

OFFICIAL CONFERENCE PROCEEDINGS

The 17th Asian Conference on Education (ACE2025)

November 23-28, 2025 | Tokyo, Japan, & Online

ISSN: 2186-5892

Organised by the International Academic Forum (IAFOR) in partnership with the IAFOR Research Centre at the Osaka School of International Public Policy (OSIPP) at The University of Osaka, Japan, and IAFOR's Global Partners.

iafor

"To Open Minds, To Educate Intelligence, To Inform Decisions"

The International Academic Forum provides new perspectives to the thought-leaders and decision-makers of today and tomorrow by offering constructive environments for dialogue and interchange at the intersections of nation, culture, and discipline. Headquartered in Nagoya, Japan, and registered as a Non-Profit Organization (一般社団法人), IAFOR is an independent think tank committed to the deeper understanding of contemporary geo-political transformation, particularly in the Asia Pacific Region.

iafor

International Academic Board

Professor Anne Boddington, IAFOR, Japan (IAB Chair)
Dr Joseph Haldane, IAFOR and The University of Osaka, Japan & University College London, United Kingdom
Professor Jun Arima, IAFOR & The University of Tokyo, Japan
Professor Virgil Hawkins, IAFOR Research Centre & The University of Osaka, Japan
Mr Lowell Sheppard, IAFOR & Never Too Late Academy, Japan

Professor Umberto Ansaldo, VinUniversity, Vietnam
Dr Susana Barreto, University of Porto, Portugal
Professor Grant Black, Chuo University, Japan
Dr Evangelia Chrysikou, Bartlett School of Sustainable Construction, University College London, United Kingdom
Professor Donald E. Hall, Binghamton University, United States
Professor Brendan Howe, Ewha Womans University, South Korea & The Asian Political and International Studies Association (APISA)
Dr James W. McNally, University of Michigan, United States & NACDA Program on Aging

ACE2025 Conference Programme Committee

Distinguished Professor Tien-Hui Chiang, Zhengzhou University, China
Dr Joseph Haldane, IAFOR and The University of Osaka, Japan & University College London, United Kingdom
Susie Kung, Manukau Institute of Technology, New Zealand
Professor May Sok Mui Lim, Singapore Institute of Technology, Singapore
Dr Tzu-Bin Lin, National Taiwan Normal University, Taiwan
Dr Leandro Loyola, Conestoga College Institute of Technology and Applied Learning, Canada
Professor José McClanahan, Creighton University, United States
Dr Sean McMinn, Hong Kong University of Science and Technology, Hong Kong
Dr Murielle El Hajj Nahas, Lusail University, Qatar
Dr Justin Sanders, Woven by Toyota, Japan
Dr Tati D. Wardi, Universitas Islam Internasional Indonesia (UIII), Indonesia
Dr Aki Yamada, Tamagawa University, Japan

Table of Contents

A Not-So-Ordinary Approach to Ordinary Differential Equations: Evaluating the Effectiveness of "CLEAR" in Enhancing Learning
Hansong Xue
Stephen Tay pp. 1 - 8

Parental Engagement in Children's Literacy Development Across Income Groups: A Comparative Analysis
Na-Thinamalar Magiswary Nadarajan
Yammuna Sivabalan
Lim Seong Pek
Hafizah Kusnek Khusni
Rita Wong Mee Mee
Md Rosli Ismail pp. 9 - 19

Enhancing Internship Support: Evaluating Student Teacher Performance for Program Development
Lualhati A. Dela Cruz
Sheryll S. Serrano
Jedidia Eunice P. Peña
Juanito C. Dela Cruz pp. 21 - 34

Tasbih Huruf: Improving Islamic Education Achievement Among *Jawi* Remedial Pupils in Rural Areas
Nazirah Binti Jabri pp. 35 - 46

How Should Immersive Learning Spaces Be Designed? Formalising the Intersection Between School Design and XR Technologies
Laura Cormio
Angelo Rega
Maria Ermelinda De Carlo
Pierpaolo Limone
Maura Mengoni pp. 47 - 58

The Effect of Passive Voice Writing Checklist on the Writing Task of Mathayom Suksa 4 Students
Jidapa Tararom
Suricha Thanwisai pp. 59 - 68

Exploring TikTok as a Learning Resource in Maritime Higher Education: Educator Perspectives and Practices
Aung Myin Moe
Selvi Thazin Win
Min Min Tun
Zina Kyriakou pp. 69 - 85

Middle School Libraries as Active Agents of Risk Awareness: Post-disaster Knowledge Curation and Public Engagement in Thailand
Kaimuk Laosunthara
Ampan Laosunthara pp. 87 - 91

Empowering Global Citizens Through Multidisciplinary Collaboration in Education for Sustainable Development: Insights From the Learning Express (LeX) Programme
Harveen Kaur Singh pp. 93 - 98

Parallax of Heritage: Intersecting Deep Learning, VR, and Cultural Narratives for Preservation
Suroyo
Hambali
Yuliantoro
Yanuar Al Fiqri
Mujiono pp. 99 - 113

Discussing ChatGPT in the Landscape of Students' Soft Skill Fostering: A Bibliometric Content Analysis
Thu-Phuong Hoang pp. 115 - 136

Rewriting Success: How Generative AI Is Shaping New Definitions of Career Achievement
Ma. Asuncion Clara F. Pantaleon
Arlyn B. Napeñas pp. 137 - 159

Innovative Learning Management Model to Create Learning Space for Elementary School Students
Tippawan Sukjairungwattana
Nopporn Chantaranamchoo
Saranya Chanchusakun pp. 161 - 173

Sustainable English Language Centers Through EdTech and Social Enterprise: Building Human Capital in Resource-Constrained Contexts
Kay Khaing pp. 175 - 190

Exploring English Education in Taiwan: Perspectives of Foreign English Teachers
Marlena L. Padgett pp. 191 - 196

From Anxiety to Engagement: Inclusive Strategies for Low-Proficiency EFL Learners in Japan
Ikhlas Abdul Hadi pp. 197 - 210

From Studio to Society: A Hardware–Software–Heartware Framework for Interdisciplinary Design Innovation in the New World University
Agnes Lishan Xue
Renjie Zheng pp. 211 - 234

Development of an Exploratory Heritage Educational Game Integrating SVVR Scenarios, Narrative Scripts, and Generative AI Characters
Ti-Chieh Lin
Hung-Yu Chan
Huei-Tse Hou pp. 235 - 243

Users' Behaviors of Submitting and Commenting in Education-Related Subreddits
Khadijah Alghamdi pp. 245 - 254

Collaborative Governance in Transnational Higher Education: Reimagining Leadership Through UK-UAE Partnerships
Sumara Khan pp. 255 - 268

Design and Preliminary Evaluation of a Psychological Counseling Training Game Using Generative AI Virtual Characters Based on Situational Learning as a Case Study
Hsi-Min Tu
Ya-Ling Wang
Chih-Chung Chien
Pei-Ching Ngu
Yen-Ting Ho
Huei-Tse Hou pp. 269 - 275

Integration of Generative AI Character Mechanism and Virtual Reality Clues for the Development of Educational Games for Clinical Reasoning Training in Nursing Care
Pei-Ching Ngu
Chih-Chung Chien
I-Chieh Mao
Yen-Ting Ho
Huei-Tse Hou pp. 277 - 282

The TaRL Experience: Challenges, Practices, and Recommendations
Ameer Benjamin B. Calderon
Lito A. Palomar
Audrey Joy R. Panganiban
Allan A. Balud pp. 283 - 301

Designing for Engagement: Exploring Task Workload and Interaction in an Online Professional Development Course for Teachers
Priya Ganapathi
Daevesh Singh
Navneet Kaur
Shitanshu Mishra pp. 303 - 311

Enhancing Curriculum Planning and Student Academic Performance in Special Schools Through Learning Progression Framework (LPF)
Shu Man Yau pp. 313 - 324

From Theory to Practice: Evaluating Short-Term Project-Based Learning for Design Thinking Pedagogy
Yuanyi Liao
Henry Ma pp. 325 - 336

Preserving Local Fishing Heritage With a VR Educational Game: Integrating Sustainability and Cultural Identity Mechanisms
Ya-Hsin Cheng
Yu-Cheng Lin pp. 337 - 342

Reimagining Critical Thinking Development: A Teacher Perspective on Alternative Approaches to Hong Kong's Education System
Cheuk Yan Leung pp. 343 - 361

From Adaptation to Engagement: Evaluating the Effectiveness of an AI-Based Personalised Learning Platform in Physics Education
Bala Murali Tanimale pp. 363 - 379

From Lingua Franca to Multilingual Place-Making: Autonomy and Positioning in Online International Collaboration
Reiko Kato pp. 381 - 391

Analysis on the Effect of Digital Literacy, Innovative Behavior, Culture, and Interpersonal Communication on Teachers Performance at DLSU-D Through SEM
Marlon C. Masangkay
Lourdes Lasian
Venusmar Quevedo pp. 393 - 410

Pedagogical Innovation in Interior Architecture Education: Integrating a User-Experience Learning Model for Spatial Service Design
Duangkamol Limwongse
Purima Noiim
Makoto Watanabe pp. 411 - 428

Enhancing Secondary Mathematics Learning Through STEAM2C: Creative Assessment With Graphing Technology
Jeyaletchumi Muthiah pp. 429 - 438

The Power of Environments in Social and Emotional Learning
Jennifer Wong-Powell pp. 439 - 451

Competencies in Transdisciplinary Thinking: Development of a Measurement Instrument for Tertiary Students
Clarice Sim
Li Min Chong
Mark Lu pp. 453 - 469

Bridging the Competence Gap in Ugandan Undergraduate Legal Education
Nagadya Hamidah pp. 471 - 483

Cross-Cultural Adoption of Generative Artificial Intelligence in Higher Education: A Longitudinal Socio-Technical Analysis Using the AI-CLASSIC Framework
Lawrence M. Ibeh
Benjamin Bensam Sambiri
Kaddour Chelabi
Sushma Kumari pp. 485 - 494

Increased Efficacy of Teacher Curated Lesson Materials in Learning Management System
Krishnendu Sarkar pp. 495 - 510

Encouraging the Implementation of Sustainable Development Practices in Open Distance Learning Higher Education Institutions: Utilizing Structural Equation Modeling for Analysis
Astri Dwi Jayanti Suhandoko
Lidwina Sri Ardiasih
Fawzi Rahmadiyan Zuhairi pp. 511 - 527

Development of a STEM-PjBL Teaching and Learning Process Using the Engineering Design Process (EDP) in a Project-Based Course for Grade 11 Students in the KOSEN-KMUTT Program
Jutharat Sunprasert
Tas Yusoontorn
Shinichiro Mito pp. 529 - 540

Developing Problem-Solving and Collaboration Skills of Grade 11 Students Through STEM-PjBL Using the Engineering Design Process (EDP): A Case Study of the KOSEN-KMUTT Program
Jutharat Sunprasert
Natthaporn Srichaikham
Tas Yusoontorn
Shinichiro Mito pp. 541 - 551

Both Are Worse: Nonword Repetition Tasks With a High vs Low Linguistic Load as Clinical Markers for Language(-Related) Impairments
Eugen Zaretsky
Benjamin P. Lange
Christiane Hey pp. 553 - 570

Effects of Supportive Parenting Style, Academic Self-Concept, Expectations, and Values on Mandarin Academic Achievement Among First-Year Vocational College Students
Yi Sun
Sittipong Wattananonsakul pp. 571 - 578

The Effect of Perceived Family Environment Functioning Previous Social Experiences, and Values on Social Competence of College Students
Lijia Fu
Sittipong Wattananonsakul
Chanya Leesattrupai pp. 579 - 586

The Influence of Family Environment, Learning Values, and Self-Expectations on Late Adolescents' Motivation to Learn Chinese
Haolin Yang
Sittipong Wattananonsakul pp. 587 - 595

The Effects of Family Functioning, Academic Self-Regulation, and Expectations on Middle School Students' Academic Achievement
Yu Bin Fan
Sittipong Wattananonsakul
Chanya Leesattrupai pp. 597 - 605

Cultural Integration Through Peer Collaboration: How PAL Programs Facilitate the Adaptation of Burmese Biomedical Science Students in Thailand
Gary Torremucha
Edward Devere Bacon pp. 607 - 622

Towards a Successful Postgraduate Life and Beyond: The Construction of a PG Transition Module
Yingchun Li pp. 623 - 630

Engaging Minds and Enhancing Speech Through Motivational Activities for EFL Learners
Rubina Gasparyan
Syuzanna Torosyan pp. 631 - 638

Exploring the Impact of Cultural Context in Management Education: A Pre- and Post-course Assessment
Salman Ali pp. 639 - 644

Becoming a Chemistry Teacher in the Age of AI: Pedagogical Encounters From School-Based Teaching Practice
Almubarak
Yusi Riska Yustiana
Nahadi
Ida Kaniawati
Galuh Yuliani pp. 645 - 663

Assessment of the Conflict and Conflict Resolution Attitude and Styles: The Case of High School Student Leaders in Angeles City
Arlan dela Cruz
Alma Natividad
Jannet Reyes pp. 665 - 681

Academic Experiences of Teachers as Graduate Students: Basis for a Proposed Graduate School Development Plan
Hannah Grace R. Lumahan
Jose M. Ocampo, Jr. pp. 683 - 701

Educational Innovation in Science Communication: Enhancing Public Understanding of Environmentally Friendly Nuclear Technology in Indonesia
Muhammad Yunus Zulkifli pp. 703 - 714

Bridging the Gap: Developing Lexical and Syntactic Complexity Through CLIL After Study Abroad Programmes
Jason Pipe pp. 715 - 736

Digital Literacy Education for Political Communication Ethics and Culture in Digital Space: Reflections After the 2024 Indonesian Simultaneous Elections
Muhammad Yunus Zulkifli pp. 737 - 747

Preservice Teachers' Perceived Effectiveness of Autonomy Support on Children With Educational Needs
Ryo Okada pp. 749 - 763

The Potential of Sketchfab in Visualizing Technical Processes in the Educational Environment
Liubov Khomenko
Lesia Matviienko
Serhii Kashuba pp. 765 - 775

Accreditation, Internationalization and World University Rankings: Basis for Quality Assurance (QA) in Higher Education Institutions (HEIs) in the Philippines
Solane S. Duque
Norita E. Manly pp. 777 - 794

Beyond Coding: Reframing Vocational Education Through South Korea's ICT Education Policy and the Varieties of Capitalism Framework
Seri Yoon pp. 795 - 806

Autoethnography as Story: The Realities and Dynamics of Transnational Children's Education on the Indonesia-Malaysia Border
Jagad Aditya Dewantara
Dasim Budimansyah
Kokom Komalasari
Gida Kadarisma
Cecep Darmawan
Iqbal Arpannudin pp. 807 - 818

Creating an Inclusive, Accessible, and Supportive Foreign Language Learning Environment for Students With Disabilities
Tanya McCarthy pp. 819 - 829

Social Studies Learning With Reflective Inquiry Approach as a Means of Improving Cultural Literacy
Eka Yuliana Rahman
Nana Supriatna
Juju Masunah
Erlina Wiyanarti pp. 831 - 844

A Community Approach: School-Wide Station Rotation Pedagogy
Yeo Haig Gene
Chew Ee
Loi Cheng Li
Marek Otreba pp. 845 - 851

Sustainability of Indigenous Community Education Through Baduy Tribe Ethnomathematics: Integrating Local Wisdom in 21st Century Mathematics Learning
Gida Kadarisma
Jagad Aditya Dewantara
Indah Puspita Sari
Anton Nasrullah
Soeharto Soeharto pp. 853 - 865

Students' Note-Taking Patterns and Interpreting Accuracy: An Empirical Study at a University in Vietnam
Do Thi Thu Phuong
Le Thi Hong Phuong pp. 867 - 883

Enhancing Andragogy for Educators Through Knowledge Building Professional Learning Approach (KBPL Approach)
Melvin Chan
Anthony Chua
Kennedy Loo pp. 885 - 891

Coding Connections: Intercultural Competence Through Peer-Assisted Learning Among Digital Media and Technology Students
Edward Devere Bacon
Gary Torremucha pp. 893 - 906

Nonprofits and Innovation in Education Using Technology
Goutham Kumar pp. 907 - 911

Transforming the Landscape: How Project-Based Learning is Evolving Material Science Education
Low Bee Lee
Gilbert Teo
Ng Suxiu
Ng Ting Ting
Joe Ong
Goh Zhen Ke pp. 913 - 924

The Role of Identity-Based Curriculum in Social-Emotional Learning
Ei Smith pp. 925 - 937

A Not-So-Ordinary Approach to Ordinary Differential Equations: Evaluating the Effectiveness of "CLEAR" in Enhancing Learning

Hansong Xue, Singapore University of Technology and Design, Singapore
Stephen Tay, National University of Singapore, Singapore

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Teaching ordinary differential equations (ODEs), while essential, is often challenging due to the abstract nature of the topic and students' difficulty in relating it to real-world applications. To address this, the Contextualized Learning via Enquiring, Answering, and Reflecting (CLEAR) approach was implemented to help students connect ODEs with authentic, real-life contexts. CLEAR was introduced during the Spring Semester of AY2025 in the graduate-level course "Applied Mathematics for Engineering" at the Singapore University of Technology and Design. As part of the assignment, students successfully developed nine unique real-world contexts, each leading to the formulation of questions and corresponding solutions involving the application of ODEs. The impact of CLEAR was explored through two guiding questions: (1) Does the CLEAR approach help students relate ODEs to observed phenomena beyond the classroom?; (2) How do students perceive the CLEAR approach? Overall, students demonstrated an enhanced ability to contextualize ODEs and reported a positive learning experience with the CLEAR assignment. Many expressed appreciations for how the approach extended their understanding beyond classroom theory and found the process engaging and enjoyable. These findings offer valuable anecdotal evidence that may inform and enhance future approaches to teaching ODEs. Furthermore, given that the CLEAR approach requires no additional hardware or software, it presents a scalable and cost-effective strategy that can potentially be adopted across a wide range of courses and disciplines.

Keywords: student-centered learning, assessment, active learning, higher-order thinking, engagement

Introduction

In the teaching and learning of mathematics, ordinary differential equations (ODEs) constitute a foundational topic that provides the mathematical basis for modelling and explaining a wide range of real-world phenomena in engineering, the natural sciences, and applied research. Despite their importance, students often perceive ODEs as abstract, procedurally demanding, and disconnected from their lived experiences, which can impede both conceptual understanding and motivation (Santos et al., 2020). Although inquiry-based approaches have been proposed to address these challenges, prior work indicates that such methods still fall short in helping students build meaningful links between differential equations and their personal or observed contexts outside the classroom (Hyland et al., 2023).

To address this gap, scenario-based student-generated questions (sb-SGQA) have been developed as a pedagogical strategy that positions students as co-creators of learning materials, thereby increasing authenticity and engagement (Tay, 2024). By constructing their own scenarios and assessment questions, students take on a more active role in the learning process, which promotes autonomy and fosters the development of higher-order thinking skills such as synthesis, evaluation, and creative problem-solving (Yu & Wu, 2020). This shift from passive recipients to active agents enables learners to deepen their metacognitive awareness, strengthen conceptual understanding, and assume greater ownership of their learning trajectories. Building on this foundation, the integration of reflective practices within the sb-SGQA framework led to the development of the Contextualized Learning via Enquiring, Answering, and Reflecting (CLEAR) approach. CLEAR seeks not only to engage students in authentic mathematical inquiry but also to support iterative reflection as a means of consolidating understanding and enhancing personal relevance. Hence, this study seeks to explore the impact of the CLEAR in the context of teaching ODEs through the following research questions (RQ):

- RQ1: Does the CLEAR approach help students relate ODEs to observed phenomena beyond the classroom?
- RQ2: How do students perceive the CLEAR approach?

Methodology

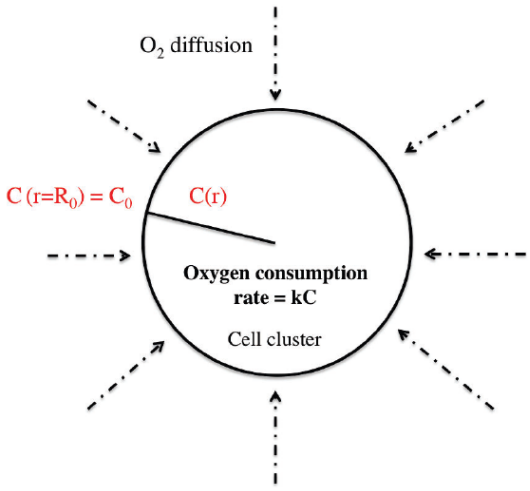
The CLEAR approach was implemented during the Spring Semester of AY2025 in the graduate-level course “Applied Mathematics for Engineering” at the Singapore University of Technology and Design. Students, in groups of 2, were tasked to develop CLEAR assignments which are considered as their student-initialed assessment (SIA) that utilize ODEs concepts and principles to a context they could draw upon from life experience. To help with scaffolding, a sample contextualized CLEAR assignment was provided (Figure 1). A total of 10 graduate students were enrolled in the class. As the course was taught for the first time, a control was not available for comparison. Consequently, data for discussion would rely on analysis of students’ work (RQ1) and feedback from students (RQ2).

The implementation schedule of SIA outlines a structured sequence of activities across the entire semester. In Week 1, students are introduced to the SIA and informed that they will design their own examination questions as part of their mid-term assessment. By Week 4, they receive individualized formative feedback to support the development of their work. In Week 6, students submit the first draft of their SIA questions, which they subsequently present for class-wide peer review in Week 7. Following this feedback cycle, students refine

and submit the final version of their SIA in Week 9. In Week 11, a perception survey is administered to gather students' reflections on their experiences with the SIA process.

Figure 1

Sample CLEAR Assignment



Question 1: Cellular respiration in cells

The cells in human body require a source of energy to function and they are able to obtain it by breaking down food molecules to release the stored energy inside. This process is called "cellular respiration". Oxygen is consumed to break down food (e.g. glucose) in this process.

$$C_6H_{12}O_6 + 6O_2 \rightarrow 6CO_2 + 6H_2O$$

Assume a constant concentration of glucose inside the cells and its concentration is much more than the oxygen concentration. Therefore, the reaction rate can be approximated to be a 1st order reaction with respect to oxygen concentration. In this question, we will be looking at the transport and consumption of oxygen inside a cluster of cells.

We consider a steady-state O_2 diffusion in a sphere of radius R_0, with a irreversible reaction of O_2 consumption. Assume that the oxygen concentration at the outer surface of the cell cluster is maintained at C_0 where the value of rate constant k is $10^{-2}/s$, the spherical radius is $0.02\,m$, the diffusivity D is $10^{-5}\,m^2/s$ and C_0 is taken to be $5\,mol/m^3$.

(a) By using shell balance technique, derive the governing equation and the boundary conditions for oxygen concentration profile, C(r). State any assumptions you have made.

Note. The assignment showed 1) the context and 2) questions. Answers to the questions were also provided but not shown in the image above.

The assessment rubric for SIA comprises three major components designed to evaluate both the technical and higher-order learning outcomes of the project. The first component,

Technical Strength (55%), assesses the depth and breadth of students' understanding of relevant concepts, the accuracy with which they apply appropriate methods, theories, and calculations, and the proportionality of the workload required to produce their solution, with a small penalty applied when the scope is excessively heavy or insufficiently rigorous. The second component, Presentation (30%), evaluates the clarity and coherence of both the oral and written presentations, with particular emphasis on the articulation of the problem statement and the rationale behind the proposed solution. The final component, Advanced Learning (15%), measures students' higher-order cognitive engagement, including creative thinking, critical thinking, and the novelty and significance of their contributions. Collectively, the rubric provides a structured and balanced framework for assessing analytical rigour, communication quality, and innovative thinking.

Results and Discussion

An analysis of the contexts developed by the students revealed that students were able to meaningfully relate ODEs to real-world phenomena beyond the classroom (Table 1). Deep diving into one such assignment, heat transfer for nuclear fuel was used as a relevant and authentic context for the application of ODEs (Figure 2), along with reasonable answers to the questions developed (not shown in abstract). This finding addresses RQ1 and responds to the concerns raised in a previous study (Santos et al., 2020).

Table 1
List of Contexts Students Developed Questions and Answers for Through CLEAR

Context No.	Topic
1	Yeast modelling for beer fermentation.
2	Linearly-doped Schottky barrier diode.
3	Heat transfer in 3D printing.
4	Vibrations of circular membrane.
5	Movement of electrical signals transmitted in neurons.
6	Heat transfer in nuclear fuel.
7	Transverse diffusion of population inversion in a fiber laser.
8	Spring-mass system.
9	Geodesic distance.

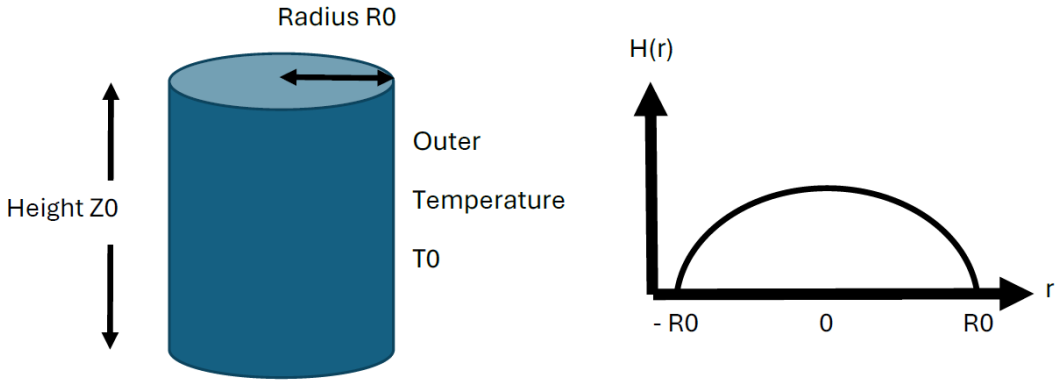
Note. 9 contexts were shown as the 4th context was duplicated by another group.

Subsequently, student feedback was analyzed to gain insight into their perception of the CLEAR approach. Table 2 presents the semester's feedback, reproduced as provided. In general, graduate students appreciated the concepts taught to beyond the classroom (Feedback No. 1, 4, 5 and 6). One appreciated how approximations are commonly used (Feedback No. 3), and another enjoyed the learning process (Feedback No. 2). These results help to answer the second research question, indicating that students were generally positive.

Figure 2

Example of CLEAR Assignment by One Group for Context Number 6

Question 1: Heat Transfer in a Cylindrical Nuclear Fuel



Nuclear materials generate heat due to some neutron interactions. To collect thermal energy, nuclear fuel is immersed in a coolant (e.g., water), which absorbs the heat and drives a turbine to produce electricity.

However, too much heat in the fuel creates thermal stress, risk of melting or structural failure. To prevent these problems, the temperature distribution must be analyzed within the nuclear fuel.

In this case, please consider a cylindrical nuclear fuel rod of constant thermal conductivity k, height Z_0 and radius R_0, where heat conduction occurs only in the radial direction. The outer cylindrical surface maintains a fixed temperature T_0. The heat generation rate, in W/cm^3, inside the fuel is given by

$$H(r) = H_0(R_0^2 - r^2)$$

where H_0 is a constant.

Assume that you are a nuclear engineer. Please:

a) Derive this ODE equation using shell-balance techniques.

$$\frac{1}{r}\frac{d}{dr}\left(r\frac{dT}{dr}\right) + \frac{H(r)}{k} = 0$$

b) Write boundary conditions for solving the ODE

c) Find the temperature profile T(r) over the cylindrical fuel by solving the given ODE.

Note. The first page of the assignment is shown for illustrative purposes.

Table 2
Student Feedback on the Use of CLEAR

Feedback No.	Feedback
1	Cool to be able to model real life scenarios
2	Applied math is fun to solve and useful in various problems
3	A lot of approximation is used in real life
4	He (the lecturer) can help with our research math relevant problems and bring Math to real–word applications
5	Very relatable to different scenarios
6	How to use maths knowledge in real engineering conditions

Conclusion

This study implemented the SIA as an instructional framework for teaching ordinary differential equations (ODEs) to graduate students. Although ODEs are traditionally regarded as challenging and often perceived as abstract or disconnected from students' lived experiences, the findings of this study indicate that the CLEAR approach in SIA can meaningfully bridge this gap. Students were able to construct a diverse range of authentic and personally relevant contexts for applying ODE concepts, demonstrating a notable shift from procedural engagement toward conceptual and contextual understanding. Furthermore, students' perceptions of CLEAR were generally positive, with feedback indicating that the learning process was not only accessible but also enjoyable. These outcomes provide preliminary yet valuable evidence that CLEAR has the potential to enhance students' engagement, agency, and relevance-making when learning ODEs. Importantly, because CLEAR relies solely on pedagogical design rather than specialized hardware, software, or costly infrastructure, the approach is inherently scalable. This positions CLEAR as a feasible and adaptable instructional model that can be implemented across different classes, course levels, and even disciplines beyond mathematics and engineering.

Limitations and Future Work

Despite the encouraging results, several limitations warrant consideration. First, the study involved a relatively small cohort of ten students, which restricts the extent to which quantitative findings can be meaningfully interpreted or generalized. Second, the participants were drawn from five different academic departments, each with varying degrees of prior mathematical preparation and disciplinary orientations. While this diversity offers rich qualitative insight, it also introduces heterogeneity that can obscure systematic patterns in students' responses or performance. To strengthen the validity and reliability of future analyses, subsequent studies would benefit from aggregating data across multiple cohorts to achieve a larger and more comparable sample size. Longer-term investigations could also examine the sustainability of the benefits observed, such as whether CLEAR supports deeper retention of ODE concepts or improved transfer to advanced coursework. Furthermore, future work may explore how CLEAR can be adapted or expanded—for example, through integration with digital tools, collaborative learning structures, or discipline-specific scenarios—to further enhance its impact on students' conceptual understanding and engagement.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that Grammarly, an AI-assisted writing software, was used in proofreading and refining the language used in the manuscript. The usage was limited to correcting grammatical and spelling errors and rephrasing statements for accuracy and clarity. The author further declares that, apart from Grammarly, no other AI or AI-assisted technologies have been used to generate content in writing the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

Official Conference Proceedings

Abstract

Parental engagement is a crucial element in children's literacy development. However, there are few studies focused on the influence of income levels and the consistency of support at home. This research examines the various aspects of parental engagement among the low-, middle-, and high-income families in Selangor. The data were collected via a survey administered to 419 parents of primary school children. The survey comprises 19 instruments designed to measure academic supervision, resource accessibility, emotional support, and digital engagement. This data is analysed using descriptive analysis. The results reveal that all the income groups demonstrate moderate to strong literacy support. However, there is a significant difference in the parents' engagement patterns. Parents with low incomes were highly emotionally involved and adaptable despite having limited financial resources. Parents with middle incomes were the most consistent in all areas, combining structure, access, and emotional support. High-income parents provided significant material and digital resources but exhibited comparatively lower direct academic and emotional engagement, presumably because they relied on external support systems. These results show that effective literacy engagement is not only determined by a family's income but also by parents' beliefs, the time they have, and how they adapt. The study enhances the existing literature by applying established parenting theories in a Malaysian context, offering comparative insights across income levels, and guiding targeted educational interventions that promote equitable literacy development.

Keywords: parental engagement, literacy development, income disparity, Malaysia, educational equity

iafor

Introduction

Parental engagement is recognised as an important component in children's literacy development. This impacts children's reading readiness, academic success, and lifelong learning practices. A study by Boerma et al. (2017) emphasises *"Parents' interest in their children's reading is significantly linked to improved reading comprehension outcomes."* In varied educational settings, active engagement through emotional support, academic oversight, or the provision of learning materials has demonstrated efficacy in enhancing language proficiency and cultivating favourable attitudes towards reading.

In Malaysia, the disparities in household income correlate with the variations in home literacy environments, resource accessibility, and parents' views on education. Parents' socioeconomic status (SES) plays a vital role in how parents engage in their children's literacy development. As Rahman et al. (2024) note, *"socioeconomic status moderates the relationship between parental involvement and young children's literacy development."* Higher-income families have better access to books, digital tools, and enrichment opportunities. On the other hand, low-income families may struggle with these things. Nonetheless, previous studies suggest that parents with lower incomes can compensate for limited resources by being highly emotionally involved and employing flexible strategies.

Within the Malaysian context, studies on parental engagement and socioeconomic status remain scarce. Particularly, there is a lack of research on how families from different income groups promote literacy at home. Existing research has predominantly focused on general parental involvement or school-related activities, neglecting comprehensive comparative analyses that address the full spectrum of literacy support, including emotional, academic, and digital dimensions. Regardless of economic standing, Mad and Mohamed (2023) stated that parents who value literacy are more likely to create an environment that supports reading and learning. This suggests that it is necessary to examine how beliefs, resources, and engagement behaviours interact.

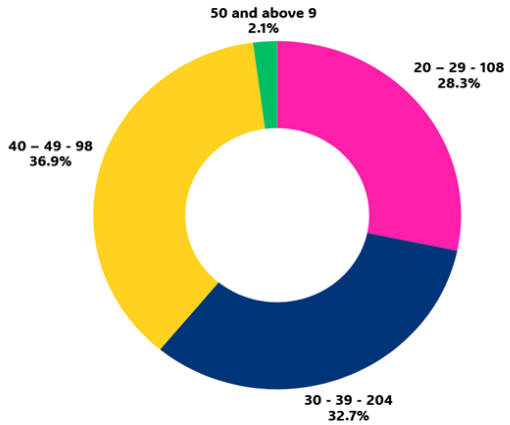
This study is guided by Epstein's Model of Parental Involvement framework and Hoover-Dempsey and Sandler's Theory of Parental Involvement. This study examines parental engagement in children's literacy development among three household income groups in Selangor. Epstein's framework emphasises the importance of parental engagement at home for learning, while Hoover-Dempsey and Sandler's model describes how parental involvement behaviours are shaped by attitude, self-efficacy, and perceived roles. When combined, these frameworks provide a comprehensive lens for observing the various forms and reasons of parental involvement across socioeconomic backgrounds.

Hence, this study contributes to the existing literature by providing a systematic comparison of low-, middle-, and high-income families, focusing on the interactions among emotional support, academic involvement, and digital practices across income groups. The study will foreground findings that will support interventions to promote literacy development by addressing key challenges and family dynamics (Calzada et al., 2014). This study will investigate parental engagement in children's literacy development in three different household income levels in Selangor, Malaysia.

Methodology

This quantitative study encompassed 419 parents of primary school children living in Selangor, Malaysia. Participants were classified into three income brackets according to monthly household earnings: Group A (low-income, below RM4,850), Group B (middle-income, RM4,851 to RM10,970), and Group C (high-income, above RM10,971). The sampling was intentional, focusing on households with school-aged children enrolled in government and private primary schools in urban and suburban regions.

A structured 19-item questionnaire was used to collect data on parental involvement in six important areas of home literacy support. These areas include academic supervision, access to learning materials, daily integration of literacy practices, digital literacy guidance, development of reading habits, and emotional support related to learning goals. Each item was evaluated on a 5-point Likert scale, with 1 indicating "Strongly Agree" and 5 indicating "Strongly Disagree." Lower scores signify greater agreement or more frequent engagement in the specified behaviour.



SPSS Version 27 was used to do descriptive statistical analysis. Mean scores and standard deviations were computed for each item across the three income groups to discern trends, behavioural patterns, and notable disparities in parental engagement. Specific focus was on domains that exhibit variance across income levels, yielding comparative insights into the impact of socioeconomic status on the nature and consistency of home support. The comparative interpretation in the results and discussion sections is based on these findings.

Results and Findings

This section presents the descriptive findings of parental engagement in children's literacy development across three household income groups: Group A (low-income), Group B (middle-income), and Group C (high-income). The analysis is based on 19 items encompassing academic supervision, access to learning resources, digital literacy support, reading routines, and emotional encouragement. Mean scores and standard deviations were computed for each item to assess patterns and variations in engagement. The results highlight both commonalities and unique trends across income groups, offering insight into how socioeconomic background influences the nature and intensity of parental involvement.

Demographic Information

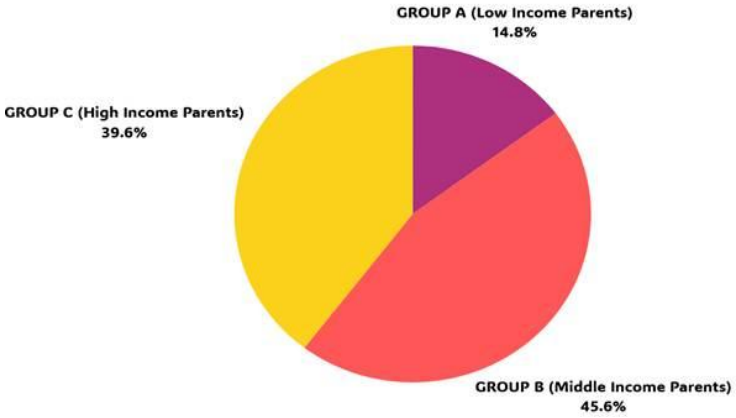


Figure 1
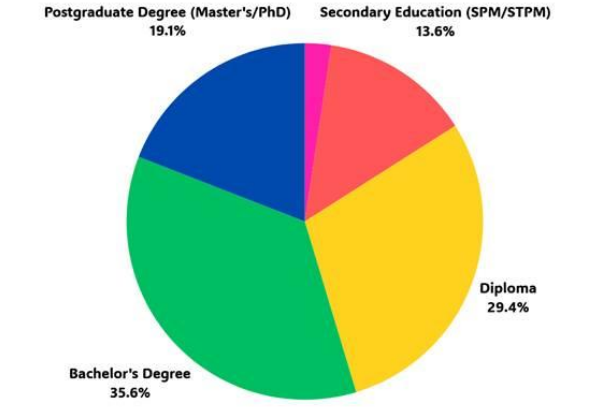
Distribution of Parents' Age

The parents' age distribution revealed the respondents' generational profile. As shown in Figure 1, most respondents were aged 30 to 39, accounting for 204 parents (48.2% of the total sample). This aligns with the common age range of parents with primary school children. The second largest group comprised parents aged 20–29 years, representing 25.5% (n = 108) of the respondents, followed closely by parents aged 40–49 years at 23.1% (n = 98). The smallest group comprised parents aged 50 and above, representing only 2.1% (n = 9) of the respondents. These findings indicate that many participants were within an active parenting age, which may contribute to their higher involvement in their children's education.

Figure 2



Distribution of Parents by Income Groups

The respondents' income distribution is illustrated in Figure 2. The largest proportion of parents fell into Group B, representing middle-income households, with 45.6% of the total sample. This was followed by Group C, comprising high-income parents, who accounted for 39.6% of respondents. The smallest proportion, 14.8%, belonged to Group A, representing low-income parents. These findings suggest that most participating parents came from middle- and high-income backgrounds, potentially influencing their capacity to provide educational resources and support for their children.

Figure 3

Highest Educational Qualifications of Parents

As illustrated in Figure 3, the majority of respondents hold a bachelor’s degree, accounting for 35.6% (n = 149) of the total sample. The statistic was followed by diploma holders, who represented 29.4% (n = 123) of the respondents. A significant proportion of the respondents, specifically 19.1%, had completed postgraduate qualifications at the master’s or PhD level. At

the same time, 13.6% had completed secondary school (SPM/STPM), while only 2.4% had completed primary school. These results reflect a predominantly well-educated parent population, suggesting that the respondents are more likely to engage actively and effectively in their children's academic development.

Figure 4

Group A (Low-Income Parents)

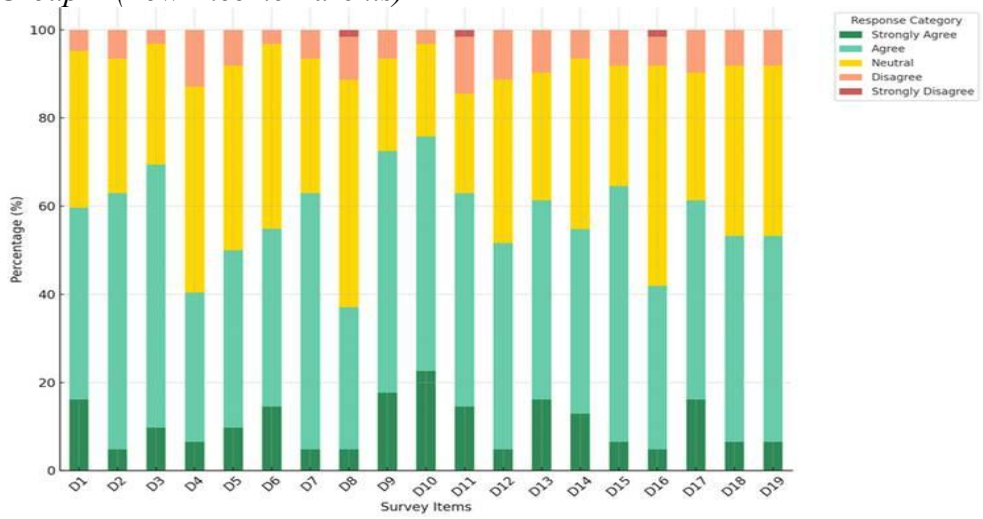


Figure 4 presents the distributions for Group A (low-income parents, n = 62) on 19 items measuring parental involvement in children's literacy development. The overall results indicate a moderate to strong parental engagement.

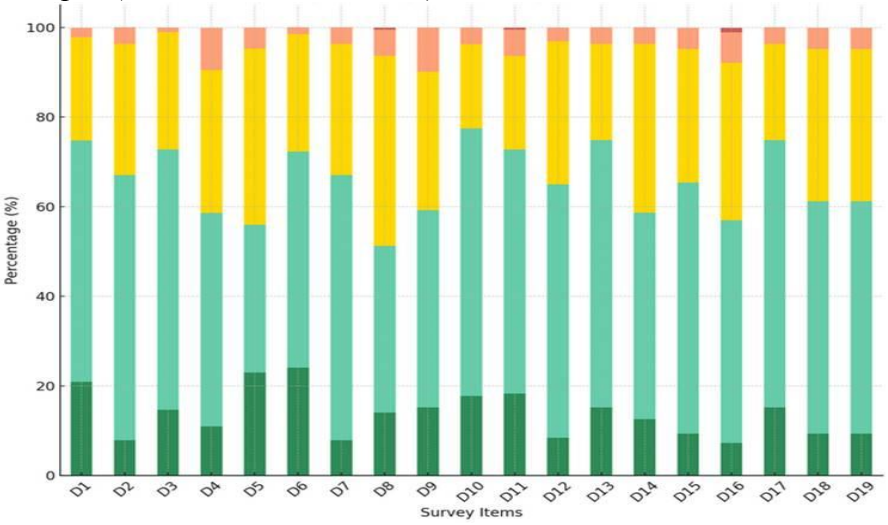
The lowest average score was observed for Item D10 (M = 2.05, SD = 0.756), which examines how parents seek limited other learning resources. This indicates that, despite financial limitations, these parents exhibit resilience and problem-solving skills in surmounting educational obstacles. Likewise, items D9 (M = 2.16) and D3 (M = 2.24) demonstrate significant integration of literacy into daily routines and motivational support, respectively, underscoring a practical and emotionally engaged approach to the child's education.

Items measuring support for digital literacy (D11–D13) had average scores ranging from 2.32 to 2.55. Notably, item D11, which assesses parental oversight and guidance in the utilisation of digital tools, exhibited a higher standard deviation (SD = 0.947), suggesting variability in digital engagement, potentially affected by disparities in technology access or parental digital proficiency.



The provision of diverse learning materials (D8) recorded the highest mean score (M = 2.71), indicating challenges in accessing literary support among low-income parents. This is likely due to financial constraints that limit access to learning materials. Despite that, the mean score remained below the neutral point, which indicates that parents value and support literacy development despite the limited availability of learning materials.

The mean values for the emotional support indicators (D17–D19) ranged from 2.32 to 2.48, indicating that parents consistently want their children to do well in school and set goals for them. Even though they have structural disadvantages, these parents are very emotionally invested and intrinsically motivated to help their children learn to read and write.

In short, parents in Group A are highly involved in their children's literacy journey, especially in motivation, emotional support, and finding new ways to address limited resources. Nonetheless, access to educational resources and ongoing digital support remains a significant limitation. These results show how important it is to recognise and support the strengths of low-income families by making sure they have equal access to literacy tools and digital infrastructure through policies and programs.

Figure 5

Group B (Middle-Income Parents)

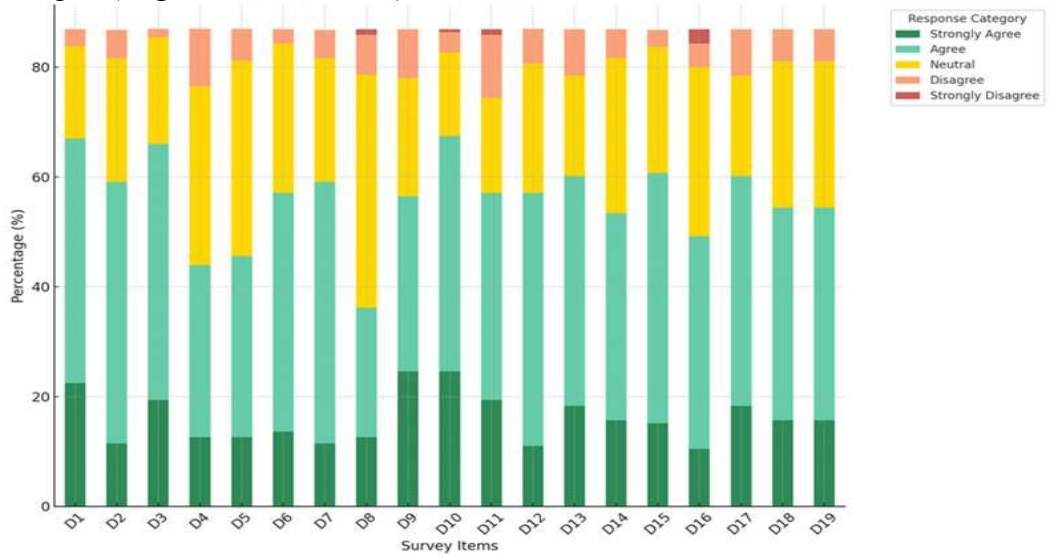
The income of middle-income parents (n = 191) was generally consistent, and they had moderately high engagement in their children's literacy development. Mean scores ranged from 2.05 to 2.45, indicating a general level of engagement across all areas.

The highest level of engagement was seen in Item D6 (“I give my child various reading materials,” M = 2.05, SD = 0.752), followed closely by D1 (“I regularly check my child's assignments,” M = 2.06, SD = 0.723) and D10 (“I address challenges in accessing resources by finding alternatives,” M = 2.08, SD = 0.713). These scores indicate robust engagement in both oversight of academic tasks and problem resolution to enhance literacy.

Digital engagement indicators (D11–D13) showed that people were participating effectively. For example, D11 (“I monitor and guide digital tool use”) had a mean of 2.16, indicating that parents with middle incomes are not only giving their children access to digital tools but also actively supervising their digital literacy activities. The standard deviation (SD = 0.806) indicates some variability, which may be due to differences in digital fluency or access to resources.

Emotional support and goal setting (D17–D19) also received favourable scores (M = 2.14–2.34), indicating that parents want their kids to do well in school. D17, which asked parents if they set educational goals for their child, had a mean of 2.14, which was low. This finding shows that parents were very involved in planning their child's academic path.

Nonetheless, items like D16 (“I help my child understand difficult words/concepts,” M = 2.45) and D8 (“My child has access to various learning materials,” M = 2.41) had the highest mean scores, indicating that people didn't agree with them as much. These findings may indicate that middle-income parents are more likely to promote independent reading or encounter



constraints in delivering comprehensive academic assistance. Even these numbers are below the midpoint, indicating that people are generally interested.

Parents in Group B were more balanced than parents in Group A in all areas. They provided more consistent, less variable emotional, academic, and digital support. The high level of agreement on key issues, such as D2 (homework help) and D3 (motivation), also shows that this group is taking action.

To sum up, parents with middle incomes are very involved in their children's literacy development in a strong, organised, and balanced way. This group is the most consistent in terms of both breadth and depth of involvement across the three income categories because they have the resources and time to support schoolwork, provide emotional support, and supervise digital literacy.

Figure 6

Group C (High-Income Parents)

The responses from Group C (n = 166), which are from parents with high incomes, show that parents are generally moderately to strongly involved in their children's literacy development. The average scores for the 19 items ranged from 1.99 to 2.55, indicating a positive trend. Lower means indicate more agreement.

The item with the most agreement was D10 (“I find alternatives to problems with getting learning resources”), which had the lowest mean score of 1.99 (SD = 0.828). The items D1 (“I regularly check my child's assignments,” M = 2.01) and D3 (“I motivate my child to get good grades,” M = 2.04) were also very close. This means that parents with a lot of money are actively involved in their children's education and are also resourceful, even though they already have enough access to learning tools.

On the other hand, D8 (“My child has access to various learning materials such as books, apps, and educational videos,” M = 2.55) had the highest mean score, even though they were relatively privileged. This might mean people think they should have access to something rather than trying to obtain it. Furthermore, D4's higher average score (M = 2.47) than the other groups suggests that this group may place less importance on direct verbal reinforcement.

Digital engagement (D11–D13) had moderate means (2.19–2.29), indicating that technology was consistently used to support literacy. However, D11, which involves monitoring the use of digital tools, exhibited a higher standard deviation (SD = 0.995), suggesting that high-income parents may not be equally involved in their children's digital learning. The difference could mean that kids have more freedom online, that they are given more responsibility by their parents, or that they have different ideas about how much time they should spend on screens.

Emotional and routine-based support (D14–D19) also showed a moderately positive range (M = 2.16–2.27). These responses indicate that affluent parents maintain aspirational, goal-directed involvement, albeit potentially less structured than that of middle-income families. For example, D16 ("I help my child understand hard words and ideas") had a mean of 2.42, which is a little higher. These results could mean that outside teachers give this kind of help more often or that kids in this group are more academically independent.

Even though access to resources is high, the higher mean response does not necessarily mean that parents are more directly involved. This difference is clear in the neutral or higher mean responses to items like D5 (M = 2.40) and D8 (M = 2.55), which suggests that people are less actively involved in providing materials.

In conclusion, parents in Group C provide strong material support and are moderately involved in their children's schoolwork, especially in motivating and monitoring their progress. However, their participation in emotional scaffolding and direct instructional support may be implemented more selectively, potentially due to reliance on external educational services. These findings indicate that although financial capital enhances resource accessibility, it does not necessarily lead to extensive parental engagement.

Discussion

This study investigated the differences in parental involvement in children's literacy development among three income groups in Selangor, Malaysia. While income is frequently seen as the principal factor influencing educational engagement, the findings revealed a more complex dynamic, with each income group demonstrating its own strengths and weaknesses.

The finding revealed that low-income parents exhibit strong motivation, emotional engagement, and ways to support literacy despite limited material resources. Middle-income parents demonstrated the most consistent engagement with their children. Their involvement remained balanced across academic supervision, active monitoring, and emotional support, as well as digital literacy monitoring. Lastly, high-income parents offer greater access to material resources but are less directly involved in their children's literacy engagement. These parents rely heavily on external support systems, such as tuition or enrichment programs, or on their children's emphasis on independent learning. This study shows that access to resources mainly does not mean active parental engagement.

Overall, the results suggest that parental engagement is influenced by socioeconomic status rather than its presence, illustrating the importance of tailored approaches to identify the engagement patterns of each income group.

Conclusion

This study offers an extensive comparison of parental involvement in children's literacy development across low-, middle-, and high-income families in Selangor. The findings suggest that socioeconomic status shapes that pattern of parental involvement, but it is not the only determining factor in parental engagement in literacy development. Low-income parents invest more emotional support in their children's literacy development than the two higher-income groups. Whereas the middle-income group appeared as the most consistent and balanced in their involvement, while the high-income group relied more on external academic support. In sum, the findings challenge one-size-fits-all assumptions about parental engagement in children's literacy development. There should be policies and programmes to support parental engagement to overcome the constraints and align with the strengths across income groups.

Official Conference Proceedings

Abstract

This study utilized a descriptive quantitative research design, employing an institutional research tool to assess the effectiveness of the Internship/OJT program in the PETE program at CHK. The respondents comprised 189 student-teachers assigned to various training stations across Metro Manila. Findings revealed that student-teachers were placed in academic institutions near their residences, with all completing the required 350 hours of training. Their performance was evaluated by cooperating teachers, receiving outstanding ratings in teacher personality (4.82), lesson planning (4.91), subject mastery (4.72), teaching methods (4.66), and classroom management before (4.80), during (4.77), and after instruction (4.75). Analysis of performance variations across training stations indicated significant differences in teacher personality ($p = 0.0012$, $F = 3.6042$), subject mastery ($p = 0.0329$), teaching methods, and classroom management before instruction. However, no significant differences were observed in lesson planning or classroom management during and after instruction. These findings suggest that student-teacher performance varies based on institutional assignments, particularly personality expression and subject mastery. The study underscores the importance of continuously assessing and enhancing internship programs to better prepare student-teachers for real-world teaching environments. Thus, an integrated internship development plan was proposed to further improve the performance of the Pre-Service Physical Education interns.

Keywords: internship support, ST performance, development program

iafor
The International Academic Forum
www.iafor.org

Introduction

Internship programs are essential in teacher education, as they bridge the gap between theory and practice. They equip aspiring educators with hands-on classroom experience under the mentorship of seasoned professionals, preparing them for the real-world challenges of teaching. The success of these programs, however, is largely dependent on the quality of support and feedback provided during the internship.

Evaluating student-teacher performance is vital for both personal and institutional growth. It offers invaluable insights that help student-teachers recognize their strengths and pinpoint areas for improvement, fostering professional development. Additionally, these evaluations provide institutions with data to refine program structures, curricula, and support systems, ultimately creating a more effective and supportive learning environment for future educators.

Material & Methods

This study employed a descriptive quantitative research design using an institutional questionnaire to evaluate student-teachers' performance during their On-the-Job Training (OJT). The primary research instrument used was the "Evaluation Instrument for Practice Teacher – Regular and Face-to-Face," an assessment tool adopted by the university. Additionally, open-ended questions were incorporated to gain deeper insights into the strengths and weaknesses of student-teachers.

The questionnaire consists of four sections. Part 1 collects demographic information, including age, sex, total number of training hours completed, and assigned training station. Part 2 assesses student-teacher performance across key areas, including teacher personality, lesson planning, mastery of the subject matter, teaching methods, and classroom management. Parts 3 and 4 identify the strengths and areas for improvement in student-teacher performance.

For data analysis, frequency, mean, weighted mean, and ANOVA were used to interpret the results. Data collection was conducted during the actual teaching demonstration of the student-teachers, ensuring an accurate evaluation of their practical teaching skills. By employing quantitative measures of feedback, this study provides a comprehensive assessment of the internship program's effectiveness and highlights potential areas for improvement in student-teacher training.

Results & Discussion

Table 1
Assessment of the Effectiveness Performance of Student-Teachers in Terms of Teacher's Personality

Areas	Weighted Mean	Verbal Interpretation
Displays a neat and well-groomed appearance	4.91	Outstanding
Exudes confidence that commands respect and attention	4.86	Outstanding
Cautious of his/her gestures not to disturb the student's attention	4.83	Outstanding
Shows dynamism and enthusiasm that foster a harmonious relationship with the students	4.80	Outstanding

Possesses a pleasing/modulated voice	4.76	Outstanding
Employs a wide range of different skills and attitudes to assist students in achieving high outcomes.	4.76	Outstanding
General Weighted Mean	**4.82**	**Outstanding**

Table 1 highlights the professional qualities demonstrated by the Physical Education Teacher Education interns, all of which were rated as *Outstanding*. The highest-rated attribute is *"Displays a neat and well-groomed appearance"* with a mean score of 4.91, indicating that the interns consistently maintain a professional and presentable demeanor. This is followed by *"Exudes confidence that commands respect and attention"* with a score of 4.86, emphasizing the interns' ability to project self-assurance, which positively influences student engagement.

Additionally, *"Cautious of his/her gestures not to disturb the student's attention"* received a score of 4.83, showing their awareness of non-verbal communication to maintain student focus. The interns also demonstrated *"Dynamism and enthusiasm that foster harmonious relationships with students"* (4.80), which reflects their ability to create a positive and engaging learning environment.

With a *General Weighted Mean* of 4.82, the results confirm that the interns exhibited outstanding professional traits, contributing to an effective and engaging learning experience for their students. These findings highlight their preparedness for the teaching profession and their ability to create a conducive and productive classroom environment.

Table 2
Assessment of the Effectiveness Performance of Student-Teachers in Terms of Lesson Planning

Areas	Weighted Mean	Verbal Interpretation
Follows the prescribed format of the school	4.93	Outstanding
Articulates congruence between Objective and Subject matter	4.94	Outstanding
Articulates congruence between Objective and Teaching Procedure	4.89	Outstanding
Articulates congruence between Objective and Assessment	4.89	Outstanding
Articulates congruence between Objective and Assignment	4.92	Outstanding
General Weighted Mean	**4.91**	**Outstanding**

Table 2 assesses the interns' competency in lesson planning, with all indicators receiving an *Outstanding* rating. The highest-rated aspect is *"Articulates congruence between Objective and Subject Matter"*, with a weighted mean of 4.94, indicating that the interns effectively align learning objectives with the subject content. Similarly, the criterion *"Follows the prescribed format of the school"* scored 4.93, demonstrating the interns' adherence to institutional guidelines and standards in lesson planning.

Moreover, both *"Articulates congruence between Objective and Assignment"* (4.92) and *"Articulates congruence between Objective and Teaching Procedure"* (4.89) highlight the interns' ability to ensure that instructional strategies and assigned tasks align with the intended

learning outcomes. The same high rating (4.89) was observed for *"Articulates congruence between Objective and Assessment"*, emphasizing their capability to design assessments that accurately measure student learning based on set objectives.

With a *General Weighted Mean* of 4.91, the results affirm that the interns excel in structuring well-planned lessons that are coherent, aligned, and effective in delivering quality instruction. These findings underscore their preparedness in lesson planning, which is essential for ensuring meaningful and goal-oriented classroom instruction.

Table 3
Assessment of the Effectiveness Performance of Student-Teachers in Terms of Mastery of the Subject Matter

Areas	Weighted Mean	Verbal Interpretation
Explores the use of relevant materials and preliminary activities (e.g. recall and motivation to stimulate student's prior knowledge	4.82	Outstanding
Shows creativity and versatility in lesson presentation	4.77	Outstanding
Integrates relevant, innovative ideas, and in-depth knowledge on the subject matter	4.69	Outstanding
Provides sufficient and concrete meaningful learning experiences that relate to actual life situations	4.66	Outstanding
Knows how to address learners' concerns and queries with clarity and/or assurance	4.67	Outstanding
General Weighted Mean	**4.72**	**Outstanding**

Table 3 presents the assessment of the interns' performance based on their mastery of the subject matter, with all indicators receiving an *Outstanding* rating. The highest-rated competency is *"Explores the use of relevant materials and preliminary activities (e.g., recall and motivation) to stimulate students' prior knowledge"*, with a weighted mean of 4.82. This suggests that the interns effectively utilize engaging strategies to activate students' prior knowledge, enhancing lesson comprehension.

Additionally, *"Shows creativity and versatility in lesson presentation"* received a score of 4.77, highlighting the interns' ability to deliver lessons in dynamic and adaptable ways. *"Integrates relevant, innovative ideas, and in-depth knowledge on the subject matter"* scored 4.69, reflecting their capability to enrich discussions with meaningful insights and modern approaches.

Furthermore, *"Provides sufficient and concrete meaningful learning experiences that relate to actual life situations"* (4.66) and *"Knows how to address learners' concerns and queries with clarity and/or assurance"* (4.67) indicate that the interns effectively facilitate learning by making lessons relatable and addressing student inquiries with confidence.

With a *General Weighted Mean* of 4.72, the results confirm that the interns demonstrate strong subject matter expertise, creativity, and responsiveness to students' needs. Their ability to integrate innovative teaching strategies and connect lessons to real-life situations further underscores their preparedness for the teaching profession.

Table 4
Assessment of the Effectiveness Performance of Student-Teachers in Terms of Mastery of the Teaching Methods

Areas	Weighted Mean	Verbal Interpretation
Prepares creative visual aids and other examples to illustrate the lesson adaptive to the learner's ability and congruent with the lesson objectives,	4.81	Outstanding
Consistently handles class discussions in any medium of instruction (Mother Tongue/Filipino/English) with linguistic eases, confidence, and competence in complex communication task	4.55	Outstanding
Elicits learner's active participation through various learning activities	4.74	Outstanding
Promotes open communication and polite interactions between the teacher and learners and their peers while exhibiting sensitivity to learner's differences	4.79	Outstanding
Motivates learners to investigate the subject matter to expand their knowledge and satisfy their curiosity	4.67	Outstanding
Asks questions that promote Higher-Order Thinking Skills (HOTS)	4.42	Outstanding
Helps learners articulate their ideas and thinking processes while observing safe and secure learning atmosphere	4.68	Outstanding
Facilitates collaborative activities that promote learner's multiple intelligences	4.64	Outstanding
Uses formative assessment effectively to monitor student learning progress	4.65	Outstanding
Maximizes the use of feedback mechanism	4.54	Outstanding
General Weighted Mean	**4.66**	**Outstanding**

Table 4 shows the assessment of the interns' teaching methods reveals an *Outstanding* performance across all indicators, with a *General Weighted Mean* of 4.66. The highest-rated competencies, *"Prepares creative visual aids and other examples to illustrate the lesson adaptive to learners' ability and congruent with the lesson objectives"* (4.81) and *"Provides homework/agreement for the continuity of the lesson"* (4.81), emphasize the interns' ability to design engaging instructional materials and extend learning beyond the classroom. These findings align with Mayer's (2009) **Cognitive Theory of Multimedia Learning**, which highlights that well-designed visual aids enhance student comprehension and retention.

Additionally, the interns excel in *"Promoting open communication and polite interactions while exhibiting sensitivity to learners' differences"* (4.79) and *"Eliciting learners' active participation through various learning activities"* (4.74). This supports **Vygotsky's (1978) Social Constructivist Theory**, which emphasizes the role of social interaction in cognitive development. Encouraging student participation fosters collaboration and enhances learning experiences (Palincsar, 1998).

Furthermore, the ability to *"Motivate learners to investigate the subject matter to expand their knowledge and satisfy their curiosity"* (4.67) is crucial in fostering **student-centered learning** (Bransford et al., 2000). Likewise, facilitating *"Collaborative activities that promote learners'*

multiple intelligences" (4.64) aligns with Gardner's (1983) **Theory of Multiple Intelligences**, which suggests that students have different learning preferences that should be accommodated in instruction.

Although all aspects were rated outstanding, the lowest-rated competency, *"Asks questions that promote Higher-Order Thinking Skills (HOTS)"* (4.42), suggests an area for improvement. Bloom's Revised Taxonomy (Anderson & Krathwohl, 2001) emphasizes the importance of HOTS in developing students' analytical, evaluative, and creative abilities. Research by King et al. (1998) also highlights that effective questioning techniques significantly impact students' critical thinking and problem-solving skills.

The use of *"Formative assessment to monitor student learning progress"* (4.65) and *"Maximizing feedback mechanisms"* (4.54) aligns with **Black and Wiliam's (1998) formative assessment theory**, which states that timely feedback enhances learning outcomes by allowing students to reflect on their progress.

Table 5
Assessment of the Effectiveness Performance of Student-Teachers in Terms of Classroom Management – Before

Areas	Weighted Mean	Verbal Interpretation
Establishes a safe and secure learning environment by providing classroom rules that allow learners to learn without distractions	4.88	Outstanding
Regularly conducts preliminary activities (i.e prayer, checking attendance, cleanliness of the environment, etc.) to ensure effective teaching-learning process	4.87	Outstanding
Ensures that lesson objectives are presented and well-discussed	4.79	Outstanding
General Weighted Mean	**4.80**	**Outstanding**

Table 8 presents the assessment of the respondents regarding the effectiveness of student-teachers in terms of classroom management *before* the lesson begins. The findings reveal an *Outstanding* performance across all indicators, with a *General Weighted Mean* of 4.80. This highlights the interns' competence in establishing an organized and conducive learning environment that sets the stage for effective teaching and learning.

The highest-rated competency, *"Establishes a safe and secure learning environment by providing classroom rules that allow learners to learn without distractions"*, received a weighted mean of 4.88. This underscores the importance of structure and discipline in the classroom, aligning with Wong and Wong's (2018) Classroom Management Theory, which emphasizes that well-defined rules and expectations contribute to a productive and disruption-free learning environment. Ensuring a safe and structured space enhances student engagement, minimizes behavioral issues, and promotes effective learning (Marzano et al., 2003).

Similarly, *"Regularly conducts preliminary activities (i.e., prayer, checking attendance, cleanliness of the environment, etc.) to ensure an effective teaching-learning process"*, with a weighted mean of 4.87, highlights the interns' ability to establish classroom routines. Research

suggests that structured preliminary activities help set a positive tone for learning and foster a sense of responsibility and discipline among students (Emmer & Evertson, 2016).

Meanwhile, *"Ensures that lesson objectives are presented and well-discussed"*, which scored 4.79, signifies that the interns effectively communicate learning goals at the beginning of the lesson. Clearly defined objectives guide student learning, enhance motivation, and improve overall comprehension (Hattie, 2009). This practice aligns with Robert Gagné's Nine Events of Instruction, which states that informing learners of the objectives helps them understand expectations and mentally prepare for the lesson (Gagné et al., 1992).

Overall, the assessment indicates that the interns demonstrate excellent classroom management skills before the lesson begins. Their ability to establish a well-structured, organized, and motivating learning environment ensures a smooth transition into instruction. These results affirm their preparedness to foster a positive classroom atmosphere that supports student engagement and academic success.

Table 6
Assessment of the Effectiveness Performance of Student-Teachers in Terms of Classroom Management – During

Areas	Weighted Mean	Verbal Interpretation
Uses an appropriate and well-prepared instructional material such as presentation slides PPT/Traditional visual aids, board works, and other's	4.83	Outstanding
Check systematically the classroom activities indicated in the prepared lesson plan	4.80	Outstanding
Implements orderliness and discipline in the classroom	4.85	Outstanding
Acts proactively, bringing attention to possible areas of learner's misconceptions	4.75	Outstanding
Conveys openness and warmth that encourage learners to interact with one another	4.78	Outstanding
Observes time management	4.59	Outstanding
General Weighted Mean	**4.77**	**Outstanding**

The assessment of student-teacher classroom management during instruction reveals an *Outstanding* performance across all evaluated indicators, with a *General Weighted Mean* of 4.77. This underscores the interns' proficiency in maintaining an effective and conducive learning environment throughout the instructional process.

The highest-rated competency, *"Implements orderliness and discipline in the classroom"*, with a weighted mean of 4.85, highlights the importance of maintaining structure during lessons. Effective classroom management is crucial in physical education settings, where the dynamic environment requires clear expectations and consistent enforcement to ensure student safety and engagement. Research indicates that establishing and maintaining order is foundational to successful teaching in physical education (SHAPE America, 2018).

The competency *"Uses appropriate and well-prepared instructional materials such as presentation slides (PPT), traditional visual aids, the board works, and others"*, rated at 4.83,

emphasizes the significance of utilizing diverse teaching aids to enhance lesson delivery. Well-prepared instructional materials cater to various learning styles and can increase student engagement and understanding. In physical education, where visual demonstration is key, the use of such materials is particularly beneficial (SHAPE America, 2018).

The ability to *"Check systematically the classroom activities indicated in the prepared lesson plan"*, with a rating of 4.80, reflects meticulous adherence to planned instructional activities. Systematic monitoring ensures that lessons proceed as intended and learning objectives are met. This practice is essential in physical education, where activities must be organized and aligned with educational goals (SHAPE America, 2018).

The competency *"Conveys openness and warmth that encourage learners to interact with one another"*, rated at 4.78, underscores the importance of fostering a positive classroom climate. A supportive environment encourages student interaction, collaboration, and a sense of community, which are vital for effective learning in physical education settings (SHAPE America, 2018).

The rating of 4.75 for *"Acts proactively, bringing attention to possible areas of learners' misconceptions"* highlights the interns' attentiveness to student understanding. Proactive identification and correction of misconceptions are crucial for effective learning, ensuring that students build accurate knowledge and skills (SHAPE America, 2018).

The competency *"Observes time management"*, with a rating of 4.59, while still outstanding, indicates a relative area for improvement. Effective time management is essential in physical education to maximize active learning time and ensure that all planned activities are conducted efficiently (SHAPE America, 2018).

Overall, these findings demonstrate that the student-teachers exhibit exceptional classroom management skills during instruction, effectively utilizing instructional materials, maintaining discipline, fostering positive interactions, addressing misconceptions, and managing time. These competencies are crucial for creating an environment conducive to learning and are particularly significant in the context of physical education.

Table 7
Assessment of the Effectiveness Performance of Student-Teachers in Terms of Classroom Management – After

Areas	Weighted Mean	Verbal Interpretation
Utilizes various forms of formative, self-assessment tools, and other data to determine student's instructional outcome success and academic growth		Outstanding
Recognizes learner's differences through the provision of activities for: · remediation · reinforcement · enhancement		Outstanding
General Weighted Mean	**4.75**	**Outstanding**

Table 7 shows the assessment of student-teacher classroom management after instruction reflects an outstanding performance, with both evaluated competencies receiving a weighted mean of 4.75. This indicates the interns' effectiveness in utilizing formative assessments and recognizing learner differences to enhance instructional outcomes.

Utilization of Formative and Self-Assessment Tools – The competency *"Utilizes various forms of formative, self-assessment tools, and other data to determine student's instructional outcome success and academic growth"* underscores the importance of continuous assessment in the learning process. Formative assessments, conducted during instruction, allow educators to monitor student progress, provide timely feedback, and adjust teaching strategies to meet learners' needs. In physical education, these assessments can include peer reviews, self-assessments, and observational checklists, which help students develop self-awareness and accountability in their learning journey. According to SupportREALteachers.org (n.d.), formative assessments are essential for evaluating program effectiveness and determining whether students are meeting learning objectives.

Recognition of Learner Differences through Differentiated Activities – The competency *"Recognizes learners' differences through the provision of activities for remediation, reinforcement, and enhancement"* highlights the significance of differentiated instruction in accommodating diverse student needs. Differentiation involves tailoring teaching methods and activities to address varying abilities, learning styles, and interests, ensuring that all students have equitable access to learning opportunities. In physical education, this approach may involve modifying tasks, offering varied equipment, or providing alternative activities to cater to individual skill levels. The PE Project (n.d.) emphasizes that differentiation is crucial for meeting the needs of all learners in physical education, promoting inclusivity, and maximizing each student's potential.

Implications for Physical Education – Implementing formative assessments and differentiated instruction in physical education fosters a supportive and effective learning environment. These strategies enable educators to identify and address individual student needs, promote active engagement, and facilitate skill development. By employing various assessment tools and recognizing learner differences, student-teachers can enhance instructional outcomes and contribute to students' overall academic growth and physical literacy.

In conclusion, the outstanding performance of student-teachers in utilizing formative assessments and recognizing learner differences reflects their commitment to effective teaching practices. These competencies are vital in creating inclusive and responsive physical education programs that cater to the diverse needs of all learners.

Table 8
Overall Result of Assessment of the Effectiveness of Student-Teachers

Areas	Weighted Mean	Verbal Interpretation
Teacher's Personality	4.82	Outstanding
Lesson Planning	4.91	Outstanding
Mastery of the Subject Matter	4.72	Outstanding
Teaching Methods	4.66	Outstanding
Classroom Management – Before	4.80	Outstanding

Classroom Management – During	4.77	Outstanding
Classroom Management – After	4.75	Outstanding
General Weighted Mean	**4.77**	**Outstanding**

Table 8 reveals the overall assessment of the ST Performance, which has demonstrated an outstanding level of effectiveness across various domains of teaching performance. With a **General Weighted Mean of 4.77**, the evaluation reflects strong competencies in critical teaching areas such as teachers' personality, lesson planning, subject mastery, teaching methods, and classroom management. These findings align with existing research that highlights the essential qualities of effective teachers.

The **teacher's personality**, with a weighted mean of **4.82**, plays an important role in fostering a positive learning environment. Research by Darling-Hammond (2000) suggests that effective teachers exhibit enthusiasm, confidence, and empathy, which contribute to stronger student engagement and motivation. The high rating in this category indicates that student-teachers demonstrate professional and approachable behavior, which positively impacts classroom dynamics. Similarly, **lesson planning**, which received the highest rating of **4.91**, is a fundamental aspect of effective teaching. Marzano (2007) emphasizes that well-structured lesson plans ensure clear learning objectives, appropriate instructional materials, and engaging activities. This outstanding performance suggests that student-teachers are well-prepared in designing lessons that cater to diverse learning needs.

Another key aspect of teacher effectiveness is **mastery of the subject matter**, which scored **4.72**. According to Shulman (1987), teachers must possess deep content knowledge to provide accurate explanations and meaningful learning experiences. The high rating in this area implies that student-teachers have a strong command of their subjects, allowing them to facilitate discussions effectively and address student inquiries with confidence. Additionally, their ability to employ diverse **teaching methods**, rated at **4.66**, suggests that they are successfully implementing instructional strategies that accommodate different learning styles. Hattie (2009) found that active learning, differentiated instruction, and technology integration significantly enhance student engagement, reinforcing the effectiveness of the student-teachers approach.

Classroom management, a critical component of teaching effectiveness, received consistently high ratings across all phases—**before (4.80), during (4.77), and after (4.75) instruction**. Studies by Wang et al. (1993) highlight that well-managed classrooms contribute directly to student achievement by ensuring a structured, supportive, and disciplined learning environment. These ratings suggest that student-teachers are adept at maintaining order, managing student behavior, and implementing smooth transitions between activities.

Overall, the outstanding ratings in all domains indicate a high level of preparedness and competence among student-teachers. Their strong lesson planning, subject knowledge, engaging teaching methods, and effective classroom management strategies reflect their potential to become highly effective educators. These findings emphasize the importance of teacher preparation programs in shaping skilled professionals. Moving forward, continuous professional development, mentoring, and reflective teaching practices will further enhance their teaching effectiveness and ensure sustained success in the classroom.

Conclusions

The assessment results indicate that student-teachers have demonstrated an **outstanding** level of effectiveness across all key areas of teaching performance. Their strong competencies in **lesson planning, mastery of the subject matter, teaching methods, classroom management, and professional demeanor** reflect their readiness to enter the teaching profession with confidence. The consistently high ratings highlight their ability to plan and deliver well-structured lessons, engage students effectively, and maintain a conducive learning environment.

These findings align with existing research, which emphasizes the importance of **teacher preparation programs** in developing skilled and competent educators. The student-teacher's exceptional performance suggests that they are well-equipped with the necessary knowledge, strategies, and professional attributes to positively impact student learning. Moving forward, continuous professional development, mentorship, and reflective practice will be essential in sustaining and enhancing their effectiveness as future educators.

Tasbih Huruf: Improving Islamic Education Achievement Among *Jawi* Remedial Pupils in Rural Areas

Nazirah Binti Jabri, Sekolah Kebangsaan Bekenu, Malaysia

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This action research was conducted to improve the academic achievement of pupils in the *Jawi* remedial programme, which is a component of the Islamic Education subject. The intervention involved the application of the "Tasbih Huruf" method. A total of 20 Level 1 pupils from one of the rural primary schools, Subis, Sarawak, Malaysia was selected as the target group for this study. A preliminary survey using the *Jawi* Diagnostic Test served as the basis for the initial findings. The pupils who failed appeared confused when given the test. In order to better analyze the particular learning challenges these pupils were experiencing, the teacher regrouped them into smaller learning groups. The primary problem found was the pupils' incapacity to commit the *Jawi* single letters to memory, which in turn impacted their capacity to write and construct *Jawi* script. The *Tasbih Huruf* method was introduced by the teacher to assist pupils in learning and mastering these letters, and this was the main focus of the intervention. The goal of this tactic was to significantly improve their *Jawi* writing abilities. Additionally, the project involved working with teachers who served as facilitators, which enhanced the validity and credibility of the research process. Within the allotted time, the pupils' post-test performance significantly improved following the implementation of the intervention. Pupils' motivation and engagement were successfully raised by the *Tasbih Huruf* method, which also improved their recognition and memorization of the *Jawi* single letters.

Introduction

According to Fatah Yasin, Raudlotul Firdaus and Jani, Mohd. Shah (2013), Pendidikan Islam in primary level includes the following subject matters in its syllabus: Asas "Ulum Syar"iyah (The foundation of Shari'ah Knowledge) which includes aqidah (Islamic belief), ibadah (prostration), sirah (Prophetic history). Adab and akhlak which include adab in daily life, towards parent and family, dealing with society, seeking knowledge, dealing with the Qur'an and Jawi Script. This study focuses on the *Jawi* domain, particularly among pupils in one of the rural primary schools in Subis District, Miri, Sarawak. It has an enrolment of 250 pupils and 45 staff members and is recognized for its strong academic and co-curricular achievements.

Kolej Yayasan UEM Research Institute stated that, Socioeconomic status (SES) is defined as a way to describe an individual according to their education, income and type of job, while tertiary education is an education after secondary education that includes college and university. In Malaysia, the SES of individuals of a family is classified into three different income groups, which are B40, M40 and T20. B40 refers to the bottom 40% of income earners; M40 is the middle 40%, and T20 is the top 20%. In contrast, pupils from higher-income families typically receive additional learning support. Consequently forming a huge gap in *Jawi* literacy skills, particularly in *Jawi* writing among the pupils.

Early childhood Jawi literacy studies hold important value because they influence a range of aspects including identity growth and religious knowledge retention and cultural tradition preservation. The ongoing impact of globalization and digitalization threatens to disconnect younger generations from their historical script which separates them from their cultural roots (Ghazali et al., 2025).

Early diagnostic assessments revealed that 20 pupils, particularly in lower primary, were unable to recognize and sequence *Jawi* letters accurately. Islamic Education teachers (GPI) identified this issue as the main barrier in learning thus committed to address it through the targeted intervention.

In response, this study introduced the *Tasbih Huruf* method, a simplified teaching approach tailored to pupils' learning levels regardless of the background. Following the approval from school leadership, the method was adopted as the best practice among the GPI teachers to enhance *Jawi* literacy mastery.

Focus of the Study

The purpose of this action research is to address pupils' learning gaps in *Jawi* writing, with specific focus on recognizing and memorizing single *Jawi* letters from *alif* to *ya*, as taught during Level 1 Islamic Education lessons.

The objective of this action research is:

- To enhance pupils' ability to recognize and memorize single *Jawi* letters.

The research question of this study is:

- How does the *Tasbih Huruf* method support pupils in improving their ability to recognize and memorize single *Jawi* letters?

Literature Review

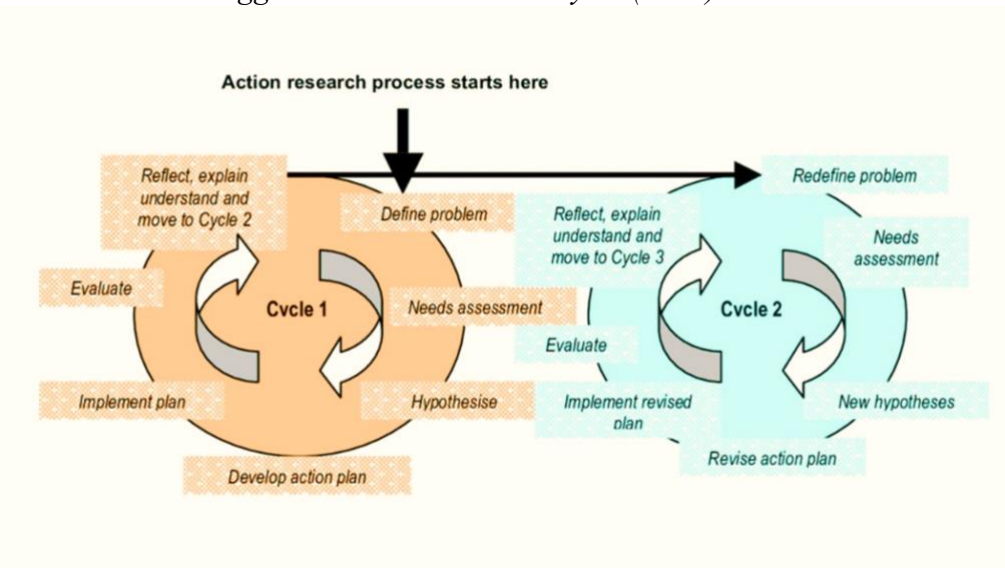
The mastery of the Jawi script remains a persistent challenge among Malaysian school pupils despite its long-standing inclusion in the national curriculum. Previous studies have consistently highlighted weaknesses in students' reading and writing skills, suggesting that existing instructional practices may be insufficient to address learners' needs. This section critically reviews relevant literature to identify gaps that justify the present study.

Ab Rahman (2020) examined secondary school students' mastery of Jawi reading and writing using a survey-based design. The study revealed that students demonstrated low confidence and limited proficiency in recognising Jawi letters and constructing words accurately. While the study effectively highlighted students' perceptions and general proficiency levels, its reliance on self-reported data limited deeper insight into specific learning difficulties. Nevertheless, Ab Rahman's findings strongly suggest the need for more innovative and learner-centred pedagogical approaches, as traditional memorisation-based methods were found to be ineffective in improving sustained mastery of Jawi.

Focusing more specifically on foundational skills, Azman (2021) investigated the effectiveness of an intervention aimed at improving students' recognition of single Jawi letters. The study demonstrated that targeted and systematic instruction significantly enhanced students' letter recognition skills. Unlike broader survey studies, this research provided empirical evidence that mastery of basic Jawi letters is a prerequisite for successful reading and writing. However, the study was limited to letter recognition and did not extensively explore how these gains translated into improved word construction or writing fluency. Despite this limitation, the study is highly relevant as it underscores the importance of strengthening foundational skills through focused interventions.

The Primary school students face significant hurdles in mastering the critical skill of connecting Jawi letters to form words. This difficulty is a substantial obstacle that impedes their ability to learn Jawi effectively. Moreover, the observed lack of enthusiasm and motivation towards Jawi writing can negatively impact their broader educational experience. It is essential to address these challenges promptly. Innovative methods and engaging teaching strategies are needed to inspire and encourage students to improve their Jawi writing skills. Such efforts will not only enhance their cultural literacy but also contribute positively to their overall academic development (Abdul Malik et al., 2024).

In contrast to studies focusing on students, Tajuddin and Zulkifli (2024) explored the level of Jawi content knowledge among Islamic Education Teachers (IETs). Their findings revealed that teachers possessed a high level of content knowledge, suggesting that students' low mastery of Jawi is unlikely to stem from teachers' lack of subject knowledge. This shifts the focus towards instructional strategies, teaching methods, and the effectiveness of teaching materials. However, the study did not examine actual classroom practices, leaving unanswered questions about how teacher knowledge is translated into instructional delivery.



In summary, the literature indicates that students' difficulties in mastering Jawi are not due to a single factor but are influenced by weaknesses in foundational skills, limited instructional innovation, and insufficient reinforcement strategies. While previous studies have identified key issues related to student proficiency and teacher knowledge, there remains a lack of empirical research on targeted classroom interventions that address basic Jawi skills in a structured manner. Therefore, the present study seeks to fill this gap by implementing and

evaluating an instructional intervention aimed at improving students' foundational mastery of the Jawi script.

Research Methodology

This study adapted an action research design using the Action Research Model developed by Kemmis and McTaggart's Cyclical Action Research Model (Kemmis & McTaggart, 1988). The model operates in a cyclical process consisting of four phases: reflecting, planning, acting, and observing.

Figure 1
Kemmis and McTaggart's Action Research Cycle (1988)

In the reflection phase, the researcher identified pupils' weaknesses in recognizing single *Jawi* letters, which highlighted the need for a structured intervention. During the planning phase, the *Tasbih Huruf* approach was designed as an instructional strategy to address this issue. The action phase involved implementing the intervention in Level 1 Islamic Education lessons in one of the Subis rural primary schools. Finally, in the observation phase, the researcher monitored pupils' progress and documented the outcomes to evaluate the effectiveness of the intervention and to inform subsequent cycles of improvement.

Before entering the first cycle, the researcher must identify the focus of the study, namely the issue or problem to be investigated. In the educational context, the researcher is required to identify what is the most obvious problem that occur during the lesson after reflecting on their own instructional practices in the classroom.

To identify the issue or problem, attention must be given to the following three aspects:

1. What is currently happening?
2. How does the issue, problem, or situation arise?
3. What actions can I take?

The planning stage requires the formulation of improvement measures to guide subsequent actions after the research focus has been identified. Kemmis and McTaggart (1988) suggested several key steps to be undertaken, namely:

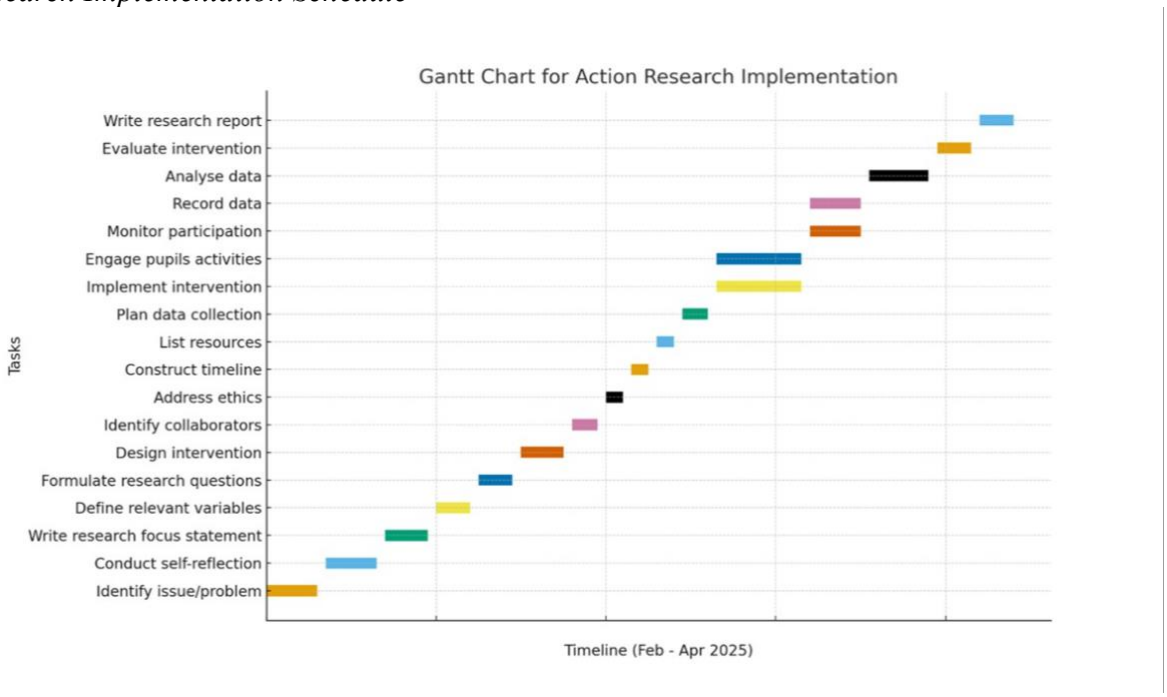
- Writing a clear statement of the research focus.

- Defining the related variables.
- Formulating the research questions.
- Explaining the proposed intervention or innovation.
- Identifying the research collaborators involved.
- Outlining the procedures to be implemented.
- Developing a research timeline.
- Stating the resources that can and will be utilized.
- Presenting ideas for data collection.

Accordingly, the researcher adapted the Kemmis and McTaggart (1988) model as the primary reference framework for conducting this action research.

Problem Statement

The mastery of Jawi script among primary school pupils in rural areas remains low and continues to be a major concern. Observations conducted by Islamic Education teachers at Sekolah Kebangsaan Bekenu revealed that many lower primary pupils, particularly those in the remedial group, still struggle to recognize and write individual Jawi letters accurately. This weakness hinders their ability to read and comprehend Jawi words, thereby affecting their overall achievement in the Islamic Education subject.



Several factors contribute to this issue. The predominant use of traditional teaching methods, such as rote memorization and flashcards, has proven insufficient in engaging pupils or supporting their long-term retention of Jawi letters. Moreover, the lack of attractive and suitable teaching aids that cater to pupils' diverse learning abilities further limits the effectiveness of classroom instruction.

As a result, pupils often lose interest, experience low motivation, and find it difficult to stay focused during Jawi lessons. This situation negatively impacts their foundational literacy skills, confidence, and overall participation in Islamic Education learning activities. The persistent gap in Jawi literacy among rural pupils highlights the urgent need for an innovative and child-friendly approach that promotes active learning and meaningful engagement.

Therefore, this study introduces the "Tasbih Huruf" method as an innovative intervention designed to assist pupils in recognizing and memorizing Jawi letters through a structured and interactive approach. The method integrates the use of prayer beads (tasbih) and a systematic learning module to enhance tactile and visual learning experiences. It is anticipated that this intervention will increase pupils' interest, attention, and mastery of Jawi letters, ultimately improving their academic performance and strengthening the quality of Islamic Education teaching in rural schools.

Planning

Figure 2
Research Implementation Schedule

Observation Findings From Islamic Education Panel Teachers (GPI)

Prior to the implementation of this study, several recurring issues were identified based on feedback from the Islamic Education Panel Teachers (GPI). A key concern highlighted was the persistent weakness among lower primary pupils in recognizing and memorizing single *Jawi* letters. This issue has been observed annually and significantly affects pupils' overall performance in *Jawi* writing.

To obtain a more comprehensive understanding, the researcher collaborated with the GPI to conduct detailed observations of pupils experiencing such difficulties. The findings revealed that a number of pupils consistently underperformed in *Jawi* assessments, particularly in recognizing and memorizing the individual letters.

For the purpose of this study, a small group of pupils was identified as the target group. The primary issue observed was their inability to recognize and memorize the basic *Jawi* letters, which consequently hindered their mastery of *Jawi* writing skills. This fundamental limitation underscores the necessity for a systematic intervention to strengthen pupils' *Jawi* basic literacy skills.

Jawi Diagnostic Test Data

A diagnostic test on single *Jawi* letters was administered to 20 pupils as the first screening. The test consisted of 10 questions at both basic and intermediate levels. The assessment was conducted over one hour, during which pupils' behaviours were also observed.

Based on the teacher's observations, pupils were unable to accurately arrange single *Jawi* letters and demonstrated difficulties in writing them correctly. Furthermore, many pupils frequently looked at one another's work and displayed signs of boredom, waiting passively for the test to end.

Figure 3
Diagnostic Test on Single Jawi Letters

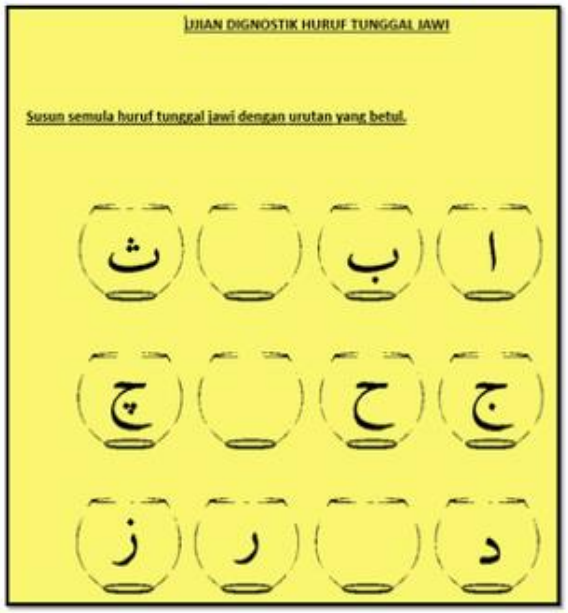


Figure 4
Implementation of the Jawi

Diagnostic Test

Intervention

The study implemented the *Tasbih Huruf* method, an intervention agreed upon by all Islamic Education teachers (GPI) to address pupils' difficulties in recognizing and memorizing individual *Jawi* letters. This method employed a systematic arrangement of 37 letters using a structured module and prayer beads (*tasbih*), enabling pupils to recall letter sequences more effectively. Teachers also jumbled letter arrangements to reinforce recognition skills.

Repeated practice strengthened pupils' memory and recognition of *Jawi* letters, consistent with Skinner's Operant Conditioning Theory (1965), which highlights the role of reinforcement in shaping behaviour. In addition, the intervention incorporated principles of Constructivist

Learning Theory, allowing pupils to actively engage, explore, and construct knowledge through interaction with learning materials.

Figure 5
Jawi Single Letter Module

Implementation Steps of the *Tasbih Huruf* Method:

1. Pupils are provided with 37 beads (tasbih).
2. Pupils refer to the *Jawi* Single Letter Module.
3. Pupils write the *Jawi* single letters in the correct sequence.
4. The teacher demonstrates the correct method of arranging the *Jawi* single letters.
5. Pupils are given a string to rearrange the *Jawi* single letters.
6. Pupils pronounce each *Jawi* single letter one by one and repeat them continuously using a rhythmic *zikir*.

Research Findings

The findings of this study revealed that the *Tasbih Huruf* method founds the most effective strategy that teachers can employ to systematically enhance pupils' proficiency in recognizing and memorizing individual *Jawi* letters. Moreover, teachers are able to implement this method within a well-structured classroom management framework in collaboration with subject panel members. The pupils' achievement is evidenced by the results of the post-test and survey administered.

This approach is highly accessible and affordable for all pupils to practice despite their backgrounds, particularly in mastering single *Jawi* letters. Furthermore, it holds significant relevance as an introductory tool for pupils' subsequent mastering of additional *Jawi* letters.

Figure 9
Comparison of Test Results

Conclusion and Implications

The present action research provides empirical evidence that the *Tasbih Huruf* approach constitutes an effective pedagogical intervention for enhancing teachers' instructional competencies and facilitating pupils' systematic mastery of individual *Jawi* letters. The method promoted active learning, engagement, and motivation among pupils, rendering the acquisition of *Jawi* letters both accessible and enjoyable.

Traditional instructional strategies, primarily flashcard-based methods, proved inadequate for pupils with lower proficiency levels. Through targeted interventions, structured lesson planning, and collaborative discussions among educators, the *Tasbih Huruf* method effectively addressed these learning gaps, resulting in measurable improvements in pupils' outcomes.

The findings underscore the critical importance of aligning instructional strategies with pupils' diverse learning needs and employing both pupil-centred and resource-centred approaches. Optimal lesson planning, time management, and classroom organization emerged as key factors in ensuring the effectiveness of the intervention. Additionally, collaborative teamwork among teachers was instrumental in overcoming pedagogical challenges and sustaining pupils' engagement.

To sum up, this study shows how well-structured and engaging interventions can enhance teaching methods and pupils' learning outcomes. Continuous reflective practice and methodical improvement of teaching techniques to suit changing classroom requirements are necessary for sustained progress. The *Tasbih Huruf* technique offers a flexible and adaptable way to promote *Jawi* literacy, and it may find use in more general educational settings where comparable issues arise.

Abstract

In recent years, the design of learning spaces has increasingly gained traction in school contexts, capturing the attention of scholars, architects, and educational communities. Following a long period of standstill in the condition of school buildings, European countries have undertaken significant efforts to renovate and modernise their school facilities through new policies and design guidelines. At the same time, a major trend in education has emerged: the adoption of eXtended Reality (XR) technologies to support and enhance learning experiences. However, despite the proliferation of research and practical implementations in both fields, physical space design and immersive learning experiences, there remains a lack of an integrated theoretical framework linking the two. Therefore, this study aims at creating a unified theoretical framework to represent and describe how virtual environments supporting learning experiences should be designed, outlining first practical indications on how the various key principles to design physical spaces can be translated into virtual environments. Using thematic analysis, the research examines key international documents and guidelines to identify the core design features and pedagogical principles on both fronts. These are then intertwined through the construction of a correlation matrix that highlights alignments and points of translation between physical and virtual design strategies. While the qualitative findings of this study require further analyses such as ethnographic techniques or quantitative assessments, this work represents a first step towards bridging the fields of educational architecture and immersive learning in that it provides preliminary design guidelines for XR learning environments.

Keywords: school design, immersive learning environments, XR

iafor

Introduction

For much of the twentieth century, the spatial configuration of classrooms remained largely unchanged, continuing to reproduce standardised layouts that reflected a transmissive model of education. Only recently has this long-standing condition begun to shift. The design of educational spaces has garnered renewed attention in discussions on 21st-century education, emerging as a central concern for scholars, designers, educators, and school communities. Across Europe, this renewed focus has translated into extensive renovation initiatives, supported by new policies and design frameworks aimed at improving the quality and performance of school buildings. Concurrently, educational practices are being reshaped by the increasing adoption of eXtended Reality (XR) technologies. These technologies introduce immersive digital environments that allow learners to engage with content in ways that extend beyond the limits of the physical classroom, whether by navigating historical settings, interacting with abstract scientific phenomena, or collaborating within shared virtual spaces. In doing so, XR expands the spatial and experiential dimensions of learning and challenges traditional assumptions about where educational activities can take place.

Although both developments seek to redefine learning environments, they have largely evolved independently rather than in dialogue. On the one hand, the redesign of physical school spaces has mainly concentrated on the material qualities of space, such as spatial organisation, comfort, safety, and functional programming. On the other hand, the development of immersive learning environments has been driven by a focus on experience, prioritising immersion, interaction, and the feeling of presence within digital worlds. As a result, the physical and virtual dimensions of learning environments are often treated as separate domains, despite their overlapping educational goals. This separation, therefore, reveals a deeper issue: the absence of a shared conceptual framework capable of linking the principles that shape physical learning spaces with those that inform the design of immersive digital ones. Without a common language to connect these domains, both research and practice remain fragmented, making it difficult to develop integrated learning environments that fully respond to contemporary pedagogical needs across physical and virtual contexts.

This paper contributes to this integration by examining influential European policies and guidelines for school design alongside international recommendations for immersive learning environments. Through a thematic analysis, it identifies key pedagogical and spatial principles present in both domains and brings them into relation through a correlation matrix. By revealing alignments and tensions between design criteria for physical and virtual spaces, the matrix provides a tool for bridging these parallel discourses and for informing future approaches to learning environment design that span material and digital realms.

Methodology

To investigate how learning spaces, both physical and virtual, are currently being reimagined and to identify emerging design features across these domains, this study adopted a qualitative document-based methodology. The analysis drew on a targeted selection of policy documents, guidelines, and reports widely recognised as influential within the design of educational spaces and immersive learning environments.

Two complementary bodies of literature were examined: documents addressing the design of physical educational spaces and those focusing on the design of XR-based learning environments. For the design of physical learning spaces, seven key documents were

selected. Four reflect recent Italian design directions and policy frameworks: the latest *Legambiente Report* (2024), the *1+4 Learning Areas Manifesto* developed by INDIRE (2016), *Piano Scuola 4.0* (Futura PNRR, 2022a), and the *Futura* design guidelines (Futura PNRR, 2022b). To situate these national perspectives within a broader European context, three additional documents were included: the *OECD Handbook for Innovative Learning Environments* (OECD, 2017), *Spazi educativi e architetture scolastiche* (Borri, 2016), and *The Classroom Has Broken* (Borri, 2018). Although the latter two were produced by the Italian research institute INDIRE, they explicitly integrate international case studies and perspectives from several European countries, including Finland, Germany, and Sweden. With respect to XR learning environments, the selection revealed a more limited body of design-oriented literature. Three documents were identified that explicitly address the design of virtual learning spaces, rather than focusing solely on learning experiences or instructional strategies: *Designing Effective VR Learning Environments: Immersive Strategies and Methods* (Pradhan & Mantry, 2025), *The Immersive Classroom: Create Customized Learning Experiences with AR/VR* (Donally, 2022), and *Virtual Reality in Education: Designing Immersive and Innovative Learning Experiences* (Sulisworo et al., 2023).

All selected documents were reviewed and analysed using Thematic Analysis, a qualitative method that supports the identification, interpretation, and reporting of recurring patterns within textual data (Braun & Clarke, 2006). The analysis was applied consistently across both sets of documents to extrapolate the main pedagogical and spatial principles, and it involved a systematic coding process in which relevant excerpts were assigned to conceptual categories capturing key design principles and criteria (Vaismoradi & Snelgrove, 2019). These thematic categories were then synthesised into a unified framework intended to support the design and development of immersive learning environments informed by spatial design knowledge.

Subsequently, to examine relationships among the identified codes and themes, correlation matrices were generated using MAXQDA, a software for qualitative and mixed-methods data analysis. These matrices visualised code co-occurrences, enabling a deeper exploration of how different design concepts and features related to one another within and across the two domains. As a final step, an overarching correlation matrix was constructed to integrate all themes emerging from the analysis. This comprehensive matrix mapped points of contact between physical and virtual learning environments, highlighting areas where architectural and pedagogical design concerns intersected with the affordances and constraints of immersive technologies. In doing so, it made visible shared design features and provided a structured basis for bridging the design of physical and virtual learning spaces.

Results and Discussion

Thematic Analysis Results

The thematic analysis revealed distinct yet complementary sets of design principles for physical learning spaces and immersive XR learning environments. While the two domains were articulated through different vocabularies and priorities, the results highlighted meaningful points of convergence as well as structural gaps that help explain their parallel development.

Concerning physical learning environments, the analysis identified five core themes: "Building quality", "Sustainability", "Pedagogical Design of Spaces", "Inclusion", and "Community", each capturing a critical dimension of contemporary school design.

The first theme, "*Building Quality",* refers to the importance of ensuring high-quality built environments, which depend on several interrelated aspects. A first dimension is represented by *Spatial organization* (n = 17), highlighting the need to carefully consider the size, proportions, and distribution of spaces (*Size and distribution*) to support flexible management of learning activities, while also maintaining strong connections with other school areas, both indoor and outdoor (*Flexible and interconnected spaces*). Alongside spatial organisation, the analysis shows that attention should also be paid to *Aesthetic quality* (n = 3), which contributes to creating a relaxed and stimulating environment for students and simultaneously functions as a behavioural reference. In addition, *Comfort and safety* (n = 17) emerged as a key concern, encompassing aspects such as appropriate lighting, thermal comfort, air quality, acoustics, and the provision of adequate safety measures. The documents further underline the importance of integrating the school building into its urban or natural context (*Integrating the school into the context*, n = 3) and of providing outdoor spaces, which are considered essential for informal learning and students' well-being (*Give importance to outdoor spaces*, n = 6). Finally, in response to the ongoing digital transition, school spaces are expected to accommodate technological infrastructure capable of supporting new teaching modalities (*Integrating spaces with technology*, n = 16). The second theme, "Sustainability"*,* relates to the construction of more environmentally responsible school buildings. This involves not only the use of sustainable materials and building techniques (*Sustainable materials and building techniques*, n = 3) and low-tech solutions (*Low-tech solutions*, n = 5), but also the enhancement of natural light (*Natural light*, n = 2) and a more conscious use of energy through energy-efficient systems (*Energy efficiency*, n = 5) and renewable energy sources (*Renewable energy sources*, n = 3). Another prominent theme identified in the documents is "Inclusion". In this respect, school buildings are expected to support diverse abilities and learning styles in order to guarantee an inclusive and equitable learning environment for all students (*Supporting learning for all*, n = 13). In addition, all classrooms and school areas should be fully accessible, ensuring that no student is excluded from participation (*Accessibility for all*, n = 7).

These themes are closely connected to the broader concept of "Pedagogical Design of Spaces"*,* which emerges through a strong focus on the needs of both students and teachers. From the students' perspective, the theme *Supporting students* (n = 40) highlights the importance of providing a variety of educational spaces capable of accommodating different needs, such as movement, rest, collaboration, or privacy, while also enabling personalised learning experiences and supporting the development of multiple skills. Achieving this requires a shift in perspective, placing students at the centre of educational design and, consequently, redefining the spaces in which innovative teaching methodologies take place. From the teachers' perspective, the analysis emphasises the importance of *Valuing pedagogical leadership* (n = 18). This includes the provision of appropriate and welcoming spaces for teachers, recognition of the role of teaching design and classroom allocation, and the promotion of interdisciplinary collaboration between educators and designers. More broadly, educational architecture should support active and collaborative learning approaches while contributing to the learning and well-being of the entire school community (*Supporting learning and well-being of the school community*, n = 47). Finally, the theme "Community" emphasises the role of the school as more than a place for formal instruction. The school building is conceived as a social environment capable of transmitting shared values through

an “implicit pedagogy” (*The school as a social place to promote an implicit pedagogy*, n = 5). As such, school design should foster meaningful social interactions both within the building (*The school as a place to foster social interaction*, n = 13) and beyond it, encouraging the involvement of students, teachers, families, and the wider non-school community (*Involvement of school and non-school community*, n = 6).

With regard to immersive learning environments, the thematic analysis identified two main themes: *XR Pedagogical Aspects* and *XR Technical Aspects*.

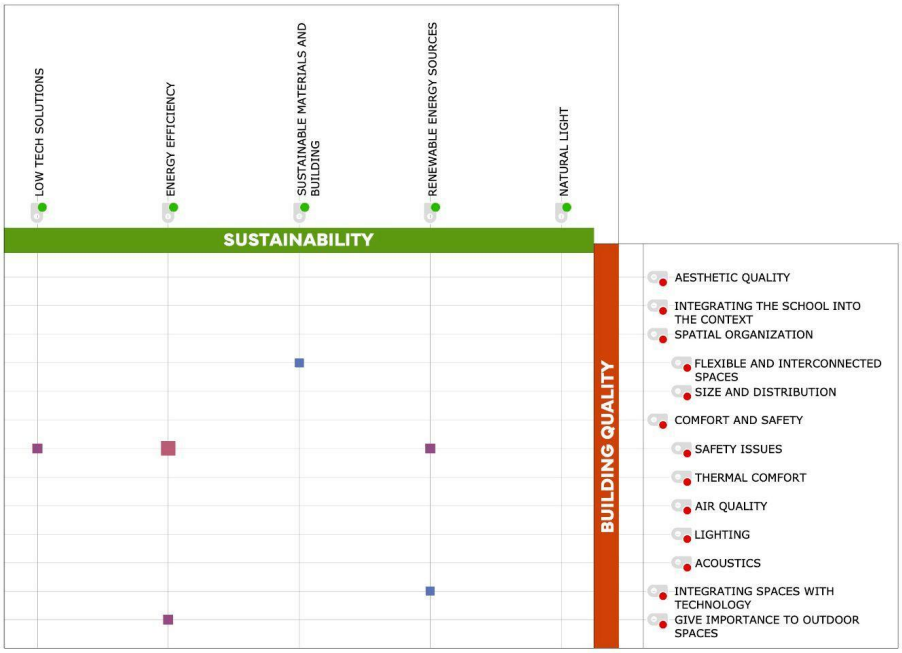
The first theme concerns the educational potential of VR and AR technologies, both in terms of learning activity design and alignment with virtual environments. According to the documents, XR technologies can increase the level of challenge for students, for example, through the use of gamification strategies (*Challenging students*, n = 3), while also enabling flexible lesson designs that can be adapted to different learners (*Lesson flexibility*, n = 4). The possibility of customising virtual environments, whether realistic, abstract, or imaginary, also emerged as a relevant factor in addressing students’ needs and learning goals (*Environment customisation*, n = 2). Moreover, immersive environments can enrich learning experiences by allowing students to explore complex or abstract concepts and to access environments that would otherwise be difficult or impossible to visit (*Immersive environments can enrich learning experiences*, n = 5). XR technologies are also associated with increased accessibility, particularly in relation to mobility and interaction, through the use of alternative input methods and personalisation options (*Immersive environments offer inclusivity and accessibility*, n = 4).

The second theme, *XR Technical Aspects*, encompasses the features that contribute to user experience design. *Immersion* (n = 7) refers to the extent to which users feel cognitively and emotionally involved in the virtual environment, while *Presence* (n = 2) relates to the sensation of being physically located within it. These experiences are supported by *Usability* (n = 2), which involves intuitive interfaces and smooth navigation, and by *Realism* (n = 4), referring to visual fidelity and environmental authenticity. The most frequently cited components within this theme are *Interaction* (n = 15) and *Engagement* (n = 14). Interaction enables users to meaningfully manipulate virtual objects and environments, whereas engagement supports sustained interest and active participation through strategies such as gamification, storytelling, and interactive challenges.

From Themes to Matrices to Guide the Design

Following the thematic analysis, five themes emerged that describe the key aspects to be considered in the design of physical learning spaces, alongside two themes addressing the main dimensions relevant to the design of immersive virtual learning environments. Each theme was articulated through a set of related codes. Building on these results, three main groups of correlations were identified and represented through three distinct matrices: (1) the relationship between building quality and sustainability; (2) the pedagogical design of spaces in relation to building quality, inclusion, and community; and (3) the pedagogical aspects of XR in relation to the technical aspects of XR.

Each matrix illustrates the co-occurrence of codes, enabling a more in-depth exploration of the connections and patterns linking different design concepts and features. In this sense, the matrices function as conceptual maps that make visible the intersections between pedagogy, architecture, and XR technologies, highlighting how these domains interact and overlap. The



intersections are represented by squares of varying sizes, indicating the frequency with which two codes appear together within the same text segment, with larger squares corresponding to stronger associations.

Matrix 1. Building Quality – Sustainability

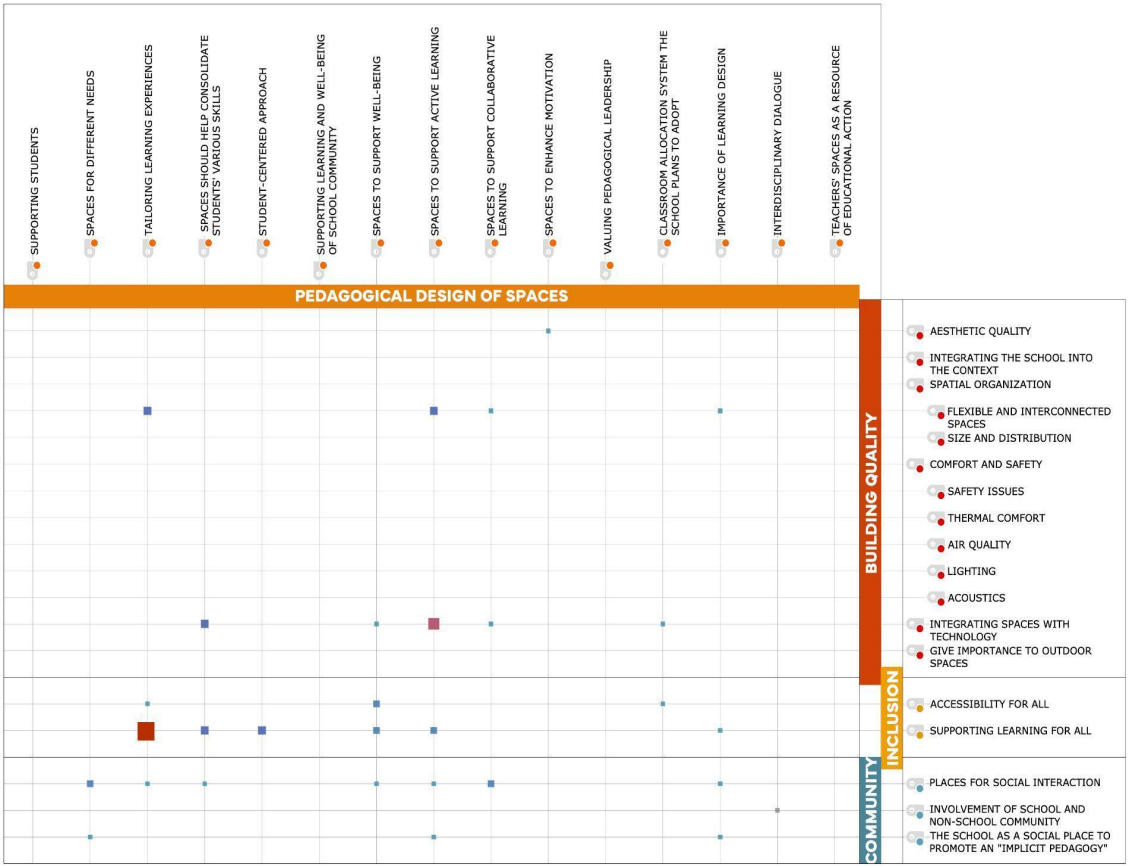
The first matrix focuses on the interaction between the themes of "Building quality" and "Sustainability", highlighting the extent to which architectural design considerations are aligned with environmental concerns (**Figure 1**).

Figure 1

Matrix 1 (Relationship Between "Building Quality" and "Sustainability")

Note. Authors' elaboration

The most prominent relationship emerges between *Safety issues* and *Energy efficiency*. This strong association indicates that ensuring a safe school environment also entails minimising resource consumption and promoting responsible energy use, suggesting that safety and efficiency are understood as mutually reinforcing aspects of building quality. Indeed, *Safety issues* are also linked to both *Low-tech solutions* and *Renewable energy sources*, pointing to a conception of safety that, incorporating long-term robustness and resilience, is not limited to present conditions but is also oriented toward safeguarding future well-being. Another relevant association is observed between *Energy efficiency* and *Giving importance to outdoor spaces*. This relationship reflects a vision of sustainability in which energy performance is not restricted to building systems but is also influenced by spatial design choices. Outdoor spaces can support passive environmental strategies, reduce dependence on artificial lighting and ventilation, and encourage healthier daily practices.



Matrix 2. Pedagogical Design of Spaces - Building Quality, Inclusion, and Community

The second matrix examines how "Pedagogical design of spaces" intersects with the themes of "Building quality", "Inclusion", and "Community", conveying more than the other

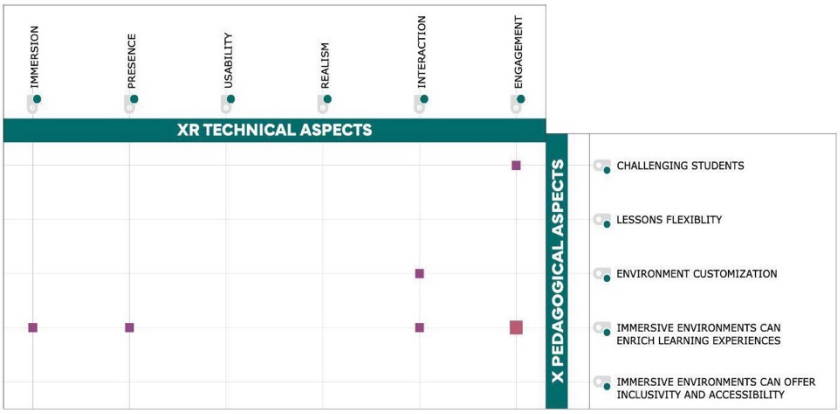
matrices an understanding of the school environment as an active component of the educational process, capable of shaping learning practices and social relations (**Figure 2**).

Figure 2

Matrix 2 (Connection of "Pedagogical Design of Spaces" With "Building Quality", "Inclusion", and "Community")

Note. Authors' elaboration

Within the area of "*Building quality"*, the strongest relationships involve *Spaces to support active learning* and *Integrating spaces with technologies.* This pattern suggests that architectural quality is closely linked to the ability of spaces to accommodate contemporary pedagogical approaches. Technology integration, in this sense, is not treated as an add-on but as an integral feature that enables active and participatory learning. A similar interpretation is supported by the association between *Integrating spaces with technologies* and *Spaces should help consolidate students' various skills*, indicating that school buildings are conceived as infrastructures that facilitate the development of transversal competencies. Furthermore, the connections between *Flexible and interconnected spaces* and both *Tailoring learning experiences* and *Spaces to support active learning* emphasise the importance of spatial adaptability in supporting student-centred pedagogies. Strong relationships also emerge in relation to "Inclusion". The most pronounced association links *Tailoring learning experiences* with *Supporting learning for all*, underscoring the idea that personalisation is a key mechanism for achieving inclusive education. *Supporting learning for all* is also connected to *Spaces should help consolidate students' various skills* and to a *Student-centred approach*, suggesting that inclusion is understood not only in physical terms but also as the capacity of spaces to support diverse learning pathways. Additionally, though less prominent, links with *Spaces to support well-being* and *Spaces to support active learning* reinforce the view of inclusion as a multidimensional principle embedded in both spatial and pedagogical



design. The intersection with the theme of "Community" reveals another set of meaningful relationships. In particular, the code *Places for social interaction* is strongly associated with *Spaces for different needs* and *Spaces to support collaborative learning*. These links reflect an understanding of the school as a socially rich environment, where spaces must simultaneously address individual requirements and foster collective engagement. The emphasis on collaboration and interaction points to a conception of the school as a civic space, in which architectural design and pedagogical intentions converge to support participation and a sense of belonging.

Matrix 3. XR Pedagogical Aspects - XR Technical Aspects

The third matrix explores the relationship between *XR pedagogical aspects* and *XR technical aspects*, showing how pedagogical objectives (e.g., enhancing learning experiences, increasing challenge, or adapting environments to learners) are directly connected to technological characteristics (e.g., immersion, presence, interaction, usability, realism, and engagement) (**Figure 3**).

Figure 3

Matrix 3 (Relationship Between "XR pedagogical Aspects" and "XR Technical Aspects").

Note. Authors' elaboration

The most prominent association is observed between *Engagement* and *Immersive environments can enrich learning experiencess*. Rather than being a secondary outcome, engagement appears as the mechanism through which immersive environments support meaningful and memorable learning experiences. The code *Immersive environments can enrich learning experiences* is also strongly linked to *Interaction*, *Presence*, and *Immersion*, suggesting that learning enrichment is conceived as the result of multiple, interrelated processes. Interaction enables learners to actively influence virtual environments; presence contributes to a heightened sense of involvement and authenticity; and immersion provides the sensory depth necessary to sustain attention and emotional engagement. Further associations add nuance to this interpretation. The link between *Challenging students* and *Engagement* indicates that the capacity of XR to stimulate deeper cognitive processes and push learners beyond routine activities depends on sustained motivation and involvement. Likewise, the connection between *Environment customization* and *Interaction* suggests that the pedagogical aim of adapting learning contexts to specific needs relies on the degree of agency and control afforded to users within the virtual environment.

Intersecting Learning Space Design and XR Technologies

The final correlation matrix (**Figure 4**) offers an integrated view of how the design principles associated with physical learning spaces relate to those emerging from immersive virtual learning environments. By bringing together all the themes identified in the analysis, the matrix allows us to observe where the two domains intersect and where they remain distinct, thereby highlighting shared design features as well as structural gaps between physical and virtual learning spaces.

Figure 4

Final Correlation Matrix

Note. Authors' elaboration

What emerges from this overall view is that the themes related to immersive environments, "XR pedagogical aspects" and "XR technical aspects", do not show substantial connections with "Sustainability" or "Community", and display only marginal associations with "Building quality". These dimensions, which play a central role in the design of physical learning spaces, appear to remain largely confined to the material, environmental, and social characteristics of school buildings. In contrast, the points of contact between physical and virtual environments are concentrated primarily around the themes of "Inclusion" and "Pedagogical design of spaces".

With respect to "Inclusion", the strongest relationships in the final matrix link *Supporting learning for all* with *Environment customization* and with *Immersive environments can offer inclusivity and accessibility*. These correlations indicate that immersive technologies are perceived as extending inclusive educational practices by enabling adaptable environments and new forms of access that are not limited by physical constraints. Additionally, though less prominent, connections with *Lesson flexibility* reinforce this interpretation. Similarly, *Accessibility for all* is associated with both *Environment customization* and *Immersive environments can offer inclusivity and accessibility*, suggesting that XR environments support inclusion through the alignment of technical affordances with pedagogical goals.

An even denser set of relationships emerges around the theme of "Pedagogical design of spaces". Within the final matrix, the most prominent association links *Spaces to support active learning* with *Engagement*, indicating a strong convergence between pedagogical intentions rooted in physical space design and XR features that sustain learner involvement. This pedagogical code is also closely connected with *Interaction* and *Immersive environments can enrich learning experiences*, while slightly weaker but still relevant associations appear with *Challenging students*. In addition, *Engagement* shows strong links with a *Student-centred approach* and with *Spaces to enhance motivation*, highlighting how XR's technical characteristics align with pedagogical strategies that prioritise learner agency and motivation. Another important group of connections links *Tailoring learning experiences* with both *Lesson flexibility* and *Environment customization*, reinforcing the role of XR in supporting differentiated and adaptable learning pathways.

Beyond these central clusters, the matrix also reveals a range of weaker but meaningful associations between the pedagogical design of spaces and both XR pedagogical and XR technical aspects. While less pronounced, these connections contribute to the overall pattern emerging from the matrix, suggesting a shared conceptual ground between physical and immersive learning environments.

Overall, the final correlation matrix shows that the most substantial bridges between physical and virtual learning spaces are built around inclusion and pedagogical design. In contrast, sustainability, community, and building quality remain largely disconnected from XR-related themes. These findings suggest that immersive technologies currently extend and amplify educational principles that are already central to the design of physical learning environments, particularly those related to learner-centred pedagogy and inclusion, rather than redefining the broader spectrum of design considerations.

Conclusion

This contribution examines the relationship between two domains that are increasingly central to educational innovation but have often developed in isolation from one another: the

design of physical learning spaces and the creation of immersive digital environments for learning. By considering policy documents, guidelines, and recommendations at both European and international levels, the analysis has made it possible to identify the main principles guiding each domain and to explore how these principles intersect.

The comparison reveals a differentiated pattern of alignment. Elements such as building quality, sustainability, and the role of the school as a community space continue to be primarily associated with the physical learning environment and find little correspondence in current approaches to immersive environments. By contrast, the pedagogical and technical dimensions of XR show strong affinities with inclusive educational aims and with pedagogical strategies that inform the design of learning spaces. Most notably, the recurring links between support for active learning and XR features such as engagement and interaction point to the capacity of immersive technologies to enhance educational practices through adaptable, personalised, and learner-centred experiences.

On the basis of these findings, a preliminary conceptual framework can be outlined, positioning inclusion and pedagogical design as the primary bridges between physical and virtual learning spaces. This framework offers an initial interpretive lens for an emerging and multidisciplinary field, while also serving as a guiding reference for architects, educators, technologists, and school communities engaged in the design of immersive learning environments.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The authors declare that Grammarly, an AI-assisted writing software, was used in proofreading and refining the language used in the manuscript. The usage was limited to correcting grammatical and spelling errors and rephrasing statements for accuracy and clarity. The authors further declare that, apart from Grammarly, no other AI or AI-assisted technologies have been used to generate content in writing the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

The Effect of Passive Voice Writing Checklist on the Writing Task of Mathayom Suksa 4 Students

Jidapa Tararom, Surawiwat School, Suranaree University of Technology, Thailand
Suricha Thanwisai, Surawiwat School, Suranaree University of Technology, Thailand

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This classroom-based research aimed to enhance the writing skills of Grade 10 (Mathayom Suksa 4) students in an intermediate English class at Surawiwat School, Suranaree University of Technology. Initial writing assessments revealed recurring grammar errors, especially in the use of passive voice, despite students' familiarity with basic English grammar. The study hypothesized that integrating peer feedback with a passive voice grammar checklist could improve accuracy in writing. Students engaged in peer review using the checklist over three writing assignments. Results showed an increase in the number of students correctly using passive voice: from 58 students (70.73%) in the first task, to 64 (78.05%) and 71 (86.59%) in subsequent tasks. The mean writing score significantly improved from Task 1 to Task 2 ($p = .001$), though no significant differences were found between later tasks. The findings support the effectiveness of checklist-based peer feedback in improving grammatical accuracy.

Keywords: grammar checklist, passive voice, writing skills

Introduction

English serves as a global language for communication across economics, education, science, and technology (Crystal, 2012). Moreover, the global role of English makes writing skills especially important for students who expect to express ideas clearly and participate in academic communities. In Thailand, the Basic Education Core Curriculum in 2008 emphasizes the importance of strengthening learners' English proficiency prepare them for the challenges and skills required in the 21st century (OBEC, 2008).

Among the four language skills, writing is widely regarded as the most cognitively demanding for English as a foreign language learners, as it requires the simultaneous control of grammatical accuracy, syntactic complexity, lexical selection, and logical organization (Nation, 2009). In the Thai EFL context, students' writing difficulties are further compounded by negative language transfer, particularly due to structural and rhetorical differences between Thai and English which often result in persistent errors and reduced clarity in written task. In other words, writing challenges in Thailand often result from language transfer due to differences between Thai and English structures (Prapaisit de Segovia & Hardison, 2008).

Moreover, long-standing reliance on traditional, grammar-oriented, teacher-centered instructional practices have limited opportunities for meaningful writing practice and learner autonomy. Such approaches tend to emphasize rule memorization over communicative purpose, thereby constraining students' ability to develop fluency and critical thinking in written discourse. In contrast, learner-centered pedagogical approaches that integrate process-based writing, feedback, and authentic communication have been shown to foster greater engagement and improved writing performance (Brown, 2007). Collectively, these factors highlight the need for instructional reforms that address both linguistic and sematic issues.

Based on the principles of Second Language Acquisition (SLA), one of the key theories related to the development of writing skills is Ellis's (2009) concept of corrective feedback, which emphasizes that receiving feedback on errors plays a crucial role in helping learners revise and improve their language use effectively. In particular, the process of peer feedback has been supported by empirical evidence demonstrating its significant contribution to the development of writing skills. Through peer feedback, learners are required to analyze and evaluate their peers' written work, which simultaneously enhances their awareness of their own errors (Lundstrom & Baker, 2009).

From a practical perspective, integrating a grammar checklist with the peer feedback process is considered an effective instructional strategy. This approach provides learners with a concrete tool to systematically monitor grammatical accuracy, such as the appropriate use of the passive voice, and helps reduce recurring errors in their writing (Bitchener & Ferris, 2012).

Given the observed problems among Mathayom Suksa 4 or Grade 10 students at Surawiwat School, Suranaree University of Technology, who frequently demonstrate repeated errors in the use of passive voice structures in their writing and lack the ability to self-correct these errors, this study aims to investigate the effects of using a passive voice grammar checklist in conjunction with peer feedback on students' English writing development. The findings are expected to contribute to the development of instructional strategies that are better aligned with the Thai EFL context and that promote sustainable language learning, and pedagogical challenges in order to enhance EFL learners' writing competence.

Research Objectives

The purpose of this study is to examine the effects of using a passive voice grammar checklist on the development of English Writing skills among Mathayom Suksa 4 or Grade 10 students at Surawiwat School, Suranaree University of Technology. The study aims to address the following research questions:

1. Does peer feedback increase the number of students correctly using passive voice structures?
2. Does peer feedback improve students' overall accuracy in using passive voice?
3. Do peer-assessed scores correlate with teacher-assessed scores of passive voice accuracy?

Literature Review

Second Language Acquisition (SLA) Theory

Learning English as a second or foreign language, particularly in relation to writing skills, is a complex process that requires the development of both grammatical accuracy and effective meaning-making. Among various grammatical structures, the passive voice is frequently perceived by EFL learners as especially challenging due to its structural complexity and its divergence from learners' first languages. For instance, Thai typically favors active voice constructions, which contributes to persistent difficulties when learners attempt to produce passive structures in English. Consequently, insights from Second Language Acquisition (SLA) theory are essential for understanding how learners develop writing competence and acquire complex grammatical forms such as the passive voice. This is particularly relevant when examining the comparative effects of peer feedback and teacher feedback within the writing process.

The Importance of Passive Voice in English Writing

The passive voice plays a significant role in English writing, especially in academic and formal contexts, including research reports, scholarly articles, and professional correspondence. Appropriate use of passive constructions allows writers to adopt a more formal tone and to emphasize actions or results rather than agents. Despite its importance, Thai learners often struggle to use the passive voice accurately due to both its grammatical complexity and its contrast with Thai sentence structures. As a result, systematic instruction, repeated practice, and focused feedback on passive voice usage are essential components in the development of students' English writing proficiency.

The Use of Grammar Checklists to Enhance Writing Skills

A grammar checklist serves as a practical instructional tool that enables learners to review and evaluate the grammatical accuracy of their own writing. By providing clear criteria and structured guidance, checklists help learners identify recurring errors and revise their work more effectively. Previous research has demonstrated that the use of grammar checklists in conjunction with feedback can significantly improve students' writing performance, particularly with respect to grammatical accuracy (Bitchener & Ferris, 2012). When learners are equipped with such tools, they are better able to monitor their language use systematically and develop greater autonomy in the writing process.

Peer Feedback in Writing Development

From a theoretical perspective, Krashen's (1982) Monitor Model offers important insights into the role of feedback in language learning, particularly through the Input Hypothesis and the Affective Filter Hypothesis. According to The Input Hypothesis, it finds that the most effective way to learn new language is when learners are exposed to input that is slightly beyond their current level of competence (i+1), while the Affective Filter Hypothesis highlights how anxiety and stress can hinder language learning. In this regard, peer feedback may provide a less threatening environment than teacher feedback, thereby lowering learners' affective filters and facilitating writing development.

Peer feedback involves learners exchanging comments and suggestions on one another's written work, enabling them to gain alternative perspectives and to develop analytical and evaluative skills. According to Processability Theory (Pienemann, 1998), learners acquire grammatical structures in a developmental sequence determined by their language-processing capacity. The passive voice, which requires coordinated control of tense, auxiliary verbs, and past participle forms, represents a relatively advanced structure. Consequently, systematic and well-scaffolded feedback plays a crucial role in supporting learners' ability to produce accurate passive constructions once they reach the appropriate developmental stage.

Empirical studies provide strong support for the effectiveness of peer feedback. Lundstrom and Baker (2009) found that peer feedback contributes significantly to improvements in writing quality, particularly in grammatical accuracy and organizational structure. Similarly, Topping (1998) reported that peer feedback fosters greater learner responsibility and engagement in the revision process. Furthermore, Rollinson (2005) demonstrated that combining peer feedback with structured tools such as checklists enables learners to identify and correct errors more effectively, resulting in notable improvements in writing quality.

In addition to linguistic benefits, peer feedback promotes critical thinking skills and language awareness, as learners must analyze both form and content in their peers' writing (Lundstrom & Baker, 2009). This reflective process often leads learners to recognize similar issues in their own work. Peer feedback also helps reduce fear of criticism and supports a learner-centered classroom environment, which encourages active participation and collaborative learning.

Peer Feedback and Teacher Feedback: A Complementary Approach

While teacher feedback is generally more accurate and particularly valuable for addressing complex grammatical issues such as passive voice usage, it may also increase learner anxiety or foster excessive dependence on the teacher (Ferris, 2006). Research suggests that integrating both peer and teacher feedback yields the most effective outcomes. Peer feedback encourages self-reflection and independent problem-solving, whereas teacher feedback provides authoritative guidance and clarification of complex grammatical structures. Together, these feedback modes offer complementary benefits that enhance learners' writing development.

This study focuses on the development of English writing skills among Grade 10 students enrolled in an intermediate English course during the second semester of the 2022 academic year at Surawiwat School, Suranaree University of Technology. The grammatical focus of the study is the passive voice, specifically constructions in which the grammatical subject functions as the receiver of an action. Across three assessed writing tasks, students were

required to incorporate passive voice structures into their compositions. These tasks were designed to evaluate both the accuracy of passive voice usage and students' ability.

Methodology

Participants

The participants in this study were 82 Grade 10 students drawn from five intact classes enrolled in an intermediate English course during the 2022 academic year at Surawiwat School, Suranaree University of Technology. All participants shared a similar instructional background and followed the same curriculum and course objectives.

Research Instruments

Three primary instruments were employed in this study: writing tasks, analytic scoring rubrics, and a passive voice grammar checklist. The writing tasks were designed to elicit the use of passive voice structures within meaningful and contextually appropriate written texts. The scoring rubrics were used by the teacher to assess students' writing performance, with particular emphasis on grammatical accuracy and appropriate use of passive voice. The passive voice checklist served as a structured tool to guide students during the peer feedback process, enabling systematic identification and correction of grammatical errors related to passive constructions.

Data Collection Procedures

Data were collected through three consecutive writing assignments administered over the instructional period. In the first task (Task 1), students completed an initial writing assignment, which served as the baseline measure of their passive voice usage. Following Task 1, students engaged in a peer feedback process using the passive voice checklist to review and comment on their peers' writing. Based on the feedback received, students revised their work and submitted subsequent drafts in Task 2 and Task 3. Teacher assessments were conducted after each task using the established scoring rubrics to ensure consistent evaluation of writing performance across all stages.

Data Analysis

The collected data were analyzed using both descriptive and inferential statistical methods. Descriptive statistics were used to summarize students' writing performance across the three tasks. To examine changes in writing performance over time, a Repeated Measures Analysis of Variance (ANOVA) was conducted. In addition, Pearson product–moment correlation coefficients were calculated to investigate the relationship between students' scores derived from the peer feedback process and the teacher-assigned writing scores. Statistical analyses were performed to determine the effectiveness of the instructional intervention and the relationships among key variables.

Results

Background Characteristics of the Participants

The participants in this study consisted of 82 Grade 10 students from Surawiwat School. The majority of the participants were female (58.84%). With regard to class distribution, students from Class M.4/4 represented the largest proportion of the sample (34.15%), followed by students from Class M.4/5 (24.39%), Class M.4/3 (14.63%), and Classes M.4/1 and M.4/2 (13.41% each). Detailed demographic information is presented in table 1.

Table 1

Demographic Characteristics of the Participants (n = 82)

gender / class	male		female		total	
	number	percent	number	percent	number	percent
Class 4/1	6	54.55	5	45.45	11	13.41
Class 4/2	5	45.45	6	54.55	11	13.41
Class 4/3	7	58.33	5	41.67	12	14.63
Class 4/4	10	35.71	18	64.29	28	34.15
Class 4/5	6	30.00	14	70.00	20	24.39
Total	34	41.46	48	58.54	82	100.00

Number of Students Able to Accurately Use Passive Voice Structures

Research Question 1 (RQ1): Does the number of students who can accurately use English passive voice structures increase after the implementation of peer feedback? The analysis revealed that 39 students (47.56%) were able to use English passive voice structures correctly across all three writing tasks. When examining each measurement point separately, the number of students demonstrating accurate use of passive voice increased progressively over time. Specifically, 58 students (70.73%) used passive voice correctly in the first writing task, 64 students (78.05%) in the second task, and 71 students (86.59%) in the third task. These results indicate a consistent improvement in students' ability to use passive voice structures following the peer feedback process. Detailed results are shown in table 2.

Table 2

Number and Percentage of Students Demonstrating Accurate Use of Passive Voice Across Three Writing Tasks

Accuracy	Number of Students (n = 82)	
	Number	Percent
none	1	1.22
once	8	9.76
twice	34	41.46
No mistake	39	47.56

Task number	Accuracy	
	Number	Percent
First task	58	70.73
Second task	64	78.05
Third task	71	86.59

Differences in Passive Voice Writing Ability Across Measurement Times

Research Question 2 (RQ2): Does peer feedback lead to improvement in students' ability to write English passive voice structures? Descriptive statistical analysis of students' writing scores across the three measurement occasions revealed differences in mean performance and score dispersion. The highest mean writing score was observed in Task 2 (M = 8.976, SD =

0.853), followed by Task 3 (M = 8.726, SD = 0.900) and Task 1 (M = 8.463, SD = 1.009). In terms of score variability, Task 2 exhibited the lowest coefficient of variation (CV = 9.503%), indicating more consistent performance among students compared to Task 3 (CV = 10.314%) and Task 1 (CV = 11.922%).

Prior to conducting the repeated measures analysis, Mauchly's Test of Sphericity indicated that the assumption of sphericity was violated (W = .920, p = .035). Therefore, the Greenhouse-Geisser correction was applied. The results of the repeated measures ANOVA revealed a statistically significant difference in mean writing scores across at least one pair of measurement occasions, F (2, 1.851) = 7.752, p = .001, η^2 = .087.

Post-hoc comparisons using the Bonferroni adjustment indicated that the mean writing score for Task 2 was significantly higher than that of Task 1 (Mean Difference = 0.512, p = .001). However, no statistically significant differences were presented between Task 1 and Task 3 or between Task 2 and Task 3 at the .05 significance level. The detailed results are presented in table 3.

Table 3

Results of Repeated Measures ANOVA and Pairwise Comparisons of Passive Voice Writing Scores

Task	n	M	SD	CV	SE	95% Confidence Interval	
						Lower Bound	Upper Bound
1st task	82	8.463	1.009	11.922	0.111	8.242	8.685
2nd task	82	8.976	0.853	9.503	0.094	8.788	9.163
3rd task	82	8.726	0.900	10.314	0.099	8.528	8.923
Mauchly's Test of Sphericity = **.920**, p = **.035** Greenhouse-Geisser = **10.758,** F(***2, 1.851***) = **7.752**, p = **.**001, n_p^2 = **.**087							
Pairwise comparisons (Post-Hoc Test): Bonferroni							
Tasks		**Mean Diff.**	**SE**	**p**		**95% Confidence Interval**	
						Lower Bound	**Upper Bound**
1st and 2nd task		0.512	0.140	.001*		-0.855	-0.170
1st and 3rd task		0.262	0.138	.182		-0.599	-0.075
2nd and 3rd task		0.250	0.140	.078		-0.019	0.519

Relationship Between Peer-Assessed and Teacher-Assessed Writing Scores

Research Question 3 (RQ3): Is there a relationship between students' peer-assessed passive voice writing scores and teacher-assessed English writing scores? Pearson correlation analysis revealed that students' peer-assessed passive voice writing scores in Task 2 and Task 3 were positively correlated with their teacher-assessed English writing scores. This finding indicates that students who received higher passive voice writing scores through peer feedback also tended to receive higher writing scores from the teacher. Correlation coefficients for all measurement occasions are presented in Table 4.

Table 4
Pearson Correlation Coefficients Between Peer-Assessed and Teacher-Assessed Writing Scores

Task	1st peer	2nd peer	3rd peer	1st teacher	2nd teacher	3rd teacher
peer 1st task	1.000					
peer 2nd task	-0.147	1.000				
peer 3rd task	-0.096	.310**	1.000

teacher 3rd task	0.022	0.150	.284**	0.188	.414**	1.000

Discussion

The present study aimed to examine the effects of integrating a passive voice grammar checklist with a peer feedback process on the development of English writing skills among Grade 10 students at Surawiwat School, Suranaree University of Technology. The findings provide several important insights into the role of structured feedback and learner involvement in EFL writing development.

First, the results revealed a consistent increase in the number of students who were able to accurately use English passive voice structures throughout the intervention period. The proportion of students demonstrating correct usage increased from 70.73% in the first measurement to 78.05% and 86.59% in the second and third measurements, respectively. This progressive improvement supports Vygotsky's (1978) sociocultural theory, which emphasizes that learning is mediated through social interaction and collaborative support. In this context, peer feedback functioned as a form of scaffolding that enabled learners to internalize grammatical knowledge through interaction, reflection, and shared problem-solving.

Second, analysis of mean writing scores indicated a statistically significant improvement between the first and second writing tasks, suggesting that the combined use of a grammar checklist and peer feedback had a substantial impact on students' writing performance during the initial stage of the intervention. However, no significant difference was observed between the second and third measurements. This pattern suggests a plateau effect in later stages of development, which may reflect limitations in the instructional challenge provided or the need for more advanced or varied writing tasks to stimulate higher-level language development. These findings imply that while structured peer feedback is effective in supporting early improvement, sustained progress may require more complex tasks and deeper cognitive engagement.

Third, the results demonstrated significant positive correlations between peer-assessed passive voice writing scores and teacher-assessed writing scores in the second and third measurements. This finding aligns with previous research indicating that learners benefit not only from receiving feedback but also from actively providing feedback to others (Lundstrom & Baker, 2009). Engaging in peer assessment appears to enhance learners' metalinguistic awareness and self-monitoring abilities, leading to improved writing performance. The ability to identify and

evaluate grammatical errors in peers' writing may, therefore, contribute to more accurate and reflective language use in students' own written work.

Conclusion

The findings of this study provide empirical support for the effectiveness of integrating a passive voice grammar checklist with peer feedback as a pedagogical approach to EFL writing instruction at the secondary level. The results highlight the importance of learner participation in the feedback process and demonstrate how structured, collaborative assessment can contribute to improved grammatical accuracy and writing development.

Recommendations

Expansion of the Sample Population

Future studies should be conducted with a more diverse sample, including students from different grade levels and educational institutions with varying contexts. This would enhance the generalizability and external validity of the research findings.

Longitudinal Investigation

It is recommended that future research examine the long-term effects of using writing checklists in combination with peer feedback. Such longitudinal studies would allow researchers to evaluate the sustainability of writing skill development and identify factors that influence the retention of these skills over time.

Comparison of Feedback Modalities

Further research should compare the effectiveness of peer feedback and teacher feedback in order to determine which feedback approach contributes most effectively to the development of students' writing skills.

Additional Qualitative Inquiry

Future studies are encouraged to incorporate qualitative data collection methods, such as interviews and classroom observations, to gain deeper insights into students' cognitive processes and the strategies they employ when revising their writing based on feedback.

In addition, the lack of statistically significant improvement in writing scores between the first and third writing tasks may be attributed to differences in task conditions. Specifically, both the first and third writing tasks were completed under time constraints in a classroom setting, whereas the second task, which showed a statistically significant increase in scores compared to the first task, allowed students to complete the writing assignment outside the classroom after initial in-class instruction. As a result, students may have utilized additional writing support tools, which could have influenced their performance. Therefore, future data collection should ensure that writing task conditions are as consistent as possible across all assessment occasions to obtain more reliable results.

Abstract

While social media platforms have increasingly been adopted across various educational disciplines, less is known, from an empirical perspective, about their application within maritime higher education. This pioneering study examines the emerging phenomenon of TikTok use among maritime educators, representing one of the first empirical investigation into social media integration within this traditionally conservative field. A qualitative research design was employed, conducting semi-structured interviews with 12 maritime educators across international institutions who have begun creating TikTok content for educational purposes. Participants represented diverse maritime specializations including navigation, marine engineering, port operations, and maritime law. Interview data were analyzed using reflexive thematic analysis, revealing four key themes: (1) democratizing maritime knowledge beyond traditional maritime academies, (2) developing micro-learning approaches for complex shipboard procedures and emergency protocols, (3) engaging digitally native students entering the seafaring profession, and (4) navigating institutional resistance within hierarchical maritime education structures. The study reveals innovative educational practices including the use of TikTok's short-form video format to demonstrate intricate maritime procedures typically requiring hands-on shipboard experience, creation of virtual vessel walkthroughs for land-based students, and development of maritime safety mnemonics through engaging visual content. However, significant challenges emerged including concerns about maintaining the seriousness of maritime safety education while creating accessible content, preserving professional standards, and overcoming institutional skepticism within a field where tradition and hierarchy remain paramount. This groundbreaking research establishes foundational knowledge about social media's potential role in maritime education, offering crucial insights for maritime institutions considering digital pedagogical innovations in an increasingly technology-driven maritime industry.

Introduction

The maritime industry stands at a critical juncture where traditional hierarchical structures intersect with rapidly evolving digital technologies. Maritime education, which prepares future seafarers, port operators, and maritime professionals, has historically adhered to conservative pedagogical approaches rooted in centuries-old traditions of apprenticeship, hands-on training, and strict adherence to safety protocols (Sharma et al., 2011). These conventional methods, while effective in maintaining industry standards and professional rigor, face mounting pressure to adapt to the expectations and learning preferences of digitally native students entering the profession (Manuel, 2017). As the maritime workforce undergoes generational transformation, educators increasingly confront the challenge of bridging the gap between time-honored instructional practices and contemporary digital engagement strategies. Of particular interest is the emerging adoption of social media platforms, specifically TikTok, within this traditionally conservative educational context, raising questions about how such platforms are being integrated into maritime teaching practices.

Literature Review

Social Media in Higher Education

Social media platforms have proliferated across educational contexts over the past decade, transforming how knowledge is created, shared, and consumed (Greenhow & Lewin, 2016). Platforms such as YouTube, Instagram, and Facebook have been widely adopted by educators across disciplines to enhance student engagement, facilitate informal learning, and democratize access to educational content (Manca & Ranieri, 2016). Research demonstrates that social media can support collaborative learning, foster communities of practice, and provide authentic audiences for student work (Carpenter & Krutka, 2015). However, challenges persist regarding privacy concerns, digital divide issues, platform sustainability, and the tension between informal communication norms and academic rigor (Selwyn, 2019).

Despite widespread adoption in many educational sectors, maritime education has remained notably resistant to social media integration, with limited empirical research examining digital innovation within this specialized field (Sellberg & Øvergård, 2022). The field's conservatism reflects concerns about maintaining the seriousness of safety-critical training, preserving professional standards, and navigating institutional structures where hierarchy and tradition remain paramount (Kitada et al., 2018). This resistance may stem from the high-stakes nature of maritime operations, where errors can result in loss of life, environmental disasters, and significant financial losses (Sellberg, 2018). Within this broader landscape of social media in education, one platform has emerged as particularly disruptive in its format and reach.

TikTok as an Educational Platform

TikTok has emerged as a particularly disruptive social media phenomenon, characterized by short-form video content, algorithmic content distribution, and predominantly youth-oriented user demographics (Anderson, 2020). While initially dismissed as entertainment-focused, TikTok has increasingly attracted educators who recognize its potential for micro-learning, visual demonstration, and reaching students through platforms they already inhabit (Escamilla-Fajardo et al., 2021). The platform's format, typically 15 to 60-second videos, aligns with cognitive science principles supporting chunked information delivery and spaced repetition (Jamet et al., 2008).

Recent scholarship has documented TikTok's educational applications across various disciplines, including language learning (Yang, 2020), science education (Barton & Ilić, 2021), medical education (Comp et al., 2021), and health promotion (Basch et al., 2021). These investigations reveal both promising pedagogical possibilities and significant challenges. TikTok enables creative knowledge dissemination, democratizes expert knowledge, and facilitates informal peer learning networks (Southgate, 2021). However, concerns include content accuracy, oversimplification of complex topics, the potential for misinformation, and questions about whether entertainment-focused platforms can maintain educational credibility (Zhu et al., 2020). Platform governance issues, data privacy concerns, and the ephemeral nature of social media trends raise questions about the sustainability of educational investments in TikTok (Cervi, 2021).

Existing research has focused predominantly on mainstream educational settings, with specialized professional education contexts remaining largely unexplored. This represents a significant gap given that professional education fields often face unique constraints and affordances that differ substantially from general higher education contexts. Maritime education exemplifies such a specialized context.

Maritime Education and Digital Technology

Maritime education presents a unique context for examining social media integration due to its distinctive characteristics. Unlike general higher education, maritime training combines academic instruction with practical skill development in safety-critical domains where errors can result in catastrophic consequences (Sellberg, 2018). The field operates within complex regulatory frameworks established by international bodies such as the International Maritime Organization, requiring standardized competencies and certification processes (Muirhead, 2020). Additionally, maritime education grapples with geographic dispersal, as students often complete portions of training aboard vessels at sea, creating challenges for sustained educational engagement (Gekara & Sampson, 2021).

The integration of digital technologies in maritime education has historically been limited to specific applications such as ship simulators, electronic navigation systems training, and maritime safety management systems (Baldauf et al., 2011). These technologies have enhanced technical skill development but have largely replicated traditional instructional models rather than fundamentally transforming pedagogical approaches. The COVID-19 pandemic accelerated some digital adoption, particularly regarding remote learning delivery (Burdová & Vujović, 2021), yet questions remain about whether this shift represents genuine pedagogical transformation or merely emergency adaptation.

Social media platforms, despite their ubiquity in students' personal lives, have seen minimal formal integration into maritime curricula. This reflects institutional reluctance to embrace tools perceived as informal, unprofessional, or incompatible with maritime education's serious purpose. Generational divides may also contribute to this resistance, as maritime educators often possess extensive sea-going experience and hold professional certifications earned through traditional training pathways (Kitada & Ölçer, 2015).

Gaps in Current Knowledge

Less is known, from an empirical perspective, about the intersection of TikTok adoption and maritime education practice. This gap is particularly significant for several reasons. First,

maritime education's conservative culture and safety-critical context provide a test case for understanding social media adoption in resistant institutional environments. Second, TikTok's particular affordances, such as visual demonstration capabilities and short-form format, may align with maritime education's emphasis on procedural knowledge and practical skill demonstration. Third, understanding how individual educators navigate institutional resistance to pedagogical innovation offers insights relevant to change processes in other conservative professional fields.

Maritime educators who adopt TikTok represent early adopters operating at the margins of institutional acceptability. Their experiences likely involve negotiating multiple tensions: between professional credibility and platform accessibility, between comprehensive instruction and brevity requirements, between institutional expectations and student engagement strategies, and between maintaining maritime education's serious purpose and leveraging creative, engaging content formats. Understanding how these educators experience and navigate these tensions remains unexplored territory.

The Purpose of This Study

The present study addresses these knowledge gaps by examining how maritime educators experience and navigate the integration of TikTok into their teaching practices within traditionally conservative maritime higher education contexts. By exploring the lived experiences of educators who have begun creating TikTok content for educational purposes, this research seeks to illuminate both the innovative practices emerging at the intersection of maritime education and social media, and the challenges these pioneers encounter within traditional institutional structures. This investigation extends the emerging literature on TikTok in education by examining its application within a specialized professional context characterized by unique constraints and affordances, while contributing to understanding digital innovation processes in conservative educational institutions.

Research Question

How do maritime educators experience and navigate the integration of TikTok into their teaching practices within traditionally conservative maritime higher education contexts?

Method

Design

This study employed a qualitative research design using semi-structured interviews to explore TikTok integration in maritime higher education. This approach was selected for its capacity to capture rich, contextual data regarding educators' experiences, motivations, and challenges in adopting social media platforms within a traditionally conservative academic field (Creswell & Poth, 2018).

Participants

Participants were recruited using purposive criterion sampling to identify maritime educators actively creating TikTok content for educational purposes (Campbell et al., 2020). Inclusion criteria required participants to be: (a) employed as educators at recognized maritime higher education institutions, (b) actively creating educational TikTok content for minimum six

months, and (c) able to participate in English-language interviews. Recruitment occurred through professional maritime education networks, social media platforms, and snowball sampling.

The final sample comprised 12 maritime educators from six countries (France, Myanmar, Thailand, Norway, Singapore, and Philippines) representing diverse specializations: navigation (n = 4), marine engineering (n = 3), port operations (n = 2), maritime law (n = 2), and maritime safety (n = 1). Teaching experience ranged from 3 to 22 years (M = 11.5, SD = 6.2), while TikTok content creation experience ranged from 6 months to 3 years (M = 16 months, SD = 8.4). The sample included nine male and three female participants. All participants held relevant professional maritime qualifications, with 10 holding master's degrees and two holding doctoral degrees. Sample size was determined by information power principles (Kyriakou et al., 2025; Malterud et al., 2016).

Data Collection

Semi-structured interviews were conducted via Zoom between January and April 2024. An interview guide addressed: (a) motivations for adopting TikTok, (b) pedagogical approaches and content creation strategies, (c) perceived benefits and learning outcomes, and (d) challenges and institutional responses. A pilot interview refined question clarity and flow. Interview duration ranged from 45 to 90 minutes (M = 62 minutes, SD = 12.8). The interviewer employed active listening, reflective probes, and follow-up questions to elicit detailed responses (McGrath et al., 2019). Field notes captured contextual observations and initial analytic impressions.

The first author transcribed all interviews verbatim, producing approximately 185,000 words of data. The second and third authors validated transcripts against recordings to verify accuracy. Discrepancies were resolved through consensus. All identifying information was removed and replaced with pseudonyms. Transcripts were uploaded to NVivo 12 for analysis.

Analytical Strategy

Data were analyzed using reflexive thematic analysis (Braun & Clarke, 2019; Clarke & Braun, 2017; Kyriakou et al., 2025), emphasizing researchers' active interpretive role in generating meaningful patterns. This approach suited the exploratory investigation of a novel phenomenon where theoretical frameworks remain underdeveloped.

Analysis proceeded iteratively through data immersion, systematic coding, theme development, and refinement. The first author engaged deeply with transcripts while documenting observations in analytic memos (Birks et al., 2008; Daher et al., 2025). Line-by-line coding captured both semantic content and latent meanings, generating 437 initial codes. All three authors then collaboratively reviewed, sorted, and clustered codes to identify broader patterns. Through intensive discussion sessions, the team interrogated candidate themes for coherence, distinctiveness, and meaningfulness. Themes underwent two-level review: first against coded extracts, then against the entire dataset, resulting in refinement, splitting, or collapsing of themes. Sub-themes captured nuanced variations within broader patterns. Each theme was clearly defined with attention to its unique contribution to understanding the phenomenon.

Ethical Considerations

Ethical approval was obtained from the Institutional Review Board at the International Executive School in Strasbourg, France. The research adhered to Declaration of Helsinki principles. All participants provided written informed consent after receiving detailed study information. Participants were informed of their right to withdraw at any time and to decline answering questions.

Confidentiality was maintained through: (a) pseudonym assignment, (b) secure storage of identifiable data on encrypted devices, (c) removal of identifying details from transcripts, and (d) restricted data access limited to the three authors. Additional care avoided including details that might identify participants through their public TikTok profiles or specialized expertise. Participants received no compensation but were offered study findings summaries. Data will be retained for five years post-publication before secure destruction.

Quality and Rigor

Multiple strategies enhanced credibility, dependability, and authenticity (Korstjens & Moser, 2018; Kyriakou et al., 2025; Tracy, 2010). All three authors independently developed preliminary coding frameworks before collaborative refinement. This investigator triangulation ensured multiple perspectives informed theme development, reducing individual bias. The first author maintained analytic memos documenting decision-making rationales and theme evolution, creating an audit trail. Four participants reviewed preliminary findings, confirming themes captured their experiences while contributing additional nuances (Candela, 2019). This member checking enhanced authenticity by ensuring interpretations aligned with participants' understandings. These strategies collectively strengthened confidence that findings authentically represented participants' perspectives while acknowledging the interpretive role of the research team.

Reflexivity

Building on these quality considerations, reflexivity involved critical reflection on how researcher backgrounds, assumptions, and positioning influenced all research stages (Haynes, 2021). The research team brought complementary backgrounds. Three of four authors had substantial maritime education experience, with two holding executive ship captain credentials. This insider positioning facilitated rapport-building and enabled nuanced interpretation of shipboard procedures, safety protocols, and industry-specific constraints. However, it also required conscious attention to potential assumptions and biases that could privilege perspectives aligned with the team's professional values or downplay criticisms of maritime education structures.

To mitigate this risk, the one author without maritime education background provided valuable outsider perspective, regularly questioning interpretations and challenging taken-for-granted assumptions. This created productive analytical tension, forcing the team to articulate and justify interpretations rather than relying on insider knowledge. The researchers' positive orientation toward educational technology required conscious attention to remain open to participants' expressions of concern or skepticism. The first author's reflexive journal documented instances where enthusiasm needed bracketing to appreciate institutional resistance and pedagogical tensions. Regular team meetings examined emerging interpretations, ensuring conclusions remained grounded in participant perspectives.

The team's shared maritime background also created potential for collective blind spots regarding taken-for-granted assumptions within maritime culture. The team actively questioned normative practices regarding hierarchical structures, gender dynamics, and resistance to innovation. The reflexive process involved ongoing interrogation of whether interpretations reflected participants' intended meanings or the research team's own professional socialization. While participants' experiences represented genuine realities of maritime education contexts, the researchers' analytical interpretations constituted one possible reading informed by particular theoretical perspectives and maritime professional knowledge. This acknowledgment of interpretive partiality situates findings appropriately within broader knowledge production about educational technology integration in specialized professional fields.

Results

Reflexive thematic analysis of interview data revealed four major themes that illuminate how maritime educators experience and navigate TikTok integration within traditionally conservative maritime higher education contexts. These themes capture both the innovative pedagogical practices emerging at this intersection and the significant challenges educators encounter. Table 1 provides an overview of the themes with illustrative excerpts.

Table 1
Summary of Findings

Theme	Description	Example Excerpt
Democratizing Maritime Knowledge Beyond Traditional Academies*	Expanding access to maritime education outside formal institutional boundaries	"I'm getting messages from kids in places like Mongolia, Paraguay, places nowhere near water, and they're asking me about becoming ship captains."
Developing Micro-Learning Approaches for Complex Shipboard Procedures and Emergency Protocols**	Adapting maritime instruction to short-form video format through innovative chunking strategies	"I'll do one video on just the breathing gear, that's it. Next one is how you approach the fire. Students aren't trying to remember 50 things at once anymore."
Engaging Digitally Native Students Entering the Seafaring Profession**	Connecting with students through their preferred digital platforms and communication styles	"My students are on their phones constantly. Like, why would I fight that? Just meet them where they already hang out."
Navigating Institutional Resistance Within Hierarchical Maritime Education Structures*	Confronting skepticism and policy ambiguity within conservative institutional contexts	"One of my senior colleagues actually said to me, you're turning maritime education into a joke by being on the same platform as teenagers doing dances."

Note. * Endorsed by all participants (n = 12). ** Endorsed by 10–11 participants.

Theme 1: Democratizing Maritime Knowledge Beyond Traditional Academies

TikTok emerged as a powerful mechanism for breaking down geographic and economic barriers that have historically limited access to maritime education. A navigation instructor captured this democratizing effect:

> I'm getting messages from kids in places like Mongolia, Paraguay, places nowhere near water, and they're asking me about becoming ship captains. That just wouldn't happen without TikTok. The algorithm puts my stuff in front of people who never would've stumbled onto maritime careers otherwise.

This experience resonated across the sample, with educators reporting unexpected audiences including teenagers exploring career options, adults considering career changes, and even active seafarers looking for quick refreshers.

A marine engineering educator explained:

> Our normal recruitment stuff reaches people already thinking about maritime careers. TikTok reaches people who didn't even know this world existed. I've had comments from folks saying they had no idea container ships were so massive or that maritime jobs paid so well.

This democratization also extended to family members of seafarers and coastal community members wanting to learn about the shipping industry's local economic impact.

However, tensions emerged around making specialized professional knowledge publicly accessible. One educator put it bluntly:

> There's a line, you know? A 60-second clip about emergency procedures can give someone a general idea, but it's not training. It can't be training. I always worry someone's gonna watch my video and think they actually know how to handle a real situation when they don't.

This concern about incomplete or misapplied knowledge was particularly acute for safety-critical content where partial understanding could lead to dangerous overconfidence.

Theme 2: Developing Micro-Learning Approaches for Complex Shipboard Procedures and Emergency Protocols

Creative strategies emerged for adapting complex maritime instruction to TikTok's short-form format. Rather than viewing time constraints as limiting, educators reframed them as opportunities to break down procedures into digestible pieces. A marine safety instructor detailed this approach:

> I'll do one video on just the breathing gear, that's it. Next one is how you approach the fire. Next one is extinguisher types. Students aren't trying to remember 50 things at once anymore. They can watch each piece multiple times, really nail it down, then move to the next part. It actually works better than the old way where we'd dump everything on them in one lecture.

The visual demonstration capabilities of TikTok proved particularly valuable for conveying procedural knowledge. One port operations educator explained:

> Before, I'd describe how to secure cargo or tie specific knots, maybe show some photos. Now I can literally film myself doing it on an actual ship. Students can see exactly how the rope moves, how much tension you need, the whole thing. It's so much better for learning hands-on skills.

TikTok's audio features enabled innovative safety mnemonics that leveraged the platform's trending sounds. A maritime law educator shared:

> I put SOLAS requirements to a popular audio track that was all over TikTok. Students told me they'd be walking around campus and the song would pop in their head and they'd suddenly remember the regulations. Is it conventional? Hell no. Does it work? Absolutely.

The format also addressed practical constraints faced by students at sea with limited internet access. One educator noted:

> Cadets on ships have terrible WiFi most of the time. They can't stream hour-long lectures or download huge files. But a 45-second video that reminds them how to do something specific? That actually works with their reality.

Theme 3: Engaging Digitally Native Students Entering the Seafaring Profession

TikTok facilitated meaningful connections with students who expect educational content to meet them in their digital spaces. A navigation instructor articulated this reality:

> My students are on their phones constantly. Like, why would I fight that? Just meet them where they already hang out. If they're scrolling TikTok for two hours a day anyway, I might as well put some navigation content in that feed.

Strategic use of TikTok supplemented rather than replaced classroom instruction. A marine engineering educator explained:

> I'll post a preview video before we cover a topic in class. Then after class, I'll post something that reinforces the key points. Students show up already having some idea what we're talking about, and then they've got the TikTok to go back to when they're studying. It's like bookends for the formal learning.

Several educators reported that students who engaged with their TikTok content participated more actively in class and asked more sophisticated questions.

The informal nature of TikTok helped break down traditional barriers between faculty and students. One educator shared:

> Students message me on TikTok asking questions they'd never ask in my office or in class. The whole vibe is different. It's less intimidating somehow. They feel comfortable just reaching out, and that leads to way better conversations about the material.

TikTok also enabled educators to showcase aspects of maritime careers that traditional materials missed. A port operations educator explained:

> I can show these massive container ships, the scale of the operations, how cutting-edge the technology is. Maritime jobs have this old-fashioned image problem, like it's all ancient sailors with no tech. TikTok lets me show students this is actually a modern, high-tech, globally connected industry.

Theme 4: Navigating Institutional Resistance Within Hierarchical Maritime Education Structures

Despite clear pedagogical benefits, significant pushback from institutions characterized all educators' experiences. This resistance manifested through absent or unclear policies and criticism from colleagues. A policy vacuum left many educators unsure of their institutional standing. One explained:

> My dean doesn't say I can't use TikTok, but there's definitely no support for it either. It's this weird gray area. So I do everything on my personal time with my own phone because I don't want them coming back later saying I shouldn't have been doing it on work time or using institutional resources.

Criticism from colleagues proved particularly difficult to navigate. A maritime law educator recounted:

> One of my senior colleagues actually said to me, you're turning maritime education into a joke by being on the same platform as teenagers doing dances. Like, he couldn't see past the dancing videos to understand there's actual educational value there.

Maintaining appropriate seriousness for safety content while making it engaging particularly troubled educators. One marine safety instructor wrestled with this:

> People die when safety procedures get screwed up. That's not exaggerating. So how do I make content about that engaging enough for TikTok without it feeling disrespectful or trivial? Sometimes I'll film something five or six times trying to get the tone right.

Generational divides compounded these challenges. One educator observed:

> There's definitely this attitude that real maritime educators earned their stripes through years at sea, not by having followers on social media. Some senior faculty treat my TikTok like it's proof I'm not serious about teaching.

Despite these obstacles, educators found ways to build legitimacy through evidence-based approaches. One navigation instructor explained:

> I started tracking how students who watched my TikToks did on practical exams compared to students who didn't. When I could show my department chair actual numbers proving the ones engaging with my content performed better, suddenly the conversation changed.

Connections with educators in other fields facing similar resistance provided valuable validation. One noted:

> Talking to a medical educator using TikTok or a science teacher doing the same thing helped me realize this isn't about maritime education being uniquely conservative. It's about institutions everywhere struggling with what legitimate teaching looks like when the platforms and tools are changing so fast.

Discussion

This study examined how maritime educators experience and navigate TikTok integration within traditionally conservative maritime higher education contexts. The four themes revealed through reflexive thematic analysis offer important insights into both the potential and challenges of social media adoption in professional education fields characterized by strong occupational cultures and safety imperatives.

The democratization of maritime knowledge beyond traditional academy boundaries carries significant implications for access and equity in professional education. TikTok's capacity to reach geographically dispersed and economically marginalized populations challenges the historic concentration of maritime education in specialized coastal institutions, potentially addressing longstanding barriers to entry in the seafaring profession. This democratization aligns with broader calls for educational equity and workforce development in maritime industries facing documented labor shortages (Gekara & Sampson, 2021). However, the tensions educators identified regarding oversimplification raise critical questions about knowledge stewardship and professional gatekeeping. The concern that brief videos might foster dangerous overconfidence in safety-critical procedures suggests that democratization without corresponding credentialing or competency verification mechanisms may introduce new risks (Hodgkinson-Williams & Trotter, 2020). Maritime education institutions may need to develop frameworks that acknowledge TikTok's value for awareness-raising while maintaining clear boundaries distinguishing informal exposure from formal professional qualification.

The innovative micro-learning approaches educators developed demonstrate how platform constraints can drive pedagogical creativity rather than merely limiting instructional possibilities. The alignment between TikTok's format and cognitive load theory principles suggests that effective educational practice may emerge from working with rather than against platform affordances (Leahy & Sweller, 2020). Virtual vessel tours and smartphone-filmed procedural demonstrations represent scalable, low-cost alternatives to expensive simulator training, potentially transforming how maritime skills are taught. The creative use of trending audio for safety mnemonics illustrates how educators can leverage viral culture and platform-specific features to enhance learning rather than viewing entertainment-oriented platforms as inherently incompatible with serious education (Southgate, 2021). However, institutions must carefully consider which competencies can be effectively addressed through micro-learning and which require more comprehensive instruction to avoid curricular fragmentation.

The enhanced engagement with digitally native students has important implications for maritime education's future viability. As generational turnover continues, maritime institutions must adapt pedagogical approaches to remain relevant to students whose media consumption habits differ substantially from previous generations (Parry, 2021). The finding that TikTok functions effectively as supplementary scaffolding challenges binary framings of traditional

versus digital pedagogy, suggesting successful integration involves strategic combination rather than wholesale replacement. The breakdown of hierarchical barriers between faculty and students through informal platform communication may facilitate more dynamic learning relationships. The capacity to showcase modern, technology-driven aspects of maritime careers addresses critical image problems that have hindered recruitment (Gekara & Sampson, 2021), suggesting digital platforms can serve important marketing functions beyond direct instruction.

The institutional resistance educators encountered reveals systemic challenges that extend beyond individual adoption decisions. The policy vacuum surrounding social media use reflects institutional governance structures struggling to keep pace with technological change, leaving early adopters professionally vulnerable while limiting institutional capacity to support effective innovations (Williamson, 2021). The colleague skepticism educators faced illuminates deeper conflicts about pedagogical authority and legitimacy in rapidly changing educational landscapes. The assumption that TikTok's association with entertainment precludes serious educational application reflects technological determinism that oversimplifies how platforms are actually used and fails to recognize educator agency in shaping platform practices (Escamilla-Fajardo et al., 2021). Generational divides between faculty raise important questions about professional development, faculty hiring, and knowledge transfer in maritime education.

The ethical tension around maintaining appropriate seriousness for safety-critical content while creating engaging material highlights how context matters profoundly in educational technology adoption. Maritime education's stakes differ meaningfully from many other educational contexts, and solutions cannot simply be imported from fields where errors carry less catastrophic potential (Sellberg & Øvergård, 2022). The strategies educators developed for navigating institutional resistance, particularly evidence-based documentation of learning outcomes, offer practical models for change agents in other conservative contexts (Trust et al., 2020).

Limitations and Future Research

Several limitations warrant consideration when interpreting these findings. The sample of 12 educators represents early adopters willing to experiment with TikTok despite institutional ambiguity or resistance. These educators may possess characteristics including higher technological fluency or greater tolerance for professional risk that distinguish them from the broader maritime education population. The sample's geographic distribution across six countries provided international perspectives but also introduced contextual variability in institutional cultures and regulatory frameworks. Data collection relied exclusively on educator self-reports without direct observation of TikTok content, student engagement patterns, or learning outcomes, limiting conclusions about actual educational effectiveness.

Future research should examine student perspectives on TikTok use in maritime education to understand learning experiences and perceived benefits from the learner viewpoint. Quantitative studies assessing relationships between TikTok engagement and measurable learning outcomes would provide crucial evidence regarding pedagogical effectiveness claims (Barana et al., 2021). Comparative research examining TikTok adoption across different professional education fields could identify whether patterns observed in maritime education reflect broader dynamics or represent field-specific phenomena. Longitudinal research tracking how institutional policies and pedagogical practices evolve as TikTok becomes more established could illuminate processes of digital innovation normalization. Investigation of

optimal content design principles for maritime education TikTok videos could provide practical guidance for educators (Ng & Ye, 2023). Research examining potential negative consequences including student overreliance on brief videos or development of superficial understanding would provide important counterbalance to predominantly positive findings reported here.

Conclusion

This study is one of the first to explore the integration of TikTok within maritime higher education, revealing how educators navigate the complex terrain between pedagogical innovation and institutional conservatism. The findings demonstrate that maritime educators are developing creative instructional strategies that leverage TikTok's unique affordances for democratizing access, facilitating micro-learning, and engaging digitally native students, while simultaneously confronting significant professional challenges including policy ambiguity, colleague skepticism, and concerns about maintaining appropriate seriousness for safety-critical content. As maritime education continues evolving to meet the demands of increasingly digital maritime industries and changing student populations, understanding how educators successfully integrate disruptive digital tools despite institutional resistance becomes crucial for the field's future. The experiences documented here offer valuable insights not only for maritime education stakeholders considering digital pedagogical innovations but also for other conservative professional fields grappling with how to balance tradition with innovation, rigor with accessibility, and preservation of core professional values with necessary adaptation to technological and generational change.

Middle School Libraries as Active Agents of Risk Awareness: Post-disaster Knowledge Curation and Public Engagement in Thailand

Kaimuk Laosunthara, Prasarnmit Demonstration School (Secondary), Thailand
Ampan Laosunthara, Institute of Science Tokyo, Japan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Following the March 28, 2025, magnitude 7.7 earthquake centered in Myanmar—which triggered long-period ground motion (LPGM) and serious disruption in Bangkok—this study explores how a Thai middle school library responded educationally to the event. It presents a case where the library served as a pilot site for youth-centered disaster learning during and after the 15th Pre-Book Fair (April–July 2025). The library launched a three-part program titled "Survive and Be Safe from Disasters," focusing on earthquake and tsunami awareness. With support from disaster experts, librarians co-designed hands-on activities such as evacuation drills and tsunami simulations using virtual reality (VR). Students also joined risk mapping using colored Post-it notes to mark safe and hazardous zones inside the library. A key element was storytelling, where students shared personal experiences of the March 28 earthquake. Accounts—from confusion in high-rises to chaotic evacuations—offered insight into how youth perceive and react to disaster risk. Their stories highlighted gaps in disaster education and increased awareness of local vulnerabilities. This paper argues that middle school libraries could serve as decentralized disaster risk reduction (DRR) nodes. By curating local knowledge, enabling experiential learning, and fostering civic dialogue, libraries can become active players in community-based DRR. Rather than passive information holders, school libraries should be integrated into national DRR education strategies. We advocate for recognizing school librarianship within disaster governance and propose a model for embedding libraries into DRR planning through outreach, learning design, and collaboration.

Keywords: school libraries, disaster education, youth engagement, disaster risk reduction (DRR), Thailand

Introduction

Natural disasters such as earthquakes pose a significant risk to children and schools in urban areas, especially in developing countries where preparedness and awareness programs are unevenly implemented. While national disaster plans often emphasize structural safety and emergency drills, the role of educational institutions in cultivating risk awareness through information literacy remains underexamined. This paper presents a case study of one middle school in Thailand during the post-earthquake period following the 2025 Mandalay earthquake. It explores how librarians assumed proactive roles in curating information, engaging students, and contributing to community resilience.

Case Context: The 2025 Mandalay Earthquake and Its impacts in Thailand

On March 28, 2025, a magnitude 7.7 earthquake struck central Myanmar. Although the epicenter was far from Bangkok, long-period ground motion (LPGM) was observed in several high-rise buildings across the capital, causing public concern, particularly among students, parents, and the education sector.

Following the event, educational authorities implemented urgent measures, such as postponing entrance examinations at certain levels to allow time for school building safety inspections. This response underscored the importance of safety and preparedness in educational settings.

Methodology

This study adopts a qualitative case study design and employs participatory observation to examine disaster-related learning activities conducted in the library of a public middle school in Thailand. The school library served as a pilot site for youth-focused Disaster Risk Reduction (DRR) learning activities carried out during and after the 15th Pre-Book Fair, held between April and July 2025.

Qualitative data were collected from multiple sources, including field observations conducted during the activities, photographs documenting the implementation process, and activity-related documents produced throughout the study period.

Results

This section summarizes the outcomes of the library-based disaster learning activities conducted at a public middle school following the March 28, 2025 earthquake. The activities were implemented as part of a three-part program titled *"Survive and Be Safe from Disasters,"* carried out during and after the 15th Pre-Book Fair between April and July 2025.

The program combined expert-supported sessions and student-centered learning activities. Disaster specialists were invited to speak with students, explain basic concepts related to earthquakes and tsunamis, and respond to student questions. These sessions were complemented by hands-on activities designed and facilitated by librarians, including evacuation drills and tsunami simulations using virtual reality (VR).

Students also participated in risk mapping activities using colored Post-it notes. They marked areas they considered safe or hazardous within the library space and discussed their choices

with peers. Through this activity, students identified concerns related to building layout, evacuation routes, and crowded spaces.

Another core activity involved storytelling, where students shared personal experiences related to the March 28 earthquake. Many described feelings of confusion, fear, and uncertainty, particularly in high-rise buildings or during evacuation. These stories reflected how students understood and interpreted disaster risk based on their own experiences and the information available to them at the time.

Field observations indicated active student participation across all activities. Students engaged in discussions, asked questions during expert sessions, and exchanged views with peers during mapping and storytelling exercises. The library environment supported open communication and allowed students to move between individual reflection and group interaction.

Overall, the activities produced a range of learning materials and interactions that captured how students experienced, understood, and discussed disaster risk. The results show that the school library functioned as an active learning space where disaster-related knowledge, personal experience, and dialogue came together during the post-earthquake period.

Discussion

This case illustrates the potential role of school libraries in disaster-related contexts. The findings suggest that libraries can function as decentralized knowledge hubs within broader disaster risk reduction (DRR) systems by translating complex risk information into forms that are accessible to young people, providing spaces for reflection and learning, and connecting schools with disaster experts. However, such roles remain limited within current formal DRR policies and educational frameworks.

In the context of Southeast Asia, where earthquake risks are increasingly shaped by rapid urbanization and infrastructure vulnerability, educational institutions play an important role in community-level disaster risk reduction. The experience of this Thai middle school highlights the importance of building localized capacity for knowledge sharing and learning during crisis periods, particularly when formal instruction is constrained.

Conclusion

The response of the middle school library to the 2025 Mandalay earthquake draws attention to the role that librarians can play within disaster-related learning environments. This case suggests that, beyond providing information, school libraries may support localized disaster risk reduction (DRR) education and offer learning opportunities for young people in post-disaster settings.

The findings indicate that school libraries could be considered more carefully within discussions on disaster education and preparedness. Recognizing the contributions of librarians in areas such as disaster communication, learning activity design, and community engagement may help strengthen educational responses to disaster risk. In this context, professional development opportunities related to disaster education, as well as collaboration with disaster science experts, could support similar initiatives in other schools.

Overall, this study highlights the value of engaging students with risk-related knowledge in ways that are sustained and sensitive to local contexts. As familiar and trusted spaces within schools, libraries may provide a practical setting for such engagement, particularly where formal disaster education is limited.

Future Work

Future research should further examine how librarians and other information professionals can develop a deeper understanding of disaster risks, such as earthquakes, and translate this knowledge into practical guidance for library users. Strengthening the capacity of librarians to support safe evacuation, provide clear risk information, and promote preparedness before disasters occur remains an important area for continued study.

In addition, future work may explore the development of training programs, guidelines, and collaborative frameworks that enable libraries to function more effectively as supportive spaces during emergencies. By enhancing librarians' risk awareness and preparedness skills, libraries may better assist users in understanding evacuation procedures and necessary pre-disaster measures, thereby contributing to safer and more resilient communities.

Acknowledgements

This research was supported by a research grant funded by the revenue of Srinakharinwirot University Prasarnmit Demonstration School (Secondary) for the Fiscal Year 2025. The authors also acknowledge the valuable contributions of experts, as well as the students who participated in the activities and shared their reflections.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The authors declare that Grammarly, an AI-assisted writing software, was used in proofreading and refining the language used in the manuscript. The usage was limited to correcting grammatical and spelling errors and rephrasing statements for accuracy and clarity. The authors further declare that, apart from Grammarly, no other AI or AI-assisted technologies have been used to generate content in writing the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

Empowering Global Citizens Through Multidisciplinary Collaboration in Education for Sustainable Development: Insights From the Learning Express (LeX) Programme

Harveen Kaur Singh, Singapore Polytechnic, Singapore

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This paper explores the transformative potential of multidisciplinary collaboration in Education for Sustainable Development (ESD) through the lens of the Learning Express (LeX) Programme at Singapore Polytechnic. The LeX Programme, operational since 2013, engages students in cross-cultural, multinational teams to address real-world challenges aligned with the United Nations Sustainable Development Goals (SDGs). By embedding Singapore Polytechnic's Design Thinking Framework within Education for Sustainable Development, the programme fosters holistic and pluralistic approaches to problem-solving, emphasising empathy, innovation, and sustainability. A mixed-methods survey of 336 participants from ASEAN LeX trips revealed high levels of socio-economic awareness, global mindset, and acquisition of career-relevant skills, though some uncertainty remains regarding long-term application and global career interest. The findings highlight the importance of facilitator support, authentic immersion, and iterative learning in nurturing global citizens equipped to tackle complex sustainability challenges. Limitations include self-reported data and regional focus. The study concludes that integrating design thinking with Education for Sustainable Development can reinforce student identity, motivation, and purposeful engagement for sustainable futures (Boeve-de-Pauw et al., 2015; Cheah et al., 2022; Singapore Polytechnic, 2025; UNESCO, 2017).

Keywords: education for sustainable development, design thinking, global mindset, multidisciplinary collaboration, Learning Express

iafor
The International Academic Forum
www.iafor.org

Introduction

The urgency of sustainable development has prompted educational institutions worldwide to rethink their pedagogical approaches. Education for Sustainable Development (ESD), championed by UNESCO, seeks to empower learners with the knowledge, skills, values, and attitudes necessary to address interconnected global challenges such as climate change, inequality, and resource depletion (UNESCO, 2017). ESD emphasises holism—recognising the interdependence of social, economic, and environmental systems—and pluralism, which values diverse perspectives in addressing sustainability challenges (Boeve-de-Pauw et al., 2015).

Singapore Polytechnic (SP) operationalises these principles through its Graduate Attributes Framework, which defines qualities essential for future-ready graduates. Among these, three attributes are particularly relevant to the LeX Programme:

- Global Mindset: Ability to understand behaviours in cultural and economic contexts and collaborate on cross-boundary projects.
- Communication & Collaboration: Ability to tailor and convey information to suit the audience, negotiate, and work with people from diverse backgrounds to achieve common objectives.
- Creativity, Innovation & Enterprise: Ability to view issues from different perspectives, generate ideas, and capitalise on opportunities and resources to create value and implement solutions (Singapore Polytechnic, 2025).

The LeX Programme exemplifies SP's commitment to cultivating these attributes through multidisciplinary, cross-cultural collaboration. By embedding Design Thinking within ESD, LeX provides students with authentic opportunities to engage in problem-solving that is empathetic, innovative, and sustainable. This paper examines how LeX fosters global mindset and related graduate attributes, drawing on survey data and situating the discussion within the broader discourse on ESD and experiential learning.

Literature Review

Education for Sustainable Development

ESD aims to develop learners who can critically comprehend and act upon global issues (Cheah et al., 2022). It is participatory and transformative, encouraging learners to question assumptions, embrace diversity, and engage in collaborative problem-solving. UNESCO (2017) identifies competencies such as systems thinking, anticipatory skills, and collaboration as essential for sustainability.

Graduate Attributes and Global Competence

Globalisation demands graduates who can navigate cultural diversity and complexity. A global mindset enables individuals to interpret behaviours in different socio-economic contexts and collaborate across borders (Javidan & Bowen, 2013). Communication and collaboration are equally critical, as multicultural teams require negotiation, adaptability, and shared understanding (Cheah et al., 2022). Creativity and innovation drive sustainable solutions, allowing learners to generate ideas and leverage resources effectively (Brown, 2009).

Design Thinking and Experiential Learning

Kolb's (1984) experiential learning theory posits that knowledge is constructed through experience, reflection, and application. Authentic, real-world contexts enhance learning by engaging students in complex, ambiguous situations that require adaptability and problem-solving (Lombardi, 2007). Design Thinking complements this approach by providing a structured framework—empathy, ideation, prototyping—that fosters creativity and collaboration (Brown, 2009).

Methodology

The LeX Programme adopts a four-phase Design Thinking Framework to guide students through authentic problem-solving experiences. Participants collaborate with peers from regional universities and polytechnics, addressing local needs while developing academic and interpersonal skills.

A survey was conducted with 336 students (70% of the cohort) who participated in LeX trips to Cambodia, Indonesia, Malaysia, the Philippines, Thailand, and Vietnam. Administered one month after a 12-day immersion, the survey measured indicators related to global mindset, communication and collaboration, creativity and innovation, and socio-economic awareness using both quantitative (5-point Likert scale) and qualitative (thematic analysis) methods (Singapore Polytechnic, 2025).

Results

Programme Reach

Since its inception in 2013, LeX has operated in 10 countries and 28 cities, involving over 11,500 participants and 38 partner institutions. Its objectives include fostering empathy, global awareness, and sustainable innovation aligned with SDGs (Singapore Polytechnic, 2025).

Survey Findings

The survey results indicate strong evidence of growth across the three graduate attributes relevant to the Learning Express (LeX) Programme. In terms of global mindset, an overwhelming 95% of respondents reported an enhanced understanding of cultural and economic contexts. This suggests that the immersive nature of the programme successfully exposed students to diverse socio-economic realities, fostering adaptability and cultural sensitivity.

For communication and collaboration, 93% of participants indicated improved ability to tailor communication for different audiences and negotiate effectively within multicultural teams. This reflects the programme's emphasis on teamwork and cross-cultural engagement, which required students to navigate language barriers and diverse perspectives to achieve common objectives.

The attribute of creativity, innovation and enterprise also showed significant development, with 90% of respondents expressing increased confidence in generating ideas and leveraging limited resources to create value. The design thinking framework, central to LeX, appears to

have played a critical role in stimulating innovative problem-solving under real-world constraints.

Beyond these core attributes, the survey revealed additional insights. A notable 98% of students recognised opportunities and challenges within host countries, and 97% acknowledged the complexity of global issues, indicating heightened socio-economic awareness. Furthermore, 93% reported gaining career-relevant skills, including project management, teamwork, and cross-cultural empathy. However, despite these positive outcomes, only 66% expressed heightened interest in pursuing international careers, highlighting a gap between short-term learning experiences and long-term global engagement.

Finally, the role of facilitators emerged as a key success factor. Students consistently identified facilitators as instrumental in guiding the learning process. Facilitators provided cultural context, supported teams through the design thinking stages, mediated conflicts, and led structured reflection sessions. These contributions were essential in helping students consolidate their learning and connect their experiences to broader sustainability concepts.

Discussion

The findings affirm that LeX effectively cultivates global mindset and related graduate attributes. Immersive experiences in diverse socio-economic contexts challenge students to move beyond ethnocentric perspectives, fostering cultural intelligence and adaptability. Collaborative projects, framed by Design Thinking, provide opportunities to practise communication and negotiation skills. Resource constraints and cultural diversity stimulate creativity and innovation, enabling students to develop solutions that are both contextually appropriate and sustainable.

However, sustaining global engagement beyond the programme remains a challenge. While students exhibit heightened awareness and skills, only 66% expressed interest in international careers. This suggests the need for post-programme interventions, such as alumni networks, industry partnerships, and global internships, to translate short-term learning into long-term aspirations.

Facilitators play a critical role in mediating cultural differences and guiding reflection. Their contributions align with Vygotsky's (1978) concept of scaffolding, reinforcing the social dimension of learning. Investing in facilitator training and cross-cultural competence is essential for programme scalability.

Limitations

The study relied on self-reported data, introducing potential bias. The timing of data collection (one-month post-trip) may have led to memory bias. The regional focus on ASEAN participants limits generalisability, and the absence of longitudinal tracking prevents assessment of long-term impact. Future research should adopt longitudinal designs and expand to non-ASEAN contexts.

Conclusion

Embedding Design Thinking within Education for Sustainable Development, as exemplified by the LeX Programme, offers a powerful model for nurturing global citizens equipped to address sustainability challenges. By fostering global mindset, communication and collaboration, and creativity and innovation, LeX prepares students to become future-ready graduates. Future iterations should address limitations related to regional focus and explore strategies to sustain global engagement through structured follow-up initiatives.

Acknowledgements

The author wishes to thank the students and facilitators of the Learning Express Programme, Singapore Polytechnic, and the National Youth Council Singapore, specifically the Asia-Ready Exposure Programme (AEP) team, for their support. Special thanks to partner institutions across ASEAN for their collaboration, and to all who contributed to the survey and research process.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

This manuscript was drafted with the assistance of Microsoft Copilot, an AI-powered writing tool, improve clarity, and ensure adherence to academic formatting. The AI was used for summarisation, language refinement, and structure, while all content was reviewed and verified by the author for accuracy and integrity.

Abstract

The preservation of cultural heritage plays a crucial role in strengthening national identity and supporting educational development; however, conventional preservation approaches often fail to engage younger generations effectively. Recent studies highlight the potential of digital and immersive technologies to transform cultural heritage learning experiences (Giannini & Bowen, 2019; Hutson, 2024). Addressing this gap, this study investigates the integration of Deep Learning (DL) and Virtual Reality (VR) as innovative tools for cultural heritage education at the high school level. An experimental study was conducted at Senior High School 18 in Pekanbaru, Riau, Indonesia, involving 72 purposively selected students across Grades 9, 11, and 12, consisting of 40 female and 32 male participants. The study examined the effectiveness of a DL- and VR-based learning approach in enhancing students' cultural heritage knowledge as well as their interest and engagement. The findings indicate a statistically significant improvement in students' cultural heritage knowledge following the intervention ($p < 0.01$). In addition, 87.5% of the participants demonstrated increased interest and engagement in cultural heritage preservation. These results underline the strong potential of combining DL and VR to create immersive and engaging learning environments for cultural heritage education, suggesting that technology-enhanced approaches can substantially improve student engagement and knowledge retention. Further research is recommended to explore the scalability and applicability of this approach across diverse educational and cultural contexts.

Introduction

The preservation of cultural heritage stands as one of the most critical challenges of the 21st century, a global imperative to safeguard the fragile repositories of collective memory, identity, and human history against the erosive forces of time, conflict, and environmental change (Malik, 2024; Otero, 2022). While international bodies like UNESCO report that countless tangible and intangible heritage sites remain at risk (Alex & Ichumbaki, 2024; Machat & Ziesemer, 2020), the digital turn has offered a powerful new arsenal for conservation, promising to immortalize cultural artifacts in virtual forms (Suroyo et al., 2021). However, the dominant paradigm of digitization, often limited to high-fidelity scans and photorealistic models, frequently results in sterile, decontextualized replicas. These digital archives, while valuable for documentation, often fail to capture the living essence of heritage: the stories, rituals, and socio-cultural narratives that imbue objects and places with meaning. This creates a fundamental problem: we are preserving the form of heritage but risk losing its soul, leaving a silent digital echo where a vibrant cultural voice once resonated (Hutson, 2024).

A critical review of the literature reveals a scholarly landscape fragmented into disciplinary silos. On one side, computer scientists have made remarkable advances in applying deep learning (DL) to heritage (Gil et al., 2024), successfully using neural networks for artifact reconstruction, script decipherment, and data analysis. On another, researchers in human-computer interaction have explored the power of virtual reality (VR) to create immersive, embodied experiences of historical sites, fostering a sense of presence and place (Suroyo et al., 2023). Concurrently, scholars in the humanities and social sciences continue to underscore the primacy of narrative in understanding cultural significance (Suroyo et al., 2022). Yet, a significant methodological and theoretical gap exists at the intersection of these domains. To date, few studies have attempted to systematically synthesize the analytical power of deep learning, the immersive potential of virtual reality, and the profound context of cultural narratives into a single, cohesive framework. The result is a missed opportunity to transition from static digital preservation to dynamic, intelligent, and pedagogically rich heritage engagement. The purpose of this study is to design, implement, and evaluate a novel framework that intersects deep learning, VR, and cultural storytelling to create living, interactive heritage experiences. To achieve this aim, the research is guided by the following central questions: (1) How can deep learning models be architected to analyse fragmented historical data and reconstruct plausible, context-aware cultural narratives? (2) What are the core principles for designing an immersive VR environment that dynamically integrates these AI-generated narratives to foster empathetic engagement and historical understanding? (3) To what extent does this integrated DL-VR approach enhance learning outcomes and affective connection to cultural heritage when compared with conventional digital museum exhibits?

The primary contribution of this work is threefold: theoretical, methodological, and empirical. Theoretically, it introduces the “Parallax of Heritage” model as a new conceptual lens for digital humanities and heritage studies. Methodologically, it pioneers an integrative pipeline for merging AI-driven content generation with immersive VR design for educational purposes. Empirically, it provides evidence-based insights into the efficacy of this approach, offering a validated blueprint for museums, educators, and cultural institutions seeking to create more meaningful and impactful digital heritage initiatives. This study is delimited to a case study focused on the reconstruction of a specific historical site and its associated oral histories, providing a focused context for developing and testing the framework. This paper will now proceed by reviewing the pertinent literature across the fields of deep learning,

virtual reality, and narrative theory. Following this, the methodology for the framework's development and evaluation is detailed, after which the results are presented and analyzed. The paper concludes with a discussion of the findings' broader implications for the future of cultural preservation and international education.

Literature Review

Deep Learning for the Digitization and Interpretation of Cultural Assets

The application of deep learning in cultural heritage has predominantly focused on the technical challenges of object classification, restoration, and 3D reconstruction (Grilli & Remondino, 2019). A significant body of work demonstrates the efficacy of Convolutional Neural Networks (CNNs) in automating the classification of artifacts like pottery shards, historical coins, and architectural styles (Gualandi et al., 2021), achieving accuracy levels that rival human experts (Zhang et al., 2025). Building on this, other researchers have employed Generative Adversarial Networks (GANs) for digital restoration, successfully in-painting damaged frescoes or predicting missing fragments of eroded sculptures (Harris et al., 2024; Karl et al., 2022). This trend highlights a clear progression from descriptive tasks (classification) to generative ones (reconstruction), showcasing the increasing sophistication of AI methodologies. However, a critical analysis of this literature reveals two significant limitations. First, these applications are overwhelmingly object-centric, treating heritage as a dataset of physical attributes to be processed. The focus is on the "what" the material form, while often neglecting the "why," the intangible stories, social functions, and cultural values embedded within the object. Second, the reliance on vast, curated datasets introduces a risk of algorithmic bias, potentially reinforcing existing canonical narratives and marginalizing heritage from underrepresented cultures for which extensive digital data is unavailable (Djabarouti, 2021). Consequently, while deep learning has proven its power in preserving the physical form of heritage, its current trajectory often results in sterile, decontextualized digital replicas, thereby missing an opportunity to engage with the richer, narrative layers of culture.

From Digital Museums to Immersive Experiences

In parallel, Virtual Reality has emerged as a powerful platform for heritage dissemination, moving beyond static online galleries to offer immersive, embodied experiences. The prevailing research in this area champions VR's ability to enhance user engagement and provide access to otherwise unreachable sites, such as fragile archaeological digs or reconstructed historical environments (Hijazi & Baharin, 2022; Wu et al., 2022). These studies consistently find that the sense of "presence" afforded by VR can foster a stronger emotional and cognitive connection to the past compared to traditional museum displays. The methodological trend has been a push towards greater photorealism and environmental fidelity, leveraging technologies like photogrammetry and laser scanning to create visually stunning "digital twins" of heritage sites (Giannini & Bowen, 20019). Despite these advancements, the dominant paradigm for VR in heritage often results in what can be termed "digital dioramas." In a critique similar to that leveled against deep learning applications, many VR heritage projects are visually spectacular but narratively shallow. User interaction is frequently limited to simple navigation, positioning the user as a passive observer rather than an active participant in the historical context. The narrative, if present at all, is typically delivered through linear, non-interactive overlays like audio guides or text panels, failing to exploit the unique affordances of the VR medium for dynamic, user-driven storytelling. A central debate within the field revolves around authenticity versus experience, with many projects prioritizing visual accuracy over interpretive depth. This leaves a critical gap

between the medium's potential for complex narrative exploration and its current implementation as a high-fidelity sightseeing tool.

The Primacy of Narrative in Contextualizing Heritage

Distinct from the technology-focused literature, scholarship in museum studies, anthropology, and digital humanities posits that cultural heritage is fundamentally constituted by narratives. An object's significance is not inherent in its material form but is constructed through the stories of its creation, use, provenance, and cultural meaning (Maulana & Ibrahim, 2021). This body of work argues compellingly for a shift away from a single, authoritative curatorial voice towards polyvocality, the inclusion of multiple, diverse, and sometimes conflicting perspectives that reflect the complex social life of an object. These scholars emphasize that heritage is not a static relic of the past but an active process of meaning-making in the present (Suroyo et al., 2021). The primary limitation of this theoretical discourse is its frequent disconnect from practical technological implementation. While the importance of dynamic, multi-vocal narratives is well-argued, the methods for embedding such complexity into interactive digital systems like VR remain undertheorized and underdeveloped. Current digital storytelling in heritage often fails to escape the linearity of traditional media, presenting pre-scripted stories rather than creating systems where narratives can emerge from user interaction with a context-rich environment (Suroyo et al., 2023). Therefore, a chasm exists between the sophisticated narrative theories developed in the humanities and the relatively simplistic narrative models employed in most digital heritage projects.

The preceding analysis reveals a clear and compelling research gap existing at the confluence of these three domains. The deep learning literature is technically robust but narratively impoverished. The VR literature is experientially immersive but often interactionally and narratively passive. The narrative theory literature is interpretively rich but technologically disconnected. No significant body of research has yet attempted to systematically integrate these streams: to use deep learning not merely to reconstruct an object's form, but to analyze and structure its associated cultural narratives; to then embed these dynamic, multi-layered narratives within a truly interactive VR environment; and to design an experience where the user's "parallax" view—their shifting perspective and interaction—co-creates their understanding of heritage. This study is positioned directly within this gap, proposing a novel framework that intersects these three fields to move beyond digital replication and toward a more holistic, meaningful, and narrative-driven form of cultural preservation.

Methodology

This study employed a quantitative, experimental research design to rigorously investigate the impact of a Virtual Reality (VR) intervention, enhanced by deep learning algorithms, on students' engagement with and understanding of cultural heritage narratives. The experimental approach was chosen for its strength in establishing cause-and-effect relationships, allowing for a controlled examination of how the immersive VR experience influenced specific, measurable outcomes related to cultural preservation. This design facilitated a systematic comparison of student learning and perception before and after exposure to the technological intervention.

Participants and Sampling

The research was conducted at Public High School 18 in Pekanbaru, Riau, Indonesia. The study's population comprised all senior high school students within this institution. From this population,

a sample of 72 students was selected using a purposive sampling technique. This non-probability sampling method was deemed most appropriate as it allowed for the deliberate selection of participants who fit the specific criteria of the study namely, students across a representative range of senior high school grade levels who could provide rich data on the learning experience. The sample was intentionally stratified to ensure proportional representation across three key age groups: Grade 9 (ages 14–15), Grade 11 (ages 16–17), and Grade 12 (ages 17–18). This stratification aimed to capture potential developmental differences in engagement and learning. The final sample consisted of 40 female (55.6%) and 32 male (44.4%) participants, reflecting the natural gender distribution within the school.

Research Instruments

To ensure a comprehensive data collection process, multiple research instruments were developed and validated. The primary instruments included:

A Cultural Heritage Knowledge Test (CHKT)

A researcher-developed instrument consisting of multiple-choice and short-answer questions designed to measure participants' baseline and post-intervention knowledge of the specific cultural narratives presented. The test's content validity was established by a panel of three experts in cultural history and educational technology.

A VR User Experience Questionnaire (VRUEQ)

Which utilized a 5-point Likert scale to assess participants' perceptions of the VR system's usability, immersion, and engagement levels.

An Attitude Towards Cultural Preservation Scale (ATCS)

Adapted from existing validated scales, to measure shifts in students' appreciation and perceived importance of cultural heritage before and after the intervention.

A System Usability Scale (SUS)

A standardized 10-item questionnaire, was used to provide a global view of subjective assessments of usability for the VR application.

Data Collection Procedures

The data collection was conducted systematically over a two-week period. First, official permissions were secured from the school administration, followed by obtaining informed consent from the participants and their legal guardians. The procedure began with the administration of the pre-intervention CHKT and ATCS to establish a baseline for each student. Subsequently, each participant engaged in a 45-minute interactive session with the VR heritage experience. During this session, observational data on engagement and interaction patterns were discreetly recorded by a research assistant. Immediately following the VR session, participants were asked to complete the post-intervention CHKT and ATCS, as well as the VRUEQ and SUS, to capture their immediate responses and measure the intervention's impact.

Data Analysis

The collected quantitative data were analyzed using the Statistical Package for the Social Sciences (SPSS) software, version 26. Descriptive statistics, including means, standard deviations, and frequencies, were used to summarize the demographic characteristics of the sample and the overall scores from the questionnaires. To test the primary hypothesis regarding the intervention's effectiveness, a paired samples t-test was conducted to compare the mean scores of the pre-test and post-test on the Cultural Heritage Knowledge Test (CHKT). Furthermore, an Analysis of Variance (ANOVA) was employed to explore whether there were statistically significant differences in outcomes based on the different age groups or gender, allowing for a more nuanced understanding of the intervention's effects across different demographic segments.

Ethical Considerations

Strict ethical considerations were upheld throughout the entire research process to protect the rights and well-being of the participants. Approval was first obtained from the institutional review board. Informed consent was a critical step; a detailed information sheet was provided to both students and their parents or guardians, clearly outlining the study's purpose, procedures, potential risks, and benefits. It was emphasized that participation was entirely voluntary and that they could withdraw at any time without penalty. To ensure confidentiality and anonymity, all data were coded, and personal identifiers were removed from the final dataset before analysis. All data were stored securely on a password-protected server accessible only to the primary researchers.

Result and Discussion

This study to ascertain the predictive power of the integrated Deep Learning (DL) and Virtual Reality (VR) approach on students' cultural heritage knowledge, a multiple linear regression analysis was conducted. The results, presented in **Tables 1**, **Table 2**, and **Tabel 3**, provide a comprehensive overview of the model's validity, explanatory power, and the specific nature of the relationship between the variables. The overall significance of the regression model was first examined using an Analysis of Variance (ANOVA), as detailed in **Table 2**. The results indicate that the model is highly statistically significant, $F(1, 78) = 45.67$, $p < .01$. This finding demonstrates that the regression model, with the integrated DL and VR approach as a predictor, is significantly better at forecasting students' cultural heritage knowledge scores than relying on the mean score alone. The extremely low p-value (less than 0.01) allows for the confident rejection of the null hypothesis, confirming a valid and reliable statistical relationship between the intervention and the learning outcome. Following the confirmation of the model's overall significance, its explanatory capacity was assessed using the Model Summary (Table 1). The R Square (R^2) value of 0.423 is of particular importance, as it indicates that approximately 42.3% of the total variance in students' cultural heritage knowledge scores can be explained by their engagement with the integrated DL and VR approach. This is a substantial effect size in educational research, suggesting that the technological intervention is a powerful factor in students' learning. The Adjusted R Square value of 0.410, which accounts for the number of predictors in the model, is very close to the R Square, further reinforcing the model's robustness and the genuine predictive power of the intervention.

Table 1
Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.65	0.423	0.410	0.562

Table 2
Model ANOVA

Model	Sum of Squares	df	Mean Square	F
Regression	12.34	1	12.34	45.67
Residual	16.78	78	0.215	
Total	29.12	79		

Table 3
Coef. Model of ANOVA

Variable	Unstandardized Coefficients (B)	Standard Error	Standardized Coefficients (Beta)	t
Constant	2.45	0.85		2.88
Integrated DL and VR Approach	1.23	0.18	0.65	6.89

Finally, the Coefficients table (**Table 3**) provides a detailed examination of the specific contribution of the independent variable. The unstandardized coefficient (B) for the integrated DL and VR approach is 1.23, which has a direct practical interpretation: for every one-unit increase in the implementation of the intervention, a student's cultural heritage knowledge score is predicted to increase by 1.23 points, holding all other factors constant. More revealing is the standardized coefficient (Beta), which stands at a strong .65. This value indicates a potent, positive relationship between the intervention and knowledge acquisition. The statistical significance of this specific predictor is confirmed by its t-statistic of 6.89 and a significance value of $p < .01$, affirming that the integrated DL and VR approach is a significant and powerful individual predictor of the outcome variable.

Table 4
Statistics for Interest and Engagement Increase

Measure	Pre-Intervention Mean (SD)	Post-Intervention Mean (SD)	Change (%)
Interest and Engagement Scores	3.2 (0.9)	6.0 (0.8)	87.5% increase
Paired Samples t-test			
t-value	12.34		
Degrees of Freedom	78		
p-value	< 0.001		
Effect Size (Cohen's d)			2.2 (Large Effect)

The statistical analysis presented in **Table 4** provides compelling evidence of the intervention's profound impact on student interest and engagement with cultural heritage. Initially, participants demonstrated a moderate level of interest, reflected by a pre-intervention mean score of 3.2 (SD = 0.9). Following their interaction with the immersive VR experience, this metric saw a dramatic and substantial rise, reaching a post-intervention mean of 6.0 (SD = 0.8). This represents a remarkable 87.5% increase, highlighting a fundamental shift in student attitude and involvement. To validate the significance of this observed change, a paired samples t-test was performed. The results confirmed that the increase was not a product of chance, yielding a highly significant outcome ($t(78) = 12.34$, $p < 0.001$). The extremely low p-value indicates that the probability of such a large increase occurring randomly is negligible, thus providing strong statistical support for the intervention's efficacy. Furthermore, to understand the magnitude and practical importance of this effect, Cohen's d was calculated. The resulting effect size of $d = 2.2$ is categorized as exceptionally large, far exceeding the threshold for a large effect ($d = 0.8$). This powerful finding underscores that the integrated Deep Learning and VR approach did not merely create a statistically significant difference but had a substantial, meaningful, and transformative impact on motivating students and deepening their connection to cultural preservation narratives. In essence, the intervention proved to be a powerful tool for fostering genuine interest and active engagement.

Discussion

The Effectiveness of Immersive Learning on Cultural Knowledge Acquisition

he primary finding of this study—a statistically significant improvement in students' cultural heritage knowledge ($p < 0.01$)—highlights the transformative potential of immersive technologies in educational contexts. This result aligns closely with Constructivist Learning Theory, which emphasizes active knowledge construction rather than passive information reception. Unlike traditional didactic approaches that rely on abstract representations, the virtual reality (VR) environment fostered a strong sense of presence, or the subjective feeling of "being there," which acted as a catalyst for deeper learning. This finding is consistent with

Experiential Learning Theory, as articulated by Moorhouse et al. (2019), which underscores the role of direct and concrete experience in knowledge acquisition. From the perspective of Embodied Cognition, Otero (2022) argued that cognitive processes are grounded in bodily interaction; by virtually navigating historical sites, students engaged in simulated physical experiences that enhanced comprehension. In addition, principles of Situated Cognition were evident, as learning occurred within a rich, contextualized environment resembling authentic settings, thereby supporting retention and transfer. This immersive experience effectively reduced the cognitive distance between learners and content (Huang et al., 2020), in contrast to the higher extraneous cognitive load often associated with decontextualized text-based instruction described in Cognitive Load Theory.

The technological mechanisms underlying these outcomes warrant closer examination. The effectiveness of the VR system extended beyond novelty, drawing on established principles of human–computer interaction and cognitive science (Hutson, 2024). A high degree of immersion, as an objective technological feature, facilitated the subjective experience of presence, creating a powerful learning pathway. By transforming abstract historical narratives into spatial, interactive experiences, the system leveraged Dual Coding Theory, as proposed by Gute and Wainman (2021), enabling information to be processed through both verbal and visual–spatial channels for more effective encoding and retrieval. The integration of Deep Learning (DL) further strengthened this effect by enabling personalized learning pathways. As noted by Kumar et al. (2025), such adaptive mechanisms—central to Intelligent Tutoring Systems—allow narrative content to respond dynamically to individual learner interactions, optimizing challenge and engagement. This personalization supports a form of narrative-based learning in which cultural stories are co-constructed with learners, fostering deeper cognitive and affective involvement in line with Media Richness Theory.

Beyond immediate pedagogical gains, this study contributes meaningfully to cultural heritage scholarship by presenting a robust framework for the preservation and transmission of Intangible Cultural Heritage (ICH). While prior research has largely emphasized the digitization of tangible artifacts, this work addresses a critical gap by enabling the dissemination of narrative, ritualistic, and experiential cultural elements. The findings provide empirical support for Cultural Transmission Theory, demonstrating how immersive technologies can function as contemporary channels for intergenerational knowledge transfer. Furthermore, the results align with the Technology Acceptance Model, suggesting that high perceived usefulness and engagement can facilitate broader adoption of VR in cultural education (Nilashi & Abumalloh, 2025). By offering high contextual fidelity, the immersive environment enables more authentic and nuanced cultural understanding than traditional text-based or 2D media. Consequently, this research not only validates VR as an effective pedagogical tool but also establishes a scalable framework for leveraging immersive and adaptive technologies to sustain and celebrate cultural narratives.

The Impact of Gamification and Interactivity on Student Interest and Engagement

A seminal finding of this research is the remarkable 87.5% increase in student interest and engagement, directly addressing the declining efficacy of traditional pedagogical methods in engaging digital native learners. This substantial outcome indicates a fundamental perceptual shift, demonstrating that the DL-VR intervention successfully transformed cultural heritage from a static subject into a dynamic and interactive learning domain. The immersive and gamified nature of the virtual reality environment was pivotal in reshaping learning into an experiential process, shifting students from passive recipients of information to active

participants capable of interacting with and influencing historical narratives. This transition from passive consumption to active participation appears to be the primary driver of increased curiosity and affective connection to cultural material, confirming the effectiveness of such technologies in bridging historical content with contemporary learners.

This finding is strongly supported by a broad body of literature examining the intervention's core elements. The motivational affordances of gamification are well documented, with Ryan and Rigby (2019) and Breien and Wasson (2021) demonstrating how mechanics such as points, challenges, and narratives enhance motivation and task persistence. These principles have been consistently validated in educational contexts by Barlow et al. (2020) and Barton et al. (2020), who linked them to higher behavioral and cognitive engagement. Similarly, the educational value of immersive virtual reality is well established. Carmona-Halty et al. (2021) emphasized the learning benefits of presence and co-presence in 3D environments, while Gute and Wainman (2019) and Geib (2020) identified this sense of "being there" as critical for improving retention and focus. In cultural heritage education, Giannini and Bowen (2019) and Goodwin and Lercari (2023) demonstrated VR's capacity to enable otherwise inaccessible historical experiences. This active engagement approach also aligns with the ICAP framework proposed by Hutchins (2020), which posits that interactive learning yields the deepest cognitive outcomes, and is consistent with Li's (2020) findings on the role of positive emotions in academic achievement and interest.

Ultimately, the 87.5% enhancement in student engagement can be attributed to the synergy between gamification and interactivity within an immersive VR framework. Rather than merely presenting information in a novel format, the technology fundamentally restructured the educational encounter. VR captured sensory and cognitive attention (Barton et al., 2020), while gamification provided the motivational structure necessary for sustained, goal-oriented interaction (Lim et al., 2025). Together, these elements effectively induced a state of flow (Yuan et al., 2024) and supported intrinsic psychological needs for autonomy, competence, and relatedness as outlined in Self-Determination Theory. Consequently, the DL-VR intervention represents a validated blueprint for bridging the gap between static historical artifacts and the participatory expectations of 21st-century learners, demonstrating the transformative potential of well-integrated educational technology.

Practical Implications, Limitations, and Future Research Directions

This study presents significant practical implications, offering a promising pedagogical model for educators, museums, and cultural policymakers. It functions as a compelling proof-of-concept, demonstrating that strategic investment in digital technologies can substantially reinvigorate cultural heritage education. However, it is imperative to acknowledge the study's inherent limitations. The reliance on a purposive sample drawn from a single institution in Pekanbaru constrains the generalizability of the findings to broader populations. Furthermore, the cross-sectional design precluded the measurement of long-term knowledge retention and sustained interest. Consequently, future research must prioritize the validation of this model across larger, more diverse cohorts in varied geographical and cultural contexts. Longitudinal studies are also indispensable for assessing the enduring impact of this intervention, as well as for exploring the scalability and adaptability of the DL-VR platform for wider integration into national curricula.

Conclusion

This study elucidates the profound pedagogical efficacy of integrating Deep Learning (DL) with Virtual Reality (VR) for cultural heritage education. The findings compellingly demonstrate that this synergistic technological approach serves as a powerful predictor of knowledge acquisition, moving beyond the passive reception of information characteristic of traditional methods. By immersing learners in a dynamic and interactive historical context, the intervention facilitates a deeper cognitive and affective engagement, aligning with core tenets of constructivist and experiential learning theories. The model's success is rooted in its ability to transform abstract cultural narratives into tangible, embodied experiences, thereby reducing cognitive distance and fostering a genuine sense of presence. Furthermore, the remarkable enhancement in student interest and engagement substantiates the intervention's capacity to reposition cultural heritage as a vibrant and compelling subject for contemporary learners. The fusion of gamified, interactive elements within an immersive framework proved to be the critical catalyst, shifting students from passive observers to active participants in the co-construction of knowledge and creating a powerful affective connection to the subject matter. Consequently, this research validates the DL-VR model not merely as an effective instructional tool, but as a transformative framework for revitalizing cultural heritage education and cultivating a deeper appreciation for intangible cultural legacies.

Despite the promising outcomes, it is essential to acknowledge the study's inherent limitations while charting a course for future inquiry. The reliance on a specific cohort from a single institution necessarily tempers the generalizability of the conclusions, highlighting the need for broader validation. Moreover, the cross-sectional nature of the research design provides a snapshot of immediate impact but does not capture the enduring effects of the intervention on long-term knowledge retention or sustained engagement. Future research should therefore prioritize the replication of these findings across more diverse demographic and cultural contexts to establish the model's robustness. Employing longitudinal designs will also be indispensable for rigorously assessing the lasting impact of this immersive experience on student learning and attitudes over time. Further investigation into the scalability of the platform and its adaptability for integration into standardized curricula would represent a critical next step in transitioning this powerful proof-of-concept into a widely accessible and transformative pedagogical tool for global cultural heritage education.

Acknowledgements

The author would like to express his sincere gratitude to his supervisors for their invaluable guidance and support throughout this process. The highest appreciation is also extended to all participants and related parties who have contributed significantly to the success of this study. Finally, the author would like to thank his beloved family and friends for their prayers and encouragement.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

During the preparation of this manuscript, the author(s) used AI-assisted tools, specifically Grammarly and DeepL, solely for language editing and grammatical review. These tools were employed to improve clarity, coherence, and readability of the text. The author(s) take full responsibility for the final content and affirm that all data, analyses, interpretations, and

conceptual frameworks presented in this work are the result of their original intellectual contributions.

Discussing ChatGPT in the Landscape of Students' Soft Skill Fostering: A Bibliometric Content Analysis

Thu-Phuong Hoang, FPT University, Vietnam

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Since its launch, ChatGPT has prompted an extensive debate among scholars and educators regarding its benefits and impediments to the development of students' soft skills. Aiming to provide a comprehensive overview of this dynamic, this study performed a dual approach, combining bibliometric and content analysis. A total of 136 peer-reviewed articles from Web of Science and Google Scholar published between 2022 and April 2025 were analyzed. The bibliometric analysis revealed a rapid growth in this field, with significant research originating from China, Taiwan, Saudi Arabia, and the United States. Content analysis of 102 empirical studies then delved into research subjects, methods, and key themes. A significant gap in research on K-12 students was discovered, as the majority of studies targeted higher education stakeholders. Moreover, while there was a focus on the impacts of ChatGPT on students' academic communication abilities and high-order thinking skills, the review identified a growing recognition of digital literacy as an essential soft skill in the age of AI. The paper concludes by offering extensive implications and pedagogical strategies, derived from the empirical studies, to guide the integration of ChatGPT in educational settings for the growth of soft skills. This study is among the first to combine bibliometric and content analyses in this research landscape.

Keywords: ChatGPT, soft skills, students, bibliometric analysis, content analysis

Introduction

The 21st century has witnessed a powerful wave of advancements in technology that is continuously reshaping human life in various ways, from the emergence of wireless Internet to the introduction of artificial intelligence (AI). In a short time, humanity has to adapt and find ways to tackle the challenges presented by these rapid changes.

Under these circumstances, soft skills (SS) are gradually gaining attention from policymakers, educators, and businesses. They are considered essential tools that empower individuals to navigate their personal development and, consequently, cope with uncertain environments and increase perseverance (International Labour Organization, 2021; United Nations Children's Fund [UNICEF], 2019). What's fascinating is that AI innovations are now assisting people in practicing these inherently human SS; among them is ChatGPT.

Within the first two months after its launch, Chat Generative Pre-trained Transformer (ChatGPT) quickly gained beyond one hundred million users (Hu, 2023) and has been recognized as a promising non-human assistant in educational settings since then, particularly in the aspect of personalization and expanding learning resources for learners (Qadir, 2022). The fact that ChatGPT can support human-like tasks, such as learning and decision-making, has opened up new directions for education (Kasneci et al., 2023).

However, researchers express concerns about ethical issues (Mhlanga, 2023), misinformation, and bias (ElSayary, 2023), as well as the risk of students misusing the tool or lacking critical analysis towards the AI-generated content (Kazley et al., 2024; Tseng et al., 2025). Besides, the reliability and consistency of ChatGPT responses can differ depending on the language used by the user, which is often higher when using English than when using other languages (Yoon et al., 2024). This can be a significant barrier for teachers and students in countries where English is not their native language.

Until April 2025, systematic studies have extensively explored the general impact of ChatGPT in education (e.g., Grassini, 2023; Tang & Chaw, 2024), challenges and opportunities of ChatGPT in classroom settings (e.g., Farrokhnia et al., 2023; Mai et al., 2024), and its influence on students' skill acquisition (e.g., Asad & Ajaz, 2024; Sardi et al., 2025). Although these studies shed light on many aspects of ChatGPT's use and its effect on learning outcomes, there is a need for comprehensive reviews for educators who want to thoughtfully integrate ChatGPT in classrooms. Alvarado-Bravo et al. (2024) recently conducted a bibliometric study to examine AI as a potential tool for SS development. However, they did not clearly indicate the impact of AI on students' SS or the models tested for AI integration.

To address this gap, this review adopted a bibliometric-content analysis approach, aiming to shift the focus from 'what' ChatGPT does to 'how' educators can intentionally implement pedagogical strategies with ChatGPT to develop SS in students. By analyzing 136 English-language journal articles and proceeding papers from 2022 to 2025, the researcher sought to synthesize the following:

1) Impacts of using ChatGPT on students' SS in educational settings;
2) Suggestions for ChatGPT integration to foster SS development.

Literature Review

Definition of Soft Skills

The role of SS in an individual's development has been acknowledged extensively. From the years spent in school to adulthood, their influence spans across all phases of human life and helps people overcome crises (Feraco et al., 2024; Martínez et al., 2021). However, in what ways are SS defined?

In 1998, Goleman suggested that SS is closely related to emotional intelligence, classifying it into self-awareness, self-regulation, motivation, empathy, and other social skills (Goleman, 2006). Many researchers, educational practitioners, and politicians in the 1990s described SS as a set of non-academic abilities and recognized its contribution to students' academic success (Chamorro-Premuzic et al., 2010).

Stepping into the 2000s, the concept of SS moved beyond interpersonal communication to encompass a skill set that helped individuals gain a profound understanding of themselves. In 2019, UNICEF acknowledged SS, interchangeably called transferable skills, as having the ability to act as a bridge and support system for foundational, digital, and job-specific skills. Therefore, they are considered essential skills for children and adolescents to succeed in school, life, and work, owing to their characteristic of being 'central magic glue' (UNICEF, p. 1, 2019).

As the 21st century reaches its 25th year, SS is commonly described as a broad set of non-technical and personal attributes that help individuals organize their lives, communicate with others, and adapt successfully to uncertainty.

Approaches to Soft Skills Education

In institutional settings, SS is cultivated both formally and informally. Students can learn and strengthen their SS by enrolling in compulsory courses (formal) and non-credit extracurricular activities (informal). One approach supported by many educators and scholars is to integrate SS into existing curricula rather than treating them as separate subjects. In this approach, teachers are encouraged to blend SS into class activities and assignments, even while delivering specialized knowledge and technical training (Otermans et al., 2023; Widad & Abdellah, 2022).

To date, SS training regularly involves a range of interactive, student-centered instructional methods that reflect real-world experiences. In other words, it should be oriented and customized to students' needs.

Digital Transformation in Teaching Soft Skills

As discussed, introducing SS into the curriculum does not equate to adding new topics or activities. This can be conveyed through what has already been done. Teaching SS by doing has been shown to work in many fields (e.g., Molek-Winiarska & Kawka, 2022; Vázquez-Calatayud et al., 2024), and with the assistance of advanced digital tools, it can be executed in innovative ways. For instance, digital games and simulations (Garcia et al., 2020), online educational platforms and flipped learning (Medvedeva et al., 2022; Moundy et al., 2022), and microlearning using mobile devices or social networks (Romanenko et al., 2023).

ChatGPT has been offering various innovative possibilities for teaching and learning experiences thanks to its ability to answer queries, generate learning material at different difficulty levels, and provide feedback (Memarian & Doleck, 2023). In a study by Wang (2025), students from non-English-speaking countries using ChatGPT-4 reported improved proficiency and gained greater confidence in their English communication. Recognizing the value added by ChatGPT, many scholars have started experimenting with this tool for training in other areas. In communication courses, ChatGPT has been reported to assist students in answering theory-based questions, generating ideas, and practicing application-based communication tasks (AlAfnan et al., 2023). Furthermore, teachers can use ChatGPT responses as examples for classroom discussions, encouraging students to think critically about their communication skills and improve them (AlAfnan et al., 2023). In healthcare training, ChatGPT helps trainees practice patient communication skills tailored to their expertise (Bonfitto et al., 2024).

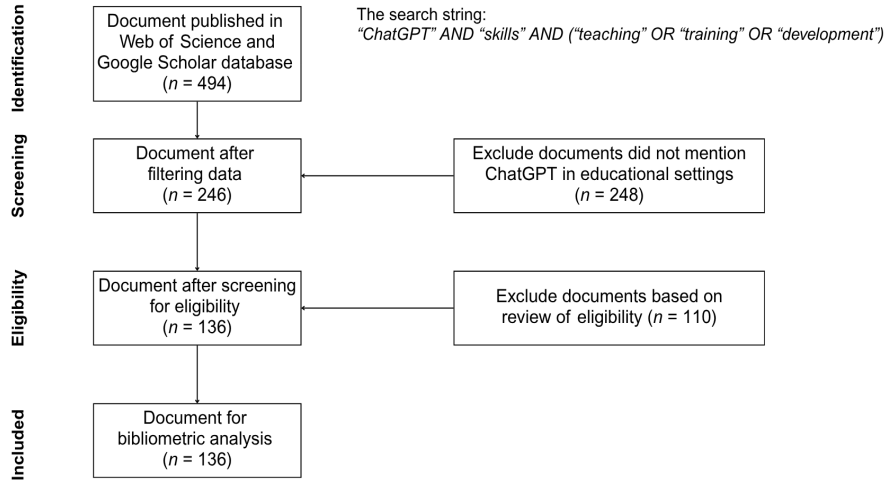
Nevertheless, students are advised to be aware of AI's limitations when it comes to its unethical use and potential harm to their critical and analytical thinking (Ogunleye et al., 2024). Relying too much on AI tools in general, and ChatGPT in particular, could threaten cognitive development (Dron, 2023). Another factor that could hinder the advantage of ChatGPT in education is the digital divide caused by limited infrastructure and other socioeconomic constraints, which would deepen the gaps between individuals from different regions (Hussein et al., 2025).

The emergence of ChatGPT in academic settings, though has promoted digital transformation in education towards personalized learning environments, requires careful consideration of ethical issues and how to integrate the tool effectively.

Methodology

The present study used a dual approach combining bibliometric and content analyses to examine previous research on the use of ChatGPT and its influence on students' SS. While bibliometric analysis provides empirical grounds for the topic under research, content analysis helps gain comprehensive insights into the publications (Maral, 2025).

Data Collection



Search Criteria

A literature search was conducted using the Web of Science (WoS) and Google Scholar databases. The researcher used relevant keywords and their combinations and Boolean operators “ChatGPT” AND “skills” AND (“teaching” OR “training” OR “development”) to search within the titles, abstracts, and keywords of publications. The selection criteria included English language, peer review (articles, conference proceedings, review papers), and publication dates from January 1, 2022, to April 30, 2025.

Article Screening

The researcher followed the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines to search for documents, as shown in Figure 1. The initial search yielded 494 documents, of which 248 were excluded because they did not refer to ChatGPT in the educational context.

Figure 1
Flowchart of Document Selection Using PRISMA Guidelines

Subsequently, the titles and abstracts of the remaining 215 documents were read to determine their relevance to SS. At this stage, the researcher used the following research questions as guidance for selection:

- *Research Question 1 (RQ1):* What were the most discussed impacts of ChatGPT on students' SS development?
- *Research Question 2 (RQ2):* What pedagogical approaches are recommended for educators to leverage the use of ChatGPT in fostering students' SS?

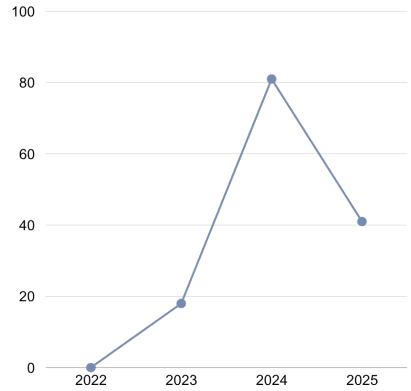
After an additional 110 documents were eliminated, the total document count was 136.

Data Analysis

The metadata of the 136 articles, such as paper title, paper source, author names, affiliations, keywords, and citations, were imported into an Excel file. The Excel file was uploaded to OpenRefine for data cleaning and preparation. Then, the VOS Viewer and Displayr were used to perform descriptive statistical analyses.

To gain further insights, the researcher employed content analysis on empirical studies to extract information such as research subjects, methods, main findings, and research implications. By doing this, the researcher was able to focus on identifying what problems exist and what benefits arise in the context of ChatGPT and the development of students' SS, as well as the recommended approaches for educators that directly address the study's research questions.

Results



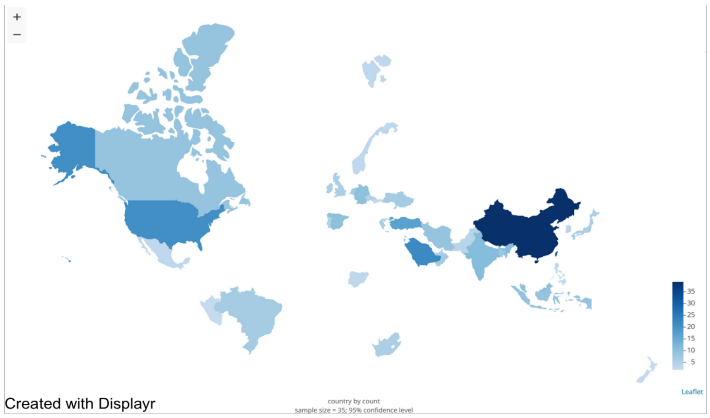
Volume and Growth Trajectory

The number of articles on ChatGPT in relation to SS in the period 2022–2025 is presented in Figure 2. Because ChatGPT was not released until November 2022, no publication was reported in this year.

Starting with 18 publications in 2023, the number of publications was multiplied approximately five times by the end of 2024. This rising trend implies not only interest among scholars regarding the intervention of ChatGPT in educational contexts but also indicates the importance of this field for stakeholders, that is, researchers, educators, and students. In the second quarter of 2025, 41 papers were published, signaling a rapid pace of research in this area moving forward.

Figure 2

Number of Publications per Year From January 2022 to 30 April 2025



Geographic Distribution

A total of 136 ChatGPT-SS-related documents were published by scholars from 35 countries (Figure 3), including Bangladesh, Brazil, Canada, China, the Czech Republic, Germany, Greece, India, Indonesia, Iran, Ireland, Israel, Japan, Malaysia, Mexico, the Netherlands, New Zealand, Nigeria, Norway, Oman, Pakistan, Peru, the Philippines, Portugal, Saudi Arabia, Slovakia, South Africa, South Korea, Spain, Taiwan, Turkey, Ukraine, the United Arab Emirates, the United Kingdom, and the United States of America (USA).

Figure 3

Choropleth Map Illustrating Geographical Distribution of Studies

Scholars from China were the most productive in this research domain (n = 38; 13.72%). Taiwan ranked second (n = 28; 10.11%), followed by Saudi Arabia (n = 21, 7.58%). These three countries, together with the USA (n = 20; 7.22%), Turkey (n = 16; 5.78%), and India (n = 10; 3.61%), comprise the top six countries in the number of publications.

The fact that ChatGPT was developed by OpenAI, an American technology company, makes the lead of China in this matter surprising. However, if we look at how the Chinese government made AI development plans a national strategic priority in 2017, this was to be expected. As of 2022, China had registered four times as many AI-related patents as the USA and was closing the gap in top-tier research output thanks to the groundwork laid years earlier (Kuo, 2025).

Along with China, the appearance of Saudi Arabia on this list has prompted closer attention. Traditionally known for its high dependency on oil, Saudi Arabia's ambition began pursuing economic diversification in 2019, shifting its major financial allocation towards AI infrastructure development (Global AI Summit, 2024).

Taken together, the involvement of these nations suggests widespread interest in AI, particularly ChatGPT, which surpasses geographical boundaries. Moreover, this interest did not stop as an abstract concept but as one that led to transformation in national strategies.

Most Frequent Keywords

To understand the evolution of literature from 2023 to 2025, keyword analysis was performed using keyword co-occurrence overlay visualization through VOS Viewer (Figure 4). Out of 559 keywords, only 43 keywords were included, since the condition for running the analysis was that the keyword had at least three co-occurrences. The most frequently used keywords included ChatGPT (125 co-occurrences), artificial intelligence (46), higher education (21), generative artificial intelligence (20), education (18), and critical thinking (13).

Figure 4 shows several interconnected clusters indicating the research themes. At the center of the network, "ChatGPT" acted as a focal point of research in the analyzed papers. From there, the rest were grouped into five major thematic clusters.

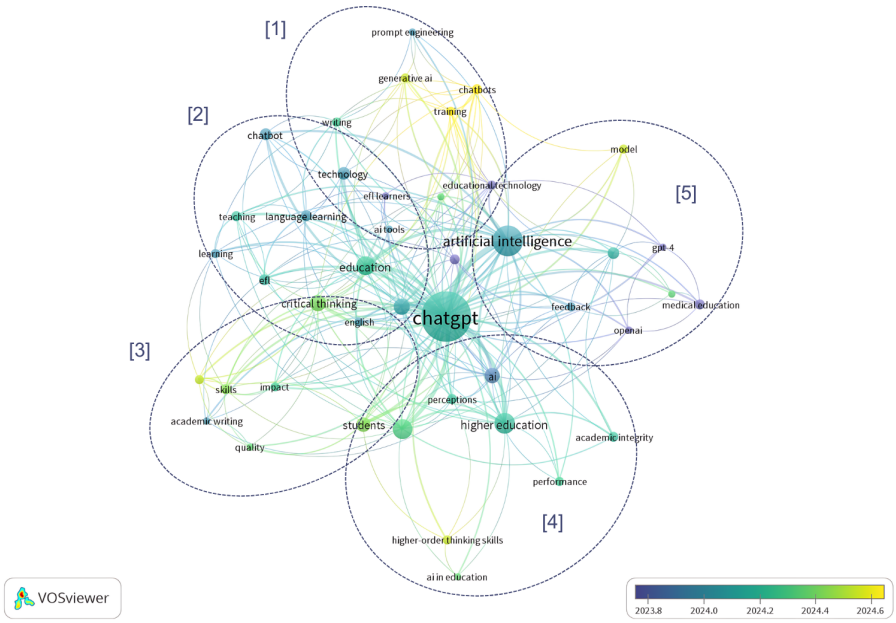
Cluster 1: ChatGPT and Technical Aspects

In the first cluster, ChatGPT was studied in a broader term: a generative AI-based technology. This cluster consists of nine keywords focusing on ChatGPT application in computational practice, for example, "prompt engineering," and its recognition as an AI conversational agent.

Cluster 2: ChatGPT and Language Learning

This cluster pinpoints the use of ChatGPT by English as a Foreign Language (EFL) learners and teachers. The keyword "chatbot" in this cluster further emphasized ChatGPT's capability to produce human-like dialogues, serving as a helpful aid for practicing language skills (Alshammari, 2024).

Cluster 3: ChatGPT and Skills



Built around keywords such as "critical thinking," "quality," "skills," and "impact," the third cluster delves into the benefits and challenges towards skill development posed by the emergence of ChatGPT. The inclusion of "academic writing" implies a focus on how ChatGPT influences skills in formal contexts, particularly writing skills.

Cluster 4: ChatGPT and Higher Education (HE)

This cluster specifically targets the implications of ChatGPT in HE. Scholars' attention has been drawn to its impact on students' higher-order thinking skills (HOTS). Alongside its potential, academic integrity, such as plagiarism and ethical usage, is a key concern for stakeholders (Aghaee et al., 2024).

Figure 4

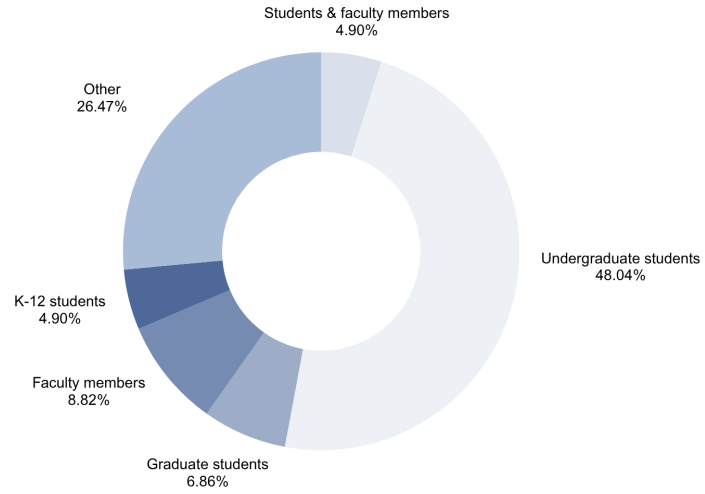
Network Analysis of Keywords With at Least Three Co-occurrences in Papers Published 2023–2025

Cluster 5: ChatGPT and Medical Education

The last cluster attends to the contribution of ChatGPT to the niche area of health care education. The appearance of GPT-4 in this cluster indicates the focus of research on the application of ChatGPT's advanced models to enhance learning outcomes. Among these, ChatGPT-generated feedback, although not fully replacing experts' input, might be a potential alternative during medical practitioners' training, especially in improving clinical reasoning skills (Çiçek et al., 2024).

Content Analysis

Of the 136 papers, 34 were review and conceptual papers, and 102 were empirical studies. The researcher focused only on empirical content analysis. These papers were read and labeled based on their research subjects and methods. The details of this are described in the following sections.



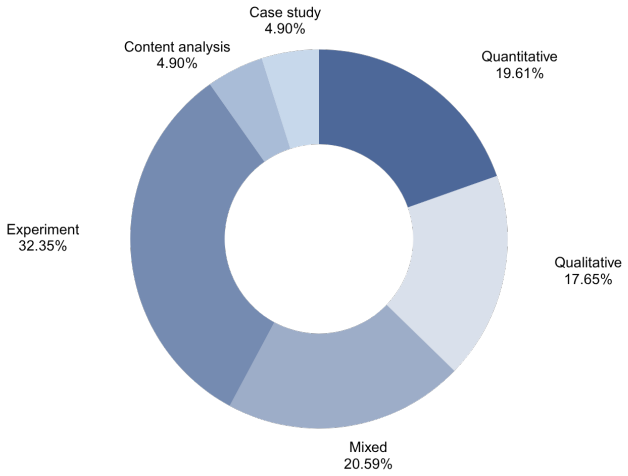
Research Subjects

The majority of 102 empirical studies targeted current students and faculty in institutions. Figure 5 presents the proportion of each research subject group. Within the sample, only five publications studied K-12 students (4.90%), whereas 56 studied HE students (54.90%). This

skewed attention in research was highlighted by Yusuf et al. (2024) in their review paper, noting that studies in ChatGPT-SS seemed to focus more on college students.

A significant number of research subjects in these empirical studies were categorized as "Other" (n = 27; 26.47%). Within this segment, pre-service teachers were the most frequently studied group (n = 11), followed by EFL learners (n = 6) at universities.

Figure 5
Research Subjects of Empirical Studies

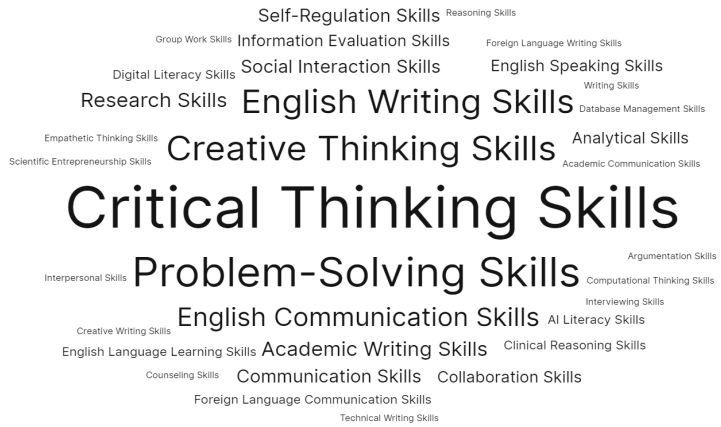


Methods

Various methods were used in the empirical studies examined (Figure 6). Most empirical studies have been conducted using traditional quantitative and qualitative methodologies, such as surveys and interviews (n = 38; 37.25%). The second most widely used was experiments, with 33 papers (32.35%), followed by mixed methods, with 21 papers (20.59%). Additionally, a few papers employed case studies (n = 5; 4.90%) and content analysis from social media and news (n = 5; 4.90%) as methodologies.

This variety of research methods highlights the wide range of methodologies used by scholars in this domain. Traditional methods have been used to investigate stakeholders' perceptions and correlational relationships. Meanwhile, adopting experimental approaches and other innovative techniques has assisted scholars in examining the causal effects of ChatGPT on particular SS and testing frameworks.

Figure 6
Research Methods Adopted in Empirical Studies



Most Researched Soft Skills

Figure 7 illustrates the word cloud of the dominant SS within papers published between 2023 and 2025. “Critical thinking” (n = 39) is the most frequent keyword in the word cloud, indicating its prominence in research related to ChatGPT and SS in educational contexts. Other HOTS that were under the interest of researchers include “problem-solving” (n = 20) and “creative thinking” (n = 14). This focus on various cognitive skills suggests a significant concern regarding how ChatGPT affects students’ fundamental intellectual competency. In the field of language learning and academic communication, “English writing skills” (n = 13) are highly studied within the context of English as a Foreign Language (EFL) learning, followed by “English communication skills” (n = 8).

Additionally, the visibility of “academic writing skills” (n = 5) in the word cloud reflects the ongoing debate among researchers on the efficacy of ChatGPT in improving students’ writing abilities (Li & Ironsi, 2024). Among interpersonal competencies, many studies have focused on “social interaction skills” (n = 4) alongside “collaboration skills” (n = 3) of HE students, implying their significant perceived importance in the context of ChatGPT's influence or use.

Figure 7
Word Cloud Visualization of Skills From Papers Published 2023–2025

Notably, there is growing interest in competencies that are crucial in the digital world, such as information evaluation skills (n = 3), digital literacy skills (n = 2), and AI literacy skills (n = 2). Collectively, they highlight a recognition among scholars that, in the constantly changing state of AI, simply possessing traditional skills is not enough. Instead, students should also be equipped with updated AI literacy skills to utilize the potential of ChatGPT (Naamati-Schneider & Alt, 2024).

Content Analysis of Key Papers From Research Questions

The papers were grouped based on the identified SS, revealing four distinct themes: HOTS, language learning and communication skills, and interpersonal skills. Within each thematic group, the maximum of the five most-cited papers was selected for a more in-depth analysis (totaling 13 papers). The researcher then extracted data on key findings related to the impact of SS (addressing RQ1) and recommendations for educators and institutions (addressing RQ2). Table 1 presents the results.

Theme 1. ChatGPT and HOTS. This cluster comprises 56 studies investigating ChatGPT in relation to HOTS, with a high concentration on critical thinking, creative thinking, and problem-solving. Five studies were selected for the content analysis.

Theme 2. ChatGPT and Language Learning and Communication Skills. This cluster contains 43 papers discussing the impact of ChatGPT on the language learning process of college students and how it influences their academic communication practice. Among the five studies chosen for content analysis, two were experimental.

Theme 3. ChatGPT and Interpersonal Skills. Cluster 3 includes papers mentioning ChatGPT and its influence on students' interpersonal skills, such as social interaction and collaboration with others. As there were only three studies addressing this topic, the researcher recruited all of them into the content analysis.

Discussion

Final Remarks About the Research Landscape Regarding ChatGPT and Soft Skills

Together with existing literature reviews, this study adds to the body of research on ChatGPT in educational settings (e.g., Grassini, 2023; Yusuf et al., 2024), especially its influence on SS (e.g., Daniel et al., 2025), and further enriches the story.

First, this study reported rapid growth in the research landscape of ChatGPT-SS, attracting researchers worldwide, especially from China, Taiwan, Saudi Arabia, and the US. This indicates that the topic of ChatGPT and its role in the development of SS is indeed a global phenomenon. Second, upon examining the most frequently used keywords in publications, we observed a significant concentration on how ChatGPT can improve and impede SS, specifically academic writing and critical thinking skills. This was followed by ethical concerns regarding potential harm to academic integrity within the HE context.

Regarding research subjects, the majority of empirical studies targeted HE stakeholders rather than those in K-12 settings. This suggests that the prominent focus of ChatGPT's impact and integration strategies was largely centered around university-level learners, even though ChatGPT has been commonly used among teen students (Beshay, 2025) and presented both

opportunities and challenges for their SS development (Zhang & Tur, 2023). This gap calls for more research to examine this phenomenon in earlier educational stages.

In terms of research methodologies, there has been an increase in experimental research, in addition to a significant number of studies that used surveys and interviews to gather information about the perceptions and attitudes of faculty and students towards ChatGPT. This could be considered an effort of scholars transitioning from examining correlation relationships to investigating the causal effects of ChatGPT on specific SS. Considering the widespread usage of ChatGPT in academic environments, more rigorous research designs are crucial to test pedagogical strategies and provide stronger evidence for effective AI integration.

Finally, the analysis of the research on SS revealed that HOTS (i.e., critical thinking, problem-solving, and creative thinking) was the main concern among stakeholders. How ChatGPT influences fundamental language competencies has also been under the research interests of many scholars, underscoring an ongoing discussion of AI adoption in improving students' language use and communication skills. There has been growing recognition among researchers of digital skills as a crucial requirement for the age of AI, implying that traditional SS alone is not enough.

Table 1
Content Analysis of Most-Cited Papers Addressing the Research Questions

Title	Author	Method	RQ1	RQ2
Theme 1: ChatGPT and high-order thinking skills				
Exploring the influence of ChatGPT on student academic success and career readiness	Dahri et al. (2024)	Quantitative	• ChatGPT's high-quality output improves student cognitive skills (info processing, problem-solving). • Stronger cognitive skills lead to more effective and frequent ChatGPT use. • Over-reliance can hinder critical thinking.	• Tailor content using ChatGPT's high-quality, personalized outputs. • Train students to critically evaluate AI content, preventing over-reliance and misinformation.
ChatGPT-enhanced mobile instant messaging in online learning: Effects on student outcomes and perceptions	Huang et al. (2025)	Experiment	• ChatMIM significantly improved HOTS by reducing cognitive load and providing instant info/feedback.	• Prioritize integrating AI features that reduce cognitive load. • Integrate AI into familiar platforms for high user acceptance and minimal learning curve. • Balance AI support with fostering independent thought and human interaction.
Exploring decision-making competence in sugar-substitute choices: A cross-disciplinary investigation among chemistry and sports and health students	Dindorf et al. (2024)	Quantitative	• Study highlights ChatGPT risks: bias, misinformation, reduced interaction, and critical thinking harm from over-reliance. • ChatGPT's diverse viewpoints may homogenize student perspectives, reducing original group divergence.	• Encourage interdisciplinary learning to boost problem-solving, critical thinking, and decision-making. • Use deep learning to analyze arguments, revealing patterns and improving decision-making.
ChatGPT challenges blended learning methodologies in engineering education: A case study in mathematics	Sánchez-Ruiz et al. (2023)	Quantitative	• ChatGPT enhanced students' problem-solving comprehension by offering step-by-step solutions, not just answers, for math problems. • Students' over-reliance on ChatGPT for problem-solving and knowledge acquisition could impede critical thinking and independence.	• Rethink assessments to ensure work reflects genuine knowledge, given ChatGPT's impact. • Use ChatGPT as a supplementary tool; monitor its use and promote critical evaluation.
A ChatGPT-AIPSS approach for SDGs: Classroom engagement and collective efficacy of students with different levels of critical thinking	Li et al. (2025)	Experiment	• High critical thinking students benefited more from ChatGPT, using it for exploration leading to richer discussions and group problem-solving. • Low critical thinking students showed no significant benefit, passively accepting AI info rather than engaging deeply.	Design differentiated instruction based on student critical thinking levels: • Offer challenging tasks to students with high critical thinking to advance their skills. • Provide explicit guidance to low critical thinking students for better engagement with LLMs and problem understanding.
Theme 2: ChatGPT and language learning and communication skills				
A study on the efficacy of ChatGPT-4 in enhancing students' English communication skills	Wang (2025)	Experiment	• ChatGPT-4 users showed significant English communication skill improvement over traditional instruction. • ChatGPT-4's personalized, adaptive environment boosted student comfort and confidence, aiding language acquisition.	• Integrate ChatGPT-4 strategically into English curricula, tailoring it to student and school needs. • Policymakers should make informed choices about integrating ChatGPT-4 as an additional tool. • Encourage collaboration between ChatGPT-4 developers and teachers for individualized materials.
Enhancing academic writing skills and motivation: Assessing the efficacy of ChatGPT in AI-assisted language learning for EFL students	Song and Song (2023)	Mixed method	• Students in AI-assisted classes demonstrated higher motivation and better academic writing performance. • Participants worried over-reliance on ChatGPT could hinder creativity and critical thinking.	• EFL learners should actively use AI writing tools for immediate, targeted feedback and improvement. • Educators should establish AI-supported writing classes and train learners on effective AI tool usage.
The impact of integrating ChatGPT with teachers' feedback on EFL writing skills	Asadi et al. (2025)	Mixed method	• Students receiving ChatGPT feedback showed statistically significant, large improvements across all writing areas (task achievement, coherence, vocabulary, grammar, and overall score).	• Use ChatGPT for personalized, prompt, and adaptive writing feedback, especially in argumentative essays. • Guide students to critically engage with AI feedback to foster independent thinking. • Institutions must update academic integrity policies for AI and ensure teacher professional development in responsible AI use.
To resist it or to embrace it? Examining ChatGPT's potential to support teacher feedback in EFL writing	Guo and Wang (2023)	Experiment	• ChatGPT focused equally on all writing areas; teachers prioritized language and content over organization. • ChatGPT's feedback was significantly more voluminous and faster, but 18% was misaligned or off-task. • ChatGPT could not directly annotate essays and lacked contextual awareness (student background, course goals).	• Leverage ChatGPT for high-volume writing feedback, reducing teacher workload and allowing focus on nuanced guidance. • Teachers should review, modify, and integrate ChatGPT's feedback with their own context-specific insights before sharing with students.
Using generative artificial intelligence/ChatGPT for academic communication: students' perspectives	Liu et al. (2024)	Mixed method	• ChatGPT saved time, identified improvement areas, and helped students learn academic communication skills. • ChatGPT was beneficial for vocabulary, grammar, and reading comprehension, but students doubted its potential for speaking/listening. • ChatGPT was more helpful for writing assignments than general communication.	• Incorporate LLM chatbots into teaching and self-regulated learning (e.g., for writing feedback, vocabulary). • Redesign assessments and course objectives to reflect AI tool integration. • Institutions must develop clear policies and provide training on ethical AI use, including assessment guidelines.

Title	Author	Method	RQ1	RQ2
Theme 3: ChatGPT and interpersonal skills				
Integration of AI into the distance learning environment: Enhancing soft skills	Borkovska et al. (2024)	Mixed method	• ChatGPT was effective for developing SS like communication, teamwork, empathy, and collaboration in distance learning. • ChatGPT couldn't mimic in-person interactions or emotional bonds, limiting its ability to fully replicate crucial human interaction for SS.	Employ strategies to enhance learning and improve students' critical thinking, communication, teamwork, and creativity. For example: (1) Students write a description, then compare it with ChatGPT's; (2) Highlight and compare student-used phrases/constructions with ChatGPT's; (3) Use chat features to introduce new descriptive constructions.
Generative AI in higher education: Educators' perspectives on academic learning and integrity	Aghaee et al. (2024)	Qualitative	• ChatGPT use might influence student interaction, potentially affecting soft and cognitive skill development like collaboration and group learning. • Some respondents worried about ChatGPT's impact on SS, while others believed it depended on individual motivation, digital skills, and tool usage.	• Develop clear digital technology guidelines, provide educator/student workshops, prioritize critical thinking, and promote ethical AI use. • Educate students on AI tool benefits and risks instead of banning them.
Exploring the impact of ChatGPT on improving 21st-century skills for future English teachers during lesson planning	Yıldız (2024)	Case study	• ChatGPT aided pre-service teachers (PST) in structuring ideas for peer sharing, supporting collaboration skills, and making brainstorming more efficient. • ChatGPT helped PST adapt their communication style with different ages of students, which was beneficial for lesson planning.	• Integrate ChatGPT into teacher training to bridge teaching methods and enhance pedagogical/technological fluency. • Systematically develop 21st-century skills (4Cs) across lesson planning, implementation, and assessment.

Suggestions for Educator Practice

Prepare Students for Effective Usage of ChatGPT

One of the main concerns of both teachers and students when using ChatGPT is that they, the students, will become overly reliant on this AI tool, which could hurt their development in SS (Aghaee et al., 2024; Klimova & De Campos, 2024) and expose them to misinformation risks (Dahri et al., 2024; Mohamed, 2023). In response, numerous researchers have emphasized the need for educators to enhance students' digital competencies (e.g., Alshammari, 2024; Kurt & Kurt, 2024) and provide them with knowledge about AI literacy (e.g., Dindorf et al., 2024; Naamati-Schneider & Alt, 2024) before introducing ChatGPT into the classroom. Asadi et al. (2025) suggested that educators should assist students in evaluating ChatGPT's feedback and encourage them to critically challenge the content created by ChatGPT. Meanwhile, Li et al. (2025) and Naamati-Schneider and Alt (2024) urged training students to effectively interact with LLMs like ChatGPT through prompting skills. This means not only understanding its language, strengths, weaknesses, and biases but also learning how to customize queries to obtain the desired responses. For this reason, a comprehensive digital competency curriculum that addresses the necessary AI knowledge and technical and communication skills is essential. From there, educators can customize digital skills aligned with the learning objectives of each subject and tailor their guidelines to support students in evaluating ChatGPT-generated content.

Leverage ChatGPT's Strengths for Soft Skill Development

Many students across empirical studies (e.g., Dahri et al., 2024; Song & Song, 2023; Wang, 2025) have stressed that ChatGPT tailors its feedback and offers personalized support to their needs, thus contributing to their SS development. Students' SS development can also benefit from ChatGPT's potential to act as a support system for self-regulated learning. However, for students to maximize these benefits and avoid over-reliance, it is important to promote their proactivity as autonomous learners and strategically integrate the tool into academic activities while adopting a critical approach to its use.

For example, according to Li et al. (2025), educators should take into account the diversity in their students' thinking skills when developing teaching materials. To further foster HOTS in students with profound SS, educators can gradually increase the difficulty of their assignments. With students who are at the early stage of critical thinking skills, Li et al. (2025) suggested providing more explicit guidance (such as breaking down problems), encouraging students to ask questions, and instructing them on how to communicate effectively with ChatGPT. In their study, Cahill and McCabe (2024) mentioned that using ChatGPT as a tutor in classrooms can enhance student learning. By interacting with ChatGPT, students can understand why their answer to a quiz is incorrect or learn the reasoning behind a mathematical solution (Cahill & McCabe, 2024). Resonating with this idea, Liu et al. (2024) recommended employing ChatGPT as a guiding tool for brainstorming ideas and helping students uncover areas for improvement. As ChatGPT tends to provide responses that contain ideas from various fields, Dindoff et al. (2024) encouraged educators to take advantage of this feature to adopt interdisciplinary learning, which is beneficial for students' problem-solving, critical thinking, and decision-making competencies.

A core principle of ChatGPT integration in SS development is to adopt it purposefully and in a timely manner. Huang et al. (2025) advised incorporating AI features into structured post-class discussions, especially in information-dense learning environments, where cognitive overload is a common challenge. Specifically, their experiment with ChatMIM revealed that not only can ChatGPT allow students to quickly obtain information without interrupting their learning flow, but it also improves the quality of student collaboration. Guo and Wang (2023) emphasized utilizing both personal touch and ChatGPT-driven personalization during writing courses for its ability to rapidly provide a large quantity of feedback. With ChatGPT, educators can focus on more complex issues, tailor feedback based on student and class contexts, and provide more informative and individual-based guidance to their students. Borkovska et al. (2024) proposed employing strategies like having students write a brief answer on paper before using ChatGPT and then comparing them with the tool's to identify weaknesses. This comparison process is helpful in improving both writing and language skills. It also draws students into a thorough evaluation process involving critical thinking.

Build a ChatGPT-Ready Educational Environment

As ChatGPT has become widely used among students, it calls for well-defined policies and guidelines to ensure effective and responsible AI integration in educational settings. First, clear policies and guidelines are required to ensure the ethical use of AI in education (Alshammari, 2024; Liu et al., 2024). These guidelines must consider concerns, such as data privacy, academic integrity, and fair access, to establish standards for the appropriate use of ChatGPT and similar AI tools. Many sources have stated that regulations should also adapt to diverse contexts, for instance, different institutional priorities and different stakeholders (e.g., postgraduates and undergraduates) (Liu et al., 2024; Zhang & Tian, 2025). Furthermore, educators and institutions should look upon inclusivity and cater to the guidelines for students from all backgrounds, particularly those from disadvantaged communities, to reduce educational inequalities (Zhang & Tian, 2025).

Second, it is crucial to revise the teaching materials, course objectives, and learning outcomes to reflect this emergence. Besides monitoring student work to ensure that they genuinely acquire knowledge (Sánchez-Ruiz et al., 2023), educators should consider redesigning assessments and exploring alternative options that incorporate the use of ChatGPT and AI tools (Liu et al., 2024). As ChatGPT has strikingly transformed the educational landscape, reviewing

curricula and instruction methodologies plays a critical role in navigating ChatGPT-assisted learning and equipping students with guidance for autonomous knowledge acquisition.

Finally, along with educating students about the benefits and risks of these tools towards their SS development, teacher training is equally important (Yıldız, 2024). Equipping faculty members with the requisite digital skills to effectively embrace technological advancements during their mentorship of students is a critical step (Asadi et al., 2025). Eventually, the role of educators is to help students navigate their learning process autonomously, maximize AI's potential, and ensure its responsible and ethical use.

Conclusion

Although the methodology employed in this study was helpful in achieving its research objectives, it had certain limitations. First, as the study only included peer-reviewed papers and conference proceedings written in English, it may have missed influential works that were published in other languages. Therefore, to better understand the impact of ChatGPT on students' SS from different cultural backgrounds, especially when this LLM-based chatbot may perform variably across various language practices (Ando et al., 2024; Fang et al., 2023)—a future literature review covering a wider range of languages would be helpful. Second, since the content analysis relied on a purposeful sample of papers based on their citation count, instead of all 102 initial papers, it risks leaving out influential younger publications that often have less exposure than older ones (Teplitskiy et al., 2022).

Despite these limitations, this study describes the overall research landscape. The results of the literature review show that even though there is debate among scholars and experts about the benefits of ChatGPT in the SS acquisition process, threats exist. Therefore, all stakeholders should be actively involved in the emergence of AI tool usage in the classroom. Key recommendations from the literature include updating regulations to maintain academic integrity and ensure digital equity, tailoring AI integration strategies instead of absolute prohibitions, and providing clear AI guidance and digital literacy training for both educators and students.

Rewriting Success: How Generative AI Is Shaping New Definitions of Career Achievement

Ma. Asuncion Clara F. Pantaleon, De La Salle University Manila, Philippines
Arlyn B. Napeñas, De La Salle University Manila, Philippines

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Generative artificial intelligence (GenAI) integration into work life is transforming how early-career professionals define and pursue success. This qualitative, phenomenological study investigates how individuals in the early stages of their careers, immersed in AI-enabled environments, construct evolving notions of career success. Using purposive sampling, the study engaged ten participants – five females and five males – who graduated from Academic Year 2022 onwards, represent diverse career fields, and are currently employed or actively seeking work (Patton, 2015). Semi-structured interviews explored their lived experiences, with thematic analysis guided by Career Construction Theory, which views careers as self-constructed realities through which individuals make sense of their experiences. It emphasizes how people build their careers by using their personal stories, themes, and life experiences to adapt to vocational challenges. This focuses on adaptability, storytelling, and how individuals' personal narratives shape their professional paths, and the Protean Career Model which states that a career path is driven by the individual, not the organization, and that it is guided by a person's intrinsic values and a desire for psychological success, such as personal fulfillment and well-being. Findings reveal that GenAI workplace adoption contributes to a shift from traditional extrinsically oriented markers such as job stability, salary, and title, towards more intrinsic adaptive, and self-directed indicators, like autonomy, continuous learning and ethical AI use, while still preserving creativity and empathy in AI-mediated work. These results affirm protean and boundaryless orientations shaped by technological disruption, indicating the importance of responsive, future-ready career development programs that integrate human-centric values with AI-era competencies.

Keywords: career success, generative artificial intelligence, AI-driven workplace, protean career, career construction theory

Introduction

The emergence of generative artificial intelligence (GenAI) has profoundly transformed education and the workforce, redefining how tasks are performed and how success is conceptualized. Tools such as ChatGPT and DALL·E are reshaping learning, work, and communication, prompting a shift from traditional success markers—job stability, income, and hierarchical advancement—toward values such as adaptability, digital fluency, and purpose-driven work (McAfee & Brynjolfsson, 2014) or students preparing to enter AI-integrated industries, these changes raise critical questions about evolving perceptions of career success.

Historically, career success has been measured through objective indicators like salary and promotions, alongside subjective dimensions such as fulfillment and growth (Ng et al., 2005). However, as AI influences skill demands and professional expectations, students increasingly prioritize creativity, adaptability, and technological competence (Succi & Canovi, 2020). Despite this shift, limited research examines how students reconcile traditional ideals with emerging realities shaped by GenAI.

This study explores the changing definitions of career success among students by comparing pre-GenAI and post-GenAI perceptions. Specifically, it seeks to identify dominant themes before AI adoption, emerging criteria after integration, and professional perspectives on GenAI's impact on skills and values. Insights from these patterns will inform responsive academic and career support programs, guiding career development centers in designing interventions aligned with the demands of an AI-driven labor market. In doing so, the research contributes to preparing students for success in a rapidly evolving world of work.

Literature Review

Career Construction Theory

Career Construction Theory (CCT) conceptualizes careers as subjective, dynamic processes through which individuals actively construct meaning from their vocational experiences (Savickas, 2005). Grounded in social constructionism, the theory posits that careers are not merely objective sequences of rankings, but evolving life narratives shaped by personal identity, values, and contextual demands. Work serves as a central arena for self-authorship, allowing individuals to express and continually renegotiate their sense of self in response to changing life roles and work environments.

A core construct of CCT is career adaptability, defined as a set of psychosocial resources that enable individuals to cope with vocational tasks, transitions, and uncertainties (Savickas & Porfeli, 2012). Career adaptability comprises four dimensions: concern, control, curiosity, and confidence. These dimensions reflect individuals' future orientation, sense of agency, exploratory behaviors, and self-efficacy in managing career challenges. In contemporary work contexts characterized by volatility and disruption, career adaptability is increasingly recognized as a critical mechanism for sustaining career development.

Protean Boundaryless Career Model

The Protean Career Model (PCM) further advances person-centered approaches to career development by emphasizing self-direction and values-driven career management (Hall, 2004) like traditional organizational career models, PCM positions the individual—rather than the

organization—as the primary agent responsible for career planning, development, and evaluation. Career decisions are guided by internal values and personal definitions of success rather than by externally imposed standards.

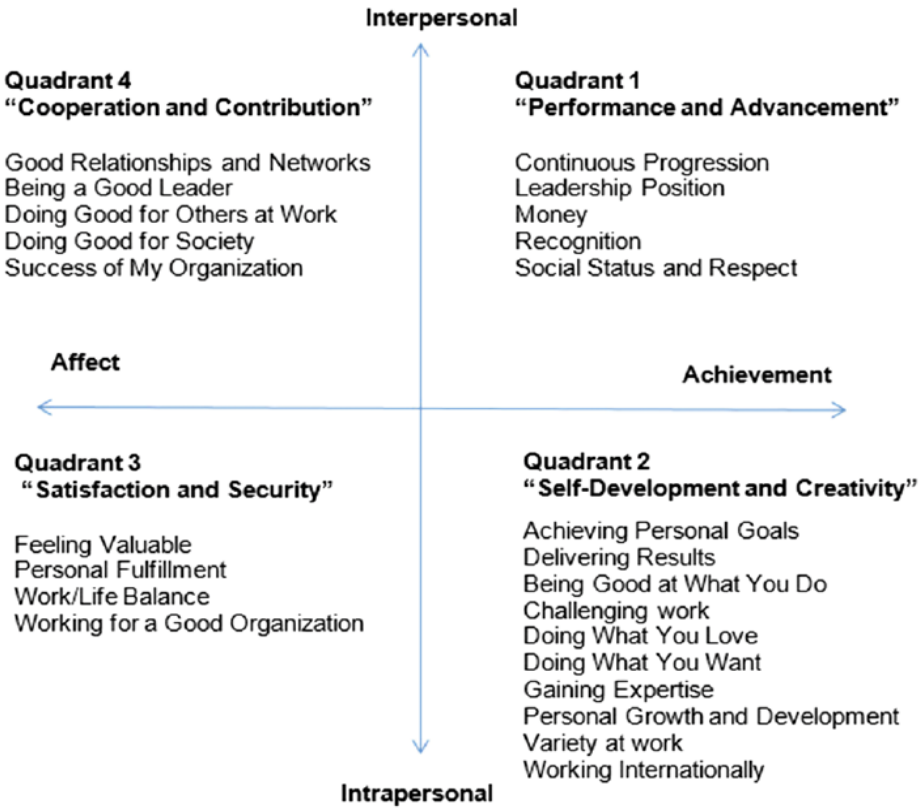
Central to PCM is the concept of psychological success, which refers to individuals' subjective evaluations of their career progress based on personal growth, authenticity, and alignment with core values (Hall & Chandler, 2005). Empirical studies have demonstrated that a protean career orientation is associated with continuous learning, adaptability, career satisfaction, and perceived employability (Briscoe et al., 2006) these findings underscore the relevance of PCM in explaining how individuals navigate increasingly uncertain and flexible career landscapes.

Evolving Definitions of Career Success

Career success is a central construct influencing career decisions and long-term goals. Perceptions of success are shaped by individual and contextual factors such as age, gender, socioeconomic background, and cultural context (Benson et al., 2020; Dries et al., 2008; Dyke & Murphy, 2006). These perceptions evolve over time in response to changing career contexts. Recent technological advancements, including generative AI, have further reshaped skill demands and career structures, prompting a redefinition of success (Duan & Wu, 2024).

Historically, career success reflected prevailing economic structures. In agricultural societies, success meant survival and stability; in industrial economies, it was linked to hierarchical advancement and external indicators such as income and job title (Dries, 2011), globalization and knowledge-based industries later broadened definitions to include subjective measures like job satisfaction and work-life balance (Mirvis & Hall, 1994). Judge et al. (1995) defined career success as positive material and psychological outcomes of work experiences, emphasizing accumulated achievements. While traditional benchmarks remain influential, they are increasingly re-evaluated amid social and technological change (Judge et al., 1995).

Contemporary frameworks such as the protean career model emphasize self-direction, adaptability, and lifelong learning. Success is now defined by authenticity, purpose, and holistic well-being rather than material rewards or organizational rank (Hall, 2004). These models highlight proactive career orientations, where individual agency and identity alignment play a central role in achieving subjective success.



Multidimensional Framework and Technological Influences

Beyond the objective-subjective dichotomy, Dries et al. (2008) proposed four quadrants of success: intrapersonal (personal growth, value alignment), interpersonal (recognition, relationships), affect (emotional well-being), and achievement (performance, financial outcomes) (Dries et al., 2008). This framework captures the complexity of modern careers and remains relevant across generations (Benson et al., 2020). In the context of technological disruption, such as generative AI, these quadrants provide a lens for understanding shifting priorities among students entering a dynamic labor market.

Technology amplifies this personalization by transforming career guidance and development. AI-powered platforms and digital tools enable tailored career planning, interactive self-assessment, and customized learning pathways (Duan & Wu, 2024). Beyond initial job placement, technology supports continuous growth through online courses, virtual internships, and certifications, reinforcing the importance of lifelong learning and adaptability in dynamic

labor markets. This evolution marks a shift from standardized career trajectories to flexible, individualized journeys, where success is viewed as an ongoing process shaped by intentional choices, resilience, and technological empowerment.

The Quick Evolution of Technology, Students' Preferences, and Institutional Support

Generative AI (GenAI) is reshaping career development and the broader world of work by transforming decision-making processes, job structures, and success criteria. At the macro level, GenAI automates routine tasks, augments decision-making, and creates new roles requiring hybrid human-AI skills, emphasizing adaptability, digital literacy, and lifelong learning (OECD, 2023; World Economic Forum, 2020). At the individual level, AI-powered platforms offer personalized career planning through resume feedback, interview simulations, and labor market insights, enabling more informed and reflective choices (Meng et al., 2025). Rather than replacing human guidance, GenAI complements it by allowing counselors to focus on meaning-making, values clarification, and emotional resilience (Bimrose et al., 2008). However, its adoption raises concerns about equity, ethics, and student agency, including issues of data privacy and algorithmic bias (Hooley, 2024).

As career success becomes more personalized and adaptive, higher education institutions must shift from static job-placement models to dynamic, developmental approaches (Kozhuk, 2023). Career services should integrate tools that foster reflection, identity development, and adaptability while leveraging AI for scalable, personalized guidance. Human advisors remain essential as interpreters and ethical anchors, ensuring students critically engage with

technology (Hooley, 2024). Institutions should embed career adaptability and psychological capital (Luthans et al., 2007) into curricula and co-curricular programs, promoting resilience and lifelong learning. Equity considerations are critical to prevent digital divides and ensure culturally responsive career technologies (OECD, 2023). Ultimately, universities must combine high-tech tools with high-touch engagement to prepare students for success in an AI-driven labor market.

Beyond career development, GenAI acts as a workplace disruptor, which fundamentally alters norms and practices. A disruptor is any force that drives rapid changes in work organization, job tasks, skill priorities, and career pathways (Inie et al., 2023). GenAI tools, including large language models and creative content generators, are significantly impacting routine tasks, job roles, and economic structures (Sarioguz & Miser, 2024). This disruption compels organizations and individuals to adapt to new approaches to work (Epstein et al., 2023), as GenAI accelerates job automation, hybrid work models, and the rise of gig and portfolio careers (Al-kfairy et al., 2024). These changes occur within compressed timeframes, from months to a few years, signaling an unprecedented pace of transformation (Feuerriegel et al., 2023).

Integrating Career Construction Theory, the Protean Career Model, and Career Success in the Age of Generative AI

The rapid advancement of generative artificial intelligence (GenAI) has reshaped how work is organized, how skills are valued, and how careers develop. By automating routine cognitive tasks and augmenting decision-making, GenAI has increased labor market uncertainty and accelerated skill obsolescence (McAfee & Brynjolfsson, 2014; World Economic Forum, 2020). As a result, traditional definitions of career success based on stability, expertise, and hierarchical advancement are increasingly inadequate. Career Construction Theory (CCT) and the Protean Career Model (PCM) offer complementary frameworks for understanding how individuals define and experience career success under these conditions.

From a career construction perspective, GenAI heightens the need for meaning making as individuals adapt to changing occupational roles. Career success is understood as the ability to maintain coherence between self-concept and work despite disruption, requiring individuals to continually reconstruct their career narratives (Savickas, 2005). Central to this process is career adaptability, which enables individuals to anticipate change, exercise agency, explore new opportunities, and sustain confidence amid technological transformation (Savickas & Porfeli, 2012). Within this framework, success is defined not by resistance to technology but by meaningful adaptation alongside it.

The Protean Career Model complements this view by emphasizing self-directed and values-driven career management. As GenAI accelerates skill commodification, individuals increasingly rely on internal criteria, such as personal growth and values alignment, to evaluate success rather than external indicators like status or tenure (Hall, 2004). This focus on psychological success becomes more pronounced in AI-mediated environments where traditional markers of professional value are destabilized (Hall & Chandler, 2005).

Empirical research supports this shift, highlighting subjective outcomes such as meaningful work, employability confidence, and learning orientation as key indicators of contemporary career success (Shockley et al., 2016). GenAI reinforces this trend by elevating uniquely human competencies, including creativity, ethical judgment, relational intelligence, and sensemaking,

which are less susceptible to automation. PCM provides a framework for understanding how individuals intentionally prioritize these attributes when navigating AI-augmented careers.

Together, CCT and PCM conceptualize career success in the GenAI era as adaptive, subjective, and agentic. CCT explains how individuals reconstruct vocational identity and meaning in response to disruption, while PCM explains how individuals actively align their careers with evolving values and personal definitions of success. In this integrated framework, career success is viewed as a dynamic process of ongoing adaptation, psychological fulfillment, and self-authorship, rather than a fixed outcome defined by occupational stability or technical superiority.

Conceptual Framework

The rise of generative AI (GenAI) represents a turning point in the world of work, introducing disruptions that extend beyond routine automation to areas traditionally considered uniquely human—creativity, knowledge work, and complex decision-making (West, 2018). This transformation underpins the framework's core pillars: job transformation, automation, and career adaptability. GenAI's ability to produce high-quality outputs rapidly not only enhances efficiency but also redefines professional value, signaling a shift from rigid, hierarchical career progression toward fluid, flexible pathways (Inie et al., 2023).

In this context, AI fluency emerges as a new professional currency, comparable to literacy or digital skills in earlier eras (Digital Education Council, 2025). However, technical proficiency alone is insufficient; enduring relevance depends on distinctly human capabilities such as creativity, empathy, critical thinking, resilience, and adaptability (Mukherjee et al., 2025). These competencies enable individuals, particularly students navigating the GenAI era, to thrive amid continuous disruption (Succi & Canovi, 2020).

The framework also acknowledges the psychological dimension of technological change. Accelerated automation fosters "AI anxiety," manifesting as fears of job loss and skill obsolescence (Epstein et al., 2023). Consequently, continuous learning becomes a professional imperative, transforming from an optional pursuit into a necessity (OECD, 2023). Simultaneously, values surrounding work and success are shifting toward fulfillment, balance, and social impact rather than salary or status alone (Benson et al., 2020; Ng et al., 2005).

Ultimately, the framework conceptualizes career success as a cyclical process of adaptation and value alignment. Each wave of disruption prompts individuals to refine their understanding of success through skill mastery, resilience, and intentional career choices (Luthans et al., 2007). Success is no longer a fixed destination, but an evolving construct shaped by the dynamic interplay between external technological forces and internal reassessment of purpose and meaning (Hall & Chandler, 2005).

Figure 2
Conceptual Framework: Rewriting Success: How Generative AI is Shaping New Definitions of Career Achievement

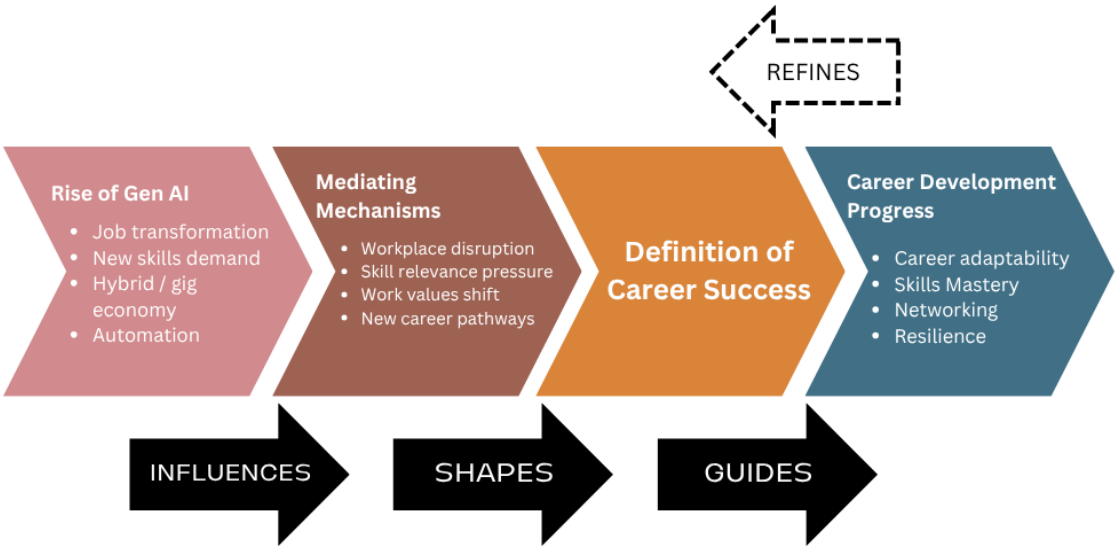

Figure 2 illustrates the conceptual framework of this study, which begins with the *Rise of GenAI*, representing technological disruptions such as job transformation, automation, and the emergence of hybrid and gig economies. These changes introduce Mediating Mechanisms, including workplace disruption, skill relevance pressures, shifting work values, and new career pathways. Together, these mechanisms shape the Definition of Career Success, moving it beyond traditional markers like salary and status toward more dynamic, personalized criteria such as adaptability, purpose, and lifelong learning.

The final component, Career Development Progress, highlights adaptive strategies—career adaptability, skills mastery, networking, and resilience—that guide individuals in navigating this evolving landscape. The dashed arrow labeled "Refines" signifies the cyclical nature of this process, where each stage of career development continuously redefines success in response to technological change and personal value alignment. This framework reflects the study's core argument: success in the GenAI era is not a fixed destination but an ongoing journey shaped by external disruptions and internal adaptation.

Methodology

This study employs a qualitative research design utilizing semi-structured interviews to examine how individuals conceptualize and define career success in the post-2019 era, with particular emphasis on the influence of generative artificial intelligence (GenAI) as a potential disruptor (Kvale & Brinkmann, 2009). Semi-structured interviews are well-suited for investigating abstract or subjective constructs, as they enable participants to articulate their lived experiences while maintaining a consistent framework for comparative analysis (Kvale & Brinkmann, 2009). Data were analyzed using Braun and Clarke's six-phase thematic analysis approach, which facilitates systematic coding and identification of recurring patterns, contextual factors, and emerging redefinitions of career success (Braun & Clarke, 2006).

A purposive, criterion-based sampling strategy was adopted (Patton, 2015), targeting individuals who graduated in 2019 or later and are currently employed. Participants were

recruited primarily from the researcher's professional and social networks, provided they met the inclusion criteria (He et al., 2025). Snowball sampling complemented this process, allowing participants to refer peers who satisfied the eligibility requirements. To capture a broad range of perspectives on career success, the sampling strategy incorporated elements of maximum variation sampling (Patton, 2015) ensuring representation across gender and professional domains. A total of 10 participants were recruited: five male and five female individuals who graduated on or after 2019 and are currently employed in various fields. Wutich et al. (2024), in their study in 2024 reported that theme saturation in qualitative interviews can be achieved with nine interviews. The year 2019 serves as a critical cutoff point, coinciding with the initial integration of GenAI into educational and professional contexts (He et al., 2025). Diversity in gender, occupation, and socioeconomic background was intentional, as prior research indicates that factors such as gender (Dyke & Murphy, 2006) socioeconomic status (Andresen & Stapf, 2023) and cultural background (Benson et al., 2020) significantly influence perceptions of career success. Given that GenAI adoption varies across industries, participants were drawn from multiple sectors to capture both shared and sector-specific nuances.

Data were collected through semi-structured interviews lasting approximately 45–60 minutes. Interviews were conducted either face-to-face or via secure online platforms (e.g., Zoom or Microsoft Teams), depending on participant availability and preference. Prior to participation, individuals received an information sheet outlining the study's purpose, procedures, potential risks, and participant rights. Written informed consent was obtained before the commencement of any interview or recording.

All interviews were audio-recorded with the participants' consent to guarantee the accuracy and comprehensiveness of their responses. The researcher also maintained reflective field notes to capture contextual information, non-verbal cues, and emergent insights during and immediately following each interview. Audio recordings were transcribed verbatim, and all personally identifiable information was removed in accordance with the study's Data Management Plan. Anonymized transcripts constituted the primary dataset for analysis.

The interview guide was informed by established literature on career success and career development, ensuring conceptual coherence and theoretical grounding. Interview questions were organized around the following thematic areas:

1. **Definitions of Career Success.** Initial questions invited participants to articulate their personal definitions of career success, consistent with a study from 2005 on subjective interpretations (Heslin, 2005) and Pico-Saltos et al.'s (2021) conceptualization of success as a cumulative sense of achievement over time. (Pico-Saltos et al., 2021)
2. **Objective and Subjective Markers of Success.** Participants were asked to reflect on both tangible indicators (e.g., salary, promotions) and intangible criteria (e.g., satisfaction, purpose, well-being), drawing on the classic objective–subjective distinction articulated by Judge et al. (1995) and the four-quadrant model proposed by Dries. (Dries et al., 2008; Judge et al., 1995)
3. **Traditional Versus Evolving Conceptions of Success.** Questions explored perceptions of traditional career trajectories and upward mobility, informed by Dries' (2011) work on the shift from hierarchical to more fluid, boundaryless career models. (Arthur et al., 2005)
4. **Perceived Impact of Technology and Generative AI.** Participants reflected on whether and how generative AI influences their understanding of career success, building on Duan and Wu's (2024) argument that technological disruption is redefining work roles, skill requirements, and indicators of achievement. (Duan & Wu, 2024)

5. **Contextual and Social Influences.** Follow-up prompts examined how demographic and structural factors—including gender (Dyke & Murphy, 2006) socioeconomic background (Hennequin, 2007) and cultural context (Benson et al., 2020)—shape individual definitions of success.

All interviews were transcribed verbatim and analyzed using thematic analysis guided by Braun and Clarke's six-phase framework (Braun & Clarke, 2006). The analysis combined inductive coding, allowing themes to emerge directly from the data, with deductive coding informed by existing theoretical frameworks, including the objective–subjective distinction in career success and Dries et al.'s (2008) quadrants (Dries et al., 2008).

Initial codes were iteratively reviewed and refined, leading to the identification of higher-order themes that captured shared patterns in participants' definitions of career success. This analytic approach supported a systematic, transparent, and theoretically informed interpretation of how success is being redefined in the context of generative AI and broader labor market transformations.

Ethical Considerations

The researchers complied with established ethical guidelines to ensure the protection, confidentiality, and well-being of participants. The participants were fully informed of the study's purpose, procedures, and their rights, including voluntary participation, the right to withdraw at any stage without penalty, and assurances of anonymity and data confidentiality. Informed consent was obtained prior to all interviews. To safeguard identities, pseudonyms (e.g., P1–P12) were used in transcripts and reports, and all personally identifying details were removed or generalized. Audio recordings and transcripts were securely stored in password-protected digital files accessible only to the researcher and were permanently deleted following data analysis and dissemination. As the primary researcher is a registered guidance counselor (RGC), participants were briefed before and debriefed after each interview, with opportunities provided to express any discomfort; interviews were paused or discontinued if distress was observed. While the topic posed minimal risk, participants were reminded they could skip questions or withdraw at any time, and referrals to support services were made available if needed. As a gesture of appreciation, participants received a modest honorarium transferred via digital wallet upon completion of the interview.

Results

The thematic analysis of the semi-structured interviews of ten Gen Zs (5 males and 5 females) revealed four major themes describing how early-career professionals define and experience career success in the context of generative artificial intelligence (GenAI): (1) persistence of traditional success markers, (2) emergence of adaptability and continuous learning as indicators of success, (3) human-centric values in AI-mediated work, and (4) coexistence of stability and self-directed career orientations.

Theme 1: Persistence of Traditional Success Markers

Across participants, traditional indicators of career success, such as stable employment, financial security, and professional legitimacy, remained salient. These were very apparent with prominent statements that related to status and financial capacity. Many participants described success as having a "stable job," "reliable income," or "position that proves

competence," particularly during the early stages of their careers. These markers were often linked to family expectations and cultural norms, with participants noting that financial stability was a prerequisite for independence and personal fulfillment. While participants acknowledged changes in the nature of work, traditional success markers were consistently framed as foundational rather than outdated. Answers from the participants included achieving a certain level in their careers, specific asset acquisitions and the likes. It cannot be denied however, that some were noted to veer away from these traditional markers. It can be noted from their answers that they also value "purpose" "passion" and "peace of mind," which are more personal rather than traditional.

Theme 2: Adaptability and Continuous Learning as Emerging Indicators of Success

Participants frequently identified adaptability and the capacity for continuous learning as central indicators of career success in AI-influenced environments. Success was described less in terms of long-term permanence and more in terms of the ability to respond to rapid technological change. Many participants emphasized the importance of "keeping skills updated," "learning how to use AI tools," and "staying relevant" in their fields. Rather than viewing success as a fixed endpoint, participants described it as an ongoing process of adjustment and skill acquisition shaped by evolving workplace demands. In essence, these participants valued continuous learning evolution, even after attaining a certain degree of stability.

Theme 3: Valuing Human-Centric Skills in AI-Mediated Work

Despite recognizing the efficiency and utility of GenAI tools, participants consistently highlighted the importance of preserving human-centric skills. Creativity, critical thinking, ethical judgment, and empathy were described as qualities that distinguish meaningful work from automated tasks. Several participants expressed that success involved knowing "when to rely on AI and when not to," emphasizing responsible and ethical use. These narratives suggest that participants perceive success not as technological mastery alone, but as the balanced integration of AI capabilities with human values and judgment. Additionally, the participants emphasized that AI is not the end all be all, and that it cannot do what the humans do because to quote one participant, AI doesn't have a *"soul,"* which is the edge of what human work can deliver. In fields that value human relationships such as healthcare, you still cannot replace the human touch with an AI mind. Participants reiterate that AI still could not perform surgeries, therapy and the likes. There is still very much a need for social interaction which AI cannot provide.

Theme 4: Coexistence of Stability and Self-Directed Career Orientations

Participants articulated a dual orientation toward career success that combined traditional stability with increased self-direction. While organizational roles and income remained important, participants also emphasized autonomy, flexibility, and alignment with personal values. Some participants described success as having the freedom to explore multiple career paths, pursue side projects, being more in touch with self, having peace of mind, or the ability to redefine goals over time. This coexistence reflects a shift toward more individualized and self-managed career trajectories, while still maintaining concern for economic security.

Discussions

This study examined how early-career professionals define career success in the context of generative artificial intelligence (GenAI), focusing on (1) dominant definitions of success prior to GenAI integration, (2) emerging criteria of success in AI-enabled environments, and (3) how individuals reconcile traditional success markers with evolving work realities. The findings suggest that GenAI does not bring about a radical shift in how success is understood; rather, it accelerates and reframes existing values, reinforcing multidimensional, adaptive, and self-directed conceptions of career achievement.

Traditional Definitions of Career Success Before GenAI

Prior to explicit GenAI integration, participants largely defined career success using traditional, extrinsic indicators such as job and financial stability, adequate income, professional recognition, and upward mobility. These definitions were shaped by family expectations, educational norms, and early workplace socialization, reflecting historically entrenched success schemas. Particularly within the Philippine and broader Asian context, financial security was described as a prerequisite for feeling successful, underscoring the continued importance of pragmatic concerns tied to socioeconomic realities.

However, even before GenAI's rise, participants' narratives already included subjective elements such as personal growth, fulfillment, and work-life balance. It is also worth it to note that these participants also gave a premium to the value they add and the purpose they are fulfilling. This suggests that the shift toward multidimensional career success predates GenAI, aligning with prior literature that frames contemporary success as a combination of objective and subjective dimensions. Rather than viewing traditional markers as obsolete, participants positioned them as foundational—necessary but insufficient on their own.

Emerging Definitions of Career Success in the GenAI Era

With the integration of GenAI into work and learning environments, participants articulated new criteria for evaluating career success, particularly adaptability, continuous learning, autonomy, and relevance. Success was increasingly defined as the ability to "keep up," "learn quickly," and "remain employable" amid rapid technological change. These narratives reflect a movement away from static milestones toward dynamic capabilities, where success is measured by responsiveness to disruption rather than fixed achievements.

This shift is consistent with Career Construction Theory, which emphasizes adaptability and meaning-making in response to vocational challenges. GenAI functioned as a salient career disruptor that prompted participants to reassess their skills, identities, and future trajectories. Success, in this context, was described as an ongoing process of adjustment and recalibration rather than a final destination.

Participants also emphasized increased autonomy and self-direction, key features of the Protean Career Model. GenAI tools were seen as enabling greater independence, efficiency, and flexibility, allowing individuals to shape their careers beyond traditional organizational boundaries. Success was thus reframed as being personally driven and values-based, emphasizing psychological fulfillment alongside professional competence.

Importantly, participants did not equate success with full reliance on AI. Instead, they highlighted the importance of preserving human qualities such as creativity, critical thinking, empathy, and ethical judgment. These attributes were perceived as increasingly valuable precisely because GenAI can replicate or automate technical tasks. As such, success in the GenAI era was framed as effective human–AI integration rather than technological dominance.

Reconciling Traditional and Evolving Success Criteria

A key finding of this study is that participants did not abandon traditional success markers in favor of new, AI-driven ideals. Instead, they articulated a dual orientation in which extrinsic indicators such as salary and stability coexist with intrinsic markers such as purpose, autonomy, and well-being. Traditional markers continued to provide security and legitimacy, while newer criteria offered meaning and sustainability.

This coexistence aligns with Dries et al.'s multidimensional framework of career success, particularly the intrapersonal and affective dimensions. Participants increasingly evaluated success through psychological well-being, value alignment, and resilience, especially in response to perceived uncertainty introduced by GenAI (Dries, 2011). The study's finding that there is no complete shift, but rather a perpetuation and refinement of values, challenges deterministic narratives that portray AI as fundamentally overturning career norms.

Instead, GenAI appears to accelerate an ongoing transition toward protean and boundaryless career orientations. Participants' definitions of success reflect continuity as much as change, suggesting that technological disruption intensifies reflection on existing values rather than replacing them outright.

GenAI, Anxiety, and Adaptive Reframing of Success

Participants also expressed varying degrees of anxiety related to GenAI, particularly concerning job displacement and skill obsolescence. However, this anxiety did not translate into resistance toward technology. Rather, participants reframed success as the ability to adapt, reskill, and collaborate with AI systems. Feeling successful was associated with remaining flexible, employable, and mentally prepared for ongoing change.

This reframing highlights the role of career adaptability and psychological capital in mediating the relationship between technological disruption and career success. GenAI-induced uncertainty prompted greater emphasis on resilience, continuous learning, and proactive career management. Success thus became closely tied to perceived preparedness for the future rather than certainty or permanence.

Cultural Context and Pragmatic Orientations

The findings also underscore the importance of cultural context in shaping definitions of career success. While participants expressed values aligned with protean careers—such as autonomy and self-fulfillment—these were often framed as goals that follow economic stability rather than replace it. This sequencing reflects an Asian pragmatic orientation in which financial security remains central, particularly in early career stages.

GenAI did not diminish these pragmatic concerns; instead, it heightened awareness of the need to balance security with adaptability. Participants' narratives therefore reflect both global

career trends and localized socioeconomic constraints, reinforcing the culturally embedded nature of career success.

Implications for Career Development and Education

The findings suggest that career development initiatives should move beyond narrow employability metrics and incorporate adaptability, ethical AI literacy, and reflective career planning. While GenAI tools can enhance efficiency and personalization, participants' experiences highlight the continued importance of human guidance in navigating uncertainty and meaning making. Career success in the GenAI era requires both technological competence and psychological support.

Conclusion and Recommendations

Overall, this study demonstrates that generative AI is reshaping but not replacing how early-career professionals define career success. Traditional markers such as stability and income remain central, particularly within the Asian cultural context of the study, where financial security continues to be prioritized before higher-order aspirations such as purpose or self-actualization. Rather than signaling a fundamental shift in values, the findings suggest an affirmation and perpetuation of established career success frameworks, now complemented by emerging dimensions such as adaptability, autonomy, and meaningful work. Career success thus emerges as a dynamic, yet continuous, self-constructed process shaped by technological change alongside enduring personal and cultural values.

Importantly, the absence of a clear redefinition of career success at this stage highlights the relative novelty of generative AI in professional life. While GenAI is influencing how work is performed and experienced, it has not yet disrupted the foundational criteria by which early-career professionals assess success. This reinforces the interpretation of generative AI as a reshaping force rather than a transformative replacement, with value systems remaining largely intact as individuals adapt to new technologies.

Given that this topic is emergent, the findings should be interpreted as a snapshot of an evolving phenomenon. Future research would benefit from longitudinal designs that revisit participants over time, particularly after five to ten years, to determine whether prolonged exposure to generative AI leads to substantive shifts in career success definitions. Expanding the number of participants and increasing diversity in terms of geography, industry, career stage, and socioeconomic background would further strengthen the generalizability of insights. Additionally, a systematic review of existing and forthcoming studies would help consolidate fragmented evidence and clarify emerging patterns across contexts.

By emphasizing career success as multidimensional, contextually anchored, and temporally evolving, this study provides a realistic framework for understanding how early-career professionals navigate the future of work in the GenAI era. As generative AI continues to mature and integrate more deeply into professional environments, continued empirical attention is essential to capture whether current patterns of value perpetuation give way to more transformative redefinitions of success.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that no AI or AI-assisted technologies have been used to generate, refine, or correct the content in the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

Appendices

Appendix A
Interview Guide

Rewriting Success: How Generative AI Is Shaping New Definitions of Career Achievement
Proponents: Ma. Asuncion Clara Pantaleon and Arlyn Napenas (facilitators)

Contact details:

ma.asuncion.pantaleon@dlsu.edu.ph
arlyn.napenas@dlsu.edu.ph

Section A. Warm-Up and Background

Can you tell me a little about your educational background and your current job or profession?
Purpose: Build rapport; situate participant's experience within career context (Creswell & Poth, 2018).

Section B. Definitions of Success

When you hear the word "career success," what comes to mind for you? How would you define it in your own terms?
Based on: Heslin (2005) – importance of subjective success interpretations.

Looking back, how did you first learn what "success" meant — from family, school, or early work experiences?
Based on: Nugin & Onken (2010) – career definitions evolve with lived experiences.

Section C. Objective vs. Subjective Markers

What would you consider as signs of success that can be measured or seen by others (e.g., salary, promotions, recognition)?
Based on: Judge et al. (1995) – objective success markers.

What about more personal or internal signs of success, such as fulfillment, growth, or purpose?
Based on: Dries, Pepermans, & Carlier (2008) – subjective success quadrants.

Section D. Traditional vs. Evolving Success

Traditionally, career success was often described as "climbing the ladder" or moving up in an organization. Does this idea still apply to you? Why or why not?
Based on: Dries (2011); Wilensky (1961); Heslin (2005) – hierarchical career models.

Do you think success today involves broader or more personal goals compared to the past? Can you share examples?
Based on: Arthur et al. (2005); Mirvis & Hall (1994) – boundaryless and protean career perspectives.

Section E. Technology and GenAI

In your opinion, how has technology, particularly generative AI, influenced how people define or pursue career success?
Based on: Duan & Wu (2024) – technology as a driver of redefining success.

Have AI tools changed the kinds of skills or values that you believe are important for success in your field?
Based on: Benson et al. (2020); Kaše et al. (2018) – contextual influences on success.

Section F. Personal Influences

How do factors such as your gender, socioeconomic background, or culture shape your idea of career success?
Based on: Dyke & Murphy (2006); Hennequin (2007); Benson et al. (2020).

Section G. Reflection and Closing

If you could give advice to students or graduates just entering the workforce about "how to define success," what would you tell them?
Purpose: Summative reflection; aligns with practical implications for career support programs.

Once the interview is done, the interview facilitator will wrap up the session and will conduct a debriefing session for the participants (not recorded) should they need to express feelings of discomfort or any untowardness in the duration of the interview.

Upon completion of the interview, an amount will be sent via cash transfer to the participants' digital wallet.

Appendix B
Informed Consent Form

Rewriting Success: How Generative AI Is Shaping New Definitions of Career Achievement

Ma. Asuncion Clara Pantaleon (ma.asuncion.pantaleon@dlsu.edu.ph)
Arlyn Napenas (arlyn.napenas@dlsu.edu.ph)

PURPOSE OF THE STUDY

You are being invited to take part in a research study. Before you decide to participate in this study, it is important that you understand why the research is being done and what your participation will involve. Please read the following information carefully and feel free to ask any of the researchers if there is anything that is not clear or if you need more information.

The purpose of this study is ***to explore how individuals who graduated or entered the workforce on or after 2019 define "career success" in light of the rise of Generative AI (GenAI). By gathering perspectives across different professions, this study seeks to understand how success is being redefined in today's technology-driven world.***

STUDY PROCEDURES

The participants of this study will undergo a one-on-one interview with the authors of this research. The interview will last approximately 45 to 60 minutes and will be conducted either face-to-face or online modality, whichever the participant prefers. With your consent, the session will be audio-recorded to ensure accuracy in data collection. You may freely decline to answer any question or withdraw at any point without any consequence.

The data collected is intended for research presentation and publication. This being said, the authors of this research would assure you that your name and any identifying information will not appear in any report or publication. Data will be anonymized, securely stored, and deleted after completion of the study and dissemination of findings.

The questions will revolve around your personal definition of career success, and the factors that influenced this definition. There are 9 questions in the interview, with two being check-in questions and a reflection/closing question to end the session.

DURATION

The interview will last approximately 45 to 60 minutes and will be conducted either face-to-face or online modality, whichever the participant prefers.

VOLUNTARY PARTICIPATION

Your participation in this study is completely voluntary. It is up to you whether or not you decide to participate. If you decide to participate, you will be asked to sign this consent form. After you sign this consent form, you are still free to withdraw at any time and without giving a reason. Withdrawing from this study will not affect the relationship you have, if any, with the researcher. If you withdraw from the study before data collection is completed, your data will be destroyed.

RISKS

While the topic is not inherently sensitive, discussing career success in the context of AI may raise concerns related to job security, personal achievement, or uncertainty about the future. You can opt out of this study at any time, and you can skip any question. If signs of discomfort arise or if you express verbally your intent not to proceed during the interview, the session will be paused, and you will be asked whether you would like to continue. If you experience heightened distress, the session will cease, and an appropriate debriefing session will be provided with information about counseling or support services.

BENEFITS

Data gathered in this study will be very helpful to the improvement and creation of appropriate progams and activities for career development of university students.

In addition, upon completion of the interview, your GCash account number will be collected for purposes of the monetary benefits (Php 300.00). Your account number will then be deleted as soon as this has been completed.

CONFIDENTIALITY

Your responses in this research will be anonymous. Every effort will be made by the researcher to preserve your confidentiality, including the following:

1. Assigning codes for participants that will be used on all research notes and documents;

2. Keeping of notes, interview transcriptions, and any other personal identifiers in the researcher's gadget that will be secured with a password that only the researchers will have access to;

3. Soft copies of notes and research data with personal identifiers are password-protected and has multi-factor authentication enabled for security;

4. Data with identifiers are kept only until the research has been presented and published. After which, all soft copies will be securely deleted;

5. Research results for publication will not include any personal identifiers of the research participant, unless explicit consent was given by the participants;

6. Research participants will be notified, and a separate consent will be asked should any collected data be used beyond the scope of this consent.

CONTACT INFORMATION

If you have any questions at any time about this study, or if you experience any non-normative sensations because of participation, or to exercise your data privacy rights, you may contact any of the researchers whose contact information is on the first page.

CONSENT
This section is mandatory

I have read the provided information, or it has been read to me. I have had the opportunity to ask questions about it and any questions I have asked have been answered to my satisfaction. I understand that I will be given a copy of this form, and the researcher will keep another copy on file. I consent voluntarily to be a participant in this study.

Innovative Learning Management Model to Create Learning Space for Elementary School Students

Tippawan Sukjairungwattana, Silpakorn University, Thailand
Nopporn Chantaranamchoo, Silpakorn University, Thailand
Saranya Chanchusakun, Silpakorn University, Thailand

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Learning spaces play a crucial role in promoting equity in learning and providing opportunities for all learners. This research aims to examine the learning space model and develop guidelines for utilizing an innovative learning management model to create learning spaces for primary school students in the lower central region of Thailand. The study involved 40 key informants, including school administrators, teachers from best-practice schools, and educational academics, with data collected through in-depth interviews and focus group discussions. Qualitative data were analyzed using thematic and content analysis. The findings indicate that the learning space model comprises: (1) active, learner-centered learning management that integrates multiple disciplines and employs project-based approaches; (2) learning management innovations in curriculum, instruction, educational technology, and school administration; (3) learning spaces both within and beyond educational institutions; and (4) learning outcomes that enhance educational opportunities and develop learners' skills. Guidelines for implementing the model emphasize the integration of learning management, learning innovation, and learning spaces, with a recommendation for educational institutions to incorporate technology and environments that foster creative learning engagement.

Keywords: learning innovation, learning management, learning space, elementary school

Introduction

The Sustainable Development Goals (SDGs) in education emphasize the provision of quality education that ensures inclusive and equitable access for all learners, alongside the delivery of vocational education and training at affordable and equitable tuition rates. These efforts are intended to reduce educational, economic, and social inequalities, thereby enabling learners to attain higher standards of educational quality (UNESCO, 2005). Consequently, educational management systems that promote universal access to education have emerged as a critical national priority. Primary education serves as a fundamental foundation for the development of essential skills in reading, writing, and numeracy, which are vital for lifelong learning (UNESCO, 2015) and for advancing educational equity. Moreover, primary education contributes to the development of learners' social, emotional, and problem-solving competencies, enabling them to adapt to societal demands and participate effectively in social contexts. Access to high-quality basic education has a significant influence on future economic opportunities and overall quality of life (World Bank, 2018). Therefore, promoting equitable access to education plays a crucial role in reducing social inequalities and fostering the sustainable development of learners' quality of life.

Enhancing access to education and improving learner quality necessitate the deliberate creation of effective learning spaces. Learning spaces are defined as learning-related environments that encompass both physical and virtual contexts in which teaching and learning activities occur. These environments must be intentionally designed to support knowledge construction, learner engagement, and meaningful interaction between students and teachers. Learning spaces may take diverse forms and serve multiple purposes, including traditional classrooms, out-of-class learning environments, and virtual learning platforms (Thorhauge, 2015). The development of such learning spaces is therefore essential for achieving equity in learning and promoting educational equality. Accordingly, educational institutions must establish environments that support equal learning opportunities for all learners by ensuring accessibility, providing adequate resources, designing inclusive settings, delivering appropriate support services, and fostering community engagement (Oblinger, 2006).

The creation of effective learning spaces requires innovative blended learning management, which represents a systematic approach to instructional design, strategies, and pedagogical methods that integrate time, place, and modes of teaching and learning. This approach combines face-to-face instruction, online interaction, and the strategic use of information technology to construct learning spaces that incorporate both physical and virtual dimensions, supported by interconnected digital systems (Nordquist & Laing, 2015). Such integration enhances flexibility in accommodating diverse learning activities, expands access to learning opportunities, supports personalized learning, encourages collaborative learning, promotes learner autonomy, facilitates anytime-and-anywhere learning support, and develops learning skills aligned with individual learner needs (Thorhauge, 2015). Consequently, the development of learning spaces functions as a key mechanism for advancing equity in learning and improving educational quality.

Learning management constitutes a critical condition for the development of learning spaces and the realization of educational equity. Effective learning management requires careful planning and the purposeful integration of both physical and virtual learning environments. This integrated approach enhances educational experiences, addresses diverse learner needs, and leads to improved learning outcomes (Starr-Glass, 2022). Educational institutions, therefore, need to implement learning management practices grounded in innovation,

commonly referred to as learning innovation. Learning innovation involves the adoption of new strategies, methods, and applications of technologies and practices aimed at enhancing learning processes and environments. It encompasses innovative learning activities, the development of new educational technologies, the application of novel teaching approaches, and the creation of effective learning environments. These innovations enhance teaching and learning processes and improve learner outcomes by fostering more engaging, effective, and meaningful learning experiences, ultimately strengthening educational quality and learners' knowledge and skills (Oblinger, 2006).

For these reasons, educational institutions must adopt innovative learning management models that involve changes in instructional formats, pedagogical methods, and learning processes to ensure equitable access to education for all learners, while simultaneously providing educators with effective approaches to support learner development. Accordingly, this study aims to investigate a model of innovative learning management for the creation of learning spaces for primary school students, with the intention of applying the research findings to benefit educational institutions and to contribute to the enhancement of quality education for learners across all groups.

Literature Review

Concept of Learning Spaces

A learning space refers to a flexible and intentionally designed environment that enables learners and educators to organize learning activities in accordance with users' needs and developmental stages. The design of spatial elements, furniture, and facilities should be adaptable and movable to accommodate a variety of learning activities. Learning spaces support diverse forms of engagement, including conversation, brainstorming, discussion, exhibitions, and the expression of children's and youths' abilities and talents. An effective learning space fosters a positive atmosphere that promotes creativity, enjoyment, and meaningful learning experiences (Thorhauge, 2015).

Learning spaces encompass both tangible physical spaces and virtual environments. Physical learning spaces consider essential environmental factors such as lighting, acoustics, ventilation, and air quality, while virtual learning spaces emphasize usability, accessibility, and the effective integration of information and communication technologies. Contemporary and future learning contexts are increasingly characterized by the integration and connectivity between physical and virtual spaces, enabling more flexible, interactive, and technology-supported learning experiences (Nordquist & Laing, 2015).

The organization of learning spaces through inclusive classroom environments plays a critical role in reducing discrimination and barriers to learning. Inclusive learning spaces enable learners to access appropriate support services, encourage collaborative learning activities, and promote educational equity (Harerimana, 2019). Equity derived from the design and management of learning spaces is therefore essential for ensuring equal learning opportunities, equitable access to qualified teachers, and the availability of high-quality educational resources for all learners. Ultimately, well-designed learning spaces contribute to the overall improvement of educational quality and learner outcomes (Wood et al., 2011).

Concept of Learning Innovation

Learning innovation refers to the creation, adoption, and application of new ideas, methods, and tools that enhance the effectiveness of teaching, learning processes, and learning management. Its primary objective is to transform traditional educational practices so that learning becomes more responsive to contemporary social and technological changes, more relevant to learners' needs, and more engaging in terms of learner participation (Kim & Maloney, 2020). Learning innovation emphasizes active learner engagement, individualized learning management, and the provision of meaningful learning experiences that lead to improved learning outcomes.

Learning innovation comprises three key dimensions. Product innovation refers to innovations related to curriculum development that align with contextual conditions and address individual learner needs, such as integrated curricula, individualized curricula, activity- and experience-based curricula, and locally contextualized curricula (OECD/Eurostat, 2018). Process innovation involves the introduction of innovative teaching and learning approaches, instructional media, and assessment methods designed to enhance learning effectiveness and support learner development. Management innovation focuses on the innovative use of information systems and digital technologies to support administrative management, improve efficiency, and enhance decision-making by educational administrators (Tidd & Bessant, 2021).

Through these dimensions, learning innovation promotes a shift toward learner-centered education and supports the development of essential twenty-first-century competencies, including critical thinking, creativity, collaboration, and problem-solving skills. These competencies are crucial for preparing learners to succeed in complex and rapidly changing social and professional contexts (Fullan & Langworthy, 2014).

Concept of Learning Management

Learning management refers to a systematic process involving the planning, design, organization, implementation, and assessment of learning activities to facilitate effective learning outcomes, with a strong emphasis on learner-centered approaches (Jonassen & Land, 2012). Effective learning management ensures alignment between educational objectives, instructional strategies, learning activities, and assessment practices.

Learning management comprises four key dimensions. Curriculum refers to the analysis of educational goals, the clarification of course objectives, and the formulation of clear and measurable learning outcomes. It also involves the selection and organization of content that aligns with learners' contexts and integrates twenty-first-century skills. Instruction involves the selection and application of appropriate teaching methods and learning management strategies that enable learners to achieve the intended learning objectives. This dimension emphasizes learner-centered instruction and accounts for individual differences among learners, including learning styles, abilities, and interests (Tomlinson, 2014). Measurement refers to the selection of appropriate assessment tools and methods, as well as the analysis of learning outcomes, to monitor learners' progress and development. Evaluation of learning management involves the systematic evaluation of the overall effectiveness of learning management processes, enabling educators to enhance learner quality and continuously improve educational quality (Nitko & Brookhart, 2014).

Research Methodology

This study employed a qualitative research approach to explore innovative learning management practices for creating learning spaces for primary school students. The research procedures were conducted as follows.

Key Informants

The key informants consisted of 20 participants, including school administrators, heads of learning areas, and teachers, drawn from four model primary schools in Thailand. These schools had received national-level awards for excellence in innovation and learning management, indicating their relevance to the objectives of the study. The selection of key informants was based on theoretical sampling (Corbin & Strauss, 2008), a method that involves identifying participants according to their relevance to the research conceptual framework.

Initially, informants were selected based on broadly defined characteristics aligned with the study's conceptual framework. Following data collection from the first informant, the researcher conducted preliminary data analysis and developed tentative hypotheses. These hypotheses then guided the selection of subsequent informants, particularly those expected to provide contrasting perspectives or non-supportive information (negative cases). Data obtained from these informants were continuously compared and used to refine, elaborate, and revise the emerging theoretical interpretations, thereby enhancing the depth and credibility of the findings.

Research Instruments

The primary research instrument was a semi-structured in-depth interview guide. The interview questions were developed based on the research conceptual framework, operational definitions of key constructs, and findings from the initial stage of the study to identify relevant issues for in-depth exploration. Sample interview questions included: How does the school manage learning for primary school students to foster learner development?" "What learning innovations does the school implement for primary school students?" and "How does the school organize learning management to enhance learner development through learning spaces?"

To ensure the quality and appropriateness of the interview guide, pilot testing was conducted with key informants who were not part of the study sites. This process aimed to assess the clarity and comprehensibility of the questions, the alignment of the questions with the research objectives, the logical sequencing of the interview content, and the nature of participants' responses (Charmaz, 2014). Based on the pilot results, the interview guide was revised and refined prior to formal data collection.

Data Analysis

Data analysis was conducted using thematic analysis of the interview data (Creswell, 2018). This analytical process involved systematic coding, categorization, and theme development to identify patterns and relationships within the data. The analysis aimed to generate a comprehensive model of innovative learning management for the creation of learning spaces for primary school students. The resulting model comprises key components, including

learning management conditions, processes for developing learning innovations, mechanisms for creating learning spaces, and learning outcomes.

Research Findings

A Model of Innovative Learning Management for Creating Learning Spaces for Primary School Students

Based on in-depth interviews with key informants from four model primary schools, this study identified a comprehensive model of innovative learning management for creating learning spaces for primary school students. The findings address four interrelated components: (1) learning management conditions, (2) processes for developing learning innovations, (3) the creation of learning spaces, and (4) learning outcomes. Each component is presented in detail below.

Learning Management Conditions

The model primary schools implemented diverse and integrated learning management approaches, including the following:

1. Active learning, emphasizing hands-on practice and active learner participation;
2. Learner-centered learning, which positions students as central agents in a wide range of learning activities;
3. STEM-based learning, integrating science, technology, engineering, and mathematics across disciplinary boundaries; and
4. Project-based learning, in which students learn through projects involving planning, implementation, presentation, and evaluation.

Learning management emerged as a crucial foundation for the development of learning innovations for primary school students. Effective instructional design motivates teachers and schools to develop new teaching models, instructional media, and learning activities that respond to learners' needs and promote engagement, experiential learning, analytical thinking, problem-solving, and creative production. These elements constitute key foundations for classroom innovation. Furthermore, innovative learning management approaches support the creation of learning spaces that enable learners to experiment, explore, and independently develop ideas, thereby enhancing learning efficiency and providing novel and challenging learning experiences for primary school students.

Processes for Developing Learning Innovations

The model primary schools developed learning innovations across four interrelated dimensions:

1. Curriculum innovation, through the development of new curricula incorporating project-based learning and game-based learning;
2. Instructional innovation, through the adoption and refinement of innovative teaching methods;
3. Educational technology innovation, through the integration of online learning with face-to-face instruction; and
4. Educational management innovation, through the systematic use of technology and data to manage educational resources within schools.

The development of learning innovations expanded opportunities for accessing education in diverse forms. Learning innovations played a significant role in creating learning spaces for primary school students by transforming classrooms into environments that foster thinking, hands-on engagement, and interaction among learners. As a result, classrooms became more flexible and diverse, allowing students to select learning activities, instructional media, and learning corners aligned with their interests. Moreover, the integration of educational technology extended learning spaces beyond physical classrooms to virtual environments, enabling learners to access a broader range of information and learning experiences. Consequently, learning innovations contributed to the creation of learning environments that stimulate interest, promote creativity, and enhance the skills of primary school students.

Creation of Learning Spaces

The model primary schools organized learning spaces both within and beyond school settings. On-campus learning spaces included libraries, laboratories, computer rooms, and sports fields. Off-campus learning spaces comprised community-based learning resources, such as community learning centers, natural resource sites, local museums, and religious institutions. These diverse learning spaces enabled schools to connect formal learning with real-world contexts and community resources, thereby enriching learners' educational experiences.

Effects of Creating Learning Spaces

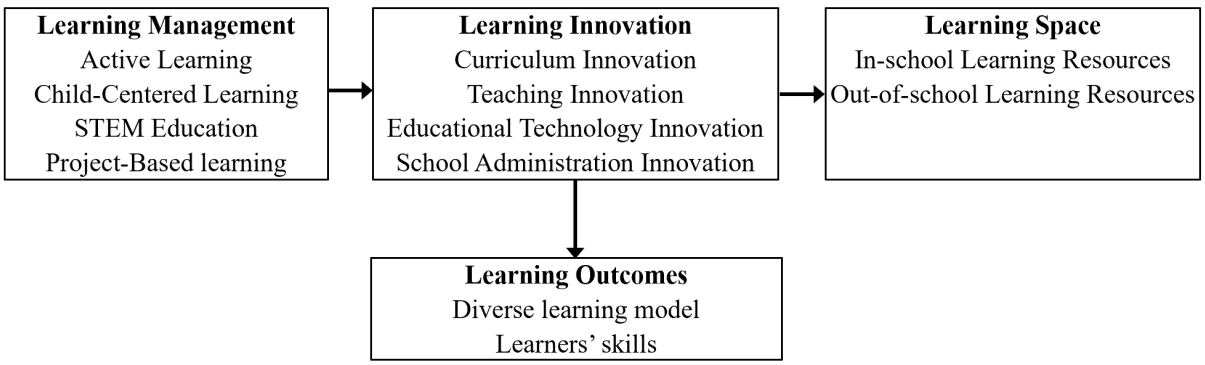
The creation of learning spaces constitutes a critical condition for enhancing learners' learning outcomes. Well-designed learning spaces increase learning efficiency, foster the development of multiple skills, enable learners to select learning methods suited to their individual needs, and reduce barriers to accessing information and new experiences. Such spaces promote equitable learning opportunities, expand access to education, and support the comprehensive development of skills that address learner diversity. Appropriately designed learning spaces therefore have a direct impact on the cognitive, skill-based, and affective development of primary school students by improving academic achievement, enhancing self-confidence, encouraging participation, and fostering positive learner attributes.

Learning Outcomes

Learner-centered learning management, learning innovations aligned with contemporary instructional practices and learner contexts, and flexible learning spaces that support both learning management and innovation collectively enhance learner engagement and development. The success of the model primary schools resulted in learning outcomes in two main areas:

1. Diverse learning modalities, including group learning, experiential learning, online learning, and blended learning; and
2. Learner skill development, encompassing academic competence, analytical thinking skills, collaboration, and responsibility for one's own learning.

These outcomes reflect the effectiveness of innovative learning management in supporting holistic learner development. The findings can be synthesized into a comprehensive model of innovative learning management for creating learning spaces for primary school students.



Theoretical Proposition

The theoretical proposition derived from this study suggests that learning management serves as a fundamental condition for the development of learning innovations and the creation of learning spaces, which together lead systematically to improved learning outcomes for primary school students. The model primary schools employed diverse learning management approaches, including active learning that emphasizes hands-on practice and learner participation; learner-centered learning that positions students as central agents in learning activities; STEM-based learning that integrates multiple disciplines; and project-based learning that promotes learning through planning, implementation, presentation, and evaluation processes. These approaches stimulate analytical thinking, problem-solving, and creativity, which form the foundation for classroom innovation.

Under these learning management conditions, schools developed learning innovations across multiple dimensions—curriculum, instruction, educational technology, and educational management. These innovations transformed classrooms into flexible learning spaces, enabled learners to select learning methods aligned with their interests, and expanded learning spaces from classrooms to community and digital environments. The creation of learning spaces both within schools and in community contexts functions as a supportive condition that enhances access to learning, reduces resource constraints, and promotes educational equity.

Appropriately designed learning spaces directly influence learning outcomes by supporting diverse learning modalities and the development of essential learner skills, including academic knowledge, analytical thinking, collaboration, and responsibility for self-directed learning. These outcomes demonstrate the effectiveness of the model primary schools in fostering holistic learner development, as illustrated in Figure 1.

Figure 1
A Model of Innovative Learning Management for Creating Learning Spaces for Primary School Students

Discussion

Learning management approaches—including Active Learning, learner-centered learning, STEM-based learning through interdisciplinary integration, and project-based learning—serve as key drivers of curriculum innovation. These approaches lead to the development of integrated curricula, individualized curricula, activity- and experience-based curricula, local curricula, and curricula for excellence. In addition, they foster innovations in instructional management aimed at holistic learner development, including the enhancement of basic life skills, self-directed learning skills, analytical thinking skills, systematic learning, and the

application of best practices. This is because learner-centered learning management, particularly Active Learning and project-based learning, encourages teachers to design instructional methods that accommodate diverse learning styles and respond effectively to learners' needs. Learning management that emphasizes hands-on practice, collaboration, and problem-solving supports the creation of learning innovations that promote analytical thinking and self-directed learning.

Moreover, learning management increasingly integrates the use of technology in instruction, including digital media, online learning platforms, and technological tools for creative production. The development of learning innovations through technology supports flexible and accessible learning environments, stimulates learners' interest, and enhances learner engagement by making learning more interactive and enjoyable. Furthermore, learning management that emphasizes interdisciplinary knowledge integration gives rise to learning innovations that address the need to connect knowledge across multiple subject areas. Such innovations enable learners to understand and apply knowledge in real-life contexts and to engage in learning activities linked to their everyday experiences, thereby enhancing the relevance and meaningfulness of learning. These findings are consistent with Muhammad et al. (2024), who reported that physical, virtual, and blended learning spaces enhance student interaction and learning motivation, and that well-designed learning spaces foster more engaging learning environments.

The findings further indicate that learning management approaches including Active Learning, learner-centered learning, STEM-based learning, and project-based learning contribute to the development of learning innovations across multiple domains, including curriculum, instructional methods, educational technology, and school management. These innovations support the development of learning resources that enhance access to learning opportunities and promote the development of learners' skills. Moreover, the results demonstrate that learning innovation has a statistically significant effect on learning spaces. This relationship can be explained by the central role of learning innovation in transforming and enhancing learning environments in terms of instructional practices, spatial organization, and learner outcomes. Learning innovations drive the adaptation of learning environments to better support innovative pedagogical practices and respond to learners' diverse needs. This includes the design of flexible classroom learning spaces that accommodate a wide range of learning activities, as well as the utilization of community resources to expand learning opportunities connected to real-life experiences.

In addition, learning innovations emphasize community participation and the use of local resources in learning management, thereby extending learning spaces beyond the classroom and strengthening connections between learning and students' real-life contexts. This expansion enhances the meaningfulness of learning experiences and fosters stronger relationships between learners and their communities. These findings align with Kotlyarova (2023), who found that creative learning spaces support diverse instructional approaches that stimulate creativity and learner engagement, with interaction playing a critical role in the effective development of educational environments. Consequently, learning spaces both within and beyond educational institutions—are created and enriched through innovative practices and contemporary instructional approaches, including project-based and experiential learning.

Furthermore, the findings reveal that the learning space model for primary school students emphasizes learning innovation across multiple dimensions. Curriculum innovation involves the development of new learning curricula; instructional innovation focuses on the creation of

new teaching methods; educational technology innovation entails the application of new technologies to enhance learning experiences; and school management innovation involves the adoption of innovative technologies and practices for educational administration. Collectively, these forms of innovation play a significant role in creating flexible learning environments, fostering learner engagement, and positioning students as active participants in the learning process through hands-on practice, creative production, and real-life problem-solving. In addition, they promote community involvement in the development of learning resources and ensure that learners from diverse backgrounds have equitable access to a variety of learning modalities.

Research Recommendations

The Importance of Learning Innovation for Learning Spaces

The findings of this study indicate that learning innovation plays a critical role in the development and enhancement of learning spaces. Educational institutions should therefore integrate educational technologies with the intentional design of learning spaces in ways that support creative, interactive, and participatory learning. Such integration enables learners to access information and diverse learning resources equitably, promotes active engagement in self-directed inquiry, and supports the development of essential competencies among primary school students, including collaboration, analytical thinking, and creative thinking skills. Well-designed learning spaces that are grounded in learning innovation thus function as enabling environments that foster inclusive, meaningful, and high-quality learning experiences.

The Importance of Learning Management for Learning Innovation

This study further highlights the importance of learning management as a foundational condition for the development of learning innovation. Educational institutions should encourage teachers to design flexible and open learning environments that support the effective use of technology and the creation of classroom innovations. Flexible and adaptive learning management practices stimulate learners' creativity and problem-solving abilities by allowing them to explore, experiment, and engage in diverse learning activities. Teachers play a crucial role in designing learning experiences that are engaging and motivating, while cultivating an open and supportive classroom atmosphere that encourages learners to experiment with, reflect on, and present new ideas.

Such learning environments promote active learner participation and provide the conditions necessary for the emergence of learning innovations. These innovative learning experiences contribute to the development of essential competencies required in the digital era, including self-directed learning, collaboration, and creative problem-solving. In addition, sustained professional development and institutional support are essential to enhance teachers' competencies in the use of modern media, digital tools, and innovative instructional strategies. By strengthening teachers' capacities in these areas, schools can ensure the effective implementation of learning management practices that integrate technology and innovation, thereby enhancing meaningful and high-quality learning experiences for primary school students.

Conclusion

This study examined an innovative learning management model for creating learning spaces for elementary school students, with the aim of promoting equity in learning and enhancing learner quality. The findings indicate that effective learning spaces are not merely physical or virtual environments, but rather the outcomes of systematic integration among learning management, learning innovation, and learning space design. Learning management approaches such as Active Learning, learner-centered learning, STEM-based learning, and project-based learning function as foundational conditions that stimulate the development of learning innovations aligned with learners' needs and real-life contexts.

Learning innovation plays a critical mediating role in transforming traditional classrooms into flexible, inclusive, and learner-responsive learning spaces. Innovations in curriculum, instructional practices, educational technology, and school management expand learning opportunities and extend learning spaces beyond the classroom to include virtual platforms and community-based resources. These innovations enhance accessibility, promote learner engagement, and support diverse learning modalities that accommodate individual differences among learners. The creation of learning spaces both within and beyond school settings directly contributes to improved learning outcomes by fostering academic achievement, analytical thinking, collaboration, and learners' responsibility for their own learning.

Overall, the proposed model underscores a dynamic and interdependent relationship in which learning management drives learning innovation, which in turn enables the creation of effective learning spaces that lead to meaningful and sustainable learning outcomes. This integrated approach offers practical guidance for educational institutions seeking to enhance educational equity and support holistic learner development in primary education, particularly in contexts characterized by increasing diversity and rapid technological change.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that Grammarly, an AI-assisted writing software, was used in proofreading and refining the language used in the manuscript. The usage was limited to correcting grammatical and spelling errors and rephrasing statements for accuracy and clarity. The author further declares that, apart from Grammarly, no other AI or AI-assisted technologies have been used to generate content in writing the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from appropriate and systematic conduct of the research.

Sustainable English Language Centers Through EdTech and Social Enterprise: Building Human Capital in Resource-Constrained Contexts

Kay Khaing, Myat Kay Khaing English Classes, Myanmar

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Human capital theory suggests that investment in education increases the productivity of a person by building required knowledge and skills; thus, it raises the employability of that person, being enabled to earn good income in later life (Becker, 1964). Human capital, defined as the stock of knowledge and skills within people to increase productivity (Becker, 1964), is essential for national development. Recent OECD research in 2024 confirms that there is a correlation between educational advancement and employment opportunities that are directly propositional for both genders and has remained constant. In conflict-affected countries like Myanmar, proficiency in the English language is viewed as a valuable human capital asset, particularly in a globalized world to reach global and be offered job opportunities (Ali et al., 2023). Human capital theory sees education monetary returns; it encompasses intellectual, social, and emotional capitals, influencing individual satisfaction, customer loyalty, and the holistic well-being of a society. One subject aera, English Language Teaching (ELT) becomes a strategic domain, enhancing individuals' employability and strengthening nation's overall competitive advantage in a globalized economy. In national development perspective, investment in English language acquisition along with the development of sustainable ELT center is essential to both individual advancement and broader socio-economic progress.

Keywords: sustainability, English language teaching, edtech, human capital, social enterprise, equity, poverty reduction, Myanmar, policy recommendations

Introduction

On the road to promote Education for Sustainable development (ESD), one essential criterion to develop human capital, crucial resource in nation building. This principle defines global education systems seeking to balance equity, innovation and resilience while promoting productivity and employability of individuals in the pursuit of equitable education for all. In a conflicted-affected nation such as Myanmar, teaching English Language—a global lingua franca—plays a vital role in helping its citizens, a human capital, to participate in international discourse, enhance employability and promote the knowledge. Equitable access to English education empowers individuals with human capability: i.e. having financial independence, social mobility and resilience to navigate turbulent socio-economic conditions.

Yet, in resource- constrained and conflicted-affected contexts like Myanmar, access to quality English education remains a significant challenge. Political instability, ethnic conflicts, prolong civil war and digital inequity continue to disrupt the education system while the shortage of qualified English teachers, insufficient teacher training, and lack of pedagogical resources limits the effectiveness of public education. These situations prevent many Myanmar students from attending private English Language Teaching centers, widening the gap between privileged and underserved learners.

In such fragile environments, sustainable education model that integrate social innovation and technology usage is a way to ensure equity and resilience. One promising approach is application of Educational Technology (EdTech) with social enterprise framework in the operation of language centers. Edtech offers cost-efficient solutions that improve organization quality, streamline administration and extend educational reach to marginalized learners. On the other hand, social enterprise practices enable to reinvest the profits into socially beneficial action. Together both approaches align economic viability with social responsibility, promoting a pathway toward educational sustainability.

From a theoretical perspective, this single case study draws upon Human Capital Theory (Becker,1964; OECD, 2024) which views education as a key driver of productivity and national development. Within this framework, English Language proficiency is viewed as a key form of human capital in developing nations where it increases the access to global market and profound knowledge of rapid changing world (Ali et al., 2023). Moreover, to solve the social problems such as unequitable education and unemployment, this study applies a self-funded social enterprise model that performs a dual function— advancing social missions while maintaining economic sustainability. Furthermore, the study incorporates social returns on investment (SROI) framework to quantify and measure the effectiveness of the social enterprise movement.

Overall, this case study shows that EdTech-integrated social enterprise models can create sustainable pathways for national development. It can be initiated at small scale at local ELT center like Myat Kay Khaing English Classes, a Pearson Accredited Center in Yangon, Myanmar _ a focal case of this study. By leveraging Edtech to reduce operation costs, reinvesting in building human capital such as employees, teachers and learners, and promoting social innovation aligned with as advocated by UNESCO's 2030 Agenda, the ELT center not only strengthens human capital but also empowers individuals to become capable, self-reliant, and socially responsible members of their communities.

Literature Review

Human capital is the collective value of an individual's knowledge, skills, and other abilities that enable them to be more productive (Becker, 1964; Schultz, 1961). It can be accumulated through training given in the form of either formal education or informal education, and it is represented as one of the most important development assets for both individuals and nations (OECD, 2024).

According to a survey done by Égert, de La Maisonneuve, and Turner (2022), there is a strong link between potential for productivity and education quality than education quantity, reinforcing the central role of education in human capital development. Beyond its economic outcomes, developing human capital involves training individuals to become more responsible for global citizens, promoting social justice, and enhancing global wealth. Education for sustainable Development (ESD) for 2030 aims to build a more just and sustainable world through strengthening ESD and contributing to the achievement of the 17 Sustainable Development Goals (SDGs). Its objective includes integrating ESD and the SDGs into policies, learning environments, capacity-building of educators, the empowerment and mobilization of young people, and local level action (UNESCO, 2020, p. 20). In this regard, ESD contributes readiness within workforce to reach global but also trains learners with the knowledge, skills and values necessary to act responsibly in complex social, economic and environmental contexts (UNESCO, 2020). If poverty is considered a national problem, education should be a mean to tackle.

Inclusive sustainable education ensures all learners from all communities can learn together while integrating in the act of environmental, social and economic sustainability in their daily learning practice. No matter which community a learner is from, education should prepare them with the skills and knowledge to meet different challenges. In fact, being sustainable is no longer additional credit to reward; but an imperative for a firm, or a company, in education context a school or a language center must develop. As noted by Irina Bokova, Former Director-General of UNESCO, reflects the role of sustainable education has a catalytic impact on well-being of individuals and future of our planet (UNESCO, 2017, p. 7). There to lead sustainable and inclusive growth, we need to think the way we define education role in combating challenging.

Within above mentioned educational philosophy, English Language Teaching (ELT) occupies a strategically important position. Given the roles of English language in the global economic context and technological advancement, the acquisition of English language education matters more than ever. English language proficiency enables individuals to have better employment opportunities and higher productivity in an international context. Hence, developing sustainable ELT centers in poverty-stricken and resource-constrained contexts like Myanmar is an educational investment but also a long-term national strategy to fight against poverty and to combat pressing global challenges (Becker, 1964; OECD, 2024).

Furthermore, English language teaching and learning programs are "good value for money", because they have a double dividend of boosting human capital. Yet, tuition costs remain a significant constraint for learners from many disadvantaged backgrounds. Increasing the learning autonomy at ELT center, and lowering the entry barriers will enhance more students' participation and result in favourable outcomes without having financial burden.

Rooted in early economic thought on socially benefit enterprise—where individual can promote collective well-being (Smith, 1776)—the establishment of sustainable ELT centers practicing social enterprises business framework offers a viable solution. Aligning with the contemporary recognition of social responsibility as a core component of sustainable business practice (McKinsey, 2014), ELT centers can initiate social innovation to solve social problem _ that is to strengthen human capital at minimal cost while carrying broader social responsibility, conducting social justice and sustainable national development. ELT centers with social mission can reinvest surplus resources to enhance education access and equity.

Initiating social innovation to solve social problem like enabling more learners from different background should be the primary goal of social enterprise (Investopedia team, 2024). By initiating social enterprise movement, ELT is believed that some of the pressing social problems like the unequitable education system, financial restrains and digital divide can be addressed. As a result, citizens of respective nations or social groups can experience better living conditions, financial freedom and social mobility. Ultimately, social enterprise model position education not just as teaching and learning service but as a transformative force of empowerment and poverty reduction.

With the extensive integration of EdTech, an affordable tool to develop sustainable social enterprise ELT centers, centers can reach undeserved communities while they can narrow the rich gap between urban and rural communities. Going along with Sustainable Development Goal 4, EdTech can function more than its pedagogical function by reducing dependence on physical infrastructure, travel and printed material. Every cost reduction using Edtech becomes every earning for an ELT firm to reinvest again in sustainable program and to contribute equitable education. In addition, social enterprise ELT centers will be able to invest in people to be prepared for an uncertain future while reaching more population.

When measuring the outcome of social enterprise initiatives, the indicator Social Return on Investment (SROI) can be used. Then, entities can not only understand the impact but also use this administrative and decision-making tool to make changes and improvements while allocating resources (ESG Voices, 2024). SROI analysis can be done in many different forms, encompassing overall social value generated entire organization or emphasizing on specific program or research scope. It can be conducted internally by the organization itself or by external research firm (A guide to SROI, 2012). By assigning monetary values to social outcomes, SROI establishes a ratio to measure how much social value is created for every dollar (any form of currency) of investment (Indira Gandhi National Open University, n.d.).

In the context of ELT centres, SROI analysis of ELT center quantify the social and economic value generated by the educational program beyond financial metrics. Although there is no fixed SROI ration for all ELT centers that does not exist die to different circumstances and contexts, the SROI framework remains valuable means to evaluate how such centers create impact through development initiatives, building human capitals (EBSCO, 2025). By this way, there is evidence that ELT generates measurable economic and social value reinforcing the role of them as key drivers of equity, empowerment and national development.

Methods

This study adopts a mixed-methods case study design to explore how English language teaching centers in Myanmar contribute to sustainable education and national development through social enterprise model, which is leveraged by the use of EdTech tools, a main method

in earning revenue and reducing cost of running a center. The current study is conducted at Myat Kay Khaing English Classes, a Person-accredited IGCSE English center in Myanmar that operates as a social enterprise for the period of 4 years from 2021 to 2025.

The approach combines quantitative and qualitative data to provide a comprehensive understanding of the case. Quantitative data includes students' enrolment, employee retention, cost efficiency and outcomes with qualitative response of employee's and educators' experiences. All participants—leaners, staff and educators—were selected using purposive sampling to capture diverse socio-economic backgrounds. Thus, the data present, both measurable and interpretive understandings of how social enterprise, operated with Edtech tools, can build human capital and expand human capabilities.

The aim of the study was to explore the way self-funded ELT social enterprise like Myat Kay Khaing sustain the firm in long term by using array of EdTech tools to create blend learning environment. Thus, this study is guided by following questions:

RQ1: How the use of Edtech tools optimize administrative efficiency and cost reduction and pricing strategy of cross- subsidization.

RQ2: How the collective profits are re-invested in its social enterprise initiatives and social causes like promoting teachers' education, and empowering young people.

Through the integration of EdTech and social enterprise practices, the centre adopts a market practice "Market Inclusion", a strategy to produce a product or a service that represents and caters to consumers from underrepresented, underserved and marginalized consumer segments to reach diverse consumers who will feel, seen, valued and able to participate.

Quantitative data were analysed descriptively to identify trends in enrolment, revenue growth, cost efficiency, and reinvestment patterns. Qualitative data from educators are staff were studied to highlight operational sustainability, workforce development and social enterprise practices. The integration of quantitative and qualitative findings strengthened the validity of the case study.

Findings

During the reporting period of five years from 2021 to 2025, Table 1 shows that the yearly revenue growth of Myat Kay Khaing English Classes show steady increase. Despite tuition fees for premium classes being approximately half of those charged by similar ELT centers, total income increased consistently across the study period.

Table 1
Yearly Revenue Summary of Myat Kay Khaing English Classes

Year	Total Budgeted Income (MMK)	Year- Over- Year Growth	Key Interpretation
2022	220,200,000	—	Recovery phrase from COVID era
2023	283,152,300	+28.6%	Expansion through EdTech Integration and enrolment growth.
2024	399,675,274	+41.1%	More Digital Learning Expansion via Zoom, Cloud-based driving operating system
2025	445,578,879	+11.5%	Stable Cash-Flow and Community Reinvestment

Note. Myat Kay Khaing financial report [2020 to 2025] are audited and reported by Aung Myint Oo & Associates Accounting Firm, Yangon (PA-317, covering the period 2020–2025).

Table 2 presents the distribution of expenditure on educational technology (EdTech) tools for instructional and administrative purposes. The largest proportional of expenditure (76 %) are spent on high teaching tech Investment, followed by software and subscription services (14.7%) and administrative and accounting technologies (10.3%). Smaller proportions of expenditure were directed toward communication and promotion technologies (1.2%) and security and infrastructure investments (3.9%).

Table 2
Expenditure on EdTech Tools at Myat Kay Khaing English Classes Over the Five Year From 2020 to 2025

Category	Examples	Total (MMK)	% of Total Spend
Administrative & Accounting Tech	SQL Accounting Sis, Cloud Storage	4,195,000	10.3
Teaching & Learning Tech	Smart TVs, Laptops, Tablets, Mobile Devices	31,078,850	76.0
Software & Subscription	Zoom, Gmail (Annual License),	6,000,000	14.7
Communication & Promotion Tech	Domain Name, Online Branding	500,000	1.2
Security & Infrastructure	CCTV, Wi-Fi Networks	1,609,900	3.9
Total		40,893,750 MMK	100

Note. Percentages may not total exactly 100 due to rounding. Financial data were audited and reported by Aung Myint Oo & Associates Accounting Firm, Yangon (PA-317), covering the period 2020–2025.

On the other hand, Table 3 summarises several training programs that management employee has to attend. The programmes include Orientation & Onboarding, Soft Skill Training

(Communication & Teamwork), Technical Skill Development, Accounting Skill Development (LCCI, ACCA), HR management training, Customer Service and other employee engagement workshops. In addition, these programs provide educational support through flexible schedules and study leave, financial assistance, skills development through training and workshops, career advancement pathways and health care support.

Based on the internal data and estimated outcomes from training expenditures between 2020 and 2025 Table 3 and Table 4, Myat Kay Khaing invested approximately 3.1 million MMK in different training programs.

Table 3
Training Programs Launched for Employees

Category	Details
Educational Support	Flexible Schedules and Study Leave for Academic Pursuits.
Financial Assistance	Partial Tuition Reimbursement and Scholarships
Skill Development	Access To Training Programs, Workshops and Career Growth Opportunities.
Career Advancement	Clear Pathways for Promotion and Leadership Opportunities After Degree Completion
Well-Being Support	Mentorship, Counselling, And Employee Engagement Activities.

As it mentioned in Table 4, there is clear evidence of continuous professional development (CPD) during the reporting period from 2021–2025. The profits retained from the streamline operation is used for human capital development by giving different trainings such as technical skills, linguistic skills and critical thinking to thrive in a globalized world. The employee training and professional development programs is initiative across multiple departments, including finance and accounting, operations, human resources, and teaching faculty.

Table 4
Reinvestment in Continuous Professional Development Programs

Employees' Departments	Courses	Amount Spent [MMK]	Year
Finance and Account (1 Employee)	Financial Management	256500	2021
Operation	Business Administration	285000	2021
Finance And Accounting	LCCI Lv1 And 2	104000	2022
Finance And Accounting	LCCI Lv1 And 2	104000	2023
Human Resource	Hr Management	250000	2023
Finance And Accounting	Financing	350000	
Operation	Sales And Marketing	400000	
Finance And Accounting	Financing	400000	
8 Assistant Teachers (Previous Works in Public School)	English Language Class [Cambridge Lingua Skill B1 And B2]	70000 Kyats Per Month for Each = 560000 Kyats	

Note. The above-mentioned data is extracted from Myat Kay Khaing Human Resource Record. Myat Kay Khaing financial report [2020 to 2025] are audited and reported by Aung Myint Oo & Associates Accounting Firm, Yangon (PA-317, covering the period 2020–2025

In addition, Table 5 indicates further that there is staff stability and human capital sustainability between 2021–2025. Despite the expansion of business, the center maintained a average 94.6% retention rate. Despite the fluctuations in 2023–2024 which reflect the pains resulted from the unstable labour market after the compulsory military law had been issued, the center retention rate is significantly high. Overall, the data indicate a relatively stable workforce over the five-year period.

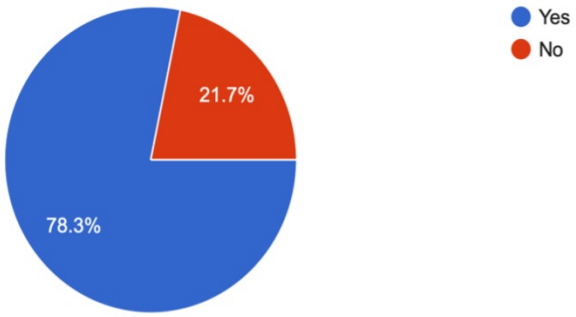

Table 5
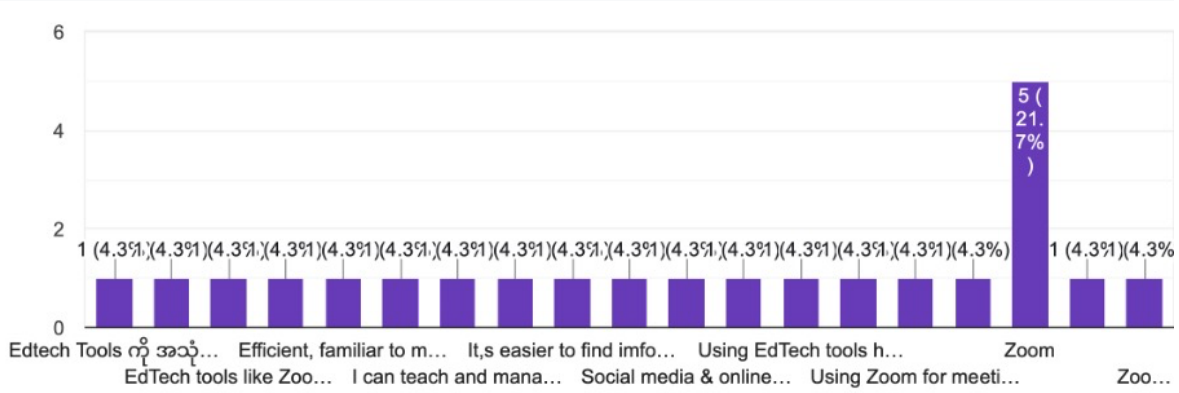
Employee Retention

Year	Description	Number of Employee	Retention
2022	Employee at the start	4	1
	Employee who left	0	
	Employees who remained	4	
	Employees at the end of the year (including new hires)	2	
2023	Employee at the start	6	0.9
	Employee who left	0	
	Employees who remained	6	
	Employees at the end of the year (including new hires)	4	
2024	Employee at the start	12	.83
	Employee who left	2	
	Employees who remained	10	
	Employees at the end of the year (including new hires)	2	
2025	Employee at the start	12	1
	Employee who left	0	
	Employees who remained	12	
	Employees at the end of the year (including new hires)	0	

While quantitative data demonstrate sustained financial growth, strategic reinvestment and high employee retention, qualitative findings provide further insight into how these outcomes were experienced by staff member in practice. Extracted data from survey forms and narrative interview reveals that most employees and assistant teachers benefit from firm's sustainable program and are actively involved in their personal, professional development while committed to organizational well-rounded growth.

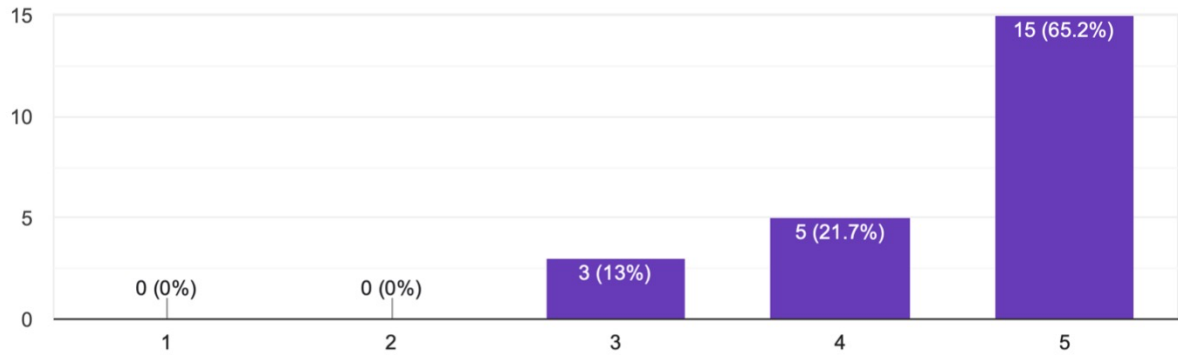
According to internal qualitative survey (2025), it is revealed that 78.3% of staff get opportunities to join different classes, offered as free and optional programs (See Figure 1). These programs were provided as optional and accessible to staff across different roles.

Figure 1
Percentage of Employees Got Training or Professional Development From the How Center



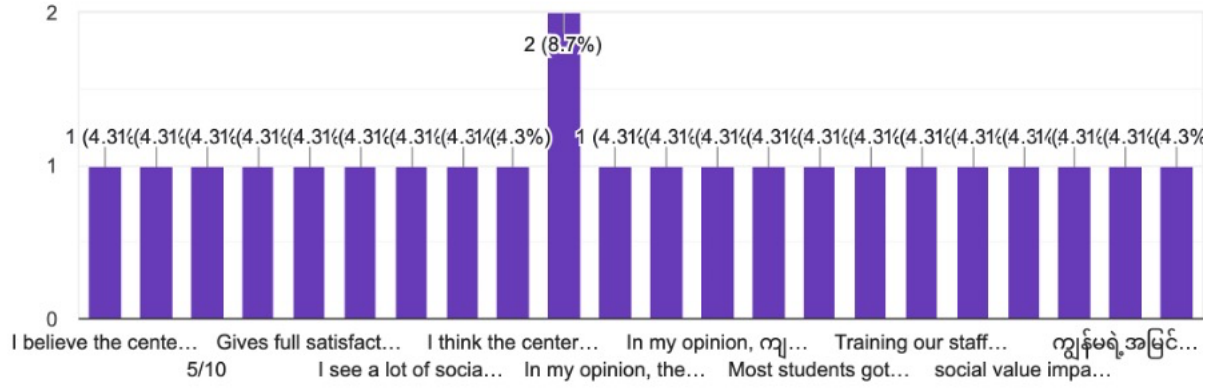
On the qualitative survey responses indicate that EdTech integration contributed to increase digital confidence among teaching staff, particular those used to work at public schools. One teacher reflected:

> When I first join the center, I was already confident in my academic subject's area and teaching. However, I faced challenges related to E-skills which made me feel a bit uncomfortable. So I continued Learning and practicing to become more confident.



Similarly, former public-school teachers who had been away from technology reported that she came to know how to operate and conduct EdTech tools, consistent with internal survey results. (Figure 2)

Figure 2
Employees Responses on EdTech Tools Application Survey Questions



According to the internal qualitative survey (2025), most employees who had been benefited by sustainable practices call high for social value created in the center as shown in figure 1 and it is remarked for good conducts of social investment done by the center (Figure 3). It is also reflected that employees' belief in the center conduct of building human capital which is visible and aligned with enterprise mission and social value creation.

Figure 3
Employees Responses on Social Value Creation

Note: Employee satisfaction level, scaled from 5 = highest to 1= lowest.

Figure 4
Social Value Created for Every Investment on Training

The data of quantitative report and outcomes from qualitative survey require an integrated to assess their broader social and economic significance. In mixed-method research applied in this current case study, combining financial performance indicators with lived experiences enables a more comprehensive understanding of social enterprise impact.

To move beyond the descriptive outcomes and to capture social value generated for stakeholders, this study applies Social Return on Investment (SROI) analysis. SROI provides as structured approach to yield both measurable financial outcomes and non-financial social benefits into comparable value framework, allowing the overall social impact of the ELT center's social enterprise practices to be evaluated.

Despite SROI being just a tool for reflection and learning rather than an absolute precision, conservative financial proxies were applied to quantify environmental and social outcomes in monetary terms (A guide to SROI, UK, 2012). Based on the financial data audited and reported by Aung Myint Oo & Associates Accounting Firm, Yangon (PA-317), it is estimated that social return ration is approximately 1.78:1 – for investing every 1 kyat, there is 1.78 kyats of social value being generated in form of improved education quality, enhanced productivity and employability of human capital, expanded education access (see Table 6).

Table 6
SROI Analysis Proxies and Estimation of Myat Kay Khaing English Classes, 2020–2025

Outcome Area	Social Value Created	Proxy / Monetary Estimate (MMK)	Rationale / Source	Stakeholders Affected
Teacher Development and Training	Improved professional qualifications	2,000,000 MMK per teacher per year	Estimated equivalent of tuition & certification value	Teachers
Employment Creation	Hiring local youth and former public-school teachers to extend business	8,400,000 MMK average annual salary	Average salary from center's HR data (2024)	Organization workforce
Tuition Fee Subsidy	Reduced or free classes for public school students	420,000 MMK per student per year	Average market tuition minus subsidy value (internal finance data)	Public school students
Employee Training and Development	Free community English and career sessions	1,500,000 MKK Per year	Estimated equivalent of tuition & certification value	Local community
EdTech Efficiency	Reduced paper, energy, and operation costs	40,000,000 MMK per year	Internal cost-saving report; reduced printing and physical record keeping	Institution
Staff/ Teacher Retention	Lower turnover cost (training, recruitment)	500,000 MKK per newly employed staff and its required training	Calculated from historical HR turnover data (pre- and post-EdTech integration)	Institution
Brand Social Value	Enhanced trust, visibility, and reputation	5% of annual revenue = 20,000,000 MMK	Conservative proxy for intangible brand equity increase	Institution / Society

Discussion

This study reveals that between 2022 and 2025, Myat Kay Khaing English Class transformed from a post-pandemic ELT center into a self-sufficient social enterprise with over 100% growth in revenue. This transformation highlights the potential of EdTech-Leverage operational models to support both sustainability, resilience and mission-driven objective within resource-constrained educational context.

This financial progression reflects an effective EdTech-Led Cost model where digitalization, automation, and online learning system significantly reduce operational expense. This finding highlights the growing possibilities of EdTech Integration serves as both pedagogical and economic advantage in developing nations, particularly where physical infrastructure and capital are limited.

Importantly, financial sustainability enabled the center to advance its social mission. Profits gained allows the firm to serve its social mission: outreaching students from diverse socio-economic backgrounds, enhancing the English language level of public-school teacher, and empowering young workforce to build their capability to attain financial and social freedom. These responsible movements of the firm enhance the brand identity as a socially engaged enterprise, creating social value.

EdTech tools expenditure reflects a strategic balance between initial hardware setup and ongoing digital transformation. In the case of an ELT firm operating at the 1000 square foot apartment yet giving service to a thousand students across different proficiency levels highlights how EdTech tools enable the small ELT firm to be self-sufficient and self-financed sustainable center.

EdTech tools applications also mean that it is not just technical solution but as a social innovation—empowering human resource—constrained ELT firms to deliver equitable, high-quality education for sustainable development. By the reducing the operation cost using Edtech, Myat Kay Khaing English Classes can empower the youth: those who hasn't got a chance to attend further study or learn at university; those who were unable to find the job that would balance their work and study. Hiring them for different roles in operation, registration and accounting department, Myat Kay Khaing give them a chance to increase their productivity and employability.

Employment record further proved that most youth employees between 20–25 years old had been serving in the industry for more than 3 years old and show low rate of employee retention. It is clear that the center commits to make social enterprise movements for social innovation, solving social problem such as unemployment and education gap. This exemplifies how a small-scale language center can sustain itself economically and serve the social mission of equitable English education access.

Additionally, the study of SROI combined with qualitative research contextualizes these outcomes. The estimated SROI ratio highlights that human capability is strengthened when meaningful social value is continuously generated. Rather than serving as a precise measurement, SROI in this study illustrates social enterprise model of the center as a sustainable and equitable approach to national development for resource-constrain country like Myanmar. This also proves that the center aligns with global definition of social enterprise _ "a business that uses profits to achieve social mission" and enables to initiates its social

innovation, empowering youth in the community (Social Enterprise UK [2012] and OECD [2024]).

If the study is examined in a broader global context, the outcomes of Myat Kay Khaing English Classes reflect those of internation movements that link education, sustainability and social entrepreneurship. If community-based ELT projects in Bangladesh (Ali et al., 2023) is taken as a reflective example to consider, it is demonstrated that social innovation act through English language teaching can improve financial resilience, education equity and inclusion, aligned with UNESCO's education for sustainable Development (ESD 2030) framework.

In this regard, Myat Kay Khaing English Classes contributes as an emerging model that exhibits resource-constrained, context-sensitive, technology-assisted and socially driven, yet remains both sustainable and scalable. It demonstrates adaptability and transferability in other developing region facing similar constraints, offering valuable insights of EdTech Integration and social enterprise practices in the pursuit of sustainable English language education.

Conclusion

While this study recognizes limitation related to data precision, geographical difference, political instability of the country and contextual generalization, the study nonetheless is transferrable and adaptable model of sustainable English language center development in resource-constrained settings. By applying quantitative and qualitative thematic interpretation, the research offers a balanced and credible understanding of how modest and humble ELT center in education sector can yield measurable social value in resource-constrained contexts like Myanmar.

Ultimately, the findings of the study reveal that sustainability in education in not solely dependent on large scale investment, or government funding. instead, it can emerge through EdTech Innovation, Social Enterprise principles and a strong commitment to human capital development. This model thus offers practical insights for policymakers, educators and entrepreneurs seeking to build more sustainable education platform where equity and social justice are prioritized. By expanding undivided opportunities for learning, such initiatives will enable people to gain more social and financial freedom, a prioritized component of national development pathway in resource-constrained context.

Limitation of the Study

This study focuses on one ELT center, Myat Kay Khaing English Classes, in Myanmar. Thus, findings may not be fully generalizable to other ELT centers not only in Myanmar but also in other counties owing to experience different circumstances and available resources, management structures and other socio-economic contexts.

Since the case study is researched and conducted by the founder of studied ELT center, the case study might have researcher bias in interpreting data or presenting results. Although every effort was made to maintain transparency and objectivity, the absence of third-party validation and audited data is concerned limitation.

Moreover, social and economic conditions in Myanmar such as political instability, inflation and internet disruptions can significantly impact the outcome. It is difficult to correlated the success of Myat Kay Khaing English Classes with other ELT centers within nation especial of

those from civil-war affected landscape, and those from suburban or less developed aeras of the country. This might have been the case to different ELT centers established in countries of similar resource-constrained situations.

Finally, the relatively shorter observation period from 2020 to 2025 restricts the study's ability to capture long-term outcomes and monetize intangible social impacts such as learners empowerment, and productivity increments into quantitative values.

Recommendation

This study proposes the model of Myat Kay Khaing English Classes which can be studied as a contextual and transferrable case study, operated in resource-constrained regions. A thorough Longitudinal study written with independent or third-party reviewers to validate the long-term human capital effects particularly in relation to teacher development and human capital progress is recommended. Furthermore, to strengthen the reliability and credibility SROI findings, broader stakeholders'—such as of learners, teachers, community member—perspectives and audited quantitative data are required. Then, such methodological expansion would highlight the generalizability and relevancy of study in wide discussion on sustainable education and social innovation.

Exploring English Education in Taiwan: Perspectives of Foreign English Teachers

Marlena L. Padgett, University of Houston, United States

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

In 2018, Taiwan launched its Bilingual 2030 policy with the goal of strengthening national English proficiency and enhancing global competitiveness. To support this initiative, foreign English teachers were recruited across public and private K–12 educational contexts. While these teachers play a central role in the daily implementation of bilingual education, their perspectives remain underrepresented in empirical research. This study draws on qualitative data from semi-structured interviews with eight foreign English teachers who have been working in Taiwan since the policy's introduction. Using a basic qualitative design informed by a phenomenological lens, the study explores how teachers perceive English education practices, institutional structures, and policy implementation, and how their lived experiences align with or diverge from the stated goals of Bilingual 2030. Thematic analysis revealed three recurring areas of tension: systemic gaps in policy and curriculum implementation, superficial hiring practices, and limited institutional support for culturally relevant teaching. Findings suggest that while bilingual reform has expanded English-rich environments, insufficient curricular guidance, inconsistent teacher preparation standards, and limited cross-cultural collaboration hinder meaningful implementation. The paper concludes by discussing implications for language policy design, teacher recruitment, and professional support structures in multilingual education contexts.

Keywords: bilingual education, English language education, Bilingual 2040 Policy, Taiwan language policy, culturally sustaining pedagogy

iafor
The International Academic Forum
www.iafor.org

Introduction

Throughout Asia, English language fluency continues to play an important role in enhancing a nation's global competitiveness. For Taiwan, the Bilingual 2030 policy is an example of this trend. Beginning in 2018, the policy outlines a vision of bilingualism in Mandarin and English in order to increase Taiwan's economic and cultural connectivity worldwide (National Development Council, 2018). As with many large-scale language policies, the nation's education sector was impacted by the expansion of recruitment for foreign English teachers across K-12 settings (Ministry of Education R.O.C. [Taiwan], 2024). Even with these teachers playing critical roles in helping the Bilingual 2030 policy come to fruition through Taiwanese learners improving their English skills, their voices are rarely highlighted in recent policy evaluations or academic research.

This paper addresses that missing perspective by examining how foreign English teachers in Taiwan perceive English education practices and institutional structures during their time teaching under the Bilingual 2030 initiative. These teachers lived experiences give insight into how this language policy looks in classrooms, specifically highlighting where any gaps emerge between the policy goals and the classroom realities.

Bilingual 2030 Policy vs. Classroom Realities

Taiwan's ambitious Bilingual 2030 policy strives to expand the island's English proficiency. However, the guidance for curriculum goals, instructional practices, and intercultural teacher collaboration across schools has been limited. This misalignment between a policy's overall vision and the realities of classroom implementation reflects what Spolsky (2004) describes as the policy-practice gap. In other words, formal top-down language policies do not necessarily guarantee effective implementation at the classroom level.

Research related to language policy points to the fact that teachers are not simply passive recipients of education reform. They are actively interpreting it, with their professional judgment shaping how policy looks in practice. Kumaravadivelu's (2023) Postmethod pedagogy emphasizes the importance of teachers having agency in their classrooms, especially when institutional guidance is not clear. In bilingual education contexts, the role of teachers as interpreters becomes increasingly challenging as cultural expectations, institutional norms, and uneven access to support come into play.

By placing teachers' perspectives at the front and center, this study provides an opportunity to examine how Taiwan's bilingual policy is understood and implemented by those in classrooms. By acknowledging the classroom as an important site of language policy implementations, this research helps support and contribute to larger conversations surrounding language reform, teacher agency, and instructional realities in Asian and international bilingual education contexts.

Methodology

This study followed a basic qualitative research design aligned with Merriam and Tisdell's (2016) approach, which emphasizes inductive, comparative meaning-making through rich data gathered in in-depth interviews. Interviews were used as the method for data collection, specifically utilizing a semi-structured interview design. This approach allowed participants to

share, in detail, their experiences teaching in English classrooms, which is a viewpoint most non-educators rarely have the chance to hear.

A phenomenological lens was also adopted to emphasize participants' lived experiences and their subjective interpretations of teaching English in Taiwan. Phenomenology aims to understand how individuals experience and interpret a particular phenomenon, focusing on what participants experienced and how they experienced it (Creswell & Poth, 2018). This made adopting a phenomenology lens a strong fit for understanding how foreign teachers interpret and make sense of their day-to-day experiences teaching in Taiwan.

Participants and Data Collection

A purposeful sampling strategy was used to select individuals who could offer both relevant and varied perspectives on English education in Taiwan. Following Merriam and Tisdell's (2016) guidance, a total of eight participants were chosen based on their post-2018 teaching experience in Taiwan and their roles across a range of instructional contexts, including bilingual programs, buxibans, international schools, and private ESL schools. Specific attention was given to ensuring variation across participants' racial and ethnic identities, nationalities, gender, professional training, and years of teaching experience. This diversity was also reflected in the types of schools and grade levels they had taught, which ranged from kindergarten through secondary education. This purposeful sampling approach was intentionally used because it allowed for a wide range of perspectives to be captured. It strengthened the study's ability to gather a more nuanced understanding of foreign teachers' experiences in Taiwan.

Data was collected through eight virtual semi-structured interviews, one with each participant. The questions in these interviews focused on exploring participants' instructional experiences, their perceptions of curriculum and policy expectations, their views on hiring and professional standards, and their experiences navigating cultural and institutional structures. Each interview lasted around one hour and was recorded, transcribed, and member checked before analysis began.

Data Analysis

Data analysis followed a thematic approach. The multi-phase process began with the writing of analytical memos during and immediately after each interview in order to capture observations, emotions, and any early analytic insights. These short, hand-typed reflections were used as preliminary meaning-making tools that helped in the development of initial codes. Then, open, manual coding was used to identify meaningful phrases and emerging patterns seen across interviews using the participants' own language. These hand-curated codes, along with the transcripts, were then uploaded into the qualitative data analysis software Dedoose, which supported in-depth, systematic coding and comparison across all transcripts. Specifically, it analyzed the transcripts and pulled all relevant excerpts from them, which were then taken and manually organized into broader categories in Microsoft Excel. After these categories were combined to develop thematic groups. This iterative process helped thoroughly identify recurring concepts and shared meanings across participant experiences. This facilitated the interpretation of broader institutional and policy-level implications, rather than focusing on isolated incidents.

Findings

The thematic analysis revealed three themes that heavily impacted foreign English teachers' experiences during their time teaching under Taiwan's Bilingual 2030 policy.

Systemic Gaps in Policy and Curriculum Implementation

The first finding shared across all participants' experiences was a consistent lack of curricular guidance. Even though bilingual English-Mandarin Chinese education was promoted as a priority island-wide, teachers all reported being expected to design or modify curriculum on their own, commonly without any alignment across grade levels or coordination with Taiwanese local or national assessment systems. Various English schools and programs often emphasized the presence of foreign-taught English instruction rather than focusing on the quality or progress of the instruction, which resulted in a very wide variety of classroom practice within and between schools. Teachers in the study noted that this lack of curricular guidance made it very difficult to scaffold learning in effective ways for their students each year. This made it so the responsibility for bridging gaps in the curriculum fell on individual teachers within their own classrooms rather than being addressed at an institutional level.

Superficial Hiring Practices

The second theme presented was teachers' perceptions of hiring practices that prioritized native-speaker or "Western" identity over pedagogical training and expertise. Participant shared that oftentimes, formal education training, teaching certifications, and classroom experiences were undervalued or dismissed, specifically within private schools and programs. Many teachers made connections to these patterns representing broader global trends in English language commodification, where the concept of "perceived authenticity" outweighed the actual instructional competence and effectiveness of the teacher (Holiday, 2006).

Some participants shared stories about their time working alongside other foreign teachers who had minimal training or experience in classrooms, which highlighted issues like instructional quality, professional fairness, and equity. These types of experiences align closely with Kubota's (2009) critique of racialized and market-driven hiring practices within the context of global English language teaching.

Limited Support for Culturally Relevant Teaching

Many of the research participants also expressed challenges regarding implementing culturally relevant and sustaining pedagogy. They reflected on primarily teaching using curriculum imported from Western countries such as the United States, the United Kingdom, and Canada, which did not align with many Taiwanese students' linguistic backgrounds, culture, or exam-heavy education system. While it was common for teachers to attempt to adapt teaching materials to better fit their students' needs, the limited collaboration and time with Taiwanese educators and minimal school and institutional support impacted these efforts. Participants shared that they believe that meaningful bilingual education needs to encourage cross-cultural professional development and shared instructional planning, instead of the current isolated attempts at classroom-level modifications and adaptations.

Discussion

After reviewing all of the findings, it is clear that there is a consistent misalignment between Taiwan's national Bilingual 2030 policy goals and the realities of what foreign teachers in classrooms are experiencing. The national policy has promoted the expansion of English language environments island-wide, but the expansion is not enough when placed against inconsistent curriculum frameworks, inequitable hiring practices, and limited professional collaboration to support culturally sustaining teaching practices.

These findings support Spolsky's (2004) work surrounding language policy and how its success depends on alignment between policy goals and institutional practice. Without any clear and consistent curriculum accountability, equitable hiring practices, and established collaboration opportunities that support cross-cultural professional development, the current bilingual 2030 policy will remain more of a symbol rather than an island-wide transformation.

Conclusion

The voices of foreign teachers in this study uncover a clear gap between Taiwan's bilingual policy goals and the daily realities in English classrooms. Bilingual 2030 has clear goals, but its success is being hindered by challenges, especially around misaligned curriculum, superficial hiring practices, and limited support for culturally relevant teaching. These kinds of issues don't just make teaching more difficult, but they also prevent schools from using proven language teaching methods that are adapted to students' needs and cultural backgrounds.

Bilingual 2030 must become more than just a slogan—it must be backed by actionable, systemic change. For the policy to succeed, Taiwan must prioritize the development of meaningful, culturally responsive curricula; uphold the professional dignity of all teachers; and build intentional structures for cross-cultural instructional collaboration. This study offers concrete starting points for that work and reinforces the idea that foreign and Taiwanese language educators are not just implementers of policy, but essential partners in shaping a more inclusive, equitable, and effective future for English education in Taiwan.

From Anxiety to Engagement: Inclusive Strategies for Low-Proficiency EFL Learners in Japan

Ikhlas Abdul Hadi, Globiz Professional University, Japan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Previous research on English language learning in Japan indicates that many students feel nervous about the communicative aspects of class, partly due to limited opportunities to use English in natural settings (Gullikson, 2024, pp. 15–16). This paper examines an English program at a Japanese professional university (専門職大学) in which students engaged in weekly conversations with native English speakers from the United States over a one-month period. The study investigates how this program influenced students' intrinsic motivation to learn English while managing cognitive load during authentic communication. Although conversational classes in the institution are typically reserved for intermediate to advanced learners, findings show that with targeted scaffolding by instructors, even low-proficiency students were able to participate meaningfully. The results suggest that structured interaction with native speakers, combined with pedagogical scaffolding, can reduce learner anxiety, support cognitive processing, and enhance motivation in low-proficiency EFL contexts. These findings have implications for designing inclusive communicative programs in vocational education settings.

Keywords: EFL, Japan, conversation classes, native speaker, low-proficiency, motivation, cognitive load, instructional design

iafor
The International Academic Forum
www.iafor.org

Introduction

This study builds on previous research on cognitive load and motivation in an English as a Foreign Language (EFL) classroom, taking a special interest in the way classroom considerations differ in a professional university (専門職大学) setting in Japan. Abdul Hadi (2025) had previously looked into managing cognitive load in a Content Language Integrated Classroom through the implementation of the Sustainable Development Goals (SDG) as a course subject in a Japanese vocational college (専門学校) among intermediate and advanced proficiency EFL students. Earlier, Abdul Hadi and Ekstrom (2024) had looked into the critical thinking aspect of SDG courses on advanced proficiency students in the same vocational college. However, despite belonging to the same parent company, the students that attended these institutions differed in terms of language capabilities as well as motivations. This study takes previous theoretical understandings on cognitive load and motivation, links them with established classroom pedagogies, and applies them to a language exchange program conducted as part of an English-language course at a professional university in Kanagawa, Japan. This paper hopes to suggest a method of managing low-proficiency students' motivations when learning and utilizing English in their everyday lives.

Japan, English Language Education, and the Professional University

Despite Japan's growth in number of foreign residents, Japan's indigenous population remains the majority at over 97% (Inoue, 2025). With such a statistic, it is perhaps no surprise that EFL classes find Japanese students generally unmotivated to learn the target language (Gullikson, 2024, p. 14). Indeed, because of a lack of real-world opportunities to engage with and practice the language, many Japanese students face "language anxiety" in the EFL classroom. Language anxiety is characterized as "the fear or nervousness associated with 'making mistakes' or receiving negative feedback from a teacher, peer, or a native speaker of the target language" and can lead to negative effects in learning and producing the language (Gullikson, 2024, p. 16). This, coupled with the fact that Japanese students have gone through many years of learning EFL through sheer memorization to answer exams (Gullikson, 2024; Vicente et al., 2024), creates a generally unmotivated EFL learner once the student graduates to higher learning institutions.

An important point to note regarding EFL research in Japan is that they have tended to be based on university or high school students where the demographics steer towards a monocultural classroom made up of Japanese students between 18 to 24 years of age. There are significantly less studies conducted in another higher educational institution: the vocational college, or the 専門学校 (*senmon gakko*). In addition to the difference in purpose of studying, where these institutions find students who seek specific training that would prepare them for a particular industry, each vocational college boasts students from varying types of backgrounds. This is especially true in the case of one vocational college in Kanagawa, where students differed in terms of age, nationalities, as well as work experience (Abdul Hadi, 2025, Abdul Hadi & Ekstrom, 2024). In Abdul Hadi's (2025) study, it was noted that in the Kanagawa vocational college, older students' motivation for learning English was mostly extrinsic, owing perhaps to their previous work experience where they saw how English could be used in the workplace (Abdul Hadi, 2025, p. 93). For the younger students under 25 years of age, they joined a class on SDGs because of their own interest in the subject – perhaps due to the topical relevance of the course (Abdul Hadi, 2025, p. 93). These studies show that the motivations that go into EFL learning in Japan may find more nuance when more research is given to other higher learning institutions besides universities.

A new category had been introduced in Japan in 2023: the professional university, or the 専門職大学 (*senmon-shoku daigaku*). Unlike a regular university or a vocational college, a professional university has both theory as well as practice in a professional field of choice. Students in a professional university have on-site training outside the university campus for over 600 hours through a 4-year program (approximately 15 weeks of training). The classes in a professional university are also kept small, with a maximum of 40 students per class. Once a professional university degree has been obtained, the student can use it to either obtain a job, a graduate degree, or even study abroad. As of September 2025, there are only 16 private professional universities, and 3 public professional universities (MEXT, 2025). EFL research in terms of the effects of cognitive load on student motivations is understandably lacking and thus would be beneficial towards providing a more holistic view of English Language Teaching (ELT) in Japan.

Understanding Motivation, Cognitive Load, and the EFL Classroom

Motivation is a popular topic amongst EFL instructors. It is undeniably an important aspect of ELT because no matter how much a teacher prepares for a class, the efforts could be undone by the motivations or lack of motivation from the students. But what do we actually mean when we talk about student motivations? For the purposes of this study, this paper will look at motivation from two perspectives: firstly, from the students' perspectives of their own capabilities and interests, and secondly, the students' perspective of the tasks set out for them in the EFL classroom.

In terms of students' perspectives of their own capabilities and interests, Zoltan Dörnyei has outlined two theories in motivation studies: self-efficacy theory and self-worth theory (1998, p. 119). In the former, this theory revolves around a person's perception of their own capabilities and how that drives their actions. When thinking about this theory from the EFL perspective, a student's perception of their English language skills might affect how they behave in class. For example, if they feel that their conversational skills are lacking, they might be less motivated to take part in communicative exercises. This perception of competence in a subject can also be termed "academic self-efficacy" (Hirosawa et al., 2024). Self-worth theory, on the other hand, is related to a feeling of needing to "maintain one's self-esteem" (Dörnyei, 1998, p. 119); from the perspective of the EFL classroom, students may or may not take part in an activity motivated by a need to ensure that they don't lose face because of a perceived lack of skill.

In the previous section, a discussion had been made on the unique position of English language education in Japan. In this sense, we could talk about the "value" of the EFL class to Japanese students. This paper will use the four components of motivation value as outlined by Eccles and Wigfield (1995): attainment value, intrinsic value, extrinsic utility value, and cost. The first three aspects mentioned are considered across a "positive" scale where attainment value refers to how a task might align with one's "personal values and needs"; intrinsic value brings "enjoyment or pleasure"; and extrinsic utility value brings about "usefulness" in the future. The "cost" is the "negative" aspect of this value system where a student might deliberate the effort, time, and emotional costs of engaging in a task. When looking at how a student might value EFL classroom activities, they might then look across all four of these dimensions which would then increase or decrease motivation to take part in the lesson (Dörnyei, 1998, p. 120).

The motivational "costs" could also be related to the concept of the cognitive load needed to carry out an activity. In this theory, it is assumed that a person has "limited working memory"

at a given time where the mind is able to "deal with information for no more than a few seconds with almost all information lost after about 20 seconds unless it is refreshed by rehearsal" (van Merrienboer & Sweller, 2005, p. 148). From a pedagogical perspective, this means that a student's capability in approaching a task is related to how difficult the task is and the amount of "mental space" the student has to deal with it. Therefore, the higher the cognitive load, the more difficult the task appears to be for the student, and thus the higher the motivational "costs".

When thinking of designing a class or a lesson, it is integral that a teacher takes into account three different types of cognitive load: intrinsic (ICL), extraneous (ECL), and germane (Sweller, 2010; Seller et al., 1998). ICL refers to how difficult the task actually is; for example, "Mary Had a Little Lamb" would have a lower ICL than that of Queen's "Bohemian Rhapsody" to an EFL learner. ECL is the manner in which the task is presented; for example, when presenting the aforementioned songs to the students, presenting them purely as a listening exercise without lyrics might invoke a higher level of ECL than if the students had a piece of text to follow during the listening activity. Finally, the germane deals with the cognitive "demands of learning itself"; how difficult do students find learning English in Japan? It is therefore unsurprising that:

> Good pedagogical practice, then, will carefully assess the cognitive burden placed by the material to be learned (intrinsic load) as well as the instructional formats (extraneous and germane loads) in order to avoid cognitive overload. (Groff, 2020, p. 76)

Communicative English Classes in Japan

One way that EFL instructors have attempted to increase motivation in learning and utilizing the target language is through creating more communicative activities or classes. In an early study on learning English in an ESL classroom, Long (1983) cited educational philosopher Krashen's natural approach to language learning as a better teaching method for non-native speakers as it afforded more meaningful communication to the students (Long, 1983, p. 96). Decades later, EFL teachers continuously seek to provide such meaningful communication in their classes, especially in Japan.

One activity that is frequently used in EFL courses in Japan can be labelled as "conversation classes", usually named "English cafe" in higher learning institutions. As evidenced by the name, the goal of such a class is to provide students with a low-stress environment that focuses on practicing their verbal skills. In one study that looked into an English Cafe as an extracurricular program, the authors found that it was generally seen favorably by the students to "improve their linguistic skills, especially their aural and oral proficiency" (Johnson and Hiratsuka, 2018, p. 40). In this study, the students' proficiency levels varied, with participation encouraged from all levels, including that of beginner's proficiency. However, the authors noted that for students with lower proficiency, they "should be provided with the necessary scaffolding to feel comfortable in partaking in the activities".

Another English Cafe study took place in a nursing school at Otemae University. This activity was a non-credit elective held once a week (Nishimura et al., 2021, p. 25). These students had strong external motivation as there is a very real growing need to attend to English-speaking patients in their future jobs. One similarity between the sample group in Nishimura et al.'s (2021) study and this research is that the students are of low-proficiency in English. This paper provides an interesting look at what can be achieved using conversation-based activities for these groups of students. One activity that seemed to work was memorization of a script that

led to building student confidence; through this confidence, students would attempt to speak without looking at a script (Nishimura et al., 2021, p. 50). Another important consideration was the encouragement of any type of communication to foster good relationships; in this study, this includes friendly expressions, body language, and even one-word answers (Nishimura et al., 2021, p. 50). This shows that students also can enhance their English communicative capabilities beyond making grammatically-correct constructions.

In Shinshu University, the students led an English Cafe activity that were TED Talk-styled events where the focus was on "thinking, expressing, and communicating" ideas rather than on practicing English per se (Fujita & Ong, 2018, p. 33). A noteworthy aspect of this activity is that the students who have had experience navigating an English-speaking world (those who have studied abroad or who were international students) were more motivated to join discussion-based activities and to be more globally minded (Fujita & Ong, 2018, pp. 41–42). It is an interesting point that might provide a layer of nuance to studies on communicative activities in a Japanese EFL classroom - to what extent do students' own interactions with the outside world fuel their motivation to learn English?

Beyond these English Cafes, Gomez (2021) discussed project-based learning (PBL) as a method to encourage high-proficiency students to communicate more naturally in English. In his study, while the students all held TOEIC scores between 710 and 965, Gomez found that because the students were all Japanese, they would opt to use Japanese to "efficiently" complete their tasks even though they were all highly motivated and desired to use English more in the classroom (Gomez, 2021, p. 40). This appears to show that it is not only low-proficiency students who struggle to maintain a conversation in English, but also high-proficiency students too. Therefore, when planning an activity, an instructor needs to consider the extent to which a student may use Japanese (or a different native language) when attempting to complete a task.

Finally, a particularly useful communicative opportunity for EFL learning is through exchange programs with native English speakers. Obviously, this is not a privilege that all higher learning institutions can afford to provide. Tsuneyoshi (2005) has discussed the difficulty of creating such a program in Japan and, surprisingly, even in the prestigious University of Tokyo itself. The author cites the gap between local students' language capabilities and the language required in an English-oriented lecture, as well as the local students' cultural expectations towards a university course and the international (Western) expectations of a university course (Tsuneyoshi, 2005, pp. 71–72, p. 79). As such, in the early days of implementing an exchange program at the University of Tokyo, specific courses had to be created for the exchange students. Unfortunately, these courses did not necessarily match the linguistic capabilities of the local students. Tsuneyoshi's (2005) paper showed the intricacy of communication between native and non-native speakers of English.

These studies show the various ways in which Japanese EFL classrooms have attempted to encourage its students to use the target language. Using their discussions and results as inspiration, a study was conducted in a professional university to test the usage of conversation classes on student motivation to use English for a communicative purpose.

Methodology

Acquiring EFL Through Conversational Classes With English Native Speakers in a Professional University

Applied English Communication is a year-long course that is split across two semesters. The students in the professional university in Kanagawa are divided according to their English language proficiency: those acquiring a TOEIC score of above 500 are placed in the "A" or Advanced English class, while those with a score lower than 500 are placed in the "B" or Basic English class. The participants in this study were in the "B" class. In this class, the textbook used as the basis for the conversational activities was *Glances of Japan* (2020) by Sakabe Toshiyuki (坂部俊行), Okajima Noriaki (岡島徳昭), and Howard Tarnoff.

The B class consisted of 25 students; 24 of the students were either Japanese and/or had grown up and been educated in Japan, while one student had immigrated to Japan as an adult. 17 students were boys and 8 students were girls; 11 students were 18 years old, 7 were 19 years old, 5 were 20 years old, and 2 were 21 years old. 15 of the students were first-year students and new to the class; 8 students were second-year students, and 2 were third-year students. As mentioned earlier, the B class consisted of students who scored under 500 points in TOEIC; however, it is worth noting that only one student scored above 400 points. 7 students scored above 300 points, 12 students scored over 200 points, 2 students scored over 100 points, and 3 students scored under 100 points. Scoring under 100 points is objectively near-impossible given the way in which TOEIC calculates the points. For these three students, they most probably had left their answers blank, resulting in a randomized placeholder score. From these results, however, it can be concluded that the B class consisted of students with beginner level proficiency, similar to CEFR A1 or A2 level.

In the first semester of the Applied English Communication course, the professional university had set up a language and cultural exchange program with American university students as well as a university professor. In the B class, the fifteen weeks of classes were divided as follows:

Preparation Stage (Weeks 1 to 5)

Before class began, students answered a survey looking into their interest in learning English as well as their feelings towards speaking with native English speakers. These questions included:

1. How confident are you in speaking English? あなたは英語を話すことにどれくらい自信がありますか?
2. How confident are you in your English listening skills? あなたは英語のリスニングにどれくらい自信がありますか?
3. How interested are you in learning English? あなたは英語を学ぶことにどれくらい興味がありますか?
4. How do you feel about speaking with the American students next month? 来月、アメリカの学生たちと話すことについてどう思いますか？

Students answered these questions on a 5-point and 4-point scale. Questions 1 and 2 offered the scale from 0 being "Not confident at all" to 5 being "Very confident"; Question 3 offered the scale from 0 being "Not interested at all" to 5 being "Very interested"; Question 4 avoided

a neutral number and gave the following options: Excited, Nervous, but excited, Nervous, and No strong feelings.

The first five weeks were spent working on the content of the textbook and preparing for a lecture and discussion session with the exchange students and professor. The topics chosen from the textbook are based on the ease of the content (being low ICL) as well as the possible interest it might generate for both the professional university students as well as the exchange students later. The topics were:

1) Animal cafes
2) Stand-up eateries (立ち食い)
3) Japanese spas (スーパー銭湯)
4) Karaoke

During these classes, students familiarized themselves with the English vocabulary associated with the topics through listening, reading, and writing exercises. Later, they answered discussion questions based on their own personal experiences or opinions, and then they were to create a set of ten questions to ask the American students on these topics.

In the fifth and final week of the preparation period, students were given lecture points provided by the American professor and they were briefed on strategies to deal with a 50-minute lecture session completely in English.

Language and Cultural Exchange Stage (Weeks 6–10)

The sixth week saw the A and B students join in one class to listen to an introductory lecture in English by an American professor. The A and B students engaged in communicative exchanges with both each other as well as the professor during this lecture.

The seventh, eighth, and ninth weeks saw the students with 6 exchange students. The first 50 minutes of each class were spent reviewing notes and materials from the Preparatory Stage. The final 50 minutes were spent with the exchange students. 5 of the exchange students were boys and one was a girl. The professional university students sat in groups of 3 or 4 and the exchange students took turns speaking with each group for 8 minutes. On Weeks 7 and 8, students answered survey questions about their experiences with the exchange students:

1. How confident are you in speaking English? あなたは英語を話すことにどれくらい自信がありますか?
2. How confident are you in your English listening skills? あなたは英語のリスニングにどれくらい自信がありますか?
3. How interested are you in learning English? あなたは英語を学ぶことにどれくらい興味がありますか?
4. You've already spoken to American students twice, but how do you feel about speaking to them two more times? アメリカの学生たちとはすでに 2 回お話されていますが、あと 2 回お話することについてどうお考えですか？
5. Please rate the level of difficulty for American students. アメリカの学生の理解の難しさを評価してください
6. How helpful was our lesson where we prepared for these? これらの会話の準備をするためのレッスンはどれくらい役に立ちましたか？

7. Did you use your notes and answers during the conversations? 会話中にメモや回答を使用しましたか?

Answer options for Questions 1–4 were the same as for the pre-class survey. Question 5 provided a scale of 1 being “I couldn't understand anything まったく理解” and 5 being “It was very easy to understand よく理解”. Question 6 provided a similar scale where 1 was “Not helpful at all まったく役に立たなかった” and 5 was “Very helpful とても役に立った”. Finally, Question 7 had three options: “Yes”, “No”, or “Sometimes”.

In the final language and cultural exchange class, the A and B students joined classes again. For the first 50 minutes, the students used the preparatory materials from class. The final 50 minutes were based on more impromptu conversations. Students answered a final survey at the end of this session, which included the following questions:

1. I can actively participate in conversations in English. (1: Strongly disagree to 5: Strongly agree)
2. I can communicate smoothly in English. (1: Strongly disagree to 5: Strongly agree)
3. I am confident in my English listening ability. (1: Not at all - 5: Very much)
4. I think my English-speaking ability will improve. (1: Strongly disagree – 5: Strongly agree)
5. I can use English words and expressions naturally. (1: Strongly disagree to 5: Strongly agree)
6. I can speak English without worrying about grammar. (1: Strongly disagree to 5: Strongly agree)
7. I am confident in my reading and writing skills. (1: Strongly disagree to 5: Strongly agree)
8. I am motivated to learn English. (1: Not at all, 5: Very much)

Review Stage (Weeks 11 to 15)

The final five weeks were spent on the textbook and preparing for presentations and final interviews with the class lecturer. Students studied four more chapters:

1. Ramen / Soba
2. Gyudon / Bento

Based on these chapters, the students answered questions on their favorite food. They presented these answers to their class and then memorized the answers for a final interview with the instructor.

Results and Discussion

This class had been designed to ensure that students would become more motivated and confident in using the English language skills learned in the classroom. Conversation-based classes when one is in the beginner’s stage of language learning is daunting, thus appropriate scaffolding was set up to ensure that the ICL of the course content and the ECL of the instructional design didn’t overwhelm the students. With these considerations in place, it was hoped that the B students would be more motivated to use English with their peers.

Before class started, students generally self-reported that their English capabilities were low. In terms of listening skills, 44% of the students reported that they had “No confidence at all”

and no student reported that they were “Very confident” in their speaking capabilities. 32% of students reported that they had “No confidence at all” in their listening skills as well. This seemed to correlate with their low TOEIC scores prior to entering class. A breakdown of the answers can be seen in the following figures.

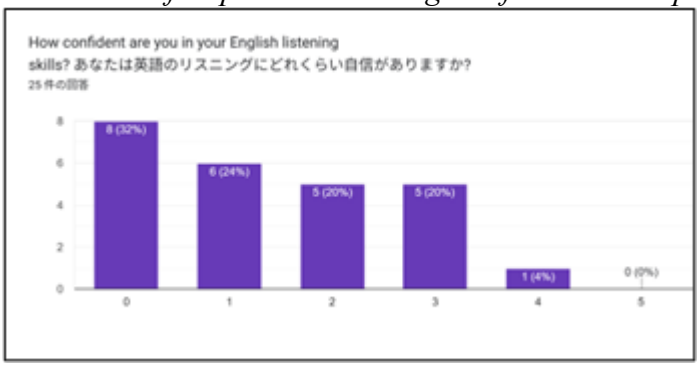

Figure 1

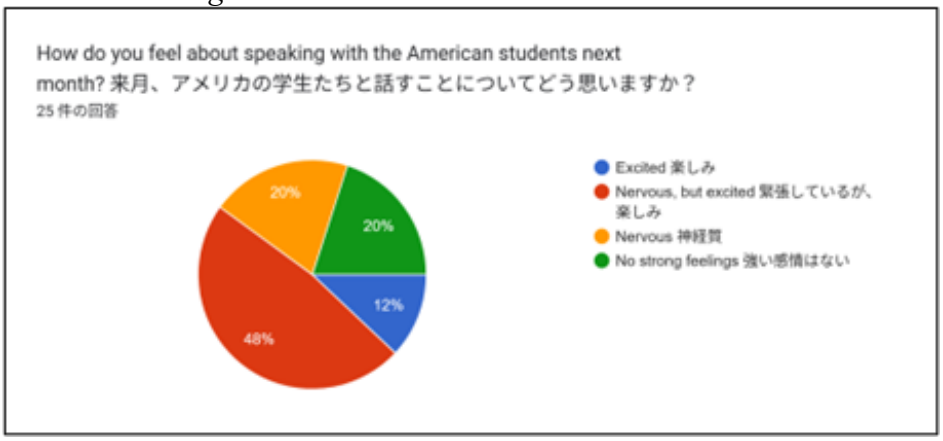
Students’ Self-Report on Speaking Confidence – Preparation Stage

Figure 2



Students’ Self-Report on Listening Confidence – Preparation Stage

However, despite their relatively low confidence in their English capabilities, 20% of the students reported that they were “Very interested” in learning English, and 60% of students were either “Excited” or “Nervous, but excited” about speaking with the American exchange students.

Figure 3

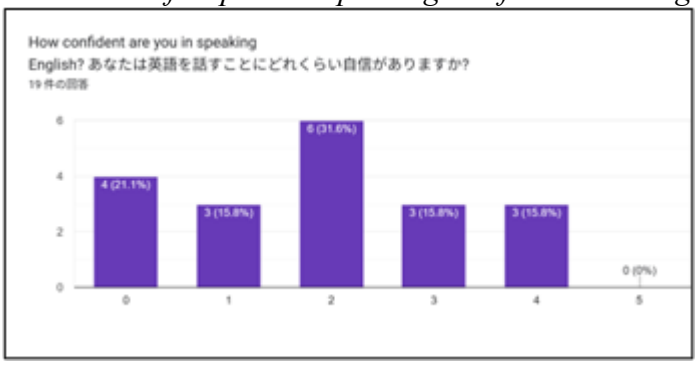
Students’ Feelings towards Conversation Classes With American Students – Preparation Stage

These results seem to mimic the students' preparation for the conversation classes. Based on the instructor's own notes taken while observing the class, the students were generally quiet but a majority were diligent in completing the textbook work. Interestingly, the first-year students had a harder time completing questions with their own opinions and many struggled to come up with ten questions on their topics to ask the exchange students. This may be due to the students' lack of connection to a world outside of Japan, and thus they lacked the capability to imagine the type of questions or answers that would be relevant to such an interaction. The students' capabilities seem to mirror those in Fujita and Ong's (2018) previous study, where the English Cafe program was attended mostly by students who had undergone an overseas exchange program, perhaps indicating a better capability to hold more unstructured conversations (41–42). Second and third year students who had already engaged in the exchange program the previous year were more capable of generating answers as well as questions for the American students.

Because of the students' quietness during the preparatory stage, it was surprising that they were quite communicative during the language and cultural exchange stage. Though a handful of students hung back and did not speak much, they were otherwise engaged and made an effort to respond. This seemed to be reflected in the survey results where students' confidence ratings went up: approximately 36% of students reported their speaking ability as a "3" or "4", showing moderately confident views and approximately 51% of students reported their listening ability as between "3" to "5", showing moderately to very confident views on their skills.

Figure 4

Students' Self-Report on Speaking Confidence – Language and Cultural Exchange Stage



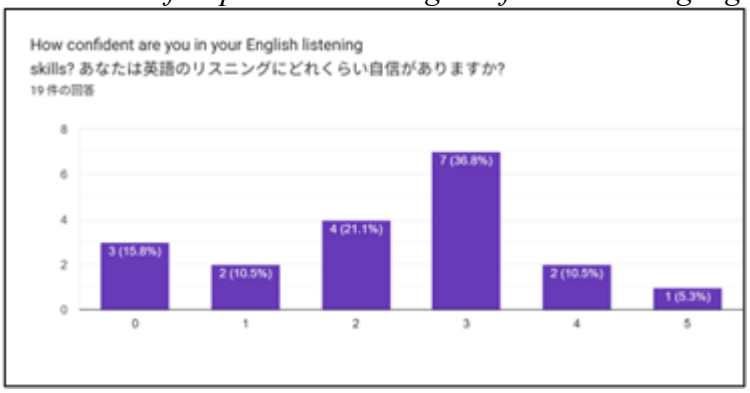


Figure 5

Students' Self-Report on Listening Confidence – Language and Cultural Exchange Stage

Interestingly, the levels of motivation remained about the same as before starting the class. When asked whether they had used the materials prepared for the conversations, only one person answered “No”, with others answering either “Yes” or “Sometimes”.

Figure 6
Students’ Usage of Notes During Conversation Classes – Language and Cultural Exchange Stage

Indeed, when observing the student interactions, it was obvious that the structured questions with prepared answers helped even low-proficiency students. Because the students repeated the questions and answers a total of six times in a session, they were able to progress to more impromptu questions and answers with the exchange students as time progressed. The American exchange students themselves were proactive and used simple words as well as translation apps to help when there were difficult words or concepts that they wanted to convey. But this is not to say that all of the conversations were held with apps – students used a mixture of apps, their notes, as well as clarifying statements to help with communication. When talking on personal subjects, some brought up photos from their phones.

Towards the end of the program, when evaluating the responses, only 14 students had been present for the beginning, the middle, and the final surveys. In terms of interest level in English, 5 students had remained the same (being “interested” to “very interested”, marking “3” to “5” on the scale) and 5 students had become more interested in English. Most rewardingly, 11 students reported a higher sense of confidence in their English language skills at the end of their interactions with the American exchange students while 3 remained the same. At the beginning, 6 of the 14 had noted that they were “Not confident at all” and had then found some degree of confidence over the five–week period.

In this sense, students had an increase in their feelings of academic self-efficacy. By ensuring that the course content had a low ICL, with content based on subjects that were familiar and interesting to the students, the ECL could afford to be higher. In this case, the task of speaking in English with native speakers was definitely a high ECL task. However, the preparatory materials and sessions where students had time to compose their answers and then practice them, helped reduce the ECL of the conversation sessions, leading perhaps to a higher sense of confidence in the students.

Concluding Remarks and Future Considerations

This is a small-scale study with many limitations due to funding constraints and a lack of resources. However, these initial results show that with proper scaffolding, even low-proficiency students with low-motivation could increase both motivation and confidence in their English language capabilities. Future considerations could be made for a long-term

program where students continue to keep in touch with the exchange students to see if this would help maintain confidence and motivation in using the English language. As this study is on self-perception of capabilities, it is not interested in the actual marks the students received from the English proficiency tests. As seen through decades of research on EFL teaching in Japan, despite (or perhaps because of) being exam-oriented, students did not develop communicative abilities in English. However, perhaps when the goal is to actually communicate through these types of exchange programs, students in Japan might see the relevance of learning the language. This study provides an optimistic assessment for using conversational activities with English native speakers as part of the instructional design in the Japanese EFL classroom.

From Studio to Society: A Hardware–Software–Heartware Framework for Interdisciplinary Design Innovation in the New World University

Agnes Lishan Xue, Singapore Institute of Technology, Singapore
Renjie Zheng, Singapore Institute of Technology, Singapore

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study investigates an interdisciplinary pedagogical model developed at the Singapore Institute of Technology (SIT) to address the growing complexity of global challenges through innovative higher education design. Implemented within the *Design Innovation* common module, the model engages students from nursing, engineering, computing, and allied health disciplines in solving authentic problems using the Critical Design Futures Thinking (CDF™) and Design Your Life (DYL) approaches. The framework guiding this initiative—the Hardware–Software–Heartware (H–S–H) Tri-Layer Framework—conceptualizes learning as a dynamic interplay of physical, curricular, and socio-emotional dimensions. *Hardware* encompasses the new SIT campus as a living laboratory that integrates the built environment, digital infrastructure, and community contexts. *Software* represents the curriculum as an adaptive system designed through iterative learning sprints, incorporating empathy-based problem framing and ethical Generative AI integration. *Heartware* focuses on the socio-emotional and cultural layers that nurture collaboration, reflective practice, and ethical awareness. A diverse array of data sources was utilised to ensure comprehensive insights and triangulation. Data sources included curriculum material, student module feedback and project deliverables, sampled from module cohorts across two consecutive trimesters (AY2024 Trimester 2 and 3). Through thematic analysis and vignette development, the study aims to illustrate how the H–S–H framework operationalizes interdisciplinarity as an active interaction among space, structure, and culture. The insights are expected to inform the framework's scalability for general education as well as Continuing Education and Training (CET) programmes, contributing to a broader vision of campuses as innovation studios and societal prototyping platforms.

Keywords: Hardware–Software–Heartware (H–S–H) framework, interdisciplinary pedagogy, innovation education

Introduction

The 21st century presents an unprecedented confluence of challenges, from climate change and global pandemics to rapid digital transformation and complex socio-political upheavals. Addressing these "wicked" problems demands more than isolated disciplinary expertise or linear problem-solving approaches; it calls for profoundly integrated, interdisciplinary forms of learning, research, and innovation. Consequently, higher education institutions globally are under increasing pressure to re-envision their core mission: not merely to disseminate knowledge, but to cultivate graduates who can lead, collaborate, and innovate across diverse professional, cultural, and technological landscapes.

This imperative for transformation is set against a backdrop of what has been termed "fast academia" – a neoliberal, performance-driven environment often characterised by relentless pursuits of productivity, competitiveness, and accelerated expectations. Such pressures can inadvertently erode the very "human(e) elements" of learning and teaching, challenging the preservation of empathy, kindness, and compassion within educational settings. In response, there has been a growing advocacy for "slow movement" principles in academia and a renewed emphasis on humanising pedagogies that prioritise dignity, critical consciousness, kindness, humility, empathy, and love as foundational ideals for humanising interactions.

The Singapore Institute of Technology (SIT) stands as a microcosm of this global trend and a vibrant testbed for innovative educational models. With students and faculty representing nearly forty diverse degree programmes ranging from engineering and nursing to allied health, computing, and business. SIT provides a unique living laboratory for cultivating interdisciplinary capabilities. Central to SIT's pedagogical philosophy is the Hardware–Software–Heartware (H–S–H) tri-layer framework, a distinctive approach that moves beyond superficial multidisciplinary efforts to foster genuine integration. This framework insists that true interdisciplinarity and holistic learning emerge from a dynamic, symbiotic interaction between three interdependent layers: the physical and digital infrastructure ("hardware"), the curriculum design and pedagogical processes ("software"), and the deeply social, ethical, and affective dimensions of student-lecturer interactions (*heartware*).

This paper argues that the H–S–H framework offers a powerful, actionable model for designing and evaluating learning environments capable of meeting both the cognitive and socio-emotional demands of 21st-century learning and work. It is a deliberate framework that emphasises that a multi-layered, dynamic interaction promotes compassion, resilience, and ethical imagination that are necessary for driving innovation.

This paper proceeds with the following objectives:

1. To situate the H–S–H Tri-Layer Framework within international and local literature on interdisciplinary innovation, campus ecology, and social-emotional learning.
2. To detail how the H–S–H framework is operationalized within the SIT Design Innovation module, including mechanisms for *hardware*, *software*, and *heartware* integration in both design and implementation.
3. To illustrate, using data and vignettes from recent module cohorts, how students and educators experience and enact interdisciplinarity when multiple domains, stakeholders, and forms of expertise collide and collaborate.
4. To analyse the impacts, challenges, and enabling conditions for wide-scale adoption of the H–S–H framework, including institutional, pedagogical, and cultural levers and potential transferability to other general education and continuing education contexts.

5. To offer a roadmap and recommendations for scaling H–S–H in diverse educational and societal settings, informed by current best practice and emerging scholarship.

By leveraging the lived experience of an applied university's common module and global research evidence, this paper aims to illuminate a path towards genuine interdisciplinary learning and institutional transformation, positioning universities as sites of continual co-creation, social impact, and lifelong learning.

Literature Review

The H–S–H framework draws on literature advocating holistic, human-centred education across interdisciplinary education, project-based/authentic learning, grid–group dynamics, and university infrastructure and campus design.

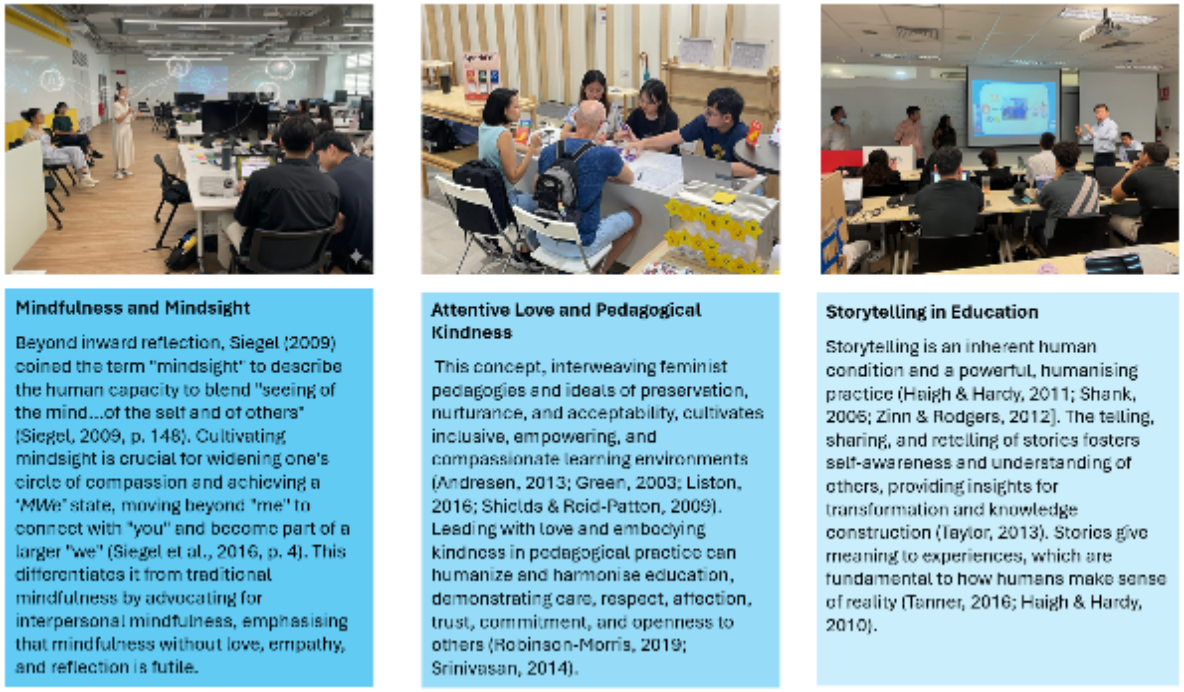
Evolution of Interdisciplinary Education

Interdisciplinary education in higher education responds to complex societal challenges by moving from disciplinary coexistence to purposeful epistemic integration that combines knowledge, methods, and ontologies for practice-based solutions (Keenan, 2020; Slothuus et al., 2025). Contemporary frameworks stress disciplinary grounding, epistemic agility, humility, and collaboration in authentic, problem-rich environments, yet remain constrained by governance, faculty preparedness, and reward systems, while students face identity tensions and uneven team dynamics (Schijf et al., 2023; Strain & Potter, 2012; Visscher-Voerman et al., 2025; Xu et al., 2022).

Project-Based Learning (PBL) and Authentic Learning

PBL is a key driver of interdisciplinary competence, engaging learners in real-world, collaborative, and outcomes-oriented inquiry that enhances motivation, deep learning, and work readiness (Aksela & Haatainen, 2019; Barell, 2007; Barron & Darling-Hammond, 2008; Boss & Krauss, 2007; Evenddy & Gailea, 2023; Gantogtokh & Quinlan, 2017; Kamanga, 2024; Klaassen, 2018; Larmer & Mergendoller, 2015; Silma et al., 2024; Warr & West, 2020). Its effectiveness depends on the interplay of software (curriculum), hardware (institutional structures and infrastructure), and heartware (affective-relational dynamics), supported by authentic assessment, reflection, and external partnerships (Barrett & Naughton, 2014; Ghani et al., 2021; Kek & Huijser, 2017; Tan, 2022).

Social-Emotional Learning (SEL) Cultivating the "Heartware"

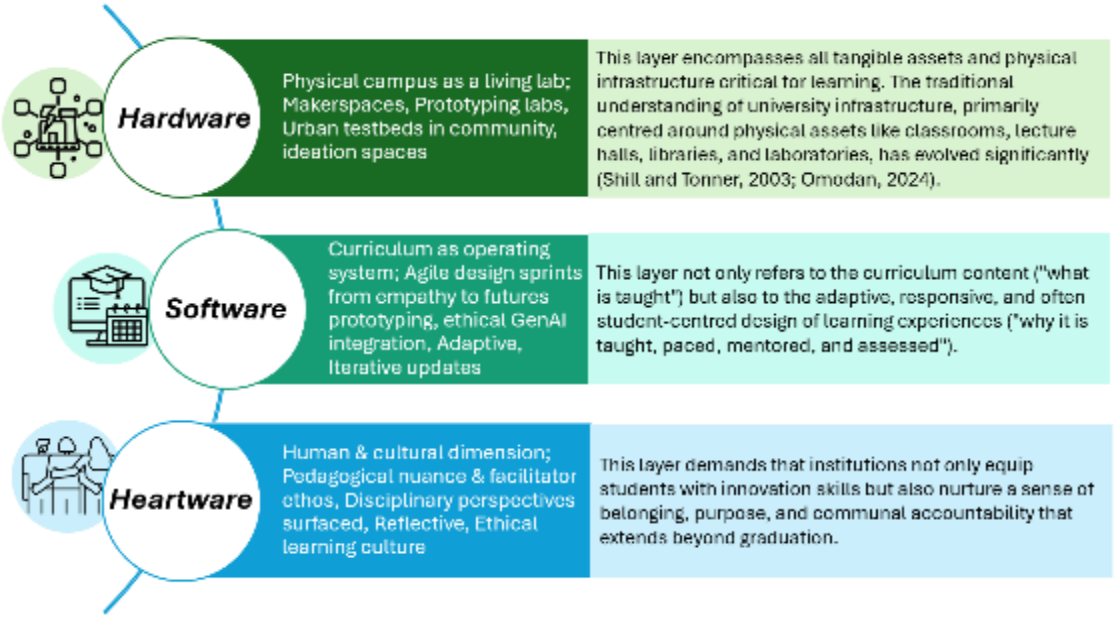


SEL constitutes the "heartware" that complements cognitive and technical learning by cultivating empathy, resilience, ethical judgment, collaboration, self-regulation, and inclusion, thereby supporting interdisciplinary practice, wellbeing, and equity (Conley & Donahue-Keegan, 2024; Ibarra, 2022; Lisciandro et al., 2016; Martinez & Gomez, 2024; Tan, 2022; Van Pham, 2024). Tan's "Heartware for the Compassionate Teacher" framework links three domains: mindfulness and mindsight (Siegel, 2009; Siegel et al., 2016; Smalley & Winston, 2010; Srinivasan, 2014), attentive love and pedagogical kindness (Antoniuk et al., 2021; del Carmen Salazar, 2013; Green, 2003; Liston, 2016; Shields & Reid-Patton, 2009), and storytelling as humanizing practice (Andresen, 2013; Benade, 2019; Haigh & Hardy, 2011; Robinson-Morris, 2019; Savvidou, 2010; Sferrazza, 2018; Shank, 2006; Taylor, 2013; Tanner, 2016; Zinn & Rodgers, 2012).

Mindfulness nurtures presence and reflective awareness (Smalley & Winston, 2010); attentive love enacts care through respect, empathy, and pedagogical trust (Antoniuk et al., 2021; del Carmen Salazar, 2013; Shields & Reid-Patton, 2009); and storytelling situates learning within narrative and meaning-making processes (Haigh & Hardy, 2011; Tanner, 2016; Taylor, 2013). Collectively, these approaches humanize education, reinvigorate the moral purpose of teaching, and counter the instrumental tendencies of neoliberal academic cultures (del Carmen Salazar, 2013; Freeman et al., 2020).

This triadic synthesis of interdisciplinarity, authentic learning, and heartware pedagogy delineates a humane and future-oriented pathway for higher education. It not only equips graduates with integrative thinking and adaptive expertise but also fosters compassion, relationality, and civic agency as defining virtues of contemporary scholarship.

Figure 1



Heartware Elaborated

Conceptual Model

The Hardware–Software–Heartware (HSH) tri-layer framework is a conceptual model which stands as a bold synthesis, integrating traditional campus strengths with experimental learning theory to address the complex demands of 21st-century education. It is built upon an insistence that interdisciplinarity is not merely superficial co-location but a profound, multi-layered interaction, aiming for campus-wide transformation rather than temporary overlays. This triad functions as a comprehensive framework aligning material, cognitive, and emotional infrastructures for the common good, moving beyond the notion of universities as mere “learning factories” to “living communities”. The HSH framework delineates three interdependent and synergistically operating layers (see Figure 2):

Figure 2
Hardware–Software–Heartware (HSH) Framework

- Hardware: Historically, these spaces were epi-centres of intellectual pursuits, academic interactions, and community building, reflecting societal values and academic philosophies (Bogart, 2022; Gevorgyan et al., 2020). However, the digital age, with the advent of the internet, online learning platforms, and digital libraries, has fundamentally altered knowledge dissemination and consumption, necessitating a re-evaluation of infrastructural orientations (Kaziev et al., 2020; Song et al., 2006). The 21st-century university infrastructure is now characterized by a complex interplay between physical assets and digital evolution. The concept of a "campus as a living lab" embodies this evolution, where physical and digital affordances provide real-time, authentic contexts for innovation, engagement, and knowledge translation (Hansen, 2016; Pilon et al., 2020; Save et al., 2021).
- Software: This layer focuses on pedagogical and instructional design elements, including teaching approaches, best practices, curriculum development, content, and assessment. It advocates for a departure from rigid, siloed learning environments towards collaborative and flexible arrangements that facilitate project-based learning, cross-disciplinary collaborations, and real-world problem-solving.
- Heartware: As the most distinctive and arguably most critical layer in education, *heartware* focuses on the cultivation of social capital, empathy, ethical reasoning, and a sense of "ownership" and care for both learning and community outcomes. It represents the "underlying values, attitudes, and "inner infrastructure" of a community or institution" (Antoniuk et al., 2021; Hackman & Reindl, 2022; Ignatovitch, 2016; Tan, 2022; Young, 2020). It counters the neoliberal tendency to view education instrumentally, shifting towards humanistic, dialectical activities and intrinsic values.

These three layers are not treated as sequential steps but as a dynamic interplay, constantly rebalanced based on evolving needs and feedback, leading to "tripartite" projects where new campus infrastructure, curriculum construct, and SEL-anchored programming co-evolve.

Method

The study employed a direct qualitative content analysis design. Direct qualitative content analysis offers distinct benefits for studying the H–S–H framework, particularly given its interdisciplinary and context-embedded nature. This approach enables the identification and interpretation of both manifest content, such as explicit references to framework components and latent content consisting of underlying meanings, values, and patterns of interaction, sourced from a rich array of qualitative data such as module feedback gathered from students and artefact analysis. This approach prioritises the systematic extraction of data-driven themes directly related to predetermined categories of the H–S–H framework, while remaining open to emergent themes that further refine the model. This technique also enhances transparency and replicability in coding, reduces interpretive ambiguity, and provides rigorous support for linking qualitative evidence to educational theory and practice (Chueh & Kao, 2024).

Context and Participants

SIT mandates the Interdisciplinary Design Innovation module for students from thirty-nine undergraduate programmes. The research participants include cohorts from trimesters two and three of the Academic Year 2024, encompassing over 2,000 students from diverse fields such as engineering, allied health, nursing, computing, and business, alongside more than twenty instructors. The module is delivered within SIT's Punggol campus, a site explicitly designed to support collaborative, interdisciplinary, and hands-on innovation, thereby embodying the *hardware* dimension of the H–S–H framework.

Data Sources

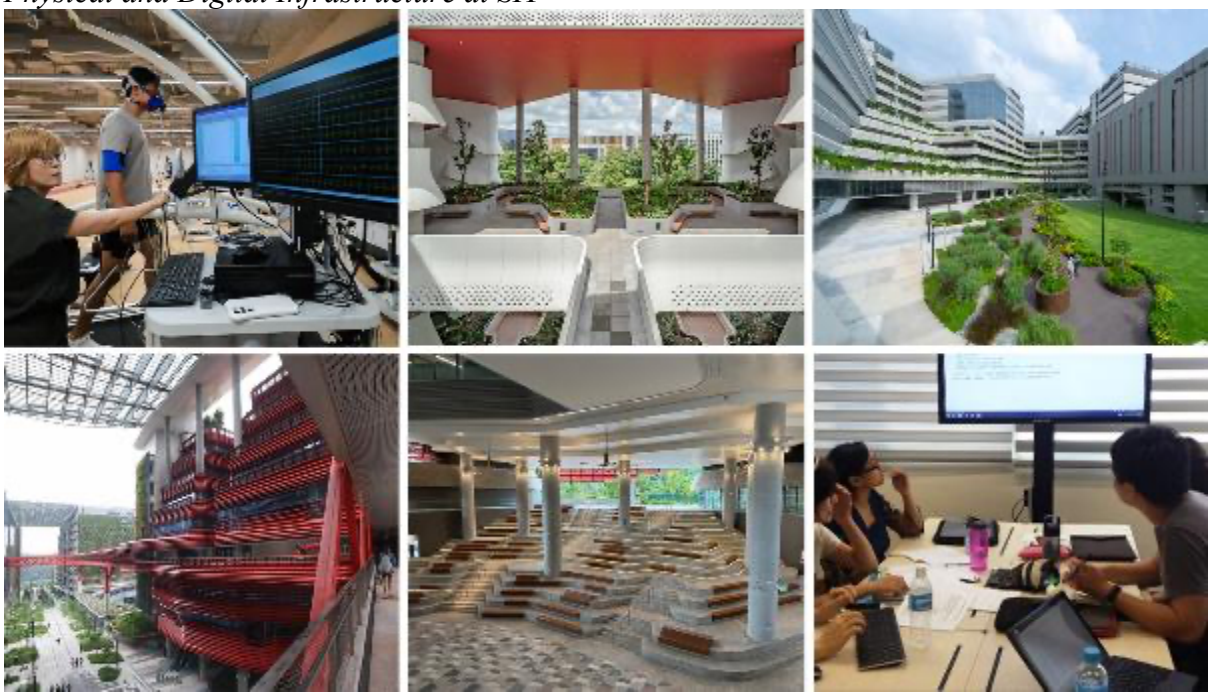
A diverse array of data sources was utilised to ensure comprehensive insights and triangulation. Data sources included curriculum material, student module feedback and project deliverables, including presentation slides, prototypes (physical, digital, or process-based) and videos, sampled from module cohorts consisting of 24 degree programmes, collected over two academic trimesters (AY2024 Trimester 2 and 3). The student module feedback dataset includes quantitative Likert-scale ratings (Q1–Q5 means) and qualitative free-text reflections.

Data Analysis

Data were analysed using thematic analysis, employing both deductive (pre-existing H–S–H categories) and inductive (emergent themes related to collaboration, reflection, and innovation barriers) approaches. Initial codes were developed to capture explicit instances of physical/digital infrastructure, curricular design/process elements, and socio-emotional or grid-group cultural dimensions. The coding process remained sensitive to emergent themes reflecting unanticipated enactments or challenges within interdisciplinary learning environments. Triangulation across data types strengthened the validity and credibility of findings. All procedures adhered to institutional ethical standards, with participant data anonymised and informed consent obtained for any supplementary research activities.

Ethics

The study strictly adhered to standard institutional review protocols (Approval-RECAS-0692_IRB_Exempted). Ethical considerations for this study were addressed under an exempted review process. Prior to analysis, all data were de-identified, and only aggregated results are reported, ensuring that no individual can be identified in any subsequent publication or presentation.



The Hardware–Software–Heartware (H–S–H) Framework in Practice

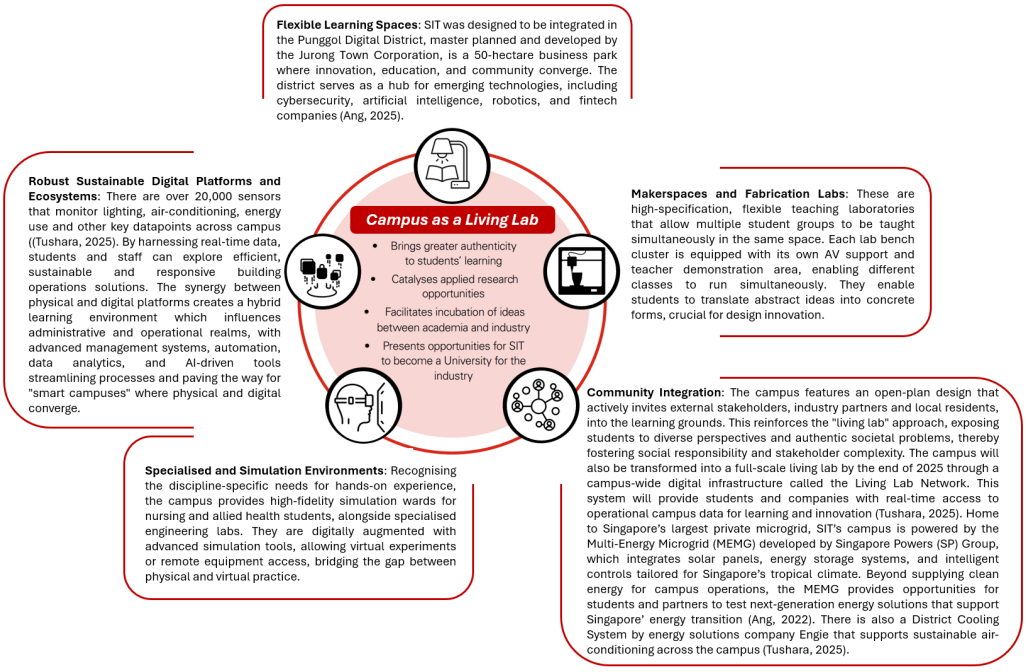
The operationalisation of the Hardware–Software–Heartware (H-S-H) Framework at SIT exemplifies a synergistic integration of physical campus design, curriculum architecture, and intentional socio-emotional learning. Each layer is designed to interact dynamically, fostering a robust learning ecosystem where deep interdisciplinarity and compassionate engagement can thrive.

Hardware

SIT's Punggol campus was purposefully conceptualised as an "urban testbed" for innovation, where the physical architecture and integrated technology infrastructure are explicitly aligned with pedagogical aspirations for collaborative, distributed, and real-world learning. This vision responds to the broader imperative for universities to redefine their infrastructural identity, harmonising tangible physical assets with the expanding world of digital evolution. The university owns state-of-the-art smart-eco buildings, flexible learning spaces, advanced laboratories, makerspaces, and physical technologies. See Figure 3.

Figure 3
Physical and Digital Infrastructure at SIT

Source: Straits Times; author



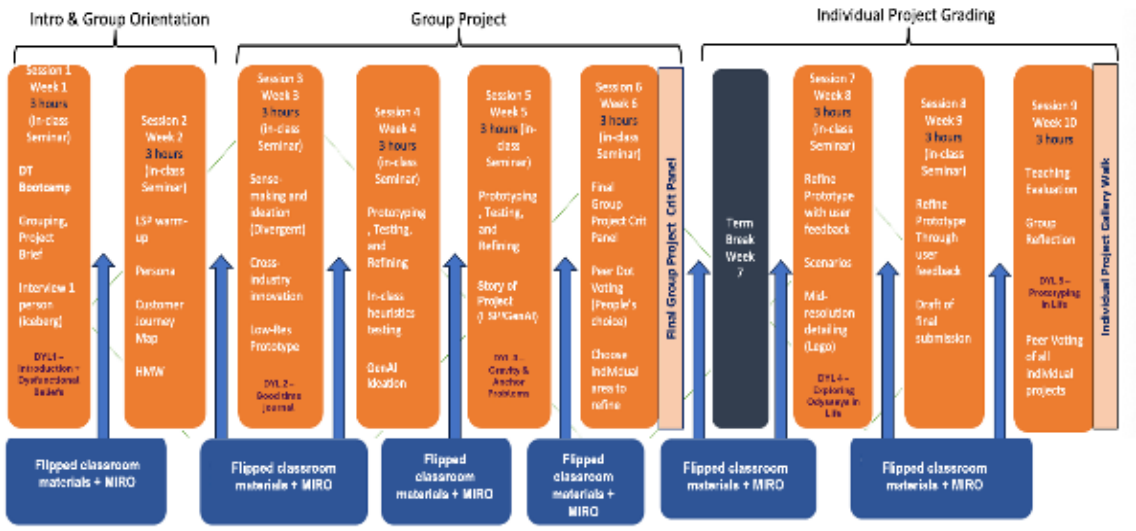
Key features of the *hardware* layer include flexible learning spaces configured to support fluid team formation, dynamic brainstorming, rapid prototyping, and a shift from rigid, siloed

settings to collaborative, inquiry-driven environments. Makerspaces and fabrication labs, equipped with 3D printers, electronics benches, and related tools, enable rapid iteration and the creation of tangible, cross-disciplinary projects. Specialised and simulation environments translate theoretical knowledge into realistic, immersive contexts, providing multi-dimensional learning experiences. The campus itself is conceived as a "Campus-in-the-Park," with SIT Campus Heart and SIT Campus Court spanning about 9 hectares—roughly 17 football fields—and integrating academic blocks with a conserved secondary forest that has been transformed into an accessible community park, thereby blending learning spaces with tropical landscapes.

A robust, sustainable digital ecosystem complements the physical infrastructure through cloud repositories, online collaboration tools, and learning management systems, supporting hybrid, asynchronous, and co-located teamwork and extending the reach and flexibility of the module. This intentional design ensures that physical spaces are not merely venues for knowledge reception but active incubators for innovation, creativity, and holistic development, seamlessly complemented by the dynamic capabilities of the digital realm. See Figure 4.

Figure 4

Hardware – Campus as a Living Laboratory



Software

The *software* layer, being the Design Innovation curriculum, is an adaptive, sprint-based programme that embeds human-centred design and iteration to mirror contemporary innovation practice and avoid rigid, siloed structures. It opens with empathy-based problem discovery, where students conduct user research and systems mapping (e.g., interviews and observations) to build deep, compassionate understanding of real-world challenges. Students then move through design thinking sprints, using methods such as the double-diamond model and Lego® Serious Play® to frame problems, ideate, prototype, and test, thereby normalising ambiguity and rapid learning from feedback (see Figure 5). Assessment is agile and authentic, organised around milestones, peer feedback, and reflective dialogue, which better

supports iterative learning than traditional high-stakes evaluations. Ethical and reflective practice is threaded throughout via ethical dilemma analyses, critical incident debriefs, and narrative feedback, ensuring that technical and collaborative skills are developed alongside ethical responsibility and critical consciousness, in line with a humanising educational ethos. This dynamic *software* layer ensures that students are not merely exposed to interdisciplinary problems but are actively equipped with the processes and mindsets to tackle them effectively, while simultaneously developing their ethical and collaborative sensibilities.

Figure 5
Software – Agile Curricula and Humanising Facilitation

Heartware: Cultivating Socio-Emotional and Ethical Dimensions

The *heartware* layer at SIT is the most distinctive and operationally challenging component of the framework, intentionally developed alongside content and process to foreground the "human(e) elements" of learning and teaching (see Figure 6). It aims to cultivate social capital, empathy, ethical reasoning, and a deep sense of ownership and care for learning and community outcomes, countering the pressures of "fast academia" and supporting a more humanistic, equitable environment.

Key practices include metacognitive scaffolding, where Designing Your Life concepts, structured check-ins, and feedback nurture mindsight (awareness of one's own and others' mental states) and mindfulness, extending from inward reflection to an expanded sense of "we." An inclusive facilitation model brings together part-time educators from multiple disciplines who are trained in protocols for inclusive dialogue, conflict navigation, and "stretch" assignments, thereby modelling collective wisdom, mutual respect, and constructive handling of epistemic friction in interdisciplinary teams.

Engagement and storytelling are central: students choose topics on the future of work and life and collaborate with diverse stakeholders, using story-sharing and user journey mapping to surface complexity, social responsibility, and lived experience. Storytelling, grounded in "attentive love," links emotion, meaning, and understanding in authentically caring teacher–student relationships, creating inclusive, compassionate learning spaces. Overall, this *heartware* cultivation equips students not only with cognitive capacity for innovation but also

with the socio-emotional intelligence and ethical compass required to act as future change agents.

Figure 6

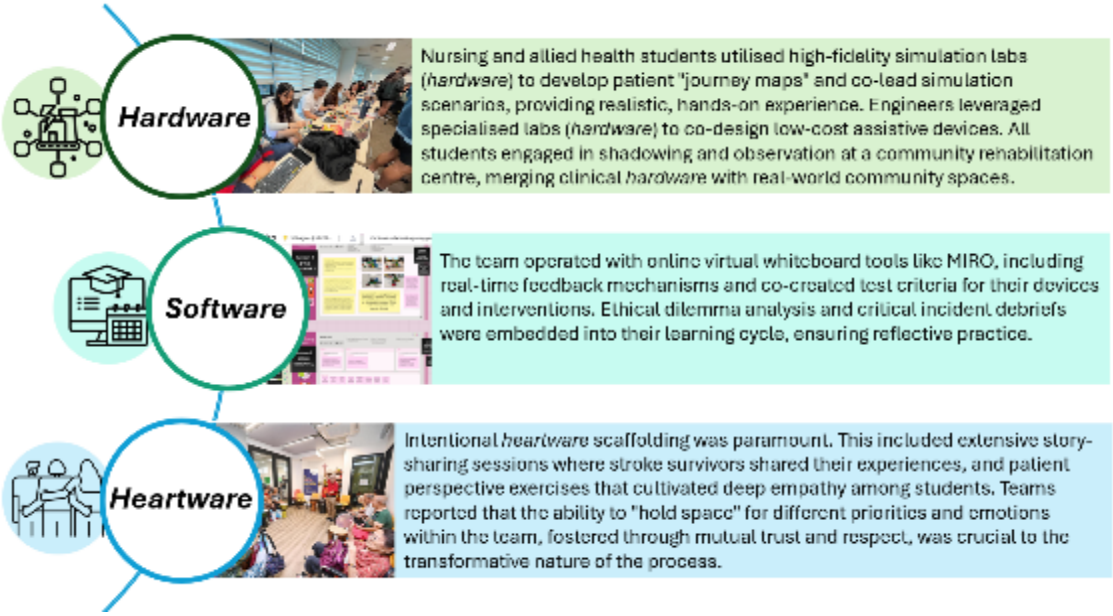
Heartware – Cultivating Social-Emotional and Ethical Dimensions

Dynamic Interplay for Interdisciplinary Learning

The H–S–H framework which surfaced at SIT, deliberately resists the siloing of these three layers. Instead, it fosters a dynamic, co-evolutionary interplay:

- Hardware and Software Co-evolution: Changes in physical learning spaces or digital platforms are rapidly mirrored in new module activities or pedagogical scaffolds. For example, the availability of makerspaces (*hardware*) directly enables agile design sprints (*software*).
- Hardware and Heartware Collision: The design of the campus to integrate with the community (*hardware*) provides authentic contexts for students to engage in empathetic user research and experience stakeholder complexity, driving the development of cultural humility (*heartware*).
- Software and Heartware Interdependence: The empathy-centric design methods and iterative feedback loops (*software*) are explicitly designed to cultivate collaborative mindsets, relational skills, and reflective practices (*heartware*). The facilitation from the instructors emphasises the critical interplay between curriculum elements (*software*) and the nuanced work of relational and ethical development (*heartware*).

This integrated approach ensures that the material, cognitive, and emotional infrastructures are aligned, allowing students to move beyond surface-level group work and form high-trust, adaptive micro-communities capable of solving complex problems with both technical proficiency and profound human compassion.



Findings

Based on the data collected, the H–S–H framework can be operationalised within SIT's Design Innovation module. The following vignette in Figure 7 illustrate the framework in

practice and they revealed how this integrated approach fosters deep interdisciplinary learning and prepares students for complex societal challenges.

A project team of students tackled the crucial area of rehabilitation for stroke survivors, integrating various disciplines and prioritising the human element (See Figure 8). Students engaged in high-fidelity simulations and community shadowing, co-designed affordable assistive devices, utilised digital collaboration platforms, and critically reflected on ethical dilemmas. Central to impact was empathetic engagement with stroke survivors, nurturing trust and shared responsibility for innovation.

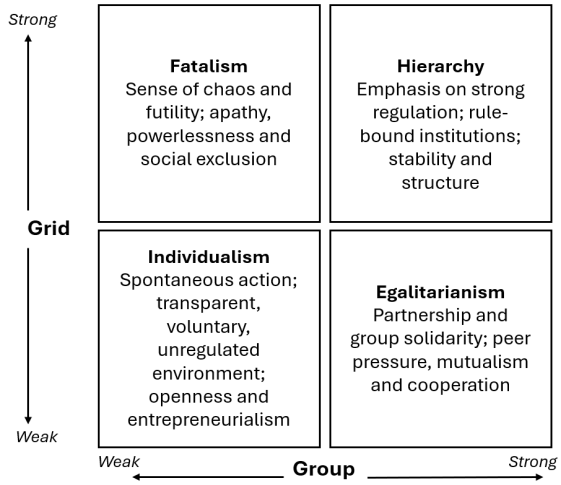
Figure 7
A Vignette on Inclusive Healthcare

The collective data demonstrated several significant impacts:

- Increased Self-Efficacy and Interdisciplinary Comfort: Qualitative data, supported by module feedback surveys, showed statistically significant increases in student self-efficacy, their comfort with interdisciplinary collaboration, and cultural humility. This aligns with findings that PBL and SEL can lead to significant increases in student self-efficacy and a decrease in anxiety.
- Enhanced Project Creativity and Conflict Resolution: Teams that explicitly adopted *heartware* rituals and engaged in frequent reflection outperformed others in terms of project creativity, effective conflict resolution, and meaningful stakeholder engagement. This underscores *heartware* as both a multiplier and moderator in collaborative learning.
- Decreased Anxiety and Increased Group Identity: Module feedback reports a decrease in student anxiety and the willingness to think about their future, largely attributed to the introduction of the Designing your Life concepts. This aligns with literature showing that SEL enhances students' resilience, and with research indicating that PBL fosters a greater sense of ownership among students

These findings strongly affirm the H–S–H framework's ability to foster genuine interdisciplinarity, resilience, and compassion, producing graduates who are not only technically capable but also deeply empathetic and ethically grounded.

Discussion

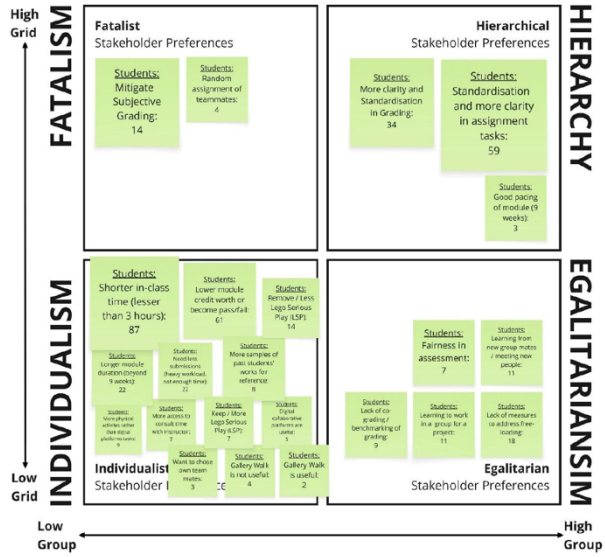


Based on the findings, a reflection was conducted on how the H–S–H framework, as conceptualised and operationalised at SIT where learning environments are designed at the intersection of space, process, and ethos, was able to empower educators to achieve their goals of enabling authentic interdisciplinarity and cultivate resilience in the face of complexity, while achieving the "buy-in" of students in the "wicked" context of diverse student learning preferences. To what extent the tri-layer framework which consciously aligns the components of physical infrastructure, curriculum, and community development (unlike traditional educational approaches that often treat them as distinct or siloed entities) for collective impact, enables measurable improvements in learning, innovation, and student well-being?

Deploying a Social Science Analytical Tool

While the findings from SIT's Design Innovation module resonate strongly with the global literature on applied learning, authentic assessment, and affective education, the reflection exercise required a more atypical analytical tool to sense-make the diversity in student learning preferences and how H-S-H aligns them to educators' goal of cultivating graduates who can lead, collaborate, and innovate across diverse professional, cultural, and technological landscapes. Such outcomes require students from diverse disciplinary cultures (how STEM students approach problem definition and solutioning is culturally distinct from students reading Business Management or Health Sciences) to learn about and experience the cultures of other disciplines. This is a complex endeavour that comes with challenges and even student resistance. Furthermore, an added complexity lies in the inherent diversity of learning preferences within each disciplinary cultures – as evident from past module feedback where students from the same disciplines expressed differing learning preferences. How may the H-S-H Framework empower SIT instructors to address these complexities? This salient reflection question needs to be addressed before the subsequent discussion on the transferability and scalability of the H-S-H Framework. First, this reflective exercise deployed Mary Douglas's Grid-Group Typology (1983, 2003) to sense-make the diversity in student learning preferences (see Figure 8).

Figure 8

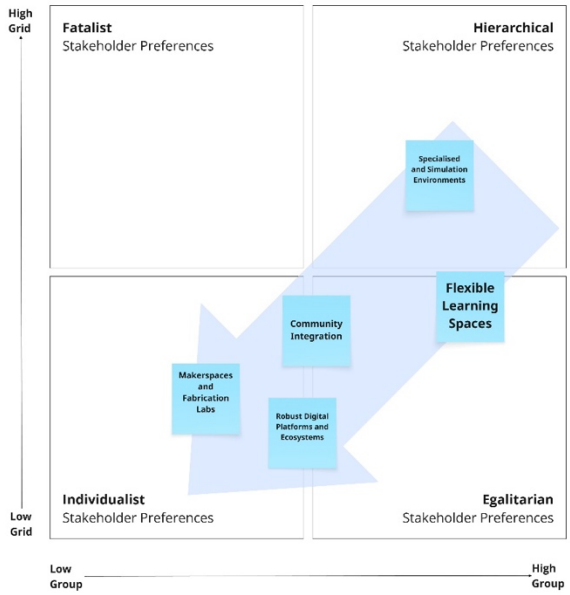


Mary Douglas's Grid-Group Typology Showing the Distinct Belief Systems of Each Rationality

Her groundbreaking typology helps to simplify the complexities of student learning preferences into just four mutually exclusive and jointly exhaustive rationalities based on their subscription to the criteria of Grid and Group: individualism, egalitarianism, hierarchism, and fatalism. Figure 8 below shows how Grid and Group can help reduce diverse preferences into the four rationalities with distinct belief systems. In the typology, *Grid* is characterized by the extent roles and rules influence a culture whereas *Group* is characterized by the extent group-orientation influence a culture. This simplification allows us to more reasonably sense-make the diversity of learning preferences by reducing its multitudes to more manageable parts for analysis. With this typology, the range of general student's learning preferences (as shared in the module feedback) can be mapped into the grid-group framework to provide an overview of the diversity of these preferences as shown in Figure 9 below. We further mapped the preferences particular to programme types into the typology to provide deeper insights.

Figure 9

Typology of Student's Learning Preferences for SIT's Design Innovation Module



Second, this reflection exercise utilized a normative assertion, derived from cultural theory and its plural rationalities (Hartmann, 2012), building on Mary Douglas's Grid-Group Typology (1983, 2003) that posits that "wicked" problems need to be dealt pluralistically due to the diversity in belief-based preferences, and that the neglect of any of the three key rationalities of Hierarchy (H), Egalitarianism (E) or Individualism (I) will lead to gaps in outcomes. This assertion is used to derive our hypothesis that the H-S-H Framework empowered SIT instructors to achieve stated goals because the pluralism of the H-S-H Framework addressed the multitude of learning preferences – where the totality of implemented features catered to the learning preferences of students from all rationalities. To test the validity of this hypothesis, we mapped the range of implemented features onto the Grid-Group Typology to study if the H-S-H Framework is truly pluralistic. Our findings as presented below supports the hypothesis.

H-S-H as a Pluralistic Framework

The Hardware aspect of the framework caters to the three key rationalities of learning preferences (see Figure 10).

- Flexible Learning Spaces: The shift from rigid, siloed learning environments to collaborative, interactive spaces indicates a shift from "H" to "E" (Lowered Grid).
- Makerspaces and Fabrication Labs: Indicates a shift from "H" to "I" (rapid iteration) and "E" (cross-disciplinary projects) due to lowered Grid.
- Specialised and Simulation Environments: Retains the "H" (retaining emphasis of roles and rules).
- Community Integration: Catering to the "E" with equality of access to greenery and Community Park.
- Robust Sustainable Digital Platforms and Ecosystems: Catering to the "I" (technological enablers for individuals) and for "E" (co-located teamwork).

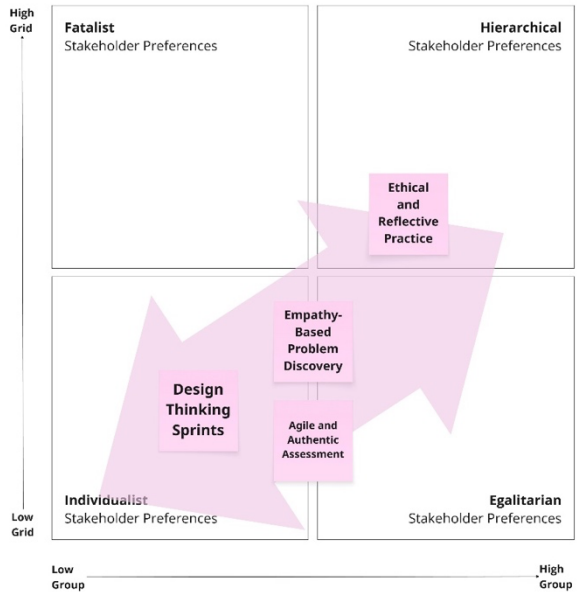


Figure 10
Typology of Hardware Implemented Features

The Software aspect of the framework also caters to the three key rationalities of learning preferences (see Figure 11).

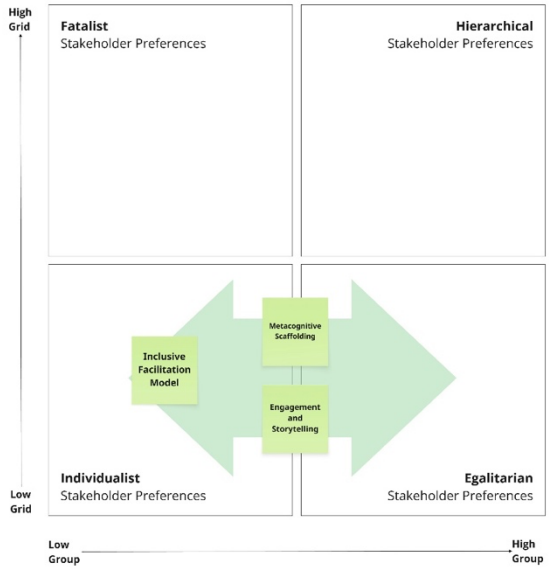
- Empathy-Based Problem Discovery: Catering to the "E" (interviews with beneficiaries and stakeholders) and "I" (emphasising compassion)
- Design Thinking Sprints: Catering to the "I" (teaching them critical skills)
- Agile and Authentic Assessment: Catering to the "E" (peer feedback) and the "I" (reflective dialogue and removing rigid assessments)
- Ethical and Reflective Practice: Retaining the "H" (cultivating cultural ethical responsibility)

Figure 11
Typology of Software Implemented Features

Last but not least, the *Heartware* aspect of the framework also caters to the three key rationalities of learning preferences by cultivation of social capital (E), empathy (I), ethical reasoning (H), and a profound sense of ownership and care for both learning and community outcomes (E), on top of these pluralistic practices (as shown in Figure 12 below):

- Metacognitive Scaffolding: Caters to "I" (Designing your Life framework) and "E" (group check-ins and feedback).
- Inclusive Facilitation Framework: Caters to "I" (Professionals from various disciplinary backgrounds co-facilitate the module as instructors).
- Engagement and Storytelling: Caters to "E" (Project collaborations with diverse stakeholders) and "I" (open choice and authentic educator).

Figure 12
Typology of Heartware Implemented Features



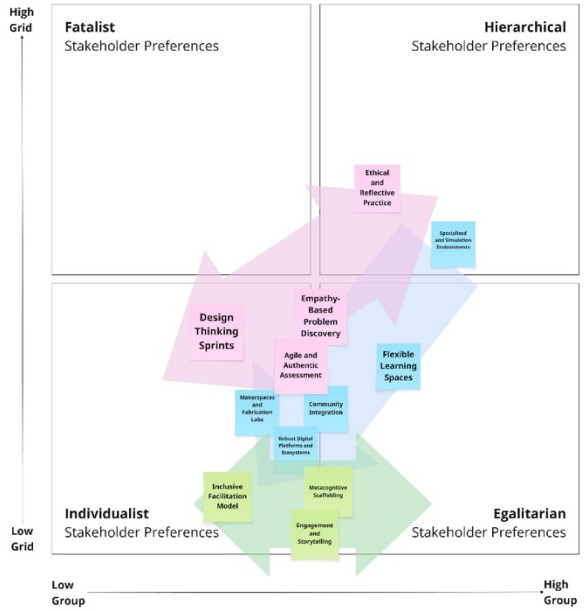


Figure 13 below illustrates the pluralism of the H-S-H Framework where the totality of implemented features catered to the learning preferences of students from all rationalities. Hence, we can posit with confidence that the H-S-H Framework which consciously aligns the components of physical infrastructure, curriculum, and community development for collective impact empowered the SIT instructors to achieve measurable improvements in learning, innovation, and student well-being; while also achieve their goals of enabling authentic interdisciplinarity for their students and cultivate in them the resilience needed in the face of complexity.

Figure 13
Typology of Totality of Implemented Features of H-S-H Framework

Structural and Cultural Enablers

Insights from the Grid–Group Typology highlight that the success and durability of the H–S–H framework at SIT depend on equally pluralistic enablers that mirror the pluralism of learner preferences. Institutional commitment functions as a hierarchical enabler: reconceiving the campus as a "living lab" and investing in flexible digital and physical infrastructure require leadership that emphasises the synergistic interplay of hardware, software, and heartware rather than isolated development.

At the individual level, comprehensive professional development equips faculty with both cognitive capabilities (e.g., interdisciplinary pedagogy, design thinking) and affective skills (e.g., *heartware* facilitation, conflict resolution, compassionate teaching), strengthening their capacity to enact the framework. Student ownership operates as both an individualist and egalitarian enabler, as autonomy, voice, and involvement in assessment design (such as co-created criteria) deepen engagement and motivation, particularly when learning is perceived as purposeful and choice-rich. Partnerships with external stakeholders, be it with industry (individualist) or community (egalitarian), are critical, providing authentic, socially meaningful projects that supply real-world problems, diverse perspectives, and relevance, while cultivating social responsibility and amplifying the framework's impact beyond the campus.

Barriers and Tensions

Insights from the Grid–Group Typology foreground the implementation and scaling challenges of the H–S–H framework by highlighting rationality-based conflicts in beliefs and preferences. Institutional inertia, rigid assessment structures, and resourcing constraints create hierarchical challenges that demand sustained effort, distributed leadership, and a willingness to "grapple with notions of impossibility" (Freeman et al., 2020, p. 86). Educators may also lack confidence or training in heartware facilitation, conflict resolution, and managing the emotional dynamics of interdisciplinary teamwork, underscoring the need for targeted support similar to that required for effective PBL design and scaffolding.

Assessment remains a persistent tension, as innovation is needed to balance individualist preferences for competition with egalitarian commitments to fairness and equality through methods that capture holistic learning beyond content mastery. Student adaptation to ambiguity presents another critical challenge: learners unfamiliar with open-ended, self-directed tasks may resist or feel discomfort, requiring "scaffolding for discomfort," explicit guidance, and hierarchical support to secure egalitarian group buy-in. The sustainability of H–S–H ultimately depends on institution-wide reinforcement, where its values are coherently embedded in recruitment, orientation, and co-curricular practices; misalignments across hardware, software, and ethos can significantly compromise outcomes.

Transferability of the Pluralistic H–S–H Framework

The mapping of the H–S–H framework onto the Grid–Group Typology suggests that, although rooted in Singapore's context, its pluralistic logic for addressing diverse learning preferences is broadly transferable across educational and societal settings. It can be modularised into general education to scaffold critical thinking, ethical imagination, and collaboration from the outset, preparing students for more complex interdisciplinary challenges. In industry–academia CET, real-world challenge-based modules, workplace learning, and mentorship can yield graduates with immediately applicable skills and holistic problem understanding.

Internationally, universities can adapt H–S–H by aligning *hardware* (campus and digital infrastructure), *software* (agile curricula), and *heartware* (socio-emotional and cultural practices) to local contexts, while investing in flexible, future-proof infrastructure that can accommodate emerging technologies such as AR and AI. Collaboration within and beyond institutions—with industry, tech firms, and other universities—supports trend sensing, guides infrastructural decisions, and enables interdisciplinary hubs, while environmental and social sustainability (e.g., green, inclusive spaces) ensures ongoing relevance.

Sustaining and scaling H–S–H depends on a strong culture of action research, including ongoing data collection, peer learning, pilots, and rigorous impact evaluation. Future research should examine longitudinal graduate outcomes (e.g., resilience, innovation, community orientation), develop robust ways to assess *heartware's* socio-emotional impacts, and pursue comparative studies across diverse systems to identify adaptation pathways and deepen efforts to humanise the academy amid accelerating change.

Conclusion

The Hardware–Software–Heartware (H–S–H) framework stands as a timely, evidence-driven response to the pressing need for reimagining how universities cultivate graduates equipped for civic contribution, professional leadership, and resilient innovation. By interrogating the intersecting roles of physical and digital infrastructure, curriculum design, and socio-emotional learning, this framework offers a comprehensive, pluralistic, and future-oriented lens on academic transformation. More importantly, the H–S–H framework demands that institutions invest not only in advanced facilities and adaptive curricula but, just as significantly, in the sustained and often unseen endeavour of nurturing empathy, ethical imagination, and a collective sense of purpose.

The experience at SIT underscores how intentional operationalisation of H–S–H catalyzes more than superficial interdisciplinarity or innovation as a rhetorical flourish; rather, it animates campus, curriculum, and community as synergistic spaces of authentic co-creation, visible societal impact, and enduring learning. Such integration is indispensable for understanding the ongoing infrastructural evolution within higher education, and it establishes a new world template for institutional research and policy reform.

In an era characterized by rapid complexity, digital disruption, and relentless change, integrated and pluralistic frameworks like H–S–H are not optional. They are essential for institutions determined to remain relevant, transformative, and genuinely future-ready. Ultimately, embracing the dynamic interplay of *hardware*, *software*, and *heartware* enables universities not only to adapt, but to lead; shaping a vision of education that realises humanity's full potential for compassion, creativity, and shared flourishing.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The authors declare that Copilot, an AI-assisted writing software, was used in proofreading and refining the language used in the manuscript. The usage was limited to correcting grammatical and spelling errors and rephrasing statements for accuracy and clarity. The authors further declare that, apart from Copilot, no other AI or AI-assisted technologies have been used to generate content in writing the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

Huei-Tse Hou, National Taiwan University of Science and Technology, Taiwan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Information integration and critical thinking skills are essential core competencies in cultural education. This study combines generative AI (GenAI) characters with Spherical Video-Based Virtual Reality (SVVR) technology to design a digital learning game that integrates knowledge of military dependents' village culture with puzzle-solving mechanisms. Players will assume the role of a grandson returning to the military village of Forty-Four South Village in Taipei City. By exploring the environment and objects within the SVVR military village and engaging in dialogue with the GenAI grandfather character, players can inquire about the grandfather's memories to compare information, piece together clues through reasoning, and recover the grandfather's lost videotape. This process enhances immersion and understanding of the culture of military villages. A total of 17 learners participated in the empirical evaluation of this study. The findings revealed that learners experienced a high level of flow (M = 4.10) and moderate anxiety (M = 2.01) while playing the game. extrinsic cognitive load was relatively low (M = 1.45), indicating that the interface design did not impose additional burdens; however, germane cognitive load was relatively high (M = 4.41), suggesting that learners were willing to invest extra effort in reasoning and integrating clues. Among them, 88.2% of learners believed that the game deepened their impression of the village and pointed out that AI grandfather clues played a key role in reasoning. Additionally, 76.5% of learners were willing to visit the village in person as a result. This study combines GenAI and SVVR to provide an innovative model for historical and cultural education.

Keywords: generative AI, spherical video-based virtual reality, cultural heritage education

Introduction

Cultural heritage education plays a central role in preserving and transmitting a society's cultural identity, traditions, and history. It fosters individuals' sense of belonging and identity while promoting cross-cultural understanding and appreciation (Camuñas-García et al., 2024). In the cultural education context examined by this study, information integration and interpretation skills are regarded as vital core competencies. However, traditional cultural education approaches, particularly within museums or cultural heritage sites, face challenges related to insufficient visitor engagement. Conventional museum artifact presentations often lack detail or provide limited information, making it difficult for visitors to connect with the artifacts or discern their significance (Othman et al., 2021). This static exhibition model typically fails to fully engage visitors and achieve effective participation, necessitating innovative approaches to enhance public interest and understanding of cultural heritage (Camuñas-García et al., 2024).

To address the limitations of traditional education, Digital Game-Based Learning (DGBL) has been widely adopted (Camuñas-García et al., 2024). Technologies such as Virtual Reality (VR), Augmented Reality (AR), and Mixed Reality (MR) have proven to be powerful tools for cultural heritage preservation and education, enhancing the interactivity of cultural objects (Jiang et al., 2025). Jiang et al. (2025) noted that the application of these technologies is shifting from traditional static preservation methods toward dynamic, interactive approaches to foster public engagement and educational impact. VR provides fully immersive experiences, such as creating detailed digital replicas of endangered cultural monuments or virtual models of fragile heritage sites (e.g., the Lascaux caves in France), enabling interactive exploration without causing physical wear to artifacts (Jiang et al., 2025).

Serious games leverage technology in the cultural heritage sector to engage users in educational and immersive experiences. They integrate instructional content and practical knowledge into gameplay mechanics, aiming to achieve user satisfaction, engagement, immersion, and effective perception of educational content (Bontchev et al., 2024). Othman et al. (2021) developed a mobile gamified tour application using a treasure hunt game mechanism. They found that while the game enhanced children's cultural heritage experiences in living museums, differences in engagement, knowledge and learning, and meaningful experiences did not reach significant levels. Only the emotional connection dimension showed a significant effect. This also indicates that traditional game mechanisms still have limitations in comprehensively enhancing cognition and engagement.

This study selected the integration of SVVR (Spherical Video-Based Virtual Reality) and GenAI (Generative AI) to overcome the limitations of either technology alone and leverage their complementary characteristics. SVVR is a form of immersive VR that captures real environments through 360-degree video (or real-life footage), offering a low-cost, user-friendly immersive learning experience suitable for educational settings. Its interactivity is limited to viewpoint switching, lacking scaffolding support and assessment capabilities (Jong, 2023). GenAI delivers creative and randomized feedback, generating content from data to provide adaptive guidance and real-time feedback (Lau et al., 2024). GenAI exhibits bidirectional dynamism and explorability, guiding learners to instantly search for information, analyze situations, and strategize within games. It also features role-playing capabilities, enabling characters like “village grandfathers” in cultural education to create contextualized learning experiences (Chien et al., 2025). Therefore, this study employs SVVR to deliver immersive real-world settings and GenAI character interactions to address its interactive limitations.

Through real-time dialogue, role-based guidance, and cultural knowledge transmission, it realizes an immersive and interactive educational model for military dependents' villages, meeting educational design requirements. Consequently, this study focuses on the SVVR military dependents' village setting, cultural artifact interactions, and dialogues with the generative AI grandfather character. Presenting the game through a web interface and panoramic VR mode, it designs a historical-cultural educational game integrating cultural exploration and puzzle-solving. The AI dialogue within the story script incorporates multiple cultural clues. Learners must progressively deduce and integrate information through exploration and conversation to piece together the historical context of military dependents' village life.

Methods

Participants in this study were recruited voluntarily, comprising 17 individuals: 9 males and 8 females, aged between 22 and 77 years old, with a mean age of 32.1 years. To assess learners' flow states, this study adopted the Flow State Inventory developed by Kiili (2006), utilizing the Chinese version translated by Hou and Li (2014). In this study, the overall reliability of the Flow Scale was Cronbach's $\alpha = .882$, indicating high reliability. To assess learners' activity anxiety, this study adapted the activity anxiety Scale translated by Hung (2001). In this study, the overall reliability of the activity anxiety Scale was Cronbach's $\alpha = .596$. Future research could improve reliability by expanding the sample size. The cognitive load scale translated by Leppink et al. (2013) was adapted and adjusted based on Klepsch et al. (2017)’s differentiated cognitive load scale to assess learners’ cognitive load. In this study, the overall reliability of the activity learning cognitive load scale was Cronbach's $\alpha = .769$, demonstrating high reliability. All questionnaires employed a five-point Likert scale, with 1 indicating strongly disagree and 5 indicating strongly agree. Additionally, to understand learners' impressions, emotions, and cultural understanding, this study incorporated open-ended questions to collect qualitative feedback.

This study designed the historical education game “Time Village” The game features a realistic storyline, generative AI-simulated character interactions, and allows players to explore environments and objects within the SVVR-created military dependents' village setting (Forty-Four South Village). Players assume the role of a young man who converses with a generative AI NPC (the protagonist's grandfather), whose character script was co-designed by the research team. Through information cross-referencing and clue deduction, players must find a lost videotape within a limited timeframe. Players can input questions in the left dialogue box to receive the grandfather's responses, as shown in Figure 1. Simultaneously, they can explore objects within the military dependents' village scene (Forty-Four South Village) created by SVVR through the right-side game interface, as shown in Figure 2.

Figure 1
Time Village-GenAI interaction

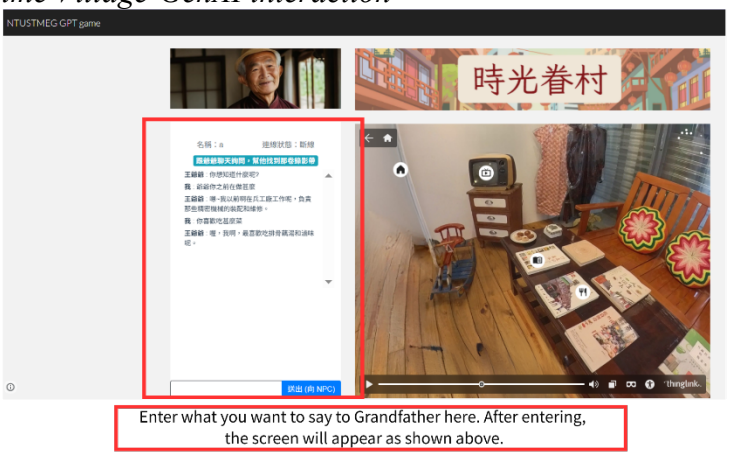

Figure 2
Time Village-SVVR Created Military Dependent Village Scene (Forty-Four South Village)

Results and Discussions

To examine learners' flow, this study employed a nonparametric one-sample Wilcoxon signed-rank test, comparing individual scores against the median (i.e., 3). Table 1 presents learners' flow states following the task. Overall flow ($M = 4.1$) was significantly higher than 3, and the subdimensions Flow antecedents ($M = 4.1$) and Flow experience ($M = 4.1$) were also significantly above 3. Results indicate that learners experienced high levels of flow ($M = 4.10$, $p < .001$) during gameplay. Among the sub-dimensions, Concentration ($M = 4.35$, $p < .001$) and Goals of an activity ($M = 4.50$, $p < .001$) stood out most prominently, showing that learners maintained focus and clearly understood task goals throughout the game. Additionally, high scores were observed for sense of Control ($M = 4.38$, $p < .01$) and Autotelic experience ($M = 4.18$, $p < .01$), showing the game's operability and provision of intrinsic feedback. The integration of SVVR scenarios with generative AI dialogue successfully created an immersive learning environment conducive to flow. This aligns with Fang (2024)'s findings that focus and control are key components of flow experiences within goal-directed training VR learning settings.

Table 1
The Mean and Standard Deviation of Learners' Flow

	(*N* = 17)			
	M	*SD*	*Z*	*Sig.*
Overall Flow	4.10	0.56	3.57***	.000
Flow antecedents	4.10	0.50	3.52***	.000
Challenge-skill balance	3.71	0.99	2.56*	.010
Goals of an activity	4.50	0.75	3.56***	.000
Unambiguous Feedback	3.76	0.99	2.64**	.008
Control	4.38	0.78	3.48**	.001
Playability	4.15	0.75	3.33**	.001
Flow experience	4.10	0.65	3.51***	.000
Concentration	4.35	0.78	3.50***	.000
Time distortion	3.91	1.08	2.65**	.008

Loss of self-consciousness	3.62	1.47	1.68	.093

*p < 0.05, **p < 0.01, *** p < 0.001

To examine learners' activity anxiety, this study employed a nonparametric one-sample Wilcoxon signed-rank test, comparing individual scores against the median. Table 2 presents the statistical results for activity anxiety. Overall anxiety (M = 2.01, p < .001) fell below 3, indicating that learners experienced low-to-moderate anxiety during gameplay. This finding also indicates that while the game provided cognitive challenges, it did not induce excessive stress, allowing learners to focus on exploration and reasoning tasks. Li et al. (2024) noted that the relationship between anxiety levels and student performance follows a fluctuating curve: low to moderate anxiety helps keep learning motivation, while excessive anxiety may negatively impact learning performance.

Table 2
The Mean and Standard Deviation of Learners' Activity Anxiety

	(*N* = 17)			
	M	*SD*	*Z*	*Sig.*
Activity anxiety	2.01	0.55	-3.52***	.000

***p < 0.001

To examine learners' cognitive load, this study employed a nonparametric one-sample Wilcoxon signed-rank test, comparing individual scores against 3. Table 3 presents the statistical results for cognitive load. Analysis indicates that intrinsic cognitive load was at a moderate level (M = 3.03, p = .740), showing no significant difference from 3. This suggests the cultural education task itself was neither excessively difficult nor overly simple. Extrinsic cognitive load was significantly low (M = 1.45, p < .001), showing significant difference from 3. This indicates that the SVVR interface and game mechanics did not impose additional burdens. Germane cognitive load was significantly high (M = 4.41, p < .001), showing significant difference from 3. This indicates that learners were willing to invest substantial effort in reasoning, integrating clues, and engaging with historical narratives. This outcome highlights how game design effectively minimizes unnecessary distractions while fostering meaningful cognitive engagement. Sevcenko et al. (2021) noted that in serious games,

appropriately managing learners' cognitive load through thoughtful design helps maintain optimal learning states, thereby promoting meaningful participation.

Table 3

The Mean and Standard Deviation of Learners' Cognitive Load

	(*N* = 17)			
	M	*SD*	*Z*	*Sig.*
Intrinsic cognitive load	3.03	0.69	0.33	.740
Extrinsic cognitive load	1.45	0.74	-3.82***	.000
Germane cognitive load	4.41	0.67	3.85***	.000

*p < 0.05, **p < 0.01, *** p < 0.001

Figure 3 presents learners' open-ended feedback and quantitative results. 88.2% of learners felt that the SVVR exploration deepened their impression of Forty-Four South Village. Similarly, 88.2% noted that conversations with AI Grandfather enhanced emotional engagement, with his authentic tone making memories of life in the munitions factory and neighborhood interactions feel more real and immersive. 100% of learners indicated that solving clues, such as flipping through recipes, reading bulletin boards, and listening to Grandfather's recollections, helped them deeply understand the culinary traditions and social interactions within military dependents' village culture. Furthermore, 76.5% of learners expressed that the SVVR experience sparked their curiosity, prompting them to visit Forty-Four South Village in person.

Figure 3

Results of the Open-Ended Questions on Military Dependent Villages

Conclusions and Limitations

This study confirms that integrating SVVR with GenAI characters in cultural education games effectively promotes learner flow, reduces activity anxiety, and enhances cultural understanding. Learners experience focus, immersion, and heightened presence during gameplay while mitigating task-induced learning anxiety, maintaining an optimal challenge level throughout exploration. Through a blend of exploratory interaction, puzzle-solving design, and contextual immersive scenarios, learners actively participate in clue collection and information inference. Simultaneously, they progressively construct cultural knowledge through dialogues with the AI Grandfather, deepening their understanding of military dependents' village history and cultural context. Research findings indicate that this gamified learning model not only enhances learner engagement and motivation but also sparks a desire to visit actual sites, bridging virtual learning with real-world cultural experiences. This achieves a connection between digital interactive education and cultural heritage preservation.

Beyond these findings, the study also identified limitations and future research directions. While AI Grandfather delivers culturally meaningful narratives, some learners suggested enriching dialogue content. Future research could enhance the contextual richness of AI dialogues and incorporate additional elements of military dependents' village knowledge—such as literature and music—to create a more comprehensive cultural learning experience.

Users' Behaviors of Submitting and Commenting in Education-Related Subreddits

Khadijah Alghamdi, Majmaah University, Saudi Arabia

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study is an investigation of users' behaviors of posting and commenting in five education-related subreddits: r/teaching, r/Teachers, r/education, r/teachingresources, and r/CSEducation. The data were analyzed for the period from January 2018 until May 2019. Comparative analysis revealed some differences among the five results showing that the r/Teachers subreddit has the most engagement scores and active users' percentages while the r/education subreddit has the lowest score of engagement although it has the second-highest number of contributions (submissions and comments).

Keywords: education, CS, reddit, subreddits, user behavior, online communities

iafor
The International Academic Forum
www.iafor.org

Introduction

Despite the major focus in educational research on ways to improve students' learning and teachers' performance, teachers still face pedagogical challenges, curriculum challenges, and structural challenges (Margot & Kettler, 2019). One of the solutions to these challenges is collaboration among teachers in online communities (Margot & Kettler, 2019), which can be implemented on social media platforms.

Online communities can be valuable resources that offer teachers continuous professional development (Duncan-Howell, 2010). However, some computer science teachers have complained that online communities for sharing resources and learning from each other by posting questions and receiving answers often disappear (Yadav et al., 2016). They are looking for a sustainable and trustworthy source of information and support.

Social media platforms such as Twitter, Facebook, and Reddit are widely used by educators and learners (Carpenter et al., 2018; Willet & Carpenter, 2019). Srinivasan and Mekala (2014) defined social media as "a group of Internet-based applications that build on the ideological and technological foundations of Web 2.0 and that allow the creation and exchange of user-generated content" (p. 155). Drawing on these affordances, many teachers use social media platforms for formal and informal professional development (Margot & Kettler, 2019). One of the social media platforms most widely used by teachers in the United States is Reddit, which was created in 2005 by Alexis Ohanian and Steve Huffman (Vella, 2015). Reddit members submit such content as links, texts, photos, and videos for discussion. There is also a function for raising content to the top (upvoting) if a member likes it or dropping content down (downvoting) if not.

The Reddit platform has many subreddits, each of which constitutes a specific online community. This social media platform thus serves different perspectives and different people. Although there are many subreddits that are concerned with education and supporting teachers, researchers have paid little attention to the different kinds (Willet & Carpenter, 2019). Moreover, Chen et al. (2014) emphasized that social media conversations provide us with rich data about teachers' experiences with, opinions on, difficulties with, or feelings about learning. In order to bridge this gap in the literature, this study focuses on five of the education-related subreddits: r/teaching, r/Teachers, r/education, r/teachingresources, and r/CSEducation, the websites of which indicate that they are all focused on education but different aspects. The earliest subreddit among the five targeted for this research is r/education, which was initiated in May 2008 as a space for educational stakeholders to discuss topics related to educational policy, research, technology, and politics. In December 2008, r/teachers subreddit was begun as a community for all teachers in different disciplines to share their experiences, stories, insights, and inspirations with others. The r/Teaching subreddit was launched in May 2009, also for teachers to share experiences and concerns. The r/CSE subreddit was begun in 2012 to target computer science educators and researchers and provide them with best practices and pedagogies for teaching computer science.

The most recently created subreddit in this study is r/Teaching Resources, which was initiated in February 2013. Its goal is to provide classroom teachers with resources and technologies in order to improve their knowledge delivery to students. All of the five subreddits are public and target mostly K-12 teachers in all disciplines, except for the r/CSEducation subreddit, which specifically targets computer science educators. The aim of this paper is to explore the behaviors of users of the five subreddits and to compare them in terms of their activities and

engagement. This work expands the work of Willet and Carpenter (2019) by adding r/CSEducation, which was initiated in response to computer science educators' quest for online communities to support their professional development (Yadav et al., 2016).

Related Work

There are many studies about online communities for teachers in general and computer science teachers in particular. However, to the best of the author knowledge and search, few qualitative studies on subreddit communities for teachers were found, in which human-coded content analysis was used, such as, Carpenter et al. (2018) and Chang-Kredl and Colannino (2017). In these studies, however, only small numbers of comments or posts were analyzed because of humans' limited ability to analyze the large amount of data available from social media platforms.

Chang-Kredl and Colannino (2017) analyzed 600 posts on a Reddit platform initiated to address the public image of teachers. The posts were selected via on a search on the Reddit platform using the following key phrases: "best teacher," "worst teacher," "favorite teacher," and "least favorite teacher". Based on this search, eight threads were selected, four about best teachers and four about worst teachers. Similar to Carpenter et al. (2018), inductive content analysis was applied. This process resulted in the identification of 15 codes, which were classified into four broad themes: teachers' professional qualities, teachers' personal qualities, relational qualities between teachers and students, and implications for students' least favorite teachers. The researchers concluded that the best teachers are those who know how to present, care about their relations with their students, and have an impact on students, while the worst teachers are those who are not qualified in their teaching skills, do not care about their relations with their students, and do not affect their students' lives.

Carpenter et al. (2018) conducted a qualitative study to analyze the top 25 posts and the associated responses in the r/teachers subreddit for a 20-day period. This sub-Reddit had the second highest number of readers. Inductive thematic analysis was used in this study in which human-coding was applied to examine the content of the posts. They found that the most frequent codes in r/teachers subreddit posts were the following: advice, teachers, a community post, specific content area, venting, new teacher, and students. Also, they found that users who posted to r/teachers most frequently sought or gave technical and emotional advice. Regarding analysis of responses, the study revealed that the top-rated responses tended to provide advice in line with what was sought in the original advice-seeking posts. In addition, sometimes the advice provided emotional support.

In an exploratory study of conversations between teachers, Willet and Carpenter (2019) collected 351,301 posts, including 114,524 original posts and 236,777 responses, from four different education-related subreddits, r/education, r/Teaching, r/teaching, and r/Teaching Resources, between July 1, 2017 and June 30, 2018. In this study, the *active percentage* was defined as "the number of contributors to a subreddit in the past year divided by the number of subscribers to that subreddit, as of September 2018," and the *engagement score* "represented the number of responses to questions in a subreddit in the past year divided by the number of threads, or clustered conversations, in that subreddit during the same span of time" (p. 2789). Based on the traced data, they found that a large number of subscribers were not necessarily associated with the most active contributors. They also calculated a text-polarity sentiment score for every contribution in each of the subreddits for the voting score, which is the sum of all upvotes and downvotes. In addition, they created a word cloud for each subreddit to explore

the most popular words. They found that the subreddit r/education included broader conversations about education while the subreddit Teaching Resources was more concerned with resources than with what happens in schools.

Research Questions

The aim of this study was to investigate users' participation in five education-related subreddits: r/education, r/Teachers, r/Teaching, r/CSEducation, and r/Teaching Resources by answering the following questions:

1. What are the engagement scores for each subreddit?
2. What are the percentages of active users in each subreddit?
3. What are the users' behaviors of posing and commenting for each subreddit?
4. What are the most used words in submissions and comments for each subreddit?
5. Are the targeted subreddits growing or not?

Dataset

A dataset of 6,870 contributions was analyzed, the total number of original posts (submissions) and responses to them (comments) in five subreddits related to education: r/Teaching, r/Teachers, r/education, r/TeachingResources, and r/CSEducation during the period of January 2018 to May 2019. This dataset was only 1% of the original data and was downloaded from the server of Dr. Riddell, the course instructor, to my laptop.

In this study, a submission is a post first submitted by a user, referred to as the submitter, in the form of either a question or a statement communicated to other users and to which other users, referred to as commenters, can respond. Each submission with its comments is called a thread.

Method

In order to answer the research questions, the dataset drawn from five education-related subreddits was analyzed using Python. First, 34 parquet files were downloaded from the server to my laptop. The first 17 files had 1% of the comments of all the subreddits, and each file contained data for one month, starting from January 2018 to May 2019. The last 17 files included 1% of all subreddit submissions. The submissions and comments of the five targeted subreddits were extracted in order to find the number of comments, the number of submissions, the number of users who submitted, the number of users who commented, and the number of questions in the submissions data for each subreddit. The percentage of active users of each subreddit was calculated by dividing the total sum of commenters and submitters to that subreddit during the 17- month period by the total number of users as of December 2019. Engagement scores were also calculated for each subreddit by dividing the number of comments in a subreddit during the 17-month period by the number of submissions during the same span of time. These definitions of active percentages and engagement scores were adopted from Willet and Carpenter (2019).

In order to classify each submission post as questions or statements, if a question mark in each post was present, the submission was classified as a question; otherwise, the submission considered to be a statement. Then the submissions and comments were merged and then words counted separately in order to find the most common 50 words in each of the five subreddits, which I then used to create word clouds. The Word Cloud tool has the feature of filtering

out all punctuation and stop words, such as articles, pronouns and conjunctions, before forming clouds.

Evaluation

To assess the validity of the coding, two alternative samples were used from two subreddits. One was one of the largest subreddits r/AskReddit (Cole et al., 2019), a forum in which users can ask questions on different topics. It was started in January 2008 and has more than 25 million users. The other subreddit was r/FIFA, a sports channel started in 2009, which has more than 3,000 users. The results were robust in support of sampling data from other months in the same time period showing similar observations.

Results and Discussion

In this part, the findings of this study of users' behaviors in five education-related subreddits are presented. Descriptive statistics for the overall contributions to the five subreddits were calculated (Table 1). The results show that all subreddits had more comments than submissions except for the r/education subreddit, in which there were more submissions than comments, yielding a 0.40 engagement score, indicating that the users of this particular subreddit were not highly engaged with or not cognizant of the content discussed. Another possible explanation is that the submissions, which are the main posts in a forum, were more often in the form of declarative statements rather than questions and so did not elicit answers, and people are more likely to be engaged when submissions are questions.

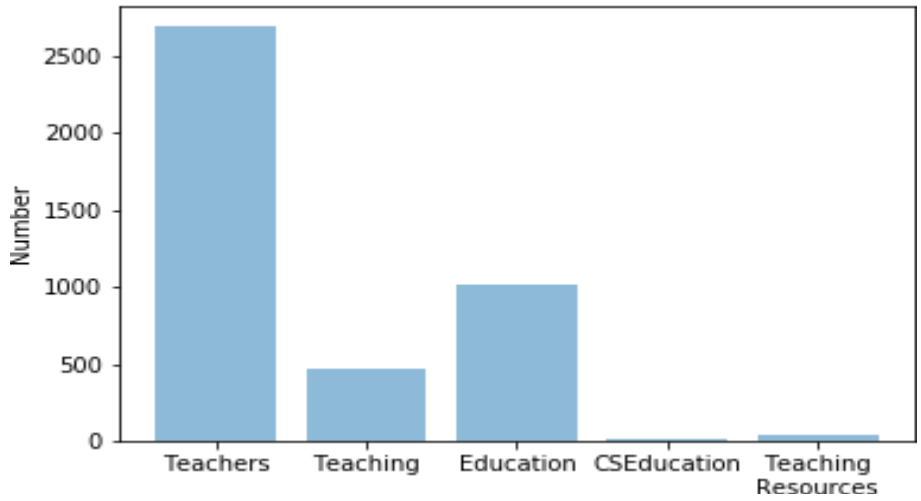
This explanation is supported by the two highest engagement scores, 11.7 for the r/Teachers subreddit followed by 8.2 for r/teaching. Both of these subreddits had submissions with more questions than statements (Table 2), which might be a reason for the higher scores for engagement with the content. This explanation is also supported by the finding that the subreddits with the lowest engagement scores, CSEducation, and r/teachingresources, had submissions with fewer questions and more statements. These results are aligned with what Willet and Carpenter (2019) found in their study.

Table 1
Engagement Score of the Subreddits

Subreddit	Comments	Submissions	Engagement
r/education	425	1102	0.40
r/teachers	4060	349	11.71
r/Teaching	512	59	8.2
r/CSEducation	9	3	3
r/teachingresources	29	23	1.34

Regarding the type of submission, all five subreddits have fewer question type submissions and more of statement submissions and the r/CSEducation subreddit does not have any questions at all (Table 2).

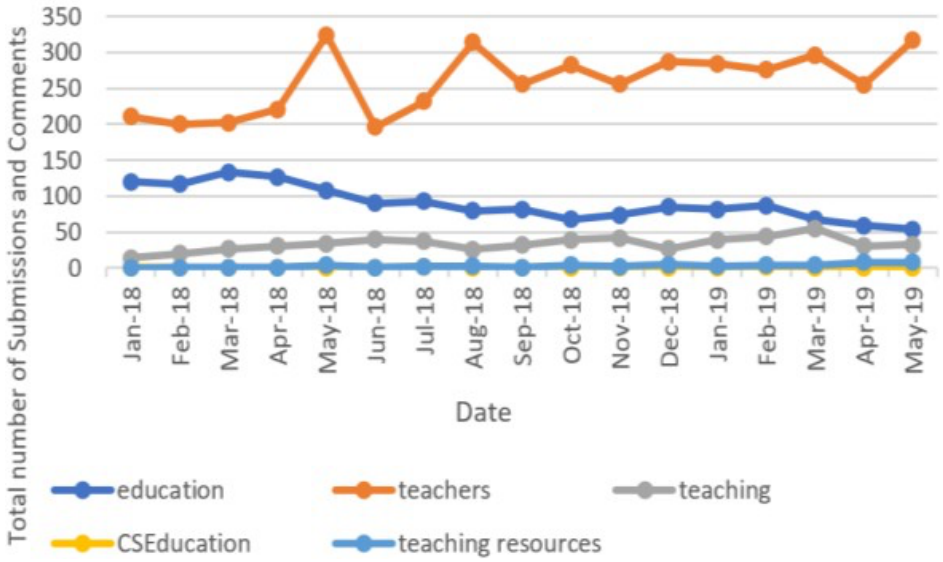
Table 2
Questions and Statements in Submissions



Subreddit	Questions	Submissions
r/education	9	1093
r/teachers	155	194
r/Teaching	26	33
r/CSEducation	0	12
r/teachingresources	3	20

While all of the five subreddits had very low percentages of active users (Table 3), r/Teaching subreddit had the highest active users' percentage (2.1%), followed by r/education, r/teaching, r/teachingresources, and r/CSEducation consecutively (Figure 1).

Table 3
Active Users Percentages for Subreddits



Subreddit	Commenters	Submitters	Subscribers	Active (%)
r/education	311	706	96,600	1.05%
r/teachers	2433	263	128,000	2.10%
r/Teaching	418	55	50,400	.93%
r/CSEducation	9	3	10,900	.11%
r/teachingresources	26	12	18,800	.23%

Figure 1
Number of Active Users of Each Subreddit

To explore the growth of subreddits during the 17 months starting from January 2018, a line graph of the total number of submissions and comments was created. The graph illustrates that the r/Teachers subreddit was more active at the beginning of this period and remained the most active subreddit until the end, while activity in the r/education subreddit decreased over the 17 months. On the other hand, the r/teachingresources and r/CSEducation subreddits, which began with low activity rates, remained relatively stable throughout the data collection period (Figure 2).

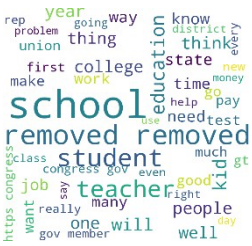


Figure 2
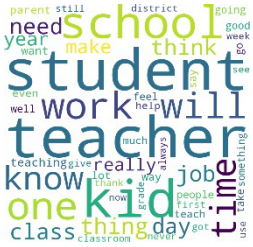
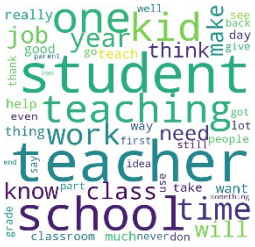
Are the Subreddits Growing?

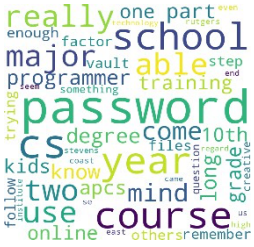


In regard to the common words in each subreddit (Figure 3), the word clouds show that in general the words were related to educational discussions about K-12 contexts. The word clouds based on the most common words show a clear similarity in the topics discussed in the r/Teachers and r/teaching subreddits, for instance, "student," "teacher," "school," "kid," "work." In the r/education subreddit, the most common word is "school." Also, in the r/education subreddit the word "removed" is shown twice in large font, indicating that a comment or submission was removed either by Reddit moderators or by spam filters. This suggests that the moderators of this subreddit actively observe the published content, and that this subreddit's users posted inappropriate content. Moreover, "https" is one of the common words, showing that in general users like to share links. The word cloud for the r/teachingresources subreddit includes "budgeting," "cloud," "exam," "question," "planning," and "certification" as the most common words. This suggests that a main concern in the teaching resources subreddit is about resources that might support students' achievement in exams and ways to use school resources to promote learning. The word cloud for the r/CSEducation subreddit shows "password," "CS (computer science) programmer," and "training" as the most common words. These words emphasize that computer science education and a focus on students as programmers are main concerns of users of this subreddit. Also, the word "training" shows the desire for professional development by CS teachers.

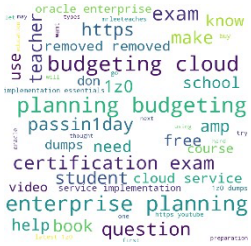
Figure 3



Common Words in Each Subreddit



r/education



r/teachers

r/Teaching

r/CSEducation

r/teachingresources

Conclusion

Four of the five subreddits in this study can be considered as low-activity communities, the exception being the r/Teachers subreddit. Therefore, based on this as well as previous studies, it can be inferred that many CS teachers suffer the disadvantage of not having an online community on which they can rely for substantive interaction and support. Thus, the findings of this study suggest the need for more research attention to education-related subreddits, especially those with low engagement scores and percentages of active users, and ways to create and sustain more dynamic communities for CS educators.

Future Work and Limitations

Toward this end, this study can be expanded by including more education-related subreddits, for instance, subject-related subreddits in K-12 contexts to examine other users' behaviors and compare them with those of the r/CSEducation subreddit users. Moreover, similar studies might be conducted to explore other online communities for teachers, such as #ComputerScienceEduction on X platform, and compare these with Reddit communities in order to find the best practices for improving users' engagement with the content and interactions in subreddits. In addition, network analysis studies can increase understanding of the relations among users and how they respond to each other. Future research should also investigate the most active subreddits related to the field of education to explore the reasons for their high rates of activity.

There are some limitations to this study. One is the researcher's limited knowledge of computational linguistics and big data analysis. Another limitation is reliance on bots-generated content, which might have affected the data on which the results of the study were based.

Acknowledgements

I would like to express my gratitude to Dr. Allen Riddle, at Indiana University Bloomington, who provided me with the dataset and for his guidance throughout this project.

Collaborative Governance in Transnational Higher Education: Reimagining Leadership Through UK-UAE Partnerships

Sumara Khan, Brunel University, United Kingdom

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Transnational education partnerships between UK and UAE institutions reveal how cultural differences shape shared leadership and decision-making in practice. Through interviews with 32 stakeholders across regulatory bodies, universities, and educational agencies, this research examines how British risk-based governance approaches negotiate with Emirati centralised quality assurance systems. The study demonstrates that effective cross-border partnerships require navigating distinct cultural expectations: British emphasis on institutional autonomy and peer review contrasts with UAE preferences for clear hierarchical structures and ministerial oversight. Key findings show that successful partnerships employ cultural translators who mediate between regulatory frameworks, implement joint governance boards balancing representation with efficiency, and develop trust through regular face-to-face engagement rather than relying solely on contractual mechanisms. Power asymmetries manifest practically in curriculum validation, where UK institutions retain final approval whilst UAE partners seek meaningful input on local contextual adaptation. The research identifies three practical strategies for culturally responsive shared leadership: bilateral quality agreements that acknowledge both regulatory systems, stakeholder engagement mechanisms incorporating voices traditionally marginalised in governance, and outcomes-based monitoring combining data-driven accountability with relational trust-building. These findings offer actionable guidance for developing equitable international education partnerships that respect cultural diversity whilst maintaining quality standards.

Keywords: transnational education, collaborative governance, quality assurance, stakeholder participation, power dynamics

iafor
The International Academic Forum

Introduction

Transnational higher education (TNE) has evolved from a niche export activity to a central pillar of internationalisation strategies worldwide. Global TNE enrolment expanded from 0.9 million learners in 2000 to an estimated 4.3 million in 2024, representing 17% of all internationally mobile education and generating US$44 billion in annual revenue (Altbach & Knight, 2007; Garrett & Verbik, 2024). This rapid expansion has surfaced critical questions about academic quality, legitimacy, and stakeholder voice in cross-border educational provision that require systematic investigation and theoretical development.

The commercial imperative driving TNE growth cannot be divorced from questions of educational quality and equity. Universities face mounting financial pressures from reduced public funding, increasing operational costs, and intensifying global competition for students. TNE partnerships offer diversified revenue streams whilst expanding institutional reach and reputation across international markets. However, this commercialisation raises fundamental questions about whose interests are prioritised in governance structures, how quality standards are negotiated across different regulatory contexts, and whether the voice of all stakeholders—particularly students, local faculty, and host country partners—is adequately represented in decision-making processes.

This research examines TNE partnerships between the United Kingdom and the United Arab Emirates, offering an instructive contrast in quality assurance approaches shaped by distinct cultural and governance traditions. The UK operates a risk-based, peer-review regime that privileges institutional autonomy through the Quality Assurance Agency (QAA), reflecting British cultural values of academic freedom, collegial decision-making, and trust in professional judgement. The UAE, by contrast, enforces a highly centralised model through the Commission for Academic Accreditation (CAA), linking quality tightly to national development goals in alignment with Emirati cultural preferences for clear hierarchical authority, government oversight, and structured compliance systems.

More than sixty UK universities deliver programmes in the UAE, most located in Dubai's education free zones, creating a natural laboratory for examining how divergent regulatory logics and cultural expectations negotiate mutual recognition. These partnerships require ongoing cultural translation as British and Emirati stakeholders navigate different assumptions about authority, transparency, consultation processes, and the appropriate balance between standardisation and local adaptation. Understanding how shared leadership functions in practice across these cultural boundaries offers insights applicable to transnational partnerships more broadly.

The overarching research question addresses: How do collaborative governance, stakeholder participation, and the relationship between home and host institutions affect quality assurance in UK TNE programmes offered in the UAE, across different delivery modes and cultural settings? This question is explored through three specific research objectives. First, examining how governance structures and institutional adaptability influence quality assurance across different TNE delivery modes. Second, analysing how power dynamics and stakeholder participation shape decision-making processes in TNE partnerships. Third, investigating the role of trust mechanisms, contractual arrangements, and principal-agent relationships in maintaining programme quality and institutional reputation.

Literature Review and Theoretical Framework

Current scholarship on TNE governance falls into two broad categories. The first, dominated by higher-education management journals, documents institutional practices through single-case studies focusing on partnership contracts, credit-transfer protocols, and resource allocation (Healey, 2016; McBurnie & Ziguras, 2006). The second, rooted in comparative-policy literature, analyses national quality assurance regimes but rarely links them to the lived experience of cross-border delivery (Altbach & Teichler, 2001; Johnson et al., 2021). Few studies attempt an integrated, multi-level account that examines both policy frameworks and operational realities whilst attending to how cultural differences shape governance practices.

Three theoretical lenses inform this research. Collaborative Governance Theory provides a framework for understanding how different actors with conflicting interests engage in consensus-driven decision-making processes (Ansell & Gash, 2008). Applied to TNE contexts, this perspective suggests that effective quality assurance depends less on imposing uniform standards than on creating spaces for genuine dialogue between home and host institutions, regulatory bodies, and other stakeholders. However, the theory's optimistic assumptions about consensus-building may underestimate how deeply entrenched power asymmetries and cultural differences constrain genuine collaboration.

Stakeholder Theory (Freeman, 1984) identifies the needs and power dynamics of key players in transnational partnerships, including students, faculty, regulators, ministries, employers, and professional bodies. In TNE contexts, this theory reveals tensions as home institutions typically prioritise reputation protection and financial returns, host partners emphasise local market access and capacity building, students expect affordable access and internationally recognised qualifications, and regulatory bodies seek to ensure quality standards whilst advancing national strategic objectives. These divergent interests create contestation over whose voice is heard in governance structures.

Agency Theory (Eisenhardt, 1989) views TNE partnerships as principal-agent relationships characterised by control issues, varying incentives, and information asymmetry. Applied to TNE, home institutions function as principals who retain degree-awarding authority but delegate delivery to host partners serving as agents. This relationship creates risks that hosts may prioritise revenue over academic standards or misrepresent their capabilities. Effective TNE governance likely requires combining the structural clarity that agency theory emphasises with the trust-building processes highlighted by collaborative governance approaches.

Methodology

This research adopts an interpretivist worldview, recognising that quality assurance in higher education is perceived differently by various stakeholders across cultural boundaries. Interpretivism acknowledges that what constitutes “quality” is not a fixed, universally agreed standard but rather a socially constructed concept negotiated through interactions between institutions, regulators, students, and other stakeholders. Understanding these negotiated meanings, particularly across UK and UAE cultural contexts, requires engaging deeply with participant perspectives.

Semi-structured interviews were conducted online with 32 participants across UK and UAE TNE institutions during September and October 2025. Interview duration ranged from 45 to 90 minutes, generating approximately 480,000 words of transcript data. Participants included

senior academic leaders such as pro-vice-chancellors and deans responsible for international partnerships, quality assurance professionals including internal auditors and compliance officers, regulatory experts from the QAA and CAA, educational consultants who facilitate TNE partnerships, agents who recruit students for TNE programmes, and institutional managers responsible for day-to-day partnership operations. Participants had between 5 and 35 years of experience in transnational education, providing rich historical perspective on how TNE governance has evolved.

Purposive sampling identified individuals with direct experience in UK-UAE TNE programmes and knowledge of governance, partnership models, and quality assurance practices. Snowball sampling supplemented this approach where initial participants referred others meeting the study criteria. The sample achieved breadth across institutional types, including Russell Group research-intensive universities, post-1992 universities with substantial TNE portfolios, specialist institutions, and private providers operating in UAE free zones.

Data analysis followed the six-step thematic analysis framework of Braun and Clarke (2008), integrated with the Gioia methodology (Gioia et al., 2013) to systematically develop first-order codes from participant narratives, second-order themes through interpretive clustering, and aggregate dimensions representing overarching theoretical constructs. This rigorous analytical approach ensures findings remain grounded in participant experiences whilst connecting to broader theoretical insights.

Ethical approval was obtained from the researcher's institution. All participants provided informed consent, and pseudonyms were assigned to protect confidentiality. The study maintains trustworthiness through credibility, transferability, dependability, and confirmability as outlined by Lincoln and Guba (1985).

Findings

Cultural Dimensions of Governance and Institutional Adaptability

Participants revealed how cultural differences fundamentally shape governance approaches in UK-UAE partnerships. British stakeholders emphasised institutional autonomy and bottom-up quality enhancement, reflecting UK higher education traditions of collegial governance and academic freedom. One UK quality director explained: “We trust our academic staff to maintain standards through peer review and professional judgement. Quality assurance is about creating an environment where excellence can flourish, not imposing rigid compliance systems.” This approach aligns with broader British cultural values privileging individual professional judgement within loosely coupled organisational structures.

Emirati stakeholders, by contrast, described quality assurance in terms of clear standards, structured processes, and governmental oversight. A UAE regulatory official noted: “Quality requires explicit criteria that everyone understands and systematic monitoring to ensure compliance. Our role is to protect students and national interests through rigorous oversight.” This perspective reflects cultural preferences for hierarchical decision-making structures and clearly defined authority relationships common in Gulf societies. These divergent cultural expectations created ongoing tensions requiring active negotiation in partnership governance.

Several participants described the emergence of “cultural translators”—individuals with deep experience in both UK and UAE contexts who mediate between different governance

expectations. These translators help UK partners understand Emirati preferences for formal documentation and explicit approval processes, whilst helping UAE stakeholders appreciate British emphasis on evidence-based quality enhancement and professional autonomy. One consultant explained: "Successful partnerships require people who can speak both languages, not just linguistically but culturally. You need to understand why UK universities resist what they see as bureaucratic compliance and why UAE regulators insist on detailed documentation."

The role of these cultural translators proved particularly critical during regulatory audits and quality reviews. British institutions approaching UAE regulatory reviews with their typical peer-review documentation found it insufficient for Emirati expectations. One UK quality manager described:

> We submitted what we considered comprehensive programme documentation—external examiner reports, student feedback analysis, enhancement action plans. The CAA reviewers wanted much more explicit detail: specific learning outcomes mapped to assessment tasks, documented approval at multiple committee levels, formal evidence of regulatory compliance checks. We initially saw this as bureaucratic, but our UAE partners helped us understand it reflects different accountability expectations.

Conversely, UAE partners initially struggled with British quality assurance emphasis on reflective practice, enhancement culture, and professional judgement. One host institution manager explained:

> QAA audits focus on how institutions learn and improve, asking about our quality culture and enhancement mechanisms. This felt vague compared to CAA's specific compliance criteria. We needed to develop different capabilities—not just demonstrating standards compliance but articulating our quality philosophy and enhancement approach.

These contrasting regulatory expectations required partnerships to develop dual capability satisfying both frameworks.

Curriculum validation emerged as a key site where cultural differences manifest practically. UK validation processes typically involve extensive collegial debate, iterative refinement based on external examiner feedback, and significant academic discretion in programme design. Emirati stakeholders, however, expressed frustration with what they perceived as vague processes lacking clear timelines and explicit approval criteria. One UAE partner described: "The UK validation process feels opaque to us. We prepare extensive documentation but then face additional questions and requests for clarification without clear standards about what's required. We need more structure and transparency."

These tensions played out concretely in curriculum localisation debates. UK institutions emphasised maintaining curriculum parity—offshore programmes matching home campus content exactly—to protect academic standards and degree equivalence. One UK academic explained: "Our degree must mean the same thing whether studied in London or Dubai. We can't compromise academic standards for local preferences." However, UAE partners argued that rigid curriculum standardisation ignored legitimate local context. An Emirati programme director noted: "Business education needs local case studies, regional economic contexts, and

examples students recognise. Teaching UK retail case studies to Dubai students who've never been to Tesco makes no pedagogical sense."

Successful partnerships navigated this tension through distinguishing core curriculum requirements from contextual application. One partnership manager described:

> We identified non-negotiable learning outcomes and theoretical foundations that must be identical. But we allow flexibility in examples, case studies, and application contexts. A module on retail strategy teaches the same analytical frameworks but uses regional examples relevant to students' future careers. This preserves academic standards whilst respecting local relevance.

This approach required extensive dialogue to define which curriculum elements were essential for degree integrity versus where contextual adaptation enhanced rather than compromised quality.

Assessment practices revealed similar cultural negotiations. British universities typically privilege diverse assessment methods emphasising critical analysis, independent thinking, and original argument development. However, participants noted that students educated in Gulf education systems often initially struggled with open-ended assessments lacking clear answer criteria. One UK programme director explained:

> We had to develop more structured rubrics and exemplars than we'd use in the UK, not because standards were lower but because cultural learning expectations differ. Emirati students excel when they understand exactly what's expected, but British-style 'develop your own argument' assignments initially felt unclear to them.

Stakeholder Power Dynamics and Shared Decision-Making

Analysis revealed how cultural norms around authority and participation shape shared leadership practices. British stakeholders generally expected inclusive consultation processes where multiple voices contribute to decisions, reflecting UK higher education traditions of committee-based governance and democratic deliberation. However, this consultation model sometimes frustrated Emirati partners accustomed to clearer hierarchical decision-making where senior leadership provides definitive direction after appropriate consultation with relevant authorities.

One host partner described this cultural difference: "UK universities hold endless meetings where everyone has input but decisions remain ambiguous. In our context, we value consultation but expect leaders to make clear decisions and provide direction. The British preference for consensus-building can feel indecisive to us." Conversely, British stakeholders sometimes perceived Emirati decision-making as top-down, with limited genuine consultation. One UK academic noted: "We're told the ministry has decided something, and there's little opportunity to discuss alternatives or understand the rationale. It feels directive rather than collaborative."

Successful partnerships developed hybrid governance models accommodating both cultural preferences. Several participants described joint academic boards with equal representation from UK and UAE institutions but structured with clear terms of reference, decision-making protocols, and escalation procedures. These boards balanced British preferences for collegial

deliberation with Emirati expectations for structured processes and clear authority. One partnership director explained: “We've learned to be explicit about how decisions get made, who has authority over what, and how disagreements get resolved. This clarity helps both sides feel comfortable with shared governance.”

Student voice revealed particularly interesting cultural dynamics. British stakeholders described extensive student feedback mechanisms, student representation on committees, and partnership approaches positioning students as active participants. However, several noted that Emirati students sometimes felt uncomfortable with this expectation, preferring more structured guidance and clearer authority relationships with faculty. One UK programme director observed: “We encourage students to challenge ideas and participate actively, but some UAE students initially find this unfamiliar. They've been educated in systems with more hierarchical teacher-student relationships.”

Trust Mechanisms and Cultural Approaches to Partnership

Trust-building emerged as fundamentally cultural, with British and Emirati stakeholders emphasising different pathways to establishing partnership confidence. British participants described trust developing through demonstrated professional competence, peer recognition, and track record of delivery. One UK pro-vice-chancellor explained: “We build trust by showing we can deliver quality education, by our external examiner reports, by our graduates' success. Trust comes from proven capability and professional reputation.”

Emirati stakeholders, whilst valuing professional competence, placed greater emphasis on personal relationships, face-to-face interaction, and social connection. Several described trust as emerging through regular visits, shared meals, and relationship-building beyond formal business meetings. One UAE partner noted:

> Trust requires knowing people personally, not just professionally. We invite UK partners to our homes, we share hospitality, we build relationships through personal connection. The British sometimes seem too focused on contracts and formal agreements without investing in relationship building.

These different cultural approaches to trust created initial friction but ultimately enriched partnerships when acknowledged and accommodated. Successful partnerships combined British emphasis on contractual clarity and documented processes with Emirati investment in personal relationships and social connection. One consultant described: “The best partnerships have solid legal agreements that satisfy British institutional risk management but also invest heavily in face-to-face relationship building that Emirati partners value. You need both the contract and the relationship.”

Practical manifestations of these different trust-building approaches emerged in partnership communication patterns. British stakeholders typically relied heavily on email communication, virtual meetings, and formal documentation exchanges. One UK partnership director noted: “We're efficient with technology—emails, video calls, shared documents. We can manage partnerships remotely quite effectively.” However, UAE partners consistently emphasised the importance of physical presence and face-to-face interaction. An Emirati senior leader explained: “Email is for logistics. Real partnership requires sitting together, sharing meals, understanding each other as people. Virtual meetings are cold—they don't build the personal connection we need for trust.”

This cultural difference had significant practical implications during the COVID-19 pandemic when travel restrictions prevented face-to-face meetings. Several partnerships reported strain as British partners felt they could maintain relationships virtually whilst Emirati partners experienced this as relationship deterioration. One UAE quality director described:

> The pandemic showed us how much we rely on personal connection. Virtual meetings felt transactional. We lost the informal conversations, the relationship building, the trust that comes from spending time together. British partners seemed comfortable with virtual-only interaction, but for us it damaged partnership.

Post-pandemic, successful partnerships deliberately rebuilt relationship dimensions through regular planned visits, social activities integrated into business meetings, and senior leadership engagement demonstrating partnership commitment. One partnership coordinator explained:

> We now build relationship time into every interaction. Business meetings include lunch together, social conversation, opportunities for informal connection. British colleagues initially saw this as inefficient, but they've learned it's essential for Emirati partners. The relationship investment pays dividends when challenges arise—we can resolve issues through established trust rather than reverting to contractual enforcement.

Conflict resolution revealed similar cultural patterns. British stakeholders described preference for direct discussion, explicit negotiation, and written clarification of disagreements and resolutions. Emirati partners sometimes found this approach uncomfortably confrontational, preferring to address conflicts through intermediaries, maintain social harmony, and resolve issues through relationship-based negotiation. One experienced partnership manager explained: “You need to understand that direct challenge can feel disrespectful in Emirati culture. Issues get resolved, but through different processes that preserve relationship and status. British directness can damage partnerships if not culturally calibrated.”

Practical examples illustrated these cultural differences concretely. When quality concerns arose about teaching standards, British partners typically wanted direct conversations with involved faculty, explicit feedback on performance gaps, and documented improvement plans. One UK quality director described: “We're trained to have difficult conversations professionally. You identify issues, provide specific feedback, agree improvement actions, document everything. It's transparent and fair.” However, UAE partners sometimes experienced this approach as face-threatening. An Emirati academic manager explained: “Public criticism damages relationships and reputation. We address performance issues privately, through trusted intermediaries, preserving dignity whilst achieving improvement. British directness can feel harsh and disrespectful.”

Successful partnerships developed hybrid conflict resolution approaches accommodating both cultural preferences. These typically involved initial private discussion identifying issues and exploring solutions, followed by formal documentation of agreed actions satisfying British requirements for transparency and accountability. One partnership director described:

> We've learned to separate the social relationship maintenance from the professional accountability. Issues get discussed privately first, preserving dignity and relationship. Once we've agreed the solution, we document it formally. Both cultural needs are met—relationship preservation and professional accountability.

Language differences added another layer of complexity. Whilst business conducted in English, British stakeholders sometimes misinterpreted Emirati communication styles emphasising politeness and indirectness. One UK programme director reflected:

> Emirati colleagues would say 'this might be challenging' when they meant 'this is completely unacceptable.' We learned to read between the lines—indirect communication isn't unclear, it's culturally appropriate. British directness that we see as honest can feel rude to Emirati partners who value more nuanced communication preserving relationship harmony.

Successful partnerships invested in cultural training helping team members understand different communication conventions and adapt their approaches accordingly.

Discussion

Towards Culturally Responsive Collaborative Governance

The findings demonstrate that effective TNE governance requires moving beyond assuming universal governance models toward culturally responsive approaches recognising legitimate diversity in how quality assurance operates. Collaborative Governance Theory, when applied to cross-cultural contexts, must account for fundamental differences in cultural assumptions about authority, participation, transparency, and decision-making that shape how stakeholders engage with governance processes.

The research reveals three practical strategies for culturally responsive governance. First, bilateral quality assurance compacts that explicitly acknowledge both regulatory systems rather than attempting to impose one framework. Such compacts specify core quality standards all partnerships must meet whilst allowing flexibility in how standards are achieved, assessed, and documented in ways culturally appropriate to each context. Second, hybrid governance structures combining elements valued by different cultural traditions—such as joint boards balancing collegial deliberation with clear authority and structured processes. Third, investment in cultural translation through individuals who understand both governance traditions and can mediate between different expectations.

Implementation of these strategies requires concrete organisational changes. One successful partnership established a "cultural interface team" comprising staff with extensive experience in both UK and UAE higher education contexts. This team reviewed all partnership documentation, quality procedures, and communication protocols to identify potential cultural misunderstandings before they created conflict. Team members participated in validation panels, regulatory reviews, and partnership meetings, actively mediating cultural differences. One team member explained:

> We translate not just language but cultural expectations. When UK colleagues propose a new assessment approach, we help them understand how it needs to be presented to satisfy UAE regulatory requirements. When UAE partners raise concerns, we help UK teams understand the underlying cultural values rather than just the surface complaint.

Another partnership developed parallel governance documentation satisfying both cultural preferences. They maintained detailed procedural manuals with explicit approval hierarchies and compliance checklists for UAE regulatory purposes, alongside reflective quality

enhancement reports emphasising professional dialogue and development for UK requirements. One quality manager noted:

> Initially this felt like duplication, but we realised we were serving different cultural accountability logics. UAE regulators need to see systematic compliance evidence. UK reviewers want to understand our quality culture and enhancement approach. Rather than choose one approach, we developed capability in both, and this actually strengthened our overall quality assurance.

Rebalancing Power Through Culturally Aware Stakeholder Engagement

Stakeholder Theory reveals that power asymmetries in TNE partnerships are not merely structural but culturally mediated. British institutional dominance reflects not only legal realities around degree ownership but also cultural assumptions about whose governance approaches are "normal" or "rigorous." Moving toward genuinely equitable partnerships requires UK institutions to recognise that Emirati preferences for clear hierarchies, structured processes, and governmental oversight reflect legitimate cultural values rather than deficient governance maturity.

Effective stakeholder engagement across cultural boundaries requires explicit attention to how consultation processes may privilege certain cultural communication styles. British-style open debate and challenge may silence stakeholders from cultures valuing hierarchical respect and social harmony. Successful partnerships develop multiple engagement mechanisms—formal committees for those comfortable with British consultation styles, relationship-based informal dialogue for those preferring Emirati approaches, and clear escalation processes satisfying both cultural preferences for different decision-making structures.

Trust and Accountability Across Cultural Boundaries

Agency Theory illuminates how different cultural orientations toward trust create challenges in TNE partnerships. British reliance on contractual mechanisms and monitoring systems reflects cultural assumptions that trust emerges through demonstrated professional competence and institutional reputation. Emirati emphasis on personal relationships and social connection reflects different cultural logics where trust develops through interpersonal familiarity and relationship investment.

Effective principal-agent relationships in cross-cultural TNE contexts require combining both trust-building approaches. Contracts provide necessary clarity and legal protection valued in British institutional contexts, whilst regular face-to-face engagement and personal relationship investment builds trust in ways meaningful to Emirati partners. The shift toward outcomes-based quality assurance offers potential for culturally neutral accountability focusing on student success rather than prescribing governance processes aligned with particular cultural traditions.

Conclusion

This research demonstrates that effective transnational education governance requires reimagining leadership as culturally situated collaborative practice. The UK-UAE corridor reveals how divergent regulatory systems shaped by distinct cultural traditions can be reconciled through frameworks that integrate regulatory alignment, stakeholder engagement respecting cultural diversity, and trust-building combining multiple cultural approaches.

The proposed framework moves beyond assuming universal governance models toward culturally responsive shared leadership. Key elements include bilateral quality assurance compacts acknowledging legitimate diversity in governance approaches whilst ensuring core quality standards; hybrid governance structures combining elements valued by different cultural traditions such as collegial deliberation with clear hierarchical authority; investment in cultural translation through individuals who understand both governance traditions; multiple stakeholder engagement mechanisms accommodating different cultural communication preferences; and outcomes-based monitoring focusing on student success rather than prescribing culturally specific governance processes.

Theoretical contributions include extending Collaborative Governance Theory to explicitly address cultural dimensions of consensus-building, demonstrating how power asymmetries in Stakeholder Theory are culturally mediated rather than merely structural, and showing how Agency Theory's trust mechanisms operate differently across cultural contexts. Together, these perspectives provide a culturally aware framework connecting policy, institutional practice, and stakeholder experience.

Practical implications for policy include developing bilateral quality assurance frameworks that explicitly accommodate different cultural governance traditions rather than assuming universal standards; establishing cultural competence requirements for TNE approval ensuring institutions demonstrate understanding of host country cultural contexts; and creating international coordination mechanisms that facilitate cross-cultural dialogue and mutual learning rather than imposing particular governance models.

For institutions, the findings emphasise investing in staff cultural competence development including understanding different governance traditions and communication styles; recruiting cultural translators with deep experience in both partnership contexts; developing hybrid governance structures combining elements valued by different cultural traditions; implementing multiple stakeholder engagement mechanisms accommodating diverse cultural communication preferences; and balancing contractual clarity with relationship investment in ways meaningful across cultural boundaries.

Limitations include the qualitative design's focus on depth over breadth, constraining generalisability across all TNE contexts. The research examines one bilateral corridor which, whilst significant, may not capture dynamics present in other regional partnerships with different cultural traditions and power asymmetries. The study engaged policy-level stakeholders but not students or parents, representing a significant gap requiring future research.

Future research should examine student and parent perspectives on culturally responsive governance, investigating whether partnerships' cultural adaptations actually serve diverse learner needs. Comparative studies extending beyond UK-UAE to other cultural dyads—including UK-China, Australia-Southeast Asia, or intra-regional partnerships—would test the framework's applicability across diverse cultural contexts. Longitudinal research tracking how cultural understanding evolves in partnerships over time would illuminate learning processes and cultural adaptation trajectories.

In an increasingly globalised educational landscape, transnational education partnerships offer significant opportunities for intercultural learning and knowledge exchange. Realising this potential requires governance models that move beyond assuming universal standards toward

genuinely collaborative approaches respecting cultural diversity in how quality assurance operates. The framework developed through this research provides both theoretical foundation and practical guidance for institutions, regulators, and policymakers committed to developing culturally responsive, equitable transnational education partnerships.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

Generative AI tools were used to assist with literature review organisation, structural refinement, and language editing during the preparation of this manuscript. Specifically, Claude AI was employed to help synthesise theoretical frameworks, improve clarity and coherence in presentation, and ensure consistency in formatting and referencing. All substantive research design decisions, data collection, analysis, interpretation, and argument development were conducted by the author. The use of AI tools was limited to enhancing the presentation and organisation of original research findings and did not involve generation of research data, fabrication of citations, or substitution of authorial analysis and interpretation.

Abstract

The recommended teaching strategy for psychological counseling training involves providing repeated training opportunities; however, the practical cost of implementation is high. Digital virtual simulations and game-based learning are expected to provide highly motivating, repetitive, low-cost training opportunities that are not restricted by time or space. This study employs the situational scaffolding-oriented generative AI virtual characters module developed by our team to design an educational game aimed at training psychological counseling. Players assume the role of a psychological counselor and conduct counseling sessions with AI characters within a limited timeframe, with the goal of eliciting positive responses from the characters. The participants in this study were 19 individuals who had completed the reserve training program in Taiwan. The research findings indicate that participants exhibited high of flow and did not experience excessive anxiety. They found the experience enjoyable and user-friendly, expressing a willingness to repeat the activity. Additionally, qualitative feedback revealed that over half of participants believed the activity aided in understanding empathy skills (56%) and identifying emotional cues (61%). It was also perceived as more simulation than general-purpose GPT models (83%) and more focused on counseling (61%). Preliminary findings suggest, this study designed a generative AI-based psychological counseling training educational game can be used for repeated practice of counseling techniques at low cost, making it suitable as a pre-practice tool before real-person case simulations. Future improvements could include adding learning feedback and scaffolding guidance to enhance the usefulness and realism of the training.

Introduction

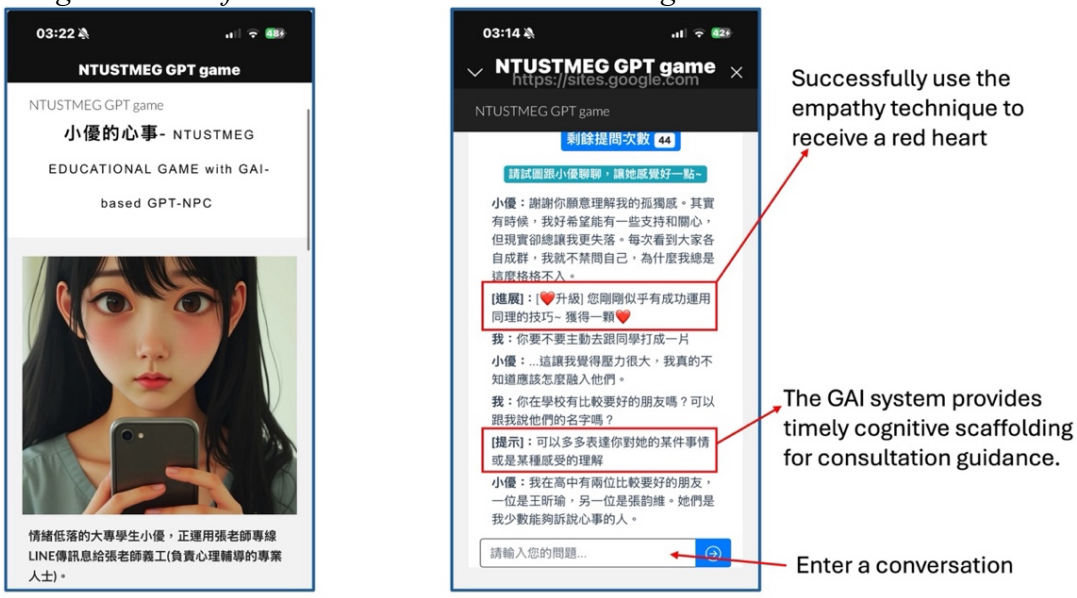
In recent years, mental health issues such as anxiety, depression, low self-esteem, and interpersonal sensitivity have frequently emerged among college students (Li, 2024). While psychological counseling remains a traditional solution, limitations in clients' subjective feelings and expressive abilities, coupled with variations in counselors' professional skills and conversational techniques, often hinder effective resolution of psychological issues (Li, 2024). In counseling skills training, emphasis is typically placed on teaching counseling techniques and therapeutic methodologies (Lau & Ng, 2014), with less focus on developing soft skills such as empathy or therapeutic presence (Chan et al., 2020). Rogers (1957) research indicates that the core conditions for therapists' interpersonal skills are empathy, congruence, and unconditional positive regard. Cooper et al. (2025) found that young people value empathetic understanding during counseling. Furthermore, in social anxiety interventions for youth, early assessments of facilitator empathy have been shown to correlate with positive counseling outcomes (Brouzos et al., 2014).

Therefore, this study proposes an innovative online digital educational game for psychological counseling training titled *Yuri's Secret Thoughts*. Utilizing Google Sites in conjunction with a scaffolding-oriented GenAI NPC simulation editing module (Chen & Hou, 2024), a simulation counseling education game platform is designed. A virtual character representing a case of low mood is also developed. Learners assume the role of professional counselors, engaging in psychological counseling interactions with the character. The case content draws from diverse everyday events experienced by college students, while also reinforcing the virtual character's personality traits, including negative thinking and pessimistic tendencies. Consequently, during the GenAI counseling process, learners can train themselves to understand and conduct effective counseling with empathy. Simultaneously, this mechanism incorporates scaffolding guidance to enhance counseling trainer effectiveness. The interactive process sets achieving four types of positive feedback from the virtual character as task objectives. Preliminary analysis of this research mechanism is also explored.

Research Purposes and Questions

The game task in this study involves learners assuming the role of a professional psychological counselor. Within the game, they engage in counseling conversations and provide psychological guidance to Yuri, a GenAI virtual character representing a specific scenario. Yuri is a college student experiencing severe emotional distress. Feeling down by university life and worthless, she has sunk into profound frustrated and seeks help through a counseling hotline. Throughout the counseling process, learners must employ empathy and counseling techniques to guide her, aiming to elicit positive feedback. Thus, this study aims to enhance counselors' communication skills and empathetic understanding through the scenario-based learning experience of *Yuri's Secret Thoughts*.

This study employs a plot dialogue interaction mechanism featuring GenAI virtual characters, immersing learners in highly simulation conversational scenarios while engaging them with authentic case events and character immersion experiences. Hou (2015) noted that scenario-based simulation games incorporating contextual learning may enhance learners' metacognitive processes. They can also boost learning motivation and maintain appropriate levels of anxiety, thereby achieving high levels of learning flow.



The research questions are as follows: *What are the learners' flow, game anxiety, game feedback, and game elements when using a generative AI virtual character grounded in situational learning as the case in a psychological counseling training educational game design?*

Method

The participants in this study were 18 individuals who had completed the reserve training program offered by Taiwan's Teacher Chang Foundation. Prior to the assessment, none of the participants had undergone any training courses utilizing the GenAI virtual character interaction mechanism. The activity was conducted via a mobile platform, enabling participants to engage in free-form counseling conversations with GenAI, as illustrated in Figure 1. The left image depicts the game's initial screen, where learners scan a QR code with their phones to enter the GenAI interaction interface, representing receiving a distress call from the virtual character Yuri, who is feeling down. The right image shows the interaction screen with GenAI, where learners can use voice input to simulate realistic, everyday conversational dialogue. When GenAI determines that responses demonstrate empathetic understanding or positive cognitive guidance, a red heart icon appears instantly. This signifies the learner has achieved a task objective and reinforces cognitive memory. Players can accumulate up to four hearts throughout the game. Success requires obtaining at least two hearts within 20 minutes using no more than 35 utterances. Additionally, the GenAI system provides cognitive scaffolding for counseling communication skills based on conversational context. Finally, a post-test questionnaire is administered, covering flow, anxiety, game feedback, and game elements. The experimental procedure begins with the researcher explaining the activity and testing process (5 minutes), followed by the instructional activity (20 minutes), and concluding with the post-test questionnaire administration (15 minutes).

Figure 1

Google Sites Platform and GenAI Interactive Dialogue Mechanism

To investigate learners' flow during learning activities, this study employed Kiili's (2006) Flow Questionnaire as the flow assessment tool, translated into Chinese by domestic scholars Hou

& Li (2014). The questionnaire comprises two major dimensions: Flow Antecedents and Flow Experience, totaling 22 items. This questionnaire uses Likert's five-point scale.

To examine learners' anxiety levels during activity participation, this study employed the Affective Filter Hypothesis Scale developed by Krashen (1982), adapted by Hung (2001) into the "Learning Experience Scale," comprising 8 items. This questionnaire uses Likert's five-point scale.

To examine learners' experiences using the game, this study modified Davis's (1989) Technology Acceptance Model (TAM) scale. It comprises two dimensions: cognitive usefulness and cognitive ease of use. Additionally, game elements were evaluated based on Hou (2016)'s proposed elements for promoting game motivation, consisting of 12 items. This questionnaire also uses Likert's five-point scale.

Results and Discussions

Based on the results of the one-sample Wilcoxon signed-rank test. Table 1 presents the descriptive statistics of flow among learners after task completion. Overall flow (M = 3.74, SD = 0.58) was significantly higher than the median of scale (i.e., 3). Additionally, both flow antecedents (M = 3.69, SD = 0.62) and flow experience (M = 3.78, SD = 0.60) were significantly above 3. All other sub-dimensions' means also exceeded 3. Notably, the sub-dimension Goals of an activity reached an average of 4.31. This suggests that the overall game design of the GenAI virtual character dialogue interaction mechanism in this study—enhanced by adding plug-in modules under the RAG framework to configure character roles, case scenarios, and knowledge cognition, achieves more realistic role-playing. This enables learners to become more immersed in the game during interactions. C.-C. Chien et al. (2024) found that in scenario-based educational games, learner interactions with GenAI virtual characters facilitate deeper scenario analysis while sustaining high flow. This may occur because interactions with GenAI are based on learners' questions and corresponding responses, creating a sense of authentic dialogue and counseling, and learners experience feedback through their sense of control (Ngu et al., 2025).

Table 1
The Mean and Standard Deviation of Learners' Flow

	(N = 18)

Autotelic experience	3.67	1.06	2.43*	0.015
Loss of self-consciousness	3.39	0.92	1.80	0.072

* $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

Table 2 presents descriptive statistics for learners' anxiety and overall game feedback. Overall anxiety (M = 2.43, SD = 0.65) was significantly below 3. Interactive games effectively reduce learning anxiety (Reed & Ferdig, 2021). C. C. Chien et al. (2023) noted that moderately low anxiety is a key indicator for sustained flow during game activities. Additionally, overall game feedback (M = 3.46, SD = 0.75), game usability (M = 3.91, SD = 0.80), and game elements (M = 3.71, SD = 0.61) were also significantly higher than the 3. Hassan et al. (2019) indicated that well-designed game elements evoke learners' sense of accomplishment, engagement, and enhanced motivation.

Table 2

The Mean and Standard Deviation of Learners' Anxiety and Overall Game Feedback

(N = 18)

	M	*SD*	*Z*	*Sig.*
Anxiety	2.43	0.65	-2.75**	0.006
Game Feedback	3.46	0.75	2.21*	0.027
Game Ease of Use	3.91	0.80	3.13**	0.002
Game elements	3.71	0.61	3.43***	< .001

* $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

Additionally, qualitative feedback indicated participants found the game "fun and highly ease of use, willing to play repeatedly." Over half believed it helped understand empathy skills (56%) and identify emotional cues (61%), while 83% felt it was more realistic than typical GPTs and 61% reported greater focus.

Conclusion

Effective counseling involves helping individuals master psychological counseling techniques and actively apply them to address issues encountered by clients, thereby assisting them in resolving problems. The instructional strategy for psychological counseling training recommends repeatedly providing guidance and feedback training opportunities to prevent skill degradation. This study, Yuri's Secret Thoughts, involves learners engaging in free-form dialogue with a GenAI virtual character during counseling sessions. Counseling interactions are dynamically inductively analyzed to foster empathetic understanding, ultimately guiding the GenAI character to overcome psychological stress and achieve four positive feedback objectives as the task goals. Based on the above data analysis, learners provided positive feedback across all aspects: overall flow, learning anxiety, game feedback, and game elements. Preliminary findings indicate that the generative AI virtual character designed in this study, serving as a psychological counseling training game for cases, achieves low-cost, repeatable practice of key principles. It is suitable for repeated practice prior to real-person case simulations. Future enhancements could include learning feedback and scaffolding guidance to improve usefulness and fidelity.

Abstract

Ward nursing staff must collect information for new patients and perform clinical reasoning for health assessment and nursing diagnosis, which requires realistic ward situations and case studies. Combining game mechanics with standardized patient simulations is expected to improve trainees' communication skills and problem-solving abilities and enhance motivation. This study investigates the effectiveness of an educational game combining GenAI and virtual reality in training nursing diagnostic reasoning. We developed a GenAI dual-role mechanism (GenAI playing the role of a patient uncle Sam and a senior nurse sister) and constructed a virtual reality clues room space through SVVR. The learning objectives of the game: learners take on the role of a nurse and interact through dialogues to perform health assessments and clinical reasoning on Uncle Sam, as well as consulting with another experienced GenAI nurse to gain expertise and solve problems. The study participants were 16 formal nurse practitioners in Taiwan. The results of this study showed that the study was highly useful in that the learners had a high flow and did not have a high external cognitive load, but only an internal cognitive load slightly above the median of the five-point Likert scale (i.e., 3), and that the difficulty of the tasks could be considered for simplification in the future. The qualitative feedback indicated that the mechanism could create realistic clinical situations (81.25%), improve interview assessment skills (93.75%), facilitate clinical reasoning (75%), reduce stress (87.5%), and increase concentration (81.25%).

Introduction

Nursing clinical reasoning is an integrated thought process encompassing knowledge, experience, and clinical observation. The reasoning process involves interpreting clinical data and evaluating assessment findings while considering the patient's and family's background, environment, and psychosocial aspects to determine the most appropriate clinical diagnosis and formulate corresponding nursing interventions or decisions (Mohammadi-Shahboulaghi et al., 2021). In practical application, nurses employ this reasoning process in clinical care, known as the "nursing process," which comprises five primary steps: assessment, diagnosis, planning, implementation, and evaluation. Nurses systematically gather data on patients' physiological, psychological, spiritual, and social dimensions based on professional expertise and objective assessment results. This enables them to establish nursing diagnoses and formulate appropriate care plans to assist patients in improving their health status.

Previous educational training on the "nursing process" has involved traditional case-based teaching or clinical placements where nursing staff use Gordon's 11 Health Function Patterns assessment to collect patient data. However, constrained by the complexity of clinical settings and limited practice opportunities, nursing staff often struggle to master the application of reasoning processes, resulting in multiple limitations in clinical practice. For instance, insufficient clinical experience leads to inadequate judgment, lack of adequate practice and interactive feedback, low motivation in one-way instruction, and the high variability and unpredictability of clinical patient symptoms. These factors make it difficult for nursing staff to rapidly engage in clinical reasoning processes, resulting in reduced diagnostic accuracy and delayed decision-making (Liao et al., 2015). Therefore, there is a need to develop teaching strategies that are highly innovative, allow for repeated practice, feature highly realistic scenarios, and provide high levels of interactive feedback. This will effectively enhance nurses' communication skills and problem-solving abilities, further cultivating their critical thinking and clinical decision-making capabilities.

Experiential learning emphasizes that learners develop competencies through a process involving practical experience, reflection, and repeated practice. It asserts that knowledge is not unidirectionally transmitted but rather actively constructed by learners through engagement in experiential and reflective processes. By simulating scenarios or recreating clinical authenticity through case studies, it enhances immersion and problem-solving abilities (Ngu et al., 2025a). Game-based learning is recognized as an effective instructional strategy for enhancing learner engagement and motivation (Hassan et al., 2021). In challenging and rewarding environments, learners' active engagement can be promoted while simultaneously strengthening their decision-making abilities, critical thinking, and problem-solving skills (Ngu et al., 2025b). Chien et al. (2023) indicate that experiential learning through scenario-based digital games not only enhances learning motivation and sustains high flow states but also effectively improves decision-making performance and reduces learner anxiety.

Generative AI (GenAI) is increasingly being applied in educational training across various fields. Its advantages include generating realistic interactions and providing instant feedback (Rahman & Watanobe, 2023), making it well-suited for use in digital standardized patients and professional senior mentors (Ngu et al., 2025a; Ngu et al., 2025c). Furthermore, GenAI standardized patients can respond to history-taking and engage in instant conversations with the same tone as real patients, enabling learners to practice clinical consultation and assessment in a safe, realistic environment. Therefore, this study integrates an AI dual-role mechanism, where AI assumes the roles of both Uncle Sam (the patient) and Nurse Sister (the senior nurse)

(as shown in Figure 1). Through SVVR technology, a virtual reality space is constructed (as shown in Figure 2). Learners engage in dialogic interactions to conduct health assessments and clinical reasoning with Uncle Sam, while consulting the experienced AI nurse to access professional knowledge and resolve problems. Finally, the effectiveness of this approach in nursing clinical reasoning training is examined.

Methods

This study is a pilot investigation involving 16 licensed practicing nurses in Taiwan. The procedure consisted of a 5-minute introduction to the game platform and rules, a 30-minute gameplay session, and a 10-minute questionnaire survey. The study assessed learners flow, activity anxiety, game feedback (game usefulness, game ease of use), perceived game elements, and cognitive load. The questionnaire's supplementary section comprised seven semi-structured questions, primarily investigating whether the game's mechanisms enhanced learners' understanding of Gordon's 11 Health Function Patterns and improved comprehension of the clinical reasoning process for nursing diagnoses.

Results and Discussions

According to the single-sample Wilcoxon signed-rank test as shown in Table 1, participants' scores on the flow scale—overall flow (M = 4.14, SD = 0.58), flow antecedents (M = 4.09, SD = 0.59), and flow experience (M = 4.18, SD = 0.63)—were significantly higher than the median of the scale (i.e., 3). The mean activity anxiety score (M = 2.73, SD = 0.88) on the activity anxiety scale was below 3. Table 2 Participants' scores on game feedback (M = 4.50, SD = 0.56), game usefulness (M = 4.45, SD = 0.61), game ease of use (M = 4.56, SD = 0.67), and game elements (M = 4.27, SD = 0.70) were significantly higher than 3. Participants in Table 3 scored significantly above 3 for both intrinsic cognitive load (M = 3.53, SD = 0.64) and generative cognitive load (M = 3.96, SD = 0.49). Conversely, participants scored significantly below 3 for extrinsic cognitive load (M = 2.18, SD = 0.99).

Through qualitative feedback analysis, participants indicated that scenarios helped clarify assessment directions and enabled them to infer appropriate nursing diagnoses based on patient responses. The GenAI Senior nurse could quickly guide them on how to question patients, provide definitions and characteristics of nursing diagnoses, and offer clues about related factors. Standardized patients further facilitated nursing staff in focusing on learning objectives.

The qualitative feedback indicated that the mechanism could create realistic clinical situations (81.25%), improve interview assessment skills (93.75%), facilitate clinical reasoning (75%), reduce stress (87.5%), and increase concentration (81.25%).

*$p < 0.05$, ***$p < 0.001$

Conclusions and Limitations

This study developed an education-oriented digital game aimed at training nursing personnel to collect data and perform nursing diagnostic reasoning using the Gordon 11 Health Function Patterns assessment. The game design mechanism trains learners to complete the nursing diagnosis process within simulated clinical scenarios. Through interaction with dual GenAI agents and realistic scenario simulation, learners gather data within the space to enhance the experiential learning process.

Results indicate that learners demonstrated increased engagement and participation during the game, with lower levels of activity anxiety. The interface was easily manipulated, and scenarios were realistic. This game is suitable for the teaching phase prior to clinical placements, serving as a preparatory training tool for nursing students before entering real clinical settings. It familiarizes them with nursing assessment techniques and clinical reasoning processes, thereby enhancing their clinical decision-making abilities. Battegazzorre et al. (2020) further noted that virtual patient simulation scenarios help nursing professionals become familiar with clinical environments, enhance communication confidence, and promote effective interactive behaviors. Additionally, virtual cases can provide a safe and contextualized practice environment, guiding students to cultivate sensitivity toward clinical practice and reflective abilities. Based on these findings, future studies are recommended to adopt experimental and control group designs to more deeply explore the impact of game-based learning on nursing clinical reasoning outcomes. at the same time, simplifying task difficulty according to learner ability should be considered to reduce cognitive load, thereby further optimizing the learning experience and educational effectiveness.

Abstract

This study explored the lived experiences of the teachers who implemented Teaching at the Right Level (TaRL) in the City Schools Division of Cavite to understand their perceptions, the difficulties they encountered, and the practices they employed in response to the identified challenges, with the ultimate goal of developing TaRL implementation recommendations. TaRL is a globally recognized remediation strategy that groups learners according to their competency levels rather than age or grade levels to address gaps in foundational skills. Using a phenomenological approach, the study gathered data that revealed TaRL as an effective strategy for improving engagement, confidence, and student achievement. However, thematic analyses also revealed that time constraints and difficulties in group management and individual support were the challenges faced by the teachers. In response, teachers employed practices such as the use of manipulatives and visual aids and peer learning. These practices responded to the challenges in group management but cannot address the time constraints and the need for additional teachers. This study recommends the provision of ready-made lesson plans and instructional materials, increased contact time, smaller group sizes, and additional teachers and support staff for future implementation. Findings highlight the importance of contextual responsiveness, teacher empowerment, and policy support for a more sustainable and scalable TaRL implementation.

Keywords: Teaching at the Right Level, foundational learning, teacher experiences, instructional practices

Introduction

Education in the global context faces an unprecedented learning crisis particularly in foundational literacy and numeracy. The inability to read and understand simple text by age 10, known as learning poverty, affects nearly 70% of children in low and middle-income countries as of 2023. This learning crisis could be attributed to the learning gaps brought about by the COVID-19 pandemic. However, even before the pandemic, many education systems already struggle with 57% of children in the aforementioned countries who are unable to read at basic proficiency levels (World Bank Group, 2023).

Failure to acquire foundational numeracy skills not only hampers students' chances to succeed in higher education but also poses limitations to what they can achieve economically, in the future. This poses a threat to these students' futures and to the broader context of national development and progress (Njie, 2016). Because of this, early-grade numeracy education is important as these are the foundation of students' academic and lifelong learning.

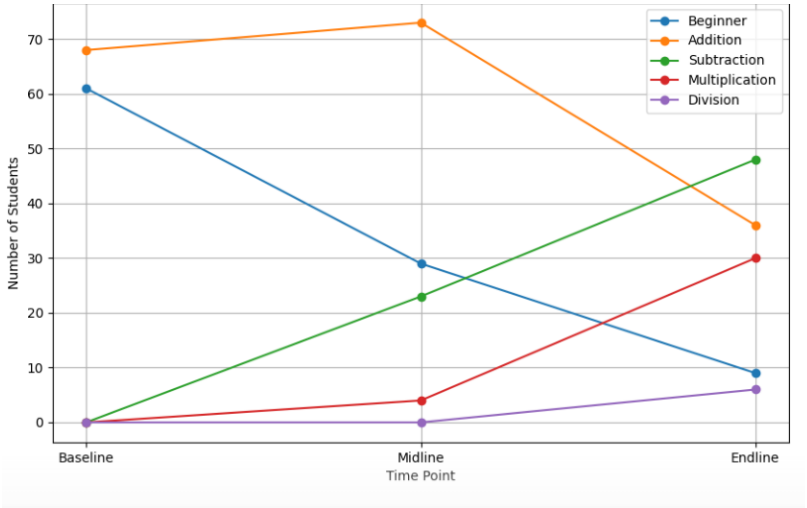
In response to the learning crisis, considering how crucial early intervention is when these learning gaps arise, Teaching at the Right Level (TaRL) emerged as an innovative approach. TaRL went away from the traditional age grouping of students, and in turn assesses the students' learning levels and groups them accordingly, which allows for competency-based teaching approaches, regardless of age or grade level (UNICEF, 2023). This approach involves regular literacy and numeracy assessments, competency-based groupings, targeted instruction, and continuous monitoring to move the students to their appropriate groups based on competency (Lim, 2023).

TaRL is an evidence-based remediation strategy that is globally recognized. It was developed by the Pratham Education Foundation, and it is designed to address gaps in foundational skills by grouping the students based on their actual competency levels rather than their ages which determines their grade levels. It has yielded results, which is evidence of its effectiveness in accelerating the acquisition of literacy and numeracy skills of those students who lag behind.

In the Philippines, where the learning crisis is deepening and has garnered attention from the academe, especially in the aftermath of the COVID-19 pandemic, where school closures and class disruptions significantly affected learning outcomes, TaRL has grown in response (Angrist et al., 2024). The above-mentioned challenges and the resulting learning gaps underscored the limitations of normal classroom settings and highlighted the need for innovations that respond to the needs of the learners.

Because of its recognition on this urgent need, the Schools Division Office (SDO) of Cavite City initiated the implementation of TaRL, piloting last school year 2024 – 2025, as part of its commitment to ensuring that no Caviteño learner is left behind and that the interventions for improving learning outcomes are data-driven and context-specific. Below are the numeracy results of the pilot implementation of TaRL in SDO Cavite City:

Figure 1
Student Progress at School A



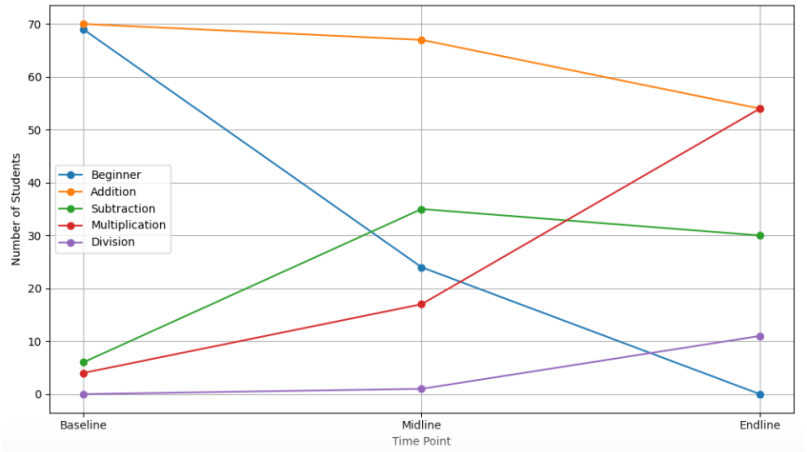


Figure 2
Student Progress at School B

While pilot implementation results reveal that TaRL had a positive impact in Cavite City in terms of numeracy, there will always be room for improvement. Further investigation is needed for a deeper understanding of the implementation from the lens of the teachers since the teachers are the main implementors of TaRL. They adopt the strategies in their teaching, navigate the difficulties, and innovate practices that respond to the challenges they encountered throughout the implementation, all to meet the needs of the learners. This study therefore addresses these important questions:

1. What are the perceptions of teachers regarding the effectiveness of Teaching at the Right Level (TaRL) in improving students' foundational math skills?
2. What challenges do teachers encounter in implementing TaRL strategies within the classroom setting?
3. What instructional practices and adaptations do teachers employ to deliver TaRL effectively in their respective contexts?
4. What TaRL implementation recommendations can be proposed based on the results of the study?

By exploring their experiences to understand their perceptions about the strategy, the difficulties they encounter and their practices to overcome the aforementioned challenges, this research aims to inform future improvements in the implementation of TaRL and contribute to how SDO Cavite City positions itself as a leading TaRL implementor in the Philippines.

Literature Review

Global Foundations and Evidence of Teaching at the Right Level (TaRL)

The COVID-19 pandemic disrupted education systems worldwide. It negatively affected learning outcomes, including basic reading and numeracy, resulting from long-term school closures (Jack & Oster, 2023).

In a more recent study, Jakubowski et al. (2024) present learning losses of 0.11 to 0.33 SD in international reading scores, which is equivalent to more than a year of schooling, based on data from 2016 to 2021, attributing greater consequences to low-performing learners and in schools with extended closures.

Adding to the data on inequity, Tadesse and Muluye (2020) state that developing countries faced greater challenges in education during the COVID-19 pandemic due to a lack of infrastructure and limited access to technology that allows the conduct of alternative learning modalities.

Several international studies evaluated TaRL's impact under randomized controlled trials, further establishing its effectiveness in various contexts.

For instance, Banerjee et al. (2016) investigated the effectiveness and feasibility of scaling TaRL into government school systems. Anchored on the premise that TaRL establishes greater relevance based on the extent to which it can be mainstreamed and embedded within the educational system.

Maruyama and Igei (2022), in partnership with the Japan International Cooperation Agency (JICA) and the Ministry of Education, assessed the effectiveness of community-wide support and TaRL in Madagascar.

Another TaRL adoption, Zambia's Catch-Up Program (Zambia, 2023), was implemented in close collaboration with education-focused organizations, including the Ministry of Education, Pratham, J-PAL (Abdul Latif Jameel Poverty Action Lab), and TaRL Africa.

Botswana-based health and education-focused organization Youth Impact also supports TaRL and its delivery in Botswana, Namibia, South Africa, and the Philippines, among other countries (Angrist et al., 2024). Based on Youth Impact's large-scale randomized controlled trial in Botswana in 2022, involving 17,622 learners from grades 3 to 5, the TaRL numeracy program yielded significant learning gains.

Although TaRL has been adopted in various contexts worldwide, its core principles continue to guide its implementation. TaRL consistently applies level-based grouping, targeted instruction, and continuous assessment and monitoring (Angrist et al., 2024; Teaching at the Right Level Africa, 2025).

Implementation Enablers and Barriers in TaRL Programs

An examination of various large-scale TaRL implementations reveals key factors affecting the success of the program. Comprehensive teacher preparation, active community engagement, strong and committed leadership, and well-functioning monitoring systems all contribute to TaRL scaling successes. These elements, when present, create enabling conditions to implement the program with fidelity and sustained impact.

Lipovsek et al. (2023) highlight the crucial role of strong government ownership in successfully scaling TaRL within Zambia's public education system. Intensive teacher training and mentoring boosted educators' confidence and ownership of the program. Contextualizing and localizing the approach improved its relevance and feasibility.

Similarly, Lebanon's TaRL pilot implementation presents that robust teacher preparation—including an intensive two-day training followed by ongoing support—and active community involvement were key to its success (World Bank, 2024).

While identified key factors have contributed significantly to the success of TaRL, scaling the approach to broader contexts presents its own set of challenges that require attention.

Commonly observed, limited instructional time and rigid school schedules restrict effective delivery of TaRL. Teachers balance the demands of the regular curriculum with the TaRL implementation (Banerjee et al., 2016; World Bank, 2020).

Teacher capacity remains a challenge. In many contexts, the short duration of capacity-building efforts limits the integration and lasting use of these skills (Darling-Hammond, 2017).

Finally, systemic and policy impediments hinder program sustainability. Rigid curricula, bureaucratic processes, and poor policy alignment can limit the flexibility TaRL needs to thrive (World Bank, 2018).

To address the earlier challenges, strengthening teacher capacity emerges as a fundamental step (Poverty Action Lab, 2025).

Equally important is fostering strong collaboration between schools, communities, and education authorities. Coordinated planning, where local leaders and caregivers are actively engaged, helps ensure that interventions align with learners' real needs (What Works Hub for Global Education, 2025).

Instead of depending on brief, one-time training sessions, expansion efforts are strengthened by ongoing, practical professional development that supports level-based instruction through consistent coaching and collaborative peer learning (Darling-Hammond, 2017; Poverty Action Lab, 2025).

Crucially, large-scale adoption is more sustainable when TaRL is embedded within policy frameworks and complemented by grassroots participation (Lipovsek et al., 2023; UNESCO IIEP, n.d.). In this way, scaling becomes less about duplicating a model and more about cultivating adaptable systems that preserve TaRL's core principles while responding to diverse educational landscapes.

TaRL in the Philippine Context: Policy and Programmatic Alignment

TaRL is shown to be a focused, time-sensitive program designed to address gaps in foundational literacy and numeracy skills for learners who lag behind their grade level (Hevia, 2024). This aligns closely with DepEd's priority for catch-up learning by providing targeted intervention to students who need it most, enabling them to "catch up" to their peers and build essential academic skills quickly and effectively.

DepEd has integrated TaRL with its broader education reform and learning continuity efforts in accordance with the Basic Education Learning Continuity Plan (BE-LCP), which emphasizes learning recovery, flexibility in modalities, and quality education. The strong connection between TaRL's catch-up model and DepEd's reform priorities supports sustainable quality learning for targeted students and improves learning motivations as well (Ningrum, 2025).

Early efforts and pilot studies of TaRL in the Philippines involved key partnerships, including with Youth Impact and other stakeholders, Early efforts and pilot studies of TaRL in the Philippines have involved multiple partnerships and collaborative initiatives with organizations such as Youth Impact, Innovations for Poverty Action (IPA), Ateneo de Zamboanga University, and other stakeholders committed as part of the effort to implement this targeted foundational learning approach in public schools (Lim, 2023).

TaRL also introduces increased inclusivity. By grouping learners by skill, not age or grade level, TaRL promotes inclusivity for learners who have fallen behind due to varied circumstances, including socio-economic disparities and interrupted schooling (Hevia, 2024). It also offers opportunities to support diverse learner needs within heterogeneous classrooms. On the other hand, teachers face difficulties in fully understanding and implementing TaRL's level-based, learner-centered approach amid existing curriculum reforms like the MATATAG curriculum.

Methodology

This study made use of the Phenomenological research method as it explores the essence of a phenomenon from the experiential perspective of the respondents (Bonyadi, 2023). This qualitative study aims to describe and understand the individual experiences of the teachers involved in the implementation of TaRL in SDO Cavite City. The researchers deemed it necessary to use phenomenological methodology as it best fits the study.

Phase 1 – Pre-data Gathering

The researchers secured all the permits needed to conduct the study. The documents were forwarded to SDO Cavite City and were signed and approved by the Schools Division Superintendent. Immediately after, the researchers convened and drafted the instrument to be used for the data gathering process. Different experts from different fields were consulted to make sure the validity and reliability of the instrument to be utilized. Upon revision of the instrument, the study proceeded to the data gathering phase.

Phase 2 – Data Gathering

When the data gathering instrument was finalized, the target participants were purposively identified specifically as the teachers who have experienced implementing the TaRL approach. The selected participants signed informed consent forms and were subjected to pre-interviews to assess participants' willingness and openness to deeply reflect on their experiences. The primary data collection method was a Focus Group Discussion (FGD).

Phase 3 – Post-data Gathering

After the data gathering procedure, the research team convened and immersed themselves in the collected data. The researchers identified significant themes, subthemes, and significant insights that reveal meaningful aspects of the implementation of the TaRL approach. Validation of results were done through member checking during a formal meeting where the data interpreted was presented to the respondents in which participants reviewed and confirmed the accuracy of the interpretations. Finally, a summary was synthesized to convey the essential and significant ideas of the research as interpreted in the results.

Ethical Considerations

The researchers complied with the permits necessary for the conduct of this research. An informed consent form was secured from the participants, discussing the objectives of the research, the sampling, confidentiality, voluntary participation, and the absence of risks involved in their participation. Responses were coded to ensure that the participants remain anonymous. Lastly, this research complies with the Elsevier's Al author policy for use of generative Al and Al-assisted technologies, using AI to improve its readability.

Findings and Discussion

This study investigated the experiences of the TaRL teachers in SDO Cavite City to understand their perceptions of the program, the difficulties they faced, and the practices they employed to respond to these aforementioned challenges, with TaRL implementation recommendations as the end in mind. The results revealed a positive perception on TaRL because of its ability to increase engagement and its focus on foundational skills, which will be leveraged in the succeeding grade levels. Challenges include time issues, and practices incorporate contextual adjustments like peer learning. These results support the need for adjustments in time and additional teachers. The following themes are the results of the study:

Teacher Perceptions on TaRL

Teachers shared their experiences in their implementation of TaRL. These insights informed the investigation about their perceptions on TaRL and how it influenced their classroom practices and ultimately, student achievement.

Table 1
Themes on Teacher Perceptions on TaRL

Theme	Subthemes	Significant Insights
Increased engagement and increased confidence	Increased student participation	Learners become more cooperative and participative in the activities because concepts are taught in languages they understand.
	Boosted learner confidence	Their confidence grew as they experienced success in tasks aligned with their competency levels.
Significant progress because of learner-centeredness and a focus on foundational skills	Instruction tailored to actual learning levels	Teachers witnessed significant leaps in the skills of the students because of learning focus and a focus on foundational skills. These form building blocks for future learning.
	Emphasis on core operations	
	Sustainable learning gains	
Rewarding and empowering	Sense of fulfillment from student progress	Witnessing how the students progressed in terms of engagement, confidence, and achievement, teachers felt a sense of fulfillment.
	Increased teacher agency and responsiveness	

Increased Engagement, and Increased Confidence

Results revealed that the teachers' experiences describe the results of TaRL with improved understanding, increased engagement, and increased confidence. Najah et al. (2024) reported the same by discussing that since the students are working on their competency level, increased enthusiasm, engagement, and level of confidence in expressing their ideas were observed. As one of the teachers shared, "I witnessed how TaRL played a major role in my learners' development. Their understanding of fundamental math skills deepened, and I could see their confidence growing with each activity."

Because the approach recommends that students ask questions and collaborate with peers, their confidence is boosted because of the enriched collaboration with classmates with the same competency level.

A more active participation because of this new-found confidence was reported by the teachers. World Bank Group (2025) highlighted this in the pilot implementation of TaRL in Lebanon, where students enjoy the interactive and collaborative activities which contributes to their confidence and ultimately, their engagement. One of the teachers had this to say: "My pupils showed genuine excitement during math lessons. They participated more actively and seemed eager to learn, which made the classroom environment more dynamic and positive."

A TaRL classroom is dynamic and empowering. It provides learning opportunities that respond to the needs of the learners without regard to their ages and grade levels. Since groups are responsive and flexible, students are prompted to participate more and engage better with their classmates, the learning materials, and the competencies being transferred.

Significant Progress Because of Learner-Centeredness and a Focus on Foundational Skills

TaRL organizes instruction and activities considering the current level of competence of the students. This is the learner-centeredness that TaRL offers. This is parallel to the findings of Rahmawati et al. (2025), when they discussed that a significant improvement in learning outcomes was observed because the approach addresses the heterogenous competency levels in the classroom. As one of the teachers said, "I witnessed significant progress in my students' math skills when instruction was tailored to their actual learning levels. This shift allowed me to meet them where they were, rather than where the curriculum expected them to be."

The progress that the students made under the TaRL approach is not a band-aid solution but rather a sustainable means to ensure that the students are successful in the succeeding years of their schooling. Akdi and Belamhitou (2024) supported this in their research on Moroccan education's focus on accelerating the learning of their students using TaRL. It was reported that TaRL targets the deep crisis in foundational knowledge among Moroccan students. A teacher from school A shared her experience about this: "Focusing on foundational skills made a noticeable difference. I saw how learners who previously struggled began to understand and apply basic operations with more confidence."

Similarly, a teacher from school B shared: "Teaching became more meaningful as I observed learners mastering the basics. The emphasis on core mathematical operations helped them build a stronger foundation, which reflected in their overall performance."

If done right, the progress is significant because it is impactful and is done efficiently within a short span of time. Because of the strategies that this approach employ, which are all simple and relatable to the students, the foundational skills, which will serve as the building blocks for future learning are built.

Rewarding and Empowering

Aside from the significant leaps in student achievement and confidence in learning, teachers also reported experiences about TaRL, being rewarding and empowering on their part. Akyeampong (2022) emphasized that TaRL empowers teachers by enabling them to employ more effective, inclusive, and learner-centered teaching practices. Because of improved understanding and confidence as well as significant progress shown by the students, the teachers feel rewarded and empowered. A teacher from school A shared that: "In my experience, students became more engaged during our sessions. I noticed a significant improvement in their ability to perform basic math tasks, which made teaching more rewarding."

Another teacher from school A also shared the same feelings when she stated that: "I felt empowered as a teacher to adjust my instruction based on what my students actually needed. This responsiveness led to real improvements in their understanding and engagement with math."

While the improvement on the students' achievements and confidence as well as the significant leaps they made in acquiring the foundational skills which shall form the building blocks for more complex competencies is a big win, it is also important to know that from the experience of the teachers, TaRL has had significant effects on them as well as they felt rewarded and empowered, witnessing how the students progressed, with the help they gave for these learners.

TaRL Implementation Challenges

The experiences of the teachers also revealed some TaRL implementation challenges that are crucial to how the program was delivered.

Table 2
Themes on TaRL Implementation Challenges

Theme	Subthemes	Significant Insights
Time Constraints	Short contact time	The teachers experienced not being able to finish some activities because of short contact time.
	Gathering students together shortens the contact time even more	Since TaRL is implemented as a remediation approach, the students come from their regular classes and gathering them presents difficulties.
Group Management and Individual Support	Students with different competency levels are grouped together.	Because of a shortage of TaRL trained teachers, there was a time early in its implementation where students of different competency levels are assigned to a single teacher.
	Shortage of TaRL trained teachers.	

Time Constraints

The results consistently report time constraints as the primary challenge that the teachers face in their implementation of TaRL. Lim (2023) stated that the instruction time under TaRL is 30 minutes per day only, which is not enough time to conduct regular classes, even more so, TaRL classes. A teacher from school A lamented that: "Time allocation has consistently been a concern in my experience. It often feels insufficient for the depth of instruction required."

This was also the same case in school B, evident when she shared that: "There were days when I couldn't carry out the planned activities because time simply ran out. It was frustrating to leave tasks unfinished."

This is the main challenge for the teachers. Given the major upside that TaRL has to offer, as well as the strides the students made because of this intervention, it is still important to note how better these students will perform if ample TaRL instruction time is given to them and their teachers.

Another challenge, as reported by the teachers, are the time constraints in terms of gathering the students together. Here is what a teacher in school A had to say: “Managing groups with varying learning levels demanded careful planning and close monitoring. The sessions often started late because students came from different sections, which further shortened our actual teaching time.”

This is the same case in school B. A teacher in School B had this to say: “The delays in assembling students significantly reduced the time available for actual learning. I often felt rushed and unable to maximize the session.”

This could be a challenge that is unique to the context of SDO Cavite City, given how it implemented TaRL. However, this will be significant in future policy recommendations if TaRL is to be implemented on a wider scale.

Group Management and Individual Support

Grouping the students presented a difficulty. This is contradictory to what Angrist et al. (2024) discussed that grouping the students should be according to learning level rather than age or grade. A teacher lamented that: “Early in the implementation, I struggled with grouping because the number of students in each teaching group was overwhelming, and their learning levels varied significantly. It was difficult to manage instruction effectively.”

This should not be the case. From the onset, the students should have been grouped according to competency level and there should not be students with varying competencies in a group. This is what one of the teachers shared: “When there weren’t enough teachers available, I had to combine groups and teach multiple operations at once. This made the sessions more challenging and less focused.” “These conditions made it hard for me to give each learner the attention they needed. With limited time and a large number of pupils, I often felt I couldn’t support everyone as much as I wanted to.”

Some challenges are external and cannot be controlled by the teachers like time, and some are internal and can be addressed like group management. Knowing these challenges, paired with the best instructional practices, can form meaningful TaRL implementation recommendations.

TaRL Instructional Practices

In response to the challenges reported, the teachers also applied certain instructional practices to adapt TaRL implementation to specific contexts.

Table 3
Themes on TaRL Instructional Practices

Theme	Subthemes	Significant Insights
The use of other manipulatives and visual aids	Use of other manipulatives like dice.	In relation to teacher resourcefulness, teachers got creative by using contextualized manipulatives like dice.
Peer learning	Pairing or grouping students so more advanced students can help the others.	In response to the group management and individual support challenge, teachers created smaller groups within their assigned classes.

The Use of Manipulatives and Visual Aids

The use of simple materials help the students be more engaged in the activities (Ahmed et al., 2024). Visuals and manipulatives make learning more interesting, and active participation increases, especially when these materials are accessible. A teacher from school A shared that: "Incorporating materials like sticks and stones into my lessons made the activities more engaging and accessible. These tools allowed me to connect with learners who struggled with traditional methods."

The same practice is being implemented in school B. A teacher in school B shared that: "Interactive and hands-on activities like matching number cards, stone throw, and stick bundling kept my students focused and actively involved in the learning process."

The use of manipulatives and visual aids resulted in more engagement and focus on the part of the learners. This is backed by Bakriev (2023) when he discussed that these manipulatives help learners create mental images of information and helps with understanding. As what the teachers said: "I found that using stick bundling for addition and subtraction helped my learners visualize the process more clearly. It made abstract operations more concrete." "Techniques such as stone throw, stick bundling, and the multiplication ladder proved to be highly effective. I saw how these visual and tactile strategies supported my students' understanding." "To teach place value, I had my students express numbers in expanded form. I also used dice and a target board to randomly select numbers, which made the lessons more dynamic and helped learners grasp the concept more intuitively."

To better help the students become more engaged and learn the concepts, the use of manipulatives and visual aids is an outstanding practice.

Peer Learning

In its early stages, the very foundation of TaRL, which is grouping the students in terms of their competency level was not fully achieved because of large groups of students since there are few teachers to handle the remediation. Peer learning is one of the strategies the teachers employed to respond to this challenge. As what one of the teachers shared, "Peer learning is also effective. I often pair or group students so that those with stronger skills can help guide others."

The teachers formed smaller groups within their classes to still form the competency grouping that TaRL promotes. After which, students with more advanced skills and understanding within the competency group share their learning to the other members of the group. Dehghani et al. (2014) supports the effectiveness of peer learning as they found significant improvements in student achievement after peer learning sessions.

The use of visuals and peer learning are the most outstanding TaRL instructional practices reported. These, paired with the challenges, can provide meaningful insights into how TaRL implementation can be further improved as an intervention strategy to address learning gaps.

TaRL Implementation Recommendations

Considering how challenges and the practices interact, some TaRL implementation measures are recommended.

Table 4
TaRL Implementation Recommendations

Theme	Subthemes	Significant Insights
Provision of lesson plans		Given the nature of TaRL implementation in SDO Cavite City, instructional goals do not differ from one teacher to another. Ready-made lesson plans may ease the burden of preparations, and the teachers can focus more on instruction.
Time and group size adjustments	Provision for more contact time for TaRL sessions	Teachers recommend giving more time for TaRL sessions to better teach foundational skills to the learners.
	Smaller groups of learners	Teachers recommend forming smaller groups of learners to better respond to homogeneity in the classroom in terms of competency levels.
Additional support and staffing	Additional teachers to handle TaRL sessions	Teachers recommend assigning more teachers to handle TaRL sessions. This is a call for management to train more teachers in teaching TaRL classes.

Provision of Lesson Plans

According to Abad and Hattie (2025), instructional materials and lesson plans are crucial not only for providing structure to the teaching process but also provides opportunities for ongoing

professional development and instructional innovation. This is also true for TaRL instruction. As what a teacher in school A requested, "Provision of ready-made lesson plans and instructional materials would be a great help."

A teacher in school B had the same request. Here is her request: "Ready-made lesson plan and examples for all operations and more tips and techniques in teaching division level."

Given the intervention nature of TaRL implementation in SDO Cavite City, instructional goals do not differ from one teacher to another. This shared goal opens doors for collaboration for teachers to refine teaching and ultimately, learning (Guo et al., 2025).

Time and Group Size Adjustments

TaRL sessions only last for 30 minutes (Lim, 2023). These sessions are supposed to be short and meaningful in terms of acquiring student competencies. The students are grouped according to their competency levels (UNICEF, 2023). This is to ensure that the groupings are homogenous and that instruction is targeted. However, in the initial implementation of TaRL in SDO Cavite City, these were not realized. Because of this, a teacher from school A recommended that: "I would suggest giving more time for TaRL sessions and reducing the number of learners per group."

In school B, another recommendation was given by a teacher: "Mabawasan ang bilang ng mga bata bawat group. (Reduce the number of learners per group.)"

Jez and Wassmer (2013) discussed that there is a positive relationship between instructional time and student performance. Additionally, Antoniou et al. (2024) conferred that smaller class sizes promote positive behavior and engagement which results to better acquisition of learning. Both are applicable to the context of TaRL and how it is implemented in SDO Cavite City. If given more contact time and smaller groups, TaRL instruction will be more effective, and the students will gain more benefits.

Additional Support and Staffing

Additional support and staffing are crucial to any program implementation, especially in schools, because it creates a positive atmosphere and productive learning environments which are crucial for student success (Khalilpour, 2024). Teachers reported the need for additional teachers that will handle TaRL classes. As what one of the teachers lamented, "Sana nadagdagan ang mga magtuturo sa TaRL. (We hope there will be additional teachers to handle TaRL.)"

This informs policy about the need to train additional teachers that will handle TaRL classes. If there are more teachers to handle the classes, there will not be any gaps in terms of grouping of students and time constraints. This is one key element for a successful TaRL implementation.

The insights extracted from the experiences of the teachers revealed a deep understanding of the enablers and challenges of TaRL implementation as a remediation strategy. It was very clear that TaRL has led to significant improvements in student engagement and achievement. However, its accomplishments were somehow hindered by realities in time constraints, challenges in group management and individual support, and shortage of teachers. The

practices employed by the teachers demonstrate adaptability, innovation, and creativity, which reinforced TaRL as a responsive remediation strategy. These findings provide meaningful inputs to how program implementation and scaling can be further improved and inform future policy.

Conclusions and Implications

The findings of this study affirm that TaRL is a responsive and effective remediation strategy to address the learning gaps in early-grade Mathematics. The lived experiences of the teacher-participants report that TaRL resulted in increased engagement, confidence, and student achievement. These outcomes were achieved through targeted instruction and a focus on foundational skills which paved the way for meaningful and sustainable progress.

While TaRL proved to be an effective remediation strategy, in its implementation in SDO Cavite City, certain challenges must be addressed to ensure its sustainability and scalability. Teachers responded resourcefully to the challenges such as group management and individual support issues through instructional practices like peer learning. These practices not only supported student achievement but also empowered the teachers in their roles. However, persistent challenges like time constraints and the need for additional teachers remained beyond their control. These challenges highlight the need for policy-related interventions and adjustments to fully realize the potential of TaRL as a remediation strategy.

The findings point to several implications for future policy. Providing ready-made lesson plans and instructional materials will not only ease the burden of planning instruction and activities but also improve quality of instruction. This should advise management for future write-shops on TaRL lesson planning and instructional materials development. Provision for more contact time and adjusting the group size will also be beneficial for the TaRL learners. Most importantly, additional teachers and support staff will ensure that learners are grouped according to their competency levels and be given the instruction they need.

This study therefore calls for strategic policy intervention to make sure that the institutionalization and large-scale implementation of TaRL will be effective and more geared towards the achievement of the learners.

Acknowledgement

The researchers express profound gratitude to the City Government of Cavite for their steadfast support of the Schools Division Office of Cavite City in its continuing efforts to further elevate the quality of education in the city.

We extend our deepest thanks to the top management of the City Schools Division of Cavite, for their transformational leadership and for the opportunity and trust accorded to us to undertake this study.

This endeavor would not have been possible without our partnership with Youth Impact. We also acknowledge the TaRL implementers and their school heads whose commitment and dedication were pivotal to the realization of this undertaking.

Official Conference Proceedings

Abstract

This paper investigates the task workload experienced by teachers in an online professional development course, analyzed through the lens of Moore's Theory of Interaction. The study examines how different forms of interaction such as learner-content, learner-instructor, learner-learner, and learner-interface shape teachers' perceptions of workload. The online course was introduced through an in-person orientation workshop that familiarized participants with registration, login, and navigation procedures. Teachers completed the NASA-TLX questionnaire at the beginning and end of the course, defining the task as the completion of all modules leading to certification. To complement quantitative data, unstructured interviews with selected participants provided qualitative insights into perceived workload, challenges, and suggestions for improvement. Findings from the study revealed that teachers experienced moderate workload across several dimensions, including mental effort, physical interaction, temporal pressure, and emotional strain. These results highlight the significant influence of course design, task complexity, and interface usability on teacher engagement in digital professional development contexts. The findings emphasize the crucial role of well-designed interactions in managing workload and maintaining learner engagement in online learning environments.

Keywords: digital learning, task workload, interaction theory, teacher experience, user experience, interaction techniques, learner engagement

Introduction

e-Learning, broadly defined as an interactive mode of instruction delivered through digital platforms (Paulsen, 2002), has emerged as a widely adopted strategy in professional development programs. It provides a flexible and scalable framework for supporting lifelong learning and extending access to formal education (Mason & Rennie, 2006). Key advantages of e-learning include its capacity to accommodate self-paced learning, promote learner autonomy, encourage self-reflection, and facilitate collaboration within dynamic digital environments.

However, alongside these benefits, several challenges have been consistently identified in literature. A frequently cited limitation is the reduced opportunity for social interaction and interpersonal communication due to the lack of face-to-face engagement (Kear, 2010). This can lead to feelings of isolation and disengagement, particularly in courses that do not provide peer collaboration or instructor presence.

In addition, for learners who are less familiar with digital technologies, the process of navigating online learning environments can introduce significant interface-related challenges. Complex or unintuitive user interfaces may increase the physical and mental effort required to complete tasks, contributing to task overload and negatively impacting the learning experience. These usability-related barriers, when combined with the intrinsic complexity of learning tasks, can intensify perceived workload across multiple dimensions such as mental demand, effort, and frustration.

While prior studies have explored learner engagement and cognitive load in e-learning environments, there is limited empirical research examining how different types of interaction, particularly learner–interface interaction specifically influence task workload in teacher professional development contexts. This gap is particularly relevant as online professional development often involves both structured content and platform-mediated interaction, requiring learners to navigate and engage independently. Moreover, as education systems increasingly turn to online modes to deliver technical content, the design of effective learning environments and resources becomes critical for engaging both teachers and learners. This need is especially pronounced in countries like India, where teachers are not yet fully equipped to integrate digital components into the curriculum, even as substantial efforts are underway to build this capacity. Institutions such as UNESCO MGIEP are leading this shift, offering professional development courses through hybrid, fully online, and workshop-based formats. These courses include a variety of training modules designed to engage both educators and students.

The present study draws on Moore's Theory of Interaction (Moore, 1989) to examine how different forms of interaction namely learner–content, learner–instructor, learner–learner, and learner–interface affect the perceived task workload in "The Digital Educator: A Primer", an online professional development course for teachers. This course is hosted on "FramerSpace", UNESCO MGIEP's digital learning platform.

Literature Review

Daniel et al. (1982) suggests that all educational transactions exist along an interaction continuum, with learner-instructor interaction at one end and learner-content interaction at the other. Building on this, Anderson (1987) and Keegan (2013) emphasize that meaningful

interaction is essential for effective learning and knowledge exchange. Moore (1989) further categorizes interaction in distance education into three distinct types. The first is learner-content interaction, defined as intellectual engagement with content that facilitates changes in the learner's understanding, cognition, or perspectives. The second is learner-instructor interaction, which involves the instructor's role in motivating, guiding, and clarifying misunderstandings for the learner. The third type is learner-learner interaction, which refers to communication among learners, either individually or in groups, and may occur with or without the real-time presence of an instructor.

As technology becomes increasingly central to mediating learning interactions, the design and functionality of educational tools take on higher importance. Garrison (1989) observes that while the medium may not fundamentally alter the nature of communication, it significantly shapes how learners perceive and experience that communication. Building on Moore's well-established framework of interaction comprising learner-content, learner-instructor, and learner-learner Hillman et al. (1994) introduced a fourth dimension: learner-interface interaction. This refers to how learners engage with the technological medium itself, which serves as a prerequisite for accessing all other forms of interaction.

This paper critically examines all four forms of interaction namely learner-content, learner-instructor, learner-learner, and learner-interface within the context of the online professional development course "Digital Educator – A Primer", designed specifically for school teachers. While prior research has highlighted platform features such as gamification, scaffolded interactivity, and learner-centered pacing as key contributors to engagement and performance (Silverajah & Govindaraj, 2018; Wang et al., 2021), these studies have not specifically examined how such platforms impact teachers in professional development settings (Feng & Sun, 2021). Our study addresses this gap by measuring perceived workload using the NASA-TLX (Hart & Staveland, 1988) instrument, providing a focused understanding of the cognitive and physical demands experienced by educators during online training.

Findings from our analysis reveal that teachers experience moderate workload across multiple dimensions such as mental demand, physical demand, temporal pressure, effort, performance, and frustration when interacting with the course platform. This suggests that while the platform fosters learning engagement, it may also impose some cognitive and interface-related demands that hinder effective interaction.

To address these challenges, we propose a set of user-centered design enhancements, including simplified navigation, real-time feedback, and modular task structures, aimed at reducing unnecessary effort and improving the overall usability of the platform. These recommendations build upon previous research but move the focus from engagement features alone to include the usability and workload impact of learner-interface interactions thus offering a more comprehensive approach to EdTech design in professional development settings.

Study Design

Course Overview

"The Digital Educator – A Primer" course is structured around five key quests designed to equip teachers with the knowledge and skills to integrate digital pedagogy effectively. Module 0 - Quest 0 (Introduction) sets the stage by familiarizing participants with the course

design and encouraging reflection on their comfort with technology, emphasizing a neuroscience-informed whole-brain approach to learning. Module 1 – Quest 1 (Understand Digital Pedagogy) explores learner variability and introduces digital pedagogy as a means to create inclusive, engaging learning experiences that are responsive to diverse student needs. Module 2 – Quest 2 (Design Learning Experiences) delves into Universal Design for Learning (UDL) principles and demonstrates how digital tools can be used to overcome learning barriers by offering multiple means of engagement, representation, and expression. Module 3 – Quest 3 (Navigate the Digital Space) focuses on digital citizenship, helping educators understand the importance of online identity, safety, and ethical behavior in digital environments. Finally, Module 4 – Quest 4 (Hybrid Learning Environments) explores how to effectively design hybrid (blended) learning by balancing online and in-person teaching strategies. Module 5 – Quest 5 (Reflect and Share Your Learning) provides an opportunity for participants to reflect on their learning journey, complete assessments, and consider how to continue applying digital strategies in their professional practice. Together, these quests promote a thoughtful, inclusive, and purposeful use of technology in education.

Participants

The study involved 30 teachers (both male and female) from a well-established English-medium school, with ages ranging from 25 to 50 years. Prior to participation, informed consent was obtained from each individual. The study received ethical clearance from the institution's review committee.

Procedure

The course was introduced to the participating teachers through a brief in-person orientation workshop. During this session, participants received step-by-step guidance on registering, logging into the FramerSpace platform, and enrolling in the course. The course itself was designed to be fully online and self-paced, allowing learners to progress independently through the modules. In this study, the task is defined as the completion of all course modules and the successful generation of a course certificate. Participants completed the NASA-TLX questionnaire prior to the commencement of the first module. Upon completing all modules, they were again asked to complete the questionnaire to report their perceived task workload. The FramerSpace platform also provided learners with access to a learner's dashboard, enabling them to monitor their progress and view individual scores for each completed module. Technical assistance was available as needed, primarily to resolve access-related issues such as login difficulties. To gain deeper insights into the learner experience, a series of unstructured one-on-one interviews were conducted with a selected subset of participants after they completed the course. These interviews explored several dimensions of the learning experience, including perceived workload, challenges encountered, and suggestions for improving different types of interaction within the course. By integrating quantitative data from the NASA-TLX with qualitative insights from participant interviews, this study enabled a comprehensive understanding of teachers' experiences with the course content and the digital learning environment.

Data Collection

The NASA Task Load Index questionnaire was employed to assess the perceived task workload at both the beginning and the completion of the course. Participants rated six subscales which are the mental demand, physical demand, temporal demand, effort,

performance, and frustration on a 5-point Likert scale ranging from 1 (very low) to 5 (very high). The mental demand subscale referred to the extent of mental and perceptual activity required (e.g., thinking, deciding, calculating, remembering, searching, reading course materials, and reflecting). Physical demand captured the level of physical activity involved in interacting with the course (e.g., navigating menus, clicking, scrolling, and operating interface features). Temporal demand assessed the perceived time pressure experienced due to the pace and flow of tasks and activities within the course. Effort measured the degree of mental and physical exertion required to complete the course tasks while maintaining performance. The performance subscale reflected the participants' perceived success in accomplishing course goals and their satisfaction with their outcomes. Frustration examined the extent of negative emotional responses such as stress, irritation, discouragement, or insecurity experienced during the course.

Table 1 and Figure 1 below show the task workload for each of the subscale. After normalization, the overall task workload after completion of the task was calculated to be 56.94. According to the classification proposed by Ernawati et al. (2019), this value corresponds to a moderate level of task workload.

Table 1
Perceived Task Workload

NASA TLX TASK WORKLOAD				
Subscales	***Beginning of the Course***		***After Completion of the Course***	
	Mean	***SD***	***Mean***	***SD***
Mental Demand	15	18.41	56.66	24.94
Physical Demand	21.66	18.58	55	22.73
Temporal Demand	25	16.36	58.33	19.72
Effort	26.66	14.84	56.66	21.34
Performance	13.33	12.9	58.33	23.57
Frustration	15	12.67	56.66	23.21
Total	19.44	5.376	56.94	19.89

Statistical analysis using the Mann-Whitney U test revealed significant differences across all six subscale and the overall workload:

Mental Demand: U = 23.00, p = .0001, r = .68 (large effect). The course required considerable concentration and decision-making, suggesting a cognitively intensive experience. While such demands are common in professional development, overly high levels may overwhelm some learners, indicating the need for refinement at both the platform and instructional design levels.

Physical Demand: U = 31.00, p = .0005, r = .62 (large effect). Learners reported a notable increase in physical interaction, reflecting tasks such as frequent navigation and engagement with interactive elements.

Temporal Demand: U = 22.50, p = .0001, r = .68 (large effect). Participants reported increased time pressure, potentially due to course pacing, tight deadlines, or competing personal obligations.

Effort: U = 27.50, p = .0002, r = .64 (large effect). The findings indicate that learners exerted substantial mental and physical effort to complete course activities.

Performance: U = 11.50, p < .0001, r = .76 (large effect). A significant change was observed in perceived performance, with some learners feeling they underperformed or struggled to meet expectations.

Frustration: U = 12.00, p < .0001, r = .76 (large effect). The results point to increased frustration levels, possibly linked to unclear instructions, lack of feedback, or technical difficulties.

Total Perceived Task Workload: U = 14.00, p < .0001, r = .75 (large effect). The overall perceived cognitive load significantly increased following the course.

Figure 1
Subscales and Task Workload

In summary, while the course was cognitively engaging and aligned with the goals of professional development, the consistently elevated workload across dimensions highlights areas for improvement. Refining course design and platform usability could help reduce unnecessary task load and better support learner performance and satisfaction. The results show that there is a need to balance course rigor with usability. Platforms must support teachers by minimizing unnecessary effort through thoughtful design such as chunking content, reducing interface complexity, integrating help systems, and allowing flexible pacing. These enhancements not only reduce cognitive overload but also promote sustained participation and successful skill transfer to classroom settings. Hence, for online teacher professional development programs to be effective and sustainable, EdTech platforms must prioritize user-centered design that considers teacher workload. By addressing issues of usability, cognitive demand, and emotional experience, such platforms can better support teacher learning and foster long-term adoption of digital tools in education.

Findings and Discussion

We analyzed the course using Moore's theory of interaction (Moore, 1989), along with Hillman et al., (1994) learner-interface interaction and have found several strengths as well as areas for improvement across different subscales of task workload.

Learner–Content Interaction was a key strength of the course. The use of multimedia elements including videos, quizzes, reflective tasks, readings, and case studies facilitated deep engagement with digital pedagogy and the principles of Universal Design for Learning (UDL). The modular, self-paced structure supported autonomy, while scenario-based questions and curated toolkits enriched the learning experience. However, the inclusion of lengthy videos increased the perceived task load, as noted by several participants. One participant remarked, "It would be better if the videos are cut short as they are too long". Segmenting videos into shorter, digestible units could reduce cognitive overload and enhance learner retention. Many participants also recommended shortening the modules so that each focused on a single topic. They noted that this would reduce *mental demand* and *effort* and help minimize *frustration* associated with processing multiple concepts within a single module.

Learner–Instructor Interaction was present but limited in scope. While instructional intent was conveyed through embedded videos, quiz having predefined questions and answers, and reflective prompts, opportunities for real-time guidance or personalized feedback were minimal. Several learners expressed uncertainty about whether their responses were acknowledged or recorded. As one participant noted, "Though I spent time answering the question, I didn't get any feedback, so I wasn't sure if my answers were recorded or not". This lack of responsive communication likely contributed to increased *frustration* and *mental demand*, as teachers were left uncertain about their progress and the validity of their efforts. To address this, the inclusion of periodic synchronous sessions, moderated discussion threads, or automated feedback systems could help strengthen learner–instructor interaction and ease the associated workload stressors.

Learner–Learner Interaction, although collaborative tools such as Padlet were made available, they were largely underutilized, resulting in limited opportunities for peer dialogue, cooperative learning, and shared knowledge construction. According to Moore, this form of interaction is essential for fostering a sense of community and supporting social learning. One participant remarked, "I did not know the need of the discussion forum, as I did not see any comments or questions or threads in that section". The absence of peer engagement may have contributed to increased *mental demand* and *frustration*, as learners navigated complex content in isolation without the cognitive or emotional support of a learning community. Future iterations of the course could benefit from integrating active peer discussion forums, collaborative assignments, and structured peer feedback mechanisms to promote deeper engagement and reduce perceived workload.

Learner–Interface Interaction, as conceptualized by Hillman et al. (1994), played a significant role in shaping the overall learning experience. The digital learning platform offered supportive features such as dashboards, progress tracking, embedded tutorials, and emotional check-ins, all of which facilitated self-regulation and reduced initial navigation load. These elements helped ease *mental* and *temporal demands* in the early stages of the course. However, participants also encountered several usability challenges that disrupted their interaction with the system. Difficulties included remembering unique login IDs,

inconsistencies in resuming course progress, and technical issues with embedded forms. One participant noted, “I wanted to submit the form, but I got lost as I was taken to the next module”. Additionally, the “Resume” feature failed to return learners to their last active point, requiring them to manually retrace their steps. These usability friction points likely increased *effort*, *physical demand*, and *frustration*, particularly among novice users. These findings underscore the importance of intuitive user flow design and accessible interface features, especially in courses that emphasize inclusive and learner-centered design principles.

The results of the NASA-TLX analysis revealed that teachers experienced moderate workload across multiple dimensions indicating high mental effort, physical interaction, temporal pressure, and emotional strain while navigating the online course. These findings underscore the need to redesign both the platform and the course to better align with the actual needs and constraints of educators participating in professional development.

To address these issues and improve overall usability, we *recommend* (a) Simplify course navigation and structure to help teachers move through content effortlessly and reduce confusion. (b) Streamline user interactions by minimizing repetitive tasks and optimizing platform responsiveness. (c) Allow flexible pacing and personalized learning paths to accommodate teachers’ varied schedules and workloads. (d) Provide in-context guidance and on-demand support to assist teachers during complex or unfamiliar tasks. (e) Deliver immediate and clear feedback on activities to help teachers track progress and build confidence. (f) Maintain transparent communication and responsive support systems to quickly address user concerns. (g) Design content using microlearning principles to avoid overload and ensure each module contributes meaningfully to professional growth.

Conclusion

This study examined how interaction design influenced task workload in an online professional development course for teachers. Utilizing the NASA-TLX instrument, the overall task workload for course completion was assessed, revealing particularly moderate scores in mental demand, performance pressure, and temporal demand. Interpreting these findings through the lens of Moore’s Theory of Interaction, the analysis highlighted that limited learner–learner interaction, delayed and inadequate feedback, and interface usability issues were key contributors to increased mental effort and frustration. These results point to the need for revising both the course structure and the digital platform by enhancing instructor responsiveness, integrating more robust social learning features, and improving platform navigation. We firmly believe that strengthening these elements will improve the quality of the learning experience and also support continuous participation and engagement of teachers in online professional development, ultimately contributing to more effective and scalable capacity-building in the education sector.

Enhancing Curriculum Planning and Student Academic Performance in Special Schools Through Learning Progression Framework (LPF)

Shu Man Yau, Tung Wah Group of Hospitals Tsui Tsin Tong School, Hong Kong

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study examines the effectiveness of the Learning Progression Framework (LPF) in Hong Kong as an assessment tool for evaluating the academic performance of students with intellectual disabilities. The LPF enables teachers to better understand student performance and strategically enhance curriculum planning, teaching, and learning, thereby improving the learning-teaching-assessment cycle. Given that students with intellectual disabilities may struggle with written tests, formative assessments are typically employed to gauge their abilities. However, formative assessments pose challenges, including subjectivity and consistency in evaluation. Developed by the Education Bureau (EDB) in 2007, the LPF aligns with high school curricula for these students and provides a common assessment framework to facilitate learning progress and inform future learning objectives. Despite its long-term implementation, there has been limited research on the impact of LPF on student learning, particularly in optimizing curricula and addressing learning differences. This research involved 170 students with mild to moderate intellectual disabilities at TWGHs Tsui Tsin Tong School from 2021 to 2025. Results indicate significant improvements in students' academic performance following the implementation of LPF. Future studies could expand on these findings to explore how special schools can further enhance curriculum planning and academic outcomes through LPF. The findings contribute to a deeper understanding of how structured frameworks like LPF can facilitate better educational practices in special education, paving the way for improved academic achievements. This paper aims to provide valuable insights for educators, policymakers, and researchers interested in enhancing the educational landscape for students in special schools.

Keywords: special education, exceptional education, assessment, curriculum

iafor
The International Academic Forum
www.iafor.org

Introduction

In the dynamic education landscape, effective assessment strategies are crucial, particularly for students with special education needs. This study investigates the Learning Progression Framework (LPF), a framework adopted by the Hong Kong Education Bureau to tackle the specific challenges encountered by students with intellectual disabilities.

In mainstream schools in Hong Kong, standardized tests and various forms of assessments like formative and summative evaluations are commonly used to gauge academic performance. However, these traditional assessment tools often fail to encapsulate the abilities of students with special needs, given the diverse nature of their disabilities.

A significant number of students with intellectual disabilities encounter obstacles that traditional assessments cannot adequately address. For instance, some students may be unable to write, while others may be non-verbal or have visual impairments that hinder their ability to engage with standard assessment materials. Additionally, students with conditions such as dyslexia, dyscalculia, and dysgraphia face severe challenges with tasks related to reading, number handling, and spelling. This highlights a critical gap in the educational system, as traditional standardized assessments do not provide a comprehensive understanding of these students' capabilities, learning progress, or academic levels.

In response to these challenges, the Hong Kong Education Bureau initiated the development of an assessment framework focused specifically on students with intellectual disabilities. Introduced in 2007, the Learning Progression Framework (LPF) serves as an innovative assessment system, offering a structured learning ladder that allows educators to systematically track and document the learning trajectories of their students. By implementing the LPF, this study aims to enhance curriculum planning and improve student academic performance in special schools. Through a detailed exploration of the LPF, this research seeks to contribute to more effective educational practices that recognize and nurture the unique learning needs of all students.

Literature Review

Learners with special educational needs are individuals whose educational requirements cannot be sufficiently met through conventional teaching methodologies (Gutuza et al., 2015).

Students with intellectual disabilities (ID) exhibit diverse characteristics that influence their learning and daily functioning, including cognitive limitations, leading to challenges in learning and understanding complex concepts, and academic difficulties in areas like reading, writing, and mathematics, necessitating specialized instruction (Kumar et al., 2024). Additionally, they may face limitations in adaptive behaviors, including conceptual, social, and practical skills, as well as communication challenges. Social and emotional development can also be impacted, affecting peer interactions and emotional regulation (Kumar et al., 2024). Some students may experience delayed motor skills and potential health issues, but they often thrive with concrete, hands-on learning experiences due to their unique learning styles (Kumar et al., 2024). To assess students ability, teachers encounter the greatest challenges in assessing written tests, such as essays, and oral examinations (Mozetič Hussu & Strle, 2010). This calls for the implementation of teaching and learning methods that differ from traditional approaches, highlighting the need for educators to reevaluate their assessment methods.

In 2007, the Hong Kong Education Bureau launched the Learning Progression Framework (LPF) for core subjects (Curriculum Development Council, 2012). The primary objective was to create a unified language and structure for articulating students' learning progress and outcomes, serving as a shared reference point for teachers, parents, students, and educators to evaluate learning levels and progress (Curriculum Development Council, 2012). At its core, the framework aims to foster a common vocabulary that enhances discussions and understanding of the academic performance of students with intellectual disabilities, thereby supporting effective teaching practices and curriculum development, providing a clear learning ladder that enables educators to systematically track and record students' learning progress (Curriculum Development Council, 2012).

Students' learning is a continuous development process. The Learning Progression Framework (LPF) provides a reference for cognitive abilities, subject-specific skills, knowledge, and understanding to describe students' learning progress and levels. Developed through rigorous research, trials, and validation with the involvement of local and international consultants as well as frontline teachers, each subject's LPF consists of two main parts: "Initial Mastery Levels" and "Subject Specific Levels." These frameworks categorize learning levels into different stages, ranging from the earliest forms of learning (I1) to advanced subject-related outcomes (S9), illustrating the progression and overview of various learning levels (Curriculum Development Council, 2012).

The Learning Progression Framework (LPF) is based on the concept of "milestones," where each level signifies important learning achievements that correspond to specific key learning requirements. Each milestone is rooted in students' cognitive development, and within the "Subject Specific Levels," these milestones consider both the breadth and depth of subject content and the distinctive characteristics of each subject area. In summary, the LPF defines critical learning milestones that reflect students' cognitive progress while integrating the comprehensive aspects of each subject's curriculum (Curriculum Development Council, 2012).

Developed by the Education Bureau (EDB) in 2007, the LPF aligns with high school curricula and serves as a common assessment framework designed to facilitate learning progress while informing future learning objectives. Despite its long-term implementation, there has been limited research investigating the LPF's impact on student learning, particularly regarding its role in optimizing curricula and addressing learning differences.

Considering the identified research gap, this study focuses on examining the effectiveness of the Learning Progression Framework (LPF) in Hong Kong as an assessment tool for evaluating the academic performance of students with intellectual disabilities. Therefore, the subsequent methodology will outline the research design and techniques employed to explore the LPF's effectiveness, aiming to provide valuable insights that may enhance curriculum planning and improve academic outcomes for these students.

Methodology

This study employs a mixed-methods research design to comprehensively evaluate the effectiveness of the Learning Progression Framework (LPF) in assessing academic performance among students with intellectual disabilities. The quantitative component focuses on analyzing the number of students reaching various proficiency levels across multiple years and examining the variations in median and highest levels attained. This analysis provides insights into the changes in student abilities over time. In parallel, the qualitative aspect

involves systematic evaluations of data recorded in minutes from reflective and annual subject meetings, along with teachers' comments on student performance during these meetings. Additionally, LPF analyses will be conducted across different subjects to quantify the impact of the framework. By integrating both qualitative and quantitative data, this research design aims to provide a robust understanding of how the LPF influences student learning outcomes and informs curriculum development.

In total, there are 62 special schools in Hong Kong, of which 43 cater specifically to students with intellectual disabilities, offering individualized learning programs that include modified curricula and life skills training. Additionally, the network includes 7 schools for students with physical disabilities, 8 focused on social development, 2 for visual impairments, 1 for hearing impairment, and 1 hospital school. This study was conducted at the Tung Wah Group of Hospitals Tsui Tsin Tong School, a special school in Hong Kong that serves students with mild to moderate intellectual disabilities.

Intellectual disability (ID) is a condition defined by incomplete or stalled mental development, significantly characterized by a decline in concrete functioning across different developmental stages. This impairment impacts overall intelligence, affecting cognitive, language, motor, and socialization skills, which leads to difficulties in adapting to the environment (Katz & Lazcano-Ponce, 2008). The students participating in this study have mild to moderate ID, with IQ ranges of 52–69 for mild ID and 36–51 for moderate ID.

The research population for this study consists of 170 students with mild to moderate intellectual disabilities, ranging from Primary 1 (P.1) to Secondary 6 (S.6), aged between 6 and 20 years. These students are enrolled at TWGHs Tsui Tsin Tong School, which serves as the research site. Data have been collected annually as part of an ongoing process, with this study utilizing data from 2021 to 2025. Throughout this period, the Learning Progression Framework (LPF) has been systematically implemented across the curriculum. This targeted application of the LPF aims to strengthen curriculum planning and enhance academic performance for these students, offering valuable insights into the framework’s effectiveness in meeting their unique educational needs.

The LPF operates by designating specific students as targets for tracking throughout their educational journey until graduation. Evidence of students' learning performance is collected, often through videos or photographs. During meetings, teachers present this evidence alongside the LPF levels assigned to the targeted students. Discussions then focus on evaluating student performance, aligning their achievements with the appropriate LPF levels. Teachers apply their professional judgment to determine grades for all students within the school. The subject panel head analyzes the collected data to provide an overview of student performance across various key stages.

The LPF is intricately linked with curriculum implementation, functioning as a crucial element within the school's assessment framework. This alignment ensures that the LPF informs instructional practices and evaluations, thus enhancing the teaching and learning processes. By observing specific learning behaviors and employing school-based assessment tools, educators can effectively assess students' learning progress and levels, generating valuable insights into each student’s development to tailor support accordingly. Furthermore, the LPF fosters collaboration among teachers, students, and parents to establish or adjust learning goals and plans, serving not just as an assessment tool but as a dynamic system that promotes continuous learning.

The study focuses on the follow research questions:

1. How does the implementation of the Learning Progression Framework (LPF) influence the academic performance of students with intellectual disabilities over time?
2. What variations exist in the proficiency levels achieved by students with intellectual disabilities within the LPF framework across different key stages?
3. How do teachers' insights and professional judgments, informed by the LPF, impact curriculum planning and instructional practices for students with special educational needs?
4. In what ways can the LPF facilitate collaboration among educators, students, and parents to enhance students' learning goals and plans?

The study focuses on the follow research objectives:

1. To evaluate the effectiveness of the LPF in improving the academic performance of students with intellectual disabilities by analyzing proficiency levels and trends over time.
2. To assess the distribution and variations in LPF levels attained by students across multiple years and key stages.
3. To explore how teachers utilize insights gained from the LPF to inform curriculum planning and adapt teaching strategies to meet the diverse needs of their students.
4. To investigate the role of the LPF in promoting collaborative efforts among teachers, students, and parents in establishing or revising learning goals and enhancing continuous learning.

Results

Students' performance has been recorded and analyzed annually. The levels of students range from S1 to S9, each representing a distinct cognitive level achieved in two subjects. These cognitive levels are linked to specific subject areas, allowing for an assessment of how well students can perform in various categories of each subject. The nine Learning Progression Framework (LPF) levels are detailed as follows (Curriculum Development Council, 2012):

Table 1

Levels of Learning Progression Framework (LPF)

S1	Recognize	Students are able to recognize and name basic concepts, items, or terms within the subject. This foundational level indicates initial awareness and identification.
S2	Identify	At this level, students can correctly identify and label more specific concepts, demonstrating an understanding of the differences between items or ideas.
S3	Demonstrate	Students can exhibit practical skills related to the subject, applying their recognition and identification skills in real-world scenarios or tasks.
S4	Describe, Distinguish	Students can describe key characteristics of concepts and distinguish between similar ideas, showcasing their ability to articulate differences and details.
S5	Apply	Students are now able to apply their knowledge and understanding to practical situations, solving problems and carrying out tasks that require the use of learned skills.

S6	Explain	At this level, students can explain concepts and processes in their own words, demonstrating a deeper understanding and the ability to communicate their knowledge effectively.
S7	Outline	Students begin to organize their thoughts systematically, outlining main ideas and supporting details, which reflects their ability to structure information logically.
S8	Analyze	Students are capable of breaking down complex concepts and examining the relationships and components, showing critical thinking and evaluative skills.
S9	Evaluate, Comment	At the highest level, students can make judgments about information and ideas, evaluating the effectiveness or significance of various concepts, and providing reasoned commentary on their findings.

Additionally, students' performance in Chinese Language and Mathematics has been compared. Data for students with mild and moderate intellectual disabilities are collected and analyzed separately to provide targeted insights into their academic progress. Students are evaluated across different categories to assess their capabilities in various areas. For Chinese Language, the four categories include reading, writing, listening, and speaking. In Mathematics, the categories consist of number and algebra, measurement, geometry and spatial sense, and data handling. This categorization allows for a comprehensive understanding of students' strengths and areas for growth.

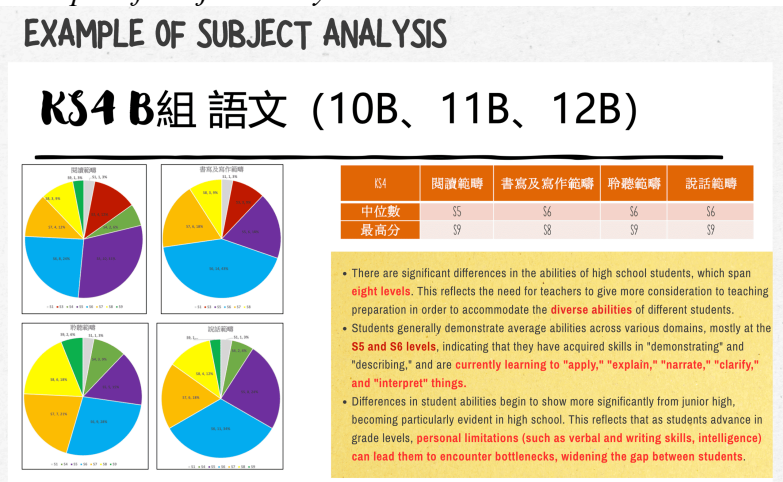
In the diagram above, "KS" refers to the "key stages" of students, with KS1, KS2, KS3, and KS4 corresponding to Primary 1 to 3, Primary 4 to 6, Secondary 1 to 3, and Secondary 4 to 6, respectively.

The data indicate significant improvement in students' Learning Progression Framework (LPF) levels between the 2021–2022 and 2024–2025 academic years. More than half of the categories in both Chinese Language and Mathematics show notable advancements (highlighted in red).



The transition from KS2 to KS3 marks the most substantial progress overall. For instance, students with mild intellectual disabilities in KS2 and KS3 demonstrated improvement in Mathematics across all categories in the 2024–2025 year. Specifically, the median levels for KS2 students increased from S5 to S6 in general performance, while scores in specific categories rose from S2 to S8 and from S4 to S6. Similarly, KS3 students showed improvements from S5 to S6 and from S4 to S5, with growth noted in all four key areas.

However, a decline is evident in some KS1 levels, which is uncommon in other key stages. For example, the median score for KS1 students in the Chinese Language category dropped from S4 to S3 in writing and listening skills. A similar decrease was observed in Mathematics, where mild ID students' performance fell from S3 to S2 in geometry. Additionally, students in KS4 exhibited improvements in several areas, though the increases were less pronounced compared to those seen in KS2 and KS3.

These findings have been further analyzed and discussed during subject and panel meetings to enhance teaching practices and curriculum development.

Figure 1

Example of Subject Analysis

In addition to conducting cross-year analyses of student performance, subject panel heads also perform same-key-stage and cross-key-stage analyses utilizing Learning Progression Framework (LPF) data, as illustrated in the diagram above. This quantitative data provides valuable insights into the distribution of abilities within each class, enabling teachers to develop tailored teaching plans and materials that meet the diverse needs of their students. Furthermore, this analysis aids panel heads and curriculum leaders in reflecting on and refining the curriculum, ensuring it remains relevant and effective in promoting student learning. By using LPF data effectively, educators can make informed decisions that enhance instructional practices, support student growth, and align curriculum development with the varying proficiency levels of students in different key stages.

The qualitative component includes methodical assessments of data documented in the minutes from reflective and annual subject meetings, as well as teachers' feedback on student performance discussed during these sessions. Students' performance and trend of improvement have been discussed and further analyzed in meetings to find out reasons behind for further improvement in teaching and curriculum in the future.

The use of Learning Progression Framework (LPF) data assists teachers in understanding the current challenges and circumstances faced by students across various key stages. Reviewing the minutes from subject meetings reveals that teachers have gained substantial insights from analyzing LPF data. For instance, it has been noted that KS1 students may experience declines in several categories. During discussions, teachers reflected that this could be significantly influenced by the quality and capability of the student intake for that year, which impacts overall performance outcomes.

Furthermore, students with intellectual disabilities (ID) often require more time to show improvement, which is why notable progress is observed during KS2 and KS3. However, the degree of improvement in KS4 tends to be less pronounced. This is largely due to the limitations in ability that many ID students experience, preventing them from reaching the highest LPF levels as they progress to senior secondary education. Additionally, some ID students may be non-verbal or unable to write, making it challenging for them to meet the skill requirements associated with higher LPF levels. As highlighted in the minutes, subject teachers have proposed increasing the use of Augmentative and Alternative Communication (AAC) tools to enhance students' communication skills. These tools can support students in meeting the necessary criteria for higher achievement levels. Moreover, teachers have suggested incorporating a “Voice Input” feature into the curriculum, allowing students with limited motor skills to articulate their ideas verbally and “write” compositions through speech input, thereby facilitating their advancement to higher LPF levels and enhancing their overall capabilities. In addition, teachers affirmed the role of LPF in enabling same-key-stage and cross-key-stage analyses, allowing subject panels to gain a deeper understanding of student groupings, class structures, and individual abilities. This information is crucial for effectively facilitating both teaching and learning, ensuring that instruction is aligned with the unique needs of each student.

Discussion

The implementation of the Learning Progression Framework (LPF) has significantly contributed to improvements in students' academic performance in a variety of ways. First and foremost, the LPF has enhanced teachers' understanding of student performance by providing structured assessment tools that offer clear insights into individual capabilities. This deeper comprehension allows educators to tailor their instruction more effectively. As a result, curriculum planning has become more strategic and targeted, addressing the specific needs of students with intellectual disabilities. The alignment of teaching strategies with these needs fosters an environment conducive to learning. Over the course of the study, students exhibited measurable academic progress, underscoring the effectiveness of the LPF in driving better educational outcomes. By facilitating a continuous improvement cycle in the learning-teaching-assessment process, the LPF not only enhances curriculum planning and teaching practices but also enriches the overall educational experience, ensuring that students are supported in their diverse learning journeys.

Future research in the realm of the Learning Progression Framework (LPF) holds great potential for further enhancing curriculum planning and academic outcomes in special schools. Subsequent studies could build upon the findings of this thesis by investigating how the LPF can be more effectively utilized across various subjects, enabling educators to harness data from the framework to reflect student abilities comprehensively. Additionally, expanding the scope of research to include cross-school comparisons can provide valuable insights into whether students at different institutions, despite attaining similar proficiency levels, exhibit comparable abilities and underlying implications. Collaboration among special schools in

sharing data and findings could further facilitate effective teaching and curriculum planning, ultimately enhancing learning outcomes. Future inquiries may also delve deeper into specific mechanisms behind the LPF's effectiveness, allowing for a nuanced understanding of its impact. Exploring the broader application of the LPF across diverse special education contexts, as well as assessing the long-term effects on student achievement, will be critical in developing a robust evidence base that informs educational practices and policies in the field of special education.

Conclusion

The findings of this thesis demonstrate that significant improvements in students' academic performance are evident following the implementation of the Learning Progression Framework (LPF). One of the primary reasons for this positive outcome is that the LPF enables frontline teachers to gain a deeper understanding of their students' abilities, allowing them to design teaching materials that are more suitable and effective. Additionally, teachers gain insights into the distribution of student capabilities within their classes, facilitating more appropriate lesson design that meets diverse learning needs. Furthermore, the LPF equips subject panels with comprehensive information regarding students' strengths and weaknesses, enhancing their curriculum planning efforts. Looking ahead, future research should explore additional strategies for how special schools can further leverage the LPF to optimize curriculum planning and improve academic outcomes for students with special educational needs. By continuously refining and implementing the LPF, educators can foster a more inclusive and effective learning environment that supports the unique learning journeys of all students.

From Theory to Practice: Evaluating Short-Term Project-Based Learning for Design Thinking Pedagogy

Yuanyi Liao, The Hong Kong Polytechnic University, Hong Kong
Henry Ma, The Hong Kong Polytechnic University, Hong Kong

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Design thinking is primarily taught through three pedagogical approaches: project-based, lecture-based, and workshop-based learning. Project-based learning is common in art and design education. It emphasises hands -on practice and supports the development of tactic knowledge, such as brainstorming, experimentation, and problem solving. Lecture-based learning, more common in non-design disciplines, prioritises theoretical understanding but often lacks practice. Workshop-based learning offers a structured, step-by-step format aligned with the stages of the design thinking process. Although project-based learning is highly effective, it typically requires a significant amount of time and sustained engagement. This study addresses the challenges of implementing design thinking pedagogy within a limited time frame by evaluating a short-term, project-based activity aimed at cultivating core design thinking skills. This study adopted a qualitative approach, with nine graduate students from design and non-design backgrounds as participants. The participants were divided into three groups and tasked with solving a tangible, time-bound problem that required creative ideation, prototyping, and testing. Data was collected through observation, video and photographic recording, and thematic analysis of post-activity reflections. The results showed that even in a brief intervention, students demonstrated greater awareness flexibility, openness to experimentation, and reflective learning. This exercise served as a facilitator for mindset shifts and interdisciplinary collaboration. This study validated that short-term, domain-neutral activities are effective teaching tools for design thinking and contribute to instructional design. Simplified experiential formats have potential in reinforcing theory, promoting the acquisition of tacit knowledge, and supporting inclusive, interdisciplinary learning.

Introduction

This study investigates how brief, constrained, and project-based mini-exercises can support the teaching and learning of design thinking for students from diverse professional backgrounds in real institutional settings. Design thinking, as an iterative, human-centred methodology, has been widely adopted to address complex real-world challenges and is frequently incorporated into the curricula of business, engineering and design schools within higher education institutions. Many universities deliver design thinking within compressed, semester-based courses where the time available for iterative projects is constrained by fixed deadlines (McLaughlin et al., 2022). Much of the existing literature in higher education focuses on semester-long project-oriented courses or multi-week studio projects, indicating improvements in students' creativity, collaboration, empathy, and problem-framing abilities. These implementations are described as time-intensive, active methodologies that rely on sustained project work and appropriate learning environments (Alvarado, 2025; McLaughlin et al., 2022). By contrast, there is relatively limited research on integrating brief, sub-day design thinking exercises into regular curricula for students from diverse disciplinary backgrounds under tight time and resource constraints.

This study analysed a single three-hour egg drop challenge integrated into the 12-week of a 13-week graduate level design thinking course. The challenge intentionally set restrictive time, budget, and material constraints, and was observed using a framework of the eight design thinker characteristics. The research focus was not on outcome (such as whether eggs break), But on how three interdisciplinary student teams engaged with the task, and how core design thinking traits manifested in their behaviour. The exercise was positioned to test whether students showed evidence of a mindset shift in design thinking after twelve weeks of coursework. Its simplicity of the exercise design was intentional, requiring no prior specialised knowledge, allowing students from diverse backgrounds could be observed on a comparable basis. The study adopted a qualitative research design, combining structured non-participatory observation with thematic analysis.

This study contributes to three aspects. First, it provides evidence that a strategically scheduled, constrained mini exercise following theoretical instruction can make design thinking traits visible in higher education context. Second, for design thinking courses operating under institutional constraints, it highlights critical instructional design considerations, including when to introduce brief interventions, how to use constraints, structure student groups, and setup physical learning spaces to foster peer learning and cross-group influence. Third, it outlines a course design direction in which multiple brief exercises are distributed across the semester, aligned with stages of the design thinking process and supplemented by reflective methods such as the photovoice, to support the progressive development of design thinking mindsets and to provide richer evidence of students' learning journeys.

The next section reviews literature on design thinking, experiential learning, project-based learning, constraints, and multidisciplinary design teams, and formulates the research questions guiding this study. The following section describes the course context and the egg-drop intervention, followed by the methodology, which outlines participants, data collection, and analysis procedures. The findings and discussion section presents three group case narratives, cross-group patterns, and key pedagogical insights. The study then discusses limitations and future research directions before concluding with implications for designing design thinking pedagogy under institutional constraint.

Background

Design thinking is described as an analytical and creative process that guides individuals to engage in experimentation, creation, and prototyping, solving complex and often unstructured problems through gathering feedback and iterative redesign (Razzouk & Shute, 2012). In professional practice, this approach is frequently described as a human-centred innovation methodology that integrates user requirements, technical feasibility and organisational constraints (Brown, 2008). The five-stage model promoted by Stanford University's Institute of Design, empathy, define, ideate, prototype, and test, has become the standard framework for teaching design thinking in higher education (Plattner, 2013).

The theoretical foundations of design thinking in the field of education are closely linked to experiential learning. Kolb's experiential learning theory conceptualises learning as "the process of creating knowledge through experiential transformation". This process is realised through a cycle of concrete experience, reflective observation, abstract conceptualisation, and active experimentation (Kolb, 2015). In design and studio pedagogy, the Kolb's model is used to describe how learners progress through a cycle of practice, reflection, theorisation, and re-attempt when tackling real-world design tasks (Kolb, 2015, 2007). Schön's concept of "reflection-in-action" further positions design practice as an ongoing dialogue with materials, situations and stakeholders, where practitioners think and learn while acting in uncertain environments (Schön, 2017). These perspectives position design thinking as an experiential, reflective, and iterative inquiry rather than a purely procedural toolkit.

Within the field of higher education, design thinking has increasingly been integrated into project-based learning (PBL), evolving into mixed teaching approaches such as Design Thinking and Project-Based Learning (DT–PBL) (Jia et al., 2023). PBL is typically defined as a learner-centred approach in which participants undertake extended periods of inquiry and response to real-world, complex problems or issues (Thomas, 2000). PBL in higher education has been demonstrated to positively impact students' learning outcomes, motivation, and teamwork abilities. However, research also indicates that actual effectiveness varies significantly depending on project design methodology, level of teaching support, assessment approaches, and the overall environmental conditions within which PBL is implemented (Guo et al., 2020). Recent review of DT–PBL indicated that integrating the stages and mindset of design thinking into project-based teaching frameworks effectively enhances creativity, problem-solving abilities, collaborative skills, and learning transfer outcomes (Jia et al., 2023).

However, design thinking and DT–PBL are often implemented through projects lasting several weeks or an entire term, which require ongoing access to materials, space, and teaching support. Studio-based and project-oriented teaching implementation models typically require substantial time for iterative cycles and formative feedback and may be constrained by the semester-based structural framework within higher education (McLaughlin et al., 2022). In many organisations, these conditions are difficult to maintain. The compressed academic term reduces the time and space for iterative refinement and reflection; class sizes are often large; student cohorts, while diverse, possess uneven levels of design experience. Design thinking is typically practised through coursework or multi-week projects, but the time and trust required for iterative design work are frequently constrained by semester deadlines (McLaughlin et al., 2022). Simultaneously, studies on creativity and education indicates that increasing constraints can reduce the scope for choice within tasks and limits alternative solutions, though restricting the initial number of options can provide a creative advantage, this encourages individuals to focus on exploring innovative outcomes and fosters deep exploration rather than superficial

engagement (Tromp & Baer, 2022). In collaborative design processes, carefully designed creative constraints have been shown to guide student teams in defining design tasks, generating ideas, and deciding which design solutions to develop. When openness and constraint are balanced, such constrained tasks effectively stimulate collaborative creative thinking (Lahti et al., 2022). These findings support the view that purposefully designing challenging time and resource constraints within design thinking scenarios may enhance rather than hinder participation and learning outcomes.

Research in design education indicates that within heterogeneous teams comprising students from different departments, those including members with interdisciplinary design education produce richer creative outcomes. Furthermore, their participation levels during the ideation and proposal evaluation stages significantly exceed those of teams formed purely from design department students (Kwon & Jang, 2014). However, in the multi-institutional study by McLachlan et al. on design thinking courses, the analysis and characterisation of student cohorts were based on their primary academic disciplines (e.g. business, design and engineering, other) and student types, rather than whether courses deliberately adopted interdisciplinary grouping (McLaughlin et al., 2022). There are still relatively few studies and DT-PBL remains in an exploratory stage, while also recognising that the DT-PBL model is dynamic and adaptable across diverse educational contexts and is ready to undergo progressive refinement into a mature pedagogical methodology that transcends disciplinary boundaries (Jia et al., 2023). Research into integrating brief, sub-day design thinking exercises into regular curricula remains relatively limited, particularly within interdisciplinary classes, and even more restricted when conducted as practical studies under real-world time and resource constraints. This study investigates how a single three-hour highly constrained micro-practice session brings design thinking characteristics and potential shifts in thinking patterns within a design thinking course, and what insights it offers for design thinking pedagogy in higher education. This study is guided by the following questions:

1. How can the characteristics of design thinking be demonstrated within the brief and constrained project-based exercises of a design thinking course?
2. How do time, budget, and material constraints shape students' creative problem-solving processes in these small-scale exercises?
3. How does team composition influence strategic orientations and behavioural patterns within interdisciplinary teams?
4. To what extent can small-scale exercises, following a theoretical instruction phase, facilitate shifts in students' design thinking mindset and demonstrate these in practice?

Course Context and Intervention

This research was conducted within a 13-week graduate-level design thinking course at the School of Design of The Hong Kong Polytechnic University, enrolling students from design, education, business, social sciences, and healthcare. The mixed-learning group was intentionally formed to explore how design thinking learning unfolds within an interdisciplinary environment. It simulates the diverse professional backgrounds found in real project teams, enabling students to gain practical experience in cross-disciplinary collaboration.

This course used a mixed teaching model. Weeks 1 to 11 focused on the foundational concepts, process models, case studies, and historical perspectives of design thinking, delivered through lectures and seminars. Students were introduced to the Empathy, Define, Ideate, Prototype, and Test model and explore its application through topics such as human-centred research methodologies, problem framing and reframing, divergent and convergent ideation, prototyping strategies, and the role of iteration, feedback, and reflection. Considering that many participants have no design background, the initial phase focuses on establishing a shared conceptual understanding and cultivating critical and creative thinking skills.

This course incorporated a single intensive project-based intervention, a three-hour egg drop challenge in Week 12. This practical session was designed as an opportunity for students to apply and test the theoretical concepts and mindsets developed earlier in the course under purposefully constrained conditions. In the egg drop challenge, students worked in teams of three to design and build solutions that would protect raw eggs from breaking when dropped from a height on campus. Each team received three raw eggs and a HK$50 budget to purchase materials from on-campus facilities such as digital print shops, workshops, and convenience stores. The entire activity was completed within three hours. To emphasise hands-on learning, contextual problem solving, and in-person collaboration, the use of online resources, including AI tools and general web searches, was prohibited. This challenge reflects constraints commonly encountered in professional design practice: limited budgets, fixed timelines, incomplete background information, and the necessity to work resourcefully with available materials. It requirs teams to understand the problem, articulate success criteria, generate ideas, construct prototypes, and test them by physically dropping eggs from height, with success or failure immediately visible. The task was intentionally simple and did not require specialised technical knowledge, enabling students from diverse disciplinary backgrounds to participate under comparable conditions.

From an educational perspective, this intervention is designed to validate students' ability to apply design thinking concepts and mindsets under real-world constraints, revealing how they navigate ambiguity, time pressure and collaborative challenges. It generates rich observational data on group dynamics and individual behaviour. The research focus was on how design thinking characteristics translated into observable actions, rather than focusing on outcomes, such as whether the egg remains undamaged.

Methodology

This study adopted qualitative research methods to explore how design thinking characteristics can be demonstrated in graduate classroom settings through brief, highly constrained project-based exercises. The egg drop challenge served both as a routine teaching activity and as a defining case study, enabling the investigation of student behaviours and interaction patterns. Analysis was conducted by comparing findings with design thinker characteristics.

Research Design

The objectives were to understand and enhance teaching practices. Three observers each followed one student team throughout the three-hour challenge. Observers were instructed not to intervene in decision-making or problem-solving processes, only to record the real-time development of processes. This design enabled researchers to capture detailed process data from all teams in real time without changing the challenge parameters or adding extra guidance.

Participants and Group Composition

Nine graduate students enrolled in the Design Thinking course participated in the egg drop challenge. They formed three self-selected teams. Allowing students to choose their own teammates aligns with course conventions, aiming to foster trust and collaboration within groups. The final team composition was as follows:

- Group 1: A professional designer with extensive industry experience, an event planning company practitioner, and an academically oriented student.
- Group 2: Students with academic and healthcare service backgrounds, whose professional cultures emphasise evidence-based approaches and pragmatic methodologies.
- Group 3: Students from business and academic backgrounds.

This composition created a diverse distribution of design experience and disciplinary perspectives. Research findings indicate that team composition significantly influences thematic orientation, leadership styles, and problem-solving strategies, a discovery consistent with interdisciplinary design education research.

Data Collection

Before the implementation of the intervention measures, observers attended a briefing session introducing the eight-characteristic framework of design thinkers and outlining the observation criteria. The characteristics adopted include navigating ambiguity, learning from others.

Integrating or synthesising information, rapid experimentation, mastering the concrete and abstract, conscious construction and creation, conscious communication, and designing one's design work. Observers, as non-participants, clearly identify behavioural patterns within each group (e.g., sequence of ideas, decision points, collaborative dynamics, substantive strategies) and provide guidance on capturing contextual details and direct quotations. During the three-hour session, observers gathered data through the following methods:

- Continuous on-site notetaking documented each group's process, including action sequences, shifts in focus, debates, and key events (such as design redirections or failures).
- Transcriptions of student dialogue are recorded with the precision, subsequent Chinese paragraphs are translated into English.
- Photographs documenting material collection processes, prototyping stages, and final outputs, supplemented by video recordings where feasible.
- Physical artefacts such as sketches and idea lists were collected or photographed for record-keeping.

Observers avoided answering questions related to the challenge, offering design suggestions, or influencing strategy in any manner. Their role was specifically communicated to students as strictly observational to minimise the risk of response bias.

Data Analysis

Following the completion of the activity, the research team integrated and analysed field notes, photographic records, and physical artefacts using thematic analysis. An initial comprehensive review of each dataset was conducted to reconstruct the process narrative for each group. The behavioural cases were subsequently coded according to eight design thinking characteristics,

with their frequency, intensity, and contextual circumstances documented. Triangulation of field notes, visual records, and physical artefacts enhanced the reliability of interpretative findings while reducing observer bias. A cross-case comparison was developed to highlight similarities and differences across groups in terms of structural composition, thematic focus, leadership patterns, conceptualisation styles, and materialisation methods. These comparative insights facilitate understanding of how constraints and team composition shape the articulation of design thinking characteristics.

Findings

During the three-hour challenge, observers documented eight characteristic behaviours of design thinking demonstrated by three teams. Despite encountering unfamiliar tasks, incomplete information about falling objects, and multiple viable solutions, they learned by observing peers, exploring the physical environment, and applying individually similar prior experience. They integrated insights from rapid testing, material interactions, and discussions, flexibly shifting between abstract inference of impacts and concrete manipulation of physical components. Rapid experimentation, deliberate construction, clear communication, and process-level reflection were also evident, though each group emphasised different key aspects. These characteristics did not appear in a linear, phased sequence but emerged as overlapping cycles as students repeatedly cycled between conceptualisation, prototyping, and testing. Each group activated all eight characteristics but demonstrated distinct emphases and operational patterns due to differences in team composition and preferred problem-solving styles.

Group 1: Designer-Led Creative Innovation

The first group included a professional designer who adopted an exploratory, creativity-driven strategy from the beginning. The team swiftly departed the studio for outdoor brainstorming sessions to explore novel concepts. Early ideas included a bucket-and-parachute combination, a bold experiment involving blinding participants, and a conical protective structure for objects. The designer's involvement appeared to make adventurous experimentation routine, encouraging the team to boldly explore unconventional possibilities before reaching agreed final idea. A crucial breakthrough occurred during the materials exploration phase. While reviewing resources, the team discovered steel wool, a material not initially considered in conceptual discussions. The moment of encountering steel wool sparked an idea moment, revealing its potential to absorb impact and distribute the force directed at the egg. This insight originated from direct interaction with the material rather than abstract reasoning, highlighting the importance of physical exploration in generating design inspiration. Budget constraints further shaped their process. The unexpected discovery of steel wool prompted the team to adjust their plans, reallocating resources within financial limitations to purchase cement at a cost of HK$40. The first group's process demonstrated multiple design thinking characteristics. They navigated ambiguity by exploring a broad conceptual solution space; learned from their environment, with material discoveries driving design shifts; conducted rapid experimentation by testing different material combinations and compositions; and demonstrated conscious construction through the meticulous layering of protective materials around the egg. Particularly noteworthy was the interplay between concrete fabrication and abstract reasoning concerning structure, cushioning, and force distribution.

Group 2: Pragmatic Systematic Protection

The second group of members, with backgrounds in academia and healthcare services, approached the challenge with a practical and protective mindset. During initial brainstorming sessions, they proposed ideas such as paper aeroplane parachutes, helium balloons, and pre-cooking eggs to transform egg structure properties. However, they swiftly initiated a self-critical assessment, systematically filtering out concepts deemed unreliable or overly complex under the exercise's constraints. The parachute solution faced doubts regarding operational reliability; balloons were considered difficult to control outdoors; and pre-cooking eggs was seen as an unnecessary complication. The team reframed the core problem as “What conditions must an egg satisfy to endure high-impact forces?” shifting focus to fundamental requirements: cushioning, stability, and controlled deceleration. The team subsequently concentrated on utilising recycled materials and workshop waste to create a robust, relatively simple protective container, maximising impact absorption within time and budget constraints. Leadership responsibilities were collectively shared, with all decisions reached through group discussion and consensual agreement. The second group's approach demonstrated how to manage ambiguity by focusing on problem definition, purposefully eliminating impractical ideas after ideation to balance divergent and convergent thinking. They extracted insights from material exploration and iterative testing, integrating information on feasibility, ease of construction, and anticipated performance. This methodology demonstrates that design thinking not only fosters creativity but also serves as an evidence-based problem-solving approach.

Group 3: Adaptive Exploratory Learning

The third group members, with backgrounds in both commerce and academia, demonstrated an adaptive learning model integrating digital and physical resources. One member recalled experience from social media, recalling protective packaging designs for fragile medical supplies, which subsequently influenced the team's initial concept. This connection between everyday examples and challenging problems highlights how real-world physical objects can inspire design thinking within the educational domain. The distinctive feature of Group Three was their implementation of real-time peer learning. As their workspace was near Group Two's, they could observe the progressively formed solutions being developed by the neighbouring team, including the use of elements such as balloons. Rather than avoiding potential perceptions of copying, Group Three openly acknowledged being inspired by this approach, adapting it into their own design. This behaviour tangibly demonstrated the practice of learning from others while highlighting the pedagogical benefits of shared physical space. Group Three gathered materials from the workshop and everyday settings like convenience stores and clinics, transforming items such as beverage cup packaging into protective components. Their division of tasks was flexible: while some collected materials, others simultaneously refined sketches or built prototypes. Their approach was both exploratory and responsive, with design concepts continually developing as new materials became available. The third group fully demonstrated the characteristic of “learning from others”, referencing both digital examples and contemporary peers’ solutions. They simultaneously exhibited an attitude of seeking opportunities, not only exploring diverse material sources but also maintaining openness to unexpected discoveries. Their conscious communication strategy was particularly evident when addressing external influences and reflecting on the creative process.

Cross-Group Patterns

Cross-case analysis revealed several patterns, identifying correlations between team composition and thematic orientation, leadership styles, and problem-solving strategies. The first group, led by senior designers, emphasised creative novelty, non-linear iteration, and opportunistic material exploration, adopting a designer-led leadership model. The second group comprised members with academic and healthcare service backgrounds, prioritising practical protection, systematic exploration, and a balanced generative-critical cycle, employing a shared leadership model. The third group integrated commercial and academic perspectives, focusing on understanding pedagogical intentions while leveraging peer learning and external inspiration, adopting a flexible distributed leadership model. These patterns demonstrate that team composition is a critical pedagogical variable, influencing problem framing, risk tolerance, success criteria, and time budgeting strategies. For educators, such diversity presents both an opportunity and a challenge when designing, facilitating, and evaluating design thinking activities.

Discussion

The discussion will interpret these findings by integrating existing research within higher education concerning design thinking, experiential learning, constraints, and curriculum design.

Brief Exercise, Visible Engagement

Research findings indicate that following thorough theoretical guidance, a single three-hour project-based exercise can enable graduate students to demonstrate observable engagement with the eight core attributes of design thinking. The egg drop challenge, through its moderate complexity and constraints, successfully triggered behaviours associated with the following traits: ambiguity management, learning from others, synthesis and integration, experimental exploration, concrete-to-abstract thinking shifts, construction and implementation, communication and collaboration, and meta-level reflection.

Constraints as Creative Catalysts

The study also emphasised the role of constraints as creative catalysts. Budget, time and material limitations did not merely restrict choice; they shaped and stimulated creativity. Budget constraints forced teams to clarify priorities and explore low-cost or repurposed materials; the three-hour time limit created urgency, motivating early prototype development, while restricted material access driven students to reinterpret everyday objects as design resources. These observations resonate with research on “creativity under constraints”, a field emphasising how limitations focus attention and foster deep engagement.

Learning-by-Making and Tacit Knowledge

The egg drop challenge underscores the importance of hands-on learning, transforming theoretical knowledge into tangible understanding. After eleven weeks of lectures and seminars, students have absorbed design thinking concepts and methodologies. This practical exercise provided an opportunity to apply these principles under pressure, observing the consequences of design decisions. By handling materials directly, constructing prototypes, and experiencing both successes and failures, students gained tangible insights into concepts such

as iteration, feedback, and risk-taking. This created a meaningful connection with experiential learning and reflective practice frameworks.

Peer Observation and Classroom Environment

Peer observation and cross-group learning emerged as another key insight. The third group's refinement of the second group's balloon concept served as a notable example, though more subtle cross-group influences were also observed, such as shifts in work pace or confidence levels. When teams collaborate within visible range, the classroom transforms into a shared experimental ecosystem rather than isolated project islands. This demonstrates that space layout and visual accessibility should be considered, with classroom configurations intentionally planned to foster peer learning and cross-group influence.

Implications for Course Design

Research findings point towards a curriculum design strategy that combines extended concept teaching with strategically scheduled brief, high-constraint exercises. Embedding micro-exercises within each phase of the design thinking process, such as assigning small observation tasks after the “empathy” phase, conducting rapid brainstorming sessions after the “ideation” phase, or setting constrained creation challenges after the “prototyping” phase, helps progressively cultivate design thinking traits and makes experimental exploration a routine practice early in the course. Combining such exercises with reflective methods like photo voicing or learning journals yields richer data on student learning trajectories and cognitive shifts, aligning with recommendations from design thinking-problem-based learning research.

Limitations and Future Directions

This study has several limitations. Firstly, the small sample size, comprising only nine students across three groups from a single institution and course, limits the generalisability of the findings. Secondly, the intervention consisted of a single three-hour practice session; while the study captured immediate behavioural outcomes, it did not investigate long-term development or learning transfer effects. Thirdly, the absence of a control group precludes determining the relative efficacy of this mini practice compared to other teaching methods. Fourth, an observer effect may have been present: students' awareness of being observed for research purposes could have influenced their behavioural performance, particularly during clear communication or argumentation segments. Fifthly, data primarily relied on observational records; the absence of systematic student self-reports means conclusions regarding internal cognitive shifts remain preliminary. Finally, multiple variables, including interdisciplinary composition, course scheduling, and self-organised team structures-intertwined, complicating the isolation of individual factors' influence.

Conclusion

This study investigates how a single, highly constrained three-hour egg drop challenge can enable interdisciplinary student teams to exhibit design thinking characteristics within a graduate-level design thinking course. Through structured non-participatory observation and analysis using an eight-characteristic framework, results indicate that all three teams demonstrated behavioural design thinking traits: navigating ambiguity, learning from others, synthesising information, rapid experimentation, shifting between concrete and abstract modes, conscious construction, conscious communication, and meta-level reflection, though emphasis

varied across teams due to composition differences. This practice demonstrates that strategically incorporating brief, constrained project tasks following theoretical instruction creates a powerful domain for observing and cultivating design thinking traits. Constraints function as catalysts for creativity rather than mere limitations; hands-on learning facilitates translating abstract models into tacit understanding; and peer observation within shared classroom environments enhances cross-group learning. These findings indicate that short-duration, highly constrained interventions play a significant role in higher education design thinking pedagogy, particularly in time- and resource-constrained settings. They offer valuable insights for curriculum design that balances conceptual depth with practical feasibility.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that ChatGPT, an AI-assisted writing software, was used in proofreading and refining the language used in the manuscript. The usage was limited to correcting grammatical and spelling errors and rephrasing statements for accuracy and clarity. The author further declares that, apart from Grammarly, no other AI or AI-assisted technologies have been used to generate content in writing the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

Preserving Local Fishing Heritage With a VR Educational Game: Integrating Sustainability and Cultural Identity Mechanisms

Ya-Hsin Cheng, Chihlee University of Technology, Taiwan
Yu-Cheng Lin, Chihlee University of Technology, Taiwan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Once a cornerstone of Taiwan's economic development, the fishing industry is now facing challenges such as marine resource depletion and labor shortages. As the SDGs and ESG principles gain prominence, preserving local fishing culture and fostering regional identity have become critical issues. This study designed a VR game centered on Huanggang's century-old Benghuozi (Sulfur fire fishing) practice to promote cultural identity and belonging. Twenty-one university students in northern Taiwan participated in the VR experience and completed a questionnaire and qualitative survey. Results showed enhanced immersion in Benghuozi culture and stronger place identity and dependence on Huanggang fishing port. The VR experience also fostered deeper understanding of traditional fishing methods and active learning motivation. Overall, the culturally embedded VR game serves as a digital tool for cultural preservation with educational and sustainability value.

Keywords: friendly fishing technique, virtual reality, game-based learning, cultural identity, SDGs

Introduction

The Benghuozi (Sulfur fire fishing) practice in Jinshan's Huanggang is a century-old, environmentally friendly fishing technique. Nevertheless, the practice now faces a transmission crisis due to a shortage of skilled labor. In light of sustainable development goals (SDGs) and environmental, social, and governance (ESG) principles, innovative approaches are needed to preserve intangible cultural heritage and strengthen regional identity. By utilizing virtual environments to assist college students in game design, 3D virtual tools can be employed to visualize discussion content, enabling participants to gain a more concrete understanding of the topics explored. This approach also enhances critical thinking, creativity, communication, and collaboration skills (Damaševičius & Sidekerskienė, 2024), while positively influencing engagement (Pellas et al., 2021) and academic emotions (Lin et al., 2025).

Virtual Reality (VR) allows individuals to transcend the limitations of time and space. Even places that cannot be physically visited can be previewed comprehensively in advance. For example, VR experiences have documented the traditional Benghuozi culture, raising public awareness of cultural heritage and immersing audiences in the lives of fishermen and maritime traditions. This not only enhances tourists' experiences but also contributes to the preservation and innovation of fishing port culture.

Research further indicates that virtual tourism experiences can serve as an information preview and reference for travelers before their trips. Activities that are time-sensitive or location-restricted can still be experienced anytime through VR. This form of virtual tourism has already been proven effective in stimulating users' willingness and motivation to travel (An et al., 2021). The VR educational game designed in this study incorporates features such as operational simulation, character simulation, and scene simulation to cultivate students' sense of local identity.

To investigate the impact of integrating local fishing knowledge into VR educational games on learners, the research questions are as follows:

1. What is the effect of this VR educational game on learners' sense of presence?
2. What is the effect of this VR educational game on learners' place identity and attachment?
3. What are the qualitative opinions of learners after using this VR educational game?

Method

This study recruited 21 Taiwanese participants aged 18 and above, with an average age of 22.30 years, who engaged in learning activities using VR headsets. The research procedure included: a 10-minute activity briefing, followed by a 40-minute VR game-based learning session, and concluded with a 20-minute administration of scales measuring sense of presence, place identity, and place dependence, along with an open-ended questionnaire. The scales were structured as follows: The Sense of Presence scale comprised 5 items based on Hwang et al. (2022). Place Identity and Place Dependence scales were derived from the Place Attachment Inventory used by Williams and Vaske (2003), with 6 items each. All scales employed a 5-point Likert scale design.

This study utilizes portable VR glasses and an integrated application characterized by their stability and efficiency to address the temporal limitations inherent in traditional Sulfur Fire

Fishing. The primary goal is to foster cultural identity among tourists through immersive digital storytelling, thereby facilitating the preservation of cultural heritage. The interface architecture is anchored in on-site field investigations, featuring digital reconstructions of fishing scenes and regional maps complemented by brief annotations. To enhance interactivity, the system employs an interactive quiz-based mechanism, which not only increases participation but also maximizes the educational impact of combining emerging technologies with intangible cultural heritage (Figure 1, Figure 2, and Figure 3).

Figure 1

VR Operation Simulation – Fishing Boat Interactive Facility

Figure 2

VR Character Simulation – Role-Play As Crew Members to Experience Fishing Missions

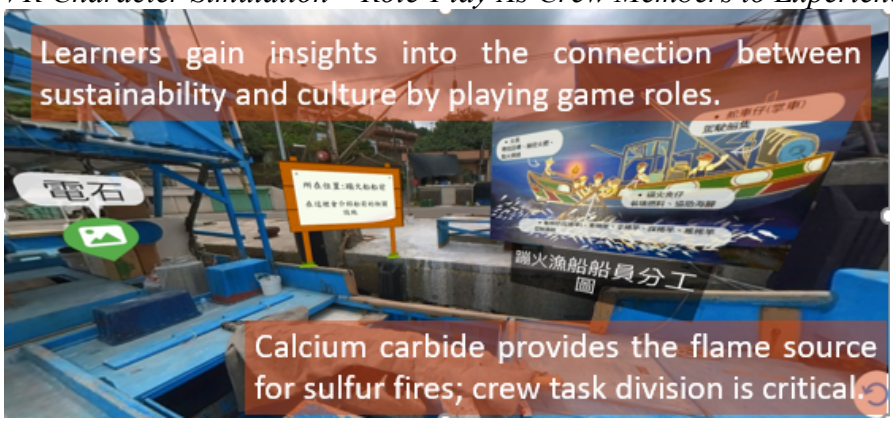

Figure 3

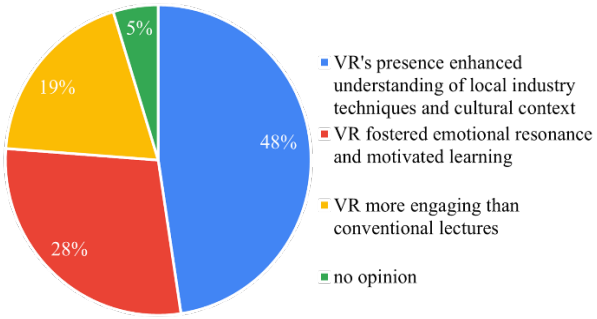
VR Scenario Simulation – On-Site Filming Scene Production

Results

This study employed Wilcoxon signed-rank tests to analyze sense of presence, place identity, and place dependence. Results indicate that the mean scores for all three variables significantly exceeded the median of 3 on the five-point scale ($p < .001$) (Table 1). This indicates that using this VR game for historical and cultural knowledge learning not only provides students with a heightened sense of presence but also fosters greater identity and place dependence toward the local culture.

Qualitative questionnaires further explored learners' perceptions of differences between VR-based local cultural learning and traditional lecture-based learning. Findings are summarized as follows: 48% (10 persons) believed VR's presence enhanced understanding of local industry techniques and cultural context; 29% (6 persons) felt VR fostered emotional resonance and motivated learning; 19% (4 persons) found VR more engaging than conventional lectures. 4% (1 person) had no opinion (Figure 4.)

Table 1



The Result of the One-Sample T-test for Each Aspect

	Mean	*SD*	*p*	*Effect Size*
Sense of Presence	3.98	.66	$< .001^{***}$	.97
Place Identity	4.17	.53	$< .001^{***}$	1.00
Place Dependence	3.91	.43	$< .001^{***}$	1.00

$^{***}p < .001$, test value = 3

Figure 4

The Result of the Qualitative Opinion Analysis

Conclusion

This study designed a VR game themed around Jinshan's Huanggang culture, enabling students to simulate traditional fishing processes and explore local industrial characteristics. The aim was to enhance students' understanding of local fishing techniques and cultural significance, thereby fostering a stronger sense of cultural identity and attachment to their community. Results indicate that the VR experience significantly enhanced participants' sense of presence within Jinshan's Huanggang culture, accompanied by heightened local identity and attachment. Qualitative feedback further revealed that VR exploration

deepened understanding of century-old fishing techniques and cultural significance while boosting learning motivation.

Reimagining Critical Thinking Development: A Teacher Perspective on Alternative Approaches to Hong Kong's Education System

Cheuk Yan Leung, Soka University, Japan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study examines critical thinking education (CTE) in Hong Kong's secondary schools, exploring how competing national identities and educational reforms have shaped pedagogical practices. Through mixed-methods research involving 23 questionnaire respondents and 4 in-depth interviews, we investigate teachers' perceptions of critical thinking skills (CTS) development and how the educational system shapes their professional identities. Findings reveal significant gaps between content delivery and practical application of CT, systemic barriers including examination-oriented curricula and socio-political constraints, and teachers' evolving roles as knowledge transformers, strategic guides, and motivational encouragers. The study highlights the tension between developing independent thinking and navigating institutional demands, particularly following the implementation of the National Security Law. We argue that meaningful educational reform requires empowering teachers, reimagining assessment frameworks, and balancing institutional structures with the transformative potential of nurturing critically aware learners.

Keywords: critical thinking education, Hong Kong, teacher identity, educational reform, Liberal Studies, pedagogical barriers

iafor
The International Academic Forum
www.iafor.org

Introduction

The complex relationship between national identity and educational reform in post-1997 Hong Kong presents a unique case study in critical thinking education (CTE), particularly within rapid social and political change. This study examines how competing identities—characterized by nationalism emphasizing loyalty to China and a local-centric mentality prioritizing Hong Kong's unique identity—have shaped educational policies and practices (Morris & Vickers, 2015; Veg, 2017). The tension between these dual hegemonies has profoundly influenced education, where promoting critical thinking (CT) has emerged as a central concern.

The unclear conceptualization of CT creates fundamental challenges for educators. Without an official definition, CT is sometimes misinterpreted as promoting political activities. The field lacks both a precise definition and universally accepted assessment methods (Petrie et al., 2020). This definitional ambiguity extends throughout education, where various professionals hold different perspectives on CT.

Recent reforms have sparked debates about educational goals and teaching methods. The Hong Kong Diploma of Secondary Education (HKDSE) system emphasizes standardized testing, which often conflicts with developing critical thinking skills (CTS). Although Liberal Studies (LS) became compulsory to promote CTS (Spires, 2017), unclear guidelines created significant implementation challenges. The 2011 introduction of "Moral and National Education" (MNE) marked a crucial shift. Critics claimed it promoted narrow patriotism while omitting politically sensitive topics (Leung & Tang, 2011). The resulting 2012 Anti-national Education movement demonstrated growing concerns about preserving democratic values and independent thinking (Tse, 2023).

This study examines how Hong Kong's education system navigates these challenges while developing students' CTS. By analyzing curriculum development, teacher perspectives, and institutional responses, the research explores complex relationships between national identity, educational reform, and CT development in Hong Kong's distinctive post-colonial environment, including restrictions following the 2019 protests and the 2021 dissolution of the Hong Kong Professional Teachers' Union (HKTPU). This paper evaluates the current state of CT development through educational professionals' perspectives, examining teachers' perceptions, attitudes, and challenges in promoting CT in schools.

Literature Review

Conceptualizing Critical Thinking in Education

CT is generally recognized as encompassing various cognitive processes aimed at evaluating and enhancing one's thinking. It involves meticulous assessment of evidence, eschewing reliance on questionable authority. CT shares affinities with rational thinking and problem-solving, yet it is distinct in its broader scope, integrating logical, reflective, metacognitive, and creative thinking into a cohesive process.

Critical thinkers are self-regulating and habitually inquisitive, seeking to clarify issues, honestly confront personal biases, and make judgments with prudence. Ennis (1962) describes CT as reflective, reasonable thinking focused on decision-making. McPeck (1981) emphasizes reflective skepticism and intelligent use of evidence. Facione (1990) encapsulates CT as

pervasive, self-rectifying, and essential for interpretation, analysis, evaluation, and inference. The ideal critical thinker is well-informed, honest, prudent, clear, orderly, diligent, reasonable, focused, and persistent in pursuing accurate conclusions.

Critical Thinking Movement Versus Critical Pedagogy Movement

The CT Movement and Critical Pedagogy (CP) Movement reflect distinct educational projects with different aims and methods.

Table 1
Comparison of the CT Movement and CP Movement

	Critical Thinking Movement (CT Movement)	Critical Pedagogy Movement (CP Movement)
Objective	To teach critical thinking skills and dispositions to enhance individual thinking, without a specific cultural, moral, ethical or political agenda	Seeks to bring about social change and justice, viewing political issues as integral to critical thinking and reasons for its necessity.
Scope	Focuses on teaching individuals how to think critically, developing skills for reasoned, reflective thinking to guide beliefs and actions and creating better thinkers.	Aims to foster social justice by making students aware of indoctrination and the social conditions perpetuating it, empowering them to challenge and escape these conditions.
Method	Involves using teachers, fellow students, and resources to cultivate cognitive skills and critical dispositions. It values impartiality on issues as a key virtue and critical thinking disposition.	Emphasizes dialogue to develop confidence and literacy, eliminating feelings of powerlessness. It views impartiality as evidence of domination and oppression, reflecting different approaches and philosophies towards education and social change.

The CT Movement and Critical Pedagogy (CP) Movement pursue different projects. CT focuses on cultivating reasoning skills and dispositions through rational reflection and comparatively impartial analysis (Burbules & Berk, 1999; Davies, 2015). CP is explicitly political, aiming to develop consciousness of oppression and support action against inequity (Giroux, 1988), linking reflection to praxis (Fernandez-Balboa, 1993; Rahimi & Sajed, 2014; Zembylas, 2015). In practice, integration is delicate: CT without CP can become technocratic neutrality, while CP without CT risks moralism or dogma. In Hong Kong, this distinction is salient for LS, where policy and assessment shape what forms of criticality are teachable and institutionally permissible (Chong et al., 2022; Kennedy, 2010; Morris & Adamson, 2010).

Historical Evolution and System Characteristics

Hong Kong's education has long balanced civic ideals with nation-building. From the mid-1980s, policy increasingly emphasized national identity and patriotism (Fisher, 2012; Hung, 2014). Post-1997 reforms promoted active learning through the Basic Education Curriculum Guide and, in 2006, introduced LS to strengthen CT for civic participation (Education and Manpower Bureau, 2004). Controversy over the 2012 MNE Guide, criticized as ideological "brain-washing", exposed tensions between policy directives and democratic, independent thinking (Law, 2009). The Concern Group on National Education called for national education

compatible with democracy and CT, reinforcing links between CT, social consciousness, and citizenship (Tse, 2023). Structural features also hinder CTE. Task-based, outcome-driven learning encourages rote memorization and exam strategies (Ng, 2019), while a provider–receiver model positions teachers as transmitters and students as passive recipients, limiting inquiry (Yuen, 2015). Teacher-centered instruction in crowded classrooms further reduces interaction needed for CTS development (Biggs, 1996).

The Role of Teachers in CTE

Teachers act as transformative agents whose influence extends beyond content delivery to students' cognitive development and personal formation (Choy & Cheah, 2009; Mullins, 1990). Professional identity matters because beliefs and philosophies shape instructional decisions and the classroom climate for CT, including whether students feel able to express ideas (Beijaard et al., 2004; Hussain et al., 2019).

Contemporary Hong Kong education confronts emerging challenges that threaten to diminish traditional teacher influence. The rise of "star tutors" and expanding shadow education undermines traditional teacher roles, with these tutors predominantly focusing on test-taking strategies rather than holistic development (Lai & Byram, 2012; Tsoi, 2013). Despite this increasing commercialization, teachers remain essential in creating structured environments where students engage with democratic principles, human rights, and social justice.

In the global educational landscape, teachers occupy a distinctive position at the intersection of CT development and civic engagement cultivation. Strengthening their voice in critical pedagogy involves researching their practices and sharing insights, contributing to evolving understandings of teaching methodologies. Beyond fostering intellectual growth, teachers also play a pivotal role in shaping students' moral development, functioning as both information sources and transformative figures, guiding students in developing personal and civic virtues.

Conceptual Framework

This study integrates three frameworks to examine CTS development, teacher perceptions, and role identity under Hong Kong's institutional and sociopolitical constraints: Davies' Critical Thinking Model (2015), Wong's Teachers' Perceptions Model (2021), and Kaplan and Garner's DSMRI (2017).

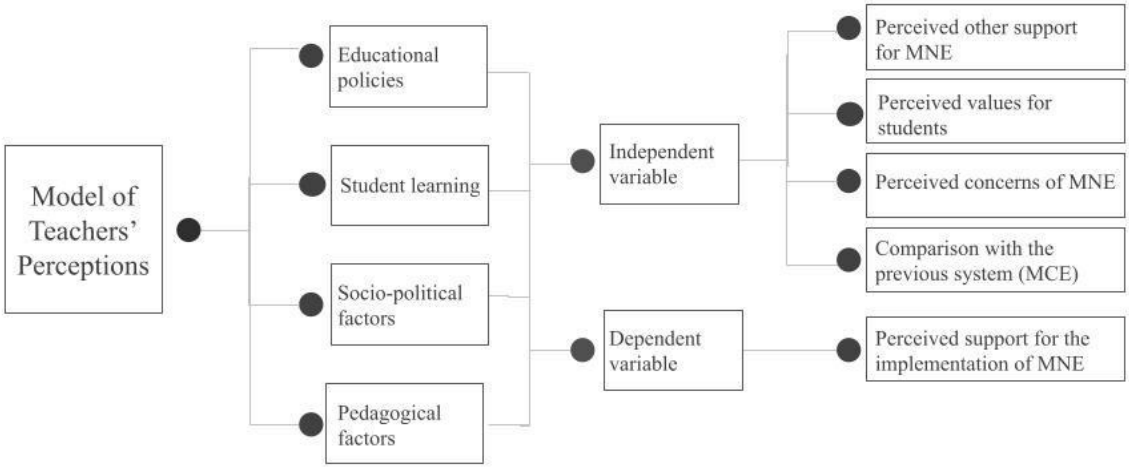
The Stages of CT Development in Hong Kong Secondary Education

The Model of Critical Thinking in Higher Education provides a multidimensional framework for evaluating CT within educational contexts by integrating cognitive skills, judgment, dispositions, emotions, attitudes, readiness, actions, and social relationships. Although originally designed for higher education, its application to secondary education is particularly relevant, as this stage serves as a crucial preparatory phase for university, where expectations for CT are heightened (Stupple et al., 2017). Given that fundamental components of CT—such as skills, dispositions, judgment, and affective-social-relational dimensions—develop incrementally across educational stages, the model's theoretical constructs are readily transferable for examining CT development in earlier-stage learners.

Figure 1
The Model of Critical Thinking in Higher Education

	Forms of criticality
CT Movement	Critical Rationality
	Critical Character
Criticality Movement	
	Critical Actions
CP Movement	
	Critical Virtue *(Awareness of oppression)*
	Critical Consciousness
	Participation *(Resistance of oppression)*
	Critical Pedagogy
Critical Openness	Critical Creativity
	Critical Being

Criticality Level
Low
High



Note. From Davies, 2015

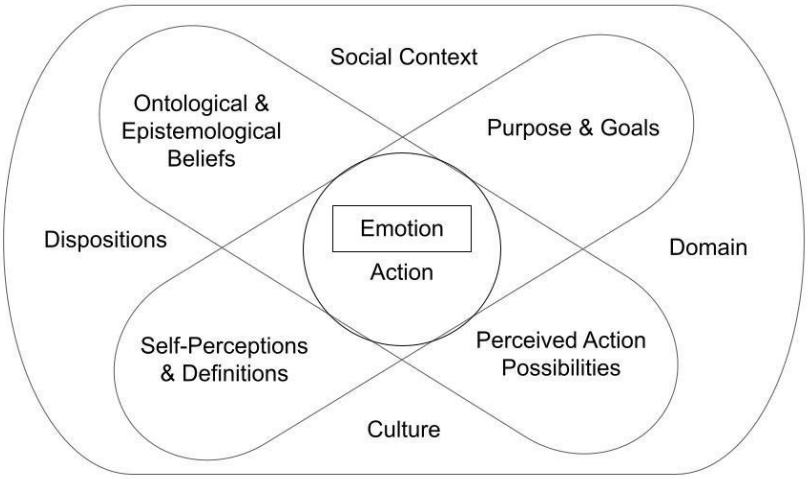
Applied here, the model supports evaluating how far the system enables criticality and where structural conditions constrain it, linking individual skills to sociocultural context (Bailin & Battersby, 2016) and informing targeted, context-responsive reform.

Teachers' Perspectives on CT: Opportunities and Obstacles

The Model of Teachers' Perceptions provides a structured framework for analyzing how educators cultivate CT in Hong Kong's classrooms while addressing the complexities of national identification through a critical education lens. Tailored to the Hong Kong educational context, it identifies four fundamental factors shaping teachers' perceptions: educational policies, student learning, socio-political influences, and pedagogical considerations (Hoffman-Kipp, 2008). The model further incorporates independent variables—such as perceived external support for MNE, perceived educational value for students, concerns regarding MNE, and comparisons with the previous system—as well as a dependent variable measuring perceived support for MNE implementation.

Figure 2
The Model of Teachers' Perception

Note. From Wong et al., 2021



Additionally, this model draws on Freire's concept of praxis, which emphasizes the integration of critical reflection with action. Within this approach, problem-posing techniques in critical pedagogy are employed to empower students as active knowledge creators rather than passive recipients. This theoretical foundation enables exploration of how external factors—including educational policies, student learning approaches, socio-political contexts, and pedagogical considerations—influence teachers' perceptions and strategies for promoting CT in secondary schools.

The Intersection of Teacher Identity and Role in CTE

The DSMRI provides a valuable lens for understanding the complexities of teacher identity and its influence on CTE. This model conceptualizes teacher identity as a dynamic construct shaped by the interplay of four interrelated components: beliefs and values, goals, self-perceptions, and perceived action possibilities. These components evolve in response to personal experiences, professional environments, and sociocultural factors, collectively shaping an educator's unique and continuously developing professional identity.

The DSMRI underscores the notion that identity is not static but is constantly redefined through interactions between individuals and their environments. By examining the intersection of personal motivations and institutional constraints, this framework sheds light on why some educators embrace or resist certain pedagogical approaches. This model offers a systematic approach to analyzing teacher identity by investigating how personal beliefs and external influences shape their roles in CTE, providing an analytical foundation for examining how teachers navigate challenges associated with promoting CTS across diverse educational settings.

Figure 3
The DSMRI

Note. From Kaplan & Garner, 2017

Together, the three frameworks enable analysis of system-level criticality, teachers' perceptions, and identity-driven instructional dynamics in Hong Kong's CTE.

Methodology

This study explores teachers' perceptions of CTS development among secondary school students in Hong Kong and examines how the educational system influences teachers' professional identities. The research is guided by two primary questions:

1. *How do teachers perceive the progression of critical thinking skills among secondary school students in Hong Kong?*
2. *How does the educational system shape teachers' identities in facilitating critical thinking development in Hong Kong?*

Research Design

A mixed-methods approach was adopted to investigate CT development in Hong Kong's secondary education system. The quantitative component employs structured questionnaires using a five-point Likert scale. The qualitative component consists of semi-structured interviews exploring four thematic areas: teachers' perceptions, identity formation (considering both internal and external influences), and outcomes through 11 questions. To enhance participant engagement and ensure data reliability, a dual-language methodology was implemented, with surveys and interviews conducted in both English and Cantonese.

Participants and Sampling

Participants were selected based on their active engagement in CT instruction, particularly within the LS curriculum, overseen by the Education Bureau (EDB). Eligibility criteria included holding a valid teaching license, being within Hong Kong's standard working age range being aged 18–65, and possessing at least a tertiary-level academic qualification. Recruitment began through personal professional networks within secondary schools and expanded via snowball sampling.

The primary data collection phase focused on questionnaire distribution, resulting in 23 valid responses. Participants' ages ranged from their 20s to early 60s, with teaching experience varying from 1 to over 40 years. All interviews conducted in Cantonese were carefully transcribed and translated into English by the researcher. From the survey respondents, four interview participants were selected through purposive sampling based on their willingness to provide deeper insights.

The interviewees represented diverse backgrounds, spanning different age groups, teaching experiences (2-20 years), and subject areas, including STEM disciplines (Chemistry, Mathematics) and humanities (Religious Studies, Visual Arts, English, and Citizenship and Social Development).

Table 2
Demographic and Professional Profiles of Interview Participants

Participant	Age group	Educational level	Years of Teaching	Teaching subjects
A	30-39 years old	Master	11–15 years	Chemistry
B	20-29 years old	Bachelor	2 years	Mathematics
C	40-49 years old	Bachelor	About 20 years	Religious Studies, Visual Arts, Citizenship and Social Development (CSD) (Previously Liberal Studies)
D	20-29 years old	Master	2 years	English, Visual Arts

Ethical Considerations

Given Hong Kong's complex political climate, the study implemented stringent ethical safeguards, including voluntary participation protocols, strict anonymization of participants, data confidentiality measures, secure communication channels, and flexible participation options.

Analytical Framework

The research analysis employed a framework examining CT in education through four key analytical elements derived from systematically coded interview and survey data.

Table 3
Conceptual Mapping: CT Research Frameworks

Author	Model	Measurements	Element
Davies (2015)	The Model of Critical Thinking	CT Movement, Criticality Movement, CP Movement, Critical Openness	1. Criticality level of the current Hong Kong Education System 2. Teachers' perspectives on the current state of critical thinking education 3. Pedagogical barriers in critical thinking instruction 4. Opportunities and challenges shaping the future of critical thinking education
Wong et al. (2021)	The Model of Teachers' Perceptions	Educational policies, student learning, socio-political factors, pedagogical factors	
Kaplan and Garner (2017)	The DSMRI	Ontological and epistemological beliefs, sense of purpose, goals, self-perceptions, and perceived action possibilities	

This framework synthesized three critical theoretical models, systematically mapping their core dimensions to provide a structured approach to understanding CT through interconnected lenses of criticality, teacher perceptions, and instructional dynamics.

Findings

The investigation into CTE in Hong Kong's secondary schools revealed four key themes: (1) the criticality level of the current education system, (2) teachers' perspectives on CTE, (3) pedagogical barriers to CT instruction, and (4) opportunities and challenges shaping the future of CTE.

Criticality Level of the Current Hong Kong Education System

Hong Kong's education system demonstrates considerable strength in content delivery, with over 65% of respondents affirming its effectiveness in broad subject knowledge transmission. However, significant limitations emerge in developing practical application and CTS. More than 70% of educators express uncertainty about students' capacity to translate theoretical knowledge into real-world contexts, highlighting a substantial gap between academic learning and practical implementation.

The development of CTS presents a particularly complex picture. Educators' responses indicate marked ambivalence, with 45% maintaining a neutral stance on students' abilities to compare, contrast, synthesize, and critically evaluate information from multiple sources. This neutrality suggests not just an absence of CT development, but potentially a systemic challenge in designing and implementing pedagogical approaches that genuinely cultivate analytical reasoning.

The integration of critical pedagogy shows limited success, with two-thirds of respondents either disagreeing or remaining neutral about the system's effectiveness in fostering advanced cognitive skills. While the system exhibits moderate achievement in promoting student identity and self-awareness, its ability to transform learning into substantive, actionable critical engagement remains constrained. These findings underscore a critical need for comprehensive reform, emphasizing the imperative of bridging the significant theory-practice divide and developing more sophisticated methodologies for instructing CT capabilities within Hong Kong's educational framework.

Teachers' Perspectives on Critical Thinking Education

The complex nature of CTE in Hong Kong is characterized by characterized by educators' varied perceptions and systemic challenges. Teachers universally recognize the importance of fostering CTS in students but their perspectives diverge when exploring key aspects of implementation across four critical categories:

Purpose of Education

A critical underlying theme emerges regarding the multifaceted purposes of education. Educators conceptualized educational objectives through three interconnected lenses: workplace skill development, fostering holistic and independent thinking, and facilitating societal adaptation. This comprehensive perspective challenges reductive views of education, positioning learning as a transformative process that extends beyond immediate academic or professional instrumentality. By conceptualizing schools as microcosmic social environments where students can encounter and navigate complex interpersonal and intellectual landscapes, teachers articulate a vision of education that is fundamentally about empowerment, critical engagement, and societal preparation.

Definition of Critical Thinking

Educators' conceptualization of CT moves beyond simplified definitions toward a practical account of intellectual engagement. Interviewees described CT as a multifaceted capacity involving independent judgment, comprehensive analysis, and the ability to evaluate issues from multiple stakeholder perspectives. This understanding is reflected in varied pedagogical approaches: science teachers emphasize data-informed objectivity, mathematics teachers encourage exploration of multiple solution pathways, and humanities teachers rely on open-ended questioning and real-world scenario integration. Across these strategies, the shared pedagogical orientation is to cultivate students' capacity to question assumptions, consider complex possibilities, and resist uncritical acceptance of dominant views. At the same time, educators must work within systemic constraints, most notably Hong Kong's examination-oriented framework, which they identify as limiting genuine CT development by privileging standardized assessment metrics over substantive intellectual exploration.

Importance of Teacher's Role

Fundamentally, teachers unanimously recognize the pivotal role of CT development, with 60% categorizing it as "very important" and 40% as "important". However, a notable discrepancy emerges between this recognition and actual implementation, as educators' self-assessment of their CT instructional effectiveness demonstrates ambivalence: approximately half perceive their efforts as "effective" or "very effective", while 40% maintain a neutral stance, and 5% candidly acknowledge limitations in their approach.

Teacher Identity Formation

The investigation further highlights the complex dynamics of teacher identity formation within CTE. Personal background, socioeconomic experience, and professional trajectory strongly shape instructional approaches. More experienced educators reported greater confidence in developing refined questioning techniques, while also emphasizing the careful balance required to manage classroom dynamics. The findings also show teachers' strong awareness of their own strengths and limitations. For example, some noted that rapid cognitive processing can unintentionally disadvantage students who learn at different speeds. At the same time, they expressed a clear commitment to building inclusive, participatory learning environments that move beyond traditional didactic models.

This study underscores the complexities of integrating CT in Hong Kong's education system, highlighting key challenges in translating recognition into practice. While the system has potential, significant structural and pedagogical reforms are needed.

Pedagogical Barriers in Critical Thinking Instruction

Building on how teachers' perceptions shape critical thinking education, this section examines the practical challenges educators face in applying CT instruction.

Syllabus

At the core of these challenges is a deeply entrenched examination-oriented curriculum that restricts educators' capacity to foster substantive critical engagement. A rigid syllabus and its emphasis on standardized assessment create a pedagogical environment that privileges content

memorization and model-answer reproduction over nuanced analytical thinking. Teachers consistently report being constrained by packed schedules, large class sizes, and institutional pressures that make individualized attention and sustained exploratory discussion difficult to achieve.

Teacher Qualification System

The teacher qualification system represents a critical institutional constraint, as the Postgraduate Diploma in Education (PGDE) and wider certification processes show substantial weaknesses in preparing educators for CT pedagogy. Although certification has become increasingly competitive, it often fails to provide meaningful training in CT instructional strategies. As a result, new teachers tend to concentrate on classroom management and textbook-driven content delivery, with limited institutional support for developing critical inquiry approaches. This systemic gap produces a clear disparity between experienced teachers who have built sophisticated strategies for integrating CT and early-career educators who enter the profession without comprehensive preparatory frameworks.

Socio-Political Dynamics

Political and sociopolitical dynamics introduce another profound layer of complexity to CT instruction. The implementation of the National Security Law (NSL) has created a chilling effect on educational discourse, compelling teachers to exercise extraordinary caution in material selection and classroom discussions. Liberal arts educators, in particular, report significant self-censorship, avoiding potentially sensitive topics related to political rights and social policies. This environment of restricted expression fundamentally undermines the core principles of CT, transforming educational spaces from platforms of intellectual exploration into zones of constrained dialogue. The potential professional and legal repercussions—including job loss or legal prosecution—create a pervasive atmosphere of intellectual restraint that directly conflicts with the open-minded inquiry essential to CT development.

Pedagogical barriers to critical thinking instruction stem from sociocultural and institutional factors. Teachers must navigate information complexities while balancing institutional demands, political sensitivities, and pedagogical goals. Addressing these challenges requires comprehensive reforms in teacher preparation, institutional culture, and alignment between education and sociopolitical contexts.

Opportunities and Challenges Shaping the Future of CTE

The landscape of CTE in Hong Kong is characterized by a dynamic interplay of promising opportunities and considerable challenges. At the heart of potential transformation lies curriculum design, which offers remarkable potential for cultivating multi-contextual CT by integrating real-life examples across disciplines. This approach seeks to reframe CT as a versatile skill that extends far beyond traditional academic boundaries.

The technological infrastructure of Hong Kong provides a compelling backdrop for this educational evolution, with its advanced digital ecosystem offering unprecedented platforms for information gathering and analysis. Nevertheless, this technological advantage is simultaneously a challenge, as students must develop refined skills to navigate and critically assess the overwhelming volume of available information. The multilingual educational environment, particularly the use of English as a primary instructional medium, presents

additional opportunities for fostering rich intellectual discourse, though these potential advantages remain largely unexplored within current pedagogical practices.

Classroom dynamics further complicate the implementation of CTE, with educators constantly negotiating between comprehensive curriculum demands and the imperative to promote deeper analytical thinking. The examination-oriented system creates significant time constraints, compelling teachers to develop innovative strategies that balance standardized assessment requirements with meaningful intellectual exploration. The diverse student backgrounds add another layer of complexity, requiring educators to develop adaptive teaching approaches that can engage students with varying levels of intellectual curiosity and participation.

The sociocultural context of CTE in Hong Kong introduces additional layers of complexity. While academic spaces nominally permit open-minded questioning and intellectual exploration, the broader political and institutional environment creates subtle yet significant constraints on discourse. Teachers must navigate these delicate boundaries, seeking to create meaningful CT opportunities within systematically defined parameters.

Ultimately, the future of CTE in Hong Kong hinges on a fundamental reimagining of educational priorities. Success will demand a holistic approach that conceptualizes CT not merely as a skill set, but as a fundamental mode of engaging with knowledge. This transformation necessitates comprehensive reforms spanning teacher training, curriculum design, and institutional culture—shifting from a model of passive information transmission to a dynamic ecosystem of intellectual inquiry and independent thought.

Discussion

Transforming Education: The Role of Teachers in Fostering Critical Beings

Fostering CTS has become a central priority, and teachers play a key role in supporting students' analytical development. In Hong Kong, educators function as essential intermediaries in CTE, continually balancing institutional requirements with educational aims. This study identified three distinct yet interconnected roles that teachers have developed.

As *knowledge transformers*, teachers maintain a delicate balance between preserving objectivity, particularly in subjective subject areas, while continuously examining and adjusting their teaching methods through self-reflection. In their role as *strategic guides*, educators leverage their classroom experience to develop multiple questioning techniques and create structured frameworks for intellectual exploration, implementing careful interventions that challenge student assumptions while providing scaffolded support for analytical development. As *motivational encouragers*, teachers focus on creating dynamic learning environments that transform CT from a mere requirement into an engaging practice, fostering student independence and genuine interest in complex intellectual concepts.

These roles, however, are increasingly shaped by external constraints, including rigid curriculum demands, examination standards, and socio-political sensitivities. Ambiguity around "freedom of expression" encourages teachers to operate within what one respondent described as a "legal and compliant framework," carefully distinguishing analytical skill development from political activism. This caution reflects the balance educators must maintain to promote CT while avoiding contentious or potentially risky territory.

With limited institutional support and no clear guidelines or assessment frameworks, many teachers rely heavily on personal creativity and resilience to manage these pressures. This growing burden highlights shifting educational dynamics in which teachers' work becomes simultaneously more demanding and more constrained. The intensifying challenges, alongside declining teacher autonomy, underscore the need for stronger systemic support so educators can sustain their evolving responsibilities and continue to nurture students' intellectual growth in a changing world.

Reforming Education: The Role and Controversy of Critical Thinking

The development of CT in Hong Kong's education system has been a focal point of discussion and reform. Reflecting on the former educational reform, the transition from the Advanced Level (AL) examination system to the HKDSE, while representing a significant structural shift, has had minimal impact on the delivery of CT instruction.

Within the DSE system, the LS curriculum stands out as a paradoxical case, showcasing both the successes and unintended consequences of efforts to foster CTE. Despite its controversial removal, the curriculum's original intent to develop students' ability to "apply CTS, creativity and different perspectives in making decisions and judgments on issues and problems at both personal and social levels" (CDC & HKEAA, 2007) was notably manifested through student-led social movements (Fung & Lui, 2017). These movements, most prominently the Anti-National Education campaign, reflected students' capacity to translate academic learning into real-world application, effectively proving the curriculum's underlying pedagogical objectives.

The elimination of LS, however, sparked intense societal debate about the role of CT in education. Former Chief Executive Tung Chee-hwa criticized the subject as a "complete failure", suggesting it encouraged excessive social activism. This perspective necessitates a crucial clarification: CTE is fundamentally about developing independent thinking skills, not promoting political opposition. The ultimate goal of CTE extends beyond mere academic achievement or political engagement—it aims to cultivate individuals capable of sophisticated analytical reasoning, informed decision-making, and thoughtful engagement with complex societal issues, equipping students with essential competencies for lifelong learning and meaningful participation in an increasingly complex world.

The ongoing discourse and reforms in Hong Kong highlight the need for a more diverse and sustained approach to CTE, ensuring that future generations are equipped to navigate the complexities of an interconnected world.

Systemic Barriers to Critical Thinking Education in Hong Kong

While the issue is widely acknowledged, the barriers to CT instruction remain persistent in practice. Teachers operate within an institutional landscape structured by interlocking pressures, including curriculum mandates, examination requirements, and socio-political sensitivities. As a result, CT instruction is less a discrete pedagogical task than a form of strategic negotiation, in which educators must continuously balance institutional constraints against educational ideals.

For instance, the absence of CT as a standalone subject creates significant implementation barriers, particularly within an examination-oriented environment that prioritizes content coverage over analytical skill development. Teachers repeatedly face an impossible choice

between facilitating meaningful discussions that develop higher-order thinking and meeting rigid curriculum coverage requirements. Without clear guidelines and established assessment mechanisms, teachers struggle to develop and verify instructional strategies, perpetuating a cycle of pedagogical improvisation where individual creativity and resilience become the primary mechanisms for CTE, rather than structured, institutionally supported development.
The lack of a comprehensive assessment framework further exacerbates these challenges, rendering the systematic evaluation of students' CT development exceptionally problematic. Traditional assessment methods, predominantly focused on content recall and standardized testing, prove inadequate for capturing the cognitive processes associated with CT.

These institutional challenges intersect with teachers' personal and professional experiences in complex ways. Our research illustrated how teachers' own socioeconomic backgrounds significantly influence their pedagogical approaches and understanding of student needs. One educator from the middle class demonstrated heightened sensitivity to the thinking patterns of students from similar socio-economic circumstances, while acknowledging difficulties in understanding the constraints faced by students from lower socio-economic status families. Similarly, educators who experienced traditional, examination-focused education during their own schooling acknowledged how these early experiences initially created barriers to adopting innovative teaching approaches.

These challenges are further compounded by historical practices within the education system in Hong Kong. The implications of this uncertain landscape extend beyond immediate classroom dynamics, potentially reproducing existing social and intellectual inequalities through inconsistent implementation of CTE. However, the declining role of teachers and their decreasing autonomy in shaping curricula and pedagogical approaches present significant barriers, further complicating efforts to achieve educational objectives.

The Shift From Teaching Critical Thinking Skills to Cultivating Critical Thinkers

The development of CT in Hong Kong fundamentally reframes its purpose as the cultivation of critical beings—individuals able to navigate complex intellectual and social landscapes. The aim moves beyond knowledge transmission toward fostering adaptive cognitive capacities that support nuanced analysis, independent judgment, and transformative engagement with multifaceted global challenges.

At the heart of this approach is identity development through critical openness, a dynamic process of self-discovery that interrogates the foundations of personal understanding. Critical openness functions as a demanding form of self-engagement in which individuals learn to deconstruct inherited narratives, trace the genealogy of their beliefs, and shape a more authentic sense of self that is grounded in lived experience yet open to deep change. Identity is treated not as a fixed construct but as an ongoing, negotiated space of becoming, where personal agency intersects with wider social, cultural, and intellectual forces.

In an era of intensified informational complexity and rapid technological change, CT becomes an essential adaptive mechanism. Individuals must cultivate the ability to analyze, evaluate, and synthesize information across diverse sources, resisting uncritical acceptance and forming well-reasoned perspectives. This orientation privileges knowing how to think over accumulating static knowledge, emphasizing cognitive resilience and the capacity to interpret and engage meaningfully with complex societal challenges.

The educational imperative, then, is to prepare individuals who can grasp intricate information, consider varied perspectives, and translate understanding into meaningful action. Critical openness becomes a transformative practice of identity formation, teaching learners to hold their views with both seriousness and humility, capable of commitment while remaining open to reimagining. In doing so, education extends beyond traditional academic boundaries, positioning learning as a comprehensive process of identity formation and intellectual development that prepares individuals not as passive recipients of information, but as active agents able to engage with and shape social, technological, and cultural change.

Opportunities for Reform: The Role the Government Can Play

Educational reform requires recognizing teachers as the primary implementers of change, particularly as professional autonomy and support have weakened after the HKTPU's dissolution. The government should provide safe, politically neutral channels for educators to share challenges without fear, while allowing flexibility for diverse teaching approaches within a coherent strategy.

Reform should combine clearer curriculum guidance with assessment frameworks that reward critical engagement, alongside practical training, sustained professional development, and international exchange. Such infrastructure can protect academic space, support teacher growth, and better balance institutional requirements with the cultivation of independent, critically aware learners.

Conclusion

This study shows that critical thinking education (CTE) in Hong Kong is shaped by systemic barriers and sociopolitical constraints: despite reforms such as Liberal Studies (LS), an examination-oriented culture still weakens real CT practice, compounded by the lack of a standardized definition of CT, political sensitivities that narrow open discourse, and assessment systems that privilege standardized testing over independent thought. Teachers sit at the center of this tension, expected to satisfy institutional mandates while nurturing students' analytical and critical reasoning, and this research affirms their efforts and that they are not alone. At its core, CTE aims to cultivate "critical beings" who can think reflectively, act purposefully, and engage deeply with the world; as Dewey (1897) argues, education is lived and becomes meaningful when knowledge connects to practice, and in Hong Kong this is also inseparable from identity formation as students reflect on values, experiences, and roles in society. Davies further stresses that skills and dispositions are insufficient without action— "criticality without action is blind" (as cited in Davies, 2015, p. 65)—so CTE must move beyond passive reflection to purposeful, ethically grounded action. Importantly, fostering CT is not a political agenda but an educational commitment to equip students to navigate diverse perspectives and societal challenges with judgment and integrity. Achieving this requires reforms beyond curriculum tweaks: empowering teachers through stronger training and support, reimagining assessment to reward critical engagement rather than rote learning and creating pedagogical spaces that protect intellectual autonomy and meaningful exploration of identity, so Hong Kong can balance institutional demands with the transformative potential of nurturing independent, critically aware learners in a complex, interconnected world.

From Adaptation to Engagement: Evaluating the Effectiveness of an AI-Based Personalised Learning Platform in Physics Education

Bala Murali Tanimale, SEAMEO RECSAM, Malaysia

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study explores how a personalised learning platform powered by AI can support secondary school students in physics by tailoring instruction to their individual needs. A total of 120 students participated in the study, with one group using the adaptive platform and the other following traditional classroom instruction. The study used a mixed-methods approach, combining pre-test and post-test performance data with insights from student interviews and focus groups. The findings showed that students using the adaptive platform achieved higher levels of conceptual understanding, with an independent sample t-test score 7.55 points higher than that of the control group. These gains were closely linked to features such as adaptive quizzes, individualised lesson pathways, and progress-tracking tools, which allowed learners to monitor and adjust their learning more effectively. Students frequently described the platform as providing "timely feedback" and "guidance at my own pace," suggesting that personalisation helped reduce frustration and sustain motivation. Interview feedback also revealed that learners in the experimental group were more engaged, often citing the platform's gamified elements and interactive content as motivating factors. While students recognised these advantages, they also identified challenges, particularly technical issues and a desire for a broader range of content. Overall, the study highlights the potential of AI-driven adaptive learning to improve both immediate academic outcomes and the development of self-regulated learning habits. At the same time, it emphasises the importance of balancing technological innovation with thoughtful instructional design to ensure accessibility and sustained effectiveness in classroom practice.

Keywords: personalised learning, AI, physics education, learning platform

Introduction

Personalised learning (PL), tailored to individual students' needs, has recently resurged, driven by Artificial Intelligence (AI) and big data analytics (FitzGerald et al., 2018). Modern classrooms face challenges in ensuring equitable, meaningful learning due to students' varied interests, knowledge, and backgrounds. The one-size-fits-all model has shifted to PL, which adapts to each learner's strengths, potential, and pace. When combined with AI-powered data solutions, PL can create more engaging, effective, and inclusive education (Castro et al., 2024).

PL extends beyond simple differentiation by emphasising learner agency, adaptability, and data-driven decision-making. Based on constructivist and self-regulated learning (SLR) theories, PL encourages learners to set goals, monitor progress, and reflect on their learning. Constructivist theory highlights prior knowledge, engagement, and social context in the construction of knowledge, not just passive instruction (Anderson, 2008). Piaget's and Vygotsky's theories focus on active participation, meaning-making, and contextual learning (Piaget, 1964; Vygotsky, 1978). Effective learning environments let learners experiment, explore, and reflect through real-world tasks (Wang et al., 2019). SLR involves learners actively controlling their learning via goal-setting, self-monitoring, strategic planning, and reflection. Cycles of planning, tracking, and interpreting guide future actions, fostering independent, lifelong skills (Chen, 2022; Khiat & Vogel, 2022; Zimmerman, 1989).

PL aligns with constructivist principles, placing learners as active participants whose experiences are tailored to interests, readiness, and knowledge (Richter et al., 2024). It features flexible pathways, inquiry-based tasks, and choice activities that foster engagement and understanding. Teachers act as guides within learners' zones of proximal development (Chand, 2023). PL environments support the development of SLR skills by encouraging goal-setting, pacing, and feedback, strengthening ownership of learning. Digital and AI-supported systems enhance SLR through adaptive feedback, analytics, and progress visualisation, aiding self-monitoring and reflection.

Constructivist theory, along with SLR theory, provides a strong theoretical foundation for PL. Constructivism focuses on building active knowledge through meaningful engagement, while SLR describes how the engagement is managed and maintained over time. PL integrates these two perspectives by creating learning environments that are both intellectually stimulating and encourage learner independence. This approach emphasises the alignment of PL with solid pedagogical foundations rather than viewing PL as tech-based innovations.

The rapid evolution of AI is transforming science education, creating more adaptable and student-centred learning environments. In physics, concepts such as Force and Motion are difficult for students to grasp due to their abstract nature and common misconceptions (Adha et al., 2023). Traditional methods with fixed visuals and steady pacing may not suit diverse learners' styles, knowledge, and readiness. There is a growing demand for customised, pedagogically sound educational platforms (Contrino et al., 2024).

An AI-driven webpage was created to teach Force and Motion, offering a tailored approach through adaptive content, real-time feedback, and data-guided paths. It customises simulations, explanations, and activities to meet each learner's needs. For example, students with misconceptions about Newton's laws benefit from visualisations and guided examples. Extension activities and inquiry-driven tasks are for advanced learners. This flexibility promotes understanding by allowing exploration at individual paces (Piyatissa & Waduge,

2023). AI supports instructional choices and provides insights into student progress, fostering participation, deeper understanding, and fair outcomes in Force and Motion.

This study aims to evaluate the effectiveness and learners' perceptions of an AI-supported PL pathway for teaching Force and Motion subtopics. It compares the learning outcomes of students using this customised approach with those receiving the current 21st-century teaching approach. Furthermore, the focus is on examining their perceptions, experiences, and attitudes towards the PL method. This research explores the pedagogical value and practical implications of AI-driven PL in physics education by examining both cognitive and affective outcomes, contributing to a more holistic understanding.

Literature Review

Personalised Learning and Pedagogical Foundations

PL has become a key instructional method aimed at addressing diverse learner needs by customising learning experiences for each student. Unlike traditional differentiated instruction, which groups students by ability, PL emphasises learner agency, adaptability, and ongoing data-driven adjustments (Tetzlaff et al., 2020). Its goal is to develop flexible pathways that allow students to progress at their own pace, with content tailored to their prior knowledge and interests (Peng & Li, 2025). Rooted in constructivist and self-regulated learning theories (Piaget, 1964; Vygotsky, 1978), PL fosters exploration, experimentation, and reflection through inquiry-based tasks and adaptive challenges (Ibrahem et al., 2022).

SLR, described by Zimmerman (1989), involves goal setting, strategy use, self-monitoring, and reflection. Evidence shows students with strong SRL skills perform better, stay motivated, and persevere (Efklides & Metallidou, 2020). Digital PL environments support SRL by enabling control over pace, prompt feedback, and progress monitoring, enhancing metacognitive skills (Faza & Lestari, 2025).

AI-Supported Personalised Learning Systems

Recent AI advancements significantly enhance PL systems, enabling adaptive, responsive, and scalable experiences. These systems analyse data such as performance, response times, and learning patterns to adjust content difficulty, sequencing, and feedback (Khine, 2024). Unlike static resources, AI-driven platforms continually adapt to learners' evolving needs, providing targeted support (Hariyanto et al., 2025).

Research suggests AI personalisation improves efficiency by reducing redundancy and focusing attention on weak areas (Gupta, 2024). This aligns with Vygotsky's Zone of Proximal Development, where tasks slightly beyond learners' abilities are effectively guided (Murray & Arroyo, 2002). Empirical studies show that adaptive environments enhance understanding in demanding areas such as science and maths (Tetzlaff et al., 2020).

AI systems also boost self-regulated learning (SRL) through analytics, progress visuals, and personalised feedback, promoting self-monitoring and reflection (Afzaal et al., 2023). These tools foster deeper metacognitive engagement when integrated effectively (Lodge et al., 2018). However, success depends on high-quality pedagogical design; superficial feedback, lack of transparency, or usability issues can hinder the benefits unless addressed (Tetzlaff et al., 2020).

Challenges in Physics Education and Technology Integration

Physics education faces ongoing challenges due to the abstract nature of core concepts and widespread misconceptions, especially regarding force and motion. Students often rely on everyday intuition, which often clashes with scientific understanding, hindering conceptual shifts (Shrestha et al., 2023). Conventional teaching methods, with their uniform pace and static visuals, might not address the diverse levels of students' prior knowledge and cognitive readiness (Michelene & Roscoe, 2006). Technology-enhanced learning environments have been extensively studied as solutions to these challenges. Interactive simulations, visualisations, and inquiry-based digital tools enable students to test hypotheses, observe results, and connect different representations of physical phenomena, aiding conceptual understanding (Kaldaras et al., 2024). When equipped with adaptive features, such technologies can further tailor instruction by targeting individual misconceptions and learning gaps (Tetzlaff et al., 2020). Recent research shows that adaptive learning tools in science education can greatly enhance learning outcomes and student satisfaction (Contrino et al., 2024). Platforms supported by AI provide tailored explanations, scaffolded practice, and extension activities, allowing both struggling and advanced students to learn together effectively. This adaptability is especially important in physics classes, where students' abilities vary widely (Marshman et al., 2018).

Learner Engagement and Motivation in AI-Driven Personalisation

Learner engagement is a key factor in academic success and is often conceptualised as a multidimensional construct encompassing behavioural, emotional, and cognitive aspects (Xue et al., 2025). Studies consistently indicate that personalised and interactive learning settings boost engagement by enhancing relevance, fostering autonomy, and improving perceived competence (Yaseen et al., 2025).

AI-powered PL systems can boost engagement by offering adaptive pacing, instant feedback, and interactive assessments. According to Self-Determination Theory, these features fulfil learners' needs for autonomy and competence, which are key for intrinsic motivation (Bucher et al., 2024). Research on adaptive testing and gamified learning shows that personalised challenges and real-time feedback help maintain focus and encourage perseverance (Zhang & Huang, 2024). However, the literature also indicates that the benefits of engagement heavily rely on system usability and clarity. Poor interface design or technical issues can undermine motivation, even when adaptive algorithms are well-crafted (Neugnot-Cerioli & Laurenty, 2024).

Research Gap and Study Rationale

While existing research shows the potential of AI-supported personalised learning, several gaps still exist. There are limited empirical studies that explore both conceptual understanding and student engagement in secondary physics education. Additionally, many studies mainly concentrate on quantitative results, paying less attention to learners' experiences and perceptions of adaptive systems. Further research is needed that explicitly aligns with constructivist and self-regulated learning frameworks.

This study addresses existing gaps by evaluating an AI-driven personalised learning platform for teaching force and motion concepts, focusing on both cognitive improvements and learners' perceptions. By combining quantitative and qualitative data, it offers a thorough understanding

of how AI-supported personalised learning can improve physics education and highlights important pedagogical factors for future use.

Methodology

Research Design

This study used a mixed-methods quasi-experimental design to assess the effectiveness of an AI-driven personalised learning platform for teaching Force and Motion concepts in physics. The quantitative part compared students' conceptual understanding between an experimental group that used the AI-supported personalised learning path and a control group that followed traditional 21st-century teaching methods. The qualitative part investigated students' perceptions, experiences, and challenges with the AI-based personalised learning environment. Combining both types of data enabled a thorough analysis of cognitive and emotional outcomes.

Participants and Context

The study involved 120 secondary school students enrolled in a physics course on Force and Motion. Students were selected from a uniform educational background to reduce differences in curriculum, instruction, and assessment. Of these, 58 students were assigned to the control group and 62 to the experimental group, with assignments based on existing classroom arrangements and following quasi-experimental research methods. All participants had prior experience with basic physics concepts and similar access to digital devices and the internet.

Instructional Intervention

The experimental group used an AI-powered personalised learning webpage focused on Force and Motion topics. The platform featured adaptive learning paths, interactive simulations, varied practice exercises, and instant feedback. Data on learner performance, such as accuracy and progress trends, were analysed to tailor the level of content difficulty and the instructional order. Students with misconceptions received targeted visual aids and step-by-step explanations, while more advanced learners were given extension tasks and inquiry-based activities.

The control group was instructed using standard 21st-century teaching methods, including teacher-led explanations, textbook-based activities, and traditional formative assessments. Both groups learned the same material during the same amount of instructional time, taught by teachers with similar levels of experience.

Instruments

Conceptual understanding was assessed with the Force Concept Test (FCT), administered as a pre- and post-test to each group. The FCT is a validated tool frequently used in physics education research to assess understanding of core force concepts and identify common misconceptions.

For qualitative data, semi-structured interview protocols were created to explore students' perceptions of the AI-based personalised learning platform. The questions focused on perceived value, the effectiveness of AI-driven adaptation, challenges faced, usability, and the

impact on engagement. Ten students from the experimental group were intentionally chosen to reflect a range of learning experiences.

Data Collection Procedure

Data collection happened in three phases. First, both groups took the FCT pre-test to establish baseline equivalence. Next, the instructional intervention was carried out during the teaching period. Both groups then completed the FCT post-test. Finally, semi-structured interviews were conducted with selected students from the experimental group; these interviews were audio-recorded and transcribed verbatim.

Data Analysis

Quantitative data were examined using descriptive statistics and independent-samples t-tests to compare learning improvements between groups. Effect sizes were computed to assess the intervention's impact magnitude. Qualitative interview data were analysed using an inductive coding approach to uncover recurring themes in learner experience and engagement.

Results and Discussions

Effectiveness of an AI-Based Personalised Learning Platform in Teaching Force and Motion Concepts

A total of 58 students in the controlled group and 62 students from the experimental group completed the pre-test and post-test using the Force Concept Test (FCT). An Independent-Samples t-test was conducted using the pre-test and post-test scores. Table 1 presents the descriptive statistics.

Table 1
Descriptive Statistics

Group	Test	N	Mean	Std. Deviation
Control Group	Pretest	58	28.41	6.12
Control Group	Posttest	58	36.62	6.34
Experimental Group	Pretest	62	27.95	5.87
Experimental Group	Posttest	62	43.71	6.01

The descriptive statistics presented in Table 1 provide an overview of students' performance on the FCT before and after the intervention. Both the control group (N = 58) and the experimental group (N = 62) began with comparable pretest scores (M = 28.41, SD = 6.12 for the control group; M = 27.95, SD = 5.87 for the experimental group), indicating a similar baseline understanding of force concepts. This equivalence in pre-test scores is important, as it establishes that the two groups had no significant prior differences in conceptual knowledge, thereby ensuring any observed post-test differences are more likely attributable to the intervention rather than pre-existing disparities.

In the post-test, however, clear differences emerged. The control group, which received traditional instruction, improved to a mean score of 36.63 (SD = 6.34). In contrast, the experimental group received web-based instruction. Achieved a notably higher mean of 43.71 (SD = 6.01). This gap suggests that integrating web-based teaching strategies enhanced students' conceptual understanding of physics to a greater extent than conventional methods.

The magnitude of improvement in the experimental group (mean increase = 15.76 points) compared to the control group (mean increase = 8.21 points) reflects the potential of technology-enhanced learning to accelerate knowledge acquisition and deepen comprehension.

These findings are consistent with prior research highlighting the advantages of technology-supported instruction in science education. For instance, studies have shown that digital platforms incorporating visualisation, interactivity, and adaptive feedback can significantly enhance learners' grasp of abstract concepts in physics (Zacharia & Olympiou, 2011). The higher post-test mean of the experimental group thus not only supports the effectiveness of web-based teaching in fostering conceptual change but also reinforces the value of integrating multimedia and interactive tools into traditional curricula.

Table 2 displays the Independent Sample t-test results comparing pre-test and post-test FCT scores between the two groups.

Table 2
Independent Sample t-Test Results

Group	N	Mean Difference	Std. Deviation	95% CI Lower	95% CI Upper	t	df	Sig. (2-tailed)	Effect Size
Control Group	58	8.21	5.15	6.85	9.57	12.07	57	.000***	0.75
Experimental Group	62	15.76	5.90	14.25	17.27	21.01	61	.000***	1.41

Table 2 provides the inferential statistics that confirm the descriptive trends observed in Table 1. For the control group, the independent sample t-test revealed a statistically significant improvement from pre-test to post-test ($t(57) = 12.07$, $p < .001$), with an effect size of 0.75. Based on Cohen's (1988) benchmarks, this indicates a medium-to-large effect, implying that standard instruction alone led to significant improvements in students' grasp of force concepts. This result supports previous research demonstrating that structured physics instruction, even without technological enhancements, can improve conceptual understanding when applied regularly (Hake, 1998).

The experimental group, however, demonstrated a substantially greater improvement. The independent sample t-test yielded a t-value of 21.01 ($p < .001$) and an effect size of 1.41, indicating a very large effect. This indicates not only that the web-based intervention was highly effective but also that the degree of improvement was almost double that of the control group. Such a strong effect suggests that web-based instruction offers distinct pedagogical benefits that surpass those of conventional teaching. These options might include self-paced learning, instant feedback, and interactive simulations, all of which are recognised for boosting student engagement and fostering a deeper understanding of concepts (Clark & Mayer, 2016).

The larger effect size observed in the experimental group supports constructivist learning theories, which argue that learners build knowledge more effectively through active engagement with content through exploration, problem-solving, and feedback (Jonassen, 1999). Web-based environments facilitate these processes by including multimedia simulations, dynamic models, and formative assessments, all of which likely help students develop more robust conceptual understandings of force. Additionally, the significant difference in learning gains between the groups underscores the scalability and efficiency of

technology-supported instruction, especially in complex subjects like physics, where misconceptions are common (McDermott & Redish, 1999).

Overall, the findings in Table 2 show that although both teaching methods enhanced learning, web-based instruction led to substantially greater conceptual gains. This indicates that digital methods should not just supplement traditional teaching but can act as a transformative tool for attaining a deeper understanding of physics.

Learners' Perceptions and Experiences

Following the intervention, semi-structured interviews were held with 10 students from the personalised learning path group to explore their experiences, challenges, and views on the AI-driven adaptation and customised content.

Subtheme 1: Perceived Value of Platform

The interviews showed that students highly value the adaptive learning platform. Throughout the discussions, students consistently emphasised the platform's adaptability, its motivational effects, and their overall positive experience. For example, one student said, "It was very positive. I liked how the system adjusted to my pace" (S1). This indicates satisfaction with the personalised learning path, which aligns with theories of self-paced and mastery learning that emphasise tailoring instruction to individual progress (Bloom, 1984; Corno & Snow, 1986). By enabling students to learn at their own pace, the system fostered a sense of ownership and minimised cognitive overload, both of which are known to enhance learning outcomes (Shute & Towle, 2003).

Another important theme from the interviews was motivation, as one student stated, "Very motivating because the AI adjusted the difficulty for me" (S2). This supports Ryan and Deci's (2000) Self-Determination Theory, which emphasises that autonomy and competence are vital for intrinsic motivation. By gradually increasing difficulty, the platform offered students an ideal mix of challenge and support, boosting their engagement. This adaptive scaffolding aligns with Vygotsky's (1978) Zone of Proximal Development, where learners excel when tasks are just beyond their independent abilities but attainable with help.

Several students initially expressed doubt but eventually grew to value the adaptive system. For instance, S4 mentioned, "At first I was unsure, but then I appreciated the adaptation." This indicates that initial hesitation towards AI-driven adaptation can turn into acceptance as users become more familiar with it and see its benefits. Such a pattern aligns with broader research on educational technology, where students' scepticism often shifts to acceptance after experiencing the tangible advantages (Ertmer & Ottenbreit-Leftwich, 2010).

The qualitative evidence clearly shows that students found the adaptive platform highly valuable. Key themes such as personalisation, motivation, focus, and satisfaction align with existing research on adaptive learning systems, which emphasise the transformative role of technology in boosting engagement and conceptual understanding (Freeman et al., 2014; Mayer, 2009). The examples illustrate that the platform benefits not only cognitive learning outcomes but also improves affective and motivational aspects, making it a promising solution for tackling challenges in physics education.

Subtheme 2: Effectiveness of AI-Driven Adaptation

The second subtheme emphasises students' views on how effectively AI-driven adaptation supports their learning. Throughout the interviews, students saw the adaptive system as both helpful and transformative, often highlighting how it personalised the learning experience to meet their individual needs. For instance, one student said, "The AI helped me to focus on what I didn't understand, instead of repeating things I already knew" (S2). This example shows a key feature of adaptive learning: its ability to minimise unnecessary repetition and focus the learner's attention on areas needing improvement. This personalisation aligns with the goal of efficient instruction, where adaptive systems save time and effort by customising learning paths (Shute & Towle, 2003).

Students also noted the motivational benefits of this adaptation. For example, S3 mentioned, "It was encouraging to see the system change questions based on my answers. It made me want to try harder." Here, adaptation not only met cognitive needs but also enhanced emotional engagement, supporting research on Self-Determination Theory (SDT), which emphasises that competence and autonomy foster intrinsic motivation (Ryan & Deci, 2000). When students felt the AI "responded" to their input, they perceived themselves as being recognised and supported, which strengthened their motivation to tackle difficult tasks.

Not all responses were entirely positive. Some students mentioned initial difficulties with adjustment, with one remarking, "At first it was confusing when the questions kept changing, but later I realised it was helping me learn" (S4). This highlights the need for effective orientation and support for learners when implementing adaptive platforms. Similarly, educational technology research indicates that unfamiliarity can cause early discomfort, but as learners get used to adaptive features, they tend to recognise their benefits more (Ertmer & Ottenbreit-Leftwich, 2010).

Overall, the excerpts from Subtheme 2 suggest that students view AI-driven adaptation as a strong tool for personalisation, focus, motivation, and building confidence. These findings support existing research on adaptive learning systems, which regularly highlight their ability to improve efficiency, increase engagement, and deepen understanding (de Jong et al., 2013; Freeman et al., 2014). Additionally, the comments about initial confusion emphasise the importance of providing scaffolding not only for the learning content but also to help learners understand how to use adaptive technologies.

Subtheme 3 for Interview: Challenges in AI-Driven Learning

Although students were mostly satisfied with the adaptive learning platform, interviews under Subtheme 3 identified challenges related to AI-driven learning systems. These issues, while not frequent or severe, offer important insights into areas needing improvement to support the platform's long-term use and growth.

More often, students highlighted pedagogical issues, especially regarding the depth of feedback. For example, S2 mentioned, "Sometimes I wanted more explanation for wrong answers," while S5 commented, "Feedback was sometimes too short." These remarks indicate that although the platform offered corrective feedback, it was frequently seen as lacking in detail. In adaptive learning, feedback serves not just to indicate correctness but also to promote metacognitive reflection and enhance conceptual understanding (Shute, 2008). The brevity of responses might have restricted learners' chances to address misconceptions, which is

particularly important in physics education, where conceptual misunderstandings are common (McDermott & Redish, 1999).

Interestingly, many students minimised or completely dismissed significant challenges. Several respondents (S6, S7, S8, S10) explicitly mentioned, *"No major challenges,"* indicating that, for most learners, the benefits of the adaptive system outweighed any limitations. This aligns with broader research showing that, once users are familiar with adaptive systems, issues such as brief feedback or initial adjustment tend to become less important compared to the advantages of personalisation, engagement, and motivation (de Jong et al., 2013).

In summary, the challenges identified in Subtheme 3 were not overwhelming but highlighted key areas for improvement in feedback detail, content richness, and learner-centeredness. While technical issues were minor, they emphasise the importance of digital equity and access. Pedagogically, learners preferred feedback that not only corrected errors but also clarified the reasoning behind them, and they wanted more examples to enhance understanding. These findings indicate that although AI-driven platforms can effectively adjust pacing and difficulty, they must also focus on enhancing the quality of instructional support in their design.

Subtheme 4: User Experience With Platform

The analysis of Subtheme 4 shows that students mainly viewed the platform as highly usable and easy to use, with smooth navigation being the most frequently mentioned feature. For instance, Student 1 (S1) called the platform *"very user-friendly,"* while Student 2 (S2) said it was *"easy to navigate."* Likewise, S10 highlighted the system's overall smooth interaction, noting it was *"very smooth to navigate."* These common comments indicate that the platform's interface effectively supports user-focused design, minimising obstacles to engagement and enabling a more seamless learning experience.

Student 4 (S4) noted that it became *"easy after a while,"* suggesting a brief initial adjustment before feeling comfortable with the system. This highlights the crucial role of adaptability in educational technologies, as learners often need a brief orientation to become fluent users. Studies on e-learning platforms indicate that after overcoming the initial learning curve, perceptions of usability tend to improve considerably, thereby boosting satisfaction and motivation (Al-Fraihat et al., 2020).

The emphasis on ease of use and smooth navigation is crucial for engaging learners and improving their outcomes. When students perceive the system as accessible and intuitive, they are less likely to experience technology-related frustration, a common obstacle in digital learning (Selim, 2007). Offering a seamless user experience can boost intrinsic motivation and persistence, both of which are essential for successful online learning (Ryan & Deci, 2000).

Subtheme 5: Impact on Student Engagement

Findings in Subtheme 5 show a strong agreement among students that the AI-driven platform greatly improved their engagement with learning activities. Participants consistently described the system as *"engaging,"* with many highlighting that it was *"much more engaging than traditional methods"* (S3, S6) or *"more engaging than in class"* (S2). This pattern indicates that the platform's adaptive features effectively boosted motivation and maintained interest in learning.

Several students specifically compared their experiences with standard classroom lessons, noting that the platform felt *"more engaging than school lessons"* (S9) and *"engaging compared to usual methods"* (S4). This implies that the system's novelty, personalisation, and interactivity contributed to higher engagement levels than static teaching methods. Previous research supports that digital learning environments with adaptive elements can produce more dynamic learning experiences, increasing student involvement (Yaseen et al., 2025).

Overall, the excerpts highlight the platform's effectiveness in turning engagement into an active, enjoyable, and meaningful experience. The results indicate that adaptive learning systems may surpass traditional approaches in maintaining attention, motivating learners, and fostering a positive emotional environment for learning. This aligns with existing research on engagement, which emphasises the role of technology in sparking curiosity and fostering deep learning (Fredricks et al., 2004).

Conclusion

This study aimed to assess the effectiveness, strengths, and challenges of deploying an AI-powered adaptive learning platform within student learning and engagement contexts. Results showed that the platform effectively bridged traditional teaching and technology-enhanced education by offering a more personalised, interactive, and adaptable learning environment. Data from interviews and focus groups consistently revealed that students using the AI-supported platform exhibited higher motivation, satisfaction, and engagement levels than those in the control group. These outcomes align with existing research indicating that adaptive learning tools can significantly enhance learner outcomes by customising instruction to individual needs, reducing cognitive overload, and fostering deeper understanding (Holmes et al., 2019).

A key strength of the platform was its capacity to provide personalised learning paths through adaptive quizzes, customised dashboards, and progress tracking. Students gained greater control over their learning and developed self-regulation skills, including goal-setting, progress monitoring, and strategy adjustments. This supports Roll and Winne's (2015) claim that AI-driven analytics help learners reflect deeply on their metacognitive skills, improving self-directed learning. Likewise, Luckin (2018) highlights that adaptive tools encourage higher-order thinking by enabling students to take ownership of their learning, a result confirmed by the current study.

Nevertheless, the study also identified key challenges and limitations that need to be addressed. Technical issues, such as occasional navigation problems and reliance on internet access, created barriers for certain learners. Additionally, disparities in digital access and device availability underscored ongoing concerns about equity in technology-driven education. These issues align with broader critiques in existing research, which emphasise the importance of supportive infrastructure and teacher training for successful AI implementation in education (Holmes et al., 2019; Zawacki-Richter et al., 2019). Furthermore, in some instances, the lack of direct teacher feedback led students to seek clarification, highlighting the crucial role of human teachers in providing emotional support and scaffolding. This indicates that while AI platforms can boost student independence and efficiency, they should complement, rather than replace, traditional teacher-led methods (Garrison et al., 2000).

This research highlights the significance of combining traditional and AI-based education rather than choosing one over the other. A blended model would leverage teachers' personal

and emotional strengths alongside AI's adaptive, data-driven features. According to Luckin (2018) and Holmes et al. (2019), the best learning environments are those in which technology enhances rather than replaces human instruction. For policymakers and educators, this emphasises the need to invest not only in AI infrastructure but also in ongoing teacher training to fully realise the benefits of these technologies.

In conclusion, this research adds to the growing evidence that AI-driven adaptive learning can boost engagement, self-regulation, and personalised education. It shows both the potential and the limitations of these platforms, emphasising the need for careful integration into current teaching strategies. Future studies should examine the long-term effects of adaptive systems on learning outcomes, particularly in knowledge retention, critical thinking, and skill transfer across subjects. Additionally, understanding the role of teachers as facilitators in hybrid AI-human environments will be vital to ensure equitable access and sound pedagogy. By focusing on these aspects, education can fully leverage AI to develop learning spaces that are not only effective and adaptable but also human-centred, inclusive, and sustainable.

Acknowledgement

The author sincerely thanks the Southeast Asian Ministers of Education Organization Regional Centre for Education in Science and Mathematics (SEAMEO RECSAM) for financially supporting this research. Their funding enabled the design, development, and implementation of the AI-based personalised learning platform, as well as data collection and analysis. The author also values the institutional support and encouragement from SEAMEO RECSAM, which played a key role in successfully completing this study.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that Grammarly, an AI-assisted writing tool, was used to proofread and refine the manuscript's language. The usage was limited to correcting grammatical and spelling errors and rephrasing statements for accuracy and clarity. The author further declares that, apart from Grammarly, no other AI or AI-assisted technologies have been used to generate content in writing the manuscript. The ideas, design, procedures, findings, analyses, and discussion are written initially and derived from the appropriate and systematic conduct of the research.

From Lingua Franca to Multilingual Place-Making: Autonomy and Positioning in Online International Collaboration

Reiko Kato, Kyushu Institute of Technology, Japan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This paper examines students' multilingual experiences in Collaborative Online International Learning (COIL) programs. In 2022–2023, the author, as a teacher-researcher, designed and facilitated two COIL programs involving 52 university students from Japan and Malaysia who engaged virtually in group discussions. Participants brought diverse linguistic backgrounds to the interaction, with English serving as the lingua franca. Drawing on three key notions—translingualism, the social construction of learning places, and multilingual identities—the study scrutinizes how learners negotiated their identities and evaluated their language practices, participation, and engagement. Data were collected through seven post-program interviews, complemented by activity logs, online whiteboards, and reflection papers. The interviews, audio-recorded and transcribed with participants' consent, were analyzed using positioning theory (van Langenhove & Harré, 1999) as the analytic framework. The findings highlight the complexity involved in constructing multilingual learning places. Students reported varied evaluations of first-language use, differing levels of appreciation for each language, and a tendency to view competence in a single language as more advantageous for identity negotiation. These insights reveal persistent challenges posed by the monolingual habitus while underscoring the importance of recognizing multilingualism and translingualism as essential conditions for fostering collective autonomy in COIL contexts.

Keywords: COIL, translingualism, positioning theory, multilingual identity

Introduction

The below reflection from a participant in a Collaborative Online International Learning (COIL) program seems to capture the spirit of intercultural engagement.

> Difficulty is always language, but I think it's okay because that's how this program is. Even though we have language barriers, we cannot give up to communicate, and at the end, the ideas we have, we can share even we have, like, language barriers. (An excerpt from interview with M University Student, October 4, 2022)

Despite linguistic challenges, students strive to communicate, collaborate, and co-construct meaning beyond differences by drawing flexibly on multiple language resources for communication and learning. However, even though put in a positive sense as a challenge and joy to overcome, the notion of language as "barriers" held by the participants raised an alert for the author, a teacher-researcher, to revisit and critically look at the participants' experience around language used during the International Collaborative Learning (ICL) projects.

In this increasingly interconnected world, higher education institutions are expanding international exchange programs. The COVID-19 pandemic pushed international educational practitioners to go online, which diversified both practitioners and participants. As the number of practitioners grows, the aims of ICL programs have diversified. These programs no longer target solely on second/foreign language acquisition but increasingly emphasize learning how to interact productively across cultural and linguistic differences while deepening topical knowledge. The scope has expanded significantly, now addressing a wide range of topics and social issues including immigration, religion, gender roles, and national responses to global crises such as the COVID-19 (O'Dowd, 2021, p. 217).

As the number of participants grows, the linguistic resources they bring to ICL contexts also become increasingly diverse. English often serves as the lingua franca, but students possess differing levels of language proficiency, and there is greater diversity in their first, second, and additional languages. English becomes both a bridge and a barrier, enabling communication while simultaneously creating an uneven degree in students' participation, causing mixture of feelings. The instructor, therefore, must carefully design activities that are inclusive and scaffolded, ensuring that students with lower proficiency are not marginalized or silenced, while at the same time students with more proficiency also feel satisfied with their engagements.

Although language learning may not be the central focus in such programs, language remains deeply intertwined with learning processes. In multilingual environments, linguistic dynamics become complex, and participants must "be resourceful to enable their interactions" (Naicker et al., 2021, p. 505). Recognizing these multilingual realities urges practitioners to shift how language is conceptualized, not as a barrier to overcome but as a resource that shapes interaction, identity, and learning.

Literature Review

To examine and understand the essence of multilingual ICL context, three concepts are briefly reviewed: 1) Translingualism, 2) Social Construction of Learning Places, and 3) Multilingual Identities.

Translingualism

Translingualism is a notion which challenges the monolingual view of languages. While monolingualism see languages as fixed and separated from one another, Translingualism promotes the fluid use of multiple linguistic resources for meaning making.

> The term translingual conceives of language relationships in more dynamic terms. The semiotic resources in one's repertoire or in society interact more closely, become part of an integrated resource, and enhance each other. The languages mesh in transformative ways, generating new meanings and grammars. (Canagarajah, 2013, p. 8)

While Monolingualism grants legitimacy and authority to "native" speakers, translingualism encourages people to reclaim the agency of language.

As participants in ICL bring diverse linguistic backgrounds to their collaborations, they often rely on multiple linguistic resources to co-construct meaning. In such environments, it is important to challenge deficit-oriented perspectives that position non-dominant languages, or less proficient English use, as barriers. By adapting the notion of Translingualism, teachers can encourage learners to strategically draw on their full linguistic repertoires.

Social Construction of Learning Places

Second perspective is understanding of place as social constrictions. In this notion, classroom is a space where actions occur and as actions are performed, space is transformed into a learning place. Kocatepe (2018) argues that autonomous language learners are learners who can "exercise the capacity to transform a classroom into a place for learning by evaluating and shaping social practices and classroom identities in ways that create effective participation in meaning making processes" (p. 146). Furthermore, Lamb and Vodicka (2018) discuss the collective autonomy of language learning as "language communities autonomously finding spaces where they can challenge the monolingual habitus, collectively creating the conditions in which multilingualism can be normalized and interlingual encounters nurtured" (p. 15).

This perspective is particularly relevant in ICL settings, where students must navigate both linguistic and cultural diversity to co-construct productive learning environments. Autonomous learners in ICL contexts are not only responsible for their own learning but must also negotiate shared meanings, practices, and norms with peers from different linguistic and cultural backgrounds.

Multilingual Identity

Thirdly, research on language and identity increasingly recognizes that language is not merely a communicative tool but a social practice through which meanings, relationships, and identities are constructed. Norton (2013) defines identity as "how a person understands his or her relationship to the world" (p. 45) and understanding learners' histories and lived experiences is therefore essential for creating learning environments where learners can claim the right to speak (p. 179).

While Norton's framework emerged from second language research, Forbes et al. (2021) extend it to multilingual contexts by introducing the notion of multilingual identity. They argue

that multilingual identity is shaped by learners' experiences with language, their evaluations of different languages, and the emotions associated with multilingual learning (pp. 434–435).

If we understand all ICL participants, though to varying degrees, as language learners engaged in creating a multilingual learning place, this conceptualization of language learning as identity construction aligns closely with the aims of ICL/COIL programs.

The Study

Research Question

In ICL, where English functions as the lingua franca but is not the first language of participants, students regularly move among English, their own languages, and sometimes their partners' languages. How learners evaluate these practices, and how they feel about using their linguistic resources, impacts their identity positions, participation, and engagement, therefore need to be examined to understand multilingual place-making in ICL contexts. Hence, this study investigates students' multilingual experiences in Collaborative Online International Learning (COIL) programs focusing on questions below.

- How did learners negotiate language & identity in COIL?
- How did they transform a space into a place for multilingual learning?

Local Context

In 2022–2023, the author, working as a teacher-researcher, designed and facilitated two COIL programs involving 52 university students from Japan and Malaysia who participated in virtual group discussions. Students were placed into mixed groups consisting of participants from both J University and M University. Each group engaged in a series of collaborative tasks, with topics designed to facilitate interaction, encourage reflective dialogue, and promote the co-construction of knowledge. The themes and the number of participants for each program were as shown in Table 1.

Table 1
Themes and Number of Participants in COIL Programs

Program	Theme	# of participants	
		J University (# interviewed)	M University (# interviewed)
Summer, 2022	Designing a SDGs lifestyle	12 (3)	18 (2)
Spring, 2023	Designing an intercultural learning space	5 (2)	18 (0)

The two programs differed in their group management structures. In the 2022 program, students remained in the same group for the entire duration of the program and were responsible for coordinating their own online meeting times. In the 2023 program, on the other hand, students were assigned to a new group for each topic, and meeting times were pre-determined by the instructor.

Data Collection and Analysis

Data for this study were collected through semi-structured individual interviews and supplementary program artifacts. Semi-structured interviews with seven participants were conducted to elicit the participants' views of the process of learning place transformation with their own words. All interviews were audio-recorded with the participants' consent and later transcribed for analysis. To complement the interview data, additional artifacts, such as activity logs, online whiteboards, reflection papers, were also collected throughout the programs and these materials were often revisited during and after interviews to deepen contextual understanding and to support interpretive analysis. Interviews with J university students were conducted in Japanese and translated into English by the author. The list of interview participants is shown in Table 2.

Table 2

List of Interview Participants (all names are pseudonyms)

Name	Affiliation	Program	Self-Evaluation of the groupwork
Aisha*	M University	2022	Positive
Lee*	M University	2022	Positive
Rin*	J University	2022	Positive
Haruto	J University	2022	Negative
Takako	J University	2022	Positive
Ami	J University	2023	Positive
Itsuki	J University	2023	Negative

Note. Aisha, Lee and Rin were groupmates in the 2022 program.

Positioning Theory and Identity Negotiation

For analytic framework, the positioning theory was used. Positioning refers to "the assignment of fluid 'part' or 'roles' to speakers in the discursive construction of personal stories that make a person's actions intelligible and relatively determinate as social act" (van Langenhove & Harré, 1999, p. 17). It is a notion based on social constructionism which understand person's action and identities are constructed/gave meaning in interaction with others. Same utterance or speech act can mean or function differently in each context, and there exist social powers. "Positioning, shaped by power and many factors, is the dynamic construction of personal identities and an essential feature of social interaction. Therefore, analyzing positioning in written and oral discourse is a way of uncovering participants identities" (Kayı-Aydar, 2019, p. 22).

Findings and Discussion

Students draw on language resources, at least, in English, Japanese, and Malay during groupworks. However, the frequency or attitude of using those three languages had certain connotation. In this section, experiences of participants were illustrated under four themes: 1) "Not good at English" or "resourceful" person, 2) Multilingual identity, 3) Transforming a space into a place of multilingual learning, and 4) Complexity of Stereotypes. The interview excerpts demonstrate how they described their feelings and experiences around languages, and how that became places of struggles to claim the right to speak and negotiate their identities in their group works.

"Not Good at English" or "Resourceful" Person

When participants were asked to evaluate their collaboration, the first challenge they consistently mentioned was language. Students from both J University and M University referred to English as a barrier, although they conceptualized "language difficulty" in different ways. For some, it was about linguistic proficiency; for others, it was more about meaning-making, pragmatics, and identity negotiation.

For Itsuki, a J University student, this was his first time participating in an international program. He first vaguely claimed that he was "not good at English" yet then described how he managed his participation and his uncertainty.

> I often used chat. In the worst case, I asked for help via chat. I also used screen sharing, showing websites, and translation sites to manage somehow. It's too bad that I couldn't rely much on Google, the great teacher. (Itsuki)

Even though he first vaguely claimed that he was "not good at English", he was still communicating using English, but in written form using the chat functions, or the translation site. As the interview continued, he also mentioned:

> I wasn't sure if what I am thinking was the same as what they were thinking. Even though we use the word 'internship,' I didn't know whether it referred to the same thing, same 'internships' commonly understood in Japan or in Japanese. (Itsuki)

This clearly shows that he was aware of cultural differences, he still demonstrated his engagement in using at least two language knowledge despite his lack of the confidence in his understanding. Even though his own evaluation about his language proficiency is "not good at English," he was still communicating using both Japanese and English resources.

On the other hand, Rin, who had difficult time previously when she participated in another international exchange program, employed similar make-up strategies as Itsuki, felt positive about her contribution to the groupwork as she was able to convey her message.

> English skill may have some influence, but I think it's more about my mentality, that I was able to maintain calm, like it's ok if they don't understand my English, I mean using my facial expression and other thing, if I can convey what I want to say, that is good enough. Before, I felt like I must speak English, but in the end, I was not able to say anything, so this time, I tried to focus on expressing my thinking, so I think that is why it was better this time. (Rin)

Her claim is confirmed by her groupmate Lee, who have friends in Japan and had previous experience talking with Japanese students.

> At first, we were shocked and then we kept on asking questions and then after she (Rin) realized that there was a misunderstanding, she looked like a bit panicked at the beginning and then she would speak out some of Japanese words and then, after that she would start to try long ways like typing in English or speaking English or showing another proof to strengthen conversation. Mostly they (Japanese students) can write very good in English. (Lee)

Lee did not position Rin as "lacking English ability," even when a misunderstanding occurs. Instead, she emphasizes Rin's resourcefulness and ability to clarify using multilingual strategies.

Although, both Itsuki and Rin described not being able to express themselves fully and reliance on non-linguistic tools, their evaluation of their own contribution was different. Translingual practices enabled their participation, yet Itsuki's understanding of spoken "English" as the legitimate lingua franca continues to shape his negative self-evaluation, while Rin, who consciously accepted translingual practice, was positioned as resourceful person and had positive evaluation about herself.

Multilingual Identity

The way participants described their or their counterpart's first language had different connotation. Aisha from M university, who had participated in a same program a year before, stated:

> Sometimes it's very hard to talk with them because I'm not good at Japanese, but I know basic Japanese things. But if I want to make a conversation, it's very hard for me to… (Aisha)

Even though Aisha put it in a negative way, she claimed that she possesses Japanese language resource and positioned herself as a multilingual speaker. However, she also mentioned not using Malay, because that creates a need for double translations.

> We were not using Malay language, because for me, if you use Malay language and we need to translate it into English, then we need to translate it into Japanese, so you just use the English language… (Aisha)

Lee, who was also a multilingual speaker of Japanese, English, and Maly, shared very similar experience.

> We seldom use Malay language because for Malay only Malaysian students understand, so we are more trying to use English. But when they (Japanese students) start in English, we also prompted that 'you can use Japanese. Maybe we can understand,' but they are not willing to use Japanese. They really stick to English because they want to learn English. (Lee)

This shows that even she encouraged the use of Japanese, Japanese students tried to use English only and Lee, herself also did not use Malay.

From these descriptions, we can understand, even though participants made effort to normalize translingual practice, both Japanese and Malaysian students limited the use of their first languages, for consideration to their groupmates, or preconceived notion of "English as linga franca."

Transforming a Space Into a Multilingual Learning Place

Lee noted the change in her Japanese groupmates attitude as groupwork unfolded, however:

> First and second time, the Japanese students, although they are Japanese, but they are from different campus, so they also don't know each other. When they have problems with language, they will not seek help from the Japanese student. They will tend to want to search by themselves. But at the end of the meeting. They will start to ask the Japanese student, the other Japanese students, to help them. And then when they are stuck in language, the other students and also help them to translate into English. (Lee)

Lee recognized the increased use of Japanese language by her Japanese groupmates. Her observation is confirmed by Rin's description; Rin also shared about her experience of using Japanese with her Japanese groupmate for time to time.

While Rin perceived her utilizing her Japanese language resource in positive way, she also noticed not only her own behavioral change but also Malaysian groupmates' behavior.

> Well, Malaysian students started to speak slowly, so it became easy to listen, maybe I was also getting used to, and also we were looking at the Streetview while talking so it was easy to understand what we were talking about. (Rin)

These may indicate that, in the process of transforming a space to a place of learning, translingual practice could be reinforced.

Complexity of Stereotypes

There were several moments in the interview that students acting or positioned as acting cultural stereotypes, such as the belief that Muslim participants would not even allow others to talk about pork products or that Japanese participants are inherently shy. These assumptions created hesitation and nervousness. However, the influence of such culturally stereotyped images proved significant only in the initial stages of interaction. In contrast, the fixed image of what constitutes "a proper discussion" was more persistent and often led students to negatively evaluate their own language abilities.

Itsuki, Haruto and Takako shared similar view that a good discussion should involve deep synthesis of ideas, yet they felt unable to achieve such discussions. Itsuki and Haruto, who evaluated their own English proficiency negatively, attributed the failure as language problem. The following excerpt from Haruto's interview illustrates this point; he felt that while his group succeeded in generating diverse ideas, they were unable to "consolidate them into one," due to language difficulties.

Haruto: (looking at the group Padlet) This, we wrote this, oh I remember, we didn't write this beforehand, but we wrote down opinions while talking, the members who could not attend the meeting added up later, but I think we wrote this while in the zoom meeting
Kato: while talking
Haruto: shared our opinions and wrote them down, and then we tried consolidate to one, but that was very hard
Kato: is that so, what was difficult about?
Haruto: for example, I think I could do this if it was in Japanese, extract and summarize elements, but it was in English.

On the other hand, Takako, who had lived in the US during her childhood, shared a similar evaluation of her group's discussion outcome, but offered a different explanation for it.

> Then I asked each person in their own field of expertise what aspects of the SDGs they were involved with. Since I was sort of the facilitator for Group 2, I made that call, gathered opinions, and then offered my own perspective based on my knowledge, like pointing out other aspects to consider. But honestly, critical opinions didn't really surface, so it ended up feeling more like exchanging ideas not like a proper discussion. […] Japan seems to be pretty big on this (SDGs), though. I mean, here in Japan, you see SDGs Week or stuff like that covered a lot on TV... But I hear that overseas, it's not really like that**.** I guess it probably depends on the country. (Takako)

Takako, felt that she managed "to speak and navigate it well" and acted as the facilitator of the group, recognized her group's difficulty not to language ability but to differences in knowledge or awareness of the theme across their respective societies.

Discussion

Across groups, participants drew on multiple semiotic resources: English, Japanese, Malay, gestures, chat writing, visuals, translation tools, and shared screens. These were not as separate from languages, but as an integrated repertoire of their translingual practices. This aligns with translanguaging theory, which conceptualizes communication as the orchestration of available linguistic and semiotic resources rather than switching among discrete languages.

For students with less English proficiency, however, participation required negotiating a balance between their desire to contribute and their perception of limited English proficiency. Their acceptance of a "not-perfect self" functioned as an emotional and identity strategy that enabled translanguaging, at the same time, allowing them to claim their right to speak in the place without striving for monolingual, native-like competence. Rin's case exemplifies how identity is also socially co-constructed: Despite misunderstandings, her Malaysian peer described her as resourceful rather than limited.

Although participants engaged in fluid translanguaging practices, many continued to evaluate themselves through an "English as Lingua Franca" lens. This revealed a persistent ideological tension. Students frequently attributed communicative difficulties, groupwork challenges, and unsatisfactory outcomes to their lack of English proficiency. Even when Japanese or Malay resources could have supported communication, participants avoided using them out of a belief that English was the "proper" language for international work.

Thirdly, essentialized images of the other, creating hesitation and nervousness, was only constraints for early stages, but internalized fixed image of what constitutes an "academic" discussion, namely deep synthesis of ideas, impacted more persistently. When collaborative outcomes did not meet their expectation, less fluent participants blamed their individual language ability rather than task design or the constraints of online groupwork. Their perceived "failure" reflects the misalignment between their translingual practices and institutionalized norms of academic discussion.

ICL space was a space of struggle for identity and ideology. Translanguaging was normalized, yet it did not just happen by bringing people with diverse linguistic resource in one space. Translingual norms such as slowed pacing, rephrasing, use of visuals, mutual assistance across languages, gradually emerged, as participants together transformed a space to a place of learning. In doing so, there were always tensions, between translingualism and monolingualism,

between ideal self and imperfect self, and between ideal image and reality of international collaboration.

Conclusion

The program functioned as an emergent place of translingual practices; a site where variety of linguistic resources were mobilized, identities were negotiated, and cultural assumptions were reshaped. Yet learners internalized monolingual norms shaped how they interpreted their own success and participation. These findings point to the need for more intentional pedagogical design that recognizes and supports translingual practices.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that ChatGPT 5.1 was used in proofreading and refining the language used in the manuscript. The usage was limited to correcting grammatical and spelling errors and rephrasing statements for accuracy and clarity. The author further declares that, apart from ChatGPT 5.1, no other AI or AI-assisted technologies have been used to generate content in writing the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

Official Conference Proceedings

Abstract

Assessing a teacher's performance may involve examining how much they have achieved the necessary competencies. Professional competence, personality competence, pedagogical competence, and social competence comprise the four competencies a teacher should have. Teacher performance has an important role in improving the quality of education through their knowledge and efforts. Teachers' performance is affected by numerous variables. This study aims to analyze the effect of digital literacy, innovative behavior, culture, and interpersonal communication on teachers' performance at De La Salle University Dasmariñas. The statistical survey methodology was employed in this study to substantiate its findings. This study was conducted at De La Salle University-Dasmariñas (DLSU-D) in Cavite, for the undergraduate college teachers only. The university comprises of almost 534 undergraduate college teachers from nine departments, 248 participated in the study. The study used the Partial Least Squares - Structural Equation Model (PLS-SEM) to derive the latent variable values to analyze the effect of digital literacy, innovative behavior, culture, and interpersonal communication on teachers' performance, and to determine the relationship of these variables. Furthermore, to construct a structural model to help management to improve teachers' performance. The study introduced nine hypotheses which has generated several significant discoveries. These findings are consistent with prior research, demonstrating beneficial impact of digital literacy and innovative behavior to teachers' performance. Based on the results, digital literacy, innovative behavior, interpersonal communication, and teachers' performance have a positive relationship with each other.

Keywords: digital literacy, innovative behavior, culture, interpersonal communication, teachers performance, structural equation modeling

Introduction

Teacher's performance assessment may involve examining how much they have achieved the necessary competencies. Professional competence, personality competence, pedagogical competence, and social competence comprise the four competencies a teacher should have (Ishak & Suyatno, 2020). Examining teacher performance is captivating despite its longstanding presence in educational research (Dewanto et al., 2024). Several educational academics have previously investigated the issue of teacher performance (Mailool et al., 2020). Teacher performance has an important role in improving the quality of education through their knowledge and efforts. Therefore, the topic of teacher performance has been a significant focus of research for educational academics up to the present time (Dewanto et al., 2024).

In recent decades, with the rapid increase in technological development and advancements, the digitalization of society has abruptly change (Travkina, 2022). As the effect of this technological advancement in every aspect of the society is observed, the result of digitalization in life and education is inevitable. Education is one of the major contributors in a nation's progress. It has a crucial role in the advancement of a country (Jahantab, 2021). The process of digitalization in education has been on its way for a long time (Arisoy, 2022). The onset of novel coronavirus disease 2019 or Covid-19 pandemic during a period of temporary communication restrictions has arisen a strong surge of interest to a completely remote format of interaction between all participants in educational process (Chertoff et al., 2020).

Digitalization has affected all levels of education, and directly the activities of students, teachers, administrators, and stake holders. The current advancements in information technologies have facilitated transparency in implementing educational methods in schools. The availability of this information enhances the ease of monitoring teacher performance (Howard et al., 2019). To address teacher performance issues, all school leaders must exert significant effort. Teacher performance encompasses teachers' measurable actions and behaviors that contribute to attaining school or organizational objectives (Wahab et al., 2020).

Furthermore, to enhance the caliber of education, teachers need to possess a dependable and enduring comprehension of digital literacy (Dewanto et al., 2024). The teacher's lack of comprehension of digital literacy may adversely affect the learning process and academic achievement as stipulated by the school curriculum (Afriliandhi et al., 2022).

De La Salle University-Dasmariñas, like other universities elsewhere in the Philippines and the world, have been experiencing a set of important changes induced by technological innovations and social trends towards digitalization. Nevertheless, in spite of these perceived barriers, institution like De La Salle University-Dasmariñas have adapted the e-learning strategy through the e-class embedded in its school book design (Rocina, 2017). Similarly, the digitalization revolution involves an intense readjustment in all sectors of education. Currently, the adoption of technologies by universities is related to a paradigm shift, where technology and advancement is conceived as a complex and interconnected environment that enables digital learning (Rodney, 2020).

De La Salle University-Dasmariñas, also referred to by its acronym DLSU-D or La Salle-Dasma, is a private Roman Catholic, Lasallian co-educational secondary and higher education institution run by the De La Salle Brothers of the Philippine District of the Christian Brothers in Dasmariñas City, Cavite, Philippines. It is a member of De La Salle Philippines, a network of 16 Lasallian educational institutions. Studies and research pertaining to the effect of digital

literacy, innovative work behavior, culture, and interpersonal communication on teachers' performance is not yet undertaken in the university.

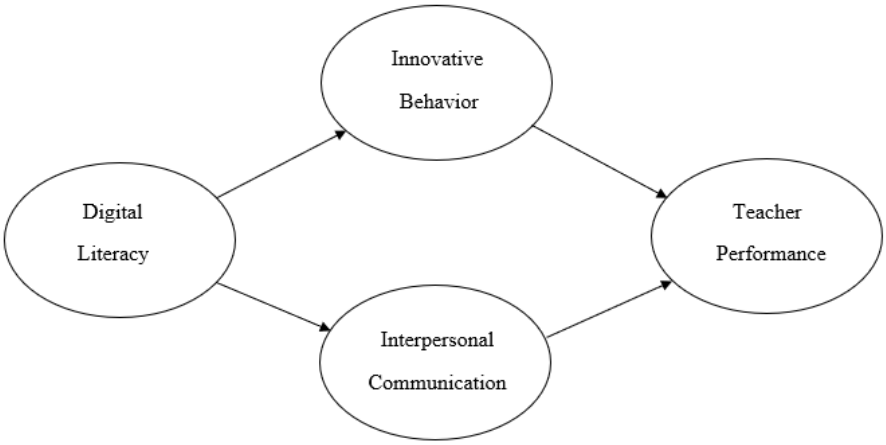
Research Goals and Objectives

This study aims to analyze the effect of digital literacy, innovative behavior, culture, and interpersonal communication on teachers' performance at De La Salle University Dasmariñas using Structural Equation Modeling (SEM). It also intends to address the gaps of the teachers in relation to the constructs mention. This research aims to answer the following questions:

1. What are the significant factors that affects teachers' performance at De La Salle University Dasmariñas that covers digital literacy, innovative behavior, culture, and interpersonal communication;
2. What is the impact of these significant factors that affects teachers' performance at De La Salle University Dasmariñas in terms of digital literacy, innovative behavior, culture, and interpersonal communication; and
3. In what ways can this research study help faculty management at De La Salle University Dasmariñas improve teachers' performance.

Hypotheses of the Study

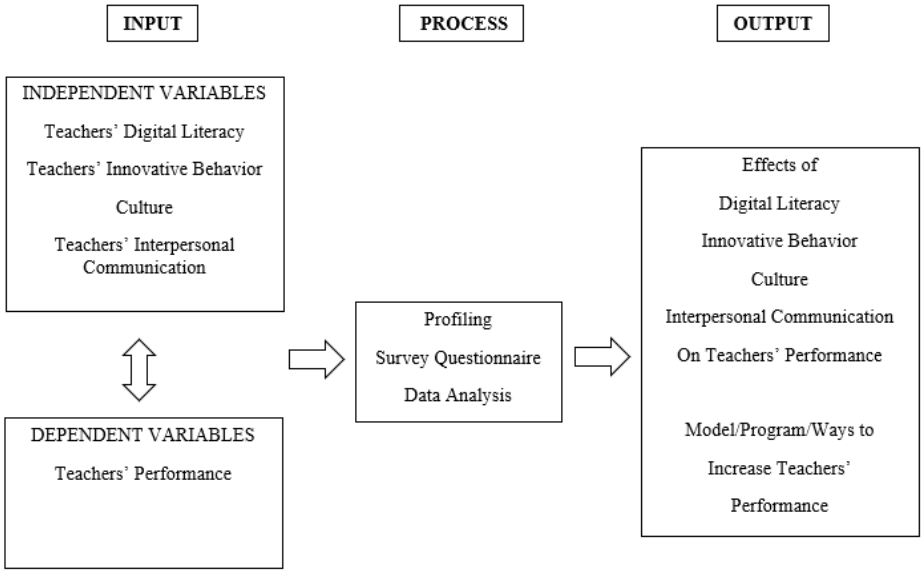
This research will combine digital literacy, innovative behavior or attitudes, culture, interpersonal communication, and teacher performance into single research. The researcher aims to examine the impact of digital literacy, innovative behavior, culture, and interpersonal communication on teacher's performance at De La Salle University Dasmariñas.



The researcher formulated the following hypotheses based on the statement of the problem and objectives of the study.

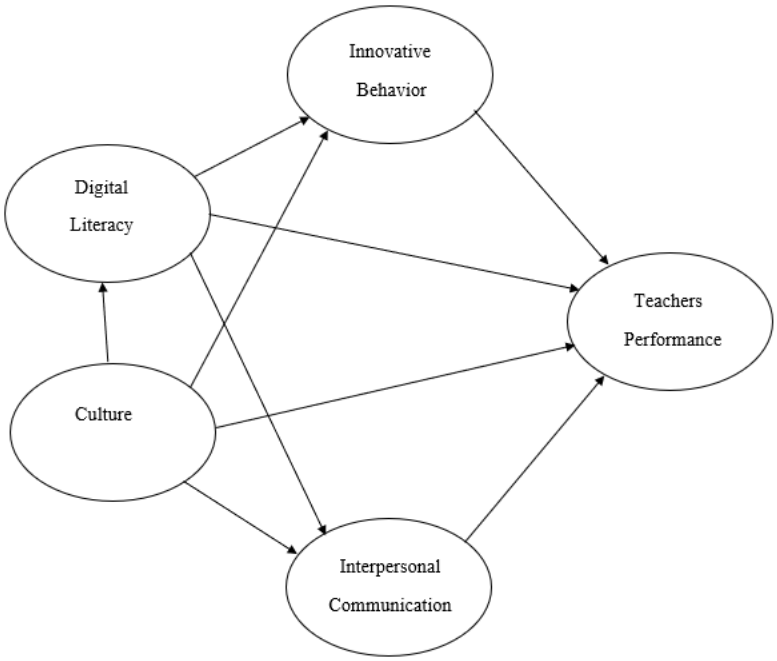
H1: Digital literacy and innovative behavior have a positive correlation
H2: Digital literacy and interpersonal communication have a positive correlation
H3: Digital literacy and teachers' performance have a positive correlation
H4: Culture and innovative behavior have a positive correlation
H5: Culture and interpersonal communication have a positive correlation
H6: Culture and teachers' performance have a positive correlation
H7: Culture and digital literacy have a positive correlation
H8: Innovative behavior and teachers' performance have a positive correlation
H9: Interpersonal communication and teachers' performance have a positive correlation

Literature Review



The theoretical framework of the study is based on the previous study regarding the effect of digital literacy, innovative attitudes, and interpersonal communication on teacher performance (Dewanto et al., 2024). According to the prior findings and discussion, the research uncovered four noteworthy and statistically significant discoveries. One is that a direct relationship exists between digital literacy and innovative mindsets. A direct relationship exists between innovative mindsets and teacher performance. A direct relationship exists between digital literacy and interpersonal communication. Interpersonal communication and teacher performance exhibit a positive association (Dewanto et al., 2024).

Figure 1
Theoretical Framework



The conceptual framework of the study is represented as an IPO (Input – Process - Output) method. The inputs are the dependent and the independent variables. The independent variables are the teachers' digital literacy, innovative behavior, culture, and interpersonal communication while the dependent variable is the teachers' performance. Culture was added in the current study.

Figure 2
Conceptual Framework

Intervening variables which are not represented are the faculty age, gender, educational attainment, and years in teaching, and the type of faculty. Processes include profiling, survey questionnaire, and data analysis. The desired output is the analysis of the effects of digital literacy, innovative behavior, culture, and interpersonal communication on teachers' performance. Furthermore, the study will help faculty management to develop program, or ways to improve teachers' performance. The study will revolve around this framework that serves as the researcher's guide.

Figure 3
Conceptual Paradigm

Methodology

This study will employ a cross-sectional study descriptive research design using statistical survey approach to ensure the accuracy of its results. The researcher will use the Partial Least Squares-Structural Equation Model (PLS-SEM) to generate predictions and to determine the values of the hidden variables. Descriptive research is a quantitative research method that attempts to collect quantifiable information to be used for statistical analysis of the population sample. The collected and analyzed data from the descriptive research can then be further studied using different research techniques and computer software.

Data Gathering Procedure

The researcher will use university records, online data, and publications as a basis for the preliminary data required in the research study. Respondents will be composed of the faculties of the selected university. Sample size will be determined from the total population of all faculties of the university using the Slovin's formula. Based on the information provided by the university, the total population of the intended respondents is 534, using the Slovin's formula with a 5% error tolerance level, the number of adequate samples are 228.

Survey method using Google Forms will be used in data gathering. In survey research, respondents will answer through survey or questionnaires, or polls. Permission in conducting the survey will be obtained from the selected university in-charged personnel. Consent of the respondents will be asked before any survey should be done and assurance of confidentiality will also be explained to them. A letter requesting consent or approval for employee participation will also be presented before starting the survey. Participation in the survey is voluntary and based on the faculty or administrator ability to give informed consent. All the questionnaires and interview or survey forms that will be used in data collection will be treated as confidential and will be placed in a secured or locked file storage.

Data Analysis and Results

Table 1 shows the demographics of the respondents. Two hundred forty-eight (248) faculty took part in the study and are currently employed at De La Salle University Dasmariñas. Participants are composed of undergraduate faculty both full time and part time.

Table 1
Respondent Profile

Indicator	Frequency	Percent	Valid Percent	Cumulative Percent
		Age

Statistical Description and Assessment of Normality

The survey question exclusively provides information in numerical format. Table 2 displays various normality measures and descriptive data for each item-level construct, including skewness, kurtosis, standard deviation, and mean.

The values for asymmetry and kurtosis between -2 and +2 are considered acceptable to prove normal univariate distribution (George & Mallery, 2024). Hair et al. (2019) argued that data is normal if skewness is between -2 to +2 and kurtosis is between -7 to +7. If the skewness statistic

is less than 2 and the kurtosis statistic is less than 7, then the data is considered to have a normal distribution (Curran et al., 1996).

Table 2

Statistical Description and Assessment of Normality

Construct	Item	Sub-Item	Mean	Median	Min	Max	Standard deviation	Excess kurtosis	Skewness

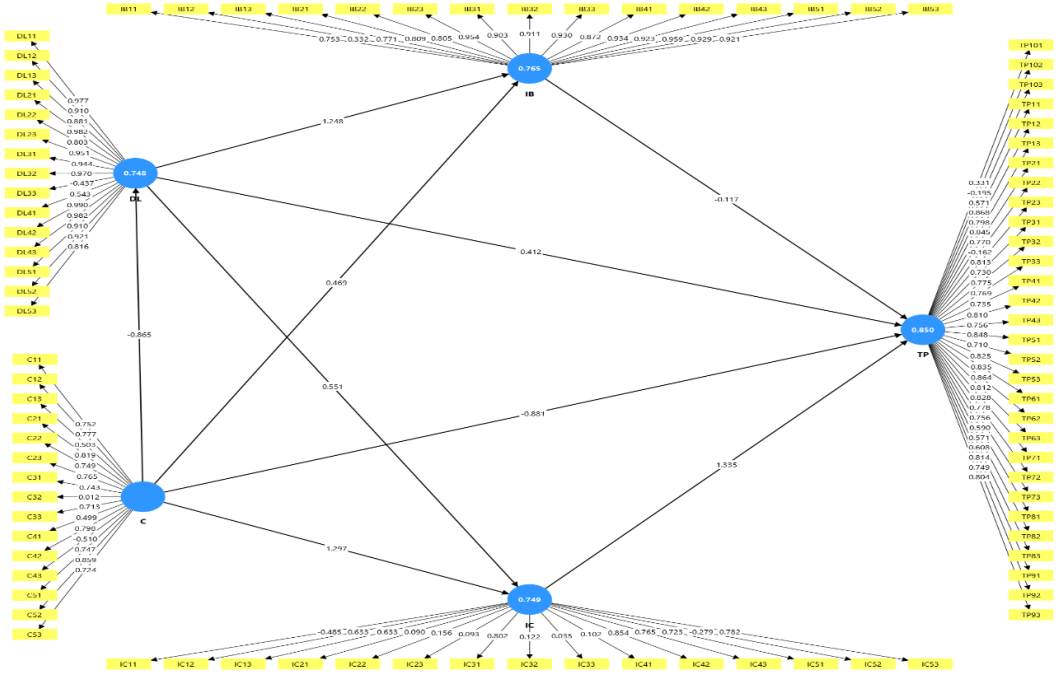
Note. DL: Digital Literacy; IB: Innovative Behavior; C: Culture; IC: Interpersonal Communication; TP: Teachers Performance

The descriptive statistics show that out of all the variables that make up the DL (Digital Literacy), the one with the lowest mean value is DL52, with a standard deviation of 1.351. On the other hand, DL41 has the highest mean value. DL22 has the most significant standard

deviation at 0.519. This means that faculty at De La Salle University Dasmariñas possess information and communication digital skills but lacking in problem solving digital skills.

For IB (Innovative Behavior), IB53 have the highest mean value of 3.621, and 1.182 values of standard deviation. IB23 have the lowest mean value at 3.117. Faculty can promote and sustain innovative ideas, while suggesting improvements on expressed ideas are rarely overlooked.

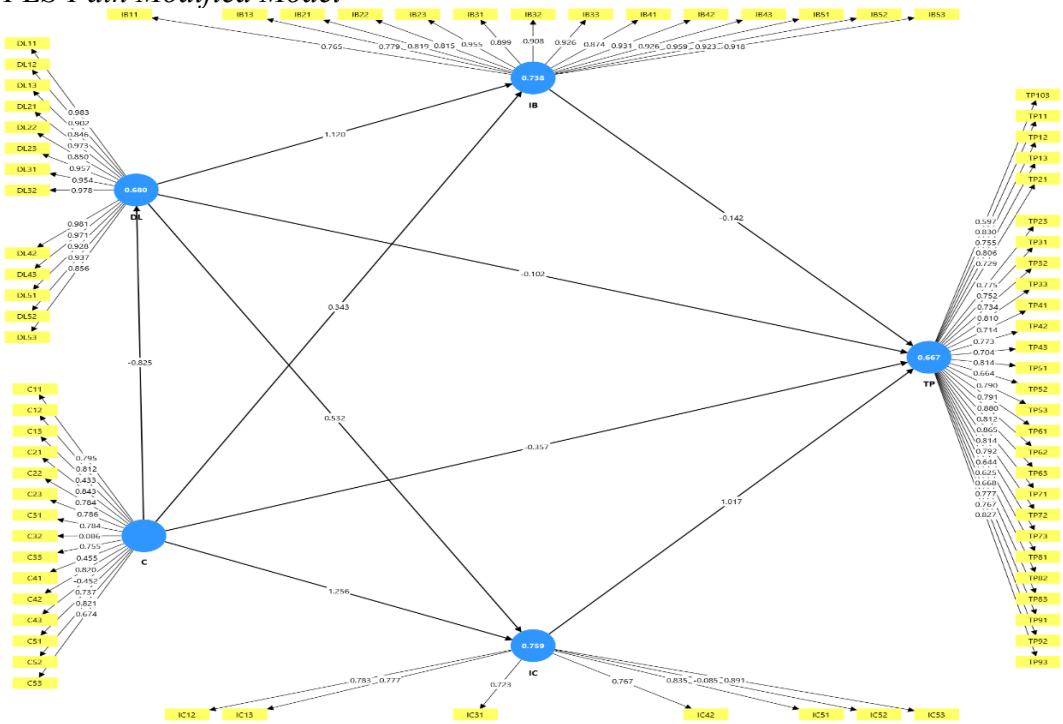
Regarding C (Culture), C13 and C43 has the lowest mean value at 3.968, while C31 has the highest at 4.617. Provision of adequate resources and training for addressing cultural diversity, and experiences in teaching methods and curriculum has the lowest mean. C52 has the most significant standard deviation at 0.442. Teachers feel respected and valued by the administration and other staff members at De La Salle University Dasmariñas.



With the highest mean value and lowest value of standard deviation at 4.806 and 0.47 respectively, IC22 displays the most uniform distribution out of the variables that make up the IC (Interpersonal Communication). Respect with everyone is the most important factor in communication amongst the faculty. IC11 which focuses on dimension of expression and collaboration has the lowest mean value.

For TP (Teachers Performance), TP22 has the lowest mean value of 3.988, with a significant value of standard deviation at 0.687. Incorporating digital innovations in lesson plan of the faculty can improve both the quantity and quality of student learning. TP101 has the highest mean value at 4.774. Ensuring proper attire and good grooming before and after classes is one of the important factors in teachers self-reflection.

Measurement Model (Outer Model): Validity and Reliability



Concurrent and convergent forms of validity will be identified thru the measurement model. Convergent validity describes the degree to which indicators of the latent construct correlate with each other and perfectly embody the construct they are meant for. Convergent validity is assessed using three indices: outer (peripheral) loadings, average variance extracted (AVE), and composite reliability (CR) (Hair et al., 2019). They suggest that the value of AVE and outer loadings should be greater than 0.500 and 0.708 respectively for each of the constructs, and likewise CR should be above 0.7.

Figure 4
PLS-Path Initial Model

On Figure 4, path initial model, outer loadings for indicators DL33, DL41, IB12, IC11, IC21, IC22, IC23, IC32, IC33, IC41, IC52, C32, C41, C43, TP22, TP101, and TP102 falls below the significant threshold of 0.500 at 0.05 significance level, and they are excluded in the study.

Figure 5
PLS-Path Modified Model

On Figure 5, path first modified model, outer loadings for indicators C13, C32, C41, C43 and IC52 falls below the significant threshold of 0.500 at 0.05 significance level, and they are excluded in the study.

Figure 6
PLS-Path Structural Model

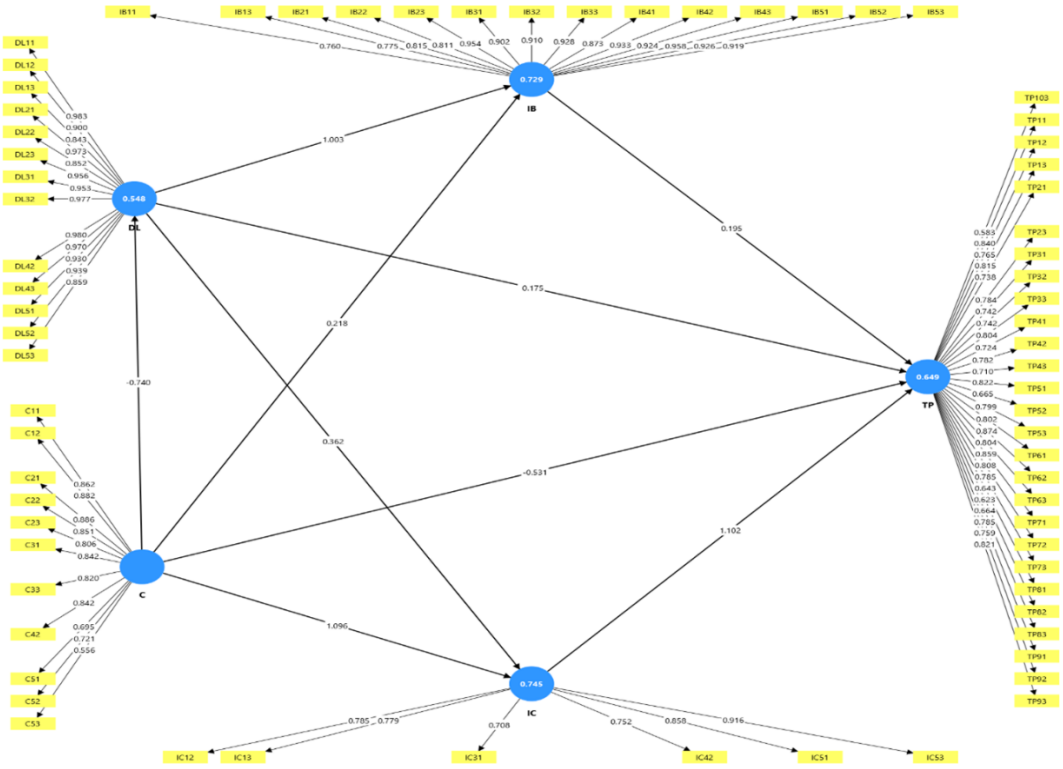


Table 3
Convergent Validity

		TP73	0.808			

	TP8	TP81	0.785			
		TP82	0.643			
		TP83	0.623			
	TP9	TP91	0.664			
		TP92	0.785			
		TP93	0.759			
	TP10	TP103	0.821			

Figure 6 and Table 3 shows that measurements are dependable. All the remaining outer loadings exceeded the significant threshold of 0.500 at 0.05 significance level shows that all individual items' measurement adds considerable significance to their studied constructs and sufficiently met the acceptable criterion set for individual item reliability (Adeleke et al., 2015). On the other hand, the results indicated that the average variance extracted (AVE) values, which varied between 0.584 and 0.871, surpassed the minimum requirement of 0.500 (Henseler et al., 2014). Cronbach's alpha and composite reliability (CR) are recommended to be higher than 0.7. Table 3 shows that all structures have Cronbach's alpha and CR values higher than the critical value of 0.70.

Cronbach's alpha and CR coefficient are frequently used index in organizational research in assessing the internal consistency of reliability of a scale, particularly those containing multiple items (McCrae et al., 2010). This study utilized a composite reliability coefficient for the assessment of internal consistency reliability. In this study, composite reliability (CR) as provided in Table 3 ranged from 0.915 to 0.989 for all the constructs which exceeded the minimum requirement of 0.7 (Hair et al., 2019), thereby validating the constructs' internal consistency and reliability.

Discriminant validity is the degree by which a latent construct differs from others in a model (Vinzi et al., 2009). The test's discriminatory power was initially assessed using the Fornell-Larcker Criterion. In the assessment of Fornell-Larcker criterion, it compares the square root of Average Variance Extracted (AVE) with the latent variable correlations. Specifically, the square root of each construct's AVE should be greater than its highest correlation with any other construct and only with this assessment the discriminant validity can be achieved (Afthanorhan et al., 2021). Table 4 shows the results for discriminant validity of the study. However, negative values are noticeable in some comparison.

Table 4

Discriminant Validity: Fornell-Larcker Criterion

Construct	DL	IB	C	IC	TP
DL					
IB	0.815				
C	0.752	0.533			
IC	0.487	0.408	0.850		
TP	0.450	0.352	0.600	0.778	

Recent research suggest that Fornell & Larcker criterion is not effective under certain circumstances in PLS method and therefore Roemer et al. (2021) offered Hetetrotrait-Monotrait (HTMT) approach to replace Fornell & Larcker criterion.

To examine this, the Heterotrait-Monotrait Ratio (HTMT) which was recommended by Roemer et al. (2021) as an alternative to Fornell and Larcker's method has been applied. The HTMT is advocated to be a superior boundary measure for assessing discriminant validity. As an evaluation for factor correlation, the HTMT should be considerably smaller than 1 (ideally < 0.850) to distinguish between two factors (Hair et al., 2019).

Table 5

Discriminant Validity: Heterotrait-Monotrait Ratio (HTMT)

Construct	DL	IB	C	IC	TP
DL					
IB	0.815				
C	0.752	0.533			
IC	0.487	0.408	0.850		
TP	0.450	0.352	0.600	0.778	

From Table 5, the results show a range between 0.352 and 0.850 which drop beneath the threshold level of 0.90, thus implying all constructs are independent of each other and that the benchmark for discriminant validity have been met.

In conclusion, convergent and discriminant validity evaluations show that the constructs are adequately valid and reliable in the study model.

Structural Model: Examination of the Impact of Interaction

The objective of structural model evaluations is to verify hypotheses concerning the statistical significance (t-values), the range of confidence intervals, and the relative significance (R2) of exogenous and endogenous variables. SmartPLS Bootstrapping method was utilized in the computation of T-values and standard errors. Two tailed tests at significance level of 0.05 was employed to ascertain results. In SmartPLS, a T-value greater than 1.96 (for a two-tailed test at a significance level of 0.05) is generally considered significant. Random subsamples of 5,000 was set and calculating the mean of the results.

Table 6

Hypotheses Result

Hypothesis	Path	Strd. Beta	Strd. Error	T-Value	P-Value	Bias	Confidence Interval		Decision
							Bias	Corrected	
H1	DL->IB	1.003	0.033	30.629	0.000	0.000	0.939	1.068	ACCEPTED
H2	DL->IC	0.362	0.045	8.017	0.000	0.003	0.274	0.450	ACCEPTED
H3	DL->TP	0.175	0.091	2.135	0.000	0.009	0.050	0.330	ACCEPTED
H4	C->IB	0.218	0.15	6.827	0.000	0.000	0.153	0.279	ACCEPTED
H5	C->IC	1.096	0.035	31.299	0.000	0.003	1.027	1.165	ACCEPTED
H6	C->TP	0.531	0.141	3.764	0.000	-0.029	0.774	0.924	ACCEPTED
H7	C->DL	-0.740	0.031	1.166	0.244	-0.008	-0.508	0.083	REJECTED
H8	IB->TP	0.195	0.127	2.535	0.000	0.000	0.230	0.501	ACCEPTED
H9	IC-TP	1.102	0.100	11.075	0.000	0.019	0.871	1.272	ACCEPTED

Table 6 showed confidence intervals for the correlation between DL and IB, ranging from 0.939 to 1.068. The statistical significance of this link was the second highest with a Beta coefficient

of 1.003 and a T-value of 30.629. This result indicates that a standard deviation rise in DL was connected to an increase in IB. Therefore, we will accept H1.

For the correlation between DL and IC, confidence intervals ranged from 0.274 to 0.450. We can say that the link was also statistically significant with a Beta coefficient of 0.362 and a T-value of 8.017. This implies that there is also a positive relationship between the two, thereby H2 was accepted.

With a confidence interval ranging from 0.050 to 0.083, and a Beta coefficient of 0.175 and a T-value of 2.135 we can assume that there is significant relationship between DL and TP. Hence, we can accept H3.

For the correlation between C and IB, confidence intervals ranged from 0.153 to 0.279. We can say that the link was also statistically significant with a Beta coefficient of 0.218 and a T-value of 6.827. This implies that there is also a positive relationship between the two, thereby H4 was accepted.

For C and IC correlation, with a confidence interval ranging from 1.027 to 1.165 and a T-value of 31.299, we can say that, the statistical significance of this link is he highest, with a Beta coefficient of 1.096, therefore H5 was accepted.

For the correlation between C and TP, confidence intervals ranged from 0.774 to 0.924 indicates that correlation between these two was statistically significant, with a Beta coefficient of 0.531 and a T-value of 3.764. H6 will be accepted also.

With a confidence interval ranging from -0.508 to 0.281, and a Beta coefficient of -0.740 and a T-value of 1.166 we can assume that there is no significant relationship between C and DL. Hence, we can reject H7.

For the relationship between IB and TP, confidence intervals ranged from 0.230 to 0.501, Beta coefficient of 1.195 and a T-value of 2.535, the link is also statistically significant so we can accept H8. This means that increase in IB is connected to increase of TP.

Lastly, with a confidence interval ranging from 0.871 to 1.272, and a Beta coefficient of 1.102 and a T-value of 11.075 we can assume that there a significant relationship between IC and TP. Therefore, we will accept H9.

Discussion

The descriptive statistical analysis of the data reveals significant factors that affects teachers' performance in relation to digital literacy namely: technical digital skills, creativity digital skills, critical-thinking digital skills, information and communication digital skills, and problem-solving digital skills. For innovative behavior, the factors are opportunity exploration, idea generation, idea promotion, idea realization, and idea sustainability. The significant factors for culture are cultural values and beliefs, communication styles, student-teacher relationship, and school culture. For interpersonal communication, the factors are dimension of respect, dimension of discipline, and teaching and learning dimension. The significant factors for teachers' performance are knowledge of subject matter, teacher-student relationship, tools and resources, collaboration with others, feedbacks, standards and expectations, fairness and justice, risk taking and self-reflection.

The statistical analysis of structural model reveals significant relationships between the variables. These correlations demonstrates that each variables have impact to other variables. From the results of the study, we can conclude that digital literacy has positive impact to innovative behavior and interpersonal communication and eventually positive results to teachers' performance. Culture has also direct relationship to interpersonal communication and teachers' performance, however it has no significant impact to innovative behavior as per the data analyzed. Innovative behavior and interpersonal communication positively affect teachers' performance at De La Salle University Dasmariñas.

This study introduced nine hypotheses which has generated several significant discoveries. These findings are consistent with prior research conducted by Dewanto et al. (2024), demonstrating beneficial impact of digital literacy and innovative behavior to teachers' performance. Based on the results, digital literacy, innovative behavior, interpersonal communication, and teachers' performance have a positive relationship with each other. However, as per the result of this research culture has no significant relationship with digital literacy.

Conclusion

The current study analyzes the effect of digital literacy, innovative behavior, culture, and interpersonal communication on teachers' performance at De La Salle University Dasmariñas. According to the findings and discussion, the research generated significant discoveries. One is that direct relationship exists between digital literacy and innovative behavior. Digital literacy has positive relationship with interpersonal communication. Digital literacy has a direct relationship in teachers' performance at De La Salle University Dasmariñas. Culture has direct relationship with innovative behavior, interpersonal communication, and teachers' performance, whereas it has no direct relationship with digital literacy. Innovative behavior and interpersonal communication also have a direct relationship with teachers' performance.

This research study also aims to find ways to help faculty management improve teachers' performance at De La Salle University Dasmariñas. Based on the structural equations modeling, we can conclude the significant factors that positively affects the performance of teachers, and thru this study management must focus and align the university's policy, rules, and regulations to these significant factors. They must enhance teachers' performance by improving their digital literacy, innovative behavior, culture, and interpersonal communication capabilities.

This study has multiple challenges. A notable constraint may be the limited sample size, restricted by duration of the study and concentrate solely on undergraduate college faculty. Applicability to all or general faculty of the university may be also be limited.

Future research on the effects of digital literacy, innovative behavior, culture, interpersonal communication, and interpersonal communication on teacher performance is anticipated to be conducted at all levels of the university, not only specific level. This study has major implications for institutions to consider the various independent variables that exist as significant factors that must be considered to support teacher performance. Future research should be able to further explore other psychological variables that are not widely identified at this time. The addition and heterogeneity of more samples can also increase the quality of the expected results.

Official Conference Proceedings

Abstract

This study presents the results of comparative classroom research exploring pedagogical innovation in interior architecture education through two approaches: the conventional design studio model and a user-experience-based learning model. The research examined how different instructional modes shape students' design processes, learning outcomes, and capacity for innovation in experiential architecture and new service design. In the conventional approach, students typically follow a linear process, beginning with site or user research, gathering requirements, and programming before developing design proposals. While effective for cultivating technical and creative skills, this process often privileges form and representation over the lived experiences of users. By contrast, the user-experience–based model required students to begin with experiential inquiry into user needs, unmet expectations, behaviors, and emotions. Reframing the design process around user insights encouraged students to move beyond conventional problem-solving toward empathetic and reflective design thinking. Both approaches produced aesthetically strong outcomes; however, the latter generated designs enriched with experiential architectural qualities, innovative spatial programming, and service-oriented solutions that integrated offline and online experiences. The research sample consisted of 18 third-year interior architecture students who engaged in both models through a flagship store design project. Their outcomes were compared in terms of technical skills, reflective insights, and the originality of their proposals. Findings suggest that while conventional pedagogy reinforces established competencies, user-experience–based learning represents a significant pedagogical innovation that cultivates empathy, adaptability, and leadership. These insights highlight the value of user-focused teaching models in advancing interior architecture curricula.

Keywords: user-experience-based learning, interior architecture education, experiential architecture, spatial service design

Introduction

Interior architecture education has historically relied on studio-based pedagogy as its primary instructional model. This approach emphasizes spatial composition, functional organization, material articulation, and aesthetic resolution through iterative design exercises. Within conventional design studios, students typically engage in a linear design sequence beginning with site and contextual analysis, followed by user analysis, program development, conceptual exploration, schematic design, and final representation. This pedagogical structure has played a critical role in cultivating foundational design competencies and professional discipline among interior architecture students.

Despite its long-standing effectiveness, the conventional studio model has been increasingly critiqued for its limited engagement with the experiential dimensions of spatial use. Although users are introduced early in the design process, as a user analysis process, they are often represented through personas, functional requirements, or demographic profiles. Such representations tend to remain static throughout the design development, resulting in spatial proposals that prioritize formal coherence and aesthetic expression while underrepresenting how users actually experience, navigate, and inhabit interior environments over time. Consequently, students may complete design projects that are technically resolved yet insufficiently grounded in lived human experience. This pedagogical limitation has become more evident as the scope of interior architecture expands beyond the design of static physical environments toward the orchestration of complex experiential systems. Contemporary interior spaces—particularly within retail, hospitality, and public environments—are increasingly shaped by service design, digital interfaces, and hybrid online–offline interactions. These shifts require designers to consider not only spatial form and function, but also user journeys, emotional responses, and temporal patterns of use. As such, interior architecture education faces growing pressure to equip students with methodologies that support empathetic, adaptive, and experience-driven design thinking.

User-experience–based learning models have emerged as a promising pedagogical response to these challenges. Influenced by service design and human-centered design frameworks, these models reposition users as central agents within the design process. Through experiential research methods such as observation, user shadowing, journey mapping, and behavioral analysis, students are encouraged to investigate users' needs, emotions, and unmet expectations prior to formal design development. This shift reframes the design process from a primarily solution-driven activity toward an exploratory and iterative mode of inquiry grounded in lived experience. While the theoretical value of user-centered and experiential approaches has been widely discussed across design disciplines, empirical studies examining their pedagogical impact within interior architecture education remain limited. In particular, there is a lack of comparative classroom research that systematically evaluates how user-experience–based learning models influence students' design processes, learning outcomes, and capacity for experiential and service-oriented innovation when compared with conventional studio pedagogy.

This study addresses this gap by conducting a comparative classroom investigation involving the same cohort of interior architecture students engaged in identical design contexts under two distinct pedagogical frameworks. By analyzing quantitative and qualitative data derived from questionnaires, interviews, and student design work, the research examines how a user-experience–based learning model reshapes students' approaches to spatial design, enhances experiential architectural quality, and supports reflective learning. The findings aim to

contribute empirical evidence to ongoing discussions on pedagogical innovation and to inform the future development of interior architecture curricula aligned with contemporary design practice.

Research Objectives

The objectives of this study are as follows:

1. To compare the conventional design studio model with the user-experience–based learning model in interior architecture education.
2. To examine how the user-experience–based learning model influences students' design processes and their understanding of user needs.
3. To evaluate the impact of the user-experience–based learning model on students' learning outcomes, particularly in relation to reflective thinking and empathy.
4. To assess whether the user-experience–based learning model enhances students' ability to develop innovative and experiential spatial design solutions.

The expected outcome of this research is to contribute to the reframing of interior architecture teaching practices toward a more user-centered pedagogical approach. Through the application of a user-experience–based learning model, students are expected to demonstrate an enhanced ability to integrate users as active agents within the design process. This includes articulating users' spatial experiences, behaviors, and emotional responses, as well as constructing coherent user scenarios that inform spatial and service-oriented design decisions.

Literature Review

Conventional Design Studio

The conventional design studio model is a foundational learning approach in design education, in which students are assigned real-life problems and are expected to develop creative design solutions (Hettithanthri et al., 2023). Learning in this model occurs primarily through reflection-in-action, supported by critiques and feedback from design jurors and tutors (Schön, 1983). The design process in the conventional studio typically consists of four main phases: the programming phase, schematic design phase, design development phase, and construction documents phase (Soliman, 2017). In alignment with this framework, the course adopted a conventional studio structure beginning with the programming phase, during which students collected and analyzed data such as project background, site analysis, and user analysis. These data informed subsequent ideation, programming, space planning, and conceptual development, corresponding to the schematic design phase. During the design development phase, students frequently moved back and forth between stages as part of an iterative refinement process. However, once the design process was completed, the final design solutions were primarily critiqued by tutors based on research and documented data rather than direct engagement with real users or stakeholders. This approach may distance designers from human-centered concerns and lived social contexts (Hettithanthri et al., 2023). Similarly, Nicol and Pilling (2000) argue that traditional design studios often prioritize final outcomes and visual aesthetics over process-based learning and social engagement.

User Experience-Based Learning

User Experience (UX) design is a human-centered design process that begins with understanding users' needs, behaviors, emotions, and expectations through empathy-driven inquiry, and progresses through ideation, iterative prototyping, and usability testing (Töre Yargın et al., 2018). Rather than focusing solely on formal or aesthetic outcomes, UX design emphasizes how people interact with spaces, systems, and services over time. Norman (2013) argues that meaningful design emerges not from aesthetic refinement alone, but from a deep understanding of user interaction, perception, and experience. Within architectural and design education, human-centered approaches have been increasingly associated with innovation and critical thinking. Dorst (2011) connects empathy and reframing to the ability to address complex or "wicked" design problems, suggesting that designers must first reinterpret the problem space through the lens of user experience before proposing solutions. Together, these perspectives support a pedagogical shift away from linear, solution-driven design processes toward more reflective, iterative, and empathetic modes of design thinking, which are particularly relevant in contemporary interior architecture education.

User-Experience-Based Learning and Experiential Architecture Quality

User-experience-based learning refers to a design process that places humans at the center of inquiry, emphasizing users' needs, behaviors, emotions, and expectations as the foundation of design development. In contrast, experiential architecture quality refers to the creation of environments that engage users through multisensory and emotional interactions, enabling meaningful spatial journeys rather than focusing solely on aesthetic expression (Hartong, 2025). The relationship between user-experience-based design and experiential architecture quality is reflected in Bitner's (1992) *servicescape* framework, which considers both physical and non-physical environmental elements. Bitner identifies ambient conditions—such as temperature, sound, music, and odor—as factors that significantly influence user behavior and spatial experience. Extending this perspective, Stickdorn et al. (2018) incorporate digital touchpoints into user journeys, demonstrating how contemporary spaces increasingly integrate physical and virtual experiences. When interior architecture students adopt these frameworks, they are better equipped to design environments that support holistic user experiences, characterized by sensory richness, coherent behavioral flows, and emotional resonance.

Research Methodology

Research Design

This study employed a comparative classroom research design to examine the pedagogical impact of a conventional design studio model and a user-experience–based learning model in interior architecture education. The research was conducted across two consecutive semesters using the same cohort of students and project in order to control variations in student background, project complexity, and learning objectives. By applying two distinct pedagogical frameworks to an identical design brief, the study aimed to systematically compare differences in students' design processes, experiential architectural quality, and learning outcomes. The research adopted a mixed-methods approach, integrating quantitative data from structured questionnaires with qualitative data obtained through semi-structured interviews and analysis of student design work. This approach enabled both measurable comparison and in-depth interpretation of students' learning experiences.

Participants and Educational Context

The participants consisted of 18 third-year undergraduate students enrolled in the Interior Architecture program. All participants were required to complete a retail design project as part of their studio coursework. The same group of students participated in both phases of the study, allowing for direct comparison of learning outcomes under different instructional approaches. The research was conducted within two courses offered in the 2024 academic year. In the first semester, students undertook the retail design project under a conventional studio-based teaching model. In the second semester, the same project was revisited and redesigned using a user-experience-based learning model within the course INA 454: Cross-Disciplinary Study Experiential Architecture through Spatial Service Design. This structure ensured continuity in project scope while allowing pedagogical variation to be the primary variable under investigation.

Pedagogical Phases

The research was implemented in three main phases.

Phase 1: Conventional Studio Design Process

During the first semester, students followed a conventional studio-based design process. Instruction focused on site and contextual analysis, user analysis, programming, conceptual development, zoning, space planning, schematic design, design development and final design representation. The design outcomes emphasized spatial organization, functional resolution, and aesthetic coherence, reflecting established interior architecture studio pedagogy.

Phase 2: User-Experience–Based Learning Process

In the second semester, the same cohort of students revisited their retail design projects using a user-experience-based learning model. Students were introduced to a set of experiential and service-design tools. These tools were applied intensively during the initial two weeks of the course to support experiential inquiry and user-centered analysis. Following this preparatory phase, students revised their original design projects by incorporating user-experience data, developing new spatial programs, and exploring the integration of online and offline retail experiences. This phase emphasized iterative design thinking, reflective analysis, and the translation of experiential insights into spatial and service-oriented design strategies.

Phase 3-4: Data Collection and Analysis

Data collection was conducted during and after the completion of the second-semester design projects. Both quantitative and qualitative data were gathered to assess the pedagogical impact of the user-experience–based learning model.

Phase 5: Conclusion

Findings from both data sets were evaluated to determine the pedagogical impact of the user-experience–based learning model in comparison with the conventional studio approach.

Data Collection Methods

Data collection was conducted during the second phase of the study, following the implementation of the user-experience-based learning model. A mixed-methods approach

was adopted to capture both measurable learning outcomes and students' reflective insights into the design process. Quantitative data were gathered through a structured questionnaire, while qualitative data were obtained through semi-structured interviews and analysis of student design work. The use of multiple data sources enabled triangulation and enhanced the credibility of the findings.

Questionnaire Survey

A structured questionnaire was developed using a five-point Likert scale (1 = strongly disagree, 5 = strongly agree) to evaluate students' perceptions of the user-experience-based learning model. The questionnaire was designed in alignment with the research objectives and focused on three key dimensions: (1) design process, (2) experiential architectural quality, and (3) learning outcomes. These dimensions reflect core aspects of user-centered and experiential design education, including the integration of user insights, the quality of experiential spatial outcomes, and the development of reflective and empathetic thinking. The questionnaire examined students' ability to understand users prior to initiating design decisions, integrate experiential data systematically into the design process, engage in iterative thinking, and articulate user journeys across both online and offline contexts. Additional items assessed perceived improvements in experiential innovation, reflective learning, and the ability to create meaningful spatial experiences beyond aesthetic considerations. The questionnaire was administered after students completed the revised design projects under the user-experience-based learning model to ensure that responses reflected the full learning experience. A total of fifteen students from the cohort of eighteen completed the questionnaire. Descriptive statistical analysis was used to identify overall trends and mean scores across the three evaluation dimensions, providing an overview of students perceived learning outcomes.

Semi-Structured Interviews

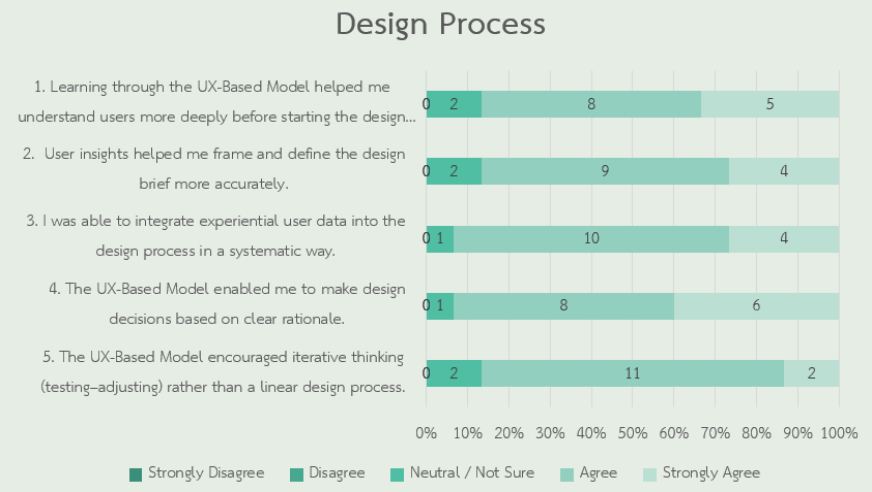
To complement the quantitative findings and gain deeper insight into students' learning experiences, semi-structured interviews were conducted with a purposive sample of five students. The interview participants were selected to represent a range of design approaches and levels of engagement observed during the studio process. This qualitative method allowed for a more nuanced understanding of how students interpreted and applied the user-experience-based learning model within their design work. The interview questions focused on identifying the most significant skills developed through the UX-based learning process, specific examples of design improvement resulting from user-experience methods, and changes in students' perceptions of users and spatial experience. Students were encouraged to reflect on their design decision-making processes, the role of experiential data, and the challenges encountered when integrating user insights into spatial and service-oriented design solutions. Interview responses were transcribed and analyzed thematically to identify recurring patterns related to user-centered thinking, experiential quality, and reflective learning.

Analysis of Student Design Work

In addition to questionnaires and interviews, students' design outputs were reviewed as part of the data collection process. The analysis focused on comparing design outcomes produced under the conventional studio model and those revised through the user-experience-based learning model. Particular attention was given to the articulation of user journeys, the

integration of online and offline experiences, spatial programming strategies, and the translation of experiential insights into architectural form and service elements. This qualitative examination provided contextual support for the questionnaire and interview findings and strengthened the overall interpretation of the pedagogical impact.

Research Result



Questionnaire Survey

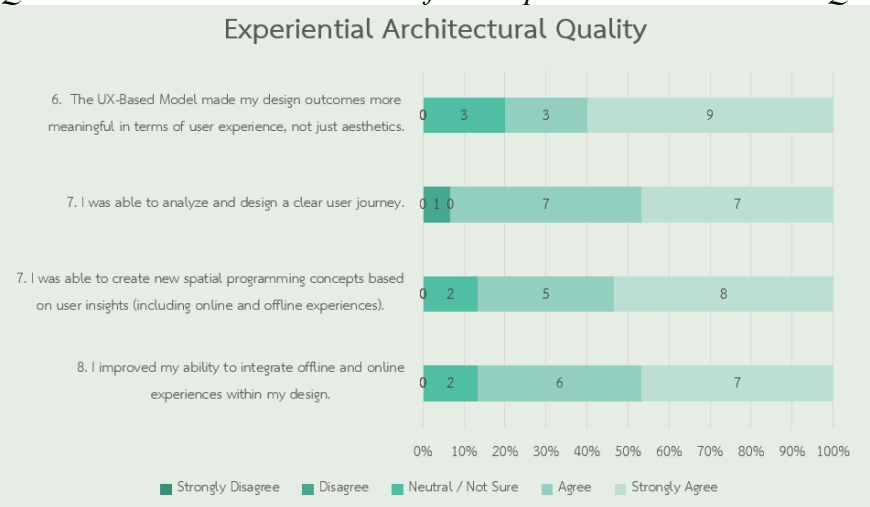
The research results demonstrate a consistently positive perception of the user-experience-based learning model across all evaluated dimensions. Analysis of the questionnaire responses indicates high levels of agreement regarding its impact on students' design processes, experiential architectural quality, learning outcomes, and overall perception of design improvement.

Design Process

The results reveal strong agreement that the user-experience-based learning model enhanced students' ability to engage with users before initiating design decisions. Most respondents indicated that experiential inquiry helped them develop a deeper understanding of user needs before beginning the design process. High levels of agreement were also observed in items related to framing and defining design briefs more accurately through user insights, as well as integrating experiential user data into the design process in a systematic manner. In addition, students reported that the User-experience–based learning models supported clearer design decision-making by providing explicit rationales derived from user research. The majority of respondents also agreed that the model encouraged iterative thinking, characterized by cycles of testing and adjustment, rather than a strictly linear design process. These findings suggest that the User-experience–based learning models effectively reshaped students' design workflows toward more reflective and user-centered approaches.

Figure 4
Questionnaire Results in Terms of the Design Process

Experiential Architectural Quality

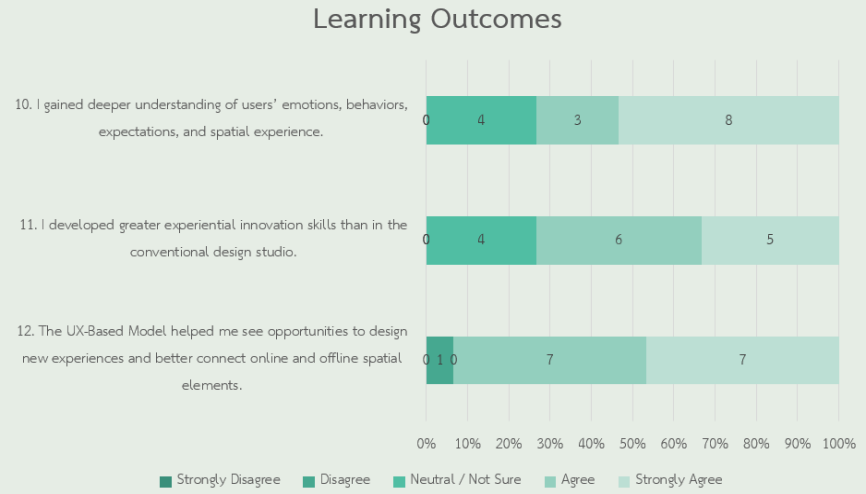


Responses related to experiential architectural quality showed strong positive outcomes. Students indicated that the user-experience–based learning model enabled them to design

spaces grounded in user experience across multiple temporal stages, resulting in more meaningful design outcomes beyond aesthetic concerns.

The findings also suggest that students developed a clearer understanding of user journeys and were able to translate these insights into spatial, programmatic, and online–offline integrated strategies, demonstrating the model's effectiveness in supporting experiential depth and service-oriented spatial thinking.

Figure 5



Questionnaire Results in Terms of the Experiential Architecture Quality

Learning Outcomes

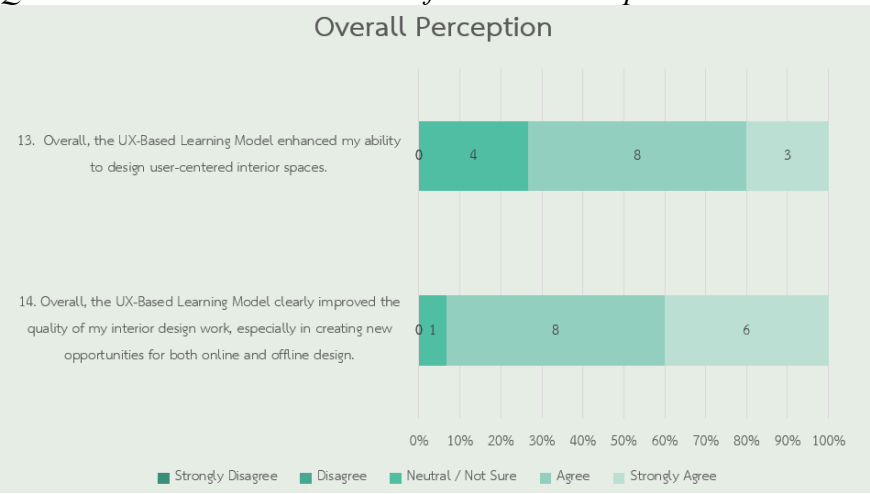
The findings related to learning outcomes demonstrate that the user-experience-based learning model contributed positively to students' cognitive and affective development. Students reported enhanced reflective and critical thinking abilities, as well as a deeper understanding of users' emotions, behaviors, and expectations. The majority of respondents also perceived that their capacity for experiential innovation was greater than that achieved through the conventional design studio model. Moreover, students indicated that the User Experience-based approach helped them identify new opportunities for design intervention, particularly in connecting digital and physical experiences within interior environments. These results suggest that the model supports the development of competencies aligned with contemporary interior architecture practice, including empathy, adaptability, and experiential innovation.

Figure 6
Questionnaire Results in Terms of Learning Outcomes

Overall perception items reveal strong agreement that the User-experience–based learning modelsimproved students' ability to design user-centered interior spaces and enhanced the overall quality of their design work. The radar chart summary further reinforces these findings, with all evaluated categories demonstrating high mean scores, ranging approximately between 4.13 and 4.31 out of 5. Among the three primary dimensions, experiential architectural quality recorded the highest mean score, indicating the strongest perceived impact of the User Experience-based model.

Collectively, the results suggest that the user-experience-based learning model is highly effective in supporting user-centered design thinking, experiential architectural quality, and reflective learning outcomes. These findings provide empirical evidence that integrating user-experience methodologies into interior architecture education can significantly enhance students' readiness to address the experiential and service-oriented demands of contemporary design practice.

Figure 7
Questionnaire Results in Terms of Overall Perception



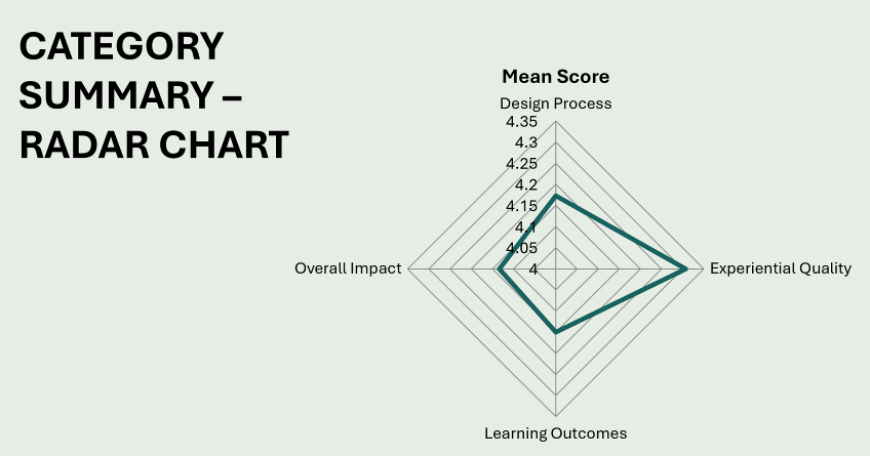


Figure 8
Category Summary Radar Chart

Interview Result

Qualitative analysis of the semi-structured interviews reveals consistent themes highlighting the pedagogical impact of the user-experience-based learning model on students' design thinking and practice. Three key themes emerged from the interview data: (1) a shift toward user-centered design perspectives, (2) the practical application of experiential methods to improve design outcomes, and (3) a transformed understanding of users as active participants in spatial experience.

Shift Toward User-Centered Design Thinking

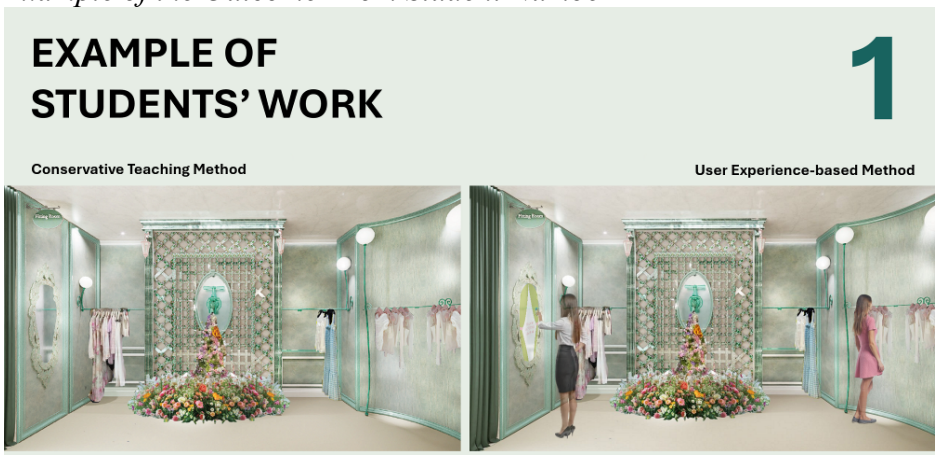
Interview responses indicate that students developed a stronger user-centered perspective through the UX-based learning model. Participants reported moving away from an exclusive focus on aesthetics or personal design assumptions toward a more evidence-based approach grounded in users' needs, pain points, and behaviors. Several students emphasized that the most important skill they gained was the ability to evaluate user experiences systematically and translate those insights into informed design decisions. This shift reflects a deeper engagement with empathy and reflective thinking, aligning with the intended learning outcomes of the User Experience-based pedagogy.

Application of UX Methods in Design Improvement

The interviews further reveal that the use of experiential research methods contributed directly to improvements in students' design outcomes. Participants described applying techniques such as user shadowing and persona development to identify spatial issues that were not initially apparent in their original designs. These methods enabled students to recognize challenges related to circulation clarity, functional zoning, and spatial usability. By incorporating user feedback and experiential insights, students reported being able to revise spatial layouts in ways that improved navigability and comfort for occupants, demonstrating the practical value of the UX-based approach in interior architectural design.

Reframing the Concept of "Users" in Spatial Design

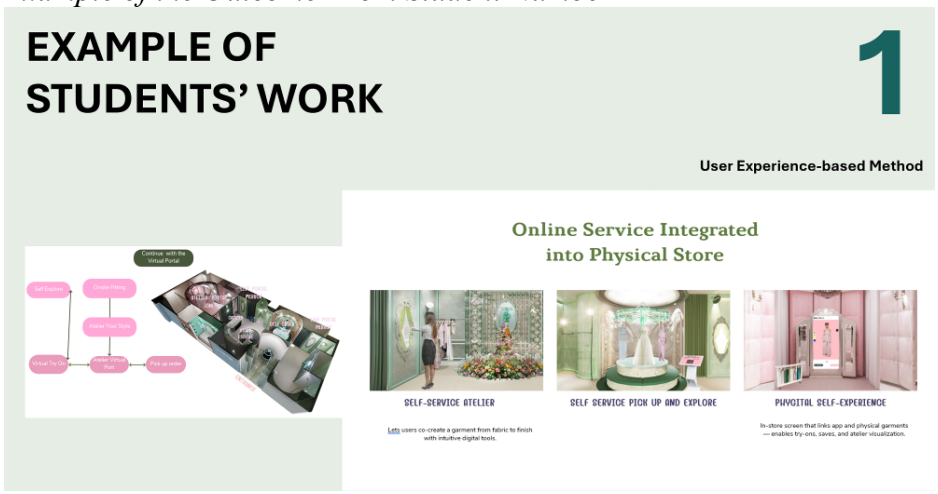
A prominent theme across the interviews was a fundamental change in how students conceptualized "users" within the design process. Participants reflected that, prior to



engaging with the UX-based learning model, users were often perceived as abstract target groups or design requirements. Through experiential inquiry, students began to understand users as real individuals with daily routines, emotions, frustrations, and lived experiences. This reframing prompted greater attention to subtle behavioral patterns and experiential details that influence how spaces are used over time. Such insights suggest that the User-experience–based learning modelssupports the development of empathy and experiential awareness, which are critical competencies in contemporary interior architecture practice.

Analysis of Student Design Work

Student Number 1



Pong designed a Landmeé retail shop, a Thai local clothing brand. In the conventional model, she proposed a "gift box" concept derived from brand research and user analysis to develop the interior space. In the user-experience–based model, she proposed a "Phygital Atelier Porta Retail" concept, which allows customers to customize products and connect services through online platforms.

Figure 9
Example of the Outcome From Student Number 1

Note. Landmeé retail shop designed and produced by Pong, 2024.

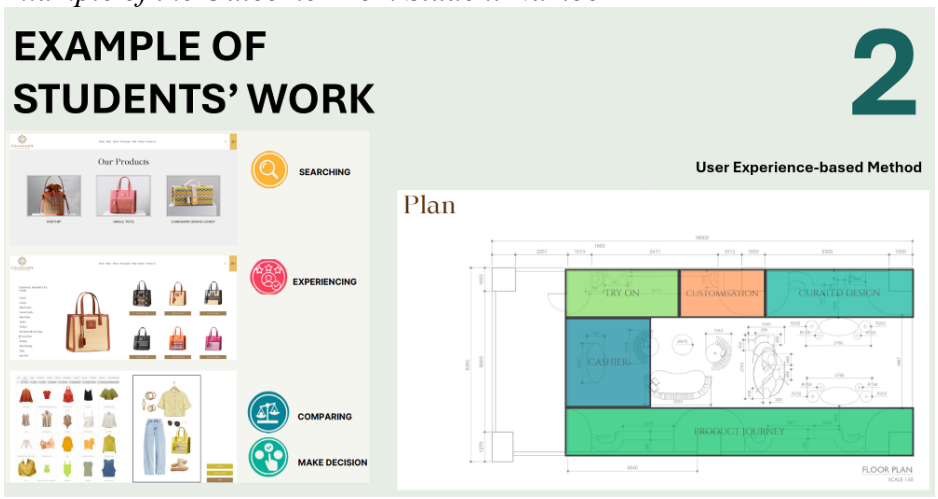
Figure 10
Example of the Outcome From Student Number 1

Note. Landmeé retail shop designed and produced by Pong, 2024.

Student Number 2

Parkes designed a Chaksarn retail shop, a Thai handbag brand made from handwoven water sedge and genuine leather. In the conventional model, Parkes proposed showcasing the richness of handcraft integrated into the retail space through the brand's narrative. In the user-experience–based model, Parkes added an online style companion that allows customers to match outfit pairings with the products, an on-site interactive wall where customers can record messages explaining their reasons for purchasing the product, and a post-purchase appreciation experience in which an online platform is used to share behind-the-scenes stories and care tips, thereby enhancing customers' emotional engagement and brand loyalty.

Figure 11



Example of the Outcome From Student Number 2

Note. Chaksarn retail shop designed and produced by Parkes, 2024.

Figure 12

Example of the Outcome From Student Number 2

Note. Chaksarn retail shop designed and produced by Parkes, 2024.

Student Number 3

Kiatthawornchai designed a Blackdog BKK retail shop, a Thai local clothing brand known for incorporating food illustrations into its clothing designs. In the conventional model, Kiatthawornchai analyzed the brand identity to inform the shop design. In the user-

experience–based model, the same brand identity was also applied to a virtual online try-on platform, allowing customers to save styling options online and scan them in-store to try the physical versions.

Figure 13

Example of the Outcome From Student Number 3

Research Finding

The findings of this study indicate a consistently high level of agreement across all evaluated categories, with mean scores ranging between 4.13 and 4.31 out of 5. These results suggest that the user-experience–based learning model had a strong positive impact on interior architecture students' design processes, experiential architectural quality, and learning outcomes. Among the three primary dimensions, experiential architectural quality achieved the highest mean score (approximately 4.31). This result indicates that the User-experience–based learning models was particularly effective in enhancing students' ability to design spaces grounded in user journeys and lived experiences. Students demonstrated an increased capacity to consider spatial experience across multiple temporal stages, including before, during, and after use, as well as to integrate online and offline experiences within a cohesive

design framework. The prominence of experiential quality underscores the pedagogical value of prioritizing user experience as a central driver of spatial and service-oriented design.

Design process and learning outcomes also recorded strong positive effects, reflecting the model's influence on students' design workflows and cognitive development. The findings suggest that the UX-based approach supported clearer design decision-making grounded in user insights and encouraged iterative, reflective processes rather than linear problem-solving. In addition, students reported enhanced reflective thinking, greater empathy toward users, and improved capacity for experiential innovation. These outcomes indicate that the model contributed not only to design output quality but also to deeper learning and skill development. Furthermore, overall impact scores confirm that students perceived the user-experience–based learning model as highly beneficial for developing user-centered interior design solutions. The convergence of high scores across all categories suggests that the model effectively aligns pedagogical objectives with contemporary professional demands, particularly in addressing experiential, service-oriented, and hybrid spatial environments. Collectively, these findings provide empirical support for the integration of user-experience–based learning models within interior architecture education as a means of enhancing both design quality and learning outcomes.

Discussion

The findings of this study provide empirical support for the pedagogical value of integrating a user experience–based learning model into interior architecture education. High levels of agreement across all evaluation dimensions indicate that positioning users at the center of the design process reshapes students' approaches to spatial design and learning.

First, the results related to the design process suggest that the user experience–based learning model effectively challenges the linear and form-driven tendencies of conventional studio pedagogy. While traditional studios remain effective in developing technical and aesthetic skills, they often rely on abstract representations of users. In contrast, the integration of experiential inquiry tools—such as user observation, journey mapping, and behavioral analysis—encouraged students to adopt more iterative and reflective design workflows, enabling them to justify design decisions through user-derived insights rather than intuition or aesthetic preference.

Second, experiential architectural quality emerged as the strongest outcome of the user experience–based learning model. Students demonstrated an enhanced ability to design for user journeys, temporal experience, and the integration of online and offline interactions. This reflects a shift from static spatial composition toward experiential orchestration, aligning interior architecture education with contemporary professional practice. The positive learning outcomes further indicate that user experience–based learning supports deeper reflective thinking, empathy, and experiential innovation. Students' responses suggest a transformed understanding of users—not as abstract design targets, but as individuals whose lived experiences shape spatial use. The convergence of quantitative and qualitative findings strengthens the validity of these results, as questionnaire data indicating high perceived effectiveness are reinforced by interview insights explaining how these outcomes emerged. This triangulation suggests that the observed impacts are embedded within students' design processes and outcomes.

Despite these positive outcomes, the findings also point to important pedagogical considerations. The user experience–based learning model was implemented as an intensive intervention within a limited time frame, suggesting that sustained integration across multiple studio levels may further enhance its effectiveness. Rather than replacing conventional studio pedagogy, the findings support the development of hybrid instructional models that combine traditional spatial training with user experience–based inquiry. Overall, the results underscore the relevance of user experience–based learning in preparing interior architecture students for experiential and service-oriented design challenges.

Conclusion

This study demonstrates that while conventional studio-based pedagogy in interior architecture education remains effective in developing students' technical skills, spatial organization, and aesthetic competence, it exhibits limitations in addressing user-centered and experiential dimensions of design. Traditional studio methods tend to emphasize formal resolution and functional clarity, often resulting in design outcomes that are technically proficient but insufficiently grounded in users' lived experiences.

The findings indicate that the integration of a user experience–based learning model significantly shifts students' design thinking toward a deeper consideration of experiential, emotional, and behavioral aspects of spatial use. By repositioning users as active agents within the design process, the model encourages students to move beyond linear, solution-driven workflows and engage in iterative and reflective design cycles informed by experiential inquiry. This shift enables students to justify design decisions based on user insights rather than relying primarily on aesthetic intuition or preconceived design assumptions. Moreover, the study reveals that the user experience–based learning model supports the development of competencies aligned with contemporary interior architecture practice. Students demonstrated enhanced capacity to design experiential architectural quality, articulate user journeys, and integrate online and offline spatial experiences within cohesive design frameworks. These outcomes reflect the increasing relevance of service-oriented and experience-driven approaches in modern interior environments, particularly within retail and public contexts.

Overall, the findings suggest that user experience–based pedagogy offers a valuable and effective framework for advancing pedagogical innovation in interior architecture education. Rather than replacing conventional studio pedagogy, the model complements and extends traditional approaches by enriching students' understanding of users, fostering empathy and reflective thinking, and preparing graduates to address the complex experiential demands of contemporary professional practice.

Further Suggestion

As interior architecture educators, future pedagogical development should focus on bridging conventional studio pedagogy with user-experience–based learning within a single semester. Integrating user experience design tools into early-stage data collection would enable students to translate user insights directly into design decisions from the outset.

Enhancing Secondary Mathematics Learning Through STEAM2C: Creative Assessment With Graphing Technology

Jeyaletchumi Muthiah, SEAMEO RECSAM, Malaysia

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study examines the integration of STEAM2C (Science, Technology, Engineering, Arts, and Mathematics with Creative and Critical Thinking) into the teaching and assessment of the topic "Graphs of Functions" among secondary school students in Southeast Asia. The project aimed to move beyond traditional instruction and rote-based evaluation by incorporating alternative assessments approaches that emphasise creativity, reasoning, and application, supported by digital graphing technologies such as Desmos, GeoGebra, and graphing calculators. The intervention began with a two-day professional development workshop for mathematics teachers, followed by classroom implementation of inquiry-based learning activities. A student-led creative graph design project served as the core assessment task and was evaluated using a structured rubric emphasizing mathematical reasoning, design aesthetics, and reflective thinking. Data collected through teacher interviews, student reflections, and rubric-based evaluations revealed that the STEAM2C approach significantly enhanced engagement, deepened conceptual understanding, and encouraged students' creative self-expression. Teachers perceived STEAM2C as a promising alternative assessment approach aligned with 21st-century learning goals, while highlighting the need for curriculum alignment and stakeholder support for sustainable implementation.

Keywords: STEAM2C, mathematics education, alternative assessment, graphing technology, creative and critical thinking

Introduction

The integration of STEAM2C into mathematics focuses on the application of STEAM (Science, Technology, Engineering, Art and Mathematics) in the learning of Secondary Mathematics and the process involved in showcasing the 2C (Creative and Critical Thinking) in Mathematics lessons (Bertrand & Namukasa, 2020; Wannapiroon & Pimdee, 2022). The Mathematical technological tools such as Desmos, graphing calculator and GeoGebra was proposed in this study.

The new mathematics curriculum for secondary schools requires students to demonstrate their mathematical skills associated with creativity, showcasing originality in thinking and ability to connect with their surroundings in a new perspective. Emphasis should be given on promoting knowledge and skills such as creative thinking, innovation, problem-solving and leadership (Yean et al., 2024).

Tasks that require creative and critical thinking with technology can be introduced to the current generation of technology natives. In fact, they ought to be given tasks that will challenge them to do better in the presence of more thought-provoking higher order thinking questions from the knowledgeable teacher. Therefore, the role of a teacher as a compulsive facilitator is very pertinent and relevant.

Statement of the Problem

While STEM initiatives have gained momentum, many mathematics teachers still lack the confidence, resources, or pedagogical frameworks to integrate technology, creativity, and critical thinking into their lessons. Assessment practices remain focused on procedural fluency and do not capture students' ability to reason, design, or model mathematically.

Furthermore, although software like Desmos and GeoGebra are available, their classroom usage is often limited to teacher demonstrations rather than student exploration. There is a need to explore how such tools, when used creatively through a STEAM2C lens, can enhance student agency and conceptual understanding. This research is designed to address the following key problem: How can STEAM2C be applied effectively in the teaching and learning of Graphs of Functions to promote creative expression, mathematical reasoning, and alternative assessment.

Literature Review

Research over the last decade the concept of STEAM education has gained significant momentum over the past decade as a response to the growing demand for interdisciplinary learning. Originally rooted in STEM (Science, Technology, Engineering, and Mathematics), the integration of the Arts ("A") broadens the educational scope by emphasising creativity, innovation, and aesthetic understanding (Sousa & Pilecki, 2013). The shift toward STEAM has been validated by studies that show improved student engagement and critical thinking when lessons incorporate visual and performance arts (Colucci-Gray et al., 2019).

Incorporating technology tools such as GeoGebra and Desmos into mathematics education has also demonstrated strong potential in improving conceptual understanding. Research by Pierce and Stacey (2010) highlighted how digital tools can transform static mathematics problems into dynamic, interactive experiences that foster deeper comprehension. Similarly, Saha et al. (2010) found that the use of GeoGebra in teaching coordinate geometry significantly improved

students' performance and engagement. Integrated STEM (Science, Technology, Engineering and Mathematics), a well-known acronym in the education fraternity is implemented widely to increase students' academic achievement in both mathematics and science. However, studies show that new ideas are still in demand to increase the students' interest especially in learning of mathematics.

One of the suggested methods is to introduce cross curriculum and move away from the traditional mathematics curriculum. Therefore, by incorporating the "A" in arts through mathematical activities, students should be able to appreciate the beauty and aesthetics values of mathematics through engaging activities that are more explorative and connected with real-world tasks (Bush et al., 2016). Thus, STEAM integrated instructional practice are expected to inculcate positives attitudes related to motivation, anxiety, confidence towards learning Mathematics with the inclusion of 21st Century Skills such as creativity, collaboration, communication and critical thinking. Studies conducted by Sousa and Pilecki (2013), shows that the arts component added into STEM is able to create more critical thinking, problem solving and communication opportunities.

There is growing recognition that the mainstream education needs to be more innovative and creative in developing knowledge and pertinent skills to face the challenges in the 21st century. Therefore, teaching of mathematics should focus on activities that could lead students to their own learning with the introduction of more explorative, connected and the real-world tasks. Meanwhile, learning outcomes will be measured in students' abilities to build new knowledge that could lead to effective self-learning that would sustain life-long learners.

Researchers (Bahrum et al., 2017; Conradty & Bogner, 2018) suggests that students should be exposed to more challenging activities that needs thinking at a higher level of cognition. Taking this into consideration, higher order thinking is not only about making the questions more complicated, but rather should be the one that can transform any child into a person that appreciate mathematics and its application in real life. This scenario can be changed with the intervention of more visualisation tool that can benefit students especially the heterogenous group of high, average and low ability students.

Methodology

This research employed a mixed-methods design integrating both quantitative and qualitative data collection to provide a comprehensive evaluation of the STEAM2C implementation. The three-phase structure allowed for iterative professional learning, practical application, and reflective analysis. It focuses on the application of STEAM (Science, Technology, Engineering, Art and Mathematics) in the learning of Secondary Mathematics and the process involved in showcasing the 2C (Creative and Critical Thinking) in Mathematics lessons in the presence of graphing technological tool such as Desmos and GeoGebra.

Tasks that require creative and critical thinking with technology was introduced to the current generation of technology natives. In fact, they were given tasks that will challenge them to do better in the presence of more thought-provoking higher order thinking questions from the knowledgeable teacher. Therefore, the role of a teacher as a compulsive facilitator is very pertinent and relevant.

Instruments used included pre- and post-workshop questionnaires to gauge teacher perceptions, reflection journals, observation checklists, and interview protocols. Google Forms and

structured templates were used for uniform data collection. Technology tools used in lessons included Desmos, Graphing Calculator and GeoGebra.

Quantitative data were analysed using descriptive statistics to assess teacher learning outcomes and perceptions. Qualitative data, including classroom observations, open-ended responses, and interview transcripts to identify recurring patterns and challenges. Evidence from each phase was analysed to ensure reliability.

Results and Discussion

Here are the general findings from this research project according to Phase 1, Phase 2 and Phase 3.

Phase 1 (Hands-On Workshop)

32 mathematics teachers participated in an immersive, two-day professional development workshop designed to build capacity in using Desmos, GeoGebra, and graphing calculators within the STEAM2C framework. Quantitative findings showed a significant increase in teacher confidence and willingness to apply graphing technologies in their teaching practices, with mean perception scores improving markedly. Qualitative feedback revealed that teachers appreciated the ability of these tools to facilitate conceptual understanding, student creativity, and interdisciplinary integration. Their participation not only enhanced pedagogical skills but also cultivated enthusiasm for alternative assessment strategies grounded in mathematical reasoning and visual design.

They also responded positively in post-workshop surveys. Many indicated that the graphing technologies enabled students to visualise mathematics conceptually. One participant noted, “Desmos allowed my students to create and manipulate functions with meaning.” Another shared, “GeoGebra helped even my lower-performing students see how changes in variables affected the graph.” These reflections are consistent with findings by Pierce and Stacey (2010), who assert that the instructional value lies not just in the tool, but in how it is used to facilitate deeper mathematical understanding. Refer to table 1 and 2 for the Pre-test/ Post-test items and its related mean score.

Table 1
Pre-test / Post-test Mean Score of Phase 1

Item No	Pre-test / Post-test Statement	Pre-test		Post-test	
		Mean	SD	Mean	SD
1.	Are you planning to use any graphing technology in your teaching and learning sessions in the classroom?	3.06	0.66	4.44	0.52
2.	Have you attended any sharing session with graphing technology?	2.76	0.75	4.50	0.51
3.	Do you think graphing technology can enhance the learning of mathematics?	3.41	0.71	4.50	0.53
4.	Will you share the knowledge you gained in this workshop with other teachers at your school or other educational institutions?	3.18	0.53	4.50	0.57
5.	Do you think you can create a creative design with graphing technology just by using mathematical functions?	3.00	0.61	4.31	0.52
6.	Do you think the task to create a creative design with Graphing technology can be used as part of classroom-based assessment (CBA)?	2.94	0.75	4.25	0.60
7.	Will you recommend the use of graphing technology to other mathematics teachers?	3.00	0.61	4.50	0.63

Table 2
Overall Mean Score for Pre-test, Post-test Survey, and Mean Gained Score for Overall Score of Phase 1

	Pre-test		Post-test		Mean Gained Score
	Mean	SD	Mean	SD	δ
Overall	3.05	0.66	4.42	0.55	1.37

The comprehensive analysis of the post-test results reveals remarkable improvements in participants' acceptance and application of the workshop content. The overall post-test mean score of 4.42, paired with a standard deviation (SD) of 0.55, indicates a substantial positive impact on learning outcomes. Compared to the pre-test mean score of 3.05 (SD = 0.66), the mean gain score of 1.37 highlights a significant increase in knowledge among the 32 participants. This growth is further underscored by the reduced dispersion of post-test scores, suggesting more consistent performance across participants. Additionally, all post-survey

means scores exceeded 4.0, ranging from 4.00 to 4.50, reflecting a high level of comprehension and engagement (Nunnally & Bernstein, 1994).

Phase 2: Multiplier Effects in School Mathematics Departments

In Phase 2, the Phase 1 teachers were encouraged to conduct sharing sessions with colleagues at their respective schools. These multiplier sessions served as a bridge to scale professional learning and disseminate the STEAM2C approach. Teachers successfully conducted sharing sessions using lesson exemplars, rubrics, and student artifacts developed during Phase 1. Pre- and post-session data from their peers indicated a significant rise in awareness, interest, and readiness to implement STEAM2C in their own classrooms. These multiplier effects demonstrate the model's scalability and the efficacy of peer-led professional learning in fostering instructional change. Refer to Table 3 for the overall score.

Table 3
Overall Mean Score for Pre-test, Post-test Survey, and Mean Gained Score for Overall Score- Phase 2

	Pre-test		Post-test		Mean Gained Score
	Mean	SD	Mean	SD	δ
Overall	2.48	0.72	4.13	0.60	1.65

These findings suggest that the STEAM2C sharing successfully enhanced the mathematics teachers foundational knowledge on graphing technology and eventually on the ability to design a creative design with just mathematical functions. Even tough, there is a drop in the post-test mean score to 4.13 compared to 4.42 recorded from the teachers involved in Phase 1, it still records a higher mean gained score of 1.65. The statistically significant improvements found in this study reaffirms the relevance of graphing technology knowledge to be incorporated in the teaching and learning of mathematics especially with topics related to graphs of functions.

Qualitative feedback corroborated the quantitative gains: teachers recognised the benefit of instant visualisation, perceived graph-art tasks as catalysts for higher-order questioning, and requested extended hands-on time for deeper exploration. Collectively, the data indicate that brief, well-structured multiplier sessions can effect a substantial shift in teachers' awareness and practical readiness to operationalise STEAM2C, thereby amplifying the workshop's impact beyond the original cohort.

Phase 3: Classroom Implementation and Observations

The third phase involved actual implementation of STEAM2C lessons in three selected schools. These lessons featured graphing tasks where students used technology to explore, model, and design functions.

The actual classroom observation was divided into three parts; the first one was the first session on the sharing of knowledge on graphing technology by the mathematics subject teachers followed by some techniques on answering more effectively the exam-based questions. The following observation focused on the students' presentation of the design they created through

their creative thinking with mathematical functions. Each students was also given a good opportunity to evaluate critically their friends work and will make use of a verified evaluation rubric. The presenting student has to explain and justify his/her creative design with mathematical graphs of functions. Eventually, teacher would choose three different best designs based on both teacher and peer evaluation and the critical justifications presented.

On the whole, the graphing technological tools were able to inculcate students Higher Order Thinking (HOTS) through the Question – Answer sessions such as:

1. What is the name of the shape of quadratic equation? (Remember)
2. Is there any general pattern that you observe? Please explain (Understand and Analyse)
3. Could you explain the effect of a, b and c value? (Analyse the shape in terms of wideness and position of the graph)
4. What happens to the graph when $b = 0$, $b > 0$, $b < 0$? Please explain. (Analyse)
5. How is the graph when $a = 0$? (Understand)
6. What is the effect of the c value? (Analyse)
7. In your opinion which one is more different? Why? (Analyse)
8. What are the strategies you employed to make sure it works? (Apply, Analyse & Evaluate)
9. What did you learn after completing this design activity? (Creative)
10. What are the other types of functions and its associated graphs that you know? (Creative and Critical)
11. How are these graphs and functions that we learn is useful for us? (Analyse & Creative)

There are also more critical thinking questions that can be posed either by the students to their presenting peers or by the teachers themselves. Some example questions are:

- What are the possible values?
- Write down your understanding…
- Can you explain the connection that you observe?
- How do you arrive at the answer? Explain your findings.
- What do you understand about the x-intercept?
- What do you understand about the y-intercept? Explain your answer
- Compare your answers. Are they the same?
- Please elaborate on your answer.

Thus, students could be given opportunity to explore, investigate, explain and give reasons to support their answers.

Meanwhile, the role of the teacher is to:

- Observes and listens to students as they present and explain their work.
- Plays the role of a facilitator.
- Corrects any misconceptions that appears during their explanation.
- Pose more thinking questions.
- encourages and create opportunity for other students to ask questions

Graphing tools such as Desmos, Graphing Calculator and GeoGebra were used as the cognitive tool, whereby the participants will do the thinking as Graphing Technology will be able to show the relationship between the Graphical (visual), Algebraic (equation) and Numerical (tabular). (Talib et al., 2019).

Conclusion

The outcome of this study can support the need for a change in today's education. Taking into consideration the fast-paced, ever changing 21st century workplace demands for critical thinkers, confident problem-solvers and technology savvy innovators with a thirst for lifelong learning. Students are also required to be equipped with skills that will ensure their prosperity in tomorrow's world (Budhai & Taddei, 2015).

Importance should be given to the expansion of students' creativity and critical thinking in solving mathematical tasks as well (Abdullah et al., 2016). This means, the solution to a task should not be a fixed answer or at least should give the student an opportunity to try to solve the task in multiple methods. This will automatically create a room for students to reflect on their cognitive strategies that requires planning, monitoring and evaluating their own strategies. Eventually, the lesson can inculcate them to be risk takers and more logical in exploring the mathematical concepts especially in the presence of technology.

Students ought to be given an exposure to "Think out of the box" before throwing all the difficult questions at them. Therefore, there is a need to improve the instructional method in the classroom so that it is not always the end results (students score) that matters. Opportunity should be given to explore the knowledge that students have gained in the classroom and then apply it in more creative manner according to their critical thinking ability (Bellanca, 2014; Kivunja, 2015).

The positive findings from this study can also be used to justify that the focus on teacher training should move away from isolated technology training and gear towards integration of technology into the curriculum to help teachers use technology to support student-centered pedagogy which allows more interaction and expression of students creative and critical thinking and learning as evidence of active learning (Rohid & Rusmawati, 2019; Saldo & Walag, 2020).

The Power of Environments in Social and Emotional Learning

Jennifer Wong-Powell, JWP Consulting – Inspired by Children, Ethiopia

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Compelling research and literature demonstrate the significant impact of social and emotional learning (SEL) on young children. There is a strong correlation between well-developed social and emotional skills and positive academic outcomes, healthy relationships, and the competencies children need to navigate the unfolding future. Adults play a central role in fostering social and emotional skills. Equally important are the environments created for and with children. Emotional, psychological, and physical environments shape children's well-being; their sense of safety and belonging; as well as their engagement and motivation to learn. Environments have the power to facilitate SEL. Why leave it to chance? Using an action research approach, this presentation details trends emerging from a workshop series titled "The Power of Environments in Social and Emotional Learning". Through a thematic examination of data, key findings from this research contribute to a deeper understanding of: 1) the application of frameworks to plan for SEL with intentionality and consistency; 2) a focus on building psychological safety in an early years context; and 3) the messages spaces convey about children's social and emotional learning and development. These findings provide a foundation for further exploration of approaches, strategies, and tools to enhance SEL in early years settings.

Keywords: social and emotional learning, environments, psychological safety

Introduction

Today's children are experiencing unprecedented social and emotional challenges (Frey et al., 2022; Haidt, 2024; Hannigan & Hannigan, 2021). With overstructure and management in the real world and under protection in the digital landscape, children are becoming an increasingly fragile generation. Thus, social and emotional learning (SEL) is at a crossroads.

While SEL is not a new discussion, the current context in which children are growing up necessitates a shift. Students have always learned social and emotional skills. However, SEL remains part of a hidden curriculum, not explicitly taught with intention and fully integrated into the classroom fabric (Frey et al., 2022). This type of learning is not effective and unsustainable. SEL requires a deliberate, explicit presence in schools. The most important question is not about the merits of different programs that support social and emotional development or which one to use. The question should be about how teachers authentically integrate SEL into everyday practice and interactions with children.

In the 2022 Transforming Education Summit (United Nations Educational, Scientific, and Cultural Organization [UNESCO], 2022), a global call to action was issued, urging a prioritization of children's social and emotional development and well-being. SEL is not an add-on. It is learning that matters. Early childhood teachers play a crucial role in driving this commitment. Like any other skill, social and emotional competencies must be taught and it begins early in life.

Why SEL? What Does the Research Say?

There is broad support and growing evidence that consistently show social and emotional learning makes a powerful difference (Collaborative for Academic, Social and Emotional Learning [CASEL], n.d.-a). It helps children build mental wellness and healthy well-being by equipping them with strategies and tools to understand and manage their emotions; face challenges with perseverance and resilience; and develop skills for learning and life (United Nations Children's Fund, [UNICEF], 2020). Developing these skills at an early age sets children up for future success. SEL also shape healthy behaviors as it encourages empathy, positive relationships, and responsible choices that extend well beyond the classroom (UNESCO, 2022). These play an important role in children's overall well-being and their capacity to learn. At the same time, SEL strengthens learning and academic achievement (CASEL, n.d.-b). When students feel safe, supported, and connected, they are motivated and able to engage more deeply and perform at their best. SEL therefore equips children to be successful today and prepares them for the future. It supports them with the adaptability, collaboration, and problem-solving skills needed to navigate an increasingly complex world.

A structure to support the development of social and emotional skills is essential. A framework like CASEL guides the development of knowledge, skills, and attitudes across five competencies. It supports the creation of equitable learning environments and offers evidence-based SEL strategies to implement.

The CASEL framework was chosen for this study as it is widely recognized, research-backed, and adaptable across diverse educational contexts. It provides a comprehensive structure for integrating SEL skills into schoolwide practice including self-awareness, self-management, social awareness, relationship skills, and responsible decision-making. The table below details each of the competencies, however is not exclusive.

Table 1
CASEL Framework (2020)

CASEL Competencies	Description
Self-awareness	• Understanding own values, thoughts, and emotions • Knowing one's personal and social identities • Having a sense of purpose • Identifying own prejudices and biases • Being aware of own strengths and challenges
Self-management	• Being able to effectively manage own thoughts, behaviors, and emotions across situations • Having self-discipline and self-motivation • Setting personal and collective goals • Using stress-management strategies • Practicing planning and organizational skills
Social awareness	• Taking on different perspectives • Empathizing with others and showing compassion • Being sensitive to diverse backgrounds, cultures, and contexts • Knowing own impact on others
Relationship skills	• Forming and maintaining positive relationships • Collaborating in a team • Understanding social demands • Resolving conflict in constructive ways • Knowing when to offer support or challenge to others
Responsible decision-making	• Making constructive and caring choices on a personal level and across diverse social interactions • Reflecting and knowing one's impact to promote personal and social well-being • Analyzing information, data, and facts to make reasoned decisions

Note. Adapted from Wong-Powell, 2023

The CASEL framework is beyond a set of skills. It is an essential foundation for children's well-being and preparing young people for the world ahead. It is about a recalibration for the next generation, necessitating a shift in how learning experiences and environments are planned and designed to support children in developing the social, emotional, and academic skills they need to flourish. When thinking about SEL in this manner, it raises an important question: *Can we really leave the development of these competencies to chance?*

An Action Research Approach to Social and Emotional Learning

The purpose of educational action research is to engage in systematic inquiry to evaluate pedagogy and practice, and improve areas that impact student learning (Clark et al., 2020). The participative and collaborative nature empowers teachers to take ownership of learning and school improvement as they plan, design, implement, evaluate, revise, and refine their practice in real-time.

Given the increasing social and emotional challenges children are facing today, teachers identified there is a pressing need to focus on social and emotional learning in early childhood education. This study was initiated to respond to this urgency, exploring the impact of a structured approach to embed SEL into practice and enhance its effectiveness. Thus, the question framing this study is: *What impact does participation in an SEL workshop series have on teachers' approaches in nurturing young children's social and emotional skills?*

The workshop series titled "The Power of Environments in Social and Emotional Learning" involved 22 early childhood teachers working in international schools in Asia and Europe. The series consisted of three 90-minute sessions delivered virtually. The intent behind this model was to provide a structure that enabled participants to learn, apply, and reflect on their SEL approaches and on-the-job practice through synchronous and asynchronous engagements. Also, collaboration with peers working in different schools across the globe provided diverse educational, cultural, and social contexts to give a wider perspective on experiences, knowledge, and ideas. Consequently, the workshop series provided a structured, iterative, and collaborative framework for this study.

Methods

Three data sources were used to triangulate for validity and reliability as well as for depth and nuance in data.

First, data were gathered at an individual level. Self-assessments were used to capture teacher perceptions of their knowledge, confidence, and current practice in supporting student development of social and emotional skills. Participant reflections offered both verbal and written insights, providing qualitative data on teachers' on-the-job experiences. The use of exit tickets at the closure of each session served as formative check-ins to record immediate learning or shifts in thinking based on the content presented. Participants also completed a webinar evaluation form at the end of each session to gather further data on perceived learning, immediate applicability, and learning needs. At the end of the workshop series, an impact survey was administered to collect data on participants' overall learning; changes in and impact on knowledge, practice, and behavior; perceived effects on student development; and sustainability in practice.

Second, data were collected at a collaborative level. The teachers engaged in non-judgemental peer feedback using protocols which provided data on the application of concepts and professional development throughout the course. The feedback enabled teachers to identify areas for improvement and plan for next steps. Participation in small-group dialogue and engaging in collaborative inquiries captured how the teachers built shared understanding and generated practical strategies around SEL.

Third, data gathered occurred at a collective level. The whole group engaged in processing and reflection throughout the workshop series. This provided a collective voice, allowing teachers to identify patterns; areas of agreement and tensions; and shifts in thinking. It also helped synthesize insights from individual and collaborative work.

Analysis

The analysis of data was approached in three complementary ways to provide a richer and more robust understanding of the impact of participating in an SEL workshop series.

From all data sources, recurring words, phrases, and statements were identified through frequency analysis. NotebookLM was employed to cross-reference findings. Beyond simple counts, the analysis considered the context and sentiment of repeated units, providing an interpretation of those counts to capture meaning and the significance behind participant responses.

Using thematic analysis, patterns in thought were also examined. Themes were identified from the most significant and consistent units that were supported across data sources. Attention was given to shifts in thinking and perspectives including changes in how participants understood SEL; application of workshop content and resources in practice; and how the teacher's role in supporting children's social and emotional development was reimagined.

Finally, connections and nuances across data sources were detected. By identifying connections, it revealed the relationships between themes, leading to a more integrated understanding of findings. By exploring nuances, diverse perspectives and contexts were acknowledged in this international group of participants. Changes over time were also explored. By comparing early reflections and webinar evaluations with later ones, development and impact strengthened findings.

The analysis was shared with teachers to ensure their participation in the process. It also served to strengthen the accuracy and credibility of findings, and promote transparency about the impact of the workshop content on practice and student social and emotional development.

Findings

The analysis revealed key themes of impact from the workshop series including:

1. integrating social and emotional learning with intentionality and consistency;
2. building psychological safety as the condition for SEL to flourish; and
3. having the power to shape learning environments to convey messages about SEL.

With Intentionality and Consistency

The findings show that when professional learning for SEL is structured, teaching and supporting social and emotional development becomes more intentional, consistent, and purposeful. As one teacher noted:

> The most significant takeaway for me was understanding how intentional use of the physical environment can support and enhance children's social and emotional development. I learned that even subtle changes in classroom setup, materials offered,

or the atmosphere we create can influence children's sense of belonging, emotional regulation, and peer relationships.

The webinar series equipped teachers with resources and empowered them with recommended practices, enabling them to integrate SEL more intentionally. The PERMA framework (Positive Emotion, Engagement, Relationships, Meaning, and Accomplishment) developed by Martin Seligman (2011) was introduced as its elements support the development of well-being, self-growth, and relationships. The framework was therefore used to strengthen SEL integration in a meaningful way. Table 2 details how PERMA supports SEL.

Table 2
PERMA Supporting SEL

Elements of PERMA Framework	Connection to SEL Competencies
Positive Emotion	When children experience positive emotions like belonging, connection, and purpose, they are more attuned to their internal states (self-awareness) and they can better manage their emotions (self-management).
Engagement	Engagement enables children to experience flow as they remain focused and self-motivated. It allows them to demonstrate agency as they set goals, and plan and organize initiatives (self-management). Engagement also helps children make constructive choices, and express their curiosity and open-mindedness (responsible decision-making).
Relationships	This element supports the ability to establish and maintain healthy and supportive relationships (relationship skills) and to effectively navigate settings with diverse individuals and groups with empathy and compassion (social awareness).
Meaning	When children have a sense of purpose, they connect to personal values (self-awareness) and they set goals for themselves based on these (self-management). When they find meaning, they see themselves as contributors to something larger, reflecting and evaluating their personal, interpersonal, and community impact (responsible decision-making).
Accomplishment	Experiencing success and achieving goals give children a sense of accomplishment. This process requires self-efficacy and a growth mindset (self-awareness), and self-motivation and resilience in challenging times (self-management).

While the teachers experienced the benefits of using the PERMA framework to be more intentional about SEL, it was also necessary to have a structure to maintain consistency. The SAFE model (Sequenced, Active, Focused, Explicit), popularized by Durlak et al. (2011), provided this foundation. The teachers realized that SEL needed to be *sequenced* with thoughtfully planned and designed learning experiences that were connected and provided in a way where the competencies complemented each other and were mutually reinforcing. This

involved an *active* approach to learning where students were given opportunities to problem-solve and make real-life applications. Therefore, SEL required *focus* where time and attention to supporting children's social and emotional development were deliberate. Additionally, learning was made *explicit* as specific competencies were targeted and children were aware of the skills they were practicing and using.

In the end, the PERMA framework and SAFE model ensured a balanced approach, giving attention to each social and emotional competency where none were overlooked or underrepresented. The teachers felt that the resources held them accountable for integrating SEL into daily practice in purposeful and meaningful ways. As one teacher concluded:

> The webinar helped me see how intentionally designed environments can support social and emotional learning in powerful, everyday ways. I plan to apply what I've learned by intentionally creating a more responsive classroom setup that encourages independence, collaboration, and emotional regulation.

Building Psychological Safety

While intentional and consistent approaches using the PERMA framework and SAFE model supported children in building their social and emotional skills in purposeful ways, the teachers emphasized that deliberateness is only effective when paired with psychological safety. Children need to feel accepted, safe, and respected in order to take risks, express emotions, and fully engage in learning without fear of judgment. Without this, even the most well-planned and designed engagements will not achieve their intended impact.

This led to an exploration of "yes" and "no" environments and language. "Yes" fostered trust and encouraged children's curiosity, experimentation, and participation. It signalled that their ideas, questions, and efforts were being invited, honored, and valued. "No", even when unintentional, limited exploration, reduced engagement, and sent subtle messages that some behaviors and contributions were not welcomed. Changing or reframing to "yes" had a significant impact. "Yes" environments and language contributed to children's sense of safety because they were being heard and valued. As the teachers shared their shifts in practice:

> Participant 1: I'm using what I learned about creating a 'yes environment' by giving children more choices, using positive words instead of saying 'no,' and setting up the classroom so they can do things by themselves more easily.

> Participant 2: During the course, I learned how powerful it is to shift from saying 'no' to offering positive alternatives that guide children's behavior while still respecting their curiosity. This approach helps children feel understood and encourages them to explore in a safe and appropriate way.

Being thoughtful and purposeful about how they planned and designed their environments, the language they used, and their responses to children, the teachers gave more attention to practicing "yes". As Elkins (2019) writes in her article on creating "yes" environments, "Saying yes as often as possible empowers children to make positive choices and have more control in their daily lives. It builds high-quality teacher–child relationships, limits teacher intrusion, increases authentic learning experiences, and promotes independence and self-esteem" (para. 2). Understanding the powerful effects of "yes" environments and language, one teacher concludes: "I will very much try to think of how to turn a 'no' into a 'yes'!"

Shaping Learning Environments

With intentionality and consistency, and recognizing psychological safety as the foundation, the teachers also came to understand the impact learning environments have on children's experiences. Spaces have the power to send specific messages and expectations about SEL. Every choice the teachers made about their environments held significance. Thoughtfully planned and designed learning environments were just as important as intentional and purposeful learning experiences. As some teachers reflected:

> Participant 1: The biggest thing I learned is that the way we set up our classroom really affects how children feel and behave. A calm and friendly space helps them feel safe, manage their emotions, and get along better with others.
>
> Participant 2: The most significant takeaway has been understanding how a supportive and empowering environment enhances children's ability to express emotions and build relationships.
>
> Participant 3: The webinar provided valuable insights into how the physical and emotional environment can be intentionally designed for learning. For example, I will incorporate more natural elements, and quiet corners to help children regulate their emotions. I also intend to set up visual prompts and SEL-focused areas where children can reflect, express their feelings, and engage in cooperative activities.

Consideration and forethought in creating spaces that inspire, nurture, and support children's social and emotional development are essential. It goes beyond basic planning and design. The workshop series enabled teachers to engage in ongoing reflection on their environments and its impact based on the messages being signalled. The teachers then used their assessment to rethink their spaces to optimize SEL opportunities.

Implications

The findings of this study hold important implications for practice. Table 3 presents the outcomes for students, teachers, schools, and research.

Table 3
Implications of Structured Professional Learning

Impact On	Practical Implications
Students	• Participate in more planned and purposeful SEL engagements • Experience SEL in more authentic and integrated contexts • Support in becoming more independent, self-directed learners • Develop future readiness and foundations for lifelong skills
Teachers	• Increase confidence and intentionality in practice • Gain practical approaches, strategies, and tools for SEL integration • Foster a deeper awareness of the values and expectations communicated through student-teacher interactions and environments • Reflect on the impact of environments on social and emotional development • Implement changes to create more supportive classroom environments
Schools	• Develop a shared language and vision for SEL to strengthen coherence • Contribute to a safe and healthy culture focused on well-being • Make data-informed decisions to improve SEL practices • Build professional capital (Hargreaves & Fullan, 2012)
Research	• Add to literature base with focus on SEL in early childhood education • Provide a model for action research by demonstrating how cycles of reflection, practice, and adjustment can empower teachers as researchers of their own classrooms • Offer a promising approach that can be adapted to support children's social and emotional development

Given the implications for practice, structured professional learning is essential to effectively support student social and emotional development.

A workshop series presented in this study is even more critical given that few opportunities exist for teachers to develop their knowledge and skills around teaching SEL (UNESCO, 2024). According to the authors of "Implementation of Social and Emotional Learning" (Dobia et al., 2020), one of the key challenges to implementing SEL is the provision of adequate time given to teacher professional learning and few teachers receive training in SEL during their pre-service learning. A mixed-methods study substantiates this claim with teachers reporting a lack of training for delivering SEL (Schiepe-Tiska et al., 2021). Priorities therefore need to be given to professional learning, embedding SEL into ongoing teacher development and training. A workshop series can close the gap and provide teachers with the professional learning needed to effectively integrate SEL into pedagogy and practice.

Limitations and Recommendations

Although the implications for practice are promising, this study has several limitations including being context-specific as the findings reflect those teaching in an international school setting. Additionally, the small sample size limits the range of experiences and perspectives captured. Also, being that the workshop series was held within a short time span of three 90-minute sessions, the longer-term impact on teacher practice and children's social and emotional development was not fully observed. Finally, the data sources presented participant subjectivity on how they perceived and interpreted the impact of the workshop series on their practice.

While the limitations present constraints to the study, there are recommendations for practice and research. Supported by UNESCO's 2024 executive summary on mainstreaming social and emotional learning, teacher education and professional learning are essential to successfully integrate SEL. However, there remains a need to provide educators with adequate training and ongoing professional development (Hamilton & Doss, 2020; Huck et al., 2023; Oliveira et al., 2025). A workshop series on SEL can address this, providing schools with a model to offer professional learning opportunities.

In addition to offering a model, the workshop series gives a structured way to support teacher reflections that are necessary for the sustainability of SEL practices and an SEL-based culture (CASEL, 2021; Hausburg, 2024; UNESCO, 2024). Not only does it develop teachers' self-awareness to become more intentional about modelling social and emotional competencies, reflection also enables teachers to identify progress and areas for improvement to align with school priorities and ensure systematic and systemic SEL implementation. Providing a workshop series empowers teachers to engage in an iterative cycle of reflection, offering approaches, strategies, and tools to measure and evaluate impact, success, and school development.

For future research, there are also promising directions. Studies could replicate this work in different schools and across contexts to expand on scope and to test its generalizability. Extending the time span would also allow observations of longer-term effects on teacher practice and children's social and emotional development. Besides gathering the perspectives and voices of adults, incorporating children into the data gathering process and reflections would provide greater depth of understanding. Finally, a mixed methods approach with both qualitative and quantitative sources would strengthen the evidence to provide more comprehensive findings.

Conclusion

The teachers who participated in the workshop series understood the need to be intentional and consistent in their approach to SEL, that psychological safety is essential to children's social and emotional well-being, and that the choices they make about their learning spaces affect the messages and expectations communicated about SEL. While the study was context-specific, used a small sample size, held in a short time span, and presented participant experiences and perceptions, the implications of professional learning surpass the limitations.

With a growing "Anxious Generation" (Haidt, 2024), the urgency to pay attention to and support children's social and emotional development is imperative. To effectively integrate SEL into practice, teachers require training and ongoing professional development. In turn, SEL is provided in a more effective way through a structured, deliberate, and meaningful approach. This study makes a case for a workshop series to provide teachers with opportunities to develop their skills, reflect on their practice, and adjust their approach to optimize impact.

Acknowledgements

Thank you to the teachers who participated in this workshop series. Prioritizing SEL and dedicating your time on supporting children's social and emotional development will drive meaningful change with the well-being of our children at the heart.

Competencies in Transdisciplinary Thinking: Development of a Measurement Instrument for Tertiary Students

Clarice Sim, Singapore Polytechnic, Singapore
Li Min Chong, Singapore Polytechnic, Singapore
Mark Lu, Singapore Polytechnic, Singapore

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

With the world and its challenges growing in complexity, singular disciplines are no longer sufficient to solve these multifaceted issues. Transdisciplinary Thinking, a skill to connect the dots among disciplines in order to transcend their boundaries, is increasingly recognized as a means for addressing many of today's complex social challenges through innovative problem-solving. Despite the increasing recognition of the importance of Transdisciplinary Thinking, there is no consensus on its conceptual definition, nor is there a validated instrument to measure this construct as a competency. This is a critical gap in transdisciplinary education, in the context of teaching, evaluating and assessing educational initiatives aimed at developing this important ability in students. In this paper, we tested out self-report survey items with a local and international expert panel (n = 8), refined the items based on expert feedback, and validated the survey with a tertiary student population (n = 100) through an exploratory factor analysis. The results suggest a unidimensional construct of Transdisciplinary Thinking with 19 items. The survey instrument is shared in this paper. At the presentation, we also shared classroom activities and real-world student projects to help nurture students in Transdisciplinary Thinking. Our work on measuring Transdisciplinary Thinking and teaching it in a classroom setting will be beneficial to other educators seeking ways to evaluate and foster holistic development in their students.

Keywords: transdisciplinary thinking, measurement instrument, tertiary education

Introduction

The term "transdisciplinary" was first conceived in 1972 by Swiss psychologist Jean Piaget, who saw it is a "higher stage succeeding interdisciplinary relationships … which would not only cover interactions or reciprocities between specialized research projects but would place these relationships within a total system without any firm boundaries between disciplines" (Piaget, 1972, as cited in Bernstein, 2015, p. 2).

Transdisciplinary Thinking is now increasingly recognized as a means for addressing complex problems beyond the reach of a single discipline, by being able to "add new dimensions and perspectives", and thus "give rise to more innovative, holistic solutions" for the progressively complex problems the world faces (OECD, 2020: 15, 24).

In Singapore, the value of fostering Transdisciplinary Thinking for creative problem-solving and innovation to address multifaceted problems is also at the forefront. A government initiative called SkillsFuture Singapore (SSG) identified Transdisciplinary Thinking as a "Critical Core Skill" essential for employees across all industries to do well in an increasingly complex economy. Also, the Design Education Advisory Committee (DEAC), launched by the Singapore Ministry of Trade and Industry, has a key pillar to "champion transdisciplinary learning", in order for students to "engage different disciplines to synthesize knowledge and make meaning". By applying Transdisciplinary Thinking to real world complex challenges, it can "spur innovation that defy traditional silos of knowledge" (DEAC, 2024).

In line with DEAC's forward strategy, the Singapore Polytechnic created a new Diploma in Media, Arts and Design in 2020, bringing together three different schools (School of Communication, Arts and Social Sciences, School of Design and School of Digital Media, and Infocomm. Technology) and eight disciplines (e.g. animation, applied psychology, creative writing, games development and music). A signature pedagogy of the diploma program focuses on Transdisciplinary Thinking, where students from mixed disciplines work together on real-world projects to create innovative solutions for complex problems like sustainability and active aging.

Despite the acknowledgement of the importance of Transdisciplinary Thinking at the global, local and institutional level, there is still a lack of consensus on a conceptual and operational definition of what Transdisciplinary Thinking is. This paper captures the ongoing research that the authors are doing towards developing and validating a survey instrument for measurement and evaluation of Transdisciplinary Thinking among students. We developed a preliminary set of survey items from a literature review, obtained feedback from an expert panel to test for content validity. Then, we administered the revised survey with a tertiary student population to check for structural validity. The results of the validated survey instrument point to a unidimensional Transdisciplinary Thinking construct consisting of 19 items (in Appendix B).

Literature Review

Sharpening the Understanding of Transdisciplinary Thinking

While recognizing the increasing importance of Transdisciplinary Thinking in society, a challenge faced by educators is that there is still a lack of agreement on definitions of even the terms "multidisciplinary", "interdisciplinary", and "transdisciplinary" (Design Council UK, 2010). Further, related concepts like transdisciplinary learning (e.g., Payne & Jesiek, 2018),

transdisciplinary research (Hadorn et al., 2008), and transdisciplinarity (e.g., Augsburg, 2014) overlap in their conceptual definitions. Finally, Transdisciplinary Thinking has been conceived as a *skill* (e.g., Henriksen, 2018), an *ability* (e.g., SSG, n.d.) or a *disposition* (e.g., Drake, 2021), making things even murkier. An unclear definition of what Transdisciplinary Thinking makes it difficult for educators to purposefully design their curriculum to teach and assess Transdisciplinary Thinking.

Given our Singapore context, we start out our conceptual definition using the definition from SSG, which defines Transdisciplinary Thinking as having two main dimensions: knowledge and ability. Despite the word "thinking" in the construct, we conceptualize Transdisciplinary Thinking as a *competency* consisting of knowledge and ability, as per SSG.

Our overall conceptual definition of Transdisciplinary Thinking is the ability to connect the dots by integrating knowledge, skills and abilities across disciplines, to create innovative solutions beyond the reach of any single discipline, for real-world complex problems.

A further literature review points to the following three possible sub-dimensions:

- *Perceiving:* This involves viewing and understanding an issue from the perspective of different disciplines (Henriksen, 2018; OECD, 2020; Sim et al., 2022), mutual learning (Payne & Jesiek, 2018), exploring/exchanging perspectives from different sources of information (Chew et al., 2020; SSG, n.d.), and consciously breaking away from "disciplinary boundaries" (Finch et al., 2021).
- *Synthesizing:* Transdisciplinary Thinking requires "integration efforts" (Payne & Jesiek, 2018) to synthesize knowledge from other disciplines "in a multi-faceted and cohesive way" (Henriksen, 2018), and to be able to recognise synergies and patterns across different disciplines (Chew et al., 2020; SSG, n.d.) so that new knowledge is gained (Henriksen, 2018; Sim et al., 2022).
- *Solutioning:* This involves combining different disciplinary skills to address a complex issue (Sim et al., 2022; SSG, n.d.), "[creating] models of things or processes that explain the real world" (Henriksen, 2018), and arriving at innovative solutions beyond the reach of any single discipline (OECD, 2020).

From our conceptual understanding of Transdisciplinary Thinking and the possible three sub-dimensions, we formulated an initial 18 items which were carefully refined based on feedback from an expert panel and further validated with a student population. We seek to answer the following research questions:

- RQ1. Do the survey items have high content validity for the Transdisciplinary Thinking construct?
- RQ2. What is the factor structure of the Transdisciplinary Thinking construct?

Method

Research Design

A systematic process following established methods for instrument development and content validation was used (Lawshe, 1975; Zamanzadeh et al., 2015), to ensure both the reliability and validity of the measurement instrument for Transdisciplinary Thinking.

Pursuant to the literature review, an initial draft 18 items were developed, which were then thoughtfully refined based on feedback from an expert panel as well as a student population.

First, we consulted an expert panel, consisting of local and international industry experts, academics, and educators, and obtained their insights on the draft survey items. We calculated the content validity index and carefully revised the draft survey items based on the expert panel feedback. After revision, we further validated the survey with a tertiary student population and conducted an exploratory factor analysis.

Appendix A includes the draft survey items before and after revisions from the expert panel feedback. Appendix B shows the latest 19 survey items after both the expert panel and the student validation exercise.

Expert Panel Participants and Analysis Procedure

We purposefully selected members of the expert panel based on their prior experience with transdisciplinary or interdisciplinary work, and intentionally included both local and international experts, for more comprehensive feedback. The criteria for inclusion were 3 years or more experience with developing curriculum for cross-disciplinary student projects, prior research in interdisciplinary or transdisciplinary research, and/or working on interdisciplinary or transdisciplinary work in the industry. For example, one expert was an educator who had years of experience developing and leading cross-disciplinary projects for students in a higher education institution using design thinking. Another had close to a decade of experience in an agency which helped leaders and organisations innovate through a transdisciplinary strategy, design and practice. Emails were sent to the identified expert panel members and we received returns from eight of them.

To check for content validity of the survey items, which is the degree to which an instrument adequately covers the content domain (Polit & Beck, 2006), the expert panel was asked to rate how relevant each item was to the overall concept of Transdisciplinary Thinking and the sub-dimensions using a 4-point scale (1 = not relevant at all, 2 = somewhat relevant, 3 = quite relevant, 4 = highly relevant). The expert panel was also asked to provide qualitative feedback, so as to determine the alignment of the items with the sub-dimensions of the survey instrument. Item-level content validity index (I-CVI) scores, scale-level content validity index based on average method (S-CIV/Ave) were calculated (Polit & Beck, 2006).

The scales were judged to have excellent content validity if they composed of items that had I-CVI of .78 or higher and S-CVI/Ave of .90 or higher. For items and scales that did not meet this requirement, we looked closely at the expert panel's qualitative feedback, drawing on their collective experience and insights, and carefully revised the items.

Student Participants and Analysis Procedure

After revising the instrument based on the expert panel feedback, we further tested the instrument with a tertiary student population. Students aged 17 to 19 years old, who were studying in a higher education institution, were sent emails to complete the survey. We targeted students from varied disciplines and years of study for a more diverse sample to test the instrument.

Students rated their level of agreement to the questions, answering the survey as they normally would, when the survey is used for evaluation in a module. 100 students completed the survey. Table 1 shows the demographic profile of the students.

Table 1
Student Demographic Profile

	Student demographic profile (n = 100)
Year of Study	Year 1 (41%) Year 2 (33%) Year 3 (26%)
Discipline	Architecture & Built Environment (8%) Computing (1%) Chemical & Life Sciences (29%) Engineering (16%) Media, Arts, & Design (34%) Business (7%) Maritime Studies (5%)

To check for structural validity, exploratory factor analysis (EFA) was run. As guided by Costello and Osborne (2005), principal axis factoring (PAF) was employed to explore the underlying factor structure of the survey items. PAF will look at the common variance which is more suitable for our needs as we seek to arrive at a more concise conceptual understanding of the latent constructs that underlie the measured variables of Transdisciplinary Thinking (Fabrigar et al.,1999).

Results

Expert Panel Validation

The item-level content validity indexes (I-CVI) and scale-level content validity indexes using average method (S-CVI/Ave) are presented in Table 2.

Items with I-CVI lower than .78 were carefully reviewed and qualitative feedback from the expert panel were thoroughly considered in the revisions (Lawshe, 1975; Zamanzadeh et al., 2015). Two items were retained as these items were very close to .78 and the qualitative feedback revealed no significant issues, five were revised and one was dropped. An additional item was added to the Perceiving sub-dimension after considering the qualitative feedback. This content validity analysis and careful review, with the expert panel's inputs based on their years of experience, enhanced the validity of the revised instrument for the next stage of reliability analysis with the student population.

Table 2
I-CVIs and S-CVI/Age of the Survey Items

Sub-dimension and items	I-CVI	S-CVI/Ave	What revisions we did
Perceiving (excluding PER3 and PER7)		.90	
PER1	1.00		
PER2	1.00		
PER3	.63		Revised to: "Recognise another discipline's strengths and limitations in understanding an issue"
PER4	.88		
PER5	.75		Retained as item was close to .78
PER6	.88		
PER7	.63		Revised to: "See an issue in a new way after considering information from different disciplines"
Synthesizing (excluding SYN5)		.94	
SYN1	1.00		
SYN2	1.00		
SYN3	.88		
SYN4	.88		
SYN5	.50		Revised to: "Move beyond my discipline to integrate information and perspectives from different disciplines"
Solutioning (excluding SOL1)		.88	
SOL1	.63		Revised to: "Try out new skills from different disciplines to explore solutions"
SOL2	.88		
SOL3	1.00		
SOL4	1.00		
SOL5	.75		Retained as item was close to .78
SOL6	.75		Revised to: "Move beyond my discipline to propose solutions that integrate skills from different disciplines"

Note. The expert panel was instructed to rate how relevant each item was to the sub-dimension (1 = not relevant at all; 4 = highly relevant). The CVIs were calculated using the formulas from Polit and Beck (2006). See Appendix A for the wording of the items.

Student Validation

After the expert validation, we further continued with the next phase of validation by testing with the student population. 100 students completed the revised survey with 19 items. Prior to conducting the Exploratory Factor Analysis (EFA), the suitability of the data was assessed. The Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy was .94, establishing that there was sampling adequacy for the EFA to proceed. In addition, Bartlett's test of sphericity was significant, $\chi^2(171) = 1670$, $p < .001$, further supporting the factorability of the correlation matrix.

With both KMO and Bartlett's test of sphericity establishing suitability for factoring of the data, we proceeded with Exploratory Factor Analysis (EFA). The scree plot of the EFA using Principal Axis Factoring (PAF) is in Figure 1. Number of factors were determined by examining the scree plot to look for the point at which the slope of the curve levels off, forming an "elbow" (Cattell, 1966), which is at Factor 1 in Figure 1.

Figure 1
Scree Plot

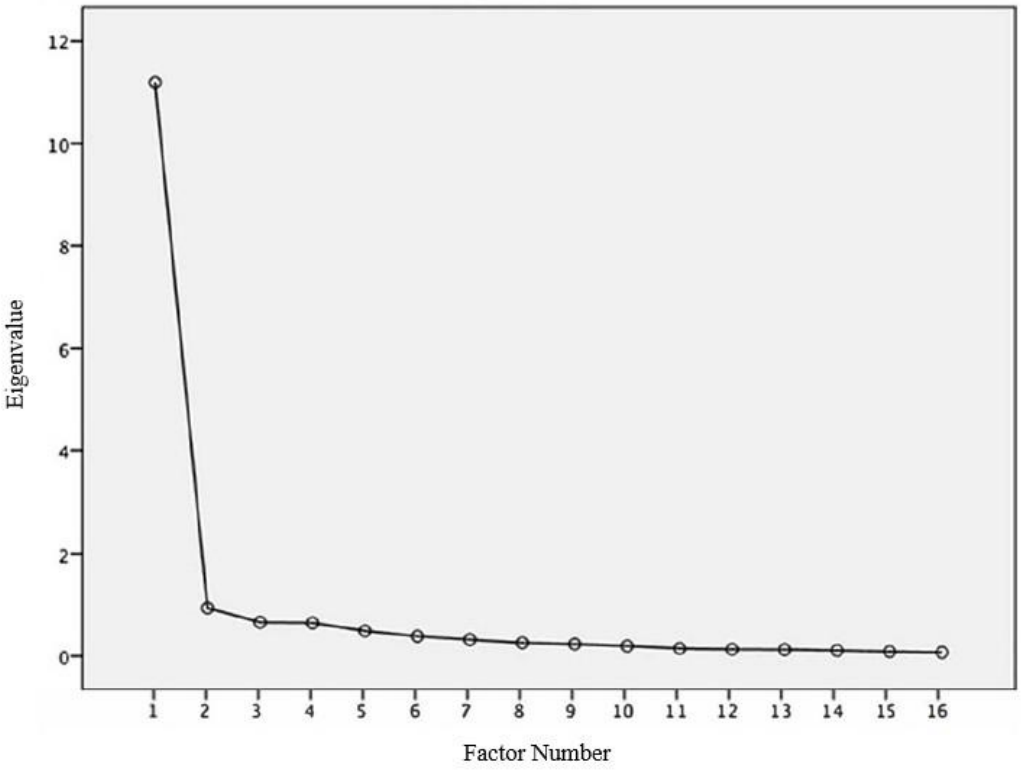

Table 3
Eigenvalues and Variance Explained

Factor	Eigenvalues	% of Variance
1	11.20	70.00
2	.94	5.86
3	.66	4.12

The EFA results point to a unidimensional construct for Transdisciplinary Thinking, with Factor 1 explaining 70.0% of the total variance. Subsequent factors explained less than 6% of the variance, providing strong evidence for a unidimensional construct for Transdisciplinary Thinking (Table 3).

Table 4 shows the factor loadings of the 19-items. The factor loadings are all sufficiently high (all above .7), also indicating a unidimensional construct for Transdisciplinary Thinking.

Table 4
Factor Loadings of the Items

Items	Factor 1 Loading
PER1	.73
PER2	.78
PER3	.80
PER4	.78
PER5	.81
PER6	.85
PER7	.82
PER8	.81
SYN1	.90
SYN2	.85
SYN3	.82
SYN4	.86
SYN5	.87
SOL1	.78
SOL2	.91
SOL3	.83
SOL4	.85
SOL5	.89
SOL6	.82

In addition, analysis of the student test data showed that the 19-items of the survey instrument has a high internal reliability, as Cronbach's alpha was a strong .92. This established the robust consistency of the instrument in measuring Transdisciplinary Thinking among tertiary students.

Discussion and Conclusion

Our analysis in this paper and our ongoing work towards a validated survey instrument to measure Transdisciplinary Thinking fills an important missing piece in our collective understanding of this important construct.

We started out with three possible sub-dimensions of the Transdisciplinary Thinking construct (perceiving, synthesizing, and solutioning). After the expert panel and student validation phases of our research, our current analysis points instead to a unidimensional construct with 19 items, where Transdisciplinary Thinking is a singular and coherent concept.

Our overall conceptual definition of Transdisciplinary Thinking is the ability to connect the dots by integrating knowledge, skills and abilities across disciplines, to create innovative solutions beyond the reach of any single discipline, for real-world complex problems. Potentially, the overarching attribute of Transdisciplinary Thinking is the underlying ability to connect the dots across disciplines in order to transcend the disciplinary boundaries, which would include "perceiving" issues from different disciplines and "synthesizing" knowledge from different disciplines as well as combining different disciplinary skills to come up with innovative "solutions".

After concluding our above expert panel and student validation exercise on Transdisciplinary Thinking and its possible sub-dimensions (perceiving, synthesizing, and solutioning), a paper to be published in August 2025 noted that a different transdisciplinary thinking scale (TTS) was recently piloted with high school students in the Philippines (Honra & Monterola, 2025), seeming to validate a multi-dimensional structure of Transdisciplinary Thinking consisting of: integrative thinking, inquiry skills and collaborative problem-solving. These dimensions differ from our analysis which points toward a unidimensional construct, and warrants further investigation. One reason for the difference could be because Honra and Monterola (2025) conceptualized their Transdisciplinary Thinking concept as a *cognitive process* among high school students in the Philippines, whereas we conceptualized it as a *competency,* per SkillsFuture Singapore's perspective in the Singapore context, and tested it with a tertiary student population.

With a well-established methodology followed for the development and validation of the 19-items Transdisciplinary Thinking survey instrument (based on literature review, expert panel validation and student validation with reliability and content validity analysis), the survey instrument can be used as a tool for educators to assess measure Transdisciplinary Thinking in tertiary students. This is an important step in our common goal of furthering Transdisciplinary Thinking as a competency in students, so as to address increasingly complex real-world challenges that cannot be solved by any single discipline alone.

In future phases of this research, the 19-items may be further tested with industry partners to check for the different instruments' external validity with practitioners and to validate the structural validity with a confirmatory factor analysis.

Appendix C shows a sample of three design-based activities that we use in the classroom to nurture students in Transdisciplinary Thinking. A presentation of our findings at the conference included the 19-item survey instrument as well as a sharing of classroom activities and real world complex project challenges that we run to develop Transdisciplinary Thinking in students. Our work on measuring Transdisciplinary Thinking and teaching it in a classroom setting will be beneficial to other educators seeking ways to foster holistic development in their students.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The authors declare that no AI or AI-assisted technologies have been used to generate, refine, or correct the content in the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

Dear Students, thank you for taking the time to participate in this survey.

Purpose
This survey aims to gather your views about working in project teams.

Instructions
Participation in this survey is voluntary. The survey should not take you more than 5 minutes to complete. As you respond to the survey statements, please focus on your current experience in project teams rather than your ideal situation. There are no right or wrong answers.

Confidentiality
The data collected will be treated in a highly confidential manner whereby all identities and responses are protected and kept confidential. Your answers will not affect your module grades or class standing in any way. Thank you for contributing to the enhancement of teaching and learning at our school!

As you respond to the survey statements, please focus on your current experience working in teams rather than your ideal situation. There are no right or wrong answers.

Your school:
Your year of study:

Thank you for your time!

Sample lesson activities and how they are used to nurture students in Transdisciplinary Thinking

	Sample lesson activity
Perceiving (i.e., Understanding and evaluating an issue from the perspective of different disciplines and exchanging perspectives beyond discipline boundaries)	**Lightning Demos** (to exchange ideas from different disciplines) Find two examples of product/service/thing **in your Specialisation's industry** that is interesting and inspires you. Take turns to share with your team members your demos. 1. The demo I would like to show you today is… ( ) 2. This company is solving the problem… 3. They did this by… 4. The important aspects of this example are… 5. This applies to our project because…
Synthesizing (i.e., the ability to integrate efforts to synthesize knowledge from other disciplines, evaluate and recognize synergies and patterns across different disciplines)	**Affinity mapping and Insights** (to synthesize and recognize synergies and patterns across different disciplines) 1. Read and highlight key points or quotes 2. Cluster and sort common points, then label each cluster 3. Summarise the key points in each cluster 4. **An insight is something that is new, interesting, and/or presents a new opportunity, perspective, or angle.** Synthesize insights by considering and connecting multiple clusters.
Solutioning (i.e., the ability to propose innovative solutions that go beyond the scope of any single discipline).	**Random Matching** (to spark new ideas by going beyond the scope of a single discipline) Individually, look at the selected ideas and add on your own take on it, from the lens of your **subject area, specialization or industry**. Add 3 pink post-its around the original idea to capture your new ideas.

Bridging the Competence Gap in Ugandan Undergraduate Legal Education

Nagadya Hamidah, Islamic University in Uganda, Uganda

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Curriculum design and development are critical for ensuring the quality and relevance of higher education. In Uganda, undergraduate legal education continues to rely on non-competence-based curricula, with each law school or faculty independently designing its own programme, which is then approved by the National Council for Higher Education and the Law Council. The problem is that, despite Uganda's shift to competence-based curricula at the ordinary secondary level, law schools or faculties continue to offer fragmented, theory-oriented programs. As a result, undergraduates possess strong theoretical knowledge but lack essential professional competencies such as advocacy, legal-drafting, ethical-reasoning, problem-solving, client-management, and critical-thinking. Consequently, law-undergraduates are inadequately prepared for contemporary legal practice, limiting the effectiveness of undergraduate-legal-education and Uganda's compliance with the United-Nations-Sustainable-Development Goal 4 (SDG 4) on quality education. The study aims to examine the structure of undergraduate-bachelor of law curricula in Uganda, identify gaps arising from non-competence-based-bachelor of law-curricula, and propose reforms necessary to establish a competence-based-bachelor of law-curriculum aligned with SDG 4. The research questions are: What is the current structure of undergraduate bachelor of law curricula in Ugandan-universities? What gaps arise from non-competence-based bachelor of law-curricula? And what reforms are necessary to establish a competence-based-bachelor of law-curricular aligned with SDG 4? Guided by an interdisciplinary-perspective drawing on educational-theory, sociological-theory, and human-capital-theory, the research is qualitative and doctrinal in nature, employing desktop-review of scholarly articles and reports. Findings indicate that non-competence-based-curricula constrain professional-readiness and underscore the urgent need for a harmonized competence-based-law-curriculum to produce practice-ready-undergraduates.

Keywords: competence-based curriculum, Ugandan undergraduate legal education, professional readiness, curriculum reform, SDG 4

Introduction

Coşkun Yaşar and Aslan (2021) note that scholars define curriculum in multiple, but closely related, ways, reflecting its complex and multidimensional role in education. They argue that curriculum goes beyond a written syllabus and should be understood as both the planned and unplanned learning experiences provided by an institution, as well as the organised structure of learning opportunities and content. Their review further shows that curriculum has been conceptualised as a comprehensive system that includes objectives, subject areas, learning experiences, and evaluation strategies, emphasising that it encompasses not only what is taught but also how learning is assessed. Drawing on Bintz and Dillard (2007), Yaşar and Aslan also highlight that curriculum is a lived experience and a tool for preparing students for life, while simultaneously functioning as a plan, a content framework, and a belief system that shapes educational practice. Taken together, these perspectives illustrate that curriculum involves the organisation of knowledge, values, and experiences. Therefore, the structure of an undergraduate Bachelor of Laws (LLB) curriculum should be understood not merely as a list of course units, but as a broader framework that integrates learning outcomes, teaching approaches, and assessment practices necessary for meaningful legal education.

Building on the above understanding, the quality of undergraduate-legal-education directly determines the calibre of legal practitioners, who subsequently influence justice delivery, policy development, and social governance. In Uganda, however, the LLB programme remains predominantly theoretical and largely non-competence-based, despite the national shift toward competence-based learning at the secondary level. This has created a clear disconnect between academic training and the practical demands of legal practice, underscoring the need to re-examine the structure and orientation of LLB curricula.

The research problem is that LLB undergraduates possess strong theoretical knowledge but many of them lack essential professional competencies such as advocacy, legal drafting, ethical reasoning, problem-solving, client management, and critical analytical skills. Consequently, LLB undergraduates are inadequately prepared for contemporary legal practice, limiting the effectiveness of undergraduate legal education and hindering Uganda's compliance with the United Nations Sustainable Development Goal 4 (Quality Education).

Currently, law schools or faculties independently design their LLB curricula, leading to substantial variation in course content, teaching-methods, and depth of coverage across universities. This fragmentation undermines consistent undergraduate competence, complicates the enforcement of minimum standards in legal research, ethics, clinical-training, and practical skills, restricts student mobility and credit transfer, and limits professional bodies' ability to assess LLB undergraduates' readiness for legal practice.

The study aims to examine the structure of undergraduate-bachelor of law curricula in Uganda, identify gaps arising from non-competence-based-bachelor of law-curricula, and propose reforms necessary to establish a competence-based-bachelor of law-curriculum aligned with Sustainable-Development-Goal 4. Guided by these objectives, the study seeks to provide evidence-based recommendations to improve curriculum design, enhance practical competence, and ensure that LLB undergraduates are adequately prepared to meet the demands of contemporary legal practice. The research also seeks to answer the following research questions; What is the current structure of undergraduate bachelor of law curricula in Ugandan-universities? What gaps arise from non-competence-based bachelor of law-

curricula? And what reforms are necessary to establish a competence-based-bachelor of law-curricular aligned with the SDG 4?

Importantly, this study is justified by the growing concern that many LLB undergraduates possess strong theoretical knowledge but insufficient practical competence for contemporary legal practice. Legal education plays a central role in strengthening justice systems, rule of law, governance, and national development. Therefore, examining curriculum structure and identifying competence gaps is essential to inform reform efforts that can improve graduate quality and professional readiness in Uganda.

The study is significant because it contributes to the ongoing national and global discourse on competence-based higher education. This research benefits curriculum developers, universities, regulatory bodies, and policymakers by providing guidance for reforming undergraduate bachelor of law curricula. The study also supports Uganda's efforts toward achieving Sustainable Development Goal 4 on Quality Education by proposing strategies for strengthening practical skill development, professional ethics, and employability among LLB undergraduates.

Methodology

This study employed a qualitative-research-approach which was doctrinal in nature using a desktop research strategy in order to examine the structure of undergraduate Bachelor of Laws (LLB) curricula in Uganda, identify gaps arising from the LLB non-competence-based curriculum, and generate evidence to support reforms toward a competence-based curriculum aligned with Sustainable Development Goal 4 (Quality Education). A case-study-research design focusing on three selected Ugandan universities was adopted to enable an in-depth and contextual-analysis of how LLB curricula are structured, how competencies are (or are not) integrated, and where major weaknesses exist. This research design was therefore appropriate for investigating the central research problem that the current LLB curricula remain largely theory-oriented and fragmented, producing undergraduates with limited professional-competence.

To achieve the research objectives, both primary and secondary data were examined. Primary data consisted of the laws regulating the structure of LLB curriculum at the university. Secondary data comprises of the curriculum documents from the three selected universities which have law faculties in the central region, institutional reports, and scholarly articles. These directly supported the first objective by enabling a systematic examination of the existing structure of undergraduate LLB curricula. These sources reinforced the second objective by helping to identify gaps associated with the LLB non-competence-based curricula, particularly relating to practical skills, professional ethics, and readiness for legal practice. Together, these datasets informed the third objective by providing a basis for proposing reforms toward a harmonized competence-based LLB curriculum in line with SDG 4.

Data analysis involved thematic content analysis, doctrinal legal analysis, and documentary review. Thematic content analysis was used to identify recurring themes and gaps in competence integration across curricula. Doctrinal legal analysis facilitated examination of regulatory and policy frameworks governing legal education and how they support—or fail to support—competence-based training. Documentary-review enabled systematic comparison of course content, teaching methods, and assessment strategies across universities. Through

these complementary analytical techniques, the study directly addressed each of its objectives: examining existing curriculum structures, identifying competence-related deficiencies, and informing reform proposals aimed at strengthening alignment with the SDG 4.

Ethical considerations were observed through accurate citation and acknowledgment of all documents and scholarly articles consulted, as well as careful representation of institutional information without distortion. Confidentiality, intellectual-integrity, and respect for academic and institutional-data were maintained throughout the research process. The names of the universities were not mentioned for ethical reasons.

This study employs an interdisciplinary framework combining Educational-Theory, Sociological-Theory, and Human-Capital-Theory to examine the structure, gaps, and proposed reforms in the undergraduate Bachelor of Laws (LLB) curriculum. Educational Theory emphasizes curriculum design aligned with competencies and demonstrates how fragmented, content-heavy, lecture-based programmes limit the development of essential skills such as advocacy, legal drafting, ethical reasoning, and client-centred practice. Sociological Theory explains how institutional norms, policies, and curriculum sequencing embed competence gaps within the higher education system. Human Capital Theory links skills development to employability and national development. Collectively, these theories justify reforms toward coherent, competence-based, and experiential LLB curricula aligned with SDG 4 and capable of producing practice-ready, ethically grounded undergraduates.

Literature Review

Structure of Undergraduate Bachelor of Laws (LLB) Curricula in Uganda

The study examines the structure of LLB curricula in Uganda across three universities, referred to as University A, University B, and University C. Notably, each law school or faculty designs its own four-year LLB curriculum independently, and there are no specific national laws or policies that regulate or standardize the development of these programmes. As a result, there is no uniformity in curricula across universities, leading to significant variations in course content, structure, teaching methods, and assessment strategies. These variations directly impact the consistency and quality of legal education in the country.

The Bachelor of Laws curricula reveal both similarities and distinctions. In Year One at University C, students are introduced to foundational legal principles and essential skills. In the first semester, compulsory courses include Foundations of Law, Criminal Law, Law of Contract, Constitutional History, Computer Applications, and Language and Communication Skills. In the second semester, students study Criminal Law II, Law of Contract II, Constitutional Law, Legal Methods, and Computer Applications II. Collectively, these courses provide a comprehensive grounding in legal doctrine, communication skills, basic computing, criminal justice, contract formation, and constitutional frameworks.

Year Two builds on this foundation, with all courses remaining compulsory. In the first semester, students take Law of Torts I, Administrative Law, Land Law I, Family Law I, and, covering civil wrongs, government powers, land tenure, and family relations. In the second semester, core courses include Law of Torts II, Land Law II, Family Law II, Law of Sale of Goods and Supply of Services, and Equity and Trusts. These subjects further develop student

competence in commercial transactions, equitable remedies, succession, and advanced tort and land law concepts.

In Year Three, students continue with compulsory courses that deepen practical and doctrinal understanding. The first semester includes Law of Evidence I, Criminal Procedure, Law of Business Associations I, and Law of Banking and Negotiable Instruments, covering evidentiary rules, criminal justice procedures, company law, and financial regulation. The second semester consists of Law of Evidence II, Law of Business Associations II, International Trade and Business, and Legal Research Methods and Methodology, emphasizing evidentiary reasoning, corporate practice, international commercial relations, legal research and writing skills.

In Year Four at University C, only Jurisprudence and Civil Procedure remain compulsory, offered across the two semesters. Jurisprudence I and II explore legal philosophy, theories of law, and methods of legal reasoning, while Civil Procedure and Practice I and II focus on court processes, litigation, and procedural rules. All other Year Four courses are electives, allowing students to specialize in fields such as public international law, human rights, intellectual property, labour law, environmental law, clinical legal education, alternative dispute resolution, oil and gas law, refugee law, and revenue and taxation law. This structure ensures a strong compulsory foundation in the first three years, preserves core theoretical and procedural training in the fourth year, and provides flexibility for specialization through elective courses.

When compared with University A and University B, similarities emerge in the early years, where all three universities emphasize core courses designed to introduce students to essential legal doctrines. In Year One, both University A and University B focus on subjects such as Constitutional Law, Contracts, Criminal Law, Legal Methods, and Torts, without incorporating electives. In Year Two, both universities maintain core courses in Family Law, Land Law, Evidence, Administrative Law, Equity, and Trusts, reflecting a shared understanding that competence in substantive law is central to undergraduate legal education.

Differences become more evident in the later years, particularly regarding electives and practical engagement. In Years Three and Four, University A offers a broad range of electives, including clinical legal training, consumer law, gender and the law, environmental law, computers and the law, and criminology and penology, allowing students to tailor their studies to professional interests. University B provides a more focused set of electives in international trade, investment law, international humanitarian law, natural resources law, labour law, taxation, insurance law, and human rights, emphasizing commercial, policy, and public law areas. University C differs by maintaining only two compulsory courses in Year Four—Jurisprudence and Civil Procedure—and offering a wide array of electives for specialization.

A further distinction lies in research and practical requirements. University B mandates a research paper as a core component of the final year, ensuring all students undertake independent legal research. At University A, the research paper is typically elective, with practical and clinical training offered through elective units in clinical legal education. University C integrates practical skills through elective courses in clinical legal education, alternative dispute resolution, and other applied fields in the fourth year. These differences reflect variations in pedagogical emphasis: University B prioritizes research as a universal

requirement, University A emphasizes flexible practical skills development, and University C balances foundational knowledge with elective specialization in senior years.

Understanding the structure of undergraduate Bachelor of Laws (LLB) curricula is central to evaluating how legal education prepares students for professional practice. Contemporary scholarship consistently emphasises that curriculum structures must move beyond fragmented, content-heavy models toward frameworks that foster progressive professional competence. There is broad consensus that traditional curricula, which prioritise theoretical knowledge transmission, are increasingly inadequate for preparing graduates for real-world practice. This observation mirrors the current structure of many LLB programmes in Uganda, where curricula remain largely content-driven and lecture-centred, offering limited opportunities for developing practical legal skills (Açıkgöz & Babadoğan, 2021; Bhatia & Kumar, 2025; Harianto, 2024).

A significant theme in the scholarship is the paradigm shift from teacher-centred, content-heavy instruction to competency-based education (CBE). Bhatia and Kumar (2025) argue that 21st-century education increasingly prioritises demonstrable skills and practical application over rote memorisation. Açıkgöz and Babadoğan (2021) emphasise that effective curricula should be structured around clearly defined learning outcomes, mastery-based progression, and integrated assessment to ensure systematic competence development. Harianto (2024) further highlights that CBE must prioritise problem-solving, adaptability, creativity, and critical thinking, rather than solely accumulating theoretical knowledge. Collectively, these studies underscore that curriculum structure is not merely a sequence of subjects but a framework that shapes the gradual development of professional skills.

Another key theme is coherence and integration within curricula. The Curriculum and Assessment Review Final Report (2025), Cambridge International (2025), and the National Council for Curriculum and Assessment (2012) all argue that effective curriculum design requires integrated, logically sequenced learning pathways rather than isolated subject lists. The First International Conference on Curriculum Development (NCDC-Uganda) observes that post-colonial African curricula, including legal education, often retain content-transmission models that emphasise knowledge recall over applied competencies. This literature collectively highlights the importance of progression, linking foundational, intermediate, and advanced content to ensure that students systematically acquire both theoretical knowledge and practical skills.

Critically, while these studies provide substantial guidance on curriculum structure, they largely focus on school-level or general higher education curricula and do not specifically address professional programmes such as LLB in Uganda. This gap is significant because Ugandan law schools or faculties continue to offer fragmented, theory-heavy programmes, leaving undergraduates with strong theoretical knowledge but insufficient professional competencies, such as advocacy, legal drafting, ethical reasoning, problem-solving, client management, and critical analysis. Therefore, there is a clear need to investigate how LLB curricula are structured, whether they support cumulative skill development, and how they can be reformed to align with UN Sustainable-Development-Goal 4 (Quality Education).

In brief the reviewed scholarship demonstrates that curriculum structure fundamentally shapes learner outcomes. For Ugandan LLB programmes, adopting integrated, coherent, and competency-oriented frameworks is essential to ensure that undergraduates are both

knowledgeable and professionally prepared, bridging the persistent gap between theory and practice in legal education.

Gaps Arising From Non-Competence-Based LLB Curricula

Despite these structural strengths, the predominance of theoretical, non-competence-based curricula across the three universities limits the development of essential practical and professional skills. Consequently, LLB undergraduates often possess strong conceptual knowledge but lack adequate readiness for real-world legal practice, negatively affecting the overall quality and effectiveness of legal education in Uganda.

The variances in course units present both advantages and disadvantages. While differences in elective options allow students to specialize in areas of interest, practical, hands-on training is largely absent across all three universities. Moot court exercises and community engagement are treated as co-curricular activities rather than integrated, credit-bearing components, and the Socratic method is minimally applied, limiting critical thinking, analytical reasoning, and active participation. Clinical legal education is offered only as an elective at University A and University C and is not a core requirement, leaving many students without structured exposure to real-world legal practice.

The significant variation in core and elective course units, combined with the predominance of theoretical, non-competence-based instruction and lecture-heavy teaching methods, creates major disadvantages. Undergraduates complete their LLB programs with uneven knowledge and skill sets, resulting in disparities in professional readiness and employability. Essential competencies—such as advocacy, legal drafting, client management, and practical problem-solving—are inconsistently developed, while active learning, experiential engagement, and critical thinking are limited. Although some students benefit from elective diversity, the overall non-competence-based approach reduces the ability of Ugandan legal education to consistently produce practice-ready undergraduates and undermines the uniformity and quality of the legal profession nationally.

Furthermore, the absence of centralized regulation or a national policy governing LLB curricula exacerbates these challenges. Without uniform standards, universities independently determine course content, teaching methods, and assessment strategies, resulting in considerable disparities between institutions. This lack of uniform-standards hinders the enforcement of minimum professional competencies, complicates credit transfer and student mobility, and limits the capacity of professional bodies to evaluate whether undergraduates meet baseline requirements for legal practice. In turn, these gaps weaken public confidence in the quality and consistency of legal education and contribute to an uneven supply of competent legal practitioners across the country.

Assessment methods across University A, University B, and University C follow a similar structure, combining summative and formative components. Examinations carry a weight of 70 marks and primarily test theoretical knowledge, while the remaining 30 marks are allocated to formative assessment, often delivered through lecture-based group assignments, presentations, or tests. This reliance on written exams and lecture-oriented formative exercises limits opportunities for students to develop practical legal skills, including advocacy, negotiation, drafting, client counseling, and courtroom procedures. Consequently, assessment reinforces rote learning over critical thinking, problem-solving, and applied competence. The absence of structured, hands-on evaluation methods—such as practical

simulations, moot courts, clinical placements, or supervised legal practice—means that undergraduates may pass exams without acquiring essential professional skills. Ultimately, this approach to assessment perpetuates the gap between theoretical knowledge and real-world readiness, further undermining the quality and professional relevance of undergraduate legal education in Uganda.

Notably, despite the growing global emphasis on competency-based education, many Ugandan Bachelor of Laws (LLB) programmes continue to rely on traditional, theory-heavy curricula that prioritise content delivery over the development of practical skills. This misalignment is highlighted across multiple studies. Bhatia and Kumar (2025) argue that conventional curricula, structured around time-bound instruction and fixed content lists, often fail to cultivate critical thinking, problem-solving, and applied competencies. Similarly, Açıkgöz and Babadoğan (2021) note that curricula that lack explicit learning outcomes and mastery-based progression leave graduates unable to translate theoretical knowledge into professional practice. Harianto (2024) reinforces that the absence of structured standards or policies for adaptability, creativity, and applied problem-solving undermines the preparation of students for complex, real-world challenges.

Ugandan studies further illustrate these gaps. Kitasse and Ssembatya (2024) show that competency-oriented reforms in secondary schools falter without clear structural frameworks, explicit competencies, and coherent sequencing of learning tasks. Muwanguzi, Kibaya, and Serunjogi (2023) add that even when competency-based principles are adopted, limited teacher preparedness, inadequate resources, and weak assessment strategies compromise their implementation. Translating these insights to the LLB context, it becomes apparent that law programmes remain fragmented: foundational, intermediate, and specialised courses are often disconnected, and opportunities to practice legal drafting, advocacy, client management, and ethical reasoning are minimal.

The persistence of lecture-based teaching methods exacerbates the problem. Herlinawati, Marwa, Ismail, and Situmorang (2024) emphasise that curricula focused on isolated theoretical content tend to produce graduates who can memorise information but cannot apply it in authentic contexts. Ayasrah (2023) and Owolabi and Ajayi (2023) similarly note that a lack of coherence, standards, and progression within curriculum structures undermines the development of higher-order thinking and professional competence. This gap is particularly critical in the Ugandan LLB context, where undergraduates often enter the legal profession theoretically knowledgeable but underprepared for practical challenges.

Collectively, this body of scholarship reveals a persistent gap between curriculum design and professional readiness. While global and Ugandan studies highlight the benefits of integrated, competence-oriented curricula, the specific structure of LLB programmes in Uganda remains largely unexamined. This underscores the importance of the present study, which seeks to evaluate LLB curricula structures, identify gaps in the LLB non-competence-based-curricular, and propose reforms that align undergraduate-legal-education with the practical demands of the profession and the objectives of UN-Sustainable-Development-Goal 4 (Quality Education).

Proposed Reforms to Establish a Competence-Based LLB Curriculum

The combination of a non-competence-based LLB curriculum, lecture-dominated pedagogy, minimal experiential learning, and the absence of detailed standards on curriculum design

and development constrains the quality of Ugandan undergraduate-legal-education. To align with UN-Sustainable-Development-Goal 4 (Quality Education), reforms should include standardizing the curricula across universities to ensure consistency in foundational and advanced legal training. Integrating experiential learning—such as mandatory moot courts, clinical placements, field placements, simulations, writing assignments, supervised probono activities, community engagement, and research projects—would enhance practical competencies. Teaching methods should emphasize the Socratic method, active learning, and problem-based approaches to cultivate critical thinking and applied legal skills. Additionally, assessment frameworks should balance theoretical knowledge with practical, hands-on evaluation to ensure undergraduates are practice-ready. Enacting and implementing a national policy or regulatory framework to guide curriculum design, assessment, and teaching methodologies would strengthen quality assurance, enhance uniformity, and ensure that all LLB graduates meet minimum professional competencies.

Results and Discussion

Using a qualitative, doctrinal approach with desktop research, this study systematically examined the structure of undergraduate LLB curricula across three Ugandan universities (A, B, and C). The analysis of curriculum documents, institutional reports, and regulatory frameworks revealed that each university independently designs its four-year LLB program, with the absence of detailed standards on curriculum design and development constraining the quality of Ugandan legal education. Early-year courses across universities consistently cover foundational subjects such as Constitutional Law, Criminal Law, Contracts, Torts, and Legal Methods, establishing a strong doctrinal base. Differences emerge in later years: University A provides diverse electives including clinical legal education and criminology, University B emphasizes commercial, public, and policy law, and University C offers only two compulsory courses in Year Four with broad elective options. Practical and research components are inconsistently integrated; for example, University B mandates a research paper, while clinical legal education remains elective at Universities A and C.

From a theoretical perspective, Educational Theory frames these findings as illustrating how content-heavy, lecture-oriented curricula limit the systematic development of competencies such as advocacy, legal drafting, ethical reasoning, and client-centered practice. Sociological Theory contextualizes the variation and fragmentation as products of institutional structures, norms, and the absence of detailed standards on curriculum design, reflecting systemic limitations in ensuring education quality. Human Capital Theory highlights the implications for professional readiness and societal outcomes, indicating that inconsistent curricula constrain undergraduates' employability and contribution to national development.

The thematic and documentary analysis revealed persistent gaps in practical and professional competence. Experiential learning opportunities—moot courts, clinical placements, simulations, and pro bono engagements—are often elective or co-curricular, and assessment methods focus predominantly on theoretical examinations and lecture-based assignments. This reinforces memorization over applied skills, leaving undergraduates theoretically knowledgeable but underprepared for real-world legal practice. The analysis also showed uneven development of core competencies, with some students accessing advanced electives while others complete the LLB with minimal exposure to client management, legal drafting, and courtroom procedures.

The findings align with global and local scholarship demonstrating that conventional, non-competence-based curricula fail to foster problem-solving, critical thinking, and applied legal skills (Bhatia & Kumar, 2025; Harianto, 2024; Herlinawati et al., 2024). Desktop research revealed that gaps are compounded by inconsistent sequencing of foundational, intermediate, and advanced courses, reflecting structural limitations within the higher education system, as emphasized by Sociological Theory.

Analysis of the curricular gaps using thematic content and doctrinal review supports targeted reforms. The study recommends standardizing core LLB courses units across universities to ensure uniformity in foundational and advanced training. Experiential learning should be integrated as mandatory credit-bearing components, including moot courts, clinical-placements, simulations, supervised pro bono work, community-engagement, and research projects. Pedagogical approaches must shift from lecture-dominated teaching to Socratic, problem-based, and active learning methods to cultivate analytical, critical, and applied skills. Assessment frameworks should balance theoretical knowledge with practical evaluation to ensure competence. Establishing a national-policy or regulatory-framework for curriculum design, teaching, and assessment would enhance quality assurance, ensure minimum professional standards, and improve the uniformity and relevance of LLB programs.

Applying Human Capital Theory, these reforms would strengthen undergraduates' employability, professional readiness, and societal contribution. Educational Theory supports designing curricula around explicit learning outcomes and cumulative skill development, while Sociological Theory underscores the need for institutional and policy alignment to embed competence-based education within the higher education system. Collectively, the findings demonstrate that transitioning from fragmented, theory-heavy curricula to coherent, competency-oriented programs is essential for producing practice-ready, ethically grounded law-undergraduates aligned with the SDG 4.

Conclusion

This study examined the structure, gaps, and potential reforms of undergraduate Bachelor of Laws (LLB) curricula in Uganda through a qualitative, doctrinal analysis of curriculum documents from three universities. The findings reveal that LLB programmes are largely content-heavy, lecture-driven, and fragmented, with significant variation in course offerings, electives, and practical components. The absence of detailed standards on curriculum design and development constrains the quality and consistency of undergraduate-legal-education, resulting in undergraduates who possess strong theoretical knowledge but limited practical competence in advocacy, legal drafting, ethical reasoning, and client management.

The implications of these findings are significant. Fragmented, non-competence-based curricula reduce professional readiness, limit employability, and weaken public confidence in Uganda's undergraduate-legal-education-system. From a theoretical perspective, Educational Theory highlights misalignment between curricula and desired competencies, Sociological Theory situates the gaps within institutional structures and practices, and Human Capital Theory underscores the lost societal and economic potential of underprepared undergraduates.

The study is limited by its reliance on desktop research; data were drawn solely from curriculum documents and scholarly sources, without input from students, faculty, or legal

practitioners. Future research should complement these findings with empirical fieldwork to verify how proposed reforms impact professional competence.

Based on the findings, the study recommends standardizing curricula across universities, integrating compulsory experiential learning such as moot courts and clinical placements, adopting competency-focused teaching methods, reforming assessments to include practical evaluation, establishing a national policy framework for curriculum design, investing in faculty development, and implementing continuous monitoring and review. These measures will promote coherent, competence-based LLB curricula, producing ethically grounded, practice-ready undergraduates aligned with United-Nations-Sustainable-Development-Goal 4 (Quality Education).

Acknowledgement

I sincerely express my heartfelt gratitude to the management and administration of the Islamic University in Uganda for their support. I am deeply thankful to my father, Mr. Muyise Ismael**,** my mothers, Ms. Moureen-Gokyalya and Ms. Rebecca-Nakirijja, and to Mr. Semwanga-Paul, Ms. Mariam-Nakanwagi, Mr. Ahmed-Settenda, Mr. Musa-Settenda, Mr. Ismail-Muyise, Mr. Basomba-Ibrahim, Mr. Rajab-Lumu, Ms. Natalia, and Mr. Spencer for their invaluable guidance, encouragement, and unwavering support, which were instrumental in the successful completion of this work.

Official Conference Proceedings

Abstract

Global interest in Artificial Intelligence (AI), and particularly Generative AI (GenAI), has increased sharply over the past decade. While adoption in higher education is accelerating, it remains uneven across countries, institutions, and cultural contexts. Most existing research emphasises automation efficiency, AI literacy, or short-term classroom use, offering limited insight into how GenAI becomes embedded within educational systems over time. This paper introduces AI-CLASSIC (AI Adoption in Classroom Instruction and Cross-Cultural Comparison), a longitudinal, multi-level socio-technical framework integrating classroom practices, institutional readiness, and societal discourse. Drawing on pilot data from Germany, Nigeria, and India, we demonstrate that similar levels of GenAI usage may arise primarily because of different adoption mechanisms. Regression-based analyses identify perceived usefulness as a universal driver, while risk perception, institutional constraints, and cultural expectations shape adoption pathways differently across contexts. By operationalising adoption, the AI-CLASSIC framework proposes the AI Competency Index (ACI), which will be systematically validated in subsequent longitudinal work. This study advances cross-cultural comparability and provides a scalable foundation for predictive modelling and policy-relevant foresight in AI-enhanced higher education.

Keywords: generative AI, artificial intelligence in education, cross-cultural research, socio-technical systems, AI-CLASSIC, higher education

Introduction

Global interest in generative artificial intelligence (GenAI) has increased sharply over the past decade. There is a substantial growth in both patent activity and reported use among students in higher education (Digital Education Council, 2024; Higher Education Policy Institute, 2025; World Intellectual Property Organization, 2024).Despite this unusual spread, most applications continue to focus on automation and the externalisation of human cognition rather than complementing human intellectual capacity (International Labour Organization, 2023). This situation creates a challenge between efficiency-driven AI and human-centred educational values.

The United Nations Educational, Scientific and Cultural Organization (UNESCO) through ethical guidelines promote responsible GenAI integration. But their impact is undermined by digital divides and uneven national readiness. Also, socio-technical disparities are reinforced through policy fragmentation and media discourse (International Telecommunication Union, 2024; Korneeva et al., 2023). These dynamics present the need to investigate how AI adoption unfolds in different national and cultural settings. While adoption patterns vary widely across countries (Mansoor et al., 2024), existing research remains geographically limited, methodologically fragmented, and largely based on short-term snapshots. The goal of this paper is to advance a longitudinal, cross-cultural, and computationally grounded framework for examining how generative AI is adopted and embedded within higher education.

Why Cross-Cultural AI Research in Higher Education

AI adoption does not happen in a vacuum; it takes shape within the everyday realities of educational systems, institutional practices, and national contexts. Germany, Nigeria, and India offer particularly important contrasts. In Germany, higher education places strong emphasis on critical thinking, academic integrity, and ethical reflection, supported by well-developed infrastructure and relatively stable policy frameworks (Zawacki-Richter et al., 2019). India has rapid uptake of generative AI tools, but this expansion is uneven, limited by gaps in connectivity and insufficient faculty training that affect scalability (Kamble et al., 2024). In Nigeria, growing student demand for AI tools coexists with infrastructural limitations, fragmented policy approaches, and uneven national strategies for AI integration (Adesiji, 2024).

Cultural and educational traditions further influence how generative AI is used in practice. In exam-oriented systems of Nigeria and India, students tend to rely on GenAI for summarisation, rote learning, and exam preparation. But in Western countries, originality and independent thinking are emphasized. Also, GenAI is more often used for brainstorming, drafting support, and idea development (Zawacki-Richter et al., 2019).Recent empirical work confirms that these different educational expectations play a decisive role in influencing patterns of AI use (Ibeh et al., 2025). These contrasts support the need for cross-cultural perspective for understanding AI adoption as a broader, system-level process rather than a uniform or purely technical phenomenon.

Theoretical Foundations

AI-CLASSIC is grounded in a multi-level socio-technical framework integrating organisational theory, educational psychology, and technology adoption research. At the macro level, Cultural–Cognitive Institutional Theory (CCIT) (Scott, 2008) explains how national

norms, regulatory regimes, and institutional logics shape AI legitimacy, policy discourse, and adoption attitudes.

At the meso and micro levels, Socio-Technical Systems Theory (Pasmore et al., 2019) and the Technology Acceptance and Use Continuum (Venkatesh et al., 2012) link technological affordances with institutional practices and user perceptions.

At the micro level, constructivist learning theory, self-efficacy theory, and self-regulated learning (SRL) frameworks (Bandura, 1997; Panadero, 2017; Zimmerman, 2002) conceptualise AI use as an active, metacognitive process shaped by learner agency. Evidence on AI-related self-efficacy further underscores the role of cognitive and motivational factors (Liang et al., 2023). These perspectives enable AI adoption to be modelled as a complex adaptive system (Holland, 2006), bridging behavioural logs, attitudinal surveys, and societal discourse.

Limitations of Existing Research

Most studies on AI in education focus on AI literacy, perceptions, or short-term classroom use (Crompton & Burke, 2023; Stöhr et al., 2024). However, findings are inconsistent across disciplines and contexts and often entangled with ethical debates (Korneeva et al., 2023). Existing frameworks such as DigComp 2.2 (Vuorikari et al., 2022) and UNESCO's AI Competency Framework mainly rely heavily on self-report measures and remain context specific.

Snapshot models such as the Technology Acceptance Model (TAM), Innovation Diffusion Theory (IDT), Normalization Process Theory (NPT), and the Unified Theory of Acceptance and Use of Technology 2 (UTAUT2) are used to explain immediate drivers of AI adoption, but they are limited in terms of how adoption evolves over time. In particular, these approaches struggle to account for changing motivations, longer-term learning processes, and the feedback loops that develop as users interact repeatedly with AI systems (Cukurova, 2025). Although computational methods could help address these gaps, they remain under-used in educational research.

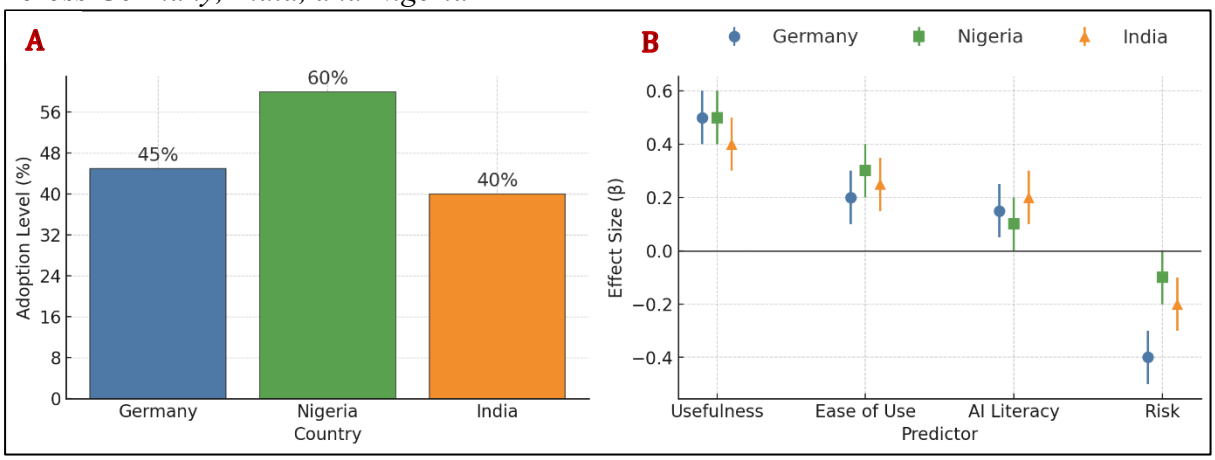
Methodology

Design and Data

Pilot data collection demonstrates feasibility across contexts (refer to Table 1). In Germany, a longitudinal classroom-based cohort (n = 210) is being followed over time. In Nigeria, a national multi-institutional survey (n = 445) demonstrates scalability. In India, a zonal survey (n = 62+) is ongoing with planned expansion.

Table 1
Overview of Preliminary Pilot Studies Across Germany, India, and Nigeria (2025)

Country	Sample Size	Design
Germany	210	Longitudinal (classroom)
India	62+	National (zonal, ongoing)
Nigeria	445	National (multi-institution)



Measures and Analysis

Measures include GenAI usage frequency, perceived usefulness, ease of use, AI literacy, and risk perception. Analyses integrates descriptive comparison and regression modelling, informed by TAM/UTAUT constructs adapted for cross-cultural contexts.

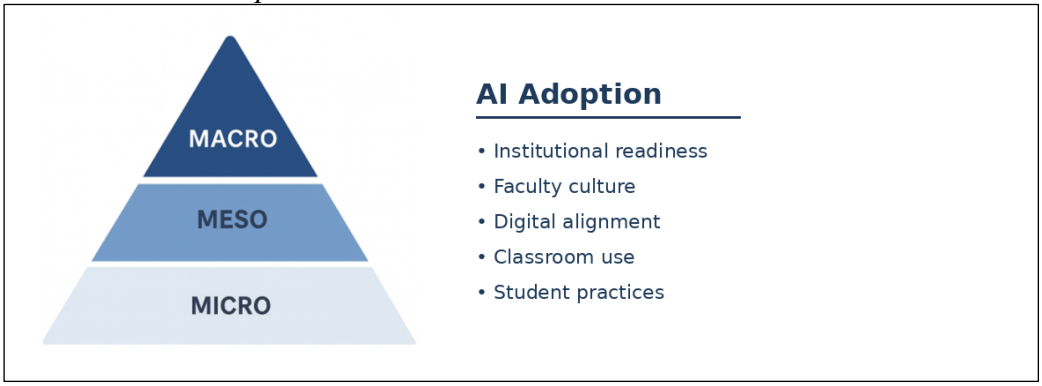
Results and Discussion

Preliminary results show comparable adoption levels across countries, with Nigeria (~60%) slightly higher than Germany (~45%) and India (~40%). However, regression-based analyses (Figure 1) reveal divergent mechanisms. Perceived usefulness resulted as the strongest predictor across all contexts. Risk perception exerts a pronounced negative effect in Germany.

Figure 1
Preliminary Pilot Results on Weekly GenAI Usage (Left) and Adoption Drivers (Right) Across Germany, India, and Nigeria

Results reflect that Germany has more ethical, privacy, and institutional influence on how generative AI is perceived and used. Nigeria and India on the hand, AI adoption is driven primarily by pragmatic considerations. These include exam preparation, and immediate academic utility. Across all the target countries ease of use and AI literacy contribute positively to adoption, but they remain secondary to these broader structural and cultural drivers.

These findings show that similar levels of AI use can result for very different reasons. Apparent convergence in adoption rates therefore masks substantial differences in underlying factors e.g. motivations, constraints, and institutional conditions. This divergence highlights the limits of single-factor or context-neutral explanations of AI adoption and points to the need for a framework that can capture interactions across classroom practices, institutional governance,



and wider cultural and policy environments. A multi-level socio-technical perspective is therefore essential for understanding not only whether generative AI is adopted, but how and why adoption pathways differ across educational systems.

The AI-CLASSIC Framework and the Proposed AI Competency Index (ACI)

The AI-CLASSIC (AI Adoption in Classroom Instruction and Cross-Cultural Comparison) addresses persistent gaps in literature by conceptualising generative AI adoption in higher education as a multi-level socio-technical process rather than a single behavioural or attitudinal outcome. The framework integrates behavioural traces, attitudinal measures, institutional indicators, and societal discourse across Germany, Nigeria, and India, enabling systematic comparison across educational and cultural contexts.

As illustrated in Figure 2, AI adoption needs to be modelled as a hierarchically structured but interconnected system comprising three analytical levels.

Figure 2
AI-CLASSIC Conceptual Framework

At the micro level, AI adoption is mainly through classroom practices and learner cognition, including patterns of GenAI use, perceived usefulness, AI literacy, and self-regulated learning. These practices are shaped and constrained at the meso level by institutional capacity and governance, such as curriculum design, assessment regimes, faculty culture, and infrastructural readiness. On the other hand, the AI adoption at macro level involves broader factors such as cultural norms, ethical expectations, regulatory frameworks, and national AI policies provide the structural conditions that legitimise, enable, or restrict institutional and classroom-level adoption.

This multi-level integration forms the proposal of a conceptual foundation of the AI Competency Index (ACI). Rather than relying on self-reported AI literacy alone, the ACI operationalises adoption as a validated composite construct that combines behavioural logs, survey-based perceptions, institutional indicators, and policy discourse.

The AI-CLASSIC framework models generative AI adoption in higher education as a unified, multi-level socio-technical system. This encompasses micro-level classroom practices and learner cognition, meso-level institutional capacity and governance, and macro-level cultural and regulatory environments. The AI-CLASSIC proposes a new framework for understanding the AI adoption through the AI Competency Index (ACI), enabling longitudinal and cross-cultural comparison of AI adoption.

Implications

The findings emerging from AI-CLASSIC underline why uniform or one-size-fits-all approaches to AI governance in higher education are unlikely to be effective. Although overall levels of generative AI use may appear comparable across countries, the underlying drivers of adoption differ substantially. In essence, Institutional responses need to therefore move beyond general statements on AI use and address the specific socio-technical conditions within which students and educators operate. In addition, there should be a careful balancing of perceived usefulness, risk communication, governance structures, and educational culture. In contexts where AI adoption is driven primarily by pragmatic needs—such as exam preparation or workload reduction—policy interventions should focus on supporting responsible use through clear guidelines, assessment redesign, and targeted capacity building. In settings where ethical concerns, data protection, and academic integrity are more prominent, institutions must prioritise transparency, trust-building, and participatory governance mechanisms that involve both staff and students.

For policymakers, the results suggest that global ethical frameworks for artificial intelligence cannot be applied mechanically across national systems. While international guidelines provide important normative direction, their effectiveness depends on how well they are adapted to local regulatory environments, infrastructural realities, and cultural expectations. AI-CLASSIC highlights the importance of aligning ethical principles with institutional practices and classroom realities. There is need to ensure that governance strategies remain both context-sensitive and educationally meaningful.

Limitations and Future Research

This study is subject to several limitations that should be acknowledged. First, the pilot samples are uneven across countries, with behavioural log data currently concentrated in the German longitudinal cohort. While this design reflects differences in data access and institutional partnerships, it limits the extent to which behavioural comparisons can be made across all contexts at this stage. Second, the present analyses focus primarily on associative relationships, and do not yet allow for strong causal inference. These limitations point directly to directions for future research.

Subsequent waves of data collection will extend behavioural logging to additional contexts and strengthen the longitudinal component of the study. This will enable more robust modelling of temporal dynamics. This will require examining dynamics in the motivation, learning strategies as well as institutional responses over time. Future work should develop and validate the AI Competency Index (ACI) by refining its components, testing measurement invariance across cultures, and integrating predictive modelling techniques. These extensions will therefore allow AI-CLASSIC to move beyond descriptive analysis toward forecasting adoption trajectories and identifying leverage points for policy intervention.

Conclusion

AI adoption in higher education should not only be understood as a technological choice or short-term response. Researchers should investigate AI adoption as a longitudinal and socio-technical transformation. There should be focus on how interactions between learners, institutions, and broader cultural and regulatory environments are shaped. The AI-CLASSIC

framework provides a structured way to capture these interactions. It also shows how similar levels of AI use can emerge from very different underlying mechanisms.

By combining cross-cultural comparison with longitudinal analysis and computational modelling, AI-CLASSIC offers a rigorous and scalable approach to studying how generative AI moves from novelty to normalised educational infrastructure. This will support evidence-based institutional decision-making. It will aso support more nuanced AI governance, and the development of inclusive policies that recognise the diversity of educational systems worldwide.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The authors declare that generative AI tools were used only for limited language refinement and stylistic clarity. All substantive content, analysis, interpretation, and conclusions are the original work of the authors, who take full responsibility for the manuscript.

Increased Efficacy of Teacher Curated Lesson Materials in Learning Management System

Krishnendu Sarkar, NSHM Knowledge Campus, Kolkata, India

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Reportedly, in the times of AI and disruptive technologies the sustained usage of faculty-made lesson materials by students were adversely being affected. Thereby, impairing the digital learning with Learning Management System (LMS), meant to enrich educational activities, especially in traditional spaces. To address a similar scenario in author's institution, a design for six sigma using DMADV methodology was initiated along with academic leadership team across various verticals of media, design, pharmacy, allied health, business & management, hospitality & tourism, and computing & analytics with a target to increase the effective usage of lesson materials from sub-optimal (below 25%) to above-optimal level (above 55%) within the period of 3 months of project implementation across the institution. The financial motivation of institution has been the maximization of return on investment on digital infrastructure, minimization of student backlogs and year lags that majorly would lead to dropouts. On the other, improvement in intake quality over the competition based on higher quality of learning outcomes. This paper elucidates the structured view of the project in form of a charter, voice of stakeholders, SIPOC, prioritization, CTQ specification table, sampling of students, faculty and alumni, root cause analysis, Kano modelling, statistical tests and validation of the new design by way of repurposing Bloom's Taxonomy with 10 human-human potential tracks of engagement, each mapped with higher-order thinking triplet verbs for best-fit lesson materials of value, negating rework and waste.

Keywords: lesson-material, real-time, value, design, DMADV

Background

From the data analysis of lesson materials uploaded on our institution's Learning Management System (LMS)[1] covering the even semester of 2025 (January – June) it was found that 6123 files, totaling nearly 15 Gigabyte,[2] additionally with 1045 links to internet resources were made available by 96 teachers, targeting 2548 undergraduate and 790 post graduate students. A Pareto analysis (Figure 1) in the above-mentioned period indicated that most of those materials were uploaded between February and mid-March (source: author, based on LMS data). Aside from that students were required to upload files as part of their continuous evaluation and other assigned tasks amounting not only to huge LMS information load but also raising concerns about its efficacy.

Yet, the information loading has been a routine compliance exercise without factoring students' receptibility of those materials. As a result, the teacher curated lesson materials in the era of Artificial Intelligence (AI) and disruptive digital technologies consistently showed a decline in sustaining the pull and engagement of students with LMS materials. It was a major roadblock for the LMS to transform from passive storage to active learning platform that would be dynamic, essential and optimal. In our consideration, sub-optimal use of lesson materials was anything less than 25% and above optimal, to begin with, was anything more than 55% for gradual elimination of rework and waste in form of unused or underused LMS materials by students.

Literature

The Bloom's original *Taxonomy of Educational Objectives* work was revised (Anderson & Krathwohl, 2001) with emphasis on using action verbs for cognitive processes and categorizing types of knowledge, making it more practical for curriculum design, instruction, and assessment. Besides, to help educators more precisely with effective learning outcomes through effective teaching and assessment. Furthermore, how students could excel with real problem-injected learning compared to traditional instruction (Chiu, 2021), particularly when learning

[1] Digicampus (LMS) of NSHM Knowledge Campus Kolkata. India (author's institution).
[2] A Gigabyte is either 1 billion bytes in the decimal system or 1,073,741,824 bytes in the binary system, which equals 1024 Megabytes. In context, a Megabyte equals 1024 Kilobyte, and a Kilobyte equals 1024 bytes.

was meant to be inherently interesting and meaningful in satisfying the psychological needs of competence, autonomy and relatedness for academic success (Froiland, 2011).

The need, therefore, was clear. Teacher-curated lesson materials hosted on LMS must be attractive to students. In practice that was not, even when those materials were found to be instructionally robust and aligned with course outcomes (Bond, et al., 2020; Henderson, et.al, 2017). Because, students increasingly depended on external digital resources, peer-generated content, and AI-mediated summaries, frequently bypassing institutional learning materials (Selwyn, 2019; Zawacki-Richter, et al., 2019). A pattern that portrayed the necessity of instructional quality and accessibility with its sufficiency to establish the real-world usefulness of teacher-curated lesson materials as a value gain. Nevertheless, pedagogical frameworks[3] typically assumed that student's engagement would emerge once barriers were removed, instructional design was optimized, or learner activity got increased. However, what remained comparatively under-theorized was a more foundational question: why should students feel compelled to return to faculty lesson materials when alternative knowledge sources were readily available?

In response, the research instances involving dynamic synergies of teachers, students, and AI showed more adaptive, engaging, and personalised learning with honing of skills such as critical thinking, communication, collaboration, and creativity (Kwan, 2025). But there remained an issue with the verbs and repeat verbs for distinguishing the Bloom's cognitive levels in deployment of those verbs for teaching, learning and assessment (Stanny, 2016).

Introduction

In pursuit of project goal towards significantly improving the efficacy of LMS materials, the investigation using six sigma DMADV (Design, Measure, Analyse, Design, Verify) approach, proceeded with the understanding of the Voice of Customer (VOC) with a Google form survey using a discipline-wise randomized sample of our recent alumni batch. Thereafter, we conducted a focussed group discussion with sample participants over a Goggle meet. Because, as alumni, they had spent the entire student-life with the same LMS's lesson materials and, more so, were without any inhibition or bias after their graduation. The alumni respondents (n = 23) reported no daily use of materials on LMS to the question "*How often during your student days you referred to lesson materials*" and also did not strongly agree with the rest – "*Materials encouraged me to explore and discover more on the taught topics*", "*Materials were relevant and up-to-date*", "*Materials enhanced my knowledge and skills beyond classroom*" and "*Lesson materials on LMS complimented classroom teaching*".

Further, surveys involving a sample of our faculty, stratified based on their last annual appraisal reports, and students' sample, stratified based on their academic grades and disciplines, were conducted using blind, hand-filled questionnaires that ensured respondent diversity, unbiasedness, and anonymity. The survey had Likert-scale, Binary (Yes/No) questions, Categorical and Open-text items. Data were processed from faculty (n = 30) and students (n = 87) responses, enabling both quantitative and qualitative analyses based on questions under sections, namely, *Usage patterns*, *Perceived value*, *Access & usability*, *Communication & engagement* meant for Students and on the other, *Practices*, *Communication with students*, *Quality & resources*, *Challenges* meant for Faculty. Put together, the VOC of alumni, faculty

[3] Provides guidance on evidenced-based strategies and practices supporting an integrated approach for quality teaching aligning curriculum, assessment and pedagogy.

and students indicated low motivation and low expectation about LMS's lesson materials and fuelled the felt need to increase the efficacy of teacher-curated materials.

Given the above, our DMADV project charter focussed on creating a design for plausible solution using Design for Six Sigma (DFSS) methodology (Brue & Launsby, 2003) that can assure increased engagement and satisfaction of students by organically engaging teachers, students, and responsible AI for reclaiming pedagogical prowess in physical spaces without resisting technologies. Moreover, correct the uncontrolled content abundance in LMS and create immediate relevance thereby motivating students to primarily use the faculty-curated resources injected with Real Time Value (RTV) as a design response to the project goal.

Following that, a SIPOC (Suppliers, Inputs, Process, Outputs, Customers) was tabled (Table 1a) with Critical to Quality (CTQ) Specification (Table 1b) based on XY (cause and effect) prioritization matrix, which prioritized process inputs (Xs) based on their impact on customer-critical outputs (Ys), paving the way for positioning the RTV.

Table 1a
SIPOC

SIPOC	
Supplier	Course instructors, LMS administrators, Academic administration, Generative AI, In-house IT support team and Library
Input	Templates for lesson plan and lesson materials, LMS user manual/guides, LMS system, user-interface, Student enrolment data, Faculty data, Faculty-tagged courses, curriculum, attendance, cohorts, routines, system access credentials
Process	▪ Faculty Development Program ▪ Preparation of lesson materials ▪ Upload of materials on LMS ▪ Student access and download ▪ Communication booths for department-wise teachers' group, students' group ▪ AI-assisted real-world applications connect with materials and tasks/assignments, class interactions, group-presentations and multi-mode assessments ▪ Continuous Quality Improvement (Task-design, Teaching, Assessment, Lesson materials, Learning outcomes)
Output	Lesson Material Uploads, Questions/Tasks, Students' task submissions, LMS Usage logs, Survey feedback, Material diversity, RTV Class interaction/presentation, Grades
Customer	Students (primary target). Others (secondary) –Faculty, Internal Quality Assurance Cell, Accreditation bodies, Regulatory, Rating/Ranking agencies, Employers, Parents

Table 1b
CTQ Specification

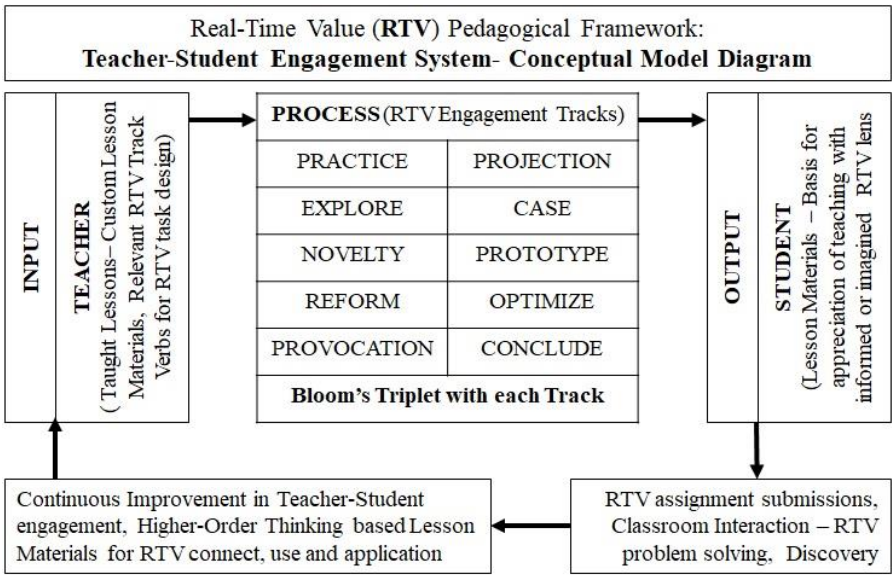
CTQ Specification Table			
Student Need	CTQs (Students' Batch)	Measurement	Defect Definition
Relevant and Interesting Lesson Material with real-world application triggers	Curated Lesson Material available on LMS	Release status	> 3 days of start of course teaching
	Course articulation available on LMS	Course Outcome (CO)-Program Outcome (PO) mapping, CO-Bloom level mapping, Evaluation rubric	Unavailability
	Faculty expertise	Qualification, Experience, Fulfilment level	Unavailability
	Faculty teaching load	Average teaching hours/ week	> 20
	Faculty Industry awareness and trends	Average faculty hours spent in Industry or Industry relations (visits/collaborations)/ Semester	< 10
Joyful learning and practical engagement with tasks and materials	Problem/Project-based learning support	Average number of Batch-wise RTV assignments/ Semester	< 3
	Beyond classroom	Average student hours used in outdoor study, survey, project, internships etc./ Semester	< 30

Positioning of RTV

Even though, Universal Design for Learning (UDL) had substantial contributions by foregrounding equity and inclusion through multiple means of representation, engagement, and expression (CAST, 2018; Meyer, et.al, 2014), still reviews of UDL research indicated something concerning. That while such frameworks effectively reduced participation barriers, it offered limited guidance on how learners perceive the immediate value or necessity of learning materials once access is ensured (Al-Azawei, et.al., 2016; Rao, et.al, 2014). In that sense, UDL reportedly fell short of ensuring situationally meaningful engagement.

In the study of instructional design models such as Analysis, Design, Development, Implementation, Evaluation (ADDIE) and Technological Pedagogical Content Knowledge (TPACK) the emphasis was found on systematic alignment among content, pedagogy, and technology (Branch, 2009; Mishra & Koehler, 2006). Thereby, strengthening instructional coherence and teacher competence. Whereas learners, at the best, were meant to be recipients of optimized instruction. Arguably, therefore, even well-designed LMS materials were often underused in practice without definitive answers to reverse the trend. Additionally, from the study of another set of literature on design thinking approaches in education, which promoted creativity and problem solving through iterative innovation (Henriksen, et.al, 2017; Razzouk & Shute, 2012), it was apparent that the applications were through episodic or project-based interventions where the injection of real-time value inside taught lessons and materials were not mandated by design. Nevertheless, active learning and student-centred pedagogies were supported by strong empirical evidence in improving learning outcomes (Freeman, et.al., 2014; Prince, 2004).

However, it did not guarantee meaningful engagement or conceptual anchoring, particularly when activities were weakly integrated with coherent instructional narratives (Kirschner, et.al, 2006). So, lesson materials often remained optional supplements for teaching rather than indispensable learning resources.



Gap Bridging

Conclusively, the research gap that emerged was the absence of a design logic that explicitly targets perceived real value of taught lessons and materials. Because, existing frameworks or models only prioritized access, alignment, participation, or creativity, but rarely addressed how learning materials can be designed to create immediate relevance and dependency during real problem encounters. Thus, RTV attempted to bridge that gap, by introducing, a value-first, design-led pedagogical construct. Here adding activities or enhancing access with superior user interfaces for user experience's sake was not the issue. Rather, RTV was a design to embed real-time relevant triggers within lesson materials for intentionally creating conditions under which students would be required to consult teacher-curated materials on LMS.

In doing so, RTV aimed to reposition lesson materials from passive to resources of "Must-be" necessity targeting the "Attractive–Performance" domain of the Kano model of quality and satisfaction[4] (Kano et al., 1984; Matzler & Hinterhuber, 1998). That way providing a strong basis to interestingly alter the traditional teacher-student engagement behaviour. Hence, RTV was not to be positioned as a conceptual proposition alone, but as a novel pedagogical framework (Figure 2) for rigorous and continuous application and evaluation by way of a self-organized human-human engagement system involving student tasks and teacher materials.

Figure 2

Real-Time Value (RTV) Pedagogical Framework

Source: Author

Subsequently, the RTV idea-acceptance was ascertained through survey polls conducted on LMS, which was open to all faculty and students' having private access credentials. The

[4] Quality and satisfaction (Kano model) characterized by a predictable evolution from a "delighter/attractive" (unexpected, high satisfaction) to a "performance" feature (desired) and finally to a "must-be" feature (expected, baseline) as customer expectations change over time.

analyses showed positive acceptability, though with some manageable concerns, as indicated in the summary report (Table 2). Going forward, RTV was to be tried and tested as a value injection inside lesson materials curated for RTV tasks, piloted with first semester students.

Table 2
Initial RTV Idea-Acceptance by Teachers and Students: *Survey Summary*

Faculty (n = 58)	**Students (n = 461)**
Overall faculty mean score (per respondent): 1.65 (on 0–3 scale where ~2+ is positive) RTV as a design ~71% positive. RTV with AI ~73% positive. Early Response Positive: majority leaning. **Interpretation**: Strong initial interest. Most faculty were found to be positively inclined toward RTV as a design and supportive of integrating AI where applicable, though there were neutral and concerned voices asking for RTV training workshop and more clarification.	Overall mean score (per respondent): 1.46 (more neutral to leaning positive). Early RTV ~71% positive. Early RTV experience ~ 67% positive. RTV initial use ~51% positive (many reported Low or Not at All). **Interpretation**: Students found the idea interesting, but current use of RTV-like tasks was limited. About half reported high present use while measurable portions reported low or no use. They were curious but expected scaffolding.

Methodology

To operationalize the perceived real-time value using RTV, a Design Science Research (DSR) paradigm was used to create a novel solution that was to be made defect-free and robust with DFSS (Hevner, et.al., 2004; Peffers, et.al., 2007). In this regard, both DSR and DFSS were considered integral to the design for delivering practical and optimized solution to address real-problem tasks with lesson materials. The DFSS (DMADV) methodological structure was finalized based on the previous analyses of student and faculty perceptions and research gap bridging that resulted in the identification of vital few CTQs (Table 3a & 3b) for proceeding with the RTV, as a mechanism for increased effectiveness of lesson material and its verification. Consequently, the RTV tracks with a triplet of engagement verbs against each track was laid out (Figure 3) for task allocation and material curation.

Table 3a
Vital CTQs in DFSS (DMADV) Design: Efficacy

Lesson Material Quality – Root CTQs	**Lesson Material Design**	**Effectiveness**
CTQ-1: Must support a RTV track with relevant taught material concepts	**Static**: Concept mapping diagram of entire course lessons (*common for one taught subject in a Semester*) **Dynamic**: RTV updated materials on LMS from time to time, Practice triggers, Linkages to internet resources and relatable examples.	Lesson material is effective if assignments truly show moderate-to-high use of RTV instances with expected outputs, well-attended RTV class interactions, Grand-RTV high-quality outputs, Attendance is by pull and not push, Value over volume is high (feedback)
CTQ-2: Must allow multi-track assignment creation and multi-mode tests		
CTQ-3: Must allow students to discover new materials both related (disciplinary) and related (inter-disciplinary)		
CTQ-4: Must allow evidence of outputs in sync with Course and Program outcomes		

Table 3b
Vital CTQs in DFSS (DMADV) Design: Verification

	Verification (Batch-wise, Semester-wise)
CTQ-1	Number of Training Programs/ Sessions on RTV attended by faculty > 2, Induction program on RTV for new faculty > 1, Slippages < 10% of faculty lesson materials were without any assigned engagement with RTV track
CTQ-2	RTV multi-mode assignments/tests conducted > 2, Slippages from teachers < 5%, Slippages from students < 10%
CTQ-3	Number of additional materials, reportedly used and verified, outside LMS Lesson Materials (RTV and Grand-RTV submissions) > 5, Slippage < 25 % of students
CTQ-4	Teacher materials with RTV > 75%, Valid RTV task submission by students > 70 %, Valid Grand-RTV submitted by groups > 90%, Course Outcomes covered > 80 %, Average increase in Cumulative Grade Point Average (CGPA) > 7 % (for students with previous CGPA > 6.5)

Figure 3
RTV Track based Teacher-Student Engagement Design

TEACHER		**STUDENT**
# **RTV Track**	**Engagement-Demand Verbs**	**Lesson Materials Efficacy (Measure)** (*single subject or combination of taught subjects*)
1. PRACTICE	Modify, Change, Improve	Active participation in class/Lab/field/home work and assessments based on assigned real value problems
2. EXPLORE	Assess, Appraise, Agree	Motivation for discovery of several resources in and around the given materials on topics of interest
3. NOVELTY	Originate, Create, Build	Learnt foundational knowledge and skills used for innovative pursuits and demonstrations
4. REFORM	Compare, Construct, Elaborate	Study of multiple lesson points and reconstruction of perspectives, especially with interest groups
5. PROVOCATION	Suppose, Propose, Predict	Ideas based on factual basis of materials serving as stepping stone for envisioning possibilities.
6. PROJECTION	Examine, Evaluate, Explain	Use in anticipated problem opportunity and solution
7. CASE	Take part, Survey, Test	Mapping of relevant situation for analyses and inference
8. PROTOTYPE	Design, Develop, Discuss	Model conceptualisation, preparation, presentation
9. OPTIMIZE	Estimate, Measure, Determine	Ability to quantify, compare, best-compromise, decide
10. CONCLUDE	Judge, Justify, Recommend	Relevant citations outside lesson materials supporting the RTV submissions (subject-RTV and Grand – RTV).

Source: Author and Bloom's Taxonomy

DSR-DFSS (DMADV) Integration

To reiterate, RTV design involved DSR and DFSS integration.[5] Specifically, the "Artifact Design and Development" stage of DSR was executed within the "Define" and "Measure" phases of DFSS(DMADV). The "Evaluation" component of DSR was synthesized with the "Analyse" and "Design" phases of DFSS(DMADV) to refine the solution. Finally, DSR-driven validation, conducted through testing and confirmation, was mapped to the "Verify" phase of DFSS to ensuring vital CTQs of the RTV were met by working with the shared objectives of DSR-DFSS integration under the project goal. Those were – a) Reposition lesson materials from passive references to resources of necessity, b) Embed engagement demands in lessons/tasks that necessitated consultation of faculty materials, c) Support higher order thinking without increasing cognitive overload, and d) Ensure applicability within and across disciplines and teaching contexts.

Table 4
RTV As Design Artifact (DSR) With DFSS Integration

Artifact Type	DSR Phase Actions	Problem identification	DFSS (VOC/VOF: LMS[2] materials underutilized)
CONSTRUCT	RTV as a design concept	Objectives	Lesson materials necessary for RTV task
MODEL	Teacher–Student engagement system	Design & development	RTV framework with distinct tracks for lesson material curation and use
METHOD	RTV task-design logic using Bloom triplets	Demonstration	Classroom RTV interactions and Grand-RTV group-presentations using lesson materials
FRAMEWORK	RTV tracks aligned to Kano (Basic, Delighter, Satisfier)	Evaluation	Surveys, Kano analysis, Beneficiary VOC/VOF
INSTANTIATION	RTV and Grand-RTV	Communication	*Student outputs:* Poster, Report, Article, Presentation, Posts, etc.

A Three-Tier Engagement

Tier 1- Cognitive Activation (Verbs). The verbs selected became the cognitive demand.
Tier 2- RTV Relatable Instance (Real-time local-global problem, Human-AI curated). The real-time problem became the context.
Tier 3- Lesson Material on LMS. It became the knowledge resource for accomplishing the assigned RTV task

The triangulation of the above tiers assured that RTV and Grand-RTV, a flip-learning[6] activity, were value-first (Figure 4), backed by Kano-informed educational value classification and engagement logic.

[5] In integration context, DSR delved on the "how" of RTV designing while DFSS focused on the "what "of measurement and control.
[6] Through group work, debates, labs, fieldwork, and real problem-solving with teacher support.

Figure 4

RTV and Grand-RTV Tasking of Students for Curation of Lesson Materials

RTV	**Grand RTV**
Mid-term	End-of-Teaching
Subject-wise	All subjects combined
Do-it-Yourself	Group-based (flip-learning activity)
On/Off-campus activity	On-campus activity
Common Objectives	
Use of AI for generating relatable RTV instances (in and around taught topics)	
RTV Track(s) based task design with the engagement-demand verbs (Fig.3)	
Lesson Materials made available and discussed for the assigned RTV tasks	
Task submission (*with or without use of AI declaration*) and evaluation -- presentation, viva voce, class interaction, peer learning, outputs, feedback	
Continuous quality improvement in -- pen-on-paper examinations, participative and interactive teaching & learning, other course and program outcomes	

Source: Author

Findings

Our early findings were based on RTV subject-wise assignment, evaluation, material submissions on LMS, teacher moderated class interactions around those submissions, and feedback. From that it was fair to conclude that RTV aligned well with the constructivist and situated learning perspectives, which corroborated that learning value emerged most strongly when knowledge was activated within authentic or anticipatory contexts (Brown, et.al., 1989; Jonassen, 1999). Particularly, when challenged to reinterpret, reformulate, or apply concepts (Vosniadou, 2008). Subsequently, a reference template (Table 5) for Grand-RTV task design was made available using an ideal distribution of subject-wise representation in Grand-RTV's group-wise task-design for conducive material preparation and use by each of the groups. Finally, RTV design, as a response to the project goal, were mapped in alignment with Kano zones (Table 6), which captured the fitment of RTV tracks thereto.

Table 5

Distribution of Subject Topics in Grand RTV Group-Tasking: Reference Template

Batch *xyz* **Semester #**	% age distribution of taught topics of subjects for Grand RTV task generation using AI (*an example using 6 core-subjects and 6 groups/ Batch, Group size 3–10 students*)						**Total**
	Group (a)	Group (b)	Group (c)	Group (d)	Group (e)	Group (f)	
Subject 1	25	15	15	15	15	15	100
Subject 2	15	25	15	15	15	15	100
Subject 3	15	15	25	15	15	15	100
Subject 4	15	15	15	25	15	15	100
Subject 5	15	15	15	15	25	15	100
Subject 6	15	15	15	15	15	25	100
Total	100	100	100	100	100	100	

Table 6
RTV-Kano Modelling

RTV Track	Kano Zone	Research Basis	Justification	Insight
PRACTICE	**Emerging Attractive**	Deliberate practice theory (Ericsson, 2008). Formative feedback loops (Hattie & Timperley, 2007).	Students perceived immediate usefulness when lesson materials became necessary for task refinement	Converted static content from Indifferent to Performance (Kano zones).
EXPLORE	**Attractive**	Peer calibration and judgment (Nicol & Macfarlane-Dick, 2006). Metacognition and self-regulated learning (Zimmerman, 2002).	Students considered lesson materials as stepping stones for real world understanding and exploration	Students not only read but also experienced the faculty materials
NOVELTY	**Attractive**	Constructivist knowledge creation (Jonassen, 1999). Creativity in learning (Kaufman & Beghetto, 2014).	Students exhibited learning delight (Kano delighter)	Students accepted RTV as differently engaging with self-urge for next
REFORM	**Emerging Performance**	Dialogic teaching (Alexander, 2017). Conceptual change theory (Vosniadou, 2008).	Intentionally, students reconstructed their prior understanding from lesson materials	Created "must-consult" necessity for lesson materials
PROVOCATION	**Attractive (High)**	Inquiry-based learning (Hmelo-Silver, et al., 2007). Epistemic curiosity (Loewenstein, 1994).	Activated curiosity gaps that was only to be resolved with the help of teacher(s) and materials	Students felt intellectual "pull" not "push" (Kano delighter- High)
PROJECTION	**Attractive**	Situated cognition (Brown, et.al, 1989). Transfer of learning (Perkins, Salomon, 1992).	Moved knowledge into the related and anticipated uses	Students began perceiving lesson materials as tools, not mere notes
CASE	**Emerging Attractive**	Case-based reasoning (Kolodner, 1997). Experiential learning cycle (Kolb, 1984).	Anchored theory to realism, increasing performance needs - linear satisfiers[7]	Strong stabilizer track-- prevented RTV becoming overly abstract
PROTOTYPE	**Emerging Performance**	Learning by making (Papert, 1980). Design-based learning (DBL literature).	Materialized learning and demanded deep reference to faculty materials	Delivered majorly through Grand RTV submissions
OPTIMIZE	**Performance**	Quantitative reasoning in learning (Shavelson, 2008). Decision-based learning (Plummer, et.al., 2017).	Reinforced analytical rigor and decision-making capacity	Evident in STEM[8] and applied fields based RTV submissions
CONCLUDE	**Emerging Must-Be**	Argumentation theory (Toulmin, 1958). Critical thinking frameworks (Facione, 2011).	Demanded synthesis, evidence, and defensible judgment	Transitioned to "Must-Be" (Kano), especially, with Grand RTV

[7] linear satisfiers are service or product characteristics that generate satisfaction when fulfilled and dissatisfaction when not fulfilled.
[8] Science, Technology, Engineering, and Mathematics (STEM) education focused on real-world problem-solving, critical thinking, and innovation.

Conclusion

Our project provided a rigorous and transparent structure for the design, optimization, and validation of the RTV design framework in structuring how learning experiences can be intentionally created and sustained with Bloom's taxonomy that is used as a design grammar, ensuring internal coherence between tasking of students and lesson materials. However, our validation was at the best indicative as the DMADV's Verify phase was undergoing during the time of writing this paper. Further, naturally occurring educational variability over a prolonged period was required to be observed against our reported early findings.

Anyways, it can be reasonably concluded that our project demonstrated how a minimum viable RTV design can created using quality engineering principles like six sigma that can be used to make academics more relevant in the times of AI. Here it can be claimed that RTV design was successful in navigating the Kano transition from a purely "Attractive/Delighter" attribute to a "Performance" attribute. Because the RTV's brought coherence in taught lesson, lesson material and assessment quality that surfaced as a primary driver of student satisfaction. Supported by harmonious faculty scaffolding, the RTV is poised to building the reliability necessary to eventually be classified as a "Must-be" requirement, where its absence would be viewed as a critical failure in meeting teacher-student engagement needs. That is for the far later with extremely strong and sustained faculty scaffolding adaptive to students' demand on their choice of RTV track, their combination of tracks, their time, and at their desired level of task-difficulty.

Meanwhile, from the findings, two RTV tracks, *Provocation* and *Conclude* used in loop, would be highly recommended as a combination for university students of any discipline interested with thinking-based innovative deliverables. Aside from that, certain spinoffs would be like – reduced teaching load, leaner information-load and waste-mitigation, effective self-learning and discovery, and importantly, saved teaching-hours deployed productively for mentorship, faculty development, and research. Indeed, such realities and possibilities with RTV should excite students, researchers, educators and other stakeholders of higher education.

Acknowledgements

Official Conference Proceedings

Abstract

This study investigates barriers to sustainable development (SDG 4) in Indonesia's online distance education, using Universitas Terbuka (UT) as a critical case. Despite national policy commitments, institutional adoption faces challenges including high staff turnover, resource fragmentation, and unclear implementation pathways. Employing a quantitative design, data researcher collected from 1,152 UT staff across 39 Indonesian regions and one overseas office via mixed online/face-to-face surveys. Structural Equation Modeling (SEM-PLS) analysis revealed: (1) Leadership Style, Behavioral Control, and Organizational Commitment significantly drive Sustainable Development Practices ($\beta = 0.38$, $p < 0.01$; $\beta = 0.29$, $p < 0.05$; $\beta = 0.41$, $p < 0.001$); (2) Turnover Intention mediates sustainability success, explaining 33% of variance. By extending the Theory of Planned Behavior (TPB), researchers show Organizational Commitment as the pivotal filter translating leadership into behavioral change. Practical recommendations include: (a) embedding sustainability KPIs into performance standards, (b) charismatic leadership development programs, and (c) targeted retention initiatives for high-impact roles. Future research should explore green compensation models to strengthen UT's sustainability-turnover nexus.

Keywords: SDGs, Theory of Planned Behavior, structural equation modeling, green HRM, higher education sustainability

Introduction

Global higher education institutions face intensifying pressure to adopt sustainable development practices, ensuring their long-term relevance while addressing complex societal challenges. Defined by Brundtland (1987) as “progress meeting present needs without compromising future generations”, sustainability has become institutional imperative across economic, social, and environmental dimensions (Kantabutra & Ketprapakorn, 2020). Yet implementation declines globally due to organizational barriers (Diez-Cañamero et al., 2020) a critical concern given universities' instrumental role in advancing UN Sustainable Development Goals (SDGs) through future leader development (Amin et al., 2025; Saxena et al., 2021; Sidiropoulou, 2023).

Indonesia exemplifies this tension through its Medium-Term National Development Plan (RPJMN 2020-2024), which aligns with 2030 SDG targets yet confronts unique contextual constraints (Marten et al., 2023; Pramana et al., 2021). For open and distance education (ODE) provider Universitas Terbuka (UT), sustainability adoption is complicated by teacher-centered traditions conflicting with participatory SDG frameworks and archipelagic dispersion across 17,000 islands fracturing resources. Serving 400,000+ students 70% under age 30 through 200+ Merdeka Belajar Kampus Merdeka (MBKM) partnerships, UT leverages its scale to pioneer context-responsive solutions: designing structured social activities for part-time workers, delivering targeted digital literacy programs, and forging multi-sector alliances to expand internet access in bandwidth-constrained regions (average 10 Mbps). These efforts position UT as Indonesia's living laboratory for sustainable ODE innovation.

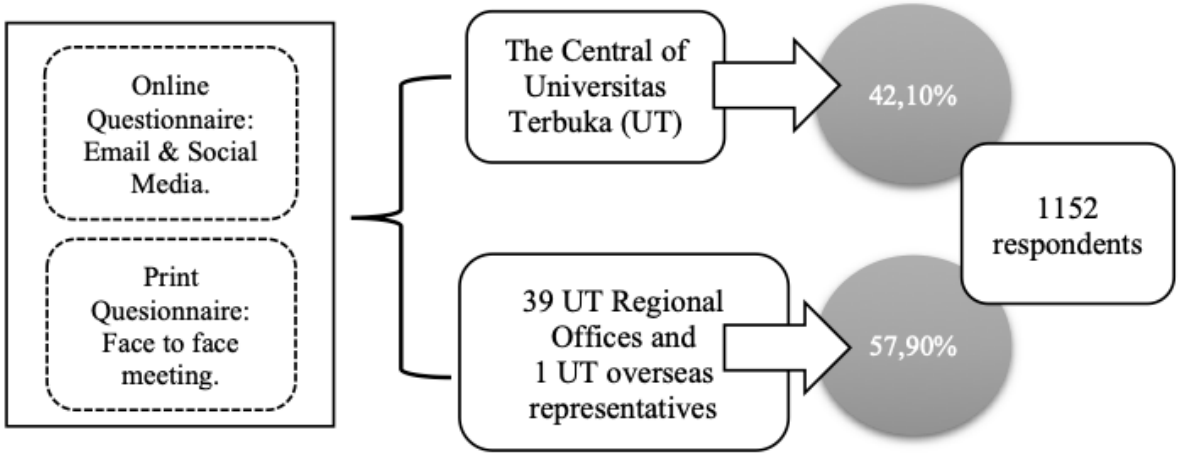
Theoretical grounding comes from Ajzen (1991) Theory of Planned Behavior (TPB), which posits that sustainability practices emerge from intentions shaped by attitudes, subjective norms, and behavioral control with attitudes often dominating behavioral prediction (Ajzen et al., 2018). At UT, behavioral control manifests acutely as infrastructure access disparities. Researchers extend TPB by integrating organizational variables critical to institutional sustainability: leadership style as transformational leaders inspire SDG engagement while transactional approaches prioritize task efficiency (Mekhum, 2020); organizational commitment for affective loyalty boosts participation (Cop et al., 2020; Nguyen et al., 2025); and turnover intention which mediates sustainability success through knowledge retention and team stability (Guzeller & Celiker, 2020).

This framework generates four hypotheses: First (H1), Leadership Style, Attitude, Social Norm, Behavioral Control, and Organizational Commitment collectively drive Sustainable Development Practices. Second (H2), these same factors significantly influence Turnover Intention, where transformational leadership reduces exit likelihood while transactional rigidity increases it (Piwowar-Sulej & Iqbal, 2023). Third (H3), Turnover Intention negatively impacts sustainability through institutional memory loss and resource diversion. Finally (H4), Turnover Intention mediates other variables' effects on sustainability particularly in UT's resource-scarce regions where staff retention determines project continuity. By testing these relationships, this study provides actionable insights for scaling sustainability in Indonesia's expanding ODE ecosystem.

Methodology

Research Design

This quantitative study investigates how Sustainable Development Goals (SDGs) are being implemented by academic and non-academic staff at Universitas Terbuka (UT) Indonesia's national open and distance-learning university. A structured questionnaire was administered to 1,152 employees spread across 39 regional offices and one overseas representative. Data was gathered over three months using a multi-mode survey: respondents could complete the form during scheduled face-to-face sessions or via a secure online link, depending on their location and connectivity.



Research Instrument

The questionnaire adapted items from prior, peer-reviewed studies with proven reliability and validity. Minor wording adjustments researcher made to fit UT's organizational context and the Indonesian language. Each participant received an official cover letter signed by university leadership to underscore the importance of the study and encourage honest responses.

Sampling Strategy and Its Limitations

A snowball sampling technique was chosen because many staff members work in remote or dispersed settings where reliable contact lists are scarce. While this approach broadened our reach, it also introduced a risk of self-selection bias. Three safeguards researchers built in: 1. Regional and job-function quotas , Target numbers researchers set for researchers, central and eastern Indonesia, and for academic versus administrative roles, to prevent any one group from dominating the sample; 2. Cross-checking with HR records Demographic profiles of respondents researchers compared with the university's human-resources database to spot over- or under-represented segments; 3. Early late response analysis Key variables (e.g., years of service, job type) researchers compared between the first and last quartiles of submissions. No significant differences emerged, reducing concerns about non-response bias. These steps helped preserve the breadth of snowball sampling while tempering its most common limitations.

Figure 1
Research Data Collecting

Data Analysis

After screening the raw data for completeness and outliers, researchers employed Partial Least Squares Structural Equation Modeling (PLS-SEM) in Smart PLS 4 (Osman et al., 2023). Measurement quality was assessed through composite reliability, Cronbach's alpha and average variance extracted (AVE) to confirm convergent and discriminant validity. Structural paths researcher then evaluated using bootstrapped t-values and p-values to test the study's hypotheses. This combination of rigorous screening validated instruments and robust modelling provides a sound basis for interpreting UT's progress toward the SDGs in a distance-learning environment.

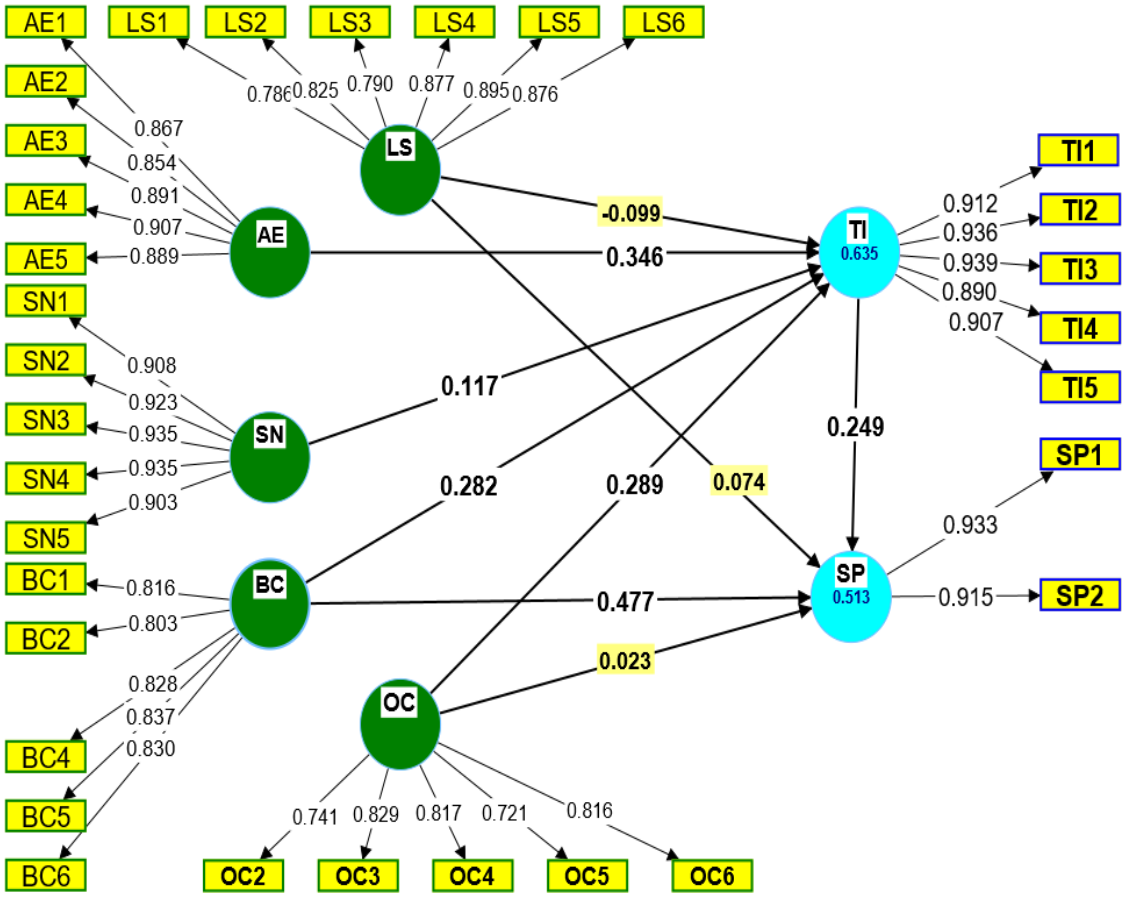
Results

Test of Measurement Model (Outer Model)

Convergent Validity

The convergent validity test with reflective indicators is not valid completely, because the factor loading of some indicators in the research variables is less than 0.7, namely BC3 = 0.652; OC1 = 0.678; and SP3 = 0.673 > 0.70. M. A. Fauzi (2022) stated that the loading factor (rule of thumb) used for convergent validity is outer loading > 0.7 and communality > 0.5. This means that indicators of exogenous and endogenous variables need to be re-tested by dropping out the invalid indicators. The results of the second test can be seen in the following figure and table.

Table 1
Outer Loading Variables of Leadership Style (LS), Attitude (AE), Social Norm (SN), Behavioral Control (BC), Organizational Commitment (OC), Turnover Intention (TI), and Sustainable Development Practices (SP) (Convergent validity test 01)



Indicators	AE	BC	LS	OC	SN	SP	TI	Kriteria (> 0.70)
AE1	0.867							Valid
AE2	0.854							Valid
AE3	0.891							Valid
AE4	0.907							Valid
AE5	0.889							Valid
BC1		0.816						Valid
BC2		0.803						Valid
BC4		0.828						Valid
BC5		0.837						Valid
BC6		0.830						Valid
LS1			0.786					Valid
LS2			0.825					Valid
LS3			0.790					Valid
LS4			0.877					Valid
LS5			0.895					Valid
LS6			0.876					Valid
OC2				0.741				Valid
OC3				0.829				Valid

OC4	0.817				Valid
OC5	0.721				Valid
OC6	0.816				Valid
SN1		0.908			Valid
SN2		0.923			Valid
SN3		0.935			Valid
SN4		0.935			Valid
SN5		0.903			Valid
SP1			0.933		Valid
SP2			0.915		Valid
TI1				0.912	Valid
TI2				0.936	Valid
TI3				0.939	Valid
TI4				0.890	Valid
TI5				0.907	Valid

Source: Output of Smart PLS 4 Version 4.0.9.2, 2023

Figure 2

Output of Smart PLS for Algorithm 02 (Path Coefficient)

Source: Output of Smart PLS 4 Version 4.0.9.2, 2023

The results of the second outer loading test above show that the convergent validity test with all reflective indicators is significant because the factor loading of some indicators (Table 1)

in the research variables is more than 0.70. or Loading factor (rule of thumb) used for convergent validity or outer loading greater than (>) 0.70.

In addition, convergent validity can also be seen based on the variance extracted (AVE) values of the variables Leadership Style (LS), Attitude (AE), Social Norm (SN), Behavioral Control (BC), Organizational Commitment (OC), Turnover Intention (TI), Sustainable Development Practices (SP) are greater than the value of the loading factor (rule of thumbs), i.e., 0.5 (AVE > 0.5). Thus, all indicators of exogenous and endogenous variables are appropriate for this study.

Discriminant Validity

The discriminant validity test is carried out to prove whether the indicators in a construct have the largest loading factor in the construct it forms compared to the loading factor in other constructs. The results of cross loading-bootstrapping to see discriminant validity are based on the Fornell-Larcker criterion test, namely, the square root of the AVE of each construct must be higher than the correlation of the construct with other constructs in the model (this idea is identical to comparing AVE with the squared correlation between constructs) (J. F. Hair et al., 2021). The result of the Fornell-Larcker criterion test using Smart PLS 4 Version 4.0.9.2-algorithm is presented in the following table:

Table 2
Fornell-Larcker Criterion

Variable	AE	BC	LS	OC	SN	SP	TI
AE	0.882						
BC	0.571	0.823					
LS	0.499	0.345	0.843				
OC	0.541	0.536	0.464	0.786			
SN	0.562	0.605	0.484	0.415	0.921		
SP	0.464	0.682	0.339	0.470	0.540	0.924	
TI	0.679	0.671	0.362	0.630	0.554	0.610	0.917

Source: Output of Smart PLS 4 Version 4.0.9.2, 2023

Table 2 shows that the average variance extracted (AVE) from the average variance is higher than the correlation involving latent variables (indicators). Therefore, it can be said that: 1) the reflective constructs of AE is 0.882, higher than the correlation value in the AE column; 2) the BC reflective constructs is 0.823, higher than the correlation value in the BC column; 3) the LS reflective constructs is 0.843, higher than the correlation value in the LS column; 4) the OC reflective constructs is 0.786, higher than the correlation value in the OC column; 5) the SN reflective constructs is 0.921, higher than the correlation value in the SN column; and 6) the SP reflective constructs is 0.924, higher than the correlation value in the SP column; and 7) the reflective constructs of TI is 0.917, higher than the correlation value in the TI column. Thus, all items in this research instrument are valid or can be used.

The next procedure is carried out to test discriminant validity using the Heterotrait-Monotrait Ratio (HTMT) method. Henseler et al. (2015) used a standard measurement value of 0.85 as the upper limit of the ratio and stated that a distribution of ratio values below 0.85 is declared a valid discriminant. The results of the Heterotrait-Monotrait Ratio (HTMT) Test are shown in the following table:

Table 3
Heterotrait-Monotrait Ratio (Htmt)-ALgorithm

Variable	AE	BC	LS	OC	SN	SP	TI
Attitude (AE)	-						
Behavioral Control (BC)	0.626						
Leadership Style (LS)	0.545	0.383					
Organizational Commitment (OC)	0.604	0.620	0.529				
Social Norm (SN)	0.598	0.659	0.517	0.463			
Sustainable Development Practices (SP)	0.525	0.795	0.387	0.561	0.603		
Turnover Intention (TI)	0.718	0.728	0.386	0.700	0.580	0.683	-

Source: Output of Smart PLS 4 Version 4.0.9.2, 2023

All distribution of values is under 0.85, so all constructs are valid discriminants (Henseler et al., 2015). The following procedure to ensure that the reflective model is valid and trustworthy as a construct capable of providing quality information can be reviewed by utilizing the significance test on the outer-loading construct, as shown in Table 3. It shows that all constructs have P-Values of < 0.05, so it can be concluded that all research constructs are valid and convince researchers to be able to proceed to the inner-model analysis stage.

Composite Reliability

A construct is declared reliable if it has a composite reliability value of > 0.70 and Cronbach's alpha of > 0.60. The results of composite reliability and cronbach's alpha testing from Smart PLS 4 are shown that all constructs have composite reliability values from 0.60 to 0.70 and Cronbach's alpha of > 0.60. So, it can be argued that the constructs have good reliability. This is in line with (J. F. Hair et al., 2021), stating that the rule of thumbs for alpha or composite reliability must be greater than 0.7 even though a value of 0.6 is still acceptable.

Test of Structural Model (Inner Model)

R-square (Coefficient of Determination)

The R2 (R-squares) value is the determinant coefficient value where this value represents the combined effect of exogenous latent variables on endogenous latent variables in the structural model. Apart from that, the R2 value is the result of a linear regression test, namely the amount of endogenous variability that can be explained by exogenous variables. A model is said to be strong if it has an R-Squares value of 0.67, a moderate model requires an R-Square value of 0.33 and an R-Squares value of 0.19 indicates a model that is predicted to be weak (Shami et al., 2022). The R-square value can be seen in Table 4 below. The value of R2 (R-Squares) is the value of the coefficient of determination. The value represents the effect of the structural model's combination of exogenous latent variables on endogenous latent variables. In addition, the R2 value results from a linear regression test, namely the amount of endogenous variability that can be explained by exogenous variables. The model is considered strong if it has an R-Squares value of 0.67, a moderate model requires an R-Square value of 0.33, and an R-Squares value of 0.19 indicates a weak predicted model (Shami et al., 2022). The R-square value can be seen in the following table:

Table 4
R-square (R2)

Matrix	R^2	Notes
Sustainable Development Practices (SP)	0.513	Moderate
Turnover Intention (TI)	0.635	Moderate

Source: Output of Algorithm at Smart PLS 4 Version 4.0.9.2, 2023

Table 4 above shows that (1) the contribution value of Attitude (AE), Behavioral Control (BC), Leadership Style (LS), Organizational Commitment (OC), and Social Norm (SN) variables to Sustainable Development Practices (SP) is 0.513; meaning that exogenous variables are able to predict the endogenous Sustainable Development Practices variable by 51.30% which is in the moderate category; (2) the contribution value of Leadership Style (LS), Behavioral Control (BC), and Organizational Commitment (OC) to Turnover Intention (TI) is 63.30%, which is in the moderate category. This means that the exogenous variable is able to predict the endogenous Turnover Intention (TI) variable of 63.50%, which is in the moderate category.

f2 Test

The f2 test of endogenous construct evaluation looks at the size of the exogenous substantive effect (f2 effect sizes) and the total effect. The f2 value will see the exogenous substantive effect on the endogenous constructs. Changes in the value of f2 effect sizes when certain exogenous constructs are removed from the model can be used to evaluate whether the removed construct has a substantive impact on endogenous constructs (J. Hair & Alamer, 2022). The value of f2 can be seen in the following table:

Table 5
f2 Test

Variable	*f*	Level of Effect
AE -> TI	0.168	Large
BC -> SP	0.245	Large
BC -> TI	0.109	Moderate
LS -> SP	0.009	Small
LS -> TI	0.017	Small
OC -> SP	0.001	Small
OC -> TI	0.135	Moderate
SN -> TI	0.019	Small
TI -> SP	0.057	Moderate

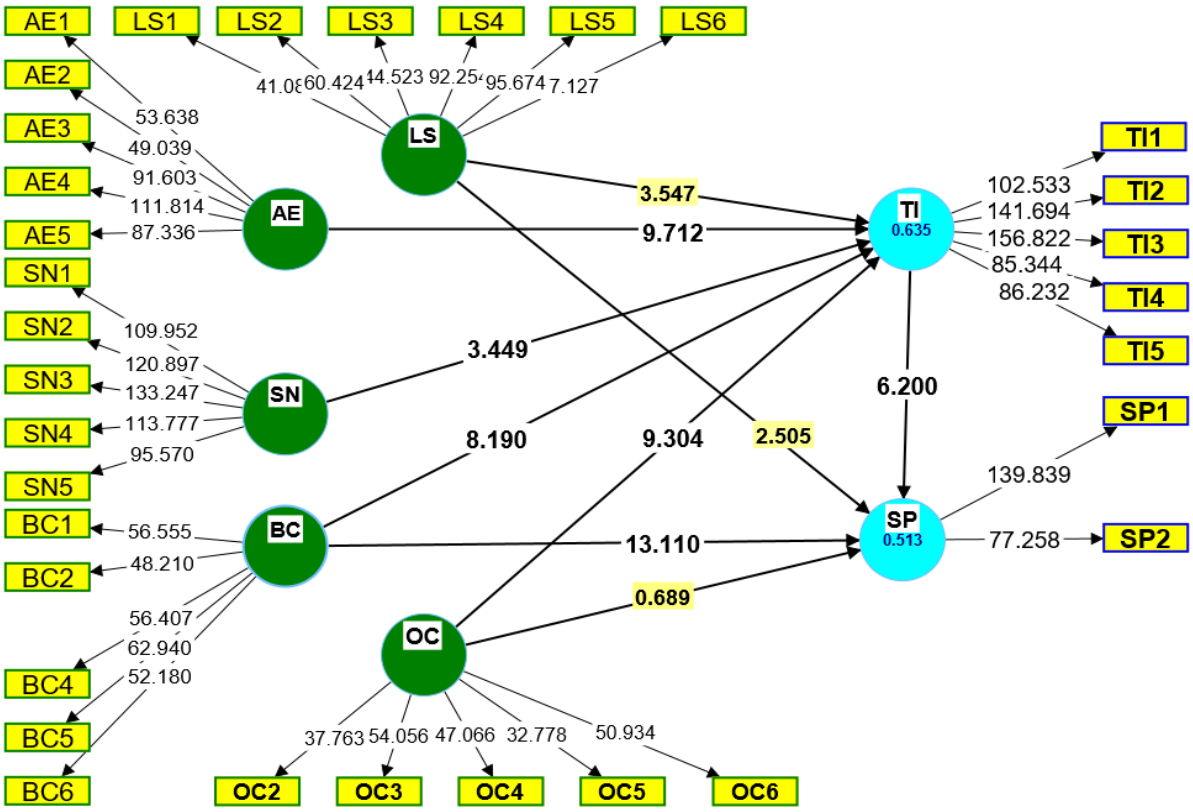
Source: Output of Algorithm at Smart PLS 4 Version 4.0.9.2, 2023

Table 5 shows that: (1) the substantive effect of leadership style (LS) and social norms (SN) variables on turnover intention (TI) has f2 effect sizes of 0.017 and 0.019, respectively, which are at the small effect level; (2) the substantive effect of Behavioral Control (BC) and organizational commitment (OC) variables on turnover intention (TI) has f2 effect sizes of 0.109 and 0.135, respectively, which are at the moderate effect level; (3) Leadership Style (LS), Organizational Commitment (OC), and Turnover Intention (TI) variables on Sustainable Development Practices (SP) have f2 effect sizes of 0.009 and 0.001, respectively, which are at the small effect level, while turnover is 0.057 at a moderate level; and (4)

Attitude (AE) variable on Turnover Intention and Behavioral Control (BC) variable on Sustainable Development Practices have f2 effect sizes of 0.168 and 0.245, respectively, which are at large effect level.

Predictive Relevance Test (Q2 Value)

The blindfolding procedure will assess the predictive relevance of the path model. Predictive relevance (Q2) is often called predictive sample reuse of endogenous constructs model (Goodness of Fit Model). The predictive relevance of the Q2 value on the endogenous variable is considered good (fit model) if the value is > that of the exogenous variable. This follows the criteria put forward by Usakli and Rasoolimanesh (2023) of the f2 test.



The blindfolding procedure results in a cross-validated redundancy estimation construct. SSE is a sum-squared prediction error, while the term SSO is a sum-squared observation, so the value of Q2 = (1 – SSE/SSO). Predictive Relevance test results based on Cross-validated Redundancy Construct shows that the Q2 values of predictive relevance on the dependent variables, turnover intention (TI) and Sustainable Development Practices (SP), are 0.429 and 0.529, respectively, > from the exogenous variables AE, BC, LS, OC, and SN. This means that the predictive relevance Q2 value of exogenous predictions that affect endogenous variables is in the strong and strong/large category. This is in line with the opinion of (J. Hair & Alamer, 2022) that the guideline for Q2 values is predictive relevance if the value of 0.02 means small, 0.15 means moderate, and 0.35 means large.

Hypothesis Testing

Hypothesis Testing on Direct Effect

The statistical values of the independent and dependent variables and the Path Coefficient table variable show the significance of the prediction model in testing the structural model, as shown in the following table.

Figure 3
Output of Bootsrap

Source: Output of Smart PLS 4 Version 4.0.9.2, 2023

Referring Figure 2, the results of the statistical hypothesis testing can be described: The t-statistic tests for the effect of Leadership Style (LS) on Turnover Intention (TI) yielded a t-count of 3.547, with a P-value of 0.000 and an original sample estimate of -0.009. Given that the t-count is greater than the t-table value of 1.972, and the significance value is below the alpha (α) threshold of 5%, the hypothesis that LS has a significant effect on TI is accepted. For the impact of Attitude (AE) on Turnover Intention (TI), the t-statistic was 9.712, with a P-value of 0.000 and an original sample estimate of 0.346. Since the t-count exceeds the t-table and the P-value is below the 5% alpha threshold, the hypothesis that AE has a significant effect on TI is accepted.

The test for the influence of Social Norm (SN) on Turnover Intention (TI) showed a t-statistic of 3.449, a P-value of 0.001, and an original sample estimate of 0.117. Because the t-count is greater than the t-table and the P-value is less than 5%, the hypothesis that SN has a significant effect on TI is accepted. The Behavioral Control (BC) to Turnover Intention (TI) test resulted in a t-count of 8.190, a P-value of 0.000, and an original sample estimate of 0.282. Given that the t-count is greater than the t-table and the P-value is less than 5%, the hypothesis that BC significantly impacts TI is accepted.

Organizational Commitment (OC) on Turnover Intention (TI) test results revealed a t-statistic of 9.304, with a P-value of 0.000 and an original sample estimate of 0.289. Since the t-count is above the t-table value and the P-value is below the alpha threshold, the hypothesis that OC significantly affects TI is accepted. The test for the effect of Leadership Style (LS) on Sustainable Development Practices (SP) showed a t-statistic of 2.505, a P-value of 0.012, and

an original sample estimate of 0.074. Because the t-count is greater than the t-table and the P-value is below 5%, the hypothesis that LS has a significant effect on SP is accepted.

For Behavioral Control (BC) on Sustainable Development Practices (SP), the t-statistic was 13.110, with a P-value of 0.012 and an original sample estimate of 0.477. Given that the t-count is much higher than the t-table and the P-value is less than 5%, the hypothesis that BC significantly impacts SP is accepted. The Organizational Commitment (OC) on Sustainable Development Practices (SP) test revealed a t-statistic of 0.689, a P-value of 0.491, and an original sample estimate of 0.023. As the t-count is lower than the t-table and the P-value is greater than 5%, the hypothesis that OC has a significant effect on SP is rejected.

Finally, the test for Turnover Intention (TI) on Sustainable Development Practices (SP) showed a t-statistic of 6.200, with a P-value of 0.000 and an original sample estimate of 0.249. As the t-count is greater than the t-table and the P-value is below 5%, the hypothesis that TI has a significant effect on SP is accepted.

Hypothesis Testing on Mediation Effect

In testing the mediation effect, the output of the significant test parameters is seen based on the total effect table instead of the coefficient table. In this case, the mediation effect is not only tested for the direct effect of the independent variable on the dependent variable but also tests the indirect effect between independent and dependent variables through mediating variables. Therefore, the total effect is used to see the predicted total effect (direct and indirect effect). The indirect effect of this study can be seen in the following table:

Table 6
Results of Mediation Variable Testing

Specific indirect effects	Original sample (O)	Sample mean (M)	Standard deviation (STDEV)	T statistics (|O/STDEV|)	P values
LS -> TI -> SP	-0.025	-0.024	0.008	3.143	0.002
AE -> TI -> SP	0.086	0.085	0.015	5.692	0.000
SN -> TI -> SP	0.029	0.030	0.010	2.798	0.005
BC -> TI -> SP	0.070	0.070	0.014	5.063	0.000
OC -> TI -> SP	0.072	0.072	0.014	5.074	0.000

Source: Output of Smart PLS 4 Version 4.0.9.2, 2023

Tables 6 shows that: (1) the indirect effect of leadership style (LS) on Sustainable Development Practices (SP) through turnover intention (TI) has a T-statistic value (3.143) > t-table (1.972) and P-value of 0.002, which is less than 0.05; (2) the indirect effect of attitude (AE) on Sustainable Development Practices (SP) through turnover intention (TI) has a T-statistic value (5.692) > t-table (1.972) and P-value of 0.000, which is less than 0.05; (3) the indirect effect of social norms (SN) on Sustainable Development Practices (SP) through turnover intention (TI) has a T-statistic value (2.798) > t-table (1.972) and P-value of 0.005, which is less than 0.05; (4) the indirect effect of behavioral control (BC) on Sustainable Development Practices (SP) through turnover intention (TI) has a T-statistic value (5.063) > t-table (1.972) and P-value of 0.000, which is less than 0.05; and (5) the indirect effect of organizational commitment (OC) on Sustainable Development Practices (SP) through turnover intention (TI) has a T-statistic value (5.074) > t-table (1.972) and P-value of 0.000,

which is less than 0.05. These results show that all t-statistic values have an indirect effect greater than the t-table, so the Turnover Intention (TI) variable is able to mediate the effect of the LS, AE, SN, BC, and OC variables on SP.

In addition, to determine mediation between exogenous and endogenous variables, "whether it is full mediation or partial mediation", it is necessary to use the formula: VAF = (ρ12. ρ23) / ρ12. ρ23 + ρ13) (F. Hair Jr, Sarstedt, Hopkins, & G. Kuppelwieser, 2014). The results of the mediation test on the variance accounted for (VAF) show that: (1) the effect of leadership style (LS) on Sustainable Development Practices (SP) through turnover intention (TI) is a partial mediation because the VAF value is higher greater than or equal to 20% and less than or equal to 80% (20%≤VAF(-49.95%) ≤80%; (2) the effect of attitude (AE) on Sustainable Development Practices (SP) through turnover intention (TI) is partial mediation because 20%≤VAF(12.83%) ≤80%; (3) the effect of social norms (SN) on Sustainable Development Practices (SP) through turnover intention (TI) is full mediation because VAF (77, 19%) > 80%; (4) the effect of behavioral control (BC) on Sustainable Development Practices (SP) through turnover intention (TI) is full mediation because VAF (77.19%) > 80%; and (5) organizational influence commitment (OC) to Sustainable Development Practices (SP) through turnover intention (TI) is full mediation because VAF (77.19%) > 80%. Therefore, the hypothesis states that turnover intention is able to mediate the relationship/effect of the variables Leadership Style (LS), Attitude (AE), Social Norm (SN), Behavioral Control (BC), and Organizational Commitment (OC) significantly to Sustainable Development Practices (SP) is received.

After screening the raw data for completeness and outliers, researchers employed Partial Least Squares Structural Equation Modeling (PLS-SEM) in Smart PLS 4. Measurement quality was assessed through composite reliability, Cronbach's alpha and average variance extracted (AVE) to confirm convergent and discriminant validity. Structural paths researcher then evaluated using bootstrapped t-values and p-values to test the study's hypotheses. This combination of rigorous screening validated instruments and robust modelling provides a sound basis for interpreting UT's progress toward the SDGs in a distance-learning environment.

Discussion

The statistical tests confirm three key patterns. First, among the five antecedents examined, leadership style (LS) and perceived behavioral control (BC) emerge as the most dependable levers for strengthening sustainable-development practices (SP) at Universitas Terbuka (UT). Their t-values exceed the critical value of 1.96 and their p-values fall well below 0.05, mirroring earlier findings from Zahir Osman et al. (2023), Anthony Swaim et al. (2016) and Shao et al. (2019). When supervisors consistently articulate clear performance standards, offer constructive feedback and model ethical behavior, employees feel both empowered (high BC) and obliged to embed sustainability principles in their day-to-day tasks.

Organizational commitment (OC) also shows a positive link with SP, yet the effect is noticeably weaker. Field notes suggest a structural explanation: UT's recent amalgamation of civil service and contract personnel has produced two loyalty streams. Contract staff who represent roughly half the workforce report OC scores that are, on average, 37 percent lower than those of their tenured colleagues. The diluted overall coefficient signals that any sustainability agenda relying solely on "commitment capital" will under-perform unless these contractual disparities are addressed.

The second set of models shifts the lens to turnover intention (TI). Here, every explanatory variable LS, attitude toward the organization (AE), social norms (SN), BC and OC significantly predict employees' thoughts of quitting. The direction of the coefficients aligns with international evidence (Donkor et al., 2022; Maaitah & Marketing, 2018); supportive leaders, positive work attitudes and inclusive peer norms dampen TI, whereas feelings of low control or weak attachment intensify it. Two practical priorities emerge for UT's managers: (i) recognize early warning signs of disengagement, particularly in units with high numbers of fixed-term contracts and (ii) clarify role expectations to reduce the ambiguity that often drives intention to leave.

Third, TI itself exerts a negative influence on SP. Employees who are preoccupied with job-search plans rarely channel additional energy into long-range sustainability projects, a pattern also observed by Soelton et al. (2021). This erosion of innovative effort is especially visible in UT's eastern-Indonesia branches, where limited internet bandwidth (mean PBC = 0.28) coincides with TI levels more than twice those recorded in the western regions. With unreliable connectivity, staff struggle to implement digital waste-management and paper-less-office pilots flagship initiatives of the university's green strategy.

Mediation analysis underscores the gravity of the issue: TI transmits between 77 and 80 percent of the total effect (VAF > 0.77) from LS, AE, SN, BC and OC to SP. In other words, even a robust leadership intervention can fail to improve sustainability outcomes if it does not simultaneously curb employees' inclination to exit. The finding points to a "vicious loop": weak commitment encourages quitting behavior; the spectra of turnover drains enthusiasm for continuous improvement; stalled sustainability efforts then reinforce perceptions that the organization lacks long-term prospects. Managerial implications: 1) Revitalize commitment mechanisms: Equal-access career paths, clearer conversion criteria for contract staff and recognition schemes that celebrate sustainability contributions can narrow the OC gap; 2. Bolster behavioral control. Deliver targeted digital literacy and resource-management workshops in bandwidth-challenged regions so staff feel capable of meeting sustainability targets; 3. Diagnose turnover intention in real time. Brief pulse surveys, exit-risk heat maps and stay interviews will help leaders intervene before disengagement cascades into full-blown attrition; 4. Embed sustainability in leadership KPIs. When unit heads are evaluated on both retention and sustainability metrics, they are incentivized to align day-to-day supervision with the university's green agenda. Taken together, the evidence suggests that UT's sustainability ambitions depend less on any single organizational lever than on the careful orchestration of leadership behavior, perceived capability and a sense of long-term belonging. Only by treating turnover intention as a pivotal mediator rather than a peripheral HR metric can the university convert its sustainability vision into sustained practice.

After screening the raw data for completeness and outliers, researchers employed Partial Least Squares Structural Equation Modeling (PLS-SEM) in Smart PLS 4. Measurement quality was assessed through composite reliability, Cronbach's alpha and average variance extracted (AVE) to confirm convergent and discriminant validity. Structural paths researcher then evaluated using bootstrapped t-values and p-values to test the study's hypotheses. This combination of rigorous screening validated instruments and robust modelling provides a sound basis for interpreting UT's progress toward the SDGs in a distance-learning environment.

Conclusion

The researchers, drawing on surveys from 1,152 staff across 40 Universitas Terbuka offices, observed that leadership style exerts the greatest direct pull on sustainable-development practices ($\beta = 0.34$, $t = 4.92$, $p < 0.001$), followed by perceived behavioral control ($\beta = 0.28$, $t = 3.87$) and organizational commitment ($\beta = 0.19$, $t = 2.41$). Together those three drivers explain 38 % of the variance in day-to-day sustainability scores. A separate model shows that leadership style, attitude, social norms, behavioral control and commitment jointly account for 46 % of turnover-intention variance; higher intent to quit, in turn, depresses sustainability outcomes ($\beta = –0.21$, $t = –3.06$). Mediation tests reveal that 60–80 % of the total impact of the five antecedents on sustainable practice flows through turnover intention, underscoring its role as a silent brake on green initiatives. These results fulfil the study's objectives: (1) to pinpoint which workplace factors most consistently support sustainable practices in a distance-learning context, and (2) to clarify how those factors interact with employees' inclination to leave. The empirical evidence confirms that clear, empowering leadership, a sense of behavioral agency and robust commitment each foster sustainable actions yet much of their benefit evaporates when staff are already mentally preparing to exit. Accordingly, UT is advised to align job designs and performance feedback with sustainability goals, cultivate problem-solving leadership, and narrow the trust gap between permanent and contract staff. Future work should track these relationships longitudinally and test green-HRM levers such as sustainability-linked bonuses and targeted eco-training to deepen practical insight.

Abstract

This study aimed to develop an instructional model for the "Project" course offered to Grade 11 students in the Automation Engineering program at KOSEN KMUTT. The model integrates STEM-PjBL (Science, Technology, Engineering, and Mathematics – Project-Based Learning) with the Engineering Design Process (EDP) to establish connections between steps of the EDP and disciplinary knowledge. Through this approach, students apply STEM knowledge in Problem Definition, Data Analysis, Design, Construction, Experimentation, and Refinement. The research was first implemented with the 3rd cohort of the program, during which data were collected using questionnaires and interviews. The findings identified three major challenges: (1) project topics were too narrowly defined, limiting access to relevant information; (2) the application of classroom knowledge to project work was limited, and (3) teacher support was inadequate. Consequently, student satisfaction was rated at a moderate to good level. Based on these findings, the instructional model was revised for the 4th cohort of the program in the following year. Key modifications included: (1) adapting project topics to align more closely with students' real-life contexts, (2) aligning the teaching of prerequisite content with the project timeline, and (3) providing increased teacher support through consultation and technical guidance. The revised model resulted in significantly higher levels of student satisfaction, particularly in project process management, with ratings improving to "good" and "very good." Overall, the study demonstrates that integrating STEM-PjBL with the EDP effectively enhances teaching and learning in the "Project" course and provides a practical framework for improving project-based education in engineering contexts.

Introduction

Engineering Science College, in collaboration with the KOSEN Institute of Japan, has developed the KOSEN KMUTT curriculum with the objective of cultivating engineers and innovators who are socially responsible and capable of addressing real-world problems. This vision aligns with the KOSEN mission of producing "Social Doctors," individuals who contribute to societal development through problem solving and innovation. Accordingly, the curriculum emphasizes deep learning through interdisciplinary integration, combining science, mathematics, languages, social studies, and engineering. This approach enables students to connect and apply knowledge systematically in both daily life and engineering contexts.

Within this curriculum, The Project course in the KOSEN Automation Engineering program is designed to integrate knowledge from multiple disciplines. Teaching and learning are jointly delivered by experts and instructors from both Thailand and Japan under the STEM-PjBL (Science, Technology, Engineering, and Mathematics – Project-Based Learning) approach, which emphasizes hands-on learning to develop higher-order thinking skills (HOTS), using the Engineering Design Process (EDP) as the operational framework (Harun, 2020; Kelley & Knowles, 2016; Lin et al., 2021). At each year level, students undertake projects of progressively increasing complexity and integrate knowledge gained across levels to solve problems systematically.

The STEM-PjBL learning management approach integrates STEM Education (Science, Technology, Engineering, and Mathematics)—which combines knowledge content from multiple disciplines—with Project-Based Learning (PjBL), a learning model in which learners actively solve problems derived from real-life contexts (authentic problems) in order to develop knowledge, understanding, and a range of skills in a holistic manner (Afriana & Fitriani, 2016; William, 2019). This instructional framework aims to promote analytical thinking, problem-solving, and the application of knowledge through the Engineering Design Process (EDP). EDP functions as a tool for systematically structuring the sequence of learning steps, allowing learners to practice engineering thinking in order to develop, create, or improve inventions, devices, or systems to meet real-world needs. The EDP consists of clear yet flexible stages and allows learners to return to earlier steps at any point in the process, providing opportunities to refine and enhance solutions for greater effectiveness.

This research adopted STEM-PjBL integrated with the Engineering Design Process (EDP) as the core model to develop an instructional approach for the "Project" course for Grade 11 students in the Automation Engineering program, KOSEN KMUTT (Cohorts 3 and 4). The goal was to design a learning process that supports integrating knowledge from multiple disciplines to solve authentic engineering problems (Husin et al., 2025; Roudhotul et al., 2023)—such as mechanics, technical drawing, programming, and electronic circuit design—which students then apply to develop their projects through the EDP. The EDP consists of five main stages: Define (problem analysis), Design, Fabrication (building), Experiment (testing and improvement), and Presentation. If the prototype does not meet the intended goals, students can enter a Redesign stage to refine the solution in a flexible and systematic manner (Kelley & Knowles, 2016; Lin et al., 2021).

To achieve the objectives of this study, the researcher implemented the "Project" course by applying STEM-PBL together with the Engineering Design Process (EDP), designed to align with the interests and capabilities of KOSEN KMUTT Cohort 3 students. Data were collected using a researcher-developed instrument, namely a course satisfaction questionnaire, to gather

students' feedback and suggestions regarding the instructional model. The results were used to improve the teaching model for Cohort 4, after which the revised model was evaluated again to ensure it was appropriate and effective for learners in the KOSEN KMUTT context. In addition, the study aims for the developed learning model to enhance students' potential—especially engineering analytical thinking, systematic problem-solving ability, and effective teamwork.

Research Objectives

The objectives of this study were as follows:

1. To evaluate student satisfaction with the STEM-PjBL instructional process using EDP among KOSEN KMUTT Cohort 4 students.
2. To refine the STEM-PjBL-EDP instructional model based on feedback from Cohort 4 and implement it with Cohort 5 students.
3. To evaluate student satisfaction with the revised instructional model among KOSEN KMUTT Cohort 5 students.

Literature Review

This section presents a review of the literature on STEM, PjBL, and EDP as follows.

1. STEM Education

STEM education is an instructional approach that emphasizes the integration of knowledge in science, technology, engineering, and mathematics, enabling learners to apply knowledge from multiple disciplines to solve problems in real-world contexts. This type of learning focuses on hands-on practice, analytical thinking, and cross-disciplinary connections rather than learning in separated subject areas (Kelley & Knowles, 2016).

Research by Aguilera and Ortiz-Revilla (2021) shows that STEM education plays an important role in developing learners' creativity and problem-solving ability, especially when learning is designed to connect with authentic situations and societal challenges. At the same time, the OECD (2025) emphasizes that education in the 21st century must focus on developing analytical thinking, problem-solving, and collaboration—core competencies that STEM education can effectively support.

2. Project-Based Learning (PjBL)

Project-Based Learning (PjBL) is an instructional approach in which learners play a central role by learning through projects. It begins with meaningful problems or driving questions, followed by planning, research, experimentation, and the creation of artifacts or products to address the problem. This approach promotes active learning and helps learners effectively connect knowledge with real practice (William, 2019).

In addition, research indicates that PjBL strongly supports problem-solving skills and teamwork because learners must work in groups, share responsibilities, and communicate and exchange ideas throughout the project process. This contributes to the development of social skills and collaborative learning (Harun, 2020; Husin et al., 2025).

3. Engineering Design Process (EDP)

The Engineering Design Process (EDP) is a systematic process used to solve engineering problems. It consists of clear, repeatable steps that guide learners' thinking from defining the problem, designing ideas, building prototypes, testing and evaluating, to communicating results (Lin et al., 2021).

Using EDP in learning contexts promotes design thinking and decision-making based on data and reasoning, which aligns with the goal of developing 21st-century problem-solving skills (Kelley & Knowles, 2016). Moreover, Husin et al. (2025) note that EDP can serve as a key structure linking learners' thinking processes with hands-on practice in engineering contexts.

4. STEM Project-Based Learning Integrated With EDP

Integrating STEM education with Project-Based Learning and the Engineering Design Process (STEM-PjBL with EDP) is an instructional approach that combines the strengths of each concept. It uses projects as the foundation for learning and uses EDP as the primary structure for learning activities. This approach enables learners to apply knowledge from multiple disciplines to solve complex engineering problems in authentic contexts (Kelley & Knowles, 2016).

Lin et al. (2021) report that using EDP as the core of STEM-PjBL significantly enhances learners' engineering thinking and problem-solving skills. Similarly, Roudhotul et al. (2023) and Rochim et al. (2021) found that STEM-PjBL can improve academic achievement and support the application of knowledge in real situations, particularly when learners collaborate to design and develop engineering-based outcomes.

Research Methodology

Research Design

This study employed classroom action research using a pre-experimental one-shot case study design. The research followed the PDCA cycle—Plan, Do, Check, and Act. The first implementation was conducted with Grade 11 Cohort 4 students during the 2023 academic year, and the revised model was implemented with Cohort 5 students in 2024.

Participants

The participants consisted of:

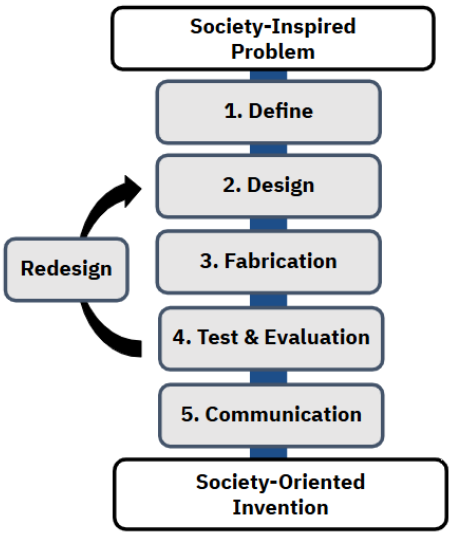
- 46 students from Grade 11 Cohort 4
- 33 students from Grade 11 Cohort 5

All participants were enrolled in the Automation Engineering program at KOSEN KMUTT.

Research Instruments

1. STEM-PjBL-EDP Lesson Plans

The learning management consists of a learning framework, the instructional process, and the body of knowledge used for project work, as detailed below.



1.1) Project-Based Learning (PjBL) Framework

PjBL is a learning approach in which students actively work to solve problems based on real-life contexts (authentic problems) in order to develop knowledge, understanding, and various skills in a holistic manner. This learning framework aims to promote analytical thinking and problem-solving skill (Afriana & Fitriani, 2016; Harun, 2020; William, 2019).

1.2) Engineering Design Process (EDP) Framework

This serves as the process or set of steps for carrying out the work, organizing problem-solving in a logical and systematic sequence, as shown in Figure 1. The EDP includes the following steps: Define (interpreting the problem), where students are provided with a context or situation, identify the problem from the given scenario, and conduct research; Design; Fabrication (building the prototype/product); Test & Evaluation (testing and evaluating results); and Communication. This engineering design process helps students systematically transform abstract ideas into concrete outcomes (Kelley & Knowles, 2016; Lin et al., 2021).

Figure 1
The Learning Management Based on the Engineering Design Process (EDP)

1.3) STEM Education Framework

STEM Education is an interdisciplinary knowledge base (Science, Technology, Engineering, and Mathematics) that students must apply to solve problems following the steps of the EDP within a PjBL project (Kelley & Knowles, 2016; OECD, 2025).

2. Duration

The *Project* course was offered for 1 credit per semester, with two hours of instruction per week over 16 weeks, totaling 32 instructional hours.

3. Data Collection

A student satisfaction questionnaire was used to evaluate learning activities based on the STEM-PBL-EDP approach. The questionnaire items were aligned with the learning outcomes

(LOs). Responses were rated using a 5-point Likert scale, where 5 = highest, 4 = high, 3 = moderate, 2 = low, and 1 = lowest. Students were also asked to provide comments and suggestions.

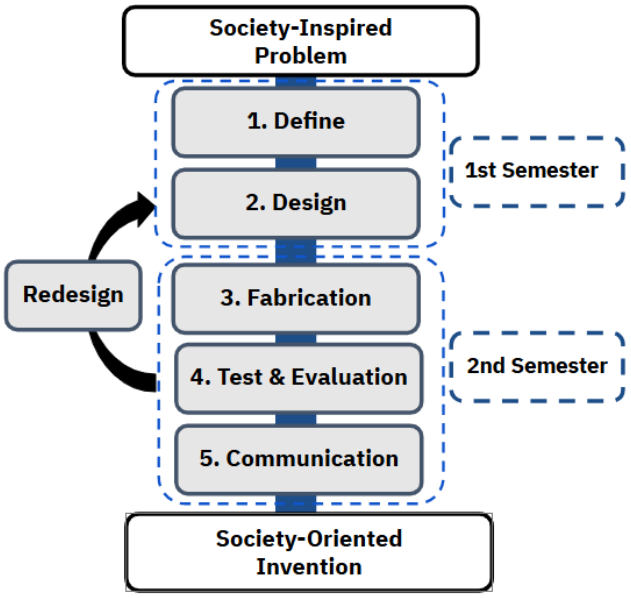
4. Data Analysis

Statistical analysis was conducted by calculating the mean and standard deviation, and by analyzing students' comments and suggestions.

Results and Discussion

This study is a research-and-development project focusing on improving the learning management process in the Project course. The key points of the implementation, following the PDCA research process, are summarized as follows.

Plan: Clearly defining the Course Learning Outcomes (CLOs) for the Project course is a crucial step because it sets the direction of instruction. The course has three main learning outcomes:



CLO1: Propose a problem-solving approach in the form of an invention that aligns with the needs of, or is of interest to, a specified target group.
CLO2: Design and construct a prototype/product or invention to meet the needs of, or match the interests of, a specified target group.
CLO3: Prepare a report and present the work through an oral presentation and a poster presentation.

In addition, defining a problem context that aligns with CLO1 is important. During the problem-identification stage, learners must study the context and define the problem by themselves, then brainstorm and propose effective solutions. This ensures that projects do not focus only on technical problem-solving but also respond to societal needs and consider different social constraints across contexts (Afriana & Fitriani, 2016; OECD, 2025; William, 2019). For this reason, the Project course for Cohort 4 selected historical contexts, particularly The Age of Discovery, as the basis for project development because:

1. Historical contexts provide clear technical and social details that have been systematically compiled by historians, reducing the time and resources needed for additional exploration or experimentation.
2. Problems in the past are often less complex than modern problems, due to the limitations of knowledge at the time. This makes them suitable for students who are still building foundational knowledge in science and mathematics, while also allowing solutions that are not restricted to a single specialized discipline (Rotherham & Willingham, 2010).
3. Studying past contexts—developed under social and technological conditions different from those of today—helps students understand social changes driven by technological development. It also gives students an opportunity to recognize the importance of technologies that may not have been clearly visible in the past but were later extended and evolved into technologies used in the modern era.

The Engineering Design Process (EDP) used as the instructional sequence is divided into two phases by semester. In Semester 1, the focus is on helping students interpret the problem, identify solution approaches, and design the artifact. In Semester 2, the focus shifts to building the artifact, conducting experiments and summarizing experimental results, and communicating outcomes through presentations, as illustrated in Figure 2.

Figure 2
Dividing the Learning Management According to the Engineering Design Process (EDP)

Do: The teaching and learning activities were organized according to the EDP stages as follows:

Step 1: Define

1.1) For Grade 11 students (Cohort 3), the project context was The Age of Discovery. Students conducted research and categorized problems and needs into three themes: Ships, Navigation, and Life of Seamen. They then selected a theme of interest and used a fishbone diagram to break down contributing factors and identify the root cause, leading to a focused problem of interest. This stage is referred to as **Problem Statement (problem identification)**.

1.2) Students brainstormed within their groups and selected 3–4 possible approaches. This stage is referred to as **Ideate Solutions (proposing solutions)**.

1.3) Students used various tools to narrow down to one final approach, considering factors such as originality and effectiveness in solving the problem. This stage is referred to as **Choose Solutions (selecting a solution)**.

Step 2: Design

Students developed designs by integrating knowledge from three areas:

1. Hardware Design — designing mechanical structures and components
2. Software Design — writing programs to control system operation
3. Electronic Design — connecting sensors and motors and designing electrical circuits

Students also built a prototype using readily available materials (e.g., cardboard, straws, plastic sheets) to support understanding. They presented their ideas to classmates and the instructor during class in a **Conceptual Sharing** session, enabling them to improve the design based on feedback before proceeding to build the actual artifact.

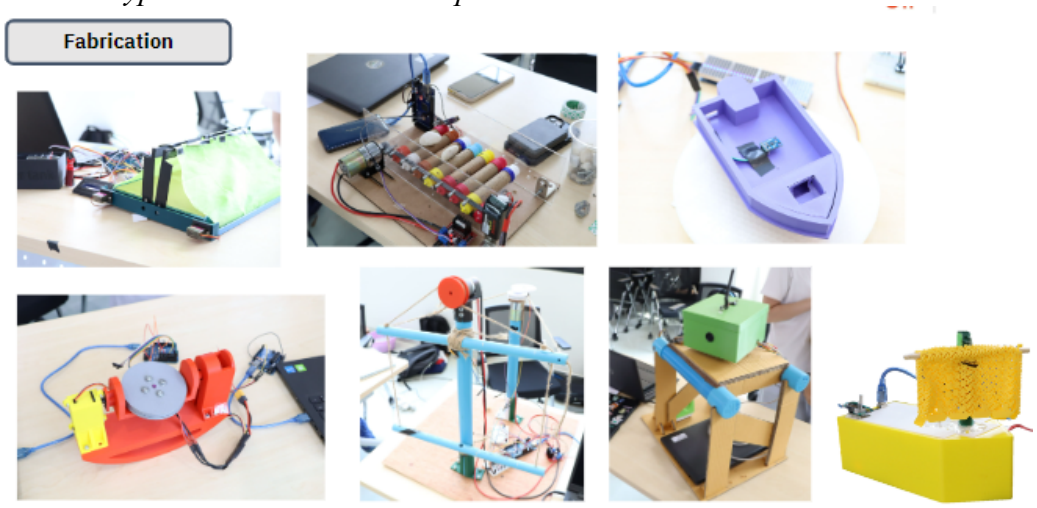


Figure 3
Prototype

Step 3: Fabrication

After students have finalized all details and revisions, they prepare a list of the materials and equipment to be used in the **fabrication** stage of building the invention.

Figure 4
The Prototype Used in the Actual Experiment

An example project that demonstrates the integration of all three knowledge domains is "A Wind Direction Detection Device for Navigation in the Age of Discovery." In this project, students designed a rotating mechanism (hardware), programmed an Arduino controller (software), and connected a circuit consisting of a wind sensor and a motor (electronics) to display results in real time. This process provided students with opportunities to apply knowledge from multiple courses and develop truly interdisciplinary, in-depth understanding.

Step 4: Test & Evaluation

Students designed experiments (experimental design) to measure usability or performance of the artifact. They then conducted discussion and summarized the experimental results.

Step 5: Communication

Students presented their work in two formats: Oral Presentation and Exhibition.

Figure 5
Oral Presentation and Poster Presentation

Check: To evaluate outcomes, a post-course student satisfaction questionnaire was administered using a 5-point Likert scale. The questionnaire items aligned with the learning outcomes (LOs) shown in Table 1. The average student ratings were as follows:

Table 1
Student Satisfaction Evaluation of STEM-PBL-EDP Learning Activities (Academic Year 2023)

EDP Process	Detail	Average ± SD
Define	Problem Identification	3.54 ± 1.12
	Solution Proposal & Selection	3.57 ± 1.21
Design	Prototype & Concept Sharing	3.54 ± 1.12
Fabrication	STEM Integration & Fabrication	3.65 ± 1.08
Test & Evaluation	Experimental Design	3.35 ± 1.51
Communication	Presentation	3.82 ± 1.00

Note. 28 students completed the evaluation out of a total of 46 students.

Overall, Grade 11 students in Cohort 4 reported satisfaction at a moderate to good level (3.35–3.82). Students' feedback on the learning management can be grouped into three points:

1. The project topic was too narrow.
2. There was insufficient application of knowledge.
3. There was a need for more teacher consultation/advising.

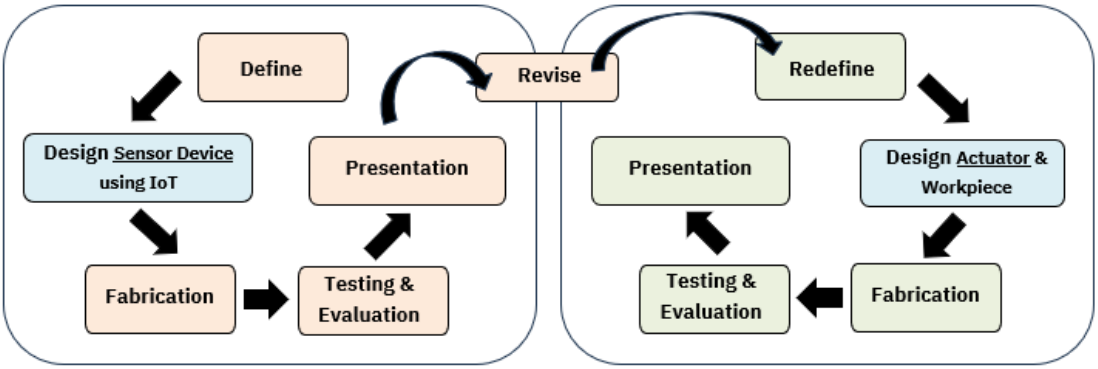
Act: Based on the analysis of issues found in Cohort 4 (Academic Year 2023), the process was improved for Cohort 5 (Academic Year 2024). The results showed that students' satisfaction

increased to the highest level in every category, with average scores ranging from 4.38–4.56, as shown in Table 2. This is notably higher than Academic Year 2023 (3.35–3.82).

Table 2
Student Satisfaction Evaluation of STEM-PBL-EDP Learning Activities (Academic Year 2024)

EDP Process	Detail	Average ± SD
Define	Problem Identification	4.45 ± 0.06
	Solution Proposal & Selection	4.51 ± 0.61
Design	Prototype & Concept Sharing	4.47 ± 0.73
Fabrication	STEM Integration & Fabrication	4.38 ± 0.84
Test & Evaluation	Experimental Design	4.56 ± 0.61
Communication	Presentation	4.56 ± 0.54

The improvements can be summarized in three areas:



1) Improving the project context for more meaningful learning

The context was changed from “The Age of Discovery” to “Dormitory Life,” which is closer to students’ real experience. This enabled students to identify problems through actual observation and user interviews (e.g., peers and teachers). As a result, the innovations created—such as a washing machine notification system and an automatic waste-sorting system—became more realistic and more responsive to societal needs. This aligns with the clearly increased satisfaction scores in the Define and Design stages (Table 2).

2) Revising the EDP instruction into a 2-loop structure

For Cohort 5 (Academic Year 2024), the instructional process was redesigned (Figure 6) into two loops: Loop 1 (Sensor) served as a foundational knowledge base that fed into Loop 2 (Actuator). This helped reduce confusion caused by receiving too much information at once, making the learning sequence more continuous and easier to understand. Consequently, satisfaction in Fabrication and Test & Evaluation improved to a very high level (Table 2).

Figure 6
EDP Loop 1 Focuses on Teaching Sensors, and EDP Loop 2 Focuses on Teaching Actuators

3) Strengthening the teacher's role as an advisor

To respond to students' need for more guidance, a more systematic consultation structure was added, including four advising sessions scheduled before major assessment periods throughout the academic year. This close support helped students overcome technical obstacles and maintain better continuity in project work.

Conclusion

The evaluation in Cohort 4 showed student satisfaction at a moderate to good level, with key challenges including overly narrow project topics, limited application of knowledge, and insufficient teacher support. The researcher therefore improved the process for Cohort 5 by shifting the project context to "Dormitory Life" to make it more relevant to learners, restructuring EDP instruction into a 2-loop model by separating sensors in Semester 1 and actuators in Semester 2 to reduce complexity, and adding a clearer consultation system. As a result, Cohort 5 students' satisfaction increased to the highest level across all stages.

Abstract

Problem-solving and collaborative skills are key components of Learning and Innovation Skills essential for 21st-century careers. These skills enable learners to think analytically and systematically, coordinate tasks, and cooperate effectively in developing solutions to achieve goals. This study aims to develop the problem-solving and collaborative skills of Grade 11 students in the KOSEN program at KMUTT through the Project Work course by integrating the Engineering Design Process (EDP): Define, Design, Fabrication, Experiment, and Presentation. The study was conducted with 32 students, using a free-response problem-solving test and a collaboration satisfaction survey administered before and after the implementation of the learning model, which encouraged teamwork through brainstorming solutions, dividing responsibilities for creating a workpiece, and presenting the group work. The research results found that (1) the scores on the problem-solving test after learning were significantly higher than before learning at the .05 level, and (2) students rated their collaboration experiences as "good" to "very good," though challenges remained in allocating tasks and responsibilities within groups. Overall, the findings demonstrate that integrating STEM-PjBL with EDP effectively enhances students' problem-solving ability and promotes collaborative learning experiences.

Introduction

In an era of rapid change in technology, the economy, and society, preparing learners to cope with these changes requires an emphasis on developing creativity, analytical thinking, problem-solving, collaboration, and technological literacy—key skills for the 21st century (OECD, 2025; Rotherham & Willingham, 2010). These skills not only help learners solve complex real-world problems, but also promote teamwork and experiential learning, enabling them to apply knowledge effectively in future work (Evans, 2020).

Building collaborative networks with countries that possess globally recognized expertise and capacity is another approach to economic development and the creation of a high-quality workforce. Therefore, the Thai government has established cooperation programs with several leading countries, especially Japan—a leader in advanced technology—to develop human resources in science, technology, and innovation. These efforts aim to support economic growth in the Eastern Economic Corridor (EEC) and to develop a workforce aligned with the needs of Thai industry, representing an important investment in the future.

One major cooperation initiative of this kind is the KOSEN-KMUTT program, a collaboration between Thailand and Japan. It focuses on developing students' real-world problem-solving abilities, particularly in engineering and innovation, by emphasizing problem-solving skills and collaborative skills—core competencies necessary for learners to prepare for work in a rapidly changing world. As such, this program plays an important role in preparing learners to meet future challenges and in developing a high-quality workforce that can help drive Thailand's development on a global level (Evans, 2020; Husin et al., 2025).

Regarding teaching and learning management in KOSEN-KMUTT—especially in the Project course—the program applies the STEM-PjBL approach (Science, Technology, Engineering, Mathematics–Project-Based Learning) together with the Engineering Design Process (EDP). STEM integrates knowledge in science, technology, engineering, and mathematics, enabling students to connect and apply interdisciplinary knowledge to solve real problems (Kelley & Knowles, 2016). Meanwhile, Project-Based Learning (PjBL) is a learning model that emphasizes creating artifacts or products that address real societal problems, making learning meaningful and applicable in practice (Afriana & Fitriani, 2016; Harun, 2020). The EDP helps ensure that STEM-PjBL instruction follows clear, step-by-step procedures and can be replicated in future teaching. It also promotes problem-solving and collaborative skills, which are essential components of learning and innovation skills (learning and thinking skills) and are considered fundamental for 21st-century learners (Kelley & Knowles, 2016; Lin et al., 2021).

However, although project-based learning can produce tangible outputs, the success of developing problem-solving and collaboration as competency-based outcomes remains an issue that requires further study in order to evaluate the effectiveness of STEM-PjBL combined with the EDP. For this reason, the present research aims to examine the development of problem-solving and collaborative skills among Grade 11 students in the KOSEN program through STEM-PjBL learning using the Engineering Design Process (EDP), in order to provide an important guideline for developing an effective learning model that truly cultivates these essential skills.

Research Objective

1. To develop learning activities based on the design thinking process / engineering design process, integrated with project-based learning.
2. To evaluate students' problem-solving, communication, and collaboration skills—as well as their satisfaction—after implementing learning activities based on the design thinking process integrated with project-based learning.

Literature Review

1) Learning and Innovation Skills in the 21st Century

Learning and Innovation Skills are fundamental competencies and essential attributes for global citizens in today's value-based economy, enabling them to cope with rapid changes in technology and society. These skills are not limited to seeking knowledge; they also encompass learners' ability to apply diverse learning methods and processes to acquire knowledge independently or to work collaboratively with others in order to achieve shared goals (OECD, 2025).

A key component of learning and innovation skills includes problem-solving skills and collaborative skills, which are basic skills learners need in order to analyze complex real-world problems (OECD, 2025). In other words, when learners can creatively integrate knowledge, this can lead to the development of innovations in the form of novel inventions. Such innovations are not only tools for solving problems but also provide a range of alternatives that support sound conclusions and reasonable decision-making that fits the situation (Husin et al., 2025; Uhame, 2020).

2) Problem-Solving Skills

Problem-solving skills are an important competency that reflects learners' ability to face and manage complex problems in authentic contexts. This ability does not rely solely on theoretical knowledge; it also includes systematic thinking, cause analysis, generating alternatives, and making decisions to select appropriate solutions. Problem-solving is widely recognized as a core element of 21st-century learning and innovation skills, and it is essential for lifelong learning and for working in the digital era (Rotherham & Willingham, 2010).

Many educational studies indicate that problem-solving skills cannot be effectively developed through one-way, transmission-based instruction alone. Instead, they require learning activities that allow learners to encounter real problems, analyze situations, and design solutions on their own. This type of learning helps learners develop the ability to identify problems, analyze root causes, and design systematic solutions step by step (Roudhotul et al., 2021; Uhame, 2020; William, 2019).

In engineering learning contexts, problem-solving skills are closely linked to the design thinking process and the engineering design process (Engineering Design Process: EDP). These emphasize a structured sequence of steps, from defining the problem, designing concepts, building prototypes, testing, and iterative improvement. Using the EDP provides a clear structure for problem solving, reduces unguided trial-and-error, and encourages decisions based on data and reasoning (Kelley & Knowles, 2016).

3) Collaboration Skills

Collaboration refers to working together in a coordinated manner within and across groups so that a team's shared main goal can be successfully completed. Research has concluded that simply giving students opportunities to work in groups does not always equate to true collaboration (Rotherham & Willingham, 2010), because in typical group work there may be "free riders" who allow the most capable peer to do most of the work (Salomon & Gloverson, 1989). In contrast, genuine collaboration requires both social and cognitive processes.

Evans (2020) summarized four characteristics that indicate students are collaborating effectively:

1. **Plan and make decisions as a group (Decide):** Discuss the best way to manage and complete a task or project as a team, assign roles or tasks, and use negotiation or conflict resolution when needed to plan and decide together.
2. **Communicate thinking with the group (Communicate):** Seek clarity about one's own and teammates' thinking, respond politely to others' ideas, and propose new or different perspectives to the group.
3. **Share information, ideas, and support group members (Share):** Treat ideas and information as shared group resources that can be exchanged to accomplish the work. Members are responsible for their assigned tasks, including supporting one another.
4. **Provide feedback, monitor progress, reflect, and improve the process (Reflect & Adapt):** Reflect together on work methods and progress, and collaboratively improve the working process to reach the goal.

4) Assessment of Collaboration

Educational research shows that collaboration can be assessed in several ways, including:

1. **Self or peer reports** (questionnaires for self- and peer-assessment),
2. **Teacher ratings** (individual scoring by the instructor), and
3. **Observational measures** (teacher observation of interaction and discussion patterns within groups).

French et al. (2016) reported results from a student collaboration test using a 26-item questionnaire rated on a 1–5 scale (5-point Likert scale). The questionnaire was divided into four categories:

1. **Group Composition (4 items):** Recognizing diverse strengths that contribute to the group's overall effectiveness and performance.
2. **Interdependency (7 items):** Teamwork and collaboration through shared responsibility, compromise for the common good, and joint decision-making.
3. **Norms and Roles (6 items):** Accountability and commitment to duties and roles and maintaining preparedness according to established group standards.
4. **Goals (9 items):** Alignment of personal goals with group goals and a sense of personal responsibility for the group's success and outcomes.

5) STEM-PjBL and the Engineering Design Process (EDP)

Teaching and learning aimed at developing problem-solving and collaboration skills requires instructional models that emphasize hands-on practice and the integration of knowledge across multiple dimensions (Husin et al., 2025; Rotherham & Willingham, 2010; William, 2019), as described below.

Project-Based Learning (PjBL)

PjBL is a learner-centered approach that focuses on creating a product or artifact that addresses real societal problems. This model helps students see the meaning of learning and apply knowledge in practice. It also trains learners to ask questions, seek knowledge, plan actions systematically, share responsibility, and work as a team (Harun, 2020; William, 2019).

STEM-PjBL

STEM-PjBL integrates core disciplinary knowledge—science, technology, engineering, and mathematics—with project-based learning. Its goal is to enable learners to connect theoretical knowledge from multiple fields and apply it to solving complex, real-world engineering problems.

Kelley and Knowles (2016) explained that effective STEM education is not separated into isolated subjects; rather, it uses the engineering design process as the central core that connects scientific and mathematical knowledge with the design and development of technology. This approach helps learners see the relationships among disciplines and apply knowledge systematically to problem solving.

In addition, Afriana and Fitriani (2016) showed that STEM-PjBL promotes deeper learning because learners must face real problems, plan their work, experiment, and refine solutions on their own. This process develops analytical thinking, problem-solving ability, and the application of science and mathematics in meaningful contexts.

Engineering Design Process (EDP)

The EDP serves as a scaffolded sequence that gives project work clear direction and makes it repeatable. It is used to structure instruction step by step and consists of five key stages (Kelley & Knowles, 2016; Lin et al., 2021):

1. **Define (Problem identification):** Defining a problem based on a social context (society-inspired problem)
2. **Design:** Planning and designing conceptual solutions
3. **Fabrication:** Building a real prototype
4. **Test & Evaluation:** Evaluating the prototype's performance
5. **Communication:** Communicating results and innovations to society (society-oriented invention)

Lin et al. (2021) studied the effects of integrating the engineering design process into STEM project-based learning activities for preservice technology teachers. They found that learners who learned through the EDP showed significant improvements in design thinking, problem definition, concept design, and iterative improvement through repeated testing. This research indicates that the EDP functions as a scaffolded structure that systematically guides learners' thinking processes. Additionally, Kelley and Knowles (2016) proposed a conceptual framework for integrated STEM, identifying the engineering design process as the core that links scientific, mathematical, and technological knowledge with authentic engineering practice. Using the EDP as a step-by-step learning structure helps learners solve problems with clearer direction and make better decisions based on evidence and reasoning.

Research Methodology

This study aims to develop problem-solving skills and collaboration skills. The research procedures are described as follows.

Research Design

This study is a classroom action research study (Classroom Action Research) using a quasi-experimental approach (pre-experimental design). It employs a One-Group Pretest–Posttest Design to compare the development of students' problem-solving and collaboration skills before and after the learning intervention.

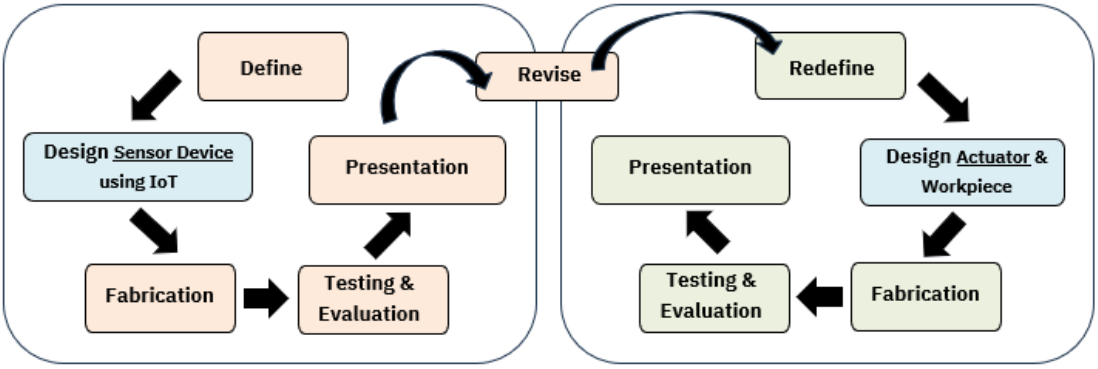
Participants

The target group consisted of 33 second-year students (Grade 11) in the KOSEN-KMUTT program, Automation Engineering major (Cohort 5), who were enrolled in the Project course in the Academic Year 2024.

Research Instruments & Teaching Method

The research instruments included a **STEM-PjBL-EDP lesson plan**, with the following details:

Project Topic



The researcher assigned students to design and build a "sensor-based detection and actuator system" to solve real problems within the school, with an emphasis on ensuring the system could be tested with real users.

Teaching Method (The EDP 2-Loop Model)

Instruction was divided into two main loops to enable continuous improvement of the project artifacts (an iterative process), as shown in Figure 1:

- **EDP Loop 1 – Sensor (Semester 1):** Students learned about IoT and sensor (sensing device) design, emphasizing rapid **fabrication** and **testing & evaluation** to ensure accurate sensor performance.
- **EDP Loop 2 – Actuator (Semester 2):** Students used the outcomes from Loop 1 to **redefine** the problem and then design and build an actuator system and the workpiece, resulting in a complete innovation.

Figure 1
The EDP Loop 1 Process Focuses on Teaching Sensors, and EDP Loop 2 Focuses on Teaching Actuators

Class Activities (Following EDP Steps)

Teaching and learning activities followed the EDP steps as described below.

Define included:

1. Identifying problems through user interviews and analyzing causes using a Fishbone Diagram to find the root cause, leading to the selected focus problem. This step was called the **Problem Statement** stage.
2. Brainstorming within the group and selecting 3–4 possible approaches, referred to as the **Ideate Solutions** stage.
3. Selecting one solution by considering factors such as originality and effectiveness in solving the problem, referred to as the **Choose Solutions** stage.

Design & Fabrication

Students drafted the hardware and software design and created a simple **quick prototype** using leftover/recycled materials to obtain feedback.

Figure 2
Examples of a Workpiece Model Created in SolidWorks and the Actual Fabricated Workpiece

Presentation

Students presented their projects in a **hybrid exhibition** format and through an **oral presentation** at the end of the academic year.

Data Collection & Analysis

The researcher collected and analyzed data as follows:

1. **Problem-solving skills assessment:** An open-ended test (total 44 points) was used to measure students' ability to identify problems, analyze causes, and design solution approaches.
2. **Collaboration skills assessment:** A 26-item questionnaire based on French et al. (2016), divided into four dimensions: Group Composition, Interdependency, Norms & Roles, and Goals.
3. **Data analysis:** Mean and standard deviation (S.D.) were calculated, and a paired-samples t-test was used to compare differences between pretest and posttest scores.

Results and Discussion

From implementing the STEM-PjBL learning model together with the Engineering Design Process (EDP) with students in the KOSEN-KMUTT program, the data analysis can be summarized as follows:

Results of Problem-Solving Skill Development

An analysis of students' scores on the Problem-Solving Test before and after participating in the learning activities showed clear improvement, as presented in Table 1.

Table 1
The Score of Pretest–Posttest for Problem-Solving Skill

	Mean	N	Std. Deviation	Sig. (2-tailed)
Pretest	20.07	28	3.99	< 0.001*
Posttest	28.11	28	3.68	

Note. *Significant at the $p < 0.001$ level

Table 1 shows that the posttest mean score (Mean = 28.11) was significantly higher than the pretest mean score (Mean = 20.07) at the **$p < 0.001$** level. This supports the hypothesis that STEM-PjBL combined with the EDP enhances learners' analytical thinking, problem identification, and systematic design of solution alternatives (Husin et al., 2025; Kelley & Knowles, 2016; Lin et al., 2021).

Results of Collaborative Skill Development

Collaboration skills were assessed using a questionnaire across four dimensions. The results indicate that students demonstrated positive attitudes and group-work behaviors after the STEM-PjBL and EDP learning intervention, as shown in Table 2.

Table 2
The Score of Pretest–Posttest for Collaborative Skill

Dimension		Mean (n = 33)	Std. Deviation
Group Composition	Pretest	4.19	0.75
	Posttest	4.35	0.69
Interdependency	Pretest	4.17	0.86
	Posttest	4.45	0.62
Norms and Roles	Pretest	4.33	0.76
	Posttest	4.30	0.74
Goals	Pretest	4.41	0.63
	Posttest	4.27	0.74

Item-level analysis (sub-questions) revealed statistically significant and noteworthy findings in two key dimensions:

1. **Group Composition:** Students recognized the value of teamwork and agreed that *group work produces better outcomes than working individually* ("groups outperform individuals").
2. **Interdependency:** Students showed a clear increase in willingness to make sacrifices and to accept collective input—especially regarding *being willing to compromise on personal issues for the benefit of the group* and *consulting all members before making decisions*.

However, the posttest mean scores for **Norms and Roles** and **Goals** decreased slightly (from 4.33 to 4.30, and from 4.41 to 4.27, respectively). This suggests challenges in assigning responsibilities within groups and maintaining a balance between personal goals and group goals (Evans, 2020; Salomon & Globerson, 1989). These issues point to the need for improved task-tracking tools or closer instructional coaching and guidance in future implementations.

Conclusion

Integrating STEM-PjBL with the EDP is highly effective in developing problem-solving skills and in fostering a sense of collaboration through interdependency and recognition of differences among team members (group composition). These are key elements in developing high-quality innovators in line with the goals of the KOSEN-KMUTT program.

Both Are Worse: Nonword Repetition Tasks With a High vs. Low Linguistic Load as Clinical Markers for Language(-Related) Impairments

Eugen Zaretsky, Marburg University Hospital, Germany
Benjamin P. Lange, IU International University of Applied Sciences, Germany
Christiane Hey, Marburg University Hospital, Germany

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Purpose: Nonword repetition (NWR) tasks are widely used for the detection of children with deficits in phonological short-term memory (PSTM). Such deficits can be indicative of language(-related) medical impairments with or without comorbidities. However, previous studies showed a considerable influence of children's language competence on NWR performance. Therefore, some language-unspecific NWR tasks were developed that should minimize linguistic interferences and provide a more direct access to PSTM.
Methods: In the current retrospective study, language-specific and language-unspecific NWR tasks were compared regarding their associations with children's language skills and language(-related) impairments. Ten samples of four- and five-year-old monolingual and bilingual German children that were tested either with language-specific or language-unspecific NWR tasks were compared regarding linguistic interferences, associations between NWR performance and language(-related) medical issues as well as possible influence factors on the NWR scores. Sample sizes varied from 161 to 2,750. Seven NWR tests were utilized.
Results: In most cases, NWR performance depended on German articulation/phonotactics skills and was hardly associated with language(-related) impairments. Monolinguals outperformed bilinguals in language-specific nonwords under condition of significantly better German articulation skills. Language-unspecific nonwords minimized the influence of language competence on the NWR performance. However, this "culture-fairness" did not result in higher associations with language(-related) medical issues in comparison with language-specific nonwords.
Discussion and Conclusion: Neither language-specific nor language-unspecific NWR tasks contribute to the diagnostics of language(-related) impairments. Independent cut-off criteria for such impairments based on the NWR performance would be misleading due to strong linguistic interferences even in case of comparatively language-unspecific nonwords.

Introduction

Deficits in phonological short-term memory (PSTM) or, more generally, working memory, are often utilized as a clinical marker for language(-related) impairments and disorders (e.g., Masoura et al., 2020; Penke, 2018). Numerous studies demonstrated significant associations between such deficits and Developmental Language Disorder (Schwob et al., 2021) as well as language impairments with comorbidities such as severe hearing loss (Ching et al., 2019) or Attention-Deficit/Hyperactivity Disorder (Redmond et al., 2011).

However, PSTM tests that are based on the repetition of nonwords, real words, sentences, and digit spans also assess language competence, because these tasks are usually language-specific (Grimm, 2016; Verhagen et al., 2017). For instance, sentence repetition requires not only PSTM, but also vocabulary, articulation, and grammar skills and is, therefore, more suitable for language assessment than for PSTM assessment (Polišenska et al., 2015). Among repetition tasks, nonwords have the lowest linguistic load, but many of them contain real morphemes, rhyme with existing words, and follow the phonotactic rules of the language they are based on. Therefore, they can put children with a weak competence in the language nonwords are based on (e.g., immigrants) at a disadvantage (Zaretsky & Lange, 2022). Bilinguals' weak performance in repetition tasks can be misinterpreted as deficits in PSTM (Engel de Abreu et al., 2013; Grimm, 2016).

Various tasks were developed for the reduction of the linguistic load in PSTM tests: meaningless sentences, low frequency words (that are unknown to most children and can be used as nonwords), nonwords without morphological elements (but with language-specific phonemes and consonant clusters), and "quasi-universal"/"cross-linguistic" nonwords. The latter avoid all more or less language-specific features (e.g., morphological elements, consonant clusters, stress patterns, rhymes with existing words) and can, therefore, be considered most "culture-fair" and language-unspecific. "Quasi-universal" nonwords (QUNW) developed by Chiat (2015) seem to represent the most promising new approach for PSTM assessment and were, therefore, in the focus of the present study.

Nonword repetition (NWR) tasks were integrated in many language tests as possible clinical markers for language impairments. For instance, the German language screening "Kindersprachscreening" ([KiSS], Holler-Zittlau et al., 2011) utilizes them, as independent cut-off criterion, for the detection of monolingual German children who need medical assistance in acquiring German. In spite of the wide-spread use of NWR tasks, hardly any statistical evidence can be found that their dichotomous results can be "translated" into acceptable sensitivity and specificity values for the detection of children with language(-related) impairments (LRI) (Schwob et al., 2021). Most studies only found evidence for statistically significant differences in NWR scores of correct answers between typically developed and language-impaired children (e.g., Boerma et al., 2015). However, such differences do not guarantee that NWR tasks can be used as a reliable clinical marker for LRI. Also, there is no evidence that a relative "culture-fairness" of language-unspecific nonwords can improve the quality criteria of such clinical markers in comparison with language-specific nonwords.

In the current study, seven NWR tasks with zero to high linguistic loads were scrutinized on the basis of ten samples of four- and five-year-old German children. The study aimed to quantify associations between total scores of correct answers in such tasks and children's LRI, under consideration of their German language competence. Also, possible linguistic

interferences and other influence factors, including monolingualism vs. bilingualism, on the NWR performance were analysed. Two gold standards were used for the assessment of children's LRI: running or completed language therapy (LT) and LRI that is known to parents (documented in questionnaires).

Methods

Test Subjects

For this study, ten samples of German four- and five-year-old kindergarten children were re-analysed retrospectively. No inclusion or exclusion criteria were applied in the original prospective studies except for appropriate age (4;0–4;11 or 5;0–5;11 years) and a written consent signed by parents.

Information on LT and LRI was documented in questionnaires for parents in dichotomous items "Does/did the child undergo a therapy due to a language impairment?" and "Has the child any language(-related) impairment or disorder?" (yes/no). Phi-correlations between these two items were predominantly low. Therefore, these items were analysed separately. For sample characteristics, including phi-correlations between LT and LRI, see Table 1.

All children were classified as monolinguals or bi-/multilinguals (called "bilinguals" from now on) on the basis of questionnaires for parents. The largest subgroups of bilinguals spoke Turkish, Russian, and Arabic languages at home.

In all samples, monolinguals and bilinguals did not differ in age in months according to Mann-Whitney *U*-tests and in biological sex according to Chi-square tests ($p > .05$).

All children were tested in German kindergartens by PhD students, researchers, and interns of three university hospitals. Children's answers were audio-recorded and controlled by postdoc researchers (linguists).

Test Materials

All children were tested with language tests that included NWR tasks. Additionally, their German vocabulary and articulation skills were assessed. All tests except QUNW are widely used, standardized, and validated for German pre-schoolers. Characteristics of language tests can be found in Table 2, characteristics of nonwords in Table 3.

NWR tasks differ in terms of item length, number of items, and linguistic load. The latter is defined as frequency of morphological elements (suffixes, prefixes, and stems) and of phonological elements (language-specific phonemes and consonant clusters) of the German language. Only one NWR task, QUNW, did not contain any of such elements and can be considered language-unspecific. All other NWR tasks were classified as language-specific. Generally, articulation errors (e.g., rhotacism, sigmatism) were not considered as NWR (or PSTM) errors in NWR tasks.

Statistical Analyses

First, monolinguals' and bilinguals' performance in NWR, articulation, and vocabulary tasks was compared by means of Mann-Whitney *U*-tests. It was assumed that (a) monolinguals would outperform bilinguals in language-specific NWR tasks under condition of better articulation and/or vocabulary skills, (b) bilinguals and monolinguals would perform equally in the language-unspecific NWR task (QUNW) irrespective of their German language competence. Effect sizes in Mann-Whitney *U*-tests were quantified by the probability of superiority index ($\hat{p}$; Grissom & Kim, 2012). Values close to .5 are considered low, those close to .0 high.

Second, possible transfers from bilinguals' first language in NWR performance were exemplified by simplifications/omissions in consonant clusters in the word final position. For this purpose, repetition of all six word final consonant clusters in SSV nonwords was compared for monolinguals and bilinguals by means of Chi-square tests, without differentiation between four- and five-year-old children (samples S2 and S7 were merged). Because word-final consonant clusters are highly language-specific and do not occur in some languages that are widely spoken in Germany (e.g., Turkish; Dirim, 2005), it was assumed that bilinguals would simplify them more often than monolinguals.

Third, associations between the NWR performance and questionnaire items on LT/LRI were quantified by point-biserial correlations. Due to linguistic interferences, it was assumed that the correlations would be low both for monolinguals and bilinguals, at least in language-specific NWR tasks.

Finally, possible influence factors on the NWR performance were assessed by linear regressions (method "enter"). The independent variables were (a) vocabulary test score, (b) articulation test score, (c) children's age in months, (d) LT, (e) LRI, and (f) classification monolinguals vs. bilinguals. It was assumed that, under consideration of children's German language skills, the associations between NWR performance and LT and/or LRI would be very weak, except in QUNW.

All calculations, except for those with consonant clusters in the word final position, were carried out separately for four- and five-year-old children as well as separately for samples S1–S10.

For retrospective studies based on anonymized data, no ethical approval is necessary.

Results

When comparing monolinguals and bilinguals regarding their NWR performance as well as articulation and vocabulary skills (see Table 4), considerable, that is, highly significant differences were found only for vocabulary: Monolinguals outperformed bilinguals in all cases. In the samples that were tested with NWR tasks with a high linguistic load (S1, S2, S6, S7), monolinguals outperformed bilinguals in NWR, but also in articulation and vocabulary in almost all cases. In the samples that were tested with NWR tasks with a low linguistic load (S3, S4, S8, S9), monolinguals and bilinguals did not differ significantly in NWR and articulation. However, monolinguals outperformed bilinguals in vocabulary tasks. In the samples that were tested with NWR tasks without any language-specific load (S5, S10), monolinguals showed weaker results than bilinguals in NWR (in one case significantly, in the

other case numerically), although they outperformed bilinguals in articulation and vocabulary. Thus, monolinguals outperformed bilinguals in NWR tasks with a high linguistic load, did not differ from bilinguals in NWR tasks with a low linguistic load, and were weaker than bilinguals in NWR tasks with zero linguistic load.

Bilinguals simplified word final consonant clusters significantly more often than monolinguals in five SSV nonwords out of six (see Table 5).

Almost all correlations between NWR scores and children's LT and LRI were low to non-existent (see Table 6). Correlation coefficients of monolinguals were predominantly higher than those of bilinguals. Correlations between NWR scores and LT were higher than correlations between NWR and LRI in 17 calculations out of 18.

In the linear regressions, vocabulary and articulation skills yielded significant results in all cases, children's age in eight calculations out of ten, LT in nine, the classification monolinguals vs. bilinguals in seven, and LRI did not yield any significant results (see Table 7). Higher total scores of correct answers in the vocabulary and articulation tasks, higher age, being bilingual, and no LT were associated with better NWR results. In two regressions, the standardized beta of LT was higher than the betas of the vocabulary and articulation tasks (S3, S8), that is, LT constituted a more important influence factor. In most other regressions, including those with QUNW, vocabulary and articulation skills showed higher beta values than LT.

Discussion and Conclusion

Although nonword repetition tasks were developed to detect deficits in children's PSTM, as a possible clinical marker for LRI, the current study showed that NWR performance depends on children's articulation skills in most cases. Also, NWR performance is hardly associated with children's (running or completed) LT and LRI (documented in questionnaires for parents). Reduction of the linguistic load in NWR tasks resulted in a relative "culture-fairness" of nonwords, that is, monolinguals could not outperform bilinguals in NWR, but this did not make such tasks more appropriate for the detection of children with LRI.

In all samples, monolinguals outperformed bilinguals in the vocabulary tasks. Therefore, the condition of comparable vocabulary skills could not be tested. Also, monolinguals outperformed bilinguals in articulation tasks in six out of ten samples. In three of these samples (S1, S2, S7), namely those with language-specific NWR tasks, this resulted in a better NWR performance of monolinguals compared to bilinguals (also, the same finding did not achieve statistical significance in S6). On the contrary, comparable articulation skills of monolinguals and bilinguals (S3, S4, S8, S9) resulted in a comparable NWR performance, without exceptions. Thus, good performance in German-based nonwords presupposes sufficient competence in German articulation/phonotactics and puts those bilinguals at a disadvantage who lag behind in its acquisition.

Language-unspecific nonwords (QUNW) showed a very different NWR performance pattern. In S10, bilinguals outperformed monolinguals in NWR in spite of weaker German language skills (vocabulary, articulation). However, the "culture-fairness" of QUNW did not result in higher correlations between NWR scores and LT/LRI, compared to German-based nonwords. Irrespective of the linguistic load, NWR tasks demonstrated far too low correlations with LT and LRI.

Generally, the importance of the linguistic load and "culture-fairness" of NWR tasks seems to be overestimated in the research on possible indicators of children's LRI. In the current study, children's German articulation skills were shown to be a more important predictor than LT/LRI for the NWR performance in both samples that were tested with QUNW (S5, S10, see Table 7). Additionally, children's age and German vocabulary skills as well as the classification monolinguals vs. bilinguals showed a higher influence on NWR scores, compared to LT, in S5. For both monolinguals and bilinguals taken together, the best regression result regarding associations between NWR tasks and LT was achieved not by QUNW, but by HASE (four-year-olds) and S-ENS (five-year-olds), that is, German-based NWR tasks with a low linguistic load (German phonology, but not morphology). The same tasks yielded the highest point-biserial correlations with LT for monolinguals. The highest point-biserial correlations with LT for bilinguals were achieved by the Mottier test (four-year-olds) and, again, S-ENS (five-year-olds) that are both German-based in terms of phonology. Thus, NWR tasks with a low linguistic load appear to be more promising than language-unspecific tasks, but none of them can contribute considerably to the detection of LRI (quantified by LT). Also, when LRI was quantified by the questionnaire item on LRI, this variable did not show any significant results in the regressions and yielded very low to non-existent point-biserial correlations with NWR scores.

It should be noted that the better performance of bilinguals, compared to monolinguals, in QUNW, in spite of weak German language skills, as well as associations between bilingualism and higher NWR scores in the regressions, might be indicative of the so-called "bilingual advantage" that consists in better-developed cognitive skills, including PSTM, of bilinguals compared to monolinguals (Gunnerud et al., 2020). The reflection of the "bilingual advantage" in QUNW results may mean that language-unspecific nonwords indeed provide a more direct access to PSTM, which, however, does not make them a more reliable clinical marker for LRI, probably because of a weak association between deficits in PSTM and (some) LRI.

Quality criteria of NWR tasks in terms of sensitivity and specificity were not determined in the present study because correlations below .5 (and mostly below .3) between NWR scores and LT/LRI cannot be "translated" into acceptable sensitivity (at least 90%) and specificity (at least 70%). Therefore, no Receiver Operating Curves (ROC) were calculated. In other studies, such calculations resulted in insufficient quality criteria of both language-specific and language-unspecific NWR tasks for LRI (e.g., Zaretsky & Hey, 2022).

Because only 9–27% of the variance of the NWR performance were explained in the regressions (see Table 7), it can be assumed that a number of other factors that were not considered in the present study influenced NWR results (e.g., attention, long-term memory, German grammar skills, year and region of the language test, typology of bilinguals' first language, oromotor skills, intelligence quotient). Also, due to the low percentage of explained variance in the regressions, it cannot be excluded that vocabulary and articulation skills do not constitute the most important influence factors on the NWR performance.

Since children in the current study did not undergo any medical examinations, it remains open whether parents' information on LT and LRI can be considered reliable. Information on LRI may be comparatively subjective, in comparison with children's participation in LT (that can hardly escape parents' attention because they are (co-)responsible for its organisation).

To sum up, no evidence was found that language-specific or language-unspecific NWR tasks can contribute considerably to the LRI detection. Hence, none of them can be recommended for this purpose. Although NWR tasks with a low linguistic load appear more promising, their results can be misinterpreted in case of weak German articulation skills. Relative "culture-fairness" of language-unspecific nonwords (QUNW) did not result in a higher predictive power for LRI. Unexpectedly, children's performance in QUNW depended, first and foremost, on their German articulation skills, followed by vocabulary skills. It cannot be excluded that some NWR tasks may provide sufficient predictive power for one or two LRI that are associated with considerable deficits in PSTM but not for all LRI taken together.

Effects of Supportive Parenting Style, Academic Self-Concept, Expectations, and Values on Mandarin Academic Achievement Among First-Year Vocational College Students

Yi Sun, Srinakharinwirot University, Thailand
Sittipong Wattananonsakul, Srinakharinwirot University, Thailand

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This research investigates the effects of supportive parenting style, academic self-concept, and expectancy-value beliefs on Mandarin academic achievement among first-year vocational college students in central and western China. Standardized scales and the Putonghua Proficiency Test were employed, with data analyzed using descriptive statistics, correlation, and regression. The results confirm that all three predictors exert significant and positive influences, with supportive parenting emerging as the strongest factor. These findings underscore the decisive role of family support and motivational beliefs in language achievement and offer practical implications for educational policy and family engagement in multicultural and under-resourced contexts.

Keywords: Mandarin achievement, supportive parenting style, academic self-concept, expectancy-value, vocational students

Introduction

Mandarin Chinese is essential for national unity, cultural exchange, and educational opportunity in China.This policy emphasis underscores a growing recognition of language as both a barrier and a bridge to social equity. Research has shown that language proficiency is strongly correlated with academic success, access to employment opportunities, and social integration, particularly for students from ethnic minority and rural backgrounds (Wang & Postiglione, 2009). In regions like Guizhou, where a high proportion of the population communicates daily in regional dialects or minority languages, the disparity in Mandarin proficiency reflects deeper issues of educational inequality and cultural marginalization (Zhou, 2000). Consequently, improving Mandarin competence among vocational college students is not merely a linguistic challenge but a multidimensional educational and social intervention. Recent initiatives, such as targeted teacher training, curriculum reform, and community-based language promotion activities, have been part of the Ministry's broader strategy to narrow the language gap (Ministry of Education of the People's Republic of China, 2021).

Developmental psychology highlights that academic achievement is shaped not only by cognitive ability but also by motivational beliefs, emotional support, and cultural context (Erikson, 1968; Marsh & Martin, 2011; Wigfield & Eccles, 2000). Three constructs are particularly relevant in explaining language learning outcomes: supportive parenting style, which provides the emotional and structural foundation for learning; academic self-concept, which reflects students' confidence in their academic abilities; and expectancy-value beliefs, which capture how students' expectations of success and perceived value of learning influence effort and persistence (Eccles & Wigfield, 2002; Grolnick & Ryan, 1989). Although each factor has been individually associated with student achievement (Cheung & Pomerantz, 2012; Marsh & Martin, 2011; Wigfield & Eccles, 2000), their combined effects on Mandarin academic performance among first-year vocational college students remain underexplored. Addressing this gap, the present study examines how supportive parenting style (Cheung & Pomerantz, 2012), academic self-concept (Marsh & Martin, 2011), and expectancy-value beliefs (Eccles & Wigfield, 2002) jointly contribute to Mandarin achievement in under-resourced and multicultural regions of China.

Literature Review

Mandarin proficiency reflects a learner's mastery of phonetics, grammar, fluency, and communicative competence, and it is formally assessed through the Putonghua Proficiency Test (PSC), which serves as a national benchmark for both educational and employment purposes (Ministry of Education of the People's Republic of China, 2021). Research has shown that such achievement is shaped not only by cognitive and instructional factors but also by psychosocial and contextual influences. Supportive parenting, characterized by emotional warmth, cognitive guidance, and autonomy support, fosters academic confidence and persistence, with Chinese families further embedding cultural values such as filial piety and the prioritization of education into parenting practices (Cheung & Pomerantz, 2012; Darling & Steinberg, 1993; Maccoby & Martin, 1983).

Alongside family influences, academic self-concept—students' beliefs in their academic abilities—emerges as a robust predictor of motivation, engagement, and achievement, particularly in language learning (Marsh & Craven, 2006; Marsh & Martin, 2011; Wolff et al., 2018). Complementing this, expectancy-value theory explains that achievement is driven

by students' expectations of success and the value they assign to learning, encompassing attainment, intrinsic, and utility values, all of which strongly shape effort and persistence in Mandarin learning (Eccles & Wigfield, 2002; Wigfield & Eccles, 2000).

Taken together, supportive parenting style, academic self-concept, and expectancy-value beliefs represent interrelated personal and contextual factors that shape student achievement. While each has been independently linked to educational outcomes, their combined influence on Mandarin proficiency among vocational college students—particularly in regions where local dialects dominate and resources are scarce—remains underexplored. This study addresses this gap by examining how these factors jointly predict Mandarin academic achievement, providing both theoretical insights and practical implications for educational policy and family involvement in under-resourced contexts.

Methodology

Participants

The target population comprised 740 first-year students enrolled in the Intelligent Manufacturing Engineering Department at Guizhou Industrial Vocational and Technical College. To ensure representativeness, a stratified random sampling procedure was applied, with strata defined according to class sections and gender distribution. From this process, 255 students were selected as the study sample. This approach minimized sampling bias and allowed the sample to reflect the demographic and academic diversity of the larger student population.

Instruments

Four instruments were used to assess the key variables in this study.

Supportive Parenting Style Scale

Adapted from Maccoby and Martin's (1983) typology, this 10-item Likert-type scale evaluates students' perceptions of their parents' supportive behaviors, including emotional warmth, cognitive guidance, and autonomy support. Responses are rated on a 5-point scale ranging from 1 ("strongly disagree") to 5 ("strongly agree"), with higher scores indicating stronger perceptions of supportive parenting. Example item: "My parents encourage me when I face difficulties in learning."

Academic Self-Concept Scale

Based on Marsh's (1993) framework, this 10-item scale measures students' beliefs and confidence in their ability to succeed in Mandarin learning. Items reflect self-perceptions of competence, persistence, and positive attitudes toward Mandarin. Responses are recorded on a 5-point Likert scale, with higher scores representing a stronger academic self-concept. Example item: "I believe I can do well in Mandarin classes."

Expectancy-Value Scale

Developed from Wigfield and Eccles (2000), this 10-item scale assesses motivational beliefs in two domains: (a) expectancy, or students' confidence in achieving success in Mandarin,

and (b) value, which covers attainment value, intrinsic interest, and utility value. Items are rated on a 5-point Likert scale, with higher scores reflecting stronger motivational beliefs. Example item: "Learning Mandarin is important for my future career."

Mandarin Academic Achievement

Achievement was measured using the Putonghua Proficiency Test (PSC), a standardized national assessment of Mandarin. The PSC evaluates phonetic accuracy, grammatical knowledge, fluency, and communicative competence. Scores range from 0 to 100, with higher scores reflecting greater Mandarin proficiency. Example item/task: Reading a passage aloud to assess pronunciation and fluency.

All measurement scales passed validity and reliability checks prior to use in the study. Approval for the research was obtained from the Graduate School and the college administration. Data were collected through self-administered questionnaires for the psychosocial variables and official test results for Mandarin achievement. The instruments demonstrated acceptable internal consistency, with Cronbach's alpha coefficients of $\alpha = .87$ for the Supportive Parenting Style Scale, $\alpha = .76$ for the Academic Self-Concept Scale, and $\alpha = .84$ for the Expectancy-Value Scale.

Results

This study analysis examines the relationships between supportive parenting style (IVSPS), academic self-concept (IVASC), expectancy-value beliefs (IVEVT), and Mandarin academic achievement (DVPSC) among 255 first-year vocational college students.

Correlations

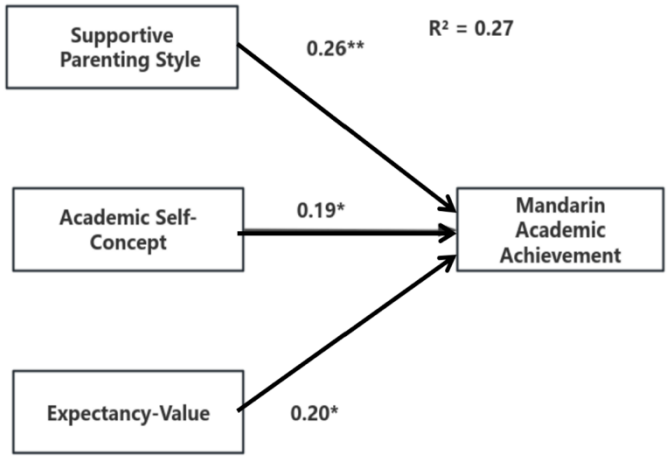
All predictors strongly and positively correlated with Mandarin achievement ($r = .419$ for Parenting, .438 for Self-Concept, .398 for Expectancy-Value, $p < .001$).

Table 2
Correlation Matrix of Study Variables (n = 255)

Variables	1	2	3	4
1. Mandarin Academic Achievement	1.000	—	—	—
2. Supportive Parenting Style	.419**	1.000	—	—
3. Academic Self-Concept	.438**	.487**	1.000	—
4. Expectancy-Value	.398**	.318**	.600**	1.000

Note. ** $p < .001$ (highly significant)

All variables show significant positive correlations with Mandarin academic achievement. Supportive parenting (r = .419**), academic self-concept (r = .438**), and expectancy-value beliefs (r = .398**) are each moderately associated with higher Mandarin proficiency. Among the predictors, academic self-concept demonstrates the strongest correlation with Mandarin achievement.



Additionally, the predictors are positively interrelated. Supportive parenting correlates with both academic self-concept (r = .487**) and expectancy-value beliefs (r = .318**), suggesting that family support is linked to students' motivation and confidence. The strongest relationship in the matrix is between academic self-concept and expectancy-value beliefs (r = .600**), indicating that students who believe in their academic abilities also tend to value and expect success in Mandarin learning.

Regression Analysis

The multiple regression model explained 27.3% of the variance in Mandarin academic achievement, $R^2 = .273$, $F(3, 251) = 31.44$, $p < .001$. Among the predictors, supportive parenting style was the strongest contributor ($\beta = .262$, $p < .001$), followed by expectancy-value beliefs ($\beta = .200$, $p = .003$) and academic self-concept ($\beta = .191$, $p = .010$). These findings indicate that all three predictors made significant, positive contributions to Mandarin academic achievement, with family support exerting the greatest influence.

Figure 1

Supportive Parenting Style Influences Mandarin Academic Achievement Through Its Impact on Students' Academic Self-Concept and Expectancy-Value of Mandarin Academic Achievement

Discussion

This study demonstrates that supportive parenting style, academic self-concept, and expectancy-value beliefs each exert significant and positive influences on Mandarin academic achievement, with supportive parenting emerging as the strongest predictor. These findings highlight the crucial role of family support, motivational beliefs, and students' self-perceptions in shaping language learning outcomes. They are consistent with prior research showing that supportive parenting fosters persistence and confidence, academic self-concept predicts long-term achievement (Marsh & O'Mara, 2008), and expectancy-value beliefs drive effort and persistence in learning (Eccles & Wigfield, 2002).

Importantly, the results confirm that Mandarin proficiency is not determined solely by cognitive ability or classroom instruction but is also shaped by the interplay of family environment, perceived competence, and motivational factors. For vocational college students, who often face barriers such as dialect prevalence and limited socioeconomic resources, these psychosocial factors may be especially critical. The findings therefore reinforce the value of family engagement and motivational support in language education policy, particularly in multicultural and under-resourced regions.

Nevertheless, several limitations must be acknowledged. The model explained a moderate proportion of variance ($R^2 = .27$), indicating that other unmeasured factors also contribute to Mandarin achievement. The cross-sectional design precludes causal inference, and the focus on one vocational college in southwestern China limits generalizability. Future research should adopt longitudinal and multi-cohort designs, while incorporating additional variables such as teaching strategies, peer influence, and learning contexts, to provide a more comprehensive understanding of language achievement.

Conclusion

This study demonstrates that supportive parenting style, academic self-concept, and expectancy-value beliefs are robust predictors of Mandarin academic achievement among vocational college students. Together, these factors underscore the importance of family support, self-belief, and motivational orientations in overcoming linguistic and socioeconomic barriers. The findings contribute to the literature by highlighting the psychosocial dimensions of language learning in under-resourced contexts and offer practical guidance for families, educators, and policymakers seeking to improve Mandarin proficiency and educational equity for vocational student populations.

Acknowledgements

The researcher extends sincere gratitude to the Faculty of Humanities and the Graduate School of Srinakharinwirot University for their invaluable support. Their guidance and assistance significantly contributed to the successful completion of this study.

Abstract

This study investigated how family environment, social experiences, and social values influence college students' social competence. A sample of vocational students from Guizhou Industry Polytechnic was randomly selected, and data were collected using self-developed assessment tools. Descriptive statistics, correlation analysis, and multivariate regression were employed to examine the relationships among the variables. The findings revealed that all three factors positively affected social competence, with social values being the most influential, followed by family environment and social experiences. These results align with Expectancy–Value Theory, which posits that individuals' motivation and competence are shaped by both the value they attach to a task and their expectations of success. The study clarified operational definitions and measurement dimensions, contributing to the literature by addressing an existing research gap and offering practical implications for social education in higher institutions, school–family collaboration, and student self-development. Nonetheless, the study is constrained by its sample size and cross-sectional design, highlighting the need for future research with larger samples and more refined frameworks.

Keywords: college students, social competence, family environment, social values, expectancy–value theory

Introduction

Social competence is widely recognized as a core developmental outcome for young adults, particularly college students who are in a critical period of transition toward autonomy and social integration (Erikson, 1950). Despite its importance, recent surveys highlight substantial challenges: the China University Media Alliance reports that 64.82% of university students possess limited social networks, while in Guizhou Province, 40% of vocational college students report low confidence in cross-cultural interactions. At Guizhou Polytechnic Institute, approximately 10% of freshmen present severe psychological difficulties annually, many of which stem from problems of social adaptation. These figures underscore the urgent need to investigate the mechanisms shaping social competence among vocational college students.

The present study focuses on four interrelated constructs—social competence, family environment function, social experience, and social values. Social competence is defined as the comprehensive ability of an individual to communicate effectively, establish relationships, and manage social interactions, encompassing five dimensions: language expression, nonverbal communication, emotional understanding, social skills, and interpersonal relationship management. Family environment function refers to the background conditions that influence personal growth—including emotional climate, communication patterns, parenting approaches, and economic resources—which provide the foundation for social values and behavioral tendencies. Social experience captures the knowledge, skills, and emotions accumulated through participation in activities such as student clubs, volunteer service, and internships. Finally, social values represent the evaluative standards that individuals hold toward social activities, which guide their interpersonal behaviors and are shaped by family, education, and cultural contexts.

The theoretical foundation of this study is grounded in Expectancy–Value Theory (EVT) (Eccles et al., 1983; Wigfield & Eccles, 2000). EVT posits that individuals' motivation and performance are determined by two key factors: (a) their expectancies for success—the belief in their own ability to succeed in a given task, and (b) the subjective task value—the perceived importance, utility, or intrinsic interest of the task. When applied to social development, EVT suggests that college students' social competence depends not only on their confidence in managing interpersonal interactions (expectancy) but also on the value they place on social relationships and group belonging (value). Family environments contribute by shaping early expectations and emotional security; social experiences provide opportunities to test and reinforce self-efficacy; and social values guide the perceived significance of social participation. Thus, EVT offers a coherent framework to understand how these three factors converge to influence students' social abilities.

A growing body of literature has examined these constructs and their associations with social competence. Research on social competence demonstrates that it is linked to psychological resources and motivational mechanisms. D. Zhang (2008) reported a significant positive correlation between college students' general self-efficacy and interpersonal communication. Bandura's (1977) social learning theory highlights the role of observational learning in developing social abilities, while Maslow's (1943) hierarchy of needs theory identifies social belonging as a prerequisite for self-esteem and self-actualization. More recently, Kong Hua et al. (2022) showed that disengaged parenting styles predict poorer interpersonal adaptability, with irrational beliefs mediating this effect.

In terms of the family environment, maternal nurturing that encourages autonomy fosters resilience, which in turn promotes social competence (Yin, 2020). Xu (2021), using structural equation modeling, confirmed that parenting styles influence adolescents' communication abilities indirectly through self-esteem. Similarly, S. Zhang (2022) revealed that evaluative fear mediates the relationship between parenting styles and college students' social anxiety. Studies on social experience emphasize its developmental value. Sang (2020) found that club participation improves teamwork and conflict resolution skills, while Xie (2021) demonstrated that internships enhance real-world communication abilities. Beyond human studies, Li et al. (2024) showed that adolescent social experiences can shape neural development in the prefrontal cortex, with long-term consequences for social behavior.

Regarding social values, Xu (2022) reported that positive digital media content promotes proactive values among students. L. Wang (2021) emphasized the role of empathetic values in building trust, whereas negative orientations often result in social barriers. Liu (2022), through qualitative interviews, demonstrated that family cultural climate plays a crucial role in internalizing social values.

Although these studies provide a multidimensional foundation, important limitations remain. First, the conceptual definitions of variables across studies are inconsistent. Second, many investigations adopt a single-factor perspective rather than examining interactive mechanisms. Finally, the internal pathways by which family environment, social experience, and social values jointly shape social competence have yet to be fully clarified. These gaps provide the rationale for the present study.

Accordingly, this research seeks to examine how different dimensions of the family environment shape social skills and the extent to which family functioning influences behavioral patterns. It also aims to analyze how campus social activities and accumulated experiences contribute to the enhancement of interpersonal competence. In addition, the study investigates how social values guide attitudes and behaviors and ultimately influence the quality of social relationships.

The objectives of this study are: (a) to analyze the mechanisms by which the family environment fosters emotional support and communication skills; (b) to examine the role of frequency and quality of social participation in enhancing social confidence; and (c) to reveal the guiding effects of social values on interactional styles and relationship quality. By anchoring these questions in Expectancy–Value Theory, the study seeks to clarify the mechanisms through which family, experience, and values interact to shape vocational college students' social competence, thereby contributing to theoretical refinement and offering practical implications for social education, school–family collaboration, and student development.

Research Hypotheses

Drawing upon Expectancy–Value Theory and prior empirical findings, this study proposes the following hypotheses:

- Hypothesis 1 (H1): Family environmental function has a significant positive relationship with college students' social competence.
- Hypothesis 2 (H2): Social experience has a significant positive relationship with college students' social competence.

- Hypothesis 3 (H3): Social values have a significant positive relationship with college students' social competence.

Method

Participants

This study targeted vocational college students enrolled at Guizhou Industrial Vocational and Technical College. Participants were selected through random sampling to ensure representativeness. A total of 370 questionnaires were distributed, of which 310 valid responses were obtained, yielding an effective return rate of 84%.

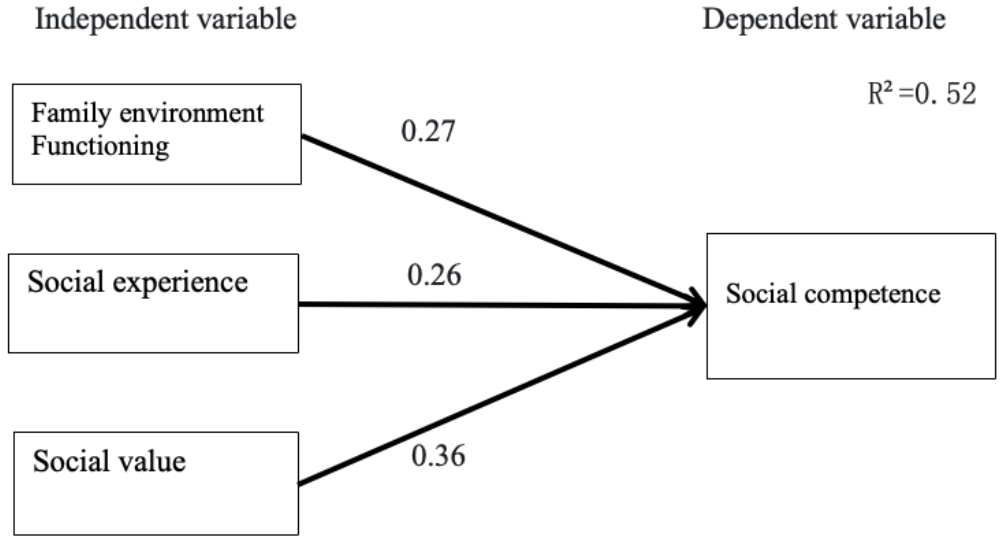
The participants were between 17 and 24 years of age and represented a wide range of academic disciplines and grade levels. They also came from diverse family backgrounds, including both nuclear and single-parent households. Such diversity in age, academic specialization, and family structure enhances the representativeness of the sample and reflects the broader characteristics of the vocational college student population.

Instrumentation

Four self-developed scales were employed in this study, each optimized through a pre-survey ($n = 100$) and confirmed to meet established reliability and validity standards. The instruments included: Social Competence Scale (19 items; Cronbach's Alpha = .95), Family Environment Functioning Scale (9 items; Cronbach's Alpha = .74), Social Experience Scale (9 items; Cronbach's Alpha = .80), Social Values Scale (14 items; Cronbach's Alpha = .93). All instruments were administered using a 4-point Likert scale (1 = strongly disagree, 4 = strongly agree). Content validity was assessed using the item–objective congruence (IOC) index, with all items exceeding the threshold of .50.

Results

To provide an overview of the relationships among the study variables, correlation analyses were conducted. Table 1 presents the correlations among social competence, social experience, family functioning, and social value. The results indicate that all study variables were significantly and positively correlated. Specifically, social competence was positively associated with social experience ($r = .60$, $p < .01$), family functioning ($r = .54$, $p < .01$), and social value ($r = .61$, $p < .01$). Social experience was also positively related to family functioning ($r = .49$, $p < .01$) and social value ($r = .56$, $p < .01$). Finally, family functioning showed a positive correlation with social value ($r = .38$, $p < .01$).



These findings suggest that stronger family functioning, richer social experiences, and more positive social values are all linked with higher levels of social competence among vocational college students.

Table 1
Correlation Matrix of Study Variables (N = 310)

Variables	1	2	3	4
1. Social Competence	1			
2. Social Experience	.60**	1		
3. Family Functioning	.54**	.49**	1	
4. Social Value	.61**	.56**	.38**	1

The multiple regression analysis indicated a significant overall model fit ($R^2 = .52$, $F(3, 306) = 52.37$, $p < .001$), supporting all three hypotheses. Family environment function had a significant positive effect on social competence ($\beta = .27$, $p < .001$). Students from families characterized by emotional support and open communication demonstrated greater social confidence and skills. Social experience also exerted a significant positive effect on social competence ($\beta = .26$, $p < .001$). Engagement in social participation, volunteer service, and related activities enhanced students' communication and collaboration abilities. Social values emerged as the strongest predictor of social competence ($\beta = .36$, $p < .001$). Students who emphasized emotional connection and reciprocity exhibited more positive and adaptive social behaviors. Together, these results suggest that family functioning provides the foundation, social experience reinforces skill development, and social values guide positive social orientations. This pathway is illustrated in Figure 1.

Figure 1
Pathway

Discussion and Conclusion

The present study examined how family environment, social experiences, and social values influence college students' social competence. Consistent with Expectancy–Value Theory (Eccles et al., 1983; Wigfield & Eccles, 2000), all three variables significantly and positively predicted social competence, with social values emerging as the strongest predictor. These findings underscore the joint influence of external contexts and internalized value orientations on students' social development.

The Foundational Role of Family Environment

The results confirmed that family functioning significantly contributes to social competence, supporting Hypothesis 1. This is consistent with prior research indicating that supportive parenting styles and positive family climates foster resilience and interpersonal confidence (Yin, 2020; Xu, 2021). Democratic families foster secure attachments through emotional support, where parents demonstrate positive social behaviors—such as listening and empathy—that help students perceive social interaction as a source of security rather than anxiety. In contrast, authoritarian or neglectful family environments are more likely to produce social skill deficiencies, which aligns with Yin's (2020) findings. Within the framework of Expectancy–Value Theory, family environments shape students' early expectancies for social success by providing or withholding the emotional and behavioral foundations for effective interaction.

The Practical Value of Social Experience

Hypothesis 2 was also supported, showing that social experiences significantly enhance students' social competence. Campus associations, volunteer services, and internships provide "trial-and-error feedback" platforms where students test and refine their interpersonal skills. Group cooperation can strengthen conflict resolution abilities, while workplace internships help students adapt to organizational norms and rules of interaction. These findings confirm Sang's (2020) view that "practical accumulation promotes ability improvement." From an EVT perspective, such experiences reinforce students' perceptions of competence by providing tangible evidence of success in real-world settings, thereby encouraging continued participation in social activities.

The Core Driving Force of Social Values

The strongest effect was observed for social values, supporting Hypothesis 3. Positive values, such as prioritizing emotional connection and empathy, motivate students to initiate communication and accept differences, fostering higher-quality relationships. Conversely, utilitarian values may lead to the instrumentalization of social interactions, ultimately reducing relational quality. This is consistent with Xu's (2022) findings on the role of digital content in shaping proactive versus instrumental value orientations. Within the EVT framework, social values represent the motivational "value" component, guiding the degree of effort students are willing to invest in social relationships. Thus, values serve as the driving force that directs students' social behaviors toward either constructive or superficial outcomes.

Theoretical and Practical Implications

Theoretically, this study extends Expectancy–Value Theory by demonstrating its applicability in the domain of social competence. The findings suggest a developmental pathway whereby family functioning lays the foundation for secure expectancies, social experiences reinforce competence through practice, and social values guide behavior through internalized standards. Practically, the results highlight the importance of a multi-level approach. Families should adopt supportive and communicative parenting practices, universities should strengthen extracurricular and service-learning opportunities, and educators should promote positive social values through curriculum design, counseling, and media literacy programs.

Limitations and Future Research

Despite its contributions, this study has limitations. First, the reliance on self-report measures may introduce social desirability bias; future research could include peer or teacher assessments. Second, the cross-sectional design restricts causal inference; longitudinal designs would clarify developmental trajectories. Third, the sample was drawn from a single vocational college in Guizhou Province, which may limit generalizability. Expanding to other institutional and cultural contexts would improve external validity.

Future studies should also explore mediating and moderating mechanisms. For instance, self-esteem or irrational beliefs may mediate the link between family functioning and social competence (Kong et al., 2022; Xu, 2021). Cultural orientation, digital media exposure, or socioeconomic status may moderate the influence of social values. Examining these pathways will provide a more nuanced understanding of how contextual and psychological factors jointly shape students' social development.

The Influence of Family Environment, Learning Values, and Self-Expectations on Late Adolescents' Motivation to Learn Chinese

Haolin Yang, Srinakharinwirot University, Thailand
Sittipong Wattananonsakul, Srinakharinwirot University, Thailand

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

In the context of globalization and the increasing role of Chinese as an international language, it has become important to understand what motivates adolescents to learn Chinese. Motivation is widely regarded as a key psychological factor influencing students' learning behavior and achievement. Drawing on expectancy–value theory, this study explores how family environment, learning values, and self-expectations shape the motivation of late adolescents to study Chinese. Data were collected from 355 students at Guizhou Industrial Vocational and Technical College, all of whom were in late adolescence or early adulthood. The findings show that family support, recognition of the value of Chinese learning, and students' confidence in their own abilities all contribute positively to learning motivation. Among these, learning values and self-expectations play a stronger role than family environment, suggesting that students are most motivated when they see Chinese as useful for their future and believe in their ability to succeed. In contrast, demographic factors such as gender, only-child status, and family structure had little effect. The study confirms the relevance of expectancy–value theory to Chinese language learning and highlights the importance of fostering value recognition and self-confidence, alongside supportive roles for families, schools, and policymakers.

www.iafor.org

Introduction

Motivation has long been recognized as a central concept in educational psychology, as it strongly influences the time, effort, and persistence students devote to learning tasks (Ryan & Deci, 2000). In second language acquisition, motivation is especially important because it affects not only students' achievement but also their long-term commitment to language learning (Gardner, 1985). With the growing global significance of China, learning Chinese has become an academic and professional priority for many students worldwide.

However, students' motivation to learn Chinese is far from uniform. While some demonstrate strong enthusiasm and perseverance, others struggle to sustain their learning even when they understand its potential benefits. To better explain these differences, this study examines three key factors: family environment, learning values, and self-expectations. Previous research suggests that family support and communication play an important role in shaping students' attitudes and confidence (Zhao, 2020). Learning values, such as the usefulness of Chinese and personal interest in it, form an essential psychological basis for motivation (Eccles & Wigfield, 2002). Self-expectations, closely tied to self-efficacy, determine whether students believe they can succeed and are therefore willing to make an effort (Bandura, 1997).

These factors can be better understood through the lens of expectancy–value theory, which has become one of the most influential frameworks for studying student motivation. The theory proposes that achievement-related behaviors are primarily determined by two elements: individuals' expectations for success and the value they attach to the task (Wigfield & Eccles, 2000). Expectancy beliefs reflect students' confidence in their ability to succeed, while task values include perceived usefulness, personal importance, and intrinsic interest. Together, these dimensions shape the choices students make, the effort they invest, and their persistence in learning.

Building on this framework, the present study examines how family environment, learning values, and self-expectations interact to influence late adolescents' motivation to learn Chinese. Motivation in this context is viewed as the combined outcome of external support from the family and internal factors such as value recognition and self-confidence.

Methodology

Participants and Data Collection

A total of 415 questionnaires were distributed at Guizhou Industrial Vocational and Technical College. After excluding incomplete or invalid responses, 355 valid questionnaires were retained, resulting in an effective response rate of 85.5%. The participants were late adolescents and young adults, ranging in age from 17 to 22 years.

Instruments

To measure these constructs, students responded to items on a 4-point Likert scale ranging from 1 (strongly disagree) to 4 (strongly agree). All scales had previously undergone reliability and validity testing, ensuring their appropriateness for use in the present study.

The Family Environment scale consisted of 12 items that assessed parental support, the quality of parent–child communication, and the overall learning atmosphere at home. The items reflected the degree of encouragement and guidance students received from their families, as well as whether the home environment was conducive to effective learning.

The Learning Values scale included 10 items measuring students' perceptions of the utility value of Chinese for academic and career development, together with their intrinsic interest in learning the language. These items captured both the extent to which students regarded Chinese as beneficial for their future goals and the enjoyment or satisfaction they experienced in studying it.

The Self-Expectations scale comprised 11 items that focused on students' beliefs about their own abilities, including confidence in learning Chinese, self-efficacy in managing learning tasks, and aspirations for achievement. These items reflected the degree to which students expected themselves to succeed and their willingness to set and pursue learning goals.

Finally, the Learning Motivation scale consisted of 11 items that measured students' motivational tendencies, including persistence in learning, initiative in taking responsibility for their progress, clarity of goals, and curiosity about the language. The items provided insights into how motivation was expressed through students' attitudes and behaviors toward learning Chinese.

Data Analysis

Data were analyzed using a statistical program. Reliability testing indicated that the Cronbach's α values of the subscales ranged from 0.69 to 0.83, demonstrating acceptable to good internal consistency. To address the research objectives, descriptive statistics were first employed to summarize the data, followed by correlation analyses to examine the relationships among the key variables. Multiple regression analyses were then conducted to further determine the predictive power of these variables in explaining the outcomes of interest.

Results

Correlation Analysis

Family environment, learning values, and self-expectations were all positively correlated with motivation to learn Chinese ($r = 0.788$, 0.787, 0.792, respectively; $p < 0.001$). This demonstrates that higher family support, stronger recognition of learning values, and greater self-expectations are each associated with higher motivation.

Regression results indicated that all three predictors significantly influenced motivation, but learning values ($\beta = 0.335$, $p < 0.001$) and self-expectations ($\beta = 0.291$, $p < 0.001$) exerted stronger effects than family environment ($\beta = 0.316$, $p < 0.001$). The overall model explained 46% of the variance in learning motivation ($R^2 = 0.46$).

Figure 1

A Part Model of the Influence of Family Environment, Learning Value, and Self-Expectations on Chinese Learning Motivation

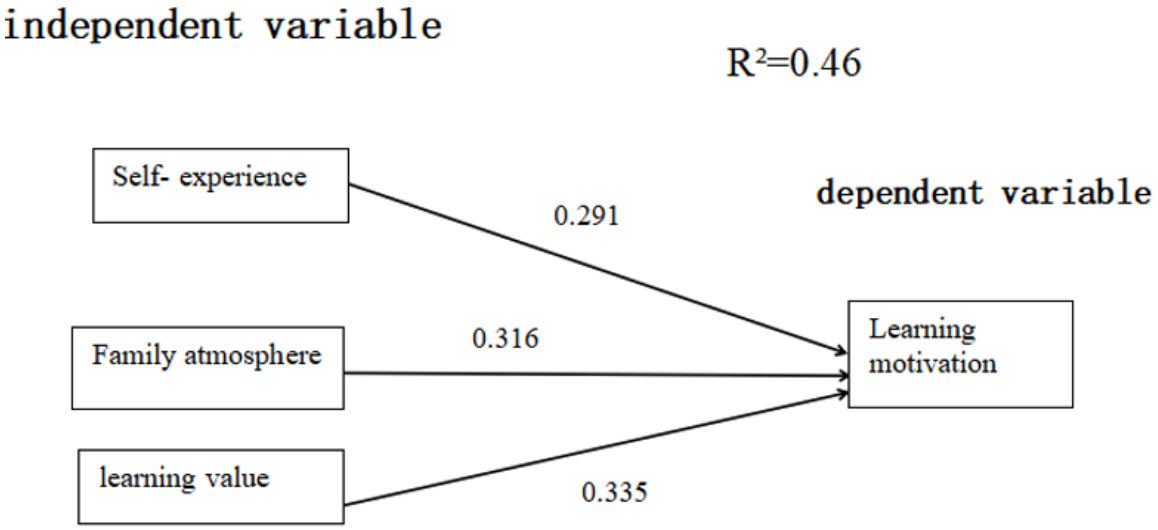

Table 1

Pearson Correlation Matrix of the Four Variables(n = 350)

Variable	1	2	3	4
1. Family Environment	0.788***	0.70***	072***	1
2. Learning Values	0.787***	0.74***	1	
3. Self-Expectations	0.792***	1		
4. Learning Motivation	1			

Regression Analysis

The regression analysis revealed that all three predictors—family environment, learning values, and self-expectations—had a statistically significant positive influence on learning motivation. Among these, learning values ($\beta = 0.335$, $p < .001$) and self-expectations ($\beta = 0.291$, $p < .001$) emerged as relatively stronger predictors when compared to family environment ($\beta = 0.316$, $p < .001$), indicating that students' perceptions of the usefulness and enjoyment of learning Chinese, as well as their confidence and aspirations, were more influential in shaping their motivation than the home environment. The overall model accounted for 46% of the variance in learning motivation ($R^2 = 0.46$), suggesting a substantial explanatory power and highlighting the importance of both individual beliefs and values in driving students' motivation to learn Chinese.

Demographic Variables

Independent sample t-tests and ANOVA showed that gender ($t = -0.80$, $p = 0.426$), only-child status ($t = -1.67$, $p = 0.097$), and family structure ($t = 0.60$, $p = 0.548$) did not produce significant differences. This suggests that learning motivation is shaped more by psychological than demographic factors.

Discussion

From a theoretical standpoint, the findings are consistent with the principles of Self-Determination Theory (Deci & Ryan, 2000), which emphasizes the critical roles of intrinsic interest and perceived competence in sustaining motivation. The relatively stronger influence of learning values underscores the dual importance of intrinsic enjoyment and the recognition of the utility of Chinese for academic and career advancement in maintaining student engagement. Similarly, the significant role of self-expectations reflects the impact of self-efficacy beliefs (Bandura, 1997), indicating that students who perceive themselves as capable and who hold high aspirations are more likely to invest effort and persist in learning tasks.

Although the family environment was also a significant predictor, its comparatively weaker effect suggests that parental support and communication provide an important foundation, yet motivation in language learning is primarily driven by students' internalized values and self-beliefs. This finding highlights the need for educational interventions that extend beyond parental involvement to explicitly cultivate intrinsic interest, utility perceptions, and self-confidence in learners. In this respect, the results also confirm the central proposition of expectancy–value theory (Eccles & Wigfield, 2002): students' motivation is shaped predominantly by their perceptions of the value of learning and by their confidence in their ability to succeed.

The alignment of these results with existing scholarship further strengthens their significance. Eccles and Wigfield (2002) have emphasized that when students perceive a task as valuable, they are more willing to expend effort, while Bandura (1997) argued that self-efficacy is fundamental for sustaining motivation. In the present study, both learning values and self-expectations were shown to outweigh the influence of family environment in the specific context of Chinese language learning. Moreover, the absence of significant effects from demographic variables challenges common assumptions in educational research, suggesting that differences in motivation are not primarily attributable to gender or family structure but are largely driven by individual psychological mechanisms.

Conclusion

Theoretical Contributions

The theoretical contributions of this study can be articulated in several key aspects. First, this research simultaneously examined the effects of family environment, learning values, and self-expectations within a single comprehensive framework, thereby extending the analytical scope of existing studies on learning motivation. Previous research has often emphasized one factor in isolation, such as the influence of family background or the role of individual self-efficacy. By integrating these three dimensions into one model, the present study demonstrates that each exerts a significant positive influence on learning motivation. This highlights that learning motivation is shaped not by a single determinant but through the combined influence of multiple factors operating across different levels. Second, the findings provide new empirical evidence for the applicability of expectancy–value theory in the context of Chinese language learning. According to this framework, motivation is shaped by students' valuation of a learning task and their expectation of success. The results of this study support this theoretical assumption, showing that students' motivation to learn Chinese is primarily driven by internal psychological mechanisms, while family support plays a supplementary role. Thus, the findings not only confirm the validity of expectancy–value

theory but also extend its application to the specific domain of Chinese language learning, reinforcing its cross-cultural relevance. Third, the study refines the understanding of demographic variables in the context of learning motivation. Educational research has often assumed that gender, only-child status, or family structure exert significant effects on motivation. However, this study found no such influence, suggesting that motivational differences are more strongly explained by psychological factors—such as value recognition and self-efficacy—than by demographic or social categories. This highlights the primacy of psychological mechanisms over background characteristics in shaping motivation, thereby contributing to a more nuanced theoretical understanding. Finally, the methodological design of this study also advances theoretical discourse. By employing a combination of reliability testing, descriptive statistics, correlation analysis, and multiple regression, the research ensured both scientific rigor and interpretive clarity. This multi-method approach serves as a model for future investigations into learning motivation, particularly in educational psychology and second language acquisition.

In summary, the theoretical contributions of this study lie in four areas: (1) expanding the analytical perspective by integrating multiple variables into a comprehensive framework; (2) providing strong empirical evidence for the expectancy–value theory in Chinese learning contexts; (3) clarifying the limited influence of demographic variables; and (4) demonstrating methodological rigor. Collectively, these contributions deepen the theoretical understanding of how learning motivation is formed and provide a solid foundation for subsequent research.

Practical Contributions

Beyond theoretical implications, this study also carries significant practical value. The results demonstrate that family environment, learning values, and self-expectations all exert important influences on adolescents' motivation to learn Chinese, and these findings can be directly applied to educational practice. *First*, in terms of family education, the findings suggest that the way parents support and communicate with their children directly shapes students' willingness to learn. A warm, supportive, and encouraging family atmosphere enhances motivation, whereas excessive pressure or punitive approaches may undermine it. Therefore, parents are encouraged to participate actively in learning activities, set realistic goals with their children, and provide constructive feedback, rather than focusing solely on criticism. *Second*, at the school level, learning values emerged as the most powerful driver of motivation. This highlights the importance of helping students recognize both the practical and intrinsic value of learning Chinese. Teachers should emphasize the relevance of Chinese for academic advancement and future career opportunities, while also fostering intrinsic interest through engaging activities such as cultural festivals, debates, or speech contests. By combining an emphasis on "usefulness" with opportunities for genuine enjoyment, schools can strengthen both the instrumental and intrinsic dimensions of student motivation. *Third*, at the individual level, self-expectations also play a critical role. Whether students believe they can succeed directly influences their motivation and persistence. In practice, this means that teachers and parents should support students in setting manageable goals, provide timely encouragement, and build confidence through small but continuous achievements. Positive peer influence can also be harnessed, as observing the success of classmates often strengthens students' own confidence and willingness to learn.

Finally, at a broader policy level, the findings point to the importance of collaboration between families, schools, and society. Educational authorities can design training programs for parents to enhance supportive educational practices, schools can integrate real-life

applications of Chinese into their curricula, and communities can provide cultural resources and extracurricular opportunities that enrich language learning. Sustainable improvement in motivation will require such multi-level cooperation across sectors. In summary, the practical contributions of this study lie in offering concrete directions: families should create supportive home learning environments, schools should strengthen value-oriented guidance, individuals should build self-confidence and persistence, and policymakers should foster collaboration across multiple levels. Taken together, these measures provide a comprehensive strategy for enhancing adolescents' motivation to learn Chinese.

Limitations and Future Directions

Limitations of the Study

While this study offers important theoretical and practical contributions, several limitations should be acknowledged. First, the study relied on self-report questionnaires, which may be influenced by social desirability bias or students' subjective interpretations of the items. Although reliability and validity testing were conducted, self-report data cannot fully capture the complexity of learning motivation and related factors. Second, the cross-sectional design of the research limits the ability to establish causal relationships among family environment, learning values, self-expectations, and learning motivation. The observed associations demonstrate predictive power but cannot confirm long-term effects or developmental changes over time. Third, the sample was drawn from a specific context of adolescents learning Chinese, which may restrict the generalizability of the findings. Cultural, linguistic, and educational differences in other populations could lead to different motivational dynamics. Future studies should include more diverse samples to strengthen external validity. Fourth, while the study examined key predictors of learning motivation, other potentially relevant factors—such as teacher support, classroom climate, or peer relationships—were not included in the model. Incorporating these variables in future research would provide a more comprehensive understanding of motivational influences. Finally, the study employed quantitative methods exclusively, which limited the depth of insight into students' personal experiences and perspectives. Complementary qualitative approaches, such as interviews or focus groups, could provide richer detail and contextual understanding of how family environment, values, and self-expectations shape motivation.

Future Research Directions

Building on the limitations of this study, several directions for future research are recommended.

First, future studies could adopt a longitudinal design to track changes in family environment, learning values, self-expectations, and motivation over time. This would allow researchers to better understand causal relationships and the developmental trajectories of motivation in language learning.

Second, expanding the sample to include students from diverse cultural, linguistic, and educational backgrounds would strengthen the generalizability of the findings. Comparative studies across different regions or countries could also reveal how cultural values shape motivational processes in language learning.

Third, future research should incorporate additional variables that may influence learning motivation, such as teacher support, classroom climate, peer interactions, or the use of digital learning tools. Including these factors would provide a more comprehensive understanding of the multi-level influences on motivation.

Fourth, employing mixed-methods approaches that combine quantitative surveys with qualitative techniques, such as interviews, focus groups, or classroom observations, could yield richer insights. Such approaches would allow researchers to capture the nuanced experiences and perspectives of students that are not easily conveyed through questionnaires alone.

Finally, intervention-based research could be conducted to test strategies aimed at enhancing family support, fostering positive learning values, and strengthening students' self-expectations. By evaluating the effectiveness of such programs, researchers could provide practical recommendations for educators, parents, and policymakers.

In summary, future research should aim to extend the scope of investigation by incorporating longitudinal, cross-cultural, multi-variable, and mixed-method approaches, as well as testing practical interventions. These directions will deepen our understanding of the mechanisms underlying learning motivation and provide stronger evidence for effective educational practices.

Abstract

This study examined the effects of family functioning, academic self-regulation, and expectations on the academic achievement of middle school students. A randomly selected sample of students from two middle schools in Guizhou City participated in the study, and data were collected using scales that had been tested for validity and reliability. Descriptive statistics, correlation analyses, and multiple regression analyses were employed to investigate the relationships among the variables. Correlational results showed that family functioning, self-regulation, and expectations were all positively associated with academic achievement. However, the regression analysis revealed that only self-regulation and expectations significantly predicted academic performance, whereas family functioning, although not a direct predictor, may influence academic outcomes indirectly through other variables. The findings extend the integrated framework of family systems theory, self-regulation theory, and expectancy-value theory, and provide practical implications for family education, classroom instruction, and educational policy. This research not only deepens the understanding of the interplay between motivation, family dynamics, and academic performance in educational psychology but also offers valuable insights for designing educational interventions.

Keywords: family function, academic self-regulation, expectations, academic performance

Introduction

In the field of educational research, academic performance has consistently been regarded as a central topic, as it reflects not only students' mastery of knowledge but also their adaptation to the broader demands of schooling. The middle school period is particularly critical, representing a stage of rapid development in cognition, emotions, and social skills. During this time, students engage in the construction of self-identity while simultaneously facing multiple pressures from family, school, and society. Recent statistics highlight the urgency of addressing these challenges. According to the 2024 Report on Depression in Children and Adolescents, the average age for the first diagnosis of depression among Chinese students is 13.41 years, while the average age for the first school withdrawal is 13.74 years, with both figures concentrated around the age of 14. These findings underscore the vulnerability of middle school students and the potential risks associated with unmanaged academic pressure and unfavorable family environments.

One theoretical framework particularly relevant to explaining students' academic achievement is Expectancy-Value Theory (EVT) (Eccles & Wigfield, 2002). EVT posits that students' academic behaviors are largely determined by two factors: their expectancies for success and the subjective value they place on academic tasks. Expectancy beliefs refer to students' confidence in their ability to succeed in a given domain, while task values encompass dimensions such as interest, importance, and perceived utility. When students believe they are capable of performing well and perceive their schoolwork as meaningful and worthwhile, they are more likely to invest effort, persist in the face of difficulties, and ultimately achieve higher outcomes. Applied to middle school students, EVT highlights how motivational beliefs shape the way learners engage with academic challenges during this sensitive developmental stage. In contexts where academic pressure is intense, fostering positive expectancy beliefs and enhancing the perceived value of learning tasks can buffer stress and promote sustained achievement. Therefore, examining expectancy alongside family functioning and self-regulation provides a comprehensive understanding of the multiple influences on students' academic performance.

Expectations, as motivational factors, include the beliefs and predictions of students, parents, and teachers regarding academic achievement. The Pygmalion effect demonstrates that positive expectations can significantly enhance students' performance (Rosenthal, 2002). Peng (2012) emphasized that reasonable expectations stimulate students' interest in learning and strengthen self-efficacy. These findings align with Expectancy-Value Theory (EVT), which posits that students' achievement-related behaviors are influenced by both expectancy beliefs (confidence in success) and task values (interest, importance, and utility) (Eccles & Wigfield, 2002). When students believe they are capable and view tasks as meaningful, they are more likely to persist and succeed academically.

Family functioning is widely recognized as a key dimension influencing the academic performance of middle school students. It refers to the capacity of the family system to meet members' emotional, communicative, regulatory, and problem-solving needs (Yue, 2014). In practice, family functioning reflects interaction patterns, the degree of emotional support among family members, and the overall stability of the family environment, including warmth, communication quality, and problem-solving ability (Zhou, 2020). From a developmental psychology perspective, the family environment is not merely a backdrop for individual growth but a critical factor shaping students' academic outcomes (Tong, 2007; Yu, 2019). Empirical research has demonstrated that parental emotional warmth, high-quality

educational involvement, and secure attachment relationships are positively associated with adolescents' learning achievements (Bowlby & Ainsworth, cited in Yue, 2014; Ding, 2018).

Academic self-regulation, in turn, refers to students' ability to set goals, implement learning strategies, monitor their progress, and reflect on outcomes. Zimmerman's (2000) model identifies self-regulation as a central mechanism for effective learning. Consistent with this view, domestic studies have found that students with stronger self-regulation skills are better equipped to cope with academic difficulties and maintain motivation (Guo et al., 2006). Self-regulated learning integrates metacognitive, motivational, and behavioral processes that enable continuous improvement in achievement (Heirweg et al., 2019; Sitzmann & Ely, 2011). More recent research further emphasizes the role of self-regulation as a mediating factor linking contextual influences to academic performance (Wolters & Hussain, 2015; Yang, 2016).

In summary, family functioning, academic self-regulation, and expectations each demonstrate meaningful correlations with students' academic performance. A supportive family environment provides the emotional security and resources necessary for learning, self-regulation equips students with the skills to manage their own learning processes, and positive expectations foster motivation and persistence. Although numerous studies have examined these associations, most have tended to focus on single factors in isolation. For example, Liu and Liu (2023) investigated the home learning environment and academic achievement, Lu and Luo (2022) examined the mediating role of family education, and Yu (2024) analyzed teacher caring behaviors and student engagement. Qu (2004) and Guo et al. (2006) highlighted the influence of self-regulated learning strategies, while Chen (2018) explored ethnic and gender differences in self-regulation among middle school students. While these studies provide valuable insights, they underscore the absence of integrative research that simultaneously considers family functioning, self-regulation, and expectations, particularly in underdeveloped regions of China where educational inequality remains pronounced.

The present study aims to address this gap by examining the effects of family functioning, academic self-regulation, and expectations on the academic performance of middle school students. Grounded in family systems theory, self-regulation theory, and expectancy-value theory, the study seeks to clarify both the direct and indirect pathways through which these factors influence academic outcomes. The findings are expected to contribute theoretically by integrating psychological and educational perspectives and practically by offering guidance for family education, classroom instruction, and educational policy.

Method

Participants

Data were collected from 334 valid cases drawn from two middle schools in Guizhou. The participants were between 12 and 15 years of age and represented a range of demographic backgrounds. Family Functioning Scale ($\alpha = 0.614$).

Instrumentation

Four instruments were employed to measure the study variables: family functioning, academic self-regulation, expectations, and academic achievement. All psychological scales

were administered using a 5-point Likert format ranging from 1 = strongly disagree to 5 = strongly agree, with higher scores indicating higher levels of the respective construct. Reliability of the scales was evaluated using Cronbach's Alpha, and construct validity was examined through expert review of the items.

Family Functioning Scale

Family functioning was assessed using a 10-item scale designed to capture emotional support, communication quality, rule-setting, and problem-solving within the family. Cronbach's Alpha for this scale was 0.614. Expert evaluation confirmed that the items appropriately represented the construct. Sample items include: "Family members openly share their feelings with one another" and "When conflicts arise, our family finds effective ways to resolve them." Higher scores reflect a more supportive and cohesive family environment.

Academic Self-Regulation Scale

Academic self-regulation was measured using a 10-item scale based on Zimmerman's model of self-regulated learning, which emphasizes goal setting, strategy use, monitoring, and reflection. Cronbach's Alpha for this scale was 0.865. Expert review confirmed the adequacy of the items for representing self-regulation in learning. Sample items include: "I set specific goals for my schoolwork" and "When I do poorly on an assignment, I try to figure out what I can do better next time." Higher scores indicate stronger self-regulatory skills in academic contexts.

Expectation Scale

Expectations were assessed with a 10-item scale measuring students' beliefs about their likelihood of success and the value they assign to academic tasks, consistent with expectancy-value theory. Cronbach's Alpha for this scale was 0.837. Expert assessment ensured that the items accurately reflected expectancy beliefs and task values. Sample items include: "I believe I can perform well in my school subjects" and "Doing well in school is important for my future." Higher scores represent stronger expectancy beliefs and task values.

Academic Achievement

Academic performance was measured using students' final exam grades, obtained from school records. Grades were used as an objective indicator of achievement and served as the dependent variable in the analyses.

Results

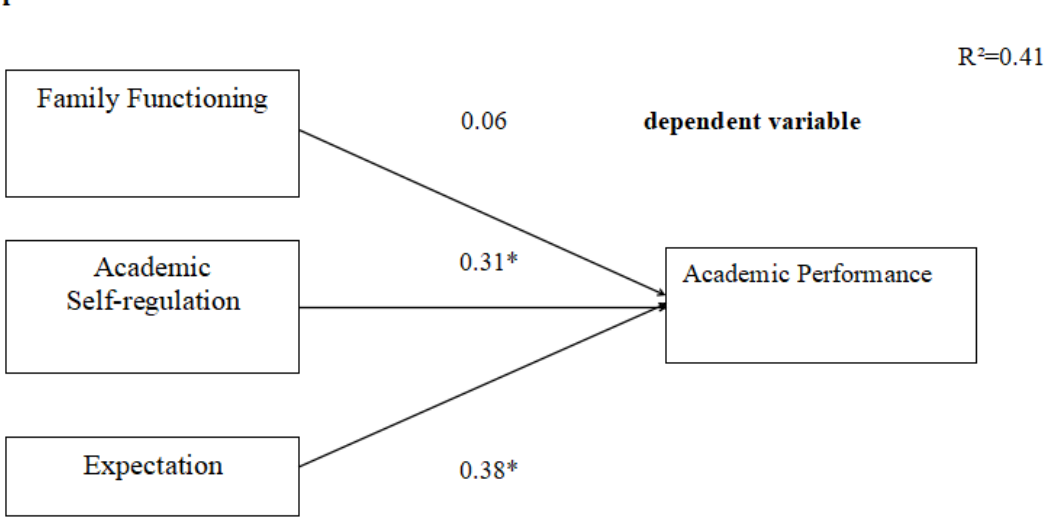
The purpose of this study was to examine the effects of family functioning, academic self-regulation, and expectations on the academic performance of middle school students. Data analysis was conducted in several stages. First, descriptive statistics were calculated to provide an overview of the central tendencies and variability of the study variables. Next, Pearson correlation analyses were performed to explore the associations among family functioning, self-regulation, expectations, and academic performance. Finally, multiple regression analysis was employed to test the predictive effects of the three independent variables on students' academic achievement. The following section presents the results of these analyses in detail.

Table 1 presents the intercorrelations among family functioning, self-regulation, expectancy, and academic performance. Family functioning demonstrated moderate positive associations with self-regulation (r = .31), expectancy (r = .47), and academic performance (r = .33). These findings suggest that students who perceive greater family support tend to report higher levels of self-regulation, greater academic expectancy, and somewhat stronger academic outcomes. Self-regulation was positively correlated with both expectancy (r = .58) and academic performance (r = .55), indicating that students with stronger self-regulatory skills not only hold higher academic expectations but also achieve better academic results. Expectancy showed the strongest correlation with academic performance (r = .59), underscoring the critical role of students' beliefs and expectations in shaping their achievement. Overall, the correlation results highlight meaningful relationships among the three predictors and academic performance. While all variables were positively related, expectancy and self-regulation emerged as the strongest correlates of academic performance, whereas family functioning, though weaker in magnitude, still exhibited a consistent positive pattern.

Table 1

Pearson Correlation Matrix of the Four Variables (n = 334)

Variables	1	2	3	4
1.Family Functioning	1			
2. Self-regulation	.306**	1		
3. Expectation	.468**	.575**	1	
4. Academic Performance	.334**	.552**	.591**	1



Note: p < 0.01**.

A multiple regression analysis was conducted to examine the predictive effects of self-regulation, family functioning, and expectancy on students' academic performance. The overall regression model was statistically significant, $F(3, n - 4) = 79.38$, $p < .001$, accounting for approximately 41.9% of the variance in academic performance ($R^2 = .419$, Adjusted $R^2 = .414$).

As shown in figure 1, both self-regulation ($\beta = .31$, $p < .001$) and expectancy ($\beta = .38$, $p < .001$) emerged as significant predictors of academic performance, indicating that students with higher levels of self-regulation and expectancy tend to demonstrate stronger academic outcomes. In contrast, family functioning did not contribute significantly to the model ($\beta = .06$, $p = .214$), suggesting that while family dynamics may play an indirect or supportive role, they are not directly associated with academic performance in this sample.

These results highlight the central role of motivational and expectancy-related factors in shaping students' academic achievement. The findings support theoretical perspectives that emphasize the importance of self-regulation and expectancy-value beliefs in predicting educational outcomes, while also pointing to the need for further exploration of how family functioning may exert its influence through indirect pathways.

Figure 1
Multiple Regression Analysis

Discussion and Conclusion

The present study examined the predictive effects of family functioning, academic self-regulation, and expectations on the academic performance of middle school students in Guizhou. The findings underscore the central role of expectancy beliefs and self-regulation in shaping students' academic outcomes, while suggesting that the influence of family functioning may be more indirect.

The correlation analyses indicated that all three predictors were positively associated with academic performance. Among them, expectations had the strongest relationship, which is consistent with Expectancy-Value Theory (Eccles & Wigfield, 2002). EVT emphasizes that students' achievement-related choices, persistence, and performance are largely determined by their expectations of success and the value they place on academic tasks. The present results confirm that when students believe they are capable of performing well and perceive schoolwork as important for their future, they are more motivated to engage and ultimately achieve higher outcomes. This finding aligns with prior research showing that expectancy beliefs are a robust predictor of effort and persistence across cultural and developmental contexts (Peng, 2012; Rosenthal, 2002).

Self-regulation also emerged as a significant predictor, highlighting the importance of students' ability to plan, monitor, and reflect on their learning processes. This finding is in line with Zimmerman's (2000) self-regulation model and supports earlier evidence that self-regulated learning strategies enhance academic performance across subject areas (Guo et al., 2006; Sitzmann & Ely, 2011). Importantly, EVT and self-regulation theory can be understood as complementary: expectancy beliefs motivate students to value and pursue academic tasks, while self-regulation provides the strategies necessary to translate motivation into sustained achievement.

In contrast, family functioning did not significantly predict academic performance in the regression analysis, although it was positively correlated with achievement. This suggests that family functioning may contribute indirectly by shaping students' motivation and self-

regulation. Supportive families provide emotional warmth, consistent communication, and structured guidance, which can foster both positive expectancy beliefs and effective self-regulation skills. This interpretation aligns with family systems theory (Yue, 2014; Zhou, 2020), which highlights the family's role in cultivating socio-emotional resources that influence learning outcomes through indirect pathways.

Taken together, these findings extend the integrated framework of family systems theory, self-regulation theory, and expectancy-value theory. They demonstrate that motivational beliefs (expectancy-value), regulatory strategies (self-regulation), and family context work together to influence academic achievement. By confirming the predictive strength of expectancy and self-regulation, the study highlights the need to strengthen students' confidence in success and equip them with the skills to manage their own learning, while recognizing the family's indirect but essential role in supporting these processes.

The findings have several practical implications. At the family level, strengthening communication, emotional support, and involvement in children's education can create a foundation that fosters positive expectancy beliefs and self-regulation. At the school level, interventions that build students' self-regulatory skills and cultivate a sense of academic competence may directly enhance achievement. At the policy level, integrating family education with motivational and self-regulation training programs can provide a holistic approach to improving student outcomes, particularly in underdeveloped regions.

This study contributes to educational psychology by demonstrating the combined influence of family functioning, self-regulation, and expectancy on middle school students' academic achievement. The findings reinforce the explanatory power of Expectancy-Value Theory, showing that students' beliefs about their success and the value they assign to schoolwork are central to their performance. At the same time, the results emphasize the complementary role of self-regulation in translating motivation into achievement and the indirect contribution of family functioning in shaping these processes. These insights provide a basis for interventions aimed at enhancing both academic performance and student well-being.

Limitations and Future Directions

Several limitations must be considered. The cross-sectional design precludes causal inference; longitudinal studies are needed to clarify the developmental pathways among family functioning, motivation, self-regulation, and performance. Reliance on self-report measures may introduce bias, underscoring the importance of incorporating multiple data sources such as teacher or parent reports. Finally, the sample was limited to two schools in Guizhou, and future research should include larger, more diverse populations to enhance generalizability.

Cultural Integration Through Peer Collaboration: How PAL Programs Facilitate the Adaptation of Burmese Biomedical Science Students in Thailand

Gary Torremucha, Rangsit University, Thailand
Edward Devere Bacon, Rangsit University, Thailand

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study investigates how Peer-Assisted Learning (PAL) sessions facilitate the cultural adaptation, intercultural competence, and personal development of Burmese international peer-mentors at a Thai university. Using a mixed-methods approach, quantitative data were gathered through structured questionnaires, while qualitative insights were derived from semi-structured interviews with peer-mentors. Findings reveal that PAL sessions significantly enhance peer-mentors' understanding of Thai culture, helping them adjust to local communication styles and social norms. Additionally, the sessions improved the mentors' leadership and communication skills, contributing to their personal and professional growth. However, language barriers and the need for more structured cultural adaptation resources were identified as challenges. This research provides valuable insights into the dual role of PAL programs in promoting both academic and cultural integration, emphasizing the need for enhanced intercultural training to support international students' success. The findings offer practical recommendations for improving PAL frameworks in higher education settings.

Keywords: peer-assisted learning, cultural adaptation, intercultural competence

The International Academic Forum
www.iafor.org

Introduction

Over the past four decades, higher education institutions in Thailand have significantly expanded international programs, fueled by the dismantling of geopolitical barriers, the reduction in air travel costs, and the widespread global connectivity enabled by the internet and social media. The growing significance of cross-border organizational relationships has heightened the importance of intercultural competence, prompting many educational institutions to establish international partnerships and offer projects supported by intercultural curricula to cultivate this competence among students (Syring, 2016). A scheme that promotes intercultural competence is one that encourages students to contribute to and value the learning of their peers (Cajander et al., 2012). An example of a scheme of this capacity is peer-assisted learning (henceforth PAL), in which empirical evidence indicates that PAL effectively boosts students' motivation, academic self-concept, performance, and retention (Ning & Downing, 2010; Öz, 2024; Yaoyuneyong & Thornton, 2011). These sessions provide a structured environment that fosters collaborative learning, intercultural dialogue, and mutual support among participants. However, the specific role of PAL sessions in facilitating cultural integration for international peer-mentors remains underexplored.

In Thailand, despite the nation's efforts to position itself as a leading destination for higher education through internationalization initiatives, many international students continue to experience challenges such as language barriers, cultural disparities, and social isolation (Chaiyasat, 2024). These challenges can significantly hinder their integration into Thai society (Snodin et al., 2021), thereby reducing the potential advantages of cultural exchange. Burmese students, who comprise a substantial segment of Thailand's international student population, frequently face challenges in cultural adaptation due to difficulties in social integration, academic adjustment, and experiences of discrimination (Rhein, 2016). Burmese students volunteering as peer mentors navigate the dual roles of cultural learners and guides, offering a unique perspective on cultural integration.

This study investigates how PAL sessions contribute to the cultural adaptation of Burmese international peer-mentors in Thai universities, focusing on the mechanisms that promote intercultural competence, social integration, and personal growth. Grounded in theories of intercultural competence and collaborative learning, this research seeks to illuminate the dual benefits of PAL programs: enriching the cultural understanding of mentors while simultaneously enhancing their leadership and communication skills. By focusing on the experiences of Burmese peer mentors at Rangsit University, this study addresses a critical gap in the literature and offers practical insights into fostering inclusive and supportive educational environments.

Program Description

The PAL program embodies the university's mission of “Creating a giving and sharing society,” connecting mentors from four major courses with mentees from six smaller courses over a 10-week period. The program focuses on Thai students enrolled in General Education English courses and aims to facilitate cultural exchange while developing intercultural competence among participants.

Burmese peer-mentors play a key role in the program, dedicating two to three hours per week to supporting mentees. These mentees, whose English proficiency is at a CEFR level of B1 or lower, participate for at least 30 minutes weekly. Mentees select their mentors online from a

pool of mentors, all of whom possess a CEFR level of B2 or higher. Each session lasts a minimum of 30 minutes, with mentees working in groups of up to five students.

At the end of the program, the Burmese peer-mentors complete questionnaires to reflect on their experiences. Additionally, 15 peer-mentors are randomly selected to participate in semi-structured interviews, offering qualitative insights into their cultural adaptation, intercultural interactions, and learning experiences within the PAL sessions. This systematic feedback collection supports a detailed assessment of how the program fosters cultural integration and personal development for the mentors.

Research Objectives

This research aims to explore how PAL sessions facilitate the cultural adaptation of Burmese international peer-mentors to Thai culture. It seeks to identify and analyze the processes within these sessions that promote cultural exchange, enabling peer-mentors to engage with Thai cultural norms, practices, and social dynamics. Additionally, the study evaluates the development of intercultural competence among Burmese peer-mentors, focusing on their ability to interact effectively and sensitively in a culturally diverse academic setting. It also investigates the personal and professional growth outcomes experienced by these mentors, such as increased confidence in intercultural communication, enhanced leadership skills, and improved academic performance. Furthermore, the research examines the level of satisfaction among Burmese peer-mentors regarding the support and resources provided by the university, while gathering their recommendations for improving the PAL framework. Ultimately, the study aims to offer evidence-based recommendations for implementing effective PAL sessions that support both academic and cultural integration, addressing the unique challenges faced by Burmese peer-mentors adapting to Thai culture.

Research Questions

The study explores the role of Peer-Assisted Learning (PAL) sessions in fostering cultural integration among Burmese international peer-mentors adapting to Thai culture. Specifically, the research is guided by the following key questions:

1. How do PAL sessions facilitate the cultural adaptation of Burmese international peer-mentors to Thai culture?
2. What impact do PAL sessions have on the intercultural competence of Burmese international peer-mentors?
3. How do PAL sessions influence the personal and professional development of Burmese international peer-mentors?
4. What are the levels of satisfaction among Burmese international peer-mentors regarding the support and resources provided by the university for their cultural adaptation, and what recommendations do they suggest for improvement?

These research questions aim to provide a comprehensive understanding of how PAL sessions can serve as a conduit for cultural exchange, personal growth, and professional development, offering valuable insights for fostering inclusive and supportive environments in higher education. The findings are expected to contribute to academic discussions on best practices for enhancing cultural integration through peer-assisted learning frameworks.

Literature Review

Educational inclusion is a pivotal component of the integration process, with schools playing a significant role in facilitating the integration of migrants (Klemenčič-Mirazchiyski et al., 2022), particularly in contexts where international students engage in learning and teaching as peer-mentors. Research highlights the significance of cultural diversity in educational environments, affirming and expanding the advantages of university diversity experiences in preparing students for a global society (Gurin et al., 2004; Nelson Laird et al., 2005). PAL transforms traditional student-teacher dynamics by promoting reciprocal knowledge and skill development among students of similar social groupings, thereby enhancing collaboration, engagement, and satisfaction (Castelyn, 2018).

Peer-Assisted Learning: A Tool for Academic and Cultural Growth

PAL involves students taking on both teaching and learning roles, with its structure categorized based on the academic relationship between students and the student-to-teacher (Espinosa et al., 2024). Research has shown that PAL is a peer-facilitated learning enhancement model designed to impact the way students learn complex content in a specific course (Huang et al., 2015; Iwata et al., 2014; Sha et al., 2023). Although the academic advantages of PAL are well-established, research on its role in cultural integration, particularly regarding the adaptation experiences of international peer-mentors, remains limited.

Cultural Integration and Intercultural Competence

Cultural integration involves incorporating and navigating social norms, beliefs, and practices in diverse settings. Byram (1997) posits that intercultural competence consists of five components—attitudes, knowledge, skills of interpreting and relating, skills of discovery and interaction, and critical cultural awareness—arguing that knowledge and attitudes are foundational for enhancing skills and fostering critical cultural awareness. Intercultural communication breakdowns stem from (1) differing communicative resources that hinder the construction and understanding of linguistic and pragmatic meanings, and (2) contrasting sociocultural norms that obstruct the perception, expectation, and execution of appropriate communicative acts in social contexts (Bardovi-Harlig & Hartford, 1990; Clyne, 1995; Rehbein, 1994; Sarangi, 1994; Thomas, 1984; Varonis & Gass, 1985)—all of which can happen in a PAL scheme. Therefore, incorporating intercultural competence into PAL sessions offers a crucial framework for promoting mutual understanding and facilitating exchange. Engagement in intercultural programs has been shown to substantially improve respect for and appreciation of cultural diversity (Block et al., 2015).

Challenges for International Peer-Mentors

International students face a wide range of challenges, including securing housing (Lee & Rice, 2007), managing homesickness (Poyrazli & Lopez, 2007), adapting to sociocultural differences in foreign educational systems (Hellstén & Prescott, 2004), and overcoming language barriers in English proficiency (Bai, 2016), all of which can adversely impact their mental health and academic success if not adequately addressed. These challenges highlight the critical need for programs such as PAL schemes to offer structured opportunities that foster meaningful interactions between international and local students throughout the acculturation process (Bai, 2016). In addition to the support provided by informal peer networks, structured university-based PAL initiatives more comprehensively address adaptation challenges by fostering social

networks that positively influence students' learning, academic success, and retention throughout their studies (Huijser & Kimmins, 2005).

Role of PAL in Facilitating Cultural Exchange

Cultural exchanges serve as catalysts for language learning, mediators between diverse linguistic and cultural groups, developers of learning communities, providers of authentic information, promoters of resolving conflicts, and creators of multifaceted learning experiences (Wang, 2013), and PAL initiatives may create this platform for such cultural exchanges to take place. Language learners can deepen their understanding of different cultures and improve their perceptions of language learning through meaningful experiences (Jung et al., 2019), such as PAL, that reflect real-life communicative contexts. Studies have shown that these programs are particularly effective in enhancing student interaction, through its socializing impact, and have been proven effective in helping students achieve desired learning outcomes (Idris et al., 2019; Jeanneau & O'Riordan, 2020; Urbanovska & Pleschová, 2024).

Addressing Research Gaps

Despite the growing global adoption of PAL initiatives, a notable research gap persists regarding its role in supporting the cultural adaptation of international peer-mentors in Thailand. Current literature primarily emphasizes academic benefits (Glynn et al., 2006; Huang et al., 2019; Yaoyuneyong & Thornton, 2011), frequently neglecting the socio-cultural aspects and the distinct needs of diverse participants. This study seeks to address these gaps by exploring how PAL sessions at Rangsit University enable Burmese peer-mentors to adapt to Thai culture, thereby contributing to cultural discourse.

The literature reviewed highlights PAL as a promising tool for promoting cultural integration and intercultural competence, particularly among international peer-mentors. This study will build on existing findings to explore the mechanisms through which PAL supports cultural exchange and adaptation, offering practical insights for enhancing such programs in higher education.

Methodology

This research utilizes a participatory action research design, conducted over a ten-week period during Term 1 of 2024 at Rangsit University in Thailand. The study explores the role of PAL sessions in promoting cultural exchange and fostering intercultural competence among Burmese peer mentors at the university's PAL center. To achieve a comprehensive understanding of participants' experiences, a mixed-method approach integrating both quantitative and qualitative methods was employed.

Population and Sample

The target population consists of 32 Burmese students, aged between 18 and 22, who voluntarily assumed roles as student managers in the PAL center. The participants represent diverse educational and regional backgrounds, with English proficiency levels ranging from intermediate to advanced.

Research Design

A combination of quantitative and qualitative data collection techniques was adopted. Quantitative data were gathered through a structured questionnaire designed to measure participants' perceptions of cultural exchange, cultural awareness, and personal growth. For qualitative data, semi-structured interviews were conducted with a subset of 15 participants to examine their experiences related to intercultural competence, communication challenges, and personal development.

Data Collection Instruments

Data collection for the study involved two primary instruments: a structured questionnaire and semi-structured interviews. The questionnaire, administered to all 150 participants, included 30 Likert-scale items rated from 1 to 5. It was designed to assess participants' interactions with peer mentors, their levels of cultural sensitivity, and their overall satisfaction with the PAL sessions. Additionally, in-depth semi-structured interviews were conducted with a subset of 15 participants. These interviews explored their intercultural experiences, communication challenges, and the benefits derived from their participation in the PAL center, providing rich qualitative insights to complement the quantitative data.

Ethical Considerations

Ethical guidelines were rigorously followed throughout the research process. Participants provided informed consent, with assurances of confidentiality and anonymity. Their participation was entirely voluntary, with the freedom to withdraw from the study at any point without repercussions. Additionally, cultural sensitivity was prioritized to ensure respect for the participants' diverse backgrounds.

This dual-method approach enabled the study to generate valuable insights into how PAL sessions facilitate cultural exchange and enhance intercultural competence among Burmese students at Rangsit University.

Data Analysis

This study utilized both quantitative and qualitative methodologies to thoroughly examine the role of PAL sessions in fostering cultural exchange and enhancing intercultural competence among Burmese students in Thailand.

Quantitative Data Analysis

The quantitative component of the study involved analyzing data collected through structured questionnaires using descriptive statistical methods. This analysis aimed to outline the demographic characteristics of participants and their responses to Likert-scale items addressing cultural exchange, intercultural competence, and personal growth. Metrics such as mean, median, and standard deviation were calculated to represent central tendencies and variability within the dataset.

Furthermore, inferential statistical techniques were applied to uncover significant associations between primary variables, including participants' satisfaction levels with the PAL sessions and their perceptions of intercultural competence development. Tools such as Pearson's correlation

coefficient and regression analysis were employed to identify potential correlations and predict outcomes, enriching the understanding of the data's implications.

Qualitative Data Analysis

The qualitative data, gathered from semi-structured interviews with selected participants, underwent a detailed thematic analysis to identify significant patterns and insights. This process involved four key stages. First, the researcher familiarized themselves with the data by thoroughly reviewing interview transcripts to understand participants' narratives and experiences. Second, relevant phrases and statements were coded based on their alignment with the study's objectives, focusing on areas such as intercultural competence, peer interactions, and communication challenges. Third, the codes were grouped into overarching themes that encapsulated the study's primary findings, highlighting how PAL sessions facilitated cultural exchange and enhanced intercultural competencies. Finally, these themes were interpreted collectively to develop a comprehensive narrative of the participants' experiences, linking the findings to the research objectives and theoretical framework. This analytical approach provided in-depth insights into the role of PAL sessions in promoting cultural integration and personal development among Burmese students.

Validity and Reliability

To ensure the dependability and trustworthiness of the research instruments applied in this study, extensive evaluations of validity and reliability were conducted.

Validity

The questionnaire's validity was verified through expert assessment and the Item Objective Congruence (IOC) method. Three specialists in education and second language pedagogy examined the content validity of the questionnaire items. Each item was rated based on its relevance to the study's objectives, using a scale of +1 (relevant), 0 (uncertain), and -1 (irrelevant). Items scoring +1 were considered well-aligned with the research aims, affirming the instrument's effectiveness in measuring the intended constructs. Following the review, all items were deemed suitable and congruent with the study's goals, thus establishing the questionnaire's content validity.

Reliability

The reliability of the questionnaire was evaluated using Cronbach's Alpha to measure internal consistency. A preliminary test was conducted involving 40 participants who shared demographic characteristics with the study's primary sample but were not included in the main study. The Cronbach's Alpha value for the questionnaire was 0.94, reflecting an excellent degree of internal consistency. Given that a value of 0.70 or above is generally regarded as acceptable, this result indicates that the questionnaire reliably captures consistent responses among participants.

By ensuring both the validity and reliability of its instruments, this study reinforces the precision and consistency of its data, enabling robust and credible conclusions.

Results

Questionnaire

The questionnaire distributed to Burmese peer-mentors in the PAL program assessed their motivations, personal growth, and perceptions of the academic support provided within the program. The responses, measured on a Likert scale, provided insight into the participants' emotional resilience, community impact, and the team environment at the PAL center. Below is a summary of the key findings based on three main themes: Motivation and Emotional Resilience, Personal Growth and Community Impact, and Academic Support and Team Environment.

Motivation and Emotional Resilience

The responses regarding motivation and emotional resilience indicate that the peer-mentors are motivated to continue their volunteer work, even amidst the political unrest in Myanmar. The mean score across items in this category was 3.37 (SD = 0.89), reflecting a moderate level of resilience and motivation. Mentors expressed a strong sense of purpose in their role, with one item scoring 3.53 (SD = 0.72), while another item concerning the emotional impact of the political situation on their well-being scored 3.69 (SD = 1.03). Despite challenges, participants found that volunteering helped them cope with stress, with a moderate score of 3.06 (SD = 0.95) for this item.

Personal Growth and Community Impact

The results for personal growth and community impact demonstrated high levels of satisfaction, with an overall mean of 3.63 (SD = 0.80). The peer-mentors reported significant personal growth and a strong connection to their cultural roots, reflected in a mean score of 3.72 (SD = 0.92) for personal growth and 3.63 (SD = 0.75) for cultural connection. Mentors also noted that their roles helped them develop leadership skills, scoring 3.72 (SD = 0.81), and they expressed a sense of accomplishment and purpose in helping others, with a mean score of 3.63 (SD = 0.83). This section highlights the positive impact of the mentoring experience on both the personal and community levels.

Academic Support and Team Environment

In terms of academic support and the team environment, the peer-mentors reported a moderate level of satisfaction, with an overall mean score of 3.49 (SD = 0.85). Although many mentors felt that their academic performance benefited from volunteering (3.50, SD = 0.95), they also recognized that balancing mentoring responsibilities and studies could be challenging (3.31, SD = 0.99). However, they expressed satisfaction with the support they received from the PAL center, particularly regarding the safe and inclusive environment provided (3.59, SD = 0.76), and the recognition and respect they felt from peers and supervisors (3.75, SD = 0.84).

Semi-structured Interviews

The semi-structured interviews with Burmese peer-mentors revealed key themes related to their experiences in the Peer-Assisted Learning (PAL) sessions. These themes reflect the mentors' cultural adaptation, communication challenges, personal growth, and cultural exchange.

Cultural Adaptation and Understanding

The PAL sessions played a vital role in helping Burmese peer-mentors adapt to Thai culture. Participants noted that interactions with Thai students allowed them to better understand local customs, particularly around politeness and respect. One mentor highlighted this by stating, "My sessions have taught me a lot about Thai culture, especially their polite way of communicating and how much they value respect. I have adjusted my teaching by using examples that match their culture." Through these interactions, mentors gained valuable insights into Thai norms, which enhanced their cultural awareness and ability to engage effectively.

Language and Communication Barriers

Despite the cultural benefits, language barriers emerged as a significant challenge for many mentors. Several participants expressed difficulty in communicating with Thai students who were hesitant to speak English or struggled with proficiency. As one mentor explained, "The language barrier some Thai students don't really wanna socialize in English." However, mentors often employed strategies such as adjusting their communication styles or asking follow-up questions to navigate these barriers and facilitate more meaningful engagement with their mentees.

Personal Growth and Confidence Building

The PAL sessions also fostered personal growth and boosted the confidence of the peer-mentors. Many participants felt that their communication skills and leadership abilities improved as a result of guiding their peers. One mentor shared, "Helping others and seeing their progress boosts my self-esteem and sense of accomplishment." These experiences not only built the mentors' confidence in cross-cultural interactions but also enhanced their empathy and adaptability, key traits that contributed to their professional and personal development.

Cultural Exchange and Mutual Learning

A strong theme of cultural exchange and mutual learning emerged from the interviews, as both mentors and mentees shared their cultural backgrounds. This exchange deepened intercultural understanding and fostered a supportive learning environment. One mentor recalled a particular instance of cultural exchange, saying, "A Thai student enthusiastically shared stories about Songkran, the water festival, explaining its cultural significance and how it's celebrated across the country." Such moments of mutual learning not only enriched the participants' knowledge but also strengthened the cultural bonds within the PAL sessions.

Discussion

Interpretation of Key Findings in Relation to Research Questions

RQ1: How do PAL sessions facilitate the cultural adaptation of Burmese international peer mentors to Thai culture?

The PAL sessions were instrumental in facilitating the cultural adaptation of Burmese international peer-mentors. Interview responses highlighted how direct interactions with Thai students allowed mentors to better understand local customs, particularly around respect and

politeness, as reflected in the literature on intercultural competence (Byram, 1997). One mentor mentioned that "My sessions have taught me a lot about Thai culture, especially their polite way of communicating and how much they value respect." This is consistent with findings from the literature, which emphasize the role of structured cultural exchange programs in improving understanding of diverse cultural norms (Wang, 2013). By learning about Thai cultural practices, such as the significance of hierarchy and respect for elders, the peer mentors were able to adjust their behaviors and communication styles to better align with their surroundings. Moreover, the informal, reciprocal nature of learning within PAL sessions mirrors the collaborative approach emphasized in intercultural communication research (Block et al., 2015). Mentors adjusted their teaching to incorporate Thai-specific examples, enhancing the learning experience for both parties and promoting mutual cultural exchange.

RQ2: What impact do PAL sessions have on the intercultural competence of Burmese international peer-mentors?

The impact of PAL sessions on the intercultural competence of Burmese international peer-mentors was substantial. The mentors reported increased sensitivity and adaptability in their communication, in line with Byram's framework on intercultural competence, particularly the development of "skills of discovery and interaction." One mentor stated, "The sessions have improved my intercultural competence by teaching me to adapt to Thai communication styles and learning preferences." Another mentor emphasized the importance of learning the "subtle ways Thai students express their thoughts," underscoring the development of critical cultural awareness.

These findings echo the literature, which highlights how engagement in intercultural programs improves cultural awareness and empathy (Bardovi-Harlig & Hartford, 1990; Byram, 1997). The sessions provided a platform for real-life application of intercultural competence, where peer mentors adapted to Thai social norms and communication styles, enriching their intercultural experiences.

RQ3: How do PAL sessions influence the personal and professional development of Burmese international peer-mentors?

The PAL sessions had a positive influence on both the personal and professional development of Burmese international peer-mentors. As noted in the literature, PAL initiatives often serve as platforms for developing leadership and communication skills (Yaoyuneyong & Thornton, 2011). Many mentors reported gaining confidence in both academic and social settings, as well as improving their leadership abilities. For instance, one mentor shared, "Helping others and seeing their progress boosts my self-esteem and sense of accomplishment." Another mentioned that the sessions had helped them "grow by improving [their] communication and cultural awareness."

These outcomes are consistent with previous research indicating that peer mentoring programs not only benefit the mentees but also contribute to the mentors' development in terms of communication, empathy, and leadership skills (Castelyn, 2018). PAL sessions encouraged the mentors to step out of their comfort zones and develop interpersonal and professional skills that are transferable to other contexts.

RQ4: What are the levels of satisfaction among Burmese international peer-mentors regarding the support and resources provided by the university for their cultural adaptation, and what recommendations do they suggest for improvement?

The satisfaction levels of Burmese international peer-mentors regarding the support and resources provided by the university were mixed. While many mentors felt that the university provided adequate support, such as access to training sessions and materials, some expressed a need for more targeted cultural adaptation resources. One mentor noted that "the training sessions, teaching materials, and mentor collaboration have been most helpful." However, another mentor suggested that "the university could provide more cultural exchange workshops or activities to help mentors better understand diverse backgrounds."

These findings align with the literature on the importance of structured support in easing cultural adaptation challenges (Huijser & Kimmins, 2005). While the PAL program provided essential resources, additional workshops or informal events focused on cultural adaptation could further enhance the experience for international mentors.

Implications for Practice

The findings suggest several practical implications for enhancing the cultural adaptation of international peer mentors through PAL sessions. First, intercultural competence training should be a key component of PAL programs to help mentors navigate the complexities of cultural exchange. Additionally, universities should consider expanding cultural exchange workshops and informal networking opportunities to foster deeper cultural understanding. Regular feedback mechanisms, such as reflection sessions, could provide mentors with more opportunities to share their experiences and receive guidance on overcoming challenges.

Contributions to Existing Research

This study contributes to the existing research on peer-assisted learning by highlighting its dual role in fostering both academic and cultural integration among international students. While previous studies have focused primarily on the academic benefits of PAL, this research adds to the literature by demonstrating how PAL sessions serve as platforms for intercultural competence development and personal growth among peer mentors. Furthermore, the study addresses a notable gap by exploring the specific experiences of Burmese students in Thailand, a population that has received limited attention in previous research.

Limitations and Future Research Directions

One limitation of this study is its reliance on self-reported data from interviews and questionnaires, which may introduce bias. Future research could benefit from longitudinal studies that track the cultural adaptation and professional development of peer mentors over time. Additionally, expanding the sample to include peer mentors from different cultural backgrounds would offer a more comprehensive understanding of how PAL programs facilitate cultural integration across diverse contexts.

Further research is also needed to explore the long-term impact of peer mentoring on both mentors and mentees, particularly in relation to their intercultural competence and academic success. By addressing these areas, future studies can provide deeper insights into how to optimize PAL programs for international students in higher education.

Conclusion

This study highlights the critical role that PAL sessions play in facilitating the cultural adaptation, intercultural competence, and personal development of Burmese international peer-mentors at a Thai university. The findings demonstrate that PAL programs not only foster a deeper understanding of Thai culture but also enhance peer-mentors' leadership, communication, and empathy skills, contributing to their overall personal and professional growth. Despite some challenges, such as language barriers and the need for more targeted cultural adaptation resources, the peer-mentors expressed satisfaction with the support provided by the university. This research offers significant contributions to the understanding of how structured peer-learning environments can serve as catalysts for cultural integration, especially in higher education contexts where international students face unique adaptation challenges. The insights gathered underscore the importance of expanding intercultural training within PAL programs to maximize their benefits, suggesting that with proper institutional support, PAL can be an effective tool for fostering inclusive and culturally responsive learning environments.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The authors declare that ChatGPT was utilized solely for proofreading and language refinement, and that no AI technologies were used to generate, analyze, or interpret the research content, data, or conclusions.

Towards a Successful Postgraduate Life and Beyond: The Construction of a PG Transition Module

Yingchun Li, Xan Jiaotong Liverpool University, China

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This paper is about the construction of a multidimensional Transition Support System (TSS) for postgraduates in XJTLU. As the university keeps expanding and the PG programme is enlarging, the need to facilitate postgraduates' transition in this Sino-British EMI University emerges. The postgraduate students may face a multitude of challenges before and after they join XJTLU. Thus, it is of necessity and urgency to build up a system to aid postgraduates in their transition to XJTLU. This system is embodied in a PG Transition Module and is currently at its piloting stage. This project will implement action research in the iterative process of constructing and modifying the TSS, while investigating the effect of the TSS on postgraduates' development of self-directed research-led learning skills. This project is highly significant as it will increase the prospect of a successful XJTLU life for postgraduates, and enhance the profile of XJTLU in the international arena as a pioneer in offering an extensive support system for postgraduate transition. After the first iteration of this PG Transition Module, there is feedback from multiple stakeholders including students, practice mentors and academic advisors, with their varied perceptions and experiences of the project-based learning in one semester. Postgraduate students mostly described how learning in authentic real world projects have helped their development of self-directed and self-regulated learning skills although they have also raised their expectations for the relevancy of these projects to their disciplinary areas for the enhancement of employability.

Keywords: PG module, project-based learning, transition support

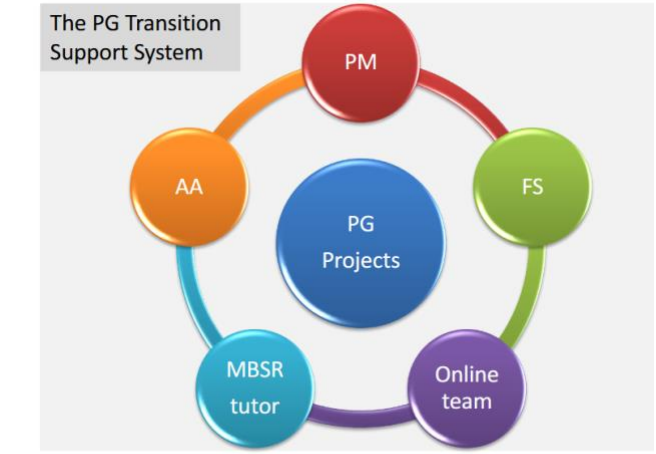
Introduction

The construction of a PG transition system was initiated against the backdrop that the postgraduate programme in XJTLU is developing rapidly and there has been a dire need for facilitating postgraduates' transition in this university. After much consultation with key stakeholders including external partnership institutions outside XJTLU and programme directors within XJTLU, it was decided that the transition system would be embodied in a PG Transition Module to be piloted in one semester, before it would be further refined and made ready to be rolled out across the whole university.

Previously, the significance of supporting students' transition has been very often undervalued. In reality, students who haven't been accommodated well in the early stages of their postgraduate studies might experience difficulties in their later academic studies. In the worst scenario, they might drop out in their first year of study if they do not feel adequately supported by their institution (Wilcox et al., 2005). Postgraduates' challenges may be associated with the curriculum, their social roles, and generic life challenges (Tsao, 2020). To meet the demand for assistance with postgraduate students' transition in universities, various pre-sessional courses have been offered to help students overcome the aforementioned challenges in universities across the globe. Typically, these courses focus on preparing students academically (Hultberg et al., 2008).

However, a more comprehensive, coordinated, and student-centred approach may serve best to support students' transition (Timms et al., 2022), because transition needs to eventually enable students' integration into their academic environment (Wilson et al., 2016) and prepare students for their future employment. It was therefore hoped that the construction of the Transition Support System in the form of a PG transition module would make it possible that support for postgraduates' transition would be delivered in a multifaceted manner with a long-term positive impact on postgraduate students and the university.

The Construction of the PG Transition Module



The aim of constructing this PG Transition module is to provide students with learning resources and guidance that will help students to develop self-regulated learning skills and 21st century soft skills including communication skills, leadership skills, and self-management skills, which will in turn enhance students' development of employability so that they may have a successful academic life in XJTLU and beyond.

Early in 2025, it was decided that a multi-dimensional support system for postgraduate transition would be established in response to the university-wide initiative of "research-led and project-based learning". The module would be counted as 80 Co-curricular Activity hours, and would be a prerequisite for students to proceed to dissertation writing stage. There were five components in the module: 1) there was an online team preparing online resources for students' self-study on Learning Mall; 2) there was onsite supervision from practice mentors for students' field work on the 4 practice bases including 3 practice bases in external partnership institutions and one home base in XJTLU, 3) there was academic skills supervision from Academic Advisors to give students tutorials in the university, 4) there were field supervisors to help administer students' onsite engagement and project progress, and 5) there was a mindfulness-based stress reduction (MBSR) course tutor to help relieve students' stress by offering MBSR course to be held at the university. In addition, students would carry

out teamwork and self-reflection on their own. The PG Transition Support System embodied in this module is shown below.

Figure 1

The PG Transition Support System in XJTLU

PM: Practice Mentor FS: Field Supervisor AA: Academic Advisor
MBSR: Mindfulness-based Stress Reduction

The Delivery of the PG Transition Module

In line with the 5 components of the module as listed above, each of its componential teams started work to support new postgraduates' transition into XJTLU in September, 2025. The module was delivered in one semester in the academic year of 2025–2026.

On 5 September, postgraduate induction activities were held to introduce the launch of this new initiative and this new module. Students met with their academic advisors and practice mentors at a "speed-dating" event and exchanged initial information on the real-world projects to be selected. After that, surveys were conducted to investigate students' interests and the matching process was completed within 2 weeks, to form project teams that were comprised of a practice mentor from a practice base, an academic advisor from within the university, and a student team of 3–5 postgraduates.

In the initial couple of weeks, students accessed online contents for self-study at their own pace to get a general comprehension of the module and their upcoming field work on practice bases. The online materials were divided into 5 mini-courses in 10 weeks. There was also an MBSR section on the university learning management system, which was called "Learning Mall" that was moodle-based.

Next, students conducted field work on practice bases from W3–W10. Students' onsite supervision was provided by their practice mentors, which was conducted on a project-by-project basis. Field Supervisors helped to gauge students' onsite engagement, ensure students' health and safety, and coordinate between students, AAs, and PMs on base. Meanwhile, students were expected to take their own initiative to start communications with AAs for help with the development of their research skills and academic skills. In addition, students attended MBSR course to learn how to relieve stress and regulate emotions.

Achievements and Challenges From the PG Transition Module

The PG Transition Module has been the first of its kind, encompassing various elements ranging from academic study skills, to problem-solving skills, and self-regulatory skills. There were 22 projects on 4 practice bases, covering various educational levels. As such, the achievements from the PG Transition Module were multifaceted, so were the challenges encountered.

First of all, the majority of students demonstrated strong interest in experiential learning through projects at the outset, and some of them have expressed their achievements in skills acquisition towards the conclusion of the module. In the Induction survey, it was revealed that 70.37% of the student respondents demonstrated strong interests in the new module. After the module was concluded, some students expressed in the follow-up survey that they have indeed acquired "leadership skills", "communication skills", and built up their self-confidence in teamwork in the problem-solving process. It was acknowledged by the student respondents (52/78 respondents) in the survey that communications skills (77%) and teamwork skills (70%) were developed through doing projects in this module.

Secondly, there were at least 6 project teams (out of 22) that have completed their project proposals without traditional classroom instructions. These students divided workload among themselves, self-studied Module Handbook and proposal sample, before they produced their own proposals centering on the projects they have completed. In their proposals, they have explained in detail the problems they identified in the real-life situations, the process of their research, and the solutions to these problems and corresponding action plans, including milestones to be achieved.

Nevertheless, there were also various challenges arisen from the module. One of these challenges was the alignment of goals, expectations and routines for the various parties involved. This was due to the diversity in participating parties' backgrounds, interests, and expected outcomes. Moreover, how to make the projects closely relevant to students' disciplinary areas was another challenge because the projects were decided by the Practice Mentors' backgrounds and the hosting institutions' interests.

Recommendations for Future Actions

After the piloting of the module, it became clear that there are several areas that can be further improved despite of the achievements made.

First and foremost, in order to make all the projects of values for the postgraduates in their learning journey in XJTLU and beyond, much more communications and discussions will be needed prior to the start of the module in its next iteration. The purpose for this is multifold: a) this may help to ease/avoid possible tensions between different stakeholders when their expectations/goals are misaligned; b) the formation process for project teams will be facilitated; c) possible changes in projects and teams may be minimized/avoided.

Secondly, in order to provide sufficient scaffolding for the newly recruited postgraduates, it is recommended that onsite workshops will be organized and more lines of communications will be opened to promote the module and enhance participants' understanding of the module and the projects. The interactions in these workshops for students may also help to open up

opportunities for their socializing and networking, which will also help their formation of project teams and facilitate their future communications in conducting projects in the fields.

Last but not least, it is recommended that certain charters for standards of practice will be outlined and resources will be co-shared between XJTLU and its partner institutions, so that the module is sustainable and there will be the win-win situation achieved for all the stakeholders involved.

Conclusion

The construction of the PG Transition Module is an adventurous endeavor. I, as the Module Leader, have led the team to venture into the unknown and we have embraced risk-taking. Yet there was no guarantee that it could be an instant success despite of the achievements made. In order for it to generate an enjoyable and productive experience for all the parties in this multi-lateral collaboration, there is still some distance to go and more challenges to overcome. But in the foreseeable future, I am confident that this module will have far-reaching significance for the changes made in students' mindset in problem-solving and their approaches to lifelong learning.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that no AI or AI-assisted technologies have been used to generate, refine, or correct the content in the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

Engaging Minds and Enhancing Speech Through Motivational Activities for EFL Learners

Rubina Gasparyan, American University of Armenia, Armenia
Syuzanna Torosyan, American University of Armenia, Armenia

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

It can hardly be denied that speaking is a vital yet challenging skill for learners. It is a productive skill that involves interaction, as well as aural comprehension. Needless to say that other factors such as student motivation and classroom environment can also have their impact on oral production. One can often hear complaints that it is easier to read, listen and understand than get involved in a short dialogue in the target language, in this case – English. The responsibility seems to be more on one stakeholder – the teacher, who has to actually teach her students to use the language and be able to express ideas in that language. A simple solution to face all these challenges is through creative tasks. A number of studies come to advocate that promoting creativity can lead to improvements in speaking skills in various educational contexts. By synthesizing creativity with practical speaking activities, the teacher can help students develop their speaking skills in engaging, enjoyable and efficient ways. This article gives a brief overview of speaking as a skill that combines a number of abilities, and offers an insight into contextual and interactional factors. A discussion on the need for communicative approach through creative activities will follow, flavored with suggestions of several classroom tasks, including rap songs, storytelling and argumentation/persuasion exercises. Hence, by incorporating these ideas and activities, the teacher can create a dynamic learning environment that boosts EFL speaking skills in students, assisting them in gaining confidence and fluency in real-life communication.

Keywords: speaking skills, creative activities, communicative approach, EFL learners

Introduction

No secret will be revealed if stated that the productive skill of speaking is quite challenging since it combines aural comprehension with oral output thus creating a process which, in its turn, promotes marriage between contextual and interactional factors. To put it simply, speaking is a process during which a constant decoding and encoding of information is taking place. If in writing, another productive skill, the writer has time to think about how they can best perform the skill, speaking does not give the speaker the luxury of thinking long. In the classroom, the fear of making mistakes can simply shut down any incentive of speaking. That is why, in order to make the classroom a dynamic environment where learners would feel safe and confident, the teacher needs to understand what problems students have and how these challenges could be addressed.

We often speak about engaging learners in enjoyable and efficient activities. But the simple truth is there is no recipe that would make an activity engaging for everyone. So, what is engagement, first of all? In educational research, student engagement is described as action, energy, active participation, effort, and emotional responsiveness (e.g., Christenson et al., 2012; Reeve, 2012; Skinner et al., 2009). According to Fredricks et al. (2004), the core dimensions of engagement are behavioral (action), cognitive (thinking), and emotional or affective (feeling). This means that knowledge of these dimensions and how they interact with one another can help teachers to design activities specifically for their groups. It also means that students learn better if they are involved in meaningful activities that require thinking and analyzing. In addition, a positive impact on learning is observed if an emotional connection can be built between the learner and the target activity. For example, students can read information in a banner that announces details of an upcoming concert of their beloved band, and discuss how and when they are going to obtain tickets, online or from a box office. In this simple activity, all the dimensions of engagement mentioned above are present.

In addition, a concept that is quite new, task engagement, has emerged. In task performance, behavioral engagement is defined in terms of active participation or time spent on task (Philip & Duchesne, 2016). Gladwell (2011), in his book Outliers: the story of success, claims that the time one spends on a task plays a crucial role in success, and he promotes his 10,000 hour-rule. Bonwell and Eisen (1991), define active learning as something that involves students in both doing things and thinking about their actions. As it can be seen, active learning does not merely mean being visibly active. It means doing something and, most importantly, reflecting on it. It is a reciprocal process where cognition and demonstration combine to reinforce key learning points. Eventually, active learning fosters learner engagement, interaction, and deeper understanding.

This article aims to discuss several activities (namely, developing creativity through rap songs, debate-oriented activities and storytelling) that help materialize the concepts briefly addressed above, and come to prove that high results in language learning can be achieved if teachers promote collaborative and interactive learning and employ behavioral, cognitive, and emotional dimensions in active learning to reach engagement.

How to Bridge Engagement and Communicative Activities

One of the activities that seems to echo the requirements of engagement is rap songs. In his Flow: the psychology of optimal experience, Csikszentmihalyi (1990) mentions that when the level of the challenge and the level of the skill of the student are similar, then flow can emerge.

He describes flow as an optimal experience which gives a person "a sense that one's skills are adequate to cope with the challenges at hand, in a goal-directed, rule-bound action system that provides clear clues as to how well one is performing" (p. 71). In such cases, people do not think about anything else that may be irrelevant to the task at hand. Instead, they find that experience gratifying, just doing it for its own sake. The rap song activity can certainly claim its place among such experiences.

In this activity, each student gets a slip of paper with three unrelated words. They are given only a few seconds to think and create a rap song using all the three words. For example, a student gets a slip of paper with the following words: elephant, purse, ice-cream. They have only 10–15 seconds to think and come up with a rhythmic verse. The choice of the words depends on the level of a given group.

> For Example:
> An elephant stole, it stole my mother's purse.
> My mother's purse was gone.
> And the ice cream dream was gone.

Many scholars, such as Chesley (2011), Fink (2017), or Lestari (2020) believe that this activity can serve as a good vocabulary revision task. It can also be used to help learners develop their pronunciation, as well as their writing and listening skills.

Building on the engaging, communicative and cognitive benefits discussed above, the approach outlined below places particular emphasis on developing persuasive skills. Activities such as "Kick or Keep It" or "Debate Corner" enhance meaningful language application via the implementation of speaking, listening and discourse skills with high-level cognitive processes, namely collaborative argumentation, decision making and critical thinking. Research in communicative and task-based language teaching suggests that discussion- and debate-oriented activities provide learners with opportunities for purposeful language use, since students need to articulate positions, express viewpoints and respond to alternative perspectives through sustained communication (Ellis, 2003; Nunan, 2004). From a sociocultural angle, such dialogic interaction encourages building shared knowledge as well as cultivating linguistic competence and cognitive skills (Mercer, 2000; Swain, 2005). More than that, the analytical and persuasive nature of debate tasks promotes emotional engagement by inviting learners to present their perspectives and contribute to the outcome of interaction, thus fostering motivation and involvement.

For the "Keep It or Kick It" activity, students are divided into groups of three to four. Each group is provided with a set of cards featuring modern trends and habits (e.g. fast fashion shopping, using AI tools for homework, influencer culture and so on), along with two labeled boxes – "Keep It" or "Kick It". Each student selects one card and is given approximately two minutes to prepare a brief justification for their decision whether to retain or to discard the trend. They are encouraged to use expressions showing agreement/disagreement, strong adjectives and intensifiers. Depending on the purpose of the lesson, the student level and interests, the teacher may provide helpful language in advance. Students take turns reading their statement aloud, placing it in the corresponding box and expressing their opinion. While they express themselves verbally, the other classmates listen carefully. They can agree, disagree, ask follow up questions and vote on the most compelling arguments, thus enhancing active involvement/participation and critical analysis. Students then proceed to the next round

of the activity, and repeat the process for as long as the teacher and students consider it beneficial to the learning process.

Optionally, the teacher can organize it as a series of mini debates. She divides the whole class into two parties: one party argues for keeping the trend, the other side advocates for kicking it. The duration of the activity and the number of trends to discuss may be adjusted in accordance with the lesson's objectives, instructional structure and the level of student engagement. When the two parties present their viewpoints, the group votes on the most convincing argument. Some samples of contemporary trends and habits to include on the cards can be found below (Teacher-created prompts, 2026):

- Wearing only designer/ branded clothing: style and confidence boost or unnecessary pressure to look expensive?
- Digital detox weekends: does taking a break from screens actually make life better?
- Fast fashion shopping: cheap and trendy or harmful and wasteful?
- Using AI tools for homework: smart support or lazy shortcut?
- Sustainable lifestyle (recycling, reusing, thrifting): saving the planet or just a trend?
- Influencer culture: inspiring creativity or boosting unrealistic lifestyle?
- Reading books on tablets instead of print: eco-friendly convenience or losing the magic of paper?
- Extreme multitasking: productivity boost or brain overload?
- Minimalist lifestyle: living with less happiness or simply fewer possessions?

Leaning on the discussion of persuasive skills, another activity known as "Debate Corner" can be implemented to reinforce these competences. The teacher prepares a set of debatable statements and labels four corners of the room as "strongly agree", "agree", "disagree" and "strongly disagree". She then reads a statement (e.g. "Smartphones should be banned at school") and students move to a corner that represents their position of agreement. While standing in the corner, students are expected to explain their choice by providing sound argumentation and using persuasive language.

Both activities discussed above serve as powerful active-learning tools that contribute to sustainable practice, enhance meaningful engagement across multiple dimensions, and foster communicative competence, thoughtful reflection and effective persuasion.

Following persuasion-based activities, a storytelling task is introduced to shift students from argumentative discourse to narrative meaning-making. Storytelling has long played a vital role in human communication and learning, thus serving as a powerful tool with the help of which knowledge, values, beliefs and language are transmitted from one generation to another. In educational context, storytelling is broadly acknowledged as a productive pedagogical means that enhances cognitive engagement, linguistic development and student motivation. Bruner (1986) claims that narrative is a central mode of cognitive process through which a person organizes and forms meaning, making stories an effective tool for learning. In language pedagogy, narratives offer students authentic and varied input contextualized in familiar and affectively appealing contexts (Krashen, 1985).

From early childhood, exposure to fairy tales is instrumental for the development of listening skills, narrative awareness and creative thinking. As students mature, their interests seamlessly extend to popular children's literature, young readers' books and young adult fiction which offer linguistically accessible and thought-provoking content. Cameron (2001) highlights that stories create a natural bridge between comprehension and production, allowing learners to

acquire language, while remaining focused on meaning rather than just form. Analogously, Wright (1995) argues that storytelling promotes students' engagement, stimulating prediction, interpretation and emotional engagement.

Leaning on this basis, encouraging learners to re-envision a narrative by modifying its plot, character or resolution can serve as an impactful way to apply storytelling in language learning. Through these activities, learners convey receptive involvement to productive language application, promoting creativity, critical thinking and meaning formation. According to Ellis and Brewster (2014), narrative-oriented writing activities foster more profound language acquisition, as they invite students to experiment with narrative form along with presenting their perspectives. Thus, experimenting with well-known narratives can improve learners' language accuracy as well as cultivate their discourse competence and confidence in writing.

One way of introducing storytelling into the language classroom setting is with the help of 'Plot Twist Challenge' activity. For this activity, the teacher selects familiar narratives, and divides students into groups of three to four. Each group receives a well-known fairy tale, reads the short summary of the original story and together they create a brand new and unexpected ending – creative, funny, sad, failing or surprising. Afterwards, students read their resolutions in class and vote for the best ending. Depending on the purpose and the audience, the implementation of the following narratives could be considered:

- Fairy tales and classic stories: Cinderella, Snow White and the Seven Dwarfs, Beauty and the Beast, Little Red Riding Hood, Sleeping Beauty, The Frog Prince
- Popular Children's/Young Readers' Books: Harry Potter, Alice in Wonderland, The Chronicles of Narnia, Winnie-the-Pooh, Charlie and the Chocolate Factory, Matilde, The Wizard of Oz
- Young Adult/Modern Favorites: The Hunger Games, The Fault in Our Stars, Twilight, The Book Thief

"A Walk through the forest" (New English File Teacher Book, 2008) is another story-building activity that can be efficiently implemented in the language classroom, as it builds on learners' imaginative engagement and collaborative meaning-making. In this activity, students are divided into pairs and are given a worksheet with prepared scenarios and sets of questions. They actively contribute to the ongoing development of the narrative, events, characters, perspectives in a structured sequence. Participants imagine walking through a forest and describe what they see and feel at each stage. Students need to describe each step below focusing on different descriptive features in detail. For example:

- Forest – sensory impressions and emotions
- House – details of a home and its atmosphere
- Bear – emotional reactions and decisions
- Garden – personal space and symbolism
- Wall – boundaries and the unknown

After completing all the stages, students' descriptions are interpreted symbolically (life, self-image, challenges, personal space, the unknown). The task finishes with reflection and discussion. Sharing personal responses is optional and voluntary. Interpretations are exploratory, not diagnostic, as the aim is insight, not judgement.

Each of these activities enhances creative language application, interaction, negotiation of meaning and building narrative cohesion. Hence, engaging with the story-building offers

meaningful opportunities to exercise linguistic forms in context as well as cultivate discourse-level competence and narrative awareness.

Conclusion

The brief discussion of the communicative activities above supports a simple truth that creativity and engagement can contribute to the development of speaking skills in various educational contexts. By combining creativity with practical speaking activities, the teacher can help students enhance their speaking skills in engaging, enjoyable and effective ways.

Exploring the Impact of Cultural Context in Management Education: A Pre- and Post-course Assessment

Salman Ali, Indian Institute of Management Kozhikode, India

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

In today's interconnected world, cultural agility is essential for effective cross-border collaboration. This study explores the role of experiential learning in developing cultural agility through the X-Culture Global Collaboration Project, which was run as a credited course for MBA participants. Participants engaged in global virtual teams to solve business challenges, promoting intercultural cooperation and enhancing key competencies. A pre- and post-project survey was conducted among over 100 participants to measure changes in cultural agility across dimensions such as tolerance for ambiguity, cultural curiosity, perspective-taking, and relationship-building. Findings indicate a significant improvement in overall cultural agility, with notable growth in cultural curiosity, perspective-taking, resilience, relationship-building, and communication styles (direct/indirect and task/relationship orientation). Additionally, participants demonstrated a shift towards collectivist tendencies and a more adaptable approach to time perception, reflecting increased flexibility in cross-cultural settings. However, aspects such as egalitarianism and cultural humility remained relatively unchanged. This study highlights the impact of immersive, team-based global projects in strengthening cultural agility, particularly in enhancing adaptability, diverse perspective-taking, and relationship-driven collaboration. It contributes to the discourse on experiential learning and global business education, offering insights into how structured international teamwork fosters essential cross-cultural competencies. Future research could examine the long-term effects of such interventions and compare outcomes across diverse participant groups.

Keywords: cultural agility, global virtual teams, experiential learning

Introduction

Globalization has fundamentally transformed the nature of work, requiring professionals to collaborate across cultural, geographic, and institutional boundaries with increasing frequency. As organizations expand their international footprints and adopt globally distributed work structures, the ability to function effectively across diverse cultural contexts has become a core managerial competency. Cultural agility—defined as the capacity to adapt behavior, communication, and decision-making to different cultural environments—has therefore gained prominence in both academic research and management practice (Caligiuri, 2012).

For management graduates in particular, cultural agility is no longer an optional or peripheral skill. Managers are expected to navigate cultural differences related to communication styles, power distance, time orientation, and relationship norms while maintaining productivity and trust. Traditional classroom-based instruction, however, often struggles to convey the complexity and lived experience of cross-cultural interaction. As a result, business schools and executive education programs have increasingly turned to experiential learning approaches to bridge the gap between theory and practice (Johnson et al., 2020).

This study examines the impact of experiential learning on the development of cultural agility through participation in global virtual teams (GVTs), facilitated by the X-Culture Business Project. By placing students in diverse, international teams and tasking them with solving authentic business problems, the project creates a setting in which cultural differences are not merely discussed but actively encountered and managed. The central objective of this research is to assess whether such an intervention leads to measurable changes in key dimensions of cultural agility, as captured through a pre- and post-course assessment design.

Literature Review

Cultural Agility and Its Importance

Cultural agility refers to an individual's ability to work effectively, respectfully, and productively across cultural boundaries. It encompasses a set of cognitive, behavioral, and emotional capabilities, including openness to difference, adaptability, and sensitivity to cultural norms and values (Bird et al., 2010). Individuals with high cultural agility are better equipped to interpret ambiguous situations, adjust their communication styles, and build trust with culturally diverse counterparts.

Prior research has consistently linked cultural agility and related constructs—such as cultural intelligence—to improved leadership effectiveness and performance in international contexts (Ng et al., 2012). Exposure to diverse cultures, whether through international assignments or structured learning experiences, has been shown to enhance individuals' awareness of their own cultural assumptions while increasing their ability to adopt alternative perspectives. These findings underscore the importance of intentionally designing educational interventions that promote sustained and meaningful intercultural engagement.

Experiential Learning in Global Business Education

Experiential learning theory, as articulated by Kolb (1984), emphasizes learning as a cyclical process involving concrete experience, reflective observation, abstract conceptualization, and active experimentation. Within the context of global business education, experiential learning

methods enable participants to engage directly with complex, uncertain, and socially embedded problems. Rather than passively absorbing knowledge, learners actively construct understanding through interaction and reflection.

Research suggests that experiential approaches—such as international projects, simulations, and cross-border collaborations—are particularly effective in fostering intercultural competence (Rehg et al., 2012). These methods allow participants to confront real tensions arising from cultural differences, including misaligned expectations, communication breakdowns, and conflicting work norms. Importantly, such challenges serve as catalysts for learning when supported by appropriate structure and feedback. Virtual team collaborations have been particularly effective in developing cultural competencies (Taras et al., 2021).

Global Virtual Teams (GVTs) and Cross-Cultural Collaboration

Global virtual teams consist of members from different countries and cultural backgrounds who collaborate primarily through digital communication technologies. While GVTs offer flexibility and access to diverse talent, they also present unique challenges related to coordination, trust-building, and communication (Hajro, 2020). Differences in language proficiency, time zones, and cultural norms can complicate collaboration, particularly in the absence of face-to-face interaction.

Despite these challenges, GVTs provide rich opportunities for developing cross-cultural competencies. Prior studies indicate that participation in virtual international teams enhances skills such as perspective-taking, intercultural communication, and relationship-building (Gibson & Gibbs, 2014). As such, GVT-based projects represent a promising pedagogical tool for preparing students to operate in contemporary global work environments.

Methods

Participants

The study involved over 100 participants enrolled in a management course that integrated the X-Culture Business Project as a core component. Participants were drawn from multiple universities across different countries and were assigned to culturally diverse global virtual teams. Each team collaborated over an eight-week period to address a comprehensive business challenge.

Data Collection

To assess changes in cultural agility, a structured survey instrument was administered at two points in time: prior to the commencement of the project and upon its completion. The survey included 14 items designed to capture multiple dimensions of cultural agility, including cultural curiosity, tolerance for ambiguity, perspective-taking, resilience, relationship orientation, and communication style preferences.

Data Analysis

Paired sample t-tests were conducted to compare pre- and post-course mean scores across each cultural agility dimension. Statistical significance was evaluated using conventional thresholds

($p < 0.05$). This approach allowed for the identification of dimensions in which meaningful changes occurred following participation in the experiential learning intervention.

Data Analysis

The results indicate statistically significant improvements in multiple dimensions of cultural agility. Key findings include:

- **Overall Cultural Agility**: Mean increased from 6.88 (pre) to 7.69 (post), $p < 0.001$.
- **Cultural Curiosity**: Increased from 5.22 to 7.32, $p < 0.001$.
- **Perspective-Taking**: Increased from 6.46 to 8.14, $p < 0.001$.
- **Resilience**: Increased from 6.35 to 7.09, $p < 0.01$.
- **Relationship-Building**: Increased from 6.36 to 7.36, $p < 0.001$.
- **Communication Styles**: Improvements were observed in indirect-direct communication ($p < 0.01$) and task-relationship orientation ($p < 0.01$). These findings confirm that experiential learning in GVTs significantly enhances cultural agility.

Discussion

Implications for Business Education

The findings reinforce the pedagogical value of experiential learning in management education. By embedding students in authentic global collaboration contexts, educators can facilitate the development of cultural competencies that are difficult to cultivate through traditional lecture-based methods alone. Integrating GVT projects into curricula may therefore better prepare students for the realities of globalized work environments.

Challenges and Considerations

While the X-Culture Business Project offers a structured platform for intercultural learning, it also presents challenges. Time zone differences, digital communication constraints, and cultural misunderstandings can create friction within teams. Addressing these challenges through facilitation, reflection exercises, and instructional support may further enhance learning outcomes.

Conclusion

This study demonstrates that experiential learning through global virtual teams can significantly enhance cultural agility among management students. By providing empirical evidence of measurable changes in key cultural competencies, the research supports the integration of cross-cultural virtual projects in business education. Future research could explore the long-term persistence of these effects and examine variations across different participant populations and instructional designs.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

The author declares that Chat-GPT tool was used in proofreading and refining the language used in the manuscript. The usage was limited to correcting grammatical and spelling errors and rephrasing statements for accuracy and clarity. The author further declares that, apart from Chat-GPT, no other AI or AI-assisted technologies have been used to generate content in

writing the manuscript. The ideas, design, procedures, findings, analyses, and discussion are originally written and derived from careful and systematic conduct of the research.

Nahadi, University of Pendidikan Indonesia, Indonesia
Ida Kaniawati, University of Pendidikan Indonesia, Indonesia
Galuh Yuliani, University of Pendidikan Indonesia, Indonesia

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

The integration of artificial intelligence (AI) in pre-service teacher education is increasingly relevant in response to the growing complexity of technology-based learning environments. Understanding student perceptions is crucial for determining how AI can be meaningfully adopted in school learning practices, particularly regarding its usefulness, ease of use, and level of trust in the technology. However, empirical studies examining pre-service teachers' experiences with AI during school-based teaching practice remain limited. This study investigated the experiences of pre-service chemistry teacher students in using AI as part of their learning preparation in the school settings. A mixed-methods design was employed, involving final-semester students from the Chemistry Education Study Program at the University of Lambung Mangkurat, Indonesia (N = 50), who were participating in a teaching practice program at school. Quantitative data were collected through a Technology Acceptance Model (TAM)-based questionnaire supplemented by in-depth interviews. The results indicated that students view AI as a helpful tool for accessing learning resources, developing teaching materials, and generating creative ideas for learning. At the same time, some students remained cautious about trusting the accuracy and scientific reliability of AI-generated information, leading them to rely on verification processes and pedagogical guidance. Furthermore, the majority of students strongly recommended the need for structured training or workshops to support more optimal use of AI in learning. These findings indicated a tension between independent use of AI and the need for pedagogical and institutional support, underscoring the importance of targeted, ethical, and pedagogically grounded integration of AI into the curriculum.

Keywords: artificial intelligence, pre-service chemistry teachers, higher education, teachers' identities

Introduction

AI in higher education has the potential to provide personalized and tailored learning experiences tailored to student needs, providing real-time feedback, and increasing student engagement (Abbasi et al., 2025; González Campos et al., 2024; Kuka et al., 2022; Orr et al., 2025; Singh & Hiran, 2022). Intelligent tutoring systems and adaptive learning platforms are representative examples of AI that adapt to students' educational content, learning style, and pace (Mupaikwa, 2025; Ratul et al., 2025). In the context of teaching efficiency, teachers can use AI-based assessments to automate various tasks, administration, especially the student assignment grading process, so that lecturers can focus more on supporting students' academic development (González Campos et al., 2024; Gurumayum et al., 2024; Ratul et al., 2025; Téllez et al., 2024). Furthermore, research processes can be conducted more efficiently, such as data collection, analysis, and presentation, as well as writing, editing, and summarizing literature (Dockens & Shelton, 2025; Orr et al., 2025). Therefore, AI development must be based on ethical principles as a form of protection and security to prepare a generation that is sensitive to the digital world (including AI) (Andocilla-Oleas et al., 2025; Wang, 2021).

In chemistry education, AI is significantly transforming the teaching and learning experience. Studies have shown that AI-based adaptive learning systems can help students understand complex chemical concepts more reflectively, including feedback and tailored content (Pullanikkattil et al., 2025; Tanveer et al., 2024). In a virtual context, AI integration can provide a safe and accessible environment for students to conduct experiments and explore chemical reactions without the risks of a physical lab (Pullanikkattil et al., 2025; Tanveer et al., 2024). It is essential, given that the laboratory aspect serves as a hands-on learning experience, allowing students to interact with various levels of representation, such as macroscopic, submicroscopic, and symbolic (Barke et al., 2012; Schwedler & Kaldewey, 2020; Tanveer et al., 2024).

Several studies have also described a variety of innovations that can improve students' skills in AI applications, such as workshops on retrosynthesis and protein structure prediction (Berber et al., 2025), intelligent tutors (Pullanikkattil et al., 2025), Gemini/BERT in assessment processes (Yamtinah et al., 2025), and detectors in exams (Sorenson & Hanson, 2024), as well as helping to design more effective and engaging chemistry lessons (Kadioğlu & Oskay, 2024; Leitea, 2023; Tanveer et al., 2024). Previous studies have identified several limitations regarding students' perceptions of AI in education. Many studies have not adequately examined the long-term impacts of AI use in education, including technical barriers and issues with the quality of the resulting content (Esfijani et al., 2025). This point emphasizes the need for in-depth studies regarding the alignment of AI integration with educational goals and its practical use (Christou, 2024; Esfijani et al., 2025), including ethical considerations of AI integration in education (Dobrovská et al., 2024; Isop, 2024; Lamanauskas & Makarskaitė-Petkevičienė, 2025; Nunez Lemoz et al., 2025).

While numerous studies have explored the potential and impact of AI in education, prior research has focused on students in general in higher education settings. Unlike previous studies, this study involves prospective science teacher students undergoing teaching practice in schools. In addition to the authentic teaching practice context, this study also emphasizes the local educational context in Banjarmasin City, South Kalimantan. This situation provides a more genuine perspective for understanding how AI is perceived in real-life teaching, particularly the alignment of local values, learning culture, and ways of thinking that characterize prospective teachers in this region. Through the field experience program in schools, students use AI technology not only as a learning tool but also to design lessons,

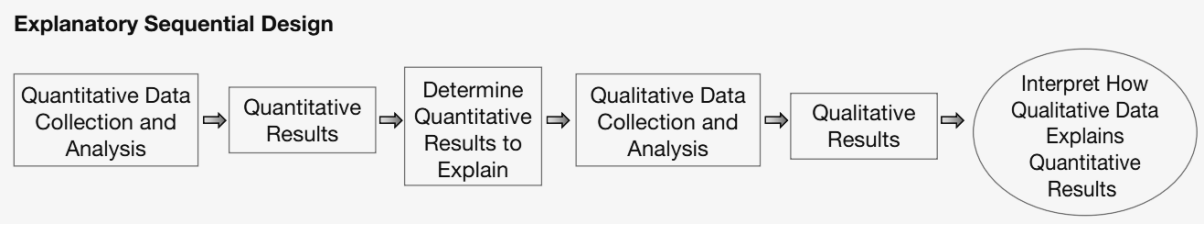
manage student interactions, and assess the effectiveness of AI use in pedagogical and ethical contexts. Therefore, this study offers a unique perspective on how prospective chemistry teachers' AI literacy, pedagogical readiness, and moral awareness are formed through authentic field experiences grounded in local values and culture.

Theoretical Framework

In this study, the Technology Acceptance Model (TAM) served as the primary theoretical foundation for exploring students' perceptions of the use of artificial intelligence (AI) in education. TAM contains two essential factors: “perceived usefulness (PU)” and “perceived ease of use (PEU)” (Davis & Granić, 2024). PU describes the extent to which students believe that the use of AI can improve the effectiveness and efficiency of learning. PEU reflects how easily students feel they can use AI technology without encountering significant obstacles. Research by Musa et al. (2024) found that using the TAM model helps in understanding market responses to digital products. The application of TAM was also used by Phuong Dung et al. (2023) to determine a person's acceptance of the digital world, which influences their intention to start something. PU and PEU are the main elements of TAM and have been consistently shown to influence students' attitudes and behavioral intentions towards technology (Bantoto et al., 2024; Chen et al., 2025; Karan & Chakma, 2025; Runge et al., 2025; Selevičienė & Koloda, 2025; Supriyanto et al., 2024; Zhao et al., 2024).

In a higher education setting, Fan (2023) used TAM to determine how students use social media in their learning. TAM effectively explained student acceptance of AI tools, such as ChatGPT and humanoid robots. Factors such as self-efficacy and perceived enjoyment further strengthened the model's predictive power (Chen et al., 2025; Karan & Chakma, 2025; Selevičienė & Koloda, 2025; Supriyanto et al., 2024; Ursavaş et al., 2025). Studies have found that TAM can guide the integration of AI into the curriculum, ensuring that tools are user-friendly and aligned with student needs and expectations (Bantoto et al., 2024; Selevičienė & Koloda, 2025; Supriyanto et al., 2024). The TAM, which encompasses individual characteristics (novelty-seeking and self-efficacy), provides deeper insights into student acceptance of AI, particularly in terms of perceived usefulness and ease of use (Chen et al., 2025; Ursavaş et al., 2025). Combinations of other models also strengthen and enrich the understanding of AI acceptance by adding factors such as discomfort, insecurity, and perceived behavioral control, including the Technology Readiness Index (TRI) and the Theory of Planned Behavior (TPB) (Zhao et al., 2024).

The TAM helps explore how individuals, including students, perceive and value technology, and how these perceptions and values affect students' attitudes, particularly regarding AI in learning. The diversity of perceptions and acceptance of technology can serve as a strong foundation for teaching, such as integrating AI into assessments, assignments, and references in learning design. By using the TAM, educators and policymakers can design and implement AI tools that meet students' needs and improve academic performance, given that technological literacy is a crucial element for today's generation.



Methodology

Design

This study employed a mixed-methods design to gain a comprehensive understanding of students' perceptions of AI (Creswell & Clark, 2018). Participants were final-semester students

in the Department of Chemistry Education at the University of Lambung Mangkurat, Indonesia, who were undergoing a teaching practicum program at a school. Purposive sampling was used to ensure respondents had direct experience with chemistry content and technology-based courses.

Figure 1
Research Implementation Design (Creswell & Clark, 2018)

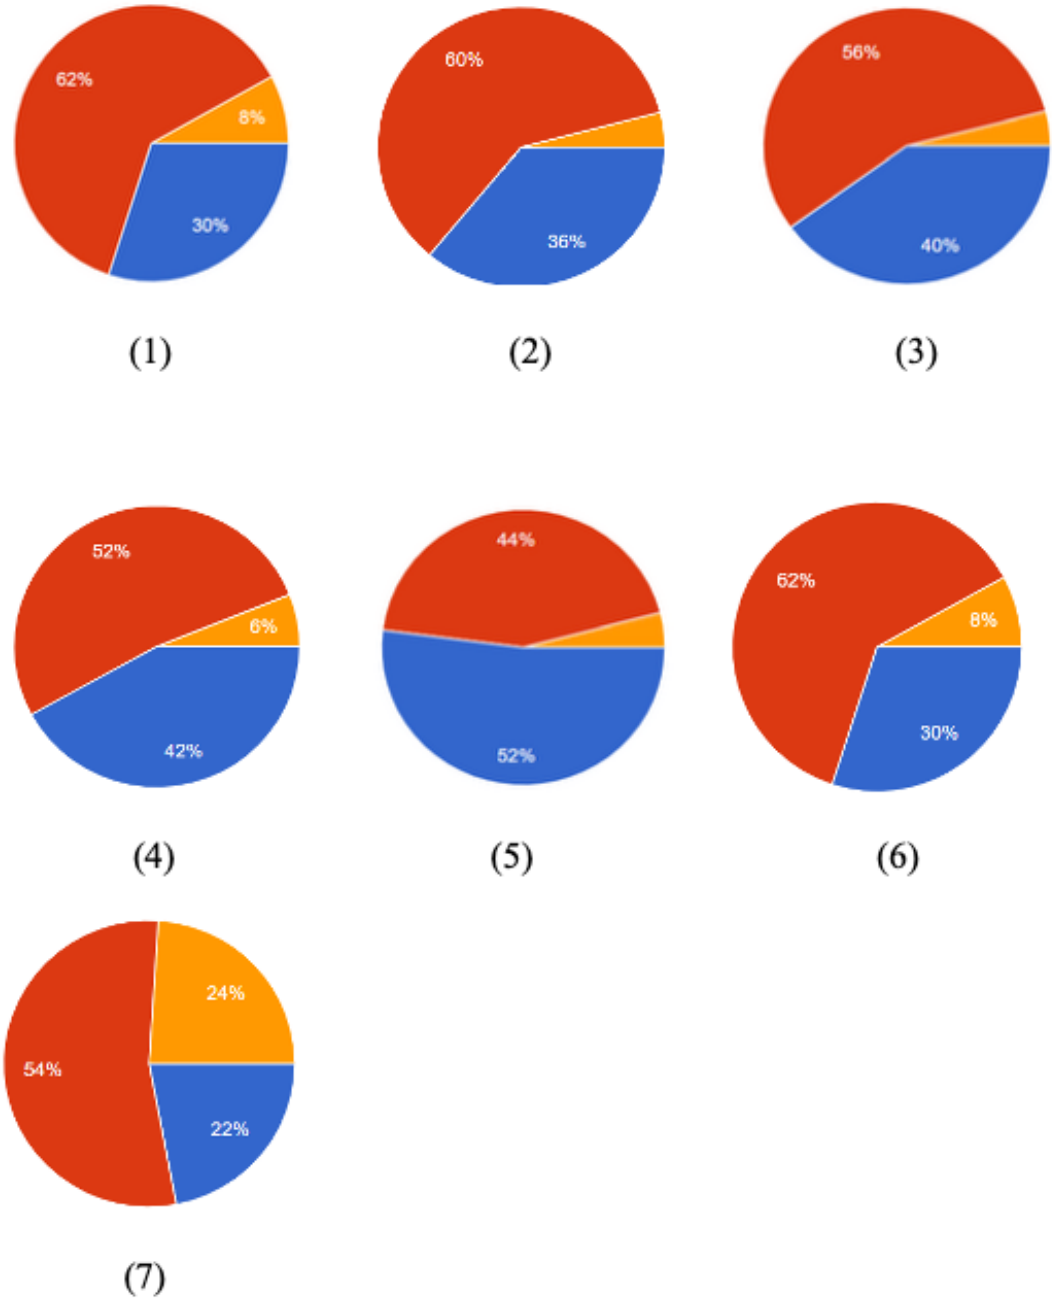
Instruments

Data were collected using a questionnaire and semi-structured interviews. The questionnaire consisted of 15 items structured based on the Technology Acceptance Model (TAM) framework, with two main factors: Perceived Usefulness (PU) and Perceived Ease of Use (PEU) (Davis & Granić 2024). In addition, a review of previous research on integration in education was conducted to strengthen the development of relevant indicators, such as alignment of AI with curriculum objectives, teacher readiness, assessment strategies, access challenges, adaptability, ethical challenges, and various concerns in using AI (Abidine et al., 2025; Almasri 2024; Guha et al., 2025; Kasat et al., 2025; Kohnke & Green-Eneix, 2025; Ramesh, 2025). The results of this review were then elaborated into several additional operational indicators that support the adopted definition of the TAM concept, particularly the perception component. PU was described as understanding complex chemical concepts with the help of AI, supporting learning motivation, and encouraging creativity in the design of learning experiences. At the same time, PEU included readiness to use AI, trust in the accuracy of sources, and the need for additional training.

The elaboration was then formulated as questionnaire items using a Likert scale. The questionnaire was then consulted and discussed with experts in educational psychology, chemistry education, and educational research and evaluation. The expert input was used to refine the instrument before use in data collection. The questionnaire underwent content validation by experts in chemistry education, educational research and evaluation, and Indonesian language and literature education to ensure clarity, relevance, and alignment with the study's objectives. Content validation included format, language, content, and sustainability values. Interviews were conducted using open-ended questions to explore students' opinions and experiences in greater depth, thereby strengthening the data obtained.

Data Collection and Analysis Procedures

Several stages were carried out in the study: (1) formulating the study objectives, (2) developing a Likert-based questionnaire, (3) developing an interview guide, (4) validating the questionnaire, and (5) distributing the instrument and collecting data. Quantitative data were analyzed using descriptive statistics, expressed as percentages, to provide an overview of student perceptions. Qualitative data from interviews were analyzed using thematic analysis to identify key themes related to the benefits, challenges, and recommendations for using AI.



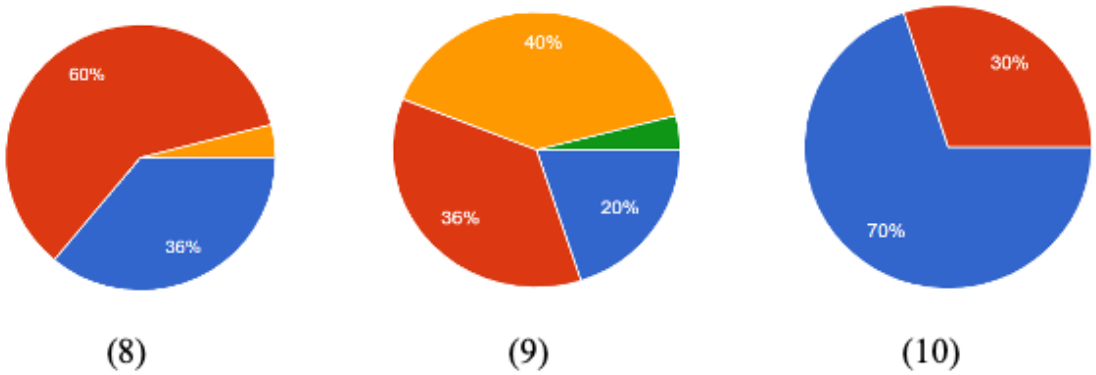
Triangulation between quantitative and qualitative data was conducted to strengthen the validity of the study's findings.

Research validity was assessed using the Content Validity Index (CVI) (Yusoff, 2019). Lynn (1986) recommended a minimum of three experts, with a neutral 4-point ordinal scale. In the assessment, scores 3 and 4 are coded as "1," while scores 1–2 are coded as "0" (Ozair et al., 2017). Items are considered valid if all validity indices are > 0.80, especially I-CVI (item-level content validity index = agreed item/number of experts), S-CVI/Ave (scale-level content validity index based on the average method), and S-CVI/UA (scale-level content validity index based on the universal agreement method) (Lau et al., 2018; Ozair et al., 2017; Yusoff, 2019).

Results

Before interpreting the study's findings, the instrument's quality must be confirmed for accuracy or validity. The content validity of the Technology Acceptance Model (TAM)-based instrument was determined through expert judgment with a Content Validity Index (CVI) involving experts. The results showed that most items had an I-CVI ≥ 0.75, with an S–CVI/Ave of 0.98 and an S-CVI/UA of 0.95. These data indicate a very high level of expert agreement on the relevance and clarity of the instrument items. This finding confirms that the instrument has adequately represented the construct being measured. Furthermore, the reliability test used Cronbach's Alpha, yielding a value of 0.874, indicating high internal consistency. Thus, the instrument is declared valid and reliable, making it suitable as a basis for interpreting students' perceptions of Perceived Usefulness and Perceived Ease of Use within the TAM framework.

Figure 2
Analysis Results for the "Perceived Usefulness (PU)" Factor for Items 1 – 6. Color Information: Blue (Strongly Agree), Red (Agree), Orange (Less Agree), and Green (Disagree)*



The items:

1. The use of AI technology helps me understand complex chemical concepts
2. I feel helped in preparing chemistry learning activities using AI technology
3. Using AI technology is part of a learning strategy to obtain interesting learning presentation references
4. AI technology can increase my motivation to study chemistry material as a prospective teacher

5. AI technology helps me design more creative learning experiences for students in the future
6. I feel that AI technology helps me develop problem-solving skills and digital literacy needed in the 21st century
7. I can learn chemistry independently and exploratively by using only AI technology

Figure 3

Analysis Results for the "Perceived Ease of Use (PEU)" Factor, for Items 8 – 10. Color Information: Blue (Strongly Agree), Red (Agree), Orange (Less Agree), and Green (Disagree).*

The items:

8. I am very ready as a prospective teacher to use AI technology in chemistry learning
9. I believe that the information provided by AI technology is accurate, scientific, and reliable
10. There is a need for more training and workshops on the use of AI technology to optimize its application in learning.

Table 1

Results of Student Interviews Regarding Their Perceptions of the Use of AI

Themes	Respondents' Statements	Participants
Benefits of using AI	AI technology is invaluable in the learning process/designing learning activities.	Participant-8
	AI Technology indeed makes it easier for users to find learning resources	Participant-9
	Utilize AI for creative projects and train teachers to use it in teaching	Participant-10
	AI helps teachers and students understand lessons more easily, for example, by assisting them in finding references.	Participant-12
Accuracy of Information	The AI often used is still inaccurate when searching for references, requiring repeated attempts.	Participant-1
	Not all results generated by AI can be trusted 100%, especially in science teaching.	Participant-5
	AI can be a learning resource, but it needs to be supported by other reliable sources.	Participant-3
	AI technology is invaluable, but its drawbacks are inaccuracy and being subscription-based	Participant-4

Need for development	I recommend AI to provide interactive simulations for virtual experiments	Participant-11
	Seminars or training on using AI in chemistry learning are needed	Participant-13
	AI for 3D visualization or augmented reality helps students better understand abstract concepts.	Participant-14
	The integration of AI into courses and workshops on its use in chemistry learning is essential.	Participant-15
Limitations of AI	Although AI is helpful, its output still needs to be filtered further	Participant-2
	There is one thing AI lacks: the human sense of reasoning, feeling, and empathy.	Participant-6
	It is hoped that AI has restrictions to prevent misuse by students	Participant-7

Discussion

The findings indicate a strong consensus that prospective chemistry teacher students consider AI to be invaluable in the academic process and teaching practice, from understanding complex chemical concepts, designing lessons, enriching references and creativity, and sparking learning motivation (a prominent dimension of Perceived Usefulness (PU). However, on the Perceived Ease of Use (PEU) dimension, trust in the accuracy and scientific nature of AI information remains fragile, so practical use is almost always accompanied by verification and guidance from lecturers. The results also found that although students feel ready and are already actively using AI, they also highly recommend training/workshops related to AI or AI integration. It indicates a gap between attitudinal readiness and pedagogically verifiable competencies, as reflected in the widespread demand for AI training in higher education. Thus, students position AI not simply as a substitute for teachers but as a pedagogical collaborator that requires verification protocols, ethical literacy, and institutional support, so that perceived benefits are directly proportional to the reliability of classroom practice. Beneath this consensus, a subtle gap emerges between the benefits and accuracy of AI output.

Confidence-Competence Gap: I Can Use It, but I Need Structural Instructions

The “can already” but “requires teaching” finding is a fascinating finding from the analysis. Students appear adept at operating AI in practical teaching tasks, yet they simultaneously highly recommend AI-related training/workshops. This phenomenon is not a contradiction but rather a sign of a “confidence-competence gap,” namely, the gap between declarative readiness and pedagogically verifiable skills. In the analysis, item 8 shows that approximately 60% of students stated they were ready to use AI in chemistry lesson design, indicating high confidence. However, this result contradicts the interview findings, in which students emphasized the need for seminars or specific training on AI integration (student 13), and around 50% of students stated they truly believed the information provided by AI was accurate, scientific, and reliable (item 9).

From the Technology Acceptance Model (TAM) perspective. High perceived usefulness (PU) (clear benefits) helps students prepare for learning, enhance creativity, and understand complex chemistry concepts through AI. However, perceived ease of use (PEU) is hampered by trust (still doubts) regarding the accuracy of AI information and how to moderate content for pedagogical validity. It indicates that students' skills remain technical-operational, such as the

ability to execute basic commands and generate AI output, but have not yet fully addressed the critical, verification, and pedagogical aspects required for teaching.

This picture was reinforced in interviews, where student 8 emphasized that AI was very helpful in designing learning activities, but student 6 reminded them that "AI is not human," and therefore lacks intuition, empathy, or contextual judgment. In other words, even though students can operate it well, they still require expert validation and guidance to ensure its valid use in the context of chemistry learning. In this context, what students are looking for is no longer how to turn on AI, but rather how to use it appropriately. The appropriate use of AI can not only boost student confidence but also strengthen the pedagogical competencies essential for future teachers. This confidence, coupled with competence, is necessary for students to become not only AI users but also educators who can use AI effectively and integrate it into chemistry learning.

Therefore, training is perceived as a "bridge" to transform operational skills into valid scientific-pedagogical skills or validated AI-based teaching competencies. For example, training materials can cover chemistry-domain prompting techniques, scientific verification (data sources, calculations, and conceptual coherence), academic ethics, the type of AI technology used, and formats for designing learning, including assessments. Therefore, students desire standardized, clear, and structured AI practices to produce outputs free of conceptual bias or blind dependence. Standardized AI integration has the potential to provide a safe environment for exploration in learning (Pullanikkattil et al., 2025; Tanveer et al., 2024). Appropriate exploration can yield insights that support the construction of scientific structures and mental models for prospective chemistry teachers, particularly understanding at various levels of representation (Barke et al., 2012; Schwedler & Kaldewey, 2020; Tanveer et al., 2024; van Berkel et al., 2009).

These findings reinforce the results of previous studies that emphasized the development of an "ethical framework" to guide the integration of AI in education (Dobrovská et al., 2024; Isop, 2024; Lamanauskas & Makarskaitė-Petkevičienė, 2025; Nunez Lemoz et al., 2025). Furthermore, other studies have highlighted that limited resources and a lack of teacher training are key barriers that must be addressed immediately for more effective AI utilization (Reyes-Villalba et al., 2024). The absence of a detailed ethical framework can lead students to use AI haphazardly, resulting in a lack of confidence that is not balanced by critical competency. In the context of chemistry education, this situation is crucial, given that even minor errors in concept verification can lead to representational bias at various levels (macroscopic, submicroscopic, and symbolic).

Agency vs Dependency

"Agency" is evident when students position AI as a pedagogical partner that strengthens creativity and independent learning. Approximately 96% of respondents stated that AI can help design more creative learning and stimulate accelerated work in searching for references, completing assignments, and developing learning strategies (item 5). In item 6, AI is considered to support 21st-century problem-solving and digital literacy skills (approximately 92%). Interviews corroborated these findings, with students 8 and 9 emphasizing the role of AI in designing learning scenarios and facilitating the search for learning resources, while students 10 and 15 considered AI relevant in developing various creative projects and recommending training courses. Students 11 and 14 even emphasized the need to develop interactive simulations and 3D visualizations powered by AI to better understand chemistry concepts. It

demonstrates that many students are not simply passive users of AI but are using it reflectively and innovatively to strengthen their pedagogical identity.

Conversely, students' tendency to be passive and to rely heavily on AI-generated output without a critical approach gives rise to “dependency.” Approximately 54% of respondents (item 7) agreed that they could learn chemistry using AI, indicating a high potential for dependence on AI as a primary learning resource. Furthermore, although only 20% of students (item 9) agreed that AI provides accurate information, interviews revealed that students still rely on AI results despite doubting their reliability. Students 1 and 5 stated that AI-generated information is often inaccurate and requires repeated verification. Students 3 and 4 considered AI a viable primary reference, though not always optimal and usually limited to premium features. Student 6 even acknowledged the lack of human sense, suggesting that AI lacks the elements of reason, feeling, and heart that characterize the human race. Therefore, guidance and direction are still needed to ensure its relevance and ethical use. These findings demonstrate an ambivalent stance among students: AI is invaluable for technical and creative tasks, but its presence creates a sense of dependency because of its limitations in conveying the human dimension.

This dialectic can be further understood within the Technology Acceptance Model (TAM). High perceived usefulness (PU) indicates student agency in using AI for learning, but a less-than-fully achieved perceived ease of use (PEU) suggests a sense of dependency due to concerns about accuracy, ethics, and security. In other words, while AI offers numerous pedagogical benefits, it also poses serious challenges, such as potential job replacement, ethical issues, data privacy, and security concerns (Salgado-Reyes et al., 2024; Shafik, 2024). These findings also support studies that argue that AI should be developed with ethical principles to protect and secure, preparing a generation of teachers who are sensitive to digitalization and equipped with skills that are adaptive to the times and sustainable (Andocilla-Oleas et al., 2025; Wang, 2021).

Thus, agency and dependency go hand in hand in student experiences using AI. Students demonstrate agency by using AI to support their creative learning design and develop problem-solving skills. This situation also reflects the dependence on AI, despite lingering doubts about its accuracy. This dialectic emphasizes that AI is not a substitute for teachers but rather a pedagogical collaborator that requires training, mentoring, guidance, and ethical development for optimal implementation in chemistry education.

Chemical Representation and the Need for Visualization and Simulation

In the Perceived Usefulness (PU) dimension, the majority of students agreed with items 4–6, with each item scoring above 90% (strongly agree and agree combined). These items demonstrate strong support for the need for interactive media to address chemical abstraction during the learning process. Conversely, with item 7, the percentage of students who disagreed was < 25%. This item demonstrates students' limitations when AI lacks adequate simulation- or visualization-based learning tools. Furthermore, item 10 (part of the PEU) showed 100% support for the need for training/workshops. It strongly indicates the urgent need for technical training in AI use across various learning needs, including visualization.

These findings confirm that students themselves proposed the need to integrate AI with various simulation-based features, demonstrating their awareness that using AI is not limited to text or automated answers, but must be grounded in evidence-based pedagogy through virtual experiments. In chemistry education, implementing various representation-based solutions

(macroscopic, submicroscopic, and symbolic) is a significant challenge. In fact, representation-based understanding is a key element that students need to internalize to easily build scientific structures and mental models, especially at the submicroscopic level (Barke et al., 2012; Cheng & Gilbert, 2009; Gkitzia et al., 2020; Wisudawati et al., 2022). Therefore, virtual lab simulations, reaction mechanism animations, or 3D or Augmented Reality (AR) visualizations are highly relevant as bridges to understanding.

Although perceived ease of use (PEU) is still limited to trust and accuracy, especially in the context of using AI without visual evidence or lab simulations (low support for item 7 and doubt for item 9), students' perceptions are considered to view AI as highly supportive of various components in designing chemistry learning, including the implementation of multi-representation in chemistry learning (seen from the high perceived usefulness in items 4-6). This finding is in line with previous studies related to innovations that can improve students' skills in using AI applications, such as intelligent tutors (Pullanikkattil et al., 2025), assessment processes (Yamtinah et al., 2025), detectors in exams (Sorenson & Hanson, 2024), and chemistry learning design (Kadioğlu & Oskay, 2024; Leitea, 2023; Tanveer et al., 2024). By integrating AI through visualization or interactive simulations, students can engage in meaningful learning while improving their mental models. Thus, students' learning needs for simulation visualization indicate that AI in chemistry education is most effective when positioned as representational scaffolding, an evidence-based tool that bridges the complexities of chemical abstraction while remaining evidence-based.

Structural Barriers

A relatively high score for perceived usefulness (PU) was obtained for items 4–6, with support > 90%. However, barriers to premium access and the absence of institutional guidelines can weaken the Perceived Ease of Use (PEU) dimension. In other words, the reluctance of some students in item 9 indicates that “trust” in AI's accuracy has not yet been fully achieved. This finding is relevant to previous studies that emphasize the need for regulation and institutional support in the integration of AI in higher education (Dobrovská et al., 2024; Isop, 2024; Lamanauskas & Makarskaitė-Petkevičienė, 2025; Nunez Lemoz et al., 2025). Without institutional intervention, the potential for inequality in AI utilization could arise, namely, for technically sound but ethically vulnerable and unsustainable uses. A standardized institutional framework can prevent over-reliance on AI, which can negatively impact students' cognitive development (Christou, 2024; Del Mundo et al., 2024; Esfijani et al., 2025; Vieriu & Petrea, 2025). This intervention is also highly beneficial for students in preparing for the workforce, given the significant gap between industry and higher education: only 3% of employers rate higher education as capable of preparing graduates for the AI era (AI in the Workplace 2025, 2025).

Student 4 stated that AI can only be optimally utilized through paid subscription AI. Paid AI has more comprehensive features. These factors explain why some students rated the use of AI technology in the “less agree” or “disagree” category (as seen in item 9, where only 4% of students disagreed). The gap in access between the free and premium versions widens the “trust” gap, as many students feel the information generated by premium AI is more accurate, scientific, and reliable than that of free AI. On the other hand, some lecturers allow the use of AI, but only as a “tool” or learning aid without clear boundaries for its use. This tolerance is not accompanied by institutional support in the form of a premium AI platform license and explicit ethical guidelines for use, leaving students in an ambiguous position between permissibility, limited access, and the absence of clear ethical guidelines. Studies indicate that

around 71% of students want to be involved in decision-making regarding AI integration, especially in determining what kind of AI should be used in their educational process (The Digital Education Council Global AI Student Survey, 2024).

These barriers are not only technical and economic, but also stem from inadequate policy structures. Students view the importance of institutional support, such as providing campus licenses (premium access to AI tools), AI ethics policies in the classroom (guidelines for AI use in the school, limits on plagiarism, scientific verification, and human oversight as ethical standards), curricular integration of AI (incorporating digital literacy and AI ethics across courses), and regular training/workshops, as essential prerequisites for more accurate, ethical, and sustainable AI practices. This perspective highlights the importance of institutional scaffolding that can offset individual limitations, supporting students not only in AI's operational capabilities but also in a supportive educational ecosystem. This finding aligns with a survey that found that approximately 72% of students expect universities to offer numerous courses on AI literacy, training, and the potential for errors (inherent bias/AI hallucinations) resulting from AI use (The Digital Education Council Global AI Student Survey, 2024).

Limitations

Despite numerous findings in the field, several limitations must be considered. First, the sample was limited to chemistry education students at one university, so these findings cannot be generalized to other contexts, including all study programs at the same institution or other universities. Second, the questionnaire was developed using the TAM framework and validated through expert justification, but the items have not been further tested using factor analysis. Third, the interviews did not cover the entire sample, so the diversity of experiences was not fully explored. Fourth, the context of AI use remains predominantly text-based, while the unique needs of chemistry have not been studied in depth, such as virtual labs and visualizations at various levels of representation. This limitation is compounded by the availability of free and premium AI access, which has led to varying perceptions of the accuracy and reliability of AI-generated information.

Recommendations

Given these limitations, a larger sample from multiple universities and across disciplines is highly recommended to obtain a more comprehensive picture of perceptions. Furthermore, it is necessary to add additional factors to the instrument and to the factor analysis to capture a more comprehensive picture of technology acceptance. From a practical perspective, institutions need to provide premium AI access for students, develop ethical guidelines for AI use in chemistry classes, and integrate AI literacy and ethics into curriculum development or ongoing curricula, particularly practice-based courses. Furthermore, organizing workshops or training sessions is a crucial recommendation, particularly those emphasizing verification skills, pedagogical integration, and the use of AI for multi-representational visualization in chemistry. It can build students' confidence and competence in using AI effectively and ethically.

Although this study used the Technology Acceptance Model (TAM) as the primary theoretical framework to understand students' perceptions through the PU and PEU dimensions, the qualitative analysis revealed additional dynamics beyond the TAM's core variables. Findings such as agency, dependency, trust fragility, the confidence-competence gap, structural barriers, and representational needs in chemistry learning demonstrate that students' experiences with

AI are far more complex than the TAM model predicts. Thus, while the TAM serves as a preliminary structure, these emergent findings enrich understanding and provide new theoretical contributions in explaining how students actually interact with AI in pedagogical contexts.

Conclusion

This study shows that the process of "becoming a chemistry teacher" in the era of artificial intelligence (AI) is characterized by diverse pedagogical encounters among students during their teaching practices in school settings. This process positions AI as a collaborative partner that enriches learning, not a substitute for teachers. Using the technology acceptance model (TAM) framework, students rated AI as having high perceived usefulness (PU) because it helped them understand complex chemistry concepts, stimulated creativity, and increased learning motivation. However, the perceived ease of use (PEU) dimension still faces challenges, including doubts about information accuracy, limited premium access, and the absence of institutional ethical regulations. This situation creates a "confidence-competence gap," where students are confident in operating AI technically but still require expert guidance, training, and institutional support for pedagogically valid use. Thus, students' experiences teaching in schools using AI not only expand their technical skills but also shape their pedagogical readiness to integrate technology into chemistry learning in ways that are critical, ethical, and sustainable.

Assessment of the Conflict and Conflict Resolution Attitude and Styles: The Case of High School Student Leaders in Angeles City

Arlan dela Cruz, Holy Angel University, Philippines
Alma Natividad, Holy Angel University, Philippines
Jannet Reyes, Holy Angel University, Philippines

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Conflict resolution techniques used by young people are important for several reasons. The ability to settle conflicts with others, particularly between peers, is one of the most crucial components of a child's or young person's social skills as they grow and progress through the adolescent stage. This descriptive quantitative study assessed the conflict and conflict resolution attitudes and styles of 363 high school student leaders enrolled across nine (9) junior high schools currently enrolled in the Department of Education in Angeles City. Results showed that the respondents, who are mostly female, class officers and grade 10 students believed that there are better ways to solve problems than fighting or physical aggression; they displayed self-control and cooperation. In terms of conflict handling styles, data suggests that respondents utilized all styles, however, problem solving style is significantly preferred. These findings collectively imply that respondents are dedicated to creating a calm, encouraging atmosphere where conflicts are resolved non-violently. Recommendations for further research, to improve conflict resolution programs for young people are discussed.

Keywords: conflict, conflict handling styles, conflict resolution, conflict resolution skills and attitude

Introduction

In every social setting, conflict inevitably arises. One of the most important aspects of a child's and young person's social skills as they develop and go through the adolescent stage is the ability to resolve interpersonal conflicts, especially confrontations with peers (Daunic et al., 2000; Humphries, 1999; McLaughlin et al., 2013). Contrary to children and young people who employ unconstructive or aggressive techniques of conflict resolution, those who adopt and put into practice constructive ways of resolving problems are more favorably received by their peers (Johnson & Johnson, 1996; Türnüklü et al., 2009).

Children and young people's conflict resolution strategies are crucial for several reasons. In addition to having an impact on peer connections, it also has an impact on how much happiness and satisfaction are felt. Contrary to non-structural conflict resolution, which heightens feelings of discontent and raises the chance of rejection by peers, constructive conflict resolution lowers the intensity of negative emotions and promotes the growth of social and communication skills (Peuraca & Vejmelka, 2015; Stevahn et al., 2002). Additionally, using violent behavior to resolve disagreements has several unfavorable effects, therefore it's critical to promote young people's employment of positive conflict resolution strategies and to prevent the rise of violent behavior in all confrontations (Mason, 2014; Shahmohammadi, 2014).

Conflict in school settings is a major problem for educators and administrators. Arguments, fights, rumors and partner conflicts are the most common conflicts between friends. Schools face the difficult task of helping students resolve conflict nonviolently. The procedure is time-consuming because those who are involved in it may spend a lot of time on it. Teachers' and guidance counselors' engagement frequently required extra time processing the conflict that could have been employed for other academic tasks (Jorbozeh et al., 2014).

This concern brought up the need for improvement in constructive conflict resolution (Adiguzel, 2015; Smith et al., 2002). Today, when conflict resolution skills are crucial for successful communication, evaluating solutions to issues, and coexisting with others with whom one may have disputes, conflict resolution programs teach young adults. Teachers and administrators experience up to a 97% reduction in disciplinary incidences as students take responsibility for their own conflicts and arrive at agreements the majority of which are upheld months later (Thomas, 2008).

The COVID pandemic has also brought attention to the need of giving student mental health and wellbeing more consideration. In the Philippines, the existing inadequate number of guidance counselors especially in public schools may make it difficult to concentrate more on the situations when their time should be used and provided (Chi, 2023; Mangaluz, 2023). Cases involving students that can be considered serious and need careful supervision and guidance may be unintentionally neglected in the desire to cater to all concerns of the students that demand mediation. This situation may cause a silent battle among students who are really in need of help and guidance. The attention of teachers and guidance counselors may take a toll in responding positively in the student situation that calls for serious help. The need for adequate guidance counselors gave teachers extra work as they served as alternative guidance counselors in providing psychosocial support to students (Chi, 2023). This additional function of the teachers adds to their duties and responsibilities that may already drag them down, and as a result the quality of the instructors' academic performance may be compromised.

Solutions to address the growing concern and need of schools who are lacking guidance counselors and teachers who are already burdened with workload have been put in place by the Department of Education (DEPED) like partnering with different organizations, teacher training for counseling students and putting up hotlines in an online platform (Magsambol & Chi, 2020). One of the responses in view of the realization of the need to call for conflict resolution programs (e.g., peer mediation program) in different schools is the need to train student leaders who will serve as other alternative mediators where conflicts within their capacity and training can be resolved. Peer mediation enables students to resolve minor conflicts without adult support (McLean, 2020; Rita et al., 2007). This will also strengthen the essential life-skills of the students in being able to communicate effectively (Avivar-Caceres et al., 2022; Johnson & Johnson, 2005). The fundamental role of peer mediation programs is to teach students peaceful communication and non-violent conflict resolution methods. The success of the peer mediation program will lead to non-violent resolution and a healthy learning environment among students.

Conflict resolution and peace education in schools now face additional challenges because of the COVID pandemic (Reyes-Guerra et al., 2021). Empirical evidence has underscored the importance of student leadership in fostering a culture of peace within school settings (Alomair, 2016; Eke, 2022; Felice & Wisler, 2007; Ozcelik et al., 2021). Engaging student leaders could eventually influence a school's culture and result in a positive school climate (Galloway, 2023). Student leaders may be very helpful in advancing the peace promotion program because they are an integral part of the school community. In addition to setting an example for peaceful conflict resolution, they can serve as role models for the values of empathy, inclusion, and critical thinking. Also, they can support initiatives for peace education throughout the entire school and help to foster a positive school climate (Eke, 2022).

Additionally, this study can provide suggestions on how school counselors and teachers might evaluate training programs incorporating conflict resolution skills and provide more useful tools for dealing with young adolescents on nonviolent conflict resolution.

Method

Descriptive quantitative research design was employed since the study aims to identify and describe the respondents' profile, conflict knowledge, attitude towards conflict, and conflict resolution skills. The study was conducted among the 363 Junior High School leaders from the nine (9) public secondary schools in the DEPEd Division of Angeles City, Pampanga with four survey instruments – instrument developed by Lam in 1989 (Dahlberg et al., 2005) for assessing attitude towards conflict, questionnaire for the Conflict Resolution-Protective Individual Profile and on conflict resolution developed by Philips and Springer (1992) and a checklist for conflict resolution developed by The Dutch Test for Conflict Handling (DUTCH).

Data collection activities were administered face to face during the respondents' vacant time inside the school premises. The data were scored and tallied accordingly before being entered into the Microsoft Excel program. An expert in the use of the Statistical Package for the Social Sciences (SPSS) application software was sought to process the collected data. The mean and standard deviation, which are required to display the descriptive statistics of the respondents' attitude, and skills on conflict and conflict resolution, were derived using the software.

Results

Based on the 363 respondents, there are 255 or 70.25% female student leaders and 107 or 29.50% male student leaders while one (1) or .27% did not respond. As per their grade level, 140 or 38.57% are Grades 10, 86 or 23.69% are Grades 8, 79 or 21.76% are Grade 9 and 58 or 15.98% are Grade 7. Most of the respondents are class officers with 233 or 68.83%, 49 or 13.50% are both class and club officers and 19 or 5.20% are club officers; 17 or 4.70% are student council/supreme officers; 16 or 4.4% are class and student council/supreme officers; 10 or 2.8% are class and club officers & student council/supreme officers and the remaining 19 or 5.20% are either class and club Officer & student council/supreme officers & others. Two (2) or .60% of the respondents did not answer the question.

Table 1 describes the respondents' attitudes to conflict. It is reflected on the table that respondents strongly agreed on the following statements: *There are better ways to solve problems than fighting* (m = 3.84); *I try to talk out a problem instead of fighting* (m = 3.64), *When my friends fight, I try to get them to stop* (m = 3.58) and *Even if other kids would think I'm weird I would try to stop a fight* (m = 3.28). The respondents' response to the abovementioned statements clearly reflects their attitude to conflict and that conflict can be resolved by talking about problems and stopping a fight.

They strongly disagreed with the following statements: *It's O.K. for me to hit someone to get them to do what I want* (m = 1.25) and *If people do something to make me mad, they deserve to be beaten up* (m = 1.35). Their disagreement with the use of violence is evident in their responses to the two (2) statements.

Table 1
Respondents' Attitudes on Conflict

	Mean	Verbal Description	SD
1. If I'm mad at someone, I just ignore them.	2.61	Somewhat Agree	0.899
2. Even if other kids would think I'm weird I would try to stop a fight.	3.28	Strongly Agree	0.768
3. It's O.K. for me to hit someone to get them to do what I want.	1.25	Strongly Disagree	0.533
4. Sometimes a person doesn't have any choice but to fight.	2.26	Somewhat Disagree	0.945
5. When my friends fight, I try to get them to stop.	3.58	Strongly Agree	0.673
6. There are better ways to solve problems than fighting.	3.84	Strongly Agree	0.533
7. I try to talk out a problem instead of fighting.	3.64	Strongly Agree	0.652

8. If people do something to make me mad, they deserve to be beaten up.	1.35	Strongly Disagree	0.619
Mean Average	**2.72**	**Somewhat Agree**	**0.70275**
N = 363			

On the respondents' resolution skills on self-control, they strongly disagree on the following statements: *If I feel like it, I hit people* (m = 1.34); *Sometimes you have to physically fight to get what you want* (m = 1.38) and *Sometimes I break things on purpose* (m = 1.54) while they disagree on the following statements: *When I am mad, I yell at people* (m = 2.07); *I do whatever I feel like doing* (m = 2.28) and *I get mad easily* (m = 2.51).

The respondents' strong disagreement with the statements implies their strong self-control in using violence while their disagreement on the last three (3) statements implies that they can put their emotions under control.

With regards to cooperation skills, respondents strongly agreed on all the six (6) items with a mean range from 3.49 to 3.73 (Table 2). This only means that the respondents believe that it is important to participate in any activities that will promote harmonious relationships with others and cooperation promotes peace and teamwork.

Table 2
Respondents' Conflict Resolution Skills

A. Self-Control	Mean	Verbal Description	SD
1. Sometimes you must physically fight to get what you want.	1.38	Strongly Disagree	0.603
2. I get mad easily.	2.51	Disagree	0.795
3. I do whatever I feel like doing.	2.28	Disagree	0.733
4. When I am mad, I yell at people.	2.07	Disagree	0.843
5. Sometimes I break things on purpose.	1.54	Strongly Disagree	0.733
6. If I feel like it, I hit people.	1.34	Strongly Disagree	0.634
Mean Average	**1.85**	**Disagree**	**0.623**
B. Cooperation			
1. I like to help around the house.	3.49	Strongly Agree	0.596
2. Being part of a team is fun.	3.6	Strongly Agree	0.597
3. Helping others makes me feel good.	3.73	Strongly Agree	0.47

4. I always like to do my part.	3.6	Strongly Agree	0.597
5. It is important to do your part in helping at home.	3.7	Strongly Agree	0.498
6. Helping others is very satisfying.	3.71	Strongly Agree	0.55
Mean Average	**3.63**	**Strongly Agree**	**0.551**
N = 363			

The respondents' conflict handling resolution styles are reflected in Table 3. The respondents display medium in all the styles in handling conflicts with the following scores: problem solving (a = 16.82), compromising (a = 14.49), forcing (a = 12.6), yielding (a = 12.16) and avoiding (a = 11.39). The respondents' conflict handling styles of being problem solvers confirm their attitude towards conflict and their resolution styles of having self-control and being cooperative. Being in the medium level in all the resolution styles, the respondents likely to utilize appropriate conflict handling resolution styles depending on the situations at hand. They may use problem solving style in one situation; compromising on the other, and vice versa.

Table 3
Conflict Handling Styles of Respondents

	Score	Interpretation
Yielding	12.16	Medium
Compromising	14.49	Medium
Forcing	12.6	Medium
Problem Solving	16.82	Medium
Avoiding	11.39	Medium

Discussion

This study seeks to provide a quantitative assessment of the conflict and conflict resolution styles of junior high school student leaders. The study was conducted in view of the lack of local empirical studies that would contribute to the effectiveness of conflict resolution programs in schools in Angeles City. In this study, respondents' attitudes on conflict have shown inclination towards a more cooperative, non-violent approach to conflict resolution. In terms of conflict handling styles, data indicated that respondents do not have a highly preferred or least preferred conflict handling style.

Data shows that most of the respondents in this study are female. This may suggest a growing willingness among females to assume leadership tasks. Women are frequently socialized to develop strong interpersonal skills, like empathy and teamwork (Lim & Kim, 2011). In leadership positions, these qualities are highly regarded, particularly in educational environments where understanding and cooperation are essential (Chapman, 2025; Singh et al., 2023). But these important qualities may not be enough for females to assume leadership as in

the findings of a large-scale study among children and adolescents in Turkey where the proportion of leadership willingness among females dropped because of decline of self-confidence (Alan et al., 2020).

With regards to grade level and leadership roles, the student leaders are mostly grade 10 and mostly class officers. This may be attributed to the fact that younger student leaders, such as those in grades 7, 8 and 9, may still be developing their conflict resolution skills. They might rely more on authority figures and exhibit more avoidance or accommodation styles due to less experience and confidence while high school or college student leaders typically have more developed social and emotional skills. They are more likely to adopt collaborative or compromising styles, showing a greater ability to negotiate and find mutually beneficial solutions (Ayub, 2024). Student leaders, such as class representatives/officers or club presidents, often develop advanced conflict resolution skills. They tend to use collaborative and integrative approaches to manage conflicts, aiming to maintain group cohesion and productivity (Feirsen & Weitzman, 2023; Rashid, 2005).

Majority of respondents do not agree that responding to conflict through physical altercation. Respondents strongly agreed that there are better ways to solve problems than fighting; they try to talk about a problem instead of fighting. It implies several positive attributes. These student leaders likely have a strong sense of respect for others and understand the importance of treating people with dignity. They prefer non-violent methods for resolving conflicts and influencing others, which is crucial for maintaining a peaceful and cooperative environment. This attitude could also reflect ethical leadership qualities, as they recognize that using force or violence is not an acceptable way to achieve goals. These leaders can serve as positive role models, promoting values of empathy, respect, and constructive problem-solving among their peers.

Not only do the respondents disagree with physical altercation, but data also suggests that respondents look for ways to stop when conflict escalates. This further implies several positive qualities. These student leaders likely possess strong peacemaking skills and are proactive in resolving conflicts among their peers. They show empathy and care for their friends, wanting to maintain harmony and prevent further escalation of conflicts (Pye et al, 2022). This attitude reflects a sense of responsibility and leadership, as they take it upon themselves to intervene and help their friends find peaceful solutions. This lends support to a qualitative study conducted by Kumar (2024) using youth participatory approach which revealed that young people's visions of peace inspire them to consider how they might live as peaceful beings who coexist peacefully with the environment, with one another, and within themselves.

On the respondents' resolution skills, they display strong self-control. Students who learned how to manage anger and emotions can enhance their interpersonal relationships and improve their academic and social environments (Pollack, 2025). This finding is supported by Johnson and Johnson (2005) where students who can control and manage their emotions in conflict situations guarantee that they take positive action may have a developmental advantage over people who cannot control their emotions.

With regards to cooperation skills, respondents strongly agreed on all the six (6) items which mean that respondents are willing to cooperate to promote harmony. Having these skills are important for working well with others and achieving a common goal. It also means building relationships with your team, resolving conflicts, and creating a work environment where everyone feels included and respected (Moseley, 2025). Moreover, when students collaborate,

they do not only engage in active dialogue, but also exchange ideas, and offer constructive feedback to one another. but also promotes critical thinking and problem-solving skills. By working together, students can tackle complex problems from multiple angles, leading to more comprehensive solutions (Kamepalli, 2024).

Respondents utilized all conflict handling styles. This may suggest a balanced approach, where respondents may use this style in some situations but not others. Just like the findings in the study of conflict management styles among students at Bahir Dar University in Ethiopia which identified all conflict management styles (Bazezew & Neka, 2017). It is noteworthy, though, that among the conflict handling styles, the problem-solving style figured the highest in the results. This may indicate that respondents equate conflict resolution with problem solving. Conflict resolution and problem solving are related but not the same. Conflict resolution can be seen as a specialized form of problem solving that focuses on interpersonal or group dynamics (Ay et al., 2019; Turk, 2017).

More so, the respondents' preferred conflict handling style is contrary to findings from other countries. In Tatarstan, Russia, 13–15 adolescents' conflict handling strategies were investigated and compromising conflict strategy was a choice of the majority while cooperation strategy is least preferred (Parfilova & Karimova, 2019). In Estonia, among 14-year-old adolescents studied, negotiation was the most frequently suggested strategy. In the same study, it was found out that in every conflict situation, girls are said to have more disagreements and are advised to negotiate more than boys (Tamm et al., 2018). Research among high school and college students in Bosnia and Herzegovina indicated a very low awareness and participation in education for peace that is responsible for promoting a non-conflict resolution. The paper highlighted the critical need for the implementation of a program that will foster a culture of peace and tolerance in a multicultural society (Mulalić, 2023). Given the cultural differences, it underscores the need for localization and contextualization of peace education and promotion of non-conflict resolution serves as a building block in promoting social skills that are pertinent in carrying out non-conflict resolution.

Comparing the conflict resolution styles of Filipinos to other nationalities, Filipinos prefer collaborating, and their alternatives are either accommodating or compromising (Jamora et al., 2020). The competing style is more favored by members of American cultures; Australians show a preference for collaborative and compromising styles. The members of Asian countries show an opposite pattern to Americans. In India the most preferred style to resolve the conflict is accommodating followed by Avoiding. Koreans resolve their conflicts mostly by Compromising and avoiding style. Chinese prefer compromising and avoiding again. Japanese prefer Avoiding and Accommodating styles in comparison to Malaysian who prefer integrating and compromising styles. No extensive study was found on conflict resolution on a variety of cultures at one platform (Asia, America and Australia), though fragmented source of information exists on different countries (Saravanakumar & Shandru, 2023).

Conclusion

Based on the results, the respondents are mostly female, class officers and belong to Grade 10. The respondents prefer non-violent solutions in resolving conflicts such as talking out problems and intervening in fights. They have strong self-control and adhere to cooperation to promote peace, and they utilize all conflict handling styles- problem solving, compromising, yielding, forcing and avoiding.

Recommendations

Given that the respondents are mostly female, class officers, and in Grade 10, schools can develop leadership and peer mediation programs. These programs can empower students to take active roles in conflict resolution and promote a culture of peace.

Since respondents prefer non-violent solutions, schools should encourage open communication through workshops and activities that teach effective communication skills. This can help students feel more confident in talking about problems and intervening in conflicts.

To build on respondents' strong self-control and cooperative attitudes, schools can implement activities that focus on emotional regulation and teamwork. This can include mindfulness exercises, cooperative games, and group projects that require collaboration.

Since respondents utilize various conflict handling styles, it would be beneficial to provide training on when and how to use each style effectively. Workshops on problem-solving, compromising, yielding, forcing, and avoiding can help students understand the appropriate contexts for each approach.

Schools should create a supportive environment where students feel safe to express their feelings and seek help when needed. This can include establishing a peer support system, having accessible counselors, and promoting a zero-tolerance policy for bullying and violence.

Many of the findings here also merit further investigation that should delve into the daily experiences of the students' leaders; thus, a qualitative study is recommended. Not only will this provide program organizers of conflict resolution a more nuanced understanding, but further qualitative studies will also allow cross checking of the quantitative results for triangulation.

Appendix

Questionnaire

PART I: STUDENT LEADERS' PROFILE
NAME OF SCHOOL: _____
YEAR LEVEL: _____ SEX: _____
INSTRUCTION: Check all which are applicable to you. What is your leadership position in your school?
____ Class Officer (President, Vice-President, Secretary, Auditor, etc.)
____ Club Officer (President, Vice-President, Secretary, Auditor, etc.)
____ Student Council/ Supreme Officer ((President, Vice-President, Secretary, Auditor, etc.)
____ Others. Please Specify _____

PART II. Attitude Toward Conflict
Instruction: Encircle the number that best describes how you feel about each statement.
Strongly Agree (4) *Somewhat Agree (3)*
Somewhat Disagree (2) *Strongly disagree agree (1)*

1. If I'm mad at someone I just ignore them.	4	3	2	1
2. Even if other kids would think I'm weird I would try to stop a fight.	4	3	2	1
3. It's O.K. for me to hit someone to get them to do what I want.	4	3	2	1
4. Sometimes a person doesn't have any choice but to fight.	4	3	2	1
5. When my friends fight, I try to get them to stop.	4	3	2	1
6. There are better ways to solve problems than fighting.	4	3	2	1
7. I try to talk out a problem instead of fighting.	4	3	2	1
8. If people do something to make me mad, they deserve to be beaten up.	4	3	2	1

PART III. Conflict Resolution Skills Instruction: Put a check (√) to indicate how closely several statements match your feelings.
4- Strongly Agree *2-Disagree*
3- Agree *1-Strongly disagree*

A. Self-Control	4	3	2	1
1. Sometimes you have to physically fight to get what you want.				
2. I get mad easily.				
3. I do whatever I feel like doing.				
4. When I am mad, I yell at people.				
5. Sometimes I break things on purpose.				
6. If I feel like it, I hit people.				
B. Cooperation				
1. I like to help around the house.				
2. Being part of a team is fun.				
3. Helping others makes me feel good.				
4. I always like to do my part.				

5. It is important to do your part in helping at home.				
6. Helping others is very satisfying.				

Part IV. Self-Assessment: Dutch Test for Conflict Handling
Purpose: This self-assessment is designed to help you identify your preferred conflict-management style.
Instructions: Read each of the statements below and circle the response that you believe best reflects your position regarding each statement.

When I have a conflict at work or school, I do the following:		Not at all	Seldom	Sometimes	Often	Almost Always
1.	*I give in to the wishes of the other party.*	1	2	3	4	5
2.	*I try to realize a middle-of-the-road solution.*	1	2	3	4	5
3.	*I push my own point of view.*	1	2	3	4	5
4.	*I examine issues until I find a solution that really satisfies me and the other party.*	1	2	3	4	5
5.	*I avoid confrontation about our differences.*	1	2	3	4	5
6.	*I concur with the other party.*	1	2	3	4	5
7.	*I emphasize that we have to find a compromise solution.*	1	2	3	4	5
8.	*I search for gains.*	1	2	3	4	5
9.	*I stand for my own and other's goals and interests.*	1	2	3	4	5
10.	*I avoid differences of opinion as much as possible.*	1	2	3	4	5
11.	*I try to accommodate the other party.*	1	2	3	4	5
12.	*I insist that we both give in a little.*	1	2	3	4	5
13.	*I fight for a good outcome for myself.*	1	2	3	4	5
14.	*I examine ideas from both sides to find a mutually optimal solution.*	1	2	3	4	5
15.	*I try to make differences seem less severe.*	1	2	3	4	5
16.	*I adapt to the parties' goals and interests.*	1	2	3	4	5

17.	*I strive whenever possible toward a 50-50 compromise.*	1	2	3	4	5
18.	*I do everything to win.*	1	2	3	4	5
19.	*I work out a solution that serves my own and the other's interests as well as possible.*	1	2	3	4	5
20.	*I try to avoid a confrontation with the other.*	1	2	3	4	5

Academic Experiences of Teachers as Graduate Students: Basis for a Proposed Graduate School Development Plan

Hannah Grace R. Lumahan, Philippine Normal University, Philippines
Jose M. Ocampo, Jr., Philippine Normal University, Philippines

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study identified the academic experiences of graduate students who are also full-time teachers. The phenomenological research design was used in this study to fully understand their experiences and interpret the themes that arose from the qualitative data that were gathered through individual interviews and focus group discussions. Using purposive sampling, participants were selected from the different programs in the graduate school of a Higher Education Institution (HEI) in the Philippines, both Master's and Doctorate degrees with a total of forty-two (42) participants across programs. Based on the findings, plans for the enhancement of the Graduate School Development Program were proposed. The findings of this study are important to inform and guide the HEIs and the education department on future innovations and further studies toward policy recommendations.

Keywords: graduate students, teachers, graduate school development program, academic experiences, challenges

Introduction

At present, a rapid change in our world is taking place with the issues left by the pandemic and its effect on industries, countries' economies, and the lives of individuals. Among all the disrupted activities of humankind, one of the sectors hit the most was the education sector (Tria, 2020), wherein educational establishments encountered stagnation, employee turnover, and a worldwide quarantine (Kaufman & Stedman, 2022; Sage & Matteucci, 2022). Given the various situations brought about by the crisis, this study looked at the academic experiences of graduate students who are also full-time teachers, even beyond the effects of the pandemic.

In this context, one of the resolutions of the Philippines' Department of Education's Basic Education Learning Continuity Plan in the Time of COVID-19 (2020) is to strengthen teacher training and development through professional development programs, scholarships, and workshops to further enhance teacher quality and teaching quality in the country.

Provided with the changes in education brought about by the crisis of the pandemic, this study magnified and elaborated details on the academic experiences of graduate students enrolled in a higher education institution (HEI) in the country, which could reveal gaps in the existing graduate school program of the university. Moreover, this study aimed to contribute to the enhancement of the university's graduate program to continuously deliver quality teacher education and training for teachers.

Literature Review

Teachers as graduate students have had different contexts, backgrounds, and experiences in their respective fields or disciplines, and in the professional development area they pursue through a graduate program. Needless to say, they have undergone various challenges in their professional journey.

Given the effects of the COVID-19 pandemic, changes occurred at the national level and in the personal lives of people. One of which that have experienced issues is the education sector, where students and educators struggled with their engagement in a face-to-face teaching and learning setup (Guiamalon et al., 2021). Studies show that teaching is one of the professions that improve the condition of society (Ulla et al., 2017; Vásquez, 2017). Providing capacity-building sessions and available graduate programs for educators addresses the need to attain the required skills of teachers on the demands of the world at present, and should be recognized as important as nation-building (Gepila, 2020).

One of the professional development programs that educators pursue is through a graduate program, which provides an opportunity for teachers to gain an understanding of the significance of quality research as a contributory factor for handlers of knowledge and doers of developmental support in society (Moulding & Hadley, 2010). The graduate program helps teachers to be more trained in preparing and guiding the learners in the classroom to be holistically ready for the future. This also helps them use their passion for teaching as an instructional tool and as a professional motivation for teachers and motivator for learners (Palmer, 2017; Ruiz-Alfonso & León, 2016); to gain professional competence level as contribution and support to the field of education (Vural & Basaran, 2021); and to achieve satisfaction in job promotion, raised pay, and privilege of supervision or management (Tanwar & Gard, 2020). Moreover, graduate school is progressing towards altruism and is addressing global problems (Kaufman et al., 2023; Kaufman & Stedman, 2022).

Government policies and guidelines in the Philippines were crafted to continuously support the needs and progression of teachers pursuing professional development opportunities, particularly graduate studies (CMO No. 15, s. 2019; CMO No. 53, s. 2007). According to the Philippines' Commission on Higher Education (CHED) Memorandum Order (CMO) No. 53, s. 2007 titled "Policies and Standards for Graduate Programs in Education for Teachers and Other Education Professionals", discusses that graduate school in teacher education is a way of expanding the capacities of professional educators who seek to contribute to the progress of education processes, specifically in teaching and in the management of educational programs. In support of this policy, CMO No. 15, s. 2019 titled "Policies, Standards, and Guidelines for Graduate Programs Policy", explains the role of urging and sustaining competencies for educators, like creative and effective ways of learning and teaching, scientific and technological advancement, and leadership and innovation as education leaders during the pandemic.

However, despite interventions, teachers still experience challenges being concurrent graduate students. Some of these challenges are their responsibilities in their roles as a family member (Bhamani et al., 2020; Nodine et al., 2021; Weaver & Swank, 2021), their digital capability and technological issues experienced (Aboagye et al., 2020; Viola et al., 2019), the demands in their graduate school and in their workstations (Housel, 2020), their physical and mental health concerns (Blatchford, 2020; Collo, 2021; Nixon et al., 2011), and their financial limitations (Adle, 2020; Asgari et al., 2021).

Using these factors from the literature, the study focused on the academic experiences of the graduate students and developed recommendations for the graduate school programs and interventions of HEIs in the Philippines, and maybe to an extent, to the other nations.

Theoretical Underpinnings

In this study, Andragogical Theory served as the framework for understanding and interpreting the lived experiences of teachers who are simultaneously pursuing graduate studies. Knowles' assumptions about adult learners—self-direction, readiness to learn, prior experience, relevance of learning, and internal motivation—align closely with the participants' circumstances as practicing teachers enrolled in graduate programs.

By foregrounding these principles, the study recognized that teachers bring substantial professional experience, which shapes how they engage with coursework, manage academic demands, and assess the relevance of graduate-level learning to their teaching practice. Their reflections, challenges, and coping strategies are viewed not merely as isolated experiences but as expressions of adult learning processes. This theoretical lens enabled the research to capture:

- how their prior knowledge influences their learning preferences,
- how their dual roles affect their readiness and motivation to study, and
- how they perceive the applicability of graduate education to their professional growth.

In essence, the use of Andragogical Theory allowed the study to translate adult learners' experiences into policy-oriented insights, ensuring that the resulting proposed plans are not only evidence-based but also aligned with the fundamental characteristics of adult learning.

Research Aims and Statement of the Problem

This study examined the lived academic experiences of teachers who are simultaneously pursuing graduate studies, using their insights as the foundation for recommending enhancements to the Graduate School Development Program, i.e., their academic and research support plan to the students. Specifically, it sought to:

1. Describe the academic experiences of teachers as graduate students, and
2. Use these findings to recommend enhancements to graduate programs' academic and research support plan.

Methodology

Research Design

Using a phenomenological approach, the researchers sought to understand the participants' "lifeworld", or their everyday academic experiences (Creswell, 2013). The research design brought out meaning and interpretation from the stories of each participant (Leavy, 2017).

Selection Criteria and Participants

The research was conducted in a graduate school in the Philippines. Participants were purposively selected based on their active enrollment in a master's or doctoral program and their progress toward completing academic or thesis requirements. Out of 197 invited students, 42 met the criteria and participated. 41 out of 42 chose online interviews and FGDs for convenience, while only 1 chose a face-to-face interview.

Data Collection

Ethical approval from the HEI in the Philippines was secured by the researchers. Participants were also provided with detailed informed consent (see Appendix) and were asked to choose their preferred schedule and interview modality. The invitation to the participants includes (1) the extent of participation, (2) question flow, (3) the truthfulness of their responses, and (4) the confidentiality clause.

On the day of the FGD/ interview, the researcher discussed the informed consent form and emphasized that all interviews and FGDs would be recorded through note-taking and/or audio and video recording. This helped the researcher in transcribing and analyzing the data that was collected. Moreover, the discussion of the confidentiality agreement was also conducted before the start of the interview. Interview sessions took thirty to sixty minutes for each participant (Fox, 2009), while FGDs were conducted for one to two hours (Morgan, 1996).

During the interview day, participants were recognized for taking part and making time to participate in the study. Before the researcher started the recording, the participants who were interviewed online were asked to turn on their microphones, and, if they were comfortable, their videos as well. For those who were interviewed face-to-face, the researcher asked permission to use and start the audio recording.

Data Analysis

The researchers used thematic analysis following the framework of Braun and Clarke (2006). Transcripts and recordings were repeatedly reviewed, coded, and organized using NVivo and manual coding. Codes were then grouped into subthemes and overarching themes that directly answered the research questions.

Through this process, the study surfaced meaningful insights into the academic experiences, challenges, and support needs of teacher-graduate students. These findings informed proposed enhancements to the Graduate School Development Program, particularly in strengthening academic and research support for working professionals.

Results and Discussions

Results of this study highlighted two (2) main themes. First is "Teachers' Academic Experiences as Graduate Students", with 2 subthemes: (a) lived-academic experiences, and (b) challenges and support needs; and the second main theme is "Recommendations for the Strengthening Academic and Research Support in Graduate Programs".

Teachers' Academic Experiences As Graduate Students

Lived-Academic Experiences

Participants shared that their most meaningful experiences came from engagements outside the four walls of the classroom. They were invited as speakers, facilitators, validators, and participants in various trainings and workshops. These opportunities allowed them to apply theories in real-life settings, broaden their perspectives, and deepen their understanding of their field. Many described these engagements as enriching, fulfilling, and central to their growth as educators.

Second is that they were able to build networks and professional connections. They also emphasized the value of collaborating with peers from different programs, institutions, and disciplines. Learning alongside teachers from both public and private schools, and from basic and higher education, gave them wider insights into diverse educational contexts. These networks led to new partnerships, extension activities, and professional linkages that strengthened their practice.

They also talked about their personal and professional development. Participants noted that graduate school also shaped their character. They spoke about developing humility, self-awareness, courage, and perseverance, especially when facing moments of exhaustion or discouragement. Despite challenges, they remained committed to completing their programs, viewing graduate studies as essential to their professional growth.

Lastly, they were able to translate their learning into practice. The participants described how their graduate school learning directly influenced their teaching and leadership roles. Many applied theories in their classrooms, mentored colleagues in research, and took on leadership responsibilities in their schools and communities. Their growing competence in research and leadership allowed them to contribute to policy conversations, school improvements, and educational innovations.

Establishing networks with other programs and other institutions is also considered important for the teachers, as they share their differences with others. Being able to learn other perspectives and to immerse themselves in various communities gives them a wider grasp of education in disparate contexts. According to Burbank and Hunter (2022), building connections and collaboration to facilitate intellectual discussions opens pathways leading to an active society. They added that through the initiatives of stakeholders and other partners from the local level to national and international organizations, a common goal among communities can be developed.

Personal realizations and their challenges are part of their educational and academic development, where many participants claimed that they have worthwhile experiences that pushed them to do more for education and taught them to develop their character as human beings. As mentioned in the study of Riby and Rees (2024), personal development is defined as one's contemplation of the different components of self, which include cognitive, social, psychological, moral, and inner being. This could enhance their overall academic experience and foster a positive learning environment in their graduate school community and their workstations. Darling-Hammond et al. (2017) stated that an outstanding advancement in one's profession opens doorways for educators to discuss propositions and work together in the individual contexts in their workstations, i.e., effective teaching approaches in their classrooms and beyond. Based on their stories, their academic experience being a teacher and a graduate student at the same time is not an easy path, but a worthwhile one. Different factors made them sacrifice and prioritize things that needed to be done, hence their full-circle experiences.

In terms of the HEI's research and development functions, one of the qualities that graduate students have to manifest is being a research scholar, where students' learning experience has to be translated to "innovations in teaching and learning processes and other forms of education practice" (Philippine Normal University, 2015). Similar to this context are the findings in the study of Sevim and Akın (2021), wherein learning in the graduate school has added expertise to the students' competencies and mastery in their discipline. Consequently, the most significant components students gain are critical thinking and analytical expertise, which graduate students can use in teaching their learners and in developing their future research works. The graduate students being engaged in research development, handling research-related courses or subjects, and taking the initiative to write their academic papers show their interest in translating theories into practical actions that contribute to policy recommendations in their workstations, their communities, and the University, among others.

Challenges and Support Needs

The next subtheme is on the challenges and needed support of the teachers. First, based on their narratives, they experienced the strain of multiple roles. Participants consistently described the difficulty of balancing their responsibilities as full-time teachers, graduate students, and family members. Their work obligations often conflicted with graduate school schedules, forcing them to miss classes or rush academic requirements. Many shared that despite their desire to focus on their studies, workplace expectations always came first. The volume of overlapping tasks, constant deadlines, and lack of institutional support, such as limited access to study permits or deloading, resulted in stress, sleep deprivation, and health issues. This struggle to manage time and competing priorities deeply affected both their well-being and academic performance.

A second major challenge involved their interactions with professors and the learning environment in graduate school. Participants recounted experiences of unclear instructions,

unread emails, inconsistent class schedules, and faculty members who were frequently unavailable due to other commitments. Some felt intimidated or unsupported, and several noted that core and specialization courses were equally heavy in workload, leading to frustration and discouragement. Miscommunication, such as late feedback, sudden changes, or faculty who failed to read submissions, added to their anxiety. These experiences weakened their motivation and affected their confidence in the program.

The third subtopic centered on administrative concerns within the HEI. Participants struggled with limited online services, slow email responses, errors in the student portal, and inconvenient onsite processes—especially for those living outside Metro Manila. Issues such as dissolved classes, limited class offerings, unclear program standards, and irregular examination schedules caused delays in their academic timelines. Many also cited the difficulty of accessing library resources and research materials. These administrative barriers contributed to additional stress, financial challenges, and doubts about continuing in the program.

Found in the study of Amida et al. (2020), it is valuable that students learn to organize their priorities to enhance proficiency and be more adept at fulfilling the expectations of their multiple roles. However, due to the many deliverables and academic obligations of the teachers, most of them somehow failed to perform in their jobs and in their graduate studies. As stated in the study of Prendergast et al. (2023), these academic obligations were described as laborious and most difficult in completing the program, such as participation in classes, browsing of academic journals, fulfilling managerial roles, completing the research paper, organizing activities/ programs, and training material production.

The claims of Nicklin et al. (2020) said that the dispute among factors in career, education, and experiences is notably linked to anxiety, while education and personal experiences are the most significantly linked with anxiety. This was also stated in the study of Solon et al. (2024), which says that inadequate self-care is one of the crucial factors that a working graduate student can experience, given the urgent work responsibilities and academic course requirements. Relatively, not having enough sleep is mostly the teachers' issue in not attending to their well-being. They honestly said that the suffering they experience in their physical health is also because they fall short of managing their time well. However, this aspect is also because of the numerous tasks expected of them, which results in losing sight of taking care of their health. Literature presented that insufficient time to finish, or even to begin many tasks, due to time constraints, affects graduate students' welfare and efficiency (Giurge et al., 2020; Prendergast et al., 2023; Whillans & West, 2022).

In the study of Albalawi and Nadeem (2020), they stated that a successful imparting of message or "communication" among learners and teachers creates a pleasing learning environment, yet sometimes, teachers fall short of doing so. In the study of Omar et al. (2021), they also discussed that one of the components of successful learning is the planning of an enriching experience for graduate students. They must receive enough support from the community they can grow to be able to continue with their journey in their career and graduate school. Furthermore, the advisers must be thoughtful in terms of recognizing the circumstances their advisees experience, particularly those who have been in the graduate school for a long time, those who exceeded the allowed years of residency period (Rungduin & Miranda, 2018).

The inefficient processes shared by the participants lead to frustrations among students, missed deadlines, alternative conceptions, and wastage of time, money, and other resources. Alternative conceptions, as defined by works of literature in the most simple way, are incorrect

interpretations of established scientific facts and proven knowledge (Adebayo et al., 2021; Horton et al., 2007; Stojanovska et al., 2015). As a result, this could lead to setbacks and failures for the graduate students.

Additionally, participants also experienced challenges with the availability of academic courses and other issues in the academic-related programs of the institution, specifically on the enrollment process and academic terms, program offerings, tutorial classes, comprehensive examinations, shortage of teachers, and writing term defense. In a similar context, in the study of Iqbal et al. (2021) and Tworek (2018), they found that there could be issues with the reliability of online resources from different web directories as a result of unrelated or unreliable sources. Thus, the participants' experiences in terms of the administrative processes were composed of many narratives. Provided with works of literature, these processes play a vital role in the academic success of the students, not only to help them finish the degree but also to make their academic experience remarkable.

Recommendations for Strengthening Academic and Research Support in Graduate Programs

In addressing the challenges faced by teachers pursuing graduate studies, the participants proposed several recommendations shown in the second theme.

The participants emphasized the need for flexible academic scheduling and program adjustments. Recommendations included properly planning onsite and online classes to avoid costly and frequent travel, offering research courses in regular academic terms rather than short-term schedules, and aligning the institutions' calendars with the Department of Education (DepEd) in the country. Based on their narratives, this will help minimize conflicts with teaching responsibilities. They also proposed a pre-research course for students without a prior research background and the use of individual academic plans to guide course enrollment and deadlines. Additionally, financial support such as tuition discounts and scholarships was suggested to reduce stress and encourage continuous academic engagement.

Participants also highlighted the importance of mentoring and peer support systems. They recommended strengthened orientations, providing primers to clarify academic expectations, and implementing a buddy or peer system for discussion, peer teaching, and exam preparation. Mentorship programs, including a sustainable "Mentorship Exchange Program", were also proposed to monitor progress and ensure no student is left behind. Another key recommendation was integrating applied learning to link theoretical knowledge with classroom practice, fostering collaboration between faculty and students, and enhancing practical outcomes in teaching.

They also suggested improving administrative efficiency and support infrastructure. This includes enhancing online transactions and communication channels, creating physical spaces like graduate student hubs or thesis labs for collaborative work, and decentralizing some classes for students outside Metro Manila. They also proposed strengthening partnerships with DepEd offices, other HEIs, and international institutions to expand research opportunities and showcase student work. Finally, participants also emphasized the need to regularly review program statistics, course offerings, and institutional systems to prevent dissolved courses, improve program marketing, and inform evidence-based innovations in graduate education.

According to the study by Walter and Stouck (2020), it was found that there is a pressing need for those students who do not have a strong and in-depth background in research development as they begin their programs in graduate school. Alternatively, those students with prior background in research could have better knowledge, be more skilled, and be more driven in doing research work (Miller et al., 2021). Whereof, the participants mentioned that based on personal observations and experiences, offering pre-research courses for those graduate students who did not encounter a research course in their previous schools shall be designed to address the difficulty in developing a research paper.

Studies by Blanchard and Haccoun (2020) and Lorusso et al. (2020) claimed that there is a battle being a graduate student. For the teachers, as much as they would like to fully focus on their studies, they need to prioritize their jobs as teachers, considering that it is their primary source of income. Further, there is an arena of synchronizing life, work, and the rest of the demands of their other roles, hence the proposal to be more lenient in the academic course requirements. Rungduin and Miranda (2018) discussed in their study that teachers who are also graduate students need to simultaneously work on their academic course outputs alongside the work deliverables expected from them. Their responsibilities go beyond their roles as teachers and graduate students, but also as family members, a church worker, and other extra-curricular assignments as professionals. Henceforth, the participants opened the possibility of considering the alignment of the HEI's calendar with DepEd and/or with other educational institutions.

Studies also show that planning and goal setting have a beneficial impact on the improvement of students' academic performance and lessening academic anxiety (Adams & Blair, 2019; Varadarajan et al., 2021). This planning will not only help the program advisers in tracking the students' academic status and engagement but will also train the teachers in monitoring their progress and aligning their goals accordingly.

Further, HEIs could provide more financial grants and support to graduate students to help and encourage them to finish their degrees. Studies show that granting financial aid to graduate students can enhance their academic achievement. It was found that this consequently leads to high student involvement and continuity in taking up professional studies (Facchini et al., 2020; Herbaut & Geven, 2020).

As found in the study by Walter and Stouck (2020), the most popular component that graduate students need is mutual support with their peers. It was presented that this will help the students in building their community, self-development, and cultivation of academic knowledge and intellectual practices among peers. The study by Omar et al. (2021) also claims that the success of students' learning is with the company of their peers. It says that through that kind of community, graduate students stay and continue the program, and feel safe being themselves and meeting the same people with the same experiences as them. They also added that this develops logical inquiry among themselves. In different studies, the involvement of peer mentors will help the students, especially those new enrollees to be more familiar with the university's processes and other expectations in the graduate school, which will consequently result in sustaining the education progress of the students (Byers et al., 2014; Chester et al., 2013; Lorenzetti et al., 2023; Murdock et al., 2013; Outhred & Chester, 2013). Therefore, the need to strengthen the designs and implementation plans of the support mechanisms for the students' well-being is important.

Provided with these narratives, the graduate students have varying proposals, yet all are considered essential to fully support them in their academic success. As found in the study of

Collier and Blanchard (2023), professors have to be familiar with the various needs of their learners based on their status, background, and culture. It was also mentioned that there should be continuous professional advancement for faculty members to embody their vital role in teaching teachers, training trainers, and leading educational leaders. Therefore, the need to study the data of the graduate students is important to be able to understand and design appropriate activities and interventions for them.

Conclusion

The findings of the study reveal that pursuing graduate studies profoundly enhances teachers' professional competence and personal development. Through advanced learning, research engagement, and reflective practice, teachers expand their pedagogical knowledge and critical thinking skills, which in turn enrich their instructional effectiveness and leadership potential. Graduate education thus serves as a transformative process that cultivates both intellectual and personal growth among educators.

However, this study also exposes the complex realities of balancing professional responsibilities with academic demands. Teachers who are concurrently employed and enrolled in graduate programs often encounter overlapping challenges such as time constraints, workload pressures, and limited institutional support. These difficulties can compromise not only their academic performance but also their overall well-being, underscoring the need for more responsive and flexible graduate school systems.

Moreover, the study highlights that faculty competence, mentoring quality, and academic guidance play pivotal roles in shaping graduate students' learning experiences. Supportive mentorship, relevant instruction, and constructive feedback contribute significantly to student motivation and persistence. In contrast, inconsistent faculty engagement and lack of structured support systems may hinder academic progress and research productivity.

Administrative issues further compound these challenges. Inefficiencies in communication, scheduling, and policy implementation often delay academic transactions, frustrate students, and impede timely completion of program requirements. These systemic concerns point to a need for institutional review and reform to ensure that graduate programs operate with transparency, efficiency, and academic rigor.

In light of these findings, the study underscores the importance of designing strengthened, flexible, and evidence-based development plans for graduate schools. Such plans should integrate the voices and lived experiences of teacher-graduates, align with contemporary educational demands, and promote equitable access to professional growth opportunities. A strategic student-centered framework will not only improve academic processes but also sustain the transformative potential of graduate education in advancing the teaching profession.

Recommendations

Based on the findings and conclusions of this study, here are the proposed recommendations to enhance the quality and responsiveness of graduate education for teachers. Foremost, graduate schools should implement flexible and teacher-responsive academic scheduling and pacing. Flexibility in course delivery and program pacing can help alleviate scheduling conflicts and promote sustained engagement.

Graduate institutions should also strengthen their mentoring, advising, and faculty development systems. Establishing structured mentorship and peer-support networks will encourage collaboration, confidence, and scholarly growth among students. Simultaneously, providing continuous training for faculty on research supervision, inclusive pedagogy, and standardized instructional practices will ensure consistency and quality in graduate instruction. Strengthened academic relationships between faculty and students create more meaningful and productive learning experiences.

Finally, the improvement of administrative systems and the expansion of research-oriented partnerships are vital for institutional advancement. Streamlined processes, responsive student services, and effective communication mechanisms will minimize bureaucratic delays and enhance academic progression. Likewise, developing partnerships with local schools, communities, and research institutions can broaden opportunities for applied learning and professional relevance. Together, these measures will support a comprehensive and evidence-based graduate school development plan that promotes both institutional excellence and teacher empowerment.

Acknowledgments

The researchers extend their deepest gratitude to the esteemed panel members—Dr. Wilfredo C. Chung, Dr. Ma. Glenda O. De Lara, Dr. Gilbert S. Arrieta, and Dr. Arlyne C. Marasigan—all are faculty members from the Philippine Normal University, for their invaluable guidance and insightful recommendations throughout the development of this study.

Sincere appreciation is also given to Mr. Erhwin Andres Clarin, the study's language editor, for his expertise, careful review, and thoughtful suggestions that enhanced the clarity and coherence of this study.

Purpose and Significance of the Study

This study aims to look into the academic experiences of graduate students and how these experiences can be used as a basis for a proposed Graduate School Development Plan of the Philippine Normal University. The results of this study are significant contributions to HEIs and the Philippine education department to enhance its graduate school program/s for graduate students, and for future innovations and further studies toward policy recommendations.

Number of Participants

A total of forty-two (42) participants across course programs of a state university in Manila, Philippines, will be invited to this study and will be asked to participate during the Focus Group Discussion and interview schedules.

Procedure for Study

Interview sessions would take thirty to sixty minutes (30–60 min.) for each participant, while FGDs usually take one to two hours (2 hrs.). A day before the schedule of the interview or the FGD, the researcher shall send a copy of the interview questions and a reminder via email on the scheduled session, while the participants shall send a confirmation of their attendance through email.

All interviews and FGDs shall be recorded through note-taking and/or audio and video recording. Various platforms, such as Zoom, Google Meet application, or face-to-face will be used in the data gathering.

Participants are given the flexibility to choose their preferred interview schedule and venue, to ensure their availability and convenience. To do this, they will be asked to complete a Google form upon signing the consent form, indicating their preferred schedule and venue.

Risks and Inconveniences

Emotional risks or discomforts may arise during the interview and FGD sessions given that the research questions require answers on the participant's experiences; however, the researcher will respect the participant’s decision in disclosing details the respondent is comfortable sharing.

Safeguards

Despite the identified risks and inconveniences, the interview and FGD sessions will be a safe space between the researcher and the participant. All data shall be secured, and the identities of the participants will not be disclosed and be kept confidential.

Confidentiality

All data must be stored on a personal computer and only the researcher/s will have access to such. Identities and other information of the participants, and actual names mentioned during interviews shall be kept confidential throughout the entire conduct of the study.

THE RESULTS WILL BE KEPT CONFIDENTIAL AND ONLY BE REVEALED IF REQUESTED BY THE PARTICIPANT.

Voluntary Participation
Participation in this study is voluntary. Should you decide to take part in this study, you will be asked to sign this consent form. After you sign the consent form, you are still free to withdraw at any time upon prior notice to the researcher. Withdrawing from this study will not affect the relationship you have, if any, with the researcher. If you withdraw from the study before data collection is completed, your data will be returned to you or destroyed.

If you have any questions or concerns, please contact the researcher through the following platforms:

- Email: lumahan.hgr@pnu.edu.ph
- Mobile, Viber, and Telegram Number: 09xx xxx xxxx

By signing below, I acknowledge that I have read and understood the above information. I am aware that I can discontinue my participation in the study at any time.

Participants' signature over printed name: _____
Date: _____

I certify that I have explained the purpose of the research to the participant and consider that s/he understands what is involved and consents to participate.

Researcher's signature over printed name: Hannah Grace R. Lumahan (sgd.)
Date: _____

Educational Innovation in Science Communication: Enhancing Public Understanding of Environmentally Friendly Nuclear Technology in Indonesia

Muhammad Yunus Zulkifli, Universitas Indonesia, Indonesia

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study investigates educational innovations in science communication aimed at enhancing public understanding and acceptance of environmentally friendly nuclear technology in Indonesia. As global energy transitions increasingly highlight the importance of low-carbon alternatives, nuclear power has re-emerged as a viable option. However, public skepticism and limited scientific literacy pose significant challenges to its acceptance. This research focuses on how nuclear power plants are represented within educational and public discourse, emphasizing the role of nuclear scientists not only as technical experts but also as educators and communicators. The Indonesian Nuclear Society Association (Himpunan Masyarakat Nuklir Indonesia/HIMNI) is examined as a case study, representing a professional community actively involved in public education and outreach. Through activities such as webinars, workshops, media campaigns, and informal learning events, HIMNI seeks to build trust and foster informed dialogue on nuclear issues. Anchored in a constructivist paradigm and utilizing a qualitative case study approach, data were collected through interviews, observations, and document analysis, applying triangulation to ensure credibility. The findings reveal that the use of innovative communication tools—including interactive digital technologies, infographics, animation, and social media platforms—plays a vital role in enhancing nuclear science literacy and increasing community engagement. Moreover, integrating artistic and visual elements into educational content contributes to making complex nuclear concepts more accessible and relatable. The study concludes by emphasizing the importance of rethinking science communication as a form of public education and calls for interdisciplinary strategies merging scientific content with effective pedagogical and media practices in the context of nuclear energy development.

Keywords: educational innovations, science communication, public understanding, nuclear technology, scientific literacy, HIMNI, public education, community engagement

Introduction

In essence, science is not only knowledge but also a way of thinking. Science, in this case, must be applied effectively in society, as it is not solely the preserve of scientific groups like scientists, but also belongs to the wider public. In this regard, members of the public who are unfamiliar with science cannot understand explanations by scientists using scientific, rigid, and seemingly complex language. This can lead to the public not achieving the results they expect from science itself. Therefore, such conditions can lead to a loss of trust in science (and the emergence of anti-science) if they consistently occur, due to the failure to meet the public's high expectations for science. This situation can also be exacerbated by the rapid spread of fake news (hoaxes) due to the lack of a comprehensive understanding of science among the majority of the public. Science communication, in this regard, is crucial for the scientific community, as scientists act as science communicators and negotiators in informing and educating the public about research results and various scientific issues, as well as for policymakers to gain a more comprehensive understanding.

In today's digital era, science communication plays a crucial role in maintaining the public's ability to think intelligently and distrust fake news (hoaxes). It is crucial for the public to receive information from reliable and trusted sources, including credible and accountable scientists. This aligns with the interconnected communication between scientists, the public, and the government. Scientists, with their expertise, are expected to be able to explain their research findings related to scientific issues to the public and provide important recommendations to the government. Furthermore, the success of science communication can also be influenced by the cultural context of society, including how they understand science. This understanding of science, in this context, also includes scientific literacy, where scientists make a significant contribution to economically competitive development (Stilgoe et al., 2014). Therefore, scientists, as practitioners and communicators of science, must be equipped with the skills to engage with the public and convey findings and innovations to the public. Furthermore, the adoption of technology and aesthetic values, such as popular science or fiction, is also necessary (Gregory & Miller, 1998).

Science communication is the science of communicating scientific topics in a popular style from scientists to scientists and the public. Practically, this is often done through journalistic media (blogs, social media, and television), exhibitions, and public policy mapping with science as a primary element. From the perspective of governments and scientists, science communication is crucial for determining the effectiveness of science communication to the public on environmental science issues, specifically regarding environmentally friendly nuclear technology, through public media. Science communication to the public can be conducted through three media groups: mainstream media (such as magazines, television, and radio), face-to-face events, and online interactions (Bultitude, 2011). However, in the modern era of advances in communication technology, we are faced with the proliferation of social media platforms, making social media science communication a complementary tool.

The concept of science communication in English is a modified form of the terms science and communication. The history of science communication can be traced back to ancient times, but its development became more structured and focused in the 19th century and flourished in the 20th century (Nielsen, 2022; Schneider & Heinecke, 2019). The history of science communication reflects a gradual evolution from elite intellectual exchange to broad public engagement. It began during the Age of Enlightenment (17th–18th centuries), when thinkers such as Galileo, Newton, and Descartes promoted rational inquiry and the scientific method.

By the early 19th century, science gained recognition as an independent discipline through the rise of scientific magazines and newspapers. Advances in printing and illustration expanded public access to complex scientific ideas, while the establishment of museums and exhibitions in the 19th century made scientific knowledge more tangible and publicly accessible (Bauer & Bucchi, 2008; Bucchi, 2013; Nielsen, 2022).

The popularization of science continued into the 20th century, exemplified by figures like Carl Sagan, whose media presence bridged science and public imagination. The emergence of mass media—radio, television, and later the internet—transformed science communication into a global phenomenon. Educational institutions and scientific organizations such as the American Association for the Advancement of Science (AAAS) and the British Science Association (BSA) strengthened the field through publications, conferences, and outreach programs. Finally, the digital and social media revolution in the late 20th and early 21st centuries enabled scientists to directly engage with audiences worldwide, marking a new era of participatory and democratized science communication. This development demonstrates that science communication is the result of a variety of interrelated factors, including the development of science itself, the development of communication technology, and the efforts of individuals and organizations dedicated to disseminating scientific knowledge to the public (Bucchi & Trench, 2014).

Several influential figures have contributed to defining and shaping the concept of science communication. Carl Sagan viewed science not merely as a body of knowledge but as a *way of thinking*, emphasizing the transmission of scientific reasoning to the wider public (Davidson, 2000). Alan Alda highlighted the relational dimension of science communication, stressing the need to bridge understanding between scientists and lay audiences through clear and empathetic interaction (Weiss, 2011). Neil deGrasse Tyson advocated that science must be accessible to everyone, underscoring the importance of explaining scientific concepts in a simple and engaging manner (Elshahed & Tyson, 2020; Tyson, 2020). Meanwhile, Sandra Knapp emphasized the role of science communication in raising public awareness of biodiversity and environmental conservation (Wheeler et al., 2012).

It is important to remember that the definition of science communication can vary between individuals and can depend on the context. Each individual might highlight specific aspects of science communication based on their experience and understanding of the relationship between science and society. In its developmental context, science communication has evolved rapidly along with technological advancements and changes in access to information.

Contemporary science communication is shaped by several key developments. Social media platforms such as X (formerly Twitter), Facebook, Instagram, and YouTube enable scientists to share research findings and interact directly with the public. Podcasts and videos make complex topics more accessible, while infographics and data visualization enhance public understanding through visual clarity. The growth of scientific blogs and websites allows researchers to reach wider audiences, supported by stronger collaboration with science journalists to ensure accuracy and accessibility. Public education programs—including workshops, exhibitions, and museum initiatives—foster direct engagement, while online communities facilitate discussion and knowledge exchange. Increasing scientist participation in media and public events strengthens outreach, and amateur science initiatives contribute valuable data, particularly in fields like astronomy and ecology. These developments collectively create an environment in which science communication can reach a wider audience

and ensure that scientific information is more openly and easily understood by the general public.

From a Science Communication perspective, science communication can be grouped into several contexts that encompass the dimensions of communication and interaction between scientists, research institutions, and the public. Science communication can be broadly categorized into interrelated domains that together form a comprehensive framework for understanding how scientific knowledge is created, shared, and received (Kappel & Holmen, 2019; Mulder et al., 2008). The first domain is public scientific communication that includes both formal and informal channels. Formal communication refers to the dissemination of research findings through scholarly journals, academic conferences, and professional presentations, while informal dissemination focuses on sharing scientific information with the general public via traditional media outlets, press releases, and public events. The second domain is communication in science education that encompasses pedagogical and outreach-oriented interactions. Within formal education, scientific learning takes place in classrooms and laboratories, emphasizing the structured transmission of scientific concepts. Beyond formal settings, public education initiatives—such as workshops, training programs, and community-based learning activities—extend the reach of science to broader audiences, promoting lifelong engagement with scientific ideas.

The third domain involves mass media and science journalism, which play an essential role in translating complex scientific developments into accessible narratives for public consumption. This area also emphasizes the importance of collaboration between scientists and journalists to ensure that scientific reporting remains accurate, engaging, and socially relevant. Another critical aspect is risk communication and scientific ethics, which focus on how information about environmental, technological, and health-related risks is conveyed to the public. This dimension also highlights the ethical responsibilities of scientists in communicating research processes and implications transparently and responsibly.

Furthermore, communication in collaborative research addresses internal communication among researchers, including teamwork, coordination, and interdisciplinary dialogue across different scientific domains. Effective communication within and between research teams fosters innovation and strengthens the integrity of collaborative inquiry. In addition, social media and online scientific communities have transformed the contemporary landscape of science communication. Through digital platforms, scientists, students, and the public can now engage directly, share information, and participate in ongoing discussions, creating new forms of interaction that transcend traditional institutional boundaries. Finally, scientific marketing activities—including research promotion and scientific branding—have become increasingly significant. These activities help communicate the societal value of research outputs, enhance institutional visibility, and establish a recognizable identity for individual scientists, research teams, or scientific organizations.

Taken together, these interconnected categories illustrate that science communication today is not merely a linear process of information transfer, but a multidimensional and participatory practice that bridges scientific communities, educators, media, and the wider public. By grouping science communication within the framework of Science Communication, it is easier to understand the various aspects of scientific communication that involve various parties and contexts.

Science communication uses a multidisciplinary approach reflecting the understanding that science and communication are interconnected, and that combining approaches from various disciplines can enhance the effectiveness and impact of scientific communication. Science communication is inherently multidisciplinary, drawing insights and methods from a wide range of academic fields. From the natural sciences, it adopts principles of scientific communication and cognitive psychology to understand how individuals process and interpret complex scientific information. Within the field of communication studies, theories of communication, media, and journalism provide frameworks for effectively transmitting scientific messages and engaging the public through mass media channels (Mulder et al., 2008; Wood, 2023).

The domain of education contributes through instructional design and health education, emphasizing the creation of accessible learning materials and the integration of science into everyday contexts. Anthropology and sociology offer perspectives on cultural values, social behavior, and group dynamics, helping communicators understand how societal factors shape the reception and acceptance of scientific knowledge. Meanwhile, information technology and graphic design enhance science communication through the use of visualizations, infographics, and interactive digital platforms that promote participation and engagement. The arts and humanities add creative and narrative dimensions—using visual art, storytelling, and literary techniques to make scientific ideas more relatable and emotionally resonant (Scrimshaw, 2019; Tuveri et al., 2024; Zallio, 2021).

Ethical and legal considerations emerge from the fields of law and ethics, which emphasize responsible communication, respect for scientific integrity, and awareness of policy frameworks influencing public discourse (Medvecky & Leach, 2019; Priest et al., 2019). Lastly, economics and marketing contribute strategies for promoting scientific initiatives, analyzing the efficiency and impact of communication efforts, and ensuring that resources are allocated effectively. Together, these disciplines form an integrated foundation for science communication, positioning it as both a scientific and cultural endeavor that bridges knowledge production and public understanding. A multidisciplinary approach enables science communication to be more holistic and adaptive to various challenges and contexts. By combining diverse perspectives and skills, science communication practitioners can reach a wider audience and optimize the impact of scientific information (Davies, 2022; Stengler, 2020).

Science topics are often raised through various media platforms within the four groups mentioned above. Currently, one hot topic is environmentally friendly nuclear technology. Based on the application of environmentally friendly nuclear technology, we recognize two sectors: the energy sector (Nuclear Power Plants/NPP) and the non-energy sector (agriculture, animal husbandry, health, industry, etc.) (Murakami & Anbumozhi, 2020). At least the government must fulfill three important things for the smooth development of nuclear power plants in Indonesia: (1) There is a strong commitment from the President regarding the realization of nuclear power plants; (2) The realization of this Presidential commitment by the House of Representatives (DPR) together with the National Energy Council (DEN) through changes to the National Energy Policy (KEN) to make nuclear energy a top priority energy and no longer a last alternative; (3) Public campaigns by the government to increase the level of public acceptance (public acceptance rate) towards the use of nuclear power plants (Hariyadi, 2017). This third point is a crucial point in shaping mindsets and educating the public.

In the Outline of A Theory Practice, it is stated that habitus is related to knowledge resources (Bourdieux, 1977). This is correlated in the form of inhibiting factors for scientists in the context of science communication, namely: language problems (translating the complexity of science from scientific language into semi-popular language that is easily understood by the public), perception problems (tendencies towards various theoretical scientific data and focus on accuracy rather than readability), and value problems (the media's assumption that science does not have enough news value). According to the government's energy roadmap through the Indonesian Ministry of Energy and Mineral Resources (ESDM), it is known that the target for new nuclear needs will begin in 2040, where the demands for the government's seriousness in building a nuclear power plant are very high. In addition, the government will form a Nuclear Energy Regulatory Agency that is directly responsible to the president.

Globally, the development of nuclear power plants for Indonesia as the largest archipelagic country is very much in line with the energy transition in order to achieve the target of zero carbon emissions by 2060, because nuclear is one of the clean energy sources. However, economically, nuclear power plants are considered expensive to maintain, and Indonesia's limited nuclear scientists' ability to produce uranium as fuel is also questionable. These political and economic factors have led to a lack of media coverage of nuclear issues, leading the Indonesian public to become less informed and perceive nuclear issues not only as uninteresting but also as frightening (Massagony et al., 2025; Rahmanta et al., 2023; Santosa et al., 2023).

With regard to the application of environmentally friendly nuclear technology, this study focuses on the energy sector in environmentally friendly nuclear technology through the representation of nuclear power plants (NPP). Furthermore, one key point reinforces the role and urgency of science communication in educating the public about environmentally friendly nuclear technology, which correlates with the government's crucial commitment to ensuring the smooth development of nuclear power plants in Indonesia. This is the urgency of public campaigns by the government to increase public acceptance of nuclear power plants.

This study is to explore the practice of communicating environmentally friendly nuclear technology, particularly through the representation of Nuclear Power Plants (NPP) to the public by nuclear scientists enabling educational innovation in science communication that can foster more effective public engagement in Indonesia’s transition toward clean energy. Hence, this study answers one main question: how do nuclear scientists communicate nuclear power plants (NPP) in Indonesia to the public as the innovation of science communication, which in turn forms public understanding and acceptance?

With the constructivist paradigm and the qualitative approach, this study has some significances as the effective communication strategy for the government in educating the public related to nuclear issues, and the support of policy-making strategy by the government and actors in the issue of NPP development in Indonesia.

The Diffusion of Innovations Theory

In science communication, gaps and innovations reflect the dynamics of developments in conveying scientific information to the public. Therefore, this study utilizes the diffusion of innovation theory, developed by Everett Rogers. This theory is a conceptual framework that explains how, why, and how quickly innovations or new ideas are accepted and spread in society (Rogers et al., 2014).

Rogers's diffusion of innovations theory discusses the process of innovation diffusion from initial discovery to widespread acceptance, using several key concepts:

1. Innovation: Refers to ideas, practices, and objects perceived as new by a particular individual or group. Innovations can be technologies, products, services, or other ideas.
2. Communication: The process of conveying information about innovations. Communication plays a crucial role in shaping individual perceptions of innovations.
3. Communication Channels: The pathways used to convey information about innovations to individuals or groups. These channels can include mass media, interpersonal communication, or even live presentations.
4. Time: The theory of innovation diffusion identifies five categories for measuring diffusion time: innovators, early adopters, early majority, late majority, and lagging majority. Each group has a different level of openness to innovation.
5. Social System: Refers to the social group within which the innovation diffusion process occurs. Social systems can involve smaller groups, such as family or friends, to larger groups, such as communities or organizations.
6. Adoption Decision: The process by which an individual or group decides to accept or reject an innovation. This decision is influenced by various factors, including the characteristics of the innovation and the characteristics of the recipient.
7. Factors Influencing Diffusion: Rogers identified several factors that influence the speed and extent of diffusion, such as the perceived benefits to the recipient, the complexity of the innovation, compatibility with existing values, demonstrability, and limited trials that can be conducted before full adoption.

In this regard, this theory can provide important insights for researchers in understanding how an innovation can be successfully implemented and spread in society, where gaps and innovations in science communication reflect the dynamics of developments in conveying scientific information to the public.

Methodology

This study used a case study method studying a particular phenomenon in a real context—usually complex and multidimensional, particularly a single case with the classification of scientists as the main actors delivering messages within the Indonesian Nuclear Society Association (HIMNI), especially affiliated with the National Research and Innovation Agency (BRIN) as the home to government nuclear scientists—previously, the home for Indonesia nuclear research was the National Nuclear Energy Agency (BATAN). For collecting data, this study applied a triangulation encompassing interview, observation, and document analysis:

1. Interview with nuclear scientists from HIMNI inside and outside BRIN;
2. Participatory observation through the HIMNI webinar series as a form of communication activity;
3. Document analysis related to communication materials in practice carried out by HIMNI as well as BRIN and BATAN as the former entity of nuclear research before BRIN.

Findings and Conclusion

The results of this study can be described as follows:

1. Interview with Nuclear Scientists. The researcher interviewed two nuclear scientists:
    a. Dr. Geni Rina Sunaryo, the nuclear scientist of HIMNI affiliated with BRIN. She is one of female nuclear scientists from BRIN, formerly BATAN. She has

only written in certain media: Detik, Media Indonesia, Senayan Post, Nawacita Study Institute, Istana Rakyat Magazine.
   b. Mr. Harun Ardiansyah, the freelancer as well as the PhD degree holder from the University of Illinois at Urbana-Champaign, USA. He wrote in scientifically certain media like The Conversation.
2. Observation: the researcher participated HIMNI webinar series as a form of communication activity organed regularly by HIMNI at least once a week.
3. Document Analysis: the researcher analyzed some documents related to communication materials in practice:
   a. Carried out by HIMNI through its official website (https://himni.org/), specifically displayed on "Berita" menu of the website (https://himni.org/category/berita/).
   b. Carried out by the National Research and Innovation Agency (BRIN) as the home to government nuclear scientists as displayed on its website, specifically at the Nuclear Energy Research Organization (https://www.brin.go.id/page/profil-pejabat).
   c. Popular nuclear media in BATAN era before merging into BRIN namely NUTECH (http://www.batan.go.id/index.php/id/publikasi-pdk).

Based on the collected data, the researcher found that HIMNI is still limited in innovation and use of digital technology as one form of digital transformation in the current era. Nuclear scientists in this regard have not been used to writing in various popular as well as online media. NUTECH was the pride of BATAN as a media for communicating nuclear science to the public, yet it is no longer published in BRIN era. In addition, the official website of BRIN as the home of nuclear research is lacking in nuclear-related educative content. BRIN displays minimum of specific content related to public campaigns about nuclear or dissemination of nuclear information to the public.

HIMNI is actually expected to play a strategic role in bridging the gap between nuclear scientists and the general public. Through its educational, collaborative, and open approach, HIMNI aims to establish a strong foundation for enhancing public understanding and acceptance of nuclear power plants (NPP) in Indonesia. This effort follows a structured communication strategy that emphasizes education and public literacy as the core pathways toward building trust. By involving experts directly in outreach and leveraging social media platforms as effective communication tools, HIMNI is hopefully capable of strengthening engagement and transparency. Ultimately, these integrated efforts are designed to foster greater public confidence and acceptance of environmentally friendly nuclear technology in Indonesia.

As the definition of science communication in this study as the science of communicating scientific topics in a popular style from scientists to scientists and the public. Practically, this is done through journalistic media (blogs, social media, and television), exhibitions, and public policy mapping with science as a primary element. Therefore, researchers can explore gaps that represent novelty in their research. Gaps and innovations in science communication reflect the dynamic developments in conveying scientific information to the public.

The following are some of the gaps observed in the context science communication in this study:

1. Language gap (scientific-public): the technical and complex language used in scientific publications can be a barrier to public understanding.

2. Demographic gap: ranges from limited access since not all groups in society have equal access to scientific information to generational gap since different generations may have different communication preferences that require diverse approaches.
3. Ethics and integrity challenges: how to respond to scientific uncertainty and how to communicate risks without causing panic or misunderstanding.
4. Issues of the politicization of science: political polarization in which science can be a source of political conflict, and scientific communication can be affected by this polarization.

In this study, various innovations in science communication are needed to address the gaps, and are designed to ensure that scientific information is more effectively accessed, understood, and appreciated by the general public. Here are the recommended innovations:

1. Interactive technology: using interactive technology to present scientific information in a more engaging way.
2. Social media and podcasts: using social media and podcasts as channels to share scientific information and interact directly with audiences.
3. Better data visualization (dynamic infographics and animations): using more dynamic and interactive data visualizations to explain scientific concepts.
4. Use of narrative (scientific stories): using narrative and story elements to make scientific information more engaging and easier to digest.
5. Scientist participation on social media (scientist's presence on social media platforms): scientists who are active on social media can directly interact with the public and disseminate scientific information in a way that is easy to understand.
6. Community engagement programs: programs that directly involve the public in the research or data collection process.
7. Collaboration with artists (arts and sciences): collaboration between scientists and artists to combine elements of art in the presentation of scientific information.
8. Increasing scientific literacy (public education): initiatives to increase scientific literacy among the public to be better able to access, understand, and evaluate scientific information.
9. Use of AI in content personalization: utilizing AI to create content that can be personalized according to the needs and level of understanding of individuals.

Bridging the Gap: Developing Lexical and Syntactic Complexity Through CLIL After Study Abroad Programmes

Jason Pipe, Kanto Gakuin University, Japan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

This study investigates the development of lexical and syntactic complexity in English as a Foreign Language (EFL) learners after returning from a five-month study abroad programme. While previous research suggests that immersion in English-speaking environments enhances fluency and general communicative competence, questions remain regarding its long-term impact on academic writing proficiency once returned to their home countries. Drawing on Content and Language Integrated Learning (CLIL) as a post-study abroad teaching strategy, this research explores whether CLIL instruction can foster continued growth in advanced academic lexis and syntactic structures. Analysing weekly written samples from six Japanese university students collected over one academic year, this paper aimed at observing changes in linguistic complexity. Through quantitative measures, findings revealed no statistically significant or consistent improvements in lexical nor syntactic complexity despite maintaining overall motivation and engagement of students since returning to their home country. These results suggest that while CLIL can provide a meaningful and content-rich context for EFL language use, it may not in itself be sufficient to stretch learning to observe measurable development in academic writing proficiency. The study highlights the need for more explicit instruction, targeted scaffolding and feedback on complex language use within CLIL frameworks, especially for learners transitioning from immersive environments back to domestic academic contexts. It also raises important pedagogical considerations for supporting sustained linguistic development in post-study abroad programmes.

Introduction

Study abroad programmes have always been seen as a feasible option for enhancing second language (L2) proficiency among university students. While these immersive experiences often lead to notable gains in confidence as well as spoken fluency, it remains unclear whether they also equip learners with the linguistic tools required for academic writing in English. Upon returning from study abroad, students may still struggle to bridge the gap between conversational proficiency and the demands of academic discourse.

A key concern in EFL language education is the absence of authentic learning, i.e. activities that mirror real-world scenarios and equip learners with meaningful, transferable knowledge that is applicable in practical contexts (Gilmore, 2007). The attractiveness of foreign exchange programme is that communicative activities can be integrated with authentic learning tasks. This has been shown to enhance learner motivation, provide culturally rich L2 (second language) input, and align second language instruction with real-life communicative contexts (Garcia-Pinar, 2019; Jacobs et al., 2022; Ozverir et al., 2017; Purnawarman & Dajarati, 2020; Vellanki & Bandu, 2021). Such authenticity would seem to be effective as it takes into account the learners' identities, the nature of the learning tasks, and the discourse in which the language is used to effectively communicate in a foreign coiuntry (Ahmadi, 2019). When studying abroad, such authenticity is likely to be embedded in instructional design, leading students to increase thei engagement, improved spoken L2 production, and enhanced knowledge transfer (Gilmore, 2007; Larsen et al., 2017; Perkins & Salomon, 2012; Wang et al., 2012). However, when returning back to their home countries, it is questionable that students can continue to maintain this momentum and develop further their academic skills.

To address this possible stagnation after returning from abroad post-study abroad English programme, a *Content and Language Integrated Learning* (CLIL) approach was implemented into the classroom as a pedagogical approach to integrate EAP subject content while also offering a potential pathway for continued language growth through authentic learning.

Literature Review

Study Abroad

Recent research continues to affirm the benefits of study abroad experiences for L2 development, particularly in enhancing oral fluency, pragmatic awareness, and vocabulary breadth (Friginal & Polat, 2022; Reynolds, 2020). Immersion in an L2 environment exposes learners to authentic communicative contexts and varied input, which can significantly improve their confidence and spontaneous language production. These gains are especially notable in functional spoken language and sociolinguistic competence (Bown & Dewey, 2020) as well as gains in fluency, pragmatic competence, and vocabulary breadth (Freed, 1995; Kinginger, 2009).

However, these benefits are not uniformly observed across all linguistic domains. While spoken interaction often improves, gains in academic language proficiency, particularly in academic writing and research, are less consistent (Pérez-Vidal & Barquin, 2014). This is due to study abroad programs catering in developing confidence, emphasising informal communication, and encouraging cultural engagement. These programmes, however, offer limited opportunities for students to engage with academic genres, advanced syntactic structures, or discipline-specific lexis (Lee & Curdt, 2021) as these students are rarely included

in truly academic and authentic enviuronments with native English speakers. As a consequence, students may return with strong conversational fluency but remain underprepared for the true linguistic demands of academic writing in the L2 (Taguchi & Greer, 2019).

Recently, there has been a small but growing body of research that would seem to suggest the necessity in providing post-return support. This should be an essential component for consolidating and hopefully extending the language gains made during study abroad. It would be beneficial for Japanese university students who have returned from their short-term programs abroad, showing improvements in fluency and lexical diversity in speech, but only marginal gains in written complexity (Imai & Kaneko, 2021). A study by Lasagabaster also observed a similar situation with Taiwanese students who studied abroad in English-speaking countries. While they significantly improved in interactive oral skills, they still required academic writing courses to develop their syntactic range and academic vocabulary further (Lasagabaster, 2021). It is evident that without explicit instruction in academic literacy, students may struggle to transfer their communicative gains to contexts that require higher-order cognitive and linguistic skills (Strobl & Baten, 2021). For instance, students' writing complexity, organisation, and vocabulary depth could continue to remain underdeveloped after studying abroad unless structured writing support is provided (Marijuan & Sanz, 2020; Strobl & Baten, 2021). Post-return programs that incorporate academic writing and critical thinking could, therefore, play a crucial role in helping learners internalise and transfer their linguistic gains into formal educational or professional contexts (Crossley & Kyle, 2021). As a result, while study abroad can offer rich, authentic input within immersive experiences to naturally enable L2 development, its impact on academic literacy remains limited without supplementary pedagogical support.

Content and Language Integrated Learning

Although often referred to as methodology, CLIL is not a method in the traditional pedagogical sense. It lacks a fixed set of teaching procedures or a universally agreed-upon implementation model. Rather, CLIL is a flexible educational approach that emerged in Europe in the 1990s, referring to programs in which a second or foreign language is used to teach subject content to learners who are still developing proficiency in that language (Coyle et al., 2010). CLIL is an increasingly influential approach in multilingual education that integrates the learning of academic subject matter with the simultaneous development of a second or foreign language (Coyle et al., 2010; Mehisto et l., 2019). In CLIL contexts, students learn curricular content, such as history, science, or the arts, through a language they are still acquiring.

This dual focus enables learners to use language for meaningful communication while also developing conceptual knowledge. CLIL operates as a dual-focused approach that integrates both content and language learning. While the emphasis may shift between content and language, the two are always interwoven. However, it is important to add that while content-based instruction teaches language through content, CLIL is subtly nuanced in that it focuses on teaching content through language (Echevarria et al., 2017; Lopriore, 2021). In other words, CLIL address the gap by shifting away from teaching language as an isolated subject to a language tool for actual learning (Morton, 2020). Its central aim is to promote meaningful language use in cognitively engaging contexts, thereby fostering deeper learning and broader communicative competence. By integrating language and content, CLIL encourages students to acquire disciplinary knowledge while developing the linguistic tools needed to discuss, analyse, and apply that knowledge in the target language. Such an approach could also have

the potential benefit of mirroring some of the positive aspects of studying abroad and thereby naturally continuing on from where the study abroad programme left off.

Empirical studies confirm that CLIL positively influences aspects of learning felt on foreign language exchanes. These EFL linguistic skills include: receptive skills, vocabulary acquisition, morphological development, creativity, fluency, and learner motivation (Dalton-Puffer, 2008). Students can also continue develop a broader range of academic and technical vocabulary than their peers in other traditional EFL courses. However, despite these obvious benefits, CLIL also appears to have minimal impact on other important aspects of second language acquistion, namely syntax, informal writing, pronunciation, and pragmatics (Table 1). In this research, the course wil adopt CLIL to teach aspects of social studies and other mumanity subjects in English within an EAP contect. Students will hopefully continue to engage in tasks such as discussions and mini-lectures to develop critical thinking and cross-cultural understanding from both British and Japanese perspectives in this EAP setting.

Table 1
Impact of CLIL on Specific EFL Linguistic Skills

Unaffected or Indefinite	Favorably Affected
Syntax	Receptive skills
Informal/non-technical writing	Vocabulary
Pronunciation	Morphology, creativity, risk-taking, fluency
Pragmatics	Emotive/affective outcomes

Lexical and Syntactic Complexity

Lexical and syntactic complexity are widely recognised as key indicators of advanced L2 writing proficiency. These constructs have, in fact, been necessary in assessing and supporting L2 writing development (Yang et al., 2023). Lexical complexity plays a particularly important role in academic writing and is commonly considered an indicator of L2 proficiency and development (Bulté & Housen, 2021). It refers to the richness, variety, and sophistication of vocabulary use, encompassing dimensions such as lexical diversity, lexical density, and word frequency (Lu & Ai, 2015). However, despite its importance, vocabulary acquisition and productive lexical use often receive less explicit attention in Japanese EFL education, particularly in terms of supporting students' academic English development (Paquot & Granger, 2020).

Syntactic complexity, in contrast, reflects the structural variety and grammatical elaboration in writing, including the use of subordinate clauses, compound sentences, passive constructions, and nominalisations (Kyle & Crossley,2019). Syntactic complexity has long been recognised as a key indicator of L2 proficiency, particularly in the context of academic writing. It refers to the range and sophistication of grammatical structures used by a learner and is widely employed in SLA research as a robust metric for evaluating linguistic development over time (Bulté & Housen, 2021; Vyatkina, 2012). When assessing syntactic development in written discourse, especially among university-level English learners, syntactic complexity provides critical insight into learners' ability to produce structurally elaborate and hierarchically organised sentences (Tavakoli & Wright, 2020).

Both types of complexity are essential elements in academic writing competence as they contribute to coherence, precision, and clarity. For instance, more sophisticated academic

writing is characterized by a high degree of lexical and syntactic complexity. It has also become evident that improvements in lexical sophistication, such as the use of low-frequency or academic words, can lead to improvements in reading fluency and writing quality in general (Paquot & Granger, 2020). Similarly, increases in syntactic complexity are associated with higher scores in holistic writing assessments, particularly in academic or argumentative tasks (Staples & Biber, 2021a).

Research Questions

Q1. Will the level of lexical complexity improve as a direct result of the introduction of CLIL?
Q2. Will the level of syntactic complexity improve as a direct result of the introduction of CLIL?

Methodology

Participants

Participants were six third-year students from a private university in Tokyo participated in this study. Each had recently returned from a five-month study abroad programme in Australia. TOEIC scores ranged from 660 to 800 before departure (CEFR: B1-B2) and from 750 to 835 after returning (CEFR: upper B2 to lower C1). Informal interviews indicated increased confidence and motivation to improve academic English.

CLIL Lessons

Over the academic year, students attended a weekly 90-minute CLIL class focusing on topics in cultural and social studies. CLIL classrooms often prioritise content delivery over language scaffolding, so learners may find few opportunities to develop grammatical accuracy and syntactic complexity (Ibarrola & Lasagabaster, 2021). Although CLIL's success depends on careful planning and responsiveness to learners' needs, time constraints meant that, in this course, lessons mainly focused on teaching content through English with minimal language-focused intervention. As a result, there was only limited explicit attention to the mechanics of language form.

Data Collection

Writing samples were collected bi-weekly over one academic year during a CLIL-based EAP course. Students were asked to write spontaniously for a 10-minute period at the end of class their opinions on the discussions introduced. Topics related to social studies and humanities, and were selected to promote critical thinking and expression.

Measuring Lexical Complexity

To assess lexical complexity in this study, we adopted Lu's (2012) Lexical Complexity Analyzer (LCA), a widely validated tool that automatically calculates 26 lexical indices across all three dimensions (Lu, 2012). This tool was chosen for its transparency, accessibility, and alignment with prior research in L2 lexical development. Due to expediency, lexical complexity commonly followed categorised the three distinct but related dimensions: lexical diversity, lexical sophistication, and lexical density (Yang et al., 2023) (Table 2). First, lexical

diversity refers to the range of different words used in a given text, often measured using indices such as the type-token ratio (TTR), and corrected TTR (CTTR) (Malvern et al., 2020). These metrics provide insight into the breadth of vocabulary employed by the learner and are widely used in studies of L2 academic writing. Second, lexical sophistication involves the use of low-frequency, academic, or otherwise advanced words, indicating the depth of a learner's vocabulary (Crossley & Kyle, 2021). Measures such as the proportion of words from the Academic Word List (AWL) and low-frequency word ratio are commonly employed to assess lexical sophistication. These measures are particularly relevant in evaluating learners' ability to engage with academic discourse, as they capture the extent to which students employ domain-specific or context-appropriate lexis (Staples et al., 2020). This paper used lexical sophistication (LS1) and verv sophistication (VS1) to determine this aspect of lexical complexity. Finally, lexical density, in contrast, assesses the informational load of a text by calculating the proportion of content words (nouns, verbs, adjectives, adverbs) to total words (Schmitt et al., 2019). Higher lexical density is generally associated with more formal or academic registers, distinguishing it from conversational or narrative writing. As a consequence, the measure lexical density (LD) was also included in this research.

Table 2

Dimensions of Lexical Complexity, Their Common Measures and Their Academic Relvance

Category	Definition	Typical Measures	Academic Relevance
Lexical Diversity	Range of different words used in a text. Reflects vocabulary breadth.	- Type-Token Ratio (TTR) - Corrected TTR (CTTR)	Indicates vocabulary range and learner variability; commonly used to assess productive vocabulary size. (Yang et al., 2023)
Lexical Sophist-ication	Use of low-frequency, academic, or advanced vocabulary items.	- Proportion of Academic Word List (AWL) words - Low-frequency word ratio such as Lexical Sophistication I (LS1); Verb Sophistication I (VS1)	Reflects lexical depth and learner ability to use domain-specific or contextually appropriate vocabulary. (Crossley & Kyle, 2021)
Lexical Density	Ratio of content words (nouns, verbs, adjectives, adverbs) to all words in the text.	- Lexical Density (LD) (Content Words / Total Words)	Indicates information load and formality; distinguishes academic from conversational writing. (Schmitt et al., 2019)

Measuring Syntactic Complexity

This study adopted Lu's L2 Syntactic Complexity Analyzer (L2SCA) to evaluate syntactic complexity across 14 established indices (Lu, 2010). Its reliability, accessibility, and consistency with corpus-based norms have made it one of the most widely used tools in academic writing research (Lu & Ai, 2015). This study focuses on nine syntactic measures that recent research has consistently found to be both developmentally sensitive and pedagogically relevant in academic contexts (Table 3). These measures are grouped into three primary categories: First are the length-based measures: Mean Length of Sentence (MLS); Mean Length of T-unit (MLT); Mean Length of Clause (MLC). These indices represent overall

grammatical elaboration and have shown significant correlation with writing proficiency in L2 learners, especially in argumentative and expository tasks (Knoch & Elder, 2017; Kyle & Crossley, 2019). The second group of measures are the subordination-based measures: Clauses per Sentence (C/S); Dependent Clauses per Clause (DC/C); Complex T-units per T-unit (CT/T). Subordination reflects learners' ability to build complex syntactic hierarchies, a characteristic of advanced academic writing. These measures are particularly effective in distinguishing between intermediate and advanced levels of syntactic development (Crossley & Kyle, 2020). The final measures concentrates on phrasal complexity: Complex Nominals per Clause (CN/C); Complex Nominals per T-unit (CN/T); Verb Phrases per T-unit (VP/T). These indices measure nominal and verbal elaboration, which are increasingly seen as indicators of mature academic style, especially in scientific and technical writing. Phrasal complexity has recently been recognised as a key developmental feature in academic writing that complements traditional clause-based complexity (Parkinson & Musgrave, 2014). Overall, this selection aligns with validated frameworks for assessing syntactic complexity in academic L2 writing (Staples & Biber, 2021b).

Table 3
Dimensions of Syntactic Complexity, Their Common Measures and Their Academic Relevance

Category	Measure	Definition	Academic Relevance
Length-Based	Mean Length of Sentence (MLS)	Average number of words per sentence.	Indicates overall grammatical elaboration; associated with advanced writing proficiency. (Kyle & Crossley, 2019)
	Mean Length of T-unit (MLT)	Average number of words per T-unit (an independent clause with any subordinate clauses).	Strongly correlated with writing fluency and syntactic maturity in academic genres. (Kyle & Crossley, 2019)
	Mean Length of Clause (MLC)	Average number of words per clause.	Reflects how learners elaborate on ideas within sentence-level grammar.(Kyle & Crossley, 2019)
Subordination-Based	Clauses per Sentence(C/S)	Average number of clauses per Sentence.	Captures sentence complexity through subordinate clause use. (Crossley & Kyle, 2020)
	Dependent Clauses per Clause (DC/C)	Ratio of dependent to total clauses.	Measures hierarchical sentence structure, signalling higher writing proficiency. (Crossley & Kyle, 2020)
	Complex T-units per T-unit (CT/T)	Proportion of T-units containing more than one clause.	Useful in identifying syntactic sophistication in expository and argumentative writing.(Crossley & Kyle, 2020)
Phrasal Complexity	Complex Nominals per Clause (CN/C)	Number of noun phrases with modifiers per clause.	Reflects nominal elaboration typical of academic writing style. (Parkinson & Musgrave, 2014)

	Complex Nominals per T-unit (CN/T)	Number of complex noun phrases per T-unit.	Associated with increased density and formality in academic prose. (Parkinson & Musgrave, 2020)
	Verb Phrases per T-unit (VP/T)	Number of verb phrases per T-unit.	Captures verbal complexity and helps identify developmental differences in syntactic use. (Parkinson & Musgrave, 2020)

Results

Lexical

Lexical Diversity

The mean TTR across the term was 0.63 (SD = 0.06), indicating a moderate range of lexical variety in student writing. A repeated-measures ANOVA revealed a significant difference across the 14 time points, $F(13, 182) = 230.43$, $p < .001$, $\eta^2 = 0.943$, suggesting that nearly 94% of the variation in TTR was linked to changes over time. However, a correlation analysis showed a non-significant downward trend ($r = –0.396$, $p = 0.161$), implying that while variation occurred, lexical diversity did not steadily increase.

Similarly, CTTR, which adjusts for text length, averaged 4.56 (SD = 0.39) over the 14 weeks. This measure also demonstrated significant differences over time, $F(13, 182) = 132.81$, $p < .001$, $\eta^2 = 0.905$, with a very large effect size. Yet again, correlation analysis revealed a non-significant decline ($r = ç0.282$, $p = 0.329$), suggesting that although CTTR values fluctuated, no consistent upward trajectory was observed.

Table 4

Lexical Diversity: Type-Token Ratio (TTR) and Corrected Type-Token Ratio (CTTR)

TTR	1	2	3	4	5	6	7	8	9	10	11	12	13	14
Mean	**0.63**	**0.66**	**0.60**	**0.62**	**0.61**	**0.69**	**0.69**	**0.67**	**0.63**	**0.59**	**0.60**	**0.63**	**0.63**	**0.55**
SD	0.10	0.06	0.04	0.06	0.06	0.06	0.05	0.05	0.06	0.07	0.09	0.07	0.06	0.07
Max	0.77	0.71	0.66	0.71	0.70	0.76	0.72	0.74	0.71	0.70	0.72	0.73	0.68	0.64
Min	0.52	0.57	0.56	0.55	0.54	0.60	0.61	0.60	0.55	0.52	0.49	0.54	0.56	0.46
CTTR														
Mean	**4.63**	**4.59**	**4.56**	**4.58**	**4.41**	**4.83**	**4.54**	**4.47**	**4.73**	**4.56**	**4.49**	**4.74**	**4.50**	**4.27**
SD	0.34	0.62	0.31	0.16	0.07	0.19	0.54	0.38	0.55	0.65	0.45	0.31	0.53	0.31
Max	5.01	5.22	4.97	4.79	4.51	5.07	5.03	5.10	5.62	5.54	4.99	5.10	4.92	4.61
Min	4.10	3.83	4.24	4.36	4.35	4.53	3.79	3.97	4.25	4.03	3.97	4.27	3.67	3.84

Taken together, the results indicate that while both TTR and CTTR varied significantly across time, neither measure showed sustained improvement. This may reflect the cognitive and linguistic demands of CLIL content, where students prioritised content comprehension and grammatical accuracy over increasing lexical variety.

Lexical Sophistication

Table 5

Lexical Sophistication: Lexical Sophistication I (LS1) and Verb Sophistication I (VS1)

SD	0.044	0.065	0.034	0.094	0.041	0.042	0.052	0.074	0.044	0.050	0.041	0.060	0.050	0.030
Max	0.087	0.150	0.062	0.250	0.100	0.105	0.111	0.174	0.087	0.105	0.133	0.148	0.174	0.071
Min	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.036	0.000	0.053	0.000

The average LS1 score was 0.25 (SD = 0.06), representing the proportion of low-frequency or academic vocabulary used in student writing. A repeated-measures ANOVA showed a highly significant difference across time, $F(13, 182) = 962.69$, $p < .001$, $\eta^2 = 0.986$, indicating nearly all variance in LS1 was accounted for by time. A correlation analysis revealed a non-significant positive trend ($r = 0.276$, $p = 0.340$), suggesting some upward movement in lexical sophistication, but without statistical confirmation of consistent growth.

VS1, representing verb-related lexical sophistication, had a mean of 0.06 (SD = 0.05). ANOVA results again indicated significant variation across time, $F(13, 182) = 109.76$, $p < .001$, $\eta^2 = 0.887$. Correlation analysis showed a non-significant positive trend ($r = 0.315$, $p = 0.272$), implying that students gradually increased their use of advanced or less frequent verbs, though not at a statistically significant rate.

In summary, both LS1 and VS1 demonstrated significant fluctuations across time, with very large effect sizes, yet neither showed a steady linear improvement. These results indicate that while CLIL instruction may encourage more sophisticated lexical choices, especially in verb use, gains may be topic-dependent or uneven in progression.

Lexical Density

Table 6

Lexical Density

LD	1	2	3	4	5	6	7	8	9	10	11	12	13	14
Mean	**0.571**	**0.600**	**0.600**	**0.585**	**0.589**	**0.597**	**0.599**	**0.550**	**0.581**	**0.618**	**0.544**	**0.578**	**0.579**	**0.597**
SD	0.049	0.030	0.024	0.064	0.047	0.043	0.040	0.086	0.017	0.017	0.037	0.060	0.045	0.041
Max	0.625	0.642	0.638	0.673	0.639	0.667	0.629	0.653	0.600	0.644	0.593	0.659	0.626	0.663
Min	0.516	0.571	0.579	0.500	0.514	0.560	0.541	0.447	0.559	0.595	0.500	0.510	0.509	0.566

The data showed no significant consistent improvements in lexical or syntactic complexity at the group level. However, individual differences were observed, suggesting that learners responded differently to the instructional context. The most notable finding was a strong negative correlation between lexical sophistication (LS1) and verb phrases per T-unit (VPT), $r = –0.628$, $p < .001$. Moderate negative correlations were also observed between LS1 and DCT ($r = ç0.450$) and LS1 and MLT ($r = –0.295$).

These patterns further support the idea that increased lexical complexity may coincide with reduced syntactic elaboration, likely due to cognitive constraints in managing both dimensions simultaneously. These findings align with the Limited Attentional Capacity Model (Skehan, 2009), which posits that learners may prioritise either lexical sophistication or syntactic complexity depending on task demands and available cognitive resources.

This study investigated syntactic development in L2 writing following a study abroad experience, using three measures of complexity: Mean Length of Sentence (MLS), Mean Length of T-unit (MLT), and Mean Length of Clause (MLC). Data were collected over 14 CLIL-based instructional sessions, and changes across time were analysed using repeated-measures ANOVA, linear regression, and correlation analysis.

The analysis of MLS revealed an average sentence length of 16.04 words (SD = 3.24). A repeated-measures ANOVA showed that the variation in sentence length across time was statistically significant, $F(13, 182) = 36.09$, $p < .001$, with a large effect size ($\eta^2 = 0.720$). This indicates that sentence complexity fluctuated meaningfully over the course. However, a linear regression showed only a slight upward trend, and the correlation between MLS and time was not statistically significant ($r = –0.073$, $p = 0.805$). While sentence length varied across the 14 sessions, there was no consistent linear increase in complexity.

For MLT, the average T-unit length was 13.67 words (SD = 2.66). ANOVA results indicated significant changes across the time points, $F(13, 182) = 2.37 \times 10^{29}$, $p < .001$, with an extremely large effect size ($\eta^2 = 1.000$). Despite this, the linear regression suggested a slight downward trend, and correlation analysis confirmed no significant relationship with time ($r = –0.189$, $p = 0.519$). These findings suggest that while structural changes occurred in T-unit length, they did

not reflect a steady increase in syntactic elaboration; rather, students may have opted for more concise structuring over time.

In contrast, MLC showed more promising indicators of development. The average clause length was 8.68 words (SD = 1.39), and this measure exhibited the lowest variability of the three, suggesting relative stability in clause construction. Repeated-measures ANOVA confirmed a significant difference across time, $F(13, 182) = 98.53$, $p < .001$, with a very large effect size ($\eta^2 = 0.876$). A linear regression showed a gentle upward trend in clause length, and while the correlation with time was not statistically significant ($r = 0.166$, $p = 0.571$), the direction of the trend points to a gradual increase in clause-level syntactic complexity.

In summary, while all three measures (MLS, MLT, and MLC) demonstrated statistically significant variation over the course of the programme, only MLC showed a clear and sustained trend toward greater complexity. This suggests that CLIL-based instruction may be particularly effective in supporting internal clause development, even if broader sentence- or T-unit-level complexity does not progress in a strictly linear fashion.

Subordination-Based

Table 8

To examine development in subordinate clause usage, three measures were analysed over the 14-week CLIL-based course: Clauses per Sentence (C/S), Dependent Clauses per Clause (DC/C), and Complex T-units per T-unit (CT/T).

The mean number of clauses per sentence (C/S) was 1.91 (SD = 0.30), indicating moderately complex sentence constructions. A repeated-measures ANOVA revealed a statistically significant difference across the 14 time points, $F(13, 182) = 167.98$, $p < .001$, $\eta^2 = 0.923$, suggesting that over 92% of the variance in clause use per sentence was attributable to instructional time. Linear regression analysis showed a noticeable upward trend, indicating that students increasingly produced multi-clause sentences as the term progressed.

The proportion of dependent clauses per clause (DC/C) averaged 0.34 (SD = 0.13). ANOVA results confirmed significant variation across time, $F(13, 182) = 55.14$, $p < .001$, $\eta^2 = 0.798$. Although the regression trend was subtler than that of C/S, it was still upward, suggesting a gradual increase in learners' use of subordination strategies over time.

The ratio of complex T-units per T-unit (CT/T) was 0.46 on average (SD = 0.22), reflecting learners' integration of subordinate structures into complete thought units. ANOVA again revealed significant changes over time, $F(13, 182) = 38.76$, $p < .001$, $\eta^2 = 0.735$, with a moderate upward regression trend. These results indicate increasing syntactic maturity in how students structured and extended their ideas.

Taken together, all three subordination-based measures demonstrated statistically significant variation across time and positive developmental trends. These findings suggest that CLIL instruction following study abroad may support learners in advancing their use of embedded and hierarchical sentence structures—an essential aspect of academic writing fluency.

Phrasal Complexity

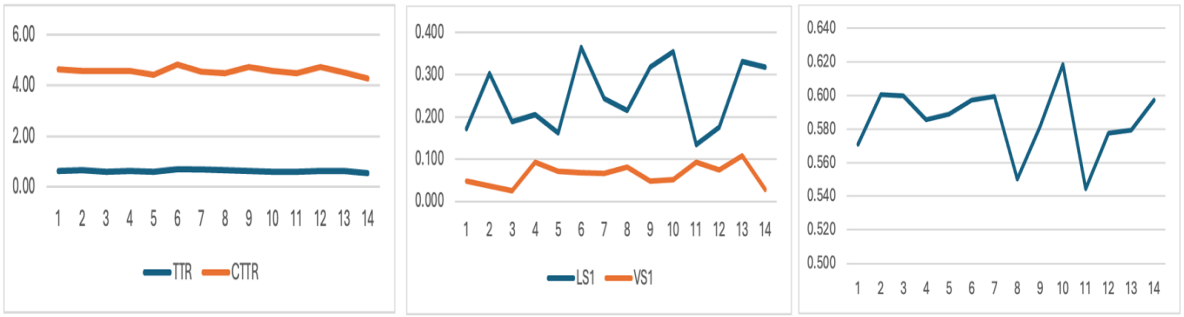
This section reports the development of phrasal complexity over 14 CLIL-based sessions, using three key measures: Complex Nominals per Clause (CN/C), Complex Nominals per T-unit (CN/T), and Verb Phrases per T-unit (VP/T).

The mean value of complex nominals per clause (CN/C) was 0.70 (SD = 0.17), reflecting a moderate density of noun phrase elaboration at the clause level. A repeated-measures ANOVA revealed a statistically significant difference across time points, $F(13, 182) = 23.02$, $p < .001$, $\eta^2 = 0.622$, indicating that nearly two-thirds of the variance was attributable to instructional changes. However, correlation analysis showed no significant trend across time ($r = 0.089$, $p = 0.763$), suggesting that while variability occurred, it did not consistently increase or decrease.

The complexity of noun phrases at the T-unit level (CN/T) averaged 1.25 (SD = 0.28), indicating frequent use of extended noun constructions. The ANOVA results showed significant differences across the term, $F(13, 182) = 15.94$, $p < .001$, $\eta^2 = 0.533$, with a medium-to-large effect size. The Pearson correlation showed a weak negative trend ($r = –0.271$, $p = 0.345$), indicating that although T-units were often complex, their elaboration did not increase over time and may have slightly decreased.

Verb phrase density, measured by verb phrases per T-unit (VP/T), yielded an average of 1.79 (SD = 0.25). The ANOVA showed significant differences across the 14 time points, $F(13, 182) = 8.97$, $p < .001$, $\eta^2 = 0.391$, suggesting moderate variability. However, the trend analysis showed a weak, non-significant positive trend ($r = 0.142$, $p = 0.631$), implying that learners may have incrementally increased their use of verb phrases, though not in a statistically meaningful way.



In summary, while all three phrasal complexity measures showed statistically significant changes across time, none displayed a consistent linear trend. These findings indicate that although CLIL instruction may foster structural variation and phrasal elaboration, such development does not necessarily progress in a steady or upward direction.

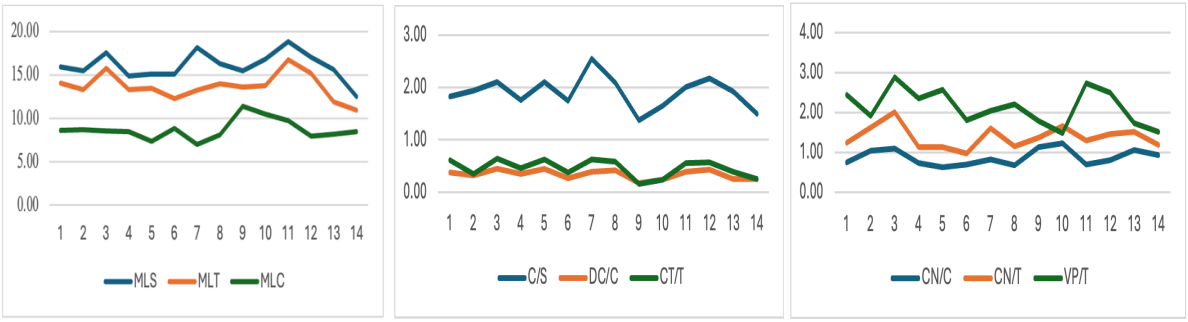
Discussion

Q1. Will the level of lexical complexity improve as a direct result of the introduction of CLIL?

Graphs 1–3

Lexical: 1. Diversity (left), 2. Sophistication (centre), 3. Density (right)

The results revealed statistically significant variation over time in all measured aspects of lexical complexity. Lexical diversity (TTR, CTTR) (Graph 1), lexical sophistication (LS1, VS1) (Graph 2), and lexical density (LD) (Graph 3) show no consistent upward trend. For example, while LS1 and VS1 showed positive correlations with time, these trends were not statistically significant. Similarly, TTR and CTTR showed slight downward trends, and LD remained relatively flat. These findings suggest that CLIL alone does not lead to sustained improvements in lexical complexity.



These outcomes suggest that while CLIL may foster variability and topic-related fluctuations in lexical usage, it does not in itself ensure steady gains in academic lexical development. This may be due to the cognitively demanding nature of CLIL tasks, which place pressure on learners' processing capacity. Learners may simplify vocabulary in favour of maintaining content coherence, illustrating the often-cited lexico-syntactic trade-off (Révész et al., 2020). Furthermore, although CLIL encourages exposure to domain-relevant texts, it often lacks

explicit focus on academic vocabulary development (Paquot & Granger, 2020), and students may struggle to internalise and actively produce advanced lexis without scaffolded vocabulary tasks. These findings align with previous studies suggesting that post-return academic language instruction must be explicitly targeted, particularly if lexical development is to be fostered (Crossley & Kyle, 2021; Lasagabaster, 2021).

Q2. Will the level of syntactic complexity improve as a direct result of the introduction of CLIL?

Graphs 4–6

Syntactic: 4. Length-Based (Left), 5. Subordination-Based (Centre), 6. Phrasal Complexity (Right)

The introduction of CLIL did not result in overall improvement across all aspects of syntactic complexity. Focusing on Length-Based Measures (Graph 4) , Mean Length of Sentence (MLS), T-unit (MLT), and Clause (MLC) indicated no consistent upward trend. In fact, by the end of the academic year, MLS and MLT values became slightly lower than at the beginning of the course. Subordination-Based Measures (Graph 5) also indicated no progress. Measures like Clauses per Sentence (C/S) and Dependent Clauses per Clause (DC/C) showed inconsistent results, with fluctuations but no overall imporvement. This suggests that learners did not systematically improve in producing subordinated structures. Phrasal Complexity (Graph 6) was the only aspect of syntactic complexity where an upward trend in the metrics, CN/C, CN/T, VP/T, was observed although not linearly and not significantly. It could be argued that phrasal complexity measures improved across most learners, which could indicate a possible shift toward denser, noun-based academic style, even if sentence or clause complexity remained static. These outcomes support the idea that CLIL may not systematically shift students toward more complex global syntactic constructions unless explicit instruction is included (Ibarrola & Lasagabaster, 2021).

Implications

Table 10

Summary of Significant Improvement in Lexical and Syntactic Complexity Measures and Instructional Suggestions

Domain	Measure	Significant Change	Correlation Trend	Effect Size (η^2)	Instructional Suggestion
Lexical Diversity	TTR	Yes	Non-significant ↓	0.943	Introduce targeted vocabulary tasks with range-building goals.
Lexical Diversity	CTTR	Yes	Non-significant ↓	0.905	Use longer writing prompts to naturally increase CTTR.
Lexical Sophistication	LS1	Yes	Non-significant ↑	0.986	Focus on low-frequency and academic vocabulary introduction.
Lexical Sophistication	VS1	Yes	Non-significant ↑	0.887	Support verb-focused lexical expansion using academic verbs.
Lexical Density	LD	Yes	Non-significant ↓	0.829	Encourage summarisation & explanation tasks to increase lexical density.
Sentence Complexity	MLS	Yes	Non-significant ↓	0.72	Encourage varied sentence structure but pair with cohesion training.
Sentence Complexity	MLT	Yes	Non-significant ↓	1	Support with sentence planning to prevent overly short T-units.
Sentence Complexity	MLC	Yes	Non-significant ↑	0.876	Reinforce internal clause building with practice in relative clauses.
Subordination	C/S	Yes	Significant ↑	0.923	Introduce scaffolded exercises on subordination and conjunction use.
Subordination	DC/C	Yes	Non-significant ↑	0.798	Encourage awareness of clause roles in complex ideas.
Subordination	CT/T	Yes	Non-significant ↑	0.735	Use structured sentence combination tasks to strengthen T-unit complexity.
Phrasal Complexity	CN/C	Yes	Non-significant ↑	0.622	Expose students to academic noun phrase models (e.g., nominalisation).
Phrasal Complexity	CN/T	Yes	Non-significant ↓	0.533	Provide sentence frames with embedded nominal structures.
Phrasal Complexity	VP/T	Yes	Non-significant ↑	0.391	Practice expanding verb phrases through tense, aspect, and modality.

As there was no significant progress evident in any of the lexical and synactic complexity over the academic year (Table 10), it would appear that there is some kind of cognitive trade-off in L2 writing (Skehan, 2009). Learners may prioritise either vocabulary or syntax depending on

task demands and cognitive resources. This finding has important pedagogical implications: without structured support, students may be unable to optimise both dimensions of complexity, limiting their academic writing development.Taken together, the findings confirm that CLIL serves as a valuable platform for extending fluency and discourse-level writing, but its impact on advanced academic language development, especially lexical sophistication and broader syntactic growth, requires additional pedagogical scaffolding. The data support calls in recent literature for integrating genre-based writing support and explicit linguistic objectives within CLIL instruction (Gierlinger, 2020; Matsuda, 2023).

As students return from immersive English programmes abroad, their fluency and confidence often outpace their academic writing capabilities. While it is evident that CLIL provides a valuable opportunity to reinforce language learning through meaningful content, additional support would seem to be required to ensure that students can meet the demands of academic discourse. CLIL does promote meaningful language use but it does not automatically result in increased complexity unless it is combined with explicit instruction in academic language. If participants have not been directed to develop specific lexical or syntactic features, it may explain the lack of measurable progress. Moreover, the absence of feedback on writing quality would also have further limited the opportunities for targeted improvement on specific aspects of academic writing. CLIL, by itself, may serve more as a platform to maintain and arguably build skills in L2 communication than a mechanism for developing refined academic writing skills. To develop complexity at a lexical and syntactic level, there may be the need for finely-tuned interventions and carefully scaffolded tasks to develop the mechanics in academic Language. Given the challenging transition from spoken to written academic English, returning students may benefit from scaffolding activities that target sentence structure, academic collocations, and cohesive devices. Combining CLIL with explicit writing instruction could better support learners' needs.

However, it remains unclear at what level that would not interfere with fluency and motivation. One method would be to include focused instruction on aspects such as advanced lexis, and syntactic structures. To optimise gains, instructors may consider: introducing corpus-informed vocabulary tasks that target academic collocations; providing sentence combining and expansion exercises to foster syntactic fluency; or incorporating reflective self-assessment and peer review, helping learners track development over time. Such support may involve tailored writing workshops, peer-review sessions, and exposure to model texts, all of which can guide students in transforming conversational competence into academic proficiency. Hopefully, these measures can support students in transforming the gains made during immersive language use abroad into academic literacy gains that are sustainable and transferrable to university and professional settings.

Conclusion

While the data indicated slight but not significant improvement in syntactic complexitity, except at subordination, overall there was no evidence in clear progress. However, ultimately, CLIL alone is not sufficiently effective in developing higher-level academic writing proficiency. This research would argue for the inclusion of supplementing CLIL-based instruction with focused academic writing support to assist students returning from their EFL programmes abroad. While immersion builds communicative confidence and general proficiency, academic writing development requires targeted strategies to target issues and enhance lexical and syntactic complexity. The integration of CLIL with explicit instruction would, therefore, seem to offer a promising direction for supporting learners’ transition from

general spoken English to more advanced EAP courses. Future implementations of CLIL should consider incorporating academic literacy goals into course design, including formative assessment, metacognitive reflection, and task-based writing development to assist in and stretch further each student's L2 academic endeavours.

Digital Literacy Education for Political Communication Ethics and Culture in Digital Space: Reflections After the 2024 Indonesian Simultaneous Elections

Muhammad Yunus Zulkifli, Universitas Indonesia, Indonesia

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

The rapid development of information technology has given rise to social media as a new space for shaping public opinion, particularly in political participation and democratic practices. However, instead of strengthening democracy, digital media in Indonesia has often worsened public communication through the spread of disinformation, hate speech, and identity politicization. This became especially visible during the 2019 Indonesian Election and resurfaced in the 2024 Indonesian Simultaneous Elections, marked by sharp political polarization fueled by unchecked information flows on platforms like Facebook, X (Twitter), Instagram, and TikTok. From a communication education perspective, digital literacy involves not only technical skills to access and manage information but also critical abilities to evaluate, create knowledge, and engage ethically in digital spaces. The four pillars of digital literacy introduced by Siberkreasi of the Indonesian Ministry of Communication and Information (Kominfo), which are digital skills; digital culture; digital ethics; and digital safety form a key foundation for fostering civilized political communication. In particular, digital culture and digital ethics play vital roles in shaping national character, reinforcing *Pancasila* values, and upholding ethical standards in free expression. This study reflects on the practice of digital literacy during the 2024 Indonesia Simultaneous Elections and identifies key lessons for strengthening communication education moving forward. By making digital literacy a strategic educational agenda, Indonesia's younger generation can be better equipped to enhance democratic practices through ethical, inclusive, and knowledge-based political communication in today's dynamic digital era.

Keywords: social media, public opinion, digital media, disinformation, 2024 Indonesian simultaneous elections, digital literacy, Siberkreasi, political communication

Introduction

The development of information technology has changed the landscape of contemporary democracy, especially through the presence of social media which has become a new space in the formation of public opinion and political participation (Kaplan & Haenlein, 2010; Smith, 2011). The media, which initially functioned as a pillar of democracy and a channel for public information, now faces serious challenges due to the rapid flow of free, fast digital information that is not always accompanied by validation and communication ethics (Bahruddin, 2019; Strömberg, 2015). In Indonesia, this phenomenon was clearly seen in the implementation of the 2019 General Election and became stronger in the 2024 Simultaneous Election, where platforms such as Facebook, X (Twitter), Instagram, and TikTok became the main means of campaigning, political communication, and the spread of disinformation, hate speech, and politicization of identity (Ramadlan, 2022; Syah et al., 2025).

Although social media has the potential to expand political participation, its ease of access and anonymity also open up space for political communication deviations, especially by users who do not understand journalistic principles and digital communication ethics (Bahruddin, 2019; Syafarani et al., 2023). In this context, Indonesia's digital democracy is still procedural, with the quality of participation not yet supported by adequate political knowledge (Hart et al., 2004; Maiello et al., 2003). This situation is exacerbated by the low level of digital literacy and the weak public awareness of the importance of ethical political communication.

To respond to these challenges, digital literacy needs to be interpreted not only as technical skills in accessing information, but also as critical and ethical abilities in sorting, assessing, and disseminating information responsibly (Setyaningsih et al., 2019; Suherdi, 2021). The Kominfo digital literacy program through the National Siberkreasi Movement emphasizes four main pillars: digital skills, digital culture, digital ethics, and digital safety (Fajri, 2022). Of the four pillars, digital culture and ethics are important foundations in shaping the nation's character and strengthening *Pancasila* values in the digital space. *Pancasila*, the philosophical foundation of the Indonesian state, consists of five core principles: belief in one supreme God, a just and civilized humanity, the unity of Indonesia, democracy guided by inner wisdom through deliberation, and social justice for all.

Thus, digital literacy rooted in ethical and cultural values is not only needed to stem the flow of hoaxes and hate speech, but is also strategic in supporting substantial democracy in Indonesia. This study aims to reflect on digital literacy practices in the context of the 2024 Simultaneous Elections and provide important implications for strengthening political communication education in the digital era. This study aims to answer the main question: how can digital literacy education strategies encourage the strengthening of ethics and culture of political communication in the 2024 Simultaneous Elections?

This study is based on a constructivist paradigm that views social reality as the result of joint construction through interaction, symbols, and communication processes (Creswell & Creswell, 2017). In this context, social media as a digital communication space not only acts as a channel for information, but also as an arena for negotiating meaning, values, and political identities. Therefore, a qualitative approach based on library research is used to examine how digital literacy education plays a role in shaping healthy political communication ethics and culture amidst the dynamics of the 2024 Simultaneous Elections.

The significance of this study lies in its contribution to filling the gap in academic discourse on the importance of digital ethics and culture in Indonesian electoral democracy. Amid the current of disinformation and hate speech that is spreading in the digital space, digital literacy education is not only a technical need, but also a normative need in realizing substantial democracy (Kominfo, 2023; Ward & Vedel, 2006). This study is expected to enrich the literature on the relationship between digital media, civic education, and strengthening democratic values in the era of technology-based political communication.

The Network Society Theory

As a figure of the Network Society Theory, Castells (2011) argues that contemporary society is increasingly structured through networks that include communication technologies, social relations, economic systems, and cultural flows. In this society, identities can change and experience resistance because it is difficult to distinguish between reality and circulating symbols. Information and knowledge become central to economic production and social organization in the concept of "informationalism", where individuals are connected locally and globally, influencing identity, social relations, and activism.

In his book "The Rise of the Network Society", Castells outlines several key concepts:

1. Networks as the primary structure of modern society that connects various aspects of life.
2. Informationalism as a new form of social and economic organization based on information.
3. Flow Space that replaces the "place space" of industrial society, emphasizing the importance of global flows of information, capital, and culture.
4. Networked Individuals, namely the broad connectivity of individuals and its impact on identity and social relations.
5. Globalization as the interconnectedness of economy, culture, and society on a global scale.

In "Communication Power" (Castells, 2009), the role of communication and media in a network society is emphasized, especially the role of information technology in shaping social, economic, and political structures; the dynamics of power in communication networks and the control of information flows; media politics as a tool of power by various actors; resistance and activism that emerges through media; and the role of globalization in communication networks.

Overall, Castells' Network Society Theory emphasizes social transformations due to technology and communication, and how power and resistance take place in a highly connected society. The book "The Rise of the Network Society" is a primary reference in understanding the relationship between technology, communication, and social change.

Methodology

This study used a systematic literature review approach as a methodological basis for understanding the dynamics of digital literacy, political communication ethics, and digital space practices in the context of the 2024 Simultaneous Elections in Indonesia. The study was conducted by tracing, evaluating, and synthesizing various relevant literature sources, both from academic and institutional realms.

The data sources reviewed include scientific articles from reputable national and international journals (Scopus, SINTA, Google Scholar), policy reports from government institutions such as Kominfo, Bawaslu, and the Ministry of Education, as well as digital literacy program documents from the National Siberkreasi Movement. In addition, reports from civil society organizations such as SAFEnet, MAFINDO, and ICT Watch were also used as important references to capture critical perspectives on digital literacy practices in the field. The literature analyzed was selected based on certain inclusion criteria: published in the 2018–2024 period, relevant to the context of Indonesian digital democracy, and explicitly discussing issues of digital literacy, communication ethics, social media, or political participation.

The data collection process was carried out through a structured search using keywords such as “digital literacy”, “political communication ethics”, “Indonesian election social media”, and “digital culture”. The main databases used include Google Scholar, DOAJ, Scopus, and repositories owned by government institutions and non-governmental organizations.

Data analysis was carried out through a thematic content analysis approach, which includes three main stages. First, a data reduction process was carried out to filter the most relevant articles and documents. Second, the content of each source was categorized based on key themes such as digital ethics, digital culture, political disinformation, and the role of social media in the electoral process. Third, findings from various literatures were synthesized to identify patterns and relationships between concepts that answer the main question of how digital literacy education strategies can encourage the strengthening of ethics and culture of political communication in the 2024 Simultaneous Elections.

To maintain the sharpness of the analysis and increase the validity of the study results, a source triangulation strategy and cross-references between literature were applied. In addition, critical reflection on possible biases contained in previous studies was carried out to maintain the objectivity of interpretation.

Findings

The results of this study can be described as follows:

Digital Literacy Gap Among Voters and Political Actors

Based on various studies (Jatmiko, 2019; Kominfo, 2024; Rianto, 2019; Yilmaz et al., 2024), digital literacy in Indonesia shows significant inequality, both in terms of age, education, and geography. Young voters in urban areas tend to be more exposed to digital literacy programs, but this is not always accompanied by an ethical understanding of the use of political information. Meanwhile, many political actors both formal and informal still use social media manipulatively that strengthen identity polarization and spread content containing disinformation and hate speech (Azizah, 2023; Danaditya et al., 2022; SAFEnet, 2024).

This phenomenon reinforces the view that technical digital literacy (digital skills) does not automatically lead to digital ethics, let alone a digital culture that reflects the values of deliberative democracy (Singer & McConnell, 2021). A study in Indonesia by Purwantiningsih et al. (2022), along with a conceptual article by Smith (2020), underscores the urgency of promoting digital politeness and ethical responsibility in social media use as an integral part of digital citizenship. Meanwhile, Sari et al. (2024) highlights that moral and legal dimensions are critical elements in shaping a civil digital culture. Furthermore, community-based research by

Wulandari & Winarno (2021) demonstrates that digital ethics can be cultivated not only through normative instruction but also through real-life social practices and collective participation at the local level.

Weak Political Communication Ethics in Digital Space

The studies by Arianto (2022), Trianto (2023), and Bawaslu (2024) show that violations of communication ethics increase during the digital campaign period, including the use of political buzzers, hoaxes containing ethnicity, religion, race and inter-group (SARA), and negative campaigns against political opponents. Low awareness of the principles of citizen journalism and the code of communication ethics has caused social media to become an arena for propaganda rather than dialogue (Felicia & Loisa, 2018).

This shows that Indonesia's digital democracy is still procedural, not substantial, because political communication is not yet rooted in public ethical values, such as honesty, respect, and responsibility (Latifah & Najicha, 2022; Lubis et al., 2022; Yulianto, 2023).

Relevance of Digital Culture in the Context of *Pancasila* Values

The digital literacy program from Kominfo and Siberkreasi which emphasizes the four pillars of digital literacy is a positive first step. However, based on an evaluation by Amaly & Armiah (2021) and Krisnawati et al. (2023), the pillars of digital ethics and digital culture are still less dominant than technical skills. In fact, *Pancasila* values such as deliberation, tolerance, and social justice are very relevant to strengthening a healthy political communication culture in cyberspace.

Digital culture, which is interpreted as the internalization of local and national values into online practices, must be a primary concern in the development of digital literacy curricula and campaigns in the future (Khoirunisa et al., 2022; Wijaya, 2023).

Implications for Strengthening Political Communication Education

Findings from the literature indicate the need for a multidisciplinary approach in digital political communication education combining technical, ethical, and cultural aspects. Educational institutions, governments, and civil society need to work together in designing political communication strategies that educate, not divide. This study recommends the integration of *Pancasila* values in digital literacy programs as an ethical and cultural foundation in building substantial digital democracy. These values are essential in shaping a digital communication culture rooted in tolerance, civic responsibility, and national integrity (Yorman & Sadam, 2025; Yusuf et al., 2024).

To strengthen the literature analysis, there is a thematic table that compiles findings from various references into main themes that are relevant to the focus of this study, namely digital literacy, communication ethics, digital culture, and digital democracy after the 2024 Simultaneous Elections:

Table 1
Literature Analysis on Digital Literacy in Political Communication

Main Themes	Sub-Theme Focus	Literature Sources	Key Findings
Digital Literacy	Definition and dimensions of digital literacy	Amaly and Armiah (2021); Kominfo (2023); Krisnawati et al. (2023)	Digital literacy includes 4 pillars: skills, culture, ethics, and digital security. Government programs are still dominant in technical aspects.
	Indonesian society's literacy level	Kominfo (2024); SAFEnet (2024)	Still low, especially in evaluative skills and digital ethics; has an impact on the high spread of hoaxes.
Political Communication Ethics	Political communication patterns on social media	Latifah and Najicha (2022); Lubis et al. (2022); Yulianto (2023); Bawaslu (2024); Yilmaz et al. (2024)	Political communication is often unethical, contains hate speech and disinformation, especially during political campaigns.
	The role of non-journalistic actors (influencers, buzzers)	Jatmiko (2019); Rianto (2019); Arianto (2022); Danaditya et al. (2022); Azizah (2023); Trianto (2023); SAFEnet (2024)	Political buzzers dominate digital narratives, blurring the lines between personal opinion and factual information.
Digital Culture	Cultural values in digital space	Smith (2020); Singer and McConnell (2021); Wulandari and Winarno (2021); Purwantiningsih et al. (2022); Sari et al. (2024); Kominfo (2024)	A healthy digital culture must uphold tolerance, rationality, and constructive participation.
	Challenges to *Pancasila* values in digital space	Felicia and Loisa (2018); Khoirunisa et al. (2022); Wijaya (2023); Kominfo (2024); SAFEnet (2024); Yusuf et al. (2024); Yorman and Sadam (2025)	Politicization of identity and intolerance often strengthen on social media; lack of awareness of national values.
Digital Democracy and Participation	Patterns of citizens' political participation on social media	Jatmiko (2019); Rianto (2019); Wulandari and Winarno (2021); Purwantiningsih et al. (2022); Sari et al. (2024); Yilmaz et al. (2024)	Social media opens up space for participation, but it is more procedural and not supported by substantial understanding.
	Challenges to the quality of democracy in the digital ecosystem	Arianto (2022); Trianto (2023)	Democratic dialogue is disrupted by polarization, digital noise, and weak public deliberation on online platforms.

Conclusion

Digital literacy based on ethics and culture is an important foundation in building the quality of digital democracy in Indonesia, especially after the 2024 Simultaneous Elections. Findings from the literature show that although social media has opened up wider political participation space, the quality of this participation is still weak due to the dominance of digital narratives by non-journalistic actors, low critical literacy of the community, and minimal understanding of political communication ethics.

Digital literacy programs that have been initiated so far, such as the National Digital Literacy Movement by the Ministry of Communication and Information, have touched on aspects of technical skills, but have not fully reached the dimensions of digital culture and ethics in depth. As a result, the digital space is still vulnerable to the spread of disinformation, hate speech, and politicization of identity, which ultimately weakens the substance of democracy. Thus, there needs to be a strengthening of the understanding that digital literacy is not merely a technological skill, but a reflective ability to use digital space ethically, critically, and responsibly.

There are several recommendations that can be given in this study:

1. Reorientation of digital literacy programs: the government, especially the Ministry of Communication and Information and its strategic partners, needs to balance the focus of digital literacy from merely technical skills to strengthening digital culture and ethics that are contextual to the conditions of Indonesian democracy.
2. Integration of political communication ethics in education: formal and non-formal education curricula need to include education in digital political communication ethics so that the younger generation is not only technically competent, but also critical and has integrity in using the media.
3. Increasing the capacity of local actors and digital communities: local communities, positive influencers, and citizen journalists need to be empowered to become literacy agents who are able to fight the flow of disinformation through fact-based narratives and *Pancasila* values.
4. Strengthening regulation and moderation of digital platforms: the government needs to encourage social media platforms to be more responsible in moderating content, especially that which has the potential to divide society during political contestation.
5. Building an inclusive digital democracy ecosystem: digital participation must be directed towards inclusive and substantive deliberation, by creating healthy public dialogue spaces, free from symbolic violence and algorithmic manipulation.

Preservice Teachers' Perceived Effectiveness of Autonomy Support on Children With Educational Needs

Ryo Okada, Kagawa University, Japan

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Recently, researchers have focused on motivating students with diverse educational needs in regular classrooms. Some students find it difficult to maintain motivation. Motivational research has revealed the positive effect of teachers' autonomy support on students' motivation. The purpose of this study was to examine the characteristics of beliefs regarding autonomy support for students with educational needs among Japanese preservice teachers. Participants were 214 Japanese undergraduates enrolled in teacher training courses. They evaluated the effectiveness of autonomy support for fictional students with and without educational needs in regular classes. General linear model analyses revealed that the preservice teachers rated autonomy support as more effective for both students who experience difficulties in daily classes and those who feel bored because of a mismatch between their abilities and the class level than for a general child. A controlling teaching style was perceived as less effective for students with educational needs. Furthermore, preservice teachers with high controlled motivation perceived controlling teaching as more effective regardless of students' characteristics. These findings suggest that most preservice teachers understand the importance of autonomy-supportive teaching for diverse students at the level of educational beliefs. Teacher training programs should provide opportunities to learn concrete instructional strategies to support students with educational needs. On the other hand, informing preservice teachers with high controlled motivation regarding the evidence regarding the effects of autonomy support and control is also important.

Keywords: perceived effectiveness of autonomy support, educational needs, preservice teachers

Introduction

Autonomy Support for Students' Motivation

Previous studies have suggested that motivation plays an important role in students' academic success (e.g., Pintrich, 2003). It has been well-documented that intrinsic motivation or autonomous motivation can lead to some aspects of academic outcomes, such as academic achievement, greater persistence, and positive attitudes to academic learning (Howard et al., 2021; Ryan & Deci, 2016). Therefore, educational researchers and practitioners have paid attention to how they can support students' motivation in classroom settings.

According to Self-Determination Theory (Ryan & Deci, 2017), autonomy support is a key component of motivational teaching. Autonomy support is a useful theoretical framework for capturing teachers' support for students' motivation. In the research literature, many factors have been found to affect individuals' motivation (Deci & Ryan, 1985). These factors were integrated within the framework of autonomy support in interpersonal interaction contexts. Deci and Ryan (1987) defined autonomy support as encouraging people to make their own choices. In more detail, as defined by Black and Deci (2000), autonomy support means that an individual in a position of authority (e.g., a teacher) takes the other's (e.g., student's) perspective, acknowledges the other's feelings, and provides the other with pertinent information and opportunities for choice, while minimizing the use of pressures and demands. Reeve et al. (2022) applied the concept of autonomy support to teachers' motivating styles in classroom settings and identified the following seven aspects: (a) taking the students' perspective, (b) inviting students to pursue their personal interests, (c) presenting learning activities in need-satisfying ways, (d) providing explanatory rationales, (e) acknowledging and accepting negative feelings, (f) relying on invitational language, and (g) displaying patience. In sum, autonomy support is the instructional effort supporting students' needs for autonomy, which is the need to be the origin of one's behaviors.

Control represents the opposite teaching style to autonomy support. Controlling teaching refers to the adaptation of a teacher-focused authoritarian attitude and an interpersonal tone of pressure in which the teacher prescribes what students should think, feel, and do, irrespective of what students prefer (Reeve et al., 2022). Researchers regard autonomy support and control as two opposite ends of a dimension (e.g., Deci et al., 1981; Reeve, 2009). On the other hand, some empirical studies found two orthogonal factors of autonomy support and control (e.g., Bartholomew et al., 2011; Reeve et al., 2013; Shih, 2013).

Autonomy-supportive teachers exhibit distinctive teaching strategies. In observational studies, autonomy-supportive teachers ask what students want to do, create independent work time, encourage students' voice, provide rationales, and provide informational feedback (Reeve et al., 2008). On the other hand, controlling teachers give directives, utter "should statements," tell "the right way," and ask controlling questions.

Empirical studies have shown that teachers' autonomy support increases students' intrinsic motivation. Deci et al. (1981) found that teachers' self-rated autonomy-supportive teaching was related to increases in children's intrinsic motivation in the sample of elementary school students. In addition, most studies focused on students' perceptions of teachers' autonomy support (e.g., Yu et al., 2018). Okada (2018a) revealed that students' perceptions of teachers' autonomy support were related to academic grade, intrinsic motivation, and school well-being by conducting a meta-analysis. A recent meta-analytic study including teachers' and

parents' need support verified the effects of autonomy support on students' academic success (Howard et al., 2024; Patzak & Zhang, 2025). Thus, it was verified that teachers' autonomy support plays a crucial role in students' academic success.

Teachers' Thinking of Autonomy Support

Teachers' autonomy-supportive behaviors are influenced by several factors. Among them, teachers' thinking or beliefs regarding effective teaching can have an impact on their actual teaching behaviors. Teachers hold thinking or beliefs regarding how it should be done, what methods are most effective, who is responsible for it, and so on. Teachers' beliefs are used to filter and interpret information, frame a specific problem or task, and guide immediate action (Buehl & Beck, 2015). Beliefs regarding teaching vary from teacher to teacher, and the belief can guide the classroom-level decisions of teachers (Fives et al., 2015).

As for autonomy-supportive teaching, teachers' thinking also can vary. Reeve (2009) stated that teachers who adopt controlling behavior (as opposed to autonomy-supportive teaching) hold the "maximal-operant principle" of motivation. The maximal-operant principle represents the belief that the likelihood of producing long-term interest in academic tasks is assumed to vary positively with the size of a reward. That is, some teachers interact with their students in controlling way because they believe that such teaching is effective. Reeve et al. (2014) examined the effect of teachers' beliefs on their autonomy-supportive teaching in the samples of eight different nations. The beliefs examined in the study were perceived effectiveness, normalcy, and ease of implementation regarding autonomy support. Among them, effectiveness was a strongest predictor of autonomy-supportive teaching behavior. This suggests that teachers who believe the effectiveness of autonomy support tend to behave in autonomy-supportive way actually.

Beliefs regarding the effectiveness of autonomy support vary across several factors. Okada (2017) examined teachers' perceived effectiveness of autonomy support toward motivation. Perceived effectiveness of autonomy support toward motivation was "teachers' perception that supporting students' autonomy is effective for motivating them" in the study. Perceived effectiveness of autonomy support toward motivation was higher in elementary school teachers than in high school teachers. Among high school teachers, perceived effectiveness of autonomy support toward motivation increased as yeas of teaching experience. In addition, preservice teachers think that autonomy-supportive teaching is less effective for motivating students than professional teachers (Okada, 2018b). On the other hand, preservice teachers who were themselves autonomously motivated for learning considered autonomy-supportive teaching as more effective (Okada, 2020).

Autonomy Support for Student With Special Educational Needs

In recent years, there has been growing attention to how to motivate students with diverse educational needs in regular classes. Ministry of Education, Culture, Sports, Science and Technology-Japan (2022) in Japan reported that 6.5 % of students in regular classes have significant difficulties in learning. However, methods to motivate them in regular classes have not been yet fully established.

Students with learning disabilities (LD) can have deficits in their academic motivation. Louick and Muenks (2022) stated that students with LD tend to attribute their difficulties to their own stable traits and their success to external factors other than their efforts, which can

lead to low motivation. A recent meta-analysis suggests that students with LD have lower intrinsic motivation compared to students without LD (Okada, 2024). Students who have difficulties in regular classes are likely to struggle to maintain their motivation.

Previous studies have demonstrated that teachers' autonomy support has an impact on students with LD. Deci et al. (1992) showed that perceived teachers' autonomy support was positively related to students' autonomous motivation in a sample of students with LD. The positive relations between teachers' autonomy support and intrinsic motivation has been confirmed in several studies (e.g., Loopers et al., 2024; Patrizia et al., 2018). These findings suggest that teachers' autonomy support can promote motivation of students with LD.

Another research literature examined the effects of autonomy support on students with high cognitive abilities. Gifted students have special needs in school learning. Previous studies have found that gifted students generally have high levels of intrinsic motivation (e.g., Gottfried & Gottfried, 1996; Hornstra et al., 2020). However, some gifted students have difficulty maintaining motivation in regular classes (Agaliotis & Kalyva, 2019). Despite their characteristically superior cognitive abilities, gifted students do not realize their full potential. As a result, they feel bored in classes and lose their motivation to learn. It has been suggested that gifted students are prone to feeling bored in school (e.g., Plucker & Mclntire, 1996; Preckel et al., 2010). Previous studies have suggested that teachers' autonomy support can affect the motivation of gifted students. Gifted students who perceived teachers' autonomy-supportive teaching reported higher levels of intrinsic motivation and engagement in their learning at school (Hornstra et al., 2020).

Given the recent emphasis on inclusive classroom, it is an important challenge to establish teaching methods that support the motivation of students with diverse educational needs in regular classes. In particular, preservice teachers are expected to acquire teaching methods that support diverse students' autonomy and motivate them for learning. As discussed earlier, autonomy-supportive teaching can be influenced by teachers' beliefs (Reeve et al., 2014). Therefore, this study focused on how students in teacher training courses perceive the effectiveness of autonomy-supportive teaching for school students with diverse educational needs. This would provide useful insights to support preservice teachers to acquire versatile teaching skills.

Present Research

The purpose of this study was to examine the characteristics of beliefs regarding autonomy support for students with educational needs among Japanese preservice teachers. The main research question was how preservice teachers perceive the effectiveness of autonomy support differently for students who have educational needs and those who do not. Given that a key concept of autonomy support is taking each student's perspective, we predicted that preservice teachers would perceive autonomy support to be more effective for students who struggle with learning. Furthermore, it was hypothesized that preservice teachers who have autonomous motivation would perceive autonomy-supportive teaching as more effective.

Method

Participants and Procedures

Participants were 214 Japanese university students (96 males, 117 females and 1 unspecified) enrolled in a teacher training course, with a mean age of 20.27 years (*SD* = 0.93). Approximately eighty-three percent (82.71%) of participants had not yet completed their practicum in elementary or junior high schools at the time of the study. All participants were volunteers and were informed that the outcome and participation would not affect their course grades. After the orientation, the participants were given a booklet and completed a questionnaire. Seventy-three participants were part of the sample from a previous study (Okada, 2020). This study was approved by the research ethics committee of Faculty of Education, Kagawa University (No. 2305).

Measures

Perceived Effectiveness of Autonomy Support

Participants were randomly presented either a short description of an elementary school student with some difficulties in daily classes (difficulty condition) or an elementary school student who feels bored due to a mismatch between his/her abilities and class levels (boredom condition). For the difficulty condition, participants were instructed: "Imagine a student in an elementary school math class who struggles academically and therefore has difficulty keeping up with daily lessons." For the boredom condition, participants were instructed: "Imagine a student in an elementary school math class who is good at studying and therefore finds the daily lessons too easy and boring." Following the instruction, participants were asked to rate the effectiveness of autonomy-supportive or controlling teaching behaviors to motivate the student mentioned above. Okada's (2017) seventeen items were used for autonomy-supportive or controlling teaching behaviors. Sample items are "Giving students the opportunity to make their own decisions during class" for autonomy support (ten items) and "Creating an atmosphere of 'I must study' during class" for control (seven items). Each item was rated on a 5-point Likert scale, from 1 (*not effective*) to 5 (*effective*). In addition to the two conditions, a general condition was also set up in which no description of a student was presented. For the general condition, some of the data from a previous study (Okada, 2020) was utilized. In the study, participants rated the same items without imaging a specific student. The instruction for the general condition was as follows: Imagine a student in an elementary school math class. The number of participants was eighty-three in the difficulty condition, fifty-eight in the boredom condition, and seventy-three in the control condition.

An exploratory factor analysis with the maximum likelihood method was administered to the data. Eigenvalues were 3.33, 2.37, 1.74, 1.18, 1.00, and 0.93 for each factor, and the value of BIC was the lowest for the three-factor solution; thus, a three-factor model was adopted. Four items with low factor loadings were removed. The result is presented in Table 1. Three factors were interpreted as "perceived effectiveness of control," (six items: e.g., "Showing clear deadlines for assignments and submissions"), "perceived effectiveness of autonomy support" (four items: e.g., "Adjusting lessons to suit the students' interests"), and "perceived effectiveness of catch-up support" (three items: e.g., "Providing individual support to students who are having trouble with assignments during class"). The estimated reliability coefficients (omega coefficient) were found to be .76 for control, .68 for autonomy support,

and .54 for catch-up support. Because the estimated reliability coefficient for catch-up support was slightly low, the following results regarding catch-up support should be interpreted with caution. The descriptive scores were calculated by averaging the item scores.

Table 1
Results of Factor Analysis

	F1	F2	F3
6. Showing clear deadlines for assignments and submissions	**.66**	.02	.05
5. Telling students that they will be in trouble if they don't study	**.65**	.01	.06
8. Creating an atmosphere of "I must study" during class	**.62**	−.03	−.17

16. Giving instructions using "do this" expression during class	**.48**	−.16	.19
12. Giving instructions to students in the form of questions, such as "Is it time to talk?"	**.47**	.00	.05
9. Adjusting lessons to suit the students' interests	−.06	**.79**	.01
10. Giving students the opportunity to make their own decisions during class	.01	**.73**	.03
15. Letting students find the ways to solve and think by themselves during class	.09	**.43**	−.15
13. Helping students realize what they are good at during class	.12	**.39**	.10
11. Providing individual support to students who are having trouble with assignments during class	.11	.00	**.65**
2. Communicating clearly what will be on the test during class	.02	.00	**.50**
3. Adjusting the lessons at the pace of the students at that time rather than staying on lesson plans	−.17	.08	**.45**
F1		.04	.19
F2			−.10

Academic Motivation

Participants' motivation was measured using Okada and Nakaya's (2006) Academic Motivation Scale. The scale was developed along the motivation constructs in self-determination theory (Ryan & Deci, 2017). There are four subscales of four items each: external regulation (e.g., "Because I'm forced to do it"), introjected regulation (e.g., "Because

I'll feel anxious if I don't"), identified regulation (e.g., "Because I think it's useful for my future"), and intrinsic motivation (e.g., "Because it's fun"). Participants were asked to rate each item on a 5-point Likert scale ranging from 1 (*not true*) to 5 (*true*).

The omega coefficients for the subscales were .80 for external regulation, .73 for introjected regulation, .81 for identified regulation, and .88 for intrinsic motivation. In previous studies, four subscales were often compounded to two motivation composites (e.g., Lens & Vansteenkiste, 2008). The present study created composite scores for autonomous and controlled motivation by averaging the subscales of intrinsic and identified and introjected and external regulation, respectively.

Analytic Procedures

First, a series of analysis of variance (ANOVA) was conducted to examine the mean difference in perceived effectiveness. Multiple comparisons were performed with the Holm test. Second, general linear model analyses were conducted using the scores of perceived effectiveness of autonomy support, control, and catch-up support as criterion variables. The predictor variables were two dummy codes representing the conditions, with the general condition as the reference group. The two motivation scores of participating students were entered as covariates. All analyses were conducted using R version 4.3.3.

Results

Descriptive Statistics in Each Condition

Descriptive statistics are presented in Table 2. ANOVA results indicated significant differences in perceived effectiveness across conditions. Perceived effectiveness of autonomy support was significantly higher in the difficulty and boredom conditions compared to the general condition (F (2,211) = 13.41, $p < .001$, $\eta^2 = 0.11$). On the other hand, perceived effectiveness of control was significantly lower in the difficulty and boredom conditions compared to the general condition (F (2,211) = 11.76, $p < .001$, $\eta^2 = 0.10$). Perceived effectiveness of catch-up support was significantly higher in the difficulty, general, and boredom conditions in order (F (2,211) = 29.03, $p < .001$, $\eta^2 = 0.22$).

Table 2
Descriptive Statistics in Each Condition

	Difficulty condition		General condition		Boredom condition		F	η^2
	M	*SD*	*M*	*SD*	*M*	*SD*		
Perceived effectiveness of autonomy support	4.52	0.47	4.23	0.51	4.63	0.36	13.41***	0.11
Perceived effectiveness of control	2.89	0.73	3.40	0.63	2.94	0.77	11.76***	0.10

Perceived effectiveness of catch-up support	4.04	0.69	3.82	0.53	3.17	0.83	29.03***	0.22

Note. *** $p < .001$.

Effects of Conditions × Academic Motivation on Perceived Effectiveness

General linear model analyses examined the effects of conditions and participants' academic motivation. Pearson correlations are presented in Table 3. A series of general linear model analyses examined the main effects of two dummy codes representing experimental conditions, two academic motivation scores, and the interaction effects between the dummy codes and the academic motivation scores. Condition 1 represents the difficulty condition, and condition 2 represents the boredom condition. The academic motivation scores were centered to avoid multicollinearity (Jaccard & Turrisi, 2003). In total, four interaction effects were created, consisting of two dummy codes and two academic motivation scores. In the first step, the main effects of two dummy codes and the two academic motivation were entered, and in the second step, the interaction effects were added. However, the increase in explained variance from step 1 to step 2 was not significant in all analyses. Therefore, a model with only the main effects of conditions and academic motivation was adopted. The results are shown in Table 4.

Table 3

Pearson Correlations Among Variables

	1	2	3	4
1. Perceived effectiveness of autonomy support				
2. Perceived effectiveness of control	−.01			
3. Perceived effectiveness of catch-up support	.09	.15*		
4. Autonomous motivation	.14*	.08	−.05	
5. Controlled motivation	.02	.20**	.13	−.13

Note. * $p < .05$, ** $p < .01$.

For perceived effectiveness of autonomy support, both condition 1 ($B = 0.30$, $p < .001$, 95%CI [0.15, 0.44]) and condition 2 ($B = 0.38$, $p < .001$, 95%CI [0.22, 0.54]) showed significant effects. The effects of participants' academic motivation were not significant. For perceived effectiveness of control, both condition 1 ($B = −0.50$, $p < .001$, 95%CI [−0.71, −0.28]) and condition 2 ($B = −0.45$, $p < .001$, 95%CI [−0.70, −0.21]) showed significant effects. The effect of participants' controlled motivation was also significant ($B = 0.09$, $p = .004$, 95%CI [0.03, 0.15]). For perceived effectiveness of catch-up support, both condition 1 ($B = 0.24$, $p = .03$, 95%CI [0.02, 0.45]) and condition 2 ($B = −0.64$, $p < .001$, 95%CI [−0.88, −0.40]) showed significant effects. The effects of participants' academic motivation were not significant.

Discussion

Present Findings

The purpose of this study was to examine the characteristics of beliefs regarding autonomy support for students with educational needs among Japanese preservice teachers. Previous studies have found that teachers' autonomy support affects students' grades, motivation, and school well-being (Howard et al., 2024; Okada, 2018a; Patzak & Zhang, 2025). The positive effects of teachers' autonomy support have also been verified in samples of students with some educational needs (Deci et al., 1992; Hornstra et al., 2020; Loopers et al., 2024). Furthermore, the practice of autonomy-supportive teaching is influenced by teachers' beliefs (Reeve et al., 2014). Preservice teachers are expected to acquire teaching methods that support the autonomy of diverse students and motivate them for learning. Therefore, this study focused on how preservice teachers perceive the effectiveness of autonomy support for students with educational needs.

First, the perceived effectiveness of autonomy support was higher in the conditions involving students with educational needs than in the condition involving a general student. This suggests that preservice teachers believe that autonomy-supportive teaching can motivate students with special educational needs. Consistent with this, they perceived the effectiveness of controlling teaching for students with some educational needs to be lower. Interestingly, they thought that autonomy support could motivate both students who have some difficulties in daily lessons and students who feel bored with daily lessons due to a mismatch between their abilities and the class level. What they have in common is that the students have their unique needs regarding interests and decisions. Both students with difficulties and students with very high cognitive abilities tend to struggle to maintain their motivation in the regular classes (e.g., Agaliotis & Kalyva, 2019; Louick & Muenks, 2022). Autonomy-supportive

teaching can help them keep their motivation for learning. Preservice teachers have beliefs regarding motivational strategies that are consistent with empirical findings (Howard et al., 2024; Okada, 2018a; Patzak & Zhang, 2025).

On the other hand, catch-up support was only perceived as effective for students with difficulties in learning. Rather, for students who feel bored with daily lessons because of their high ability, preservice teachers perceived that catch-up support was less effective. Catch-up support consisted of items showing teaching that compensate students' understanding of lessons and completing assignments. Students with difficulties in learning have a need to individualize the learning processes to ensure their understanding, and preservice teachers seem to recognize this need.

In addition to the characteristics of the students, the preservice teachers' own academic motivation was associated with their perceived effectiveness of support. Preservice teachers who have high controlled motivation perceived controlling teaching as more effective, regardless of the characteristics of students. Richardson (2003) suggested that the most important source of teachers' beliefs is experience with schooling and instruction. Also, Reeve (2009) assumed that teachers' own control-oriented personality dispositions promotes controlling teaching style. Preservice teachers have long experiences as school students before entering the teacher training courses, which form their beliefs regarding teaching and learning. Preservice teachers who tend to learn through controlled motivation may believe that such controlling motivational techniques are effective. However, empirical studies have suggested that controlling teaching can have detrimental effects on students' motivation (Haerens et al., 2016). Teacher training programs should focus not only on evidence regarding the evidence regarding the effects of autonomy support and control, but also on preservice teachers' own motivation styles.

We can draw a practical implication from present findings. Most preservice teachers believe that autonomy support is more effective for students with some educational needs in regular classes. They appear to recognize the importance of autonomy-supportive teaching for diverse students at the level of educational beliefs. Therefore, teacher training programs should provide opportunities to learn concrete instructional strategies to support students with educational needs. Additionally, preservice teachers with high controlled motivation should be informed regarding evidence on the effects of autonomy support and control.

Limitations

This study has three main limitations. First, most participants had not yet completed practicum in elementary or junior high schools at the time of the survey. In that sense, the preservice teachers in this study were in the early stages of their teaching careers. Levin (2015) suggested that preservice teachers' pedagogical beliefs can be influenced by their experiences observing and practicing in classroom during their teacher education program. Preservice teachers' perceptions of the effectiveness of autonomy support are expected to change as they learn teaching methods and gain experience. In particular, practicum may affect their perceptions of the effectiveness of autonomy support. Future studies should examine how their perceptions of the effectiveness of autonomy support change during teacher training programs.

Second, the vignettes did not provide detailed descriptions of students' difficulties. This study assumed two types of educational needs for students in regular classes: a student who has

some difficulty with daily lessons and a student who feels bored with daily lessons due to a mismatch between his/her abilities and the class level. Although the students with educational needs described in this study seem to be common in Japanese elementary schools, the students' actual needs may be diverse in terms of their backgrounds, symptoms, relationships with classmates and teachers, etc. Depending on the situation in which the student is placed, preservice teachers may perceive the effectiveness of various teaching methods differently. The findings of this study should be considered in more detailed case studies of students with educational needs.

Third, this study focused solely on preservice teachers' perceptions. Previous study has shown that thinking and perceptions of autonomy support affect actual teaching behaviors (Reeve et al., 1999; Reeve et al., 2014). In addition, teachers' beliefs may be a target of intervention in educational programs (Reeve & Cheon, 2014). Therefore, it is reasonable to focus on preservice teachers' perceptions of the effectiveness of autonomy support. However, the correlation between perceptions and behaviors regarding autonomy-supportive teaching is not perfect, and there may be a discrepancy between the two. Considering that it is the teacher's behaviors that directly affect students, in addition to the perceptions of the effectiveness of autonomy support, it is also necessary to focus on preservice teachers' autonomy supportive teaching behaviors.

Conclusions

This study addressed how preservice teachers perceived the effectiveness of autonomy support for students with and without educational needs. They perceived that autonomy support was more effective for students with some educational needs. Teacher training programs should provide opportunities to learn concrete instructional strategies to support students with diverse educational needs. Providing preservice teachers with autonomy-supportive teaching strategies for students with educational needs may be effective. This approach could foster classrooms where diverse students maintain their motivation to learn.

Abstract

This study analyzes the educational affordances of Sketchfab as a digital platform for representing technological processes through interactive 3D models, emphasizing its relevance for STEM and technology education. The paper considers how the use of three-dimensional visualization contributes to improved academic performance by enabling learners to interpret complex technological phenomena more effectively and by supporting the development of advanced spatial reasoning. The research is framed within the ongoing shift toward the digitalization of learning environments and the increased incorporation of immersive technologies into pedagogical practice. To investigate these aspects, a mixed-methods methodology was applied, integrating statistical evaluation of user activity with qualitative data gathered from educator and student interviews and survey responses. Results demonstrate a substantial increase in the adoption of Sketchfab among both educators and learners between 2023 and 2024, with teacher utilization increasing by 40% and student engagement rising by 37.5%. The platform is predominantly employed for the visualization of 3D models, the facilitation of project-based learning, and the enhancement of laboratory-based activities. Students reported a high level of satisfaction: 85% agreed that Sketchfab improved their comprehension of complex disciplinary content, while 90% indicated that it contributed to the development of their spatial reasoning skills. The findings indicate that Sketchfab provides significant pedagogical value, particularly within technical and STEM-oriented educational contexts. The integration of Sketchfab into instructional design not only enriches multimodal content delivery but also promotes learner autonomy and collaboration.

Keywords: Sketchfab, 3D visualization, STEM education, spatial reasoning, project-based learning

Introduction

In the contemporary educational landscape, increased emphasis is placed on the integration of advanced digital technologies-particularly virtual 3D modeling tools-to enhance the quality and effectiveness of the learning process. One such innovative resource is Sketchfab, an online platform for creating, displaying, and interacting with 3D models, which possesses the potential to transform approaches to the visualization of technical processes within educational institutions (Areshonkov, 2020). The affordances of Sketchfab contribute to more immersive, interactive, and learner-centered instruction, which is especially important in the context of technical and engineering education.

In the conditions of martial law in Ukraine, the educational system has encountered significant challenges that necessitate the adoption of flexible and resilient instructional solutions. As illustrated in Figure 1, "Virtual Education in Ukraine," virtual learning technologies have gained particular relevance, ensuring pedagogical continuity by providing access to high-quality digital learning resources despite restrictions on physical presence and limited infrastructural capacity (Rani, 2025). Within this context, Sketchfab emerges as a powerful pedagogical instrument for teaching technical disciplines, as the platform enables precise modeling and visualization of complex technological processes. This, in turn, supports the development of deeper conceptual understanding and facilitates the integration of theoretical knowledge with practical application in a safe, accessible, and digitally enriched learning environment.

Figure 1
Virtual Education in Ukraine

The relevance of this study is determined by the urgent need to adapt the educational process to contemporary realities, particularly under conditions in which traditional instructional approaches are disrupted by constraints associated with military operations (Efimov, 2020).

To advance the modernization of engineering education in Ukraine, it is essential not only to conduct theoretical investigations but also to implement practice-oriented research that fosters independent, creative, and innovation-driven thinking among future engineers. The integration of advanced digital technologies into the instructional process-particularly 3D modeling tools-contributes to the expansion of students' professional worldview, strengthens their cognitive engagement, and promotes the development of transversal and domain-specific scientific competencies.

Integrating advanced digital tools for the visualization of technical processes also enhances learning effectiveness, supports multimodal cognition, and sustains high educational standards even in exceptional or crisis-driven contexts, including the current conditions of martial law in Ukraine. Within this framework, the Sketchfab platform serves as an immersive visualization environment that enables engineering students to explore object modeling and create interactive 3D representations across various stages of professional preparation.

Despite these advantages, there remains a significant need to improve the instructional and methodological support that ensures the pedagogically sound integration of such tools into the educational process. Therefore, the purpose of this article is to examine the pedagogical potential of using Sketchfab as an immersive visualization platform for representing technical processes within the educational environment and to identify existing challenges along with possible solutions that can ensure high-quality professional training in Ukraine's contemporary educational ecosystem.

Materials and Methods

To solve the problem, the following set of methods was used: theoretical analysis, diagnostic, teaching methods, primary statistical processing, and generalization of the obtained data.

Results and Discussion

The study examined the role and significance of visualization technologies in contemporary educational practice, highlighting their potential in the development of technical competencies within engineering education. Particular emphasis was placed on the application of 3D modeling tools, specifically the Sketchfab platform, for the visualization of technical processes in an educational environment, with consideration of the constraints imposed by the state of martial law in Ukraine.

This research is grounded in a comprehensive analysis of current trends in digital education and their transformative impact on the teaching and learning process. The focus was placed on enhancing technical competence among engineering students under conditions of limited resources and a complex security context, emphasizing the need for resilient and adaptable educational strategies.

To achieve these objectives, an extensive review of scientific literature on the integration of 3D modeling and virtual reality in technical education was conducted. Special attention was given to studies exploring the adaptation of instructional design and pedagogical strategies during periods of military conflict and instability.

The study also incorporated the practical implementation of virtual 3D models developed on the Sketchfab platform within technical discipline classes for both secondary school and engineering students. These models illustrated technical processes, mechanisms, and technological applications, thereby facilitating the translation of theoretical knowledge into practical understanding and supporting experiential learning in constrained educational settings.

A comprehensive content analysis of materials available on the Sketchfab platform was conducted to evaluate their educational potential within the Ukrainian context, particularly considering the adaptations required under martial law conditions. This analysis focused on

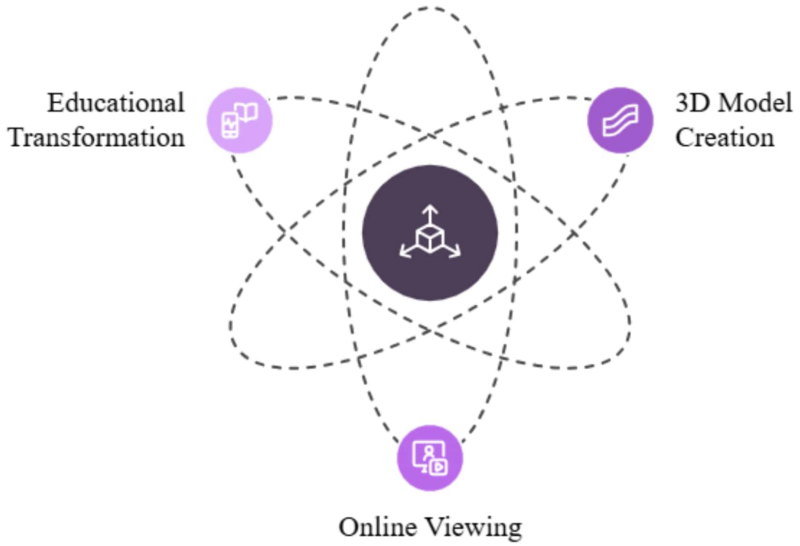
multiple dimensions, including the technical quality of 3D models, the availability of step-by-step instructional guidance, interactivity features, accessibility under limited technological resources, and the alignment of digital resources with specific educational objectives and expected learning outcomes.

The study revealed that Sketchfab models vary in complexity, from basic visualizations suitable for introductory lessons to highly detailed simulations for advanced technical training. Instructional guidance often included annotations, embedded instructions, and interactive labels, which enhanced students' ability to engage with the content independently. These features were particularly valuable in situations where classroom teaching was disrupted due to emergency conditions, as they allowed students to continue learning in a self-directed and flexible manner.

To summarize the findings, the analysis results are presented in Table 1, highlighting key aspects of Sketchfab materials and their alignment with Ukrainian educational standards under martial law conditions.

Furthermore, a comparative evaluation was conducted between conventional teaching methods for technical processes and the use of digital 3D models. The analysis highlighted that 3D visualizations significantly improve spatial reasoning, engagement, and comprehension of complex systems, while traditional methods often require more physical resources and direct teacher supervision.

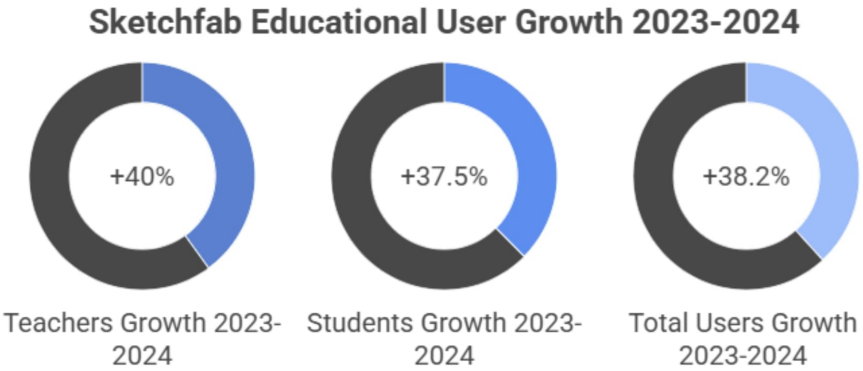
Overall, these research methods provide a comprehensive understanding of Sketchfab's potential as a pedagogical tool for visualizing complex technical processes, supporting active learning, and ensuring continuity of education in emergency and resource-limited conditions.



The figure illustrates how Sketchfab 3D models facilitate interactive learning, support curriculum alignment, and enhance student engagement, particularly under conditions of emergency education Figure 2.

Table 1

Content Analysis of Sketchfab Educational Materials



Dimension	Observed Characteristics	Educational Relevance
Technical Quality	High-resolution 3D models, some low-poly models	Facilitates accurate visualization of technical processes
Instructional Guidance	Step-by-step instructions, annotations, interactive labels	Supports self-directed learning and independent practice
Alignment with Learning Outcomes	Models mapped to curriculum objectives	Ensures relevance for technical, STEM, and vocational education
Accessibility	Requires internet access and moderate device specifications	May limit usability under constrained resources
Interactivity	Rotation, zoom, embedded animations, measurement	Enhances spatial understanding and cognitive engagement
Adaptability	Models adaptable to emergency teaching contexts	Maintains continuity of education under martial law and resource constraints

Figure 2
Sketchfab's Impact on Education

The first graph illustrates the growth dynamics of Sketchfab users in the educational sector from 2023 to 2024, categorized into teachers, students, and the total number of users (Figure 3). The data indicate a significant increase in adoption, with the number of teachers using Sketchfab rising from 320 in 2023 to 450 in 2024, representing a 40% growth. Similarly, student engagement has increased from 1,200 to 1,650 users, reflecting a 37.5% rise. Overall, the total number of users has grown from 1,520 to 2,100, marking an increase of 38.2%.

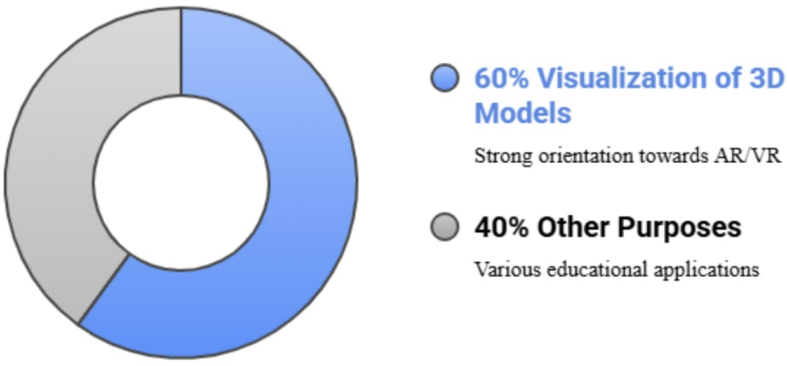
Figure 3
Number of Sketchfab Users Among Teachers and Students

The observed upward trend reflects an increasing recognition of Sketchfab's pedagogical affordances in promoting digital literacy, facilitating immersive learning experiences, and supporting interdisciplinary educational approaches. The growing adoption of the platform by educators underscores its integration into instructional design, particularly within STEM education, where three-dimensional visualization contributes to cognitive load management, spatial reasoning development, and conceptual understanding.

A notable increase in student engagement suggests a paradigm shift toward interactive and constructivist learning environments. In such contexts, learners actively explore, manipulate, and analyze 3D content, constructing knowledge through experiential and inquiry-based

approaches. This aligns with contemporary pedagogical frameworks that emphasize multimodal representations of information, active learning strategies, and student-centered methodologies.

The expansion of Sketchfab usage can also be linked to the broader digitalization of education, the demand for remote and blended learning solutions, and the growing interest in immersive educational technologies. These trends highlight the necessity for systematic research on the effects of 3D visualization tools on learning outcomes and the development of evidence-based strategies for their effective pedagogical implementation.



Analysis of the collected data indicates that Sketchfab is widely utilized in educational settings, primarily due to its potential to enhance visualization of learning materials and to support project-based and collaborative learning experiences. Its adoption represents a meaningful step toward integrating advanced digital tools to enrich the teaching and learning process.

The analysis of the collected data demonstrates that the predominant objective for integrating Sketchfab into the educational process is the visualization of 3D models, with 60% of educators emphasizing this purpose (see Figure 4). This finding underscores a pronounced orientation of contemporary teaching practices toward immersive technologies, including augmented reality (AR) and virtual reality (VR), which are increasingly recognized as transformative tools in modern pedagogy.

The integration of 3D and virtual models into instruction plays a significant role in fostering both domain-specific and interdisciplinary competencies. By providing a tangible representation of abstract and complex phenomena, these digital tools enhance conceptual understanding and support the cognitive processes involved in learning technical and scientific content.

Furthermore, the employment of virtual visualization strategies contributes to the development of higher-order thinking skills, such as spatial reasoning, problem-solving, and analytical thinking. This approach aligns with contemporary educational paradigms that prioritize experiential and constructivist learning, enabling students to interact dynamically with subject matter in ways that traditional methods cannot replicate.

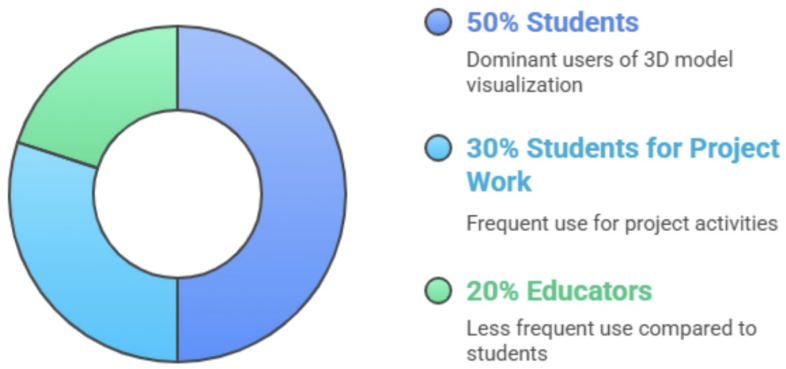


Figure 4
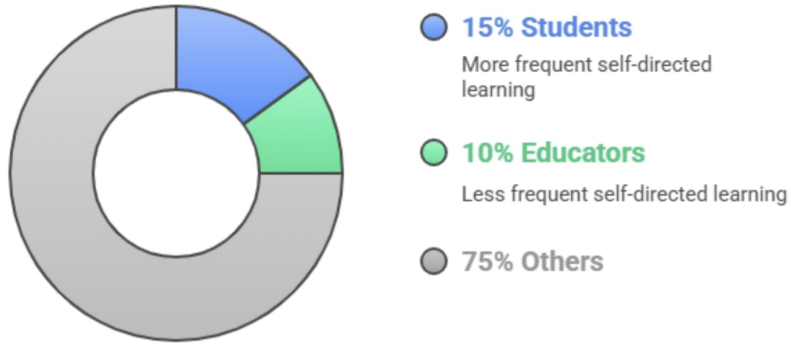
Pedagogical Priorities of Using Sketchfab in Education

Among students, 3D model visualization also dominates (50%), yet they use the platform more frequently for project work (30%) compared to educators (20%). This trend aligns with modern



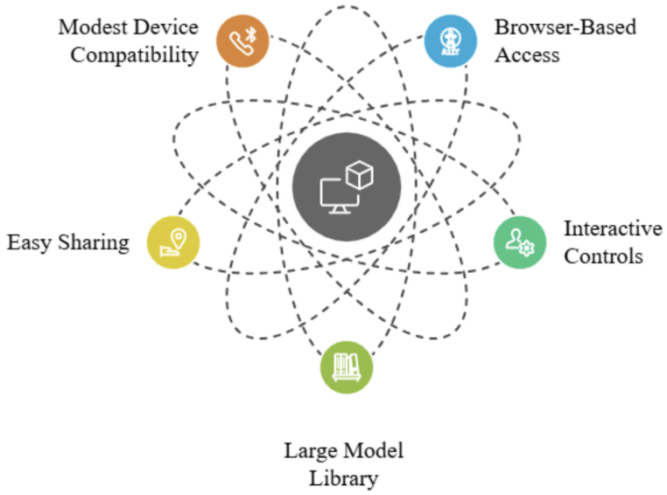
requirements for developing project-based competencies and implementing inquiry-based learning methodologies (Figure 5).

Figure 5
Distribution of 3D Model Visualization Usage

Interestingly, students utilize Sketchfab for self-directed learning (15%) more often than educators (10%) (Figure 6). This underscores the growing importance of self-regulated learning environments and reinforces the relevance of blended learning and flipped classroom methodologies.

Figure 6
Sketchfab Usage for Self-Directed Learning

The utilization of Sketchfab for laboratory activities appears to be minimal, with only 5% of students and 10% of educators reporting its use. This suggests that the integration of 3D models into laboratory settings may necessitate additional pedagogical scaffolding, as well as access to specialized technical infrastructure. Incorporating such resources effectively requires careful instructional design to ensure meaningful engagement and learning outcomes.



Overall, the analyzed findings substantiate that the incorporation of digital tools, specifically Sketchfab, contributes significantly to the development of digital literacy, facilitates the practical implementation of STEM education frameworks, and enhances cognitive engagement through interactive and immersive learning experiences.

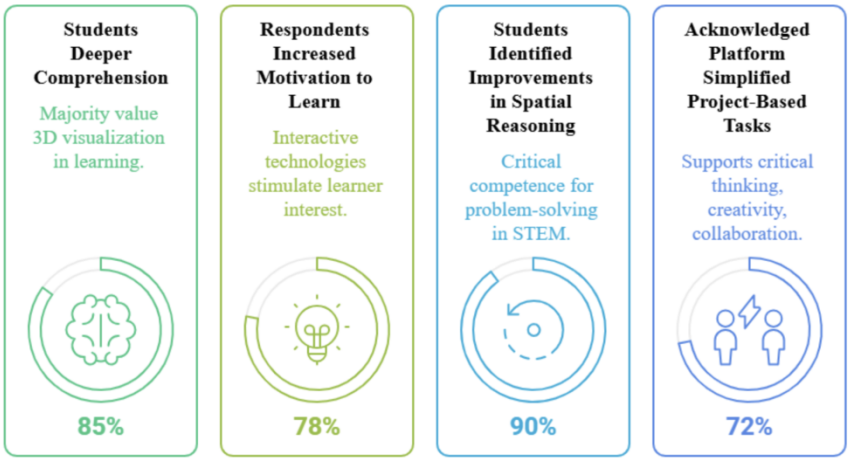
Optimizing instructional strategies through virtual and 3D technologies can markedly increase the effectiveness of the educational process, aligning pedagogical practices with the evolving

requirements of the contemporary educational landscape. As illustrated in Figure 7. Enhancing Education with 3D Models, the model demonstrates how interactive 3D visualization can serve as a catalyst for deeper conceptual understanding, foster experiential learning, and provide learners with a dynamic platform for exploration and experimentation.

Research evidence demonstrates the active utilization of the Sketchfab platform by both educators and learners. Instructors engage with the platform for an average of 3.5 hours per week, indicating its integration into instructional practices, particularly for the visualization and creation of 3D models that support cross-disciplinary applications. This practice aligns with contemporary constructivist approaches, emphasizing experiential and visual learning strategies.

Figure 7
Enhancing Education With 3D Model

Students, in turn, devote more time to Sketchfab, averaging 5.2 hours per week, reflecting heightened motivation, engagement, and learner-centered participation in educational activities. Such intensive interaction with digital 3D tools highlights the platform's potential to enhance cognitive and metacognitive skills, including spatial reasoning, imaginative thinking, and autonomous learning. The overall mean usage of 4.3 hours per week illustrates a broader trend toward interactive, technology-enhanced pedagogies that foster active and personalized learning experiences.



Survey results presented in Table 2 further underscore the pedagogical efficacy of Sketchfab. A substantial majority of students (85%) indicated that the platform facilitates deeper comprehension of learning materials, demonstrating the value of 3D visualization in promoting conceptual understanding and knowledge acquisition in complex academic domains. Additionally, 78% of respondents reported increased motivation to learn, highlighting the role of interactive and visually mediated technologies in stimulating learner interest and sustained engagement.

Table 2
Impact of Using Sketchfab on Learning Outcomes (Survey of Students)

Learning outcome	% of Students agreeing
Better understanding of the material	85%
Increased motivation	78%
Development of spatial thinking	90%
Facilitation of project work	72%

Moreover, 90% of students identified improvements in spatial reasoning, a critical competence for problem-solving in STEM disciplines, while 72% acknowledged that the platform simplified project-based tasks, thereby supporting the development of critical thinking, creativity, and collaborative skills (Figure 8). Collectively, these findings emphasize the transformative potential of digital 3D modeling tools in fostering higher-order cognitive skills and enhancing the overall quality of contemporary learning experiences.

Figure 8
Students Perception of Sketchfab Impact

Conclusions

The analysis of Sketchfab usage in the educational environment demonstrates a steady increase in adoption among both teachers and students, highlighting the growing role of 3D visualization technologies in contemporary pedagogical practices. The observed rise in the number of users underscores the platform's relevance in facilitating immersive, interactive, and student-centered learning experiences.

The integration of Sketchfab into the instructional process serves multiple pedagogical functions, including enhancing spatial cognition, supporting interdisciplinary project-based learning, and fostering digital literacy. The data reveal that educators primarily utilize the platform for the visualization of complex three-dimensional models, which contributes to cognitive load reduction and improved conceptual understanding, particularly in STEM

disciplines. Simultaneously, students engage with Sketchfab not only for academic purposes but also for self-directed learning and creative exploration, reflecting the shift towards constructivist and inquiry-based learning paradigms.

The increase in weekly usage hours among students compared to teachers suggests a higher degree of learner autonomy and motivation in interacting with 3D content. This trend aligns with contemporary educational frameworks emphasizing active learning, digital fluency, and the development of metacognitive skills. Furthermore, survey results indicate that students perceive Sketchfab as a valuable tool for improving learning outcomes, particularly in terms of knowledge retention, problem-solving abilities, and overall academic engagement.

From a methodological perspective, the findings suggest that the effective integration of 3D visualization tools into curricula requires well-structured pedagogical strategies that align with competency-based education and differentiated instruction principles. Educators should be equipped with adequate training and methodological guidelines to maximize the didactic potential of such technologies. Additionally, institutional support in terms of technological infrastructure and curriculum adaptation is essential to ensure the sustainability of digital learning innovations.

Given the accelerating digital transformation in education, further research should explore the long-term impact of immersive visualization tools on cognitive development, knowledge acquisition, and student motivation. Future studies should also examine best practices for implementing 3D technologies in hybrid and distance learning settings to enhance accessibility and inclusivity in education.

Acknowledgements

The author expresses sincere gratitude to colleagues and educators who have contributed to the conceptual development of this study by sharing their insights into the integration of immersive technologies in education. Special appreciation is extended to researchers in the field of educational technology whose prior work has provided a solid theoretical foundation for analyzing the pedagogical affordances of Sketchfab in fostering digital literacy, spatial reasoning, and constructivist learning experiences. Furthermore, we acknowledge the academic community's contributions in developing of interdisciplinary methodologies that enhance student engagement and cognitive development through innovative digital tools. The increasing adoption of 3D visualization platforms in education underscores the relevance of ongoing research in the field, and the author acknowledges the invaluable contributions of those advancing the discourse on interactive and multimodal learning environments. Deep appreciation is expressed to all educators and students who participated in the study, providing empirical insights into the pedagogical applications of Sketchfab. Their engagement and feedback have been instrumental in shaping the analysis and reinforcing the significance of immersive technologies in contemporary educational paradigms.

Accreditation, Internationalization and World University Rankings: Basis for Quality Assurance (QA) in Higher Education Institutions (HEIs) in the Philippines

Solane S. Duque, Civil Service Commission, Philippines
Norita E. Manly, Emilio Aguinaldo College, Philippines

The Asian Conference on Education 2025
Official Conference Proceedings

Abstract

Accreditation, Internationalization, and World University Rankings (WUR) have increasingly shaped the higher education landscape over the last decade. Whilst these three dimensions have been previously examined in isolation, studies have suggested that there is a strong interplay among them. Applying qualitative content analysis using NVivo and QCAmap software, the study identified eight themes and 23 sub-themes related to accreditation across five international standards of the Asean University Network (AUN, ASEAN), Commission on Academic Accreditation (CAA, UAE), Oman Academic Accreditation Authority (OAAA, Oman), Quality Assurance Agency for Higher Education (QAA, Europe), and Southern Association of Colleges and Schools Commission of Colleges (SACSCOC,USA); seven WUR themes across the Times Higher Education (THE), Quacquarelli Symonds (QS), and Academic Ranking of World Universities (ARWU); and seven internationalization themes based on Transnational Higher Education (TNHE) Philippine Republic Act 11448 and common internationalization definitions. The Philippine accreditation standards revealed no connections in the sub-themes of Documentation, Performance, and Funding and Financial Support within the Accreditation themes. Similarly, in the Internationalization themes, there were no connections found in the Strategy and Communication, Facilities and Infrastructure for Internationalization, and Faculty and Staff Development for Internationalization. In the Ranking themes, there were also no connections in Faculty/Staff Quality, Global Outlook and Diversity, Student Success and Graduation, Global Influence, and Income and Investments. To address these identified gaps, the study extracted indicators from the five international standards and proposed a quality assurance framework aimed at enhancing the outcomes of Accreditation, Internationalization, and World University Rankings for Philippine HEIs.

Keywords: accreditation, internationalization, transnational higher education, quality assurance

Introduction and Literature Review

Accreditation, Internationalization, and World University Rankings (WUR) are three pivotal elements shaping the strategies and outcomes of Higher Education Institutions (HEIs). Though traditionally examined as separate entities, recent studies suggest a dynamic interplay among them, where each factor influences and reinforces the others, collectively steering institutional development.

Quality Assurance and Accreditation

Accreditation serves as a quality assurance mechanism, ensuring that educational institutions or programs meet necessary standards set by external evaluators. Accreditation is the process involves evaluating services and operations to determine compliance with applicable standards. Institutions meeting these benchmarks are granted accreditation by the relevant body (ABET, 2021). Similarly, the Council for the Accreditation of Educator Preparation (ACPE, 2021) views accreditation as a process ensuring that educator preparation providers equip future teachers with essential skills and knowledge. CAEP emphasizes areas like content knowledge, clinical partnerships, program impact, equity, and diversity. Several benefits of accreditation for institutions, including: (1) providing reliable information about institutional quality; (2) ensuring fairness and accountability in student services, graduate achievements, and program delivery; (3) supporting voluntary quality improvement efforts; (4) enhancing students' confidence in institutions; (5) facilitating student transfers between institutions; (6) offering feedback to employers on graduate quality; and (7) unlocking financial support opportunities for students (Cura & Alani, 2018).

World University Rankings

University rankings reflect the global competitiveness of institutions and their relative standing in terms of quality, status, and success (Hou & Jacob, 2017). Prominent world university rankings include:

Academic Ranking of World Universities (ARWU)

Established in 2003 in China, ARWU uses six indicators, including the number of Nobel Prize winners among alumni and faculty, highly cited researchers, scholarly publications, and institutional per capita performance. Data sources include Thomson Reuters' Web of Science and national agency resources. ARWU Focuses on citations, publications, and prizes, emphasizing research output and academic recognition.

Quacquarelli Symonds (QS)

Launched in 2004 in the UK, QS evaluates universities using six indicators, such as academic reputation, employer reputation, faculty-student ratio, international faculty and student ratios, and citations per faculty. Data is sourced from Scopus databases and university portfolio surveys. QS balances academic and employer reputation, faculty-student ratios, and internationalization metrics.

Times Higher Education (THE)

Founded in 2004 in the UK, THE uses 13 indicators, including teaching reputation, research productivity, citation impact, international outreach, and industry income. These rankings rely on data from Thomson Reuters' Web of Science and institutional surveys. THE evaluates teaching, research, internationalization, and industry income, offering a holistic view of institutional performance.

Internationalization

Internationalization refers to the inbound or outbound mobility of faculty and students as a result of any of the 3: (1) individual mobility – where an individual chooses to study/teach abroad or someone from another country chooses to study/teach in the Philippines; (2) academic program mobility – where an academic program has been accepted to be taught in another country; and (3) institutional mobility – where an institution has been licensed to setup a branch in another country (i.e. a Philippine HEI has been granted a permit/license to open a branch campus in another country or a foreign HEI has been granted a permit/license to open a branch campus in the Philippines).

In a study by Buckner & Stein (2020) involving 1,439 higher education institutions across 137 countries, finding that administrators in knowledge-rich countries like the USA and Anglophone Canada see internationalization to enhance students' global awareness, with some also highlighting revenue generation as a benefit. However, Tight (2022) argued against the notion that internationalization in higher education is merely a transient trend driven by Western nations through international recruitment and the creation of overseas campuses. In the Philippines, research conducted by Ferrer (2019) with 87 private and state universities and colleges from 16 regions, revealing that the main perceived benefits of internationalization were: (1) boosted international cooperation and capacity building; (2) improved international performance via adopting global best practices; and (3) networking opportunities for faculty. Conversely, the risks associated with internationalization included limited access for students lacking financial resources and unequal benefit distribution among partners. In this study, 94.25% of respondents incorporated internationalization into their strategic planning. It is worth noting that internationalization is one of the key components of the world university rankings.

The above literature shows that accreditation, internationalization and world university rankings serve as complementary forces in higher education. Accreditation ensures quality assurance through external and internal mechanisms, rankings highlight institutional competitiveness on a global scale, while internationalization boosts global competitiveness. Together, they play a vital role in shaping the strategies, outcomes, and reputation of higher education institutions worldwide.

Research Gap

Although existing research confirms that accreditation systems are vital for improving the quality of higher education and significantly support internationalization and global rankings, there is limited exploration of why these outcomes remain underdeveloped in the Philippine higher education sector. Despite having an established accreditation system, the country exhibits poor levels of internationalization and low standing in world university rankings compared to neighboring countries like Singapore, Japan, and China. This gap underscores the

necessity to examine how the design, implementation, and alignment of accreditation practices in the Philippines compare to those in countries with higher-ranking HEIs, especially concerning their effectiveness in promoting global competitiveness and international collaboration.

Statement of Purpose

This study aims to explore the role of accreditation in advancing the internationalization and global competitiveness of Philippine higher education institutions (HEIs). Through a comparative analysis of accreditation practices in countries with high-ranking universities, the research seeks to identify effective strategies and quality assurance mechanisms that can be adapted to the Philippine context. By aligning local accreditation standards with internationally recognized benchmarks, the study intends to contribute to the development of stronger accreditation frameworks that enhance internationalization outcomes and improve performance in global university rankings. Ultimately, this research aims to support policy reforms and institutional practices that elevate the quality and global reputation of Philippine higher education.

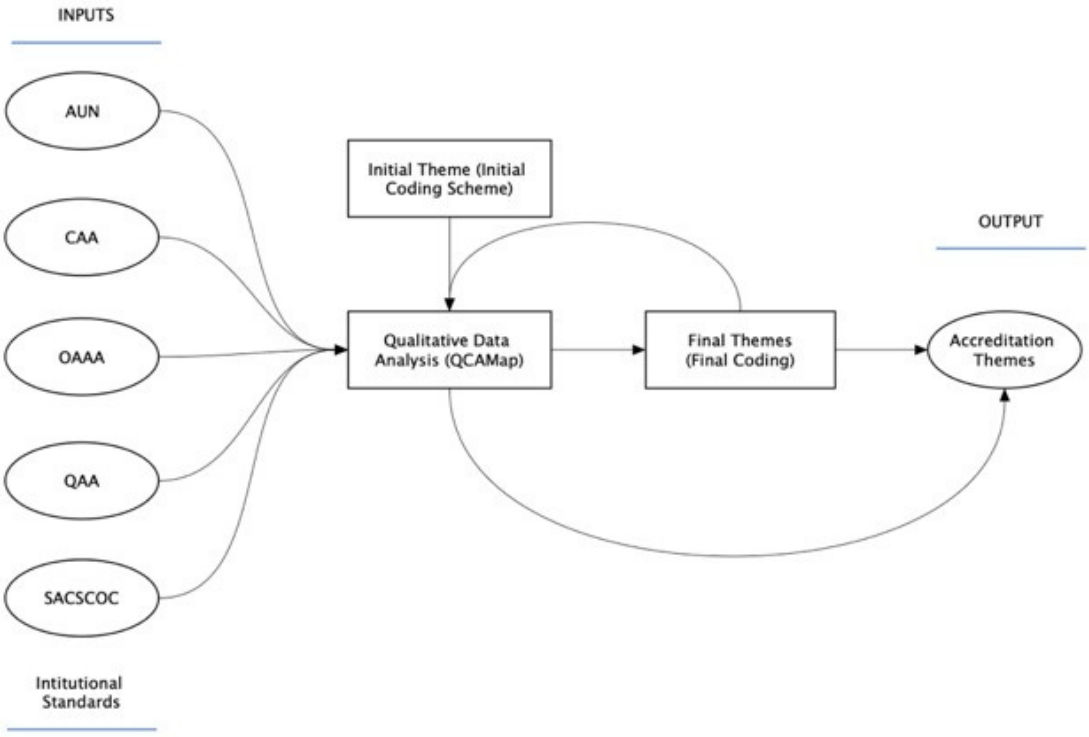
Purpose 1: To compare Philippine accreditation standards and criteria with those of the countries which rank high in the world university rankings.

Purpose 2: To introduce institutional standards extracted from the AUN, CAA, OAAA, QAA and SACSCOC to align the Philippine accreditation system with international standards.

Methodology

The study by Aspers & Corte (2019), a qualitative research design was employed, incorporating an iterative process that involved both deduction and induction to identify and analyze various categories. Qualitative Content Analysis (QCA) was utilized as the primary method. QCA is a technique for the subjective interpretation of textual data through systematic coding and the identification of themes or patterns (Prasad, 2019). It is defined as any effort to reduce qualitative data and extract meaning by identifying core consistencies within a large volume of material. Because Accreditation, Internationalization, and Ranking are distinct variables that cannot be directly mapped onto each other, themes enabled the exploration of possible connections and relationships among them.

Developing the Themes Using QCAMap Software



For the Accreditation theme, the study examined practices from international accreditation bodies of the AUN, CAA, QAA, OAAA, and SACSCOC to better understand the core concepts of accreditation. These standards are available online in the organization's respective websites. In exploring the Internationalization theme, the study analyzed common definitions and the provisions of the Transnational Higher Education Act, or Republic Act No. 11448 (2019) of the Philippines. For the Ranking theme, the focus was on the indicators used by the three major global university rankings: ARWU, QS, and THE. The development of these themes involved the following steps:

Accreditation Themes

To develop the Accreditation Themes, the Institutional Standards of the AUN, CAA, OAAA, QAA and SACSCOC were used as inputs in the QCAMap. There were 10 initial coding

schemes used for 29% of the data as required by the software to group common attributes, elements, concepts, or ideas of the five institutional standards. Using deductive and inductive reasoning, eight final coding schemes which generated and served as the final accreditation themes. These final accreditation themes were used to group the remaining 71% of data. Figure 1 presents the process.

Figure 1
Developing the Accreditation Themes

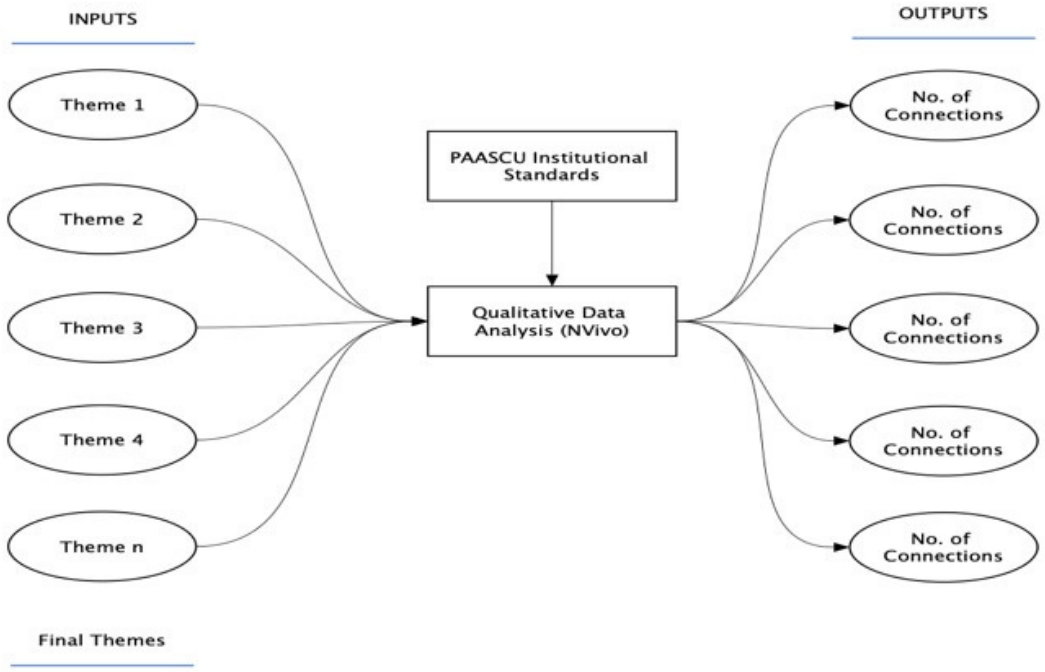
Internationalization Themes

Using the same procedure presented in Figure 1, the Internationalization Themes were developed using the provisions of the Transnational Higher Education Act (TNHE) on August 28, 2019, through Republic Act 11448, and common definitions of internationalization, as input to the QCAMap.

World University Rankings Themes

Likewise, using the same procedure presented in Figure 1, the Ranking Themes were developed using the indicators of the ARWU, QS, and THE, as input to the QCAMap.

Finding the Number of Connections Using NVivo Software



After completing the QCAmap, the NVivo software was used to finalize the Accreditation, Internationalization, and Ranking Themes which involved the following steps:

1. Preparing the Institutional Standards for importing to NVivo
2. Using the final themes generated from the QCAMap as input
3. Finding the number of connections from the institutional standards for each theme

Finding Connections of the Philippine Institutional Standards With the Accreditation, Internationalization, and Ranking Themes

At the time of the study, only the Philippine Accrediting Association of Schools, Colleges and Universities (PAASCU) Institutional Standards was available as basis for the study. PAASCU is a private, voluntary non-profit, non-stock corporation that accredits academic programs in the Philippines. Using the final themes, the PAASCU (23) Institutional Standards were inputted to the NVivo to find the number of connections for each of the Accreditation, Internationalization, and Ranking Themes. The number of connections shows the strength of relationship of each institutional standards to the final accreditation themes.

Figure 2
Finding the Number of Connections for Each Themes

Developing the Proposed Institutional Standards

A summary of the data from the QCAMap showing each institutional standard from the AUN, CAA,OAAA, QAA, and SACSCOC that falls under each theme was used as basis for proposing a list of institutional standards that can be used to augment the Philippine institutional standards.

Results and Discussion

To find answers for the Statement of Purpose 1, the study compared Philippine accreditation standards and criteria with those of the countries which rank high in the world university rankings such as USA, Europe, UAE, ASEAN Countries, and the Sultanate of Oman. To do this, Accreditation Themes were developed from the 5 Institutional Standards, and the Philippine Institutional Standards were mapped to find the number of connections.

The PAASCU Institutional Standards has 23 indicators and criteria which when mapped against the accreditation themes showed no connection with *Documentation*, *Performance*, and *Funding and Financial* Support. The findings suggests that while the Philippine accreditation standards exhibit similar characteristics with the international accreditation bodies, it lacks crucial components which are important in elevating the Philippine accreditation standards. Well-documented processes and measurable outcomes are critical for fostering transparency and accountability among stakeholders, including faculty, staff, students, regulatory bodies, and the broader community. This transparency is a cornerstone of institutional credibility, which is essential for meeting accreditation standards, gaining international recognition, and improving global rankings. Transparent practices not only build trust but also promote collaboration across all levels of the institution.

Presented in Table 1 are the Accreditation Themes and the number of connections that the PAASCU Institutional Standards have.

Performance and Outputs	2

Clear goal setting and alignment (Aguinis, 2019)—particularly between individual and institutional objectives—enhance performance management and institutional coherence. Aligning personal goals with institutional targets ensures that every member of the organization understands their role in achieving shared outcomes, a key factor in demonstrating quality assurance during accreditation reviews.

Furthermore, strategic financial investment in research and scholarly activities—such as innovation, commercialization, and start-up development—amplifies the institution's academic reputation and research productivity. These outputs not only contribute to institutional rankings but also align with internationalization goals by attracting global partnerships and talent. Importantly, such initiatives extend the institution's impact beyond academia, contributing to national development and economic growth.

Presented in Table 2 are the Internationalization Themes and the number of connections that the PAASCU Institutional Standards have.

Table 2
Results of Mapping the Philippine Institutional Standards With Internationalization Themes

Internationalization Themes	Number of Connections
Internationalization Strategy and Communication	0
Global Engagement and Collaboration	1
Facility and Infrastructure for Internationalization	0
International Standards	23
Faculty and Staff Development for Internationalization	0
Research and Scholarly Activities with Global Impact	2
Student Mobility	1

The PAASCU Institutional Standards has 23 indicators and criteria which when mapped against the internationalization themes showed no connection with *Internationalization Strategy and Communication*, *Facility and Infrastructure for Internationalization*, and *Faculty and Staff Development for Internationalization*.

The above findings suggests that while the Philippine accreditation standards exhibit similar characteristics with the international accreditation bodies, it lacks crucial components which are important in elevating internationalization outcomes. Internationalization when embedded into the strategic pillar provides the necessary direction for planning, decision-making, and implementation - shaping the long-term direction of the HEI and reinforces its global engagement goals. This strategic orientation must be clearly communicated to both internal and external audiences to gain broad support and recognition.

High-quality infrastructure and facilities are vital enablers of successful internationalization. Institutions must invest in efficient academic and administrative systems to support international recruitment, admissions, and student services. This includes streamlined processes for visa support, housing, orientation, and academic guidance for international students. On the other hand, Faculty and staff development must evolve beyond traditional professional training to encompass the skills and competencies required in a globalized education environment. Additionally, internationalization-focused development equips educators and administrators with tools for inclusive teaching, cross-cultural communication, and global citizenship.

Presented in Table 3 are the Internationalization Themes and the number of connections that the PAASCU institutional standards have.

Table 3
Results of Mapping the Philippine Institutional Standards With Ranking Themes

Ranking Themes	Number of Connections
Innovation and Knowledge Transfer	2
Faculty/Staff Quality	0
Global Outlook and Diversity	0
Academic and Employer Reputation	1
Student Success and Graduation	0
Global Influence	0
Income and Investments	0

The PAASCU Institutional Standards has 23 indicators and criteria which when mapped against the accreditation themes showed no connection with *Faculty/Staff Quality*, *Global Outlook and Diversity*, *Student Success and Graduation*, *Global Influence*, and *Income and Investments*. The above findings suggests that while the Philippine accreditation standards exhibit similar characteristics with the international accreditation bodies, it lacks crucial components which are important in elevating ranking outcomes.

The quality of faculty and staff is a critical determinant of an institution's standing in global university rankings (WUR). HEIs achieves excellence in teaching, research, institutional performance, and student outcomes. Faculty members play a central role in engaging students, cultivating critical thinking, and fostering academic environments where learners can excel. Their contributions to research and scholarly work are vital in driving innovation and enhancing the institution's academic reputation.

Global Outlook and Diversity refer to cultivating an institutional environment that embraces international perspectives, values cultural diversity, and actively engages with global educational issues. It enriches the academic and social experience by promoting cultural awareness and inclusion across all levels of the institution. This commitment includes advancing equity and representation, ensuring that women, ethnic minorities, and marginalized groups have a voice in leadership and decision-making processes. It fosters a culture of mutual respect, inclusion, and co-existence—core values in building a globally responsive institution.

Student Success and Graduation lie at the heart of higher education. They encompass students' academic achievement, personal growth, and readiness for professional careers—outcomes developed and nurtured throughout their educational journey. Key indicators of student success include retention, academic progression, and on-time graduation.

To find answers to Statement of Purpose 2, presented in Table 4 are the extracted Institutional Standards using QCAMap from the AUN, CAA, OAAA, QAA and SACSCOC to align the Philippine accreditation system with international standards.

Table 4

Institutional Standards From the AUN, CAA, OAAA, QAA, and SACSCOC

THEME 1: CONTINUOUS IMPROVEMENT AND ENHANCEMENT	
Documentation	
1	There is an established document classification policy to safeguard privacy and confidentiality, ensure that the information remain current and appropriate.
2	The institution has a document classification policy which provides guidelines to protect institutional as well as individual data from unauthorized access.
3	The published information is clear, accurate, objective and readily accessible to stakeholders.
4	The Institution has comprehensive, consistent, and accurate published (print or electronics) Policies and Procedures Manual.
5	The Institution has comprehensive, consistent, and accurate published (print or electronics) Health and Safety Manual.
6	The Institution has comprehensive, consistent, and accurate published (print or electronics) Employee Handbook.
7	The Institution has comprehensive, consistent, and accurate published (print or electronics) Program Specification (Program Catalog).
8	The Institution has comprehensive, consistent, and accurate published (print or electronics) Student Handbook.
9	The Institution has a comprehensive and integrated Academic Handbook (covering all phases of teaching and learning).
10	The institution provides Enrolment and Student Records.
11	The institution maintains a record of all employees.
Improvement	
1	Results on the achievement of the course learning outcomes are used to form basis for course improvement.
2	Results of the program evaluation are used as basis for improving the program.
3	Performance is periodically monitored and results are released to relevant stakeholders in a timely manner for improvement.
Review and Monitoring	
1	The performance of the governance and management teams are periodically evaluated.
2	The planning process and the accomplishments against plans are periodically reviewed to form basis for improvement.
3	There are key performance indicators and targets that are established to measure performance at the institutional, department and individual units. The performance indicators are benchmarked to reflect international best practices.
4	The institution has a system to oversee, direct, implement, monitor and review research activities, resources, and outputs.
5	The institution has a mechanism to solicit information on Student Satisfaction on all services and actions taken to address their concerns are communicated in a timely manner.
6	The institution collects, analyze and use relevant information on the effective management of the programs including feedback from alumni, student population, student progression, success and drop-out rates, student satisfaction with programs and services, employment graduation rates, and employer satisfaction.
Systems and Processes	
1	The Institution has a Quality Management System/Quality Assurance.

2	The institution has a quality assurance system or continuous quality enhancement system which covers the review and monitoring of all entities and activities that includes the collection of institutional data and statistics as basis for decision-making.
3	The Institution has a clearly established and communicated Policy Management System which governs the policy implementation, review, approval, communication and archiving.
4	The quality assurance system is a cyclical approach wherein the progress made on the last review is taken into consideration when preparing the next plan for continuous improvement.
5	The institution has a system for collection, management and control of documents which include guidelines for archiving and disposal.
6	The institution has a mechanism for monitoring and reporting health and safety incidents.
7	The institution complies with the national requirements on health and safety.
8	The institution has a health and safety guidelines that are communicated to the students, faculty, staff, visitors and other stakeholders.
9	The institution ensures that health and safety guidelines are provided in the use of equipment and that fire drills, earthquake drills, terrorist attacks and the likes are conducted for faculty, staff and students on periodic basis.
THEME 2: GOVERNANCE AND MANAGEMENT	
Leadership	
1	The Institution applies the Principle of Integrity in all matters of its operation and adheres to the highest ethical standards in teaching, professional development and service.
2	The Institution has a clearly defined governance and management structure.
3	The governance and management structure has a clearly defined authority, responsibility and accountability matrix.
4	The governance team exercises full responsibility for setting the strategic direction of the institution.
5	There are clear communication channel and reporting lines.
Mission, Vision, and Values	
1	The Mission, Vision and Value Statements have been developed in consultation with the stakeholders and are communicated through difference channels such as publications, websites, catalog, etc.
2	The Mission, Vision and Value Statements are cascaded and form the cornerstone for the development of the Institution’s Strategic Plan.
Planning	
1	The Institution has a comprehensive and integrated Strategic plan.
2	The Institution has a comprehensive and integrated Operational Plan.
3	The Institution has a comprehensive and integrated Risk Management Plan.
4	The Institution has Risk Registers and Mitigation Strategies.
5	The Institution has a comprehensive and integrated Financial Management Plan.
6	The Institution has a comprehensive and integrated Human Resource Management Plan.
7	The Institution has a comprehensive and integrated Physical Resources/Infrastructure Management Plan.
8	The Institution has a comprehensive and integrated Community and Industry Engagement Plan.

Policies and Procedures	
1	The Institution has a comprehensive and integrated Community and Industry Engagement Policies and Procedures.
2	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information and policies and procedures related to: Program Planning and Development.
3	The Institution has a comprehensive and integrated Planning for Changes.
4	The plans are mission driven, includes goals, objectives and performance indicators
5	The institution has well-established policies and procedures related to succession, re-deployment, and severance that are appropriately communicated to stakeholders and consistently implemented.
6	The institution has policies and procedures for budgetary planning and control, auditing, risk management, insurance and indemnity coverage, and internal auditing.
7	Educational Policies and Procedures (covering all phases of student "life cycle" from admission to graduation).
8	There are student grievance policy and procedure for academic related matters that is readily accessible, effectively communicated to staff and student.
9	The Institution has a comprehensive and integrated Research and Scholarly Activities.
10	The institution has policies and procedures to protect and manage intellectual property such as inventions, patents, copyrights and research results.
11	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information and policies and procedures related to: Budgeting for the Program.
12	The institution has a well-established policies and procedures for appeals, grievances and disciplinary actions that are consistently implemented.
13	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information and policies and procedures related to: Grading System.
THEME 3: RECOURCE MANAGEMNET	
Fiscal Resources and Budgeting	
1	The Institution has an annual budget that is formally approved, effectively managed and the financial statement is externally audited.
2	The Institution has appropriate funding for learning and teaching activities that ensure adequate and appropriate learning and support resources including funds for teach-out in the event of institutional or program closure.
3	The Institutional Budget are linked to the institutional plans.
4	Where the institution has associated entities, there is mechanism to ensure that the Institution is protected against financial, legal and reputational liabilities from the entity it controls/owns.
Resource Allocation and Management	
1	The institutions provide the necessary tools, facilities and equipment to faculty and staff to allow them to dispatch their duty.
2	The institution provides recreational facilities and activities to foster camaraderie and collegiality.

3	The institution maintains appropriate number of academic, non-academic and support staff to support its the mission and goals.
THEME 4: STUDENT SERVICE AND SUPPORT	
Academic Support Services	
1	The institution supports the timely completion of degree though appropriate Academic Advising.
2	The institution recognizes and supports the different needs of International Students.
3	The institution provides Learning Resource Center/Library.
4	The institution provides Electronic and Non-Electronic Collections.
5	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information, and policies and procedures related to Recognition of Prior Learning.
6	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information, and policies and procedures related to Student Entry Standards.
7	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information, and policies and procedures related to General Education Courses.
8	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information, and policies and procedures related to Student Recruitment and Admission.
9	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information, and policies and procedures related to Transfer Credits and Advanced Standing.
10	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information, and policies and procedures related to Student Retention and Progression.
11	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information, and policies and procedures related to Definition of Academic Freedom.
12	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information, and policies and procedures related to Credit Hours.
13	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information, and policies and procedures related to Degree Audit.
General Support Services	
1	The student grievance policy and procedure is consistently used to resolve student grievances in a manner that is fair, impartial and transparent.

2	There is a mechanism for students to air for redress of grievances on non-academic related matters. The procedures is accessible and effectively communicated to students and staff.
3	Students are provided with avenues to represent themselves in decisions that affect their learning experience (i.e. Student Council).
4	The institution provides Residence Halls.
5	The institution provides Catering/Canteen.
6	The institution provides Transportation.
7	The institution provides Sports and Recreational Activities.
8	The institution takes into consideration Student with special needs in the design of the curriculum and facilities management (i.e. special parking, elevators, ramps, PWD toilets. etc).
9	The institution provides ongoing Career and Employment Services and support students employability through various activities.
10	The institution provides various scholarship and financial support for deserving students.
11	The institution provides Student Publication and Clubs.
12	The institution provides Student Rights and Code of Conduct.
13	The institution provides Medical and Counseling Services.
14	The institution provides General Support Services.
15	The institution provides Information Technology services.
16	The institution provides Teaching and Learning Resources.
THEME 5: COMMUNITY ENGAGEMENT AND SERVICE	
Community and Stakeholder Involvement	
1	The institution has relationship with industry and employers to provide feedback toward program improvement.
2	The institution monitors alumni employment and maintains relationship with alumni to draw on their experience for improving the program.
3	The institution maintains external relations and networks which include business, industry, professional bodies and non-government organizations.
Community and Stakeholder Services	
1	The institution enters MOU with other educational providers for benchmarking of best practices.
2	The institution has a well-established MoUs with various organizations for On-the-Job Placement of students. OJT students are monitored to ensure that the intended learning outcomes are achieved.
THEME 6: TEACHING, LEARNING AND CURRICULUM DESIGN	
Assessment and Moderation	
1	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information and policies and procedures related to: Assessment and moderation of exams.
2	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information and policies and procedures related to: Marking Schemes and Rubrics.

3	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information and policies and procedures related to: Grade Release and Grade Appeal.
4	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information and policies and procedures related to: Examinations Regulations, Handling Results and Records.
5	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information and policies and procedures related to: Academic Security and Invigilation.
6	The institution maintains a record of all students including exam scripts and communications.
Curriculum	
1	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information and policies and procedures related to: Curriculum Development, Review and Approval.
2	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information and policies and procedures related to: Alignment of the Program with the appropriate Qualifications Framework.
Graduate Attributes and Program Learning Outcomes	
1	The evaluation of the programs includes direct measures (i.e. student output) and indirect measures (i.e. feedback from employer, OJT supervisors, etc).
2	The institution has a mechanism for the periodic evaluation to determine the achievement of the course learning outcomes, program learning outcomes and graduate attributes.
3	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information and policies and procedures related to: Graduate Attributes.
4	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information and policies and procedures related to: Program Learning Outcomes.
Teaching and Learning Activities	
1	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information and policies and procedures related to: Course Delivery and Program Evaluation.
2	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information and policies and procedures related to: Remedial of Courses.

3	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information and policies and procedures related to: Graduation Requirements.
4	The Institution offering degrees by coursework, by research, by correspondence, or by distance learning; at undergraduate or graduate levels, should each have well-established and published information and policies and procedures related to: Student study mode and load.
THEME 7: HUMAN RESOURCE MANAGEMENT	
Performance	
1	The Institution periodically evaluated faculty and staff performance and provides timely feedback including coaching and mentoring.
2	Results of performance evaluation are communicated to the stakeholders and form basis for rewards, recognitions, incentives, coaching and/or mentoring.
Qualifications	
1	Faculty qualifications are aligned with the courses that he/she teaches, and in accordance with the national guidance.
2	There is a fair and transparent recruitment and selection process that is consistently applied to both part-time and full-time faculty and staff.
3	There is proper induction provided to all faculty and staff at relevant levels within the institutions where faculty and staff are informed regarding their terms of employment and expectations in terms of roles, teaching, research, and community engagements.
Professional Development	
1	There are opportunities for faculty and staff professional development, training, use of innovation and use of new technologies.
2	There are opportunities for promotion, awards and recognition for faculty and staff.
3	The institution provides support for professional development in research, scholarships and other development programs for staff.
4	The institution clearly provides roles and expectations, code of conduct. key performance indicators and targets to faculty and staff for performance management.
THEME 8: RESEARCH AND SCHOLARLY ACTIVITIES	
Funding and Financial Support	
1	The institution has a budget allocated to research and scholarly activities.
2	The institution has a research funding scheme which include conference participation and research publications.
Performance and Outputs	
1	The institution defines the expectations for research and scholarly activities which are in line with its mission and adheres to ethics and bio-safety standards.
2	The institution has research collaboration and partnerships.
3	The institution supports research, innovation, collaboration and research excellence.
4	The Institution has a comprehensive and integrated Research and Scholarly Activities.
5	The institution has a well-established guideline for research commercialization, student involvement in research, and research-teaching nexus.

Conclusion

Accreditation bodies establish defined standards and criteria that higher education institutions (HEIs) must meet to attain and maintain accredited status. These benchmarks are typically outlined in a document referred to as Institutional Standards, which covers key areas such as governance and management, teaching and learning, program quality, qualifications, and institutional effectiveness**.** The study identified common themes and sub-themes across the institutional standards of international accreditation bodies such as AUN, CAA, OAAA, QAA, and SACSCOC, highlighting benchmark criteria that collectively define institutional quality assurance. Furthermore, the analysis revealed opportunities for enhancement within the Philippine accreditation system. By integrating relevant criteria and indicators from these international frameworks, the Philippine system can be strengthened—potentially leading to improved outcomes in accreditation, internationalization, and global rankings.

Recommendation

In light of the findings, the following are the recommendations:

Benchmark Accreditation Practices Against International Standards: Conduct a systematic benchmarking of the Philippine accreditation system with international accreditation bodies such as AUN, CAA, OAAA, QAA, and SACSCOC to identify specific areas for enhancement. This process aims to elevate the quality of higher education by aligning local accreditation practices with globally recognized standards.
