey & Klein, 2007). The design and development research has 3 important phases including i) needs analysis; ii) design and development; and iii) implementation and evaluation (Saedah et al., 2013). Thus research methodology is grounded with ASSURE Instructional Model to provide a comprehensive instructional design that supports the development of digital competency modules for PETs. This model is particularly suitable for designing and developing this module because it is more effective in designing instructional materials that focus on technology integration and learning media (Hasna Nirfya & Ema, 2022). Moreover, since the development of the EduTechPJ© Module highlights technology usage from an overall teaching profession perspective, the ASSURE model can be categorized as practical and implementable in teaching and learning activities (Stavinibelia et al., 2023; Yudi Hari & Supriyo, 2021). The model follows a systematic approach which begins with analyses learners, state objectives, select media, methods and materials, utilize media, methods and materials, require learner performance and evaluation. All these elements are arranged systematically according to the design and development research approach. For this research, Type 1 which refers to specific product or program design, project development and evaluation of design and development research is selected because it produces a product which is the EduTechPJ© Module that is specific for PETs. Table 1 showed the summary of ASSURE Model according to the design and development research phase.

Table 1
The Summary of ASSURE Model According to the Design and Development Research Phase



Phase of Design and Development Research	ASSURE Instructional Model	Explanation
Phase 1 (Need Analysis)	A: Analyze Learners	Analysis of teacher competency levels and the agreement by experts to develop a digital competency module for PETs
Phase 2 (Design and Development)	S: State learning objectives	State the objective of module development
	S: Select media, methods and materials	Choose media, mehods and teaching materials that suit the PE Secondary School curriculum content
	U: Utilize media, methods and materials	Develop and utilize media by integrating technology in teaching and learning materials
Phase 3 (Implementation and Evaluation)	R: Require learner responses	The implementation of EduTechPJ© module
	E: Evaluation	Evaluate the usability and effectiveness of the EduTechPJ© module base on Kirkpatrick Evaluation Model

In the first phase of design and development research which need analysis, the researchers also conducted a survey to identify the digital competency level of PETs. Instead of the survey, the researchers also explored all the problems and challenges arose among PETs in integrating the digital technology in their. The importance of developing the digital competency module for PETs was highlighted by this data collection. The interviews session was held by focus group discussion to get as many and depth information including thoughts, opinions and experiences of the PETs. In the second phase of design and development research, design and develop a module is required. In the design phase, the elements of state objectives (S), select media, methods and materials, (S) utilize media, methods and materials (U) in ASSURE instructional model elements were implemented. All these elements were firstly designed by the experts in specific area including, technology education, physical education and training module experts. The consensus of those experts was analyzed using Fuzzy Delphi Method (FDM). Additionally, in order to determine the extent to which the components and elements are appropriate in development phase, there needs to be a content validation process for the components and elements. This process to ensure it have been accurately defined.

The final phase of design and development research is implementation and evaluation. In this study, the EduTechPJ© module was evaluated using a structured training program implemented for secondary school PETs. In the other hand, the Kirkpatricks' Evaluation Model was used to guide the evaluation of the usability and effectiveness of EduTechPJ© Module through Digital Competency training. This well-established framework provides a structured approach to evaluating the impact of training interventions across four key levels: i) reaction; ii) learning; iii) behavior; and iii) results as shown in Figure 3.

Figure 3

Evaluation of EduTechPJ© Module Using Kirkpatrick's Model

For the purposes of this evaluation phase, the researchers examined all four levels of the model. At the reaction level, the researchers conducted a usability evaluation as well as the effectiveness of the training in terms of management, trainer delivery, facility, and material provided. The study then examined the learning level by employed a pretest-posttest design where PETs' digital competency levels were measured before and after the training intervention. In addition, a survey was carried out to evaluate the participants' learning outcomes immediately after the training session.

In addition, to evaluate changes in PET's behavior as outlined in the behavior level of Kirkpatrick's Evaluation Model and to assess the application of the acquired digital competencies, the researchers gathered perspectives from the participants themselves as well as from their principals five months after the training. This longitudinal assessment provided insights into the sustained impact of the EduTechPJ© module on teaching and learning practices. Following the behavior level of Kirkpatrick's Model, the evaluation progressed to the highest level, which is results. In this level, broader organizational and institutional outcomes are examined, including the overall digital integration within the participating schools. By integrating these complementary methodological approaches across all four levels of Kirkpatrick's Model, the researchers aimed to gain a comprehensive understanding of the EduTechPJ© module's impact on the targeted group of secondary school PETs.

Participants

For the need analysis phase, this study involved 169 secondary school PETs from nine schools in Selangor, Malaysia, selected through purposive sampling. A self-assessment digital competency survey was conducted to evaluate their proficiency levels, followed by semi-structured interviews with nine experts to gain qualitative insights into their experiences and challenges.

For the second phase of design and development research, there were two stages involved in the design and development phase, which are the module design stage and the module development stage. A total of 16 experts in the fields of educational technology, physical education, and module development were involved in this stage. All the selected experts had extensive experience and had served for more than five years in their respective fields. The criteria for expert selection are aligned with Berliner (2004), who stated that an individual is

considered proficient in a particular field if they have more than five years of experience in that field. In the module development stage, five experts in technology education, physical education, pedagogy, and training module experts were given the module to be validated in terms of the objective, adaptation of DigCompEdu Framework, applying Connectivism, Boyatzis Competency, and Collaborative Learning Strategies. At the third phase of design and development research, the researcher conducted digital competency training using the EduTechPJ© Module involving 38 secondary school PETs in Selangor selected through purposive sampling. Demographics such as gender, age, school location, teaching experience, and qualifications of the participants were determined in this study.

Instrument

In the need analysis phase, the researcher utilized a questionnaire adapted from the SelfieforTeachers questionnaire, and was based on the DigCompEdu Framework, which is widely used in the field of teachers' digital competencies. The researcher translated the instrument's questions and tailored them to suit the Malaysian context and conditions. The questionnaires of the interview session have been evaluated by experts with expertise in technology education and physical education. Nonetheless, the researchers themselves serve as the primary tool in this investigation. According to Gay et al. (2012), the researcher serves as the main tool for gathering data. Then, it followed by the second phase of the design and development research which is design and development. In this phase, the researcher employed the Fuzzy Delphi Method (FDM) to determine the elements to be included in the module. The instrument used in this FDM was a fuzzy questionnaire that had been reviewed by experts in educational technology and physical education. After obtaining validation, the questionnaire was distributed to 16 experts in the fields of educational technology, physical education, and module development.

Subsequently, after developing the module based on the analysis conducted during the design phase, a module validation instrument was employed to ensure that the features identified in the design phase were incorporated into the module. This instrument was adapted from the studies of (Muhammad Nidzam Yaakob, 2016; Syar Meeze, 2021). Since this was a validation instrument derived from the design phase, the same constructs were used, but with a different scale applied, considering the exclusion of items following the module design analysis.

Lastly, for the third phase of design and development research which is implementation and evaluation, **t**he questionnaire was distributed to the participated PETS to analyze the usability of the digital competency module. This questionnaire was adapted from the studies of (Muhammad Nidzam Yaakob, 2016; Syar Meeze, 2021). It was based on the usability questionnaire by (Lund, 2001), known as the USE questionnaire (Usefulness, Satisfaction, Ease of Use). However, in order to assess the EduTechPJ© module effectiveness, the researchers utilized the EduTechPJ© Effectiveness Questionnaire, which was designed based on Kirkpatrick's evaluation levels.

Analysis

In the first phase of design and development research, the findings of survey were analyzed using the Statistical Package for the Social Sciences (SPSS) version 29.0. The data were then processed using descriptive statistical procedures. This analysis followed by the thematic analysis whereby the data from the verbatim interviews were analysed using the NVIVO

software. According to Creswell and Creswell (2018), validity and reliability refer to how well and consistently a study's results reflect the topic under investigation. To increase the study's validity and reliability, the researcher employed expert verification techniques.

Next, FDM method was used to analysis the module's content by gathering input from 16 experts. Experts provided their feedback on a 7-point scale using a predefined linguistic scale, which was then converted into triangular fuzzy numbers for analysis. The defuzzification process was applied to compute the average agreement levels, and three key conditions were used to determine consensus: i) the threshold value (d) must be ≤ 0.2, ii) the percentage of expert agreement must be $\geq 75\%$, and iii) the fuzzy score (A) must be ≥ 0.5. These criteria ensured that the validation process was objective and met the required standards for agreement among experts. This process ensured that the module was aligned with expert opinions and achieved high reliability and validity.

From the analysis, the acceptance of each element was stated in order to know the most suitable elements that will be used in the module. After the design process by the experts had done, the development of the module took place. In order to develop the module, the Canva Pro Application was used. It is user friendly, easy to access and enables fast editing as well as updated. The elements from the design process were implemented in the module including the DigCompEdu Framework, theorical foundation of Connectivism and Boyatzis Competency Theories and Collaborative Learning Strategies. All theories, framework and learning strategies used were aligned with the module objectives.

Lastly, for the last phase of design and development research, the researcher used SPSS version 29.0 in order to employ descriptive analysis to examine the usability and effectiveness of the module. Additionally, to evaluate the effectiveness of the training using the EduTechPJ© Module, the researcher also conducted a paired t-test to identify statistical differences. In this study, the paired t-test analysis was performed using the same sample using pretest and posttest.

Results

A self-assessment digital competency survey involving 169 secondary school PETs revealed that most are at the C1 (leader) level of the DigCompEdu framework. This indicates that they effectively use digital technology to enhance pedagogical and professional practices, share innovative ideas, and inspire others. Despite their high competency, the findings highlight the need for a digital competency module to guide the integration of digital technology, specifically within PE teaching and management.

However, interviews with nine experts, each with 7 to 22 years of experience in PE, revealed that digital technology is rarely used and often depends on lesson content. While experts acknowledged the benefits of digital tools for teaching, learning, and administrative tasks, they also identified challenges such as limited infrastructure, financial constraints, lack of training, and negative perceptions of PE. These findings emphasize the importance of a tailored module addressing teachers' needs, including video creation, quiz applications, and digital tools to overcome these barriers.

The findings from phase two indicated that the researcher successfully developed a digital competency module for secondary school PETs based on Connectivism Theory, Boyatzis Competency Theory, DigCompEdu framework, and collaborative learning strategies based

on the consensus of 16 experts. The expert panels were selected based on clear criteria, including a minimum of five years of professional experience, academic qualifications, and expertise in educational technology, physical education, and training module. Therefore, the innovation introduced through this module represents a novelty and catalyzes future digital technology modules for PE teachers.

Lastly, the third phase represents the final stage in the development and evaluation of the digital competency module for secondary school PE teachers (EduTechPJ). The findings from this study demonstrate that the EduTechPJ Module meets the usability criteria and addresses the needs of these teachers. Furthermore, the empirical findings from the five-month implementation period showcased exceptionally high levels of agreement among participants and educational leadership. The data reveals a highly positive response, with PETs reporting substantial improvements in their digital competencies and technological integration capabilities. The evaluation findings further reveal that PETs were able to confidently apply new digital knowledge in their professional role, demonstrating a notable increase in their ability to perform tasks more effectively. Additionally, the module contributed to enhancing their work performance and boosting their motivation in carrying out their professional responsibilities. These outcomes indicate that the module not only equipped the participants with relevant digital skills but also positively impacted their confidence, efficiency, and overall workplace engagement. More critically, school principals and administrative leaders of the PETs in each school also provided overwhelmingly supportive feedback indicating the module's alignment with broader institutional technology integration goals.

Discussion

This study highlights the successful development and evaluation of the EduTechPJ© Module, designed to enhance the digital competencies of secondary school PETs. The module addresses critical gaps in digital technology integration due to limited resources, insufficient training, and technical challenges.

Through a structured design process guided by the ASSURE model and validated by experts, the module demonstrated high usability and effectiveness. Additionally, this research offers significant theoretical implications by extending the application of Connectivism Theory and Boyatzis Competency Theory within the context of teacher education. Specifically, it demonstrates how these theories can guide the development of a digital competency module tailored for PETs. Moreover, by integrating the DigCompEdu framework and collaborative learning strategies, the study also enriches the understanding of how digital competency development can be aligned with theoretical models to address the unique needs of educators in the 21st century. Similarly, Al Mamun et al. (2020) showed high practicality when using structured learning guidance effectively. In addition, validation thresholds are essential in ensuring the reliability and credibility of expert validation processes (Hsu & Sandford, 2007; Yusoff, 2019). In this study, the Fuzzy Delphi Method was utilized with clearly defined thresholds to establish consensus among the 16 experts. These thresholds included a threshold value (d) ≤ 0.2, expert agreement $\geq 75\%$, and a fuzzy score (A) ≥ 0.5. Such measures ensure that the findings reflect a high level of methodological rigor and reliability. The use of these validation thresholds provides confidence in the module’s design and alignment with educational objectives, further reinforcing the credibility of the research findings.

Training sessions with 38 PE teachers, evaluated using Kirkpatrick's Evaluation Model revealed significant improvements in digital competencies, high levels of usability and positive feedback on the module's effectiveness. The feedback from school leaders, including participants' leaders and principals, highlights the positive changes observed in the teachers' integration of digital tools into their teaching practices and overall professional responsibilities. These findings underscore the module's sustained impact not only on the participants' competencies but also on their ability to apply these skills in real-world teaching and learning in schools. This aligns with previous research, which emphasizes that sustained application of digital skills by teachers supported by administrators is crucial for enhancing digital teaching performance (Arnel Sumaya Alde, 2023).

These findings indicate that the EduTechPJ© Module is an effective and practical approach to enhancing the digital competencies of PETs. Its development and evaluation offer valuable insights for policymakers, educators, and researchers seeking to address the challenges of integrating technology into education. The module not only bridges existing gaps in digital competency but also catalyzes creative and innovative teaching practices, paving the way for future advancements in educational technology.

Conclusion

This study aimed to investigate the development and evaluation of the EduTechPJ© Module in enhancing the digital competencies of secondary school PETs. The research addresses the gap in digital integration among PE teachers by providing a structured, evidence-based training module tailored to their professional needs. Key findings revealed that the module, grounded in Connectivism Theory, Boyatzis' Competency Theory, and the DigCompEdu Framework, significantly improved teachers' digital competencies, as demonstrated by pre- and posttest results. Additionally, high usability scores and positive feedback affirmed the module's practicality, accessibility, and relevance. The training also led to sustained behavioral changes, with teachers applying their newly acquired skills in schools, enhancing lesson delivery and job performance.

These findings underscore the broader significance of the EduTechPJ© Module in bridging competency gaps and advancing technology integration in PE education. By providing teachers with essential digital skills, the module has the potential to transform teaching practices, improve student engagement, and inspire similar innovations in professional development. Future research could explore the long-term impact of the module on educational outcomes, its scalability across different educational contexts, and adaptations for other subject areas. Further studies could also examine the integration of emerging technologies to ensure the module remains relevant in an evolving digital environment in education.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that Grammarly, an AI-assisted writing software, was used in proofreading and refining the language used in the manuscript. The usage was limited to correcting grammatical and spelling errors and rephrasing statements for accuracy and clarity. The author further declares that, apart from Grammarly, no other AI or AI-assisted technologies have been used to generate content in writing the manuscript. The ideas, design,

procedures, findings, analyses, and discussion are originally written and derived from appropriate and systematic conduct of the research.

Cultivating Students' Interest and Agency in Learning Social Studies: Knowledge Building and Concrete-Pictorial-Abstract Model

Jiehui Lin, Damai Secondary School, Singapore
Melvin Chan, Chua Chu Kang Secondary School, Singapore
Gaoxia Zhu, Nanyang Technological University, Singapore

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

The Singapore Social Studies curriculum often presents abstract and complex concepts, making it challenging to arouse and maintain students' interest, let alone exercise their sense of agency in learning. To address the challenges, this study integrates the Knowledge Building (KB) approach and the Concrete-Pictorial-Abstract (CPA) model, along with diverse technology-supported learning experiences at rotating stations. Findings indicate that this integrative approach enhanced students' interest in the subject, becoming active participants as they explored complex concepts through the various stations. Furthermore, the CPA model enhanced students' understanding by guiding them from concrete to a deeper comprehension of abstract concepts using concrete and visual representations. This comprehension, in turn, cultivated greater student agency, as students actively contributed their learning reflections and ideas, leading to a collaborative contribution of diverse ideas. Further consideration could build-on from this approach in helping students deepen their knowledge of the abstract concepts based on their initial contributions.

Keywords: social studies, knowledge building, e-pedagogy, Concrete-Pictorial-Abstract Model, station rotation model

Introduction

The 2023 revised Singapore Social Studies syllabus advocates a shift away from traditional direct instruction toward more active and authentic approaches, enabling students to make sense of the content while enhancing their interest and understanding of abstract Social Studies concepts (MOE, 2023). This paradigm shift challenges educators to adopt innovative instructional strategies that engage learners more effectively. Research by Chiodo and Byford (2004) found that students often perceive Social Studies as "boring" when it is taught predominantly through expository instruction, which lacks active student involvement. This finding underscores the need for dynamic, participatory teaching methods that make learning meaningful and engaging for the students.

This paper examines the Knowledge Building (KB) approach integrated with innovative instructional models, particularly the Station Rotation and Concrete-Pictorial-Abstract (CPA) frameworks, further enhanced by the affordances of the Singapore Student Learning Space (SLS) platform. Together, these strategies aim to cultivate active and authentic learning environments that nurture students' interest and agency in learning Social Studies.

Review of the Models

Knowledge Building

Scardamalia and Bereiter (2014) articulated that KB involves students' creation and improvement of knowledge within a community through progressive discourse. This perspective aligns with the need for students to engage in collective inquiry and discourse, which is critical for building up students' comprehension of abstract Social Studies concepts. The KB approach positions students as active contributors to the knowledge creation process rather than recipients of information, fostering deeper engagement with the content. It guides teachers to facilitate an environment of collective inquiry with a set of unique KB principles.[1]

Station Rotation Model

The Station Rotation Model is a series of varied learning activities that students rotate through. Activities could include online (technology-enabled) offline, teacher-led stations. Key benefits of the model include encouraging communication and collaboration among students for purposeful building of community and collective knowledge and prioritising student agency (Tucker, 2021). By weaving Knowledge Building principles with the Station Rotation Model, educators can design a structured yet flexible learning environment that encourages student agency, collaborative knowledge building and deep understanding of what they are learning.

Concrete-Pictorial-Abstract Model

The Concrete-Pictorial-Abstract (CPA) Model is based on Bruner's (1966) conception of enactive, iconic, and symbolic modes of representation in learning concepts. Commonly used in Singapore's Mathematics curriculum, this approach extends beyond mathematical learning, positing any set of knowledge and concepts can be represented in three ways: 1. By actions or physical/external/experiential representations (Concrete), 2. Summary of images/visual representations (Pictorial), and 3. Language (words), symbolic representations (Abstract)

[1] Comprehensive list of Knowledge Building Principles: https://www.kbsingapore.org/12-principles-of-kb.

(Leong et al., 2015). The CPA model could enhance students' learning of Social Studies by scaffolding their understanding from concrete, tangible experiences to more complex abstract concepts. Guided by the KB principle of "Real Ideas, Authetic Problems", students would explore artefacts and real-world examples through various modes of representations. Finally, when students achieved better understanding, it would provide them the knowledge to become active contributors, paving the possibility for further synthesis of ideas and collective knowledge expansion.

Methods

Participants

The student participants (N = 33) were from one secondary 4 (grade 10) class in a government-aided school in Singapore. The class was an express class taking the Social Studies subject at the GCE O-level standards and were considered middle to low achievers. The lesson took place in April 2024 and the duration was one hour. It was the first time that the students were exposed to the KB approach and experienced such an integrative lesson, whereas other lessons were designed based on more direct instruction or structural discussions.

Lesson Design and Technology Environment

In designing the lesson, a few other key KB principles like "Epistemic Agency", "Idea Diversity" and "Democratising Knowledge", guided the design and selection of learning activities at each station while integrating CPA model. Guided by the principle of "Real Ideas, Authentic Problems", driving forces that contribute to Globalisation were determined as an authentic topic because it is relatable to students given Singapore's position as an open economy reliant on trade and movement of people. In the current syllabus, students are required to understand the meaning of Globalisation and the roles of the driving forces – 1. Technological advancements in transportation, 2. Technological advancements in digital technology and 3. Growth of Multinational Corporations.

The Student Learning Space (SLS) was selected as the main technology platform given students' familiarity with the platform. It is a core technology platform used by Singapore schools for teaching and learning (MOE, 2024). It allows students to engage with visual representations of abstract concepts either in the form of embedded images, videos or other interactive tools. A key component of the SLS platform – the Interactive Thinking Tool (ITT), allows students to contribute their initial ideas or theories for all to view – promoting idea diversity with the potential of synthesising various ideas, leading to a more comprehensive understanding of the abstract. Lastly, we considered the Key Applications of Technology (KAT)[2] in designing the learning activities to help enhance the integration of the models with KB. Table 1 provides a summary of integrating the KB approach with the station rotation and CPA model, considering the KATs to enhance the learning experiences:

[2] Key Applications of Technology (KAT) are design guidelines on how learning processes are enhanced with the affordances of technology. There are eight KATs (Learning Together, Metacognition, Motivation, Personalisation, Scaffolding, Assessment for Learning, Conceptual Change, Differentiation) teachers could consider when designing and enhancing their lesson activities with the use of technology (ETD, 2024).

Table 1
Summary of the Lesson Design

<table>
<tr><th colspan="3">Topic: What are the factors that contribute to Globalisation?</th></tr>
<tr><td colspan="3">Key Concepts: Globalisation, Technological advancements in transportation, Technological advancements in digital technology, Growth of Multinational Corporations (MNCs)</td></tr>
<tr><th>KB Principle</th><th colspan="2">How the principle guides the lesson design</th></tr>
<tr><td>"Epistemic Agency"</td><td colspan="2">Student agency is encouraged when they take ownership to decide on the station to participate, own pace of learning at each station and be active contributors of their reflections and ideas as they learn as a community. Teacher act as a facilitator of their learning, supporting students to overcome any difficulties encountered during the lesson.
KAT: Technology allows for Differentiation and Personalisation as SLS allows content to be integrated and embedded using different media forms. Students access the content based on their readiness level and interests, at their own pacing, enhancing student agency.</td></tr>
<tr><td>"Idea Diversity"

"Democratising Knowledge"</td><td colspan="2">Students' idea contributions on the Interactive Thinking Tool (ITT) are displayed for all to view. This provide a platform of idea diversity where all are empowered to create and recognise as valid contributors of the community.

KAT: The SLS Interactive Thinking Tool (ITT) facilitates the process of Learning Together, and allows students to contribute, improve and build-on one another's ideas (ETD, 2024).</td></tr>
<tr><td>"Real Ideas, Authentic Problems"</td><td colspan="2">At each learning station, based on CPA model, students are given concrete "real" and/or visual manipulatives to help them learn the abstract concepts. There are four learning stations (Station Rotation Model) for four key concepts with a fifth station assessing their learning of the topics. Summary of each station as below:
<table>
<tr><td>Station one: Globalisation</td><td>CPA: Use of the game Jenga as a concrete manipulative, providing students with a concrete understanding on how countries are interconnected and interdependent to each other like Jenga blocks.</td></tr>
<tr><td>Station two: Transportation</td><td>CPA: A visual manipulative of animation of movements of all container ships around the world to illustrate visual representation on how transportation has developed and facilitates increased movement of people and goods, driving Globalisation.
KAT: Using videos to bring about Conceptual Change.</td></tr>
<tr><td>Station three: Digital Technology</td><td>CPA: Use of the old Nokia Phone 3310 model as concrete manipulatives. Comparison of older technology of communication (Nokia Phones) with smart devices (iPad) to provide students a concrete understanding of advancement in technologies, bringing about more connections and communications across the world.</td></tr>
<tr><td>Station four: MNC</td><td>CPA: Using the EdTech tool called Blooket, students are tested on their general knowledge of popular MNCs through a gamified approach with each Booklet question showcasing visual representations of MNCs. The enactive activity can help students understand the growth of MNCs as they recognise these international corporations in their everyday lives.
KAT: Increase Motivation through a gamified platform that can bring about understanding the role of MNCs.</td></tr>
<tr><td>Station five: Consolidation</td><td>In words (abstract), students at this station will state the three driving forces that they've learned on the SLS Interactive Thinking Tool as part of the consolidation.</td></tr>
</table></td></tr>
</table>

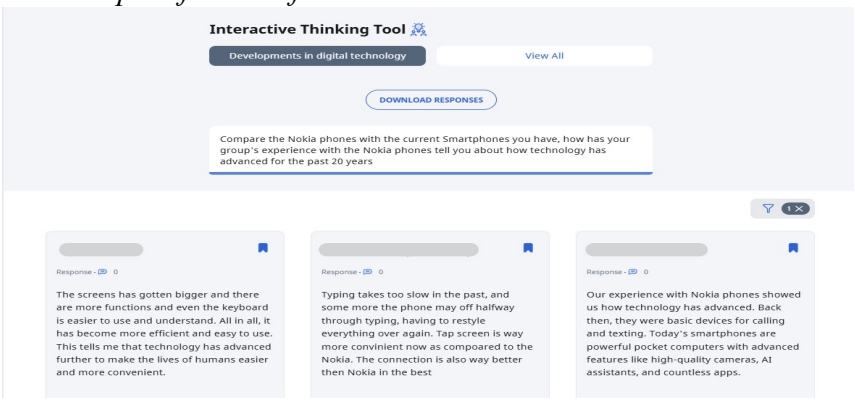
Research Questions

To evaluate the effectiveness of the design in cultivating students' interest and agency in learning Social Studies, two research questions would guide this study:

1. How does the Knowledge Building approach with Station Rotation and the Concrete-Pictorial-Abstract (CPA) models, enhanced with Key Applications of Technology, cultivate students' interest towards learning Social Studies?
2. To what extent does the Knowledge Building approach with Station Rotation and the Concrete-Pictorial-Abstract (CPA) models, enhanced by the Key Applications of Technology, cultivate student agency in learning Social Studies?

To address the first question, a post-survey with two items ("Do you prefer today's lesson over your other lessons? Provide an explanation". "Would you want to see more of such station-led lessons in the future?") was administered to capture students' perceptions of their interest in

learning during the Social Studies lesson. The first question required students to provide a yes or no response and relevant explanations. The second question was on a Five Point Likert Scale, asking students to rate "strongly disagree" to "strongly agree". The data would provide insights into how the integrative approach cultivated interest among students towards Social Studies.



For the second question, calculating the number of contributions on the ITT at each stations would provide evidence of students taking active, autonomous roles in deciding and moving to each station, participate in the station's activity at their own pace and reflecting on their learning on ITT, all accomplished with limited to zero involvement from the teacher. Another measurable data point could examine the number of attempts made on embedded interactive activities on SLS, specifically at station 4 on the attempts made at the Blooket activity.

Findings

Out of the 33 student participants, 24 responded to the post-survey. For the first post-survey question regarding whether they preferred the lesson over other lessons, 100% responded "Yes". Analysis of their explanation to the question provided further insights, with 66.7% of the respondents indicating the lesson was "fun" or "less boring", suggesting such lessons provided students with a positive learning experience, nurturing a joy of learning. In addition, words like "hands on" and "interactive" were indicated by 9 respondents, while other explanations pertained to enjoying the Jenga or Nokia Phone concrete experiences. For the second post-survey question, 87.5% of the respondents indicated "strongly agree" (62.5%) or "agree" (25%) that they wanted to see more such lesson designs. In all, the findings suggested the benefits of integrative design in helping students to be interested and better engage with the Social Studies content they were learning.

In examining the second research question, the ITT facilitated the KAT of learning together, empowering students to be active contributors at each station. Figure 1 shows an example of the ITT for the third station:

Figure 1
An Example of an ITT for the Third Station

The number of contributions by students at each stations' ITT were as follows: station one – 32, station two – 28, station three – 26, station four - 27 and station five – 29. The data suggested active student agency where most took active, autonomous roles in deciding their choice and participation at each station, leading to contribution of their learning reflections and ideas at each station's ITT. Rather than being passive or reactive towards teacher's direct instructions, students were engaged in self-directed exploration. In addition, statistics from the Blooket

activity at the MNC station showed a total of 42 active participants, which is nine more than the number of actual participants. This further highlighted increased student agency where a few students made a deliberate choice to repeat the station (Blooket) activity, based on their interest in the content and/or activity.

Reflection and Conclusion

Reflecting on the findings, it was evident that this approach effectively cultivated student interest and agency in learning Social Studies. However, despite students' contributions leading to ideas diversity as observed at each stations' ITTs, the SLS tool was limited in function and was not suitable in encouraging students to further build-on, make improvements or engage in KB discourse. This observation aligned with Scardamalia and Bereiter's (2012) perspective that the progression of understanding of concepts in Social Studies, such as Globalisation, often does not emerge from sudden insights or "a-ha" moments typical in scientific inquiry. This meant that the process of build-on idea improvement in Social Studies does not come naturally for students. Instead, these ideas evolved through gradual increases in perceived complexity. Hence, this underscored the importance of intentional scaffolding in the KB process, particularly for abstract Social Studies concepts that require deeper engagement over time. To enhance the advancement of conceptual understanding, educators may consider implementing additional KB scaffolds, such as idea improvement prompts, reflective questioning, and iterative dialogue tools that encourage students to re-examine and refine their ideas continuously. By reinforcing these supports, future iterations of this approach may better facilitate students' ability to develop a nuanced understanding of complex Social Studies concepts, ultimately contributing to a more robust, enduring comprehension and student-driven learning of the concepts.

Furthermore, educators could consider designing a second lesson and build-on from this lesson, intentionally guided by the other KB principles of "Improvable Ideas", "Rise Above" and "Symmetric Knowledge Advancement", which could lead students to deepen their knowledge of the abstract concepts from their initial contributions from the first lesson. The affordance of technologies would enrich the advancement of conceptual understanding when educators consider KATs in implementing scaffolding and conceptual change on the platform they're using. Knowledge Forum (KF) might be a better platform for KB given the availability of theory-building scaffolds that can help guide students in contributing, build-on and improving each other's ideas through KB discourse (Scardamalia & Bereiter, 2014).

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The authors declare that no AI or AI-assisted technologies have been used to generate, refine, or correct the content in the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

Transformative Impact of University-Led Communities of Practice on Working Professionals in Japan: A Text Mining Analysis of Self-Reported Changes

Sachiko Morita, Utsunomiya University, Japan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study examined transformations experienced by working professionals in a university-led Community of Practice (CoP), triggering factors, and the university's facilitation role. Participants were 109 working professionals who responded to an end-of-program survey conducted between 2019 and 2024 as part of a leadership development program operated by a national university in Tochigi Prefecture, Japan. Each cohort ran two months with weekly hybrid sessions involving cross-sector professionals learning from regional role models. Text mining analysis using KH Coder examined participants' responses to “What changes have you experienced before and after the program?” through frequency analysis and co-occurrence network analysis. Six clusters emerged representing transformation across five dimensions: cognitive (expanded perspectives and worldviews), behavioral (reflection to action), social (cross-industry networks), professional (workplace application), and personal (increased confidence). Five triggering factors were identified: social learning through diverse interaction, cross-industry exposure, role models, community support, and local contextual relevance. The university’s role manifested as neutral convener, knowledge broker, learning designer, and local anchor. Findings demonstrate universities’ unique capacity to facilitate cross-sector professional development while serving as regional development hubs.

Keywords: communities of practice, university-led professional development, KH Coder, transformative learning

iafor
The International Academic Forum
www.iafor.org

Introduction

The rapid advancement of technology, particularly artificial intelligence and digital transformation, has fundamentally reshaped the professional landscape, creating an urgent need for working professionals to continuously update their knowledge and skills. In Japan, employee education has traditionally been the responsibility of employers through comprehensive in-house training systems. However, as the modern workplace increasingly demands career autonomy and lifelong learning, attention has turned to the potential role of universities in providing professional development opportunities for working adults. Universities, positioned as neutral educational institutions with convening power across industries, offer unique opportunities to facilitate professional learning communities that transcend organizational and sectoral boundaries.

Communities of Practice (CoP) offer a theoretical framework that illuminates how universities can effectively facilitate such professional learning and development through structured social interaction. Wenger et al. (2002) define CoPs as "groups of people who share a concern, a set of problems, or a passion about a topic, and who deepen their knowledge and expertise in this area by interacting on an ongoing basis" (p. 4). The framework consists of three essential elements: Domain, a shared area of competence that differentiates members; Community, the social structure that facilitates learning through interaction; and Practice, the shared repertoire of resources, experiences, and ways of addressing problems that members develop together (Wenger, 1998; Wenger et al., 2002).

Research demonstrates that CoP participation significantly benefits individual professional development through multiple pathways. CoPs help shape professional identity, as participation influences how professionals see themselves and make career decisions (Chang, 2021; Jørgensen & Keller, 2008). They provide networking and mentorship opportunities that increase confidence and create career planning opportunities (Gander & McInnes, 2021). Furthermore, CoPs facilitate skill development through collaborative learning, with Pyrko et al. (2017) finding that "thinking together" in CoPs creates safe spaces for reflection and tacit knowledge sharing, leading to skill enhancement.

While universities are increasingly recognized as crucial providers of professional education for working adults, and Communities of Practice have demonstrated significant benefits for professional development, research examining university-led CoPs designed specifically for working professionals remains notably scarce. Online and blended learning CoPs represent particularly accessible formats for working professionals, yet even within this domain, Smith et al. (2017) systematic review found that 78% of studies in higher education focus on course-level activities for students and faculty development, with only 22% addressing professional development. Although emerging case studies exist, such as those examining universities facilitating CoPs for social care practitioners (Hashem et al., 2024) and online CoPs for professional development (Abedini et al., 2021), research remains scarce on how working professionals transform through university-led CoPs, what factors trigger these changes, and what unique role universities play as neutral facilitators of cross-industry professional learning.

This gap is pronounced in the Japanese context as well, where documented cases of university-led CoPs for working adults remain virtually nonexistent. In response to this gap, the present study examines a leadership development program operated by a national university in Japan from 2019 to 2024. Through text mining analysis of participant self-reports, we investigate three research questions:

RQ1: What changes do working professionals experience through participation in a university-led CoP?
RQ2: What factors trigger these changes?
RQ3: What role does the university as facilitator play in these transformations?

Methodology

The Leadership Development Program

This study examines a university-led leadership development program for working professionals, operated by a national university located in Tochigi Prefecture, Japan. The program, which has been running since 2017, aims to cultivate regional leaders and promote community revitalization through cross-sector professional learning. Each cohort runs for two months with weekly hybrid sessions, combining online and in-person formats to accommodate working professionals' schedules.

The program embodies the three essential elements of a Community of Practice (Wenger, 1998; Wenger et al., 2002). First, it establishes a shared Domain focused on regional revitalization and leadership development, bringing together professionals who share concerns about local community challenges. Second, it creates a Community through structured interaction among cross-sector participants, facilitating learning through diverse professional perspectives. Third, it develops shared Practice through collaborative learning from regional role models—successful entrepreneurs, community leaders, and university faculty who demonstrate practical approaches to regional challenges. A distinctive feature is the final session, which serves not as a conclusion but as a "kick-off" for participants to implement action plans in their communities, embodying the program's emphasis on moving from reflection to action.

Data Collection

Although the program has been operating since 2017, the present analysis focuses on participant survey data collected between 2019 and 2024, when the standardized questionnaire was introduced. During this period, 172 individuals participated in the program across multiple cohorts. We collected data through an anonymous, voluntary end-of-program survey administered to all participants. The survey included one open-ended question: "What changes have you experienced before and after the program?" This question was designed to elicit participants' self-reported transformations without imposing predetermined categories, allowing for rich, authentic descriptions of their experiences. Of the 172 participants, 109 responded to the survey, yielding a response rate of 63.4%. The anonymous nature of the survey encouraged honest reflection while protecting participant privacy. The open-ended format generated qualitative data suitable for identifying patterns and themes in participants' transformation experiences.

Text Mining Analysis

We employed text mining methodology using KH Coder, a quantitative content analysis software developed by Japanese researcher Koichi Higuchi. According to the website of KH Coder, it has been utilized in over 8,000 research studies worldwide. The software enables systematic analysis of qualitative data through computational methods, reducing researcher bias while maintaining interpretive depth.

We conducted two primary analyses. First, frequency analysis identified the most commonly occurring words and themes in participants' responses, revealing dominant patterns of change and frequently mentioned concepts. Second, co-occurrence network analysis visualized relationships between concepts by examining which words appeared together in participants' responses. This analysis reveals how different aspects of transformation connect in participants' experiences, identifying clusters of related concepts that represent distinct dimensions of change. These analytical approaches allow us to extract patterns of change experienced by participants and identify factors that triggered these transformations through systematic examination of their self-reported experiences.

Participant Characteristics

While the survey data collection began in 2019, demographic information (e.g., age and occupational background) was collected only from 2021 onward. Of the 90 participants from 2021–2024 cohorts who provided demographic information (82.6% response rate for this subset), the age distribution revealed a concentration of mid-career professionals: nearly half (47.2%) were in their 30s, followed by 40s (33.7%), 20s (15.7%), and 50+ (3.4%). Regarding occupation, the majority (65.2%) worked in the private sector, reflecting the program's appeal to corporate professionals. The remaining participants included self-employed individuals (14.6%), public sector employees (14.6%), and smaller numbers from city council, NPOs, entrepreneurship, and unemployment. This diverse occupational mix created opportunities for cross-sector dialogue and mutual learning, with private sector professionals gaining insights from entrepreneurs and public servants, while public sector participants learned from business perspectives.

This cross-sector composition aligns with the program's design as a university-led CoP, where the university serves as a neutral convener bringing together professionals who might not otherwise interact in their daily work environments.

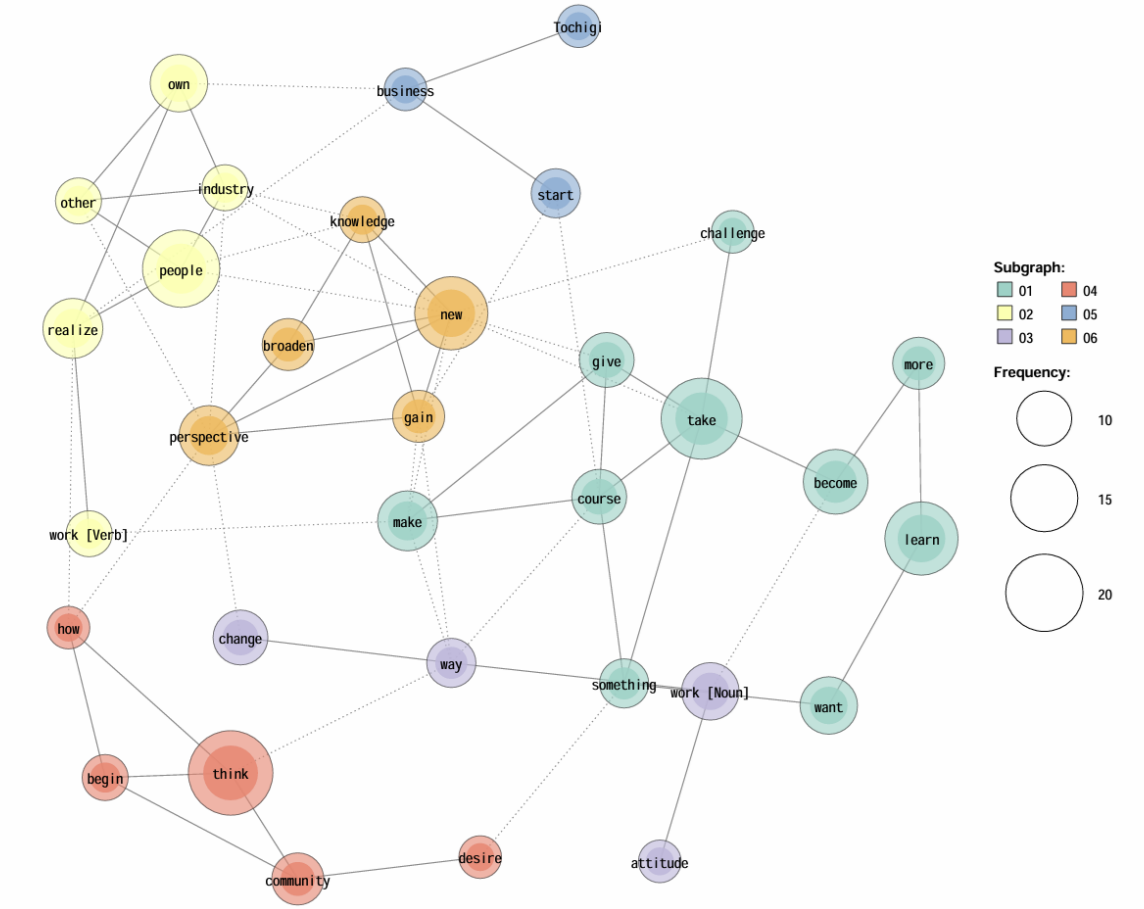
Results

Frequency Analysis

The frequency analysis identified the most commonly occurring words in participants' open-ended responses, providing insight into dominant themes of transformation. The three most frequent words were "think" (24 occurrences), "take" (22 occurrences), and "people" (20 occurrences). This distribution suggests that participants engaged in deep cognitive reflection throughout the program, while interpersonal interactions with instructors and fellow participants provided significant stimulation for their learning journey. The prominence of "think" indicates sustained engagement with reflective practice, while "take" suggests active engagement in implementing new approaches. The frequency of "people" underscores the social nature of learning within the CoP. Learning-oriented vocabulary appeared prominently in the responses. The words "learn" and "new" each occurred 18 times, while "community" (9 occurrences), "broaden" (9 occurrences), and "perspective" (12 occurrences) emerged frequently. This pattern demonstrates that participants experienced expansion of their worldview through the program, acquiring new knowledge and perspectives that extended beyond their existing professional frameworks. Action-oriented language also featured prominently in participants' descriptions. Words such as "start" (8 occurrences), "begin" (7 occurrences), and "action" (5 occurrences) reflect the program's explicit goal of moving participants from reflection to action. This linguistic pattern suggests that participants not only

contemplated change but also developed concrete intentions and plans for implementation in their professional and community contexts.

Table 1
The Result of Frequency Analysis



Word	Frequency	Word	Frequency	Word	Frequency
think	24	give	10	challenge	6
take	22	broaden	9	desire	6
people	20	community	9	get	6
learn	18	gain	9	how	6
new	18	more	9	Tochigi	6
become	14	something	8	action	5
feel	12	start	8	also	5
make	12	way	8	change	5
perspective	12	begin	7	confidence	5
realize	12	industry	7	even	5
own	11	knowledge	7	horizon	5
want	11	other	7	importance	5
work	11	work	7	increase	5
change	10	attitude	6	local	5
course	10	business	6	more	5

Co-occurrence Network Analysis

To understand how these concepts connect in participants' experiences, we conducted co-occurrence network analysis, which visualizes relationships between words by examining which terms appear together in responses. In this analysis, node size reflects word frequency, while edges (connecting lines) indicate co-occurrence strength—how often words appear together within the same response.

The network analysis revealed a structure consisting of four major clusters and two smaller clusters, naturally emerging from the strength of word co-occurrences without predetermined categorization. This emergent structure suggests that participants' transformations occurred across multiple interconnected dimensions, each representing a distinct but related aspect of their CoP experience. The clustering indicates that certain concepts consistently appeared together in participants' narratives, revealing meaningful patterns in how they conceptualized and articulated their changes.

Figure 1
The Result of Co-occurrence Network Analysis

Cluster Analysis: Six Dimensions of Transformation

Cluster 1 (Green): Learning and Transformation

The first cluster comprises words including “take,” “learn,” “become,” “give,” “make,” “want,” and “course.” This cluster represents active engagement in the learning process and personal transformation through action. The language pattern suggests participants moved beyond passive reception of information to actively implementing new approaches in their professional lives. A representative participant’s comment illustrates this transformation: “Before taking the course, I would overthink things and not take action, but now I feel like I've made it a habit to just give it a try.” This statement captures the essence of behavioral change facilitated by the program—shifting from analysis paralysis to action-oriented practice. Participants developed confidence to experiment with new approaches, embodying the program’s emphasis on moving from intention to practice.

Cluster 2 (Red): Reflection and Community Connection

The second cluster includes “think,” “begin,” “community,” “desire,” and “how.” This cluster reveals deep reflection on future possibilities combined with strong connection to community purpose. Unlike Cluster 1’s focus on immediate action, this cluster represents the cognitive and aspirational dimensions of transformation. One participant articulated this connection: “The vague desire to ‘achieve something’ was transformed into a concrete image of what kind of

environment would be best through the keywords 'local community' and 'connections.'" This comment demonstrates how the CoP helped crystallize participants' fuzzy aspirations into concrete goals grounded in local community context. The program provided both conceptual frameworks and social connections that enabled participants to envision specific pathways for community contribution.

Cluster 3 (Orange): Expanding Worldview and Knowledge

The third cluster contains "new," "perspective," "knowledge," "broaden," and "gain," representing cognitive expansion through diverse input. This cluster captures the knowledge acquisition dimension of transformation, particularly the broadening of professional perspectives beyond participants' existing frameworks. A participant described this expansion: "By listening to people from various industries, I was able to broaden my perspective and knowledge, and by exchanging opinions, I was able to discover new ideas." This statement highlights how cross-sector dialogue functioned as a catalyst for cognitive growth. The CoP structure, bringing together professionals from diverse industries, created opportunities for perspective-taking and knowledge transfer that would not occur in single-industry professional development contexts.

Cluster 4 (Yellow): Cross-Industry Learning and Engagement

The fourth cluster includes "own," "people," "other," "realize," "work," and "industry." This cluster specifically addresses recognition of cross-industry wisdom's value and the decision to actively engage with professionals from other fields. While Cluster 3 focuses on knowledge acquisition, this cluster emphasizes the relational and networking dimensions of cross-sector learning. One participant expressed this realization: "I realized that the wisdom of other industries is very useful, so I decided to get more involved with people from other industries." This comment reveals both cognitive recognition (realizing value) and behavioral intention (deciding to engage). The university's role as a neutral convener becomes particularly evident in this cluster, as participants explicitly valued the cross-industry composition that the program facilitated.

Cluster 5 (Blue): Business Challenges and Local Context

The fifth cluster, smaller but significant, includes "business," "start," and "Tochigi" (the prefecture name). This cluster shows participants connecting program learning to concrete business initiatives within their local geographical context. The appearance of the specific place name suggests that participants were thinking about entrepreneurship and business development grounded in regional realities rather than abstract concepts. This cluster reflects the program's explicit focus on regional revitalization, demonstrating that participants internalized the connection between their professional development and local community development. The co-occurrence of "business" and "Tochigi" indicates participants were considering how to apply entrepreneurial thinking to address regional challenges.

Cluster 6 (Purple): Mindset Change and Attitude Shifts

The sixth cluster contains "change," "way," "attitude" and "work" representing fundamental shifts in participants' approaches to work and problem-solving. This cluster captures metacognitive awareness of transformation—participants recognized that their thinking patterns and professional attitudes had evolved through the program. Unlike the other clusters

that focus on specific types of learning or action, this cluster represents participants' awareness of their own transformation process. This metacognitive dimension suggests the program successfully fostered reflective practice, enabling participants to recognize and articulate changes in their professional mindsets and approaches.

Discussion and Conclusion

This study examined how working professionals transform through participation in a university-led Community of Practice in Japan. Text mining analysis of 109 participants' self-reported experiences revealed multi-dimensional transformations across six interconnected clusters. We now address each research question in turn.

RQ1: What changes do working professionals experience through participation in a university-led CoP?

The cluster analysis reveals that participants experienced transformation across five interrelated dimensions. First, cognitive transformation manifested through development of new perspectives and expanded worldviews (Cluster 3), with participants explicitly noting how exposure to diverse professional viewpoints broadened their thinking beyond existing frameworks. Second, behavioral transformation was evident in the shift from reflection to action (Cluster 1), with participants reporting increased propensity to implement new approaches rather than remaining in analysis paralysis. Third, social transformation emerged through building cross-industry networks (Cluster 4), with participants recognizing the value of professional connections beyond their immediate sectors. Fourth, professional transformation occurred as participants applied new insights to their work contexts, connecting abstract learning to concrete workplace challenges (Cluster 5). Fifth, personal transformation manifested through increased confidence and agency (Cluster 6), with participants demonstrating metacognitive awareness of their own development.

RQ2: What factors trigger these changes?

Analysis of participant responses identifies five key triggering factors embedded in the CoP's social environment. Social learning through interaction with diverse professionals provided the foundational mechanism, consistent with Wenger's (1998) emphasis on learning as social practice. Cross-industry exposure enabled participants to see possibilities from other sectors, challenging industry-specific assumptions and revealing transferable approaches. Role models—successful entrepreneurs and community leaders who served as instructors—demonstrated achievable pathways, making abstract concepts concrete through lived examples.

Community support created a psychologically safe space for deep reflection and exploration, reducing the risk associated with sharing challenges and experimenting with new approaches. Finally, the Tochigi regional context made learning personally relevant, grounding abstract concepts in participants' local business and community realities. This local anchoring appears particularly significant for regional revitalization goals, as participants explicitly connected their learning to place-based challenges (Cluster 5). These findings suggest that transformation in university-led CoPs results not from program content alone but from carefully designed social environments that activate multiple reinforcing learning mechanisms.

RQ3: What role does the university as facilitator play in these transformations?

By examining these questions, this research identifies four distinct roles through which universities serve as hubs for regional development: neutral convener, knowledge broker, learning designer, and local anchor. This contributes to understanding the unique value of university-led cross-sector professional communities.

As neutral convener, the university created a cross-industry space where professionals from diverse sectors could meet as equals, transcending organizational and sectoral hierarchies that might inhibit open dialogue in other contexts. As knowledge broker, the university actively connected different industries, perspectives, and experiences, curating diverse expertise that individual organizations could not assemble independently. As learning designer, the university structured the program to move participants systematically from reflection to action, with the final "kick-off" session explicitly transitioning from learning to implementation. This intentional design is evident in the cluster progression from cognitive transformation (Clusters 2 and 3) through recognition of learning opportunities (Cluster 4) to concrete action orientation (Clusters 1 and 5). As local anchor, the university grounded learning in the regional Tochigi context while introducing broader conceptual frameworks, linking local challenges to universal principles of leadership and community development.

These four roles distinguish university-led CoPs from both corporate training programs and informal professional networks. Unlike corporate programs that serve single organizations, universities can convene cross-sector participants. Unlike informal networks that emerge organically, universities can provide structured learning design. This unique positioning enables universities to serve as regional development hubs, cultivating local leaders while building social capital for sustained community revitalization.

Limitations and Future Research

This study has three primary limitations. First, data relies exclusively on self-reported experiences captured through end-of-program surveys, without behavioral observation or longitudinal follow-up to verify claimed transformations. Second, the cross-sectional design cannot track long-term impacts or determine whether reported changes persist beyond the immediate post-program period. Third, as a single case study of one regional university program, generalizability to other contexts remains uncertain. Future research should track participants longitudinally to measure sustained behavioral change and career outcomes. Comparative studies across multiple university-led programs in different regions would identify which design elements prove most critical for transformation. Combining survey data with observable indicators such as community engagement, career progression, or business outcomes would strengthen evidence for CoP impacts beyond self-perception.

Conclusion

This research demonstrates that university-led Communities of Practice offer powerful mechanisms for transforming working professionals across multiple dimensions simultaneously. By serving as neutral conveners, knowledge brokers, learning designers, and local anchors, universities can facilitate professional development that transcends organizational boundaries while remaining grounded in regional contexts. As technologies reshape professional landscapes and demand for lifelong learning intensifies, universities' capacity to convene diverse stakeholders for structured cross-sector learning represents an

increasingly valuable contribution to both individual career development and regional revitalization. This study provides empirical foundation for expanding universities' role from traditional degree education toward becoming sustained hubs for professional and community development.

Beyond Digital Adoption: How Data Analytics Drives Marketing Effectiveness and Competitiveness in MSMEs

Chandra Kuswoyo, Maranatha Christian University, Indonesia
Hendra Bunyamin, Maranatha Christian University, Indonesia
Henky Lisan Suwarno, Maranatha Christian University, Indonesia

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

In today's digital era, the business landscape is changing rapidly and requires businesses to gain digital readiness, especially micro, small and medium enterprises' sectors (MSMEs). This study examines the strategic role of data analytics in enhancing the competitiveness of micro, small, and medium enterprises (MSMEs). Drawing on the resource-based view and dynamic capabilities theory, the study argues that data analytics creates value not through mere adoption but through its effective integration into marketing and decision-making processes. The findings highlight that embedding data analytics within core marketing strategies enables MSMEs to better understand customers, optimize marketing campaigns, and deliver more personalized offerings, thereby improving marketing effectiveness and customer engagement. Moreover, the study emphasizes the critical role of human and managerial capabilities in translating analytical insights into actionable marketing strategies. Strategic and managerial training is identified as a key driver of digital readiness, allowing MSMEs to adapt to market dynamics and sustain competitive advantage. Overall, the study contributes to the digitalization literature by demonstrating that MSME competitiveness depends more on the strategic application of data analytics than on the ownership of digital technologies alone.

Keywords: data analytics, MSME competitiveness, digital readiness, strategic marketing integration, managerial capabilities

iafor
The International Academic Forum
www.iafor.org

Introduction

In today's digital era, the business landscape is changing rapidly and requires businesses to be adaptive to technology, especially in the micro, small, and medium enterprises (MSMEs) sector. This adaptation, commonly referred to as digital readiness, reflects the ability of firms to adopt, integrate, and utilize digital technologies effectively in their operations and strategies. For MSMEs, digital readiness is crucial to enhancing competitiveness, responding to market dynamics, and sustaining long-term business growth. Furthermore, fashion retail MSMEs in Indonesia have made a substantial contribution to the national economy. This sector plays an important role in generating income and supporting economic growth at both local and national levels. In addition, fashion retail MSMEs significantly contribute to labor absorption by creating employment opportunities for a large segment of the workforce (Kementerian Koperasi dan UKM RI, 2023).

However, MSMEs face significant challenges in maintaining their survival and achieving sustainable growth in an increasingly competitive business environment. One major challenge arises from competition with large companies that have stronger capital, advanced technology, and broader market reach. In addition, the rapid expansion of global e-commerce platforms intensifies price competition and increases customer expectations. These platforms often offer greater convenience, variety, and efficiency, making it difficult for MSMEs to compete on equal terms. As a result, MSMEs must continuously adapt their strategies and enhance their capabilities to remain competitive and grow (Barus et al., 2023).

Big data analysis of customers' data, market trends, and purchasing behavior provides valuable insights that can help businesses enhance their competitiveness. Through systematic analysis, firms can better understand customer needs, preferences, and buying patterns. These insights allow businesses to design more targeted and personalized marketing campaigns. As a result, digital marketing strategies can be optimized to reach the right audience at the right time. Consequently, marketing activities become more effective and efficient compared to traditional, intuition-based approaches (Cadden et al., 2023; Maroufkhani et al., 2020; Mikalef et al., 2018).

The Purpose of This Research

The purpose of this research is to examine how data analytics can be transformed from a mere technological resource into a strategic asset that enhances the competitiveness of micro, small, and medium enterprises (MSMEs). Grounded in the resource-based view and dynamic capabilities theory, the study aims to clarify that competitive advantage does not arise simply from adopting data-related technologies, but from strategically integrating analytical capabilities into marketing and decision-making processes. By doing so, the research seeks to extend existing MSME digitalization literature with a more nuanced, strategy-oriented perspective.

Specifically, this research aims to investigate the role of data analytics integration within digital marketing strategies as a key mechanism through which MSMEs improve marketing effectiveness and customer engagement. The study focuses on how analytical insights can be embedded into everyday marketing activities, such as understanding customer behavior, optimizing campaigns, and personalizing offerings. Through this lens, the research intends to demonstrate that the strategic application of data analytics is a critical pathway through which MSMEs achieve and sustain competitiveness in dynamic market environments.

In addition, the study aims to explore the importance of human and managerial capabilities in enabling effective use of data analytics. It seeks to assess how strategic and managerial training supports digital readiness by equipping MSME owners and managers with the skills needed to interpret data, align digital tools with business objectives, and translate insights into concrete marketing actions. Ultimately, the purpose of this research is to provide both theoretical and practical insights into how MSMEs can build adaptive, data-driven marketing capabilities that lead to long-term competitive advantage rather than short-term technological adoption.

Related Work

Some recent studies have examined how big data analytics influence the digital marketing capabilities of MSMEs in China. These studies generally focus on the direct impact of data-driven insights on marketing performance and strategic decision-making. However, they have not taken digital readiness into account as a moderating factor that may shape the effectiveness of big data analytics adoption. In addition, much of the existing research has been conducted in developed countries with more advanced technological infrastructure and digital ecosystems. Consequently, the findings may not be fully applicable to the Indonesian context, which differs in terms of technological maturity, market characteristics, and MSME digital capabilities (Abrokwah-Larbi, 2024; Sharabati et al., 2024).

Rafiah et al. identify digital readiness as a key factor in achieving successful digital transformation among MSMEs. Their study highlights the importance of technological infrastructure, digital skills, and organizational support in enabling MSMEs to adopt digital solutions effectively. However, the analysis does not specifically examine digital readiness as a moderating variable that influences the relationships between big data analysis and digital marketing strategies. As a result, the conditional effects of varying levels of digital readiness on the effectiveness of data-driven marketing initiatives remain unclear. This gap suggests the need for further research to better understand how digital readiness shapes the impact of big data analysis on MSMEs' digital marketing performance (Rafiah et al., 2022).

Lastly, Anatan et al. develop a comprehensive framework to measure digital readiness among MSMEs. Their framework captures key dimensions such as technological infrastructure, digital skills, organizational culture, and management support. This contribution provides a useful tool for assessing the level of preparedness of MSMEs in adopting digital technologies. Nevertheless, the interaction between digital readiness and big data analysis in shaping business outcomes has not been examined in their study. In particular, how these factors jointly influence the competitiveness of MSMEs remains an open area for further investigation (Anatan & Nur, 2023).

Our Reflections on Beyond Digital Adoption

We argue that data analytics alone is not a strategic asset unless translated into effective marketing and decision-making processes based on resource-based view (RBV) (Barney, 1991) and dynamic capabilities theory (Teece et al., 1997). Furthermore, we hypothesize that MSMEs operate within context-specific dynamics in which the pathway to competitiveness does not occur directly through technology adoption alone, but rather through its strategic application, particularly in how data-driven insights enhance marketing effectiveness and customer engagement. We believe this perspective adds nuance to MSME digitalization theory by suggesting that "*smaller firms achieve competitiveness not simply by owning or*

adopting data-related technologies, but by effectively integrating those tools into their digital marketing strategies".

Additionally, we suggest that MSMEs should focus on integrating data analytics into their marketing strategies rather than merely adopting digital technologies, for example by using analytical insights to better understand customers, optimize marketing campaigns, and personalize offerings. Integration means embedding data analytics into the core of their marketing strategy so that data-driven insights guide everyday decision-making. By analyzing customer data, MSMEs can better understand customer preferences, behaviors, and purchasing patterns. These insights enable businesses to optimize marketing campaigns by targeting the right audience at the right time with appropriate messages. Furthermore, data analytics allows MSMEs to personalize products, services, and promotions according to individual customer needs. As a result, integrated use of data analytics can improve marketing effectiveness, strengthen customer relationships, and enhance overall competitiveness.

Training in strategic data use is essential for enabling MSMEs to move beyond basic adoption of digital tools. Such training helps develop a strategic mindset in which data is treated as a valuable asset for decision-making rather than merely as operational output. By learning how to interpret and apply data insights, MSME owners and managers can align digital tools with their business goals. This strategic approach supports digital readiness by ensuring that technology use is purposeful and integrated into core business processes. Moreover, training encourages MSMEs to proactively respond to market changes and customer needs using data-driven strategies. As a result, MSMEs become more adaptive, competitive, and resilient in an increasingly digital business environment.

Encouraging managerial training in turning analytical insights into marketing actions is crucial for improving organizational performance. Such training helps managers understand how to translate data findings into clear, actionable marketing strategies. By developing these skills, managers can make more informed decisions regarding customer targeting, product positioning, and promotional activities. Training also reduces the gap between data analysis and practical implementation within daily marketing operations. Furthermore, it empowers managers to evaluate campaign performance and adjust strategies based on real-time insights. As a result, marketing efforts become more effective, efficient, and aligned with overall business objectives.

Conclusion

In conclusion, this study emphasizes that data analytics should not be viewed as a standalone technological asset but as a strategic resource whose value emerges only when effectively integrated into marketing and decision-making processes. Grounded in the resource-based view and dynamic capabilities theory, our arguments highlight that MSME competitiveness is shaped less by the mere adoption of digital tools and more by how these tools are strategically applied. This perspective contributes to the digitalization literature by clarifying that ownership of data-related technologies does not automatically translate into competitive advantage for smaller firms.

Furthermore, the findings underscore the importance of embedding data analytics within core marketing strategies to enhance customer understanding, campaign optimization, and personalization. When analytical insights guide everyday marketing decisions, MSMEs are

better positioned to engage customers in more targeted and meaningful ways. Such integration strengthens marketing effectiveness and fosters deeper customer relationships, which are critical for sustaining competitiveness in dynamic and highly competitive markets.

Finally, the role of human and managerial capabilities emerges as a central enabler of successful data-driven transformation. Strategic and managerial training equips MSME owners and managers with the skills needed to interpret data, convert insights into actionable marketing initiatives, and continuously refine strategies based on performance feedback. By developing these capabilities, MSMEs can build greater adaptability and resilience, ensuring that digital readiness evolves into long-term competitive advantage rather than remaining a superficial technological upgrade.

Acknowledgements

The authors would like to express their sincere gratitude to all respondents who participated in this study for their valuable time and insights. We also thank the Ministry of Higher Education, Science, and Technology of The Republic of Indonesia for the funding (Hibah BIMA). The authors also acknowledge the assistance of Maranatha Christian University in providing access to research facilities. Any remaining errors are the sole responsibility of the authors.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that ChatGPT, an AI-assisted writing software, was used in proofreading and refining the language used in the manuscript. The usage was limited to correcting grammatical and spelling errors and rephrasing statements for accuracy and clarity. The author further declares that, apart from ChatGPT, no other AI or AI-assisted technologies have been used to generate content in writing the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

The Utilization of Artificial Intelligence in Shaping College Instruction

Janice Akia-Calugan, University of the Cordillera, Philippines
Ramir S. Austria, University of the Cordilleras, Philippines

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

The academic sector has transformed due to the integration of Artificial Intelligence (AI) in higher education, thus bringing opportunities and challenges. This study aims to determine and investigate the level of awareness among college instructors at the University of the Cordilleras regarding the utilization of AI in their teaching practices, particularly in a trimester-program, and a blended learning environment. Using a quantitative research design, 155 faculty members participated in a researcher-made assessment across four core domains: personalized learning, writing assistance, student engagement, and administrative automation. Findings reveal a moderate awareness in the areas of personalized learning and writing support, and awareness in leveraging AI for student engagement and administrative tasks. Limited training, time constraints, and technological unfamiliarity are a few of the gaps that exist aside from AI's potential. These insights imply the necessity of institutional support and targeted professional development to bridge awareness and implementation. The study is significant to understand how AI can reshape instructional practices and highlights the urgent need for systematic strategies to prepare educators for AI-driven academic environments.

Keywords: Artificial Intelligence (AI), teacher awareness, personalized instruction, educational technology, higher education, blended learning, administrative automation

Introduction

The advancement of incorporating Artificial Intelligence (AI) in some work tasks has completely changed the way we learn. AI has become a crucial part of today's teaching and learning practices. Due to the continuous advancement of technology, academic institutions continually find ways to upgrade various sectors that help sustain their provision of educational services to stakeholders. This includes the integration of AI to stay at par with the demands of the world.

Globally, the integration of AI in higher education is manifested in various forms. For example, using AI to assist in personalizing the learning of students. AI usually offers suggestions on how teachers can support their learners according to their preferences and needs. Designing the academic content that fits students' preferences plays a vital role in developing essential 21st-century skills. In addition to academic knowledge, personalized learning focuses on developing essential 21st-century skills. Collaboration, critical thinking, problem-solving, creativity, and communication are nurtured through collaborative projects, problem-based learning, and real-world applications. A classroom that applies personalized learning encourages exploration and inquiry that prepares students with the potential to adapt to their thriving society (Shloul et al., 2024).

Another indication of the potential of AI is its function as a writing assistant, especially for the administrative tasks of teachers and their additional job as researchers. According to Khalifa and Albadawy's (2024) study, AI tools such as ChatGPT, Google's Gemini AI, Microsoft's Bing provide substantial help in crafting and organizing academic content. Thus, instructors are guided by these AI tools to innovate their teaching methods because of the suggested teaching-learning preferences. In addition, AI is also increasingly utilized for engaging students through gamified learning, real-time feedback mechanisms, and predictive analytics that identify at-risk students for proactive intervention. The increasing digitization of the world has nudged the academe to emphasize engaging and motivating students even in an online distance learning modality. Simultaneously, AI assists teachers with their administrative tasks, like assisting with grading and assessments, automating processes like admissions and student record management, scheduling, and even using chatbots to answer students' queries (Rahiman & Kodikal, 2024). In that way, using specific AI tools helps faculty and staff save time, which allows them to have more time facilitating and guiding their students.

To guarantee that AI is properly managed in the academic sectors, the Philippines' trifocal education system --Department of Education (DepEd), the Commission on Higher Education (CHED) and Technical Education and Skills Development Authority (TESDA) have initiated policies, projects, and studies that focus on the integration of AI in the academic sector. These efforts target how AI can guide both students and educators in completing their duties effectively. For instance, DepEd is working on establishing an Education Center for AI Research (E-CAIR) to develop AI-driven tools for teaching, learning, and school administration, including applications for enhancing learning resources and improving student assessments (Department of Education, 2025). In addition, CHED highlighted its goal to weave AI into the learning process for all students and teachers, not just those in tech programs. It has also stressed that faculty members need to grasp AI's impact on their specific subjects and incorporate it into their teaching, even for humanities and social sciences (Hernando-Malipot, 2025). TESDA has started establishing the role of AI as a transformative or influential factor in the labor market. TESDA has presented several plans to incorporate AI into Technical and Vocational Education and Training (TVET) courses. These plans aim to prepare the Philippine

workforce for the challenges of the Fourth Industrial Revolution and to enhance the alignment of TVET programs with the developing industry needs (TESDA, 2021). These efforts reflect a strategic approach to AI integration that promotes the innovation of the use of AI within the Philippine education system.

Despite the escalation of interest and initiatives of several academic sectors, research gaps still exist on the integration of AI use in shaping college instruction. Many teachers from different levels acknowledge the power of AI, but implementing its potential is still limited. Despite the continuous trend of artificial intelligence in various sectors, especially in the academic sectors, many teachers still lack the skills and knowledge of integrating AI into their teaching practices, such as personalizing students' learning, writing and research, administrative processes and engaging students. As a result, more research is suggested to explore further the teachers' awareness, influencing factors, and their own initiatives in the utilization of AI in teaching. Accordingly, this study seeks to assess the level of awareness among college instructors regarding the application of artificial intelligence in their instructional practices.

Relevant innuendos that are drawn from this study are essential for the institution's stakeholders. Firstly, understanding the level of awareness among college instructors can help support the design of professional development and training programs that strengthen the pedagogical system of the university, especially in a fast-paced system with a blended learning environment. The findings may also improve the institutional policies and guidelines that will establish an ethical and responsible use of AI while keeping a quality and academic integrity. Furthermore, the study can lead to the design of more user-friendly technological tools that embed AI use. Lastly, this research may enhance the superiority and efficiency of college instruction not only in the Philippines but also in the rest of the world to guarantee that teachers are not left behind in this AI-driven educational environment.

Research Methodology

In this study, a quantitative research method is used to assess the awareness of college teachers on the adoption of AI into their teaching practices. The locale of the study is the University of the Cordilleras (UC), a private institution in Baguio City, Philippines. Purposive sampling was used to select 155 faculty members from the university. UC follows a trimester academic calendar and implements a blended learning modality, combining traditional face-to-face instruction with online learning platforms.

A researcher made multiple-choice test was given to the participants to measure their awareness along four dimensions: the use of AI for personalizing learning, writing assistance in research and instructional content design, engaging students, and automating administrative tasks. The test consists of 16 items aligned to identify the level of awareness of teachers along the study's core dimensions. The test was validated by a group of experts in education and technology. A reliability test was conducted with the teachers at the College of Information Technology and Computer Sciences, based on the reason that they possess a higher level of familiarity with the use of AI tools. Responses were analyzed using descriptive statistics, specifically, the mean and skewness were used to determine the level of awareness. Skewness was included for further analysis of the data distribution and normality of the data.

Results and Discussion

The findings presented in Table 1 show varying levels of awareness among college teachers at the University of the Cordilleras vis-à-vis the use of Artificial Intelligence in their teaching practices. The general weighted mean is 2.32, interpreted as moderately aware. This means that their understanding of implementing AI in the study's core dimensions is developing. This then suggests that faculty are still in the initial stages of using AI tools. This idea corresponds to the study of Deacon et al. (2024), indicating a reluctance to embrace new technologies entirely due to the perception that AI is seen as both a threat and an opportunity. The participants in their study have provided concerns ranging from academic integrity issues to the broader implications for learning and future employment. Other concerns were indicated in the study of Sibug et al. (2024), stating that teachers generally hold positive attitudes towards AI's potential, their issues mainly revolve around the difficulties on practical implementation, like the need for technical support, maintaining human connection, safeguarding data privacy, and addressing the learning curve for both educators and stakeholders.

Table 1
Level of Awareness of the College Teachers in the Utilization of AI in Their Teaching Practices

Domain	Mean	Awareness Level	Skewness	Interpretation
Personalized Learning	1.97	Moderately Aware	0.10	Positively Skewed
Writing Assistance	1.94	Moderately Aware	0.20	Positively Skewed
Administrative Tasks	2.55	Aware	-0.23	Negatively Skewed
Engagement of Students	2.65	Aware	-0.20	Negatively Skewed
General Weighted Mean	2.27	Moderately Aware		

Personalized Learning

The result of this study presents a mean score of 1.97 and a positive skewness of 0.10 in the Personalized Learning domain. This suggests that some college teachers of this institution have limited knowledge of the use of AI as a potential tool for individualized instruction. Possibly, teachers are capable of using only the basics of AI, but not yet the sophisticated features of AI. Thus, this level highlights the need for more faculty training and programs that will focus on providing familiarity with AI tools that are intended to be used for personalized learning of their students.

According to the participants of this study, they are aware of the magnitude of AI; however, they lack the understanding of the general characteristics of AI and how to apply it in their teaching practices, as they are used to their traditional ways of customizing the learning strategies of their students. Another factor that hinders teachers from personalizing the learning of their students through AI is the limited time to adjust to the fast-paced innovation of technology, especially to the advent of AI in education. This can also be in connection with the workload of the faculty, especially that the participants of this study must manage and juggle their numerous tasks in the hasty system of a trimester program. To add to the challenge is the number of students each faculty must deal with, since evaluation of the needs and learning styles of students can be overwhelming because every trimester brings in a new batch of students. Hence, frequently recalibrating lessons and activities every semester is time-consuming.

The result also indicates a significant gap between the potential of technology and its application to the teaching-learning process. It has been discovered that teachers have limited awareness of using AI across these critical dimensions of personalized learning: analyzing the learner's data, adapting to individual needs, and developing instructional support. Participants of this study have stated that AI tools require technical knowledge, especially in providing prompts to generative AI such as ChatGPT and NotebookLM, making it difficult for them to use AI effectively. The tendency is that most instructors are still reliant on traditional methods rather than data-driven personalization.

Another issue that teachers find as a factor in adapting AI to their teaching practices is the cultural diversity of their classrooms. Subsequently, teachers' insights into personalized learning strategies are complex and time-intensive; hence, most teachers usually apply a one-size-fits-all approach. Although personalization involves adjusting instruction, resources, feedback, and interventions to learners' specific needs and goals (Idowu, 2024), limited training in AI integration discourages faculty from implementing such practices. Overall, the teachers' moderate awareness level of the use of AI for personalized learning is determined due to the limited time of teachers, workload pressures, the complexity of the blended learning environment, and an insufficient training program for teachers.

These reasons align with the Technology Acceptance Model (Davis, 1989), which suggests that while most college instructors recognize the essentials of most AI tools, their limited knowledge and demanding workload cause them to fully embrace the use of AI in their teaching practices. Furthermore, the concerns raised by the instructors on time constraints and the drastic changes in the educational landscape of the working environment of the instructors are recognized in the Concerns-Based Adoption Model (Hall & Hord, 1987). This concept deals with the contextual barriers to the implementation of educational innovations.

This finding corroborates the study of Balahadia et al. (2023), stating that there is a moderate level of awareness of ChatGPT, the most commonly used AI tool, among university teachers at selected schools in the Philippines. This indicates that while some knowledge of ChatGPT exists, there is still room for improvement in understanding its full capabilities. Another study from Sibug et al. (2024) has presented that the teachers at selected universities in Pampanga believe that AI tools can tailor learning experiences to individual students' needs. They have emphasized in their study that teachers gave high scores to the personalization capabilities of AI, but are balanced by reservations, such as concerns about technical issues on software and hardware compatibility problems, and privacy and data security might also result in a cautious approach to fully leveraging AI's personalization potential.

In conclusion, the results highlight a gap between college teachers' recognition of AI's potential and their actual application of some AI tools in personalizing their students' learning. Even though moderate awareness exists, the positive skew in data reveals that most teachers remain at the lower end of the awareness scale. This means that limited understanding of some AI tools, time constraints, and institutional workload pressures are contributing factors to the positive skewness. Bridging the gap is important to fully harness AI's potential in teaching practices among university instructors, specifically improving the strategies to personalize learning.

Writing Assistance

Awareness of AI as a writing assistant is also moderate, with a 1.94 mean, and it is positively skewed at 0.20, suggesting that educators are beginning to view the value of AI as a writing assistant, but the adoption of AI remains limited. This level is also a positive indicator that the college instructors are engaging in the use of technology to assist in their writing tasks, such as updating and creating their content materials for instruction, and for tasks aligned to research writing. However, the result also indicates that the teachers are not fully confident or do not have enough knowledge in using them for more complex tasks like literature review summarization or research design support.

According to some of the faculty, the university has offered programs for teachers and students on the use of AI, but these offers are not enough to establish a more efficient use of AI. Some teachers have also expressed their awareness of the use of tools like ChatGPT, Grammarly, or citation generators, but due to constant updates to the curricula, constant revisions to assessment materials, and the volume of administrative tasks, hindered their ability to stay updated. As a result, learning to use the other features of AI often becomes a low priority.

This finding implies that strategic faculty development in the integration of AI into the writing tasks of teachers, particularly in writing instructional materials and assessments, research designs, and academic writing, is a critical need to support teachers. Drawing on the Technological Pedagogical Content Knowledge (TPACK) framework (Schmidt et al., 2009), cultivating the technological proficiency of teachers is more significant and meaningful if it synergizes with their teaching practices. Teachers with a moderate level of awareness, as identified in the study, represent a promising cohort for transformation. According to Rogers' Diffusion of Innovations Theory (2003), these faculty members belong to the early majority group. This means they are typically deliberate in adopting innovations because they rely mostly on social validation, that is, they expect support from their institution. In addition, evidence of effectiveness must be presented to the faculty to ensure a full integration of the innovation AI can offer them.

Considerable studies have reflected similar outcomes; the data gathered by Kim & Kim (2022) stated that the teachers present a positive attitude toward incorporating AI as a writing assistant, specifically through an AI-enhanced scaffolding system (AISS). However, the teachers are concerned about their future roles as AI may take over their role as a supervisor of the teaching-learning process, and that teachers will just serve as class assistants. Thus, this negative view leads some teachers to be hesitant in integrating AI into their instruction.

Furthermore, embedding AI literacy across faculty development programs is especially pertinent in a trimester-based academic system with a blended learning institution where educators must constantly revise syllabi, adapt to new content, and deliver instruction with efficiency and precision. This insight is supported by the study of Palaoag et al. (2020), stating that the rapid nature of technological innovations and inventions means that educational institutions must always assess the provision of required technological support in meeting their teachers' and students' requirements. Educational institutions are liable to have a clear picture of their teachers and students' technological literacy, competency, and proficiency level to mount a dependable a successful blended learning, especially at the advent of AI in the academic sectors.

Administrative Tasks

AI is also a useful tool in helping with the everyday administrative work of teachers, such as streamlining tasks in grading, exam creation, attendance monitoring, and performance reporting. In contrast to the previous domains- personalized learning and writing assistant- the administrative tasks project an "Aware" level with a mean score of 2.55. This means that there is a significant number of teachers who are using and recognizing the role of AI in terms of routine administrative duties of teachers, such as grading, exam creation, attendance monitoring, and performance reporting.

The accumulated responses of this domain show a -0.23 negative skewness, suggesting that their answers are clustered toward the higher end of the awareness scale. This implies that most of the teachers accept AI positively, since they find it more familiar and relevant compared to the other instructional areas. The teachers perceive the use of AI as a solution to reduce the workload of the faculty, which allows them to have more time to engage with students and complete other teaching tasks required of them.

The immediate and concrete benefits of AI in this domain have contributed to the "Aware" level. Most teachers claim that using AI in their administrative tasks is less disruptive and aligns better with their usual duties. Thus, teachers are motivated to embrace AI as an auxiliary tool in assisting them in their administrative tasks. However, there is a need for institutional support and faculty development in terms of the use of AI in teaching amongst teachers who are only moderately aware and not aware of the implementation of AI on the administrative tasks of teachers. Strengthening their awareness, knowledge and skills of the potential of AI through training and hands-on exposure along with a clear institutional guideline is beneficial to elevate teachers' confidence of using AI in various teaching practices.

Supporting evidence aligns with the result of this study; for instance, the research of Goli-Cruz (2024) indicates that ChatGPT can simplify the repetitive tasks that educators perform. The researcher stated that while faculty members were aware of ChatGPT's existence, they did not entirely rely on the technology for delivering high-quality education (Goli-Cruz, 2024). Kayali and Balat (2024) confide in their study that teachers use AI applications to facilitate the rapid and easy completion of assessment and evaluation activities, which traditionally demand significant teacher time and effort. Moreover, teachers from the study of Oktavianus et al. (2023) showed a positive attitude towards AI as it offers in-depth feedback to students. The participants of their study perceives that AI is an essential tool in providing feedback that can be effective in guiding students to have better learning outcomes. Integrating AI to assist and automate teacher's administrative tasks allows teachers to have more time on human-centric aspects of teaching such as mentorship and facilitating individualized learning (Oktavianus et al., 2023).

Despite these supporting corroborations, some studies have an opposite view of the findings of this study. In Ecuador, teachers in higher education institutions are still in an "incipient manner" of implementing AI in their educational processes due to the findings that teachers still "lack the knowledge on the use of AI" (Taipicaña et al., 2024). Furthermore, the study Taipicaña et al. (2024) stated that most teachers do not fully embrace that using AI in the education field is a good practice, indicating a general skepticism or lack of faith in the benefits AI can offer to teachers and students. Furthermore, faculty members from 18 universities in the Russian Federation generally lack a systematic understanding of the organizational, teaching, and learning potential of AI tools. Many educators possess only segmental

knowledge, primarily related to their direct professional activities in teaching specific disciplines. The moderate awareness hinders them from forming a complete picture of AI's potential in education (Sysoyev, 2023).

Teachers are pragmatically accepting AI, for the reason that it supports teachers by reducing their repetitive tasks, such as writing students' assessments, providing feedback, grading, and checking attendance. But in contrast to the teachers' "aware" level in this domain some studies stated that teachers are skeptical of the accuracy of AI and lack adequate knowledge, which obstructs them from utilizing AI in their teaching practices (Idrissu et al., 2024; Taipicaña et al., 2024). To bridge the gap between knowing about something and actually doing something, higher education institutions must prioritize strengthening the faculty's use of AI, along with presenting clear guidelines that will empower teachers to have control over the use of AI in their administrative tasks.

Engagement of Students

Similarly, the dimension of engaging students in using AI exhibits an awareness level; thus, this suggests that teachers can manage to engage their students with the assistance of AI. The mean score, which is 2.65, has garnered the highest among the four dimensions of this study, suggesting that most of the respondents have moderate to high awareness, and the negative skewness, which is -0.20, presents a significant portion of instructors who still demonstrate limited knowledge or utilization of AI for engaging students in a blended learning environment.

In the Philippines, most schools and institutions have continued implementing the blended learning modality even after the pandemic period. Hence, teachers have found ways to engage with their students in an online distance learning (ODL) modality, which can be attributed to the level of awareness of teachers on engaging students. The "aware level" reflects that the faculty members are familiar with AI-powered gamified tools such as Quizziz, Menti, and Kahoot, which are intended to reinforce participation through interactive, game-like experiences. Participants of the study also stated that current gamified tools with AI features contributed to the awareness level that led them to use them in their classes, which helped in promoting participation and engagement.

The Self-Determination Theory (Deci & Ryan, 2014) confirms this insight, which suggests that when learners experience autonomy, competence, and relatedness, their motivation increases. Therefore, the moderate-to-high mean score of 2.65 implies that there is sufficient knowledge of teachers' use of AI in terms of engaging students in a blended learning environment. This also indicates that the university must invest in training and supporting teachers to be more confident in sharpening their teaching strategies with the appropriate use of AI. To demonstrate its importance, the study of Huang and Zhang (2025) shows that the training program involved in the study has effectively improved teachers' understanding and application of AI technology. This suggests that well-designed training can directly address the knowledge gap among educators regarding emerging technologies.

In the study of Balajadia et al. (2023), a 'moderate awareness level' among the teachers implies that there is an intermediate understanding of the commonly used AI tool, which is ChatGPT, across various domains. Because technology changes, AI's features and potentials will continue to upgrade as well, thus there must be continuous understanding of AI's full capabilities and opportunities among various institutions.

This is supported by the study's recommendation for educational seminars and workshops to facilitate effective utilization of AI tools. The innovation of AI appeals to students, according to some of the participants of this study. The new features of some Gamification and Collaboration tools offer engaging activities that traditional teaching methods cannot offer. According to Zainuddin (2024), the current technology's novelty can enhance motivation, particularly for students who find traditional learning environments less stimulating because most AI tools often incorporate gamified elements like points, levels, and interactive feedback, which are seen as creating a motivational framework that encourages students to progress through tasks. Though engaging students in this manner makes it more interesting and enjoyable, the effectiveness of this approach may diminish over time because the "novelty effect" has the tendency to fade and may not sustain the engagement in class.

The high mean score in this dimension indicates that many teachers are ready to integrate AI more effectively, especially in blended learning contexts. However, to fully adapt the ability of AI to engage students effectively, sustained support and initiatives are needed. The objective of these development programs is to cultivate an educational environment where teaching and learning are empowered by human touch, but with the AI educational tools as the co-pilot.

Conclusion

This study assessed the awareness of the college teachers at the University of the Cordilleras on the utilization of AI in teaching. The findings present moderate awareness in personalized learning and writing assistance, while automating administrative tasks and engaging students are at the awareness level. The overall interpretation presents that the educators recognize the potential of AI in their teaching practices. The gaps that are illustrated in this study are due to the limited training, time constraints, and workload demands. The results imply a need for targeted AI training and institutional support to enhance integration in instruction. Since this study focused on one institution, it is recommended that broader research will help to validate these findings. Empowering teachers' AI literacy will be essential in improving the instructional quality and efficiency in higher education institutions.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

In the preparation of this research paper, various AI-powered tools were utilized to support and enhance the writing and research process. Specifically, ChatGPT was used to assist in organizing content, clarifying concepts, and refining the structure of the manuscript. Grammarly and Quillbot were employed to improve the mechanics of writing, including grammar, punctuation, clarity, and paraphrasing where necessary. Litmaps and SciSpace were used to help locate and summarize relevant literature to support the development of the review of related studies and the theoretical framework. All AI-assisted inputs were critically reviewed, edited, and verified to ensure accuracy, originality, and academic integrity. The final content reflects my intellectual contributions and scholarly judgment.

Design and Preliminary Evaluation of an Interactive Form Technology-Based Escape Room Music Learning Game With Contextual Spatial Clues Exploration

Yu-Chun Tsai, National Taiwan University of Science and Technology, Taiwan
Huei-Tse Hou, National Taiwan University of Science and Technology, Taiwan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Lecture-based music teaching is often characterized by low student motivation and insufficient participation in the classroom, reflecting the difficulty in stimulating interaction and enthusiasm. Game-based learning can help to overcome these limitations of low motivation and low interaction, but it still faces the challenge of insufficient contextualization. In this study, we used Google Forms platform to develop an educational game called “The Sound of Your Presence,” which was designed to build a realistic castle space for players to explore and embedded digital tools such as an online virtual musical instrument and Google Chrome Music Lab to assist players to enhance their listening skills while exploring the castle and listening to melodic music. In addition, e-books are used as scaffolds to provide timely knowledge of music history and theory. Players can explore and analyze the music in the game. The participants in this study were 40 Taiwanese high school students. The study measured the students' flow, acceptance, and cognitive load. It was found that the learners had a high level of flow and acceptance of the game; they did not have a high intrinsic and extrinsic cognitive load, and had a moderate germane cognitive load, which indicated that the game was effective in facilitating the players' thinking. In the qualitative survey, more than half of the learners mentioned that games can stimulate the learning experience, and more than thirty percent of them said that the clues and scaffolding e-books provided in the games can help them learn more about music.

Keywords: music game-based learning, situated learning, scaffolding

Introduction

In high school music classrooms, adolescents often experience reduced engagement due to boredom and distraction from mobile phones (Arnett, 1991). Despite diverse course content, abstract classical music and specialized terminology disconnected from daily life create significant barriers to comprehension and immersion, thereby undermining learning motivation and classroom interaction (McLeod & Becker, 1981; Palmgreen, 1984).

To bridge cognitive and emotional needs, appropriate scaffolding strategies reduce cognitive load. Music listening exercises employ score analysis and task decomposition (guiding students to first discern musical melodies before understanding harmonic progressions in accompaniment), layered instruction (supported by digital music technology platforms), and real-time prompts (e-book or question guidance) can be scaffolding strategies. This multi-modal integration of visual, auditory, and kinesthetic channels reduces cognitive load while enhancing auditory discrimination and music theory comprehension, thereby boosting learning motivation and situational engagement (Chandler & Sweller, 1991; Kuo & Hou, 2025; Lavy, 2023; Moreno & Mayer, 2000; Sai, 2024; Zhang, 2025).

Scenario-based simulation learning emphasizes student-centered motivation and emotional needs. This study employs a triple simulation mechanism of "story, space, and character" to design the educational game "Music with You" using Google Forms. This game features scenario exploration environments. During puzzle-solving, learners freely explore visual representations of the castle space. This immerses learners in the game's interactivity and fun while progressing through levels, aiming to simultaneously boost self-efficacy and learning motivation, reduce anxiety, enhance flow experiences, and ultimately improve learning outcomes (Chien et al., 2023; Csikszentmihalyi, 1990).

To address the abstract nature of music theory concepts, this study employs scaffolding theory as the core design framework for scenario-based game learning. Within educational games, multidimensional scaffolding effectively promotes knowledge application and overall learning outcomes (Chien et al., 2023; Csikszentmihalyi, 1990; Hou & Chou, 2012; Hou & Li, 2014). To support the learning process, this study employs an e-book integrated with clue inference mechanisms as an immediate knowledge guidance scaffold, providing timely prompts and task decomposition. It further incorporates digital tools such as the online virtual instrument Mussica and Google's Chrome Music Lab to enhance auditory discrimination skills, promote cognitive construction of auditory perception and music theory, and systematically reduce cognitive load through layered scaffolding design. seamlessly elevating auditory discrimination and music theory cognition to achieve classical music appreciation objectives.

Research Purposes and Questions

This study aims to design and evaluate an educational game operating on Google Forms. The game integrates two technological music platforms—*Mussica* and *Chrome Music Lab*—to enhance its visualization and concreteness. Additionally, it incorporates spatial scenes of 17th-18th century castles simulated through forms and generative AI images for learners to explore. An e-book provides scaffolding cues for real-time guidance. These designs aim to overcome challenges common in traditional lecture-based classical music appreciation, such as insufficient contextual authenticity, limited interactive time, and venue constraints. Through spatial exploration via contextual Google Forms, multimedia materials, and scripted form

interaction paths, learners enhance their comprehension of abstract classical music theory and increase learning motivation.

The research questions are: First, can the music-themed escape room game utilizing spatial exploration and form technology enhance learning flow? Second, what is the game's acceptance level based on its design? Third, how can cognitive load in learners be assessed within educational games?

Methods

This study was preliminarily tested through case analysis, involving 40 participants (20 male, 20 female) from two classes of Taiwanese high school students, with 20 students per class and equal representation of genders.

This music education game, titled "*The Sound of Your Presence*," utilizes Google Forms as its operational platform. It employs AI-generated imagery to recreate Baroque-era historical facts from the 17th to 18th centuries, simulating period-specific narratives, characters, settings, and environments. All operational details are centered on the 1600–1750 (Fiorentino, 2023) timeframe (Figure 1). Titled "*The Sound of Your Presence*," this educational game centers on an antique harpsichord crafted by Scarlatti himself, which can only be unlocked and played using the "*King's Key*." During problem-solving, students may consult an e-book for clues to find answers (Figure 2).

Figure 1

Generated AI Realistic Scenes Enhance the Immersive Fidelity and Presence of the Gaming Experience

Figure 2

Learners Engage in Game-Based Problem-Solving Through Coordinated Audiovisual Design, Utilizing the Scaffolding E-book as a Reference Resource for Clues and Answers

The research methodology employed three scales to measure students' flow, game acceptance, and game elements alongside cognitive load. The learning process comprised game instructions 10minutes), game activities(25minutes), and questionnaires on flow, acceptance, and cognitive load (15 minutes).

The flow questionnaire utilized the Kiili Flow Questionnaire (2006), translated and revised by Hou and Li (2014). This scale encompasses Flow Antecedents and Flow Experience, scored on a 5-point Likert scale. The 22-item questionnaire demonstrated high internal consistency (Cronbach's alpha = 0.98).

To assess learners' acceptance of games, the Game Acceptance Scale measures two sub-dimensions: Game Feedback and Game Elements, comprising 12 items. Adapted from Davis's (1989) Technology Acceptance Model, the Game Feedback Scale includes Cognitive Usefulness and Cognitive Ease of Use, totaling 7 items. Additionally, drawing from game motivation factors proposed by Chan et al. (2024), Chien et al. (2023), and Hou and Chou (2012), a game elements scale was developed, comprising five items. Both scales employed a five-point Likert scale for assessment. The internal consistency reliability for game acceptance was Cronbach's alpha = 0.98; for game feedback, Cronbach's alpha = 0.99; and for game elements, Cronbach's alpha = 0.95. All measurements demonstrated high internal consistency reliability.

The cognitive load scale was developed based on Leppink et al. (2013) and adapted from Klepsch et al. (2017). It comprises three dimensions with 8 items: extraneous cognitive load (3 items), assessing cognitive load arising from learning activity design or methods that fail to facilitate learning; and germane cognitive load (3 items), measuring the extent to which learning content helps learners establish metacognitive schemas and promotes reflection. All questionnaires employed a 5-point Likert scale, with internal consistency reliability (Cronbach's alpha) of 0.87.

Results and Discussions

The study measured students' flow, game acceptance, and cognitive load using scales. Results revealed that learners' descriptive statistics showed an overall flow mean of M = 3.69, standard deviation SD = 0.94 (Table 1); game feedback mean of M = 3.80, standard deviation SD = 0.94; and game elements mean of M = 3.76, standard deviation SD = 0.87 (Table 2). Following a one-sample t-test, the study found that the overall flow mean and all flow sub-dimensions, as well as game acceptance feedback, were significantly higher than the scale median (i.e., 3). This indicates that learners possess a moderately high level of flow experience, exhibit high flow during gameplay, and demonstrate high game acceptance.

Table 1
The Mean and Standard Deviation of Learners' Flow (N = 40)

	M	*SD*	*t*	*p*
Overall Flow	3.69	0.94	4.62***	< .001
Flow antecedents	3.67	0.96	4.41***	< .001
Flow experience	3.70	0.93	4.72***	< .001

Note. ***$p < 0.001$

Table 2
The Mean and Standard Deviation of Learners' Game Feedback, and Game Elements (N = 40)

	M	*SD*	*t*	*p*
Game Feedback	3.80	0.94	5.34 ***	< .001
Game Usefulness	4.45	0.61	5.38 ***	< .001
Game Ease of Use	4.56	0.67	5.06 ***	< .001
Game elements	3.76	0.87	5.46 ***	< .001

Note. $^{***}p < 0.001$

Regarding the descriptive statistics of cognitive load, the mean value for intrinsic cognitive load was M = 3.47 with a standard deviation SD = 0.92; The mean for extrinsic cognitive load was M = 3.16, with a standard deviation SD = 1.07; the mean for generative cognitive load was M=3.26, with a standard deviation SD = 0.89. Results from the one-sample t-test indicated that intrinsic cognitive load was significantly higher, while extrinsic cognitive load during gameplay showed no significant difference. For generative cognitive load, M = 3.26, SD = 0.89, t-test = 4.20, highly significantly exceeding the median of 3, indicating that music education games effectively enhance players' cognitive learning through thinking (Table 3).

Table 3
The Mean and Standard Deviation of Learners' Cognitive Load (N = 40)

	M	*SD*	*t*	*p*
Intrinsic cognitive load	3.47	0.92	3.19**	0.003
Extrinsic cognitive load	3.16	1.07	0.93	0.356
Germane cognitive load	3.26	0.89	4.20***	< .001

Note. $^{*}p < 0.05$, $^{**}p < 0.01$, $^{***}p < 0.001$

In the qualitative survey, regarding learning motivation, 57.5% of learners reported that the game was highly engaging, effectively stimulating their motivation to learn, and providing an excellent, enjoyable experience. Regarding game acceptance, 30% of learners reported that this teaching method was unique, allowing them to use mobile phones and the internet to look up information, solve problems, and enhance memory, making the class innovative and fun. Regarding the scaffolding e-book teaching aid, 35% of learners reported learning a lot of knowledge through fun games, and that the game manual also provided valuable learning through reading. 25% of learners reported acquiring relevant musical terminology, music styles, music theory, and knowledge of various instruments through the game.

Conclusions and Limitations

This study developed a music education game titled "*The Sound of Your Presence*," using Google Forms to design a castle-themed spatial visualization. Preliminary results indicate that the design of a music-themed escape room game utilizing spatial exploration and form technology enhances learners' flow state, acceptance, and provides appropriate cognitive load during the learning process. Future research could expand the sample size and incorporate AI-powered online interaction as scaffolding. This would enable a comprehensive comparative analysis of how integrating AI as a teaching assistant within the same online game design affects flow, cognitive load, learning outcomes, scaffolding effectiveness, and perceived realism.

Evaluating the Spillover Effects of an Ageism Reduction Intervention on Other Social Biases

Yuho Shimizu, Seijo University, Japan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

There is a growing need to reduce ageism toward older adults. Prior studies have developed interventions that present a brief explanatory text emphasizing that "everyone will become an older adult someday" and introducing empirical findings from Stereotype Embodiment Theory. While such interventions can reduce ageism, they may unintentionally increase prejudice toward other groups. This could occur if the message is misinterpreted as implying that it is acceptable to hold biases against social groups one is unlikely to join. Therefore, the present study examined whether this type of intervention might inadvertently reinforce racism, sexism, or ableism. A total of 564 Japanese participants took part in an online experiment and were randomly assigned to either an experimental group (n = 289) or a control group (n = 275). The experimental group read the explanatory text described above, while the control group read an unrelated passage. To test group differences, Bayesian analyses were conducted to support the null hypothesis of no effect. Bayesian regression analyses, controlling for age and gender, showed no group differences in racism (β = -.12, 95% Credible Interval [CI] [-.29, .05], Bayes Factor [BF] = 0.57), sexism (β = -.01, 95% CI [-.17, .15], BF = 0.21), or ableism (β = -.09, 95% CI [-.25, .08], BF = 0.37). These results suggest that the intervention based on Stereotype Embodiment Theory does not reinforce other forms of prejudice. Therefore, the intervention developed in previous research should be actively utilized in the future to reduce ageism.

Keywords: ageism, racism, sexism, ableism, Bayesian analysis

Introduction

In Japan and many other countries, the proportion of older adults in the total population is increasing. Accordingly, the importance of older adults and other generations working together and coexisting is growing year by year. Meanwhile, one of the obstacles to such intergenerational cooperation is ageism, which is defined as a "process of systematic stereotyping and discrimination against people because they are old" (Butler, 1987, p. 22). Ageism has been shown to negatively affect the well-being of older adults (Brinkhof et al., 2023), highlighting the need for its reduction.

One study in Japan that aimed to reduce ageism among younger people is Shimizu et al. (2022). This study employed a strategy that focused on the unique characteristic of older adults, emphasizing the idea that everyone will eventually become old. In addition, the Stereotype Embodiment Theory (SET; Levy, 2009) can be cited as a gerontological theory related to this characteristic. The SET suggests that individuals internalize age-related stereotypes from a young age. As they grow older, these stereotypes become self-relevant and can influence their health, behavior, and self-perception, often in negative ways. For example, in a 38-year longitudinal study involving 440 younger and middle-aged adults, Levy et al. (2009) found that individuals who held ageism at baseline were more likely to develop cardiovascular disease compared to those who did not.

In Shimizu et al. (2022), participants were presented with a brief explanatory text that included the fact that everyone will eventually become an older adult, along with empirical findings related to the SET (i.e. SET intervention). This brief intervention reduced participants' ageism, and the effect was shown to last for about one week (Shimizu et al., 2022). Moreover, the intervention was also found to increase the importance participants placed on policies supporting older adults (Shimizu et al., 2023). Based on the above, the SET intervention can be considered moderately effective in reducing ageism.

While this intervention has demonstrated effectiveness in reducing ageism, it may also inadvertently reinforce prejudice or discrimination against other social groups. This is because the SET intervention may strengthen attitudes that justify prejudice and discrimination toward groups perceived as unlikely to become part of one's own future self. For example, since it is essentially impossible for a White person to envision themselves as a member of a racially marginalized group, such as Black individuals, the SET intervention may inadvertently increase tolerance for prejudice toward that group. Therefore, it is necessary to demonstrate that the SET intervention does not reinforce prejudice or discrimination against other social groups.

This study aims to implement the SET intervention and verify that it does not reinforce prejudice or discrimination against other social groups. As concrete examples, this study addresses prejudice against racial minorities, sexual minorities, and people with disabilities, which are commonly examined in research on prejudice. Therefore, in this study, participants will be divided into an experimental group and a control group. After the intervention, racism, sexism, and ableism will be measured and compared between the groups. In doing so, this study aims to examine whether the null hypothesis of no difference between groups is supported. Therefore, this study employs Bayesian analysis, which allows for the affirmative acceptance of the null hypothesis.

Methods

Participants

Participants were recruited through major Japanese crowdsourcing platforms, CrowdWorks and Lancers. The participants consisted of 598 individuals (362 men and 236 women). A total of 34 participants who answered incorrectly on the reading check for the explanatory text used as the experimental manipulation (details provided below) were excluded from the analysis. As a result, the final sample used for analysis consisted of $N = 564$, including 337 men and 227 women. The mean age was 42.84 years (range = 21–64, $SD = 9.10$).

Procedure

The experiment was conducted online. Participants were informed about the purpose of the study and provided their consent to participate. They were randomly assigned to either an experimental group ($n = 289$) or a control group ($n = 275$). The experimental group read the explanatory text, while the control group read an unrelated passage. Next, participants responded to items measuring racism, sexism, and ableism. Finally, they were asked to report their age and gender as demographic variables. The data and the R code used for the analysis have been made available on the Open Science Framework (OSF) repository (https://osf.io/4jmbq/overview?view_only=b60c6c97bc71477d83b0c898e4861de1).

Intervention

In the experimental group, participants read the following text (Shimizu et al., 2023, p. 5): “Everyone will eventually become older adults with time. However, we can internalize negative attitudes toward older adults throughout our lives, and turn them against ourselves. In short, the stronger your current internalized negative attitudes, the worse your own mental and physical health as you become older (e.g., increased loneliness, decreased memory). Therefore, you should avoid maintaining negative attitudes toward older adults as they will have undesirable impacts on your own future. Such negative attitudes can also lead to a disregard for the will of older adults and other negative effects, which should be avoided for the sake of the older adults around you.”

In the control group, participants read the following text (Shimizu et al., 2023, p. 6):

Internet technology has changed the traditional information environment. There was once a clear division between huge senders and small receivers of information (e.g., TV and viewers or newspapers and readers). In the past, people were only receptive to information in the media; however, the interaction between the sender and receiver and the immediacy of communication have dramatically changed this environment. Media that allow people to demonstrate their active nature are called ‘participating’ media. These circumstances have produced new problems relating to trustworthiness and risk judgments regarding websites and information.

This explanatory text is grounded in the work of Ikeda (2010).

Reading Check Items

In the experimental group, participants were asked the following questions (Shimizu et al., 2023, p. 6): "Everyone will eventually become older adults with time," and "Negative attitudes toward older adults have undesirable impacts on ourselves and the older adults around us." In the control group, participants were asked the following questions (Shimizu et al., 2023, p. 6): "Media that allow people to demonstrate their active nature are called 'participating' media," and "There are new issues of trustworthiness and risk judgement regarding websites and information." The response options were "yes" or "no," with "yes" being the correct answer in all cases. Only participants who answered both questions correctly in each group were included in the analysis.

Questionnaire Items

Racism, sexism, and ableism were measured using the social distance scale developed by Muto and Kugihara (2015). Participants responded to the following eight items regarding racial minorities, sexual minorities, and people with disabilities: "1. not want to live together," "2. not want to work together," "3. not want to be friends," "4. not want them to live nearby," "5. not want to marry them," "6. cannot understand them," "7. not want to have conversations with them," and "8. would be embarrassed if others knew someone like this was in their family." The response options were as follows: "1. strongly disagree," "2. disagree," "3. somewhat disagree," "4. somewhat agree," "5. agree," and "6. strongly agree." For each category, the average score of the eight items was calculated, with higher scores indicating greater levels of racism, sexism, or ableism. The reliability coefficients (Cronbach's alpha) were .95 for racism, .94 for sexism, and .94 for ableism, respectively.

Results

Racism scores were M = 2.54 (SD = 1.02) in the experimental group and M = 2.66 (SD = 1.09) in the control group. Sexism scores were M = 2.76 (SD = 1.12) in the experimental group and M = 2.76 (SD = 1.12) in the control group. Ableism scores were M = 2.71 (SD = 1.06) in the experimental group and M = 2.81 (SD = 1.06) in the control group.

Bayesian regression analyses were conducted with racism, sexism, and ableism scores as dependent variables, and group (1 = experimental group, 0 = control group) as the independent variable. Participant age and gender were controlled in the analysis. The results showed no differences in racism, sexism, or ableism scores between the two groups (in order, β = -.12, 95% Credible Interval [CI] [-.29, .05], Bayes Factor [BF] = 0.57; β = -.01, 95% CI [-.17, .15], BF = 0.21; β = -.09, 95% CI [-.25, .08], BF = 0.37). In other words, the null hypothesis of no difference between the two groups was actively supported over the alternative hypothesis of a difference. Accordingly, these results suggest that the SET intervention does not reinforce other forms of prejudice.

Discussion and Conclusion

This study seeks to carry out the SET intervention and confirm that it does not lead to increased prejudice or discrimination toward other social groups, including racial minorities, sexual minorities, and people with disabilities. To this end, Bayesian analysis, which allows for the active acceptance of the null hypothesis, was employed. Results from an online experiment conducted with Japanese participants showed that the SET intervention did not reinforce racism,

sexism, or ableism. Therefore, the SET intervention should be actively utilized in the future to reduce ageism.

While the SET intervention did not produce any backfire effects such as reinforcing prejudice or discrimination toward other social groups, it also failed to reduce other forms of prejudice. This suggests that the SET intervention is specifically effective in reducing ageism, but not in addressing other types of bias. Given that the intervention focuses exclusively on content related to older adults, this result is not unexpected. To enhance its broader applicability, however, it may be beneficial to integrate the SET intervention with strategies targeting other forms of prejudice. Combining SET with additional educational or contact-based approaches could help reduce prejudice and discrimination across a wider range of social categories.

This study yielded the findings described above; however, it is limited by the fact that participants' racism, sexism, and ableism were measured only once. Consequently, it remains unclear to what extent the SET intervention produced changes in these three forms of prejudice. Additionally, in this study, to reduce participant burden and facilitate comparisons across target groups, prejudice toward each group was assessed using the same social distance scale (Muto & Kugihara, 2015). For more precise measurement of racism, sexism, and ableism, it is preferable to employ scales specifically designed for each category. Therefore, future research should incorporate more specialized items tailored to each specific form of prejudice.
