## The Asian Conference on Education

### Conference Proceedings 2012

**Dr Shamim Ali**, Lecturer, National University of Modern Languages, Pakistan

**Professor David N Aspin**, Professor Emeritus and Former Dean of the Faculty of Education, Monash University, Australia  
Visiting Fellow, St Edmund's College, Cambridge University, UK

**Dr William Baber**, Associate Professor, Kyoto University Graduate School of Management, Japan

**Professor Don Brash**, Former Governor of the Reserve Bank, New Zealand, Former Leader of the New National Party, New Zealand, Adjunct Professor, AUT, New Zealand & La Trobe University, Australia

**Lord Charles Bruce of Elgin and Kincardine**, Lord Lieutenant of Fife, Chairman of the Patrons of the National Galleries of Scotland, Trustee of the Historic Scotland Foundation, UK

**Professor Judith Chapman**  
Professor of Education, Australian Catholic University, Australia  
Visiting Fellow, St Edmund's College, Cambridge University, UK  
Member of the Order of Australia

**Professor Chung-Ying Cheng**  
Professor of Philosophy, University of Hawai'i at Manoa, USA  
Editor-in-Chief, The Journal of Chinese Philosophy

**Professor Tien-Hui Chiang**, Professor and Chair, Department of Education, National University of Tainan, Taiwan/Chinese Taipei

**Mr Marcus Chidgey**, CEO, Captive Minds Communications Group, London, UK

**Professor Kevin Cleary**, President of the Japan Association of Language Teachers (JALT)

**Professor Steve Cornwell**, Professor of English and Interdisciplinary Studies, Osaka Jogakuin University, Osaka, Japan  
Osaka Local Conference Chair

**Professor Michael A. Cusumano**, SMR Distinguished Professor of Management and Engineering Systems, MIT Sloan School of Management, Massachusetts Institute of Technology, USA

**Professor Dexter Da Silva**  
Professor of Educational Psychology  
Keisen University, Tokyo, Japan

**Professor Georges Depeyrot**, Professor and Director of Research, French National Center for Scientific Research (CNRS)/Ecole, Normale Supérieure, Paris, France

**Professor Sue Jackson**, Professor of Lifelong Learning and Gender, Pro-Vice Master of Teaching and Learning Birkbeck, University of London, UK

**Professor June Henton**, Dean, College of Human Sciences, Auburn University, USA

**Professor Michael Hudson**, President of The Institute for the Study of Long-Term Economic Trends (ISLET), Distinguished Research Professor of Economics at the University of Missouri, Kansas City

**Vice-Consul Kathryn Kiser**, Cultural Affairs Officer, Lahore, Pakistan, The United States Department of State, USA

**Mr Shahzada Khalid**, Deputy Director, SAARC Energy Center, Pakistan

**Mrs Eri Kudo**, Head Private Sector Fundraising, United Nations World Food Programme Japan, Tokyo, Japan

**Professor Sing Kong Lee**, Director, The National Institute of Education, Singapore

**Dr Woon Chia Liu**, Associate Dean, Practicum and School Partnerships, Teacher Education, The National Institute of Education, Singapore

**Professor Sir Geoffrey Lloyd**, Senior Scholar in Residence, The Needham Research Institute, Cambridge, UK, Fellow and Former Master, Darwin College, University of Cambridge, Fellow of the British Academy, Honorary Foreign Member, The American Academy of Arts and Sciences

**Dr Robert Logie**, Associate Professor of Computer Science  
Osaka Gakuin University, Japan

**Dr David McLoughlin**, Associate Professor, Meiji University, Japan

**Professor Vasile Meita**, General Manager, The National Institute for Research and Development in Construction, Urban Planning and Sustainable Spatial Development (URBAN=INCERC), Romania

**Professor Keith Miller**, Louise Hartman Schewe and Karl Schewe Professor of Computer Science, The University of Illinois Springfield, USA, Editor-in-Chief, IEEE Technology and Society

**Professor Marjo Hannele Mitsutomi**, Head of English Language Teaching Practices and the Language Development Intercultural Studies Center, Akita International University, Japan

**Professor Ka Ho Joshua Mok**, Chair Professor of Comparative Policy, Associate Vice-President (External Relations), Dean of the Faculty of Arts and Sciences, The Hong Kong Institute of Education, Hong Kong SAR

**Dr Jo Mynard**, Associate Professor & Director of the SALC, Kanda University of International Studies, Japan

**Professor Michiko Nakano**, Professor of English Director of the Distance Learning Center, Waseda University, Tokyo, Japan

**Ms Karen Newby**, Director, Par les mots solidaires, Paris, France

**Professor Jerry Platt**, Professor of Business, Akita International University, Japan, Dean and Professor Emeritus, College of Business, San Francisco State, USA

**Professor Michael Pronko**, Professor of American Literature and Culture, Meiji Gakuin University, Tokyo, Japan

**Professor Richard Roth**, Senior Associate Dean, Medill School of Journalism, Northwestern University, Qatar

**Professor Monty P. Satiadarma**, Clinical Psychologist and Lecturer in Psychology, Former Dean of the Department of Psychology and Rector of the University, Tarumanagara University, Indonesia

**Mr Michael Sakamoto**, Interdisciplinary Artist UCLA, USA

**Mr Mohamed Salaheen**, Director, The United Nations World Food Programme, Japan & Korea

**Mr Lowell Sheppard**, Asia Pacific Director, HOPE International Development Agency, Canada/Japan

**Professor Ken Kawan Soetanto**, Professor and Director of CLEDSI, Waseda University, Japan

**Dr Jeffrey Sommers**, Associate Professor of Economics, University of Wisconsin-Milwaukee, USA, Visiting Faculty, Stockholm School of Economics, Riga, Latvia

**His Excellency Dr Drago Stambuk**, Croatian Ambassador to Brazil, Brazil

**Professor Mary Stuart**, Vice-Chancellor, The University of Lincoln, UK

**Professor Gary Swanson**, Distinguished Journalist-in-Residence & Mildred S. Hansen Endowed Chair, The University of Northern Colorado, USA

**Dr David Wilkinson**, Associate Dean (International & External Programmes), Faculty of Law and Management, La Trobe University, Australia

**Professor Kensaku Yoshida**, Professor of English, Director of the Center for the Teaching of Foreign Languages in General, Education, Sophia University, Tokyo, Japan

**Mrs Elly Zaniewicka**, Political Correspondent, BBC Political Programmes, London, UK

Abstracts

This paper draws conclusions from a case study based on an introductory research course in a college of education: a course taught first in a blended format, and then taught fully online. Using the self-reflections and self-assessments of ethnically diverse students in each version of the course, quantifying their levels of achievement in comparison with learning objectives, the author systematically compared the two versions. Students' anonymous self-assessments addressed the degrees to which they had attained each of ten course learning objectives. Students from the blended version of the course tended to assign relatively higher ratings to their levels of achievement, in comparison with students in the fully online course. The results also highlight the advantages of flexible assessment practices, and of involving students in the course evaluation process. It is clear that when students monitor and manage their own progress in courses with online components, valuable learning experiences take place. This paper discusses possible reasons for the differences in the experiences of students in blended versus fully online courses. Realizing the full potential of both course formats will require identifying ways in which the core values of higher education may best be expressed in online courses.

**Keywords:** online course, blended course, course management system, student self-assessment, online learning environment, higher education

Over the past few years, the assessment field has changed so that much more emphasis is now placed on how student assessment is an integral part of teaching, not just something that is done after instruction to measure what students have learned (McMillan, 2011, p. xi). Involving students in the assessment and evaluation process is also becoming an essential part of assessment programs in higher education. Through such involvement, students can reflect on what they have learned and on how they learn. In doing so, they develop the skills to become more effective learners.

Higher education now attracts a wider variety of students than ever before (Dunn, Morgan, O'Reilly, & Parry, 2004, p. 5); specifically, students are more diverse in terms of culture, ethnicity, age, socioeconomic status, and even expectation. Addressing reasons to move to more flexible assessments with diverse students, Dunn et al. (2004) state the following:

*Underlying the move to flexible learning and assessment is a concern that student profiles have changed and those committed to higher education nowadays have to work to support their studies. There are also far more mature-age students entering higher education than ever before. In addition, there is the realization that traditional teacher-centered methods of delivery are outmoded because they focus on coverage of content and do not engage learners in authentic learning experiences that can be effectively measured. (pp. 39-40)*

### **Purpose of the Study**

This study discusses the case of an introductory graduate research course implemented with blended learning, and then taught fully online, in the School of Education at the University of Guam. Requirements for the course included a self-assessment at the end of the semester. In both blended and fully online versions of the course, students' self-ratings of their performance relative to the objectives for the course were analyzed and then compared. Implications of the results for teaching and learning with technology are presented. The paper includes recommendations for future research as well as for optimal practices in teaching.

### **Background**

Chute, Thompson, and Hancock (1999) provide a comparison of 20th century and 21st century learning environments, as follows: 20th century learning was characterized by homogeneity, by lectures, students as listeners, instructors as sources of information, and by evaluation and testing; and 21st century learning is characterized by diversity, dynamic content, students as collaborators, instructors as guides, and by performance as the metric of success.

Although technologies cannot transform poorly informed or unmotivated teaching into good teaching, there are great new opportunities to move from instructor-centered to student-centered learning: which shifts the instructor's role from the source of all knowledge to a guide in the process of learning (Wong, Habibah, Ahmad, Kamariah, & Tang, 2003).

### ***Computers have infiltrated human life***

"Computers are everywhere," as Beekman (2005) has pointed out, "and our lives are affected in all kinds of ways by their operation—and non-operation. It is amazing that computers have infiltrated our lives so thoroughly in such a short time" (p. 33). As the future looks increasingly

digital, wireless, and net-worked, the notion that a traditional classroom instruction, by itself, is no longer adequate for higher education teaching and learning, has considerable merit. Institutions of higher education now must address “changing expectations associated with the quality of the learning experience and the wave of technological innovation. Those who have grown up with interactive technology are not always comfortable with large lectures as an approach to transmitting information. Students expect a relevant and engaging learning experience” (Garrison & Vaughan, 2008, p. ix).

Technological innovations have provided students with new options, and it is imperative that course designs reflect both students’ and instructors’ expectations of higher education (Bedi, 2006). Bedi argues that to maintain the quality of online courses, the instructor has to perform a multi-faceted role, providing “human” elements in the process of online learning. To the extent that face-to-face interactions produce quality instruction, many academics believe that online learning places the instructor at an inherent disadvantage. Bedi maintains, however, that in partially or fully online courses, instruction requires a somewhat different set of skills than face-to-face instruction, and that, given those skills, instruction can meet all of the instructor’s and students’ goals. Online instruction becomes a *production* in which the instructor plays the roles of producer, director, and leading actor. Students’ levels of satisfaction with online learning environments, and their reflections, may be important contributors to the success of blended or fully online courses.

### ***Online learning with a course management system***

The University of Guam has over 150 courses delivered either in blended (hybrid) or in fully online format. More than 75 faculty and 2000 students are now actively involved in these courses. Given that the University maintains enrollments of 3500 students, the majority of its students now have experience with online learning environments. As faculty and students in blended courses realize, online approaches to learning can supplement and enrich classroom-based instruction. It is no longer necessary to use lectures simply to transmit information. The University’s blended and online courses use an open source Course Management System (CMS) called the Modular Object-Oriented Dynamic Learning Environment (Moodle), which is a server-based software package designed to allow the instructor to provide online students with collaborative activities, critical reflections, and learning resources. Moodle was selected because of its flexibility, efficiency, and cost-effectiveness, in addition to its user-friendliness. Moodle, in fact, “has evolved into one of the most widely-used Learning Management Systems in the world, with over 35,000 installed sites and 25 million users” (Moore & Churchward, 2010, p. 1).

## **Self-Assessments from Blended and Fully Online Courses**

### **Description of the Course**

The introductory graduate research course reported in this study provides an overview of the concepts and applications used in educational research, with a focus on knowledge of research methods necessary to obtain valid and reliable results or outcomes as solutions to educational problems. Students in the course are exposed to techniques that will enable them to understand and enhance the procedures of scientific investigations as they apply in educational settings.

The course syllabus provided details of (a) the instructor's learning objectives; (b) the assignments; and (c) how mastery would be assessed. For two years (from Fall 2008 to Spring 2010), the course was offered using a Moodle-based blended format, incorporating classroom instruction (35%) and online instruction (65%), and thus, reducing face-to-face classroom lectures and tutorial time.

The three main tasks of *online* instruction in blended (and fully online) versions of the course are: (1) to provide students with guidance for their weekly online exercises, readings, discussions, and submissions of assignments; (2) to provide feedback on online assignments; and (3) to provide answers to students' daily online questions. The fully online course was initiated in the fall semester of 2010. The fully online version was also a Moodle-based course with integrated communications provided through Moodle, along with tutoring via telephone and e-mail. Although the course changed from a blended to a fully online format, the instructor, the textbook, and the learning objectives, the coursework, and the systems for evaluating student performance were the same in both blended and online courses.

By employing an active learner model and a constructivist approach—demonstrating new knowledge to the learner and revisiting prior knowledge and experience as a foundation for new knowledge—the course emphasized three instructional methods: (1) active demonstrations of skills; (2) student-centered learning based on active learning and cooperative interaction; and (3) encouraging students' progressive mastery of skills by providing them with many opportunities to practice and to apply what they learn. To optimize practice and students' abilities to learn from each exercise, the instructor provides timely feedback. Moodle-supported components of the course in blended and fully online versions are categorized in Table 1.

**Table 1. Moodle Features and Learning Activities (Source: Adapted from Ko & Rossen, 2004)**

Categories	Learning Activities	Moodle 'Building Blocks'
Instructor presentation	This includes lectures, simulations, charts, and graphs, as well as computer assisted presentations using tools like PowerPoint slides.	<i>News Forum</i> -- Instructor's welcome message <i>Resources</i> -- PowerPoint slides for each week's lecture
Discussion	Guided discussion is common format for discussion. In seminars, instructor presentation and discussion are often combined.	<i>Forum</i> -- Students participate in a weekly online discussion as well as a weekly online exercise
Group-oriented and individual projects	Collaborative activities are included here, in addition to group and individual projects presented to the entire class.	<i>Assignment</i> -- Students work on weekly assignments and submit online
Research	Research may be conducted either by individuals or in groups (e.g., practical applications, fieldwork, and interviews).	Students develop and submit their research proposal online
Assessment	This involves exams, essays, and projects; portfolios that combine different types of work; and evaluation for participation.	Scoring guidelines and rubrics are used; all assignments are submitted online and are graded via Moodle

### **Blended Learning**

This assessment, addressing ten areas derived from the learning objectives, was conducted as a summative evaluation. Although 31 students registered for the course, two students dropped in the middle of the semester. The remaining students (N = 29) anonymously rated the degree to which they agreed with each statement (5 = very much, 4 = much, 3 = some, 2 = little, and 1 = very little). Table 2 indicates the mean (M) and standard deviation (SD) for each area.

According to their mean ratings, students felt that they had achieved the most in the areas of:

- (1) “knowing how to get research materials through the Internet” (M = 4.72; SD = .45);
- (2) “knowing the purpose and process of reviewing literatures” (M = 4.59; SD = .68); and
- (3) “knowledge of APA style writing” (M = 4.28; SD = .77).

Throughout the course, students submitted all assignments to the Moodle Web site, creating files and participating in weekly online discussions. At the end of the course, students also submitted a one-page narrative evaluation of their experiences, including their opinions regarding future trends in online learning. Representative student reflections are quoted below.

- I was reluctant to take this course, but this blended course gave me the opportunity to experience online learning and eventually to become familiar with fully online courses.
- All the assignments were communicated and administered through the Internet using Moodle, which helped us to create effective online learning communities.
- Blended learning worked well for me. I studied at my own pace and submitted online assignments. Feedback from the professor was always prompt for each assignment.
- The only thing that I had trouble with was Internet connectivity and occasionally the submission files did not go through. Sometimes the e-mail system was still not reliable.
- If I had questions, I could e-mail the professor. But I need the structure and strict demands that regular courses usually entail. It is difficult to find the motivation for studying.
- Blended learning provides an opportunity. It gives us a chance to experience both a classroom way of learning and online learning. It gives us the best of both worlds.

### **Fully Online Learning**

Thirty students registered for the course but four students dropped in the middle of the semester. At the beginning of the semester, 21 students indicated that they had never taken an online course before; the remaining nine students had. When asked about the advantages of taking this fully online course, their answers were as follows (note that they selected all that apply): it fit their time schedule better than a face to face class (28 students); it fit their learning style better than a face to face class (7 students); it fit their communication style better than a face to face class (3 students); spending more time with their family (3 students); keeping their job while taking this course (14 students); and transportation issues or distance from campus (10 students). Regarding their expectations for this course, 23 students said that they would like to develop skills they can apply to daily life situations such as their jobs and to their other classes.

This assessment, which addressed ten areas derived from the learning objectives, was conducted as a summative evaluation. The 26 students completing the course anonymously rated the degree to which they agreed with each statement (5 = very much, 4 = much, 3 = some, 2 = little, and 1 = very little). As seen in Table 2, the three areas of achievement receiving students' highest ratings were:

- (1) “knowing how to get research materials through the Internet” ( $M = 4.44$ ;  $SD = .71$ );
- (2) “knowing the purpose and process of reviewing literatures” ( $M = 4.28$ ;  $SD = .73$ ); and
- (3) “knowing the differences between primary and secondary resources” ( $M = 4.24$ ;  $SD = .60$ ).

**Table 2. Comparison of Student Self-Ratings for Achievement in Blended and Online Courses**

		Blended Learning N = 29 (Spring 2010)		Online Learning N = 26 (Fall 2010)	
Assessment categories		M	SD	M	SD
1	I understand what makes an effective researcher in education	3.5862	.68229	<b>4.1600</b>	.62450
2	I feel I have established a sense of self-efficacy in writing a research proposal	4.0000	.59761	3.8000	.76376
3	I know the differences between primary and secondary resources	<b>4.2069</b>	.77364	<b>4.2400</b>	.59722
4	I know the characteristics of both qualitative and quantitative studies	4.0345	.65841	3.8000	.60000
5	I know how to identify the research problem and to establish research questions and/or hypotheses	3.4828	.57450	<b>4.1200</b>	.72572
6	I know the purpose and process of reviewing literatures	<b>4.5862</b>	.68229	<b>4.2800</b>	.73711
7	I know how to get research materials and references through the Internet.	<b>4.7241</b>	.45486	<b>4.4400</b>	.71181
8	I know all the necessary steps in conducting research studies	3.3448	.48373	<b>3.8800</b>	.72572
9	I am prepared to use a variety of research designs and methods	<b>4.2069</b>	.77364	3.9600	.78951
10	I know the APA style writing and how to cite in-text and references	<b>4.2759</b>	.64899	3.6800	.69041

### Implications of the Results

The areas in which students in each version of the course felt they had achieved the most, ranked by mean ratings, appear below. (Note that the five top areas are listed below, yet the mean scores of two areas for blended students tied at the fourth rank.)

<i><b>Blended Learning</b></i>	<i><b>Fully Online Learning</b></i>
1. getting materials through the Internet	1. getting materials through the Internet
2. knowing the literature review process	2. knowing the literature review process
3. knowing the APA style writing	3. knowing primary and secondary resources
4. knowing primary and secondary resources	4. knowing what makes an effective researcher
5. using a variety of research designs	5. identifying research problems and questions

### ***What I do, I understand...***

Three areas—“getting research materials through the Internet”; “knowing the purpose and process of reviewing literature”; and “understanding the differences between primary and secondary resources”—received high ratings in both versions of the course. The University library tour helped students in the blended course to increase their skills in using library resources, both print and electronic: including primary and secondary resources. In the fully online course, in lieu of the library tour, the University provided distance education library support, including access to the library’s databases from off-campus, and this support may have enhanced their skills in using the Internet. These results provide additional evidence for Frank, Lavy, and Elata’s (2003) proposals that human beings are active learners who construct knowledge based on their experience and on their efforts to give meaning to that experience, and that *doing* (e.g., hands-on practice, and interactive workshops) is important to learning. The results are consistent with theory and with the well known Chinese proverb: *What I hear, I forget; what I see, I remember; but what I do, I understand*” (Learning Quotes, 2007). Even in fully online courses, it may be that the instructor’s approach, incorporating *active* teaching, for *active* learning that enhances *active* reading (with students fully attending to the message), supports students in engaging the course.

### ***Approaches used to achieve the learning objectives***

If data from this sample are representative, students in blended courses may tend to assign higher ratings overall to their levels of achievement than do students in fully online courses. However, certain specific areas such as “understanding what makes an effective researcher in education,” “knowing how to identify the research problem and to establish research questions and/or hypotheses,” and “knowing all the necessary steps in conducting research studies,” were rated much higher by students in fully online courses than by students in blended courses. Enhancing these areas requires “careful” reading: reading the textbook and other supplemental materials thoroughly.

Students in the online course were asked to list at least two approaches they used to achieve the course learning objectives. Approaches typically listed include: reading carefully not only the textbook but also online materials provided by the instructor; reading empirical research and evaluation research studies published in journals; attending conferences to listen to research presentations; accessing the University library’s database and references; reading articles posted online that were written in APA style; discussing the material with classmates through Moodle or e-mail; e-mailing the instructor for clarification and better understanding; and practicing each part of the research process by working on each assignment thoroughly.

### ***Online students read and write more...***

It appears that students in online classes are more willing actively to engage both their peers and the instructor than are students in blended classes. It also appears that online students read and write more than blended students do. Challenges for online instructors include tailoring teaching strategies to the needs of individual students, and finding ways for technology to enhance the student’s ability to read, write, reflect, and synthesize course materials. Instructors who are successful in mentoring student-teacher communications utilize a variety of techniques or materials to create a more positive online learning environment (Lawhon & Ennis-Cole, 2005).

The most daunting challenge for online faculty may be the substantial increase in time that faculty must commit to course preparation, to grading and feedback, and to interaction and support (Travis & Price, 2005).

### ***Moodle as an instructional tool***

If instructors can enhance first-time online students' levels of satisfaction with their first experiences in an online course, then the instructors will have a good chance of keeping them for subsequent online courses (Kelly, 2007). With this insight in mind, the online course reported in this study was implemented based on the three factors described by Kelly (2007): (1) *clear communication policies*, given that the syllabus clearly stated how frequently the instructor would communicate; (2) *a regular schedule*, in that weekly exercise materials were provided, given that many students dislike self-paced courses; and (3) *updated grades*, given that students who cannot see their grades throughout the course are less likely to be satisfied with the final grade (Moodle shows each student's updated grade at any time). It should be noted that students in both versions of the course felt that Moodle was easy to use, and appreciated the way that Moodle presented materials week by week, and how they could upload their assignments to the server, which were then date-stamped. It should be also noted that students in both versions of the course felt that finishing assignments in a timely manner was a real challenge. The course organization, including weekly activities and readings, was very important, as voiced by this student: "This course is my first ever online class. The outline of the course helped me a lot. I am also grateful for the resources that the instructor provided. Such resources made it easy for me to follow along and were very helpful supplements of the textbook."

### **Summary and Conclusions**

Benefits from courses similar to those described in this study will attract increasing numbers of institutions, not just those that happen to have large proportions of tech-savvy faculty and students. Yet, those institutions may expect some resistance from otherwise well-educated faculty members who pride themselves on their other skills in communication, and from students. Given that using technology as a teaching tool requires fundamental changes in how one approaches and facilitates a course, many faculty members more comfortable with traditional classroom-based teaching are reluctant to take the plunge. Many students who are unsure of their computer skills feel the same way about technology-based learning. There is no denying that teaching and learning in a course like those described here require familiarity with the technology involved.

However, there is also nothing unique about this requirement: increasingly, good computer skills are a necessity of professional survival, just as reading and writing are. To take one example, the U.K. Government's White Paper, titled *21<sup>st</sup> Century Skills, Realizing Our Potential*, identifies skills with information and communication technology as acknowledged as essential "skills for life," on a par with good reading and math skills (NIACE, n. d.). There is another important parallel between technology-based skills and reading and writing. Just as reading and writing can be improved with practice, technology-based skills improve with practice.

Given that increasing percentages of college courses will be taught partially or completely online, how can the transition be optimized? One way is to compare the core values of blended and

online higher education courses with their outcomes, in order to improve the design of these courses. To enhance and maintain high quality online instructional practices, it is essential for instructors to develop and implement assessments that evaluate the effectiveness of the online teaching-learning process.

A second way involves instructors learning from what students find involving and satisfying. It does appear that factors contributing to student satisfaction in online courses are associated with the quality of online instruction, the instructor's feedback to students, and especially quality of relationships with the instructor. This study supports the principle of an online instructor who not only becomes a facilitator of learning but also a motivator for students.

Learning is most effective when embedded in the pursuit of intrinsically rewarding activities. Self-directed learning and self-monitoring promote learning and achievement, and are essential for online learners. For this reason, though student self-assessments as reported in this study cannot be the only measure of success, they are among the most useful indices of success.

### **Recommendations for Future Research**

This study has described some ways in which technology allows instructors to promote student-centered learning, rather than curriculum-centered learning. Though feedback on students' performance generally originates from the instructor, students can also play an important role in the learning and assessment process through self-evaluation, and they learn most when they accept responsibility for their own learning. To promote these goals, the author offers the following three recommendations.

#### **Including both formative and summative self assessments**

Only summative student self assessments were conducted in the course reported in this study. Formative assessment is tightly linked with instructional practices. Instructors need to consider how their activities, assignments, and tests support learning goals and allow students to communicate what they know, then use this information to improve teaching and learning (Boston, 2002). Formative student self assessments should be conducted to modify the content of the course so that students can get maximum benefits from their learning experiences.

#### **Including criteria-referenced self-assessment**

Criteria-referenced self-assessment is viewed as a process in which students collect information about their own progress. Andrade and Valcheva (2008) argue that criteria-referenced self-assessment must be a formative type of assessment, done on drafts of works in progress. It should not be a matter of determining one's own grade; instead, the purposes of such self-assessments are to identify areas of strength and weakness in one's work, in order to make improvements. The corresponding rubric is a document that lists criteria and describes varying levels of quality, from excellent to poor, for a specific assignment. As Andrade and Valcheva note, a good rubric describes the kinds of mistakes students tend to make, as well as the ways in which good work shines: giving students valuable information about the task they are about to undertake, and taking the guess-work out of understanding what counts as high quality work.

### Design research supplying empirical evidence

Any future research should focus on developing online learning environments that include content and styles of delivery that promote learning, while also engaging a diverse student population. One major concern in online learning is the lack of empirical evidence for learning enhancement (Macdonald, 2008). To effectively utilize open-source CMSs (such as Moodle), design research is important (Reeves, Herington, & Oliver, 2005). The instructor has to keep in mind two design principles: (1) to make sure that course objectives are defined in terms of the desired learning outcomes; and (2) to make sure that all activities, assignments, and assessments are aligned with those learning outcomes (Ko & Rossen, 2004). As emphasized by Reeves et al. (2005), design research requires that instructors should define pedagogical outcomes and create learning environments that address them, emphasize *content* and *pedagogy* rather than *technology*, and modify the learning environments until the pedagogical outcomes are reached.

Official Conference Proceedings 2012

Abstracts

Much has been written about various forms of transnational education, some of them greatly concerned about the problems but few making any real analysis of how the students and staff concerned feel about such enterprises. This paper investigates the degree to which key stakeholders are satisfied with the academic achievements of students in a transnational education campus. Questionnaires were completed by past and present students, local staff members, and the course coordinators at the home university. The questionnaires attempted to gauge the satisfaction of the stakeholders with particular regard to the relevance of the courses, the implication of a multicultural campus, the communication between the international campus and the home university, and the academic quality insofar as it met the demands of the course coordinators. This research revealed that, although there were some problems which require addressing, in general, most stakeholders were happy with the way the international campus functioned and the achievements it made. Among the issues raised, a major concern was the lack of sufficient reference to local conditions. There was a perennial problem of language, a problem which occurs with any form of multicultural education. However, the level of the students' performance satisfied most of the academics concerned. This investigation affirms the belief that transnational education is of great practical value, especially to students in developing countries. Hopefully financial restraints will not hinder the further development of such projects.

## Introduction

Even in ancient times, ambitious students travelled to Athens or Rome hoping to improve their learning, just as today students worldwide journey to the most prestigious universities provided they have the necessary qualifications and financial backing. However, students no longer need to travel to receive an overseas education. Now the overseas education can come to them, in the form of transnational education. Within the current literature on the topic, writers (Huang, 2007; Ziguras, 2003; Yang, 2008) use the definition given by UNESCO/Council of Europe (2000) stating that “transnational education” is generally defined as “education in which the learners are located in a country different from the one where the awarding institution is based”.

Contemporarily, this process is usually at a tertiary level and thus called transnational higher education. According to the Australian Universities Quality Agency (AUQA), it refers broadly to higher education provided by a tertiary institution in a source country to students studying in another, or host, country (Baird, 2006). Other similar definitions are found in Eldridge and Cranston (2009) and Australian Education International (2009a).

Over the past decade, transnational higher education has been a rapidly growing phenomenon (Yang, 2008). Hyam (2003) claimed that the number of students enrolled in universities outside their own country numbered 1.8 million in 2000 and that it was anticipated this number could reach 7.2 million by 2025. Other projections give different figures but they all indicate a massive increase (McBurnie & Ziguras, 2001). In Europe, the Sorbonne Declaration 1998 signed by France, Germany, Italy and the United Kingdom, set out objectives to increase the interchange of students among European countries. In recent years, Australia has become a major provider of transnational higher education (Chapman, 2007; AVCC, 2003; Naidoo, 2009). According to Australian Education International (2009a), in 2007 there were 273,099 international students studying in Australian institutions. Of these, 72,282 were either entirely offshore or spent some time during their qualification offshore. This represented 26.5 per cent of all higher education international students. Maslen (2009) reported that Australian universities now operate almost 900 programs in other countries. Thirteen universities have established offshore campuses and another 24 have arrangements with institutions in host countries preparing students for study in Australia or running degree courses under the Australian university's academic control. Apart from the publicised revenue in 2009 gained from overseas students studying in Australia, estimated at \$15 billion, a further \$505 million was earned from offshore education (Australian Education International, 2009b). However, “it is clear that transnational education is past its rapid growth stage, and to be successful from this point forward, Australian universities are going to have to pay closer attention to the needs of both their partners and the student cohorts” (Heffernan et al. 2010, 34).

Although much has been written about this educational phenomenon, there does not seem to be a corresponding amount written on how stakeholders feel about its educational effectiveness. What are its benefits? Have the programs been successfully delivered? If what Heffernan has written is true, then this investigation may give some idea of how some international students feel and what they are expecting of a transnational education.

The question of quality control of transnational education is important both for public tertiary institutions and private providers. There is now a wealth of information on trends and advice on quality assurance for transnational education (McBurnie & Ziguras, 2006; UNESCO IIEP, 2006; Yang, 2008; Pyvis & Chapman, 2008; Saarinen, 2008; Mok 2008; Sérgio, 2002). This

matter is one of universal concern. Even in 1999, the Bologna Declaration which was signed by 29 European countries stated that one of the set of specified objectives is a European dimension in quality assurance, with comparable criteria and methods (European Commission, 1999).

There are many different forms of transnational education (Mok & Xu, 2008; Huang, 2003; Naidoo, 2009; Heffernan et al., 2010). This article investigates a transnational higher education campus established by an Australian university in a second country attended by local students and students from other countries. The country in which the campus was set had two local ethnic groups who lived according to quite different cultural mores: one being the indigenous inhabitants and the other descendants of people who settled there more recently. Students from these two groups, together with international students especially from China, attended the campus. The campus offered both Bachelor and Master degrees in business and information technology/information systems. Most management positions on the staff were held by Australians. Most of the academic and administrative staff were locally recruited. There was a core of full-time academic staff but much of the teaching was done by local sessional staff.

## Method

To gain a comprehensive picture of students' degree of satisfaction with the courses offered and their academic progress, an ethics clearance was obtained from the appropriate university and three different questionnaires were given to: a) students; b) campus teachers; and c) course coordinators located in Australia. It was anticipated that each of these groups would view the campus from a different perspective. The students would be naturally concerned with their own progress. The local teaching staff were in a different situation from most higher education academics as they were aware of the students' reaction to the courses and were also aware of the reaction from the course coordinators in Australia. The course coordinators were not only concerned about the students but about the way the courses were delivered and the maintenance of academic standards.

On the surface, all the stakeholders appeared to be reasonably happy, but in order to gauge the level of satisfaction amongst the stakeholders, this investigation was carried out. The questionnaires used enabled the respondents to express their satisfaction or dissatisfaction by circling one of five reactions: 1) very strongly agree, 2) strongly agree, 3) agree, 4) disagree, 5) uncertain. To allow all the stakeholders to further express their opinions, each question was followed by a space where they could make further comments.

The survey for the students was carried out in several randomly-chosen classes on a voluntary basis and administered by a member of staff. It involved 10 per cent of the entire local campus population, equally shared across the disciplines. The questionnaire for the local teachers was given to those members of staff who voluntarily agreed to take part and was later collected by a member of staff. The questionnaire for the course coordinators was presented by email again on a voluntary basis. The response rates were shown on Table 1.

**Table 1: Response rate to questionnaire**

Respondent	Distributed	Received	Response Rate
Students	100	65	65%
Local teaching staff	30	15	50%
Course coordinators in Australia	25	15	50%

## **Results and Discussion**

### ***Evaluation of courses***

There was unanimous agreement amongst the campus teachers that the courses were relevant to local needs. Students were more divided, some being very enthusiastic and a small number expressing doubts. Most of the student criticism was regarding information technology (IT) courses which some students thought were too theoretical.

Some students supported the idea that there should be more local content, whereas other students were pleased with a more global perspective. This was particularly relevant in giving examples of topics discussed in the textbook. Some students would have liked examples from the host country or from Asian countries. The campus teachers also suggested that the studies were based exclusively on Australian or American scenarios, especially in the case studies. Some of them felt that the lack of relevance to the local scene tended to make the students less interested. The idea of the inclusion of local content was also supported by some course coordinators but they realized the difficulties of maintaining equitable standards with students at the home university. It was pointed out that campus teachers were quite free to relate the studies to local content in terms of examples if they so wished.

### ***Evaluation of assessment methods***

Students were generally happy with the way in which the assessment process worked. Language problems and the lack of feedback were the major criticisms. Students felt that discussion of marked assignments could have been helpful. IT students complained that there was not enough relationship between the textbook material and the assessment questions. Some students found it difficult to understand what was required in the assignment questions. International students appeared to be slower in doing research because of their lack of reading skills in English. The students found that too much research was often required for the time given.

On the other hand, 25 per cent of the course coordinators were not happy with the assessment methods because they felt the marking by the campus teachers was too lax and that the deadlines were not always met. In contrast, the campus teachers were generally satisfied with the quick feedback from the university and felt that the moderation appeared to be reasonable and fair.

### ***Evaluation of students' capability***

In this case "capability" means that the students felt that they could handle the courses. The students were the most confident group, most of them agreeing, but only a small number enthusiastically. About 10 per cent doubted their ability. Most of the campus teachers deemed the students capable of handling the courses but about one third disagreed. The course coordinators registered the same degree of agreement. Some students found that the courses were too technical and others struggled to come to terms with the Australian scenario on which most of the courses were based. Lack of analytical skills and expensive textbooks also contributed to the problem.

Twenty (20) per cent of the campus teachers thought that the students' English language skills were inadequate. Questions in assessments were sometimes couched in colloquial terms which would make them more attractive to native speakers but very confusing to second language speakers. However, most of them agreed that written assignments were reasonably well done. There was a general lack of research skills and analytical skills. The campus

teachers agreed with the students that the textbooks and the courses were both focused on an industrial scene with which they were not familiar. Course coordinators generally agreed that the work presented by the students was of a standard equal to the work done by international students at the home university. They mentioned that cultural differences were an important factor affecting the work done by the students. This worked both ways. Course coordinators lacked a deep knowledge of the students for whom they were responsible and there were many issues in the course which the students often did not understand because of their lack of understanding of Western culture.

### ***Evaluation of students' attitude***

Campus teachers were divided in their opinion of how interested the students were in their studies. There was not a great deal of enthusiasm apparent in supporting this question and almost half felt that the students were not genuinely interested. It appeared generally that students were more motivated by the desire to gain a pass in the subject than they were in actually learning about the subject. Students were more likely to attend classes when assignments and tests were coming up.

### ***Evaluation of campus teachers***

The campus had a variety of teachers, some from Australia either appointed by the university or recruited from Australian, New Zealand and USA residents within the country, but the majority from the main ethnic group and the immigrant ethnic group. English was spoken with a variety of accents. Consequently, some students found this quite a challenge. Yet the students appeared to be very happy with their teachers, the majority of them (57%), expressing their approval strongly or very strongly. A handful of students were critical of the commitment and the depth of knowledge of some teachers.

A majority of course coordinators were happy with the campus teachers. They felt that most of them maintained good communication and that a few were not consistently operating at an appropriate academic or professional standard.

### ***Evaluation of course coordinators***

Campus teachers were strong in their praise of the course coordinators. They were appreciative of the support that the course coordinators gave. However, there was a feeling that some course coordinators had little idea of how the campus operated. The course coordinators themselves admitted they were generally not well informed about the campus conditions, nor about the culture of the country. A large group was happy with and interested in the campus but there was a small group who were sceptical about the whole concept of transnational higher education.

### ***Evaluation of student support services***

There were formal English language programs which provided instruction to those students who sought it. Teachers were prepared to discuss individual problems and difficulties, usually related to study. Staff members, especially senior staff members, could be consulted on more personal problems. Generally speaking, the campus had an open approach. Consequently, students were generally happy with the student support services. Unfortunately, many students, especially the international ones, preferred not to take advantage of these services.

### ***Evaluation of resources***

Students were less happy with the resources available with 41 per cent saying that they were inadequate. Students considered there were too few books in the library. They found the Internet services were unreliable and slow. There were not enough computers and the maintenance of these was not satisfactory. Campus teachers admitted that the library was small and complained that many students had difficulty accessing information electronically. This was in part a problem of the country itself. There were other technical problems. Similarly because of the inadequate local infrastructure, the staff often complained of problems of connection with the university. Email service was not reliable. The inadequacy of the IT system also caused problems for the course coordinators since it interfered regularly with communication. These resources were obviously not the equivalent that would be offered in the home university.

### ***Evaluation of cultural diversity***

As explained before, the campus was attended by local students, a large group of Chinese students and students from other countries such as Vietnam and Korea. The staff also were a multicultural group with local teachers as well as teachers from Australia, New Zealand and the USA. Hence the students were involved in a campus where cultural diversity was very evident. Cultural diversity is a factor of modern life and the extent to which it affects both education and the workplace is a subject of much modern research (Ely & Thomas, 2001; Ogbu, 1992). A large majority of the respondents were obviously very happy about the cultural diversity of the campus and felt that it presented no major problems. In fact, they felt that it made for a more interesting environment. Campus teachers found the cultural diversity challenging but not problematic. The major difficulty was one of language.

### ***Evaluation of other issues***

Over 80 per cent of the students agreed that study at the campus fulfilled their expectations and 74 per cent of the campus teachers felt that there were no serious problems in the delivery of the courses. There were, however, other issues raised. Most students saw the campus as a stepping stone to furthering their education in Australia. There were political issues that affected the campus. These were mostly dealt with by the local administrative staff. Another issue raised was the question of autonomy. It was felt that many of the decisions affecting the campus could have been made locally. Too many issues were resolved by the university in Australia, making the decision-making process slow. It would seem that a major problem for course coordinators was their lack of knowledge about the host country and of the culture of the various groups of students with whom they were dealing. Communication between the campus and the university had its difficulties such as the different time zones. Course coordinators often seemed not to understand the difficulties under which the campus staff worked.

### ***The implications for transnational education***

The main impression from these findings is that such an example of transnational higher education can work to the satisfaction of all concerned. The campus appears to have fulfilled the needs of most students involved. Campus teachers were also satisfied with the work of the students as were the course coordinators in the university. It is to be remembered that this was a campus in a poorer country and that the problem of IT infrastructure is still likely to be a challenge when a metropolitan university ventures into one of the world's poor countries.

Yet, such countries are possibly the ones with greatest need for help from universities in the more affluent countries of the world.

### ***Conflict between quality and profit***

One of the problems with this form of education is that at its root it has a dual purpose: making money and providing an education. As a result of the demand for transnational education, unscrupulous entrepreneurs have established sometimes shoddy learning establishments providing doubtfully valuable educational or vocational courses. On the other hand, many worthy education institutions have welcomed the advent of international students to help them to balance their budgets. Such institutions very carefully try to ensure the quality of the courses they offer. Some academics would probably argue that it is the Australian government's responsibility to adequately fund higher education and that universities are places of higher learning, not profit-making businesses. They would further argue that education for profit is incongruous with the belief in universal access to education. Believing this to be true, a number of Australian academics are apathetic towards, even if not directly opposed to, transnational education for profit (Shanahan & McParlane, 2005). There seems no doubt that what is required is the assurance that, despite the aim of receiving enough revenue from transnational education students to keep the universities running, there also needs to be an assurance that the quality of the university courses is maintained.

In Australia, AUQA is responsible for auditing the quality of Australian universities, including their activities offshore. A 2006 AUQA report asserts that as Australian institutions enter a mature phase of transnational education, it is to be expected that quality auditors will raise the bar. AUQA is aware that the financial question is a sensitive one as it would not wish to embarrass an Australian higher education institution with a negative audit as it might damage the attractiveness of Australian higher education (Carroll & Woodhouse, 2006). A media release (Ministers' Media Centre, 2009) by the Honourable Julia Gillard MP indicated that \$57 million over four years was to be invested to establish a new national quality and standards agency, the Tertiary Education Quality and Standards Agency, which among other things would work with the higher education sector to develop objective and comparative benchmarks and to carry out rigorous audits. This body will accredit providers and protect the overall quality of the Australian higher education system.

In the replies to the questionnaires already discussed, it was noticeable that most students and staff were satisfied with the courses and the standard of the work done by the students although not ecstatically delighted. One way in which universities can maintain satisfaction in an offshore program is to see that there is regular contact with the home university. If possible several staff from the university should either work at the venture or visit it regularly. When one recognizes that international students have difficulty finding the requisite money for fees and accommodation and that often this money is secured as a result of much sacrifice on the part of their family, one feels even more committed to the idea that they be treated justly. This means that the education they receive will be worthy of the sacrifices made.

### ***The need for local consideration***

Students were equally divided when asked whether more local content needed to be introduced to the courses. Some could see the problem of maintaining equity with students in the home university. Others realized the advantages of knowing more about their home economic environment. Others suggested that campus teachers should relate what was learned in the classroom to local conditions as much as possible. Some would have liked scenarios within their own community to be used as examples when appropriate theory was

introduced. Other students suggested field trips to visit local companies and factories. Campus teachers realized that the course was very dependent on the Australian economic situation which was of little interest to the students. Course coordinators were aware of the problem but felt that it was up to the campus teachers to relate what was read in the textbooks to the local situation.

Another aspect of cultural relevance is the actual difference in the way in which people learn and the relationships developed in the classroom. Claims are made that natural cultural differences create complications in terms of the pedagogy, the assessment procedures and the social aspect of the transnational education programs (Rambruth & McCormick, 2001; Eldridge & Cranston, 2009). Even in a mono-cultural classroom, students will have different methods of learning. In a multi-cultural classroom, this problem is magnified. Within the campus being discussed, there were at least three different racial groups with different traditions of learning.

Cultural diversity also has implications for management theory. Eldridge and Cranston (2009), speaking of transnational education partnership between Australia and Thailand, assert that the impact of national cultural difference can be varied and potentially substantial in consequence and should therefore be given considered thought in any transnational education partnership. There are actually two different aspects to this matter of cultural relevance. For any institutions wishing to engage in a transnational educational venture, a university needs to consider how well the courses offered suit the cultural environment of the country to which it is being presented. But care also needs to be taken in ensuring that cultural matters are reflected in the classroom situation (Dunn & Wallace, 2008) and in the management of the local campus. This can become a problem when the people in charge of an institution come from another country. People are inclined to reinforce management systems with which they are familiar, although these may not be highly regarded by the local staff who work in the institution. In the campus described in this paper, not only were the senior members of the academic staff from overseas countries, but the administrative staff and many of the teaching staff were local people. Such a situation requires diplomacy and tolerance.

Of course, the greatest cultural diversity of all is language. In the surveys, most students seemed to think that their English was adequate and both campus teachers and course coordinators agreed that mostly the language of the students was satisfactory. Yet, there were some whose language skills made it difficult for them to make any headway. Much has been written about this topic (Black, 1991; Andrade, 2006; Galloway & Jenkins, 2005; Fakeye & Yemi, 2009). Students who pass the language examinations designed to test whether their English skills will allow them to study at an overseas university often find when they actually enter the classroom that they do not have the breadth of language skills that they really require. In other words, language entrance exams do not always show the true level of understanding of another language by the student. In fact the key lack is in their confidence. It really means a combination of better teaching programs and better testing methods.

## **Conclusion**

From this investigation, it can be seen that courses offered to international students in a transnational education should be relevant to the needs of the students. Care needs to be taken in framing courses to ensure that they do actually meet the needs of international students. The problem in some cases is how to do this without prejudicing the local student. Perhaps all that is needed is for those who plan educational courses in institutions where international

students are welcomed to be mindful of the fact that we no longer cater only for local students and that international students may have additional or different needs as well as having distinctly different backgrounds and learning habits. Heffernan et al. (2010) has asserted that in establishing relationships with overseas education providers, it is appropriate to attempt to understand the differences in culture and learning of new student cohorts.

From the inquiries made, both students and teachers regarded language difficulties as a major problem in transnational education. Although the level of education in English is rising in most parts of the world, many students attempt studies in which the English language is the vehicle of instruction without an adequate understanding of the language. Universities can take the easy course and set very high English standards for new entrance. However, there are possibly many worthy international students who do not have the opportunity to study English at a high level in their own country and yet they are intelligent and able students. It is therefore possible that some students embarking on transnational education need additional help in their English in order to complete their courses. Universities which take transnational education seriously need make provision for such students.

The findings also revealed that neither staff nor students felt that cultural diversity within the classroom presents any barrier to learning. On the contrary, the students surveyed felt that it was an enriching experience.

The investigation revealed that one feature of a successful transnational education operation was close cooperation and trust between the campus and the university. The campus teachers surveyed were very appreciative of the support given by the course coordinators. Such a degree of trust and cooperation depends on very careful planning including the choosing of enthusiastic and supportive people to carry out the work.

As far as the studies themselves are concerned, the maintenance of a high standard of quality is demanded. The intangible factors are evident but not measureable. Students who are able to afford moving to another country for their studies will obviously benefit from a wider understanding of the world and the chance to make international friendships. Those who attend overseas ventures in their own country do not have these benefits but they have gained a degree from another country without the expense that studying in a foreign country entails and they have a greater chance of being employed.

The International Academic Forum

[www.iafor.org](http://www.iafor.org)

During the last twenty or so years, language teachers have actively sought ways to increase student-to-student interaction in the L2 (e.g., The Interaction Hypothesis, Ellis 1999; Gass 1997; Gass & Mackey, 2007). At the same time, the need for corrective feedback has been recognized as essential to the L2 learning process (e.g. Li 2010). Peer correction has been accepted by many as a means to achieve both increased learner interaction and opportunities for corrective feedback in classroom settings (see for instance The British Council English Teaching Knowledge Database, accessed April 26, 2012 at <http://www.teachingenglish.org.uk/knowledge-database/peer-correction>). Although much research exists on peer correction practices in ESL/EFL settings (e.g., De Guerrero & Villamil 2000; Lockhart & Ng 1995; Mendoca & Johnson 1994), little research focuses on this practice in Japanese language classes (Ikeda 2002). Mendoca and Johnson (1994) express the need to explore what actually occurs during peer correction, particularly when used as a second language-learning task. In order to fill this gap in the literature, this study investigated a near peer review task, which is presented as an extension of peer correction tasks. Here, intermediate learners of Japanese graded the written homework of their near peers (high beginning learners) enrolled in a different class in a large university in the U.S. In analyzing the verbal interaction between the higher-level learners as they corrected grammar-focused homework of their near peers, it was found that the two participants discussed specific linguistic issues raised by the beginning level learners' responses on the homework. This study suggests the usefulness of near peer correction tasks, which allows language learners to practice their reading skills, analyze, and expand their existing linguistic knowledge.

### **Peer Review Practices and Language Learning**

There has been growing interest in second and foreign language education regarding how peer review or correction benefits L2 learners (Ohta 1995). Many aspects of L2 peer review or correction have been explored and thus led to the development of many names and descriptions of this process. For the purposes of this article, Topping's (1998, p. 250) commentary will stand as a working definition: "An arrangement in which individuals consider the amount, level, value, worth, quality or success of the products or outcomes of learning of peers of similar status." Peer review practice, also referred to as "peer feedback," "peer response," "peer revision," and "peer critique," is generally conducted among students who are in the same class (Hu 2005). Overall, the literature suggests that peer review or correction tasks can encourage learners to develop their cognitive, linguistic, and socio-affective skills. It has been suggested that learners can learn by assessing other learners' work (Hu 2005; Tsui & Ng 2000; Topping 1998;). In order to assess peers' written work, learners access their stored L2 knowledge, and this allows learners to review, reconstruct, and reanalyze their existing linguistic knowledge (Gass & Mackey 2007). Liu and Hanse (2002) surmised that in discussing their partners' products, learners share what they have learned, and get opportunities to apply and reflect on their acquired knowledge.

### **Near Peer Review VS Peer Review**

It is widely acknowledged that peer review practices serve as a valid and effective learning task. However, what if the task is conducted among near peers who possess different L2 abilities? This is the question that the current study attempts to answer. As Hu (2005) notes, peer review practices are utilized among learners who are in the same class taking the same course, dividing participants into *correcting* learners and *corrected* learners. In other words, each learner has the opportunity to correct someone else's work and have his/her own work corrected. In a near peer review practice, higher-level learners review lower-level learners' work, so this practice targets L2 learning by the correcting side (higher-level learners), not the corrected side (lower-level learners). Consequently, corrected learners don't receive much benefit from this task. This task was devised in hopes of remedying the following two problems. First, due to time constraints and

course loads, little time was allocated for review on previously learned material. Second, some students have difficulty understanding complex grammatical concepts that require a solid grasp of basic Japanese grammar (and are often covered in a first-year Japanese course).

## **Method**

### **Participants**

The participants were two female students who were taking a second year Japanese course in Fall, 2011 in a large central U.S. university. The author was not teaching the participants at the time. One participant was 23 years old (Participant “C”) and the other (Participant “R”) was 20. Participant “C” is a native speaker of French although her English proficiency was high enough to engage in undergraduate study at the university. Thus I operated under the assumption that for this project, her L1 is English. Participant “R” is a native speaker of English. The participants were asked to grade the first year students’ homework because it was felt it would be a useful learning experience for them and because they had the L2 skills and knowledge to grade the homework fairly and appropriately. The participants’ then-current instructor indicated that their Japanese proficiency levels were high in terms of performance in their second year classes.

### **Materials and Procedure**

The materials consisted of an audio recording and the resulting transcript of that recording. The interaction of the two participants engaged in the near-peer review task was recorded for 100 minutes. Both participants were aware that their interaction was being recorded. The researcher was not present during the task. The participants were not provided any instructions besides being asked to grade the homework without using an answer key. The interaction between the participants was transcribed verbatim following the conversation analysis transcription conventions appearing in Wong and Zhang Waring (2010). The participants were not told what language to use while reviewing the homework of their near peers.

The participants graded the homework of seven U.S. undergraduates in a first year Japanese class at the same institution. The homework consisted of two sections from the workbook *Genki I* (Banno, Ohno, Sakane, & Shinagawa 2000), a text and workbook series commonly used for Japanese instruction in the U.S. The homework comprised translation items and the production of Japanese sentences based on several pictures. The names of the first year students were hidden to protect their privacy.

### **Analysis**

To investigate how two learners work on the task, a fine-grained transcript was developed. The transcript was reviewed three times without looking for any specific communicative functions following Mercer’s (2010) caveat. The transcript was developed carefully by listening to the audio file multiple times and adding emerging details about what was said and how. There was a one-month interval between each iteration of transcription and analysis. As the analysis process went on, several features of the participants’ talk became salient.

## Results

### Read the written Japanese sentences out loud

The transcript revealed that the participants read the written Japanese sentences out loud from the homework to catch errors. Generally, if a participant found an error in a sentence, she made a comment or stated the correct answer and then moved on to the next sentence in the homework.

47 R: .hh arewa nan arewa >nandesuka< alrigh (1.0)

48 C: minus one cuz ah: (0.5) ah .hh yes (2.0)

49 R: kono tokeiwa ikura. un ikuradesu↑Ka: (1.7)

50 C: °Takeshi [desu° {J=1}

51 R: [sono tokei↓wa >ikura desuka.:< kono what is this (4.6)

At line 47, participant R reads over the sentence out loud and confirms the answer by stating “alrigh.” At Line 49, participant R notices an error, the missing particle *ka*, so she emphasizes what is missing in rising intonation.

64 R: ano to wh[:at. (2.0)

65 C: [(denwa arimasen)] (0.4)

66 R: OH tokei wo

At line 64, the R cannot decipher the word (*ano to*) as she says *wh[:at* followed by a two-second pause. After this, participant R demonstrates her understanding at line 66 by saying *OH*. In this case, the participants were reading the L2 sentences, although this sequence showed participant R using the L1 to initiate a repair sequence (*wh[:at*) of the trouble source). In terms of L1 and L2 selection, the participants read sentences in Japanese first, and when they found possible errors, or thought of questions or something interesting, they started speaking in English (the L1). Confirming the correctness of the answers and asking questions seemed to force them to rely on English.

### Access their L2 knowledge

The transcript provided many examples of how the two learners applied their learned knowledge in order to assess the assigned work. The following excerpt indicates how this task allowed the participants to share and reexamine their previous knowledge.

108 C: [watashi no. watashi no watashi no senko mo (0.9)

109 R: senko [mo?

110 C: [senko mo (1.0) rekishi desu

111 R: oh wait isn't that my major is also. but like referring to major also: (1.7)

112 C: oh yo so would you say watashi mo senko (0.5) No: yah watashi no senko ↑mo (0.6)

113 rekishi desu (1.2)

114 R: but I just think that when you put it after senko.: its emphasis is on the=

115 : = Wrong part.

At line 108, participant C reads the sentence aloud, and participant R finds the sentence possibly wrong at line 109. Carrying through the repair, participant R repeats the last part of the previous utterance in rising intonation. At line 110, participant C provides the whole sentence, to which participant R poses a question. This particular utterance triggers a long sequence of discussion as to what should be the correct answer. After sharing their understandings, they come to agree on the right answer as follows.

153 R: [watashimo no. no.: that sounds stupid (0.7)

154 C: so watashino senkomo rekishi desu.

155 R: yeah:: has to be:: I guess (1.0)

## Private speech to organize and reinforce learned lessons

The function of private speech is typically defined, in contrast to social speech, “as speech addressed to the self (not to others) for the purpose of self-regulation (rather than communication)” (Diaz 1992, p. 62). Examples of private speech emerged in the transcript, mostly in Japanese. The following excerpt indicates how private speech was conducted to memorize correct pronunciation of a word. Participant C tries to figure out the pronunciation of *toshokan* in lines 33 and 34 using private speech, but then participant R picks up on it and demonstrates how it should be pronounced. Following this, participant C repeats *toshokan* in lines 36 and 40, in which she strongly articulates each syllable to reinforce this learning.

33 R: [arewa toshokan de tosho toshi to::shokan. how do yo is it (1.0)

34 R: to: to::shokan {E = 1, J = 2}

35 C: To[shokan {J = 1}

36 R: [toshokan {J = 1}

37 C: yeah Toshokan

38 C: not Tosh[o:kan. but Toshokan (E = 1, J = 3)

39 R: [either way this is wrong

40 R: To.sho.kan. {E = 1, J = 3}

## Discussion

This study investigated whether a near peer review task can serve to ameliorate two issues arising in Japanese courses, namely lack of review practices and insufficient first-year Japanese knowledge. Although this study was descriptive, there were some notable observations which suggest utility of the task. First, without being told, the participants read Japanese sentences aloud in order to grade the assigned work until they found possible errors or encountered difficulties. Considering the emphasis on reading as a means to provide L2 input and experience (Al-Homoud & Schmitt 2009; Bochner & Bochner 2009), this task offers a valid way to provide ample opportunities to read and experience in the L2. Second, the task allows the participants access to their previous L2 knowledge and reexamine their understanding of specific forms. The participants discussed L2 linguistic forms they already knew by accessing their previous knowledge and defending their points as part of the near peer review task. This interaction provided an opportunity for the participants to share what they had learned and to make decisions by applying their previous knowledge even when they disagreed on solutions to “the problem” of correcting the homework of other learners (Liu & Hanse 2002). The near peer review task allowed the participants to develop and reinforce foundational Japanese linguistic knowledge; therefore, it can be a very productive and useful review task for language learners. Finally, the participants used private speech to reinforce some learned lesson amongst themselves. Sugiyama (1999) observes that a Japanese language learner repeated L2 words in peer interaction. She interprets this as the learner’s method for practicing and memorizing newly learned vocabulary. Similar instances were observed in this study.

## Conclusion

This study investigated how conversational interaction unfolded while two participants engaged in a near peer review task outside of a classroom setting. Clearly, more studies must be conducted focused on near peer review tasks and learners’ interactions as they engage in such tasks in order to make decisive comments. However, this small study delivered some intriguing insights. The study demonstrated that as two participants engaged in the task, they read Japanese sentences out loud, applied and reexamined their Japanese linguistic knowledge, and reinforced newly learned information through private speech. Considering these observations, this type of task potentially

offers a valuable review practice for language learners who could not get ample opportunities for reviewing in the classroom.

Abstracts

This paper aims to investigate students' language faculties that form the basis of their language learning and skills. It brings into question the existence whether there is more than one faculty resides in the linguistic repertoire of excellent second language users. This quantitative study incorporated the used of corpus-driven error analysis as well as critical discourse analysis. Upon investigation, for proficient users of English (second language), they experience less language interference and are well-adapted to the natural flow of the language. They have developed specific language faculty for each language that they have been exposed to prior to the critical period. Thus, based on this research, it is concluded that there are multiple language faculties reside in the language learning repertoire of bilinguals and multilingual. It is important that such understanding of ESL learners' learning process is made aware to the teachers especially in the designs of appropriate approaches in teaching ESL classes in schools. Keyword: Language faculty, bilinguals, error analysis, critical discourse analysis, etc.

## 1. INTRODUCTION

Phenomenon such as code-switching, code mixing, language interference, critical period hypothesis, etc – all point out, in part of the existence of Chomsky's language faculty in the mind. Though many correlates such incidents as overlapping between the learner's mother tongue and his second language system, nevertheless, some part of the theory is still vaguely or incompletely explained. While this paper is in agreement of Chomsky's notion however, it is in the interest of this research to investigate whether one language faculty is subjected to all the learner's languages in the present and even the ones he'll ever learn or is it one faculty per language?

### *1.1 Human Intelligence System: General Intelligence Governs Specific Intelligence*

Based on the theories proposed so far with regards to human intelligence, to one extreme there is the idea of a general intelligence and to another extreme, there is the idea of multiple intelligence as proposed by Gardner. Sternberg (2002) takes the middle ground with his idea of 'successful intelligence'. However, despite this many theories, not one of them could house all of the concepts and properties of human intelligence together. Additionally in terms of language faculty on the other hand, is it govern by general intelligence or does it has a specific intelligence domain as proposed by Gardner to be 'linguistic intelligence'? But if intelligence is being looked at in a different light as having a system consists of general and specific intelligence domain, then, as Gardner stated, language must be included in the latter. However in order to explain the formation and construction of language faculty in the mind, it is necessary to consider the roles of general intelligence in this matter.

Internet is a global network of computers. Using unique addresses, billions of computers connect to the internet – an abstract system – that oversees the in and out-goings of information throughout the system. Accordingly these computers are like components of multiple intelligences as proposed by Gardner – natural, linguistic, interpersonal, intrapersonal, bodily-kinaesthetic, logical-mathematical, spatial and musical intelligence with each bound to specific-specialized areas of the brain – makes up the physical intelligence system of human intelligence. Hence, the abstract intelligence system that controls the physical system is in the form of a general intelligence. While the concept of multiple intelligences has specific domains in which intelligence might apply, the general intelligence on the other hand, is "defined as the ability to balance the needs to adapt to, shape and select environments in order to attain success, however, one defines it, within one' socio-cultural context" (Sternberg, 1999). The abstract system is designed to create schemes or organization that could achieved the highest survival rates possible whereas the physical system provides the assistance needed by channelling relevant specialized expertise.

Furthermore, the abstract system is also the centre for metacognition processes, which constantly corresponds with the physical system that manages cognition processes and combined, they make up human intelligence system. However when it comes to language, Darwin's theory of natural selection can be used to explain the existence of the abstract system particularly for language, in constructing the need as well as the idea for language in human's mind in the first place. Although the existence of both system is innate but for the

physical system, it is an advantage privileged only to humans. Chomsky's (2002) and Gould's (1988) idea that language may have evolved as the by-product of selection of other abilities coincides with the concept of physical system. The abstract system orders the need for some language form in order to communicate, but it is actually the physical system that comes up with a specific language faculty in the brain. Based on Piaget's cognitive development, humans have these tendencies towards 'organization' and 'adaptation'. They construct organization of schemas to form systems to be able to understand and interact with the world. This concept of schemas formation gave rise to the idea behind physical system which responsible for learning and storing of information that ultimately, becomes a specialized expertise, such as in the concept of multiple intelligences.

Thus, if asked which aspects of the language capacity is uniquely human, and then the language faculty in the physical system is the answer. But if asked which are share with other groups of creature and then, it's the abstract system. In a research conducted by Premack and Woodruff (1978) to test the availability of the theory of mind in chimpanzees have discovered that they do have this ability to infer, for examples; purpose, knowledge, belief, thinking, doubt, guessing, pretending, liking and so forth (1978: 515). Non-human primates or other mammals that can be considered to have high cognitive level such as the dolphins do have the abstract system build into their system – they do have a basic form language for communication. However, they could never reach or achieve the linguistic ability as complex as the humans because they lack the physical system that is responsible for such specialized expertise. In a study by Fitch and Hauser (2004), they have found that the monkeys that were used as their subjects in the experiment were unable to master a grammar of higher 'phrase-structure grammar level'.

Hence, as Lenneberg proposed in his theory of Critical Period Hypothesis (henceforth, CPH), the level of exposure during a certain period of time as the child is growing up, might have jumpstarted the formation or the readiness of such faculty in the mind. General intelligence manages this exposure or data on languages in order to be able to internalize the language system to make up the ability to communicate. However, as the learner's ability gets more defined, it marks the formation of a language faculty. The research findings supports the idea that exposure before the critical age, provides the readiness or basic formation of language faculty in the learner's mind to receive language. If this can be achieved before the brain lateralized, then it might be possible to deduce that more than one language faculty exists in the human minds. Since early exposure in children resulted in better proficiency in their second language (henceforth, as L2) compared to those who did not. Hence, there is a possibility that specific language faculty for each specific language exists (including L1 or L2) as a proof to explain the reason behind lower level of interference from L1 in children with early exposure towards their L2.

### *1.2 Chomsky's Language Faculty*

Those who share the same view as Lenneberg usually believe in the idea that adults' second language learning is qualitatively different form a child acquiring first language. According to this view, the language acquisition device (henceforth, LAD) in position for a child is pre-programmed to process linguistic coding while; an adult operates using general coding ability.

Chomsky (1968) then, put forth the idea of a specific language faculty for first language acquisition which atrophies at a certain age. He hypothesized that language can still be learned, past the age-limit, by using other faculties available in the brain. Stern (cited in McLaughlin) on the other hand, proposed that language learned in adulthood is filtered through existing learning acquisition system, modified by the first language. Stern's proposal is supported by the interference argument based on errors made by individuals learning a second language.

This study runs alongside Stern's idea regarding adults using existing learning language system. If during childhood, the adults in questions were not being exposed to their L2, than no formation of a specific language faculty for L2 will take place in their minds. Additionally, as Chomsky has put it, that ability to form language faculty atrophies at a certain age.

### *1.3 Lenneberg's Critical Period Hypothesis*

Observations made on the outcomes of children acquiring second language have prompted many researchers to investigate its underlying explanations and mechanisms. When compare the result to those of adult-learners of second language, many, such as Lenneberg shared the idea that age is correlated with individual's ability to acquire and learn a second language. Children readiness and efficiency in acquiring the language, as well as their ability to reach native-like proficiency have driven many into thinking that children are born with pre-programmed or a superior biological predisposition (applies to first, second or third languages). Hence the debate is always on the comparison between adult-learners and children. However, evidence from past studies has shown that older children and adolescents do better than younger children in acquiring a second language in a natural environment (Ervin-Tripp, 1974; Snow & Hoefnagel, 1975; cited in McLaughlin's). Thus, it appears that both children and adults can acquire and learn a second language in a way that they are both being exposed to the language naturally as well as through formal instruction.

### *1.4 Corder's Error Analysis: L1 and L2*

Corder (1967) introduced the distinction between errors (in competence) and mistakes (in performance). This distinction directed the attention of Second Language Acquisition (henceforth, SLA) researchers to competence errors and provided for a more concentrated framework. Like Richard, he has highlighted the sources of competence errors in his article, "A Non-contrastive Approach to Error Analysis" (1967); as a form of L1 transfer results in interference; incorrect application of language rules in intra-lingual errors; whereas construction of faulty hypotheses in L2 results in developmental errors (Kara, 2006). Although not all have agreed with Richard's proposal, one still cannot simply diminish its importance, or rather, error analysis role in SLA research.

Moreover, the distinction of the term 'competence' and 'performance' had once, also been a focused topic of Chomsky's. He uses the term 'competence' in the same sense as the word 'grammar' which means a certain kind of language knowledge (Steinberg, 1993). Competence is the knowledge that persons have of their grammar while performance

involves knowledge for using competence (Steinberg, 1993). Since errors form systematic pattern in L2 as compare to mistakes which are unsystematic errors in L1, it shows that errors occur at the basis of language understanding of a learner. Such as the case when innate language ability (similar to Chomsky's Universal Grammar idea) enables children to acquire language at the young age of 4 to 18 months old. Through exposure, they formulate a general understanding of the principles of the language which will later on formed the basis of their schema ('internalized grammar'/ competence) when learning another language. Due to interference from L1 and other factors, their second language (performance) will never reach 100% competency as the target language.

Thus, if individuals are to relate both linguists' tabulations, it will become apparent that errors (in competence) are a significant factor in the learning of a second language. Through the identification of errors and mistakes – idiosyncrasies patterns for example – it is possible to trace the learner's nature of language faculty and perhaps answered the research question proposed at the beginning of the report. It is important to understand that it was never about the teaching as much as about the learning when it comes to language.

## **2. METHODOLOGY**

### *2.1 Research Design and Procedures*

The research design used for this study is quantitative method – percentages of errors calculated through Error Analysis process. This error analysis is a corpus-driven research. The data was collected in the form of essays writing.

### *2.2 Sample and Population*

The sample included 35 form 2 students from a secondary school in Pahang. The data was collected in the form of essays writings: 20 essays were selected randomly out of the total of 35 essays (total number of students in the class). All of the students were given the same title, "My Best Friend". The class ranks second in all of form 2 classes and their level of proficiency is intermediate.

### *2.3 Measures, Data Collection and Data Analysis*

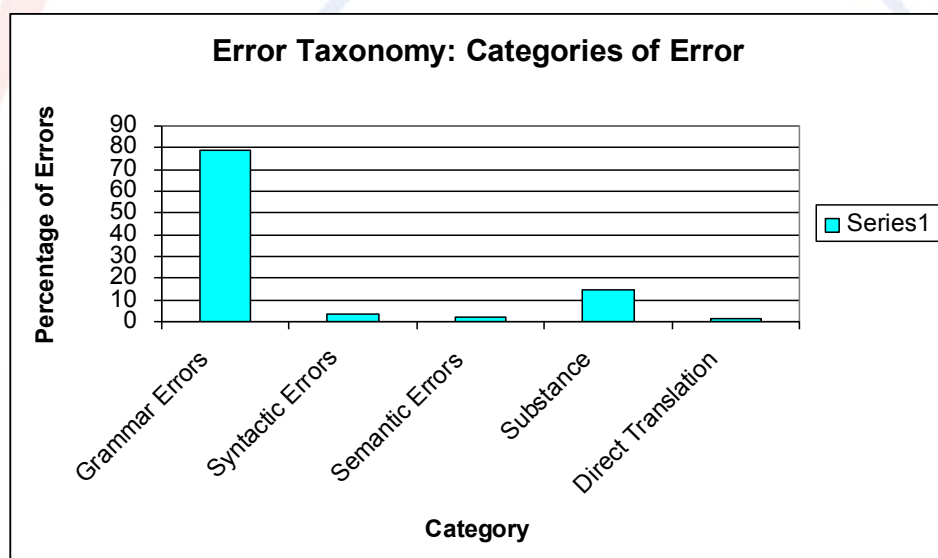

The corpus is formed by using 'Antconc'; (1) generate frequency list of words and (2) assist in finding the collocation words from the data. For the purpose of defining the error types, linguistic terms have been chosen (clear and simple) for the first stage of the analysis; noun, pronoun, verb, conjunction, adjective, adverb, preposition, article, determiner and sentence structure (if the sentence is fragmented/ incomplete). Then for the second stage of the analysis process, the classification of error type was narrowed to the use of the following terms; surface structure taxonomy: (1) Omission, (2) Addition (Double-marking; regularization; irregularization, etc), (3) Misinformation and (4) Misordering.

The corpus of students' essays were then subjected to Critical Discourse Analysis which views language as a social practice, shaped by and shaping social identities, social relations and systems of knowledge and beliefs of individuals (Fairclough, 1989). Through the combination of the corpus and the students' background information, the analyses will a more holistic result.

### 3. RESULTS AND DISCUSSION

#### 3.1 Error Analysis: Idiosyncrasies Pattern

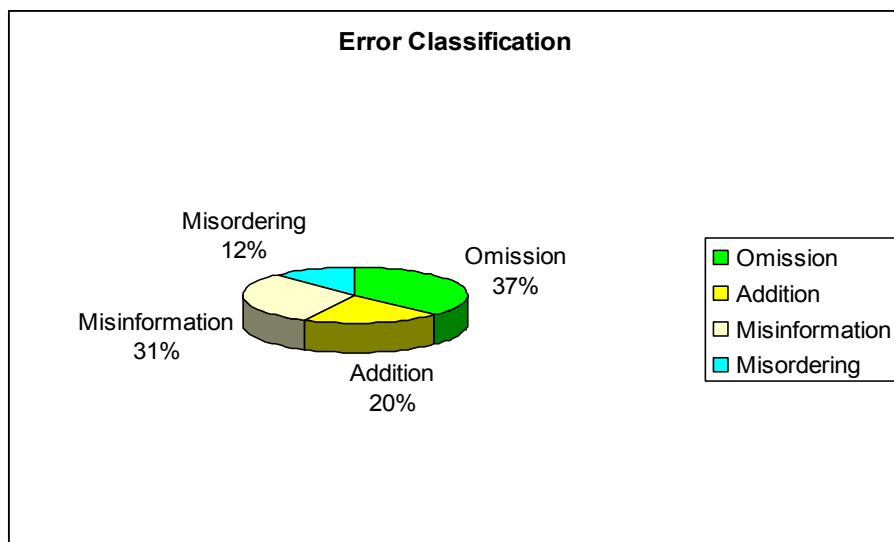

The table below specifies errors in terms of linguistic categories based on where it is located in the system of the target language; grammar, semantics, syntax and substance. The total number of errors is 473 and below is the number of errors within each category:

Graph 1: Error Taxonomy: Categories of Error

Table 1: Total number of sentences: 373

	Type of Sentence:	Total number of sentences:	Percentage (%):
1.	Simple sentence	325	87
2.	Compound sentence	24	6.5
3.	Complex sentence	24	6.5

Graph 2: Error Classification (examples from the essays)

As shown in the graphical data representation above, the highest error percentage falls under the classification category of Omission (37%) which then, follows by the Misinformation category. However, with regard to Table 2, it shows very limited information on the types of errors committed by the students in their essays. Hence, for the rest of the tables that followed, all of the students' errors are scrutinized under their each respected category.

Table 2: Classification of Errors: Omission

Identification of Error (Omission) (examples sentence):	Definition and Classification of Error:	Explanation of Rule (corrected sentence):
1. She ( ) also ( ) success in her UPSR.	Verb and Article. a) Omission of a 'be' verb. b) Omission of article 'a'.	= <i>She is also a success in her UPSR.</i> A sentence requires a verb and the word 'also' creates a general meaning for the sentence, thus, article 'a' should be used when addressing the noun the first time.
2. I have <u>many</u> best friend( ).	Plurality. a) Omission of morpheme '-s'.	= <i>I have many best friends.</i> The determiner 'many' is a plural quantity word, thus the noun which comes later must also be in plural.
3. She ( ) also active in sports.	Verb. a) Omission of 'be'	= <i>She is also active in sports.</i> SVO pattern warrants the presence of

	verb, "is".	a verb in a sentence, thus, 'be' must be inserted here.
4. The address ( ) his village is Num. 2, JalanMengkarak....	Conjunction. a) Omission of conjunction; either 'to' or 'of'.	= <i>The address <b>to</b> his village is...</i> = <i>The address <b>of</b> his village is...</i> The sentence needs a conjunction to link the two parts together; one is the statement and another is the address.
5. I also like her because she ( ) always teaching me how to swim.	Verb. a) Omission of 'be' verb, "is".	= <i>I also like her because she is always teaching me how to swim.</i> The sentence is in the '-ing' participle form.
6. I and Mira ( ) likes a sibling.	Verb. a) Omission of plural 'be' verb, "are".	= <i>Mira and I are like siblings.</i> 'Like' here is not a verb but a comparative. Thus, 'are' needs to be inserted as the main verb into the sentence.

Table 2 shows several examples of omission errors committed by the students in their writing. The examples were in the form of missing verbs, conjunction and plurality. The same goes to the addition-error types (Table 3), with the inclusion of some pronouns and subject-verb agreement errors.

Table 3: Classification of Errors: Addition

Identification of Error: Addition (examples of sentence):	Definition and Classification of Error:	Explanation of Rule (corrected sentence):
<b>a) Double markings:</b>		
1. She don't <u>likes</u> to play netball.	Verb (subject-verb agreement). a) The markers are on two verbs.	= <i>She <u>doesn't like</u> to play netball.</i> If there are two verbs in a sentence, the marker should be on the first one.
2. She <u>was borned</u> on 16 <sup>th</sup> August 1996.	Verb. a) Tense markers on two verbs in the same sentence.	= <i>She <u>was born</u> on 16<sup>th</sup> August 1996.</i> If there are two verbs in a sentence, the marker should be on the first one.

3. She <u>does knows</u> how to sew clothes.	Verb (subject-verb agreement).  a) Tense markers on two verbs.	= <i>She <u>does know</u> how to sew clothes.</i>  If there are two verbs in a sentence, the tense marker is placed on the first.
<b>b) Regularization:</b>		
1. She was <u>borned</u> on 16 <sup>th</sup> of August 1996.	Verb.  a) unnecessary insertion of tense marker, ‘-ed’.	= <i>She was <u>born</u> on 16<sup>th</sup> of August, 1996.</i>  Double marking rule can also be applied here. However, ‘born’ is an irregular verb – it does not have a past tense form.
2. I hope her ambition will <u>reached</u> and our relation never <u>breaked</u> .	Verb.  a) Unnecessary insertion on tense marker, ‘-ed’.	= <i>I hope she will be able to reach her ambition and that our relationship will never be <u>broken</u>.</i>  ‘Break’ is an irregular verb as in ‘broke’ when it is used in past tense. However, the meaning of the sentence actually warrants the writer to use the verb in its past participle form.
3. She will <u>helps</u> everyone who have problem.	Verb (subject-verb agreement and future tense)  a) unnecessary insertion of singular marker, ‘-s’.	= <i>She will <u>help</u> everyone who has problem.</i>  2 <sup>nd</sup> singular pronoun, ‘she’, warrants a singular marker, ‘-s’ at the end of every verb that comes later. But since there is ‘will’ (future tense), the verb should be in its root form.
4. <u>She’s</u> age is 13 years old.	Pronoun.  a) Misplacement of possessive pronoun.	= <i><u>Her</u> age is 13 years old.</i>  ‘Her’ should be used instead of “She”. But it seemed that the writer has over-generalized the features of possessive pronoun by adding, ‘-’s’ to ‘she’. It has the same meaning but ‘She’s’ to show possessive is not acceptable.
<b>c) Archi-forms:</b>		
1. a) <u>His</u> study at SMK Al-Wosto.  b) <u>His</u> hobby is playing badminton.	Pronoun.  a) Wrong choice of pronoun.  In the example, ‘His’ is	= <i><u>He</u> studies at SMK Al-Wosto. His hobby is playing badminton.</i>  ‘His’ is a possessive determiner of ‘he’. The first sentence warrants for a

	used as a substitute to all forms of pronoun.	3 <sup>rd</sup> person singular pronoun and not a possessive one in nature.
2. I <u>has</u> a best friend.	Subject-verb agreement.  a) Incorrect choice of verb.  'Has' is used to represent 'Have' as well.	= <i>I <u>have</u> a best friend.</i>  'I' is a 1 <sup>st</sup> person plural pronoun. Thus, the verb that comes after it should also be in plural form. 'Has' is a singular form for 'have'.
3. He is <u>a</u> intelligent boy.	Article.  a) Incorrect choice of article ('a' represents all forms of the article).	= <i>He is <u>an</u> intelligent boy.</i>  'an' should be used instead of 'a' because the letter of the word that comes after that, started with a vowel.
<b>d) Alternating Forms:</b>		
1. She is 13 years old. (then, through the rest of the essay, the pronouns keep changing):  a) His hobby is...  b) She like to eat...  c) His favourite subject...	Pronoun.  a) Incorrect used of pronouns.  'She' and 'Her' is the correct choice of pronouns but the writer keeps alternate them with 'He' and 'His'.	= a) <i><u>Her</u> hobby is...</i> = b) <i><u>She</u> likes to eat...</i> = c) <i><u>Her</u> favourite subject is...</i>  The person in which the writer was referring to is a female. So, the correct terms should be 'She' and 'Her'.
2. His favourite subject <b>is</b> <b>Mathematics</b> and <b>Science</b> .  (then, the second sentence...)  a) He likes <u>this</u> subject because <u>it</u> are very fun.	Subject-verb agreement.  a) Wrong form of 'be' verb.  b) incorrect used of pronouns.	= <i>His favourite <b>subjects are</b> <u>Mathematics and Science</u>.</i>  = <i>He likes <u>these subjects</u> because <u>they are</u> very fun.</i>  Since they are two subjects mentioned, the 'be' verb should be in plural form – 'are'.  In the second sentence, the demonstrative pronoun, 'these' and morpheme, '-s' are inserted to tally with the first structure which is in plural.

However as shown in Table 4 below, the error transgressed linguistic categories. For example, as shown in Table 4, there was a substitution of a verb form in place for a noun.

Table 4: Classification of Errors: Misinformation

Identification of Error: Misinformation (examples of sentence):	Definition and Classification of Error:	Explanation of Rule (corrected sentence):
1. a) She <u>was</u> a cute, white and tall girl. b) She <u>was</u> the tallest in our class while we <u>was</u> in primary school.	Verb. a) Incorrect used of verb form. b) Incorrect used of plural-past tense verb form. (Misinformation about the timeline).	= <i>She <u>is</u> a cute, white and tall girl.</i> = <i>She <u>was</u> the tallest in our class while we <u>were</u> in primary school.</i> Description in the first sentence should be written in the present tense (since her friend is still alive). While in the second sentence, 'we' warrants verb to be in plural form. Thus, 'were' is the correct choice.
2. We are sharing more thing about all the subject.	Verb. a) Substitution of the progressive for the simple present.	= <i>We <u>share</u> information on all of the subjects.</i> Progressive form cannot be used in the sentence since it is used to for temporary happening, whereas in the sentence, the action is something that is still going on (a statement).
3. a) When my mother cook chicken rice, I always <u>invited</u> her to my house. b) She does not decline my <u>invited</u> .	Verb and Noun. a) Substitution of a verb form in place for a noun.	= <i>She never declines my <u>invitation</u>.</i> In the second sentence, the writer repeated the used of 'invited' – the verb, to mean the noun, 'invitation'. Following the SVO pattern, an object should be placed at the end of the sentence.

In Table 5, the examples of errors committed by the students, under the Misordering category covers a wider linguistic structure in a particular sentence or a clause.

Table 5: Classification of Errors: Misordering

Identification of Error: Misordering (examples of sentence):	Definition and Classification of Error:	Explanation of Rule (corrected sentence):
1. He is <u>very</u> like to play cube.	Adverb. a) Misordering of adverb.	= <i>He likes to play Cube <u>very much</u>.</i> In this example, ' <u>very</u> ' makes up the adverbial phrase, 'very much'. Thus, it should be placed at the end of the sentence.
2. She <u>also is</u> a caring person.	Verb. a) Misordering of the verb and adverb.	= <i>She <u>is</u> also a caring person.</i> The adverb should never precede the auxiliary verb.
3. She <u>very</u> likes the actor.	Adverb. a) Misordering of the adverb.	= <i>She likes the actor <u>very much</u>.</i> In this example, the adverb should be placed at the end of the sentence.
4. <u>On the television</u> , she watch the Elly Mazlein drama.	Sentence structure (clause). a) misordering of adverbial clause.	= <i>She watches Elly Mazlein's drama <u>on television</u>.</i> In this example, the prepositional clause should be placed at the end because it is giving information about the object of the sentence (Elly's drama).
5. We always reading together <u>when we have a free time</u> .	Sentence structure (clause). a) misordering of adverbial clause.	= <i><u>When we have some free time</u>, we always read together.</i> Such adverbial clause is mostly placed at the beginning of the sentence.

Furthermore, several examples of Direct Translation and Insertion of L1 phrases into L2 sentence are as follows:

- i. She also like visits the Malaysia. When the holidays, she and her family visit the Malaysia at somewhere. When she is back, there were many places that they are visits at there.
- ii. His ambition is want to be a lawyer because his mouth always open.
- iii. My mother occupation is just care my brother and sister at home.
- iv. She is not like to play hocky because she is afraid when her friends pukul bola.

v. He like to eat Nasi Ayam and his favourite water is Bandung.

### *3.2 Data about the Learning Process*

Students are not internalizing the rules of the target language. It appears that much of the correct phrases or bombastic words are results from the acts of memorizing and copying from books.

For examples:

- i. The word, 'decline'; correct usage but incorrect choice of object.
- ii. Sentence connectors such as 'moreover'; its position is correct but then again, the sentence developed into this – "Moreover it is, her favourite food is..."
- iii. They are confused with basic principles of grammar such as singularity and plurality, subject-verb agreement, pronouns etc.
- iv. Although the class is the second ranked class in the school, the level of proficiency is quite low. In most of the essay, there is no coherency between different points.

### *3.3 Parts of the target language that the students cannot produce correctly.*

The students are having most difficulty with grammatical morphemes. Based on the data, the incorrect insertion of '-s' ranked one of the highest errors within the list of errors. They are also weak in syntax and semantic. However, since they seldom write in the forms of compound and complete sentences, the percentages are not too obvious.

### *3.4 Types of errors involved.*

#### *A. Global and Local Errors:*

Between global and local errors, they mostly committed global errors in their writings rather than the latter. As mentioned above, their choice of using simple sentences prevented them from committing significant errors in writings – not to the point of hindering communication. But in cases, where some of them did use compound or complex sentences, the results were mostly incorrect and incomplete.

For example:

- i. She also like visits the Malaysia. When the holidays, she and her family visit the Malaysia at somewhere. When she is back, there were many places that they are visits at there.

For the simple sentences, obviously there were signs of L1 interference but still the message was successfully conveyed.

For examples:

- i. I have best friend.
- ii. The place of birth is at Hospital Mentakab.

iii. I feel that the world will lonely without her.

#### B. Intralingual and Interlingual Errors:

- i. Intralingual errors dominated over most of the data, especially in terms of over-generalization and ignorance of rule restriction.
- ii. With reference to the categories of classification, the Addition category portrays most examples of over-generalization whereas Misinformation and Omission categories contain evidences of rule-restriction ignorance.

### 3.5 Sources of Errors.

#### A. L1 Interference

The major source of error in the production and/or reception of a second language are the native language.

- i. One can account for the errors by considering differences between L1 and L2. The greater the differences between L1 and L2, the more errors will occur.
- ii. For examples; the use of grammatical morpheme, '-s' to show plurality. There is no such form in Bahasa Melayu.

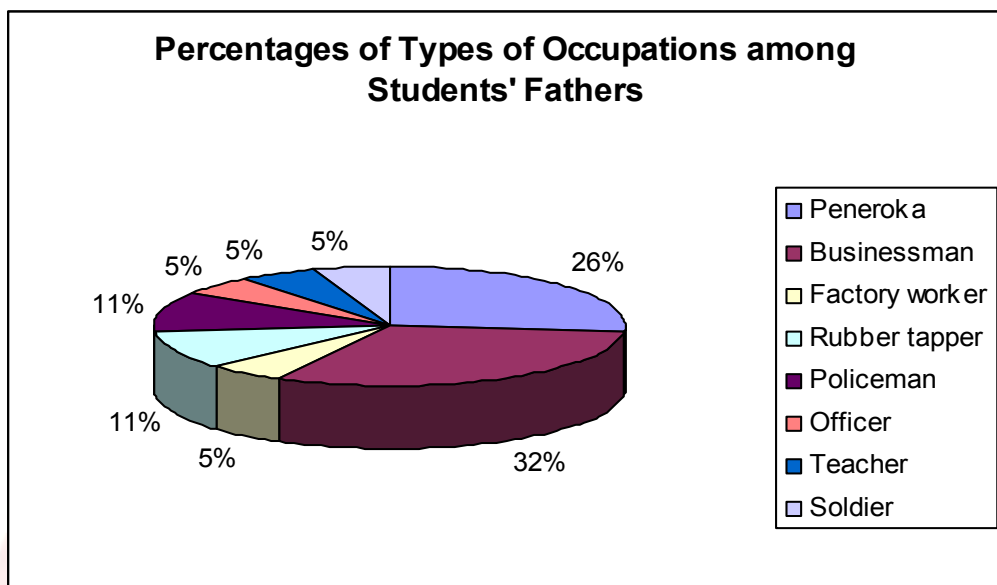

#### B. Induced Errors – result from incorrect instruction of TL

The techniques or strategies that are being used in today's classroom are not the best way to teach a language. First, lesson plans and syllabuses need to be design to cater to the students' needs. The language that is being portrayed to students is in a fragmented form. The grammatical rules, syntactical rules and whatnots are rigidly forced upon the students to be memorized for exams. Thus, there is no internalization of the target language structure within the students' schemata. In addition, language must be taught in its whole and the exposure must consistent as well.

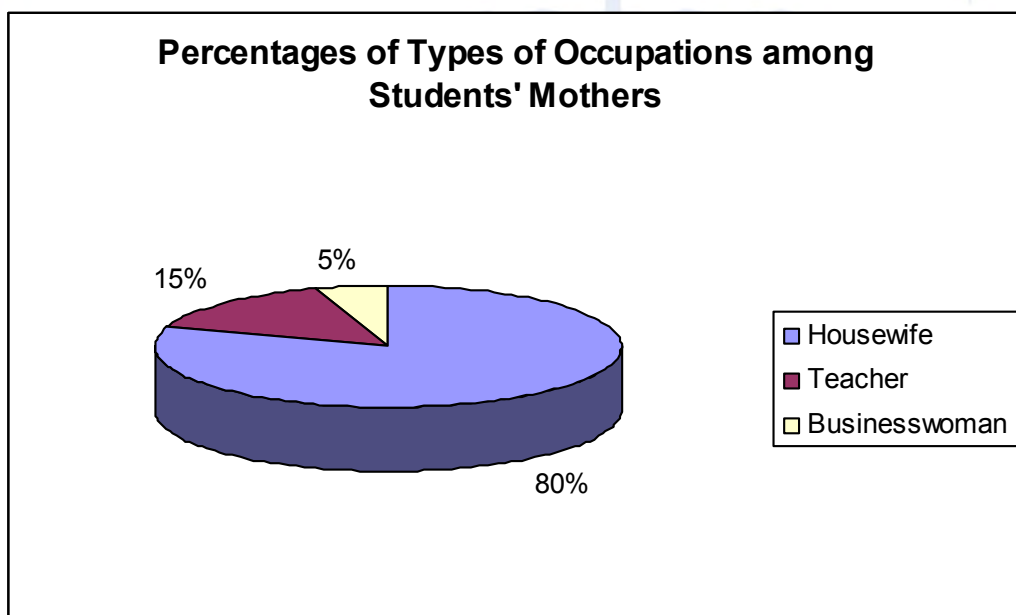

### 3.6 Background Checklist of the Students

Based on the two pie charts below, it is possible to concur that most of the students do not have sufficient exposure or practice with regards to the target language outside the classroom. Support or motivations from parents also play an important role in the students' development towards the language. One of the students wrote a reasonably good essay. Her father being an officer and her mother a teacher, they perhaps could provide a better learning environment for their children to acquire as well as learn the language.

Graph 3: Student's Background: Percentages of Types of Occupations among Students' Fathers.

Graph 4: Student's Background: Percentages of Types Occupations among Students' Mothers.

In a study conducted by Nor Hashimah, Norsimah and Kesumawati (2008) involving a total of 315 schools in Malaysia – urban, sub-urban and rural schools to study the mastery of English language among students in lower secondary schools – they have found that students from lower income families have the lowest mastery level of the language. Combination of factors such as poverty, unavailability of tuition services, social environment, interest and attitude contribute to the students' inability to acquire English (Nor Hashimah, Norsimah & Kesumawati, 2008).

From the results, it can be concluded that the subjects have committed a lot of errors in their writings, especially grammatical errors. Moreover, errors in terms of 'omission' and 'misinformation' reported as the highest among other types of errors. As mentioned earlier, the subjects are students from secondary school in Pahang with an intermediate level of proficiency as the class average. Key information regarding the students is the fact that they are from a rural school – outskirts of a town in Pahang. The students lack exposure towards the English language and their usage is limited only to the classroom context. Furthermore, the results showed a high level of interference from L1 with errors involving direct translation of their mother tongue. Hence, based on the assessment on students' writing skills, the data showed a high degree of possibility that they only used one language faculty which is their L1's. When compared to the results of urban students (presented in Nor Hashimah, Norsimah & Kesumawati, 2008), they showed high possibility of having used another language faculty aside from their L1's. Their writings presented less interference from their mother tongue as well as much less grammatical errors.

There are three factors of importance here; exposure towards L2, age as well as background. Early exposure prompts general intelligence to provide the foundation of constructing more than one language faculty in the learner's repertoire of linguistic intelligence. The exposure needs to take place before the brain lateralizes and loses its flexibility to cater to the demands of a new language. In this case, the student's background is important to provide that opportunity as well as the ideal environment for language acquisition and learning to take place. Moreover, family could act as motivators as well as providers of knowledge to the students when they are at home.

### *3.7 Tracing Language Faculty through Learner's Errors*

Based on the errors committed by the students, they are indeed using their language faculty for L1 to learn L2 – too many interference instances in their writing products as proof. Even if past studies such as conducted by Stern and Baine with regard to language acquisition and learning – differences between adults learner and children – the only upper hand that they have is early exposure and natural conditionings. Hence, there is a possibility that there is more than one language faculty within an individual with high level of proficiency in his repertoire of languages – L1 or L2.

Moreover, this study also highlights the importance of general intelligence as the system that provides learner the ability to comprehend and learn language before such linguistic system even existed prior to exposure.

## **4. CONCLUSION**

Chomsky's theory has been around for a long time but nobody questioned it unlike this research which proposed the idea of multiple language faculties in the learner's mind. Even in the aspect of human intelligence system, while others busy themselves over innateness as well as UG (Universal Grammar), no research has ever touched upon general intelligence as the main contributor to the early stage of language learning as well as the ability to communicate in the first place. Therefore, by studying the errors committed by learners in writings – which can be seen as the products of the mind – it is possible to trace whether there is more than one language faculty available to an individual. Hence, this study concluded that there is multiple language faculties reside in the language learning repertoire of bilinguals and multilingual.

*Perceptions of Japanese EFL Learners' /r/ and /l/ Pronunciation: Comparing Native Speakers' Ratings of Word-level Utterances*

Brian Rubrecht

0055

Meiji University, Japan

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

It is well known that English /r/ and /l/ pronunciation poses production difficulty for many native Japanese speakers, but the intelligibility and acceptability of that production ultimately lies with listener perceptions and judgments. As it was speculated that listener dialect may influence these perceptions and judgments, research was conducted with native speakers who used different varieties of English rating native Japanese speakers' production of /r/ and /l/ in various utterances. Initial data analyses (Rubrecht 2009) revealed statistically significant differences at but not above the word level. Because listeners have been found to primarily use segmental cues such as /r/ and /l/ to determine strength of accent (e.g., Riney, Takagi & Inutsuka 2005), which could influence pronunciation instruction, training, and assessment, a second set of data analyses was conducted, the aim of which was to determine more precisely how the raters from the initial study differed in their perceptions of the participants' word-level phonemic productions. Results indicate statistical significance between the raters in multiple word positions for the two phonemes, thereby legitimizing questions regarding the potential lack of pronunciation instruction and evaluation standards across educators and raters.

iafor

The International Academic Forum

[www.iafor.org](http://www.iafor.org)

As related in a previous study (Rubrecht 2009), although there has been a recent increase in interest in language learner pronunciation research, particularly involving pronunciation training with English as the target language, what has generally been overlooked is attention paid to listener perceptions of learners' pronunciation. Such perceptions are crucial to explore, as listeners, who are often labeled simply as "native English speakers" in various studies, may come from different English variety backgrounds. As such, they may pronounce English differently and may therefore have disparate perceptions concerning the intelligibility and acceptability of the English pronunciation that they hear. With there being no single "standard English" variety used worldwide, it becomes necessary to determine how such native English speakers perceive learners' pronunciation, for any differences could impact and mediate the effects of pronunciation evaluation, not to mention any initial pronunciation instruction and training.

In an attempt to discern whether or not native English speakers from different English variety backgrounds perceive spoken English by non-native speakers differently, a preliminary research study (Rubrecht 2009) was conducted with native Japanese English as a foreign language (EFL) learners pronouncing /r/ and /l/ minimal pair words in various positions (e.g., word onset, intervocalic) and contexts (i.e., at the word and sentence levels, as well as in a free narrative). Statistical significance was discovered among the ratings of pronunciation raters at but not above the word level, suggesting that pronunciation instruction and training conducted by those from different English variety backgrounds may not be standardized. Such a discrepancy could not only have a clear impact on the conducting of pronunciation instruction and training, but also, considering that Japanese learners of English generally lack awareness of disparate English varieties (Rubrecht 2010), it could influence learners' perceptions of what is "true" or "acceptable" English pronunciation.

In order to gain a better understanding of what native English speakers from different variety backgrounds may consider intelligible and acceptable /r/ and /l/ production, continued analyses were conducted on the findings of the aforementioned previous study. The current paper details deeper analyses of the statistical significance found at the word level among the three native English speaking raters, with the aim being to discern (a) which /r/ and /l/ word position evinced statistically significant differences in raters' ratings and (b) which phoneme was heard differently most often by the raters.

## **1. Literature background**

There has been a marked upswing over the past two decades in interest in research into second and foreign language learners' pronunciation, which includes interest in pronunciation instruction and training. Pronunciation has often been an overlooked component of language instruction, even though it is arguably an essential component of oral communicative activities. Pronunciation can impact a learner's speech production in the target language, and it can also influence how listeners regard the learner as a target language user. Pronunciation has therefore increasingly come to be thought of as more than an area of remedial instruction, and as such, language instructors themselves have noticed that it is important that they understand the mechanics behind target language phoneme production, as it is "a skill that teachers cannot do without" (Benrabah 1997, p. 157). As a result, instructors have continually sought ways to incorporate efficient and effective pronunciation training into their curricula, even as their curricula become ever more crowded (e.g., Acton 1997; Celce-Muria 1987; Celce-Muria, Brinton & Goodwin 1996; Kendrick 1997; Kenworthy 1987; Levis & Grant 2003; Lin, Fan & Chen 1995; Macdonald, Yule & Powers

1994; Makarova 1996, 1997).

This renewed interest in pronunciation is reasonable and even long overdue, as miscommunication can arise from problems or difficulties with foreign accents (Jarvis & Stephens 1994). Comprehensible pronunciation benefits the communicative activities of non-native speakers of English, from international business personnel and scientists to students studying abroad (Morley 1991) and even foreign language learners who must give presentations in the foreign language (Greer & Yamauchi 2008). Increased knowledge of and training with the pronunciation of a second or foreign language has been found to lead to improved speaker comprehensibility and intelligibility (Derwing & Munro 1997; Derwing, Munro & Wiebe 1998; Kashiwagi & Snyder 2003; Kenworthy 1987; Munro, Derwing & Morton 2006) as well as improved target language listening and comprehension skills (Bohlken & Macias 1992; Major, Fitzmaurice, Bunta & Balasubramanian 2002, 2005).

Certainly, a speaker with a strong accent may still present fully intelligible speech (i.e., Munro & Derwing 1995a, 1995b), as listeners do possess a fair amount of plasticity in accommodating peculiar pronunciation (e.g., Clarke & Garrett 2004; Eisner & McQueen 2005; Kraljic & Samuel 2006; Maye, Aslin & Tanenhaus 2008; Norris, McQueen & Cutler 2003), but listener judgments of non-native speaker speech have been found to include subjectivity, as factors such as listener experience with accented speech or their biases against certain accents can come into play (Derwing & Munro 2005). Nevertheless, because speech has both productive and perceptive components, the onus of intelligible speech should be placed more on speakers improving their pronunciation rather than listeners trying to decode the message behind utterances, especially if one considers that pronunciation instruction and training traditionally includes the productive components far more than the perceptive components.

As pointed out elsewhere (Rubrecht 2009), the research on improving learner pronunciation comprehensibility and intelligibility through training has focused almost solely on the learners and their pronunciation production, with surprisingly little consideration paid to the perceptive component, that is, to the pronunciation evaluators, or raters, whose job it is to assess the comprehensibility and intelligibility of those who have undergone pronunciation training. Naturally, listeners are considered in listener discrimination studies (e.g., Best, McRoberts & Goodell 2001) and when researchers attempt to identify pedagogical clues to improve pronunciation instruction (see Morley 1991), but in studies that focus on pronunciation training and assessment, raters are usually simply noted as being “native English speakers,” with the role of the raters’ English variety (i.e., the potential biases that may be present from possessing and utilizing a particular variety) remaining an unconsidered variable (see Derwing & Munro 1997; Munro & Derwing 1995a, 1998), though of course some studies present more specific rater information (e.g., Derwing, Munro & Wiebe 1998). With there always having been a great diversity in the spoken realizations of English (Cruttenden 2001) and with no single English standard by which to judge learners’ pronunciation, research must be conducted that considers rater background English variety, or at minimum, take into account differences in perceptions of raters who come from different English variety backgrounds.

## **2. The research**

### **2.1 The research questions**

The research questions that drove the current study were twofold. In the initial research, statistically significant differences were discovered among the ratings of the three raters at the word level. As such, the research questions for the present study were:

1. Which /r/ and /l/ word positions evinced statistically significant differences in raters' ratings? Stated differently, in what word position instances were the raters not hearing the same pronunciation?
2. Which phoneme in each position was heard differently most often by the raters? In other words, if the raters were all hearing the same pronunciation of /r/ and /l/ across the various word positions, were there common differences in rater perception about which phoneme they professed to hear?

### **2.2 Background and impetus**

The original research (Rubrecht 2009) was conducted to ascertain if native speaker perceptions of Japanese speakers' /r/ and /l/ pronunciation were due to differences in listener English variety background. Readers are encouraged to refer to the original research for a fuller description of the study, but it can be noted here that listeners have been found to primarily use segmental cues such as /r/ and /l/ to determine strength of accent (e.g., Riney, Takagi & Inutsuka 2005), and that the /r/ and /l/ of English do not exist in Japanese (see Avery & Ehrlich 1992; Ingram & Park 1998), making them ideal phonemes to be examined for research purposes. The details most consequential to this second set of analyses will now be briefly recounted here.

The research focused on the production of /r/ and /l/ phonemic contrasts (i.e., minimal pairs) in word-, sentence-, and narrative-level utterances by native Japanese speakers (see below) and was concerned with how the speakers' utterances were rated by native speakers of American, Australian, and British English, either in terms of phoneme heard (for the utterances at the word level) or acceptability (for the utterances above the word level).

### **2.3 Participants**

There were two groups of participants in the study: the speakers and the raters. The speakers were 24 native Japanese university students majoring in English. All were freshmen English major volunteers who had little or no travel abroad experience. None had ever engaged in specific pronunciation training apart from what was presented to them in the course of their learning English prior to matriculating to university. They were of high intermediate to advanced English speakers.

The three raters were native English speakers with extensive English teaching experience both in Japan and abroad. Each possessed a unique variety of English, that is, American English, Australian English, and British English, or General American, General Australian, and BBC English, which was formerly referred to as Received Pronunciation, or RP (see Roach 2001), respectively. The raters all professed to possess normal hearing.

## 2.4 Procedure

Because the current article focuses only on the word-level utterances, where statistical significance had been previously found, only the data collection procedure for these utterances will now be described. To elicit word-level production of the selected 35 /r-l/ minimal pair words, the learners were individually presented one of three unique PowerPoint presentations, all with complimentary content. On each slide was one minimal pair word (70 words in total). Each word contained /r/ or /l/ in one of four positions: word onset, as the second element of an onset cluster, intervocalic, and word ending. The learners were presented with onscreen instructions stating that they would be shown words, one at a time, and that each click of the mouse would present them with a new word. They were instructed to pronounce each word in a loud clear voice with their best possible English pronunciation. There was no time limit.

The recordings were made using audio recording software. They were recorded with a USB microphone at a rate of 44 kHz with 16-bit resolution, saved as WAV audio files. Before being given to the raters, the recordings were edited to remove unwanted information (e.g., long pauses, researcher explanations, questions asked by the speakers during the recordings) and had short, low tones inserted in places (e.g., after every 10 minimal pair word utterances) so that the raters could keep track of their place when rating the recordings.

Each rater was provided with a digital copy of the recordings, one rating sheet for each speaker, and high-fidelity headphones. For the word-level utterances, they were instructed to mark their rating sheets to indicate if they heard an /r/ or an /l/. The raters had no clue as to whether an /r/ or /l/ word was being spoken. If they could not discern what was uttered, they were told to place a mark in the “?” column. In order to run calculations on the ratings, the researcher later assigned the ratings numerical values.

## 3. Results

As the original research indicated statistical significance in the ratings among the raters at the word level via One-Way ANOVA tests (i.e., with all words and with word onset words), it was not necessary to repeat comparisons across the three raters. Because the current research focus was to locate and analyze the specific instances when the raters were not hearing the same phonemes being produced, it was necessary to compare the ratings of one rater against the ratings of each of the other two raters. This was done by conducting multiple repeated-measures (paired) *t*-tests.

The first set of *t*-tests was conducted between raters on the following levels: all words ( $n = 1,680$ ), word onset position words ( $n = 672$ , from 14 minimal pair sets), second element of an onset cluster position words ( $n = 624$ , from 13 minimal pair sets), intervocalic position words ( $n = 144$ , from 6 minimal pair sets), and word ending position words ( $n = 240$ , from 10 minimal pair sets). Table 1 indicates via letters in parentheses where statistical significance between ratings was found. The results of these statistical analyses are presented in Appendix A.

**Table 1:** Tests for statistical significance across all words and word positions

Category	Amer. – Aus.	Amer. – Brit.	Aus. – Brit.
All words	(A)	(B)	(C)
Word onset	(D)	(E)	(F)
Second element of an onset cluster	(G)	--	--
Intervocalic	(H)	(I)	--
Word ending	--	--	--

The analyses revealed statistical significance to be found most often between the ratings of the American and Australian raters and least often between the Australian and British raters. Statistical significance was found in four out of the five tests when comparing the perceptions of the American versus the Australian, in three tests between the American and British raters, and twice between the Australian and the Briton.

These statistical analyses were revealing, but they only indicated statistically significant differences in ratings of /r/ and /l/ in the various word positions. They did not reveal if there were any differences in how the raters were rating with respect to intended phoneme, that is, there was no indication if there were differences in ratings in expected phoneme production (e.g., /l/ in word onset position, /r/ in intervocalic position, etc.). Table 2 presents the *t*-tests regarding phonemes in specific positions. The results of these statistical analyses are presented in Appendix B.

**Table 2:** Tests for statistical significance of phonemes in specific positions

Category	Amer. – Aus.	Amer. – Brit.	Aus. – Brit.
/r/, all positions	(J)	--	(K)
/l/, all positions	(L)	(M)	--
/r/, word onset	(N)	--	(O)
/l/, word onset	(P)	(Q)	--
/r/, second element of an onset cluster	--	--	--
/l/, second element of an onset cluster	(R)	(S)	--
/r/, intervocalic	--	--	--
/l/, in intervocalic	(T)	--	--
/r/, word ending	--	--	--
/l/, word ending	--	--	--

The tests revealed statistical significance six out of 10 times between the ratings of the American and Australian raters, but only three times and two times between the American

and British raters and the Australian and British raters, respectively, which indicates that, generally speaking, there were fewer differences to be found between the perceptions of the Australian and British raters. Comparing the results found between the American and Australian raters, discrepancies were noted between the ratings when the /l/ phoneme was intended in all instances except in word ending position. Similar discrepancies were revealed when comparing the American and British raters, except that /l/ in intervocalic position was not statistically significant, nor was /r/ in all word or in word onset positions. The only instances where statistical significance was found between the Australian and British raters was when comparisons were made with /r/ in all positions and /r/ in word onset position.

#### 4. Conclusions and discussion

In order to draw conclusions from this second set of analyses, let us return to the research questions. In responding to the first question, which asked which /r/ and /l/ word positions evinced statistically significant differences in the raters' ratings, we must consider the results presented in Table 1. With 12 instances possible (minus the "all words" tests), it was discovered that half of the time (i.e., in six instances), the raters were, statistically speaking, not hearing the same phonemes being produced. Excluding the "all words" category, statistically significant differences were detected in word onset position across all three comparisons of the raters. It was not unexpected that statistical significance was not found between the Australian and British raters in instances involving the other three positions, that is, as second elements, intervocalic, or word ending, given the noted similarities between Australian and British English with regard to their being non-rhotic (see Celce-Murcia, Brinton & Goodwin 1996; Cruttenden 2001), such as with BBC English where /r/ only occurs before a vowel (Gimson 1989; Wells 1982). Why there was statistical significance found between the American and Australian raters with regard to second elements of an onset cluster and in intervocalic position, and why the American and British raters differed with regard to intervocalic /r/ and /l/, however, remains open to speculation. It is of interest to note that statistical significance was not found between the American rater and the other two raters for the word ending words, given that (a) only the American rater's General American dialect included rhotic aspects, especially in word ending position, and (b) Japanese speakers of English often delete /r/ in word ending position (Avery & Ehrlich 1992), which matches more closely with the varieties used by the Australian and the Briton. Why there was no statistical significance found here warrants further analysis.

When considering the second research question, that is, which phoneme in each position was heard differently most often by the raters, examining the results presented in Table 2 reveals that of the 24 possible tests (i.e., /r/ and /l/ in the four word positions minus the "all positions" tests), seven revealed statistical significance, which is between one-third and one-fourth of the instances. The American and Australian raters differed in their perceptions of both /r/ and /l/ in word onset position, while the Briton differed from the American for /l/ and from the Australian for /r/. As it is suspected that in most if not all cases of pronunciation training specific phonemic production would involve instruction on the mechanics behind /r/ and /l/ production (e.g., in practice with minimal pair words such as "right" and "light" where the phonemes are most clearly produced and heard), that there were differences discovered here across the raters suggests the potential for discrepancies in pronunciation training. That there were other instances where differences were detected only serves to strengthen this suspicion.

As to the import of the results of this study, as was discovered in the initial study, statistical significance was not discovered above the word level. Indeed, Suenobu, Kanzaki, and Yamane (1992) note that when words were presented in their original sentences (i.e., in context), the intelligibility scores of Japanese speakers rose from 42% to 67%. While this may encourage educators to concentrate on the suprasegmental level, non-native learners tend to place a great deal of emphasis on pronunciation at the word level (Field 2004). The results of this second set of analyses indicate that should pronunciation instruction and training occur with even a modicum of attention paid to the segmental level, educators should clearly inform students of the background English variety from which this /r/ and /l/ pronunciation springs, and if the time and means are available, they should also provide models and even practice sessions with the pronunciation of multiple common accents.

In the end, given that the goal of current pronunciation instruction and training is to produce second and foreign language learners who can more clearly communicate with others rather than have them emerge with native-like pronunciation (Paul 2012), the quest to seek a pure English pronunciation standard as a model for learners is not only deemed impossible but also quite possibly counterproductive. If it is acceptable to allow speakers to communicate orally with various accents, it stands to reason that listener accents must somehow be accounted for as well.

Because this study meant to delve deeper into data collected previously, the caveats and limitations of the first study carry over to this one, that is, there were only three raters from three specific English-speaking regions, and factors such as their age, gender, or length of time living in Japan were not considered. As such, the research results cannot necessarily be generalizable. Nevertheless, as discrepancies between the native English speakers were found, further studies are recommended. Such studies could examine a myriad of areas, including raters' perceptions of learners' pronunciation before and after pronunciation training. They could also seek to answer why /r/ was not found to be statistically significant between the raters even though the presence or lack of rhoticity is used to differentiate the English varieties used by the raters in this study. Those interested in pursuing these and other lines of research are encouraged to include a greater number of participants (both learners and raters) to strengthen any results found.

#### **Author note**

The author wishes to thank Elizabeth Ginsberg for her assistance with this research.

Abstracts

Online courses have been adopted rapidly in tertiary learning institutions as a delivery mode for its courses in order to reach as many students as possible as well as to take advantage of the ease of access of the course content by these students. This online delivery mode is also adopted for academic staff training and professional development purposes. Thus, the views of the academic staff are no less important for the success in such an endeavour. In view of this, a small scale study was carried out to investigate the opinions of the academic staff in a big and well-established private college in Penang, Malaysia, which is also a member of the Laureate International Universities, regarding the online courses that have been implemented in that institution. Thirty lecturers from various departments in that establishment took part in this survey which used a five-point Likert scale questionnaire to find out their opinions on various aspects of the online courses in that college. This paper reports on the lecturers' views regarding six aspects, namely, course content, course organization, assessment and evaluation of student learning, website accessibility as well as security and support, interactive learning environment, and institution commitment.

## INTRODUCTION

Online education, or online learning, usually refers to the learners being at a distance from the tutor or instructor, and that the learners use some form of technology (usually a computer) to access the learning materials as well as to interact with the tutor/instructor and sometimes even other learners. In addition, the learners are provided with some form of support (Ally 2004).

Online education is gaining popularity, especially among institutions of higher learning, due to the rapid expansion of computer technology and broadband connectivity. Moreover, other reasons include alleviating capacity constraints, capitalizing on emerging market opportunities as well as being a catalyst for institutional transformation (Volery and Lord 2000). Some advantages of online education are that learners do not need to travel long distances to be present in a classroom during a learning session, and neither do they need to learn at a prescribed time, as in conventional classroom learning. This reduces the need to build big campuses because learners can access the learning materials from their home, for example, and learners can optimize their learning time, especially working people with tight schedules. Another benefit of online learning is being able to deliver information via modes not found in traditional sources, namely, multimedia and animation. Multimedia allows learners to apply concepts realistically in learning exercises, while animation helps to demonstrate difficult concepts.

In view of the benefits of online education, Laureate International Universities embrace this mode of learning passionately because they believe in providing new opportunities for its academic staff to gain new knowledge and develop themselves professionally.

## BACKGROUND

Laureate International Universities is a leading international network of quality, innovative institutions of higher education. This network, comprising 60 accredited campus-based and online universities spanning over 29 countries throughout North America, Latin America, Europe and Asia, offers undergraduate and graduate degree programmes to more than 740,000 students. It offers hundreds of career-focused, undergraduate, master's, and doctoral degree programmes in fields including architecture, art, business, culinary arts, design, education, engineering, health sciences, hospitality management, information technology, law, and medicine (Laureate International Universities 2012).

To enhance its teaching staff skills, Laureate International Universities has set up a portal called the Faculty Development Initiative whereby Laureate teachers have online access to various resources and professional development opportunities. In the latter, courses are available to the academic staff members. The courses, which the lecturers may register for, are grouped under Induction, Learning Methods, and Laureate Certificate in Teaching and Learning in Higher Education. The course offered in Induction is called Laureate Faculty in the 21<sup>st</sup> Century, while the courses available in Learning Methods are Collaborative Learning, Problem-based Learning, and Case Study Methodology. On the other hand, Laureate Certificate in Teaching and Learning in Higher Education has a series of five instructor-led modules, namely, Introduction (Module I), Student-centred Teaching (Module II), Teaching Tools (Module III), Assessment Tools (Module IV), and Technology Tools (Module V). The duration of the Induction course and the three courses under Learning Methods is 20 hours each. These four courses may be registered in any sequence. The courses in the Laureate

Certificate in Teaching and Learning in Higher Education, on the other hand, must be taken in sequence, that is, Module I followed by Module II, which is then to be followed by Module III, and so on.

Due to the fact that lecturers at Laureate International Universities member institutions are encouraged to register and sit through these in-house online courses for professional development purposes, these lecturers have thus become students when they are following any of these courses.

This small scale study was meant to obtain the opinion of the teaching staff at Laureate International Universities regarding the quality of these in-house online courses after having gone through these courses themselves as registered participants. It also studied the influence of gender, and years of teaching experience of the academic staff as well as the school they were working in on their perception of the quality of these online courses.

## METHODOLOGY

### Instrument

A survey questionnaire was used in this small scale study to collect the data on the lecturers' perceptions regarding the online courses available in their learning institution. There were a total of 28 items in the survey form, which included three items on the respondents' background information. All the questionnaire items, with the exception of the three items on background information, were provided with a five-point Likert scale, ranging from 1=Strongly Disagree to 5=Strongly Agree. Besides that, all the 25 items were positively-worded. The items were grouped under various factors, such as, course content, course organization, and assessment and evaluation of student learning. These factors, which have been identified to be successful ones in implementing an e-learning programme, were drawn and adapted from Goi and Ng (2009). For example, the factors 'web page accessibility' and 'web site security and support' from Goi and Ng (2009) have been merged into a single factor in the present study as 'website accessibility, security and support'. The reason this was done was because these were considered as quality factors for websites (Zhang and von Dran 2001). Some sample items as well as the number of items associated with each factor in the questionnaire are listed in Table 1.

Table 1: Factors, sample items and number of items in questionnaire

Factor	Sample items	No. of items
Course content	The objectives of the course are clearly stated.  Language used is simple and clear.	6
Course organization	Activities are aligned with the learning objectives.	4

Assessment and evaluation of student learning	Criteria to pass an assessment are stated clearly.  Results on each assessment or activity are given promptly.	4
Website accessibility, security and support	The website is easily accessible.  Technical support or Help Desk is available.	4
Interactive learning environment	Learners are encouraged to give opinions or ideas in discussion forum.	4
Institution commitment	The management is committed to improve the quality of the course.  The management encourages learners to register for the course.	3
Total		25

## Respondents

A total of 30 lecturers from a big and well-established private college in Penang, Malaysia participated in this survey. This tertiary institution also happened to be a member of the Laureate International Universities. A criterion we set for our respondents was that all of them must have attended or were attending at least one of the Laureate online courses at the time of the study. These participants possessed different years of teaching experience and were from various schools.

## DATA ANALYSIS AND DISCUSSION

A breakdown of the number of respondents in terms of their gender, years of teaching experience and school they are working in is shown in Table 2. There were about equal number of male and female respondents, with the majority of them having just begun their teaching career. As for the school they were working in, nearly half of them were from the Centre of Excellence for Pre-University Studies.

Table 2: Number of respondents according to gender, years of teaching experience and department

		No. of respondents
Gender	Male	16
	Female	14
Teaching experience	1 – 5 years	15
	6 – 10 years	6
	More than 10 years	9
School	School of Business	3
	School of Engineering	5
	School of Computing and Information Technology	3
	Language Centre	6
	Centre of Excellence for Pre-University Studies	13

The lecturers' views for each factor in the questionnaire were analyzed descriptively. The means and standard deviations for each of the six factors were calculated for all the 30 lecturer respondents and the results are shown in Table 3. Since the questionnaire used the scale of 1=Strongly Disagree and 5=Strongly Agree, a high mean score would indicate a positive stance of the lecturers. Among the six factors the course content factor had the highest mean score at 4.19, while website accessibility, security and support factor had the lowest, which was at 3.73. Therefore, it can be surmised that the lecturers in general were satisfied with all the six factors related to the online courses.

Table 3: Means and standard deviations for each factor

Factor	N	<i>M</i>	<i>SD</i>
Course content	30	4.19	.38
Course organization	30	4.12	.48
Assessment and evaluation of student learning	30	3.90	.65
Website accessibility, security and support	30	3.73	.48
Interactive learning environment	30	4.06	.44
Institution commitment	30	3.80	.54

The views of the lecturers, separated according to gender, were also analyzed. The means and standard deviations of the participants' selected answers for each factor are given in Table 4.

Table 4: Means and standard deviations for each factor, according to lecturers' gender

Factor	Male		Female	
	<i>M</i>	<i>SD</i>	<i>M</i>	<i>SD</i>
Course content	4.21	.39	4.18	.38
Course organization	4.08	.57	4.16	.37
Assessment and evaluation of student learning	3.89	.65	3.91	.67
Website accessibility, security and support	3.86	.53	3.59	.39
Interactive learning environment	4.11	.56	4.00	.28
Institution commitment	3.88	.59	3.71	.47

When the mean scores, taken from Table 4 above, for each factor according to gender are depicted in a graph format (Figure 1), it can be clearly seen that there was no big difference in the mean scores between males and females for the first three factors. This meant that males and females had similar opinions of the online courses where these factors are concerned. The other three factors, on the other hand, showed female lecturers having much lower mean scores than their male counterparts. These three factors were website accessibility, security and support, interactive learning environment, and institution commitment. This meant that female lecturers were less satisfied with these three factors compared to their male colleagues. Moreover, website accessibility, security and support

factor showed the biggest disparity between these two groups of lecturers, with females getting a mean score of 3.59 and males 3.86.

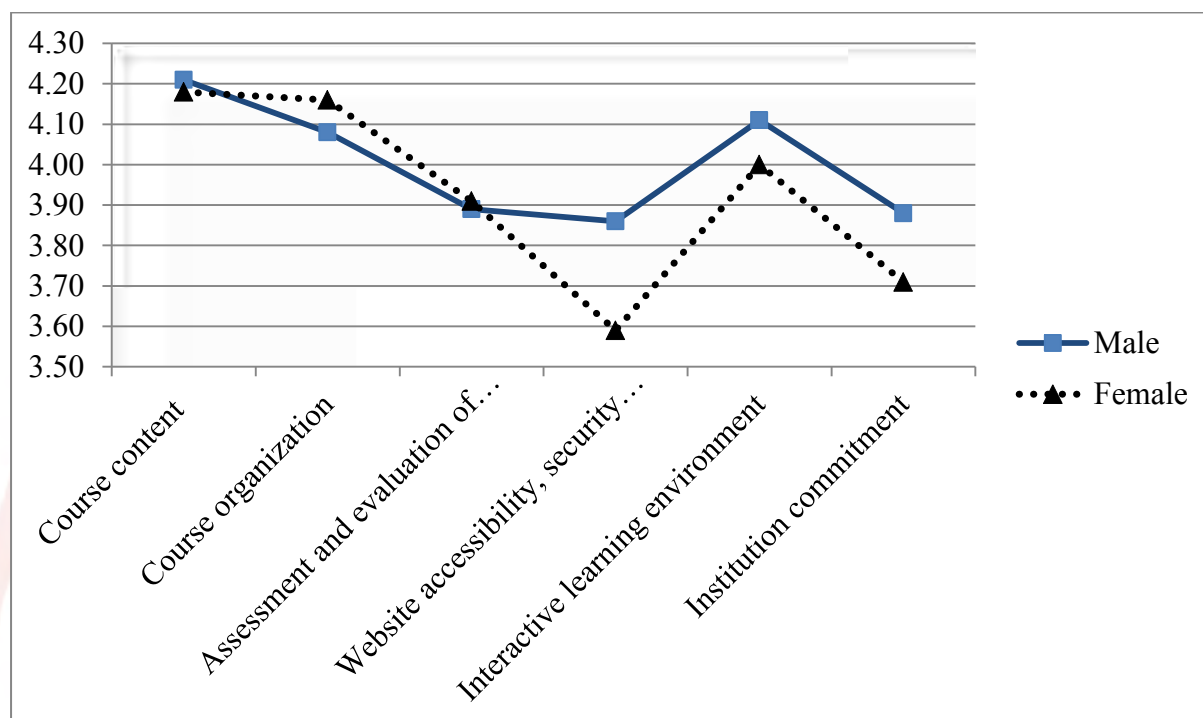

Figure 1: Mean scores for each factor, by gender

The questionnaire responses of the participants, grouped according to their years of teaching experience, were analyzed. Figure 2 shows the mean scores in each group of participants for the six factors. A noticeable trend in Figure 2 is that respondents with the most years of teaching experience, i.e., more than 10 years, were the most satisfied with the online courses for all six factors, except for website accessibility, security and support factor, when compared to the other two groups of respondents, namely, those with 6-10 years and 1-5 years of teaching experience. For the website accessibility, security and support factor, the most experienced lecturers were the least satisfied.

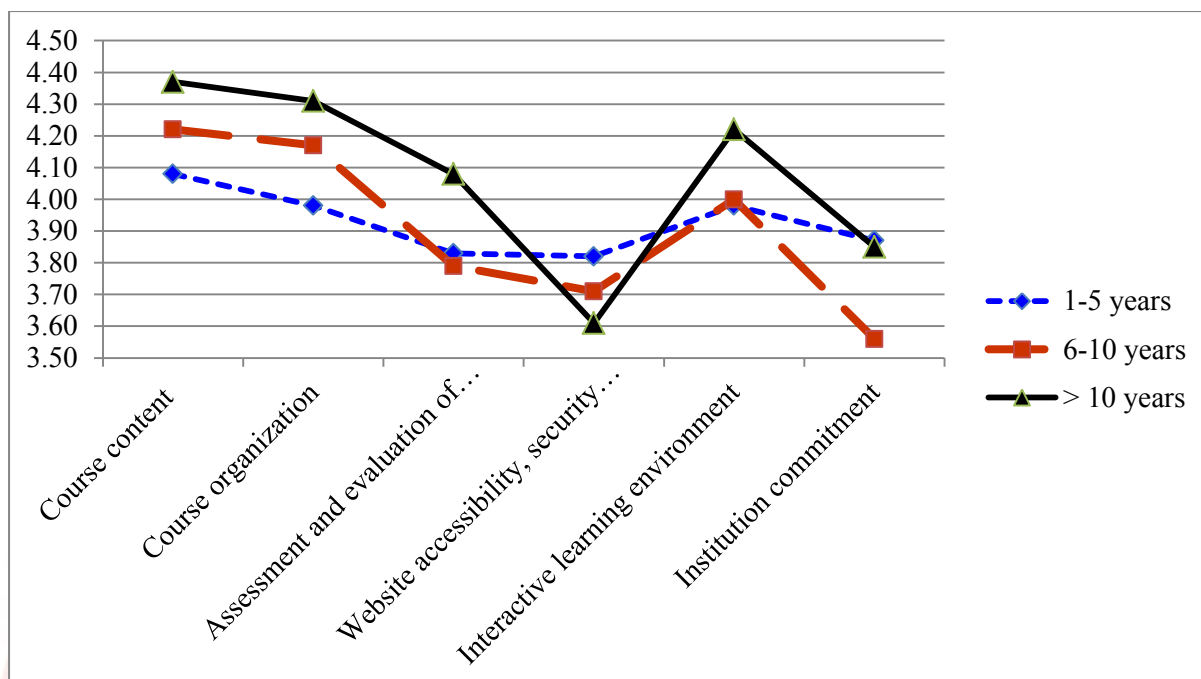

Figure 2: Mean scores for each factor, by years of teaching experience

The mean scores of the responses of the lecturers, separated according to the schools they are in, were calculated and these are shown in Figure 3 below. It is evident from Figure 3 that the School of Business had the highest mean scores for all six factors. In other words, the respondents from this school felt the most positive about the online courses with regard to the six factors. On the other hand, the lowest mean scores for all the factors were from the School of Engineering. This implied the respondents from this school, as compared to those from the other schools, were consistently the least satisfied with the online courses they have gone through where all these six factors are concerned.

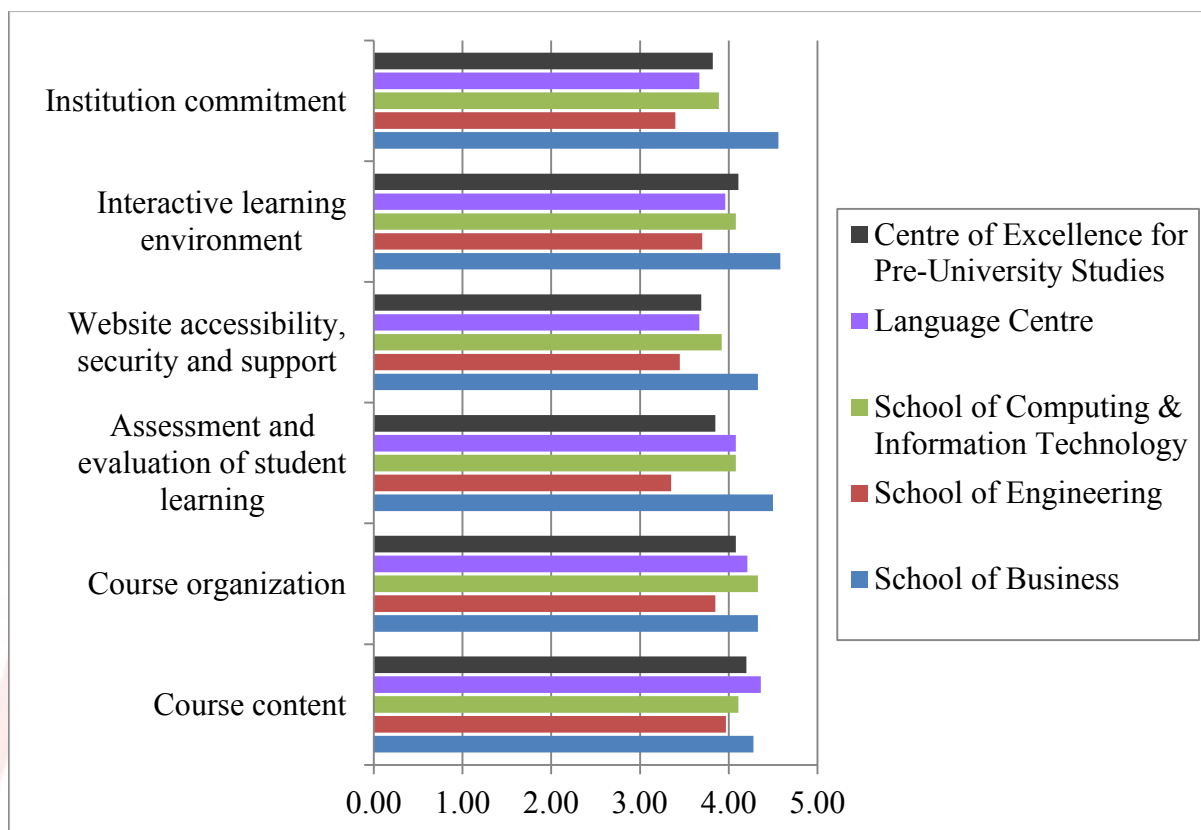

Figure 3: Mean scores for each factor, by schools

## CONCLUSION

From this small scale study that was carried out, it can be concluded that the academic staff members at this Laureate International Universities member institution were generally satisfied with the quality of its in-house online courses in relation to the six factors. With regard to the influence of gender, years of teaching experience, and the school the lecturers were working in, only three factors were seen to have a perceptible difference between the male and female lecturers. The three factors were website accessibility, security and support, interactive learning environment, and institution commitment, with the females perceiving them less favourably. Lecturers with more than 10 years of teaching experience, compared to their younger counterparts, were the most satisfied with the quality of the online courses, with the exception of website accessibility, security and support factor. Finally, the academic staff members from the School of Business were the most affirmative about the online courses in all the six factors, unlike those from the School of Engineering who were the least positive.

## 1. Introduction

Language shift, maintenance and extinction in immigrant communities have been a core area of bilingualism research. Language attitudes have been one of the crucial factors that encourages language maintenance in multilingual societies. Myes-Scotton (2006, p.120) separates language attitudes from language ideologies and suggests that “attitudes can be defined as subjective evaluations of both language varieties and their speakers”. In other words, language attitudes involve personal judgments which do not have objective basis. Those language attitudes, however, have a significant role in language minority societies for the reason that the future of those minority languages depends on how speakers of those minority societies individually or collectively judge their own language and the dominant languages. Therefore, in order to understand the existence of an immigrant or indigenous minority language, investigation of attitudes of the speakers is important.

This study investigates language attitudes and practices of Sinhala immigrant children and parents in Southern California in order to understand the how attitudes affect on language maintenance. Sinhala is the native language of Sinhalese, the majority group lives in Sri Lanka. Sri Lankan government statistics report that about three million people speak the language in foreign countries outside Sri Lanka. United States has been one of the foreign countries where the most of the Sinhalese are living as immigrants. Even though Sinhala is neither an official language nor commonly used language outside the immigrant community in the US, and there is no official institutional support for the Sinhala language development in the US, it has been the most common language within the Sinhala community. Therefore, the language practices of Sinhalese immigrants and their attitudes towards their language and its maintenance deserve investigation, especially because there is no previous study done on Sinhala language maintenance in diasporic community.

The purpose of this study is to investigate language attitudes and practices of the Sinhala speaking families living in Southern California. There were three research questions in this study: 1). what are the attitudes of Sinhala speaking parents and children towards their heritage language, 2). what are the language practices of Sinhala parents and children, and 3). what are the effects of language attitudes of parents and children on heritage language maintenance.

## 2. Literature review

Heritage language maintenance in many social contexts has been studied in several perspectives in previous studies. Some of the studies specifically focused on the parents and children's attitudes towards the heritage language maintenance, and some other studies focused on the heritage language development practices in heritage families and heritage language immersion programs in immigrant communities.

Fishman (1978) proposes that the attitudes, motivation and exposure to the language are the core factors which influence the minority language maintenance. He found that the prestige of the language has been a key factor that develops language loyalty which finally results in language maintenance. He also notes that the basic pattern of non-English language maintenance during the first two centuries of the United States has been “a). rapid and wider spread adaption of English as a second language by the immigrant first generation, and b) wider spread transmission of this second language to the young as their mother tongue” (1972, p.222). Many recent research and surveys in many immigrant communities in the US and in other countries on various heritage languages, however, report mixed results of positive and negative attitudes and various language practices of parents and children that affect on their native language and its maintenance.

Martin (2009) investigated attitudes and language practices of Arabic parents' towards Arabic as a heritage language in the US. She was also looking at how epistemological racism influences the language attitudes of Arab American parents and investigated 94 Arab parents who had at least one child aged 15 to 18 years old in order to find data for five research questions: “1). What are the language practices of Arab American parents and children, 2). What are Arab American parents' attitudes towards Arabic language 3). What are level of perceived racism, 4). Are Arab parents' perceived racism significantly associated with language practices and 5). Are Arab American parents' perceived racism significantly associated with language attitudes” (Martin 2009, p.1). The findings of this study through attitudinal questionnaire reveal that Arab American parents hold positive attitudes towards their mother tongue and employ various practices to maintain the language such as speaking in Arabic in religious settings and teaching Arabic in schools etc. At the same time, she found that the racism does not have significant effect on the language attitudes and practices among the Arab immigrant families.

In another study, Zhang and Slaughter-Defoe (2009) investigated language attitudes and heritage language maintenance among Chinese immigrant families in the US. The results of this study show that while the Chinese parents value their heritage language as a resource of cultural heritage and ethnic identity and take positive actions to maintain the HL in the next generation, immigrant children do not see the relevance of heritage language learning to their life expectations; therefore, they often resist practices in HL maintenance. However, the researchers suggest that “the American mainstream schools should work together with immigrant parents and HL schools to incorporate children's HL in the official school curriculum and create a supportive environment for HL learning” (Zhang and Slaughter-Defoe 2009).

Parental attitude towards Korean language maintenance in Canada has also been investigated by Park and Sarkar (2007). They investigated parental attitudes and language practices of nine Korean immigrant families in Canada who had at least one child between ages of 6-18 years. They reported the similar results to the Zhang and Slaughter-Defoe (2009) study showing that Korean parents believe if their children have high level of proficiency in the Korean language, that would help them to keep their cultural identity as Koreans, ensure them better future

economic opportunities, and give them more chances to communicate with their grandparents efficiently.

Some scholars found various results of attitudes towards language maintenance in immigrant refugees in different societies. For instance, Terry Yang (2005) investigated Hmong refugees in the United States and found that the Hmong parents want to maintain their heritage language and pass it on to the next generation because they believe that language, culture, and tradition are the foundation of a strong Hmong family, hence they must maintain their language at home. As in many other cases, Hmong parents claim that their children resist learning and using their language in schools or at home. However, one of the significant findings of this research is that Hmong parents prefer their children to become Hmong-English bilinguals, and some parents agreed their children to become English dominant speakers (p.13). For them, native language is the marker of their identity in the English dominant society.

However, Canagarajah's (2008) study on language attitudes of Sri Lankan Tamil refugees in Toronto, London and Lancaster reported that language maintenance is not considered as a mechanism of preserving ethnic identity by the refugee Sri Lankan Tamils in those cities. Instead, they preferred preserving cultural traditions such as dancing in the immigrant community as a marker of their ethnic identity. At the same time, majority of the 500 participants of this study exhibited preference towards English over Tamil for the purposes of economic stability and social mobility.

Scholarship in Heritage language maintenance not only focuses on parental and learners attitudes towards heritage language, but researchers are also interested in the role of heritage language immersion programs and language practices in and outside the family. For example, Otcu (2010) investigated the role of a Turkish Saturday school in the United States in helping students maintaining the Turkish language and sense of Turkish identity using the method of linguistic ethnography. Employing the Gee's discourse analytical frame work, the researcher analyzed the findings drawn from the school's administrators, teachers', students' and parents' beliefs and practices on Turkish. He found that there are five overarching goals of the Turkish school: "1) connection building: the school as a bridge to Turkish heritage, 2) collectivity building: bringing together the Turkish speech community, 3) contentment building: building a Turkish American identity in the U.S. and 4) identity building: building a Turkish American identity in the U.S, and 5) diversity indicating: enabling the school clientele to see themselves as one of many other ethno linguistic groups in the United States" (Otcu 2010).

In another study, Oriyama (2010) examined the role of schooling and ethnic community contact in Japanese heritage language maintenance and identity formation in Australia. Employing three groups of Japanese-English bilingual youth and their parents in Australia, she collected data through surveys and narratives of the participant groups. She found that community schools had

a greater effect on Japanese HL maintenance and identity formation in children with the support of home, community and peers. Interestingly she found, contrary to most of the other research, positive attitudes towards English-Japanese hybrid identity and heritage language maintenance.

Most of these previous studies conclude the fact that parental attitudes are more positive towards their language than those of their children. Second, heritage language has been considered as the most important identity marker of the ethnicity in many immigrant communities. Third, language practices and formal heritage language development programs have greater impact on both attitudinal and proficiency development in heritage children than parental motivation or self motivation.

Current study investigates language attitudes of Sinhala heritage learners and their parents and language practices in families and community. Most importantly this study will compare the parents' attitudes with their children and the children's language attitudes with their language proficiency in heritage language. Such a nuanced analysis will uncover the interrelatedness among parental and children's attitudes and the language proficiency of the children.

### **3. Methodology**

#### **3.1 Participants**

Five Sinhalese families living in Southern California participated in this study. One parent and one child from each family participated and the participants of the study were divided into two groups as parents' group and children's group. Parents group consisted of 10 participants, five males and five females, age ranged from 40-50. In the children's group, there were five males and five females, age ranged from 15 to 18. Parents were either Sinhala monolinguals or Sinhala dominant Sinhala English bilinguals. Children were English dominant bilinguals and educated in English.

#### **3.2 Data collection**

Data was collected mainly through a background and attitudinal questionnaire and language proficiency tests. Questionnaire was designed based on the attitudinal questionnaire of Oriyama (2010, pp.101-109) and Romaine (1990, p.303). Two separate questionnaires were distributed in two groups. Each questionnaire had three parts. Part one included demographic questions, and

part two consisted of questions regarding participants' language proficiency and language practices at home and in the community. Questions of part three were looking for the participants' attitudes towards majority and minority languages of the family and community. First two parts of the questionnaire included open ended questions, and the questions in the third part were close ended. Both parents and children filled out the appropriate questionnaire in maximum of 30 minutes.

Only the children's group participated in the oral and proficiency tests in Sinhala. They were asked to judge the grammaticality of ten ungrammatical sentences in Sinhala in the written proficiency test. In the task, they were required to judge whether the sentence is right or wrong and if any sentence was judged to be wrong, what was the wrong about it. The test lasted in 30 minutes. In the oral proficiency test, they spoke about their home country in Sinhala for ten minutes. All speeches were recorded for error analysis.

### **3.4 Data Analyses**

Data derived from three tasks were statistically and qualitatively analyzed.

Each answer for the attitudinal questions was assigned a score within the scale of 4 to 0. Most positive answer for each question was given the maximum score of 4.0 and the most negative answer was given the score of 0. Neutral answers were given scores of 2-3 according to the degree of positive relevance to the question. Each participant's Attitude Indicator Score (AIS) towards their language were measured on the basis of the overall score they earned.

In the Writing proficiency Task (WPT), total errors were calculated and each participant was given a score out of maximum of 10. In the Oral Proficiency Task (OPT), only two types of errors were marked. If any speaker made a gross grammatical error in his speech he/she lost one point, and if any participant switched into English, minimum for one full sentence within the speech, he/she lost one point at a time. Only those two aspects, oral grammar and good command in unmixed Sinhala, were taken into account, because the objective of this test is only to measure the basic communicative abilities of the participant children in Sinhala speech rather than measuring their native like proficiency in heritage language. Overall oral proficiency of the participants was evaluated by a scale of 0-7.

Finally, percentages of scores across three tasks were calculated. Overall parental attitudes compared with the children attitudes and their language proficiency levels. Further, the language practices in the participant families and in the communities were qualitatively analyzed.

## 4. Results and Discussion

### 4.1 Language Attitudes and Proficiency

Attitude Indicator Scores for children (Table.01) show that no child exceeds the level of 75% of the positive attitudes towards their mother tongue. Only two participants (4 and 6) reached the AIS above 50% and there are five participant children who scored 25% or below. Mean percentage of positive attitudes of children is 34.1% which means that the Sinhala immigrant children hold negative attitudes towards their mother tongue.

Participant	Score	%
1	14	25
2	9	16
3	13	23
4	38	67
5	22	39
6	39	69
7	12	21
8	22	39
9	8	14
10	16	28

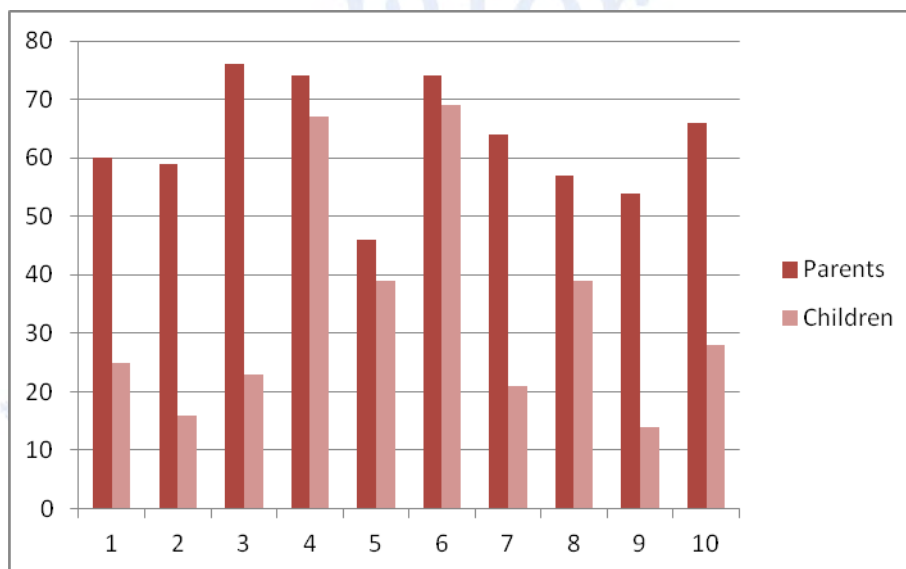

Table.01 Children's Attitude Indicator Scores

Parental attitudes towards their mother tongue (Table.02) show that nine of the ten participant parents hold above 50% of AIS where as only one parent hold 46% positive attitudes towards Sinhala language and its maintenance. They maintain mean AIS of 63%, which means that even Sinhalese parents do not have strong positive attitudes towards their mother tongue and its maintenance. But the statistical analysis confirms that the AIS for two groups are significantly different. A paired samples t-test was conducted to evaluate the difference of the AIS of two groups. There was a statistically significant difference between the parents' group ( $M=63$ ,  $SD=9.73$ ) and Children's group ( $M=34.01$ ,  $SD=19.71$ ),  $t(9)=5.12$ ,  $p=.00$  (two tailed) (Appendix 4:3).

Participant	Score	%
1	34	60
2	33	59
3	43	76
4	41	74
5	26	46
6	41	74
7	36	64
8	32	57
9	30	54
10	37	66

Table.02 Parental Attitude Indicator Scores

Even Graph 01 clearly suggests that there is no significant effect of the parental attitudes towards language on their children's language attitudes as 60% of the participant families (1, 2, 3, 7, 9, and 10) report at least 49% of difference in AIS. For example, parent 3 had the highest AIS of 76% where as his child scored only 23% which is the fourth lowest score in the group. Only the families 4, 5 and 6 maintain the minimum gaps between attitudes of parents and children.

Graph 01. Parents and children's Percentage Attitude Indicator Scores

Results for the GJT reveal that 50% of the participant children scored 50% or more scores at the task (Table. 03). One child reported 20 % and another child scored 30%.

Participant	Score	%
1	6	60
2	6	60
3	3	30
4	8	80
5	4	40
6	9	90
7	5	50
8	4	40
9	4	40
10	2	20

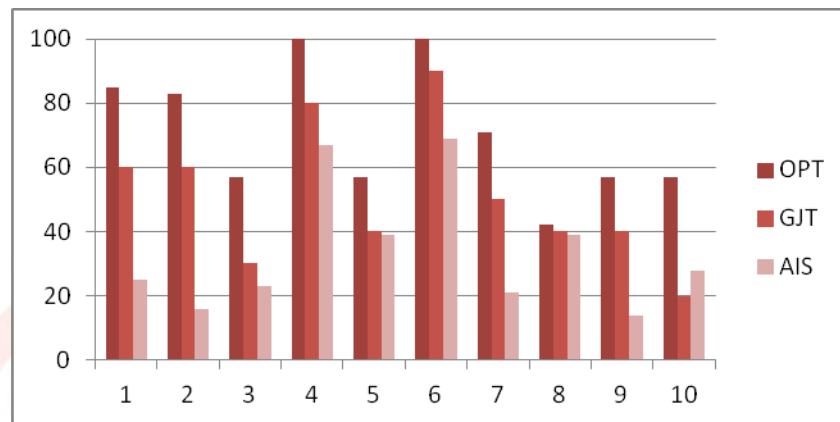

Table.03 Grammaticality Judgment Test scores

At the OPT, however, scores were higher than at GJT for all participants (Table. 04). Two participants reported the maximum accuracy (100%) in the task where as only one participant scored below 50% (P8-42%). A paired samples t-test was conducted to evaluate the impact of instruction on the performance of the children on two tasks. Statistical analysis shows that there is a significant differences between the scores of GJT ( $M= 51.00$ ,  $SD=21.833$ ) and OPT ( $M= 70.90$ ,  $SD=20.130$ ),  $t(9) = 6.613$ ,  $p=.000$  (two tailed) (Appendix 4:1). Performance of the participants at the two language proficiency tasks. These results suggest that the Sinhala heritage learners are more proficient in oral language than the writing.

Participant	Score	%
1	6	85
2	5	83
3	4	57
4	7	100
5	4	57
6	7	100
7	5	71
8	3	42
9	4	57
10	5	57

Table.04 Oral Proficiency Task

Graph 02 reveals, however, that there is correlation between attitudes and the language proficiency for three participants. Participants 6, 4 report the two highest AIS respectively they out performed the other participants at the Language proficiency tasks as well. Participant 8 reports almost similar scores across three tasks, and AIS for participant 10 is higher than her GJT scores. Overall scores suggest, however, that the children's attitudes lag behind their performance.

Graph 02.Children's Scores Across Three Tasks

At the sametime, statistical analysis reveals that there is a correlation between parents' attitudes and the children's performance on the two language proficiency tasks. Paired sample t-test that was carried out to evaluate the correlation between parental attitudes and children's overall language performance. There is no significant difference between parental attitudinal scores ( $M=61.5$ ,  $SD=20.47$ ) and Children's mean percentage scores of language proficiency tasks ( $M=61.20$ ,  $SD=11.09$ ),  $t(9)=.05$ ,  $p=.96$  (Two tailed)( Appendix 4:4), but there is a significant difference between children's attitude scores ( $M=34.10$ ,  $SD=19.70$ ) and mean scores of their language performance ( $M=61.5$ ,  $SD=20.47$ ),  $t(9)=4.891$ ,  $p=.001$  (Two tailed)( Appendix 4:2).These results mean that the Sinhalese children's language performance is motivated , among other factors, by the parental attitudes rather than their own interests in the language.

English is the most important language for the majority of parents (70%) and children (80%).Reason is that it is the language of the majority in society.40% of the parents belive that their children would be able to communicate with the relations in home country if they learn Sinhala language and 30% belive that their children should learn it because it is their first language. Majority of the Children (60%), on the other hand, learn Sinhala language because their parents want them to learn the language. Only majority of the parents (80%) belive that the maintenance of their language is the most important matter for their community where as 60% of the children do not agree with the suggestion.Both parents and children, however, believe that language maintenance is a very difficult task.

Both parents (80%) and Children (70%) think that they can not maintain their culture and identity without learning their mother tongue, but only the parents (80%) belive that the main purpose of teaching of sinhala language is to give their children a Sinhalese or Sri Lankan identity. In contrast, children (60%) learn Sinhala language inorder to be able to study their heritage knowledge in Buddhism, indeginuiuos medicine, literature, ect.Being more profecienct in Sinhala language is belived to be an obstacle for children (70%) to find a good job. 40% of their

parents think that there is no any disadvantage their children being proficient in Sinhala. Two parents thought that it would be a challenge for their children to find a job, and four parents think that their children will be subjected to humiliation by their peers if they are more proficient in mother tongue.

Most of the children prefer American as an ethnic identity over Sri Lankan identity though, majority (80%) of them identify themselves as Sri Lankan American. Their parents (70%) prefer Sinhala as an ethnicity and they (60%) want their children to be identified as Sri Lankan American as well. 30% consider that they should be Sinhalese and one parent believes in Sri Lankan identity. None of the groups believe that their language and culture are valued in the US but both groups are glad that they can speak and write in Sinhala language.

#### **4.2 Language practices**

Language practices in the families and community may be the reason for the children's higher proficiency level in OPT than GJT. All parents reported that they use Sinhala only or mostly Sinhala language to communicate with the children. Participant children also confirm the parents' language practice. Children use Sinhala language as much as possible to communicate with their parents even though their language outside the family is English. At the same time, they prefer entertainment in Sinhala. 50% of participant children watch Sinhala films 60% of them watch either TV news in Sinhala or teledramas. Frequent visit to home country might also have effected their higher proficiency in oral language. Five participant children visit their home country once a year and four children visit once for two years. The more exposure to oral language might have effected the greater fluency in Children's oral language.

On the other hand, 70% of children read books or news papers in Sinhala only once a month. The rest are not quite certain about their reading frequency in Sinhala. Most importantly 80% report that their weaker reading and writing skills is the major difficulty for them to develop their Sinhala language skills. Even though most of the parents report that they allow their children read news papers (40%), books (50%), magazines (40%), and internet (40%), children seem to be reluctant to use those resources. Only one child reads news papers and five children read books in Sinhala while no one reads magazines and four use internet resources in Sinhala. This tendency contradicts with their language learning purposes because the majority reported that they want to read subject knowledge in Sinhala language. Inadequate family and community support to develop their reading and writing skills may be the reason. Only three children are strongly satisfied with the family support to develop their language skills and two children are strongly unsatisfied with the family support while another two are unsatisfied. Five children are neither unsatisfied nor strongly unsatisfied with the community support they receive in order to develop language skills; therefore, majority of the children (70%) suggest that community should initiate formal heritage language immersion classes. They further suggest that the Sunday school and other cultural events

may be beneficial to improve their language skills. Five children propose that the US government should initiate such heritage language classes while the other five children oppose to the proposal.

Even though parents are satisfied with the family instruction for their children, they are not interested in the community support they have. They do not think that supplementary schools are sufficient alternative for heritage language immersion classes. They also do not believe in the US governmental support towards formal Sinhala language classes, instead, they believe in special Sinhala language classes for their children such as heritage language immersion class. In addition they think that more opportunities for their children to engage in cultural events in the community might improve their language skills.

## 5. Implications

Findings of this research confirm the idea that language attitudes have greater effects on heritage language maintenance (Fishman 1972; 1980). Both statistical analysis and qualitative analysis of the findings show that positive attitudes of the parents have a significant role in improving language skills in the heritage language learners. These results lie parallel to the findings of the other heritage communities (Yang 2005; Park and Sarkar 2007; Zhang and Slaughter-Defoe 2009). It has also found evidence that attitudes of the heritage language learners lag behind those of their parents.

Most importantly, as oppose to the findings of many previous studies, this study reveals that the heritage learners and their parents do not rely on their language competence as an identity marker of their ethnicity even though they believe that their language should be maintained in the US. Majority of the Sinhalese in Southern California prefer hybrid identity as Sri Lankan Americans rather than Sinhalese or the Sri Lankans. This is an important indicator of the tendency to accommodate new language, culture and society.

The findings of this study also support the idea that the exposure to the language in improving heritage language has a greater importance. Home language of the participant families, frequent visits to home country and access to heritage language through media have been the key practices that keeps heritage language learners oral skills improving. On the other hand, the findings of this study confirm the ideas of Myers-Scotton (2006, p.103) who claims that minority languages rarely can survive in all domains. For instance, Sinhalese heritage learners are at a risk of losing their language in writing and reading because of lack of opportunities, motivation and mechanisms to develop those skills; therefore, this study implies that members of the community should take the appropriate measures to develop their childrens' writing proficiency in order to

be able them to access to the heritage knowledge that they preferred the most. As the most of the participants suggested for a formal heritage immersion class, that would be a possible solution.

In addition this study suggest that the Sinhala community in Southern California should take necessary measures to preserve their cultural heritage by implementing community orientated activities which their children could engage in. Otherwise Sinhala language is at a risk of extinction across generations.

## **6. Limitations**

Smaller sample is the major limitation in this study. Appropriate sample in a future research will justify the claims made in this study. At the same time, within the limits of this study, I did not investigate the attitudes and practices of the both parents in participant families. Therefore, some findings of the research may have limitations, as the language performance of the children may be influenced differently by each parent. In addition, more ethnographic data is required for more nuanced analysis of the language practices in the family and in the community. Such an in-depth investigation will draw much clearer picture of what is happening in Sinhala community in Southern California in regard to their language and its maintenance.

Abstracts

This Second Language Acquisition (SLA) investigation aims to provide key concepts and insights related to the specific pedagogic situation of the subject. The case study approach, a qualitative research method, has been employed to look at a non-native speaking young adult's English language learning situated within a non-native English-speaking environment. Apart from the case study approach, this paper has employed an ethnographic orientation with retrospective journal entries to capture in detail the subject's learning activities. More specifically, this paper seeks to provide relevant SLA and English Language Teaching (ELT) theories and reflections attendant to the subject's learning experience. Because of the very nature of a case study, the findings in this paper do not attempt to provide conclusive remarks. Rather, it is hoped that such information be of help to both language teachers and learners eventually helping minimize whatever gaps there are between the language teacher's scheme of teaching and the language learner's scheme of learning.

**Key words:** SLA, ELT, second language acquisition and learning

## Introduction

The field of Second Language Acquisition (SLA) has always been a fascinating area to explore primarily because of the nature of language learning itself and the whole myriad of complexities that comes with it. Along this line, Vivian Cook (1991) underscored the significance of having teachers understand the reasons behind people's wanting to learn languages and the process how such knowledge is absorbed and learned. Rod Ellis (1985) stated that

...unless we know for certain that the teacher's scheme of things really does match the learner's way of going about things, we cannot be sure that the teaching content will contribute directly to language learning. (p. 4)

Hence, when studying SLA cases, it is imperative that not only the nature of the target language be considered, but also the milieu within which said learning takes place dovetailed with L1 learning. This does not perfunctorily presuppose that L1 learning directly influences the L2 learning paradigm or that L1 acquisition and learning will yield exactly the same developmental stages as the L2 experience. However, because of the very rich resource correlating the L1 to L2 acquisition and learning routes, the complexity of the entire process offers a number of possibilities concerning the L1 and L2 interface. Moreover, in a typical non-native-speaking (NNS) learning context where L2 students constantly grapple with the intricacies of learning a second or a foreign language, learning from a non-native speaking learner's experience proves significant.

Lastly, this paper subscribes to Widdowson's (2010) "mediation," taking the "linguist's abstract version of reality" and referring it "back to the actualities of the language classroom" (p. 12).

## Conceptual Framework

Below are relevant theories and discussion meant to help situate this research in context.

The first hypothesis is anchored on Stephen D. Krashen and Tracy D. Terrell's (1996) the Natural Approach. It centers on the distinction between acquisition and learning. It states that adults who are learning a second language employ two different means of developing language skills and knowledge. To acquire a language means to 'pick it up' allowing him to develop the ability to use it naturally and communicatively. To learn a language, on the other hand, means to be more aware of the grammar rules that govern a certain linguistic structure via language teaching or guidance from a language teacher. In short, exposing a language learner to the target language (TL) is not enough. One has to study formally the language, its rules, and conventions to fit himself in.

The Affective Filter is another hypothesis this study corroborates. This hypothesis focuses on the language learner's emotional state while actively learning. The Affective Filter is "an adjustable filter that freely impedes, passes, or blocks input needed for acquisition" (Krashen, 1988, p. 133). Built around SLA research, it identifies three forms of affective variables: motivation, self-confidence, and anxiety. This hypothesis states that language learners who have low affective filter are deemed more "open" to the input that "sinks" more deeply as opposed to language learners whose affective filter is high and are, therefore, less willing to absorb the lessons taught them (Richards & Rodgers, 2001). In return, learners who have lower affective filter are more capable of knowing more about the language rules and conventions and using/ producing the language more satisfactorily.

While Stephen Krashen's theories are considered a landmark on which this study is hinged, said principles left some gap. This study explores and offers the possibility to either narrow or close that gap. In so doing, it also anchors its framework on the importance of output and interaction theories. The gap resulted from Krashen's theories arguing that it is only input that matters in L2 learning (Krashen, 1981). Output and interaction theorists are keen to note that a successful L2 learning happens not only because of a learner's exposure to comprehensible input, but also because of his output brought about by interactions with other speakers. With Krashen's only-input-matters tenet, output theorists believe "that the act of producing language (speaking or writing) constitutes, under certain circumstances, part of the process of second language learning" (Swain in Hinkel, 2005, p. 471). Interactionists, on the other hand, argue that learners are given the chance at seeing, exploring, and using whatever differences there are between their own production of the language and that of others (Gass & Mackey, 2006). In effect, the interactionists claim that being able to identify one's differences from others' allows him to learn how to modify relevant language performance when needed.

## Materials and Methods

### Research Questions

This case study aims to address the following research questions:

1. What are the typical developmental stages that one goes through within a second language acquisition and learning context?
2. What approaches to and issues in language teaching are most relevant and/ or observed to have played key roles in this particular study?
3. What implications/notes of experience do these language teaching approaches have which both language learners and teachers can draw knowledge from?

### Data-gathering Instruments

The case study approach, a qualitative kind of research, was chosen to capture the details surrounding the subject's L2 acquisition and learning experience inside and outside the classroom. Such approach allowed the author to catch the unique features inherent in the gathering of data in this study (Nisbet & Watt, 1984). It also permitted the author to have a lengthened engagement with the subject and other participants through interviews and detailed accounts leading to obtaining a better perspective of the entire investigation. Coupled with this was the author's use of retrospective journal entries to further substantiate the data gathered. Through such journal entries, an ethnographic orientation was utilized as well. Such a method afforded the author to collect comprehensive information about behavior, events, and other facets of the subject's attitude and activities, providing an ethnographic orientation and standpoint. One key strength of the case study approach, as used in this investigation, was the author's use of multiple sources in pertinent data. The tools used to collect data were the following: interviews, documentation review, and observation. This case study involved two separate learning contexts, that is, the subject's learning of the English language in a formal school setting and during the tutorial sessions the subject had with the author.

### Participant

The subject, a 15- year old boy, was originally from Ho Chi Minh City, Vietnam. After having spent his first year in high school in his mother country, Quang<sup>i</sup> transferred to a private Catholic high school in Manila, Philippines to join his mother. Quang was admitted as a second year high school student in a Catholic school where he had to attend weekday classes. It was an

arrangement different from his former classes in Vietnam where he attended daily classes on a half-day basis, with afternoons spent doing group studies and tutorial sessions. In Vietnam, all his subjects were taught in his native language. English was taught as an elective course. His other language, however, was French. In the Philippines, on the other hand, he had to use English in most other subjects, except for some compulsory ones, such as Filipino.

### Data collection

Data gathering and observation, lasting for 15 months via 185 two-hour sessions, began when this author tutored Quang. The author witnessed from the very beginning Quang's L2 acquisition and learning, enabling her to conduct an ethnographic observation crucial to formulating many relevant research questions. In this study, *language acquisition* should be taken to mean "gaining knowledge or ability through a more natural and informal means," whereas *learning* means "gaining knowledge or ability through being taught in a deliberate, usually formal, manner" (Lin, 2004, p. iii).

The period of study correlating to the subject's language development was divided into three: (1) The Regulation/ Hesitation Stage, (2) The Transition/ Repetition Stage, and; (3) The Semi-Spontaneous to Spontaneous Speech Stage. Discussion of the subject's language developmental stages vis-à-vis the findings are provided as well.

## Results and Discussion

### The Regulation/ Hesitation Stage

The author gathered significant amount of data from her conferences with Quang's classmates and teachers. Duc, Quang's fellow Vietnamese classmate and friend, was instrumental as well as the author was able to use him as her point of reference for Quang's own development. Quang and Duc both lived in the same residential compound. Since Duc started studying in the Philippines a year earlier, interviews and voluntary inputs from him proved very helpful in this investigation.

The first three months of the author's tutorial sessions with Quang can be described as The Regulation/ Hesitation Stage. Having been in the Philippines for only a few months, Quang did not feel ready to converse spontaneously especially with strangers. He had been with a language teacher who always communicated with him in English, a language he did not use back home. At this stage, Quang went through what is called the silent period, a phase in language learning when a learner typically chooses not to talk and verbalize his thoughts. During this time, Quang was assumed to be processing his own thoughts and trying to assimilate whatever input he got from his current learning context. Short responses, nods, facial expressions, and gestures dominated the initial conversations between him and this author. Earlier in the sessions, Quang would give one-word replies such as "yes," "hmmmm," "maybe," "aha...", and "no." Quang, at this stage, was going through the stage of learning formulaic chunks of his target language. On this note, it can be said that one's silent period does not mean complete silence. Quang's silent period experience, however, cannot be considered an isolated or a unique case. Various studies prove that different learners vary in this regard. While it is seen as an important phase that allows learners "to discover what language is and what it does... it is not obligatory" (Ellis, 1994, p. 82).

The author, resorting to Total Physical Response (TPR), did not force him to speak in English, but acted out words, phrases, and other utterances that he could not understand verbally. TPR, a language teaching approach developed by James Asher, refers to a language teaching method that

requires synchronization between one's speech and action teaching the target language (TL) through physical or motor tasks (Richards & Rodgers, 2001). During this first stage, the author often directed her speech by giving some commands to which he responded physically before attempting to answer verbally. This pattern lasted for three months. During this period, Quang slowly grew more at ease with the author, seeing her as his companion in his journey to language learning, rather than as a threatening presence to his language learning ability. Despite Quang's inability to string out complete sentences, he generally understood the author's instructions as evidenced by his corresponding answers.

However, amidst said changes happening to Quang, he distanced himself from others. Remarkably, he was attentive to any of his classmates who recited in class. Duc mentioned that Quang occasionally would ask him for word meanings. During said conversations, Quang used his L1. It was also at this time when Quang showed interest in his classmates' activities, particularly in seeing other boys fight. He often made personal remarks about such fights, albeit in his own language. This behavior marked his slow, but steady show of interest in the people around him although he was clearly avoiding conversations with anyone using the English language.

Within the confines of his own home, Quang was warm, friendly, and often animated with Duc, quite the opposite when he was at school. Some changes were seen, though, when he was on his third month of studying. Quang showed strong interest in his frequent conversations with one official, Mr. Nguyen, who often dropped by the study area where he and this author met for tutorials. Mr. Nguyen would speak to him in English, but Quang would typically hesitate to talk. If he did, he responded sparingly. At one point, however, Quang started becoming more engaged in their conversations. He started responding to Mr. Nguyen's questions although his replies were in Vietnamese. This happened towards almost the end of this stage, the Regulation/ Hesitation Period.

#### The Transition/ Repetition Stage

When it was Quang's fourth month in school, he went through some noticeable social changes. Whereas Quang was hesitant in mingling with his classmates in the beginning of the second stage of his L2 learning, this time he started becoming overtly interested in listening to them. He started becoming more sensitive to the activities of the people around him, watching them speak and engage in various activities. He also opened up by playing outdoor games with them and by having some conversations with his classmates through chunking. Below is a sample conversation between him and a classmate:

Classmate: So where do you come from?

Quang: Vietnam.

Classmate: How are you called?

Quang: Me? Called? Vu Quang.

Classmate: I mean, your nickname.

Quang: Oh, nickname? [long pause] Quang.

Quang's development became more noticeable, but alarming at the same time, especially when one of his classmates cracked a joke that he could not relate to. His attitude of indifference toward such a classmate turned out very pronounced that, at one point, he became utterly angry. Believing he was the subject of his classmates' conversation, he reacted by inflicting harm. Although his language development was already advancing at this point, he still could not fully comprehend conversations.

Finding the situation as an opportunity to get Quang to open up and be comfortable in using the language, the author used this event for him to vent out his emotions, making the situation a meaningful exercise. This author allowed him to talk freely about his feelings regardless of the language production errors he committed. Quang, in return, unhesitatingly let out his feelings about what happened. From their conversations, the author also learned that Quang was feeling homesick. He missed the company of his friends in Vietnam. He said he did not really like to come to the Philippines, but only did so because his mother obliged him. Interestingly, during this conversation and in the succeeding ones, Quang already used some English words more frequently than before. However, at home, he only used English during tutorial sessions. When conversing with his mother and others from his country, he spoke in his L1. This could be explained by the fact that everybody in the neighborhood spoke in the L1, except for a few diplomats who would occasionally drop by to exchange a few words with the author.

With the author's encouragement, Quang started getting himself familiar with the English sounds by imitating her. The author would model out to him how to pronounce a prepared set of words every meeting. Given Quang's approximations of the sounds he listened to, he arrived at a number of phonological variations. The author initially thought of them as a result of an L1 and L2 interface, such that the influence of the Vietnamese syllable structure on his attempts at pronouncing the words was very noticeable.

His choice of substitutes showed how the consonant cluster /ch/ turned out to be /ts/ and the consonant /s/ came out as /ʃ/. The /dʒ/ sound for 'margarine' became /ʃai/. He also doubled the /h/ sound in 'household' producing /háwsh-hòld/. A study of the Vietnamese alphabet shows that Quang's substitution of the /s/ sound for /sh/ and /ʃai/ reflected his prior pronunciation knowledge in his native language. His /s/ sound was such because the Vietnamese alphabet, composed of 12 vowels and 17 consonants, includes the letter 's' but is sounded out either as /sh/ or /ʃai/. On the other hand, the Vietnamese alphabet's letter 'x' is pronounced as /s/. Thus, what Quang did was to apply the rules of pronunciation in his L1 and applied it in his L2 speech context.

In the latter part of the Transition/ Repetition Period, Quang started making attempts at stringing out short but complete sentences. There were times, however, when he would code switch between English and Vietnamese.

STANDARD ENGLISH	QUANG'S CODE SWITCHING
I don't like it.	I <i>khong</i> thi'ch.
No. Just fine.	<i>Khong</i> . Just fine.

**Table 1.** A sample of Quang's code switching

### The Semi-Spontaneous to Spontaneous Stage

Quang, at this stage, seemed to have reached another phase in his L2 development. Instead of simply repeating either the questions or the last few words in the question, he would go back and forth from hesitating to speak to speaking spontaneously. His repetitions usually happened whenever he would ask for clarification concerning word meanings. As things turned out, Quang already had a very clear concept of the sentence structures he was using at this point. However,

despite such knowledge, he continuously dropped the linking verbs (LVs or copular verbs) in actual conversations as shown below.

STANDARD ENGLISH	QUANG'S SIMPLIFICATION
Where are you going now?	Where you going now?
What is this, Miss?	What this, Miss?

**Table 2.** A sample of Quang's semantic simplification

Together with this, he would say *was* in place of the question word *what* and the verb *does*.

STANDARD ENGLISH	QUANG'S SIMPLIFICATION
What does it mean?	Was mean?

**Table 3.** A sample of Quang's structural simplification

When uttering sentences in the declarative form, he would also drop the linking verb. A sentence below, expressing his opinion about a classmate, shows an example of the missing linking verb, *are*.

STANDARD ENGLISH	QUANG'S SIMPLIFICATION
You are very bad.	You very bad.

**Table 4.** A sample of Quang's semantic simplification

In the next sentence, however, Quang used the linking verb *is* despite the presence of another verb *have*. He dropped a significant part of the speech though, the subject of the sentence: *I*.

STANDARD ENGLISH	QUANG'S SIMPLIFICATION
I have.	<i>Is</i> have.

**Table 5.** A sample of Quang's simplification

When asked, Quang said that he deliberately dropped the linking verbs in his sentences because he was still confused about the subject-verb agreement rule. In effect, he felt that dropping the linking verbs allowed him some space to move about without having to worry which verb to use. As regards his *is have* pattern, Quang over-generalized the rule thinking that singular subjects, whether *he*, *she*, *it*, or *I*, are always followed by singular verbs.

Analysis

The discussion that follows looks at how Quang's case validates Stephen Krashen's theories. Recognizing, however, the gap left by Stephen Krashen's theories, a discussion of relevant principles on output and interaction theories is provided to shed more light on the subject's L2 acquisition and learning experience.

Findings of this study show that Quang's experience is in keeping the Natural Approach by Stephen Krashen. While Quang was learning the English language within a formal school context and informal tutorial sessions, he was also acquiring it from his classmates and peers. This typically happened when he was using the language naturally and communicatively during school recesses. This also happened whenever his tutor would deliberately turn their meetings into more informal sessions. Conversations were freewheeling, but more meaningful. In this case, Quang dealt with his TL both formally and informally, giving himself the necessary language skills to reach his learning goals.

The Affective Filter is the second hypothesis this study validates. Quang's unwillingness to join his mother in the Philippines made his affective filter high, making his intrinsic motivation to learn either low or absent. Being away from a familiar ground made him emotionally unprepared for all the new experiences he had. Knowing he could not go back to Vietnam soon made him even more reluctant to embrace a very new experience. He admitted to being homesick, missing his father and his younger sister, his close friends, and anything that was Vietnamese. Because of that, he subconsciously put up a psychological barrier, extending its adverse effects on his studies and language learning. Because of the kind of relationship Quang had with his present social context—he was with strangers, in a new country, and in a new learning environment—he had to reconstruct his motivation and attitude, if only to make his learning experience positive (Lin, 2004). Various studies have shown that positive attitudes and motivation are typically linked to success in second language learning. Lightbown and Spada (1999) remarked that

[i]f the speaker's only reason for learning the second language is external pressure, internal motivation may be minimal and general attitudes towards learning may be negative.

Apart from being able to establish the correlation between Quang's L2 acquisition and learning difficulties, Krashen and Terrell's (1996) and Krashen's (1988) language learning theories, the author found issues that only unfolded during the observation period. These issues had led her to trace Quang's learning experience to many other factors that she did not account for in the initial conduct of this study. Additionally, these issues eventually had led this author to consider other SLA theories such as the output and interaction theories. Quang never had English, the official medium of instruction in his new school, as his L2 in his own country. He instead had French, the language of his country's former colonial master. The only time he studied English was when he arrived in the Philippines. He barely had three weeks prior to joining the private Catholic high school his mother chose for him to be acquainted with the English language. It is no wonder that in his first attempts to learn and produce various language patterns, he produced the coarsest contrasts. Undeniably, it took him great lengths to learn and produce other finer sub-contrasts before he was finally able to assimilate his spontaneous language productions into the complex structural mechanisms of his target language (TL). The same reason propelled him to avoid socializing with his classmates, confessing that he would rather not talk, lest the people around him laugh at and make him the subject of their jokes for mistakes he said he was sure to commit.

Corollary to the previous discussion was Quang's lack of support system in his struggle to enhance his English language skills. The people in the official residence where he and his mother stayed spoke only in their native tongue. English was used exclusively for business transactions.

The only time Quang could use English for communication was when he was in school. After school hours and during weekends and holidays, Quang's chances at using the English language for practice, which he badly needed, were either low or totally absent. Neither did he have access to desired input through watching English cable channels, listening to English- anchored radio shows, reading an assortment of English materials, and the like. Quang also lacked the chance to produce desired outputs (Skehan, 1998) which could have resulted from conversational interactions. Interaction theorists like Evelyn Hatch (1978), Teresa Pica (1996), and Michael Long (2003) argued that desired outputs ushered in by conversational interactions are the key to acquisition.

Part of Quang's difficulty can also be traced to the fact that his initial language productions and learning process operated not on the phonemic patterns and semantics. Rod Ellis (1994) referred to Quang's language production, as shown in Tables 2 to 5, as structural and semantic simplifications done through dropping and/ or omitting some words. First, Quang resorted to structural simplification when he omitted grammatical functors, e.g., auxiliary verbs and articles. He also committed semantic simplification, leaving out content words such as nouns and copular verbs. In the process of Quang's learning, he needed to understand the syntactic relationships involved in manipulating and producing the language. Together with all this, Quang initially attempted to string out ideas by chunking or putting two, three or more words. His effort, however, to put across his ideas before finally composing complete sentences may be considered part of the normal process an L2 learner like him typically goes through. Fourth, as illustrated in Table 5, Quang over-generalized rules for his target language thinking that singular subjects, whether *he*, *she*, *it* or *I*, are always followed by singular verbs. Thus, he produced "*Is have*" rather than "*I have*."

Chunking, referred to as the learning of formulaic language, is characteristic of L2 learning known as interlanguage (Selinker, 1972). Susan Gass and Larry Selinker (2008) further defined it as the language system that takes shape in the mind of a second language learner, one which should not be viewed as a poor or incomplete account of the target language. It may be full of errors; nevertheless, the errors should not be seen as an influence of the learner's first language. It should instead be considered as a language that has its own methodical conventions.

Long (2003) maintained that an interaction adapted to the level of the learner allows modification of the speech thereby promoting acquisition. Jianwei Xu (2011) said that L2 learners' self-confidence in using the TL is dictated heavily by outside factors underscoring the need for interaction. Lack or absence of the chance to interact with other speakers of the English language could have also slowed down Quang's development.

## **Conclusions/ Recommendations**

This case study reveals a number of concerns with regard to the subject's L2 acquisition and learning. For one, it demonstrates an L2 learner's need to both acquire and learn the TL, if only to allow him to use it in both natural and communicative ways. Second, findings show how one's affective state heavily influences the learning condition. Thirdly, a support system or a scheme that allows an L2 learner to interact with other speakers of the TL are much needed, if only to further one's developmental stages. Lastly, in Quang's case, interlanguage in the form of simplifications is a natural coping mechanism which L2 learners resort to, at times, to help them in their learning process.

To conclude, the author offers a few recommendations, which she hopes, would help both learners and teachers to have a better understanding of a learner's language acquisition and learning experience.

1. That language learners not only learn and memorize the grammatical rules and conventions governing the TL. They should also be constantly using their TL for most of their waking hours.
2. That errors produced be viewed not as errors *per se*, but, most likely, part of the process L2 learners typically go through.
3. That language learners use the TL not only for the sake of using it. It should be done in ways meaningful both to them and to other speakers who are using the language when communicating.
4. That language learners will usually find the learning process complete only when they are able to associate and infer a meaningful relationship between the TL and their own experiences.
5. That language teaching that involves L2 learners like Quang be designed in light of the above-mentioned recommendations.
6. That further investigations within the specific context of other L2 learners' own learning environment be explored. As Quang's case does not necessarily represent every L2 learner's experience, the author does not attempt to make the findings in this study conclusive in respect of learners' individual differences and other external factors that come into play.

Leadership means different things to different people. When people are asked to define what leadership is they often cite past heroes or political figures as example. The most common are John F. Kennedy, Nelson Mandela, Ghandi, Winston Churchill, Martin Luther King and the leaders of the 21<sup>st</sup> century. Very rarely do people mention themselves as a powerful or influential leader. We are all leaders. We are all put in situations daily where everyone is leading. It can be as a teacher, principal, office worker, camp counselor or the guy who makes your coffee at Starbucks on the way to the work. Leadership is an everyday phenomenon. It occurs every time an individual directs or encourages people to take a direction or a specific route.

Leadership is perceived as something only educated or powerful people do. If you are a normal everyday individual you do not see yourself as being all powerful and directive, yet you are. The power of influence is at hand and is easily dispensed.

In understanding leadership one must put it in a perspective that is very similar to understanding early childhood behaviors. Children often will seek out things that are fun to do, or else they find a way to have fun at what they are doing. They jump from one interest to another. They are curious and usually eager to try anything once. They smile and laugh a lot.

They experience and express emotion freely. They are creative, passionate and innocent

They are physically active. They are constantly growing mentally and physically. They will risk often, not afraid to fail. They rest when their body tells them to. They learn enthusiastically.

They dream and imagine. They believe in the impossible. They don't worry or feel guilty. (Katzenbach & Smith, 2003)

Adults often forget to do the following things when they become leaders. It is almost like a part of the brain ceases to have fun and is overtaken with seriousness, planning and manipulation. The fun is soon abandoned and replaced with a sense of duty and obligation. Effective leaders never lose their ability to think and act like children! They relinquish the constraint and substitute them with a freedom to explore and a sense of adventure. The power of early childhood thinking allows the individual to think freely and divergently.

Leaders must be aware of what is going on in their organizations to have clear understanding of what needs to be accomplished and begun. A leader who does not have an accurate evidence based evaluation of the inner working of the team or the existing structures of their organization plans to fail if wanting to implement any type of course of action.

The leader in his/her ongoing evaluation of his/her organization quickly comes to the realization that there is a need for change. Once the need has been identified the path to change must include the following:

1. Input from a wide variety of sources. Evaluation teams must be given the time to give their opinions and fact finding expeditions must be ongoing during these discussions. Individuals who will be affected by the decisions and /or changes must be part of the process. The lens that these individuals are looking through can seriously affect the success or failure of the change.
2. A focus on results. The discussions have occurred, the existing plan or structure has been clearly articulated as needing change and people are ready to look at attaining different results. At this stage of the change the question that needs to be asked is "What do we want to accomplish and what is the best way to do so?" This will focus the efforts of the team and will produce the needed results to make the change successful.
3. Communicate a vision and reinforce it repeatedly. The leader must be clear and articulate how these new changes will improve the lives of the individuals it will affect but also is for the

betterment of the organization. This vision must be clear and ambiguous enough that there is room for development and change as it evolves.

4. Show dedication by enthusiasm, persistence and problem solving. Change does not occur overnight, it is a slow sustained turtle like approach. The individual who is leading must be able to progress at the speed that the team readiness for change dictates. Trying to integrate change at a pace that is not aligned with people's ability to accept the change will be disastrous in the long run.

5. Motivate by building on their team strengths. To build an organization there must be a team. If a leader wants to effect change he or she must surround themselves with individuals that have a variety of skills, dispositions and temperaments. You want random global thinkers for the idea development and some very concrete sequential thinkers for the details and the precision thinking that is needed to implement change or to build something new. The combination of individuals is crucial to a successful change.

Change is a process that is often very fearful and people are not interested in change if what they are doing is working for them. Change becomes an issue when production, lifestyle, individual productivity, destructive behaviors or inefficiency prevents an individual or organization from being successful or innovative.

How people affect change is measured in their behaviors. There are five categories of individuals when looking at how people accept change. The first group is the Innovators: 1-3% try new ideas, risk takers, new ventures.

Second group are the Early Adopters: 13% communicators, part of the informal power structures, are respected for their judgment. They will be more cautious than innovators. They are the key group in instilling new innovations.

The third group are the Early Majority-34%: They are usually joiners, follow the lead of the early adopters, but are reluctant to accept a new idea too quickly.

The fourth group are the Late Majority-34%: This group of individual is usually skeptical and usually adopts an innovation only after social or peer pressure is applied.

The final group is the Laggards 16%: Last to adopt an innovation. This group is very dependent on the past, is not receptive to change or those who advocate change. (Rogers, 1983).

The key formula here is in understanding human behavior in that all groups are needed to be part of an effective organization. Each group plays a pivotal role in the creative process to the pragmatic logistical implementation of change within an organization. They are all needed for success. The responsibility of the leader is to know how much power to give to each group and when to intervene to have the group move forward on the vision and its full development and implementation.

The children's book *Who Moved My Cheese?* By Spencer Johnson is a wonderful example of what an individual or organization must experience to affect or invite change. The book summarizes ten life lessons.

1. When you choose to change, you gain.
2. Change imposed is change opposed.
3. Simplicity conquers complexity.
4. Life is a maze.
5. When you change what you believe you change what you do.

6. Smell the cheese often. (Cheese being the metaphor for what we want in life, job, relationship, money, freedom, health, recognition, spiritual peace, etc.)
7. Savor the adventure.
8. If you don't change you can become extinct.
9. New cheese is always out there.
10. Change and move beyond your fear to feel free.

Who knew that out of a child's book could develop such a variety of important life lessons. Each one of these life lessons can create a chain reaction that could forever change the direction of one's life, one's interactions with people on a daily basis and one's ability to leave a legacy. The power of children's literature!

Vision is often cited and touted as a necessary component of effective leadership. How does one define vision? What is the difference between vision and powerful vision? Is vision uniquely individualistic or a collaborative effort?

Marjorie Parker in her book *Creating Shared Vision* speaks of vision as having to have several key components to be effective. She describes vision as something that is described as a preferred and meaningful future state. It has to have a purpose. The vision must be something that can be articulated.

Vision must evoke images in the mind of others. People need to see what this vision entails. Is it described in measurable and observable outcomes? Can individuals wrap their thinking around what the vision will accomplish or change? The answer must be yes.

Powerful visions will give people a better understanding of how their purpose could be manifested. Being part of the planning and execution of the vision empowers people to be better engaged and supportive of the vision.

If a leader possesses a vision that can motivate even in hard economic times and in times of conflict, people will pay attention. Organizations and the individuals within these systems want to know that they will be protected, and /or taken care of financially during these troubling times. The vision must be about hope but also be realistic and achievable in a reasonable amount of time.

Leaders must develop a vision that is achievable, genuine and comes from the heart. A vision based solely on economic financial growth may forget a key ingredient, the people who work within that organization. The success of any vision depends on people's willingness to be part of the change but also to do the work towards effecting change.

A vision must be lofty, challenging and compelling for it to be effective. Setting the bar too low never achieves great results. It does achieve changes, it does produce results, though sometime mediocre and these changes are measurable. Powerful visions must not settle for the tried and true and must challenge all individuals and systems within the organizational structure that it lives in. It is imperative that a leader have a vision that will create movement towards change. Otherwise is it really a powerful vision, or is it just good management?

Leaders must have some very specific traits and dispositions to be effective and effect change. Stephen Seay and Stephen Macchia both agree leaders must possess the following attributes to be fully successful as effective leaders of change:

Honesty - Displays sincerity and honesty in all actions. Deceptive behavior does not inspire trust.

Competent - Bases actions on reason and moral principles.

Forward-looking - Sets goals and has a vision of the future. Effective leaders envision what they want and how to get it.

Inspiring - Displays confidence. Takes charge when necessary.

Intelligent - Reads, studies, and seeks challenging assignments.

Fair-minded Broad-minded - Seeks out diversity.

Courageous - Has the perseverance to accomplish a goal, regardless of the obstacles. Displays a confident calmness when under stress!

Straightforwardness - Uses sound judgment to make a good decision.

Imaginative - Makes timely and appropriate changes.

Shows fair treatment of others.

Many leaders if they are truly reflective are able to use this list as guiding principles towards becoming effective leaders. Being able to be honest in one's self analysis and evaluation is key towards having people perceive you as the leader. The dispositions listed above are the starting point to becoming and evolving as a present or future leader. Leadership is both transformative for the individual as well as the organization.

Douglas Fisher and Nancy Frey in their research and writings have indicated that there are five key lessons that an effective leader must learn early on to be successful.

Lesson 1: Spend time doing things you care about.

Lesson 2: Be the teacher/worker you want to hire.

Lesson 3: Talk with the students/staff often, and talk about things that matter.

Lesson 4: Surround yourself with good people, then get out of their way.

Lesson 5: Nurture partnerships, especially those that benefit school/preschool/organization

Following these guiding principles allows a future leader to gauge their performance and their abilities. It allows an individual leader whether new or veteran to be reflective about what they are bringing to the organization. It encourages the leader to build relationships through their own self-awareness. Leaders who are not self-aware are missing an opportunity to see themselves in action. The lack of self-awareness will often lead to increase conflict and migration to positions that are opposite to what the leaders wants to achieve.

Leaders who are able to develop synergy with groups of people are often able to effect change. Leaders must have an excellent understanding that the energy of a group is always potentially greater than the sum of the combined energies of its members. If the leader is able to create an environment when the team concepts are applied to group formation, the result is not only effective use of energy but also the creation of new energy. Change does not occur without new energy.

Choosing the right team is key to the success of change within an organization. The leader must be diligent in understanding that the focus of the team efforts is on combining rather than on coordinating resources. ( University of Wisconsin, 2012). Interdependence in today's organization is a simple reality. Most services and products are so complex and the skills needed to produce them successfully are so specialized, that it is impossible for any individual to accomplish them alone. Leaders no matter how gifted they are cannot do it alone. They must have teams of people who are willing to follow and do the work.

Teams that are directed and focused by an effective leader will achieve more organizational objectives from a position of strength and creativity. If the team is an effective one where the

team members share a common goal, objective or vision the support that is given to and within the team achieves results.

Any leader worth his or her weight must be very strategic about picking their teams to move forward their vision or their agenda. It is crucial that when a group of people are thrown together that team building occurs. Through team building members gain a better understanding of the team's purpose. The team has increased communication and greater mutual support. They are able to generate a clearer understanding of the group process and how people can and should work together. One of the major benefits to team building is that there is more effectiveness in working through team problems. They are able to develop the ability to constructively use conflict for development, implementation and/or creativity.

Members of a team who have had shared experiences and have had the opportunity to develop a sense of interdependence are more likely to be invested in the success of the group and themselves. Interdependent teams are less likely to be ego-centric as the function of their behavior or the motivations for their actions.

Leaders who are interested in creating new and vital teams must be cognizant of the following areas:

1. Relationships: These relationships must be based on interpersonal trust, open communication and risk taking.
2. Mission: It must be articulated as the team's purpose and formulated by them.
3. Vision: What is the end result once the team's purpose is fulfilled
4. Goals: There are very specific statements of desired results to which the team is committed.
5. Roles: The roles are clearly assigned with stated expectations.
6. Procedures: Guidelines and procedures for the team's effective functioning are articulated and understood by all team members. ( University of Wisconsin, 2012)

The task of leading teams is not a simple process. It requires very specific skills and dispositions. The leader must be calculated in their approach to choosing the team, developing the team , monitoring the team for effectiveness and productivity and evaluating the results and outcomes. Effective ongoing feedback is required to guide a team to achieve the desired results.

Leadership strategies are plentiful. There is a new book every year that professes to be the new truth. This author has read many books and articles over the years and has found the following leadership strategies and guiding principles when in a leadership role or having leadership responsibilities to be best practices.

Strong leaders delegate. As a leader you cannot do it all by yourself, create an effective team and have them work hard to achieve.

Lead during transitions. If the organization is experiencing lots of upheaval or change, make sure that you the leader are visible and directive. Take charge, ask questions, and make decisions.

Honesty: The Best Policy for Uncertainty. Don't lie to people. Don't sugar coat the results. It will only come back later to haunt you as people will feel misled or fooled.

The Right questions lead to the right vision. Ask many questions, talk it out. Ask people to weigh in with their comments and additional questions. Let people explore through a variety of open ended questions and discussions.

Star performers enhance value. Find your superstars, your innovators who will be able to be creative. Find the people who have the creative genius and the work ethic to develop.

Hire better people. Find the excellent workers who are going to jump on board and do the work. Through effective team building assemble the right group of individuals. If there is a specific skill set missing from the group go out and find it. Bring this individual on the team to balance out and be productive and produce products or procedures.

Effective recruitment and retention tools. Develop ways to find the people you need for innovation and development. Once you find them make it worth their while to stay. Look for committed individuals who are willing to work hard and strive for excellence. Reward them in ways that works to developed ongoing loyalty and commitment to the organization.

Continuous clarity for team success Make the objectives and goals realistic and measurable. State the expectations in a way that indicate success and what is ongoing. What still needing work or ongoing development.

Overcome undermining staff who are sarcastic-joking. Being honest and making team members accountable and responsible for their words and actions will empower individuals to be part of the solution rather than constantly being the negative nag.

Make your staff want to change. As a leader you need to be a role model of change. You need to demonstrate and emulate the dispositions and characteristics you want your team to have. You must lead by example.

Capitalize on experience and wisdom of your team members. As the leader you need to recognize the skills and abilities of the people in the organization. These skills must be celebrated and encouraged. There must no jealousy or envy, just recognition of what the individual is bringing to the process.

Courage under fire: good ways to deliver bad news (Forewarn, in person, be brief, firm and fair). In difficult times a leader must face the facts and stand strong. The storm will pass. The conflict will end. The key is how the leader manages her/ his own behavior and sincerity during these times. Will people remember a solid honest individual or a rat who was all about self-preservation?

Know how to frame an argument (support and cooperation). Change never comes without argument and discussion. An effective leader is able to frame all discussion on facts and all decisions are evidence based, keeping the personal out of the discussion is paramount to having enlightened decision making processes.

How to admit your mistakes (apologize –past-present-future)- don't apologize if only regrets are called for. A great leader knows when to be humble and admit a mistake. We are human beings and perfection is not a realizable attribute. We need to be honest with ourselves and others when we mess up. Accepting responsibility in a mature way is crucial to effective leadership.

In conclusion, leadership is made up of several components that must be present for an individual to be successful at this concept. Leadership is a work in progress. It is never fully achieved as there are always new challenges or situations just around the corner. An effective leader knows that he or she must continue to learn and practice this abstract construct called leadership.

As the journey of leadership begins for all of us in one way or another, it will be fundamental that we understand that we are all leaders, we are all able to effect change and we are all able to make a difference in someone's else life every single day.

## Introduction

In 2009, Sultan Hassanali Bolkiah Institute of Education launched a new Master's Degree Program in Education as part of its efforts to upgrade and promote the teaching profession in Brunei Darussalam. The Master of Teaching (MTeach) degree is a professional qualification for entry into the teaching profession and is designed to provide a comprehensive understanding of teaching and learning and to develop effective professional skills. Partnerships with schools allow for student teachers to undergo practical experience throughout the program; 2 days per week in schools for observation and/or teaching, a series of Professional Practice blocks whereby they are to teach assigned classes and a mentor-mentee arrangement of which students teachers receive mentorship by experienced teachers in the partner schools. An important feature in the MTeach program has to be a strong emphasis on reflective practice as a source for creating awareness, evaluating and decision making for classroom instructional and managerial decisions with trainee teachers especially during the practicum. However, while reflective practice have been synonymous with teacher training, the concept of the reflective practitioner (Schön, 1983) points to the problem that reflective inquiry in student teachers' learning can remain tacit and lead to idiosyncratic knowledge that is not open for scrutiny and development (Goodson & Hargreaves, 1996). Reflective practice in teacher training programs are more often than not denigrated to records of observations in journals – mere pieces of descriptive writing. As such, new approaches using reflection and self-regulation as vehicles for student teacher learning, need to be considered carefully. How does reflective practice for teacher preparation account for what Shuell (1990) calls 'active meaningful learning', denoting a constructive, cumulative and goal-directed learning process in which the student teachers build new knowledge upon existing conceptions and beliefs (Halliday, 1996)? In addition, student teachers' beliefs, lay theories, and observations of the school and its community teachers have to be considered of relevance as these form Funds of Knowledge (FoK) (Gonzalez, Moll and Amanti, 2005) that provide a more authentic context for student teacher learning, which in turn contributes to their sense self efficacy as they begin to evaluate teaching and learning and make decisions for classroom instructional and managerial decisions. In order to account for 'active meaningful learning' (Shuell, 1990), this paper focuses on one aspect of reflective practice - illustrates dialoguing reflections to help and challenge student teachers to direct their gaze at students' lives and consider how they may develop and build their knowledge base in order for best practices for teaching and learning.

## A framework for the underlying theoretical rationale and methodology

The underlying rationale for 'active meaningful learning' stems from the assumption that the educational process can be greatly enhanced when teachers learn about the everyday lived contexts of their students' lives otherwise known as the funds of knowledge (Gonzalez & Moll, 2002). For this module, student teacher venture as 'anthropological learners' or 'teacher-ethnographers', they acquainted themselves with their students', familiarised with the whole school community and sought to understand the ways in which the school community makes sense of their everyday lives.

## The Funds of Knowledge (FoK)

"Funds of knowledge (FoK) is based on a simple premise; *that people are competent and have knowledge, and their life experiences have given them that knowledge*" (Gonzalez & Moll, 2002, p. 625). It is centered on the principle that the best way to learn about lives and backgrounds is through a focus on households' everyday practices, by learning about "what people do and what they say about what they do" (Gonzalez, 2005, p. 40).Diverse definitions suggest the importance

of consideration of various FoK, with notions of FoK each highlighting and/or excluding different factors. For this paper, I make reference to FoK as the fluid collection of knowledge base, mainly derived from observations. FoK provides the basis for understanding/making sense of their beliefs, teaching philosophies in the development and building of knowledge base as they began to develop their own personal understanding of teaching and learning which contributes towards enabling them to be informed on best practices. This in turn could potentially help student teachers achieve self-efficacy which Bandura (1986) defines as “as people’s judgments of their capabilities to organize and execute courses of action required to attain designated types of performance” (p. 391).

### The concept of reflection

John Dewey (1933) defined the term reflection as “active, persistent and careful consideration of any belief or supposed form of knowledge” taking into consideration its origins and effects (as cited in Richards & Ho, 1998:153). Reflection, is today established as a key concept in discussions of teacher learning and involves teachers in thinking about their work, understanding what they and their learners do, and considering ways of improving the quality of teaching and learning. Research on effective teaching over the past two decades indicate that effective practice is linked to inquiry, reflection, and continuous professional growth (Harris, 1998). Teachers can improve their effectiveness in the classroom by gaining a better understanding of their own individual teaching styles through reflection on practice (Calderhead, 1989). However, reflection is also considered difficult due to a lack of understanding of reflection (Boud & Walker, 1998), thus, a range of methods for identifying the nature and quality of reflection have been developed to mitigate these concerns.

Typically used and studied in the context of pre-service teacher education programmes (Borg, 2006), reflective writing frequently takes the form of reflective journals (Hatton & Smith, 1995). Reflection can also be understood as a process of internal dialogue facilitated by thinking or writing and through an external dialogue and reflection together with others (Clarke, 2003). However, reflective dialogues are used to facilitate and support group learning whereby participants are responsible for personal reflections and committed to active participation. This paper looks at the benefits of dialoguing that participating student teachers derived from, over one semester of practicum and classes in session and reports on the learning outcomes through the construction of stories of three student teachers, gathered during the student teachers’ reflective dialogues.

### The dialogue sessions

The module in context had a primary focus, to provide support be it professional or otherwise, vis-à-vis dialoguing sessions, to student teachers as they underwent practicum for a 14 weeks (1 semester) in schools. The body of research on student stress in the practicum identifies and describes sources of practicum stress to be plenty as “teaching is considered to be among the professions in which employees are subject to high levels of stress...and is capable of exposing student teachers to situations that are similarly, if not more stressful than those experienced by practicing teachers” (Black-Branch & Lamont, 1998, p. 183 cited by Murray-Harvey, 1999). With reflective practice as the module’s approach for teaching and learning, student teachers were required to observe, note down in their reflective journals, reflect on what they have observed and then share these reflections when they attended classes weekly on campus. The goal was to create a climate of dialogue where student teachers professional (and sometimes personal) questions and thoughts were given due respect and attention and collectively explored. To

facilitate the development of their reflections systematically, a semi-structured check-list was provided, they were required to do the following:

- i. Observe moments (critical, significant, spontaneous) and describe them in their notebooks
- ii. Approach and become acquainted with the students (this could be after a class, recess, etc)
- iii. Become familiar with the school (in their notebook, they should describe the school's physical environment, teachers, principal, understand the school's policies, culture)

From the very start of these classes, trust and privacy were main priorities, a safe environment had to be ensured. There was very little, if at all, interference from the lecturer who had to be flexible with the structure of the classes – although lectures had been prepared, these had to be postponed if it was noticed that the student teachers required prolonged period of talk-time. Among questions/topics suggested for reflective purposes were questions that covered an array of topics that included perceptions and beliefs about teaching, classroom management, pedagogical decisions, these topics were usually based on their experiences/critical moments/incidents. The student teachers were encouraged to pursue the selected topics in whatever direction seemed most fitting and to diverge from the initial questions whenever necessary. Sometimes, digressions ensued, these may include, a rough day at school, class management problems, teaching methods that did not work, work relationship problems; however not all digressions were negative in nature.

During each of the reflection sessions, the student teachers were asked to identify and discuss successes and problems. The dialogue sessions appeared most helpful as the student teachers learned to reflect and talk through on their reflections and experiences, they also began understand see other perspectives. This resonates with Game & Metcalfe (2009) who said that people in dialogue, are able to hear the differences offered by others, because they are not personally affronted. They can imagine the experience of others and therefore understand how different perspectives can co-exist.

The following section presents case examples of 3 student teachers, Ros, Nana and Rina and the stories gathered from the dialogue sessions.

#### Student teacher 1:- Ros

Ros has been a trained speech therapist for more than 10 years and presents an image of the very committed professional with a strong sense of professional identity. Among her most rewarding instances are when the children she's helping are able to communicate coherently. When she decided on a mid-career change, she chose to become an early childhood educator. Ros wears many hats, she is a mother of 4 young boys, wife, part time actress and full time student. Ros is confident and unafraid to speak her mind, she very seldom allows herself to be 'bullied' into situations. However, she is also very soft hearted and compassionate, sometimes during class, she has been known to shed a few tears albeit tears of frustration, anger, sadness.

#### Ros' Story:- The supervisor – supervisee tension

During the initially stages of her practicum, conflicts arose between Ros and her practicum supervisor due to differences in teaching practices and/or perspectives. Ros's supervisor was trained in Primary Education while Ros was undergoing training as an Early Childhood practitioner. As pedagogical and methodological differed for the two areas of specialisation, Ros found herself in constant conflict with her supervisor. For example, during a class on campus,

Ros appeared quite upset. It seemed that she had been awarded a grade which to her opinion, was not justifiable and she was very frustrated and she talked about it. As she dialogued on her reflections on that incident, she had the opportunity to understand and retain her self efficacy; by the end of the semester, she had actually begun to see eye to eye with her supervisor. If she hadn't been able to dialogue with the rest of the student teachers and the lecturer, she could have eventually ended up being more frustrated and disheartened. Throughout the dialogue sessions, she grew increasingly aware of where to draw the middle-line – when to agree and when to disagree with her supervisor, she also reflected on ways to structure her lessons, so while she still stayed true to her training as an Early Childhood educator, she could still present lessons which met the necessary structures and requirements of a 'good' lesson. All these decisions eventually contributed to an improved supervisor-supervisee relationship by the end of the semester, and she even received a very good grade for her practicum.

#### Student teacher 2:- Nana

Nana is a young teacher who has been teaching the General Paper to pre-university students for 3 years. Educated abroad in English Language and Linguistics, she did not receive any formal teacher training, thus her admission into the Master of Teaching program. As most of Nana's students are about her age, she has always assumed that she has good rapport with them. While she is a highly motivated teacher and is constantly making every effort to ensure best practices in teaching, she does have some set ideas and beliefs which she has been 'collecting and building' in the 3 years of her teaching, particularly in the area of classroom management.

#### Nana's Story:-Through the reflective glass

Nana considered herself to be 'young, hip', and seemed to have no issues identifying with her young students. ...however, during one of the dialoguing sessions, as reflected on an incident during a classroom observation, she realised that she was not as approachable as she thought she was and that she had very set ideas on (un)acceptable behavior in a classroom. For example, she said *"the funny thing I encountered today was when the teacher was taking the students' attendance, the teacher asked the students to respond with animal sounds. To my surprise, none of them were reluctant... they were rather responsive and jolly."* From her comment, Nana appeared to be unaware of the types of activities her students would consider as fun, she said *"I didn't know they liked that sort of thing, I thought they would find it silly to make animal sounds cause they're you know, seventeen."* She later admitted that she seemed to be an 'old' person with little tolerance and had very little patience for 'young people's habits or behaviour, thus explaining her reaction to the students' enjoying the activity above. This 'revelation' proved quite surprising to her as she had always thought that she understood her students' Funds of Knowledge,

Nana also discovered that she never actually built relationships with her students. In one session, she talked about her observation of her mentor, and she said, *"...when the teacher mentioned smoking, the boys in the class gave a funny look to the teacher, and both (teacher + student) laughed. To be honest, I do not know what was funny about this. I could see that the teacher and students understood each other perfectly. They had a rule – we do not laugh at the person, we laugh with the person. Knowing that I once taught this class before, I could clearly tell that the students' performance have improved since the teacher took over."* She remarked of her reflection *"I liked the fact that the students were able to communicate easily with the teacher. Students*

*were more responsive and not entirely scared or shy.*” A stickler for rules, Nana, through reflection, began to see how other teachers’ implemented rules which empowered the students instead of disempowering. Also her dialogues helped her see that she was indeed not as flexible and approachable as she had always assumed to be. She once said, “*I have a younger sister in the school... and I’m very close to her... so I get along well with my students because they’re like my sister.*” By the end of the semester, she admitted... “*yeah, I never saw myself as strict or fussy.. I did wonder, why they never seemed to laugh during my classes, but they always seemed to have a good time with Mr Ravi.*” Nana’s reflective dialogues do not mean that she undergoes a total professional and personal transformation, rather, these reflections of authentic teaching experiences provide her the feedback from peers and the lecturer, which can potentially help in her development of a decision-making schema. Farrell’s (2001) description of reflective teaching explains that teachers learn to subject their own beliefs of teaching and learning to a critical analysis, and thus, take more responsibility for their actions in the classroom (p. 23).

### Student teacher 3:- Noni

Noni is another young teacher, educated abroad in the area of Applied Linguistics, however, she never received any formal teacher training. Having taught General Paper for A-Levels since graduation, she has had 3 years teaching experience. Self-admitting, she ‘envies’ her colleagues who appear to have close bonds with their students, she feels that she is ‘*not the kind to be friendly or close. I just do my work, that doesn’t mean I don’t like my students, I’m just incapable of being close to them*’.

### Noni’s Story: The ‘s’mothering mentor

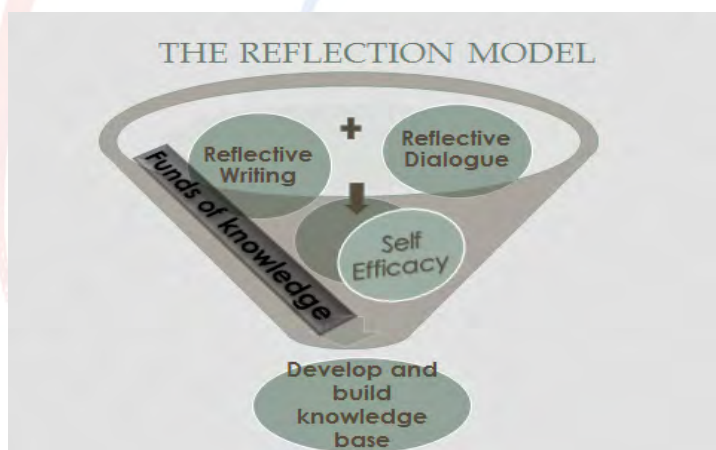

For her practicum, Noni was sent to an all girls’ school which is well known for its Language Arts Program. Unlike Noni who claimed that she was unable to be personable with her students, her mentor on the other hand, was very learner centred and his students’ wellbeing was considered above everything else, he referred to his students as “*my girls.*”

Being a very hands-on teacher and mentor, he observed all her classes, tracked her pace during class, pre-set her activities, she was kept on very ‘short leash’. To illustrate, he felt that one of her weakness was the ‘incapability’ to keep track of time so she was asked to write a script which she was to read aloud in class, so instead of spending time preparing her lesson, she was kept busy writing the script. Although she had the highest regards for him as the mentor and teacher, she felt very frustrated and unable to be herself. Often during the dialogue sessions, she would comment that “*if he wasn’t there, I would not have done that...*” For Noni, the dialogue sessions appeared to have helped her go through the entire practicum, these sessions were almost akin to therapy sessions and as she shared her frustrations, she began to make sense of who she had become and why she was like that. She remarked... “*I know many times I don’t want to do what he suggests, and now I won’t even look at him as he taps his watch. But I just keep quiet whenever he suggests something, I disagree inside but outwardly, I don’t. In my mind though, I’m just not listening to him.*” When Noni made this comment, her peer at the dialogue session remarked, “*why don’t you just tell him, why do you let him think you don’t have an opinion?*” This comment actually helped Noni re-think her reactions towards her mentor, although at the initial stages, Noni was unable to answer her peer, she had become too wrapped up in the bubble of incompetency which had been growing since the beginning of her practicum. Many of the sessions were filled with Noni venting her frustrations, however, being able to reflect on the

different incidents, for example, not being to make her own professional decisions, she eventually understood that she was in fact a teacher who have had 3 years teaching experience, and she was empowered to make professional decisions which in the best interest of her students. The dialogue sessions were not just for reflective purposes, they were sessions where she received support and validation from her other colleagues who spurred her on with encouraging words and courage to stand up for what she thought were good pedagogical decisions.

### Conclusion : The Reflection Model

Reflection is today, established as a key concept in discussions of teacher learning. Reflection can be understood as a process of internal dialogue facilitated by thinking or writing and through an external dialogue and reflection together with others (Clarke, 2003) However, reflection is considered difficult due to a lack of understanding of reflection (Boud & Walker, 1998), thus a range of methods for identifying the nature and quality of reflection have been developed to mitigate these concerns. In the context of this module, it was pertinent to make sense of the process of reflective practice and consider its reliability and validity as an approach in teacher education. From the outcomes of the dialoguing sessions, a model of reflection is proposed below to illustrate the key elements necessary for meaningful reflection.

### The Reflection Model

Through the sessions, it was apparent that in order for meaningful reflection instead of mere tacit practice to have the potential to develop and build an effective knowledge base for teaching and learning, the funds of knowledge which is extrapolated from ethnographical observations, written records of the observations (reflective writing) which is then turned into reflective dialogues were essential. These three elements collectively contribute towards self efficacy of the student teachers as they began to “belief in their capacity to organize and execute the courses of action required to produce given attainments” (Bandura, 1997, p. 3).

The stories in this paper highlight the role of collaborative dialogue as a key element in reflective practice. To reiterate Black-Branch and Lamont’s (1998) point that “teaching is considered to be among the professions in which employees are subject to high levels of stress”, reflective dialogues appear to encourage and enable teachers to operate in the affective domain. While reflecting alone may be beneficial, reflection may be "enhanced by communication and dialogue with others" Zeichner and Liston (1996 p. 22). Working with others to inquire has several benefits as described by Kasl and York (2002), a dialogical process can support teachers to see other perspectives and people in dialogue, are able to hear the differences offered by others,

because they are not personally affronted (Game & Metcalfe, 2009). They can imagine the experience of others and therefore understand how different perspectives can co-exist.

In conclusion, teacher educators must think of ways to incorporate all three elements, should they choose the reflective approach in their teaching and learning as these elements systematically present a structure for reflection of which neither should be indispensable.

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

The research purposes were to study about local wisdom learning management of an ASEAN Focus School in Chachoengsao province in Thailand, to develop the local wisdom learning management model of ASEAN Focus School and to study the results of the model which considered from the result of local wisdom learning units integrated to ASEAN developed by teachers, asking teachers' opinions and students' opinions. It found that, teachers in each department of the school have taught local wisdom learning in different types and times in a semester. There were only two of eight departments (Thai language department and foreign language department) could be able to teach all ten types of local wisdom. The four models of local wisdom learning management of ASEAN Focus School were developed in this research and they were in a high level of consistency and appropriateness. It also found that teachers and students were satisfied in a high level of teaching and learning from the learning unit designed by the model, and they also revealed that every school in Thailand should implement the models for preparing students and other stakeholders to facing the ASEAN community by the year 2015.

**Key words:** Local Wisdom, Learning Management Model, ASEAN Focus School

## Introduction

In October 2003 the Association of South East Asian Nations (ASEAN) announced its intention to create an ASEAN Community based upon three pillars: 1) ASEAN Security Community 2) ASEAN Economic Community and 3) ASEAN Socio-Cultural Community. A year later ASEAN established the Vientiane Action Programme to realise this goal. The process of [ASEAN community](#) building is a result of the considerable change in the association's mission in the recent two [decades](#). The end of the [Cold War](#), the advance of [globalization](#), the rise of [China](#) and [India](#) in economic size and political influence as well as the Asian financial crisis have forced ASEAN to shift from its original preventive diplomacy of maintaining peace and harmony among its members and in the region to the constructive diplomacy of community building to cope with increasing political and economic competition in a globalised world. In more details, one of the most notable threats to ASEAN members is China, whose robust economy is in direct competition with those of its Southeast Asian neighbours, especially in trade and foreign direct investment. Meanwhile, in recent years, China has also tried to enhance its economic and political influence and presence in the region, particularly in Myanmar, Laos, Vietnam and Cambodia. This important change has increasingly drawn ASEAN states, which share the common fear of intrusive outside powers, into the long-term strategic competition between the United States and China in Asia Pacific. In order to cope with China and avoid external intervention, Southeast Asian countries feel the need to act collectively and to lean on each other, so that they can have combined strengths as well as better bargaining power in both economic and political issues. The same will work when dealing with an amalgamated or regional community such as the United States and the European Union, or with international organizations such as the United Nations and the World Trade Organization. Besides, in the time of economic globalization and after it was hit hard by the Asian financial crisis, forming an economic community will help Southeast Asia boost its economic competitiveness and attractiveness to investors inside and outside the region (Almonte, 2006 cited in Wikipedia, 2012). In 2005, member countries agreed to establish an ASEAN Charter, which would serve as the legal and institutional framework for the regional organization and the ASEAN Community. Although it will not take on any supranational functions, with its ambitious goals, the ASEAN Community is believed to have far-reaching and important impacts on the lives of the people in Southeast Asia (Wikipedia, 2012). To response to the globalization and the regional economic and political development, in less than three short years the ASEAN 2015 will become a reality bringing with it enormous new opportunities for Thai companies to expand in the region and exploit the unprecedented new freedoms that the 10-country ASEAN Economic community will offer.

From the mentioned above influenced Thailand to enhance people to be educated and ready for facing the changed situation not only formal education but also informal and non-formal education as well. According to the Office of Basic Education Commission revealed that the office has been conducted a project called Spirit of ASEAN to prepare Thai students since 2011, there are three types of school model in the project which are Buffer School, Sister School and ASEAN Focus School.

Thailand should beware and also necessary to consider our role as one of the main founders of ASEAN. As a core leader in the ASEAN Community Thailand is aiming at the prosperity of its people through developing resources and economy building under the strategic vision of, "One Vision, One Identity and One Community". The main purpose of the Ministry of Education on educational readiness preparation is as follows: (Nipa Yamwagee.2010)

1. To build an ASEAN Community through education: Thailand will be an Education Hub with crucial concepts which focus on equipping Thai people with the essential awareness of being part of the ASEAN Community, through having the capacity to be able to live harmoniously in a multi-society, also in showing the ability to establish educational cooperation in the region. The latter will emphasize educational quality development, educational opportunity expansion and participatory enhancement on educational services and educational management.

2. To reinforce ASEAN Community building through education: This process will be highlighted through the understanding of inculcation regarding ASEAN neighboring countries, ethnic differences, human rights principles. Moreover, a high emphasis will also be given to teaching foreign languages. This is in order to develop efficient communication amongst ASEAN citizens. The Ministry will also allow English teachers to integrate the English language at every level. The aim is to encourage Thai students to communicate creatively. In addition, the private sector will assist in the support of volunteer teachers to teach foreign languages. In addition foreign languages volunteers should also teach cultural awareness in order for all to reach better understanding. With regards to ICT for education, development of this will be through 3 Ns principles, namely the Ned Net- National Education Networks, the NEIS- National Education Information System –A Center for gathering, collecting and linking educational information and data, and NLC – National Learning Center for life-long learning. The significant objectives embedded are to develop Thai students to become good ASEAN citizens. To develop Thai citizens who can live together with all other citizens of ASEAN in harmony, in a happy, caring and sharing atmosphere. Furthermore, students who graduate from vocational and technical colleges will be ready to enter the workplace as efficient staff members who are coupled with sufficient abilities to work in multicultural societies.

Finally, the Ministry of Education will set out to promote Thailand as being an education center of ASEAN in the areas of religion and culture. This policy will be implemented under the 6 months - 6 qualities strategy. This is in order to continually develop Thailand's move forward to both ASEAN and International Communities.

In addition to considering the change towards the ASEAN Community, Thailand Educational Act is another factor to consider, especially, chapter 4 : National Education Guidelines Section 23 : "Education through formal, non-formal, and informal approaches shall give emphases to knowledge, morality, learning process and integration of the following, depending on the appropriateness of each level of education". Especially, (3) Knowledge about religion, art, culture, sports, Thai wisdom, and the application of wisdom. (Office of the National Education Commission. 1999 : 10-11). As a role of a lecturer in the Faculty of Education, Rajabhat Rajanagarindra University (RRU), Chachoengsao Province Thailand, influenced the researcher to be interested in studying the ongoing of the Spirit of ASEAN project in Chachoengsao Province in the area of local wisdom learning management in school of the Spirit of ASEAN project. The researcher found from the preliminary study showed that a school in the project which is in ASEAN Focus School type model and located near by RRU is Wat Sothonwararam Worawiharn School. It is one of fourteen schools in ASEAN Focus School project, therefore this school was selected into this study. The aim of the research was to study the local wisdom learning management of an ASEAN Focus School in

Chachoengsao province in Thailand then develop the local wisdom learning management model of ASEAN Focus School and study the results of the model.

### **Research objectives**

The research objectives were:

1. to study the local wisdom learning management of Wat Sothonwararam Worawiharn School teachers.
2. to develop the local wisdom learning management model of ASEAN Focus School.
3. to study the results of the local wisdom learning management model, which considered from
  - 3.1) the result of local wisdom learning management unit integrated to ASEAN
  - 3.2) teachers' opinion toward using of the local wisdom learning management model.
  - 3.3) students' opinion toward learning by the local wisdom learning integrated to ASEAN learning unit.

### **Research Procedure**

#### **1. Sample**

Purposive selection was used in this research. The samples were school administrators, teachers, and students of Wat Sothonwararam Worawiharn School which selected according to the research process which consisted of ;1) 97 teachers in the process of studying the local wisdom learning management, 2) 10 teachers in the process of using the model and 3) 29 students in the process of studying the opinion of learning from local wisdom learning integrated to ASEAN learning unit.

#### **2. Method**

This research operated according to the following stages

**Stage 1 :** study the local wisdom learning management in school, this stage set up during September – October, 2011.

**Stage 2 :** develop and evaluate the local wisdom learning management model of ASEAN Focus School, this stage set up during November – December, 2011.

**Stage 3 :** study the results of using the local wisdom learning management model, this stage set up during January – April, 2012.

#### **3. Research tools**

Research tools consisted of :

- 1) questionnaire asking teachers about the local wisdom learning management of Wat Sothonwararam Worawiharn School
- 2) local wisdom learning management model assessment form
- 3) Semi structure interview
- 4) questionnaire asking students about learning of local wisdom learning integrated to ASEAN.

#### 4. Data collection

Data collection were as following :

- 1) The researcher surveyed and analyzed local wisdom learning management of the teachers in Wat Sothonwararam Worawiharn School after the process of documentary studied.
- 2) The researcher set up focus group together with school administrators and teachers then analyzed and constructed method of local wisdom learning management in school.
- 3) The re searcher developed local wisdom learning management together with the school teachers and curriculum and instruction experts.
- 4) The researcher evaluated the results of the model by interviewing the teachers in the project and asking opinion of students who learned the local wisdom integrated to ASEAN learning unit.

#### 5. Data analysis

1) Descriptive statistics were used to analyze the data collection which were mean ( $\bar{x}$ ), standard deviation (SD) and percentage (%).

2) For analyze satisfaction questionnaires data, rating scale of means were interpreted as follow :

4.51 – 5.00	mean	satisfaction at the highest level
3.51 – 4.50	mean	satisfaction at a high level
2.51 – 3.50	mean	satisfaction at a medium level
1.51 – 2.50	mean	satisfaction at a low level
1.00 – 1.50	mean	satisfaction at the lowest level

3) Content analysis was used to analyze the interview data collection.

#### Research Results

1. Kindergarten teachers and teachers in each department which were Thai language, Mathematics, Science, Social studies Religion and Culture, Health and Physical Education, Art, Occupations and Technology, and Foreign languages departments have taught local wisdom essential learning in different types and times in a semester. Teachers in Thai language department and foreign language department could be able to teach all of ten types of local wisdom which consist of (1) local wisdom of religion and belief, (2) local wisdom of tradition and rituals, (3) local wisdom of folk art, (4) local wisdom of food and vegetables, (5) local wisdom of folk dance, (6) local wisdom of cultural arts, (7) local wisdom of folk songs, (8) local wisdom of herbs and medicine, (9) local wisdom of fabrication, and (10) local wisdom of living under natural conditions. On the other hand teachers in health and physical education department could be able to teach two types of local wisdom which were local wisdom of folk art and local wisdom of folk dance.

2. There were four types of local wisdom learning management model of ASEAN Focus School, which were 1) local wisdom integrated to ASEAN learning management model in fundamental subjects group, 2) local wisdom integrated to ASEAN learning management model in selective subjects group, 3) local wisdom integrated to ASEAN learning management model in students activities and 4) local wisdom integrated to ASEAN learning management model in school special project. All four types model were in high level of consistency and appropriateness evaluated by the specialist in curriculum and instruction area as the following figure 1-4.

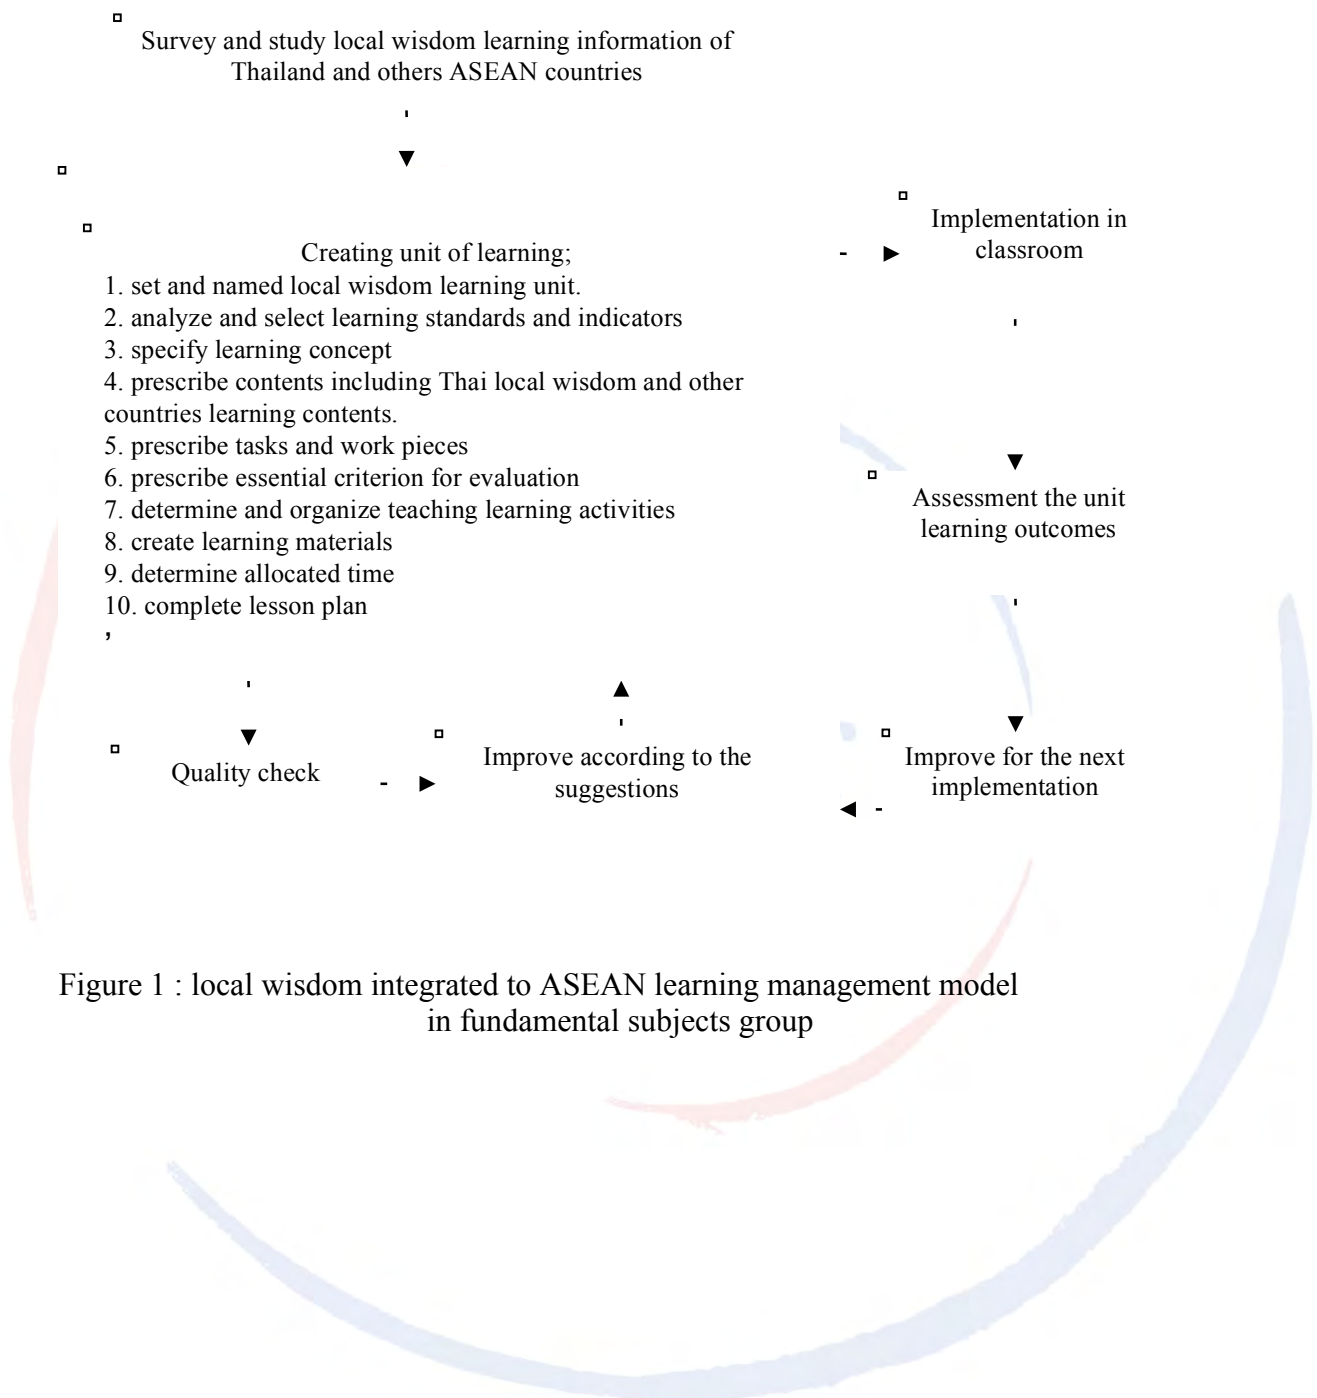

Figure 1 : local wisdom integrated to ASEAN learning management model in fundamental subjects group

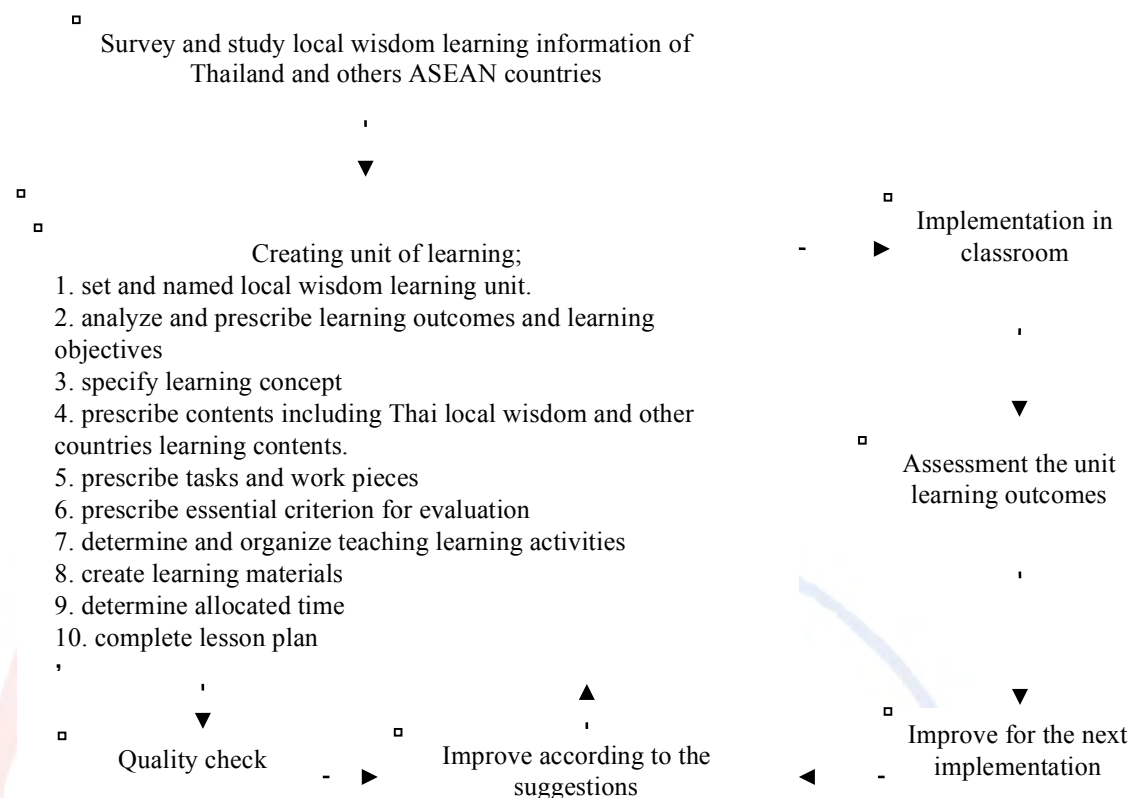

Figure 2 : local wisdom integrated to ASEAN learning management model in selective subjects group

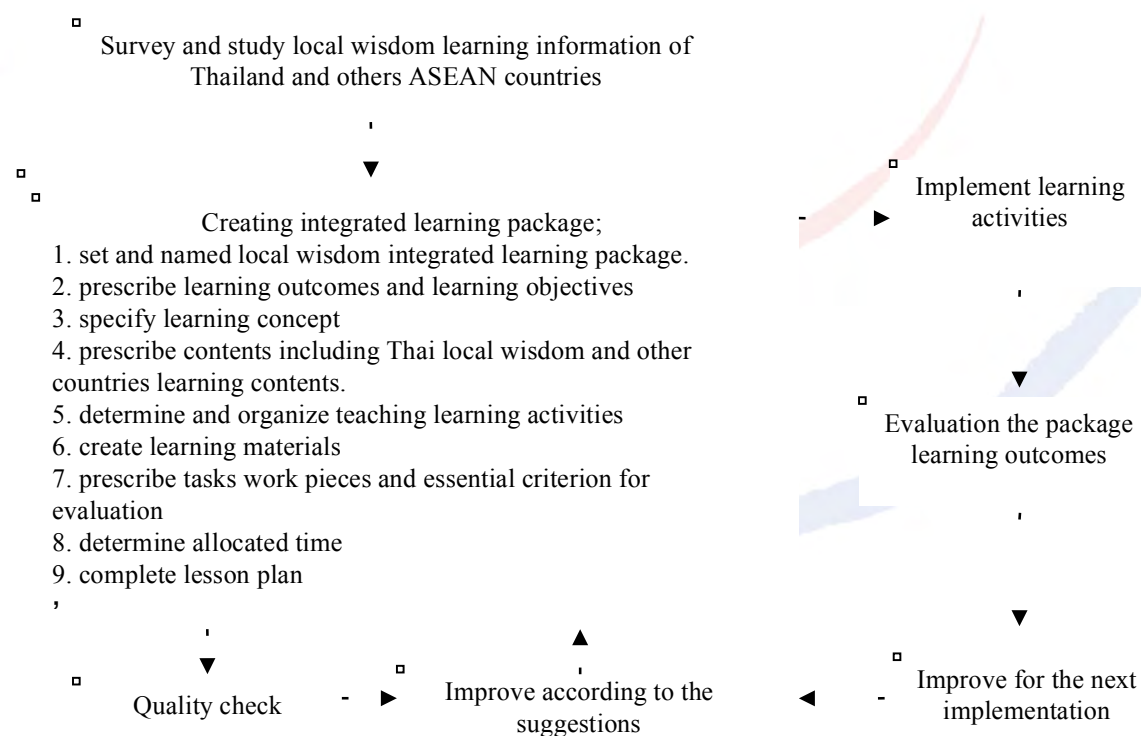

Figure 3 : local wisdom integrated to ASEAN learning management model in students activities

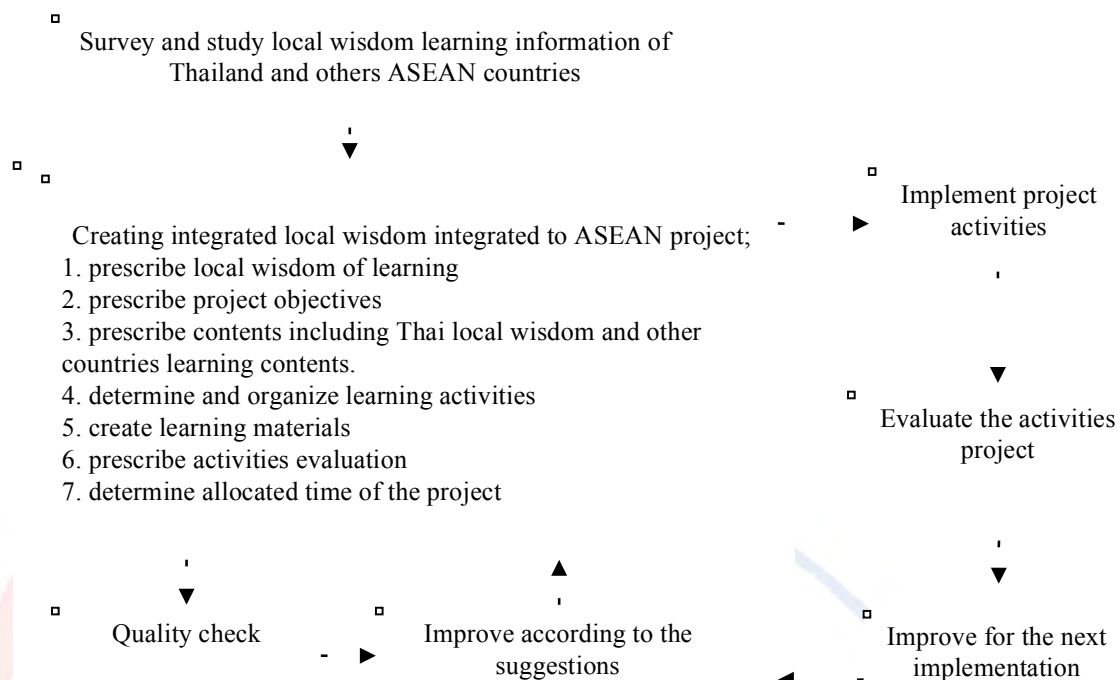

Figure 4 : local wisdom integrated to ASEAN learning management model in school special project

### 3. The results of implementing the model were as followed;

3.1 In this research there were 9 learning units developed according to the local wisdom integrated to ASEAN learning management model in fundamental subjects group; Unit 1 : Religion and Belief in ASEAN, Unit 2 : Tradition and Worship in ASEAN, Unit 3 : Thai and ASEAN Music, Unit 4 : Local Food in ASEAN, Unit 5 : Thai and ASEAN Folk Dances, Unit 6 : Enjoy in Literature, Unit 7 : Thai and ASEAN Herbs. Unit 8 : Thai and ASEAN Fabrication, Unit 9 : Wisdom in Living Naturally in ASEAN.

3.2 Teachers' opinion revealed that to prepare effective lesson plans it was necessary to consider and set up learning objectives which aligned to the curriculum indicators, selected suitable content, essential learning, teaching and learning materials and prepared alternative assessments. Besides learning objectives should be comprehensive altogether cognitive domain, psychomotor or process domain and effective domain which mainly enhancing local wisdom appreciation, tenacious, and conservation altogether with learning ASEAN local wisdom.

3.3 Students' satisfaction toward learning local wisdom integrated to ASEAN unit 6 : Enjoy in Literature as a whole and aspects were in high level of satisfaction as the following table 1 and table 2.

Table 1 : Mean, standard deviation and level of satisfaction of students (n=29)

Aspect	( $\bar{x}$ )	(SD)	Level of satisfaction
Learning materials	4.43	0.50	High
Learning activities and environment	4.47	0.50	High
Assessments	4.31	0.49	High
Learning Benefits	4.26	0.46	High
<b>Average</b>	<b>4.37</b>	<b>0.49</b>	<b>High</b>

Table 1 showed the students' satisfaction towards learning the local wisdom integrated to ASEAN unit 6 : Enjoy in Literature as a whole was in high level of satisfaction ( $\bar{x} = 4.37$ ). Classify by aspect it was found that the satisfaction towards learning materials, learning activities and environment, assessments and learning benefits were also in high level of satisfaction ( $\bar{x} = 4.43$ ,  $\bar{x} = 4.47$ ,  $\bar{x} = 4.31$ ,  $\bar{x} = 4.26$  in order).

Table 2 Mean, standard deviation and level of satisfaction of students in aspects and items (n=29)

Aspects / Items	$\bar{x}$	SD	Level of satisfaction
<b>Learning materials</b>			
1. interesting	4.48	0.51	High
2. difficulty	4.41	0.50	High
3. suitable for activities	4.38	0.49	High
average	4.43	0.50	High
<b>Learning activities and environment</b>			
4. learning objective informed	4.41	0.50	High
5. duration of learning activities	4.45	0.51	High
6. active participation by learners	4.41	0.50	High
7. learning activities are interesting	4.52	0.51	Very High
8. enjoy participated in learning activities	4.55	0.51	Very High
average	4.47	0.50	High
<b>Assessments</b>			
9. alternative assessment	4.41	0.50	High
10. suitability assessment and aligned to objectives	4.31	0.54	High
11. benefit of feedback to improve learning	4.21	0.41	High
average	<b>4.31</b>	<b>0.49</b>	High
<b>Learning Benefits</b>			
12. enhanced understanding of local wisdom	4.31	0.47	High
13. enhanced appreciation of local wisdom	4.34	0.48	High
14. valued Thai local wisdom and other countries knowledge	4.21	0.49	High
15. applied knowledge to daily life	4.17	0.38	High

Table 2 showed the satisfaction in items it was found that the two highest satisfaction average score were 4.52 and 4.55 in items; the learning activities are interesting and, students enjoy participated in learning activities. The lowest average score item was 4.17 showed in item of applying knowledge to daily life, nevertheless it still meant in high level of satisfaction.

## Conclusion and discussion

1. It found in the research that, teachers in each department of the school have taught local wisdom learning in different types and times in a semester. There were only two of eight departments (Thai language department and foreign language department) could be able to teach all ten types of local wisdom. This because of according to Thailand Educational Act which is an important factor for the educators especially teachers to consider the way to prepare their lessons, especially, chapter 4 : National Education Guidelines Section 23 (3) Knowledge about religion, art, culture, sports, Thai wisdom, and the application of wisdom. (Office of the National Education Commission. 1999 : 10-11). It is a main factor to influence teacher in the school prepared their lesson with local wisdom integration. And it can be explained by analysis the learning standard criterion in the curriculum, because of the learning standards of the two disciplines Thai discipline and foreign languages discipline are focus on the language skills, and grammar focus then the teachers in the two departments can be able to choose any content freely to teach their students including ten types of local wisdom learning contents.

2. The four models of local wisdom learning management of ASEAN Focus School were developed in this research and it was found from the implementation of one model which was local wisdom integrated to ASEAN learning management model in fundamental subjects group, the teachers' opinion revealed that to prepare effective lesson plans it was necessary to consider and set up learning objectives which aligned to the curriculum standard and curriculum indicators, selected suitable content, essential learning, teaching and learning materials and prepared alternative assessments. Besides learning objectives should be comprehensive altogether cognitive domain, psychomotor or process domain and effective domain which mainly enhancing local wisdom appreciation, tenacious, and conservation altogether with learning ASEAN local wisdom. And they also revealed that every school in Thailand should implement the models for preparing students and other stakeholders to facing the ASEAN community by the year 2015. From the founding it can be explain that because of the implemented model was for fundamental subject group so the teachers had to focus of the curriculum standard and curriculum indicators then they prepared the lesson. Also in Thailand teachers must prepare the objectives which covered all type of cognitive domain, psychomotor domain and affective domain so the teachers always remind themselves to set the learning objectives comprehensively of those three domains.

3. Students were satisfied in a high level of teaching and learning from the local wisdom learning unit integrated to ASEAN which designed by the model especially in the items of the learning activities are interesting, and students enjoy participated in learning activities were in very high satisfaction. It meant that students enjoyed their learning, this because the teacher had been prepared a valuable lessons for them, not only emphasized on the curriculum standard but also focus on the local wisdom and expanding to ASEAN knowledge, this design made students realized that they were the students of ASEAN Focus School which focus on preparing students in ASEAN knowledge, knowledge in science and technology, thinking skills, leadership and multicultural understanding to be ready for adjust themselves in any changed situation in the future. Anyway it was found that the lowest satisfaction was showed in item of applying knowledge to daily life, nevertheless it still meant in high level of

satisfaction. This probably because the students felt that the local wisdom which was immersed in the unit of Enjoy in Literature cannot be applied directly to daily life.

## Recommendations

1. Recommendation for implementing the local wisdom integrated to ASEAN learning management model were as follow :

- 1) Teachers and administrators should prepare themselves to know and have enough information about local wisdom not only about Thai but also of other countries.
- 2) Teachers should be skillfully on design curriculum and instruction and the lesson should be appropriate with students' age and be able to activate students interesting.
- 3) Not only teachers should skillful on knowledge and information retrieval but also necessary to be skillful on preparing learning materials for students to enhance the successfulness.

2. Recommendation for further research were as followed :

- 1) There should be a variety study of dependent variable to confirm the efficiency reliable of the local wisdom integrated to ASEAN both in learner dimension and management dimension
- 2) The results of implementation on other two models ; local wisdom integrated to ASEAN learning management model in students activities and local wisdom integrated to ASEAN learning management model in school special project should be studied.
- 3) There should be a comparison study between or among local wisdom learning management in Thailand and those other countries.
- 4) Should research and develop the suitable local wisdom bank for Thai students according to curriculum and instruction research methodology design.

The research purposes are to 1) find out suitable factors for indicating desirable characteristics of guidance teachers and 2) propose indicators of undergraduate students' desirable characteristics by Eastern cultural principle. Survey research was conducted with 194 Chachoengsoa's guidance teachers, spread all school levels (elementary, secondary and high school). The participants were arranged to the study by purposive selected from teachers who attend in Thai Teacher Professional Development Program. Research instrument was a desirable characteristics of guidance teachers questionnaire developed from 7 factors of Kanlayanamitradham (7 qualities of a good friend) compound with 10 desirable characteristics of undergraduate student of Faculty of Education, Rajabhat Rajanagarindra University. Questionnaire content there were 2 parts included 4 items of general data and 25 items of desirable characteristics of guidance teacher. Reliability of questionnaire was 0.686. Data were analyzed by Principal Component Factor Analysis with orthogonal rotation, varimax technique.

The research results indicated that in the original 17 factors such as: lovable, respectable, adorable, being a counselor, being a patient listener, able to deliver deep discourses, never exhorting groundlessly. Those could group into new 6 factors include 1) Teaching competencies, with 8 indicators, factor loading between 0.71-0.77, 2) Good behave, with 9 indicators, factor loading between 0.61-0.68, 3) Teaching spiritual, with 5 indicators, factor loading between 0.50-0.59, 4) Democratism, with 1 indicator, factor loading was 0.60, 5) In-depth communication ability, with 1 indicator, factor loading was 0.72, and 6) Knowledge acquisition ability, with 1 indicator, factor loading was 0.58.

## Introduction

The first wave of educational reform in Thailand had begun in 1999 with the obligation of the National Education Act, which had been revised in 2002 (Office of the National Education Commission, 2002). This reform impacted students, teachers, administrators, faculty staff, and educational personal throughout the country. It yielded some gratifying outcomes regarding education system, administration structures, and education quality assurance. Inevitably, several concerns were raised particularly on: "quality of learners, teachers, faculty staff, and educational personal; efficiency of administration and management; and need for increased educational opportunities" (Office of the Education Council, 2009). To deal with such concerns, Thailand has initiated the second wave of educational reform with the Proposals for the Second Decade of Educational Reform (2009-2018) (Office of the Education Council, 2009). The vision of the forthcoming reform is that "All Thai people are able to access high quality lifelong learning". Seven frameworks of the reform were proposed to the government; one of these explicitly deals with quality of teachers.

Teachers appear as an essential component of education. Teacher characteristics and teaching styles are related to the diversity of teaching and learning and, ultimately, the presence of effective classroom practice (Opdenakker & Damme, 2006). Teachers with effective characteristics and teaching styles indeed contribute to the success of educational reform in general and co student learning gains in particular (Stronge, Ward, Tueker, & Hindman, 2007). Thus, promoting effective teachers, or cultivating the characteristics of effective teachers in extant teachers, is a major responsibility of the government in the educational reform era.

Defining characteristics of effective teachers is not an easy task because several factors can be brought into consideration such as aim, focus, scope, policy, culture, and context. In the Thai literature, most of the teacher characteristic studies focused on the desirable characteristics of teachers in general rather than in specific area (i.e., school psychology, guidance) and circumstance (i.e., educational reform) (Boontapuan, 2005; Jogsatit, 2004; Kaneperm, 2002; Kompetpanee, 2005; Limprawat, 2002; Sawetnai, 1999; Suphatnanon, 2002; Watewong, 2002).

The present study aims to explore perspectives of teachers, and school administrators regarding the characteristics of guidance teachers for educational reform by using Kanlayanamitratham (7 qualities of a good friend) and 10 characteristics of undergraduate student of Faculty of Education, Rajabhat Rajanagarindra University. The combination of diverse perspectives taken from persons involved in educational reform may provide some useful and valid insights to potentially serve the government, policy makers, curriculum developers, and guidance teacher educators in improving guidance teaching and learning as well as guidance teacher education and professional development for educational reform.

## Research Question

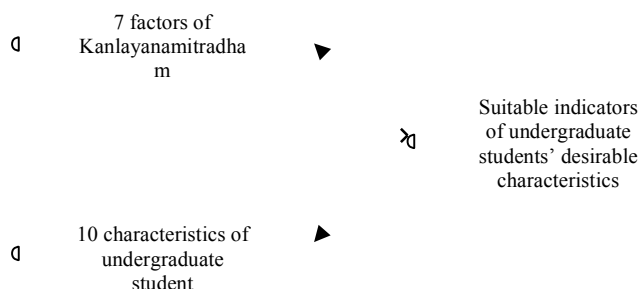

What are factors and indicators of guidance pre-service teacher's desirable characteristics?

## Objectives

Research objectives were 1) find out suitable factors for indicating desirable characteristics of guidance teachers and 2) propose indicators of undergraduate students' desirable characteristics of pre-service teacher student, department of Psychology and guidance, Rajabhat Rajanagarindra University by eastern cultural principle (7 factors of Kanlayanamitratham)

## Research Framework

□

## Methodology

### Research procedure

The documentary research was the first step for indicated good characteristics of guidance teacher. Researcher found 7 factors of Kanlayanamitradham (15 items) and 10 characteristics of undergraduate student, Faculty of Education, Rajabhat Rajanagarindra University were merged into good characteristics of guidance teacher (GCGT). Then, the researcher decided factor analysis criteria and determined by exploratory factor analysis (EFA) tested by performing a Principal Component Factor Analysis with orthogonal rotation, varimax technique. Finally, improved the desirable characteristics of guidance teachers indicators from expert's recommendations data for high efficiency items.

### Participants

Survey research was conducted with representativeness 194 Chachoengsoa's guidance teachers, spread all school levels (elementary, secondary, and high school) and office of Chachoengsoa educational service areas (primary service area 1, primary service area 2, and secondary service area 6). The participants were arranged to the study by purposive selected from all Chachoengsoa guidance teachers who attend in 2011 Thai Teacher Professional Development Program, the government project.

### Research Instrument

Research instrument was a desirable characteristics of guidance teachers questionnaire developed from 7 factors of Kanlayanamitradham (7 qualities of a good friend) compound with 10 desirable characteristics of undergraduate student of Faculty of Education, Rajabhat Rajanagarindra University. The questionnaire total consists of 29 items in the two parts of general data (4 items) and desirable characteristics of guidance teacher (25 items). The internal consistency reliability of questionnaire determined by Cronbach's alpha was 0.686. That's has been well above an acceptable alpha value of 0.60 in most studies (Hair et al., 1998). In administering the questionnaire, respondents are asked to answer their characteristics in five-point Likert-scale items from "(1) never or almost never true of me" to "(5) always or almost always true of me"

## Data collection and Analysis

The data were collected at the end of 2011 Thai Teacher Professional Development Program, the government project. When data collection was finished, a research assistant examined all the data, screened out missing data, and coded the data into the SPSS program for analysis. Then, researcher analyzed the general data by descriptive statistics, for instance, frequency, mean, standard deviation, and percentage. For the desirable characteristics of guidance teacher data correlations among the constructs were investigated by calculating Pearson product-moment correlations. Finally, the researcher determined exploratory factor analysis (EFA) tested by performing a Principal Component Factor Analysis with orthogonal rotation, varimax technique.

## Results

The results of general data analysis shown 90% of the participants were female. Range of age were over 50 years old mostly (about 60%), inferior to 40-49 years old (about 20%). All participants are from schools in Chachoengsoa Province that there were amount of students between 67 in minimum and 3915 maximum ( $\bar{x} = 761.17$ ,  $SD = 877.33$ ) and amount of teachers were 6 minimum to 170 maximum ( $\bar{x} = 37.61$ ,  $SD = 38.50$ ).

For the desirable characteristics of guidance teacher data correlations among the item were investigated by calculating Pearson product-moment correlations. As shown in table 1, the characteristics data correlations between .009 to .709

The results of exploratory factor analysis by determined KMO (Kaiser – Meyer-Olkin) was 0.882 higher than 0.5 and tend to 1.00 that mean the data are appropriate to analyze by factor analysis. Bartlett's of sphericity shown statistic significant that mean the data have high correlation enough to analyze by factor analysis either. The research results found 25 appropriate indicators and merged into new 6 factors by considered of the eigen value.

1. High academic achievement
2. High responsibility even on yourself and others

3. Be a good thinker and able to find new knowledge
4. Systematic working, planning, and managing
5. Able to motivate students and colleagues
6. Excellence in teaching and inspiring students
7. Able to impress the students in the school and community
8. Has a respected personality
9. Belief in potential of student and reduce inequality in society
10. Warmly and easy to communicate
11. Able to communicate with students, colleagues, and the general public
12. Be a good listener and adviser
13. Able to explain the difficult things easier
14. Was not induced in the unreasonable to student
15. Able to lead others
16. Faith in the teaching profession
17. Has ability to work in education field
18. Analysis, synthesis, critical thinking and creativity
19. Able to use of foreign languages, computers and technology in education as well
20. Exemplary moral values and to others
21. Assertive and reasonable solution
22. Able to adapt environment for benefit of the student learning
23. Balance of knowledge, mental, and health
24. Good personality
25. Behave as an effective democratic monarchy

The new 6 factors:

factor 1: Teaching competencies, with 8 indicators, factor loading between 0.71-0.77

factor 2: Good behave, with 9 indicators, factor loading between 0.61-0.68

factor 3: Teaching spiritual, with 5 indicators, factor loading between 0.50-0.59

factor 4: Democratism, with 1 indicator, factor loading was 0.60

factor 5: In-depth communication ability, with 1 indicator, factor loading was 0.72

factor 6: Knowledge acquisition ability, with 1 indicator, factor loading was 0.58.

The eigen value, % of variance, and Cumulative % of variance as shown in table 2

Table 2 Eigen value, % of variance, and Cumulative % of variance

Factor	Eigenvalue	% of variance	Cumulative % of variance
1	9.921	39.683	39.683
2	1.587	6.348	46.031
3	1.449	5.794	51.825
4	1.297	5.190	57.015
5	1.164	4.655	61.670
6	1.017	4.067	65.736

## Implications

The perspectives of stakeholders involved in pre-service teacher institute are indeed an important indicator that may drive the efficiency teacher. This study revealed indicators regarding desirable characteristics of guidance teacher. The perspectives emerged from this

study maybe beneficial for guidance teacher educators, curriculum developers, and policy maker in designing, planning, and implementing pre-service teacher education, professional development, and so on.

Abstracts

Research and theories in Second Language Acquisition and Applied Linguistics abound, but many language teachers find it difficult to apply research and theories to practice. To address this issue, the present paper proposes The Pedagogical Activity Design Model (PAD-Model) Prototype which is theoretically grounded and readily accessible to second language teachers. The model follows three steps: setting learning objective setting, choosing teaching materials, choosing a teaching framework. In the second part of the paper, the author proposes The Communication-Centered Pedagogical Activity Design Model (CC-Model), which is based on the PAD-model prototype. The CC-model sets communicative competence as its learning objective, uses conversation analysis as the resource of its teaching materials, and finally utilizes Task-Based Instruction as its teaching framework. The PAD-model aims to provide an easy plane on which second language teachers can design pedagogical activities based on their knowledge base and philosophy so that the disconnection from theory to practice can be bridged.

Keywords: Conversation Analysis, Task-Based Instruction, The Pedagogical Activity Design Model (PAD-Model) Prototype, The Communication-Centered Pedagogical Activity Design Model (CC-Model)

iafor

The International Academic Forum

[www.iafor.org](http://www.iafor.org)

## 1. Introduction

A great number of SLA theories have been proposed, attested, challenged, abandoned, revised, revived, and applied to practice, and therefore we are supposed to have a great synchronization and coordination of sound SLA theories and practice by now. However, the disconnection of theories from practice is still a serious issue.(Gloria Lo, 2005; Beaugrande,1997; Liu, 1999). Liu (1999) surveyed non-native English speakers with MA TESOL degrees from English speaking countries, and only one third of the surveyed participants considered the SLA theories they had learned in their MA TESOL programs to be useful.

The author of the present paper has experienced this disconnect from theory to practice prior to, during, and subsequent to her MA study in Applied Linguistics. Personal experience as an EFL teacher has alerted her to the fact that most EFL teachers in Taiwan lacking in SLA and Applied Linguistics knowledge tend to use teaching approaches and materials that are theoretically unsound. She was also well aware that even teachers familiar with Applied Linguistics and SLA theories find them very difficult to apply to practice.

Therefore, to address these issues, the present paper aims to propose a model of designing pedagogical activities that is not only theoretically grounded but also readily accessible to second language teachers. In the first part of the paper, the author will give an overview of the model prototype and a brief explanation of the model constructs. Since the model encompasses multiple theoretical arguments and pedagogical practice as its constructs, the second part of the paper will give a brief account of each theoretical argument and pedagogical practice. In the third part of the paper, the author will provide a detail account of how these elements are logically connected and bounded, and then suggest a sample activity whose design is based on this model.

## 2. The Communication-Centered Pedagogical Activity Design Model (CC-Model)

### 2.1 The model prototype and its constructs

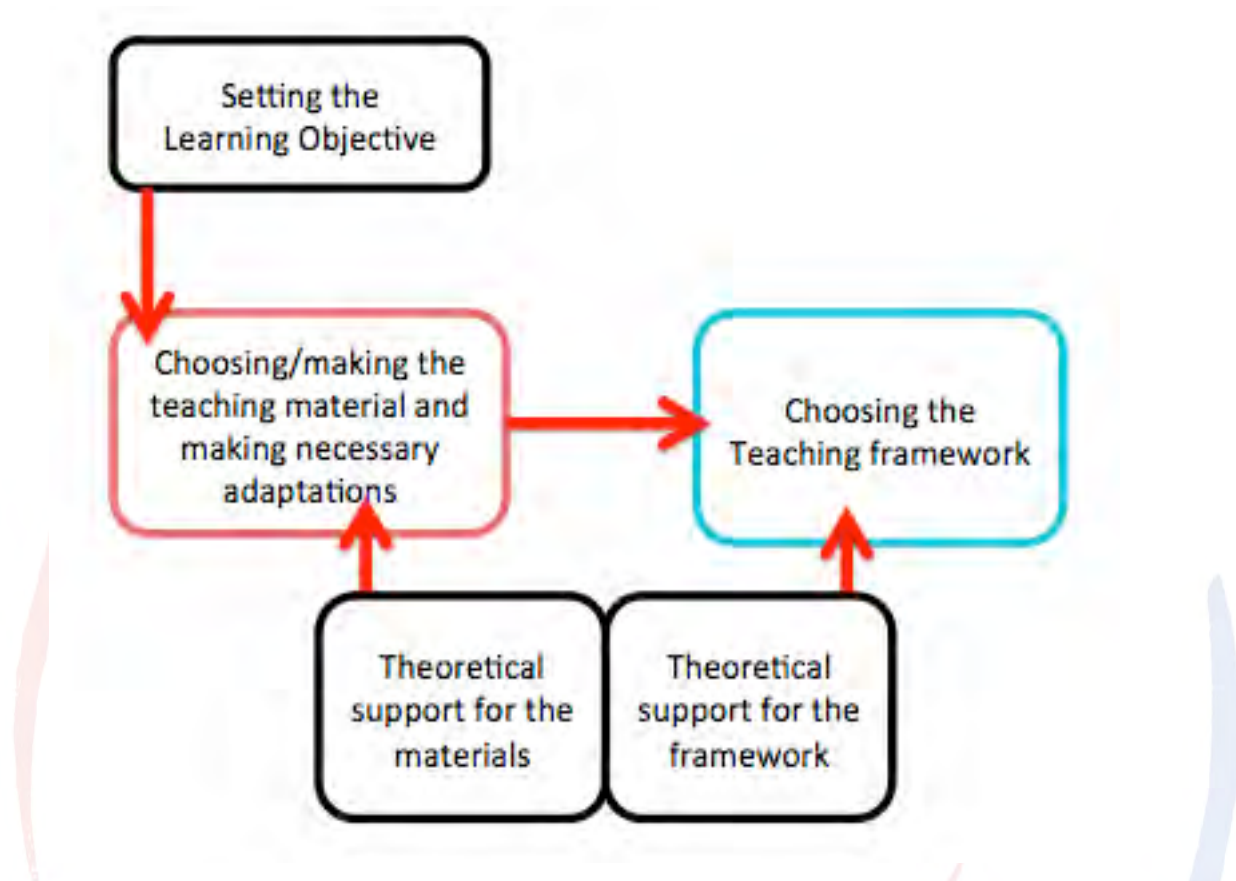

Figure 1. The Pedagogical Activity Design Model (PAD-Model) Prototype

First of all, setting the learning objective is the first step in every pedagogical activity design. Questions like, “What is the ultimate goal of this pedagogical activity?” and, “What do I want my students to learn?” are questions that teachers often ask when they plan their teaching, and this is the “objective setting”.

Secondly, teachers need to know what materials to use in the framework. Some questions asked are, “Where can I get the materials?”, “Do I buy or make the materials?”, “What format should the materials be?”, and “How can I tailor the materials to fit the learning objectives?”. Not only should teachers have access to materials, they also need to know how to tailor the materials to address the particular classes they are teaching.

Thirdly, teachers need to choose a teaching plan that can materialize the learning objectives, and also can accommodate the teaching materials we have chosen. Teachers need to be familiarized with different teaching frameworks/approaches in order to know which works with the learning objective that has been set.

At the bottom of the model are “theoretical supports”. It is very important to choose the framework and materials supported by theories and research that fit the teachers’ teaching philosophy and the local conditions (the set of conditions, concerns, and limits in the local, immediate environment). It is dangerous for teachers to design class activities (syllabus and courses alike) without theoretical support, since they may lag behind the current research and employ a teaching framework and materials that are unfit. Not keeping up with the research and theories may also cause the teachers to reinvent the wheels or repeat mistakes.

## 2.2 The Communication-Centered Pedagogical Activity Design Model (CC-Model)

The author of the present paper used the PAD-Model prototype to build a Communication-Centered Pedagogical Activity Design Model, which is developed with communication as its center. The following shows the plotting of the CC-model:

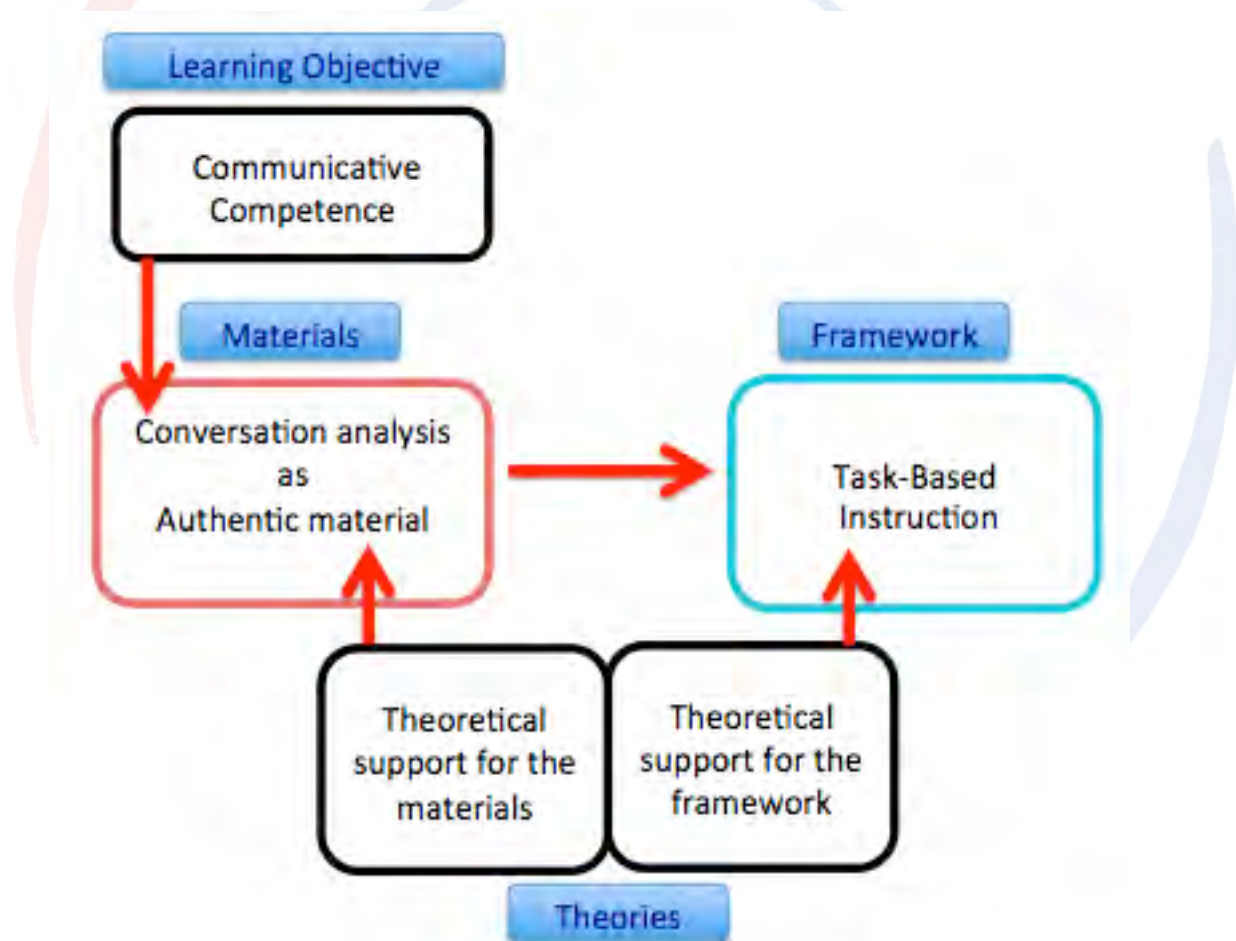

Figure 2. The Communication-Centered Pedagogical Activity Design Model (CC-Model)

First of all, we set the communicative competence as the learning objective. In the final section of the paper in which a sample activity is shown, the author will show how to evaluate and choose which competence to set as the learning objective.

In the second step, the CC-model uses the method of Conversation Analysis to produce authentic teaching materials. This choice is grounded in the desire to incorporate authentic materials focused on daily conversation, an aspect overlooked in the wide application of authentic materials. The author will again give a detail account of the conversation analysis and how to utilize it to create authentic materials, as well as its theoretical support in the next and the final section.

In the third step, the CC-model uses Task-Based Instruction (TBI) as its teaching framework. TBI has been widely used in second language teaching because of its capacity to stimulate genuine communication, believed to trigger acquisition and cognitive development. Details in regard to TBI and its theoretical support will be provided in the next section.

### 3. Conceptual framework and related literature in the CC-model

#### 3.1 Communicative competence

Setting objectives should be prioritized whether designing an entity as large as a language school or program, or as small as a single syllabus or pedagogical activity. Objectives (or learning outcomes, or learning goals) set the directions and in turn set the steps. In many syllabus or course design research, the first step is setting the objective and goals. Likewise, checking the goals/objective has also been considered the first step in language program evaluation (Griffie & Gevara, 2011). Even though the present paper focuses on pedagogical activity design (as opposed to entire program or course syllabus), setting learning objectives has to be the first step.

What to set as the learning objective, however, is another issue. Munby (1978) points out that validly specifying the target communicative competence is the most crucial problem facing a foreign language syllabus designer, and ultimately the one producing materials (Munby 1978, page vi). It has been widely agreed upon that learning a language does not only involve learning vocabulary and syntax (as previously believed), and in order to successfully communicate in the target language, one needs to possess communicative competence. Scholars in many fields have recognized the importance of communicative competence, and thus much research has been done to investigate communicative competence (e.g. Canale & Swain, 1980; Gumperz, 2000; Saville-Troike, 1989, 1996). Though communicative competence is mainly employed in language testing and assessment, it also works as a learning objective since tests and course contents should inform each other to form a positive “washback” effect (the teach-to-the-test effect). (J. Lee & VanPatten, 2003)

Many different categorizations and rationales of communicative competence have been proposed and adopted, but they are essentially similar, with slightly different naming and categorization systems.<sup>1</sup> In short, communicative competence encompasses all

---

<sup>1</sup> Note that this is the case if we only look at the field of language teaching and learning, not other fields that also investigate communicative competence such as communication studies, which takes a very difference approach to probing communicative competence (e.g. Knapp & Antes, 2008).

competences one needs in order to be engaged in meaningful and successful communication in different social settings.

The following account of communicative competence is adopted and adapted from Bachman and Palmer (1996) and Wong and Waring (2005) for their easy accessibility for general language teachers.

- a. Organization competence: knowledge of linguistic elements in communication
  - (A) Grammatical competence concerns the organization of individual utterances or sentences and includes knowledge of vocabulary, syntax, morphology, graphology, and phonology.
  - (B) Textual competence concerns the organization of utterances or sentences to form texts and includes the cohesion and rhetoric of conversational organization.
- b. Interactional competence: the ability to use the various interactional resources to interact and communicate
  - (A) Socio-cultural competence enables interlocutors to create or interpret language that is appropriate to a particular language use setting. It includes knowledge of dialects and varieties, registers, natural or idiomatic expressions, cultural references, etc.
  - (B) Functional competence concerns how utterances and texts are related to the communicative goals of language users.
  - (C) Strategic competence refers to the metacognitive ability to use verbal and non-verbal communication strategies to compensate for breakdowns in communication or to improve the effectiveness of communication. It is thought of as a higher order executive process that provides a cognitive management function in language use.

It is crucial to know what types of communicative competence to set as the learning objective of each pedagogical activity, since only then can we integrate the instruction and the materials to serve one unified purpose.

### 3.2 Task-Based Instruction

#### 3.2.1 Brief introduction of Task-Based Instruction (TBI)

The CC-Model is built on TBI as its pedagogical framework. TBI outweighs other teaching approaches and methodologies because it fortifies important principles and practices in language teaching. These principles and practices include (but are not limited to): interaction-driven learning of communication in the target language, the use of authentic texts in the classroom situation, how well L2ers' learn the learning process itself (besides the learning of the language), a wider application of the learners' own experiences as an important contributing element to classroom learning, linking classroom language learning to the language used in real-life situations (Nunan, 2004, p.1), and the learner-centered classroom design (Willis, 2003).

Definitions of tasks abound, and most of them emphasize the exchange of information, the real purpose of communication, and the necessity of cooperation and interaction (e.g. Richards, Platt, & Weber, 1985; Long, 1985.) In Lee (1999), he reviews many definitions of tasks and provides a well-rounded definition of a task as "a classroom activity or

exercise that has (a) an objective attainable only by the interaction among participants, (b) a mechanism for structuring and sequencing interaction, and (c) a focus on meaning exchange; (2) a language learning endeavor that requires learners to comprehend, manipulate, and/or produce the target language as they perform some set of workplans” (Lee, 1999, p.32).

It is easy to see from the definition of task and the five criteria that a TBI aims for real-time, genuine communication, which promotes learner’s communicative competence beyond the lower level competence (i.e. grammatical and textual competence).

In the CC-model, we will adopt Lee’s (1999) criteria of structuring activities: (1) identify a desired informational outcome, (2) breakdown the topic into subtopics, (3) create and sequence concrete tasks for learners to do, and (4) build in linguistics support, either lexical or grammatical or both.

The first step is to set a learning outcome, and an informational outcome here refers to the end product of the learners’ discussion and collaboration, (e.g. a list, a chart, a spoken summary). In the second step, we need to divide the activities into smaller sub-tasks that are easier for learners to perform and will eventually add up to the completion of the target informational outcome. Third, we need to order the sub-tasks in a reasonable sequence. Finally, we need to provide the learners with linguistics support, which works as a plane on which the learners can collaborate and interact.

### 3.2.2. Theoretical support for the TBI- Socio-cultural Theory and the Zone of Proximal Development

As the PAD-Model suggests, all pedagogical decisions should be backed up by theories, and the author will introduce the theoretical support for the choice of TBI, which is Vygotsky’s Socio-cultural Theory (SCT).

Vygotsky’s (SCT), which originated as a psychological theory of learning and mental development, has been borrowed in the second language acquisition (SLA) research, and has created a broad line of research in SLA. Vygotsky maintains that humans use physical and psychological tools (or *cultural artifacts*) to mediate their interactions with the world. Language is considered the “most pervasive and powerful cultural artifact that humans possess to mediate their connection to the world, to each other, and to themselves”(Lantolf & Thorne, 2007). Through TBI, learners use language to connect to the world, to each other and to themselves, since TBI is a social setting in which the learners need to actively participate in the production of language for a social purpose. Moreover, Vygotsky maintains that human beings do not react automatically and mindlessly to stimuli, but rather are able to “consider possible actions (plan) on an ideal plane before realizing them on the objective plane.” The process of completing a task in TBI necessitates learners to engage themselves in the “planning” that Vygotsky describes; they cannot respond mindlessly to the stimuli because then they cannot complete the task. TBI provides a context for the learners to be involved in planning, which entails “memories of previous actions, attention to relevant aspects of the situation, rational thinking, and projected outcome” (Lantolf, 2008, p.205).

What has been mostly applied to SLA is the notion of the Zone of Proximal Development (ZPD) in the SCT. ZPD has been defined as “the distance between the actual development level as determined by independent problem solving and the level of potential development as determined through problem solving under adult guidance or in collaboration with more capable peers” (Vygotsky, 1978, p. 86). ZPD has provided justification for TBI because TBI creates a context in which the learners can explore that difference and gain assistance from “more capable peers” or the instructor to reach their upper limit in the ZPD. van Lier (1996, p. 193) expanded the resource for development from only the “more capable peers” to also “interaction with equal peers”, “interaction with less capable peers (e.g. peer teaching)”, and “the inner resources (e.g. knowledge, experience, memory, strength)” which can all be realized in a well-designed TBI.

### 3.3 Authentic materials-Ties the framework and the materials into the CC-Model.

In TBI, the second crucial element besides interaction is authenticity. TBI not only promotes authentic communication but also supports using authentic materials.

The use of authentic materials (also called realia) has been applauded in the field of second language teaching because authentic materials are believed to abound with precious cultural, linguistic, and pragmatic knowledge that cannot be easily duplicated in pedagogically made materials; they are also believed to disabuse learners of stereotypes of the target cultures (Berwald, 1987). Research has not only favored the use of authentic materials in all level of L2 classrooms (e.g., Bacon & Finnemann, 1990; Tomlinson, Bao, Masuhara, & Rubdy, 2001) but has also attested to the positive effects of authentic materials. For example, Peacock (1997) reported the learners' increased motivation. Purcell-Gates, Degener, Jacobson, and Soler (2002) reported that participants engaged in more reading and writing outside classes, and they were reading and writing more complex texts as a result of using real-life materials and authentic activities in class.

However, there are some issues with authentic materials. First of all, when we talk about authentic materials, most of us think of printed, written texts: news article, novels, stories, magazine article, flyers, maps, menus, etc. Actually, even the definition of authentic materials mostly includes examples of written and printed texts. For example, Berwald (1987, p3) defines realia as “real objects, specimens or artifacts-not copies, models, or representations- from a particular culture. Indeed, authentic materials, such as newspaper, magazines, catalogs, timetables, files, etc., are designed for use in real-life situation, not for use as instructional used...Other examples include telephone book, menus, tickets and radio and television broadcast.” Moreover, Vaiciuniene and Uzpaliene's (2010) categorization of authentic materials has also manifested the inclination to printed and written materials. The categorizations are as follows: “daily objects such as business cards, bank leaflets, photographs, receipts, catalogues, currency, reports, financial statements, instructions, bank accounts, application forms, pictures, registration forms, letters/emails, diagrams, agreements, etc; broadcast texts such as newspapers, journals, TV and radio programmes, films, documentaries, general or special literature, etc.; and websites” (Vaiciuniene and Uzpaliene, 2010, p.95). Since written and printed texts are the most common authentic materials, pedagogical activities designed with these authentic materials are, unsurprisingly, mostly reading and writing activities.

The gap that we have observed here is the lack of using genuine daily conversations as authentic materials. Even though audio and video files have already been adopted (such as movies, ESL podcast, songs, YouTube videos), these audio/visual materials are usually made with pre-written scripts which eliminate much precious knowledge in genuine daily conversation.

Despite the need to use genuine daily conversation as authentic material, genuine daily conversation is not easy to adopt. The first problem is scarce resources. Unlike written texts, which can be easily stored and accessed in many formats, audio files are harder to store or access. Another potential issue is the difficulty of adapting daily conversations due to the seeming messiness of such conversations.

To address the two issues of authentic materials (lack of daily conversation as authentic materials and the difficulties of implementing daily conversation in the classroom), the author proposes using Conversation Analysis (CA) as a solution. The author will discuss CA briefly and justify the use of CA to address these issues in the next section.

### 3.4 Conversation Analysis

Conversation Analysis originated as a sociological research methodology and was later borrowed by the field of Applied Linguistics since the core of CA is the study of language. CA, in the most basic definition, is the “study of *recorded*,<sup>2</sup> *naturally occurring talk-in-action*,” and the aim of CA is the to provide “the systematic analysis of the talk produced in everyday situations of human interaction: *talk-in-interaction*” in order to “discover how participants understand and respond to one another in their turns of talk, with a central focus on how sequence of actions are generated” (Hutchby & Wooffitt, 1988, p.14). Markee (2000) deems CA to be a great methodology that complements the SLA research because CA helps us see how learners can gain understanding of the use of new language through the on-line, socially constructed conversation. Furthermore, CA analysis needs to be built upon contexts, including the relationship or the interlocutors, the local and immediate environment, the nature of the topic, etc.

The importance of CA can be revealed through the clarification of some misconceptions about *conversation*. First of all, despite what general people (language teachers and learners alike) believe, conversation is not easy or simple, and it does resemble textbook dialogue. Wong and Waring (2010) argue that engaging in simple daily conversation can be a very daunting task for second language learners. Many language teachers think that once learners acquire enough syntax and vocabulary, they can synthesize their knowledge and they can just go around talking to people. Such ignorance leads to insufficient instruction and practice for learners.

---

<sup>2</sup> In Conversation Analysis, naturally occurring conversation needs to be recorded and then transcribed for further analysis. Recorded data can preserve all the important and minute details, as well as subconscious interlocutory choices that the interlocutors made that cannot otherwise be attained or preserved (Wong & Waring, 2010).

The complex sociolinguistic knowledge embedded in the conversation is almost inaccessible to second language learners without proper guidance. If we language teachers do not know how conversation in the target language works, there is no way for us to prepare our learners for daily conversation, which can be a key step in their acculturation.

Second of all, most people think that conversation is messy and does not follow any rules, and this fallacy has contributed to the marginalization of conversation in the field of materials design. CA analyses have contributed to our knowledge that conversation follows order at all points, and people in a certain cultural engage in conversations following a set of rules that differ from culture to culture. (Hutchby & Wooffitt, 1988)

Wong and Waring (2010) summarized the steps to follow in CA data analysis as follows: (1) collecting (recording) data; (2) transcribing data; and (3) analyzing data. Here the author would like to add a fourth step, which is (4) transforming data and findings to pedagogical activities, since the purpose of the PAD-model and the CC-model is to create pedagogical activities.

In the CC-Model, we adopt CA to make the authentic materials because this allows learners to be exposed to genuine daily conversation. Also, the systematic analysis can provide ample data for teachers to draw from to form unified pedagogical activities, such as “topic management strategies”, “repair strategies”, “how the invitations are given, taken, and decline”, etc.

In a word, CA can address the aforementioned two problems because CA requires naturally occurring conversation, and it also provides detailed and systematic analysis of the authentic materials. From this detailed analysis, the teacher can choose the topics that are adaptable and suit the needs of the class.

#### 4. A sample activity from the CC- Model

In the final section of the paper, the author provides a sample pedagogical activity made from the CC-Model.

##### 4.1 Step one: Setting the target communicative competence

Following the CC-model, we first set our learning objectives from the communicative competence. We will assume this is an intermediate Chinese class, and the teacher hopes to promote her students’ strategic competence in carrying out a conversation in the target language.

##### 4.2 Step two: Choosing/making and adapting the materials

Here we use a recorded and transcribed talk between two native Mandarin Chinese speakers. They are both female graduate students in their mid twenties, and they have been friends for more than two years. The recording was done in T’s house, and they

were chatting about their schoolwork, weather, mutual friends, and some other common daily topics.<sup>3</sup>

Since the learning objective is “strategic competence”, the teacher decides to focus on how native Chinese speaker deal with pauses and gaps<sup>4</sup> in their conversation. When dealing with gaps and pauses, interlocutors need to employ their strategic competence to continue the talk.

Before we move onto the next step to design a TBI activity, we will first look at sample excerpts from the transcript to get a better understanding of how Chinese speaker deals with gaps and pauses. We will focus on what triggers gaps and pauses during the talk, how interlocutors buffer the gaps and silence, and most importantly, how they remedy the gaps and silence.

1. What triggers gaps and pauses.

(T and S are talking about T’s PhD minor and her comprehension examinations)

- 7) T: (1.3) then can’t you finish that test and then come take this later? Can’t you?  
8) S : It must be simultaneous  
9) T : (1) oh  
10) (1.3)  
11) S : yeah:::: I thought about it (...) forget it, doesn’t matter  
12) (5)  
13) T : ridiculous:::::  
14) S : ((pouring water)) (3) nah:: depends on what minor you take hhhhhh  
15) T: hhhhhh<sup>5</sup>

We can observe in line 9, 10, and 12 that the lack of “termination practice” (Wong & Waring, 2010) from T has triggered the long series of pauses. Termination practice is a response to recognize receiving the message and signal the desire to terminate the topic. There are several similar excerpts in the original transcript that we can use as our teaching materials.

2. How interlocutors buffer the gaps and pauses

We have found the following buffering devices that the native Chinese speakers use when they are faced with gaps and pauses.

- a. Laughter (hhhhhhh)
- b. Sound prolonging (:::):
- c. Response tokens (that does not add to real meaning)
  - i. Yea, umm, anyways, really? Sure?
  - ii. Oh, that’s right, good, for real?

<sup>3</sup> The recording and transcription were done in 2011 by the author of the present paper, and the language was Chinese. We translated the excerpts into English in the present paper for the sake of serving language teachers in general, regardless of the language. The complete transcript is not provided here.

<sup>4</sup> A gap is defined as a between-turn silence, and a pause as a within-turn silence (Sacks, 2004).

<sup>5</sup> For a complete and detail explanation of the transcription symbols, please see Schegloff (2007).

- iii. Phatic function terms (e.g. Yea, yes, but, don't know)
- d. On-topic comments that add minimum meaningful value. e.g. so funny, ridiculous

### 3. How interlocutors remedy of pauses and gaps:

- a. Staying on the previous topic

133) T: I though he got into another school and then (...) why is he going to another school at this time of the year?

134) S : yea it doesn't make sense

135) T : (0.5) yea

136) S: umm

137) (3)

138) S : so:::

139) (3)

140) T: yea

141) S: anyways

142) T : that's right

143) S : yea, I think

144) T : and also they left so suddenly

- b. Change to a new topic

158) S : (1) some require more than just tests

159) T: oh I don't know but I think he, don't know::: yea:::

160) S: (2)umm::: (2) really::

161) T: (1) don't know::

162) (3)

163) S : huh then you now you now you now go to school must be convenient isn't it:::.<sup>6</sup>

### 4.3 Step three: Plotting the materials onto the TBI framework.

In the third step, we will apply the CA transcript and analysis to the TBI framework following Lee's (1999) criteria of structuring activities:

(1) Identify a desired informational outcome: The learners need to come up with a list of buffer devices that they use in their first language, and they need to make a list to compare the buffer devices of their target language and first language.

(2) Break down the topic into subtopics: We will break down the topic into 3 subtopics: pre-task, during-task, and post-task.

(3) Create and sequence concrete tasks for learners to do

(4) Build in linguistics support, either lexical, grammatical or both: We will list the "buffers" that we identified in the transcript analysis in the previous section, and ask learners to study them and guess their meaning. We will also provide the learners the transcripts to read.

---

<sup>6</sup> The repetition of "you now" is original in the transcript.

### **Sample Task: Rescue the awkward moments!**

Pre-task: Awareness raising and world knowledge

#### **Brainstorming:**

Have you been caught in an awkward moment where no one can continue on the topic? What has triggered the silence, and how did you to hang on to the conversation?

#### **Step 1)**

Work in groups of 2, make a list of things you said or would say to help the conversation go on before you can come up with new topics or add meaningful comments to the topic.

**Step 2) Work in a group of 2. Look at the list of words or phrases, and guess what they mean and when Chinese speaker use them.**

- iv. Yea, umm, anyways, really? Sure?
- v. Oh, that's right, good, for real?
- vi. Yea, yes, but, don't know (at the beginning of a new turn)
- vii. So funny, ridiculous

#### **Step 3)**

Read the following conversation excerpts and identify the strategies that native Chinese speakers use to rescue the silent moment. Compare the techniques used in your L1 and those in Chinese; list similar and different techniques (each group will get one different excerpt).

- 158) S : (1) some require more than just tests  
159) T: oh I don't know but I think he, don't know::: yea:::  
160) S: (2)umm::: (2) really:::  
161) T: (1) don't know:::  
162) (3)  
163) S : huh then you now you now you now go to school must be convenient isn't it::::::

During task: Collaboration & communication

**Step 4)** Share what you found in step 3)

**Step 5)** Each group reads one excerpt and identifies the starting point of the silence, the ending point of the silence, and what happened in between.

**Step 6)** Act out excerpts with your group mates. Pay attention to the gaps and pauses.

**Step 7)** Take notes of other groups' acting and report what technique in saving conversations you have identified from them.

Post-task: Reflection & Application

#### **Homework:**

Please record your conversation with your native speaker friend and report your analysis to the class: Did the communication breakdown? Where? What did you or your native speaker friends do to keep the conversation going?

#### **4.4. Discussion:**

The sample activity uses transcript and data in Chinese, and if a teacher wants to adopt the CC-Model, it's important to record conversation in their target language and analyze

the recorded data to get the conversation features that are distinct to the target language and culture. There is some data done in English, but not in many other languages. It is suggested that language teachers initiate this work in the language that they teach. It is important to know that every culture follows a different set of rules in communication, and even though there are indeed similar practices employed in many different languages, it is usually the very subtle features that make or break a conversation. It takes systematic CA analysis to discern these subtle rules and apply them to teaching.

#### 5. Conclusion:

The PAD-model that the present paper proposed is a model that can be easily adopted by language teachers. Based on the teachers' knowledge base and their philosophy, they can set the learning objective and choose a framework and materials that can be woven into a soundly designed pedagogical activity. On the other hand, the CC-Model, which is built upon the PAD-model, reflects the importance of communication in SLA. The CC-model incorporates communicative competence as its learning objective, and then employs TBI as its framework, which emphasizes the communication, interaction, negotiation, and collaboration among learners. Finally, the CC-Model utilizes CA to create authentic materials because, on top of the conversation and interaction that TBI will make the learner produce, they are explicitly studying the features of native talk that may be otherwise overlooked by the learners. The author's purpose is to offer language teachers an easily understood and readily accessible model, and to demonstrate how to apply the PAD-Model to create a pedagogical activity.

Abstracts

The purposes of this research were to study and compare participation levels of the general public in the Pharmaceutical Development Project in Community. The samples were 152 students studied in the Diploma of the Public Health Program (Technical Pharmacy). Data was collected in April to May 2012 by using a questionnaire with 5 rating scales and open-ended questionnaires. The reliability of this study was 0.79 (cronbach's alpha). The statistics employed to analyze the data were percentage, standard deviation, t-test and F-test.

The research findings revealed that:

1. Overall, public participation in the Pharmaceutical Development Community Project in Community was at a high level and the participation levels consisted of five components: participation in problem finding, project planning, project conduction, also project evaluation and project receiving benefits. Each component showed a high participation level.
2. By comparison with the participation levels via several kinds of personal factors such as gender, age, education level, administrative position in the community, the periods of living time in the community, and the project information obtaining. It can be seen that the samples' participation was not significantly different with those factors.

The suggestions from this students' project were that people required an increase of a health promotion project by cooperation with local organizations. Some people suggested that students' project should be more promoted widely to people in community and be set an appropriate time with local people's life style.

Key words: *Participation, Pharmaceutical Development in Community*

## 1. Introduction

Sirindhorn College of Public Health, Yala is one of the public higher education institutions in Thailand. The main missions of the college are five areas as the following; 1) producing community health care workers for Thai health care system 2) developing health care worker's competencies 3) Researching and developing in health knowledge 4) Serving knowledge and several equipments to social responsibility and 5) caring and conserving Thai art and culture. The college aims to engross in quality learning system and improve straight forward to be a learning organization to produce high quality products.

The Diploma of Public Health Program (Technical Pharmacy) is one of the study programs in Sirindhorn College of Public health, Yala. This program aims to educate a pharmacy technician to be an assistant of a pharmacist and a health care team for promoting rational drug use in health care system, especially primary health care in community area. The teaching approaches in this program emphasize the students' experiences of working in a real situation and realize how to participate community. Pharmaceutical Development Project in Community is one subject in such program, which emphasizes to provide education for students by experiences and training to work in the sense of a community management in terms of health problem as pharmacy side. The study procedure is beneath participating of a community and a health team by using the principle of research methodology, data collection, problem specification, problem arrangement, project writing and conduction follow the project framework and systematically project evaluation.

Comments from this subject between 2010 and 2011 found that there were few people interested in the health care promotion approaches and also a low response for being participated with students provided the knowledge activities of chronic diseases for them in community. This study was investigated that people's participation and what factors has influenced this decision on this community pharmaceutical development project, a subject in Technical Pharmacy Study Program, Yala.

## 2. Research Methodology

This research was a survey study. The data from 152 samples was collected in April to May 2012 by using simple random sampling method from the label address of people lived in Ban-Nam-Yen, the community in Mueng, Yala, southern of Thailand. The research tool was a questionnaire consisting 3 parts as follows; 1) Independent variables 2) Dependents variables, and 3) Opened-end questions.

The independent variables were personal factors such as gender, age, education level, occupation, income, administrative position in community, a period of living time at the community and the information acknowledgement about the students' project.

The dependent variable was the people's participation in students' project. The questionnaire was 5 rating scales to collect data of the participation consisted of 5 components according to the problem finding, the project planning, the project conduction also project evaluation and project receiving benefits. The opened-end questionnaires were to explore any problem and suggest for the students' project.

The research tool was established by three experts for checking the validity of the questionnaires and analyzing the accuracy of the accordance by using the value of IOC (Index of item-objective concurrence). The questionnaires were used in accordance with at least 0.5 on average

accordance index from the three experts, then were led to change and check in order to try out with some people were not involving in a purposive sample of 30 people of this study. The results of reliability checking by accordance within the internal consistency method used Crinbach's alpha was 0.79.

Quantitative data was analysed by using a program. The statistics to describe personal factors were frequency and percentage. The participation levels in student's project were described by mean ( $\bar{X}$ ) and standard deviation (S.D.). The mean value was separated in 5 levels followed Best method (Best, 1977), presented in Table 1.

**Table1:** The translation of people participation level in student's project

<b>The mean value</b>	<b>The participation level</b>
4.50 – 5.00	Very high
3.50 – 4.49	High
2.50 – 3.49	Moderate
1.50 – 2.49	Low
1.00 – 1.49	Very low

The inferential statistic was used by t-test to compare the average of participation levels between the groups with two difference variables and was used by F-test to compare the average of participating levels between the groups with more than two variables.

The opinions and suggestions from open-end questionnaires were determined by using content analysis for finding the important project conduction of student project in community.

### 3. Result

The research results were summarized as follows:

1. Personal factors, the several variables of 152 samples were determined by frequency and percentage. The results were presented in Table 2.

**Table 2:** The personal factors of samples

N = 152

Personal factors	Frequency	Percent
<b>1. Gender</b>		
1.1 Male	71	46.7
1.2 Female	81	53.3
<b>2. Age</b>		
2.1 Less than 30 years	40	26.3
2.2 30-39 years	34	22.4
2.3 40-49 years	40	26.3
2.4 50-59 years	23	15.1
2.5 More than 60 years	15	9.9
<b>3. Education level</b>		
3.1 Lower the bachelor's degree	132	86.8
3.2 Bachelor's degree	20	13.2
3.3 Higher the bachelor's degree	-	-
<b>4. Occupation</b>		
4.1 General laborer	65	42.8
4.2 Farmer	55	36.2
4.3 Government servant	11	7.2
4.4 Private employee	4	2.6
4.5 Businessman	7	4.6
4.6 Others	10	6.6
<b>5. Average income</b>		
5.1 Less than 5,001 baht	56	36.8
5.2 5,001 – 10,000 baht	88	57.9
5.3 10,001 – 15,000 baht	6	3.9
5.4 15,001 – 20,000 baht	2	1.3
5.5 20,001 – 25,000 baht	-	-
5.6 More than 25,000 baht	-	-

**Table 2:** The personal factor of samples (Continuous)

Personal factors	Frequency	Percent
<b>6. Position in community</b>		
6.1 Community leader	6	3.9
6.2 Community committee	4	2.6
6.3 General people	137	90.1
6.4 Others	5	3.3
<b>7. Period of living time at community</b>		
7.1 Less than 1 year	1	0.7
7.2 1-3 years	-	-
7.3 3-5 years	-	-
7.4 More than 5 years	151	99.3
<b>8. Information receiving in the student project</b>		
<b>8.1 Source of information</b>		
8.1.1 Printing medias such as local newspaper, journal	4	2.6
8.1.2 Electronic medias such as E-mail	-	-
8.1.3 Audiovisual medias such as community radio	12	7.9
8.1.4 Project medias such as information board, exhibition	-	-
8.1.5 Personal medias such as community health volunteer	136	89.5
<b>8.2 Frequency of information receiving</b>		
8.2.1 Less than 2 times / week	17	11.2
8.2.2 2-3 times / week	117	77.0
8.2.3 More than 3 times / week	18	11.8

According Table 2, the majority samples were female, age was between 40-49 years old, education level of the samples was lower the bachelor's degree, occupation was general laborer, average income was 5,001 – 10,000 baht per month, administrative position in community was general people, a period of living time at the community was more than 5 years, information source providing a students projects was personal medias, and the frequency of information obtaining was were 2-3 times per week.

2. Overall of the results, the level of public participation in Pharmaceutical Development Project in Community was a high level, averaging on  $3.63 \pm 0.71$  (mean  $\pm$  S.D.). The participation was separated into five components presented in Table 3.

**Table 3:** The participation levels in Pharmaceutical Development of a Community Project

The participation components	mean	S.D.	Participation level
1. Participation in community problem finding	3.67	.85	High
2. Participation in project planning	3.51	.86	High
3. Participation in project conduction	3.61	.79	High
4. Participation in project evaluation	3.50	.90	High
5. Participation in project receiving benefits	3.78	.75	High
<b>Overall</b>	<b>3.63</b>	<b>.71</b>	High

Data from Table 3 was determined that the people's participation among 5 components was at high level ( $3.63 \pm 0.71$ ). The highest score of all components of participation level was "participation in project receiving benefits", this score was  $3.78 \pm 0.75$ . In addition, the lowest component was "participation in project evaluation", averaging on  $3.50 \pm 0.90$ .

3. The comparisons of the levels of sample's participation as Table 4 and 5, It indicated that the participation of the informants with difference personal factors were not significantly different.

**Table 4:** The comparisons of participation level for the groups with two difference variables

Test variables	mean	S.D.	t	Sig.
<b>Gender</b>				
Male	3.19	.78	.620	.536
Female	3.27	.63		
<b>Education level</b>				
Lower the bachelor's degree	3.23	.72	.022	.983
Bachelor's degree	3.23	.62		

**Table 5:** The comparisons of participation levels for the groups with more than two variables

1.3 Personal medias such as community health volunteer	3.21	.72		
<b>2. Frequency of information receiving</b>				
2.1 Less than 2 times / week	2.79	.54	3.969	.052
2.2 2-3 times / week	3.30	.74		
2.3 More than 3 times / week	3.21	.47		

#### 4. Conclusion

The following research results were summarized the objectives of study.

1. The overall public participation in the pharmaceutical Development Project in Community was at a high level and for each participation level among 5 different components were also high levels.
2. By comparison with the participation levels via several kinds of personal factors such as gender, age, education level, administrative position in the community, the periods of living time in the community, and the project information obtaining. It can be seen that the samples' participation was not significantly different with those factors.
3. The suggestions from this students' project were that people required an increase of a health promotion project by cooperation with local organizations. Some people suggested that students' project should be more promoted widely to people in community and be set an appropriate time with local people's life style.

*The Internal Quality Assurance System and Formative Evaluation of Thai Teacher TV Project*

Pongthep Jiraro

0135

Burapha University, Thailand

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

The objectives of these studies were to describe the internal quality assurance system and synthesize for self assessment report (SAR) of Thai teacher TV project and to analyze the satisfaction of the project audiences in past two years . The subject from 5 documents (SAR) and 1,370 samples from the project target groups, the collecting data from questionnaire . The research found that the satisfaction in general were at good levels. The most satisfaction is a worthiness of watching , but the lowest satisfaction is channel to approach. Age of target groups has a negative relation with satisfaction in channel to approach. Age of the target group has a positive relation with satisfaction in the content of presentation. The strength of this project was an effective website. The product of this project was an important source for teacher and other educational staff, many channels to approach, and the project has a good internal quality assurance system for quality control. Finally, the main suggestion for proceeding project were emphasis in website approach . Free TV should be fine suitable time for target groups and activity of this project increate an encourage for more satisfaction .

**Keywords:** internal quality assurance, self assessment reports , Thai teacher TV project

## **Introduction**

Thai teacher TV project is the important project of Thai education. The aim for teacher training and developing, to encourage a development vocation teacher continuously. There are teacher vocation improving high class vocation actively by high technology in high quality television programs. The production concern with the instruction includes teaching technique of teacher by the best practice and to improve or change teacher by high quality program television. This project can spread variously to target group and throughout teachers.

Thai Teacher TV project has managed for over 2 years. We used an internal quality assurance to guarantee the quality. We did project assessments continuously and self assessment reports are 5 reports for more information. Next, we synthesized a self assessment report to the overall image to show the development of the project from tangible and continuous assessment. This research is important steps to get information for project development. The result of this project had many advantages for project executive and project inventor for the next steps.

## **Materials and Methods**

This research used self assessment report (SAR) of project 1-5 (April 2010 to September 2011) and the audiences of teacher TV project in the Education International Conference EDUCA 2011, the amount was 30,329 audience members. Data was collected by implementing a questionnaire, the amount was 1,370 samples. The data was analyzed by frequency distribution, percentage, mean( $M$ ) and standard deviation (SD). Then, we compared the mean of teachers' satisfaction by independent t-test, analysis of variance (One-way ANOVA), Pearson's product moment correlation and content analysis.

## **Results of the studies**

### **1. Internal Quality Assurance System (IQA)**

#### **1.1. system and mechanical internal quality assurance of teacher TV project**

The system and mechanical internal quality assurance of teacher TV project composed with quality control, quality audit, quality assessment such as:

#### **system of internal quality assurance**

**Quality control** Consist of master plan, operating plan in project level, and the action plan in function level.

**Quality audit** Consist of actively checking by subcommittee to checks each of the activities appointed by project director.

**Quality assessment** Are the assesses procedure follows by IQA plan by assesses subcommittee , continuously 4 times per year.

### **mechanical of internal quality assurance**

The process of internal quality assurance mechanical composted of the following :

IQA assessor subcommittee appointed 4 assessor per time by project director for internal assessment , this procedure 4 time per year, each of group assessors consist of 1 representative from the faction of IQA project , and 3 experts from outside.

IQA auditor subcommittee appointed 1 auditor by project director for auditing , this procedure occurred 4 times per year and to coordinate quality assessment within of the project.

#### **1.2. An evaluation of internal quality assurance of teacher TV project**

An evaluation of internal quality assurance of teacher TV project was processed by IQA assessor subcommittee appointed 4 assessors per time by project director for internal assessment . This procedure occurred 4 times per year their role is as follows :

- 1) set a policy of internal quality assurance
- 2) teacher TV projects fix the trend of internal quality assurance process
- 3) teacher TV projects fix the system to audit and assess the IQA sub organizing.
- 4) to develop internal quality assurance for teacher TV projects.
- 5) to continue assessing internal quality assurance for teacher TV projects.

The IQA project committee processing an internal quality assurance for teacher TV projects coverage correctness , and lead the assessment to improve the system for modernization , the effectiveness , long lasting continuity by trends to assessed as follows:

- 1) standard of production
- 2) standard of expanding
- 3) standard of promoting
- 4) standard of public activity relations and participate
- 5) standard of IQA
- 6) standard of risk management system
- 7) standard of project impact

### **1.3 The internal quality assurance for teacher TV projects(IQA)**

The auditor and assessor committee of project was an important mechanism for internal quality assurance (IQA) for teacher TV projects system, that was appointed by director. Roles of the project auditor and assessor were internal quality assessment checked each part of the project by themselves.

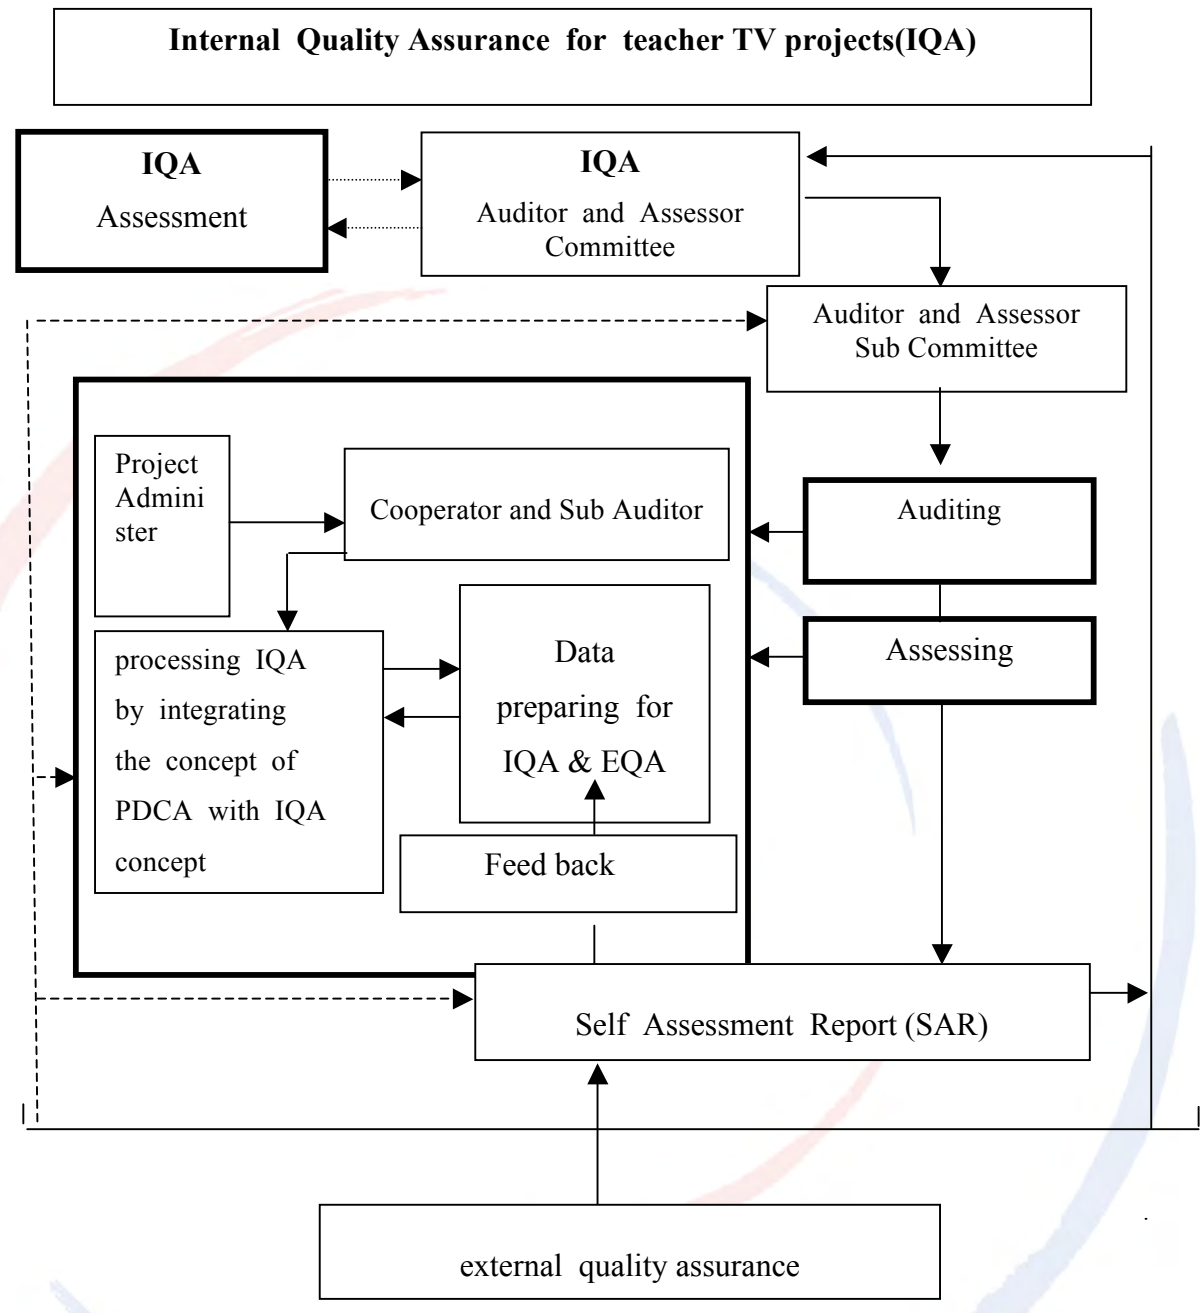

### **1.4 The internal quality assurance for teacher TV projects auditing**

The auditor and assessor committee of project was the IQA auditing. The objective of these were:

- 1) for listen to operating of IQA
- 2) for suggestion and advise, follow operating progress of IQA
- 3) for prepare the readiness of the project for external quality assurance (EQA).

### **1.5 The internal quality assurance for the part of teacher TV projects**

The internal quality assurance for the part of teacher TV projects was processed 4 times per year. So, part of the project on processing IQA by integrating the concept of PDCA with IQA concept has consisted of quality control, quality audit, quality assessment and quality improvement.

Internal Quality Assurance for Thai Teacher TV Projects(IQA)

## 2. Results of formative evaluation

**Table 1** A comparison of teachers' satisfaction for teacher TV project for two years in different teachers' education background by one-way ANOVA

variable name	source of variance	SS	df	MS	F	Sig
Satisfaction of approach channel	Between Groups	3.160	3	1.053	1.879	.131
	Within Groups	765.093	1365	.561		
	Total	768.252	1368			
List of the presentations	Between Groups	6.246	3	2.082	6.396***	.000
	Within Groups	444.650	1366	.326		
	Total	450.896	1369

	Total	379.705	1369			

\*  $P < .05$  , \*\*  $P < .01$  , \*\*\*  $P < .001$

**Table 2** Mean (*M*) and standard deviation(*SD*) of Satisfaction of approach channel follow with part of satisfaction and total

part of satisfaction	Statement	<i>M</i>	<i>SD</i>	Satisfaction
1	Satisfaction of approach channel	3.6177	.74939	Good
2	List of the presentations	4.0055	.57390	Good
3	Worthiness of watching	4.0975	.61036	Good
4	Activity of Teacher TV Network	4.0774	.68601	Good
5	Impact by this project	4.0368	.75426	Good
total satisfaction		3.9518	.52665	Good

The satisfaction for the content of presentations from Teacher TV Project totally is good levels ( $M = 3.95$ ,  $S.D. = 0.53$ ), by the worthiness of watching was the highest satisfaction, ( $M = 4.10$ ,  $S.D. = 0.61$ ), but by approach channel is the lowest ( $M = 3.62$ ,  $S.D. = 0.75$ ).

A comparison of presentation content of the audience differently by education in totally finding that, the satisfaction of master's degree higher than bachelor's degree and lower the bachelor's degree (.05 significance level). The list of the presentations finding that, person have the qualification lowers the bachelor's degree, there is the a little satisfaction more than bachelor's degree, master's degree, doctorate, and master's degree were higher than the bachelor's degree(.05 significance level). The activity of Teacher TV Network lowers the bachelor's degree, there is a lower satisfaction. The bachelor's degree, master's degree was higher than the bachelor's degree (.05 significance level). The worthiness of watching, the satisfaction of the lowers bachelor's degree is the a little satisfaction more, bachelor's degree, master's degree, and master's degree more satisfaction than bachelor's degree(.05 significance level) .05. The impact by this project, the satisfaction of lowers bachelor's degree, and the bachelor's degree are the little satisfaction more than master's degree(.05 significance level) .05. The status differently for impact by this project, the satisfaction of the executive higher than undergraduate, teacher, and a parent(.05 significance level).

The coefficient is related of the satisfaction with, age finding that, age of the target group has the relation in approach channel in the minus (.05 significance level), and finding that, age of the target group has the positive relation with satisfaction on the presentation list (.05 significance level).

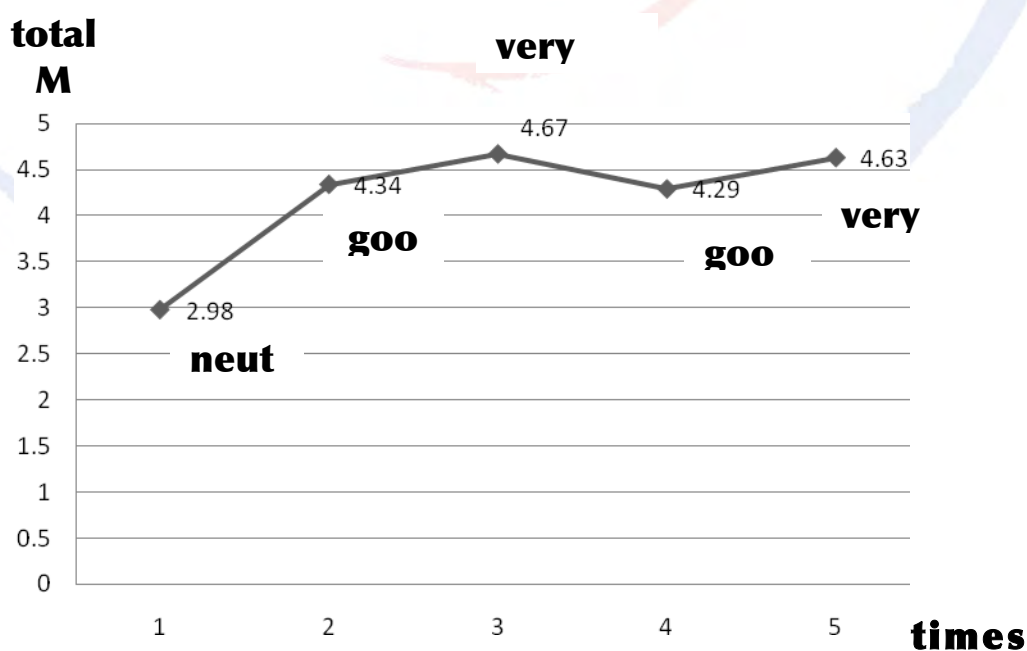

The concluding of internal quality assessment of Teacher TV project the past 2 year by Self Assessment Report(SAR) finding that , the proceeding of Teacher TV project , it has continue developed , in the only first time was so fair level , after that the result be between good to excellent in finally of past two years.

The strength of the project is the effective website , the product of the project is an important knowledge source for a teacher and education staffs , there is the various presents content , the project systematically of internal quality assurance was continual, the project has many of readiness by input of project , there is administrative project development is in high-level.

The weakness of this project in Self Assessment Report , the summarize the weakness of the project in the following , the satisfaction of the project that still doesn't arrive at excellent level , administration risk system of the project lacks the continuity in the activity develops , the lower training to the staff in the project , and the satisfaction of a member in attending activity of the Teacher TV project still not high satisfaction as expected , the data feed back a few development and still don't become visible , and still not continual as expected.

Diagram 1

A development of self assessment result  
of teacher TV project for two years

## Discussion

The total satisfaction was good. The worthiness of watching was the highest satisfaction, but the approach channel is the lowest because the presentation in project was worthwhile to cause the idea or trend in the routine work for them, but however still get into trouble the lead presents by free TV which majority likes and can appreciate easy but the presents while inappropriate suit is the cause of the lowest approach channel.

Every total satisfaction cause who have higher educate qualification will more satisfaction than other, particularly the master's degree in education has higher satisfaction than other because more Thai teachers get master's degree because of level master's degree education has higher possibility master's degree can synthetic and analysis well. Teacher TV project effect was good for audience should must have advanced stage skill in synthetic and analysis about something for integrating or applying. Then, the project made many advantages for teacher and teachers' satisfaction.

In different status of audiences, the impact of this project found that the satisfaction of the executive higher than undergraduate teacher and parents because the executive is an advantage from the project most because of the list of Teacher TV project emphasizes to develops a teacher throughout both of substance that covers every substance group and limitation development teacher reduction and they can do all of provincial time throughout no limited by local. This project can develop teachers. The executive can go to one level. Moreover, the executive has still the trend or the substance or the way from the list in the project can develop teachers. The results show that master's degree qualification has more satisfaction teacher TV project than other because of the executive has important property assembles a position must master's degree everybody qualification before reaches a position that the official has noted for the confidence system to administrates the education and a parents who use education of the school service that who come to the executive of master's degree at least.

The coefficient is related of the satisfaction with age finding that age of target group has relation in approach channel. In the minus show that old age are lower satisfied in approach channel than the young age and the young age more satisfied than older because of old people will more like from free the TV. They do not like high technology such as, a television changes the artificial satellite or from the Internet but free TV cannot finding because of don't wish the profit. Then the time for the presentation inappropriate to suit as expected, such as late at night or present time everybody can not open can

watch it so satisfaction is low but the lower old age higher easiness and convenient in using technology assemble with the project has the completeness network , Internet ,and so convenient in reaching or download can keep to study when they needs. So, the younger get higher satisfaction than the another.

The result show that age of the target group positive relation with satisfaction on the presentation list show than the old age higher satisfied the present than other and in younger will lower satisfied because a younger audience tends that the qualification is uneducated more and lack analysis or synthetic skill and without expertise applicability hoping will apply immediately the substance that correspond the younger requirement make to have the lower satisfaction for the older are higher correspond education and advanced stage level ,so they high satisfied because of this project has already can induce applied or analysis and synthetic more than other so it higher satisfaction than other , correspond with the result of the research above.

### **Suggestion**

1. The revelation spreads the project should encourage appreciate with internet or website too much because this way can accept everywhere and all time.
2. The public television should fine the time that the suitability to should for a teacher that they can reach to see at a house or their residence .
3. The project should develop an administration risk system of the project about passing on knowledge understanding and builds good attitude of the project continuity in the activity develops the officer by the training. The seminar to gives the knowledge to the staff within the project.
4. The project should to encourage the audience who attend Teacher TV network for the higher satisfaction more and more .

### **Policy Suggestion**

1. After , there is completed innovation by first already, an institute should manage the next by where is responsible affiliated with education foundation organization.
2. Teacher education foundation developments should fix to the policy , there is the official letter from education foundation or local education to go to still , secondary education , and due to the school .

3. The public information should show in two ways. One is follow by government service system. Another one is the privacy advertising.
4. The project should join with the institute produces an undergraduate , Science of Education student , education science , and government officer institute emphasizes undergraduate development , teacher student , have applying has from the project.
5. The project should supposed affecting with the human developing in primary education, by might apply it to claim as same as the part of staff training and can apply to the property of a teacher who has training.
6. The project should bring to the part of school quality assurance for the development of teacher .

## Introduction

Expanding and the development of the English language has been increased dramatically while number of those who speak English as their mother tongue is far below who use it as a foreign or second language. Experts like Crystal (2004) believe that the English language is not belonged to English speaking countries anymore. As Kachru (1997) suggests, the educational programmes must enjoy Inner Circles as well as Outer and Expanding Circles. For the same reason, according to Alptekin (1984), teaching culture must initiate from familiar to unfamiliar and not the other way around. Moreover, in teaching English as an international language, it is very important to teach international culture or the world culture instead of teaching culture of some particular countries. Latest experiments have shown that increasing the intercultural competence is one of the main skills in learning a language.

This article is a report on a research that critically analysed one of the best sellers of English Language Teaching books in Iran called Top Notch series which is being employed by a good many institutes in Iran, according to cultural perspective based on latest research. It has to be stated that the study was carried out by investigating from two angles: Behavioural Aspect (which divides target culture into positive, neutral and negative) and Frequency (which divides target culture into high, middle and less). It is recommended then that the cultural matters which are within the negative aspect and less frequent should not be included within textbooks or they should be taught cautiously or figuratively.

## Culture

To date culture has been viewed from different vantage points, but the enigmatic nature of culture has remained obscure. There is virtually no general consensus over the definition of culture. According to some references, there are over 164 definitions of culture. Moreover, there is a host of studies on culture, but these potpourris of studies the nature of culture is disappearing. Since there is no consensus over it, its characteristics and impacts have remained vague too.

To date, it might be argued that no one can define culture in a way that some criticisms are not levelled at. To Chastain (1988) culture means different things to different walks of people. She differentiates small c culture from big C culture. The former refers to the culture the students of language are dealing with and try to grasp while; the latter refers to major effect of it.

In what follows, a few definitions of culture are listed.

Culture can be used to refer to the literature, arts, history and similar concepts of a certain people (Hinkle, 2001).

Rivers (1981) in his book preferred to consider culture an umbrella concept which covers all aspects of life in a society or community.

Culture is a distinctly human means of adapting to circumstances and transmitting this coping skill and knowledge to subsequent generations. Culture gives people a sense of who they are, of belonging, of how they should behave, and of what they should be doing. Culture impacts

behaviour, morale, and productivity at work, and includes values and patterns that influence company attitudes and actions. (Harris, Moran and Moran 2004, p. 4)

Allmeh Jafari who was one of the greatest Islamic scholars presented one of the most comprehensive definitions of culture. According to him (2000),

Culture consists of a necessary and suitable quality or style for those kinds of mundane and spiritual human activities based on right thinking and feeling in a logical evolving life. (p. 10)

He (2000) further argues culture can be classified into four major groups:

The first one, *remaining culture*, refers to justification and manipulation of life behaviour and manner with a number of fixed racial and psychological rules and customs. This kind of culture tries to benefit from all changes or to remove them. It also tries to make stable its own ideas and activities through the environmental forces and or through the psychological inability of the society members.

The second one, *liquid and colourless culture*, refers to justifications and colouring of ideas without basing on any well-established grounds. Of course, in those societies with long history such a culture seldom happens.

The third one, *pursuant culture*, refers to activities and ideas which describe the real nature of culture are in themselves important, and this kind of culture was prominent during 18<sup>th</sup> and 19<sup>th</sup> centuries.

The last one, *pioneer culture*, refers to those activities and ideas which are resistant to transient social and environmental conditions. The reason lies in the fact that the ideas of this culture stem from the frequent realities of nature and dimensions of noble humans. Its aim consists of relative goals which motivate humans to go through the ultimate purpose of life.

It goes without saying that culture has an important role on thought and language. Fotos (2001) suggests that there are four major views concerning the relation between thought and language and thought. The first one is that of Sapir-Whorf suggesting that “both thought and language are determined by culture (p. 269)”. This view is known as linguistic determinism. Although the strong version of this view is not popular, the weak version, language relativity, has an important role in intercultural communication. The second one, Piaget’s view, sheds light on the fact that cognitive development in a child occurs in a predetermined way. Moreover, it states that cognitive development precedes language. The third one, Chomsky’s view, states that language and cognition are separate. The last one, Vygotsky’s view, states that from scratch, thought and language are separate but become interdependent as people go through communication and interaction.

The above classifications show the importance of culture. As it was mentioned in the first view, culture determines thought and language.

### **Role of Culture in ESL/EFL**

Culture has a significant role in language learning from three perspectives: *sociolinguistic theory*, *schema learning theory* and *cultivation theory*. According to Swain and Canale (1980), communicative competence comprises grammatical competence, discourse competence, strategic competence and sociolinguistic competence. Sociolinguistic competence stresses the appropriate use of language in specific cultural contexts. Likewise,

schema learning theory highlights the appropriate culture schema as an essential factor in language learning without which learning will be incomplete (Tseng 2002). Cultivation theory focuses on the effect of culture on changes in individual perception which is of utmost importance in expanding an individual's perspective of the world, and according to this theory, culture is crucial in language learning for at least two reasons: First, achieving perspective consciousness and Second, cross-cultural awareness (Tseng 2002).

As Piller (2011) puts:

Culture is not something that exists outside of and precedes intercultural communication. Instead, intercultural communication is one domain where 'culture' as concerned with the specific – and different – ways of life of different national and ethnic group is constructed.

Culture is an ideological construct called into play by social actors to produce and reproduce social categories and boundaries, and it must be the central research aim of a critical approach to intercultural communication to understand the reasons, forms and consequences of calling cultural difference into play. (p. 16)

Guest (2002) argues that culture should be taught indirectly while emphasising pragmatic and linguistic universals. Alptekin & Alptekin (1984) claim that there should be a balance between the target culture and students' native culture. According to Alptekin (1993), teaching culture in EFL books should move from familiar to unfamiliar and in this case unfamiliar could even be the international culture and not necessarily American or British culture.

### **Caveats**

As already mentioned, culture is a generic concept but Atkinson (1999) believes that this overarching concept has been reduced to terms such as *difference*, *identity*, or some other notions of that ilk. In a similar vein, Tseng (2002) states that culture is consigned to oblivion while deserving to be one the highlighted elements in language.

### **Statement of the Problem**

Nowadays, culture can be considered as the fifth skill in teaching a language. Many of students from different country try to swallow it. They are not aware that this food can be poisonous. They think it is tantamount to other skill and has to be committed to memory by a hook or a crook. In this humdrum of learning, books play an important role.

### **Significance of the Project**

Investigating the fifth skill in second language learning, the researchers try to examine Top Notch series from a cultural perspective. That is to say this project is meant to uncover the covering of the culture introduced in English as a Foreign Language (EFL) / English as a Second Language (ESL) books. Furthermore, it is an attempt to introduce a new paradigm based on which culture and its ethical effect could be measured.

## Research Design & Methodology

This is a qualitative based project which is complemented by quantitative data analyses. Put another way, to strengthen the findings and to mitigate the subjectivity of the study, quantitative data analyses have been employed.

The textbooks that were considered for the purpose of this study is called Top Notch and have been developed by Pearson Longman in 6 levels mostly for EFL learners, composed of Top Notch Fundamentals, Top Notch 1, Top Notch 2 and Top Notch 3. There are other books for the advanced learners called Summit 1 and 2. Like any other EFL books, each level includes a student book, a workbook, an audio CD and a Video DVD. So, the whole series of Top Notch have been employed in this project. Moreover, this series has been investigated from two angles, one ethical and the other cultural, in one new perspective.

The ethical view of the series is a qualitative, whereas the cultural view of the series is both qualitative and quantitative.

## Data Analysis and Discussion

The researchers employed an inductive, bottom up, approach for data collection and analysis. Thus, the entire series of Top Notch, including the videos, course books, and workbooks, were examined. Then all the topics and ideas which were particularly pertinent whether directly or indirectly to culture and ethics were pinpointed and consequently six pronounced themes were abstracted. Finally, the frequency of the six pronounced themes were obtained and qualitatively studied. These six themes seem to threaten Asian ethics and deviate from both geocultural approach to ethics and four basic principles of biomedical ethics.

**Violence** is a trend in these series which obviously promotes violence in societies. Violence and superstition could be considered somehow relative from among these six themes in relation to Asian ethics. Some countries may not consider violence as a threat since martial arts were born in these countries and what is regarded in Iran as violence may be practised in those countries as well.

As with violence, **superstition** is somewhat relative from among different countries in Asia. It goes without saying that many cultures are abundant with legends and superstitions; whereas in Islamic countries superstitions are regarded with circumspection. Strictly speaking, Muslims try to differentiate between superstitions and real premises of religions and thoughts. This differentiation reaches its zenith when it comes to religion. As far as there is a clear-cut borderline between religion and superstition, nothing goes wrong, but once superstition tries to masquerade itself as part of religion it becomes Muslims' anathema, a sinister threat, and has to be uprooted.

The next theme, **modesty**, is a highly respectable value in oriental cultures which does not devalue over time. This definition runs contrary to the alleged negative concept of modesty, portrayed in Top Notch series, which is viewed as an old-fashioned notion and thus needing to be changed by immodesty. This theme has a strong tie with modernity in this study.

**Modernity** is depicted as a strong willingness towards the blind obedience of new-fangled events and thoughts which are mundane and valueless, if not anti-ethical, by nature. Apparently, modesty could be considered under the wide concept of modernity, but what differentiates modesty from modernity lies in its root in religion.

**Religion**, here, does not lend itself to any specific religion; rather it is generic and seeks to commonalities between religions. Thus, any notions or ideas trying to either capture religion or stand against it or even give rise to anti-religion are included in this theme. Broadly speaking, modesty could be part of religion, but the point is the latter refers to some general and holistic concepts, whereas the former seems to be rather a peripheral concept, yet widespread and frequent.

The last theme which is **individualised ethics**, unlike the others, does not nominally stand against the divine concept of ethics rather it tries to devalue that under the guise of ethics by making some ungrounded new-fangled notions. Strictly speaking, this very last theme views ethics from alleged modern vantage points, psychological or psychoanalytical, for example.

The table below shows the frequency of six pronounced themes of ethics existing in the series.

Ethical trends

Themes	Violence	Superstition	Modesty	Individualised Ethics	Religion	Modernity
Frequency	3	3	4	5	4	6

In the sitcoms of Top notch, at pre-intermediate and intermediate levels, violence has been introduced as a controversial issue. The interviewer asked the interviewees about their ideas regarding censorship of the movies, books and of that type. Since the interviewees had different opinions towards the issue of censorship it seems to be something quite debatable. The same goes with Top notch book, 2A, which reiterates the same idea that violent movies are debatable “one popular filmmaker asks why violent images on the screen are a problem since we live in such a violent world (p. 22)”. Of course in the Workbook at level 2A, some statistics about violence are given which alleviates the aforementioned points to a small extent.

# Can Violent Movies Be Dangerous?

**B**efore the 1960s, most movies did not show much graphic violence. When fighting or shooting occurred on the screen, it was clean: Bang! You're dead! The victim fell to the ground and died, perhaps after speaking a few final words. The viewer never saw blood or suffering. But in the late '60s, filmmakers Arthur Penn and Sam Peckinpah began making movies with more graphic violence, such as *Bonnie and Clyde* and *The Wild Bunch*. They believed that if audiences could see how truly horrible real violence

was, people would be less violent in their own lives.

Today, special effects technology has made it possible to create very realistic images of bloodshed and violence. Steven Prince, author of *Savage Cinema: Sam Peckinpah and the Rise of Ultraviolent Movies*, describes the difference between early movies and the movies of today "...filmmakers can create any image that they can dream up." So, Prince believes, because of the technology, movies today have become more and more violent and bloody.

Some people are worried that viewing a lot of violence in movies and video games can be dangerous. They feel that it can make violence seem normal and can cause people to imitate the violent behavior, to do the same thing themselves. Other people disagree. They believe that showing violence is honest and can even be helpful.

One popular filmmaker asks why violent images on the screen

are a problem since we live in such a violent world. "Just open any newspaper," he says. "Any newspaper is much more violent. And those are true stories about what happens in real life. Or open any history book and read about what happens when a people are conquered."

"There's so much violence right now," says a well-known European actress. "And maybe this is the way that filmmakers speak against violence: by making violent movies."

The Wild Bunch

Bonnie & Clyde

Regarding superstition, three major pronounced examples can be found in the series. First, astrology has been introduced controversial, at level 2B in the Workbook. Birth order relationships predicting different characters is another point that can be mentioned here, which stresses the role of superstition in one way or another. The Chinese zodiac has been introduced, on page 62 Summit1, and students are asked to find their animal signs of their birthdays according to the Chinese zodiac.

## UNIT 6

# Animals

**A Topic Preview.** Find your birth year on the Chinese Zodiac. What's your animal sign?

### UNIT GOALS

- 1 Exchange opinions about the treatment of animals
- 2 Discuss the benefits of certain pets
- 3 Compare animal characters
- 4 Debate the value of animal conservation

**RABBIT**

1939 1951 1963  
1975 1987 1999

Intelligent, kind, and helpful. You are also traditional and somewhat conservative. You tend to tell people what's on your mind.

**TIGER**

1938 1950 1962  
1974 1986 1998

Self-confident, independent, and emotional. Sometimes you tend to be inconsiderate and selfish.

**OX**

1937 1949 1961  
1973 1985 1997

Hardworking, serious, and responsible. You can sometimes be a workaholic. It's difficult to get you to change your opinions and beliefs, and you get angry easily.

**DRAGON**

1940 1952 1964  
1976 1988 2000

Fun loving, artistic, and truthful. You don't always feel confident in yourself or your abilities. You are also a little eccentric at times.

**RAT**

1932 1944 1956  
1972 1984 1996

Generous, honest, and imaginative. You are usually careful, and sometimes you are a perfectionist.

**BOAR**

1947 1959 1971  
1983 1995 2007

Generally quiet and honest. You work hard toward your goals. You don't have many friends, but you are very considerate to the friends you have.

**SNAKE**

1941 1953 1965  
1977 1989 2001

Attractive and very calm. You are able to make good decisions and give good advice. Sometimes you can be self-centered.

**DOG**

1946 1958 1970  
1982 1994 2006

Honest, caring, and modest. You are always there for your friends. You may at times seem cold and unfriendly to people who don't know you.

**HORSE**

1942 1954 1966  
1978 1990 2002

Popular, outgoing, and cheerful. You are a real people person. Sometimes you are too talkative.

**GOAT**

1943 1955 1967  
1979 1991 2003

Passionate, very artistic, and a bit shy. You are good at understanding other people's problems. Sometimes you are too willing to believe what other people say.

**MONKEY**

1944 1956 1968  
1980 1992 2004

Clever and likable. You have new and interesting ideas, and you learn very quickly. Sometimes you can also be a little egotistical.

**ROOSTER**

1945 1957 1969  
1981 1993 2005

Attractive and self-confident. You want to be very successful. Sometimes you say things just to make people look up to you.

Source: [silverdragonstudio.com](http://silverdragonstudio.com)

**B Discussion.**

1. How well do the adjectives for your sign describe your personality? How are you different from the description?
2. Do you think the descriptions match the animals in any way? Why or why not?

Not only has Modesty been introduced controversially in this series but also old-fashioned and to some extent backward. At level 2B, a father who thinks modesty is necessary for women, has been labelled as old-fashioned. In a similar vein, at the same level on page 116 there is a radical viewpoint labelling the following commonsensical belief as sexist: “a lot of people think it’s ok for men to wear shorts, but not for women”. Oddly enough, the word *sexist* is tantamount to a person who thinks men and women are not the same in terms of

wearing clothes. For instance, a man believing shorts are appropriate for men and not for women in public is labelled as a sexist.

LESSON

3

## Express Personal Values

**A LISTENING COMPREHENSION.** Listen to the conversations. Check true (T) or false (F).

	T	F	
1.	<input type="checkbox"/>	<input type="checkbox"/>	a. Beth thinks it's OK for Luke to wear an earring to the office. b. Luke agrees with Beth.
2.	<input type="checkbox"/>	<input type="checkbox"/>	a. Celia's husband has a tattoo. b. Celia's husband likes Celia's tattoo.
3.	<input type="checkbox"/>	<input type="checkbox"/>	a. His daughter married a lawyer. b. He wants his daughter to stay home and have children.
4.	<input type="checkbox"/>	<input type="checkbox"/>	a. Kate's dad likes the way Kate is dressed. b. Kate's dad thinks girls don't have to be modest.

**B** Read the following quotations from the conversations. Then choose the correct definition for the underlined word or phrase. Listen again if necessary.

- "But lots of people are old-fashioned, and they don't think men should wear earrings."  
a. have ideas from the past  
b. don't like traditions
- "What a double standard!"  
a. the same rules for all people  
b. different rules for different people
- "That's a little sexist, if you ask me!"  
a. the idea that men and women are not equal  
b. the idea that men and women are equal
- "But modesty is very important for girls."  
a. wearing clothes that cover their bodies  
b. wearing clothes that show their bodies

**C PAIR WORK.** Think of an example for each word or phrase. Write your ideas in the chart. Share your ideas with a partner.

old-fashioned	
a double standard	
sexist	
modesty	

☞ A lot of people think it's OK for men to wear shorts, but not for women. ☞

Finally, at the same level, on page 117, there is a statement based on which there are two standpoints on modernity, namely being modern and old-fashioned. In fact, the word *modest* has been accompanied by old-fashioned, double standard, and sexist.

**TOP NOTCH INTERACTION • What do YOU think?**

**STEP 1. Fill out the Values Self-Test. Then discuss with your partner.**

## VALUES SELF-TEST

**Check the boxes that best describe your values. Include a specific example.**

☐ I'm modern in my attitudes about modesty.  
☐ I'm old-fashioned in my attitudes about modesty.

**Explain** \_\_\_\_\_

☐ I think tattoos and body piercing are OK for men.  
☐ I think tattoos and body piercing are OK for women.

**Explain** \_\_\_\_\_

☐ I think it's OK to have a double standard for different people.  
☐ I think the rules should be the same for everyone.

**Explain** \_\_\_\_\_

☐ Some people might say I'm sexist.  
☐ Nobody would say I'm sexist.

**Explain** \_\_\_\_\_

**STEP 2. DISCUSSION. Discuss one or more of the following questions. Give reasons and examples.**

1. Is it sometimes OK to have a double standard for men and women?
2. Can people be sexist when they talk about men, or only about women?
3. Are old-fashioned ideas usually better or worse than modern ideas?

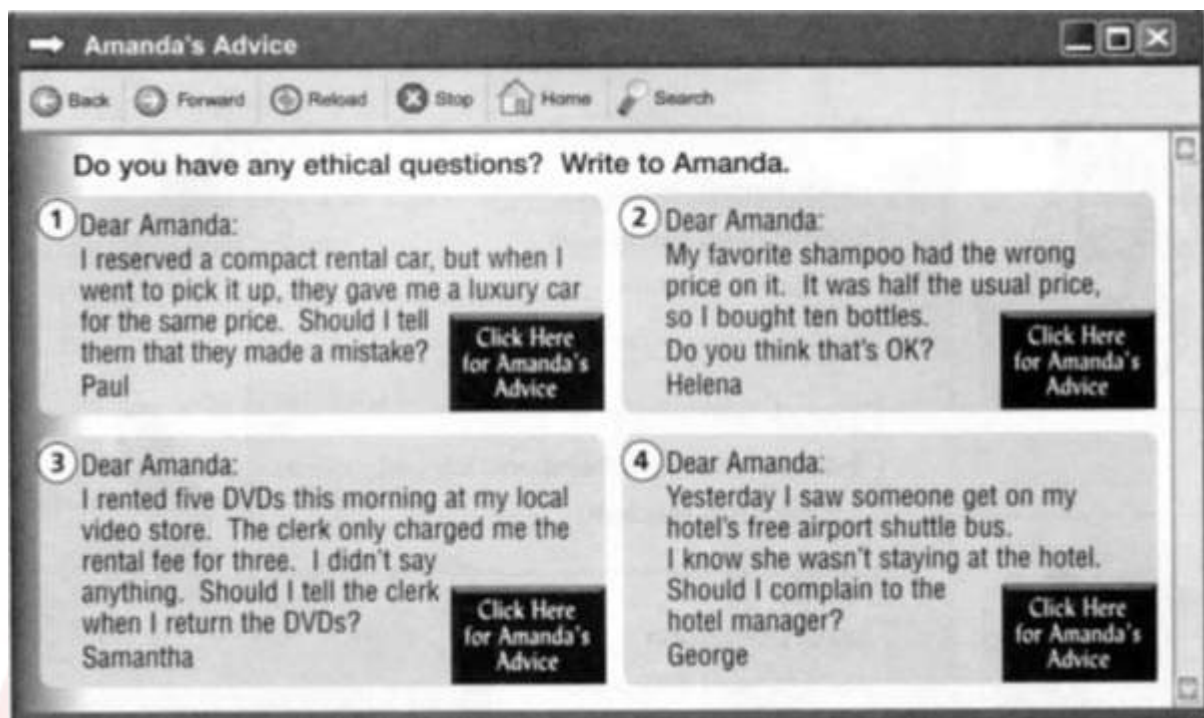

**STEP 3. WRITING. On a separate sheet of paper, write your ideas about modesty and personal appearance. How should men dress? How should women dress?**

117

Man measuring the length of woman's swimsuit in the 1920s (U.S.)

Individualised ethics is the other theme which can be the crux of ethics in the series. Telling lies and stealing are the examples introduced in Top Notch videos at Pre-intermediate level. At level 2B, in the workbook, page 85, there is a passage entitled *Ethics and Values* and there is a question which reads: “do you have any ethical questions? Write to Amanda...” which in fact regards ethics as something like psychology which can be quite different among people. Then, it is followed by five questions resting on the fact that it is plausible to steal in one way or another. For instance, a person who reserved five DVDs but was being charged only for three asks for a solution. It goes without saying that the topic tries to make ethics relative by hook or by crook.

Likewise, there is another topic, at 3A on page 11, which says whether dating customs have changed a lot or a little, and whether the change is for the better. There is little doubt that the western notion of dating has been taken for granted and accepted as the world-wide norm. Moreover, it suggests that it has considerably been changed since now almost there is no traditional marriage and the like.

**STEP 1. Have cultural features changed a little or a lot in the last fifty years?**  
Complete the survey.

<b>Culture Survey</b>	have changed a little	have changed a lot	Is the change for the better? (YES or NO)	
1. Table manners	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Musical tastes	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Dating customs	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Clothing customs	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Rules about formal behavior	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Rules about punctuality	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. Forms of address	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8. Male / female roles in the workplace	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
9. Male / female roles in the home	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
		Total YES answers: _____		

**Are you a dinosaur or a chameleon?**

How many times did you check YES in the third column?

**0-3 = Definitely a dinosaur.**  
You prefer to stick with tradition. Your motto: "If it isn't broken, don't fix it!"

**4-6 = A little of both.** You're willing to adapt to change, but not too fast. Your motto: "Easy does it!"

**7-9 = Definitely a chameleon.**  
You adapt to change easily. Your motto: "Out with the old, in with the new!"

At the same level on page 80, there is a piece of writing about comics based on which comics may be rather immoral but the conclusion, to a large extent, eerily inculcates morality to be subdued by popularity. That is to say, although some are immoral, they are good because of their popularity. Again at the same level on page 104, there is a discussion on four major problems of the current world in a global survey but once more there is no name of ethics and spirituality. Of course, the validity of the survey and the generalisability can be called into question as there is no piece of evidence regarding the validity of the survey. Fortunately, unlike the statement above, these days, lots of people are hungry for ethics.

Religion is the next theme which has a lot in common with ethics and of course has an important role in it. In the movies of Summit 2, unit seven, there is a part about Simpson animation series, in response to the critics based on the fact that in this animation, more or less, religion has been overlooked and people have been never shown in church, one of the producers says we even show God in our animation. Then there is a picture showing a huge animate to some extent vaguely as God. As a matter of fact, in this way they scoff at God. On page 56 level 3A, Ramadan has been down played as holidays around the world and accompanied with some festivals. Please kindly bear it in mind that we're talking about an Islamic country called Iran where it's a very religious country and everything is considered under the umbrella of religion. Furthermore, in 3A, page 104, there is a discussion regarding four major problems of the current world in a global survey but again there is no name of religion and spirituality, which has been already mentioned regarding ethics.

**C Pair Work.** Use the expressions in the vocabulary to discuss the talents of the following people.

1. Irish writer James Joyce spoke thirteen languages.

2. The work of Chilean poet Gabriela Mistral, a Nobel Prize winner, conveyed profound feelings about common human experiences.

3. Indian genius Srinivasa Ramanujan astonished people by solving complex numerical problems instantly in his head.

4. U.S. industrialist Henry Ford built an early gasoline engine and one of the first automobiles.

5. Austrian physician Sigmund Freud, the founder of psychoanalysis, showed an immense capacity for understanding human behavior and feelings.

6. U.S. sculptor Louise Nevelson's abstract arrangements of wood, metal, and other materials demonstrated her artistic vision.

7. Joseph Dunninger was an American magician famous for reading people's minds and guessing their thoughts.

Modernity is the last theme that has been put under the heading of ethics. By modernity, we chiefly underscore the trend towards a modern life with little or no celebration of ethics. Put it simply, here, the interplay between modern life and ethics is dubbed modernity. In the provided videos for the Pre-intermediate level, it has been tried to suggest that make up is appropriate for men. Moreover, it is regarded as something more or less modern and consequently better. At the same level in the videos, a so-called modern woman says to another woman now we live in the 21<sup>st</sup> century and these days women can invite men for dinner, of course by dinner she meant dating. In the Workbook of 2A, page 44, *cosmetic surgery vacation* is introduced and has been defined as: Going to another country which is cheaper than your country in terms of the cost of cosmetic surgery and returning to your country without mentioning the surgery. Therefore, your neighbours may think your changes are due to your vacation.

**14** Read the online article. Then read the statements and check true or false.

**→ Cosmetic Surgery Vacations**

Cosmetic surgery vacations are the latest trend in cosmetic surgery. These holidays can take you to foreign lands, sometimes save you money, and offer you privacy.

But be careful—all surgery is serious. Here are some of the reasons for a cosmetic surgery vacation—and some important things to keep in mind.

**PRIVACY**

Cosmetic vacations are great if you want to keep your surgery private. You don't have to tell anyone where you're going, or why. When you return home, friends and family will think you look great because you've just had a relaxing vacation.

**SAVING MONEY**

Many cosmetic surgery vacations take you to countries where costs for surgery can be relatively inexpensive. But in many places, surgery prices can be high for foreigners. So be sure to check before you go.

**QUALIFIED DOCTORS**

There are excellent surgeons throughout the world, but if you decide on a cosmetic holiday, be sure to ask a lot of questions. Here are some things to think about. Find out the qualifications of your doctor. Where did he or she study? Where has he or she worked? Ask how long he or she has been a doctor. Also, if possible, speak to past patients. Were they happy with their new appearance?

The above research is very important. After all, you will be placing your life in the surgeon's hands.

In 2B on page 117, there is a sentence stating: "I am modern in my attitude about modesty". The implication is ethics is not fixed and modernity changes everything in one way or another. In Summit1 on page 45, there is a question reading "who do you think should spend more time making themselves attractive, men or women? Why?". The point is why such a question should be raised, is there any doubt about it? or because we live in a new age everything should be different, good should be bad and bad should be good, the same goes for beauty, ugly should be beautiful and beautiful should be ugly.

**DISCUSSION BUILDER • Now evaluate ways to change one's appearance.**

**Step 1. Pair Work.** Discuss and complete the checklist.

**Ways people spend time and money to make themselves more attractive**

Which do you think are good ideas for women? How about for men? Which do you think are good for both? Check the appropriate box.

	men	women		men	women
skin lightening	<input type="checkbox"/>	<input type="checkbox"/>	contact lenses	<input type="checkbox"/>	<input type="checkbox"/>
skin tanning	<input type="checkbox"/>	<input type="checkbox"/>	false eyelashes	<input type="checkbox"/>	<input type="checkbox"/>
body piercing	<input type="checkbox"/>	<input type="checkbox"/>	makeup	<input type="checkbox"/>	<input type="checkbox"/>
tattoos	<input type="checkbox"/>	<input type="checkbox"/>	hair coloring	<input type="checkbox"/>	<input type="checkbox"/>
facials	<input type="checkbox"/>	<input type="checkbox"/>	permanents (perms)	<input type="checkbox"/>	<input type="checkbox"/>
manicures	<input type="checkbox"/>	<input type="checkbox"/>	hair transplants	<input type="checkbox"/>	<input type="checkbox"/>
nail extensions	<input type="checkbox"/>	<input type="checkbox"/>	wigs	<input type="checkbox"/>	<input type="checkbox"/>
nail polishing	<input type="checkbox"/>	<input type="checkbox"/>	hair removal	<input type="checkbox"/>	<input type="checkbox"/>
cosmetic surgery	<input type="checkbox"/>	<input type="checkbox"/>	other	<input type="checkbox"/>	<input type="checkbox"/>

**Step 2. Discussion.**

- Who do you think should spend more time making themselves attractive—men or women? Why?
- Can people do too much to try to make themselves attractive? If so, what do you think is "too much"?

Finally, in the Workbook of Summit 1 on page 34, there is a weird idea based on which "ninety per cent [of women] are afraid of being conspicuous and of what people will say. So they buy a grey suit. They should dare to buy different." It simply implies women should wear a different colour at any cost.

**9 Challenge. Read the quote from 1930s fashion designer Elsa Schiaparelli. Then answer the questions.**

**“** *Ninety percent [of women] are afraid of being conspicuous and of what people will say. So they buy a gray suit. They should dare to be different.* **”**

1. Rewrite Ms. Schiaparelli's fashion advice in your own words.

2. Do you think this is good fashion advice for people (not just women) today? Why or why not?

The above points just shed little light on the reality we are dealing with these days. What should we expect when in books scientists have been replaced by western celebrities? The students will follow whoever they see in books and unfortunately, the western celebrities being mostly actors and actresses regarding ethics are virtually infamous for good deeds and behaviour. To Alptekin (1993), teaching culture in EFL books should move from familiar to unfamiliar and in this case unfamiliar could even be the international culture and not necessarily American culture. But what we observe in this series is miles away from what it should be. This series focuses on some specific English culture like playing up the celebrities and luxury and playing down scientists and simplicity. Alptekin & Alptekin (1984) claim that we should strike a balance between the target culture and students' native culture. Put it simply, it seems that one particular culture should not be dominant in books. Unfortunately, such an idea is hardly observed in this series.

The section below shows the various analyses employed in this study. The first three tables reveal the nationalities of the people employed in the sitcoms and the visual interviews.

**The countries of the actors in to notch sitcoms**

country	America	France	Total
<b>Number of actors</b>	4	1	5

**The countries of the interviewees in to notch sitcoms**

country	America	Austria	India	Italy	Japan	Greece	Taiwan	Britain	Chile	Germany	Grenada	total
<b>frequency</b>	1345	5	4	3	10	5	6	5	4	4	2	182
<b>Number of interviewees</b>	19	1	1	1	2	1	1	1	1	1	1	30

### The countries of the guests in Top Notch sitcoms

country	Asia	Western English	Western non-English	Total
frequency	3	16	2	21
Number of visitors	1	5	1	7

The Top Notch series were also being studied on the perspective aspect of culture, which has already been adopted by Ka-Ming (2011). Every single books and videos was analysed based on this table:

Perspectives	English speaking countries	European countries	Asian countries	Latin American countries	African countries
Inspirations					
World view					
Myth					

The following table revealed the frequency of each category plus the total number at the end of the analysis.

### The frequency of each category

Perspectives	English speaking countries	European countries	Asian countries	Latin American countries	African countries	Total
Inspirations	10	3	4	0	2	19
World view	96	6	9	0	1	112
Myth	61	3	10	3	0	77
Total	167	12	23	3	3	208

As can be seen, the high frequency of the cases related to English speaking countries is quite obvious. In other words, the other four categories: European, Asian, Latin American, African countries were not addressed as equally as English speaking countries. This finding runs contrary to the alleged idea of generating cultural fluency, which has been stated by the Top Notch producers. Thus the writers unlike what have claimed have not equally represented the cultural cases of different countries in the world, even tentatively.

### Frequency results of the cultural cases in Top Notch Series

	Observed N	Expected N	Residual
<b>English speaking countries</b>	167	41.6	125.4
<b>European countries</b>	12	41.6	-29.6
<b>Asian countries</b>	23	41.6	-18.6
<b>Latin American</b>	3	41.6	-38.6
<b>African countries</b>	3	41.6	-38.6

### The Chi-square results for the cultural cases in Top Notch Series

Chi-square	497
Degree of freedom	4

As can be seen, the results (Chi-square=497, df=4,  $p < 0.01$ ) revealed a significant proportion of the cultural cases embedded in Top Notch series. In other words, these results indicated cultural bias in favour of English-speaking countries.

### Conclusion

According to Guest (2002), culture should be taught indirectly while emphasising pragmatic and linguistic universals. In the same vein, he suggests that the focus should not be on the differences as it works like a Pandora's Box. As matter of fact, EFL/ESL syllabus designers can include those ideas, customs, and ethics which are widely accepted by both occidental and oriental people. Moreover, ethics should not be consigned to oblivion. Put another word, ethics should be the cornerstone on which a book is designed rather than as desultory and peripheral ideas which are added to a book. This project suggests that culture should not be considered in isolation. Put it simply, culture and ethics are inextricable concepts, which necessitates the study of their interplay. More importantly, teaching some particular concepts directly without any consensus may cause some troubles. Instead, we can find the middle ground, and teach those concepts with high agreement around the world.

All in all, mudding the water of violence, playing up superstitions, playing down religions, compromising modesty, dubbing individualised ethics, and surging to modernity is the disease of this age, which circulates from one country to another, from one continent to another through an airplane called the book. In conclusion, this study suggests that it stands to reason to view culture from the ethical point of view as ethics provides an eagle eye to look through culture. Moreover, ethics should not be confined to just a set of new-fangled terms such as ethics in research and likewise. Ethics is the heritage of humanity if it is compromised, humanity will be forsaken.

### **Pedagogical Implications**

1. Syllabus designers can consider ethics while designing books.
2. Teachers can devote some time to teach culture and its relation to ethics.
3. The frame obtained in this project may help the syllabus designers, in that it helps them what to include and exclude from their books regarding ethics.
4. It might be an avant-garde study regarding the relation between culture and ethics in the field of TEFL.
5. It may give rise to emergence of an interdisciplinary study on the philosophy of ethics and language.

### **Suggestions for Further Research**

1. It is highly recommended that a study be carried out on a different series with the same line of thinking to confirm this project.
2. The paradigm created in this project might need to be investigated from different points of view.
3. This study needs to be carried out in different countries with different cultures to see what the commonalities are.
4. It is of paramount importance to know whether the observed culture and ethics in this series has been done on purpose or inadvertently. Put another way, do the series designers have some guidelines based on which different ethics and cultures are presented?

*Instrumental Motivation and CET Band 4*

Cathy Zhang

0148

Nanjing University of Aeronautics and Astronautics, China

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

The paper, inspired by Gardner and his associates' research on instrumental motivation, mainly discusses what kind of effect it will have on students' performances, with particular reference to CET Band 4 in China. CET Band 4 stands for College English Test Band 4, the certificate of which used to be essential to the awarding of bachelor's degree in China before 2006. Driven by this strong instrumental motivation, the students tend to be willing to put more efforts and time into the study of vocabulary, grammar, listening, reading etc. Then the paper analyses the negative backwash of CET and describes the features of the students motivated by it. In the year 2006, the link between the certificate of passing CET Band 4 and bachelor's degree was cut off. This consequently has influenced instrumental motivation in English learning. Students' motivation went down to a large extent. But some desirable results appeared. English teachers changed their syllabus, courses and teaching approaches, while students' English are improved in a more balanced way and they are more willing to participate in classroom activities. The most important thing is that their motivation has no significant drop after they pass the CET-4. It can be explained by their increased intrinsic motivation during the two years of English learning. The paper finally discusses what language teachers can do to enhance motivation.

Keywords: instrumental motivation, CET, validity, intrinsic motivation.

The paper, inspired by Gardner and his associates' research on instrumental motivation (language learning for more immediate or practical goals) (Lightbown and Spada, 2006: 64), mainly discusses what kind of effect it will have on students' performances, with particular reference to CET Band 4 in China. The research made in Philippines by Gardner and Lambert in 1972 shows that instrumental motivation appears to be much powerful to the learners who have little or no interest in the target-language culture and few or no opportunities to interact with its members (from Ellis, 1994: 514), which accounts for our choosing this as the final topic. The research subject consists of some non-English majors in Nanjing University of Aeronautics and Astronautics who precisely fit the description of the above.

CET Band 4 stands for College English Test Band 4, the certificate of which used to be essential to the awarding of bachelor's degree in China before 2006. Driven by this strong instrumental motivation, the students tend to be willing to put more efforts and time into the study of vocabulary, grammar, listening, reading etc. For example, before the coming of the examination there seems to be no need to worry about the rate of attendance. And instead of being absent-minded, the students become more absorbed in the class. Therefore, approximately 90 percent of the sophomores in our university will pass the examination.

CET has been very popular in China. It does have positive effect on college English teaching, but with the development of society, the negative backwash has been reflected.

In the first place, because many companies regard CET band 4 or 6 certificates as one of the qualifications to recruit new employees, colleges and universities tend to put too much emphasis on it. They even link the certificate of passing CET band 4 to bachelor's degree. Students feel under pressure when learning English. At some colleges and universities English teachers are evaluated according to the scores their students get in CET. In such environment English teachers have to focus their teaching on test instead of communicative competence in English. They are forced to discard those texts of vivid and pure English articles but concentrate on explaining answers to those so-called model tests.

Secondly, the validity of CET is doubtful. CET is supposed to test students' communicative

language ability. But the communicative competence can hardly be reflected in CET. It has been proved by the fact that many students who have passed the exam cannot utter a complete English sentence. Also, linguistic competence includes receptive skills and productive skills. But many testing questions in CET are recognition test instead of recall test. Thus CET cannot well reflect students' productive skills. Moreover, the authenticity of testing material is an important factor of testing validity. Yet the testing material in CET is not so authentic. For example, there is no background noise in any listening material and no title in any reading material in CET. So though CET has high reliability, its validity has to be improved.

Thirdly, types of test items in CET are too limited. Multiple-choice items account for 75%-85% of the whole test. Of course, they are reliable, economic, practical and objective. Because of these advantages they are often used in large-scale exams. But they also have some unavoidable shortcomings. First of all, multiple-choice items only test receptive skills, which cannot reflect students' whole linguistic competence. For example, when doing cloze items, students needn't recall what has been stored in their mind. All they have to do is to fill four options into a blank to see which is suitable. Then multiple-choice items can make it hard to test what the designer wants to test. For example, listening comprehension is designed to test students' listening skills; yet four options give them too much information by reading. Also the backwash of multiple-choice items tends to be negative. Students neglect to develop their linguistic productive ability. They may put their textbooks aside and devote themselves to model exercises. And then it is hard to design good distractors. Sometimes two of the four options are reasonable answers to the problem. Sometimes, especially in reading comprehension, distractors can be excluded out by common sense without any information from the reading material. What's more, guessing accounts for part of the scores in multiple-choice items and it is impossible to decide how much. Theoretically the chance of guessing right is 25%. Yet after some training the percentage can be increased greatly and students get higher scores with no improvement in linguistic competence. In addition, multiple-choice items encourage cheating in exams.

Composition is another indispensable type of test items in CET. But it also has problems. The

worst one may be its low reliability. The rating criteria of composition is too global, which leads to arbitrary and subjectiveness in scoring.

To our joy, the CET organizer has recognized the existing problems and made some reforms, like introducing compound dictation and short-answer questions.

Motivated by CET, the students in our university have their features. As Krashen and Terrell state, “written input alone will not result in spoken fluency, due to the phonological factor as well as differences in spoken and written language”.(1983) So, students’ capabilities that can’t be reflected directly through the examination, like the ability to express fluently and accurately, are weak. To make things worse, the students have a tendency to attach less importance to the input not closely related to CET. For instance, they are reluctant to engage in group discussions in the class, showing no interest in any introduction about the cultural background unless the chance of its appearance in the examination is emphasized. After the examination, as Gardner and MacIntyre claimed in the study made in 1991, once any chance for receiving a reward is eliminated, learners may cease applying extra effort, which is seen as a major disadvantage of instrumental motivation (from Ellis, 1994: 514). As mentioned above, 90 percent of sophomores’ passing CET Band 4 leads to nothing but a sharp drop in their instrumental motivation, which is reflected through their attitude to English study after the examination. Many of the students begin to be absent from the class, or be unwilling to finish their assignments.

But things have changed. In the year 2006, the link between the certificate of passing CET Band 4 and bachelor’s degree was cut off. Students are not forced to take the exam. This consequently has influenced those non-English majors’ instrumental motivation in English learning. Their motivation went down to a large extent. It can be seen from many aspects. For example, students’ attendance to English class dropped, especially in classes of large size. They spent less time in memorizing new words and did less exercises of close, reading comprehension, and some other exercises which are similar to those in the CET-4. Their performance in the CET-4 also became worse, which in turn explains students’ low

motivation, if other conditions are equal.

But not all the changes are bad. Some desirable results appeared as the authority had expected. English teachers changed their syllabus, courses and teaching approaches as a response to the new policy. They added oral English course to non-English majors which was set only to English majors in the past. And they also employed the functional and task-based approaches in the class hoping that their students can say appropriate words in different situations. There were no longer mock test done or discussed in the class time. Therefore whether or not students pass the CET-4 becomes their own business and a natural reflect of their English proficiency. Even whether or not they take the exam is their own choice.

On the other hand, students' competence and performance of English are improved in a more balanced way during the two years' learning. Their productive skills ---speaking and writing skills develop together with their listening and reading skills, which makes a sharp contract to the past when they couldn't say a complete sentence even though they passed the CET-4. They are more willing to participate in classroom activities such as group discussion and role play which they had viewed as a waste of time because these activities had no direct relation to the exam.

The most important thing is that their motivation has no significant drop after they passed the CET-4, which can also be seen in their attendance to the class and how well they do their homework. It can be explained by their increased intrinsic motivation during the two years of English learning. Csikszentmihalyi and Nakamura (1989) defined the intrinsic motivation this way. When the experience of doing something generates interest and enjoyment, and the reason for performing the activity lies within the activity itself, then the motivation is likely to be intrinsic. In comparison, when the only reason for performing an act is to gain something outside the activity itself, such as passing an exam, or obtaining financial rewards, the motivation is likely to be extrinsic.

So what can language teachers do to enhance motivation?

1. Be aware of both initiating and sustaining motivation.(Williams and Burden,1997)
2. Recognize people as individual.
3. Help learners to be self-directed(Ellis,1994).
4. Give them optimal degree of challenge(Zone of proximal development(Williams and Burden,1997)).
5. Build up individuals' beliefs in themselves.
6. Generate learners' interest and curiosity.
7. Give feedback that is informational and in time.
8. Set a supportive learning context.

*"A Life-Changing Experience": Second Life as a Transformative Learning Space*

Yvonne Masters, Sue Gregory

0172

University of New England, Australia

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

Higher education teaching traditionally occurred, and to some extent still does, in face-to-face physical settings (often lecture theatres) with an academic and a group of students. In recent decades, the emphasis has shifted to learning communities and the mode of delivery has evolved from traditional face-to-face to online. This occurs either blended with face-to-face or exclusively online, most commonly through the medium of a learning management system. For students who have been studying by distance education, this has frequently been an isolating, if not alienating, experience. At the University of New England, Australia, transformative learning spaces have been created in the virtual world of Second Life. These spaces have proven to engage students in their learning and provide opportunities for interaction that can span both time and space. In doing this, learning communities and a sense of belonging have been fostered. Data from four research projects are presented in this paper, demonstrating how virtual world learning spaces have transformed learning for students. From the data, it is argued that learning in a virtual world lessens the sense of isolation and heightens the sense of belonging to a learning community. It is also argued that virtual world learning increases engagement and provides opportunities for students removed from each other geographically to work together to meet learning outcomes. The paper is concluded with a discussion of how virtual world learning spaces have the capacity to provide for global sharing of both learning and teaching.

## **Introduction:**

Higher education institutions (HEIs) are important centres of learning, continuing a long tradition of tertiary education. Traditionally, this learning has occurred face-to-face and the learning spaces have been lecture theatres and tutorial rooms or laboratories. Much of the teaching in the lecture theatres has been direct transmission from 'expert' to 'novice'. However, this more traditional way of learning and teaching has changed. Online learning has gained momentum in HEIs around the world (Gutierrez, 2010; Hiltz & Turoff, 2005; Puzziferro & Shelton, 2009) and this is dramatically demonstrated by the current exponential growth in the exploration into and delivery of what are described as massive open online courses (MOOCs). These MOOCs have the capacity to deliver education on a large scale to thousands participants who may be anywhere around the world. These courses are pushing the envelope of distance education and creating new kinds of online learning spaces.

Accompanying a change in the learning spaces in HEIs (from physical to online), there is greater accountability and HEIs are being measured against a range of indicators including retention and student satisfaction as well as success rates (Shillington et al., 2012). In Australia, most HEIs are government funded and the success of and satisfaction with the learning experience provided is publicly reported via a government website (Simpson, 2009) and in New Zealand government funding for HEIs is performance based with retention, course completion and achievement as key indicators (Marshall, 2012; Shillington et al., 2012). Engaging students in their learning and the university community is thus vital and predicates the need for effective learning spaces, particularly for distance education students. Simpson (2009) has argued that too often HEIs have tried what he describes as a 'goulash' approach to supporting and engaging distance education students, providing a toolbox of as many strategies as possible rather than developing spaces that work. This occurs in spite of the research outlining the importance of the learning space to student engagement and success (Bennett, 2011; Dugdale, 2009; JISC, 2006).

In this paper, the authors discuss their research about a virtual world learning space that demonstrates the capacity of this environment to engage students in their learning and to transform how online learning, particularly for distance education students, has been transformed.

## **Distance Education and Virtual World Learning Spaces:**

As long ago as 1995 Keegan outlined the possibility of students being able to engage in education that was "face-to-face at a distance" (p. 109), in this case education via satellite. However, the capacity to study from a distance has earned its share of critics. While the development of a range of information and communication technologies such as learning managements systems, blogs, wikis and other Web 2.0 tools have been argued as impacting online learning (Beldarrain, 2006; Bower, 2011; Buck, 2009; Peters, 2010), distance education is still seen as needing to overcome the view that it is a "second rate, impersonal educational option" (Baggaley, 2008, p. 41). Research suggests that what is lacking is a sense of social presence and accompanying student engagement. Social presence (Short, Williams, & Christie, 1976), a feeling of belonging to a community, has been shown to have positive impact on student satisfaction and "students' perceptions of social presence overall ... contribute[d] significantly to the predictor equation for students' perceived learning overall" (Richardson & Swan, 2003, p. 68). Dow (2008) argues that the quality of student and academic interactions that occur impact on social presence and that high quality interactions require strategies that "effectively facilitate online socialization and engagement" (p. 240).

Engagement is closely linked to social presence and its development is essential. Student engagement means that they “have a sense of energetic and effective connection with the activities they are undertaking” (Schaufeli, Bakker, & Salanova, 2006, p. 702). Linked with social presence, engagement has been shown to improve student outcomes (Tu, 2002).

The literature on distance education reporting student feelings of isolation, feelings that have been shown to contribute to high attrition rates and reduced student satisfaction (Alston et al., 2005; Buchanan, Myers, & Hardin, 2005) prompted the authors to explore alternative learning spaces from those already available. They work at the University of New England in Australia which has a long tradition of distance education delivery. It has more than 80% of its students studying in this external mode (UNE Corporate Intelligence Unit, 2011) and e-learning is one of its strategic goals. While acknowledging that Web 2.0 tools, UNE’s main delivery mode, have been shown to assist in student interaction online (Guri-Rosenblit, 2009; Lee & Chan, 2007; Peters, 2010; Veletsianos, 2010) enhance interaction, an environment that could better help to overcome isolation and enhance social presence was seen as crucial. Research into the use of a virtual world environment began.

Virtual worlds are “richly immersive and highly scalable 3D environments” (New Media Consortium and EDUCAUSE Learning Initiative, 2007, p. 18) and they have affordances such as their capacity for immersion, simulations and extended interactions (Warburton, 2009) that suit them to educational purposes. Indeed, a research project conducted by McKerlich, Riis, Anderson and Eastman (2011) examining student perceptions of a teaching, social and cognitive presence in virtual worlds demonstrated that “learning in a virtual world is often perceived as a rich educational experience that includes elements of all three presences” (p. 334) and they concluded that:

learning is taking place in virtual worlds and this medium will continue to grow. The days of presence deprived online learning could be limited; virtual worlds have the potential to provide a rich learning experience overflowing with presence (McKerlich et al., 2011, p. 334).

The use of virtual worlds as learning spaces is growing and, in Australia and New Zealand, they are being used in innovative ways for teaching and learning across a range of disciplines (Dalgarno, Lee, Carlson, Gregory, & Tynan, 2010; B. Gregory et al., 2011; Gregory et al., 2012). *Second Life*, although losing some traction in the educational field, is still the virtual world that is most used by educational institutions worldwide (Liu, Kalk, Kinney, & Orr, 2012). For this reason the authors commenced researching in *Second Life* in 2008.

### **The Research Studies in Brief:**

#### *Study 1: 2008*

The first study commenced in 2008 when Gregory built a custom learning environment, Education Online Headquarters to provide her participants with somewhere they could feel a sense of belonging and where they could meet both formally for class sessions and also informally, outside of ‘class’ time. In this way, social presence could be enhanced. The aim of the research was to explore the potential of virtual worlds as an effective environment to engage students in their learning. Gregory had created her avatar, Jass Easterman, 12 months before data collection began and honed her skills in the use of *Second Life*. Each week, for a two-hour tutorial period, participants met in *Second Life*: in the first hour the meeting was held at Education Online Headquarters to consider issues they were having with their learning and to discuss the focus topics for the week. In the second hour, they visited a range of virtual national and international institutions where they were given tours of the facilities

and the virtual guest academic introduced them to how s/he was using the environment for education. Data was collected through surveys, recording of the in-world sessions (where text rather than audio was used to avoid some bandwidth issues) and questioning. The data supported the contention that a virtual world is an effective teaching and learning environment (Gregory & Tynan, 2009).

#### *Study 2: 2009/2010*

In 2009 the authors began researching together and were particularly interested in the possibilities inherent in the use of a virtual world for role-play. A long term goal was to use a virtual world learning space for teaching practice, but this first research into role-play was more modest and aimed to explore whether a role-play that was practised by teacher education students in face-to-face sessions could be replicated in a virtual world. To assist in the verisimilitude of a classroom, a new learning space was custom-built by Gregory which was interactive and could later be used for other purposes. A playground was also created again for verisimilitude, but also to provide a space for later research. Traditional face-to-face workshops were conducted and then, to permit comparison, repeat sessions occurred in *Second Life*. De Bono's (de Bono, 1985) six thinking hats strategy was the focus of the role-play for two reasons: it was relatively easy to replicate in *Second Life* and it was an integral component of the unit of study of the first year participants. Data was again collected in a range of forms: observation of the participants both by the authors and another academic occurred in all role-play sessions; all online dialogue (which took the form of typed chat) was recorded for analysis; and, at the end of each workshop, surveys were completed. The overall finding was that role-play in a virtual world could be effective and engaging (Gregory & Masters, 2012). This finding is supported by Inman, Wright and Hartman (2010) who, after reviewing other role-play research in *Second Life*, stated that "*Second Life* has the capacity to facilitate role-play activities that are equally effective as role-play activities in the real world" (p. 53).

#### *Study 3: 2010/2011*

While the earlier projects demonstrated that engagement in virtual world learning was high, affirming the use of this learning space, the authors were also interested in whether such learning had any effect on performance. While enhancing social presence and engagement is a plus, it is important that any innovative learning space does not detract from the acquisition of skills and knowledge and possibly have a negative impact on performance. To explore this aspect of learning in a virtual world space, the authors researched the performance (as measured by final grade results at the end of units of study) of participants across seven units in 2010 and another three units in 2011. Those students who studied via the university learning management system had access to chat rooms, discussion forums, blogs, etc. Those who met for discussions in *Second Life* did so in the rooms available at Australis 4 Learning, the island where our classroom and playground had been built and which now included a library space and a staffroom. One particular mini-project within the larger project was the exploration by masters of her students' performance where she was fully responsible for teaching and marking the assessments for 50 students, 20 of whom used *Second Life* and the other 30 interacted with her in the online chat room for an hour per week. The results of this mini-project are discussed later and information regarding the entire cohort can be found at <http://www.une.edu.au/altc/ult-futures/documents/ULT-Futures-2010-Masters.pdf> (Masters & Gregory, 2010). The general finding was that there was no detrimental effect on performance and persuasive evidence that a virtual world learning space could positively affect performance.

#### *Study 4: 2011/2012*

The positive response to a role-play situation in 2009 and 2010 encouraged the authors to seek funding at the end of 2010 for the project which was their long term goal when they commenced researching together. They had demonstrated that a virtual world learning space was effective and innovative and they believed that this research could now be extended in new to benefit teacher preparation. This project, which was concluded at the end of 2012, was undertaken by the authors in collaboration with five other researchers from different institutions as part of an Office of Learning and Teaching grant. VirtualPREX (Virtual Professional Experience) was developed to enhance teacher preparation by providing a virtual world space for students to practise their teaching without risk. Students have been able to role-play teaching scenarios with their peers acting as primary school students. Further developments of the synchronous role-plays are possible as bots (robot avatars) are developed to interact with the student playing the role of teacher. This will facilitate asynchronous practice permitting anytime anywhere access to a teaching practice environment. Data collected through observation, recording and survey demonstrated that this role-play activity had the capacity to add to the repertoire of learning experiences for pre-service teacher preparation.

#### **Discussion of the Results:**

##### *Student Engagement and Presence*

The results of the 2008 project demonstrated that “the virtual world of *Second Life* is an engaging environment for the students” (Gregory & Tynan, 2009, p. 379). This is supported by the data from several re-iterations of this early project. Student comments from the surveys revealed evidence of both engagement and social presence. One convincing example from the many is:

*I had a defining experience last week when we sat down in that open-air lecture space and I sat on one side and the rest of you sat on the other side. Suddenly I felt lonely and, without thinking, got up and moved to where you were all sitting. And then, I thought, that felt so real!*

Again, distance education students, after undertaking the role-play in the de Bono project, informed us that:

*For an external student, you can feel very isolated and alone whilst studying. I find that SL provides an opportunity to ‘pretend’ that we are all sitting around a table throwing around ideas. I find SL engaging as opposed to chat rooms and I love wearing a ball gown to lectures each week!;*

and

*The use of Second Life is a great way to motivate and engage students, especially those studying off campus. I find that I am more absorbed in this unit (and ICT last semester) because of the interaction with the lecturer(s) and the visual stimulus of actually seeing the other students (avatars). In doing this I feel like I am actually part of the University, being involved in a tutorial and learning from others.*

These comments indicate that learning in a virtual world is engaging and that it also enhances social presence. Several of the comments reported also indicate that the students were able to articulate what it was about their experiences that created this engagement.

### *Enhancing Learning*

As reported in the section on the research projects, while engagement is important, engagement without learning is not constructive. Gregory's early project suggested that learning was effective, with all of the students scoring 80% or more on their assessment tasks with 71.45% of students reporting that *Second Life* supported their learning "quite a lot" and 28.58% reported the support level as a "fair amount". These were the highest two choices on the scale.

The de Bono research project also had students comment about their learning with one student, who had learned the theory from a recorded lecture and textbooks, commenting after the in-world role-play that:

*The opportunity to use Six Thinking Hats strategies in a group situation to guide discussion was deeply beneficial. It gave me a clearer understanding of how to use the hats, and provided an insight into how it may be used in a classroom (something that up until the Second Life session had eluded me).*

Skill transfer occurred from the experiential learning possible in the virtual world learning space. There was also a comment made by a student who used virtual world learning in an ICT and an EDLT unit) that:

*From looking at my results in other units, I can see an improvement in results for both ICT and EDLT, compared to my other two units that had no chat option at all.*

This latter comment suggests that learning is enhanced through the use of a virtual world learning space and this suggestion is supported by the data from the research on performance grades. The mini-project previously described, where Masters had groups in both *Second Life* and the learning management system, again has persuasive results about the efficacy of virtual world learning. Based on the final results of all students (rather than task by task) the two groups in *Second Life* performed significantly better than the three using the LMS as shown in Table 1.

**Table 1: Student Grades - Comparison of *Second Life* and LMS**

*Adapted (Masters & Gregory, 2010, p. 6)*

<b>Result</b>	<b>Blackboard n=30</b>	<b>Second Life n=20</b>
High Distinction	0%	17%
Distinction	46%	72%
Credit	46%	11%
Pass	8%	0%
Fail	0%	0%

These figures suggest that learning in a virtual world is not detrimental to learning and also that learning in a virtual world environment had a positive effect on results.

### *Opportunities for Practice*

As previously described, role-play is seen as one of the positive affordances of virtual worlds (Inman et al., 2010) and the opportunity to role-play de Bono's six thinking hats was

beneficial as indicated by the quoted student comment explaining that it allowed her to understand a concept which ‘*up until the Second Life session had eluded me*’. The VirtualPREX project revealed similar views regarding the benefits of role-play:

*Being able to consider unexpected occurrences within the classroom and approaches in how they can be overcome*

and

*Experiencing a classroom environment without a classroom*

and

*I liked how effective the role-play situation was, and how it relates back to teaching in real life. It helped me see and experience what happens within the classroom with the students.*

These comments demonstrate that the students felt the teaching environment in the virtual world was authentic and that they were able to practise their teaching skills, including management of, and interaction with, the students. One other comment was particularly insightful, with the student able to articulate why a virtual learning space might be so beneficial:

*Enjoyable to see what others did and how they coped with the situation in a safe environment where you could make mistakes and learn from them.*

The risk-free aspect of this form of preparation, where students can practise teaching with no possible detrimental effects on the learning and well-being of real children in a physical classroom was a key driver for this project. Further discussion of this research project can be found in other literature (S. Gregory et al., 2011; Masters, Gregory, Dalgarno, Reiners, & Knox, 2012).

### **Conclusion:**

We are not the only researchers in the arena of virtual world learning spaces. The Virtual Worlds Working group began in 2009 in Australia with ten members from 4 institutions: it now has over 190 members from 54 institutions across both Australia and New Zealand. Research also covers many disciplines and the kinds of learning spaces are diverse. In 2008, Kelton wrote that “the movement toward the virtual realm as a viable teaching and learning environment seems unstoppable” (p. 16) and the literature on virtual world research supports this. Jarmon, Lim and Carpenter argue that a shift has occurred and virtual worlds “are no longer the preserve of the stereotypical geek, nor are they just technical or social curiosities that educators ... can safely ignore” (2009, p. 3). Importantly, they claim that the research has moved away from a “focus on the actual teaching and learning practices and on their assessment in the virtual learning environment” (Jarmon et al., 2009, p. 4).

While virtual world learning spaces have proven to be engaging and effective there is still more research to be done, particularly in the area of how these spaces can transform the way in which higher education institutions support and teach their distance education students. As research commences into the effectiveness of massive open online courses, it is also possible that virtual world learning spaces will have a place in the debate.

Are virtual world learning spaces transformative learning spaces? The authors believe that their research demonstrates that capacity. In terms of transformation, the last word should be left to one of the student participants commenting on her experience of learning in *Second Life*:

*It has been one of the highlights of my entire uni life! This is my 7th year of uni.... and only performing in operas has been better. This has been a life-changing experience!*

Through the immersive use of personal mobile devices such as smart phones, tablets, and traditional laptops and desktop computers, adolescents inhabit an out-of-school world of burgeoning new media. Using a multiliteracies pedagogy, mobile devices, social networking platforms and digital applications can give students voice and agency in the context of their learning communities, and thus provide opportunities for them not only to learn subject matter but also to explore issues of identity and their places in the world around them. Using a mixed method research approach of qualitative case study analysis and quantitative surveying, this research investigates the relationship between a multiliteracies pedagogy and the development of adolescent digital literacy and social justice. More specifically, this paper focuses on how two classes of adolescents ages 11-12, reflected on issues of injustice related to First Nations communities in Canada, specifically related to poverty, housing and water crises and residential schooling. The students explored these issues while immersed in a rich media setting, using a social networking site and a combination of print text in traditional book form and a variety of digital texts that they accessed via Mac iBook laptops that were provided to them by their classroom teachers. They also created their own digital and multimodal texts to be shared with a wider community as a way of representing their understandings about the issues and communicating their concerns.

### **Context of the Study**

The research was conducted in two grade 6 classrooms at an elementary school located in Toronto, Ontario. This specific area has a high concentration of immigrants and refugees of mid-lower income status - as a result, the student body of the school reflected this surrounding community. All of the students were New Canadians and some were English Language Learners - a large proportion from middle-eastern countries like Afghanistan, Pakistan, and Syria. Many of these students had witnessed atrocities and suffered hardships that no child should have to experience. Their teachers felt that, even though some of the topics we would explore might be difficult for 11 and 12 year old students to grasp, they would be able to relate to the subject matter as they also were in the position of trying to hold on to their first languages and cultures - even though many students indicated a limited knowledge of First Nations issues in Canada in a pre-project survey.

At this research site, the grade 6 students explored Aboriginal rights to preserve their cultures, languages, customs and knowledge because these are protected under the Canadian Constitution. The overarching research question for the project is, how can we use digital texts to critically engage learners to become socially and globally conscious of the plight of others in our world? Our research team working with the participating teachers collaborated to select the theme, which tied in with their Social Studies and Language Arts curricular goals.

Prior to the study, the two participating grade six teachers had limited experience incorporating technology and the laptops into the learning process, daily routine, and/or the curriculum expectations. The teachers had some basic knowledge of key programs, like iMovie and Garage Band from Professional Development days with the school board, so they were able to provide additional support. However, they also shared that they did

not integrate the laptops as much as they would like to in the classroom as the greatest difficulty was in knowing how to incorporate them.

The site where the research was being conducted is one of the TDSBs inner-city schools. The Principal's vision for the school is one that draws heavily on technology for teaching and learning. Because it is designated as "model school" one of the primary goals is to employ innovative teaching and learning practices.. The Principal chose to intervene with technology, as he sees access and home exposure to technology generally lacking in the community. Furthermore, he sees technology as part of the solution for innovative teaching and learning practices – the kind of projects students can produce and the type of learning (inquiry-based) can potentially raise the quality of education, relevancy and interest in the learning process. The Principal also strongly believes that technology is a positive tool for engaging the community, by sharing student work through the school website and YouTube.

## **Theoretical Framework**

### ***Critical Literacy***

Christensen (2000) reminds us that educators must teach students how to "read" not only "novels and science texts, but cartoons, politicians, schools, workplaces, welfare offices, and Jenny Craig ads" (p. vii). Due to the "sheer volume and varying formats" of digital texts, Stevens & Bean (2007) argue that readers must read more critically, as available texts "demand sharper uses of critical lenses" (p. 17). The plethora of new and emerging digital texts, and the affordances that come with them, need to be taken into account in the literacy classroom. Affordances provided through digital texts offer the potential to assert agency, action and change, offering a different experience. Teaching adolescents to 'rise up' and become aware of the world in which they make meaning requires an "emancipatory act" and development of skills in which their voice and actions have both meaning and consequence at the same time (Christensen, 2000, p.vii). Understanding what this means is an essential component of being a part of a community. Learning what it means to be a "justice-oriented citizen," which moves beyond the notion of a "personally responsible citizen" (Lewison, Leland & Harste, 2008, p. 4), requires the development of a literacy community which focuses on open communication, the exchange of viewpoints, the sharing of opinions, as well as the ability to listen attentively to others and demonstrate empathy. Understanding how positive choices contribute to a social consciousness, and how negative choices lead to misunderstandings and conflict, we can help adolescents to embrace our global society.

### ***Multiliteracies***

The New London Group's (1996) concept of multiliteracies highlights the relevance of new forms of literacy associated with emerging multimedia, multimodal technologies. A multiliteracies framework takes into consideration "the wide variety of culturally specific forms of literacy evident in complex pluralistic societies" (Cummins, Brown & Sayers, 2007, p. 46). Traditional forms of literacy that focus solely on reading and writing in the dominant language, typically fail to recognize the impact of digital media in adolescents' lives, or take into account students' multilingual and multicultural backgrounds and

experiences. It is important to better understand how adolescents, who have grown up in a digital age, use and interact with digital media in the context of their writing. This would help develop a theoretical basis for teaching practices that aim to draw and build upon the digital literacies that students already possess, albeit in a nascent form, and which remain largely untapped in classroom contexts. Prior to the study, students indicated on the pre-project survey that they used technology primarily for Facebook, watching YouTube videos, email, Google searches, Wikipedia and online gaming. Thus, the students had some previous technology skills; however, they had not used their skills in an educational setting.

The argument for a pedagogy that takes into account, not only traditional print and oral literacies, but also visual and multimodal representations, has been well established in the literature (Alvermann, 2004; Cope & Kalantzis, 2000; Kress, 2003; Kress & Van Leeuwen, 2001; New London Group, 1996). The potential role of digital media in education is only beginning to be explored and although scholarly discussion surrounding this new field is growing, there is much work to be done if we are to understand how emerging technologies are changing the literacy and learning practices of today's adolescents. What happens when students are given opportunities to construct knowledge and understanding using the kinds of digital media that figure largely in their out-of-school lives? More importantly, within the context of a knowledge economy, what does it mean when school communities' acts of citizenship accessed through digital texts, can reach out to the global community to affect social, cultural and political change? The Internet has offered youth of today the capacity to affect change in the lives of others; however, many school boards are taking a protectionist stance by banning cell phones and iPods and blocking many of the websites that could be used for their educational potential. A multiliteracies pedagogy responds to this capacity to affect change through embracing a collaborative learning and teaching community through recognition of the pluralities in literacies and learning within our global society.

### ***Communities of Practice***

We extend Wenger's (2009, 1998) notion of communities of practice to school and classroom communities that use an inquiry approach as they strive to have students see themselves within a larger world and what that means within a diverse society. As learners develop socially, cognitively, and emotionally, it is necessary that they understand that everyone has rights and responsibilities within a given community and this understanding needs to be extended to other global situations. Developing adolescents' emotional maturity and understanding of others globally can happen with acceptance and taking responsibility for each other. Peterson (2007) suggests that there are five characteristics essential in the development of a critical/social justice classroom. These include focusing on a curriculum grounded in the lives of the students, facilitating dialogue within and among communities, advocating a questioning or problem-posing approach, emphasizing critical literacy skills such as detecting and critiquing bias and attitudes, and teaching activism for social justice. Peterson insists that a symbiotic relationship exists between teaching through inquiry and teaching for social responsibility

because “with inquiry-based teaching, the process becomes part of the content” (p. 28). No longer is the curriculum simply the novel or the facts to be learned but, rather, the students and their teacher together using books, other authentic resources, and their own opinions and experiences to create the “living curriculum” as a true community of learners.

### **Research Design**

This mixed-methods study employed a combination of quantitative surveying and case study methodology. The bulk of the study is primarily qualitative in nature, in keeping with the established practice of in-depth studies of classroom-based learning and case studies in general (Stake, 2000). As Bruce points out, case studies “provide the best articulation of adolescents’ media literacy processes, especially as much of the emergent forms of their use has not been studied” (Bruce, 2009, p. 302). Case study data consists of (a) detailed field notes; (b) students’ writing; (c) transcribed interviews with students and teachers; (d) the digital texts created by students; and (e) video recordings of selected learning/authoring activities.

Prior to the commencement of the project, the students completed an online pre-project survey. Using MacBooks, students read and critiqued a variety of digital texts in literacy centres, which focused on the UN Convention on the Rights of the Child and the UN Declaration on the Rights of Indigenous Peoples. In each of the literacy centres students were required to read print and digital texts related to the issues of concern in First Nations Communities. As a response to what they read, the students created their own digital and multimodal texts to be shared with a wider community as a way of taking action. After the unit was completed, the students completed an online post-project survey and the research team conducted open-ended interviews with the Principal, the teachers and selected student participants. These interviews were transcribed and analyzed in order to determine best practices in the use of digital media to teach social justice/critical literacy. Student generated artifacts were also analyzed based on their effectiveness to communicate a social justice message through a digital text (one in which image, text, sound, graphics, etc. converge to make meaning).

Because of the complex blending of multimodal data elements, we use the digital visual literacy analysis method of Hull and Katz (2006) of developing a “pictorial and textual representation of those elements” (p.41) - that is, columns of the spoken words from recordings juxtaposed with original written text, the images from digital texts, and data from interviews, field notes and video recordings. This facilitates the “qualitative analysis of patterns” (p.41). The analytic methods will include thematic coding (Miles, 1994) and critical discourse analysis (Fairclough, 1995). The data was read and coded for major themes and sub-themes across data sources, and the codes were revised and expanded as more themes emerged. In the authoring of the digital texts, we were particularly interested in moments that might be interpreted as “turning points” (Bruner, 1994) in the conceptual understanding of inequities related to Indigenous peoples.

In 2007 the UN General Assembly adopted the UN Declaration on the Rights of Indigenous Peoples. There are over 370 million Indigenous peoples in Africa, the Americas, Asia, Europe and the Pacific and many of them are among the most impoverished, marginalized and frequently victimized people in the world. At the time we were planning the research activities, information about the housing crisis and general living conditions in Attawapiskat, a northern Ontario First Nations community, was all over the media. The teachers wanted to extend the traditional unit of study based on First Nations history and culture to include an examination of some of the current issues facing First Nations people today. Some of these issues include the impact of colonization, low levels of educational attainment, high unemployment rates and extreme poverty in some areas, mental and physical health issues, such as depression, suicide, type II diabetes, and fetal alcohol syndrome, substance abuse, incarceration rates, family or community separation as a result of residential schooling policies, and the loss of traditional ways of life, specifically related to culture and language.

The students were each provided with a MacBook laptop and divided into groups of 4 – 5 with whom they would circulate to each of the seven mandatory digital learning centres. Each centre were based on the following topics and addressed a major political, social and/or economic issue in the Indigenous community (past or present): Impact of Colonization; Current Events: Focus on Attawapiskat; Residential Schools; Rights of the Child; Child Poverty; Endangered Aboriginal Languages; Indigenous Culture and the Arts. In each centre, students read a text/watched a video clip and responded to the information by producing a piece of digital media. After students completed the digital literacy centres they created digital poems in small groups

### ***The Digital Poems***

As the culminating activity for the First Nations unit, students wrote poems from the perspective of a Residential School survivor – either individually or as a group - and then put their poem to music or created a multimodal video of their poem using music, images and text. This was done in order to give the poem and message more impact and to make it easier to share with the school and community.

The students were engaged by the digital format and social justice element of the culminating tasks - the element of novelty when cutting the iMovie videos and recording the music ignited students' creativity as they were able to choose the images, sounds and structure that best reflected their poems. In the age of YouTube and information sharing, the video format - with the ability to share it - appealed to the students. Additionally, the social justice element allowed students to develop an emotional connection to the content. They talked about wanting to share their poems with residential school survivors so that the survivors would know they are not alone and that others empathized with them. One of the students said, "I think that I would share this poem with probably more residential school survivors because I would want to share it with them just to let them know that they are not alone and they are not the only ones feeling sorry for themselves. I want them to feel that they are not alone." Another student mirrored these sentiments in saying: "I would do the same, uh, I would give it to most residential schools because

they are the ones who actually inspired us to make this poem. You know to show them that um, that they don't have to feel alone about where ever they are. If they are feeling sad, we can always help them and we are always a part of their society."

Finally, after completing the digital poems, one student saw a greater application as she said: "I wanted to share it to children, like maybe if there are children out there who are still racist or mean or leaving people out because of a really rude, mean reason, I would want to share with them to tell them that life can be worse for other people and you can't just, you like have to think of the other person's feelings."

### ***Community Outreach***

An important component of the research project is involving community. We invited two award-winning First Nations musicians into the classroom to share their music and experiences growing up on a reservation in Manitoba – Tracy Bone and JC Campbell. We also had an elder, Cliff StandingReady, who is a residential school survivor come in to talk to the students about his turbulent experience in a residential school.

This dialogue with community members brought the project to life for most students. One explained: "He actually brought it out and when you talk to a person, well, he's actually a man expressing his experience about it happened. And while on the web you can read it out but you don't feel any expression or any feelings. But when you talk to a real person you can actually understand it." Similarly, another student shared: "Cliff was a real person from, like a residential school survivor, and after, when the survivor was talking, we understand more about it and have more feelings about it." Integrating the community in the learning process moved the learning beyond the classroom walls thus, breathing life into the content and adding a necessary emotional connection.

### ***The Project of Heart***

Throughout the project, which included the digital literacy centres and the culminating tasks, students simultaneously worked on 'The Project of Heart'. POH is a multi-school art project to commemorate the lives of the Aboriginal children who died as a result of the Residential School system. Each participating student received one tile to decorate to represent a child. When the tiles were completed, an Aboriginal elder visited the school to perform a 'Smudging Ceremony' where the tiles were 'blessed' by the elder, and the 'souls' of the children were lifted up to the sky. After the ceremony, the students were encouraged to ask the elder additional questions about the ceremony, the children, his personal residential school experience and the First Nations' experience with the Canadian government in recent history. Through the Smudging Ceremony, students were able to witness first hand some of the sacred rituals introduced earlier in the project.

In terms of the research findings, we found that students made gains in both their understanding of aboriginal issues, and their development of digital literacy and critical literacy skills. Prior to the study, the students' knowledge of First Nations issues was varied – the residential schools system, access to housing and healthy food/water, and

drug and alcohol abuse were the least understood. On the pre-survey, one student wrote, “to be honest, I thought that First Nations were more like a [*sic*] extinct community...” After the study, 98% of students indicated their awareness of historical and current issues had risen. When asked how, one student responded, “Now I know what Colonialism is, and more about Residential Schools.”

### *Creativity and Innovation*

The teachers found that students were eager to use the technology to create their own digital texts and that students who typically struggled with paper and pencil tasks excelled when using the technology. One teacher reflected:

There was this one boy who, he wasn't getting through the centres and he is somewhat more slow with tasks anyway. So I wasn't surprised by that, I was a little frustrated with him and I was thinking, oh here we go again. Like, he isn't getting his work done and when I went over to look at; you know he had spent five or six days on one thing, I realized that he was so engaged with doing this amazing job and was having so much fun getting this task to be the absolute best, it didn't matter that he maybe didn't complete some of the other tasks. Because some of the other kids were all about, okay, I want to have all of the tasks completed. There are seven: I need to have seven done. He was more engaged in getting at the depth within that activity and that we really showed me a different side of him and I was kind of like, that was really neat. I didn't think that he could sustain that much energy but he enjoyed the technology and I could see that there were other aspects to him that technology would bring out in school where as the regular pencil, paper doesn't engage him.

The creative and multi-modal affordances technology introduces in the learning process was crucial in getting this particular student engaged.

One of the students shared: “I thought that the process was interesting because it was different from our original school lives and it was fun to do something different and more creative than writing on a piece of paper.” The majority of students interviewed shared similar sentiments regarding the ‘interesting’ ‘fun’ and ‘more creative’ elements that arise when technology is integrated into the learning and application processes.

### *Communication and Collaboration*

One of the key findings was how students collaborated and shared their expertise. The teachers found that they were no longer the “experts” in the room. The inquiry based approach proved to be very successful in terms of empowering the students and promoting independence. One of the teachers observed:

...once someone figured out how to solve a problem or get something done, they became the experts in the room. And I kept saying, “I am not going to be an expert in any one of these things, I am here to oversee things and you guys are going to have to become the experts yourself.” That was neat to see and I

would say, “You need to go and see Omar for that and you need to go and see Fifa, she knows how to do that” and they ran themselves without me having to be constantly on them. They knew how many they had to do, which ones were done, who they could get help from. They became independent, which is really the goal. We set up the learning challenges, the success criteria, then let them go and they did it...[it] was really exciting to see them helping each other and coming up with great solutions to technological problems.

It was clear that the laptops leveled the learning ‘playing field’ and that the teacher-student hierarchy was put on pause during these sessions. The level of engagement, empowerment and confidence rose dramatically in some students

#### *Research and Information Fluency*

For many of the students, being able to access current information from their desks was a highlight of the project. The teachers found that the novelty of using laptops didn’t last long and the focus became the learning. One of them commented:

It’s noticeable now that the technology in the room is a tool. It’s not this thing that is housed over there and we only take it out a few times. Now when someone takes a laptop out and someone is using an atlas, or someone takes a book out, or someone is talking to a partner working, it’s not like everyone is crowding around like it’s this special thing anymore. It’s just a tool that we use and then you can get on with learning when it’s no longer that novelty. And I am becoming that much more comfortable and I am now looking for ways- I go there first. How can I use them to introduce this lesson or this topic and what can they use that to show me. Now I am not looking only for going to the library to do this, where we pull out the books, right; we pull out the laptops.

By integrating the laptops, the teachers and students learned to rely on them as sources of information and as educational tools rather than as novelty items. Additionally, the teachers discovered there was learning happening on multiple levels throughout the project – both skills-based and content-based:

I think there was a fair amount of learning in terms of their computer skills, their ease of working with the laptops, their ease of working with software on the particular websites. And, I think that’s where the biggest learning happened and also in the content area, learning about modern day First Nation’s issues, so that’s where the information learning was and the skills learning was the technology.

As a result, the biggest challenge for the unit was not potential student distractibility with the computers, but rather, finding the materials for the unit.

#### *Critical Thinking, Problem-Solving and Decision-Making*

The teachers also noted that the students all made gains in terms of their problem-solving skills and ability to “trouble-shoot” – with 37 students in each classroom, they had to learn to rely on each other or find another way to do something or they would have been waiting a long time for help. One teacher noted, “Definitely trouble-shooting became an issue, so some of them got stronger at it. It was obvious which kids do a lot of computer trouble shooting at home and I felt there was a lot of helping of people.” The project gave students the opportunity to practice their problem solving skills as there was often multiple solutions to one problem; for example, saving an image to the desktop. Furthermore, the leveling of knowledge in the classroom allowed some quieter students to shine when they discovered answers to questions posed by their peers.

Finally, in the culminating tasks, students were challenged to make difficult decisions when it came to choosing the most appropriate images, sounds, fonts and transitions to reflect the tone, mood and message of their piece. At times, students were asked why they had chosen a particular image or transition and asked to reflect on whether or not this truly served the function of their piece. The decision they had to make encouraged them to think deeply about how these tools affected the overall piece – something some of them had not previously considered. Participating in the digital learning centres and the culminating project, and listening to the guest speakers helped the students critically examine the First Nations’ role in Canada both past and present.

#### *Critical Literacy Development*

Most notably, the students made gains in terms of their critical literacy skills. They asked important and hard questions about inequities and injustices. The elder that came in said that they asked better questions than his typical university audiences. And they became, as one teacher commented, “more motivated by social activism as the result of this project” – in a subsequent initiative unrelated to the project, most of the participants and organizers were from these two grade 6 classes. The other teacher was surprised by how moved to action her 11 and 12 year old students became: “I think for eleven and twelve year olds to be able to do that, it’s a big deal because they are very self-centered.” One student responded in her post-project survey, “at first I thought it wasn’t such a big issue. But this project made me realize what First Nations have been through.” It was clear the students had engaged with the content on a critical level that caused them to internalize the content and opened them up to social justice activism.

When questioned what type of action one student could take to raise awareness about the issue of residential schools in Canada, he explained he would use the digital tools from the project to, “spread the message so that more people are aware...” and that he would use, “media, internet, Glogster and Facebook.” Having the students internalize these social issues and view the digital programs as tools of social activism and change was significant. This student concluded by adding that learning the tech tools was necessary for their future as, “...we are growing up in a world of technology, so when we grow up, we can process this technology.” He understood that without access to, and knowledge of how to use these tools, the students would be at a disadvantage later in life. Furthermore, it was through the critical thinking tasks in the digital learning centres – like the

comparisons and critiques of different modes of media – that the students learned to be critical of what media is the most effective.

## Conclusion

By tapping into students out-of-school reality – one heavily immersed in the digital world with personal computing and handheld devices and the internet – and using a multiliteracies pedagogy, students were able to quickly connect with the First Nations' content, the technology-based teaching tools and the multimodal final project. Furthermore, the exploration of First Nations' issues in this type of critical and tech-based environment ignited a greater interest for the students in what it means to develop critical literacy skills and to become a socially engaged member of society. The mixed method research using qualitative case study analysis and quantitative surveying concluded in a clear link between a multiliteracies pedagogy and the development of adolescent digital literacy skills and social justice activism.

*Enhancing Chemistry Learning with Moodle Application among Foundation  
Engineering Students - A Survey on Students' Perception*

Kasturi Muthoosamy, Guat Poh Betsy Lee, Choon Lai Chiang

0193

The University of Nottingham Malaysia Campus, Malaysia

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

Teaching Chemistry as one of the components in the foundation engineering program has been a challenging task to chemistry lecturers. Students that are not progressing to Chemical Engineering find the module daunting and unimportant for their undergraduate studies. In addition, with the intermixture of Malaysian and international students enrolled in this program, some students have high-school Chemistry knowledge whereas others do not possess any knowledge at all. In order to accommodate these two opposites, a course webpage was constructed with the Moodle software system that utilizes various applications such as forum discussions, on-line assessments, accessing course information and learning resources including videos and useful links. The web application is not a duplicate of classroom content but serves as a complementary to further provide guidance and assistance to students' learning outside the classroom. Therefore, the research investigates students' perception on the usefulness of the course webpage in terms of content, accessibility, satisfaction and whether the experience stimulated their interest towards learning Chemistry. A total of 124 foundation students were surveyed using a standard questionnaire. The survey results show that the majority of the students gained positive experience in their chemistry learning via Moodle application, while 73% of the students valued a combination of face-to-face and Moodle-assisted learning methods. This implies that the hybrid approaches offer flexibility and provide adequate support to students in learning chemistry.

## 1. Introduction

Chemistry is a compulsory module in foundation engineering programme at the University of Nottingham Malaysia Campus (UNMC), the branch of the UK campus. Pre-requisite for this programme is high-school leavers, with A-levels or high-achievers of O-levels. Students in this programme will progress to undergraduate studies in mechanical, electrical & electronics, civil or chemical engineering degree courses.

Due to more physics-related modules in the engineering subjects, teaching chemistry has always been a tough task to most chemistry lecturers. Research has revealed that students often become uninterested, as the subject demands theoretical and fundamental understanding which they should have acquired in a science lesson during their high-school (Stark & Gray, 1999, cited in Cheung, 2009). Generally, most students are in-favour of calculations and proving-concept modules rather than memorizing periodic table and deriving chemical equations. In addition to this, there is a vast mixture of students from various countries, which are from the Middle East, Africa, Eurasia and Asia continents. Due to the variety, students carry different levels of background knowledge of chemistry. Some are in an advanced stage, with a few at a basic level as well as those who use chemical terminologies from their country of origin.

Catering to all these different students' needs can be a daunting and challenging task to lecturers. With only a two-hour lecture and one-hour tutorial class allocated per week, contact hours have to be spent wisely to cover one chapter per week. Moreover, additional classes for the less performing students are almost impossible due to their heavy time-table. The contact hours sometimes can prove to be insufficient, especially when introducing new chapters. The good performing students often challenged and cherish the time constraint; however, the poor performing students often feel stranded, which can be de-motivating to them in the long run.

In order to address this issue, a blended learning environment using Moodle platform is proposed to facilitate students' learning in chemistry. The term 'blended learning' is usually recognised as a combination of face-to-face and online course delivery (Brouwer & McDonnell, 2009). It provides a harmonious balance between web-based activities and in-class activities (Ocak, 2011). Blended learning shifts the content delivery practices from a lecture-centered to a student-centered instruction in which students become active as well as interactive learners (Dziuban, 2004).

## 2. Background of Study

The usage of Learning Management Systems (LMSs) such as WebCT, Moodle or Blackboard has been widely integrated in the higher education process. It is normally utilized as a supplemental learning platform to traditional learning education, which is known as blended learning environment or hybrid learning environment. Many universities have practised and have been committed to blended learning approaches (Peat, 2000, Liaw, 2008, McDonnell, 2009). According to Peat (2000), the transition to a mixed mode learning environment at higher institution is related to four imperative reasons namely the rise of lecturer-student ratio due to the growth of students enrolment and low staff resources; course modularization that increases the pressure to share materials; information technology that satisfies user expectation and consumer expectation on educational technology in higher education institution.

The learning management system at UNMC was previously supported by WebCT and the usage of U-drive, i.e., a shared network storage space for students and staffs. Instructors were given the option to upload their course materials either through WebCT or U-drive. Students were not obliged to use online learning approaches because most of the course materials were easily accessible through U-drive system within the campus. However, UNMC has introduced Moodle as the new virtual learning environment to support teaching and learning in the academic year 2011-2012. There is a gradual shift from WebCT based e-learning to the Moodle application and the transformation will be in full force across the whole university during the autumn 2012 teaching session. Gradually, the U-drive network system will be removed as Moodle will be the key resource for learning materials and activities. Nevertheless, students need a period to adapt to the new blended learning environment as they are not uniformly knowledgeable in the use of virtual learning and some of them are still comfortable with the existing U-drive network interface to access the learning materials. Thus, the aim of our work is to examine students' perception when acquainted with the blended learning environment as well as their insight in the use of Moodle environment in learning chemistry. This paper will investigate the learning experience of first year foundation engineering students at the UNMC when Moodle acts as a supplementary platform to teach and learn chemistry.

### 3. Literature Reviews

Learning chemistry is challenging to students in that they require thinking and visualizing chemical structures and reactions at several levels. Due to the abstract concepts involve in chemistry, many students fail to visualize and translate the interplay between the chemical concepts at several levels (Wu, Krajcik & Soloway, 2001). Visualisation of chemical structures, processes and reaction mechanisms on molecular level is needed and can be a daunting experience for the students (McDonnell & Brouwer, 2009). To overcome this, support of educational technology has been developed and found to be very useful for teaching chemistry to large groups of first year undergraduates, particularly those who have not studied chemistry at secondary level. Charlesworth and Vician (2003) reported about their introduction of a WebCT learning on a first year chemistry programme. Their intention was to motivate and improve students' learning through virtual learning approaches. Students' feedback revealed the appreciation on the flexibility of the system where they showed confidence in learning chemistry and less anxiety about the exams. Lovatt et. al. (2007) examined the interaction of first year undergraduates with Moodle system and it was found that students who were stimulated to use the online resources did better in their examination than those who were not. In general, the use of e-learning especially in higher chemistry education provides flexible learning environment that helps students to learn and improve their performance in chemistry especially in the freshman year.

On the other hand, McDonnell and Brouwer (2009) wrote a chapter about online support and online assessment for teaching and learning chemistry. They reviewed several good practices of using educational technology to support the teaching and learning in chemistry for higher education. They commented that the flexibility of online learning platform allowed students to access lecture materials and resources at anytime on any networked computer. Support materials such as useful website addresses, sample exam questions, revision materials and self-study materials assisted the first year undergraduates to narrow the gaps between their pre-requisite science knowledge and the initial knowledge required for higher education. Online assessment tools such as online quizzes and self-tests with instant feedback also

improved the students' learning and they performed better in exams. This is equivalent to the survey of Rossiter et al. (2010), where online quizzes were implemented in a Chemical Process Principle course during the freshman year. They discovered that the online quizzes engaged the students throughout their learning and also assisted the weaker students to improve through teamwork and discussion.

Besides, communication online such as chat room, blogs, wikis and discussion forum develop a flexible student-centered learning platform in which students share information and work in groups. Lu and Law (2011) have investigated the effect of wiki and peer assessment tools embedded in the Moodle system on students' collaborative learning behaviour. 186 students participated in the study and they were put into groups of five or six to work on their projects. From their findings, wikis were effective in getting students to work on their individual projects, i.e., the more they participated, the better their final project performance became. However, the students did not focus much in working and sharing on the wikis of other groups' project. It was recommended to design wiki activities that encouraged more collaboration works among the groups.

Although the benefits of e-learning have been discussed in various previous studies, some researchers have also revealed some critical factors affecting user satisfaction with e-learning. Liaw (2008) investigated learners' satisfaction, behavioural intentions and the effectiveness of the Blackboard e-learning system. From the responses of 424 university students, learners' self-efficacy, system quality and interactive learning activities were the key factors that influenced e-learning usefulness. Pei-Chen Sun et al. (2008) discovered that course quality which includes teaching materials, interactive discussions and course-scheduling have the strongest association with satisfaction regarding e-learning. Nevertheless, they could not deny that instructors' attitudes played the most significant role to push forward the success of e-learning activities.

#### **4. Course Webpage Design and Description**

The blended learning environment was designed for a course entitled "Chemistry B", which was a core module offered to chemical and civil engineering foundation students. The front webpage provides the overall course content of the Chemistry module with the names of the chapters, followed by the activities in a drop-down list for each chapter (as shown in Figure 1). The activities involved in each chapter include: course materials, additional materials, quizzes, open forum/chat and latest news message/calendar.

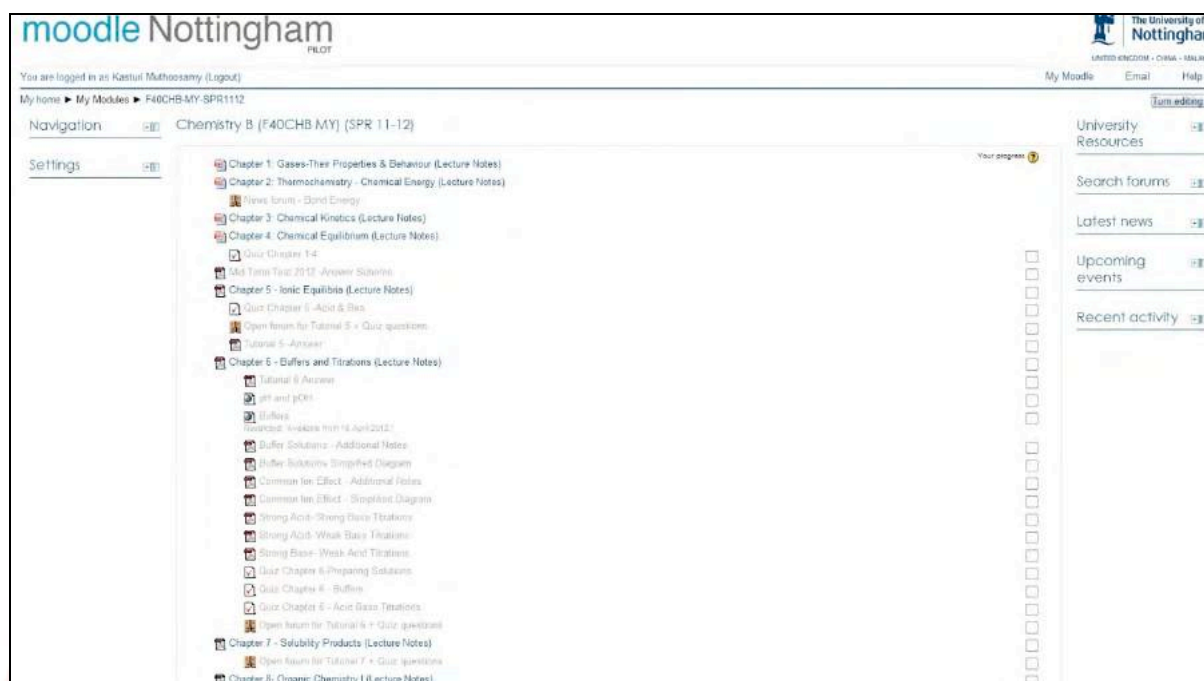

Figure 1: The course outline for chemistry module

#### 4.1 Course materials

There are a total of nine chapters in Chemistry B with topics of namely, Thermochemistry; Chemical Kinetics; Chemical Equilibrium; Acid and Base; Buffers and Titrations; Ionic Equilibrium and Organic Chemistry. Each of these chapters has plenty of information and activities related to the topic. This includes the course materials in the form of PowerPoint slides and Acrobat PDF documents, which are the duplicates of hand-outs that the students received in class. It is important to provide a softcopy to the students, as it is colored compared to their hardcopy and helps better in comprehending complex diagrams or figures.

#### 4.2 Additional Materials

Nowadays students are very much visual learners. Chiang and Lee (2011) did a survey on the learning style of 150 foundation engineering students at UNMC. Their findings showed that the majority of the students expressed the strongest preference to visual learning style compared to other learning style dimensions. This implies that engineering students are strongly depending on visual learning environment. Video is clearly a valuable additional learning activity that provides a sensory experience that allows concepts and ideas to actually become alive and connected. It has the option to rewind and review a particular section of the video to ensure students understand the key concept. Thus, free educational video sharing websites that explained the chemistry theories such as Hess Law and Bond Energies were uploaded in the webpage. In addition to this were video links from You Tube about Acid, Base and Titrations. Apart from this, problems and solutions as well as simplified diagrams explaining complex concepts, taken from textbooks or take-home questions which were not discussed in class, were made available online for students. In each of these adapted materials, references were stated clearly in order to allow students to seek the original sources if the need arises, apart from avoiding copyright infringement.

### *4.3 Quizzes*

Quizzes were incorporated in each chapter for students who were keen to self-test their knowledge and learning after the revision of a chapter. Short quizzes in the form of true/false, multiple choice, short answers or numerical questions were assigned, depending on the chapter content. The majority of the questions were of problem solving type that involved calculation with pre-determined specific units and significant figures of the numerical answers. Two attempts were allowed for each question and the students received immediate feedback if they failed in their first attempt. Positive responses were provided if the students were successful in answering the questions. However, there was no time limit to answer each question as the students were given sufficient time to read and understand the questions, and to answer calmly at their own pace.

Since the quizzes were not part of the students' assessment, it was considered as an independent study at the students' own will. Hence, the quizzes were designed with a due date of two weeks, in order to encourage the students to have a constant revision and to avoid last-minute cramming before examination.

### *4.4 Open Forum/Chats*

Open forum serves the purpose of allowing a student to post his/her questions or doubts and can be viewed by their fellow peers. This allows the lecturer to disseminate the answered questions to the whole class without repeating in the classroom. Hence, each of the chapters was constructed with their very own Open Forum. Students were also encouraged to use the chat function that facilitated live discussion and interaction with their instructors and peers.

### *4.5 Latest news Message/Calendar*

Another interesting feature of Moodle is the function on the right of the webpage which allows the lecturers to post any new messages. It also comes with the list of recent activities so that students can keep-track with any updates. General announcements such as due date of assignments, examination dates and venues, replacement classes etc. were posted at this section and these were linked to the students' email accounts, so that they were notified of every update.

## **5. Methodology**

### *5.1 Participants*

The evaluation on student perception was conducted on 124 students enrolled for Chemistry B in the foundation engineering programme during the spring semester 2012 and the investigation spanned for one whole semester. The students had completed their Chemistry A by the time they enrolled in the foundation engineering program in 2011.

This study used the survey approach to understand learners' attitudes toward learning chemistry through Moodle application. Survey questions were adapted from Bromham and Oprandi (2006) and Buzzetto-More (2008), which determines the satisfactory level of the

students using Moodle. The questionnaire was distributed to the students after they had used the Moodle e-learning system for two months. Participants were asked to complete the questionnaire that included demographic information and two other sections. All 124 students answered the questionnaire but 24 responses were incomplete. Therefore, this study group comprised of 100 students.

## 5.2 Measurement

The data for this study were based on students' experiences taking a Moodle assisted online learning unit offered by the Foundation Engineering of the UNMC at its website, <http://moodle.nottingham.ac.uk/course/view.php?id=6743>. The data were gathered by means of paper-and-pencil survey. The following depicts the content of the questionnaire.

The questionnaire had 3 sections. Section A contained 9 items related to the respondents' background information. Section B with 19 items was designed to gather required information on the respondents' perception on Moodle learning unit. All the items were slated on a 5-point Likert-type scale of strongly agree, agree, neutral, disagree and strongly disagree, and scored 5 to 1, respectively. Section C was about their preference of learning approaches, i.e., face-to-face or blended learning environment. One open-ended question was included to let the respondents/participants explain further about their preference. All participants took approximately 10 minutes to complete the survey. The data gathered were subjected to basic descriptive statistical analysis using frequency counts and percentages.

## 6. Results and Discussion

The characteristics of the participants are summarized in Table 1. Data from 100 students (26 females and 74 males) were used in the analysis as indicated in Table 1. The overall sample was not evenly distributed by nationality. Eighty six students were Malaysian while the rests were international students. Only five students possessed very little or did not have any chemistry knowledge at all while the rest had high-school chemistry knowledge.

With respect to frequent access of the Chemistry B Moodle webpage, the responses showed that most students visited the webpage at least once a week or every other week in a semester while thirty six students visited the webpage only once a month or rarely. The low access rate might have been due to no grading assessment involved in the webpage. According to the survey of Murray et al (2012) on students' interaction with online course content, students tend to participate in the online activities with one specific reason, i.e., the grade that determines their course performance. In other words, the access rates are associated with the grading of online assessment involved in the course.

**Table 1. Participants' demographic information**

Variables	Frequency
<i>Gender</i>	
Male (1)	74
Female (2)	26
<i>Nationality</i>	
Malaysian (1)	86
International Student (2)	14

<i>Prior Knowledge on Chemistry</i>	
Yes (1)	95
No (2)	5
<i>How often did u visit the course webpage?</i>	
Daily (1)	1
Several times a week (2)	4
Once a week (3)	33
Every other week (4)	23
Monthly or rarely (5)	36

### 6.1 Respondents' Perceived Satisfaction of the Online Units

Students' satisfaction with the Moodle application was divided into three main sectors which are satisfaction with the course content; satisfaction with assessment style; and satisfaction with the quality of their learning experience. Students' perception and expectation were also explored to give additional perspectives on the Moodle implementation. At least two questions were set for each of these sections and they were not arranged in any particular order to gauge the consistency of the students' responses.

Overall, the majority of the students were satisfied with the online lecture notes as well as the content of the course website, as shown in Table 2. A big portion of the students also gave positive responses about the online self-study quiz/exam with instant feedback. However, only 39.6 % of students agreed that the assessment section was easy to use. The majority of the students chose 'neutral' probably due to the fact that they had little or no experience of using Moodle. Nevertheless, many students still expressed their personal preference to the traditional classroom-based assessment modes (38.6% chose 'agree' and 17.8% chose 'strongly agree' for Q13).

**Table 2. Percentage distribution and mean of respondents' perceived satisfaction of the online learning units (N=100)**

Items	SD	D	N	A	SA	Mean	Sd
Q1. I was satisfied with the content available on the course Website.	3.0	5.0	33.7	43.6	13.9	3.61	0.89
Q2. I was satisfied with the online lecture notes included on the course Website.	3.0	5.0	24.8	55.4	10.9	3.67	0.85
Q10. I found the exam section easy to use.	1.0	7.9	50.5	33.7	5.9	3.36	0.76
Q12. I liked that I received an instant grade after taking an online quiz/exam.	2.0	5.9	28.7	39.6	22.8	3.76	0.94
Q13. I prefer to take my quizzes/exams in person.	1.0	7.9	33.7	38.6	17.8	3.65	0.90
Q14. I enjoyed the portion of the course on Moodle.	1.0	5.9	40.6	43.6	7.9	3.52	0.77
Q16. I was satisfied with Moodle in regards to the quality of my learning experience.	1.0	8.9	44.6	36.6	7.9	3.42	0.81
Q18. I would like to see course Websites added to all of my other courses.	1.0	7.9	28.7	43.6	17.8	3.70	0.89
Q19. I believe that course Websites will play an important role in college education in the future.	3.0	4.0	30.7	45.5	15.8	3.68	0.89
						3.60	0.86

**Key:** 5= SA-Strongly Agree, 4= A-Agree, 3=N-neither agree nor disagree, 2= D-Disagree, 1= SD-Strongly Disagree

Many students enjoyed the Moodle application in their course (43.6% agreed and 7.9% strongly agreed), which they believed improved their quality learning experience (36.6% agreed and 7.9% strongly agreed). However, some students seemed to be undecided about the quality of learning experience using Moodle. Probably these students needed more time to be fully adapted to this new blended learning approach.

In general, most of the students responded positively about the employment of Moodle as a supplemental learning platform to all their courses (43.6% agreed and 17.8% strongly agreed). They believed that the application of e-learning would play an increasingly important role in college education in the future (45.5% agreed and 15.8% strongly agreed). These findings are depicted in Figure 3.

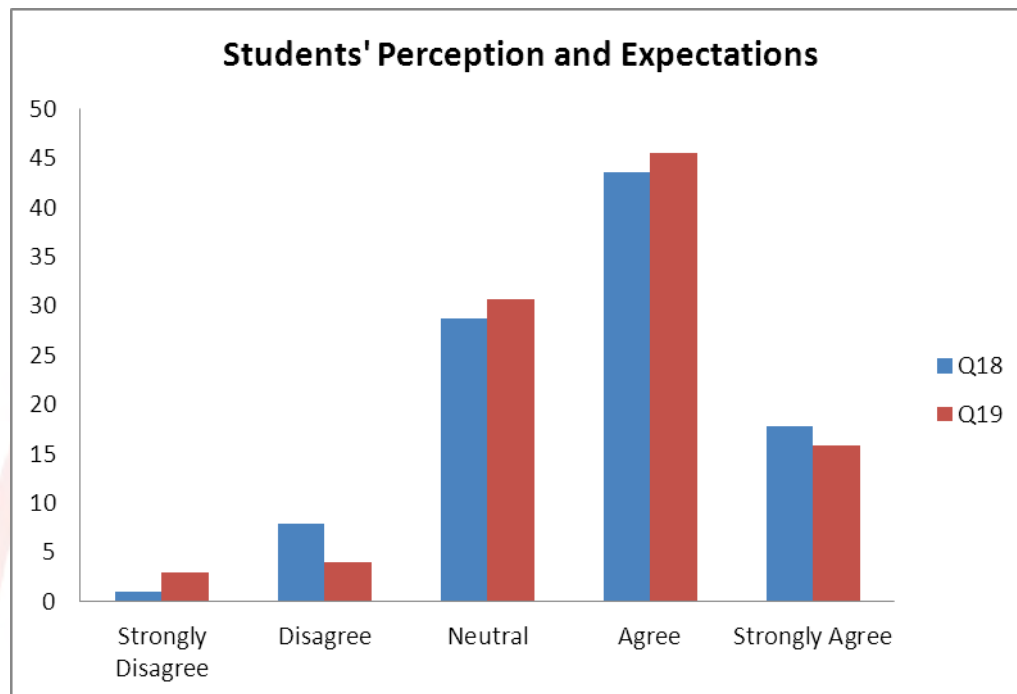

Figure 2: Students Perception and Expectation on Moodle Application

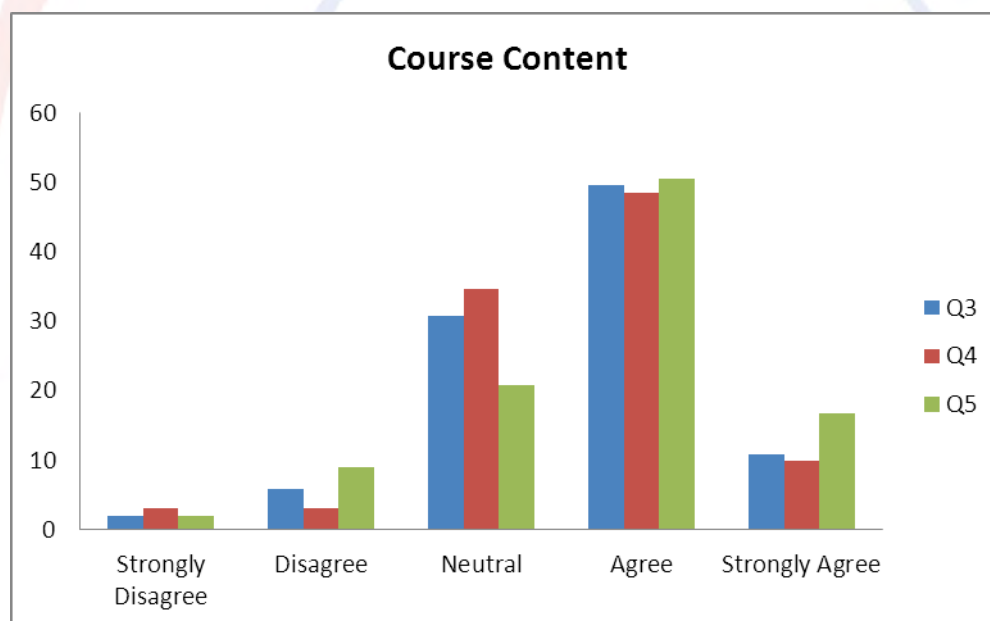

### 6.2 Respondents' Perceived Benefits of the Online Units

Students' benefits can be determined based on their perception, whether they find the resources given and the experience gained valuable. Table 3 indicates that many of the respondents perceived that the online lecture notes and the links provided were very useful and valuable (49.5% agreed, and 10.9% strongly agreed with Q3; 48.5% agreed and 9.9% strongly agreed with Q4). A significant proportion of the respondents (67.3 %) agreed that the course website was a great place for the instructor to place handouts as against 10.9 % who did not agree. In general, the students valued the overall pattern of access to teaching materials and additional resources through Moodle, as can be seen in Figure 4.

**Table 3. Percentage distribution and mean of respondents' perceived benefits in terms of access to valuable resources (N=100)**

Items	SD	D	N	A	SA	Mean	Sd
Q3. The online lecture notes were a valuable resource.	2.0	5.9	30.7	49.5	10.9	3.62	0.84
Q4. I found the links contained on the course Website valuable.	3.0	3.0	34.7	48.5	9.9	3.60	0.83
Q5. The course Website is a great place for the instructor to place handouts.	2.0	8.9	20.8	50.5	16.8	3.72	0.92
						3.65	0.86

**Key:** 5= SA-Strongly Agreed, 4= A-Agreed, 3=N-neither agree nor disagree, 2= D-Disagree, 1= SD-Strongly Disagree

**Figure 3: Students' perceived benefits in terms of access to valuable resources**

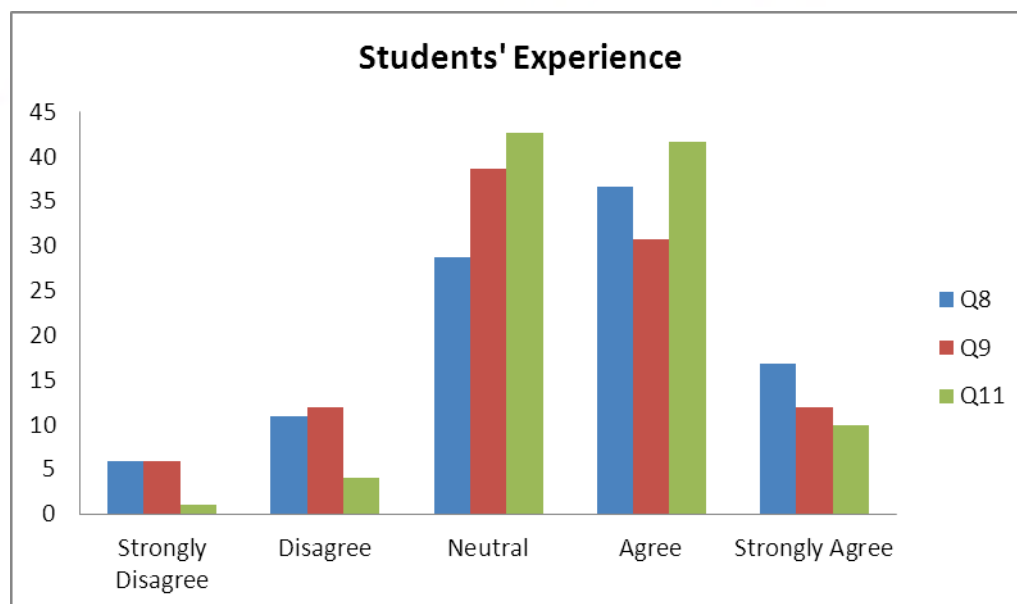

It is also important to determine whether the students gained any benefits based on their experience using Moodle for the whole semester. The most popular feature noted in this study was taking the online assessment. 53.4 % of the students took the online quizzes, and 42.6 % agreed/strongly agreed that the self-test quiz was convenient (Table 4). It is however observed that only 36 % indicated that Moodle stimulated their desire to learn. This could be due to the fact that these foundation students were experiencing a transition period from a school education to a higher learning education. The students are yet to adapt to a more self-study culture that are normally practiced in higher institutions, and thus the lack of interest was observed. However, 43.6 % viewed Moodle as a reliable communication tool and the majority of them also found that the online assessment worked reliably during their visit.

**Table 4. Percentage distribution and mean of respondents' perceived benefits in terms of their experience using Moodle (N=100)**

Items	SD	D	N	A	SA	Mean	Sd
Q8. I took the online quizzes/exams.	5.9	10.9	28.7	36.6	16.8	3.48	1.08
Q9. I found taking exams online convenient.	5.9	11.9	38.6	30.7	11.9	3.31	1.03
Q15. The Moodle portion stimulated my desire to learn.	2.0	10.9	50.5	30.7	5.0	3.26	0.80
Q17. Moodle provided a reliable means of communication.	1.0	11.9	42.6	38.6	5.0	3.35	0.80
Q11. The quiz/exam worked during my visit.	1.0	4.0	42.6	41.6	9.9	3.56	0.77
						3.39	0.90

**Key:** 5= SA-Strongly Agreed, 4= A-Agreed, 3=N-neither agree nor disagree, 2= D-Disagree, 1= SD-Strongly Disagree

Overall, most students believed that they had gained beneficial experience when using the online assessment tools in Moodle, which can be seen in the quantities of 'agree' shown in Figure 4, in terms of students' experience using Moodle online assessment.

**Figure 4: Students' perceived benefits in terms of students' experience using Moodle online assessment**

### 6.3 Interaction between Students and Lecturer

This study sought to determine the interaction between students and lecturer outside the classroom. On the frequency of checking the mailbox, 57.4 % of the students agreed that they checked their mailbox regularly, while 14.8 % of the respondents were in disagreement category and 26.7 % remained neutral, as observed in Table 5. Furthermore, only a small number of respondents emailed their lecturer through the course website. This implies that students were keen on updates from the lecturers. However, they were less interactive with their lecturer and were waiting to be fed with more information and learning materials. A one way communication is clearly observed in this scenario. Moreover, the assessments designed demanded more self-study approach instead of an interaction-based approach with the lecturers.

**Table 5. Percentage distribution and mean of respondents' perceived interaction between students and lecturer (N=100)**

Items	SD	D	N	A	SA	Mean	Sd
Q6. I emailed the instructor through the course Web-site.	10.9	21.8	47.5	15.8	3.0	2.78	0.95
Q7. I regularly checked my mailbox.	7.9	6.9	26.7	36.6	20.8	3.56	1.14
						3.17	1.05

**Key:** 5= SA-Strongly Agreed, 4= A-Agreed, 3=N-neither agree nor disagree, 2= D-Disagree, 1= SD-Strongly Disagree

### 6.4 Preference with Delivery Methods

Most respondents preferred a combination of traditional and web courses over face to face class (Figure 5). To further illustrate their preference, students were allowed to voice out their opinion at the end of the questionnaire. Comments received from them were generally very positive and encouraging about the blended learning environment. Some of the comments are as follows:

- 1) Face to face classes are more effective for learning but web courses are convenient for self-study.
- 2) More flexible learning. Different student have different learning style. Can cater for different learning styles.
- 3) Two is better than one. I can have more input on the knowledge of the course.
- 4) Lecturer's explanation is better to have in classes while answer for tutorials can be posted on website.

Thus, these feedbacks were consistent with students' expectation on Moodle implementation, i.e., they viewed e-learning in courses as a supplemental learning platform to traditional classroom practices. The finding was also similar to what was reported in the 2005 EAR report (Caruso & Kvavik, 2005) in which students' preferred moderate support of educational technology in their courses and they were still pleased with the face to face classroom engagement.

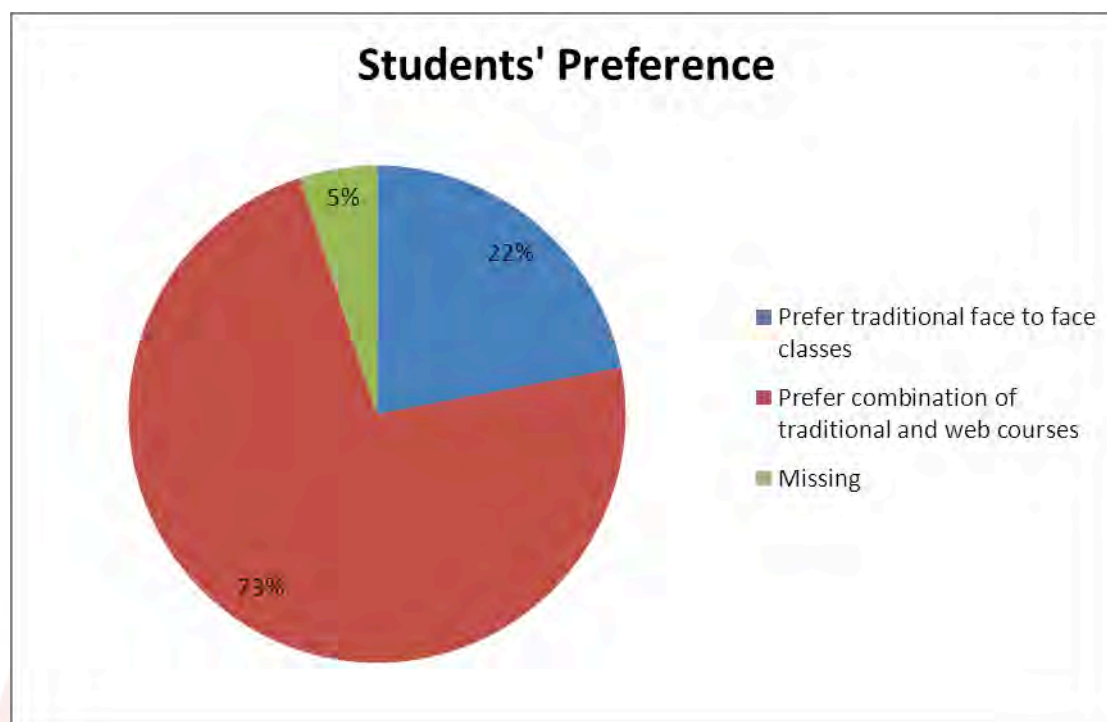

Figure 5: Students' Preference on delivery methods (N=100)

## 7. Limitations and Future Prospects

The study focused only on a minority of students from the foundation engineering programme. A larger scale could have been adopted. Nonetheless, the study conducted is a good stepping stone to further expand the sample size to include undergraduate students from various disciplines. With a larger sample size and a variety of students, a comparison study of students' perception and dependence level on Moodle to aid their self-study could be investigated. This will also allow the utilization of more sophisticated statistical analysis.

Another limitation of the study is the high frequency of respondents taking the "neutral" stand. By changing the 5 point Likert scale to 4 points Likert scale, this would best enable respondents to express their perception more accurately. As an alternative, weight measures could also be included to the Likert scale in order to determine the importance of each given statement. By multiplying the weight and the 5-point score of various items in Likert scale, the overall trend can be easily computed (Ten et al., 2008).

## 8. Conclusion

University teaching and students' learning are moving through transition processes that use education technology in support of academic work. There exists a greater acceptance of the online mode of instruction as an adjunct to learning. Nevertheless, the results of our work showed that most students preferred a moderate use of e-learning in their courses. Their positive attitude was observed towards the model of blended learning approach, and Moodle platform did create a positive impact on students' learning experiences in terms of the accessibility of learning materials and the support of online assessment activities. Students reported that the most valuable benefits of using Moodle platform in learning chemistry were the convenience of accessing the course materials and completing the online assessment tasks. Overall, the majority of the students perceived the use of course website as an opportunity to enhance their academic experience.

Although the students agreed that the hybrid learning provided them with the needed assistance, one of the drawbacks observed was that this method of delivery was prone to become a one-way communication. Responses to this study showed that the number of the students' email correspondences to the lecturers were minimum. The students were expecting to be "spoon-fed" with information, announcements and notes. Thus, a more interactive learning is needed to promote a two-way communication. Communication tools such as forum discussion and online chat room have the features that create interaction with instructors and among the peers. However, as mentioned earlier in the study, most students are likely to participate in the learning practices only if the activities are considered as part of the evaluation of their academic performance. It is therefore necessary to assign grading procedure in e-learning activities to increase students' participation. With the improvements at these loose ends, Moodle application in Chemistry will be an invaluable and imperative tool for the instructors as well as for the students.

*German and Japanese Education in the Shadow - Do Out-of-School Lessons Really  
Contribute to Class Reproduction?*

Steve Entrich

0197

University of Potsdam, Germany

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

Considering the great impact the first PISA-results caused in Germany and Japan, this study seeks to provide an explanation for the continuous higher achievement rates of students in the PISA-winner country Japan compared to their German peers. Another great difference between the two participants that was detected in PISA is the correlation between students' social origin and educational achievement, which is still very strong in Germany but not in Japan. The author assumes the reason for these differences lay outside the formal school system, in the sector of shadow education. The so called *Juku*-industry in Japan provides out-of-school lessons that seem to enable all Japanese students to achieve top results regardless of their social origin. In Germany the increased use of *Nachhilfe* is seen as an indicator for the downfall of the compulsory school system and a problem that seem to widen the gap in education levels all the more. If in Japan almost every household regardless of its social status sends its children to out-of-school classes, the assumption that people do invest in further education in terms of extra classes at *Juku* believing this will have a neutralizing effect on disadvantaged family background suggests itself. Consequently the author intends to refute the prevailing assumption of researchers in Germany and Japan stating that out-of-school lessons just contribute to the reproduction of class structure. Using secondary data as well as PISA-data the author wants to show that shadow education helps to counteract educational disadvantages through the provision of various educational opportunities.

The International Academic Forum

[www.iafor.org](http://www.iafor.org)

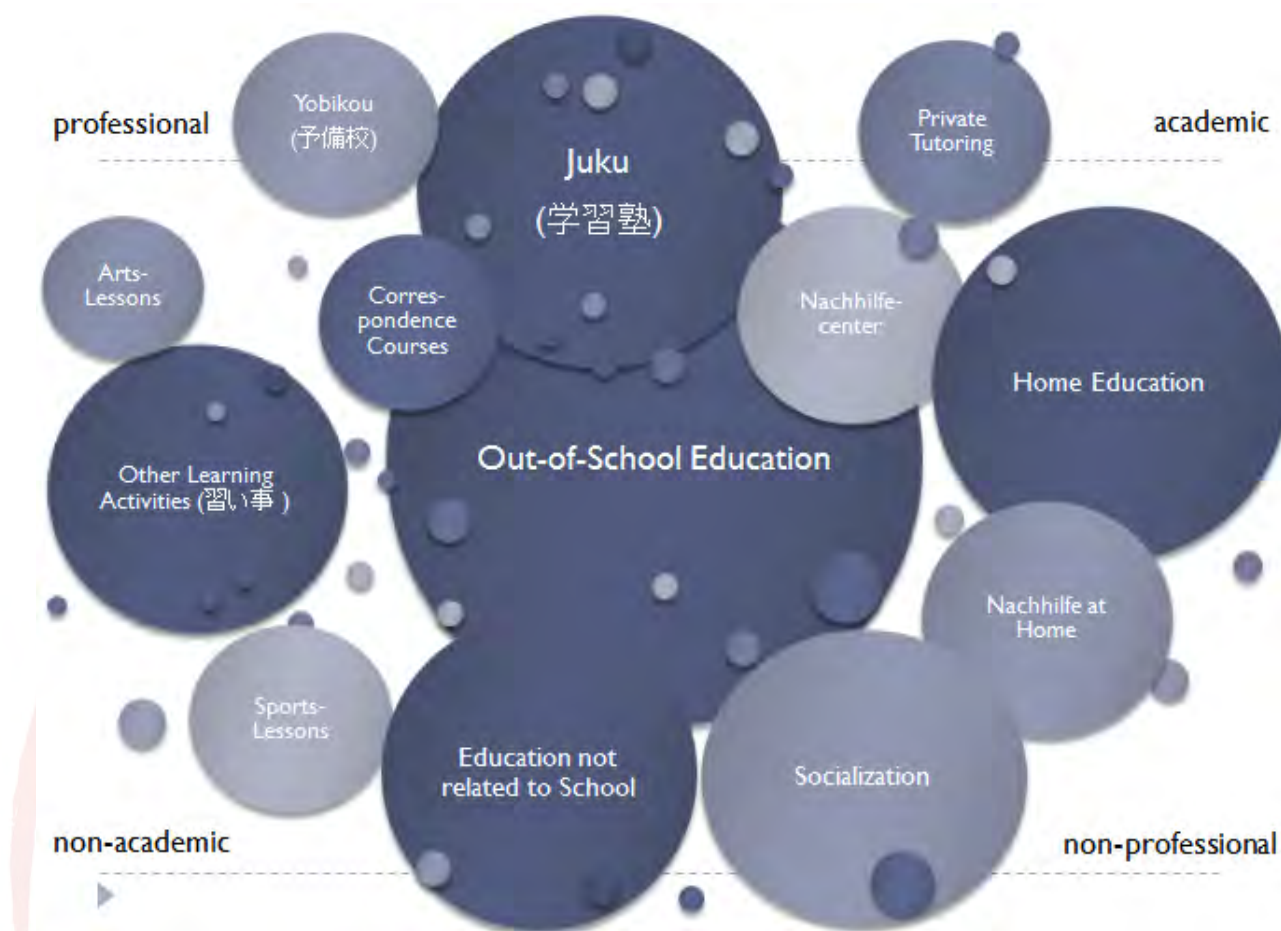

## 1. Introduction

The publishing of the first results of the *Programme for International Student Assessment* (PISA) caused a public, political and scientific debate about education in Germany. Germany's hope for a top position was unfortunately not a reality. Instead the OECD certified the German students at best in the middle field of performance within the study. In addition, students' social origin correlated strongly with educational achievement in Germany (Stanat, et al., 2002, p. 12). German researchers began to ask how Germany's educational system could have performed so poorly amid other OECD countries and what was done differently in PISA winner countries such as Japan? Not only were Japanese students able to achieve top results. The influence of students' social origin on the performance at PISA was the lowest in Japan amid the participants (Ibid., p. 12). The Japanese seem to have found a way to neutralize disadvantaged family background through education enabling all students to achieve a high level of education regardless of the wealth of their parents. Considering that the formal school system possesses no apparent significant differences that could clearly explain the Japanese success over Germany (von Kopp, 2000, p. 181f.) another explanation had to be found. Not only can the formal school system be held responsible for the success of its students. Also education outside of school has to be acknowledged to understand the Japanese success (Schümer, 1999, p. 46). These responsible out-of-school lessons are called shadow education.

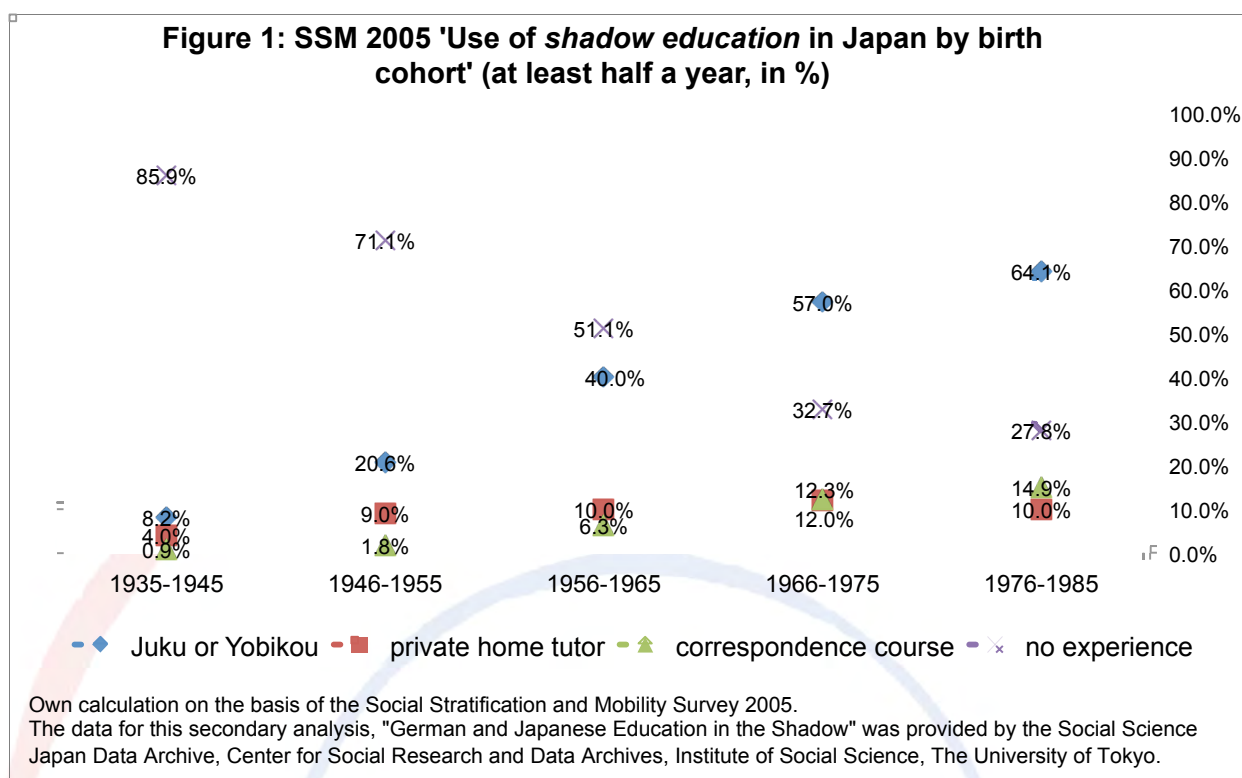

## 2. Shadow Education and its Implications

A shadow education system is an educational system of private institutions and organizations operating alongside the formal school system. In comparison to non-professional forms of shadow education, such as home education given by parents, all forms of professional shadow education (scheme 1) as taught by (non-)school teachers has to be paid for and is related to school education. In the following only such forms of shadow education will be considered, which are academic and professional, also assuming that they have to be paid for. Mostly this kind of shadow education is found at private institutions offering private tutoring, enrichment as well as remedial courses or simply out-of-school classes providing help with homework or the preparation for tests and exams. Most of the providers do also offer courses that let students expand their knowledge beyond that of their peer's. As recent research indicates, these out-of-school lessons do indeed have a positive effect on school achievement (Bray, 1999; 2009; Dettmers, Trautwein and Lüdtke, 2009; Dohmen, et. al., 2008; Jäger-Flor and Jäger, 2009; Klemm and Klemm, 2010; OECD, 2011).

Scheme 1: Different Forms of Shadow Education

Today shadow education can be found all around the globe (Bray, 1999; 2009; 2010). Particularly in Japan the use of out-of-school classes has a long tradition. After the great *Juku*-Boom (Rohlen, 1980) in the 1970<sup>ies</sup> as a result of the extraordinary high increase of educational aspirations of the Japanese population in the course of educational expansion, the Japanese shadow education system expanded steadily (Haasch, 2000, p. 195; Dierkes, 2010a, p. 26), as figure 1 shows. Here instead of the Japanese government, which did not met the educational needs of worried parents, private operators promised help through the provision of supplementary classes at their educational institutions, the *Juku* (Haasch, 1979, pp. 43, 45f.; Drinck, 2002, p. 263). Currently almost every student in Japan is taking or has taken classes at *Juku* (MEXT, 2008, p. 12).

Consequently the so called *Juku*-industry, as this national supplemental private tutoring entity external to the formal education system is entitled, provides one possible explanation for Japan's high performance results in international educational research studies, such as PISA.

Nowadays the phenomenon of rising demands for private supplementary education has also increased in most western countries, such as Germany. In Japan, *Juku*-owners promote that shadow education will lead to the superior results of the Japanese youth compared to compulsory school education (Dierkes 2010a, p. 25). In Germany, comparable programs known as the *Nachhilfe*-institutions offer the same promises that operators of private educational institutions make all over the world: they lure students with the promise for better pedagogical concepts that give parents a way out of an educational misery – successfully as it seems. Especially since the 1990<sup>ies</sup> the use of professional out-of-school lessons in Germany has strongly increased (Guill and Bensen, 2011, p. 307; Mayr, 2010, pp. 10f.). The German *Nachhilfe*-system has expanded and became an influential factor educationally as well as economically. Various conservative estimates suggest that around 1.1 million German students yearly use *Nachhilfe*. This industry has approximately already a turnover up to nearly 1.5 billion Euros a year (Klemm and Klemm, 2010, p. 20). Although these numbers may seem impressive, the German *Nachhilfe*-system with its approximately 3.000 to more than 4.000 *Nachhilfe*-branches is still in an early stage of development compared to the Japanese *Juku*-system that generates about \$12 billion a year (Dawson, 2010, p. 16). While in Japan most shadow education has been professionalized and is mostly taking place at *Juku*, in Germany other forms of shadow education are still predominant. Only about 30% of all shadow education in Germany takes place at *Juku*-like institutions (Dohmen, et. al., 2008, p. 53). In comparison, in Japan there are even more *Juku* (almost 50.000) today than formal schools combined (about 39.000) (Benesse, 2007, p.2). This indispensable addition to the public compulsory school system has become influential in such a way, that it is perceived the Japanese formal school system alone cannot prepare students for their later life course in a proper way anymore (Sato, 2005). In promotion with this belief, local officials have advocated for the *Juku*-schools as positive alternatives and actually pursue partnerships with those institutions to improve their learning opportunities (Dierkes, 2010b). The fear, compulsory

schools will not be able to sufficiently educate children anymore is already present in Germany, too. In general, in Germany students needing *Nachhilfe* is seen as a problem and an indicator for the downfall of the compulsory school system. The idea the compulsory school system is no longer able to equip students with the needed armamentarium to succeed in school and thereafter is a national issue of concern. In fact, the high costs for private lessons seem to intensify social disparities and widen the gap between rich and poor all the more, as some studies indicate (Schneider, 2004/2006). While in Japan all social classes seem to be able to use the expensive out-of-school education, this is not the case in Germany. Whether it really are the costs that some German parents cannot afford, the unwillingness to pay for supplementary education for their child, or it is the nescience about what shadow education can possibly offer, has not been sufficiently researched yet. As social scientific research on education has proven, primary as well as secondary effects of origin have a great influence on educational pathways. Parents do decide on the educational trajectory of their child regarding to their socioeconomic capital considering costs of education depending on the estimated returns to education (Becker and Lauterbach, 2010, p. 15ff.). If in Japan almost every household sends its children to *Juku*, parents might indeed think that an investment in further education will pay off for their children. This would explain a low achievement range between students with high and low social origin.

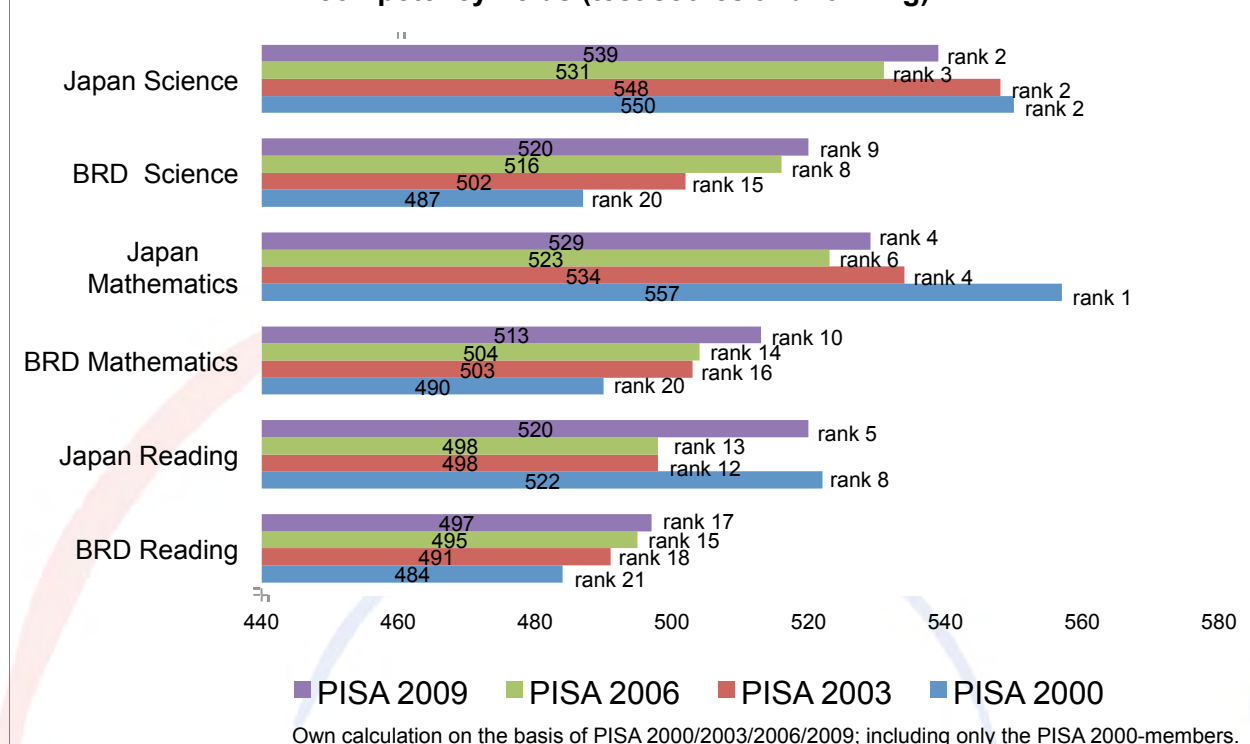

### **3. The Cause of the Achievement Gap: The Use of Professional Shadow Education**

Before we can discuss the question if out-of-school lessons just contributes to the reproduction of class structure or if shadow education may in fact counteract educational disadvantages through the provision of various educational opportunities where needed, the theoretical framework of such a thesis has to be determined. Of greatest interest for this work is to first prove if Japanese students are constantly achieving better results compared to their German peers. Therefore, in the following some results of the most popular international student achievement study PISA will be presented.

#### *3.1. Educational Achievement in International Comparison*

After Germany has been absent from its participation in international student assessment studies for nearly 30 years, the empirical educational research in Germany was rediscovered as a powerful means for educational policies in the late 1990<sup>ies</sup> (Arnold, 2001, pp. 161ff.). Unfortunately, the hoped for top-position within the PISA study of the year 2000 remained a dream. On the contrary, a comparatively low performance was attested (figure 2). As we can see, it seems that Japan's students achieve always significantly higher results in all fields of performance within the PISA study than their German peers. Over the last decade, German students never reached the competency levels of their Japanese contrahents. In the PISA survey of the year 2000 Japanese students achieved rank 1 in Mathematics, rank 2 in Science and rank 8 in Reading, showing nearly equally good results in 2009 (ranks 4, 2 and 5 respectively). German students on the other hand did not achieve comparable results. With rank 20 in mathematics and science as well as rank 21 in reading, Germany made it barely to the lower middle field in international comparison. Although the results for Germany were getting better over the years (2009: mathematics rank 10, science rank 9, reading rank 17) ranks within the PISA top field could not yet be achieved.

**Figure 2: PISA 2000 to 2009 'Positioning of Germany and Japan within the different competency fields (test scores and ranking)'**

### 3.2. Instruction Time

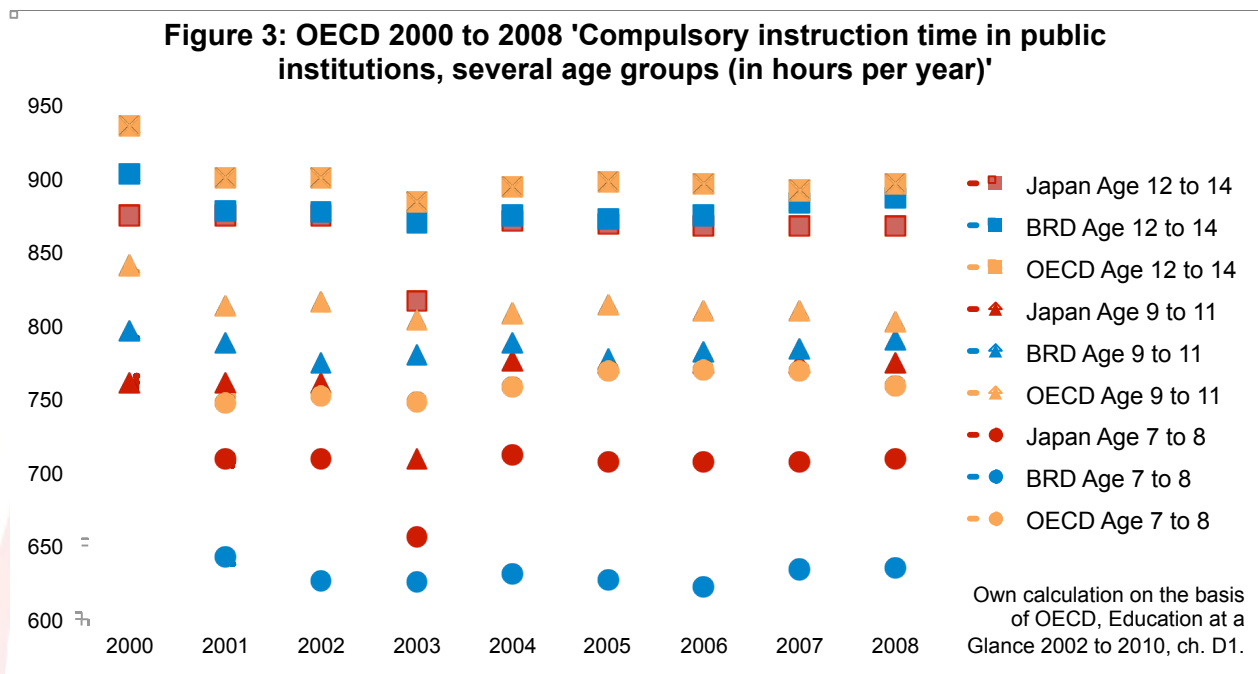

One could assume that the higher achievement rates of Japanese students may be mainly caused by longer study hours at school. As will be shown in the following, this is not the case. The quantitative learning time of students in Germany and Japan today does not differ very much or, at least, in Japan the time spend in school is not significantly higher than in Germany. Table 1 shows the medians of the number of class periods in both countries, also considering the three performance fields of the so far conducted surveys of the PISA study.

**Table 1: PISA 2000 to 2009 'Number of weekly class periods per subject'**

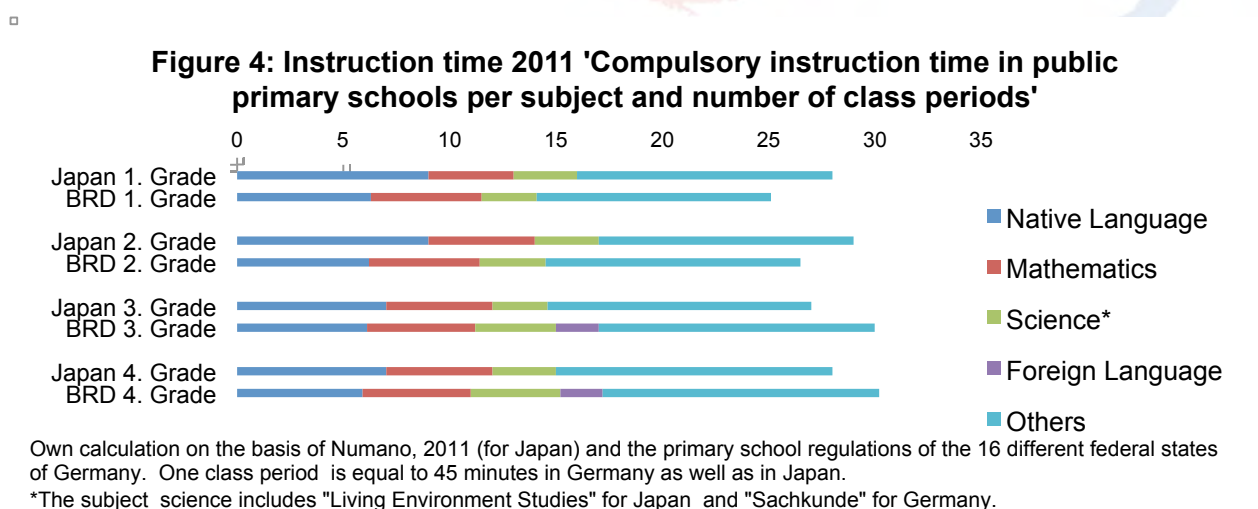

Country			native language	mathematics	science	all subjects
Germany	PISA 2009	valid	659798	656892	637595	636625

		missing	225168	218224	235950	-
		median	5	5	4	-

Own calculation on the basis of PISA 2000/2003/2009.  
One class period is equal to 45 minutes for Germany and 50 minutes for Japan.  
The data of PISA 2006 is not considered, because no clear categories were defined.

Here a development in school learning time from PISA 2000 to PISA 2009 can be found. While in Germany the learning time increased in general from 30 (2003) to 32 (2009) class periods per week and in the field science from 4 (2000) to 5 (2009) class periods per week, it decreased in Japan in native language as well as in science about one class period from 5 (2000) to 4 (2009) and 4 (2000) to 3 (2009) respectively. Further data as conducted by the OECD might show if the learning time in Japan differs very much prior to ninth grade or not (figure 3).

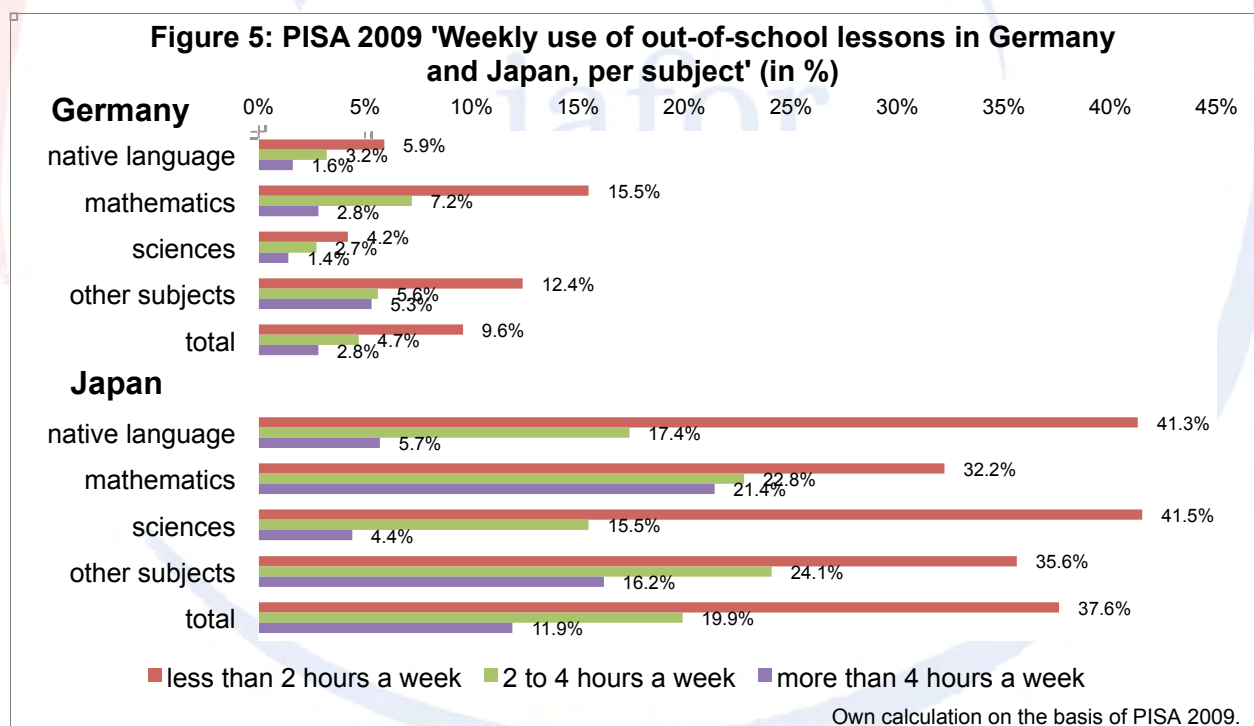

Although the overall instruction time seems to even be slightly higher in Germany for 9- to 14-year olds, a real difference in instruction time can only be detected for students of the age 7 to 8. Even the comparison of instruction time in the three subjects related to the three performance fields of PISA reveals no great differences between German and Japanese students aged 9 to 14 (own calculation on the basis of OECD, 2002 – 2010, ch. D1). A glance on public primary schools in both countries shows that there is a difference in the total number of school hours, but no huge differences in the time spend for the PISA related subjects. Only in native language real differences seem visual (figure 4).

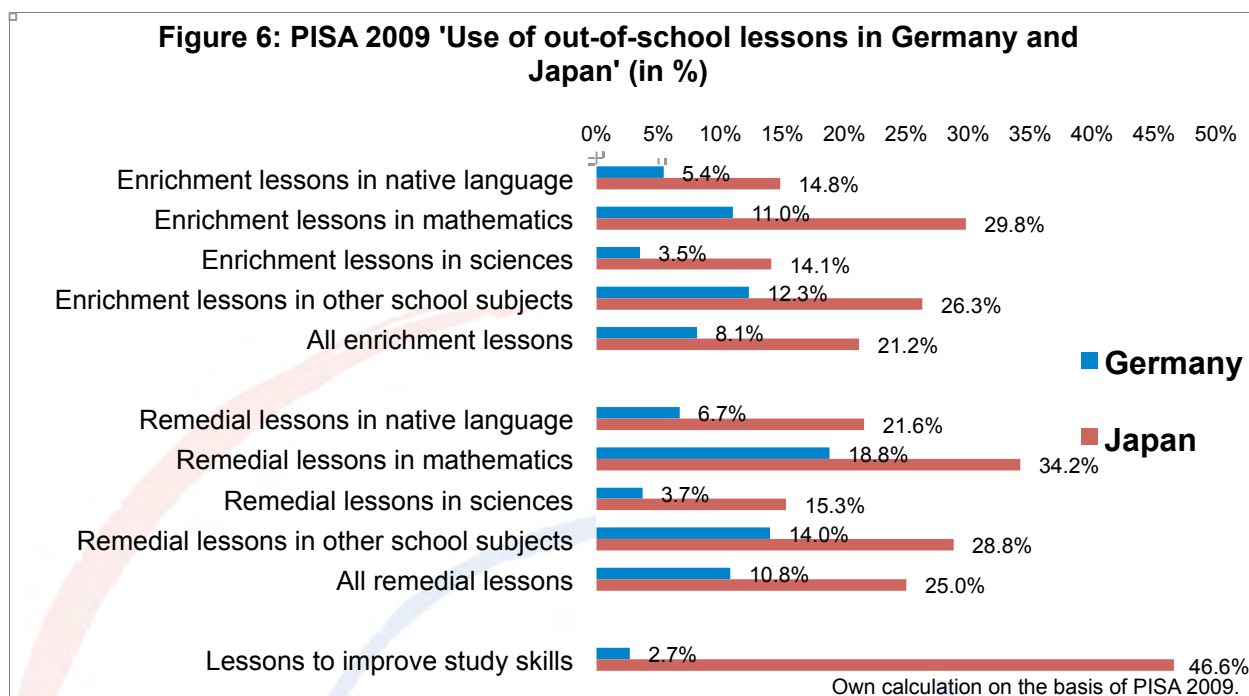

Due to the reformation of primary education in Japan as initiated in 2008, the time for instruction in school has increased for the first time in 30 years. Especially for native language and science

more time is now invested (Numano, 2011, p. 8). On the other hand, the curricula in Germany have also been reformed since the implementation of curriculum and school structure reforms after the great PISA-shock in 2001 (Entrich, 2008). In conclusion it has to be stated, that the differences between the amount of instruction time in German and Japanese schools in the three above mentioned PISA-related subjects are not convincing enough to serve as an explanation for higher achievement rates. The pure quantity of lessons is not that different in both countries, so a clear explanation for the much higher achievement rates in Japan is still missing. Although the Japanese school lessons might be of much higher quality than in other countries, as indicated by several studies (e.g. Stevenson and Stigler, 1992), this higher quality is also not possible without an investment in extra classes (Schümer, 1999, pp. 50ff.). Nevertheless, until today the Japanese *Juku*-industry has not been acknowledged for what it is: an indispensable addition to the public school system (e.g. OECD, 2012, p. 202). Although in Japan everybody seems to know that “Educational achievement is prompted by a broad societal and educational infrastructure, of which formal schooling is just one part.” (Tanabe, 2000, p. 125) In addition to that, higher quality is mostly found in primary schools rather than in middle or high schools (von Kopp, 2000, p. 181f.).

It seems more reasonable to assume that a possible explanation for the higher achievement-rates of Japanese students in PISA lays in the far greater use of out-of-school education in comparison to German students. Consequently Japanese ninth graders have to generally attend significantly more out-of-school classes than their German peers (figure 5).

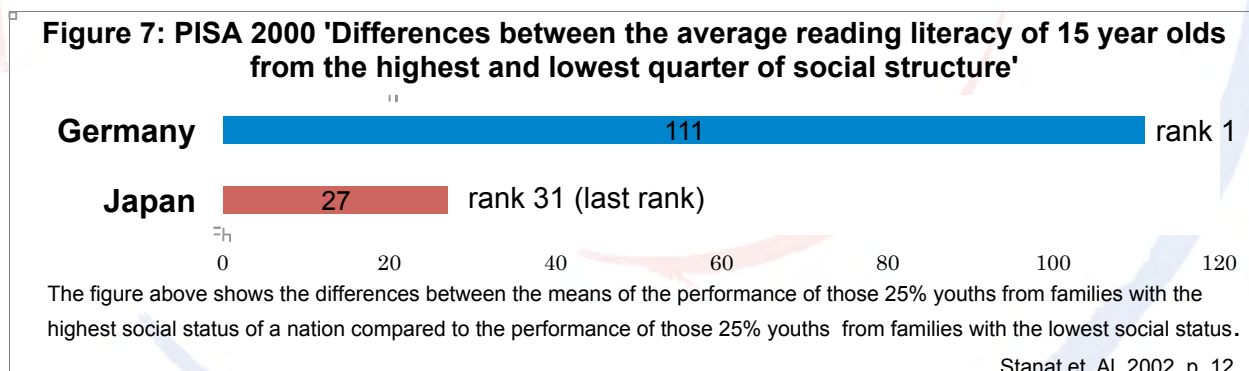

Assuming that out-of-school lessons contribute to students' educational achievement, this might be one explanation for the higher achievement rates of Japanese students compared to German students. The Japanese PISA-participants did generally use shadow education more often. As we can see, especially in the three PISA-related subjects native language, science and mathematics (!) out-of-school classes are attended to a high degree. As figure 6 shows, it even makes no great difference what kind of out-of-school education is used. Japanese students use more out-of-school supplementary education of all types. Especially the high percentage of lessons to improve study skills in Japan (46.6%) is impressive, whereas in Germany (2.7%) this seems to be an exception.

### 3.3. Social Origin and Educational Achievement

Besides the at best mediocre results of German students in PISA 2000, it became clear that the social origin of a student plays a significant role for the level of educational achievement in Germany. In Japan the correlation between social background and educational achievement is not very high (figure 7).

Here the range between the performance of students of the highest and lowest social quartile of society was the lowest in Japan (27 points), but highest in Germany (111 points) in 2000. Although the influence of social background in 2009 seems to be not as strong in Germany as it used to be in 2000, there still remains a big difference in comparison to the Japanese case. Here about 11% of resilient students can be found among the 25% of those youths from families with a low social status. Germany still belongs to the countries where students' learning outcomes are strongly determined by their social origin (OECD, 2012, p. 49). The reason for this nevertheless apparent improvement in Germany may be a result of reform measures undertaken in the different federal states of Germany. Also the increased use of shadow education may play a great role here. The lower range of performance in Japan may be caused by the higher use of shadow education in all social quartiles. Especially students with disadvantaged social origin may indeed be the ones to use out-of-school education as a means to counteract their family background.

Following leading sociological theories, scheme 2 illustrates what causes may underlie the motivation of different social classes to invest in shadow education.

Scheme 2: Social Status and Shadow Education

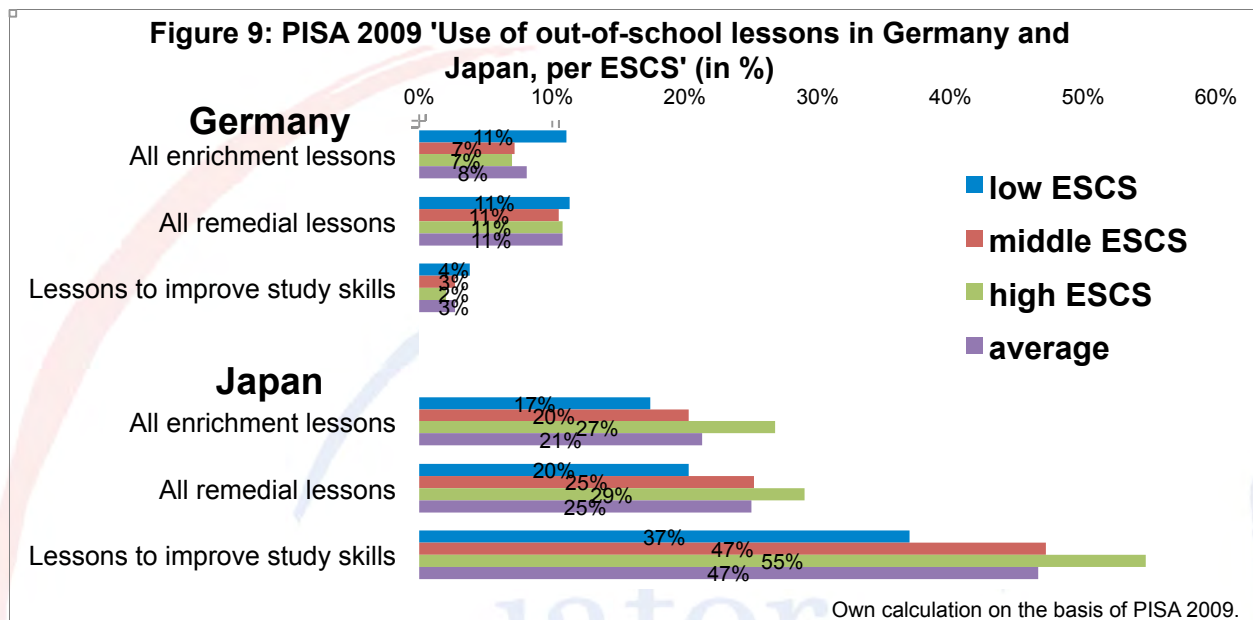

Through the above showed scheme possible causal relationships can be visualized theoretically before we translate them into our data analysis. As scheme 2 illustrates, families with a high social status are trying to preserve their status. To achieve this goal a high level of education has to be guaranteed for their children. Whether the school seems to not prepare their children enough for a successful life course or the children's grades are not what they ought to be, parents may be concerned in one way or the other. Therefore measures have to be taken that will assure a high status. Here shadow education, although it may seem as some kind of emergency solution, can serve as possible guarantor for educational success. The expenses for this supplementary education seem to be tacitly approved by those parents. In comparison, families with a low social status do have the greatest opportunities in education. On the other hand, those families may not even realize the importance of a good education. They might just not see the chance of social advancement. But even if they realize how important education can become for their children, they might not have the financial resources to take the opportunity that shadow education may provide for them. So this has to be proven in the following chapter. Middle class families have to worry about status preservation so they will not slide down the social ladder. On the other hand they can also grab the opportunity to climb the social ladder. Again education is the crucial factor for both scenarios. It becomes clear, how influential primary as well as secondary effects of origin are for educational pathways. Here shadow education can advance to become a chance to at least preserve the social status or even climb the social ladder. Of course parents are also measuring if further investments in education will pay off in the end (Becker and Lauterbach 2010, p. 15ff.). We will see what similarities and differences exist in Japan and Germany regarding the investment in shadow education. Consequently we will be able to make conclusions about the ability as well as the willingness of parents to invest in shadow education in Japan and Germany. Does social class play a role in who utilizes out-of-school classes in the two countries? Are really all Japanese students able to utilize out-of-school education regardless of their social origin? Some answers shall be given in the next chapter.

#### 4. Shadow Education as a Means to Counteract Social Disadvantages?

To verify our theoretical assumptions we will use PISA data of the year 2009. Therefore the dependent variables about the use of shadow education and the covariate, the index of the economic, social and cultural status (ESCS) to describe students' social status are included in the

analysis. The ESCS index was derived from PISA variables which are all related to family background: the highest parental education in years (PARED); the highest parental occupation (HISEI); as well as the number of home possessions (HOMEPOS). The variable HOMEPOS was used as an approximate measure of family wealth (OECD, 2006, p. 316). For our further research all data was weighted to get unbiased estimates of population parameters. To categorize the ESCS variable, it has been subdivided into three social classes: lowest 25% (lower class), highest 25% (upper class), and the 50% in between (middle class).

Surprisingly the greatest differences between social classes are detected in Japan (figure 9). Although all Japanese students use shadow education far more than German students, it seems as if the use of shadow education increases the higher the students' status gets. In comparison, in Germany more lower class students attend *Nachhilfe*-classes. Especially enrichment lessons are attended by more lower class students (11.1%) than higher class students (7%) in Germany. On the other hand, remedial lessons are nearly equally used by all students (about 11%). In general, the demand for remedial lessons is slightly higher than that of enrichment lessons in both countries.

Although high percentages of all Japanese students are able to use shadow education, it seems as if social strata have a greater impact on who uses shadow education in Japan than in Germany. It seems advisable to proof how much out-of-school lessons are attended per social class.

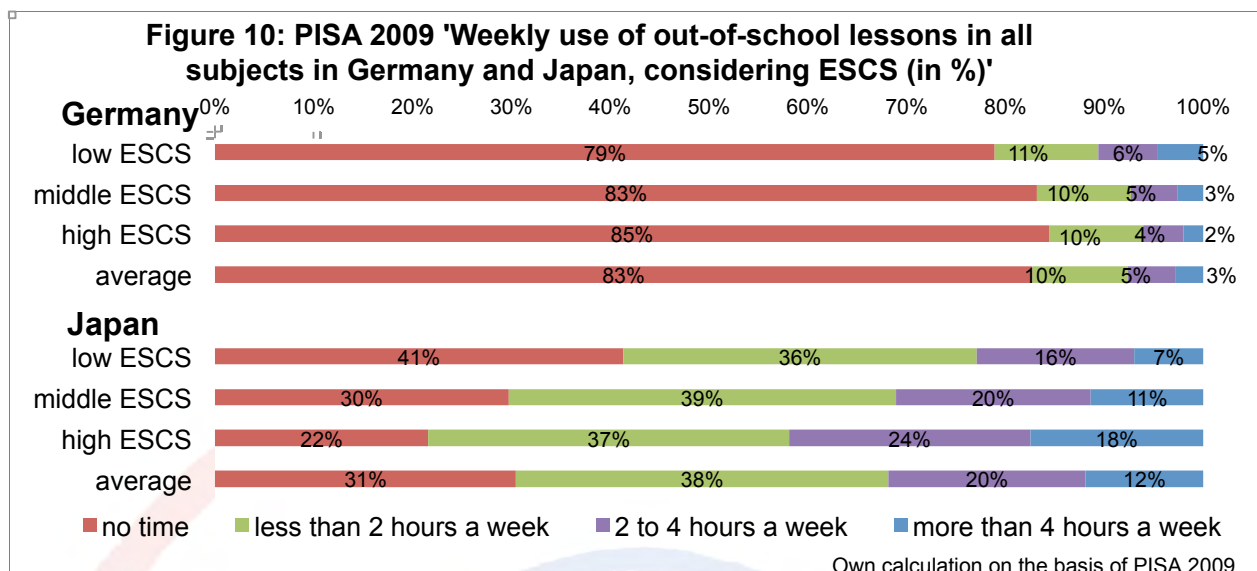

Figure 10 reveals the weekly amounts of time spend for out-of-school classes by social class. Now we see that there are some differences in the use of *Nachhilfe* in Germany. Students with low ESCS do attend more *Nachhilfe*-lessons (21%) than their peers with higher ESCS (approximately 15%). In Japan differences seem to be even more obvious. The higher the social background of a student, the more he uses the opportunity of shadow education. In total a difference of 21% can be detected between low and high ESCS students. The percentage of users that attend out-of-school classes less than two hours a week does not differ that much between social strata. Particularly those students who can afford to attend more than two hours a week of out-of-school classes differ extremely between high (2-4 hours: 24,4%; 4 and more hours: 17,5%) and low ESCS students (2-4 hours: 15,9%; 4 and more hours: 7%).

In conclusion, we have to acknowledge these first results. It seems as if German shadow education is functioning more as an instrument to neutralize disadvantaged family background than Japanese shadow education. Although this would also be a very positive result of this investigation, there are other factors we have to consider before jumping to final conclusions.

First, we have to keep in mind in what way the two student populations of our dataset differ. Here one thing might be of great importance to understand the presented percentages of the two countries. If we take a look at the distribution of respondents using lessons to improve study skills as an example (table 2) we will see a great difference between the two countries.

**Table 2: PISA 2009 'Lessons to improve study skills in Germany and Japan, per ESCS' (in %)**

			ESCS			Total
			low ESCS	middle ESCS	high ESCS	
GERMANY	Lessons to improve study skills	Count	156705	334292	178962	669959
		%	23.4%	49.9%	26.7%	100.0%
JAPAN	Lessons to improve study skills	Count	335997	583536	183176	1102709
		%	30.5%	52.9%	16.6%	100.0%

Own calculation on the basis of PISA 2009.

There might be approximately the same number of students with a high ESCS in both countries. But as we can see above, the percentage between social classes is differing: in Germany about 26.7% of all students belong to the higher class. In Japan only 16.6% are counted to this class. This means that the beforehand presented data has to be interpreted keeping these population diversities in mind. Consequently, percentages of Japanese lower and middle class students who attend out-of-school education carry much more weight than those of upper class students.

Also the correlations between the ESCS of a student and the use of out-of-school lessons is not very high (tables 3 and 4). It seems as if the ESCS has no great influence on who is able to attend out-of-school lessons in Germany and Japan.

**Table 3: Correlation between ESCS and out-of-school lessons in Germany and Japan.**

		Lessons to improve study skills	Enrichment Lessons in				Remedial Lessons in			
			native language	mathe-matics	science	other subjects	native language	mathe-matics	science	other subjects
ESCS GER-MANY	Pearson Correlation	-.040**	-.117**	-.071**	-.026**	-.032**	-.099**	.012**	.007**	.024**

ESCS JAPAN	Pearson Correlation	-.144**	-.028**	-.142**	-.034**	-.121**	-.060**	-.129**	-.044**	-.079**
	Sig. (2-tailed)	.000	.000	.000	.000	.000	.000	.000	.000	.000

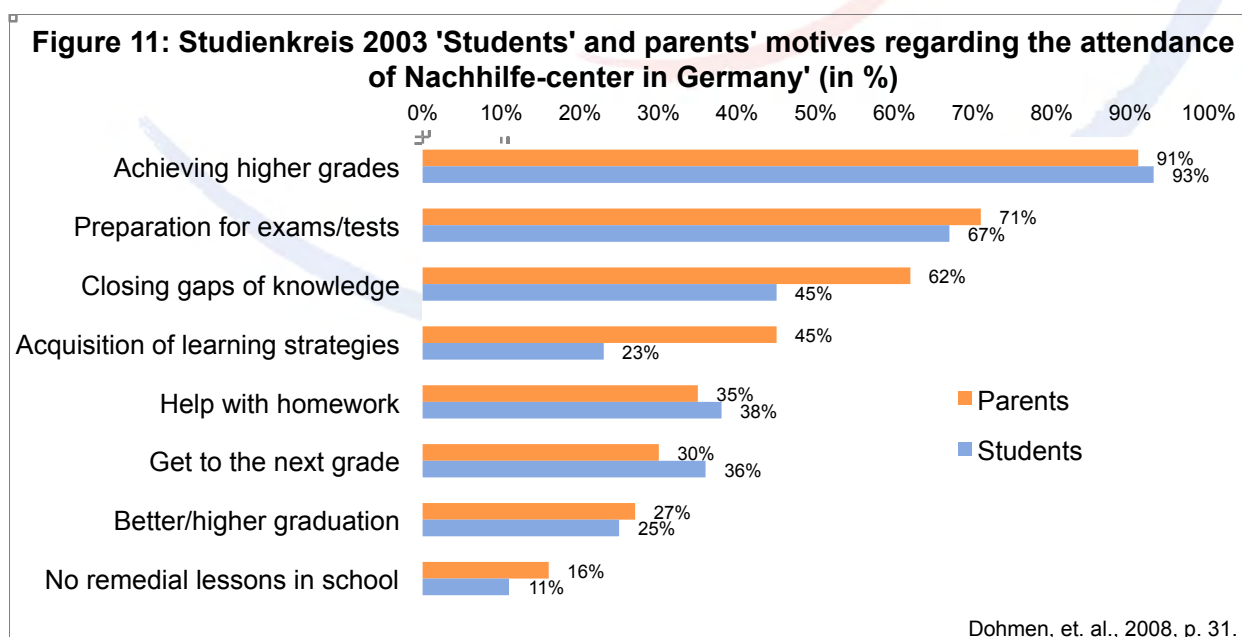

\*\*. Correlation is significant at the 0.01 level (2-tailed).  
Own calculation on the basis of PISA 2009.

**Table 4: Correlation between ESCS and weekly amount of out-of-school lessons in Germany and Japan.**

		Weekly out-of-school lessons in			
		native language	mathematics	science	other subjects
ESCS GERMANY	Pearson Correlation	-.119**	-.077**	-.058**	-.025**
	Sig. (2-tailed)	.000	.000	.000	.000
ESCS JAPAN	Pearson Correlation	.143**	.264**	.167**	.247**
	Sig. (2-tailed)	.000	.000	.000	.000

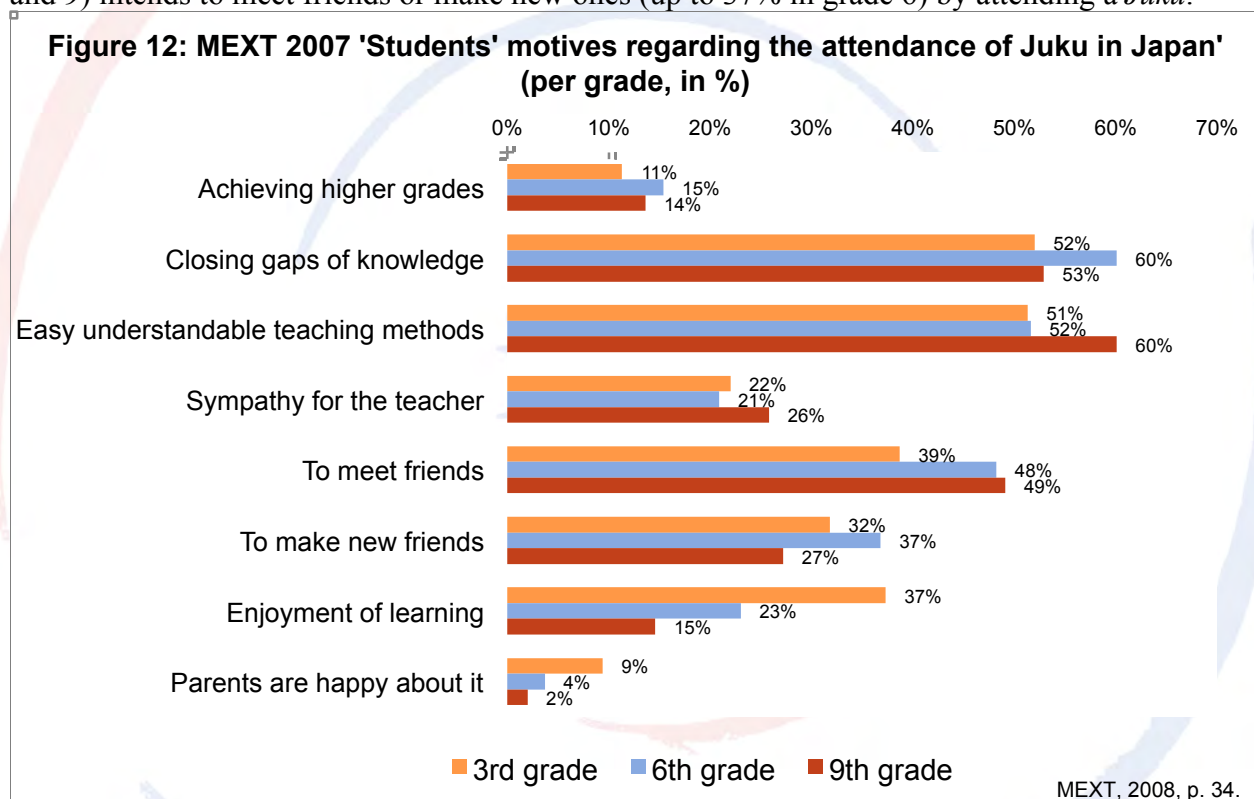

\*\*. Correlation is significant at the 0.01 level (2-tailed).  
Own calculation on the basis of PISA 2009.

Another explanation for the great class specific differences in the use behavior regarding shadow education between the two countries can also be found in the different motives why out-of-school lessons are attended (figures 11 and 12).

Following the data of a survey conducted by one of the two biggest German *Nachhilfe*-providers, owning more than 1.000 *Nachhilfe*-center in Germany, it is the foremost objective of German parents as well as students to get better grades. Most German students seem to attend out-of-school lessons because they have a certain problem at school. Besides getting better grades, they seek to close gaps of knowledge or get help with preparations for tests or with homework. In Japan it is entirely normal for a child to go to a *Juku*. Especially in middle school nearly everybody goes to a *Juku* in the afternoon. As the next figure (12) shows, Japanese students have also very different reasons to attend a *Juku*.

In comparison to German students, where nearly everybody uses shadow education to get better grades (91%), just a mere 11% to 15% of Japanese students use out-of-school lessons to achieve higher grades in school. Nearly of equal importance is it to close gaps of knowledge. But besides that the better teaching methods play a big role for attending a *Juku*. Otherwise though, more social aspects seem important to Japanese students, too. So nearly every second student (grade 6 and 9) intends to meet friends or make new ones (up to 37% in grade 6) by attending a *Juku*.

Based on sociological cost-benefit-assessments the assumption that those motives are also determined by social origin make a lot of sense (Becker and Lauterbach, 2010, pp. 15ff.). While wealthier parents can easier afford to send their children to *Juku* the more disadvantaged families may not. Considering the nevertheless high attendance ratio of lower class students in Japan, it becomes clear that lower class students will not be able to attend a *Juku* because they would like to meet their friends or something like that, but they need a certain kind of education. Here parents decide to send their children to a *Juku* because they assume that this is an investment worth being given (secondary effect of origin). This would also explain the low achievement gap between students of higher and lower social class.

## 5. Conclusion

Although comparable school instruction time is found in Germany and Japan, Japanese students achieve constantly higher results than their German peers. The assumption that the reason

herefore lays only within quality differences between the school instructions of the two countries is not sufficient enough. Here the Japanese shadow education system provides a reasonable explanation for those higher achievement rates. As could be shown, Japanese ninth graders are much less influenced by their family background in achieving educational success than their German counterparts. Also, Japanese students of all social classes invest in shadow education to a high degree. This means, shadow education may indeed be used to counteract disadvantaged family background – although with some restrictions. On first sight, the influence of the social origin of a student seems to be much stronger in Japan than in Germany. Different educational aspirations of social classes as well as financial resources do also play a role for the shown differences between low and high ESCS groups in Japan. When it comes to quantity, students of low ESCS cannot compare with those of higher ESCS. But it seems as if lower class students do just invest in essential classes to get an education as good as the more advantaged students. This would explain the high percentage of resilient students in Japan (about 11%). In Germany the social origin of a student does not seem to play a great role in who uses shadow education and who does not. Students from lower classes do even invest slightly more for supplementary education. Nevertheless, the small difference in the amount of use as well as the comparatively low attendance ratio is not yet sufficient enough to be a cause for a decrease of disparities.

Abstracts

Numerous philosophies and theories of education affect teaching and learning in academic institutions by influencing the ways teachers think, plan their work, and interact with students. An ideal philosophy of education stresses the need for learner autonomy and personal growth, empowering students to actively pursue lifelong learning in a wide range of fields. The life-experience of each individual student can be incorporated into the curricula of an educational system in order to make significant contributions to society (Dewey, 1997). Effective teaching relates learning in a meaningful way to the real-life experiences of students. An appropriate educational philosophy and system must also address the functions of schooling at all levels, curriculum design, and pluralism in the era of globalization. A philosophy of education must possess substantial historical and philosophical foundations and embrace technological change without being dominated by technology. Change has been a constant factor in education, and a realistic educational philosophy must embrace change. Historically, schools have experienced constant change, and the rate of change has accelerated exponentially due to the impact of technological advances in society. The goals and objectives of schools and the roles of teachers have throughout history been determined by underlying philosophies and social theories in a progression of technical, academic, and social transformations. Post-modernism, with its emphasis on the development of critical thinking skills, may be the ideal supporting social theory for an effective philosophy of education in contemporary international society.

## *Introduction*

The ideal philosophy of education emphasizes the need for learner autonomy and personal growth, empowering students to actively engage in lifelong learning. Dewey (1997) maintained that “education in order to accomplish its ends both for the individual learner and for society must be based upon experience- which is always the actual life-experience of some individual” (p. 89). Effective teaching connects learning in a meaningful way to the real life-experiences of students. A philosophy of education must be based on substantial historical and philosophical foundations and promote technological change without being overwhelmed by such change. Post-modernism, which emphasizes critical thinking skills, may be the ideal supporting social theory for a contemporary philosophy of education. The ideal educational philosophy and system must also address the functions of schooling, curriculum, and pluralism in the current era of globalization.

## *The Historical Foundations of Education*

Historically, schools have experienced constant change, and the rate of change has accelerated exponentially due to the impact of technological advances in society. Schools and teachers have frequently been blamed for economic and political problems. deMarrais and LeCompte (1999) maintained that the way teaching is conducted is “more a function of external political, ideological, and economic pressures than of concern over expertise and technical skills” (p. 193). External threats to the entire society have profoundly influenced and driven change in the field of education. An ideal philosophy of education embraces the need for the educational system to adapt to changing circumstances and to new technology, while maintaining a balance between the need for national security and the rights of the individual.

American political, business, and education leaders viewed the launching of the Russian “Sputnik” satellite in the 1950s with alarm and considered it to be a direct challenge to the global influence of the United States and a serious threat to national security (Boyle, 2008). As a result of the Russian technological and military challenge, the National Science

Foundation was used to increase funding for mathematics and science programs, and the National Defense Education Act greatly increased the number of college scholarships and funds for science materials in local schools (Peoples, 2008). An ideal philosophy of education seeks a balance in funding priorities in all subject areas. Literacy skills, critical thinking skills, and historical knowledge are as important as mathematics and science programs for the long-term survival of a democratic society.

As a result of the Sputnik crisis, the American government became more involved in education and in the formulation of national educational policies and goals. Spring (1985) maintained that “the National Institute of Education’s main concern is the control of education by the channeling of research interest into particular fields” (as cited in deMarrais & LeCompte, 1999, p. 18). The Soviet threat strengthened the National Institute of Education’s central role in the American education system.

The fear of increased international economic competition, primarily from Japan and Germany, eventually replaced the external political and military threat of the Soviet Union. In 1983, the report *A Nation at Risk* created the public perception that rapidly dropping American school standards were causing American companies to lose their competitive edge in the global marketplace (Johanningmeier, 2010). As a result of the report, the National Commission on Excellence in Education created guidelines intended to raise standards in the key subjects of science, mathematics, English, and foreign languages in American schools (Good, 2010). At a national conference, the governors of every state agreed on six educational goals, including the goal of making American students the best in the world in science and mathematics, and the goal of implementing standardized tests nation-wide in several grade levels (Meadows, 2007). National educational policies can provide national unity and a sense of purpose. However, the accuracy of the report *A Nation at Risk* later came into question as America experienced “unprecedented prosperity” in the 1990s (Tozer, Violas, & Senese, 2002, p. 441). The ideal educational philosophy requires a careful examination of all facts presented in educational reports that influence national educational policies.

Change has been a constant factor in education, and an educational philosophy must embrace change. At the beginning of the twentieth century, most children attended school, but few of them went beyond the eighth grade. Schools were traditional, with the teacher playing a central role, transmitting information to obedient, unquestioning, passive students. Rote memory was central to the traditional educational experience. Scientific management practices were applied to schools, which began more and more to resemble factories, both in the design of school buildings and in the regimented curriculum (deMarrais & LeCompte, 1999). A backlash occurred against the increasing regimentation. The progressive school movement emerged, and placed a greater emphasis on student centered lessons and natural,

free expression (Kohlstedt, 2008). Educational leaders such as John Dewey and George Herbert Mead believed that the philosophy of traditional schools needed to be applied to real life problems in order to improve society (Freeman-Moir, 2012; Gutek, 1997). The struggle between traditional and progressive approaches continues, and the tension between the two schools of thought has led to numerous changes and compromises in curriculum design. The ideal philosophy of education emphasizes progressive approaches to education.

In the twentieth century, the roles and tasks of high schools increased steadily over the decades. Vocational training was added to the traditional academic curriculum, and by the 1960s many multicultural and social activities had been added to the educational mission of high schools. Schools were also involved in the fight for racial equality and desegregation in the United States and transformed themselves into diverse, multiethnic organizations that helped to transform the greater society (Pai & Adler, 2001). Schools transmitted knowledge and values, provided vocational skills training, and prepared students to live as productive, well-adjusted citizens in a democracy.

Standardized testing is increasing in importance as a result of the *No Child Left Behind Act* (Kaufman & Blewett, 2012). However, Amrein and Berliner (2002) noted that standardized testing leads to increased cheating, drop-out rates, and to a narrowing of choices in the curriculum. The increased use of standardized testing, school choice, and the unequal distribution of resources to schools based on the wealth of the local communities are all examples of external forces that have forced schools to change and adapt to constantly changing circumstances and societal conditions.

Private and public universities and colleges in the United States have benefited from corporate donations and have in many cases formed close partnerships with large corporations in local industries. The board of directors of the New American Schools Development Corporation (NASDC) is composed mainly of CEOs of major American corporations (Barone, 1993). The purpose of higher education is often linked in the public mind to job training and the acquisition of specialized knowledge and skills to be used in a career. An ideal educational philosophy welcomes partnerships between schools and the business community, provided that the requirements of business leaders do not dominate all aspects of education.

### *The Philosophical Foundations of Education*

The goals and objectives of schools and the roles of teachers have throughout history been determined by underlying philosophies and theories. Plato founded his Academy in Athens based on his philosophy of Idealism, and his student Aristotle founded his own school, the

Lyceum, based on his philosophy of Realism (Gutek, 1997; Zhmud, 1998). The numerous philosophies and theories of education also influence teaching and learning in schools by influencing the ways teachers think, plan their work, and interact with students.

The teacher's relationship with students exemplifies his or her beliefs, ethics, and values in a variety of ways. Barone (1993) asserted that every student should be "challenged to see her life as an ongoing project...comparable to the creation of a work of art" (p.7). Teachers should teach

students to value their own uniqueness as individuals, while respecting the rights and needs of others. Students must learn to actively seek out new learning experiences in a wide variety of situations and settings and try to make meaningful contributions to the local community through volunteer service.

Teaching methods, curriculum design, course content, and the language used by teachers are all influenced by the theories and philosophies of education to which individual teachers subscribe. Tisdell and Taylor (1999) maintained that humanist teachers believe in the importance of the individual and self-directed learning, while other teachers may be more critical in their personal beliefs and may wish students to understand or become agents of social change. Ideally, teachers should encourage students to engage in critical thinking in all subject areas and in their daily lives.

Pai and Adler (2001) described the patronizing, condescending attitude of typical Korean teachers towards their students. Such an attitude reflects a highly teacher-centered, hierarchical, traditional approach to teaching in which teachers simply transmit knowledge to students with little respect for individuality or personal needs. Teachers, whether consciously or not, base their teaching practices on one or more leading philosophies or theories. The patterns of interaction in the classroom, choice of language, level of formality, facial expressions, and gestures of teachers reflect their own personal beliefs, philosophies, and theories of what should be taught and how best to teach it.

Educators can draw upon different philosophies, both purposefully and casually, to fashion their own unique views of teaching and learning in a variety of ways. Thomas Jefferson believed that lifelong learning should be a fundamental aim of education (Tozer, Violas, & Senese, 2002). Educators can draw purposefully upon different philosophies by continuing their own education and professional development by attending workshops, conferences, and seminars related to educational philosophies. Teachers can conduct their own research on educational philosophies and actively apply that research to the improvement of existing educational policies. Educators can take philosophy courses and pursue advanced degrees. The writing of a dissertation on educational philosophy is perhaps the best method for a teacher to purposefully fashion a comprehensive and unique view of teaching.

Educators can contrast and evaluate different philosophies casually by holding frequent discussions and friendly debates with colleagues on different educational issues and concerns, and by trying to reflect on the underlying philosophies in each issue. Kimball (1974) stated that ethnocentric individuals can become intellectually “isolated from new insight through adherences to established formulas, dogmas, or other rigid structures of beliefs” (as cited in Pai & Adler, 2001, p. 11). Participating in teacher exchanges with schools in different regions or different countries is another way to gain exposure to different philosophies of education.

Teacher exchanges, combined with intensive foreign language courses, can serve to reveal an entirely new perspective on teaching practices and the underlying theories and philosophies. The ideal educational philosophy is capable of evolving and is open to new ideas and useful elements of philosophies from many different sources, while maintaining a fundamental respect for the needs and rights of individuals and the importance of personal experience.

### *Post-Modernism: The Ideal Social Theory of Education*

Giroux (1993) maintained that, “Post-modernism rejects a notion of reason that is disinterested, transcendent, and universal . . . ” (as cited in Pai & Adler, 2001, p. 148). Proponents of post-modernism, also known as post-structuralism, are deeply suspicious of all forms of authority. Foucault (1980) stated that, “Truth is a thing of this world; it is produced only by virtue of multiple forms of constraint” (as cited in deMarrais & LeCompte, 1999, p. 30). Post-modernists do not believe in a single, absolute truth and are constantly testing and questioning the facts that constitute the curriculum of the educational system (Stronach, 1996). The term post-modernism covers a wide range of similar movements that question official versions of economic, political, and social reality.

However, given the use of standardized testing as a sorting mechanism, and the growing influence of business models and job training in schools, the social theory of functionalism may best explain the function of education in contemporary American society. Functionalists view society as a living organism that is composed of specialized, interlocking parts that function in support of each other (Sever, 2012). Parson (1985) described the goal of society, in functionalist terms, as the “development in individuals of . . . capacities which are essential prerequisites of their future role performance” (as cited in Pai & Adler, 2001, p. 130). Schools act as sorting mechanisms in a functionalist system, grouping students according to their measured abilities, and training them to perform their assigned functions in society. Standardized testing facilitates the selection process by grouping students into clearly defined levels of ability and related job categories. Business and technical courses are steadily

supplanting the traditional liberal arts curriculum of many schools. Students are being selected based on early demonstrations of ability and trained to perform their assigned roles in different parts of the body of society.

Rigidity is the greatest weakness of functionalism, and the danger exists that individual freedom and choice will decrease if the educational system becomes dominated by the political and business elite. Purely functionalist approaches to education leave few opportunities to individuals for a second chance once they have been processed and labeled by the system at an early age. The effect of the G.I. Bill at the end of World War II is a prime

example of the ability of individuals to transform themselves through learning. To the surprise of many educators, the veterans chose mainly liberal arts courses and achieved better grades than non-veterans and traditional students (Tozer, Violas, & Senese, 2002). Functionalism does not allow for the possibility of later individual transformation and growth in unexpected or unconventional ways.

Post-modernism is an appropriate model for education in an increasingly complex world. In view of the complexities of contemporary global society, independent critical thinking skills have become essential at work, school, and in private life. Functionalism stresses conformity and obedience, Marxism is based too heavily on resentments and conflict, and interpretivism, based on classroom interactions, is too narrowly focused on the immediate classroom environment. The questioning, critical stance of post-modernism seems appropriate for modern circumstances and the pursuit of independent, lifelong learning. Post-modernist views equip students with a healthy skepticism of official facts and stimulate intellectual curiosity, leading to new discoveries, modes of thinking, and improvements in existing social, political, and economic structures (Stronach, 1996). In an ideal world, educators would be free to base the entire curriculum on post-modernism. In the real world, educators should find a method to introduce some elements of post-modernist thought into contemporary education.

### *The Functions of Schooling*

The function of education should be to enhance and promote both personal and economic growth at all levels of a free and open society. The mastering of social skills and critical thinking skills is as important as the acquisition of advanced technical skills. Finch (2001) stated, "It is no longer *what* is learnt that matters, but *how* . . . . The autonomous learner is no longer a matter of conjecture, but of necessity" (as cited in Edwards, 2004, p. 20). Students require critical thinking skills to help process an increasing flow of daily information and to solve complex problems. "The brain learns best in real-life, immersion-style, multi-path learning: Fragmented, piecemeal teaching can forever kill the joy and love of learning" (Jensen, 2000, p. 309). Learning should be a highly integrated and interactive process

connected to real-life and personal experiences. Educational institutions should function as a bridge between teachers, students, parents, the business community, and politicians. Schools should seek a harmonious balance between the needs of the internal and external constituents.

The need for critical thinking skills is increasing. Hargreaves (1994) observed that technological trends "do not lead us forward in some direct way to a new world, but make it increasingly important for people to shape their own lives" (as cited in Levin & Riffel, 1998, para. 4). Students require improved reasoning abilities in addition to technical skills.

The main function of schools should be to provide opportunities for learning and teaching. Testing should be of secondary importance. However, Flinders (2005) stated, “What is tested now determines what is taught” (p. 8). Ideally, what is learned should determine what is tested. If too much focus is placed on preparing for and administering standardized tests, then learning opportunities may be lost in the classroom, and the educational experience of students may be narrowed. Lessons related to meaningful personal experience should form the basis of schooling.

### *Curriculum Design and the Development of Critical Thinking Skills*

Plato stressed the need for physical fitness, reasoning, and moderation in the curriculum that he developed for his Academy in Athens (Gutek, 1997). Children from ages six to fourteen practiced gymnastics, music, and studied literature, and older students were introduced to the study of philosophy (Tozer, Violas, & Senese, 2002). Physical education and music can play an important role in the education of children as well as adults. Jensen (2000) stated, “All learning involves our body, emotions, attitudes, and physical well-being. Brain-based learning advocates that we address these multiple variables more often and more comprehensively” (p. 200). Meeting the physical and emotional needs of students helps to enhance the learning experience and to make lessons more effective.

A standardized curriculum can provide a useful foundation on which to build individualized lessons and to create spontaneous learning opportunities. Regarding curriculum design, Dewey (1997) stated, “The planning must be flexible enough to permit free play for individuality of experience and yet firm enough to give direction towards continuous development of power” (p. 58). Individual experience can be integrated into all lessons, and different subjects can be combined creatively to provide a richer, more meaningful context for learning. For example, physical education, history, geography, and science teachers can collaborate in a small learning community to create a unit on the Olympics. Students can also make a contribution to the development of curricula and be given a degree of choice in selecting classroom activities and homework assignments. Flexible online learning systems can supplement regular class lessons and provide additional tutoring to students with special needs. A needs analysis can be conducted at the beginning of each course in the classroom or online, and teachers can collect student opinion surveys at the end of each course on which to base changes and improvements in the curriculum.

Professional educators, parents, the business community, and politicians should all work together to determine the curriculum of schools. Leadership in the vital area of curriculum development should be shared between both the internal and external constituents of schools. Ideally, professional educators should take the leading role in the process, consulting closely with and responding to the needs of both parents and the business community. However,

Jacoby (1987) advised against “yielding to a new Latin, a new scholasticism insulated from the larger public” (as cited in Giroux, 1992, p. 219). While professional educators should take the lead in designing the curriculum, educators must be careful not to alienate parents and the general public with complex language.

Politicians may focus more on their own short term career goals than on implementing effective, long-term educational policies. However, Portelli (1991) noted that Aristotle, a great educator, believed the answer to what should be taught could be found in politics. Politicians should seek more guidance from professional educators and balance the expert opinions of educators with demands from business leaders.

In theory, professional educators, parents, the business community, and politicians should all be working towards the same objectives: the creation of an increasingly educated, affluent, and peaceful society. Giroux (1987) stated, “Hope is very important . . . we have to be able to dream . . . we can’t always operate in the logic of resistance. We must be able to speak the language of possibility as well” (as cited in Portelli, 1991, para. 13). Conflicts between educators, parents, the business community, and politicians have a negative impact on the effectiveness of curriculum development. A close partnership based on mutual respect should be formed between all interested parties to allow for the creation of a curriculum that prepares students to be well-rounded individuals and highly skilled workers in a vibrant and tolerant democratic society.

Educational institutions are essentially a part of the community and reflect the hopes and aspirations of the local community. The problems of local communities, including poverty, drug abuse, and violence can also directly influence the school environment in negative ways. The relationship between schools and the community is often ambiguous; members of the community may respect the influence of the school, but the community may also blame the

school for a wide range of problems in society. In general, schools and the local community influence each other and share a roughly equal relationship. However, the state and federal governments in the United States have more power than educational institutions, and through laws and control of funding the state and federal governments may choose to dictate educational policies and guidelines to schools. Crowley (1986) warned against taking “the social and historical processes out of discourse in order to make a certain order of things appear natural and given” (as cited in Giroux, 1992, p. 225). Politicians should not oversimplify the complex issues facing schools. Aronowitz and Giroux (1986) noted the “current conservative demand for a common cultural identity based on forms of exclusion and hierarchy” (as cited in Giroux, 1992, p. 225). Professional educators should be given the most responsibility for setting educational standards and policies.

All students should be treated equally and integrated to the extent possible into regular classroom settings. The American Association of Colleges for Teacher Education (AACTE) issued a report in 1972 entitled *Not One Model American* that stressed the need for cultural pluralism in American society (Pai & Adler, 2001, p. 105). Policies regarding the rights of minorities and of students with disabilities have become increasingly complex. Evanciew (2003) stated that “contextualized, situated, and social learning is crucial for students with special needs” (para. 5). Regular students can participate in learning activities and exercises with special needs students for the benefit of both types of students. Helping special needs students can serve to develop a sense of empathy in regular students.

Jordan (2004) maintained that the “function of schools can be . . . skewed when rights and protections afforded to one individual with a disability conflict with those of another” (p. 3). Teachers must try to balance the needs of students with disabilities. It may be desirable to simplify existing laws regarding students with disabilities to avoid conflicts and to reduce the administrative burden on teachers while guaranteeing the basic rights of special needs students.

#### *Pluralism in the Education System*

Faculty and staff can work together to prepare the implementation of multicultural programs in an educational setting by doing research on the habits and customs of various cultures and by giving research presentations. However, Buber (1995) noted that “dialogue must be built on equality but doesn’t necessarily lead to action” (as cited in Rose, 1999, para. 7). Simply building a knowledge base of other cultures is not enough to create genuine understanding and empathy. In order to translate knowledge into action and true understanding, the faculty and staff can write and perform role plays together of situations in which minorities are subjected to discrimination or involved in simple misunderstandings.

Kimball (1974) observed that individuals may become “isolated from new insight through adherence to established formulas, dogmas, or other rigid systems of belief” (as cited in Pai & Adler, 2001, p. 11). In other words, one’s own culture may act as a rigid system of belief, blinding its members to the positive aspects of other cultures. For example, Hebert (2001) maintained that Canada’s 1971 multicultural policy “failed to recognize the endemic nature of racism and discrimination in Canadian society,” and did not engage in “serious pedagogical treatment of value and belief systems” (para. 23). Policies and directives are not enough to fundamentally change the attitudes of citizens; people must be stimulated to take concrete actions based on new understandings.

## *Conclusion*

In conclusion, the ideal philosophy of education addresses the need for learner autonomy, guiding the learner towards the ultimate goal of lifelong learning. Teaching and learning should be related to the real-life experiences of students. A philosophy of education must incorporate historical and philosophical elements. External military and economic threats to society have historically led to dramatic responses and changes throughout the entire society. Such changes have always had a significant and direct impact on education in terms of changes in national research priorities and the redistribution of resources, including program funding, scholarships, classroom materials, changes in curriculum design, and increases in standardized testing. The ideal educational philosophy is capable of adapting to change and embraces new technology without being dominated by it. Post-modernism may be the ideal supporting social theory for a philosophy of education, training students to be independent and critical thinkers.

Schools should play a central role in the life of students and the community. Educational institutions should function as a bridge between teachers, students, parents, the business community, and politicians. The curriculum should address the emotional and physical needs of students, providing them with a balance of social and technical skills. Pluralism should also play an important role in schools, and both students and teaching staff should learn to respect the positive elements of different cultures and to value diversity in the context of international society and globalization.

Official Conference Proceedings 2012

Abstracts

This study examines learning motives of undergraduate EFL students, compare learning motives among students categorized by their background (gender and field of study), and investigate the relationship between students' English background knowledge and their learning motives. The samples are 210 undergraduate students enrolled in Fundamental English course at Bangkok University. The instrument in this study is a questionnaire. Results indicate that the overall learning motive is at a moderate level. There are significant differences at .05 level found in students' learning motives as classified by gender. Female students have more learning motivation than male students. There are no statistically significant differences at .05 level found in terms of field of study. In addition, there is a positive relationship between students' English background knowledge and their learning motives at .01 level. In other words, students with high English background knowledge are found to have high motivation to learn English. On the other hand, students with low English background knowledge are found to have low motivation to learn English.

## **Introduction and Theoretical Framework**

Motivation has long been recognized as one of the key factors that determine foreign/second language (L2) learning achievement and attainment because it serves as the initial engine to drive a person into doing something and later functions as an ongoing driving force that helps him or her to accomplish the task. Robert Gardner (1985: 10) sees motivation as “the combination of effort plus desire to achieve the goals of learning the language plus favorable attitudes toward learning the language. That is, motivation to learn a second language is seen as referring to the extent to which the individual works or strives to learn the language because of a desire to do so and the satisfaction experience in this activity.” Most researchers would agree that motivation is responsible for: “why people decide to do something, how long they are willing to sustain the activity, and how hard they are going to pursue it” (Dörnyei, 2001: 8). Researchers may use different dichotomies of motivation depending on their purposes and research frameworks. According to Gardner and Lambert (1959), two general types of motivation are integrative motivation and instrumental motivation. The concept of integrative motivation in the EFL context would be the idea that it represents the desire of the individual to become bilingual, while at the same time becoming bicultural (Benson, 1991). On the other hand, learners who have instrumental motivation desire to learn a target language for functional reasons such as meeting the requirements for school or university graduation, applying for a job, requesting higher pay based on language ability, reading technical material, translation work or achieving higher social status. While some researchers pay attention to integrative and instrumental motivation in language learning, other researchers focus on intrinsic and extrinsic motivation. Intrinsic motivation refers to doing something because it is inherently interesting or enjoyable whereas extrinsic motivation refers to doing something because it leads to a separable outcome.

Ichikawa (2001, cited in Shwalb, Nakazawa & Shwalb, 2005) created the two-factor model of learning motives and developed a questionnaire to measure the six types of motives. Each motive was rated on a five-point scale (5 = “applies to me”; 1= “does not apply to me”). According to Ichikawa, learning motives are classified into six types: enjoyment, cultivation, practicality, relation, pride, and reward. The first three motives (enjoyment, cultivation, and practicality) are referred to as “content-attached” motives. Relation, pride, and reward are called “content-detached motives.” Horino and Ichikawa (1997, cited in Shwalb et al., 2005) found out that motives affect strategy selection, which in turn influences achievement in English language learning.

In the EFL learning classroom, it can be found that mostly only a few of the students are motivated and active in class; responding to the teacher's questions, practicing and getting involved in activities and various tasks. Only students majoring in English and related fields have enthusiasm for learning English. Others are physically present in the classroom but largely mentally absent. To provide effective foreign language instruction, teachers have to be aware of the necessity of looking for techniques and interactive activities that promote interaction among students in the classroom to motivate their students to learn. Therefore, it is necessary to examine how strong students' motivation is for practicing English and how their motivation influences their English achievement.

## **Purposes of the Study**

The objectives of this study are:

1. to study learning motives of undergraduate EFL students

2. to compare learning motives of students with different background (gender and field of study)
3. to investigate the relationship between students' English background knowledge and their learning motives

## **Research Methodology**

### *Population and Samples*

The participants included in this study were undergraduate students enrolled in Fundamental English course at Bangkok University. These students have studied English as a foreign language. The samples were selected by the use of stratified random sampling technique. As a result, 210 students participated in the data collection.

### *Research Instrument*

In order to identify students' learning motives, a questionnaire was used to collect the data. The first part gathered personal information from the respondents who were asked to answer the questions on gender, field of study, and English background knowledge. This general background might have something to do with students' learning motives. The second part was a survey of learning motives adopted from Ichikawa (2001, cited in Shwalb et al., 2005). To respond this part, the respondents were asked to check their learning motives in terms of types: enjoyment, cultivation, practicality, relation, pride, and reward. The questionnaire was prepared for rating in a form of five-rating scale.

### *Data Analysis*

The acceptable statistical significance level was set at alpha ( $\alpha$ ) < .05. After the receipt of the completed questionnaires, the data were statistically analyzed by using SPSS/Window 12 through the following steps:

1. The data of personal information were brought to calculate for average means.
2. The data of learning motives were brought to calculate for average means and standard deviation.
3. The means of learning motives were divided into three levels and interpreted in the form of range based on the criterion of  $\bar{x} \pm .5SD$ .
  - The average mean of learning motives was 3.49 and standard deviation was .49.

$$3.49 \pm (.5)(.49) \rightarrow 3.49 \pm .25$$

<b>Level of Learning Motives</b>	<b>Mean Range</b>
high	3.75 – 5.00
moderate	3.24 – 3.74
low	1.00 – 3.23

4. The independent-samples t-test was used to test the mean scores of two groups of subjects concerning their learning motives.
5. The One-Way Analysis of Variance (ANOVA) test was used to compare mean scores of three and more groups concerning their learning motives. Then the Scheffe test was used to test a statistically significant difference in the mean scores of any two groups.
6. The Pearson product-moment correlation coefficient test was used to investigate the relationship between English background knowledge and learning motives.

## Results

### 1. Results of Fundamental Analysis

The study revealed that the overall learning motive was at a moderate level ( $\bar{X} = 3.49$ ). Among six types of learning motives, the three highest means were practicality, cultivation, and enjoyment respectively ( $\bar{X} = 4.02, 3.88, 3.67$ ). The lowest mean falling on pride was at a low level ( $\bar{X} = 2.88$ ). The results were presented in Table 1.

**Table 1** Mean and Standard Deviation of the Respondents' Learning Motives

Learning Motives	$\bar{X}$	S.D.	Level
1. Enjoyment	3.67	.61	moderate
2. Cultivation	3.88	.68	high
3. Practicality	4.02	.70	high
4. Relation	3.21	.72	low
5. Pride	2.88	.77	low
6. Reward	3.32	.69	moderate
<b>Total</b>	3.49	.49	moderate

### 2. Results of Hypothesis Testing

#### 2.1 Hypothesis 1 compared students' learning motives with different background

Hypothesis 1 was partially accepted because not all variables of background information affected students' learning motives. There were significant differences at .05 level found in students' learning motive as classified by gender, but no statistically significant differences in terms of field of study.

The overall mean score of learning motives of female students ( $\bar{X} = 3.61$ ) was higher than that of male students ( $\bar{X} = 3.36$ ). Both groups had language learning motives at a moderate level. According to the results of the comparison of the mean scores of learning motives, there were significant differences found in students' learning motives between two groups (male and female) at .05 level. That is, female students had more learning motivation than male students. The results obtained from applying the ANOVA revealed that no difference in overall learning motives among three groups of field of study (math, science, and language arts) was found

statistically significant at .05 level. This means that students in different fields of study were not different in having learning motives.

## 2.2 Hypothesis 2 investigated the relationship between students' English background knowledge and their learning motives

The Pearson product-moment correlation coefficient test was used to find out whether there was a statistically significant relationship between English background knowledge and learning motives. This hypothesis was accepted. Table 2 shows that there was a positive relationship between students' English background knowledge and their learning motives at .01 level. In other words, students with high English background knowledge had high motivation to learn English. On the other hand, students with low English background knowledge had low motivation to learn English.

**Table 2** Correlate Results for the Respondents' English Background Knowledge and Their Learning Motives

VARIABLE	English Background Knowledge	Learning Motives
English Background Knowledge	1.00	
Learning Motives	.24**	1.00

\*\* P < .01

When all items were considered, the result showed that there was a positive relationship between students' English background knowledge and their learning motives in terms of enjoyment, cultivation and practicality (items no. 1, 2 and 3) at .01 level and reward (item no. 6) at .05 level. In other words, students with high English background knowledge had a high level of enjoyment, cultivation practicality, and reward motives. On the other hand, students with low English background knowledge had a low level of enjoyment, cultivation practicality, and reward motives. The results were shown in Table 3.

**Table 3** Correlate Results for the Respondents' English Background Knowledge and Their Learning Motives Shown in All Items

VARIABLE	English background knowledge	1. Enjoyment	2. Cultivation	3. Practicality	4. Relation	5. Pride	6. Reward
English background knowledge	1.00						
1. Enjoyment	.33**	1.00					
2. Cultivation	.24**	.73**	1.00				
3. Practicality	.24**	.65**	.74**	1.00			
4. Relation	-.02	.30**	.21**	.34**	1.00		
5. Pride	.13	.33**	.22**	.38**	.61**	1.00	
6. Reward	.17*	.46**	.42**	.58**	.63**	.77**	1.00

\* P < .05

\*\* P < .01

## Discussion and Conclusions

The results of the research have shown the importance to determine EFL students' learning motives. Some suggestions are proposed in accordance with the findings.

First, students' initial motives were cultivation and practicality. This means students desired to develop general ability and utilize knowledge. Among all the correlations, these two motives had a strong positive association with English background knowledge. Therefore, language teachers should provide students with activities which boost their language ability and opportunities in reflecting their use of knowledge in the classroom.

Second, enjoyment and reward had positive correlation with English background knowledge, but the students expressed these types of motivation at a moderate level. Thus, teachers may make their students enjoy learning by creating a pleasant, cooperative, energetic environment and giving them rewards.

Finally, the finding revealed that difference did exist in learning motives among the students from different background. Students were motivated regardless of their field of study, but the mean scores for the male were lower than those for the female in all motives. There were significant differences in learning motives between male and female students in terms of enjoyment, cultivation, practicality, and pride. Consequently, male students should be motivated mainly by these motives.

*Internationalization Process Curriculum Approach for Distance Education in Higher Education in Iran*

Mahdi Gheysari

0219

University of Applied Science and Technology, Iran

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

This study is a descriptive- survey approach, with the purpose of study of process and dimensions of Internationalization curriculum process in distance education, in higher education in Iran, Within investigating the reasons necessity of this subject, paid to Identifying factors, conditions, resources, facilities, impasses, opportunities and strategies for it. In this regard, by using cluster- stratified sampling and using the formula of Cochran, 543 Iranian and foreign teachers and students in five universities in Tehran have been addressed to complete a questionnaire in Likert spectrum, consisting of 8 questions and 96 items. After analyzing data by using statistical single group t-test, The Friedman ranking and analysis of variance, according to results, to keep pace with the globalization process and introducing Iranian culture and civilization to the world Curriculum internationalization in higher education is essential. And distance learning approach, due to the high flexibility and crossing geographical, political, economic and cultural boundaries can be effective in this process. The most important factors influencing the success of curriculum internationalization process approach for distance education in higher education in Iran, it can pointed to the expansion of international cooperation among the universities expansion of International language in teaching, revising the current rules and clarify them, financial and human resources development, and necessary technological infrastructure, exploitation of opportunities for cultural similarities, and a high number of applicants for study in the area, selecting appropriate course topics and considering conversion approach in curriculum elements or shift in the intellectual paradigms of teachers and learners by basic change in what is taught and how it taught.

**Keywords:** Distance learning, internationalizing the curriculum, higher education in Iran

iafor

The International Academic Forum

[www.iafor.org](http://www.iafor.org)

## Introduction

Amazing growth of distance education on one hand and phenomenon of internationalization and globalization of education and the curriculum on the other hand, are issues that have caused serious changes in the world of higher education scenarios. But these two new educational approaches to what extent have effect on each other, whether distance education can be used as a strategy of internationalization of the curriculum. Does internationalization of education will provide wider application of distance learning? How can be designed an international curriculum in distance education? And..., They Are challenges for many experts and specialists.

The most common approaches in international development curriculum include:

1. Add-on: Add content, concepts or topics and international and cultural perspectives into the curriculum without changing the basic structure or approaches to their education
2. Infusion: content which rich understanding and knowledge among students from different cultures and reflects the different perspectives is included in the curriculum and it offers to the learners' professional knowledge of the difference in yield between cultures.
3. Transformative: Internationalization of curriculum which is based on changing its basic structure and it t is teaching and learning approach. Shift in thinking paradigm and attitude in the way of what is taught and how it is taught.

Although the conversion approach conducive to intellectual development, increasing the power of analysis, criticism and methacognition in order to foster intercultural and international students has a high ability(wiliams,2008), but each institution according to its goals, context and impasses can choose an appropriate approach(Aspan,1993).

Considering what was mentioned at the beginning of this discussion, this seems that distance education approach in supranational and international level can also be considered as an effective strategic way; Because in addition to having advantages such as cost, high speed, participation funds with a curriculum of international in the nature of features such as flexible, highly available, flexible interaction, learner-centered, and so on, brings it as an appropriate option for development of international higher education, and for fostering global citizens. In fact, the approach to internationalization of the curriculum at home which universities are providing the foundation for personal and professional development opportunities for all people in the world as a global citizen, to support distance education approach and ICTs they can reach higher goals. In fact in terms of theory, modern technology can be indicated on the plurality distance global education (Thune&welle-Strand, 2005).

According to statistics announced by UNESCO in 2005, in 2004,there are 2.5 million international students worldwide and there is thus anticipated that these figures will increase to 7.2 million in 2025(Bain &Green,2006) and what is interesting is Asian countries like Singapore and Muslim Asian countries like Malaysia among the leading countries in attracting international students(International Study Abroad Guides,2008) and this is indicative of the priority that countries paid for international education and internationalization of their curriculum in order to respond to the diverse needs of applicants for entry to higher education.

Thus, Morey (2000) to shift towards internationalization in higher education institutions, has developed a framework in which the skills and expertise of teachers, different and international f teachers, content and process international curriculum, different and international students, links with other universities and organizations and increasing knowledge based on research, as the most important factors for training students with cross-cultural competence has emphasized and in addition to importance of institutional management, it also emphasized the influence factors such as needs assessment, organizational structure, planning and implementation, and evaluation of educational issues.

## **Literature Review**

Results of William's study (2008) indicate that an international curriculum should be a good alternative to support different learning requests of international students. In this respect, moving toward a changeable approach that improve critical knowledge about values of educational approaches and curriculum, appreciate different ways of knowledge and entity, and student as an active participant in learning process, should be the goals of higher education institute.

Results of Bound's survey (2006) shows that international curriculum should involve students who never go abroad, and construct international knowledge and inter-cultural experience in the center of curricula so that students could enjoy it and internationalization thought become real in home.

Mihhailova (2006) did a study to determine that, "whether electronic learning can be a main tool in the internationalization of higher education"; his results indicate that blended learning is the best teaching and learning method.

Caruana's study (2004) about the role of ICT, in internationalization of curriculum shows that IOC's challenges are similar to electronic learning challenges and probably, a two-way leading approach is more effective than parallel approaches.

## **Purpose and Questions**

The purpose of this study is to examine the dimensions of internationalization process of curricula of distance education in Iran's higher education; we'll try to answer these questions:

- What are the necessity reasons for internationalization of curricula of distance education in Iran's higher education?
- What does effect on the internationalization of curricula of distance education in Iran's higher education?
- What conditions, resources, equipment's, are necessary for internationalization of curricula of distance education in Iran's higher education?
- What are limitations of internationalization of curricula of distance education in Iran's higher education?
- What are opportunities of internationalization of curricula of distance education in Iran's higher education?
- What topics are proper for internationalization of curricula of distance education in Iran's higher education?

- What are the best approaches to internationalization of curricula of distance education in Iran's higher education?
- What effective factor in distance education, do make it a good approach to internationalization of curricula of Iran's higher education?

## Method

This study is descriptive-research, and sample is all members of scientific board, P.H.D and M.A students of Art, engineering, sciences groups and all foreign students in public universities of Tehran sampling is done by cluster-class method. Each university is a cluster and 5 clusters (5 university) consist of Sanati-Sharif, Shahid-Beheshti, Tarbiat Moddres, Tehran, Payame-Noor and then by Kekran formula  $X = 0.05$ , and  $d=0.1$ , numbers of sample in each selective cluster are chosen. In next step, according to volume of units in each group, major and scientific rank, each sample is allocated. Numbers of final samples in all clusters are 543 individuals.

Research tool was a questioner which is made by researcher and when it is affirmed, its validity is used to gather data by some experts and calculation of kronbach-Alfa0/82, for its reliability. This question are involve & main questions and 96 sub-questions which is designed on liker spectrum.

To analyze data, on the part of responder's data, descriptive statistics is used and on the part of research question, first, one sample T-test, then Friedman Test and variance analysis is used based on the spsswin 15 software.

## Findings

Question 1- Does it necessary to internationalized curricula of distance education in Iran's higher education?

All options of these questions are designed by liker spectrum, standard average is the average of spectrum (number3) (test value=3) and

$$H_0: \mu \leq 3$$

$$H_1: \mu \geq 3$$

In fact, in each question, above statistic hypothesis are considered. To answer this question, 3 determinant variables are considered. Based on table 1, average of answers, in relation to determination of every cases on the internationalization of curricula of distance education in Iran's higher education, ( LOCDIHE ), are on the satisfactory value (  $\bar{x} > 3$  ) and on the level of  $\alpha = 0.05$  (  $p\text{-value} < 0.05$  ). By Friedman Test, these cases are classified, and determination value of internationalization procedure receives high rank. According to Friedman test's results, in table 9, at the level of  $\alpha=0.05$ , there is significance difference between ranks of determinant cases.

Question2- what factors are effective on the internationalization curriculum of distance Education in Iran's higher education?

According table 2, average of responses in relation to effects of each case ( $\bar{x} > 3$ ), are on the level of  $\alpha=0.05$  (p-value<0.05) and international scientific cooperation of universities with other universities, research centers, scientific, business, occupational associations, receive higher rank, and competitive tuition, receive lowest rank.

Question3- what are necessary conditions, resources, equipment's for internationalization of curriculum of distance Education in Iran's Higher Education?

According to table 3, average of responses, in relation to effects of each factor

( $\bar{x} > 3$ ), Are in the level of  $\alpha=0.05$  (p-value <0.05) and political construction of society receive higher rank and recreational and welfare equipment's receive lowest rank.

Question 4- what are limitations to internationalized curriculum of distance education of Iran's higher education?

According to table 4, responses, in relation to each effective factors, are at the satisfactory value ( $\bar{x} > 3$ ) and  $\alpha=0.05$  (p-value < 0.05) and improper political relation receive higher rank and lack of motivation and desire of experts to produce international contents, receive lowest rank.

Question 5- what topics are proper to internationalized curriculum of distance education of Iran's higher education?

According to table 5- are range of response, in relation to effects of cases 1,2,4,5,6,7,8, as a proper topic to internationalized curriculum are at the satisfactory level ( $\bar{x}>3$ ) and  $\alpha=0.05$  (p-value <0.05), but lessons topic in case 983 involve ( $\bar{x} < 3$ ) and (p-value>0.05), then they were not appropriate to internationalized curricula in higher education. 7 proper topics are categorized and allocated for internationalization, that medical science receive high rank and the humanities receive lowest rank.

Question 6- what are opportunities to internationalize curriculum of distance education of Iran's higher education?

According to table6- responses, in relation to effects of each cases 3-8, are at the satisfactory level( $\bar{x} > 3$ ) an  $\alpha=0.05$  (p-value), but above opportunities in case 1 & 2, have ( p-value > 0.05 ), so in point of view of individuals, these opportunities were not effective for IOCDIHE.

Between effective opportunities for IOCDIHE (case 3-8) existence of famous and skillful masters in some cases, receive higher rank, while language and cultural similarities, receive lowest rank.

Question 7- what are good approaches and action to internationalize curriculum of distance education of Iran's higher education?

To answer this question, 38 variables are considered.

According to table 7- average of responses are at the satisfactory level ( $\bar{x} > 3$ ) and  $\alpha=0.05$  (p-value  $<0.05$ ) and use of valuable books and scientific reference books receive higher rank and selection right to select relative lessons to the host country's culture, receive lowest rank.

Question 8- what effective factors in distance education, do make it a good approach to internationalize curricula of Iran's higher education?

To answer this question, effectiveness of 5 variables is considered as a leading quality in distance education approach, and one variable is considered to deny its leading effectiveness in direction of internationalization of curriculum of distance education in Iran's higher education. In table 8, average of responses, in relation to effectiveness of above factors, are at the satisfactory level ( $\bar{x} > 3$ ) and  $\alpha=0.05$  (p-value  $< 0.05$ )

Furthermore, agreement of distance education approach with internationalization, due to lack of geographical, with internationalization, due to lack of geographical, cultural, economic and political bounds, receive higher rank and necessity of attending teaching and denying of distance education, receive lowest rank and there is significant difference between these average ranks. (Table9).

### **Discussion and conclusions**

According to these findings, resort to internationalizing curricula in Iran's Higher education, is necessary. It is obvious that in present century, universities' duty is to train competent persons for life & work and response to request of international and intercultural societies, and it entails adequate knowledge of students towards different cultures & societies & respect to them. International direction of curricula in Higher education system, for both Iranian students (internationalization in home) and foreigners get the chance of learning international & inter cultural competence. In this respect, results of research on the Association of universities and colleges of Canada (Aucc), in 2006, shows that the most logical reason for internationalization is to train students who are internationally knowledgeable, and wise and be competent from intercultural point of view.

Now, Iran is in a direction that needs up to date knowledge and experts in order to present in economic competitions like education, but a balance in scientific & cultural exchanges is necessary to prevent it become a mere consumer of imports sciences. So it is better to have a productive point of view toward compilation and design of curricula that introduce Iran's culture to the world. In fact, internationalization of curricula and higher education can attract foreigners to the country and prevent intelligent people exit. In respect of flexibility, availability and high speed of distance education, based on technology in learning-teaching processes, and its ability to highlight the presence and influence of Iran's higher education in international scientific field ( based on findings of questions 7 & 8 ) that indicate common aspects of curriculum and international curricula, It seems that in case of availability of conditions, resources and infrastructure equipment sin Iran, distance education will be an effective approach, because there will be less challenges. According to results of Collis & Vander Wanda's research (2002), international students will have greater influence on their policies and institutions, in direction of using ICT & educational approaches, in the future. These new target groups need more flexibility

in transformation ways and execution of education by institutes and ICT can be an effective factor.

According to findings, the most effective factor on IOCDIHE is international cooperation's of universities.

So, acquaintance with international scientific activities and its procedures, convening educational workshops or giving educational opportunities,... in international dimensions, by interior students, is very important. Scientific cooperation of interior masters with foreign masters' cause our masters know more about other countries higher education systems and international students will be attracted to Iran's higher education by their own masters.

Ghaheri (2005) study's results and Zare'e, Fathi, Vajargah, Yamani (2009) indicate these findings.

According to research findings, because Persian language is not international and learning it is very difficult in short term, so it is a serious challenge in internationalization of curriculum in Iran's higher education. William's results (2008) emphasize on the language incompatibility for international students in host country. There are several ways to abolish these limitations such as compilation of curricula in international language, compilation of bilingual curriculum, introduce reference books and resources in international language, availability of several options linguistically to study contents, abolish legal limitations to teach in a non-Persian language...

Higher education policies in each country determine that whether higher education should be closed? Whether it should be native? Where is the place of international higher education and competent students in higher education missions? There are effective approaches such as regarding internationalization of higher education in guiding document by "High council of cultural revolution, international viewpoint of government, policy makers, programmers,... toward higher education and the need to activities in international level and experts to act in this field; accurate understanding of internationalization concept; flexibility and avoiding prejudice; priority of thought in society and understanding of global environment. Zare and al (2009) and Williams (2008) indicate these findings.

Competence of masters and managers is an important and effective factor in IOCDIHE. Lack of appropriate content is due to lingual & scientific inability of masters and lack of knowledgeable experts. This problem cause limitation in international cooperation, so improvement of specialists is necessary. Results of Vali and Etal (1997), be nick, Newby & Samuel (1996) confirm this issue.

In order to develop occupational and intercultural sensitivity of masters, starting educational workshops, educational opportunity, cooperation with masters form other cultures, doing common teaching and research efforts, can have an effective role in development of Iranian master's knowledge, experience & international attitudes. Schuerholz's results (2007) confirm this issue. In Ellingboe's study, some masters who had international experience did not have adequate cognitive change (mestenhauser & Ellingboe 1998).

Supportive service is very important, especially at the first of educational course. These supportive services consist of presentation of necessary data to attract international students, and

counseling service by intercultural counselors, support learning and use curricula in another language, help students out their training and cooperation with employers who value international skills (Walleg et al, 1997).

Another effective factor on IOCDIHE is to advertise international educational space and present capacities in and out of country. Advertisement in the country in form public opinion, specialist groups and students about its necessity & its advantages to Iran, and in international level, especially in Region, introduce Iran's history and resources and opportunities that non-Iranians can use it by attending in Iran's higher education. Fortunately by ICT, there is more possibility to inform and advertise about international higher education. There are several ways to inform international societies about university's activities and equipment's in the process of internationalization, such as establishment of University's site, catalogue,... in English language and international meetings.

In order to reach international education, political, cultural and economic dimension of a country is another effective factor. Political construction of a country influence on the acceptance of other countries' cultural patterns and designing of curricula which respect cultural differences, and may produce main limitations and barriers on its way. Over control of foreign students and masters limits international cooperation of Iran's so distance education is a good way that international students educate in Iran's higher education system without worry. Accurate understanding of internationalization process and balance in scientific, cultural exchange, prevent absorption of nation's identity. With respect to our history and history of deposition and colonization by foreign governments, there is a kind of xenophobia and distrust in our culture but in order to avoid foreigner's opportunism and receive political & social development, we must believe that foreign students and masters are our guests who can restore our culture so it is necessary to teach children how to accept other's culture.

Economic construction effects on the international efforts of higher education. Free economy, internationalization of business and markets cause higher education tend toward internationalization, and establishment & development of private higher education connect with international higher education (Fegan & Field, 2009).

Distance education has a high potential in political, cultural, economic & social changes by pass political, economic, social and cultural boundaries and internationalization of curricula in from of distance education, can be very successful. The more university has financial resources, the more it has educational equipment's. So developed universities will pay more attention to them and our universities will attract more foreign students and masters. Macklin's study (1998) in British Columbia indicated that organization's priority to invest on the internationalization, will determine their development level. International association of universities did a research in 2003 and its results confirmed this issue (Knight, 2003). There are several approaches to solve this problem such as increasing of educational budget, more attraction of foreign students to produce more revenue, increasing number of scientific board members to decrease burden of present masters and bilateral exchanges to decrease financial load of institutes.

Technical infrastructures, educational equipment's, based on technology, are necessary factors for ICT. In fact, one of special goals of organizations, is to give opportunity to international students. Ghaehri (2005), Zare' et al (2009) found out, inappropriate attention to new technology, electronic hardware equipment's are main barriers for IOC.

If Iran's higher education system wants to internationalize its curricula, it should consider its achievement possibilities, presence of skillful and famous masters, good university, especially in Region, and common culture and language similarities with neighbor countries, are suitable opportunities that can attract many applicants from Region's countries. Facilities and equipment's of ICT and distance education approach, in addition to good advertisement and establishment of figurative higher education centers with the participation of other credible universities, help Iran's higher education system to introduce itself to the world and increase its scientific potential.

In order to internationalize curricula, knowledge about other countries' higher education system, comparative study about curricula, membership in international and regional higher education conversions and establishment of thought rooms which is composed of interior & international specialists, are helpful approaches that determine weakness and strength of present curricula and change them to international and inter cultural curricula. The first step into internationalize Iran's higher education system is to search common interest and goals in Region and start common educational course in figurative from.

It is notable that there should be a place for a specialized establishment in science department in order to internationalized higher education.

Internationalization of curricula entails determination of proper subjects. Findings indicate that subjects like experimental science and basic science are suitable subjects because they have less cultural debates than the humanities. Results of research about international universities associations, confirm it (knight, 2003), but experimental & basic science in Iran are translation so in order to internationalize curricula, there should be more productive & research efforts. These subjects need technical, hardware & software infrastructures in distance education system. Iranian sciences depend on its culture & civilization and have less experimental nature so have more chance to internationalize. In order to train students who are competent internationally, there should be a content that is up-to-date and made of different scientific and cultural resources and be understandable & applicable for different learners. Such contents are designed base on different learning approaches and are presented on line. Considering learner's differences, especially interior learner & foreign learner, is very important in formation of content. Learning-teaching and evaluation methods should have more flexibility & center-learner principle should be considered. Flexibility in use of different methods such as lecture, debate, questioning, project, training, laboratory, film, video conference, figurative debate room, figurative visit from historical places,... according to major & subjects, help to reduce problems of lingual, education, cultural and incompatibility of international students. William's results confirm this issue. It is notable that emphasis on achievement to metacognitive, critical education & training & active learning encourage students to do critical search & analysis and expand their intercultural skills and know edge. This principle change their though and viewpoint and this is the ideal form for exchangeable approach. In exchangeable approach to IOC, main change in material and way of teaching will be considered. Because, main part of approaches and activities in field curricula (question7) are based on this approach, and according to statistic, they are effective on IOCDIHE, it seems that select approach for IOCDIHE is exchangeable one. Exchangeable approach allows students and teacher to share power by learning from each other. Bound's study (2006) shows that multilingual masters and those who live in another culture or have studied about them, make more effort to challenge student's backgrounds & know ledges.

Present and main approaches in curricula of Iran's higher education are far from research, exploratory, analytical, critical approaches and even in figurative environments, are based on lectures, text translation, and pamphlets and are not update, so serious review and study is necessary.

Ghaheri (2005), Zare` ET al (2009) they confirms this issue. Distance education environment have more equipment & flexibility than conventional learning environment and have less cultural and ethnic prejudice and based on its common and center learner nature, is successful to prevent biased conflicts. Studies show that giving selection right to student to do their assignments, researches and projects and diversity of evaluation methods, can help intercultural approach enter curricula. In addition to final exam, class activities, researches and projects... should be considered.

In present process of globalization of higher education is in order to reach scientific power and presence in international levels. Use of distance education approach and figurative and electronic media to present curricula, are the best way to internationalize curricula of Iran's higher education system. Flexibility, availability and high productivity of this kind of educational environment make it a good option to change material and teaching method, which internationalize curricula of Iran's higher education, and with respect to environmental factors, resources, equipment's, limitations and opportunities, it can be used independently or in a blended from, but with respect to cognitive & motivational barriers to distance education as a considerable approach in learning, nationally or internationally, and lack of infer structures, financial & human resources, in order to use it perfectly, the best way is to use distance approach alongside present education or blended learning.

*The Production of Learning Space: A Spatial-Social Study of Higher Education  
Institutions in Hong Kong's Local Communities*

Ricky, Yuk-kwan Ng

0225

Vocational Training Council, Hong Kong

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

Articulating the concepts of community, architecture and learning in a spatial-social approach and framing them into the discourses of Lefebvre's 'production of space', Bachelard's 'the poetics of space', Bourdieu's '*habitus*' and de Certeau's 'practice of everyday life', this paper argues how synergies can be derived by locating the higher education institutions, in particular, the community colleges in the local communities in Hong Kong. Looking from a sociological perspective, this paper argues that the specific cultures, the richness of the activities and complexities of the surroundings in local neighborhoods would make the community, architecture and learning meaningful. This concept of '*sans frontieres*' may shed lights to position the social role of the community colleges in Hong Kong for the mutual benefits of both the colleges' students and the once segregated underprivileged groups. It is hoped that the results of this study will further articulate the concept of community college and its social responsibilities to enable equal access of knowledge to the public mass for the betterment of community life and social cohesion.

*Keywords: changing role of higher education, community college, production of space, social cohesion.*

### **The changing roles of the higher education institutions**

The concept of higher education institution has changed gradually over the centuries. Higher education institutions were once restricted to the privileged people: those who were rich, elite and of nobility. In the old days, universities around the world, as we have known and seen, were built in the style of castles and isolated themselves from the mass public behind the tall and sturdy red brick walls. There were slim chances for the less privileged people to receive any forms of higher education in those institutions. Addressing the issues of equality and the rights for education, voices to liberate higher education to the under privileged were widely heard. To tackle these proclamations, the initiative to create a university-affiliated six-year high school and two year college, named “junior colleges” was first developed by William Rainey Harper, founding president of the University of Chicago as a preparatory programme in the late 19<sup>th</sup> century. This prototype of community college movement had revolutionized the higher education sector and provide “a gateway for those on the verge of enrolling in college: older students, those who cannot afford to attend full-time, and those who need to develop their basic skills” (Kane and Rouse, 1999, p81). Community college as suggested by Harper acted as a stepping stone for the public mass to proceed to the arena of higher education. Studies have found that community colleges not only benefited the public mass but at the same time also provided access to the less academic achievers so as to prepare them for further study in the university. Grubb finds that “The lower fees and open-access policies at community colleges have broadened access to postsecondary education for student facing such barriers to entry as poor academic performance in high school, limited English-language skills or other basic skill deficiencies, or financial hardship” (Grubb, 1999 in Hoachlander, Sikora and Horn, 2003, p. 121). Fusch expresses his view that “the two-year college, with its flexibility and open admission, has provided opportunities for disadvantaged individuals who might otherwise not attend college” and to “educate students and encourage students to become active and responsible citizens” (Fusch, 1996 in Bryant, 2012, p.77). On a social perspective, community college also “offer[s] opportunity and access [to] provid[e] students with social mobility as well as the chance to flourish academically and personality” (Byrant, 2012, p.89). Following the same vein, Kwiek asserts that as higher education gradually began to pass from its elite to mass to its near-universal participation model, higher education institutions need to redefine their social role and should look into what is going on in the public sphere in terms of political, social-economical and cultural dimensions (Kwiek,2001). Given the above, dialogues and interactions between the higher education institutions, the communities and the public are the essential needs.

### **The production of space**

Bachelard, in his 1964 classic “The Poetics of Space” suggests that space should not be looked at as primarily a container of three-dimensional objects; space should be studied as ‘topoanalysis’ to understand how it accommodates human consciousness to reveal the value of intimacy (Bachelard, cited in Ockman, 1998). Michel de Certeau has an insightful suggestion on space, asserts that space is a place made meaningful through contextualization; “space occurs as the effect produced by the operations that orient it, situate it, temporalise it, and make it function in a polyvalent unity of conflictual programmes or contractual proximities... [space] is modified by the transformations caused by successive contexts... space is a practiced place” and ultimately; space is a problem of representation (de Certeau, 1984, cited in Leach, 2002, p.129). Fortier claims that space is demarcated by individuals or groups by appropriations then evolved into repetitious rituals to create enactments and belongings as the end products of performativity (Fortier, 1999 in Leach, 2002). Bourdieu’s concept of *habitus* suggests that one should carefully inspect the “material practices of everyday culture”, as well the realms of the symbolic and the historical for an understanding of everyday life (Bourdieu, 1985 in Robbins, 2002). Garfinkel endorses semiotic analysis of signs because they function as “marks and indications” (Garfinkel, 1967 cited in Conroy, 2010, p.74). Bourdieu further interprets ‘habitus’: the conscious reflection or finding ourselves, as “a dynamic field of behaviour, of position-taking, when individuals inherit the parameters of a given situation and modify them into a new situation... an interaction between a social behaviour and a given objectified condition” (Bourdieu in Robbins, 2002). Given the above, Bourdieu thinks that architecture and objects can be understood as “objectivated cultural capital” and their cultural values are waiting to be revived, to be unlocked in order to establish new meanings (Bourdieu in Robbins, 2002). According to Lefebvre, space has a complex character and enters social relations at all levels, there is also a relationship between power and space. Lefebvre (1991) in his ‘the production of space’ proposes a three-dimensional framework to analyse space:

- 1) the conceived space: the formal representation of the space (mental imaging)
- 2) the perceived space: the various spatial practices; (perception of built forms) and
- 3) the lived space: the experiences and interpretations of the users (social practice).

Framing the above concepts of space in to the changing role of community college suggests that it is important for community colleges to involve different stakeholders such as the teachers, students and the residents of the community to feel, to immerse into the architecture, the environment, the facilities and activities to generate

knowledge through dialogues and interactions by regarding learning as a 'practice of everyday life' so as to produce a preferable learning space for the communities. It is argued that the views collected from the different stakeholders after their daily practices of the architecture will be able to shed lights to redefine the social role of the community college. A glance at the community colleges in North America reveals that they not only provide higher education opportunities to students that leave afar and facilities not easily access, but also equity of access and indirectly to nurture and sustain local or regional culture. They also carry social roles to "assist in community development by offering programmes of community education and service. In rural areas, [community college] will serve as a mechanism for the maintenance and development of a viable way of life" (Faris, Report and Saskatchewan, 1972, p.59). Bryson once praised the open campus of the Dartmouth University in the United States, "none of its grounds are off limits to us. Indeed, much of it is open to the community. We can use the library, attend its concerts, go to its commencement exercises if we want. One of my daughters skates on the college ice rink. My son's high school track team practices in winter on the college's indoor track. The college film society regularly puts on seasons of movies, which I often attend. Just last night I saw North by Northwest on a big screen with one of my teenagers, and afterwards we had coffee and cheesecake in the student cafeteria" (Bryson, 1998, p.190). Bryson's experiences further pointed out that the architecture, facilities and activities of higher education institutions can act as a distinctive platform to preserve history, culture, to facilitate learning and to promote mutual interactions in the community. The concepts of '*sans frontieres*', 'no barriers' and 'no walls' of equal access to higher education institutions in a way to nurture the culture of the production of learning space for the betterment of community life and social cohesion.

### **Buildings are media of intentions, passions and actions**

Buildings tell stories; they can also be read as if they were texts to generate multiplicity of meanings-the multivocality of readings, the interpretations of different stakeholders (Dvora, 1995). Peltonen also contends that architecture has the power to convert ideas of organizational forms into material shapes leading to distinct social relations and identities; they are open to be appropriated and framed by the users in their everyday uses (Peltonen, 2011). In this sense, the buildings of education institutions are media of intentions, passions and actions. Such places provide a forum and "a focus where we experience meaningful events of our existence ... it is in this spatial and social ecology of work... in which organization and their members pursue their interests, accomplish their purpose, communicate, and operate

practically” (Kupers, 2010, p.82, citing Norberg-Schulz, 1971, and Gorawara-Bhat, 2000). The richness of the activities and complexities of the surroundings in the neighborhood are amongst the things that make the place meaningful. The cultural interactions in the neighborhood reflect “social reality as constructed through actors’ practical accomplishments and the meaning of social phenomenon as resulting from the actors’ construction and negotiation of their interpretations” (Holy, 1987 as cited in Vertovec, 1999, p.24). Therefore, it has been argued in this paper that the location and architectures of the institutes can be read as social activities and real life dramas that can provide a better understanding of the roles of these institutes.

### **The Hong Kong experience: Educational reform and the government’s policy**

The consultation document named ‘Learning for Life - Framework of Education Reform’ was published in September 1999 by the Education Commission of Hong Kong with an aim to develop a “diversified, multi-channel, multi-layer higher education system” (Education Commission, HKSAR, 2000). A further step was taken in 2001 when the Chief Executive Office of Hong Kong announced “to increase the local tertiary education opportunities of the relevant age cohort from the existing 30% to a target of 60% within a period of ten years”. It was hoped that higher education will no longer be confined to the small elite group but also accessible to the mass population.

The encouragement of global education in the Hong Kong education system is a major challenge for the Hong Kong government to build a city of equality and harmonious (Sawan, 2008). Hong Kong has been enacting legislations on human rights and anti-discrimination policies in order to eliminate discrimination and ensure equal rights and opportunities amongst different social classes and races. To ensure fair opportunities for all students to excel and to minimize the “social inequality, the inclusive concept arose from the “Reform Proposal for the Education System in Hong Kong” was first promulgated in 2000 to cater for student differences. The objectives of the “no losers” and “teaching without discrimination” education initiatives aim to enable different varieties of students to receive education in equal footing despite of their social status. The first badges of Hong Kong community colleges emerged in 2000, offering self-financing Associate Degree [AD] programmes with an aim to develop a more diversified higher education structure. “By the autumn semester of 2001, nearly all tertiary institutions in Hong Kong are offering AD programmes” (Lee and Young, 2010, p.153). Government statistics revealed that in 2002, the total number of self-finance recognized Associate Degree places was around 3840. Because of the keen competitions and demands, in a time span of 10 years, there are

more than 20,000 self-financing Associate Degree or Higher Diploma places available by different tertiary institutions in 2012.

### **The unique nature of “community college” in Hong Kong**

It is interesting when one tries to interpret the term of ‘community college’ in Hong Kong. As mentioned earlier and using Bryson’s experience on Dartmouth University as an example, community college in North America or Europe bears a role to provide services to the residents of the community besides their functions of a higher education institution. However, community colleges in Hong Kong seem to have a common political aim: that is to fulfill the government’s need to increase the local tertiary education opportunities to a target of 60% in ten years’ time. On the bright side, the rapid increase of community colleges and its available self-financed programmes provide chances for different varieties of students to receive education but on a closer look, some of the programmes are profit-making and established without discreet planning to become a ‘college for the community’. Addressing the problem, Yung argues that “similarly, there were queries on the feasibility and effectiveness of setting community colleges based on geographical locations of the community, since the proximity of communities, population density, and the well developed mass transportation system of Hong Kong reduces the heterogeneity of community college in different communities. Indeed, not many people realized that community college carries a wide range of educational functions and missions as university performs” (Yung, 2002, p.34). Without any doubt, the experience of active life and interactions between the colleges and the communities can become “the embryo of culture life of a community” (Yung, 2002, p.36). Now, the question remains:

How possibly higher education institutions in Hong Kong, in particular, the community colleges, can take up the role to generate, regenerate, preserve or conserve the local architectures and at the same time nurture cultural interactions and learning in the communities?

### **Data collection and analysis**

A photo-ethnographic study was adopted. The data of this study was collected from a variety of sources in a span of three stages. Theoretical literature, government policy documents, district and architectural planning materials were reviewed in the first stage to generate the argument of this study. Photo-ethnographic studies of the locations, communities and the buildings of the two institutions were conducted in the second stage to observe the facilities and activities in the institutions and the

communities. This was followed by the interviews with different stakeholders (the senior management teams of the institutions, the users of the buildings, the neighbors and general public) in the third stage for a better understanding of their views on how possibly higher education institutions can take up the role to generate, regenerate, preserve or conserve the local architectures and at the same time nurture cultural interactions and mutual learning in the communities. A spatial-social approach was used for data analysis.

### **Research design and method**

Two higher education institutions each with different academic and cultural backgrounds located in Hong Kong are selected as the cases for this study. They are being selected because of their distinctive backgrounds and geographical locations. The first one is an American Art and Design University, the Savannah College of Art and Design (SCAD), resided in a former magistracy building in Sham Shui Po, North Kowloon while the second one is a vocational design training school, the Hong Kong Design Institute (HKDI), with her state of the art design building located in a newly developed neighborhood Tseung Kwan O in the New Territories. At the time of writing, the empirical work of this study is in progress because the availability of the students in the two participated institutions was limited by the summer vacation. Up till now, literature reviews, photo-ethnographic studies of the locations, communities and the buildings of the two institutions and the interviews with the two institutions' senior managements (the Assistance Vice President of SCAD and the head of department, one lecturer and one officer of HKDI) had been carried out. Shortly before the write up of this essay, a focus group composed of six of the HKDI's students was also conducted to collect views on their perceptions and their practical uses of the building. Further interviews will be conducted in the coming months in order to get holistic views and perspectives from the remaining stakeholders: the residents of the communities and if possible, the district councils' officials.

### **The photo-ethnographic study in SCAD**

With a structured questionnaire, the researcher first conducted a one hour interview with the Assistance Vice President of SCAD then used two hours for photo-ethnographic data collection in SCAD's building. After the data collection in SCAD, the researcher spent another two hours in the neighbourhood to observe, to feel and took photographs to get an understanding of the community. Responses to the questionnaire's item *1) about the community and surroundings* reveal that the Sham Shui Po community in which SCAD located is a "densely populated district, surrounded with poor and migrant families and lesser social economical status

residents” but interestingly, the district “is famous for technological gadgets; it is the biggest computer outlet in Hong Kong”. In a way, Sham Shui Po “is a well preserved community because of less tourism, not like areas such as Tsim Sha Tsui or Mong Kok; it is not new to hear that some say tourism is the best way to preserve culture, but in Sham Shui Po, it is different and all these made an interesting composition and unique culture of the district”. The above suggests that the community where SCAD located is a densely populated community with distinctive culture and residents. A short walk and observation in the community further support the responses, as showed in photo 1, streets are crowded with residents and shoppers for electric and computer gadgets as well as street wanderers.

*Photo 1. The Sham Shui Po community.*

Responses to the questionnaire’s item 2) *about the architecture* state that the location of SCAD “is a historical building and in the 1960’s it served as a court house as one of nine Kowloon districts and it is an iconic authority building” (photo 2, 3).

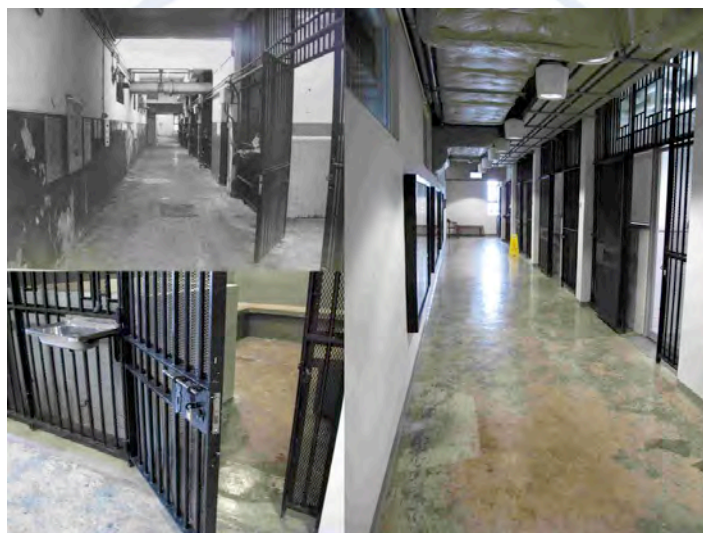

*Photo 2. The building of SCAD is a historical building and it served as the North Kowloon Magistracy in the 1960's.*

*Photo 3. SCAD Hong Kong*

It was told by the Assistance Vice President of SCAD that in 2005, under the development bureau revitalization scheme, the building was opened for leasing by inviting different parties to participate in the building's regeneration and the HK government asserted that the building is best and appropriate for education purposes, of which SCAD as a university for its reputation in cultural and architecture preservation, won the competition. It was also told that "it is coincident that one of

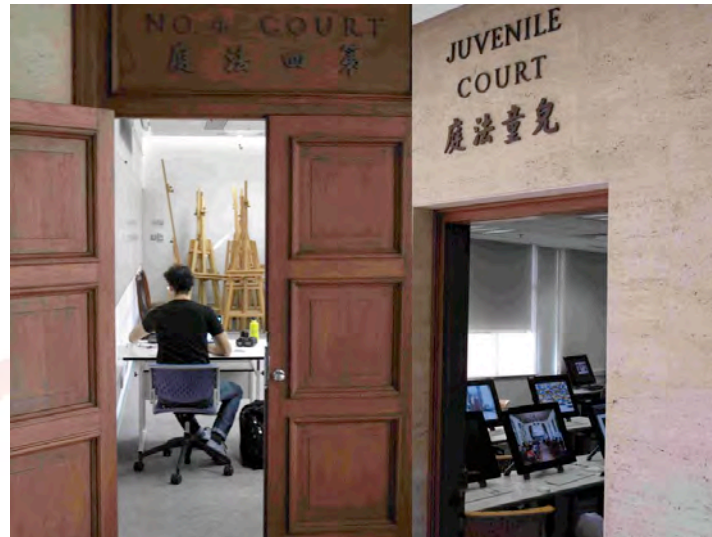

SCAD's buildings in the States was a former armory military building, same as this North Kowloon Courthouse, the architecture also represents a once authoritative institute. It reveals that "architecture preserves memories, and when infuses with education, it passes on the culture and history to nurture the next generation". Responses also reveal that "in general, the community and the government are pleased with SCAD's management and maintenances of the building". It is pleased to see that SCAD have preserved one major courthouse, one jail cell as was together with all the historical elements and details of the buildings and they have "renovated the rest of the building and changes the functions of the rooms into classrooms, art studios and galleries for our teaching purposes (Photo 4, 5, 6, 7). It is obvious that SCAD is using the building as a platform to promote cultural interactions with our faculties and students".

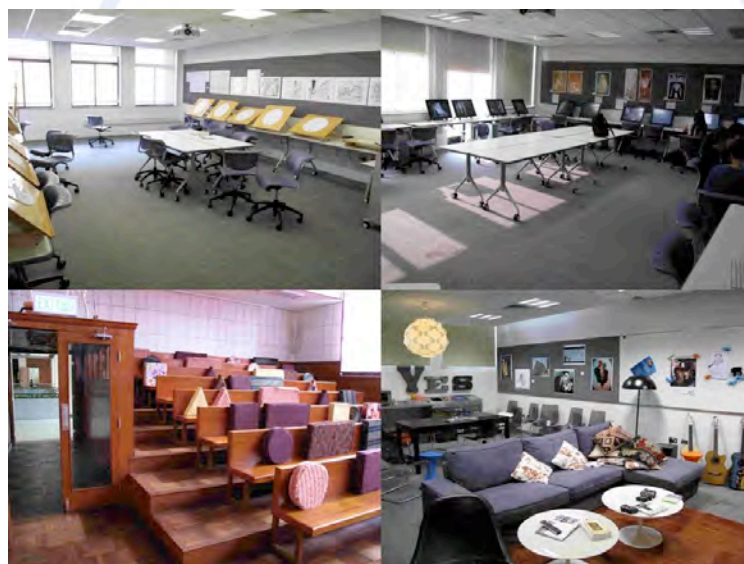

*Photo 4. The jail cells are preserved.*

### **The photo-ethnographic study in HKDI**

With a structured questionnaire, the researcher first conducted a one hour interview with the head of department, a lecturer and an officer of HKDI before using two hours for photo-ethnographic data collection in HKDI's buildings (Photo 8).

*Photo 8. HKDI's building*

After the data collection in HKDI, the researcher spent another two hours in the neighbourhood to observe, to feel and took photographs to get an understanding of the community. Responses to the questionnaire's item 1) *about the community and surroundings* reveal that the district of Tseung Kwan O “geographically, it is a reclamation land, in the past, it was fish villages and dock yards; the demographic of this community is very diverse. It is a mixed class community composed of local residents (former fisherman), new middle class and the new immigrants as well as the mental recovery people (from the community's shelters)”. It was also learnt from HKDI's management that “the most distinctive distribution is the high class complexes verses the public housing, interestingly, they are using the same facilities such as the transportation, supermarket, shopping mall, to name a few” as shown in Photo 9 and 10.

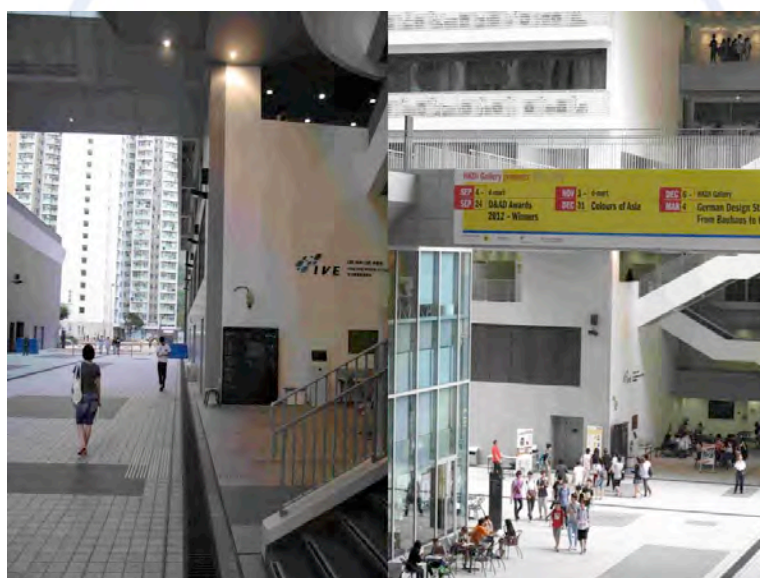

*Photo 9. The mixed groups: high class complex verses the public housing*

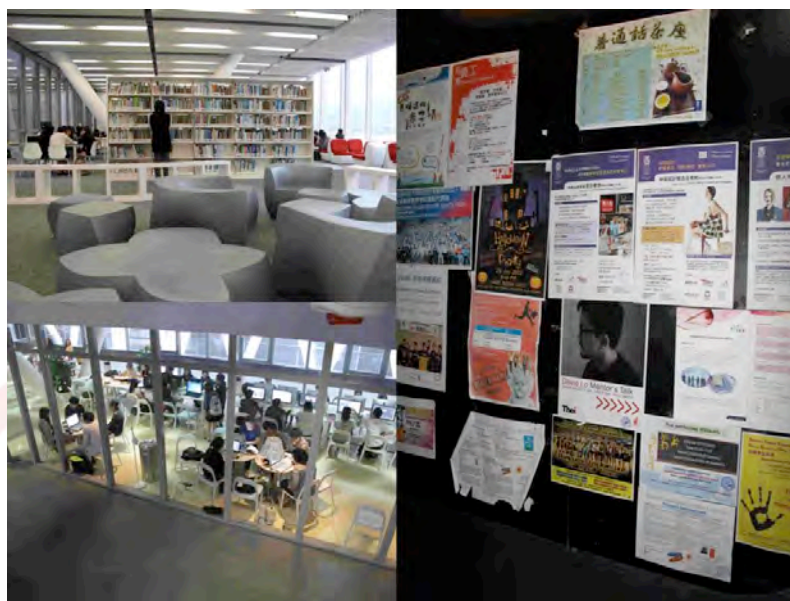

*Photo10. The mixed groups of residents are sharing the same facilities*

To answer the questionnaire item 2) *about the architecture*, all of the respondents regarded HKDI “is a new building established in 2010, it acts as a city spot, a landmark for the community and Hong Kong and the institute could be a platform to gather and draw attentions of the local residents but on the synergy and mutual learning level, there are a lot more to be done”. It was also told that there is a plan to expand the architecture into the green, landscape and sustainable design but in the short term there may not be any renovation because this is a relative new building.

In additional to the interview with HKDI's management, a focus group interview of six students was conducted using a structured questionnaire in order to see their perceptions of the architecture and whether they are benefited from the interactions with the community. When asking them the significance of this architecture, most of them responded that this is a famous architecture and they are proud to study in this building. On the design of the building, one student said "it is a special building; the view is spectacular, especially the big square opening in the middle. The window structure is impressive and amazed me during my interview". In general, most of them agreed that the building has a good view and emotionally, it offers psychological and learning motivation and they feel comfortable to study here. When asking them whether the institute environment is able to nurture learning, most of them said the architecture signifies a relaxing atmosphere, spacious structure, the open space to rest and for discussions, e.g. the podium and the boulevard (Photo 11 and 12).

*Photo 11. Views of the campus and facilities in HKDI*

*Photo 12. Views of the campus and facilities in HKDI*

They all agreed that they can experience the cultural environment from the open campus and benefited from the services such as the cafe, the library, the 24-hours study zone. One student said “I realised that there is no dormitory, I understand that some students have to travel a long way to school and therefore they have prepared their sleeping bags in case they need to stay over”. It is learnt that from the responses that for the interviewees the most distinctive facilities in this architecture complex are “the natural feeling, with lights, and the concept of a green building” and “it is not only for design, it is a mobile learning space to open up eyes because it has shows and it has its elasticity for different occasions to enable me to understand others through the interactions with them”. On the other hand, they expressed negative comments on the facilities and administrative procedures. One the one of the students felt that “the architecture is pretty but personally, there are many downsides on the building, for examples, there are many rules and regulations on using the facilities”. One student carried on and said “sometimes I feel the architect is just like a shell, the exterior is ok but it does not really take care of students’ learning; for examples, a lot of spaces and facilities are open for public use, like the swimming pool or else, may be it is the school’s strategies to open up the school for public but I think it should focuses more on students’ needs by improving its administration policy”. She continued “there should be more facilities, especially for art students. Sometimes I feel the bureaucratic structure that the use of facilities needs a lot of administrative procedures”. Another student expressed her view that “the campus is small, not spacious enough, it needs more rooms. Other than those, it feels good to study in a place like that, with open space and garden on the 2<sup>nd</sup> floor and 9<sup>th</sup> floor”.

Responses from the question: do you consider the institute a hub for you to know the community? Most of them said “in certain way, yes but it is limited to art groups. The institute is relatively new, even my friends live in this district do not know the campus. The residents do not have special feelings to it because in this community, the people are of average education level, the exhibitions are too high soundings and hard for them to join and enjoy”. They suggested that “the boulevard should open up for performance arts so that people can join, for example, more events such as band and music shows and they think the school should be responsible for the community but it really depends on the objectives of the school. In addition, they think the surroundings in the neighbourhood do not benefit and inspire them; other than that, one student said she always heard complaints from the residents.

Addressing the roles of students and the institution in this community to nurture cultural interactions and mutual learning, one student said she “simultaneously act the roles as student/visitor so as to voice for and share with the community and she will first start by influencing my friends that live here. The students also believed that “interactions will generate learning community on different levels, for examples, talk to others or local people to get their views” and it is good cultural exchanges between different community, district, residents and stakeholders but it needs strategies to achieve the no barriers, no walls learning community because there may be misunderstandings, segregations, preconceptions between the stakeholders. For them, it is possible to use the architecture of the institute as a platform and synergies to nurture mutual learning. However and once again, they think it needs a lot of understanding and latitude/elasticity between the school and community and residents to overcome the blind spots that create discrepancies so that we can accept each others to enable social cohesion.

### **Preliminary findings and discussions**

A few noteworthy points were found from the collected data and ethnographic studies.

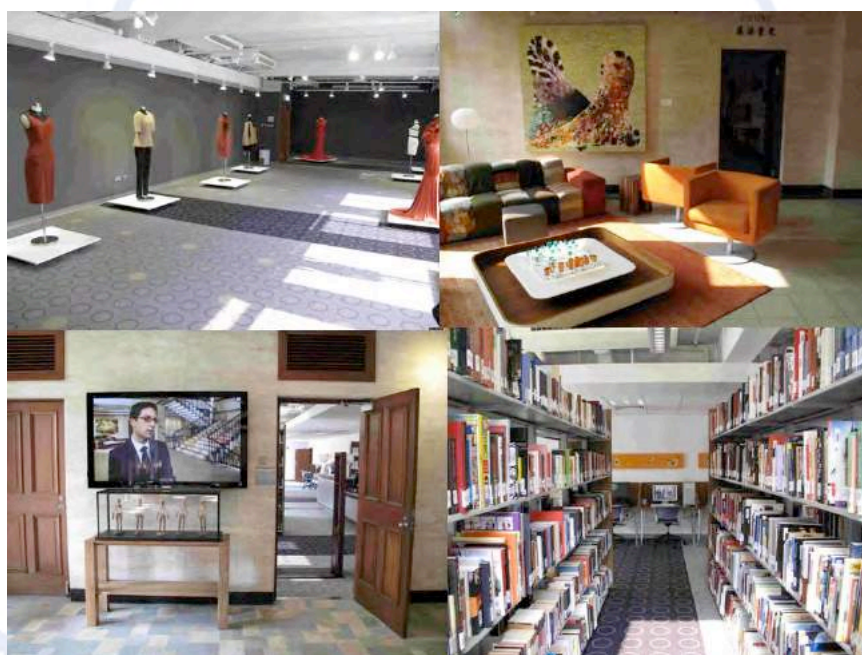

#### *1) Both institutes participate in serving the local communities*

It is realised both if the two participated institutions see participating in local communities tie to their vision and aim. For SCAD, “it is tied to its vision, using the locations as environment strategy and extra curriculum, it acts as a community university in the Hong Kong community and prepares for the extensions in Asian cities, for examples, Shanghai, China and we definitely look outwards into the community and see what else can be done”. Although right from the beginning

HKDI was not meant to be a community college to serve the community, however, it is pleased to know that HKDI has started working on projects with the community in 2011 so as to encourage their staff and students to interact with the residents.

*2) Services have been provided to the community by both institutes*

In order to reach out to the communities, a variety of services have been provided to the public by the two institutions. It is told that SCAD's services are down to earth and work closely with district council to disseminate the message to the community. SCAD has public tour daily and special arranged tour one Saturday each month and the library and galleries are open to the community. Public lectures, fine arts exhibitions and symposiums to cater for broad-based visitors". In addition, spaces and facilities are open to different bodies, for example, the Sham Shui Po police force once used SCAD's facilities for training.

*Photo 13. SCAD's facilities such as galleries and libraries are open to public*

With its specific geography location and the newly established campus, HKDI maintains a semi-open campus and the facilities such as the canteen, the cafe, the swimming pool, exhibition halls and at one time the basketball courts are open for the residents; more will be gradually open to the public because of the security, facility management and the resources issues. While touring in HKDI's campus, it was delighted to find that the ground floor boulevard provides an open passage to

the residents as a short cut from the MTR station to the public housing estates and there is a foot bridge built to link the shopping mall and the institution. Physically, the facilities enable links with the communities to facilitate interactions between the institution and the residents.

*Photo 14. HKDI's facilities such as galleries and cafe and swimming pool are open to public*

### *3) Interactions with the community benefit the student and residents*

Responses reveal that in general, the two institutions agreed that there are mutual benefits resulted from the interactions between the students and the residents. SCAD regarded "the interactions help to break down barriers by exposing students to east and west culture. It also uplifts, aspires and inspires the community by infusing the students into the community. It is also a good experience for the international or local students to understand the specific culture through the interactions between the students and the locals, to generate insights and reflections". It is also interesting to find that mutual acceptance between the students and the communities as the local restaurants start to have English menu to cater for SCAD's students and that signifies the constant interactions and mutual influences between the students and the community. It is also seen that the appreciation of design, the changes in English and Chinese types and the sustainable design by the residents and shop owners as results of the exposure of SCAD's services to the community.

HKDI provides the residents a place to enjoy their leisure time but the management admitted that they are not able to satisfy all the needs requested by the district council and the residents. Despite that, HKDI endeavours to provide activities to benefit the community and with a hope to upgrade the residents' awareness of design. The exhibitions are means to generate interactions between the students and the residents, for example, it was told that "HKDI once had a toy exhibition and the local residents were happy with that because the residents can save travel time and money to travel to the museums in the city".

*4) Both institutions are aware of their social role in the communities*

Social role in the communities is important to the two institutions. Both institutions want to have more proactive involvements with the community with the participation of their students to support the community services so as to raise the students' awareness of the community's diversified groups and societal needs. For example, SCAD are trying to change people's perception that SCAD is a noble and expansive design school and the school is servicing the community and using design as a means to benefit everybody. SCAD had held a number of summer workshops for the teens in collaborations with the district's secondary schools and SCAD is receiving a lot of requests of short course from schools and other NGOs. HKDI has been organizing social innovation projects to connect the institution with the community so as to improve community life and generate a better living environment; it is also learnt that HKDI is planning to provide more in service trainings for the local residents to cater for the local residents' needs.

*5) The 'no barriers' or 'no walls' education to enable equal access of knowledge for the betterment of community life and social cohesion are built on mutual understandings*

Although the concept of 'no barriers' and 'no walls' education is necessary and important to the learning process to enable a free flow of conversations of what is inside and outside the "walls" because it is what actually happening out there; however, attention should be focused on the risks of misunderstandings between the institution and the community to avoid miscommunications. Both institutions agreed that it needs mutual objectives to steer the directions that tie to the institutions' missions, visions and the activities to enable the equal access of knowledge. Given that, the AVP of SCAD contended that "a friendly presentation of the building and the role of being a community university is important, especially it is crucial to maintain the 'fabric' that contains the stories of the architecture, to promote interactions and mutual learning" and interviewees from

HKDI expressed the view that “there should be more exposure to the residents as well as to the other HK communities as well as an international recognition. It is also beneficial to establish art culture in the district to increase community value. Because of that, it was suggested that the activities should also aim to involve interested parties and stakeholders, such as parents and their children as well as the Bianchi design school located across HKDI in order to form a creative hub in the district through this synergy.

*6) Space is subjected to the social practice, experiences and interpretations of the users*

The findings further confirm Lefebvre’s concept of ‘the production of space’. The conceived space, which is the mental image of the higher education institutions have been changed from the once elite space for the privileged to the current user-friendly place to benefit the equal access of education for the public mass. At the same time, the perceived space: the various spatial practices of the architecture are under constant changes and the usages are subjected to the social practice, experiences and interpretations of the users. It is realised that the two institutions use their buildings to act as platforms to promote interactions between the students and the residents. Responses from the interviews further reveals that both institutions maintain open views on the usages of the buildings with a hope to utilise the possibility of a free flow of conversations of what is inside and outside the “walls”. It is also by the constant interactions between the institutions and the communities that enable the ‘production of the learning space’. As such, this asserts that space is subjected to the social practice, experiences and interpretations of the users.

**Limitation and Further work**

The limitations of this study rest in the similar nature of the two participated institutions. The two institutions both offer art and design programmes and in common practice, art and design institutions tend to be more proactive in cultural exchanges with the communities. It is not to say that institutions that offer humanities, engineering, science or business programmes do not normally participate in community activities but to the best of the researcher’s knowledge, they may maintain a low profile and thus such interaction activities are not observed. It is also hoped that more institutions with diverse teaching programmes will participate in this research. Efforts were made to contact a number of institutions but without any surprise, most of the institutions are reluctant or not interested to participate in this study. After all, as the study is still on-going, further interviews with the district

council, the daily users: the students and the communities' residents will be conducted and it is expecting that the interviews can be arranged in the coming months.

## Introduction

According to the 2009 American Community Survey, the population of Asians, including both Asian Americans and Asians who are temporarily present in the USA, reached approximately 15.7 million in 2009 (U.S. Census Bureau, 2010). The percentage of the population of Asians in the USA from 2000 to 2009 reached approximately 32%. Accordingly, the number of school age children and adolescents of Asian descent has also grown significantly (Yeh & Inoue, 2002; Johnson & Lichter, 2010). The population of Asian immigrants in the USA is expected to continue to grow in the future (Frisbe, Cho, & Hummer, 2001; Johnson & Lichter, 2010).

Although the foreign-born population is still concentrated in “gateway states” (i.e., California, Florida, Illinois, New Jersey, New York, and Texas), the number of foreign-born residents who moved to non-gateway states grew by roughly 15% between 1995 and 2000 (Hempstead, 2007). That is to say, the population of immigrant children and youth has increased throughout the USA. For example, according to Census 2000, the number of Asians who were present in the state of Indiana in 2000 was 59,126 (U.S. Census Bureau, 2000). In 2009, the number had reached 90,593 (U.S. Census Bureau, 2010). This growth demonstrates that the Asian population in the Midwest has steadily increased in recent years. With the growth of the Asian population in the USA, research on Asian immigrant youth in gateway states such as California (Feliciano, 2001; Le & Stockdale, 2005; Zhou, & Kim, 2006) and New York (Bhattacharya, 2000; Lew, 2007; Rosenbloom & Way, 2004) has increased. Despite the rise in the Asian population in the Midwest, however, little is known about the schooling experience of Asian immigrant high school students in this region of the USA. Kincheloe and Pinar (1991) state that “place” is a key element that has an effect on how a student undergoes his or her schooling experience and develops his or her educational knowledge because a place, such as the Midwest, holds its own social, cultural, historical and educational characteristics. The linkage between the Midwest and education as well as the educational experiences of Asian immigrant students is a neglected research area that needs to be examined.

In addition, the voices of Asian immigrant high school students on their educational experiences are often overlooked in the discourse of educational equity (Kumashiro, 2005; Xu, Connelly, He & Phillion, 2007). Thus, examinations of Asian immigrant youths’ educational experience in the Midwest are urgently needed in order to understand and address their educational needs.

## Research Questions

The foundational research question for this study is: *What is it like to be an Asian high school student in the Midwest?* This question is the driving force that prompted me to design as well as execute this study, which I will further discuss in chapter three. What I present in this dissertation is a compilation of my descriptive and analytical work in responding to the foundational research question.

Three related questions derive from this foundational question: (1) How do bicultural/bilingual Asian students construct and maintain their identities?; (2) How do they perceive their

relationships with school, curriculum, peers, teachers, and family?; and (3) What do they think is important in their high school life?

### Theoretical Perspectives

Through an extensive review of the literature I found two important theoretical perspectives. First, the research has pointed to the fact that the current racial stereotypes of Asians such as the model minority image, which have been constructed by racial ideology embedded in US society (Winant, 2004), are problematic entities that hinder people from becoming aware of the academic and psychological problems that some of Asian immigrant youth currently have (Kim & Yeh, 2002). Martinot (2003) explained that the idea of racialization lies in the concept that race is a socially and historically constructed category and it is a phenomenon that people racially classify other people based on their physical characteristics such as skin color and begin to impose racial interpretations, in other words racial stereotypes, on each racial group. Additionally, Webster (1992) pointed to the fact that the process of racialization is notably affected by the concept of white supremacy entrenched in US society, which indicates that white people are superior to other racial groups. In examining what it is like to be an Asian high school student, it is imperative to scrutinize the concept of racialization since the racial stereotypes seem to have an impact on Asian immigrant youths' schooling experience.

### Literature Review

#### *The "Problematic" Model Minority Image*

Commonly, Asian Americans are described as model minorities due to their academic attainment and economic success (Jo, 2004; Kawai, 2005; Lee, 1994, 1996; Ng, et al., 2007). Extensive research examines whether Asian American students' academic success is atypical by contrasting them to other minority groups' and White Americans' academic achievement (Bhattacharya, 2001). Regardless of the outcomes of this research, however, the model minority stereotypes are embedded in US society. This model minority image constructs and perpetuates both positive and negative representations of the Asian population in the USA such as viewing them as high achievers, hard workers, submissive, or quiet and nerdy (Kim & Yeh, 2002; Lee, 1996). The literature suggests that despite the model minority image, Asian students' actual social status has not improved over the years. The model minority image is, in reality, a problematic construct for many Asian immigrants in the educational milieu (Endo, 2009).

The positive image of Asian Americans began appearing in the 1960s, along with the increase in Asian immigrants in the USA. The positive representation of Asian Americans was attributed to the popular press, which paid attention to the success stories of Asian Americans in a variety of contexts (Wong & Halgin, 2006). The emergence of the term "model minority" is rooted in an article published in 1966, written by sociologist William Petersen, on the subject of Japanese Americans' unusual academic triumph in adversity (Wu, 2002). By focusing on a positive picture of Asian Americans, the model minority stereotype of Asians working hard in order to succeed in US society was constructed. However, Japanese Americans' educational achievement was already close to that of White Americans in the early 1940s (Fogel, 1966; Wong, 1990).

It is too optimistic to believe that the model minority image was a better replacement for the “yellow peril” image, which had been implanted in White American society for over 100 years. One cannot ignore the fact that the dominant racial group in US society used to openly hold immigrants, especially racially inassimilable immigrants, in abhorrence. The exclusion acts of the late 19th and early 20th centuries such as the Chinese Exclusion Act, along with the 1924 Immigration Act, which was promulgated to prohibit Japanese from immigrating to the USA, show how immigrants of color, particularly Asians, were discriminated against in the USA.

Instead of producing a new representation of the Asian population in the USA, the model minority stereotype was used to justify White Americans’ racial ideology. The success stories of Asian Americans were disguised in the norm in which, regardless of one’s racial background and socioeconomic status, everyone has equal opportunity to succeed in the USA, as if that were the virtue of US society. It appears that the model minority myth was exploited to keep perpetuating the concept of the “American dream” to some extent (Cheng, 1997; Suzuki, 1977). This concept denotes that one’s economic success is fundamentally attributed to one’s work ethic. However, it absolutely dismisses other significant factors such as one’s social class (Anyon, 1981; Kincheloe & Steinberg, 2007), gender (Gibson, 1991; Suárez-Orozco & Suárez-Orozco, 1995), race/ethnicity (Delpit, 1995, Lee, 2005) and educational attainment (Breen & Goldthorpe, 2001), all of which affect one’s economic accomplishments in US society.

Not surprisingly, the model minority stereotype began to transform into a social burden not only for Asians but also for other minority groups. Indeed, some scholars claim that the model minority was constructed to send a political message—claiming that Asian Americans climbed up the social mobility ladder without governmental support—to the social justice movement, which culminated in the Civil Rights Act of 1964 and was supported by African American activists in the 1960s (Kawai, 2005; Osajima, 2000; Suzuki, 1977). Moreover, the model minority image was exploited to label other minority groups, especially African Americans, as failures (Takaki, 1993). The image began oppressing other racial minorities as if to say they were to blame for not being able to achieve a better economic mobility.

The distinctive academic accomplishment of the Asian population in the USA has been highlighted ever since this positive image appeared. Numerous educational researchers have examined the academic realization of Asian students and have provided evidence to show that Asian students are academically more successful than other racial groups (Caplan, Choy, & Whitmore, 1991; Goyette & Xie, 1999; Hirschman & Wong, 1986; Sanchirico, 1991; Zhou & Bankston, 1994, Zhou & Kim, 2006). Examining the success stories of Asian students is exceedingly important since the findings and implications derived from the investigation can contribute to numerous arenas in the field of US educational research. It is also true, however, that these studies are inclined to perpetuate the model minority myth that has prevailed in US society, especially in the educational environment in which Asian American students are high academic achievers. Consequently, the model minority myth overlooks the fact that, behind the label, there are many Asian immigrants who are not academic achievers. Therefore, the stereotypes that are reinforced in the educational setting limit one’s perception of Asian students (Kim & Yeh, 2002).

## Methodology

The present study is qualitative in nature, with an emphasis on phenomenology. Phenomenological research is an outstanding methodological framework to explore a certain phenomenon that a person or a group of people experience in their “lifeworld” (Husserl, 1970), which represents what “the world of lived experience” (Van Manen, 1990, p. 182) means to them. Since the core question for my dissertation is what it is like to be a foreign-born Asian immigrant high school student in an American school in the Midwest, the foundational components that phenomenology addresses are quite important in order to refine the methodology.

### *The Research Site: Orange High School*

I gained entry into Orange High School. Orange High School is a large public high school that serves grades 9-12 located in one of the metropolitan cities in the Midwest. Student enrollment for the 2008-2009 academic year was 2,612. Orange High School is one of two high schools in the metropolitan district. The sister high school of Orange High School also serves approximately 2,600 students. As for the ethnic breakdown of Orange High School, 47.8% of the entire student population is White. The second largest racial/ethnic group at the high school is African American, representing 38.7 % of the school’s population. The Hispanic population, which is 6.7% of the total student population, follows. Only 1.5% of the population is Asian. The remaining part of the total student population, 5.2%, is multiracial. According to the National Center for Education Statistics (2007), the average ratio of White students’ population enrolled in public schools in the state where Orange High School is located is 80.3%, the ratio of African American students 12.5%, Hispanic 5.7%, and Asian 1.2%. The ratio of Asian students at Orange High School is slightly higher than the state average. However, given that the population of the racial/ethnic minorities at Orange High School is much larger than that of the state average, it appears that Orange High School is a racially/ethnically diverse high school.

### *Participants*

The primary participants of this study are Asian immigrant high school students in the Midwestern high school. Following the concept of purposeful sampling strategies, which allows me to focus purposefully on a small sample in order to understand the in-depth meaning of this small sample (Patton, 2002), I recruited four Asian high school students: Tamika, a recent immigrant to the USA from the Philippines (She had been in the USA for only four months as I started the fieldwork at the research site in February, 2009); Kevin, who identified as a “parachute kid,” which is an academic expression used to describe a foreign student who comes to the USA alone to have a better education and lives separately from their parents (Zhou, 1998); Mako, currently a *Kaigaishijo*, which is a Japanese term used to identify Japanese students who attend school in a foreign country (Harkins, 2001) and who will become a *Kikokushijo*, which is a Japanese term used to describe a *Kaigaishijo* who returns to Japan (Harkins, 2001); and Ashley, a half Korean and half Chinese second generation American who takes care of her younger siblings for her busy mother. Four teachers who teach the primary participants and the principal are the secondary participants.

### *Data collection*

In order to collect data, I conducted my fieldwork once or twice a week from February 7<sup>th</sup> to May 27<sup>th</sup>, the last day of the 2008-2009 school year at Orange High School. Direct observations

and in-depth interviews are the principle components of my fieldwork. In order to collect data, I directly and closely observed my participants in their classrooms, hallways, and cafeteria so as to understand the essence of what it is like to be an Asian immigrant student. Spindler and Spindler (1997) have noted that direct observation leads researchers into a deeper understanding of their participants' behavior, voices, as well as the social and cultural contexts where the events take place. The other significant vehicles which helped me to gather data are in-depth semi-structured interviews. I interviewed each of the primary participants three times throughout my fieldwork. In the interviews, I asked the participants about some of the events that I observed and their school life in general.

#### *Data Sources*

Throughout my fieldwork, I collected data in the form of field notes; audio files; interview transcripts that I obtained by transcribing the interviews with the participants; and a research journal that I kept to express what I observed, experienced, and felt throughout my observations and interaction with the students and teachers and theoretical themes that I came across while immersing myself in the high school environment. The emails I exchanged with the participants also become data. There are a total of 18 sets of interview transcripts.

#### *Data Analysis*

Following the completion of the fieldwork, first I vigilantly read the interview transcripts and the research journal three times with the aim of capturing the essences of the life stories and phenomena centered on the lives of the students, which is considered an essential portion of the data analysis process in phenomenological studies (Miles & Huberman, 1994). Subsequently, I began coding the data using constant comparative analysis (Glaser & Strauss, 1967), which allows for a potentially deeper understanding of the high school experiences of the four Asian students, as well as identification of the differences among the Asian students.

#### *Findings*

##### *Isolation of Asian Race/Ethnicity: No Acknowledgement of Asian Heritage at Orange High School*

One of the major themes that I found important in my analysis of the Asian high school students' experiences is the isolation of Asian race/ethnicity in the school environment. At Orange High School, race becomes an important social identity of each student and a key element that affects how the students form their peer groups. The peer groups that the students at Orange High School form are largely racially divided. Latino students, mainly immigrant students who are in the ENL classes, spend time with other Latino ENL students. African American students also regularly associate with other African American students. Correspondingly, White Americans associate with other White Americans. I also witnessed interracial groups and some students who challenge the racial boundaries and respect racial integration. Besides race, socioeconomic status may be another factor that has an impact on the formation of the peer groups. Nevertheless, race seems to play a crucial role in creating peer groups among the students.

Asian students are literally "the minority race" at Orange High School. As mentioned previously, there are only 40 students of Asian descent in the large urban high school that serves 2,612 students. Only seven of the 40 students of Asian descent are foreign-born; the majority of the

Asian students are US-born. I have seen the Asian students, both the Asian students in this study and other students, in the hallways. In most cases, they were on their own, moving from one classroom to another while other students walked the hallways with students of the same race. Many students likewise linger in the hallways with other student of the same race before the bell rings to signal the beginning of each period. However, I did not see any “Asian groups” in the hallways while I was immersed in the school milieu. I saw, however, Asian students, particularly the US-born students, who associate with White students in the hallways and cafeteria at times.

No racial solidarity seems to bring Asian students together to rejoice in their racial background among the Asian students at Orange High School. In addition to the small number of Asian students, the heterogeneous nature of the Asian population (as addressed in the literature review chapter), may prevent the Asian students from bonding closely as a unified or pan-ethnic racial category. In Kevin’s math class, there are two other Asian American students. One of the Asian American students is Ashley. However, the three Asian students barely talk to each other. In the interviews, I asked Kevin and Ashley whether they know their Asian classmates well. They said “No.” For Kevin, his LEP status may be hindering him from getting to know the other Asian students. But I never saw the two Asian American students talk to each other either.

Ethnic solidarity, which signifies the unification of a group of people who share the same ethnic identity (Martinez, 2008), does not exist among the Asian students. Because of the small Asian population, constructing ethnic solidarity at Orange High School is not a viable task. To be more precise, it is simply difficult for the Asian students to meet other Asian students of the same ethnicity or similar ethnic background. Kevin once had a Taiwanese friend, John. John was a senior when Kevin was a freshman. John graduated from Orange High School and currently attends a large state university in the Midwestern state. I asked Kevin about his friend, John:

- Hidehiro: Which language did you speak with John?  
Kevin: We speak Mandarin because he is from Taiwan, and he speaks Mandarin. He doesn’t know how to speak Cantonese, so we speak Mandarin.  
Hidehiro: Did you guys talk in English?  
Kevin: We seldom do that because you know, you are so excited to speak to another person who can speak your own language [laughing].  
Hidehiro: Has anyone asked you which language you were speaking as you spoke Chinese? No one really reacted to the language?  
Kevin: Sometimes, some people are like, what are you talking about? Are you talking behind my back?  
Hidehiro: They don’t know the sounds of Chinese.  
Kevin: I think it’s because not too many Asians are here, so they will feel surprised.  
Hidehiro: He was the only person you could speak to in Chinese?  
Kevin: Yeah.  
Hidehiro: Right now, you have no Chinese friend at school?  
Kevin: No.

(Kevin, personal communication, March 10, 2009)

Kevin told me that he misses John, with whom he could share his culture and heritage. At present, he has no friend with whom he can communicate using his native tongue. As explained

in the previous findings chapter, Tamika stated that she misses talking with Filipino students using Tanglish. Kevin and Tamika, who are recent immigrants, pine for friends with whom they can share their heritage culture. In surroundings where it is very difficult for an Asian to meet other Asians of a similar ethnic background, ethnic solidarity cannot materialize.

Furthermore, as indicated in the dialogues between Kevin and me, for many of the Orange High School students, Asian culture or language appears to be an unfamiliar custom. Unfortunately, Orange High School offers no Asian language courses such as Japanese and Chinese that can promote the students' acknowledgement of Asian culture (Endo, 2008). Also, no school events celebrate the cultural traditions of Asian people. The school cafeteria offers an "Asian" menu on Mondays; according to Mako, however, the cafeteria does not offer genuinely "Asian food":

The cafeteria serves a dish called Asian chicken on Mondays. That chicken comes with a strange looking Teriyaki sauce. But the chicken is pre-cooked popcorn chicken. That's just such a strange combination and not Asian at all. I tried it but it wasn't good.

(Mako, personal communication, March 6, 2009)

Although the school's attempt to offer a wide range of food at the cafeteria may be commended, it does not help the students become familiar with Asian culture. On the whole, Asian customs are neither promoted nor celebrated in the school milieu. Consequently, non-Asian students as well as teachers have very limited opportunities to gain knowledge of Asian students and their culture at the school. This condition further perpetuates the idea of Asians as perpetual foreigners in US society (Ng et al., 2007).

At Orange High School, Asian race/ethnicity and culture are often disregarded. Thus, Asian race/ethnicity becomes isolated—i.e., a social condition develops in which there is no racial/ethnic solidarity among Asian students to share their racial or ethnic pride, nor do they recognize their Asian heritage and culture. As a result of the isolation of Asian race/ethnicity at Orange High School, Asian students become marginalized. Accordingly, the Asian students at Orange High School become marginal members of the school society.

### *Intricate Identity Construction Allied with Language and Culture*

The Asian students in this study, including Ashley, who is US-born, practice their heritage customs at home. The three foreign-born Asians, Tamika, Kevin and Mako, live with their family members with whom they can share their native language. Ashley, whose first language is English, speaks one of her heritage languages, Korean, with her mother. I found that the four Asian students who value their ethnic background experience the intricate processes of both developing new social identities and maintaining their ethnic identity in the Midwestern high school.

Mako, who eventually will go back to her homeland, seems to be aware of the importance of maintaining her ethnic identity. She also feels that she has developed an identity with which Japanese youth of her age in Japan may not touch a chord. She stated:

I heard Japanese people usually think *Kikokushijo* are mean. Here, we say "you are stupid" to friends as a joke. But if I say the same thing in Japan, people might take it

seriously. That's why I thought Japanese people think *Kikokushijo* are mean. Maybe Japanese language sounds more serious than English does.

(Mako, personal communication, March 20, 2009)

Mako's statement shows her concern for blending into Japanese society again. She has constructed an identity that allows her to blend in US high school culture. However, this identity that she has developed in the US educational milieu may not be fully accepted in Japanese society since the identity is too "foreign" for many Japanese people of her age (Kanno, 2000). This identity is also strongly connected with the English proficiency that she has developed for eight years. I asked her which language she is more comfortable speaking:

It's probably Japanese. When I speak Japanese, I feel I can be more open. But I am not so confident in my English. So, when I speak English, I think I am a little apprehensive.

I sometimes stumble as I can't find an English word that I am looking for.

(Mako, personal communication, March 26, 2009)

Even though Mako has been living in the USA for eight years, she feels Japanese is the language with which she is more comfortable. She speaks English well, but after all English is not her first language. Her English does not allow her to fully express herself at Orange High School. She perceives that she becomes an "ambiguous self" that hovers between Japanese culture and American culture at times in her school.

Ashley is likewise in the process of constructing her social identities. This second generation, multiracial Asian American struggles to identify her cultural affiliation. In the interview, she stated:

Well, I kinda feel I am culturally deficient, maybe. Because I don't know about culture. I don't know much about Korean culture other than food perhaps, then I know almost nothing about American culture 'cause I don't like to go out and watch movies. Or I don't know about all about historical American details. I don't listen to American music much, so when my friends talk about these things, I don't know. Also about TV. They think everyone watches TV. My family doesn't.

(Ashley, personal communication, March 26, 2009)

For Ashley, the USA is her homeland. However, she does not associate with the cultural activities in which her American peers at Orange High School take pleasure. She admits that she does not have a strong sense of American identity. Conversely, according to Ashley, her younger sister, who enjoys American youth culture, has developed a stronger American identity than Ashley has. One's attachment to a particular culture seems to be entangled with one's social identity (Ying, Han & Wong, 2008).

As indicated, Ashley believes that she is not an authentic Korean since she was not born in Korea. Palmer (2007) mentions that Korean-born Korean American students are likely to differentiate US-born Korean American students from themselves since US-born students are too "Americanized." Ashley told me that when she is with other Korean-born Korean Americans who are members of a small Korean church in the Midwestern state, she feels that people see her as an unauthentic Korean because she does not speak the Korean language well and she is half Chinese. As Gee (2001) indicates, one's strong sense of belonging to an affinity group affects how one constructs an identity. Thus, the fact that she does not fit well in Korean affinity groups to some extent hinders her from developing her Korean identity.

Nevertheless, Ashley's desire to build up and sustain her Korean identity does not cease. As I communicated with her via emails, I noticed that the last name that appears on her email account differs from her real last name, which she inherited from her Chinese father. The last name that she used for her email account is a family name commonly used in Korea. I asked her how she came up with the Korean last name. She answered, "That's my mom's last name. I just used that online." Edwards (2006) maintains that one's name is connected with the construction of one's social identity. Ashley's tight bond with her mother prompts her to cherish her Korean heritage. By using her mother's last name as her online name, she inwardly develops and embraces her Korean identity.

The recent immigrant Tamika likewise began learning the importance of constructing a new identity that masks her "foreignness":

Hidehiro: When you met other Filipinas in class, did you speak your native language?

Tamika: Filipino? No! English.

Hidehiro: Because other people were there too?

Tamika: Yeah.

(Tamika, personal communication, March 13, 2009)

Tamika, who misses speaking her mother tongue with other Filipino/as, did not communicate with other Filipina students in her school. As described in Kevin's statements in the previous chapter, some students respond negatively towards the foreign languages spoken in the school environment. Tamika perhaps intuited that one who spoke a language other than English will be the object of the other students' attention and avoided initiating conversations with the Filipina student in Filipino. She just began constructing a new identity that enables her to blend in the US high school milieu.

The Asian students who are culturally and racially/ethnically marginalized youths in the Midwest construct a social identity that allows them to integrate into host school society (Kibria, 2000; Palmer, 2007). While developing a social identity, the Asian students also undergo cultural negotiations by hovering between their heritage customs and US school culture in order to find a self with which they can be content.

The theoretical theme, intricate identity construction allied with language and culture, signifies the complicated process that the Asian high school students undergo in discovering who they are. Maintaining a bicultural and bilingual/trilingual status has an impact on how the Asian students construct their social identities and how they develop their self-esteem as persons of Asian descent in the Midwestern state.

## Conclusion

In the Midwestern educational environment where Asian ethnic values are largely disregarded, there are hardly any opportunities for the Asian students to embrace their ethnic backgrounds at school. Thus, the Asian students need to conceal their cultural backgrounds, which are often seen as too "foreign" in the Midwestern educational environs. As a consequence, they venerate spending time with their family with whom they share their ethnic values and bonds. In the Midwestern educational environs, the ethnic values and bonds are only sustained in their family.

The findings of this study also represent the vulnerability as well as the isolation of the Asian students, particularly the recent immigrant students, Tamika and Kevin, who are marginalized from the mainstream school society. Kevin and Tamika undergo more intricate social and cultural adjustment process than the other two participants in the Midwestern area due to their unfamiliarity with the dominant school culture and the language barriers between them and their mainstream peers.

The challenge to provide Asian students in the USA with better educational opportunities can be a never-ending trial. However, I believe these efforts can be transformed into knowledge that guides both current and future educators to learn what it is like to be an Asian student in the US educational environment and to become more culturally sensitive to Asian students.

Abstracts

An action research of Design Thinking with integration to the science and technology education at a senior high-school has been proposed. The students involving in this research belong to the 12<sup>th</sup> grade at the senior high-school where the researcher is that school teacher. According to our preliminary studies, there are three major problems when a senior high-school tries to integrate the design thinking into science and technology education. The school authorities, the teachers, and the students have their own problems from the traditional education system, which will be discussed in this paper. The future prospects and the potential benefits of the design thinking education will also be included and discussed here.

## **I. Introduction**

Since 1990, mankind has entered the era of knowledge economy. The United States (U.S.) and the European Union economy, which are highly developed countries alike, realize the importance of secondary education reform; Science education to enable students to take the initiative to identify problems and integration solutions for scientific and technical knowledge to create the core of this study. The core spirit of such process to make the change is “design”.

Based on the foregoing ideas, 1992, the British national curriculum framework stipulated that "Design and Technology" (DT) is a required course. Some design companies in the U.S., the Industrial Designers Society of America (IDSA) pull strings with some of the State Board of Education will co-design into secondary school teaching.

However, traditional education in science and technology is leaded by two major Entrance Examinations of Universities in Taiwan. The General Scholastic Ability Test is held around February in winter recess and the Department Required Test is held around July in summer recess. As a result, the courses are divided as prescribed courses and elective courses respectively. In Taiwan, senior high school students are mostly selected through their scores in the high school entrance examination. The students in Chung-Gang Senior High-school (CGSH) are graded among 70% to 80% with the best students graded 99%.

Our research program attempts to implement British "design and technology" of the national curriculum framework as the core, with the U.S. industrial design and design education into secondary school teaching with the university cooperation. The collaborative members include CGSH, National United University (NUU), and other members such as Koi-Mei Primary School, Washington Senior High-school, and National Yun-Lin University of Science and Technology.

## **II. What's Design Thinking? How to Proceed?**

The program is composed of three groups with the funding from Taiwan government, National Science Council (NSC). The professors in the universities are the first group which plays the role of advisors in this project. The high school teachers and staff are the second group. The final group is the students who are regarded as study objects. In the very beginning of this research, we have to find some teachers who are willing to learn. As a result, a summer workshop is provided by a design company (Gixia Inc.) in July and August 2011. After the training courses of Design Thinking, the teachers then become the instructors and speakers of the training courses for students. The students then do their projects based on the principle of the design thing.

The study methodology is a portfolio assessment by Delphi Method which can make the research a reflective practitioner (Avrramidou & Zembal-Saul, 2002), (Gibson, Bernhard, Kropf, Ramirez, & Van Strat, 2001), (Swanson, 2000), (Schön, 1983, 1988).

Based on the definitions of Design Thinking (Brown, 2010), we summarize the qualifications of Design Thinking with the following abilities; observation, user analysis, empathy, definition, ideate, prototype, and testing. The activation of

humanity and active learning and the skill training of new science and broad abilities are finally toward the ability of problem-solving.

On the other hand, in order to motivate the students in this Design Thinking Project, we need to take care of the students needs, which contain at least three categories. The first is the preparation of the career guidance of the students. Because the Portfolio is asked by the General Scholastic Ability Test for the applied students, the designs of the Portfolio can be guided by the Design Thinking. The second is the feeling experience of traditional prescribed courses. The incorporation of Design Thinking is expected to prevent the boring experience on classes. The last category is to make the project embedded into traditional courses which can improve students' capabilities.

The first year project is to implement the design thing in the science and technology course and encourage students to do some small projects. One example will be discussed in the following sections.

### III. Redesign on flag-raising platform

An example is executed by the redesign on flag-raising platform. Initially, the authors make the students observe the platform and analysis the experience of themselves on the original platform. Followings are their conclusions. The appearance is a traditional building. The usage frequency is below once per year. The location is at bolder area of the campus. The overall evaluation is that it could be better or it should be better. Based on their experience, the first author proposes his redesign platform which is a physics teacher-based proposal. In order to ideate the user-based thinking, the author uses a "Like" button on Facebook in order to ask the students: What's the platform you like? In this design, the Design Thinking, new science, and feeling experience are embedded experimentally. The fish bone diagram is applied and depicted in Fig. 1.

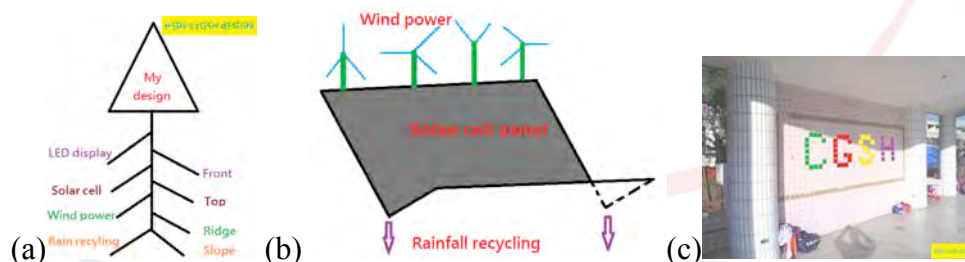

Figure 1 : (a) Fish bone diagram as an example of Design Thinking. (b) Schematic diagram of sample redesign platform. (c) Schematic LED display in the front of the platform.

In Figure 1, the platform is proposed to set a LED display on the front, solar cell panels on the top, a wind power module on the ridge, and rain fall recycling system on the slope. Due to our former study which is joined to the Science Fair, in CGSH people encounter very strong northern wind in winter. As a result, the wind power in new science is introduced. Finally, the author asks students: Is there any other crazy ideas like some reports on the newspaper which is redesigned for the bus stops as a school-bag and a magic cube. What if we design the platform as a very huge concentrated solar energy module?

#### **IV. Related bright-spots and the Students Feedback**

Besides the embedded courses, the students are encouraged to join the invention contests. For International Exhibition for Young Invention (IEYI) 2012 in Taiwan, two teams of the High Scope Program in CGSH win silver medal awards.

As the High Scope Program is a three-year project. The embedded course is executed by three stages recursively. The first stage is a preliminary test as external course after joint examination. The second stage is an elective course. These two stages had been finished in last year which is the first year of our project. The final stage is being executed and embedded into prescribed course in this year. It is observed that the student designs are limited by traditional shape design and are not sufficiently satisfied due to the lack of training courses in stage 1. Contrarily, in stage 2, the student designs are colorful and emerged with environments around CGSH. For example, the location of CGSH is near the Taichung-Port, it is observed that many designs are ship-shaped accordingly. More fruitful designs can be observed such as the usage of mind-map and specialized CG-ark. It is also noteworthy that a student introduces the idea provided in the class. He claims that the best design is no design. As a result, keep the platform as it is. More interesting designs not related to the platform can be seen in their design notes.

#### **V. Conclusions and future challenges**

In summary, on the good side, High Scope Program is beneficial for the integration of university, high school faculty, teachers, and students to develop their own professional enhancement. An embedded course with Design Thinking is beneficial for the promotion of feeling experience in Science and Technology curriculum. We are not intended to find the best solution, but, instead, the better solution.

Contrarily, on the down side, additional burden and loading are not avoidable for the integration of university, high school faculties, teachers, and students. For example, the ability of program execution for high school faculties is desired. The peer-relationship of teachers should be handled with care. The motivation of students should be activated by various approaches in the beginning of this project. As a result, more skills and experience are needed for some other innovative curriculums. Survey and investigation of curriculum, student feedback, and activity design could be helpful for the improvement of this project.

As a result, more investigations are needed. For example, because Design Thinking is not so easy to be qualified, evaluations are still under construction in this project. In our future works, the evaluations can be at least three dimensions which are depicted as Fig. 2.

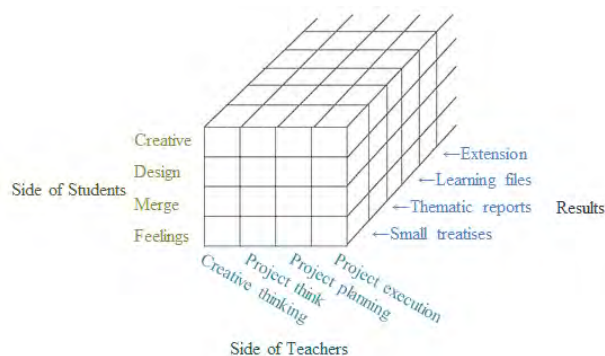

Figure 2 Three dimensions of the project evaluation.

## **1. Introduction**

Use of mobile technologies is growing worldwide, and especially among students. A 2012 study of undergraduate students at universities in the United States showed that 62% owned smartphone devices (Dahlstrom 2012), which is higher than the rate among all adults in the US, which was 35% (Smith 2011). Smartphone ownership among students has increased for a number of years, growing 5545% since 2004 (Dahlstrom 2012), and this growth trend among students indicates the shape of things to come.

More than mere ownership, students feel that their mobile devices are important to academic success (Dahlstrom 2012). According to the 2012 ECAR Study of Undergraduate Students and Technology (Dahlstrom 2012), 37% of students feel their smartphones are extremely very important to academic success, and 67% of students who own a smartphone have used it for academic purposes, which is almost double the 37% who felt the same way in 2011 (Dahlstrom et al. 2011).

Although students have been eager to adopt new mobile technologies, faculty members need more time and support to adapt their courses and pedagogies to accommodate and utilize mobile devices. Faculty members must consider both curricular and pedagogical issues. They must also address infrastructure and institutional policies before transforming their teaching.

There have been numerous articles in the news media criticizing the use of mobile devices in the classroom (Childs 2012), which has made some faculty apprehensive about adopting mobile learning. They cite many reasons, but the most common are that mobile devices are too distracting in the classroom, they are usable only for entertainment or texting, they are too expensive, and they are difficult to use for learning purposes. This accompanies a general belief that mobile devices are not appropriate for academic use because they cannot be used for productive, high-level work.

At the same time, many faculty members are excited about the opportunities provided by mobile technology, but do not know what is possible and may struggle to support students' technology use. These individuals need help exploring device capabilities, finding technology and software solutions, and incorporating pedagogical best practices into their activities.

Faculty Development or Teaching and Learning Centers play a significant role in academia in promoting effective teaching and learning strategies, and they can play a significant role in addressing the needs of both types of faculty members, those who are apprehensive about mobile learning and those who are willing to explore them, by demonstrating the uses of mobile technologies, dispelling misconceptions, and modeling effective pedagogical practices. By meeting the needs of both faculty and students, the Centers can advance their missions, increase visibility on their campuses, and lead their institutions to adopt active and engaged teaching and learning strategies to meet the learning needs of students (Lefoe et al. 2009).

## **2. Misconceptions**

One of the first steps in any transformation process is to dispel myths and misconceptions that impede such a transformation. For those who are critical or apprehensive of mobile teaching and learning, Faculty Development Centers can help to dispel misconceptions and reduce concerns

about mobile technologies. The negative opinions prevent them from being open to new ideas and from being willing and able to learn something new. Some deeply held beliefs, like an aversion to technology or annoyance with SMS (texting) as a means of communication, can be challenging to overcome. In these cases, it may be difficult to show the faculty member the positive benefits of mobile learning at least initially until they see their colleagues use the technologies successfully or recognize students' demand for integrating such technologies in the classroom. Alternatively, they may recognize the benefits but still believe that does not justify the negative aspects.

Faculty misconceptions about mobile learning cover a broad range of topics and types. From conversations with faculty development support staff from a variety of institutions, we have identified that the most common misconceptions are related to devices, software, communication, teaching, learning, training, and support. For example, some are still unsure if mobile devices are appropriate for learning. Some faculty members think that mobile learning can only occur with smartphones, or particularly with iPhones. In reality, mobile learning can be accomplished with a wide variety of devices, including traditional cell phones, smartphones, tablets, netbooks, laptops, eReaders, and student response systems. Some believe that the small screen of a smartphone is not useful for serious tasks, like reading course materials or research documents. While some screens are quite small, most mobile devices allow for content to be enlarged in size, and materials or portals can be developed or adjusted to fit the smaller screen.

Another area of common misconceptions relates to the software used for mobile devices. Faculty members may believe that the apps available for mobile devices are only for games or social networking. They dismiss mobile devices as being only useful for entertainment purposes. However, a great number of productivity apps are available for creating or editing documents, managing tasks, recording data, and more. If they are aware of these apps, faculty may believe that the apps are expensive. However, many of the most commonly used apps are free or cost less than their Windows- or Mac-based counterparts. A web search for "free education apps" will return a multitude of lists compiled by other educators.

Some faculty members do not understand the communication methods used by mobile devices. For example, they may believe that WiFi is a requirement for mobile teaching and learning, which limits the locations where mobile devices can be used. Others believe that cellular internet access is necessary and that those networks (either 3G, 4G, or LTE) are only available in metropolitan areas. To the contrary, many devices can operate with either method of communication. In many rural or developing areas, cellular internet networks are readily available, more reliable, and faster than wired broadband. For many academic uses, network connection is not necessary in the field. Instead, the devices can be used without connection and the results can be uploaded to a website or course management system after returning to an area with more connectivity.

Misconceptions also exist around mobile teaching and learning strategies. Some faculty members believe that mobile devices can only be used in certain disciplines. Another common misconception is that mobile devices are not useful for teaching content. This is related to the belief that mobile devices are only for entertainment rather than intellectual pursuits. Mobile

devices are indeed being used for teaching content, and particularly to encourage students to construct knowledge themselves.

Finally, faculty members believe that they would require extensive training to implement mobile learning, both on the use of the devices and the apps they would plan to use. Faculty members also overestimate the type and extent of technical support they and their students would require. Many mobile learning initiatives take advantage of a few easy-to-use free apps, and so there is no need to learn complex development platforms or coding languages. There are also plenty of “how to” videos on YouTube and other web sources on using the apps for teaching and learning purposes. It is critical to address the mentioned misconceptions before transforming faculty development to promote mobile teaching and learning, and there is a wealth of literature available already to aid in the transformation process (Boise State 2011; Crow 2010; Grush 2011).

### **3. A Framework for Supporting Mobile Teaching and Learning**

Faculty Development, and Teaching and Learning Centers that want to begin developing mobile learning initiatives need to address four areas for a successful transformation. First, they need institutional support for the process, although this support may be incomplete until they can demonstrate progress. Second, the Center will need to acquire and explore mobile devices and apps. It is powerful to be able to share personal experience when discussing the use of mobile devices and apps with faculty members. Third, Centers need to research and design strategies to overcome resistance to mobile teaching and learning, and address some of the misconceptions mentioned earlier. Finally, there is a need for a logical approach or framework to guide the faculty development transformation process to support mobile learning.

We propose a framework with four components that address the process of transforming a faculty development centers to promote mobile teaching and learning. Figure 1 shows the framework. The four components of the framework are (1) technology, (2) pedagogy, (3) infrastructure, and (4) training and support.

#### **3.1 Technology**

Technology for mobile learning includes the devices and software utilized for mobile learning. Faculty development centers that want to support mobile teaching and learning initiatives must become familiar with the technology before pushing for faculty use. They should investigate both the strengths and weaknesses of the devices and be aware of the limitations inherent in smaller devices. It is important to gain experience with a variety of mobile devices. Some faculty development centers have only explored a single platform, which gives the impression to faculty that only one platform is appropriate for mobile learning. This can also undermine the credibility of the Center by making it appear that they are simply promoting particular company's products.

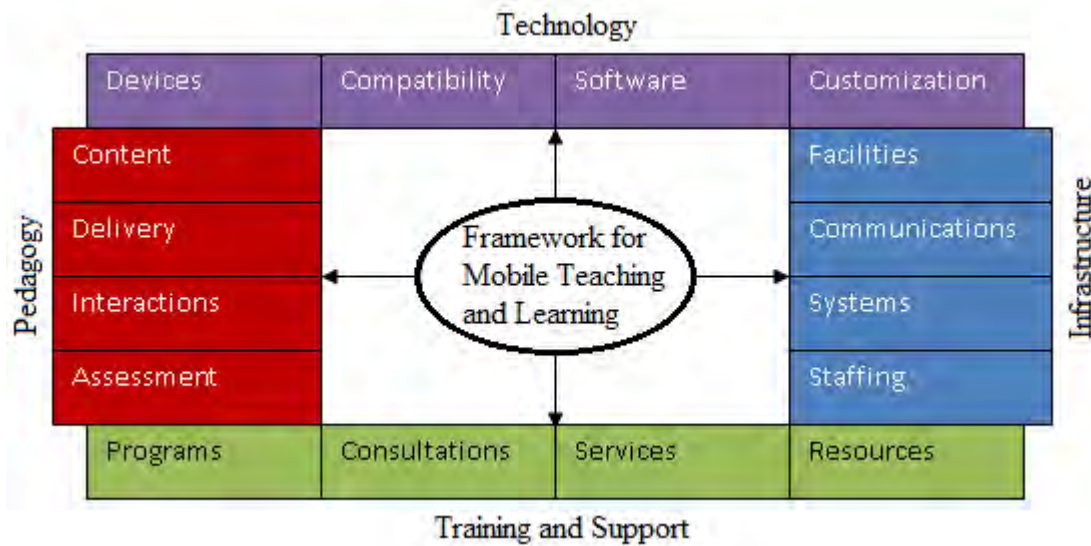

Figure 1. Framework for Mobile Teaching and Learning

In addition to acquiring and evaluating mobile devices, Centers should also make an effort to stay current with the constantly shifting landscape of mobile technology and capabilities. This can be accomplished by following the press releases of the most significant mobile manufacturers or by reading articles and reviews published by technology news aggregators and bloggers.

Faculty development centers should also become familiar with a wide range of mobile software. The best way to gain experience is by trying different apps, but purchasing and distributing apps within an educational institution can be challenging, particularly for tax-exempt institutions. However, there are a plethora of free apps that are ideally suited to educational purposes that do not require special contracts or purchasing.

It is also important to collect app and accessory recommendations for different disciplines and content areas in addition to those that support general productivity. For example, being aware of apps and workflows for managing classroom attendance, grading from a mobile device, and maintaining an appointment calendar can benefit faculty members from any discipline, but there are also scientific reference apps, foreign language learning apps, and graphic design apps that would benefit faculty members and students from specific academic programs and disciplines.

Within the institution, faculty development centers should also be aware of the compatibility between mobile devices and existing institutional technology. Centers can assist faculty members who want their or their students' mobile devices to integrate with classroom technology, learning management systems or online system portals.

### 3.2 Pedagogy

Another way that faculty development centers can transform themselves to support mobile learning is to learn about pedagogical strategies and approach for incorporating mobile technology into the classroom. This is more than recommending devices or apps, and is most effective if the Center staff members have instructional experience or training.

Because of particular capabilities of mobile devices and the environments they are used in, pedagogical approaches for mobile learning are not identical to more traditional delivery approaches. Most mobile users do not focus entirely on the content on the device, and so it is important to consider length of time and depth of concentration when designing content. Content delivery should be divided into multiple short segments in mobile-friendly delivery formats.

Mobile learning also makes it possible to use more active learning strategies, like problem-based or experiential learning or situated learning. Faculty can also use constructivist approach in encouraging students to create content using their mobile devices. Game-based learning is also a powerful teaching strategy that is well-suited to the use of mobile devices. Faculty development centers should become familiar with these methods to support advanced mobile learning initiatives.

Mobile devices can be incorporated into any delivery model because they are so flexible. Faculty development centers can add mobile learning strategies to current programs or resources for face-to-face, blended, or online teaching. In addition, while mobile devices are most advantageous when used on-location and in the real world, there are many applications in the classroom. Student response systems (clickers) are one example of how mobile devices can be incorporated into face-to-face teaching in a traditional classroom. Most current clicker providers have or are developing a solution for students to use their personal mobile devices such as smart phones instead of purchasing a dedicated device.

Because they were originally designed as communication devices, it is simple to find examples of mobile devices used for interaction in courses. Short Message Service (SMS), or texting, is possible from nearly all mobile devices and can be used to send reminders to students or for students to submit comments or questions to faculty members during or after class. Free polling tools available from online polling services such as [pollev.com](http://pollev.com) allow faculty to conduct quick polls in class for which students can text their responses to indicate their comprehension of course topics covered in a lecture.

Mobile devices can also be used to assess student learning. In particular, the photo and video capabilities of even basic cell phones make it simple for students to create their own media for assessment purposes. They can be used in class, as clickers, or on location to record and respond to stimuli in the environment. Faculty development centers can assist faculty members with selecting authentic assessment techniques for use with mobile devices, but they may also need to remind faculty to match assessment techniques with the instructional objectives. It is easy to be carried away with excitement for fancy technology and choose tools based on popularity or impressive features rather than instructional benefit.

### **3.3 Training and Support**

Training and other forms of support are a significant factor in any technology-related teaching and learning initiative. For mobile learning, faculty members need training about devices, apps, and pedagogy. However, for some, training may not be sufficient. Some faculty members may need ongoing support in addition to or instead of training, in the form of consultations or teaching observation or other services as their technology skills and discipline-specific needs may vary.

Faculty development centers that already offer training programs like workshops or institutes can begin to offer additional programs on mobile learning topics. Centers that do not provide training can begin to offer such training or can partner with a department or unit at their institution that does offer workshops or other programs. Because mobile learning is such a broad field, it may be helpful to begin by planning a sequence of programs on progressively more advanced topics, starting with a general introduction or overview to mobile learning. Other topics can include specific mobile capabilities, like text messaging, or mobile learning strategies, like using student-generated media or assessment using mobile devices.

Past experience with technology-based workshops suggests that it is more effective to weave technology and pedagogy into the same program rather than separating them. Hands-on or technology-specific programs are generally more popular because they appear to be more interesting or exciting than programs focused only on pedagogy. If technology and pedagogy are presented independent of one another, many participants will not learn effective pedagogy. In addition, it can be harder for faculty members to connect them when they are not discussed together.

In some circumstances, it may be more beneficial to work with faculty members through consultations. These sessions can be customized to meet the needs of the specific participants. Consultations can be held individually or with a group of faculty who are working in the same discipline or on the same project. Because of the individualization of a consultation, it is possible to provide more practical suggestions. Faculty members often prefer the one-on-one attention, but this is more time-consuming for faculty development centers and can strain possibly limited resources.

For faculty members who have implemented a mobile learning lesson or activity, there are other services that faculty development centers can provide. The easiest is to review lesson plans or design documents to provide feedback on the proposed mobile learning activity. It may also be possible for Center staff to observe the class session or on-location activity and provide feedback on the actual event. These observations are the most taxing for Center resources, since they may require extended time or more than one observation. For on-location events, the observations may also require travel and a longer time out of the office. However, the benefits of observations and feedback are worth the cost, as long as the resources are available.

Faculty development centers may also want to create or acquire and make available additional resources to support mobile learning. It may be helpful to collect links to online mobile learning resources, like guides for devices reviews, app recommendations, and other technical documentation, including tutorials for installing or using apps. When such resources do not exist, it may be the responsibility of the faculty development center to create them. Having a central repository of resources will support faculty members in their design and development efforts and promote independence. But such online resources require ongoing maintenance as new updates of devices and apps are released. For training sessions and consultations, it is also helpful to have a set of mobile devices faculty members may use. For those faculty, who do not own a smartphone or tablet, being able to try one is the first step towards exploring mobile teaching and learning, and faculty development centers can make available devices for faculty to experiment with and this will require some considerations in budgeting and equipment policies.

### **3.4 Infrastructure**

Supporting mobile learning initiatives requires significant resources and infrastructure. Some of these may be outside of the purview of faculty development centers, but they should at least consider making recommendations to the appropriate departments or units at their institutions. For example, student learning spaces may need to be modified in order to accommodate the increased use of student-owned technology. In the classroom, this should include flexible seating, ways for students to integrate mobile technology with existing classroom technology like projectors and audio systems, and additional electrical outlets for charging or powering devices. Similar accommodations are needed in informal learning spaces, as well, where students can meet in groups to study or work collaboratively on class projects.

Communication networks also need to be prepared for an increase in mobile traffic. Wireless (WiFi) networks need to be expanded to increase coverage for both academic and student living spaces. Capacity should be increased as well, so that the ever-growing number of devices can connect and use the network efficiently. Cellular internet coverage and capacity should also be considered. Institutions can partner with cellular providers to ensure adequate service. Network security is another important issue. Security protects user data and network integrity, but should be balanced with openness to maintain usability.

Infrastructure also extends to the integration of mobile devices with institutional systems like student and employee record systems, course registration, library materials, and the learning management system (LMS). According to the ECAR report (Dahstrom 2012), the top three tasks students want to complete from their mobile devices are accessing course websites or syllabi, using the course or learning management system, and checking grades, but administrative tasks like registering for classes, ordering books, and accessing library materials were in the top ten.

With increased mobile use and integration, technical support for students must also increase. Technical services can help students connect to networks, assist with device configuration, and use of the integrated tools. This support may be available by phone, email, live chat, or drop-in centers where students can get face-to-face assistance with their devices.

Faculty development centers can discuss these issues with administrators at their institutions and advocate for increasing mobile access on their campuses. However, faculty development centers should also ensure that they have sufficient resources for training and support of mobile learning. Centers should have devices for experimentation, access to a wireless network, and physical space conducive to training and experimentation. Faculty development centers can use the devices, network, and space to offer training programs specifically on mobile learning or they can use the resources to model mobile learning strategies during other programs. Finally, due to the time required for supporting mobile learning initiatives through training and other means (e.g. consultations and creating resources), faculty development centers may need to hire additional staff members or student help and provide training to new and existing staff.

### **4. Mobile Learning Support at Northern Illinois University**

At Northern Illinois University (NIU), the Faculty Development and Instructional Design Center has been supporting mobile learning in a variety of ways that align with the mobile learning support framework. The Center began experimenting with mobile learning in 2005 by offering

training programs on podcasting and exploring the use of mp3 players for educational purposes (Faculty Development and Instructional Design Center 2012a). In 2006, the Center launched its first two podcasts, both of which are still active (Faculty Development and Instructional Design Center 2012b). Since then, the Center's mobile learning support has expanded to include technology, pedagogy, training and support, and infrastructure.

The Center has experimented with a number of mobile devices, beginning with early mp3 players and notebook computers. These devices have also included netbooks, eReaders, advanced mp3 players, and tablets. Staff members have worked with both Android and Apple devices as well as multiple form factors, including both seven- and ten-inch tablets. For official purposes, the Center has primarily used free apps to limit costs, but staff members have used other apps on personal devices.

In addition to learning about technology, the Center has researched pedagogies that support mobile learning. These include Integrated Course Design, Problem-Based Learning, Game-Based Learning, Team-Based Learning, and Experiential Learning. Staff members attended and presented at conferences and workshops related to these techniques as well as those dedicated to mobile learning.

While the NIU Faculty Development and Instructional Design started training about mobile learning with podcasting workshops, offerings have significantly increased since then. In 2011, the Center launched a Mobile Learning Series of workshops. To date, the workshops have covered such topics as location-based learning, media, eBooks, text messaging, QR Codes, mobile grading, and using the LMS to create mobile-friendly courses. The Center has also enlisted the help of experts from other institutions to discuss mobile learning design and pedagogy, including a day-long institute in June 2012 about mobile learning. The Center has modeled mobile design techniques by developing mobile handouts for day-long programs and conferences as well as by ensuring that all documentation is mobile-friendly.

To provide ongoing support, the Center created a website of mobile learning resources. The site includes app recommendations, links to documentation provided by device manufacturers, and custom documentation to demonstrate setting up a device for NIU's email and other web services. As part of its mission, the Center also maintains documentation on using NIU's learning management system. This documentation also includes details about working with the mobile access to the LMS.

Through partnerships with other units at Northern Illinois University, the Center has been able to provide recommendations on infrastructure. The Center has collaborated with committees to support the academic experience of undergraduate students and used the opportunity to promote the needs of active learners with mobile devices. The Center has also kept administrators informed about technology advances, like mobile technology, that impact the university and its students. The Faculty Development and Instructional Design Center is grateful for the opportunity to provide input to these and other groups on campus, which in turn, has helped to transform faculty development to promote mobile teaching and learning. Figure 2 shows screen captures of a sample mobile device documentation website developed by Faculty Development

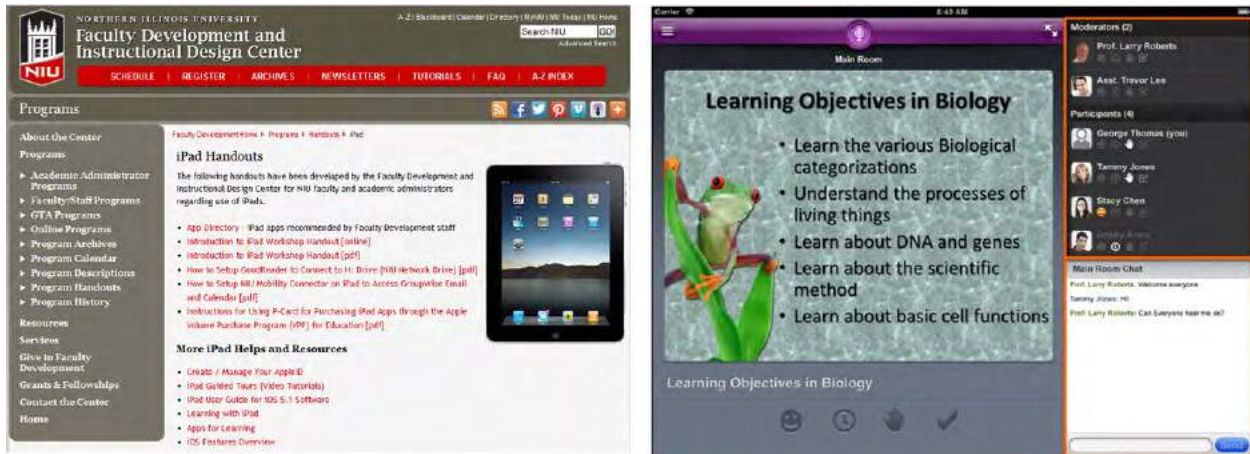

Figure 2. Sample Mobile Device Documentation Website (left) and a Sample Screen from Blackboard Collaborate™ Web Conferencing for Mobile Devices (right)

and Instructional Design Center and the Blackboard Collaborate™ web conferencing feature available for mobile devices.

## 5. Conclusions

The increase in mobile teaching and learning at higher education institutions requires faculty development and teaching and learning centers to be proactive in their support. Students have and want to use the technology, but faculty members need support to be open to experiment with mobile learning. Misconceptions about device capabilities and the role of mobile technology in the classroom may interfere with willingness to engage in mobile learning, and faculty development centers must work with faculty to dispel the misconceptions.

Faculty development and teaching and learning centers are well-suited to support mobile learning because of existing relationships within their institutions, but they need to transform themselves to influence mobile learning initiatives. By addressing technology, pedagogy, training and support, and infrastructure issues, these centers can have a positive impact on the growth of mobile learning. The centers can focus on the first three of these areas, and provide advice and recommendations on infrastructure as it may be outside the scope of their direct responsibilities.

Implementing the framework is a gradual effort. The change cannot be rushed without risking further resistance. Resources for technology will need to be built over time, as will openness and excitement for the pedagogies of mobile learning. It is possible that mobile learning, when gradually incorporated into existing teaching and learning strategies, can have a positive impact on student engagement.

*Geographic Information System (GIS) Management Strategies for schools  
in Bangkok Metropolitan Administration*

Tongluck Jirawatcharakorn

0246

Rajamangala University of Technology Thanyaburi, Thailand

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

Schools in Bangkok Metropolitan Administration's strategies for managing Geographic Information Systems (GIS) play a crucial role in the success of the technology within the organization. As with any technological innovation, the key factor in GIS success is how it is applied to solve the school's administrative problems. Corporate wide strategies to introduce, implement, and operate the GIS how well it serves administration school needs. School management issues associated with GIS technology adoption in complex organizations. I discuss issues related to managing the introduction and use of GIS and alternative strategies for integrating GIS into education operations. The article draws on key organizational factors that must be considered when developing a GIS strategy.

## Introduction

There are many changes in the present world as per the dynamic of Information Technology. Thailand is focusing on the development of her capacity and competition among other countries. The people development requires the development of education administration together with other parts of development Thai Education Act mentions on education for all and contribution from everyone to manage the education (all for education). This is the fundamental of education administration, which is agreed by all over the world (UNESCO, 2000). Thai government allocates the budget as a support funds to schools, facilitates and promotes the education role. To reduce the block grants problem, especially the insufficient of the capital, the limitation of the capital, capital decentralization problem and insufficient of long term funds and to give the ability to schools to administrate according to the state of society, economic including information technology, which have been dynamically changed, to satisfy the community and social needs and to fulfill the quality of education administration. According to the education reform follow up and evaluation report, the research from Education Council (2006) shows the problems in budget allocation, the Basic Education budget per student was not conform to the current situation, the needs of students, size and school's location, especially for the small size schools, which have not had sufficient budget to administrate and improve the education to reach expected quality and slow budget allocation. The expense per student makes the schools lack of budget to improve students' quality and the resource gathering is not widely operated. Government sectors have to promote and encourage the private sectors and the community to give the contribution to schools and support them to gather the education resource for school improvement according to their ability and latency. There are some recommendations regarding to budget allocation, which should be considered in terms of local needs.

Bangkok Metropolitan Administration provides the basic education curriculum to under supervision schools. It is necessary to follow the decentralization strategy in terms of academic, budget, personnel administration and general administration Bangkok Metropolitan has been followed the policy to improve the education quality in the small schools but in the reality, the schools under Bangkok Metropolitan supervision have the continuous problems , which conforms to the evaluation results of The office for National Education Standards and Quality Assessment (ONESQA) , which found that the overall efficiency. School is not effective education resource management that consists of resource capital, human resource, equipment and technology, assets and learning resource to develop the Basic School and lack of approach in Information Systems development and implementation and the information was scattered and not linked.

The way for the school administrators to manage the schools effectively is to emphasize on the implementation of MIS as it is the important strategy tool to win the opportunity and to improve work efficiency. At the present, the Geographic Information System is one of the modern Information Systems Management too, it is the powerful, which could be able to collect the

spatial data by integrating and collecting the area based data and store data as the database. The system is able to amend, analyze, display and present the Topological data and spatial data (Burrouh, 1989; Star and Estest, 1990; Montgomery & Schuch, 1993; Pickles, 1995; Rodrigues, 1995). Other than that, Geographic Information System can be applied in education administration to promote the equality and fairness in education as the system will support the school administrators to access the students' data, teachers' data and provide the solution for facility management and to promote and support the schools to search for the education resources such as wisdom scholars, outstanding teachers and knowledge source outside classroom. The administrative schools issues related to introducing and implementing technology in an organization are often more crucial to success than the technological issues. Specialized organizational and management approaches and their role in the organization's school operations the current state of GIS technology and its future directions, the relationship of GIS technology with other. GIS is a broad term used to refer to many different types of technologies and organizational implementations. In fact, the GIS in one organization could be very different from that in another.

Therefore, The researcher hope that the applied of GIS and management strategy will make the equality and the right of education resource management as the geographic information will be able to provide the information of education resource, students, teachers and the guideline of education resource management that consists of resource capital, human resource, equipment and technology, assets and learning resource to develop the Basic School.

The study of GIS management strategy for the school. Bangkok Metropolitan Administration. IT administrators can make the necessary spatial planning decisions to solve problems in the management of educational resources relevant and timely to the school achieve continuous improvement. The strategy was developed based on the principles of the possibility. Acceptable and appropriate to the context of the school. To guide the management of the school's educational resources. To have a better and more efficient and effective anyway. This will contribute to the development of quality education by the spirit of the National Education Act.

### **Research question**

How the feasible GIS management strategy for Bangkok Metropolitan Administration School for resource management administration, which would be accepted and suitable for the school context should be?

### **Objectives of Research**

To study GIS management strategy for Bangkok Metropolitan Administration School for resource management administration, which would be the feasible accepted and suitable for the school context

## **Scope of the Research**

- 1) Population and sample in this research were as the unit of analysis small schools in Bangkok Metropolitan Administration with no more than 400 students on the basis of criteria defined by the Department of Education ,total 131 schools consist of administrator and teacher involve administration
- 2) Educational resources, including financial resources, capital consists of 5 elements: Funding , Human Resources, materials and technology, Land and buildings, Learning resources.

## **Keywords**

**The Geographic Information System for school:** The information system that collects the data, analyses data and presents the output in the form of information, which could be able to use as a geographic reference. The system responds the management needs in school to plan the decision, implement and follow up according to the framework or tasks of the school

**GIS Management Strategy;** the implementation of GIS for supporting the management to make it success and efficient according to the vision.

**Education resource;** direct and indirect factors related to the education administration, which consist of capital resource, human resource, equipment and technology, assets and learning resource. There are the support factors, which make the education administration successful and efficient according to the school vision.

## **Expected benefits**

### **Academic benefits;**

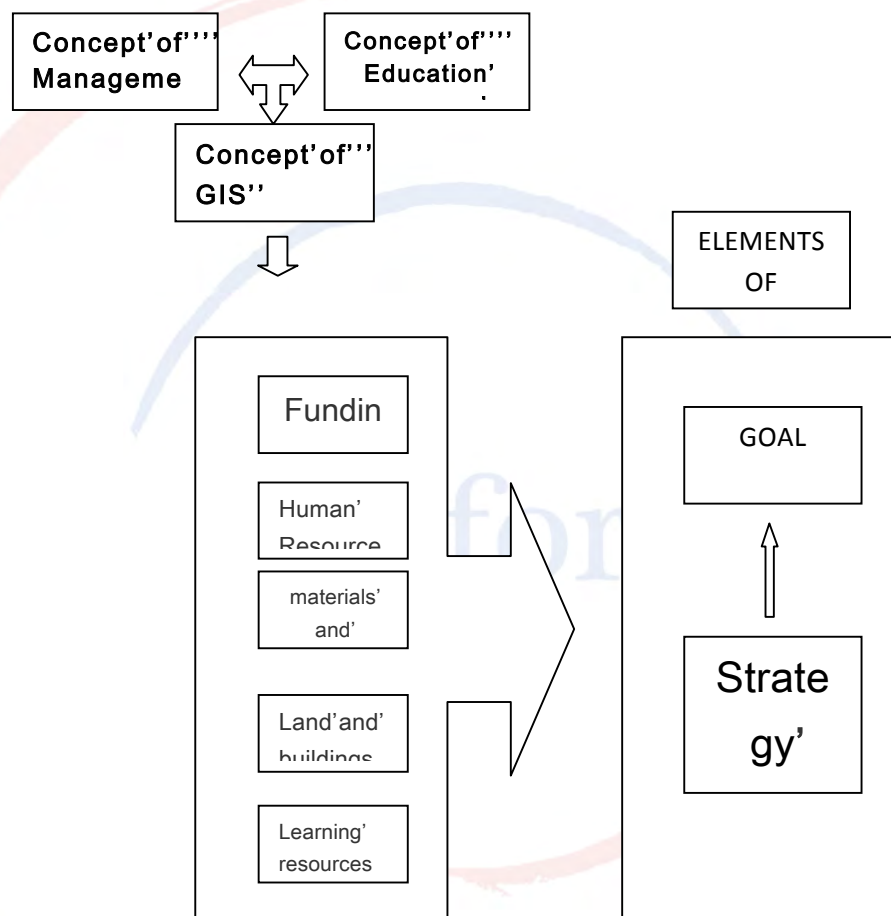

- 1) The research presented in the policy research and case study which would be applied to the research and implementation in different functions.
- 2) Having the GIS management strategy for school, which has been gone through the contribution process and be able to use as a strategy guideline, the implementation of strategy, systematically and efficient strategy evaluation and the knowledge of resource gathering distribution to improve the school for future study.
- 3) Good for interdisciplinary learning by integrating the methods in Management of Information Systems, Geographic Information System and Education Administration

### **Applied benefit;**

School will be able to use and apply the guide line of GIS for school strategy recommendation to implement in resource gathering for efficient education administration.

## **Conceptual framework**

Researchers have defined framework elements is the purpose of the strategy consists of determining the direction of the basic education of the public, including goals by the strategic management of educational resources to improve education, which will be presented in five points. which will be presented in each issue. A synthesis and a research framework .

## **Research Methodology**

### **Phrase 1. Context study for strategy draft**

- 1) Documentary study and analysis; to study, analyst and synthesize the internal and external factors related to policy, law, regulation or national plan, level of influence that effects to education resource and school context.
- 2) Survey study; to study the current state, problem of education resource management in school and management strategy of GIS for Bangkok Metropolitan Administration schools for education resource management.

**The sample** were the unit of analysis from 131 schools consist of administrator and teacher involve administration .

### **Data collection tool**

In this phrase, questionnaire for data collection designed by research would be used as a tool. The questionnaire consists of;

**Part 1** General data from interviewees. The questionnaire is Check list

**Part 2** Current state of education resource management in school. The questionnaire is Rating Scale questionnaire.

**Part 3** Management strategy of GIS for education resource management guideline for Bangkok Metropolitan Administration School. The questionnaire is open ended questions.

### **The development of tool**

1.The tool was verified by experts to evaluate the content validity and used the result to analyst the conformity by finding Item Objective Congruence index or IOC and considered only the questions, which had  $IOC = 0.50$  or more that means the questions were related to the objectives or contents.

2.Tool Try out The selected questions were selected to make the complete questionnaire and distributed the questionnaire to 30 school executives and teachers, which were not in the sample group. The data from try-out were analyzed to find research tool's efficiency, which were reliability by using the formula  $\alpha$  - coefficient according to Cronbach, 1970. The result of Reliability of the questionnaire was 0.961.

### **Data collection**

Researcher sent the questionnaires and the permission of data collection letters to the sample by post. The sample replied the questionnaires by post and received the retuned of the questionnaires from 104 schools (79 present).

### **Data analysis**

Researcher received the questionnaires and verified the completion of them then analyzed the data as below;

**1) Quantitative data analysis;** by using computer software to calculate the percentage mean standard deviation then read the meaning of average by comparing to the range as below (Best, 1978). Current state of school's education resource management;

4.51-5.00 means the management problem is critical

3.51-4.50 means the management problem is high

2.51-3.50 means the management problem is moderate

1.51-2.50 means the management problem is not much

1.00-1.50 means the management problem is low

**2) Quality data analysis;** by using content analysis method then summarized in essay. GIS management strategy for Bangkok Metropolitan Administration School for resource management administration.

## **Phrase 2 Strategy development and verification**

1) In-depth interview of experts; the objective of the interview is to verify goal, strategy, strength, weakness, opportunity, obstacle in school education resource management and to use them as the basic information to consider the GIS for Bangkok Metropolitan Administration School management for education resource management strategy that feasible and was accepted from stakeholder according to Majchrzak (1984) concept.

## **Sample**

The sample of this research were experts in policy level who have knowledge and hold/are Doctorate degree, the position of Associated Professor and have an experience in education resource management strategy by using GIS, which consisted of 9 experts. Researcher provided the "strategy draft" to the experts as a reference.

## **Data collection tool**

Data collection tool was semi-structured interview designed by researcher, which included goal, strategy, strength, weakness, opportunity and obstacle in school's education resource management.

## **Data analysis**

- 1) Quality data analysis; by using content analysis method then summarized in essay .
  - 2) Conduct public hearing of stakeholders; to verify the strategy draft by stakeholders.
- The stakeholders who attended the public hearing seminar were school executives, teachers and parent representatives, all together 30 persons. By affirming GIS management strategy for Bangkok Metropolitan Administration School for resource management administration.

## **Research summary**

As a result of the draft strategy. The in-depth interviews with experts. The public hearing. And criteria for evaluation of the strategies on the basis of a (feasible) and accepted by all stakeholders as perceived by Majchrzak (1984) deals with the stakeholders group. The result of the operation. The strategy was to mobilize resources for the development of basic education.

As a result : Current state of the resource management problems of school education. Results are as follows.

- 1) the funds or budget. Found to have a moderate level ( $\bar{X} = 3.02$ ).
- 2) the person is found to have a moderate level ( $\bar{X} = 2.61$ ).
- 3) the material, equipment and technology. There is a moderate level ( $\bar{X} = 2.81$ ).
- 4) The land and buildings. Found to have a moderate level ( $\bar{X} = 2.60$ ).
- 5) the learning that is at a low level ( $\bar{X} = 2.42$ ).

GIS management strategy for Bangkok Metropolitan Administration School for education resource management could be summarized into 5 sectors according to the strategy.

## 1) Capital or budget strategy

**Goals:** to assign the area for capital or budget gathering to develop the process of the efficient learning and teaching activities and to elevate the quality of students, teachers, and schools.

### **Spatial**

### **strategy:**

The first strategy is create a culture of team work and a strong network.

- 1) arrange a meeting to plan the funding or budget consistently.
- 2) Encourage team or network be submitted extensive Lange and listen to the opinions of all members.
- 3) Using GIS systems to track and monitor a team or network participation by all members.

Strategy 2: that promote student performance. Teachers and schools constantly and consistently.

Strategy 3 :that parents and the community were aware of the financial status of the school with a variety of methods. The opportunities. Continuously.

Strategy 4: Use GIS to manage the budget, the Parties shall participate in the development process

## 2) Personnel strategy

**Goals:** personnel, experts, local experts, monks, community leaders who have expertise, energy, money and knowledge will join to improve the quality of students, teachers and schools for the academic excellent as other countries and to establish local-wisdom teachers to promote the sustainable development.

### **Spatial strategy:**

The first strategy is coordinate relationships jointly develop sustainable youth Thailand. Through a strong network of local wisdom teachers.

Strategy 2: The development of students and staff through meaningful learning activities and network development

Strategy 3: Transparent personnel management by focusing on the individual and community participation in the implementation and monitoring.

Strategy 4: Coordinate, direct and indirect contact with the person. Guardian development network. And community development that focuses on students is significant and lasting

Strategy 5: Personnel management develop a plan that is focused on the involvement of parents. Network development. And as a community

Strategy 6: Target. Methods and evaluation of management personnel with the responsibility of knowledge and ability

Strategy 7: Thailand and Cognitive Development expert scholars to participate in the development of learning activities for students

### **3) Equipment and technology strategy;**

**Goals:** to utilize equipment and technology to improve the efficiency of learning activity management. Encourage all students to have knowledge, ability and skill according to individual learning ability. Establish the information technology and communication learning center for learning, training, student, teacher and personnel development.

**Spatial strategy:**

Strategy 1: Projects to support the equipment. And from parents or community organizations, local government organizations. The alumni network.

Strategy 2: Develop a plan to manage the materials. Equipment and information technology in both the short and long term continuous operation

Strategy 3: Push for laws governing tax for education purpose

Strategy 4: Students develop a strong networking and community involvement

### **4) Asset strategy**

**Goals:** to gather the resource to renovate or build student building, service building and special rooms to support and improve the education administration to reach the standard requirement from certified organization and to manage school's assets, which can make profit for school development. Establish the learning park in Basic School by utilizing the donation fund and provide the necessary facilities for learning park.

**Spatial strategy:**

Strategy 1: Build a strong management team of the school property.

Strategy 2: Property Management System to generate revenue transparency and accountability.

Strategy 3: Park was established learning through modern information technology. To encourage students to learn throughout life and community service.

Strategy 4: Relationships and a better understanding of the treatment and utilization of land and buildings in the school, together with others in the community.

Strategy 5: Land and resource management plans for the building of a school that produces income

### **5) Learning resource strategy**

**Goals:** to gather outside and inside school learning resource and internet learning resource to administrate the learning activities according to school curriculum and to encourage the learners to be self-directed learners with ethic and be able to live in the society with happiness and also develop the learning resource on the internet for Basic School.

**Spatial strategy:**

Strategy 1: School leaders and role models of development and conservation learning in school and learning within the community.

Strategy 2: Schools and communities together to develop and create learning networks. High up in the school or community.

Strategy 3: Accelerate the good relations and build relationships with individuals and the community in learning together effectively.

Strategy 4: Development and building a network of learning efficiency. To provide services to students and the community thoroughly.

Strategy 5: Network with alumni, parents and the community in the use and study of various sources. Both inside and outside of school efficiency with a variety of activities

## **Research result**

**1) Content coverage;** it was found that the research covered all goals, mission, strategy, measure and indicator. It was systematically coverage from broad thinking to specific thinking (Razik and Swanson, 2001). Goal was considered as a final result, the schools wanted to accomplish or make it happen in the future (Desired end) , which considered as a part of strategy that specified in the gathering of education resource and a part of suitable strategy determination guideline. Measure and indicator was suitable according to the concept of the correct way of development (do the right things) referred to Bartol et al. (2001) concept. The strategy of each function showed the measure and clear achievement indicator in quantity and quality of process. The strategy included the framework of the administration activity was needed the systematically decision making process by contribution or decision from every sectors. It is the directed planning, flexibility and environment conformity, the process of participation strategy, decentralization and encouragement. The strategy guideline showed the decision process related to the future vision and current circumstance by considering the outside environment and inside, which focused on planning that led to the goal development of desired vision.

Therefore, to implement the GIS strategy and to administrate the education resource for training goal process and to conform to the principle of reaching the school based management, schools had the power in efficient administration by considering in the actual needs, existing resource and focused on participation that made schools to achieve the efficiency resource gathering for school development in the future.

## **2) Context conformity**

Strategy development came from the actual context on insufficiency of quality in education administration. By using the standard to verify the development of strategy to see the outcome according to Majchrzak (1984) concept, it had been divided into 2 categories; 1) Feasibility, considered from the ability of the process by having sufficient resource, risk, regulation that promoted the implementation and 2) Acceptability from stakeholders, considered from the process to get the strategy, coverage duty, prominent point, law conformity, regulation, policy from original affiliation and school's context.

### 3) System approach

System approach was conducted according to Seiler's successful resource gathering concept (Timoty L. Seiler, 2003). In the process, the school executives and team must adhere to the ethic in resource gathering (ethical in fund raising or resources mobilization), which conformed to Stenbeck (2006) concept that includes lawful, truthful, accountable and respectful to donors. The process could be easy applied to implement in education resource gathering and conformed to the quality cycle process of Deming's cycle or be able to apply to conform the operation cycle. In every process, school executive should focus on the participation from every function, especially from parents and community.

### Research recommendation

#### 1. Research recommendation for result usage

1) The strategy have been applied according to school context and implemented to the school which have the insufficiency of resource, accessibility problem, different economic and context. However, the user should stick to the participation in process in various ways, continuous and long term process and conduct the evaluation and report the operation process frequently.

2) There should be the way to promote and develop teachers and executives to have knowledge, understanding and have efficient skill in GIS administration for resource management. School may ask for the expert or knowhow from academic institute to support the implementation in terms of workshop or training for school personnel. Other than that, there should be a support and encouragement for the resource gathering in every school such as establishment of the network for patronage people who supported school and presenting them the commemorative certificate.

#### 3) Recommendation for the future research

3.1) Development of the education resource gathering model to support the different size, location, readiness and context of school in the community.

3.2) Study of model for knowledge skill development and attitude of school executive in education resource management.

*The Study of Knowledge Management of Teacher Professional Training Schools,  
Faculty of Education, Rajabhat Rajanagarindra University, Thailand*

Pojanee Mangkang

0247

Rajabhat Rajanagarindra University, Thailand

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

The research objectives were to investigate knowledge management of professional teacher training schools and to compare those knowledge management as classified by type of school and Location of school. The research samples consisted of 17 administrators and 110 teachers. The research data were collected by questionnaire and interview. Mean, standard deviation and ANOVA were employed for statistically data analysis.

The research findings were as followings :

1. The Knowledge management of teacher professional training schools which cooperated with faculty of Education, Rajabhat Rajanagarindra University as a whole was at a high level. Ranking by mean scores from the highest to the lowest were Knowledge utilization, Knowledge identification, Knowledge acquisition, and Systematic knowledge management respectively.
2. Comparison of Knowledge Management of teacher professional training schools which cooperated with faculty of Education, Rajabhat Rajanagarindra University as classified by type of school, The opinions toward knowledge management of administrators and teachers in primary and secondary schools were not significantly differences.
3. Comparison of Knowledge Management of teacher professional training schools which cooperated with faculty of Education, Rajabhat Rajanagarindra University as classified by location of school, The opinions toward knowledge management of administrators and teachers in schools which situated inner city area and outer city area were significantly differences. and there was no co-effect between school type and school location to the Knowledge Management of teacher professional training schools.

## Introduction

### Background and Significance of the Study

In globalization and changing world, many countries including Thailand are facing the New Economy System (NES) which utilizes information and knowledge materials. This system encourages society to create innovations to elevate capability of national competitiveness. As the result, our society in New Economy System has continuously developed to knowledge-based society. which has arisen because countries and international organizations recognize that knowledge as the critical element to develop politics, economic and society both domestic and international. Moreover, knowledge has become a significant factor of economic growth in the era of information technology revolution. Hence, we can state that knowledge in human being is the main factor in economics and society development. (Pathomlek, 2003)

The country's capability measurement is changed from economic growth index and GDP to the ratio of international innovators of each country because knowledge has become the factor that determines rules and profit of the new economic system. In the other words, knowledge is the most important factor in manufacturing and can be transferred as Intellectual Capital which is the most valuable property of organization. Wealth in the new economic system and utilization the new capital have become the most mission of all organizations. In the other words, nowadays, the world community gives priority to intellectual capital or knowledge capital since it has become an important factor for creating advantages to society and nation and has become an energy to drive social development. In the organization level, to survive in such high competitive situation, each one needs knowledge and ability about Knowledge Management (KM) because the concept of knowledge management has more involved and effected to the changing world.

Especially, government agencies must change their paradigm to increase ability and efficiency to compete in international level (Charoenwongsak, 2002: 4). Panitch (2004: 5) stated that Thai society has needed to develop knowledge and ability to create innovation from knowledge which has been the force to drive the change and the paradigm change of Thai society to survive in globalization phenomenon. So, every organization has to adapt itself for inventing new innovation and knowledge (Kettut. 2001: 69-70). Knowledge management is an important factor that facilitates organization to learn more rapidly and efficiently and to gather fragments of knowledge together then the organization can utilize it and encourage their staffs to learn more and more.

Characteristic of new era organization that can adapt themselves to rapidly change is the organization that seeks for opportunities to change systematically. In changing, they must develop their management system to support growth by (1) becoming a learning organization which consists of leadership, teamwork and systematic thinking, (2) applying Total Quality Management, and (3) applying continuous process improvement and Knowledge Management. Learning organization is the organization that increases their performances and vision continuously and everyone in organization learn together continuously. (Sarattana, 2004 : 10).

The important factors that encourage schools to success is knowledge and awareness about knowledge. Especially in learning society era, the school must shift their paradigm and adjust management system to emphasize on knowledge management that leads to sustainable development. Knowledge management is new issue for school. Moreover, it is a very vast framework that is difficult to apply entirely. So, clearly organization goals will lead to efficient and effective knowledge management in school. Knowledge management has four important elements as diversity people, gather them to work creatively, find the new ways to work and trial

and learn new knowledge from outside organization properly. (Panich : Online) The most important problem in knowledge management is that the organization doesn't concern about one of knowledge management elements which interrupts the knowledge cycle. (Wongprasert, 2005 : 72). Likewise, Watchai (2003 : Online) said that academic achievement must achieve both in quantitative and qualitative aspects and must consider its effect on environment, health, ethics, law and society. So, the instrument to enhance education of nation to meet the third criteria: developing learning society is to develop robust method of learning which can measure by academic service and cooperation with community to become a learning society and knowledge society for supporting learning source and learning mechanism, and knowledge invention and knowledge management in every level of society.

The faculty of education has a very important mission to create high quality teachers by developing the curriculum which contains four courses - Teaching Observation and Participation, Train Teaching, Professional Teaching Practice in School 1 and Professional Teaching Practice in School 2 – to encourage teacher students to learn from experiences in real situations and environment in schools. The schools must prepare learning resources such as profession teachers, learning source and knowledge for teacher students. And the faculty has selected schools by their readiness which leads to experiences and attitudes that are gained by teacher students. So, schools need to adapt their role in knowledge management to response to the present education system. Knowledge management is the process to gather scatter knowledge in organization systematically, and to make it accessible and utilizable. Knowledge management method comprises of various processes such as inventing, collecting and processing knowledge for utilizing the knowledge accurately, promptly and suitably. The objective of knowledge management is to develop work quality, human resource and knowledge base. Therefore, the factors that effect to knowledge management must be concerned in order to lead their organization to be effective learning organization. These factors are policy and objective, structure of organization, vision, mission, teamwork, information technology, leadership, motivation, environment and learning culture of organization.

The researcher who is responsible for teacher professional training program of the faculty of education interested to study about knowledge management of teacher professional training schools to gather information for further teacher professional training development and program improvement.

### **Objectives**

1. To investigate knowledge management of teacher professional training schools, faculty of education, Rajabhat Rajanagarindra University.
2. To compare knowledge management of teacher professional training schools categorized by school type and school location.

### **Method**

This research intended to study knowledge management of teacher professional training schools that cooperated with faculty of education, Rajabhat Rajanagarindra University by following procedures;

#### **1. Population and sample**

- 1) The population comprised of 18 administrators and 155 teachers from teacher professional training schools under Chachoengsao Educational Service Area 1 and 2 in academic year of 2010.
- 2) The sample consisted of 17 administrators and 110 teachers from the schools. Size of sample was decided according to Krejcie & Morgan table. (Krejcie &

Morgan. 1970 : 607-610). Sample obtained by the mean of simple random sampling technique.

## **2. Instruments**

The instruments were consisted of interview form and questionnaire. The questionnaire divided into two parts:

Part one: Background information (checklist)

Part two: 48 questions about knowledge management with a set of 5 item-Likert's rating scale questionnaire as followings:

- 5 = Extremely applied knowledge management
- 4 = Much applied knowledge management
- 3 = Moderately applied knowledge management
- 2 = Little applied knowledge management
- 1 = Seldom applied knowledge management

## **3. Developing the instruments.**

- 1) Studied theories, concepts, documents, textbooks, and research about knowledge management.
- 2) Developed questionnaire about knowledge management.
- 3) Developed interview form about knowledge management.
- 4) The questionnaire and interview form were approved by experts, for content validity.
- 5) Adjusted questionnaire and interview form according to experts' comments.
- 6) Interviewed sample.
- 7) Tried adjusted instruments to the schools that were not the sample. The reliability of instrument was 0.894.
- 8) Collected data by the instruments.

## **4. Collecting data.**

- 1) Contacted professional training schools for permission to collect data.
- 2) Interviewed sample (conducted on November, 24<sup>th</sup> 2011).
- 3) Sent questionnaires to 15 schools.
- 4) Ten days later, sent staff to collect the questionnaires.
- 5) Check the collected questionnaires.

## **5. Statistical analysis.**

- 1) frequency and percentage were analyzed for background data and information.
- 2) Mean ( $\bar{X}$ ) and standard deviation (*S.D.*). were employed for data analysis of knowledge Management
- 3) ANOVA was applied for comparison between factors.

## **Results**

The findings revealed as followings:

1. Background information of the samples, there were 35 males and 92 females. Most of the samples (61.90%) graduated bachelor degree. Samples were one-hundred and ten teachers and seven-teen administrators. One-hundred of them worked in secondary schools and twenty-seven worked in primary schools. Sixty-nine of them worked in schools located outer city area of Chachoengsoa and fifty-eight of them worked in schools which located inner city areas.
2. Knowledge management: In overall, teacher professional training schools which cooperated with the faculty of education Rajabhat Rajanagarindra University much applied knowledge management (mean = 3.86). The elements of knowledge management ranking from the highest to the lowest scores were Knowledge utilization, Knowledge identification, Knowledge acquisition, and Systematic knowledge management. Each element had details as followings;
  - 1) Knowledge identification: found that all aspects of this element gained rather high score. The aspects ranking from the highest to the lowest score were to encouraging staff to learn, participate and work independently and create new invention, having strategies or policy that encourage habit

to learn, arranging training courses, seminars, workshops or academic events to enhance staff efficient and arranging training courses, seminars, workshops or academic events both inside and outside the organization for knowledge sharing.

2) Knowledge acquisition : found that in overall and every aspects of this element gained rather high score. The aspects ordered from highest to the lowest score were administrator encouraging staffs to participate in training courses, meetings and seminars continuously and encouraging to applied gained knowledge to work, schools searching for knowledge from many sources and introducing to staffs, schools recognizing worth of staffs and encouraging them to introduce knowledge to all of staffs and the least score aspect was school searching for knowledge systematically.

3) Knowledge invention and use : found that nine aspects of this element gained rather high score and an aspect gains medium score. The most ranking aspect was staffs interesting in getting knowledge and seeking for advice from experts without hesitation. The second ranking aspect was school arranging activities to enhance knowledge of staffs. However, there was the aspect that gained medium score which was school preparing budget for staffs to get additional knowledge.

4) Systematic knowledge management: found that in overall and most aspect of this element gained rather high score and only aspect gained medium score. The first three highest score aspects were school managing knowledge systematically, School emphasizing on working method report and school having up-to-date equipments in searching collected knowledge. However, there was the aspect that gained medium score which was school summarizing knowledge into essay and upload to school's website.

5) Sharing knowledge: found that in overall and every aspects gained rather high score. The aspects ranking from the highest to the lowest score were school organizing activities for knowledge sharing, school acknowledging value of knowledge, skill and expertise of teachers and encouraging them to share those knowledge throughout the school, Information system of school being up to date and reliable information which enhanced working skills, and the least score aspect was that school staffs often having chances to learn from experts.

6) Knowledge utilization : found that in overall and every aspects of this element gained rather high score. The aspects ranking from the highest to the lowest score were staffs using knowledge to enhance their efficient, staffs planning in important activities, staff use knowledge for themselves, others and society and, the least score aspect was that staffs using knowledge to create innovation both in work life and personal life.

7) Knowledge service: found that in over all and every aspects of this element gained rather high score. The aspects ranking from the highest to the lowest score were teachers having creative thinking skill to integrate knowledge and use the results efficiently, school permitting other organizations to study about their knowledge management system, school updating knowledge continuously and knowledge management system of school facilitating teachers to conveniently utilize knowledge easily and rapidly.

3. The opinion of administrators and teachers in primary and secondary schools about knowledge management of teacher professional training schools were not significantly differences. ( $p = .297 > .05$ ). But the opinion of administrators and teachers when categorized by school location (inner city area and outer city area) was significantly difference ( $p = .048 < .05$ ). However, school type and location had no co-effect to knowledge management ( $p = .298 > .05$ ).

## Discussion

As the findings have shown, there are important issues to be discussed as followings;

1. In overall, knowledge management of teacher professional training schools which cooperated with the faculty of education Rajabhat Rajanagarindra University gained high score, corresponds with study result of Lachuntuk (2003:Abstract), Maswanna (2008: Abstract), Saraprang (2008 :Abstract) and Karnsa-ard (2008 :Abstract). But contrast with study of Harnpanich (2003 : Abstract) which found that administrators of universities had noticed that, in present, knowledge management was merely applied. However, the result corresponds with the study of Charoenpat

(2009 :Abstract) about knowledge management of staffs in Krungsri Ayudhaya Bank (Co, Ltd.) in Phuket. The objectives of his research were to study overall knowledge management of it's staffs, and to compare personal factors that affect knowledge management. The study found that in overall knowledge management was rather much applied and emphasized on knowledge invention, knowledge searching, knowledge specifying, knowledge storage, knowledge sharing and knowledge utilization, respectively. However, the result doesn't correspond with the study of Srikwanchai (2007: Abstract) that studied about knowledge management in elementary schools under Ayudhaya Educational Service Area 1. His study found that teachers little applied knowledge management in overall and also in each element: knowledge invention, knowledge storage and knowledge utilization. Except, knowledge searching was moderate applied. From abovementioned results, we may conclude that from now on, knowledge management is the key element of successful organization to achieve it's goals. (Makhum,2006: 280-281; citing Sallis; & Jones. 2002: XIV). Knowledge Management is modern management idea that realizes the value of human resource. Every staffs of organization can responsible for every main tasks and work as team to drive the organization effectively. Knowledge management is coordinated process of each units in organization to use knowledge for better overall efficient. Also, it is the process of practitioners. Theorists or academics are only resource persons or facilitators in the process. Bacha (2000, cited in Putes,2008 : 24) stated about benefit of knowledge management that knowledge management made the organization to retain their expertise, skill and knowledge that may lost when they lost some staff. Knowledge management can enhance efficient of decisions by facilitate in acquiring information and knowledge which needed for the decision.

Due to decision makers must decide rapidly with quality knowledge management that adaptable and flexible, it made them understand about works objectives and create good attitude toward work. In aspect of service, the knowledge management made staffs to understand in customers, tend and competition then it can narrow the gap between competitors and open opportunities to compete. Makhum (2006: Abstract), studied about developing indicators of knowledge management of teachers in basic education schools under the Ministry of Education. The objectives of this study were to develop teacher's knowledge management indicators and to examine correspondence of LISREL model of knowledge management indicators. The study found that there are six main elements of knowledge management of schools under the Ministry of Education as knowledge identification, knowledge searching, knowledge invention, knowledge sharing, knowledge storage and knowledge utilization. As of the policy of the ministry, the schools rather much applied knowledge management.

2. The highest score element was knowledge utilization which corresponds with the study of Saraprang (2008:Abstract) which found that guideline in developing knowledge management were opportunities to share knowledge, experience and skill with experts and to create friendly environment in workplace which lead administrators and teacher to share more knowledge and extend their network to sharing knowledge in order to utilize the gained knowledge in different context.

3. The lowest score element was systematic knowledge management which corresponds with the study of Srikwanchai (2007:Abstract) which found the same result. Then, the school may need to find new convenient and safe system to collect knowledge such as information technology system according to Education Act (1999 and The additional 2002) section 22 which emphasizes on encouraging students to gain skills in information technology on learning and their lifelong learning. Panich (2003:84-90) proposed that collecting knowledge by efficient technology is the way to enhance efficiency in knowledge flow, knowledge storage and retrieve. Also, Maquarde. (1996: 27-30; cited in Makhum. 2549: 294) found that systematic knowledge storage was rather few applied when compare with other elements. This may because of schools

lack of readiness in staff, equipments, technologies, skill and knowledge to collecting data systematically. As well, Nekmanurak, (2007,cited in Srikwanchai .2007 : 70) stated that teachers in primary school rarely applied knowledge management method to enhance their teaching efficiency and their schools lack information in systematically knowledge management.

4. When categorized by school type, the study found that no different between administrators' opinion about knowledge management. The result correspond with the study of Karnsa-ard (2008: Abstract) which found that government officers who worked in difference school size had no difference in their opinion concerning knowledge management. In other hand, the result contrasted with the study of Maswanna (2008 : Abstract) which found that the schools that had different sizes had different knowledge management.

5. When categorized by school location, the study found that administrators have different opinions. The result corresponded with the study of Charoenpat (2009 : Abstract) which found that in different agents there was difference in level of knowledge management. The reasons of difference might be the result from difference in context of inner city area school and outer city area school. Most of inner city schools were large size schools and had sufficient staffs. Meanwhile, most outer city area schools lack of staffs and other resources. Beside, modern technology is one of important factors in successful knowledge management because technology can support working and learning of staff. In addition, technology is the easy way to create and manage database and to share knowledge. After all, It doesn't mean that we need the expensive technology to create knowledge management system, what the most important is the knowledge. The Fourth Asian Conference on Education 2012 Official Proceedings Osaka, Japan

management system or method that corresponds with characteristics of the organization that lead to maximize knowledge management utilization.

## **Recommendation**

### **1. For utilization of research results.**

- 1) Support persons in school to store knowledge management systematically.
- 2) Arrange training courses, meetings, seminars and academic events as channels to transfer knowledge to both inside and outside organizations.
- 3) Each school should arrange activities to increase staff knowledge such as training courses, meetings, seminars, presentation and mentoring. Also, prepare budget for human resource development.
- 4) Each school should gather knowledge of their teachers and transform to essay for uploading to their website as knowledge storage.
- 5) School staffs should often have opportunities to gather knowledge from experts.
- 6) Encourage school staff to utilize knowledge in both work and personal life.
- 7) Schools should set convenient knowledge management system for their staffs to retrieve knowledge easily.

### **2. For further research.**

- 1) Study about knowledge management in qualitative research and other factors of knowledge management.
- 2) Study about factors that effect to knowledge management of schools.
- 3) Study relationship between change leadership and knowledge management in schools.

*A Learning Process Suitable for Contents in Education Law Course*

Kanporn Aiempaya

0248

Rajabhat Rajanagarindra University, Thailand

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

The purpose of this research is to study a teaching method by using a learning process suitable for contents in Education Law Course. This Course is an educational foundation for teaching profession program of the Faculty of Education and a mandatory class for first-year students.

The research is conducted by using samples of selected 40 first-year students. The students are divided into 10 groups of 4 in order to perform designed activities. The research consists of two sets of tools which are 1) a group study set 2) an after teaching and idea sharing among groups set. Each set includes a case study on Education Law, a knowledge test, and a problem-solving and creativity test.

The study finds that the learning process which is suitable for contents in Educational Law Course is a teaching method based on an exchange of views among group members combining with instruction and guidelines from an instructor. Such method will help students to develop skills in two ways which are as follows:

1. Knowledge skill – The students are able to understand more clearly on the goal of the subject, to better conclude the key contents and points, and to apply the principles to various situations.
2. Problem-solving and creativity skill - The students are able to develop practical problem-solving guidelines, an alternative problem-solving, an ability to foresee problem-solving and future events and to predict future behaviors and occurrences from related experiences, and a logical reference to situations, culture, influences of information technology and surroundings. Moreover, the students' skills on using language for communication are improved that the students can better communicate in writing by knowing how to make a sequence of situations, how to utilize and connect information in an analyzing process, and how to select proper words or language for explanation.

## Introduction

Learner emphasis policy is directly relevant to determine learning and teaching methods, emphasizing on learners studying in their areas of interest, participating, researching, practicing and application. The policy had lead to student centered learning (or child centered learning) which has been known throughout the Thai academic community for a long period of time. However student centered learning hasn't been as successful in practice due to the fact that teachers still adhere to the conservative pedagogy. Although Thailand's education reform had launched the new regulations in Thai education policy; stating that every teacher now has to apply the student centered method. Teacher began to emphasize this method, which lead to studying, understanding and finding ways to apply this method tangibly (Chowkeeratipong, N. et al, 2010).

Education Act (1999) sections 4-22 states the tenet of education management is that everyone has the ability to learn and develop themselves and that learners are the most important element. Thus, the learning processes must encourage learners to develop themselves naturally and to their full potential. The 1999 Act, section 24 (learning arrangement method) regulates that education institutes and relevant agents have to (1) Assign contents and activities according to learners' interests and aptitude by emphasizing their individuality. (2) Drill skills, thinking methods, management, handling situations and applying knowledge to prevent and solve problems. (3) Provide direct experience with emphasis on thinking skills and stimulating learners' enthusiasm. (4) Integrate knowledge proportionally, cultivate virtue and good value. (5) Encourage teachers to arrange their learning environments using research as a learning process. (6) Encourage continuous learning with the cooperation of parents and local communities. Section 28 states that all curriculums must be designed in accordance to the diversity of learners at each level, age and potential. Curriculum content must include both academic matters and technical matters. Also, the curriculums must put emphasis on balancing knowledge and virtue. Especially, at the undergraduate level which has to emphasize on high level professionalism and research.

Peers are very important to learners. In the group study method, learners had a chance to share their knowledge in groups and cooperate in the learning process. Cooperative learning is a method that builds good relations between learners, encouraging them to share their ideas and problems creating a good learning atmosphere. Also, learners learnt about peer behaviors which lead to adjusting themselves to their communities and understanding themselves and also others. Moreover, they had chances to share experiences and create a good attitude towards teamwork (Intaya, Y. 2007). If the cooperative learning process is used continuously, it will develop member's cooperative learning skills (Kemmanee, T. 2005).

Teaching models are important for the efficiency of teaching methods. Teaching models that conform to theories and learning principals will guide learners to gain knowledge appropriate to their courses. Teaching methods are processes that teachers use to teach the objectives of their courses. Incidentally, each teaching method has its merits both strong and weak. An example of this is the lecture format method in which learners play a passive role in the lesson and in accordance to this lecturer's must have the ability to communicate captivantly to gain the learners attention. Additionally, the lecture format method can't respond to the learner's individuality (Rattanasasi, K. 2007). The case study method's strong point is its openness to learning but if the learners have an unequal level of knowledge and experience, the method will

not yield an appropriate outcome. Moreover in the case study method, opinions of learners usually incline towards group opinion, leading to failure of the method (Rattanasasi, K. 2007).

The educational foundation for the teaching profession department has many courses that are relevant to law and many other mandatory courses.

Courses about law are usually taught using the lecture format method and contain a lot of information that students have to learn and remember. From the above mentioned problems and benefits of the various teaching methods, this research was to study teaching methods suitable for Education Law courses.

### **Research Question**

What is a suitable learning process for contents in Education Law Course?

### **Objective**

To study learning processes suitable for contents in Education Law Course.

### **Area of Research**

#### **1. Content**

Main issues of the studying learning process (1) knowledge teaching and (2) creative thinking skills and problem solving teaching.

#### **2. Population**

Population was first year students from the Faculty of Education at Universities throughout Thailand whom had enrolled in subjects relevant to education law.

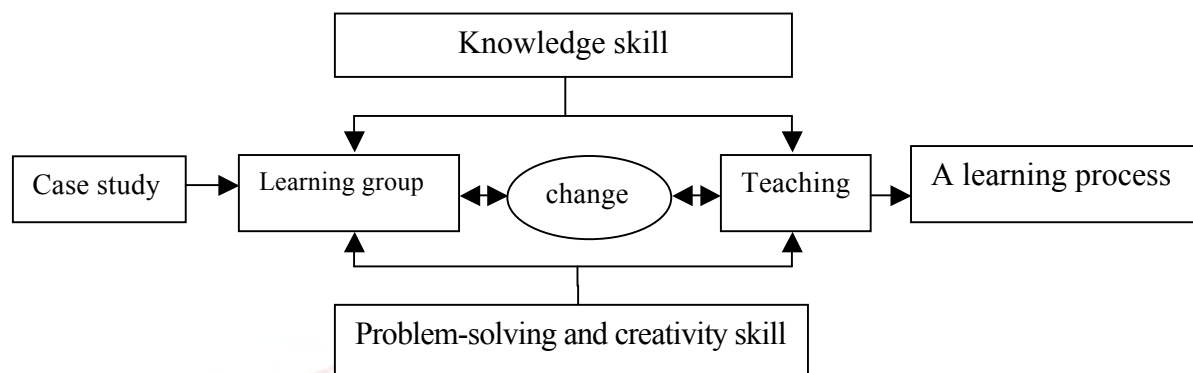

Samples were 40 first year students in the Faculty of Education of Rajabhat Rajanagarindra University. The sample was selected by purposive sampling method and then divided into ten groups of four.

### **Expectations**

1. Use result as guidance in developing teaching subjects that are relevant to education law.
2. Use results as guidelines in the development of other student centered methods.

### **Framework**

From Bloom's Taxonomy (1956) and Bloom's Revised Taxonomy Anderson (2001), researcher developed framework:

## Method

Research method was separated into five steps:

1. Literature review, included the opinions of experts, selected case study and developed tools.

1.1 Research Tools comprised of:

1.1.1 A case study about education law.

1.1.2 Knowledge, problem-solving and creativity tests.

1) A Group Study Set.

2) After Teaching and Idea Sharing Among Groups Set test.

2. Sampling process

2.1 The population in this study was first year students whom were studying in the faculty of education throughout the universities and enrolled in courses that were relevant to Education Law. The sample of the study was first year students who were studying in The Faculty of Education of Rajabhat Rajanagarindra University. Forty students were selected by purposive sampling then were separated in to ten groups of four.

2.2 Applying the case study and tools to the sample.

2.2.1 Separated the sample in to ten groups of four.

2.2.2 Distributed copies of the case study to all students and distributed the Group Study Set test to each of the groups.

2.2.3 Each group studied the case and completed the Group Study Set test.

2.2.4 After 30 minutes, the researcher collected the Group Study Set test

2.2.5 Instructor lectured about content, gave guidance and discussed with the class for 15 minutes. Then gave another 15 minutes for groups to completed the After Teaching and Idea Sharing Among Groups Set test.

2.2.6 Discussion.

3. Compared results of the first and second test.

4. Summarized issues and then presented in a table.

5. Summarized knowledge that had been gained, creative thinking skills and problem solving skills used.

## Result

The results are presented in following table;

Group number	Learning group		Teaching and change	
	knowledge	Creative thinking skill	knowledge	Creative thinking skill
1.	- Can summarize content from the case study.	- Found problems and means to solve the problems.	- Better composing in presenting idea. - Better sequencing. - More detail. - Can analyze the case study.	- Can present the means to solve problems concretely. - Various problem solving means.
2.	- Can summarize content from the case study.	- Can reasoning the issues from the case study but can't clearly define means to solve problem.	- Clearly set the goal of reading the case study. - Can brief the issues in the case study. - Found more issues in the case study.	- Have concrete problem solving means. - Can categorize problems in difference issues. - Various problem solving means.
3.	- Can summarize content from the case study.	- Found ordinary means to solve the problems.	- Apply Education Law as criteria.	- Use situation, culture and information technology as criteria in problem solving. - Can reasonably predict behavior and situation to prevent the problems.
4.	- Can summarize content from the case study.	- Can define the problem solving means from the case study.	- Can completely and clearly summarize the issues.	- Found problem solving means that beyond the information in the case study.
5.	- Can summarize content from the case study.	- Can broadly define the problem solving means from the case study but can't apply concretely.	- Better in summarizing critical issues.	- Have clear problems solving means. - Can set priority to the problems.
6.	- Can	- - Can broadly	- Better in	- Can define problems and

	summarize content from the case study.	define the problem solving means from the case study but can't apply concretely. - Some problems in communication.	summarizing the critical issues. - Better in composing. - Better in reasoning.	problem solving means specifically. - Can present briefly and clearly.
7.	- Can summarize content from the case study.	- Can define the problem solving means from the case study.	- Can summarize critical issues. - Better composing the issues.	- Have clear problem solving means - Can present briefly and clearly.
8.	- Can summarize content from the case study.	- Can broadly define the problem solving means from the case study but can't apply concretely.	- Gain knowledge beyond the case study. - Additional analyzing.	- Have clear problem solving means - Can present briefly and clearly.
Group number	Learning group knowledge	Creative thinking skill	Teaching and change knowledge	Creative thinking skill
9.	- Miss some critical issues from the case study.	- Can define the problem solving means from the case study.	- More summarizing and analyzing critical issues. - More emphasize on the causes of problems.	- More concrete problem solving means. - Have various problem solving means for each problem. - Can present briefly and clearly.
10.	Can summarize content from the case study but miss some issues.	- Use problems as base to find the means to solve.	- Can analyze the causes of problems.	- Found more problem solving means. - Emphasize on analyzing the causes of problems.

The results from the “Group Study Set and the After Teaching and Idea Sharing among Groups Set test” can be summarized as follows:

### The Group Study Set

Knowledge: Sample understood assigned content, could summarize the content but not clearly, understood some issues. In addition, they could recognize some details or important issues.

Creative thinking and problem solving: Sample could use creative thinking skill to analyze the problem solving process according to the content. But couldn't create any new ways in which to

change other than the content they had been given, thus couldn't define clearly the problem solving process.

### **The After Teaching and Idea Sharing Among Groups Set.**

Knowledge: Sample completely understood assigned content. They could define the intention of the content and could clearly present the ideas. They saw more facets of the case and could refer to Education Law. Also, they could present their ideas clearly and briefly.

Creative thinking and problem solving: The sample could create ideas beyond the assigned content, could analyze and find problem solving means and could categorize the issues of the problems. In addition the group used their knowledge of their culture, personal experiences and IT as reference to create new ways to think creatively, problem solve and predict the desired solution which subsequently led to more ways to prevent the problems, thus could define more specifically the solution to the problem. Moreover, they could prioritize their problems according to need, importance and urgency. With this they could present their ideas clearly and briefly in a practical way.

### **Discussion**

From the study's results, the researcher could discuss results as follows;

1. From the literature review, previous studies showed that the group method could develop learners' learning skills via cooperative learning leading to success increasing learners' enthusiasm and encouraging them to delve further for true understanding that could lead them to find their true efficiency and aptitude (Johnson & Smith, 2008). In addition, group work can help weak learners to get along with other learners via cooperation and sharing, both academic and personal (Intaya,Y,2007). Group work also increases learner's personal responsibility, encourages them to participate and express their abilities, gain knowledge from experiences and select learning material by themselves (Bruner, 1963). For improvement and better efficiency in the use of the group method; learners should participate continuously in group activities and learn from appropriate level material and gradually moving on to more difficult material.

Setting learners in various situations will encourage more effective adaptation to the situation (Tylor, 1998). In developing learners' knowledge, in addition to the group method, teaching methodologies are very important factors in creating knowledge and skills. There are many varieties in teaching method each having their advantages and disadvantages. Instructors may need to combine teaching methods in order to obtain the best results. The most important principal is to select suitable teaching methods for the learner, subject and size of class (Ratanarasri, K. 2007).

2. Creative thinking and problem solving skills; group method develops learners' learning skill via cooperative creative thinking. In the group method, weaker learners often give less cooperation and don't recognize their importance within the group. Alternatively, superior learners often use their abilities to problem solve; when group member don't cooperate they often do all the work alone. In addition, superior learners can think faster, sometimes too fast to the point that other learners can't catch up with them. Some of them lack the ability to control their emotions causing relationship problems; while weaker learners often look down upon themselves. These problems would be lessened if the instructor paid proper attention and encouraged the

group to gain better understanding and solve the problems together, thus leading to efficient learning (Intaya, Y, 2007).

Teaching by the group method can stimulate thinking skills as stated in Bloom's Taxonomy (1956) which develops creative thinking skills and problem solving skills based on knowledge, comprehension, application, analysis, synthesis and evaluation. Except for drilling, these thinking skills can be better develop via coordinated learning. Bloom's revised Taxonomy (Anderson, 2001) describes that learners must develop through all thinking skills before they can acquire better creative thinking and problem solving skills. Creative thinking skills will emerge when learner have enough knowledge and experience to apply these new skills.

3. The suitable teaching method relevant to education law is the group learning method with lectured guidance. The method can develop learners' knowledge, creative thinking and problem solving skills. Moreover, the method can develop learners' communication and presentation skills which are consistent with Kitti Rattanasri's study (2007). In which the study stated that; in any subject, content often aims to create knowledge, skill and attitude. Teaching knowledge is given through content, theory, principal and fact to learners. While drilling target skills until learners gain expertise can be a viable method.

Teaching by using case study isn't intend to find the only answer for each question but encourages learners to find various answers and reasons which lead to circumspect decisions. In addition, case study method encourages learners to face and solve the problems and stimulate learners to analyze the case.

The study of Yuphin Intaya (2007) supports the use of the group learning method. The study found that using the group learning method created positive attitudes to learning. The majority of the sample (97.81%) had a positive attitude towards the group learning method. Pattamarin Kerdsonkram (2011) studied the use of the group learning method in Thai teaching. The study found that teachers preferred to use the group learning method as it encouraged cooperation, teamwork and opportunity to practice. Learners' efficiency is highly significant towards a more positive attitude towards learning. Springer & Mary (1999) studied the efficiency of small group learning at SMET (Science, Mathematics, Engineering and Technology) and found that learners' efficiency had increased.

## **Suggestion**

### **1. Using study results.**

1.1 Study all processes and overview the methods thoroughly before applying them to the classroom. Follow the process carefully, but may need experimentation before application in a class room environment.

1.2 The method could be applied to students of any other faculty or university as the method was developed in accordance to core subject matter of the undergraduate curriculum.

### **2. Suggestions related to the policy.**

2.1 Universities should encourage staff to learn more about learning methodologies to be applied in their courses.

2.2 Universities should encourage staff to develop new learning methods on a continuous basis.

2.3 Universities should do more research on the group learning method so as to reach a standard and applicable method in teaching.

3. For further study

3.1 Compare the results of this group learning method with other related research

3.2 Bring the study to a national scale.

3.3 Study the learning process in various ways to develop new methods

3.4 Replicate this study and tools used to develop a more suitable learning method for subjects relevant to education law.

Abstracts

A great deal of research has been conducted on the effects of sketching for design educations. However, previous studies have failed to elucidate the ways in which sketching skills such as the use of perspective and shading influence these effects. If the role and effects of sketching skills could be elucidated, it would be possible to transform sketching training, on which so much time has conventionally been spent in acquiring skills, into an avenue for the effective acquisition of techniques for generating ideas for design features. This could be expected to make it possible to use sketching to easily generate ideas towards the resolution of problems. Seeking to shed light on the role and effects of sketching skills in relation to the generation of design ideas in the process of product design, the research discussed in this paper clarified the elements that make up sketching skills and the relationships among them. Specifically, the authors observed the process of sketching skills acquisition in a sketching class and evaluated sketches drawn by students in the class. By analyzing the evaluation results using the interpretive structural modeling (ISM) method, quantification method III, and the cluster analysis method, the authors elucidated the relationships among the elements making up sketching skills, enabling a structural model of sketching skills to be proposed. This made it possible to analyze the purposive use of sketching skills and methods of acquiring these skills, and assisted in the design education.

Key words: Design Education, Sketching, Structural Model of Sketching Skills

## 1. Introduction

Most product designers use display techniques, of which sketching is a representative example, in generating ideas for design features. This is because designers recognize that sketches stimulate new ideas and creativity, and most continue to use sketching even in this age of advanced computer-aided design (1, 2). Sketching skills are considered to be fundamental skills, and a great deal of time is spent on acquiring them in the process of product design education. However, almost no research has been conducted that scientifically considers the role and effects of sketching skills in the generation of ideas for design features. Elucidation of the role and effects of sketching skills would allow a transformation of sketching training, in which so much time is conventionally spent on acquiring basic skills, into an avenue for the effective acquisition of techniques for generating ideas for design features. This would make it possible not merely for product designers, but also for mechanical designers and product planners, to use sketching to easily generate ideas towards the resolution of problems. The project discussed here aims at clarifying the role and effects of sketching skills in the generation of ideas for design features, and clarifies the elements that make up sketching skills and the relationships among them. In terms of method, the project first confirms the validity of the research, focusing on sketching skills by producing an overview of the use of sketching in product design and summarizing previous research concerning sketching and the generation of ideas for design features. Next, previously untrained participants engage in sketching training, and the process of acquiring sketching skills is observed. Finally, the relationship between the elements making up sketching skills is considered through analysis of participant sketches, and a structural model is created.

## 2. Related Work

The display techniques used in design are techniques that aim to illustratively express how the subject of the design will look, for example through models and prototypes created by isolating and expressing the design characteristics of the subject. Sketching is one such technique, and is used by many designers to generate ideas for design features because sketches can be quickly created whenever paper and drawing implements are available.

A great deal of research has been conducted on the uses of sketching in design. The following are reported as representative functions of sketching (1, 3):

- Stimulating new ideas and creativity
- Communicating intentions beyond what can be formulated in words
- Simultaneously linking all elements
- Providing an interface between implicit expression and verbal expression
- Identifying features that cannot be overlooked
- Promoting serendipitous discovery of ideas
- Clarifying vocabulary
- Suggesting possibilities for new design proposals

In the field of design science, research taking sketching as a guidepost is being conducted to clarify the structure of creative thought in design (4-6). In the field of cognitive science, research is being conducted on the relationship between creative thought and sketching to shed light on “creation” as a human intellectual activity (7), and sketching is viewed as an action that assists in design reasoning. This research posits the discovery of unanticipated visual attributes, the associative generation of new concepts through the reinterpretation of visual attributes, and the creation of new design demands. As indicated above, despite the fact that a great deal of research has been conducted on the effects of sketching in promoting the generation of ideas for design features, because there has been no focus on the detailed causes of those effects, the role and effects of sketching skills in the generation of ideas for design features have not been clarified (Figure 1). Although sketching skills are considered important in both design practice and education, almost no research has focused on their concrete role, or on how a designer’s level of mastery of these skills affects the generation of ideas for design features.

Because of this, the authors believe that elucidation of the role and effects of sketching skills in the generation of ideas for design features will allow students to efficiently acquire techniques for the generation of concepts during the process of design education. The authors also believe that offering this form of education to mechanical designers and planners as well as industrial designers will enable the generation of ideas for design features during the various processes of product development, stimulating the development of innovative products.

### **3. Methods**

#### **Observation of the training in sketching skills**

Training aimed at promoting the acquisition of sketching skills was offered to a group of university students with no previous design education, and the process of skill acquisition was observed.

Participants were 13 science students with some mechanical design knowledge. The participants were provided with sketching training consisting of a 90 min lecture and a 210 min practical session. The lecture promoted understanding of perspective drawing, drawing basic shapes, and basic techniques for representing solids through drawings made by the participants.

Following training, the participants formulated design proposals using sketching exercises, working with the theme of a self-propelled robot vacuum cleaner. Using the internal parts shown in Figure 2, subjects were required to decide on a sketch-based design concept in 180 min, and then to produce multiple idea sketches based on that concept in a 90 min period.

## Observation of the acquisition process of sketching skills

The skill acquisition process was observed in sketching education. Observations indicated that sketching skill can be classified according to difficulty, as follows:

- (1) Skills that are quickly acquired  
Many participants mastered basic skills, such as expression of figures and fundamental solids by shading, in a short time. Such skills are considered to be relatively easily acquired.
- (2) Skills whose acquisition requires varying amounts of time  
For some complex skills such as drawing curved surfaces, freehand drawing, and mastering the parts that constitute design elements, participants had varying levels of accomplishment within the allotted time. Such skills are considered to be relatively difficult to acquire.

## Observation of the practical use of a sketch

In the exercise, each participant successively drew 3 to 14 proposals (91 in total) using the perspective method. The following was verified for each sketch:

- (1) Development of structural design  
Following sketches for the original proposal, subsequent development of unrelated design elements, such as differing structures or composition of parts, or different internal structure (Figure 3).
- (2) Development of exterior design  
Following sketches for the original proposal, subsequent development of designs that maintained similar structure but with modified external forms (Figure 4).
- (3) Development of design elements  
Development of design proposals in which control and functional components are drawn in a way that describes function or specification as an industrial commodity

### Classification of sketching skills

Sketching during design enables designers to clarify ideas in their minds by visualizing images, thus effectively linking ideas to subsequent steps. To clarify ideas, it is essential that designers possess techniques that accurately express the characteristics of a desired form, allowing it to be captured on paper (8). To effectively link ideas to subsequent steps, the designer must furthermore be able to develop multiple design proposal candidates, and to select the best from among them. From the above, for this project sketching skills were broadly categorized as expression skills, techniques for the accurate expression of forms, development skills, or techniques for the development of a large number of design proposal candidates, and an attempt was made to elucidate the structure of each skill set.

### Evaluation of expression skills

The items used in the evaluation of expression skills were abstracted from the perspective drawing method, and from methods of setting angles and expressing the three-dimensionality of the object of design, as presented in a design handbook introducing basic sketching techniques. Also evaluated were techniques enabling the intent and features of the design to be emphasized, as presented in a design handbook

introducing advanced sketch expression techniques (9, 10). Ten items were abstracted, as follows:

(E1) Expression of perspective

Does the participant understand perspective drawing and use it correctly to express designs?

(E2) Expression of shadows and materials

Does the participant use shadows to give a sense of three-dimensionality and adequately express materials?

(E3) Expression of three-dimensional form

Does the participant understand the three-dimensional form of the design, and express it correctly?

(E4) Application of perspective

Has the participant used perspective drawing based on an adequate perspective and setting of vanishing points?

(E5) Expression of ridge line

Has the participant adequately expressed “corner R,” as formed by ridge line and vertices?

(E6) Expression of curvature

Has the participant adequately expressed curved forms that describe the curvature of the object?

(E7) Expression of profiles

Has the participant adequately expressed profile lines that describe the external form of the object?

(E8) Expression of constituent elements

Has the participant adequately expressed the position, size, shape, etc. of constituent elements such as operating sections and movable sections that represent design accents?

(E9) Freehand expression

Has the participant drawn smooth freehand lines?

(E10) Expression of emphasis

Has the participant emphasized and expressed the characteristics of the intended form and other features using the boldness, thickness, etc. of lines?

### **Evaluation of development skills**

Based on the results of the sketching observations, in addition to the total number of developmental sketches, development skill evaluation items were isolated by categorizing skills as “Development of structural design” or “Development of external design.” In addition to items indicating the quantity of information expressed in sketches for each proposal or the quality of the development in each case as indicated by its presence or absence, the following nine evaluation items were formulated:

(D1) Number of uses of perspective

A count of the total number of sketches employing perspective.

(D2) Number of developments of shape

Number of sketches developing different external shapes while maintaining the same structure.

(D3) Number of developments of structure

Number of sketches developing different overall structures through the use of different sectional structures or compositions of parts.

(D4) Number of developments of shape for same structure

The average number of developments of the shape of the object for the same structure in each continuously drawn series of sketches.

(D5) Number of developments of form

Within the development of the shape of the object, the number of variations in basic form that represent design motifs, for example the use of cylindrical shapes and rectangular parallelepipeds.

(D6) Development of constituent elements

Separate from the development of the external shape, expression or non-expression of the constituent elements of the subject of the design, such as operating sections, drive sections, and functional components, sketched to demonstrate its function and structure as an industrial product.

(D7) Development of explanation of shape

In addition to sketches from a single perspective, presence or absence of supplementary sketches demonstrating the shape of the object, made to enable correct expression of its shape as a three-dimensional object.

(D8) Development of structural elements

Presence or absence of sketches intended to demonstrate the structure of the object and the functioning of moving parts, etc.

(D9) Development of detail elements

Presence or absence of sketches of detail elements separate from the basic shape, such as sketches including expression of elements providing design accents.

Evaluation was performed by two professional designers and one design teacher using the 10 “expression skill” criteria and 9 “deployment skill” criteria listed above.

## 4. Results and Discussion

### Correlation between evaluation items for expression skills

Table 1 shows correlation coefficients for the “expression skill” evaluation items. Except for the 0.698 correlation coefficient between E6 and E8, coefficients of correlation of 0.7 or higher were obtained for the correlations between (E5) “Expression of contours,” (E6) “Expression of curvature,” (E7) “Expression of profiles,” (E8) “Expression of constituent elements,” (E9) “Freehand expression” and (E10) “Expression of emphasis,” which are “Skills whose acquisition requires varying amounts of time” in Table 1. On the other hand, 0.8 or higher correlations were obtained between (E1) “Expression of perspective” and (E3) “Expression of three-dimensional forms,” which are “Skills that are quickly acquired.” This result indicates that categorization of “expression skill” may be possible using the time required for acquisition.

### Correlation between evaluation items for deployment skills

Correlation coefficients of the evaluated “deployment skill” items shown in Table 2 indicate that (D2) “Number of developments of shape” has a 0.7 or higher correlation with (D1) “Number of uses of perspective,” (D5) “Number of developments of form,” and (D7) “Development of explanation of shape.” On the other hand, between (D3) “Number of developments of structure” and other “deployment skills,” high correlation coefficients were not seen, except for (D5) “Number of developments of form.” From this, while “Development of exterior design” tends to have a high correlation with the total number of deployed sketches and “Deployment of design elements,” correlation with “Development of structural design” and other “deployment skills” tends to be low.

### Correlation between evaluation items for expression skills and evaluation items for development skills

Correlation coefficients of the evaluated “expression skill” items shown in Table 3 indicate that (D9) “Development of detail elements” has a 0.7 or higher correlation coefficient correlation with all “expression skills” except (E2) “Expression of shadows and materials.” This result indicates that detail used to accent designs or detail elements accompanies improvement in “expression skill.”

Correlation coefficients of 0.7 or higher were seen between (E7) “Expression of profiles,” which is a “Skill whose acquisition requires varying amounts of time,” and (D2) “Number of developments of shape” which is a “design deployment of form.” Furthermore, 0.7 or higher correlation coefficients were also seen between (E10) “Expression of emphasis” and (D2) “Number of developments of shape.” It is thought that “Skills whose acquisition requires varying amounts of time” tend to have correlations with both “design deployment of form,” and “design deployment of an element.”

## Creation of a structural model of expression skills

A structural model was created using interpretive structural modeling (ISM) to verify the causal relationship between each of the evaluation items for expression skills.

Each subject's evaluation result for the "expression skills" was used to create an adjacency matrix. When 80% or more of subjects with a given expression skill A specifically had the expression skill B, it was judged that expression skill B was a necessary condition for expression skill A. Figure 5 shows a layered structural model of the expression skills from the reachability matrix. That figure shows skills with strong connection relations, indicated by enclosing frames. The structure was divided into four levels. (E10) "Expression of emphasis," (E9) "Freehand expression," and (E5) "Expression of contours," which were classified as "Skills whose acquisition requires varying amounts of time," were shown in the third and fourth levels, levels that imply acquisition of other skills. (E1) "Expression of perspective," (E3) "Expression of three-dimensional form," (E4) "Expression using perspective drawing method," and (E7) "Expression of profiles" are shown in the first level.

## Categorization of expression skills

Hayashi's quantification method III was applied to the evaluation data to organize the ten evaluation items relating to expression skills. The eigenvalues and contribution ratios shown in Table 4 were obtained. Figure 6 shows category scores for the first, second, and third components. Using category score features, the primary axis can be considered to be an evaluative axis indicating the degree of difficulty of skill acquisition. The secondary axis can be considered to be an evaluative axis indicating expression of three-dimensionality and shape, and the third axis can be interpreted as showing "expression of curved surface form."

Because the cumulative contribution ratio up to the third component was 0.8, cluster analysis (Ward's method) was applied to the category scores up to the third component to produce four categories (Figure 7).

The four categories of expression skills were named as follows, based on the characteristics of the evaluation items included in the categories:

- Skills for expression of perspective  
This category is made up of (E1) "Expression of perspective," (E2) "Expression of shadows and materials," (E4) "Expression using perspective drawing method," and (E8) "Expression of constituent elements." These are skills based on an understanding of the perspective drawing method, enabling expression including expression of constituent elements.
- Skills for expression of three-dimensional form  
This category is made up of (E3) "Expression of three-dimensional form" and (E7) "Expression of profiles." These are skills for the accurate expression of three-dimensional form, based on an understanding of that form.
- Skills for the expression of curved form

This category is made up of (E6) “Expression of curvature.” These are skills in the expression of soft curves, enabling accurate expression of curved designs.

- Skills for the expression of the object image

This category is made up of (E5) “Expression of contours,” (E9) “Freehand expression,” and (E10) “Expression of emphasis.” These are skills based on skill in freehand drawing, enabling accurate expression of the design image through elements including expression through the relative strength and vigor of lines and the expression of outlines.

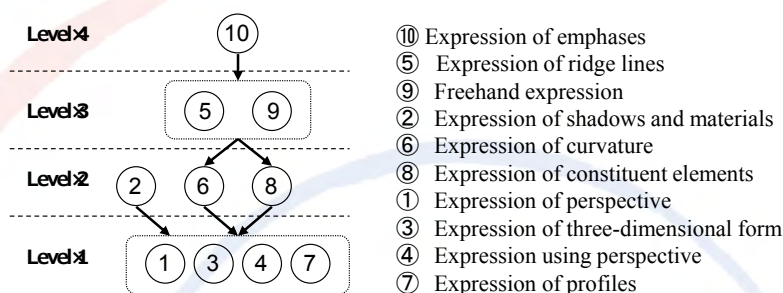

Fig. 5. The layered structural model of expression skills

Table 4. Eigenvalues and contribution ratios of expression skills

Axis No.	Eigenvalue	Contribution ratio	Cumulative contribution ratio
1	0.218	39.2%	39.2%
2	0.139	25.0%	64.2%
3	0.087	15.7%	80.0%

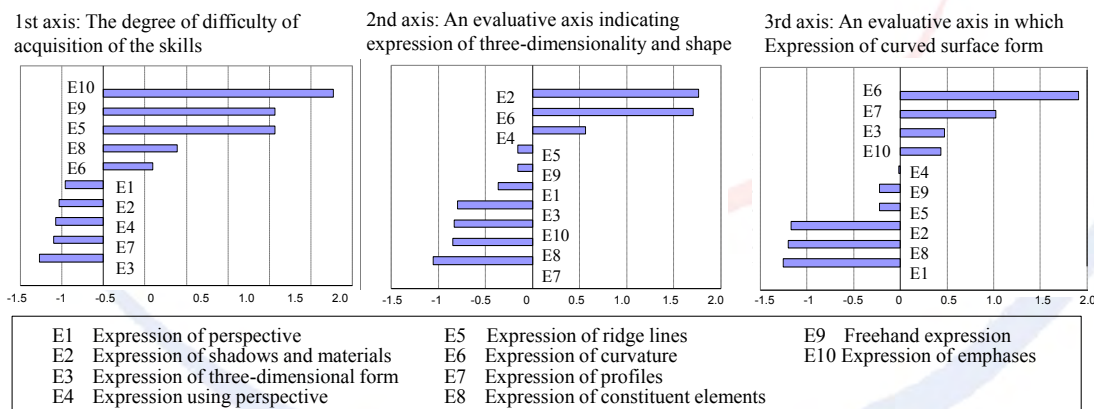

Fig. 6. Category scores of expression skills

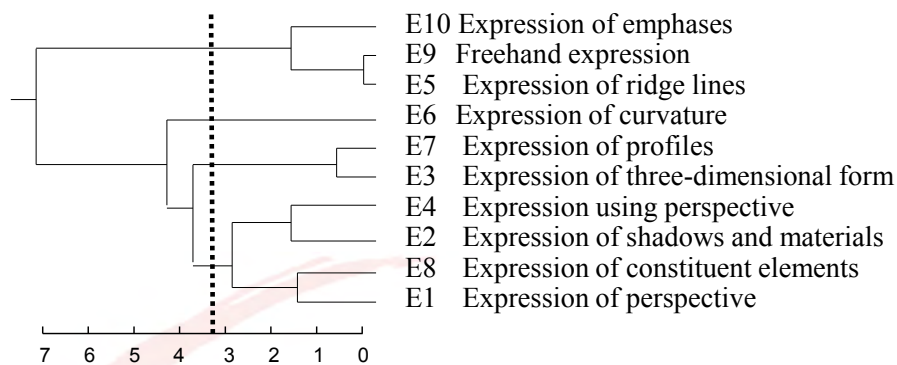

Fig. 7. The cluster tree diagram of expression skills

### Creation of a structural model of development skills

A structural model was also created using ISM to verify the causal relationship between each of the nine evaluation items for development skills.

Using the results of the evaluation of development skills, a structure graph was formulated using ISM (Figure 8). (D2) “Number of developments of shape,” (D4) “Number of developments of shape for same structure,” and (D9) “Development of detail elements,” items classified as “Development of external design,” were shown in the second and third levels, levels that imply acquisition of other skills. (D3) “Number of developments of structure” and (D5) “Number of developments of form,” items classified as “Development of structural design,” and (D1) “Number of uses of perspective” and (D6) “Development of constituent elements,” items classified as “Deployment of design elements,” were shown in the first level. These results indicate that “Development of external design” is learned after acquisition of “Development of structural design” and “Deployment of design elements.”

### Categorization of development skills

Hayashi’s quantification method III was applied to the evaluation data to organize the nine evaluation items related to development skills. The eigenvalues and contribution ratios shown in Table 5 were obtained. Figure 9 shows category scores for the first, second, and third components. Using the category score, the primary axis can be considered to be an evaluative axis showing “Development of structural design” and “Development of external design.” The secondary axis can be considered to be an evaluative axis for the type of information displayed as elements making up designs, and the third axis can be considered to be an axis in which “deployment of shape” is shown.

Because the cumulative contribution ratio up to the third component was 0.71, cluster analysis (Ward’s method) was applied to the category scores up to the third component to produce four categories (Figure 10).

The four categories of development skills were named as follows, based on characteristics of the evaluation items included in the categories:

- Skills for development of structure  
This category is made up of (D1) “Number of uses of perspective,” (D3) “Number of developments of structure,” (D5) “Number of developments of form,” and (D7) “Development of explanation of shape.” These are skills for developing variations on basic structure and form, making up the basic shape of the design.
- Skills for development of shape  
This category is made up of (D2) “Number of developments of shape” and (D4) “Number of developments of shape for same structure.” These are skills for developing differing external shapes for the same basic structures and forms.
- Skills for development of constituent elements  
This category is made up of (D6) “Development of constituent elements.” This is a skill for the development of constituent elements that serve as distinctive features of the object, separate from the external shape that constitutes its basic form.
- Skills for development of detailed shape  
This category is made up of (D8) “Development of structural elements” and (D9) “Development of detail elements.” These are skills for developing detail elements such as details and explanations of structure that serve as distinctive features of the object.

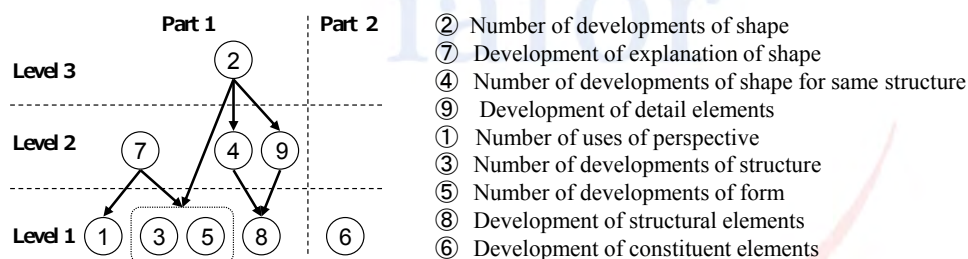

Fig. 8. The layered structural model of development skills

Table 5. Eigenvalues and contribution ratios of development skills

Axis No.	Eigenvalue	Contribution ratio	Cumulative contribution ratio
1	0.305	31.6%	31.6%
2	0.244	25.3%	56.9%
3	0.139	14.4%	71.3%

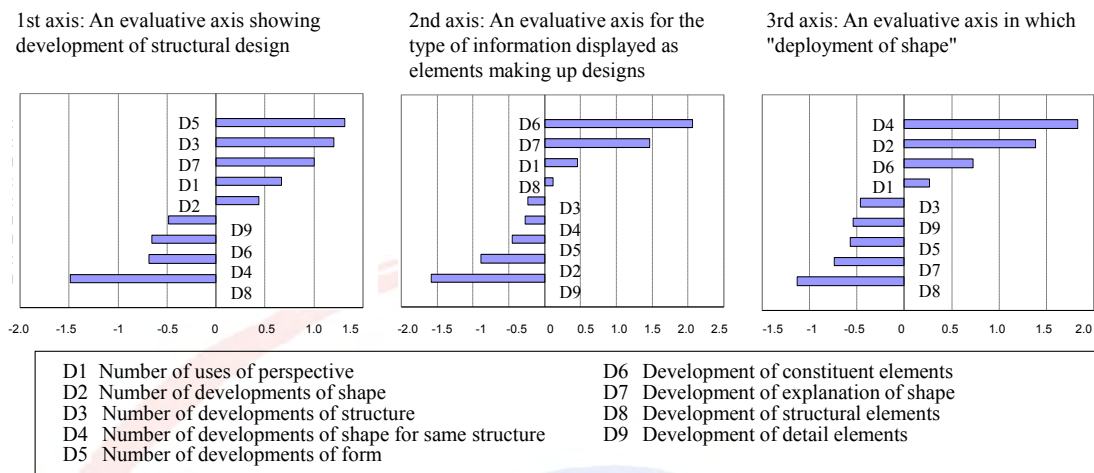

Fig. 9. Category scores of development skills

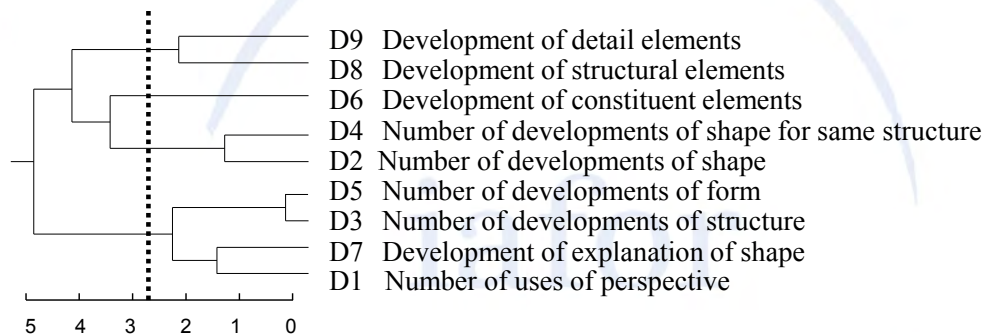

Fig. 10. The cluster tree diagram of development skills

## 5. Structure of sketching skills

### Structure of expression skills

Figure 11 shows the category score graph for expression skills obtained by Hayashi's quantification method III, incorporating arrows expressing the causal relationships demonstrated by ISM and the four categories of expression skill.

Acquisition of "Skills for expression of object image" requires acquisition of the "Skills for expression of curved form," "Skills for expression of perspective," and "Skills for expression of three-dimensional form." Moreover, "Skills for expression of perspective" and "Skills for expression of three-dimensional form" are skills mutually learned by being the requisite, and it is shown that acquisition of "Skills for expression of curved form" will be the requisite.

### Structure of development skills

Figure 12 shows the category score graph for development skills obtained by Hayashi's

quantification method III, incorporating arrows expressing the causal relationships demonstrated by ISM and the four categories of development skills.

It is thought that acquisition of “Skills for development of shape” is premised on acquisition of “Skills for development of structure” and “Skills for development of detailed shape,” in many cases. In addition, it is thought that “Skills for development of constituent elements” is an independent skill that does not influence acquisition of other deployment skills, and furthermore does not require acquisition of other skills.

### **Structural model of sketching skills**

Figure 13 shows a proposed structural model of sketching skills, based on the results of a study of the structures of expression skills and development skills. “Sketching skills” are here divided into “expression skills,” which enable accurate expression of the shape of a design proposal, and “development skills,” which enable the development of numerous candidates for design proposals.

Expression skills are made up of “Skills for the expression of three-dimensional form,” “Skills for expression of perspective,” “Skills for expression of curved form,” and “Skills for expression of object image.” Development skills are made up of “Skills for development of structure,” “Skills for development of external design,” “Skills for development of constituent elements,” and “Skills for development of detailed shape.” Each skill is typified from its relation with skills in two groups, “design deployment of form” and “design deployment of structure.” A skill in connection with “design deployment of an element” belongs to neither. Skills shown with arrows in this structural model indicate necessary conditions for the skill (the origin of the arrow).

## 6. Summary

The project discussed in this paper aimed at clarifying the role and effects of sketching in the generation of ideas for design features, and was conducted to elucidate the structure of the skills involved.

To this end, the authors observed the process of sketching skill acquisition in a sketching class and evaluated sketches drawn by students in the class. By analyzing the evaluation results using ISM, Hayashi's quantification method III, and the cluster analysis method, the authors elucidated the relationships among the elements making up sketching skills, enabling a structural model of sketching skills to be proposed.

Use of this model would allow transformation of sketching training, in which so much time is conventionally spent on acquiring basic skills, into an avenue for effective acquisition of techniques for generating ideas for design features. This would allow not only product designers, but also mechanical designers, product planners, and others to use sketching to easily generate ideas for problem resolution.

However, this model was formulated based on the results of an experiment in which sketching training was provided to subjects with no design experience. Further verification is therefore necessary, for example through comparative analysis of subjects who already possess sketching skills.

In the future, in addition to testing the validity of the proposed structural model of sketching skills, the authors intend to further elucidate the function and role of sketching in the generation of ideas for design features on the basis of this model.

The logo for the International Association of Facilitators (iafor) is centered on the page. It features the word "iafor" in a light blue, lowercase, sans-serif font. The text is enclosed within a circular frame composed of two concentric, hand-drawn style arcs. The outer arc is a light red color, and the inner arc is a light blue color, matching the text. The arcs are slightly irregular, giving the logo a hand-drawn or artistic feel.

## Introduction

Due to the common use of information and communication technology (ICT) in the field of education in recent years, a great deal of attention has been paid to learner autonomy or independent learning outside the classroom by many scholars, including Jackson and Shenton (2010) and Valentine (2002). This, however, creates a number of conflicts for students learning second/foreign languages in Australia, since they have a natural tendency to employ English as the medium when conducting any communication practice in the target language outside the classroom. If there is no specific guidance available, the increase of the students' reliance on English usage can be observed. It must be agreed that the independent learning environment is restricted severely by limited class contact hours, and it is unrealistic to expect students to maintain regular practice of the target language outside as well as in the classroom. Therefore, as Hasegawa (2012) claimed, following the studies of Barker (2004), Pickard (1996), and Springer and Collins (2008), the ideal situation for second/foreign language education is to provide sufficient opportunities for students to acquire communication skills and knowledge in the target language in class and then apply these and exercise the language use outside the classroom. Implementation of this kind of practice will not be successful unless mechanisms are established to encourage students to carry it out as a regular task.

It has been documented that overseas second/foreign language students have limited opportunities to use the target language outside the classroom, even while living and studying in the target country (Cotterall & Reinders 2001). This can be interpreted to suggest that they lack the opportunities to interact with local people in the countries where they are studying. Consequently there is potential to create the right set of circumstances for two groups, the local students studying the target language and the overseas students and/or local residences who are native speakers of the target language. The Language Exchange Program (LEP) at Curtin University provides an opportunity for this to occur. This has been running since 2003, as a special program for Curtin University students enrolled in the second year Japanese course. It requires them to team up with native Japanese students/residents in the Perth area and to meet once a week or more to communicate, mainly in Japanese, for a minimum of 60 minutes. LEP participation has a weighting of 5% of the entire unit assessment, so students who meet with their designated Japanese native language partners for the LEP purpose are eligible to obtain the full 5% mark irrespective of what they do in their meetings. Repeated reminders are given throughout the semester to all students participating in the LEP that Japanese language practice and cultural information exchange are the ideal types of activities, and the official stance of the LEP as a component of the unit assessment is maintained solidly.

Students in the LEP may take advantage of participating in the program through some arbitrary tasks such as having a general conversation and/or checking the assessment tasks linked directly to their Japanese lessons. However, due to its flexible nature and the need to rely on the participating students' self-responsibility, the LEP can easily turn into an effortless and superficial social chat session unless it is accompanied by a carefully designed program guideline. (Refer to Hasegawa (2006) for further information about the LEP.) Thus, it is vital for the program coordinator to understand the nature of the students' program activities and to provide suggestions and coherent language learning philosophy about how they can ideally organise their weekly meeting tasks with their native-speaking Japanese partners in order to enhance the value of the LEP. The purpose of this research was to contribute to this understanding, describing a concrete analysis of the students' activities based on previous LEPs.

## Value of the Contact with Native Speaker in LEP

Despite the fact that there have been widespread discussions about the use of the controversial lexical item 'native/non-native', this paper employs these terms because 'none of the alternative phrases have come into common use' (Medgyes n. d. p. 429). Traditionally there has been a prevalent theory that a native speaker of a target language has the ideal grammatical judgement (Chomsky 1965) and is the best person to teach the target language due to an intuitive and inherent sense of culture, pragmatics and linguistics, aka Sprachgefühl (Merino 1997, p. 71). In the early 1990s', however, many began questioning this theory and it became this subject of research (Mahboob, 2005; Moussu & Llurda 2008). Phillipson (1992), for example, has highlighted that this argument should take into account the Native Speaker Fallacy, criticising that this is inappropriate due to 'nativization' referred to by Kachru (1986) (cited in Phillipson 1992), which means that acculturation in the target language can eventually be seen outside the classroom. Nevertheless, both the advantages and negative effects of certain aspects of language use have been discussed with increasing momentum by numerous scholars including Andreou and Galantomos (2009), Gill and Rebrova (2001), Mahboob (2005), Medgyes (1992), Medgyes (n. d.), Merino (1997), Moussu and Llurda (2008), Phillipson (1992), and Sung (2010). The current linguistics and sociolinguistic perspectives do not accept the 'native speaker ideal' theory for second/foreign language learners to achieve (Andreou & Galantomos 2009) but consider that the effective target language employment should be the ultimate goal for learners (Medgyes n. d.).

Despite differences in target participants' demographic backgrounds, the majority of learners still support the native speaker ideal theory or Chomsky's Native Speaker model (Butler 2007a; Butler 2007b), at least in terms of the target language proficiency and cultural connotations (Coma & I 2010; Sung 2010). In other words, the Native Speaker model does not seem to contribute in any way to decreasing an individual's motivation to learn a target language as part of the learning process. Also, it is important to bear in mind that there has not been any conclusive empirical evidence to suggest that native-speaker teachers have any critical negative impacts on second/foreign language learning outcomes (for example, Butler's (2007b) research on Korean students' listening/comprehension skills), despite a few inconsistent results that have depended on research conditions and target participants (Butler 2007b). In fact, it is clearly not enough just to rely on native speakers of the target language without also taking into account their pedagogical and methodological skills. In this regard, it could be valuable for learners to have contact with both native and non-native speakers (Medgyes 1992; Merino, 1997).

Consequently, there have been suggestions to give students access to both native and non-native speaking teachers in class. However, currently there are any situations in which this balance does not occur, with non-native teachers teaching non-native students, or non-native students conducting their exercises together in the target language at great length in the classroom, and little or no contact with native speaker sat all. Consequently, there is a need to create opportunities for students to interact with both native and non-native speakers outside the classroom (Alptekin 2002). Where this has occurred (for example, Andreou and Galantomos (2009)), especially students have perceived the experience to have been beneficial in terms of both second/foreign language learning and intercultural communications and understanding. (Without opportunity for contact with native speakers, it is not feasible for students to encounter even the 'nativization' noted above.) However, an ideal interactive setting outside the classroom can also only be established if the teacher and/or students make a strategic effort to initiate it. In this sense, the LEP, in enabling students to maintain the regular contact with the native speakers outside the classroom, can be a valuable learning experience.

## **Research Objects, Methods and Target Participants**

This research aimed to investigate the types of activities that the Curtin University students do in the LEP and how these activities make up their weekly meetings. The research was designed to address the following research objectives (ROs):

- RO1: To find out the frequencies of meetings.
- RO2: To discover the lengths of meetings.
- RO3: To figure out the proportion of Japanese language usage at the meeting.
- RO4: To identify the types of activities and the extent to which each is used.

The research drew on the LEP report sheet distributed weekly to each student during one designated class per week in Semesters 1 and 2 in 2011. The LEP report sheet contained the following sections: participant's name and ID, meeting date, length of each meeting, proportion of Japanese language used in the meeting, content of the meeting including each activity, weighting of each activity in the meeting, and the partner's signature as confirmation of the meeting. A report sheet was filled in by each participating student in a self-report style and returned to the researcher in exchange for a new report sheet for the following week. The reminder was also given frequently that the types of activities carried out at the meeting would not affect the assessment, so the students were expected to complete the LEP report honestly.

Naturally, the target participants were the students involved in the LEP offered in the 2<sup>nd</sup> year Japanese language course (that is, the units Japanese 211 and Japanese 212) at Curtin University in 2011. The total number of target students for this research was 35, including 19 students in Semester 1 and 16 students in Semester 2. Some students undertook the units Japanese 211 and Japanese 212 consecutively in 2011, while others selected one or the other for a variety of reasons, such as a requirement to take a single unit for an elective, 2<sup>nd</sup> semester university enrolment, or the suitability of their Japanese levels at the time of their enrolment. All students who were enrolled officially in the unit until the end of the semester, irrespective of their class attendance rates, were considered for this research. The following sections focus on the research outcomes and the discussion relating to each RO.

### **RO1: To Find out the Frequencies of Meetings**

The LEP is organised specifically for students in the second year Japanese language course at Curtin University. In other words, the course at this level includes students who have completed the first year Japanese language course at Curtin University or its equivalent and those who have already studied Japanese language at other institutions. Since the LEP does not commence in the first week of the semester, due to the need for students to become familiarised with the university system and for the lecturer to set up the administrative arrangements, it begins in Week 3. This means that students are required to meet their Japanese language partners at least ten times per semester. (One semester consists of 12 teaching weeks.) A summary of the recorded meeting numbers can be seen in Table 1 below.

**Table 1**

	1	2	3	4	5	6	7	8	9	10	Total (/10)	Ratio (/100.00 %)

S32	1	1	1	1	1	1	1	1	1	1	10	100.00%
S33	1	1	1	1	1	1	1	1	1	1	10	100.00%
S34	1	1	0.83	0.83	0.91	-	-	1	-	-	6	60.00%
S35	1	1	1	1	1	1	1	1	1	1	10	100.00%

15 students out of the total 35 (42.86%) conducted their once-a-week meetings properly. One student (1/35: 2.86%) missed only one meeting, five students (5/35: 14.29%) met their language partners 8 times, three students (3/35: 8.57%) conducted their meetings seven times, two students (2/35: 5.71%) met their partners six times and two (2/35: 5.71%) met five times. One student (1/35: 2.86%) met his/her partner four times, one student (1/35: 2.86%) twice, and one student (1/35: 2.86%) met his/her partner only once. Three students (3/25: 8.57%) failed to meet their allocated partners at all. Student No 29 was required to meet his/her partner only nine times during the semester due to illness, and they actually met seven times.

These statistics can be examined further by setting up the different categories. Considering the fact that LEP requires students to meet their language partners only once a week, a meeting rate of 80% can be regarded as Category A, indicating that the students had achieved the target fully or satisfactorily. At the other extreme, Category E can be used to describe those who failed to conduct their meetings properly. Based on this categorisation, 60% of the students (21/35) can be rated as A, 11.43% as B (4/35), 5.71% as C (2/35), 5.71% as D (2/35), and 17.14% as E (6/35). This summary can be seen in Table 1-1 below.

**Table 1-1**

<b>Category</b>	<b>Student</b>	<b>Quantity of student</b>
<b>A</b> <b>(80.00-100.00%)</b>	S2, S3, S4, S5, S7, S8, S9, S10, S11, S13, S14, S16, S21, S22, S23, S25, S27, S30, S35	<b>21</b> <b>(/35: 60.00%)</b>
<b>B</b> <b>(70.00-79.99%)</b>	S15, S24, S25, S28	<b>4</b> <b>(/35: 11.43%)</b>
<b>C</b> <b>(60.00-69.99%)</b>	S12, S34	<b>2</b> <b>(/35: 5.71%)</b>
<b>D</b> <b>(50.00-59.99%)</b>	S1, S31	<b>2</b> <b>(/35: 5.71%)</b>
<b>E</b> <b>(0.00-49.99%)</b>	S6, S17, S18, S19, S20, S26	<b>6</b> <b>(/35: 17.14%)</b>

Unlike in tests or examinations, all students can potentially attain the 100% meeting rate, or at least achieve the highest category, A, if they are willing to do so. However, 40% of the students, for various reasons, failed to achieve an A rating. This can be considered as the result of one or more of three possible factors: (1) a geographical problem, such as the student and Japanese language partner living a long distance apart, (2) lack of commitment during their spare time, (3) reluctance to meet the Japanese partner due to some kind of incompatibility, and (4) communication problems/difficulties. These problems can be reduced or solved by the LEP coordinator introducing practical strategies to take these factors into consideration when setting up the partnership.

The first factor can be addressed by the program coordinator's careful planning to match the partners' residential locations in order to avoid long commuting times for their meetings. Where no appropriate match can be made, the LEP coordinator should ensure that one of the pair has access to reliable transport. The second influential factor relies heavily on how the students spend their spare time; part-time employment is one of the major factors reducing their spare time and thus affecting meeting times. This can be eased by the LEP coordinator recommending that the students build their meetings into their weekly routines from the start. The third factor can be solved by replacing the Japanese participant. It is important to take a certain amount of time to analyse the problem deeply after considering the partners' individual explanations. Nevertheless, the LEP is a ten-week program, so allocating a different partner is the most practical solution since this kind of problem usually appears after a few sessions have already passed. The fourth factor is caused mainly by miscommunication between interlocutors. Hasegawa (2006) pinpointed this issue and suggested a practical and simple communication method such as a direct telephone conversation to make, cancel or change an appointment. In fact, most of these cases are not caused by unsatisfactory linguistic skills but by superficial daily communication habits. Instant responses and conformation should be encouraged for the purpose of the LEP, so some less direct IT devices, such as e-mail or mobile text messaging which transfer messages in a non-simultaneous manner, should be prohibited.

## RO2: To Discover the Lengths of Meetings

The LEP requires the target students to meet their Japanese partners once a week and spend 60 minutes or more at each meeting. With ten meetings per semester, they are to spend at least 600 minutes together. This investigation of the lengths of their meetings has been synchronised with the frequencies because students sometimes attempt to meet their partners less frequently and spend more time, or vice versa. The information about meeting lengths can be observed in Table 2. It can be seen that only three of the 35 students (3/35: 8.57%) recorded slightly shortened meeting times: S26 showed 50 minutes (1<sup>st</sup> meeting), S32 showed 40 minutes (1<sup>st</sup> meeting), and S34 recorded 50 minutes, 50 minutes, 50 minutes and 55 minutes (at his/her 2<sup>nd</sup> 3<sup>rd</sup> 4<sup>th</sup> and 5<sup>th</sup> meetings respectively).

**Table 2**

	1	2	3	4	5	6	7	8	9	10	Total (/600 min)	Ratio (/100.00 %)

S32	40	80	60	60	60	60	60	60	60	60	600	100.00%
S33	90	90	90	60	60	95	60	60	60	90	755	125.80%

<b>S34</b>	60	50	50	50	55	-	-	60	-	-	<b>325</b>	<b>54.20%</b>
<b>S35</b>	105	60	60	60	60	60	60	60	60	60	<b>645</b>	<b>107.50%</b>

The statistics in Table 2 can be examined further by defining six categories; A (100.00% or more of total time required to be spent), B (80.00-99.99%), C (70.00-79.99%), D (60.00-69.99%), E (50.00-59.99%), and F (0.00-49.99%). Over half of the students (18/35: 51.43%) spent more than the required time (600 minutes) in total and five (5/35: 14.29%) spent 80-99%. There were one student (1/35: 2.86%), four students (4/35: 11.43%) and two students (2/35: 5.71%) who spent 70.00-79.99%, 60.00-69.99% and 50.00-59.99% of the required time respectively. Another five students (5/35: 14.29%) failed to spend enough time or to spend any time at all. This summary can be seen in Table 2-1.

**Table 2-1**

Category	Student	Quantity of student
<b>A</b> <b>(100.00% or more)</b>	S2, S3, S8, S9, S10, S11, S13, S14, S16, S21, S22, S23, S24, S25, S30, S32, S33, S35	<b>18</b> <b>(/35: 51.43%)</b>
<b>B</b> <b>(80.00-99.99%)</b>	S4, S5, S7, S15, S27	<b>5</b> <b>(/35: 14.29%)</b>
<b>C</b> <b>(70.00-79.99%)</b>	S28	<b>1</b> <b>(/35: 2.86%)</b>
<b>D</b> <b>(60.00-69.99%)</b>	S1, S12, S29, S31	<b>4</b> <b>(/35: 11.43%)</b>
<b>E</b> <b>(50.00-59.99%)</b>	S19, S34	<b>2</b> <b>(/35: 5.71%)</b>
<b>F</b> <b>(0.00-49.99%)</b>	S6, S17, S18, S20, S26	<b>5</b> <b>(/35: 14.29%)</b>

Concentrating on the people who clearly met the required time criteria, the average number of hours spent by the 18 students in Category A (18/35: 51.43%) is 902.78 hours (/16250 hours in total). Moreover, there were four students who spent over 900 minutes, or 150% of the required length; S3 (1010 minutes/ 168.3%), S8 (1480 minutes/246.7%), S13 (1285 minutes/ 214.2%), S24 (1410 minutes/ 235%), and S25 (1590 minutes/ 265%). The 2011 students were asked not to count time spent on watching a DVD or movie at a cinema. However, going out together and/or spending time at someone's house for a social occasion were not officially noted; this was the main reason for the very long session recorded by S24 - 360 minutes recorded for the 10<sup>th</sup> meeting.

### **RO3: To Figure out the Proportion of Japanese Language Usage at the Meeting**

Meeting their language partners as required regularly does not necessarily mean that students are taking advantage of the opportunities to use Japanese language and attempting to improve their language proficiency. Although acquiring the broader knowledge of the target language is one of the main purposes of the LEP, a basic practical component is for the students to use Japanese outside the classroom. (In theory the knowledge of the target language can be acquired through the usage of the target language, which is ideal for the language learning.) The overall average of their Japanese usage during meetings is 56.48% and the average, disregarding the three students (S17, S18 and S20) who failed to meet their partners at all during the semester, is 61.77%. A rating of more than 50.00% is deemed to be satisfactory when considering the proficiency level of the target students who are enrolled in the second year university units as well as their

Japanese language educational backgrounds, so it is appropriate to interpret this statistical result as being sound. The summary can be viewed in Table 3.

**Table 3**

	1	2	3	4	5	6	7	8	9	10	Japanese Usage Average (/100%)
<b>S1</b>	-	60	60	-	70	40	50	-	-	-	<b>56.00%</b>

<b>S34</b>	80	80	80	80	80	-	-	40	-	-	<b>73.33%</b>
<b>S35</b>	90	70	80	70	90	90	90	90	90	85	<b>84.50%</b>

For a further, more detailed, examination, the statistics in Table 3 above were investigated in the following five categories; A (80.00-100.00% of total ratio of the meeting spent in Japanese), B (70.00-79.99%), C (60.00-69.99%), D (50.00-59.99%), and E (0.00-49.99%). Three students (3/35: 8.57%) were in Category A, eight (8/35: 22.86%) in B, another eight (8/35: 22.86%) in C,

nine (9/35: 25.71%) in D, and seven (7/35: 20.00%) in E. The summary of this categorisation can be seen in Table 3-1.

Considering that an average of more than 50.00% (Categories A to D) can be seen as a satisfactory level, Category E should be examined further. The seven students in Category E were S5 (48.13%), S7 (35.71%), S17 (0.00%), S18 (0.00%), S20 (0.00%), S22 (47.00%), and S28 (42.14%). Excluding the three students S17, S18 and S20, who abandoned the LEP entirely, there were only four who may have needed extra attention and/or a warning from the LEP coordinator regarding the need to use Japanese language as a medium more frequently. Since this is a small number of students, the coordinator's encouragement to establish the routine to engage with Japanese use early in the semester, along with sending information and reminders to their Japanese partners, should be effective in future LEP implementations.

**Table 3-1**

Category	Student	Quantity of student
<b>A</b> <b>(80.00-100.00%)</b>	S26, S27, S35	<b>3</b> <b>(/35: 8.57%)</b>

#### **RO4: To Identify the Types of Activities and Ratio of Each Activity regarding the Whole Meeting Time Per Case**

There is a variety of activities conducted during meetings which, for this research, can be classified into the following three activity types (ACT): ACT1, Timely completion of formal unit tasks for the semester; ACT2, Japanese language learning activities which are not linked directly to the formal unit task activities; and ACT3, General social oral interaction. Concrete examples of these activities can be seen in Table 4.

**Table 4**

Category	Activity examples
<b>ACT1</b>	Completing weekly homework, preparing for the weekly task, the mid-semester examination and the end of semester examination.
<b>ACT2</b>	Reviewing Japanese structures learnt in the past and/or to be learned in the future, pronunciation, katakana and kanji, and checking materials written in Japanese such as newspapers, books or magazines.
<b>ACT3</b>	Teaching English to their partner, talking about weekend and/or from casual to deep and serious issues.

In order to identify the proportions of time spent on each activity, it should be taken into account that some students failed to meet their language partners even though they were expected to organise their meetings at least ten times in a semester. Table 5 below shows the proportion of time spent on the three different categories of activities during the meetings.

Generally speaking, the activities can be divided into two major categories: focusing on the structures the students are learning at the time, or simple general chat. Not many students used their meeting times for practices such as reading particular magazines/books or vocabulary/kanji practices. At the same time, it was assumed and/or expected that some students implemented further extra tasks such as writing resumes or letters or writing official documents (application form and cover letter for overseas exchange study program) in Japanese. However, there was not even one single student who conducted such activities. Because of the fact that the LEP could be the students' only opportunity to use their target language and to communicate with the native speaker of the target language, the program coordinator's clear direction to obtain some assistance from their Japanese language partners in advance would be helpful, especially for those who are applying for exchange programs.

**Table 5**

	<b>ACT 1</b>	<b>ACT 2</b>	<b>ACT 3</b>
<b>S1</b>	60.00%	20.00%	20.00%
<b>S2</b>	12.50%	-	87.50%
<b>S3</b>	69.50%	-	30.50%
<b>S4</b>	56.10%	12.50%	31.40%
<b>S5</b>	58.80%	6.30%	35.00%
<b>S6</b>	23.30%	-	76.70%

<b>S19</b>	-	-	100.00%
<b>S20</b>	-	-	-
<b>S21</b>	49.00%	-	51.00%
<b>S22</b>	73.00%	-	27.00%
<b>S23</b>	23.00%	7.00%	70.00%
<b>S24</b>	-	-	100.00%
<b>S25</b>	2.50%	-	97.50%
<b>S26</b>	-	-	100.00%
<b>S27</b>	18.80%	-	81.30%
<b>S28</b>	2.90%	-	97.10%
<b>S29</b>	13.60%	-	86.40%
<b>S30</b>	38.00%	27.00%	35.00%
<b>S31</b>	32.00%	-	68.00%
<b>S32</b>	67.70%	13.00%	19.30%
<b>S33</b>	68.50%	5.00%	26.50%
<b>S34</b>	50.00%	16.70%	33.30%
<b>S35</b>	3.00%	-	97.00%

The statistical summary seen in Table 5 above was investigated further to identify students in each ACT category. First, ACT1 will be discussed. Nine students (9/35: 25.71%) said they had employed ACT1 for over 50.00% of the activities, while the other 26 students (26/35: 74.29%) used ACT1 activities less than 50.00% of the time (see Table 5-1 below).

Category E (0.00-49.99%) in Table 5-1 includes 26 students (26/35: 74.29%); since this is the majority, it justifies a further investigation. Table 5-1-1 shows that there are three students (3/26: 11.54%) who used ACT1 at 40.00 to 49.99%, another three students (3/26: 11.54%) who used it at 30.00 to 39.99%, four (4/26: 15.38%) who used it at 20.00 to 29.99%, five (5/26: 19.23%) who used it at 10.00 to 19.99%, and 11 (11/26: 42.31%) who used it at 0.00 to 9.99%. Especially in the last group of ten students, seven; S12, S17, S18, S19, S20, S24 and S26 (7/26: 26.92% or 7/35: 20.00%) entirely ignored implementing any activities associated directly with the unit tasks/assignments regarded as ACT1.

From the unit coordinator's practical perspective, there is a high expectation that the LEP will promote students to engage with their target language use through the weekly assignment/tasks, although it appears that not many students were fully utilising the LED for review and/or preview of the elements directly linked to the unit which they were taking at that time. Nevertheless, such expectation may be suppressed for the future because ACT1 is one of the ACTs which may enhance students' total motivation and interest in Japanese language and learning. In order to let the students implement more balanced program activities, it might be a sound strategy to encourage the LEP as a program for their study assistance, as well as informing the Japanese native speaker participants officially about this particular aim of the LEP. Alternatively, the LEP should be altered to the Language Assistant Program, and it might be better to shift it completely to being volunteer language assistance, rather than the language exchange that it naturally tends to be.

**Table 5-1: Students Conducting ACT1**

Category	Student	Quantity of student
<b>A</b> <b>(80.00-100.00%)</b>	-	<b>0</b> <b>(/35: 0.00%)</b>

<b>C</b> <b>(60.00-69.99%)</b>	S1, S3, S15, S32, S33	<b>5</b> <b>(/35: 14.29%)</b>
<b>D</b> <b>(50.00-59.99%)</b>	S4, S5, S34	<b>3</b> <b>(/35: 8.57%)</b>
<b>E</b> <b>(0.00-49.99%)</b>	S2, S6, S7, S8, S9, S10, S11, S12, S13, S14, S16, S17, S18, S19, S20, S21, S23, S24, S25, S26, S27, S28, S29, S30, S31, S35	<b>26</b> <b>(/35: 74.29%)</b>

**Table 5-1-1: Students Conducting ACT1 for Less Than 49.99% (Category E in Table 5-1)**

Category	Student	Quantity of student
<b>A</b> <b>(40.00-49.99%)</b>	S8, S13, S21	<b>3</b> <b>(/26: 11.54%)</b>
<b>B</b>	S16, S30, S31	<b>3</b>

<b>(30.00-39.99%)</b>		<b>(/26: 11.54%)</b>
<b>C</b> <b>(20.00-29.99%)</b>	S6, S10, S11, S23	<b>4</b> <b>(/26: 15.38%)</b>
<b>D</b> <b>(10.00-19.99%)</b>	S2, S9, S14, S27, S29	<b>5</b> <b>(/26: 19.23%)</b>
<b>E</b> <b>(0.00-9.99%)</b>	S7, S12, S17, S18, S19, S20, S24, S25, S26, S28, S35	<b>11</b> <b>(/26: 42.31%)</b>

Next, ACT2 will be discussed (see Table 5-2 for the summary). All students used Japanese activities linked directly to their unit assignments/tasks for over 50.00% of the LEP. Therefore, the analysis was concentrated only on Category E, which was divided further into five categories: A (40.00-49.99%), B (30.00-39.99%), C (20.00-29.99%), D (10.00-19.99%) and E (0.00-9.99%), which can be seen in Table 5-2-1. There are no data recorded in Categories A and B, two (2/35: 5.71%) in C, three in D (3/35: 8.57%) and 30 in E (30/35: 85.71%). This result indicates that the majority of students did not utilise the LEP as an opportunity to conduct further study or improve their Japanese language. In this case, the concept of the LEP for further core study of the target language should be reconsidered. At the same time, it might be more practical for the LEP coordinator to let the students concentrate more on activities of either ACT1 or ACT3 from the very beginning.

**Table 5-2: Students Conducting ACT2**

Category	Student	Quantity of student
<b>A</b> <b>(80.00-100.00%)</b>	-	<b>0</b> <b>(/35: 0.00%)</b>

	S16, S17, S18, S19, 20, S21, S22, S23, S24, S25, S26, S27, S28, S29, S31, S33, S35	
--	--	--

Third is the ACT3, which will be discussed by referring to Table 5-3 below. There were 12 students (12/35: 34.29%) conducting activities categorised as ACT3 at 80.00 to 100.00%. This means that activities such as teaching English to their partners, talking about weekend activities and/or moving from casual to deep and serious issues were their main activities during the LEP. In particular, the four students S12, S19, S24 and S26 (4/35: 11.43%) rated 100.00%, indicating that the LEP meetings with their partners were based entirely on activities which were neither directly nor indirectly linked to Japanese language learning. This indicates the need for caution in future LEP management, and an official warning that ACT3 should be engaged as a substitute for ACT1 and ACT2. Identifying students such as these and monitoring their activities from the early stage of the program should ideally be introduced in the future.

The largest category shown in Table 5-3 is Category E (0.00-49.99%), which includes 13 students (13/35: 37.14%). The summary of further examination can be seen in Table 5-3-1 below. Considering that Category E contains three students, S17, S18 and S20 (3/13: 23.08%), who had never attended any meetings at all, it can be said that all of the other ten students (10/13: 76.92%, 10/35: 28.57%) belonging to the other categories B, C and D would be the ones who introduced their activities in an ideal manner, since ACT3 can be a critical aspect which may turn the LEP into a peripheral compulsory assignment.

**Table 5-3: Students Conducting ACT3**

## Conclusion

The results of this investigation suggest strongly that the LEP instruction should be designed carefully, with clear guide-lines, in order to maximise the positive effects for students. According to the students' activity patterns identified in this research, it is highly recommended that students make the LEP a part of their routine. The LEP coordinator should acknowledge fully the nature of the LEP and ensure that effective contacts are made throughout the semester. Before students establish their meeting patterns, it is crucial that they be given clear guidelines about time, topics and the proportion of time that should be spent on Japanese usage. This might create a motivation issue as this kind of approach would be relying more on external than internal motivation. Practically, however, there should be no negative effects of external motivation. Therefore, overt direction and encouragement to introduce the activities linked to ACT1 and ACT2 should be demanded as core activities, with ACT3 being practised subconsciously, in the LEP meetings with their language partners.

*Through the Lens of Schools: An Examination of School-based Curriculum  
Innovation (SCI) in Technology-Driven Schools in Singapore*

Li-Yi Wang, We-Leng Neo

Official Conference Proceedings 2012

Abstracts

This study investigates the school-based curriculum innovations (SCIs) in nine primary and secondary schools in Singapore, including six schools which have implemented information and communication technology (ICT) initiatives in their curriculum, pedagogies and school wide activities. The study adopts a holistic approach and takes both retrospective and in-situ perspectives while looking into the SCIs in these ICT schools with the intent of obtaining in-depth understanding about the conditions, processes, and outcomes of the SCIs in these school contexts. This paper first introduces the general scope of the study, which is followed by the review of the literature on approaches to SCIs and the discussion of the methodologies adopted in the study. The paper ends with the presentation of some preliminary findings; and some major challenges encountered since the study was carried out together with several recommendations proposed by the authors.

**Keywords:** SCIs, SBCE, ICT, curricular innovation, curricular development

## 1. Introduction

Singapore continues in the second top ranking of The Global Information Technology Report 2010-2011, which exemplifies the government's earnest efforts in adopting and implementing Information and Communication Technology (ICT) advances for increased growth and development. In response to developing a knowledge based and ICT applied economy, the Ministry of Education (MOE) Singapore has developed various initiatives to create an increasing diversity and flexibility in Singapore's education landscape where it is regarded as important to make local decisions and be more responsive to student needs. The major aim of these initiatives is to improve the quality of learning by encouraging and supporting school-based curriculum innovations (SCIs). The term SCI is also known as School-based Curriculum Development (SBCD) in academic and international area, and in this paper we use the two terms interchangeably. In Singapore, this current SCI movement has now involved six cohorts covering nearly all schools (primary and secondary), which is a significant change from previous practice in which curriculum was centrally planned. The study is designed to acquire baseline information and understanding of curriculum initiatives in nine Singapore schools, including six schools which have implemented ICT initiatives in their curriculum, pedagogies and school wide activities.

## 2. Literature Review

As a philosophy approach, SBCD articulates a blend of philosophical/theoretical ideas and ideals regarding education. (Marsh 1992; Skilbeck, 1984). Skilbeck suggests that SBCD necessarily requires the co-construction of curriculum by teachers and students; teacher and student autonomy in curriculum development, and schools' responsiveness to the environment (local conditions). Others highlight collaboration among school staff as a significant aspect of SBCD (Bezzina, 1991). In systemic approach, we refer to works which attempt to discuss curriculum change in the broader context of educational change/reform and organization theory. Thus Fullan's works (1993, 1999, 2001, 2007) highlight the importance of viewing schools as complex systems requiring restructuring and re-culturalizing (i.e., developing organization leadership) to bring about fundamental educational change/reform.

From the West, since 1970s, there are collections of empirical studies on SCIs in countries such as UK, and Australia (Bolstad, 2004). These case studies examine aspects like teacher roles and experiences of teachers involved in SBCD (Bezzina, 1991; Cocklin *et al.*, 1995); student roles (Brooker & Macdonald, 1999), community involvement (May, 1992), and processes (Marsh *et al.*, 1990; Cocklin *et al.*, 1995). However, these works do not focus on whole school curriculum development in which the school staff consciously tries to develop policies which would affect the practice of them all. In the East, empirical work on SBCD has been emergent since the 1990s, mostly initiated in response to national and economic policy of the different countries. Taiwan, Hong Kong, and Korea share in common the development of integrated and interdisciplinary curriculum. In Singapore, there is a dearth of theoretical work on SBCD with the exception of the

work of Gopinathan and Deng (2006). They propose a SBCD model for Singapore which they term “enactment of curriculum” in the context of education reforms in Singapore since the late 1990s. The characteristics of this model include the provision by central authorities of curricular materials in which teachers in Singapore mostly adapt and integrate, rather than create new curriculum to fit the local context (specific school and student needs). Hence, there is a need to conduct more case studies of whole school curriculum development in order to be able to compare within school and across schools towards the development of theory of SBCD and its specific aspects.

### **3. Methodology**

This research involves two phases. The two phases are differentiated by methodology while our research questions apply across the two phases. The first phase focuses on a retrospective study of school based innovations in nine diverse schools over a period of 12 months. From the nine schools, we intend to sieve out the common patterns and divergent pathways in SBCD enactment which will help refine our research focus in the in-situ study in Phase 2. In Phase 2, an in-situ, ethnographic study will be conducted over a period of a year in two schools selected from the nine schools in the first phase. The following research questions in order of priority are:

1. How do schools with diverse conditions enact curriculum innovation?
2. What conditions shape the enactment of curriculum innovations in the case study schools?
3. What are the outcomes of curriculum innovations on key personnel, teachers, and students?

Phase 1 will involve seven NIE (National Institute of Education) researchers and nine MOE collaborators to conduct focus groups in nine schools over nine months. The NIE researchers will be responsible for the research conceptual framework, the research design, data collection, data analysis and written output. The MOE collaborators have, prior to this project, been working with some of the schools and their familiarity with those schools will facilitate the conduction of the research. Apart from aliasing with schools and providing access to schools, the MOE collaborators will participate in the data collection and analysis. Such an arrangement is to ensure a tight network of working relations within NIE team and between NIE researchers as well as MOE collaborators. Workshops at NIE will be held for the MOE collaborators before research commences to ensure a common understanding of research approaches and methodology. In the retrospective study of this first phase, we will be examining the conditions, processes, and outcomes of SBCD from the perspectives of the participants through Focus Group Interviews (FGDs). Phase 2 spans a period of two years; in-situ, ethnographic research work will be carried out in two schools in 12 months for a complete academic cycle, with another one year allocated to data analysis and writing. We will identify two schools that exhibit the most depth and breadth in SBCD enactment for our purpose.

Whereas the emphasis in Phase 1 is on the SBCD participants’ perceived conditions, processes and outcomes, more time in the field in the second phase allows us to also capture SBCD in practice as well as in perception. An ethnographic approach combines on-site observations of SCI enactment

with interviews on practice observed can reveal the congruence or discrepancies in perceived and practised SBCD which in turn will provide insight into negotiations in the practice of SCI, and illuminate conditions explaining the convergences and discrepancies. The fieldwork component is thus very important in this phase. So, apart from FGDs and individual interviews, lesson observations as well as field notes made of committee meetings, teachers' informal exchanges and activities will be studied.

#### **4. Preliminary Findings**

Regarding the first research question, the six Singapore schools which have implemented ICT initiatives in their SCI/SCBCD show a culture of learning as the core theme across the school stories. The culture of learning has four characteristics, namely collaborative (in terms of constant teacher interactions and curricular and pedagogical sharing), autonomous (with teachers having autonomy and empowered to design, plan and implement curricular innovations), open (to diverse opinions and to experimentation) and safe (to express spontaneous and/or dissenting opinions).

As to the conditions, the leaders who share the following common characteristics tend to serve as a catalyst for this culture of learning. They encourage teachers to take risks in experimenting with SCI. They are consultative and often make themselves available for discussion. They also institute supportive structures such as budgetary support, the provision of time as well as project committees for talks across levels and across departments among teachers. Finally, they propel a direction in terms of vision, beliefs and values. These findings are consistent with existing literature on importance of school leadership.

In reference to the last research question, the reported outcomes of curriculum innovation fall mainly into four areas. One such outcome is reflected in the exam grade maintained, particularly as a "non-negotiable" bottom-line for any curriculum innovation. To MOE's credit, the recent emphasis on 21st century learning has encouraged schools to achieve such competencies in varying degrees. Also, gains in teacher learning have been noted in such areas as technological skills, alternative assessments and appropriate ICT integrated and student-centred pedagogy as a result of their involvement in SCI. Finally, for some schools the culture of learning as mentioned above has evolved as an outcome of the school's involvement in SCI.

#### **5. Challenges and Recommendations**

It is worth noting that the discussion in this section will focus on methodologies since the results were still preliminary when this paper was written. The researchers have encountered some challenges since this study was initiated. First, coordinating the common time between the school personnel, MOE staff and researchers was not easy because of the tight schedules under which all three groups of stakeholders work under, thus multiple attempts needed to arrange and rearrange the dates of focus group discussions. There were many delays in the commencements of the FGDs and there were two instances where arranged FGDs were cancelled without advance notifications to the

research team, leading to wastage of time and the need to re-arrange the sessions. Greater attention needs to be paid to the building of a closer relationship and better communication between the schools and researchers. In addition, in a number of FGD sessions, many participants had difficulty in identifying the common SCI initiatives that all of them could relate to in their schools as they lacked the experience of making collective decisions among them, ending up asking each participant to talk about stories in respective departments. The FGD facilitators needed to handle the silence, inquiries and clarifications before arriving at one SCI initiative that the school has implemented. This challenge can be solved by choosing FGD participants from the same department.

## **Introduction**

The dissemination of native-speaking assistant language teachers (ALTs) throughout the Japanese state school system has been proclaimed as ‘the greatest initiative undertaken since World War II related to the field of human and cultural relations’ (CLAIR, 1991, in McConnell, 2000, p. x). The arrival of 848 young, mostly American, recent graduates at a hotel in Tokyo in 1987 marked the start of the Japan exchange and teaching (JET) program, which has grown greatly and continues to this day. With its unprecedented co-operation between three government ministries and multiple aims, the program had to overcome a difficult start in order to establish itself. Despite the reluctance of many local education boards to accept an ALT and a number of highly-publicized criticisms of the purpose of the program from both local and international media, the JET program continued and was able to overcome its early difficulties, and has received many favorable critiques (see Wada, 1994).

Despite its longevity and expansion, its success in revolutionizing English language teaching (ELT) methodology is debatable<sup>1</sup>. Many Japanese teachers of English (JTE) still teach according to a traditional grammar-based approach that does not include the aspects of communicative language teaching (CLT) that the ministry of education’s official ‘course of study’ lays out (Sakui, 2004), and the average scores of Japanese students taking the international Test of English as a Foreign Language (TOEFL) still rank lower than most other countries for which data is available, unimproved from the 1980s when team teaching was introduced in Japan (Gottlieb, 2004).

This study will attempt to assess the extent to which ALTs and their lessons, team taught with a JTE, are integrated into the wider curriculum. By examining the extent to which team teaching is integrated into the English curriculum in Japanese state schools, it may be possible to infer whether team teaching has become an effective component of ELT in Japan, or whether it is a distraction, unrelated to the daily reality of preparation for English examinations.) Particular attention will be paid to the use of the class textbook; as JTEs believe their primary objective when teaching English is to teach the contents of the textbook (Browne and Wada, 1998, in Crooks, 2001), and therefore as the textbook is often the ‘de facto curriculum’ in the classroom (Gorsuch, 1999), evaluating the extent of its use allows for a practical investigation of curricular integration. This is a particularly timely question with the recent introduction of a mandatory ELT curriculum into elementary schools.

## **Team Teaching in Japan**

The reasons for team teaching being embraced in Japan are numerous and are more political than educational, as explained by McConnell (2000). Throughout the 1980s, Japan was under pressure to address its trade deficit with the United States. At the 1986 summit between President Reagan and Prime Minister Nakasone, Japan was once again under pressure to ‘internationalize’. Nakasone’s office had the idea of inviting foreign youth to Japan, but was not sure by what means until coming upon a number of small teaching programs involving

---

<sup>1</sup> There are ALTs assigned to teach other languages, but the overwhelming majority teach English.

foreign participants being run by the ministry of education (*mombusho*<sup>2</sup>). The ministry had been running small-scale projects that utilized native-speaker teachers in schools, such as the *Mombusho* English Fellows program and the British English Teaching scheme. These schemes grew steadily in number, to more than 200 teachers in total in 1986, but these schemes did not involve team teaching in any form (McDonnell, pp. 41-43). Nakasone's office came up with the idea of inviting foreign youths into Japanese schools, but not wishing to upset the teachers' union by designating untrained foreign arrivals as teachers, it was decided that program participants were to be assistants to the Japanese teachers.

The JET program was presented to the American delegation as a 'gift' to show Japan's commitment to (1) open its doors to foreign (primarily American) youths, (2) internationalize local Japanese government and (3) improve the English skills of its citizens (ibid.). *Mombusho* was the last ministry to be consulted, after the ministries of foreign affairs and home affairs. The ministry had not requested large numbers of English native speakers, but was informed that 848 participants were to come to Japan as assistant language teachers and the ministry was to find an educational purpose for them. The result of this in the early years of the JET program was that many ALTs complained of being 'human tape recorders' (the experience of being in the classroom only to read out loud conversations and example sentences from the textbook), as local education officials and JTEs did not know what to do with the new arrivals due to the lack of guidance issued to them. Subsequent guidelines, revisions of the ELT curriculum, and the passing of time as all parties involved settled into a pattern helped to clarify the role of ALTs in Japanese schools, though poorly defined roles and the confusion this can create is an issue that lingers (see Mahoney, 2004).

Team teaching in Japan is usually a 45 minute English lesson carried out by two teachers, the ALT and the JTE, who also conducts solo lessons when the ALT is not present. ELT in Japan has traditionally been based on the grammar-translation method, and does not require students to speak in English (Davies & Tsuido, 2008). One of the aims of the JET program is to introduce a more communicative aspect to English lessons by introducing ALTs into Japanese classrooms to undertake team teaching. ALTs must be native speakers of English from a select group of countries<sup>3</sup>, and although they are required to be university graduates, they are not required to be trained in ELT. After receiving a week-long induction and training period in Tokyo, ALTs are distributed to regional boards of education and schools throughout Japan.

The scale of team teaching using foreign teaching assistants is unprecedented. Although similar schemes exist in neighboring countries, they are generally on a smaller scale and use experienced ELT teachers, such as in Hong Kong (Carless, 2006). Indeed, the longevity of the JET program is all the more remarkable when compared to a similar scheme to place ALTs in schools in South Korea, which due to the problems it encountered no longer exists (ibid.).

---

<sup>2</sup> *Mombusho* is the Japanese name for the ministry of education that is frequently used in the literature. Therefore the same convention will be followed here.

<sup>3</sup> These countries were initially the United States, the United Kingdom, Australia and New Zealand (McConnell, 2000, p.50), but the list has now grown to include 36 countries: see <http://www.jetprogram.org/e/aspiring/countries.html>

The curriculum of English lessons in Japan is decided by *mombusho*, and is issued as the ‘course of study’. Japan is one of only a few countries to officially authorize textbooks for use in schools (McConnell, 2000). Despite the introduction of ALTs and team teaching being intended to prompt a more communicative-based methodology, the course of study was slow in changing to reflect this (Wada, 1994). ALTs are generally expected to work with the Japanese teacher to produce a lesson plan that incorporates and adapts elements of the curriculum, rather than being provided with a set team-teaching curriculum by *mombusho* or any other official source (CLAIR, 2010). This could provide opportunities for ALTs and JTEs to integrate their lessons into the curriculum, but the lack of guidance provided by *mombusho* and the differing pedagogical approaches of the teachers has the potential to create confusion, conflict and the subsequent marginalization of team taught lessons.

### **Team Teaching on the JET Program**

It may be expected that there is one definitive definition of what is expected in a team taught lesson given by *mombusho* or one of the other agencies involved in the JET program, but this is not the case. The only definition from *mombusho* is to be found in the Handbook for Team Teaching (1994, p.14, in Carless, 2001), written and published by *mombusho* itself and distributed to all JET program participants at their orientation in Tokyo. It states:

‘Any time two or more teachers work together to guide an individual learner or a group of learners toward a set of aims or objectives, that type of teaching can be called team teaching.’

This is a rather broad definition, and does not appear to be specific to the Japanese context. It also does not make reference to the teachers actually being in the classroom together. A more specific definition from Wada, one of the architects of the JET program, states that:

‘Team-teaching is a concerted endeavor made jointly by the Japanese teacher of English and the assistant English teacher in an English language classroom in which the students, the JTE and the AET<sup>4</sup> are engaged in communicative activities.’ (Brumby & Wada, 1990, in Igawa, 2009)

This is very similar to the only other available definition of team teaching in Japan, which is from CLAIR’s<sup>5</sup> Resource Materials and Teaching Handbook:

‘The goal of team-teaching is to create a foreign language classroom in which the students, the Japanese teacher of the foreign language (JTL) and the native speaker (ALT) engage in communicative activities.’ (CLAIR, 2010, p. 22)

---

<sup>4</sup> AET (Assistant English Teacher) is sometimes used interchangeably with ALT.

<sup>5</sup> CLAIR, the Council of Local Authorities for International Relations, is a quasi-governmental organisation created to administer the JET program.

These are much more specific definitions, but do not make reference to the expected role of each teacher. They exclude what happens before and after lessons, and only discuss what occurs in the classroom. There is no mention of how responsibility could or should be shared between the teachers, and in fact do not discuss teaching in any form, only that all participants should be involved in communicative activities. The most noteworthy aspect of the definitions of team teaching from CLAIR and Wada is that team teaching in this context is inextricably linked with communicative activities, but no reference is made to planning, evaluation or teacher roles.

The lack of defined roles has consequences. Richards and Farrell (2005) state that knowing and abiding to pre-agreed roles is essential for team teaching, and that only with these elements can the second required element, trust and mutual respect, develop. It is also important for the teachers to agree on how to share or divide various responsibilities during the team teaching process. The emphasis should be on sharing responsibilities, otherwise 'the collaboration dissolves into team teaching in name only' (Sandholtz, 2000). Mahoney's (2004) recent survey assessed the roles of ALTs and JTEs. It contains comments from ALTs such as 'Although my role is as an assistant, I'm actually the teacher of the class'. A significant minority of senior high school JTEs believe the role of the ALT is to lead the class, that the JTE should be the assistant to the ALT and that the ALT should either provide lesson plan ideas or make the whole lesson plan. This may be due to the fact that senior high school classes are divided into reading, writing and speaking classes, and ALTs may be more likely to be placed in speaking classes, where JTEs are more likely to defer to the speaking ability of ALTs. JTEs and students may not see speaking classes as 'serious' exam preparation, and so these classes may not be considered as important as reading and writing classes. This is in contrast to junior high schools, where lessons are not divided into skills and there is less pressure to pass exams (LoCastro, 1996). These results could suggest that team teaching is more successfully carried out in classes where the pressure from exams is less keenly felt.

Time is also an important factor. Teaching teams require 'sufficient time allotted for joint planning, instruction, and evaluation' (ibid.). Allocated time outside the classroom is particularly important, especially when considering that 'only a small part of team teaching actually happens with teachers working together in classrooms. A great deal occurs *before* lessons' (Bailey, Curtis & Nunan, 2001, p. 181). In the long term, time may also be a necessary factor for successful team teaching; Armstrong (1977), conducting an analysis of team teaching research in public education in America, noted that some studies only reported benefits on student performance in the second year of team taught lessons. He concluded that 'this finding may indicate that a teaching team requires a necessary "percolation time" before it becomes an efficient instructional unit'. It is difficult to assess whether JTEs and ALTs are given sufficient time to form the necessary relationships to forge successful teaching teams.

Team teaching successfully carried out may provide educational benefits; Armstrong (1977) reviewed studies on the effect of team teaching in American state schools on academic achievement and found that, although difficult to generalize due to the different nature of each study, team teaching may have a positive effect on academic achievement when compared to solo teaching. Team teaching generally requires a lot of preparation time to be successful: a class should be well coordinated between teachers, as there is a danger that a lesson can simply become two separate classes taught by two teachers in the same room

rather than a coordinated lesson (Sandholtz, 2000). This was noted by McConnell (2000) in his observations of team taught classes; they tended to gravitate to one extreme or the other and either be handed over entirely to the ALT, or the ALT became part of the furniture of the classroom, or the dreaded human tape recorder. Other classes involved dividing the lesson into two sections; a conversation-based section lead by the ALT, and an exam preparation section lead by the JTE. In either case, the potential for spontaneous interaction between the teachers in English is minimized.

## **Methodology & Findings**

Having established that various factors, including time planning together and clearly defined roles, are essential factors in a successful teaching team, I created a survey to attempt to assess how these factors can affect curricular integration of team taught lessons. 68 participants began the questionnaire, of which 57 completed all the questions<sup>6</sup>. 38 (66.7%) of the respondents were female, and the nationality of the participants is shown in table 1.

<b>Table 1: Nationality of participants</b>		
<i>Nationality</i>	<i>Number of respondents</i>	<i>Percentage</i>
USA	31	54.4%
Canada	10	17.5%
UK	10	17.5%
Australia	3	5.3%
New Zealand	2	3.5%
Ireland	1	1.7%

Respondents were overwhelmingly JET program participants<sup>7</sup>, with only three respondents having been recruited by private companies, and one via a sister city program. 93% of participants were former ALTs.

ALTs were asked to participate for various reasons. Practically, as alumni organizations for the JET program and other private companies exist, they were easier to contact than JTEs, for whom no such organizations exist. ALTs have also received more official guidance regarding team teaching, and it is the main activity of their employment, again in contrast to JTEs. As this is a single group, potential participants contacted self-selected into the study by choosing to complete the questionnaire.

<sup>6</sup> Only the responses of those participants who completed the whole survey were included. Therefore the number of questionnaire participants was 57.

<sup>7</sup> I also invited ALTs who had been recruited by private companies to complete the survey. ALTs provided by such companies perform the same roles as those recruited by the JET program.

The questionnaire that was distributed to participants was created on Survey Monkey (SurveyMonkey.com) and distributed electronically. The questionnaire consisted of an information page, consent form, demographic information regarding team teaching, and questions regarding lesson planning and methodology. Three semi-structured interviews were also conducted. One interview was with a former ALT, one with a JTE and one with a Japanese high school graduate. The interviews were between 30 and 40 minutes, and the format was between unstructured and semi-structured.

### **General findings**

Firstly, examining who the lesson plan was created by, the total responses given indicate that ALTs most commonly created lesson plans alone (see table 2). However, the results are slightly more complex when the answers are divided by school level.

<b>Table 2: For team taught lessons, who would usually create the lesson plan?</b>					
	<i>Kindergarten</i>	<i>Elementary school</i>	<i>Junior high school</i>	<i>Senior high school</i>	<i>Total responses</i>
<i>Joint preparation</i>	1	9	19	17	46
<i>Myself</i>	5	21	12	19	57
<i>The JTE</i>	1	6	17	11	35

It may be possible to explain these results when considering the findings of other studies discussed above. Before proceeding to an attempted explanation, it is necessary to consider the role of the curriculum at each school level. As figure 1 shows, at kindergarten and elementary school, no curriculum is provided, or the ALT is required to create their own. This is in sharp contrast to secondary school, where the school or JTE provides the curriculum, although the difference is less prominent at the senior high school level where a significant minority of ALTs were also required to create their own curriculum.

## For team taught lessons, who provided the curriculum?

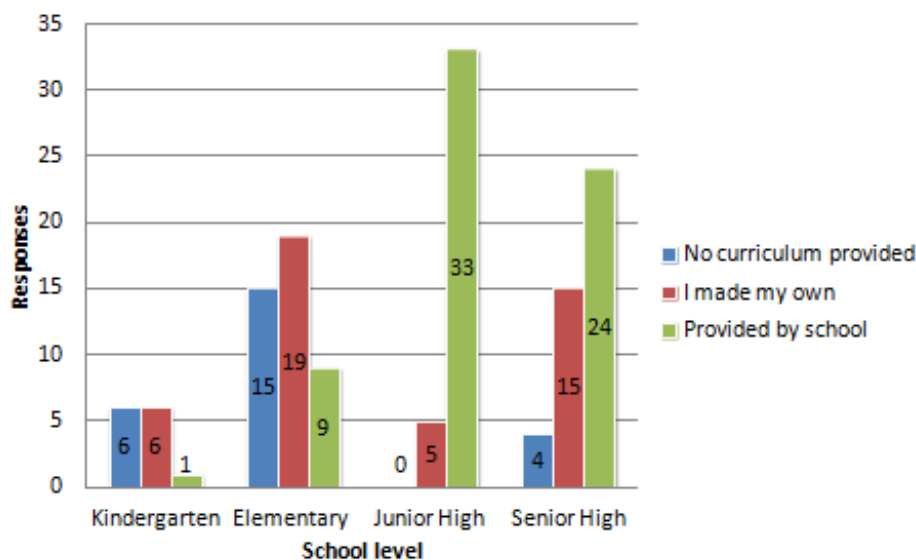

Figure 1

At elementary schools and kindergartens, a curriculum was supplied in only a few cases. It is highly likely that Japanese teachers at these levels did not teach any solo lessons, both because English was not a mandatory subject prior to April 2011 and because of the lower English ability of Japanese teachers reported by some ALTs in their open-ended responses. It would seem that both of these factors contribute to English lessons at these levels being formulated and delivered by ALTs alone. To illustrate this point, one ALT reported that:

‘For elementary I controlled the curriculum and collaborated as I felt necessary, for example, for teachers who wanted to team teach rather than having me take the class.’

Kindergarten and elementary schools must therefore be considered separately from secondary schools. At three of the four school levels, lesson preparation by the ALT was the most common response. Junior high school was the only level for which joint preparation was the most common response, though it must be noted that JTE-only preparation was a close second. It should also be noted joint preparation is still occurs in a minority of cases (39.6%), though interestingly solo preparation by the ALT was the least common response at this level, in direct contrast to all other school levels.

Observing which teachers are involved in creating a lesson plan at each school level may provide a crude measure of how integrated team taught lessons are into the curriculum, at least at secondary level. Figure 2 shows the response rate for JTE involvement in lesson planning, which is either joint planning or JTE-only planning, and no JTE involvement, which is ALT-only planning. At secondary school level, it is assumed that as the JTE teaches the students alone for the majority of classes, the JTE has good knowledge of the curriculum. It is also assumed that the JTE being involved in the planning of a team taught lesson, either alone or with the ALT, will, or at least can, produce a lesson plan for a team taught class that is

integrated into the curriculum. This is not always the case; for example, one ALT reported that ‘For high school, my JTE assigns the topic (i.e. grammar point), and I create the plan by myself.’ The reverse is also true, as some JTEs will wish to use the lesson to deliver content that is not in the regular curriculum. Nevertheless, assuming that in most cases collaboration can lead to well-integrated lessons, figure 2 shows that lessons planned for junior high school provide the most opportunity for curricular integration.

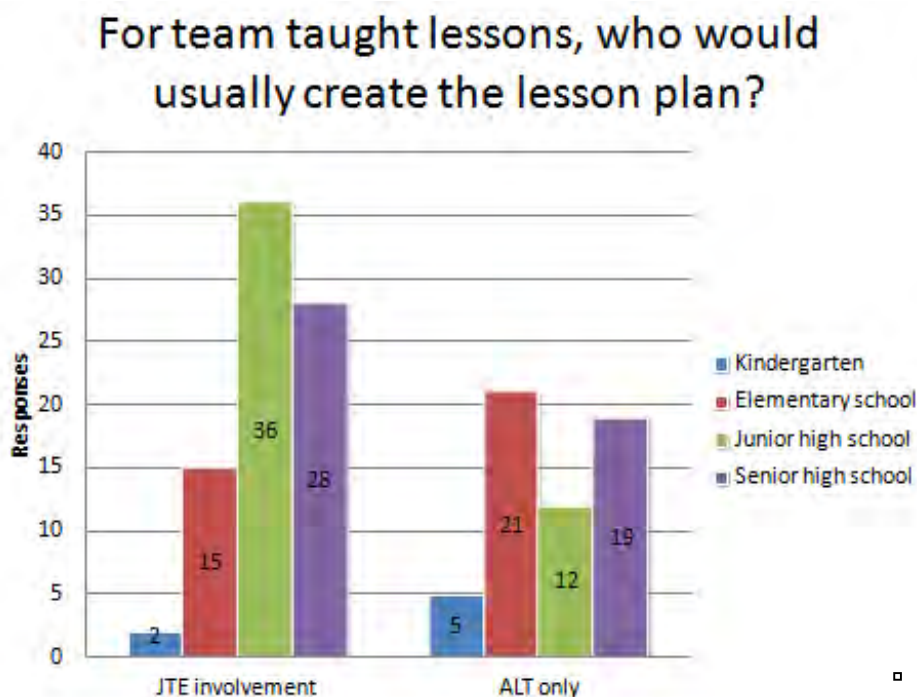

Figure 2

At the high school level, responses in figure 1 for who provided the lesson plan are much more evenly distributed than at other school levels, and only 24 of 45 responses (53.3%) stated that the school provided the curriculum, compared to 33 of 41 responses (80.5%) at the junior high school level. The lower levels of collaborative lesson planning and school-provided curriculum would appear to indicate that high school team-taught English lessons are more isolated from the rest of the English curriculum when compared to junior high school. This may be due to the nature of English lessons in senior high schools. Ryan (2008) and McConnell (2000) have suggested that the pressure on students and teachers to prepare for university entrance examinations can have various effects. Team taught classes can become compartmentalised, unrelated to the rest of the curriculum and the ‘serious’ study of English for entrance examinations, or it may be that there are few or no team taught lessons at some senior high schools; fewer ALTs reported having regular classes at this level.

### **Textbook use**

For the vast majority of ALTs, a textbook was provided for their classes (table 3).

<b>Table 3: For most of your classes, was a textbook provided?</b>	
<i>Yes</i>	52
<i>No</i>	5

This would seem to indicate that ALTs were provided with the opportunity to integrate team taught lessons. However, the amount to which a textbook was used as a source of materials in team taught classes (figure 3) shows that 60% of respondents used the textbook ‘always’ or ‘often’. This is a majority of respondents, but not a large majority, and shows that the presence of a textbook does not necessarily indicate an expectation that it should be used; it is also worth noting that the textbook provided is not necessarily the same textbook that the JTE uses in a solo-taught lesson.

### How often did you use the textbook as a source of materials for using in class?

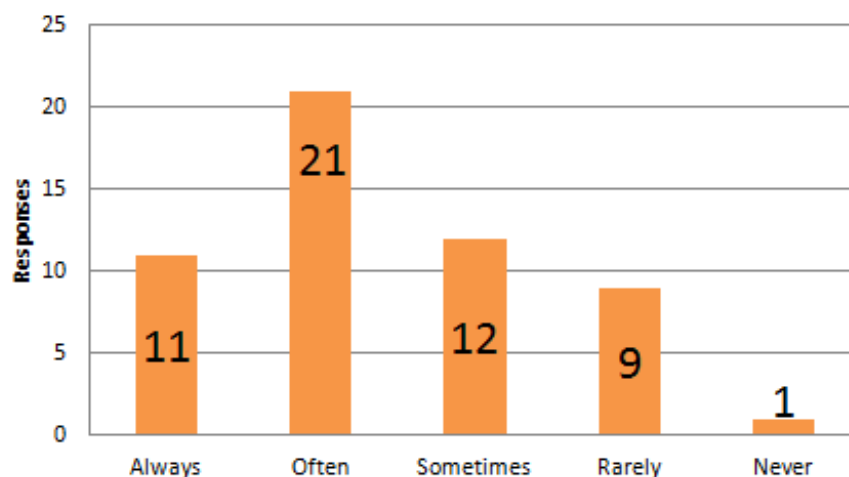

Figure 3

If there is a discrepancy between the presence of a textbook and the amount it is used, it is worth considering the expectations of using the textbook by various parties involved in English classes, shown in figure 4 (taken from a likert scale question in the survey).

## Who felt it was important to use the textbooks as a source of materials?

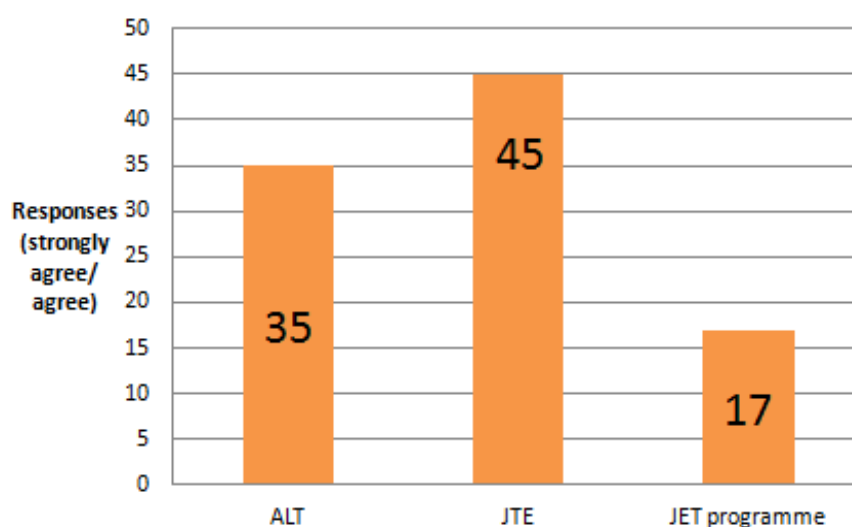

Figure 4

That JTEs expect the textbook to be used more often than ALTs themselves may not be surprising, but the low number of ALTs who perceived that the JET program expected textbooks to be used in team taught lessons could indicate that there is little ‘pressure’ from official channels for textbooks to be used (and therefore content to be integrated) in team taught lessons.

In terms of teaching situations, there are many more possibilities than when the JET program was created in 1987. With so many variables, it may not be surprising that the administering bodies of the JET program provide so few guidelines and expectations for its many participants. But this lack of guidance has implications. One of the earliest complaints about the JET program from ALTs was that they were being used as ‘human tape recorders’ by JTEs and local boards of education that were unsure how to utilize the ALTs (McDonnell, 2000). Four participants in this study also used the term ‘human tape recorder’ to describe at least one of their experiences, two of whom were ALTs as recently as 2005-2006. One participant summarized the situation ALTs find themselves in:

‘The pressure from what the JET program is meant to be and what occurs at the local level must be confusing to local boards of education ... it is often unclear to JETs whether they are there to teach, or learn and experience Japanese culture, or both. This makes for a messy and confusing time for JETs. If a JET can make headway through this heady mix and become a great *sensei*<sup>8</sup>, which only really occurs after a couple of years on JET, (when the participant has a better grasp on culture and language) then English tuition and education improves.’

The many experiences that the participants in this study have had are likely to reflect the variety of experiences of the many tens of thousands of assistant language teachers who have

<sup>8</sup> This is the Japanese word for teacher.

worked in Japan, and still are. I would argue that this variety should be seen as a reason to introduce more clear guidelines about what is expected of ALTs and JTEs in the classroom so that the ‘human tape recorder’ and other more negative aspects of the ‘variety’ of experiences can hopefully be banished, and the many benefits of team teaching can be maintained while giving all parties involved in team teaching a clearer idea of what is expected of them regarding curriculum, collaboration and being culture and language teachers.

### Curricular knowledge

The final way of examining how well team taught lessons are, or can be, integrated into the wider curriculum is asking ALTs about their knowledge of how their lessons fit into the ELT curriculum. The most interesting findings relate to the availability of the curriculum in English, and the effects it has on other areas of knowledge. Figure 5 shows only 45% of respondents thought they had easy access to the curriculum written in English.

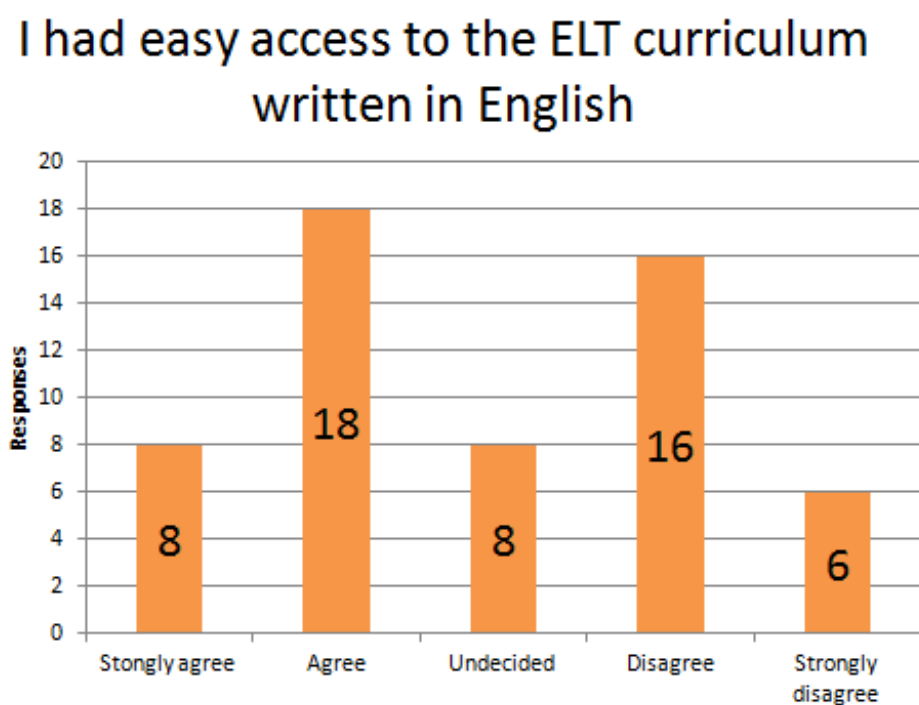

Figure 5

The effect of having access to the curriculum written in English was striking. Figures 6, 7 and 8 show responses to various statements filtered by whether respondents had easy access to the curriculum written in English. Those who did were also more likely to agree that they knew the overall aims of the curriculum for the semester and each lesson, and more likely to agree that they knew what the students were being taught in JTE solo taught lessons; however, even among this group those who agreed that they knew the content of JTE solo lessons were still in a minority (11 responses, 45.8%).

## The overall aims for each term/semester were clear to me

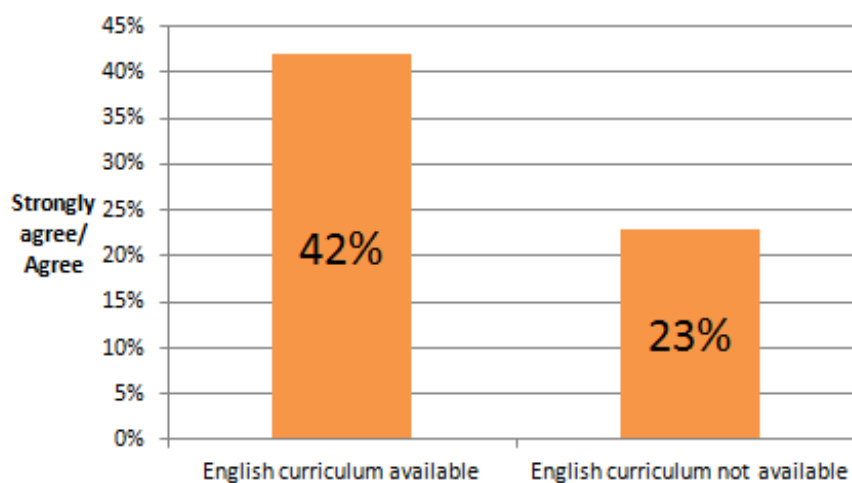

Figure 6

The effects of not having the curriculum available in English are encapsulated by one ALT's experience in an elementary school:

'Toward the end of my time on JET, my 4 elementary schools began using the Ministry of Education text books for 5th and 6th graders. These were by far the most difficult to work with, and had almost no instructions in English for ALTs. All teacher manuals were written in Japanese only. This made it difficult to work with for ALTs with little Japanese ability.'

The apparent lack of emphasis on attempting to integrate lessons is perhaps not surprising. In the case of the JET program, it was created by three different government ministries, is administered by another, and the participants are employed directly by local education boards. There are likely to be difficulties in providing guidelines or advice that can reasonably cover such a vast and disparate program, but that does not mean nothing can be done. Mombusho ensuring that the curricula of all textbooks that it approves and its own course of study are easily available in English would seemingly be of great benefit to ALTs and JTEs alike, particularly for those working at elementary level where the language barrier could be partially overcome by bilingual materials.

## The aims for each lesson were clear to me

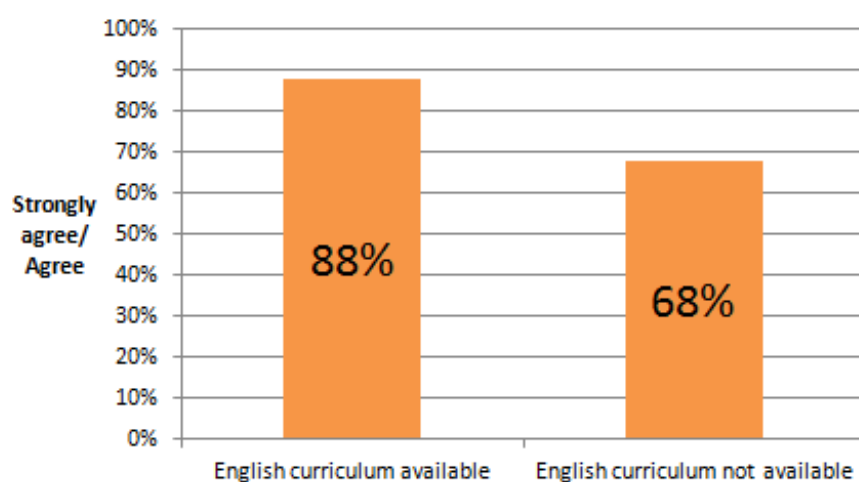

Figure 7

## I knew what the students were covering in lessons the JTE taught alone

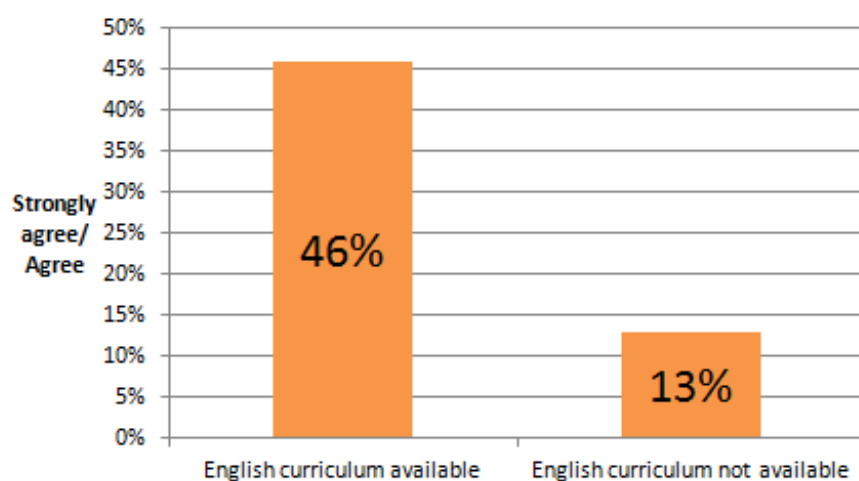

Figure 8

## **Conclusion**

This study set out to examine team teaching in state schools in Japan, specifically the extent to which ALTs and JTEs are able to integrate team taught lessons into the rest of the ELT curriculum. The findings suggest that lessons in junior high schools involve the highest levels of collaboration, and appear to be more integrated into the curriculum than lessons at other levels. Collaboration and integration are also highly dependent on how well individual teachers are able to work together.

This study is limited by the number and identity of the participants. 57 participants are a fraction of the tens of thousands of ALTs who have worked in Japan, and so caution should be taken not to generalize the results of this study too readily. The majority of participants in this study are also ALTs; only one JTE and one former student were interviewed, so this study looks at team teaching from only one perspective. JLTs completing a similar survey about team teaching may give slightly different answers. Team teaching in some form is a daily occurrence for almost all ALTs, who have the opportunity to develop their collaborative skills, whereas it is a less regular occurrence for JTEs, who still deliver the majority of their lessons solo.

If JTEs were to answer this study's survey about their solo taught lessons, there would almost certainly be universal agreement that lessons are always based on the chosen textbook, as alluded to by the JTE interviewed in this study, who confirmed that all JTEs in the two schools he had taught at were expected to proceed through the textbook at a similar pace. If this is the case, and JTEs are expected to always follow the curriculum, then it could be argued that team taught lessons still require further integration into the curriculum, though due to the lingering lack of clarity about the role of ALTs and the dependence of team teaching upon the successful teamwork of its participants, this is probably an unrealistic expectation.

Team teaching in the state education system has expanded not only through more ALTs being placed in more schools, but also into new school levels, particularly elementary level. As this study shows, many ALTs are already engaged in team teaching in elementary schools, and how this evolves in response to the introduction of a mandatory ELT curriculum in April 2011 to elementary schools should be of great interest to educational researchers. This study suggested that ALTs in elementary schools are very independent, and how ALTs will collaborate with elementary school teachers and the new curriculum remains to be seen.

The main conclusion that I feel can be drawn from this study is the need for institutional support from the Ministry of Education and the JET program. In particular, this could be facilitated by introducing materials that are conducive to team teaching. As this study found, materials that are provided only in Japanese are a great hindrance to teachers, particularly at school levels where team teaching is only recently being introduced and the English ability of JTEs may be lower. A curriculum or textbooks that specifically are designed for use by two teachers would also be welcome. It appears that currently ALTs and JTEs are expected to shoehorn their joint lessons into the curriculum, which is not conducive to good integration into the rest of the curriculum. The fact that this undesirable situation still persists after 25

years of such a radical intervention into English lessons in public schools calls into question how serious the Ministry of Education is about team teaching and reforming English language education in Japan.

One final challenge to the success of team teaching is the implications of the recent global financial crisis and the costs of the rebuilding effort required after the March 2011 Tohoku earthquake. Local education boards have already been increasingly turning to private companies that provide ALTs in order to reduce costs, and whether local governments still wish to provide two teachers in a classroom instead of one may be the biggest threat to the continued existence of team teaching. As team teaching was arguably introduced as a result of financial politics, it is ironic that after being accepted educationally the biggest threat to its future may also come from the same source that it sprang from.

The logo for the International Association of Teachers (iafor) is centered on the page. It consists of the lowercase letters "iafor" in a light blue, sans-serif font. The text is enclosed within a large, stylized circular graphic composed of two concentric, slightly irregular arcs. The upper arc is a light blue color, and the lower arc is a light red color, creating a frame around the central text.

*The Relationship between Support Behavior of Physical Education Teachers and  
Amotivation of Students in Physical Education Activities at Schools*

Abstracts

The aim of this study is to investigate the relationship between the social support behavior of physical education teachers and amotivation (absence of motivation) of students in P.E activities at schools. This is a descriptive and correlation study which is done as a field study. In doing so, we chose 381 high school students of Boukan city (201 of boys and 180 of girls), to fill out, 1) the questionnaire of amotivation inventory – physical education (AI - PE), and 2) interpersonal behavior scale (IBS). For data analyzing we used the Spearman test of correlation. The results showed that there is a significant but negative relationship between the social support behavior of P.E teachers and amotivation of students in doing P.E activities of schools ( $r = -0.252$ ,  $p \leq 0.01$ ). There are respectively significant but negative relationships between factors of social support behavior (i.e. autonomy support, competence support, and relatedness support) and amotivation ( $r = -0.207$ ,  $r = -0.255$ ,  $r = -0.216$ ,  $p \leq 0.01$ ). According to the fact that, reduction of P.E teachers support behavior may result in amotivation of students, we recommend that teachers should identify the multi-lateral nature of amotivation, and then increase the amount of students social support, to finally improve their participation at school P.E activities.

**Keywords:** motivation, self-determination theory, physical education, high school students

## Introduction

It is widely acknowledged that the physical activity levels of young people are currently below the levels thought to be sufficient to promote health benefits (Cavill, Biddle, and Sallis, 2001). Studies in industrial countries show that the most intensive education a level of physical activity related to aging, is between the ages of 13 to 18 (Sallis, 2000). The adolescence level is defined as an important period in which individuals either confirm as constant participant in physical activities, or just leave them completely (Murcia, Rojas, and Coll, 2008). One of the basic goals of physical education is to prepare young adults with needed skills, knowledge, competencies and the act of participating in physical activities related to fitness and safety in leisure time (Hagger et al, 2005). However, it is important for children to participate in physical education lessons and courses actively and with a good level of motivation if they want an increase in their physical activities (Ntoumanis, 2005). Sallis and McKenzie (1991) argued that positive experiences of physical education can have influence on children to choose an active life style for the rest of their lives, and also can increase public health in society. Student's belief of their abilities may affect their participations (Ajzen, 2005). In addition, students which have a positive view about physical activities may want to continue such activities (Subramaniam, and Silverman, 2002). Success in such activities may be a cause for students to go on with their participation and being physically active (National Association for Sport and Physical Education [NASPE], 2009). Conversely, students who feel that are not successful in one activity, may not be attracted to physical education and also do not wish to continue their participation (Subramaniam, and Silverman, 2002).

The theoretical structure for studying motivation in physical education that has increasingly been used is self-determination theory. Self-determination theory differentiates between three different kinds of behavioral regulations with different levels of self-determined motivation: intrinsic motivation, extrinsic motivation and amotivation (Ntoumanis, 2005). Whereas both the intrinsic and extrinsic motivations show different degrees of volition; however, amotivation represents the absence of motivation. Amotivation is evident when individuals have no intention and tendency to participate in a special behavior. This, often, is a result of incompetence and uncontrollability, leading to be dropped out from physical education and even schools (Ntoumanis et al, 2004). It is argued that different kinds of motivation are affected by several social factors (Vallerand, and Losier, 1999; Ntoumanis, 2001). Deci and Ryan (1985) indicated that those social factors which increase the perception of competence, autonomy, and relatedness, may promote the self-determined behavior (intrinsic motivation), whereas, those social factors that weaken this perception, may promote the amotivation behavior.

In sport field, coaches' behaviors and interpersonal style have an important role not only in athletes' performances, but also their mental and psychic experiences. Self-determination theory shows that a coach behavior can be seen in two interpersonal styles: autonomy-supportive and controlling style (Bartholomew, 2011). Studies sustain this claim that athletes' conceptions about their coaches' different behaviors, are consistent with their motives (Amorose, and Butcher, 2007). For example Amorose and Horn (2000) showed that athlete student's perceptions from their coaches' leadership styles, which insisted on training and instructions and were high in democratic behavior and low in autocratic behavior, have shown higher levels of internal motives.

This means that coaches' behaviors have influences on athletes' perceptions of competence, autonomy, and relatedness feeling, which affect athletes' motives (Amorose, and Butcher, 2007). Shen et.al.(2010) also showed that a decrease in physical education teachers' social support of students can act like an important factor in students' amotivation.

Realizing the various aspects of amotivation in physical education is not only important theoretically, but also practically. Amotivation in participating in physical education can have important effects for public health of society (Cavill, Biddle, and Sallis, 2001). Beside, in developed countries where physical education is mandatory up to a certain age, it is not a choice to leave sport at once (Spray, 2000). The motivation of teaching physical education is rarely measured according to the self-determination theory, and despite its promotion, a few number of its motivational characteristics, especially those related to teachers and students of physical education, are investigated (Spittle, Jackson, and Casey, 2009). However, the important point here is that there are few studies about amotivation or loss of motivation. It may be concluded that it is difficult to observe amotivation in sporting field because of the fact that amotivated individuals may not participate in sports at all. Thus, if during sport courses, the amotivation increases gradually, they may leave participating in such activities voluntarily (Ntoumanis et al, 2004). So, realizing the fact that motivational processes can identify whether children look at the physical education as a worthy and pleasing experience or as a boring and worthless one, is of a remarkable importance.

## Method

*Participants:* The participants were 381 high school students (Mean age = 16.72 years old; SD= 0.87; range = 15-19 years old) from different high schools in Boukan, West Azerbaijan, Iran.

*Amotivation in Physical Education:* The Amotivation Inventory-Physical Education (AI-PE) (Shen et al, 2010) was used to examine students' amotivation in physical education. The AI-PE consisted of 16 items. The participants responded on 5 points from Likert-type scale (from 1 = does not correspond at all, to 5 =corresponds exactly). In this study, Cronbach alpha for the Amotivation Inventory-Physical Education were 0.90.

*Teachers' Social Support:* The Interpersonal Behavior Scale (IBS) (Pelletier et al, 2008), being composed of 12 items, was used to assess teachers' social support that measuring the three subscales: autonomy support, competence support, and relatedness support. Participants were asked to rate, from 1 to 5 on a Likert-type scale, the degree to which their teachers behave as depicted in the items (from 1 = never, to 5 = always). In this study, Cronbach alpha coefficients for the autonomy support, competence support, and relatedness support were 0.72, 0.77, and 0.73, respectively.

*Procedure:* Before data collection, a panel of experts evaluated both instruments and translated them into Persian in order to establish both face and content validity. And then after taking needed justifications, the questionnaires were distributed in high schools (5 girlish, 5 boyish).

*Data Analysis:* Cronbach alphas were calculated to assess the internal reliability of each sub-scale. The correlation among variables was examined by Spearman's correlation coefficient.

## Results

Means and standard deviation of variables are shown in table 1. Among the subscales of social support, competence support had the highest mean value. Relatedness support and autonomy support had the second and third values, respectively. The results of descriptive statistics showed that, in general, amotivation score was low.

**Table 1 Descriptive Statistics of variables**

Variable	Mean	SD	Range
competence support	3.37	1.10	1-5
autonomy support	2.95	1.11	1-5
Relatedness support	3.20	1.08	1-5
Social Support	3.18	0.99	1-5
amotivation	1.81	0.80	1-5

The correlation test of the variables is illustrated in the Table 2. The results of Spearman correlation test indicated that there was a significant and negative relation between social support behavior of physical education teachers and amotivation of students ( $r = -0.252^{**}$ ).

**Table 2. Correlation between Teachers Social Support and students' amotivation**

Variable	Amotivation
Social Support	-0.252**

\*\* Correlations are significant at  $P < 0.01$

Also there were a significant and negative relation between social support subscales and amotivation (Table 3).

**Table 3. Correlation between subscales of Social Support and Amotivation**

Variable	Amotivation
competence support	-0.255**
autonomy support	-0.207**
Relatedness support	-0.216**

\*\*Correlations are significant at  $P < 0.01$

## Discussion

The aim of this study was to investigate the relationship of physical education teachers support behavior and students' amotivation in physical education activities of schools. According to study results we can say coaches have an important effect in athletes' motivation. Feedback from coaches may affect athlete perception of competency, autonomy, and relatedness (Vallerand, 1997). Study results show a significant but negative relationship between physical education teachers social support behavior and students' amotivation. This can be because of different aspects of interpersonal climate and students' perceptions about the need for support (Vallerand, 1997). This fact shows us students may become amotivated of participating in schools physical education activities because of various reasons, and teachers social support behavior decreasing acts like an important factor in students' amotivation. Thus with an increase in physical education teachers social support behaviors from students, their amotivation in physical education activities decreases.

Results also show a significant but negative relationship between autonomy support and amotivation. Autonomy support has effects on intrinsic motivation. Students in physical education, who feels autonomy for their activities, are more internally motivated (Hassandra, Goudas, and Chroni, 2003). Choice right and feeling confirmation may improve self-initializing feeling, provides satisfaction for need autonomy. Physical education teachers can make the opportunity for students to act independently and be creative. Such views may lead to positive results and decrease students' amotivation. According to the fact that teachers are the most leading factors who can receive information from students and support their capabilities in schools, then more companions between teacher and student is vital for improving students' motivation (Shen et al, 2010).

Results say that there is a significant but negative relationship between competence support and students' amotivation. According to the fact that teachers are the most important factor to receive information and support students' abilities in schools, thus more interaction between teacher and student is vital to increase and grow students' motivation (Reeve, 2002). Mageau and Vallerand (2003) showed that the act of teachers may be one of the necessary motivational effects in sporting places. The loss of required information and instructions related to activities can put the students' need of competence into risk and result in amotivation (Reeve, 2002). If teachers focus on students' efforts and their own capabilities and also evaluate them according to the past performance, then they can promote the competence experiences (Bieg, Backes, and Mittag, 2011).

There is significant but negative relationship between relatedness support and students' amotivation. Students' perceptions of teachers' improper supportive behavior have relation with their feeling about less relatedness with teachers. Students under compulsory supportive methods, feel less sympathy from teachers (Reeve, 2002). Relatedness noticed as an important stimulus for interaction, which is a key structure in motivation. Relationship between teachers and students mean acceptance, respect, and an attention feeling (Bieg, Backes, and Mittag, 2011). Therefore students, who feel their teacher ignores them, are more likely to have doubt about their abilities.

It is surprising to see such students' participating in physical education activities (Shen et al, 2010).

Biddle, et.al. (1995) stated that a different style of teaching, in which students have a range of options, has the positive reaction of students about sporting activities. Thus, we can reduce the amotivation of students with diversity in sport lessons of schools, having the ideas of students about their favorite sports, giving more freedom in selecting the kind of sport, expectations equal to students' abilities, and not imposing the teachers' preferences to students.

Amotivation is a complicated phenomenon and is consistent with wide social fields students are in. Teachers, parents, and peers are important social partners and each of them may have unique effects on students' mental and cognitive development. In respect of the fact that amotivation has a multi-dimensional nature, students' amotivation in physical education activities can be because of other factors than physical education teachers' social support behavior, which must be investigated in future studies.

Abstracts

This article is an account of a small scale qualitative action research study intended to investigate the development of critical thinking skills within an Indian *Ismaili* RE context (Mumbai). In the midst of the narrative, it problematizes some of the stark realities of classroom research, with regard to contextual and logistical challenges. It thus serves as an insightful source for a first time teacher-researcher to understand the nuances of classroom research. The study also highlights the crucial variables which one needs to consider while planning, implementing and reporting a small scale research study. In terms of the focus of the research study it elucidates some of the conceptual complexities of critical thinking given the fact that it has become the 'buzz word' (Fisher, A, 2001, p.1) in education circles. At the same time it argues that, although skill development has been an overriding educational aim, it is a time and resource intensive endeavour, which requires sincere commitment not only on the part of the teacher but also for the institution involved.

**KEY WORDS:** critical thinking, action research, problem based learning, classroom research.

## 1. INTRODUCTION

If one were to ask for an indicator of being educated in the 21<sup>st</sup> century, it would not be surprising to get the response, '*ability to think critically*'. Bailin and Siegel, (2003 cited in Abrami et al, 2008, p.1102) argue that "*critical thinking is often regarded as a fundamental aim and an overriding ideal of education*" (p. 188). As expressed by Moon, (2008) in the introduction of her book "*Critical Thinking*", she suggests that enabling students to become critical thinkers has been the absolute goal of higher education in recent years. However, one would also want to argue that it has been an expected outcome of education by various stakeholders in society.

On the other hand Critical Thinking (CT) is not only richly grounded in theory, but it is a theoretical response to a world in which students are increasingly interconnected, exposing them to a pluralistic world of knowledge. Thus, demanding that education should enable the students to explore alternate versions of truths that they encounter. Or one would expect it to create a future generation of individuals who are not only equipped to think, but also have the ability to think for themselves in relation to others (Kennedy, 2004).

This research is an attempt to investigate and develop an understanding of the concept of CT in the light of the overwhelming hope that the development of CT has risen for the future of education. Thus, as part of the MTeach research work I undertook this action research study to foster critical thinking within the context of Ismaili<sup>i</sup> Religious Education Centres (REC<sup>ii</sup>) of India.

### 1.1. Thesis and Hypothesis

The study was planned as an investigation to examine the development of critical thinking skills among Ismaili students attending religious education classes in Mumbai, India. In doing so the study involves using problem based learning (PBL) as a key approach. As it was assumed that problem based learning approach will promote critical thinking and this can be gauged by the analysis of student talk and work.

### 1.2. Situating the study within the context

The research study was part of the two-year MTeach course for Secondary Teacher Education Programme (STEP<sup>iii</sup>). The students who attended the REC were girls and boys, aged between twelve and thirteen. The research practicum was reduced to a mere eight classes (of an hour and half each) over a period of four weeks, contrary to the planned six weeks practicum. The class was earlier taught by another teacher, while I entered the classroom as a teacher researcher. The secondary RE curricula comprises of various modules, designed by *The Institute of Ismaili Studies*<sup>iv</sup> for the religious education of the students of the Ismaili community globally between the ages of 12-16 years. Based on the premise suggested by Splinter and Sharp (1995) CT approaches provides an ideal context to deal with ethical issues, I choose the Ethics and Development module (*One Earth Many hopes*). It introduces students to plethora of challenges faced by humanity at large and inspires them to respond to these issues within the ethical framework of Islam. The change of Curricula from *Muslim Literature* to *Ethics and Development*, as well as the change from the host teacher to me as a teacher-researcher undoubtedly had an influence upon the

students. These challenges might have influenced: the dynamics, as well as the interaction within the classroom, thus possibly affecting the outcome of this research.

## 2. LITERATURE REVIEW

As discussed earlier, CT has lately received unprecedented attention in the field of education, leading to copious literature in the form of debates, discussions, varying theories and experiments about CT (Papastephanou and Angeli, 2007). One would also argue that CT isn't a new concept; however, the bulk of research based on practice raises the hope that advantages of teaching thinking can be turned into reality (Fisher, R., 1999). Given this trend, one needs to then begin by reflecting on some of the important questions like: *"What is CT? How does CT relate to the process of learning? Is it one activity or a number of activities? How do learners learn the ability to think critically? What are its implications for Pedagogy?"* (Moon 2008, p. 5). Even though these might be valid questions, due to the limited scope of the paper, we will broadly examine some of these themes.

### 2.1. Defining critical thinking

In the process of defining CT one comes across the challenge faced by practitioners and researchers alike, as it is a very complex and controversial notion which cannot be limited to a fixed definition or understanding (Moon, 2008). Thereby, we can begin by exploring some of the definitions given by key figures in this field. John Dewey, 1909 (Cited in Fisher, A., 2001, p.2) who is considered to be the father of modern CT discourse defines it: as an active and reflective process in which one thinks for oneself by raising questions, with careful consideration as well as forming one's beliefs on the basis of appropriate reasons. This idea of learning is contrary to the one in which an individual is engaged in a passive and unreflective thought process.

Similarly Edward Glaser, 1945 (Cited in Fisher, A., 2001, p.3) defines CT as an *"attitude or disposition...and the ability to apply the methods of logical enquiry and reasoning, with some skills in applying these methods"*. Although his ideas are similar to Dewey, it accentuates an important debate in the CT tradition about skill versus disposition. Lately, scholars in this tradition have acknowledged that CT cannot be a mere teaching of skills, it is also important that individuals develop the dispositions to look at the world through a critical lens. Thus stressing that critical thinker not only has the ability (the skills) to seek reasons, truth, and evidence, in a given situation, but also that he or she has the urge (disposition) to seek them (Burbules and Berk 1999). For instance, Ennis, 1996 (Cited in Mason, 2008) emphasises that for a person to be a critical thinker he or she should not only seek reasons and try to be well informed, but also have the tendency to do such things. Siegel, 1990 (Cited in Mason, 2008) critic's Ennis because, according to him he simply considers dispositions as something that stimulates the skills of CT. Thereby not differentiating adequately the critical thinker from CT. For Siegel, a disposition to CT is more like an intrinsic trait.

Paul, 1983, p.23 (Cited in Burbules and Berk, 1999) also stresses this distinction between skills and dispositions and explicates the same through the distinction between *"weak-sense"* and *"strong-sense"* while defining critical thinking. According to him the *"weak-sense"* means that an individual has learned the skills and can demonstrate the same only when asked; the *"strong-sense"* means that it has become part of an individual's consciousness and thus constantly re-

examines his/her own assumptions . With regard to this study, both the views are considered on the premise that they are inter-related as oppose to being two distinct things, which is also a stand taken by most scholars.

The other vital theme in the Critical Thinking literature has been the extent to which CT is a generalised ability or disposition in contrast with CT being content-specific ability and disposition. John McPeck, 1981(Cited in Mason, 2008), advocates that it is content-specific; however, there are others who consider it to be generic in nature. It is an important issue as it defines how one approaches and facilitates CT. From the point of view of this study, the research is based on the definition of CT proposed by Moon (2008, p.33) who suggests that CT is, “...an aspect of the activity of thinking. It is a form of learning in that, it is a means of generating new knowledge by processing existing knowledge and ideas using what we have called tools of manipulation of knowledge (e.g. analysis, understanding, and synthesis)”.

## **2.2. Research on critical thinking**

Exploring the research and practices on thinking skills programmes, Cotton (1991), suggests that it leads to a positive shift in the students’ achievement level. While the author also explicates research findings pertaining to whether it is beneficial to teach thinking skills to students via infused programs or separate curricula? The findings reported imply that although there is sufficient data to support both the approaches, it can be indicated that either approach can be effective. With regard to the time required for the thinking skill instruction, she reports that this has been one of the uncertain areas. This can be attributed to the limitation of a research design as well as most research can hardly focus on the time question implicitly (Cotton, 1991). To conclude, one can argue that on the basis of theoretical and research evidence, providing students the opportunity to develop thinking skills is important for several reasons: these skills are vital in this rapidly changing world, it enhances intellectual growth, and promotes academic achievement and most significant of all is that it shifts the focus from “‘knowing how’ rather than ‘knowing’” (Ryle, 1949, cited in Fisher, R., 1999, p. 53). Irrespective of all the benefits one also has to be mindful that, it is not a matter of simply imparting certain skills.

## **2.3. Problem based learning**

As stated by Baden and Major (2004) PBL has emerged as a relatively recent educational approach, especially being widely popularised by the work of Barrows and Tambylnin, 1980 (Cited in Baden and Major, 2004). However having explored the literature one would want to agree with Walton and Matthews, 1989 (Cited in Baden and Major, 2004) that there isn’t any fixed definition of what PBL is and what constitutes PBL. One can consider it to be a general teaching strategy or a pedagogical approach or a philosophy. With reference to the study, it is used as a pedagogical approach as well as a general teaching strategy. Although the originators of PBL were medical educators, they did acknowledge the fact that there are different perspectives in understanding the way people learn and hence came up with an approach which is based on a whole range of theories for learning (Baden and Major, 2004). Thus one of the reasons for selecting this approach was the premise that it supports the constructivist approach to learning which is part of my own teaching philosophy.

Pithers and Soden (2000); Baden and Major (2004), highlights that PBL seems as a promising approach for developing CT. As students are required to determine what the key issues within the given problem are then thinking of different ways to resolve the problem and later evaluating and applying ways to find the solution which may not be merely one. On the other hand, it also supports the basic premise of constructivist approach that new knowledge has to be introduced with reference to students existing knowledge as it allows, the scope for knowledge construction (*Camp, 1996, cited in Baden & Major, 2004, p.30*).

However, one cannot ignore the challenges in implementing PBL. Based on the various challenges which Baden and Wilkie (2004), suggest through extensive research evidence, one has to be primarily aware that the content in PBL and the ability/ skill required are different things. Furthermore one needs to acknowledge that the overwhelming shift in the learning environment as well as the multiple roles and responsibilities expected, can be a source of many challenges for the student and teacher thus needing utmost attention and consideration. Moreover, Silver (2004), states that, there is minimal research conducted outside medicine and gifted education. Thus studying this approach within an Indian REC context was a step towards an investigation into a new area and context to make a unique contribution to the existing body of knowledge.

### **3. RESEACRCH METHODOLOGY**

In order to overcome some of the contextual challenges and limitations of a small scale study the approach of a qualitative study using the action research approach was chosen. The action research approach was also an opportunity for reflecting and improving my own practice, as well as a means to work within the constraint of time and the complexity of real world experiences. The study was based on Lewin's model of action research. As described by Kemmis et al (2004), the Lewin model of action research can be described as a process of spiral steps. Each of which consisted of planning, action and the evaluation of action. It was cyclic in nature i.e. the evaluation of action enabled me to plan the next step, which in my case was each new class.

Further, this approach provides an opportunity to alter things and allows one to bring change in their class as per the need of the hour. However, through implementing this approach it was experienced that one can get carried away at times by focusing more on the practice as compared to creating a balance between teaching and researching. Indeed one would want to consider it as an important challenge for further reflection. Moreover, the scope which action research allows has posed the challenge of generalizability of the findings, which is further aggravated due to the higher influence of context variables. Yet, one can argue that although action research findings cannot be used to make grandiose claims, it allows an opportunity to explore ideas from the existing theories, implement and evaluate their relevance and add to the existing body of knowledge (Denscombe, 2007).

#### **3.1. Ethical issues**

As proposed by Robson (2002), it is important that at an early stage of one's research planning, there is a substantial level of thought given to the ethical aspects pertaining to the research study. Reflecting on this with regard to this study I had carefully considered the following: Obtained student and parental consent and oriented them regarding the research study. The students were also allowed to opt out from the study. While an effort was made to create a conducive

environment as first time experience could have been demanding. Most importantly the study ensures to maintain anonymity and confidentiality of students, throughout the research process and reporting.

#### **4. DATA COLLECTION METHODS**

A range of data collection methods were used to capture and analyse student interaction as well as the teaching and learning processes taking place. This also enabled to gauge students' ability to think critically. Moreover, the use of multiple sources of data allowed triangulating the findings, thus adding rigour to the research (Robson, 2002).

##### **4.1. Classroom observation**

Given the limitation of audio recording in research context, classroom observation was the primary source of data collection, as it allowed capturing the entire classroom interaction and processes. On the other hand observation data are sensitive to the context and do reflect strong ecological validity (Cohen, et al, 2007p.396). It also lends scope for a qualitative researcher to capture the dynamic and complex events as they unfold, given the presumption that they are seeking to gather trends and patterns over time.

The observer was expected to:

- a) Keep a detailed written record of the classroom interaction of three students whose case-study we wanted to develop.
- b) While, also capture those teaching learning moments which mirrored students' response to critical thinking opportunities.
- c) Furthermore, she also provided me with feedback about my teaching which enabled me to review and modify my teaching as an action researcher.

To achieve these outcomes through observation process and to overcome lack of clarity and knowledge about the focus of observation between the teacher and the observer (Wragg, 1999) two observation tools were planned and developed. These tools also provided the scope to make the observation more focused and objective. The first observation tool captures the 'critical incidents' in the classroom. "'Critical incident' (Flanagan, 1949 cited in Cohen, et al, 2007, p.404) or 'Critical event' (Wragg, 1994 cited in Cohen et al, 2007, p404) are events or occurrences that might typify or illuminate very starkly a particular feature..." Wragg (1994) also suggests that these are events which can offer important insights and require greater detailed recording. With regards to this research study the observer focused on events which could provide insights on students' ability to think critically. Similarly, second observation tool was designed with a purpose to capture student talk on set criteria of only students who formed the subjects of my case study. Further, the intention of the second observation tool was also to record some aspect of my teaching, in regards to my facilitation and questioning skills which enabled the development of students' CT.

## **4.2. Self-reflection and Field notes**

Primarily, my personal reflection was used to plan my lessons for the following class and recognised it as a supporting evidence for some of the insights which I would gather from my classroom experience. The reflective journal was in the form of a 'vignette' (Daly, 2009), a narration of some critical events in class, which allows one to pose some vital questions about their teaching and the research study. The challenge experienced while reflection was to create a balance between the role as a teacher and a researcher. On the other hand, field notes help in creating more detailed reflections as well as helped in filling the gaps and loop holes from other methods, as they are short notes made when something interesting and important is noticed or experienced (Kemmis et al, 2004).

## **4.3. Student work**

Due to the constraints posed in implementing the planned data collection methods (case study and focus group), as a supplementary method student work was used. The student work included the individual student activity sheets as well as collective work created by the students as and when any activity was introduced. The student artefacts helped further explicate some of the findings.

## **5. RESEARCH FINDINGS AND DISCUSSION**

This section discusses the research findings based on some of the critical incidents which occurred during the span of seven classes. These critical incidents were chosen and analysed because they illuminated aspects of research focus. In order to triangulate the data relevant sections for the same incident from classroom observation tool, excerpts from self reflection and artefacts of student work and field notes were examined to gain insights. As suggested by Cohen et al (2007), in the process of reporting and analysing the data one needs to be conscious of the fact that qualitative data can be presented in varied ways and allows for scope of multiple interpretations. Below outlined are research findings, summarised based on the common themes emerging from the analysis.

### **5.1. Contextual implication and data collection methods**

The research study spanned over a period of seven classes. Each class was for duration of an hour and a half, however due to the issue of student punctuality, the effective teaching learning time available was only an hour. Thus, it is important to be mindful of the fact that it was a research study based on mere seven hour of teaching learning experience. Also these variables (duration, time and span) can pose a severe challenge in the process of implementing any small scale classroom research. Added to this was the fact that the teacher researcher was entering into the classroom in Mumbai for the first time. Nevertheless, despite the contextual and logistical challenges of reduced contact time and inconsistent student attendance and challenges of implementing all the data collection methods, the results do reflect the perspective of the observer, teacher and the student on any given point and thus has some element of triangulation. Nevertheless, it is essential to carefully consider issues of validity and objectivity as stressed by Cohen, et al (2007).

Before commenting along these lines it is important to consider some of the limitations of classroom observation as a method. Despite overcoming some of the challenges of classroom observation, the research study was affected by a few key challenges. Firstly, the observer and I were unable to complete the data tools on an ongoing basis due to unforeseen logistical and contextual challenges. Thus all the data transfer into the observation tools was done at the end of the research study. Having scrutinized this further I did identify that the observation tools were too sophisticated to adapt in the stated research context. Thereby, highlighting the need as a researcher to run a pilot study of the same before actual implementation.

The data was mainly transferred in the critical incident sheet which was filled for the incidents that were considered to be important by the observer and me. This raises the question of how objective we were in selecting the data for inclusion. Although this approach of narrating critical incidences has been very helpful and is a primary source of data, one needs to realize that the meaning which an individual derives at a given point of time from a particular critical incident might change over a period of time. In other words, there exists the possibility of multiple interpretation of a critical incident not only by two different individuals but also by the same individual at different times (Daly, 2009). In that case self reflection, field notes and student work have been an important source of supportive evidence.

Secondly, classroom observation as a main data source contains contextual and logistical challenges. This study highlights that although it is an eyewitness account of what happens in a classroom, many a time it fails to capture the motive behind the incident. Furthermore, it also overlooks certain contextual information which can affect the data. As well as one has to be sensitive to the fact that it's impossible to entirely fade away the presence of the observer (Wragg, 1999). Finally, as a researcher I also acknowledge that the study was in some measure unable to establish clarity for the observer with regard to key indicators of constructs or concepts being studied, which is crucial for ensuring the validity and reliability of the findings (Cohen et al., 2007).

Based on the finding one can argue that this research study has been able to provide some key critical incidents on students' thought processes and response to PBL as an approach to enhancing critical thinking. The data provides scope for meaning making, without leading to or supporting any major claims about critical thinking in an Indian RE context. At the same time one could argue that the duration of the study was too short to even gauge the student thought process. Thus in order to enhance and nurture student ability to think critically and to capture CT processes it would take a longer period of time. Although, a fruitful attempt in some sense, the study was barely able to lead the students to question and re-question their own understanding and allow scope to learn, unlearn and relearn, a learning outcome recommended by Stoll, Fink and Earl, (2003).

## **5.2. Complexities of critical thinking and problem based learning approach**

In terms of critical thinking as a concept I would want to begin by reiterating some of the discussion regarding, varied conceptual traditions which have arisen with regard to the understanding of CT as a skill, attitude or disposition. I had considered the argument that it is inter-related as compared to being two distinct things i.e. skill and attitude. Retrospectively thinking about the same with respect to the research study then I would argue that it is both; however, I would also add a third element which is ability. Through my study as a teacher I could

contend, which I may not be able to support with evidence, is the fact that my students had the ability to think critically. However, I realised that they lacked the skills to utilize this ability for thinking critically. Thus, as part of my study I tried to develop their skill, which could unleash their ability and further develop their disposition or attitude for thinking critically.

As a teacher as well as a researcher I realised that there is another aspect of critical thinking which although I had questioned in the beginning of my literature review but not considered while planning the research; was the students' understanding of their own thinking, or what one would consider as 'meta learning'(Watkins, 2001). It is clearly evident through the critical incidences that I could gauge that the students limited their thought process at the level of comprehension. Therefore, before engaging the students towards enhancing their CT skills, as a researcher it is important that we enable them to become aware of their learning pattern. This would also allow the scope to make them feel involved into this process, thereby leading them to identify the need to think critically. Thus, recommending meta-learning as the first step in the process of nurturing CT skills. One way of achieving this and finding data on this aspect as a researcher could be through student reflection.

Additionally, reflecting on the definition of CT mentioned in the literature review one can argue that the teaching-learning experience generated during the research study did engage the students in the process of knowledge construction. However, their ability to implement the tools of manipulation was only gauged in terms of understanding, which too was in question in some activities. It further raises some of the complex and critical questions such as; how is CT related to learning? Did the learning still take place? If students aren't thinking critically then do they still think?

Similarly with regard to PBL as an approach one of the key issues which one needs to consider in any future study within similar context is about the challenges the joint problem-solving activity poses. Especially when each individual involved is at a different level. In this research, although students were engaged in the joint mental effort to create knowledge, the amount of contribution from each student was varied. In that case how do you as a researcher have an account of individual student learning and growth? Moreover it is an activity which demands a lot of maturity, as it involves people to respect each other's ideas and space and at the same time ensure that the process is not taken over by dominant students, ignoring the students who are passive. Thus, once again raising the question about, how do we equip students to learn about their learning? As well as, how do you assist students to handle different roles necessary for them to undertake in the process to learn? As a researcher, it is important to think about the social skills which students might need for effective group work, while planning a research.

In addition to this the other concern which did surface during the research study was the dichotomy in education between process and content. One would argue that in the case of CT although the process is at the forefront it doesn't deny the role of content. As a researcher and teacher there was an acknowledgement at my end that the process without content is meaningless. Thus, the research was focused on working towards utilising the scope, the content, or syllabus allowed for implementing the PBL approach (Splinter & Sharp, 1995). However, in the two activities it was realised that it was too early to introduce PBL tasks without students having enough background information to discuss the topic.

Furthermore, having witnessed the challenge students had to comprehend the content raised an important question: should students thinking be knowledge dependent? One possible response could be that, on a logical basis one can argue that to think critically one needs to have something to think. For example, if the students have to think of X, they need to have a firm knowledge base of X to think about. Its immediate counter argument could be that, if this was the case then students would never learn abstract concepts without concrete knowledge (Splinter & Sharp, 1995). On the contrary one would want to argue on the basis of the idea of Zone of Proximal Development proposed by Vygotsky, (1962, 1978 cited in Moore, 2000). He argues that students can attain a level of intellectual performance higher than the actual performance if provided with the appropriate forms of assistance. However, one would still want to argue that to move from the position of where you are now and where you can be, one does require a minimum amount of knowledge and skills i.e. one has to move from A to B (Splinter and Sharp, 1995). Thus, as a suggestion for future research one may want to consider developing students thinking skills initially using the content in which students have some degree of proficiency.

## 6. CONCLUSION

To conclude in terms of the research question, the study could hardly accomplish any substantial findings that could be used for speculating with regards to student's ability to think critically. However, the research has enabled to elucidate some key aspects about the nuances of the research context and data collection methods one needs to consider before embarking on their research project. It also provides some of the insights gained as a researcher on critical thinking and PBL as concepts, at times making necessary suggestions for someone interested in considering these as their research focus, within the Indian RE context. On the other hand the research study enables one to become cognizant of the fact that skill development is not an overnight process; rather it is a complex task and requires a lot of rigour and commitment. One would also want to make a judicious decision with regard to how far one can get involved with skill development, without compromising the implementation of the curriculum.

Having provided the glimpse into the challenges of the research study and making suggestions at different junctures during the paper, it would be worth concluding with the thought that '*Change is a process, not an event.*' (Fullan, 2001).

## Introduction

English, as a global language, has become a powerful social, linguistic, and economic agent (Hall & Knox, 2009). As the most commonly spoken second language (L2) in the world, this positioning imposes high demands for effective training of teachers of English as L2 (a.k.a., ESL) or a foreign language (FL; a.k.a., EFL). In addition, the advancement of technology has created an ever-shrinking “global village,” increasing the significance of learning English while also producing an historical precedent in concerted efforts to increase English language learners’ (ELLs) proficiency. Teaching English to speakers of other languages (TESOL) goes hand in hand with this socio-global trend, which requires a new form of learning that adds a new layer of complexity to educational services. Furthermore, the clientele of educational services has expanded from the local to the international and from full-time students to nontraditional learners already in workforce. In response to these shifts, the delivery of TESOL content has transitioned from traditional face-to-face classrooms to “hybrid” and online/distance education formats<sup>1</sup>.

The purpose of this paper is to critically review the current global demand of TESOL and the rewards and challenges that accompany this demand. First, the transition from face-to-face to distance learning will be discussed from local and global perspectives followed by a review of the Teacher Education Standards of TESOL from state governing and accreditation bodies. The review will be followed by a discussion of the advantages and rewarding aspects of online TESOL programs in respect to global outreach and opportunities for interactional communities that encompass researchers and practitioners (Nunan, 2002). Next, challenges associated with distance education will be examined from multiple points of view that include perspectives from learners, instructors, and institutions. Finally, commonalities and differences in English as L2 and English as FL contexts will be examined.

## Transitioning from Face-to-Face to Distance Learning

There has been a gradual shift in the delivery mode of classes from traditional face-to-face to hybrid and/or distance learning in higher education in the USA. At the onset stage of distance learning, nontraditional learners whose work schedules interfered with face-to-face class times were targeted. Traditional students, however, gradually became part of the demographic make-up of distance students when they saw the benefit of having both on-campus and online classes available to them especially when traditional courses they wanted were full (Swan, Shea, Fredericksen, Pelz, & Maher, 2000).

The driving force behind the shift in course delivery mode was based on 1) the availability of technology, 2) the desire for a fast-paced information cycle and accessibility to new educational content, and 3) flexibility of course delivery. First, the surge of online classes hinges on the availability of technology that allows for synchronous and asynchronous virtual classes. Most post-secondary or higher education institutions in the U.S. use Blackboard or a similar platform as an online learning environment, which provides various features of learning modules and workspaces. With the availability of this online platform, rarely do traditional classes only utilize face-to-face communication as most classes employ Blackboard in one way or another, resulting in hybridity of e-learning and classroom coursework. Many instructors of face-to-face courses not only post their syllabi and other course materials on Blackboard one or two weeks prior to the class start date so that students have a sense of the course, but instructors also use

---

<sup>1</sup> In this paper, distance learning and online education are used interchangeably.

Blackboard throughout the term for assignment submission, quizzes/exams, and extended discussion.

Secondly, with the 21<sup>st</sup> Century expectation of a fast-paced cycle of information and knowledge, there is the requirement for frequent updates on content knowledge. Individuals in the hypermedia era are also more able and likely to respond quickly to the constantly evolving technology and information available. In addition, with frequent updates, students' learning new technologies and learning tools as well as keeping abreast with the newest version of information are difficult to achieve in the traditional face-to-face class format if there is not an aspect of hybridity (e-learning or technology) involved. In essence, turnaround time on new information and technology innovations require the very technology that makes the cycle fast-paced, which is not found in the traditional classroom setting.

Thirdly, the flexibility of online classes makes life-long learning easier than other class formats. The accessibility and flexibility of online classes create a wide clientele of educational consumers who are not restricted by geography. Online delivery transcends time zones and localities in which nontraditional learners reside, reinforcing "anytime, anywhere" access to knowledge. The demographic of online class takers mirrors the trend of "life-long learning." Online class takers are typically older than traditional face-to-face students, and have work or family obligations (Deka & McMurry, 2012). Online delivery is an excellent option for those who have responsibilities other than school work, and online learning is an avenue that allows them to overcome situational barriers such as job, family, and transportation that can limit traditional learning venues.

In response to the demand and benefits of online learning, many higher education institutions have begun to operate fully online programs. TESOL is one of the disciplines gaining popularity in online delivery. According to Reeves's survey (2010), every state in the U.S. offers TESOL certificate or licensure as of the 2007-2008 academic year, although some states began earlier. Teacher candidates get certified to teach ESL students via one of two routes. One is getting an initial teaching license in TESOL (typically 10 courses, 30 semester hours), and the other is getting a TESOL endorsement license (typically 5 to 6 courses, 15 to 18 semester hours), an add-on certificate to the existing initial teaching license. The TESOL endorsement license is obtained by in-service teachers who wish to address the needs of ELLs within the subject areas they teach. Therefore, online TESOL endorsement programs tend to be at the graduate level and well serve in-service teachers in terms of time, flexibility of engagement, geography, and content knowledge.

TESOL programs are frequently offered in the U.S. as a professional development venue or a Master of Education (MEd) program. Professional development venues are operated to serve teacher candidates or in-service teachers who wish to renew their license or want to teach ELLs but are not interested in seeking a Master's degree. These individuals take TESOL courses as non-matriculated students. MEd students take TESOL courses in order to be equipped with a caliber of the most recent teaching methods and strategies for ELLs as well as for core course contents, including theories of second language acquisition, applied linguistics, sociolinguistics, and practicum.

## TESOL Standards

Due to the growing number of ELLs in U.S.<sup>2</sup> public schools, ELLs' diversity in terms of language, culture, and geographic regions has become a focus of teacher education programs. This is to ensure that instruction for ELLs reflects the variety of backgrounds and needs that can be found within a classroom. In respect to quality assurance, all TESOL programs in the U.S. are required to comply with two forms of Standards: (1) the International TESOL and CAEP/NCATE P-12 ESL Teacher Education Accreditation Program and (2) the State Department of Education.

The international TESOL and CAEP/NCATE Standards cover five domains, including language, culture, instruction, assessment, and professionalism. Domain 1 *Language* includes what teacher candidates should know about language as a system as well as theories of and research on language acquisition and development. Domain 2 *Culture* requires that endorsement or licensure candidates know and understand the role of culture in student learning as well as how cultural components affect language learning and school achievement. Domain 3 *Instruction* covers planning, implementing, and managing standard-based content instruction for ESL students. Domain 4 *Assessment* involves concepts and issues of formative and summative assessment as well as high-stakes testing in respect to language proficiency assessment and classroom-based assessment. Domain 5 *Professionalism* calls for keeping abreast with new instructional strategies, evidence-based results, advances in the ESL field, public policy issues, and the history of ESL teaching in the U.S. (TESOL, 2008).

Side-by-side with the international TESOL standards exist the requirements mandated by each State Department of Education or State Board of Regents. Each state mandates a set of standards as well as the passing of an examination such as the Praxis-II ESOL exam. For example, the State of Ohio specifically states that a teacher candidate is an individual “who is deemed to be of good moral character; who has successfully completed an approved program of preparation; who has successfully completed an examination prescribed by the State Board of Education; and who has been recommended by the dean or head of teacher education at an approved institution” (Ohio Board of Education, 2008, p. 1). The Ohio standards are as follows:

- Standard 1: Candidates demonstrate knowledge and understanding of students of diverse cultural and language backgrounds.
- Standard 2: Candidates demonstrate knowledge and understanding of English structure and usage.
- Standard 3: Candidates demonstrate knowledge and understanding of the process of language learning.
- Standard 4: Candidates demonstrate knowledge and understanding of the context of second (new) language acquisition in the U.S.
- Standard 5: Candidates know and demonstrate knowledge of and skills in the assessment of second (new) language learners.
- Standard 6: Candidates demonstrate knowledge of and skills in the instruction of linguistically diverse learners.

---

<sup>2</sup> Although the U.S. is not the only English-speaking country, the U.S. is used to refer to an English-speaking country in this paper.

- Standard 7: Candidates observe, participate and practice teaching in second (new) language instruction in classroom settings with experienced certified/licensed teachers having TESOL validation endorsement.

Since the Standards are formulated to gain quality assurance, the coursework of the TESOL programs in the U.S. is aligned with both TESOL and a variety of state standards. There is variability across states because each state rather than the U.S. federal government monitor K-12 TESOL licensure or certification (Reeves, 2010). Even within the state, however, there is no uniform curriculum in place because each university, college, or school district designs its own curriculum under the overarching state standards. Thus, what is still unknown is the effect on K-12 ELLs' achievement due to the lack of uniformity and consistency across TESOL program providers and states. Empirical research studies are needed to address this issue.

Regarding the add-on TESOL endorsement, many states offer flexibility as to when to induct TESOL certification. Some states allow already certified in-service teachers to begin with the TESOL endorsement while they are teaching at schools, which is indicated by the title of "add-on" or "endorsement." Other states allow pre-service teachers to pursue the TESOL certificate while they are working toward the initial teaching license (Reeves, 2010). Regardless of the nature of the license (i.e., initial teaching license or add-on endorsement), the coursework candidates take in TESOL programs reflects both international TESOL and State Standards.

### **Advantages and Benefits of Online TESOL Programs**

There are advantages and benefits of online programs in general and TESOL in particular. Although overlaps exist between general and specific TESOL online offerings, no differentiation between these two will be made in this section. In general, distance learning is a great way to fulfill the life-long nature of learning for individuals who are in workforce. It also satisfies not only the need of learning in our fast-paced, ever-evolving technology era, but also offers accommodation for career- and family-related needs.

From the perspective of class-takers, those who are teacher candidates are able to take advantage of the various merits of distance education, such as flexibility, accessibility, low cost, and an ever-growing learner-centered climate. Distance learning provides excellent accommodation for career- and family-related needs; therefore, teacher candidates as well as in-service teachers do not need to give up their current positions to obtain the TESOL certificate.

Accessibility is another merit that distance education provides. Unlike traditional classes, online courses allow for 24-7 access to the class site, regardless of geographical region or location, thus allowing those who live in remote rural areas or outside the U.S. to access to academic or professional knowledge. Accordingly, online students can adjust their schedules around the demands of their lives. Some online programs offer intensive residential workshops at satellite offices or branch campuses for the sake of the student's convenience or enhanced academic offerings.

Accessibility is directly related to convenience. Some students find online classes more convenient and comfortable, because they can work from home and feel less social pressure than

in face-to-face classes. In addition, what they learn in an online TESOL program can be immediately applied to their classroom teaching in the K-12 setting, and K-12 students can get the most up-to-date resources through their classroom teachers' constant renewal of teaching methods and strategies. This benefit is closely related to the life-long enhancement of teaching, as teacher development is a continuous process that begins before earning teaching credentials and sustains throughout the teaching career (Johnson, 2006). Furthermore, many online courses can be less expensive than transitional classes (Hall & Knox, 2009). Costs associated with traveling, on-campus living, or child-care can be saved through attendance in online classes.

From the service provider's perspective, online delivery allows the program coordinator to solicit content-expert instructors nationally and internationally without the geographical constraint. It also enables the program provider to operate the program with lower costs than face-to-face delivery because classroom space and furnishings are not needed. Hall and Knox (2009) note that distance education is more economically efficient than face-to-face delivery at one-third or two-thirds of the cost of traditional classes. In addition, the asynchronous characteristic of delivery makes online classes immune from weather conditions preventing from class cancelation (e.g., snow days, etc.).

From the instructor's perspective, flexibility is also an advantage. Instructors are able to make their own schedules without the obligation of fitting into the institutionally-scheduled class offering times. Convenience is another advantage for the instructor as well. The instructor can work from home and does not need to travel to campus. Instructors can experiment with new technology and its applicability to their coursework as well as development of their online students, which may not be feasible in face-to-face situations. Instructors can also create opportunities for the engagement of all students through a variety of learning tools that may not work in on-campus offerings; thus encouraging the reticent student to participate in class activities with lower social pressure than in face-to-face classrooms.

The overall benefit of online TESOL programs would be the opportunity for global outreach and building an interactional global community. Collegial networking among theorists and practitioners around the world can engender a system of exchange whereby ideas are more broadly distributed, closing the gap between research and practice. Aside from the academic endeavors, online class takers can seek personal pursuits, such as job openings in other countries, personal connections, and travel purposes.

### **Challenges of Online TESOL Programs**

Benefits come with a price tag. From the class-taker's viewpoint, there is a physical separation between the instructor and the learner, and students who need more structure will miss the immediate supervision in a distance learning course. There is also the feeling of isolation for some students. According to Moore (1989), there are three types of interactions in distance education: 1) learner-content interaction, 2) learner-instructor interaction, and 3) learner-learner interaction. The first type of interaction, *learner-content interaction*, does not change greatly in distance learning classes. Rather, more instructional modules and materials are likely to be provided online, as the instructor tends to upload extensive information to a learning platform in an attempt to ensure that no communication gap exists between the instructor and the student.

Since interaction type and quality can be different between face-to-face and online classes, the second and third interaction types (i.e., *learner-instructor interaction* and *learner-learner interaction*) can frequently undergo changes and generate a new form of indirect interaction. The change in the *learner-instructor interaction* is probably the most crucial dimension. In traditional classrooms, the power dynamic plays a part with the physical presence of the instructor. However, it is unknown whether or not computer-mediated virtual interactions make a difference in the power dynamics frequently found in face-to-face classrooms. The quality of interaction between the two delivery modes is also unknown. Concerning the *learner-learner interaction*, peer-support networking can be reduced unless students make efforts via email or other social networking platforms, such as Facebook, twitter, or text messages to stay in contact. While traditional face-to-face students can learn through group work or casual meetings on campus, online learners' peer contact tends to be lower and more formal unless these additional efforts to know one another are made.

In addition, time management can be challenging because the level of autonomy and self-directed learning is frequently greater than the on-campus face-to-face classroom equivalent. Another challenge involves online students' personal situations. Unlike traditional full-time students, online learners work full-time and take classes at the same time. They tend to be married and have family obligations (Deka & McMurry, 2012). The multiple roles online students play in their lives while taking online classes have the potential to impede their time investment in and concentration on content learning. Undoubtedly, distance learning requires an optimal level of writing skills because the medium of online exchanges is largely communicated through the written word. Individuals whose writing abilities are not correlated to their speaking skills may feel the additional burden of learning to communicate in writing while also attempting to learn the content or to engage in discussion with their peers.

From the instructor's perspective, several challenges also exist. First, the instructor's time commitment in online classes is often greater than in face-to-face classes. Some online classes can take double or triple the time dedication than face-to-face teaching, especially when students' competency with technology is wide-ranging. In essence, online instructors may also find themselves teaching the technology in addition to the classroom content. Due to the inherent nature of computer-based exchanges, instructors may need to walk through the navigation processes of the online learning platform along with other instructional media utilized in the class. There is also the additional time spent responding to email messages regarding technical queries. The navigational disorientation some students present can inhibit class progress while also frustrating the instructor and fellow students.

Secondly, because online learners can fall outside the realm of traditional student and may not be as technology-savvy as traditional students, instructors sometimes need to limit their online tools to lower technologies. The low-end technology use in classes may limit the functionality of the online learning environment. Although there is an expectation that online students will have a level of technology proficiency as a prerequisite for taking online classes, there is still the issue of students' anxiety of technology that can interfere with the employment of synchronous meeting vehicles, such as *Illuminate* or *Adobe Connect*.

Thirdly, there is a wide range of variability in the level of TESOL candidates' classroom experience, as some are veteran teachers who have taught K-12 students for decades, while

others are rookie or even pre-service teacher candidates. This variability in experience may lead to challenges in online discussions about the content under study. Hence, instructors need to be cognizant of the heterogeneity of experience when planning class discussions, as well as the particular needs of early-career or pre-service teachers. Lastly, instructors may need to change their communicative and pedagogical roles in online courses (Hall & Knox, 2009). Richards (1994) highlighted the importance of tailoring language to the demands of the semiotic environment in online classes because written words are subject to misinterpretation when there is a lack of nonverbal communicational tips that usually accompany verbal messages. Therefore, instructors need to constantly check for clarity in instructions or comments so there is little room for misinterpretation.

### **Commonalities and Mismatches in Teaching ESL and EFL Contexts**

There are two ways that English is commonly taught throughout the world. The first is when English is learned as L2 within the U.S. and other English-speaking countries (i.e., ESL context), while the second is as a foreign language in non-English speaking countries (i.e., EFL context). There are common threads in learning English regardless of the learning context, however, and can be beneficial to those who are delivering coursework about how to teach English. First, the target language is the same. The survey and analysis of the linguistic system that would be covered in coursework would remain the same regardless of the two different learning environments. The underlying learning mechanism of L2 or FL, compared to L1, is sensitive to the learner's age, as supported by the critical period hypothesis<sup>3</sup>. The distance between ESL and EFL learning is closer than that between L1 and L2/FL.

Secondly, there are overlaps, if not entirely the same, in the theoretical models of L2 and FL acquisition. This overlap also applies to the teaching methods and strategies, evaluation, sociolinguistic inquiries, and practicum of both environments as well. The commonalities enable educational service-providers and instructors to utilize rich resources available for either ESL or EFL learners.

Despite the common thread shared in ESL and EFL learning contexts, however, there are differences between the two settings with respect to opportunity, accessibility, and utility. ELLs in the ESL setting are constantly exposed to English and have opportunities to speak English outside of the classroom, whereas ELLs in the EFL context are not surrounded by English, thus have limited opportunities to speak English unless they take deliberate attempts to garner exposure to English and practice it. Teacher education service-providers need to take these differences into account in L2 and FL teacher education, because one uniform curriculum cannot satisfy different expectations. In addition, there are also concerns about learning styles and cultural understanding of teacher candidates that need to be addressed, especially in respect to ESL students. The gap that exists between White, middle class teachers and students from largely cultural, linguistic, and ethnic minorities can create a mismatch that is not necessarily connected to ineffective educational outcomes, but rather the incongruence of culture, language,

---

<sup>3</sup> Since the critical period hypothesis is beyond the scope of this paper, it is not discussed in this paper. It posits that there is a critical period in the life span (typically the adolescent period) during which the brain is so plastic that it is conducive to learning an L2 more easily than after the period. The brain plasticity is known to diminish after puberty.

and race. Coursework that addresses these issues may help teachers better understand the challenges and complexities involved in learning L2 and create a bridge for efficient school-home connections (Gandara & Maxwell-Jolly, 2006). So, while many courses can provide the required knowledge to those interested in teaching ELLs, there will be deviation depending on the target knowledge base.

There is also a gap in the language spoken by the teacher and the student in the ESL context. As indicated earlier, teachers in the U.S. are largely White, native English speakers. The intuitive knowledge of English as native speakers is not a sufficient condition to be an effective teacher. As Reeves (2010) notes, extensive linguistic knowledge of English is necessary for teaching English to ELLs, because the scientific understanding of the language is knowledge beyond native speaking proficiency. Reeves (2010) claims that, in order to be successful, ELL teachers need to be equipped with a scientific understanding of the English language so that they can explain why certain arrays of words are ungrammatical or out of collocational norms, rather than relying on common knowledge that would result in saying “*Because it sounds awkward*” or “*I just wouldn’t say it that way*” to ELLs. The language gap between the teacher and the student in the EFL context is typically the same, as both parties speak the same native language. Yet, there is also some discontinuity of commonly spoken or vernacular language in situations where both teacher and student are from the same native language group.

The difference or commonality in the language spoken by the teacher and the student raises a question about the necessary coverage of some items in the course materials in TESOL. Most of textbooks used in the TESOL program begin with identifying who ELLs are and the demographic changes in the U.S. to set the stage for English-speaking teachers and teacher candidates who are not familiar with ELLs’ cultural, linguistic, and ethnic backgrounds. This background information about ELLs often creates moments of surprise to teachers and teacher candidates who have not had frequent or familiar contact with ELLs. This introductory information is often useful for teacher candidates interested in ESL because they do not share the same cultural and social realms as their ELL students. However, the introductory information in the EFL setting is unnecessary or not as useful as in the ESL context because teacher candidates and ELLs frequently belong to the same societal and cultural body (i.e., in-group members). There have been changes, however, as more and more native English-speaking teachers are hired for EFL contexts with non-English speaking countries recruiting native speakers for English teaching positions. The proportion of English-speaking teachers in non-English speaking countries is still small; hence, the in-group teachers, so to speak, often find the introductory information about ELLs to be irrelevant to their courses. Similarly, some TESOL programs have an independent course of cross-cultural communication as one of the required courses (e.g., Nebraska). This course may be necessary for English-speaking in-service teachers or teacher candidates, but its utility may be questionable for those who share the same language and culture with their classroom students.

Incongruence can also be found in the expectations of the two groups of teacher candidates. Specifically, English-speaking teacher candidates feel comfortable with discussion-heavy classes, and a discussion board in the online learning environment is instrumental for them because it is a platform on which they can share their own experiences, perspectives, and ideas one another. However, those who speak the same language as their prospective classroom students in the EFL

context find discussion-oriented classes difficult because of English language barriers and a lack of comfort level with discussion-oriented classes. Teacher-fronted instruction with minimal discussions has been dominant in most non-English speaking countries. As Fletcher and Portalupi (2001) note that teachers tend to teach as they were taught, teacher candidates from the EFL context are accustomed to one-way instruction and feel more comfortable with teacher-fronted information transmission than with lively discussions. Teacher candidates who are from non-English speaking countries and expect one-way information transmission are likely to ask for a video clip that contains the instructor's instruction so that they can actually "learn" something from it. From their viewpoints, the concept of learning is direct information transportation from the instructor to the student, and learning is generated from the instructor's instruction rather than from self-involved discussion. Therefore, when teacher candidates who are from an EFL setting take discussion-heavy U.S. TESOL online courses, there are dissonance between the instructor and the cohort and further issues between the ESL context and the EFL context.

## **Conclusion**

Although there has been a wide range of discussion on TESOL programs, a comprehensive look at online TESOL programs from multiple angles has been lacking. This paper attempts to fill the gap by covering the trend, standards, advantages, challenges, and differences of learning contexts (i.e., ESL and EFL settings). This paper surveys the trend, advantages, and challenges of the online TESOL programming that has expanded to the global level due to advancements in technology. The accessibility, flexibility, and functionality of online programs are components that both benefit and challenge those who teach ELLs or who are learning to navigate their own future classrooms. Online TESOL programming reflects many aspects of changes, including technology, the life cycle of new information, the body of learners, the evolving nature of curricula, and so on.

Given that pure face-to-face classes are rare due to the availability of online learning environments, dialogue and discussion about online delivery will likely continue. Since younger learners were born after the advent of the Internet, K-12 students find computer-mediated interaction as a natural means of communication. ELLs are not an exception. However, teacher candidates may not reflect the same comfort with online learning and teaching as their technology-savvy K-12 students. Relearning and updating their skills through online TESOL programs allow in-service and pre-service teachers to build their comfort while also equipping them with the most up-to-date teaching methods and strategies, computer-assisted language learning, and evidence-based pedagogy. In spite of some current challenges with online coursework, there exists a multitude of advantages to online classes that outweigh the reduction of physical presence and distances that exist within such a learning environment. The online component of the TESOL program, regardless of whether it is a Master's program or a professional development venture, provides teachers and teacher candidates with excellent opportunities to reflect on what they learn in the TESOL program while also participating with students in the field. This is important because knowledge is not directly transferred from the decontextualized university classes to teachers' practice in or application to ELL classrooms; rather teachers develop skills and knowledge in action by reflecting on what they consume, tailoring what they learn in TESOL programs to their classrooms, and making modifications

when needed. This way, it is likely that TESOL programs for ELLs are “educationally sound, contextually appropriate, and socially equitable learning opportunity for the students they teach” (Johnson, 2006, p. 235).

Furthermore, the differences between ESL and EFL identified in this paper call for an awareness of and a sensitivity to specificities involved in ESL and EFL learning. Educational service-providers and practitioners need to be especially cognizant of the learning processes, contextual variables, cultural incongruences, expectation clashes, and learner characteristics that differ across contexts. This awareness may lead to the reexamination of current standards to see if the international TESOL and CAEP/NCATE as well as individual states address the fundamental differences involved in ESL and EFL learning. Finally, the assessment and evaluation scheme of the TESOL program and individual ELLs also need to be reconsidered. These issues warrant systematic discussions, informed decisions, and concerted efforts in the field of TESOL. Fruitful outcomes remain to be seen in the near future.

The logo for the International Association for Frontiers in Education (iafor) is centered on the page. It features the word "iafor" in a light blue, lowercase, sans-serif font. The text is surrounded by two large, overlapping, semi-transparent circular arcs. The upper arc is a light red color, and the lower arc is a light blue color, matching the text color. The arcs are positioned such that they appear to frame the text, with the red arc on top and the blue arc on the bottom.

Abstracts

The paper presents a software tool CodeSim that is used in E-Learning systems. For many computer programming courses, the students' programming assignments are in the form of electronic source code files and it is difficult for the teacher to manually detect the plagiarisms among the assignments. CodeSim can measure the similarities between source files automatically and help to solve this problem. The principle of CodeSim is summarized: Firstly, the source files are processed with intension of filtering the noise elements such as header file include statements, comments, input/output statements, string literals and empty loop statements. These statements have no effect on measuring the similarity between two source files. Secondly, a feature vector is generated for each source file. The features include physic metrics such as the number of source lines and the number of total words, Halstead metrics such as the number of unique operators, the number of unique operands, total number of operators and total number of operands. To avoid the disturbance of syntax equivalent variations, we propose a counting technique for six metrics. Lastly, the distance between two feature vectors is computed which is considered as the similarity between the corresponding source files. Different weights are used for different features. Experimental results show that CodeSim can effectively spot the suspect program copies that have some kind of modifications such as changing the comments, changing the names of the variables and functions, substituting some statements with equivalent variations. It has been used in practical programming courses at Tsinghua University.

## 1 Introduction

In many computer programming courses, the students are required to complete a sufficient amount of programming assignments. These assignments are generally not written on papers, they are in the form of electronic source code files instead. The main reasons are:

- The programming assignments written on papers need to be scored by the teacher or TA manually and it will become a huge burden to read these source code line by line. If the students can submit the electronic source files, it is possible for the teacher to score these assignments using software tools automatically.
- For each programming assignment, the students need to design the algorithm, write the corresponding source code and debug the program using a computer. There is generally a long way from thinking up a solution to writing correct code and making it work in a computer. Therefore, it is not enough for a student to just write his/her preliminary solution on a paper, he/she should submit the final source code that can work well.

In every year, there are many millions of programming exercises being turned in by students around the world. This may bring a potential problem of plagiarism. A few students may submit copies (verbatim or with some modifications) of programs supplied by somebody else who is taking the same course at the same time. For a teacher, the plagiarisms are not allowed. However, very few teachers have the patience to thoroughly search for plagiarisms; although finding plagiarisms is possible, it is much too time-consuming in practice, especially when there are several hundred of students taking the same course at the same time. Sometimes a teacher may do find duplicates among the assignments, but it is mainly by accident. For example, a student forgot to replace the name of his friend in the head of the program source text. Therefore, for an instructor who is teaching a computer programming course, a powerful automated search that finds similar pairs among a set of programs would be most helpful.

The first author of this paper is teaching an introductory programming course for non-computer science undergraduate students at Tsinghua University, China. It is an optional course for anyone who is interested in studying computer programming. The course focuses on common computational problem solving techniques and no prior programming experience is assumed. Generally there are more than 160 students in the class and they are from different majors such as materials science and engineering, chemical engineering, hydraulic engineering, mechanical engineering, automotive engineering, etc. The course is given in one semester of sixteen weeks, and in each week, the students are required to finish four or five programming assignments. This means that we will receive more than 640 source files from the students per week and it is impossible for us to manually detect all the plagiarisms among the assignments. On the other hand, there are really existing some sorts of plagiarisms among the assignments. A few students want to get the course credits with less effort, after all, computer programming is not their major course. If we are not able to detect the plagiarisms and warn them in time, the problem will become more and more serious. Therefore, we really need a powerful automatic software tool that can help us to solve the problem. Moreover, we have already designed and implemented a practical E-Learning system for computer programming courses (Shi and Chen, 2012). The system provides a high quality training mechanism for students. The online source code editor, the remote compiler of our own, the automated assessment of programming assignments and the quick feedbacks enable

students to practice their programming skills effectively and efficiently. Therefore, we can implement a new software component that is used to detect the plagiarisms and integrate it into the whole system.

This paper presents a software tool CodeSim that can measure the similarities between a pair of source files automatically and help the teacher to find the potential plagiarisms among the programming assignments submitted by the students. The whole process is divided into three steps. Firstly, the source files are processed with intension of filtering the noise elements. Secondly, a feature vector is generated for each source file. Lastly, the distance between two feature vectors is computed which is considered as the similarity between the corresponding source files.

The rest of the paper is organized as follows. In Section 2, we present the related works on the automatic detection of source-code plagiarisms. Then we give a detailed description of our method in Section 3. In Section 4, the evaluation results are shown and discussed. Finally we conclude our work in Section 5.

## 2 Related Work

The first known plagiarism detection system was developed by Ottenstein (1976). It uses the basic Halstead (1977) metrics (number of unique operators, number of unique operands, total number of operators, total number of operands) to compare two Fortran programs and if all the four values coincide, the programs can be considered to be plagiarisms. The above system can be categorized as the feature-based method. The basic idea of a feature-based system is summarized as follows:

Firstly, for each program file, a set of software metrics are extracted and they make up a feature vector. Different systems may use different metrics such as Halstead metrics, physical metrics, etc. The length of the feature vector can also be different. Generally speaking, longer feature vectors tend to be more sensitive than shorter ones and may come up with a large fraction of false positives.

Secondly, each feature vector corresponds to a point in an  $n$ -dimensional Cartesian space ( $n$  is the length of the vector). Therefore, we can compute the distance between two feature vectors and consider the distance to be the similarity degree of corresponding programs. Typical feature-based systems include Berghel (1984), Donaldson (1981), Faidhi (1987), etc.

The feature-based systems are efficient because they only need to compute a limit number of feature values for each program. This can be accomplished by scanning a source file once or twice. However, they can hardly have very good performance because they throw away too much structural information.

The second type of plagiarism detection method is based on program structures. The structure-based systems compare the structures of two programs directly. The basic idea is to convert each program into a stream of tokens and then compare these token streams to find common segments. The comparing algorithm needs to be designed carefully because it will determine the efficiency of the whole system.

Typical structure-based systems include Michael Wise's YAP3 (1992), Alex Aiken's MOSS and Guido Malpohl's JPlag (2000). The differences lie in the detection performance, the run time efficiency and the user interface.

Generally speaking, the feature-based systems are more efficient and have relatively lower performance, while the structure-based systems have better performance and are less efficient, especially when dealing with a large data set (Verco, 1996). It is not reasonable to declare that one method is always better than another. In our case, we have to consider the following aspects when trying to detect the plagiarisms among the students' assignments.

- We actually don't need a "perfect" plagiarism detection system. As a teacher, the more important thing is to educate the students not to cheat and let them know the serious consequences of cheating. If the students know about it, most of them will not even try to attempt it. Therefore, the plagiarism detection system is just an auxiliary technical tool that helps us to find as many plagiarisms as possible in limited time.
- There needs to be a balance between effectiveness and efficiency. As we mentioned before, we will receive more than 640 source files from the students per week. This is a large data set and the time efficiency is more important to us. We can't accept a system that takes a long time to complete the job, even though it may have a higher accuracy.
- Although there are already several free plagiarism detection tools available on the internet, it is still time consuming to use these tools. We have to prepare the data files in a local machine and submit them to the servers. These files should meet the requirements of the system including the type, the format and the directory structure of the source files. On the other hand, we already have a powerful E-Learning platform and this platform is already in use in our courses. If we can implement a new plagiarism detection component and integrate it into the platform, it will be convenient to use and no extra time is required because all the data files are already there.

### 3. The System

Based on the discussion above, we decide to utilize the feature-based strategy. Our source-code plagiarism detection system consists of three main components: the pre-processing component, the feature extraction component and the similarity measurement component.

#### 3.1 The Pre-processing Component

For each programming assignment, the students will submit the corresponding source code files. These files can't be compared directly because they contain many noise elements that have negative effects on measuring the similarity between source files. Therefore, we need a pre-processing component to filter out these noise elements.

Firstly, we need to filter out all the "header file include" statements. The following are some of the examples:

```
#include <math.h>
#include <ctype.h>
```

For a typical C program, the "header file include" statements are absolutely necessary because we often need to call the commonly used system functions in the program, for example, printf, scanf, strlen, etc. If the "include" statements do not occur in the program, the compiler

will not be able to recognize these functions and locate their objective code files, which will lead the compiling process to fail. Therefore, the “header file include” statements are important to the compiling and running of the program. However, these statements are meaningless when computing the similarity value of two source files. Instead, they may have negative effect. For example, a student may insert functionally useless “header file include” statements in a source file on purpose to make it look different with others.

Secondly, we need to remove all the comments and blank lines from the source files. From a programmer’s point of view, the comments and blank lines are there mainly for the readers of the source code. It is very important for a professional programmer to include appropriate (not too many, not too few) comments and blank lines in his program. For example, if a piece of code is too hard to understand, the author should include a paragraph of text to illustrate its principle in detail. That will help his colleagues to understand the code with less effort and improve the communication efficiency of the whole team. The blank lines are mainly used to separate different blocks of code and make the structure of the program clear and comprehensible. For example, you can use a blank line to separate the variable declaration section from the ordinary statements.

However, from the compiler's point of view, both the comments and the blank lines have no effects on the functionality of the program. Actually, they will be removed by the compiler during the compiling process. Therefore, when computing the similarity value of two source files, we should remove all the comments and blank lines from the files at first. Otherwise, one can easily fool the automatic plagiarism detection system by writing fake statements in the comment area. For example,

<pre> void main() {     int m, n, factor;     int num, i;      scanf("%d %d", &amp;m, &amp;n);     scanf("%d", &amp;factor);     num = 0     for(i = m; i &lt;= n; i++)     {         if(i % factor == 0)             num ++;     } } </pre>	<pre> /*     for (i = 0; i &lt; N; ++i)     for (j = 0; j &lt; N; ++j)     {         for(C[i][j]=0,k=0; k&lt;N; ++k)             C[i][j] += A[i][k]*B[k][j];     } */ void main() {     int m, n, factor;     int num, i;      scanf("%d %d", &amp;m, &amp;n);     scanf("%d", &amp;factor);     num = 0     for(i = m; i &lt;= n; i++)     {         if(i % factor == 0)             num ++;     } } </pre>
--	--

(a) the normal program

(b) a plagiarism with fake code

Figure 1. Plagiarism with fake code as comments

Figure 1.a is a normal program and figure 1.b is a plagiarism with fake code. In figure 1.b, the bottom part of the code has real functionality and it is an exact copy of figure 1.a. The top part of the code is a piece of fake code (in the form of comments) that used to fool the automatic plagiarism detection system.

Thirdly, we need to remove all the input/output statements. These statements are mainly used for user interface purpose and have few relationships with the core functions of the program.

Lastly, all the string literals are removed from the source files. Strictly speaking, a string literal is actually a type of data, not a statement. It is mainly used for program debugging and user interface purpose. It has no effect on the running of the program. Furthermore, just like the comments, the string literals in a program can also be used to fool the automatic plagiarism detection system. For example, one can define a carefully designed long string literal that contains all types of operators, operands and keywords in his program, and then this string literal will cause great troubles to any type of detection systems. The following is a small example:

```

strepy(s,“+*/&%=!~^(){}[]\|;?<>\\.main.int.char.double
float.if.else.while.for.a[i].int*.return”);

```

After filtering out all the above noise elements, we need to re-format the source code according to a specification. The main purpose is the separation of operators and operands. All the operators defined in C are listed as follows:

```
single_symbol    =    {'=',    '+',    '-',    '*',    '/',    '%',    '<',    '>',    '!',
                      '&', '|', '~', '(', ')', '{', '}', '[', ']', ',', ';', ':', '.', '?', '#'}
double_symbol    =    {'//',    '+=',    '-=',    '*=',    '/=',    '%=',    '&=',
                      '^=',    '|=',    '++',    '--',    '<=',    '>=',    '==',
                      '!=', '&&', '||', '<<', '>>', '->', '::'}
```

After the formatting is completed, each operator will have exact one blank space printed before and after, which is convenient for further processing.

```
/******20120501*****
*****just for test *****/
#include <iostream>
#include <string>
using namespace std;

#define MAX_N 5
int main()
{
    char test[]="for test"; //print
    cout<<test<<endl;
    printf("%s\n",test);

    int num[MAX_N][MAX_N],x;

    cin>>x;

    for(int i=0;i<MAX_N;i++){
        for(int j=0;j<MAX_N;j++){
            num[i][j]= i+x;
        }
    }
    return 0;
}
```

Figure 2. Program before the pre-processing

We will give an example to illustrate how the pre-processing component works. Figure 2 is an original program submitted by a student. Figure 3 is the program after the pre-processing.

```
# define MAX_N 5
int main ( ) {
    char test [ ] = "";
    int num [ MAX_N ] [ MAX_N ], x ;
    for( int i = 0 ; i < MAX_N ; i ++ ) {
        for( int j = 0 ; j < MAX_N ; j ++ ) {
            num [ i ] [ j ] = i + x ;
        }
    }
    return 0 ; }
```

Figure 3. Program after the pre-processing

As we can see, all the “header file include” statements, all the comments, all the blank lines, all the input/output statements and all the string literals are removed from the source code. Furthermore, all the words (variable names, keywords, etc) and the operators are separated with blank spaces.

### 3.2 The Feature Extraction Component

For a feature-based system, the next step is to extract a set of software metrics from an input source file and construct a feature vector. In our system, we considered two types of features: physical features and Halstead features.

Physical features are quite straightforward. They include file size, number of source lines, number of words, number of characters, etc. In our system, we use two physical features, i.e. number of source lines and number of words. These two features seem to be more valuable than others. The calculation of the number of sources lines is easy. We just need to count how many carriage return (“\n”) characters are there in the source file. Furthermore, since we have re-formatted the source code to conform to a uniform standard in the pre-processing stage, the number of words roughly equals to the number of blank spaces in the code string.

Halstead features refer to the statistics of source code attributes, specifically, the usage of different identifiers. For a feature-based system, it is important to choose which types of identifiers to use because it will affect the accuracy of the system.

The identifiers in the C language can be categorized as follows:

- Operators: including assignment operators (=, +=, -=, \*=, /=), arithmetic operators (+, -, \*, /, %, ++, --), relational operators (<, <=, >, >=, ==, !=), logical operators (&&, ||, !, <<, >>), bitwise operators (&, |, ~, ^) and other operators (type conversions, pointer operators, etc).
- Keywords: including int, if, char, etc.
- Predefined identifiers: including define, undef, include, etc.
- User defined identifiers: including variable names, constants, user-defined functions, etc.

In our system, we will consider six attributes of source code: arithmetic operator metrics, relational operator metrics, logical operator metrics, execution flow metrics, operand metrics and the number of different operands.

For the first four metrics, the system uses a dictionary structure to store the counting object, the unit value of the operator and the unit value of the corresponding operand. The counting object is the index key of the dictionary and the latter two values make up a list that is used as the index value. Each item is in the form of “X: [n1, n2]”. For the last two metrics, their values are already there when the first four metrics accomplish.

Take the arithmetic operator metrics as an example. They reveal the characteristics of a program on arithmetic operations. Different operators are assigned different unit values. For example, the unit values of ‘=’, ‘+’ and ‘+=’ are 1, 2 and 3. Therefore, the statement “x += y” can be seen as the same as the statement “x = x + y”.

The following is the pseudo code of how to compute this attribute value:

```
attribute_value = 0
for object_to_count in attribute_dict.keys():
    attribute_value = attribute_value + num[object_to_count] *
                        attribute_dict[object_to_count][0]
```

num[object\_to\_count]: the number of times object\_to\_count occurs in the source code

attribute\_dict[object\_to\_count]: the unit value of object\_to\_count, i.e. the n1 in “X:[n1, n2]”

### 3.3 The Similarity Measurement Component

The feature extraction component transforms a pair of source files into two feature vectors. The next step is to compute their similarity. Each feature vector consists of two parts: physical attributes and Halstead attributes, they are given different weights. The similarity computation of two feature vectors is summarized as follows:

The first step is vector transformation. Suppose we have two vectors  $H_i$  and  $H_j$ , we need to transform them into another two vectors  $H'_i$  and  $H'_j$  using the following formulas:

$$h'_{ik} = \frac{h_{ik}}{h_{ik} + h_{jk}} \quad (1)$$

$$h'_{jk} = \frac{h_{jk}}{h_{ik} + h_{jk}} \quad (2)$$

$h_{ik}$ : the  $k$ -th element of  $H_i$

$h_{jk}$ : the  $k$ -th element of  $H_j$

After the transformation, each element value is limited in the range of [0, 1].

The second step is to compute the vector difference using the following formula:

$$D = H'_i - H'_j \quad (3)$$

The last step is the similarity computation using the following formula:

$$\text{sim} = \begin{cases} 1 - \frac{|D|}{\sqrt{6 * sen}}, & |D| \leq \sqrt{6 * sen} \\ 0, & |D| > \sqrt{6 * sen} \end{cases} \quad (4)$$

*sen* is the sensitivity coefficient whose value is in the range of [0, 1]. A smaller value indicates that the similarity detection is stricter, i.e., if the vector difference is bigger than a small value, the two source files are considered to be not similar to each other. In our system, *sen* is set to 0.2.

Suppose the physical similarity is  $S_1$  and the Halstead similarity is  $S_2$ , then the final similarity of two source files is computed using the following formula:

$$S = S_1 * W_1 + S_2 * W_2 \quad (5)$$

$W_1$  and  $W_2$  are the corresponding weights, in our system,  $W_1 = 0.2$ ,  $W_2 = 0.8$ .

#### 4. The Results

The usage of CodeSim is quite straightforward. For each programming assignment, all the source files submitted by the students will be compared in pairs. The result is in the form of Excel file currently. Figure 4 is an example of the output file.

Figure 4. An example of the output file

To testify the effectiveness of our system, we have conducted a series of experiments. In the first experiment, for a given program submitted by a student, we added additional “header file include” statements, comments and output statements (used for debugging) in the source text to make it look different with the original one. However, when we used CodeSim to measure the similarity of these two programs, the result was 1.0 which means they are completely the same.

In the second experiment, we changed the names of different type of identifiers, such as the variable names, function names and user-defined struct names. Again, the measurement result was still 1.0. This is because CodeSim only computes the numbers and distributions of operators and operands, it does not care about the names of different identifiers.

In the third experiment, we changed the structure of the code. For example, we changed the order of some functions and substituted a function call with the body of the function itself. The similarity degree was more than 0.9.

We also used a real data set to testify CodeSim. The data set consists of a group of source files submitted by the students in our class. These source files are the students’ solutions to a same programming problem. Those pairs of programs that have a relatively high similarity degree are examined by us manually. It turns out that for any pair of programs whose similarity value is greater than 0.7, there are always exist many code blocks that seem to be similar enough.

## 5 Conclusion

The paper presents a software tool CodeSim that can help teacher to find the potential plagiarisms among the vast number of programming assignments. CodeSim is a feature-based source code plagiarism detection system. It consists of three main components: the pre-processing component, the feature extraction component and the similarity measurement component. Each component is discussed in detail in the above sections. Experimental results show that CodeSim can effectively spot the suspect program copies that have some kind of modifications such as adding the comments, changing the names of the variables and functions, substituting some statements with equivalent variations, etc.

Ongoing and future work includes the further improvements of CodeSim. For example, we can try to improve the accuracy of the system by making use of the program structure information. The second problem is how to make the system work more efficiently when processing a large data set. Besides, there is the problem of user interface. We need to provide a better interface for the users to understand the results.

Abstracts

The purpose of this paper was to select correctly students who have stable and potential performance. Participants were 35 fourth grade students in Central Taiwan. Based on GM(1,1) method, researcher used students' scores of previous seven semesters to predict students' scores of second semester of fourth grade. Through comparing traditional method with GM(1,1) method, this study found that whether in single subject or multiple subjects, GM(1,1) method and traditional method have similarly high goodness of fit. The combination of two methods has been used to select contestants having stable performances. And based on GM(1,1) method, students having unstable performances can be filtered out. Furthermore, using GM(1,1) method can select potential students in various subjects while using traditional method cannot. The combination of GM(1,1) method and grey relational analysis, according to students' scores in various subjects, can improve traditional method in selecting contestants. This method is innovative that provides teachers a good way to select contestants based on both single subject and multiple subjects.

## 1. Introduction

There are many methods which can be used to select contestants. In qualitative approach, using literature research and analysis can find out the best selection (Hsu, Chang, & Su, 2007). In quantitative method, analyzing the data of various competitions or test is the most common way. Some studies used descriptive statistics to analyze and showed a mean value or percentage in order to understand the overall status (Chang, Chen, & Hsu, 2006; Yeh, Chu, & Wu, 2009), and other researches implement a variety of test in order to find out the differences between groups (Lin, Chen, Chan, & Chang, 2008; Wang, Liu, & Jeng, 2008). These findings have provided various schools and organizations with the base for selection.

In order to select hopeful student, schools usually announce the proportion of all investigatory items in general regulations to recruit people who they desire. However, some previous studies showed that the proportion of the real influence of the objective written test was higher than expected, and the proportion of the real influence of the subjective assessment was lower than expected (Chan, et. al., 2008; Chan, & Syu, 2011). This shows that in general although oral test has increased and the paper-pencil test has reduced, but the training on judgement and related knowledge is not too much. Thus, potential students are not easy to be identified or recognized (Oreck, Owen, & Baum, 2003). Consequently, Pan, & Lai, 2005 compared the achievement of students who are selected base on the recommendation and other students who are admitted base on the score of college entrance examination to confirm the mode of recommended selection setting by the school indeed reached the predetermined selecting effect (Pan, & Lai, 2005).

In recent years, Grey system theory has been more widely used in education. Many researchers used the gray relational analysis (GRA) to analyze the correlation of various factors and to find the factor which the most strongly influences on overall performance. For example: factors affecting scores in the volleyball game (Chang, 2007, 2011), factors affecting quality of the kindergarten (Liu, 2010), designing factors of basketball shoes (Huang, Ho, Peng, Cheng, & Liao, 2009), factors affecting junior high school students to select technical colleges (Chou, & Li, 2001). In addition, the GRA on a math test to identify the degree of the questions difficulty have been applied by many scholars (Sheu, Tzeng, Tsai, & Chen, 2012; Sheu, Tzeng, Tsai, Chen, & Nagai, 2012a, 2012b, 2012c; Sheu, et. al., 2012).

In grey system theory, GM(1,1) model which can find out the prediction characteristic based on small size of data has been widely used in various research fields. For example: assessment of unemployment rate (Huang, & Tsai, 2004; Zhao, 2003), population prediction (Hsu, 2008), price prediction (Peng, 2001; Lai, 2007; Hsu & You, 2007). Currently, in education, some studies have focused on the human resources prediction (Sun, & Chan, 2007), however, there are little

research using this model to predict students' performances in various subjects and to find potential students in some subjects.

In summary, by the use of traditional selection which is whether qualitative or quantitative analysis, the results can only show students' performance at selecting time, and they can't predict a variation of students' scores in the future. Hence, in order to select more correctly students who have stable performance and potential, this study firstly applied the GM(1,1) prediction method to estimate the scores of second semester of fourth grade students' scores of seven semesters from first semester of first grade to first semester of fourth grade. Secondly, this study combined the GM model and GRA theory to improve the traditional method for selection contestant and provides teachers an innovative method selecting contestants based on single subject and multiple subjects.

## 2. Basic Theory

### 2.1 GRA Grey Relational Analysis

The grey system theory was proposed by Deng in 1989. The main points of this theory refer to the relational analysis of related system in uncertainty and incomplete of information, to the exploration of overall system through the prediction and decision manner, combining with mathematical method, to effective solution of the not certainty, multi-input, discrete, and incomplete data (Wen, Chang, Yeh, Wang, & Lin, 2006; Wen, Chou, Chang, Chen, & Wen, 2009). The GRA estimation functions are as following:

#### 2.1.1 Establishing the raw data analysis

Establish the reference vector  $x_0$  and comparative vector  $x_i$  of the raw data. They are defined as follows:

$$\begin{aligned} x_0 &= (x_0(1), x_0(2), L, x_0(k), L, x_0(m)) \\ x_1 &= (x_1(1), x_1(2), L, x_1(k), L, x_1(m)) \\ x_2 &= (x_2(1), x_2(2), L, x_2(k), L, x_2(m)) \\ &\vdots \\ x_i &= (x_i(1), x_i(2), L, x_i(k), L, x_i(m)) \\ &\vdots \\ x_n &= (x_n(1), x_n(2), L, x_n(k), L, x_n(m)) \end{aligned}, \text{ where } i = 1, 2, \dots, n; \quad k = 1, 2, \dots, m \quad (1)$$

### 2.1.2 Calculations of Grey Relational Grade

To calculate with the grey relational grade formula defined by Nagai (Yamaguchi, Li, & Nagai, 2005, 2007), where local grey relation's reference vector is  $x_0$  and comparative vector is  $x_i$ . When  $\Gamma_{0i}$  is close to 1, it means that  $x_0$  and  $x_i$  are highly correlated. On the other hand, if  $\Gamma_{0i}$  is close to 0, the relationship between  $x_0$  and  $x_i$  is lower.

#### (1) The formula of the local grey relation

$$\Gamma_{0i} = \Gamma(x_0, x_i) = \frac{\bar{\Delta}_{\max} - \bar{\Delta}_{0i}}{\bar{\Delta}_{\max} - \bar{\Delta}_{\min}}, \text{ where } \bar{\Delta}_{0i} = \|x_0 - x_i\|_{\rho} = \left( \sum_{k=1}^m [\Delta_{0i}(k)]^{\rho} \right)^{\frac{1}{\rho}} \quad (2)$$

$\bar{\Delta}_{0i}$  means that the absolute difference form two sequences.  $\bar{\Delta}_{\max}$  and  $\bar{\Delta}_{\min}$  means maximum and minimum of  $\bar{\Delta}_{0i}$ , respectively. When  $1 \leq \rho \leq \infty$ , it represents Minkowski's grey relation; when  $\rho = 2$ , it represents Euclidean grey relation.

#### (2) The formula of the global grey relation

$$\Gamma_{ij} = \Gamma(x_i, x_j) = 1 - \frac{\bar{\Delta}_{ij}}{\bar{\Delta}_{\max}}, \text{ where } i, j \in 1, \dots, n; \bar{\Delta}_{ij} = \left( \sum_{k=1}^m [\Delta_{ij}(k)]^2 \right)^{\frac{1}{2}} \dots \dots \quad (3)$$

### 2.1.3 Grey Relational Ordinal

The decision-making is based on the comparison of the grey relational grade  $\Gamma_{0i}$ . After sorting  $\Gamma_{0i}$ , the maximum or minimum impact factors can be found and this can be the ordinal principle of the system.

## 2.2 GM(1,1) Model

Grey prediction is used to proceed prediction on the existing data based on GM(1,1) model. Substantively, it is used to find future dynamic conditions of each element in a series. GM(1,1) model represents the GM model which is first-order differential and had one input variable. The biggest advantage of GM(1,1) model is not too many data needed, least data needed are only four data. In addition, the procedures of GM(1,1) are quite simple (Wen, Chang, Yeh, Wang, & Lin, 2006; Wen, Chou, Chang, Chen, & Wen, 2009). The procedures of GM(1,1) model are shown as

follows:

### 2.2.1 AGO: Accumulated Generating Operation

The grey differential equation of GM(1,1) model is defined as  $x^{(0)}(k) + az^{(1)}(k) = b$ . Although it meets the conditions to constitute the differential equations approximately, it is not true differential equations after all and can't do continuous analysis and prediction for the process of times. The white differential equation  $\frac{dx^{(1)}(t)}{dt} + ax^{(1)} = b$  is used instead of  $x^{(0)}(k) + az^{(1)}(k) = b$  to establish accumulated generating sequences in grey prediction.

### 2.2.2 Finding the mean generation $z^{(1)}(k)$

The parameters  $a$  and  $b$  are calculation and identification of GM(1,1) model parameters, where  $a$  is the coefficient of the development of predictive model;  $b$  is the grey action of predictive model. The GM(1,1) model  $x^{(0)}(k) + az^{(1)}(k) = b$  is defined to meet the following sequence.

$$x^{(0)} = x^{(0)}(k) = (x^{(0)}(1), x^{(0)}(2), \dots, x^{(0)}(n))$$

$$x^{(1)} = x^{(1)}(k) = (x^{(1)}(1), x^{(1)}(2), \dots, x^{(1)}(n))$$

$$\begin{aligned} x^{(0)}(2) &= -az^{(1)}(2) + b \\ \text{and then } x^{(0)}(3) &= -az^{(1)}(3) + b \\ &\quad \text{M} \quad \text{M} \\ x^{(0)}(n) &= -az^{(1)}(n) + b \end{aligned}, \text{ where } z^{(1)}(k) = \frac{1}{2}(x^{(0)}(k) + x^{(0)}(k-1)) \cdots (4)$$

### 2.2.3 Solving accumulated prediction equation of differential equations

Assume the matrix  $Y = B\hat{a}$ , the parameters  $a$  and  $b$  are found based on least square method

$$\text{, where } Y = \begin{bmatrix} x^{(0)}(2) \\ x^{(0)}(3) \\ \text{M} \\ x^{(0)}(n) \end{bmatrix}_{(n-1) \times 1}, \quad B = \begin{bmatrix} -z^{(1)}(2) & 1 \\ -z^{(1)}(3) & 1 \\ \text{M} & \text{M} \\ -z^{(1)}(n) & 1 \end{bmatrix}_{(n-1) \times 2}, \quad -\hat{a} = \begin{bmatrix} a \\ b \end{bmatrix}_{2 \times 1} \cdots \cdots (5)$$

According to the parameters, accumulated prediction equation of differential equations was shown as follows:

$$\hat{x}(k+1) = (x^{(0)}(1) - \frac{b}{a})e^{-ak} + \frac{b}{a} \dots\dots\dots (6)$$

#### 2.2.4 IAGO: Inverse Accumulated Generating Operation

$$\hat{x}^{(0)}(k+1) = \hat{x}^{(1)}(k+1) - \hat{x}^{(1)}(k) \text{ and } \hat{x}^{(1)}(1) = \hat{x}^{(0)}(1) \dots\dots\dots (7)$$

### 3. Selecting Contestants Based on Single Subject

In this section, the difference between traditional method and GM(1,1) method has been compared for selecting contestants based on single subject. Students' scores usually reflect their abilities, and if a competition can obviously show the student performance regarding the needed subject; teachers can select contestants according to students' score of this subject. The study assumed that the time of contestants' selection was at the beginning of second semester of fourth grade and the number of contestants was ten. The selected contestants have been trained on second semester of fourth grade and then participate in competition on behalf of their school at the fifth grades.

The study cases were Chinese competitions which are often organized in the elementary school. Students' scores in Chinese competition reflect their Chinese abilities. The study therefore took students' total scores of seven semesters, from first semester of first grade to the first semester of fourth grade as a basis of estimation (C1~C7 were listed in Appendix). The total scores is selected since it represents students' total performance of that subject.

Before analyzing students' scores, the reliability was test. Cronbach's  $\alpha$  value is 0.962, which means the reliability of Chinese scores is very high.

#### 3.1 Traditional Method

Traditional method has been used to select contestants based on their performance for certain period of time. One of traditional methods which had been frequently applied is to compare students' average scores. This means that students' total average score of seven semesters in Chinese is calculated and then according to average score to rank top 10 of students. Table 1 shows the result of contestant selection based on traditional method.

After sorting based on traditional method, ten selected students are number 4, 28, 12, 29, 21, 16, 26, 32, 22, 3, and 31 (Student 3 and Student 31 are both tenth high score.).

Table 1. Result based on traditional method

Student	C1	C2	C3	C4	C5	C6	C7	Total Average Score	Sort
4	99	98	99	98	99	99	98	98.57	1
28	97	98	98	97	98	99	99	98.00	2

### 3.2 GM(1,1) Method

The advantage of GM(1,1) method is it can predict students' score in future. The purpose of using this method is to select contestants who have stable and potential performance. Similarly, researchers take students' total scores of seven semesters in Chinese which are from the first semester of first grade to the first semester of fourth grade as a basis (C1~C7 were listed in Appendix).

Firstly, using GM(1,1) model to estimate the total score of the second semester of the fourth grade. Then, researchers get maximum value, calculated Gamma value of seven scores according to local GRA and then sorted based on Gamma value. The twenty students who had better score were selected initially. The result based on GRA is shown in Table 2.

Researchers take the twenty students' scores to proceed the prediction based on GM(1,1) method by Matlab software. Students' total scores of second semester of fourth grade in Chinese have been obtained and then sorted based on the scores to select ten students. Though using GM(1,1) method, Students' total performance of second semester of fourth grade in Chinese have been predicted, this can be the ordinal principle of selecting contestants of state of Chinese competition. The ten selected students are Student 28, 29, 4, 26, 31, 32, 25, 22, 1, and 16.

Table 2. Result based on GRA

Student	C1	C2	C3	C4	C5	C6	C7	Gamma	Sort
4	99	98	99	98	99	99	98	1.00	1

### 3.3 The comparison of two selection methods

Table 4 shows the contestant selection's result of both traditional and GM(1,1) methods. The comparison results indicate that 8 of 10 contestants having more stable performance in both methods. This finding demonstrates that goodness of fit of both GM(1,1) and traditional methods are very high.

In term of traditional method students' performance in certain period of time can be seen, however, the variation of student achievement in the future cannot be predicted. Based on GM(1,1) method, this study have proceeded a detailed analysis of 8 contestants. The analysis results showed that only 5 of 8 contestants of fourth grades have Chinese predicted scores is higher than the scores of first semester. The five contestants were student number 28, 29, 4, 26, and 31 respectively. This result represents that these contestants' performance is stable as well sustainable growth potential. And other three contestants (Student 32, 26, and 31) had less predicting scores than their scores of first semester of fourth grade. Moreover, three contestants with trended backward in the future have been represented.

The most noteworthy students were students numbered 1 and 25. The two students' total average scores were both at the age of twelve. They have not been selected according to traditional method, but they have been selected according to GM(1,1) method. Though comparing their predicting score with their score of first semester of fourth grade, it showed the two students had

great progress. Thus it can be seen they had potential performance in Chinese.

Table 4. Results based on traditional method and GM(1,1) method

Traditional Method			GM(1,1) Method			
Student	Total Average Score	Sort	Student	C7	Predicting Score	Sort
4	98.57	1	28	99	99.07	1

3	95.57	10	16	97	96.47	10
31	95.57	10				

#### 4. Selecting Contestants Based on Multiple Subjects

In this section, the difference between traditional method and GM(1,1) method has been compared for selecting contestants based on multi-subject. Because many competitions must combine various abilities, teachers may be biased when they select contestants based on students' score of one subject. At this time, teachers need to consult students' score of various subjects and select contestants according to students' total performance of these subjects. In the same measure, we assumed the time of selecting contestants is the beginning of second semester of fourth grade and ten contestants are selected. The contestants are trained on second semester of fourth grade and enter a competition on behalf of their school when they are on fifth grades.

For example with national primary and high school science fair, most of time students participate as a team, and therefore the students must have the teamwork spirit, and have ability to operate experiment, analyze data, and write scientific article in the activity. If they can go to the final competition, they still need to make the bulletin board and explain scientific experiments in the field. According to the required abilities of students who participate the national primary and high school science fair, researchers took students' total scores of seven semesters in three subjects (Chinese, Mathematics, Nature and Science Technology) which are taught from the first semester of first grade and to fourth grade as a basis (C1~C7, M1~M7, and S1~S7 were listed in Appendix). Since nature and living technology subject is one part of living science subject in the first and second grade students, in the third grade, this subject is divided into separate subject. The score of nature science subject of up first and second grades presents students' scores of living science. Similarly, the reason of choosing total scores is because the total scores represent students' total performance of that subject. Abilities needed and corresponding subjects for

national primary and high school science fair were shown in Table 5.

Table 5. Abilities needed and corresponding subjects for national primary and high school science fair

Ability needed	Corresponding subject
Operating an experiment	Nature and Science Technology
Analyzing data	Mathematics
Writing scientific article and explaining contents	Chinese

Before analyzing students' scores, researchers tested the reliability of seven scores of every subject once again. Cronbach's  $\alpha$  value of every subject is larger than 0.96 (Table 6), which means the reliability of the scores of three subjects is very high.

Table 6. Testing reliability of every subject

Subject	Chinese	Mathematics	Science
Cronbach's $\alpha$ value	0.962	0.964	0.962

#### 4.1 Traditional Method

To continue using traditional method of selecting contestants in last section, researchers selected students based on students' average performance in various subjects in a certain period of time. First, average score of every subject was calculated separately. Then, total average score of three subjects was calculated according to average score of each subject. Finally, researchers sorted based on total average score in three subjects and ten students were selected. The result based on traditional method was shown in Table 7. After sorting based on traditional method, researchers took students' average performance in three subjects in a certain period of time on a basis of selecting contestants of national primary and high school science fair. The ten selected students are Student 4, 28, 29, 16, 26, 21, 12, 22, 32, and 5.

Table 7. Result based on traditional method

Student	Average Score in Chinese	Average Score in Mathematics	Average Score in Science	Average score of three subjects	Sort
4	98.57	97.57	97.71	97.95	1
28	98.00	96.43	96.86	97.10	2
29	97.29	96.57	96.86	96.90	3
16	96.86	96.86	95.57	96.43	4

18	83.29	75.71	82.00	80.33	33
34	79.29	63.57	79.86	74.24	34
10	75.71	58.29	77.57	70.52	35

#### 4.2 Traditional GRA Method

The similarity between traditional GRA method and traditional method is that both methods based on students' average performance in various subjects in certain period of time. The difference between them is sorting method. Traditional method is used to sort and to select ten students based on total average score of three subjects; traditional GRA method is used to get maximum value, to calculate Gamma value of three average scores according to local GRA, to sort based on Gamma value and then to select ten students. The result based on traditional GRA method was shown in Table 8.

Table 8. Result based on traditional GRA method

Student	Average Score in Chinese	Average Score in Mathematics	Average Score in Science	Gamma	Sort
4	98.57	97.57	97.71	1.00	1
28	98.00	96.43	96.86	0.97	2
29	97.29	96.57	96.86	0.96	3
16	96.86	96.86	95.57	0.94	4
21	97.00	95.86	95.86	0.94	5
26	96.29	96.71	95.71	0.94	6
12	97.71	94.57	95.14	0.92	7

22	95.86	95.86	95.00	0.92	8
32	96.14	94.29	94.57	0.90	9

1	95.43	91.14	94.71	0.84	13
14	94.14	92.29	93.86	0.84	14
19	93.43	92.14	93.57	0.83	15
9	94.57	91.14	93.57	0.83	16
20	93.14	92.71	91.29	0.80	17
13	92.29	90.86	93.71	0.80	18
31	95.57	89.57	92.43	0.80	19
33	93.43	90.86	91.43	0.79	20
35	93.86	88.71	92.43	0.77	21
2	90.43	90.71	92.57	0.76	22
27	89.00	88.43	91.29	0.70	23
7	84.57	93.14	94.71	0.70	24
15	90.71	84.86	87.71	0.64	25
17	92.86	83.29	88.29	0.64	26
6	87.43	86.43	86.86	0.62	27
30	91.43	81.43	88.71	0.60	28
23	83.43	84.43	89.14	0.56	29
24	82.86	84.29	89.00	0.55	30
11	89.43	75.57	87.71	0.48	31
8	90.29	74.29	82.14	0.41	32
18	83.29	75.71	82.00	0.38	33
34	79.29	63.57	79.86	0.14	34
10	75.71	58.29	77.57	0.00	35

After sorting based on traditional GRA method, researchers took students' total performance of three subjects in a certain period of time on a basis of selecting contestants of national primary and high school science fair. The ten selected students were Student 4, 28, 29, 16, 26, 21, 12, 22, 32, and 5 equally.

### 4.3 Traditional GRA method of the last three

The same at traditional GRA method of the last three and traditional GRA method is to calculate Gamma value of three average scores and to sort based on local GRA, the difference is the range of choosing scores. The scores based on traditional GRA method were students' scores of seven semesters in three subjects which are from first semester of first grade to first semester of fourth grade, but the scores based on traditional GRA method of the last three were students' scores which were close to current abilities. It referred to the scores which are from first semester of third grade to first semester of fourth grade. The purpose of such selecting is with the increase of subject content, the growth of students' age, the students' performance are not the same. When selecting contestants, teachers will choose the best students of the current performance. The

differences of students' performance are usually small in lower grade; the differences are more and more obvious in intermediate and higher grades. Thus researchers took students' scores of the last three on a basis of selecting contestants. The result based on traditional GRA method of the last three was shown in Table 9.

After sorting based on traditional GRA method of the last three, researchers took students' total performances which were close to current abilities in three subjects on a basis of selecting contestants of national primary and high school science fair. The ten selected students were Student 4, 29, 26, 28, 22, 16, 21, 32, 25, and 5

Table 9. Result based on traditional GRA method of the last three

Student	Average Score of the Last Three in Chinese	Average Score of the Last Three in Mathematics	Average Score of the Last Three in Science	Gamma	Sort
4	98.67	97.33	98.67	1.00	1

34	83.67	61.33	81.00	0.34	34
10	70.00	45.67	71.00	0.00	35

#### 4.4 GM(1,1) Method

Similarly, researchers used the advantage of GM(1,1) method which can predict students' next score to select contestants who have stable and potential performance in three subjects. Researchers took the total score of 7 semesters in three subjects (Chinese, mathematic, and nature science subjects) from the first semester of first grade to the first semester of fourth grade as a base of selection (As listed in Appendix).

Firstly, using Matlab software calculation and GM model to estimate the students' total score of the second semester of fourth grade (see table 10). Then twenty students who had better score in each subjects were selected. From the list of 20 selected students in each subject, the outstanding students in all 3 subjects were selected.

Table 10. Predicting scores in three subjects

Student	Predicting Score in Chinese	Student	Predicting Score in Mathematics	Student	Predicting Score in Science	Sort Every Subject in
28	99.07	26	98.40	26	99.98	1

5	92.22	1	89.17	33	93.15	17
9	91.94	23	89.05	19	92.93	18
19	91.47	14	88.52	23	92.87	19
30	91.47	12	87.32	14	92.54	20

The result in table 10 indicates that sixteen students who are outstanding in all 3 subjects were selected. Researchers got maximum value of predicting scores in three subjects individually, calculated Gamma value of three scores according to local GRA and then sorted based on Gamma value (Table 11). Though GM(1,1) method, Students' total performance of the second semester of fourth grade in three subjects were predicted, this can be the ordinal principle of selecting contestants of national primary and high school science fair. The ten selected students are Student 26, 29, 4, 22, 28, 16, 25, 32, 20, and 5.

Table 11. Result based on GRA

Student	Predicting Score in Chinese	Predicting Score in Mathematics	Predicting Score in Science	Gamma	Sort
26	98.23	98.40	99.98	1.00	1
29	98.68	97.46	99.23	0.97	2
4	98.60	96.80	99.28	0.92	3
22	96.67	98.08	98.28	0.83	4
28	99.07	95.93	97.33	0.78	5
16	96.47	95.94	94.73	0.56	6
25	96.88	92.93	97.54	0.56	7
32	97.54	92.68	95.75	0.49	8
20	95.14	96.81	94.03	0.49	9
5	92.22	95.74	96.20	0.41	10
21	95.74	93.09	94.41	0.40	11
31	98.15	92.91	93.61	0.40	12
1	96.60	89.17	96.01	0.25	13
9	91.94	90.80	94.80	0.15	14

14	93.73	88.52	92.54	0.00	16

#### 4.5 The comparison with four selecting methods

The results based on three traditional methods and GM(1,1) method were shown in Table 12. Though comparing with four selection methods again, it also showed that eight in ten contestants were selected no matter what kind of methods used. This case represented that the goodness of fit of the GM(1,1) method and three traditional methods are equivalent high and similar in multiple subjects. If only comparing the results based on traditional GRA method of the last three and GM(1,1) method, it even showed nine in ten contestants were selected. In these students, Student 25 was not selected based on traditional method and traditional GRA method. Until using traditional GRA method of the last three, the student was just selected. Thus it can be seen, Student 25 can also be selected based on GM(1,1) method, this represented using the method to select contestants can correctly select contestants who have better and better performances and is also a potential contestant.

As mentioned above, the using of three traditional methods showed only students' performance for a certain period of time, cannot predict the variation of students' scores in the future. Similarly, the detailed analysis of eight contestants based on GM(1,1) method found that the predicting scores of two contestants were better than their scores of the first semester of the fourth grade in three subjects. The two contestants were Student 26, and 29 respectively. This results also represented these contestants have stable and potential performance. And another four contestants (Student 4, 22, 28, and 5) had unstable performances, predicting scores of two subjects trended progressive and predicting scores of one subject trended backward. In addition, Student 16 trended backward in three subjects in the future. However, the student was still selected based on traditional methods. The most noteworthy students were Students 25 and 20. The two students' total average scores of three subjects were eleventh and eighteenth. They weren't selected according to traditional methods, but they were selected according to GM(1,1) method. Though comparing their predicting score with their score of the first semester of fourth grade, it showed the two students had great progress in three subjects. Thus, it can be seen they had potential.

Table 12 Results based on three traditional methods and GM(1,1) method

Traditional Method	Traditional GRA Method	Traditional GRA Method of the Last Three	GM(1,1) Method						
Student	Student	Student	Student	C7	Predicting Score in Chinese	M7	Predicting Score in Mathematics	S7	Predicting Score in Sort Science
4	4	4	26	98	98.23	97	98.40	99	99.98
28	28	29	29	98	98.68	96	97.46	99	99.23
29	29	26	4	98	98.60	97	96.80	99	99.28
16	16	28	22	97	96.67	97	98.08	97	98.28
26	26	22	28	99	99.07	97	95.93	97	97.33
21	21	16	16	97	96.47	95	95.94	95	94.73

5	5	5	5	92	92.22	96	95.74	95	96.20

## 5. Conclusions

The purpose of this paper was to select correctly students who have stable and potential performance. The sample of the paper was 35 fourth grade students in Central Taiwan. Researcher used students' learning scores of seven semesters in various subjects which have been taught from the first semester of first grade to fourth grade to predict students' scores of the second semester of fourth grade based on GM(1,1) method. The results were as follows:

- (1) By the comparing between a traditional method with GM(1,1) method, the study found that, whether in single or multiple subjects, the goodness of fit of both methods are equivalently high. The use of both two methods can select contestants who had stable performances.
- (2) Regarding to contestants selection for multiple subjects, the goodness of fit of traditional GRA method of the last three and GM(1,1) method is the highest. This represented that using GM(1,1) method can more correctly select contestants whose performances are more and more good, it also means that they are potential contestants.
- (3) Based on GM(1,1) method, students who had unstable performances have been filtered out. Based on traditional method, it only showed students' total performances in a certain period of time.
- (4) Regarding contestant selection, the combination of GM(1,1) method and grey relational analysis to sort students according to their scores in various subjects can improve traditional method. This method is an innovative method to provide teachers for selecting contestants both single subject and multiple subjects.

*Creative Learning Space: A Re-shaping of KMUTT Landscape Master Plan Towards Sustainable University*

Apinya Limpai boon

0287

King Mongkut's University of Technology Thonburi, Thailand

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

This research is about the re-shaping of spatial development to achieve sustainable future of King Mongkut's University of Technology Thonburi (KMUTT), a polytechnic institution as first initiated, which is to become a multidisciplinary university. KMUTT was ranked 17<sup>th</sup> in UI Green Metric Ranking of World Universities 2010 and 47<sup>th</sup> in 2011. Now, we are facing the challenge of the following issues: (1) How to keep up with our record, how to achieve better Green Index and how to sustain it? (2) Is the image of green within the perception of KMUTT community and considered as the KMUTT identity? (3) How to build *the Green Heart Leader* among our students? Thus, this paper aims to demonstrate the roles of integrated learning space which has been superimposed onto the university master plan in order to transform the campus space and infrastructure towards sustainable green and clean university. The reshape of landscape and functions will make the green concept visible. As an integrated learning garden, it will facilitate teachers and learners to bring knowledge out of classroom or laboratory, and to share and interact with others in public spaces. It will encourage and support KMUTT community members to carry out activities which promote green awareness. Hence, the development of Creative Learning Space will be used as a key driven mechanism to build green heart society and knowledge community, which is the core value of KMUTT.

**Keywords:** Sustainable Green and Clean University, Creative Learning Space, Green Heart Leader, Transformed campus spaces

## 1. Introduction

King Mongkut's University of Technology Thonburi (KMUTT), Thailand was known as a skillful polytechnic institution since it was established in 1960. Its first objective was to train technicians, technical instructors and technologists (Planning Department, KMUTT, 2011). After 50 years, KMUTT developed its role to serve Thai society as one of the leading institutions in science and technology. KMUTT's educational role keeps changing according to the expectation of industries and society, so as to the teaching and learning methodology that support the activities of staffs and students. Its direction is to be a multidisciplinary university which collaborating among science, technology and creativity. The long term goal is to construct a lifelong learning behavior in our students. The desired change in students' learning behavior requires an environment which facilitates and enhances them in terms of physical and digital systems. Recently, KMUTT has announced its role as leader in green innovative research university with its focus on environmental technology contributes to the society. The effort outcome in environment and energy management is being ranked the 17<sup>th</sup> in UI Green Metric of World Universities 2010 and 47<sup>th</sup> in 2011 (UI, 2011). Despite its good record, KMUTT has been struggling to build its identity as green even among its own community. Now, we are facing the challenge of how to make it visible to all and sustain a green record and how can our students become change agents in sustainable development. This paper demonstrates Physical facility Management Unit (PMU)'s work of place making to provide an effective integrated learning space in green in order to tackle 2 tasks, to make sustainable green and clean campus visible and to encourage knowledge-based community.

## 2. Reviewing of the relationship between space and learning

The study of learning spaces has been increasingly discussed among educators and learners over recent years. Many schools, colleges and campuses have altered their classrooms, and offices to be more informal learning spaces such as learning coffee corners, informal seating areas, corridor alcoves or social hubs, equipped with technological support system. An attempt lies within the assumption that in providing more informal, flexible and social interaction spaces in institutions will shift or change the conventional teaching learning model that limits self-wisdom (JISC, 2006). In the book *21st Century skills: Rethinking How Students learn*, Bob Pearlman talked about "Designing New Learning Environments to Support 21st Century Skills" that schools are now be able to move away from teacher-directed to learner centered workplace for a collaborative culture because of technology skills. He underscored that 21st century knowledge and skills are not only built upon core content knowledge, but also they include information and communication skills, thinking and problem-solving skills, interpersonal and self-directional skills, and the skills to utilize 21st century tools, such as information and communication technologies. Eventually, this new pedagogy requires a change in physical learning environment (Pearlman, 2010). Learning innovators commonly argued about learning places beyond classroom that can accommodate casual learning such as extended studying areas and collaboration zones. Pearlman reviewed the new learning spaces in 5 institutions in U.S.A. and U.K. and concluded that though the design is different in all, the common facilities are the space for individual work, small-group work, cross-disciplinary group work, casual lectures and talks, presentations, breakouts, and cluster meetings.

In case of Thai higher education, high competition in globalization stimulated the search for local knowledge and wisdom. Paitoon Sinlaratr (Sinlaratr, P., 2008) mentioned the paradigm shift of higher education learning model that requires 7 necessary key points in post-globalization. Some of those are to train critical thinking skills and creative ideas, to encourage individualization as well as socialization, and to build new network of knowledge by collaboration and interaction.

In KMUTT case, we realized that a space facilitating self learning would strengthen the 21st century learning behavior and then would lead to lifelong learning of our graduates. Traditional classrooms and laboratories are still important to build core knowledge and research skills, but how to bring that knowledge out to share with others is equally important for sustaining the continuity of learning. Thus, this paper demonstrates a plan to transform the entire 52 acre KMUTT campus including most building first floor into creative learning spaces and to transform the campus core space to be a common learning garden. Through the integrated common open space approach, KMUTT is expected not only to utilize its limited space as shared space but also to construct the inside-out learning behavior among its communities.

### **3. Methodology of the study**

The method of study has been conducted through the critical thinking process from data gathering and reviewing stages to planning and designing. The critical thinking process for the study of transforming KMUTT into creative learning space involves

- review and analysis
- goal setting
- proposing revised infrastructure master plan
- mapping the role
- reviewing the organizations related
- designing the physical development plan.

In order to determine the possibility of KMUTT's potential to transform its space towards sustainable learning spaces, 3 main factors have to be taken into account. They are physical environment, policy, and users. The study has been conducted through literature review, interview, measurement and stakeholder meetings. The role of learning space was mapped onto the existing school plan and structures according to potential of each zone. Finally, the learning space model as well as physical development plan is published to get feedback since it should be a common understanding of KMUTT communities to utilize space with the same direction as an overall policy.

### **4. Review of KMUTT policy towards sustainable direction: From philosophy to visibility**

In 2006 KMUTT laid the roadmap for its vision in 2020 as follows:

1. Committed to the Search for Knowledge, "Lifelong Education"
2. Determined to be at the Forefront of Technology and Research
3. Maintaining the Development of Morally Correct and Proficient Graduates
4. Endeavoring for Success and Honor in order to be the Pride of Our Community
5. Striving to Become a World-Class University

Recently, KMUTT has announced its positioning as a pioneer in green innovative research university with its focus on environmental technology which is advantageous to the society. The strong emphasis is placed on knowledge integration between its members and collaboration with society.

#### 4.1 Policy on Sustainability

KMUTT has announced the direction towards Sustainable Green University called KMUTT Sustainability Policy Plan since 2005. Its mission is to educate the students and encourage them to learn outside classroom and transform our campus as an ideal environment for developing awareness and innovative solutions to problem that will improve the world for current and future generations. The policy aims to support the development of sustainability leadership in all activities from operations, and teaching, to conducting research.

KMUTT commitments to sustainability are (EESH, KMUTT, 2012),

- To be a Green University providing a role model on Energy, Environment, Safety Management Systems, promoting the application of all these activities within the university.
- To strive for continual improvement in energy, environment and safety management systems to help achieve sustainability for all.
- To make our students and staff to be change agents for helping community & society in making a better quality of life by expanding the good Energy, Environment Safety management system to surrounding communities and societies.

The continuous policy has been constantly executed accordingly through the administrative and knowledge management system. However, the knowledge in green technology is still limited in specific groups of experts, so as to the green management. The perception in green or sustainability remains unrecognized by all to be KMUTT identity because the tangible campus environment has not yet reflected the matter. To bring green knowledge and innovation down to accessible green open space would make the sustainable university campaign visible to all. The school's serious action to build campus green space will bring back sense of belongingness and KMUTT pride of all stakeholders and will encourage them to participate and contribute more in the commitment towards sustainability.

#### 4.2 Policy in Learning

Based on KMUTT Roadmap 2020, the mission to construct new approach to learning and network, and to utilize resources for learning is integrated into every level of action plans. KMUTT has set 6 targets plus 1 student core value called 6+1 flagships to be strategic approaches for Development Plan11 (2012-2016). After several meetings, some requirements of facilities were identified to support 6+1 flagships such as,

##### **25 January 2011 Retreat: The Making of Plan11**

- Educational display
- Learning media by students
- Knowledge museum
- Alternative learning Space throughout the entire University
- Space for multidisciplinary-task working
- Enrichment atmosphere
- Space for knowledge interchange
- Street performance (for social +KMUTT)

Social distribution (education+ green space)  
Space management and effectiveness  
Most utilized space (24 hour University)  
Safety space  
Digital learning space  
International center

Hence, the university space needs to re-organize, alter and transform to support those activities. The design of learning garden should answer to those requirements and more.

## 5. In making of creative learning space

The policy on sustainability and learning has been put into action plan to transform the campus common ground into an ideal environment for developing environmental awareness and providing integral learning atmosphere. At present, the campus open spaces are scattered, lack of linkage and appropriate flow with low safety and sometimes conflict with other activities. Most spaces are not in good design and have not been assigned appropriate functions. PMU is appointed to do a revised master plan study for KMUTT at Bangmod as a creative learning space for KMUTT members, visitors and surrounding communities, which is commonly called learning garden or Education Park.

Refer to KMUTT philosophy (KMUTT, 2002), “**Education Park** means a beautiful shady place that provides peaceful atmosphere, encouraging enthusiasm for intellectual dialogs and new ideas, that support KMUTT to produce young graduate with greater knowledge and virtue for improving our society . The pleasurable park atmosphere will make users inside the garden feel fresh and comfortable, so as to have open-minded for new things and eagerness to exchange opinions”. KMUTT learning garden is creative environment that will respond to users’ behaviors and interaction, will foster knowledge by bringing out the research and innovation from classrooms to KMUTT communities and its neighbors.

In making creative learning space, 4 key components are needed,

- **Space**
- **Learning**
- **Design**
- **Driven mechanism**

### 5.1 Space: Reshaping the space towards sustainability

To construct the integrated learning space in campus common ground, the important tasks KMUTT management team has to agree upon are,

Restructuring the campus towards Green Index,  
Re-shaping Campus master plan to win back public space,  
Transforming the entire campus to be learning, living, sharing place,  
Encouraging digital-learning and casual studying,  
Creating a sense of belonging and identity of green.

From the infrastructure plan which was clustered with workshops, traditional classroom and laboratories. All those buildings were occupied by heavy tools, chemical or mechanical devices for specific groups. The review of existing condition was done to increase the amount of public space. Winning back the public open space is the concept to alter private occupied space to be shared common space. In KMUTT plan 9 (2002-2007), the revision of KMUTT

master plan at Bangmod campus has drawn a guideline for infrastructure and open space development. At the end of 2011, the central area of 20 acres was cleared to be public open space connected to semi-open space on the first floor of every building. Those common grounds will serve as the main pedestrian axis to increase a chance of interacting. The master plan 2006 guideline for open space (Limpaiboon, A., Opartpongsakorn A., 2006) stated that,

- University should have adequate safe green space
- University should have public space to support community activities
- University should have space for interaction and demonstration
- Every building should have personal space for reading, group working, relaxing
- Everyone must respect space for public
- All of these should be in easy and good maintenance

Fig. 1: A revised masterplan 2006 shows the demolishing of some old workshops to transform the central area to common open space

### Restructuring campus route

Energy saving and environmental friendly is a main concern for planning. Since Bangmod campus is not big in size, alternative travelling by non-fuel mobility is appropriate and possible to be a major linkage. The shady 2 pedestrian corridors will provide convenient connection of the north-south, east-west zones in shortest distance to access every building. Slow travelling mode also provides a chance of observation and social interaction when they move through the park and pass by the activities along the way. Moreover, the continuous green corridor will unit plots of learning spaces local among campus buildings and demonstration sites together as living museum.

Traffic calming techniques such as sharing road space, loop road and limited entrance-exit are used to direct vehicles. Parking building is built on the front to reduce traffic volume in academic zone.

- The revised conceptual master plan has been proposed to be pedestrian approach, so the inner loop will be car, and bicycle free zone.
- Walking is first priority by direct axis, second is bicycling as inner loop, and the vehicle and service will access from ring road.
- East-west pedestrian axis is the linkage from surrounding neighbors to campus, North-south axis is main linkage from dormitory to academic zone

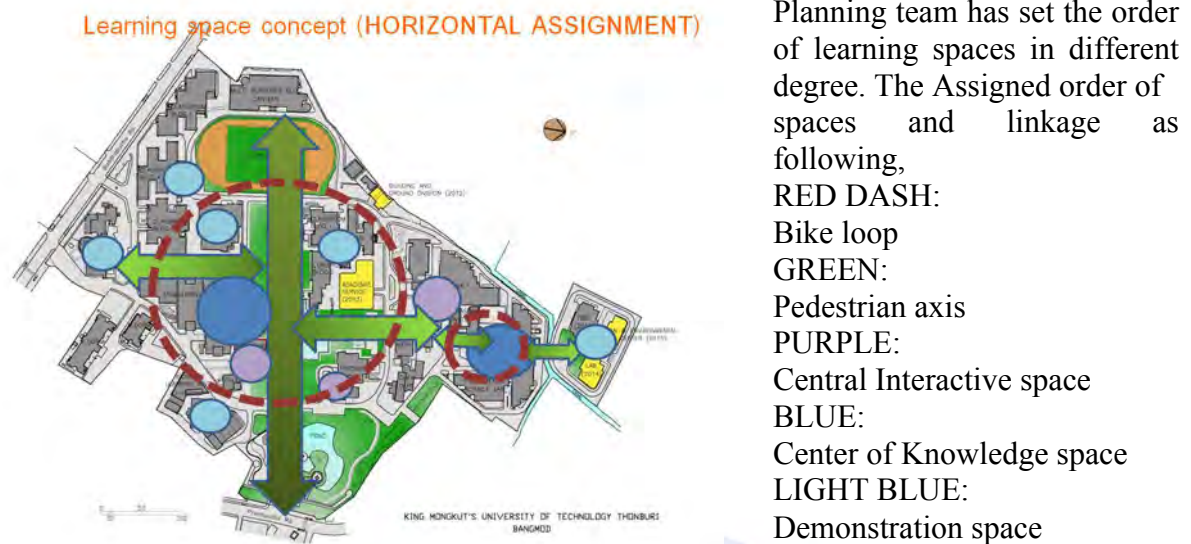

Fig. 2: A Learning space plan 2011.

### Mapping the Learning Space

After KMUTT had announced to construct learning space throughout the entire campus, a plan to utilize all first floors as more public necessitated most buildings to reorganize and redesign their space. Primarily, the role of learning spaces has been assigned to create priority, varieties and dynamism that bring visitors move through the campus like they are walking in a living museum. We have to re-think of space usage from knowledge in Science and Technology to ignite the Imagination and Innovation. KMUTT Interpretation Center and its park create chances of social-interaction to develop soft skill as well as inspire intelligent activities.

Fig. 3: Assigned role of learning space to map the Space for Creative Learning in campus

## 5.2 Learning: Space needed for learning behavior

The model of physical spaces used in KMUTT learning space was adopted from The Seven Spaces of Technology in School Environments by Evan McIntosh (McIntosh, 2010), the type of physical spaces needed to encourage 21st Century learning habit. Those 7 learning spaces are, Individual Space, Group Space, Publishing Space, Performing Space, Participation Space, Watching Space, and Data Space.

He talked about how to map technological spaces to physical ones to adjust the physical school environments to harness technology even better. Whilst he compared interior spatial arrangement to technological spaces (facebook, google etc.), those space terms are also commonly used in behavior settings of built environmental design in landscape architecture.

In KMUTT case study, we reviewed the learning behavior in 1<sup>st</sup> floor library spaces after its renovation based on the 7spaces, and how users respond to each area. We found that the design varieties of seating and flexible furniture arrangement attracted more teenagers and modern instructors than conventional adults. The user friendly learning environment becomes a favorite place for group appointment or even casual class lectures.

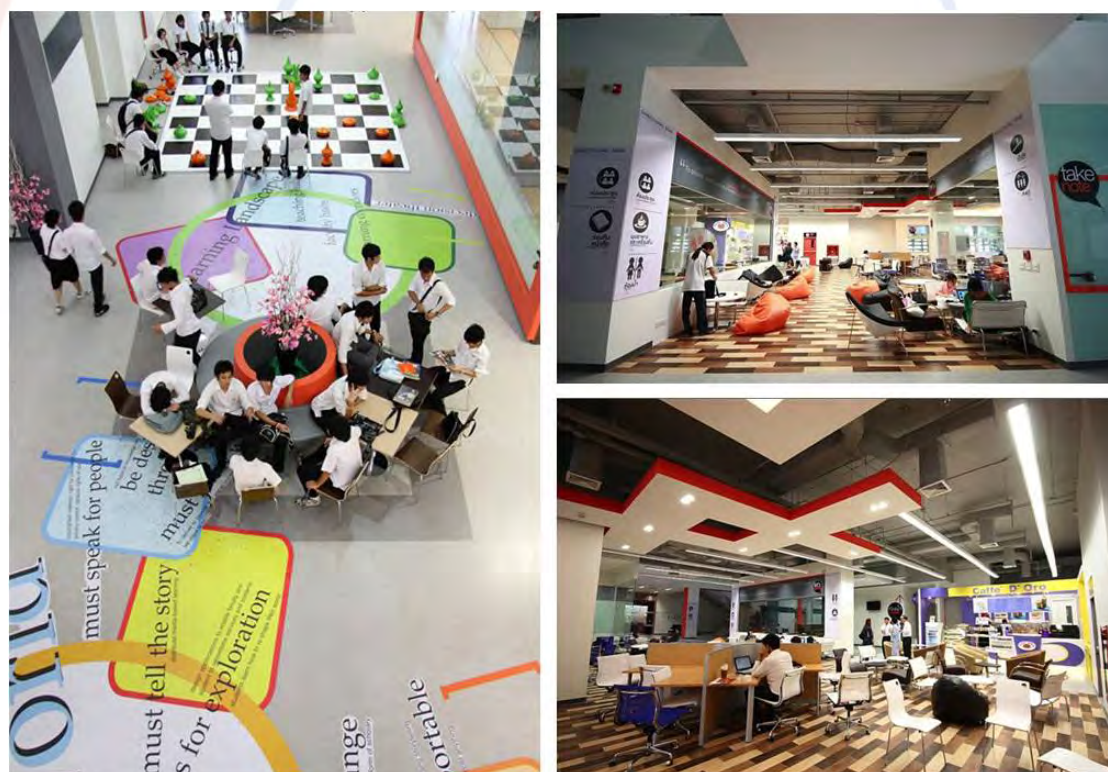

Fig.4: The example is the adaptation of KMUTT library space to be casual learning space which students enjoy working sharing in casual atmosphere.

PMU applies those seven learning spaces on the entire campus in order to transform our semi public and outdoor areas into common ground of lifelong learning. The inside-out model of learning will be developed naturally as well as the soft skills in interacting with others. The critical thinking skill will be integrated not only in their learning but also in their living. Thus, it becomes a behavior of learning anytime anywhere and any way. The self-wisdom which is the true knowing will urge them to expand their knowledge to others. The space that provides

chance of interaction and performance will inspire idea exchange and discussion to construct new knowledge. As a result, that knowledge is not limit only in lessons.

Learning anytime any way and anywhere

Learning should happen anywhere and anyhow. Students will develop the life-long learning habit, but then the environment should provide opportunity and raise their curiosity. The outside-in model is to create the spatial environment with the green innovative contents and facilities, so users will be inspired by the surrounding and will generate new ideas. Creative environment in green or *learning garden* is the environment that fosters opportunities, raises curiosity, encourages opinions and supports learning behaviors.

### 5.3 Design: Designing the Learning environment in green (*Learning garden*)

The well designed, effective planned space is very important to create the inside-out model of learning. What is important is that the spatial design should link to the institution's vision and strategic mission in teaching and learning. The KMUTT learning spaces should be a physical representative of its core value intersected with its diverse creativity and cultural resources that are built over time. The transformation of central space to be common learning garden will have high impact in creating a sense of belonging and unity as well as promoting healthy community and diversity in school. This will make the space itself sustainable and will become the valuable asset of the institution.

Fig.5: The Landscape master plan for KMUTT learning garden

Strategic Image: Green and Clean atmosphere

The image of the park is built upon these criteria,

- The park should reflect the identity and culture of the institution
- The activity should support community involvement in liberated and creative culture
- The atmosphere should inspire curiosity, creativity and casual learning
- The areas should be flexible and enterprising
- The zonings should strengthen sharing and public contribution
- The overall manner should be international learning atmosphere
- The holistic approach should be green and clean campus

### Outside-in: Towards sustainable campus

The content of sustainable green is the main theme of learning garden. The place will support KMUTT community to bring green knowledge out of laboratory and classroom to demonstrate and share in outdoor and semi-outdoor spaces. The space will encourage a chance of casual learning in natural light. The infrastructure must provide convenient non-fuel mobility and digital-learning to reduce use of resources.

### Content: Innovative Park

Creative Learning Space concept made visibility: Green approach/passive energy saving /Green image. The design of central space or learning garden is the integration of green knowledge and green technology into landscape design to allow users to have access to knowledge while they are walking through or while they are in the garden. The using of green technology in designing the spaces is the attempt to encourage users to think and to be involved in green advocacy.

### Functions: Integration of Learning Spaces.

The 7 learning spaces are integrated to each zone in the park to support various learning behaviors. Fig.6 is the gallery of space examples in Wetland zone.

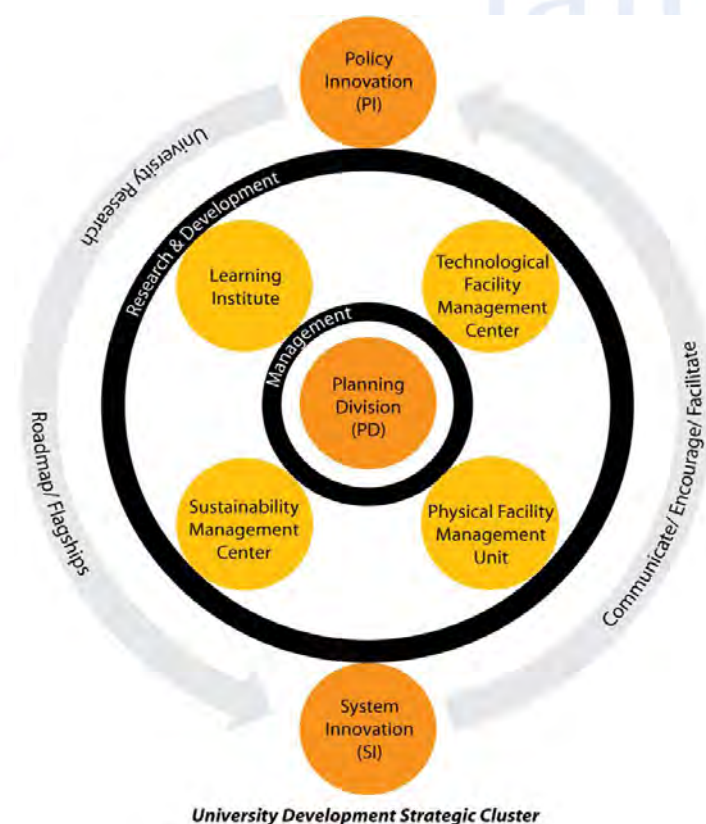

Fig.6: The example of idea in making the garden that response to learning behavior, 7 learning spaces are applied into designing each zone of the garden

#### 5.4 Driven mechanism

The least but not last important component is the “driven mechanism”, the working collaborations among related strategic clusters. It is the most significance to make the learning space sustainable (Mengveha, 2012). From policy to plan, from plan to implementation and from implementation to action, every unit must be geared towards the same direction. Teaching learning methodology has to change and the management needs shift how it works, the communications should be delivered to all stakeholders.

The 4 clusters to assist Planning Division are,

- LI or Learning Institute: Develop research methods, learning tools and curriculums to facilitate learning efficiency of KMUTT staff, students and Thai citizens. This unit is in charge of the Learning teaching programs.
- Sustainability Management Center (former EESH): Develop and manage activities towards sustainable energy, environment, safety and health. Mainly, this unit mainly runs the green and clean program and activities.
- TM or Technological Facility Management Center: Develop learning environmental system in terms of technological support such as e-kmutt project. This unit is in charge of technological support.
- PMU or Physical facilities Management Unit: Develop spatial learning environment system and conduct physical design and planning. This unit is charge of physical facilities and infrastructure support.

System Innovation (SI) and Policy Innovation (PI) are 2 Units to gear the collaboration model.

PI is in charge of policy direction and SI is in charge of developing the system that manages and facilitates the school development

*Investigation on Social Interaction and Learners' Perception in a Virtual World*

Min-Tun Chuang, Hsin-Chieh Chen

0289

National Chiayi University, Taiwan

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

The aim of this study was to investigate learners' social interaction and perception of English learning in a virtual world, Second Life. More specifically, the use of social strategy and affective strategy of language learning in a virtual world were examined and compared with a traditional classroom. College English majors of a University in Southern Taiwan were the participants; they were all native Taiwanese and speakers of Chinese Mandarin. The six experiments were scheduled for two hours every week over six weeks in a period. The data was collected and analyzed in qualitative and quantitative methods from surveys and interviews. The results of the quantitative data showed little social and affective strategy used by learners in a virtual world. However, the results from the quantitative data revealed the importance of sociability and a certain degree of satisfaction of English learning in a virtual world. This study showed learners' motivation and perception increased significantly and learning experiences were positive in a virtual world.

Key words: Virtual world, Second Life, learners' motivation, learners' perception, social and affective strategies

iafor

[www.iafor.org](http://www.iafor.org)

## INTRODUCTION

The purpose of this study was to investigate learners' perception and motivation of language learning in a virtual world, in terms of social and affective strategies. It examined how well they perceived and how they were motivated by a technology-enhanced language learning environment, Second Life (SL). Furthermore, to explore the applicability and flexibility of the SL used in educational purposes. Most Taiwanese students had less confidence and a lower speaking competency due to the lack of adequate opportunities and situations to use English for communication. Hence, providing learners with a situated learning platform and ample interactive classroom activities to carry out meaningful conversations was necessary for any future advancement in education. Computer-assisted language learning, virtual learning, teaching method, learning strategies, and motivation in language learning were elaborated.

## Literature Review

### *Computer-Assisted Language Learning*

Computer-Assisted Language Learning (CALL) refers to a technology that facilitates language learning. Since the 1980s, the CALL had gradually shifted its focus towards learners and was regarded as a tool controlled by learners (Kern & Warschauer, 2000). Wiebe and Law (2005) noted its effectiveness and impact on learner development and also pointed out the CALL had provided a wide range of beneficial features to the learning process. However, learners' perception toward technology use also needed to take into consideration. Perceived usefulness and perceived ease of use were two key predictors that presented perception of technology use. Perceived usefulness was defined as the degree of one's' belief to use technology that enhanced performance (Davis, 1989) and it had been applied in the context of personal use of technologies outside the workplace as well (Venkatesh & Brown, 2001). Davis stated that perceived ease of use was defined as ones' effort required when using the technology processing for the perceived extent. Besides, perception of technology played a crucial role in predicting and determining learners' acceptance of technology use, and defined perceptions as a motivation for learners to use a technology. They believed technology helped them perform better and potential users perceived it as easy to use.

### *Virtual Learning*

Virtual worlds were defined as 3D online virtual environments (Schiller, 2009), simulated and immersive environment with graphical representations (Shen & Eder, 2009). IbÂñez et al. (2011) pointed out virtual worlds were 3D interactive simulations which immersed

participants into learning situations where they practiced and received an individualized feedback. Simulations involved real-life situations that promoted student's engagement (Shih & Yang, 2008). Lam (2004) claimed that learning in a 3D game-like virtual world reduced learners' anxiety while having face-to-face conversation; language learners felt more comfortable, confident, and became fluent in an online chat room while speaking English as their second or foreign language. The SL was one of the active virtual worlds in higher education. The SL, a game-like platform that combined academic concepts and meaningful plays, provided a stage for learners immersed in the target language community and socialized in an online virtual room through chat, telegrams, emails and complete task-based quests. In rich graphic object-oriented worlds, themes of social responsibilities and educational quests, learners obtained more chances to use English, became more familiar with English and further increased their language production.

### ***Teaching Method***

Britto (2007) stated every method influenced the practices, reflected that moment of the educational fashion, and affected the institutional setting and the selection of materials available. Leah (2012) stated that every teaching method had its own significant advantages and valuable strengths. Norman and Spohrer (1996) identified that the teaching methods were the key elements toward teaching and learning. Hence, teachers generally alternated teaching methods according to the learners' age, language proficiency, curriculum design, school policy or other concerns. Task-Based Language Teaching (TBLT) appeared to develop the classroom practices and procedures which were based on communication and meaning (Britto, 2007). Ellis (2003) called the TBLT a stronger version of the Communicative Language Teaching since it provided the basis for the entire language curriculum. The TBLT involved real communication, meaningful tasks, meaningful learning that supported learners' language knowledge (Robinson, 2011). It also required learners' problem solving skills, such as, learners interacted communicatively and solved the given tasks purposefully. Moreover, instructional materials of the TBLT were able to be adapted for various situations, for example, a wide variety of media, such as newspapers, television and the Internet, were used as teaching materials. Those were designed as "task focus" or "task-based activities (Richards & Rodgers, 2007).

### ***Learning Strategies***

Learning strategies were important toward foreign language learning because of several reasons: firstly, learners were mentally active and had control over their own learning. Secondly, proficient strategy users learned faster on new contents (Chamot, Uhl & others, 1990). Learning strategies assisted learning tasks which achieved highly successful performances. Learning strategies were classified into direct and indirect strategies:

cognitive, memory and compensation were direct strategies (Chamot, et al., 1990); metacognitive, social and affective strategies were indirect strategies. Strategies should be integrated into regular curriculum and it works better if the teaching materials are challenging.

Affective strategies were the techniques that helped learners gain better control over emotions, attitudes, and motivations toward language learning which involved self-talk, the redirecting of negative thoughts about one's capability (Noormohamadi, 2009). Both were regarded as crucial criteria for language learning. Affective strategies helped learners' lower their anxiety, encouraged them and took their emotional temperature (Oxford, 1990). Affective filter of the learner was pointed out as one of the very biggest influences on the success or failure of language learning by Oxford. Social strategies were considered as actions which involved other people in the process of language learning, such as asking questions, interacting with other people and empathizing others (Noormohamadi, 2009). Asking questions helped learners acquire the intended meanings, and further assisted understanding. It also encouraged learners to continue a conversation in a meaningful way. Empathy was trying to understand and feeling someone else's perspective.

### ***Motivation in Language Learning***

Learning motivation was also regarded as the assessment and expectation of learners toward specific learning purposes (Wigfield & Eccles, 2000). Motivation was one of the keys that influenced the successfulness of language learning (Dörnyei & Otto, 1998). Gardner (1985) identified motivation as the most influential factor in learning a new language. According to Gardner, a motivated learner was eager to learn the language and willing to pay with effort to sustain the learning activity. A highly-motivated learner wanted to learn the language, enjoyed learning the language, and strived to learn the language (Gardner, 1985). Motivation had been considered crucial in the concept of language learning. First of all, Wu and Marek (2010) stated learners' motivation played an important role in learner-centered and active learning experience. They found motivation increased when learners felt more comfortable interacting in English. Second, Lopez (2010) explained there were some scholars and researchers interested in learners' motivation which related directly to learners' expectations for success and accomplishments if these learners contributed to effort and persistence (Eccles, 2005; Wigfield & Eccles, 1992). Third, motivation improved the consequence of negative learning experiences that motivated the learners (Sakai & Kikuchi, 2009).

### **Research Problems of This Study**

Previous literature reviews placed an immense focus on virtual learning in the classroom or

for educational purposes (Wagner & Ip, 2009; Warburton, 2009; Shen & Eder, 2009). However, few studies mentioned the design of teaching content and task design. Besides, the studies of using technology to motivate learners were limited (Reber, 2005; Issroff, 1994). The present study designed the tasks and activities as well as constructed teaching materials by the researcher and embedded the learning materials in a virtual world, which showed a distinct difference from other studies. Tasks were designed based on engaging learners into activities; having more interactions with other learners and helping them gain problem-solving skills.

### **Statement of Research Questions**

Inspired by the prior studies and current trend of using technology in second language learning and learning languages in a virtual world, the researcher examined participants' perceptions and motivation in terms of the use of social and affective strategy in a virtual world and compared the results with the traditional classroom. Furthermore, the future academic application of using the SL as an instructional tool was visible. The researcher examined the following four research questions:

RQ1: What were the differences in social strategy used between a traditional classroom and a virtual world?

RQ2: What were the differences in affective strategy used between a traditional classroom and a virtual world?

RQ3: What was learners' motivation toward language learning in a virtual world?

RO4: How did learners perceive language learning in a virtual world?

## **METHODOLOGY**

### **Settings**

The six experiments all took place in a traditional classroom as well as a computer lab of a university located in southern Taiwan. Every experiment took two hours a week over a six week period. This study was conducted in a pre-paid land called Ben's Lab constructed by a graduate student whose major was E-learning Design and Management (see Appendix A). Participants could take the elevator to different floors (see Figure 3.1).

Figure 3.1. Participants took the elevator to different floors

### Participants

There were fifty four participants engaged in total and they were divided equally into a control group and an experimental group. There were twenty- six participants in each group. They were all freshmen of a Taiwan university's Foreign Language Department. Mandarin Chinese was their first language and English their second language. They had no experiences to either live or study abroad. Their English proficiency was approximately the intermediate-level of the GEPT.

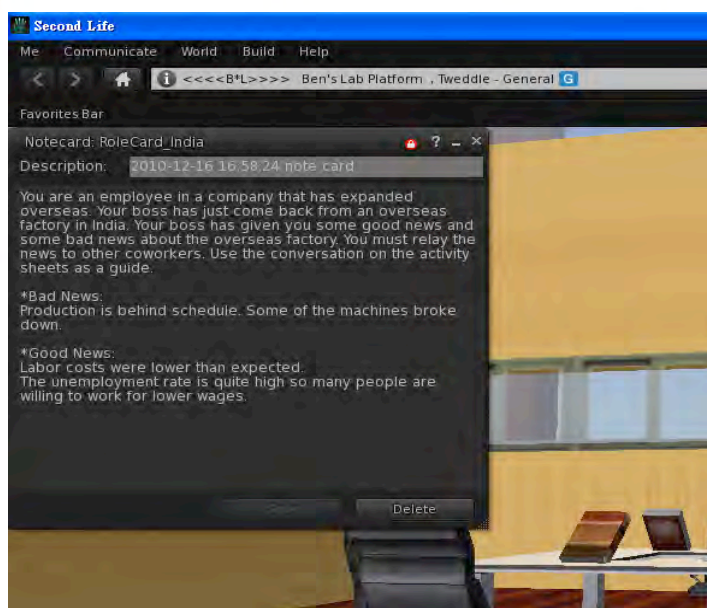

### Research Instruments

The study used mixed-methods to collect quantitative data from the *Virtual Task LLSA survey* and qualitative data from the individual interviews. All of the participants received and responded to the *Virtual Task LLSA survey*. Among these participants, the top three who had the highest and the lowest evaluation were selected for interviews. The data was collected and analyzed by comparing the data between a virtual world and a traditional classroom.

The *Virtual Task LLSA survey* was adapted from Strategy Inventory for Language Learning (SILL) (Oxford & Ehrman, 1987) and modified by the researcher. There were four sections in the *Virtual Task LLSA survey* (see Appendix B). The first three sections was a five likert-scale and the last section was open-ended questions. The scale ranged from 1 (strongly disagree) to 5 (strongly agree) that reflected the level of agreement on the statements. Individual interviews were conducted to ask participants who had the highest and the lowest scores on the sections of Perception toward the learning environment and Attitudes toward the SL on the *Virtual Task LLSA survey*. There were four opened-ended questions prepared that asked the top three highly-motivated and the top three less-motivated participants (see Appendix C).

## Teaching Materials

The teaching materials in a virtual and a traditional classroom were the same, based on a book called *Communicating in Business*. It was a school textbook used in the course of English Communication and Negotiation during that semester. *Communicating in Business* was a book for Business English students which stressed on presenting, negotiating, telephoning, meetings and socializing skills. The titles of these six lessons were, “Knowing what you want,” “Getting what you can,” “Not getting what you don’t want,” “Making meetings effective,” “Sorry to interrupt, but...” “What do you mean by...?” The instructional materials such as role cards, objects’ labels, note cards, illustrations, audio clips and virtual bulletin boards (see Figure 3.3), were in English displayed in Ben’s Lab. Role cards and note cards provided participants with extra and alternative information of tasks (see Figure 3.2). The activities in these six lessons were designed for learners to interact, communicate, discuss and negotiate (see Table 3.1). Through these lessons, learners were able to use and practice English.

*Figure 3.2. Role cards and note cards provided extra and alternative information*

Weekly Lesson	Activities
Knowing what you want	<ul style="list-style-type: none"> <li>• types of negotiation</li> <li>• preparation for a negotiation</li> <li>• making an opening statement</li> </ul>
Getting what you can	<ul style="list-style-type: none"> <li>• bargaining and making concessions</li> <li>• accepting and confirming</li> <li>• summarizing and looking ahead</li> </ul>
Not getting what you don't want	<ul style="list-style-type: none"> <li>• types of negotiator</li> <li>• dealing with conflict</li> <li>• rejecting</li> <li>• ending the negotiation</li> </ul>
Making meetings effective	<ul style="list-style-type: none"> <li>• what makes a good meeting</li> <li>• chairing a meeting</li> <li>• establishing the purpose of a meeting</li> </ul>
Sorry to interrupt, but...	<ul style="list-style-type: none"> <li>• the structure of decision making</li> <li>• stating and asking for opinion</li> <li>• interrupting and handling interruptions</li> </ul>

---

What do you mean by...?	<ul style="list-style-type: none"> <li>• asking for and giving clarification</li> <li>• delaying decisions</li> <li>• ending the meeting</li> </ul>
-------------------------	---

---

### Data Collection Procedure

There were four phases of this study: preparation, instruction, quantitative data collection and qualitative data collection. Data collection procedures were introduced as follows (see Table 3.2). On phase 1, a tutorial tour was given of the SL which lasted for two hours. During the tour, the instructor guided the participants to register an account and then showed them how to be teleported to Ben's Lab. On phase 2, six lessons were taught in SL. Every lesson covered one theme and the lesson lasted for two hours. On phase 3, pre and post the *Virtual Task LLSA* surveys were given to forty four participants before and after the experiments. On phase 4, qualitative data collection was noted from interviewing the top three highly-motivated and less-motivated users.

Table 3.2. Data Collection Procedure

Phase	Time	Data collection Procedure
Phase 1: Preparation	1 lesson (2hrs)	Tutorial (Second Life)
Phase 2: Instruction	6 lessons (12hrs)	Instruction covered 6 themes
Phase 3: Quantitative Data Collection	1 lesson (2hrs)	Administrating the Virtual Task LLSA survey
Phase 4: Qualitative Data Collection	2 lessons (4hrs)	Interviewing six participants from a virtual world (three highly- motivated users; three less motivated users).

---

### Results

In this chapter, quantitative and qualitative methods were used to analyze the data from the *Virtual Task LLSA* survey and the individual interviews. First, the quantitative results of learners' social and affective strategy use were introduced. Then, quantitative and qualitative data from individual interviews of learners' perception and motivation of virtual learning were discussed descriptively and statistically.

RQ 1: What were the differences in social strategy used between a traditional classroom and a virtual world?

Independent sample *t*-test statistical analysis was used to analyze the data from the *Virtual Task LLSA* survey. Table 4.1 revealed that the mean frequency of social strategy use in a

virtual world was 3.5, and the mean frequency of social strategy use in a traditional classroom was 3.49. The results of independent sample *t*-test showed that there was no significant difference ( $t(50) = 0.10, p > .05$ ). Therefore, the result indicated that the students in a traditional classroom reported to use social strategy use as often as those in a virtual world.

Table 4.1. Social Strategy Use in a Virtual World and a Traditional Classroom

Social strategy use		t-test of equal mean			P (two tailed)	Mean	SD
		n	t	d f			
	Virtual world	26	.10	50	.91	3.50	.56
	Traditional Classroom	26				3.49	.61

RQ2: What were the differences in affective strategy used between a traditional classroom and a virtual world?

An independent sample *t*-test statistical analysis was used to analyze the differences in affective strategy use between a traditional classroom and a virtual world. As shown in Table 4.2, the mean frequency of affective strategy use in a virtual world was 3.57 and the mean frequency of affective strategy use in a traditional classroom was 3.34. The frequency of affective strategy use in a virtual world was slightly higher than a traditional classroom. However, based on the results of independent sample *t*-test ( $t(50) = 1.32, p > .05$ ), the results showed there was no significant difference. The result indicated that the students reported to use affective strategies as often as those in a virtual world.

Table 4.2. Affective Strategy Use in Learning Environments

Affective use	strategy	t-test of equal mean			P (two tailed)	Mean	SD
		n	t	d f			
	Virtual world	26	1.32	50	.19	3.57	.64
	Traditional Classroom	26				3.34	.58

RQ3: What was the learner's motivation toward language learning in a virtual world?

The quantitative method, paired-*t* test, was used to analyze research question three, Learners' motivation toward language learning in a virtual world. As shown in Table 4.3, the mean score of the learners' attitude in pre-test was 3.00 and the post-test were 3.43. Based on the results of paired-*t* test, there was a significant difference in learners' motivation ( $t(25) = -2.53, p < .05$ ). The result indicated a significant increase in learners' motivation.

Table 4.3. Significance of Learners' Evaluation in a Virtual World

Attitude in Pre-test & Post-test	Paired t variance			P (two tailed)	Mean	SD
	n	t	d f			
Pre-test	26	-2.53	25	.01	3.00	.85
Post-test	26				3.43	.84

RQ4: How did learners perceive language learning in a virtual world?

To begin with, background of these six participants, learning experiences, and the different opinions of virtual learning were introduced. The average age of the three highly-motivated participants was 20. The average years of English learning was 12.6. The average hours of computer use every week was 9.3. On the other hand, the average age of the three less-motivated participants was 20.3. The average years of English learning was 10. The average hours of computer use every week was 11.6.

### Common Views on Learning Experiences in the Second Life

These six participants pointed out the importance of sociability and language learning functions in the SL. They all reported that they were given more opportunities to learn a

language through communicating and cooperating with other peers in this virtual learning environment. For example, one of them claimed she was able to cooperate with her teammates. And the other participants claimed that she was engaged into activities. Nevertheless, these six participants also shared some negative view. A few of these negative issues include: Internet issues, hardware availabilities, and operation difficulties. For example, six of them pointed out the Internet disruption hindered the learning process. Another participant suggested school's hardware needed upgrading.

### **Different Views on Learning Experiences in the Second Life**

The different views of these six participants were categorized into three areas: affectivity, interesting operation and consistence. For example, the highly-motivated participants said she felt more relaxed and less anxious while practicing speaking online. On the other hand, the less-motivated participants mentioned the interesting operation such as moving their avatars and taking the elevator. They also pointed out the consistency of the learning materials in the SL were the same with the school textbook.

## **CONCLUSION**

### **Summary of the Findings**

First of all, learners were found to have increased their motivation and gained perception towards language learning in the SL. The participants shared their common and different views on language learning in the SL. Sociability, functions of language learning, Internet issues, hardware availability and operation difficulty were agreed as a common view. On the other hand, the highly-motivated users agreed that emotional factors influenced them the most in the SL, whereas the less-motivated users agreed on the interesting operational process and the consistency of learning materials. Second, even though there were no significant changes in the learners' use of social and affective strategies. However, the slight changes in social and affective strategies were noticed. More explanations were needed to explore the vast potential in educational benefits for future language learning.

### **Discussions**

#### ***Social and Affective Strategies***

The learners in a virtual world in this study showed higher mean frequency in social and affective strategy use than in those in a traditional classroom. However, it didn't show any significance in the *t*-test. It seemed to have other feasible explanations outside the study's findings. First, it's necessary to provide learners ample opportunities to learn and use language learning strategies. Riazi (2007) mentioned that language learning strategies may include instructional materials, teaching, and learning activities in the classroom. Clear and specific instruction, adequate in-class activities and explanation of learning strategies are

necessary. Second, technical difficulties consumed a large amount of time. As a researcher, continuous technical difficulties were also considered as interferences. During the six experiments, participants faced and complained about login issues, Internet instability, and unsupportive hardware and software. Third, low self-efficacy of technology effected learners' use of language strategies. Friedman and Kajder (2006) mentioned some students in their study spoke of their technology fears such as, "I am so uncomfortable with technology." Technology fear also showed in this study that some of the participants weren't confidence in technology use or they weren't familiar with 3D virtual world. Fourth, social and affective strategies aren't easy to be observed. Riazi (2007) reported participants showed more tendencies to use metacognitive, cognitive, and compensation strategies than social, affective, and memory strategies. Metacognitive, cognitive and compensation were not examined in this current study, social and affective strategies were surveyed instead. Fifth, self-efficacy of one's language proficient is somehow related to language learning strategies. Wong (2005) investigated the relationship between self-efficacy and language learning strategies and found a significant similarity. The results of Wong's study showed high self-efficacy participants had greater use of language learning strategies compared to low self-efficacy ones.

### ***Learners' Motivation & Perception***

The findings showed learners had positive feedback and better perception toward language learning in the SL. Prior studies also supported the findings (Chen, Chen, & Kinshuk, 2009; Singh & Lee, 2008; Siragusa & Dixon, 2008; Liaw, Huang & Chen, 2007). Chen, Chen and Kinshuk (2009) mentioned E-learning is a great stimulus to enhance learners' performance and knowledge sharing. More specifically, first of all, E-learning had been considered as a great stimulus for the interest in virtual learning communities. Secondly, using the setting of virtual learning communities enhanced learning performance. Third, learners had more probability of actual behavior of knowledge sharing in virtual learning communities. According to Ajzen (1991), behavioral intentions were also motivational factors that influenced learners' willingness when performing certain behavior. Therefore, behavioral intention was regarded when related to one's attitude and motivation.

### ***Pedagogical Implications***

There were several implications for the findings. Since learners' perception and motivation had increasingly changed on the integration of school English curriculum with technology, the feasibility of virtual learning was more visible on higher education. Singh and Lee (2008) stated that online education was wide-spread in the United States, as there were many more universities now offering courses. Even though virtual worlds were being used for business and social networking, they should additionally be adopted as instructional

tools in education.

The first implication was to promote virtual learning on educational systems in Taiwan, especially in higher education. The second implication was to consider inserting text-embedded or audio- embedded materials into the SL and also teaches reading and writing skills. Since Internet issues, hardware availability and operational difficulties were pointed out as barriers during the learning process, using text-embedded and audio-embedded materials experienced less loading issues.

On the other hand, schools and teachers' perspectives should also be considered. From the school's perspective, identifying barriers such as Internet issues, hardware availability and operational difficulties were major considerations. These factors represented challenges that future studies required careful and planned improvements. Schools may gradually upgrade partial computer hardware, software and equipment to see pedagogical uses of virtual learning. Also, to plan and design a complete teaching schedule for one semester, ensure success by exposure to virtual learning. Moreover, from a teachers' perspective, knowledge of and attitude towards computer technology, determined the degree of success (Atkins & Vasu, 2000). Hence, teachers need a series of preparatory training to become familiarized with digitized teaching materials, cope with technical problems or have an assistant to help with these difficulties in class.

### **Limitations and Suggestions for Future Research**

There were three notable limitations related to this study, technical issues, limited time and unfamiliarity. Wiebe and Kabata (2010) also mentioned technical issues in their study that they identified an overwhelming need for upgrading computer laboratories, updated hardware, projector systems, and Internet connectivity. Secondly, time limits were the next concern. Learners had no ample exposure in a virtual world which hindered the possibilities of familiarization with the virtual platform and its operations, which were then harder to achieve without an effective and sufficient language learning system. Third, learners were unfamiliar with a 3-D virtual world that consumed a lot of time operating avatars and exploring the environment. Another study also pointed out the learners had difficulties on how to navigate and control the avatar in the direction they chose (Wang & Braman, 2009). Lastly, the researcher encountered several complicated technical problems during the experiments but those problems couldn't be solved while the researcher was lecturing or assisting other learners.

Consequently, there were some suggestions provided in response to encountered limitations. One was that gradually updating school hardware, software and other devices to the

technological requirements of the SL. Alternative solutions and requirements were suggested to be better prepared, for example, an up-to-date computer motherboard, a high-speed Internet connection (cable or DSL), and a good quality graphic card. Second, plan a whole semester's schedule of virtual English learning curriculum. Thus, learners will have enough time to explore, to become familiar with the learning environment and operation, whilst also interacting with other learners. Then, prepare teachers by providing sufficient knowledge of educational technology, training programs, and by appointing a technical classroom assistant.

The logo for the International Association for Future-Oriented Research (iafor) is centered on the page. It consists of the lowercase letters "iafor" in a light blue, serif font. The text is enclosed within a circular frame composed of two concentric, hand-drawn style arcs. The outer arc is a light red color, and the inner arc is a light blue color, matching the text. The overall design is minimalist and modern.

## Introduction

The world is becoming interdependent at an unprecedented speed. Historically, exchanges of products and contacts with people beyond national borders have taken place for more than 2,000 years (McNeill 1963). However, the difference between the present and 2,000 years ago is the “degree of frequency, depth, and scope” (Pike & Selby 1988, p. 3) of global interdependence. In sum, we are living in a world where we influence each other on a global scale more regularly and deeply than ever.

Due to such global interconnectedness, Japanese people have come to recognize and understand “Japan in the world” and “the world in Japan” (Yoneda 1997, p. 17). The increasing global worldviews of Japanese people and the rapid change of Japan’s interconnectedness to the world have significantly influenced Japanese education. For example, in 1996 the Central Council on Education (*chuo kyoiku shingikai*) proposed that education in the 21<sup>st</sup> century should include several global characteristics, such as the concept of global interdependence, an emphasis on environmental education, an interest in countries and areas otherwise neglected, and the development of an appreciation of different perspectives in different cultures (Ono 2001). Consequently, Japanese scholars and educators have paid more attention to global education as an alternative for education in the 21<sup>st</sup> century (Uozumi 1995).

The goal of this paper is to introduce learning activities and resources that enhance undergraduate students’ perspective consciousness in a Global Education course that the author has taught since 2010.

## Theory and Practice of Perspective Consciousness

Global education developed in the United Kingdom and the United States in the 1970s. There is tacit consent that the primary purpose of global education is to prepare youths to become global citizens by developing their global perspectives. There are six conceptualizations of global perspectives: perspective consciousness, global issues, global interdependence, global history, cross-cultural learning and skills, and participation in a global society. Perspective consciousness is considered to be “the recognition or awareness on the part of the individual that he or she has a view of the world that is not universally shared, that this view of the world has been and continues to be shaped by influences that often escape conscious detection, and that others have views of the world that are profoundly different from one’s own” (Hanvey 1976, p. 4). Students’ acquisition of perspective consciousness is particularly essential, since there is agreement among

scholars that it is better to express opinions about the world based on a wide-ranging and unbiased examination from different perspectives than based on unexamined and established assumptions (Case 1993).

By applying the concept of perspective consciousness, global educators teach content such as global interconnectedness, global issues, and cultures from multiple perspectives (Merryfield 1998). “The richness of multiple perspectives” (Pike 1997–1998, p. 8) was used by global educators in Canada and the US. Most of the social studies teachers in Merryfield’s study recognized that it is necessary for students to learn “multiple perspectives, multiple realities, and conflicting viewpoints on issues, events, and people under study” (Merryfield 1998, p. 352). Global educators tend to involve multiple perspectives by using different sources and role-playing (Kirkwood 2002).

Textbooks, other teaching materials, and people with different perspectives have usually helped students develop multiple perspectives. For example, when learning about the similarities and differences between the cultures of different people, especially minorities such as Native Americans and the Ainu people, who are said to be Native Japanese and who mainly live in Hokkaido, Japanese university students have examined textbooks that include these minorities’ perspectives (Gettings 1997).

Teaching materials from different points of view concerning one particular event have also allowed students to develop multiple perspectives on various events. Tajiri (2000) provided his high school students with resources about the Battle of Mactan from the perspectives of Spain and the Philippines when teaching about the relationship between Ferdinand Magellan and Lapu-Lapu. Including resources from both sides showed different perspectives on the battle in that the material from the Spanish viewpoint presented Magellan fighting against Lapu-Lapu and dying in the middle of his around-the-world journey, while the Philippine point of view considered Lapu-Lapu to be a hero who fought against the invaders, including Magellan.

The experience of interacting with people with different points of view also enhances students’ perspective consciousness. People with different perspectives are usually internationally experienced people (e.g., returned Peace Corps volunteers and exchange and international students) and minorities (e.g., Koreans, Chinese, and Ainu people in Japan). Angene Wilson (2001) conducted numerous studies to investigate how the international experiences of teachers, students, and people in the community had an impact on students’ learning and found that teachers used the knowledge and experiences that they or internationally experienced people

possess in their instruction.

In addition to the use of textbooks, other teaching materials, and people with diverse perspectives, role-play is a popular classroom activity that can develop students' perspective consciousness, and teachers may assign students the roles of different countries, organizations, and people. For example, Gaudelli (1996) assigned his students the roles of Bosnian-Serbs, Muslims, and Croats and had them discuss the Bosnian civil war from their assigned points of view. In another example, Otsu (1994) developed a high school curriculum for her Contemporary Society course to teach students about minority populations, including Koreans and the Ainu, Australian Aborigines, and Native Americans and African Americans in the US, and had her students recognize and understand them through playing the roles of these minority populations.

In sum, numerous scholars and educators have emphasized the importance of perspective consciousness and introduced various types of activities to enhance students' perspective consciousness. However, little work has been done to examine what teaching approaches or resources actually help undergraduate students develop their perspective consciousness. In order to fill this gap, this study was conducted to investigate the effects of various learning activities or resources on undergraduate students' perspective consciousness.

### Research Methodology

The study was conducted in an undergraduate Global Education course at a university in Kansai area, Japan. The Global Education course was taught during the spring semester (from April to July) in the academic years 2010, 2011, and 2012. Data were collected from the students who enrolled in this course in these three academic years (42 students total). The demographics of the students were as follows:

Table 1. Demographic information about students enrolled in the Global Education course in the 2010, 2011, and 2012 academic years.

Academic Year	Student Population (ID)	Details
2010	25 (from A to Y)	6 juniors (5 Korean students) & 19 seniors
2011	11 (from AA to KK)	3 juniors (1 Korean student) & 8 seniors
2012	6 (from AAA to FFF)	3 junior & 3 seniors (no international students)

The research participants were told to write down any comments they had, including what they learned, on a piece of paper called a “reflective note” (Fig. 1) during the last five minutes of most of the class sessions.

<b>Reflective Note (Introduction to Education): Please write your learning, comments, or suggestions.</b>			
<b>Date:</b>	<b>Period:</b>	<b>Name:</b>	<b>Student #:</b>
<b>Attention!!</b> Your reflective note might be referred to or cited in my research presentation or paper. I promise that your identity be kept into confidential by using anonymity (fake names). If you do not want me to include your note as my research data, please circle “NO” below. Your decision will NOT affect a grade of your reflective note assignment.			
NO			

Figure 1. Reflective Note.

In total, 784 reflective notes were collected and analyzed. In order to develop a theory grounded in the data rather than find the data to match a theory in order to better understand the effects of teaching approaches and resources, a constant comparative method was employed for the study. The constant comparative method refers to inductive data analysis in which “the formal analysis begins early in the study and is nearly completed by the end of data collection” (Bogdan & Biklen 1998, p. 66). The data were analyzed in the study inductively, in that I did not start out to find data to prove or disprove a predetermined hypothesis, but attempted to discover categories, themes, or theories from the data or “grounded in the data” (Strauss & Corbin 1994, p. 273).

## Findings

As a result of the data analysis, four common teaching approaches that the participants felt helpful for developing their perspective consciousness were found: (1) teaching the importance of perspective consciousness, (2) having students put themselves into “different shoes”, (3) having students encounter diversity through multicultural resources, and (4) having students examine resources involving multiple perspectives. Each teaching approach will be discussed below in detail.

### Teaching the importance of perspective consciousness

One teaching approach that enhanced undergraduate students’ perspective consciousness was to directly teach them its importance through readings and media resources. Perspective

consciousness was thoroughly discussed in a chapter of the book *An Attainable Global Perspective*, by Robert Hanvey (1976). The research participants were assigned to read this chapter as homework and discuss it in the following lesson. One student recognized a new perspective that Japanese people, including himself, may be racist and learned the importance of widening one's perspective by stating in a reflective note, "I learned that I might be racist by the article. Japanese shouldn't think we're not racist, which is a narrow opinion..." (GG, May 16, 2011).

In another lesson, they watched part of the movie "Dead Poets Society," which portrayed students' lives with a new instructor, Mr. Keating (played by Robin Williams), at a prestigious high school (The Welton Academy). The two scenes I showed them were those in which Mr. Keating instructs his students to rip the preface pages out of their textbook and when Mr. Keating explains the importance of seeing things from different angles in his English class and has his students stand on the teacher's platform to see the classroom from his perspective. Through these scenes, some of the students became aware of the existence of mainstream academic knowledge and the importance of seeing things from different perspectives. One student wrote the following: "We watched the movie Dead Poet Society. In this movie, one professor has a unique perspective. He told students that in creating poets, it doesn't need the idea of the textbook. He also told his students to have various perspectives by standing up on the desk" (DDD, May 18, 2012).

Other students came to recognize the importance of perspective consciousness by learning the importance of thinking outside the box. A nine-dot puzzle allowed them to "think of everything around up out of our perspectives" (AAA, May 11, 2012). They were told to cross through all nine dots on a piece of paper like the one below, using one, two, three, or four straight lines without lifting their pencils from the paper.

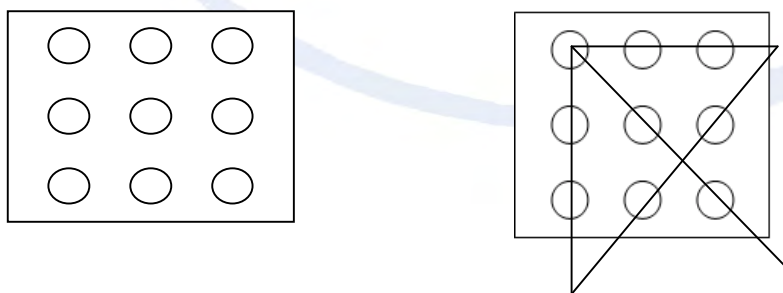

Figure 2. "9 dots activity" and its solution with four straight lines.

Most of the students could not solve it since they had the preconceived notion that they should not draw a line beyond their imagined borders. This activity allowed them to see how important it is to recognize their own fixed notions and think of solutions outside of these notions.

Having students put themselves into different shoes

There are some teaching approaches that involve putting students into different shoes and helping them recognize the existence of diverse perspectives. These approaches include debating, Barnga, and Model United Nations activities.

One day, students were divided into three small groups. The groups negotiated and decided which two would debate and which one would judge the debate, and then the two debating groups negotiated and decided which group would take the “agree” position and which one the “disagree” position. After that, students were provided with a statement to debate. Following a five-minute preparation session that included the consideration of the other group’s counterargument, each debating group gave a speech in support of its position for one minute and then engaged in a question-and-answer session for five minutes. After the debate, the judging group judged which group’s argument was more persuasive. The three groups switched their roles and repeated the entire procedure until all three had played the judging role. The discussion topics presented in this course were as follows: (1) this University should have stricter rules for students, (2) English should be taught from kindergarten, and (3) university entrance exams should be banned. Debating was helpful for the students to “tell the one side of view and listen the other side of view” (DDD, May 22, 2012).

Barnga<sup>1</sup> is one of the most popular classroom activities in the intercultural communication field. Students were divided into groups consisting of three or four members, and in each group they first learned how to play Barnga by reading the instructions printed on a sheet of paper and then actually playing it a couple of times for five minutes. While they were playing, they were not allowed to talk or write but were permitted to make some gestures or draw pictures. After that, all the group members were shuffled and moved to different groups to create new groups; then they played Barnga for ten minutes. After a ten-minute session, they discussed how the game went. Integral to the lesson’s goal, when learning how to play Barnga in the beginning, all

---

<sup>1</sup> See Thiagarakan’s & Thiagarajan’s 2006 book titled *Barnga: A Simulation Game on Cultural Clashes* [25th Anniversary Edition] for detailed information and instructions on this simulation activity)

groups were provided slightly different instructions, which resulted in great confusion when playing Barnga with people from different groups. Through this game, one student became aware of the existence of different ways of seeing the same thing by stating, “I learned that people think different thing even they see the same thing (paper?). So it is important to decide rule/opinion exactly” (C, May 10, 2010).

Another popular activity that allowed students to put themselves into different shoes was Model United Nations. It is believed that Harvard University originated this activity in the 1920s, calling it Model League of Nations at the time. Sadako Ogata first introduced Model United Nations to Sophia University in Japan in 1983. There are various levels or types of Model United Nations around the world. For this course, the American Model United Nations was employed by using the “Model UN ‘in a Box’” kit sold at <http://www.amun.org/>. The main aim of Model United Nations is to simulate United Nations conferences by having students become delegates of UN member states, having them individually study global issues that the UN has actually discussed and having them discuss the issues with other delegates and attempt to create resolutions. When learning about global issues (education rights were studied in this course), students were exposed to member states’ perspectives of which they had not previously been aware. One of the students commented, “We had a UN meeting and it was great. I think! We discussed right of education and thought what is important thing in education. We thought the ideas based on our countries (for example, My ideas based on Russia). It was the funniest activity among the classes” (C, June 25, 2010). Moreover, some of the students tended to be surprised at what other member states believed regarding the same issue. “Although it was easy to come up with issues that we have to solve from our country’s point of view. It was quite difficult to share them with other countries and to discuss and decide the solutions with many countries which also have their own problems. I’ve learned this!” (H, June 25, 2010).

#### Having students encounter diversity through multicultural resources

Multicultural resources encourage students to develop their perspective consciousness, especially their awareness of stereotypes or prejudice towards a particular country, culture, or group of people. In the Global Education course, three resources—“Disney Learning: Our World” by Maureen Hunterbone and Thea Feldman (2005), “A Class Divide with Jane Elliot” by Public Broadcasting Service (2003), and Multicultural Cinderella by Alexander (2006)—were used to have students examine how those resources represent a particular country, culture, or group of people.

“Disney Learning: Our World” is a comprehensive, cross-cultural learning book for the young and provides basic information about geography, people, culture, and so on for thirty-five countries in five regions. The students were divided based on their nationalities (Japanese and Korean) and assigned sections on their home countries to read and examine as to whether their home countries were accurately represented or not. After that, they gave presentations on their findings and learning through this activity. One student identified that the assigned section offered a fixed perspective (stereotype) of the home country by saying, “I’ve learned how stereotype is created through the book of Disney. They offer the exotic, romanticized information, but distorted one. I think the stereotype is caused by the benefit of commercial intention” (E, April 30, 2010). Another student recognized that “it’s really important to critically think and examine the information we got from limited resources” (Q, April 30, 2010).

“A Class Divided” featuring Jane Elliot is one of the most popular segments of the PBS Frontline series and presents the case of Jane Elliot’s famous “blue-eyed/brown-eyed” exercise in her 3<sup>rd</sup> grade class. The students in my class watched two video clips: “1. The Daring Lesson” and “2. Day Two.” In the first video, Elliot divided her students into two groups—students with blue eyes and those with brown—and told them that the blue-eyed children were superior to the brown-eyed ones. She treated her students accordingly throughout the day. In the second video, she reversed the roles by saying that the brown-eyed children were superior to the blue-eyed ones and treated them accordingly throughout the second day. At the end of the second day, she had a discussion with the whole class on how they felt on the first day and the second day and how they should treat other people. These video clips seemed to help my students identify the power relationships inherent in race relations as demonstrated in Elliot’s class and to enable them to step into another’s shoes and feel like they were “less ‘powerful’ people” (AAA, May 1, 2012).

Multicultural Cinderella is a cross-cultural learning activity that compares different versions of Cinderella published in different regions or countries (Alexander 2006). It is said that there are more than 500 versions of the Cinderella story around the world, some of which are published<sup>2</sup>. In the first round of the lesson, students in small groups were assigned two versions of Cinderella stories and told to compare them to find similarities and differences. After the first round of comparison, each group was assigned two other versions and asked to examine them for the same purpose; then they presented what they found to the whole class. The students discovered a

---

<sup>2</sup> Refer to “Multicultural Cinderella Stories” by the American Library Association (2000) for a list of the Cinderella stories.

lot of differences among the stories in terms of the content, characters, pictures, and linguistic expressions. For example, one student found “the differences of sense of ‘beauty’ in the differences of pictures” (II, May 9, 2011).

Having students examine resources involving multiple perspectives

The last teaching approach, but not the least, was to have students examine resources involving multiple perspectives. World maps, two movies, and scripts titled “Meeting on the Congo” were utilized in the Global Education lesson.

Four different types of world maps, each of which located different regions in the center, were shown in class and students discussed the question, “Whose perspective is involved in this world map?” After that, a map of Japan was shown, and the same question was asked. Korean international students answered it rapidly; however, Japanese students were not able to answer it because they did not recognize that the sea among Russia, North Korea, South Korea, and Japan was named “Sea of Japan” on the map, but it was called “東海” (East Sea) in Korea.

After this activity, one student mentioned, “I didn’t know that there is a map which Australia is middle. Also, I didn’t know that sea of Japan is called 東海 in Korea. It’s interesting to know about something with many aspects. I want to know more about like that” (N, May 17, 2010). This activity encouraged the students to recognize different types of world maps representing different perspectives that people have.

“Letters from Iwo Jima” and “Flags of Our Fathers,” both of which were directed by Clint Eastwood and released in 2006, showed the battle over Iwo Jima from a Japanese perspective and an American perspective, respectively. In “Letters from Iwo Jima,” Japanese soldiers attempted to defend Iwo Jima from American Marines coming from the sea; in “Flags of Our Fathers,” American Marines attempted to attack and occupy Iwo Jima from the sea. After watching both of them, a student commented, “I’ve never thought about the different perspective about one topic. Especially about the topic which is historical event. To know both is could make me understand well. So, I thought I should see one thing from multi-side and not with only one thought” (O, May 17, 2010). Showing one historical event, the battle for Iwo Jima in this case, from different perspectives was indeed helpful for the students to develop their perspective consciousness.

The last activity, “Meeting on the Congo,” originally introduced by Merryfield and Timbo

(1983), presents two different stories of people who met on the Congo River in the 1800s and used two different scripts for discussion. One was written by a European explorer traveling along the Congo, and the other was told by an African chief living by the Congo River. These two stories describe clearly how differently the two narrators perceived the situation when they met each other on the river. Students were first divided into two groups, and each was assigned a different script. After reading the scripts, they discussed the following questions: “What were the expectations of the person telling the story? What emotions were expressed? Why were people killed? (Merryfield & Timbo 1983, p. 20)” Both scripts were then shown to the whole class. Learning about the same event from different perspectives helped one particular student to recognize “the importance of learning from multiple perspectives.” Moreover, the same student became aware of the existence of Eurocentrism, stating, “It was too sad for African people who believed that white men were their brothers. Also, it made me sad that the Africans’ true story cannot be revealed for other Europeans because of the Eurocentrism and barrier of language” (Q, May 14, 2010).

## Conclusion

As the world is becoming more interconnected through the rapid advance in technology and transportation, people of all nationalities will have more opportunities to interact with others whose perspectives are diverse. Recognition of diverse perspectives and the ability to see things from multiple perspectives are essential for global citizens. The students in the Global Education course tended to develop their perspective consciousness in the lessons involving the four teaching approaches discussed above. These approaches can be employed in any academic course, and it is necessary for all faculty members throughout the institute—regardless of their academic fields—to offer instruction in and help develop students’ perspective consciousness in their courses.

Abstracts

*MyAccess* is one of the most popular automated essay scoring systems. It is both a writing tool and an essay grader. Students can choose among various essay topics, such as effects of technology, job skills necessary for success, society's biggest problem, and top vacation place, write as many drafts as they wish, and receive immediate feedback.

The study data comes from the Foreign Language Centers of two universities located in the center of Taiwan. 54 students coming from different departments of 15 universities followed a program fully funded by the Ministry of Education during the summer of 2011. The program lasted four consecutive weeks, with the total curricular time adding up to be 140 hours. During the evening self-study sessions, the students first undertook on-line writing practice individually and then peer-editing, led by teaching assistants.

This research compares students' motivation with their scores during the one-month training in order to measure the impact of motivation on their progress in writing. Three study cases are presented in more detail: a student with high motivation, with scores progressing significantly; a student with relatively good motivation, but who fails to progress during the training; and a student with lower motivation who regresses during the training.

**Keywords:** English as a second language; motivation; *MyAccess*; writing skills.

## 1. Introduction

In 2011, Taiwan's Ministry of Education (MOE) funded various intensive English programs (IEPs) aimed at helping students to enhance their academic competitiveness. The present study analyzes the case of 54 students who joined two programs offered by two universities (26 in university 1 and 28 in university 2) in Taichung. The MOE fully funded accommodation, fees of tuition, and meals during the one-month program from August 1<sup>st</sup> to August 26<sup>th</sup>, 2011. The total curricular time was 140 hours. Students were instructed by native-English-speaking instructors helped by teaching assistants. Students also used an automated essay scoring (AES) system, *My Access*, during the training. During the first week, they were invited to submit essays on four pre-selected prompts: (1) Effects of Technology, (2) Job Skills necessary for Success, (3) Society's Biggest Problem, and (4) Top Vacation Place. Students were supposed to submit all their essays by the end of the program. No limit was fixed to the number of essays students could submit. In the end, the average of drafts submitted was 9.6 (the minimum being 4 and the maximum 32).

The study proposes to concentrate on the impact of students motivation and satisfaction about their progress in writing. Students' motivation is measured by data coming from questionnaires answered by them every week during the training. Students' progress is measured by data coming from the scores they received every week after passing standardized English proficiency tests and by the resulting level according to the Common European Framework of Reference for Languages (CEFR, 2001). Students were required to have passed level B1 before joining the program. The goal of the IEPs was to help students reach a CEFR B2 level of workplace English skills as measured by Business English Testing Service of Cambridge ESOL (Bulats). This research will first present an overview of the impact of motivation of students' progress in writing and then analyze in detail three case studies.

## Literature review

### 2.1. Literature related to English writing and *MyAccess*

Various companies provide nowadays Automated Essay Scoring (AES), that is, computer technology able to grade the written prose (Shermis and Burstein, 2003). Among the most successful AES are Project Essay Grader (PEG), Criterion, *MyAccess*, and Bayesian Essay Test Scoring System (BETSY) (Rudner and Liang, 2002). *MyAccess* is the instructional application of IntelliMetric developed by Vantage Learning. The American company founded in 1990 by Peter Murphy was the first to create artificial intelligence-based automated essay scoring, blending artificial intelligence (AI), natural language processing (NLP), and statistical technologies.

Various studies show that *MyAccess* significantly improves student academic achievement (Yang, 2004; Yeh and Yu, 2004a; Yeh and Yu, 2004b; Wang, 2005; Huang, 2006). Elliot (2001) claims that the program has a 99 percent reliability rate. However, some studies highlight inadequacy of scores provided by *MyAccess* (Cheng, 2006; Grimes and Warhauer, 2006; Yang, 2004). One of the flaws of the system would be to favor quantity over quality: long essay tend to obtain a higher score (Cheng, 2006; Herrington, 2011). Ware and Warschauer (2005) notably demonstrate that online automated scoring systems tend to be static models which might discourage creative writing. Creative essays often receive a low score and creative students might feel discouraged and frustrated. Therefore, many scholars insist on the fact that computer-assisted learning programs should be a complement to classroom instruction (Burtstein and Marcu, 2003; Yang, 2004; Oladejo, 2005).

Stern and Solomon (2006) confirmed the study by Connors and Lunsford (1988) which found that spelling errors were the most common form of mark on a paper. They showed that most comments were technical corrections (spelling, grammar, word choice, and missing words); comments addressing paper organization and quality of the ideas contained in it (support/evidence for claims, paper structure/organization, voice, and creativity) were absent. It should be noted that *MyAccess* focuses much more on technical corrections than on organization. According to Cheng (2006), one Taiwanese student who used *MyAccess* was critical of the fact that he was given a high score even though he did not write a conclusion. Some students said that the correction was too “kind” and that they did not feel they deserved a so high score for their drafts.

Students’ motivation is also influenced by teachers’ mastery of the technology. When the instructor appears to be ill at ease with the scoring engine, it affects students’ learning (Carroll et al., 2001). The role of the instructor is to guide students and to provide post-grading consultation to students (Cheng, 2006). In fact, Yang (2004) showed that when the instructor was able to provide assistance and guidance to students, their motivation was significantly higher. Using *MyAccess* can increase teachers’ motivation to teach writing courses in the sense that this type of course is time-consuming and exhausting. Writing classes are very big and improving students’ writing skill involves correcting multiple drafts (Hyland, 2003; Kroll, 2003). Scoring engines can at least correct some of students’ mistakes and ease teachers’ working load; instructors could then focus on logic and organizational aspects more than on vocabulary and grammar. Elliot and Mikulas (2004) showed that *MyAccess* helps students to make better revisions. Montoneri et al. (2012) applied data envelopment analysis (DEA), a robust and reliable quantitative method, to calculate the relative learning efficiency in English writing of university students who completed a one month training using *MyAccess* during the summer of 2011.

### **3. Methodology**

The study uses SPSS to run the data collected during the summer of 2011 in the Foreign Language Centers of two universities located in the center of Taiwan.

#### **3.1. Data source**

The two Foreign Language Centers were in charge of planning and offering university-level foreign courses for students attending various universities in the center of Taiwan. The characteristics of the data source and research object are as follows:

1. The summer intensive English program was from August 1<sup>st</sup>, 2011 to August 26<sup>th</sup>, 2011.
2. 54 students coming from different departments of 15 universities; 26 followed the training offered by University 1 and 28 by University 2.
3. To be eligible for applying for this intensive English program, university students nationwide must meet requirements of: (a) sophomore or above, (b) non-English major, and (c) English proficiency level of CEFR B1 or above.
4. Students passed three mock tests (one at the end of week 1, one at the end of week 2, and one at the end of week 3).
5. Students passed the real test as the post-test at the end of week 4.
6. All the tests had 110 questions.

#### **3.2. Selected indicators**

During the training, students passed exams every week and were asked to answer questionnaires. This study uses some of the data collected to analyze if students' determination and satisfaction have a significant impact on their scores and CEFR level. Moreover, the indicators are selected only if they are significantly correlated.

1. Student ranking. It represents the rank of students' average total final scores in their class in academic year 2010, that is, before joining the program: 1. within the top five, 2. front level, 3. before and near middle level, 4. middle level, 5. after and near middle level, 6. low level.
2. Student determination to participate. It represents the level of determination of full participation in the English intensive course at the beginning of the training: 1. extremely low, 2. low, 3. high, 4. extremely high.
3. CEFR level at the end at the start of the program. CEFR level is required to be B1 before joining.
4. The level of confidence to advance your English proficiency one level within a month: 1. extremely low, 2. low, 3. high, 4. extremely high.
5. CEFR level at the end at the end of the program. This indicator show if students have progressed or not to a higher level, that is, at least from B1 to B2 or C1.

6. Satisfaction with the course.
7. Posttest scores (accurate answers / 110 questions). It represents students' scores at the end of the four weeks program.

### 3.3. Correlations

We use SPSS to find out if there are significant correlations and Analysis of Variance (ANOVA) to further investigate significant differences.

#### 3.3.1. Gender

ANOVA table (Table 1) indicates there are no statistically significant differences between male and female for any of the following factors: certificate level at the start of the program, certificate level at the end of the program, first simulated test results, second simulated test results, third simulated test results, and posttest scores.

Table 1. Gender differences

Indicator	Groups	Sum of Squares	Df	Mean Square	F	Sig.
Certificate level at the start of the program	Between Groups	.333	1	.333	2.667	.109
	Within Groups	6.500	52	.125		
	Total	6.833	53			
Certificate level at the end of the program	Between Groups	.009	1	.009	.024	.878
	Within Groups	20.306	52	.390		
	Total	20.315	53			
First simulated test results (accurate answers / 110 questions)	Between Groups	20.454	1	20.454	.183	.671
	Within Groups	5818.583	52	111.896		
	Total	5839.037	53			
Second simulated test results (accurate answers / 110 questions)	Between Groups	1.333	1	1.333	.022	.882
	Within Groups	3140.667	52	60.397		

questions)	Total	3142.000	53			
Third simulated test Between results (accurate Groups answers / 110 Within Groups questions)	Total	2739.426	53			
Posttest scores Between (accurate answers / Groups 110 questions)	Between Groups	40.333	1	40.333	.470	.496
	Within Groups	4459.667	52	85.763		
	Total	4500.000	53			

Generally speaking, there is no gender bias in this study and gender plays no role in student's test scores and their perception of the course. However, Table 2 indicates statistically significant difference between student ranking and gender differences (0.022).

Table 2. Gender differences

Indicator	Groups	Sum of Squares	df	Mean Square	F	Sig.
Determined to Participate	Between Groups	.037	1	.037	.109	.742
	Within Groups	17.611	52	.339		
	Total	17.648	53			
Student Ranking	Between Groups	8.333	1	8.333	5.579	.022
	Within Groups	77.667	52	1.494		
	Total	86.000	53			
Satisfaction with course	Between Groups	.009	1	.009	.028	.869
	Within Groups	17.472	52	.336		
	Total	17.481	53			
Satisfaction with the final course result	Between Groups	.333	1	.333	.754	.389
	Within Groups	23.000	52	.442		
	Total	23.333	53			

Table 3 shows that the difference between males and female students in their ranking is due to female students' significantly higher mean than male students. This indicates that female students

ranked significantly higher than male students in this study.

Table 3. Gender and ranking

Genre	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Minimum	Maximum
					Lower Bound	Upper Bound		
Female	36	4.61	1.128	.188	4.23	4.99	2	6
Male	18	3.78	1.396	.329	3.08	4.47	1	6
Total	54	4.33	1.274	.173	3.99	4.68	1	6

Haahr (2005) notably analyzed gender differences in the acquisition of basic skills and on the performance of different education systems in providing gender equality. Females achieved significantly higher average scores in reading than males in all the 27 OECD countries studied. Males performed somewhat better in some countries in science and mathematics. The findings of this study confirm the previous study (Haahr, 2005) with regard to gender differences and average score.

### 3.3.2. Training location

Table 4 shows that there is no significant difference between the two training locations in student confidence in advancing their English ability (3.08 and 3.11). This indicates that the groups were originally homogenous and there are no antecedent variables. Because students are from two different universities, it is possible that their English level or their confidence in learning English be different. Table 4 indicates that students were originally homogenous.

Table 4. Training location and confidence in advancement during the course

Groups	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	.012	1	.012	.044	.835
Within Groups	14.525	52	.279		
Total	14.537	53			

According to Davis' (1983) conventions for interpreting correlation associations, .70–1.0 = very strong association, .50–.69 = substantial association, .30–.49 = moderate association, .10–.29 = low association and .01–.09 = negligible association.

Table 5 indicates that there is a positive and moderate correlation between the determination to participate in the training and confidence in advancement during the courses.

Table 5. Determination to participate and confidence in advancement during the course

Indicator	Correlation	Determined to Participate	Advance Confidence
Determined to Participate	Pearson Correlation	1.000	.526**
	Sig. (2-tailed)		.000
	N	54.000	54

Table 6 shows that there are significant differences between the two training locations and student's satisfaction. However, there are no significant differences between the locations for test scores and certificates. Students in university 2 are more satisfied with courses, teaching, administrative staff, TA counseling, and overall satisfaction. But, students in university 1 are more satisfied with self satisfaction, with improvement, and about final course result.

If they wish to offer the training again, both universities will have to reflect on these results. Probably for psychological reasons, such as atmosphere during the training, personal relationship with the teachers, teaching assistants, and staff, students seem to be more satisfied with university 2, which means that university 1 should improve communication skill. However university 2 should improve teaching material, content, and teaching skill as satisfaction with the final course result is lower.

Table 6. Training location and satisfaction

Indicators	Group	Sum Squares	of df	Mean Square	F	Sig.
Student Ranking	Between Groups	.033	1	.033	.020	.888
	Within Groups	85.967	52	1.653		
	Total	86.000	53			
Satisfaction with course	Between Groups	8.149	1	8.149	45.406	.000
	Within Groups	9.332	52	.179		
	Total	17.481	53			
Satisfaction Teaching	with Between Groups	20.972	1	20.972	125.701	.000
	Within Groups	8.676	52	.167		
	Total	29.648	53			
Satisfaction	with Between Groups	12.393	1	12.393	28.252	.000

administrative staff	Within Groups	22.810	52	.439		
	Total	35.204	53			
Satisfaction with TA counseling	Between Groups	2.804	1	2.804	10.791	.002
	Within Groups	13.511	52	.260		
	Total	16.315	53

	Within Groups	8.390	52	.161		
	Total	17.426	53			
Self satisfaction with the Improvement	Between Groups	2.476	1	2.476	6.174	.016
	Within Groups	20.857	52	.401		
	Total	23.333	53			
Satisfaction with the final course result	Between Groups	2.770	1	2.770	7.005	.011
	Within Groups	20.563	52	.395		
	Total	23.333	53			
Certificate level at the start of the program	Between Groups	.015	1	.015	.112	.740
	Within Groups	6.819	52	.131		
	Total	6.833	53			
Certificate level at the end of the program	Between Groups	.254	1	.254	.659	.420
	Within Groups	20.060	52	.386		
	Total	20.315	53			

## Findings and Discussions

The empirical study illustrates the fact that a relatively small number of students progressed significantly during the training.

### 4.1. Overview

How many students progressed? How many regressed? It appears that only 18 students on 54 obtained a higher CEF certificate level at the end of the program. Seven of these students answered at the end that they were very satisfied (5/5) and 11 that they were satisfied (4/5). Nine of these students who progressed were males and 9 were females. Surprisingly, only 4 of these students wrote

a number of drafts higher than the average of 9.6, which would mean that writing many drafts is not necessarily synonym with progress. Obviously, quality of the drafts is more important than quantity. Ten of the students who progressed were trained at university 1 and 8 at university 2.

Five students regressed and had a lower certificate level at the end of the training, 2 trained at university 1 and 3 at university 2. As for the other students, that is, the majority (31), they had the same certificate level at the beginning and at the end of the program.

#### **4.2. Study cases**

##### **Study case 1: Student with high motivation, with scores progressing significantly**

Student 20 came from university 2 and was trained at the foreign language center of university 1. She was a female junior student who had a quite high motivation at the beginning of the program (level of determination of full participation in the English intensive course: high; level of confidence to advance your English proficiency one level within a month: high). She wrote a higher number of drafts than the average (9.6): 14, including 3 on Effects of Technology, 5 on Job Skills necessary for Success, 3 on Society's Biggest Problem, and 3 on Top Vacation Place. Her certificate level was B1 at the beginning and B2 at the end of the training, as her scores progressed from 46/100 to 57/100. Student 20 end self-satisfaction was very high (superior to 90%). She was also very satisfied with the course content (4/5).

However, typically, student 20 seemed to be very unhappy about the personnel as she gave a 5, that is, "extremely low", to the teaching, staff, and TA counseling. It appears that the case of this student is very common: many students had a quite high motivation, were satisfied with their progress in writing, obtained higher scores, wrote many drafts, but were very unsatisfied of all the people involved in the training. The quality of the training and the competence of the personnel are not involved, but there was obviously a problem of atmosphere and communication during the one month program.

##### **Study case 2: Student with relatively good motivation, but who fails to progress during the training**

Student 10 also came from university 2 and was trained at the foreign language center of university 1. She was a female senior student who had a good motivation at the beginning of the training (level of determination of full participation in the English intensive course: very high; level of confidence to advance your English proficiency one level within a month: high). However, her level remained B1 at the end and her scores went down from 57/100 to 48/100. She relatively regressed. Probably one of the reasons is because she wrote only 5 drafts in one month: 2 on Effects of Technology, 1 on Job Skills necessary for Success, 1 on Society's Biggest Problem, and 1 on Top Vacation Place.

That is, less than the average of 9.6.

Her satisfaction concerning the training, course content, teaching, TA counseling, administrative staff, satisfaction with overall activities, and even self-evaluation were very low at the end of the program. Student 10 was very clearly disappointed. Her score for the second week exam was significantly lower: 48/100. It is quite disturbing that students who received so much support from teachers, assistants, staff, and who had access for free to a very expensive online scoring engine did not seem to appreciate it and lost motivation in a matter of days.

### **Study case 3: Student with lower determination, regressing during the training**

Student 44 had a relatively lower determination at the beginning of the program (3; more students have 4). She was a senior female student from university 1. She gave a lower evaluation of the course content (3.14/5) and of the administrative management (3.5/5). She seemed to be a little more satisfied of the teaching by the teachers during the training (4/5). Student 44 wrote a low number of drafts during the one-month program: only four, the minimum, just one draft per prompt. It shows on her scores: she obtained only 38/100 at the end of the first week, then 30/100, 38/100, and finally 31/100 at the end of the last week.

As a result, her CEFR level went down from B1 to A2. Her end self satisfaction was 3/5, that is, in the group 50-69%. As a comparison, 38 students on 54 had an end self satisfaction of 2/5, that is, 70-89%, and only three students have 3/5. She expected, according to the questionnaire she filled, to remain a senior students after the program, that is, not to become a graduate student. This student's determination was not particularly low at the beginning. It appears she got disappointed with the courses and the way the training was managed. She lost motivation and did not take advantage of using *MyAccess* to make progress in writing (only four students wrote 4 drafts; the average is 9.6).

### **Conclusion**

The paper uses SPSS to measure the impact of students' motivation and satisfaction on their progress in writing. Correlations and Analysis of Variance (ANOVA) show that there are no statistically significant differences between male and female for any of the following factors: certificate level at the start of the program, certificate level at the end of the program, first simulated test results, second simulated test results, third simulated test results, and posttest scores. Moreover, there is no gender bias in this study and gender plays no role in student's test scores and their perception of the course. There is no significant difference between the two training locations in student confidence in advancing their English ability, indicating that the groups were originally homogenous. There are significant differences between the two training locations and student's satisfaction. However, there are no significant differences between the locations for test scores and certificates.

Relatively few students took advantage of using MyAccess during the 1 month program to make progress; the average of drafts written is 9.6 (between 4 and 32). The empirical study illustrates the fact that only 18 students progressed significantly during the training, 5 regressed and 31, the majority, did not improve in scores and certificate level. Actually, even the students who progressed wrote a quite small number of drafts.

Almost all the students were satisfied with course content, but it seems that students were less satisfied with teaching, with TA counseling, and administrative staff in university 1; however, there were more satisfied with their progress at the end of the program. Training was paid by MOE, but still students decided to apply during the summer vacation and most of them had high determination. Probably the program was too short to make significant progress in writing. That is why a relatively low number of students were able to move on from B1 level to B2 or higher. The two universities and the MOE should reflect on the fact that 36 students on 54 did not progress or even regressed after so much money and effort were spent to implement this training.

### **Future directions**

The training was fully paid by MOE, but if results are disappointing, the ministry will probably have to rethink its policy. The two universities, the two foreign language centers, and the personnel involved should reflect on these results and find ways to improve the training. More studies should analyze in detail the use of automated scoring engines in Taiwan, the impact of motivation and determination on writing progress, and the influence of communication skill.

Abstracts

This paper reports on the study pertaining to the effectiveness of PBL approach intended for the teaching and learning of course of Concrete Technology for Polytechnic students in India. This paper also deals with the comparison of PBL package with System of Conventional Learning (SCL) generally adopted in teaching polytechnic students. A pre and post test as well as questionnaire were administered to the students before and after the exposure respectively. Finding of the study suggests that PBL approach is an effective method over SCL method for teaching concrete technology to Polytechnic students.

Key Words : Problem Based Learning (PBL)  
System of Conventional Learning (SCL)

## **1. Introduction to Problem Based Learning**

Problem based learning (PBL ) has been used in higher education for over fifty years as a method of teaching the practical application of knowledge to the students in a real world setting . It originated in the field of health in the 1950's and gained wide acceptance in medical education . However in the last decade there has been a growing movement through out the world to adopt PBL in other fields including engineering . There is a close relationship between engineering methods with PBL methods. Both engineering and PBL start from the problems followed by the identification of the need . PBL approaches to learning have been used with some success in engineering courses in many countries . Young et al ( 1994) describe the use of PBL in Civil engineering drawing classes , while Said at al ( 2005) describe how PBL has been used in Malaysia with Electrical engineering students. PBL has recently been put in place in the penultimate and final year transport engineering classes in the Civil Engg. degree in University College Dublin ( 2008) . PBL has been introduced in number of undergraduate Civil Engineering courses to help students to become deep and active learners and to help them in the transition from passive note taker to researcher and lifelong learner. Problem Based Learning is a way of constructing and teaching course using problem as a stimulus and focus on student activity ( Boud and Felletti 1991)

According to Liu , M.J. ( 2005) , PBL is a learning process where students are presented with a problem and are asked to apply reasoning , questioning , researching and critical thinking techniques to find a solution to the problem .

Thus, the essential characteristics of PBL include:

- i) Learning is student centered only .
- ii) Authentic and real world problem is the focus for learning
- iii) Learning is self directed .
- iv) Learning occurs in small tutorial groups.
- v) Teacher acts as facilitator
- vi) Collaboration is a must

## **II Introduction to Course of Concrete Technology in Polytechnic**

The Civil Engineering diploma in India is a three year programme . It is only in the last two years of the programme that students start to really engage in civil engineering subjects. In second year, students of civil engineering are introduced to concrete technology principles , methods and policies . Looking at the importance of subject in the field , it was felt that PBL approach suited over SCL method as students would be asked to think about how principles and policies of concrete technology can be implemented and of the likely impact of the subject application in the real world . In lecturers , it is possible to introduce students to the theories regarding various policies but by engaging in PBL, students were able to investigate these policies more deeply.

### **III PURPOSE**

The main objective of using PBL with the second year students of civil engineering in course of concrete technology was to enable them to make transition from learning to research. These students after the completion of diploma will either join industry to become junior engineers, or may continue their academic career with further studies in engineering degree courses. In both situations they need to be able to use the knowledge they have gained in lectures to solve problems and to research on the other hand; this study also research into whether PBL approaches creativity, criticality and team working among polytechnic students.

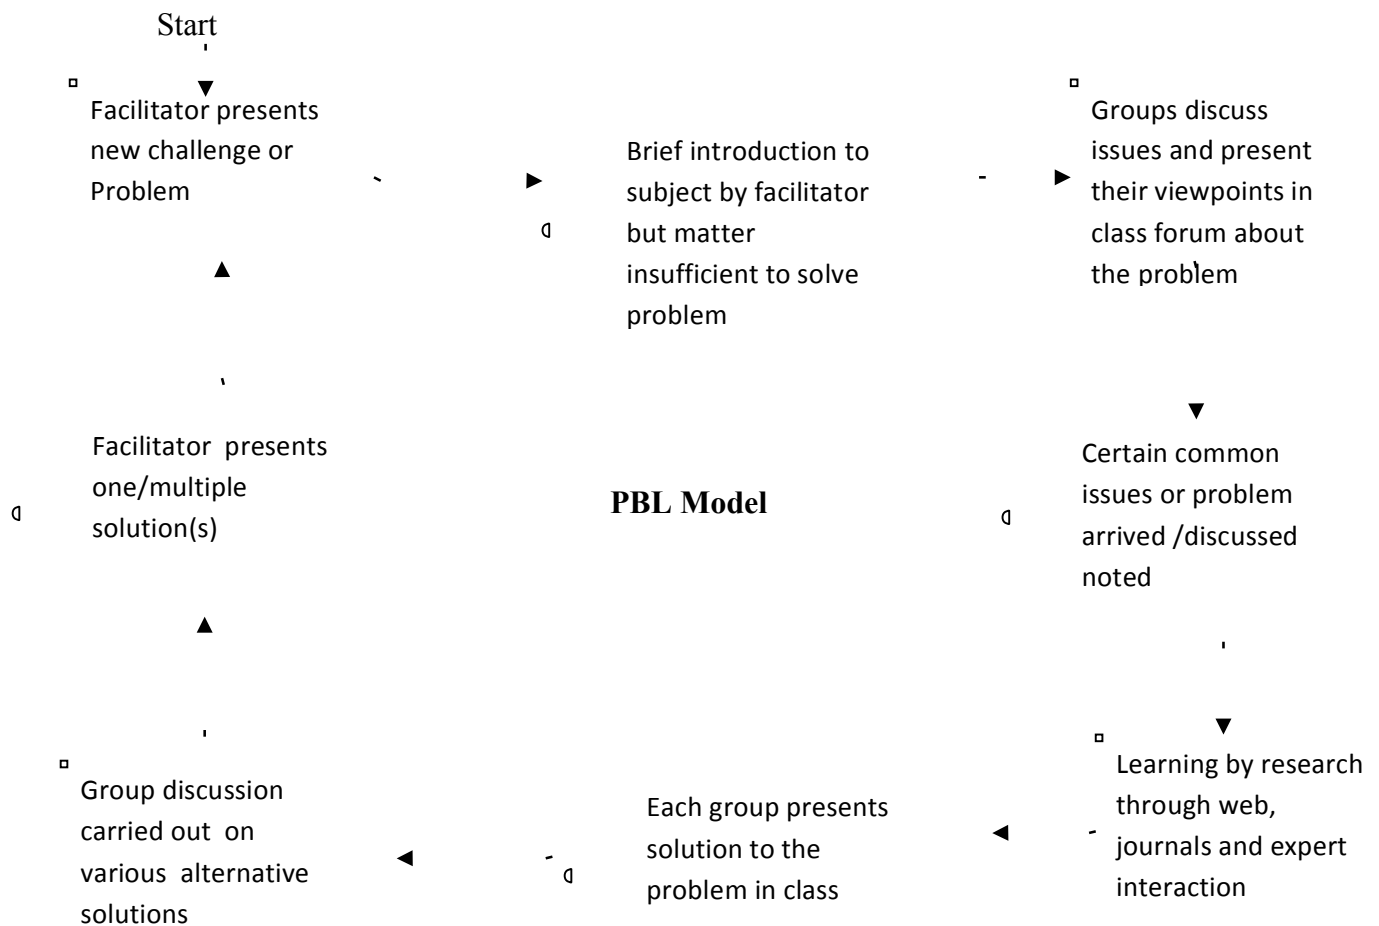

### **IV OBJECTIVE**

The objectives of this study include:

- a) To study what is the difficulty faced by the students in concrete Technology course in teaching through SCL method.
- b) To judge the suitability of PBL approach in teaching civil engineering courses to Polytechnic students.
- c) To compare the learning strategy by SCL and PBL methods.
- d) To study student attitude on learning method in research
- e) To compare student achievement through use of PBL approach in engineering education.

### **V RESEARCH METHODOLOGY**

This research proposed the cognitive constructivist learning model (as shown in fig. (i)) to study to what extent does PBL method improve the performance of polytechnic students in Civil Engg. courses with respect to the system of conventional learning (SCL). Understanding on problem proposed is cognitive activity where student need to think with knowledge they have. The learning process by research and PBL method will be applied in this study through development of webpage which will be used by students for problem solving and information sharing.

**Fig. (i) PBL Model**

### **First Phase ( Formation and Development)**

- The second year class of Civil Engineering students was divided into two major groups A and B based on their even and odd roll numbers . Group A was taught by conventional method ( SCL) and group B by PBL approach
- Group B was further sub- divided into small PBL groups ( each group consisting of 4-6 students )
- Information was collected from students regarding learning interest and style on subject of concrete technology .
- Difficulties faced by students in SCL method was analyzed .
- Present knowledge of students in the subject of concrete technology was tested by conducting an objective written test ( Pre-test study)

- Based on the result of Pre- Test Score the whole Group B was split into Above Average , Average and Below Average students .  
( It was ensured that atleast one above average , one average and one below average student exists in each PBL group ) .

### **Second Phase : ( Methodology and Implementation )**

- Introduction about learning style of Concrete Technology was provided to the students of Group B by research method with PBL application .
- Knowledge about PBL resources was provided such as link to web page , library books and journals, expert knowledge etc.
- PBL implementation technique was discussed such as problem identification , brain storming and analyzing the problem , determining the solution , searching and collecting information and lastly sharing and synthesizing new information .
- PBL problems on related topics was prepared and shared with the students through webpage .
- Assignments and projects related to the subjects were given and the students were asked to present solution through presentations.

### **Third Phase : ( Integration & Evaluation )**

- One to one in depth interviews were conducted throughout study as the method of data collection
- Students were also asked to give their own description of PBL learning experience from different aspects of learning environment .
- Post study tests through written questionnaire were also conducted to assess students and evaluate their PBL learning experience .
- Based on Feedback and State Board academic results , comparison of students of Group A and B were analyzed and determined .
- Presentation of progress reports and assignment were also evaluated through various parameters.
- Separate analytical research was focused on the impact of PBL inclusion on above average , average and below average students .

## **VI DESIGNING PBL PROBLEMS**

An effective PBL problem should :

- a) Motivate students learning through real world relevance
- b) Post open-ended initial questions that encourage discussion.
- c) Push students to identify and seek out needed information .
- d) Be complex enough to promote group effort in solving.
- e) Require discussion making or judgement.
- f) Address course learning objectives.

Two examples of PBL problems given to the students of Concrete Technology are given below :

### **EXAMPLE PROBLEM – 1**

Diabetes Type 1 and Diabetes Type 2 also known as ‘Sugar’ in ordinary language can be controlled by taking medicine or insulin injection. The patient is said to have controlled sugar’ says a doctor . But a civil engineer working at mixing plant says ‘prepare a controlled concrete’ . Do you agree with the statement of engineer . Can concrete be controlled like sugar? If yes ,how ? explain degree of control .

Is something written as uncontrolled concrete in IS : 456-1978 ? what is the importance of IS : 456-1978 in concrete Technology .

Do you agree that as medicines are given to sugar patients , certain materials are injected in concrete also to modify its properties and increase its strength . If yes , what are they called .Give name of few such materials and explain their properties .

### **EXAMPLE PROBLEM - 2**

“ Ability to work is workability . When it is workable , it does not segregate . It has love for water , but too much water .....o.....o..f...f..... baba , I even don’t work then and sometimes fail .So always fulfill my requirements .....I am sometimes ordinary , sometime reinforced but many times prestressed too”

Study the above text and answer the following questions ?

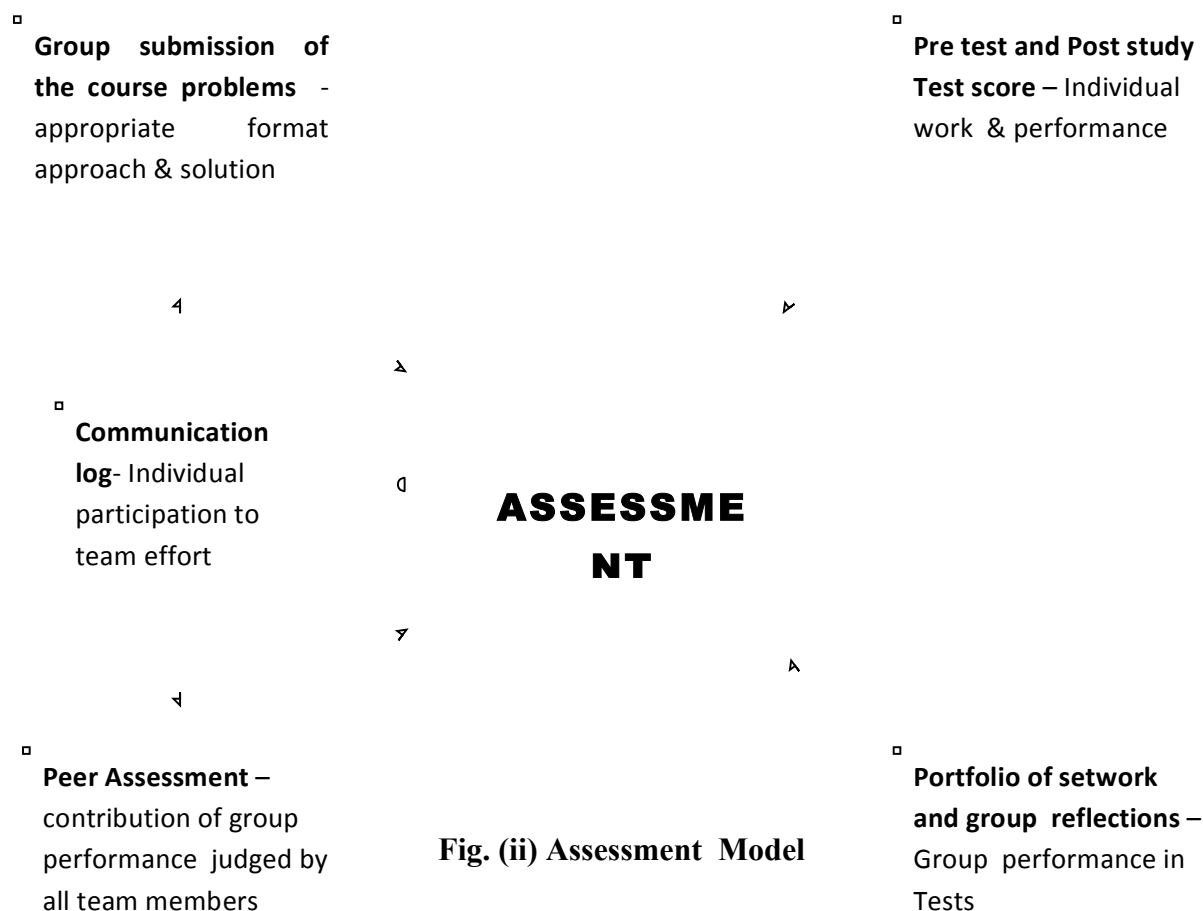

1. Who is ‘I’ ?
2. Explain how segregation is linked to workability .

3. Can workability be tested ? if yes how ?
4. How it can fail and under what conditions
5. What is meant by the terms ordinary, reinforced and prestressed here ?
6. What is meant by 'love for water' ?
7. How you can fulfill its requirements ? Discuss its various types in detail .

## **VII RESULTS AND DISCUSSIONS**

In this section, the successes and failures of the implementation of PBL approaches are discussed . In addition, some feedback collected from students through oral and written questionnaire has also been described which outlines how students felt about the introduction of PBL in course of Concrete Technology . The comparison between PBL and SCL methods too have been discussed .

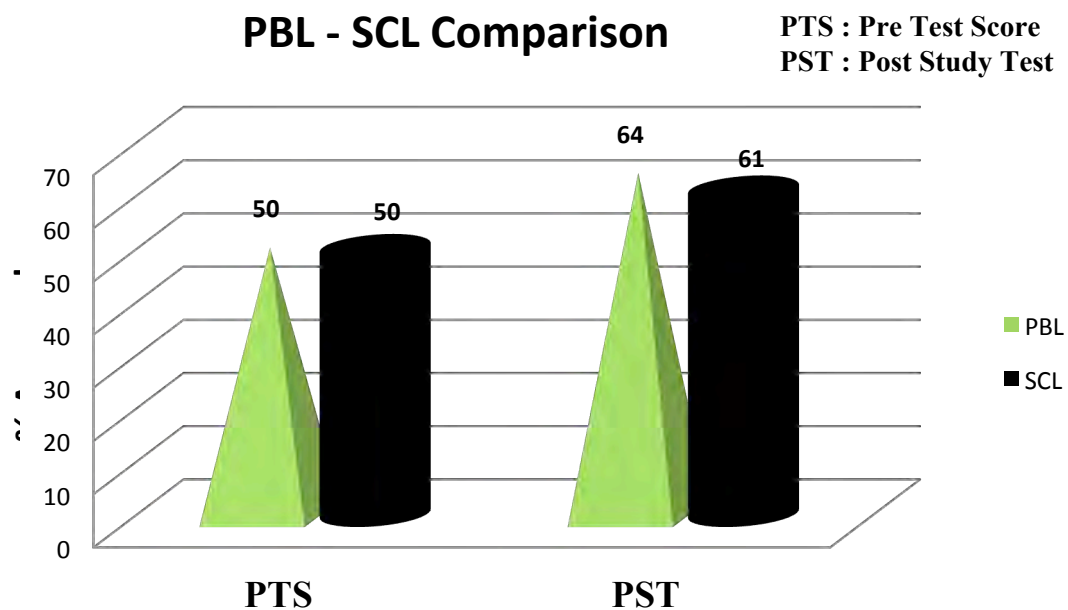

The assessment strategy adopted for the PBL course of Concrete Technology to assess the work and performance of Polytechnic students varied slightly from the Brodie Model ( 2002) . The revised assessment model is shown in fig (ii)

**Fig. (ii) Assessment Model**

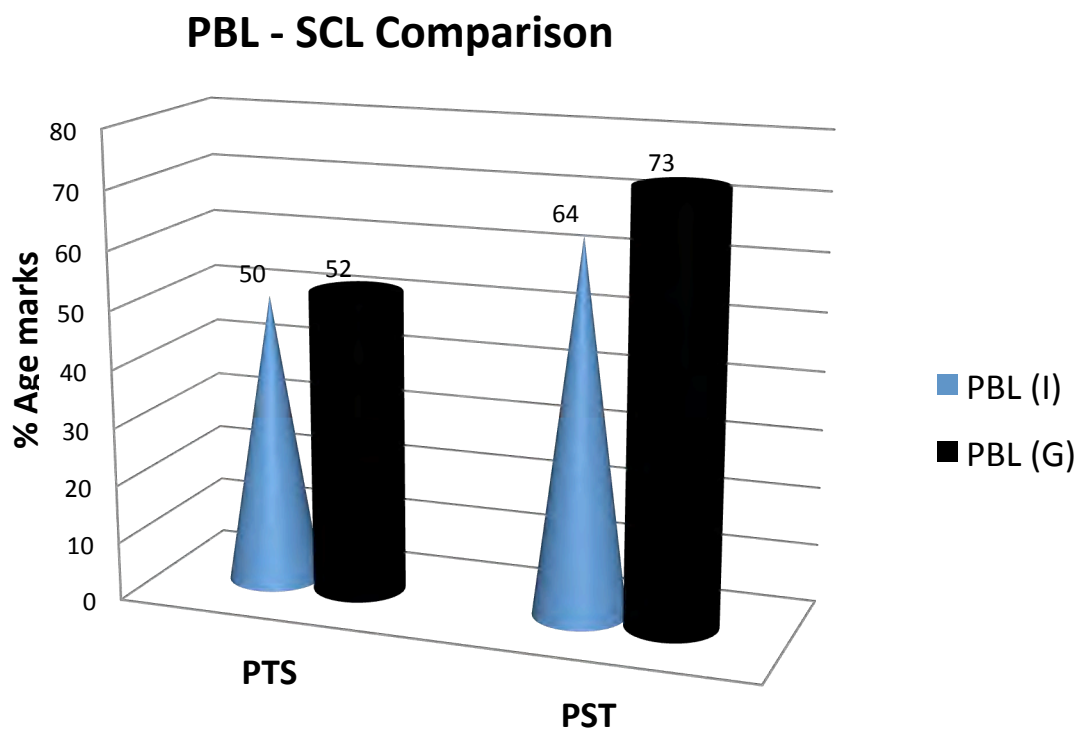

- (i) In this test conducted on both PBL and SCL groups, the average marks in the examination ( Pre Test & Post study Test scores ) of PBL group was not significantly different from SCL group & approximately the same proportion of students got average and above average marks . Even PBL group had the slight edge in post study test carried out in the second half of the semester ( shown in fig (iii) ) . This provides the evidence that using the PBL methodology does not put students at a disadvantage as compared with conventional system of learning . However the reaction of the students to the delivery mode was generally very favourable and the feedback from the facilitator was also very positive .

□

**Fig. (iii)**

- (ii) In this trial of test the individual performance of each member of PBL group was compared to its group effort ( shown in fig iv) . Except one group , the average performance of students increased to a marked extent . Groups of 5 students were used for PBL research as it was felt that this is a group no. that is easy to manage and allows all members to have some chance to speak .

**Fig. (iv)**

- (iii) One interesting thing happened during the implementation of the concrete technology course at MC Polytechnic, Jalandhar was the improvement in class attendance. At Polytechnics in Punjab, class attendance is generally low due to boring lecture methodology adopted in SCL approach. In first part of PBL course (first trimester), class attendance fluctuated (60-65%), however in the second trimester, when full scale PBL activities were conducted, an average 82-83% of the class was present most of the time, whereas in SCL group the class attendance was quite less (72-73%). The weekly class attendance is shown in fig. v (a),(b).

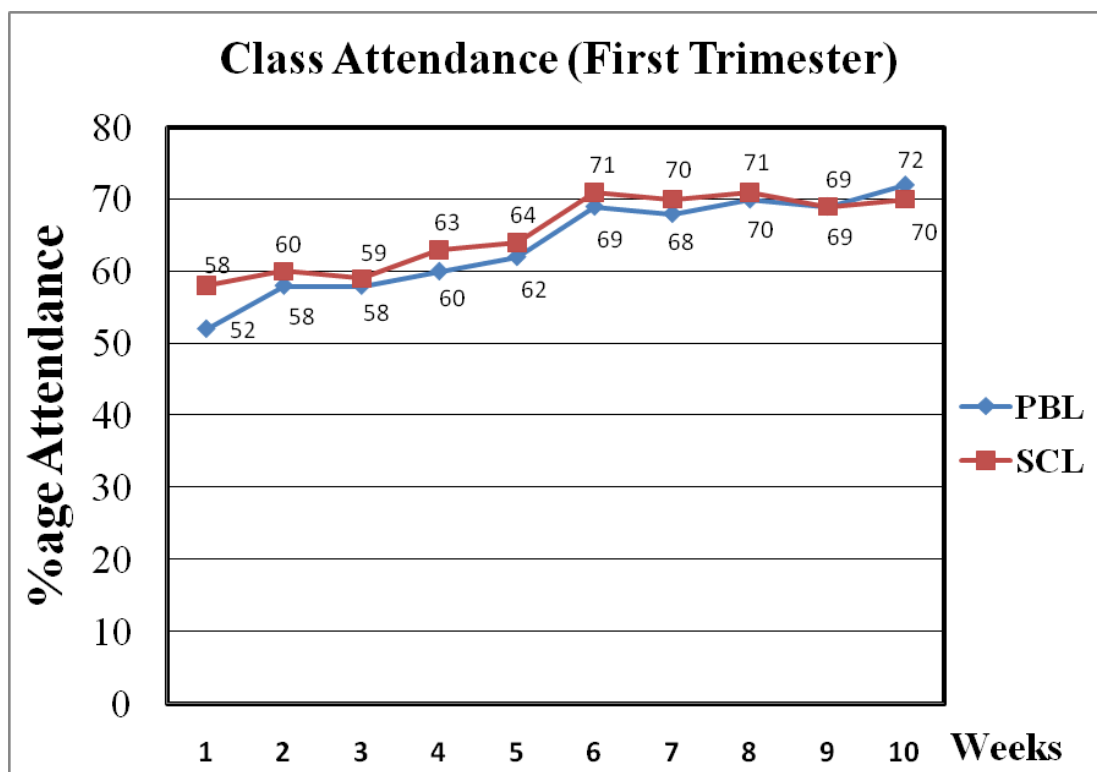

Fig. v (a)

□

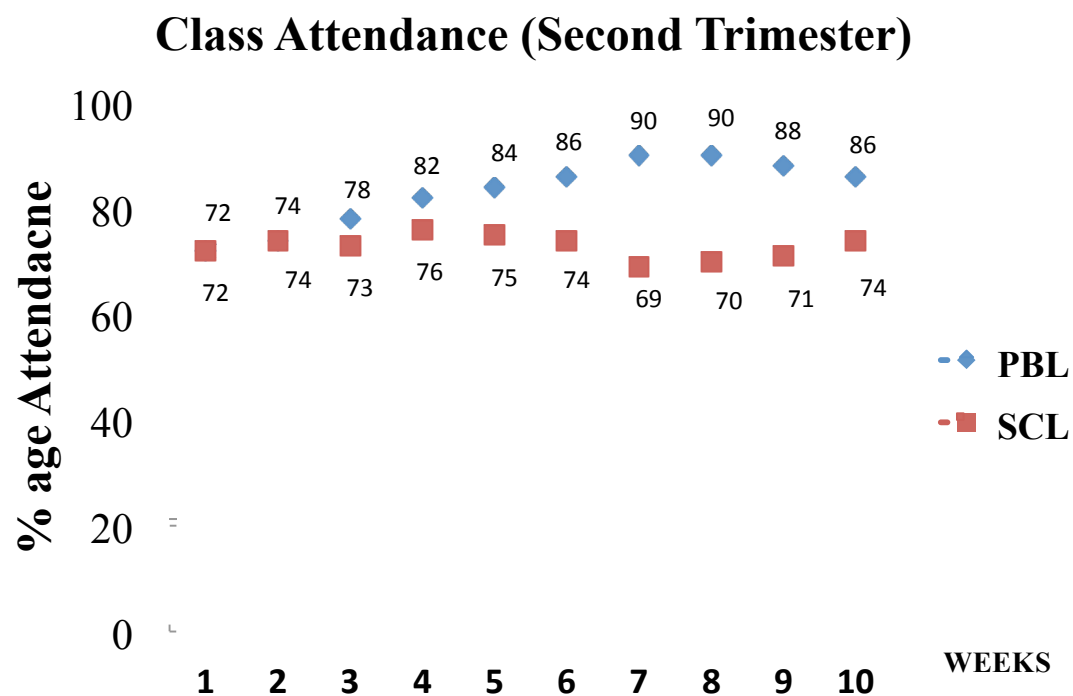

Fig. v(b)

- (iv) Students felt strongly that they were learning skills, that would be useful to them in higher studies or during work as a supervisor in construction industry in later life. They felt that it was very valuable to work with other students in a group and that discussing problems with other made them understand issues more deeply and gain a broader understanding of the subject. However few students (4-5) also strongly felt that PBL was more difficult and more time consuming than SCL methodology.
- (v) The online discussion forum (web page) worked as useful way to share ideas and resources within the class as well as during holidays but technology was not frequently used by one or two groups to share information with the class and especially to discuss within themselves.
- (vi) In the final week of semester, a questionnaire was issued to all students of PBL group by email. Although 100 percent students did not responded the questionnaire but most of them returned. The students acknowledged that they have enjoyed PBL although it was messy and difficult. They also felt that they had learnt better team working skills, better communication and better research skills. Although there were four students, who felt that PBL wasted time only and nothing concrete came out of it. They said that the time spent on reading, studying and solving problems would have been better spent on getting information through lectures.
- (vii) The students in favour of SCL method explained "There is no burden on us, we clarify our doubts in mind immediately from the teacher; moreover there is no pressure to find out the correct solution". But there were more people and more points in favour of PBL. "How can you gain, if there is no pain. They (SCL group) are following easy and simple path". An overwhelming majority of students (about 83%) stated that they enjoyed the PBL process. The reason being:
  - a) It helped them learn together and solve problems related to the course.
  - b) It is an interesting way of learning provided the team works well together.
  - c) This learning approach provides the highest standard of self control and planning.
  - d) It is good for improving research skills.
  - e) They really learned something deeper what was expected to be learned in B.Tech.
  - f) It really helped them to understand the assignment.
  - g) They never learned like this before through the use of SCL approach.
  - h) Although more than 83% of students enjoyed PBL experience, their preferences leaned towards a combined traditional and PBL approach. Their main suggestion was to combine PBL technique with the traditional SCL method through the introduction of small lectures in between so as to provide them the basic materials to solve their problems.
  - i) The PBL tasks designed by teachers determining the learning activities can be undertaken by students during non-contact hours. This is the key advantage of PBL that it can help students manage 'non contact hours' more effectively.
  - j) As a facilitator, I got the most satisfaction when sizeable number of students of SCL group approached and requested me to join the PBL group for learning. Despite constant pressure of work, 25 students in a group of 30

indicated that their PBL experience was positive rather than negative. 5 students who disliked PBL cited two reasons – the high workload and a preference for lectures in which the teacher is a primary source of information.

## **VIII CONCLUSIONS**

PBL introduction to course of concrete technology for Polytechnic students was motivated by the desire to engender more independent and deep learning in students in the final year and in B.Tech classes. It appears to have been quite successful in this respect as students not only engaged in independent research, reading outside of the course but their class attendance improved a lot. The use of PBL will continue not only in this course in future years but some other subjects of Civil Engineering will also be brought under PBL regime. It is also intended in future implementation to have more training for facilitators. It may not be possible to expand the number of facilitators available, due to lack of resources, but better and more extensive training of existing facilitators can be put in place for good results.

The study also indicated that a pure PBL approach is not appropriate because of the anxiety caused to students when no background material and immediate feedback are available. In the future the course will be taught by combining aspects of both PBL and SCL methodology. Smaller problems that can be solved over a week's time and hybrid lectures in between PBL tutorials will be experimented in future Study course. Finally it can be concluded that this paper has highlighted the theoretical and practical issues of using PBL in Civil Engineering courses at Indian Polytechnics. Questionnaires and interviews were used to obtain the feedback on the overall effectiveness of the system.

Abstracts

It is now widely accepted that theoretical knowledge is not sufficient to develop the full potential of students. At SoA+D, academics address this issue using “Work-Integrated Learning” (WIL). WIL is a pre-training professional course for students. WIL encourages students to practice soft and hard skills in real work situations, while the teacher’s role is to provide support, advice and receive feedback from company’s supervisor. WIL evaluation reports showed that student’s soft skills are a major problem. This research therefore aims to seek a methodology for improving the design student’s soft skills appropriately. From this objective, one of university project-based learning projects was selected to be a real work situation case study. The researchers developed an experiment called “work together learning” (WTL). Researchers gave different assignments to two student groups. Each group worked together with teachers, who played the role of colleagues. In this experimental situation, teachers could directly observe and supervise the students during work. Students were assumed to practice their soft skill under the teacher’s advice. Based on observation, the student's soft skill development was evident because, in the role of colleague, the teacher can directly perceive and address soft skills problems. The result indicated WTL is a useful form of project-based learning for students, especially in soft skills improvement. We propose that it will be more effective to insert WTL before WIL in order to extensively practice advanced soft and hard skills before students undergo the WIL experience.

## Introduction

The educational transformation of 21<sup>st</sup> century required an adoption of a new paradigm of education. The article of “what is 21<sup>st</sup> century education” gives definition of the schools in the industrial era, that will be laced with a project-based curriculum for life aimed at engaging students in addressing real-world problems, issues important to humanity, and questions that matter. The learner should learn learning methodology and the learning must be cause of learner changing broadly. At the same time teacher should be a learning facilitator to encourage learner for integrative development. (Marriam, et. al, 2007) This propensity will effect to the changing role of teacher students and school and shape up a new concept of “knowledge” which is not mainly concern on Theoretical Knowledge but also Practical Skills. Knowledge can be learnt whereas skills require practical exposure and can also be in-born. From a philosophical perspective, knowledge is intangible but skills can be made tangible by applying those skills to a context and getting the desired result (Economic Times).

Main purpose that educational field always use for learning and development is to indicate behavioral objective which is to identify learning result that expect to be happen which can identify observational behavior and Clear tangible behavior (Orstein& Hunkins, 2009). Nowadays, university provides theoretical knowledge based on tacit knowledge, the theoretical knowledge is as a primary basis of learning while practical or applied knowledge which related to experience is needed to enhance students ready for professional future work. Practical knowledge based on real life experience and be significant during the final year before graduation.

Elizabeth A. Jones(1996) have done the research for National Center for Education Statistics(NCES) about the “Expected Learning outcomes” which is to study skill and learning level necessary for bachelor to work and to live in society. The essential skill for graduate students is composed of communication skill (listening, verbal communication, reading, writing and IT skill), critical thinking, problem solving skill teamwork based on IT. These skills are quite important especially to liberal arts education. (Julie Bogart, 2011). Architecture study is one part of liberal arts. However Jones proposes the entire bachelor should integrate this particular skill throughout the curriculum.

As architecture study is one of professional education; Stark, et.al (1986) defined the expected outcome for the professional education composes of 11 issues. It is composes of conceptual competence which is the understanding of professional basic theory, technical competence means the ability of professional basic skill operation which is not cover the skill of psychomotor skill but also included the interpersonal skills and special cognitive skill eg. creative skill which is really important to architecture study and communication arts. The contextual competence means the understanding of sociological context, economics and culture which related to the professional operation. The interpersonal communication competence included empathic and service-mind. The integrative competence means the personal ability to integrate ability of

thinking, context, technique and interpersonal communication together for professional judgment. Adaptive competence for futuristic problem solves orientation. The expected outcome of professional perspective composes of 5 issues, the career marketability, professional character/identity, professional ethics, professional morality or code of conduct, scholarly concern for improvement and motivation for continuing learning.

"Experience is also being a teacher ever" because it will help you in proper dealing with everything in the outside world. Rooijen V. Maurits mentioned universities must rethink their traditional organizational, philosophical and operational tenants to align more closely with real world needs". However, presently educational paradigm is changing from the teacher center to learner and knowledge center. To motivate student to have an effective learning; experience of professional practice is very important especially the architectural students which is one kind of professional education. According to concept of learning style, (Claxton, Murrell, 1987; Kolb, 1981) which has been developed from experiential learning theory explains the process of learning from experiential learning theory. It is composed of concrete experience, reflective observation, abstract conceptualization and the active experimentation. Kolb's theory cited by Svicki& Dixon(1998) proposed the direction of learning and teaching direction, teacher manages learning activities in order to enhance 4 dimensions of learning;

- A) Concrete experience means experimentation, observation and primary sources review or reading, studying by simulation, movie, to study from the actual problems.
- B) The learning from observation (reflective observation) composes of keeping learning logs/journal, experience changing conversation, questioning
- C) The activity enhance learning from abstract conceptualization; report assignment Project based learning
- D) Active experimentation; teaching from simulation, case study, laboratory, field study or project assignment.

### **Work Integrated Learning (WIL), Learning through working experience**

Work-integrated learning (WIL), also understood as work experience in industry, cooperative education, and field education (Emslie, 2011). Universities have been encouraged to implement WIL and have demonstrated an eagerness to do so; yet accounts of university educator's work roles have not kept pace and generally omit the delivery of WIL (Coaldrake & Stedman, 1999; Hall, 2002; Orrell, 2004). WIL is the key strategy adopted by universities to produce the work-ready graduates demanded by employers (Emslie, 2011)

Patrick et al. (2009) suggest WIL is an umbrella term for a range of approaches and strategies that integrate theory with the practice of work within a purposefully designed curriculum. This is on the same direction of King Mongkut's University of Technology Thonburi (KMUTT)

policy. One of WIL; cooperative program is a part of professional education for School of Architectural and Design (SoA+D) to develop student to be quality graduate and to be precise at professional aspect. The cooperative program emphasizes on the system of student's professional operation experience. The concept of this program is the collaboration of school and private office to enhance 4<sup>th</sup> year students (a year before graduation) to get involved in the future career. The expected outcome of cooperative program is to encourage students to apply hard skills in the real workplace and to practice their soft skills at the same time. soft skills are self management skills and people skills such as communication skills. In contrast, hard skills can be learnt in school and from the books. (Hard Skills vs. Soft Skills – Difference and Importance, June 30, 2011 Lei Han )

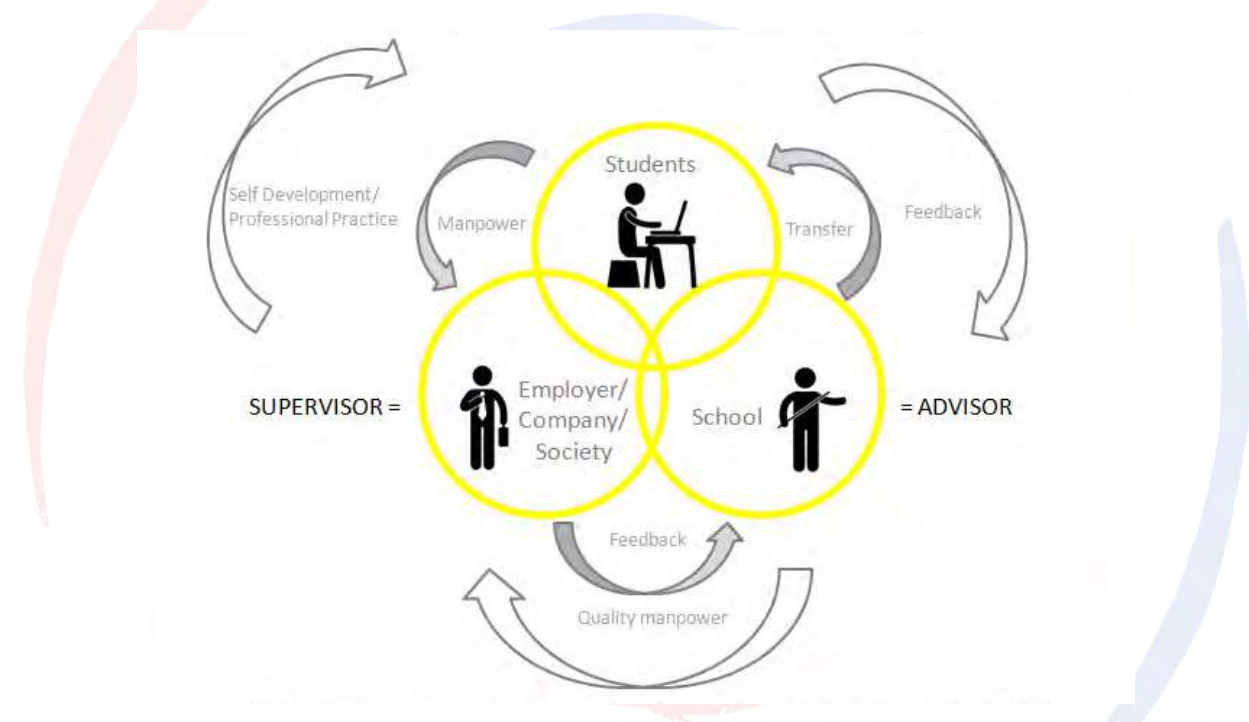

Fig.1: Relationship and benefit of cooperative program stakeholders

This above diagram shows the cycle of benefit and relationship of each cooperative program stakeholders. While students perform as temporary company workers and give manpower to the company they also can experience the professional career and have self development at the same time. The second stakeholder is company which adopts students to work with will get manpower and will perform as a field supervisor to reflect student's performance back to school advisor. The third stakeholder is the school advisor; the duty is activities planning, student counseling, and student evaluation in which customized to the company's jobs At the end of cooperative process Students have to conduct cooperative study report, field supervisors or business owner suggestion and evaluation then advisor responsible for field experience – compile and approve.

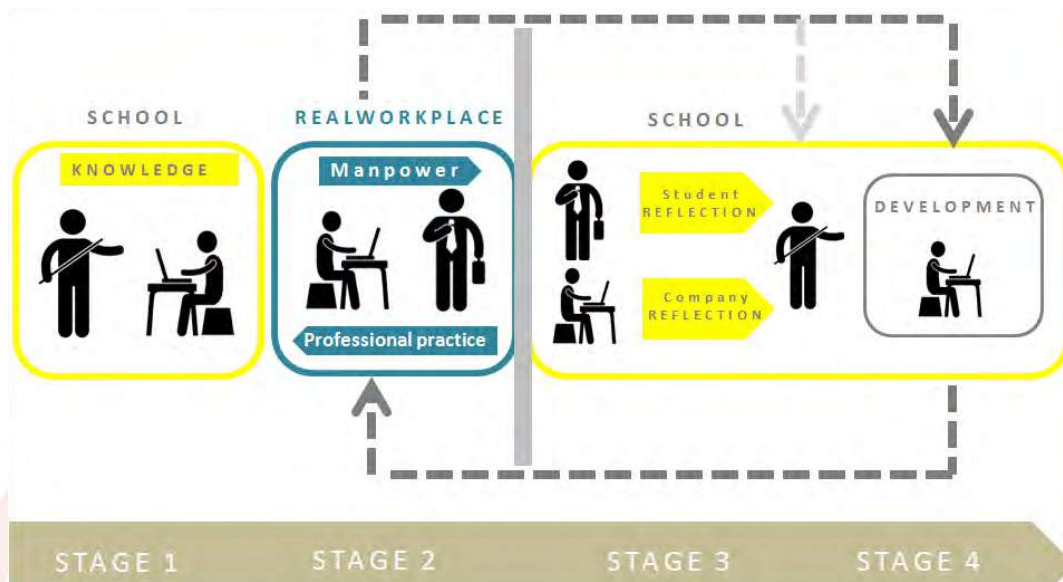

Fig.2: School duty and Cooperative process relation

Fig.3 shows the duty of school from theoretical knowledge provider to practical process with the real company. It shows the limitation of this process that is the school advisor cannot directly observe while students are working in the company.

From the cooperative program evaluation report (2011) exposes the reflection from field supervisor to students in hard and soft skills classification as following; Hard skills: individual's ability to complete technical tasks; program and technical skill improvement, and professional skill improvement such as structure Improve skills for construction knowledge implementation in real profession. At the same time the soft skills which mean interaction with people which students should develop are composed of self management such as time management, childish habit, communication and networking skill improvement, leadership and teamwork improvement. The conclusion is that about 23% is hard skill and about 77% is soft skill needed to be improved.

## Experiment with the Interrelation of Learning, Teaching and Working

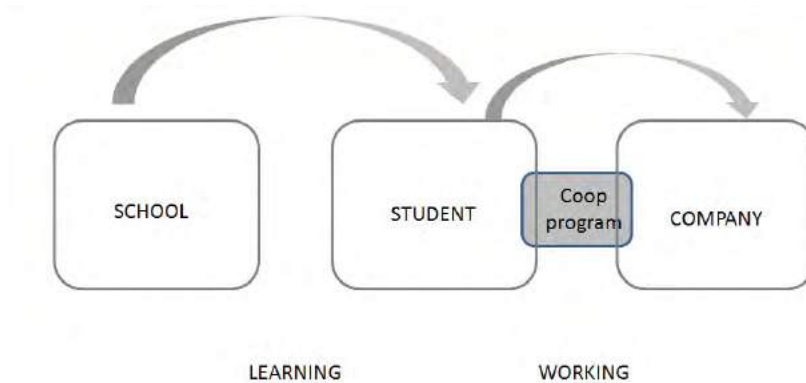

Fig.3: The location of cooperative program

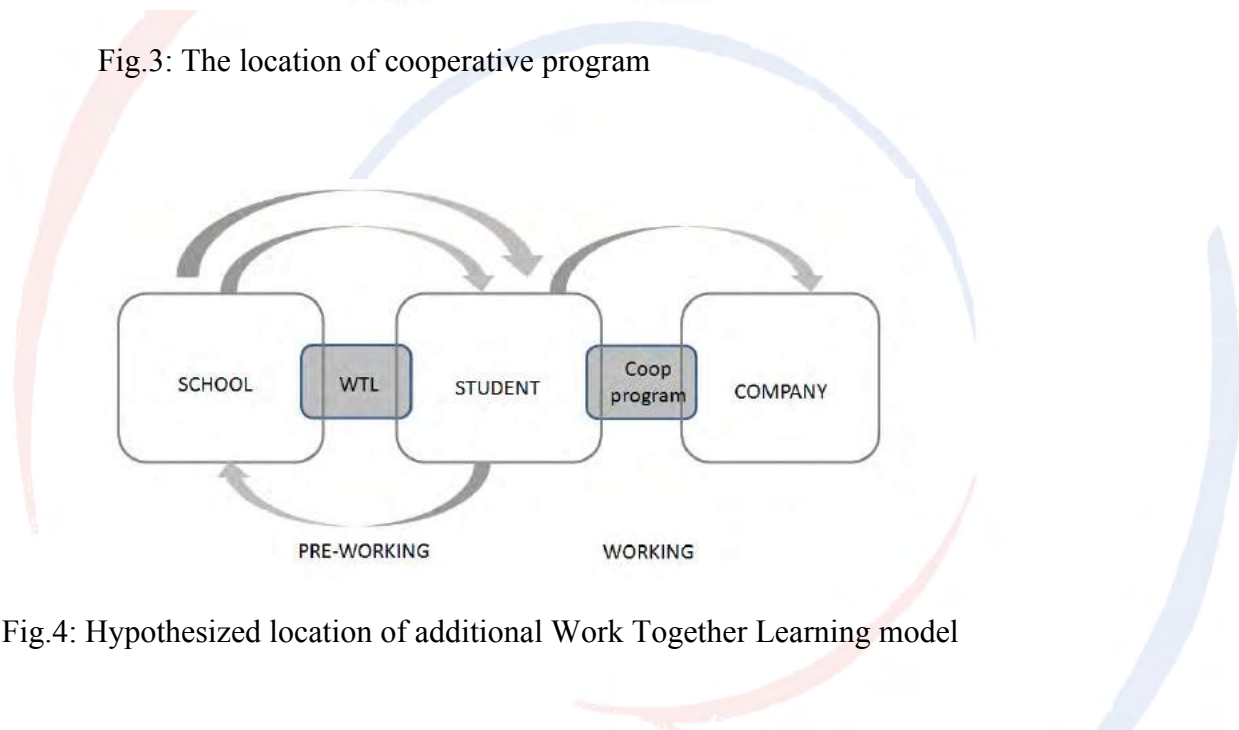

Fig.4: Hypothesized location of additional Work Together Learning model

From the company reflection school should pay attention to improve student's soft skill. This is the background of question "How to develop and improve student's soft skill appropriately".

The objective of this study is to experiment the methodology to improve students soft skill appropriately. If students have an opportunity to improve their soft skill, they assumed to gain more benefit of self integrative development of soft and hard skill practicing while attending cooperative program. Normally, soft skill practicing cannot effectively practice in school it usually related to emotional Intelligence or EQ which most soft skills are not taught well in school and have to be learned on the job by trial and error. (Han, 2011).

An university project-based learning was selected to be a real work situation case study "The Museum of Renaissance Conservation and Developing Learning Communities for Sustainable Tourism at Baan Ngangoi and Baan Ponplalol, Tao Ngoi district, Sakhon Nakron province,

Thailand” one of community development project of the university has been chosen to be a trail project to develop student’s soft skill evidently. It is consistent to the article of “what is 21st century education” which mentioned about the role of an interdisciplinary, project-based, and research-driven, connected to the local community effected to thinking skills, multiple intelligences, technology and multimedia, the multiple literacies of the new paradigm of education. Same perspective with Abeysekera (2006) who referred to “service learning” that is student has intentional learning goals and reflects actively on what is being learned throughout the experience. These programs are intended to develop research, critical thinking and interpersonal skills through participation in public service. However service learning may suit some academic programs more than others. For instance, they may be less suited to business-related studies, such as accounting, on the basis that most accounting professionals are employed by firms in the private sector (Certified Practicing Accountants, (CPA), 2002). In case of future architect or engineer need to possess both ‘hard’ and ‘soft’ skills. Soft skills are important because architects interact in organizational settings instead of working by themselves. Soft skills may be grouped under ‘conscientiousness’, ‘initiative’, ‘social skills’, ‘controllability’ and ‘commitment’ (Ofori, Low, 2000).

#### **Methodology: Work Together Learning (WTL)**

The methodology of this participation observation research involved the development of appropriate soft skill can be divided into 3 stages. It is started from the first stage which is “Reviewing” The secondary data of relationship of WIL cooperative program in SoA+D work and knowledge, company feedback, type objective and expected outcome of WIL program are the main interests. Then the second stage is WTL model design. And the last stage of this study is experiment and implementation before make a conclusion and suggestion.

“WTL” (Work Together Learning) is a process adopted for experimenting with this study. The conceptual development of WTL is based on grounded principle of WIL (Work Integrated Learning) but to investigate and to fulfill WIL’s absent dimension. The hypothesis of this experiment is WTL should be an appropriate preprocess before cooperative program. The simulation of the real workplace atmosphere in school project will drive students practice their soft skill automatically. Advisors gave different assignments to two student groups and work parallel. Each group composed of 2-3 instructors and 3-4 students, students worked with advisors. In this experimental situation, advisors played the role of senior/ field supervisor instead of knowledge giver accompanying with students who acted like co-worker. The multidisciplinary teams of 4th year of Interior Architecture, Architecture and Communication design assembled for this experimental study sample, the major processes are as following

**Method 1:** Co-creation: To create a workshop or activity for data collection, Advisors (Field supervisor) gave the objective of data collection to co-worker and brainstorming to sort out the most suitable process.

**Expected outcome:** Students can practice soft skill; communicating, listening, engaging in dialogue, giving feedback, cooperating as a team member, solving problems, and resolving conflict. Leaders at all levels rely heavily on people skills, too: setting an example, team building, facilitating meetings, encouraging innovation, solving problems, making decisions, planning, delegating, observing, instructing, coaching, encouraging and motivating.

**Method 2:** Design and presentation and community: To bring the result from co-creation workshop to design the learning space for community, present and get some feedback from them.

**Expected outcome:** Students can apply professional skill eg. Computer skill, design skill, construction and drawing skill, while practicing soft skill at the same time.

With this methodology, teachers could directly observe and supervise the students during work. Students were assumed to practice their soft skill under the teacher's advice.

## **Result**

From the observation of WTL experimentation can be divided into 3 stages

### **First stage**

**Advisor:** Change the role from knowledge giver to be field supervisor, advisors had to spend much input to reduce to blur the hierarchy and reduce the distance between advisors and students

**Student:** Students still shy to pretend as a co-working with advisor without strong hierarchy. They are still wait for confirmation and decision making from advisor.

### **Second stage**

**Advisor:** Being a motivation driver and facilitator and consultant, to stimulate student's discussion without suggestion, propose question to group of student and being moderator for discussion

**Student:** Self adjustment to be part of teamwork gradually, discussion and brainstorming occurred automatically and smoothly. They have freedom to learn and freedom to share. Students have more self confident to their idea, they argued the advisor's idea reasonably. This stage initiated sense of belonging and responsibility of students to their work/project.

### **Third stage**

**Advisor:** Working students without hierarchy, propose and listen to students appropriately

**Student:** have more leadership skill, work management and communication skill with both team worker and supervisor, Learner as an initiator and whether or not the group members worked effectively and learnt from and with each other.

## Analysis of the results

From this result, it can be analyzed that Work Together Learning (WTL) should be engaged with the actual project or field study. In this case the project is community development/community service type. The outcome is quite satisfied and clearly noted. The students can develop their soft skill as the experimental expectation. WTL is very useful to be a preparation process before cooperative program. When the student participate the cooperative program with the company, they will be able to adapt their ability and their experience both hard skill; the theoretical knowledge that they have been learnt from school and the soft skill that they have been practice with the WTL participation.

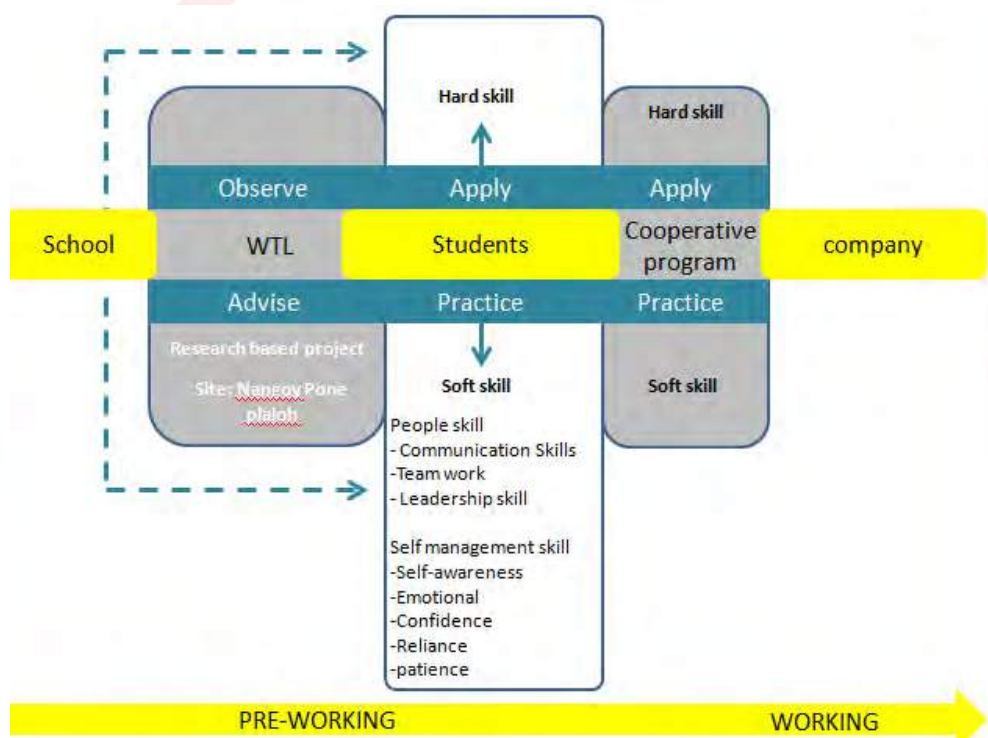

Fig.5: Suggestion of the relationship between WTL and cooperative program

The diagram above shows the process which WTL should be assessed into either subject which operated with the company or the organization outside to enhance cooperative program. The advisor can observe the student's ability closely and give them advice appropriately.

## Limitation of this study

The limitation of this study is the duration of the experiment. Actually, the cooperative program duration is approximately 16 weeks. The WTL experiment is only 5 days. The limited time encouraged two groups of student pay much attention to their task consistency until finish. The

assumption is how long students can concentrate and perform their responsibility to their mission continuously as professional do? Another limitation is the ratio between advisors and students. This experiment, it is about 1:2 so, the advisor can take care of students almost one by one and closely. So what is the suitable amount of students per an advisor. In the real workplace, on the other hand, school cannot predict the amount of the field supervisor in the real workplace. WTL on this study aims to practice and apply for architecture/design students who have to be trained on people skill as same as specific professional hard skill. To bring this WTL to apply with different professional education or study field, WTL process should be adjusted as followed the objective and nature of each type of education. At last the appropriate evaluation of WTL experiment on this study is not be assured this evaluation needs to be elaborate.

## INTRODUCTION

There is a continuously growing scale and rise in demand for education and training in response to the requirements of the knowledge society (OECD, 2001). To meet this demand for education, E-learning emerges. It seems to have different meanings for different people. It is generally considered by researchers in this area that e-learning could be seen in a narrow concept and a broad concept. The narrow concept views e-learning as a term similar to computer-based training (CBT). On the other hand, the broad concept sees e-learning embrace more than just “the provision of learning opportunities through computer technology” (Pollard & Hillage, 2001; p7). Hall and Snider (2000) defined e-learning as the process of learning via computers over the Internet and intranets. Hall (1997) defined computer-based training as an all-encompassing term used to describe any computer-delivered training including CD-ROM and World Wide Web. Gotschall (2000) added that online training was also known as net-based training.

In terms of the form of e-learning, Hall (2000) pointed out that e-learning could take the form of a complete course, access to opportunities for “just-in-time” learning, access to components, and the parts of courses to acquire and test knowledge or content as an immediate resource to resolve an immediate problem. Furthermore, he contended that more links to real-time data and research would become quickly available.

The models of e-learning are changing, with knowledge increasingly viewed as something that can be created in, and captured by communities of learners rather than a discrete body of information to be transferred (Pollard and Willison, 2005).

A great number of institutions nowadays have extended or want to extend their use of computer-based technology to provide learning resources and communication platform for learners and tutors. This research aims to investigate the use of e-learning as a support of the traditional teaching method and analyze in what ways e-learning contributes to better teaching methods and learning environment for the e-learning blended courses run by an institute in UK.

The main objectives of this paper is to explore the way an e-learning course in an institution is virtually designed, developed and delivered to students, in what ways people are arranged, under what thoughts the departments have decided to launch a course blended with e-learning technology correspondent to a subject area. Most importantly, it is concerned about both the students and staffs’ attitudes towards this program. Based on these questions to be answered, it will evaluate the pros and cons in this e-learning blended solution, trying to figure out problems existing and progress it has made, with a perspective that it might enlighten the development of other Msc. e-learning programs.

## **METHOD**

### **Data collection**

The data collection was conducted at an institute in UK, among the students who were taking *EEE (engineering enterprise and excellence)* course. Three approaches were adopted to collect data:

1. observing the online course provided on websites;
2. interviewing faculty members;
3. distributing questionnaires to EEE students

#### **Observing this e-learning blended program via its web pages.**

In forum, every piece of information entered into the system, including all the messages is stored and can be accessed. These messages are suitable for content analysis (Holsti, 1968).

The information observed covers the online contents provided including journals, mind maps, course instructions, messages content left by students and staff in online forum, and students' blogs. This step is vital since it could help the researcher to recognize the fundamental framework behind the course. Sensible questions could be only raised on the basis of an acknowledgement of the subject. After a thorough observation, drafted questions to staff and students were sketched.

#### **Interviewing faculty members**

Target students and staffs should be representative and eligible. Under the constraints of limited time and human resources, only a small number of students and staffs were chosen. Besides, both the names of students and staffs were kept anonymous.

Staffs include one IT service staff, the program leader and one tutor of the EEE module. The interview helps the researcher figure out the key problem and questions, and enhances the understanding of the course implementation.

#### **Distributing questionnaires to EEE students**

Based on the drafted questions designed after step one, a pilot questionnaire was personally sent to one student with an interview followed. The final questionnaire was then decided after revision. These questionnaires were then sent to students in a large scale via email.

As previously mentioned, instead of distributing the questionnaire through the official channel, questionnaires were sent with the assistance of interviewed students, to ensure a high respond rates.

Students' background experience is an uncontrollable variable in e-tutoring. Also, considering the limited number of questionnaire respondents, the analysis of students answer is more closely related with their background. Therefore, it is necessary to present table 1.0 which lists the main background of respondents. Here, students' names were kept anonymous.

**Table 1.0**

Student NO.	Gender	Age	Background (subject for BD)
Student A	Male	23	Computer Science
Student B	Female	23	Business information system
Student C	Male	44	Aeromechanical systems engineering
Student D	Female	23	Business
Student E	Female	26	International Business Administration
Student F	Female	23	Information Management
Student G	Female	23	E business
Student H	Female	22	Mathematics and Business Studies
Student I	Male	24	International trading
Student J	Female	23	Business Law

Answer sheets were then being examined to check if most of the key questions were answered and if the questionees are eligible EEE students. With a consideration that, although cases have been selected in a limited range, performance would still vary because of age and working experience, therefore, the background information about the students selected were given as a reference.

The analysis will in general rely on the theoretical proposition that led to the case study.

## DISCUSSION

Forums, blogs, links to reading materials and content storing are not new to those learners. 90% students taking EEE course expressed that they are familiar with these elements and are fully skilful in using them. These four elements are also not a unique existence to EEE course. They are virtually essential elements of the institution's websites as a whole. Every student can sign up and build up a blog. EEE course makes it compulsory for learners to blog and initiate them with forum discussion. Among these four elements, 8 out of 10 students put forum at the first place. The importance of these elements decreases, following a sequence of Forum, reading materials, blogs, and content storing. Hereafter, the contribution of each

element will be discussed.

## Forum

Forum plays a crucial role in supporting the discussion. It reveals its benefits in this particular context.

Firstly, the flexibility of e-learning has again been proved is enormous. All of the students spontaneously pointed out that they enjoy the flexibility forums provide. In addition, the benefits are two folds: time-based and location-based. For example, during the interview with student A, the interviewer noted that sometimes, it is hard for team members to accommodate each other's timetable or when they have to discuss topic overnight and hand in the report next morning. The Forum allows them to discuss at anytime anywhere. This echoes the advantages claimed by a range of e-learning researchers (eg. Karon, 2000; Wentling, Waight & Gallaher; 2000)

Another student (Student B) raised the language issue. Particularly in the institution's learning context, overseas students tend to speak their mother tongue to colleagues from same country. Consequently, it sometimes happens a team is split into small groups. This phenomenon ruins the learning community the course intended to build. However, in forum, it is comfortable for course participants to post messages in English and meanwhile understand colleagues without accent problem.

By using the constructive approach, students are expected to gain their own understanding of the concepts. At the mean time, discussions on forum give each student an opportunity to make contribution to the knowledge pool in the learning community, which to some extent would revise the mistakes occur in the self-awareness of the knowledge stage, and offers students various views towards one question, as student C said "each student revealed different aspects of each subject rather than all quoting from the same set of tutor provided notes or set text."

From the tutors' view point, the "easy to track" feature helps tutors be able to go through every thread on forum and to monitor the discussion. In addition, unlike the in-class discussion, the contribution of each participant is blurred. In this way, the assessment is based on the quality and quantity of students' message (from interview w/ Prof. Roberts'). Tutors could also have a record of the students' login times displayed. Student A expressed that this way of assessment was fairer than in-class performance based evaluation. This approach of evaluation echoes "portfolio" assessment method and the discussion thread is in another sense an automatic record of portfolio.

However, 6 out of 10 students stated that face-to-face discussion was still necessary, because it is more direct and saves time. Moreover, although 9 of them were familiar with forum, they emotionally felt less get in touch through solely online discussion. This fact reflects the use of blended solution is appropriate in the school settings.

## **Online reading material**

Online reading material is also an important element in EEE-learning environment. The EEE websites provides the direct extract of learning contents on WebPages and the links to e-journal, online library and database. Students are encouraged to read through the contents provided and meanwhile to look for more materials by themselves.

Similar to forum, flexibility and convenience are basic benefits figured out by students. They are given the right to decide their own reading time instead of “setting 8 hours in class”(student D). Meanwhile, the links online are 24hours available, unlike the library which has opening time (Student C).

The biggest problem exists for tutors is that it was difficult to measure how many hours students spend on reading. It seems fair for stream leader judging students by evaluating their performance, but the student's knowledge edge remains unknown. At the meantime, as Pollard & Hillage's (2001) highlighted, online reading method is heavily reliant on self-discipline, so students' reading time to a large extent relies on their motivation. However no action has been taken to ensure the motivation. Student A spends only 5-6 hours a week on reading, which is much less then the time required by the program. Meanwhile, Student F, D, E pointed out that well time management was a challenge in their study. The rough time management chart provided online seems not enough to ensure their motivation.

Validity of materials places another problem on online reading (Pollard & Hillage's; 2001). Several e-learning commentators doubt the quality of the-learning material. In the case of EEE course, the links to official websites and formal journal providers, to a large extent, ensures the quality and validity of reading materials. However, problem still exits when students look for answers via online search engine.

To solve the motivation and validity problem, two suggestions are given. A detailed reading checklist would suit for students to clarify the-learning points, and meanwhile encourage them to cover all the points through reading. Similarly, an online pre-test would be able to have same effect as the checklist has, and additionally offer tutors a tool to measure students' knowledge edge.

## **Blog**

It is creative to use blog as a tool of e-learning, because traditionally blog concerns more about personal opinion on its own right. In the case of EEE course, blog doesn't shift to an academic publication tool, but somewhere in between becomes a space where students reflect and review their learning. Pollard & Hillage (2001) emphasized the share of experience and thoughts of learners in a higher model of e-learning. Blog actually provides a platform where student can achieve this sharing of experiences.

The comments from students prove the feasibility of this self-reflection and sharing of

thoughts. In student H/ B/ D's opinion, writing blog posts is a useful way of getting all of their thoughts out and by writing them down they reflect on the knowledge and are able to make further logical steps with their argument. It is good also to try to explore how students can apply their knowledge in the future. In comparison, student C noted that when the study and the topics were new, the blog allowed "the recording of thoughts" and for others to share and build upon their thoughts.

From the tutors' aspect, the practice of blogging provides an opportunity to acknowledge what learners have learned and how they will continue to challenge themselves. On EEE website, students are encouraged to use the web form of blogging which allows students to share their thoughts with others (from the institution's website). It also defines writing a blog as an important part of reflection, especially in adult education, since adults learn best and have better retention when they consciously take time to reflect on their learning.

However, although the idea of sharing thoughts and self-reflection is good and feasible, the feedbacks show that students did not frequently write blog posts or visit their colleagues' blogs. Student A wrote his blog to meet tutors requirement and seldom visit colleagues' blogs. Student F&G thought the blog was not quite helpful. Other students wrote blogs depend on their moods. All of the students seldom made comment on other students' blogs. This result shows that most of students realized the advantage of self-reflection of writing blogs, but only two students hinted at the sharing of thoughts. A contrast exists between what clearly states on EEE WebPages and learners' understanding. Therefore students still need explanation on the purpose of using blogs and they need to be stimulated at this stage. Without any one of the two factors, the self-reflection and sharing of thoughts hardly take place in the meantime.

### **Content storing**

Content storing is a supplement tool for course participants uploading and sharing useful files. It doesn't play a key role in the-learning environment, because the students' feedback shows the content storing system is not frequently used. Student A hoped the content storing function could be connected with the forum; therefore course participants would be able to upload and download useful documents directly in the discussion board, which is more handy and convenient. Presently, they can only firstly upload file and then post messages on forum to inform others.

### **Cooperation between IT staffs and tutors**

The EEE course doesn't outsource the design and development part to a third party company. Instead, the course was developed with the help of the University IT service. IT Services provides the essential resources and support to all members of the institution to gain access to information technology for research, teaching, learning and administration purposes (IT service website).

Mr. Carpenter is a key staff in charge of IT service and e-learning. As Mr. Carpenter said, to tailor an online program for the EEE course, the technicians have to do debugging and corrections day by day. Outsourcing would put obstacles for the further improvement, since it is time consuming to keep in contact with the third party company. This is the main reason why the institution relies on IT service, but the cost is subsequently higher than purchasing from third party providers.

Limited material on the way of cooperation between IT staffs and tutors has been found in literature. However, both the stream leader of EEE and the IT service are satisfied with their cooperation so far. Therefore, the approach of this cooperation (interview w/ Mr. Carpenter) in university setting will be described. After the stream leader expressed the willingness of launch an e-learning course, given the amount of time and money IT service gets, IT staff there will introduce the functionality of tools they already have to tutors. In this case, the stream leader was satisfied with the functionality they could offer. Then a team of 7 java developers negotiated with tutors and worked out the main “trunks” the tutors need, following by building up the WebPages with “site builder “. During this process, a frequent communication between tutors and IT service is needed. The IT service has to accommodate the requirement raised by tutors and finally train the users.

### **SCORM – e-learning standards**

SCORM is the most widely used collections of standards for web based e-learning (Fallon & Brown, 2003), which aims at building learning systems that enable the reusability and sharing of learning contents developed by different authoring tools (Gilliean & Su, 2006). However, IT service doesn't adopt any e-learning standards. Mr. Carpenter argued that each e-learning program on Campus tailored to a particular course, and there was no further plan of selling these e-learning platforms. Therefore, it is no need to adopt SCORM or any other standards.

It seems fair because the system was developed solely for users in UK. However, it neglects the fact that the university has decided to set up branches in Singapore and other oversea regions. Not using SCORM would be a big problem in the way of branch development.

On the other hand, the sharing of resources between institutes is becoming popular nowadays. An un-standardized system would prevent the sharing of e-learning resources and codes between universities. Therefore, given the further development of the institution's scale and trend, the adoption of SCORM is suggested.

### **Tutors' role**

In the EEE course, tutors play a role of a co-coordinator and an advisor. E-moderating is a concept concerned with tutors' role in e-learning. Considering the case of EEE – an e-learning blended course, the tutors' role is virtually more complicated, the examination of tutors' performance will follow the sequence of five-step model (Salmon, 2000) introduced in the literature review chapter, simply evaluating tutors activities from e-learning's aspect.

At the first stage, students were given basic information on the EEE course structure. However, strong motivation, which Salmon (2000) defines as a prime factor at this stage does not seem work as it expected, as analyzed in the “blog” session. 9 out of 10 students did not encounter e-learning before. 4 students were skeptical about the e-learning method. Others were not sure about the form of the learning environment would be. In contrast, after one week of study, they all felt comfortable and satisfied with the new method, which from another perspective proves the success of familiarizing students with the learning environment at the second stage. Students gradually got used to the cooperation between course participants. Further more the course related interaction became more collaborative. Due to the students’ familiarity with the online tool, these two stages seem to be achieved easily. However, at stage five, students’ idea to this e-learning environment were various. 8 students reflected that they still follow tutors instruction, without a clear method to deal with this new learning environment. When instruction was not given after a module finishes, students tend to stop reviewing the knowledge they gained. It could be found that the EEE course has gone through the 5 steps of e-moderating, which to some extent is positive. However, as previous analyzed, the e-moderating in this case is still lack of motivation at the first stage and further development guidance at the final stage.

## CONCLUSION

The initial purpose of this project was to provide an analysis of e-learning’s contribution to the EEE course. More specifically, the primary research objective was to 1) investigate how an e-learning blended course in an institution is designed and developed, the necessity of involvement of e-learning elements, and the role tutors play 2) analyze the pros and cons existing, as well as the space for further development.

The initial research process began with a detailed investigation into current literature on e-learning. The research on e-learning covers various aspects in educational and technological areas. Then following the objectives, interviews and questionnaires have been conducted with staffs involved in e-learning and students to gain their views and opinions on the use of e-learning elements and study within the e-learning environment. The analysis of programs provided on the institution’s websites and course participants’ feedbacks shows that all students and tutors are skillful to computer operations and well accept the e-learning’s involvement in learning.

The EEE course adopts a constructive approach for students to build up their own autonomy with the assistance of e-learning. In terms of e-learning, students were satisfied with the flexibility forums offer, but it seems that they need more guidance on the approach of dealing with this new type of learning environment and more motivation. With the current situation in EEE course, more knowledge management skill is expected to be involved. The research also identified the importance of using SCORM in sight of the institution’s future development.

The International Academic Forum

[www.iafor.org](http://www.iafor.org)

The way we understand and engage with 'place' is changing thanks to mobile computing devices (smartphones/tablets). Users can digitally dig down through layers of history, and move across paradigms of knowledge ('alternate realities') all while standing in a particular location. And, with the advent of augmented reality applications, used in combination with cloud based data management systems, multiple streams of information can be accessed simultaneously and overlaid on the landscape.

So what are the implications of using these new technologies in situations like Aotearoa/NZ where knowledge is contested and epistemological colonisation has occurred: should 'other' realities and understandings be placed alongside each other as if they are of equal stature and relevance? Who should be able to access information - should some information be reserved for those who belong to certain groups? And what are the spiritual implications of laying out webs of information across landscapes?

The following material was collected using semi-structured interviews, and represents a cross-section of perspectives addressing the points of inquiry noted earlier. It is by no means representative of a population in general – merely a sampling of practitioners working in and around a particular place. The respondents are Maori and Non-Maori, and work across different disciplines and paradigms of practice including: Maori Elders and Kaitiaki (Spiritual Guardians/Caretakers of Place); Archeologists; Local (European) Historians; and Educationalists (Maori and European).

### **Epistemological Multiplicity of Place and learning**

Academic place based research involves a number of different disciplines and ideologies (Robbert), 'place' is, at once, geological, statistical, architectural, philosophical, cultural, psychological, environmental, educational, spiritual and more. These different disciplines, while crossing and blurring academic lines, are not yet fundamentally connected.

In contrast, indigenous understandings of place are often complex and holistic in nature and involve a construction of a way of being and seeing that is in direct relationship to the physical environment. (Denzin, Lincoln, & Smith, 2008, p. 136). Place is multi-dimensional, interconnected and alive with spirit (T.K.K.B Morgan, 2006; T.K.K.B Morgan, 2009a, 2009b; Patterson, 1992). Learning is acquired through living in one's environment (Berkes, 2009) and is connected with the whole person rather than just their mind. (Maurial, 1999). For this reason connection to 'place' and context is critical to content (Maurial, 1999).

As Semali & Kincheloe (1999) point out, it is problematic to try and create a taxonomy of alternative ways of knowing and alternative pedagogy. But it is reasonable to say that indigenous cultures the sense of 'knowing' can be very different, and that it has, until relatively recently, has been systematically marginalised by a western education system that devalues these underpinning philosophies (see Denzin et al., 2008; Smith, 1999)

NZ is unique in that it has rehabilitated a 160 year old Treaty between indigenous peoples and Europeans (Te Tiriti o Waitangi/ The Treaty of Waitangi) and enshrined this in legislation (Sibley & Liu, 2007). This treaty forms foundational document which underpins bi-cultural policies (including educational frameworks). However, NZ did not escape the oppressive and marginalising effects of Pakeha rule (Walker, 1996) and there is a recognised gap between the theory and practice of biculturalism (Taniwha, 2010)

## Technological Multiplicity and Learning

Thanks to the aforementioned developments in technology, data that was previously held in multiple locations (within families as oral history; within museums and city council archives; within libraries and universities; within art galleries) can be (if digitised and made accessible) brought through to a user at a touch of the screen; stories and myths can be digitally located in the place from which they were generated. Places can be seen as multi-layered constructs containing multiple dimensions of social, technological and physical interconnections (Resch, Britter, & Ratti, 2012).

Internationally, educationalists are experimenting with this to create location-aware mobile (hand-held computing) games that allow a rich interchange of data both from user to facilitator, but also collaboratively from user to user and user to the environment (de Souza e Silva & Delacruz, 2006). In Aotearoa/New Zealand, the use of mobile devices (such as tablets) in classrooms is increasing, and in some schools they are compulsory purchases (Binning, 2012) and Augmented Reality technology (while still relatively under-utilised) is gaining traction – but mainly, at this stage, in the business community (Wolde & Virki, 2012).

## Multiplicity and Contested Histories

So, mobile applications now allow for multiple streams of information to be accessed in multiple formats in a particular (contextually relevant) place– in contrast to using the more traditional ‘technologies’ of paper or digital textbooks. In this environment of accessibility and multiplicity one wonders whether ‘other’ realities and understandings be placed alongside each other as if they are of equal stature and relevance?

Respondents contacted through the study were generally positive regarding the easy accessibility of information but most qualified their support in some way. In one participant’s case they could see how efficient this process could be but worried that relationship building that would normally occur as part of any information gathering process would be lost. Another participant noted that they were fine about having different histories available simultaneously, but had a more general worry was that the digitisation of information means that the Government can appropriate material and use it in ways that is not authentic or supportive of their culture. This participant noted that a government department had sourced a few local stories (via secondary analogue material) and used these as source information for a sign near a sacred site. The material was partial and incorrect and in the participants view “*corrupted their culture*”. In this case, the individual saw this technology as potentially emancipatory as they could put their own information down in the form of selectively accessible ‘geo-markers’, ‘parallel’ marks that contrasted ‘official information’.

A third issue that arose was the potential for information to be lost in the tumult of individual stories and voices. It was felt that the user may get ‘lost’ accessing disparate forms and sources of information and the participant felt that experience and expertise was needed to ‘sift’ through material and present it in a way that was useful.

At least one respondent (a Maori educationalist) clearly positioned themselves as wanting to promote indigenous material (tribal histories) first and foremost. They noted that as Maori then had been subjected to Pakeha versions of their history which negated their own values. They were concerned that foreign teachers were teaching Maori children with Euro-centric view points and this did not cater for children or affirm who they really were.

## **Legal Boundaries and Accessibility Issues**

Another issue that appeared from the research was the issue of access and intellectual property. With the increasing degree of digitisation of oral stories there seemed to be important issues arising about how to maintain tight protocols around access of information. Indeed, one participant in the research who was a member of a commercial AR development organisation was keen to make it clear that they were operating from the position that information was the total property of the user and it was at no stage their property. They made clear that this was in contrast to other organisations researched that had varying degrees of access (and rights over) user data.

It will be important for indigenous organisations using these technologies to ensure that they have taken good advice over the implications of digitising their histories – both in terms of boundaries of accessibility and intellectual property rights. Commentators on indigenous engagement with computing not with concern the potential for commodification of thought and communication (Bowers, Vasquez, & Roaf, 2000)

## **Spiritual Implications**

When engaging with mixed reality technologies it is easy to be seduced by the excitement of what can be done, and the vision of implementing it as far and wide as possible. It is also rare to think about the implications of using this technology in anything other material terms. We may engage with the political or economic implications depending on our discipline or theoretical orientation, but it is very rare for academics to engage with the spiritual implications of technological programmers and advancements. In the case of augmented reality applications, we are laying out webs of information across landscapes, so what might be some spiritual implications for this work on the landscape or the spirit of the place in which it is implemented?

In general, most respondents were more concerned with the intent and rational behind the use of technology (i.e. the intent of the human using it), than the nature of the technology itself. They believed that if the intent is right it is fine, but control needed to be maintained over the process of implementing the technology in sacred spaces so that no abuse occurred. Another also noted that all technology was just a tool that was as good as the person using it. Like anything else it could be used for good or ill. These views seem to fall into the stream of discourse promulgating technological ‘neutrality’. However, there are concerns that technological neutrality is a myth and that it in fact hides a process of increasing consumerism and dependence on technology in our day to day lives. (Bowers et al., 2000, p. 185).

One participant spoke proudly that the beauty of their culture was that it was forever evolving and that using different technologies was part of this adaption process. Another also noted that they were always trying to adapt and if the technology was going to help us be able to share knowledge out to their people then that sounded good. The dynamic nature of indigenous cultures has been noted by a number of researchers (Semali & Kincheloe, 1999; Smith, 1999), but it remains to be seen as to how these emerging technologies interact with the dynamically changing world in which they are engaged. In order to provide some kind of balance it will be important to educate teachers to understand how technology may affect cultural ways of knowing.(Bowers et al., 2000)

## Conclusion

The places in which we work, live and learn have always been multidimensional – the physicality of the land, the social interactions, the meaning we make from our interactions, memories and connections all combine in rich layers of knowledge and information. Academics have begun to recognise this in their increasingly interdisciplinary discourses, but indigenous peoples have recognised this for thousands of years and also understood that ‘place’ is also an inherently spiritual concept tied up with one’s identity and inner spirit. Now, emerging technologies allow us to more starkly realise the multidimensionality of ‘place’ framed as it is through the viewers of our mobile devices. With the rapid development of technology we need to be mindful of the issues that arise in contested spaces where colonising influences have marginalised indigenous and first nation peoples. Although there are indications that technological developments are supported, the degree of partnership, participation and respect afforded to indigenous groups is critical to the implantation of any educational programme involving their interests.

*Developing of Industrial Design Program in Major Subjects to Suit for Local Students*

Voraporn Tantikarun

0315

Walailak University, Thailand

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

The first Industrial Design program in south started by The School of Architecture and Design, Walailak University in 2007. The aim of the program is to create local industrial designers emphasizing on local identity, cultural, materials, techniques and so on in order to serve the needs of the southern businesses; to preserve and promote local identity of southern through design.

After 3 years, the evaluation was taken to determine the result of the curriculum in order to adjust the learning and studying methods which is suitable to students throughout the 4 academic years. The study was collected from current teachers and students of year 1, 2 and 3. The study found that most of students have little experience in design works and don't know how to apply basic design knowledge to their design. Also students don't understand the importance of their local identity, cultural, materials and techniques to use in design. As a result of the study, to develop the program major subjects where the students lack knowledge must be added. In each class, teachers have to teach in detail and add the theory little by little, also show variety of good samples and give them a lot of practices after the class. Moreover, rearrange the sequence of the major subjects to create a strong foundation of the precedents of design in the industrial design program and make students interested in history and culture.

**Industrial Design** is the professional service of creating and developing concepts and specifications that optimize the function, value and appearance of products and systems for the mutual benefit of both user and manufacturer  
(The Industrial Designers Society of America, 2007)

The design process, at its best, integrates the aspirations of art, science, and culture.

— Jeff Smith

Nakhon Si Thammarat is one of 14 provinces in the southern of Thailand. The distance is around 850 kilometers from Bangkok, the capital city. Walailak University has started 20 years ago to serve education needs of upper part province of Southern region because of there was one other public university in the south region at that time and serve the lower part of the southern region. 2 years before 2007 there was feasibility study about the needs of industrial design why and how this program is important to people.

The studies are to define the general characteristics in social, economic, cultural and natural resources of the South in order to understand Market trends and the needs. People who live in the southern parts of Thailand are composed of Thai-Buddhist, Thai-Muslim and Thai-Chinese. Those multi nationalities create the mixing of social, cultural and life-styles which are unique and difference from other regions. For instance, Shadow Puppet Play, Feeding Red-whiskered Bulbu for Competition show life-styles of Thai- southern people how they gathering created social and cultural aspect. Products from the natural resources such as Yan Lipao, Sedge, and earthenware show craftsmanship and how people gathering from work created the cultural and economic aspect. Not only craft products from natural recourses but also other craft design such as Neilloware, pearl and else promote the economics of the south. Not only social and cultural aspects, but also the economic plant such as palm plantation grown for oil industry, coconut plantation grown for food industry or rubber wood plantation grown which produces both rubber for rubber industry and rubber wood which has to be cut after grown for 20 years and can be made for furniture and toy industry. Therefore, there are importance reasons of industrial design for social and economic development of the country and the south. Firstly, Industrial design helps adding economic value of local products by, design packaging and create identification of local products, adding new products to the Industry. People finally can have their own brands which create the new entrepreneur. Secondly, Industrial design helps Conserve and restore the southern culture including Lifestyle- mind, Intellectual and folk wisdom which added value by creating products of cultural heritage and traditional knowledge. Thirdly, Industrial design aware of resource utilization which added value by the manufacturing of products from raw material resource base of the South and for the production efficiency by reduce, reuse, recycle for sustainable production

After the feasibility and studies proof that the industrial program is important to help development of the south and it should be taught to young generation. The data which was collected from Thai commission on higher education show that there are only 6 Industrial

Design programs taught in Thailand on 2007. Therefore The first Industrial Design program in the south was started by The School of Architecture and Design, Walailak University in 2007 where would be the only one university to offer the educational chance in Industrial design in the southern of Thailand. Although in 2012, this year, there are more Industrial Design Program taught but Industrial Design program in Walailak University is still the only one in the south.

Industrial Design program taught in Thailand is different in terms of philosophy and curriculum which produce graduates with different properties. According to the feasibility and studies, course philosophy of Industrial Design program in Walailak Programs respond to the important needs which aims to create local industrial designers emphasizing on local identity, cultural, materials, techniques and so on in order to serve the needs of the southern businesses, to preserve and to promote local identity of southern through design. It combined the main ideas of Industrial design and the unique of the varieties of needs different from other universities. The curriculum was created the connection and continuity of knowledge all over the program which concentrate on produce graduates who have knowledge of design standards with special in not only in social economic and cultural characteristic of the south but also skill and knowledge in materials, techniques and production processes in the south. The programs would have divided into three professional areas responded according to those needs which are

- Wood and Rubber Product Design
- Packaging and Promotional Design
- Craft Product Design

Since Walailak University has three semesters learning system. Students who get into Industrial Design program would study 3 quarters each year for 4 years. Students would choose their professional areas in the third semester of the second year after pass the basic of industrial design knowledge such as basic design, materials and processes also manufacturing techniques. After 3 years of the program found that 80% of current student comes from the south and other from outside

The evaluation was taken after 3 years of the program in 2011 to determine the result of the curriculum in order to adjust the learning and studying method suitable to students throughout the 4 academic years. as Tyler identified in the forth question about objectives, experiences, organization and evaluation for basic curriculum development.

*“The process of evaluation is essentially the process of determining to what extent the educational objectives and actually being realized by the program of curriculum and instruction” (Tyler 1949, p105)*

The study was collected from current teachers, students of year 1, 2 and 3 and qualified people who have experience teaching in industrial design field using focus groups research method in order to gather information from student discussion in the curriculum and method

of teaching of the program including the problem of study as the aim of course philosophy. The questions for asking in student focus group are 7 aspects as following

- Industrial Design Curriculum aspect – there are more or less redundant in accordance with students and society needs.
- Learning and teaching aspect – lecture or theory, studio works and field works with a focus on self-help classes and critical thinking.
- Instructor aspect – be a good role model, Knowledge and experience in the subjects they teach, teaching method.
- The academic advisor aspect – helpful, kindness and generosity.
- Learning Resources aspect - teaching media, books, library, audio-visual and Studio.
- Technical skills and resources aspect – machinery, equipment and other tools for producing design prototype. (plastic, steel, wood, rubber, ceramic, cloth, etc.).
- Extracurricular activities aspect - such as study trips, activities and workshop for the course in accordance with professional development.

The problems identification after the interview of teachers and students of industrial design Student at Walailak university focus on local students in design skill, technical skill and southern knowledge can be defined that background and experience of student has effect to their studied. For example, students have little experience in design works and they don't know how to apply basic design knowledge to their design. That is because their background in design is not in the same standard as student from the city. Some students have rarely gone to another regions, rarely seen the design and there are few tutor art and design school for students to practice. Moreover students don't understand the importance of their local identity, cultural, materials and techniques to apply in design.

Students had comment in the focus group telling about the problem in many aspects. It can be summarized as below:

*“...since I've got to learn Technical drawing in the first quarter, I tend to forget what i have learned when I need to use that skill for Industrial Design I in the third quarter..”*

*“....there are too many computer design software.....2-3 programs in Computer design class, I can't possibly keep up with it...and I am not able to practice even one of them..”*

*“...I understand basic design when I study and I can create projects on industrial Design, but I don't know what is the connection between the two..”*

*“...I don't know what professional areas to choose since I don't know what they are about and if I have ability to do, there should be some class to review all the three..”*

Therefore to identify problems gotten from teachers and students interview can divide into 2 parts both sequences of the major subject and content of the major subject which still have the missing parts and some are not connected. As the result of evaluation, it is necessary to develop Industrial Design Program focusing on Local Students. Then, to develop of Industrial Design program can follow three guidelines provided by Tyler.

- “1. Continuity refers to the vertical reiteration of major curriculum elements*
- 2. Sequence emphasizes the importance of having each successive experience build upon the preceding one but to go more broadly and deeply into the matters involved*
- 3. Integration refers to the horizontal relationship of curriculum experiences.”*

*(Baker, 2003)*

Firstly, the sequences of the major subject has to be rearranged in order to get straight to the aim of program philosophy. Some major subjects have to be added and some subjects that are not connected have to be taken off. For instance, technical drawing subjects has to connect to the industrial design subjects in order to integrated both technique and design skill together. Secondly, the content of the major subjects involves in teaching method have to be adjusted to suit for students. For example, teacher has to show more design work sample, to give assignment and to let student practice and get to real experience. After the assignment, teachers need to follow up the result and let students repeat all process again. Finally this process can affect the student not only from perception but to cognition as Tyler's theory.

As Method of teaching and learning of Industrial Design in Walailak University focus on Active Learning Focus on PBL as Problem Base Learning and Project Base Learning, This can promote the teaching method as Integration of Tyler's. Student would learn the theory in technical and design skill from their classroom. Then apply all knowledge to the real project. Then student would understand how to use their craft design knowledge applying to lifestyle.

In summary, the beginning of Industrial design program under school of Architecture and design, Walailak University in 2007. there is the development of the program concentrate on continuity, sequence and integration in major subject to suit for local student and to create a strong foundation of the precedents of design in the industrial design program and make students interested in history and culture.. In the next step in the near future, there will be continue developing the program base on the past studies in order to make the program suit for local

*Design creates culture. Culture shapes values. Values determine the future.*

*— Robert L. Peters*

*The Effect of Moral Behavior Development Using Project Approach on Dental Public Health Students in Sirindhorn College of Public Health, Yala, Thailand*

Kwanjit Pongrattanamarn

0317

Sirindhorn College of Public Health, Thailand

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

The purposes of this research was to study the effect of moral behavior development using project approach on dental public health students in Sirindhorn College of Public Health, Yala. The samples were the first year dental public health students from Sirindhorn College of Public Health Yala in 2011 (N = 32). The research was divided into two phases; Phase 1: Providing moral education emphasizing on public consciousness, Phase 2: Using project approach on developing and implementing public consciousness project. The data collecting instrument were a questionnaire of the opinion on public consciousness development project and the test on public consciousness knowledge. Mean, standard deviation, percentage and content analysis were used as data analysis.

The research findings revealed that:

1. Samples were highly satisfied with this program as having the means score ranging from 3.94 – 4.63 ie: the means score of opinion on the activities could promote moral and ethical idea of the students were 4.63, the means score of opinion on the students were highly impressed in the public consciousness project activity were 4.6, the means score of opinion on the public consciousness project could create the moral and ethical awareness to the students were 4.53. And the most encouraged ethical behavior were unity, responsibility and sacrifice.

2. The public consciousness knowledge score were high as having the means score of 9.43 from the total score of 10 (S.D = 0.37).

Key word: moral development, dental public health students

iafor

The International Academic Forum

[www.iafor.org](http://www.iafor.org)

## 1. Introduction

Sirindhorn Colleges of Public Health are responsible for producing health care personnel to work in public health care service system such as public health officer, pharmacy technicians and dental public health officers. The dental public health officers work as part of a dental team in a variety of clinical and non-clinical setting. They provide preventive oral care and dental treatment to communities in rural and remote locations. They implement policy, as direct by Ministry of Public Health, to encourage community participation in aspect of oral health promotion, prevention and treatment process. The education of the dental public health officers is an intensive two year post-high school course which emphasizing on 1) Knowledge, skill and attitude of professional dental services 2) Self-discipline, responsibility to themselves and society, dedication to promote holistic dental health quality 3) Being role model in health 4) Morality, ethic, professional pride and public consciousness. (Praboromarajchanok Institute, 2007)

To accomplish that the development of moral behavior and professional ethics is a crucial subject for the dental public health students. This is a three credits subject emphasizing on fundamentals of moral and professional ethics, relationship between ethics and role of public health personnel, public health reasoning usage in problem solving and living, moral development for being role model in living and working. Kohlberg (1975) defined moral development as a process which is expected to change according to moral reasoning. According to Kohlberg (1984), each new cognitive structure transforms and displaces the structure that defines the previous stage, causing stages to develop in an invariant developmental manner.

Unfortunately the students often failed to take this subject seriously, dismissing them as oversimplifications, misrepresentations of real-life issues and character traits and boring. To avoid this problem, it should be noted that moral education involves more than knowledge and lessons in moral education should be personal and not academic. Teachers should not only concern themselves with what they teach but also with how they teach and interact with students, they should do this in a way that is meaningful and relevant to students. The teaching pedagogy is of prime importance. Research has shown that children learn best through meaningful activities. It has also shown that children's skills are much more likely to be mastered if they have the opportunity to apply them in meaningful activities (Katz & Chard, 1989) The same may be true of older students who can benefit from being actively engaged in meaningful activities. ( Jones, 1992; Rogers & Sluss, 1996; Vartuli & Fyfe, 1993 Jones, E.,1992) Projects are another way for students to experience how an inviting, dynamic environment can encourage learning. Projects are defined as "an in-depth study of a topic or theme" (Chard, 1998b) According to Katz and Chard (1989) projects can help children meet learning goals in the four major areas of knowledge, skills, dispositions, and feelings, Projects not only help children gain academic skills, social skills, and communication skills, they can help children form good self-concepts about themselves as successful learners. They can also help children gain positive dispositions toward learning. The main features of the project approach consisted of three distinct phases: phase 1- getting started; phase 2- gathering information about the chosen topic; and phase 3- concluding the project.

## 2. Research Objective

The purposes of this research was to study the effect of moral behavior development using project approach on dental public health students in Sirindhorn College of Public Health, Yala.

### **3. Methods**

#### **Participants .**

This study involved the participation of the first year dental public health students from Sirindhorn College of Public Health Yala in 2011 (N = 32).

#### **Procedures**

The study was conducted in two phases: the first was to provide moral education emphasizing on public consciousness in students , the second was using project approach on developing and implementing public consciousness project.

Phase I—Developing public consciousness : This phase involved providing moral education emphasizing on public consciousness to the students. This phase began with lecture on public consciousness, video-clip presentation of the interesting public consciouss projects, and class discussion on this topic. This phase took 3 hours.

Phase II—Using project approach on developing and implementing public consciousness project.: This phase involved the using project approach on developing and implementing public consciousness and assessing, which began with :

- 1.The participants were randomly divided into 4 groups. Each group consisted of 8 students and had their own advisor. All groups were instructed to do the projects which giving the benefit to the their college community. Each group had one teacher as an advisor.

- 2.Beginning the project: Each group had to share their past experience and opinion on what they think about their college as they studying and living in this college, discussed on what they interested in , what they wanted to do for the college and then coming to the agreement on the topic of the project. In this step the advisor had to make sure that every students share their own opinion based on their past experience.

- 3.Developing the project: After getting the project topic The students had to dig deep in the project. They had to set the objectives and goals of their project. And to achieve the objectives and goals they set, what activities should be done in sequences. Then they implemented the project according to what they planed.

- 4.Concluding the project: After implementing the projects the students had to make a project report and analyze what they learn and what they experience while implementing the project. Then each group had to give a presentation. This presentation gave students a chance to share what they had learned with the fellow students. Students took turns during the half-day-long presentation to answer questions and explain the process and what they learned from doing this project.

- 5.After the classroom presentation all students were given the questionnaires on their opinion of public consciousness development project and the test on their public conscioussness knowledge to complete.

### **4. Research instruments**

The data collecting instrument were a questionnaire of the opinion on public consciousness development project and the test on public consciousness knowledge. Mean, standard deviation, percentage and content analysis were used as data analysis.

The questionnaire was a 5-rating scale and divided into 3 sections including:

Section 1: Personal information

Section 2: Opinions regarding on public consciousness development project implementation

Section 3: Recommendation with open-ended questions

The rating scales were rated with the score as follow as:

- 1 = Strongly disagree  
2 = Disagree  
3 = Fairly agree  
4 = Agree  
5 = Strongly agree

The criteria was interpreted as follows:

- Mean between 1.00-1.50 = Strongly disagree  
1.51-2.50 = Disagree  
2.51-3.50 = Fairly agree  
3.51-4.50 = Agree  
4.51-5.00 = Strongly agree

The quality evaluation of opinions regarding on public consciousness development project implementation. Content validity was evaluated by the experts and IOC scores were then calculated as shown in table 1

**Table 1:** IOC scores of Opinions regarding on public consciousness development project implementation items.

item	Opinions regarding on public consciousness development project implementation	IOC
1	The public consciousness project implementation meet stated objective.	0.8
2	The public consciousness project implementation meet your expectation.	1
3	Sequence /content/ and the organized activities of the public consciousness project were appropriate.	0.6
4	Time frame of the public consciousness project was appropriate.	0.6
5	Selected places for the public consciousness projects were appropriate.	0.6
6	The students were impressed by the public consciousness project implementation.	0.8
7	The public consciousness project activities could promote moral and ethical idea of the participated students.	1
8	Willingness of teaching staff /advisor of the public consciousness project to provide you with support.	0.6
9	the public consciousness project could create the moral and ethical awareness to the students	1
10	The overall aspect of the public consciousness project was fulfilled completely.	0.6

## 5. Results

Phase I : All the first year dental public health students ( N=32) were attended in a three hours class of moral education emphasizing on public consciousness which began with lecture on public consciousness, video-clip presentation on the interesting public consciousness projects, and class discussion on this topic .

Phase II : 4 public consciousness projects were implemented by 4 groups of 32 participants aiming to give the benefit to the Sirindhorn college of Public Health Yala consisted of the project on improving landscape for motorcycle parking lanes, the big cleaning day project, the water pipes dredging project and the sport day for harmony project. The participants were satisfied with this program as having the means score ranging from 3.94 – 4.63 as shown in table2

**Table 2:** Opinions regarding on public consciousness development project implementation.

Item	Opinions regarding on public consciousness development project implementation	$\bar{X}$	S.D	Level
1	The public consciousness project implementation meet stated objective.	4.34	0.48	Agree
2	The public consciousness project implementation meet your expectation.	4.34	0.60	Agree
3	Sequence /content/ and the organized activities of the public consciousness project were appropriate.	4.13	0.55	Agree
4	Time frame of the public consciousness project was appropriate.	3.97	0.59	Agree
5	Selected places for the public consciousness projects were appropriate.	4.00	0.57	Agree
6	The students were impressed by the public consciousness project implementation.	4.63	0.61	Strongly agree
7	The public consciousness project activities could promote moral and ethical idea of the participated students.	4.63	0.49	Strongly agree
8	Willingness of teaching staff /advisor of the public consciousness project to provide you with support.	3.94	0.50	Agree
9	the public consciousness project could create the moral and ethical awareness to the students	4.53	0.51	Strongly agree
10	The overall aspect of the public consciousness project was fulfilled completely.	4.13	0.49	Agree

The participants agreed that this public consciousness project implementation meet stated objective ( means = 4.34, S.D. =0.48). The participants were agreed that this public consciousness project implementation meet their expectation ( means = 4.34, S.D. =0.60) and overall aspect of the public consciousness project was fulfilled completely ( means = 4.13, S.D. =0.49). The participants satisfied with sequence /content/ and the organized activities of the public consciousness project ( means = 4.13, S.D. =0.55). They satisfied with the time frame of this public consciousness project ( means = 3.97, S.D. =0.59).. They also agreed that the selected places for the public consciousness project were appropriate ( means = 4.00, S.D. =0.57) and . The participants were strongly agree that they were impressed by the public consciousness project implementation ( means = 4.63, S.D. =0.61) , the project activities could promote moral and ethical idea ( means = 4.63, S.D. =0.49) and the public consciousness project could create the moral and ethical awareness to the students ( means = 4.53, S.D. =0.51) . The participants were satisfied with the willingness of teaching staff /advisor of the public consciousness project to provide them with support ( means = 3.94, S.D. =0.50 And the most encouraged ethical behavior were unity, responsibility and sacrifice.The participants also mentioned that

Project on improving landscape for motorcycle parking lanes.

“ Working for this project I learned a lot about how to respect other person’s idea.”

“ I learned a lot about conflict management.”

“I learned that punctuality, responsibility, unity are crucial for accomplishment of any project or group work .”

The big cleaning day project

“ I learned how to work as a team.”

“ I learned how to respect other person’s idea.”

“ I was surprised that I am engaged in this project, and learned that we should give more respect to public properties and it is our duty to take good care of them if we want our next generations to get the use of them.”

The water pipes dredging project

“ I learned to managed any difficulties. And by learning that I also knew that life is tough, we can't give up easily, we have to be persistent not in an aggressive way but in a compassionate way.”

“ I learned that when we were discouraged by the hard work or any obstacles/difficulties , our group members gave support for each other, physically and mentally, to make the project successful.”

The sport day for harmony project

“I was surprised that I am willing/happy to scrfice my own time and energy for other people's pleasure , helping them release stress from school work.”

“ This project was a collaboration with our two years students and teachers. I love them all.”

The public consciousness knowledge Test score were high as having the means score of 9.43 from the total score of 10 (S.D = 0.37).

## **6. Discussion and conclusion**

The findings in this study revealed that the participants were highly agree that the public consciousness project activities could promote moral and ethical idea of the participated students (means = 4.63, S.D. = 0.49), they were highly impressed by the public consciousness project implementation (means = 4.63, S.D. = 0.61), they were highly agree that this project could create the moral and ethical awareness to the students (means = 4.53, S.D. = 0.51), the most encouraged ethical behavior were unity, responsibility and sacrifice. And the public consciousness knowledge score were high as having the means score of 9.43 from the total score of 10 (S.D = 0.37). This could showed that students participating in projects that are fulfilling and engaging realize for themselves the difference between taking part in meaningful project activities and merely sitting quietly through classes listening to a teacher. They experience the benefits of taking part in a project that results in new knowledge, not only for themselves but for sharing with others. Students participating in projects in their classrooms often have the possibility of making choices during those activities. According to Chard (1998a), “ One of the most powerful motivators for children in the classroom is choice. When children can make a choice from among a range of authentic alternatives and can choose when, for how long, where, and with whom to work, their motivation is likely to be greatly enhanced” (p.16). The same may be true for older students as well. Students may also gain a deeper appreciation for and understanding of the importance of this type of meaningful learning. They will have experienced firsthand a constructivist approach to learning (Bufkin & Bryde, 1996) where they can take ownership and responsibility in co-constructing their own learning with their peers and instructors. Using public consciousness development project as part of pedagogy in Development of Moral Behavior and Professional Ethics fulfilled the objectives of the Diploma of Public Health (dental public health) curriculum that dental public health students should have morality, ethic, professional pride and public consciousness .

## **7. Recommendations**

### **7.1 Research Utilization**

Sirindhorn Colleges of Public Health , should encourage the lecturer to use project approach as one of the main pedagogy especially in exact subject as Moral Behavior and Professional Ethics.

## 7.2 Further Research

Follow up study : in-service evaluation on the opinion of Sirindhorn College of Public Health Yala graduated dental public health officers' moral behavior .

## 8. Acknowledgement

Abstracts

The purpose of this research were 1) to integrate knowledge, academic service and disseminating art and culture and 2) to assess the satisfaction level of the dissemination art and culture. This research were divided into 2 parts. The first part was to develop knowledge about local art and culture for student. The second part was to dissemination of local art and culture to the participants in training course. This research tool was a questionnaire with 5 rating scales and open-ended questions. The statistics employed to analyze the data were percentage, standard deviation and content analysis

The research finding revealed that: 1) The subjects that student can use knowledge in the integration of academic service and dissemination art and culture were Systems Thinking Process Development, Personality Development and pharmacology. The art and culture that students bring to publish is Degehulu, wedding ceremony, Procedure to hadith and drug use in the month of Ramadan. 2) The opinion of student toward the students'ability to disseminate the art and culture were overall at a high level The suggestion from student were : the experts should be Invited to provide knowledge. The results of academic service were : the students gained experience in academic service and cherished their local culture. 3) The opinion of participants in training course toward the dissemination of art and culture were highly satisfied. The suggestion from participants were: the activities promoted and enhanced local art and culture and made them cherish the culture of Thailand.

## 1. Introduction

Sirindhorn College of Public Health as a Community institution of higher education in addition to the commitment to the public health workforce. The College also has an important mission. Another aspect that needs to be done in conjunction with academic and administrative. Professional society. The preservation of arts and culture. The College recognizes the importance of the mission. For the culture. Studies aimed at creating awareness and awareness of the importance of arts and culture to students. Particular local culture. The local culture is a way of life in each community. This is the heritage of all people in the past and they are very proud to be jointly owned. Makes me jealous. The southern border of the province's unique culture is proud to honor the dignity of the common people in the area. Which is considered as a precious heritage that should be preserved and promoted. This is to allow students to cherish the love and preservation of arts and culture organization.

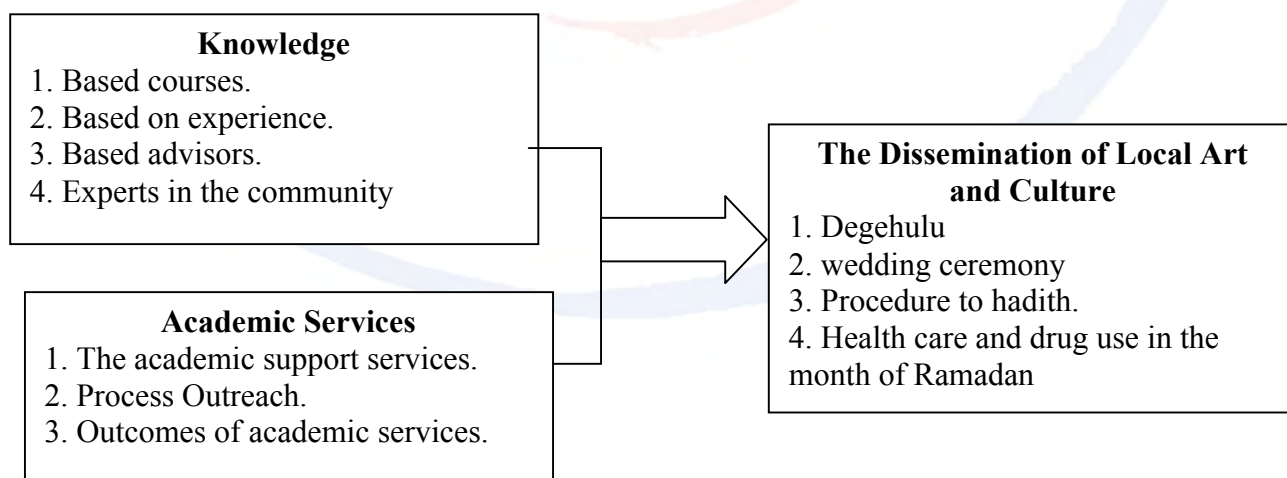

In this regard, in order to raise awareness of the value of arts and culture to the students. And the technical services provided accurate information about the local culture.

Local arts and culture as well as the good ones are. In order to maximize the quality of education in the academic component 5, 6 and preservation of arts and culture indicators 5.1.1 5.1.2 6.1.1 6.1 and feature integrated operations. Department of Pharmaceutical Technology course, Sirindhorn College of Public Health has established a Community Integrated Project linked to teaching and learning. Academic Services. With the preservation of the arts and culture. In conjunction with education research. The integration of academic knowledge with the local culture and the dissemination of technical pharmacy students. Sirindhorn College of Public Health, Yala

## 2. Research Objectives

- 2.1 To integrate knowledge, academic service and disseminating art and culture.
- 2.2 To assess the satisfaction level of the dissemination art and culture.

## 3. Research Conceptual Framework

**Figure 1:** Research Conceptual Framework

## **4. Research Methodology**

This study.Aimed at the integration of Knowledge, The Academic Service and The Dissemination of Local Art and Culture. which is divided into 2 parts. The first part was to develop knowledge about local art and culture for student. The second part was to dissemination of local art and culture to the participants in training course

### **4.1 Population and Sample:**

4.1.1. Teacher in Department of Pharmacy Technique curriculum of Sirindhorn Colleges of Public Health,Yala, Thailand

4.1.2. Technical Pharmacy Students of Sirindhorn Colleges of Public Health,Yala, Thailand

4.1.3. Professionals in the community

4.1.4 Participants in Pharmacy Technique officer training course

### **4.2 Research Instrument:**

4.2.1. Survey of student opinions about the integration of cognitive and academic services. And local arts and culture. Which the tool is used to query a closed end and open end is divided into six parts: 1) general information, 2) opinions on the knowledge of students in the arts culture, 3) comment on the academic services of students in 4) comments on events, arts culture, 5) the dissemination of art and culture, 6) feedback and comments.

4.2.2. Questionnaire of participants towards arts and culture of the students in training course that uses a closed and open end. As a scale (Rarting Scale) 5 levels divided into three parts: 1) general information, 2) and arts and culture activities, 3) findings and recommendations to the arts and culture activities.

### **4.3 Data collection:**

4.3.1. The first Questionnaires were distributed to the students after completion of the Pharmacy Technique officer training course 1 week, 3 days for a response, and recovery research.

4.3.2 The second Questionnaires were distributed to the participants in Pharmacy Technique officer training course after a national arts and culture activities for the students.

### **4.4 Data analysis:**

4.4.1 Quantitative data was analyzed and presented as percentage, mean and standard deviation

4.4.2 Qualitative data was analyzed by using content analysis

## **5. Results**

### **5.1 The opinion of students on the integration of knowledge. Outreach to the local culture and arts.**

1) The respondents were mostly female percentage 82.4 Age 20 years Percentage 82.30 experienced in the arts and culture Percent 70.60 Nature of arts and culture, most activities, the percentage of 47.06 is shown. Degehulu 70 percent of the distribution in the peronnances include.To promote the knowledge of wedding ceremony, 50 percent for the media to educate about the hadith percentage 60.00 and activities dissemination and preservation of arts and culture, the roots try Length Degehulu and way of life, man. Ko Yo equivalent is 33.33 percent.

2) Students use knowledge of students in the integration and Academic services and arts and culture is a student of one follows the course of the development process in a systematic way the number 11 as a percentage 64.70 Course Personality Developrnent 4 people think. 23.50 percent.

3) Undergraduate courses is that students have the knowledge integration and

management of academic culture and arts of the 7 subjects from the highest to the lowest in a Systems Thinking Process Development, Personality Development, Pharmacology, law and consumer protection, Live Society and Environment, Professional Behavioral Ethics Development and Pharmaceutical Development in Community Project respectively.

4) Needs of students learning more about the Academic service. Arts and culture courses in the Top 3 course is developed personality. The dress, demeanor and social pharmacology courses for 47.10 percent of the drug in the month of Ramadan. And traditions of other religions and 35.30 percent of the course development process in a Systems Thinking Process Development. Thinking about linking, and speaking skills, presentation and technical services of equal value is 23.50 percent.

5) Opinions on student knowledge of the local arts and culture. Course development process in a Systems Thinking Process Development. In problem solving and reasoning to solve problems. Can be used to perform the activity. Can be used practically in (7 person) should be invited to provide expert knowledge to students in arts and culture. For students to ask questions and learn more (3) the need for community participation in the arts, and more (1 person) would provide courses on preservation of art, culture depictions (.1 person) and audiovisual heritage and cultural exchange for students and another person (the first person).

6) A student is on academic services to students in training course average as a whole was 4.09 level with the comment to the areas. The service support academic equals 3.73 level process Outreach at 4.31 level, and the results of academic services at 4.41 level and provide feedback for the channel, and a variety of presentations, as Published in the period .conference (2 people) want to have time to exchange knowledge between patients and providers more

7) Students comment on events, arts culture of the whole is equal to 4.17 level, which classified the reviews on events, arts and culture on a Dege Hulu equal to 4.14 level wedding ceremony at 4.20 level the procedure hadith 4.02 level Health care and the use of drugs in the month of Ramadan is equivalent to 4.31 level

8) Impression of a crowd Studies published in the local culture, which is a Dege Hulu unity, patriotism, religion and the king only 76.50 percent.

9) Way to create public awareness to love and cherish in their own local Instilled in their young students learn. And learn about local culture. And 29.40 percent passed to the next generation and conservation as part of the local culture of the people have been known to 23.50 per cent.

10) Feedback and comments from students as to the event is continuing due to network between students and course (5 people) want the activities to disseminate local culture of the South in the student next version (3) Students will demonstrate the ability to recognize the importance of academic and arts and culture (3) the activity is appropriate (1)

## **5.2 Opinion of the training activities, arts and culture of the students in training course**

1) 77.10 percent of the participants were female, mean age 30.67 years, and 40.40 percent of residents in the south.

2) Average score, participants towards arts and culture at 4.14 level with the top 3 is to preserve heritage cultural averaging 4.28 Level colleges are responsible for the preservation of arts and culture, averaging 4.25 level and feel loved and cherished in the Thailand Cultural average 4.18.

3) Participants most impressive in the arts and culture that Dege Hulu, Wedding Ceremony and New guise of local people, respectively.

4) Culture that wants participants in the College published the next hop is alive shadow play. And sang the anazi's.

## **6. Conclusions and Discussions**

### **6.1 Students to integrate their knowledge. Outreach to the arts and culture.**

1) Integration of knowledge integration and academic services and distribution. Preservation of the cultural and subjects respectively. Development process in a systematic way. Personality Development Pharmacology law and consumer protection, public health, social life, and the environment. Ethical behavior, professional development, and program development in community pharmacy. The needs of students learning more about the Research and Preservation of Cultural dissemination in the Top 3 courses personality development course Caracas. Dress issue. Social orientation and 47.1 percent in pharmacology courses. The drug in the month of Ramadan and the traditions of other religions, and 35.3 percent of the course development process in a systematic way Linking and Thinking Skills. Academic offerings and services. Is equal to 23.5 percent of the student body of knowledge on the distribution of local culture. Mean of 3.55 on average in the high level of experience as a supervisor at the 2.78 level and 3.98 level professionals in the community

#### **Suggestion**

- Course development is a systematic process for problem solving and reasoning problem solving can be used to perform the activity. Can be very True (7).
- Should invite experts to disseminate cultural knowledge students ask questions and learn more (3).
- To provide the community with arts, culture and more (1).
- How to choose a course on cultural preservation intervention (1).
- The traditions and cultural exchange trips for students and others (1).

#### **6.1.2 Academic Services**

Comment on Research of Students in the training course the average was 4.09 with a separate comment to areas of service support. Academic level equal to 3.73 and 4.31 at the academic level and the results of academic services at 4.41 high level.

#### **6.1.3 The distribution of Local culture in the southern**

Opinions on local cultural events art publishing under. The overall mean was 4.17 with a separate opinion as to the arts and culture are the DegeHulu were 4.14 level over. Wedding ceremony at 4.20 level The procedure to hadith were 4.02 and health care and Drugs use in the month of Ramadan is equivalent to 4.31 level.

Students in the arts and culture of the Degehulu represents unity, patriotism, religion, and the king and was 76.5 percent over wedding ceremony. Simply Because it is close to the 52.9 percent social problems.

How to create public awareness to love and cherish their own local culture is instilled in their young students. Study and learn the local culture. And 29.4 percent passed to the next generation and conservation as part of the local culture of the people that have been 23.5 percent.

### **6.2 Opinions of the participants to the activities of students in training course**

Average score, participants towards arts and culture at 4.14 level with the top 3 is to preserve cultural mean 4.28 level colleges are responsible for the preservation of arts and culture at 4.25 level and feel loved and cherished in the arts and culture of Thailand is the most impressive 04.18 in the DegeHulu Wedding ceremony and New guise of three Muslim southern most provinces Needs of participants. In the arts and culture of the college in the future, including the Manora. Shadow Play. And other cultures. the dominated by the South.

## Discussion

That students need more instruction on the academic and public service. Preservation of Art and Culture in the Global Top 3 course is to develop the personality of dress and social orientation. May be caused by various things. To be published.

Expresses the beauty of the culture of art. And experiences of college students found that although students have some but mostly it is about public relations, media preparation and knowledge. Access to and preservation of cultural dissemination. Has published a number of resources for less. The lack of self confidence. Therefore, to promote the development and learning of students. Who are knowledgeable, experienced and confident. In the dressing. Orientation and social life. It is the student's needs first for Pharmacology course. Ttre drug in the month of Ramadan and other religious traditions. Topics maybe 1 due to the drug in the month of Ramadan. Students that are only locally under the body of knowledge and beliefs need to be teaching the website is accurate as of the individual, the public peace, and at the same time. have a better understanding of other religious traditions for course development process in a systematic way to think about the link.

Students will see how important it is for students to have a comprehensive plan implementation issues. It is not ,iilcavv.pltk academic integration. On the daily life. For speaking skills. Academic offerings and services. Students may be due to lack of experience and opportunities in the various Therefore, all courses should be organized to develop teaching skills. Be presented to students. And students see the importance of a solution to the problem of course is the development process in a systematic way. May be due to the activities of students in the process requires systems thinking. Must have a clear plan. As a national project, so some things may have happened, so the issues by reasoning. And how to find appropriate solutions to the various activities. Achieve the objectives set. It is important to be very true. For most students the impression of the local cultural arts of the show DegeHulu. The student may not be present at the Advisory Committee has considered the silicate knowledge on Hulu. After the students have to deal with the issue on their own. Are guided by a faculty advisor. The rub is that the knowledge of experienced professionals dedicated to arts and culture to students in DegeHulu display correctly. And a favorite of the audience.

## 7. Recommendations

7.1. An integrated body of knowledge. Outreach and dissemination of art and culture activities should include. The student continuously. This willenable students to use the process in a systematic way which is beneficial to the student and society.

7.2. Should the results of the integration of knowledge. And academic services: Arts and culture in the development of this curriculum in the subjects concerned. To develop the potential of students.

7.3. Should have studied the integration of knowledge. Outreach to the arts and culture.

*“Knowledge Diffusion”: Developing Appropriate Approaches to Knowledge Transfer  
in Thai Rural Communities: A Case Study by King Mongkut’s  
University of Technology Thonburi (KMUTT)*

Pronyos Chattarakul, Duangkamol Limwongse

0323

King Mongkut's University of Technology Thonburi, Thailand

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

KMUTT is involved in many rural community development projects in Thailand. The purpose of these is to convey knowledge directly to local communities through short events such as workshops, conferences and projects. However, research suggests that only little of this overall knowledge has been adopted effectively. We hypothesize that this is due to differences in lifestyle, expectations and motivation between urban researchers and rural communities. Therefore, this study aims to determine an approach to knowledge transfer that is appropriate for rural communities. The study is based on participation observation of a particular community project. In this, a series of short events grounded in local lifestyles was created as a research tool. In these, researchers adopted the position of role-models working to diffuse knowledge rather than directly influence local community life. Using this approach, the reaction and feedback from rural people about knowledge accessibility seems much improved. The result suggested that an appropriate approach to rural knowledge transfer should emphasize local “lifestyles” and researchers adopt a role model based on the diffusion of knowledge rather than direct influence. In this way, people in rural communities might be given the opportunity to sub-consciously adopt knowledge diffuse this effectively for use in rural community development.

## **Introduction**

King Mongkut's University of Technology Thonburi (KMUTT) is located in Bangkok, Thailand. KMUTT is involved in many rural community development projects in Thailand. The purpose of these is to convey knowledge directly to local communities. Researchers work as facilitator to find appropriate technologies to mainly increase agriculture productivity and also pull experts to help on social problems, such as drug abuse. KMUTT also indoctrinates the knowledge and mechanism of building co-operation of local organizations. It is coherent with the success factors of community development project mentioned by Akin (2009). Nongluck (2012) presented that the social worker should work as enabler in the community by stimulating via creating activities to pull co-operation from the community for basically maintaining security, development, and relationship between each organization in the community.

## **Problem Statement**

According to different contexts of urban and rural community, urban researcher and rural people lifestyles are different as well. Rural community is traditionally, patron-client system, where people focus on relative system and land ownership. It relates to an expressive friendship (Wolf, 1887, cited in Akin, 2009) formed between the persons or groups who have same form, characteristic, or attitude. It is totally different from the urban lifestyle which related to economics system and instrumental friendship that focusing on personal benefit (Akin, 2009).

The problem is, nowadays, many urban researchers still have stereotype of people in rural communities as uneducated, and credulous (Pracha, 2011). It is why many urban researchers use an "influence" approach for knowledge transfer projects. Influence is same as an approach that urban people in Thailand are influenced by western. In this case, it seems that urban researchers set themselves into the middle of western and rural people. They are influenced by western and, at the same time, they also influence rural communities. However, focusing on knowledge transfer approach which is naturally happened in rural community, it is diffusion approach instead of influence approach. Knowledge is normally diffused from one to one or one to group via the lifestyle activities.

During the study of Community Life Museum development at Nagnoy and Poneplaloh community, Sakolnakorn province, north-east of Thailand, where KMUTT has involved in

community development for more than ten years, it was found that only little of this overall knowledge has been adopted effectively. The hypothesis is due to changes and differences in lifestyle, expectations and motivation between urban researchers (KMUTT) and rural community (Nagnoy and Poneplaloh). Therefore, this study aims to determine an approach to knowledge transfer that is appropriate for rural communities.

## Methodology

The study is based on participation observation during one community development project. In this, paralleling with data collection of this project, a series of short events grounded in local lifestyles was created as a research tools. However, in traditional Thai culture, rural people pay much respect to urban researcher which showed the role of urban researchers, is always considered by rural people as an influencer. The study suggested that, as children in the rural community are considered as a non-leader in the rural community point of view. In this study, researchers trained a group of children to adopt the position of role-models working to diffuse knowledge rather than directly influence local community life.

The series of activity in religious ceremony preparation is considered as a local lifestyle activity. In the activity, new knowledge for solving problems, which were happened in religious ceremony preparation activities, was directly transferred to children by researchers. Urban researchers played as facilitators to ground the particular lifestyle activities encouraging children to diffuse knowledge to people in the community.

□

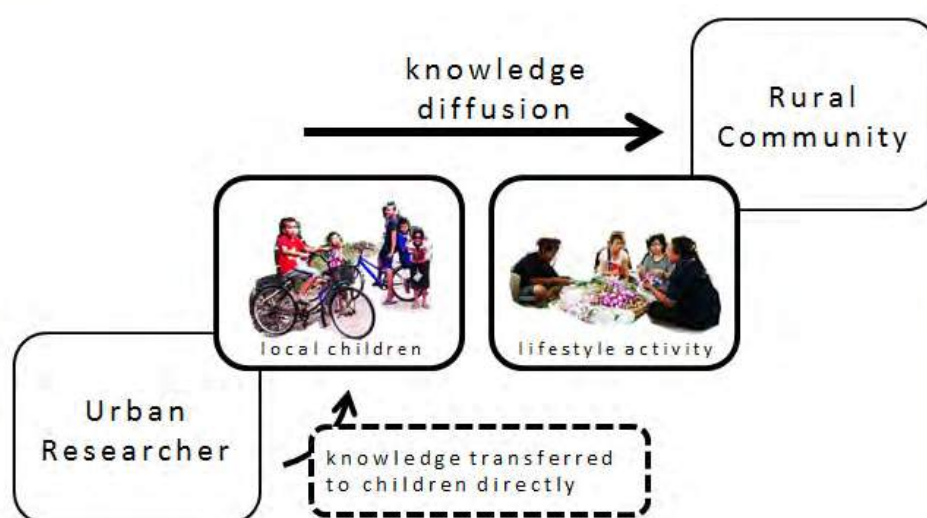

Figure 1: The conceptual framework at field work

## Result

From the observation, adults normally give children assignments. In this case, assignments are considered to be as immediate needs of social. However, when the children finished the assignments completely by using the computer (Represented as new knowledge), they did not accept children's competence immediately. Until a certain number of successes, they basically tried on computer (New solution and knowledge) by themselves. The observation showed that, in case they cannot use computer, the requests were sent to children indirectly. In this kind of situation, the knowledge was diffused from children, who are smaller, in term of social status, to adult sub-consciously.

After observation interview, the result showed that people did not note on helps from children. They think that children, as a new generation, must have this kind of knowledge (Computer). They also thought that if children can do it, they can do it too. Comparing to the previous situation, with the same content (Computer training), they denied training and knowledge provided from the social workers. The reasons, in that time, are such as "It is not necessary for my life" and "You can do it because you are from urban, I cannot do as you". So using diffusion approach, the reaction and feedback from rural people about knowledge accessibility seems much improved.

## Discussion

In 2009, Akin presented the story from his experience in one community: *When the rich person in community was interviewed by urban reporter, he told that "I am rich because I have been working very hard". On the other hand, when he was asked from the people in the same community, his answer is "I am rich because of the power from super natural"*. The case study showed that people in the rural community customize the contents following the characteristics and expectations of the interlocutors. This story explains why urban researchers think that people in the community can adopt the knowledge they provide.

It is same as the observation in field work. At the community meeting, the official village leaders and government officers always explain government policy to the community's members (rural people) by influence approach. It is the same approach that they were influenced by urban center. In this case, leaders and officers set themselves at the middle between urban center, who influence them, and community's members, whom they are

influencing. Community's members might act as Akin's story mentioned above. To maintain relationship and benefits, members might customize an answer to show their intention and understanding to outside.

Influence approach is mostly used for driving urban society to be "beyond their lifestyle". In the urban society, the relationship of members is depended on the purposes. Therefore "role-model" in the urban society represents as presenter influencing society members to be like him/her. By this approach, it seems that "beyond lifestyle" is presented by focusing on "semiology of culture". Instead of focusing on function, influencing of role-model tries to present the concept of social and culture value of objects or activities (Wanpimon, 2001). Tonnies (1887, cited in Akin, 2009) hypothesized the community movement direction. The traditional community which is formed naturally by the relative system is possible to be replaced by society, which is rationally depended on purposes. Akin (2009) presented that, in fact, a group of people in the real situation are between traditional community and modern society. It is depended on the level of *Gemeinschaft* and *Gesellschaft* in each group.

According to literatures, it can be compared to the present situation in Thailand. At rural communities, numbers of organization focusing on purposes such as, learning centers, small and micro community enterprises, one tumbon one product (OTOP), or even factories, are increasing significantly because of development policies of government. These kinds of organization are systematically set by the government (urban people). It normally works efficiently at the beginning because communities are forced by government. However, many organizations, in the rural communities, are not working as they should and knowledge is not adopted effectively at the communities as well. Communities might be influenced to accept things and their social values of them at the beginning, but they also can rationally cut unnecessary things which are not matched to their lifestyle. It is coherent with the suggestion from Weber (Cited in Akin 2009). He mentioned that in the history, the proportion of rational action, compared to non-rational action, of human has kept increasing significant. At the present, this change is not depended on agrarian transformation as in the past but it might be rural restructuring. The lifestyle of rural community has been changed especially, consumption. They do not consume just only food but also others such as satisfaction, meaning, knowledge, and ideology (Anan, 2009).

Nongluck (2012) suggested that social worker must understand the lifestyle of community members including culture and tradition. Carl Roger (cited in Nongluck, 2012) mentioned

that one of characteristics that everyone has is lifestyle, the combination of value, attitude, habit, and also the mechanic which is used to resist their worries. In the context of Thailand, at B.A.D. Award 1995, Panu (cited in Pracha, 2010) presented that the gap between urban and rural lifestyle was increased. However, lifestyle is not limited as visual. It should be included as feelings, or situations which can be understood and involved by only people who own that lifestyle.

Focusing on context of knowledge transfer in Thai rural communities today, the result suggested that an appropriate approach to rural knowledge transfer should more emphasize local “lifestyles” and researchers adopt a role model based on the diffusion of knowledge rather than direct influence.

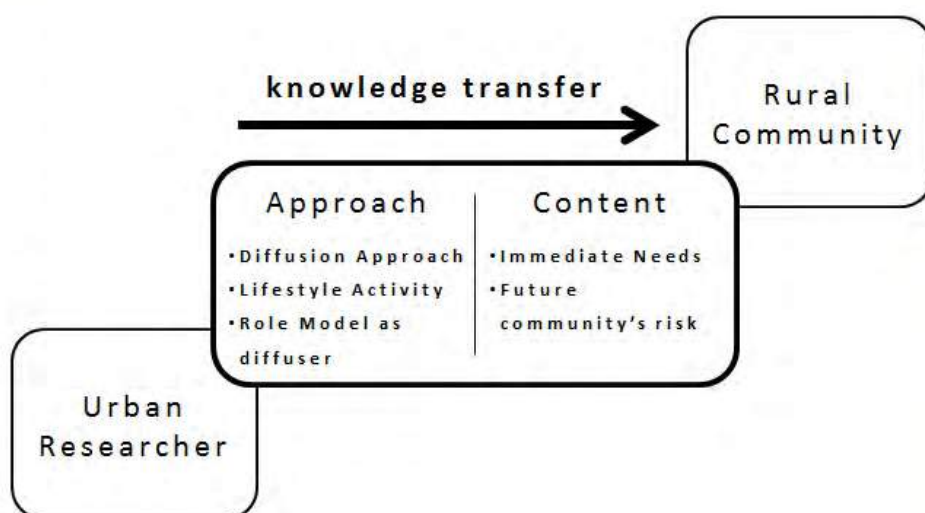

Figure 2: The conceptual of appropriate approach of knowledge transfer

In case of researchers are much respected from the communities' members, a role model based on the diffusion approach might be needed. In this way, people in rural communities might be given the opportunity to sub-consciously adopt knowledge diffuse this effectively for use in rural community development.

Abstracts

Since 2008, we have introduced a pair approach in the university's computer literacy education with the aim of establishing the pair work, which is effective in addressing computer literacy gap. The previous report focused on the pair learning effect from the amount of utterances, and it revealed that paired cooperative problem solving improved the overall task achievement level and suggested that mixed-gender pairs with similar academic ability were highly effective as the combination of criteria.

To affirm the suggested combination of criteria and to find the obstructive factors of pair work, this study shows the result of pairs in the problem-solving class conducted in a computer literacy program in two private universities in Japan, in 2011. A total of six classes and approximately 280 students were examined to see the effectiveness of the criteria for pair combination by comparing the experimental group (the criteria combination pair) with the control group (the random combination pair). The task achievement and the amount of utterances of the experimental group were overall higher than those of the control group. From the survey, it was observed that the criteria for pair combination were effective.

Conversely, high basic academic ability and male pairing were the factors that highly affected the negative effect of pair work.

## 1. Introduction

With As a movement in the educational field, there is a need to improve skills necessary for the 21st century, such as the ability to learn independently, problem solving skills, and communication (Iiyoshi, 2009). Higher education now emphasizes the importance of communication and cooperation skills, advocating a shift toward participatory approaches to instruction and, in many cases, practical studies to support these shifts. The cooperative learning approach, such as pair learning, particularly stimulates a desire for learning and is reported to correlate with improvements in communication and cognitive abilities, intrinsic motivation, and

**Fig.1 The era of free college admissions in Japan** ( after MEXT report ,2006 )

autonomy. However, newly enrolled university students show a growing computer literacy gap because of the rapidly changing environment in information technology and the great disparity between university computer literacy education and high school courses. Further, as the era of free college admissions will be arriving in Japan (Fig. 1), students have a weaker sense of purpose and less motivation to do coursework, thereby making traditional teaching approaches ineffective.

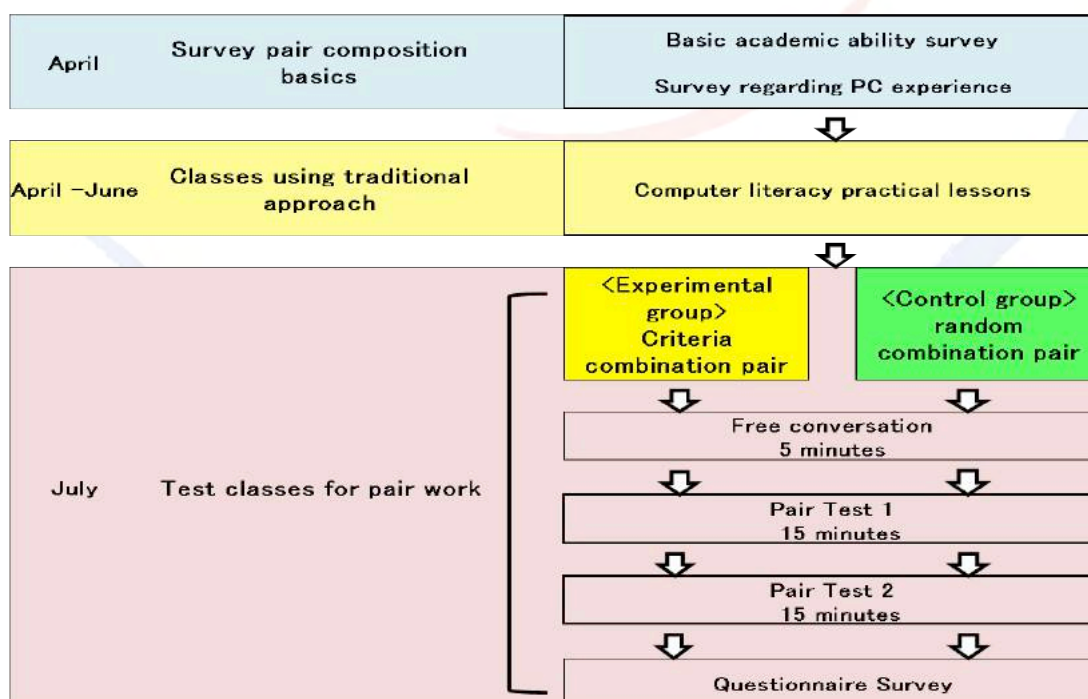

Given this educational context, we have made attempts to introduce pair work into university computer literacy education since 2008, conducting research to develop a pair approach adaptable to the expanding literacy gap. The reason for the particular focus on pair learning within group learning approaches is focused for the following reasons: 1) it is easy to build relationships with the first person to encounter; 2) it is less likely that the leader does all the work, a common problem with group approaches; 3) it is less likely that

participation varies between individuals; 4) it promotes active participation that develops one-on-one learning; 5) larger groups exhibit more complex groupings; and 6) pairs are generally more flexible because they are the smallest unit for a group learning approach.

Our previous study (Oya & Uchida, 2011) focuses on the communication process during pair work, analyzing the effects of the number of utterances, and the character count of the utterance. Although the results of that study demonstrated that pair learning approach is an effective solution to information processing problems, their effects were low or null, depending on the number and pattern of utterances, the percentage of correct responses, and time constraints. The present study validates methods that use pair combination indicators as a solution to address these issues. This study's results consider the relationship between the number of utterances and the learner's specific traits as moderated by the pair effect.

## 2. Method

The subjects of this study were enrolled in a computer literacy program in 3 departments of 2 private universities in Aichi Prefecture. A total of 7 classes and about 280 students participated in 2011. In April, students were surveyed on pair combination criteria, namely basic academic ability and PC experiences (Fig. 2). The basic academic ability survey consisted of 20 math and kanji (Japanese character) problems. The survey on computer experience before university had 20 multiple-choice questions about the Internet, software, and computer usage inside and outside the high school. The survey time lasted 5 minutes and

**Fig.2** Flow chart of the research process

surveys were collected individually for each participant. After 8–10 practical computer literacy classes, students were tested (Test 1 and Test 2) in pairs for 15 minutes (22 questions) based on word-processing proficiency such as, “please use ‘30’ characters and ‘35’ lines on one page,” and “please center align page numbers in the footer.” Before the pair test, students were given five minutes for free conversation to develop smooth communication for each pair’s first encounter. Thirty five minutes of conversation was recorded from the time free conversation began to the end of the pair test.

Pairs remained unchanged for both Tests 1 and 2. Therefore research, so far, has identified several obstructive factors to the pair learning effect: lack of communication between pair members, tendency toward lengthy conversations, and time constraints. The teacher warned the students about these obstructions before beginning the test and five minutes before its end. Immediately after the test, students responded to a five-minute survey about the pair test.

To evaluate the validity of the two indicators for pair combination, basic academic ability gap and gender, as identified in our previous study, the class was arbitrarily divided by each university class unit. The experimental group pairs were assigned according to matching characteristics based on the above indicators, the rest were randomly assigned to the control group.

To make pairs in the experimental group, we sorted the student in order to basic academic ability score at first (Fig.3). After that we combined pairs from top in order. At that time, if this happens the same sex, we tried to change the combination to make a mixed gender pair of as many as possible. Then the experimental group consisted of opposite genders having a minor gap in basic academic ability.

Fig.3 Method of combination for the experimental group

### 3. Results of the Analysis

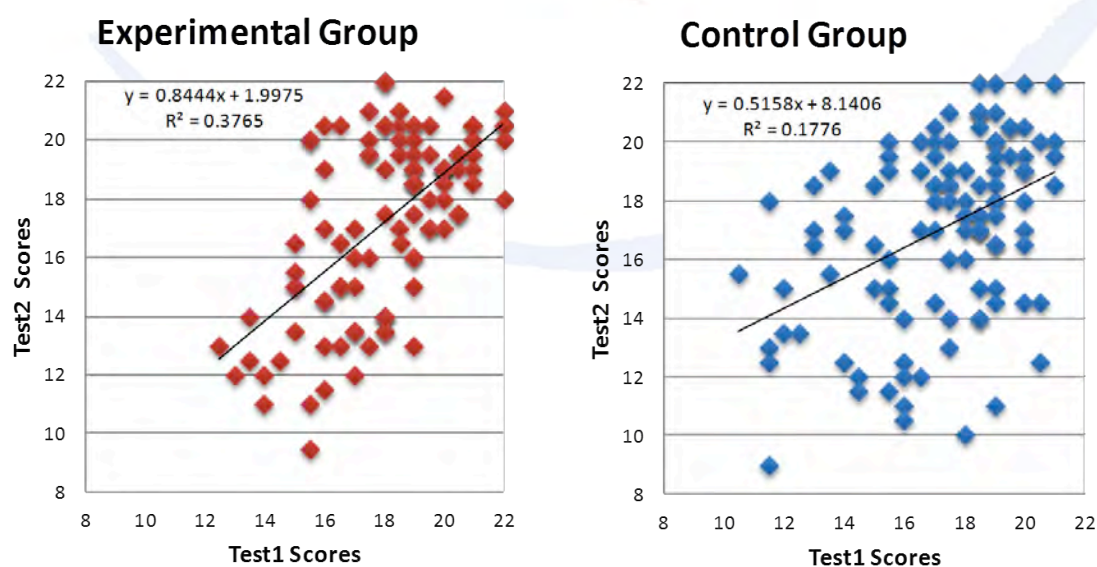

#### 1) Indicators for Pairs and the Pair Learning Effect

The analysis considers whether there was a divergence in pair test scores and the number of utterances between the experimental group, where pair combinations had been assigned with matching indicators, and the randomly assigned control group. Results reveal that the experimental group's average scores were higher than those of the control group by 0.79 for Test 1 and 0.30 for Test 2 (Table 1). Test 1 showed a significant difference between average scores with  $p = .01$ , but Test 2's result was not significant. The range of test scores between Tests 1 and 2 (Test 2 Score – Test 1 Score) differed significantly with  $p = .05$ .

**Table 1** Score and amount of utterances in each group

		Experimental Group			Control Group			$\rho$
		<i>ne</i>	<i>me</i>	<i>s.de</i>	<i>nc</i>	<i>mc</i>	<i>s.d.c</i>	
Test score	Test1	104	18.02	2.20	110	17.24	2.49	0.008 **
	Test2	109	17.22	3.08	116	16.92	3.03	0.233
Amout of Conversational Utterance	Test1	96	157.6	30.19	100	136.8	44.19	0.028 *
	Test2	96	126.0	32.00	102	121.2	43.78	0.266

Examining the score distribution of each pair for Tests 1 and 2, although there was a positive correlation between both tests' scores, overall, there was some variation in the experimental group, and a higher percentage of control group pairs had higher scores in Test 2 (Fig.4). The number of utterances was higher

**Fig.4** Distribution of scores in each group

for the experimental group in both tests, particularly for Test 1, with a significant difference of 5%, a similar outcome to that of the scores. The number of utterances' range (the number of Test 2 utterances – the number of Test 1 utterances) had similarities with the range of test scores; the experimental group made fewer utterances in Test 2. Further, two pairs in the control group failed to establish communication, whereas all experimental group pairs established communication. A significant difference of 1% was observed in six out of 11 questions between the experimental and control groups in the post-test questionnaire survey results. The question, “do you think the pair learning approach is good?” had the largest difference. The experimental group's significantly higher positive response suggests that the indicators for pair combinations were effective. For questions like “did you consult your partner?” “Were you able to interact with your partner on the pair test?” “Did you find consulting with your partner helpful?” and other questions relating to the exchange between partners, the experimental group responded with higher ratings (Table 2). This outcome is consistent with the experimental group's scores and number of utterances being higher than those of the control group. However, given that the survey did not show a significant difference in the number of utterances, nor did it in Test 2 scores, results suggest that the experimental group evaluated pair work as effective.

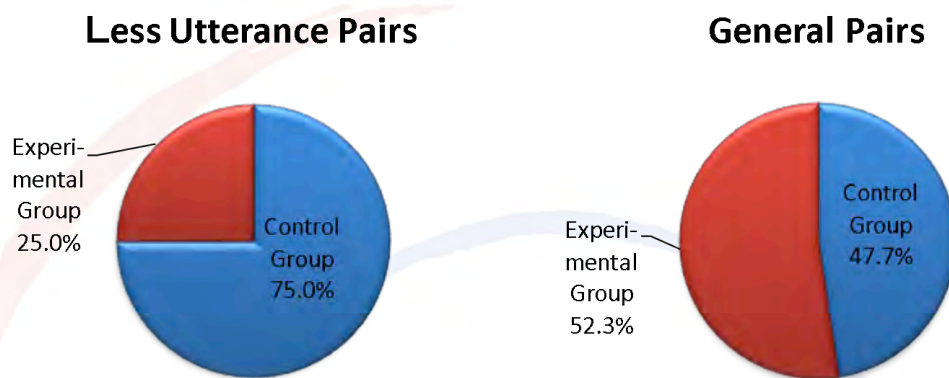

**Table 2 Results of questionnaire in each group**

	Experimental Group			Control Group			$\rho$
	<i>ne</i>	<i>me</i>	<i>s.de</i>	<i>nc</i>	<i>mc</i>	<i>s.d.c</i>	
Do you think the pair learning approach is good?	110	2.88	0.32	115	2.63	0.57	0.000 **
Did you consult your partner?	110	2.82	0.41	115	2.52	0.74	0.000 **
Were you able to interact with your partner on the pair test?	110	2.72	0.51	115	2.49	0.63	0.001 **

## 2) Relationship between pair learning effects and the number of utterances

As So far, research has demonstrated a correlation between the number of utterances and the pair learning effect. It has also shown that a decrease in the number of utterances has a significant impact on the pair learning effect. This study specifically targeted pairs with a low number of utterances in the pair learning approach. Specifically, analysis examined the relationship between each factor. Group L contained 12 pairs

with fewer than 100 utterances, considered to be low; Group G contained the remaining pairs with over 100 utterances. Group L composed of 75% of the control group and 25% of the experimental group (Fig.5), suggesting that the indicators for pair combination proposed by this study are effective in encouraging communication between pairs. Group L contained more male pairs, supporting the findings in previous studies that males converse less than females.

**Fig.5 Proportion of each group in less utterance pairs**

There was no significant difference between the groups' basic academic ability gap or PC experience before they joined the university; however, Group L exhibited a significantly higher basic academic ability (Table 3). This may reflect a learning attitude that is characteristic of students with a high basic academic ability, who attempt to solve problems independently. There was no significant difference in the test scores. However, Group L had marginally higher values for Test 2. This result is attributed to Test 2's greater difficulty level, wherein, Group L pairs having had to sacrifice conversation time to ensure having sufficient time to answer the questions. The survey results revealed a significant difference for seven questions for Group G. The amount of consultation scored the highest t value, presumably because the students in Group L realized that there was little communication between pairs. Moreover, a significant difference was recorded for factors like the effectiveness of pair interaction and the topics consulted, which clearly showed that they felt that the pairs were ineffective.

**Table 3 The values of pair combination criteria in less utterance pairs**

	Less)U tterance)P a irs			G enera lP a irs			p

#### 4. Conclusion

The Students were divided into two groups, a experimental group where pairs were assigned with matching indicators and a control group where pairs were assigned randomly. They were then given a pair test for computer processing in an experimental class setting. Analysis of the comparison of both groups' tests and surveys, particularly focusing on pairs with fewer utterances, yielded the following results:

- 1) The experimental group had higher test scores than the control group and a greater number of utterances, which suggests that the indicators for pair combination proposed in this study are generally effective;
- 2) When the results of the control and experimental group surveys were compared, the experimental group's responses were higher to the questions about preference for the pair approach, partner interaction, amount of consulting, and topics consulted, confirming the pair work effect based on the pair combination indicators;
- 3) In Group L, which had fewer utterances, 75% of mostly male members came from the control group. Furthermore, although Group L was not characterized as having computer experience before university level education, their basic academic ability was significantly higher; and
- 4) When comparing the survey results of Group L and Group G, for 7 out of 11 questions, Group L responded with significantly lower values than Group G, suggesting that Group L did not actively participate in pair work.
- 5) These results suggest that high academic ability and male pairing were the factors that highly affected the negative effect of pair work.

Further investigation will be conducted on the characteristics of pairs with fewer utterances and the utterances' content. Actionable items must be identified to improve the overall pair effect in education.

#### Supplementary Notes

This study received financial support from 2008 to 2011 scientific research grants and a Grant-in-Aid© for Scientific Research (Issue Number: 20500816).

Abstracts

Digital technology has provided a very different outlook to sculpture, especially to those who are engaged in creation through technological processes as it offers and develops new possibilities for conception and experience of art. The role of the artist is to create a condition which leads to specific forms of expression and reception. The expressive quality of this condition is conveyed through the actualisation of the sculpture and the receptive quality through the analysis of perception of artwork by receivers. This methodology then outlines the conceptual and technological approach to trace the changing visual perception, cognition and evaluation in the process of shaping three dimensional forms.

Digital sculpture is categorised in three divisions: works that have been created and manipulated digitally and then produced in traditional manual process; works created without the use of digital technology and then produced through digital process and works created and processed through technology. Redefining contemporary sculpture has become necessary and it can only be done through an understanding of perception as a mode of enquiry in relation to aesthetics of presentation and judgmental discourse of the constitution of a sculpture- actual and virtual. This research reviews the basic elements of sculptures ascertaining what is seen and how it is seen and to expose the shifting patterns of visual understanding in digital technology. The research outcome thus presents the potential to integrate seeing with critical awareness from analysis of perception affected by cognition.

## 1. INTRODUCTION

Since 1990, the range of creative works and artistic practices using digital technology gives us an insight into how technology has provided artists, designers, engineers, architects and craftspeople the tools to manoeuvre and new expressions to reveal (Callicott, 2001). Terms which have been used over the years for digital processes, specially associated with creative purposes both in Art and Design discipline, are Computer Art, Virtual Art, Computer Graphics, Multimedia Art, New Media Art, etc. and they all come under the umbrella of Digital Art. To determine the date (or even year) of birth of an art form or artistic technique is always problematic, if not a futile endeavour, but it might be safe to say that the 1990s are the decade when Digital or Virtual Sculpture officially began to exist- even if it had its roots in earlier experiments (Paul, 2000).

The term Digital or Virtual Sculpture has been broadly used for a variety of different forms and activities immersed in digital world (Ganis, 2005). The making of Digital sculpture is both a technological and a conceptual phenomenon. Technically, digital sculpture is a computer-generated process that either involves 3d modelling software to create forms or initiates from the digital inputting of real forms through scanning technologies, which are then manipulated using particular software, and ultimately produced through a computerised digital printing process. Simultaneously, at a conceptual level, digital sculpture originating from digital art, echoes elements from the art movements of Dada, Fluxus, Surrealism and Abstraction.

Gabriela Celani analyzed four points of view of using digital processing to produce artwork be it an architectural model or an artifact in a museum (Celani, 2008). In her diagram (Figure 1), she emphasized on the digital generation of form, which can combine digitization of physical objects, computational synthesis, digital manipulation and the combination of the above, covering all possible digital processing. On the other hand, it has in some way led to further investigation of presenting such digital artworks in public spaces.

**Figure 1: A diagrammatic interpretation of Digital processing.**

## 2. ARTISTS USING COMPUTER BASED TECHNOLOGY FOR SCULPTURE

Many contemporary artists have been exploring the conceptual and technical possibilities of digital technology to fit into their creative process more efficiently and effectively. Interacting and manipulating with the digital tools and helping in developing new software, these artists have not only contributed within the margins of virtual space but also in the actual physical space.

The issue of how a sculpture is made has diminished and the issue of what the sculpture is about has enlarged over the period. Digital technology has taken the meaning of sculpture to new levels

- beyond the known limits of form, scale, gravity and space. Dan Collins assessed the whole process as an artist would do and found that it places the artist in the center of an interdisciplinary conversation, not as a marginal agent peripheral to the dialog (Paul, 2000).

Both Robert Michael Smith and Dan Collins have used digital technology mostly receiving positive response considering the potential to encourage a broad interdisciplinary conversation involved in similar core issues (Paul, 2000). Dan Collin states, "My work is sourced, intended, produced, critiqued and hopefully understood in and for an interdisciplinary context apart from what normally passes for the history of art". His "Of More Than Two Minds" and later "Twister" show amicably his interest "in the gap between the virtual space of the computer and the tangible, body-felt reality of sculptural objects". Robert Michael Smith did crossover various disciplines as source for his images from "archaeology, anthropology, zoology, anatomy and scientific visualization to cosmic/microcosmic photography and sci-fi CGI special effects, Dada, Surrealism and Abstraction" (Paul, 2000). "Urchanticede" and the recent "Paradise Bird Burlesque" are fine examples to explain his belief, "Art is alchemy. Alchemy is the magic, observation, process and ritual of life...I build alien abstract worlds that become familiar through frequent immersion. These worlds are constructed to open exploration to the deepest regions of the human psyche for development within the landscape of the imagination" (Smith, 2010).

Michael Rees calls his virtual digital sculptures "meta-forms", meaning that the end result can take on a variety of forms or be produced in different media. He has rightly pointed out at the very beginning that the development of computer based technology and software do not play the pivotal role but significant credit has to be given to "Art and Language and conceptual art in general" (Paul, 2000). His creations can be considered a reconfiguration and expansion of scientific discipline. He borrows images from medical anatomy to explore "spiritual/psychological anatomy" to give new meaning to his work, few examples of his works are "Ajna Spine Series 2 over 1", "Putto 8 2.2.2.2" and "Foot S Curve to Toe, Equivalency Series".

Christian Lavigne created the words "Robo-sculpture, Tele-sculpture, and Cyber-sculpture" for computer sculpture materialized with rapid-prototyping devices and other digital techniques. It is very right when he states, "For a poet of shapes, new technologies give perfect tools to materialize the creative verb. It is the first time in human history that writing and describing an object turn from virtuality to reality" (Wands, 2006). This definitely makes it easier to understand Robert Lazzarani's "Skulls" which seems to defy resolution. In an interview with curator Harry Philbrick discussing his work "Guns and Knives", he said, "When it comes to the physical, the digital manifestation of these objects, it's all run through computer design programs. I start off with a non-verbal sense of what something should be, and then I slowly start to shape it and it becomes more verbal and more numerical until it becomes the final design, which is made up of extremely specific numbers". As the overall foreshortenings and elongations become more complicated in three dimensions, the forms remain warped from all angles (Ganis, 2005).

"Art should, in any case, transcend the medium" is Keith Brown's belief. His biomorphic forms with so many undercuts clearly denote the engagement of technical processes in creating relationships between the hollowness and solidity of his works. He says, "I explore the possibilities that are made available through manipulating forms in the cyber environment and because they don't behave in the same way as they do in actual world it is full of surprises" (Brown, 2007). His works like "Geo\_03", "Shoal" and others show his concept of sculptures moving within and passing through each other in a way that the physical world would not allow.

Bruce Beasley said in an interview regarding his work, "It's better to make mistakes in electrons, than in granite" (Smith, 2008). "Challenge" is a fine example of his work. Beasley believes the ability to design digitally is very liberating because it allows him to play with shapes and design in a way that's more freeing than working with a physical prototype. He manipulates overlapping geometric blocks within one another onscreen, creating a spatial assembly which would have an improbable physical balance if the center of gravity of the entirety was not verified by computer calculation (Lavigne, 1998). Kenneth Snelson's preoccupations encompass both the macro and micro realms. "Atom I" describes his interpretation of the atom's electronic architecture. His conceptualization of the Snelson Atom was based on his enquiry of the structure of atom and its many manifestations in two-and three-dimensional mediums as seen in his work "Atom Animations".

Bathsheba Grossman's exploration of mathematics and science in sculpture and popularizing direct-metal printing as an art medium have made her a successful name in both art and design discipline. She says in simple words, "My work is about life in three dimensions: working with symmetry and balance, getting from a zero point to infinity, and always finding beauty in geometry" (Grossman, 2005). Corinne Whitaker, aka the Digital Giraffe, was acclaimed for creating sensuous and organic shape virtually and physically and the simplicity of the forms with a strong touch of feminism (example of her work is "Lip Service").

### **3. RESEARCH QUESTIONS**

This section presents the key research question of the study, as well as a number of sub-questions related to identifying new approaches and perception of Digital Sculpture. It then introduces the methodology employed to answer these questions, giving details of strategy of work process and significance of interviewing and data collection and data analysis, as well as the possibilities of generalization beyond this study and finally its contribution to the shifting paradigm of digital sculpture theory.

The key research question of this study is:

How should we reframe our understanding of perception of Sculpture, mediated and produced through digital and technological processes exhibited online or in the physical space of a gallery?

Considering the process of artistic and technical exploration of producing 3dimensional forms in answering this key research question, this study raises the following sub-questions regarding changing perceptual qualities of Digital Sculpture:

- How to analyse the changing conceptual meaning connected with knowledge, experience and evaluation of Digital Sculpture by artists and audience?
- Which interdisciplinary aspect of the creative process of digital sculpture making should be considered as the basis of learning such process?

In order to answer these questions, the method of enquiry undertaken was in two stages. The initial stage was creating an effective working methodology through own practice in virtual and actual space and the final stage was a comprehensive explanation of the context of realisation of Sculpture and critical discourse of perception of viewers in an exhibited space.

### **4. FIRST STAGE OF METHODOLOGY - FROM VISUALISATION TO ACTUALISATION**

The initial stage of the research was an artist enquiry mainly seeking to develop new forms and develop new techniques as the basic exploratory nature of the pursuit. The process becomes a critical factor as a part of the creative work, be it from any resources, materials, tools or techniques which then influences the way it occurs. Therefore, the artists never aimed to create

new systems in the discipline of technology but new creative forms according to a variety of requirements for which digital technology was required. The digital technology was part of the method for making rather than an aim in itself. Hence expressing the work process is the intention and the forms created are the vehicles of communication which opens up an area of debate on perception. The process of transformation becomes necessary to be defined.

#### **4.1 Digital experimentation in virtual space: texture, materials and light arrangement**

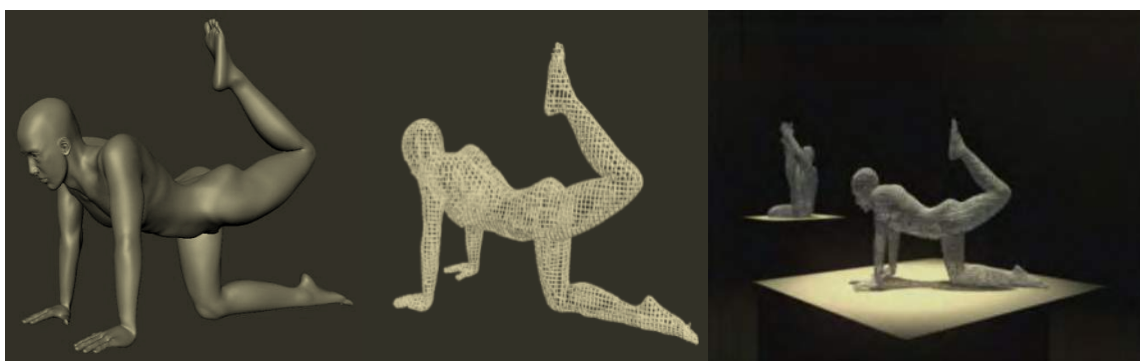

At the outset of studio work, forms were created in virtual space. Every step was intended to lead towards digitally generated images, as the modalities of digital technology not only become a vehicle but also a substance to be modeled, manipulated and juxtaposed in various ways. Firstly the two dimensional layouts were made and later three dimensional modeling of figurative formations and the interior of the gallery space were created. Simultaneous use of Autodesk Mudbox and Maya provided facilities to create human figure formations denoting a particular Yoga Asana literally meaning "posture" or "pose". The complete set of Yoga Asana covers the entire human anatomy, quite literally from the top of the head to the tips of the toes.

It is interesting to note here as a practitioner, the working process in comparison to traditional medium using traditional methods of sculpting, definitely adds a new dimension to realisation and exploration. A traditional sculptor incorporates a process that starts with defining the volume and refining the surface. While using 3d virtual tools, a sculptor uses volume modeling, by growing, extruding and manipulating edges, faces and vertices of a polygon. Virtual sculpture allows form to occupy a multiplicity of possible formations continuously within the same form. But actual sculpture involves traditional methods of modeling, casting, welding, etc., a certain kind of physical engagement.

The placement of eight figurative formations in a virtual gallery space was in accordance with the geometrical space division of the actual Studio3 Gallery at University of Kent, Canterbury. The floor space was divided by diagonal lines called 'Dishas' directing the cardinal points and inter-cardinal points and the center, 'Bindu', symbolizing primal point. When all these points were joined together, it formed a circle which is called 'Mandala', the mystic circle. Consideration for the material used for the models was a must in this research. Modeling and texturing of forms in wire mesh in virtual space is done in such a way keeping in mind the see through and reflective quality of the surface. Also the pedestals, walls, floors, ceilings, doors of the gallery space had to be exactly what was seen in the real gallery space.

The spot light effect in Studio3 Gallery had to be recreated in the virtual gallery space. The light falling on each sculpture and its reflection, the light passing through the surface texture of each sculpture, the overlapping shadow of lines of wire mesh falling on top of the pedestal, the reflected light falling on each wall and floor had to be rendered in the same way as it was seen in the real gallery space.

Therefore, working in virtual space three things were explored within the framework of the software - the modeling of figurative formation, the texture of the surface of the material of the model (fly screen wire-mesh) and other objects in the gallery space and finally the light arrangement in the space. These played a fundamental role in comparing virtual experiences with real world experience.

**Figure 2: The process of modelling, texturing of each model and placement of each sculpture with spot light effect in virtual gallery.**

#### **4.2 Digital Forms- from virtual to real**

There are various ways to produce any 3dimensionalforms in actual space using digital technology and some of the terms used for such digital printing technology that we come across are “digital fabrication”, “digital prototyping” or even “digital materialization”. Although these technologies are primarily driven by industrial design and manufacturing industries, developments in Rapid Prototype offers a lot more potential in terms of creativity for the artist (Sequin, 2005). For the production of the models of sculptures, Rapid Prototype manufacturing technology was the most suitable in comparison to Subtractive Manufacturing Technology like CNC Milling. Rapid Prototyping is the automatic construction of computer-generated three-dimensional model created rapidly from a CAD drawing using additive manufacturing technology. Manipulation of the technique and technology and stretching to such an extent to get the best result in production of material like wire mesh, gives an impetus to expound interest in the epistemology of current technologies.

Undertaking a technical evaluation of current Rapid Prototype techniques’ capabilities and emphasising on the latest development in Additive Manufacturing technology, there were few constraints which had to be dealt with. Three things became very important in this process. Firstly to execute the wire mesh texture on the surface of each figurative formation and maintaining the actual dimension and thickness all over and also keeping the inside hollowness to make it see through. Feasibility of manufacturing such sculptures and choosing the material for production directly affected the total cost of each artwork. Stratasys Prodigy Plus Fused Deposition Machine was used to produce the final sculptures in ABS plastic. Maximum build size measured 203 x 203 x 305 mm (8 x 8 x 12 in). Using the complex three-dimensional geometries of the sculptures as .stl files and creating actual models of the concept of the Yoga Asanas required lot of experimentation before the final sculptures were printed out in parts and then assembled together ready for exhibition.

**Figure 3: Sculpture showing ‘Vyaghrasana’ produced by Rapid Prototype Technology exhibited in Studio3 Gallery.**

### **4.3 Integration of virtual sculptures in real space**

Possibility of incorporating the virtual sculptures in such a way so as to be seen in real time real space was considered. Another way of displaying the virtual models was to use Augmented Reality Application on Android Tablet. For a sculptor, to engage with augmented reality applications that simultaneously display both the physical world and computer-generated images required special care and a different level of knowledge. This is a step further than just using existing software to create 3d models. This was considered to be part of the exhibition the reason being that it is very easy to visualise any virtual sculpture in real space. This is not only to enhance the viewer's current perception of real space but also to associate the virtual and real space. For a sculptor it is highly useful. If it is made user-friendly for artists then a virtual model of any sculpture can be shown on laptop, tablet and even mobile phone anywhere in the world in any surrounding. The problem of transporting very heavy, fragile or massive sculptures can be dealt with by first visualising its placement and its feasibility using this application. By placing a marker at the exact place of the sculpture, a sculptor now has possibilities of seeing the sculptures and making adjustments in terms of materials, colour and size.

### **5. A PUBLIC EXHIBITION**

The exhibition was showcased in Studio3 Gallery, University of Kent in Canterbury from 28<sup>th</sup> August, 2012 onwards. Three methods of display were highlighted in the exhibition space – display of the virtual sculptures in virtual space projected on wall screen, display of rapid prototype manufactured sculptures placed on pedestals and augmented reality experience on tablet placed in the center of the exhibition space which incorporated virtual sculptures in the real gallery space. Before the viewers entered the Studio3 gallery they were led to an enclosed space at the entrance where the virtual gallery was projected upon a wall screen mainly to show the conceptualization of the exhibits and positioning of the sculptures with spot light effect in the virtual gallery space. Then the viewers were led to the real gallery space where the physical sculptures produced through Rapid Prototype manufacturing technology were displayed on pedestals and the sculptor explained the process of making in detail emphasizing on the transformation of texture of wire mesh from virtual to real sculptures. Pointing out the similarities of the effects of spot light in virtual and real gallery space and the set up of the placement of sculptures on pedestals in the virtual and real space highlighted mainly the comparison of virtual experience with real world experience. Later the viewers were encouraged to use the Augmented Reality Application on Android Tablet to see each virtual sculpture and place it anywhere in the gallery space using the marker.

### **6. THE ROLE OF THE VIEWERS**

The final stage of the research was to be able to present a comprehensive explanation and critical discourse of perception of the viewers. Following were the main objectives of the purpose of interpretation:

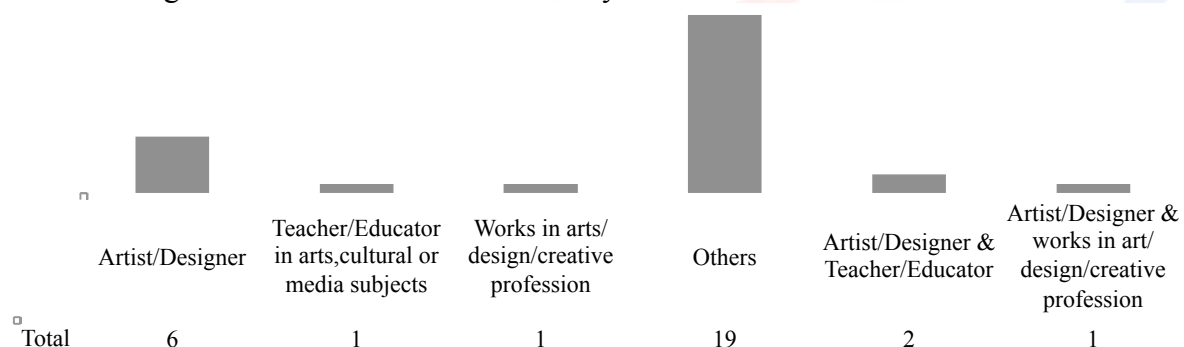

- To establish the level of knowledge of Digital Sculpture and related terms of the viewers.
- To investigate how viewers rate different display methods of Digital Sculpture.
- To identify suitable examples of display and explain the techniques and processes of sculpture and its creation.
- To establish which aspects of the exhibition were particularly liked or disliked by the viewers.
- To analyse the relationship between the knowledge of Sculpture and its interpretation on the one hand and learning experience on the other.
- To identify viewers interest to learn themes and narratives relating to the physical representation of sculpture.

The process which is highlighted in this exhibition involved the production, creation and display of sculptures in an exhibition space as an artist's enquiry to create a working methodology and then presented to viewers who had different vision, understanding, perception and also different background, in order to know about their perception and opinion. The invited viewers were from different professions- academicians, researchers, technicians, artists, art-lovers, critics and general public. The experience of the artist is definitely very different from the experience of the viewer and sometimes unexpected and different interpretation of viewers modifies the understanding of the whole process. There are three assumptions on which the reaction of the viewers in response to any art-form is ascertained. Firstly, the traditionalist view traces back to the history to justify any art work, the institutional theory relies on the definition of what should be art and the third view has its basis in decisions on perceptual qualities of the artwork. Document the responses and reactions of viewers who are either aware or unaware of the process of realising the sculptures, opens up the main relevance of this research in redefining art through perception as a mode of enquiry.

Viewers usually come under two categories: those who are "familiar with art and expect an exhibition to answer and broaden understanding of art within the confines of what is already understood" and those who are "more aware of what is going on in art scene and seek to find validation of this awareness or believe they are able to judge the quality of the exhibition on a deeper level" (Witkamp, 2007). Even though this distinction exists, the viewers have to undergo the art experience and become the ultimate judge of the work which directly or indirectly is enabled through cultural values, social context and personal state of mind. The attention and reception of viewers, and mixed perceptual experience challenges the unwavering line between object and subject. Perception involves information which is imparted to our senses and collected in our mind affecting individual's insight and viewer's response.

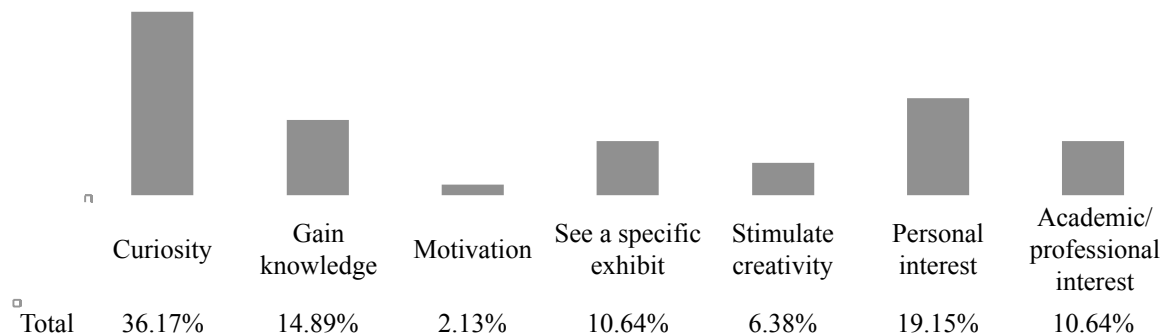

## 7. DISCOURSE OF PERCEPTION OF VIEWERS

The first group of viewers who visited the Studio3 Gallery at University of Kent in Canterbury and the first study for this paper was based on interviews of 30 people, out of which 16 were female and 14 were male. The majority of viewers, almost 36.6%, were in the age group of 25-45 years; 16.6% were in the age group of 19-25 years, 26.6% were of 45-65 years and 20% were over 65 years. The chart in Figure 4 shows 36.7% of the viewers were already engaged in art and creative profession either working or teaching in the field. The remaining 63.3% of viewers were those who had general interest in art and creativity.

**Figure 4: Background of viewers visiting Studio3 Gallery.**

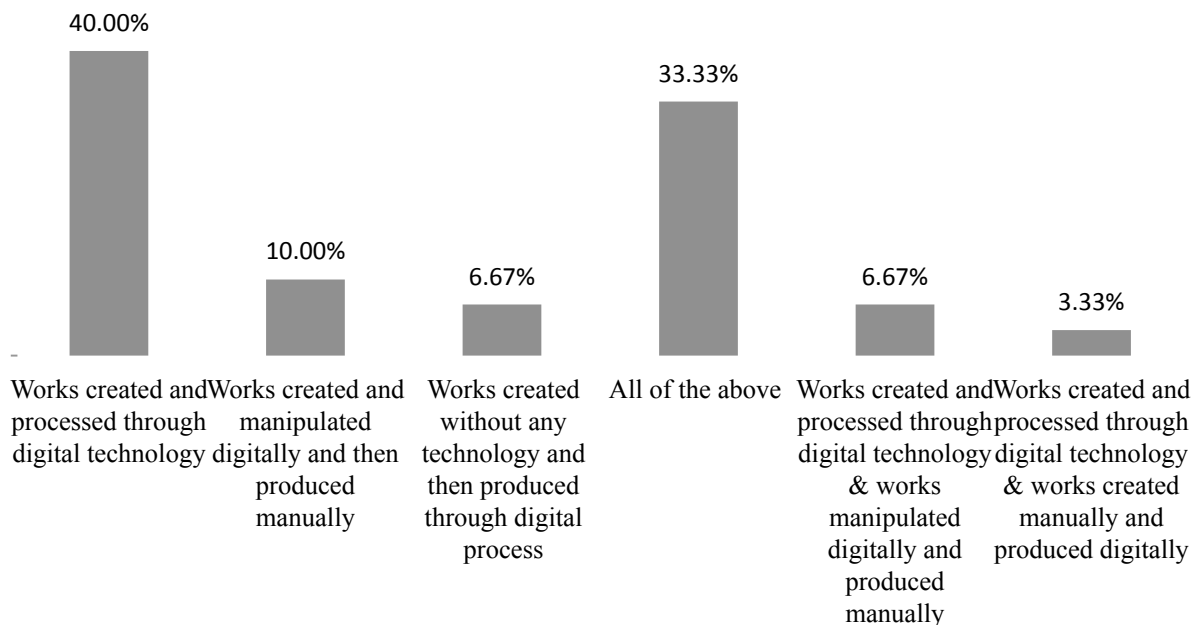

It was interesting to note from the chart in Figure 5, that maximum number of viewers wanted to see the exhibition out of curiosity. In a way it implies that the term 'Digital Sculpture' which was mentioned in the publicity of this exhibition attracted these viewers, because of being more aware of Digital Art as part of Digital Age, irrespective of having either some knowledge or no knowledge of the subject.

**Figure 5: Primary reason for visiting the exhibition.**

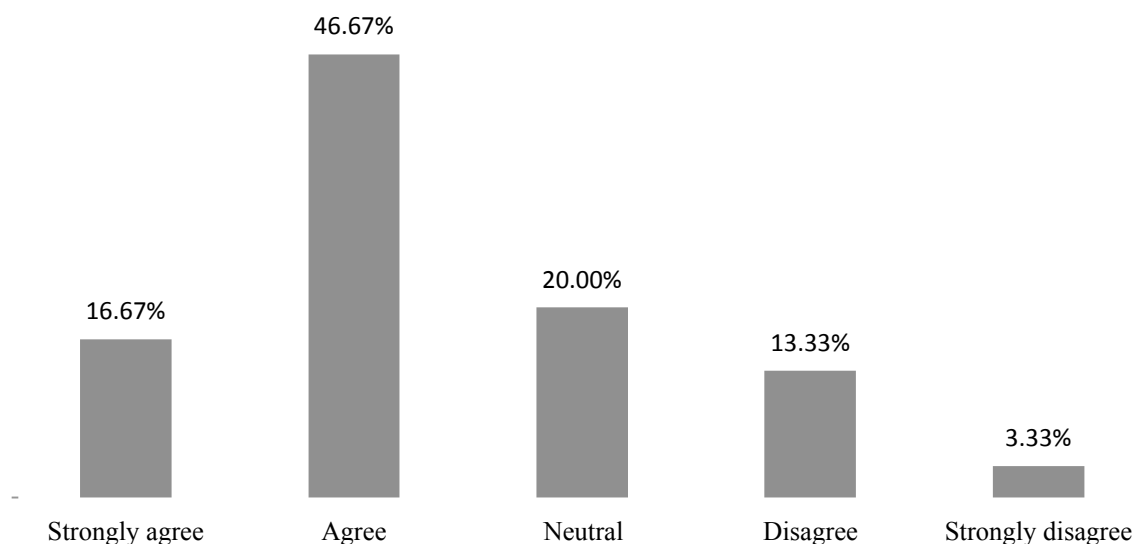

Determining the background of these viewers were important as the standard for judging digitally manufactured art forms cannot be the same as for the standard used to judge manually produced art since the latter is derived from 'non-technically informed perception'. 70% of viewers who visited the exhibition had little or no knowledge of digital technology used for processing and producing sculpture. 27% had very general knowledge and 3% had expert knowledge. The method of displaying the sculptures in this exhibition involved the preference of the process of Rapid Prototype technology over CNC Milling technology and the projection and display of 3d images using screen and android tablet. It was necessary to find out if the viewers had any prior knowledge of these technological processes. 63.3% of the viewers had no knowledge of Rapid Prototype technology and remaining viewers already had knowledge of the process not only being used for creative works but also for industrial purposes. Interestingly less people knew about CNC Milling manufacturing technology, almost 70% had no knowledge about this process being used. When asked about projection and display of 3d images, 83.3% of the viewers responded positively. Most of these viewers have seen commercial displays and projections of commodities in shopping areas mainly for promotion or sale purpose. 17% of the viewers knew very few artists involved in making digital sculpture. Anthony Gromley and Scott Snibbe's exhibitions have been seen earlier by most of these viewers.

It was the first experience of 87% of viewers to see an exhibition of digitally processed and manufactured sculptures. It was important to ask all the viewers what is digital sculpture according to them? They were given four options to choose: sculptures which are manipulated digitally and then produced through traditional manual process; sculptures which are created without the use of digital technology and then produced through digital process of production; sculptures which are created and processed entirely through digital technology or all of the options. Maximum viewers, about 40%, considered digital sculptures as works which are created and processed entirely through digital technology.

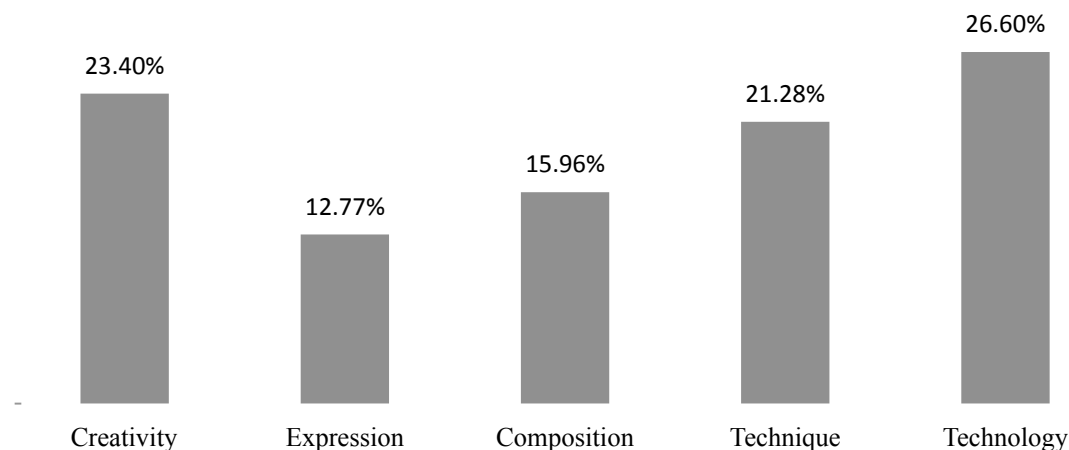

**Figure 6: Viewers' knowledge of what is Digital Sculpture.**

The next section of the interview questions was mainly to analyse the viewers' cognitive responses to the exhibition. Based on the three modes of display method and three processes of digital technology involved in producing and presenting the sculpture, viewers were asked for their preference. Besides the display of real sculptures in the gallery space where the viewers could actually see, feel or touch the sculptures, the other two display methods only showed virtual sculptures. 60% of the viewers preferred the display of virtual and real sculptures together, of the remaining 37% of viewers preferred to see the real sculptures and preference for virtual sculpture was only 3%. The chart in Figure7 very clearly shows that 63.34% either strongly agreed or agreed that traditional sculpture using traditional medium is different from digital sculpture.

**Figure 7: Viewers' response on difference between traditional and digital sculpture**

**Figure 8: Viewers' opinion on what the artist wanted to emphasise in the exhibition**

Viewers were given a choice of five options- creativity, expression, composition, technique and technology - specifically to find their opinion of what the artist wanted to emphasize in the exhibition. According to the answers to the interview question, technology seemed to be highlighted in the above chart followed by creativity, technique, composition and lastly expression. It is interesting to note that the artist's intention was to give equal emphasis on creativity and technology and subsequent emphasis on the value of expression, technique and composition.

Those viewers who had little or no knowledge of Digital Sculptures i.e. almost 70% of total number of viewers, 52.4% were interested to learn and practice Digital Sculpture, 28.6% were interested to learn traditional sculpture using traditional medium and 19% wanted to try both together. Out of 26.7% of the viewers who had general knowledge of Digital Sculpture, 50% were interested to learn and practice digital sculpture and the remaining 50% wanted to learn both. Those with expert knowledge were only 3.3% and they showed eagerness in exploring Digital Sculpture further.

Following are some of the interesting comments the viewers stated in their interviews giving preference to traditional sculpture:

- 'Would rather do a maquette and go through the process of engaging with the material'*
- 'Would want to work hands-on with materials, feeling how they behave, seeing how they balance'*
- 'Would like to go by the pace of making dictated by a particular medium e.g. stone'*
- 'Sculpture needs to be felt and touched as opposed to virtual sculpture'*
- 'Would better start from basics of sculpture making and then move to technology'*

Some of the comments of viewers who preferred Digital Sculptures are stated below:

- 'Already familiar and has background knowledge'*
- 'Interested in physical digital sculpture making'*
- 'Seems very engaging process and encouraged to try'*
- 'Like digital art, would like to try something digitally'*
- 'Will try digital technology as it is more accurate and also not good with traditional sculpting'*
- 'Would like to see how far it could go while experimenting'*

## 8. CONCLUSION AND FUTURE WORKS

This paper examined the different types of Digital Sculpture models, virtual as well as real, and their applications, within the framework of available digital platform. It presented a number of applications for study, presentation, evaluation of analytical models which included the use of

different technologies, from 3D modelling to Rapid Prototyping. The changing perceptual qualities of Digital Sculpture were further analysed by interviewing viewers alongside the artist's own experience of sculpture making. The next stage would be to create user friendly hands-on guides for artists and other people who would like to learn the process of making, presenting and exhibiting Digital Sculpture in any location - in virtual or real space.

Abstracts

The advent of e-publishing not only clearly has ramifications for book consumption patterns generally, it may be post-secondary education that is one of the sectors of society where the impact of this technology is felt most. Textbooks tend to serve an apparently prosaic function. They are used by students and then discarded according to course requirements. As well, students tend to be acutely aware of text book cost. A technology that lowers these costs is likely to create a new status quo of text book consumption. Over the past six years, I have interviewed over sixty people working in the publishing trade, from people at the very top of immense multinationals to a variety of small houses. Over the past decade, publishing has gone through radical changes. It has also responded to the challenges posed by e-publishing with a variety of reactions ranging from anxious fear to uninhibited enthusiasm. At the same time, I have been teaching in South Korea for almost ten years and have observed the behaviour of students regarding purchase and use of texts. I have seen the rise of "smart phone culture". And I have repeatedly talked to my students about these phenomena and their reactions to them.

Key words: digital, education, textbook, publishing

## INTRODUCTION

The idea that technologically “advanced” modes of teaching are ipso facto superior is not a new concept. The reasons for this are as often intuitively limned over as they are established as fact. As anyone who has spent time in a language lab engaging in rote-learning gap fill exercises to a cassette tape or entering a somewhat drowsy state in a darkened room while a documentary movie is being played can tell you, technological change in the classroom does not automatically spell improved teaching in the classroom. Good pedagogy, ultimately, has its source in good instruction with a communicative basis. What is paramount is an educator who pays active attention to the progress of students. Yet sometimes technological changes in the way instruction occurs are driven by the simple fact that technological change is inevitable.

Consider the following analogy: we use computers not because they produce manuscripts that are more legible than those produced by typewriters. Yet, among the many reasons why students (and virtually everyone else, for that matter) uses computers is because they are ubiquitous. Anyone wishing to use a typewriter (for example, because they hate digital machines) would find the task of purchasing one these days so arduous it is likeliest he or she would give up and buy a computer simply for convenience's sake. In a parallel sense, if e-books eventually catch on in the classroom, they will, for reasons, including some cited below, become prevalent.

But are all e-text books the same? And do students feel an unequivocal desire for them? Is the (apparently inevitable) digital revolution in e-texts understood in terms of its driving forces? To understand possible answers to these questions, we have to look at the broader publishing industry, and the radical changes in attitudes it has experienced the last decade, and continues to experience.

This paper will consider some of the ways in which change is both being forced upon and driven by the textbook publishing industry, and it will also consider the more nuanced ways in which university students – particularly in an EFL context – themselves view digital technology. For it is not necessarily the case that a general love (and here that noun is not excessive) for digital technology translates into a blanket preference for E-books over print books. At the same time, it will consider the ways in which “extra-cultural and extra-educational” factors such as economic forces can drive choices that appear to occur because of “natural” change.

### 1.

Change away from the traditional notion of a book being exclusively an object printed on paper is not new to the text-book industry; as “add-ons” such as cassettes, CDs, and additional online material show, textbook publishers have long been adapted to the educational text as being a hybrid in terms of its medium(s). But it is within the trade industry that the idea of a book published entirely in a digital medium that change – and anxiety – has had its focus.

The ideas of an e-book has been around for many years: in the 1980s, the idea that CDs placed in a desktop and read on the monitor gained a certain currency. Two inventions pushed the idea much further. The first was the Internet; the second the invention by Sony of “e-ink”, a screen with a resolution and lack of illumination that was much easier on the eyes than electromagnetic screens. The result was the internet-distributed e-book: a digital “object” which successfully mimicked paper but with very low production costs and extraordinary ease of distribution.

In a telephone interview with this author, Jonathan Burnham of HarperCollins observed in late 2008:

I think that if the right sort of device dash at the right price-point as well – comes along, this will lead to a major shift – quite a rapid shift – from the traditional book form. I know that I myself use my e-reader around 70% of the time. I think there is a very strong potential market for them. As with the iPod, there could be an explosion of use of that sort of medium which would be very sudden. The complication is that we're now in the middle of a recession. [Interview by phone, December 12, 2008, January 12, 2009]

This rapid evolution of technology did not lead, however, to a rapid evolution in the way publishers did things. Factors besides pure technology were at play: economics and social attitudes were determining rates of change. The “major shift” Burnham predicted approximately four years ago as of this writing still has not materialized. Nevertheless, Burnham's concern about and acceptance of the effects of digital technology on traditional print publishing are germane to all fields of publishing. And this is as true of textbook publishing as any other sector of the industry.

Thad McIlroy, a publisher and consultant with a specialty in textbook publishing, commented in a recent e-mail exchange with this author “publishers of successful legacy print products can milk them for a few more years but it would be foolhardy to launch a product primarily in print today”. [Interview by e-mail, September 5, 2012].

In other words, the entire print publishing industry is in a state of great uncertainty. Change, on the one hand, is coming more slowly than some pundits within the industry are predicting, yet on the other hand, change is viewed as inevitable. And given that any multinational industry will make its strategic choices on the basis of sound research and well thought-out business models, the textbook publishing industry is particularly poised for change since its primary audience –that of secondary and post secondary students –is the demographic most amenable to changes in digital technology. Students, above all university students, are a group whose perceived tastes and preferences will drive significant choices made by the textbook publishing industry.

Yet already a subtle contradiction reveals itself. If university students are perceived as having particular preferences, is it necessarily the case that these preferences exist in quite the form that textbook publishers –especially multinational ones –assume that they do?

## 2.

The textbook industry, while separate from what is termed trade publishing, does not exist in a vacuum that is untouched by major trends affecting the latter. Trade publishing is the term used to refer to the way average people understand publishing generally: the novels, celebrity biographies, cookbooks, travel books, self help books, and so forth that one finds in large commercial bookstores. Text publishing, in contrast, is aimed at the specific market of students enrolled in schools. University textbook publishing aimed at undergraduates in a more specific group yet: those students pursuing undergraduate degrees at universities and colleges, whose reading lists are assigned by instructors, and who then purchase their texts for classroom and study use.

In late 2006, when I first asked publishers about the role that e-technology (e-readers such as the Sony reader or Kindle) and audio books might play in altering book publishing, the responses I received were enthusiastic but guarded. Understandably, publishers often had an emotional attachment to the physical object of the book. They also saw the print book remaining a superior “platform” for text. As one publisher, Bev Daurio, remarked, “audio books will continue to be

used and useful, but e-books – it's hard to say – though on-line access to archive, historical and reference materials as well as specialty journals and the like is growing and seems appropriate" [Daurio, interview, 2006].

During the period 2006 – 2007, the author interviewed a wide array of people involved in publishing, from small press publishers such as Daurio. Richard Nash, Che Elias, Jordan Jones, Rolf Maurer, Cathryn Kilgarriff to mid-sized publishers such as Patrick Crean, Lorin Stein and Jack David to major publishers such as Adam Bellow, Jonathan Burnham and Peter Ginna. (The author also interviewed several arts journalists and writers.) Opinions, of course, varied. But all recognized the industry was going through an unusually turbulent period.

Then the recession of 2008/2009 occurred. It had a devastating effect on the sales of trade books. As journalist Alex Good observed, sales for HarperCollins Canada fell approximately 70%. Peter Ginna, publisher at Bloomsbury USA, commented in an e-mail to this author, "this is not the first recession I've seen, but it is the worst" [Ginna, interview, 2008]. The recession came after the dampening economic effects of 911 in 2001. A spate of articles appeared in magazines such as the London Review of Books, Harper's, New York magazine, and the New York Times predicting the "end" of publishing as people had traditionally known it. This generally pessimistic mood had its effect on textbook publishing.

Within the same approximate time frame, the cost of print text books was itself becoming an issue.

The major issue is the high cost of textbooks, mainly those used in higher education, where students must shell-out the cost directly, estimated, by the College Board at between \$805 and \$1,229 on books and supplies alone during the 2007-08 school year. The price of textbooks has never been dirt-cheap, but the last several years have seen the price of many texts climb to \$150 or more. Suddenly a range of individuals and groups have taken notice. "

<http://thefutureofpublishing.com/industries/the-future-of-educational-publishing/>

In short, students are very sensitive the price of their texts, and the texts themselves can sometimes be overpriced (on occasion, conspicuously so).

What frequently happens is students react to high prices by simply avoiding paying at all; they make illegal copies. While on the face of it, this may seem to put the onus of blame on students, there are co-factors contributing to this "too much or too little" mentality that the industry needs to remain sensitive to: prices can be very high (one writing book I know of – printed on relatively cheap paper, retailed for close to \$90 USD – an exorbitant mark-up). Educational publishers can counter their costs have increased not only because of the price of print publishing but all the "extras" that students are now coming to expect:

"While many factors affect textbook pricing, the increasing costs associated with developing products designed to accompany textbooks, such as CD-ROMs and other instructional supplements, best explain price increases in recent years. Publishers say they have increased investments in developing supplements in response to demand from instructors."

Annual Percentage Increase in College Textbook Prices, College Tuition and Fees, and Overall Price Inflation, December 1986 to December 2004

Students were responding to the increase in textbook prices by buying secondhand books or, in jurisdictions where it was feasible, photocopying them. This latter phenomenon is easily evident

in the country where this author works, South Korea. However, while on the one hand, this habit of producing samizdat editions of copyrighted books may seem to put the onus of blame on students, textbook publishers deserve some blame for creating a situation in which students saw themselves as being overcharged. One undergraduate writing book I know of – printed on relatively cheap paper dash now retails for close to \$90.00 U.S. This is an exorbitant markup.

Furthermore, textbooks are often sold in what can sometimes seem to be a dizzying array of new editions. Particularly in nations outside North America, this can create a double stress: it dampens the market in secondhand books, and creates confusion at the beginning of a semester when, for example, a bookstore orders copies of a book and finds that at the regional warehouse there is either a mixture of additions or the edition that the instructor prefers to use is not available.

3.

As mentioned earlier, the textbook industry has in reality producing books that are a hybrid of print and digital for some years now.

“While many factors affect textbook pricing, the increasing costs associated with developing products designed to accompany textbooks, such as CD-ROMs and other instructional supplements, best explain price increases in recent years. Publishers say they have increased investments in developing supplements in response to demand from instructors.”

Annual Percentage Increase in College Textbook Prices, College Tuition and Fees, and Overall Price Inflation, December 1986 to December 2004

The textbook industry, then, is already in a state of transition; arguably one significantly more advanced than that of trade publishing. However, recall that one major difference between trade and textbook publishing at the retail end is individual consumers make their own choices about which trade title they will buy and read, while university in college students have their titles assigned to them.

For obvious reasons, publishers expect and require reasonable profit margins. The challenges that face them are in no small measure the result of the singular relationship they have with their readers. Textbooks produced on a mass scale can be quite profitable when the titles prove popular with departments and instructors. In this regard, textbook publishers have an advantage over their compatriots in trade publishing. But at the same time, textbook publishers are acutely sensitive to the risk of piracy. Since this can take the form of a legal photocopying, digital technology, with its extraordinary means of copying poses a threat to the industry. What textbook publishers are looking for is a means of getting titles to students while protecting their profit margins. And what students (via instructors) are looking for, obviously, is good quality and reasonably priced material.

The question for the industry then becomes, what do students want? The underlying assumption of analyses of trends within the publishing industry tends to assume –as University of Calgary instructor Robyn read suggests –that students will naturally gravitate toward e-texts because students are so enamored of their digital phones, laptops and tablet computers. However it turns out that student preference for digital platforms is not as universal as one might initially assume, and that print books still possess practical advantages.

4.

Discussions with students at the university where I work on the topic of e-texts has led to a few

preliminary conclusions: the first is that digital technology is not loved in a whole-hearted way by students because of the same factor that tends to alienate students from print books that are overpriced: the digital devices are themselves quite expensive.

Unsurprisingly, however, given that e-books are digital devices and young people more than any other demographic are particularly comfortable with this kind of machinery, students certainly saw that e-books had advantages. What was unexpected in the research, however, was the ambivalence students expressed. Students offered opinions on e-books without any prompting from myself apart from an initial classroom discussion on the various topics one might think about. [For the sake of clarity of separation, even though some of these responses were written by two or three students working together, others were written singly; therefore, I refer to each statement in the singular followed by an identifying letter.]

\*

Students saw advantages to e-books in terms of portability:

First, e-books are lighter than paper books. Weight of paper books becomes much heavier if the book has a lot of content. On the contrary, e-books don't need any paper. Users don't have to worry about the weight of books because they only put the e-books device in their bags. [personal interview A, September, 2012]

Students also liked the digital search functions of e-books (one reason, incidentally, why students often prefer e-dictionaries over printed ones):

Third, it is easy to find specific words or phrases using the books there are some cases when people need to find the content they want to see again. In textbooks, finding words or phrases is not easy because we need to look through all the pages. It makes our eyes and brain so tired. However, the [e-]book users can solve this problem easily. [student A, interview]

Finally, it's easy to quote from. There's no need to re-type unquote in. When you want to quote, all you have to do is just copy and paste. [student C]

Some students thought the light of an e-reader with a back-light was advantageous but saw this as a Pyrrhic benefit because it added to eyestrain:

First, using E-booked can cause health risk to the users. People's eyes staring at the screen at close range longtime blink less then become stiff. The screen of tablet PC maintains regular amount of light. However, the eyes which absorb the light her strain to the limit constantly until he slashed she finishes using device. It causes decreased visual acuity. [Student D]

If people use E books for long periods of time, their cause will experience fatigue and may have their eye sight worsened. This will cause the user spies to feel extremely tired of a quick rate. Moreover, this affect can be significantly multiplied if the users read in the dark.

[student F]

Similarly, while some students saw digital readers as capable of offering a good medium in which to write notes:

... but I know that iPad have keyboard the can be attached a iPad so user can type words and iPad. Therefore, it could be possible that the book also have keyboard that have that function. This it makes student more convenient to write memos in class then hit the delete previous word handwriting on textbook. Of course, student also can use electric hand to mark or highlight text on screen. [student B]

Others did not::

Secondly, it's hard to write in E-books. Although you can jot down brief notes through some devices, this process cannot be as delicate and accurate as handwriting. [Student G]

One student pointed out in an essay (though others mentioned this verbally in class) that digital devices that are connected to the Internet (the medium of e-title distribution) also carry temptations; they easily provide their users with text, but also easily provide them with distractions.

First, there are many temptations in E books. I'm pretty sure that most of you guys have experience that surfing the Internet or playing game while studying on Internet. As you know, there are many distracting things when you enter Internet by E-book like game, face book etc. For instance, according to the local research by Seoul National University, one out of third of students are having difficulty on concentrating on class. [student E]

Ease of purchase via the internet was an advantage for one student:

First, helping users save the time is one of the reasons why people like e-books. If it were not for e-books, uses would have to go to a bookstore to get what they want. By using them, however, users can stay at home and easily access what they want. In other words, they can reduce the time and do other things. [student C]

But other Internet issues, such as piracy, raised concerns:

Third, there could be legal dispute with copyright problems. Typical characteristic of digital devices is that you can download any file you want. It can be both merits and demerits. Good for users, but bad for producers. [student E]

The last disadvantage of using the books is piracy. With the advancement of technology,

piracy and illegal downloading has become a big issue. This applies to almost any kind of file on the Internet, and the book files are not an exception. [student F]

Electromagnetic waves were a concern to many students:

Last, electromagnetic waves from the device are harmful to our bodies. It can be fatal and drive devastating results two are by side and the amount of sperm. According to the recent studies of Massachusetts institute of technology, MIT, it is found out that electromagnetic waves from Electronic Devices such as smart phones and E books are not friendly to our health. [student E]

Another health risk of it can become we're read to the users is the fact that Electronic Devices emit microwaves. Even though the amount may be little, a longtime of exposure to microwaves can become harmful to the users. [student F]

On a more prosaic level, the annoyance of recharging batteries was a concern.

[It] can be a hassle to constantly supply power for the device. Most devices compete in the performance of the tablet PC. The competition causes the deficiency of batteries. [student D]

Second, without better a comment you can't study. One of typical shortcomings of digital devices is that they need to be recharged. If he forgets a recharge, no way to study unless you recharge it. But studying while recharging can be uncomfortable because it gets hot when recharging. And you should handle it carefully not to disconnect jack that helps recharging. [student E]

Another disadvantage that e-books have is that they are too inconvenient to use. Some may argue that this is not true, however, I believe the books are inconvenient. The reason why I say they are inconvenient is because the books need constant supplies of power. But the books are run on batteries that is supposedly set to last for a long period of time, in the end, the batteries will eventually run out. [student F]

Of course, the main argument in favour of e-books is their economical benefit: the reduction in price of each e-title. Even here, however, students were skeptical – and perceptive. This was of particular interest to the author, since it is the economic argument that is most often used by e-book advocates within the publishing industry to promote this mode of publication.

Second, expecting the decline if the price of the device is absurd. The consumer who want to read the book, have to consider the price of the device first. None of them as economical. That is not over. After buying the tablet PC, the consumer must buy each of the E books here she wants to read. Except Amazon, all companies are not directly associated with publishing industry. If the company wants to publish of the e-book, they have to deal with copyright. The cost of buying copyright can be imposed on consumer and the price of the book will never decrease. [student D]

The second disadvantage that the books have is that they can be quite expensive. First of all, the prices of the devices are expensive. They use the cost over 100,000 won. This price far exceeds that of a single print book. This is a price that is not easily affordable for most people to spend so freely. In addition, once E readers are purchased, users must now buy the actual file of the book. However, these books are not much cheaper than the actual print versions. Due to the cost of the initial investment made in the device, using ee books can be extremely expensive in some cases. Therefore, due to its expense of cost, ee books have a great disadvantage when compared to print books. [student F]

5.

## CONCLUSION

Digital technology is certainly here to stay. And e-books in some forms – for example, the easy-to-read, colour-saturated, ever updated texts used in first and second-year university undergraduate EFL classrooms – are certainly moving in the direction of e-books. As noted earlier, referring to some of these texts as “print books” is becoming an increasing misnomer in any case, since they are becoming more multi-media with their CD and online exercise tie-ins.

However, other texts demanding longer attention spans or texts written by authors sensitive to the issue of piracy may not be as amenable to e-publication as proselytizers for tech-change like to argue; similarly, the audience of university level book buyers may not push for them with unequivocal eagerness.

Ultimately, text book publishing, being an industry, will follow consumer trends as well as try to set them. Some form of e-publishing is inevitable; it is already occurring. But the final form of the text-book publishing may not take a digital form, though it is doubtless the case that the majority of change which e-technology will afford is yet to be witnessed.

Abstracts

Science Camp Project is an educational initiative designed to provide students with opportunities to apply basic concepts in science and thereby develop their key competencies. Three study purposes were 1) to construct and develop lesson model of science concept learning for lower secondary students by negotiation in science camp. 2) to compare students' correct scientific concepts between before and after using the developed science learning stations, and 3) to study students' key competencies through science camp activities. The samples had attended in science camp were concluded of 75 students, levels 13 and 14. Three science learning stations were designed for each group through Predict-Observe-Explain task. Data collections were used two-tier multiple choice, student written work and interview. Data triangulation was used for interpreting and confirming students' concepts in science before and after operating in each station. The results of the study revealed the following: 1) students can construct 3 suitable science stations- physics, chemistry and biology- for individual challenging student's learning activities in science concepts, 2) percentage of students had correct science concepts in physics, biology and chemistry after operating were higher, and 3) students' key competencies after finishing camp process were high and very high levels.

## Introduction

Following the announcement of the National Education Act B.E. 2542 (1999) and Amendments (Second National Education Act B.E. 2545 (2002), student-centred and constructivist educational approaches have been progressively implemented since 2002 in formal teaching and learning practice in Thailand. These approaches recognise and apply students' prior knowledge and understandings. In addition, from 2012 all schools in Thailand have been adopting a new approach to the school curriculum, each school developing its own curriculum based upon the Basic Education Core Curriculum B.E. 2551 (A.D. 2008) (Bureau of Academic Affairs and Educational Standards, 2008). The new educational policy features a complete change in approach to basic education in Thailand. Apart from curriculum changes, student-centred and constructivist approaches are widely employed in promoting five key competencies and eight desirable learner characteristics within the basic educational system. The study reported in this article investigated the possibility of modifying, where necessary, current conceptual scientific understandings of lower secondary students by presenting challenging alternative conceptions within the science camp process through activities at three science learning stations, each based upon a student-centred, constructivist approach.

Constructivism incorporates both psychological and epistemological principles, and advances the notion that knowledge is not merely received passively, but is progressively built up by the cognising subject. It holds that the function of cognition is adaptive, enabling the learner to construct viable explanations of experiences (Driver, 1989). Such constructivist ideas embrace many facets of Piaget's genetic epistemology and often serve as a reference position for discussions of constructivism in education (Treagust, Duit, & Fraser, 1996). Constructivist teaching approaches also consider students' beliefs and conceptions with respect to student-centred pedagogy in science instruction, by including a focus on the interests, learning skills and needs of students in actively constructing their knowledge (Duit, 1994).

Research applying student-centred and constructivist approaches, conducted within a 2-day and 1-night school science camp environment, involved 1) preparing students for the learning process, 2) assessing their present level of scientific conceptual understanding, 3) assessing the *validity* of their scientific conceptual understandings, 4) designing and conducting relevant science experiments, 5) having students construct science learning stations autonomously. The study adopted some common strategies for investigating students' understanding, including two-tier multiple-choice tests (Treagust, 1988), Predict-Observe-Explain (POE) sequences (Gunstone, 1995), interviews (Chen, Lin, & Lin, 2002), and written work tasks. In addition, the Learner's Key Competency Survey, a survey instrument compiled by the study author, school teachers and science camp mentors (as expert referees) was used to investigate students' key competencies with respect to evaluating science camp activities.

Congruent with principles of established validity as confirmed in a review of research on science concepts in physics, chemistry and biology, the study author constructed science problems based on information and concepts from standard textbooks and recent online websites. The first science station (physics), entitled *Free Falling* (Hewitt, Lyons, Suchocki & Yeh (2007)), describes an object falling freely with an acceleration of  $g$  ( $9.8 \text{ m/s}^2$ ), air resistance being negligible, and requires students to explain why two connected bricks do not fall twice as fast as a single brick. The answer is of course evident from Newton's second

Law of Motion: according to which the acceleration of an object depends not only upon the force acting (as weight, in this case) but also upon the object's resistance to motion-its inertial mass. Kapu (2009) employed the same experimental idea demonstrated by Galileo's famous experiments with falling bodies. The second station (biology), entitled *Tree Height*, integrates the disciplines of biology and geometry. This station used a simple clinometer (utilising the concept of relationship between two similar triangles) to determine the height of a tree in the ecosystem (a biological exploration). The Faculty of Engineering and Applied Science, Queen's University (2012) provided the instrument and procedural protocols used in estimating the tree height. Details of how to construct and use a simple clinometer were clearly explained. The third station (chemistry), entitled *Elephant Toothpaste*, demonstrates the relationship between a chemical reaction mechanism (the mixing procedure) and the overall reaction (products). Advice for making Elephant Toothpaste and the associated chemical reaction mechanism was provided by Helmenstine (2012).

The aims of the study were therefore to investigate the effectiveness of using constructivist-oriented science learning stations to modify students' understanding of various science concepts, using multiple investigation methods as part of a science camp of 2-day and 1-night duration. The study aimed to challenge students' present conceptual understandings in physics, chemistry and biology by consideration of alternative conceptions presented through participation in group activities within constructivist-oriented science learning stations (see Figure 1).

This article reports on the effectiveness of using the Predict-Observe-Explain (POE) task model for group activities, within constructivist-oriented science stations in a science camp environment, to enhance students' understanding of essential concepts in science. Learning outcomes were measured by means of two-tier (pre-test and post-test) questionnaire items triangulated with students' written work and interview results, combined with assessment of learners' key competencies using a learners' key competency questionnaire.

## **Methodology and Research Design**

### ***Methodology***

The science camp process encourages students to prepare for learning and engage in continuous activities within a group environment. Each group adopted a name, group motto and performance identity, individual group member roles being decided through entertaining games organised by camp mentors, as well as through various group activities. Different forms of the two-tier test elicited students' pre-test and post-test understandings before and after attending each science station. A POE teaching sequence encouraged students to utilise their prior knowledge when participating in the learning activities in the science station experiment with a view to constructing their own knowledge pertinent to the activity.

The assessment techniques for group and individual activities in this study were based upon established assessment strategies, including the two-tier test, interview, written work and open investigation.

### ***Research Design***

The research design consisted of a series of case studies (Merriam, 1998) which informed the design of the three learning stations, using both quantitative and qualitative methods (Cohen,

Manion, & Morrison, 2000) for data collected from lower secondary (levels 13 & 14) students at Ban Phu Pittayasun School, Thailand. The students attended science stations at a science camp organised by Udon Thani Rajabhat University and the study author, and results from three of these form the substance of this report. The participant sample, numbering 75 students, was divided into groups of approximately 12, two groups being allocated to one science station. As the research was conducted within a science camp format, using a constructivist teaching / learning paradigm, the research protocols are therefore presented here in two parts: Part one explores changes in students' understanding of science concepts; Part two examines the quality of the science camp activities themselves.

*Part One: The use of the Predict-Observe-Explain (POE) task model within science learning stations to challenge students' science conceptual understandings*

Science camps, based on the National Education Act B.E. 2542 (1999) and Amendments (Second National Education Act B.E. 2545 (2002), are one of the select activities in Basic Education provided for school students. These camps are one of the principle means adopted for the development of students' personalities, key competencies and other desirable characteristics. Furthermore, students attending science camps have the opportunity to rectify any conceptual inaccuracies they may have with respect to science disciplines. In this research study, each of the two groups assigned to a particular science station followed the same four-phase design protocol outlined below.

**Phase 1: Orientation**

This phase introduced the science camp process to prepare students for learning via group activities within the science stations. Orientation consisted of three steps:

*Step 1:* The camp mentors 'warmed up' the camp participants and introduced themselves with a game ('Happy Birthday');

*Step 2:* The mentors then divided students into six groups, introducing themselves and the group's mentors with a game designed to promote group cohesiveness;

*Step 3:* Each group then decided upon their own group name, group motto, performance identity and individual member function within the group. All students were given science camp handbooks and individual work sheets.

**Phase 2: Eliciting of students' alternative conceptions: parallel activities within three science stations**

This phase used a two-tier diagnostic test for identifying inconsistencies in conceptual understandings students may have with respect to science disciplines. The test questions were adapted by the study researcher and previous camp mentors from published research studies, particularly with regard to science concepts elucidated in standard texts (Hewitt, Lyons, Suchocki & Yeh, 2007) and current websites (Kapu, 2009, Faculty of Engineering & Applied Science, Queen's University, 2012 & Helmenstine, 2012). The two-tier diagnostic test items were selected in conformity with the Plan-Do-Check-Action (PDCA) process. The content validity of the instrument (Creswell, 2008) was confirmed by University colleagues and school teachers.

Three steps were involved in the assessment process:

*Step 1:* Camp mentors demonstrated the required experimental procedures to the camp participants, using the two-tier diagnostic test within each station (for example: **do not** proceed with the experiment as suggested by questions);

*Step 2:* Each student completed a pre-test (a two-tier diagnostic item). Some students were personally interviewed;

*Step 3:* Proceeding from the results of diagnostic testing and the use of data triangulation for validating the assessment results, mentors then divided the students into two categories according to the accuracy of their conceptual understandings:

1. ***Students with Alternative Conceptions:*** These students proceeded to the group experiment with the POE tasks in Phase 3;
2. ***Students with Correct Conceptions:*** These students proceeded with the group experiment, acting as mentors.

The details of questions used in the physics, biology and chemistry stations are given in Figures 2, 3 and 4, respectively:

**Place Figures 2, 3 and 4 about here**

### ***Phase 3: Designing & exploring the science station group experiments***

This phase involved a group experiment based on the Predict-Observe-Explain (POE) task model. The students designed, tested and confirmed the results by themselves. Successful completion of the POE tasks required students' to independently recognise and modify their individual conceptual understandings, a process involving the following three steps:

*Step 1:* Groups of students developed the science station experimental objectives and designed POE scenarios (more than one) by themselves;

*Step 2:* Groups of students tested POE tasks (more than one) and confirmed the appropriacy of the concepts involved, based upon the POE task results;

*Step 3:* Each student completed an individual work sheet in accordance with the concepts he or she had learned in their experiments.

### ***Phase 4: Assessment and Discussion***

The purpose of this phase was to assess the extent of changes in students' conceptual understandings. Changes that had occurred were identified from individual diagnostic post-test, written work and interview results, and also through the use of descriptive statistics (means, standard deviations and percentages) derived from the diagnostic test results. Mentors divided students into two groups as before (those with accurate and alternative conceptions), according to the results of the post-tests. Some students who had alternative conceptions would be asked to repeat Phase 3. There were three steps in this process:

*Step 1:* Groups discussed the experimental results and the correct scientific conceptions underlying the experiment;

*Step 2:* All students completed a post-test questionnaire (a two-tier diagnostic item) and some were interviewed. Those who had alternative conceptions would be asked to repeat Phase 3 and reconsider their answers;

*Step 3:* From the results of diagnostic testing (validated by data triangulation), mentors divided students into three categories on the basis of correct, unclear or alternative science conceptual understandings.

Details of the post-test questions used in the biology and chemistry stations are shown in Figures 4 and 5, respectively. Physics station is used parallel question as the pretest.

**Place Figures 4 and 5 about here.**

### **Part Two: Construction of the science learning stations and science camp evaluation**

This, phase 5, is the final part of the study. After attending all science stations, the camp members constructed their own version of science learning stations for other school students in order to assess their conceptual accuracy in the three sciences represented. The stations were established within the relevant science laboratories or other suitable areas. Each station was equipped with pre- and post-test questionnaires, chemicals or instruments used in the experiments, instructions on how to use the station and the names of the members involved in the station construction. The Learners' Key Competency questionnaire was used to assess students' key competency levels before formal closure of the science camp project. This 10-item questionnaire was compiled by the study author and previous camp mentors via the PDCA process and was based on the five key competencies of the Basic Education Core Curriculum B.E. 2551 (A.D. 2008), (Bureau of Academic Affairs and Educational Standards, 2008). The content validity (Creswell, 2008) of questions used in this instrument and succeeding question scores were verified by experts comprising University colleagues and school teachers. The Lickert scale (Creswell, 2008) used in this instrument features a five interval scale (from strongly agree to strongly disagree). The following three steps were involved in the assessment process:

*Step 1:* Groups of students were selected to make their own science station;

*Step 2:* Each group designed the station format and determined its manner of use through appropriate group activities;

*Step 3:* Groups established their own science stations in the area provided, took photographs within the stations and individually completed the Learners' Key Competency questionnaire.

### **Results**

Results data and data analysis pertaining to the five-phase research design are as follows:

#### ***Phase 1: Orientation***

With reference to the introductory 'Happy Birthday' game, all students were surprised by the correct prediction of member's birth dates. They discovered that they could use such number charts for prediction, and learned how to make a number chart based upon the theory of numbers to the base 2. They had therefore become more receptive to the new experiences accorded by the science station activities. After completing the 'grouping game,' the 75 lower secondary students were subsequently divided into six groups, which then independently decided their own group name, motto, performance identity and individual member roles.

#### ***Phase 2: Eliciting of students' alternative conceptions***

The results from students' answers to the two-tier diagnostic pre-test questionnaire within the three stations were triangulated with data from their written work and personal interviews. The number and percentage of 'pre-instruction' students with correct, alternative or unclear science conceptions are shown in Table 1.

**Place Table 1 about here**

### **Phase 3: Designing & Exploring: Group Experiments within the Science Stations**

Within each station, each group of students designed the experimental procedures and interpreted the results in different ways. The following is an example of the work of student group A in designing and exploring experiments within science station 1 (*'free falling objects'*):

*Objective:* to determine which ball reaches the floor first when two balls are simultaneously released from the same height.

There were three steps in the experimental procedure:

*Step 1:* place two balls, a ping-pong and a tennis ball, on a book at around shoulder height;

*Step 2:* simultaneously release the two balls;

*Step 3:* observe which ball reaches the floor first.

POE2: use ping-pong and plastic balls, at around shoulder height;

POE3: use ping-pong and plastic balls, at around knee height;

POE4: use ping-pong and plastic balls, at around head height;

POE5: use ping-pong and earth (softer) balls, at around shoulder height;

POE6: use tennis and earth balls, at around shoulder height.

Each POE experiment should be replicated 3-5 times: observe and record the results in the work sheet.

*Mentor's comment:* always measure the height of the balls from the base. **Do not** measure height from the middle or top of the balls.

### **Phase 4: Assessment and Discussion: Analysis of Students' Conceptual Changes**

Students' answers to the two-tier diagnostic post-test questionnaires, obtained after completing the science station activities, were triangulated with data from their written work and personal interview. The post-test questionnaire results suggest that the number of students having correct conceptual understandings was higher than that of the pre-test results. The number and percentage of 'post-instruction' students with correct, alternative or unclear science conceptions are shown in Table 2.

**Place Table 2 about here**

Commensurate with the results of their post-instruction conceptual understandings, students were divided into three groups: those with correct, unclear or alternative conceptual understandings. Students who did not improve in this respect after completing the first cycle were required to reformulate their ideas in the second cycle of the station experiment. However, some of these students (from both science stations) continued to hold alternative or unclear conceptions even after proceeding to the second cycle.

### **Phase 5: Construction of Science Stations and Science Camp Evaluation**

Three science learning stations were established within the science laboratory of Ban Phu Pittayasun School by students who decided upon their own station name and experimental procedures. Accordingly, physics, biology and chemistry stations were named *Small or Big*;

*Which Size arrived First?, Determination of Tree Height by Simple Clino and How to Make Foam, respectively.*

The mean scores of the five point scale of the Learners' Key Competency questionnaire reflect students' personal satisfaction ratings with respect to perceived changes in capacity for key competencies after completing the science camp. These data appear in Figure 6 and Table 3.

**Place Figure 6 and Table 3 about here.**

Table 3 lists the key competencies which received an 'agree' response; namely Communication Capacity, Thinking Capacity, and Capacity for Technological Application. Responses of 'strongly agree' were received for Problem-Solving Capacity and Capacity for Applying Life Skills. These responses suggest that the science camp process, based on a constructivist learning paradigm, is useful for developing students' capacities, with respect to the relevant competencies, to a level commensurate with the questionnaire responses.

### **Findings and Implications**

The research findings indicate that, with respect to essential concepts pertaining to three scientific disciplines, students' understandings changed following participation in the science camp learning activities based upon a constructivist approach. The multiple case study design therefore served to enhance students' understanding of concepts in physics, biology and chemistry, and may serve as a promising means for investigating both the *process* of conceptual change and the *influence of conditions* generally supportive of such changes.

Constructivist-oriented activities within science learning stations, using a series of Predict-Observe-Explain (POE) tasks, appear to be a useful facilitator for the achievement of conceptual change. The group activities conducted via the science camp environment resulted in a significant degree of success in rectifying the alternative (inaccurate) conceptual understandings of science students. After completion of the learning activities within the three science stations, most of the students' understandings of science concepts and processes were found to be correct. Validation of the results through the use of triangulation (the use of multiple methods for obtaining data, such as written work, interview, and diagnostic two-tier tests in this case) was important in evaluating students' conceptual understandings before and after science knowledge construction within the context of the science activities, as inferred by the positive results obtained from different data sources. Students' key competencies, gauged from their responses to the five-point Lickert scale of the Learners' Key Competencies questionnaire, suggested that a high degree of students' satisfaction was derived from attending the science camp using a constructivist learning paradigm.

### **Conclusion**

The findings of this study have broad implications for the use of science stations employing constructivist approaches and relevant science camp processes in formal Thai basic education, by providing students with improved opportunities for developing their understandings of essential concepts in the various sciences.

## SCIENCE STATION 1

### Physics: Pre-test (adapted from Kapu, 2009)

• **Scenario:**

**Question 1:** If two different balls, eg ping-pong and tennis balls, are simultaneously released at the same distance from the floor, which ball reaches the floor first?

**Assertion**

- 1) ping-pong ball
- 2) tennis ball
- 3) \*simultaneous arrival
- 4) cannot conclude with *because* certainty

**Reason**

- a) The heavier material moves faster than the lighter material;
- b) The larger sized ball has more wind resistance than the smaller one;
- c) The softer material moves more easily against the wind than the more rigid one;
- d) \*The rate of free fall is independent of the mass of material.

Your descriptive details: .....

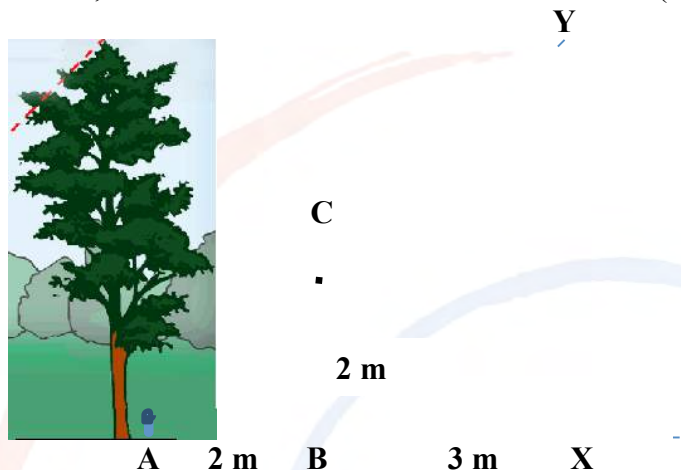

\* *Correct answer*

**Figure 2: Two-tier item question for free falling material: Physics (translated from Thai version)**

## SCIENCE STATION 2

**Biology: Pretest (adapted from** Faculty of Engineering and Applied Science, Queen's University, 2012)

• **Scenario:** In the figure below, the can (point A) is at the end of the two shadows formed by the top of the wall (point C) and the top of the tree (point Y). The height of the wall (BC) is 2 metres, the same distance from the wall to the can (AB).

**Question:** If the distance (BX) from the tree to the wall is 3 metres, what is the height (XY) of the tree in metres?

### Assertion

- 1) 4
- 2) \*5
- 3) 7
- 4) cannot calculate accurately

*because*

### Reason

- a) ABC is an isosceles triangle.
- b) \*Triangles ABC and AXY are related as 'two similar triangles.'
- c) Triangles ABC and AXY are related as 'two triangles equal in all respects.'
- d) Triangles ABC and AXY are not related to each other.

Your descriptive details:.....

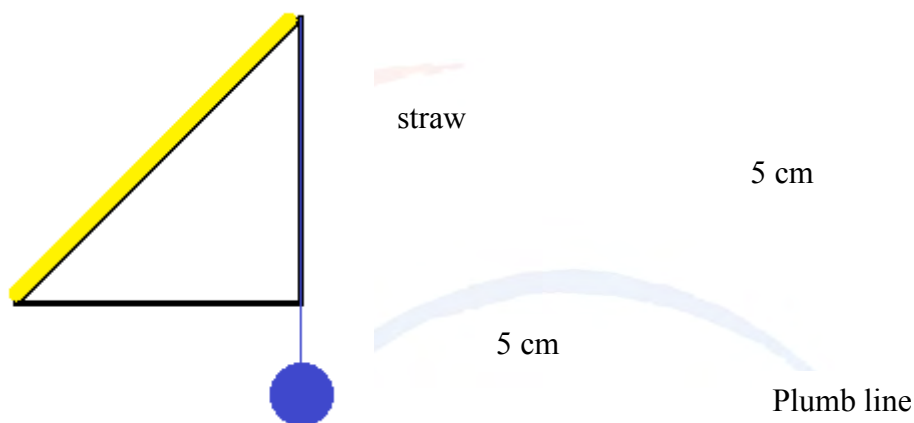

\* *Correct answer*

**Figure 3: Two-tier item question for the tree height: Biology (translated from Thai version)**

## SCIENCE STATION 2

### Biology: Post-test

• **Scenario:** Mr. Black determines the height of a tree with his newly- invented clinometer. A simple clinometer is shown in the figure below. The two sides of the right angle are each 5.00 cm in length:

**Question:** When Mr. Black looks at the top of the tree through the hollow straw, his feet are 5 metres from the tree. If the distance between his feet to his eyes is 150 centimetres, how high is the tree in metres?

#### Assertion

- 1) 5.0 metres
- 2) \*6.5 metres
- 3) 7.5 metres
- 4) cannot calculate accurately

*because  
the simple  
clinometer*

#### Reason

- a) is an isosceles triangle.
- b) \*is based on the rule 'The two triangles are similar.'
- c) has no relation to the tree height.
- d) is based on the rule that 'The two triangles are equal in all respects.'

Your descriptive details:.....

\* *Correct answer*

**Figure 4: Two- tier item question for tree height (biology): (translated from the Thai version).**

### SCIENCE STATION 3

#### Chemistry: Pretest and Post-test (adapted from Helmenstine, 2012)

- **Scenario:** A reaction is a process of change that forms new substance(s) which have properties different from the original substances, or reactants. For example, the decay reaction of hydrogen peroxide ( $\text{H}_2\text{O}_2$ ) in the presence of iodide ion ( $\text{I}^-$ ) as catalyst forms oxygen gas ( $\text{O}_2$ ) and water ( $\text{H}_2\text{O}$ ). The reaction proceeds as follows:

- **Scenario:** Given: Substance A consists of a 30%  $\text{H}_2\text{O}_2$  solution, 40 mL;  
Substance B is liquid dish washing detergent, 80 mL (for capturing gas bubbles);  
Substance C is crystallised potassium iodide (KI), 10 g (which acts as a chemical catalyst).

**Question 1:** If we conduct two experimental procedures inside 1000 mL cylinders as follows:

*Procedure I:* mix A and B, then C;

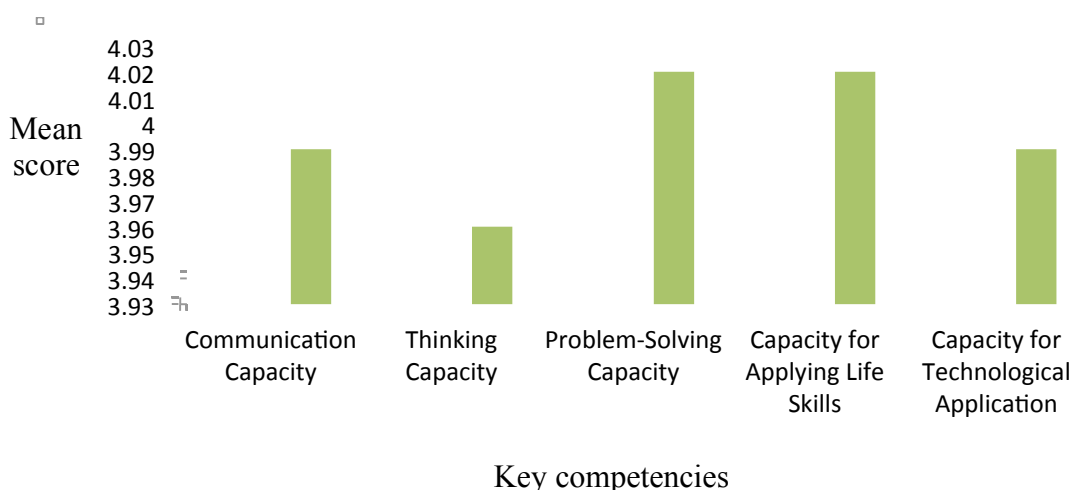

*Procedure II:* mix B and C, then A; what are the results of two reactions?

Assertion		Reason
1) the same results		a) the two procedures used the same reactants.
2) different results		b) when mixing reactants in each step, new product(s) are always formed.
3) *different results while reacting but the same end products	because	c) the reaction mechanism is not consistent.
4) cannot conclude accurately		d) *different mechanisms will be involved in the reaction pathways, but the final product is the same.

Your descriptive details: .....

\* *Correct answer*

**Figure 5: Two-tier item question for elephant toothpaste: Chemistry (translated from Thai version).**

**Note:** 1-strongly disagree, 2- disagree, 3-Neutral, 4- agree 5- strongly agree

**Figure 6: Comparison of mean scores for learners' key competencies (N=39)**

**Table 1: Results of students' pre-constructed conceptions, focusing upon level of understanding**

Level of Understanding	Science station 1		Science station 2		Science station 3

## Introduction

The ultimate goal of Multicultural education is to enhance equitabilities in a diverse society. Moreover, critical multicultural education is a way to provide members of the society with equal opportunities regardless of religion, race, gender, etc. We believe that a democratic society must embrace critical multicultural education or fall behind other nations which do. This study investigates the way in which multicultural education has been provided for minority children in Japan by looking at diverse and equitable practical factors in *living* (abr., L1), *learning* (abr., L2), *school activities* (abr., SA) and *community life* (abr., CL), combined as LLSC.

In this study, we argue that educational policy writers, textbook authors, school administrators, teachers, minority parents and in fact the entire society need to work together to create a multicultural educational system. The purpose of this study is to critically analyze essential multicultural elementary school textbooks and teachers consciousness in order to provide the LLSC for minority children in a diverse society.

## Theoretical backgrounds

Every child has a different social background. In comparison to past decades, it is argued that the differences in living, learning, school activities and community life for a minority child are not as great as they used to be. However, many people are still concerned that differences in social context are confusing for minority children in non-inclusive societies. Bennett (1995) has pointed out: "Differences in communication methods, class participation, and world view enter the classroom when students and teachers represent different ethnic groups and/or different nationalities, although both cultural and racial differences might be an important source of transitional trauma, misunderstanding, and conflict in the classroom" (p.77). Grant and Sleeter have also studied the effects of differences in culture, language and gender in education: "A central idea behind the cultural difference orientation is cultural continuity. Anthropologies have documented that discontinuities between one set of cultural practices and another can be confusing to the individual who must make a rapid transition between the two different sets" (2003, p.49).

The development of children depends on diverse and equal contexts. Nieto (2000) argues: "Affirming diversity is not enough unless we also challenge inequitable policies and practices that grant unfair advantages to some students over others, moreover,

simply tackling issues of racism and discrimination at the school level does little to change the broader context” (p.345). Another theorist, Bennett (1995) also indicates that equity “is not only a matter of bettering our country’s educational system. It is required if we value this nation’s democratic ideals: basic human rights, social justice, respect for alternative life choices, and equal opportunity for all” (p.20). According to Bank (1993), a major goal of multicultural education, as stated by specialists in the fields, is to reform the school and other educational institutions so that students from diverse racial, ethnic, and social-class groups will experience educational equality. Do minority children receive advantages from majority children in a diverse society? Unfortunately, it has been argued that many children with majority social and cultural background still have stereotypes and prejudice toward to children with minority social and cultural backgrounds. Bank says, “An important factor that limits human freedom in a pluralistic society is the cultural encapsulation into which all individuals are socialized” (1994, p.1).

In this research, we employ the approach of critical multicultural education which takes place in diverse and equitable multicultural education, and research ways to provide equal opportunity and access to minority children not only in majority educational implementations but also in the majority society including living, learning, school activities and community life.

### **Conceptual framework**

Many ideas and concepts of multicultural education have been developed in various educational studies. Canada and the United States were known as a "melting pot" until the 1980s and a "salad bowl" from the 1990s onward due to their history of assimilating various cultures and ethnic groups. In addition, the European nations developed multiculturalism with cheap minority laborers and their families especially from African and Asian nations in past centuries. Therefore, most Western democratic countries developed their own multicultural education style earlier than Japan. The most important point is that in the future we need a larger variety of concepts and theoretical frameworks in the field of multicultural education. Since Japanese society is getting more diverse and dissimilar, simplification can not be applied as in past decades.

In this study, several new concepts appear, such as the environmental and human factors which were discovered in theoretical orientations of ICF (International Classification of Function, 2001, from World Health Organization).<sup>1</sup> ICF consist of body functions,

structures, activities, participation, environmental factors, personal factors, health condition, and functioning. We apply these factors to our study as living (abr., L1), learning (abr., L2), school activities (abr., SA) and community life (abr., CL), combined as LLSC. As the primary ICF functions are based on patients who need rehabilitation and disabled children/people, there is a need to further discuss, consider and examine from a critical perspective the effect of factors on multicultural education.

The concepts of ICF and LLSC are similar in their ideas of diversity, equity and difference. For example, “In order to achieve equality of educational opportunity, knowledge and understanding about differences, develop competencies in multiple ways of perceiving, evaluating, believing, and doing and reduce prejudice and discrimination” (Bennett, 1995, p.14). Sleeter and Grant also argued for “Main streaming and inclusive education with exceptional children who have mental and physical differences when teaching the exceptional and the culturally different” (2003, p.39).

According to Sleeter and Grant (1987), much of the existing literature addresses only limited aspects of multicultural education.<sup>2</sup> The literature has developed a taxonomy by which to define the term, to examine how the term has been used, and to criticize various approaches for their shortcomings and insights. The literature also address several categories, e.g. teaching the culturally different, human relations, single group studies (they mean an ethnic group in 1987), multicultural education, education that is multicultural and social reconstructionist by goal, language, culture, social stratification, gender, social class, handicap, history, political and legal issues, instructional modals, curriculum, instruction, teaching guide and project description. Thus, we would like to define human relation factors and social environment factors related to a critical perspective on multicultural education. Moreover, the LLSC factors are based on diversity and an equitable critical multicultural education which means that the knowledge is based on an understanding and acceptance of difference.

In this study, we refine my ideas from some of their approaches (categories) to LLSC of multicultural education. We believe that these factors are certainly helpful for rethinking prospective multicultural education since LLSC has the function to help ease understanding between different groups. In addition, both the research of Sleeter and Grant (1987) and LLSC possess similar views on concepts such as diverse and equitable supports for minority children, school teachers, parents, local governments, etc. Moreover, it is concerned with social formulations such as culture, history, policy,

curriculum design and pedagogies. This study seeks to rethink multicultural education in Japan. The definition of LLSC is as the following.

**a. Living (L1)**

The factor of L1 focuses on personal factors of minority families, e.g., cultural background, family history, as well as the comparisons of these factors with majority families. Moreover, L1 includes psychologies approach such as self-consciousness, self-expression, self-determination, and the problems of living in Japan.

**b. Learning (L2)**

L2 focuses on language problems, bilingual and capacity of academic skills at school. Some minority children can easily solve language problems in the classroom by actively communicating with teachers and friends while some minority children have difficulties not only in communication but also writing, especially in learning Japanese characters.

**c. School activities (SA)**

The factor of SA focuses on events and activities hold by the school, including communication between teachers and parents, teacher parent conferences, and participation of after school activities. In SA, We deal with how to make a good cooperate program between parents, teachers and minority/majority children in a class or school.

**d. Community life (CL)**

The factor of CL focuses on the communication within local communities. We asked participants about a number of factors related to CL, including the need for a multicultural center, and local Japanese language lessons. The primary concern of CL is: How can ethnic minority people easily communicate within local community and gather information from the local government? It is important for minority families to join the local community and get information from the local government.

**Multicultural aspects in elementary school textbooks**

Students are rarely invited to reflect critically on their own schooling and learn to accept inequality as normal and textbooks and school curricula fail to encourage students to ask an assortment of critical questions (Bigelow, 2004, p135). Especially, East-Asian students strongly influenced from nationalism, homogeneous, and non critical thinking from their education system in past decades. Since its earliest

conceptualization in the 1980s, ideas about international education, global education, inclusive education, human right education, ethnic education have been spreading in East-Asian nations. With the rapid increase of the number of immigrant children in schools and Japanese society, more support for international children and families communities is needed (e. g. using two languages in education or the presence of a multicultural education coordinator in school and in society) to help children into the critical local multicultural education system. Japan has recently experienced important shifts in what was once seen as a stable, homogeneous, and orderly social environment, foremost among the challenge facing Japanese society are those involving the educational system, educational concepts, and educational philosophy (Willis and Yamamura, 2002, p1).

### **Data procedure**

The first type of methodology is a critical textual analysis. A critical textual analysis is different from a narrative textual analysis, which tends to trace a series of events. The critical textual analysis in this study involves first collecting a large number of texts which describe multiculturalism and multicultural education for foreigners in the Japanese elementary school textbooks mainly three published companies in 2011. A detailed methodology showed in Table 1.

Table1.Categories for LLSC analyzed by elementary school textbooks

<b>A, Syogakusyakai</b> <b>Published by Kyoiku Syupang, Tokyo</b>	<b>B, Atarashiisyakai</b> <b>Published by Tokyo Syoseki, Tokyo</b>	<b>C, Syogakusyakai</b> <b>Published by NihonBunkyo, Osaka</b>
A, Syogakusyakai was compiled under the supervision of 2 professors. 31 professors and 6 elementary school leaders wrote on each subject in the textbook.	B, Atarashiisyakai written by 29 professors and 11 elementary school leaders and school teachers.	C, Syogakusyakai written by 18 professors, 4 school leaders and 1 member of the educational center.
The main contents of the 3rd and 4th year books include: "Our Town", "Our shopping", "Production of goods" and "Traditional living style" (303/304). The main contents of 5th year books are: "Daily Life and Country", "People Who Make Food", "Living and Information", and "People Who Protect the Environment" (503/504). The main content of the 6th year books is: "Living Policy in Japan and the World" (603/604).	The main contents of the 3rd and 4th grade textbooks include topics such as: "My Machi", "Our Machi", "Working People in Our Society", and "Our Prefecture" (state) (301/302). The main topics in the 5th grade textbooks are:) "Our Living and Factories", "Living and Information", "Living and the Environment" (501/502). The main topics in the 6th grade textbook are: "Japanese History", "Policy, the World and Japanese Rules" (601/602).	The main contents of the 3rd and 4th grade textbooks include topics such as: "Living Area" (city), "Old Times and Today", "Better Living and Safe Living", and "People Who Help to People" (307/308). The topics of the 5th grade text include: "Living in Japan, "Our Food and Food Products", "Our Living and Developed Factories", and "Information about the Environment" (507/508). The main contents of the 6th grade textbooks are: "Japanese History" and "Policy and the World" (607/608).

LLSC ANALYZING

$$L1 = r^1, e^1, g^1, r^2, p^1, \dots, L2 = 1^1, b^1, a^1, s^1, \dots$$

$$SA = c^1, p^1, s^1, t^1, t^2, \dots, CL = c^1, c^1, n^1, s^1, \dots$$

$$LLSC = L1+L2+SA+CL$$

<b>Living (L1):</b>	<b>Community Life (CL):</b>
<ul style="list-style-type: none"> <li>➤ Food from where? (64,65,89p, K-303)</li> <li>➤ Let's introduce Japanese food to foreigners (101p, K-503)</li> <li>➤ Interviews with Japanese workers abroad (131p, K-503).</li> <li>➤ Disabled people and old people in factories (147p,K-503)</li> <li>➤ Japanese and European (61p, K-603)</li> <li>➤ Japanese immigration (115p, K-603)</li> <li>➤ Why Korean and Chinese came to Japan? colony problem (121p, K-603)</li> <li>➤ The variety housing in other nations (51p, N-507)</li> <li>➤ The laborers in Japanese factories (35p, N- 508)</li> <li>➤ Human rights (a discrimination about Ainu and Korea (N-608)</li> </ul>	<ul style="list-style-type: none"> <li>➤ Fukuoka city and many nations (159,161p, K-304)</li> <li>➤ The world map (K-503)</li> <li>➤ Kobe city and the world (154-155p, T-302)</li> <li>➤ Okayama prefecture and the world (153p,N-308)</li> </ul>

In table 1, we analyzed by LLSC data processing. For the first step of LLSC analysis, we established each symbol, which is easy to understand and analyze such as L1 = r1 (race and human rights), e1 (ethnic), g1(gender and disability), r2 (related to living, food, building, and so on), p1 (psychology such as self-expression and self-determination)....., L2 = l1 (language), b1 (bilingual), a1 (academic skills), s1(socio-cultural learning)....., SA = c1 (curriculum), p1 (pedagogy), s1 (school system), t1 (teacher and classmate), t2(textbooks)....., CL = c1(communication between minority and majority society), c1(cooperation between majority society and minority society), n1 (network and partnership), s1(sharing and understanding between majority and minority society)....., The following step was to divide LLSC into collections for the setup of categories.

## Results

According to the MEXT website (Japanese national Ministry of Education, Culture, Sports and Technology hereafter, MEXT), especially in the document of 2007, *Chuokyoiku Simgikai* (The Central Council for Education, hereafter CCE) organized a discussion time for social studies in elementary school and junior high school. In their paper, they examined the general outline of social studies in elementary schools. According to arguments in the CCE paper, there exist a lot of differences in the world, and therefore "Japanese children must be curious about the differences." They go on to suggest actively teaching these differences in social studies class in the 3rd and 4th grades of elementary school.

However, according to our data, these activities only appear in only 11% of the textbook contents (LLSC analysis of 16 Japanese elementary text books, 14 times. Sum total: 126). Multicultural aspects are focused on especially in L1 and CL. For example, in L1, Food is from where? (p. 64, 65, 89, K-303), Lets introduce Japanese food to foreigners (p.101, K-503), Interview with Japanese worker in abroad (p.131, K-503), Disabled people and old people in factories (p.147, K-503) Japanese and Europeans (p.61, K-603), Japanese immigration (p.115, K-603), Why Korean and Chinese moved to Japan? (p.121, K-603), The variety housing in other nations (p.51, N-507), The laborers in Japanese factory (p.35, N-508), Human Rights (discrimination about Ainu and Korea) (N-608). In CL, Fukuoka city and many nations (p.159-161, K-304), The world map (K-503), Kobe city and the world (p.154-155, T-302), Okayama prefecture and the world (p.153, N-308).

As you can see from table 1, this LLSC analyzing is based on several sub-categories (keywords) and analysis was implemented 3 times. Moreover, table 1 showed that A, *Syogkusyakai* (*Kyoiku Syupang*) > C, *Syogakusyakai* (*NihonBunkyo*) > B, *Atarashiisyakai* (*Tokyo Syoseki*). It clearly shows which publisher has more multicultural aspects included in the contents. However, each textbooks series has common textbook aspects such as knowing about *Machi*, kinds of working, visiting factories, and so on. Also, table 1 shows that the editorial committee of each book series includes only university professors and school leaders (c has one member of and educational center).

We analyzed elementary school textbook contents and noticed the following. Firstly, there are plenty of times where the words 'we', 'our' or 'us' (*minnano, watasitachi*) are used rather than 'I', 'my' or 'me' (*watashi*). For example, our street and our city, our shopping, our living and so on. Secondly, the focus is on pride in Japanese culture, for example, Japanese food is claimed to be healthier than other nations as well as higher quality (concern about whether international products are safe or not), Japanese industry is praised ("made in Japan", famous Japanese car industries) and so on. Thirdly, international contents are divided three ways: image, relationships between countries, and roles in the world. The contents are focussed on what Japanese culture gives a good impression to foreigners, which nations have good a relationship with Japan today and what the Japanese role is in the world (UN).

Lastly, Japan is in the midst of school reform (Komatsu, 2002), and their curriculum and school textbooks are seems to emphasize the principle of developing more international awareness. We hope all schools have these goals and move toward diversity, difference and equity.

### **Multicultural aspects in teacher's consciousness**

In Japan, the elementary school standard curriculum (from MEXT) established an intercultural class time and they have been using so-called '*Gaigokugo katsudo*' (Time for Foreigners language) and '*Sogotekina Gakusyuno Zikan*' (a synthetic time) and/or society class. According to the Japanese elementary school standard curriculum, they planned to gain intercultural experience and understanding to Japanese children who do not understand different cultures (2008, p107).

The interesting part of the standard curriculum was that the main activities are learning English and they are still not using terminology such as 'multicultural', 'diversity', 'equity' and 'difference' in their teaching contents. They are using only 'a term of international understanding' from 1980 in their curriculum, although there are more than 80,000 minority children living in Japan today. With this attitude, the Japanese government acts as an outsider who does not consider multicultural education as one of its responsibilities. The Japanese school standard curriculum contains a dubious attitude in its contents. We believe they should seek to critically explore a multicultural education system in Japan for teachers and minority families/children to have a multicultural society in the future.

### **Survey data**

This article is intended as an investigation of LLSC of multicultural education in public Japanese elementary schools. The methodology proposed here is a questionnaire which consists of four parts (LLSC) with 43 questions (with scores from 2 to 4). These were distributed to public elementary school teachers in Japan. We sent 500 surveys (questionnaire form) to elementary schools attached to teaching training colleges in *Hokaido, Tohoku, Kanto, Kitasinsyu, Tokai, Kinki, Chugoku, Sikoku* and *Kyusyu* prefectures. The participants were 80 elementary school teachers and the data was gathered from December, 2011 to January, 2012. The aggregate rate of the survey was 16% (80 out of 500 surveys were returned).

The basic profile information of the participants is shown as following. This questionnaire was a qualification survey item. 72.8% were male elementary school teachers and 26% were female elementary school teachers (1.2% no answer). The age groups were, 4x years old (46.4%), 3x year old (35.2%), 5x year old (15.4%) and 2x year old (3%). More than 40% of the Japanese elementary school teachers (hereafter referred to as J teachers) are interested in multicultural education, however nearly 10% of the J teachers answered that they are not interested in multicultural education.

Moreover, 40% of J teachers did not understand exactly what the meaning of multicultural education is. Only 20% of teachers understood the meaning of multicultural education. Also, only 18% of J teachers had participated in a multicultural education seminar. About 45% J teachers had no positive thoughts of multicultural seminars, conferences, books and such. As a more inclusive and accepting multicultural environment is needed for minority children, we believe that teachers have to try to gain

more information and knowledge of multicultural education, as otherwise minority children have no equal chance to go to elementary schools attached to teaching training colleges.

#### **a. Living (L1)**

In L1, we asked 10 questions related to personal information, minority identity, culture, living style and others to J teachers. Most J teachers had a lack of personal information about the minority children's background. The results of L1 are the following: J teachers think that minority children need some support from them. Also, 47% of J teachers answered there were no problems with the identity of minority children in their classroom. On the other hand, they answered that the minority children have problems with social relationships, self-expression and others.

Also, they marked that the biggest problem of minority children is communication for daily life. They say, although the minority children learn to speak Japanese language very quickly; reading and writing of *Kanji* (Japanese characters) is difficult up to a point where some children cannot acquire this skill. They wrote that minority children have different living styles at home, different food and a different language. That is why it is too difficult to teach a different living style for them as a Japanese teacher.

#### **b. Learning (L2)**

In L2, we asked 10 questions related to language and academic skills to J elementary teachers. Most J teachers answered that the biggest issue is language, especially writing Japanese characters. According to J teachers, generally young minority children learn Japanese very quickly. However, they have problems writing Japanese characters. 65% of the J teachers hope to have a personal J teacher for minority children in a special classroom. From our aspect, the most interesting answer was that only 20% of J teachers answered the bilingual question, such as what is the meaning of bilingual or have you ever heard the term bilingual? Moreover, the important thing they answered is that they do not need a new political system for bilingual education in their country.

#### **c. School activities (SA)**

In SA, we asked 10 questions related to the need for school activities, counseling with minority parents, sharing information with classmates, problems in the Japanese standard curriculum, school system for minority children and others. Through SA we hope for active cooperation between minority and majority children, teachers and parents. According to J teachers, they had difficulties connecting with minority

children; however they do not know how to deal with this problem, how to understand each other and/or what their needs are. Only 4 J teachers answered that they could deal with this problem. Besides, only 7.5% J teachers took time for counseling with minority parents. Most J teachers answered that there is no need for counseling time with minority parents.

#### **d. Community life (CL)**

The factor of CL is related to how to connect in social communities, partnership programs between minority families, local government and school teachers. In CL, we asked 10 questions to J teachers and the results are as follows: 61% of the J teachers do not exchange or share information with local education centers or local multicultural centers. Also, 70% of J teachers hope to make a community education program that unites minority parents, teachers and local government. The most interesting point of CL is that the majority of J teachers (70%) hope to make a multicultural society. However, they do not consider it absolutely necessary to make a new multicultural education law and a political system for the future, as indicated by the results, 'we do not need any new system' (22%) and 'we need a slightly new system' (32%). Finally, we asked the reason 'why multicultural education does not progress in Japan today?' 50% of the J teachers answered that 'it is the recognition of the Japanese society', 19% of J teachers answered that 'it was because of the social system such as nationalism laws and the social environment'.

#### **Conclusion and discussion**

As survey data in 2010, a lot of elementary school teachers wrote that 'the needs of multicultural education research for social studies. According to the their answers the main reason were "Because with increasing of international social studies textbook, they want to teach with view of international awareness, however, it is too difficult to teach international ways" , "It was difficult to explain their country (the minority children`s country) because their country was not good in the history"

In this article, we attempted to analyze the LLSC (living, learning, activities at school, and community life) with diverse and equitable support as one of the methodologies. Using the LLSC we found it easy to understand the needs of multicultural education for elementary school teachers. Moreover, also it was easy to discover the big questions and main issues related to multicultural education in their school textbooks.

The limitations are as follows. Our investigation was based on a survey which was answered by 80 Japanese elementary school teachers and only 16 school textbooks. Furthermore, we would like to point out that there is ambiguity in the four factors of the LLSC. One could argue about whether certain aspects should be in one of the factors (for instance living) or in another factor (e.g. learning).

Finally, a global and local perspective of multicultural education enables us to create a diverse and equitable society that respects each individual. In other words, critical multicultural education is based on a diverse and equitable society. Japanese multicultural education has not progressed in laws, curriculum, textbooks and teacher's understanding compared with other democratic developed nations due to the factors mentioned in this article. We have learned that we to consider a more diverse and equitable methodology for multicultural education, it is absolutely necessary to cooperate with teachers, policy writers, textbook authors, parents and all children.

### **Acknowledgements**

We are sincerely grateful to the Japanese teachers of elementary schools attached to teaching training colleges, some public elementary schools and officials who cooperated with the present research from 2011 to 2012.

### **Notes**

1. WHO established the ICIDH (International Classification of Impairments, Disabilities, and Handicaps: A Manual of Classification Relation of Disease) from 1980. Especially ICF (2001), ICFCY (2007) (International Classification of Functioning, Disability and Health) is revised to use not only health but also, education including curriculum, right, living, inclusion, diversity and equity. ICF model consist of body functions/structures, activities/participation, environmental factors, personal factors/ health condition/ functioning and these factors. In this research, ICF and LLSC are one kind of methods achieve way of understanding and communicating between two comparative groups with diversity and equity. (You can check more ICF related research such as model and checklist from [www.who.int/classification/icf/en](http://www.who.int/classification/icf/en))

Abstracts

In the globalization, Schools are changing their images with the change in socio-economic scenario, change in materials & technology. School buildings are second home for children at age group of 3-9 years. School environment quality matters especially physical environment .it is an important component contributing to quality of learning environment. It is our responsibility to create conditions for advancement of the intellectual and psyche growth.

The pilot study carried out is organized in three parts .The first part is research review identifying physical environment characteristics and second part gives information about school in Pune municipal area .In this paper, we wish to find out the relationship between spatial characteristics of built environment and students learning. The paper concludes by suggesting that understanding of contribution of architectural design and students learning process is important.

Key words: -- *child psychology, school spaces, interrelationship.*

## INTRODUCTION

Primary school is an educational and social place that children experience and enjoy during school hours, they interact with educational and related space along with transitional space. Learning at school is formal with systematic teaching; but learning also occurs even in places that are not designed especially for structured learning.

There is continuous research going on related to physical environment; the same with research into teaching pedagogies but research into learning and physical environment needs more attention.

Physical environment or architecture affects learning; this has been researched with a single variable – the environmental factors such as noise, temperature, air quality, heating, ventilation and lighting (Higgins et al. 2005, C. Weinstein 1979). There is also part of research focuses on significance of colour, interiors and physical environment, making learning environment conducive to learning (Dudek 2001, Nair 2007). Researchers and planners have demonstrated that use of daylight also increases students outcome (Tina Haghighat and Aziz Bahauddin)

Surveys regarding current school environment have not been so specific about inter relationship between physical environment and learning specially in Indian context; Reggio Emilia's notion for physical environment as a third teacher needs more attention from this point of view.

Dutch architect Herman Hertzberger whose contribution regarding school architecture is valuable puts it as;--a thing exclusively made for one purpose suppresses the individual because it tells him exactly how it is to be used. If the object provokes a person to determine in what way he wants to use it, it will strengthen his self identity. Merely the act of discovery elicits greater awareness. Therefore a form must be conditioned to play a changing role (ref)

### Environmental Psychological Approach

Environmental psychology focuses on people, place i.e physical environment in learning and people using it and development of the same. It's universal assumption/belief among educators that physical environment has an effect on behaviour, achievement and performance of student (J. Lackney). Research findings were summarized according to six major categories of school building environment. The first three categories are concerned with basic interface between educational program, its basic philosophy and the physical design of building –nontraditional instructional space, school size, density (J. Lackney, C. Weinstein, King & Maran 1979)

Environmental psychologists have been more concerned about interaction between children and teacher with each other within the context of physical environment but environmental design approach talks about the comfort of users issues related to physical dimensions.

The learning environment can be conceptualized as a series of relations between educational administration and administration procedures, teacher –student interaction, student –student interaction and school building within which all these happens.

## SCHOOL ARCHITECTURE IN INDIA---AN OVERVIEW

School architecture India display a variety as far as physical environment is concerned from ancient era –Gurukul system, pre independence education system up to education for all as a government policy today. India is progressing in 21<sup>st</sup> century. Primary education has been declared as a right for

every child under government funding a special move is undertaken as Sarva Shiksha Abhiyan (SSA) along with many private schools started offering primary schools.

Primary educational education comprises learning of child from age 3-12 years .attempts are made throughout India that every child must have elementary education so number of schools have increased noticeable .This planned expansion raises a question about the quality of physical environment and its role in learning, shaping child behaviour, increasing social interaction .Undoubtly role of teacher, teaching methodology is important but physical can be ignored

Education is an investment so governments of India along with state government of India fund the primary school schools for building infrastructure, development of same, additional facilities like labs, library and midday meal. In 11<sup>th</sup> five year plan, www crores are allotted only for building schools, no. of classrooms. Therefore this relationship if studied in detail will improve a primary school making a comfortable and friendly second home; where they spend almost eight hours a day .there is difference still exists but with communication facilities improving.; this gap will be soon less .so studies regarding both types need special attention .not just classification schools are further categories per their management (stakeholders) and funding schools are categorized as below:--

#### PRIMARY SCHOOLS

#### PUNE

Pune is Ninth largest metropolis in India and second largest in the state of Maharashtra .also referred to as cultural capital of Maharashtra .Pune is an educational hub with almost www primary schools to nine universities, largest number of higher educational campuses referred AS Oxford of East .first school for girls started in Pune way back in 19 th century, pioneering this primary education movement. Public schools (locally known as municipality schools) are run by Pune Municipal Corporation; private schools are run by educational trust or individual .they are usually affiliated to state board of education (SSC) or national board of education (CBSE).Pune municipal corporation admeasures about 243 sq.km with its core area and surrounding 35 villages merged into it .in PMC area there are approximately ww schools.

#### Schools in Pune

This pilot survey conducted by researcher with few basic indicators of school building s which are described as per local byelaws the basic component of physical environment if assessed needs few quality indicators .this is been done with reference to following:--

- 1) General ideas and elements of building emerged from architectural evaluation
- 2) Opinions expressed by CABE (British commission for architecture and built environment) OECD centre for efficient learning environment CELE) and Prakash Nair J.Lackney at design share
- 3) Common Wealth Assessment of Physical Environment (CAPE)

This data collection gave insight into a useful list of quality indicators of physical environment satisfying needs for all, providing health, safety and also satisfying educational norm. Researchers also indentified few indicators regarding 21<sup>st</sup> century's development, any sustainability measures changing social conditions flexibility with reference to teaching methods.

	Elements	Urban School--Aided	Urban School—Non Aided
<b>Physical Context</b>	School location	Majority city core	Within suburban area
	Distance from home	6 kms max– travelling distance.	6-8 kms – travelling distance.
<b>School Context</b>	School size -- Density	1000-1500	500-1500
	Student -teacher ratio	Varies from 1:30 to 1:65	Minimum 1:25 to maximum 1:50
	Girls: Boys ratio		
<b>Social Context</b>	Friendship		
	Sense of belongingness		
<b>Building age</b>	School as a whole	Pre-independence and After independence	1980 onwards
		Permanent housed in old colonial buildings	Permanent
<b>Spaces</b>	Learning spaces	As per norms.	As per norms at times excess.
	,Non instructional spaces		
	Transitional spaces		
<b>Space dividers</b>	walls	Natural texture due to materials	Smooth & glossy
	floors	Rough shahabad flooring	Granite, marble, ceramic flooring
	Doors, openings	Traditional two leaf paneled doors ,	Two leaf paneled doors with colour codes
	steps		
<b>Environmental</b>	Light & Ventilation	Widows are only on one side, some schools need artificial light & ventilation due to recent buildings in periphery.	Ample light& ventilation, some buildings are air-conditioned.
	sound	Busy commercial areas & traffic zone are posed problems of changing land-use with high noise levels. 50% of students are not able to listen.	Less disturbance of noise due to landscape barriers & side margins though located in commercial zones.
<b>Interior</b>	colour	Majority white washed Decoration by student's own work in form of charts.	White washed or grey colour preferred Decoration by artificial paints & murals, student's project work
	Furniture in class	Formal arrangement	Formal arrangement ,Modular

<b>Building maintenance</b>	Overall school	Maintained but care to be taken considering hygiene	Well Maintained
	classrooms	Maintained but needs more frequency–no separate dining area	Maintained –no separate dining area
	Transitional spaces	Maintained	Maintained
	toilets	Enough needs maintenance.	Enough

There are eminent educators who discovered child psychological development parameters one of them is Howard Garner whose multiple intelligence has had an impact on child development thinking and education .in his theory he formulated seven intelligences –linguistics ,logical –mathematical ,musical ,bodily –kinestics ,spatial interpersonal ,intrapersonal with special focus on bodily kinesthetic –using one’s whole body or parts to solve problems ,seen as mental and physical activity related allows people to work with each other and spatial involves the potential to recognize and use of patterns of wide space and more confined area .few educators ,child psychology researchers and principals of schools were asked to rank the /identify a relationship the fifteen indicators who have influence of learning considering above mentioned intelligences and development related to it .still considering the academic achievement ,linguistics and logical mathematical ,musical intelligence is yet to be explored .

## OBSERVATIONS

		20	40	60	80	100
	School with historical ,cultural ,educational reference					
<b>Building age</b>	School building age					
	School building as an expression					
<b>Spaces</b>	School with clear spatial structure					
	School with clear ,controlled entry, parking					
	School open to outdoor environment at least on two sides					
	Ample natural elements grass ,play ground					
<b>Space dividers</b>	Easy access to classrooms					
	Easy access to non instructional areas					
	Easy access to transitional areas, ground					
	Flexibility of arrangement in classroom					
	Adequate work space for staff					
<b>Environmental</b>	Class rooms facing light direction and less noise					
<b>Building maintenance</b>	School building is well protected from hazards					
	School building is well maintained					
	Access to physically handicapped					
<b>Interior</b>						

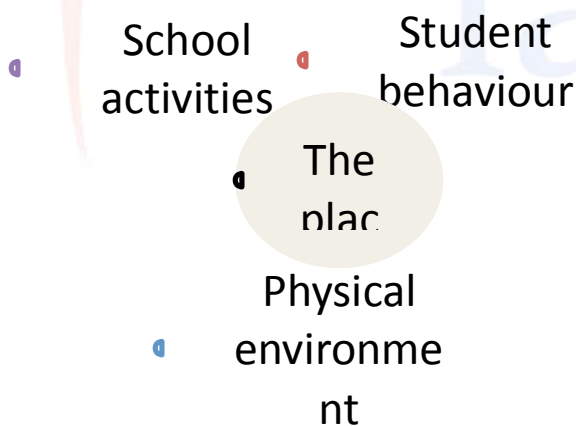

Purpose of this analysis is to find out the important indicators of physical environment which have strong relation to learning.

## DISCUSSION

Considering school size on average classrooms are as per norms with other specified facilities. School entry points though abutting a main road are controlled. Yearly maintenance as well as daily maintenance need more monetary provisions but points 5,6,13,14,15 are lacking in most of the schools regarding health and safety, use of transitional spaces which can be more interactive, need more attention from management (stakeholders) light and colour is equally important, this is similar to findings of (www).

Being in tropics and schools have summer vacation for about 8 weeks less attention is paid on ventilation, mechanical ventilation needs improvement.

Considering time spent, school environment should provide opportunities for play and learning. School is also a working place and learning place if seen from a spatial intelligence perspective, physical environment indicators do matter. Learning place where ever children encounter with space, materials, finishes and flexibility in space need strategic planning. So it can be concluded that more attention should be given to physical environment. This plays an important role in developing years of child.

Although solid proof remains a distant goal, a picture of the environment's role in the educational process is gradually taking shape. It is a picture that is likely to please neither those who advocate minimally decorated, no nonsense classrooms, nor those who advocate minimally decorated, no nonsense classrooms, nor those who call for softer "more humane educational settings." Carol Weinstein 1979.

## 1. Introduction

Leaders in business, government, and education sectors throughout the world recognize intercultural communication skills as vital to the success of our nations' futures. The demand for graduates who are multilingual, knowledgeable of other cultures, and have been educated or trained in an international context is higher than ever before and continues to grow. Within higher education discourse, this has been articulated as a need for graduates who are *globally competent*.

The term global competence crops up in virtually every domain related to higher education – academic studies, university mission statements, course syllabi, etc. – but a clear definition defies consensus among educators and researchers. Whereas educators have been reported as favoring a more broad definition of global competence (Deardorff, 2004), intercultural experts have expressed the need for greater specificity, intimating the concern that reliable assessment of global competence is only possible provided a clear definition of its component parts.

### **What is global competence?**

Broadly speaking, the term global competence means “having an open mind while actively seeking to understand cultural norms and expectations of others, leveraging this gained knowledge to interact, communicate and work effectively outside one’s environment” (Hunter, White & Godbey, 2006, p. 6).

Institutions employ different terminology to refer to the knowledge, skills and attitudes associated with global competence. They may refer to cross-cultural competence, intercultural competence, global citizenship, international competence, global awareness, or cross-cultural understanding, to name just a few.

Intercultural competence, for example, is often placed within the broader context of intercultural communication competence, which is defined as the ability to “interact with people from another country and culture in a foreign language” (Byram, 1997). Although for Byram intercultural competence does not necessarily entail proficiency in a foreign language, he is careful to point out that intercultural competence most likely

derives from an individual's experience of studying a foreign language. For most, ability to communicate in a foreign language forms a cornerstone of global competence because it equips one with the skills to associate and interact with people of diverse nationalities and cultural backgrounds. Moreover, because language is inextricably rooted and interactive with culture, study of a foreign language entails exposure to and familiarization with the culture that forms its historical and modern context.

Global literacy, or familiarization with issues that transcend national boundaries, is also considered an important component of global competence. This may be demonstrated through knowledge of current international news and awareness of major trends of global change, knowledge of global organizations as well as knowledge of world history and geography.

In Deardorff's (2004) study, a panel of intercultural experts was asked to rate 31 items in response to the question: "What constitutes intercultural competence?" The specific components of intercultural competence rated as most highly relevant were:

1. skills to analyze, interpret and relate
2. flexibility
3. cultural self-awareness and capacity for self-assessment
4. ability to tolerate and engage ambiguity
5. adaptability – adjustment to new cultural environments
6. willingness to withhold judgment
7. deep knowledge and understanding of culture – one's own and others'
8. respect for other cultures
9. cross-cultural empathy
10. skills to listen and observe

In the decades over which the term global competence has gained currency within scholarly studies on internationalization, it has come to encompass so vast a range of meanings as to render it effectively meaningless in the eyes of some researchers. Contrastingly, amenability to a wide range of interpretations allows educators to use the term flexibly, molding it and adapting it to fit each institution's unique objectives. No

matter the particular terminology an institution's adopts to describe its institutional goals, it is nevertheless imperative that global competence (or any of its variants) as an expected output of internationalization efforts be articulated in terms of explicit program objectives, which are then linked to specific learning outcomes.

### **How do university students acquire global competence?**

The challenge of equipping students with global competence has been charged to universities and other institutions of higher education, which have responded by ramping up internationalization efforts. Some of the internationalization strategies that have implemented to date include adding an international major or minor to the curriculum or within specific disciplines, adding foreign language or area studies, infusing courses with international content, increasing international relations degree programs, increasing international students, faculty and scholars, providing opportunities for study abroad and international internships or research, and encouraging faculty involvement in international research, teaching and consulting (Herrera, 2008).

In order to launch such initiatives, universities are obliged to look for outside sources of funding. In addition, regardless of whether internationalization efforts are financed through the government or private sector contributions, investors require proof that the students who participate in such programs are, in fact, globally competent as a result. Reliable assessment of global competence as an outcome of internationalization efforts is therefore crucial to maintaining high quality programs as well as providing education quality assurance.

Thus far, we have seen that global competence involves a complex combination of knowledge, skills and attitudes. Therefore, the road to cultivate global competence must be similarly diverse, as should be the opportunities universities provide students for doing so. Some of the inroads to global competence will naturally have significant overlap, such as foreign language learning and study abroad. This paper is part of a larger report that looks closely at three specific strategies: 1) foreign language learning, 2) study abroad, and 3) infusing existing courses with international content, discussing each in terms of how it uniquely contributes to the goal of producing globally

competent students, if and how it is assessed by universities, and finally how its implementation and assessment may differ between American and Japanese contexts. The present paper highlights study abroad with respect to the criteria outlined above and offers several precautions as well as suggestions for how assessment tools and methodologies might be modified to better suit the circumstances particular to Japanese universities.

## **2. Study Abroad and Its Role In a Globalized Japanese Society**

As increasing numbers of Japanese manufacturers shift their productions bases overseas,<sup>1</sup> the recent decline in Japanese young people's interest in working abroad, tagged in the media as *uchi muki shiko* or "inward-looking" Japanese, has given many Japanese companies cause for concern. In a related trend, the number of Japanese students studying abroad has steadily declined since 2004, decreasing markedly from 2007 to 2009 by approximately 20 percent.<sup>2</sup> Among the factors speculated to have influenced this trend is students' desire to gain a head start in the fiercely competitive job hunting process, now beginning in the third year of university, the so-called "study abroad year" of American and European students. "Japanese students who study overseas often find that by the time they enter the job hunt back home, they are far behind compatriots who have already contacted as many as 100 companies and received help from extensive alumni networks. And those who spend too long overseas find they are shut out by rigid age preferences for graduates no older than their mid-20s." (Tabuchi, 2012)

Nevertheless, the notion study abroad is instrumental in improving students' intercultural sensitivity is widely acknowledged in Japan, reflected here in a statement from the Japan Business Federation's 2011 proposal "Toward the Promotion of Global Human Resources":

---

<sup>1</sup> Overseas production among domestic manufacturing firms accounted for 17% of total production in fiscal year 2008, up 5 percentage points from the previous decade.

<sup>2</sup> Data compiled from Japan Student Service Organization (JASSO).  
<<http://www.jasso.go.jp/statistics/index.html>>

In addition to the improvement of communicative competence in a foreign language, study abroad is a particularly effective means of nurturing the qualities required of today's global workforce, including intercultural competence and the spirit to take on challenges abroad.<sup>3</sup> (p. 8)

The Japanese government provides support to universities sending students abroad through various funding schemes. The Japanese Ministry of Education, Science, Sports and Technology (MEXT) included a 60% increase in expenditure on funding for study abroad in fiscal year 2011. According to MEXT, 2,845,908 Japanese students were enrolled in university in 2009. That same year, 59,923 Japanese students studied abroad, representing just over 2 percent of the total (MEXT 2012b). One of MEXT's primary goals as a part of its plan to promote internationalization of Japanese universities is increasing the annual number of Japanese students who study abroad to 300,000 by the year 2020, reflecting 10 percent of the total university student population (MEXT 2012a).

JASSO, Japan Student Services Organization, also offers scholarships to Japanese students studying abroad as well as international students studying at Japanese universities. JASSO's Student Exchange Support Program provides monthly scholarships in the amount of 80,000 yen for Japanese students enrolled in university, junior college, technical college or vocational school as part of its Short-Term Visit Program<sup>4</sup>. After reviewing applications submitted by Japanese universities, JASSO determines the number of students who will receive the scholarship for the upcoming academic year. In 2011, JASSO awarded Short-Term Visit Scholarships to 6,683 students at 137 schools, representing 59 percent of JASSO's total expenditure on international student exchange for that year (JASSO 2012).

### **3. Study Abroad as an Internationalization Strategy**

The following table, featured in an article in *Nihon Keizai Shimbun* titled "Universities

	470 students abroad in 2011.
Kyoto University	IELTS administered on campus.
Hiroshima University	Established 2-week study abroad training courses for first-year students for a participation fee of 50,000 yen.

As mentioned earlier, in return for their support of universities' internationalization efforts, including study abroad programs, investors are requiring that universities provide proof of their programs' effectiveness. Universities, thus, are left with the burden of accountability. In other words, how do universities show that students who participate in study abroad actually become globally competent as a result? Methods for evaluating whether study abroad programs achieve their stated goals are absolutely essential to the design and implementation of such programs, not only to remain accountable to investors but also to build international credibility in promoting education quality assurance. Methods of evaluating the effectiveness of study abroad programs are referred to as *assessment*.

Despite the clear enthusiasm exuded by institutions of higher education to formally express their commitment to "prepare...graduates to be active and critical participants in society" (Forsey, Broomhall & Davis, 2012, p. 129), few of those who have included some aspect of globalization or internationalization in their mission goals are actively assessing global competence as an outcome of internationalization efforts (Punteney, 2012).

Deardorff (2004) posed the question to administrators at U.S. institutions of higher education as to how their institutions currently measure intercultural competence as a student outcome of internationalization. The most commonly reported forms of assessment were student interviews (89%), student papers/presentations (79%), and finally other forms, including observation, student portfolios, professor evaluations, pre/post tests, custom/adapted self-reporting instruments, and commercial self-reporting instruments. In fact, institutions engaged in assessment of intercultural competence as a student outcome of internationalization reported using a variety of assessment methods,

on the average of 5 per institution.

Naturally, the tools and methods used to assess global competence will vary according to, among other factors, 1) how a given institution chooses to define global competence, as well as 2) particular program characteristics. The following presents a framework for organizing study abroad learning into three categories for which specific learning outcomes can be developed and ultimately assessed.

#### **4. Study Abroad Learning Outcomes**

In their article “Research design in assessing learning outcomes of education abroad programs”, Sutton, Miller and Rubin (2007) distinguish three categories of expected learning outcomes for students studying abroad: Cognitive, affective and behavioral. The act of breaking down study abroad learning outcomes into three general categories allows for more targeted assessment. Thus, the three types of learning, expressed in three categories of expected learning outcomes, will be assessed using different means.

Anticipated learning outcomes for students studying abroad

Type of learning	Anticipated learning outcome
Cognitive	Knowledge and skills
Affective	Attitudinal development
Behavioral	Resultant life choices

##### **Cognitive dimension**

The cognitive dimension of learning that takes place during study abroad corresponds to the acquisition of knowledge and skills. Study abroad participants are expected to achieve higher levels of knowledge of course content and assimilation of associated skills than their peers enrolled in an identical course at the home institution. Within the domain of knowledge and skills, language proficiency is the most commonly addressed type of learning targeted by assessment tests. These tests can take a number of different forms.

### **Quantitative assessment**

- Pre-test/post-test (optionally with an additional, mid-program administration)
- Interviews in which students are given hypothetical scenarios and asked to select the most appropriate linguistic response
- Computer-based assessment (e.g., SOPI)
- Self-evaluation reports and surveys

### **Qualitative assessment**

- Conversation analysis of students interacting with host family members
- Analysis of audio taped recordings of class interaction
- Evaluation of journal writing in the target language

### **Affective dimension**

The affective dimension of study abroad learning relates to attitudinal development, which translates to gains in intercultural sensitivity. Learning outcomes reflecting participants' attitudinal developments are notoriously more difficult to reliably and accurately assess.

Research studying the effect study abroad has on attitudinal development has relied almost exclusively on self-report satisfaction scales, used, for example, in questionnaires asking participants to rate the impact study abroad has had on their goals and personal growth or development. For example, exit questionnaires may ask students to rate their satisfaction with various aspects of the program, such as *My home-stay family was friendly and helpful*, or *I would recommend this program to other students at my college*. Instruments designed to target specific skill sets may offer a slightly more objective alternative to satisfaction questionnaires in assessing the affective outcomes of study abroad. These paper and pencil instruments are typically administered pre-program departure and post- program completion, then compared with the results from students who enrolled in an identical course on the home campus. Some examples of these types of assessment instruments are given below.

### **Intercultural Development Inventory**

The Intercultural Development Inventory (IDI) is based on the Development Model of Intercultural Sensitivity, a theoretical framework proposed by Milton Bennett. Bennett identifies six stages that mark an individual's progress toward intercultural competence. "The underlying assumption of the model is that as one's *experience of cultural difference* becomes more complex and sophisticated, one's potential competence in intercultural relations increases." (Hammer, Bennett & Wiseman, 2003, p. 423)

### **Cross-Cultural Adaptability Inventory**

The Cross-Cultural Adaptability Inventory (CCAI) identifies four skill areas that predict success in cross-cultural adaptability and intercultural communication:

- ① Emotional Resilience
- ② Flexibility and Openness
- ③ Perceptual Acuity
- ④ Personal Autonomy

### **Global Competency and Intercultural Sensitivity Index**

The Global Competency and Intercultural Sensitivity Index (ISI) developed by Olsen and Kroeger (2001) measures the relationship between an individual's experience abroad and global competency, which is said to comprise the following knowledge, skills and attributes:

- ① Substantive knowledge (knowledge of cultures, languages, world issues, etc.)
- ② Perceptual understanding (open-mindedness, flexibility, resistance to stereotyping)
- ③ Intercultural communication (skills relating to adaptability, empathy, and cultural mediation)

In addition to these instruments, assessment of the affective dimension of study abroad may rely on student written accounts of cross-cultural experiences, as well as structured interviews.

### **Behavioral dimension**

The third, behavioral, component of study abroad relates to resultant life choices as a consequence of having studied abroad. These learning outcomes may be expressed as

new or different interpretations on world events, increased interest in other cultures, or increased likelihood to pursue careers with an international scope.

Assessment of the behavioral dimension of study abroad learning may be accomplished through longitudinal studies, which, while requiring institutional commitment and dedication of resources, may help determine the impact of study abroad programs on students' intercultural sensitivity in the months and years after they return home. For example, do study abroad participants view world events differently following graduation? Are study abroad participants more likely to accept job offers that place them overseas? What kind of careers do study abroad participants pursue after graduation? How long do they remain at each company or organization where they are employed? This type of assessment may be achieved through the distribution of exit questionnaires coupled by follow up interviews and surveys which track students after graduation through the first few steps of their careers.

#### **4. Discussion**

As we have seen, study abroad constitutes a major internationalization strategy utilized by Japanese universities to provide students with more opportunities to gain the knowledge, skills, and attitudes that will then enable them to take active roles in an increasingly globalized Japanese society. However, the methods for assessing whether study abroad positively contributes to this end will necessarily differ from methods used among American institutions of higher education. This is primarily due to three factors that will be examined briefly in the following subsections.

##### **Differences in the foreign language education landscape**

There is no question that English dominates foreign language education in Japan. Partially due to lack of clarity in national policy (see Butler and Iino's discussion of MEXT's definition of international understanding, pp. 40), in combination with the particular historical circumstances and social mores that have shaped Japan's role in the international community and world economy, the rhetoric behind internationalization and globalization has become conflated with that of foreign language education.

It is often assumed that foreign language proficiency constitutes an important aspect of global competence, presumably in order to foster communication with diverse members of an international community. The perception of international community, however, in Japan, tends to overlook those cultures and nations who do not belong to the economic and military powers of the West (Kubota, 2002, p. 19). Consequently, although in Western academic discourse foreign language education is considered a tool for building global competence, due to its equation with English (and moreover, specific varieties of North American or British English) in Japan, it could potentially work counter to the purported goals of internationalization by reinforcing attitudes promoting English hegemony (to the detriment of minority languages) and its reactionary counterpart: Japanese nationalism.

Perhaps there needs to be a more clear distinction between foreign language learning as a dimension of study abroad and English language education, both of which are considered important for global competence. With regard to the cognitive dimension of study abroad learning, which has traditionally dealt primarily with evaluating foreign language proficiency, instruction and assessment by Japanese universities must take into special consideration the following if study abroad is to truly serve the goal of helping to instill global competence in program participants.

1. Promote the study of foreign languages other than English, in particular languages of Asian countries that provide Japanese universities with the majority of their international students.
2. Raise awareness of other varieties of native and non-native English.
3. Incorporate content into foreign language courses that reinforces more realistic representations of the international community.

### **Global competence as an individual attribute versus interpersonal relationship**

Transcending the dichotomy of general versus specific, competence has alternately been characterized as relating to inter-personal relationships rather than individual attributes, in essence, “a social judgment that people make about others” (Lustig & Koester, 2003, p. 64-65). This has prompted some to regard the approach to defining intercultural, international and communication competence in Western societies as engendering

serious limitations when it is uncritically applied to non-Western societies, where the unit of analysis may reside in the network of one's interpersonal relationships rather than the individual per se. In fact, Miyahara (2004), echoing Ho (1998), suggests that "Western ideological presuppositions, such as individualism, are alien to the Asian ethos" and should not be employed to frame psychological phenomena in Asian societies (2). Thus, it may be particularly important to establish structured activities for intercultural exchange during Japanese students' sojourn abroad in order to ensure ample opportunity for developing the skills to create, manage and maintain the type of inter-personal relationships that form the basis of global competence in this approach.

### **Gap in actual hiring processes**

A third factor warranting reevaluation of the methods used to define, operationalize, and assess global competence as an outcome of study abroad is the inconsistency arising between the skills and attitudes MEXT uses to characterize "global human resources" and the skills and attitudes expected of new graduates entering most Japan companies. As one recent graduate from Oxford explained to the *New York Times* (Tabuchi, 2012), "I really wanted to gain experience at a Japanese company, but they seemed cautious. Do Japanese companies really want global talent? It seemed to me like they're not really serious."

In order to ensure that government and university resources dedicated to creating globally competent students are allocated effectively, assessment of study abroad learning should not be targeting those skills and attitudes that characterize global competence in *theory*, that is, theories developed with particular regard for the circumstances of American students studying at American institutions, likely looking for jobs in the U.S. Rather, Japanese universities' assessment of global competence should determine whether or not participants in study abroad gain the appropriate perspectives and attitudes that enable them to work effectively in Japanese companies striving to compete in the global marketplace.

## **5. Concluding Remarks**

MEXT defines global human resources as individuals who possess the following

attributes:

- I. Linguistic and communicative competence
- II. Independence and assertiveness, determination to challenge oneself, cooperativeness and flexibility, sense of responsibility and duty
- III. Understanding of foreign cultures and identity as a Japanese

At first glance, this definition appears consistent with many of the definitions offered for global competence in Western scholarship. However, if MEXT defines the global human resources that industries are calling for as having characteristics such as *individualism* and *assertiveness*, there is clearly a gap in the actual hiring processes of Japanese companies (Tabuchi, 2012). Rather than assessing whether or not participants in study abroad programs come back globally competent in the Western research paradigm-developed sense of the term, assessment should be asking the question: Does (short-term) study abroad positively impact students' desire to seek out intercultural experiences while reinforcing the behaviors and attitudes that enable them to integrate and thrive within Japanese companies? This may require redefining the term global competence, or global human resources, or both; ultimately, however, Japanese universities looking to provide accountability for outside investment in their study abroad programs must evaluate success measured against actual labor market conditions, while taking into consideration the reality of Japanese corporate culture and the ability or failure of graduates to meet the expectations of what global human resources truly implies.

*Primary Students' Perspectives on the Use of Multiple Languages in Learning Science*

Jualim Vela, Hideo Ikeda

0366

Hiroshima University, Japan

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

The Philippines is a multilingual country with at least 170 languages in 17 regions. This created an endless debate over which language should be used in educating Filipino students particularly in science and mathematics education, which are taught in English. Recent studies reveal that primary students perform better when using their first and second languages.

This research supports the advocates of first language in teaching and learning science concepts in primary education.

The study aimed to know the students' extent of use of the local language and of the academic language in learning science concepts, as well as to identify in which language they comprehend best.

The study involved elementary Bicol-speaking Filipino students from one of the six provinces of Region Five (V). To achieve the objectives, the researcher developed and incorporated the use of modified survey questionnaires which were translated into the national language to determine the students' language preference in learning science concepts. Each item in the survey questionnaire solicited responses from the students regarding their use of the local and academic language in science learning.

iafor

The International Academic Forum

[www.iafor.org](http://www.iafor.org)

## **Background of the Study**

The Philippines is an archipelagic, heterogeneous society. It has at least 170 languages in 17 regions. Of these, eight are major languages – Tagalog, Pampango, Bicol, Hiligaynon, Waray, Cebuano, Ilocano, Pangasinan - with Filipino as the national language, and English the official language.

The language diversity in the Philippines became a constant problem on the utilization of the medium of instruction which led to the implementation of the Bilingual Education Policy (BEP) in 1974 which specified Filipino and English as medium of instruction (Gonzales, 1987).

Even so, the existence and implementation of the language policy in education did not stop the never ending dispute over which language should be used in educating Filipino students. Educators and policy-makers have been divided in which language is most appropriate in teaching content subjects, such as science and mathematics.

## **Debates on Which Language is Appropriate as Medium of Instruction in Science Education**

The quandary in the medium of instruction in science education is due to the unsatisfactory performance of Filipino students in school tests, the national achievement tests in science and in TIMSS which may indicate their comprehension in science.

Some educators posit that Filipino, as the national language, can be effective as a medium of instruction in science. The proponents of teaching science in English claim that it is tested and feasible, economical and universal in science education. While others argue that the vernacular of students should be used as medium of instruction since English and Filipino are considered foreign language and/or second language in other provinces of the Philippines.

Several educators and curriculum developers supporting the use of the students' mother language argue that it should be used as medium of instruction since students learn to read more quickly and English and Filipino are considered foreign language and/or second language in other provinces of the Philippines.

Brock-Utne (2001) stated that students learn to read more quickly when the mother tongue is used as medium of instruction. It is also best used as bridge in learning main languages of instruction (Sibayan 1994). In the same light, it will enable the students to think and process their experience in logical and rational way (Gonzales 2003).

## **Researches, Advocacies and Educational Programs that were Developed and Implemented which Utilized the Students' Mother Language**

In the province of Kalinga, an experiment called the Lubuagan Experiment was administered to the students using the local language in teaching Science, Math and English, students' test scores indicated greater gains (Dumatog & Dekker 2003).

The PCER (Presidential Commission on Educational Reform) recommended the use of vernacular in the primary grades, at least, in Grade I as it seems the practical thing to do. UNESCO's stand in favor of the use of mother tongue instruction is worth mentioning. UNESCO Regional Director for Asia Victor Ordoñez (1998) has stated that "it is part of our [UNESCO's] task to protect and celebrate the diversity ... between cultures and not

homogenize it to the point that we lose our individual identities." UNESCO has been known to be a staunch supporter of the idea of developing functional literacy through the vernacular.

The Philippine Community School Movement and the Vernacular experiments in Iloilo in the early 1950's, are but some of the Philippine studies whose results favored the use of vernacular instruction in the primary grades.

Learning is meaningful and productive if the incoming ideas, concepts and activities are relevant, and is best administered using the language that students are familiar and can comprehend with.

### **Language Used in Science Education in other Countries**

TIMSS 1995, 1999 and 2003 results indicate that a number of top performing countries in science achievement tests are those who use their own language in their educational system or in science education notably Japan, Korea, Finland and Hong Kong SAR. As an example, Japan a highly industrialized country, has been using its own language in teaching science to Japanese students from primary to tertiary level. Kawasaki (1996) specified that a large percentage of scientific concepts were translated into Japanese language and several scientific concepts were also given equivalent Japanese terms.

Rollnick (2000 cited in Ong 2008) conducted a research on the use of Bahasa Malaysia as medium of instruction in teaching and learning science. Results show that there was no setback in using the national language in learning and teaching science.

In South Africa which has 11 official languages, Ferreira (2011) stated in her research that students in grades 1, 2 and 3 are taught using their first language and afterwards learn English and Afrikaans. She further stated that a number of students from the rural areas only encounter English at school and not in their own home or community. This situation affects the learners' comprehension and performance at school.

### **Students' Performance in Science**

The low performance of Filipino students in the national and international achievement tests in science triggered arguments and disagreements among educators, experts and policy-makers on which language is appropriate for students in teaching and learning science concepts.

It can be concluded that the low performance of students in the tests reflects their comprehension in science, and students are only able to comprehend science concepts and apply it in real life situations if classroom environment provided them the adequate atmosphere for learning. Part of that classroom environment is the use of proper medium of instruction in teaching scientific concepts.

At the 1999 TIMSS (Trends in International Mathematics and Science Study) for 8<sup>th</sup> graders, the Philippines ranked third (36<sup>th</sup> overall out of 38 countries) to the last, garnering an average score of 345, the international average was 488. In the 2003 TIMSS for 4<sup>th</sup> graders, the Philippines

again placed low in ranking at 23<sup>rd</sup> out of the 25 participating countries with an average of 332, compared to the international average of 489.

Many factors that may have affected the students' performance in the national and international achievement tests in science have been mentioned, such as lack of books, teaching materials, shortage of qualified teachers, classrooms, funds and many others. But the medium of instruction which is very vital is often set aside.

Research and tests conducted by Vela (2010) between 2009 and 2010 indicated that Bicol-speaking students performed well in science tests using the Filipino (national language) and Bicol (vernacular language) languages.

### **Objectives of the Study**

To have a further understanding on the appropriate medium of instruction in science education in the local areas of the Philippines, this study investigated the students' language preference as well as their extent of use of the local and academic languages in learning science concepts.

### **Delimitation of the Study**

The study was conducted on grade three Bicol speaking students and focused on determining the language in which they comprehend best in learning science concepts by administering modified survey questionnaires, soliciting response on their language preference in learning science in and outside the school.

The venue of the study was in an island province in the Bicol region. It was chosen due to its accessibility and familiarity with the researcher. The Bicol language is one of the eight major languages in the country. In education, its achievement in science is ranked 14<sup>th</sup> out of 17 regions. ([http://www.pcij.org/blog/wpdocs/Quality\\_of\\_basic\\_education\\_NSCB\\_2006.pdf](http://www.pcij.org/blog/wpdocs/Quality_of_basic_education_NSCB_2006.pdf))

The researcher developed testing materials as well as the translation into the Filipino language in consultation with Filipino teachers, college professors and science education specialists.

### **Significance of the Study**

The study aimed to:

- ♦ Provide information on the extent of use of the languages based on students' perspective.
- ♦ Impart ideas in facilitating students' understanding of science concepts and enhance science process skills in the language they are familiar with.
- ♦ Support the earlier studies and the current MLE-MTB program of the department of education in the Philippines which use local languages in teaching students.

## Methodology

The study was conducted in one of the six provinces of the Bicol region between December 2011 and March 2012 in four public schools located in the northern and southern part of the province. The schools follow the regular public elementary education program implemented by the Department of Education. The participants of the study were 318 grade three students from three sections. Students are usually assigned to a section based on their performance in the class. Those who perform well are sent to the first section. On the other hand, students whose performance are average are sent to the second or middle sections while those who perform below average belong to the third or lowest section possible.

The study primarily used a 20-item questionnaire with multiple choices to obtain information on students' language preference in the classroom and in learning science concepts and skills from various science activities. It also elicited the students' preference on the use of their first language, national language and the academic language in the classroom, and in learning science concepts and skills in various science activities.

The questionnaires were written in Filipino. Each item and procedures for answering were also explained by the researcher to the students in the Filipino language.

The questionnaire consists of two parts. The first part asks respondents about their background information such as name, age, sex and parents' job. The second part comprises the main questions which pertain to the respondents' use of the three languages (Filipino, Bicol and English) at home, outside home, at school and inside the classroom. Subsequent questions are about the language their teachers use while teaching science and what language they prefer during class activities. The concluding part of the set of questions refers to the respondents' language preference in studying science.

## Findings

Table 1  
Characteristics of the Grade Three Respondents

Age	Male	Female	Total	Percentage
8	22	23	45	14.2%
9	104	112	216	67.9%
10	25	18	43	13.5%
11	3	5	8	2.5%
12	3	2	5	1.6%
13	1			.3%
<b>Total</b>	<b>158</b>	<b>160</b>	<b>318</b>	<b>100%</b>

Of the 318 student respondents, 160 (50.3%) are female while 158 (49.7%) are male. The age of the respondents range between 8 and 13 years old, with 216 (67.9%) 9 year olds comprising the largest group of respondents.

Table 2  
Language students understand

<b>N=318</b>	<b>Yes</b>	<b>Slightly</b>	<b>No</b>
<b>Do you understand the Bicol Language?</b>	<b>270</b> 84.9 %	<b>47</b> 14.8%	<b>1</b> .3%
<b>Do you understand the Filipino Language?</b>	<b>284</b> 89.3%	<b>27</b> 8.5%	<b>7</b> 2.2%

The first two questions asked the students if they understand Bicol and Filipino languages. 84.9% of the respondents answered that they understand the Bicol language while 14.8% replied “slightly” and 1 answered “no”. 89.3% of the respondents confirmed that they can understand the Filipino language whereas 8.5% chose “slightly” and 2.2% respondents chose no.

Regarding the means of transportation to school, forty-one percent (41%) of the respondents walk to school every day, thirty percent (30%) use the public transportation while twenty-eight percent (28 %) of the respondents use private vehicle in going to school.

Table 3  
Language used at home, outside home, at school and in the classroom

<b>At home</b>	<b>Outside home</b>	<b>When talking to friends</b>	<b>At school and in the classroom</b>
<b>76.7% Bicol</b>	<b>73.9 % Bicol</b>	<b>66.4% Bicol</b>	<b>41.2% Filipino</b>
19.8% Filipino	25.2% Filipino	31.8% Filipino	36.8% Bicol
3.5% English	9% English	1.6% English	21.7% English

Majority of the students from the schools used Bicol at home, outside their home and while talking with friends. 41.2% chose Filipino as the language they normally use in the classroom.

Table 4

Language students and their teachers use during science class and while studying science

Students	Teachers	Other languages used when studying science on their own
<b>84% English</b> 7.9 % Filipino 7.5% Bicol	<b>39.3% English and Filipino</b> 32.1% English 24.8 % Bicol, Filipino and English	<b>58.2% Filipino</b> 31.8% None 7.5% Bicol

On the other hand, 84% of all the respondents chose English as the language they use while studying science in the classroom. Regarding the language their teacher use when teaching science, 39.3% responded that their teacher uses both English and Filipino, while 32.1% confirmed that their teacher uses only English.

When studying science on their own, 58.2% of the respondents said they use the Filipino language while 31.8% answered they only use English.

Table 5

Language students prefer to use in science activities and in studying science

While Science	Studying	During Recitations	Class	While Science	Reading	While teacher's instructions	following
<b>62.3 % English</b> 23 % Filipino 14.2 % Bicol		<b>64.8% Filipino</b> 21 % Bicol 13.8 % English		<b>40.6 % Filipino</b> 34.3 % English 25 % Bicol		<b>40.9% Filipino</b> 35.8% English 23.3 % Bicol	
While the teacher is discussing science lessons	During exams	science	While during classes	thinking science	While homework	doing	
<b>50% Filipino</b> 30.5 English 19.5 Bicol		<b>56.6 % Filipino</b> 29.2 % Bicol 14.2 % English		<b>40.9% English</b> 39.3% Filipino 19.8 % Bicol		<b>54.1 % Filipino</b> 26.7% Bicol 19.2 % English	

62.3% percent of the respondents chose English as the language they are comfortable with studying science, however, 64.8% said they are more relaxed during class recitations if they use the Filipino language.

40.9% of the respondents prefer their teacher to use the Filipino language in giving directions during science class activities. 40.9% replied they are able to think well during science class when they use the English language while 39.3% selected Filipino.

40.6% of the respondents answered that the Filipino language is easier during reading and understanding science, while 34% chose English.

50% of the student respondents selected Filipino as the language they can understand better if utilized by their teacher in science class, while at least 30% chose English.

49.1 % stated that they can understand the science lessons in English, while 46.2 % answered “slightly”, and 4.7% of the respondents said “No”.

Subsequently, respondents were asked which language they find difficult in science exams, 74 % affirmed that English is difficult to use in science examination, 56.6% chose Filipino as the language they find easier in answering exams. Lastly, 54.1% indicated Filipino as the language easiest to use when doing their homework while 26.7% chose the Bicol language, only 19.2 % respondents chose English.

## **Conclusion**

The results show that most of the students feel comfortable and can comprehend better if both Filipino and Bicol language are used in various science class activities.

The research also revealed that most students prefer both the Bicol and Filipino languages as medium of instruction in learning science concepts. It can be a positive instructional medium for motivation and interactive learning since students are familiar with the language. Students will be able to relate science concepts well with real life situations and build self confidence, especially in expressing their ideas in the language they know best. Furthermore, the study strengthened the premise that learning takes place in the language that students are familiar with.

The results of the study indicated that both the Filipino and Bicol language are suitable mediums of instruction in science education for Bicol-speaking students. Furthermore, this study provided significant information regarding the use of local language as medium of instruction and broadens the standpoint of contemporary theories in education (such as the behaviorist, constructivist or cognitivist approach) and sets aside old traditional methods and practices in classroom instruction.

## **Implication of the Study**

The goal of science education is to develop and nurture students' functional understanding of natural systems and their ability to utilize the methods of scientific inquiry and principles linked with real life situations which should prepare them to make responsible decisions on various social issues which are science-related. Learning comes in many forms, not only inside the classroom but also from the immediate environment and everyday life experiences of which one of the imperative aspects in any learning environment is the instructional medium,

which is the carrier of message. Hence, concerning the points mentioned, this study provides relevant information regarding the use of local language as medium of instruction.

The study supports the premise that learning takes place in the language that students are familiar with. The results of the study determined that both the Filipino and Bicol language are suitable mediums of instruction in science education for Bicol-speaking students.

Finally, this study opens possible areas of concern in relation to the development of medium of instruction that facilitates science learning and teaching.

### **Recommendations for future Studies**

Based on the results of this study, the following is recommended:

1. Conduct more in-depth research on the use of the local language as medium of instruction in science education especially in other regions of the country.
2. Develop instructional modules using the language students are familiar with.
3. Encourage the use of students' mother language in both formal and non-formal education especially to far-flung communities.

Abstracts

This paper uses the reduct and core in the rough set as a screening tool in the important property or factor of the system. The paper adopts the rough set which does not need to provide a subjective assessment of knowledge or data. That bases on the students' test data to delete the redundant information. The paper focuses on two classes of junior high school students in the Dual Linear Equations unit. The use of the clustering results of the students' tests compares the roughness of the knowledge of each group. We can define the importance of learning Misconception point, decide the structure of the Misconception order and then provide the reference of the remedial teaching.

## **1. Introduction**

Misconception is also known as “Alternative Conception.” Many scholars pointed out that before the students acquire knowledge, they have already had the system structure of explaining the phenomenon of knowledge. The knowledge structures of these courses are basically different. The difference leads to students’ learning obstacles (Brown & Burton, 1978). Hewson and Hewson (1983) pointed out that if we want to change students’ misconceptions, we must first identify misconceptions which students have. In recent years, the diagnostic teaching has generally been accepted in science education. In both foreign and domestic policies, there are a great number of teaching experiments which are performed in accordance with the concept of diagnostic teaching (Bell, 1993; Kerslake, 1987).

Item response theory is frequently used by people. However, the basic assumptions of item response theory are limited in the harsh, which needs a lot of samples. It is very difficult to operate this way in the teaching site because teachers can not timely receive the feedback after having the students measured. In order to overcome the reasons above, this paper is quite different from the previous psychometric research methods in the analysis. We use rough set theory to analyze the reactions of the student's answers. Rough set theory is a very practical discipline, proposed by Pawlak in 1982. It is a mathematical tool which mainly deals with the problem of Vagueness and Uncertainty. It is able to identify some of its related and has the advantages which other theories do not have. Under not losing any information, rough set theory can gain the same knowledge with the original decision-making system. But at this time the state is for the minimum condition attribute, which maintains the simplest form of the sub-types of the ability with the original decision-making system.

In this paper, rough set combined with the Interpretive Structural Modeling to analyze students’ misconceptions. The experimental objects focus on a class of junior high school students in a central country. The experimental subject is mathematics unit of simple equation with two variables. By using rough set theory to analyze the different misconceptions, and combining ISM chart to set the appropriate remedial teaching. We expect to be able to provide teachers an objective diagnosis and effective tool.

## **2. Theoretical Framework**

### **2.1. Interpretive Structural Model (ISM)**

J.N. Warfield in 1976 proposed Interpretive Structural Model. This mathematical analysis changes the relationship between the different types of elements into the associated constructor class diagram in a complex system. Among analyses, he used “Graphic Theory” in order to clarify the structure of the complex events (Warfield, 1982).

In education applications, Sheu, Tzeng, Tsai, Chen, & Nagai, (2012c) all begin with the ISM to analyze the structure of the teaching content and is considered as a teaching reference. In this paper, by combining the misconception structure analyzed from GSP and the ISM concept chart each other, we got an innovative approach to the concept of learning path. This method can clearly pointed out the learning sequence and the difficulty of the concept.

## 2.2. Student-Problem Chart.

The so-called SP chart (Student-Problem the Chart) refers to the two letters of Student and Problem in English. SP chart is proposed by the Japanese scholar Takahiro Sato in 1969. SP chart can be used not only to show the diagnostic assessment of learning but also give full play to improve the effectiveness among the formed curricula.

**Definition 1:** Establish student number  $S_i, i = 1, 2, \dots, m$ , Problem number  $P_j, j = 1, 2, \dots, n$ , and item response  $Y = (y_{ij})$ , for  $i = 1, 2, \dots, m, j = 1, 2, \dots, n$ , where  $y_{ij} = \begin{cases} 0, & \text{if ans is wrong.} \\ 1, & \text{if ans is right.} \end{cases}$  (1)

Student Problem	$P_j$ Problem Number $j = 1, 2, \dots, n$	Total Score
$S_i$ Student Number $i = 1, 2, \dots, m$	$Y = (y_{ij})$	▲ High Score ▼ Low Score
Avowal People	More ◀ ▶ Less	

Figure 1. S-P Chart (Sato, T. 1974)

## 2.3. Grey Relational Analysis.

Gray system theory is put forward by Deng Julong in the year 1989. The theory is for the uncertainty or incompleteness of Relational Analysis of the system model. With “Prediction”, “Decision” and other methods, then investigate the overall system. Gray system theory is the study of gray system analysis, modeling, forecasting, decision-making and theory-controlling, which combines with mathematical methods and develops a set to solve information which is not complete.

In this paper, reference to the GRA procedures is shown as follows:

**Definition 2:** Establish the reference vector  $y_{0k}$  and comparative vector of the raw data  $y_{ik}$ ,  $i = 1, 2, \dots, m, j = 1, 2, \dots, n$ , listed as follows: (Yamaguchi, Li, & Nagai, 2005, 2007)

$$\begin{aligned}
 y_{0k} &= (y_{01}, y_{02}, \dots, y_{0j}, \dots, y_{0n}) \\
 y_{1k} &= (y_{11}, y_{12}, \dots, y_{1j}, \dots, y_{1n}) \\
 y_{2k} &= (y_{21}, y_{22}, \dots, y_{2j}, \dots, y_{2n}) \\
 &\vdots \\
 y_{ik} &= (y_{i1}, y_{i2}, \dots, y_{ij}, \dots, y_{in}) \\
 &\vdots \\
 y_{mk} &= (y_{m1}, y_{m2}, \dots, y_{mj}, \dots, y_{mn})
 \end{aligned} \tag{2}$$

Generations of Grey Relation: To normalize the data of reference vector. The comparativeness of establishing series has to meet three conditions: non-dimension, scaling, polarization. To begin generation and data standardization uses the way of larger-the-better.

**Definition 3:** Larger-the-Better: The expected goal is bigger, the better.

$$y_{ik}^{\max} = \frac{y_{ik} - \min_{\forall i} y_{ik}}{\max_{\forall i} y_{ik} - \min_{\forall i} y_{ik}} \tag{3}$$

$\max_{\forall i} y_{ik}$  is the maximum data of the  $j$ ;  $\min_{\forall i} y_{ik}$  is the minimum of the  $j$ . This paper use rule of the Larger-the-Better, because the grade of standard is the higher the better.

$$y_{0k} = \max \{y_{ik} \mid k = 1, 2, \dots, m\} \tag{4}$$

The calculation of GRA: This paper uses Nagai's GRA to calculate the grey relation in which the reference vector is  $y_{0k}$  and the comparative vector is  $y_{ik}$ . When  $\Gamma_{0i}$  is close to 1, it means that  $y_{0k}$  and  $y_{ik}$  are highly related to each other. On the other hand, if  $\Gamma_{0i}$  is close to 0, the relationship between  $y_{0k}$  and  $y_{ik}$  is lower (Yamaguchi, Li and Nagai, 2007).

**Definition 4:** Localized GRA

$$\Gamma_{0i} = \Gamma(y_{0k}, y_{ik}) = \frac{\bar{\Delta}_{\max} - \bar{\Delta}_{0i}}{\bar{\Delta}_{\max} - \bar{\Delta}_{\min}} \quad (5)$$

$\bar{\Delta}_{0i}$  is the absolute difference of the two comparative series.

$$\bar{\Delta}_{0i} = \|y_{0k} - y_{ik}\|_p = \left( \sum_{k=1}^m [\Delta_{0i}(k)]^p \right)^{\frac{1}{p}} \quad (6)$$

Grey Relational Ordinal: The whole decision-making is made by the comparison of the grey relation  $\Gamma_{0i}$ . Through the ordinal, different causes can be identified, and the most important influent cause can be found, becoming the relational standard in the system.

**2.4. Rasch Model GSP Chart.**

Rasch Model GSP chart is a theory which is created in the year 2010 by Nagai. The grey relational theory the S-P chart shows the GSP chart, which can make the analysis of the problems more specific. Rasch Model GSP can identify students' discrimination toward test  $\alpha$ , the average of the item difficulty  $\beta$ , and the lowest rate of answering correctly  $\gamma$  according to the condition when students are answering the test items (Tzeng, Sheu, Liang, Wang and Nagai, 2012a).

**Definition 5:** Grey Student-Problem Chart

Student Problem			$P_j$ Problem Number $j = 1, 2, \dots, n$	Total Score	LGRA-S
$S_i$ Student $i = 1, 2, \dots, m$	Number		$Y = (y_{ij})$	▲ High Score $SS_i$ ▼ Low Score	$GS_i$ $i = 1, 2, \dots, m$

LGRA-P			$GP_j \quad j = 1, 2, \dots, n$		

Figure 2. The Matrix of Rasch Model GSP Chart

$$GS_i = \Gamma_{0i} = \Gamma(y_{0k}, y_{ik}) = \frac{\bar{\Delta}_{\max} - \bar{\Delta}_{0i}}{\bar{\Delta}_{\max} - \bar{\Delta}_{\min}}, \text{ where } i = 1, 2, \dots, m \quad (7)$$

$$GP_j = \Gamma_{j0} = \Gamma(y_{k0}, y_{kj}) = \frac{\bar{\Delta}_{\max} - \bar{\Delta}_{j0}}{\bar{\Delta}_{\max} - \bar{\Delta}_{\min}}, \text{ where } j = 1, 2, \dots, n \quad (8)$$

**2.5. Misconception Oeder Analysis Method**

**2.5.1. Misconception-Student Chart (M-S chart).**

**Definition 6:** Misconception- Student Chart

LGRA-S \ Student	Misconception-Student Number $\hat{S}_i \quad i = 1, 2, \dots, \hat{m}$
$\gamma$	$X_\gamma = (x_i)$

Figure 3. Misconception- Student Chart

The so-called M-S chart is abbreviated from two words: Misconception and Student. Let  $x_\gamma = (x_\gamma(1), x_\gamma(2), \dots, x_\gamma(\omega), \dots, x_\gamma(\hat{m}))$ , where  $x_\gamma(\omega) \in \{0, 1\}$ , if  $x_\gamma(\omega) = 1$ , it displays that  $\omega$  person by measuring the LGRA-S =  $\gamma$  for GSP chart choosing misconception student; otherwise, if  $x_\gamma(\omega) = 0$ , it don't show the  $\omega$  person by measuring the LGRA-S =  $\gamma$  for GSP chart choosing misconception student. The data matrix of misconception- student chart measuring the LGRA-S =  $\gamma$  of person,  $x_\gamma(i) = x_i, i = 1, 2, \dots, \hat{m}, 2 \leq \hat{m} \leq m, \hat{m} \in N$ , is shown in Fig. 3.

### 2.5.2. Misconception-Problem Chart (M-P chart).

This paper selected the students whose Gamma value near  $\gamma$ , then selected those students' at the same time answer with the wrong and correct answers, that show the students' misconception problems, defined as misconception problems  $\hat{P}_j$ .

**Definition 7:** Misconception Student-Problem Chart

Student Problem	$\hat{P}_j$ Problem Number $j = 1, 2, \dots, n$	Total Score	LGRA-S
$\hat{S}_i$ Student Number $i = 1, 2, \dots, m$	$\hat{Y} = (\hat{y}_{ij})$	▲ High Score $SS_i$ ▼ Low Score	$GS_i$ $i = 1, 2, \dots, m$
Avowal People	More $PP_j$ ◀ ▶ Less		
LGRA-P	$GP_j \quad j = 1, 2, \dots, n$		

Figure 4. The Matrix of Misconception Student-Problem Chart

$$\hat{P}_j = \begin{cases} \bigvee_{i=1}^m \hat{y}_{ij} = 0, & \text{for } i = 1, 2, \dots, \hat{m} \\ \bigvee_{i=1}^m \hat{y}_{ij} = 1, & \text{for } i = 1, 2, \dots, \hat{m} \end{cases} \quad \text{where} \quad \bigvee_{i=1}^m \hat{y}_{ij} = \hat{y}_{1j} \vee \hat{y}_{2j} \vee \dots \vee \hat{y}_{ij} \vee \dots \vee \hat{y}_{mj}, \quad \text{for } i = 1, 2, \dots, \hat{m} \quad (9)$$

### 2.5.3. Problem-Concept Chart (P-C chart).

The so-called P-C chart is abbreviated from two words: Problem and Concept, the ordinate axis of P-C chart is series of questions, and horizontal axis is the concept of the test.

Let  $z_j = (z_j(1), z_j(2), \dots, z_j(v), \dots, z_j(\xi))$ , where  $z_j(v) \in \{0, 1\}$ , and  $z_j$  show the  $j$  question test the concept. If  $z_j(v) = 1$ , that shows the  $j$  question test the concept of  $v$ ; otherwise, if  $z_j(v) = 0$ , that shows the  $j$  question don't testing the concept of  $v$ , shown in Fig. 5.

**Definition 8:** Problem-Concept Chart

Problem	Concept	$C_k$ Concept Number $k = 1, 2, \dots, \xi$
---------	---------	---

$P_j$ Problem Number $j = 1, 2, \dots, n$	$Z = (z_{jk})$
---	----------------

$\gamma$		$U = (u_k)$

Figure 6. Misconception - Concept Chart

Let  $u_\gamma = (u_\gamma(1), u_\gamma(2), \dots, u_\gamma(v), \dots, u_\gamma(\xi))$ , where  $u_\gamma(v) \in N \cup \{0\}$ ,  $\mu$  display the numbers of misconception testers whose LGRA-S value near  $\gamma$ . Now  $\rho = \hat{m}$ ,  $u_\gamma(k) = u_k$ ,  $k = 1, 2, \dots, \xi$ , display the matrix of misconception-concept chart, shown in Fig. 6.

#### 2.5.5. Misconception Rate.

**Definition 10:** Misconception Rate

$$M = (\mu_\gamma(v)) \quad (11)$$

M shows the matrix of misconception rate,  $\mu_\gamma(v) = \frac{u_\gamma(v)}{\lambda}$ , shows the misconception rate of the concept  $v$ , where  $\lambda = \max\{u_\gamma(1), u_\gamma(2), \dots, u_\gamma(v), \dots, u_\gamma(\xi)\}$ ,  $\mu_\gamma = (\mu_\gamma(1), \mu_\gamma(2), \dots, \mu_\gamma(v), \dots, \mu_\gamma(\xi))$ , where  $0 \leq \mu_\gamma(v) \leq 1$ .

#### 2.5.6. Misconception Order.

The misconception order compares with the misconception rate in accordance with  $\mu_\gamma(v)$  value. Through the sorting, we can discern the degree of the misconception.

**Definition 11:** Misconception Order

$$\hat{\mu}_\gamma = (\hat{\mu}_\gamma(1), \hat{\mu}_\gamma(2), \dots, \hat{\mu}_\gamma(i), \hat{\mu}_\gamma(j), \dots, \hat{\mu}_\gamma(\xi)), \text{ for } 0 \leq \hat{\mu}_\gamma(j) \leq \hat{\mu}_\gamma(i) \leq 1, \forall i < j \quad (12)$$

### 2.6. Rough Set Theory

Rough Set Theory is put forward by Pawlak in the year 1982.

#### 2.6.1. Students' answers reaction Chart

**Definition 12:** Students' answers reaction Chart (SR)

Student Problem	$P_j$ Problem Number $j = 1, 2, \dots, n$
$S_i$ Student Number $i = 1, 2, \dots, m$	$\tilde{Y} = (\tilde{y}_{ij})$

Figure 7. The Matrix of Students' answers reaction Chart (SR)  
(The present study derived.)

$$\tilde{Y}_j = \begin{cases} \tilde{y}_{ij} = 0 & , \text{ for } y_{ij} = 1; i = 1, 2, \dots, m; j = 1, 2, \dots, n \\ \tilde{y}_{ij} = 1 & , \text{ for } y_{ij} = 0; i = 1, 2, \dots, m; j = 1, 2, \dots, n \end{cases} \quad (13)$$

### 2.6.2. The Matrix of Students with Condition Attributes

$$\hat{U} = \tilde{Y} \times Z \quad (14)$$

$$\hat{u}_{ik} = \sum_{j=1}^n \tilde{y}_{ij} z_{jk} \quad , \text{ for } y_{ij} = 1; i = 1, 2, \dots, m; k = 1, 2, \dots, \xi \quad (15)$$

**Definition 13:** Students with Condition Attributes Chart (SC)

Student Record	$C_k$ Condition Attributes Number $k = 1, 2, \dots, \xi$
$S_i$ Student Number $i = 1, 2, \dots, m$	$\hat{U} = (\hat{u}_{ik})$

Figure 8. The Matrix of Students with Condition Attributes Chart (SCD) (The present study derived.)

### 2.6.3. The Matrix of Students with Condition and Decision Attributes

$$D = X_{\gamma_{cs}} = (x_i) \quad , \quad \text{where} \quad i = 1, 2, \dots, m \quad (13)$$

$$\tilde{U} = \begin{cases} \tilde{u}_{ik} = 0 & , \text{ for } 0 \leq \hat{u}_{ik} \leq \rho \times \sum_{j=1}^n z_{jk}; i = 1, 2, \dots, m; k = 1, 2, \dots, \xi \\ \tilde{u}_{ik} = 1 & , \text{ for } \rho \times \sum_{j=1}^n z_{jk} \leq \hat{u}_{ik}; i = 1, 2, \dots, m; k = 1, 2, \dots, \xi \end{cases} \quad (14)$$

In this paper  $\rho = 1/3$

**Definition 14:** Students with Condition and Decision Attributes Chart (SCD)

Student Record	$C_k$ Condition Attributes Number $k = 1, 2, \dots, \xi$	$D$ Decision Attributes
$S_i$ Student Number $i = 1, 2, \dots, m$	$\tilde{U} = (\tilde{u}_{ik})$	$x_i \quad i = 1, 2, \dots, m$

Figure 9. The Matrix of Students with Condition and Decision Attributes Chart (SCD) (The present study derived.)

### 2.6.4. The Matrix of Students with Condition and Decision Reduct Attributes

$$C_k \times D = \{(\hat{u}_{i1}, \dots, \hat{u}_{i\xi}, x_i) \mid \text{for } (\hat{u}_{i1}, \dots, \hat{u}_{i\xi}, x_i) \neq (\hat{u}_{i+11}, \dots, \hat{u}_{i+1\xi}, x_{i+1}), 0 \leq i \leq \hat{m} \leq m\}$$

**Definition 15:** Students with Condition and Decision Attributes Reduct Chart (SCDR)

Student Record	$C_k$ Condition Attributes Number $k = 1, 2, \dots, \xi$	$D$ Decision Attributes
$S_i$ Student Number $i = 1, 2, \dots, m$	$\hat{U} = (\hat{u}_{ik})$	$\hat{x}_i \quad i = 1, 2, \dots, m$

Figure 7. The Matrix of Students with Condition and Decision  
Attributes Reduct Chart (SCDR) (The present study derived.)

**Definition 16** : Information System (IS) :

$W = IS(S, R, T, f)$  is a knowledge system (information system). In which,  $S$  is finite set.  $R$  is a rough set,  $R = C \cup D$ ,  $C$  is condition attribute set,  $D$  is decision attribute set,  $C \cap D = \emptyset$ ,  $D \neq \emptyset$ .  $T$  is the attribute's values set,  $T = \bigcup_{r \in R} T_r$ .  $f$  is the mapping (information function)  $f: S \times R \rightarrow T$ ,  $\forall x \in S, r \in R, f(x, r) \in T_r$ .

**Definition 17** : Equivalence relation  $ind(C)$  :

For every attribute subset  $C \subseteq R$ , the equivalence relation  $ind(C)$  is defined as :

$$ind(C) = \{(\bar{u}_i, \bar{u}_j) \in S \times S, \forall c \in C, c(\bar{u}_i) = c(\bar{u}_j)\}$$

$ind(C)$  can be abbreviated as  $C$ .

For every subset  $X \subseteq S$  and an equivalence relation  $C \in ind(S)$ , the lower approximation of  $X$  can be definite as  $\underline{R}X = \bigcup \{\tilde{X} \in S/R \mid \tilde{X} \subset X\}$ , and the upper approximation of  $X$  can be definite as  $\bar{R}X = \bigcup \{\tilde{X} \in S/R \mid \tilde{X} \cap X \neq \emptyset\}$ .

Then, the positive region and the negative region of  $X$  can be denoted as  $pos_R(X) = \underline{R}X$  and  $bn_R(X) = S - \bar{R}X$ .

Reduct and independent :

$R$  is a set in equivalence relation. If  $ind(C) = ind(C - \{c\})$ , when  $c \in C$ ; then we say  $c$  is reduct in  $C$ . On the contrary, If  $ind(C) \neq ind(C - \{c\})$ , when  $c \in C$ ; then we say  $c$  is indenpent in  $C$ .

**Definition 18** : dependents :

Let  $C, D$  are two equivalence relation in the set  $S$ , then  $C$  is depended by  $D$  with the dependency degree of  $\gamma_c(D)$ . Define dependents :

$$\gamma_c(D) = \frac{|pos_c(D)|}{|W|}, \text{ where } pos_c(D) = \bigcup_{X \in S/D} C(X) \quad (15)$$

$D$  can be derived completely by  $C$ , when  $\gamma_c(D) = 1$ .

$D$  can be derived partially by  $C$ , when  $0 < \gamma_c(D) < 1$ .

$D$  can't be derived completely by  $C$ , when  $\gamma_c(D) = 0$ .

**Definition 19** : Significant

$$\sigma_{(C,D)}(C_i) = \frac{\gamma_C(D) - \gamma_{C-\{C_i\}}(D)}{\gamma_C(D)} = 1 - \frac{\gamma_{C-\{C_i\}}(D)}{\gamma_C(D)}. \quad (16)$$

**Definition 20** : Reduct

Let  $C \subseteq C$ , if  $ind(C) = ind(C)$ ,  $C$  can be called  $a$ -reduct relative to  $C$ , denoted as  $red(C)$ .

**Definition 21** : Core

The intersection of all  $red(C)$  is called  $a$ -core.  $core(C) = \bigcap red(C)$

### 3. Research methods

#### 3.1. The data reliability test

In this paper, take the seventh grade of the same school on a math paper test data for example. The numbers of the students in 104 classes are twenty-nine, the numbers of the questions are fifteen, and the numbers of the concept are ten. Before the analysis, the researchers firstly carried out a reliability test for the answers of this class. The result showed that the Cronbach's  $\alpha$  value of the class 104 is about 0.823, which means the credibility of the information is quite high.

#### 3.2. Implementation steps

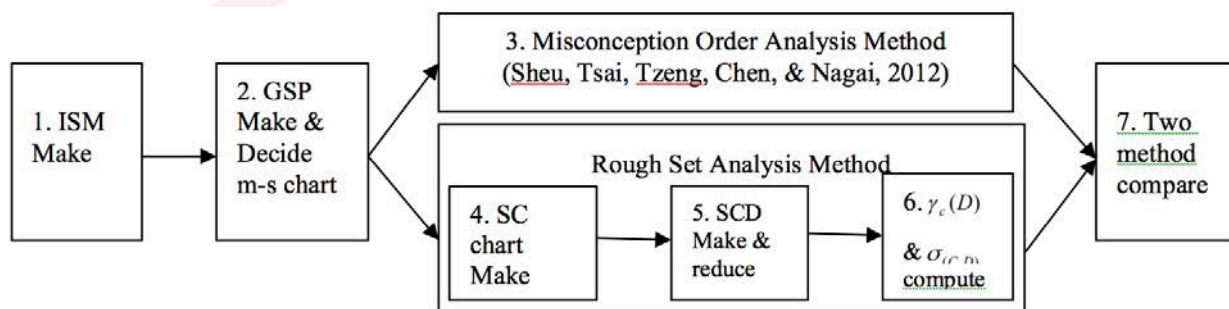

Figure 8. Implementation steps

### 4. Results and Discussion

#### 4.1. The production and analysis of the ISM conceptual structure diagram

In this paper, we use of mathematics first equation unit, “solving a Dual Linear Equations” for example, is divided into three units, ten kinds of concepts, such as shown in Table 1.

In table 2 “Concept - Concept Chart”, teachers’ evaluation is a direct way of the pairwise comparison to judge if it is associated among the concepts, and then fill “1” in the corresponding field. If it is not associated with each other, and then fill in “0” in the corresponding field.

Teachers developed Concept - Concept Chart (Table 3) through the ISM software for matrix computation to obtain the structure of ISM. (Figure 9.)

It can be find from Figure 2, it has three layers conception structure, the lowest level is the basic conception of this unit, the top is the most difficult conception. Teachers teach this unit, there are four teaching path, respectively

$C1 \rightarrow C2 \rightarrow C3 \rightarrow C4 \rightarrow C5 \rightarrow C7 \rightarrow C8$ ,  
 $C1 \rightarrow C2 \rightarrow C3 \rightarrow C4 \rightarrow C5 \rightarrow C7 \rightarrow C9 \rightarrow C10$ ,  
 $C1 \rightarrow C2 \rightarrow C3 \rightarrow C4 \rightarrow C6 \rightarrow C7 \rightarrow C8$ ,  
 $C1 \rightarrow C2 \rightarrow C3 \rightarrow C4 \rightarrow C6 \rightarrow C7 \rightarrow C9 \rightarrow C10$ .

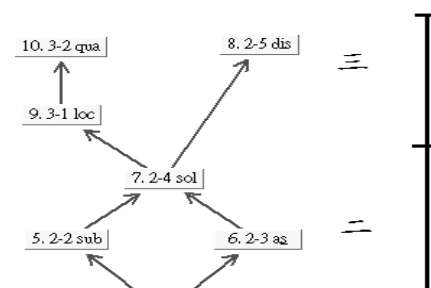

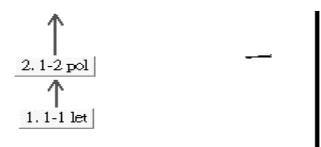

Figure 9. ISM Structure Figure

#### 4.2. Make Problem-Conception Chart

In accordance with the correspondence between the teachers’ evaluation questions and concepts, if the concepts and the questions are associated, and then we enter ‘1’ in the corresponding field. If they are not associated with each other, in the corresponding field, then we enter ‘0’, such as the question-concept chart (P-C chart) in Table 3.

### 4.3. Make SP Chart with LGRA-S and LGRA-P

The sample of this paper focuses on the seventh-grade students. The research analyzes the answering reaction of the students for mathematics first equation unit. The subjects are encoded and then respectively filled in the longitudinal coordinates of the GSP chart. And then will fill the result in the abscissa. When the answer is correct, we should fill in 1. On the contrary, fill in 0. As shown in table 4.

Based on the number of the students' correct answers, from the lower left to the right side, we can draw the same grid number equal to the same correct answer's number, such as the red line of table 5. That shows the S-curve of the students' answering questions. Then review the difficulty of the questions. According to the number of the students whose answers are correct, from the bottom left to top right, we can draw the same grid number equal to the same correct answer's number. As shown in the Blue Line of table 5, which represents the reaction of the problem in P curve.

### 4.4. The formation of Rasch Model GSP chart

Adopting LGRA-S and LGRA-P in Table 4, then sorting by Matlab software calculate to plot the Rasch Model GSP chart in Fig. 10.

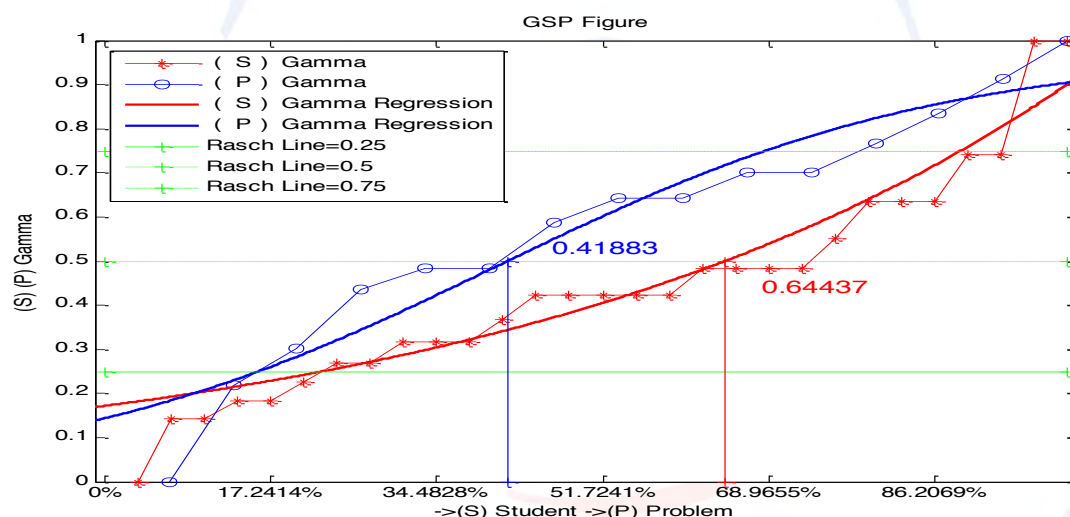

Figure 10. Rasch Model GSP chart

### 4.5. The formation and analysis of Misconception Student-Problem Chart (M-SP chart)

According to the theoretical structure of the S-P chart, the LGRA-S in table 4 can clearly identify the numbers of the students' correct answers in this class, and the situation of each question which were answered correctly. Select the students whose Gamma value is near 0.5, and those are 1, 15, 24 and 25. Then elect the questions which students answer correctly and wrongly respectively. Those are students' confused questions, and those are question 3, 8, 9, 11, 12, 14 and 15. Such as students' easily confused questions and M-SP chart in table 5.

Comparing to the misconception student-problem chart show in Table 5, with the problem-concept chart in Table 3, than shows the misconception-concept chart. To calculate the misconception rate and misconception order, than defined Sum as questions with total of the concept. And misconception order defined as various concepts divided by the maximum of the Sum, final defined misconception order of the sort of misconception rate. So we can see that the concept of

2-2 sub, 2-3 a&s, 2-4 sol, 2-5 dis and 3-1 loc are the most difficult, shown in Table 6.

According to ISM structural chart in Figure 9, analyze the cluster analysis of the concepts (Cluster Analysis). Classify the relevance of this concept into three concept classes. The bottom to top concept hierarchy is the concept class one to three. The concept class is located in the top and it is the most difficult concept papers; the bottom of the hierarchy is the basic concept of this paper. The misconception order in table 6 above presents that *C5*, *C6*, *C7*, *C8*, and *C9* in the concept class two and class three are the most critical positions of the whole problem concepts. That means teachers should strengthen this concept when teaching.

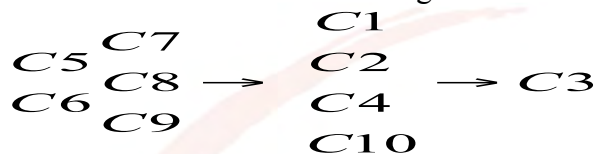

Figure 11. Misconceptions' order chart

## 5. Make 104 class Student-Condition Attribute Chart

In table 4 Student - Problem Chart, if element value is "1", and then fill "0". If element value is "0", and then fill "1", such as shown in Table 7.

### 5.1. Make Students' answers reaction

In this paper, the SCD is produced based on the knowledge system information in rough set theory. SCD chart is the decision chart, where S stands for the students, the condition attributes C means the concept of this unit need to learn, and decision attribute D is the remedial instruction that teachers need. Before making SCD chart, firstly we must have SC chart (as shown in Table 8). SC chart is obtained from the student problem chart and the problem - concept chart by the students in 104, which is on behalf of the times where students respectively got the wrong answers in the concept *C1* to *C10*. For example, from Table 7 we know that the student 10423 got the wrong answer in *P13*. And who wants to answer the problem *P13* needs the concept *C1* and *C2*. Therefore, in the class 104, the student 10423 should fill "1" in the conditions of properties *C1* and *C2*. The matrix in Table 8 and Table 4 formed Table 8 with the matrix operations.

### 5.2. Make Student-Condition Attribute Chart (SC Chart)

In the paper, the researchers define the students near  $\gamma = \text{LGRA-S} = 0.5$  as the misconception students, by according to Table 5. Because it is close to  $\text{LGRA-S} = 0.48$ , finally we judge that the misconception students are 10401, 10415, 10424 and 10425.

In SC chart, the numbers that students got the wrong answers on some of the concepts are greatly different. Through the rough set calculations in accordance with SC chart, the problem - concept chart in Table 3 shows the concept of the questions is very different. Thus we can not effectively identify students' true common misconception. Therefore, in this paper, the researchers assumed that students' wrong answer in a concept is not more than one-third of the concept problems, which can be regarded that the students do not accidentally get wrong. If the wrong answer of the concept is more than one-third of the number of the concept, it means students have the misconception. According to this idea, we can convert SC chart to SCD chart (in Table 9). In SCD chart, the number that the students got it wrong on some concepts is more than one-third of the concept, and then we write "1" and on the contrary insert a "0".

### 5.3. Make Student-Condition & Decision Attribute Chart (SCD Chart)

The attrube of 10421 and 10422 are the same, it reduct to leave 10421; the attribute of 104216 and 10423 are the same, it reduct to leave 1016; the attribute of 10401 and 10415 are the same, itreduct to leave 10401; The attribute of 10408 and 10411 are the same, it reduct to leave 10408; The attribute of 10406 and 10420 are the same, it reduct to leave 10406; and reordering and renumbering code made from Table 10.

### 5.4. Make Remedial Decision

#### 5.4.1. Correlation between the attributes

$$\begin{aligned} S/IND(\{C\}) &= S/IND(\{C1,C2,C3,C4,C5,C6,C7,C8,C9,C10\}) \\ &= \{N1\},\{N2\},\{N3\},\{N4\},\{N5\},\{N6\},\{N7\},\{N8,N9\},\{N10\},\{N11\},\{N12\},\{N13\}, \\ &= \{N14\},\{N15\},\{N16\},\{N17\},\{N18\},\{N19\},\{N20\},\{N21\},\{N22\},\{N23\},\{N24\} \end{aligned}$$

If the decision attribute D is Yes, the equivalence relation calculated in accordance with the conditional probability and regardless discernible relationship, the following results can be obtained.

$$\begin{aligned} X_1 &= \{S|D(S) = Yes\} = \{N6, N8, N11\} \quad \text{Upper approximations} \quad \bar{R}X_1 = \{N6, N8, N9, N11\} \\ \text{Lower approximations} \quad \underline{R}X_1 &= \{N6, N11\} \quad \text{Boundary} \quad bn_R(X_1) = \bar{R}X_1 - \underline{R}X_1 = \{N8, N9\} \\ \text{Complementary set} \quad S - \bar{R}X_1 &= \{N1, N2, N3, N4, N5, N7, N10, N12, N13, N14, N15, \\ &N16, N17, N18, N19, N20, N21, N22, N23, N24\} \end{aligned}$$

Similarly, if the decision attribute D is No, the equivalence relation calculated in accordance with the conditional probability and regardless discernible relationship, the following results can be obtained.

$$\begin{aligned} X_2 &= \{S|D(S) = No\} = \{N1, N2, N3, N4, N5, N7, N9, N10, N12, N13, N14, N15, \\ &N16, N17, N18, N19, N20, N21, N22, N23, N24\} \\ \text{Upper approximations} \quad \bar{R}X_2 &= \{N1, N2, N3, N4, N5, N7, N8, N9, N10, N12, N13, N14, \\ &N15, N16, N17, N18, N19, N20, N21, N22, N23, N24\} \\ \text{Lower approximations} \quad \underline{R}X_2 &= \{N1, N2, N3, N4, N5, N7, N10, N12, N13, N14, N15, \\ &N16, N17, N18, N19, N20, N21, N22, N23, N24\} \\ \text{Boundary} \quad BN_R(X_2) &= \bar{R}X_2 - \underline{R}X_2 = \{N8, N9\} \quad \text{Complementary set} \quad S - \bar{R}X_2 = \{N6, N11\} \end{aligned}$$

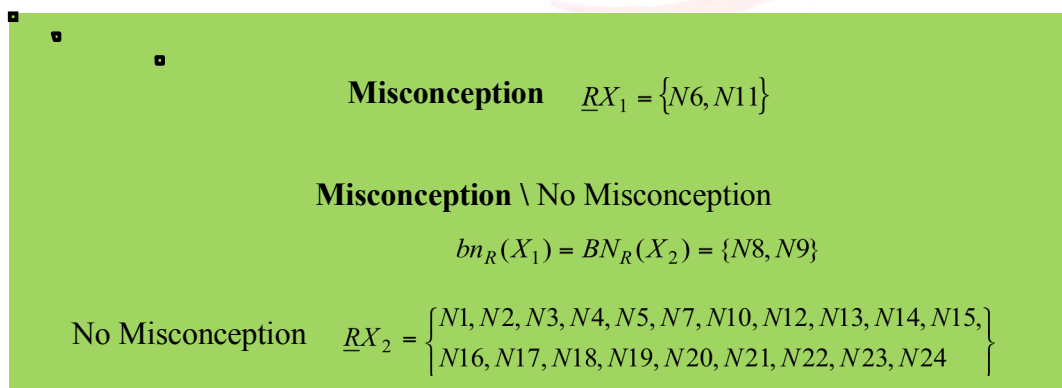

Figure 12. Figure of the misconcept students

#### 5.4.2. Calculate dependence degree

In this section, based on rough set theory, the researchers will do the reduction on SCD chart in the class 104 in order to identify the core of 104. That is a common misconception. The

researchers provide the important methods to identify the misconceptions of the core.

The dependence of the properties can determine the degree of the importance of the property. The method of the calculation of the importance is to remove the usual practice from a property and take a look at the extent of its positive domain. Thus, before calculating the importance, we must first calculate the degree of dependence.

To calculate  $\gamma_c(D)$ , the calculation process is as follows to obtain the  $\gamma_c(D) = \frac{11}{12}$

$$S/IND(\{C\}) = \{\{N1\}, \{N2\}, \{N3\}, \{N4\}, \{N5\}, \{N6\}, \{N7\}, \{N8, N9\}, \{N10\}, \{N11\}, \{N12\}, \{N13\}, \\ \{N14\}, \{N15\}, \{N16\}, \{N17\}, \{N18\}, \{N19\}, \{N20\}, \{N21\}, \{N22\}, \{N23\}, \{N24\}\}$$

$$S/IND(D) = \{\{N6, N8, N11\}, \{N1, N2, N3, N4, N5, N7, N9, N10, N12, N13\}, \\ N14, N15, N16, N17, N18, N19, N20, N21, N22, N23, N24\}$$

$$pos_c(D) = N1, N2, N3, N4, N5, N6, N7, N10, N11, N12, N13, N14, \\ N15, N16, N17, N18, N19, N20, N21, N22, N23, N24$$

$$\text{Substituting dependence formula } \gamma_c(D) = \frac{|pos_c(D)|}{|S|} = \frac{22}{24} = \frac{11}{12} \approx 0.92$$

Then calculate the individual from  $S/IND(C - C_1)$  to  $S/IND(C - C_{10})$ . The calculation results are as follows:

$$\begin{aligned} S/IND(C - C_1) &= S/IND(C - C_2) \\ &= \{\{N1\}, \{N2\}, \{N3\}, \{N4\}, \{N5\}, \{N6\}, \{N7\}, \{N8, N9\}, \{N10\}, \{N11\}, \{N12\}, \{N13\}, \\ &\quad \{N14\}, \{N15\}, \{N16\}, \{N17\}, \{N18\}, \{N19\}, \{N20\}, \{N21\}, \{N22\}, \{N23\}, \{N24\}\} \\ S/IND(C - C_3) &= \{\{N1, N2\}, \{N3\}, \{N4, N7\}, \{N5, 10\}, \{N6\}, \{N8, N9\}, \{N11\}, \{N12\}, \{N13\}, \\ &\quad \{N14\}, \{N15, N20\}, \{N16\}, \{N17\}, \{N18\}, \{N19\}, \{N21, N24\}, \{N22\}, \{N23\}\} \\ S/IND(C - C_4) &= \{\{N1\}, \{N2\}, \{N3\}, \{N4\}, \{N5\}, \{N6\}, \{N7, N12\}, \{N8, N9\}, \{N10\}, \{N11\}, \{N13\}, \\ &\quad \{N14, N15\}, \{N16\}, \{N17\}, \{N18\}, \{N19, N23\}, \{N20\}, \{N21\}, \{N22\}, \{N24\}\} \\ S/IND(C - C_5) &= \{\{N1\}, \{N2\}, \{N3\}, \{N4\}, \{N5\}, \{N6\}, \{N7\}, \{N8, N9\}, \{N10\}, \{N11\}, \{N12\}, \\ &\quad \{N13\}, \{N14\}, \{N15\}, \{N16\}, \{N17\}, \{N18\}, \{N19\}, \{N20\}, \{N21\}, \{N22\}, \{N23\}, \{N24\}\} \\ S/IND(C - C_6) &= \{\{N1\}, \{N2\}, \{N3\}, \{N4\}, \{N5\}, \{N6\}, \{N7\}, \{N8, N9\}, \{N10\}, \{N11\}, \{N12\}, \\ &\quad \{N13\}, \{N14\}, \{N15\}, \{N16\}, \{N17\}, \{N18\}, \{N19\}, \{N20\}, \{N21\}, \{N22\}, \{N23\}, \{N24\}\} \\ S/IND(C - C_7) &= \{\{N1\}, \{N2\}, \{N3\}, \{N4\}, \{N5, N11\}, \{N6\}, \{N7\}, \{N8, N9\}, \{N10\}, \{N12\}, \{N13\}, \\ &\quad \{N14\}, \{N15\}, \{N16\}, \{N17\}, \{N18, N21\}, \{N19\}, \{N20, N22\}, \{N23\}, \{N24\}\} \\ S/IND(C - C_8) &= \{\{N1\}, \{N2\}, \{N3\}, \{N4, N6\}, \{N5, N8, N9\}, \{N7\}, \{N10\}, \{N11\}, \{N12\}, \{N13\}, \\ &\quad \{N14\}, \{N15\}, \{N16\}, \{N17\}, \{N18\}, \{N19\}, \{N20\}, \{N21\}, \{N22\}, \{N23\}, \{N24\}\} \\ S/IND(C - C_9) &= \{\{N1\}, \{N2\}, \{N3\}, \{N4\}, \{N5\}, \{N6\}, \{N7\}, \{N8, N9\}, \{N10\}, \{N11\}, \{N12\}, \\ &\quad \{N13\}, \{N14\}, \{N15, N18\}, \{N16\}, \{N17, N19\}, \{N20\}, \{N21\}, \{N22, N24\}, \{N23\}\} \\ S/IND(C - C_{10}) &= \{\{N1\}, \{N2\}, \{N3\}, \{N4, N5\}, \{N6, N8, N9\}, \{N7, N10\}, \{N11\}, \{N12\}, \{N13\}, \\ &\quad \{N14\}, \{N15\}, \{N16\}, \{N17\}, \{N18\}, \{N19\}, \{N20\}, \{N21\}, \{N22\}, \{N23, N24\}\} \end{aligned}$$

Using (15) to calculate dependence of condition attributes, such as show in Table 11.

Table 11. Dependence of Condition Attributes

Condition Attributes	C1	C2	C3	C4	C5	C6	C7	C8	C9	C10
$\gamma_c(D)$	$\frac{11}{12}$	$\frac{11}{12}$	$\frac{11}{12}$	$\frac{11}{12}$	$\frac{11}{12}$	$\frac{11}{12}$	$\frac{5}{6}$	$\frac{19}{24}$	$\frac{11}{12}$	$\frac{7}{8}$

### 5.4.3. Calculate Significant degree

Finally, to calculate significant of condition attributes by using formula (16)  
 $\sigma_{(C,D)}(C_i) = 1 - \frac{\gamma_{C-\{C_i\}}(D)}{\gamma_C(D)}$ . The order of Significant of each attribute as  
 $C1 = C2 = C3 = C4 = C5 = C6 = C9 < C10 < C7 < C8$ , such as show in Table 12.

Table 12. Significant of Condition Attributes

Condition Attributes	C1	C2	C3	C4	C5	C6	C7	C8	C9	C10
$\sigma_{(C,D)}(C_i)$	0	0	0	0	0	0	$\frac{1}{11}$	$\frac{3}{22}$	0	$\frac{1}{22}$

According to the results in Table 12, attribute C1, C2, C3, C4, C5, C6 and C9 are redundant can be removed to obtain a reduct  $red(C) = \{C7, C8, C10\}$ . So  $core(C) = \{C7, C8, C10\}$ .

#### 5.4.4. Common misconceptions in the class 104

By using the importance of rough set theory and misconception order method, the result showed that the students of 104 in the C7, C8 and C10 have the same misconception, which was displayed in the Dual Linear Equations unit. However, Rough set can simplify the redundant data and reduce the unnecessary factors. That means that the class 104 directly does the remedial instruction for these three part "Equation solution of checking", "solution class" and "Quadrant coordinate"

The use of Rough set method has the same conclusion with the misconception order of Rasch Model GSP, and it can effectively filter out the misconception of the core.

## 6. Conclusion

This paper is based on rough set theory and combines with ISM (Interpretive Structural Modeling) to analyze students' misconceptions. The object of the paper aims at the junior high school students of the central country in the Dual Linear Equations unit. "Misconception analysis and Rough set analysis are used in this paper to calculate the separate misconception order of the two classes. And then set the appropriate remedial teaching decision in accordance with the

different degree of each class. Finally, by combining with ISM chart, we can compare the high and low degree of the classes, hoping to provide teachers an easy and effective tool when doing the diagnosis. The results are listed as follows:

From the structure of ISM concept, we can clearly see that the conceptual block diagrams have three layers in Dual Linear Equations unit cell. The lowest level is the basic concept of this unit, and the top level is the most difficult concept. When teachers teach this unit, there are four teaching path, that is

$C1 \rightarrow C2 \rightarrow C3 \rightarrow C4 \rightarrow C5 \rightarrow C7 \rightarrow C8$ ,  $C1 \rightarrow C2 \rightarrow C3 \rightarrow C4 \rightarrow C5 \rightarrow C7 \rightarrow C9 \rightarrow C10$ ,  
 $C1 \rightarrow C2 \rightarrow C3 \rightarrow C4 \rightarrow C6 \rightarrow C7 \rightarrow C8$ , and  $C1 \rightarrow C2 \rightarrow C3 \rightarrow C4 \rightarrow C6 \rightarrow C7 \rightarrow C9 \rightarrow C10$ .

From the use of misconception order analysis method, the class 104 gets the most misconceptions order, and that are  $C5$ ,  $C6$ ,  $C7$ ,  $C8$  and  $C9$ . From the rough set analysis method of Rough set method, the class 104 gets the most misconceptions, and that are  $C8$ ,  $C7$ , and  $C10$ . The result showed that the importance method of rough set method and misconception order got the same results. Dual Linear Equations in this unit, the students of 104 have the common misconception in the  $C7$  and  $C8$ . And Rough set can simplify the redundant data and reduce out unwanted factors. As a result the class can directly do the remedial teaching for these three part "Equation solution of checking", "solution class" and "Quadrant coordinate".

The use of rough sets does not need to provide a subjective assessment of knowledge or data. And we can achieve to remove redundant information based on student test data. By using the clustering results of students' tests, we can compare learn the roughness of each group who has the original knowledge. Then we can define the importance where the leaning misconception is and thus determine the structure of the misconception order to provide the remedial instruction as the reference.

*Considerations and Suggestions on University Development Strategic Cluster  
Towards Sustainability*

Nimit Mengveha, Apinya Limpai boon

0373

King Mongkut's University of Technology Thonburi, Thailand

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

This paper focuses on the higher education's policy and strategic management towards sustainable development in case of King Mongkut's University of Technology Thonburi. The strategic cluster is suggested to gear up the relevant management and policy units with the existing university-development research centers for the accomplishment of their institute's vision and flagships. On the basis of investigation, the core management and policy units in KMUTT consist of The Planning Division, The Policy Innovation Center, and The Systems Innovations Center. According to the KMUTT's vision, The Policy Innovation Center has researched and initiated the KMUTT's strategic goals. The Planning Division conducts the strategic and development plans in which The Systems Innovations Center continues managing to be the action plans. Meanwhile, several university-development research centers have been gradually established in different function and expertise: teaching and learning development, sustainability development, technological facility development, and physical facility development. The appropriate mechanisms to manage all units together will be the key success for the university's continuous improvement.

## **Introduction: KMUTT's History in brief**

KMUTT's history has been evolved from its origin as the Thonburi Technology Institute (TTI) in 1960. In national problem-solving scenario, the lack of technicians and technologists, TTI's establishment was the first technical institute recruiting students after their completions in secondary education. Later, the institute has been developed as shown in quotation.

- By the virtue of the Technology Act, enacted on April 24, 1971, three technical institutes under the Department of Vocational Education, namely Thonburi Technical Institute (TTI), North Bangkok Technical Institute, and Nonthaburi Telecommunication Institute, were combined to form one degree-granting institution under the name of King Mongkut's Institute of Technology (KMIT) constituting three campuses. TTI thus became KMIT Thonburi Campus. In 1974, KMIT was transferred from the Ministry of Education to the Ministry of University Affairs. A new Act was enacted on February 19, 1986; the three campuses of KMIT became three autonomous institutions, each having the status of a university. KMIT Thonburi Campus henceforth became King Mongkut's Institute of Technology Thonburi (KMUTT). On March 7, 1998 as announced in the Royal Gazette, KMUTT became King Mongkut's University of Technology Thonburi (KMUTT). KMUTT is the first among public universities in Thailand to receive full autonomy. Its administrative system is now patterned after international government owned universities. The new act gives KMUTT total control over its budget, allows it to own and manage property, and grants authority to set up new faculties and departments, as well as introduce new academic programs. (<http://global.kmutt.ac.th/about/history>)

After becoming KMUTT in 1998 as an autonomous university with nation's trend in less public funding for higher education, this academic institute unavoidably committed with issues that have been debated and resolved in principle; Funding support from the government, Performance evaluation and personnel management, Autonomous university governance, and Privileges for autonomous public universities and their personnel (Kirtikara 2002).

## **KMUTT's Evolution on Strategic Development Units**

Consequently, to maintain its competitiveness and sustainability in higher education arena, several units have been gradually established relating to various aspects of university development starting with The Policy Innovation Center (PI) and Systems Innovations Center (SI) in 2000. Both centers were founded in order to collaborate with The Planning Division as in the strategic cluster. PI initiative's concept is to monitor the rapid advance in science and technology trends and issues in economic and social developments. The derived trends or impacts hence are synthesized to be the knowledge base for the university's policy and strategic managements (Policy Innovation Center 2003). Meanwhile, to connect the policies and strategies with the operational levels, SI is accountable for facilitating forums and information to cascade both top-down policies and strategies and bottom-up valuable initiatives among management, staffs and all stakeholders. This is not only to leverage the efficiency of workplace's

communication, but also the expectation to improve or create the organization's performance-based systems continuously (Systems Innovations Center 2011).

The Sustainability Management Center, named "Energy Environment Safety and Health office", was then set up to ensure the vision to be Green University (KMUTT Sustainable University 2012). This office functions in regulating code of conducts, standards, or systems and being the role model on energy, environment, safety, and health management. Becoming the implementation in university as the holistic approach, the office has to promote, support, and facilitate school, faculty, department, division, or unit within KMUTT to integrate the green policy into their workplaces and systems.

Since 2001, according to the National Education Act (1999) and one of the KMUTT's flagships towards learning organization, The Learning Institute (LI) was established and entrusted with teaching and learning development and innovation. The structure of LI has been evolved from its origin to now three functional roles. The first role is to be the research unit for teaching development and new approach to learn. Secondly, role of training and coaching new academic staffs has been deployed to support every school and department's academic staff development. And last role is to be the pilot unit for kinds of innovative pilot projects in learning within KMUTT (Learning Institute 2012). In addition, LI has been demanded from the emerging of educational trends and issues such as work-integrated learning or general education in higher education level.

The next research and development unit following into this field is The Cluster for Educational Development (C4ED 2011). The cluster, called as its generic name, determined networking and team-working approaches to develop from faculties, instructional strategies, to organization systems. In fact, the major role of this unit has been shown as the technological facility development. Its Beta Lab has been researched and developed the university online learning platform called "Learning Environment" to enhance the classroom activities to be more comprehensive with outside the classroom.

And recently, The Physical Facility Management Unit (PMU) has originated in the school of architecture and design in order to cope with issues in campus such as master plan, learning environment and space, landscape, architecture and communication design. The rationale of PMU's initiative is the incidence of physical growth among three campuses in addition with the new city-center building located nearby downtown area. The review of institute's roadmap and development plans by this unit will assist the university to layout and design the growth of physical functions and campus themes in every location with strategic alignment.

**Figure 1. The KMUTT's Timeline with Strategic Development Units**

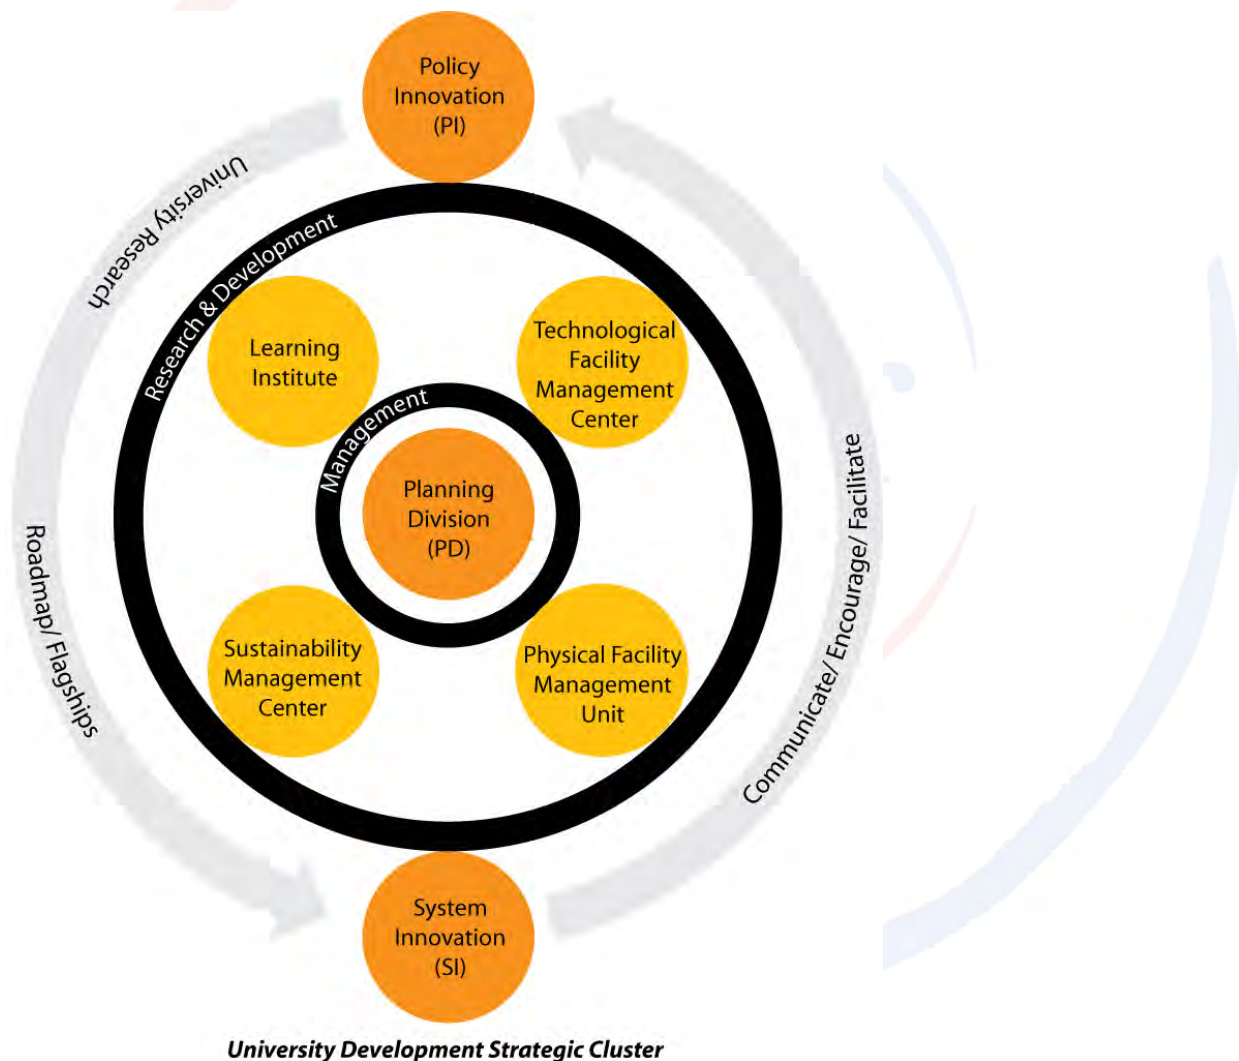

### **Suggestions on University Development Strategic Cluster towards Sustainability**

The cluster in the university's strategic development suggested in this paper is grounded on realizing that several units have already existed and functioned, but with or without well-organized coordination. Instead of setting up the new office for strategic management as the mechanism for matching strategic ambition with academic performance in university (Duggan n.d.), which probably be appropriate with other university's conditions and structures, KMUTT is potential and capable of managing collaboration or just slightly restructuring its existing organization chart as suggested in Figure 2. The Planning Division would be the center of strategic cluster. All related information from university management to the studies in research and development units will be managed with integrated decision making and planning. Coherently, there should be the session for all university's R&D units as the R&D clustering to brainstorm in multidisciplinary.

The integrative solutions from this collaborative research and development process would ensure that the university development initiatives will be aligned with the overall university's visions and strategic goals. The implementation plans out of the strategic cluster should attempt to

complement among other units. Then the organization resource allocating and sharing should be utilized efficiently and effectively.

Finally, to accomplish the strategic goals of KMUTT roadmap and flagship, the Systems Innovations Center will be responsible for the cluster's outbound roles including communication, encouragement, and facilitation through the strategic forums. The more participation from university's stakeholders means the more satisfaction in their academic activities. At the circle's end, conceptually, the long-term strategic planning or KMUTT's roadmap and flagship shall be addressed by the Policy Innovation Center with the significant study in S&T, economic and social trends towards sustainability.

Approach in Outcome-Based Education (OBE) promotes diversity in students learning. The main concern in preparatory engineering education is to promote balance between technical and non-technical aspects in training for future engineer. Shift in curricula design has given more flexibility for educators to explore the best way in conducting courses and change conventional assessment methods. Discussion is focus in developing comprehensive assessment to cover course outcomes and design programme outcomes. The design must consider student learning time and sufficient guidance for students to execute the task. The challenges are to establish effective teaching and well design assessment to develop highly competent technical persons as well as social skills. This study is to examine the effectiveness of project based learning (PjBL) in laboratory to promote students' achievement in holistic approach. The idea is to nurture students' skills in analytical, logical, organized and structured thinking stems. Using cluster sampling, students are selected and analyzed based on given questionnaire to evaluate the perception of students towards project based learning subject. Then the questionnaires were analyse to determine the correlation between perception and performance of students towards the skills enhancement.

**Keywords:** project based learning, comprehensive assessment, skills development, student performance

## INTRODUCTION

The approach in Outcome-Based Education (OBE) in a way promotes educators to be more comprehensive in all aspect in teaching and learning. Horak (2003) stated that it is a trend to create a balance between technical and non-technical aspects in the training and education of engineers. New curricular should be design in such way students will be able to acquired cognitive domain as well as required skills in engineering. All engineering schools in Malaysia have adapted OBE of the new higher learning education thus need to enhance people skills in conceptual and holistic thinking. One of teaching and learning approach is project based learning (PjBL). However, the challenges are to establish effective teaching and well design assessment to develop highly competent technical persons as well as social skills. The ideal way is to cultivate students' skill in analytical, logical, organized and structured thinking stems.

## PROJECT BASED LEARNING (PjBL)

Project based learning defined by Jones, Rasmussen and Moffitt (1997) as a complex tasks, based on challenging questions or problems that involve students in design, problem-solving, decision making, or investigative activities; give students the opportunity to work relatively autonomously over extended periods of time; and culminate in realistic products or presentation. This method of learning is promoted to develop students' professional problem-solving skills in engineering. The skill is required to enhance students ability to reach a solution using data that is usually incomplete, attempting to satisfy demands from clients, government and the general public that will usually be in conflict, minimizing the impacts of any solution on the social and physical environment and doing all this for the least cost possible as describe by Scott et al. (2003).

PjBL will allows student learn by doing, applying ideas while engaging in the real world activities through investigating question, proposing hypothesis and explanation, discussing their ideas and finally developing solution or outcomes. The comparison between student taking courses with the standard methodology and with PBL are students get a more general view, identify the problem, relevant information better, improve their social skill and the presentation of their work. The objectives of PjBL are to equip students with skills in critical thinking, collaboration, communication, and problem solving. Through the PjBL, the students' motivation is increased and gives the lecturers the opportunity to encourage skills as teamwork, writing technical documents and the presentations. This type of approach is to promote co-operative learning.

Co-operative learning is referred as a teaching method that needs students from various cooperation skills in a small group to achieve the same target or vision (Slavin, 1992). Cooperative learning in college is based on the theories of cognitive development, behavioral learning, and social interdependence (Morgan, 2003). Explained by Attler and Baker (2007) cooperative development is an outcome of cooperative learning, wherein constructivist knowledge development and transformation result from collaborative attempts to discover, comprehend, and decipher. Behavioral learning theory suggests that students will commit to participation in team efforts if they are rewarded for that participation, and are likely not to commit if no rewards are evident (Attler and Baker, 2007).

The students will have two responsibilities which are learning and understanding. These elements are needed for group work, and make sure all group members also understand the elements. Both responsibilities are identified as positive dependability. These components exist when a student in a certain group realizes that he or she will not succeed if the other group members are not successful as he or she is. They have to combine their effort with the group members in order to complete a particular task (Roger and Johnson, 1994). Effort from each group member is needed and without it, success will not be achieved meaning that there is no passenger. Co-operative learning is very important is the practice of interpersonal skill in order to coordinate to achieve group goal, students should have a trust and believe each group member, communicate effectively and without any doubt, accept and support each other and solve conflicts constructively (Johnson and Johnson, 1994; Johnson et al., 1991). Interpersonal skills and small group just do not come naturally when needed but the student must be taught about social skills for a high quality of cooperation and to motivate themselves to use in a productive cooperative group.

### PROJECT BASED LEARNING (PjBL) IN SOIL LABORATORY COURSE

Soil Engineering Laboratory (ECG223) is a course offered at Year II which is part four of a civil engineering diploma programmed. This course is one credit hour with three course outcomes; (i) organize standard laboratory testing, (ii) conduct experiment and interpret data for report, (iii) perform effectively as a team in carrying out the laboratory works. In this course too, student are not just to be evaluate on the technical assessment was based on the output while they also will be evaluated on the soft skill on the performance during the PjBL, by introducing open-ended project as for students' assessment. The class is divided into team consisting of 4 or 5 people. These teams are assigned to do 4 different laboratory sessions which required 2 hours per week and assigned task to be completed in 4 weeks duration of time. Table 1 is the stages that have been design for open ended project in order to carry out PjBL implementation.

Table 1: Stages in Open Ended Project in Soil Laboratory Courses

Stage	Description
Project Briefing	<p>Student will be guided with this open-ended project based on:</p> <ul style="list-style-type: none"> <li>• problem statement (identify soil location, sample requirement)</li> <li>• Laboratory session (4 different laboratory session)</li> <li>• Laboratory duration (4 weeks)</li> <li>• Submission (complete written laboratory report)</li> </ul> <p>Students' references</p> <ul style="list-style-type: none"> <li>• Laboratory manual</li> <li>• Marking rubrics</li> </ul>
Routines and	<ul style="list-style-type: none"> <li>• Assess student's ability to collect local disturbed sample</li> <li>• Conduct laboratory testing to clarify the soil classification and</li> </ul>

Tasks	<p>properties</p> <ul style="list-style-type: none"> <li>• Soil sample with soil depth at least 500mm depth and 3kg sample.</li> <li>• Soil treatment must left to room temperature for 24 hours or more.</li> <li>• Properties tests: moisture content, sieve analysis, cone penetration and particle density test.</li> </ul>
Report Writing	<p>Students' will be assessed according to:</p> <ul style="list-style-type: none"> <li>• Competency in analyzing and interpreting laboratory data</li> <li>• Standard format.</li> </ul>

## ASSESSMENT

The assessment strategy for open-ended project is to align with the course outcomes (COs) and programme outcomes (POs). However the COs are not categorized in the same domain, thus required multiple assessment. At this stage lecturer need to design these tasks to deliver the outcomes. The dominant domain is identified in Table 2. The same table shows the assessment strategy extracted from course information.

Table 2: Assessment Strategy for Soil Laboratory Course

Course Outcome	Domain	PO3	PO5	Assessment
CO1 - Organize standard laboratory testing	Cognitive	√		<ul style="list-style-type: none"> <li>• Lab report</li> <li>• Test</li> </ul>
CO2 - Conduct experiment and interpret data for report	Cognitive	√		<ul style="list-style-type: none"> <li>• Lab report</li> <li>• Test</li> </ul>
CO3 - Perform effectively as a team in carrying out the laboratory works.	Affective		√	<ul style="list-style-type: none"> <li>• Lab report</li> <li>• Test</li> </ul>
PO3: Ability to identify, formulate and solve engineering problems.				
PO5: Ability to supervise and function as a team member and have entrepreneurial capabilities.				

This information needed to design a comprehensive open-ended project question. The question has been set with two major tasks that state clearly the objectives and the activities need to be executed. The first stage is to assess students' ability to collect disturbed samples and conduct laboratory testing to clarify the soil classification and properties. The scope involved sub-soil exploration and testing. The second stage of this test is to assess students' competency in analyzing and interpreting laboratory data thus report all information in standard format.

The question is attached with set of rubrics to detail on the assessment. The rubrics are also act to detail all requirement needed before submission. This practice is to promote transparent and necessary guidance for students to plan their work in laboratory and report writing. Three major themes are identified in final report which describes as: (i) description on preliminary data on site and available resources, (ii) conducting experiment and (iii) teamwork and management. The detail on these major themes describe in Table 3. The overall process to execute this PjBL is shown in flow chart in Figure 1 that describes the whole process undertaken by students and monitoring stages needed from lecturer or laboratory supervisor.

Table 3: Lab Report Major Themes

Stage	Description
Description on preliminary data	Students are trained to be able to search data based on available data whether on-line or from relevant department. This is essential to introduced students on the importance of having desk study before executing any site works. The data collection is to include maps, drawings, details of existing or historic development, geological maps and sketching. Students with good insight will explore relevant standards to describe as referred to BS5930.
Conducting experiments	All criteria in this section as students' guide to train their data management skills. The orders are as follows: structured data management skills by using appropriate tables and templates, quality control (all data need to be checked by instructors), analyze raw data to obtain the objective of the experiments and summarized the calculated data.
Teamwork and management	Teamwork and management criteria are solely depending on report which is the end product for the all activity for this project-based learning. The criteria details are time for submission, formatting, editing and referencing. Ability to produce complete report with all requirement asks in the question will reflect how well they can work in group.

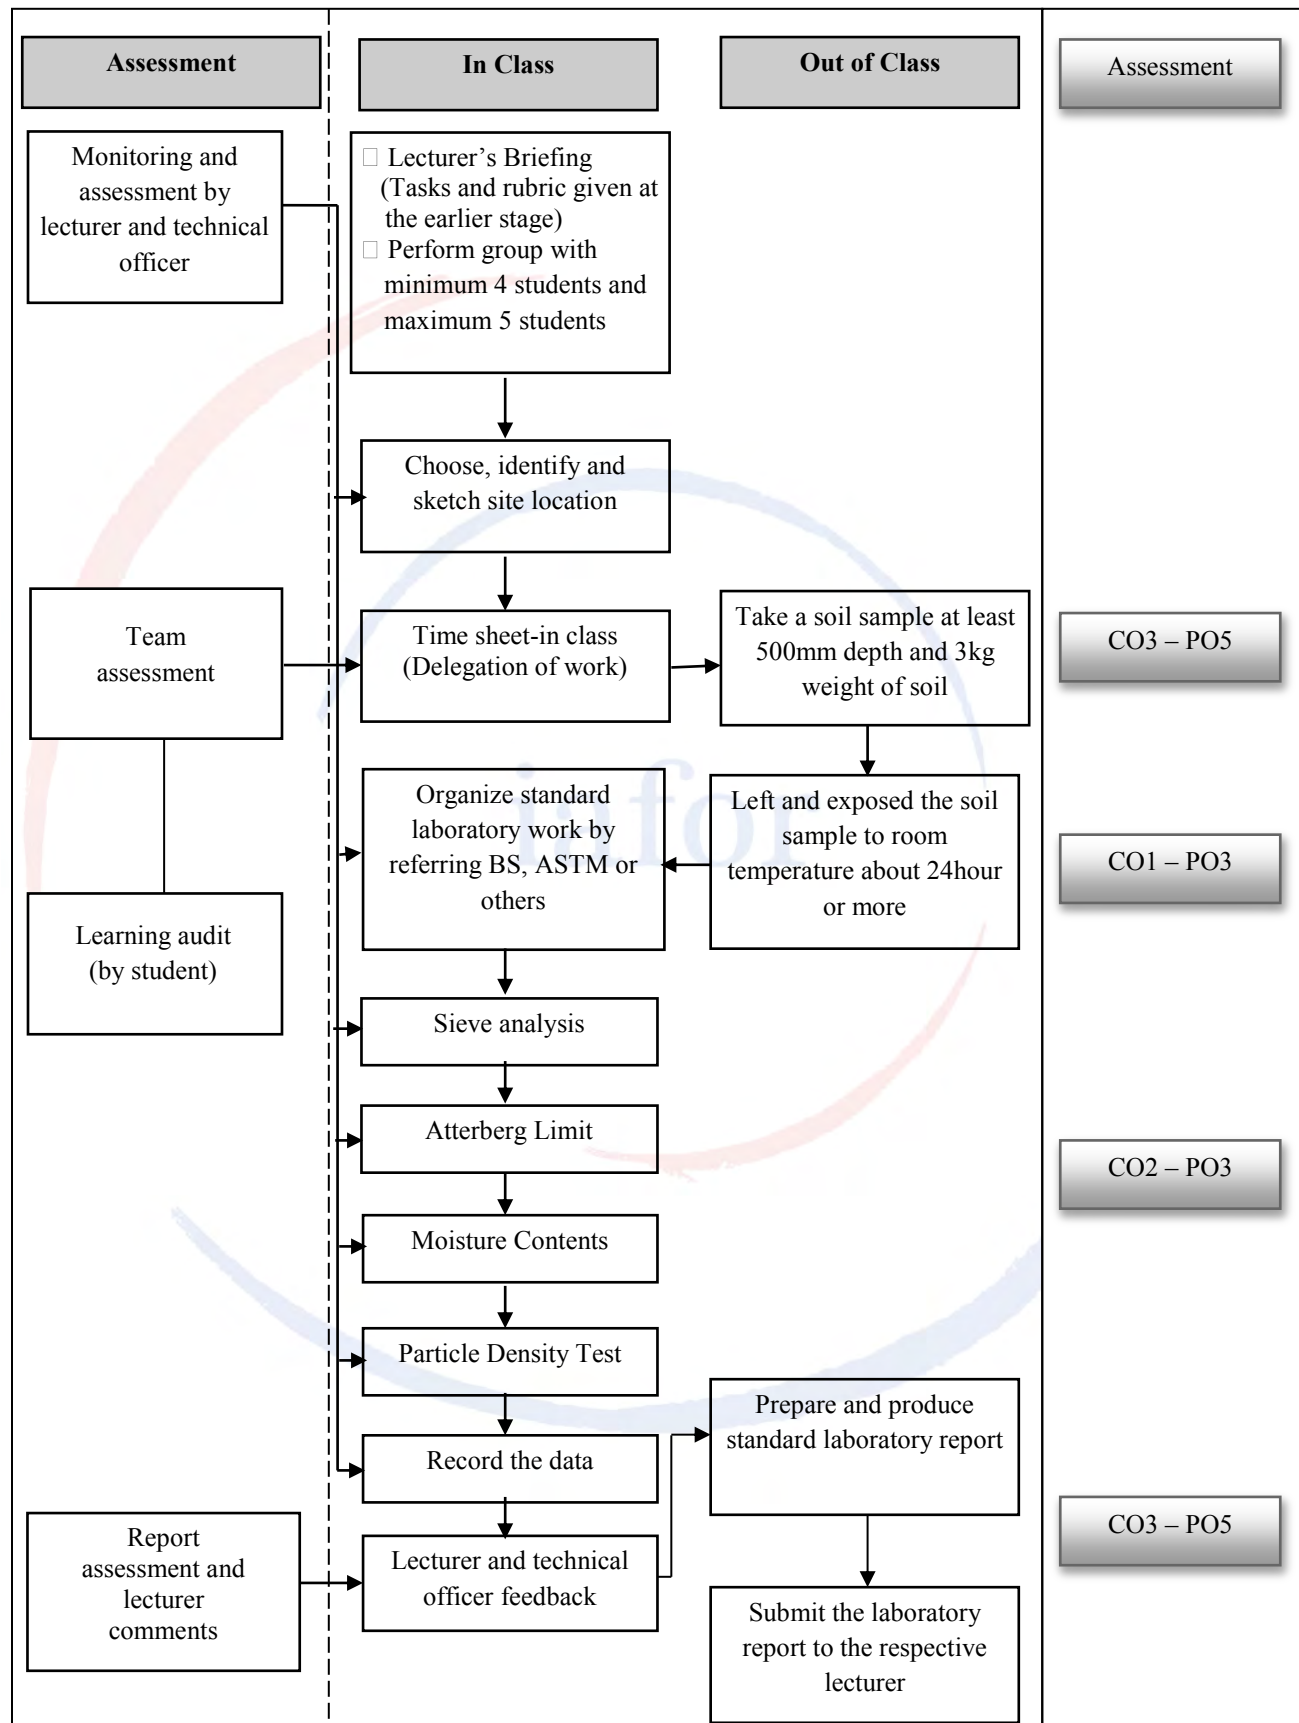

Figure 1: The processes Involved in Open Ended Laboratory Assessment for Soil Engineering Course

## DATA ANALYSIS

### Skills Development in Soil Engineering Laboratory

Table 4 shows a result of students' perception in acquiring skills from the course of ECG223. 36 numbers of students are selected and taken from cluster sampling in order to study their perception on open ended project. The questionnaire is designed based on likert scale of (1) strongly disagree; (2) disagree; (3) agree; and (4) strongly agree. The data obtained from this study will assist the course owner in continual quality improvement (CQI) stage and will be used as a baseline data for the next research. Most of the course outcomes show significant achievement where the mean value is at a range of 3.111 to 3.667. The mean value results are indicated that the students are agreed in acquiring the designed skills from the offered course which are has an ability to identify, formulate and solve engineering problems (PO3) and, has an ability to supervise and function as a team member (PO5).

Table 4: Students' Perception in Acquiring Skills from the Offered Course

Course Outcome	Students' Learning Experience	Related Program me Outcome	Mean Value	Standard Deviation
CO1: Organize standard soil laboratory testing.	I can analyse raw, interpret and observe data pattern for the use of soil engineering design	PO3	3.286	0.458
CO2: Conduct experiments and interpret data for laboratory report.	I can execute soil engineering testing (i.e.: sieve analysis, permeability, shear box, tri-axial and CBR tests)	PO3	3.472	0.506
	I can conduct field testing to determine soil bearing capacity and strength by using JKR Probe, Vane Shear and Sand Replacement Method		3.472	0.506
	I know the importance to refer to relevant standards (i.e.: British Standard, ASTM) as references		3.111	0.523

	I am able to produce standard report which detail in objective, procedure, well recorded raw data, analysis, interpretation and conclusion		3.500	0.507
CO3: Perform effectively as a team in carrying out the laboratory works.	I am able to work in a team effectively by participating actively in laboratory works and report writing	PO5	3.667	0.478
	I am able to practice my leadership skills in managing team members to execute laboratory works and report		3.639	0.487

From the study, the PO3 is achieved from two (2) course outcomes which are CO1 and CO2. The range of mean values is 3.111 to 3.500. From the observation in the class during the open ended test, the students is proficient in producing standard report (3.500) where this exercised is one of their routine task not only for this course but the others in civil engineering programme. Students also can properly conduct the experiment in the field and laboratory (3.472) for the open ended test based on their experienced in the previous courses (ECG 203 and ECG 213). The table indicates lowest mean value in PO3 for interpretation and observation of obtained results (3.286). The authors believed that the students are still in developing their skills on data evaluation since the skill is required in higher level of cognitive domain (normally designed for higher semester). Besides, the importance in referring the relevant standards (3.111) shows the lowest mean value. Students have difficulties to understand the approach and complicated terms stated in the standard. The PO5 results show the students acquired skill as a team member and a leader in a group which are 3.667 and 3.639. These results demonstrate the students are good in managing and participating actively in the laboratory work and preparing the technical report. This is good indicator to the civil engineering students which this skill is highly required in the actual field. Most of the course outcomes show significant achievement (mean value at 3.47 – 3.67), while students' rate good understanding on how to use relevant standard (3.111). It is understood that standard provide a comprehensive guide and students have difficulties to understand the complex language.

Table 5 shows the correlation of students' perception with final examination results which course outcomes are classify as cognitive domain. Students are agreed they have received the skill of identifying, formulating and solving the problem during the course. The perception results are verifying with the final examination results which the students obtained the grade of 3.33 for CO1 and 3.67 for CO2, indicate level GOOD.

Table 5: Correlation of Students' Perception and Final Examination Results for ECG223

Course Outcome	Programme Outcome	Mean Value	
		Students' Perception	Examination Result
CO1	PO3	3.286 (Agree)	3.33
CO2	PO3	3.389 (Agree)	3.67

### Open-ended Test as Comprehensive Assessment

Open-ended test is comprehensively designed to assess the time management, utilisation of preliminary data, the application of fundamental knowledge and working as a group. From the four (4) weeks project, the students are agreed that they are acquired the designed skills in open-ended test which the mean values are in a range of 3.500 to 3.639 as showed in Table 6. Standard deviation from this table also shows the significant value of the prepared criteria. The students believed that they have learned a lot from the open-ended project especially in managing and organising their work, obtain relevant data independently which help them in executing the laboratory works and the experience in working together either as a team member or as a leader. In another hands, this exercise also can help students in developing their critical thinking and make them creative to solve the problem.

Table 6: Students' Perception in Open-ended Test

Criteria	Students' Learning Experience in Open-ended Test	Mean Value	Standard Deviation
Time management	I have enough time to do all the works including soil sampling, drying and laboratory testing	3.500	0.561
Course materials	The course materials given are sufficient to help executing the laboratory works	3.639	0.487
Previous and current courses	The theoretical courses (ECG203 – soil mechanics and ECG213 – soil engineering) very much help to do the data analysis and interpretation	3.556	0.504
Skills enhancement	I learn a lot for this particular exercise including being independent, working in group and timing	3.639	0.487

---

management

---

Final assessment for open-ended test is measured using the marking rubric. The rubric is distributed to the students in early stage of project briefing in order to promote the transparent assessment as required in OBE. For this study, the correlation between students' perception with the final assessment results are produced as showed in Table 7. The mean value for open-ended test grade (3.763) showed the higher value compared to the mean value for students' perception (3.584). This results showed the students are successfully achieved all criteria and followed all the requirements designed in the marking rubric for the open-ended test or project, however, they underestimated their capability to do so.

Table 7: Correlation of Students' Perception and Final Assessment in Open- ended Test

	Mean Value	Standard Deviation
Students' perception in open-ended test	3.584	0.510
Final Assessment in Open-ended grade	3.763	0.184

### Teamwork Assessment

Commitment, contribution and communication are the most important criteria in the teamwork. From this open-ended project, the students are designed to obtain these criteria as showed in Table 8. The students claimed and agreed that they have learned and experienced in teamwork during the course with the range of mean value of 3.528 to 3.714. The standard deviation also showed the significant value of their perception.

Group meeting and consistency in progress work submission (commitment) showed the lowest mean values which are 3.556 and 3.528, respectively. In order to avoid this problem, time sheet in-class and learning audit as introduced in this project, play a major role as a work planning references.

Contribution and share their ideas to discussion is one of important skills to be a good team member. The quality of work is controlled and produced from these acquired skills. From the table, the mean value for the students' perception on ideas contribution and discussion is in a range of 3.600 to 3.657 which is in a likert scale of agreed.

Communication performed as a major factor in teamwork. Failure in communication results the failure in a group project. All group members should be performed to aware their task and know their roles in order to ensure the successfully of teamwork. Group members also should be able to notice all the changes made and problem arise during the project. From the perception study, the mean value rated by students' communication skill is 3.714. The students agreed that they have a skill of communication during the course.

Table 8: Students' Perception in Teamwork Experiences during the Course

Criteria	Students' Learning Experience in Teamwork	Mean Value	Standard Deviation
Commitment	All the team members are reliable for group meetings and give full commitment	3.556	0.504
Group contribution	As in a team, we are reliable to meet the deadlines for progress work and final report for submission	3.528	0.560
	All of my team members are able to contribute ideas to the group	3.600	0.497
Interacting with team members	As in a team, we are able to respects other members' opinion	3.667	0.478
	All the group members are able to contribute his/her opinion/share to discussions	3.657	0.482
	All the group members are aware on the given tasks, know their role and able to fulfil the role	3.714	0.458
Keeping the team on track	As in a team, we are able to notice all the changes/problem and know on what everyone in team should be done	3.714	0.458
Expecting quality	All the group members are giving the input for work-in-progress promptly and with a good faith effort	3.657	0.482

Table 9 shows a correlation of students' perception and final assessment in teamwork. The mean value of students' perception is higher (3.637) compare to mean value of teamwork test grade (3.391). The result indicates that the students believed they had the skill to work in a team but they still required the proper training in managing the time and task of the project.

Table 9: Correlation of Students' Perception and Final Assessment in Teamwork

	Mean Value	Standard Deviation
Students' perception in teamwork	3.637	0.490
Final Assessment in Teamwork grade	3.391	0.129

## Leadership Assessment

Table 10 shows the correlation of students' perception and final assessment in leadership skill. The perception results showed the higher mean value, 3.639 compared to final assessment of the skill, 3.231. This result indicates that the students perceived they required the skill but from the final grade they still need the continuous training as a leader not only from this course but from other course in the programme. The leadership skills can only developed by appropriate training. From the project, the learning audit and group meeting can help in developing this skill.

Table 10: Correlation of Students' Perception and Final Assessment in Leadership

	Mean Value	Standard Deviation
Students' perception in leadership	3.639	0.487
Final Assessment in Leadership grade	3.231	0.244

## Conclusion

Open ended project as Project Based Learning approach is introduced to developed students' skills. The challenge in is to design multiple assessment in one project. The complexities are in delivering and assessing knowledge, skills and attitude of students. Based on this research shown that student acquired skills with project based learning approach. However it is understood that students are able to enhance skills since they will have another one year before graduating. The authors suggest open-ended project can be introducing to others relevant courses to empowered students skills. In addition teamwork and leadership skills need to be improve with refinement in two aspect: 1) revise assessment rubric and 2) improve delivery methods.

The lecturer must have a good understanding on the subject, student population, outcomes requirement, and availability of materials, support staff and machines. It is understood that students have the difficulties to manage; as they need to master the theoretical part of the subjects, have a good communication with team members, have a good time management skills, understanding standard guideline to support the data collected during experimental programme, and many others. However based on preliminary research, students agree this type of assessment is beneficial to grasp designed course outcomes.

Abstracts

In contrast to many other disciplines, built environment, engineering and design (BED) academics often have significant amounts of practical work experience and chose a university job because of their desire to teach and shape 'professional practice' in the next generation. This paper documents BED academics experience of being teachers and their teaching and learning environment, specifically how they deal with the realisation that universities typically focus on research, not teaching. Five key domains of the teaching experience (Perceived Value, Motivations and Perceptions, Teaching Experience, Teaching Preparation, Barriers) were explored through two focus groups (n=9) and a comprehensive anonymous 150 item online survey (n=68) of BED academics at an Australian university. Interactions with students were perceived as positive, with most students enthusiastic, engaged and motivated, and the success of former students' in the 'real world' deeply gratifying. Most derived immense satisfaction from their careers, despite ongoing confrontation with barriers (limited academic freedom, lack of perceived recognition from senior staff) and limitations (large classes, lack of sufficient resources, administrative burnout) that inhibited their capacity to teach as effectively as they would like. BED academics were disappointed and surprised about the low value placed on teaching and lack of recognition for their commitment and contribution – many believed promotion 'was not in their future' because they prioritised teaching over research. This paper discusses the impact of this teaching and learning culture for these BED academics and the implications for their students, their own career choices and the workplace.

iafor

The International Academic Forum

[www.iafor.org](http://www.iafor.org)

Traditionally, an academic's role has comprised of three distinct activities: teaching, research and service. Although all three of these activities are critical to the success of a university, in an increasingly competitive tertiary education environment, contemporary universities are characterised by increased legislative requirements, institutional change and a significant focus on research quality, output and performance (Norton, 2012). Although teaching undergraduates is the primary purpose of most universities, there has been a fundamental shift in how teaching and learning are perceived and conducted. The reality is that despite strong national and institutional expectations for excellence in *both* teaching and research, the day-to-day experience of most academics is that research is more highly valued than skills and expertise in teaching (Wahlen, 2002). Most universities typically have a strong research culture, with research enjoying higher prestige and offering a clear path to career advancement, whilst there is usually much less recognition for quality and innovation in teaching (Drennan, 2001). The perceived increase in value placed on research (potentially at the expense of teaching) has not only shifted the status of teaching, but has also put greater pressure on individual workloads, as academics work to increase research quality and output, while still attempting to meet teaching responsibilities (McInnis, 2000).

### ***Teaching in Higher Education – the Australian Context***

Internationally, the context for teaching in higher education has transformed over the last few decades, with an increasingly diverse student population and more explicit focus on teaching quality. In Australia, for example, a recent governmental review of higher education recommended two key targets to increase the proportion of the Australian population with higher-level skills: (1) *“40 per cent of 25- to 34-year-olds will have attained at least a bachelor-level qualification by 2025”* and (2) *“20 per cent of higher education enrolments at undergraduate level are people from low socio-economic status backgrounds by 2020”* (Bradley et al. 2008). To help meet these targets, the Australian Government has provided significant financial incentives for universities to accept (and graduate) students from lower socio-economic status backgrounds. Such policy initiatives will impact on the experience of teaching and learning, and offers an opportunity for universities and educators to focus attention on issues of pedagogy and best practice. As the success of these students at university will depend largely on the skills and energy of teaching staff, individual universities' will have to appropriately forecast, plan, implement and/or access appropriate training, services and resources to best meet the needs of this increased and more diverse cohort of students.

A critical first step, therefore, is to enhance our understanding about academic's current experiences of teaching and the wide range of issues that potentially require consideration when seeking ways to improve the experience, quality and outcomes of tertiary teaching. Thus, the overarching aim of this paper, using one Australian university as a case study, is to explore how built environment, engineering and design (BED) academics conceptualise and experience their teaching and learning environment. Notably, unlike many other disciplines, BED academics often choose a university job because of their desire to teach and shape 'professional practice' in the next generation, typically bringing significant amounts of practical work experience and less research expertise to their role. This paper focuses on BED academics experience of being teachers, perceptions of institutional and collegial commitment, and how they deal with the realisation that excellence in teaching is often less recognised than research and publication success. With universities recruiting an increasing number of practitioners to academia to provide 'real-world' insight and expertise to students (Coaldrake & Stedman, 1999), exploring the experiences of this BED cohort of 'non-traditional' academics is timely.

### *Academic's experiences of teaching*

While studies have explored the experience of learning within the tertiary education sector from the students perspective (see Hellsten & Prescott, 2004), less is known about how academics view and design the learning environment, set learning outcomes, interact with students and prioritise investment in teaching (e.g., Buelens, Clement & Clarebout, 2002; Evans & Tress, 2009). While teaching is a central component of an academic's role (most Australian academics spend approximately half of their working week on teaching related activities; McInnis, 2000), several studies have identified issues associated with the higher education teaching experience, ranging from workload, quality, resourcing and support (e.g., Coate, Barnett, & Williams, 2001; McInnis, 2000, Prosser & Trigwell 1997). Recently Watty (2006), in a teaching quality survey of 231 accounting academics from 39 Australian universities, found that nearly a third were concerned about 'exhausted' staff due to reduced staffing levels and high student numbers.

Part of the challenge is that an academic's job description involves not only being an engaged teacher, but an active researcher and a contributor through service to their university, discipline and the wider community. Several studies have found that balancing these multiple and competing responsibilities typically means a heavy and stressful workload: one respondent to a survey of academic staff in the United Kingdom explained how "*research is serious, teaching is serious, administration is serious; they are three jobs, not one*" (Kinman & Jones, 2003 p35). Similarly, a nation-wide survey of 2609 academics from 15 Australian universities, McInnis (2000) found approximately half reported working more than 50 hours per week and described their work as a source of considerable stress. McInnis argues increased institutional demand for high quality – in both research and teaching – means many Australian academics feel under enormous pressure, reflected in a fall in overall job satisfaction from 67% in 1993 to 51% in 1999.

### *Teaching versus research*

The prevailing experience seems to be that the structure, culture and practices in higher education - implicitly and explicitly - prioritises research over teaching; as Jencks and Riesman (1968) argued over three decades ago, academics "*have only a limited amount of time and energy, and they know that in terms of professional standing and personal advancement it makes more sense to throw this into research than teaching*" (p532). A large national study of 47 American research universities (of over 23,000 faculty members, chairs, deans, and administrators) supported this contention, finding that even these decision-makers felt teaching received too little emphasis in comparison to research (Gray, Froh & Diamond, 1992). More recently, in Australia, Ramsden et al. (1995) reviewed policies for recognising teaching and research in appointing and promoting staff, as well as surveying staff about perceptions of university policy and practice in acknowledging good teaching. They found that, compared to research, the status of teaching had declined in the last 50 years and that staff with a distinguished research record were rewarded, not staff with teaching leadership.

There is a strong belief among academics that universities prioritise research and that, in response, there is a general "*lack of recognition and reward for those academics with a teaching focus*" (Watty, 2006 p297). Numerous studies outline how many academics view the main basis for promotion, salary increases and acknowledgement to be based on research activities, specifically: winning competitive grants, writing and publishing journal articles and graduating higher degree research students. The perceived lack of output tangibility associated with teaching was raised in interviews with 15 senior academics in 13 Scottish universities, where Drennan (2001) describes how the major issue appears to be 'proving'

outstanding achievement in teaching and learning versus achievement in research. Unlike teaching, research has a strong transferable market value appreciated by other universities, thus motivating academics to “*concentrate on research and publication, even if this is to the detriment of teaching and the experience of their students*” (Drennan, 2001, p171).

### *Role of institutional characteristics, management, and workplace culture*

Although the prioritisation of research above teaching has been relatively well-documented, only a relatively small body of research have explored how workplace culture and institutional characteristics might impact academics’ teaching (and none documenting the perspective of BED academics). In the United Kingdom, Fanghanel (2007) interviewed eighteen lecturers (from seven different institutions and fifteen different disciplines) and identified seven key ‘filters’ that impacted on lecturers’ teaching practice and ‘pedagogical constructs’ (defined as how they conceptualise, approach and relate to teaching and learning). Four filters operate at the macro level of practice (the institution, external factors, academic labour, the research-teaching nexus), two at the meso level (department/school and discipline) and one at the micro level of the individual (pedagogical beliefs). Fanghanel’s study powerfully illustrates that how individual lecturers conceive and approach their teaching and learning is moderated by both the local context and their own individual ideological beliefs. More recently, Ramsden, Prosser, Trigwell and Martin (2007) surveyed 439 Australian lecturers to explore the link between experiences of academic leadership and approaches to teaching. They found perceptions of their academic environment was “at least partly determined by the management and leadership practices of academic managers” (p153), concluding that management need to recognise their role in fostering approaches to teaching, which “enable more effective student learning” (p153) and encourages staff to prioritise investing in further developing their own teaching.

Building on this previous research, this study explores academics’ experience of teaching and learning within an Australian university with high expectations for both teaching and research. Focussing on the unique perspective of academics from BED disciplines, there are two main aims. First, to explore how they conceptualise teaching and learning, identifying key motivators and barriers to teaching excellence. Second, to explore the role of institutional and workplace culture, specifically how BED academics believe their peers, senior staff in their school and ‘the university’ view teaching. Our focus is to deeply explore the impact workplace culture and how the perceived values and priorities of colleagues, superiors and the university impacts on BED academics.

### **Methodology**

The method included an online survey and focus groups, utilising one Australian tertiary institution as a case study. Using a purposive sampling approach, all academic staff (approximately 200 sessional, part-time and full-time) from the Faculty of Built Environment and Engineering (BEE) at an Australian university received a generic invitation email to participant. Standard good practice ethical and interview protocols were utilised, with survey participants having the opportunity to enter a prize draw to win one of 25 coffee vouchers and focus group participants receiving a free lunch as an incentive.

There was an approximately 34% participation rate, with 68 BED staff completing the survey and 9 participating in two focus groups (4 and 5 participants respectively). The first stage of the research was the 150 item online survey. Developed by the authors, the survey covered six sections: Teaching Experiences, Workplace Culture, Barriers to Teaching, Developing Teaching Skills, Personality; and Socio-Demographics. Where possible, existing measures

were utilised (e.g., Dahlstrom et al. 2005; Ramsden et al., 2007), with most items measured on a 5-point Likert scale anchored at strongly agree and strongly disagree (space constraints limit details, complete survey is available from authors). Three key open-ended questions asked what was *most* and *least* satisfying about teaching, as well as what surprised them most. The second stage of the research was the focus groups. Lasting approximately 60 minutes and held on the university campus, these were audio-recorded and later transcribed verbatim. For consistency, one researcher (the lead author) moderated both groups, which followed a semi-structured format focussing on teaching experience, teaching and workplace culture and barriers to effective teaching. This was “insider research”, as the researchers were also members of the social group (BED academics) under study. “Insiders”, best defined as individuals with intimate knowledge of the community and its members due to previous and ongoing association, often have epistemological privilege through their unique access to particular forms of knowledge, although being an insider also raises potential ethical and methodological dilemmas (see Labaree, 2002). This paper focuses specifically on the results surrounding academics’ experiences of teaching and workplace culture.

### **Participants**

A total of 68 BED staff completed the survey, with 9 participating in two focus groups (4 and 5 participants respectively). There was an even representation of the three schools in the Faculty: Design (42%), Engineering Systems (27%) and Urban Development (34%). The most common disciplines were architecture (27%), civil engineering (15%), industrial design (14%) and urban/regional planning (14%). Most were male (72%), average age of 44 years (21 to 73 yrs). They had been working in the university for an average of 7.4 years, representing a range of positions: sessional (37%), associate lecturer/lecturer (35%), senior lecturer (13%) and professoriate (15%). A third had a PhD (36%) and/or Masters (28%), with half (54%) reporting significant industry experience (27% 1-5 yrs; 27% 6-10 yrs).

### **Results**

#### ***The perceived value of teaching***

Table 1 illustrates that the vast majority perceive teaching to be a valuable component of their academic role, which provides considerable satisfaction. A number described how this satisfaction was the most surprising aspect of teaching, “*how much enjoyment it provides*” and “*I actually really, really enjoy it – the process of teaching, from preparation through to delivery*”. BED academics teach because they enjoy the challenge of teaching students to be more critical thinkers, describing in their comments and focus groups how they enjoyed “*figuring out ways of enlivening the teaching process*” and “*when students begin to understand and apply critical lateral thinking skills*”. Student interaction, and the impact of their teaching on the students, was greatly valued: “*seeing a student who was struggling produce a fantastic assignment*”, and “*I think seeing the transition from when they start to when they finish*”. Over half felt high quality graduates were produced by the course, with the importance of translation of knowledge into the workplace one of the most satisfying aspects: “*When students that are out in the industry say that what I taught them is still valuable out in the ‘real world’*” and “*I love seeing students I have taught produce great outcomes in practice*”.

*Table 1: Perceived value of, and motivations for, teaching*

<b>Perceived value of teaching</b>	<i>Disagree</i>	<i>Neutral</i>	<i>Agree</i>
Teaching students is an activity that gives me a great deal of satisfaction	1.7%	6.8%	91.5%
I believe teaching is an important part of my role	3.4%	5.1%	91.5%
The course produces high quality graduates ready for professional practice	10.2%	22%	67.8%
My efforts as a teacher are valued by students	3.4%	11.9%	84.7%
My efforts as a teacher are valued by my co-workers	8.5%	22%	69.5%
My efforts as a teacher are valued by senior management	20.4%	32.2%	47.5%
<b><i>Motivations for and perceptions of teaching</i></b>			
I like the challenge of teaching students as effectively as possible	0%	10.2%	89.9%
I teach because I can challenge students to be more critical in their thinking	5.1%	6.8%	88.2%
I teach because of the intellectual stimulation	1.7%	11.9%	86.5%
I teach because I want to help students prepare for professional practice	8.5%	10.2%	84.4%

The survey revealed a clear hierarchy of perceptions about the perceived value of teaching: most valued by students (85%), co-workers (70%) and then senior management (48%). They explained how “*learning how wide a range of perceptions about teaching other academics have*” was their greatest surprise, with one explaining how:

I feel I’ve gotten mixed messages because I’m very new. Yes, teaching is valued, and then I get someone else telling me, forget your teaching, what’s your research? Don’t worry about the teaching, focus on the research.

There was a strong belief that senior staff had a negative view of teaching: “*I’ve been told by a senior person that teaching is nothing, research is everything*”, and with one participant recognising their need to “*write something because otherwise it won’t be remembered*”, in regards to their achievements in teaching.

Tables 2 and 3 illustrate the findings of a thematic content analysis of comments in the survey and focus groups. Least satisfying aspects were senior management’s sole reliance on student learning experience surveys (termed “LEX”) in evaluation of their teaching quality and the sense that innovative, experimental and creative teaching was not supported. As one explained, even teaching and learning advisors (a new faculty initiative), were more focussed on administrative compliance than trialling new approaches:

We need T&L people who are really creative, willing to take risks. We need to be able to allow people the freedom, actually have the support mechanism so that, if you do fall, they help pick you up, they don't actually pick you up and kick you.

*Table 2: The most and least satisfying (and surprising) aspects of teaching*

“What aspects of teaching do you find MOST satisfying?”	Student interaction / engagement Student learning Intellectual stimulation
“What aspects of teaching do you find LEAST satisfying?”	Student interaction /engagement Performance (eg LEX) Administration
“What has surprised you most about teaching?”	Satisfaction Enjoyment Learning Challenges Attitudes of others

Table 3 illustrates how barriers ranged from the attitude of others including disinterested colleagues, non-engaged senior management and unmotivated students – through to resourcing and time management implications. As one explained, a key barrier was *“the culture of academia here... teaching is not valued as much as research, many staff are not open minded about their teaching practices”*. One described *“how isolating it is, how rarely colleagues discuss fundamentals of teaching and discipline knowledge”*, whilst another believed that *“as long as students come here and researchers win grants, I think that's all that management cares about... Teaching staff are nothing and mean nothing to senior management”*. Many participants felt that by choosing to invest in teaching, they were sacrificing their chances for promotion: the survey found that 86% felt the university recognises and rewards high quality research. Only 48% agreed the university recognises and rewards high quality teaching.

*Table 3: Key barriers to effective teaching – and how they could be overcome*

<b>What (if any) are the barriers to effective teaching?</b>	<b>How could they be overcome?</b>
<ul style="list-style-type: none"> <li>▪ Resourcing <ul style="list-style-type: none"> <li>○ Class size</li> <li>○ Administration</li> <li>○ Delivery</li> <li>○ Timeframes</li> </ul> </li> <li>▪ Indifference by senior staff</li> <li>▪ Lack of clear standards – quality issues</li> <li>▪ Student attitudes</li> <li>▪ Research focussed culture</li> </ul>	<ul style="list-style-type: none"> <li>▪ Resourcing <ul style="list-style-type: none"> <li>○ Smaller classes</li> <li>○ Better distribution of admin support</li> <li>○ Better facilities</li> </ul> </li> <li>▪ Better balance of Values between research and teaching</li> <li>▪ Greater academic freedom/ autonomy</li> <li>▪ Engage staff in discussions about teaching quality &amp; innovation</li> <li>▪ Methods / training</li> </ul>

To build a workplace culture that values teaching and learning, BED academics emphasised the importance of leadership that prioritised excellence in teaching, wanting *“informal discussions about teaching with senior staff”* and *“genuine acknowledgement from senior staff of the value of undergraduate teaching, recognition for innovative and outstanding*

*learning activities*". Specifically, they recommended improved administrative support; introducing broader evaluation methods (beyond LEX), recognition (academic promotion through exemplary teaching activities and not just through research); and supporting peer-to-peer engagement and mentoring.

## Discussion

This research depicts university teaching as a multi-dimensional construct with numerous confounding issues. The measures chosen allowed for candid exposure of teacher's experiences, perceptions and attitudes revealing current cultures of teaching and the impact of both organisational and individual factors on the participant's views. Reiterating similar findings in the literature, this study provides a new context (the perspective of BED academics) for old and ongoing issues. This research highlights how BED academics very much enjoy teaching and interactions with students, yet feel that research is more valued than teaching. These findings are consistent with previous research, suggesting that the individual and organisational factors that impact on teaching culture are generic and not discipline specific. Taken together, our findings have several implications and recommendations for higher education practice and policy.

First, there can be little doubt that the vast majority of BED academics in our sample derived immense satisfaction from teaching. BED academics found most students enthusiastic, engaged and motivated, describing student interactions and the resultant success of student's in the 'real professional world' as the most positive and deeply gratifying aspects of teaching. Yet, there was a hierarchy of perceptions about the perceived value of their teaching: most felt their teaching was valued by students (85%) and fellow co-workers (70%), but less than half (48%) felt it was valued by senior staff. Although they personally valued and enjoyed teaching, these BED academics felt that focus on teaching was not valued by the university or senior staff and that they were much more likely to be acknowledged and supported (and promoted) for research. These perceptions are consistent with a large body of research (Gray, Froh & Diamond, 1992) which shows academics perceive prioritising teaching as a 'risky priority'; leadership from senior staff and management is required to challenge these perceptions and empower academics to invest in, and remain committed to, their teaching (Hattie & Marsh, 1996).

Second, balancing the teaching-research nexus was challenging. Unlike many other disciplines, most BED academics reported relatively limited previous research training and were often concurrently studying for a PhD. They had been attracted to their academic role specifically to teach and help "shape professional practice in the next generation". For this BED cohort, the realisation that teaching was viewed as 'less important' than research was a surprise. Participants felt it was 'easier' to get promoted on the basis of research, describing how promotion was 'not in their future' because they prioritised teaching and learning. Such staff sentiments, consistent with other research, highlights how universities need to examine existing systems to ensure staff focussed on teaching excellence are also rewarded. Our participants described an uncertainty about what "counted", explaining how they received different messages for different colleagues: "

These findings are consistent with research by O'Meara and Bloomgarden (2011), who in a case study of an American university striving to improve productivity, concluded that academics felt such "*institutional striving had made it difficult to prioritize and commit to different parts of their work because of conflicting messages from leaders about what was most important*" (p64). Through 29 in-depth interviews, O'Meara and Bloomgarden (2011)

found that - like our cohort – these American felt fragmented and pulled in many different directions, believing that it was an ‘uphill battle’ competing with target/aspirational universities that were differently resourced (e.g., reduced teaching loads).

Third, institutional policies and procedures have a very significant impact on teaching and learning, and can hinder good, ‘creative’ or ‘innovative’ practice. Consistent with past research (e.g., Phillips-Miller, Pitcher & Olsen, 2000; Ramsden et al, 2007; Saroyan & Amundsen, 2001), participants strongly disliked management’s reliance on student teaching evaluations and the lack of alternative evaluation techniques to provide a more holistic examination of teaching quality. As well as negatively affecting workplace morale, the focus on student evaluation made educators’ reluctant to ‘take risks’ in their teaching practice. A related example was how participants described that their experience of a new faculty initiative, the provision of ‘teaching and learning advisors’, were actually more focused on ensuring compliance with administrative rules than supporting their experimentation and innovation in teaching. These academics did not feel they had the support, freedom or confidence to be creative in their teaching; something that impeded innovative best practice.

Fourth, consistent with a large body of existing literature (e.g. Kinman & Jones, 2005; McInnis, 2000 ), there was a strong sense that workload demands were simply too high. BED academics explained feeling that “there were never enough hours in the day” and a sense that they could not maintain such heavy workloads. A range of issues were identified, including a lack of space and resources (e.g., data projectors) and large class sizes. Time constraints were also highlighted as barriers to seeking or implementing processes to improve teaching. From marking to repeatedly responding to relentless student email requests, teaching is seen as a demanding role. As it must also be shared with other responsibilities, including research and service, it is apparent that a lack of time is profound, an issue that negatively impact staff morale and work-life balance. In his interviews with UK academics, Fanghanel (2007) also concluded that “stress-related stories were present in these narratives, and linked to disempowering feelings of not being able to do one’s work properly” (p12); such emotions were clearly also evident in this Australian sample, with academics wanting more time (and opportunities) to share and discuss teaching ideas with colleagues.

This research, focussing on the experiences, frustrations and concerns of BED academics in one Australian university, provides deep insight into their perceptions of their workplace teaching and learning culture. These BED academics, passionate about their students and deeply committed to best practice in teaching and learning, reported a strong sense that their efforts were not valued by senior management or promotion committees. Although, as Johnsrud and Rosser note “*faculty members are rarely satisfied with their own institutions*” (p518), these findings suggest that universities need to re-examine the relative importance of teaching and learning and explore ways to support and recognise academics commitment to teaching: senior staff must understand their key role in influencing teaching and learning culture. Our hope is that these insights will help inform and contribute to the debate about how best to reshape and transform the activities of teaching, learning, and research in higher education.

Abstracts

In this paper I consider the cause and affect relationship between the limitations of acceptable speech and practices of normative racism among future teachers. I argue that the current discourses of race, immigration, and the politics of the “other,” which follows the logic of individual liberalism, works to perpetuate normative racism by systematically eliminating authentic discussions in multicultural education. While education has long been a circumstance of culture that works to maintain dominant practices, it has also provided a space for critique and re-imagination—a place to resist, through intellectual and critical analysis, the social injustices within society. However, the continued rise of the neo-conservative movement in the United States of America challenges such critical pedagogies by reigniting the debate of acceptable limitations of speech on University Campuses. While most colleges of education have made efforts to teach tolerance and diversity, what is not being discussed is the pressing need within pedagogical sites for discourses of race that bring students to understand how and why they, as members of a collective society, emotionally and affectively invest in normative practices of institutionalized hate and racism (Romo, 2006). I argue that a truly transformational pedagogy of social justice necessitates the freedom for students and teachers to engage in “risky language” (Giroux) in classroom discussions of difficult topics—e.g. race, immigration, white privilege—in order to create authentic possibilities for teacher agency against the challenges of normalized hate.

While education has long been a circumstance of culture that works to maintain dominant practices, it has also provided a space for critique and re-imagination—a place to resist, through intellectual and critical analysis, social injustices within society. Central to this notion are issues of politically correct and acceptable speech within academic contexts. Both public and private educational institutions in the United States frequently adopt policies prohibiting stigmatization on the basis of attributes such as race, sexual orientation, religion, disability, or national origin. In the 1980s and 1990's, more than 350 public universities adopted "speech codes" regulating discriminatory speech by faculty and students (Herron, 1994). While these codes are frequently overturned as violations of the First Amendment, debate over restriction of "hate speech" in public universities has resurfaced with the adoption of anti-harassment codes covering discriminatory speech. However, Giroux (2006) makes the argument that higher education within the United States is being targeted by a diverse number of right-winged forces that have high-jacked political power and have waged a campaign to undermine the principles of academic freedom in place of critical pedagogical practice in the name of patriotic correctness. According to Giroux, this dismantles the university as a stronghold of autonomy and independent thought. Furthermore, by controlling the vocabulary of individuals, academic freedom, and free speech, right-wing forces are attempting to slander liberal and left-oriented professors and place control on what is said and taught in the classroom.

### **Theoretical Framework**

My interest in this issue is grounded in my personal experiences and challenges in teaching multicultural competencies to pre-service teachers at Arizona State University amidst recent and on-going controversial immigration legislation that highlights the current wave of normalized racism. Students unknowingly exhibit "anti-immigrant" ideology as normative and fail to recognize their own value positions and assumptions as a form of institutional racism.

My efforts to engage pre-service teachers in transformative learning for social justice are largely informed by Henry Giroux' conceptualization of *border pedagogy*, an approach to

critical pedagogy that views the act of teaching “as a form of social criticism” and takes seriously the call to rethink the nature of university teachers’ role “with respect to issues of politics, social responsibility, and the construction of a pedagogy of possibility” (Giroux, 1992, p. 105). A central tenet to Giroux’ concept of a critical border pedagogy suggests the need to explore a language of possibility that is capable of thinking risky thoughts and that gives students the opportunity to “air their feelings about race from the perspective of the subject positions they experience as constitutive of their own identities” (Giroux, 1992, p. 137).

Thus, my goals in teaching this course are to provide these future teachers with an understanding of current issues in multicultural education by deconstructing “whiteness” in order to recognize and dismantle practices of normative racism circulating within recent educational policies in the State of Arizona. However, While I take seriously Giroux’s suggestion that border pedagogy “does not silence in the name of its own ideological fervor or correctness”, I frequently found it extremely difficult to continue to give some students the freedom to express their views and explore their value positions when those views were racist in the extreme. Thus, the essential dilemma for me was in determining the extent to which students should be given the freedom to voice their opinions and explore their value positions without perpetuating racist stereotypes.

With these issues in mind, one topic that seems to have recurring resonance for me, and certainly one that weighs on my mind as an aspiring teacher, concerns concepts of dominance, power and authentic possibilities for transformational pedagogies. Using Foucault’s theory of the polyvalence of discourse and Judith Butler’s conceptualization of the power of language performativity as a theoretical lens, I am interested in understanding the cause and affect relationship of censorship and normative racism among future teachers.

## Language and Power

In "How to do Things with Words, J.L. Austin (1962) attacks the traditional view within linguistics that the main purpose of uttering sentences is to state facts, which can either be true if they succeed or false if they fail to perform. He argues that uttering some sentences is neither to state a truth or a falsehood, but to actually perform a kind of action, which he calls an "illocutionary act." However, other sentences can be the cause of an action to take place, or what he calls "perlocutionary acts." Austin argues that it is possible to "do things with words", as words themselves do not have one absolute signification, but various meanings depending on the context. Language is a mix of words and body, and bodies can alter the meaning of a spoken word.

Building off of Austin's conception of illocutionary and perlocutionary speech acts, Judith Butler (1997) incorporates Foucault's theory of the polyvalence of discourse (1976) to demonstrate that language and power are inextricably related and dominant discourse functions as an instrument of power by governing and shaping social and cultural beliefs and practices. Foucault contends that discourse is at the same time polyvalent and can function to either inflict power or to resist it. Thus, discourse can ultimately "undermine and expose [power]," and thus "renders it fragile and makes it possible to thwart" (Foucault, 1976:34). This idea is central to Butler's argument, and she rejects Austin's conception of the absolute efficacy of illocutionary speech acts by demonstrating that what gives illocutionary speech acts their force is not the words themselves, but social and political conventions. Using the example of hate speech, Butler reveals that names have a history that is imbedded in the word itself, and thus, "repetition that congeals, that gives the name its force" (Butler, 1997:36) invokes a words' historicity and conventionality when it is used. Thus, Butler states that hate speech only works as hate speech because it cites itself, claiming because "we know its force from its prior instances [that] we know it to be offensive now" (p. 80).

However, according to Butler, if the illocutionary acts are grounded in convention as Austin claims, then they contain a condensed historicity that refutes the claim of

simultaneity between speech and conduct. Rather, Butler asserts that the illocutionary force of an utterance stems from the presence of structures and conventions that both precede and endure beyond that utterance, and thus, “no term or statement can function performativity without accumulating and dissimulating historicity of force” (p. 51). In this way Butler demonstrates that the injurious force of hate speech is not necessarily always effacious and, based on Foucault’s theory of the polyvalence of discourse, there is a possible break between the actual act and the injury that hate speech inflicts that can be exploited as means of resistance. Language itself is outside the control of its user, but rather “excitable.” Thus, Butler rejects arguments that define hate speech as illocutionary, which assumes both instantaneous and absolute performative force as it is spoken, and instead argues that language is highly vulnerable and thus the performative force of hate speech as perlocutionary; hate speech generates consequences, yet because speech is “excitable” and discourses polyvalent, sovereign control over language is impossible and the consequences of the perlocutionary speech act are not definite. Thus, hate speech becomes open to reinterpretation and recontextualization, which in turn create possibilities for change. In this sense, attempts to censor language prevents possibilities for counter speech, which, according to Butler, confounds the performative power of speech by loosening the link between the performative act and injury:

One is not simply fixed by the name one is called. In being called an injurious name, one is derogated and demeaned. But the name holds another possibility as well: by being called a name, one is also, paradoxically, given a certain possibility for social existence...Thus the injurious address may appear to fix or paralyze the one it hails, but it may also produce an unexpected and enabling response. If to be addressed is to be interpellated, then the offensive call runs the risk of inaugurating a subject in speech who comes to use language to counter the offensive call...

For Butler, Hate Speech theory denies possibilities for derogatory terms to be turned around and their meaning reinvented, and thus eliminates the responsibility to do that political work.

By demonstrating that illocutionary performatives are not always successful, Butler opens up possibilities for alternatives to state regulation of speech by further demonstrating the vulnerability of speech, citing what Austin terms “the doctrine of the infelicities” which refers to the occasional possibility of performatives to fail. For example, an illocutionary performative lacks power if the subject making the utterance lacks the necessary power and the authority. Speech can essentially break with existing contexts and be used in unconventional ways, which creates the means for hate speech to not only lose ability to inflict injury, but also be counter-signified. For example, counter speech, which Butler refers to as “redoubling of injurious speech” are possible as a result of the vulnerability of speech (pp. 14). The key issue then, for Butler, is that attempts to regulate hate speech through censorship ironically function to perpetuate the very discourses that these attempts seek to eradicate. This is the paradoxical effect of speech regulation that Butler demonstrates is so dangerous.

The paradoxical irony has further implications and Butler claims that attempts to make hate-speech prosecutable also produce a reductive effect by localizing the political problem of hate speech to the level of the individual, which functions to limit and reject opportunities to consideration of the larger issues of racism and sexism that inform hate speech. Thus, Butler questions the authenticity of oppositional speech used to combat hate speech—even so-called liberal attempts to create new terminology and language aimed at being “politically correct” or inoffensive—noting that, “If speech depends upon censorship, then the principle that one might seek to oppose is at once the formative principle of oppositional speech”. The power of the state to decide certain language forbidden by labeling it as hate speech simultaneously functions to spread the same language it attempts to prohibit. I personally would include in this discussion the use of euphemisms and doublespeak in place of hate speech as a result of censorship laws that attempt to eradicate the performative power of hate speech consequently become part of the cycle of resistance and domination: When the lived experiences of the oppressed interrupt dominant narratives and language, calling them into question in attempts to resist dominant productions of ideology, the dominant powers that control representation

of truth and meaning are able to re-envision and re-construct these resistance efforts to legitimize their power. The result is the production of new speech informed by dominant ideology, which functions to maintain the oppressive conditions of subordinate peoples and perpetuate the cycle (Darder, 1991).

### **Review of the Literature**

#### **Language and the construction of “Whiteness”**

Governments wield the power to control the media, build corporations, and circulate ideas. In this sense those with power fix not necessarily what people think, but the spectrum of what people think and talk about by limiting the source and extent of ideas to which they are subjected. Schools are also responsible for the production and transmission of knowledge, and limitations on language prevent possibilities for engaging in authentic and meaningful considerations of very real and imminent social issues. In this sense, as long as dominant discourses define social life as the sum total of conscious and deliberate individual activities, then only individual manifestations of personal prejudice and hostility will be seen as racist; systematic, coordinated, and collective behavior disappears from sight (Schrag, 2004).

One of the consequences of language that promotes individual liberalism in democratic society is the absence of critical discussion and reflection, which produces a dichotomy of “pro” or “against” that establishes concrete dichotomies of social issues such as immigration. For example, in her article on the controversy over Israel and Palestine, Butler (2009) argues that

“Many important distinctions are elided by the mainstream press when it assumes that there are only two possible positions on the Middle East, the ‘pro-Israel’ and the ‘pro-Palestinian.’ The assumption is that these are discrete views, internally homogeneous, non-overlapping, that if one is ‘pro-Israel’ then anything Israel does is all right, or if ‘pro-Palestinian’ then anything Palestinians do is all right.

Butler cites the former President of Harvard, Lawrence Summers, who in an address to the University community stated that there would be absolutely no tolerance of anti-

Semitic talk, which, according to Summer's logic, includes critique of Israel. This suggests that certain actions of the Israeli state must be allowed to go on unimpeded by public protest, for fear that any protest would be tantamount to anti-Semitism, if not anti-Semitism itself. For Butler, this presents a serious dilemma and she acknowledges that while all forms of anti-Semitism must be opposed, the logic of acceptable discourse has a set of serious confusions about the forms anti-Semitism takes.

One of the primary consequences of the language of individual liberalism is the production of normative whiteness. My use of the term Normative Whiteness draws from a more general notion within the social sciences that reflects a set of dominant values, principles, and modes of representation within institutional settings. According to Margaret Anderson (2003:29), normative Whiteness refers to the material practices that privilege and sustain the dominance of white imperial Eurocentric Worldviews. It is from this understanding of whiteness as ideological that I am interested in, and there are three specific discourses within the notion of white normativity that I will focus on: 1) concepts of citizenship and belonging to the United States, 2) the racial ideology of color blindness, and 3) the notion of meritocracy in US society, which also includes issues of reverse-racism and white resentment. It is these three discourses, which legitimize normative whiteness, that are tantamount to issues of educational equality within multicultural education. Even well intentioned efforts within multicultural educational programs designed to promote inclusion and understanding of minority students are often undermined by subversive forms of deficit thinking that perpetuate the discourses of exclusion by focusing on historical injustices without a consideration of current realities. As Ovando and McLaren point out (2000), even attempts to include such critical considerations are often impeded by appeals to "white guilt" and white resentment.

The first discourse of white normativity, the ideology of citizenship and belonging, is largely informed by the assimilationist approach to multiculturalism that promotes the notion that all citizens, regardless of race, class, linguistic or ethnic background, should assimilate into "American Culture" by conforming to dominant (normative) practices. This perspective is problematic on many levels, primarily because it assumes that

“American Culture” and to be “American” are isolated concepts. This perspective also requires that “others” concede the use of their own native languages and cultural practices to conform to the dominant group. Such a deficit orientation perpetuates the ‘othering’ of non-Anglo groups, which are consistently compared and defined by their ability to conform to normative Anglo culture (Hurd, 2008:295). Within the state of Arizona, rising nativist sentiments are driving the anti-immigrant sentiment and racist thinking that has allowed for the normalization of hate in discourses of patriotism and society. However, immigration and Nativism have long been permanent threads of American life (Schrag, 2004), and today’s conservative rhetoric about Mexicans as the new immigrant group in the US echo older fantasies.

Furthermore, Leistyna (1999) argues that in the United States, which has always been in the hands of white groups of Anglo-Saxon origin, to be white was to be American, and “whiteness” therefore came to represent a cultural group as opposed to a racial category, thus blurring distinctions of race and ethnicity. Hill (2008) demonstrates how normative whiteness has functioned to prevent the majority of people to even recognize acts of racist speech. The appropriation of folk conceptions of race—a theory which contains the notion that there exist biological distinctions that separate people into so-called “racial groups”—enables people who consider themselves not to be racist to in reality utter unintentionally language that has racist effects. Furthermore, the folk theory of race, which permeates mainstream conceptions of race despite public discourses of “unity” and “equality,” has become entwined with specific linguistic ideologies that, in isolation are not racist, but become central to the reproduction of everyday racism when articulated with the folk theory of race.

Concepts of Normative Whiteness are certainly not unique to the US, and the politics of cultural unification, secularism, and the place of Islam in Europe offer a useful lens to view this phenomenon. The “question of Islam” in Europe has dominated recent discourses resulting from the growing ‘Islamophobia’ that has constituted legislation in recent years, and according to Ozyurek (2005), the issue of anti-Islam tendencies in Europe parallels the rise of the religious right in the U.S., the difference being that the

United States has always viewed the ‘enemy’ as external as opposed to internal. The term *Islamic Terrorism* has now come to define political enemies in terms of religious categories in the US in which the power of language to situate the discussion of terrorism within a homogenous relationship of religion and culture works to silence and conceal the reality “that real people, rather than an abstract category of religion or culture, are being discriminated against” (p. 511).

For educators, the issue of religion is surfacing as a central element that places professors and students in conflict with each other. According to Fish (2005), the changing landscape of today can be linked to the intersection of religion and terror that has emerged within the framework of acceptable political and popular discourses. Primarily, it is the infiltration of religion into politics that reflects the larger issue of changing attitudes of traditional distinctions (faith versus reason, belief versus truth, science versus revelation) observing that an overwhelming percentage of the world does “not observe the distinction between private and public, or between belief and knowledge” (Fish, 2005). The religious right has come to dominate many spheres of modern intellectual debate, including higher learning, and critical pedagogues are being challenged and contested in interestingly new and unforeseen ways by this altered backdrop.

While ‘whiteness’ is everywhere, if individuals cannot perceive themselves as a member of a collective society, Lipsitz (1995) points out that it is very hard to see: “white power secures its dominance by seeming not to be anything in particular” (p. 369). Racist images and language have institutionalized racism by the present political culture in the US, which gives broad sanction to white supremacy, cannot be solely blamed on ignorance and intolerance at an individual level. Rather, the past several decades have given rise to an overwhelming inadequacy of language in which individual liberalism is used to describe collective experience, particularly in public education (p. 381).

The second principle discourse of normative whiteness is the racial ideology of color-blindness, which posits the post-civil rights era as one in which racism is no longer a structural or institutional phenomenon, existing only as decontextualized individual acts.

However, color-blindness, rather than eradicating racism by claiming to “not see race” eludes consideration of the historical and social realities of inequality and injustice that persist. Furthermore, this reduction of racisms produces systematic white privilege and the reaffirmation of the ideology of meritocracy (Lipsitz, 1998; McIntyre, 1998). It is our inability as a collective society to even recognize racism in our everyday lives that is the direct result of the sort of essentialized discourses that follow the logic of individual liberalism that dominate both in public and in academic settings. The study of race and race relations within the United States and in higher learning today has failed to adequately address the issue of race as a result of the failure to acknowledge racism as institutionalized norm, and the lack of a cross-cultural, comparative and intragroup perspective that transcends traditional views of race and race relations (Johnson, 1983). The absence of actual discussion and reflection is also influencing society’s very ability to recognize such injustices and Giroux (2005) comments on the underlying theory of *Newspeak*, which is that if something can't be said, then it can't be thought (similar to the Sapir–Whorf hypothesis). Giroux points out that there is substantial argument in favor of this notion, in that most humans think by carrying on a dialogue in their heads. They tend to sub-vocalize their thoughts as they form them and manipulate them. When words are eliminated from speech, so to are the ideas behind them.

The third discourse in the notion of white normativeness is concerned with issues of white resentment, guilt, and the imbedded notion of meritocracy. The inability to view social issues within a framework of collective responsibility present a political culture in this country gives broad sanction for viewing white supremacy and anti-Black racism as forces from the past, as demons finally put to rest by the passage of the 1964 Civil Rights Act (Cohen, 1991). As a result, resentment at having to talk about black grievances, for example, accurately reflects the logic of the language of liberal individualism and its ideological predispositions in discussions of race.

## **The Function of the Media**

According to Gitlin (1986), “today’s cultural and historical events bombard our sensibilities with such exponential speed and frequency, and through such a variety of media forms, that our critical comprehension skills have fallen into rapid deterioration. This collective loss of reasoning, and of history, appears to be reaching epidemic proportions. The etiology of this plague, many scholars argue, stems from the expanding sophistication and complexity of networks of social relations we call television (p. 120). The media functions to shape morality and to construct forms of citizenship and individual and collective identity, and critical awareness of the media’s use of language is important to understanding contemporary social life. The mainstream media solidify and establish social norms in many ways: Choice of topic addressed, by framing of issues, by their choice of sources of information, and by their use of language, among other practices (Herman, 27). The struggle over words, the integration of word usage, framing, and source selection points up the fact that language is an arena of conflict and struggle. Western Racism has surfaced in media representations on immigrants in disguise as traditional rhetoric that follows the logic of individual liberals as an element of US democracy.

As it is the powerful that control language, the powerful can successfully label social issues and individuals in a way that makes it easy to impose policy that strategically discriminates. With a sufficiently compliant media system, any one can be made into a victim engaging in self defense regardless of the reality that shock and awe tactics are openly designed to terrorize the target population into submission (Herman, 95). By the internalized rule of the compliant media, according to which the invidious and horrible language always seems only to apply to ‘others’, there is an internalized belief that acts of racism are limited to individuals, not society as a whole. For example, the mass production of patriotic sentiment and the mobilization of consent that allowed such a disproportionate and excessive use of force in the Iraq War was, in the minds of the American people, largely justified via a mass advertisement in the media. Rather than

creating a more critically informed public, the media successfully created passive subjects that could not demonstrate an ability to recognize blatant acts of racism.

### **The language of Multicultural Education**

The deformation of reality via the media has deeply impacted the state of higher education. There has been an invention of and concurrent attack on what has been called the repressive “left mandarin” regime of “political correctness” that is supposedly sweeping North American University campuses (McLaren, 2008). Educators who work in the public schools and universities are currently witnessing a well-orchestrated and singularly scandalous assault on the efforts of the progressive educators to make race, class, and gender issues central to the curriculum. The new left literacies that have been influenced by continental social theory, feminist theory and critical social theory in its many forms are being characterized by New Right critics as a subversion of the political neutrality and ideological disinterestedness that they claim the enterprise of education should not allow (MacLaren and Hammer, 132).

In reference to multicultural education, lack of critical thinking among today’s student body is a large aspect in the struggle against racism and xenophobia that has allowed hate and fear to constitute normal elements of modern social life (Lipsitz, p. 371). White supremacy and the history of an investment in white solidarity has surfaced in the classroom creating very complex tensions between teachers who attempt to bring critical themes to the discussion. For example, in American history classes, often there are feelings of resentment and frustration among white students who continually feel “attacked” and “threatened” by the attention paid to issues of slavery. The gap between white students’ perceptions of minority experiences has powerful consequences, and the type of questions and comments that are raised about the legacy of slavery in American History classes are a reflection of the deeper significance of racism (Lipsitz, 1998:382). This sort of disconnect between reality and what students perceive as being “picked on” and “blamed” for racial injustices is a very accurate reflection of the way language has created a fundamental sense of individualism and its ideological predispositions in discussions of race. Included in this issue is the rise of neo-conservative racism in

America's universities and educational policies. Schrag (2004) makes an eerie parallel to Arizona House bill 228, which bans ethnic studies in public schools, to the racialized discourse that gave power to the first immigration quota, observing that ethnic-based preferences in education are incompatible with public support for immigration.

Bartolomé (2008) traces this irony to the tainted understanding of what it means to teach multiculturalism and the one-dimensional approach to multicultural curriculum design that embodies the language of individualism and the 'other.' Consequently, multicultural curriculums are limited to superficial displays of holidays, food, and music, which are void of critical thought or significant understanding of the elements that inform these cultural models. At the same time, it seems that many educators view such in-depth looks into different cultures is 'too political.' However, Bartolomé makes a clear point that multiculturalism and critical literacy are inseparable, and "incorporating 'others' into the curriculum does not necessarily change anything. The issue is not whether to add in attention to those who have been excluded, but how to think about exclusion, and what it means to listen to voices of all of us" (p.#). Teachers must therefore have an understanding of the oppressive conditions within traditional curriculums and the portrayal of "others," i.e. non-white, non-Anglo-Saxons. This must include reflection of students' own racism assumptions through the lens of normative whiteness as a form of institutionalized and collective act of racism.

While multicultural education is generally seen to be about the 'Other' and taught in ways in which the "dominating aspects of white culture are not called into question and the oppositional potential of difference as a site of struggle is muted," (Giroux, 1992:101) it is crucial that future teachers are guided to examine how the "boundaries of ethnicity, race, and power make visible how whiteness functions as a historical and social construction" (p. 117). According to Burdick and Sandlin (2010), due to a lack of critical thinking skills, future educators "risk adopting an institutionalized, colonial gazes, applying reductive logics to or even failing completely to experience phenomena that are not easily resolved in existing cultural meanings of teaching and learning" (p. 349). Despite attempting to locate critical pedagogies in their application, student teachers are

nevertheless isolated by traditional frameworks of pedagogy that construct culture from within a Colonial perspective. Rather, there is an “imperialist legacy evident in current educational research and practice” (p. 352). Viruru and Cannella (2006) observe that “despite the field’s historic openness to new ideas and insistence on the inclusion of marginalized perspectives, these structures continue to reflect mostly Euro Western perspectives: define, categorize, and develop guidelines for how it should be done” (p. 182).

### **Deconstructing Deficit Thinking and Student Resistance**

Efforts to create more equitable learning environments often fail because student teachers are unwilling to examine the root causes of underachievement and of failure among minority students. Furthermore, education students have a tendency to locate the problems within their students, their families, and communities, rather than examining their own racist assumptions (Garcia & Guerra, 2004; Berman & Chambliss, 2000). This tendency can be traced to the changing nature of white identity following the Civil Rights movement, in which the transformation of whiteness from a form of social standing to a norm produced resentment among whites (Olson, 2008). This transformation produces resentment characterized by a deep anger at the loss of ‘legalized’ racial superiority (Brown, 1995). Defensive reactions to acknowledging ‘white privilege’ can be understood from this notion, despite the reality that white normalization is largely produced without state sanction (Olson, 2008:709) and continues to be a position of racial privilege in US society.

### **The Power of Language Performativity and Normative Racism**

According to Walker (1994) in the United States, there is a general consensus that free speech values take precedence over limiting the harm caused by verbal insult. At the same time, some conservatives believe verbally expressed “discrimination” against religions such as blasphemy, or sometimes “morally incorrect” or “unpatriotic” speech which opposes deep-seated sociocultural or religious mores, and national interest, should be condemned or prohibited, while liberals feel the same way about verbal

"discrimination" against identity-related personal characteristics, such as homosexuality and language of someone who happens not to speak English.

While free speech and the First Amendment are often cited in the debate concerning hate speech, many argue that the best way to deal with the issue is to create state imposed regulation to deter hate speech. Mari Matsuda (1993), who is recognized as one of the architects of the legal rationale behind campus speech codes, argues that areas of the law, specifically the First Amendment, are "ostensibly designed to advance the cause of racial equality." As such, Matsuda argues that hate speech is "qualitatively different" from other varieties of offensive speech and that arbitrary censorship of hate speech is therefore preferable to the potentially devastating effects it might have and the potential to inflict injury and violence on its targets. Catharine MacKinnon (1993) offers a similar argument against pornography as a form of speech and calls for the unquestioning use of the state's power to censor it. For MacKinnon, the implications that pornography creates within society is a form of hate speech and should thus apply to state-sponsored attempts to regulate language that causes injury—even violence—in an attempt to seek positive social change. Similarly, Richard Delgado (1997) argues that it is possible to identify hate speech on the use of certain key-words. He states that, "words such as 'nigger' and 'spick' are badges of degradation even when used between friends: these words have no other connotation." Therefore, according to Delgado, the act of calling someone a name should be censored if the name used belongs to a previously identified hate speech.

While there has been considerably support for state imposed regulations of speech, and many liberal educators and thinkers have offered their support for such solutions, others argue that there are dangers involved in the censorship of speech, which often proliferate the very language it seeks to suppress. Foucault (1976) claims that any attempt at censorship, legal or otherwise, necessarily propagates the very subject it seeks to forbid. In his first volume of the *History of sexuality*, he shows that censorship produces its own discourse by using the example of the strict sexual mores of 19th century Western Europe that did nothing but amplify the discourse of sexuality it sought to control. Building off of

Foucault's analysis, Judith Butler (1997) examines when and how we deem speech to be an act of injury.

The issue of censorship and hate speech can also be understood as a political tool. There are many who feel that the co-optation of acceptable discourse is not only a rhetorical movement, but a political movement aimed to silence resistance among marginalized and oppressed groups. Some left-wing commentators claimed that after 1980, right-wing American conservatives re-engineered the term political correctness to ideologically re-frame US politics as a culture war. For example, Hutton reports:

"Political correctness is one of the brilliant tools that the American Right developed in the mid-1980s, as part of its demolition of American liberalism. What the sharpest thinkers on the American Right saw quickly was that by declaring war on the cultural manifestations of liberalism — by leveling the charge of “political correctness” against its exponents — they could discredit the whole political project."

According to Toynbee (2008), many who use the term do so to distract attention from substantive debate about racial, class and gender discrimination and unequal legal treatment. Crawley (2007) shows how invocations of political correctness still work in nuanced ways to close down debates and trivialize issues, and effectively slow down progress towards achieving an anti-racist society. One of the concerns is that terms chosen by an identity group as being acceptable descriptors of themselves, become part of dominant discourses, including the discourses of the racists, sexists, and violators, whose racist and sexist ideology functions to re-envision the meaning of the new terms according to their dominant values. Thus, the new terms become devalued, and another set of words must be coined, giving rise to lengthy progressions of euphemisms, also known as the *Euphemism treadmill*.

The issue of politically correct and acceptable speech is also a controversial issue specifically within an academic context. Gordon (2005) argues that the appropriation of academic codes and academic “bills of rights” are examples of how the conservative right

has co-opted typically left-wing rhetorical terms to disguise interior motives. Higher education within the United States is being targeted by a diverse number of right-winged forces that have high-jacked political power and have waged a campaign to undermine the principles of academic freedom in place of critical pedagogical practice in the name of patriotic correctness (Giroux, 2006). This dismantles the university as a stronghold of autonomy and independent thought. Furthermore, by controlling the vocabulary of individuals, academic freedom, and free speech, right-wing forces are attempting to slander liberal and left-oriented professors and place control on what is said and taught in the classroom.

## **Conclusion**

There is a need to examine the epistemologies and implications of language restrictions on the abilities of future teachers to examine their own racist assumptions. This includes a critical understanding of how current discourses of race in teacher education programs produce and reflect realities for the perpetuation of normative racism. I suggest that a pedagogy that encourages students to become border crossers can enable students to develop the ability to interpret media, images, and social constructions with a critical lens, as well as understand the ways they themselves consume and affectively and emotionally invest in these structures. Such an appreciation encourages critical thinking and self-analysis that provides young teachers with the opportunities to navigate racist language, as students begin to realize that everyday decisions are not necessarily made freely and rationally. While I strongly believe that humans exercise agency, I understand that there are social, cultural, and political forces that affect agency. However, I believe that critical pedagogies are capable of creating authentic change despite external structures, and I understand transformational learning as an opportunity to realize how everyday decisions are encoded and inscribed by emotional commitments relating to the production social structures, all of which leads to “the manufacture of consent” (Chomsky, 1988).

Abstracts

The workshop-based craft product design course is to teach students how to create and design three-dimensional crafts products. It is not only the knowledge, but also the skill in the design education field. The aim of this paper is to evaluate the professional learning aspects which can apply to the educational evaluation identification, and the results can be used to improve the teaching methods and adjust the teaching content. The paper chose the people who graduated from the department of related craft products design, and are working in the related products design field as examinees. The data were analyzed by GRA (Grey Relational Analysis) to evaluate the extent of importance of the course content and then put them in order. Afterward, the S-P (Student-Problem) chart has been modified and becomes the GSP (Grey Student-Problem) chart which provides the cognitive domain of the examinees and use as the basis of the paper. Finally, the results are shown in the GSM (Grey Structural Modeling) chart which becomes the analytical basis of this paper. During this evaluation process, the data and figures generated through the paper can clarify the course evaluation which is one of the best innovative evaluation methods in educational learning and teaching.

## **Introduction**

During the craft product design teaching process, the mission of the teacher is to apply the teaching methods and the professional courses to guide students meeting the teaching goals. According to education and training research, there are four sections in the systematic teaching portfolio and they are teaching goals, teaching process, teaching activities and teaching evaluation. We could understand the importance of the craft product design courses via the teaching evaluation. Then, we can use it as the reference for teaching improvement. It not only could help us to estimate the teaching goal, but also can manipulate the teaching process and teaching activities.

The course of craft product design is to train students to be able to design three-dimensional craft works, and enhance the knowledge and skill in this field. The content of this course included that: materials processing technology, form structure analysis, the cultivation of esthetics and professional learning item. Diagnosis and analysis of craft product design courses will be able to improve for teaching quality [1]

There are several mapping evaluation methods such as characterization of tree, semantic attribute analysis, concept mapping, cross-classification, multidimensional scaling, pathfinder network, spider diagram, cluster analysis and so on [2,3]. Those methods have different aspects and effect for the teaching domain.

This paper used GRA method to combine the S-P theory, and proposed GSP chart and GSM chart which become a systematic research method for the reference mapping of judging the difficulty of the designing courses. Through the ordinal results and the structure of the courses, it will provide reference to teaching and improvement.

## **Methods**

### **Grey Relational Analysis (GRA)**

Professor Deng (1989) proposed the Grey System Theory [4], and the grey relational analysis (GRA) can be used to manage the uncertain, multi-dimensional, discrete, and incomplete data. The main function of GRA is to quantify the factors and calculate the discrete data. Through the ordinal process, the information can be translated into useful data. We can find many successful researches [5~15].

The paper aims to find out the importance in the craft designing courses as the improvement for teaching. According to Glaser, the systematic teaching process should include teaching goals, teaching process, teaching activities and teaching evaluation.

### **Establishing the raw data analysis**

For setting up the GRA, there must be reference vector and comparative vector, and they are shown as follows[16].

$$x_0 = (x_0(1), x_0(2), \dots, x_0(k), \dots, x_0(m)), k = 1, 2, 3, \dots, m \quad (1)$$

$$\begin{aligned} x_1 &= (x_1(1), x_1(2), \dots, x_1(k), \dots, x_1(m)) \\ x_2 &= (x_2(1), x_2(2), \dots, x_2(k), \dots, x_2(m)) \\ &\vdots \\ x_n &= (x_n(1), x_n(2), \dots, x_n(k), \dots, x_n(m)) \\ i &= 1, 2, \dots, n \end{aligned} \quad (2)$$

Then the AHP is used to clarify if the data of the comparative vector are clean by checking the Consistency Index (CI). When  $CI \leq 0.1$ , it is clear that the data are consistent.

$$\begin{aligned} &A_{i,1} \quad A_{i,2} \quad A_{i,3} \quad \dots \quad A_{i,m} \\ &A_{i,1} \quad 1 \quad w_{12} \quad w_{13} \quad \dots \quad w_{1m} \\ &A_{i,2} \quad w_{12}^{-1} \quad 1 \quad w_{23} \quad \dots \quad w_{2m} \\ [W]_i &= A_{i,3} \quad w_{13}^{-1} \quad w_{23}^{-1} \quad \dots \quad \dots, i = 1, 2, \dots, n \\ &\vdots \quad \vdots \quad \vdots \quad \vdots \quad \ddots \quad \vdots \\ &A_{i,m} \quad w_{1m}^{-1} \quad w_{2m}^{-1} \quad w_{3m}^{-1} \quad \dots \quad 1 \end{aligned}$$

$$CI = \frac{\lambda_{\max} - n}{n - 1}$$

### Generations of grey relation

During the GRA process, there are three rules have to be satisfied for researchers to extract the available data, which are non-dimension, scaling and polarization. There are three methods to generate and standardize the data, and they are: larger-the-better, smaller-the-better, and nominal-the-better which are shown as follows[16].

#### (1) Larger-the-better

$$x_i^*(k) = \frac{x_i(k) - \min_i x_i(k)}{\max_i x_i(k) - \min_i x_i(k)} \quad (3) \quad \text{where } \max_i x_i(k) \text{ means the maximum number in } j \text{ and } \min_i x_i(k) \text{ means the minimum number in } j.$$

#### (2) Smaller-the-better

$$x_i^*(k) = \frac{\max_i x_{ij}(k) - x_i(k)}{\max_i x_i(k) - \min_i x_i(k)} \quad (4)$$

#### (3) Nominal-the-better

$$x_{ik}^* = \frac{\max_i \{e_{ik}\} - e_{ik}}{\max_i \{e_{ik}\} - \min_i \{e_{ik}\}}, e_{ik} = \frac{|OB - x_{ik}|}{|OB|} \quad (5)$$

where  $OB \neq 0$  and the target goal is zero, Nagai's equation of smaller-the-better will be used, that is,  $\max_i x_{ij} \geq x_{OBj} \geq \min_i x_{ij}$ .

### Calculations of Grey Relational

Based on Nagai's equation [17], the grey relation can be calculated in this paper when partial grey relation's reference vector is  $X_0$  and comparative vector is  $X_j$ . When  $\Gamma_{0i}$  is close to 1, it means that

$x_0$  and  $x_j$  are highly related to each other. The equation of the partial grey relation is shown as follows.

$$\Gamma_{0i} = \Gamma(x_0(k), x_i(k)) = \frac{\bar{\Delta}_{\max} - \bar{\Delta}_{0i}}{\bar{\Delta}_{\max} - \bar{\Delta}_{\min}} \quad (6)$$

$$\text{where } \bar{\Delta}_{0i} = \|x_{0i}\|_{\rho} = \left( \sum_{k=1}^n [\Delta_{0i}(k)]^{\rho} \right)^{\frac{1}{\rho}}$$

where  $\bar{\Delta}_{\max}$  represents the maximum and  $\bar{\Delta}_{\min}$  represents the minimum. When  $\rho \geq 1, 2, \dots, m$ , it means Minkowski's grey relation; when  $\rho = 2$ , it means Euclidean grey relation. The overall grey relation is as follows.

$$\Gamma_{ij} = \Gamma(x_i, x_j) = 1 - \frac{\bar{\Delta}_{ij}}{\bar{\Delta}_{\max}} \quad (7)$$

$$\text{where } \bar{\Delta}_{ij} = \left( \sum_{k=1}^n [\Delta_{ij}(k)]^2 \right)^{\frac{1}{2}}$$

### Grey relation ordinal

The grey relation  $\Gamma_{0i}$  is compared in the decision-making process and the more important factor has larger  $\Gamma_{0i}$  number, and this rule is applied to be the ordinal principle of the system .

### S-P Theory

In 1970, Sato proposed the Student-Problem chart which can do the mapping analysis based on students' responses toward test items[18]. The main purpose is to gain every student's learning diagnose information and to provide teachers in offering efficient remedial teaching [19].

### Application of S-P Chart

From the students' responses (S graph), it is able to access students' learning achievement while the students' evaluation on courses (p graph) provides the students responses to the difficulty of the questions. Then it can be applied to diagnose the learning problem and improve the teaching method and the offering of the remedial classes. In regard to the craft product design course responses to the learning importance, the two dimensions can be presented clearly in Fig. 1[20].

	(P) craft product design Course Title	Overall Score
(S) Professionals	<i>Data</i>	High
		Low
	◀ Most important important	Least ▶

Fig.1. The S-P chart of this paper

### GSP Theory

In 2010, the Grey Student-Problem theory was introduced by Nagai [21], and it combines GRA and S-P chart. Through the GSP, the analysis is more concrete and accurate, and the uncertain factors can be calculated. By using Nagai's equations, the GSP can make the readable chart effectively and find out the weighting or ordinal numbers between the discrete data. Generally speaking, the GSP is an effective way to treat complicated factors.

### GSM structural analysis

Based on the evaluation data, grey relational ordinal and the GRA can be calculated. Then the value of  $\Gamma_{0i}$  is compared based on GRA. When the value of  $\Gamma_{0i}$  is greater on one side, it is recognized as the more important item and becomes the guide lines for the system structure ordinal. This paper uses Nagai's GSM theory to make matrix ordinal [22], and then Matlab is used for calculation. Finally, the overall research evaluation can be presented with the ordinal structure. GSM can be applied to many researches with the incomplete data, and uncertain factors can be shown in the clear figure which also provides the information of weighting and structure. The equation of GSM is shown as follows[22].

Make  $\Gamma$  denote a grey relational matrix, which is the result of a globalized GRA as follows.

$$\Gamma = \begin{matrix} & \gamma_{11} & \gamma_{12} & \cdots & \gamma_{1m} \\ \gamma_{21} & \gamma_{22} & \cdots & \gamma_{2m} \\ \vdots & \vdots & \ddots & \vdots \\ \gamma_{m1} & \gamma_{m2} & \cdots & \gamma_{mm} \end{matrix} \quad (8)$$

其中  $i, j = 1, 2, \dots, m$ ;

$$\gamma_{ij} = 1 - \frac{\|x_i - x_j\|_{\xi}}{\max_i \forall_i \max_j \forall_j \|x_i - x_j\|_{\xi}} \quad (9)$$

### Setting Hierarchal Structure

Due to the localized GRA, the GSM procedure sorts some classes. A hierarchy of each class is shown as follows.

(1) Let  $C$  indicate a set of elements and it is shown as follows:

$$C_i = \{X_j | e_{ij} \leq \theta\} \quad (10)$$

where  $i, j = 1, 2, 3, \dots, m$ ;  $\theta$  is a class coefficient given as  $0 \leq \theta \leq 1$ ; and

$$E = \begin{pmatrix} e_{11} & e_{12} & \cdots & e_{m1} \\ e_{21} & e_{22} & \cdots & e_{m2} \\ \vdots & \vdots & \ddots & \vdots \\ e_{m1} & e_{m2} & \cdots & e_{mm} \end{pmatrix} \quad (11)$$

is the error matrix as  $e_{ij} = |\gamma_{oi} - \gamma_{oj}|$ ,  $0 \leq e_{ij} \leq 1$  and  $e_{ii} = 0$ .

(2) The  $C_{target}$  in this paper ( $C_i$ ) are placed in the digraph when the following conditions are satisfied.

1.  $\text{card}\{C_i\} = \min_{\forall i}$ ; 2.  $C_i \not\subset C_j$  for all  $j, i \neq j$ .

### Setting Paths

Based on Nagai's equation [8], the GSM procedure needs to place a directive path among several pairs of elements and it can be shown as follows.

$$P = \{(x_i, x_j) | \gamma_{ij} \geq \psi, \gamma_{oi} < \gamma_{oj}\} \quad (12)$$

where  $\psi$  is a path coefficient as  $0 \leq \psi \leq 1$ .

Next, establish a direct path for all pairs  $(x_i, x_j)$  of  $P$  from  $x_i$  to  $x_j$

### Research Design

#### Participants and Coding

The paper organized a research team of eight craft product design professionals whose graduated from department of craft design as examinees. Based on their cognitive understanding of the course of the craft product design, the paper execute the investigation of the importance of the course. Subjects are coded from  $S(A)$  to  $S(H)$  as follows (Table 1).

**Table 1. The Information of Experts with Coding**

Experts	Professional Years	Professional area
<i>S(A)</i>	3 years	Jewelry Designer, New Products Development
<i>S(B)</i>	3 years	Stone Craft making , Hand-made and Machine-made
<i>S(C)</i>	5 years	Design Drawing, Craft Products Development, Market Analysis
<i>S(D)</i>	5 years	Design Drawing, Accessories Design, New Products Development, Design with multi-material, Pattern and Modeling Design
<i>S(E)</i>	6 years	New Products Development, Design with multi-material, Design management
<i>S(F)</i>	8 years	Senior Designer at a workshop, Design for custom-made Products , Cost estimation
<i>S(G)</i>	9 years	Senior Designer at a workshop, Innovation Design for Cultural Products, Handicrafts Design and Development
<i>S(H)</i>	12 years	

### The Formation and Coding of the Content in the Course of Craft Product Design

The paper selected ten departments of product design with craft product design courses in universities from northern, central and southern regions of Taiwan. Based on the course in craft product design, the paper collated and analyzed courses into eight major programs and these programs are coded as follows (Table 2).

**Table 2 The coding of the courses in Craft Product Design**

Craft Product Design courses Main Factors	learn content item
<i>P(A)</i> Capacity of design analysis and idea development	Training of material selection and shape design Training of ability to understand graphics and application of technical drawing Training of design drawing for craft products Training of material character and idea developing

$P(B)$ <b>Capacity of hand skills</b>	Learning of application of hand drawing skills Learning of the procedure in the craft product making Training of the safety use in tools and instruments Training of use and maintenance of tools
$P(C)$ <b>Capacity of machining</b>	Training of mechanical working Training of industrial knowledge and safety regulations Learning of forming capacity by machine Training of safety use and maintenance in Power Systems
$P(D)$ <b>Capacity of Texture and Surface Decoration</b>	Learning of surface decoration skills Training of the working procedure for surface decoration Training of the ability to design the texture of the product Learning of material and related tools for surface decoration
$P(E)$ <b>Capacity of integration with computer</b>	Learning of the ability to dynamic modeling by computers Training of 2D&3D design software for design Ability to integrate design idea with computer Understand the benefits of CAD/CAM
$P(F)$ <b>Capacity of Design management</b>	Capacity of the quality control for the work Capacity of making a customized work Execution of integrated craft product Planning ability to save effort, time and material
$P(G)$ <b>Capacity of skill application and development</b>	Ability to make complicated model Ability to combine multiple materials in works Ability to develop advance skills by themselves Ability to overcome the challenge of new product
$P(H)$ <b>Capacity of the estimation of cost</b>	Ability to estimate the time consuming Ability to operate the cost of material and production Ability to determine the margin of profit Ability to integrate the hand-making and mechanical-making cost

### Establish the Raw Decision-making Matrix and GRA

The paper constructed the decision-making matrix by using assessment of subjects and the craft product design courses. Follow the three principles: non-dimension, scaling and polarization, the matrix can be constructed. Then the examinees were asked to choose from Saaty's 9-point scale ranging from 1 (equal importance between the elements) to 9 (absolute dominance of element over ) and reciprocal values, respectively . Then Nagai's equation is used to analyze these results [23]. LGRA and Larger-the-better are used to calculate and all of the data are consistent by providing the results. ( Table 3.)

**Table 3. The  $S(A) \sim S(A)$  value of the professionals**

## The Implementation and Analysis of GSP and GSM

### Formation and Calculation of LGRA-S

Based on the S-P analysis chart, the eight subjects are coded to the ordinate of LGRA-S chart and the eight courses in product design are assigned to the abscissa in the LGRA-S chart. Then, the values of LGRA in Table 3 were respectively filled into  $P(A) \sim P(H)$  and the LGRA-S chart of Tab.4 was produced. Then the Larger-the better column is set in abscissa to provide the computation of the examinees by using Nagai's equations and Matlab[16]. The detailed LGRA-S results and the GRA ordinal are shown in Tab. 4 and Table Tab. 5, respectively.

Table 4. LGRA-S Chart

$S \backslash P$	$P(A)$	$P(B)$	$P(C)$	$P(D)$	$P(E)$	$P(F)$	$P(G)$	$P(H)$

## Formation and Calculation of LGRA-P

LGRA-P (Tab. 6) is formed by transporting the ordinate and abscissa in Tab. 4. Once again, professor Nagai's equations of LGRA and Larger-the-better are used in Matlab to calculate Gamma [27,29], and the raw data are presented in. Table 6, and the ordinal numbers are shown as follows:

$$P(A) \succ P(B) \succ P(F) \succ P(C) \succ P(D) \succ P(E) \succ P(H) \succ P(G)$$

**Table 6. LGRA-P Chart**

$P \backslash S$	$S(A)$	$S(B)$	$S(C)$	$S(D)$	$S(E)$	$S(F)$	$S(G)$	$S(H)$
<b>Larger-the-better</b>	1	1	1	1	1	1	1	1
$P(A)$	1.000	0.927	1.000	1.000	1.000	1.000	0.870	1.000
$P(B)$	1.000	1.000	1.000	0.467	1.000	0.693	1.000	0.750
$P(C)$	0.360	0.652	0.410	0.421	0.642	0.172	1.000	0.103
$P(D)$	0.642	0.764	0.642	0.812	0.458	0.000	0.144	0.000
$P(E)$	0.642	0.000	0.129	0.254	0.129	0.333	0.000	0.384
$P(F)$	0.129	0.382	0.642	0.619	0.000	0.760	0.688	0.492
$P(G)$	0.000	0.139	0.000	0.000	0.360	0.092	0.144	0.103
$P(H)$	0.129	0.139	0.126	0.097	0.129	0.381	0.397	0.281

**Table 7 LGRA-P GRA Ordinal**

Main Factors	Gamma		Main Factors	Gamma	Ordinal
$P(A)$	1.000		$P(G)$	0.000	8
$P(B)$	0.786		$P(H)$	0.122	7
$P(C)$	0.362		$P(E)$	0.129	6
$P(D)$	0.298		$P(D)$	0.298	5
$P(E)$	0.129		$P(C)$	0.362	4

$P(G)$	0.000		$P(B)$	0.786	2
$P(H)$	0.122		$P(A)$	1.000	1
Raw data			Ordinal data		

According Table.7, the paper arranged the courses in model-making corresponding with Table. 2 and listed assessment results table as follow ( Table 8 ) .

**Table 8 Evaluation results**

Main Factors	Ordinal	Item description
$P(A)$	1	Capacity of design analysis and idea development

$P(B)$	2	Capacity of hand skills
$P(C)$	3	Capacity of machining
$P(F)$	4	Capacity of Design management
$P(D)$	5	Capacity of Texture and Surface Decoration
$P(E)$	6	Capacity of integration with computer
$P(H)$	7	Capacity of the estimation of cost
$P(G)$	8	Capacity of skill application and development

### Formation and Analysis of GSP

According to S-P analysis theory, Based on the foundation of Tab. 4 and Tab. 6, and according to the ordinal numbers of Tab.5 and Tab. 7, the GSP figure is formed, and it has become the main analytical figure of the paper which is shown in the following Fig. 2.

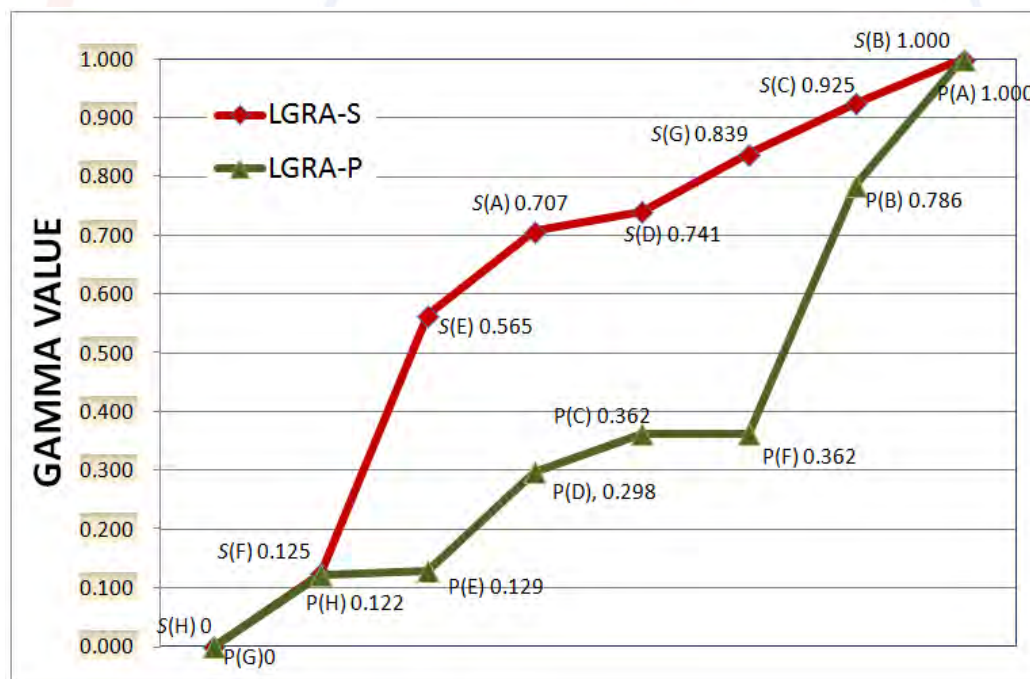

Fig.2. GSP chart

Fig. 2 showed two curves, LGRA-S and LGRA-P. According to the theory of S-P chart the upper-left area is belong to high correct rate and lower-right area is belong to low correct rate. The results corresponded to the structure of the S-P chart.

According to Tab. 5, The largest Gamma value were  $S(B)$ --1, respectively. The paper found that  $S(A)$   $S(D)$  have the similar anchor point and expressed that these two subjects have the same affirmation

on the assessment. Gamma value of  $S(H)$  is zero and is arranged in the lowest area of Fig. 2. It expresses that the subject deviates from all the others' consensus. This state shows that the result are personal perspective and did not affect the result in this paper. And then, the other subjects had different Gamma values respectively and showed each subject's opinion about the importance of craft product design courses. So, according to the order, they were arranged in the Fig.2 in regular sequence.

In Tab. 7, the most important course was  $P(A)$  and its' Gamma value was 1. The least important course was  $P(G)$  and its' Gamma value was 0. They were arranged separately in the top and bottom of Fig. 2. Gamma value of  $P(C)$  was close to that of  $P(F)$  and it expressed these two courses have similar importance. So, they were arranged in the same anchor point in Fig.2. The other courses had obvious difference in the important degree of the course. Then, they were arranged in the sequence in Fig. 2.

### Formation and Analysis of GSM

For the important degree of craft product design programs, the matrix of Tab.6 was took into Nagai's equations based on partial grey relation and the definition of the Larger The Better, using Matlab to calculate and draw the GSM Structured Chart. The Fig. 3 respectively sorted structure of subjects programs ( $P$ ). According to the curves of the LGRA-P in Fig. 2, they had the similar sorted structure. This verified that the structures of GSP and GSM will not change under the operation of the same Gamma value. But the GSM with vertical structure is more easy to analysis the examination than the GSP with curve structure. This is the important finding of this paper.

Besides, GSM structure chart can make cluster analysis clearly and find the structural factors. The cluster analysis of Fig.3, according to the item of the programs in the Tab.2, can clearly define the structure and sort of the educational content of the craft product design and provide the application of craft product design education.

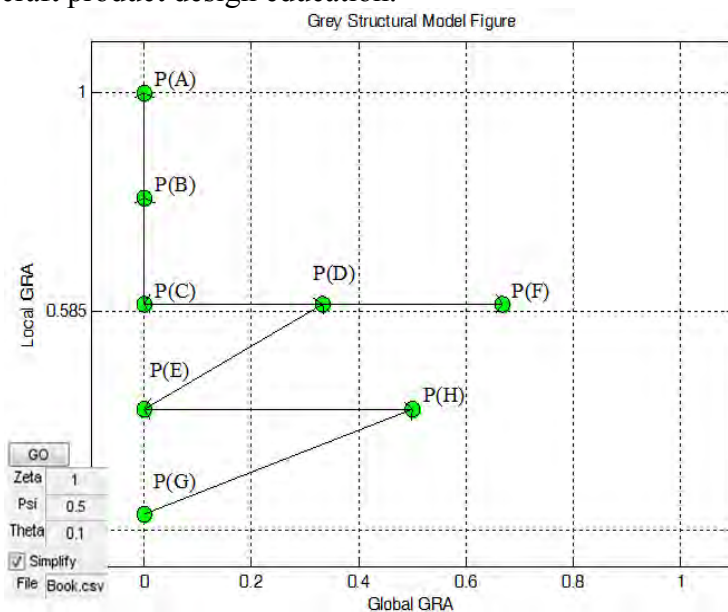

Figure 3. The GSM of ( $P$ )

In the Fig.3, Gamma value of  $P(A)$  was the largest and it expressed that this course is the most important one that all subjects think. Gamma value of  $P(B)$  got the similar value as  $P(A)$ , so it had the relevant importance. The Gamma value of  $P(D)$ ,  $P(C)$  and  $P(F)$  were similar and it expressed that they have similar importance. They also became horizontal arrangement in the figure and formed a cluster. Gamma values of  $P(E)$  and  $P(H)$  were similar and became diagonal arrangement in the GSM. It means that the importance of these programs are very similar and form a cluster. Gamma values of  $P(G)$  was 0 and it was the least important in all programs by all subjects' thought.

## Conclusion

The paper was based on evaluating the people with learning experience and thus made the data objectively and reasonably. The paper operated the Gray relation analysis (GRA), combined with the theory of S-P chart, used the application and analysis according to LGRA and considered the continuity, sequence, integration and articulation. The data of assessment were constructed into vertical structure and showed the conclusion with GSP chart clearly that actually showed the identified assessment of the subjects and the result of the importance of those programs for analysing completely. Furthermore, the paper used GSM chart to display the structural of the importance of those programs. It can clearly execute comparative study and actually provide a new method for craft product design education and a basis of the teaching improvement. This organized, systemic, and innovated methods made the investigation of assessment more accurate and rigorous.

From the results of the paper, GSP chart and GSM chart fully submitted the results of the assessment and made a contribution to teaching and courses arrangement as follows.

1. The method of experts assessment relies on their experience to systemize a definite diagram from unresolved or complex data. The research model of educational assessment could be renovated.
2. The arrangement of the courses will be identified clearly and appropriately and become the benchmark for the new courses arrangement.
3. According to the conclusion of the research, this is an objective paper for actually confirming the importance of the professional course in craft product design.

On the other hand, GSP and GSM made more contributions than S-P chart, and had some advantages as follows.

1. GSP and GSM were operated by the data of assessment and produced through the operation of GRA that can actually reflect the difference of the assessment in the subjects. Gamma value ranging between 0 and 1 can execute the operation of many quantitative data better than the function of the S-P chart that only presented 0 or 1 and can not accurately identify the actual value.
2. The presentation of the S-P chart was vertical zigzag line and each subject or each problem had the fixed length or segment. S-P chart could not localize the actual assessment when many subjects had the same results under the same problem. Under this circumstance, it will make errors. But GSP and GSM is based on the operation of the Gamma value, the diagram produced by GSP and GSM can truly localize the results. So, they were better than S-P chart.
3. GSP and GSM can clearly distinguish the right localization of the structure and scheme. They could find out similar subjects or problems from the sort of the assessment and the state of the cluster. thus, they were better than S-P chart.

*Human Beings and Other Creatures: Education for Sustainable Development*

Amy Wai Sum Lee

Official Conference Proceedings 2012

Abstracts

Creatures other than human beings have existed in our culture since our earliest memory. Whether used as images to stand in for divine powers, as figures to represent nature, or even as bearers of human fears and desires, these non-human creatures have taken up numerous shapes and forms in the rich cultures throughout our history. Despite our success in space adventure, and in enormous efforts to dispel “supernatural” intervention in our lives, non-human creatures remain a prominent presence in our lives today, moreover adapting more and more functions with increasing visibility. While it is understandable to see non-human creatures being featured in children’s fictions and young adult literature, it is perhaps worth pondering the spread of these creatures to mainstream popular culture in the English speaking world. This paper proposes to examine a recent fictional publication by history professor Deborah Harkness, *Discovery of Witches* (2011), which not only features a world containing human beings, vampires, witches, and daemons as regular members of the population, but also a witch as the main character and narrator. Although the multi-species world has a history in western culture, this fiction presents a world not only as an ancient fantasy but also a 21<sup>st</sup> century tale of the anxiety of extinction. Through the examination of how the non-human creatures tried to understand their origins, we can view this fictional representation as a masked human search for sustainable development when threatened by a sense of impending end.

[www.iafor.org](http://www.iafor.org)

According to some interpretations of the Mayan Calendar, the end of the world will arrive at the end of this year. How should one respond to such a piece of information? Well, if you are reading this paper, I think probably you do not take that very seriously. Otherwise you would be somewhere else doing something that gives you pleasure, or that you find meaningful, for the amount of time left before the approaching end is too preciously little to be squandered carelessly. On the other hand, the reason that you do not take the announcement of the impending end seriously may be your faith in the human ability to sustain itself come what it may, or it could be because over the years there have been so many similar announcements and threats that you have become quite immune to the fear and anxiety usually induced by this kind of announcements.

Indeed, fear (and thus prediction) about the end of the world, the total erasure of everything that we have established has never been lacking in the history of humankind. The anxiety is not just individual people's uncertainty about what is to come in the future, but a collective anxiety that is also mixed with hopes and excitement about what will come in the new era. This complex psychology is infectious and has shown its ability to spread to different aspects of life. We can see this excitement cum despair reflected in the cultural and literary works towards the end of the 19<sup>th</sup> century. The pride in what we can know about the world using science and the despair of what we don't know about ourselves find a perfect expression in Robert Louis Stevenson's *The Strange Case of Dr. Jekyll and Mr. Hyde*, which perhaps reminds us of Mary Shelley's *Frankenstein*, a narrative already raising similar issues concerning the progression of the time and the uncertainties we suffer at the same time. This head-on collision of the old and the new can also be seen in Bram Stoker's *Dracula* which presents the excitement brought by the new era side by side with the haunting unknown chasing us from the past. These confused emotions can also be seen in paintings such as *At the Moulin Rouge* (1895) by Henri Toulouse Lautrec and *The Scream* (1893) by Edvard Munch. The feeling of degeneration, decline and decadence against the impending end of one era and the beginning of another is perhaps most fatefully seen in Oscar Wilde's play *Salomé* (1891), and not much later, his own personal downfall at the height of his career. The notorious murders happening in the Whitechapel area in London at about the same time tells us that the fear and anxiety reflected in the artistic and cultural products did have a real source.

As we all know, humanity stepped safely and even gloriously into the 20<sup>th</sup> century. Science and technology continued to flourish, bringing so many previously unimaginable advancements to aspects of life that the end of the 20<sup>th</sup> century was almost unrecognizable for those who lived just one century ago. And yet, behind the surface of all the improvements, doubts and uncertainties about the future of humanity were never far away. The two world wars, both happening in the first half of the new century, moreover making use of exactly the improvements proudly presented by scientists in the new century, certainly did not inspire confidence in human beings about their ability to make wise decisions for the good of the majority. Thus in the second half of the 20<sup>th</sup> century, the fear for a third world war, one that is more destructive, involving more people, and harder for mankind to recover from, if ever, had always been there in the air. When this physical war did not materialize at the end of the century, there was the millennium bug scare which put the developed world in a state of panic because so much of its life had been taken over and controlled by hands other than human.

And then even after we stepped into the 21<sup>st</sup> century unscathed by the millennium bug, the general outlook of the world was still not one of undisturbed peace and hope. Political and humanitarian unrest is a matter of daily occurrences, economic crises left the previously rich countries much shaken, talks about the ecological disasters continue and increase since the mid-20<sup>th</sup> century, and technology continues to bring us both nice and nasty surprises. Feeling like being attacked from various fronts, humanity has to face the talk of yet another end of the world just 12 years into this brave new century. As an educator working in the field of humanities, I do not have adequate professional knowledge to estimate the extent of damage these factors have on our world, or whether this new scare about the impending end of the world is justified or not. What I see, however, is a culture that is aware of its degeneration and is crying for help through its many products and in different ways. Science fiction, beginning at the end of the 19<sup>th</sup> century, documents not only our dream of the fantastic achievements made through science, but also the horror of a life which is taken over by the products of scientific research. Film adaptations of famous science fiction are particularly powerful in their depiction of these horrors using the visual medium. One after another, in popular science fiction movies we see exploration of space bringing intelligent and superbeings from outside earth to invade us and destroy everything or conquer us to become their slaves. Even without being attacked by aliens, life on earth is not a peaceful improvement. Devices we create to help us in our daily life take up so much of our daily tasks that they threaten to become us, and replace us as the beings living on this earth. On the other hand, while we improve machines to have more human qualities, we the real human gradually forget and lose some of these qualities which make us unique. Thus it seems that even in the most entertainment-oriented popular cultural products, the cry for help is visible and audible.

In this paper, I propose to examine a recently published novel, *A Discovery of Witches* (2011), by historian and academic Deborah Harkness, and read it as a symptom of the times, a call for help from a culture that sees its own decline and fears for its demise. While there are thousands of interesting cultural narratives created everyday, this novel imaginatively combines the target to entertain, using some of the most recognizable formula and features currently fashionable in our culture, and the function of describing a situation in our world that requires our attention and concern. I feel that this narrative which is partly fiction, partly history, and partly fantasy, has managed to ride on the current fashion in popular culture to convey an important message to its audience – that we have reached a point in our history that new perceptions of what we need to sustain our existence are called for, and that an awareness of this need is the beginning of finding a way for sustainable development.

In the 21<sup>st</sup> century world where Diana Bishop lived as a historian of science, there were 4 species of beings - human, witch, vampire and daemon, although human beings were by far the majority. On the whole these beings existed peacefully side by side with one another, because the creatures had their own age-old covenant which their ancestors had agreed to follow in order to maintain a reasonable balance of power among creatures themselves, and they were also careful not to make their presence and their idiosyncratic ways felt too much by the human beings. This point of more-or-less equilibrium among the different beings was not an easy achievement, because the beings had such different powers and ambitions which could lead to

major conflicts and even the end of all beings. As inhabitants of this world in the 21<sup>st</sup> century, we the readers are well aware of the great wars, purges, epidemic, disasters that conflicts among different groups of people had resulted in, not to say beings with special powers as possessed by the fictional creatures. In fact, what Harkness has done, in prescribing 4 species of beings to her fictional world, is to distribute the special abilities and potentials of human beings among the 4 fictional beings, in highly exaggerated extents, to explain how the world up to the present is a result of the combined work of these beings. The longevity of the vampire which allows them to take part in major battles in the world, and to provide a coherence to events; the power of the witches to bond with nature and its powers; the extraordinary intelligence of the daemons which enables them to stand at the forefront of their times and invent the best for the world; and finally the endurance and adaptability of the human beings to let them grow to be the majority inhabitants of the world. In this way, Harkness has rationalised the fantastic, guiding our attention to see these creatures' "human" attributes rather than their out-of-the-world power.

Diana Bishop, as a descendent of Bridget Bishop, the first witch to have been hanged in Salem, and the daughter of Rebecca Bishop and Stephen Proctor, both powerful witches from great New England families, had been born with the great baggage of her family's reputation. That was the reason why she consciously lived a magic-free life, created her world through serious academic work, adapted a sportive lifestyle and devoted her time to study the history of science. In this volume of the narrative, Diana accidentally came across a much sought after manuscript *Ashmole 782*, and released the power bounded inside the book for centuries. The activation of the power of the book immediately alerted all the other creatures to the presence of this book, and started a race for its capture. Matthew Clairmont, a vampire from a powerful family who also wanted the book, watched Diana struggle with her own power, and finally joined hands with her in seeking to get hold of the book before all the other creatures. The narrative is the story of how the two, together with their families and allies, competed with the other creatures to find the book, and learn the secrets of their own ancestors recorded inside.

In the course of her adventure, Diana Bishop had come to realise that it was useless to deny who she was, her heredity, her in-born abilities and her potentials – the capacity to bond with nature and its powers, to maintain an intimate relationship with other beings of the world, to have the sensitivity to look into the others and know how they feel, and so on – because those were her attributes whether she liked them or not. Similarly, the vampire's long life across time gives it the time to accumulate wealth, the perspective to understand the meaning of life, and the courage to fight for what is treasurable, such as dignity, honour, loyalty and so on – all these well demonstrated in the various members of the Clairmont family. The daemons' extraordinary intelligence, on the other hand, makes them the legendary inventors, artists and geniuses in various times. Although the inhabitants of Harkness' fictional world are fantastic creatures not of our world, what they represent are none other than the ordinarily seen, the treasured and sometimes feared qualities of humankind. As the drama of their fight for manuscript *Ashmole 782* unfolds, when each creature used his special ability to steal, to coax, to cheat, to damage, to outwit, and to fight one another, the central driving force of this series of actions is still the very human motive of wanting to know the content of the manuscript which was thought to contain the secrets of all the beings – almost a parallel of Darwin's *On the Origin of Species*.

According to Peter Knox, one of the most eager witches to get his hands on the book, *Ashmole 782* contained “[t]he first spells ever constructed. Descriptions of the enchantments that bind the world together.... The secret of immortality. How witches made the first daemon. How vampires can be destroyed, once and for all” (Harkness, 2011, pp. 157-8). From a witch’s perspective, “[i]t’s the source of all [their] power, past and present. It cannot be allowed to fall into the hands of daemons or vampires – or humans” (Harkness, 2011, p. 158). As for the daemons’ interest in the manuscript, it was because they believed that *Ashmole 782* was “the story of all origins – even human origins” (Harkness, 2011, p. 187). And vampires? Matthew Clairmont, who had been looking for this lost manuscript since the publication of Darwin’s book, remarked that, “Vampires believe the lost manuscript explains our longevity and our strength, ... In the past, our fear was that this secret – if it fell into witches’ hands - would lead to our extermination. Some fear that magic was involved in our making and that the witches might find a way to reverse the magic and destroy us. It seems that that part of the legend might be true” (Harkness, 2011, pp. 187-188).

There, we do not need to know the content of *On the Origin of the Species*, or even to agree that *Ashmole 782* could possibly contain any of the things mentioned by these creatures in order to understand the importance of this lost manuscript in the fiction. The story of our origin, the secret that will explain us, how to live forever, and avoid death – aren’t these the very secrets that human beings have been pursuing in different ways throughout history? And aren’t they the driving force for most of our pursuits in science and technology to improve and prolong, our lives? In the novel, the creatures had their own fictional reason for wanting to know the secrets of the manuscript, as Matthew Clairmont revealed from his study of the creatures:

It seems that witches, like vampires, have also felt the pressures of surviving in a world that is increasingly human. Daemons, too. They exhibit less genius – which was how we used to distinguish them from the human population – and more madness. (Harkness, 2011, p. 198)

Although readers do not share their superhuman or preternatural powers to race one another in getting hold of the missing book, we can sympathize with their motives without having to be a witch, a vampire or a daemon, for their desires and fears are human.

But if the manuscript has been known all along to contain all these secrets of the various powerful species, why was it that the race for capturing this book suddenly intensifies in the beginning of the 21<sup>st</sup> century, when the world is so full of promises because of the advancement in scientific and technological development? Matthew, who was engaged in cutting edge scientific research concerning the development of the various creatures, especially the vampire, discovered that although they were known for their longevity (he himself had at least lived for 1500 years), fewer and fewer vampires had been made in the recent centuries, and the vigor of these newly vampires was not comparable to those of the past. In other words, even the vampires, the undead, were dying out. This decline in the life force of the species was found not only among the vampires, but also in the daemons and the witches. While the genius of the daemons have not diminished, there had been many more cases of daemons ending in madness; and the witches’ power of bonding with nature had to give way to the much more aggressive power of the new technology manipulated in the hands of the human beings. The three creatures were facing extinction, when the world will be

taken over entirely by the human beings, who although had no special talent, were able to survive the most difficult times because of their endurance and adaptability.

So in many ways *A Discovery of Witches* is a very recognisable reading experience for a 21<sup>st</sup> century reader. The subject matter and the setting are both well familiar to the general reader, as Harkness (2011) remarked in an interview, “It’s pretty hard not to notice the popular preoccupation with witches, vampires, and things that go bump in the night” (Readers’ guide, p. 6). It is, however, not the presence of these icons from our traditional stories in itself that makes us connect with the narrative, but rather the conscious “updating” that Harkness had achieved which place the novel and its concerns firmly in our midst. The updating is not just the superficial dressing up by having these characters use the everyday objects of our life such as the computer, the smart phone, or engage in cutting edge scientific research regarding DNA. It is more the creation of a sentiment that we can well identify with at the beginning of the 21<sup>st</sup> century, a time when we celebrate the breakthroughs in science yet mourn for the gradual disappearance of a sustainable globe.

This sentiment of the new century, interestingly, is so clearly felt partly because of the presence of so many “old” things in the narrative. Diana was a historian of science and she had a very good sense of the consistent pursuits human (and other) beings had started to make in the past and which had continued untiringly to the present. She also had no problem tracing Matthew’s and the Clairmont family’s unending struggles across both the bright and dark periods of our history – fighting the holy wars, upholding the highest principles of human nature despite the sacrifices needed, and in fact using their long life to accumulate knowledge in the hope of finding a way to sustain life. As Diana and Matthew engaged in their investigation concerning the missing manuscript, citing the major incidents in human history, we are given a “good lesson” of history and an overview of the wonderful courage and insight that many great thinkers and artists in the past had shown to bring humankind to this point in time. Although this novel is definitely not meant to be a history book, and the writer has taken some liberties with the historical facts, the general outlook is a celebration of the history we have carved out for ourselves.

At the end of the novel, Diana and Matthew had decided to “timewalk” (their expression for travelling in time) to 1590s England in order to chase after *Ashmole 782*. It was a difficult feat to achieve and full of danger, even for a potentially gifted witch such as Diana and a determined and wealthy vampire such as Matthew. This return to the past is definitely a plot-oriented decision, to provide a space and an occasion for their adventure, and apparently also a choice made with the author’s own expertise in mind. At the same time, however, the characters’ return to the past, assisted by the witch’s supernatural power and the extraordinary wealth accumulated in a vampire’s long life, to the root of the problem, concurs with the general outlook of this narrative – the fusion of the past and the present – to draw our attention back to basic issues that human beings are concerned about. Watching Diana and Matthew drive away, the ghosts of Bridget Bishop and Diana Bishop’s grandmother conversed:

*What will we do now?* Diana’s grandmother asked.

*What we’ve always done, Joanna,* Bridget replied. *Remember the past – and await the future.* (Harkness, 2011, p. 718)

I think this is a very apt ending for the first part of these creatures' adventure, and also a competent introduction of the events to come in the next volume where the setting will be end of 16<sup>th</sup> century England. For the purpose of our discussion, I think it creatively represents the sentiment Humanists have about the value of the humanities in our university education today, and the narrative it has told embodies a strategy that could be followed to update the Humanities subject areas in today's world. These legendary creatures in our traditional stories re-surface again and again in our popular culture because they could be used to express feelings and ideas that we feel safer, more interesting, more thorough, or more thought-provoking, to be expressed by voices a bit farther from home. *A Discovery of Witches* is interesting because among the 4 species inhabiting the fictional world – humans, vampires, witches, and daemons – only the humans are silent and do not play a part in this whole adventure of seeking the book containing the secrets of life. Yet, the sentiments represented in and by the 3 species of creatures, though shying away from human company in the story, are all human, exhibited not only in their desire to secure the book of secrets, but also in their responses to one another during the race for the treasure.

The sequel to this novel, entitled *Shadow of Night* (2012) has already been published. This volume focuses on the Diana and Matthew's journey back in time to Shakespearean England to locate the book that was supposed to contain all the secrets of the 4 species of beings in the world. At the end of the second volume, although it was clear that the book of secrets existed, Diana and Matthew had not succeeded in finding a solution to the problems they saw in the 21<sup>st</sup> century. The solution, if there is one, will probably emerge in the final volume of the trilogy. As an educator who works with young people of the generation who no longer takes pen and paper to classes, and enters lecture halls which offer glorious exhibitions of various digital devices (the students take photos of whatever important message I wrote on the white board), I feel that reading popular fiction as symptomatic of the times is an important exercise for the students. They have to be shown how narratives in the popular culture are talking to all of us, reflecting what real people feel and think in interesting ways. Otherwise the field of the humanities will be further sidelined and finally deemed obsolete, an exact materialization of the fear shown in these popular texts of our culture today.

*Audiovisual Translation as an Educational Tool in New Egypt*

Muhammad Y Gamal

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

In an age where the average Egyptian viewer has access to more than 500 Arabic-language channels and with crumbling state censorship, the issue of education and entertainment in the contemporary digital age becomes very significant, particularly when the percentage of those under 20 accounts for 40% of the total population. The paper looks at the role of Audiovisual Translation (AVT) in raising the standard of education in the digital age. AVT research remains a western European academic pursuit and it has not been translated into different linguistic or cultural settings. AVT research and studies in Arabic remain few and far in between (Gamal: 2007, 2008, 2010, 2012). And while most western research focuses on subtitling, dubbing and audio description, research in other parts of the world need not follow suit. It should use global techniques to tackle local issues and problems and create innovative solutions. Such global/local, or as the now-accepted term 'glocal', suggests a new approach for making AVT a vehicle for educational change and cultural development. The paper examines the situation of audiovisual translation in Egypt and reflects on the Arab world which exhibits the same features seen in Egypt. In previous studies by the author, he points to the need to develop Screen Translation which focuses only on subtitling and dubbing to widen its scope to include other relevant areas such as the DVD Industry, audio-description on television, same language subtitling and the enhancement of the on-line content in Arabic.

Key words: DVD industry, digital technology, young population, Omar Sharif, Arabic content.

## The digital age

The last decade of the Twentieth Century witnessed major changes to the way information is created, stored and accessed. This can be seen through the advancement in computer technology particularly multimedia and the emergence of digital technology. The Internet became popularised and the size of the computer hard disk has been rising since the early 1990s. Software programs appeared in almost every domain and by 1995 Microsoft offered integrated computing solutions for the average computer user through its Windows 95 operating system. By the mid-1990s multimedia became the operative word with programs co-deploying text, image, colour, sound, motion, and video in a single medium. Software programs such as PowerPoint (1997) had an impressive impact on the style of presentation not only in academic and educational settings but also in business, medical and the financial sectors. This development gave rise to multimodality as an area in linguistics that took the mono-dimensional Hallidayian Systemic Functional Linguistics a step further (Baldry and Thibault: 2006). Today, texts and discourse are characterised by their multisemiotic nature and this, in turn, led to different approaches in text analysis which focus on the multimodality of the text whether in print, on the internet or on screen.

## The new medium

While multimodality is not a totally new concept since the ancient Egyptians employed a verbo-visual system of writing (the hieroglyphs) and through to the last two centuries cartoons, children books, picture books, and advertisements have been using image and language to create meaning, the concept of multi-modal and dynamic text was born with the digital technology that enhanced the resources of meaning-making activities as can be seen today through interactive web sites, commercials, CD-ROMS, educational programs and promotional material in electronic format. Today, the concept of *infotainment* is part and parcel of the cultural scene in the 21<sup>st</sup> century and is endorsed by the educational sector as well as the entertainment industry. The manifestation of this can also be seen in the complimentary CDs that accompany books, magazines, newspapers and the promotional DVDs that corporates produce in a wide range of industries from tourism to investment.

## The digital versatile disc

The appearance of the Digital Versatile Disk (DVD) in 1998 gave the broadcasting, cinema and television industries a unique advantage: accessibility. The invention of the DVD has been termed the most significant invention for film since the advent of sound. The DVD differs from the CD-ROM (Compact Disc –Read Only Memory) in many ways as it stores up to 70 times the content of a normal CD-ROM but more importantly it can store video, text and sound. It can also arrange material into chapters which are searchable. The medium has been widely utilized by a large number of publications offering DVDs for specialized coverage. Magazines particularly make use of the new medium by presenting topics capitalizing on the inclusive multimedia capability of DVDs. Corporate videos, which originally replaced print brochures and information packages, now appear on DVDs with

several topics arranged in a searchable format and with multi-language versions. This last capability means that films could now be stored with subtitles in a large number of languages loaded on the same searchable disc. A single DVD disc can store subtitles in up to 40 languages and soundtracks for up to 8 languages (Carroll: 2004).

A typical feature film DVD has two sections: the film and the Extra Features. The Extra Features vary from film to film, but on average they include the following: film trailer, scene selection, deleted scenes, changed endings, bloopers, interviews with cast and crew, commentary on the film, the original film poster and the language options. This could take the form of either subtitles or language tracks. An average American film sold in Australia is typically subtitled into 12 to 20 languages and has sound tracks in about three to four languages. In addition to the bonus or Extra Features, there are several versions of the same subtitled film such as: the standard release, the deluxe release with commentary, the anniversary release with deleted scenes, the box-set release with similarly themed pictures, and the aluminum box-set release with the director's other titles.

National cinema industries began producing DVDs of their films with subtitles and dubbed sound tracks since the year 2000. The portability of DVDs meant that films can be available and accessible by wide audiences the world over. Whereas American films have dominated the world market for many decades due, inter alia, to their technical specifications and distributing power, the new digital medium offers local cinemas an opportunity that was unattainable prior to 1998. Today, almost every cinema in the world has its own films available on DVD and many of them come with subtitles at least in one foreign language: English.

### Egyptian DVDs

The first Egyptian DVDs appeared in 2002 (Asharqalwasat: July 2002) with two significant works: *Days of Sadat* (2001) and *A Man in Our House* (1961). The former examines the life and times of Egyptian president Anwar Sadat (1918-1981) starring prominent Egyptian actor Ahmad Zaki. The film was a recent success coinciding with the twentieth anniversary of Sadat's assassination. The latter starring Omar Sharif is considered one of the Best 100 Films ever produced by Egyptian cinema (Tawfic: 1969) and also one of the Most Important 100 Films that reflect the development of the Egyptian cinema industry (Al Hadary: 2007). The early history of the DVD industry in Egypt has not been documented and the little available information is neither complete nor official (Gamal: 2007). The first collection of films to be produced on DVD was titled 'Egyptian Cinema Classics' which included a number of films that appeared in Tawfic's (1969) initial list of the Best 100 films although it also contained a number of other popular films (Alsharqalawsat: September 2002). The company Finoon produced about 100 titles before it was acquired by Rotana, a Saudi media company that also purchased the originals of almost one third of the Egyptian film library and remastered them for its free-to-air *Rotana Cinema* and *Rotana Zaman*, two satellite channels that specialize in showing current Egyptian films and old films. The viewership of Egyptian films exceeds the 300 million viewers in the Arab world and extends to Arabic-speaking communities almost everywhere in the world via satellite. The Arabic word *Zaman* means old, previous and

before. However, one of the connotations of the word is “good old times” and also classic. Thus Rotana *Zaman* has come to signify classic Egyptian cinema. In May 2012, Rotana Company launched a new channel titled *Rotana Classic* which, in addition to showing old and classic Egyptian films, it began showing old television interviews and live concerts mostly from Egypt which in this context the word classic came to mean old and “archival” programs. The channel uses as a subtitle “Eternal masterpieces”.
